NOTICE OF PREPARATION

This page intentionally left blank

PUBLIC NOTICE/NOTICE OF PREPARATION OF DRAFT ENVIRONMENTAL IMPACT REPORT

Project: Cypress City Center
Lead Agency: City of Cypress
Project Applicant: Shea Properties

PROJECT DESCRIPTION: The City of Cypress (City) is the Lead Agency responsible for preparing an Environmental Impact Report (EIR) addressing potential environmental impacts associated with the Cypress City Center Project (proposed project). The proposed project is located on an approximately 13-acre site (project site) at the northwest corner of Katella Avenue and Winners Circle in Cypress, California. The project is currently an undeveloped paved parking lot. Temporary existing uses on the project site include vehicle parking during events at the nearby Los Alamitos Race Course and periodic temporary truck parking two to three times per year. The project site is bounded by vacant land and surface parking lots associated with the Los Alamitos Race Course to the north, Katella Avenue to the south, Winners Circle to the east, and Siboney Street to the west. Surrounding land uses include the Los Alamitos Race Course to the north; commercial and retail uses to the east; commercial, office, and business park uses to the south; and religious facilities and a commercial center to the west. The project site is within the boundaries of the Cypress Business and Professional Center Specific Plan (Specific Plan), and specifically occupies a portion of Planning Area 5, which is designated for Professional Office uses. The project site currently has a zoning designation of PBP-25A, Planned Business Park (PBP). The Specific Plan is the regulatory plan that constitutes the zoning for the project site. The project would require a Specific Plan Amendment to allow the proposed residential and hotel land uses on the project site.

The proposed project involves the construction and operation of a mixed-use development on the project site. The proposed project includes a 43,200 sf theater with approximately 840 seats, a five-story hotel with up to 120 rooms, approximately 20,800 sf of retail and restaurant uses, and a four-story residential component with up to 251 apartment units and a variety of amenities, including a fitness center, clubhouse, leasing/lounge area, main recreation courtyard, and a dog park. Proposed offsite improvements include curb, sidewalk, and landscaped parkway improvements along Katella Avenue, Winners Circle, and Siboney Street. Off-site storm drain improvements along the north edge of the property within an existing storm drain easement are also included as part of assumed capital improvements for Assessment District 1.

Required discretionary actions associated with the project include the following: certification of the EIR; approval of a Development Agreement between SP Acquisition, LLC and the City of Cypress; approval of a Specific Plan Amendment to create a new mixed-use land use district for the project site to allow residential and hotel uses; approval of a Tentative Parcel Map required for the subdivision of the project site; approval of Conditional Use Permits for the hotel, theater, commercial, and restaurant/alcohol uses; and approval of a Design Review Permit.

POTENTIAL ENVIRONMENTAL IMPACTS: The Draft EIR (DEIR) will examine potential environmental impacts generated by the proposed project in relation to the following Environmental Analysis categories: Aesthetics, Air Quality, Energy, Geology and Soils, Greenhouse Gas Emissions, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Noise, Population and Housing, Public Services, Recreation, Transportation, Tribal Cultural Resources, and Utilities and Service Systems. These categories reflect the probable environmental effects of the proposed project.

- **Aesthetics.** The proposed project would introduce new structures on the site. The EIR will analyze any impacts of the height and massing of the proposed structures, and will include a consistency analysis with the City's zoning and General Plan regulations governing scenic quality. Project-related impacts with respect to light and glare will also be analyzed in the EIR.

- **Air Quality.** The construction and operation of the proposed project would cause the emission of certain air pollutants. Potential air quality impacts, including consistency with the AQMP, violation of air quality standards, the

increase of criteria pollutants, and exposure of sensitive receptors to substantial pollutant concentrations will be analyzed further in the EIR.

- **Energy.** The construction and operation of the proposed project would involve the use of energy. Project impacts to energy resources will be evaluated as part of the EIR, analyzing short-term and long-term impacts of the project, as well as project consistency with state and local plans related to energy.

- **Geology and Soils.** The proposed project would involve grading and soil disturbance, and would involve the construction of new structures. Potential impacts associated with strong seismic ground shaking, seismic-related ground failure, soil erosion, unsuitable soils, and paleontological resources will be analyzed further in the EIR.

- **Greenhouse Gas Emissions.** During construction of the project, equipment and vehicles would be used that would generate some greenhouse gases (GHG). In addition, the project's use of energy during long-term operations would contribute to the emission of GHGs. Potential GHG impacts will be analyzed further in the EIR.

- **Hazards and Hazardous Materials.** Potential impacts related to the release of hazardous materials into the environment as a result of project construction and operation will be analyzed further in the EIR.

- **Hydrology and Water Quality.** The proposed project would alter the drainage of the subject site, and would introduce construction and operation activities on the site. The EIR will evaluate any potentially significant adverse project impacts related to waste discharge requirements and surface and groundwater water quality, on- or off-site erosion and siltation, changes in the rate or amount of surface runoff, and other hydrology and water quality concerns.

- **Land Use and Planning.** The proposed project includes residential and hotel land uses that are not expressly allowed by the Specific Plan, and includes an amendment to the Specific Plan. The project's potential conflicts with applicable land use plans, policies, or regulations will be addressed in the EIR.

- **Noise.** The construction and operation of the proposed would generate certain levels of noise. Potential impacts related to noise exceeding established thresholds and vibration and ground-borne noise impacts will be analyzed further in the EIR.

- **Population and Housing.** The proposed project would include a maximum of 251 apartment units and the corresponding increase in the City's population. The project's potential to induce substantial population growth, either directly or indirectly, will be assessed in the EIR.

- **Public Services.** The proposed project would bring additional residents and visitors to the City, which may increase the need for public services. Potentially adverse physical impacts associated with new or physically altered governmental facilities related to police, fire, schools, parks, and libraries will be analyzed in the EIR.

- **Recreation.** The proposed project would bring additional residents and visitors to the City, which may increase the demand for recreational facilities. Potential impacts related to the physical deterioration of park facilities, and the construction or expansion of recreational facilities will be evaluated in the EIR.

- **Transportation.** The project construction would generate construction traffic. The operation of the project would bring approximately 164 additional morning peak hour trips and approximately 323 additional afternoon peak hour trips. The project's potential short- and long-term traffic impacts with respect to the exceedance of adopted LOS standards and the project's compliance with program plans, ordinances, and policies addressing the circulation system will be analyzed further in the EIR.

- **Tribal Cultural Resources.** The proposed project would involve ground disturbance, which carries with it some potential for encountering tribal cultural resources. Information provided through tribal consultation will be

incorporated in the EIR analysis and will assist in identifying whether tribal cultural resources are present, and the significance of any potential impacts to such resources.

- **Utilities and Service Systems.** The proposed project would introduce land uses that require utility and drainage services and systems. Potential impacts related to water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, water supply, and solid waste disposal will be analyzed further in the EIR, and mitigation proposed if necessary.

The EIR will also identify appropriate and feasible mitigation measures, if necessary, for each of the environmental impacts listed above. Although the proposed project is not anticipated to result in impacts related to Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Mineral Resources, and Wildfire, these topics will be briefly discussed in the DEIR. An Initial Study has not been prepared for the proposed project. The project site is not included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5.

PROJECT SCOPING PROCESS: Circulation of this Notice of Preparation (NOP) starts a 30-day public review and comment period on the scope of the DEIR that begins on **November 22, 2019**, and ends on **December 23, 2019** at 5:00 p.m. All interested parties, including the public, responsible agencies, and trustee agencies, are invited to provide comments and input on the scope and content of the environmental analysis to be addressed in the DEIR. Responsible and trustee agencies should provide comments and input related to the agencies' respective areas of statutory responsibility. Comments received during the scoping period will be considered during preparation of the DEIR. Public agencies and interested parties will have an additional opportunity to comment on the proposed project during the 45-day public review period to be held after the publication and circulation of the DEIR.

SCOPING MEETING: The City will conduct a Public Scoping Meeting in order to present the proposed project and the EIR process and to receive public comments. The City invites interested parties to the following public scoping meeting in order to learn more about the project, ask questions, and submit comments:

Date/Time:

SR 22 PM 20.717

Dear Mr. Ramirez,

Thank you for including the California Department of Transportation (Caltrans) in the review of the Notice of Preparation (NOP) for an Environmental Impact Report (EIR) for the Cypress City Center Project in the City of Cypress. The mission of Caltrans is to provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability.

The City of Cypress (City) proposes a project that involves the construction and operation of a mixed-use development located on an approximately 13-acre site (project site) at the northwest corner of Katella Avenue and Winners Circle in Cypress, California. The proposed project includes a 43,200 sf theater with approximately 840 seats, a five-story hotel with up to 120 rooms, approximately 20,800 sf of retail and restaurant uses, and a four-story residential component with up to 251 apartment units and a variety of amenities, including a fitness center, clubhouse, leasing/lounge area, main recreation courtyard, and a dog park. Proposed offsite improvements include curb, sidewalk, and landscaped parkway improvements along Katella Avenue, Winners Circle, and Siboney Street. Off-site storm drain improvements along the north edge of the property within an existing storm drain easement are also included as part of assumed capital improvements for Assessment District 1.

The project site is bounded by vacant land and surface parking lots associated with the Los Alamitos Race Course to the north, Katella Avenue to the south, Winners Circle to the east, and Siboney Street to the west. Surrounding land uses include the Los Alamitos Race Course to the north; commercial and retail uses to the east; commercial, office, and business park uses to the south; and religious facilities and a commercial center to the west. The project site is within the boundaries of the Cypress Business and Professional Center Specific Plan (Specific Plan), and specifically occupies a portion of Planning Area 5, which is designated for Professional Office uses. The project site

currently has a zoning designation of PBP-25A, Planned Business Park (PBP). The Specific Plan is the regulatory plan that constitutes the zoning for the project site. The project site is approximately 2 miles from Interstate 605, State Route (SR) 39 and SR 22. Interstate 605 as well as SR 39 and SR 22 are owned and operated by Caltrans. Caltrans is a responsible agency and has the following comments:

Traffic Operations

1. Please refer to the "Guide for the Preparation of Traffic Impact Studies" to prepare the Traffic Impact Studies report to support the transportation section of the DEIR. https://nacto.org/docs/usdg/guide_preparation_traffic_impact_studies_caltrans.pdf

2. Please use the latest Highway Capacity Manual methodology to analyze the interrupted flow and/or uninterrupted flow facilities that fall within Caltrans' right of way. For interrupted flow, facility 95 percentile queue length needs to be analyzed. For the uninterrupted flow, facility basic freeway, diverge, merge and weaving will need to be analyzed if it is applicable.
https://dot.ca.gov/programs/design/manual-highway-design-manual-hdm

System Planning

1. Please submit the Transportation Impact Study when it becomes available.

2. As part of state goals to increase active transportation, and given the nearby Class I regional bike path on Valley View and the Class II bike lanes on Cerritos Avenue, Caltrans recommends the inclusion of secure and functional short- and long-term bike parking. Short-term bike parking at public/commercial locations should be located at multiple locations throughout the project site and should be placed in visible areas that are close to main entrances. Bike racks should be installed at least 24" away from walls and other objects (e.g. trash cans, plants, etc.). Long-term secure bike storage for residential units should be provided indoors and on the ground floor. Both short- and long-term bike parking should be designed to accommodate different types of bikes (e.g. cargo bike, bike with trailer).
For additional guidance on providing functional bike parking, see the attached "Essentials of Bike Parking" guidance created by the Association of Pedestrian and Bicycle Professionals (link to online PDF: https://www.apbp.org/Publications).

3. OCTA Bus Route 50, Long Beach to Orange, has stops at the southern edge and southeastern corner of the development. Please encourage the use of transit among residents, visitors, and workers of the development. Increasing multi-modal transportation will lead to a reduction to congestion, Vehicle Miles Traveled, and improve air quality.

4. Please Coordinate with OCTA and ensure that construction of the development will not interfere with any transit services.

Designated Freight Delivery Area

1. Please consider incorporating designated areas/parking for freight delivery, package, and transportation network company's pickup and drop-off.

Permits:

1. Any project work proposed in the vicinity of the State right of way will require an encroachment permit, and all environmental concerns must be adequately addressed. Please coordinate with Caltrans in order to meet the requirements for any work within or near State Right-of-Way. A fee may apply. If the cost of work within the State right of way is below one Million Dollars, the Encroachment Permit process will be handled by our Permits Branch; otherwise the permit should be authorized through the Caltrans's Project Development Department. When applying for Encroachment Permit, please incorporate all Environmental Documentation, SWPPP/ WPCP, NPDES, Hydraulic Calculations, R/W certification and all relevant design details including design exception approvals. For specific details for Encroachment Permits procedure, please refer to the Caltrans's Encroachment Permits Manual. The latest edition of the Manual is available on the web site: http://www.dot.ca.gov/hq/traffops/developserv/permits/

Please continue to coordinate with Caltrans for any future developments that could potentially impact State transportation facilities. If you have any questions, please do not hesitate to contact Julie Lugaro at 657-328-6368 or Julie.lugaro@dot.ca.gov.

Sincerely,

Scott Shelley
Branch Chief, Regional-IGR-Transit Planning

City of Cypress
Mr. Peter Grant, City Manager
5275 Orange Avenue
Cypress, CA 90630

RE: Consideration of a Disposition and Development Agreement for the Sale of City Owned Property at the Northwest Corner of Katella Avenue and Winners Circle (APNs 241-091-022 through -026) to SP Acquisition, LLC for a Mixed-Use Project

Mr. Grant,

During their regularly scheduled meeting today, the Cypress City Council is scheduled to consider the approval of a Disposition and Development Agreement for the Sale of City Owned Property at the Northwest Corner of Katella Avenue and Winners Circle (APNs 241-091-022 through -026) to SP Acquisition, LLC for a Mixed-Use Project. The prospective purchaser, Shea Properties, has proposed a development concept that includes a 120-room hotel, 64,000 square feet of commercial retail, and 251 resort-style residential apartments.

Though it is understood that what is being proposed is a development concept at this time, it is expected that the development will generate a number of new vehicle trips to Katella Avenue. It is also anticipated that a majority of these trips will utilize Katella Avenue west of the subject site. This arterial currently experiences greater than 60,000 average daily trips. As a result, heavy congestion is common during peak hour trip movements, especially to the west of the subject site in the general area of Katella Avenue & Los Alamitos Boulevard. In addition, the amount of activity and variety of trips that includes large trucks also results in excessive wear and increases the frequency and ultimately the cost to adequately maintain Katella Avenue.

As a result, it is requested that the City of Cypress work closely with the City of Los Alamitos to establish a mitigation fee designed and intended to establish an equitable amount to be paid for the future maintenance of Katella Avenue within the City of Los Alamitos. With the environmental review process for the proposed development

commencing this month and likely not to conclude until mid-2020, it is recommended that our request be considered in conjunction with such.

Thank you in advance for your consideration of this request. Should you have any questions or would like to further discuss, please do not hesitate to contact me.

Sincerely,

Les Johnson
Interim City Manager/Development Services Director

John P. Ramirez
Cypress, City of
5275 Orange Avenue
Cypress, CA 90630

RE: SCH# 2019110458, Cypress City Center Project, Orange County

Dear Mr. Ramirez:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

RECEIVED
DEC 4 2019
CITY OF CYPRESS
COMMUNITY DEVELOPMENT

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
    a. A brief description of the project.
    b. The lead agency contact information.
    c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
    d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).
    a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
    a. Alternatives to the project.
    b. Recommended mitigation measures.
    c. Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
    a. Type of environmental review necessary.
    b. Significance of the tribal cultural resources.
    c. Significance of the project's impacts on tribal cultural resources.
    d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
    a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
    b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:
    a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
    b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:
    a. Avoidance and preservation of the resources in place, including, but not limited to:
        i. Planning and construction to avoid the resources and protect the cultural and natural context.
        ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
    b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
        i. Protecting the cultural character and integrity of the resource.
        ii. Protecting the traditional use of the resource.
        iii. Protecting the confidentiality of the resource.
    c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
    d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).
    e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).
    f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
    a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.
    b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
    c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
    a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
    b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
    a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
    b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
    c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address:

Andrew.Green@nahc.ca.gov.

Subject: **Notice of Preparation of Draft Environmental Impact Report for the Cypress City Center Project.**

Dear Mr. Ramirez:

Thank you for providing the Orange County Transportation Authority (OCTA) with a copy of the Notice of Preparation of the Draft Environmental Impact Report (NOP/DIER) for the Cypress (City) City Center (Project). The following comments are provided for your consideration:

- Please note that Katella Avenue is part of the Congestion Management Program Highway System and should be analyzed as such for any potential traffic impacts. You may reference the latest Congestion Management Program (CMP) report available on the OCTA website here: http://www.octa.net/Projects-and-Programs/Plans-and-Studies/Congestion-Management-Program/Overview/

Throughout the development of this project, we encourage communication with OCTA on any matters discussed herein. If you have any questions or comments, please contact me at (714) 560-5907 or at dphu@octa.net.

Sincerely,

Dan Phu
Manager, Environmental Programs

Re: Cypress City Center

Dear Mr. Ramirez:

This letter is written on behalf of the Rincon Band of Luiseño Indians. Thank you for inviting us to submit comments on the above mention project. Rincon is submitting these comments concerning your projects potential impact on Luiseño cultural resources.

The Rincon Band has concerns for the impacts to historic and cultural resources and the finding of items of significant cultural value that could be disturbed or destroyed and are considered culturally significant to the Luiseño people. This is to inform you; your identified location is not within the Luiseño Aboriginal Territory. We recommend that you locate a tribe within the project area to receive direction on how to handle any inadvertent findings according to their customs and traditions.

If you would like information on tribes within your project area, please contact the Native American Heritage Commission and they will assist with a referral.

Thank you for the opportunity to protect and preserve our cultural assets.

Sincerely,

Deneen Pelton

Notice of Preparation of a Draft Environmental Impact Report for the Proposed Cypress City Center

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. South Coast AQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the Proposed Project that should be included in the Draft Environmental Impact Report (EIR). Please send South Coast AQMD a copy of the Draft EIR upon its completion. Note that copies of the Draft EIR that are submitted to the State Clearinghouse are not forwarded to South Coast AQMD. Please forward a copy of the Draft EIR directly to South Coast AQMD at the address shown in the letterhead. **In addition, please send with the Draft EIR all appendices or technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files[1]. These include emission calculation spreadsheets and modeling input and output files (not PDF files). Without all files and supporting documentation, South Coast AQMD staff will be unable to complete our review of the air quality analyses in a timely manner. Any delays in providing all supporting documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

South Coast AQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. South Coast AQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from South Coast AQMD's Subscription Services Department by calling (909) 396-3720. More guidance developed since this Handbook is also available on South Coast AQMD's website at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ceqa-air-quality-handbook-(1993). South Coast AQMD staff also recommends that the Lead Agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com.

[1] Pursuant to the CEQA Guidelines Section 15174, the information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

South Coast AQMD has also developed both regional and localized significance thresholds. South Coast AQMD staff requests that the Lead Agency quantify criteria pollutant emissions and compare the results to South Coast AQMD's CEQA regional pollutant emissions significance thresholds to determine air quality impacts. South Coast AQMD's CEQA regional pollutant emissions significance thresholds can be found here at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf. In the event that some elements of the Proposed Project will be operational when other elements of the Proposed Project are still under construction, South Coast AQMD staff recommends that the Lead Agency use its best efforts to identify the overlapping years of construction and operational activities, combine construction emissions (including emissions from demolition) with operational emissions from the overlapping years, and compare the combined emissions to South Coast AQMD's air quality CEQA operational thresholds of significance to determine the level of significance in the Draft EIR.

In addition to analyzing regional air quality impacts, South Coast AQMD staff recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LSTs can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the Proposed Project, it is recommended that the Lead Agency perform a localized analysis by either using the LSTs developed by South Coast AQMD staff or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the Proposed Project and all air pollutant sources related to the Proposed Project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis.

In the event that the Proposed Project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("*Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*") can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

In addition, guidance on siting incompatible land uses can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Health Perspective*, which can be found at: http://www.arb.ca.gov/ch/handbook.pdf. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. Guidance[2] on strategies to reduce air pollution exposure near high-volume roadways can be found at: https://www.arb.ca.gov/ch/rd_technical_advisory_final.PDF.

[2] In April 2017, CARB published a technical advisory, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*, to supplement CARB's Air Quality and Land Use Handbook: A Community Health Perspective.

Mitigation Measures

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize these impacts. Pursuant to CEQA Guidelines Section 15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are available to assist the Lead Agency with identifying potential mitigation measures for the Proposed Project, including:

- Chapter 11 "Mitigating the Impact of a Project" of South Coast AQMD'S *CEQA Air Quality Handbook* South Coast AQMD's CEQA web pages available here: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies
- South Coast AQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions and Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities
- South Coast AQMD's Mitigation Monitoring and Reporting Plan (MMRP) for the 2016 Air Quality Management Plan (2016 AQMP) available here (starting on page 86): http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2017/2017-mar3-035.pdf
- CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* available here: http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf

Alternatives

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires the consideration and discussion of alternatives to the project or its location which are capable of avoiding or substantially lessening any of the significant effects of the project. The discussion of a reasonable range of potentially feasible alternatives, including a "no project" alternative, is intended to foster informed decision-making and public participation. Pursuant to CEQA Guidelines Section 15126.6(d), the Draft EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the Proposed Project.

Permits

If implementation of the Proposed Project requires a permit from South Coast AQMD, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the EIR. For more information on permits, please visit South Coast AQMD's webpage at: http://www.aqmd.gov/home/permits. Questions on permits can be directed to South Coast AQMD's Engineering and Permitting staff at (909) 396-3385.

Data Sources

South Coast AQMD rules and relevant air quality reports and data are available by calling South Coast AQMD's Public Information Center at (909) 396-2001. Much of the information available through the Public Information Center is also available at South Coast AQMD's webpage at: http://www.aqmd.gov.

This technical advisory is intended to provide information on strategies to reduce exposures to traffic emissions near high-volume roadways to assist land use planning and decision-making in order to protect public health and promote equity and environmental justice. The technical advisory is available at: https://www.arb.ca.gov/ch/landuse.htm.

South Coast AQMD staff is available to work with the Lead Agency to ensure that project's air quality and health risk impacts are accurately evaluated and mitigated where feasible. If you have any questions regarding this letter, please contact me at lsun@aqmd.gov.

Sincerely,

To: Reviewing Agencies

Re: Cypress City Center
SCH# 2019110458

Attached for your review and comment is the Notice of Preparation (NOP) for the Cypress City Center draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

John P. Ramirez
Cypress, City of
5275 Orange Avenue
Cypress, CA 90630

with a copy to the State Clearinghouse in the Office of Planning and Research at state.clearinghouse@opr.ca.gov . Please refer to the SCH number noted above in all correspondence concerning this project on our website: https://ceqanet.opr.ca.gov/2019110458/2.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

CITY OF CYPRESS
COMMUNITY DEVELOPMENT

The city should continue to implement green spaces that add to the aesthetics of the city. We already have an abundance of retail venues. Our city is unique and should remain that way. Cypress residents live here because it is a pleasant city in which to reside. Adding high-rise buildings and/or additional retail will add to the traffic of the city which is already getting out of hand. Cypress residents have always been informed of changes. Please continue to respect our right to know about changes in our city. Meetings with hidden agendas are not appreciated. The Project Meeting was not communicated clearly and many residents did not get the information needed to attend the December 11th meeting. In the future, it would be helpful to include such important information in the city newsletter that reaches all citizens of Cypress.

I am in agreement with the following comments submitted by George Pardon. Mr. Pardon's comments are copied below:

The purpose of this comment card is to solicit input regarding the scope and content of the Environmental Impact Report (EIR). Please submit comment for the record that pertain to the environmental issues to be addressed in the EIR (please print).

Comments:
• Aesthetics – Katella Ave is a primary transportation corridor in Orange County. Putting a 4-story high density apartment building with a parking garage along a primary city boundary is going to give an image to those driving by that Cypress is something other than a low density residential community. The proposed project introduces the first 4 story apartment building and the first parking garage. This is not representative of who Cypress is. Drive around our city and you will see that this apartment complex with a parking garage is not aesthetically or otherwise representative of what Cypress is. In fact, in 2016, the same City Council members that are serving now opposed a 66 unit residential townhome development on Orange Ave across from City Hall because some units were 3 story and they had traffic and safety concerns. The density on that project was less than twenty units per acre. The developer

went back and revised their project to 52 units that were 2 stories with a density closer to 15 units per acre. Everyone agreed that this development with the height limit was more representative of what Cypress is. How could our city have changed so dramatically in 4 years? Even the apartments on Lincoln are substantially lower density when you make the density calculation based on the site the residential units physically occupy. Most residents would tell you that they still believe the density on those Lincoln units is too high.

• Air Quality – The density calculation that the city has suggested is very misleading because it gives no consideration to the hotel, movie theater, and retail components. Increased traffic given the compactness of this site will clearly lend itself to poorer air quality.

• Land Use and Planning. Prior to 1990, this property had Public/Semi-Public zoning on it which would have prohibited any of the uses being proposed by the project. Any zoning change required a vote of the residents due to Measure D that was approved by voters in 1987. In 1990, the voters approved a change to the zoning on some of the frontage road along Katella and along Walker St. The zoning permitted the commercial/retail/office projects currently found on those frontage properties. The residents did not approve a zoning change that permitted residential. However, when the zoning was changed, there was unfortunately no caveat in the language that said that future zoning changes would have to be voted on by the residents. The residents at that time evidently believed the city leaders would honor the voice of the residents. As residents have seen some of the zoning changes that have been made by the city leadership in recent years, there is a growing demand for a separate planning commission to give residents a greater voice in zoning. It was this concern of the change in zoning that is now being considered that when the zoning was changed for the race track property in 2018, language was incorporated in that initiative that requires another vote of the residents to change the zoning of the race track property from the zoning approved by the residents. The city leaders should honor the voice of the residents from that 1990 vote or take it back to a vote to see if the residents want this type of residential development on this site.

The analysis has to take into consideration how the city plans to rezone the property to accommodate the residential component. Given the density calculation of 18.9 units per acre put forth by the city, then one can conclude that all 13.3 acres will be rezoned residential. If only the 4 acres is zoned residential then the 18.9 unit per acre density calculation doesn't work since the other 9 acres wouldn't permit residential so shouldn't be part of the calculation. If, on the other hand, the City Council rezones all 13 acres for residential, nothing would prevent the property owner five or so years from now to seek approval for another apartment building on the retail sites if those aren't successful. In fact, Shea was just approved in June 2019 to build 44 single-family homes and 61 townhouses on what is now Mission Foothill Marketplace in Mission Viejo, a mostly vacated mall.
https://www.ocregister.com/2019/06/26/plan-to-convert-mission-foothill-marketplaces-main-building-into-105-homes-approved-by-mission-viejo-city-council/

• Population and Housing. The current residential occupancy in our city averages 3 people per residence. If that average holds out, the population in our city would grow by 750 residents due to this project. Reality is that many recent studies have concluded that the higher rents being demanded in Orange County have led to substantial overcrowding in residential units. In fact, the standard is that two people can occupy each bedroom with one additional person in the living space. As such, if the average apartment in this complex has 2 bedrooms, then each apartment could legally accommodate 5 people which could bring the overall occupancy to 1,250 residents. These new occupancy studies showing the overcrowding issues ultimately falsify the results of a traffic study and lead a developer to substantially underpark a residential development. This doesn't happen on a retail development as there are only so

many seats in a movie theater or restaurant. The residential component of this project dramatically changes the clear intent of this property when the voters approved a zoning change in 1990.

• Public Services. This development will significantly increase the demand for police, fire, schools, parks, and libraries especially given the residential component.

• Recreation. When Measure A was approved in 2018 to change the zoning for the race track, one of the significant benefits was that 20 acres of park land were going to be provided. No new park land will come from this project. While there will be park developer fees paid as part of the construction costs, this is one time money and no new park will be provided.

• Transportation – Since this project will sit on Katella, many think about the traffic impacts on Katella. The problem is to gain access or use any of the city services, the new residents will travel north along already impacted interior roads to gain access to schools, parks, and other public services. The Student Yield Factor established by the State Allocation Board would increase in enrollment due to new housing construction. The states guideline says you can expect .5 elementary students per new residential unit and .2 junior high and high schools for a combination of .7 students per residential unit. As such, we could see an increase of about 175 students needing to go to school and be provided transportation to schools, sporting activities, parks, and public services. The fact that the elementary school district has indicated a willingness to open one of the closed schools, there will still be increased traffic. If overcrowding in these units takes place then the problem is worse.

This project will create many impacted intersections along Katella Ave but also along Walker and Lexington that will be affected by the Katella Ave traffic patterns this project will create. These intersections need to be studied.

Subject: EIR ON KATELLA AVE
Date: Wednesday, December 18, 2019 1:57:09 PM

Mr. Ramirez,

I do not want apartments along Katella Ave. It will make the area too dense in population and cause much more congestion and strain on our Fire, Police, EMS, schools, and parks.

Measure A was approved in 2018 to change the zoning for the race track, and there was to be 20 acres of parkland; but I do not see the park being provided. The residential component of this project dramatically changes the clear intent of this property when the voters approved a zoning change in 1990. The city leaders should honor the voice of the residents from that 1990 vote or take it back to a vote to see if the residents want this type of residential development on this site.

Thank you for your consideration.

- Very Concerned about the impact this will have on traffic in areas of Cypress / Los Alamitos that is already heavily saturated with Costco and adjoining Shopping center. By approving this High Density residential property / parking garage (as proposed by Shea Properties) within the 13 acre parcel. We are impacting schools, roads, nearby parks, and local Hospital.
- The increased population will also draw more traffic naturally on Katella Ave but areas North of Katella where in Cypress Schools are located.
- The intersection at Katella / Los Alamitos Blvd has already been cited as the 2nd busiest intersection in Orange County. My concern is that this has the risk of getting even busier, with increased potential for traffic bottlenecking and accidents.

THE HIGH DENSITY (H.D.H.) HOUSING INCLUDED IN THIS PROJECT WILL SIGNIFICANTLY INCREASE TRAFFIC, CONGESTION, POLLUTION AND WEAR OF THOROUGHFARES (IE KATELLA AVE.) AND NEIGHBORHOODS IN AREA H.D.H. WILL ALSO STRAIN POLICE, FIRE, PARK AND SCHOOL SERVICES. ZONING CHANGE ALLOWING H.D.H. OPENS DOOR TO FUTURE CHALLENGES FOR OWNERS OF COMMERCIAL PROPERTY TO REQUEST SIMILAR ZONING RESULTING IN MORE TRAFFIC, CONGESTION, POLLUTION ETC. THIS PROJECT WILL ALSO REQUIRE MORE ENERGY SUCH AS GAS, ELECTRICITY AND INCREASE IN WASTE REMOVAL BY CITY.

A NON-EIR CONCERN. THE NEED FOR MORE MOVIE THEATERS IN CYPRESS VERY QUESTIONABLE AS A FINANCIAL INVESTMENT

- Concerns re: additional traffic along Katella Ave. Currently a disaster during 6AM 9AM & 4PM - 7PM.
- Will traffic be allowed to exit onto the racetrack property to the north? And will that traffic be allowed to then exit back onto Vessels Dr.?
- There is a need for a lot of E.V. charging stations @ this property...
- Aesthetics: I think it's important to add lots of green screening along all sides of the property to shade/protect the project site from Katella (from noise, pollutants, & car lights) & from the racetrack (noise, smell, & lighting).

Email: CityPlanner@cypressca.org

Dear Mr. Ramirez,

I have been a resident of Cypress for the past 9 years, after having returned here after living out of state of many years. I grew up in Cypress and attended Pacifica High School. I suffer from the lack of affordable housing in Orange County, and want to express my desires to see Cypress develop in a manner that gives greater housing options for all. I know how difficult city planning can be, as low-income people struggle to have their needs met and local property owners fight to maintain property values. I support whichever plan will bring the greatest number of apartments to Cypress.

A current search on Zillow for Cypress shows that a 805 sqft condo sells at a price where the estimated monthly costs (mortgage, HOA, etc) are $2500. This is supposed to be an entry level into home ownership. I know very few of my peers, all with degrees beyond high school, who can afford this. Even if they could, there are only 7 available properties in Cypress at that budget. What about the people who need more space (small families) and who aren't in a position to buy a home? We need options.

Are luxury apartments my first choice? No. But, in a city with voters like I see in Cypress, I'll take what I can get. From what I can tell, even luxury apartments do their part in managing rent prices for all. I leave an article I found HERE, that also contains links to studies on the effects of luxury apartments on rent prices.

Ideally, I would like to see a comprehensive city planning strategy that includes creating more permits for duplexes/triplexes to grow in an organic way, permits for "mother-in-law" units, in addition to zoning for apartments. I'd like to see what I've seen in Ventura and San Luis Obispo, where a certain percentage of dwellings are reserved for county low-income programs. Such a strategy should be future-oriented. Cypress (and OC/LA) cannot remain a metro dominated by the automobile forever. We need to do city planning in a way that makes sense to future public transportation developments. In my view, Katella & Lincoln are the obvious transportation arteries, that will one day feature a light rail or increased bus service. What better place to build apartments? Who is most likely to use public transportation, but apartment dwellers?

I am shocked and concerned by public sentiment that I see on these proposed changes to Cypress. I see people who would rather families cram into small apartments and homes or commute 3 hours a day from Corona/Riverside, just so they don't have an extra 15 minute drive on their Costco run and picking up the kids from school. On a Facebook page, a woman complains about traffic while shopping while callously saying that OC is a "commuter

culture" and people should just accept 1-3 hour commute times each day.

Cypress is a centrally-located city in Orange County. If you build it, they will come. That is a given. I know of college educated couples who work in Cypress and Huntington Beach and commute from Signal Hill and Long Beach. I often work down in Irvine, while my husband commutes to LA. Cypress is a perfect location for us. We have to think bigger than Cypress and be part of the solution for the future of Orange County and this state.

Thank you for your consideration of my comments. Where is the best place that I might follow the progress on this matter. I want to be sure to participate in any public hearings?

Sincerely,
Shaunna Hargrave

The purpose of this comment car is to solicit input regarding the scope and content of the Environmental Impact Report (EIR). Please submit comment for the record that pertain to the ***environment issues*** to be addressed in the EIR.

Mr. Ramirez:

The comment form specially specifies the comments are for records and that they pertain to the '***environment issues'*** to be addressed in the EIR. My comments will be submitted in two parts: 1) one to conform to the format request and two a letter to the you, City Planner to share with the Mayor and Council.

As a resident I am not knowledge of the California State Clearinghouse requirements for the EIR submission. An observation on the process is that it is solely based on those categories that have impacts of the components or elements of a site developments. It lists several of the major Cypress areas and development issues; but, the EIR process does not require the the developer to show or use analysis to establish the project's compliance with the all City of Cypress plans ordinances and prolicies. The California State regulation is flawed in a similar manner as it required the SMOG Testing of vehicles; with no requirements for annual safety road worthiness testing. The overall, long term financial analysis for it impact of the City of Cypress does not seem to addressed. See my attached letter for more on this issue.

PUBLIC SCOPING MEETING
CYPRESS CITY CENTER PROJET
Wednesday, December 11, 2018

The City of Cypress should engage a independent licensed professional services company to perform a detailed review of this draft EIR. The should be provided with the City of Cypress, Plans, Housing, Developments, ordinances and policies to ensure that they will be using the City base requirements for this development. They should all be required to have a kickoff meeting so that the Mayor and Council with guiding from staff to review the scope with the emphasis on the City of Cypress requirements

The licensed professional services company shall review and provide detailed comments on all sections of the EIR. I ask that they do a more detailed analysis on the Air Quality, Energy, Hydrology and Water, Noise, Publics services, recreation, Transportaion.

All of the areas will have a long term increased financial effect on the City of Cypress. The City will require funds and they will be asking us to approve more property taxes.

In summary, City of Cypress should contract with a licensed professional service company to preform the review of the Draft EIR.

Millage House, Jr

Cypress, CA 90630

Subject: Draft EIR, **environmental *issues*** review

Mr. Ramirez, this letter is directed to your attention because of the request to submit comments for the record that pertain to the environmental issues to be address in the EIR.

I referenced in my submission comment:
"An observation on the EIR process is that it is solely based on those__ categories that have impacts of the components or elements of a site development. It lists several of the major Cypress areas and development issues; but, the EIR process does not require the developer to show or use analysis to establish the project's
compliance with the all City of Cypress plans ordinances and policies. The California State regulation is flawed in a similar manner as it required the SMOG Testing of vehicles; with no requirements for annual safety road worthiness testing. The overall, long term financial analysis for it impact of the City of Cypress does not seem to addressed. See my attached letter for more on this issue."

My recommendation is for your office to present a formal request to the Mayor and Council a request to direct the planning department to perform a financial planning study on this EIR and its entire development. The result will be a report that addresses the short and long/life expectancy financial, public services, and infrastructure requirements on the City and the residents. This report should be used to support the staff recommendation to the Mayor and council.

The process that the City of Cypress is following seems to be a little flawed and only seems to be addressing the CA state regulations/requirements. The residents need equal representation; since the long term financial responsibly falls on us. The buck stops here. The residents have a right to have full disclosure and the planning Department, Mayor and Council have an obligation to provide this information.

The City of Cypress needs to use a model similar to the one that is currently being used by the City of Anaheim.

Sincerely,

Millage House, Jr.

To:	City Planner
Subject:	Four-Story High-Density Apartment Building
Date:	Saturday, December 21, 2019 5:05:46 PM

Mr. John Ramirez
City Planner
City of Cypress

Dear Mr. Ramirez:

I am writing regarding the four-story high-density apartment complex that is being planned for the City of Cypress. My husband and I have lived in Cypress since 1978 (first in Tanglewood for 1-1/2 years and then in our current single-family home that we added onto twice). As former New Yorkers, we are flustered as to why the Cypress City Council appears determined to recreate Manhattan traffic gridlock on Cypress and Los Alamitos streets.

The four-story high-density apartment complex is not good for Cypress. If built, whatever benefits it brings to the city will be at Los Alamitos' AND Cypress' expense.

Whenever I speak to residents about the abysmal traffic on Katella Avenue (especially at the Katella/Los Alamitos intersection), many say they get around the awful congestion by using Farquhar Avenue. I started doing that and even with stop signs at each corner traffic currently moves faster than on Katella Avenue. Moreover, you can usually make a left turn onto Los Alamitos Blvd. without waiting through two or three cycles.

If this four-story high-density apartment complex is allowed to go through along with all the other asinine residential building that Cypress has approved, who knows how much more traffic Los Alamitos and Cypress residents will suffer with.

If you would like additional reasons against the four-story, high-density apartment complex, please let me know. In the meantime, on behalf of my husband and myself, we are AGAINST THIS PROJECT!

Sincerely,

Robin Itzler

Property on Katella Condomenian proposed property

From: Star Johnson (oonthgo@sbcglobal.net)

To: cityplanner@cypress.org

Date: Friday, December 20, 2019, 05:13 PM PST

Attention: John P. Ramirez

The development of this property as proposed is unconventional with the surrounding area and landscape.

There isn't anything else in this same area with this elevation. The proposed is said to house 3 people per unit, which I am sure will not be the case. There will undoubtedly be more people per unit.

It sounds like it is planned as a separate community with it's own theather and shops and garage parking.

The traffic will be increased 3 fold of the units proposed, 253 x 3= 759 more cars traveling on Katella morning
and night to work and back. In addition to the occupant traffic will be the theather and shops.

I personally think this has not been thought out very well.

The currant daily traffic on Katella is bad enough plus the strip mall that is proposed next or in front of the recent
Senior homes next to Cornerstone Church will add additional traffic.

I really think the Planning committee needs to rethink this whole idea.

I have lived in Cypress for 51 years and would hate to have this ruin our city.

I plan to be at the meeting on Monday.

Sincerely,

Star Johnson

Comments:

• Aesthetics – Katella Ave is a primary transportation corridor in Orange County. Putting a 4-story high density apartment building with a parking garage along a primary city boundary is going to give an image to those driving by that Cypress is something other than a low density residential community. The proposed project introduces the first 4 story apartment building and the first parking garage. This is not representative of who Cypress is. Drive around our city and you will see that this apartment complex with a parking garage is not aesthetically or otherwise representative of who Cypress is. In fact, in 2016, the same City Council members that are serving now opposed a 66 unit residential townhome development on Orange Ave across from City Hall because some units were 3 story and they had traffic and safety concerns. The density on that project was less than twenty units per acre. The developer went back and revised their project to 52 units that were 2 stories with a density closer to 15 units per acre. Everyone agreed that this development with the height limit was more representative of who Cypress is. How could our city have changed so dramatically in 4 years? Even the apartments on Lincoln are substantially lower density when you make the density calculation based on the site the residential units physically occupy. Most residents would tell you that they still believe the density on those Lincoln units is too high.

• Air Quality – The density calculation that the city has suggested is very misleading because it gives no consideration to the hotel, movie theater, and retail components. Increased traffic given the compactness of this site will clearly lend itself to poorer air quality.

• Land Use and Planning. Prior to 1990, this property had Public/Semi-Public zoning on it which would have prohibited any of the uses being proposed by the project. Any zoning change required a vote of the residents due to Measure D that was approved by voters in 1987. In 1990, the voters approved a

RECEIVED

COMMUNITY DEVELOPMENT

change to the zoning on some of the frontage road along Katella and along Walker St. The zoning permitted the commercial/retail/office projects currently found on those frontage properties. The residents did not approve a zoning change that permitted residential. However, when the zoning was changed, there was unfortunately no caveat in the language that said that future zoning changes would have to be voted on by the residents. The residents at that time evidently believed the city leaders would honor the voice of the residents. As residents have seen some of the zoning changes that have been made by the city leadership in recent years, there is a growing demand for a separate planning commission to give residents a greater voice in zoning. It was this concern of the change in zoning that is now being considered that when the zoning was changed for the race track property in 2018, language was incorporated in that initiative that requires another vote of the residents to change the zoning of the race track property from the zoning approved by the residents. The city leaders should honor the voice of the residents from that 1990 vote or take it back to a vote to see if the residents want this type of residential development on this site.

The analysis has to take into consideration how the city plans to rezone the property to accommodate the residential component. Given the density calculation of 18.9 units per acre put forth by the city, then one can conclude that all 13.3 acres will be rezoned residential. If only the 4 acres is zoned residential then the 18.9 unit per acre density calculation doesn't work since the other 9 acres wouldn't permit residential so shouldn't be part of the calculation. If, on the other hand, the City Council rezones all 13 acres for residential, nothing would prevent the property owner five or so years from now to seek approval for another apartment building on the retail sites if those aren't successful. In fact, Shea was just approved in June 2019 to build 44 single-family homes and 61 townhouses on what is now Mission Foothill Marketplace in Mission Viejo, a mostly vacated mall.
https://www.ocregister.com/2019/06/26/plan-to-convert-mission-foothill-marketplaces-main-building-into-105-homes-approved-by-mission-viejo-city-council/

• Population and Housing. The current residential occupancy in our city averages 3 people per residence. If that average holds out, the population in our city would grow by 750 residents due to this project. Reality is that many recent studies have concluded that the higher rents being demanded in Orange County have led to substantial overcrowding in residential units. In fact, the standard is that two people can occupy each bedroom with one additional person in the living space. As such, if the average apartment in this complex has 2 bedrooms, then each apartment could legally accommodate 5 people which could bring the overall occupancy to 1,250 residents. These new occupancy studies showing the overcrowding issues ultimately falsify the results of a traffic study and lead a developer to substantially underpark a residential development. This doesn't happen on a retail development as there are only so many seats in a movie theater or restaurant. The residential component of this project dramatically changes the clear intent of this property when the voters approved a zoning change in 1990.

• Public Services. This development will significantly increase the demand for police, fire, schools, parks, and libraries especially given the residential component.

• Recreation. When Measure A was approved in 2018 to change the zoning for the race track, one of the significant benefits was that 20 acres of park land were going to be provided. No new park land will come from this project. While there will be park developer fees paid as part of the construction costs, this is one time money and no new park will be provided.

• Transportation – Since this project will sit on Katella, many think about the traffic impacts on Katella. The problem is to gain access or use any of the city services, the new residents will travel north along already impacted interior roads to gain access to schools, parks, and other public services. The Student

Yield Factor established by the State Allocation Board would increase in enrollment due to new housing construction. The states guideline says you can expect .5 elementary students per new residential unit and .2 junior high and high schools for a combination of .7 students per residential unit. As such, we could see an increase of about 175 students needing to go to school and be provided transportation to schools, sporting activities, parks, and public services. The fact that the elementary school district has indicated a willingness to open one of the closed schools, there will still be increased traffic. If overcrowding in these units takes place then the problem is worse.

