This page intentionally left blank.

1. Introduction

CenterPoint Properties (Applicant) is considering the feasibility of a speculative warehouse project at 506 Brookside Drive in North Richmond, an unincorporated area in Contra Costa County, California. This Air Quality and Greenhouse Gas (GHG) Emissions Technical Study evaluates the potential air quality and GHG emissions impacts from the construction and operation of the proposed industrial project. Existing sensitive receptors proximate to the project site include the students and staff to the south at Verde Elementary School, and the single-family residences further to the south. This assessment is pursuant to the California Environmental Quality Act (CEQA) and is prepared for CenterPoint Properties.

1. Introduction

This page intentionally left blank.

2. Project Description

2.1 PROJECT LOCATION

The project site is at 506 Brookside Drive in the community of North Richmond, California. The site is bounded by Fred Jackson Way to the west, Brookside Drive to the north, and Da Villa Street to the south. Uses associated with the proposed facility would include commercial office and industrial warehousing. Nearby surrounding land uses primarily consist of industrial to the north and east, commercial properties to the west, and Verde Elementary School to the southeast. The project site is largely undeveloped, with single-family residences on the northeast portion. These residences and the nearby structures near the intersection of Brookside Drive and Niemeyer Road will be demolished as part of the project. However, the structures just north of the Verde Elementary School (and accessed from Da Villa Street) are not part of the project and will remain. The project site and vicinity are shown on Figure 1, *Site Location*.

2.2 PROJECT DETAILS

The proposed project layout would encompass approximately 31.47 acres and three buildings that would provide approximately 522,709 square feet (SF) of warehouse space and 32,801 SF for offices. The square footage of each building is as follows:

- **Building 1:** 234,613 SF and 25 truck bays
- **Building 2:** 208,927 SF and 21 truck bays
- **Building 3:** 111,970 SF and 26 truck bays
- **Building Total:** 555,510 SF with 72 total truck bays

In addition, the proposed project would include 447 parking stalls for passenger vehicles and 246 parking stalls for trucks along with paved internal circulation and landscaping. The proposed buildings would be designed and constructed to achieve LEED Certification under the LEED for Core & Shell v3 (CS v2009) Rating System. Project design features include:

- Skylights that cover 2 percent of the total floor area.
- Additional tenant improvement office space build-outs must provide, at a minimum, R-13 for wood-framed, and R-13 with R-2 wrap for metal-framed, insulation in exterior wall cavities and demising walls between office and warehouse spaces, and R-19 insulation in ceiling cavities.
- Installed lighting power density in a warehouse cannot exceed 0.50 watt per square foot of floor space.
- Photocell daylight and occupancy motion sensor controls for all non-emergency lighting.

- Installation of conduits from the facility to the parking lot to allow for the future installation of electric vehicle (EV) charging stations.
- Water-efficient landscaping.
- Low-flow indoor plumbing fixtures that reduce total indoor water use by 35 percent.
- Preferred parking for low-emitting and fuel-efficient vehicles.
- Bicycle parking and only code-compliant passenger automobile parking.

In addition to these features, the proposed buildings would be designed and built to be solar ready to support the proposed roof-top solar photovoltaic (PV) system. This PV system would generate an estimated 8,083,000 kilowatt hours per year (kWh/yr) of renewable electricity. Furthermore, the proposed project would not include an emergency generator. The proposed drainage pump would be connected to a permanent electric power source. The proposed site configuration is shown on Figure 2, *Proposed Site Plan*.

2.3 CONDITIONS OF APPROVAL

The following lists the Conditions of Approval agreed to between CenterPoint Properties and Contra Costa County.

1. The following conditions of approval shall be implemented during all on-going business operations and shall be included as part of contractual lease agreement language to ensure the tenants/lessees are informed of all on-going operational responsibilities.

    a. The property owner/tenant/lessee shall ensure that all heavy-duty trucks (Class 7 and 8) domiciled on the project site are model year 2014 or later from start of operations, and shall expedite a transition to zero-emission vehicles, with the fleet fully zero-emission by December 31, 2025 or when commercially available for the intended application, whichever date is later.

        "Domiciled at the project site" shall mean the vehicle is either (i) parked overnight at the project site more than 70% of the year or (ii) dedicated to the project site (defined as more than 70% of the routes start at the project site even if parked elsewhere).

    b. The property owner/tenant/lessee shall utilize a "clean fleet" of vehicles/delivery vans/trucks (Class 2 through 6) as part of business operations as follows: For any vehicle (Class 2 through 6) domiciled at the project site, the following "clean fleet" requirements apply: (i) 33% of the fleet will be zero emission vehicles at start of operations, (ii) 65% of the fleet will be zero emission vehicles by December 31, 2023, (iii) 80% of the fleet will be zero emission vehicles by December 31, 2025, and (iv) 100% of the fleet will be zero emission vehicles by December 31, 2027 except that during a "surge" in demand (defined as an increase in greater than 20% in monthly traffic compared to the monthly average for the preceding 6-month period), those vehicles needed to accommodate the

surge do not need to meet the 100% zero emission requirement; the "surge" vehicles must meet the 100% zero emission requirement by December 31, 2030.

The property owner/tenant/lessee shall make all reasonable efforts to procure the zero emission vehicles/trucks required to meet the "clean fleet" requirements. In the event that there is a disruption in the manufacturing of zero emission vehicles/trucks or that sufficient vehicles/trucks are not commercially available for the intended application, the "clean fleet requirements" may be adjusted as minimally as possible by the Contra Costa County Department of Conservation and Development, Community Development Division (CDD) to accommodate the manufacturing disruption or unavailability of commercially available vehicles/trucks. The property owner/tenant/lessee shall provide all necessary documentation describing efforts made to meet clean fleet requirements as part of any adjustment request. The CDD staff may seek the recommendation of the California Air Resources Board in determining whether there has been a manufacturing disruption or there are insufficient vehicles/trucks commercially available for the intended application.

"Domiciled at the project site" shall mean the vehicle is either (i) parked overnight at the project site more than 70% of the year or (ii) dedicated to the project site (defined as more than 70% of the routes start at the project site even if parked elsewhere).

The property owner/tenant/lessee shall not be responsible to meet "clean fleet" requirements for vehicles used by common carriers (e.g., US Postal Service, UPS, FedEx) that provide delivery services to or from the project site.

c. The property owner/tenant/lessee shall ensure all on-site equipment and vehicles (e.g., yard hostlers, yard equipment, forklifts, yard trucks and tractors, and pallet jacks) used within the project site are zero-emission from start of operations.

d. The property owner/tenant/lessee shall use the cleanest technologies available and provide the necessary infrastructure to support zero-emission vehicles and equipment that will be operating on-site.

e. At least 30 days prior to applying for building permits, the property owner/tenant/lessee shall submit plans for review and approval of CDD staff, which include the necessary infrastructure for future use of electric trucks, both semi-trucks and delivery trucks (e.g., installation of conduit specifically designated for truck charging equipment in the future).

f. At least 30 days prior to applying for building permits, the property owner/tenant/lessee shall submit plans for review and approval of CDD staff, which provide for a trucker's lounge appropriately sized for the square-footage/use intended for the space being occupied.

g. Idling is strictly prohibited on the subject property and adjacent streets in the Richmond/San Pablo area. The property owner/tenant/lessee shall inform all truck drivers associated with the business of this prohibition.

2. Project Description

h. Applicant/tenant/lessee shall periodically sweep the property to remove road dust, tire wear, brake dust and other contaminants in parking lots.

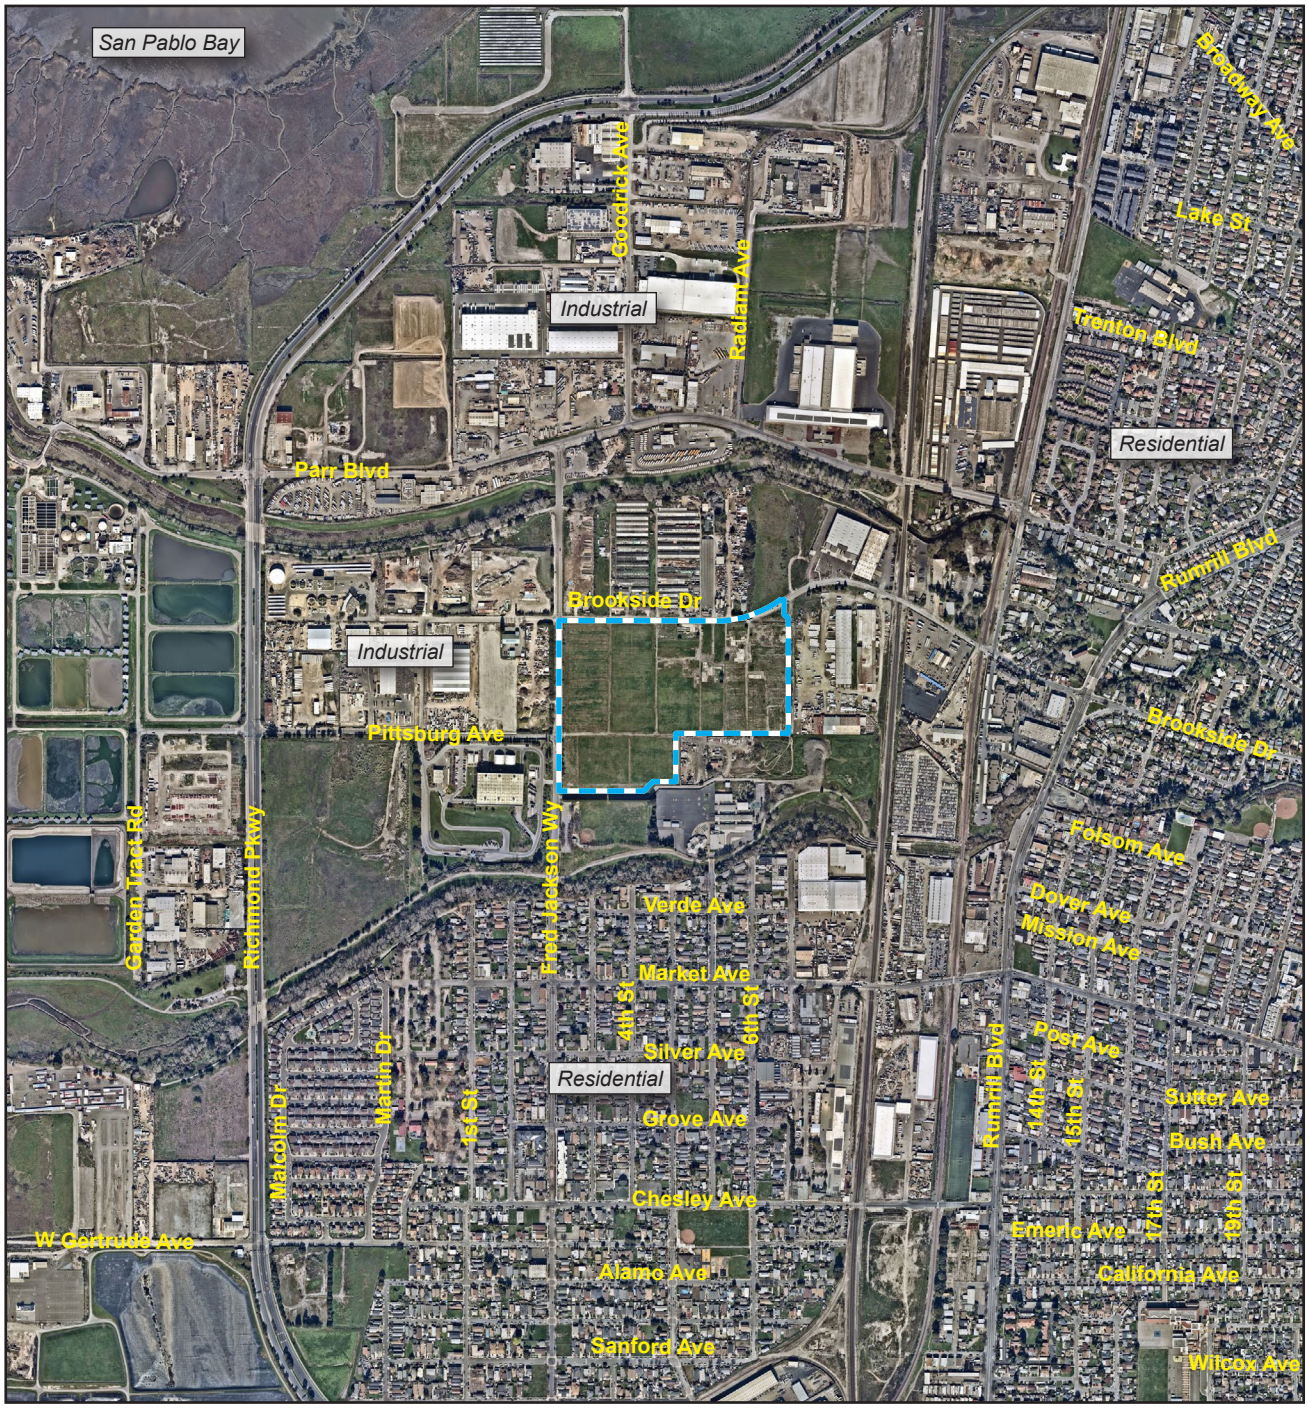
i. Applicant/tenant/lessee shall not use diesel back-up generators on the property unless absolutely necessary. If absolutely necessary, generators shall have Best Available Control Technology (BACT) that meets CARB's Tier 4 emission standards or meets the most stringent in-use standard, whichever has the least emissions.

j. The property owner/tenant/lessee shall monitor and be in compliance with all current air quality regulations for on-road trucks including CARB's Heavy-Duty (Tractor-trailer) Greenhouse Gas Regulation, Periodic Smoke Inspection Program, and the Statewide Truck and Bus Regulation.

k. The operation of Transportation Refrigeration Units (TRUs) is prohibited on the subject site. Any proposed use of TRUs at the subject location will require submittal of a Development Plan modification application.

l. As determined by the Community Development Division, the property owner/tenant/lessee shall install sound walls and/or vegetation, when appropriate, to effectively block diesel emissions from existing nearby sensitive receptors (e.g., schools and residential neighborhoods).

m. The property owner shall add conditions of approval 1a through 1l as part of contractual lease agreement language to ensure the tenant/lessee is informed of all on-going operational responsibilities.



2. At least 30-days prior to applying for a building permit, the applicant shall submit evidence to the CDD staff for review and approval, demonstrating that the subject building(s) have been designed to be solar ready by meeting or exceeding the current California Building Code (e.g., structurally able to support solar panels on roofs, appropriately sized electrical panels and conduit, etc.).

3. The project sponsor shall include with the building permit application, sufficient solar panels to provide power for the operation's base power use. Project sponsor shall include analysis of projected power requirements and generating capacity for solar installation. Completion of the solar project will be a condition of occupancy of the building(s).

   In the event sufficient space is not available on the subject lot to accommodate the needed number of solar panels to produce the operation's base power use, the applicant shall demonstrate how all available space has been maximized (e.g., roof, parking areas, etc.). Areas which provide truck movement may be excluded from these calculations unless otherwise deemed acceptable by the supplied reports.

4. At least 30-days prior to applying for the initial building permit, the applicant shall pay the Contra Costa County, Department of Conservation and Development, Current Planning Division, a flat not-to-exceed amount of $500,000 as its fair share contribution towards the cost of planning and/or constructing a Solar Project for the benefit of the North Richmond area. The Solar Project must benefit North Richmond residents as mitigation for the construction of the project with its associated emissions and truck traffic.

3. Regulatory Setting

3.1 AIR QUALITY

The project site is in the San Francisco Bay Area Air Basin (SFBAAB or Air Basin). Land use is subject to the rules and regulations imposed by the Bay Area Air Quality Management District (BAAQMD or Air District), the California Ambient Air Quality Standards (AAQS) that have been adopted and are periodically updated by the California Air Resources Board (CARB), and National AAQS adopted by the United States Environmental Protection Agency (EPA). Air pollutants for which the state and federal government have identified AAQS are known as criteria air pollutants. In addition to criteria air pollutants, both the state and federal governments regulate the release of toxic air contaminants (TACs). Federal, state, regional, and local laws, regulations, plans, or guidelines that are potentially applicable to the proposed project are summarized below.

3.1.1 Federal and State Laws

3.1.1.1 AMBIENT AIR QUALITY STANDARDS

The Clean Air Act (CAA) was passed in 1963 by the US Congress and has been amended several times. The 1970 Clean Air Act amendments strengthened previous legislation and laid the foundation for the regulatory scheme of the 1970s and 1980s. In 1977, Congress again added several provisions, including nonattainment requirements for areas not meeting National AAQS and the Prevention of Significant Deterioration program. The 1990 amendments were the latest in a series of federal efforts to regulate the protection of air quality in the United States. The Clean Air Act allows states to adopt more stringent standards or to include other pollutants. The California Clean Air Act, signed into law in 1988, requires all areas of the state to achieve and maintain the California AAQS by the earliest practical date. The California AAQS tend to be more restrictive than the National AAQS.

The National and California AAQS are the levels of air quality considered to provide a margin of safety in the protection of the public health and welfare. They are designed to protect "sensitive receptors" most susceptible to further respiratory distress, such as asthmatics, the elderly, very young children, people already weakened by other disease or illness, and persons engaged in strenuous work or exercise. Healthy adults can tolerate occasional exposure to air pollutant concentrations considerably above these minimum standards before adverse effects are observed.

Both California and the federal government have established health-based AAQS for seven air pollutants, which are shown in Table 1, *Ambient Air Quality Standards for Criteria Pollutants*. These pollutants are ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), coarse inhalable particulate matter (PM_{10}), fine inhalable particulate matter ($PM_{2.5}$), and lead (Pb). In addition, the state has set standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles.

3. Regulatory Setting

Table 1 Ambient Air Quality Standards for Criteria Pollutants

Pollutant	Averaging Time	California Standard[1]	Federal Primary Standard[2]	Major Pollutant Sources
Ozone (O_3)[3]	1 hour	0.09 ppm	*	Motor vehicles, paints, coatings, and solvents.
	8 hours	0.070 ppm	0.070 ppm	
Carbon Monoxide (CO)	1 hour	20 ppm	35 ppm	Internal combustion engines, primarily gasoline-powered motor vehicles.
	8 hours	9.0 ppm	9 ppm	
Nitrogen Dioxide (NO_2)	Annual Arithmetic Mean	0.030 ppm	0.053 ppm	Motor vehicles, petroleum-refining operations, industrial sources, aircraft, ships, and railroads.
	1 hour	0.18 ppm	0.100 ppm	
Sulfur Dioxide (SO_2)	Annual Arithmetic Mean	*	0.030 ppm	Fuel combustion, chemical plants, sulfur recovery plants, and metal processing.
	1 hour	0.25 ppm	0.075 ppm	
	24 hours	0.04 ppm	0.14 ppm	
Respirable Coarse Particulate Matter (PM_{10})	Annual Arithmetic Mean	20 µg/m^3	*	Dust and fume-producing construction, industrial, and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g., wind-raised dust and ocean sprays).
	24 hours	50 µg/m^3	150 µg/m^3	
Respirable Fine Particulate Matter ($PM_{2.5}$)[4]	Annual Arithmetic Mean	12 µg/m^3	12 µg/m^3	Dust and fume-producing construction, industrial, and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g., wind-raised dust and ocean sprays).
	24 hours	*	35 µg/m^3	
Lead (Pb)	30-Day Average	1.5 µg/m^3	*	Present source: lead smelters, battery manufacturing and recycling facilities. Past source: combustion of leaded gasoline.
	Calendar Quarter	*	1.5 µg/m^3	
	Rolling 3-Month Average	*	0.15 µg/m^3	
Sulfates (SO_4)[5]	24 hours	25 µg/m^3	*	Industrial processes.
Visibility Reducing Particles	8 hours	ExCo =0.23/km visibility of 10≥ miles	*	Visibility-reducing particles consist of suspended particulate matter, which is a complex mixture of tiny particles that consists of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. These particles vary greatly in shape, size and chemical composition, and can be made up of many different materials such as metals, soot, soil, dust, and salt.

Table 1 Ambient Air Quality Standards for Criteria Pollutants

Pollutant	Averaging Time	California Standard[1]	Federal Primary Standard[2]	Major Pollutant Sources
Hydrogen Sulfide	1 hour	0.03 ppm	*	Hydrogen sulfide (H_2S) is a colorless gas with the odor of rotten eggs. It is formed during bacterial decomposition of sulfur-containing organic substances. Also, it can be present in sewer gas and some natural gas, and can be emitted as the result of geothermal energy exploitation.
Vinyl Chloride	24 hours	0.01 ppm	*	Vinyl chloride (chloroethene), a chlorinated hydrocarbon, is a colorless gas with a mild, sweet odor. Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products. Vinyl chloride has been detected near landfills, sewage plants, and hazardous waste sites, due to microbial breakdown of chlorinated solvents.

Source: CARB 2016a.
Notes: ppm = parts per million; $\mu g/m^3$ = micrograms per cubic meter
* Standard has not been established for this pollutant/duration by this entity.
1 California standards for O_3, CO (except 8-hour Lake Tahoe), SO_2 (1 and 24 hour), NO_2, and particulate matter (PM_{10}, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California AAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
2 National standards (other than O_3, PM, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The O_3 standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu g/m^3$ is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.
3 On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
4 On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 $\mu g/m^3$ to 12.0 $\mu g/m^3$. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 $\mu g/m^3$, as was the annual secondary standard of 15 $\mu g/m^3$. The existing 24-hour PM_{10} standards (primary and secondary) of 150 $\mu g/m^3$ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
5 On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. The 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

California has also adopted several other regulations that reduce criteria pollutant emissions, including:

- Assembly Bill (AB) 1493: Pavley Fuel Efficiency Standards
- Title 20 California Code of Regulations (CCR): Appliance Energy Efficiency Standards
- Title 24, Part 6, CCR: Building Energy Efficiency Standards
- Title 24, Part 11, CCR: Green Building Standards Code

3.1.1.2 TANNER AIR TOXICS ACT AND AIR TOXICS "HOT SPOT" INFORMATION AND ASSESSMENT ACT

Public exposure to TACs is a significant environmental health issue in California. In 1983, the California legislature enacted a program to identify the health effects of TACs and reduce exposure to them. The California Health and Safety Code defines a TAC as "an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health" (17 CCR § 93000). A substance that is listed as a hazardous air pollutant pursuant to Section 112(b) of the

federal Clean Air Act (42 U.S. Code § 7412[b]) is a toxic air contaminant. Under state law, the California Environmental Protection Agency, acting through CARB, is authorized to identify a substance as a TAC if it is an air pollutant that may cause or contribute to an increase in mortality or serious illness, or may pose a present or potential hazard to human health.

California regulates TACs primarily through AB 1807 (Tanner Air Toxics Act) and AB 2588 (Air Toxics "Hot Spot" Information and Assessment Act of 1987). The Tanner Air Toxics Act set up a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an "airborne toxics control measure" for sources that emit that TAC. If there is a safe threshold for a substance (i.e., a point below which there is no toxic effect), the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate "toxics best available control technology" to minimize emissions. To date, CARB has established formal control measures for 11 TACs that are identified as having no safe threshold.

Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the air quality management district or air pollution control district. High priority facilities are required to perform a health risk assessment, and if specific thresholds are exceeded, are required to communicate the results to the public through notices and public meetings.

CARB has promulgated the following specific rules to limit TAC emissions:

- **13 CCR Chapter 10 § 2485: Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling.** Generally restricts on-road diesel-powered commercial motor vehicles with a gross vehicle weight rating of greater than 10,000 pounds from idling more than five minutes.
- **13 CCR § 2477 and Article 8: Airborne Toxic Control Measure for In-Use Diesel-Fueled Transport Refrigeration Units (TRU) and TRU Generator Sets and Facilities Where TRUs Operate.** Regulations established to control emissions associated with diesel-powered TRUs.

3.1.1.3 ASSEMBLY BILL 617

In July of 2017, Governor Brown signed Assembly Bill 617 to develop a new community-focused program to more effectively reduce exposure to air pollution and preserve public health in environmental justice communities. The bill directs CARB and all local air districts to take measures to protect communities disproportionally impacted by air pollution through monitoring and implementing air pollution control strategies. In 2018, Richmond-San Pablo community, which includes North Richmond and the project site, was selected by CARB for a community air monitoring program in Year 1 of the AB 617 program. Subsequently, in 2019, the Richmond-San Pablo community was selected for a community emissions reduction program (CERP) in Year 2 of the program. BAAQMD is required to prepare a CERP and implement enhanced and more robust community air monitoring, accelerated retrofitting of pollution controls on facilities, and increased fines. The Richmond-San Pablo CERP is currently in development with a draft anticipated by late summer or early fall of 2021. The final draft of the AB 617 Richmond-San Pablo Community Air Monitoring Plan was released on July 15, 2020 (BAAQMD 2020a).

3.1.2 Air Pollutants of Concern

3.1.2.1 CRITERIA AIR POLLUTANTS

The pollutants emitted into the ambient air by stationary and mobile sources are categorized as primary and/or secondary pollutants. Primary air pollutants are emitted directly from sources. Carbon monoxide (CO), reactive organic gases (ROG), nitrogen oxides (NO_x), sulfur dioxide (SO_2), coarse inhalable particulate matter (PM_{10}), fine inhalable particulate matter ($PM_{2.5}$), and lead (Pb) are primary air pollutants. Of these, CO, SO_2, NO_2, PM_{10}, and $PM_{2.5}$ are "criteria air pollutants," which means that AAQS have been established for them. ROG and NO_x are criteria pollutant precursors that form secondary criteria air pollutants through chemical and photochemical reactions in the atmosphere. Ozone (O_3) and nitrogen dioxide (NO_2) are the principal secondary pollutants. Each of the primary and secondary criteria air pollutants and its known health effects is described here.

- **Carbon Monoxide (CO)** is a colorless, odorless, toxic gas produced by incomplete combustion of carbon substances, such as gasoline or diesel fuel. CO is a primary criteria air pollutant. CO concentrations tend to be the highest during winter mornings with little or no wind, when surface-based inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion engines, motor vehicles operating at slow speeds are the primary source of CO in the Air Basin. Emissions are highest during cold starts, hard acceleration, stop-and-go driving, and when a vehicle is moving at low speeds. New findings indicate that CO emissions per mile are lowest at about 45 miles per hour (mph) for the average light-duty motor vehicle and begin to increase again at higher speeds. When inhaled at high concentrations, CO combines with hemoglobin in the blood and reduces its oxygen-carrying capacity. This results in reduced oxygen reaching the brain, heart, and other body tissues. This condition is especially critical for people with cardiovascular diseases, chronic lung disease, or anemia, as well as for fetuses. Even healthy people exposed to high CO concentrations can experience headaches, dizziness, fatigue, unconsciousness, and even death (BAAQMD 2017a).

- **Reactive Organic Gases (ROGs)** are compounds composed primarily of hydrogen and carbon atoms. Internal combustion associated with motor vehicle usage is the major source of ROGs. Other sources include evaporative emissions from paints and solvents, the application of asphalt paving, and the use of household consumer products such as aerosols. Adverse effects on human health are not caused directly by ROGs, but rather by reactions of ROGs to form secondary pollutants such as O_3. There are no AAQS established for ROGs. However, because they contribute to the formation of O_3, BAAQMD has established a significance threshold for this pollutant.

- **Nitrogen Oxides (NO_x)** are a by-product of fuel combustion and contribute to the formation of O_3, PM_{10}, and $PM_{2.5}$. The two major components of NO_x are nitric oxide (NO) and nitrogen dioxide (NO_2). The principal component of NO_x produced by combustion is NO, but NO reacts with oxygen to form NO_2, creating the mixture of NO and NO_2 commonly called NOx. NO_2 acts as an acute irritant and in equal concentrations is more injurious than NO. At atmospheric concentrations, however, NO_2 is only potentially irritating. There is some indication of a relationship between NO_2 and chronic pulmonary fibrosis. Some increase in bronchitis in children (two and three years old) has also been observed at

3. Regulatory Setting

concentrations below 0.3 ppm. NO_2 absorbs blue light; the result is a brownish-red cast to the atmosphere and reduced visibility. NO is a colorless, odorless gas formed from atmospheric nitrogen and oxygen when combustion takes place under high temperature and/or high pressure (BAAQMD 2017a).

- **Sulfur Dioxide (SO_2)** is a colorless, pungent, irritating gas formed by the combustion of sulfurous fossil fuels. It enters the atmosphere as a result of burning high-sulfur-content fuel oils and coal and from chemical processes at chemical plants and refineries. Gasoline and natural gas have very low sulfur content and do not release significant quantities of SO_2. When SO_2 forms sulfates (SO_4) in the atmosphere, together these pollutants are referred to as sulfur oxides (SO_x). Thus, SO_2 is both a primary and secondary criteria air pollutant. At sufficiently high concentrations, SO_2 may irritate the upper respiratory tract. At lower concentrations and when combined with particulates, SO_2 may do greater harm by injuring lung tissue.

- **Suspended Particulate Matter (PM_{10} and $PM_{2.5}$)** consists of finely divided solids or liquids such as soot, dust, aerosols, fumes, and mists. Two forms of fine particulates are now recognized and regulated. Inhalable coarse particles, or PM_{10}, include the particulate matter with an aerodynamic diameter of 10 microns (i.e., 10 millionths of a meter or 0.0004 inch) or less. Inhalable fine particles, or $PM_{2.5}$, have an aerodynamic diameter of 2.5 microns or less (i.e., 2.5 millionths of a meter or 0.0001 inch).

  Some particulate matter, such as pollen, occurs naturally. In the Air Basin most particulate matter is caused by combustion, factories, construction, grading, demolition, agricultural activities, and motor vehicles. Extended exposure to particulate matter can increase the risk of chronic respiratory disease. PM_{10} bypasses the body's natural filtration system more easily than larger particles and can lodge deep in the lungs. The EPA's scientific review concluded that $PM_{2.5}$ penetrates even more deeply into the lungs, and this is more likely to contribute to health effects—at concentrations well below current PM_{10} standards. These health effects include premature death in people with heart or lung disease, nonfatal heart attacks, irregular heartbeat, aggravated asthma, decreased lung function, and increased respiratory symptoms (e.g., irritation of the airways, coughing, or difficulty breathing). Motor vehicles are currently responsible for about half of particulates in the Air Basin. Wood burning in fireplaces and stoves is another large source of fine particulates (BAAQMD 2017a).

  Both PM_{10} and $PM_{2.5}$ may adversely affect the human respiratory system, especially in people who are naturally sensitive or susceptible to breathing problems. These health effects include premature death; increased hospital admissions and emergency room visits (primarily the elderly and individuals with cardiopulmonary disease); increased respiratory symptoms and disease (children and individual with asthma); and alterations in lung tissue and structure and in respiratory tract defense mechanisms (South Coast AQMD 2005). There has been emerging evidence that even smaller particulates with an aerodynamic diameter of <0.1 microns or less (i.e., ≤ 0.1 millionths of a meter or <0.000004 inch), known as ultrafine particulates (UFPs), have human health implications, because UFPs toxic components may initiate or facilitate biological processes that may lead to adverse effects to the heart, lungs, and other organs. However, the EPA or CARB has yet to adopt AAQS to regulate these particulates. Diesel particulate matter (DPM) is also classified a carcinogen by CARB.

- **Ozone (O_3)** is commonly referred to as "smog" and is a gas that is formed when ROGs and NO_x, both by-products of internal combustion engine exhaust, undergo photochemical reactions in the presence of sunlight. O_3 is a secondary criteria air pollutant. O_3 concentrations are generally highest during the summer months when direct sunlight, light winds, and warm temperatures create favorable conditions for its formation. O_3 poses a health threat to those who already suffer from respiratory diseases as well as to healthy people. O_3 levels usually build up during the day and peak in the afternoon hours. Short-term exposure can irritate the eyes and cause constriction of the airways. Besides causing shortness of breath, it can aggravate existing respiratory diseases such as asthma, bronchitis, and emphysema. Chronic exposure to high ozone levels can permanently damage lung tissue. O_3 can also damage plants and trees and materials such as rubber and fabrics (BAAQMD 2017a).

- **Lead (Pb)** is a metal found naturally in the environment as well as in manufactured products. The major sources of lead emissions have historically been mobile and industrial sources. As a result of the phasing out of leaded gasoline, metal processing is currently the primary source of lead emissions. The highest levels of lead in air are generally found near lead smelters. Other stationary sources are waste incinerators, utilities, and lead-acid battery manufacturers. Twenty years ago, mobile sources were the main contributor to ambient lead concentrations in the air. In the early 1970s, the EPA set national regulations to gradually reduce the lead content in gasoline. In 1975, unleaded gasoline was introduced for motor vehicles equipped with catalytic converters. The EPA banned the use of leaded gasoline in highway vehicles in December 1995. As a result of the EPA's regulatory efforts to remove lead from gasoline, emissions of lead from the transportation sector and levels of lead in the air decreased dramatically (BAAQMD 2017a). Because emissions of lead are found only in projects that are permitted by BAAQMD, lead is not an air quality of concern for the proposed project.

Table 2, *Criteria Air Pollutant Health Effects Summary*, summarizes the potential health effects associated with the criteria air pollutants.

Table 2 Criteria Air Pollutant Health Effects Summary

Pollutant	Health Effects	Examples of Sources
Carbon Monoxide (CO)	• Chest pain in heart patients • Headaches, nausea • Reduced mental alertness • Death at very high levels	Any source that burns fuel such as cars, trucks, construction and farming equipment, and residential heaters and stoves
Ozone (O_3)	• Cough, chest tightness • Difficulty taking a deep breath • Worsened asthma symptoms • Lung inflammation	Atmospheric reaction of organic gases with nitrogen oxides in sunlight
Nitrogen Dioxide (NO_2)	• Increased response to allergens • Aggravation of respiratory illness	Same as carbon monoxide sources
Particulate Matter (PM_{10} & $PM_{2.5}$)	• Hospitalizations for worsened heart diseases • Emergency room visits for asthma • Premature death	Cars and trucks (particularly diesels) Fireplaces and woodstoves Windblown dust from overlays, agriculture, and construction

3. Regulatory Setting

Table 2 Criteria Air Pollutant Health Effects Summary

Pollutant	Health Effects	Examples of Sources
Sulfur Dioxide (SO_2)	• Aggravation of respiratory disease (e.g., asthma and emphysema) • Reduced lung function	Combustion of sulfur-containing fossil fuels, smelting of sulfur-bearing metal ores, and industrial processes
Lead (Pb)	• Behavioral and learning disabilities in children • Nervous system impairment	Contaminated soil

3.1.2.2 TOXIC AIR CONTAMINANTS

By the last update to the TAC list in December 1999, CARB had designated 244 compounds as TACs (CARB 1999). Additionally, CARB has implemented control measures for a number of compounds that pose high risks and show potential for effective control. The majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from diesel-fueled engines.