This project will create many impacted intersections along Katella Ave but also along Walker and Lexington that will be affected by the Katella Ave traffic patterns this project will create. These intersections need to be studied.

A project alternative would be one with significantly lower density in the apartment complex as well as the overall height of the residential units being limited to two stories and eliminate the parking garage. Another alternative project would be one with no residential with the residential replaced with a family friendly entertainment center like a ~~Dave & Buster's~~ or the Splitsville Luxury Lanes in Downtown Disney, movie theater or nature center.

This seems to be loosely organized to reach only a few citizens + comments. Disappointed in city government. Why don't you have chairs for us to write our comments comfortably?

I have seen many upgrades in 45 yrs. Yes all the while impacts in our city. Dense living high rise results in many adults living together - too many cars not enough open space. No one ever admits police cannot cover crime investigations. We see blighted retail that Cypress Gov does not help - city does not maintain our city streets, fencing, sidewalks due to funding - we are turning into a ghetto if you are adding more expense to city.

The purpose of this comment card is to solicit input regarding the scope and content of the Environmental Impact Report (EIR). Please submit comments for the record that pertain to the ***environmental issues*** to be addressed in the EIR (please print).

POTENTIAL ENVIRONMENTAL IMPACTS:
• AESTHETICS: CITY OF CYPRESS HAS LONG BEEN RECOGNIZED PUBLICLY AND PRIVATELY AS A GOVERNMENT LEADER PROMINENTLY PROTECTING "QUALITY OF LIFE FOR CYPRESS RESIDENTS AND ADJACENT COMMUNITIES." PROPOSED DEVELOPMENT VIOLATES THIS STANDARD BY INTENTIONAL DEVIATION FROM EXISTING ZONING DESIGNATION PBP-25A (PBP). THEREFORE, CCC NOT ONLY NEGATES CYPRESS PROTECTION FOR QUALITY OF LIFE CONCERNS - IT COUNTERATTACKS PRIOR WRITTEN PLANNING GUARANTEEING PROTECTION TO OUR CITIZENS. WHY?

Please comment by December 23, 2019

WHY IS EXPLAINED BY UNDERSTANDING THE THRUST OF THIS CCC. IT IS TO GENERATE NEW MONEY IN TAXES AND SERVICES FOR CITY OF CYPRESS. THERE IS NO VISIBLE BENEFIT TO CYPRESS CITIZENS. THE IMPLOSION ON WE THE PEOPLE BECOMES SECONDARY TO GOVERNMENT OFFICIALS WHO ALWAYS SUCCUMB TO POWER, PROMISES AND REVENUES FROM DEVELOPERS; INCLUDING CAMPAIGN DONATIONS AND OTHER PERQUISITES.

BECAUSE OF THIS CONTRARY VIEW RECOGNIZING THE DEMERITS OF THIS CCC, CITY OF CYPRESS OUGHT TO CEASE AND DESIST THE CURRENT DRIVE FOR THE DEVELOPMENT. OFFER TO US CYPRESS CITIZENS A REFERENDUM VOTE FOR OR AGAINST CCC.

- AESTHETICS CONTINUED:

DEMERITS FOR THIS CCC ARE OBVIOUS FOR THE 13-ACRE SITE:

- BUILDING A FOUR STORY RESIDENTIAL COMPONENT FOR RESIDENTS VERTICALLY STACKS TOO MANY HUMANS IN A NEW AND DENSE POPULATION EXPLOSION.

- DESIGNING THIS RESIDENTIAL COMPONENT PROVIDES AMENITIES WHICH ARE PRIVATE AND EXCLUDES WE THE PEOPLE. WE NEED A PUBLIC PARK ON THIS 13-ACRE VENUE.
- BUILDING A FIVE STORY HOTEL FOR TRANSIENT VISITORS TO OUR HOMETOWN DOUBLES, PERHAPS TRIPLES, THE POPULATION EXPLOSION ALONG WITH THE RESIDENTIAL COMPONENT. THAT'S A DOUBLE JEOPARDY.
- PROPOSING 20,800 SF OF RETAIL AND RESTAURANTS IS NOT DEFINED BUT SIMILARLY EXPANDS POPULATION AND USAGE ISSUES WHICH NEGATIVELY AFFECT OUR CITIZEN QUALITY OF LIFE.
- ADDING A 43,200 SF THEATER WHICH IS PRINCIPALLY FOR PM ENTERTAINMENT EMPHASIZES STATED DEMERITS.
- PROPOSED OFFSITE IMPROVEMENTS AS STATED OFFER NO BENEFIT TO WE THE PEOPLE. WE NEED PUBLIC BENEFITS FOR ANY CYPRESS PROJECT.

POTENTIAL ENVIRONMENTAL IMPACTS:

- LAND USE AND PLANNING: AS RECORDED, PROPOSED PROJECT INCLUDES LAND USES THAT ARE NOT EXPRESSLY ALLOWED BY THE SPECIFIC PLAN. THEREFORE, EXPRESSLY DISALLOWED. WE CITIZENS DEMAND THAT NO AMENDMENT BE MADE TO THE SPECIFIC PLAN.
- POPULATION AND HOUSING: INCLUDING A MINIMUM OF 251 APARTMENT UNITS IN NO WAY MINIMIZES POPULATION EXPLOSION. STRUGGLING RESIDENTS WILL ADD CO-TENANTS TO REDUCE THE HIGH-COST OF LIVING. THAT'S ANOTHER THREAT TO OUR COMMUNITIES STANDARD OF LIVING.

THERE ARE ACCORDINGLY, MANY UNRESOLVED PITFALLS BY EXAMINING THE REALITY FOR CCC.

PLEASE HEAR US, LISTEN TO US, RESPOND TO US, WE THE PEOPLE. HONOR US BY GIVING TO US THE RIGHT TO VOTE ON THIS CCC.

RESPECTFULLY,
T.R. MCCAULEY

Subject: Shea project / Katella

I very strongly oppose the building of apartments in this said area. It will have a very huge effect on the traffic flow regarding Katella going East to West, also impacting shopping centers throughout Cypress and mainly Los Alamitos. Also the homes considered “Carrier Row”, our parks, our grocery stores, all the facilities west of this complex will see the greatest effect. Cypress or not, it will lead to disaster.

At this time we are in the process of a huge luxury apartment complex on Cerritos and Chestnut St., a huge townhome development, plus a hotel within 2 miles of each other in Los Alamitos. This is on Los Alamitos Blvd by Old Town. Sausalito and Los Alamitos Blvd.

These quaint towns that we’ve lived in for over 50 years is being over developed and causing grid lock on all the main streets and on our residential streets.

This is pure greed shown from these developers, it has literally destroyed both Cypress but mainly Los Alamitos. I realize the city line, but I also see how our town has become a nightmare even to go to a grocery store within a mile from my home. Our children can’t ride bikes because of cars zooming down the side streets and the main streets. Extremely dangerous and extremely selfish to take away the joys of children.

It is an absolute disgrace that these city planners are ruining and destroying our homes. Not only removing safety for our children. It is so crowded on the roads, bumper to bumper traffic throughout the day. Unsafe air quality, dredging up contaminated ground that was forbidden to be used for any construction for the last 30 years.

I’ve had 3 neighbors that have owned their homes since the late 50’s to the 70’s sell their properties to get away from this massage development that has effected their daily routines, within this last year alone!

Shame on you for using and trying to develop any piece of dirt left in this 5 mile radius. You have destroyed a once beautiful area with over population and over building.

What’s also amazing to many, there are so many empty office buildings, vacant stores, but you developers still manage to construct new buildings... That are also empty still!!!

Believe me when I tell you, it is all people talk about, complaining and disliking living here any longer.

I loved my safe town, I loved being able to walk without fear to the local corner store for an ice cream with my children. Or ride our bicycles through Rossmoor and laugh and enjoy the day. Not any more, too many cars, too many people, a complete tragedy waiting to happen. Everyday, all day!

I ask please do not develop your plan of another huge “luxury apartment complex”. You will be hurting so many people just to make your pocket book larger.

Respectfully,

Tracy Mackey
Los Alamitos

Regarding the Shea development on Katella...
I agree 100% with the quote I attached below.

The 4 story high density plan is a radical step away from Cypress' aesthetics.
The impact to parking, traffic, air quality, population, and overall congestion will impact our infrastructure, property values, and quality of life. Our property is located on Ferne Ave. west of Holder Ave. Apartments in the area are 2 stories, lower density.
A 4-story apartment building which necessitates a multi-level parking garage to accommodate the influx of vehicles does not provide continuity to Cypress. We have new apartments on Lincoln which have added to parking, traffic, and other problems. This 4-story plan may be in Shea's best interest but is not in ours.
Cypress residents would like Development that would improve the quality of life and maintain our City's image. 2-story non-dense residential, affordable senior apartments, or a family-friendly hub of activity, dining, retail would be in-line and match Cypress' current demographic. This proposed plan is fraught with far reaching consequences including the impact to traffic on streets running North/South through Cypress and the congestion it will cause for neighborhood schools.

"Comments:
• Aesthetics – Katella Ave is a primary transportation corridor in Orange County. Putting a 4-story high density apartment building with a parking garage along a primary city boundary is going to give an image to those driving by that Cypress is something other than a low density residential community. The proposed project introduces the first 4 story apartment building and the first parking garage. This is not representative of who Cypress is. Drive around our city and you will see that this apartment complex with a parking garage is not aesthetically or otherwise representative of who Cypress is. In fact, in 2016, the same City Council members that are serving now opposed a 66 unit residential townhome development on Orange Ave across from City Hall because some units were 3 story and they had traffic and safety concerns. The density on that project was less than twenty units per acre. The developer went back and revised their project to 52 units that were 2 stories with a density closer to 15 units per acre. Everyone agreed that this development with the height limit was more representative of who Cypress is. How could our city have changed so dramatically in 4 years? Even the apartments on Lincoln are substantially lower density when you make the density calculation based on the site the residential units physically occupy. Most residents would tell you that they still believe the density on those Lincoln units is too high.

• Air Quality – The density calculation that the city has suggested is very misleading because it gives no consideration to the hotel, movie theater, and retail components. Increased traffic given the compactness of this site will clearly lend itself to poorer air quality.

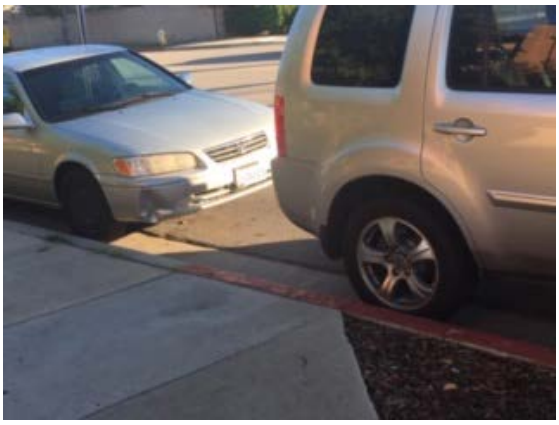
• Land Use and Planning. Prior to 1990, this property had Public/Semi-Public zoning on it which would have prohibited any of the uses being proposed by the project. Any zoning change required a vote of the residents due to Measure D that was approved by voters in 1987. In 1990, the voters approved a change to the zoning on some of the frontage road along Katella and along Walker St. The zoning permitted the commercial/retail/office projects currently found on those frontage properties. The residents did not approve a zoning change that permitted residential. However, when the zoning was changed, there was unfortunately no caveat in the language that said that future zoning changes would have to be voted on by the residents. The residents at that time evidently believed the city leaders would honor the voice of the residents. As residents have seen some of the zoning changes that have been made by the city leadership in recent years, there is a growing demand for a separate planning commission to give residents a greater voice in zoning. It was this concern of the change in zoning that is now being considered that when the zoning was changed for the race track property in 2018, language was incorporated in that initiative that requires another vote of the residents to change the zoning of the race track property from the zoning approved by the residents. The city leaders should honor the voice of the residents from that 1990 vote or take it back to a vote to see if the residents want this type of residential development on this site.

The analysis has to take into consideration how the city plans to rezone the property to accommodate the residential component. Given the density calculation of 18.9 units per acre put forth by the city, then one can conclude that all 13.3 acres will be rezoned residential. If only the 4 acres is zoned residential then the 18.9 unit per acre density calculation doesn't work since the other 9 acres wouldn't permit residential so shouldn't be part of the calculation. If, on the other hand, the City Council rezones all 13 acres for residential, nothing would prevent the property owner five or so years from now to seek approval for another apartment building on the retail sites if those aren't successful. In fact, Shea was just approved in June 2019 to build 44 single-family homes and 61 townhouses on what is now Mission Foothill Marketplace in Mission Viejo, a mostly vacated mall. https://linkprotect.cudasvc.com/url?a=https%3a%2f%2fwww.ocregister.com%2f2019%2f06%2f26%2fplan-to-convert-mission-foothill-marketplaces-main-building-into-105-homes-approved-by-mission-viejo-city-council%2f&c=E,1,1n4xEn7ZXgoc11SA7-tVOMZycYG9shrw-FOfiX3IWwvMQoAHrPCzZfZcG2Is6ETB2yECnFlqp9wvoBzcYztm94stEFvfMazpDC8AymRhwp5R0QsAtWLKoOXVUdM,&typo=1

If that average holds out, the population in our city would grow by 750 residents due to this project. Reality is that many recent studies have concluded that the higher rents being demanded in Orange County have led to substantial overcrowding in residential units. In fact, the standard is that two people can occupy each bedroom with one additional person in the living space. As such, if the average apartment in this complex has 2 bedrooms, then each apartment could legally accommodate 5 people which could bring the overall occupancy to 1,250 residents.

These new occupancy studies showing the overcrowding issues ultimately falsify the results of a traffic study and lead a developer to substantially underpark a residential development. This doesn't happen on a retail development as there are only so many seats in a movie theater or restaurant. The residential component of this project dramatically changes the clear intent of this property when the voters approved a zoning change in 1990.

• Public Services. This development will significantly increase the demand for police, fire, schools, parks, and libraries especially given the residential component.



• Recreation. When Measure A was approved in 2018 to change the zoning for the race track, one of the significant benefits was that 20 acres of park land were going to be provided. No new park land will come from this project. While there will be park developer fees paid as part of the construction costs, this is one time money and no new park will be provided.

• Transportation – Since this project will sit on Katella, many think about the traffic impacts on Katella. The problem is to gain access or use any of the city services, the new residents will travel north along already impacted interior roads to gain access to schools, parks, and other public services. The Student Yield Factor established by the State Allocation Board would increase in enrollment due to new housing construction. The states guideline says you can expect .5 elementary students per new residential unit and .2 junior high and high schools for a combination of .7 students per residential unit. As such, we could see an increase of about 175 students needing to go to school and be provided transportation to schools, sporting activities, parks, and public services. The fact that the elementary school district has indicated a willingness to open one of the closed schools, there will still be increased traffic. If overcrowding in these units takes place then the problem is worse.

This project will create many impacted intersections along Katella Ave but also along Walker and Lexington that will be affected by the Katella Ave traffic patterns this project will create. These intersections need to be studied.

A project alternative would be one with significantly lower density in the apartment complex as well as the overall height of the residential units being limited to two stories and eliminate the parking garage. Another alternative project would be one with no residential with the residential replaced with a family friendly entertainment center like a Dave & Buster's or the Splitsville Luxury Lanes in Downtown Disney."

Thank you,
Ingrid and Brent Marino
23 year residents

The density of the residential is too high by a factor of (3). The traffic on Katella would be horrendous, impacting air quality and emergency services.

CONCERN ABOUT CLIENTLE FOR PROPOSSED HOTEL.

Please comment by December 23, 2019

From: Angie Mizrahi
To: City Planner
Subject: Acreage vs anchorage on Katella
Date: Wednesday, December 18, 2019 10:54:55 AM

Good afternoon Mr. Ramirez.

I am writing to you in regards to the property being developed. I do not support a four story building full of extra people in our community using our resources and crowding our streets. However, I am also a realist that lives off of Walker a much traveled road where people are still able to speed past the speed limit. If we were to have a new apartment complex that is an appropriate location. I personally would like to see the building no taller than the tallest along that street. There is no reason for it to stick out like a sore thumb we all know that apartments are not aesthetically constructed. I drive by the apartments near Bella Terra and cringe. Near a college was fitting for those, not here! Please!

I am actually more thrilled about the possibility of family entertainment.

Please look at Big Als as a possible fit, if they will come this way we would all benefit! There is a gorgeous, very family orientated mall in Meridian ID called the Village it has this on one corner as an anchor and it is always busy with families, teams, parties and just people enjoying a meal. A Dave and Busters but better. This mall has a small playground and water fountain in the center of the outdoor mall area and at least 4 restaurants face the playground with outdoor seating where families can enjoy outdoor time, watch a sport on tv and watch their children at the playground area all at the same time. The fountain and small water fall are host duck race fundraisers and has colored music for the holidays, There is a small stage also in the center where local bands can rent and entertain guests. The center is very well planned and worth your trip to see what would generate money, family and unity here in CYP!

If we have to develop this land. Please consider an environment where we can come together with our community and its youth to enjoy what life has to offer and allow us to stay local.

Kind Regards,

Angie Mizrahi

Re: Cypress City Center Project Comment Form

Dear Mr. Ramirez,

Before I get into my comments regarding the EIR comment form I must express my disappointment in the fact that the city purposely decided to hold the EIR session with such short notice and place a deadline on citizens to respond two days prior to Christmas. These actions reflect poorly upon the city council and those involved in this project.

The following is my formal submission in regards to the City Center Project EIR Comment form due December 23, 2019.

Aesthetics
Katella avenue is a primary transportation corridor in within the city of Cypress and Orange County. Given how heavily this corridor is used by city residents I have the following comments and concerns:

- Putting a 4-story high density apartment building with a parking garage along a primary city boundary is going to give an image to those driving by that Cypress is something other than a low-density residential community.
- The proposed project introduces the first 4 story apartment building and the first parking garage in our city.
- This is not representative of who Cypress is. Drive around our city and you will see that this apartment complex with a parking garage is not aesthetically or otherwise representative of who Cypress is.
- In 2016, the same City Council members that are serving now and approved of this development opposed a 66-unit residential townhome development on Orange Ave across from City Hall because some units were 3 story and they had traffic and safety concerns.
    - The density on that project was less than twenty units per acre. The developer went back and revised their project to 52 units that were 2 stories with a density closer to 15 units per acre.
    - Everyone agreed that this development with the height limit was more representative of who Cypress is.
    - How could our city have changed so dramatically in 4 years?
    - Even the apartments on Lincoln are substantially lower density when you make the density calculation based on the site the residential units physically occupy. Most residents would tell you that they still believe the density on those Lincoln units is too high.

Air Quality

- The density calculation that the city has suggested is very misleading because it gives no consideration to the hotel, movie theater, and retail components.
- Increased traffic given the compactness of this site will clearly lend itself to poorer air quality.

Land Use and Planning

- Prior to 1990, this property had Public/Semi-Public zoning on it which would have prohibited any of the uses being proposed by the project.
- Any zoning change required a vote of the residents due to Measure D that was approved by voters in 1987.
- In 1990, the voters approved a change to the zoning on some of the frontage road along Katella and along Walker St. The zoning permitted the commercial/retail/office projects currently found on those frontage properties.
    - The residents did not approve a zoning change that permitted residential. However, when the zoning was changed, there was unfortunately no caveat in the language that said that future zoning changes would have to be voted on by the residents.
    - The residents at that time evidently believed the city leaders would honor the voice of the residents.
    - As residents have seen some of the zoning changes that have been made by the city leadership in recent years, there is a growing demand for a separate planning commission to give residents a greater voice in zoning.
    - It was this concern of the change in zoning that is now being considered that when the zoning was changed for the race track property in 2018, language was incorporated in that initiative that requires another vote of the residents to change the zoning of the race track property from the zoning approved by the residents.
- The city leaders should honor the voice of the residents from that 1990 vote or take it back to a vote to see if the residents want this type of residential development on this site.
- The analysis has to take into consideration how the city plans to rezone the property to accommodate the residential component.
    - Given the density calculation of 18.9 units per acre put forth by the city, then one can conclude that all 13.3 acres will be rezoned residential.
        - If only the 4 acres is zoned residential then the 18.9 unit per acre density calculation doesn't work since the other 9 acres wouldn't permit residential so shouldn't be part of the calculation.
        - If, on the other hand, the City Council rezones all 13 acres for residential, nothing would prevent the property owner five or so years from now to seek approval for another apartment building on the retail sites if those aren't successful.
        - *Side Note/Example for Comparison*: Shea was just approved in June 2019 to build 44 single-family homes and 61 townhouses on what is now Mission Foothill Marketplace in Mission Viejo, a mostly vacated mall. https://www.ocregister.com/2019/06/26/plan-to-convert-mission-foothill-marketplaces-main-building-into-105-homes-approved-by-mission-viejo-city-council/

- Questions:
    - Is the developer, Shea, aware that a competing movie theatre located in Garden Grove on Valley View at Chapmen is currently being built?
    - If the movie theatre and/or restaurants are not successful will the developer be allowed to convert the property in to an additional high-density housing development?

Population and Housing

The current residential occupancy in our city averages 3 people per residence.

- If that average holds out, the population in our city would grow by 750 residents due to this project.
- Reality is that many recent studies have concluded that the higher rents being demanded in Orange County have led to **substantial overcrowding in residential units**.
- In fact, the standard is that two people can occupy each bedroom with one additional person in the living space.
    - As such, if the average apartment in this complex has 2 bedrooms, then each apartment could legally accommodate 5 people which could bring the overall occupancy to 1,250 residents.
    - These new occupancy studies showing the overcrowding issues ultimately falsify the results of a traffic study and lead a developer to substantially under park a residential development.
        - This doesn't happen on a retail development as there are only so many seats in a movie theater or restaurant.
- The residential component of this project dramatically changes the clear intent of this property when the voters approved a zoning change in 1990.
- Questions:
    - 1) What is the proposed breakdown in unit types: Studio, 1 bedroom, 2 bedroom and 3 bedrooms?
    - 2) For the breakdowns in number 1, what are the maximum occupancy per unit based on unit types (studio, 1 bedroom, 2 bedrooms and 3 bedrooms)?
    - 3) What percentage/number of designated units will be affordable housing?
    - 4) What are the proposed number of parking spaces in the parking garage?
    - 5) What are the number of proposed handicapped parking spaces in the parking garage?
    - 6) What are the number of proposed handicapped parking spaces outside of the garage/close to the building entrance(s)?
    - 7) What are the number of visitor parking spaces proposed inside of the parking garage?
    - 8) What are the number of visitor spaces proposed outside of the parking garage?

- 9) Is the city considering all current **and** future developments in looking at the overall "big picture" for the city?
  - *Consideration examples:*
    - *3 commercial tenants, Yamaha, Vans and Mitsubishi Motors have vacated and/or are in the process of vacating. This leaves 3 major commercial properties at the intersection of Katella & Holder potentially available to new tenants.*
      - *Question 1: Once new tenants are identified how will these types of new tenants potentially impact traffic flow, and near-by residential neighborhoods, on Katella in conjunction with the new Shea City Center development?*
    - *Measure A Los Alamitos Race Track at some point will be sold and subsequently developed.*
      - *Question 2: What long-term planning consideration is being take into account with the additional traffic increase on Katella and Cerritos due to this new development and the 2 additional parks?*

Public Services

- This development will significantly increase the demand for police, fire, schools, parks, and libraries especially given the residential component.
- Questions:
  - 1) What is the proposed number of increase(s) to the number of police officers required to support this new development?
  - 2) What is the proposed number of increase(s) to the number of firefighters required to support this new development?
  - 3) What is the proposed number of increase(s) to the number of paramedics required to support this new development?

Hydrology & Water Quality

- Questions:
  - 1) With the current and ever-increasing water conservation rules placed on each city/water agency, what considerations are being taken to ensure that water rates to current city residents and businesses will not be impacted by the addition of this development?

Recreation

- When Measure A was approved in 2018 to change the zoning for the race track, one of the significant benefits was that 20 acres of park land were going to be provided.
- No new park land will come from this project.
- While there will be park developer fees paid as part of the construction costs, this is one-time money and no new park will be provided.
- Question:
  - 1) What are the estimated impacts to existing parks?

Transportation
Since this project will sit on Katella, many think about the traffic impacts on Katella.

- The problem is to gain access or use any of the city services, the new residents will travel north along already impacted interior roads to gain access to schools, parks, and other public services.
- The Student Yield Factor established by the State Allocation Board would increase in enrollment due to new housing construction.
    - The states guideline says you can expect .5 elementary students per new residential unit and .2 junior high and high schools for a combination of .7 students per residential unit.
        - As such, we could see an increase of about 175 students needing to go to school and be provided transportation to schools, sporting activities, parks, and public services.
        - The fact that the elementary school district has indicated a willingness to open one of the closed schools, there will still be increased traffic.
        - If overcrowding in these units takes place then the problem is worse.
- This project will create many impacted intersections along Katella Ave but also along Walker and Lexington that will be affected by the Katella Ave traffic patterns this project will create.
    - These intersections need to be studied.
- Question:
    - 1) Will this new development require new bus stop(s) along Katella to support a new housing development?

I believe strongly that the city should step back and consider alternative projects for this property:

- A project alternative would be one with significantly lower density in the apartment complex as well as the overall height of the residential units being limited to two stories and eliminate the parking garage.
- Another alternative project would be one with no residential with the residential replaced with a family friendly entertainment center like a Dave & Buster's or the Splitsville Luxury Lanes in Downtown Disney.
- The city should consider a high-end grocery store such as Trader Joe's, Sprouts or Whole Foods be a part of this development. The City of Cypress residents have been requesting better grocery options than that are currently provided in the city.
- The city should also examine the feasibility of affordable senior apartments. The City of Cypress currently has 2 designated apartment complexes that have a multi-year wait list. The city demographics and demand support this need

I would like to know when residents will have the opportunity to meet with the city and the developer for a two-way dialog in addition to the city properly communicating this meeting to the residents. Simply announcing on the city website and in an ad for a paid newspaper for which many residents do not subscribe to is an insufficient means of communicating with the residents.

Regards,

Brooke Nafarrete

Since this project will sit on Katella, many think about the traffic impacts on Katella.

- The problem is to gain access or use any of the city services, the new residents will travel north along already impacted interior roads to gain access to schools, parks, and other public services.
- The Student Yield Factor established by the State Allocation Board would increase in enrollment due to new housing construction.
    - The states guideline says you can expect .5 elementary students per new residential unit and .2 junior high and high schools for a combination of .7 students per residential unit.
        - As such, we could see an increase of about 175 students needing to go to school and be provided transportation to schools, sporting activities, parks, and public services.
        - The fact that the elementary school district has indicated a willingness to open one of the closed schools, there will still be increased traffic.
        - If overcrowding in these units takes place then the problem is worse.
- This project will create many impacted intersections along Katella Ave but also along Walker and Lexington that will be affected by the Katella Ave traffic patterns this project will create.
    - These intersections need to be studied.
- Question:
    - 1) Will this new development require new bus stop(s) along Katella to support a new housing development?

I believe strongly that the city should step back and consider alternative projects for this property:

- A project alternative would be one with significantly lower density in the apartment complex as well as the overall height of the residential units being limited to two stories and eliminate the parking garage.
- Another alternative project would be one with no residential with the residential replaced with a family friendly entertainment center like a Dave & Buster's or the Splitsville Luxury Lanes in Downtown Disney.
- The city should consider a high-end grocery store such as Trader Joe's, Sprouts or Whole Foods be a part of this development. The City of Cypress residents have been requesting better grocery options than that are currently provided in the city.
- The city should also examine the feasibility of affordable senior apartments. The City of Cypress currently has 2 designated apartment complexes that have a multi-year wait list. The city demographics and demand support this need

I would like to know when residents will have the opportunity to meet with the city and the developer for a two-way dialog in addition to the city properly communicating this meeting to the residents. Simply announcing on the city website and in an ad for a paid newspaper for which many residents do not subscribe to is an insufficient means of communicating with the residents.

Regards,

Carlo A. Nafarrete

Phish Alert

I have been following information provided on the Katella Avenue project and I do not like what I am reading. This development does not fit in with the rest of Cypress and I am very disappointed in the direction the city council is taking this city,
I have been a resident of Cypress since 1975 and the proposals I have seem of high density residential buildings is not what the people of Cypress want. This was demonstrated by two recent issues put before the voters who turned down high density residential proposals but the city council seems to ignore the will of the voters and approved this project.
I would sincerely encourage the city council to review this project again and support a lower density project.

Please don’t build all those apartments on Katella.
Now we hear that if retail can’t be found more apartments will be squeezed onto the property
The will of the citizens is of utmost importance. We’ve voted for one thing only to find the city council is doing the complete opposite.

Comments:

• Aesthetics – Katella Ave is a primary transportation corridor in Orange County. Putting a 4-story high density apartment building with a parking garage along a primary city boundary is going to give an image to those driving by that Cypress is something other than a low density residential community. The proposed project introduces the first 4 story apartment building and the first parking garage. This is not representative of who Cypress is. Drive around our city and you will see that this apartment complex with a parking garage is not aesthetically or otherwise representative of who Cypress is. In fact, in 2016, the same City Council members that are serving now opposed a 66 unit residential townhome development on Orange Ave across from City Hall because some units were 3 story and they had traffic and safety concerns. The density on that project was less than twenty units per acre. The developer went back and revised their project to 52 units that were 2 stories with a density closer to 15 units per acre. Everyone agreed that this development with the height limit was more representative of who Cypress is. How could our city have changed so dramatically in 4 years? Even the apartments on Lincoln are substantially lower density when you make the density calculation based on the site the residential units physically occupy. Most residents would tell you that they still believe the density on those Lincoln units is too high.

• Air Quality – The density calculation that the city has suggested is very misleading because it gives no consideration to the hotel, movie theater, and retail components. Increased traffic given the compactness of this site will clearly lend itself to poorer air quality.

• Land Use and Planning. Prior to 1990, this property had Public/Semi-Public zoning on it which would have prohibited any of the uses being proposed by the project. Any zoning change required a vote of the residents due to Measure D that was approved by voters in 1987. In 1990, the voters approved a

change to the zoning on some of the frontage road along Katella and along Walker St. The zoning permitted the commercial/retail/office projects currently found on those frontage properties. The residents did not approve a zoning change that permitted residential. However, when the zoning was changed, there was unfortunately no caveat in the language that said that future zoning changes would have to be voted on by the residents. The residents at that time evidently believed the city leaders would honor the voice of the residents. As residents have seen some of the zoning changes that have been made by the city leadership in recent years, there is a growing demand for a separate planning commission to give residents a greater voice in zoning. It was this concern of the change in zoning that is now being considered that when the zoning was changed for the race track property in 2018, language was incorporated in that initiative that requires another vote of the residents to change the zoning of the race track property from the zoning approved by the residents. The city leaders should honor the voice of the residents from that 1990 vote or take it back to a vote to see if the residents want this type of residential development on this site.

The analysis has to take into consideration how the city plans to rezone the property to accommodate the residential component. Given the density calculation of 18.9 units per acre put forth by the city, then one can conclude that all 13.3 acres will be rezoned residential. If only the 4 acres is zoned residential then the 18.9 unit per acre density calculation doesn't work since the other 9 acres wouldn't permit residential so shouldn't be part of the calculation. When the City Council approved the Exclusive Negotiation Agreement with Shea in April 2019, the agreement clearly said the density was 63 units per acre which was based on 251 units on 4 acres. The rendering submitted by Shea also said 63 units per acre. If, on the other hand, the City Council rezones all 13 acres for residential, nothing would prevent the property owner five or so years from now to seek approval for another apartment building on the retail sites if those aren't successful. In fact, Shea was just approved in June 2019 to build 44 single-family homes and 61 townhouses on what is now Mission Foothill Marketplace in Mission Viejo, a mostly vacated mall. https://www.ocregister.com/2019/06/26/plan-to-convert-mission-foothill-marketplaces-main-building-into-105-homes-approved-by-mission-viejo-city-council/ The report should specifically delineate the City Council's plan on any re-zoning and study any ramifications accordingly. The residents have had to deal with bait and switch scenarios in the past.

• Population and Housing. The current residential occupancy in our city averages 3 people per residence. If that average holds out, the population in our city would grow by 750 residents due to this project. Reality is that many recent studies have concluded that the higher rents being demanded in Orange County have led to substantial overcrowding in residential units. In fact, the standard is that two people can occupy each bedroom with one additional person in the living space. As such, if the average apartment in this complex has 2 bedrooms, then each apartment could legally accommodate 5 people which could bring the overall occupancy to 1,250 residents. These new occupancy studies showing the overcrowding issues ultimately falsify the results of a traffic study and lead a developer to substantially underpark a residential development. This doesn't happen on a retail development as there are only so many seats in a movie theater or restaurant. The residential component of this project dramatically changes the clear intent of this property when the voters approved a zoning change in 1990.

• Public Services. This development will significantly increase the demand for police, fire, schools, parks, and libraries especially given the residential component.

• Recreation. When Measure A was approved in 2018 to change the zoning for the race track, one of the significant benefits was that 20 acres of park land were going to be provided. No new park land will come from this project. While there will be park developer fees paid as part of the construction costs, this is one time money and no new park will be provided.

• Transportation – Since this project will sit on Katella, many think about the traffic impacts on Katella. The problem is to gain access or use any of the city services, the new residents will travel north along already impacted interior roads to gain access to schools, parks, and other public services. The Student Yield Factor established by the State Allocation Board would increase in enrollment due to new housing construction. The states guideline says you can expect .5 elementary students per new residential unit and .2 junior high and high schools for a combination of .7 students per residential unit. As such, we could see an increase of about 175 students needing to go to school and be provided transportation to schools, sporting activities, parks, and public services. The fact that the elementary school district has indicated a willingness to open one of the closed schools, there will still be increased traffic. If overcrowding in these units takes place then the problem is worse.

This project will create many impacted intersections along Katella Ave but also along Walker and Lexington that will be affected by the Katella Ave traffic patterns this project will create. These intersections need to be studied.

Project Alternatives:
A project alternative would be one with significantly lower density in the apartment complex as well as the overall height of the residential units being limited to two stories and eliminate the parking garage.

Another alternative project would be one with no residential with the residential replaced with a family friendly entertainment center like a Dave & Buster's or the Splitsville Luxury Lanes in Downtown Disney.

From:	Lynn Pardon
To:	City Planner
Subject:	Cypress City Center - Public Scoping Meeting Comment Card Revised
Date:	Saturday, December 21, 2019 12:05:20 AM
Attachments:	Cypress City Center - Public Scoping Meeting Comment Card Revised.docx

Dear Mr. Ramirez,

Thank you for the time you spent with George and me discussing our concerns on the pending developments on the 13 Acre Site on Katella Avenue in Cypress. In talking it over, I realized I would like to revise my EIR comments to include my additional concerns. Nothing else is changed in my submission except for an added paragraph at the end of Land Use and Planning and a paragraph added under Drainage and Absorption, noted below. Please forward my attached revised comments to the EIR committee.

Sincerely,
Lynn Pardon

Land Use and Planning - While my hope is that the residential density in this project is lowered significantly, if this project moves forward, I think the residential component should be moved to the Winner's Circle side of the project site. Having the residential component along the race track entrance doesn't seem like a good fit. Also, if the race track ever closes, there is supposed to be a town center immediately north of this project site with Siboney as a likely entrance to the town center. This project site should be laid with consideration of any future development. Having the residential component adjacent to Winners Circle also allows residents easy walking access to Costco and the other restaurants in that development rather than the residents having to walk in front of or behind the movie theater which doesn't seem as safe.

Drainage and Absorption - Because of a high water table, much of Cypress is prone to flooding during heavy or frequent rains, as the water takes time to dissipate. I expect the builders of this project to pay extra special attention to the need for a water retention basin and runoff directions to assure that when it rains the subject property, surrounding businesses and streets are not affected by flooding. For instance, on westbound Katella the 3rd lane east of Lexington floods to the extent of closure, which becomes a safety issue as cars abruptly make a lane change to avoid the flooded lane. I personally experienced this several times in 2019. There is a required water retention basin in the parking lot of Cottonwood Church which helps their property but not the flooding on Katella Avenue itself. So it is imperative that each property handle the water retention necessary in order to relieve flooding in surrounding areas.

With 250 units planned, at a rental that will be affordable primarily to households with two (or more) income earners, we can anticipate that the development will bring in around 500 additional cars. The proposed four-story garage, with 55 spots per story can accommodate less than half of that. Where will the rest of the cars park? Worse, being cars of people with jobs, we can anticipate that all 500 of them will enter and leave the development within a short time at evening and morning rush hours, adding to the already intense traffic on Katella Avenue.

As the existing Cypress schools are already packing students into temporary structures (trailers, actually) for classrooms, the school systems (CSD and AUHSD) are already working at over 100% capacity. Some proportion of the households that can afford this housing will have children and will further overburden the local schools. This will, in turn, add to traffic congestion experienced at drop-off and pick-up time on the streets adjacent to the Cypress schools.

Cypress does not need more people living here, and it certainly does not need the associated crowding and traffic congestion. What Cypress needs is more business establishments catering to the needs of the existing residents.

DEC 23 2019
CITY OF CYPRESS
COMMUNITY DEVELOPMENT

The city should continue to implement green spaces that add to the aesthetics of the city. We already have an abundance of retail venues. Our city is unique and should remain that way. Cypress residents live here because it is a pleasant city in which to reside. Adding high-rise buildings and/or additional retail will add to the traffic of the city which is already getting out of hand. Cypress residents have always been informed of changes. Please continue to respect our right to know about changes in our city. Meetings with hidden agendas are not appreciated. The Project Meeting was not communicated clearly and many residents did not get the information needed to attend the December 11th meeting. In the future, it would be helpful to include such important information in the city newsletter that reaches all citizens of Cypress.

I am in agreement with the following comments submitted by George Pardon. Mr. Pardon's comments are copied below:

The purpose of this comment card is to solicit input regarding the scope and content of the Environmental Impact Report (EIR). Please submit comment for the record that pertain to the environmental issues to be addressed in the EIR (please print).

Comments:
• Aesthetics – Katella Ave is a primary transportation corridor in Orange County. Putting a 4-story high density apartment building with a parking garage along a primary city boundary is going to give an image to those driving by that Cypress is something other than a low density residential community. The proposed project introduces the first 4 story apartment building and the first parking garage. This is not representative of who Cypress is. Drive around our city and you will see that this apartment complex with a parking garage is not aesthetically or otherwise representative of what Cypress is. In fact, in 2016, the same City Council members that are serving now opposed a 66 unit residential townhome development on Orange Ave across from City Hall because some units were 3 story and they had traffic and safety concerns. The density on that project was less than twenty units per acre. The developer

went back and revised their project to 52 units that were 2 stories with a density closer to 15 units per acre. Everyone agreed that this development with the height limit was more representative of what Cypress is. How could our city have changed so dramatically in 4 years? Even the apartments on Lincoln are substantially lower density when you make the density calculation based on the site the residential units physically occupy. Most residents would tell you that they still believe the density on those Lincoln units is too high.

• Air Quality – The density calculation that the city has suggested is very misleading because it gives no consideration to the hotel, movie theater, and retail components. Increased traffic given the compactness of this site will clearly lend itself to poorer air quality.

• Land Use and Planning. Prior to 1990, this property had Public/Semi-Public zoning on it which would have prohibited any of the uses being proposed by the project. Any zoning change required a vote of the residents due to Measure D that was approved by voters in 1987. In 1990, the voters approved a change to the zoning on some of the frontage road along Katella and along Walker St. The zoning permitted the commercial/retail/office projects currently found on those frontage properties. The residents did not approve a zoning change that permitted residential. However, when the zoning was changed, there was unfortunately no caveat in the language that said that future zoning changes would have to be voted on by the residents. The residents at that time evidently believed the city leaders would honor the voice of the residents. As residents have seen some of the zoning changes that have been made by the city leadership in recent years, there is a growing demand for a separate planning commission to give residents a greater voice in zoning. It was this concern of the change in zoning that is now being considered that when the zoning was changed for the race track property in 2018, language was incorporated in that initiative that requires another vote of the residents to change the zoning of the race track property from the zoning approved by the residents. The city leaders should honor the voice of the residents from that 1990 vote or take it back to a vote to see if the residents want this type of residential development on this site.

The analysis has to take into consideration how the city plans to rezone the property to accommodate the residential component. Given the density calculation of 18.9 units per acre put forth by the city, then one can conclude that all 13.3 acres will be rezoned residential. If only the 4 acres is zoned residential then the 18.9 unit per acre density calculation doesn't work since the other 9 acres wouldn't permit residential so shouldn't be part of the calculation. If, on the other hand, the City Council rezones all 13 acres for residential, nothing would prevent the property owner five or so years from now to seek approval for another apartment building on the retail sites if those aren't successful. In fact, Shea was just approved in June 2019 to build 44 single-family homes and 61 townhouses on what is now Mission Foothill Marketplace in Mission Viejo, a mostly vacated mall.
https://www.ocregister.com/2019/06/26/plan-to-convert-mission-foothill-marketplaces-main-building-into-105-homes-approved-by-mission-viejo-city-council/

• Population and Housing. The current residential occupancy in our city averages 3 people per residence. If that average holds out, the population in our city would grow by 750 residents due to this project. Reality is that many recent studies have concluded that the higher rents being demanded in Orange County have led to substantial overcrowding in residential units. In fact, the standard is that two people can occupy each bedroom with one additional person in the living space. As such, if the average apartment in this complex has 2 bedrooms, then each apartment could legally accommodate 5 people which could bring the overall occupancy to 1,250 residents. These new occupancy studies showing the overcrowding issues ultimately falsify the results of a traffic study and lead a developer to substantially underpark a residential development. This doesn't happen on a retail development as there are only so

many seats in a movie theater or restaurant. The residential component of this project dramatically changes the clear intent of this property when the voters approved a zoning change in 1990.

• Public Services. This development will significantly increase the demand for police, fire, schools, parks, and libraries especially given the residential component.

• Recreation. When Measure A was approved in 2018 to change the zoning for the race track, one of the significant benefits was that 20 acres of park land were going to be provided. No new park land will come from this project. While there will be park developer fees paid as part of the construction costs, this is one time money and no new park will be provided.

• Transportation – Since this project will sit on Katella, many think about the traffic impacts on Katella. The problem is to gain access or use any of the city services, the new residents will travel north along already impacted interior roads to gain access to schools, parks, and other public services. The Student Yield Factor established by the State Allocation Board would increase in enrollment due to new housing construction. The states guideline says you can expect .5 elementary students per new residential unit and .2 junior high and high schools for a combination of .7 students per residential unit. As such, we could see an increase of about 175 students needing to go to school and be provided transportation to schools, sporting activities, parks, and public services. The fact that the elementary school district has indicated a willingness to open one of the closed schools, there will still be increased traffic. If overcrowding in these units takes place then the problem is worse.

This project will create many impacted intersections along Katella Ave but also along Walker and Lexington that will be affected by the Katella Ave traffic patterns this project will create. These intersections need to be studied.

Being a resident and business owner in the city of Cypress, your project represent no benefit. I presently drive 1.2 miles from home to work, it can take me 20 minute ob commute time.-
-4 story building with over 200 units of residence. will bring in more cars (traffic) and multiple families living in one unit. *Air quality *Aesthetics *Noise
-Movie Theatre - is only a business that is struggling to survive.
-Shopping Center, with the rise ob online shopping, shopping centers are struggling to survice.
Your report migh show information and numbers expressing the city is capable ob developing but for a resident the impact ob enviroment is **not** a **positive** outcome.

A PROJECT OF THIS TYPE IS TOTALLY OUT OF CHARACTER WITH OUR CITY, AND WILL ONLY SERVE TO ADD MORE CONGESTION TO OUR STREETS AND BUSINESSES, ALONG WITH ADDING MORE LOAD TO OUR OVERTAXED AND UNDER-MAINTAINED POWER GRID & WATER SUPPLY. IT'S PRETTY OBVIOUS WHAT THIS SCURGE OF HIGH-DENSITY HOUSING IS DOING TO OUR COMMUNITY WHEN WE HAVE TO WAIT DURING TWO LIGHT CYCLES TO MAKE A LEFT TURN, OR WAIT SOMETIMES 40 MINUTES OR MORE TO GET A SEAT IN A LOCAL RESTAURANT. CRAP HOUSING LIKE THIS HAS NO PLACE IN OUR CITY, IT'S SAD ENOUGH THAT WE GOT STUCK WITH ALL OF THE BONANNI / BOWMAN PROJECTS AND NOW YOU WANT TO TRAIN US TO ACCEPT THESE MASSIVE BIRDCAGES IN THE NAME OF MORE TAX REVENUE.