Diesel Particulate Matter

In 1998, CARB identified DPM as a TAC. Previously, the individual chemical compounds in diesel exhaust were considered TACs. Almost all diesel exhaust particles are 10 microns or less in diameter. Because of their extremely small size, these particles can be inhaled and eventually trapped in the bronchial and alveolar regions of the lungs.

Community Risk

To reduce exposure to TACs, CARB developed and approved the *Air Quality and Land Use Handbook: A Community Health Perspective* (2005) to provide guidance regarding the siting of sensitive land uses in the vicinity of freeways, distribution centers, rail yards, ports, refineries, chrome-plating facilities, dry cleaners, and gasoline-dispensing facilities. This guidance document was developed to assess compatibility and associated health risks when siting sensitive receptors near existing pollution sources. CARB's recommendations were based on a compilation of recent studies that evaluated data on the adverse health effects from proximity to air pollution sources. The key observation in these studies is that proximity substantially increases exposure and the potential for adverse health effects. Three carcinogenic TACs constitute the majority of the known health risks from motor vehicle traffic—DPM from trucks and benzene and 1,3-butadiene from passenger vehicles. CARB recommendations are based on data that show that localized air pollution exposures can be reduced by as much as 80 percent by following CARB minimum distance separations.

3.1.3 Air Quality Management Planning

The Air District is the agency responsible for assuring that the National and California AAQS are attained and maintained in the SFBAAB and is responsible for:

- Adopting and enforcing rules and regulations concerning air pollutant sources.
- Issuing permits for stationary sources of air pollutants.
- Inspecting stationary sources of air pollutants.
- Responding to citizen complaints.
- Monitoring ambient air quality and meteorological conditions.
- Awarding grants to reduce motor vehicle emissions.
- Conducting public education campaigns.
- Preparing the air quality management plan.

Air quality conditions in the Air Basin have improved significantly since the BAAQMD was created in 1955. The BAAQMD prepares air quality management plans (AQMPs) to attain ambient air quality standards in the SFBAAB. The BAAQMD prepares ozone attainment plans for the National O_3 standard and clean air plans for the California O_3 standard. The BAAQMD prepares these AQMPs in coordination with the Association of Bay Area Governments (ABAG) and the Metropolitan Transportation Commission (MTC). The most recent adopted comprehensive plan is the Bay Area 2017 Clean Air Plan: Spare the Air, Cool the Climate, which incorporates significant new scientific data, ambient measurements, new meteorological episodes, and new air quality modeling tools.

3.1.3.1 BAY AREA CLEAN AIR PLAN

2017 Spare the Air, Cool the Climate: A Blueprint for Clean Air and Climate Protection in the Bay Area

BAAQMD adopted the 2017 Clean Air Plan on April 19, 2017. It serves as an update to the adopted Bay Area 2010 Clean Air Plan and continues in providing the framework for SFBAAB to achieve attainment of the California and National AAQS. Similar to the Bay Area 2010 Clean Air Plan, the 2017 Clean Air Plan updates the Bay Area's ozone plan, which is based on the "all feasible measures" approach to meet the requirements of the California Clean Air Act. Additionally, it sets a goal of reducing health risk impacts to local communities by 20 percent by 2020. Furthermore, the 2017 Clean Air Plan lays the groundwork for reducing GHG emissions in the Bay Area to meet the state's 2030 GHG reduction target and 2050 GHG reduction goal. It also includes a vision for the Bay Area in a postcarbon year 2050 that encompasses the following (BAAQMD 2017b):

- Construct buildings that are energy efficient and powered by renewable energy.
- Walk, bicycle, and use public transit for the majority of trips and use electric-powered autonomous public transit fleets.
- Incubate and produce clean energy technologies.
- Live a low-carbon lifestyle by purchasing low-carbon foods and goods in addition to recycling and putting organic waste to productive use.

3. Regulatory Setting

A comprehensive multipollutant control strategy has been developed to be implemented in the next three to five years to address public health and climate change and to set a pathway to achieve the 2050 vision. The control strategy includes 85 control measures to reduce emissions of ozone, particulate matter, TACs, and GHG from a full range of emission sources. These control measures cover the following sectors: 1) stationary (industrial) sources; 2) transportation; 3) energy; 4) agriculture; 5) natural and working lands; 6) waste management; 7) water; and 8) super-GHG pollutants. Overall, the proposed control strategy is based on the following key priorities:

- Reduce emissions of criteria air pollutants and toxic air contaminants from all key sources.
- Reduce emissions of "super-GHGs," such as methane, black carbon, and fluorinated gases.
- Decrease demand for fossil fuels (gasoline, diesel, and natural gas).
- Increase efficiency of the energy and transportation systems.
- Reduce demand for vehicle travel, and high-carbon goods and services.
- Decarbonize the energy system.
- Make the electricity supply carbon-free.
- Electrify the transportation and building sectors.

3.1.3.2 BAAQMD'S COMMUNITY AIR RISK EVALUATION PROGRAM

The BAAQMD's Community Air Risk Evaluation (CARE) program was initiated in 2004 to evaluate and reduce health risks associated with exposure to outdoor TACs in the Bay Area. In the latest report, DPM was found to account for approximately 85 percent of the cancer risk from airborne toxics. Carcinogenic compounds from gasoline-powered cars and light duty trucks were also identified as significant contributors: 1,3-butadiene contributed 4 percent of the cancer risk-weighted emissions, and benzene contributed 3 percent. Collectively, five compounds—DPM, 1,3-butadiene, benzene, formaldehyde, and acetaldehyde—were found to be responsible for more than 90 percent of the cancer risk attributed to emissions. All of these compounds are associated with emissions from internal combustion engines. The most important sources of cancer risk–weighted emissions were combustion-related sources of DPM, including on-road mobile sources (31 percent), construction equipment (29 percent), and ships and harbor craft (13 percent). A 75 percent reduction in DPM was predicted between 2005 and 2015 when the inventory accounted for CARB's diesel regulations. Overall, cancer risk from TACs dropped by more than 50 percent between 2005 and 2015, when emissions inputs accounted for state diesel regulations and other reductions (BAAQMD 2014).

Modeled cancer risks from TACs in 2005 were highest near sources of DPM: near core urban areas, along major roadways and freeways, and near maritime shipping terminals. The highest modeled risks were found east of San Francisco, near West Oakland, and at the Maritime Port of Oakland (BAAQMD 2014). The Air District has identified North Richmond as an impacted community under the CARE program (BAAQMD 2020b).

The major contributor to acute and chronic noncancer health effects in the air basin is acrolein (C_3H_4O). Major sources of acrolein are on-road mobile sources and aircraft near freeways and commercial and military airports (BAAQMD 2006). Currently CARB does not have certified emission factors or an analytical test method for acrolein. Since the appropriate tools needed to implement and enforce acrolein emission limits

are not available, the BAAQMD does not conduct health risk screening analysis for acrolein emissions (BAAQMD 2010a).

3.1.4 BAAQMD Rules and Regulations

3.1.4.1 REGULATION 7, ODOROUS SUBSTANCES

BAAQMD's Regulation 7, Odorous Substances, places general limitations on odorous substances and specific emission limitations on certain odorous compounds. Odors are also regulated under BAAQMD Regulation 1, Rule 1-301, Public Nuisance, which states that "no person shall discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance or annoyance to any considerable number of persons or the public; or which endangers the comfort, repose, health or safety of any such persons or the public, or which causes, or has a natural tendency to cause, injury or damage to business or property." Under BAAQMD's Rule 1-301, a facility that receives three or more violation notices within a 30-day period can be declared a public nuisance.

3.1.4.2 OTHER BAAQMD REGULATIONS

In addition to the plans and programs described above, BAAQMD administers a number of specific regulations on various sources of pollutant emissions that would apply to development projects, including:

- BAAQMD Regulation 2, Rule 2, New Source Review
- BAAQMD Regulation 2, Rule 5, New Source Review of Toxic Air Contaminants
- BAAQMD Regulation 6, Rule 1, General Requirements
- BAAQMD Regulation 6, Rule 2, Commercial Cooking Equipment
- BAAQMD Regulation 8, Rule 3, Architectural Coatings
- BAAQMD Regulation 8, Rule 4, General Solvent and Surface Coatings Operations
- BAAQMD Regulation 8, Rule 7, Gasoline Dispensing Facilities
- BAAQMD Regulation 11, Rule 2, Asbestos, Demolition, Renovation and Manufacturing)

3.1.5 Contra Costa Transportation Commission

The Contra Costa Transportation Authority (CCTA) is the designated congestion management agency for the county. The CCTA's congestion management plan (CMP) includes traffic level-of-service standards for state highways and principal arterials; multimodal performance measures to evaluate current and future systems; a seven-year capital program of projects to maintain or improve the performance of the system or mitigate the regional impacts of land use projects; a program to analyze the impacts of land use decisions; and a travel demand element that promotes transportation alternatives to the single-occupant vehicle (CCTA 2020).

Pursuant to the EPA's transportation conformity regulations and the Bay Area Conformity State Implementation Plan (also known as the Bay Area Air Quality Conformity Protocol), the CMP is required to be consistent with the MTC planning process, including regional goals, policies, and projects for the regional transportation improvement program (RTIP). The MTC cannot approve any transportation plan, program, or project unless these activities conform to the State Implementation Plan. The CMP legislation also requires

each congestion management agency to prepare and maintain a computerized travel demand model, including a land use database. To meet this requirement, CCTA has developed and maintains a countywide model that runs using TransCAD® software. In 2010, CCTA undertook a comprehensive update of its land use database, consistent with the ABAG "Current Regional Plans" (aka Sustainable Communities Strategy Base Case) land use allocation, and in 2019 completed an update of the model with the adopted Plan Bay Area 2040 land use forecasts (Projections 2017) for use in the Transportation Expenditure Plan, the Action Plans for Routes of Regional Significance, and other planning efforts (CCTA 2019).

- The federal CAA requires that federal transportation plans be prepared for regions in nonattainment of the federal AAQS. The CCTA provides county-level input to MTC during preparation of the regional transportation plan (RTP). Plan Bay Area 2040 was adopted on July 26, 2017. Plan Bay Area was prepared by MTC and ABAG. It incorporates the region's sustainable communities strategy (SCS) pursuant to Senate Bill (SB) 375 (MTC and ABAG 2017).

3.2 GREENHOUSE GAS EMISSIONS

Scientists have concluded that human activities are contributing to global climate change by adding large amounts of heat-trapping gases, known as GHGs, to the atmosphere. The primary source of these GHGs is fossil fuel use. The Intergovernmental Panel on Climate Change (IPCC) has identified four major GHGs—water vapor, carbon dioxide (CO_2), methane (CH_4), and ozone (O_3)—that are the likely cause of an increase in global average temperatures observed within the 20th and 21st centuries. Other GHGs identified by the IPCC that contribute to global warming to a lesser extent are nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons, perfluorocarbons, and chlorofluorocarbons (IPCC 2001).[1,2] The major GHGs are briefly described below.

- **Carbon dioxide (CO_2)** enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, and respiration, and also as a result of other chemical reactions (e.g., manufacture of cement). Carbon dioxide is removed from the atmosphere (sequestered) when it is absorbed by plants as part of the biological carbon cycle.

- **Methane (CH_4)** is emitted during the production and transport of coal, natural gas, and oil. Methane emissions also result from livestock and other agricultural practices and from the decay of organic waste in municipal landfills and water treatment facilities.

[1] Water vapor (H_2O) is the strongest GHG and the most variable in its phases (vapor, cloud droplets, ice crystals). However, water vapor is not considered a pollutant because it is considered part of the feedback loop rather than a primary cause of change.

[2] Black carbon contributes to climate change both directly, by absorbing sunlight, and indirectly, by depositing on snow (making it melt faster) and by interacting with clouds and affecting cloud formation. Black carbon is the most strongly light-absorbing component of particulate matter (PM) emitted from burning fuels such as coal, diesel, and biomass. Reducing black carbon emissions globally can have immediate economic, climate, and public health benefits. California has been an international leader in reducing emissions of black carbon, with close to 95 percent control expected by 2020 due to existing programs that target reducing PM from diesel engines and burning activities (CARB 2017b). However, state and national GHG inventories do not include black carbon yet due to ongoing work resolving the precise global warming potential of black carbon. Guidance for CEQA documents does not yet include black carbon.

- **Nitrous oxide (N_2O)** is emitted during agricultural and industrial activities as well as during the combustion of fossil fuels and solid waste.

GHGs are dependent on the lifetime, or persistence, of the gas molecule in the atmosphere. Some GHGs have a stronger greenhouse effect than others. These are referred to as high GWP gases. The GWPs of GHG emissions are shown in Table 3, *GHG Estimates and Their Relative Global Warming Potential Compared to CO_2*. The GWP is used to convert GHGs to CO_2-equivalence (CO_2e) to show the relative potential that different GHGs have to retain infrared radiation in the atmosphere and contribute to the greenhouse effect. For example, under IPCC's Fifth Assessment Report (AR5), GWP values for CH_4, 10 MT of CH_4 would be equivalent to 280 MT of CO_2.

Table 3 GHG Emissions and Their Relative Global Warming Potential Compared to CO_2

GHGs	Carbon Dioxide (CO_2)	Methane[1] (CH_4)	Nitrous Oxide (N_2O)
Second Assessment			
Atmospheric Lifetime (Years)	50 to 200	12 (±3)	120
Global Warming Potential Relative to CO_2[2]	1	21	310
Fourth Assessment			
Atmospheric Lifetime (Years)	50 to 200	12	114
Global Warming Potential Relative to CO_2[2]	1	25	298
Fifth Assessment			
Atmospheric Lifetime (Years)	50 to 200	12	121
Global Warming Potential Relative to CO_2[2]	1	28	265

Source: IPCC 1995; IPCC 2007; IPCC 2013.
[1] The methane GWP includes direct effects and indirect effects due to the production of tropospheric ozone and stratospheric water vapor. The indirect effect due to the production of CO_2 is not included.
[2] Based on 100-year time horizon of the GWP of the air pollutant compared to CO_2.

3.2.1.1 CALIFORNIA'S GREENHOUSE GAS SOURCES AND RELATIVE CONTRIBUTION

In 2019, the statewide GHG emissions inventory was updated for 2000 to 2017 emissions using the GWPs in IPCC's AR4.[3] Based on these GWPs, California produced 424.10 million metric tons (MMT) of CO_2e GHG emissions in 2017. California's transportation sector was the single largest generator of GHG emissions, producing 40.1 percent of the state's total emissions. Industrial sector emissions made up 21.1 percent, and electric power generation made up 14.7 percent of the state's emissions inventory. Other major sectors of GHG emissions include commercial and residential (9.7 percent), agriculture and forestry (7.6 percent), high GWP (4.7 percent), and recycling and waste (2.1 percent) (CARB 2019a).

California's GHG emissions have followed a declining trend since 2007. In 2017, emissions from routine GHG-emitting activities statewide were 424 $MMTCO_2e$, 5 $MMTCO_2e$ lower than 2016 levels. This represents

[3] Methodology for determining the statewide GHG inventory is not the same as the methodology used to determine statewide GHG emissions under Assembly Bill 32 (2006).

an overall decrease of 14 percent since peak levels in 2004 and 7 MMTCO$_2$e below the 1990 level and the state's 2020 GHG target. During the 2000 to 2017 period, per capita GHG emissions in California have continued to drop from a peak in 2001 of 14.0 MTCO$_2$e per capita to 10.7 MTCO$_2$e per capita in 2017, a 24 percent decrease. Overall trends in the inventory also demonstrate that the carbon intensity of California's economy (the amount of carbon pollution per million dollars of gross domestic product [GDP]) is declining, representing a 41 percent decline since the 2001 peak, while the state's GDP has grown 52 percent during this period. For the first time since California started to track GHG emissions, the majority of California's electricity comes from zero-GHG sources (hydro, solar, wind, and nuclear energy) (CARB 2019b).

3.2.1.2 HUMAN INFLUENCE ON CLIMATE CHANGE

For approximately 1,000 years before the Industrial Revolution, the amount of GHGs in the atmosphere remained relatively constant. During the 20th century, however, scientists observed a rapid change in the climate and the quantity of climate change pollutants in the Earth's atmosphere that is attributable to human activities. The amount of CO_2 in the atmosphere has increased by more than 35 percent since preindustrial times and has increased at an average rate of 1.4 parts per million per year since 1960, mainly due to combustion of fossil fuels and deforestation (IPCC 2007). These recent changes in the quantity and concentration of climate change pollutants far exceed the extremes of the ice ages, and the global mean temperature is warming at a rate that cannot be explained by natural causes alone. Human activities are directly altering the chemical composition of the atmosphere through the buildup of climate change pollutants (CAT 2006). In the past, gradual changes in the earth's temperature changed the distribution of species, availability of water, etc. However, human activities are accelerating this process so that environmental impacts associated with climate change no longer occur in a geologic time frame but within a human lifetime (IPCC 2007).

The increase in global surface temperatures is hard to predict, and projections vary. The environmental consequences of gradual changes in the Earth's temperature are also hard to predict. Projections of climate change depend heavily upon future human activity. Therefore, climate models are based on different emission scenarios that account for historical trends in emissions and on observations of the climate record that assess the human influence of the trend and projections for extreme weather events. Climate-change scenarios are affected by varying degrees of uncertainty. For example, there are varying degrees of certainty on the magnitude of the trends for:

- Warmer and fewer cold days and nights over most land areas.
- Warmer and more frequent hot days and nights over most land areas.
- An increase in frequency of warm spells/heat waves over most land areas.
- An increase in frequency of heavy precipitation events (or proportion of total rainfall from heavy falls) over most areas.
- Larger areas affected by drought.

- Intense tropical cyclone activity increases.
- Increased incidence of extreme high sea level (excluding tsunamis).

3.2.1.3 POTENTIAL CLIMATE CHANGE IMPACTS FOR CALIFORNIA

Observed changes over the last several decades across the western United States reveal clear signs of climate change. Statewide average temperatures increased by about 1.7°F from 1895 to 2011, and warming has been greatest in the Sierra Nevada. By 2050, California is projected to warm by approximately 2.7°F above 2000 averages, a threefold increase in the rate of warming over the last century. By 2100, average temperatures could increase from 4.1 to 8.6°F, depending on emissions levels (CCCC 2012).

In California and western North America, observations of the climate have shown: 1) a trend toward warmer winter and spring temperatures; 2) a smaller fraction of precipitation falling as snow; 3) a decrease in the amount of spring snow accumulation in the lower and middle elevation mountain zones; 4) a shift in the timing of snowmelt of 5 to 30 days earlier in the spring; and 5) a similar shift (5 to 30 days earlier) in the timing of spring flower blooms (CAT 2006). Overall, California has become drier over time, with five of the eight years of severe to extreme drought occurring between 2007 and 2016, with unprecedented dry years in 2014 and 2015 (OEHHA 2018). Statewide precipitation has become increasingly variable from year to year, with the driest consecutive four years from 2012 to 2015 (OEHHA 2018). According to the California Climate Action Team—a committee of state agency secretaries and the heads of agencies, boards, and departments, led by the Secretary of the California Environmental Protection Agency—even if actions could be taken to immediately curtail climate change emissions, the potency of emissions that have already built up, their long atmospheric lifetimes (see Table 3), and the inertia of the Earth's climate system could produce as much as 0.6°C (1.1°F) of additional warming.. Consequently, some impacts from climate change are now considered unavoidable. Global climate change risks to California are shown in Table 4, *Summary of GHG Emissions Risks to California*, and include impacts to public health, water resources, agriculture, coastal sea level, forest and biological resources, and energy.

Table 4 Summary of GHG Emissions Risks to California

Impact Category	Potential Risk
Public Health Impacts	Heat waves will be more frequent, hotter, and longer Fewer extremely cold nights Poor air quality made worse Higher temperatures increase ground-level ozone levels
Water Resources Impacts	Decreasing Sierra Nevada snow pack Challenges in securing adequate water supply Potential reduction in hydropower Loss of winter recreation
Agricultural Impacts	Increasing temperature Increasing threats from pests and pathogens Expanded ranges of agricultural weeds Declining productivity Irregular blooms and harvests

3. Regulatory Setting

Table 4 Summary of GHG Emissions Risks to California

Impact Category	Potential Risk
Coastal Sea Level Impacts	Accelerated sea level rise Increasing coastal floods Shrinking beaches Worsened impacts on infrastructure
Forest and Biological Resource Impacts	Increased risk and severity of wildfires Lengthening of the wildfire season Movement of forest areas Conversion of forest to grassland Declining forest productivity Increasing threats from pest and pathogens Shifting vegetation and species distribution Altered timing of migration and mating habits Loss of sensitive or slow-moving species
Energy Demand Impacts	Potential reduction in hydropower Increased energy demand

Sources: CEC 2006, 2009; CCCC 2012; CNRA 2014.

Specific climate change impacts that could affect the project include:

- **Water Resources Impacts.** By late this century, all projections show drying, and half of the projections suggest 30-year average precipitation will decline by more than 10 percent below the historical average. This drying trend is caused by an apparent decline in the frequency of rain and snowfall. Even in projections with relatively small or no declines in precipitation, central and southern parts of the state can be expected to be drier from the warming effects alone—the spring snowpack will melt sooner, and the moisture in soils will evaporate during long dry summer months (CCCC 2012).

- **Wildfire Risks.** Earlier snowmelt, higher temperatures, and longer dry periods over a longer fire season will directly increase wildfire risk. Indirectly, wildfire risk will also be influenced by potential climate-related changes in vegetation and ignition potential from lightning. Human activities will continue to be the biggest factor in ignition risk. The number of large fires statewide is estimated to increase from 58 percent to 128 percent above historical levels by 2085. Under the same emissions scenario, estimated burned area will increase by 57 percent to 169 percent, depending on location (CCCC 2012).

- **Health Impacts.** Many of the gravest threats to public health in California stem from the increase of extreme conditions, principally more frequent, more intense, and longer heat waves. Particular concern centers on the increasing tendency for multiple hot days in succession, and heat waves occurring simultaneously in several regions throughout the state. Public health could also be affected by climate change impacts on air quality, food production, the amount and quality of water supplies, energy pricing and availability, and the spread of infectious diseases. Higher temperatures also increase ground-level ozone levels. Furthermore, wildfires can increase particulate air pollution in the major air basins of California (CCCC 2012).

- **Increased Energy Demand.** Increases in average temperature and higher frequency of extreme heat events combined with new residential development across the state will drive up the demand for cooling in the increasingly hot and long summer season and decrease demand for heating in the cooler season. Warmer, drier summers also increase system losses at natural gas plants (reduced efficiency in the electricity generation process at higher temperatures) and hydropower plants (lower reservoir levels). Transmission of electricity will also be affected by climate change. Transmission lines lose 7 to 8 percent of transmitting capacity in high temperatures while needing to transport greater loads. This means that more electricity needs to be produced to make up for the loss in capacity and the growing demand (CCCC 2012).

3.2.2 Federal Laws

The EPA announced on December 7, 2009, that GHG emissions threaten the public health and welfare of the American people and that GHG emissions from on-road vehicles contribute to that threat. The EPA's final findings respond to the 2007 US Supreme Court decision that GHG emissions fit within the Clean Air Act definition of air pollutants. The findings did not themselves impose any emission reduction requirements, but allowed the EPA to finalize the GHG standards proposed in 2009 for new light-duty vehicles as part of the joint rulemaking with the Department of Transportation (EPA 2009).

To regulate GHGs from passenger vehicles, the EPA was required to issue an endangerment finding. The finding identifies emissions of six key GHGs—CO_2, CH_4, N_2O, hydrofluorocarbons, perfluorocarbons, and SF_6—that have been the subject of scrutiny and intense analysis for decades by scientists in the United States and around the world. The first three are applicable to the proposed project because they constitute the majority of GHG emissions from the on-site land uses, and per BAAQMD guidance are the GHG emissions that should be evaluated as part of a project's GHG emissions inventory.

3.2.2.1 US MANDATORY REPORT RULE FOR GHGs (2009)

In response to the endangerment finding, the EPA issued the Mandatory Reporting of GHG Rule that requires substantial emitters of GHG emissions (large stationary sources, etc.) to report GHG emissions data. Facilities that emit 25,000 MT or more of CO_2e per year are required to submit an annual report.

3.2.2.2 UPDATE TO CORPORATE AVERAGE FUEL ECONOMY STANDARDS (2017 TO 2026)

The federal government issued new Corporate Average Fuel Economy (CAFE) standards in 2012 for model years 2017 to 2025, which required a fleet average of 54.5 miles per gallon in 2025. On March 30, 2020, the EPA finalized an updated CAFE and GHG emissions standards for passenger cars and light trucks and established new standards covering model years 2021 through 2026, known as the Safer Affordable Fuel Efficient (SAFE) Vehicles Final Rule for Model Years 2021 to 2026. However, in May 2020, California and 22 other states; the District of Columbia; the cities of Los Angeles, Denver, and New York; and the counties of San Francisco and Denver filed a lawsuit with the U.S. Court of Appeals for the District of Columbia Circuit, challenging the SAFE Rule. To date, a ruling has not been made on the lawsuit. In addition, a consortium of automakers and California have agreed on a voluntary framework to reduce emissions that can serve as an alternative path forward for clean vehicle standards nationwide. Automakers who agreed to the framework are

Ford, Honda, BMW of North America, and Volkswagen Group of America. The framework supports continued annual reductions of vehicle GHG emissions through the 2026 model year, encourages innovation to accelerate the transition to electric vehicles, and gives industry the certainty needed to make investments and create jobs. This commitment means that the auto companies which are party to the voluntary agreement will only sell cars in the United States that meet these standards (CARB 2020b).

3.2.2.3 EPA REGULATION OF STATIONARY SOURCES UNDER THE CLEAN AIR ACT (ONGOING)

Pursuant to its authority under the Clean Air Act, the EPA has been developing regulations for new stationary sources such as power plants, refineries, and other large sources of emissions. Under President Obama's 2013 Climate Action Plan, the EPA was directed to develop regulations for existing stationary sources. On June 19, 2019, the EPA issued the final Affordable Clean Energy rule, which became effective on August 19, 2019. The rule was crafted under the direction of President Trump's Energy Independence Executive Order. It officially rescinds the Clean Power Plan rule issued during the Obama Administration and sets emissions guidelines for states in developing plans to limit CO_2 emissions from coal-fired power plants.

3.2.3 State Laws

Current State of California guidance and goals for reductions in GHG emissions are generally embodied in Executive Order S-03-05, Executive Order B-30-15, AB 32, SB 32, and SB 375.

3.2.3.1 EXECUTIVE ORDER S-03-05

Executive Order S-03-05, signed June 1, 2005, set the following GHG reduction targets for the state:

- 2000 levels by 2010
- 1990 levels by 2020
- 80 percent below 1990 levels by 2050

3.2.3.2 ASSEMBLY BILL 32, THE GLOBAL WARMING SOLUTIONS ACT (2006)

Current State of California guidance and goals for reductions in GHG emissions are generally embodied in AB 32, the Global Warming Solutions Act. AB 32 was passed by the California state legislature on August 31, 2006, to place the state on a course toward reducing its contribution of GHG emissions. AB 32 follows the 2020 tier of emissions reduction targets established in Executive Order S-3-05.

CARB 2008 Scoping Plan

The final Scoping Plan was adopted by CARB on December 11, 2008. The 2008 Scoping Plan identified that GHG emissions in California are anticipated to be approximately 596 $MMTCO_2e$ in 2020. In December 2007, CARB approved a 2020 emissions limit of 427 $MMTCO_2e$ (471 million tons) for the state (CARB 2008). In order to effectively implement the emissions cap, AB 32 directed CARB to establish a mandatory reporting system to track and monitor GHG emissions levels for large stationary sources that generate more than 25,000 $MTCO_2e$ per year, prepare a plan demonstrating how the 2020 deadline can be met, and develop appropriate regulations and programs to implement the plan by 2012.

First Update to the Scoping Plan

CARB completed a five-year update to the 2008 Scoping Plan, as required by AB 32. The First Update to the Scoping Plan, adopted May 22, 2014, highlights California's progress toward meeting the near-term 2020 GHG emission reduction goals defined in the 2008 Scoping Plan. As part of the update, CARB recalculated the 1990 GHG emission levels with the updated AR4 GWPs, and the 427 $MMTCO_2e$ 1990 emissions level and 2020 GHG emissions limit, established in response to AB 32, are slightly higher at 431 $MMTCO_2e$ (CARB 2014).

As identified in the Update to the Scoping Plan, California is on track to meet the goals of AB 32. The update also addresses the state's longer-term GHG goals in a post-2020 element. The post-2020 element provides a high-level view of a long-term strategy for meeting the 2050 GHG goal, including a recommendation for the state to adopt a midterm target. According to the Update to the Scoping Plan, local government reduction targets should chart a reduction trajectory that is consistent with or exceeds the trajectory created by statewide goals (CARB 2014). CARB found that reducing emissions to 80 percent below 1990 levels will require a fundamental shift to efficient, clean energy in every sector of the economy. Progressing toward California's 2050 climate targets will require significant acceleration of GHG reduction rates. Emissions from 2020 to 2050 will have to decline several times faster than the rate needed to reach the 2020 emissions limit (CARB 2014).

3.2.3.3 EXECUTIVE ORDER B-30-15

Executive Order B-30-15, signed April 29, 2015, sets a goal of reducing GHG emissions within the state to 40 percent of 1990 levels by year 2030. Executive Order B-30-15 also directs CARB to update the Scoping Plan to quantify the 2030 GHG reduction goal for the state and requires state agencies to implement measures to meet the interim 2030 goal as well as the long-term goal for 2050 in Executive Order S-03-05. It also requires the Natural Resources Agency to conduct triennial updates of the California adaption strategy, *Safeguarding California*, in order to ensure climate change is accounted for in state planning and investment decisions.

3.2.3.4 SENATE BILL 32 AND ASSEMBLY BILL 197

In September 2016, Governor Brown signed Senate Bill 32 and Assembly Bill 197 into law, making the Executive Order goal for year 2030 into a statewide mandated legislative target. AB 197 established a joint legislative committee on climate change policies and requires the CARB to prioritize direct emissions reductions rather than the market-based cap-and-trade program for large stationary, mobile, and other sources.

2017 Climate Change Scoping Plan Update

Executive Order B-30-15 and SB 32 required CARB to prepare another update to the Scoping Plan to address the 2030 target for the state. On December 14, 2017, CARB adopted the 2017 Climate Change Scoping Plan Update. The 2017 Climate Change Scoping Plan Update includes the regulations and programs to achieve the 2030 target. The 2017 Scoping Plan establishes a new emissions limit of 260 $MMTCO_2e$ for the year 2030, which corresponds to a 40 percent decrease in 1990 levels by 2030 (CARB 2017d).

3. Regulatory Setting

California's climate strategy will require contributions from all sectors of the economy, in addition to the land base, and will include enhanced focus on zero- and near-zero emission (ZE/NZE) vehicle technologies; continued investment in renewables, including solar roofs, wind, and other distributed generation; greater use of low carbon fuels; integrated land conservation and development strategies; coordinated efforts to reduce emissions of short-lived climate pollutants (methane, black carbon, and fluorinated gases); and an increased focus on integrated land use planning to support livable, transit-connected communities and on conservation of agricultural and other lands. Requirements for direct GHG reductions at refineries will further support air quality co-benefits in neighborhoods, including in disadvantaged communities historically adjacent to these large stationary sources, as well as efforts with California's local air pollution control and air quality management districts to tighten emission limits on a broad spectrum of industrial sources. Major elements of the 2017 Scoping Plan framework include:

- Implementing and/or increasing the standards of the Mobile Source Strategy, which includes increasing ZE buses and trucks.
- Increasing the stringency of the Low Carbon Fuel Standard (18 percent by 2030).
- Implementing SB 350, which expands the Renewables Portfolio Standard (RPS) to 50 percent RPS and doubles energy efficiency savings by 2030.
- Improving freight-system efficiency with the California Sustainable Freight Action Plan, which uses NZE technology and deploys ZE trucks.
- Implementing the proposed Short-Lived Climate Pollutant Strategy (SLPS), which focuses on reducing methane and hydroflurocarbon emissions by 40 percent and anthropogenic black carbon emissions by 50 percent by year 2030.
- Continuing implementation of SB 375.
- Implementing the Post-2020 Cap-and-Trade Program that includes declining caps.
- Reducing GHG emissions from refineries by 20 percent by 2030.[4]
- Developing a Natural and Working Lands Action Plan to secure California's land base as a net carbon sink.

In addition to these statewide strategies, the 2017 Climate Change Scoping Plan also identified local governments as essential partners in achieving the state's long-term GHG reduction goals and recommended local actions to reduce GHG emissions—for example, statewide targets of 6 $MTCO_2e$ or less per capita by

[4] The plan includes policies to require direct GHG reductions at some of the state's largest stationary sources and mobile sources in accordance with AB 197. These policies include the use of lower GHG fuels, efficiency regulations, and the Cap-and-Trade Program, which constrains and reduces emissions at covered sources.

2030 and 2 $MTCO_2e$ or less per capita by 2050. CARB recommends that local governments evaluate and adopt quantitative, locally appropriate goals that align with the statewide per capita targets and sustainable development objectives, and develop plans to achieve the local goals. The statewide per capita goals were developed by applying the percentage of reductions necessary to reach the 2030 and 2050 climate goals (i.e., 40 percent and 80 percent, respectively) to the state's 1990 emissions limit established under AB 32. For CEQA projects, CARB states that lead agencies have discretion to develop evidenced-based numeric thresholds (mass emissions, per capita, or per service population) consistent with the Scoping Plan and the state's long-term GHG goals. To the degree a project relies on GHG mitigation measures, CARB recommends that lead agencies prioritize on-site design features that reduce emissions, especially from vehicle miles traveled (VMT), and direct investments in GHG reductions within the project's region that contribute potential air quality, health, and economic co-benefits. Where further project design or regional investments are infeasible or not proven to be effective, CARB recommends mitigating potential GHG impacts through purchasing and retiring carbon credits.