How does the Shea Properties mix-use project compare with the project proposal prevsiously presented by Los Al Race Track owner Dr. Ed Allred?

How was density calculated for each proposal?

What infrastructure changes will be required? What entities will be responsible for the costs?

How does the proposed project align with Measure A "Cypress Town Center and Commons 2.0 Initiative" approved by Cypress residents ?

How will utilities and service systems be impacted?

What is the anticpated impact on traffic patterns on the area surrendering the project?

What is the anticpated impact on city services?

For a project of this nature, why aren't direct mailings to Cypress residents being done?

However, when the zoning was changed, there was unfortunately no caveat in the language that said that future zoning changes would have to be voted on by the residents. The residents at that time evidently believed the city leaders would honor the voice of the residents. As residents have seen some of the zoning changes that have been made by the city leadership in recent years, there is a growing demand for a separate planning commission to give residents a greater voice in zoning. It was this concern of the change in zoning that is now being considered that when the zoning was changed for the race track property in 2018, language was incorporated in that initiative that requires another vote of the residents to change the zoning of the race track property from the zoning approved by the residents. The city leaders should honor the voice of the residents from that 1990 vote or take it back to a vote to see if the residents want this type of residential development on this site.

The analysis has to take into consideration how the city plans to rezone the property to accommodate the residential component. Given the density calculation of 18.9 units per acre put forth by the city, then one can conclude that all 13.3 acres will be rezoned residential. If only the 4 acres is zoned residential then the 18.9 unit per acre density calculation doesn't work since the other 9 acres wouldn't permit residential so shouldn't be part of the calculation. If, on the other hand, the City Council rezones all 13 acres for residential, nothing would prevent the property owner five or so years from now to seek approval for another apartment building on the retail sites if those aren't successful. In fact, Shea was just approved in June 2019 to build 44 single-family homes and 61 townhouses on what is now Mission Foothill Marketplace in Mission Viejo, a mostly vacated mall.
https://www.ocregister.com/2019/06/26/plan-to-convert-mission-foothill-marketplaces-main-building-into-105-homes-approved-by-mission-viejo-city-council/

• Population and Housing. The current residential occupancy in our city averages 3 people per residence. If that average holds out, the population in our city would grow by 750 residents due to this project. Reality is that many recent studies have concluded that the higher rents being demanded in Orange County have led to substantial overcrowding in residential units. In fact, the standard is that two people can occupy each bedroom with one additional person in the living space. As such, if the average apartment in this complex has 2 bedrooms, then each apartment could legally accommodate 5 people which could bring the overall occupancy to 1,250 residents. These new occupancy studies showing the overcrowding issues ultimately falsify the results of a traffic study and lead a developer to substantially underpark a residential development. This doesn't happen on a retail development as there are only so many seats in a movie theater or restaurant. The residential component of this project dramatically changes the clear intent of this property when the voters approved a zoning change in 1990.

• Public Services. This development will significantly increase the demand for police, fire, schools, parks, and libraries especially given the residential component.

• Recreation. When Measure A was approved in 2018 to change the zoning for the race track, one of the significant benefits was that 20 acres of park land were going to be provided. No new park land will come from this project. While there will be park developer fees paid as part of the construction costs, this is one time money and no new park will be provided.

• Transportation – Since this project will sit on Katella, many think about the traffic impacts on Katella. The problem is to gain access or use any of the city services, the new residents will travel north along already impacted interior roads to gain access to schools, parks, and other public services. The Student

Yield Factor established by the State Allocation Board would increase in enrollment due to new housing construction. The states guideline says you can expect .5 elementary students per new residential unit and .2 junior high and high schools for a combination of .7 students per residential unit. As such, we could see an increase of about 175 students needing to go to school and be provided transportation to schools, sporting activities, parks, and public services. The fact that the elementary school district has indicated a willingness to open one of the closed schools, there will still be increased traffic. If overcrowding in these units takes place then the problem is worse.

This project will create many impacted intersections along Katella Ave but also along Walker and Lexington that will be affected by the Katella Ave traffic patterns this project will create. These intersections need to be studied.

A project alternative would be one with significantly lower density in the apartment complex as well as the overall height of the residential units being limited to two stories and eliminate the parking garage. Another alternative project would be one with no residential with the residential replaced with a family friendly entertainment center like a Dave & Buster's or the Splitsville Luxury Lanes in Downtown Disney.

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	8			**Operational Year**	2022
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	502.65	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 Intensity Factor is based on 2020 forecast in City of Cypress General Plan, 33% RPS, Cap and Trade, and reduction in SF6.

Land Use - Parking structure designed for residential use only. Total Project site 13.28 acres.

Construction Phase - Complete project buildout scheduled at 20 months.

Off-road Equipment - Pile driving equiptment will be used during the construction phase of the mid rise apartments and hotel.

Demolition - Estimated total of 8,600 tons of debris from demolishment will be removed from project site.

Grading - 10,000 cubic yards of material will be imported to the project site.

Vehicle Trips - Total daily trip generation is 4,978 vehicle trips.

Woodstoves - No woodstoves or fireplaces will be implimented in this project.

Energy Use -

Construction Off-road Equipment Mitigation - All off-road equiptment over 50 HP will utilize Tier 2 engines. Water exposed area at least three times daily.

Water Mitigation -

Off-road Equipment -

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 Intensity Factor is based on 2020 forecast in City of Cypress General Plan, 33% RPS, Cap and Trade, and reduction in SF6.

Land Use - Parking structure designed for residential use only. Total Project site 13.28 acres.

Construction Phase - Complete project buildout scheduled at 20 months.

Off-road Equipment - Pile driving equiptment will be used during the construction phase of the mid rise apartments and hotel.

Demolition - Estimated total of 8,600 tons of debris from demolishment will be removed from project site.

Grading - 10,000 cubic yards of material will be imported to the project site.

Vehicle Trips - Total daily trip generation is 4,978 vehicle trips.

Woodstoves - No woodstoves or fireplaces will be implimented in this project.

Energy Use -

Construction Off-road Equipment Mitigation - All off-road equiptment over 50 HP will utilize Tier 2 engines. Water exposed area at least three times daily.

Water Mitigation -

Off-road Equipment -

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 Intensity Factor is based on 2020 forecast in City of Cypress General Plan, 33% RPS, Cap and Trade, and reduction in SF6.

Land Use - Parking structure designed for residential use only. Total Project site 13.28 acres.

Construction Phase - Complete project buildout scheduled at 20 months.

Off-road Equipment - Pile driving equiptment will be used during the construction phase of the mid rise apartments and hotel.

Demolition - Estimated total of 8,600 tons of debris from demolishment will be removed from project site.

Grading - 10,000 cubic yards of material will be imported to the project site.

Vehicle Trips - Total daily trip generation is 4,978 vehicle trips.

Woodstoves - No woodstoves or fireplaces will be implimented in this project.

Energy Use -

Construction Off-road Equipment Mitigation - All off-road equiptment over 50 HP will utilize Tier 2 engines. Water exposed area at least three times daily.

Water Mitigation -

Off-road Equipment -

Literature Review and Records Search

LSA Biologist Jeremy Rosenthal conducted a literature review and records search on December 30, 2019, to identify the existence and potential for occurrence of sensitive or special-status plant and animal species[1] in the vicinity of the project site. Mr. Rosenthal also examined federal and State lists of sensitive species. Current electronic database records reviewed included the following:

- **California Natural Diversity Data Base information (CNDDB – RareFind 5)**, which is administered by the California Department of Fish and Wildlife (CDFW). This database covers sensitive plant and animal species as well as sensitive natural communities that occur in California. Records from seven USGS quadrangles surrounding the project site (*Anaheim, La Habra, Long Beach, Newport Beach, Seal Beach, South Gate, and Whitter*) were obtained from this database to assist with the field survey.

- **California Native Plant Society's (CNPS) Electronic Inventory of Rare and Endangered Vascular Plants**, which uses four specific categories or "lists" of sensitive plant species to assist with the conservation of rare or endangered botanical resources. All of the plants constituting California Rare Plant Ranks 1A, 1B, 2A, and 2B are intended to meet the status definitions of "threatened" or "endangered" in CESA and the California Fish and Game Code, and are considered by CNPS to be eligible for State listing. At the discretion of the CEQA Lead Agency, impacts to these species may be analyzed as such, pursuant to CEQA Guidelines Sections 15125(c) and 15380. Plants in Rank 3 (limited information), Rank 4 (limited records), or that are considered Locally Unusual and Significant may be analyzed under CEQA if there is sufficient information to assess potential significant impacts. Records from the seven USGS quadrangles surrounding the project site were obtained from this database to assist with the field survey.

In addition to the databases listed above, historic and current aerial imagery, existing environmental reports for developments in the project vicinity, and regional habitat conservation plans and local land use policies related to biological resources were reviewed.

Wildlife

Native wildlife habitat is largely absent on the project site. Furthermore, the lack of ground cover and suitable foraging habitat make the site undesirable for many native wildlife species.

Suitable habitat for such species is absent from the proposed project disturbance limits. In addition, the project site does not function as a wildlife movement corridor.

---

[1] For the purposes of this report, the term "special-status species" refers to those species that are listed or proposed for listing under the CESA and/or FESA; California Fully Protected Species; plants with a CRPR of 1, 2, or 3; California Species of Special Concern; and California Special Animals. It should be noted that "Species of Special Concern" and "California Special Animal" are administrative designations made by the CDFW and carry no formal legal protection status. However, Section 15380 of the CEQA Guidelines indicates that these species should be included in an analysis of project impacts if they can be shown to meet the criteria of sensitivity outlined therein.

Special-Status Natural Communities

The CNDDB search identified occurrences of five special-status natural (i.e., plant) communities within five miles of the project area (hereafter referred to as the "project vicinity"): California Walnut Woodland, Southern Coastal Salt Marsh, Southern Cottonwood Willow Riparian Forest, Southern Dune Scrub, and Southern Foredunes. No special-status natural communities are present at the project site.

Table C-1: CNPS Special-Interest Plant Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Table C-2: CNDDB Special-Interest Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Table D-1: CNPS Special-Status Plant Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Scientific Name	Common Name	Status	General Habitat Description	Flowering Period	Likelihood of Occurrence on the Project Site and Rationale
Abronia villosa var. *aurita*	**Chaparral sand-verbena**	US: – CA: 1B CNPS: 1B.1	Sandy areas (generally flats and benches along washes) in chaparral and coastal sage scrub, and improbably in desert dunes or other sandy areas, below 1,600 meters (5,300 feet) elevation. In California, reported from Riverside, San Diego, Imperial, Los Angeles, and Ventura Counties. Believed extirpated from Orange County. Also reported from Arizona and Mexico (Baja California). Plants reported from desert communities are likely misidentified.	Blooms mostly March through August (annual or perennial herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Aphanisma blitoides	**Aphanisma**	US: – CA: 1B NCCP: NC CNPS: 1B.2	Sandy or clay soils on slopes or bluffs near the ocean, usually in coastal bluff scrub, coastal dunes, or coastal scrub, below 305 meters (1,000 feet) elevation. Known in California from Ventura, Santa Barbara, Los Angeles, Orange, and San Diego Counties. Also occurs in Mexico.	Blooms March through June (annual herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Astragalus pycnostachyus var. *lanosissimus*	**Ventura marsh milk-vetch**	US: FE CA: SE/1B CNPS: 1B.1	Coastal salt marsh within reach of high tide or protected by barrier beaches, or more rarely near seeps on sandy bluffs, below 35 meters (120 feet) elevation. Known only from Santa Barbara and Ventura Counties. Believed extirpated from Los Angeles and Orange Counties.	Blooms June through October (perennial herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Atriplex coulteri	**Coulter's saltbush**	US: – CA: 1B	Alkaline or clay soils in ocean bluffs and ridge tops and alkaline low	Blooms March through October	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable

Scientific Name	Common Name	Status	General Habitat Description	Flowering Period	Likelihood of Occurrence on the Project Site and Rationale
		NCCP: NC CNPS: 1B.2	places in coastal bluff scrub, coastal dunes, coastal sage scrub, and valley and foothill grasslands below 460 meters (1,500 feet) elevation. In California, known only from Los Angeles, Orange, Santa Barbara, San Bernardino, San Luis Obispo, Ventura, and San Diego Counties. Also occurs in Mexico. Reports of this species from Riverside County are based on misidentification of *Atriplex serenana* ssp. *davidsonii* (*The Vascular Plants of Western Riverside County, California*. F.M. Roberts et al., 2004).	(perennial herb)	habitat is absent on the project site.
Atriplex pacifica	**south coast saltscale**	US: – CA: 1B NCCP: NC CNPS: 1B.2	Alkali soils in coastal sage scrub, playas, coastal bluff scrub, coastal dunes, and chenopod scrub below 200 meters (600 feet) elevation, and perhaps formerly up to about 430 meters (1,400 feet) in Los Angeles County. In California, known from the Channel Islands and mainland Los Angeles, San Diego and Orange Counties. Also occurs in Mexico. Believed extirpated from Ventura County. Reports of this species from Riverside County are based on misidentification of *Atriplex serenana* ssp. *davidsonii* (*The Vascular Plants of Western Riverside County, California*. F.M.	Blooms March through October (annual herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.

Table D-1: CNPS Special-Status Plant Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

			Roberts et al., 2004).		
Atriplex parishii	**Parish's brittlescale**	US: – CA: 1B NCCP: NC CNPS: 1B.1	Alkali soils in meadows, vernal pools, chenopod scrub, and playas. Usually on drying alkali flats with fine soils. In California, known from Riverside and San Diego Counties. Also occurs in Mexico. Believed extirpated from Los Angeles, Orange, and San Bernardino Counties.	Blooms June through October (annual herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Atriplex serenana var. *davidsonii*	**Davidson's saltscale**	US: – CA: 1B NCCP: NC CNPS: 1B.2	Alkaline soils in scrub and herbaceous communities from 10 to 460 meters (30 to 1,500 feet) elevation. In California, known only from Los Angeles, Orange, Riverside, San Diego, San Luis Obispo, and Ventura Counties. Believed extirpated from Santa Barbara and perhaps Los Angeles Counties. Also occurs in Mexico.	Blooms April through October (annual herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Calochortus weedii var. *intermedius*	**Intermediate mariposa lily**	US: – CA: 1B NCCP: CC CNPS: 1B.2	Dry, open rocky slopes and rock outcrops in chaparral, coastal sage scrub, and grassland, at 105 to 855 meters (340 to 2,800 feet) elevation. Known only from Los Angeles, Orange, Riverside, and San Bernardino Counties, California. In the western Riverside County area, this species is known from the hills and valleys west of Lake Skinner and Vail Lake (*The Vascular Plants of Western*	Blooms May through July (perennial herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.

Table D-1: CNPS Special-Status Plant Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Scientific Name	Common Name	Status	General Habitat Description	Flowering Period	Likelihood of Occurrence on the Project Site and Rationale
			Riverside County, California. F.M. Roberts et al., 2004). Appears to intergrade with *Calochortus plummerae*, which is mostly east and north of Santa Ana Mountains.		
Calystegia felix	**Lucky morning-glory**	US: – CA: 1B CNPS: 1B.1	Wetland and marshy areas, sometimes alkaline, sometimes artificially watered, from 30 to 215 meters (100 to 700 feet) elevation. All of the known extant occurrences are associated with well-watered landscaping on recently completed industrial, commercial, and residential developments in the City of Chino within a historical area of artesian springs. Older collections are from areas that are now heavily urbanized areas (including one from South Los Angeles and another from Pico Rivera in Los Angeles County). Known to occur only in western San Bernardino County. Presumed extirpated from Riverside and Los Angeles Counties.	Blooms March through September (annual or perennial rhizomatous herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Centromadia parryi ssp. *australis*	**Southern tarplant**	US: – CA: 1B NCCP: NC CNPS: 1B.1	In vernally wet areas such as edges of marshes and vernal pools, at edges of roads and trails, and in other areas of compacted, poorly drained, or alkaline soils where competition from other plants is limited, often due to disturbance, below 425 meters (1,400 feet)	Blooms May through November (annual herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.

Table D-1: CNPS Special-Status Plant Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Scientific Name	Common Name	Status	General Habitat Description	Flowering Period	Likelihood of Occurrence on the Project Site and Rationale
			elevation. In California, known only from Santa Barbara, Ventura, Los Angeles, Orange and San Diego Counties. Also occurs in Mexico.		
Chloropyron maritimus spp. *maritimus*	**Salt marsh bird's beak**	US: FE CA: SE/1B CNPS: 1B.2	Coastal dunes and salt marshes. In California, known from Los Angeles, Orange, Santa Barbara, San Bernardino, San Diego, San Luis Obispo, and Ventura Counties. Historical collections referred to this taxon from alkaline meadow in vicinity of San Bernardino Valley and from interior San Diego County are intermediate to C. maritimus ssp. canescens. Also occurs in Mexico.	Blooms May through October (annual herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Dudleya multicaulis	**Many-stemmed dudleya**	US: – CA: 1B NCCP: NC CNPS: 1B.2	Heavy, often clay soils or around granitic outcrops in chaparral, coastal sage scrub, and grassland below 790 meters (2,600 feet) elevation. Known only from Los Angeles, Orange, Riverside, San Bernardino, and San Diego Counties.	Blooms April through July (perennial herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Dudleya stolonifera	**Laguna Beach dudleya**	US: FT CA: ST/1B NCCP: C CNPS: 1B.1	Rocky areas (generally north-facing sandstone cliffs) at 10 to 260 meters (30 to 850 feet) elevation. Known only from Orange County, California near Laguna Beach, with most occurrences in Laguna Canyon west of SR-73.	Blooms May through July (perennial herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.

Table D-1: CNPS Special-Status Plant Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Scientific Name	Common Name	Status	General Habitat Description	Flowering Period	Likelihood of Occurrence on the Project Site and Rationale
Eryngium aristulatum var. *parishii*	**San Diego button-celery**	US: FE CA: SE/1B CNPS: 1B.1	Vernal pools and similar mesic habitats in coastal scrub and grassland at 15 to 620 meters (50 to 2,000 feet) elevation. In California, known only from Los Angeles, Orange, Riverside and San Diego Counties. In Riverside County, this species is known only from the Santa Rosa Plateau. Also occurs in Mexico.	Blooms April through June (annual or perennial herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Helianthus nuttallii ssp. *parishii*	**Los Angeles sunflower**	US: – CA: 1A CNPS: 1A	Marshes and swamps (coastal salt and freshwater) at 10 to 500 meters (30 to 1,600 feet) elevation. This species is historically known from Los Angeles, Orange and San Bernardino Counties, California. Last seen in 1937. Presumed extinct. Plants found in 2002 at Castaic Spring along the Santa Clara River in Los Angeles County were initially reported as possibly this taxon, but instead appear to be hybrids or evolutionary intermediates between *H. nuttallii* and *H. californicus*, based on chromosome counts and pollen morphology (*A Quantitative Analysis of Pollen Variation in Two Southern California Perennial* Helianthus *(Heliantheae: Asteraceae)*, J.M. Porter and N. Fraga, 2004).	Blooms August through October (perennial herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.

Table D-1: CNPS Special-Status Plant Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Scientific Name	Common Name	Status	General Habitat Description	Flowering Period	Likelihood of Occurrence on the Project Site and Rationale
Isocoma menziesii var. *decumbens*	**Decumbent goldenbush**	US: – CA: 1B NCCP: NC CNPS: 1B.2	Sandy soils, often in disturbed areas, in coastal scrub and chaparral from 10 to 135 meters (30 to 440 feet) elevation. Known from mainland Orange and San Diego Counties and from San Clemente and Santa Catalina Islands in California. Also occurs in Baja California.	Blooms April through November (shrub)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Lasthenia glabrata ssp. *coulteri*	**Coulter's goldfields**	US: – CA: 1B BLM: S CNPS: 1B.1	Vernal pools and alkaline soils in marshes, playas, and similar habitats below 1,220 meters (4,000 feet) elevation. Known from Colusa, Merced, Tulare, Orange, Riverside, Santa Barbara, San Diego, San Luis Obispo, Tehama, Ventura, and Yolo Counties. Believed extirpated from Kern, Los Angeles, and San Bernardino Counties, and possibly also from Tulare County. Also occurs in Mexico.	Blooms February through June (annual herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Nama stenocarpum	**Mud nama**	US: – CA: 2B NCCP: NC CNPS: 2B.2	Lake shores, riverbanks, and similar intermittently wet areas at 5 to 500 meters (20 to 1,600 feet) elevation. Known in California from San Diego, Orange, and Riverside Counties and from San Clemente Island. Believed extirpated from Los Angeles and Imperial Counties. Known also from Baja California and Arizona.	Blooms January through July (annual or perennial herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.

Table D-1: CNPS Special-Status Plant Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Scientific Name	Common Name	Status	General Habitat Description	Flowering Period	Likelihood of Occurrence on the Project Site and Rationale
Nasturtium (Rorippa) gambelii	**Gambel's watercress**	US: FE BLM: – CA: ST/1B CNPS: 1B.1	Marshes from 5 to 330 meters (20 to 1,100 feet) elevation. Currently believed to occur in California only in Santa Barbara and San Luis Obispo Counties. There are historical records from Los Angeles, Orange, and San Bernardino Counties. A historical report from San Diego County likely constitutes a misidentification. Also occurs in Baja California.	Blooms April through September	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Navarretia prostrata	**Prostrate vernal pool navarretia**	US: – CA: 1B CNPS: 1B.1	Vernal pools, usually alkaline, from 15 to 1,210 meters (50 to 4,000 feet) elevation. Known only from Alameda, Fresno, Los Angeles, Merced, Monterey, Orange, Riverside, San Benito, San Diego, and San Luis Obispo Counties. Presumed extirpated from San Bernardino County.	Blooms April through July (annual herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Nemacaulis denudata var. *denudata*	**Coast woolly-heads**	US: – CA: 1B NCCP: NC CNPS: 1B.2	Sandy places such as coastal dunes below 100 meters (300 feet) elevation. Known in California from Orange, Los Angeles, and San Diego Counties. Believed extirpated from Santa Catalina Island. Also occurs in Mexico.	Blooms April through September (annual herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Orcuttia californica	**California Orcutt grass**	US: FE CA: SE/1B BLM: – CNPS: 1B.1	Vernal pools from 15 to 660 meters (50 to 2,200 feet) elevation. In California, known from Los Angeles, Ventura, Riverside, and San Diego Counties. Also occurs in Mexico.	Blooms April through August (annual grass)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.

Table D-1: CNPS Special-Status Plant Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Scientific Name	Common Name	Status	General Habitat Description	Flowering Period	Likelihood of Occurrence on the Project Site and Rationale
Pentachaeta lyonii	**Lyon's pentachaeta**	US: FE CA: SE/1B CNPS: 1B.1	Clay soils in edges of openings in fire-adapted coastal sage scrub and chaparral on saddles between hills, on the tops of small knolls, or in flat areas at the base of slopes, particularly where soil crust results in less competition from annual grasses, from 30 to 630 meters (100 to 2,100 feet) elevation. Occurs only in the Santa Monica Mountains in eastern Ventura and western Los Angeles Counties and in the western Simi Hills in Ventura County. Based on historical records, it once occurred on the Palos Verdes Peninsula and on Santa Catalina Island, but has not been seen at these locations since 1910 and 1855, respectively, and is assumed to be extirpated from those areas.	Blooms March through August (annual herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Phacelia stellaris	**Brand's star phacelia**	US: – CA: 1B CNPS: 1B.1	Dunes and sandy openings in coastal scrub communities at 5 to 400 meters (20 to 1,300 feet) elevation. In western Riverside County, this species appears to be restricted to sandy washes and benches in alluvial floodplains. Known only from Los Angeles (believed extirpated), Riverside and San Diego Counties, California. The most recent record of this species from Los Angeles County was in 1943.	Blooms March through June (annual herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.

Table D-1: CNPS Special-Status Plant Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Scientific Name	Common Name	Status	General Habitat Description	Flowering Period	Likelihood of Occurrence on the Project Site and Rationale
Ribes divericatum var. *parishii*	**Parish's gooseberry**	US: – CA: 1A CNPS: 1A	Deciduous shrub of willow swales in riparian habitats at 60 to 300 meters (200 to 1,000 feet) elevation. Believed to be extinct. Historical collections from Los Angeles and San Bernardino Counties.	Blooms February through April	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Sagittaria sanfordii	**Sanford's arrowhead**	US: – CA: 1B CNPS: 1B.2	Marshes and swamps below 650 meters (2,100 feet) elevation. Occurs in standing or slow-moving fresh water (ponds, marshes, and ditches). Known only from Butte, Del Norte, El Dorado, Fresno, Merced, Mariposa, Placer, Sacramento, Shasta, San Joaquin, and Tehama Counties. Believed extirpated from Southern California.	Blooms May through October (perennial emergent herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Sidalcea neomexicana	**Salt Spring checkerbloom**	US: – CA: 2B NCCP: NC ECMSCP: – CNPS: 2B.2	Alkaline springs and brackish marshes below 1,530 meters (5,000 feet) elevation. In California, known only from Kern, Orange, Riverside, San Bernardino, San Diego, and Ventura Counties. Believed extirpated from Los Angeles County. Also known from Arizona, New Mexico, Nevada, Utah, and Mexico.	Blooms March through June (perennial herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.
Suaeda esteroa	**Estuary seablite**	US: – CA: 1B NCCP: NC CNPS: 1B.2	Coastal salt marshes below 5 meters (15 feet) elevation. Occurs along immediate coast from Santa Barbara County to Baja California.	Blooms May through October (January) (perennial herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.

Table D-1: CNPS Special-Status Plant Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Scientific Name	Common Name	Status	General Habitat Description	Flowering Period	Likelihood of Occurrence on the Project Site and Rationale
Symphyotrichum defoliatum	**San Bernardino aster**	US: – CA: 1B NCCP: NC CNPS: 1B.2	Vernally wet sites (such as ditches, streams, and springs) in many plant communities below 2,040 meters (6,700 feet) elevation. In California, known from Ventura, Kern, San Bernardino, Los Angeles, Orange, Riverside, and San Diego Counties. May also occur in San Luis Obispo County. In the western Riverside County area, this species is scarce, and documented only from Temescal and San Timoteo Canyons (*The Vascular Plants of Western Riverside County, California*. F.M. Roberts et al., 2004).	Blooms July through November (perennial herb)	**Not Expected.** There are no known occurrences in the vicinity of the project site and suitable habitat is absent on the project site.

[1] Project vicinity = project site plus a 5-mile buffer

Status: Federal Endangered (FE), Federal Threatened (FT), Federal Candidate (FC), Federal Proposed (FP, FPE, FPT), Federal Delisted (FD), California Endangered (CE), California Threatened (CT), California Species of Special Concern (SSC), California Fully Protected Species (CFP), California Special Plant (CSP), California Special Animal (CSA), NCCP Identified Species (IS), NCCP Target Species (TS), NCCP Conditionally Covered Species (CCS), S1 = Critically Imperiled, S2 = Imperiled, S3 = Vulnerable, S4 = Apparently Secure

CNPS Designations:

1B = Rare threatened, or endangered in California and elsewhere
2B = Rare, threatened, or endangered in California, but not elsewhere
3 = Not very endangered in California
4 = Plants of Limited Distribution – Watch List

Abbreviation/Acronym Definitions:

CA = California
CNDDB = California Natural Diversity Database
CNPS = California Native Plant Society
ft = foot/feet
US = United States

Table D-2: CNDDB Special-Status Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Species	Status	Habitat and Distribution	Sample Occurrence Probability
Plants			
Astragalus pycnostachyus var. lanosissimus **Ventura marsh milk-vetch**	US: FE CA: SE/1B	Coastal salt marsh within reach of high tide or protected by barrier beaches, or more rarely near seeps on sandy bluffs, below 35 meters (120 feet) elevation. Known only from Santa Barbara and Ventura Counties. Believed extirpated from Los Angeles and Orange Counties.	**Absent.** No salt marshes or sandy bluffs on site.
Chloropyron maritimum spp. maritimum **Salt marsh bird's-beak**	US: FE CA: SE/1B	Coastal dunes and salt marshes. In California, known from Los Angeles, Orange, Santa Barbara, San Bernardino, San Diego, San Luis Obispo, and Ventura Counties. Historical collections referred to this taxon from alkaline meadow in vicinity of San Bernardino Valley and from interior San Diego County are intermediate to C. maritimus ssp. canescens. Also occurs in Mexico.	**Absent.** No coastal dunes or marshes on site.
Eryngium aristulatum var. parishii **San Diego button-celery**	US: FE CA: SE/1B MSHCP: C	Vernal pools and similar mesic habitats in coastal scrub and grassland at 15 to 620 meters (50 to 2,000 feet) elevation. In California, known only from Los Angeles, Orange, Riverside and San Diego Counties. In Riverside County, this species is known only from the Santa Rosa Plateau. Also occurs in Mexico.	**Absent.** No vernal pools on site.
Nasturtium (Rorippa) gambelii **Gambel's watercress**	US: FE BLM: – CA: ST/1B	Marshes from 5 to 330 meters (20 to 1,100 feet) elevation. Currently believed to occur in California only in Santa Barbara and San Luis Obispo Counties. There are historical records from Los Angeles, Orange, and San Bernardino Counties. A historical report from San Diego County likely constitutes a misidentification. Also occurs in Baja California.	**Absent**. No marshes on site.
Orcuttia californica **California Orcutt grass**	US: FE CA: SE/1B BLM: – MSHCP: S	Vernal pools from 15 to 660 meters (50 to 2,200 feet) elevation. In California, known from Los Angeles, Ventura, Riverside, and San Diego Counties. Also occurs in Mexico.	**Absent.** No vernal pools on site.
Pentachaeta lyonii **Lyon's pentachaeta**	US: FE CA: SE/1B	Clay soils in edges of openings in fire-adapted coastal sage scrub and chaparral on saddles between hills, on the tops of small knolls, or in flat areas at the base of slopes, particularly where soil crust results in less competition from annual grasses,	**Absent.** Site is not within species range.

Table D-2: CNDDB Special-Status Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Species	Status	Habitat and Distribution	Sample Occurrence Probability
		from 30 to 630 meters (100 to 2,100 feet) elevation. Occurs only in the Santa Monica Mountains in eastern Ventura and western Los Angeles Counties and in the western Simi Hills in Ventura County. Based on historical records, it once occurred on the Palos Verdes Peninsula and on Santa Catalina Island, but has not been seen at these locations since 1910 and 1855, respectively, and is assumed to be extirpated from those areas.	
Invertebrates			
Bombus crotchii **Crotch bumble bee**	US: – CA: SA BLM: –	Nectars on Antirrhinum, Phacelia, Clarkia, Dendromecon, Eschscholzia, and Eriogonum in coastal California east to the Sierra-Cascade crest and south into Mexico.	**Absent.** No suitable vegetation on site.
Branchinecta sandiegonensis **San Diego fairy shrimp**	US: FE CA: SA BLM: – NCCP: CC	Small, shallow (usually less than 30 centimeters deep), relatively clear but unpredictable vernal pools on coastal terraces. Pools must retain water for a minimum of 13 days for this species to reproduce (3 to 8 days for hatching, and 10 to 20 days to reach reproductive maturity). Known from Orange and San Diego Counties, and Baja California.	**Absent.** No vernal pools on site.
Euphydryas editha quino **Quino checkerspot butterfly**	US: FE CA: SA BLM: – MSHCP: C	Meadows or openings within coastal sage scrub or chaparral below about 5,000 feet where food plants (Plantago erecta and/or Orthocarpus purpurascens) are present. Historically known from Santa Monica Mountains to northwest Baja California; currently known only from southwestern Riverside County, southern San Diego County, and northern Baja California.	**Absent.** No suitable vegetation (coastal sage scrub or chaparral).
Streptocephalus woottoni **Riverside fairy shrimp**	US: FE CA: SA BLM: – MSHCP: S NCCP: CC	Warm-water vernal pools (i.e., large, deep pools that retain water into the warm season) with low to moderate dissolved solids, in annual grassland areas interspersed through chaparral or coastal sage scrub vegetation. Suitable habitat includes some artificially created or enhanced pools, such as some stock ponds, that have vernal pool like hydrology and vegetation. Known from areas within about 50 miles of the coast from Ventura County south to San Diego County and Baja California.	**Absent.** No vernal pools on site.

Species	Status	Habitat and Distribution	Sample Occurrence Probability
Fish			
Oncorhynchus mykiss irideus **Southern steelhead - Southern California**	US: FE CA: SA BLM: –	Federal listing refers to runs in coastal basins from the Santa Maria River, south to the southern extent of the range (presently considered to be Malibu Creek. Proposed rulemaking 12/19/2000 to extend southern portion of the range to San Mateo.	**Absent.** No streams on site.
Reptiles			
Chelonia mydas **green turtle**	US: FT CA: -	Marine. Completely herbivorous; needs adquate supply of seagrasses and algae.	**Absent.** No suitable habitat on site.
Birds			
Agelaius tricolor (nesting colony) **Tricolored blackbird**	US: – CA: ST/SSC (breeding) BLM: S MSHCP: C NCCP: C	Open country. Forages in grassland and cropland habitats. Nests in large groups near fresh water, preferably in emergent wetland with tall, dense cattails or tules, but also in thickets of willow, blackberry, wild rose, or tall herbs. Seeks cover for roosting in emergent wetland vegetation, especially cattails and tules, and also in trees and shrubs. Occurs in western Oregon, California, and northwestern Baja California.	**Absent.** No suitable wet areas or other habitat on site.
Buteo swainsoni (nesting) **Swainson's hawk**	US: – CA: ST BLM: S MSHCP: C	Open desert, grassland, or cropland containing scattered, large trees or small groves. Breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley. Forages in adjacent grasslands or suitable grain or alfalfa fields, or livestock pastures. Breeds and nests in western North America; winters in South America. Uncommon breeding resident and migrant in the Central Valley, Klamath Basin, Northeastern Plateau, Lassen County, and Mojave Desert. Very limited breeding reported from Lanfair Valley, Owens Valley, Fish Lake Valley, and Antelope Valley. In Southern California, now mostly limited to spring and fall transient. Formerly abundant in California with wider breeding range.	**Absent**. Site is in urban setting without adjacent open country.

Table D-2: CNDDB Special-Status Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Species	Status	Habitat and Distribution	Sample Occurrence Probability
Charadrius alexandrinus nivosus (nesting) **Western snowy plover**	US: FT (coastal population) CA: SSC BLM: –	Sandy coastal beaches, lakes, alkaline playas. Scattered locations along coastal California and Channel Islands, inland at Salton Sea and at various alkaline lakes.	**Absent.** No suitable habitat on site.
Coccyzus americanus occidentalis (nesting) **Western yellow-billed cuckoo**	US: FT CA: SE BLM: S MSHCP: S	Breeds and nests in extensive stands of dense cottonwood/willow riparian forest along broad, lower flood bottoms of larger river systems at scattered locales in western North America; winters in South America.	**Absent.** No riparian habitat on site.
Empidonax traillii extimus **Southwestern willow flycatcher**	US: FE CA: SE BLM: – MSHCP: S	Rare and local breeder in extensive riparian areas of dense willows or (rarely) tamarisk, usually with standing water, in the southwestern U.S. and possibly extreme northwestern Mexico. Winters in Central and South America. Below 6,000 feet elevation.	**Absent.** No extensive stands of riparian habitat on site.
Laterallus jamaicensis coturniculus **California black rail**	US: – CA: ST/CFP BLM: S	Requires shallow water in salt marshes, freshwater marshes, wet meadows, or flooded grassy vegetation. Prefers areas of moist soil vegetated by fine-stemmed emergent plants, rushes, grasses, or sedges, with scattered small pools. Known from coastal California, northwestern Baja California, the lower Imperial Valley, and the lower Colorado River of Arizona and California. Now extirpated from virtually all of coastal Southern California.	**Absent.** No salt marshes, freshwater marshes, wet meadows, or flooded areas on site.
Passerculus sandwichensis beldingi **Belding's savannah sparrow**	US: – CA: SE BLM: –	Resident in salt marshes, with rare exception (e.g., Islas Todos Santos, Baja California), of Pacific Coast from Santa Barbara County to Baja California.	**Absent.** No suitable habitat on site.
Polioptila californica californica **Coastal California gnatcatcher**	US: FT CA: SSC BLM: – MSHCP: C NCCP: C	Inhabits coastal sage scrub in low-lying foothills and valleys up to about 500 meters (1,640 feet) elevation in cismontane southwestern California and Baja California.	**Absent.** No suitable coastal sage scrub on site.
Rallus obsoletus levipes **light-footed Ridgway's rail**	US: FE CA: SE	Found in salt marshes traversed by tidal sloughs, where cordgrass and pickleweed are the dominant vegetation. Requires dense growth of either pickleweed or cordgrass for nesting or escape cover; feeds on molluscs and crustaceans.	**Absent.** No suitable habitat on site.

Table D-2: CNDDB Special-Status Species Identified as Potentially Occurring or Known to Occur in the Project Vicinity

Species	Status	Habitat and Distribution	Sample Occurrence Probability
Riparia riparia (nesting) **Bank swallow**	US: – CA: ST BLM: S	Nesting habitat is vertical banks of fine textured soils, most commonly along streams and rivers. In Southern California, fairly common spring and fall transient in interior; very uncommon spring transient and rare fall transient along coast. Casual in winter.	**Absent.** No streams and rivers on site.
Sternula antillarum browni (nesting colony) **California least tern**	US: FE CA: SE/CFP BLM: –	Nests along the coast from San Francisco Bay south to northern Baja California. Forages in shallow water. Colonial breeder on bare or sparsely vegetated, flat substrates, sand beaches, alkali flats, land fills, or paved areas.	**Absent.** No suitable habitat on site.
Vireo bellii pusillus **Least Bell's vireo**	US: FE CA: SE BLM: – MSHCP: S NCCP: CC	Riparian forests and willow thickets. The most critical structural component of Least Bell's Vireo habitat in California is a dense shrub layer 2 to 10 feet (0.6–3.0 meter) above ground. Willows usually dominant. Nests from central California to northern Baja California. Winters in southern Baja California.	**Absent.** No suitable habitat on site.
Mammals			
Perognathus longimembris pacificus **Pacific pocket mouse**	US: FE CA: SSC BLM: –	Historically occupied open habitats on sandy soils along the coast from Los Angeles to the Mexican border. Now known from only four sites in Orange and San Diego Counties.	**Absent.** Site is highly disturbed, within an urban environment and isolated from better habitat.

MEMORANDUM

DATE: January 21, 2020

TO: John P. Ramirez, City Planner, City of Cypress

FROM: Kerrie Collison, RPA, LSA

SUBJECT: Cultural Resources Record Search and Field Survey for the Cypress City Center Project in Cypress, Orange County, California (LSA Project No. SHO1901)

This memorandum presents the results of the cultural resources record search and field survey (study) for the Cypress City Center Project (project) in Cypress, Orange County, California. This study was conducted to do the following: (1) establish the status and extent of previously recorded sites, surveys, and excavations in and adjacent to the project area; and (2) note what site types might be expected to occur within the project site based on the existing data from archaeological sites located within 0.25 mile of the project site. All work for this study has been completed per the requirements of the California Environmental Quality Act of 1970 (CEQA).

PROJECT LOCATION AND DESCRIPTION

The approximately 13-acre project site is depicted on the United States Geological Survey (USGS) *Los Alamitos, California* 7.5-minute topographic quadrangle map in Section 28 of Township 4 South, Range 11 West, San Bernardino Baseline and Meridian (USGS 1981; see Attachment B, Figure 1, Project Location and Vicinity). The project site is at the northwest corner of Katella Avenue and Winners Circle in Cypress, California, which is currently a paved parking lot (see Attachment B, Figure 2, Project Area).

The proposed project includes a 43,200 square-foot (sf) theater with approximately 840 seats, a five-story hotel with up to 120 rooms, approximately 20,800 sf of retail and restaurant uses, and a four-story residential component with up to 251 apartment units and a variety of amenities, including a fitness center, clubhouse, leasing/lounge area, main recreation courtyard, and a dog park. Proposed off-site improvements include curb, sidewalk, and landscaped parkway improvements along Katella Avenue, Winners Circle, and Siboney Street. Off-site storm drain improvements along the north edge of the project site within an existing storm drain easement are also included as part of assumed capital improvements for Assessment District 1. Project-related ground disturbance is expected to reach a maximum depth of 15 feet.

RECORD SEARCH

On January 9, 2020, LSA Archaeologist Aaron McCann conducted a record search at the South Central Coastal Information Center (SCCIC) at California State University, Fullerton. The SCCIC, an affiliate of the California Office of Historic Preservation (OHP), is the official repository of cultural resources records and reports for Orange County. The record search included a review of all

recorded historic-period and prehistoric cultural resources within a 0.25-mile radius of the project site, as well as a review of known cultural resources survey and excavation reports. The record search also included a review of the following State and federal inventories:

- Directory of Properties in the Historic Property Data File (OHP 2012). The directory includes the listings of the National Register of Historic Places, National Historic Landmarks, the California Register of Historical Resources, California Historical Landmarks, and California Points of Historical Interest.
- California Historical Landmarks (OHP 1996).
- California Points of Historical Interest (OHP 1992).
- *Five Views: An Ethnic Historic Site Survey for California* (OHP 1988).
- California Inventory of Historic Resources (OHP 1976).

Record Search Results

The record search results indicate that one cultural resources study (OR-02162, a field survey) has been conducted that includes the project site. Three additional cultural resources studies have been conducted that include the 0.25-mile radius of the project site. These three studies include two surveys and one railroad abandonment study.

As a result of previous cultural resource studies, no historic-period or prehistoric cultural resources have been recorded within the project site. One cultural resource (P-30-176854, the historic-period Navy Golf Course in Seal Beach) has been recorded within 0.25 mile of the project site. Site P-30-176854 is located approximately 0.25 mile southeast of the project site and, as such, will not be impacted by project-related construction activities. None of the examined inventories contained entries for the project site.

ADDITIONAL BACKGROUND RESEARCH

Online aerial photographs were also reviewed for this project (NETR 2020).

Additional Background Research Results

The earliest aerial photograph of the project site available online dates to 1952, at which time the project site consisted of plowed fields. The project site remained relatively unchanged until the years between 1972 and 1994, when the area appears to have been paved and used for a parking lot. The project site continues to be used as a paved parking lot to this day.

FIELD SURVEY

On January 14, 2020, LSA Archaeologist Ivan Strudwick conducted an archaeological pedestrian field survey of the project site by walking transects spaced approximately 5 meters in unpaved portions of the project site.

Field Survey Results

The field survey results confirmed that the project site is currently utilized as a mostly-paved parking lot and is level. Portions of the project site that are not paved are located along the southern edge of the project site and the southern portion of the western side of the project site. In these areas, ornamental vegetation (such as shrubbery, ice plant, and grass) grows on constructed (not natural) berms that range from approximately 2 to 5 feet high. Exposed sediments of the berms (red/brown silty loam alluvium) were examined for the presence of cultural resources; none were observed.

SUMMARY AND RECOMMENDATIONS

The record search results for this project indicate that no previously recorded resources exist within the project site and that one previous cultural resources study (a survey) has included the project site. One cultural resource (P-30-176854, the historic-period Navy Golf Course in Seal Beach) has been recorded within 0.25 mile of the project site. Site P-30-176854 is located approximately 0.25 mile southeast of the project site and, as such, will not be impacted by project-related construction activities.

The archaeological pedestrian field survey did not identify any surficial archaeological cultural deposits within the project site. Surficial geologic mapping indicates that the project site contains Young Alluvial Fan Deposits, Unit 2, which are Holocene to late Pleistocene in age (less than 126,000 years ago) and consist of poorly to moderately consolidated clay, silty clay, and sand (Saucedo et al. 2016). These deposits would have been eroded from higher elevations, carried by flooding streams and debris flows. As such, any artifacts that may be identified in surficial deposits are likely not in their original locations. Additionally, the project site is located within floodplains of rivers and creeks, which are subject to erosion from seasonal flooding. As a result of this seasonal flooding, the floodplain containing the project site would not have been conducive to the accumulation and preservation of intact archaeological cultural deposits.

For the above reasons, there is a low likelihood of encountering buried archaeological deposits during ground-disturbing construction activities. However, there is always a possibility that isolated archaeological cultural resources may be encountered during construction activities. For this reason, LSA recommends that a qualified professional archaeologist provide cultural resources awareness training to construction personnel prior to the commencement of ground-disturbing activities. This training should be in the form of a presentation and handout describing the types of possible archaeological deposits that may be encountered during construction activities; and the procedures that should be used in the event of inadvertent discoveries of cultural resources during construction.

LSA also recommends that a qualified professional archaeologist be retained on an on-call basis and be contacted in the event that construction personnel encounter any archaeological deposits and/or human remains during construction activities. If any such resources are discovered, contractors should stop work in the immediate area of the find and contact the retained archaeologist to assess the nature of the find. Upon completion of any monitoring activities, the archaeologist should prepare a report to document the methods and results of monitoring activities. This report should be submitted to the SCCIC.