The Scoping Plan scenario is set against what is called the "business as usual" yardstick—that is, what GHG emissions would be if the state did nothing at all beyond the policies that are already required and in place to achieve the 2020 limit, as shown in Table 5, *2017 Climate Change Scoping Plan Emissions Reductions Gap to Achieve the 2030 GHG Target*. It includes the existing renewables requirements, advanced clean cars, the "10 percent" LCFS, and the SB 375 program for more vibrant communities, among others. However, it does not include a range of new policies or measures that have been developed or put into statute over the past two years. Also shown in the table, the known commitments are expected to result in emissions that are 60 $MMTCO_2e$ above the target in 2030. If the estimated GHG reductions from the known commitments are not realized due to delays in implementation or technology deployment, the post-2020 Cap-and-Trade Program would deliver the additional GHG reductions in the sectors it covers to ensure the 2030 target is achieved.

Table 5 2017 Climate Change Scoping Plan Emissions Reductions Gap to Achieve the 2030 GHG Target

Modeling Scenario	2030 GHG Emissions $MMTCO_2e$
Reference Scenario (Business-as-Usual)	389
With Known Commitments	320
2030 GHG Target	**260**
Gap to 2030 Target	**60**

Table 6, *2017 Climate Change Scoping Plan Emissions Change by Sector to Achieve the 2030 Target*, provides estimated GHG emissions by sector, compared to 1990 levels, and the range of GHG emissions for each sector estimated for 2030.

3. Regulatory Setting

Table 6 2017 Climate Change Scoping Plan Emissions Change by Sector to Achieve the 2030 Target

Scoping Plan Sector	1990 $MMTCO_2e$	2030 Proposed Plan Ranges $MMTCO_2e$	% Change from 1990
Agricultural	26	24 to 25	-8% to -4%
Residential and Commercial	44	38 to 40	-14% to -9%
Electric Power	108	30 to 53	-72% to -51%
High GWP	3	8 to 11	267% to 367%
Industrial	98	83 to 90	-15% to -8%
Recycling and Waste	7	8 to 9	14% to 29%
Transportation (including TCU)	152	103 to 111	-32% to -27%
Net Sink[1]	-7	TBD	TBD
Sub Total	431	294 to 339	-32% to -21%
Cap-and-Trade Program	NA	34 to 79	NA
Total	431	260	-40%

Source: CARB 2017d.
Notes: TCU = Transportation, Communications, and Utilities; TBD = To Be Determined.
[1] Work underway through 2017 was used to estimate the range of potential sequestration benefits from the natural and working lands sector.

3.2.3.5 SENATE BILL 375

In 2008, SB 375, the Sustainable Communities and Climate Protection Act, was adopted to connect the GHG emissions reductions targets established in the 2008 Scoping Plan for the transportation sector to local land use decisions that affect travel behavior. Its intent is to reduce GHG emissions from light-duty trucks and automobiles (excludes emissions associated with goods movement) by aligning regional long-range transportation plans, investments, and housing allocations to local land use planning to reduce VMT and vehicle trips. Specifically, SB 375 required CARB to establish GHG emissions reduction targets for each of the 18 metropolitan planning organizations (MPOs). The MTC is the MPO for the nine-county San Francisco Bay Area region. Pursuant to the recommendations of the Regional Transportation Advisory Committee, CARB adopted per capita reduction targets for each of the MPOs rather than a total magnitude reduction target.

2017 Update to the SB 375 Targets

CARB is required to update the targets for the MPOs every eight years. CARB adopted revised SB 375 targets for the MPOs in March 2018, and the updated targets became effective on October 1, 2018. The updated targets consider the need to further reduce VMT, as identified in the 2017 Scoping Plan Update (for SB 32), while balancing the need for additional and more flexible revenue sources to incentivize positive planning and action toward sustainable communities. Like the 2010 targets, the updated SB 375 targets are in units of percent per capita reduction in GHG emissions from automobiles and light trucks relative to 2005; this excludes reductions anticipated from implementation of State technology and fuels strategies, and any potential future State strategies such as statewide road user pricing.

The updated targets call for greater per capita GHG emission reductions from SB 375 than are currently in place, which for 2035, translate into proposed targets that either match or exceed the emission reduction

levels in the MPOs' currently adopted SCSs to achieve the SB 375 targets. For the next round of SCS updates, CARB's updated targets for the MTC/ABAG region are a 10 percent per capita GHG reduction in 2020 from 2005 levels (compared to 7 percent under the 2010 target) and a 19 percent per capita GHG reduction in 2035 from 2005 levels (compared to the 2010 target of 15 percent) (CARB 2018).

Plan Bay Area, Strategy for a Sustainable Region

Plan Bay Area 2040 is the Bay Area's RTP/SCS and was adopted jointly by ABAG and MTC on July 26, 2017. It lays out a development scenario for the region, which, when integrated with the transportation network and other transportation measures and policies, would reduce GHG emissions from transportation (excluding goods movement) beyond the per capita reduction targets identified by CARB. Plan Bay Area 2040 is a limited and focused update to the 2013 Plan Bay Area, with updated planning assumptions that incorporate key economic, demographic, and financial trends from the last several years.

As part of the implementing framework for Plan Bay Area, local governments have identified Priority Development Areas (PDAs) to focus growth. PDAs are transit-oriented, infill development opportunity areas in existing communities. Overall, well over two-thirds of all regional growth in the Bay Area by 2040 are allocated in PDAs. Per the Final Plan Bay Area 2040, while the projected number of new housing units and new jobs within PDAs would increase to 629,000 units and 707,000 jobs compared to the adopted Plan Bay Area 2013, its overall share would be reduced to 77 percent and 55 percent (MTC and ABAG 2017). However, Plan Bay Area 2040 remains on track to meet a 16 percent per capita reduction of GHG emissions by 2035 and a 10 percent per capita reduction by 2020 from 2005 conditions (MTC and ABAG 2017). The project site is in the North Richmond PDA (MTC and ABAG 2020).

3.2.3.6 TRANSPORTATION SECTOR SPECIFIC REGULATIONS

Assembly Bill 1493

California vehicle GHG emission standards were enacted under AB 1493 (Pavley I). Pavley I is a clean-car standard that reduces GHG emissions from new passenger vehicles (light-duty auto to medium-duty vehicles) from 2009 through 2016 and is anticipated to reduce GHG emissions from new passenger vehicles by 30 percent in 2016. California implements the Pavley I standards through a waiver granted to California by the EPA. In 2012, the EPA issued a Final Rulemaking that sets even more stringent fuel economy and GHG emissions standards for model year 2017 through 2025 light-duty vehicles. In January 2012, CARB approved the Advanced Clean Cars program (formerly known as Pavley II) for model years 2017 through 2025. The program combines the control of smog, soot, and global warming gases and requirements for greater numbers of zero-emission vehicles into a single package of standards. Under California's Advanced Clean Car program, by 2025, new automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions.[5]

[5] See also the discussion on the update to the Corporate Average Fuel Economy standards under Federal Laws, above. In January 2012, CARB approved the Advanced Clean Cars program (formerly known as Pavley II) for model years 2017 through 2025. The program combines the control of smog, soot, and global warming gases and requirements for greater numbers of zero-emission

3. Regulatory Setting

Executive Order S-01-07

On January 18, 2007, the state set a new LCFS for transportation fuels sold in California. Executive Order S-01-07 sets a declining standard for GHG emissions measured in carbon dioxide equivalent gram per unit of fuel energy sold in California. The LCFS requires a reduction of 2.5 percent in the carbon intensity of California's transportation fuels by 2015 and a reduction of at least 10 percent by 2020. The LCFS applies to refiners, blenders, producers, and importers of transportation fuels and would use market-based mechanisms to allow these providers to choose how they reduce emissions during the "fuel cycle," using the most economically feasible methods.

Executive Order B-16-2012

On March 23, 2012, the state identified that CARB, the California Energy Commission (CEC), the Public Utilities Commission, and other relevant agencies worked with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to accommodate zero-emissions vehicles in major metropolitan areas, including infrastructure to support them (e.g., electric vehicle charging stations). The executive order also directs the number of zero-emission vehicles in California's state vehicle fleet to increase through the normal course of fleet replacement so that at least 10 percent of fleet purchases of light-duty vehicles are zero-emission by 2015 and at least 25 percent by 2020. Finally, the executive order sets a target of reducing GHG emissions from the transportation sector 80 percent below 1990 levels.

3.2.3.7 RENEWABLES PORTFOLIO: CARBON NEUTRALITY REGULATIONS

Senate Bills 1078, 107, and X1-2 and Executive Order S-14-08

A major component of California's Renewable Energy Program is the RPS established under SB 1078 (Sher) and SB 107 (Simitian). Under the RPS, certain retail sellers of electricity were required to increase the amount of renewable energy each year by at least 1 percent in order to reach at least 20 percent by December 30, 2010. Executive Order S-14-08 was signed in November 2008, which expanded the state's Renewable Energy Standard to 33 percent renewable power by 2020. This standard was adopted by the legislature in 2011 (SBX1-2). Renewable sources of electricity include wind, small hydropower, solar, geothermal, biomass, and biogas. The increase in renewable sources for electricity production will decrease indirect GHG emissions from development projects because electricity production from renewable sources is generally considered carbon neutral.

Senate Bill 350

Senate Bill 350 (de Leon), signed into law September 2015, establishes tiered increases to the RPS of 40 percent by 2024, 45 percent by 2027, and 50 percent by 2030. SB 350 also set a new goal to double the energy efficiency savings in electricity and natural gas through energy efficiency and conservation measures.

vehicles into a single package of standards. Under California's Advanced Clean Car program, by 2025, new automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions.

Senate Bill 100

On September 10, 2018, Governor Brown signed SB 100, which replaces the SB 350 requirements. Under SB 100, the RPS for public owned facilities and retail sellers consist of 44 percent renewable energy by 2024, 52 percent by 2027, and 60 percent by 2030. Additionally, SB 100 also established a new RPS requirement of 50 percent by 2026. Furthermore, the bill also establishes an overall state policy that eligible renewable energy resources and zero-carbon resources supply 100 percent of all retail sales of electricity to California end-use customers and 100 percent of electricity procured to serve all state agencies by December 31, 2045. Under the bill, the state cannot increase carbon emissions elsewhere in the western grid or allow resource shuffling to achieve the 100 percent carbon-free electricity target.

Executive Order B-55-18

Executive Order B-55-18, signed September 10, 2018, sets a goal "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter." Executive Order B-55-18 directs CARB to work with relevant state agencies to ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal. The goal of carbon neutrality by 2045 is in addition to other statewide goals, meaning not only should emissions be reduced to 80 percent below 1990 levels by 2050, but that, by no later than 2045, the remaining emissions be offset by equivalent net removals of CO_2e from the atmosphere, including through sequestration in forests, soils, and other natural landscapes.

3.2.3.8 ENERGY EFFICIENCY REGULATIONS

California Building Code, Building Energy Efficiency Standards

Energy conservation standards for new residential and non-residential buildings were adopted by the California Energy Resources Conservation and Development Commission (now the CEC) in June 1977 and most recently revised in 2016 (24 CCR Part 6). Title 24 requires the design of building shells and building components to conserve energy. The standards are updated periodically to allow for consideration and possible incorporation of new energy efficiency technologies and methods. On June 10, 2015, the CEC adopted the 2016 Building Energy Efficiency Standards, which went into effect on January 1, 2017. The 2019 Building Energy Efficiency Standards were adopted on May 9, 2018, and went into effect January 1, 2020.

The 2019 standards move toward cutting energy use in new homes by more than 50 percent and require installation of solar photovoltaic systems for single-family homes and multifamily buildings of three stories and less. Four key areas the 2019 standards focus on are 1) smart residential photovoltaic systems; 2) updated thermal envelope standards (preventing heat transfer from the interior to exterior and vice versa); 3) residential and nonresidential ventilation requirements; and 4) nonresidential lighting requirements (CEC 2018a). Under the 2019 standards, nonresidential buildings will be 30 percent more energy efficient compared to the 2016 standards, and single-family homes will be 7 percent more energy efficient (CEC 2018b). When accounting for the electricity generated by the solar photovoltaic system, single-family homes would use 53 percent less energy than homes built to the 2016 standards (CEC 2018b).

3. Regulatory Setting

California Building Code, CALGreen

On July 17, 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (24 CCR, Part 11, known as "CALGreen") was adopted as part of the California Building Standards Code. CALGreen established planning and design standards for sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and internal air contaminants.[6] The mandatory provisions of the California Green Building Code Standards became effective January 1, 2011, and were last updated in 2019. The 2019 CALGreen standards became effective January 1, 2020.

2006 Appliance Efficiency Regulations

The 2006 Appliance Efficiency Regulations (20 CCR §§ 1601–1608) were adopted by the CEC on October 11, 2006, and approved by the California Office of Administrative Law on December 14, 2006. The regulations include standards for both federally regulated appliances and non–federally regulated appliances. Though these regulations are now often viewed as "business as usual," they exceed the standards imposed by all other states, and they reduce GHG emissions by reducing energy demand.

3.2.3.9 SOLID WASTE REGULATIONS

Assembly Bill 939: Integrated Waste Management Act of 1989

California's Integrated Waste Management Act of 1989 (AB 939, Public Resources Code Sections 40050 et seq.) set a requirement for cities and counties throughout the state to divert 50 percent of all solid waste from landfills by January 1, 2000, through source reduction, recycling, and composting. In 2008, the requirements were modified to reflect a per capita requirement rather than tonnage. To help achieve this, the act requires that each city and county prepare and submit a source reduction and recycling element. AB 939 also established the goal for all California counties to provide at least 15 years of ongoing landfill capacity.

Assembly Bill 341

AB 341 (Chapter 476, Statutes of 2011) increased the statewide goal for waste diversion to 75 percent by 2020 and requires recycling of waste from commercial and multifamily residential land uses. Section 5.408 of the CALGreen also requires that at least 65 percent of the nonhazardous construction and demolition waste from nonresidential construction operations be recycled and/or salvaged for reuse.

Assembly Bill 1327

The California Solid Waste Reuse and Recycling Access Act (AB 1327, Public Resources Code §§ 42900 et seq.) requires areas to be set aside for collecting and loading recyclable materials in development projects. The act required the California Integrated Waste Management Board to develop a model ordinance for adoption by any local agency requiring adequate areas for collection and loading of recyclable materials as part of development projects. Local agencies are required to adopt the model or an ordinance of their own.

[6] The green building standards became mandatory in the 2010 edition of the code.

Assembly Bill 1826

In October of 2014 Governor Brown signed AB 1826 requiring businesses to recycle their organic waste on and after April 1, 2016, depending on the amount of waste they generate per week. This law also requires that on and after January 1, 2016, local jurisdictions across the state implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units. Organic waste means food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste.

3.2.3.10 WATER EFFICIENCY REGULATIONS

SBX7-7

The 20x2020 Water Conservation Plan was issued by the Department of Water Resources (DWR) in 2010 pursuant to Senate Bill 7, which was adopted during the 7th Extraordinary Session of 2009–2010 and therefore dubbed "SBX7-7." SBX7-7 mandated urban water conservation and authorized the DWR to prepare a plan implementing urban water conservation requirements (20x2020 Water Conservation Plan). In addition, it required agricultural water providers to prepare agricultural water management plans, measure water deliveries to customers, and implement other efficiency measures. SBX7-7 requires urban water providers to adopt a water conservation target of 20 percent reduction in urban per capita water use by 2020 compared to 2005 baseline use.

Assembly Bill 1881: Water Conservation in Landscaping Act

The Water Conservation in Landscaping Act of 2006 (AB 1881) requires local agencies to adopt the updated DWR model ordinance or equivalent. AB 1881 also requires the CEC to consult with the DWR, to adopt, by regulation, performance standards and labeling requirements for landscape irrigation equipment, including irrigation controllers, moisture sensors, emission devices, and valves to reduce the wasteful, uneconomic, inefficient, or unnecessary consumption of energy or water.

3.2.3.11 SHORT-LIVED CLIMATE POLLUTANT STRATEGY REDUCTION

Senate Bill 1383

On September 19, 2016, the governor signed SB 1383 to supplement the GHG reduction strategies in the Scoping Plan to consider short-lived climate pollutants, including black carbon and CH_4. Black carbon is the light-absorbing component of fine particulate matter produced during incomplete combustion of fuels. SB 1383 requires the state board, no later than January 1, 2018, to approve and begin implementing that comprehensive strategy to reduce emissions of short-lived climate pollutants to achieve a reduction in methane by 40 percent, hydrofluorocarbon gases by 40 percent, and anthropogenic black carbon by 50 percent below 2013 levels by 2030. The bill also establishes targets for reducing organic waste in landfills. On March 14, 2017, CARB adopted the "Final Proposed Short-Lived Climate Pollutant Strategy," which identifies the state's approach to reducing anthropogenic and biogenic sources of short-lived climate pollutants. Anthropogenic sources of black carbon include on- and off-road transportation, residential wood burning, fuel combustion (charbroiling), and industrial processes. According to CARB, ambient levels of black carbon in California are 90 percent lower than in the early 1960s, despite the tripling of diesel fuel use

(CARB 2017c). In-use, on-road rules are expected to reduce black carbon emissions from on-road sources by 80 percent between 2000 and 2020.

3.2.4 Local

Contra Costa County Climate Action Plan

Contra Costa County adopted its Climate Action Plan (CAP) on December 15, 2015. The CAP is intended to streamline future environmental review of development projects in the Contra Costa County by following the CEQA Guidelines and meeting the BAAQMD expectations for a Qualified GHG Reduction Strategy. The CAP identifies how the County will achieve the AB 32 GHG emissions reduction target of 15 percent below baseline levels by the year 2020, in addition to supporting other public health, energy efficiency, water conservation, and air quality goals identified in the County's General Plan and other policy documents (Contra Costa 2015). The CAP also lays the groundwork for achieving long-term state GHG reduction goals for 2035 and presents an implementation program to assist with monitoring and prioritization of reduction strategies (Contra Costa 2015). The County's strategy is structured around the following six topic areas: energy efficiency and conservation, renewable energy, land use and transportation, solid waste, water conservation, and government operations.

4. Environmental Setting

California is divided geographically into air basins for the purpose of managing the air resources of the State on a regional basis. An air basin generally has similar meteorological and geographic conditions throughout. The state is divided into 15 air basins. North Richmond is in the San Francisco Bay Area Air Basin. The discussion below identifies the natural factors in the Air Basin that affect air pollution. Air pollutants of concern are criteria air pollutants and TACs.

4.1 SAN FRANCISCO AIR BASIN

The BAAQMD is the regional air quality agency for the Air Basin, which comprises all of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, and Santa Clara counties; the southern portion of Sonoma County; and the southwestern portion of Solano County. Air quality in this area is determined by natural factors such as topography, meteorology, and climate; the presence of air pollution sources; and ambient conditions (BAAQMD 2017a).

4.1.1 Meteorology

The Air Basin is characterized by complex terrain, consisting of coastal mountain ranges, inland valleys, and bays, which distort normal wind flow patterns. The Coast Range[7] splits in the Bay Area, creating a western coast gap, the Golden Gate, and an eastern coast gap, the Carquinez Strait, which allow air to flow in and out of the Bay Area and the Central Valley.

The climate is dominated by the strength and location of a semipermanent, subtropical high-pressure cell. During the summer, the Pacific high-pressure cell is centered over the northeastern Pacific Ocean, resulting in stable meteorological conditions and a steady northwesterly wind flow. Upwelling of cold ocean water from below the surface because of the northwesterly flow produces a band of cold water off the California coast.

The cool and moisture-laden air approaching the coast from the Pacific Ocean is further cooled by the presence of the cold water band, resulting in condensation and the presence of fog and stratus clouds along the Northern California coast. In the winter, the Pacific high-pressure cell weakens and shifts southward, resulting in wind flow offshore, the absence of upwelling, and the occurrence of storms. Weak inversions coupled with moderate winds result in a low air pollution potential.

[7] The Coast Range parallels California's west coast from Humboldt County to Santa Barbara County.

4.1.2 Wind Patterns

During the summer, winds flowing from the northwest are drawn inland through the Golden Gate and over the lower portions of the San Francisco Peninsula. Immediately south of Mount Tamalpais in Marin County, the northwesterly winds accelerate considerably and come more directly from the west as they stream through the Golden Gate. This channeling of wind through the Golden Gate produces a jet that sweeps eastward and splits off to the northwest toward Richmond and to the southwest toward San Jose where it meets the East Bay hills.

Wind speeds may be strong locally in areas where air is channeled through a narrow opening, such as the Carquinez Strait, the Golden Gate, or the San Bruno gap. For example, the average wind speed at the San Francisco International Airport in July is about 17 knots (from 3:00 pm to 4:00 pm), compared with only 7 knots at San Jose and less than 6 knots at the Farallon Islands.

The air flowing in from the coast to the Central Valley, called the sea breeze, begins developing at or near ground level along the coast in late morning or early afternoon. As the day progresses, the sea breeze layer deepens and increases in velocity while spreading inland. The depth of the sea breeze depends in large part upon the height and strength of the inversion. Under normal atmospheric conditions, the air in the lower atmosphere is warmer than the air above it. An inversion is a change in the normal conditions that causes the temperature gradient to be reversed or inverted. If the inversion is low and strong, hence stable, the flow of the sea breeze will be inhibited, and stagnant conditions are likely to result.

In the winter, the Air Basin frequently experiences stormy conditions with moderate to strong winds as well as periods of stagnation with very light winds. Winter stagnation episodes (i.e., conditions where there is little mixing, which occur when there is a lack of or little wind) are characterized by nighttime drainage flows in coastal valleys. Drainage is a reversal of the usual daytime air-flow patterns; air moves from the Central Valley toward the coast and back down toward the Bay from the smaller valleys within the Air Basin.

4.1.3 Temperature

Summertime temperatures in the Air Basin are determined in large part by the effect of differential heating between land and water surfaces. Because land tends to heat up and cool off more quickly than water, a large-scale gradient (differential) in temperature is often created between the coast and the Central Valley, and small-scale local gradients are often produced along the shorelines of the ocean and bays. The temperature gradient near the ocean is also exaggerated, especially in summer, because of the upwelling of cold water from the ocean bottom along the coast. On summer afternoons, the temperatures at the coast can be 35 degrees Fahrenheit cooler than temperatures 15 to 20 miles inland; at night, this contrast usually decreases to less than 10 degrees Fahrenheit.

In the winter, the relationship of minimum and maximum temperatures is reversed. During the daytime the temperature contrast between the coast and inland areas is small, whereas at night the variation in temperature is large.

4.1.4 Precipitation

The Air Basin is characterized by moderately wet winters and dry summers. Winter rains (November through March) account for about 75 percent of the average annual rainfall. The amount of annual precipitation can vary greatly from one part of the Air Basin to another, even within short distances. In general, total annual rainfall can reach 40 inches in the mountains, but it is often less than 16 inches in sheltered valleys.

During rainy periods, ventilation (rapid horizontal movement of air and injection of cleaner air) and vertical mixing (an upward and downward movement of air) are usually high, and thus pollution levels tend to be low (i.e., air pollutants are dispersed more readily into the atmosphere rather than accumulating under stagnant conditions). However, during the winter, frequent dry periods do occur where mixing and ventilation are low and pollutant levels build up.

4.1.5 Wind Circulation

Low wind speed contributes to the buildup of air pollution because it allows more pollutants to be emitted into the air mass per unit of time. Light winds occur most frequently during periods of low sun (fall and winter, and early morning) and at night. These are also periods when air pollutant emissions from some sources are at their peak, namely, commuter traffic (early morning) and wood-burning appliances (nighttime). The problem can be compounded in valleys when weak flows carry the pollutants up-valley during the day and cold air drainage flows move the air mass down-valley at night. Such restricted movement of trapped air provides little opportunity for ventilation and leads to buildup of pollutants to potentially unhealthful levels.

4.1.6 Inversions

As described above, an inversion is a layer of warmer air over a layer of cooler air. Inversions significantly affect air quality conditions because they influence the mixing depth (i.e., the vertical depth in the atmosphere available for diluting air contaminants near the ground). There are two types of inversions that occur regularly in the Air Basin. Elevation inversions[8] are more common in the summer and fall, and radiation inversions[9] are more common during the winter. The highest air pollutant concentrations in the Air Basin generally occur during inversions.

4.2 SFBAAB AREA DESIGNATIONS

The AQMP provides the framework for air quality basins to achieve attainment of the state and federal AAQS through the State Implementation Plan. Areas are classified attainment or nonattainment for particular pollutants depending on whether they meet the AAQS. Severity classifications for nonattainment are marginal, moderate, serious, severe, and extreme.

[8] When the air blows over elevated areas, it is heated as it is compressed into the side of the hill/mountain. When that warm air comes over the top, it is warmer than the cooler air of the valley.

[9] During the night, the ground cools off, radiating the heat to the sky.

- **Unclassified.** A pollutant is designated unclassified if the data are incomplete and do not support a designation of attainment or nonattainment.
- **Attainment.** A pollutant is in attainment if the AAQS for that pollutant was not violated at any site in the area during a three-year period.
- **Nonattainment.** A pollutant is in nonattainment if there was at least one violation of an AAQS for that pollutant in the area.
- **Nonattainment/Transitional.** A subcategory of the nonattainment designation. An area is designated nonattainment/transitional to signify that the area is close to attaining the AAQS for that pollutant.

The attainment status for the SFBAAB is shown in Table 7, *Attainment Status of Criteria Pollutants in the San Francisco Bay Area Air Basin*.

Table 7 Attainment Status of Criteria Pollutants in the San Francisco Bay Area Air Basin

Pollutant	State	Federal
Ozone – 1-hour	Nonattainment	Classification revoked (2005)
Ozone – 8-hour	Nonattainment (serious)	Nonattainment (marginal)[1]
PM_{10}	Nonattainment	Unclassified/ Attainment[2]
$PM_{2.5}$	Nonattainment	Nonattainment
CO	Attainment	Attainment
NO_2	Attainment	Unclassified
SO_2	Attainment	Attainment
Lead	Attainment	Attainment
Sulfates	Attainment	Unclassified/Attainment
All others	Unclassified/Attainment	Unclassified/Attainment

Source: CARB 2017c.
[1] Severity classification current as of February 13, 2017 (EPA 2018b)
[2] In December 2014, US EPA issued final area designations for the 2012 primary annual PM2.5 National AAQS. Areas designated "unclassifiable/attainment" must continue to take steps to prevent their air quality from deteriorating to unhealthy levels. The effective date of this standard is April 15, 2015 (BAAQMD 2017c).

4.3 EXISTING AMBIENT AIR QUALITY

Existing levels of ambient air quality and historical trends and projections in the vicinity of project site have been documented by measurements made by the BAAQMD. The San Pablo-Rumrill Boulevard Station is the closest air quality monitoring station to the project site. Data from this monitoring station is summarized in Table 8, *Ambient Air Quality Monitoring Summary*. The federal $PM_{2.5}$ standard has been exceeded several times in the last five years. The state and federal CO, O_3, PM_{10}, and NO_2 standards have not been exceeded in the last five years in the vicinity of the project site.

Table 8 Ambient Air Quality Monitoring Summary

Pollutant/Standard	Number of Days Threshold Were Exceeded and Maximum Levels during Such Violations				
	2014	2015	2016	2017	2018
Ozone (O_3)					
State 1-Hour ≥ 0.09 ppm	0	0	0	3	0
State 8-hour ≥ 0.07 ppm	0	0	2	2	0
Federal 8-Hour > 0.075 ppm	0	0	0	1	0
Maximum 1-Hour Conc. (ppm)	0.075	0.084	0.094	0.104	0.061
Maximum 8-Hour Conc. (ppm)	0.055	0.062	0.049	0.080	0.052
Carbon Monoxide (CO)					
State 8-Hour > 9.0 ppm	*	*	*	*	*
Federal 8-Hour ≥ 9.0 ppm	*	*	*	*	*
Maximum 8-Hour Conc. (ppm)	*	*	*	*	*
Nitrogen Dioxide (NO_2)					
State 1-Hour ≥ 0.18 (ppm)	0	0	0	0	0
Maximum 1-Hour Conc. (ppb)	0.0516	0.0459	0.0392	0.0476	0.0600
Coarse Particulates (PM_{10})					
State 24-Hour > 50 µg/m^3	0	0	0	4	2
Federal 24-Hour > 150 µg/m^3	0	0	0	0	1
Maximum 24-Hour Conc. (µg/ m^3)	44.3	43.0	33.0	95.0	191.1
Fine Particulates ($PM_{2.5}$)					
Federal 24-Hour > 35 µg/m^3	1	0	0	9	14
Maximum 24-Hour Conc. (µg/m^3)	38.2	33.2	19.5	71.2	195.4

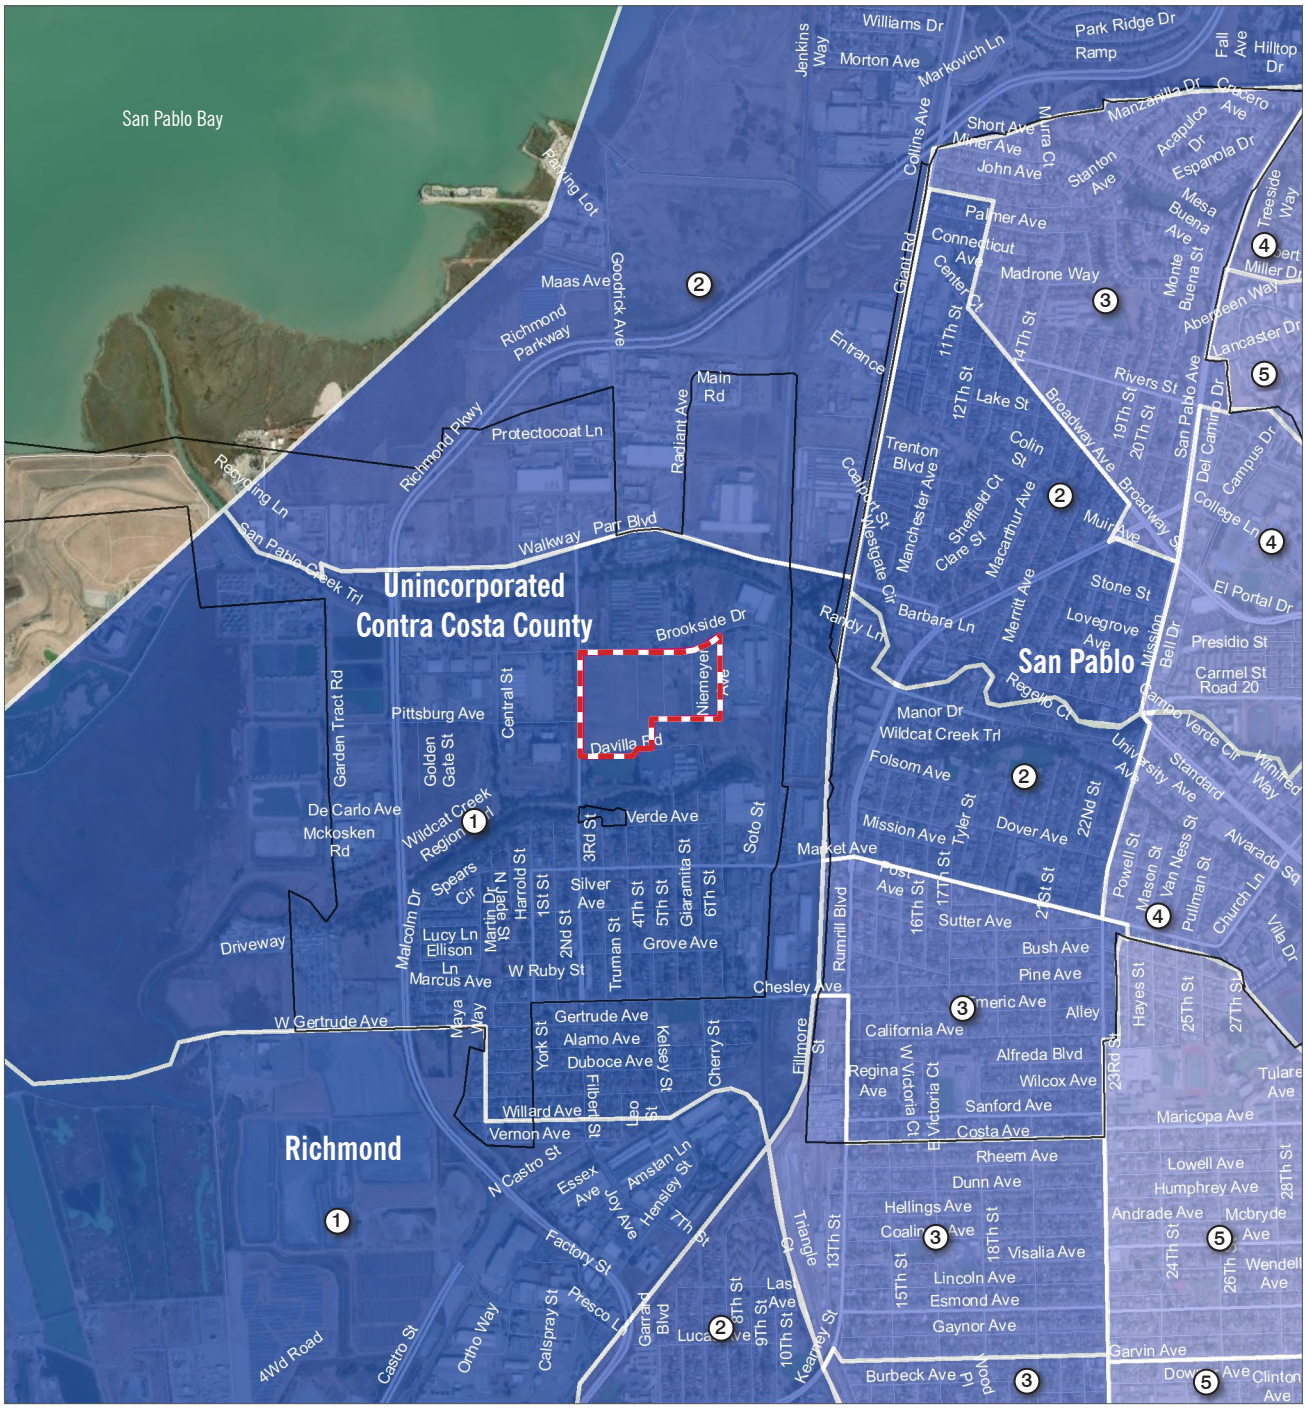
Notes: ppm: parts per million; ppb: parts per billion; µg/m^3: or micrograms per cubic meter; * = insufficient data; NA = Not Available
Data from the San Pablo-Rumrill Boulevard station.

4.4 EXISTING CONDITIONS

CalEnviroScreen 3.0

The California Communities Environmental Health Screening Tool (CalEnviroScreen) is a mapping tool developed by OEHHA on behalf of the California EPA (CalEPA). It identifies California communities by census tract that are disproportionately burdened by and vulnerable to multiple sources of pollution (OEHHA 2018b). CalEnviroScreen 3.0 is the latest version and was released in January 2017. As shown in Figure 3, *Pollution Burden*, according to the CalEnviroScreen 3.0, the project site is in a census track that ranks in the 70th to 80th percentile (77th percentile) for pollution burden. This metric represents the potential exposures to pollutants and the adverse environmental conditions caused by pollution (OEHHA 2020a). Additionally, as shown in Figure 4, *Diesel Particular Matter*, the project site is in an area that ranks in the 80th to 90th percentile (84th percentile) for DPM emissions (OEHHA 2020a). Overall, as shown in Figure 5, *CalEnviroScreen 3.0 Score*, the area ranks in the 90th to 95th percentile (94th percentile) for the CalEnviroScreen 3.0 score, which measures the relative pollution burdens and vulnerabilities in one census tract compared to others (OEHHA 2020b).

Criteria Air Pollutant and GHG Emissions



The project site is largely undeveloped, with four existing single-family residences on the eastern edge of the site. This land use currently generates criteria air pollutant emissions from the burning of fossil fuels in vehicles (mobile sources); energy use for cooling and heating (energy); and consumer products, landscaping, and application of architectural coatings (area sources). Additionally, GHG emissions are also generated from mobile sources, energy use, water demand, and solid waste generation.

4.5 SENSITIVE RECEPTORS

Some land uses are considered more sensitive to air pollution than others due to the types of population groups or activities involved. Sensitive population groups include children, the elderly, the acutely ill, and the chronically ill, especially those with cardiorespiratory diseases. Residential areas are also considered sensitive receptors to air pollution because residents (including children and the elderly) tend to be at home for extended periods of time, resulting in sustained exposure to any pollutants present. Other sensitive receptors include retirement facilities, hospitals, and schools. Recreational land uses are considered moderately sensitive to air pollution. Although exposure periods are generally short, exercise places a high demand on respiratory functions, which can be impaired by air pollution. In addition, noticeable air pollution can detract from the enjoyment of recreation. Industrial, commercial, retail, and office areas are considered the least sensitive to air pollution. Exposure periods are relatively short and intermittent, since the majority of the workers tend to stay indoors most of the time. In addition, the working population is generally the healthiest segment of the population.

Existing sensitive receptors proximate to the project site include Verde Elementary School to the south along Da Villa Street. Other nearby receptors include the surrounding single-family residences farther to the south, along Verde Avenue and Fred Jackson Way.

5. CEQA Thresholds

5.1 CEQA APPENDIX G THRESHOLDS

5.1.1 Air Quality

According to Appendix G of the CEQA Guidelines, the proposed project would have a significant effect on the environment with respect to air quality if it would:

AQ-1 Conflict with or obstruct implementation of the applicable air quality plan.

AQ-2 Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

AQ-3 Expose sensitive receptors to substantial pollutant concentrations.

AQ-4 Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

5.1.2 Greenhouse Gas Emissions

According to Appendix G of the CEQA Guidelines, the proposed project would have a significant effect on the environment with respect to GHG emissions if it would:

GHG-1 Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.

GHG-2 Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

5.2 BAAQMD SIGNIFICANCE CRITERIA

The BAAQMD CEQA Air Quality Guidelines were prepared to assist in the evaluation of air quality impacts of projects and plans proposed within the Bay Area. The guidelines provide recommended procedures for evaluating potential air impacts during the environmental review process, consistent with CEQA requirements, and include recommended thresholds of significance, mitigation measures, and background air quality information. They also include recommended assessment methodologies for air toxics, odors, and GHGs.

In June 2010, the BAAQMD's Board of Directors adopted CEQA thresholds of significance and an update of the CEQA Guidelines. These thresholds are designed to establish the level at which the District believed

air pollution emissions would cause significant environmental impacts under CEQA. The updated BAAQMD CEQA Air Quality Guidelines were amended in June 2011 to include a risk and hazards threshold for new receptors and modified procedures for assessing impacts related to risk and hazard impacts. However, this later amendment regarding risk and hazards was the subject of the December 17, 2015, California Supreme Court decision (*California Building Industry Association v BAAQMD* (2015) 62 Cal.4th 369), which clarified that CEQA generally does not require an evaluation of impacts of the environment on a project's future users or residents. The California Supreme Court also found that CEQA requires the analysis of exposing people to environmental hazards in specific circumstances, including the location of development near airports, schools near sources of toxic contamination, and certain exemptions for infill and workforce housing. Additionally, it also held that public agencies remain free to conduct this analysis regardless of whether it is required by CEQA. To account for these updates, BAAQMD published a new version of the Guidelines dated May 2017, which includes revisions made to address the Supreme Court's opinion (BAAQMD 2017a). This latest version of the BAAQMD CEQA Guidelines was used to prepare the analysis in this EIR.

5.2.1 Criteria Air Pollutant Emissions and Precursors

Regional Significance Criteria

The BAAQMD's criteria for regional significance for projects that exceed the screening thresholds are shown in Table 9, *BAAQMD Regional (Mass Emissions) Criteria Air Pollutant Significance Threshold*s. Criteria for both the construction and operational phases of the project are shown.

Table 9 BAAQMD Regional (Mass Emissions) Criteria Air Pollutant Significance Thresholds

	Construction Phase	Operational Phase	
Pollutant	Average Daily Emissions (lbs/day)	Average Daily Emissions (lbs/day)	Maximum Annual Emissions (Tons/year)
ROG	54	54	10
NO_X	54	54	10
PM_{10}	82 (Exhaust)	82	15
$PM_{2.5}$	54 (Exhaust)	54	10
PM_{10} and $PM_{2.5}$ Fugitive Dust	Best Management Practices	None	None

Source: BAAQMD 2017a.

If projects exceed the emissions in Table 9, emissions would cumulatively contribute to the nonattainment status and would contribute in elevating health effects associated with these criteria air pollutants. Known health effects related to ozone include worsening of bronchitis, asthma, and emphysema and a decrease in lung function. Health effects associated with particulate matter include premature death of people with heart or lung disease, nonfatal heart attacks, irregular heartbeat, decreased lung function, and increased respiratory symptoms. Reducing emissions would further contribute to reducing possible health effects related to criteria air pollutants. However, for projects that exceed the emissions in Table 9, it is speculative to determine how exceeding the regional thresholds would affect the number of days the region is in nonattainment—since

mass emissions are not correlated with concentrations of emissions—or how many additional individuals in the air basin would be affected by the health effects cited above.

The Air District is the primary agency responsible for ensuring the health and welfare of sensitive individuals to elevated concentrations of emissions in the Air Basin, and at the present time, it has not provided methodology to assess the specific correlation between mass emissions generated and the effect on health, which would allow the lead agency to reasonably evaluate how the project's air quality impacts could cause any health impacts, as required by *Sierra Club v. County of Fresno (Friant Ranch, L.P.)* (2018) 6 Cal.5th 502, Case No. S21978. Ozone concentrations are dependent upon a variety of complex factors, including the presence of sunlight and precursor pollutants, natural topography, nearby structures that cause building downwash, atmospheric stability, and wind patterns. Because of the complexities of predicting ground-level ozone concentrations in relation to the National AAQS and California AAQS, it is not possible to link health risks to the magnitude of emissions exceeding the significance thresholds. To achieve the health-based standards established by the EPA, the air districts prepare air quality management plans that detail regional programs to attain the AAQS. However, if a project within the Air District exceeds the regional significance thresholds, the project could contribute to an increase in health effects in the basin until the attainment standards are met in the Air Basin.

Local CO Hotspots

Congested intersections have the potential to create elevated concentrations of CO, referred to as CO hotspots. The significance criteria for CO hotspots are based on the California AAQS for CO, which is 9.0 ppm (8-hour average) and 20.0 ppm (1-hour average). However, with the turnover of older vehicles, introduction of cleaner fuels, and implementation of control technology, the SFBAAB is in attainment of the California and National AAQS, and CO concentrations in the SFBAAB have steadily declined. Because CO concentrations have improved, the BAAQMD does not require a CO hotspot analysis if the following criteria are met:

- The project is consistent with an applicable congestion management program established by the County Congestion Management Agency for designated roads or highways, the regional transportation plan, and local congestion management agency plans.

- The project would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour.

- The project traffic would not increase traffic volumes at affected intersection to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway). (BAAQMD 2017a)

Community Risk and Hazards

The BAAQMD's significance thresholds for local community risk and hazard impacts apply to both the siting of a new source and to the siting of a new receptor. Local community risk and hazard impacts are associated

5. CEQA Thresholds

with TACs and $PM_{2.5}$ because emissions of these pollutants can have significant health impacts at the local level.

- The proposed project would generate TACs and $PM_{2.5}$ during construction activities that could elevate concentrations of air pollutants at the nearby school and residential sensitive receptors. The thresholds for construction-related local community risk and hazard impacts are the same as for project operations. The BAAQMD has adopted screening tables for air toxics evaluation during construction (BAAQMD 2010b). Construction-related TAC and $PM_{2.5}$ impacts should be addressed on a case-by-case basis, taking into consideration the specific construction-related characteristics of each project and proximity to off-site receptors, as applicable (BAAQMD 2017a).

- The proposed project involves construction of new industrial warehouse facilities and would be a source of operational TACs and $PM_{2.5}$ from trucking activity. BAAQMD thresholds related to siting new sources of TACs and $PM_{2.5}$ near existing or planned sensitive receptors are applicable.

Since Contra Costa County does not have a qualified risk reduction plan, a site-specific analysis of TACs and $PM_{2.5}$ impacts on sensitive receptors was conducted. The thresholds identified below are applied to the project's construction and operational phases.

Community Risk and Hazards: Project

Project-level emissions of TACs or $PM_{2.5}$ from individual sources that exceed any of the thresholds listed below are considered a potentially significant community health risk:

- An excess cancer risk level of more than 10 in one million, or a noncancer (i.e., chronic or acute) hazard index greater than 1.0 would be a significant cumulatively considerable contribution.

- An incremental increase of greater than 0.3 micrograms per cubic meter ($\mu g/m^3$) annual average $PM_{2.5}$ from a single source would be a significant cumulatively considerable contribution. (BAAQMD 2017a)

Community Risk and Hazards: Cumulative

Cumulative sources represent the combined total risk values of each of the individual sources within the 1,000-foot evaluation zone. A project would have a cumulative considerable impact if the aggregate total of all past, present, and foreseeable future sources within a 1,000-foot radius from the fence line of a source or location of a receptor, plus the contribution from the project, meets any of these conditions:

- Has excess cancer risk levels of more than 100 in one million or a chronic non-cancer hazard index (from all local sources) greater than 10.0.

- Exceeds 0.8 $\mu g/m^3$ annual average $PM_{2.5}$. (BAAQMD 2017a)

In February 2015, Office of Environmental Health Hazard Assessment (OEHHA) adopted new health risk assessment guidance that includes several efforts to be more protective of children's health. These updated

procedures include the use of age sensitivity factors to account for the higher sensitivity of infants and young children to cancer-causing chemicals, and age-specific breathing rates (OEHHA 2015).

Odors

BAAQMD's thresholds for odors are qualitative based on BAAQMD's Regulation 7, Odorous Substances. This rule places general limitations on odorous substances and specific emission limitations on certain odorous compounds. Odors are also regulated under BAAQMD Regulation 1, Rule 1-301, Public Nuisance, which states that no person shall discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or the public; or which endangers the comfort, repose, health, or safety of any such persons or the public, or which causes, or has a natural tendency to cause, injury, or damage to business or property. Under BAAQMD's Rule 1-301, BAAQMD has established odor-screening thresholds for land uses that have the potential to generate substantial odor complaints, including wastewater treatment plants, landfills or transfer stations, composting facilities, confined animal facilities, food manufacturing, and chemical plants. Table 10, *BAAQMD Screening Distances for Potential Odor Sources*, shows the screening distances for various land uses that are considered to have objectionable odors (BAAQMD 2017a).

Table 10 BAAQMD Screening Distances for Potential Odor Sources

Type of Operation	Screening Distance
Wastewater Treatment Plant	2 miles
Wastewater Pumping Facilities	1 mile
Sanitary Landfill	2 miles

5.2.2 Greenhouse Gas Emissions

BAAQMD has adopted CEQA Guidelines to evaluate GHG emissions impacts from development projects (BAAQMD 2017a). Land use development projects include residential, commercial, industrial, and public land use facilities. Direct sources of emissions may include on-site combustion of energy, such as natural gas used for heating and cooking; emissions from industrial processes (not applicable for most land use development projects); and fuel combustion from mobile sources. Indirect emissions are produced off-site from energy production, water conveyance due to a project's energy use and water consumption, and nonbiogenic emissions from waste disposal. Biogenic CO_2 emissions are not included in the quantification of a project's GHG emissions, because biogenic CO_2 is derived from living biomass (e.g., organic matter in wood, paper, vegetable oils, animal fat, food, animal, and yard waste) as opposed to fossil fuels. BAAQMD is currently updating its CEQA Guidelines. Under the 2017 CEQA Guidelines, BAAQMD identified a tiered approach for assessing GHG emissions impacts of a project:

- **Consistency with a Qualified Greenhouse Gas Reduction Strategy**. If a project is within the jurisdiction of an agency that has a "qualified" GHG reduction strategy, the project can assess consistency of its GHG emissions impacts with the reduction strategy.

- **BAAQMD Screening Level Sizes.** BAAQMD has adopted screening criteria for development projects, with a buildout year of 2020 and earlier, that would be applicable for a proposed project based on the square footage, units, acreage, students, and/or employees generated by a project. Typical projects that meet the screening criteria do not generate emissions greater than 1,100 $MTCO_2e$ per year and would not generate significant GHG emissions.

- **Bright-line Screening Threshold.** BAAQMD adopted a bright-line screening threshold for development projects of 1,100 $MTCO_2e$ per year that would be applicable for projects with an opening year of 2020 and earlier. If a project exceeds the BAAQMD Guidelines' GHG screening-level sizes or screening criteria of 1,100 $MTCO_2e$, the project would be required to conduct a full GHG analysis based on GHG reduction goals of AB 32 and SB 32.

- **Efficiency Threshold.** AB 32 requires the statewide GHG emission to be reduced to 1990 levels by 2020. On a per-capita basis, that means reducing the annual emissions of 14 tons of carbon dioxide for every person in California down to about 10 tons per person by 2020 (BAAQMD 2017a). Hence, BAAQMD's per capita significance threshold is calculated based on the state's land use sector emissions inventory prepared by CARB and the demographic forecasts for the 2008 Scoping Plan. The land use sector GHG emissions for 1990 were estimated by BAAQMD, as identified in Appendix D of the BAAQMD CEQA Guidelines, to be 295.53 $MMTCO_2e$ and the 2020 California service population (SP) to be 64.3 million. Therefore, the threshold that would ensure consistency with the GHG reduction goals of AB 32 is estimated at 4.6 $MTCO_2e$ per service population per year ($MTCO_2e$/SP/yr) for year 2020 (BAAQMD 2017a).

As discussed above, the County has an adopted qualified CAP for purposes of meeting the AB 32 GHG reduction target for year 2020. In addition, it also identifies a year 2035 target and includes strategies to meet

this target. However, the CAP does not specifically address the SB 32 GHG reduction target for year 2030. While the next update to the CAP may address the SB 32 GHG reduction target for 2030, because the proposed project would have a post-2020 opening year (year 2021, for purposes of this analysis, an interpolated bright-line threshold is utilized. Based on the adopted 1,100 $MTCO_2e$ per year bright-line screening threshold, and the GHG reduction target for year 2030 established under SB 32 (i.e., 40 percent 1990 levels by 2030), the interpolated bright-line screening threshold of 660 $MTCO_2e$ per year is utilized for the proposed project.[10] If project emissions are below this bright-line screening threshold, GHG emissions impacts would be considered less than significant.

[10] This approach is based on discussion with BAAQMD staff during the in-person meeting between staff from BAAQMD, Contra Costa County, and First Carbon Solutions on March 4, 2020, at the Contra Costa County office.

5. CEQA Thresholds

This page intentionally left blank.

6. Environmental Impacts

6.1 METHODOLOGY

This air quality and GHG emissions evaluation was prepared in accordance with the requirements of CEQA to determine if the proposed project would result in significant air quality and GHG emissions impacts. Construction-related and operational criteria air pollutants and GHG emissions associated with the proposed project were calculated using the California Emissions Estimator Model (CalEEMod), version 2016.3.2. Air quality modeling datasheets for the project can be found in Appendix A. The CalEEMod output files for the project are in Appendix B.

Modeling Scenarios

Per discussion with Contra Costa County, project-related regional criteria air pollutant and GHG emissions are quantified for four scenarios (Scenarios 1 through 4). Each scenario includes four separate calendar years (2021, 2023, 2025, and 2027) and specific assumptions for off-road equipment used in daily operations, delivery vehicles, drayage trucks, and non-drayage heavy-duty trucks. Overall, the scenarios reflect various levels of implementation of certain conditions of approval agreed upon between Contra Costa County and CenterPoint Properties.[11] For purposes of this analysis, Scenario 4 – Year 2021 is evaluated to the CEQA Appendix G thresholds below under Section 6.2, *Air Quality Impacts*, and Section 6.3, *Greenhouse Gas Emissions Impacts*. The operational regional criteria air pollutant and GHG emissions results of all other scenarios are provided in Section 7, *Additional Emissions Data*, of this study and are included for information purposes. The details for the scenarios are as follows.

Scenario 1

This scenario assumes no unique conditions of approval are adopted for vehicles and is provided for reference. The assumptions regarding the fuel types for off-road equipment, delivery vehicles, drayage trucks, and heavy-duty trucks are provided in Table 11, *Scenario 1 Assumptions*.

Table 11 Scenario 1 Assumptions

Vehicle/Equipment	Fuel Type			
	Year 2021	Year 2023	Year 2025	Year 2027
Off-Road Equipment	Diesel	Diesel	Diesel	Diesel
Delivery Vehicles	Diesel	Diesel	Diesel	Diesel
Drayage Trucks	Diesel	Diesel	Diesel	Diesel
Heavy-Duty Trucks	Diesel	Diesel	Diesel	Diesel

[11] See Conditions of Approval 1a through 1c.

6. Environmental Impacts

Scenario 2

This scenario represents a scenario where electric vehicle development and availability are significantly less than expected compared to Scenarios 3 and 4, and is provided for reference. The assumptions regarding the fuel types for off-road equipment, delivery vehicles, drayage trucks, and heavy-duty trucks are provided in Table 12, *Scenario 2 Assumptions*.

Table 12 Scenario 2 Assumptions

Vehicle/Equipment	Fuel Type			
	Year 2021	Year 2023	Year 2025	Year 2027
Off-Road Equipment	Zero Emission	Zero Emission	Zero Emission	Zero Emission
Delivery Vehicles	25% Zero Emission/75% Diesel	35% Zero Emission/65% Diesel	45% Zero Emission/55% Diesel	55% Zero Emission/45% Diesel
Drayage Trucks	Diesel	Diesel	25% Zero Emission/75% Diesel	25% Zero Emission/75% Diesel
Heavy-Duty Trucks	100% Model Year 2014 or Later Diesel	100% Model Year 2014 or Later Diesel	25% Zero Emission/75% Model Year 2014 or Later Diesel	25% Zero Emission/75% Model Year 2014 or Later Diesel

Scenario 3

This scenario is provided for reference and represents best faith efforts by applicant(s) to purchase electric vehicles when commercially available, but production numbers of these electric vehicles cannot meet customer demand. The assumptions regarding the fuel types for off-road equipment, delivery vehicles, drayage trucks, and heavy-duty trucks are provided in Table 13, *Scenario 3 Assumptions*.

Table 13 Scenario 3 Assumptions

Vehicle/Equipment	Fuel Type			
	Year 2021	Year 2023	Year 2025	Year 2027
Off-Road Equipment	Zero Emission	Zero Emission	Zero Emission	Zero Emission
Delivery Vehicles	50% Zero Emission/50% Diesel	65% Zero Emission/35% Diesel	75% Zero Emission/25% Diesel	85% Zero Emission/15% Diesel
Drayage Trucks	Diesel	Diesel	50% Zero Emission/50% Diesel	50% Zero Emission/50% Diesel
Heavy-Duty Trucks	100% Model Year 2014 or Later Diesel	100% Model Year 2014 or Later Diesel	50% Zero Emission/50% Model Year 2014 or Later Diesel	50% Zero Emission/50% Model Year 2014 or Later Diesel

Scenario 4

This scenario represents full compliance with the conditions of approval. For purposes of this analysis, Scenario 4 – Year 2021 is evaluated to the CEQA Guidelines Appendix G thresholds and used to determine whether recommended measures to further reduce emissions and impacts are necessary. The assumptions

regarding the fuel types for off-road equipment, delivery vehicles, drayage trucks, and heavy-duty trucks are provided in Table 14, *Scenario 4 Assumptions*.

Table 14 Scenario 4 Assumptions

Vehicle/Equipment	Fuel Type			
	Year 2021	Year 2023	Year 2025	Year 2027
Off-Road Equipment	Zero Emission	Zero Emission	Zero Emission	Zero Emission
Delivery Vehicles	33% Zero Emission/67% Diesel	65% Zero Emission/35% Diesel	80% Zero Emission/20% Diesel	100% Zero Emission
Drayage Trucks	100% Zero Emission	100% Zero Emission	100% Zero Emission	100% Zero Emission
Heavy-Duty Trucks	100% Model Year 2014 or Later Diesel	100% Model Year 2014 or Later Diesel	100% Zero Emission	100% Zero Emission

Operation

The operational-phase emissions are based on development of the proposed industrial park. The modeling accounts for the average daily vehicle and truck trips and VMT, energy usage, water demand, and wastewater and solid waste generation. For purposes of this analysis, hours of operation for the proposed project are 24 hours per day, 7 days per week.

Transportation

On-road transportation sources are based on passenger vehicle and truck trip generation rates and VMT provided by Fehr and Peers (Fehr & Peers 2021). Per the VMT information provided, an average trip length of 20.53 miles per trip (mi/trip) is used for passenger vehicles and delivery vehicles, and an average trip length of 28.61 mi/trip is used for drayage trucks and heavy-duty trucks. The proposed project is estimated to generate up to 860 passenger vehicle trips per day and 240 heavy vehicle truck trips per day. For passenger vehicles, it is assumed that 75 percent would consist of light duty automobiles and 25 percent would be delivery vans and trucks. For heavy vehicles, it is assumed that 20 percent would be drayage trucks and 80 percent would be non-drayage heavy-duty trucks. The overall vehicle ratio is 81 percent light duty passenger vehicles, 13 percent delivery vehicles, and 6 percent heavy vehicles (i.e., drayage trucks and heavy-duty trucks).

CalEEMod is used to quantify mobile-source emissions using derived vehicle emission rates based on vehicle emissions data obtained from CARB's EMFAC2017 Version 1.0.2 web database and adjusted based on methodology provided in Appendix A of the CalEEMod User's Guide (CAPCOA 2017). Additionally, the emission rates for the LDA, LDT1, LDT2, and MDV vehicle classes account for the SAFE adjustment factors released by CARB (CARB 2019c, 2020a).[12] The EMFAC2007 vehicle categories assigned to light duty passenger vehicles, delivery vehicles, drayage trucks, and heavy-duty trucks are based on the EMFAC vehicle categories and on information provided by the County, including the United States Department of Energy

[12] The standards set under the SAFE Rule are pending until resolution of the lawsuit filed by California and other parties against its implementation. Thus, incorporation of the CARB SAFE Rule adjustment factors provide conservative vehicle emission factors because the SAFE Rule would result in less stringent vehicle emissions standards compared to the previously adopted standards for passenger vehicle model years 2021 through 2025.

6. Environmental Impacts

Vehicle Weight Classes & Categories matrix (US Energy 2020). Zero emission vehicles are assumed to be electric vehicles. For purposes of this analysis, zero emission vehicles would not generate running, idling, starting, and running loss emissions, but would generate particular matter emissions from brake wear and tire wear in addition to diurnal, resting loss, and heat soak emissions. The EMFAC2017 diurnal, resting loss, and heat soak emission rates for electric-powered LDA, LDT1, LDT2, and MDV vehicles are used for all other electric-powered vehicles.

The following provides further modeling details assumed and used for each vehicle category for the various scenarios:

- Light Duty Passenger Vehicles
  - 75 percent of total passenger vehicle trips (i.e., 645 trips/day)
  - Average one-way trip length of 20.53 mi/trip.
  - Consists of the LDA and MCY EMFAC2007 vehicle categories.[13]
  - The fleet mix is based on the CalEEMod default fleet mix normalized to the overall vehicle ratio.

- Delivery Vehicles
  - 25 percent of total passenger vehicle trips (i.e., 215 trips/day).
  - Average one-way trip length of 20.53 mi/trip.
  - Consists of the LDT1, LDT2, MDV, LHD1, LHD2, MHDT, OBUS, UBUS, SBUS, and MH EMFAC2007 vehicle categories.[14]
  - The fleet mix is based on the CalEEMod default fleet mix normalized to the overall vehicle ratio.

- Drayage Trucks
  - 20 percent of total heavy vehicles vehicle trips (i.e., 48 trips/day).
  - Average one-way trip length of 28.61 mi/trip.
  - Consist of the HHDT EMFAC2007 vehicle category. However, emissions data is based on the EMFAC2011 T7 POAK vehicle category.[15]
  - The fleet mix is based on the CalEEMod default fleet mix normalized to the overall vehicle ratio.

- Heavy-Duty Trucks
  - 80 percent of total heavy vehicles vehicle trips (i.e., 192 trips/day).
  - Average one-way trip length of 28.61 mi/trip.
  - Consist of and utilizes the emissions data for the HHDT EMFAC2007 vehicle category.
  - Emissions data obtained from EMFAC2017 are based on model year 2014 and newer trucks. The range of model years is from model year 2014 through the model year for each calendar year

[13] LDA=light duty automobile; MCY=motorcycle.
[14] LDT1=light duty truck 1; LDT2=light duty truck 2; MDV=medium duty vehicle; LHD1=light heavy duty 1; LHD2=light heavy duty 2; MHDT=medium heavy-duty truck; OBUS=other bus; UBUS=urban bus; SBUS=school bus; MH=motorhome.
[15] HHDT=heavy-heavy duty truck; T7 POAK= heavy-heavy duty diesel drayage truck in Bay Area.

modeled (i.e., 2021, 2023, 2025, and 2027). The emissions data for the range of model years is used to calculate aggregated emission rates based on EMFAC methodology. The calculated aggregated emissions data is further processed based on CalEEMod methodology in converting EMFAC data for use in CalEEMod.[16]

- The fleet mix is based on the CalEEMod default fleet mix normalized to the overall vehicle ratio.

Other Operational Emissions

Solid Waste Disposal. Indirect emissions from waste generation are based on the CalEEMod default solid waste generation rates, which are based on data from CalRecycle.

Water/Wastewater. GHG emissions from this sector are associated with the embodied energy used to supply water, treat water, distribute water, and then treat wastewater and fugitive GHG emissions from wastewater treatment. Outdoor water use is based on water usage calculated from the "Water Budget Workbook for New and Rehabilitated Non-residential Landscapes" (CDWR 2015). Indoor water consumption is based on CalEEMod default indoor water use rates.

Area Sources. Area and stationary sources are based on the CalEEMod defaults for use of consumer products and cleaning supplies.

Energy. Emissions from this sector are from use of electricity and natural gas by the proposed buildings. New buildings are assumed to comply with the 2019 Building Energy Efficiency Standards and are modeled to be 10.7 percent and 1 percent more energy efficient for electricity and natural gas, respectively, compared to the 2016 Building Energy Efficiency Standards (NORESCO 2018). Based on the default CalEEMod electricity rates adjusted to reflect the increased energy efficiency associated with the 2019 Building Energy Efficiency Standards, the proposed project would generate an electricity demand of 6,760,296 kWh/yr. The proposed PV system is estimated to generate up to 8,083,000 kWh/yr of renewable electricity. Thus, for purposes of this analysis, it is assumed 100 percent of the electricity demand for the proposed project would be provided by the PV system.

The CO_2 intensity of electricity supplied by Pacific Gas and Electric (PG&E) is based on the year 2018 CO_2 intensity reported to the Climate Registry (Climate Registry 2020). For year 2025, the PG&E CO_2 intensity is adjusted to account for the SB 100 RPS target of 44 percent by year 2024. For year 2027, the PG&E CO_2 intensity is adjusted to account for the SB 100 RPS target of 50 percent by year 2026.

Off-Road Equipment. Per the Applicant, 12 diesel-powered forklifts and 6 diesel-powered yard trucks are modeled for Scenario 1 (all years). For Scenarios 2 through 4, all off-road equipment are modeled as electric-powered consistent.[17] Emissions from diesel-powered forklifts are based on Contra Costa County year 2021 emissions data obtained from CARB's OFFROAD2017 Version 1.0.1 web database for the Industrial-Forklifts vehicle class rated at 100 horsepower. Additionally, daily hours of operation for each forklift is

[16] See Appendix A of the CalEEMod User's Guide.
[17] See Condition of Approval 1c.

6. Environmental Impacts

modeled at 12 hours per day per unit (hrs/day/unit) and 365 days per year.[18] Yard truck emissions are based on OFFROAD2017 emissions data for the diesel-powered CHE-Rail Yard Tractor vehicle class rated at 175 horsepower. Each yard truck is modeled to operate 4 hrs/day/unit and 365 days per year.[19,20]

Life cycle emissions are not included in the GHG analysis because not enough information is available.[21] Black carbon emissions are not included in the GHG analysis because CARB does not include it in the state's AB 32 inventory, but treats this short-lived climate pollutant separately.[22]

Construction

Construction emissions associated with the proposed project are based on the construction schedule and equipment provided by the project Applicant (see Table 15, *Construction Phasing and Equipment Assumptions*). Modeling also includes 397 tons of building and asphalt demolition haul, approximately 100,000 cubic yards of soil import, and 2,000 cubic yards of soil export. Average daily emissions from construction activities are based on the annual construction emissions starting November 2020 through December 2021 divided by the total number of active construction days (285 workdays).

Table 15 Construction Phasing and Equipment Assumptions

Phase	Schedule[1]	Equipment[2]
Demolition and Debris Haul	23 Workdays: November 2020—December 2020	1 Concrete/Industrial Saw, 3 Excavators, 2 Rubber Tired Dozers, & 1 Water Truck
Soil Import	45 Workdays: November 2020—January 2021	1 Excavator, 1 Tractor/Load/Backhoe, & 1 Water Truck[3]
Site Preparation and Soil Export	22 Workdays: December 2020—January 2021	3 Rubber Tired Dozers,4 Tractor/Loader/Backhoe, & 1 Water Truck
Grading	44 Workdays: January 2020—March 2020	2 Excavators, 1 Grader, 1 Rubber Tired Dozer, 2 Scrapers, 2 Tractor/Loader/Backhoes, & 1 Water Truck
Building Construction	196 Workdays: March 2020—December 2021	1 Crane, 3 Tractor/Loader/Backhoes, 1 Generator Set, 3 Forklifts, & 1 Welder
Paving	10 Workdays: November 2021—December 2021	2 Pavers, 2 Paving Equipment, & 2 Rollers

[18] In comparison, based on OFFROAD2017 data, the average daily hours in which a 100-horsepower Industrial – Forklift operates is 2.06 hours based on the reported 143,411 annual hours and total population of 191 units for Contra Costa County.

[19] In comparison, based on OFFROAD2017 data, the average daily hours in which a 175-horsepower CHE – Rail Yard Tractor operates is 1.43 hours based on the reported 1,047 annual hours and total population of 2 units for Contra Costa County.

[20] "CHE" = cargo handling equipment.

[21] Life cycle emissions include indirect emissions associated with materials manufacture. However, these indirect emissions involve numerous parties, each of which is responsible for GHG emissions of their particular activity. The California Resources Agency, in adopting the CEQA Guidelines Amendments on GHG emissions found that lifecycle analysis was not warranted for project-specific CEQA analysis in most situations, for a variety of reasons, including lack of control over some sources, and the possibility of double-counting emissions (see Final Statement of Reasons for Regulatory Action, December 2009). Because the amount of materials consumed during the operation or construction of the Proposed Project is not known, the origin of the raw materials purchased is not known, and manufacturing information for those raw materials is also not known, calculation of life cycle emissions would be speculative. A life-cycle analysis is not warranted (OPR 2008).

[22] Particulate matter emissions, which include black carbon, are analyzed under *Air Quality*. Black carbon emissions have sharply declined due to efforts to reduce on-road and off-road vehicle emissions, especially diesel particulate matter. The State's existing air quality policies will virtually eliminate black carbon emissions from on-road diesel engines within 10 years (CARB 2017b).

Table 15 Construction Phasing and Equipment Assumptions

Phase	Schedule[1]	Equipment[2]
Architectural Coating	10 Workdays: November 2021—December 2021	1 Air Compressor

Notes:
[1] Based on information provided by the Applicant. Where specific information regarding project-related construction activities was not available, construction assumptions were based on CalEEMod defaults. The construction schedule is based on preliminary engineering and is subject to changes during final design and as dictated by field conditions.
[2] Construction equipment is based on CalEEMod defaults unless otherwise noted. Per the Applicant, overlapping construction phases that require the same type of equipment would share equipment.
[2] Equipment is anticipated for purposes of this analysis.