If human remains are encountered, the regulatory process outlined in California Health and Safety Code Section 7050.5 must be followed, which involves coordination with the Native American Heritage Commission (NAHC) and a Native American Most Likely Descendant.

If you have any questions concerning the content or the intent of this memorandum, please contact me at kerrie.collison@lsa.net.

GEOTECHNICAL ASSESSMENT AND PALEONTOLOGICAL MEMORANDUM

This page intentionally left blank

NMG Geotechnical, Inc.

June 13, 2019

Project No. 19046-01

To: Shea Properties
130 Vantis, Suite 200
Aliso Viejo, California, 92656

Attention: Mr. Rick Rutecki, Vice President of Commercial Construction

Subject: Geotechnical Due Diligence Study for Proposed Mixed-Use Development at NE Quadrant of Siboney Street and Katella Avenue, City of Cypress, California

INTRODUCTION

In accordance with your request and authorization, NMG Geotechnical, Inc. (NMG) has performed a geotechnical feasibility study for the subject mixed-use development site in the City of Cypress, California. The approximately 13-acre site, located on the northeastern corner of Siboney Street and Katella Avenue, is currently a vacant lot covered primarily with mature asphalt pavement. The primary purpose of our study was to provide a summary of the geologic and geotechnical conditions of the site, along with an evaluation of the feasibility of the project with respect to geotechnical constraints. From these data, this report provides preliminary design recommendations to be used for your development cost estimating.

The site geologic conditions include the following:

- Predominantly silty and sandy soils in the upper 2 to 10 feet with relatively low expansion potentials;
- Compressible clayey and silty alluvium with some sand layers below 10 feet;
- Shallow groundwater;
- Located in a mapped liquefaction hazard zone;
- Not located within an Alquist-Priolo Fault Zone;
- No mapped faults in the immediate site area; and
- Subject to seismic shaking resulting from earthquakes produced by nearby active faults.

Seismic shaking, potential liquefaction induced ground settlement/deformation, shallow groundwater, and settlement of the heavier structures planned at the site are the primary geotechnical design constraints. Some type of ground improvement, such as rammed aggregate piers or stone columns, will significantly mitigate these constraints. Groundwater and wet soil conditions will require proactive measures during grading and construction of underground infrastructure. Based on our review, we conclude that the subject property is feasible for the planned development from a geotechnical viewpoint provided the recommendations herein are utilized during design and implemented during grading and construction.

SCOPE OF SERVICES

Our scope of services for this study included the following:

- Research and review of in-house data (referenced in Appendix A) and our recent experience of this locale pertaining to the geologic conditions in the vicinity of the project, including underlying soil types, recent and historic groundwater levels, and grading impacts of saturated soil;
- Review of historic, site-specific project geotechnical reports related to prior studies at the site (referenced in Appendix A);
- Archive search for prior geotechnical reports through the City of Cypress;
- Site reconnaissance to observe existing conditions, locate existing groundwater observation wells and obtain current groundwater data;
- Observation and measurement of groundwater level in open excavation at construction site on the south side of Katella across from the subject site;
- Review of available online historic aerial photographs and topographic maps dating back to 1927;
- Obtaining a groundwater well permit from the County of Orange;
- Excavation of 5 small-diameter borings (one hollow-stem-auger boring to 20 feet below ground surface (bgs) and four hand-augered borings to 5 feet bgs). Disturbed bulk soil samples were collected from the upper 5 feet of each boring. After hand-augering the upper 5 feet, the deeper boring (OW-1) was excavated with a truck-mounted drill rig. Soil was sampled at select intervals using a California-type, split-spoon sampler with 2.5-inch-diameter brass rings, driven with a 140-pound automatic hammer dropping 30 inches. Resistance to driving was recorded in blows per foot and is shown on the boring logs in Appendix B. The drill rig was also used to collect ring samples from the bottom of the four hand-excavated borings.
- Collection of bulk soil samples and relatively undisturbed soil samples in the five borings;
- Laboratory testing of selected soil samples for classification and engineering properties;
- Conversion of the 20 foot boring (OW-1) to a groundwater observation well;
- Evaluation of site seismicity;

- Liquefaction analyses using cone penetrometer (CPT) data from a prior study (Leighton, 2017);
- Seismic settlement analysis;
- Static settlement analysis of planned major structures using the above mentioned CPT test results, along with assumed typical foundation loads;
- Review of ground improvement alternatives, including proposal from Western Ground Improvement;
- Preparation of this report summarizing our findings, conclusions and recommendations.

The approximate location of the borings excavated for this study and the three groundwater observation wells are shown on Figure 2, Boring, Well and CPT Location Map, at rear of text. The CPT soundings used in our settlement and liquefaction analyses are also shown on that figure. The CPT logs are included in Appendix B and the liquefaction analysis and settlement analyses from the CPT data are included in Appendix D.

SITE DESCRIPTION

The subject site is located just south of the Los Alamitos Race Track in the city of Cypress, California. Specifically, the site is bounded by Winners Circle street on the east, a large asphalt parking area to the north, Siboney Street on the west and Katella Avenue on the south. The site location is shown on Figure 1, Site Location Map.

The site is currently vacant and used for event parking. Temporary parking of trucks and trailers for a commercial business on a portion of the site (southwestern quadrant) was also observed during this study. Most of the site is covered by older degraded asphalt, with a small unpaved dirt area adjacent to the terminus of Winners Circle (cul-du-sac). The south and southwestern boundaries of the site along Katella Avenue consist of some landscaping, including mature eucalyptus trees, shrubs, and turf. There are existing light poles and various electrical utility boxes and lines within the site. The site is drained by two sets of drainage ditches that flow south toward storm drain grates that flow into underground storm drain pipes. A water main valve is present along Siboney Street near the southwest corner of the site. There are two groundwater observation wells which were installed by an unknown party sometime before 2008, during a previous investigation (GPI, 2008). Also, NMG recently installed a groundwater observation well in the southwest quadrant of the site.

PROPOSED DEVELOPMENT

The conceptual site plan (Option 1) by Architects Orange shows a mixed-use development with the following:

- A rectangular-shaped four-story hotel approximately 50 to 60 feet wide by 300 feet long at the southwest corner;
- Three stand-alone retail buildings ranging from 5,000 to 7,000 square feet each at the southeast corner; a 842-seat theater at the northeast corner;
- A four-story multi-family residential wrap-type structure roughly 380 feet by 370 feet, including an internal five-story parking structure, pool and two open court yard areas.

These proposed buildings are connected with pedestrian walkways and parking areas. Vehicular access to the site will be from multiple entry points off Katella Avenue (one), Siboney Street (two), and Winner's Circle (two off the cul-du-sac).

The preliminary grading plan by the project civil engineer, Kimley-Horn, shows large areas of fill on the order of 1 to 1.5 feet thick above existing elevations. Existing 4- to 5-foot-high berms along Katella Avenue and Siboney Street will be removed during grading.

We understand that an onsite below-ground storm water retention system, such as a Contech corrugated metal pipe system (8-foot-diameter pipes), will be required. The preliminary sizing of this system is on the order of 90 feet wide and over 300 feet long.

SITE HISTORY

Historic aerial photographs of the vicinity show that the subject site was used for agriculture prior to 1962. A ranch house, approximately ¼ mile to the west, was constructed in 1931. Plow rows can also be seen within the site as early as 1927. In 1947, a small horse-racing track was constructed near the ranch house. In 1953, a large horse-racing track was being constructed just north of the site. In 1963, the racetrack was completed, and the site was paved and used as a parking area for the track. During this time, residential neighborhoods were also constructed south of the site. By 1972, the horse race track had moved slightly to its current location. By 1994, Siboney Street was extended toward the race track and marked the western boundary of the site. The existing landscaped areas were also present by this time. By 2002, Winner's Circle was constructed, marking the eastern boundary of the site. By 2005, the retail buildings on the west of the subject site were constructed. The Costco store on the east was also being constructed in 2005. Since 2005, the site has remained in the same condition as present day.

PRIOR GEOTECHNICAL STUDIES

Available reports of prior geotechnical investigations of the subject site include those by Geotechnical Professionals, Inc., in 2008, and later by Leighton and Associates for potential commercial land developers in 2017 and 2019. A summary of these studies is provided below:

- The 2008 study evaluated the site for a potential retail development. It included subsurface exploration consisting of 10 CPTs to 50 feet and 8 hollow-stem borings up to 31.5 feet deep. Laboratory testing was performed on samples collected from the borings. They also measured groundwater levels in the borings and reported the existence of two previously installed groundwater monitoring wells (no origin given). The report provided recommendations for the retail development planned at that time (GPI, 2008).
- The 2017 study was performed to assist in a due diligence review for a different commercial development. The subsurface exploration consisted of 12 CPTs to 50 feet and shallow hand excavations for near-surface soil sampling. Limited laboratory testing was performed on those bulk soil samples. The report provided recommendations for the commercial development planned at that time (Leighton, 2017).
- The geotechnical study in 2019 was performed to evaluate a different potential retail development. This study included 8 new CPTs to 50 feet and 9 hollow-stem borings up to 53 feet deep. Laboratory testing was performed on samples collected from the borings. They also measured groundwater levels in the borings. The report provided recommendations for the retail development planned at that time (Leighton, 2019).

Additional studies and associated reports may exist but they were not discovered during this study. NMG explored and graded the Lyon Homes project currently being constructed near the subject site (NMG, 2017a, 2017b, 2018a, 2018b, 2018c). A list of these and other references are included in Appendix A.

SUMMARY OF GEOTECHNICAL CONDITIONS

Regional Geologic Setting: The subject site is located within the Downey Plain, a sub-basin of the larger Los Angeles basin. The site is underlain by approximately 100 feet of Holocene sediments and a total of approximately 2,600 feet of Quaternary sediments (CDMG, 1980).

Earth Units and Soil Characteristics: Below the asphalt pavement, prior studies reported between 2 to 9 feet of undocumented artificial fill consisting of moist to wet, moderately to poorly compacted sand, silty to clayey sands and silty clays. Borings across the site indicate the undocumented fill is generally 2 to 5 feet thick with dry densities in the upper 5 feet over 100 pcf (only one test of 98 pcf and one as high as 114 pcf). The deepest undocumented fill appears to be in the southeast corner of the site where two borings encountered 7 to 9 feet of fill. The boring logs reported fragments of fabric, asphalt, brick, concrete and clay pipe (GPI, 2008 and Leighton, 2019). The underlying alluvium consists of similar materials: sands, and silts to 10 feet below ground surface (bgs), and silty clays and clay with thin sand layers from 10 to 30 feet. The alluvial material was described as moist to wet and medium dense/stiff to firm. Significant sand

layers were observed below 30 feet interlayered with the silty clay and clay. The near-surface soil (undocumented fill) is predominantly silty and sandy.

Moisture contents of soil at 5 feet bgs ranged from ranged from 20.8 to 26.9 percent. Dry densities ranged from 92.0 to 102.7 pcf. Four expansion index tests for this study resulted in "very low" potentials. Soluble sulfate contents were in the "S0" category (negligible). Two R-value tests had R-values of 16 and 60. Test results are included and summarized in Appendix C and the boring logs are included in Appendix B.

Settlement analyses using prior CPT data resulted in static settlements on the order of 2 to 3 inches for shallow foundations with assumed typical structural loads for the proposed buildings. In addition, seismically induced settlements were calculated to be on the order of 1 to 3 inches.

Existing Asphalt Section: Existing asphalt concrete (AC) and aggregate base (AB) was observed in three of the five borings for this study. AC thicknesses ranged from 2 to 3 inches and the AB layer was approximately 2 inches thick.

At the two other boring locations, the existing pavement was so deteriorated that there were no distinct AC or AB sections. Prior borings by others did not report any AC or AB thicknesses.

Groundwater: Groundwater at the site is very shallow, ranging from approximately 4½ to 6 feet bgs as measured on April 16, 2019 in two groundwater monitoring wells (MW-1 and MW-2) located onsite (Figure 1). In addition, we measured groundwater at approximately 6 feet BGS in an open trench at the construction site on the southwest corner of Katella Avenue and Winners Circle on April 16, 2019. These measured levels are consistent with the prior study by GPI in 2008, where they measured very similar depths, and NMG's recent subsurface exploration and grading experience (2017 through 2019) at the Ovation Flora Park development located ¼ mile to the west, where we encountered groundwater as shallow as 3½ feet bgs. Also, Geotracker data from sites near the subject property have reported groundwater anywhere from 1 to 7 feet bgs in recent years. These recent data indicate that historic high groundwater reported by CGS (approximately 10 feet bgs) is obsolete.

Groundwater level readings for our study from the two existing wells and the newly installed well are summarized below:

Well No.	Approximate Ground Elevation in Feet Above msl	Depth to Groundwater (Below Ground Surface)	
		April 16, 2019	*May 21, 2019*
OW-1	31	--	4.75
MW-1	32	4.6'	4.55'
MW-2	32	5.92'	5.8'

The direction of groundwater flow appears to have a slight gradient toward the south to southwest.

Seismicity, Faulting, and Seismic Hazards: Based on background review, no known active faults are located within or immediately adjacent to the subject site, nor is it located within an Alquist-Priolo Fault Rupture Hazard Zone (CGS, 2007). Therefore, the potential for primary ground rupture is considered very low at the site.

The site is mapped by the State of California as having potentially liquefiable soil (CGS, 1998). Leighton reported a PGA of 0.55 at the site with a seismic category of D according to their draft report. The primary seismic hazard at the subject site is ground shaking due to a future earthquake on one of the major regional active faults and potential ground deformation due to liquefaction.

Using the USGS de-aggregation computer program (USGS, 2017) and the site coordinates of 33.804 degrees north latitude and 118.042 degrees west longitude, the closest major active faults to the site are the Newport-Inglewood Fault, approximately 4.6 miles southwest of the site, and the Puente Hills Blind-Thrust Fault (Coyote Hills) located 6.1 miles northeast of the site, at depth.

The site is not located within a zone of earthquake induced landslide as mapped by the (CGS, 1998).

Tsunami and seiche are not considered secondary seismic hazards at this site due to the elevation and location.

Historic Seismicity: Based on the Environmental Geology of Orange County California (CDMG, 1976), there were reports of water/sand boils, earth and pavement cracks in the city of Cypress and surrounding cities during the March 10, 1933, Long Beach earthquake. Seismic settlement (induced subsidence) from this earthquake was measured to be approximately 0.5 inch through Los Alamitos, Cypress, and La Habra (CDMG, 1976). This earthquake occurred along the Newport-Inglewood Fault system.

Storm Water Treatment/Storage: The subject site is underlain by relatively fine sands, silts and clays in the upper 20 feet, with low permeabilities and shallow groundwater ranging from 4½ to 6 feet bgs. Therefore, the site is not suitable for storm water infiltration systems.

Underground treatment and/or storage systems must account for hydrostatic uplift (buoyant) forces due to the shallow groundwater.

CONCLUSIONS AND GENERAL RECOMMENDATIONS

Based on our feasibility-level study, the proposed development is feasible provided the main geotechnical constraints of compressible soils, seismically induced settlement, and seismic shaking are mitigated. The primary grading and construction phase issue will be the presence of shallow groundwater and associated saturated soil conditions which will be encountered during excavations for remedial removals and underground improvements. These and other conditions are discussed below.

1. Site Demolition

Aggregate derived from crushing existing AC and the existing AB may be suitable for stabilizing saturated excavation bottoms or as bedding under pipelines. These materials often can be tested and classified for use as crushed miscellaneous base (CMB), which can also be used for future pavements and below structural slabs-on-grade.

Existing buried structures, foundations, utilities and pipelines and prior backfill should be removed, with resulting excavations backfilled with engineered fill.

2. Foundation Types and Remedial Measures

Compressible and liquefiable soils at the site will require either deep foundations or some type of ground improvement for the larger buildings. The best suited ground improvement to mitigate settlement of the large structures should be stone columns or rammed aggregate piers (RAP) on the order of 15 feet deep. For the RAP method, we concur with the preliminary design values provided to you by a RAP specialty contractor using Geopier brand RAPs: bearing value of 7,000 psf; a coefficient of sliding resistance of 0.40; and total static and differential settlements limited to less than 1 inch and 1/2 inch in 30 feet, respectively. Additional differential seismic settlement on the order of 1 to 1.5 inches may be expected with RAPs.

Building areas where ground is improved with RAPs or stone columns should be provided with a minimum 2-foot-thick layer of newly compacted fill. Commonly, a surface layer of aggregate is recommended with RAPs or stone columns. This layer may be counted toward the 2-foot-thick layer recommendation. In other words, building pads may be graded with a 1-foot-thick layer of fill, left low by one foot, then capped with one foot of aggregate following RAP installation.

The smaller retail buildings may be supported on a combination of newly compacted fill and shallower ground improvement, such as aggregate and geogrid reinforcement. The fill material, including aggregate, should be a minimum of 5 feet below finish grade or 3 feet below bottom of foundations, whichever is deeper. The bottom of the excavation should have a layer of geogrid, such as Tensar 130 or BX1515 and a minimum of 2 feet of aggregate base. The remaining fill may be compacted native soil. The deeper undocumented fill in the southeast corner of the site (future retail shops area) as described in the Summary of Geotechnical Conditions, should be completely removed and replaced with engineered fill. Significant amounts of debris and/or larger sized debris should be culled from the removed soil prior to it being placed as compacted fill. These removals and replacement operations very likely will be below the groundwater table. Therefore, local dewatering and excavation bottom stabilization should be anticipated. With the

aforementioned remedial measures, total and differential settlements of the smaller retail buildings should be less than 1-inch and ½-inch over a 30-foot span.

RAPs or the above described geogrid and aggregate system is also recommended for larger walls, monuments, signs, etc. if designed with shallow spread footings.

3. Remedial Grading of Non-structural Areas

All other areas of the site which may have vehicular paving or hardscape improvements should be provided with a minimum of 2 feet of newly compacted fill below the bottom of pavements and slabs-on-grade. This grading should not be impacted by groundwater or wet soil conditions unless it is during the rainy season.

4. Shallow Groundwater and Wet Soil

Excavations deeper than 3 feet in some areas and 4 feet in others are likely to encounter shallow groundwater and/or soft, wet soil. Grading in these conditions will require some type of ground stabilization, such as cement treatment or aggregate or a combination of both. (Onsite soils are not suitable for lime treatment due to the primarily sandy composition.) Geofabric or geogrid is recommended in combination with aggregate to reduce the required depth of treatment, amount of aggregate and time required to backfill the excavations. Excavations and grading from existing ground surface to within 2 feet of the groundwater table, such as the grading for parking lot areas, will likely not require soft ground stabilization.

From our experience, 1.5 to 2 feet of cement-treated soil mixed at 6 percent cement content by weight was sufficient to stabilize wet excavation bottoms. For aggregate method, a geogrid, such as Tensar 130 placed on the bottom with approximately 1 to 2 feet aggregate, was sufficient to stabilize the bottoms enough to place native soil as compacted fill. Success factors for these methods included experienced contractor/operators for excavating wet ground without getting equipment mired; placement and spreading of stabilization materials; skilled soil treatment contractors using proper equipment and techniques; and good planning/staging for timely excavation and stabilization/fill placement.

Site soil conditions are not suited for pre-construction dewatering using a well point system; while there are abundant sandy soils, many of the sands have high silt and some clay content, which result in low permeabilities. Local sump pumps should be sufficient for areas where groundwater rises in an excavation. At the nearby Lyon Homes (Ovation) site, smaller excavation areas allowed for more rapid stabilization and backfilling without the need for significant use of sumps. Deeper excavations left open for longer periods or overnight will be prone to filling with standing groundwater.

Larger underground structures may require extra thickness of aggregate bedding due to the shallow groundwater and saturated soils. Cement-treated soil stabilization is also a viable option. Buried structures, such as storm water retention/treatment systems, must consider potential hydrostatic uplift forces in their design.

5. Slabs-on-Grade for Structures

Concrete slabs-on-grade under the structures should be a minimum of 4 inches thick and may be constructed over the aggregate layer above the RAPs or stone columns. The smaller retail building slabs may be constructed over the anticipated sandy subgrade fill.

6. Vehicular Pavements

Prior studies did not perform any R-value tests of onsite soil for vehicular paving design but assumed R-values are in the 40 to 60 range, owing to the near-surface soil being predominantly sandy. We believe these assumptions to be overly optimistic based on our local experience. The sands at the site are predominantly fine sands with significant amounts of silt and some clay. From our very limited testing (two R-value tests), we used a design R-value of 25 and assumed traffic indices (TIs) in order to arrive at the following preliminary pavement sections:

- Parking Stalls (little or no potential for heavier truck traffic): 3.5" AC/6" AB.
- Drive Aisles/Secondary Loop Roads (passenger cars, light duty trucks): 3.5" AC/ 7" AB.
- Main Entry Drives with Some Truck Traffic: 4" AC over 10" AB.

Final sections may change depending on postgrading soil testing for R-values and site specific traffic index values, which should be calculated by a traffic engineer. Truck ramps and loading docks will require thicker AC/AB sections or PCC pavements.

7. Earthwork Bulking and Shrinkage Factors

For estimating grading quantities, the following shrinkage factors are provided:

- Existing Fill: 0 to 2 percent shrinkage
- Native Alluvium: 10 to 15 percent shrinkage

Ground subsidence due to grading operations should be less than 0.1 inch due to the age and prior use of the site.

8. Cement Type and Corrosivity

Soluble sulfate contents of soil at this and adjacent sites are in the "S0" category (negligible) and soil corrosivity is in the "moderately corrosive" category. Other soil chemical constituent contents, such as chlorides, were not particularly high as reported by others (Leighton, 2019 and GPI, 2008).

9. Exterior Hardscape

Following site grading, near-surface fills are expected to have "very low" to "low" expansion potential, though some occurrences of "medium" expansive soils cannot be completely ruled out. For estimating purposes, you may assume concrete hardscape designed and constructed for "low" expansion potentials, overall. Final hardscape design should be based on soil sampling and laboratory testing following the completion of site grading.

Concrete flatwork for people spaces, walkways, sidewalk, etc., may be 4 inches thick with appropriate control and expansion joints, as specified by a landscape architect to mitigate concrete shrinkage cracking. No reinforcement, subbase or AB is required from an expansive soil standpoint.

10. Additional Exploration, Testing, and Analyses

- The need for additional exploration (borings, test pits or CPTs) and laboratory testing of soil should be evaluated once the development plan is finalized, especially the structural characteristics and structure locations.
- Exploration with a backhoe is recommended to further investigate the extent and depths of the undocumented fill.
- Settlement analyses should be refined once actual rather than the assumed structural foundation loads are available.
- The final grading plan should be reviewed by the geotechnical consultant and the remedial grading recommendations in this report should be re-evaluated in light of the planned cuts and fills and extent of ground improvement measures.
- Pavement designs should be finalized based on TIs provided by a traffic engineer and R-value testing of near-surface soil following grading of the site.
- The groundwater monitoring wells should be read periodically leading up to the start of grading. We recommend two readings during the summer months and two in the fall and winter.
- The design parameters and recommendations herein are based on the anticipated engineering properties of the onsite soil. Import soils, if required, should be evaluated and tested as necessary to verify their engineering properties are similar or better than the onsite soils.

11. Limitations

This report has been prepared for the exclusive use of our client, Shea Properties, within the specific scope of services requested by them for the Cypress mixed use project. This report or its contents should not be used or relied upon for other projects or purposes or by other parties without the written consent of Shea Properties and NMG. Our methodology for this study is based on local geotechnical standards of practice, care, and requirements of governing agencies for a given time. No warranty or guarantee, express or implied is given.

The findings, conclusions, and recommendations are professional opinions based on interpretations and inferences made from geologic and engineering data from specific locations and depths, observed or collected at a given time. By nature, geologic conditions can be very different in between data points, and can also change over time. Our conclusions and recommendations are subject to verification and/or modification with more exploration and/or during grading and construction when more subsurface conditions are exposed.

NMG's expertise and scope of services did not include assessment of potential subsurface environmental contaminants or environmental health hazards.

If you have any questions regarding this report, please contact our office. We appreciate the opportunity to provide our services.

Respectfully submitted,

Sampler and Symbol Descriptions

- Modified California sample (D-#)
- Standard Penetration Test (S-#)
- Undisturbed pushed tube sample (U-#)
- Large bulk sample (B-#)
- Small bulk sample (b-#)
- Approximate depth of groundwater during drilling
- Approximate depth of static groundwater

Note: Number of blows required to advance driven sample 12 inches (or length noted) is recorded.

Laboratory and Field Test Abbreviations

AL	Atterberg limits
CC	Chemical Testing incl. Soluble Sulfate
CN	Consolidation test
DS	Direct shear test
EI	Expansion Index
GS	Grain Size Analysis (Sieve, Hydro. and/or -No. 200)
MD	Compaction test
RV	Resistance Value (R-Value)
SE	Sand Equivalent
UU	Unconsolidated Shear Strength

GENERAL NOTES

1. Soil classifications are based on the Unified Soil System and include color, moisture, and relative density or consistency. Field descriptions have been modified to reflect results of laboratory tests where deemed appropriate. Bedrock descriptions are based on visual classification and include rock type, moisture, color, grain size, strength, and weathering.
2. Descriptions on these boring logs apply only at the specific boring locations and at the time the borings were made. They are not warranted to be representative of subsurface conditions at other locations or times.

LOG OF BORING

Shea Properties/Cypress Mixed-Use
Cypress, California
PROJECT NO. 19046-01

NMG

Report: HOLLOW STEM; Project: 19046-01.GPJ; Data Template: NMG_GINT_2016.GDT; Printed: 5/22/19

Date(s) Drilled	**5/13/19**	Logged By	**ZKH**
Drilling Company	**BC2 Environmental**	Drill Bit Size/Type	**10"**
Drill Rig Type	**CME 95**	Hammer Data	**140lb @ 30" Drop**
Sampling Method(s)	**Bulk, Modified California**		
Approximate Groundwater Depth:	**4.5 Feet**		
Comments			

HA-4

Sheet 1 of 1

Total Depth Drilled (ft)	**6.5**
Approximate Ground Surface Elevation (ft)	**32.0 msl**

Elevation (ft)	Depth (ft)	SAMPLES Type	SAMPLES Number	Blows per foot	Graphic Log	USCS	MATERIAL DESCRIPTION	Moisture Content (%)	Dry Density (pcf)	OTHER TESTS and REMARKS
30	0					SM	Surface: Dirt/damaged asphalt parking lot. Some gravel and asphalt fragments in upper foot. Very weathered old asphalt parking lot. **Alluvium (Qal)** @ 0'-5': Olive brown to light olive brown silty fine SAND, very moist to wet.			B-1 @ 1'-5' RV, EI, CC
			B-1							
	5		D-1	5			@ 5': No Recovery.			
							Notes: Total Depth: 6.5 Feet. Groundwater 4.5 Feet After Drilling. Backfilled with Cuttings and Tamped.

Sample	Compacted Moisture (%)	Compacted Dry Density (pcf)	Final Moisture (%)	Volumetric Swell (%)	Expansion Index[1] Value/Method		Expansive Classification[2]	Soluble Sulfate (%)	Sulfate Exposure[3]
OW-1 B-1 1-5'	8.5	114.4	16.1	0.33	3	A	Very Low	0.05	S0
HA-1 B-1 1-5'	9.0	112.2	17.9	1.6	16	A	Very Low	0.06	S0
HA-2 B-1 1-5'	9.5	111.2	14.2	0.03	0	A	Very Low	0.05	S0
HA-4 B-1 1-5'	10.0	108.0	15.9	0.06	1	A	Very Low	0.05	S0

Test Method:
ASTM D4829

HACH SF-1 (Turbidimetric)

Notes:
1. Expansion Index (EI) method of determination:
   [A] E.I. determined by adjusting water content to achieve a 50 ±1% degree of saturation
   [B] E.I. calculated based on measured saturation within the range of 40% and 60%
2. ASTM D4829 *(Classification of Expansive Soil)*
3. ACI-318-14 Table 19.3.1.1 *(Requirement for Concrete Exposed to Sulfate-Containing Solutions)*

Expansion Index and Soluble Sulfate Test Results

(FRM001 Rev.5)

Project Name: Shea / Cypress

NMG

R-VALUE TEST DATA CTM 301 / ASTM D2844

Project: Shea / Cypress	Project No: 19046-01	Date: 5/17/2019
Boring Trench No: HA-1	Sample No: B-1	Sample Depth: 1-5'
Field Description: SM		
Lab Description: Olive Brown sandy SILT		

Specimen Number	1	2	3	4
Mold Number	10	11	12	
Water Adjustment (g)	+65	+52	+39	
Compactor Pressure (psi)	175	300	350	
Exudation Pressure (psi)	250	412	618	
Gross Weight (g)	3264.8	3236.4	3209.6	
Mold Tare (g)	2130.9	2118.3	2120.8	
Wet Weight (g)	1133.9	1118.1	1088.8	
Sample Height (in)	2.55	2.50	2.42	
Initial Dial Reading	0.0902	0.0502	0.0612	
Final Dial Reading	0.0902	0.0505	0.0620	
Expansion (in $x10^{-4}$)	0	3	8	
Stability(psi) at 2,000 lbs (160 psi)	74 | 120	70 | 116	44 | 84	|
Turns Displacement	4.78	3.50	3.40	
R-Value Uncorrected	15	21	40	
R-Value Corrected	15	21	38	
Moisture Content (%)	13.2	12.1	10.9	
Dry Density (pcf)	119.1	120.9	122.9	
Assumed Traffic Index	4.0	4.0	4.0	
G.E. by Stability	0.87	0.81	0.63	
G.E. by Expansion	0.00	0.10	0.27	
Gf	1.25			

Moisture Content				
Dish No.	OO	I	Q	
Weight of Moist Soil and Dish (g)	254.9	254.4	254.0	
Weight of Dry Soil and Dish (g)	231.1	232.4	233.9	
Water Loss (g)	23.8	22.0	20.1	
Weight of Dish (g)	50.4	50.2	50.3	
Dry Soil (g)	180.7	182.2	183.6	
Moisture Content (%)	13.2	12.1	10.9	

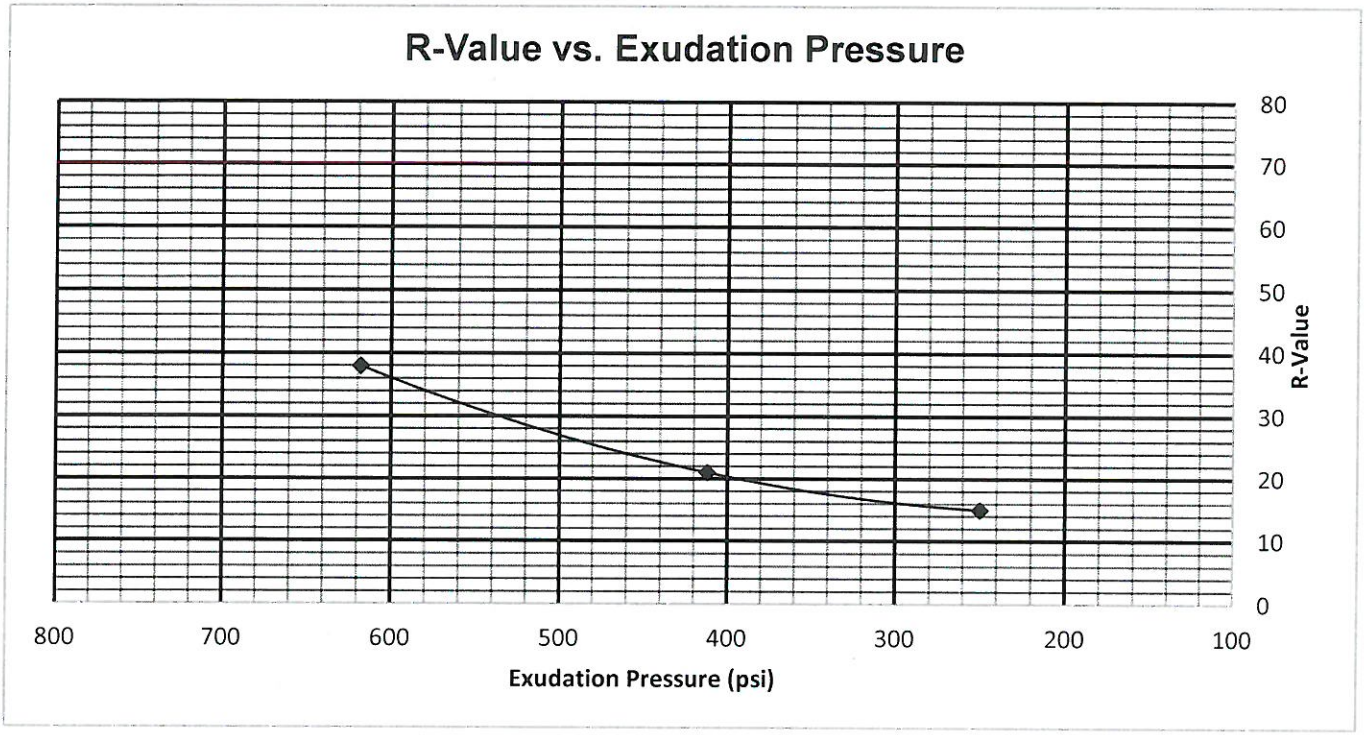
R-Value by Exudation = 16

R-Value by Expansion = 57

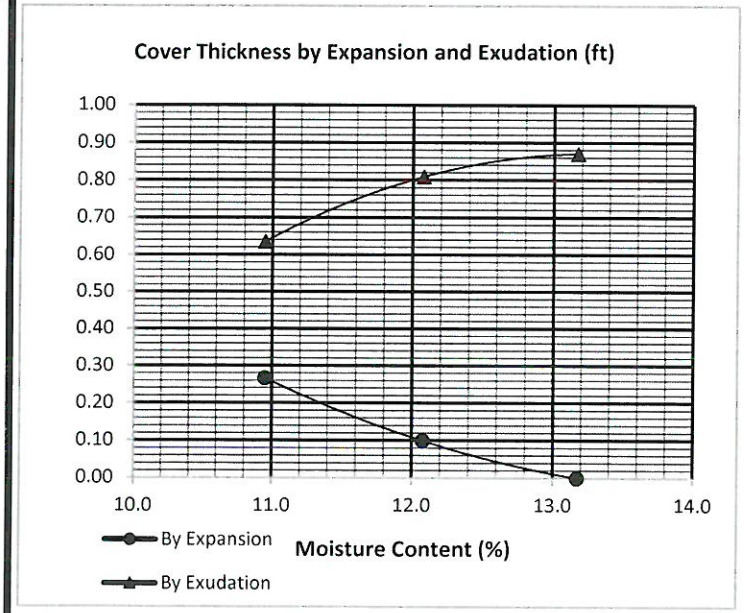
R-Value at Equilibrium = 16 By Exudation

The data above is based upon processing and testing samples as received from the field. Test procedures in accordance with latest revisions to Department of Transportation, State of California, Materials & Research Test Method No. 301 and/or ASTM Standard D2844

Remarks: A traffic index of 4.0 was used for calculation purposes.



Set up by: CAT/BAJ Run by: BAJ/TG



Calculated by: TG Checked by: BAJ Date Completed: 5/20/2019

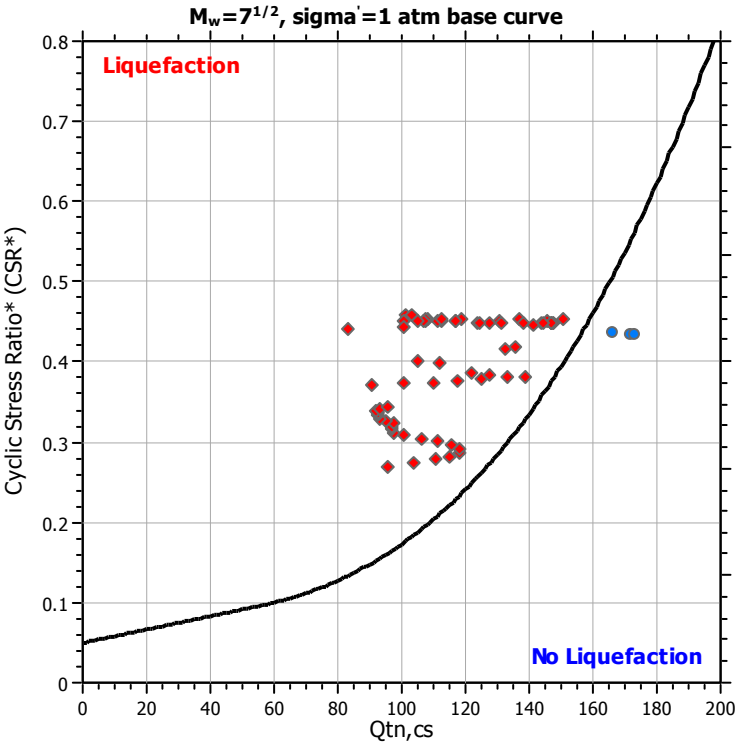
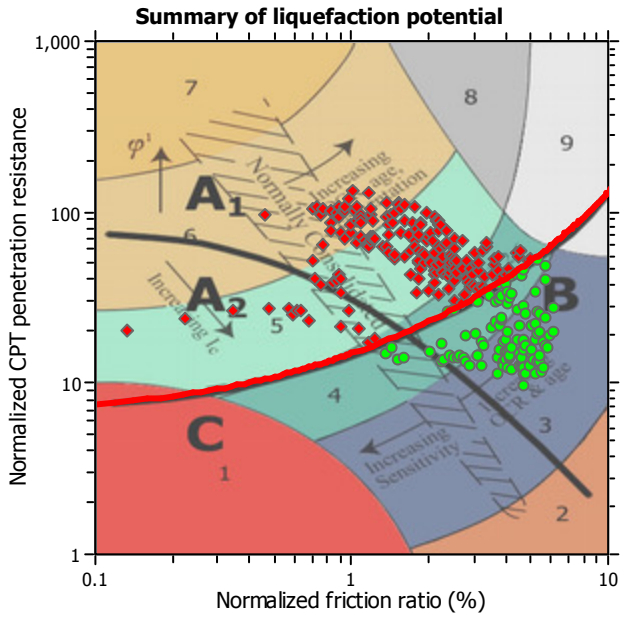
LIQUEFACTION ANALYSIS REPORT



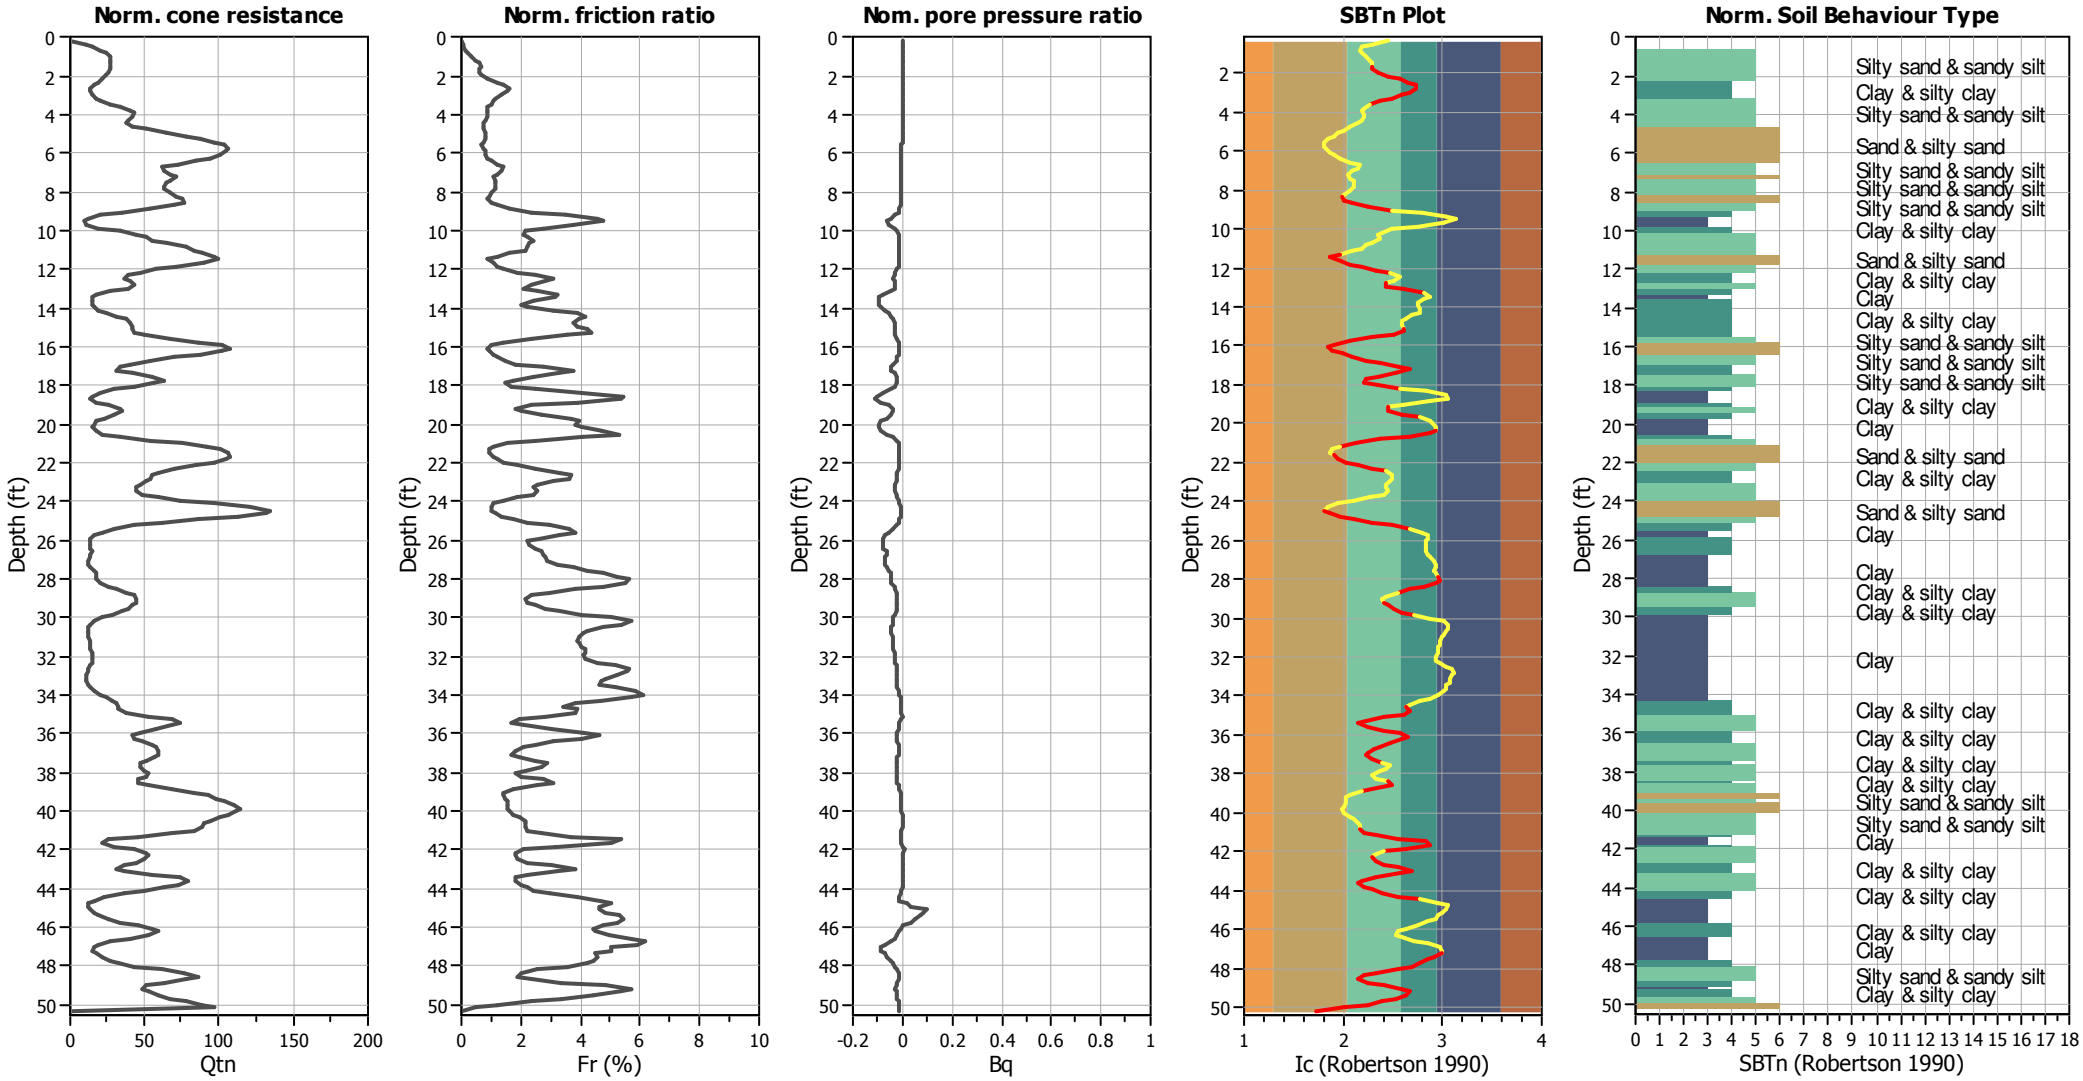
Project title : Shea Properties/Cypress **Location : Cypress, California**



CPT file : CPT- 1

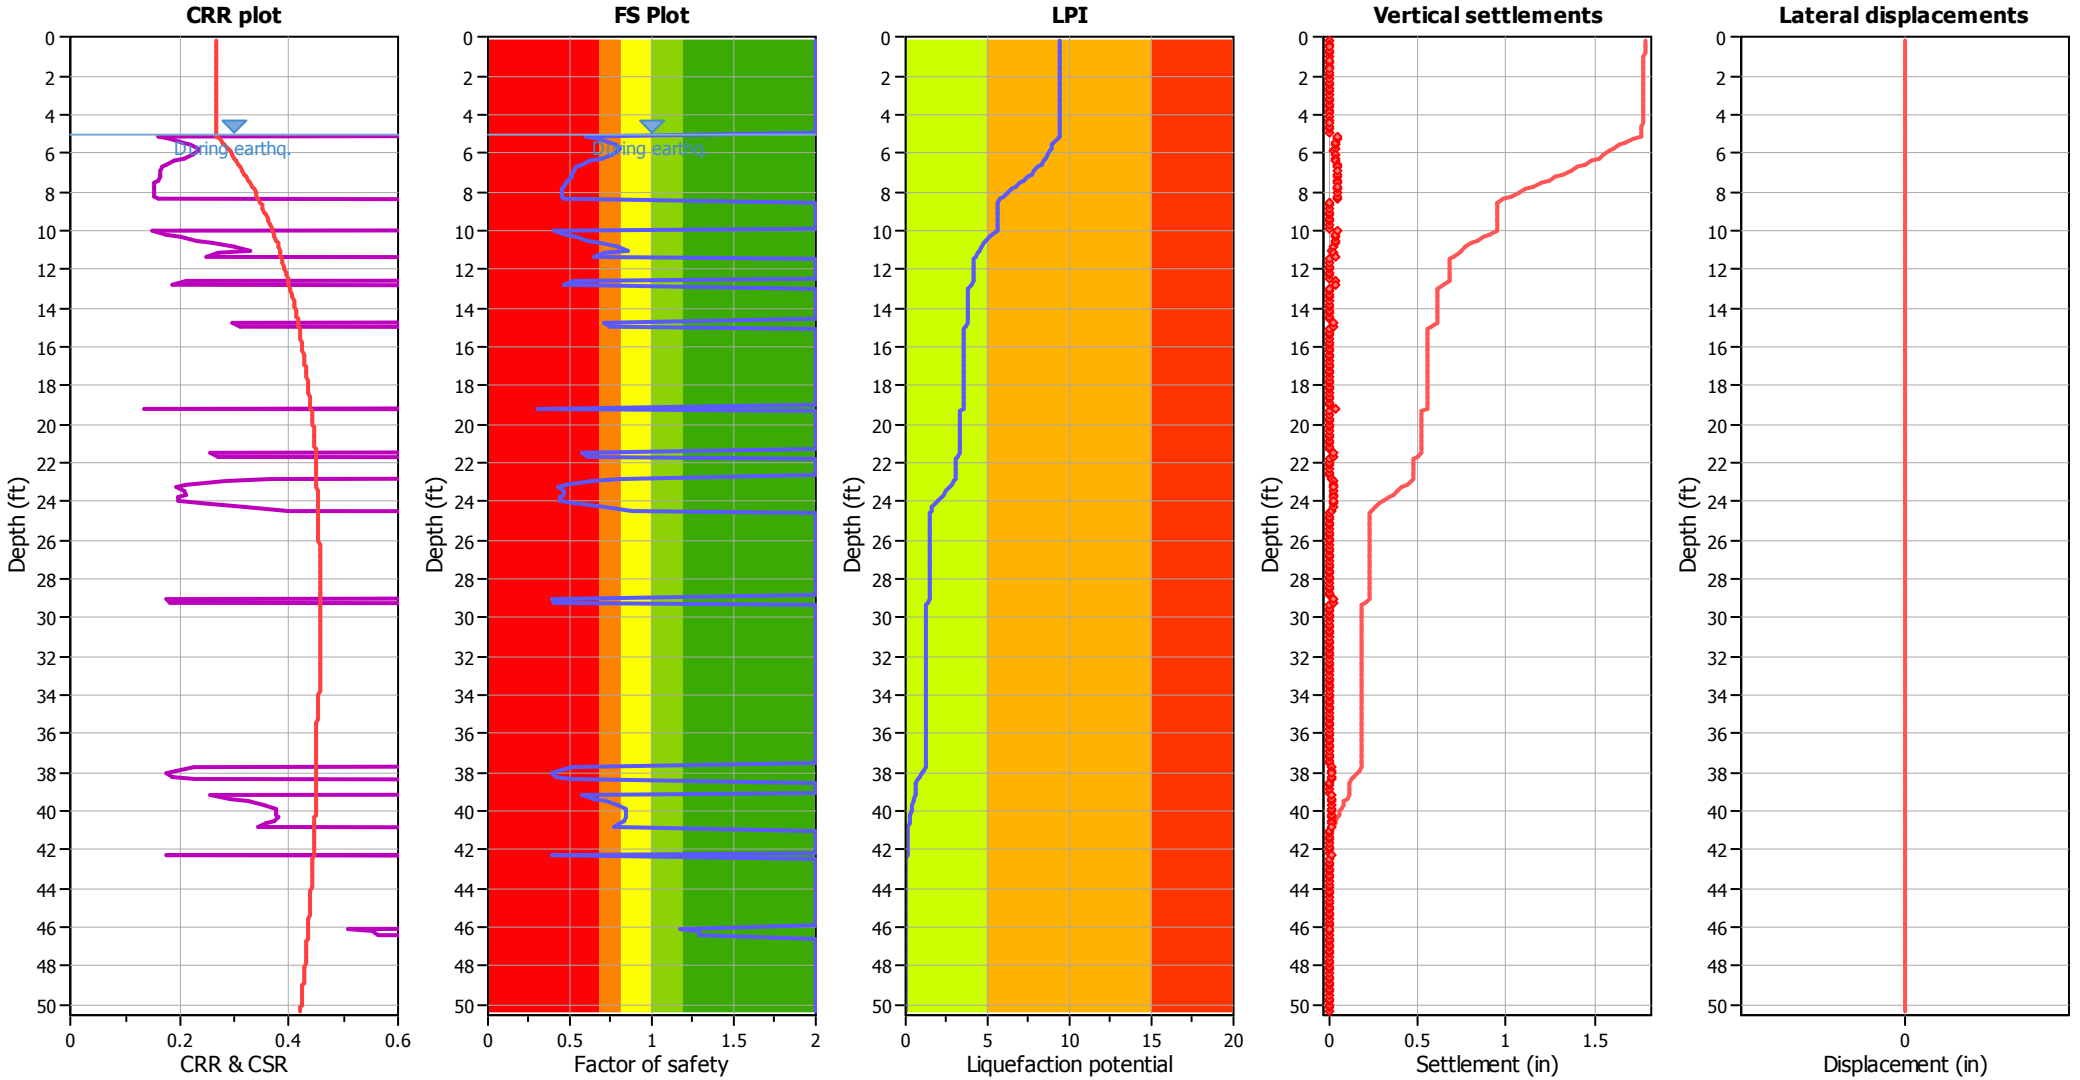
Input parameters and analysis data

Analysis method:	NCEER (1998)	G.W.T. (in-situ):	5.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	NCEER (1998)	G.W.T. (earthq.):	5.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	6.70	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method based
Peak ground acceleration:	0.55	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots (normalized)



Input parameters and analysis data

Analysis method:	NCEER (1998)	Depth to water table (erthq.):	5.00 ft	Fill weight:	N/A
Fines correction method:	NCEER (1998)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	6.70	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.55	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	5.00 ft	Fill height:	N/A	Limit depth:	N/A

SBTn legend

1. Sensitive fine grained
2. Organic material
3. Clay to silty clay
4. Clayey silt to silty
5. Silty sand to sandy silt
6. Clean sand to silty sand
7. Gravely sand to sand
8. Very stiff sand to
9. Very stiff fine grained

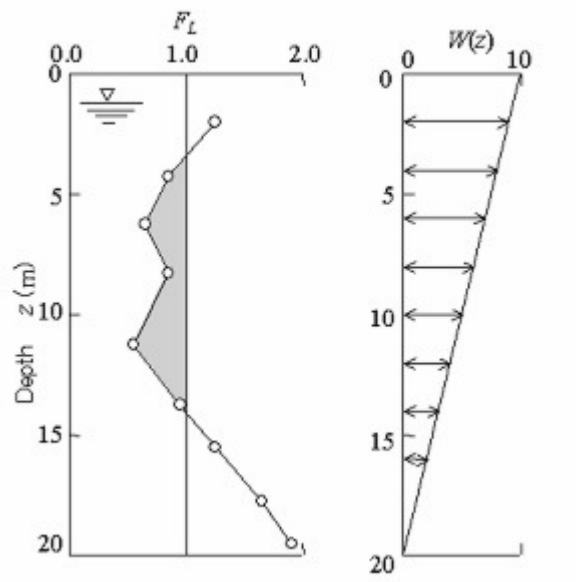
Procedure for the estimation of seismic induced settlements in dry sands

Robertson, P.K. and Lisheng, S., 2010, "Estimation of seismic compression in dry soils using the CPT" FIFTH INTERNATIONAL CONFERENCE ON RECENT ADVANCES IN GEOTECHNICAL EARTHQUAKE ENGINEERING AND SOIL DYNAMICS, Symposium in honor of professor I. M. Idriss, San Diego, CA

Liquefaction Potential Index (LPI) calculation procedure

Calculation of the Liquefaction Potential Index (LPI) is used to interpret the liquefaction assessment calculations in terms of severity over depth. The calculation procedure is based on the methology developed by Iwasaki (1982) and is adopted by AFPS.



To estimate the severity of liquefaction extent at a given site, LPI is calculated based on the following equation:

$$\mathbf{LPI} = \int_0^{20} (10 - 0{,}5_z) \times F_L \times d_z$$

where:
F_L = 1 - F.S. when F.S. less than 1
F_L = 0 when F.S. greater than 1
z depth of measurment in meters

Values of LPI range between zero (0) when no test point is characterized as liquefiable and 100 when all points are characterized as susceptible to liquefaction. Iwasaki proposed four (4) discrete categories based on the numeric value of LPI:

- LPI = 0 : Liquefaction risk is very low
- 0 < LPI <= 5 : Liquefaction risk is low
- 5 < LPI <= 15 : Liquefaction risk is high
- LPI > 15 : Liquefaction risk is very high

Graphical presentation of the LPI calculation procedure

Shear-Induced Building Settlement (Ds) calculation procedure

The shear-induced building settlement (Ds) due to liquefaction below the building can be estimated using the relationship developed by Bray and Macedo (2017):

$$Ln(Ds) = c1 + c2 * LBS + 0.58 * Ln\left(Tanh\left(\frac{HL}{6}\right)\right) + 4.59 * Ln(Q) - 0.42 * Ln(Q)^2 - 0.02 * B + 0.84 * Ln(CAVdp) + 0.41 * Ln(Sa1) + \varepsilon$$

where Ds is in the units of mm, c1= -8.35 and c2= 0.072 for LBS ≤ 16, and c1= -7.48 and c2= 0.014 otherwise. Q is the building contact pressure in units of kPa, HL is the cumulative thickness of the liquefiable layers in the units of m, B is the building width in the units of m, CAVdp is a standardized version of the cumulative absolute velocity in the units of g-s, Sa1 is 5%-damped pseudo-acceleration response spectral value at a period of 1 s in the units of g, and ε is a normal random variable with zero mean and 0.50 standard deviation in Ln units. The liquefaction-induced building settlement index (LBS) is:

$$LBS = \sum W * \frac{\varepsilon_{shear}}{z} dz$$

where z (m) is the depth measured from the ground surface > 0, W is a foundation-weighting factor wherein W = 0.0 for z less than Df, which is the embedment depth of the foundation, and W = 1.0 otherwise. The shear strain parameter (ε_shear) is the liquefaction-induced free-field shear strain (in %) estimated using Zhang et al. (2004). It is calculated based on the estimated Dr of the liquefied soil layer and the calculated safety factor against liquefaction triggering (FSL).

Attn: Sarah Rieboldt, Ph.D., Associate / Senior Paleontologist

re: Paleontological Resources Records Check for the proposed Cypress Mixed-Use Development Project, LSA Project # SHO1901, in the City of Cypress, Orange County, project area

Dear Sarah:

I have thoroughly searched our paleontology collection records for the locality and specimen data for the proposed Cypress Mixed-Use Development Project, LSA Project # SHO1901, in the City of Cypress, Orange County, project area as outlined on the portion of the Los Alamitos USGS topographic quadrangle map that you sent to me via e-mail on 9 December 2019. We do not have any vertebrate fossil localities that lie directly within the proposed project area, but we do have vertebrate fossil localities nearby from sedimentary deposits similar to those that occur in the proposed project area, either at the surface or at depth.

Surficial sediments at the proposed project area and in the surrounding vicinity consist of younger Quaternary Alluvium, with older Quaternary sediments occurring at various depths, as part of the floodplain deposits from Carbon Creek that currently flows just to the north and from Coyote Creek and the San Gabriel River that currently flow just to the west. The younger Quaternary deposits typically do not contain significant vertebrate fossils, at least in the uppermost layers, but older Quaternary deposits at modest depth may well contain significant fossil vertebrate remains.

Our closest fossil vertebrate locality from older Quaternary deposits is locality LACM 3757, southwest of the proposed project area south of 7th Street and east of the Pacific Coast

Highway, that produced fossil specimens of eagle ray, *Myliobatis,* guitar fish, Rhinobatoidea, white shark, *Carcharodon*, blue shark, *Prionace*, surfperches, *Damalichthys* and *Rhacochilus*, croaker, *Genyonemus*, pond turtle, *Clemmys*, sea duck, *Chendytes*, loon, *Gavia*, dog *Canis*, sea otter, *Enhydra*, horse, *Equus*, camel, *Hemiauchenia*, and pocket gopher, *Thomomys*. Further to the west along 7th Street, west of the Pacific Coast Highway, we have locality LACM 6746 that produced fossil mammoth, *Mammuthus*. North of locality LACM 6746 and west-southwest of the proposed project area we have the locality LACM 7493, near the intersection of the Pacific Coast Highway (Highway 1) and Grand Avenue, that produced a fossil specimen of camel, Camelidae, at a depth of 8.5 feet below the surface.

Shallow excavations in the uppermost few feet of the younger Quaternary sediments exposed in the proposed project area are unlikely to uncover significant fossil vertebrate remains. Deeper excavations in the proposed project area that extend down into older Quaternary sediments, however, may well encounter significant vertebrate fossils. Any substantial excavations in the proposed project area, therefore, should be closely monitored to quickly and professionally collect any specimens without impeding development. Also, sediment samples should be collected and processed to determine the small fossil potential in the proposed project area. Any fossils recovered during mitigation should be deposited in an accredited and permanent scientific institution for the benefit of current and future generations.

This records search covers only the vertebrate paleontology records of the Natural History Museum of Los Angeles County. It is not intended to be a thorough paleontological survey of the proposed project area covering other institutional records, a literature survey, or any potential on-site survey.

Sincerely,

Samuel A. McLeod

Executive Summary

Shea Properties (the User) retained Roux Associates, Inc. (Roux Associates) to perform a Phase I Environmental Site Assessment (ESA) and Phase II Limited Soil Investigation of a property located at the northwest corner of Katella Avenue and Winners Circle in Cypress, California, with the Assessor's Parcel Numbers (APNs) 241-091-22, 23, 24, 25, and 26 (Site). As specified in our Proposal dated May 8, 2019, Roux Associates performed this Phase I ESA in general accordance with the American Society for Testing Materials (ASTM) *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM E1527-13) in an effort to identify, to the extent feasible, the presence of *recognized environmental conditions* (RECs) with respect to the Site as defined in ASTM E1527-13. Exceptions to, or deviations from, this practice are described in Sections 1.5 and 8.0 of this report.

The Site is a relatively flat vacant lot, approximately 13.29 acres in size, with no physical street address. The Site has historically been used for surface parking and staging of empty truck trailers and is bordered by an entrance to the Los Alamitos Race Course to the west, beyond which is a retail development; parking for the Los Alamitos Race Course (Race Course) to the north; Winners Circle the east, beyond which is Costco and other retail development; and, Katella Avenue to the south, beyond which are commercial properties.

On May 13, 2019 Roux Associates representatives Messrs. Mauricio Escobar and Mark Edwards visually assessed the Site for potential RECs, including, but not limited to, potential underground storage tanks, aboveground storage tanks, polychlorinated biphenyl-containing equipment, hazardous materials storage or handling areas, containerized or bulk wastes, and visual indications of impacted soil. Roux Associates was unaccompanied during the Site reconnaissance. Roux Associates also performed a records review for the Site and surrounding properties in an effort to identify potential RECs in connection with the Site and assess potential concerns associated with the migration of hazardous substances to the Site from off-Site sources. The records review included reasonably ascertainable historical data, which can be helpful in identifying the past uses of the Site and surrounding areas, as it may relate to the environmental condition of the Site.

ASTM E1527-13 defines a REC as:

> "The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. *De minimis* conditions are not recognized environmental conditions."

A Controlled Recognized Environmental Condition (CREC) as:

> "A recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls)."

And a Historical Recognized Environmental Condition (HREC) as:

> "A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). Before calling the past release a historical recognized environmental condition, the environmental professional must determine whether the past release is a *recognized* environmental condition at the time the Phase I Environmental Site Assessment is conducted (for example, if there has been a change in the regulatory criteria). If the EP considers the past release to be a recognized environmental condition at the time the Phase I ESA is conducted, the condition shall be included in the conclusions section of the report as a recognized environmental condition."

The term *recognized environmental condition* is not intended to include *de minimis* conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

This Executive Summary provides a brief overview of the findings of this Phase I ESA and Phase II Limited Soil Investigation. Although the Executive Summary is an integral part of a report, it does not substitute for reading the entire report or the appended or referenced documents in order to fully understand the findings and potential environmental concerns associated with the Site.

Based upon the results of the Phase I ESA investigation described in this report, Roux Associates identified the following REC in connection with the Site.

- **REC-1: Disturbed/Imported Soils.** Areas of historically disturbed and/or imported soils were identified along the southern and eastern boundaries of the Site. Aerial photographs from 1977 to 1990 suggest that two roughly square areas surrounded by earthen berms were being used to collect surface run-off from the Site and a portion of the Race Course to the north. Also, during the Site reconnaissance an approximately 5-foot high berm was observed along the length of the southern boundary, immediately adjacent to Katella Avenue; it is apparent from aerial photographs this was a feature that was emplaced in the mid-1990s. Additionally, near the southeastern corner of the Site, on-Site topography is several feet higher than the surroundings. Finally, aerial photographs show a construction staging area at the northeastern portion of the Site in the mid-2000s, which was confirmed by Mr. Frank Sherren who works for the Race Course and is knowledgeable of historical Site activities. During the Site reconnaissance it was noted that this northeastern area of the Site is missing surface pavement and coarse gravels resembling road base appeared to have been brought to the Site. Evidence of disturbed and possibly imported materials is considered a REC for the Site.

Based upon the investigations described in this report, this Phase I ESA did not reveal evidence of HRECs in connection with the Site.

Based upon the investigations described in this report, this Phase I ESA did not reveal evidence of CRECs in connection with the Site.

On June 7, 2019, Roux Associates performed a Phase II Limited Soil Investigation at the Site to address disturbed and possibly imported materials along the southern and eastern portions of the Site. Shallow soil samples from approximately 0.5 and 1.5 feet below ground surface (bgs) were collected from eight locations

using hand tools. Initially all of the samples collected from 0.5 feet bgs were submitted for laboratory analysis of California Title 22 metals. In addition, one randomly selected sample collected from 0.5 feet bgs was also analyzed for Total Petroleum Hydrocarbons (TPH) and Volatile Organic Compounds (VOCs). Laboratory reports showed that Title 22 metals concentrations for all samples analyzed were within acceptable background ranges. Additional analyses showed TPH concentrations below actionable levels and VOC concentrations below laboratory method reported limits (MRLs) for all constituents in the one sample analyzed. Based on the results of the Phase II Limited Soil Investigation, REC-1 has been addressed and Roux Associates does not recommend any additional investigation at the Site.

1. Introduction

Roux Associates, Inc. (Roux Associates) completed this Phase I Environmental Site Assessment (ESA) and Phase II Limited Soil Investigation of an approximately 13.29-acre property with Assessor's Parcel Numbers (APNs) 241-091-22, 23, 24, 25, and 26, located at the northwest corner of Katella Avenue and Winners Circle in Cypress, California (Site; Figures 1 and 2). Roux Associates has performed the Phase I ESA in compliance with the scope and limitations of American Society for Testing Materials (ASTM) *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM E1527-13). Both the Phase I ESA and the Phase II Limited Soil Investigation were performed in accordance with the scopes of work and the terms and conditions of Roux Associates' proposals dated May 8, 2019 and May 30, 2019, respectively. Roux Associates conducted all of the work documented in this report for the benefit of Shea Properties (the User). Shea Properties is in the process of evaluating potential purchase and redevelopment of the Site as a mixed-use commercial and residential property, as presented in plans provided in Appendix A.

Sections 3 through 6 of this report present our Phase I ESA findings and conclusions. Section 7 presents the protocols and procedures for the Phase II Limited Soil Investigation, as well as the sampling rationale, the laboratory results, and the conclusions and recommendations of the investigation. A glossary containing terms and definitions presented in ASTM E1527-13 is included as Appendix B – Glossary of Terms. Other appendices presented at the end of the report consist of figures, a table presenting soil analytical results, User-provided information, historical records, regulatory records review documentation, personnel qualifications, and laboratory data.

1.1 Purpose

The purpose of this Phase I ESA is to identify and report, to the extent feasible, recognized environmental conditions (RECs) with respect to the Site. Performing a Phase I ESA in general compliance with ASTM E1527-13 may enable a User to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) liability. That is, the practice that constitutes one of the requirements for "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined in 42 USC Section 9601(35) (B).

The purpose of the Phase II Limited Soil Investigation was to address REC-1 by collecting shallow soil samples from the southern and eastern portions of the Site and conducting laboratory analysis to evaluate concentrations of Title 22 Metals, Total Petroleum Hydrocarbons (TPH) and volatile organic compounds (VOCs). The Phase II Limited Soil Investigation was intended to provide opinions and recommendations as to additional work that could be necessary for the Site (with respect to REC-1), if any.

1.2 Scope of Services

The scope of services for the Phase I ESA included, but was not limited to, the activities listed below:

- A review of reasonably ascertainable and practicably reviewable topographic maps, historical aerial photographs, and city directories to investigate past Site conditions;
- A review of specific government lists pursuant to ASTM Standard E1527-13 regarding environmental activities for the Site and local area properties;

- A review of records, permits, citations, and/or reports connected to the Site that were reasonably ascertainable, practicably reviewable, and publicly available within reasonable time and cost;

- An inspection by an environmental professional to investigate the current use of the Site and to identify environmental concerns including but not limited to, the presence of hazardous substances or petroleum products, wastes, underground storage tanks (USTs), aboveground storage tanks (ASTs), or other environmental concerns; and

- Preparation of this Phase I ESA Report.

Roux Associates initiated this Phase I ESA pursuant to written authorization received from the User on May 8, 2019.

The scope of services for the Phase II Limited Soil Investigation included, but was not limited to, the activities listed below:

- Pre-field activities including the preparation of a Site-specific Health & Safety Plan (HASP) and the notification of Underground Service Alert (USA) of intended subsurface work;

- Collection of subsurface soil samples from eight (8) locations across the Site followed by laboratory analysis of the samples; and,

- Preparation of this Phase II Limited Soil Investigation Report.

Roux Associates initiated the Phase II Limited Soil Investigation pursuant to written authorization received from the User on June 2, 2019.

1.3 Phase I ESA Standard of Care

Roux Associates conducted the Phase I ESA using a defined scope of services considered appropriate and agreed upon by all parties on the date the service was authorized, unless the scope of services or the methods used were later modified, in writing, and accepted by all parties prior to performance. Roux Associates conducted this Phase I ESA in accordance with generally accepted practices in a manner consistent with that level of care exercised by other members of our profession in the same locality and under similar conditions of time and accessibility of improvements and information. No other representations, expressed or implied, and no warranty or guarantee is included or intended to be part of this Phase I ESA.

Please note that the scope of services performed in execution of this assessment may not be appropriate to satisfy the needs of other parties. We, therefore, are not responsible for independent conclusions, opinions, or recommendations of others based on our assessment. Furthermore, this Phase I ESA relates to the environmental conditions of the Site and does not address issues raised in transactions such as business risk, purchase of business entities, or interests therein, or of their assets, that may well involve environmental liabilities pertaining to properties previously owned or operated or other off-site liabilities.

Additionally, the findings of this Phase I ESA are based on Roux Associates' observations, inquiries, and historical research using reasonably ascertainable and practically reviewable information obtained within reasonable time and cost constraints. Roux Associates does not represent that this Phase I ESA is an exhaustive investigation that reflects the findings of all of the information available for the Site, nor is it

representative of future Site conditions. If additional information is generated from the Site, it should be provided to Roux Associates so that we may evaluate its impact on our conclusions. As such, activities or episodes that transpire subsequent to this Phase I ESA are not considered in this assessment. It is not intended that a Phase I ESA in accordance with ASTM E1527-13 be an exhaustive assessment of a property nor can it wholly eliminate uncertainty regarding the potential for RECs in connection with a property.

1.4 Phase I ESA Assumptions

This Phase I ESA Report, including the exhibits attached hereto, describes the results of Roux Associates' investigation to identify the presence of RECs connected with the Site in accordance with ASTM E1527-13, as allowed by and consistent with the regulatory requirements of the All Appropriate Inquiry (AAI) Rule, 40 CFR Part 312, Amendment to Standards and Practices for All Appropriate Inquires Under CERCLA, Final Rule, published December 30, 2013 (AAI Rule). Specifically, the preamble to the amended AAI Rule states:

> *The Environmental Protection Agency (EPA) today is taking final action to amend the standards and practices for conducting all appropriate inquiries under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) to reference a standard practice recently made available by ASTM International, a widely recognized standards development organization. Specifically, this final rule amends the "All Appropriate Inquiries Rule" at 40 CFR Part 312 to reference ASTM International's E1527–13 "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process" and make clear that persons conducting all appropriate inquiries may use the procedures included in this standard to comply with the All Appropriate Inquiries Rule*[1].

One of the requirements that a person acquiring real property must meet in order to qualify for either the innocent landowner, contiguous owner, or bona fide prospective purchaser (collectively hereinafter "Prospective Purchaser") defense to liability under the federal Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended by the Superfund Amendments and Reauthorization Act of 1986, and the Small Business Liability Relief and Brownfields' Revitalization Act of 2002, 42 U.S.C. 9601-9675 (collectively referred to hereafter as "CERCLA") is that person must conduct all appropriate inquiries into the previous ownership and uses of the property in conformance with the AAI Rule (or the ASTM E1527-13) prior to acquisition of the property. The User has acknowledged that, under the AAI Rule, Roux Associates' performance of this Phase I ESA in accordance with ASTM E1527-13 will not alone result in the User satisfying all requirements of the AAI Rule and will not in itself provide a defense to CERCLA liability. The User has acknowledged that the AAI Rule also requires that the Prospective Purchaser undertake certain additional inquiries and post-acquisition activities to satisfy the CERCLA AAI requirements. Accordingly, Roux Associates makes no guarantees or warranties, expressed or implied, regarding this Phase I ESA, including without limitation, that this Phase I ESA will qualify the User for a defense to CERCLA liability.

Roux Associates has performed this Phase I ESA in a professional manner using that degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. Professional judgments expressed herein are based on the facts currently available to Roux Associates.

---

[1] Federal Register: December 30, 2013 (Volume 78, Number 250) Page 79319

The AAI Rule requires, and the conclusions stated herein represent, the application of a variety of engineering and technical disciplines to material facts and conditions associated with the Site. As such, these conclusions are based on subjective interpretations and the exercise of discretion based on the facts available to Roux Associates and conditions at the time of the performance of this Phase I ESA. Many of these facts and conditions are subject to change over time. Accordingly, the conclusions must be considered within this context.

The User has agreed that Roux Associates shall not be responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time this Phase I ESA was performed. To the extent practicable, Roux Associates has identified data gaps, and has evaluated the potential significance of such data gaps. Recommendations to address those data gaps may be provided to the User upon request and are based on the data available at the time of the performance of this Phase I ESA. Implementation of the recommendations may not fully address the data gaps, and the information obtained from execution of those recommendations may alter and/or modify the interpretation of the Site conditions and conclusions, herein. This Phase I ESA does not include consideration of matters specifically excluded by ASTM E1527-13, including but not limited to, asbestos-containing materials (ACM), radon, lead-based paint (LBP), lead in drinking water, wetlands, regulatory compliance, and mold unless specifically identified herein.

Roux Associates has not collected samples at the Site and is relying on information from other sources. By referencing this information, Roux Associates does not accept responsibility for the accuracy of the underlying data, sampling methods, laboratory analysis, or documentation.

This Phase I ESA Report should not be considered a legal interpretation of existing environmental laws and regulations. This Phase I ESA was conducted with a reasonable degree of inquiry to identify RECs, but uncertainty is not eliminated. No Phase I ESA can wholly eliminate uncertainty regarding the potential for RECs in connection with a property. The Phase I ESA process is intended to reduce, but not eliminate, the uncertainty involved with identifying RECs.

This Phase I ESA Report is not an appraisal or value judgment of the Site. The User has agreed that Roux Associates shall not be liable for any use of this Phase I ESA Report as an appraisal or value judgment of the Site.

This Phase I ESA Report has been prepared for the exclusive use of the User for specific application to the Site covered by this Phase I ESA Report. The User has agreed that any third-party use of this Phase I ESA Report, upon disclosure by the User, is the sole responsibility and at the sole liability of the User.

1.5 Phase I ESA Limitations and Exceptions

The limitations and exceptions associated with performing this assessment include outstanding Freedom of Information Act (FOIA) requests. These are described as data gaps in Section 6.1.

1.6 Phase I ESA Special Terms and Conditions

There were no special terms and conditions associated with performing the Phase I ESA.

1.7 User Reliance

This report is confidential and has been prepared for the exclusive use of the User. No additional parties may use the information contained in this report without obtaining the written permission of Roux Associates or the User. Roux Associates' duties and obligations extend to the User and to no other party. Roux Associates' duties and obligations to the User are not transferable to persons, corporations, or organizations without the express written consent of the User and Roux Associates. The User may rely upon the information provided in this Phase I ESA report for a period of 180 days from the date of issue. After 180 days, this Phase I ESA should be updated in accordance with ASTM guidance. Roux Associates will not be liable for any consequential damages arising from the use of this report for other than its intended purpose, for use of this report beyond 180 days of its issue date, or from unauthorized use by third parties.

This report must be read and interpreted as a whole and can only be considered representative of the conditions of the Site as of the date of our Site reconnaissance described herein. Roux Associates makes no representation whatsoever concerning the condition of the Site beyond the date of our Site reconnaissance described herein. Individual sections and appendices of this report are dependent on the balance of this report, and on the terms, conditions, and stipulations contained in the proposal and written amendments accepted by Roux Associates.

2. Site Description

2.1 Location and Legal Description

The Site is located at the northwest corner of Katella Avenue and Winners Circle in the City of Cypress, California (Figures 1 and 2). According to Mr. Douglas Hawkins, City Planner for the City of Cypress, the Site has never been issued a physical street address. The Site is an approximately 13.29-acre property and identified by APNs 241-091-22, 23, 24, 25, and 26.

2.2 Site and Vicinity General Characteristics

The site is currently vacant and is used as a parking lot for the adjacent Los Alamitos Race Course; at the time of the Site reconnaissance the Site was being used for temporary truck trailer parking associated with GES, an events management company. The elevation of the Site is approximately 30 feet above mean sea level (msl) according to several sources, which include Google Earth, topographic maps (Appendix C), and the Environmental Data Resources Inc. (EDR) Radius Map Report (Appendix D). The Site and vicinity are relatively flat sloping gently to the south-southwest. The Site is located in a mixed commercial and residential area.

2.3 Description of Structures, Roads, and Other Site Improvements

The Site is currently undeveloped and consists of a flat, surface parking lot, which is mostly paved with the exception of its northeastern quadrant. The Site is accessible from the south by Katella Avenue, from the east by Winners Circle, and from the west by the unnamed Los Alamitos Race Course driveway. There is no physical boundary between the Site and the adjacent parking lot to the north of the Site.

2.4 Current and Past Use of the Site

According to aerial photographs, topographic maps, and city directory obtained from EDR, the Site was undeveloped from at least 1896 through 1925. The Site appears to have been utilized for agricultural purposes in 1928 and the Site was vacant from at least 1938 through 1947. The Site was improved with a parking lot before 1963, and it has been generally used for that purpose since that time.

2.5 Current Uses of the Adjoining Properties

The Site is located in a mixed commercial and residential area of Cypress, California. The Site is bordered to the west by an entrance to the Los Alamitos Race Course, beyond which is a commercial retail development; parking for the Los Alamitos Race Course is located to the north of the Site; Winners Circle borders the Site to the east, beyond which is Costco and other commercial retail development; and, Katella Avenue borders the Site to the south, beyond which are commercial office properties. No concerns were noted on the adjacent properties during the Site reconnaissance.

2.6 Physical Setting

Roux Associates obtained and reviewed published, reasonably ascertainable information concerning the physical setting of the Site. The following is a summary of our review of those physical setting sources.

2.6.1 Surface Water and Drainage

The only surface water and drainage features of note on the Site are two surface concrete drainage swales that lead to two drains at the southern portion of the Site. These drains lead directly to storm water drainage pipes that run along Katella Avenue, as confirmed by Mr. Hawkins with the City of Cypress. Aerial photographs from 1977 to 1990 suggest that prior to installation of the drains, surface water ran along the same surface swales into two square unlined features surrounded by small berms. The nearest surface water feature in the Site vicinity is the Rossmoor Storm Channel, which is located approximately 1,500 feet south of the Site.

2.6.2 Physiographic Setting

The elevation of the Site is approximately 30 feet above mean sea level. The Site is situated within a physiographic feature called the Downey Plain, which forms a part of the greater coastal plain of the Los Angeles Basin. Recent sediments underlying the Downey Plain region include unconsolidated gravel, sand, silt, and clay originally deposited in a fluvial environment. Below recent Downey Plain alluvial deposits are up to 2,000 feet of Quaternary and Tertiary deposits (Arcadis, 2011).

2.6.3 Regional and Local Geology

According to the California Department of Conservation 2010 Geologic Map of California, the Site vicinity is underlain by alluvium, lake, playa and terrace deposits of the Pleistocene-Holocene era, unconsolidated and semi-consolidated. According to documents for subsurface investigations at nearby sites, underlying sediments in the vicinity of the Site primarily consist of fine-grained sands with silt, with lenses of interbedded clays from the ground surface to approximately 20 feet below ground surface (bgs) (Arcadis, 2011).

2.6.4 Regional and Local Hydrogeology

According to the California Department of Water Resources (DWR) Groundwater Bulletin 118 – Update 2003, the Site is located in the Coastal Plain of Orange County Groundwater Basin (Orange County Basin). The Orange County Basin consists of an accumulation of fresh water-bearing marine and continental sand, silt, and clay deposits. The Basin consists of the Upper, Middle, and Lower Aquifer system. The Upper Aquifer System averages approximately 800 feet in thickness and includes Holocene and older alluvium deposits, terrace deposits, and upper Pleistocene deposits including the La Habra Formation (DWR, 2003).

Roux Associates reviewed the December 2011 Arcadis *Confirmation Soil Borings Report* for a nearby release case located at 5100 Katella Avenue, approximately 230 feet southwest of the Site. The report is available on the California State Water Resources Control Board (SWRCB) GeoTracker database. Based on the groundwater monitoring data provided in the report, the expected direction of groundwater flow is to the west-southwest in the Site vicinity. This is generally consistent with the topography of the area. The reported depth to groundwater in 2011 was 4.62 to 7.37 feet below ground surface (bgs).

3. User-Provided Information

ASTM E1527-13 provides that the User perform certain tasks. The purpose of this section is to present select User-provided information that can assist in identifying possible RECs in connection with the Site. According to ASTM E1527-13, these tasks do not require the technical expertise of an environmental professional and the environmental professional generally does not perform these tasks.

Roux Associates administered a questionnaire to the User at the beginning of this Phase I ESA to assist them with these tasks. Ms. Elizabeth Cobb of Shea Properties completed the questionnaire, included in Appendix A, on May 8, 2019. According to the questionnaire, Ms. Cobb had no knowledge of current or prior developments on the Site.

Ms. Cobb was not aware of any environmental liens, activity and land-use limitations, engineering or institutional controls, chemical releases or contamination on the Site, or environmental cleanups in connection with the Site.

3.1 Environmental Liens or Activity and Use Limitations

The User indicated that they have no knowledge regarding environmental liens or activity and use limitations (engineering/institutional controls) with respect to the Site.

3.2 Specialized Knowledge

The User did not report any specialized knowledge related to the Site.

3.3 Valuation Reduction for Environmental Issues

The User indicated that they have no knowledge regarding valuation reduction for environmental issues.

3.4 Commonly Known or Reasonably Ascertainable Information

The User did not have any knowledge regarding commonly known or reasonable ascertainable information about the Site not otherwise addressed.

3.5 Obvious Indicators of the Presence or Likely Presence of Contamination of the Site

The User did not have any knowledge regarding obvious indicators of the presence or likely presence of contamination of the Site not otherwise addressed.

3.6 Previous Phase I ESA Report

Roux was provided the following previous Phase I ESA for review:

Phase I Environmental Site Assessment for Commercial Property, APN's #241-091-22, 23, 24, 25 & 26, Cypress, CA. 90630, dated August 10, 2006, prepared by DCI Environmental Services (DCI; Appendix E).

DCI did not identify any "hazardous substances that pose a threat to the environmental integrity of the Subject Property" and noted that "it does not appear that the Subject Property…is adversely impaired by hazardous

substances or underground storage tanks" during the preparation of the ESA. The parking lot area of the Site was noted to be in generally good condition during the Site reconnaissance.

In their conclusions and recommendations, DCI did not identify any RECs in conjunction with the Site or recommend further environmental investigations.

4. Records Review

The historical uses of the Site and surrounding properties were researched through the review of historical aerial photographs (Appendix F), historical topographic maps (Appendix C), and the EDR City Directory Search (Appendix G) (Section 4.1). No Sanborn Fire Insurance Maps were available for the Site, as indicated in Appendix H.

4.1 Historical Sources Summary

The table below provides a historical summary of the Site in 10-year increments using information compiled from historical aerial photographs (Appendix F), historical United States Geological Survey (USGS) topographic maps (Appendix C), and the EDR City Directory Search (Appendix G). The table includes a discussion of pertinent findings, but it is not exhaustive of all historical information that may be available for the Site.