Health Risk Assessments

A construction health risk assessment (HRA) was conducted for the proposed project using Lakes Environmental AERMOD View and is provided in Appendix C. The purpose of the construction HRA is to evaluate the potential health impacts from DPM and $PM_{2.5}$ emitted during construction activities. Additionally, an operational HRA was conducted to evaluate the potential health impacts of TACs and $PM_{2.5}$ emitted from diesel trucks during the operational phase. The operational HRA was prepared under a separate technical report (PlaceWorks 2020). Sources evaluated in the construction HRA include haul trucks and off-road construction equipment such as excavators, tractors/loaders/backhoes, cranes, forklifts, generators, welders, and air compressors. Operational sources include trucks and delivery vehicles traveling on-site and idling at the 72 proposed truck bays as well as trucks and delivery vehicles traveling off-site within 1,000 feet of the project boundary.

The methodology used in this HRA is consistent with the following BAAQMD and OEHHA guidance documents:

- **BAAQMD.** California Environmental Quality Act Air Quality Guidelines, May 2017.
- **BAAQMD.** Screening Tables for Air Toxics Evaluation During Construction, May 2010.
- **BAAQMD.** Recommended Methods for Screening and Modeling Local Risks and Hazards, version 3.0, May 2012.
- **OEHHA.** Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments, February 2015.

Potential exposures to DPM and $PM_{2.5}$ from proposed project construction and operational activities were evaluated for off-site sensitive receptors proximate to the site, which include an elementary school and single-family residences to the south of the project site. The EPA AERMOD air dispersion modeling program and CARB's Hotspots Analysis and Reporting Program (HARP2) Risk Assessment Standalone Tool were used to estimate excess lifetime cancer risks, chronic noncancer hazard indices, and the $PM_{2.5}$ maximum annual concentrations at the nearest sensitive receptors. These risks were compared to the significance thresholds in the BAAQMD CEQA guidelines in the attached Construction HRA (Appendix C) and separate operational HRA Technical Report (PlaceWorks 2020).

6.2 AIR QUALITY IMPACTS

This section discusses the air quality impacts of the project based on Scenario 4 – Year 2021. The discussion is organized by and responds to each of the Appendix G thresholds identified for air quality in Section 5, *CEQA Thresholds*.

AIR-1 Implementation of the proposed project would not conflict with or obstruct implementation of the applicable air quality plan.

BAAQMD is directly responsible for reducing emissions from area, stationary, and mobile sources in the SFBAAB to achieve National and California AAQS. The BAAQMD 2017 Clean Air Plan is a regional and multiagency effort to reduce air pollution in the Air Basin. A consistency determination with the AQMP plays an important role in local agency project review by linking local planning and individual projects to the 2017 Clean Air Plan. It fulfills the CEQA goal of informing decision makers of the environmental efforts of the project under consideration early enough to ensure that air quality concerns are fully addressed. It also provides the local agency with ongoing information as to whether they are contributing to the clean air goals in the 2017 Clean Air Plan.

The regional emissions inventory for the SFBAAB is compiled by BAAQMD. Regional population, housing, and employment projections developed by ABAG are based, in part, on cities' general plan land use designations. These projections form the foundation for the emissions inventory of the 2017 Clean Air Plan. These demographic trends are incorporated into Plan Bay Area, compiled by ABAG and the MTC to determine priority transportation projects and vehicle miles traveled in the Bay Area. The 2017 Clean Air Plan strategy is based on projections from local general plans. Projects that are consistent with the local general plan are considered consistent with the regional air quality plan. Large projects that exceed regional employment, population, and housing planning projections have the potential to be inconsistent with the regional inventory compiled as part of the 2017 Clean Air Plan.

The proposed project would demolish the existing buildings on-site and construct three new multitenant industrial buildings totaling approximately 555,510 square feet. The project would include 72 truck bays, 522,709 square feet of industrial warehouse space, and 32,801 square feet of office space as well as approximately 447 parking spaces for passenger vehicles and 246 spaces for trucks. The project site is in North Richmond and is zoned for heavy industry according to the Contra Costa General Plan (Contra Costa 2005). Thus, the project would generally be consistent with the underlying general plan land use designation and would not have the potential to substantially affect housing, employment, and population projections in the region that are the basis of the 2017 Clean Air Plan projections.

Additionally, the net increase in regional emissions generated by the proposed project would not exceed the BAAQMD's emissions thresholds (see Impact AIR-2). These thresholds are established to identify projects that have the potential to generate a substantial amount of criteria air pollutants. Because the proposed project would not exceed these thresholds, the proposed project would not be considered by the BAAQMD to be a substantial emitter of criteria air pollutants. Furthermore, Table 16, *Consistency with 2017 Clean Air Plan Control Measures*, identifies the control measures in the 2017 Clean Air Plan that are required by BAAQMD to

reduce emissions for a wide range of both stationary and mobile sources. As shown in Table 16, the proposed project would not conflict with the plan or hinder BAAQMD from implementing the control measures in the 2017 Clean Air Plan. Overall, the project would not conflict with or obstruct implementation of the 2017 Clean Air Plan.

Table 16 Consistency with 2017 Clean Air Plan Control Measures

Type	Measure Number/Title	Consistency Analysis
Stationary Source Control Measure	▪ SS 1 – Fluid Catalytic Cracking in Refineries ▪ SS 2 – Equipment Leaks ▪ SS 3 – Cooling Towers ▪ SS 4 – Refinery Flares ▪ SS 5 – Sulfur Recovery Units ▪ SS 6 – Refinery Fuel Gas ▪ SS 7 – Sulfuric Acid Plants ▪ SS 8 – Sulfur Dioxide from Coke Calcining ▪ SS 9 – Enhanced NSR Enforcement for Changes in Crude Slate ▪ SS 10 – Petroleum Refining Emissions Tracking ▪ SS 11 – Petroleum Refining Facility-Wide Emission Limits ▪ SS 12 – Petroleum Refining Climate Impacts Limit ▪ SS 13 – Oil and Gas Production, Processing and Storage ▪ SS 14 – Methane from Capped Wells ▪ SS 15 – Natural Gas Processing and Distribution ▪ SS 16 – Basin-Wide Methane Strategy ▪ SS 17 – GHG BACT Threshold ▪ SS 18 – Basin-Wide Combustion Strategy ▪ SS 19 – Portland Cement ▪ SS 20 – Air Toxics Risk Cap and Reduction from Existing Facilities ▪ SS 21 – New Source Review for Toxics ▪ SS 22 – Stationary Gas Turbines ▪ SS 23 – Biogas Flares ▪ SS 24 – Sulfur Content Limits of Liquid Fuels ▪ SS 25 – Coatings, Solvents, Lubricants, Sealants and Adhesives ▪ SS 26 – Surface Prep and Cleaning Solvent ▪ SS 27 – Digital Printing ▪ SS 28 – LPG, Propane, Butane ▪ SS 29 – Asphaltic Concrete ▪ SS 30 – Residential Fan Type Furnaces ▪ SS 31 – General Particulate Matter Emission Limitation ▪ SS 32 – Emergency Backup Generators ▪ SS 33 – Commercial Cooking Equipment ▪ SS 34 – Wood Smoke	Stationary sources are regulated directly by BAAQMD, which routinely adopts/revises rules or regulations to implement the stationary source (SS) control measures to reduce stationary source emissions. Therefore, any new stationary sources associated with the proposed project would be required to comply with BAAQMD's regulations. Based on the proposed warehousing use for the project site, it is not anticipated that the proposed project would result any new major stationary source emissions. Additionally, in the event stationary equipment is installed on-site, it is anticipated that the equipment would be small-quantity emitters and would require review by BAAQMD for permitted sources of air toxics, which would ensure consistency with the 2017 Clean Air Plan.

6. Environmental Impacts

Table 16 Consistency with 2017 Clean Air Plan Control Measures

Type	Measure Number/Title	Consistency Analysis
	▪ SS 35 – PM from Bulk Material Storage, Handling and Transport, Including Coke and Coal ▪ SS 36 – PM from Trackout ▪ SS 37 – PM from Asphalt Operations ▪ SS 38 – Fugitive Dust ▪ SS 39 – Enhanced Air Quality Monitoring ▪ SS 40 – Odors	
Transportation Control Measures	▪ TR 1 – Clean Air Teleworking Initiative ▪ TR 2 – Trip Reduction Programs ▪ TR 3 – Local and Regional Bus Service ▪ TR 4 – Local and Regional Rail Service ▪ TR 5 – Transit Efficiency and Use ▪ TR 6 – Freeway and Arterial Operations ▪ TR 7 – Safe Routes to Schools and Safe Routes to Transit ▪ TR 8 – Ridesharing, Last-Mile Connection ▪ TR 9 – Bicycle and Pedestrian Access and Facilities ▪ TR 10 – Land Use Strategies ▪ TR 11 – Value Pricing ▪ TR 12 – Smart Driving ▪ TR 13 – Parking Policies ▪ TR 14 – Cars and Light Trucks ▪ TR 15 – Public Outreach and Education ▪ TR 16 – Indirect Source Review ▪ TR 17 – Planes ▪ TR 18 – Goods Movement ▪ TR 19 – Medium and Heavy Duty Trucks ▪ TR 20 – Ocean Going Vessels ▪ TR 21 – Commercial Harbor Craft ▪ TR 22 – Construction, Freight and Farming Equipment ▪ TR 23 – Lawn and Garden Equipment	Transportation (TR) control measures are strategies to reduce vehicle trips, vehicle use, VMT, vehicle idling, and traffic congestion for the purpose of reducing motor vehicle emissions. Although most of the TR control measures are implemented at the regional level—that is, by MTC or Caltrans—the 2017 Clean Air Plan relies on local communities to assist with implementation of some measures. The proposed project would provide preferred parking for low-emission and fuel-efficient vehicles. Electrical conduits would be provided in the parking lot to accommodate future electric vehicle parking spaces. Additionally, the conditions of approval require future tenants to obtain zero emission vehicles and trucks for their fleets. They also require the property owner/tenant/lessee to ensure all on-site equipment and vehicles (e.g., yard hostlers, yard equipment, forklifts, yard trucks and tractors, and pallet jacks) used within the project site are zero-emission from start of operations. Though the project is not adjacent to transit stations, CenterPoint would provide other VMT-reducing measures, such as bicycle parking to encourage alternative forms of travel. The proposed project would also be subject to the Bay Area's Commuter Benefits Program, which requires all employers in BAAQMD's jurisdiction that have 50 or more full-time employees to offer commuter benefits to their employees.
Energy and Climate Control Measures	▪ EN 1 – Decarbonize Electricity Production ▪ EN 2 – Renewable Energy Decrease Electricity Demand	The energy and climate (EN) control measures are intended to reduce energy use as a means of reducing adverse air quality emissions. The proposed project would install a PV system that would provide 8,083,000 kWh/yr of renewable electricity. Additionally, overall, the proposed buildings would comply with 2019 Building Energy Efficiency Standards' solar requirements and would be constructed to support a roof-mounted solar system. Compliance with the 2019 Building Energy Efficiency Standards would improve energy efficiency by 10.7 percent and 1 percent for electricity and natural gas, respectively, compared to the 2016 Building Energy Efficiency Standards. The proposed project would also be LEED certified and include insulated office spaces, warehouse motion-sensor lighting, and low-power-density warehouse lighting. Therefore, implementation of the proposed project would not conflict with these EN control measures.

Table 16 Consistency with 2017 Clean Air Plan Control Measures

Type	Measure Number/Title	Consistency Analysis
Buildings Control Measures	▪ BL 1 – Green Buildings ▪ BL 2 – Decarbonize Buildings ▪ BL 3 – Market-Based Solutions ▪ BL 4 – Urban Heat Island Mitigation	The buildings (BL) control measures focus on working with local governments to facilitate adoption of best GHG emissions control practices and policies. As discussed above for the EN control measures, the proposed buildings would comply with 2019 Building Energy Efficiency Standards—i.e., constructed to support a roof-mounted solar system and achieving greater energy efficiency compared to the 2016 Building Energy Efficiency Standards. The proposed project would also be LEED certified and include insulated office spaces, warehouse motion-sensor lighting, and low-power-density warehouse lighting.
Agriculture Control Measures	▪ AG 1 – Agricultural Guidance and Leadership ▪ AG 2 – Dairy Digesters ▪ AG 3 – Enteric Fermentation ▪ AG 4 – Livestock Waste	Agricultural practices in the Bay Area account for a small portion, roughly 1.5 percent, of the Bay Area GHG emissions inventory. The GHGs from agriculture include methane, nitrous oxide, and carbon dioxide. The proposed project would not involve any agricultural activities or operations.
Natural and Working Lands Control Measures	▪ NW 1 -- Carbon Sequestration in Rangelands ▪ NW 2 – Urban Tree Planting ▪ NW 3 – Carbon Sequestration in Wetlands	The control measures for the natural and working lands sector focus on increasing carbon sequestration on rangelands and wetlands. The proposed project would include the planting of various ornamental and shade trees throughout the project site.
Waste Management Control Measures	▪ WA 1 – Landfills ▪ WA 2 – Composting and Anaerobic Digesters ▪ WA 3 – Green Waste Diversion ▪ WA 4 – Recycling and Waste Reduction	The waste management (WA) control measures include strategies to increase waste diversion rates through efforts to reduce, reuse, and recycle. The project would comply with AB 341, which requires mandatory commercial recycling for businesses that generate 4 cubic yards or more of commercial solid waste per week. Additionally, the proposed project would reduce construction waste by 75% and use 30% recycled content during construction of the proposed facility. Therefore, the proposed project would not conflict with these WA control measures.
Water Control Measures	▪ WR 1 – Limit GHGs from publicly owned treatment works (POTWs) ▪ WR 2 – Support Water Conservation	The 2017 Clean Air Plan includes measures to reduce water use. The proposed project would include water efficiency measures required under CALGreen. In addition, the project would be designed and built to attain LEED certification and would include water efficient indoor fixtures above and beyond the requirements of CALGreen as well as water efficient landscaping outdoors.

6. Environmental Impacts

Table 16 Consistency with 2017 Clean Air Plan Control Measures

Type	Measure Number/Title	Consistency Analysis
Super-GHG Control Measures	▪ SL 1 – Short-Lived Climate Pollutants ▪ SL 2 – Guidance for Local Planners ▪ SL 3 – GHG Monitoring and Emissions Measurements Network	Super-GHGs include methane, black carbon, and fluorinated gases. These compounds are sometimes referred to as short-lived climate pollutants because their lifetime in the atmosphere is generally fairly short. Measures to reduce super-GHGs are addressed on a sector-by-sector basis in the 2017 Clean Air Plan. The conditions of approval would require future tenants to obtain zero emission vehicles and trucks for their fleets. They would also require the property owner/tenant/lessee to ensure that all on-site equipment and vehicles (e.g., yard hostlers, yard equipment, forklifts, yard trucks and tractors, and pallet jacks) used within the project site are zero-emission from start of operations. These actions would contribute to reducing black carbon. Furthermore, the project would comply with AB 341, which mandates commercial recycling for businesses that generate 4 cubic yards or more of commercial solid waste per week, which could contribute to reducing methane by diverting waste from landfills.
Further Study Control Measures	▪ FSM SS 1 – Internal Combustion Engines ▪ FSM SS 2 – Boilers, Steam Generator and Process Heaters ▪ FSM SS 3 – GHG Reductions from Non Cap-and Trade Sources ▪ FSM SS 4 – Methane Exemptions from Wastewater Regulation ▪ FSM SS 5 – Controlling start-up, shutdown, maintenance, and malfunction (SSMM) Emissions ▪ FSM SS 6 – Carbon Pollution Fee ▪ FSM SS 7 – Vanishing Oils and Rust Inhibitors ▪ FSM SS 8 – Dryers, Ovens and Kilns ▪ FSM SS 9 – Omnibus Rulemaking to Achieve Continuous Improvement ▪ FSM BL 1 – Space Heating ▪ FSM AG 1 – Wineries	The majority of the further study control measures apply to sources regulated directly by BAAQMD. Because BAAQMD is the implementing agency, any new sources of stationary and area sources in the project site would be required to comply with these additional study control measures in the 2017 Clean Air Plan.

Source: BAAQMD 2017b.

AIR-2 Construction activities associated with the proposed project could generate short-term emissions that would exceed the BAAQMD significance thresholds and cumulatively contribute to the nonattainment designations of the SFBAAB.

The Air District has identified thresholds of significance for criteria pollutant emissions and criteria air pollutant precursors, including ROG, NO_x, PM_{10}, and $PM_{2.5}$ (listed in Table 9). Development projects with emissions below these thresholds are not expected to generate sufficient criteria pollutant emissions to violate any air quality standard or contribute substantially to an existing or projected air quality violation.

Construction Emissions

Construction activities produce combustion emissions from various sources, such as on-site heavy-duty construction vehicles, vehicles hauling materials to and from the site, and motor vehicles transporting the construction crew. Demolition, site preparation, and grading activities produce fugitive dust emissions (PM_{10} and $PM_{2.5}$) from demolition and soil-disturbing activities, such as grading and excavation. Air pollutant emissions from construction activities on-site would vary daily as construction activity levels change. Construction activities associated with the proposed project would result in emissions of ROG, NOx, CO, PM_{10}, and $PM_{2.5}$.

Fugitive Dust

Ground-disturbing activities would generate fugitive dust. Fugitive dust emissions are considered significant unless the project implements the BAAQMD's best management practices (BMPs) for fugitive dust control during construction. PM_{10} is typically the most significant source of air pollution from the dust generated by construction. The amount of dust generated during construction would be highly variable and is dependent on the amount of material being demolished, the type of material, moisture content, and meteorological conditions. In the absence of BAAQMD's BMPs for fugitive dust control, PM_{10} and $PM_{2.5}$ levels downwind of actively disturbed areas could possibly exceed state standards.

Construction Exhaust Emissions

Construction emissions are based on the preliminary construction schedule developed for the proposed project. The proposed project site would be developed in one development phase. Activities that would take place are demolition, hauling, site preparation, grading, building construction, paving, and architectural coating. Construction activities are assumed to occur from November 2020 to December 2021.

To determine potential construction-related air quality impacts, criteria air pollutants generated by project-related construction activities are compared to the BAAQMD significance thresholds. Average daily emissions are based on the annual construction emissions divided by the total number of active construction days (285 days). Criteria air pollutant emissions from construction equipment exhaust are shown in Table 17, *506 Brookside Drive Construction-Related Criteria Air Pollutant Emissions Estimates.*

6. Environmental Impacts

Table 17 506 Brookside Drive Construction-Related Criteria Air Pollutant Emissions Estimates

Year	Criteria Air Pollutants (tons/year)[1]					
	ROG	NO_x	Fugitive PM_{10}[2]	Exhaust PM_{10}	Fugitive $PM_{2.5}$[2]	Exhaust $PM_{2.5}$
2020	<1	3	<1	<1	<1	<1
2021	3	5	1	<1	<1	<1
Total	4	9	1	<1	<1	<1
	Criteria Air Pollutants (average lbs/day)[1]					
	ROG	NO_x	Fugitive PM_{10}[2]	Exhaust PM_{10}	Fugitive $PM_{2.5}$[2]	Exhaust $PM_{2.5}$
Average Daily Construction Emissions all Phases[3]	25	60	7	1	2	1
BAAQMD Average Daily Project-Level Threshold	54	54	BMPs	82	BMPs	54
Exceeds Average Daily Threshold	**No**	**Yes**	**NA**	**No**	**NA**	**No**

Source: CalEEMod 2016.3.2.
Notes: BMP: Best Management Practices; NA: not applicable. Manual summation of emissions may not equal to the Total due to rounding.
[1] Construction phasing is based on the preliminary information provided by the Applicant. Where specific information regarding project-related construction activities was not available, construction assumptions were based on CalEEMod defaults, which are based on construction surveys conducted by South Coast Air Quality Management District of construction equipment and phasing for comparable projects.
[2] Includes fugitive dust control measures based on BAAQMD best management practices for fugitive dust control. Measures incorporated include watering disturbed areas a minimum of two times per day, reducing speed limit to 15 miles per hour on unpaved surfaces, application of non-toxic soil stabilizers, replacing ground cover, and street sweeping.
[3] Average daily emissions are based on the construction emissions divided by the total number of active construction days. The total number of active construction days is estimated to be 285 workdays.

As shown in the table, construction activities associated with improvements under the proposed project would exceed BAAQMD's regional significance thresholds for NO_X. The primary source of NO_X emissions is exhaust from vehicles and construction equipment. Haul trips associated with earthwork would be a primary contributor in the generation of NO_X emissions. Since NO_X is a precursor to the formation of both O_3 and particulate matter (PM_{10} and $PM_{2.5}$), project-related emissions of NO_X would contribute to the O_3, PM_{10}, and $PM_{2.5}$ nonattainment designations of the Air Basin.

Operational Emissions

Long-term air pollutant emissions generated by an industrial development are typically associated with the burning of fossil fuels in cars and trucks (mobile sources); energy use for cooling, heating, and manufacturing (energy); and area sources such as architectural coatings, and landscape equipment. The primary source of long-term criteria air pollutant emissions would be project-generated vehicle trips. The proposed project would generate a total of 1,100 ADTs consisting of 645 light duty passenger vehicle ADTs, 215 delivery vehicle ADTs, 48 drayage truck ADTs, and 192 heavy-duty truck ADTs.

Table 18, *Scenario 4 – Year 2021: Operational Criteria Air Pollutants Emissions Forecast*, identifies the criteria air pollutant emissions associated with operation of the proposed project. As shown in Table 18, operational

emissions generated by the project would not exceed BAAQMD daily or annual thresholds. Therefore, the proposed project would not contribute to the nonattainment designations of the Air Basin.

Table 18 Scenario 4 – Year 2021: Operational Criteria Air Pollutants Emissions Forecast

Source	Criteria Air Pollutants

Notes: Manual summation of emissions may not equal to the Total due to rounding.
1 New buildings would be constructed to the 2019 Building Energy Efficiency Standards and are modeled to be 1 percent more energy efficient for natural gas, compared to the 2016 Building Energy Efficiency Standards (NORESCO 2018).
2 Based on calendar year 2021 aggregated emission rates derived from EMFAC2017 Version 1.0.2 emissions data and CalEEMod methodology.
3 Assumes 33 percent of vehicles would be zero emission.
4 Assumes 100 percent zero emission drayage trucks.
5 Assumes 100 percent of trucks would be model year 2014 or newer.
6 Based on model years 2014 through 2021 emission rates derived from EMFAC2017 Version 1.0.2 emissions data and CalEEMod methodology.
7 Average daily emissions are based on the annual operational emissions divided by 365 days.

AIR-3 Construction and operation activities associated with the proposed project would not expose sensitive receptors to substantial criteria air pollutant and toxic air contaminant concentrations.

The proposed project could expose sensitive receptors to elevated pollutant concentrations if it would cause or contribute significantly to elevated pollutant concentration levels. Unlike regional emissions, localized emissions are typically evaluated in terms of air concentration rather than mass so they can be more readily correlated to potential health effects.

Construction

Off-Site Community Risk and Hazards During Construction

The proposed project would elevate concentrations of TACs and $PM_{2.5}$ in the vicinity of sensitive land uses during construction activities. The nearest off-site sensitive receptors proximate to the project site include

6. Environmental Impacts

Verde Elementary School to the south and residences to the south along Verde Avenue and Fred Jackson Way. Construction activities would occur near these sensitive receptor locations. Consequently, a construction HRA of TACs and $PM_{2.5}$ was prepared (see Appendix C).

Sources evaluated in the HRA include off-road construction equipment and heavy-duty diesel trucks along the truck route based on the 13-month construction duration and off-road equipment list provided by the Applicant. The EPA AERMOD air dispersion modeling program and the latest HRA guidance from OEHHA were used to estimate excess lifetime cancer risks, chronic noncancer hazard indices, and the $PM_{2.5}$ maximum annual concentrations at the nearest sensitive receptors. Results of the analysis are shown in Table 19, *Construction HRA Results*.

Table 19 Construction HRA Results

Receptor	Project Level Risk		
	Cancer Risk (per million)	Chronic Hazards	$PM_{2.5}$ (µg/m³)
Maximum Exposed Receptor – Verde Elementary School Student	0.8	0.03	0.09
Maximum Exposed Receptor – Verde Elementary School Staff	0.2	0.03	0.09
Maximum Exposed Off-Site Resident	2.2	0.01	0.02
BAAQMD Threshold	10	1.0	0.30
Exceeds Threshold	**No**	**No**	**No**

Source: Appendix C.
Cancer risk calculated using 2015 OEHHA HRA guidance.

The results of the HRA are based on the maximum receptor concentration over a 13-month construction exposure period for off-site receptors. It was conservatively assumed that the receptors were outdoors 8 hours a day, 260 construction days per year and exposed to all of the daily construction emissions. Cancer risk from project-related construction emissions for the maximum exposed receptor at Verde Elementary School is estimated at 0.8 in a million for students and 0.2 in a million for adult staff, which would be below the 10 in a million significance threshold. Cancer risk for maximum exposed single-family residences is estimated at 2.2 in a million, which is also under the 10 in a million significance threshold. For noncarcinogenic effects, the hazard index identified for each toxicological endpoint totaled less than one for off-site sensitive receptors. Therefore, chronic noncarcinogenic hazards are below the significance threshold. The highest $PM_{2.5}$ annual concentration, which occurs at Verde Elementary School, would not exceed the BAAQMD significance threshold of 0.3 micrograms per cubic meter (µg/m³). Therefore, the project would not expose sensitive receptors to substantial concentrations of air pollutant emissions during construction.

Operation

Off-Site Community Risk and Hazards During Operation

Operation of the proposed project would generate TACs from diesel-fueled truck and delivery vehicle activity and $PM_{2.5}$ emissions from all trucks and delivery vehicles in proximity to the same nearby sensitive receptors

evaluated in the construction HRA (i.e., Verde Elementary School students and nearby residents). The full methodology and results of the operational HRA are provided under a separate technical report (PlaceWorks 2020).

Operational emission sources evaluated in the HRA include the trucks and delivery vehicles traveling on-site over the ingress and egress driveways, idling at truck bays. The projected truck volumes and truck fleet mix were provided by Fehr and Peers (Fehr & Peers 2021). To account for the emission standards representative of the California fleet, the California Air Resources Board (CARB) has developed the EMFAC2017 emission factor model. EMFAC2017 was used to identify pollutant emission rates for DPM and $PM_{2.5}$. The EPA AERMOD Version 9.9.0 air dispersion modeling program and CARB's Hotspots Analysis and Reporting Program (HARP2) Risk Assessment Standalone Tool Version 19044 were used to estimate excess lifetime cancer risks, chronic noncancer hazard indices, and the $PM_{2.5}$ maximum annual concentrations at the nearest sensitive receptors. The results of the operational HRA are provided in Table 20, *Operational HRA Results*.

Table 20 Operational HRA Results

Source	Cancer Risk (per million)			Chronic Hazard Index[1]	$PM_{2.5}$ ($\mu g/m^3$)[1]
	Staff	Students	Resident		
Trucks and Delivery Vehicles	0.06	0.11	2.5	0.001	0.005
BAAQMD Threshold	10	10	10	1.0	0.3
Exceeds Threshold?	**No**	**No**	**No**	**No**	**No**

Source: PlaceWorks 2020.

[1] Chronic Hazard Index value and $PM_{2.5}$ value for the maximum exposed residential receptor. Chronic hazard index values and $PM_{2.5}$ values at the maximum exposed school receptor are less than at the residential receptor.

The calculated incremental cancer risks are 0.06 per million for adult school staff, 0.11 per million for students, and 2.5 per million for residents. Carcinogenic risks are all below the significance threshold value of 10 in a million for school staff, students, and residents. For noncarcinogenic effects, the chronic hazard index identified for each toxicological endpoint totaled less than one for all nearby sensitive receptors. Therefore, chronic noncarcinogenic hazards are below the significance threshold. Lastly, the highest $PM_{2.5}$ annual concentration at the maximum exposed receptor was 0.005 $\mu g/m^3$ and does not exceed the BAAQMD significance threshold of 0.3 $\mu g/m^3$.

The cumulative health risk values were determined by adding the health risk values from refined modeling of the project to the screening level health risk values from each individual stationary and mobile source within a 1,000-foot radius of the site. (BAAQMD 2020c).

The results of the health risk assessment from cumulative emission sources in the surrounding area are provided in Table 21, *Cumulative Health Risk Analysis Results*. The cumulative health risk values are less than the BAAQMD threshold of 100 in a million for a lifetime cancer risk and less than the noncarcinogenic chronic hazard index of 10.0. Additionally, the $PM_{2.5}$ concentrations for all emission sources are below the cumulative BAAQMD significance threshold of 0.8 $\mu g/m^3$.

6. Environmental Impacts

Table 21 Cumulative Analysis Results

Source	Cancer Risk (per million)	Chronic Hazard Index	Acute Hazard Index	$PM_{2.5}$ (µg/m3)
Refined Modeling Values				
Project[1]	2.5	0.001	N/A	0.005
Screening Analysis Values				
West County Resource Recovery	0.001	<0.001	<0.001	0.35
R&K Industrial Products Inc.	0.34	0.002	0.002	0.050
East Bay Municipal Utility District	0.62	0.001	0.001	0.001
Pick-n-pull Auto Dismantlers-Richmond #12	0.04	<0.001	<0.001	n/a
Cumulative Total	3.5	0.003	0.003	0.41
BAAQMD Threshold	100	10.0	10.0	0.8
Exceeds Threshold?	**No**	**No**	**No**	**No**

Source: PlaceWorks 2020.
[1] BAAQMD Screening Level Cancer Risk Values for stationary and mobile sources are for 30-year residential exposures. Therefore, the 30-year year residential health risks from Table 20 were used for the cumulative analysis.

Based on a comparison to the carcinogenic and noncarcinogenic thresholds established by OEHHA and BAAQMD, hazardous air emissions generated from operation of the project, when added to emissions from all the stationary and mobile sources within a 1,000-foot radius, are not anticipated to pose an actual or potential endangerment to residents. Therefore, the project would not expose sensitive receptors to substantial concentrations of air pollutant emissions during operation.

CO Hotspots

Areas of vehicle congestion have the potential to create pockets of CO called hotspots. These pockets have the potential to exceed the State one-hour standard of 20.0 ppm or the eight-hour standard of 9.0 ppm. Because CO is produced in the greatest quantities from vehicle combustion and does not readily disperse into the atmosphere, adherence to ambient air quality standards is typically demonstrated through an analysis of localized CO concentrations. Hotspots are typically produced at intersections, where traffic congestion is highest because vehicles queue for longer periods and are subject to reduced speeds.

Based on existing peak hour turning movement counts taken at the busiest intersections in the traffic study area, the highest existing peak hour intersection traffic volume is 5,310 PM peak hour vehicle trips at the intersection of Richmond Parkway and San Pablo Avenue (Fehr & Peers 2021). The proposed project would generate 1,100 ADTs, which would be distributed throughout the various segments and intersections of the traffic study area. Under existing plus project and cumulative plus project conditions, The addition of project trips at the intersection of Richmond Parkway and San Pablo Avenue would result in a high of 5,351 PM peak hour vehicle trips under existing plus project conditions and 7,354 PM peak hour trips under cumulative plus project conditions. Therefore, the proposed project would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour or 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited. Thus, trips associated with the proposed project would not exceed the screening criteria of the BAAQMD.

AIR-4	Operation of the proposed project could create or expose a substantial number of people to objectionable odors without incorporation of mitigation.

Construction

During construction activities, construction equipment exhaust and application of asphalt and architectural coatings would temporarily generate odors. Any construction-related odor emissions would be temporary and intermittent. Additionally, noxious odors would be confined to the immediate vicinity of the construction equipment. It is anticipated that by the time such emissions reach any sensitive receptor sites, they would be diluted to well below any level of air quality concern.

Operation

The proposed project would construct a new industrial park. Operation of this type of project could generate odors depending on what type of industry occupies the facilities. The type of uses that are considered to have objectionable odors include wastewater treatments plants, compost facilities, landfills, solid waste transfer stations, fiberglass manufacturing facilities, paint/coating operations (e.g., auto body shops), dairy farms, petroleum refineries, asphalt batch plants, chemical manufacturing, and food manufacturing facilities.

Though the specific uses of the buildings have not been decided, it is not anticipated that a wastewater treatment plant or solid waste transfer station would be accommodated at the project site. However, the proposed project could potentially accommodate the other types of land uses that are considered to have objectionable odors such as food processing facilities or chemical manufacturing. As shown previously in the Table 10, food manufacturing plants and chemical manufacturing have odor screening distances of one mile and two miles, respectively, from the facility to sensitive receptors. Sensitive receptors surrounding the project site that are within these screening distances are generally to the north, east, and south and consist of school and residential land uses. Thus, if the future tenants propose the types of land uses shown in Table 10, implementation of the project could create or expose a substantial number of people to objectionable odors.

6.3 GREENHOUSE GAS EMISSIONS IMPACTS

This section discusses the GHG emissions impacts of the project based on Scenario 4 – Year 2021. The discussion is organized by and responds to each of the Appendix G thresholds for GHG emissions identified in Section 5, *CEQA Thresholds*.

GHG-1	Operation of the proposed project would generate GHG emissions that exceed the BAAQMD bright-line threshold.

Global climate change is not confined to a particular project area and is generally accepted as the consequence of global industrialization over the last 200 years. A typical project, even a very large one, does not generate enough greenhouse gas emissions on its own to influence global climate change significantly; hence, the issue of global climate change is, by definition, a cumulative environmental impact. Therefore, this section measures the project's contribution to the cumulative environmental impact. The following is a

discussion of the project's contribution to GHG emissions during both the construction and operation phases.

Construction Phase

The Air District does not have thresholds of significance for construction-related GHG emissions, which are one-time, short-term emissions and therefore would not significantly contribute to the long-term cumulative GHG emissions impacts of the proposed project. One-time, short-term emissions are converted to average annual emissions by amortizing them over the service life of a building. For buildings in general, it is reasonable to look at a 30-year time frame, since this is a typical interval before a new building requires the first major renovation (IEA 2008). Project-related construction emissions are shown in Table 22, *Project GHG Emissions: Construction Phase*, and would be generated from construction worker and vendor vehicle trips in addition to truck haul trips. Additionally, operation of off-road equipment and vehicles would also generate GHG emissions. As shown in the table, when evaluated over an average 30-year project lifetime, average annual construction emissions from the proposed project would not exceed the BAAQMD *de minimis* bright-line threshold of 660 $MTCO_2e$/year.