Summary of Historical Sources		
Date Range	**Site Description**	**Historical Sources**
Pre-1920	The Site appears to be undeveloped from at least 1896 through the 1910s. Approximately 600 feet north of the Site is a Southern Pacific railroad (Los Alamitos Branch), which is depicted as being installed by 1902. A creek is depicted approximately 0.25 miles east of the Site. Other properties in the vicinity also appear to be mostly undeveloped with the exception of one structure that is present to the east-northeast of the Site near the creek. By 1902 an unlabeled road is present to the immediate south of the Site in the location of present-day Katella Avenue, and other roads are present throughout the Site vicinity.	- 1896, 1899, and 1902 USGS Downey Topographic Maps
1920-1929	The 1923 and 1925 topographic maps do not show details of the Site vicinity. The Site appears to be used for agricultural purposes in the 1928 aerial photograph. One structure that appears to be used for agricultural/homestead purposes is situated approximately 500 feet west of the Site. Other parcels remain undeveloped and appear to be vacant or agricultural.	- 1923 and 1925 USGS Artesia Topographic Maps - 1928 EDR Aerial Photograph

Summary of Historical Sources		
Date Range	**Site Description**	**Historical Sources**
1930-1939	The 1935 topographic map depicts a tank farm labeled “Texas Oil Tank Farm” approximately 0.6 miles north-northwest of the Site. Additional structures are depicted approximately 0.8 miles west-southwest of the Site. The creek formerly depicted to the east of the Site is no longer shown in the 1935 topographic map. Additional roads are shown in the Site vicinity. The road immediately south of the Site is labeled as Katella Avenue. A rectangular feature that appears to be an irrigation pond is depicted approximately 0.7 miles east of the Site. In the 1938 aerial photograph, the Site and vicinity appear to be used for agricultural purposes and appear to be generally consistent with the area shown in the 1928 aerial photograph.	- 1935 USGS Los Alamitos Topographic Map - 1938 EDR Aerial Photograph
1940-1949	The 1942 topographic map depicts additional structures throughout the Site vicinity. Two structures are depicted west adjacent of the Site boundary; however, they are not shown in the 1947 aerial photograph. A structure is depicted approximately 0.2 miles east of the Site. The 1943 topographic map is largely consistent with the 1942 topographic map; the 1945 topographic map does not include details of the Site vicinity. The Site property appears to be undeveloped land in the 1947 aerial photograph, and Site usage is unclear. The Site vicinity has been developed with what appears to be a circular race track approximately 1,000 feet west of the Site. An additional road was constructed sometime before 1947 approximately 1,500 feet south of the Site. Most of the Site vicinity appears to continue to be used for agricultural purposes. The 1949 topographic map depicts a race track approximately 1,000 feet west of the Site, which is consistent with the 1947 aerial photograph. The road shown in the 1947 aerial photograph approximately 1,500 feet south of the Site is depicted as belonging to a “Naval Reservation” shown on the 1949 topographic map. The Naval Reservation includes multiple structures and roads.	- 1942 and 1943 USGS Downey Topographic Maps -1945 USGS Artesia Topographic Map -1947 USGS Downey Topographic Map - 1947 EDR Aerial Photograph - 1949 USGS Los Alamitos Topographic Map
1950-1959	The 1950 topographic map is largely consistent with the 1949 topographic map. In the 1952 aerial photograph, the Site remains undeveloped. The race track remains to the west of the Site. Much of the Site vicinity appears to be used for agricultural purposes. The orientation of the road to the south of the Site associated with the Naval Reservation has changed, and multiple structures that appear to be related to agricultural or livestock use are situated approximately 600 feet southwest of the Site.	- 1950 USGS Los Alamitos Topographic Map - 1952 EDR Aerial Photograph

Summary of Historical Sources		
Date Range	**Site Description**	**Historical Sources**
1960-1969	In the 1963 aerial photograph, the majority of the Site appears to have been paved, possibly for use as a parking lot. A road appears to be situated across the Site from Katella Avenue to the racetrack. The area immediately south of the Site has been developed with structures that appear to be residential in nature. The race track has moved to the north of the Site, and now contains ponds in the center of the track. The areas adjacent to the Site to the west, north, and east remain undeveloped. A paved surface that appears to be a runway is situated approximately 1,400 feet southwest of the Site The 1964 topographic map depicts the Site as being undeveloped and within or immediately adjacent to a parking area. A road which connects the Los Alamitos Racetrack to Katella Avenue is depicted across the Site. The 1964 topographic map depicts the area immediately to the south and southwest of the Site as red-shaded developed land. The topographic map depicts the Los Alamitos Racetrack as having been relocated to the north of the Site, consistent with the 1962 aerial photograph. The naval installation is now labeled as the “Los Alamitos Naval Air Station”, and a northeast-southwest-trending runway appears to have been developed. The perimeter of the naval station has expanded relative to the perimeter depicted in the 1950 topographic map. The northern boundary of the naval station is now approximately 0.25 miles south of the Site. A feature labeled “Rossmoor Storm Channel” is depicted approximately 0.25 miles south of the Site. A channel labeled “Channel Naval” is depicted approximately 0.75 miles east of the Site. Water tanks are depicted approximately 600 feet northwest of the Site; they may be associated with a golf course depicted on the topographic map approximately 0.25 miles northwest of the Site. A creek labeled “Carbon Creek” is depicted approximately 0.7 miles north of the Site. A feature labeled “pumping station” is depicted at the tank farm north-northwest of the Site.	- 1963 EDR Aerial Photograph - 1964 USGS Los Alamitos Topographic Map

Summary of Historical Sources		
Date Range	**Site Description**	**Historical Sources**
1970-1979	In the 1970 aerial photograph, the Site appears to be consistent with the 1963 aerial photograph. The Site vicinity appears to be mostly consistent with the 1963 aerial photograph. The former runway appears to have been truncated, and a pond appears to be situated approximately 1,000 feet southwest of the Site, adjacent to the former runway. In the 1972 topographic map, neither the parking area in the Site vicinity nor the road transiting across the Site are depicted. The majority of the features in the Site vicinity appear to be consistent with those depicted in the 1964 topographic map with the exception of additional development shown throughout the vicinity. The pond feature shown in the aerial photograph is depicted in the topographic map. In the 1977 aerial photograph the Site appears to remain used as a parking lot. Two roughly square areas in the southern portion of the Site appear to be used to collect surface run-off from the Site and of the Race Course to the north, and berms appear to be placed around these features. The approximately square features are located at the southern terminus of the two concrete drainage swales located at the Site. The Site vicinity is largely consistent with the 1970 aerial photograph.	- 1970 EDR Aerial Photograph - 1972 USGS Los Alamitos Topographic Map - 1977 EDR Aerial Photograph
1980-1989	The 1981 topographic map is largely consistent with the 1972 topographic map. The naval facility to the southwest of the Site is now labeled “Los Alamitos Armed Forces Reserve Center”. Development is indicated approximately 700 feet southwest of the Site. The 1981 aerial photograph is generally consistent with the 1977 aerial photograph, with the exception of development to the southwest of the Site that appears to be commercial in nature. The majority of the Site appears to be used as a parking lot. The 1989 aerial photograph is largely consistent with the 1981 aerial photograph. According to Mr. Douglas Hawkins and Mr. Frank Sherren, the parking lot situated on the Site has been in place for at least 30 years and has not been significantly modified or altered since then.	- 1981 USGS Los Alamitos Topographic Map - 1981 EDR Aerial Photograph - 1989 EDR Aerial Photograph - Telephone interviews with Mr. Douglas Hawkins and Mr. Frank Sherren, May 14, 2019

Summary of Historical Sources		
Date Range	**Site Description**	**Historical Sources**
1990-1999	The 1990 aerial photograph is largely consistent with the 1989 aerial photograph. A portion of the Site appears to be occupied by parked automobiles. In the 1994 aerial photograph, the two approximately square drainage features situated at the south of the Site appear to have been paved, and it appears that the berm currently situated at the south edge of the Site was constructed or under construction. A structure was developed on the parcel adjacent to the Site to the west in the location of the current Seventh-Day Adventist Church.	- 1990 EDR Aerial Photograph - 1994 EDR Aerial Photograph
2000-2009	A portion of the Site appears to have been repaved in the 2005 aerial photograph; the Site appears to continue to be used as a parking lot. In the northeastern portion of the Site, the surface pavement appears to have been damaged and/or removed. In the southwest portion of the Site there appear to be staged equipment or vehicles. According to Mr. Sherren, construction equipment was being temporarily staged at the Site, which damaged the surface the surface asphalt. An apparently commercial structure was developed by 2005 immediately adjacent to the east of the Site, and various apparently commercial buildings appear in the vicinity to the east of the Site. Multiple apparently commercial structures were also developed on the parcel adjacent to the west of the Site. The Southern Pacific Railroad is no longer visible to the north of the Site. The 2009 aerial photograph is largely consistent with the 2005 aerial photograph. Semi-trailer trucks appear to be parked in the northeastern portion of the Site. An additional commercial structure was developed on the parcel adjacent to the eastern border of the Site.	- 2005 EDR Aerial Photograph - 2009 EDR Aerial Photograph - Telephone interview with Mr. Frank Sherren, May 14, 2019
2010-Present	The Southern Pacific railroad is no longer depicted to the north of the Site in the 2012 topographic map. The armed forced facility to the south of the Site is now labeled “Los Alamitos Army Airfield”. The tank farm depicted in the 1981 topographic map appears to be developed. The 2012 aerial photograph is largely consistent with the 2009 aerial photograph. The 2016 aerial photograph is largely consistent with the 2012 photograph, with the exception of the development of a structure approximately 250 feet northwest of the Site that appears to be commercial in nature.	- 2012 USGS Los Alamitos Topographic Map - 2012 EDR Aerial Photograph - 2016 EDR Aerial Photograph

According to the aerial photographs, topographic maps, and city directory obtained for the Site and vicinity from EDR, the Site was undeveloped from at least 1896 through 1925. The Site appeared to be utilized for agricultural purposes in 1928 and the Site was vacant from at least 1938 through 1952. By 1963, the Site

appears to have been paved and used for parking purposes, and the Site has remained paved and used for parking since that time. According to Mr. Douglas Hawkins, City Planner for the City of Cypress, the Site was purchased in 2006 by the Cypress Redevelopment Agency from the owners of the Los Alamitos Race Track. In 2011, the Site was sold by the Cypress Redevelopment Agency to the City of Cypress, the current owner of the Site.

According to historical sources, the Site may have been used for agricultural purposes as early as 1928. Although there is a potential that agricultural chemicals, such as pesticides, herbicides and fertilizers, were used on-Site, based on the limited apparent duration of agricultural activities at the Site historical agricultural usage is not considered a REC.

According to historical sources, an oil tank farm was present within one mile of the Site from at least 1935 through 1981. The tank farm is not associated with any release cases identified in any records searches performed during the preparation of this report and is therefore not considered a concern to the Site.

4.2 Database Search

Roux Associates used a computerized environmental database and radius map report prepared by Environmental Data Resources Inc. (EDR) to conduct a government records database search of properties of potential environmental concern within a 1-mile radius of the Site. Appendix D contains a complete copy of the EDR Radius Map Report.

Roux Associates reviewed the results of the state and federal environmental database searches performed by EDR. The Site target property was not listed in any of the databases queried by EDR.

A summary of the properties within the applicable search radius is provided the table below. The remainder of the discussion of environmental databases has been restricted to adjacent facilities and nearby facilities of concern with listings potentially indicative of a release (e.g. NPL; LUST).

Nearby Properties of Potential Environmental Concern from EDR Radius Map Report		
Address	**Property Listings**	**Database**
5122 Katella Avenue	Nelson Pai DDS & Susan Ishioka DDS MS Inc.; Barker Robert H.	RCRA NONGEN/NLR; EDR HIST AUTO
5100 Katella Avenue	Kincher Gary; Union Oil Service Station 5511; Innabi Union 76 #1; Tosco #5680; Service Station 5511; unnamed facility	EDR HIST AUTO; LUST, HIST UST; HAZNET, SWEEPS UST, CA FID UST; HIST CORTESE; UST; HIST UST; RCRA-LQG
5074 Katella Avenue	Racer Cleaners; Alamitos Cleaners and Laundry; Alamitos Cleaners; Alamitos Laundry & Dry Cleaners	DRYCLEANERS; EDR HIST CLEANER; DRYCLEANERS; DRYCLEANERS
5074-78 Katella Avenue	Alamitos Cleaners	DRYCLEANERS

4961 Katella Avenue	Los Alamitos Race Track; Los Alamitos Race Course	FINDS, LUST, RCRA-SQG, HAZNET, SWEEPS UST, CA FID UST, HIST CORTESE, ORANGE CO. INDUSTRIAL SITE, ECHO, CIWQS; AST, LUST, ENF, HIST CORTESE, NPDES, CIWQS
4959 Katella Avenue	Island Cleaners	EDR HIST CLEANER
4921 Katella Avenue	Cypress Golf Club	LUST, NPDES
5401 Katella Avenue	Replanet LLC	SWRCY, CHMIRS
5001 Cerritos	Robert Kahn Property/Former HRAKO Service Center	LUST

10800 Valley View Street	The Boeing Company	HAZNET, EMI, ENVIROSTOR, ORANGE CO. INDUSTRIAL SITE
None provided	Los Alamitos Rad Bomb/Score Site	ENVIROSTOR
None provided	NAS Los Alamitos	ENVIROSTOR
None provided	Los Alamitos Armed Forces Reserve Center	DOD

The EDR Search Report identified several listings for off-Site adjacent or nearby properties on databases potentially indicative of a contamination concern. Roux Associates notes that surface topography in the Site vicinity generally slopes to the south-southwest according to historical topographic maps and the EDR Radius Map Report (Appendix D).

The listings of potential concern are herein discussed by facility or address.

- Nelson Pai DDS & Susan Ishioka DDS MS Inc., located at 5122 Katella Avenue approximately 160 feet southwest of the Site, is listed in the RCRA NONGEN/NLR database. No violations or spills are noted, and inclusion in this database is consistent with general regulatory compliance; therefore, this listing is not considered to represent an environmental concern to the Site.

- Barker Robert H., located at 5122 Katella Avenue approximately 160 feet southwest of the Site, is listed in the EDR HIST AUTO database from 1969 to 1983. No evidence of spills or violations is reported for this facility; therefore, this listing is not considered to represent an environmental concern to the Site.

- 5100 Katella Avenue, which is situated approximately 225 feet southwest of the Site, is associated with multiple gasoline station and automotive listings including Kincher Gary, Union Oil Service Station 5511, Innabi Union 76 #1, Tosco #5680, Service Station 5511, and one unnamed facility whose mailing address is associated with Circle K. The facilities at 5100 Katella Avenue are listed in the EDR HIST AUTO, LUST, HIST UST, HAZNET, SWEEPS UST, CA FID UST, HIST CORTESE, UST, and RCRA-LQG databases. Of these listings, only the LUST listing associated with the Tosco #5680 facility is indicative of a release.

  According to the GeoTracker listing for the Tosco #5680 facility, a gasoline leak from a UST was discovered on May 19, 1987. Remediation of the gasoline leak involved excavation, operation of a groundwater pump and treat system, soil vapor extraction, and ozone injection. The facility received a No Further Action letter on September 23, 2015. Based on the downgradient location of the Tosco #5680 facility and the issuance of regulatory closure for the gasoline leak, this listing is not considered to represent an environmental concern to the Site.

- 5074 Katella Avenue, located approximately 410 feet west-southwest and hydraulically downgradient of the Site, is associated with multiple dry cleaner facilities including Racer Cleaners, Alamitos Cleaners and Laundry, Alamitos Cleaners, and Alamitos Laundry & Dry Cleaners. These facilities are listed in the DRYCLEANERS and EDR HIST CLEANER listings. The listings for Racer Cleaners, Alamitos Cleaners, and Alamitos Laundry & Dry Cleaners are associated with perchloroethylene; however, there are no listings indicative of environmental releases and therefore these listings are not considered to represent an environmental concern to the Site.

- Los Alamitos Race Track and Los Alamitos Race Course are listed at 4961 Katella Avenue in the FINDS, LUST, RCRA-SQG, HAZNET, SWEEPS UST, CA FID UST, HIST CORTESE, ORANGE CO. INDUSTRIAL SITE, ECHO, CIWQS, AST, ENF, NPDES, and CIWQS databases. According to the EDR Radius Map Report the facility is listed as being located approximately 550 feet west-southwest of the Site; however, it is situated adjacent to the Site to the north. With the exception of the listings described below, the inclusion of this facility in these databases is indicative of general regulatory compliance.

  The LUST cases identified for this facility are for leaks that are reported to have been discovered on August 9, 1988 and June 23, 1997. The leak discovered August 9, 1988 received regulatory closure on June 26, 1996 according to the LUST database listing. The Orange County Environmental Health Division Remedial Action Case Closure Summary associated with this leak indicates that four diesel USTs containing gasoline and diesel were removed from the property. Soil sampling following UST removal indicated that the tank pit area was heavily contaminated, and free product was observed floating on groundwater in the tank pit. Vapor extraction, groundwater extraction and implementation, and bioremediation were implemented. Carbon tetrachloride and 1,2-DCA are reported to have been detected in several monitoring wells at the facility; the origins of these contaminants was allegedly unknown. Prior to closure, only one monitoring well was reported to show impacts related to the former USTs in the form of elevated benzene. However, the LUST case subsequently received closure.

  The leak discovered June 23, 1997 received closure on July 29, 1997 according to the LUST database listing. Files available on GeoTracker corresponding to this leak indicate that soil testing following the removal of three USTs indicated low levels of gasoline, diesel, and MTBE

contamination. Approximately 5 tons of contaminated soil was moved to an open area at the race track, and fertilizer and water were added to the spoils. The spoils were spread across the track area and were left in place for the contamination to naturally attenuate. Based on the closure status of both LUST cases, these listings are not considered to represent an environmental concern to the Site.

The FINDS listing associated with the Los Alamitos Race Course facility indicates that the facility was in violation of the Clean Water Act in 2018 and 2019 for best management practice deficiencies, discharge without a permit, failure to monitor, and for not submitting an annual report. Based on the lack of documented environmental release, this listing is not considered to represent an environmental concern to the Site.

- Island Cleaners, located at 4659 Katella Avenue, is listed in the EDR HIST CLEANER database and was also observed to be present at that location during the Site reconnaissance. Island Cleaners is approximately 550 feet west-southwest of the Site. There are no releases or violations associated with this facility, and this listing is not considered to represent an environmental concern to the Site.

- Cypress Golf Club, located at 4921 Katella Avenue, is listed in the LUST and NPDES databases. The Cypress Golf Club was situated approximately 550 feet west-northwest of the Site. According to the GeoTracker listing associated with this facility, a UST formerly used to store gasoline and diesel was removed in March 2004. A grab water sample from the saturated zone showed elevated levels of MTBE, and three groundwater monitoring wells were subsequently installed. Groundwater samples showed low levels of NTBE and other contaminants below risk levels, and the case received closure from the Orange County Environmental Health Division on January 16, 2007. Based on the low concentrations of MTBE and other contaminants associated with the LUST case and the regulatory closure issued, this listing is not considered to represent an environmental concern to the Site.

- Replanet LLC at 5401 Katella Avenue, approximately 585 feet east-southeast of the Site, is listed in the CHMIRS database for a Freon gas leak indicated by an alarm panel on June 9, 2006. The CHMIRS listing reports that 0.000000 gallons of Freon gas were spilled, and this this listing is not considered to represent an environmental concern to the Site.

- The Los Alamitos Armed Forces Reserve Center is listed in the DOD database, and is listed as being approximately 1,220 feet south of the Site. The Los Alamitos Armed Forces Reserve Center listing is not associated with an address, and the DOD database listing does not have any information regarding environmental releases. Therefore, this listing is not considered to represent an environmental concern to the Site.

- The Robert Kahn Property/Former HRAKO Service Center located at 5001 Cerritos Avenue is approximately 0.4 miles north-northwest of the Site and is associated with a LUST case. According to information available on GeoTracker pertaining to the Robert Kahn Property/Former HRAKO Service Center facility, a gasoline leak discovered on August 27, 1991 impacted groundwater. Cleanup involved excavation which was completed on January 26, 1998. The facility received closure on June 11, 2002. Based on the distance from this facility to the Site and the regulatory closure achieved, this listing is not considered to represent an environmental concern to the Site.

- Orange County Fire Station #17 located approximately 0.4 miles north-northwest of the Site is listed in the LUST, SWEEPS UST, CA FID UST, and HIST CORTESE databases. Only the LUST listing is indicative of an environmental release. According to documents available on GeoTracker pertaining to this facility, a UST leak was discovered on July 30, 1997. One 1,000-gallon diesel UST and one 550-gallon gasoline UST were removed from the facility on April 1, 1998. Soils in the immediate vicinity of the tanks and former dispenser area were noted to be contaminated by TPH, toluene, ethylbenzene, and xylenes but the lateral extent of the contamination was noted to be limited. Groundwater samples showed limited MTBE impacts; all other contaminants were below detection limits or respective MCLs. A dual-phase extraction pilot test was conducted, but was deemed not feasible based on limited hydrocarbon recovery. The MTBE concentration in groundwater showed a decreasing trend following tank excavation. Based on these factors, no further action was recommended and the facility received regulatory closure on December 20, 2004. Given the distance from the Site to this facility and the regulatory closure obtained for the LUST case, the Orange County Fire Station #17 listing is not considered to represent an environmental concern to the Site.

- R&D Bldg Parcel 7 is listed in the HAZNET, ENVIROSTOR, and CIWQS databases; of these listings, only the ENVIROSTOR database is indicative of potential environmental releases at the facility. R&D Bldg Parcel 7 is located at 5730 Katella Avenue, approximately 0.4 miles east-southeast of the Site. According to the EnviroStor listing for this address associated with Rolls-Royce High Temperature Composite, Inc., the facility has an active tiered permit. A tiered permit checklist submitted July 18, 2018 by the facility indicates that a Phase I ESA conducted in April 2015 did not identify any RECs in conjunction with the facility. No releases are indicated on the EnviroStor listing for the facility. Based on the absence of known releases, this listing is not considered to represent an environmental concern to the Site.

- Vesper Corporation and Arrowhead Products are listed at 4411 Katella Avenue, approximately 0.7 miles west of the Site, and are listed in the HAZNET, EMI, ENVIROSTOR, and CIWQS databases. This facility is approximately 3,600 feet west of the Site. According to the EnviroStor listing associated with Arrowhead Products, the company moved to its Los Alamitos location in 1962 and was sold to Vesper Corporation in 1983. The facility continues to operate as Arrowhead Products and manufactures metallic and non-metallic bellows and ducting systems, reinforced plastic structures, composite laminates, and thermal protective products for the aerospace and defense industries. According to the EnviroStor listing for the facility, contaminants found at the facility include arsenic in soil and VOCs in soil, soil gas, and indoor air. VOCs identified at the facility include TCE and PCE. According to the Preliminary Endangerment Assessment (PEA) Report prepared for the facility, groundwater is encountered between 8 and 12 feet below ground surface. Based on the relatively shallow groundwater depth, the PEA Report recommended that groundwater samples be collected to evaluate for the presence of VOCs. Although the presence of VOC contamination in groundwater at the Arrowhead Products facility has not been evaluated, based on the distance to the Site this listing is not considered to represent an environmental concern to the Site.

- The Joint Forces Training Base, Los Alamitos – BLDG 34 facility located at 4250 Constitution Avenue is listed in the LUST, ENVIROSTOR, and RESPONSE databases. The facility associated with this listing is situated on the Los Alamitos Joint Forces Training Base approximately 3,630 feet west-southwest of the Site.

According to the GeoTracker listing for this facility, the cleanup status is Open – Remediation as of June 15, 2007. Six USTs were historically associated with BLDG 34, and were removed from March to May 1994 along with 225 cubic yards of petroleum-impacted soil. A soil vapor and groundwater treatment system was operated from September 2006 through March 2007, and oxygen release compound was applied in May 2007 in 44 locations. Following these remedial activities, long-term groundwater monitoring was implemented. As of 2016, additional assessment is needed to determine the vertical and lateral extent of petroleum impacts.

The RESPONSE listing for the BLDG 34 facility lists the status as No Further Action as of February 3, 2010. The potential contaminants are listed as munitions debris. According to the EnviroStor listing for the Joint Forces Training Base that BLDG 34 is a part of, potential contaminants of concern include explosives, metals, and munitions debris. The cleanup status is listed as No Further Action as of February 3, 2010.

Based on the distance to the Site and the remediation that has occurred associated with the LUST case, these listings are not considered to represent an environmental concern to the Site.

- The Boeing Company located at 10800 Valley View Street is listed in the HAZNET, EMI, ENVIROSTOR, and ORANGE CO. INDUSTRIAL SITE databases. The Boeing Company facility is situated approximately 4,020 feet east of the Site. Of the database listing for the Boeing Company facility, only the ENVIROSTOR and ORANGE CO. INDUSTRIAL SITE listings are indicative of environmental releases.

  The ENVIROSTOR listing for the facility lists the status as Refer: 1248 Local Agency as of September 2, 2004. There are no potential contaminants or affected media noted in the EnviroStor listing for the facility. According to the ORANGE CO. INDUSTRIAL SITE listing for the facility, closure certification was issued on January 27, 2005 for a release of oil and water. Based on the regulatory closure issued for the oil and water release and the distance from the Site, these listings are not considered to represent an environmental concern to the Site.

- Los Alamitos Rad Bomb/Score and NAS Los Alamitos are not associated with an address. Both facilities are listed as being situated 5,050 feet southwest of the Site, and both facilities are associated with an ENVIROSTOR listing. According to the EnviroStor page for NAS Los Alamitos, there are no specified contaminants of concern and the status is Inactive – Needs Evaluation as of July 1, 2005. According to the EnviroStor page for Los Alamitos Rad Bomb/Score Site, potential contaminants of concern include explosives. The status for this facility is Inactive – Needs Evaluation as of August 14, 2018. Based on the distance from the Site to these facilities and the lack of documented environmental releases, these listings are not considered to represent an environmental concern to the Site.

One listing was identified as an orphan site and is described in the table below.

Orphan Site Listings from EDR Radius Map Report		
Address	**Property Listing**	**Database**
Northeast Corner Los Alamitos and Katella	Benjamin B & Maria L Barajas DBA	DRYCLEANERS

The orphan listing is discussed below.

- Benjamin B & Maria L Barajas DBA is located on the northeast corner of Los Alamitos Boulevard and Katella Avenue in Los Alamitos, approximately two miles west of the Site. The facility is listed as a dry cleaning facility. This listing is not expected to represent a significant environmental concern to the Site based on the distance from the Site.

4.3 Information from Government Agencies

Roux Associates contacted selected federal, state, and local regulatory agencies to determine whether they have potentially relevant environmental records pertaining to the Site, including records relating to USTs, aboveground storage tanks (ASTs), environmental permits, enforcement orders, reports and correspondence related to Site assessment, soil sampling, monitoring, clean-up and/or remediation, removal actions, closures, or any records related to conditions in air, soil, surface water, groundwater, or other environmental media. The agencies contacted and Roux Associates' interactions with them are documented below. Roux Associates contacted or reviewed information from the following agencies:

- Federal;
    - United States Environmental Protection Agency (EPA),
    - National Pipeline Mapping System (NPMS),
- State;
    - State Water Resources Control Board (SWRCB): GeoTracker,
    - SWRCB: Storm Water Multiple Application and Report Tracking System (SMARTS),
    - Department of Toxic Substances Control (DTSC),
    - DTSC: EnviroStor,
    - DTSC: Hazardous Waste Tracking System (HWTS),
    - California Air Resources Board (CARB),
    - California Office of Environmental Health Hazard Assessment (OEHHA),
    - CalEPA: CalRecycle,
    - CalRecycle: Solid Waste Information System (SWIS),
    - State of California Department of Conservation: Division of Oil, Gas and Geothermal Resources (DOGGR),
- County/Regional;
    - Santa Ana Regional Water Quality Control Board (SA-RWQCB),
    - South Coast Air Quality Management District (SC-AQMD),
    - Orange County Sanitation Department (OCSD),
    - Orange County Public Works (OCPW),
    - Orange County Environmental Health,
    - Orange County Waste and Recycling, and
- City/Local;
    - City of Cypress – City Clerk.

It is noted that the Site does not have a physical street address and therefore the requests were made using the general location of the Site (northwest corner of Katella and Winners Circle), as well as APNs (241-091-22, 23, 24, 25, and 26). Some agencies require physical street addresses and therefore were unable to respond, as explained below. The following sections summarize Roux Associates' review of those records. Copies of the records are provided in Appendix I – Regulatory Records Documentation.

4.3.1 Federal Agencies

US EPA

Roux Associates submitted an online Public Records Request on FOIA online on May 8, 2019. A response dated May 89 [*sic*] 2019 stated that any available records are available on the EPA MyProperty database, and the request was subsequently closed.

NPMS

Roux Associates queried the online NPMS Public View database on May 8, 2019. There are no gas transmission or hazardous liquid pipelines within the Site. The nearest pipe is a hazardous liquid pipeline, approximately 0.5 miles north of the Site.

4.3.2 State Agencies

SWRCB: GeoTracker

Roux Associates queried the online SWRCB GeoTracker database on May 8, 2019. No listings associated with the Site were identified on GeoTracker. One facility, listed below, was identified in the immediate vicinity of the Site and is discussed in greater detail in Section 4.2.

- Tosco – 76 # 5511 at 5100 Katella is a closed LUST case.

SWQCB SMARTS

Roux Associates queried the online stormwater public database on May 8, 2019. No listings associated with the Site were identified.

DTSC

Roux Associates submitted a Public Records Request form to DTSC via email on May 8, 2019. On May 13, 2019, a response was received via email stating that there were no records associated with the Site.

DTSC: EnviroStor

Roux Associates queried the online EnviroStor database on May 8, 2019. No listings associated with the Site or in the immediate Site vicinity were identified.

DTSC: HWTS

Roux Associates queried the online tracking database on May 8, 2019. No listings associated with the Site were identified.

CARB

Roux Associates submitted a Public Records Request to CARB via email on May 8, 2019. On May 22, 2019 an email response was received stating that no records associated with the Site were identified.

California OEHHA

Roux Associates submitted a Public Records Request to OEHHA via email on May 8, 2019. At the time of this report, no response has been received.

CalEPA: CalRecycle

Roux Associates submitted a Public Records Request to CalRecycle via email on May 8, 2019. On May 20, 2019 an email response was received stating that no records associated with the Site were identified.

CalRecycle: SWIS

Roux Associates queried the online SWIS Facility and Site database on May 8, 2019. No listings associated with the Site were identified.

State of California Department of Conservation: DOGGR

Roux Associates queried the online DOGGR database on May 8, 2019. No listings associated with the Site or within the vicinity of the Site were identified.

4.3.3 County/Regional Agencies

SA-RWQCB

Roux Associates submitted a Public Records Request to SA-RWQCB via email on May 8, 2019. At the time of this report, no response has been received.

SC-AQMD

Roux Associates submitted a Public Records Request to SC-AQMD via email on May 8, 2019. A response dated May 9, 2019 stated that the request could not be fulfilled because SC-AQMD can only search by address.

Roux Associates also queried the online SC-AQMD database on May 8, 2019. No listings associated with the Site were identified.

OCSD

Roux Associates submitted a Public Records Request to OCSD on May 8, 2019. On May 8, 2019, a response was received via email, stating that no records associated with the Site were identified.

OCPW

Roux Associates submitted a Public Records Request to the Orange County web portal on May 8, 2019. On May 15, 2019, a response was received via email stating that one record was available. The record provided describes the discharge of wastewater to the municipal storm water system at 5275 Orange Avenue, Cypress, California on September 13, 2003. This address is approximately 1.4 miles north of the Site; therefore, this incident is not considered an environmental concern to the Site.

Orange County Environmental Health

Roux Associates submitted a Public Records Request to the Orange County web portal on May 8, 2019. A response received via email on May 8, 2019 stated that the request could not be fulfilled because Orange County Environmental Health can only search by address.

Orange County Waste and Recycling

Roux Associates submitted a Public Records Request to the Orange County web portal on May 8, 2019. A response was received via email on May 10, 2019 stating that no records associated with the Site were identified.

4.3.4 City/Local Agencies

City of Cypress – City Clerk

Roux Associates submitted a Public Records Request via email on May 8, 2019. According to a response dated May 14, 2019, the City of Cypress did not identify records associated with the Site. Roux Associates spoke with Mr. Douglas Hawkins, City Planner for the City of Cypress, by telephone on May 14, 2019 regarding the Site. Information regarding the Site obtained from the interview is described in Section 4.1.

5. Site Reconnaissance

Roux Associates representatives Messrs. Mauricio Escobar and Mark Edwards conducted a visit of the Site and surrounding areas on May 13, 2019. During the Site reconnaissance, it was generally partially cloudy and dry. Roux Associates was unaccompanied during the Site reconnaissance. Site access was unobstructed, and the reconnaissance was conducted on foot. Following the Site reconnaissance, Roux Associates spoke with Mr. Douglas Hawkins, City Planner for the City of Cypress, and Mr. Frank Sherren, Facilities Manager at Los Alamitos Race Course, by phone. Information obtained from these interviews is detailed in Section 4.1 of this report.

Roux Associates observed an active geotechnical investigation at the southwestern portion of the Site and evidence of historical boring location (presumably former geotechnical investigations) at various locations throughout the Site.

5.1 Methodology and Limiting Conditions

Roux Associates' Site reconnaissance methods included a site visit to physically observe the Site to identify RECs in connection with the Site. Mr. Escobar and Mr. Edwards traversed the Site on foot to observe conditions. Photographs taken to document conditions encountered at the time of the site reconnaissance are included in Appendix J – Photographic Log. Roux Associates also visually and/or physically observed adjoining properties from reasonably accessible locations on the Site and public thoroughfares.

The Site was observed to be flat, undeveloped land used for parking and temporary storage of truck trailers. On-Site improvements consisted of asphalt pavement, which is in disrepair throughout much of the Site, light poles, and surface swales leading to two individual drains that connect to the storm sewer along Katella Avenue. Landscaping including trees and grass were observed along the southwestern border of the Site. Standing water and muddy conditions were observed at the southwestern corner of the Site, which appeared to be from overwatering of the landscaping. A surface berm, which was a landscaping feature, was observed running along the entire length of the southern Site boundary adjacent to Katella Avenue.

On-Site topography slopes gently to the south but there appear to be artificial low spots on the southern portion of the Site, likely associated with the surface drains. It was noted that on-Site surface elevation at the southeastern corner of the Site was several feet higher than the surrounding elevation at Winners Circle. It was also noted that the pavement is missing at the northeastern portion of the Site with numerous ruts, which were likely created by large trucks that were observed running through the Site. Gravelly material suggesting road base was observed in this area of the Site. Mr. Sherren indicated that this area of the Site was formerly used to stage construction equipment, which also damaged the former asphalt.

The Site is bounded by a fence to the south, by a paved race track entrance to the west, by a parking area for the Los Alamitos Race Course to the north, and by Winners Circle and Costco to the east. According to Mr. Hawkins and confirmed by Mr. Sherren, long-haul trucks are allowed to temporarily park empty trailers at the Site.

5.2 Interior and Exterior Observations

The following sections summarize Roux Associates' Site reconnaissance observations.

5.2.1 Drainage Swales or Culverts

Roux Associates observed two shallow concrete drainage swales within the Site parking lot. The swales originate from the north of the Site and generally trend north-south. No hazardous substances, staining, or other indications of a release were observed in the vicinity of the swales.

5.2.2 Drains, Sumps, Wells, or Subsurface Piping

Roux Associates observed two stormwater drains in the southern portion of the Site. The drainage swales located on the parking lot lead to the drains, which empty to the storm sewer that runs along Katella Avenue. No hazardous substances, staining, or other indications of a release were observed in the vicinity of the drainage features. A capped pipe labeled 'LASCO PVC 8"' was observed in the southern portion of the Site.

5.2.3 Equipment Suspected to Contain Polychlorinated Biphenyls

Roux Associates observed one aboveground pad-mounted transformer in the southwest corner of the Site and two aboveground pad-mounted transformers in the southeast corner of the Site. The transformers appeared to be owned and operated by Southern California Edison. It is unknown whether the observed transformers contained oils and potentially PCBs, although this is unlikely given the labeled manufacturing dates of the transformers which ranged from 2010 to 2017. No staining or leaks were observed in the vicinity of the transformers and the pads appeared to be in good condition. Maintenance of the transformers would be the responsibility of Southern California Edison. Roux considers the potential environmental impact associated with the transformers to be low.

5.2.4 Pools of Liquid

Pools of liquid (irrigation water) were observed in the southwestern corner of the Site. No visual or olfactory evidence was observed to indicate that the pools of liquid contained anything other than water from adjacent irrigation.

5.2.5 Solid Waste

Roux Associates observed minor evidence of general refuse and waste throughout the Site. Small amounts of trash from consumer products were observed in various locations throughout the Site.

5.2.6 Stained Pavement

Roux Associates observed minor staining in various portions of the parking lot at the Site. The staining appeared to originate from motor vehicle leaks. Based on the small apparent quantities of leaked automotive fluids, the staining is considered *de minimis* in nature.

5.2.7 Other Features

The following features were not observed by Roux Associates during the May 13, 2019 Site inspection:

- Areas of stressed vegetation
- Areas which receive flood or storm water from potentially contaminated areas
- Air compressor vent discharges
- Discharge areas
- Drums

- Empty hazardous substance or petroleum product containers
- Hazardous substances and petroleum products
- Incinerators
- Landfills or landfarms
- Loading and unloading areas
- Non-contact cooling water discharge
- Open areas away from production areas
- Stockpiled soil
- Unidentified substances containers assumed to contain or once contain automobile-related chemicals
- Unusual odors
- USTs or other storage tanks
- Wastewater, wells, septic systems
- Wetland areas, pits, ponds, or lagoons
- The site is currently vacant with no structures; therefore, ACM and LBP are not a concern.

5.2.8 Vapor Intrusion

Roux considered likely sources of on-site vapor intrusion and off-Site vapor migration during the preparation of this Phase I ESA. None of the features identified at the Site are considered to be a likely source of soil vapor impacts. None of the adjoining or nearby properties were identified as likely source for vapor encroachment onto the Site.

6. Findings

6.1 Data Gaps

During conduct of this ESA, the following data gaps were identified:

- The following agency FOIA requests are pending as of this report date:
    a. California Office of Environmental Health Hazard Assessment (OEHHA)
    b. Santa Ana Regional Water Quality Control Board (SA-RWQCB)

Based on the quality of information obtained from other sources including aerial photographs, topographic maps, and interviews, these data gaps are not considered significant and are not expected to alter Roux Associates' findings.

Roux Associates has performed this Phase I ESA in general compliance with the scope and limitations of ASTM E1527-13. Roux Associates separated the findings of this assessment into the following four categories: RECs, CRECs, HRECs, and *de minimis* conditions.

6.2 Recognized Environmental Conditions

Roux Associates identified the following REC in connection with the current and historical operations at the Site or nearby properties:

- **REC-1: Disturbed/Imported Soils.** Areas of historically disturbed and/or imported soils were identified along the southern and eastern boundaries of the Site. Aerial photographs from 1977 to 1990 suggest that two roughly square areas surrounded by earthen berms were being used to collect surface run-off from the Site and a portion of the Race Course to the north. Also, during the Site reconnaissance an approximately 5-foot high berm was observed along the length of the southern boundary, immediately adjacent to Katella Avenue; it is apparent from aerial photographs this was a feature that was emplaced in the mid-1990s. Additionally, near the southeastern corner of the Site, on-Site topography is several feet higher than the surroundings. Finally, aerial photographs show a construction staging area at the northeastern portion of the Site in the mid-2000s, which was confirmed by Mr. Frank Sherren who works for the Race Course and is knowledgeable of historical Site activities. During the Site reconnaissance it was noted that this northeastern area of the Site is missing surface pavement and coarse gravels resembling road base appeared to have been brought to the Site. Evidence of disturbed and possibly imported materials is considered a REC for the Site.

Based on the identification of this REC, Roux Associates performed a limited subsurface investigation at the Site. The methods, results, and conclusions of this investigation are presented in Section 7 of this report.

6.3 Controlled Recognized Environmental Conditions

Roux Associates did not identify evidence of CRECs in connection with the current and historical operations at the Site or nearby properties.

6.4 Historical Recognized Environmental Conditions

Roux Associates did not identify evidence of HRECs in connection with the current and historical operations at the Site or nearby properties.

7. Phase II Limited Soil Investigation

On June 7, 2019, Roux Associates performed a Phase II Limited Soil Investigation at the Site to address disturbed and possibly imported materials along the southern and eastern portions of the Site (REC-1). This section details the activities performed during the limited soil investigation, describes the analytical results obtained for shallow soil samples from the Site, and presents conclusions based on the data obtained.

7.1 Methods of Investigation

7.1.1 Pre-Field Activities

Roux Associates prepared a Site-specific Health and Safety Plan (HASP) to identify potential significant risks and hazards that could have been encountered during implementation of the scope of work. Prior to the start of fieldwork, field workers acknowledged their familiarity with all safety procedures and indicated their intent to follow the HASP by signing the HASP following a tailgate safety meeting.

Roux Associates notified Underground Service Alert (USA) of intended subsurface work at the Site at least 48 hours prior to fieldwork by updating DigAlert ticket number A191280457.

7.1.2 Soil Sampling Methodology and Sample Collection

Soil sampling locations were selected along the southern and eastern portions of the Site to address fill materials suspected at the Site (Figure 3). Specifically,

- Two borings (SS-1 and SS-2) were placed at the northeastern corner of the Site in an area characterized by damaged or missing pavement;
- Two borings (SS-3 and SS-4) were placed at the southeastern corner of the Site in an area with higher elevation than the adjacent Winners Circle,
- Three borings (SS-5 through SS-7) were placed within the soil berm that runs along the southern edge of the Site; and,
- One boring (SS-8) was placed near the central portion of the Site.

On June 7, 2019, Roux Associates personnel collected soil samples from all eight borings using hand tools. Discreet samples were collected from all borings at depths of 0.5 and 1.5 feet bgs. At boring locations covered with paving, asphalt was removed prior to collecting samples with a mechanical hand auger; asphalt thicknesses ranged from approximately 2 to 4 inches. Once the asphalt was removed, the hand auger was advanced and soil samples were collected directly into laboratory-supplied glass jars. The samples were then labeled and placed on ice. At boring locations situated in landscaped areas, grass was removed from the boring location prior to advancing the hand auger. Following sample collection, all borings were backfilled using native soil material, and in paved areas the boring was patched using asphalt cold patch to match the existing grade.

Soils encountered generally consisted of silts and sands. Visual cues did not suggest evidence of contamination for any of the shallow or deeper samples collected. Between all boring locations, the hand auger bucket was decontaminated using Alconox detergent and deionized water and paper towels. A “dry-wipe” decontamination method was employed during the entire Phase II Limited Soil Investigation, and no investigation-derived waste was generated.

7.1.3 Laboratory Analyses

A total of 16 soil samples were collected during this investigation, including eight "shallow" samples from 0.5-feet bgs, and eight "deeper" samples from 2-feet bgs. All 16 samples were transported under chain-of-custody protocol to Enthalpy Analytical, Inc. (Enthalpy) of Orange, California, a California state-certified fixed laboratory, and submitted for potential laboratory analysis on the day of collection. All shallow soil samples were analyzed for Title 22 Metals using United States Environmental Protection Agency (USEPA) Methods 6010B and 7471A. Additionally, one randomly selected shallow sample (SS-2-0.5) also was analyzed for Total Petroleum Hydrocarbons (TPH) using USEPA method 8015M and Volatile Organic Compounds (VOCs) using USEPA Method 8260B. All deeper samples were held by the laboratory pending laboratory results of the shallow soil samples. The analytical results are attached as Appendix K and are presented in Table 1.

7.2 Results

Reported soil metals, TPH, and VOC concentrations were compared to applicable and available published screening levels, including USEPA Regional Screening Levels (RSLs) for residential soil, the Department of Toxic Substances Control (DTSC) Human Health Risk Assessment (HHRA) Human and Ecological Risk Office (HERO) Note Number 3 - Soil Screening Levels (SLs) for Residential Soil, and/or San Francisco Regional Water Quality Control Board (SF-RWQCB) Environmental Screening Levels (ESLs). Metals concentrations were also compared with background concentrations identified in California soils.

A summary of the soil laboratory results are presented in Table 1 and presented below:

- **Metals**: California Title 22 Metals were analyzed for the eight shallow samples (SS-1-0.5 through SS-8-0.5) collected at the Site. Antimony, arsenic, barium, cadmium, chromium, cobalt, copper, lead, molybdenum, nickel, vanadium, and zinc were reported in one or more samples above laboratory method reporting limits (MRLs). With the exception of arsenic, concentrations of all Title 22 Metals were below applicable screening levels.
    - **Arsenic**: Concentrations of arsenic in shallow soils analyzed from the Site ranged from 2.99 milligrams per kilogram (mg/kg) to a maximum of 11.7 mg/kg. These concentrations exceed the USEPA RSL of 0.68 mg/kg, the DTSC HERO Note 3 residential soil SL of 0.11 mg/kg, and the SF-RWQCB ESL of 0.26 mg/kg. However, the measured concentrations of arsenic in Site soils are below the upper-bound background concentration of arsenic in California (DTSC). Therefore, arsenic concentrations are not considered a concern for Site soils.

  Based on the reported concentrations of metals at the Site which, with the exception of arsenic as discussed above, fall below applicable screening levels, metals are not considered a concern for Site soils.
- **TPH**: One randomly selected soil sample, SS-2-0.5, was analyzed for TPH by USEPA Method 8015M. TPH fractions C6-C12 and C13-C22 concentrations were below their respective laboratory MRLs. TPH fraction C23-C44 was reported at a concentration of 73 mg/kg, which is below the applicable SF-RWQCB screening level for motor oil of 12,000 mg/kg. Based on this result, TPH is not considered a concern for Site soils.
- **VOCs**: One randomly selected soil sample, SS-2-0.5, was analyzed for VOCs by USEPA Method 8260B. No VOC constituents were reported above their respective laboratory MRLs in this sample. Based on this result, VOCs are not considered a concern for Site soils.

Soil samples were generally free from staining or odor and no visual indications of subsurface impacts were identified during this investigation.

7.3 Conclusions and Recommendations

Shallow soil samples were collected from eight locations across the Site and were analyzed for California Title 22 metals, TPH (one sample only), and VOCs (one sample only). Laboratory reports showed that Title 22 metals concentrations for all samples analyzed were within acceptable background ranges. Additional analyses showed TPH concentrations below actionable levels and VOC concentrations below laboratory method reported limits (MRLs) for all constituents in the one sample analyzed. Based on the results of the Phase II Limited Soil Investigation, REC-1 has been addressed and Roux Associates does not recommend any additional investigation at the Site.

8. Deviations

Roux Associates performed this assessment in accordance with the generally accepted practices for environmental assessments at the time of implementation, except for the limitations described in Section 1.5. Roux Associates made a reasonable effort to ensure that the information presented in this report is materially complete and accurate.

10. Signature of Environmental Professional

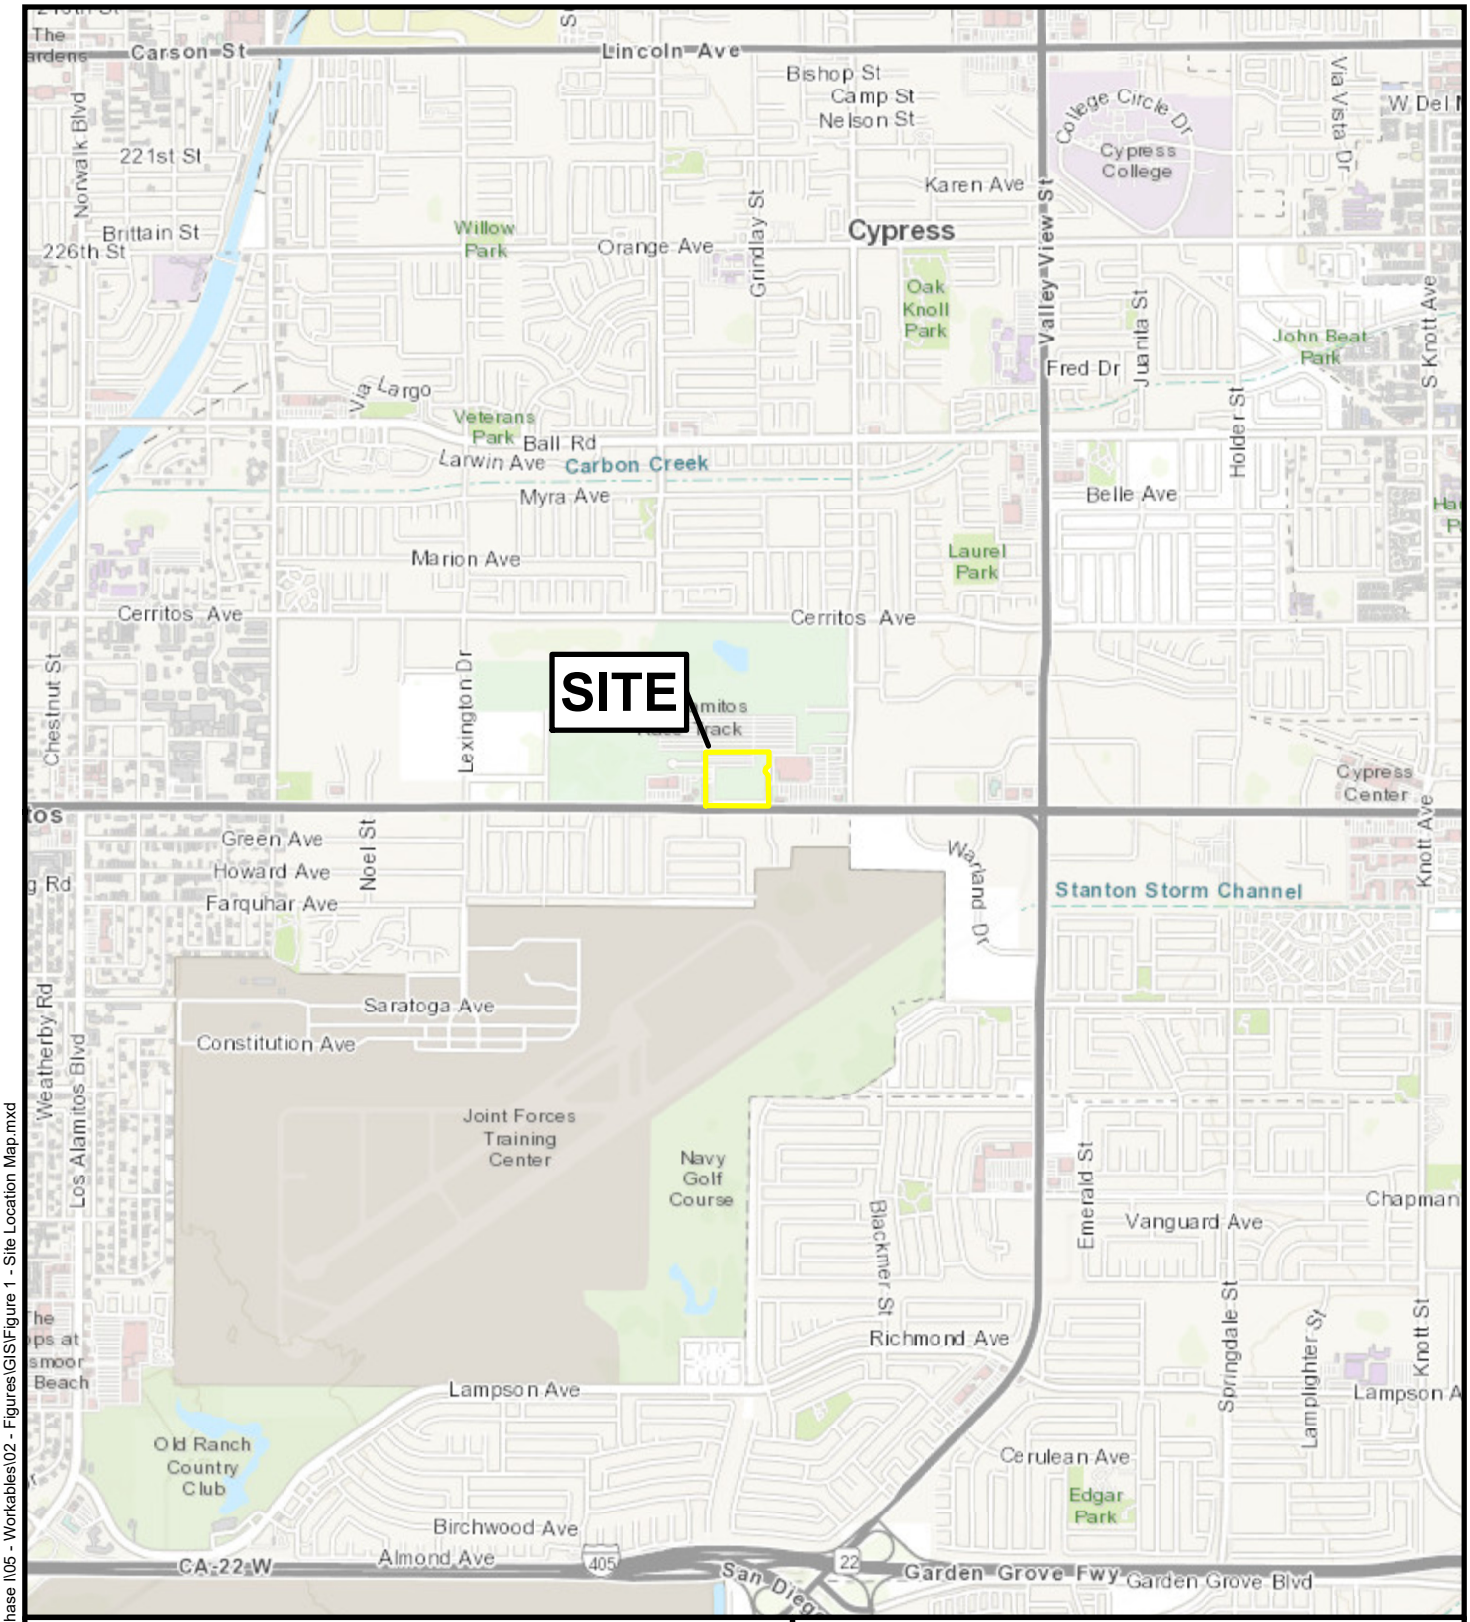
Roux Associates completed a Phase I ESA and Phase II Limited Soil Investigation for the approximately 13.29-acre property located at the northwest corner of Katella Avenue and Winners Circle in the City of Cypress, California. The Phase I ESA was performed in general compliance with the scope and limitations of ASTM E1527-13 of the Site, "We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental professional as defined in §312.10 of 40 CFR 312" and,

"We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312."

Roux Associates performed this Phase I ESA and Phase II Limited Soil Investigation by, or under direct supervision of, the undersigned environmental professionals. Resumes are included in Appendix L - Personnel Qualifications.

Respectfully Submitted,

Mark A. Edwards, GIT
Staff Geologist



Mauricio H. Escobar, PG
Principal Geologist

ASTM E 1527-13 User Questionnaire

In order to qualify for the protection offered under the EPA All Appropriate Inquiry (AAI) Standard, the **User** (entities seeking to use the ASTM E1527-13 Practice to complete an environmental site assessment of the property; i.e. Lenders and/or Borrowers) must provide the following information (if available) to the environmental professional. Failure to provide this information could result in a determination that AAI is not complete. This information should be the collective knowledge of the entities relying on the Phase I. **Please note that you are not being asked to evaluate the property, but rather to provide your knowledge of information on the property.**

Site Name/Address: Northwest corner of Katella Ave. and Winners Circle

Person Interviewed/Title: Elizabeth Cobb - VP of Development Date: 5/8/19

If known, when was the property initially developed? Unknown

If different, when were the current building(s) on the property constructed? No building on-site

1. Environmental cleanup liens that are filed or recorded against the site (40 CFR 312.25).

Did a search of *recorded land title records* (or judicial records where appropriate, see note 1 below) identify any environmental liens filed or recorded against the *property* under federal, tribal, state or local law?

Yes [ ] No [X] If you answer yes, please include an explanation in the space provided below:

_____
_____
_____
_____

2. Activity and land use limitations that are in place on the *property* or that have been filed or recorded in a registry (40 CFR 312.26).

Did a search of recorded *land title records* (or judicial records where appropriate, see note 1 below) identify AULs, such as *engineering controls*, land use restrictions or *institutional controls* that are in place at the *property* and/or have been filed against the *property* under federal, tribal, state, or local law?

Engineering Controls are defined as physical modifications to a site or facility to reduce or eliminate the potential for exposure to hazardous substances or petroleum products in the soil or ground water on the property). *Institutional Controls* are defined as a legal or administrative restriction on the use of, or access to, a site or facility to 1) reduce or eliminate the potential for exposure to hazardous substances or petroleum products in the soil or ground water on the property, or 2) to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment.

Yes [ ] No [X] If you answer yes, please include an explanation in the space provided below:

_____
_____
_____
_____

Note 1 - In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than land title records. In such cases judicial records must be searched for environmental liens and AULs.

3. Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).
Do you have any specialized knowledge or experience related to the *property* or nearby properties?
For example, are you involved in the same line of business as the current or former *occupants* of the *property* or an adjoining *property* so that you would have specialized knowledge of the chemicals and processes used by this type of business?

Yes[ ] No[X] If you answer yes, please include an explanation in the space provided below:

_____
_____
_____
_____

4. Relationship of the purchase price to the fair market value of the *property* if it were not contaminated (40 CFR 312.29).

a) Does the purchase price being paid for this *property* reasonably reflect the fair market value of the *property*?

Yes[X] No[ ] If you answer no, please include an explanation in the space provided below, including whether the lower purchase price is because contamination is known or believed to be present at the *property*?

_____
_____
_____
_____

5. Commonly known or *reasonably ascertainable* information about the *property* (40 CFR 312.30).

Are you aware of commonly known or *reasonably ascertainable* information about the *property* that would help the *environmental professional* to identify conditions indicative of releases or threatened releases? For example, as *User*:

a. Do you know the past uses of the *property*?

Yes[ ] No[X]

b. Do you know of specific chemicals that are present or once were present at the *property*?

Yes[ ] No[X]

c. Do you know of spills or other chemical releases that have taken place at the *property*?

Yes[ ] No[X]

d. Do you know of any environmental cleanups that have taken place at the *property*?

Yes[ ] No[X]

If you answered yes to any of the questions above, please include an explanation in the space provided below:

_____
_____
_____
_____

6. The degree of obviousness of the presence of likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

Based on your knowledge and experience related to the *property,* are there any *obvious* indicators that point to the presence or likely presence of contamination at the *property*?

Yes [ ] No [X] If you answer yes, please include an explanation in the space provided below:

_____
_____
_____
_____

Please provide the following property contact information:

Property Owner: City of Cypress Phone Number: (714) 229-6700

Key Site Personnel: _____ Phone Number: _____

Past Owner: Dr. Allred Phone Number: Unknown

APPENDIX B

Glossary of Terms

GLOSSARY OF KEY TERMS

This appendix provides definitions, description of terms, and a list of acronyms for many of the words used in ASTM E 1527-13. These terms are an integral part of ASTM E 1527-13 and are critical to understanding ASTM E 1527-13 and its use.

DEFINITIONS:

Abandoned Property – *property* that can be presumed to be deserted, or an intent to relinquish possession or control can be inferred from the general disrepair or lack of activity thereon such that a reasonable person could believe that there was an intent on the part of the current *owner* to surrender rights to the *property*.

Activity and Use Limitations – Legal or physical restrictions or limitations on the use of, or access to, a site or facility: *(1)* to reduce or eliminate potential exposure to *hazardous substances* or *petroleum products* in the soil, soil vapor, groundwater, and/or surface water on the *property*, or *(2)* to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment. These legal or physical restrictions, which may include institutional and/or *engineering controls*, are intended to prevent adverse impacts to individuals or populations that may be exposed to *hazardous substances* and *petroleum products* in the soil, soil vapor, groundwater, and/or surface water on the *property*.

Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) – The list of sites compiled by EPA that EPA has investigated, or is currently investigating, for potential hazardous substance contamination for possible inclusion on the National Priorities List.

Construction debris – Concrete, brick, asphalt, and other such building materials discarded in the construction of a building or other improvement to property.

Contaminated public wells – Public wells used for drinking water that have been designated by a government entity as contaminated by toxic substances (for example, chlorinated solvents), or as having water unsafe to drink without treatment.

Contiguous Property Owner Liability Protection – a person may qualify for the *contiguous property owner liability protection* if, among other requirements, such person owns real *property* that is contiguous to, and that is or may be contaminated by *hazardous substances* from other real *property* that is not owned by that person. Furthermore, such person conducted *all appropriate inquiries* at the time of acquisition of the *property* and did not know or have reason to know that the *property* was or could be contaminated by a *release* or threatened *release* from the contiguous *property*. The *all appropriate inquiries* must not result in knowledge of contamination. If it does, then such person did “know” or “had reason to know” of contamination and would not be eligible for the *contiguous property owner liability protection*.

Controlled Recognized Environmental Condition – a *recognized environmental condition* resulting from a past *release* of *hazardous substances* or *petroleum products* that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with *hazardous substances* or *petroleum products* allowed to remain in place subject to the implementation of required controls (for example, *property* use restrictions, *activity and use limitations*, *institutional controls*, or *engineering controls*).

CORRACTS list – a list maintained by EPA of *hazardous waste* treatment, storage, or disposal facilities and other RCRA-regulated facilities (due to past interim status or storage of *hazardous waste* beyond 90 days)

that have been notified by the U.S. Environmental Protection Agency to undertake corrective action under RCRA. The *CORRACTS list* is a subset of the EPA database that manages RCRA data.

Demolition debris – Concrete, brick, asphalt, and other such building materials discarded in the demolition of a building or other improvement to property.

Drum – A container (typically, but not necessarily, holding 55 gal (208 L) of liquid) that may be used to store *hazardous substances* or *petroleum products.*

Dry wells – Underground areas where soil have been removed and replaced with pea gravel, coarse sand, or large rocks. Dry wells are used for drainage, to control storm runoff, for the collection of spilled liquids (intentional and non-intentional), and wastewater disposal (often illegal).

Dwelling – Structure of portion thereof used for residential habitation.

Engineering controls – Physical modifications to a site or facility (for example, capping, slurry walls, or point of use water treatment) to reduce or eliminate the potential for exposure to contaminants in the soil or groundwater on the property.

Environmental lien – A charge, security, or encumbrance upon title to a *property* to secure the payment of a cost, damage, debt, obligation, or duty arising out of response actions, cleanup, or other remediation of *hazardous substances* or *petroleum products* upon a *property*, including (but not limited to) liens imposed pursuant to CERCLA 42 USC § 9607(1) and similar state or local laws.

ERNS list – EPA's emergency response notification system list of reported CERCLA hazardous substance releases or spills in quantities greater than the reportable quantity, as maintained at the National Response Center. Notification requirements for such releases or spills are codified in 40 CFR parts 302 and 355.

Federal Register (FR) – Publication of the Untied States government published daily (except for federal holidays and weekends) containing all proposed and final regulations and some other activities of the federal government. When regulations become final, they are included in the Code of Federal Regulations (CFR), as well as published in the Federal Register.

Fire insurance maps – Maps produced for private fire insurance map companies that indicate uses of properties at specified dates and that encompass the property. These maps are often available in local libraries, historical societies, private resellers, or from the map companies who produced them. See Question 23 of the transaction screen process in Practice E 1528 and 7.3.4.2 of this practice.

Hazardous substance – A substance defined as hazardous pursuant to CERCLA 42 USC § 9601(14), as interpreted by EPA regulations and the courts: "(A) any substance designated pursuant to section 1321(b)(2)(A) of Title 33, (B) any element, compound, mixture, solution, or substance designated pursuant to section 9602 of this title, (C) any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Soil Waste Disposal Act (42 USC § 6921) (but not including any waste the regulation of which under the Solid Waste Disposal Act (42 USC § 6901 *et seq.*) has been suspended by Act of Congress), (D) any toxic pollutant listed under section 1317(a) of Title 33, (E) any hazardous air pollutant listed under section 112 of the Clean Air Act (42 USC § 7412), and (F) any imminently hazardous chemical substance or mixture with respect to which the Administrator (of EPA) has taken action pursuant to section 2606 of Title 15. The term does not include petroleum, including crude oil or any fraction thereof, which is not otherwise specifically listed or designated as a hazardous substance under subparagraphs (A)

through (F) of this paragraph; the term does not include natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas)."

Hazardous waste – Any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Solid Waste Disposal Cat (42 USC § 6921) (but not including any waste the regulation of which under the Solid Waste Disposal Act (42 USC § 6901 *et seq.*) has been suspended by Act of Congress). The Solid Waste Disposal Act of 1980 amended RCRA. RCRA defines hazardous waste, in 42 USC § 6903, as: "a solid waste, or combination of solid wastes, which because of its quantity, concentration, or physical, chemical, or infectious characteristics may – (A) cause, or significantly contribute to an increase in mortality or an increase in serious irreversible, or incapacitating reversible, illness; or (B) pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, or disposed of, or otherwise managed."

Institutional control – A legal or administrative restriction (e.g., deed restriction, restrictive zoning) on the use of, or access to, a site or facility to reduce or eliminate potential exposure to contaminants in the soil or groundwater on the property.

Landfill – A place, location, tract of land, area, or premises used for the disposal of solid wastes as defined by state solid waste regulations. The term is synonymous with the term *solid waste disposal site* and is also known as a garbage dump, trash dump, or similar term.

Local street directories – Directories published by private (or sometimes government) sources that show ownership, occupancy, and/or use of sites by reference to street addresses. Often, local street directories are available at libraries of local governments, colleges or universities, or historical societies.

Material safety data sheet (MSDS) – Written or printed material concerning a hazardous substance which is prepared by chemical manufacturers, importers, and employers for hazardous chemicals pursuant to OSHA's Hazard Communication Standard, 29, CFR 1910.1200.

National Contingency Plan (NCP) – The National Oil and Hazardous Substances Pollution Contingency Plan, found at 40 CFR § 300, that is the EPA's blueprint on how hazardous substances are to be cleaned up pursuant to CERCLA.

National Priorities List (NPL) – List compiled by the EPA, pursuant to CERCLA 42 USC § 9605(a)(8)(B), of properties with the highest priority for cleanup pursuant to EPA's Hazard Ranking System. See 40 CFR Part 300.

Occupants – Those tenants, subtenants, or other persons or entities using the *property* or a portion of the *property.*

Owner – Generally the fee owner of record for the *property*.

Petroleum exclusion – The exclusion from CERCLA liability provided in 42 USC § 9601(14), as interpreted by the courts and EPA: "The term (hazardous substance) does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance under subparagraphs (A) through (F) of this paragraph, and the term does not include natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas)."

Petroleum products – Those substances included within the meaning of the *petroleum exclusion* to CERCLA, 42 USC § 9601(14), as interpreted by the courts and EPA, that is: petroleum, including crude oil or any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance under Subparagraphs (A) through (F) of 42 USC § 9601(14), natural gas, natural gas liquids, liquefied natural gas, and synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas). (The word fraction refers to certain distillates of crude oil, including gasoline, kerosene, diesel oil, jet fuels, and fuel oil, pursuant to *Standard Definitions of Petroleum Statistics*[1]*.)*

Phase I Environmental Site Assessment – The process described in this practice.

Pits, ponds, or lagoons – Man-made or natural depressions in the ground surface that are likely to hold liquids or sludge containing *hazardous substances* or *petroleum products*. The likelihood of such liquids or sludge being present is determined by evidence of factors associated with the pit, pond, or lagoon, including, but not limited to, discolored water, distressed vegetation, or the presence of an obvious wastewater discharge.

Property – The real property that is the subject of the *environmental site assessment* described in this practice. Real property includes buildings and other fixtures and improvement located on the property and affixed to the land.

Property tax files – The files kept for property tax purposes by the local jurisdiction where the property is located and includes records of past ownership, appraisals, maps, sketches, photos, or other information that is reasonable ascertainable and pertaining to the property.

RCRA generators – Those persons or entities that generate hazardous waste, as defined and regulated by RCRA.

RCRA generators list – List kept by the EPA of those persons or entities that generate hazardous wastes as defined and regulated by RCRA.

RCRA TSD facilities – Those facilities at which treatment, storage, and/or disposal of hazardous wastes takes place, as defined and regulated by RCRA.

RCRA TSD facilities list – List kept by the EPA of those facilities at which treatment, storage, and/or disposal of hazardous wastes takes place, as defined and regulated by RCRA.

Recorded land title records – Records of fee ownership, leases, land contracts, easements, liens, and other encumbrances on or of the property recorded in the place where land title records are, by law or custom, recorded for the local jurisdiction in which the *property* is located. (Often such records are kept by a municipal or county recorder or clerk.) Such records may be obtained from title companies or directly from the local government agency. Information about the title to the property that is recorded in a U.S. district court or any place other than where land title records are, by law or custom, recorded for the local jurisdiction in which the property is located, are not considered part of recorded land title records.

Records of emergency release notifications (SARA § 304) – Section 304 of EPCRA or Title III of SARA requires operators of facilities to notify their local emergency planning committee (as defined in EPCRA) and the state emergency response commission (as defined in EPCRA) of any release beyond the facility's boundary of any reportable quantity of any extremely hazardous substance. Often the local fire department is the local emergency planning committee. Records of such notifications are "Records of Emergency Release Notifications" (SARA§ 304).

Report – The written record of a transaction screen process as required by Practice E 1528 or the written report prepared by the environmental professional and constituting part of a "Phase I Environmental Site Assessment," as required by this practice.

Solid waste disposal site – A place, location, tract of land, area, or premises used for the disposal of solid wastes as defined by state solid waste regulations. The term is synonymous with the term *landfill* and is also known as a garbage dump, trash dump, or similar term.

Solvent – A chemical compound that is capable of dissolving another substance and may itself be a *hazardous substance,* used in a number of manufacturing/industrial processes including, but not limited to, the manufacture of paints and coatings for industrial and household purposes, equipment clean-up, and surface degreasing in metal fabricating industries.

State registered USTs – State lists of underground storage tanks required to be registered under Subtitle I, Section 9002 of RCRA.

Sump – A pit, cistern, cesspool, or similar receptacle where liquids drain, collect, or are stored.

TSD facility – Treatment, storage, or disposal facility (*see RCRA TSD facilities*).

Underground storage tank (UST) - Any tank, including underground piping connected to the tank, that is or has been used to contain *hazardous substances* or *petroleum products* and the volume of which is 10% or more beneath the surface of the ground.

USGS 7.5 Minute Topographic Map – The map (if any) available from or produced by the United States Geological Survey, entitled "USGS 7.5 Minute Topographic Map," and showing the property.

Wastewater – Water that (1) is or has been used in an industrial or manufacturing process, (2) conveys or has conveyed sewage, or (3) is directly related to manufacturing, processing, or raw materials storage areas at an industrial plant. Wastewater does not include water originating on or passing through or adjacent to a site, such as storm water flows, that has not been used in industrial or manufacturing processes, has not been combined with sewage, or is not directly related to manufacturing, processing, or raw materials storage areas at an industrial plant.

Zoning/land use records – Those records of the local government in which the *property* is located, indicating the uses permitted by the local government in particular zones within its jurisdiction. The records may consist of maps and/or written records. They are often located in the planning department of a municipality or county.

DEFINITIONS SPECIFIC TO ASTM E 1527-13:

Actual knowledge – The knowledge actually possessed by an individual who is a real person, rather than an entity. Actual knowledge is to be distinguished from constructive knowledge that is knowledge imputed to an individual or entity.

Adjoining properties – Any real property or properties the border of which is contiguous or partially contiguous with that of the property, or that would be contiguous or partially contiguous with that of the property but for a street, road, or other public thoroughfare separating them.

Aerial photographs – Photographs taken from an airplane or helicopter (from a low enough altitude to allow identification of development and activities) of areas encompassing the property. Aerial photographs are often available from government agencies or private collections unique to a local area.

Appropriate inquiry – That inquiry constituting "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined in CERCLA, 42 USC § 9601(35)(B), that will give a party to a *commercial real estate* transaction the *innocent landowner defense* to the CERCLA liability (42 USC § 9601(A) and (B) and § 9607(b)(3)), assuming compliance with other elements of the defense. See Appendix X1.

Approximate minimum search distance – The area for which records must be obtained and reviewed pursuant to Section 7 subject to the limitations provided in that section. This may include areas outside the *property* and shall be measured from the nearest *property* boundary. This term is used in lieu of radius to include irregularly-shaped properties.

Building department records – Those records of the local government in which the property is located indicating permission of the local government to construct, alter, or demolish improvements on the property. Often, building department records are located in the building department of a municipality or county.

Business environmental risk – A risk which can have a material environmental or environmentally-driven financial impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated in this practice. Consideration of *business environmental risk* issues may necessitate that an *environmental professional* address one or more non-scope considerations, some of which are identified in Section 12.

Commercial real estate – Any real property except a dwelling or property with no more than four dwelling units exclusively for residential use (except that a dwelling or property with no more than four dwelling units exclusively for residential use is included in this term when it has a commercial function, as in the building of such dwellings for profit). This term includes, but is not limited to, undeveloped real property and real property used for industrial, retail, office, agricultural, other commercial, medical, or educational purposes; property used for residential purposes that has more than four residential dwelling units; and any property with no more than four dwelling units for residential use when it has a commercial function, as in the building of such dwellings for profit.

Commercial real estate transaction – A transfer of title to or possession of real property or receipt of a security interest in real property, except that it does not include transfer of title to or possession of real property or the receipt of a security interest in real property with respect to an individual dwelling or building containing fewer than five dwelling units, nor does it include the purchase of a lot or lots to construct a dwelling for occupancy by a purchaser, but a commercial real estate transaction does include real property purchased or leased by persons or entities in the business of building or developing dwelling units.

Controlled Recognized Environmental Condition – a *recognized environmental condition* resulting from a past *release* of *hazardous substances* or *petroleum products* that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with *hazardous substances* or *petroleum products* allowed to remain in place subject to the implementation of required controls (for example, *property* use restrictions, *activity and use limitations*, *institutional controls*, or *engineering controls*).

Due diligence – The process of inquiring into the environmental characteristics of a parcel of *commercial real estate* or other conditions, usually in connection with a commercial real estate transaction. The degree and kind of due diligence vary for different properties and differing purposes.

Environmental audit – The investigative process to determine if the operations of an existing facility are in compliance with applicable environmental laws and regulations. This term should not be used to describe Practice E 1528 or this practice, although an environmental audit may include an *environmental site assessment* or, if prior audits are available, may be part of an environmental site assessment.

Environmental professional – A person processing sufficient training and experience necessary to conduct a *site reconnaissance, interviews,* and other activities in accordance with this practice, and from the information generated by such activities, having the ability to develop opinions and conclusions regarding *recognized environmental conditions* in connection with the *property* in question. An individual's status as an environmental professional may be limited to the type of assessment to be performed or to specific segments of the assessment for which the professional is responsible. The person may be an independent contractor or an employee of the *user.*

Environmental site assessment (ESA) – The process by which a person or entity seeks to determine if a particular parcel of real *property* (including improvements) is subject to *recognized environmental conditions.* At the option of the *user*, an environmental site assessment may include more inquiry than that constituting *appropriate inquiry* or, if the user is not concerned about qualifying for the *innocent landowner defense,* less inquiry than that constituting *appropriate inquiry.* An environmental site assessment is both different from and less rigorous than an *environmental audit.*

Fill dirt – Dirt, soil, sand, or other earth, obtained off-site, that is used to fill holes or depressions, create mounds, or otherwise artificially change the grade or elevation of real property. It does not include material that is used in limited quantities for normal landscaping activities.

Hazardous waste/contaminated sites – Sites on which a release has occurred, or is suspected to have occurred, of any *hazardous substance, hazardous waste,* or *petroleum products,* and that release or suspected release has been reported to a government entity.

Historical Recognized Environmental Condition – a past *release* of any *hazardous substances* or *petroleum products* that has occurred in connection with the *property* and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the *property* to any required controls (for example, *property* use restrictions, *activity and use limitations*, *institutional controls*, or *engineering controls*). Before calling the past *release* a *historical recognized environmental condition*, the *environmental professional* must determine whether the past *release* is a *recognized environmental condition* at the time the *Phase I Environmental Site Assessment* is conducted (for example, if there has been a change in the regulatory criteria). If the EP considers the past *release* to be a *recognized environmental condition* at the time the Phase I ESA is conducted, the condition shall be included in the conclusions section of the report as a *recognized environmental condition*.

Innocent landowner defense – That defense to CERCLA liability provided in 42 USC § 9601(35) and § 9607(b)(3). One of the requirements to qualify for this defense is that the party make "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice." There are additional requirements to qualify for this defense.

Interviews – Those portions of this practice that are contained in Section 9 and 10 thereof and address questions to be asked of *owners* and *occupants* of the *property* and questions to be asked of local government officials.

Key site manager – The person identified by the *owner* of a *property* as having good knowledge of the uses and physical characteristics of the property.

Local government agencies – Those agencies of municipal or county government having jurisdiction over the *property.* Municipal and county government agencies include, but are not limited to, cities, parishes, townships, and similar entities.

LUST sites – State lists of leaking underground storage tank sites. Section 9003 (h) of Subtitle I of RCRA gives EPA and states, under cooperative agreements with EPA, authority to clean up releases from UST systems or require owners and operators to do so.

Major occupants – Those tenants, subtenants, or other persons or entities each of which uses at least 40% of the leasable area of the *property* or any anchor tenant when the *property* is a shopping center.

Material threat – A physically observable or obvious threat which is reasonable likely to lead to a release that, in the opinion of the *environmental professional,* is threatening and might result in impact to human health and the environment. An example might include an aboveground storage tank that contains a hazardous substance and which shows evidence of damage. The damage would represent a material threat if it is deemed serious enough that it may cause or contribute to tank integrity failure with a release of contents to the environment.

Obvious – That which is plain or evident; a condition or fact that could not be ignored or overlooked by a reasonable observer while *visually* or *physically observing the property.*

Other historical sources – Any source or sources other than those designated in 7.3.4.1-7.3.4.8 that are credible to a reasonable person and that identify past uses of the property. The term includes, but is not limited to, miscellaneous maps, newspaper archives, and records in the files and/or personal knowledge of the *property owner* and/or *occupants.*

Physical setting sources – sources that provide information about the geologic, hydrogeologic, hydrologic, or topographic characteristics of a *property.*

Practically reviewable – Information that is practically reviewable means that the information is provided by the source in a manner and in a form that, upon examination, yields information relevant to the *property* without the need for extraordinary analysis of irrelevant data. The form of the information shall be such that the user can review the records for a limited geographic area. Records that cannot be feasibly retrieved by reference to the location of the *property* or a geographic area in which the *property* is located are not generally *practically reviewable.* Most databases of public records are *practically reviewable* if they can be obtained from the source agency by the county, city, zip code, or other geographic area of the facilities listed in the record system. Records that are sorted, filed, organized, or maintained by the source agency only chronologically are not generally practically reviewable. Listings in publicly available records which do not have adequate address information to be located geographically are not generally considered practically reviewable. For large databases with numerous facility records (such as RCRA hazardous waste generators and registered underground storage tanks), the records are not *practically reviewable* unless they can be obtained from the source agency in the smaller geographic area of zip codes. Even when information is provided by zip code for some large databases, it is common for an unmanageable number of sites to be

identified within a given zip code. In these cases, it is not necessary to review the impact of all of the sites that are likely to be listed in any given zip code because that information would not be *practically reviewable*. In other words, then so much data is generated that it cannot be feasibly reviewed for its impact on the *property,* it is not *practically reviewable.*

Preparer – The person preparing the *transaction screen questionnaire* pursuant to Practice E 1528, who may be either the user or the person to whom the user has delegated the preparation of the *transaction screen questionnaire.*

Publicly available – Information that is publicly available means that the source of the information allows access to the information by anyone upon request.

Reasonably ascertainable – For purposes of both this practice and Practice E 1528, information that is (1) *publicly available,* (2) obtainable from its source within reasonable time and cost constraints, and (3) *practically reviewable.*

Recognized Environmental Conditions – the presence or likely presence of any *hazardous substances* or *petroleum products* in, on, or at a *property*: (*1*) due to release to the environment; (*2*) under conditions indicative of a *release* to the *environment*; or (*3*) under conditions that pose a *material threat* of a future *release* to the *environment*. *De minimis conditions* are not *recognized environmental conditions*.

Records review – That part that is contained in Section 7 of this practice addresses which records shall or may be reviewed.

Site reconnaissance – That part that is contained in Section 8 of this practice and addresses what should be done in connection with the *site visit.* The site reconnaissance includes, but is not limited to, the *site visit* done in connection with such a Phase I Environmental Site Assessment.

Site visit – The visit to the property during which observations are made constituting the *site reconnaissance* section of this practice and the *site visit* requirement of Practice E 1528.

Standard environmental record sources – Those records specified in 7.2.1.1.

Standard historical sources – Those sources of information about the history of uses of the property specified in 7.3.4.

Standard physical setting source – A current USGS 7.5-minute topographic map (if any) showing the area on which the property is located.

Standard practice(s) – The activities set forth in either and both this practice and Practice E 1528.

Standard sources – Sources of environmental, physical setting, or historical records specified in Section 7 of this practice.

Transaction screen process – The process described in Practice E 1528.

Transaction screen questionnaire – The questionnaire provided in Section 6 of Practice E 1528.

User – The party seeking to use Practice E 1528 to perform an *environmental site assessment* of the *property*. A user may include, without limitation, a purchaser of *property,* a potential tenant of *property,* an *owner* of *property,* a lender, or a property manager.

Visually and/or physically observed – During a *site visit* pursuant to Practice E 1528, or pursuant to this practice, this term means observations made by vision while walking through a *property* and the structures located on it and observations made by the sense of smell, particularly observations of noxious or foul odors. The term "walking through" is not meant to imply that disabled persons who cannot physically walk may not conduct a *site visit;* they may do so by the means at their disposal for moving through the *property* and the structures located on it.

ACRONYMS:

CERCLA – Comprehensive Environmental Response, Compensation and Liability Act of 1980 (as amended, 42 USC § 9601 *et seq.*)

CERCLIS – Comprehensive Environmental Response, Compensation and Liability Information System (maintained by EPA)

CFR – Code of Federal Regulations

CORRACTS – Facilities subject to corrective action under RCRA

EPA – United States Environmental Protection Agency

EPCRA – Emergency Planning and Community Right to Know Act (also known as SARA Title III), 42 USC § 11001 *et seq.*)

ERNS – Emergency response notification system

ESA – Environmental site assessment (different than an *environmental audit*)

FOIA – U.S. Freedom of Information Act (5 USC 552 *et seq.*)

FR – Federal Register

LUST – Leaking underground storage tank

MSDS – Material safety data sheet

NCP – National Contingency Plan

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Roux Associates were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/25/2019 has revealed that there are 2 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/25/2019 has revealed that there are 3 RCRA-SQG sites within approximately 0.25 miles of the target property.

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 01/28/2019 has revealed that there are 7 ENVIROSTOR sites within approximately 1 mile of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 2 EDR Hist Auto sites within approximately 0.125 miles of the target property.

Classification:	Large Quantity Generator

(Continued) **1007200349**

Description: Handler: generates 1,000 kg or more of hazardous waste during any calendar month; or generates more than 1 kg of acutely hazardous waste during any calendar month; or generates more than 100 kg of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month; or generates 1 kg or less of acutely hazardous waste during any calendar month, and accumulates more than 1 kg of acutely hazardous waste at any time; or generates 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulates more than 100 kg of that material at any time

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

Violation Status: No violations found

FINDS:

Registry ID: 110006486873

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting

LOS ALAMITOS RACE TRACK (Continued) **1000101555**

requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110064126565

Environmental Interest/Information System
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the

ENVIROCON INC (Continued) **1000594790**

Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET,

COSTCO WHOLESALE NO 748 (Continued) **1007989088**

WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 1909

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 449

Waste code: D009
Waste name: MERCURY
Amount (Lbs): 20

Waste code: D010
Waste name: SELENIUM

Completed Info:
Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: * Discovery
Completed Date: 08/01/1981
Comments: FACILITY IDENTIFIED ID PHONE BOOK MFG CHEMS IN 1966. AIRCRAFT EQUIP MFG. WASTES NOW SEWERED, RECYCLED OR LDFL

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 10/28/1994
Comments: Database Validation Program confirms NFA for DTSC.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 02/14/1992
Comments: SSI Report was reviewed by Region 4 staff. The facility began operations in 1961 as the Arrowhead Products Div. of Federal-Mogul Corp. In 1983, facility was purchased by Indian Bar Co. In 1987, facility sold to present owner, Vesper Corp. Arrowhead Products manufactured metal and non-metal ducting for aircraft. The facility generates approx. 165 gals. of used degreas. containing 95% PCE, every 90 days. This is stored in 55 gal drums in storage yard. Facility should be permitted. NFA by SMB.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 03/11/2019
Date Data Arrived at EDR: 03/14/2019
Date Made Active in Reports: 04/01/2019
Number of Days to Update: 18

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 03/11/2019
Date Data Arrived at EDR: 03/14/2019
Date Made Active in Reports: 04/01/2019

Next Scheduled EDR Contact: 07/15/2019
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

Data Release Frequency: No Update Planned

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 03/11/2019

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

CERS: CalEPA Regulated Site Portal Data

The CalEPA Regulated Site Portal database combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases, and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

NOT REPORTED
NOT REPORTED
LOS ALAMITOS, CA 90720

TARGET PROPERTY COORDINATES

Latitude (North):	33.804178 - 33° 48' 15.04''
Longitude (West):	118.042085 - 118° 2' 31.51''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	403541.2
UTM Y (Meters):	3740738.2
Elevation:	32 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5633745 LOS ALAMITOS, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

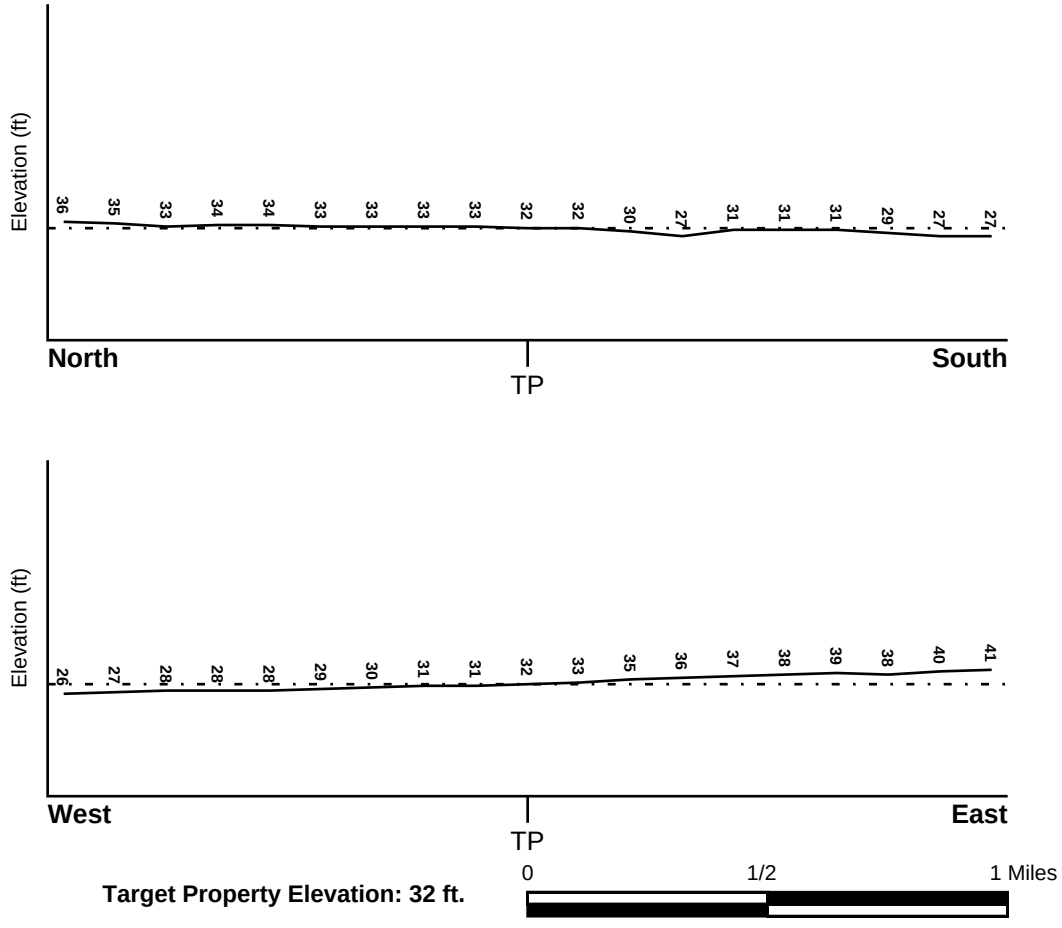
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 32 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06037C2000F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
Not Reported	

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
LOS ALAMITOS	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/2 - 1 Mile West
Site Name:	FEDERAL MOGUL CORP-ARROWHEAD PRODUCTS
Site EPA ID Number:	CAD008302002
Groundwater Flow Direction:	S TO SW ON A REGIONAL BASIS.
Inferred Depth to Water:	15 to 20 feet in the perched aquifer.
Hydraulic Connection:	The shallow perched aquifer is underlain by the Artesia water table aquifer at a depth of 40 to 100 feet. Lower aquifers are separated by confining layers.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information is inferred in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

11	1/2 - 1 Mile NNE	SSW
1G	1/2 - 1 Mile NNE	SSW
2G	1/2 - 1 Mile NNW	SW
3G	1/2 - 1 Mile NNW	Varies
4G	1/2 - 1 Mile NNW	SW
5G	1/2 - 1 Mile ENE	SW
7G	1/8 - 1/4 Mile ESE	Varies

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: SAN EMIGDIO

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	fine sandy loam	Not reported	Not reported	Max: 42 Min: 14	Max: 8.4 Min: 7.9
2	7 inches	61 inches	stratified gravelly loamy coarse sand to very fine sandy loam	Not reported	Not reported	Max: 42 Min: 14	Max: 8.4 Min: 7.9

Soil Map ID: 2

Soil Component Name: HUENEME

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class:

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	27 inches	fine sandy loam	Not reported	Not reported	Max: 42 Min: 14	Max: 8.4 Min: 7.4
2	27 inches	59 inches	stratified sand to silt loam	Not reported	Not reported	Max: 42 Min: 14	Max: 8.4 Min: 7.4

Soil Map ID: 3

Soil Component Name: BOLSA

Soil Surface Texture: silt loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	11 inches	silt loam	Not reported	Not reported	Max: 4 Min: 1.4	Max: 8.4 Min: 7.9
2	11 inches	68 inches	silty clay loam	Not reported	Not reported	Max: 4 Min: 1.4	Max: 8.4 Min: 7.9

Soil Map ID: 4

Soil Component Name: METZ

Soil Surface Texture: loamy sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 14 Min: 4	Max: 8.4 Min: 6.6
2	16 inches	62 inches	stratified sand to fine sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 14 Min: 4	Max: 8.4 Min: 6.6

Soil Map ID: 5

Soil Component Name: Water

Soil Surface Texture: loamy sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class:

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

1. Executive Summary

Walter K. Bowman Real Estate retained DCI Services to perform a Phase I Environmental Site Assessment on the Subject Property, located at APN's #241-091-22, 23, 24, 25 & 26 (northwest corner Katella Avenue and Winners Circle), in Cypress, California.

The purpose of this due diligence investigation was to assess the Subject Property for evidence of hazardous waste contamination and the possibility of underground storage tanks, in an effort to minimize the exposure of the Subject Property owner to liability pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), known generally as the "Innocent Landowner Defense". A rigorous records review and environmental database survey of the Subject Property and surrounding properties were performed. In addition, a site reconnaissance survey was conducted on July 28th, 2006.

Based on prior site usage, interviews with persons having knowledge of the Subject Property, review of available records, and a physical site inspection, it does not appear that the Subject Property, located at APN's #241-091-22, 23, 24, 25 & 26, in Cypress, California, is adversely impaired by hazardous substances or underground storage tanks. The Subject Property is used as a parking lot with no history of any building improvements. There are no hazardous substances present that pose a threat to the environmental integrity of the Subject Property. Any incidental spills or leaks from vehicles parked onsite should diminish with time through natural attenuation processes. Properties under remediation for soil and/or groundwater contamination in the vicinity of the site appear unlikely to impact the Subject Property. DCI Services has no recommendations for further environmental investigations of the Subject Property at this time.

2. Introduction

Walter K. Bowman Real Estate retained DCI Environmental Services to perform a Phase I Environmental Site Assessment (ESA) at the Subject Property located at APN's #241-091-22, 23, 24, 25 & 26, in Cypress, California.

2.1. Purpose

The purpose of this environmental site assessment was intended to identify, to the extent feasible pursuant to the processes prescribed by ASTM E 1527-00, "recognized environmental conditions" in connection with the Subject Property. Recognized environmental conditions include, but are not limited to, the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. This investigation was performed in an effort to minimize the exposure of the Subject Property owner to liability pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), and should constitute "appropriate inquiry" for purposes of CERCLA "innocent landowner defense" as defined in 42 USC § 9601 *et seq*.

2.2. Detailed Scope of Services

DCI Environmental Services will attempt to obtain all reasonably ascertainable information related to the Subject Property that may help identify recognized environmental conditions in connection with the property. As per ASTM E 1527-00, a Phase I ESA includes four components. The first component of the Phase I is a records review, which typically includes the standard Federal and State environmental record sources, additional Regional and Local environmental record sources, physical setting sources, and historical use information.