Table 22 Project GHG Emissions: Construction Phase

Year	GHG Emissions $MMTCO_2e$ Per Year
2020	691
2021	1,360
Total Construction Emissions	**2,051**
30-Year Amortized Construction	68
BAAQMD Bright-Line Threshold[1]	660
Exceeds Threshold?	**No**

Source: CalEEMod Version 2016.3.2.25
[1] Based on BAAQMD's 1,100 $MTCO_2e$/yr bright-line threshold for AB 32 and the SB 32 GHG reduction target of 40 percent below 1990 levels by year 2030.

Operation Phase

The proposed project would contribute to global climate change through direct and indirect emissions of GHG from transportation sources (passenger vehicles, trucks), energy (natural gas and purchased energy), water use and wastewater generation, and solid waste generation. The proposed project under Scenario 4 – Year 2021 assumes 100 percent of off-road equipment used in daily operations and drayage trucks would be zero emission. Additionally, 33 percent of delivery vehicles are also assumed to be zero emission vehicles, and 100 percent of heavy-duty trucks are assumed to be model year 2014 and newer. The GHG emissions associated with operation of the project are shown in Table 23, *Scenario 4 – Year 2021: Operational GHG Emissions Forecast*. However, although zero emission and newer model year trucks are assumed, the proposed project is estimated to generate 5,454 $MTCO_2e$./yr, which would exceed the BAAQMD bright-line threshold of 660 $MTCO_2e$/yr. Passenger vehicles, which would not have restrictions placed on them, would alone generate emissions that exceed the bright-line threshold. In general, passenger vehicle trips are associated with employees and visitors. In addition, while it is anticipated that the proposed PV system would provide 100

percent of electricity demand, which would eliminate GHG emissions associated with electricity demand, the project would still generate energy sector GHG emissions from natural gas usage.

Table 23 Scenario 4 – Year 2021: Operational GHG Emissions Forecast

Source	GHG Emissions ($MTCO_2e$/Year)	
	$MTCO_2e$/Yr	Percent Proportion
Area	<1	<1%
Energy[1,2]	571	10%

Exceeds Threshold?	**Yes**	**NA**

Source: CalEEMod 2016.3.2.

Notes: Manual summation of the sources may not equal to the Total due to rounding.

1 New buildings are assumed to comply with the 2019 Building Energy Efficiency Standards and are modeled to be 10.7 percent and 1 percent more energy efficient for electricity and natural gas, respectively, compared to the 2016 Building Energy Efficiency Standards (NORESCO 2018). The proposed solar photovoltaic system would generate up to 8.083 gigawatt hours per year of renewable electricity and would provide 100 percent of the anticipated electricity demand of the proposed project.

2 Energy sector emissions are associated with project-related natural gas usage.

3 Based on calendar year 2021 aggregated emission rates derived from EMFAC2017 Version 1.0.2 emissions data and CalEEMod methodology.

4 Assumes 33 percent of vehicles would be zero emission.

5 Assumes 100 percent zero emission drayage trucks.

6 Assumes 100 percent of trucks would be model year 2014 or newer.

7 Based on model years 2014 through 2021 emission rates derived from EMFAC2017 Version 1.0.2 emissions data and CalEEMod methodology.

8 Based on BAAQMD's 1,100 $MTCO_2e$/yr bright-line threshold for AB 32 and the SB 32 GHG reduction target of 40 percent below 1990 levels by year 2030.

GHG-2 Implementation of the proposed project would not conflict with an applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

The following discusses project consistency with applicable plans adopted for the purpose of reducing GHG emissions, which include CARB's Scoping Plan, MTC/ABAG's *Plan Bay Area 2040*, and the Contra Costa County CAP.

CARB Scoping Plan

The CARB Scoping Plan is the State's strategy to achieve the GHG emissions reduction goals under AB 32 and SB 32, as well as a long-term strategy to achieve the state's overall carbon neutrality goals for 2050 under Executive Order S-03-05. It is applicable to state agencies, but is not directly applicable to cities/counties and individual projects (i.e., the Scoping Plan does not require the County to adopt policies, programs, or regulations to reduce GHG emissions). However, new regulations adopted by the state agencies outlined in the Scoping Plan result in GHG emissions reductions at the local level. As a result, local jurisdictions benefit

from reductions in transportation emissions rates, increases in water efficiency in the building and landscape codes, and other statewide actions that affect a local jurisdiction's emissions inventory from the top down.

Transportation Sector

Trucks

Under Scenario 4 – Year 2021, approximately 81 percent of the project's emissions are from the transportation sector, and over 50 percent of the project's total emissions are associated with VMT generated by heavy-duty trucks. In general, the state strategy for the transportation sector for medium and heavy-duty trucks is focused on making trucks more efficient and expediting truck turnover rather than reducing VMT from trucks. This is in contrast to the passenger vehicle component of the transportation sector, where both per-capita VMT reductions and an increase in vehicle efficiency are forecast to be needed to achieve the overall state emissions reductions goals.

Emissions associated with heavy-duty trucks involved in goods movements are generally controlled on the technology side and through fleet turnover of older trucks and engines to newer and cleaner trucks and engines. The following state strategies reduce GHG emissions from the medium and heavy-duty trucks:

- CARB's Mobile Source Strategy focuses on reducing GHGs through the transition to zero and low emission vehicles and from medium-duty and heavy-duty trucks (CARB 2017d).
- CARB's Sustainable Freight Action Plan establishes a goal to improve freight efficiency by 25 percent by 2030, deploy over 100,000 freight vehicles and equipment capable of zero emission operation and maximize both zero and near-zero emission freight vehicles and equipment powered by renewable energy by 2030 (CARB 2017d).
- CARB's Emissions Reduction Plan for Ports and Goods Movement (Goods Movement Plan) in California focuses on reducing heavy-duty truck-related emissions focus on establishment of emissions standards for trucks, fleet turnover, truck retrofits, and restriction on truck idling (CARB 2006). While the focus of Goods Movement Plan is to reduce criteria air pollutant and air toxic emissions, the strategies to reduce these pollutants would also generally have a beneficial effect in reducing GHG emissions.

Thus, these strategies would contribute to controlling heavy-duty truck GHG emissions associated with the proposed project. The proposed project would not conflict with statewide strategies. Trucks on-site are required to comply with CARB's Heavy-Duty (Tractor-Trailer) GHG Regulation, which requires SmartWay tractor trailers that include idle-reduction technologies, aerodynamic technologies, and low-rolling resistant tires that would reduce fuel consumption and associated GHG emissions. Furthermore, truck manufacturers would be required to comply with CARB's Advance Clean Truck (ACT) rule, which requires manufacturers of medium- and heavy-duty trucks and vans to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. Under the ACT rule, by 2035, zero-emission truck/chassis sales would need to be 55 percent of class 2b to 3 truck sales, 75 percent of class 4 to 8 straight truck sales, and 40 percent of truck tractor sales (CARB 2020d). Furthermore, the conditions of approval for the proposed

project would require use of model year 2014 or newer heavy-duty trucks with a transition to zero-emission trucks, which is also consistent with the state's goal to expedite turnover of older trucks with newer, more efficient trucks.

Passenger Vehicles

Approximately 24 percent of the total emissions associated with the project are associated with light-duty passenger vehicles. Statewide strategies to reduce GHG emissions from passenger vehicles and the transportation sector in general include the LCFS and changes in the corporate average fuel economy standards (e.g., Pavley I and Pavley California Advanced Clean Cars program).

Energy / Commercial-Residential Sector

Energy use generated by the project represents the second largest source of emissions (10 percent) after the transportation sector. New buildings under the proposed project would meet the current CALGreen and Building Energy Efficiency standards. In addition, the proposed PV system is anticipated to provide up to 8,083,000 kWh/yr of renewable electricity. Furthermore, over the long-term, electricity generated would be from sources with lower carbon intensity as a result of the state's carbon neutrality goals established under Executive Order B-55-18. SB 100 sets the RPS at 44 percent by 2024, 50 percent by 2026, 52 percent by 2027, and 60 percent by 2030. It also sets an RPS policy goal 100 percent by 2045. As a result, over time, GHG emissions from the energy sector will decrease. As evidenced by CARB's documentation of GHG emissions trends, in 2017 California generated more electricity from zero-GHG sources than GHG-emitting sources (CARB 2019b). Therefore, the proposed project would be consistent with the state's goals for this sector.

Other Sources

Other sources of GHG emissions represent approximately 8 percent of the total emissions inventory, with the vast majority from solid waste disposal (6 percent), which is associated with landfilling municipal solid waste. The amount of methane emitted to the atmosphere as a fraction of the total amount of methane generated from the decomposition of accumulated waste has gradually declined over time as more landfills install landfill gas collection and control systems and existing systems are operated more efficiently as a result of CARB's Landfill Methane Control Measure (CARB 2019b). Therefore, the proposed project would be consistent with the state's goals for the recycling and waste sector.

The proposed project would be required to adhere to the programs and regulations identified by the Scoping Plan and implemented by state, regional, and local agencies to achieve the statewide GHG reduction goals of AB 32 and SB 32. Project GHG emissions shown in Table 23 include reductions associated with statewide strategies that have been adopted since AB 32 and SB 32. Therefore, the proposed project would not obstruct implementation of the CARB Scoping Plan.

MTC's Plan Bay Area

As discussed, as part of the implementing framework for Plan Bay Area 2040, local governments have identified PDAs to focus growth. The project site is within the North Richmond PDA. Thus, the proposed project would be consistent with the overall goals of Plan Bay Area, which include concentrating new

investment in areas that would encourage job growth. In addition, the project would be developed in an area with existing infrastructure. Therefore, the proposed project would not conflict with the land use concept plan in Plan Bay Area 2040.

Contra Costa County Climate Action Plan

Contra Costa County adopted its CAP on December 15, 2015. The CAP is intended to streamline future environmental review of development projects in Contra Costa County by following the CEQA Guidelines and meeting the BAAQMD expectations for a qualified GHG reduction strategy. The County's strategy is structured around the following six topic areas: energy efficiency and conservation, renewable energy, land use and transportation, solid waste, water conservation, and government operations.

The proposed project incorporates several design elements that would reduce GHG emissions, such as conformance to the 2019 Building Energy Efficiency Standards and CALGreen building regulations and installation of a PV system. In addition, a development checklist under the CAP has been filled out for the proposed project to demonstrate compliance and is included in Appendix A. As identified in the checklist, the proposed project would not require a general plan amendment. The project will also be pursuing LEED certification, resulting in additional energy efficiency, water conservation, and waste reduction strategies. The proposed project would also be consistent with the measures in the CAP, as identified in Table 24, *Contra Costa County Climate Action Plan Consistency*.

Table 24 Contra Costa County Climate Action Plan Consistency

Applicable Goals	Measures	Consistency Analysis
Energy Efficiency and Conservation		
Increase energy efficiency in residential and commercial building stock, and reduce community-wide electricity and natural gas use.	EE-2: Provide opportunities for nonresidential buildings to become more energy efficient.	**Consistent**. The project would comply with the California Building Code and the 2019 Building Energy Efficiency Standards. This would improve energy efficiency by 10.7 percent and 1 percent for electricity and natural gas, respectively, compared to the 2016 Building Energy Efficiency Standards. The proposed project would also be LEED certified and will include insulated office spaces, warehouse motion-sensor lighting, and low power density warehouse lighting.
	EE-6: Support the statewide transition to net zero energy construction for new residential buildings by 2020 and new nonresidential buildings by 2030.	
Renewable Energy		
Increase the production of renewable energy from small-scale and commercial-scale renewable energy installations.	RE-1: Promote installation of alternative energy facilities on homes and businesses	**Consistent**. The proposed project would install a PV system that would provide 8,083,000 kWh/yr of renewable electricity. Additionally, overall, the proposed buildings would comply with Title 24 solar requirements and would be constructed to support a roof-mounted solar system.

Table 24 Contra Costa County Climate Action Plan Consistency

Applicable Goals	Measures	Consistency Analysis
Land Use and Transportation		
Reduce transportation emissions.	LUT-1: Maintain and expand access to goods, services, and other destinations through increased transportation alternatives (mobility improvements) and improved proximity (land use improvements).	**Consistent**. The proposed project would be subject to the Bay Area's Commuter Benefits Program, which requires all employers in the Air District's jurisdiction with 50 or more full-time employees to offer commuter benefits to their employees.
	LUT-2: Expand the use of alternative fuels in vehicle travel.	**Consistent.** CenterPoint would provide preferred parking for low-emitting and fuel-efficient vehicles. Electrical conduits would be provided in the parking lot to accommodate future electric vehicle parking spaces. Additionally, per the conditions of approval, future tenants would be required to obtain zero emission vehicles and trucks for their fleets.
	LUT-4: Reduce vehicle miles traveled.	**Consistent**. While the project is not adjacent to transit stations, CenterPoint would provide other VMT-reducing measures, such as bicycle parking to encourage alternative forms of travel. The project is consistent with the overarching goals of LUT-4.
Waste Reduction and Recycling		
Increase recycling and composting in the commercial sector.	W-1: Develop a waste reduction strategy to increase recycling and reuse of materials.	**Consistent**. The project would comply with AB 341, which requires mandatory commercial recycling for businesses that generate 4 cubic yards or more of commercial solid waste per week. Additionally, the proposed project would reduce construction waste by 75% and use 30% recycled content during construction of the proposed facility.
Water Conservation		
Conserve water.	WE-1: Reduce water demand.	**Consistent**. The proposed project would include water efficiency measures required under CALGreen. In addition, the project would be designed and built to attain LEED certification and would include water efficient indoor fixtures above and beyond the requirements of CALGreen as well as water efficient landscaping outdoors.

Source: CCC 2015.

6.4 RECOMMENDED REDUCTION MEASURES

6.4.1 Air Quality

Impact AIR-2

Fugitive Dust

AQ-1 The project's construction contractor shall comply with the following Bay Area Air Quality Management District best management practices for reducing construction emissions of PM_{10} and $PM_{2.5}$:

6. Environmental Impacts

- Water all active construction areas at least twice daily, or as often as needed to control dust emissions. Watering should be sufficient to prevent airborne dust from leaving the site. Increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour. Reclaimed water should be used whenever possible.
- To control dust, pave, apply water twice daily or as often as necessary, or apply (nontoxic) soil stabilizers on all unpaved access roads, parking areas, and staging areas at construction sites.
- Cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least 2 feet of freeboard (i.e., the minimum required space between the top of the load and the top of the trailer).
- Sweep daily with water sweepers (using reclaimed water if possible) or as often as needed, all paved access roads, parking areas, and staging areas at the construction site to control dust.
- Sweep public streets daily (with water sweepers using reclaimed water if possible) or as often as needed in the vicinity of the project site to keep streets free of visible soil material.
- Hydroseed or apply nontoxic soil stabilizers to inactive construction areas.
- Enclose, cover, water twice daily, or apply nontoxic soil binders to exposed stockpiles (e.g., dirt, sand, etc.).
- Limit vehicle traffic speeds on unpaved roads to 15 mph.
- Replant vegetation in disturbed areas as quickly as possible.
- Install sandbags or other erosion control measures to prevent silt runoff from public roadways.

Construction Exhaust

AQ-2 Construction contractors shall, at minimum, use equipment that meets the United States Environmental Protection Agency's (EPA) Tier 4 Interim emissions standards for off-road diesel-powered construction equipment with more than 50 horsepower for all site preparation, grading, and building construction activities, unless it can be demonstrated to the Contra Costa County Department of Conservation and Development that such equipment is not available. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by Tier 4 Interim emissions standards for a similarly sized engine, as defined by the California Air Resources Board's regulations.

Prior to construction, the project engineer shall ensure that all construction (e.g., demolition and grading) plans clearly show the requirement for EPA Tier 4 Interim emissions standards for construction equipment over 50 horsepower for the specific activities stated above.

During construction, the construction contractor shall maintain a list of all operating equipment in use on the construction site for verification by the Contra Costa County Department of Conservation and Development. The construction equipment list shall state the makes, models, Equipment Identification Numbers, and number of construction equipment onsite. Equipment shall be properly serviced and maintained in accordance with the manufacturer's recommendations. Construction contractors shall also ensure that all nonessential idling of construction equipment is restricted to 5 minutes or less in compliance with Section 2449 of the California Code of Regulations, Title 13, Article 4.8, Chapter 9.

Impact AIR-4

Odors

AQ-3 Prior to issuance of the certification of occupancy, Contra Costa County shall require future tenants proposing operations that have potential to emit nuisance odors to prepare an odor management plan that identifies project design features, measures, and control technologies to ensure compliance with Bay Area Air Quality Management District Regulation 7, Odorous Substances, which requires abatement of any nuisance generating an odor complaint. Facilities that have the potential to generate nuisance odors include, but are not limited to:

- Composting, green waste, or recycling facilities
- Fiberglass manufacturing facilities
- Painting/coating operations
- Large-capacity coffee roasters
- Food-processing facilities

The odor management plan for the proposed facility shall be submitted to the County. During operation of the proposed facility, the County shall conduct periodic evaluation of on-site odors per the schedule and reporting requirements outlined in the odor management plan.

6.4.2 Greenhouse Gas Emissions

Impact GHG-1

Operation

GHG-1 Prior to the issuance of building permits, the project applicant/developer shall demonstrate (e.g., provide building plans) to the satisfaction of the Contra Costa County Department of Conservation and Development, that the proposed buildings are designed and will be built to, at minimum, meet the Tier 2 advanced energy efficiency requirements of the Nonresidential Voluntary Measures of the California Green Building Standards Code, Division A5.2, Energy Efficiency, as outlined under Section A5.203.1.2.2.

6. Environmental Impacts

GHG-2 Prior to issuance of occupancy permits, the project applicant/developer shall demonstrate to the satisfaction of the Contra Costa County Department of Conservation and Development, that the proposed parking areas for passenger automobiles are designed and will be built to accommodate electric vehicle (EV) charging stations. At minimum, the parking shall be designed to accommodate a number of EV charging stations equal the Tier 2 Nonresidential Voluntary Measures of the California Green Building Standards Code, Section A5.106.5.3.2.

GHG-3 Prior to issuance of occupancy permits, the project applicant/developer shall demonstrate to the satisfaction of the Contra Costa County Department of Conservation and Development, that the proposed parking areas for passenger automobiles are designed and will be built to provide parking for low-emitting, fuel-efficient, and carpool/van vehicles. At minimum, the number of preferential parking spaces for passenger automobiles shall equal the Tier 2 Nonresidential Voluntary Measures of the California Green Building Standards Code, Section A5.106.5.1.2. At minimum, the number of preferential parking spaces shall equal the Tier 2 Nonresidential Voluntary Measures of the California Green Building Standards Code, Section A5.106.5.1.2.

GHG-4 To reduce idling emissions from transport trucks and support Condition of Approval 1g, which places restrictions on idling, the project applicant/developer shall have signage placed at truck access gates, loading docks, and truck parking areas that clearly notes idling is strictly prohibited on the subject property. In coordination with Contra Costa County, the project applicant/developer shall also place similar signs in the adjacent streets in the Richmond/San Pablo area. At minimum, each sign placed outside the interior premises of the subject property shall note the idling prohibition on the adjacent streets and include telephone numbers of the building facilities manager and the California Air Resources Board to report violations. All signage shall be made of weather-proof materials. All site and architectural plans submitted to the Contra Costa County Department of Conservation and Development shall note the locations of these signs. Prior to issuance of occupancy permits, the Contra Costa County Department of Conservation and Development shall verify compliance with these requirements herein.

GHG-5 All landscaping equipment (e.g., leaf blower) used for property management shall be electric-powered only. The property manager/facility owner shall provide documentation (e.g., purchase, rental, and/or services agreement) to the Contra Costa County Department of Conservation and Development to verify, to the County's satisfaction, that all landscaping equipment utilized will be electric-powered.

6.5 LEVEL OF SIGNIFICANCE AFTER MITIGATION

6.5.1 Air Quality

Impact AIR-2

Adherence to Recommended Reduction Measure AQ-1, which requires implementation of BAAQMD's BMPs for reducing construction emissions of PM_{10} and $PM_{2.5}$, would control and minimize fugitive dust emissions. Similarly, Recommended Reduction Measure AQ-2 would control and reduce NO_X emissions generated by project-related construction activities to below the average daily project-level threshold. Mitigated construction emissions are compared to the BAAQMD significance thresholds in Table 25, *Construction-Related Criteria Air Pollutant Emissions Estimates With Reduction Measures*.

Table 25 Construction-Related Criteria Air Pollutant Emissions Estimates With Reduction Measures

	Criteria Air Pollutants (tons/year)[1,2]					
Year	ROG	NO_x	Fugitive PM_{10}[3]	Exhaust PM_{10}	Fugitive $PM_{2.5}$[3]	Exhaust $PM_{2.5}$
2020	<1	3	<1	<1	<1	<1
2021	3	5	1	<1	<1	<1
Total	3	7	1	<1	<1	<1
	Criteria Air Pollutants (average lbs/day)[1,2]					
	ROG	NO_x	Fugitive PM_{10}[2]	Exhaust PM_{10}	Fugitive $PM_{2.5}$[2]	Exhaust $PM_{2.5}$
Average Daily Construction Emissions all Phases[4]	24	49	7	<1	2	<1
BAAQMD Average Daily Project-Level Threshold	54	54	BMPs	82	BMPs	54
Exceeds Average Daily Threshold	**No**	**No**	**NA**	**No**	**NA**	**No**

Source: CalEEMod 2016.3.2.

Notes: BMP: Best Management Practices; NA: not applicable. Manual summation of emissions may not equal to the Total due to rounding.

1 Construction phasing is based on the preliminary information provided by the Applicant. Where specific information regarding project-related construction activities was not available, construction assumptions were based on CalEEMod defaults, which are based on construction surveys conducted by South Coast Air Quality Management District of construction equipment and phasing for comparable projects.

2 Incorporates Recommended Reduction Measure AQ-1, which requires off-road construction equipment of 50 horsepower or more used for site preparation, grading, and building construction activities to comply with Tier 4 Interim emissions standards.

3 Includes fugitive dust control measures based on BAAQMD best management practices and as required under Recommended Reduction Measure AQ-1 for fugitive dust control. Measures incorporated include watering disturbed areas a minimum of two times per day, reducing speed limit to 15 miles per hour on unpaved surfaces, application of non-toxic soil stabilizers, replacing ground cover, and street sweeping.

4 Average daily emissions are based on the construction emissions divided by the total number of active construction days. The total number of active construction days is estimated to be 285 workdays.

Impact AIR-4

Implementation of Mitigation Measure AQ-3 would require the future tenants proposing food processing or food manufacturing operations to prepare an Odor Management Plan to ensure compliance with BAAQMD

Regulation 7, Odorous Substances. Adherence to the Odor Management Plan would minimize and contain odor impacts to people proximate to the project.

6.5.2 Greenhouse Gas Emissions

Impact GHG-1

The proposed project would install a PV system that would provide up to 8,083,000 kWh/yr of renewable electricity, which is estimated to cover the electricity demand of the proposed project. In addition, the proposed project would be subject to the conditions of approval outlined in Section 2.3 of this study. Conditions include requiring the purchase and use of zero emission on-road vehicles and trucks in addition to off-road equipment (see Conditions of Approval 1a through 1c). Additionally, providing the necessary infrastructure to support zero-emission vehicles and equipment operating on-site is also included as a condition (see 1d). Furthermore, under the conditions of approval, idling would be prohibited on-site and on the adjacent streets in the surrounding Richmond/San Pablo areas (see 1g). Implementation of Recommended Reduction Measures GHG-1 through GHG-5 would complement and supplement actions to be taken as part of the conditions of approval and reduce emissions to the extent possible. However, even with incorporation of these recommended measures, it is anticipated that operation of the proposed project as evaluated under the Scenario 4 – Year 2021 assumptions would still exceed the BAAQMD bright-line GHG emissions threshold of 660 $MTCO_2e$.

7. Additional Emissions Data

7.1 OVERVIEW

This section includes the air quality and GHG emissions results for the additional scenarios other than Scenario 4 – Year 2021 as requested by Contra Costa County. As stated, the scenarios reflect various levels of implementation of certain conditions of approval agreed upon between Contra Costa County and CenterPoint Properties.[23] The scenarios consist of Scenarios 1 through 4 with each examining emissions for calendar years 2021, 2023, 2025, and 2027.

7.2 MODELING RESULTS

The emissions results for each scenario are presented below. In addition to providing the emissions data for each scenario, each scenario is also compared to the Scenario 4 Year 2021 emissions.

7.2.1 Scenario 1

As stated, this scenario assumes no unique conditions of approval are adopted for vehicles and is provided for reference.

Year 2021

Scenario 1 – Year 2021 assumes diesel-powered forklifts and yard trucks. In addition, all delivery vehicles, drayage trucks, and heavy-duty trucks are assumed to be diesel powered.

Notes: Manual summation of the sources may not equal to the Total due to rounding.

1 New buildings are assumed to comply with the 2019 Building Energy Efficiency Standards and are modeled to be 10.7 percent and 1 percent more energy efficient for electricity and natural gas, respectively, compared to the 2016 Building Energy Efficiency Standards (NORESCO 2018). The proposed solar photovoltaic system would generate up to 8.083 gigawatt hours per year of renewable electricity and would provide 100 percent of the anticipated electricity demand of the proposed project.

2 Energy sector emissions are associated with project-related natural gas usage.

3 Based on calendar year 2021 aggregated emission rates derived from EMFAC2017 Version 1.0.2 emissions data and CalEEMod methodology.

4 Assumes 100 percent diesel-powered.

5 Based on 12 diesel powered forklifts each operating 12 hrs/day and 365 days per year and 6 diesel powered yard trucks each operating 4 hrs/day and 365 days per day. Forklift emissions are based on Contra Costa County year 2021 emissions data obtained from CARB's OFFROAD2017 Version 1.0.1 web database for the Industrial – Forklifts vehicle class rated at 100 horsepower. Yard truck emissions are based on OFFROAD2017 emissions data for the diesel-powered CHE – Rail Yard Tractor vehicle class rated at 175 horsepower.

6 Based on BAAQMD's 1,100 $MTCO_2e$/yr bright-line threshold for AB 32 and the SB 32 GHG reduction target of 40 percent below 1990 levels by year 2030.

Year 2023

Scenario 1 – Year 2023 assumes diesel-powered forklifts and yard trucks. In addition, all delivery vehicles, drayage trucks, and heavy-duty trucks are assumed to be diesel powered.

7.2.2 Scenario 2

As stated, this scenario represents a scenario where electric vehicle development and availability are significantly less than expected compared to Scenarios 3 and 4.

Year 2021

Scenario 2 – Year 2021 assumes the following for off-road equipment and delivery vehicles, drayage trucks, and heavy-duty trucks:

- **Off-Road Equipment:** Zero emission and assumed all forklifts and yard trucks would be electric powered.
- **Delivery Vehicles:** 25 percent zero emission (electric-powered) and 75 percent diesel powered.
- **Drayage Trucks:** 100 percent diesel powered.
- **Heavy-Duty Trucks:** 100 percent model year 2014 or later and diesel powered.

Notes: Manual summation of the sources may not equal to the Total due to rounding.

1 New buildings are assumed to comply with the 2019 Building Energy Efficiency Standards and are modeled to be 10.7 percent and 1 percent more energy efficient for electricity and natural gas, respectively, compared to the 2016 Building Energy Efficiency Standards (NORESCO 2018). The proposed solar photovoltaic system would generate up to 8.083 gigawatt hours per year of renewable electricity and would provide 100 percent of the anticipated electricity demand of the proposed project.

2 Energy sector emissions are associated with project-related natural gas usage.

3 Based on calendar year 2021 aggregated emission rates derived from EMFAC2017 Version 1.0.2 emissions data and CalEEMod methodology.

4 Assumes 45 percent of vehicles would be zero emission.

5 Assumes 25 percent of vehicles would be zero emission.

6 Assumes 25 percent would be zero emission and 75 percent would be model year 2014 or newer. Non-zero emission truck emissions based on model years 2014 through 2025 emission rates derived from EMFAC2017 Version 1.0.2 emissions data and CalEEMod methodology.

7 Assumes 100 percent zero emission.

8 Based on BAAQMD's 1,100 $MTCO_2e$/yr bright-line threshold for AB 32 and the SB 32 GHG reduction target of 40 percent below 1990 levels by year 2030.

Year 2027

Scenario 2 – Year 2027 assumes the following for off-road equipment and delivery vehicles, drayage trucks, and heavy-duty trucks:

- **Off-Road Equipment:** Zero emission and assumed all forklifts and yard trucks would be electric powered.
- **Delivery Vehicles:** 55 percent zero emission (electric powered) and 45 percent diesel powered.

7. Additional Emissions Data

- **Drayage Trucks:** 25 percent zero emission (electric powered) and 75 percent diesel powered.
- **Heavy-Duty Trucks:** 25 percent zero emission (electric powered) and 75 percent model year 2014 or later and diesel powered.

4 Assumes 55 percent of vehicles would be zero emission.

5 Assumes 25 percent of vehicles would be zero emission.

6 Assumes 25 percent would be zero emission and 75 percent would be model year 2014 or newer. Non-zero emission truck emissions based on model years 2014 through 2027 emission rates derived from EMFAC2017 Version 1.0.2 emissions data and CalEEMod methodology.

7 Assumes 100 percent zero emission.

8 Based on BAAQMD's 1,100 $MTCO_2e$/yr bright-line threshold for AB 32 and the SB 32 GHG reduction target of 40 percent below 1990 levels by year 2030.

7.2.3 Scenario 3

As stated, this scenario is provided for reference and represents best faith efforts by applicant(s) to purchase electric vehicles when commercially available, but production numbers of these electric vehicles cannot meet customer demand.

Year 2021

Scenario 3 – Year 2021 assumes the following for off-road equipment and delivery vehicles, drayage trucks, and heavy-duty trucks:

7. Additional Emissions Data

- **Off-Road Equipment:** Zero emission and assumed all forklifts and yard trucks would be electric powered.
- **Delivery Vehicles:** 50 percent zero emission (electric powered) and 50 percent diesel powered.
- **Drayage Trucks:** 100 percent diesel powered.
- **Heavy-Duty Trucks:** 100 percent model year 2014 or later and diesel powered.

Notes: "<1"=A value greater than 0, but less than 1; -<1=A value less than 0, but greater than -1. Manual summation of emissions may not equal to the Total due to rounding.

1 New buildings would be constructed to the 2019 Building Energy Efficiency Standards and are modeled to be 1 percent more energy efficient for natural gas, compared to the 2016 Building Energy Efficiency Standards (NORESCO 2018).

2 Based on calendar year 2027 aggregated emission rates derived from EMFAC2017 Version 1.0.2 emissions data and CalEEMod methodology.

3 Assumes 85 percent of vehicles would be zero emission.

4 Assumes 50 percent of vehicles would be zero emission.

5 Assumes 50 percent would be zero emission and 50 percent would be model year 2014 or newer. Non-zero emission truck emissions based on model years 2014 through 2027 emission rates derived from EMFAC2017 Version 1.0.2 emissions data and CalEEMod methodology.

6 Average daily emissions are based on the annual operational emissions divided by 365 days.

Greenhouse Gas Emissions

Table 49 Scenario 3 – Year 2027: Operational GHG Emissions Forecast

Source	GHG Emissions ($MTCO_2e$/Year)	
	$MTCO_2e$/Yr	Percent Proportion
Area	<1	<1%
Energy[1,2]	571	15%
On-Road Mobile Sources (Passenger)[3]	1,110	29%
On-Road Mobile Sources (Delivery Vehicles)[3,4]	77	2%
On-Road Mobile Sources (Drayage)[3,5]	398	10%
On-Road Mobile Sources (Heavy-Duty Trucks)[3,6]	1,268	33%
Off-Road Equipment[7]	0	0%
Waste	341	9%
Water/Wastewater	115	3%
Total	**3,880**	**100%**
BAAQMD Bright-Line Screening Threshold[8]	660	NA
Exceeds Threshold?	**Yes**	**NA**
Scenario 4 – Year 2021 Annual Emissions	5,454	NA
Net Difference	**-1,574**	**NA**

Source: CalEEMod 2016.3.2.

Notes: Manual summation of the sources may not equal to the Total due to rounding.

1 New buildings are assumed to comply with the 2019 Building Energy Efficiency Standards and are modeled to be 10.7 percent and 1 percent more energy efficient for electricity and natural gas, respectively, compared to the 2016 Building Energy Efficiency Standards (NORESCO 2018). The proposed solar photovoltaic system would generate up to 8.083 gigawatt hours per year of renewable electricity and would provide 100 percent of the anticipated electricity demand of the proposed project.

2 Energy sector emissions are associated with project-related natural gas usage.

3 Based on calendar year 2027 aggregated emission rates derived from EMFAC2017 Version 1.0.2 emissions data and CalEEMod methodology.

4 Assumes 85 percent of vehicles would be zero emission.

5 Assumes 50 percent of vehicles would be zero emission.

6 Assumes 50 percent would be zero emission and 50 percent would be model year 2014 or newer. Non-zero emission truck emissions based on model years 2014 through 2027 emission rates derived from EMFAC2017 Version 1.0.2 emissions data and CalEEMod methodology.

7 Assumes 100 percent zero emission.

8 Based on BAAQMD's 1,100 $MTCO_2e$/yr bright-line threshold for AB 32 and the SB 32 GHG reduction target of 40 percent below 1990 levels by year 2030.

7.2.4 Scenario 4

As stated, this scenario represents full compliance with the conditions of approval. The operational regional criteria air pollutant and GHG emissions for years 2023, 2025, and 2027 are provided below. Year 2021 emissions are provided in Section 6.2, *Air Quality*, and Section 6.3, *Greenhouse Gas Emissions*.

Year 2023

Scenario 4 – Year 2023 assumes the following for off-road equipment and delivery vehicles, drayage trucks, and heavy-duty trucks:

7. Additional Emissions Data

- **Off-Road Equipment:** Zero emission and assumed all forklifts and yard trucks would be electric powered.
- **Delivery Vehicles:** 65 percent zero emission (electric powered) and 35 percent diesel powered.
- **Drayage Trucks:** 100 percent zero emission.
- **Heavy-Duty Trucks:** 100 percent model year 2014 or later and diesel powered.

1. Introduction

CenterPoint Properties is proposing to develop a speculative warehouse project located at 506 Brookside Drive in North Richmond, an unincorporated area in Contra Costa County, California. The site is bound by Brookside Drive to the north, Fred Jackson Way to the west, industrial uses to the east, and Verde Elementary School, North Richmond Ball Field, and a storage facility to the south. The project would encompass approximately 31.47 acres and would include three buildings with approximately 522,709 square feet (SF) for industrial warehouse space and 32,801 SF for office space (555,510 SF total building space). Approximately 246 truck trailer parking spaces and 72 truck bays would be provided on-site.

Existing sensitive receptors proximate to the project site include the students and staff to the south at Verde Elementary School. Additionally, single family residences are located approximately 600 to the south beyond Verde Elementary School. Operation of the proposed project would generate toxic air contaminants (TACs) and fine particulate matter ($PM_{2.5}$) emissions due to truck activity in proximity to nearby sensitive receptors. Guidance from the California Environmental Protection Agency (Cal/EPA), Office of Environmental Health Hazard Assessment (OEHHA), California Air Pollution Control Officers Association (CAPCOA), and the Bay Area Air Quality Management District (BAAQMD) recommend the completion of health risk assessments (HRA) to determine the impacts of hazardous air emissions upon sensitive receptors in the vicinity of the project.

This HRA considers the health impact to sensitive receptors (adults and children at the nearby school and residences) of operational phase emissions from diesel trucks. It should be noted that these health impacts were based on conservative (i.e., health protective) assumptions. The United States Environmental Protection Agency (USEPA, 2005) and OEHHA (2015) note that conservative assumptions used in a risk assessment are intended to ensure that the estimated risks do not underestimate the actual risks. Therefore, the estimated risks do not necessarily represent actual risks experienced by populations near a site. The use of conservative assumptions tends to produce upper-bound estimates of risk and usually overestimate exposure and thus risk.

For school-based receptors, the following conservative assumptions were used:

- It was assumed that the maximum exposed receptor (MER), which includes elementary school students, stood outside for 8 hours per day, 180 days per year (i.e. school days per year). In reality, most students typically will spend a maximum of two hour per day outdoors for nutrition, lunch and physical education classes. This would result in lower estimated risk values.
- The calculated risk for students age 2-16 is multiplied by a factor of 3 to account for early life exposure and uncertainty in child versus adult exposure impacts.

For residential-based receptors, the following conservative assumptions were used:

1. Introduction

- It was assumed that maximum exposed residents (children and adults) stood outside at their residence for 24 hours per day, 350 days per year. In reality, California residents typically will spend on average 2 hours per day outdoors at their residences (USEPA, 2011). This would result in lower estimated risk values.

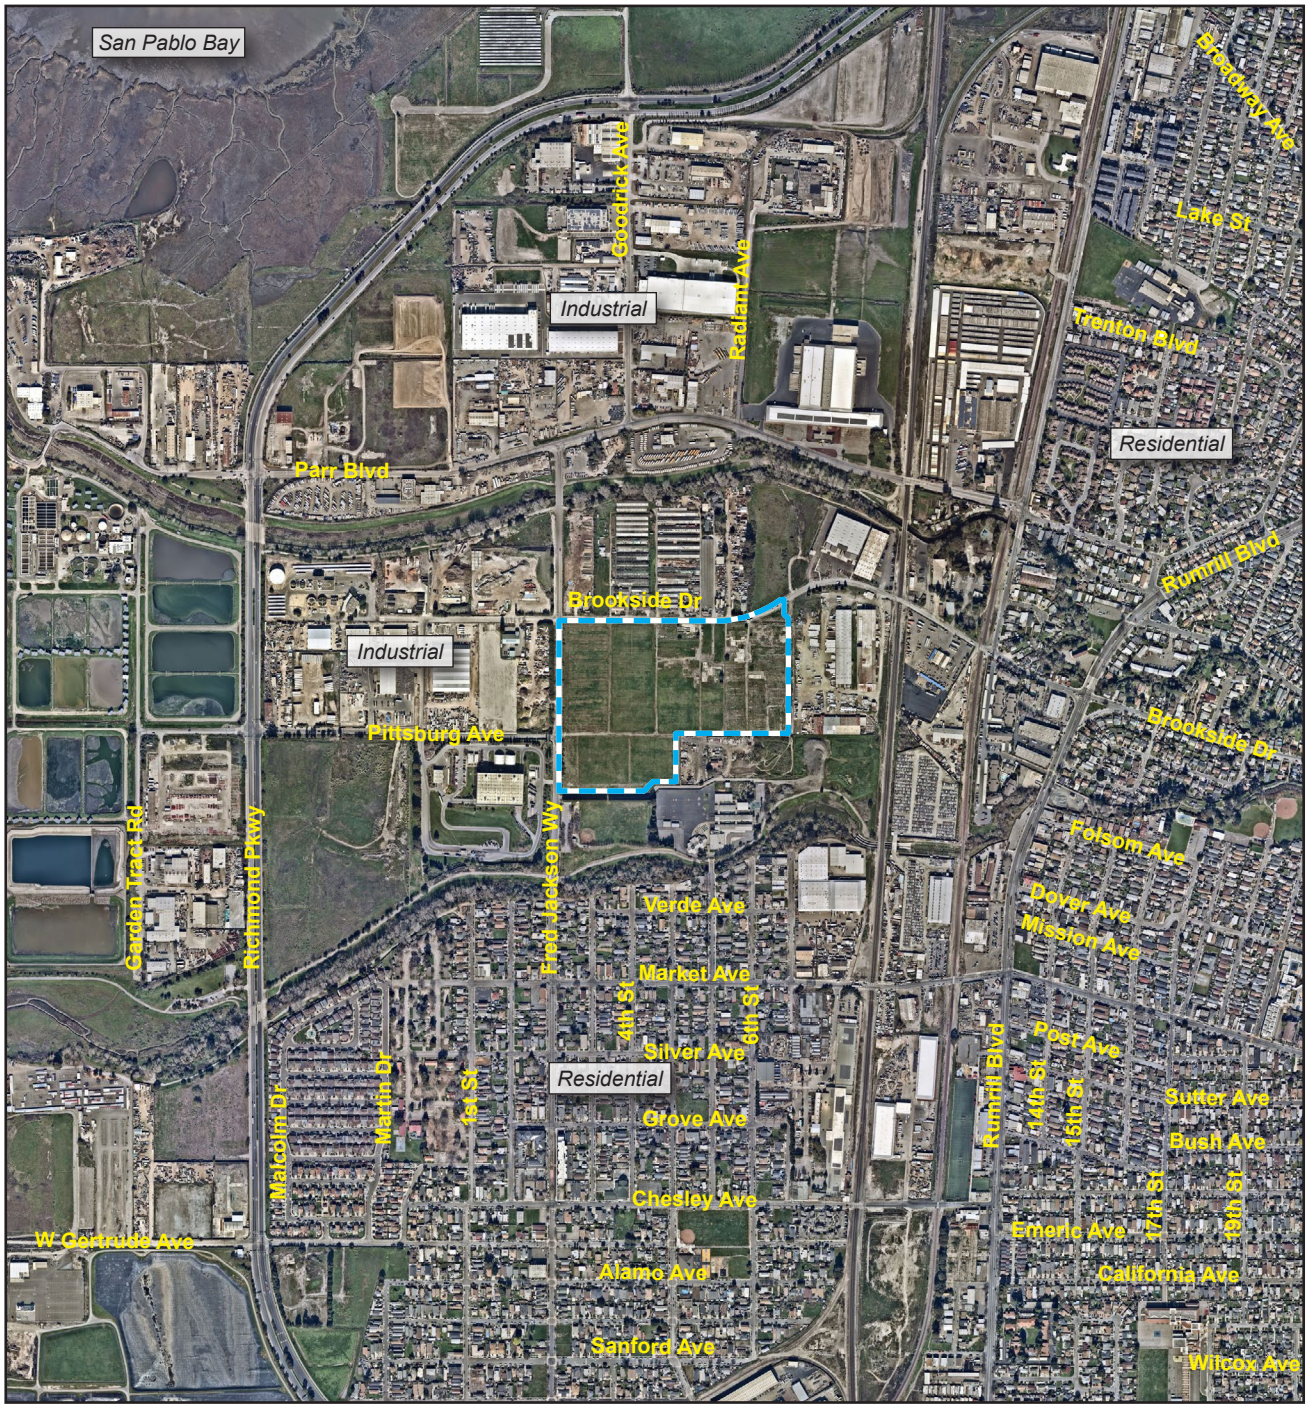
- The calculated risk for infants from third trimester to age 2 is multiplied by a factor of 10 and for children from 2-16 years is multiplied by a factor of 3 to account for early life exposure and uncertainty in child versus adult exposure impacts.

Thus, the estimated risks provided in this HRA are conservative.

2. Project Description

The project site is located at 506 Brookside Drive in the community of North Richmond, California. The site is bound by Fred Jackson Way to the west, Brookside Drive to the north, and Da Villa Street to the South. Uses associated with the proposed facility would include commercial office and industrial warehousing. Nearby surrounding land uses primarily consist of industrial to the north and east, commercial and industrial properties to the west, and Verde Elementary School to the southeast. The site is largely undeveloped with a single-family residence on the northeast edge of the project site. This residence and the nearby structures near the intersection of Brookside Drive and Niemeyer Road will be demolished as part of the project. The project site and vicinity are depicted in Figure 1.

The project would encompass approximately 31.47 acres and include three buildings with approximately 522,709 square feet (SF) of high-cube warehouse space and 32,801 SF for offices. The building details are as follows:



- Building 1: 234,613 SF and 25 truck bays
- Building 2: 208,927 SF and 21 truck bays
- Building 3: 111,970 SF and 26 truck bays
- Building Total: 555,510 SF with 72 total truck bays

The proposed site configuration is depicted in Figure 2.

2. Project Description

The following lists Conditions of Approval agreed to between CenterPoint Properties and Contra Costa County. The following mitigation measures shall be implemented during all on-going business operations, and shall be included as part of contractual lease agreement language to ensure the tenants/lessees are informed of all on-going operational responsibilities:

a) The property owner/tenant/lessee shall ensure that all heavy-duty trucks (Class 7 and 8) domiciled on the project site are model year 2014 or later from start of operations, and shall expedite a transition to zero-emission vehicles, with the fleet fully zero-emission by December 31, 2025 or when commercially available for the intended application, whichever date is later.

   "Domiciled at the project site" shall mean the vehicle is either (i) parked overnight at the project site more than 70% of the year or (ii) dedicated to the project site (defined as more than 70% of the routes start at the project site even if parked elsewhere).

b) The property owner/tenant/lessee shall utilize a "clean fleet" of vehicles/delivery vans/trucks (Class 2 through 6) as part of business operations as follows: For any vehicle (Class 2 through 6) domiciled at the project site, the following "clean fleet" requirements apply: (i) 33% of the fleet will be zero emission vehicles at start of operations, (ii) 65% of the fleet will be zero emission vehicles by December 31, 2023, (iii) 80% of the fleet will be zero emission vehicles by December 31, 2025, and (iv) 100% of the fleet will be zero emission vehicles by December 31, 2027 except that during a "surge" in demand (defined as an increase in greater than 20% in monthly traffic compared to the monthly average for the preceding 6-month period), those vehicles needed to accommodate the surge do not need to meet the 100% zero emission requirement; the "surge" vehicles must meet the 100% zero emission requirement by December 31, 2030.

   The property owner/tenant/lessee shall make all reasonable efforts to procure the zero emission vehicles/trucks required to meet the "clean fleet" requirements. In the event that there is a disruption in the manufacturing of zero emission vehicles/trucks or that sufficient vehicles/trucks are not commercially available for the intended application, the "clean fleet requirements" may be adjusted as minimally as possible by the Community Development Division (CDD) to accommodate the manufacturing disruption or unavailability of commercially available vehicles/trucks. The property owner/tenant/lessee shall provide all necessary documentation describing efforts made to meet clean fleet requirements as part of any adjustment request. The CDD staff may seek the recommendation of the California Air Resources Board in determining whether there has been a manufacturing disruption or there are insufficient vehicles/trucks commercially available for the intended application.

   "Domiciled at the project site" shall mean the vehicle is either (i) parked overnight at the project site more than 70% of the year or (ii) dedicated to the project site (defined as more than 70% of the routes start at the project site even if parked elsewhere).

   The property owner/tenant/lessee shall not be responsible to meet "clean fleet" requirements for vehicles used by common carriers (e.g., US Postal Service, UPS, FedEx) that provide delivery services to or from the project site.

2. Project Description

c) The property owner/tenant/lessee shall ensure all on-site equipment and vehicles (e.g., yard hostlers, yard equipment, forklifts, yard trucks and tractors, and pallet jacks) used within the project site are zero-emission from start of operations.

d) The property owner/tenant/lessee shall use the cleanest technologies available and provide the necessary infrastructure to support zero-emission vehicles and equipment that will be operating on-site.

e) At least 30 days prior to applying for building permits, the property owner/tenant/lessee shall submit plans for review and approval of CDD staff, which include the necessary infrastructure for future use of electric trucks, both semi-trucks and delivery trucks (e.g., installation of conduit specifically designated for truck charging equipment in the future).

f) At least 30 days prior to applying for building permits, the property owner/tenant/lessee shall submit plans for review and approval of CDD staff, which provide for a trucker's lounge appropriately sized for the square-footage/use intended for the space being occupied.

g) Idling is strictly prohibited on the subject property and adjacent streets in the Richmond/San Pablo area. The property owner/tenant/lessee shall inform all truck drivers associated with the business of this prohibition.

h) Applicant/tenant/lessee shall periodically sweep the property to remove road dust, tire wear, brake dust and other contaminants in parking lots.

i) Applicant/tenant/lessee shall not use diesel back-up generators on the property unless absolutely necessary. If absolutely necessary, generators shall have Best Available Control Technology (BACT) that meets California Air Resources Board (CARB)'s Tier 4 emission standards or meets the most stringent in-use standard, whichever has the least emissions.

j) The property owner/tenant/lessee shall monitor and be in compliance with all current air quality regulations for on-road trucks including CARB's Heavy-Duty (Tractor-trailer) Greenhouse Gas Regulation, Periodic Smoke Inspection Program, and the Statewide Truck and Bus Regulation.

k) The operation of Transportation Refrigeration Units (TRUs) is prohibited on the subject site. Any proposed use of TRUs at the subject location will require submittal of a Development Plan modification application.

l) As determined by the CDD, the property owner/tenant/lessee shall install sound walls and/or vegetation, when appropriate, to effectively block diesel emissions from existing nearby sensitive receptors (e.g., schools and residential neighborhoods).

m) The property owner shall add mitigation measures Air Quality XX, a through l, as part of contractual lease agreement language to ensure the tenant/lessee is informed of all on-going operational responsibilities.

2. Project Description

Lastly, CenterPoint Properties has agreed that all drayage vehicles traveling from local ports to the project site will be 100 percent zero emission vehicles at start of operation.

The proposed project will not include any stationary sources of emissions. Based on information provided by CenterPoint Properties, the project includes a drainage pump which will be connected to a permanent electric power source and no other stationary source of potential air emissions (i.e., emergency generator). Therefore, no stationary emission sources of air toxics were included in the evaluation.

2. Project Description

This page intentionally left blank.

3. Methodology and Significance Thresholds

The purpose of the HRA is to evaluate the potential health impacts from TACs and $PM_{2.5}$ emitted from trucks and vehicles during the project's operational phase. Operational emission sources include trucks and delivery vans traveling on-site, traveling along truck routes in the site vicinity, and idling at the proposed truck bays.

In May 2011, the updated BAAQMD CEQA Air Quality Guidelines were amended to include a risk and hazards threshold for new receptors and modified procedures for assessing impacts related to risk and hazard impacts; however, this later amendment regarding risk and hazards was the subject of the December 17, 2015, California Supreme Court decision (*California Building Industry Association v BAAQMD*), which clarified that CEQA does not require an evaluation of impacts of the environment on a project. The Supreme Court also found that CEQA requires the analysis of exposing people to environmental hazards in specific circumstances, including the location of development near airports, schools near sources of toxic contamination, and certain exemptions for infill and workforce housing. The Supreme Court also held that public agencies remain free to conduct this analysis regardless of whether it is required by CEQA. To account for these updates, BAAQMD published a new version of the Guidelines dated May 2017, which includes revisions made to address the Supreme Court's opinion.

For this HRA, the BAAQMD significance thresholds were deemed to be appropriate and the thresholds that were used for this project are shown below:

- Excess cancer risk of more than 10 in a million
- Non-cancer hazard index (chronic or acute) greater than 1.0
- Incremental increase in average annual $PM_{2.5}$ concentration of greater than 0.3 $\mu g/m^3$

In addition, there are thresholds of significance for cumulative impacts defined as the aggregate total of all past, present, and foreseeable future sources within a 1,000-foot radius of a source or receptor, plus the contribution from the project, exceeds the following:

- Excess cancer risk of more than 100 in a million
- Non-cancer hazard index (chronic or acute) greater than 10
- Average annual $PM_{2.5}$ concentration of greater than 0.8 $\mu g/m^3$

A site-specific analysis of TACs and $PM_{2.5}$ impacts on sensitive receptors was conducted. The methodology used in this HRA is consistent with the following BAAQMD and the Office of Environmental Health Hazard Assessment (OEHHA) guidance documents:

- BAAQMD, 2017. *California Environmental Quality Act Air Quality Guidelines*. May 2017.

3. Methodology and Significance Thresholds

- OEHHA. 2015. *Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments.* February 2015.
- BAAQMD, 2012. Recommended Methods for Screening and Modeling Local Risks and Hazards. Version 3.0. May 2012.

Potential exposures to DPM and $PM_{2.5}$ from proposed project operational activities were evaluated for off-site sensitive receptors in close proximity to the site, which includes Verde Elementary School and residences to the south of the project site. Receptor concentrations were estimated using air dispersion modeling, and excess lifetime cancer risks and chronic non-cancer hazard indexes were calculated. These risks were then compared to the significance thresholds identified in the BAAQMD CEQA guidelines and adopted in this HRA.

4. Emissions Inventories

Operational emission sources evaluated in the HRA include the diesel trucks traveling on-site over the ingress and egress driveways and idling at truck bays. To the degree practical, all contaminant emissions generated from each source were considered. The limiting factor for the inclusion of a compound was the availability of published exposure factors and other toxicity data enabling risks to be quantified and, where appropriate, target organs identified. To account for the emission standards representative of the California fleet, the California Air Resources Board (CARB) has developed the EMFAC2017 emission factor model. EMFAC2017 was used to identify pollutant emission rates for DPM and $PM_{2.5}$. The PM_{10} emission factor for diesel-fueled vehicles was used as the surrogate for DPM (CARB, 2017).

The evaluated truck volumes and truck fleet mix were from the trip generation for the project (Fehr & Peers, 2021). Fehr & Peers provided trip generation in terms of warehouse and office automobiles (860 one-way trips per day or 430 vehicles per day) and warehouse heavy trucks (240 one-way trips per day or 120 trucks per day). Trucks with 5 or more axles were modeled as heavy-heavy duty trucks (HHDT). CenterPoint Properties provided that drayage trucks would make up approximately 20% of heavy trucks.

To estimate the number of delivery vehicles (vans and trucks, Class 2 through Class 6 vehicles), CenterPoint Properties provided that delivery vans and delivery trucks would make up approximately 25% of warehouse and office automobiles (i.e., 108 delivery vehicles). Per the Conditions of Approval for the project, 33% of the delivery fleet will be zero emission (ZE) vans and trucks. Lastly, a 50/50 split of delivery vans and delivery trucks was used for the delivery fleet.

Table 1 provides the vehicle specifications and numbers used for the EMFAC2017 model run and to create the emissions inventory.

Table 1 Vehicle Specifications

Vehicle Type	Fuel Type	Vehicles per Day	Added EMFAC Specifications[1]
Heavy-Heavy Duty Trucks	Diesel	96	Model year 2014, HHDT class
Drayage Vehicles 20% of heavy trucks	100% Zero Emission at Buildout	24	Aggregated model years T7-POAK vehicle class
Delivery Vans 25% warehouse+office autos	67% Diesel 33% Zero Emission at Buildout	54 total delivery vans 37 diesel-fueled	Aggregated model years LHT1/2, MDV, LHD1/2, MHD classes
Delivery Trucks	67% Diesel 33% Zero Emission at Buildout	54 total delivery trucks 37 diesel-fueled	Aggregated model years LHT1/2, MDV, LHD1/2, MHD classes
Forklifts/Yard Equipment	100% Zero Emission at Buildout	n/a	Not included in HRA

Note: Project Buildout 2021.
1 EMFAC2017 emission rates estimated for Contra Costa County, year 2021, 5 mph for on-site vehicles, 35 mph for vehicles traveling on off-site truck routes.

4. Emissions Inventories

DPM emissions were estimated for running and idling emissions from the diesel-fueled vehicles listed in Table 1. Running emissions were determined for an assumed lot speed of 5 mph for on-site travel and for the speed limit of 35 mph for off-site travel along the designated truck routes. The designated truck routes for the City of Richmond are towards Parr Boulevard to the north and Richmond Parkway to the west. During operation of the project, trucks would use the segment of Fred Jackson Way north of Pittsburg Avenue to access the Parr Avenue truck route or would travel west on Pittsburg Avenue to access the Richmond Parkway truck route. Idling emission rates for trucks and delivery vans idling at the project truck bays were also determined using EMFAC2017 using an idling time of 15 minutes per truck or van.

$PM_{2.5}$ emissions were estimated for all heavy duty trucks (including drayage vehicles) and the delivery fleet for running, idling, brake wear, tire wear, and re-entrained dust. The predictive emission equation developed by the USEPA was used to generate the entrained dust source strength (USEPA, 2015).

Emission rate calculations are provided in Appendix A for each emission source. It should be noted that emission rate calculations were based on EMFAC2017 emissions data for the project buildout year (2021). Using only the emission factors for the year 2021 is conservative since emissions are predicted to decline over time due to implementation of CARB's Diesel Risk Reduction Plan and increasing emissions requirements for engines (CARB, 2000). For instance, CARB estimates DPM emissions in 2035 will be less than half those in 2010 (CARB, 2020).

5. Air Dispersion Modeling

Air quality modeling using the AERMOD atmospheric dispersion model was performed to assess the impact of emitted compounds on sensitive receptors near the project. The model is a steady state Gaussian plume model and is an approved model by BAAQMD for estimating flagpole-level impacts from point and fugitive sources in simple and complex terrain. The on-site operational emissions from truck travel were modeled as poly-area sources, and the idling trucks sources were modeled as point sources. The off-site truck travel emissions were modeled as adjacent volume sources from the project site up to a distance of 1,000 feet from the property boundary towards the designated truck routes to the north and to the west. A 10 meter by 10 meter receptor grid was used for Verde Elementary School, and a 20 meter by 10 meter receptor grid was used for the residences south of the site.

The model requires additional input parameters, including chemical emission data and local meteorology. Inputs for the operational phase emission rates are those described in Section 4. Meteorological data obtained from the BAAQMD for the nearest representative meteorological station (Chevron Tower, anemometer height 1.5 m) with the four latest available years (2013, 2015 to 2017) of record were used to represent local weather conditions and prevailing winds. The prevailing wind direction at the Chevron Tower met station is to the north, and the wind rose is provided in Appendix A. Therefore, nearby sensitive receptors are located upwind of the project site.

The modeling analysis also considered the spatial distribution and elevation of each emitting source in relation to the sensitive receptors. To accommodate the model's Cartesian grid format, direction-dependent calculations were obtained by identifying the Universal Transverse Mercator (UTM) coordinates for each source location. In addition, digital elevation model (DEM) data for the area were obtained and included in the model runs to account for complex terrain. A vertical emission release height of 4.15 meters was used as representative of the stack exhaust height for diesel truck traffic, and an initial vertical dispersion parameter of 1.93 m was used (CARB, 2000). A horizontal release height of 0.6 meters was used to represent tailpipes for delivery vans (CARB, 2000). For the operational model run, the model's HRDOW scalar option was invoked to predict flagpole-level concentrations (1.5 m for ground-floor receptors) for emissions generated during normal school hours of 8:00 AM to 4:00 PM, 5 days per week. For residential receptors, emissions generated were for the proposed work hours of 24 per day, 7 days per week.

A unit emission rate of 1 gram per second was used for all modeling runs. The unit emission rates were proportioned over the poly-area sources for on-site operational truck travel emissions and divided between the volume sources for off-site hauling emissions. The maximum AERMOD concentrations from the output files were then multiplied by the emission rates calculated in Appendix A to obtain the maximum flagpole-level concentrations at the maximum exposed receptor (MER). The air dispersion model output for the emission sources is presented in Appendix B. The model output DPM and $PM_{2.5}$ concentrations used in the risk analysis are provided in Appendix C.

5. Air Dispersion Modeling

This page intentionally left blank.

6. Risk Characterizations

6.1 CARCINOGENIC CHEMICAL RISK

The BAAQMD has established a threshold of ten in a million (10×10^{-6}) as a level posing no significant risk for exposures to carcinogens.

Health risks associated with exposure to carcinogenic compounds can be defined in terms of the probability of developing cancer as a result of exposure to a chemical at a given concentration. The cancer risk probability is determined by multiplying the chemical's annual concentration by its cancer potency factor (CPF), a measure of the carcinogenic potential of a chemical when a dose is received through the inhalation pathway. It is an upper-limit estimate of the probability of contracting cancer as a result of continuous exposure to an ambient concentration of one microgram per cubic meter ($\mu g/m^3$) over a lifetime of 70 years.

Recent guidance from OEHHA recommends a refinement to the standard point estimate approach with the use of age-specific breathing rates and age sensitivity factors (ASFs) to assess risk for susceptible subpopulations such as children. For the inhalation pathway, the procedure requires the incorporation of several discrete variates to effectively quantify dose for each age group. Once determined, contaminant dose is multiplied by the cancer potency factor in units of inverse dose expressed in milligrams per kilogram per day $(mg/kg/day)^{-1}$ to derive the cancer risk estimate. Therefore, the following dose algorithm was used to accommodate the unique exposures associated with the school and residential receptors.

$$\text{Dose}_{\text{AIR,per age group}} = \left(C_{air} \times EF \times \left[\frac{BR}{BW}\right] \times A \times CF\right)$$

Where:

Dose_{AIR}	=	dose by inhalation (mg/kg-day), per age group
C_{air}	=	concentration of contaminant in air ($\mu g/m^3$)
EF	=	exposure frequency (number of days/365 days)
BR/BW	=	daily breathing rate normalized to body weight (L/kg-day)
A	=	inhalation absorption factor (default = 1)
CF	=	conversion factor ($1x10^{-6}$, µg to mg, L to m^3)

The inhalation absorption factor (A) is a unitless factor that is only used if the cancer potency factor included a correction for absorption across the lung. The default value of 1 was used for this assessment. To represent the unique characteristics of the school population, the assessment employed the USEPA's guidance to develop viable dose estimates based on reasonable maximum exposure, defined as the "highest exposure that is reasonably expected to occur" for a given receptor population. Lifetime risk values for the student population were adjusted to account for an exposure of 180 days per year for 9 years (K through 8th grade). In addition, the calculated risk for students is multiplied by an ASF weighting factor of 3 (for children ages 5

6. Risk Characterizations

to 14 years) to account for early life sensitivity to pollutant exposures (OEHHA, 2015). To assess staff-related risk, exposures were adjusted to account for an employment period of 250 days per year for 25 years. This timeline is considered appropriate for potential workplace exposures established by OEHHA. It was assumed that the MER spent 8 hours per day, 5 days per week outdoors at the school, as per default exposure parameters.

For residential receptors, the exposure frequency (EF) of 0.96 is used to represent 350 days per year to allow for a two week period away from home each year (OEHHA 2015). This timeline is considered appropriate for potential workplace exposures established by OEHHA (2015). The 95th percentile daily breathing rates (BR/BW), exposure duration (ED), ASFs, and fraction of time at home (FAH) for the various age groups are provided herein:

Age Groups	BR/BW (L/kg-day)	ED	ASF	FAH
Third trimester	361	0.25	10	1.0
0-2 age group	1,090	2	10	1.0
2-9 age group	861	7	3	1.0
2-16 age group	745	14	3	1.0
16-30 age group	335	14	1	0.73
16-70 age group	290	54	1	0.73

A fraction of time at home value of 1 was used for this assessment for ages under 16 years due to the proximity to Verde Elementary School.

To calculate the overall cancer risk, the risk for each appropriate age group is calculated per the following equation:

$$\text{Cancer Risk}_{\text{AIR}} = \text{Dose}_{\text{AIR}} \times \text{CPF} \times \text{ASF} \times \text{FAH} \times \frac{\text{ED}}{AT}$$

Where:

Dose_{AIR}	=	dose by inhalation (mg/kg-day), per age group
CPF	=	cancer potency factor, chemical-specific $(\text{mg/kg-day})^{-1}$
ASF	=	age sensitivity factor, per age group
FAH	=	fraction of time at home, per age group (for residential receptors only)
ED	=	exposure duration (years)
AT	=	averaging time period over which exposure duration is averaged (always 70 years)

The CPFs used in the assessment were obtained from OEHHA guidance. The excess lifetime cancer risks are calculated separately for the students, adult staff, and residents because of age differences in sensitivity to carcinogens and age differences in intake rates. The final step converts the cancer risk in scientific notation to a whole number that expresses the cancer risk in "chances per million" by multiplying the cancer risk by a factor of $1x10^6$ (i.e. 1 million).

CARB's Hotspots Analysis and Reporting Program (HARP2) Risk Assessment Standalone Tool was used to calculate the cancer risk values (CARB, 2019), and the output results are provided in Appendix C.

6.2 NON-CARCINOGENIC HAZARDS

An evaluation of the potential non-cancer effects of chronic chemical exposures was also conducted. Adverse health effects are evaluated by comparing the annual receptor level (flagpole) concentration of each chemical compound with the appropriate reference exposure limit (REL). Available RELs promulgated by OEHHA were considered in the assessment.

The hazard index approach was used to quantify non-carcinogenic impacts. The hazard index assumes that chronic sub-threshold exposures adversely affect a specific organ or organ system (toxicological endpoint). Target organs presented in regulatory guidance were used for each discrete chemical exposure. To calculate the hazard index, each chemical concentration or dose is divided by the appropriate toxicity value. This ratio is summed for compounds affecting the same toxicological endpoint. A health hazard is presumed to exist where the total equals or exceeds one.

CARB's HARP2, Risk Assessment Standalone Tool was used to calculate the chronic health risk values (CARB, 2019), and the output results are provided in Appendix C.

6.3 CRITERIA POLLUTANTS

The BAAQMD has incorporated $PM_{2.5}$ into the District's CEQA significance thresholds due to studies that show adverse health impacts from exposure to this pollutant. An incremental increase of greater than 0.3 $\mu g/m^3$ for the annual average $PM_{2.5}$ concentration is considered to be a significant impact (BAAQMD, 2017). The modeling results for $PM_{2.5}$ are summarized in Table 2 and provided in Appendix C.

6. Risk Characterizations

This page intentionally left blank.

7. Results Conclusions

The following section summarizes the results and conclusion for this HRA report. For the operational modeling, the receptor and MER locations are presented in Figure 3.

7.1 PROJECT ANALYSIS

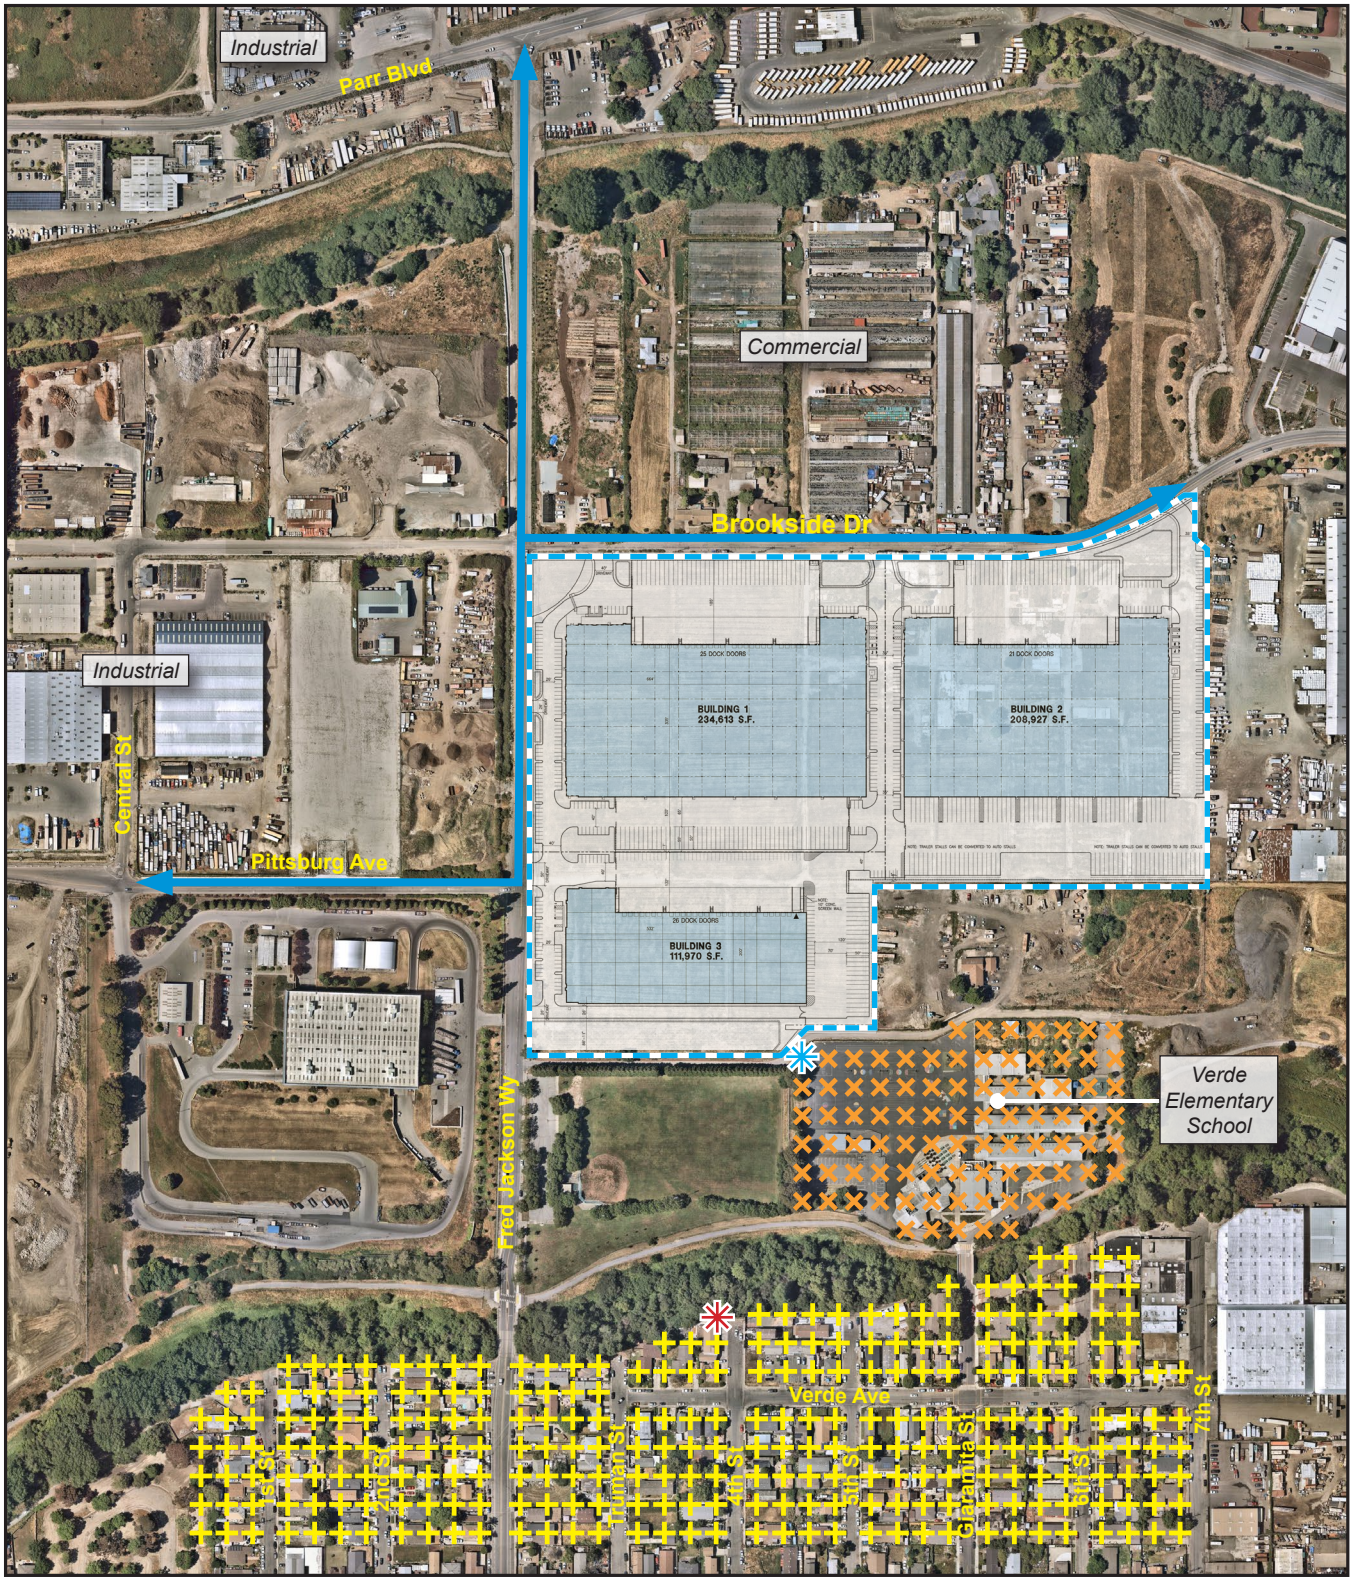
This risk assessment assumed a maximum exposure scenario, i.e., students and staff are exposed to outdoor pollutant concentrations from emission sources during the entire school day (8 hours per day) and residents are exposed for the entirety of operational work hours (24 hours per day). The results of the health risk assessment are provided in Table 2. The incremental cancer risk was calculated to be 0.06 per million for adult school staff, 0.11 per million for students, and 2.5 per million for residents. In comparison to the threshold level of 10 in a million, carcinogenic risks are all below the significance threshold value of 10 in a million for school staff, students, and residents.

For non-carcinogenic effects, the chronic hazard index identified for each toxicological endpoint totaled less than one for all off-site sensitive receptors. Therefore, chronic non-carcinogenic hazards are below the significance threshold. Lastly, the highest calculated $PM_{2.5}$ annual concentration at an off-site receptor was 0.005 $\mu g/m^3$ (i.e., at the residential MER) and would not exceed the BAAQMD significance threshold of 0.3 $\mu g/m^3$.

Table 2 HRA Results

Source	Cancer Risk (per million)			Chronic Hazard Index	$PM_{2.5}$ ($\mu g/m^3$)
	Staff	Student	Resident		
All Sources of the Project	0.06	0.11	2.5	0.001[(a)]	0.005[(a)]
BAAQMD Threshold	10	10	10	1.0	0.3
Exceeds Threshold?	**No**	**No**	**No**	**No**	**No**

Sources: HARP2, Risk Standalone Tool (CARB, 2019).



(a) Chronic Hazard Index value and $PM_{2.5}$ value for the maximum exposed residential receptor. Chronic hazard index values and $PM_{2.5}$ values at the maximum exposed school receptor are less than at the residential receptor (see Appendix C).

Based on a comparison to the carcinogenic and non-carcinogenic thresholds established by OEHHA and BAAQMD, hazardous air emissions generated from operation of the project are not anticipated to pose an actual or potential endangerment to the surrounding sensitive receptors and no mitigation measures are required.

7. Results and Conclusions

Maximum Exposed Receptor Locations

7.2 CUMULATIVE ANALYSIS

The cumulative health risks values were determined by adding the health risk values from refined modeling of the project to the screening level health risk values from each individual stationary and mobile source within a 1,000-foot radius of the site. BAAQMD has developed screening analysis tools for identifying and characterizing stationary and mobile sources and were utilized to characterize the emission sources within 1,000 feet of the project site (BAAQMD, 2020). The screening level health risk analysis and BAAQMD correspondence is provided in Appendix A.

The results of the health risk assessment from cumulative emission sources in the surrounding area are provided in Table 3. The cumulative health risk values are less than the BAAQMD threshold of 100 in a million for a lifetime cancer risk and less than the non-carcinogenic chronic hazard index of 10.0. Additionally, the $PM_{2.5}$ concentrations for all emission sources are below the cumulative BAAQMD significance threshold of 0.8 $\mu g/m^3$.

Based on a comparison to the carcinogenic and non-carcinogenic thresholds established by OEHHA and BAAQMD, hazardous air emissions generated from operation of the project when added to emissions from all the stationary and mobile sources within a 1,000-foot radius are not anticipated to pose an actual or potential endangerment to nearby sensitive receptors.

Table 3 Cumulative Analysis Results

Source	Cancer Risk (per million)	Chronic Hazard Index	Acute Hazard Index	$PM_{2.5}$ (µg/m3)
REFINED MODELING VALUES				
Project [(a)]	2.5	0.001	N/A	0.005
SCREENING ANALYSIS VALUES				
West County Resource Recovery	0.001	<0.001	<0.001	0.35
R&K Industrial Products Inc.	0.34	0.002	0.002	0.050
East Bay Municipal Utility District	0.62	0.001	0.001	0.001
Pick-n-pull Auto Dismantlers-Richmond #12	0.04	<0.001	<0.001	n/a
Cumulative Total	3.5	0.003	0.003	0.41
BAAQMD Threshold	100	10.0	10.0	0.8
Exceeds Threshold?	**No**	**No**	**No**	**No**

Sources: CARB HARP2 for refined modeling; BAAQMD screening tools for screening analysis (BAAQMD, 2020).
(a) BAAQMD Screening Level Cancer Risk Values for stationary and mobile sources are for 30-year residential exposures. Therefore, the 30-year year residential health risks from Table 1 were used for the cumulative analysis.

Step 1: Enter Facility Data	
Plant Name	West County Resources
Plant No.	6316

Step 4: Specify Source Type	
Does facility have only diesel backup generators?	no
Is this analysis for a gas station?	yes

Note: Default generic distance multiplier used if source is not a generator or gas station.

Step 2: Estimate Distance	
What is the distance (m) from the facility boundary to the MEI?	205

Step 5: Read Estimates

Total Cancer Risk		0.001	per 1,000,000
Total Chronic Hazard		0.000	
Total PM2.5	Concentration	0.000	µg/m^3

Step 3: Enter Emissions Data

Chemical Name	CAS No. (dashes removed)	Rate (lb/day)	Risk (# / 1,000,000)	Hazard (index)	Concentration (µg/m3)

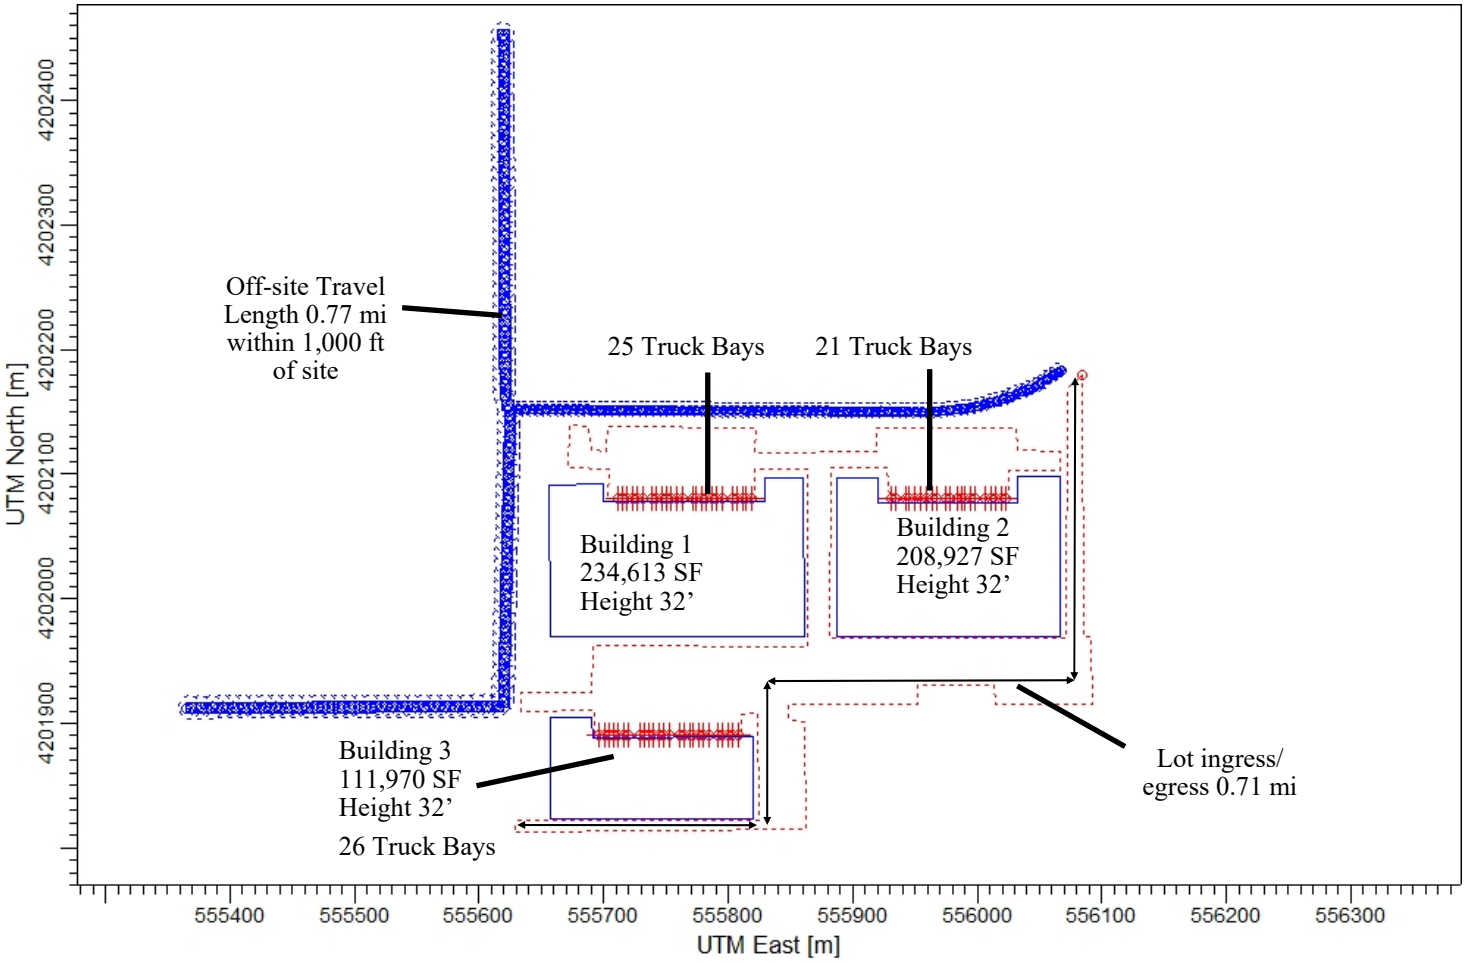
Diesel Internal Combustion (IC) Engine Distance Multiplier Tool: This distance multiplier tool refines t values for cancer risk and PM2.5 concentrations found in the District's Stationary Source Screening Anal permitted facilities which contain only diesel IC engines, to represent adjusted risk and hazard impacts t expected with farther distances from the source of emissions.



Diesel Backup Generator

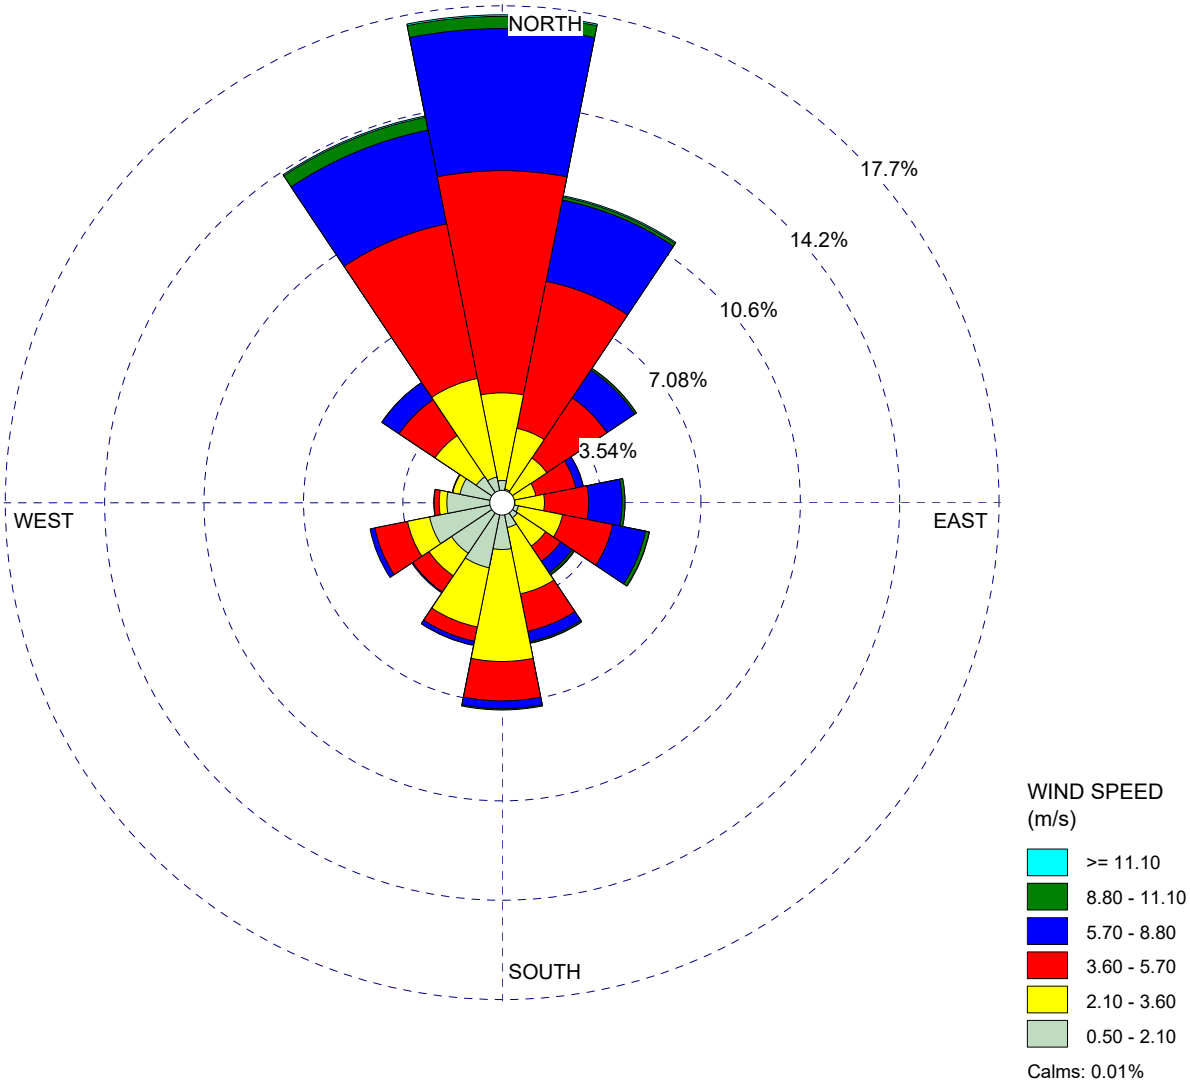
506 Brookside Drive
North Richmond, CA 94801
Operation 24 hours per day, 7 days per week

N

Trucking Operations
Heavy-Heavy Duty Trucks: 96 HHDT trucks per day, diesel-fueled
Drayage Trucks: 24 T7_POAK trucks per day, 100% EV
Delivery Vehicles: 108 total vehicles per day (Class 2 thru Class 6)
Delivery Vehicles: 73 diesel-fueled vehicles per day (Class 2 thru Class 6)



- For trucks, release height of 4.15 m and initial vertical dimension (δy) of 1.93 m is based upon California Air Resources Board's "Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles" (2000). For delivery vans, release height of 0.6 m used due to lower tailpipe height (CARB, 2000).

Appendix B. Air Dispersion Model Output

Appendix

This page intentionally left blank.

Model Output - School Receptors
Unit Emission Rates (1 g/s)

*** MODELOPTs: CONC ELEV FLGPOL URBAN SigA Data

***   MODEL SETUP OPTIONS SUMMARY   ***

- -

**Model Is Setup For Calculation of Average CONCentration Values.

  -- DEPOSITION LOGIC --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION. DRYDPLT = F
**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for   496 Source(s),
  for Total of   1 Urban Area(s):
  Urban Population =   217853.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Used.
        7. Option for Capped & Horiz Stacks Selected With:
                0 Capped Stack(s); and   72 Horizontal Stack(s)

**Other Options Specified:
        TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: OTHER

**Model Calculates PERIOD Averages Only

**This Run Includes: 496 Source(s);   6 Source Group(s); and   274 Receptor(s)

               with: 144 POINT(s), including
                           0 POINTCAP(s) and   72 POINTHOR(s)
                and: 350 VOLUME source(s)
                and: 2 AREA type source(s)
                and: 0 LINE source(s)
                and: 0 RLINE/RLINEXT source(s)
                and: 0 OPENPIT source(s)
                and: 0 BUOYANT LINE source(s) with   0 line(s)

Model Output - School Receptors
Unit Emission Rates (1 g/s)

```
**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date:  18081

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     1.50 ;  Decay Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =      5.2 MB of RAM.

**Input Runstream File:          aermod.inp
**Output Print File:             aermod.out

**Detailed Error/Message File:   Op_School.err
**File for Summary of Results:   Op_School.sum
```

Note: Due to high emission rates for delivery fleet idling and truck idling, the Idling MER location produces the highest total DPM concentrations, and therefore, the highest calculated health risks.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F

**Model Uses URBAN Dispersion Algorithm for the SBL for   496 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =    217853.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

**Other Options Specified:
        TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of:  OTHER

**Model Calculates PERIOD Averages Only

**This Run Includes:    496 Source(s);       6 Source Group(s); and     378 Receptor(s)

               with:    144 POINT(s), including
                           0 POINTCAP(s) and     72 POINTHOR(s)
                and:    350 VOLUME source(s)
                and:      2 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 RLINE/RLINEXT source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)

**Model Set To Continue RUNning After the Setup Testing.
```

Model Output - Residential Receptors
Unit Emission Rates (1 g/s)

```
**The AERMET Input Meteorological Data Version Date:  18081

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     1.50 ;  Decay Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =      5.0 MB of RAM.

**Input Runstream File:          aermod.inp
**Output Print File:             aermod.out

**Detailed Error/Message File:   Op_residents.err
**File for Summary of Results:   Op_residents.sum
```

Note: Due to high emission rates for delivery fleet idling and truck idling, the Idling and Van Idling MER location produces the highest total DPM concentrations, and therefore, the highest calculated health risks.

[1] For informational purposes, 70-year and 9-year residential cancer risks are 2.8 and 1.7 in a million, respectively.

[2] Inhalation rate taken as the 95th percentile breathing rates (OEHHA, 2015).

Table C5 - Summary of Health Risks
Cumulative Analysis

Health Risk Summary

Source No.	Source	Cancer Risk (per million)	Chronic Hazard	Acute Hazard	$PM_{2.5}$ (µg/m3)	Methodology
SCREENING ANALYSIS VALUES [1]						
1	West County Resource Recovery Inc	0.001	<0.001	<0.001	n/a	Gasoline Dispensing: Health Risk Calculator Beta 4.0 (BAAQMD, 2020)
		n/a	n/a	n/a	0.354	Material Handling: Health Risk Calculator Beta 4.0 (BAAQMD, 2020)[2]
2	R&K Industrial Products Inc.	0.34	0.002	0.002	0.050	Stationary Source Inquiry Form (BAAQMD, 2020)
3	East Bay Municipal Utility District	0.62	0.001	0.001	0.001	Generators: Health Risk Calculator Beta 4.0 (BAAQMD, 2020); Diesel Generator Multiplier 0.04,
4	Pick-n-pull Auto Dismantlers-Richmond#12	0.04	0.000	0.000	n/a	Stationary Source Inquiry Form (BAAQMD, 2020)
CUMULATIVE ANALYSIS						
	All Stationary Sources	1.0	0.003	0.003	0.40	
	All Sources (including Project)	3.5	0.003	0.003	0.41	
	BAAQMD Significance Threshold	100	10.0	10.0	0.80	
	Exceeds Threshold?	**No**	**No**	**No**	**No**	

[1] BAAQMD Screening Level Cancer Risk Values for stationary sources are for 30-year residential exposures, which are more conservative than the risk values that would be determined for 25-year staff exposures or 9-year student exposures.

[2] BAAQMD provided air emissions report (2019) for total particulate emissions. PM2.5 emissions estimated using CARB's speciation profile for PM2.5/total particulates for landfill dust, and adjusted for distance from facility to site (205 m away).

Criteria Air Pollutant Emissions Summary - Construction

Annual emissions divided by total construction duration to obtain average daily emissions. Average construction emissions accounts for the duration of each construction phase and the time each piece of construction equipment is onsite.

Criteria Air Pollutant Emissions Summary - Construction Mitigated (Tier 4 Interim Equipment)

Annual emissions divided by total construction duration to obtain average daily emissions. Average construction emissions accounts for the duration of each construction phase and the time each piece of construction equipment is onsite.

Mitigated Run - with Best Control Measures for Fugitive Dust and Tier 4 Interim Equipment for Site Preparation, Grading, and Building Construction Activities

Greenhouse Gas Emissions Summary - Buildout

Operation

GHG Emissions Thresholds

	BAAQMD Threshold - AB 32 Target	SB 32 GHG Reduction Target (40% of 1990 Levels by 2030)
Year	2020	2030
Threshold (MTCO2e/Yr)	1,100	660

** Forecasts based on BAAQMD's 1,100 MTCO2e/yr brightline threshold and the SB 32 GHG reduction target of 40 percent below 1990 levels by year 2030.*

Construction Emissions

Year	GHG Emissions MTCO2e/Yr
2020	691.4672
2021	1359.7995
Total	**2051.2667**
Amortized 30-Yr*	68.375557

**For buildings in general, it is reasonable to look at a 30-year time frame, since this is a typical interval before a new building requires the first major renovation. International Energy Agency (IEA). 2008, July. Energy Efficiency Requirements in Building Codes, Energy Efficiency Policies for New Buildings.*

(1) Based on information provided by Applicant.

(2) 4 hour daily on-site operation of the yard trucks is based on the Southern California International Gateway Recirculated Draft EIR. Table C1.2-BL-17 Activity Data for Existing Business CHE –2010 Baselineindicates that the average annual hours of operation for all diesel Container Handling Equipment, Forklifts, and Yard Tractors totaled 72,187 annual operating hours. The total number of pieces of equipment equals 52. As such, 72,187/52 = 1,388 annual hours per piece of equipment. 1,388 annual hours per piece of equipment/365 days = an average of 3.80 hours per day per piece of equipment. As a conservative measure this is rounded up to 4 hours for analytical purposes.

DEVELOPMENT CHECKLIST

Project Description Characteristics

Please identify the applicable land uses included in the proposed project and provide a brief description of the proposed project (or the project description to be used for the associated environmental document).

1) What is the size of the project (in acres)?:

31.37 Acres

2) Identify the applicable land uses:

- ☐ Residential
- ☐ Commercial
- ☒ Industrial
- ☐ Manufacturing
- ☐ Other

3) If there is a residential component to the project, how many units are being proposed?

SINGLE-FAMILY RESIDENCES:	N/A
MULTI-FAMILY RESIDENCES:	N/A

4) Please provide a brief project description:

2534,723 OF HIGH CUBE CLASS A CONCRETE TILT UP WAREHOUSE,

5) Does the project require any amendments to the General Plan or specific plans?

☐ Yes ☒ No

If yes, please explain:

Development Checklist

6) Is the project located in a specific plan area?

☐ Yes ☒ No

If yes, which one?

7) Please complete the following table to identify project compliance with any applicable CAP measures.

Table E.1. Standards for CAP Consistency – New Development

Reduction Measure and Applicable Standard	Does the Project Comply?	Notes & Comments
EE 1 & EE 6. New residential development will install high-efficiency appliances and insulation to prepare for the statewide transition to zero net energy.	☐ Yes ☐ No ☒ N/A	Additional Notes:
EE 1. New nonresidential development will install high-efficiency appliances and insulation.	☒ Yes ☐ No ☐ N/A	Additional Notes: LEED (CERTIFIED)
RE 1. New residential and nonresidential development will meet the standards to be solar ready as defined by the California Building Standards Code.	☒ Yes ☐ No ☐ N/A	If yes, how many kW of solar will be installed? Additional Notes: ROOF TO BE SOLAR READY
LUT 2. New single-family houses and multi-family units with private attached garages or carports will provide prewiring for EV charging stations inside the garage or carport.	☒ Yes ☐ No ☐ N/A	If yes, how many spaces are prewired? Additional Notes: CONDUITS TO PARKING ONLY
LUT 2. New multi-family (greater than five units) and nonresidential (greater than 10,000 square feet) developments will provide EV charging stations in designated parking spots.	☐ Yes ☐ No ☒ N/A	If yes, how many spaces are prewired? Additional Notes:
LUT 4. New residential and nonresidential development will be located within one half-mile of a BART or Amtrak station, or within one quarter-mile of bus station.	☐ Yes ☒ No ☐ N/A	If yes, what is the vehicle miles traveled reduction from the project? Additional Notes:

4. EMFAC2017 Worksheets: Passenger

a. Year 2021

b. Year 2023

c. Year 2025

d. Year 2027

This page intentionally left blank.

1 Source: California Air Resources Board. EMFAC2017 Web Database. https://www.arb.ca.gov/emfac/2017/; California Air Pollution Control Officers Association (CAPCOA). 2017, November. California Emissions Estimator Model User's Guide, Version 2016.3.2, Appendix A.

2 Unless otherwise noted, per CalEEMod methodology, the calculated CalEEMod emission rates are derived from the emission rates obtained using the EMFAC2017 Web Database for the Contra Costa (SF) region .

3 Because EMFAC2017 provides vehicle trips data for MHDT and HHDT diesel trucks, the formula provided in Appendix A of the CalEEMod User's Guide in calculating the NO_X STREX emission rates are utilized.

Off-Model SAFE Rule Adjustment Factors for Gasoline Light Duty Vehicle (LDA, LDT1, LDT2, MDV) Emissions in EMFAC2017

1 Source: California Air Resources Board. EMFAC2017 Web Database. https://www.arb.ca.gov/emfac/2017/; California Air Pollution Control Officers Association (CAPCOA). 2017, November. California Emissions Estimator Model User's Guide, Version 2016.3.2, Appendix A.

2 Unless otherwise noted, per CalEEMod methodology, the calculated CalEEMod emission rates are derived from the emission rates obtained using the EMFAC2017 Web Database for the Contra Costa (SF) region .

3 Because EMFAC2017 provides vehicle trips data for MHDT and HHDT diesel trucks, the formula provided in Appendix A of the CalEEMod User's Guide in calculating the NO_X STREX emission rates are utilized.

Off-Model SAFE Rule Adjustment Factors for Gasoline Light Duty Vehicle (LDA, LDT1, LDT2, MDV) Emissions in EMFAC2017

1 Source: California Air Resources Board. EMFAC2017 Web Database. https://www.arb.ca.gov/emfac/2017/; California Air Pollution Control Officers Association (CAPCOA). 2017, November. California Emissions Estimator Model User's Guide, Version 2016.3.2, Appendix A.

2 Unless otherwise noted, per CalEEMod methodology, the calculated CalEEMod emission rates are derived from the emission rates obtained using the EMFAC2017 Web Database for the Contra Costa (SF) region .

3 Because EMFAC2017 provides vehicle trips data for MHDT and HHDT diesel trucks, the formula provided in Appendix A of the CalEEMod User's Guide in calculating the NO_X STREX emission rates are utilized.

Off-Model SAFE Rule Adjustment Factors for Gasoline Light Duty Vehicle (LDA, LDT1, LDT2, MDV) Emissions in EMFAC2017

1 Source: California Air Resources Board. EMFAC2017 Web Database. https://www.arb.ca.gov/emfac/2017/; California Air Pollution Control Officers Association (CAPCOA). 2017, November. California Emissions Estimator Model User's Guide, Version 2016.3.2, Appendix A.

2 Unless otherwise noted, per CalEEMod methodology, the calculated CalEEMod emission rates are derived from the emission rates obtained using the EMFAC2017 Web Database for the Contra Costa (SF) region .

3 Because EMFAC2017 provides vehicle trips data for MHDT and HHDT diesel trucks, the formula provided in Appendix A of the CalEEMod User's Guide in calculating the NO_X STREX emission rates are utilized.

Off-Model SAFE Rule Adjustment Factors for Gasoline Light Duty Vehicle (LDA, LDT1, LDT2, MDV) Emissions in EMFAC2017

1 Source: California Air Resources Board. EMFAC2017 Web Database. https://www.arb.ca.gov/emfac/2017/; California Air Pollution Control Officers Association (CAPCOA). 2017, November. California Emissions Estimator Model User's Guide, Version 2016.3.2, Appendix A.

2 Unless otherwise noted, per CalEEMod methodology, the calculated CalEEMod emission rates are derived from the emission rates obtained using the EMFAC2017 Web Database for the Contra Costa (SF) region .

3 Because EMFAC2017 provides vehicle trips data for MHDT and HHDT diesel trucks, the formula provided in Appendix A of the CalEEMod User's Guide in calculating the NO_X STREX emission rates are utilized.

Off-Model SAFE Rule Adjustment Factors for Gasoline Light Duty Vehicle (LDA, LDT1, LDT2, MDV) Emissions in EMFAC2017

1 Source: California Air Resources Board. EMFAC2017 Web Database. https://www.arb.ca.gov/emfac/2017/; California Air Pollution Control Officers Association (CAPCOA). 2017, November. California Emissions Estimator Model User's Guide, Version 2016.3.2, Appendix A.

2 Unless otherwise noted, per CalEEMod methodology, the calculated CalEEMod emission rates are derived from the emission rates obtained using the EMFAC2017 Web Database for the Contra Costa (SF) region .

3 Because EMFAC2017 provides vehicle trips data for MHDT and HHDT diesel trucks, the formula provided in Appendix A of the CalEEMod User's Guide in calculating the NO_X STREX emission rates are utilized.

1 Source: California Air Resources Board. EMFAC2017 Web Database. https://www.arb.ca.gov/emfac/2017/; California Air Pollution Control Officers Association (CAPCOA). 2017, November. California Emissions Estimator Model User's Guide, Version 2016.3.2, Appendix A.

2 Unless otherwise noted, per CalEEMod methodology, the calculated CalEEMod emission rates are derived from the emission rates obtained using the EMFAC2017 Web Database for the Contra Costa (SF) region .

3 Because EMFAC2017 provides vehicle trips data for MHDT and HHDT diesel trucks, the formula provided in Appendix A of the CalEEMod User's Guide in calculating the NO_X STREX emission rates are utilized.

1 Source: California Air Resources Board. EMFAC2017 Web Database. https://www.arb.ca.gov/emfac/2017/; California Air Pollution Control Officers Association (CAPCOA). 2017, November. California Emissions Estimator Model User's Guide, Version 2016.3.2, Appendix A.

2 Unless otherwise noted, per CalEEMod methodology, the calculated CalEEMod emission rates are derived from the emission rates obtained using the EMFAC2017 Web Database for the Contra Costa (SF) region .

3 Because EMFAC2017 provides vehicle trips data for MHDT and HHDT diesel trucks, the formula provided in Appendix A of the CalEEMod User's Guide in calculating the NO_X STREX emission rates are utilized.