The second component is the site reconnaissance, which may include, but is not limited to observations of current and past uses of the Subject Property and adjoining properties, visible hydrogeologic and topographic conditions, structures, roads, and water systems. The site reconnaissance attempts to make observations regarding the presence of hazardous substances and petroleum products, storage tanks, polychlorinated byphenols (PCB's), and other potentially hazardous substances or materially threatening practices.

The third component of the Phase I ESA comprises interviews with the Subject Property's owner, key management personnel, commercial occupants, and relevant government officials. The fourth component is a report summarizing the findings of the records review, site reconnaissance, and interviews, and presenting a professional opinion regarding the existence of any recognized environmental conditions in connection with the Subject Property.

2.3. Significant Assumptions

The only significant assumptions made during this investigation were that the information DCI obtained from outside sources (environmental and historical records) was accurate and up-to-date at the time this report was prepared, and that no information was withheld from DCI by any persons with actual knowledge of recognized environmental conditions associated with the Subject Property.

2.4. Limitations and Exceptions

This environmental site assessment report was prepared in accordance with ASTM E 1527-00, and generally accepted practices and principles. The ASTM E 1527-00 standard states, that no environmental site assessment can wholly eliminate uncertainty regarding the potential for recognized environmental conditions in connection with a property. Performance of a Phase I ESA is intended to reduce, but not eliminate, uncertainty regarding the potential for recognized environmental conditions in connection with a property, while recognizing the limits of time and cost. No sampling or analysis of soil, water, building materials, or air is conducted as part of this assessment. This study is not intended to be a definitive investigation of recognized environmental conditions at the Subject Property and is not inclusive of all possibilities. Opinions expressed herein reflect conditions existing at the time of our investigation, and may change at any time.

2.5. Special Terms and Conditions

In accordance with ASTM E 1527-00, this report is considered to be valid up to 180 calendar days from the date it was finished. Any use of this report after such time is not recommended by DCI and is not in accordance with the appropriate standards and practices. All information in this report is considered to be privileged and confidential. DCI shall release the report only to the client. DCI shall not release the report, or make disclosures or notifications to any others, including government agencies, unless so authorized by the client in writing. DCI does not authorize the use of the report or portions thereof by any third party.

2.6. User Reliance

The opinions expressed in this report are based on all reasonable ascertainable information obtained through a rigorous records review, site reconnaissance, and personal interviews. Although DCI believes that the information contained herein is reliable, no guarantee can be made as to the accuracy of information provided to DCI by others.

3. Site Description

3.1. Site Location and Legal Description

The Subject Property, located at APN's #241-091-22, 23, 24, 25 & 26, in Cypress, California, is on the northwest corner of Katella Avenue and Winners Circle. The Subject Property can be located on Thomas Brothers Map (Orange County) page 769, grid J-1. A Site Location Map is included in Appendix A.

3.1. Site Vicinity and Characteristics

The overall character of the surrounding neighborhood is a mixture of commercial and residential developments. Commercial buildings surround the Subject Property (see Site Location Map - Appendix A).

3.2. Current Use of Property

The Subject Property has no building improvements or other permanent structures. The site is used as a parking lot for the adjacent quarter horse racetrack (Los Alamitos Racetrack). The racetrack business has occupied the site since the 1960's.

3.3. Descriptions of Structures, Roads, Other Improvements on the Site

The exterior lot is improved with asphalt pavement, decorative landscaping, and cement sidewalks. Overhead lighting illuminates the lot and two below grade drains direct surface water flows onto Katella Avenue. No aboveground or underground storage tanks, clarifiers, or other substantial sources of hazardous wastes are located on-site. Also, no spills, heavy staining, or illegal dumping of hazardous materials were present. All municipal services — including sewer, water, telephone, gas, and electric are available. Site photographs are included in Appendix C.

3.4. Current Uses of Adjoining Properties

The sites directly adjacent to the Subject Property are described below:

North: A parking lot and horse racetrack (Los Alamitos Racetrack) located at 4961 Katella Avenue.

South: Across Katella Avenue are commercial offices located at 5212 Katella Avenue.

East: Across Winners Circle is a wholesale discount store (Costco).

West: A driveway for the adjacent racetrack (Los Alamitos Racetrack).

4. User Provided Information

The user provided the following information to DCI Environmental Services regarding the Subject Property.

4.1. Title Records

Title record documents were not provided for review by DCI from the user. These records would most likely indicate that the Subject Property was developed from vacant land subdivided from a larger agricultural parcel prior to completion of the parking lot in the late 1960's.

4.2. Environmental Liens or Activity and Use Limitations

No information regarding environmental liens on the Subject Property was provided to DCI. Further, there are no known activity or use limitations in connection with the property.

4.3. Specialized Knowledge

According to ASTM E 1527-00, if the user is aware of any specialized knowledge or experience that is material to recognized environmental conditions in connection with the Subject Property, it is the user's responsibility to communicate any information based on such specialized knowledge or experience to DCI prior to the site reconnaissance. The user has not communicated any specialized knowledge to DCI.

4.4. Valuation Reduction for Environmental Issues

In a transaction involving the purchase of a parcel of real estate, if a user has actual knowledge that the purchase price of the property is significantly less than the purchase price of comparable properties, the user should attempt to identify an explanation for the lower price and to make a written record of such explanation. If the information in this report concludes that there are recognized environmental conditions connected to the Subject Property, such information may be used to explain a valuation reduction of the property.

4.5. Owner, Property Manager, and Occupant Information

The manager of the Subject Property was identified to DCI Services as Mr. Frank Sherren. DCI Services contacted Mr. Sherren who provided the following information regarding the Subject Property:

1) Mr. Sherren indicated that there is no history of hazardous materials use, underground storage tanks, industrial wastewater discharges, or other substantial sources of hazardous wastes located at the Subject Property. Also, there are no regulated air-emissions or hazardous wastes on the Subject Property.

4.6. Reason for Performing Phase I ESA

It is assumed that the reason this Phase I Environmental Site Assessment was requested in order to qualify for the "innocent landowner defense" to CERCLA liability associated with a commercial real estate transaction. Another reason for performing a Phase I ESA might include the need to understand potential environmental conditions that could materially impact the operation of a business associated with the Subject Property.

5. Records Review

5.1. Standard Environmental Record Sources

DCI Environmental Services obtained a report containing (at a minimum) all federal and state environmental databases required by ASTM E 1527-00 to determine any potential recognized environmental conditions connected to the Subject Property from onsite or in the vicinity of the Subject Property. The environmental databases are included in the Environmental Records Search (ERS) in Appendix E.

Several of the databases included in the ERS report contain information not relevant to this investigation, have duplicate information, or contain no sites within a one-mile radius of the Subject Property. Lists of concern are discussed below within their respective minimum search distances defined in ASTM E 1527-00 § 7.2.1.1.

5.1.1. Federal Environmental Record Sources

Federal NPL (within 1.0 miles)

The United States Environmental Protection Agency (US EPA) has compiled this list from the designated CERCLIS list. The National Priority List (NPL) sites are prioritized as to their significant risk to human health and the environment. The list targets those sites to receive remedial funding under the Comprehensive Environmental Response Conservation and Liability Act (CERCLA). The NPL lists the nation's highest priority sites for remedial action. Only NPL sites can receive CERCLA funding. As of March 2006, the Subject Property and adjacent properties were not on the NPL list. There was no NPL site listing located within a one-mile radius of the Subject Property.

Federal CERCLIS (within 1.0 miles)

The EPA has compiled this list of contaminated properties for designation under the Federal Superfund Program pursuant to the Comprehensive Environmental Response Conservation and Liability Act (CERCLA). These sites represent environmental concern for the discharge of hazardous materials by hazardous waste generators, treatment and storage facilities, and hazardous waste disposal sites. As of March 2006, the Subject Property and adjacent properties were not on the CERCLIS list. There was no CERCLIS site listing located within a one-mile radius of the Subject Property.

Federal CERCLIS NFRAP (property and adjoining properties)

As of February 1995, CERCLIS sites designated 'No Further Remedial Action Planned' NFRAP have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the site being placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed these NFRAP sites from CERCLIS to lift unintended barriers to the redevelopment of these properties. As of March 2006, the Subject Property and adjacent properties were not on the NFRAP list.

Federal RCRA CORRACTS (within 1.0 mile)

The Resource Conservation and Recovery Act of 1976 provides for "cradle to grave" regulation of hazardous wastes. RCRA requires regulation of hazardous waste generators, transporters, and storage/treatment/disposal sites. Evaluations of potential violations ranging from manifest requirements to hazardous waste discharges are typically conducted by the US EPA. This database is also known as Corrective Action Report (CORRACTS). If enforcement action is required it is typically delegated to a State Agency. As of March 2006, the Subject Property and adjacent properties were not on the CORRACTS list. There was no CORRACTS site listing located within a one-mile radius of the Subject Property.

Federal RCRA-D non-CORRACTS TSD (within 1.0 miles)

The Environmental Protection Agency regulates the treatment, storage and disposal of hazardous material through the Resource Conservation and Recovery Act (RCRA). All hazardous waste TSD facilities are required to notify EPA of their existence by submitting the Federal Notification of Regulated Waste Activity Form (EPA Form 8700-12) or a state equivalent form as well as part A (EPA form 8700-23) and Part B of their Hazardous Waste Permit Application. As of March 2006, the Subject Property and adjacent properties were not on the RCRA-D list. There was no RCRA-D site listing located within a one-mile radius of the Subject Property.

Federal RCRA-G Generators (within 0.25 miles)

The Environmental Protection Agency regulates generators of hazardous material through the Resource Conservation and Recovery Act (RCRA). All hazardous waste generators are required to notify EPA of their existence by submitting the Federal Notification of Regulated Waste Activity Form (EPA Form 8700-12) or a state equivalent form. The notification form provides basic identification information and specific waste activities. As of March 2006, the Subject Property was not on the RCRA-G list. There are six RCRA-G site listings located within a one-quarter mile radius of the Subject Property. The nearest RCRA-G site listing is at Los Alamitos Race Track (4961 Katella Ave.), adjacent to the north side of the Subject Property. Based on observations of the Subject Property, it is unlikely that any RCRA-G site listing has impacted the environmental integrity of the Subject Property.

Federal ERNS (within 0.25 miles)

The Emergency Response Notification System (ERNS) list is a database of reported releases of oil or other hazardous materials. As of 2005, the Subject Property and adjacent properties were not on the ERNS list. There was no ERNS site listing located within a one-quarter mile radius of the Subject Property.

5.1.2. State Environmental Record Sources

California Annual Work Plan (within 1.0 miles)

The California Health and Safety code, as amended by AB 129, requires the California Environmental Protection Agency to develop a site-specific expenditure plan as the basis for an appropriation of California Hazardous Substance Cleanup Bond Act of 1984 funds. The Agency is also required to update the report annually and report any significant adjustments to the Legislature on an ongoing basis. The plan identifies California hazardous waste sites targeted for cleanup by responsible parties, the California and the Federal Environmental Protection Agency over the next five years. As of January 2006, the Subject Property and adjacent properties were not on the AWP list. There is no AWP site listing located within a one-mile radius of the Subject Property.

California CALSITES (within 1.0 miles)

The State of California CALSITES list combines the former Abandoned Site Program Information System (ASPIS) and the Bond Expenditure Plan databases. CALSITES is the state equivalent to the CERCLIS list and is a compilation of known potential hazardous waste sites. As of January 2006, the Subject Property and adjacent properties were not on the CALSITES list. There was no CALSITE listing located within a one-mile radius of the Subject Property.

California SWIS (within 1.0 miles)

The California Waste Management Board maintains this list pursuant to the Solid Waste Management and Resource Recovery Act of 1972. The list contains the most current inventory of active, inactive, and closed solid waste disposal and transfer facilities. As of January 2006, the Subject Property and adjacent properties were not on the SWIS list. There is one SWIS site listing within a one-mile radius of the Subject Property. However, there is no SWIS site listing within one-half mile of the Subject Property. Considering the current status and distance from the Subject Property, it is unlikely that any SWIS site listing has impacted the environmental integrity of the Subject Property.

California LUST (within 0.5 miles)

The California Water Resources Control Board's Leaking Underground Storage Tank (LUST) database identifies properties with possible environmental hazards. According to the State of California's WRCB LUST list, as of February 2006, the Subject Property and adjacent properties were not on the LUST list. There are seven LUST site listings located within a one-half mile radius of the Subject Property. However, there is only one active LUST site listing within one-quarter mile of the Subject Property. The nearest active LUST site listing is at Los Alamitos Racetrack (477 N. Jefferson St.) approximately 750 feet northeast of the Subject Property. A surface spill released gasoline fuel that impacted soil only. Considering the current status and distance from the Subject Property, it is unlikely that any LUST site listing has impacted the environmental integrity of the Subject Property.

California UST (within 0.25 miles)

The California Water Resources Control Board also provides a list of all permitted underground tanks containing hazardous substances (UST). This database provides information on all registered underground storage tanks. According to information provided, the Subject Property and adjacent properties were not on the UST site list. There are sixteen permitted / registered underground storage tank listings located within a one-half mile radius of the Subject Property. The nearest UST site listing is at Hyster Company (3650 E. Miraloma Ave.) approximately 300 feet southwest of the Subject Property. This UST site listing is not reported as leaking on the LUST database. Considering the current status and distance from the Subject Property, it is unlikely that any UST site listing has impacted the environmental integrity of the Subject Property.

5.2. Additional Environmental Record Sources

Several sources of environmental records, in addition to those required by ASTM E 1527-00 § 7.2.1.1, were obtained by DCI and are described below.

5.2.1. Federal

FEDFAC Federal Facilities

As part of the CERCLA program, federal facilities with known or suspected environmental problems, the Federal Facilities Hazardous Waste Compliance Docket is tracked separately to comply with a Federal Court order. As of March 2006, the Subject Property and adjacent properties were not on the FEDFAC list.

Site Enforcement Tracking System (SETS)

When expanding Superfund monies at a CERCLA (Comprehensive Environmental Response, Compensation and Liability Act) Site, EPA must conduct a search to identify parties with potential financial responsibility for remediation of uncontrolled hazardous waste sites. EPA regional Superfund Waste Management Staff issue a notice letter to the potentially responsible party (PRP). The status field contains the EPA ID number and name of the site where the actual pollution occurred. As of December 2005, the Subject Property and adjacent properties were not on the SETS list.

Enforcement Docket System (DOCKET)/Consent Decree Tracking System (CDETS)

DOCKET tracks civil judicial cases against environmental polluters, while CDETS processes court settlements, called consent decrees. As of March 2006, the Subject Property and adjacent properties were not on the DOCKET list.

Criminal Docket System (C-DOCKET)

The Criminal Docket System is a comprehensive automated system for tracking criminal enforcement actions. C-Docket handles data for all environmental statues and tracks enforcement actions from the initial stages of investigations through conclusion. As of March 2006, the Subject Property and adjacent properties were not on the C-DOCKET list.

Federal Enforcement Dockets

The US EPA, Office of Enforcement, maintains a list of sites under enforcement by the US EPA. As of March 2006, the Subject Property and adjacent properties were not on the FED list.

5.2.2. State

CALSITES - No Further Action

This section includes the sites on the CALSITES list, which have been flagged for no further action by the California Environmental Protection Agency, Department of Toxic Substance Control (DTSC) in accordance with Section 25359.6 of the California Health and Safety Code. As of January 2006, the Subject Property and adjacent properties were not on the NFA CALSITES list.

State of California Office of Planning and Research (CORTESE)

This database is a consolidation of information from various sources. It is maintained by the State Office of Planning and Research and lists potential and confirmed hazardous waste or substances sites. Facilities that have been reported elsewhere in this report will not be included in the listing below. As of January 2006, the Subject Property and adjacent properties were not on the CORTESE list.

Well Investigation Program (WIP)

The Well Investigation Program (AB1803) identifies groundwater that is already contaminated and empowers the California Department of Health Services and local health officers to order ongoing monitoring programs. The focus of this program is to monitor and protect drinking water. The Subject Property and adjacent properties were not on the WIP list.

Drinking Water Program

In order to provide for the orderly and efficient delivery of safe drinking water the California State Department of Health Services collect information on the quality of public drinking water wells under the California Drinking Program. Below, the latest and maximum analyses of contaminants are reported (only positive readings are included). The Subject Property and adjacent properties were not on the WQ list.

5.2.3. Regional

The Regional Sources list consists of sites tracked by the State of California Water Resources Control Board and the Regional Water Quality Control Board for program tracking and inventory of waste management units.

Toxic Releases

The California Regional Water Quality Control Boards or local Department of Health Services keeps track of toxic releases to the environment. These lists are known as Unauthorized Releases, Spill, Leaks, Investigations and Cleanups (SLIC), Non-Tank Releases, Toxics List or similar, depending on the local agency. The Subject Property and adjacent properties were not on the SLIC list.

Toxic Pits

The Toxic Pits Clean-Up Act (Katz Bill) places strict limitations on the discharge of liquid hazardous wastes into surface impoundment, toxic ponds, pits and lagoons. Regional Water Quality Control Boards are required to inspect all surface impoundment annually; in addition, every facility was required to file a Hydrogeological Assessment Report. Recent legislation

allows the Department of Health Services to exempt facilities that closed on or before December 31, 1985, if a showing is made that no significant environmental risk remains (AB1046). Special exemption provisions have been created for surface impoundments that receive mining wastes. As of January 2006, the Subject Property and adjacent properties were not on the TP list.

Solid Waste Assessment Test (SWAT)

This program, provided for under the Calderon legislation (Section 13273 of the Water Code), requires that disposal sites with more than 50,000 cubic yards of waste provide sufficient information to the regional water quality control board to determine whether or not the site has discharged hazardous substances which will impact the environment.

Site operators are required to file Solid Waste Assessment Test reports on a staggered basis. Operators of the 150 highest ranking (Rank 1) sites were required to submit Solid Waste Assessment Tests by July 1, 1987, Rank 2 in 1988 and so on.

Operators submit water quality tests to the Regional Water Quality Control Board, describing surface and groundwater quality and supply; and the geology within 1 mile of the site. Air quality tests are submitted to the local Air Quality Management District or Air Pollution Control District. As of January 2003, the Subject Property and adjacent properties were not on the SWAT list.

5.2.4. Federal and State Operating Permits

Various agencies issue operating permits or regulate the handling, movements, storage and disposal of hazardous materials and require mandatory reporting. The inclusion in this section does not imply that an environmental problem exists presently or has in the past. The sources referenced below have been searched within half a mile radius, unless otherwise stated, of the Subject Property.

SARA SARA Title III,section 313 (TRIS)

Title III of the Superfund Amendments and Reauthorization Act, Section 313, also known as Emergency Planning and Community Right-to-Know Act of 1986 requires owners or operators of facilities with more than 10 employees and are listed under Standard Industrial Classification (SIC) Codes 20 through 39 to report the manufacturing, processing or use of more than a threshold of certain chemical or chemical categories listed under section 313. This database is also known as Toxic Release Information System (TRIS). As of 2005, the Subject Property and adjacent properties were not on the SARA list.

Nuclear Regulatory Commission Licensees

The Nuclear Regulatory Commission, Office of Nuclear Material Safety and Safeguards has been mandated (10 CFR Ch 1.42) to protect the public health and safety, the common defense

and security, and the environment by licensing, inspection, and environmental impact assessment for all nuclear facilities and activities, and for the import and export of special nuclear material. As of January 2006, the Subject Property and adjacent properties were not on the NRC list.

PCB Waste Handlers Database

The U.S. Environmental Protection Agency tracks generators, transporters, commercial stores and/or brokers and disposers of PCB's in accordance with the Toxic Substance Control Act. As of January 2006, the Subject Property and adjacent properties were not on the PCB Waste list.

Permit Compliance System (PCS)

PCS contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS was developed by The U.S. Environmental Protection Agency to meet the information needs of the NPDES program under the Clean Water Act. The PCS tracks permits, compliance and enforcement statues of NPDES facilities. As of January 2006, the Subject Property and adjacent properties were not on the PCS list.

AIRS Facility System

AFS contains emissions and compliance data on air pollution point sources tracked by the U.S. EPA and state and local environmental regulatory agencies. There are seven "criteria pollutants" for which data must be reported to EPA and stored in AIRS: PM10 (particulate matters less than 10 microns in size), carbon monoxide, sulfur dioxide, nitrogen dioxide, lead, reactive volatile organic compounds (VOC), and ozone. AFS replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aeromatic Data (SAROAD). As of January 2006, the Subject Property and adjacent properties were not on the AIRS list.

Section Seven Tracking System (SSTS)

SSTS evolved from the FIFRA and TSCA Enforcement System (FATES). SSTS tracks the registration of all pesticide producing establishments and tracks annually the types and amounts of pesticides, active ingredients, and devices that are produced, sold or distributed each year. As of January 2006, the Subject Property and adjacent properties were not on the SSTS list.

FIFRA/TSCA Tracking System/ National Compliance Database (FTTS/NCDB)

NCDB supports implementation of the Federal Insecticide, Fungicide and Rodenticide Control Act (FIFRA) and the Toxic Substance Control Act (TSCA). As of January 2006, the Subject Property and adjacent properties were not on the FIFRA/TSCA list.

Federal Facilities Information System (FFIS)

Federal Facilities Information System (FFIS) contains a list of all Treatment Storage and Disposal Facilities (TSDs) owned and operated by federal agencies. As of January 2006, the Subject Property and adjacent properties were not on the FFIS list.

Chemicals in Commerce Information System (CICIS)

Chemicals in Commerce Information System (CICIS) contains an inventory of chemicals manufactured in commerce or imported for Toxic Substances Control Act regulated commercial purposes. CICIS allows EPA to maintain a comprehensive listing of over 70,000 chemical substances that are manufactured or imported and are regulated under TSCA. As of January 2006, the Subject Property and adjacent properties were not on the CICIS list.

FINDS EPA Facility Index System

The U.S. Environmental Protection Agency maintains an index system of all facilities, which are regulated or have been assigned an identification number for other purposes. Facilities that have been reported elsewhere in this report will not be included in the listing below. As of January 2006, the Subject Property and adjacent properties were not on the FINDS list.

Hazardous Waste Information System (HWIS)

The Department of Toxic Substance Control, California Environmental Protection Agency, maintains a database keeping track of the movement and disposal of hazardous waste. The data is used to support the Tanner legislation, AB 2948. As of 2005, the Subject Property and contiguous properties were not on the HWIS list.

5.2.5. Other Regional and Local Sources

City of Cypress – Building Permit Department

DCI requested building permits for the Subject Property for information concerning the past use of the property and for the possible installation of UST's, clarifiers and other substantial sources of hazardous wastes that could have impacted soil and groundwater. According to City of Cypress Building Department, Technician Mr. Joel Watson, there is no permit information available in file under Assessor Parcel Numbers. Orange County Assessor Records identify the Subject Property as being completed as part of the Los Alamitos Race Course.

City of Cypress – Planning Department

Records indicate that the Subject Property is approved for commercial use.

CSUN Library

DCI reviewed available Historical Topographic Maps, Sanborn Fire Insurance Rate Maps, and Aerial Photographs to establish and historical use of the Subject Property. Historic Topographic Maps produced in 1939 identify the Subject Property and surrounding properties as vacant or developed agriculturally. Sanborn Fire Insurance Rate Map coverage was not available due to the limited commercial and industrial developments. In an aerial photograph taken in 1952, the Subject Property appears to be part of a larger agricultural field. In an aerial photograph taken in 1989, the parking lot is present with commercial developments surrounding the vicinity of the Subject Property.

Orange County Fire Authority

DCI requested records at the Orange County Fire Authority, for information concerning hazardous materials use records, underground storage tanks and posted violations for the Subject Property. According to personnel, records with the Orange County Fire Authority are filed by postal address. There is no record of hazardous materials use, underground storage tanks or outstanding violations for the Subject Property located at APN's #241-091-22, 23, 24, 25 & 26, in the City of Cypress, California.

Orange County Environmental Health Care Agency

DCI requested records at the Orange County Environmental Health Care Agency for information concerning hazardous materials use and underground storage tanks located at the Subject Property. A request letter with a self-addressed envelope has been submitted however, at this time this agency has not responded to our request. Based on information from the Orange County Health Care Agency Source Control Lists, there is no record of underground storage tanks or industrial site cleanups for the Subject Property located at APN's #241-091-22, 23, 24, 25 & 26, in the City of Cypress, California.

State of California, Department of Health Services

Records indicate that the Subject Property is not licensed through this agency.

Munger Map Book – California-Alaksa Oil & Gas Fields

The Subject Property is not located within any oil field boundary - see Appendix D. Also, there is no identified producing and/or abandoned oil well located within 1,500 feet of the Subject Property.

5.3. Physical Setting Sources

The physical setting of the Subject Property and vicinity is described in terms of topographic, geologic, and hydrogeologic features in the following text.

5.3.1. Topographic Features

DCI reviewed current USGS 7.5 Minute Topographic maps to establish the historical use of the Subject Property. On a Historic Topographic Map produced in 1939, the Subject Property and adjacent properties are vacant land or agriculturally improved. In a topographic map produced in 1964, Katella Avenue appears to be a main thoroughfare. The Los Alamitos Race Course is located to the north and the Los Alamitos Armed Forces Reserve Center is approximately one-quarter mile south of the Subject Property. On a map dated 1981 (Orange map) the Subject Property appears to be fully developed. Adjacent properties appear to be commercial and residential developments. See Topographic Map in Appendix D.

5.3.2. Geologic Features

The Subject Property is located within the Orange County Groundwater Basin at an elevation of approximately 30 feet above mean seal level. The natural materials underlying the site consist of Quaternary age alluvium overlying Pleistocene age and Tertiary age semi-consolidated sedimentary rocks, which overlie Mesozoic age igneous and metamorphic rocks of the basement complex at a depth of about 2,500 feet below ground surface. The underlying alluvium consists primarily of sand, gravel, silts and clay. Also, there appears to be no fill material placed on the Subject Property. The alluvium overlies late Pleistocene and Upper Miocene age sediments. Tertiary sediments underlying the Subject Property are semi-consolidated (non-water bearing) sedimentary rocks. Mesozoic age igneous and metamorphic rocks of the basement underlie the Tertiary age rocks.

5.3.3. Groundwater Hydrogeology

Groundwater flow direction and depth have been determined through groundwater monitoring wells located on the Subject Property. Local groundwater flow direction follows the surface topography, which generally appears to be in a southerly direction. Based on information provided by the California Department of Water Resources, the depth to shallow groundwater in the vicinity of Subject Property was measured at approximately 26 feet above mean sea level. However, this well is over one-quarter mile northwest of the Subject Property. Based on monitoring wells at nearby locations, depth to groundwater beneath the Subject Property is assumed to be over 10 feet below ground surface.

5.4. Historical Use Information of the Property and Adjoining Properties

5.4.1. Aerial Photographs

In an ASCS-USDA aerial photograph taken in 1938, the Subject Property appears to be vacant land as part of a larger parcel. Katella Avenue is constructed. Fairchild Collection aerial photographs taken in 1947 identify the Subject Property as vacant land adjacent to vacant land and fallow agricultural fields. A dirt racetrack and agricultural field are to the west and the Los Alamitos Armed Forces Center is present to the south. Agricultural crops appear to be located across Katella Avenue south from the Subject Property in ASCS-USDA

aerial photographs taken in 1952. The dirt track has some additional buildings, residential dwellings are located to the southwest, and the Los Alamitos Armed Forces Center has extended the airstrip runway. The Subject Property appears to be vacant land adjacent to a parking lot for the Los Alamitos Race Course in a Fairchild Collection aerial photograph taken in 1960. Teledyne Collection aerial photographs taken in 1968 seem to show agricultural fields located at the Subject Property. The Subject Property appears to be a developed parking lot for the Los Alamitos Race Course in Teledyne Collection aerial photographs taken in 1977. There were no apparent changes to the Subject Property or contiguous properties in AMI Collection aerial photographs taken in 1983, USGS aerial photographs taken in 1990 and 1994. In an USGS aerial photograph taken in 2002, the subject property appears to be developed similar to present.

5.4.2. Fire Insurance Maps

Sanborn Fire Insurance Rate Map coverage was not available due to the lack of commercial and/or industrial developments.

5.4.3. Property Tax Files

DCI did not research Property Tax Files for the Subject Property based on the limited history of use.

5.4.4. Recorded Land Title Records

DCI did not research Land Title Records for the Subject Property based on the limited history of use.

5.4.5. USGS 7.5 Minute Topographic Maps

DCI reviewed current USGS 7.5 Minute Topographic maps to establish the historical use of the Subject Property. On a Historic Topographic Map produced in 1939, the Subject Property and adjacent properties are vacant land or agriculturally improved. In a topographic map produced in 1964, Katella Avenue appears to be a main thoroughfare. Los Alamitos Race Course is located to the north and the Los Alamitos Armed Forces Reserve Center is approximately one-quarter mile south of the Subject Property. On a map dated 1981 (Orange map) the Subject Property appears to be fully developed. Adjacent properties appear to be commercial and residential developments. See Topographic Map in Appendix D.

5.4.6. Local Street Directories

DCI did not research Historic Street Directories for the Subject Property located at APN's #241-091-22, 23, 24, 25 & 26, in Cypress, California. Prior to construction of the present development, there was no business tenant identified on the Subject Property.

5.4.7. Building Department Records

DCI requested copies of building permits for the Subject Property for information concerning the past use of the property and for the possible installation of UST's, clarifiers and other substantial sources of hazardous wastes that could have impacted soil and groundwater. According to City of Cypress Building Department, Technician Mr. Joel Watson, there is no permit information available in file under Assessor Parcel Numbers. Orange County Assessor Records identify the Subject Property as being completed as part of the Los Alamitos Race Course.

5.4.8. Zoning/Land Use Records

Records indicate that the Subject Property is zoned for mixed commercial use.

6. Site Reconnaissance

A site reconnaissance of the Subject Property was conducted to look for signs of any recognized environmental conditions at the Subject Property and its adjoining properties.

6.1. Methodology and Limiting Conditions

A site reconnaissance generally consists of a brief meeting onsite with the property owner (or owner's representative), a walk through visual inspection of the property itself, and a visual inspection of the interior and exterior of any existing onsite structures. Conclusions drawn from the site reconnaissance regarding recognized environmental conditions are only based on surface evidence. This conclusion does not apply if surface evidence was concealed from view or altered beyond recognition. A subsurface investigation to detect the presence of UST's, hazardous substances, or petroleum products was not part of this investigation.

6.2. General Site Setting

All sides of the parcels are open to vehicular traffic. The Subject Property is level terrain currently developed as a parking lot. The site is improved with asphalt pavement, decorative landscaping, and cement sidewalks. There are no hazardous substances present that pose a threat to the environmental integrity of the Subject Property. Also, no spills, heavy staining, or illegal dumping activities were observed on the Subject Property or adjacent parcels. See Appendices.

6.3. Exterior Observations

DCI found no adverse environmental impact due to hazardous materials use and storage on the Subject Property. The exterior lot is covered with asphalt composition, cement slab, and decorative landscaping that appears to be in good condition overall. No significant evidence

of releases, such as large stains or corrosion, was observed at the Subject Property. Migration of hazardous substances from off-site sources does not appear to be a concern.

6.3.1. Hazardous Substances and Petroleum Products (Containers)

Hazardous substances are not permitted for use at the Subject Property. There was no evidence of illegal dumping of chemicals or suspicious containers identified on the Subject Property.

6.3.2. Underground Storage Tanks

During the site reconnaissance, exposed and accessible areas of the Subject Property were visually inspected for signs of underground storage tanks. After an interview with the representative of the Subject Property, records search with local authorities, and visual inspection completed, there appeared to be no underground storage tanks at the Subject Property.

6.3.3. Polychlorinated Byphenols (PCBs)

No private transformer is located on the Subject Property. Transformers are a concern because of the presence of PCB's in the coolant of some earlier models. Current (new) transformers utilize mineral oil as the insulating or cooling fluid exclusively. In a recent statistically-valid test of over 20,000 distribution transformers, it was determined that the concentration of PCB's in mineral oil was less than fifty parts per million in over ninety-six percent of the transformer units tested.

6.3.4. Pits, Ponds, or Lagoons

DCI did not locate any pits, ponds, or lagoons on the Subject Property and directly adjacent properties currently present or in past historical data.

6.3.5. Stained Soil or Pavement

DCI did not observe any stained soils on the Subject Property and adjacent properties currently present or in past historical data.

6.3.6. Stressed Vegetation

DCI did not observe distressed vegetation on the Subject Property and adjacent properties currently present or in past historical data.

6.3.7. Solid Waste

No solid waste dump container was observed on the Subject Property. No spills, staining, odors, or suspicious containers suggestive of the improper disposal of hazardous materials were

present. DCI Services observed no vegetative stress or staining suggestive of illegal hazardous materials dumping.

6.3.8. Wastewater Treatment / Discharge

DCI did not observe any industrial wastewater discharge sources, such as clarifiers or sumps, on the Subject Property and adjacent properties. No industrial waste discharge permit is on file with the Orange County Health Care Agency.

6.3.9. Septic Systems

DCI did not observe any septic tanks located on the Subject Property. Local sewers permits are available through the City of Cypress Building Department.

6.3.10. Wells

DCI did not observe any Wells (monitoring, water, oil and/or gas) located on the Subject Property and adjacent properties.

6.4. Interior Observations

DCI did not observe any buildings located on the Subject Property.

6.4.1. Heating / Cooling (gas, electric, steam boiler with furnace, etc.)

Natural gas fueled appliances are not located on the Subject Property.

6.4.2. Stains or Corrosion

DCI did not observe any heavy staining or corrosion located on the Subject Property.

6.4.3. Drains and Sumps

DCI did observe two subsurface drains located on the Subject Property. Surface flows in the parking lot are directed southwest onto Katella Avenue.

6.4.4. Asbestos Containing Materials (ACM's)

Sampling for Asbestos Containing Materials (ACM's) was not a part of the scope of services for this report. It should be noted that both friable and non-friable forms of ACM might be present in building materials used prior to 1976. Based on the lack of construction, ACM's are unlikely to be present.

7. Interviews

7.1. Interview with Owner

The owner's representative of the Subject Property was identified to DCI Services as Mr. Frank Sherren. Mr. Sherren indicated that he is responsible for the day-to-day management of the Subject Property.

7.2. Interview with Site Representative

The site representative (Walter) was interviewed on the Subject Property. Walter stated that; "hazardous substances are not permitted for use at the Subject Property".

7.3. Interviews with Occupants

There were no occupants to interview located on the Subject Property.

7.4. Interviews with Local Government Officials

Cypress City Technician Mr. Joel Watson assisted DCI personnel with file research on past development for the Subject Property. Mr. Watson indicated that there is no building permit information in-file for the Subject Property located at APN's #241-091-22, 23, 24, 25 & 26.

8. Findings and Opinions

Based on prior site usage, interviews with persons having knowledge of the Subject Property, review of available records, and a physical site inspection, it does not appear that the Subject Property, located at APN's #241-091-22, 23, 24, 25 & 26, in Cypress, California, is adversely impaired by hazardous substances or underground storage tanks. The Subject Property is used as a parking lot with no history of any building improvements. There are no hazardous substances present that pose a threat to the environmental integrity of the Subject Property. Any incidental spills or leaks from vehicles parked onsite should diminish with time through natural attenuation processes. Properties under remediation for soil and/or groundwater contamination in the vicinity of the site appear unlikely to impact the Subject Property. DCI Services has no recommendations for further environmental investigations of the Subject Property at this time.

9. Conclusions

We have performed a Phase I Environmental Site Assessment, in conformance with the scope and limitations of ASTM Practice E 1527, at APN's #241-091-22, 23, 24, 25 & 26, in Orange, California. Any exceptions to, or deletions from, this practice are described in Section 10 of this report. This assessment has revealed no recognized environmental conditions in connection with the Subject Property.

10. Deviations

Any additions, deletions, or deviations from the standard practice outlined in ASTM E 1527-00 are noted here.

11. Additional Services

No additional services outside the Detailed Scope of Services described in Section 2.2 were employed.

ENVIRONMENTAL RECORD SEARCH

LISTED BY SOURCE

INTRODUCTION

BBL has used its best effort but makes no claims as to the completeness or accuracy of the referenced government sources or the completeness of the search. Our records are frequently updated but only as current as their publishing date and may not represent the entire field of known or potential hazardous waste or contaminated sites. To ensure complete coverage of the subject property and surrounding area, sites may be included in the list if there is any doubt as to the location because of discrepancies in map location, zip code, address, or other information in our sources. For additional information call 858 793-0641.

In accordance with ASTM E-1527-05, the following government sources have been searched for sites at the street address, unless otherwise stated, of the subject location.

FEDERAL SOURCES

NPL National Priority List

EPA has prioritized sites with significant risk to human health and the environment. These sites receive remedial funding under the Comprehensive Environmental Response Conservation and Liability Act (CERCLA).

No listings within 1 mile radius of the subject site.

CERCLIS Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS is a database used by the EPA to track activities conducted under the Comprehensive Environmental Response and Liability Act CERCLA (1980) and the amendment the Superfund Amendments and Reauthorization Act SARA (1986).

Sites to be included are identified primarily by the reporting requirements of hazardous substances Treatment, Storage and Disposal (TSD) facilities and releases larger than specific Reportable Quantities (RQ), established by EPA.

Using the National Oil and hazardous Substance Pollution Contingency Plan(National Contingency Plan) the EPA set priorities for cleanup.

The EPA rates National Contingency Plan sites according to a quantitative Hazard Ranking System (HRS) based on the potential health risk via any one or more pathways: groundwater, surface water, air, direct contact, and fire/explosion.

The EPA and state agencies seek to identify potentially responsible parties(PRP) and ultimately Responsible Parties (RP) who can be required to finance cleanup activities, either directly or through reimbursement of federal Superfund expenditures.

No listings within 1 mile radius of the subject site.

NFRAP No Further Remedial Action Planned sites (CERCLIS)

As of February 1995, CERCLIS sites designated 'No Further Remedial Action Planned' NFRAP have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the site being placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration.

EPA has removed these NFRAP sites from CERCLIS to lift unintended barriers to the redevelopment of these properties. This policy change is part of EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens promote economic redevelopment of unproductive urban sites.

This list has been researched within 1 mile radius of the subject site.

Site: FEDERAL-MOGUL CORP ARROWHEAD P
Address: 4411 KATELLA AVE
City: LOS ALAMITAS
Map Loc: 23 - about .79 mile W of the subject
Status: EPA ID#: CAD008302002

Discovery of this Hazardous Waste site was brought to EPA's attention on 12/01/87. The Preliminary Assessment, consisting of collecting and documenting existing information about the source and nature of the site hazard was completed on 03/22/90. On 06/07/91, a screening Site Inspection was completed, collecting site data and samples to characterize the severity of the hazard to support the ranking and enforcement of the clean-up required.

FEDFAC Federal Facilities

As part of the CERCLA program, federal facilities with known or suspected environmental problems, the Federal Facilities Hazardous Waste Compliance Docket is tracked separately to comply with a Federal Court order.

No listings within 1 mile radius of the subject site.

ERNS Emergency Response Notification System

The ERNS is a national computer database used to store information on unauthorized releases of oil and hazardous substances. The program is a cooperative effort of the Environmental Protection Agency, the Department of Transportation Research and Special Program Administration's John Volpe National Transportation System Center and the National Response Center.

There are primarily five Federal statutes that require release reporting the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) section 103; the Superfund Amendments and Reauthorization Act (SARA) Title III Section 304; the Clean Water Act of 1972(CWA) section 311(b)(3); and the Hazardous Material Transportation Act of 1974(HMTA section 1808(b).

No listings within a quarter of a mile radius of the subject site.

HMIRS Hazardous Material Incident Report System

The Hazardous Material Report Incident Report Subsystem HMIRS of the Research and Special Programs Administration (RSPA) Hazardous Material Information System was established in 1971 to fulfill the requirements of the Federal hazardous material transportation law. Part 171 of Title 49, Code of Federal Regulations (49 CFR) contains the incident reporting requirements of carriers of hazardous materials. An unintentional release of hazardous materials meeting the criteria set forth in Section 171.16, 49 CFR, must be reported on DOT Form 5800.1. The data from the reports received are subsequently entered in the HAZMAT database.

No listings within the street address of the subject site.

SETS Site Enforcement Tracking System (SETS)

When expanding Superfund monies at a CERCLA (Comprehensive Environmental Response, Compensation and Liability Act) Site, EPA must conduct a search to identify parties with potential financial responsibility for remediation of uncontrolled hazardous waste sites. EPA regional Superfund Waste Management Staff issue a notice letter to the potentially responsible party (PRP). The status field contains the EPA ID number and name of the site where the actual pollution occurred.

No listings within a quarter of a mile radius of the subject site.

DO Enforcement Docket System (DOCKET)/Consent Decree Tracking System (CDETS)

DOCKET tracks civil judicial cases against environmental polluters, while CDETS processes court settlements, called consent decrees.

No listings within a quarter of a mile radius of the subject site.

CD Criminal Docket System (C-DOCKET)

The Criminal Docket System is a comprehensive automated system for tracking criminal enforcement actions. C-Docket handles data for all environmental statues and tracks enforcement actions from the initial stages of investigations through conclusion.

No listings within a quarter of a mile radius of the subject site.

RCRA RCRA Violators List (CORRACTS)

The Resource Conservation and Recovery Act of 1976 provides for "cradle to grave" regulation of hazardous wastes. RCRA requires regulation of hazardous waste generators, transporters, and storage/treatment/disposal sites. Evaluation to potential violations, ranging from manifest requirements to hazardous waste discharges, is typically conducted by the US EPA. This database is also known as Corrective Action Report (CORRACTS)

If enforcement is required, it is typically delegated to a state agency.

No listings within half of a mile radius of the subject site.

RCRA-D Resource Conservation and Recovery Information System - Treatment, Storage & Disposal

The Environmental Protection Agency regulates the treatment, storage and disposal of hazardous material through the Resource Conservation and Recovery Act (RCRA). All hazardous waste TSD facilities are required to notify EPA of their existence by submitting the Federal Notification of Regulated Waste Activity Form (EPA Form 8700-12) or a state equivalent form as well as part A (EPA form 8700-23) and Part B of their Hazardous Waste Permit Application.

Status Codes:	I	Incinerator
	T	Storage/Treatment facility other than Incinerator
	D	Land Disposal Facility

No listings within 1 mile radius of the subject site.

FD Federal Enforcement Dockets

The US EPA, Office of Enforcement, maintains a list of sites under enforcement by the US EPA.

No listings within a quarter of a mile radius of the subject site.

CALIFORNIA STATE SOURCES

AW Annual Work Plan (previously known as Bond Expenditure Plan)

The California Health and Safety code, as amended by AB 129, requires the California Environmental Protection Agency to develop a site-specific expenditure plan as the basis for an appropriation of California Hazardous Substance Cleanup Bond Act of 1984 funds.

The Agency is also required to update the report annually and report any significant adjustments to the Legislature on an ongoing basis. The plan identifies California hazardous waste sites targeted for cleanup by responsible parties, the California and the Federal Environmental Protection Agency over the next five years.

Status Codes:	BKLG	Backlog, Potential Annual Work Plan Site
	AWP	Active Annual Work Plan site
	COM	Certified, but still in Operation & Maintenance mode
	CERT	Certified after remediation
	DLST	Delisted from the AWP
	REFRC	Former AWP site referred to RCRA
	REFRW	Former AWP site referred to the Regional Water Quality Board

No listings within 1 mile radius of the subject site.

CALS CALSITES

The Site Mitigation and Brownfields Reuse Database (CALSITES) identifies certain potential hazardous waste sites. The identification of these sites were generally not made via sampling and site characterization, they were made as a result of file searches and windshield surveys. Some of the sites may have had a site inspection with sampling.

The information has been compiled into this database by the California Environmental Protection Agency, Department of Toxic Substance Control (DTSC) in accordance with Section 25359.6 of the California Health and Safety Code.

This database was previously known as The Abandoned Sites Program Information System ASPIS.

Status Codes:	PEARL	Preliminary Endangerment Assessment Required,Low priority
	PEARM	Preliminary Endangerment Assessment Required,Medium priority
	PEARH	Preliminary Endangerment Assessment Required,High priortiy
	SSR	Site Screening Required
	HRR	Hazard Ranking Required
	PRPR	Potential Responsible Party Search Required
	EPA	EPA is the lead agency
	RCRA	Mitigated under the RCRA permitting program
	RWQCB	Mitigated under the lead of the Regional Water Quality Boar
	CNTY	County lead
	OAL	Other Agency lead

No listings within half of a mile radius of the subject site.

VCP Voluntary Cleanup Program

This category contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have requested that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

Status Codes:	VCP	Property with either confirmed or unconfirmed releases and project proponents have requested that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSCs costs.
	VCOMP -	The scope of work in the VCP Agreement has been completed.
	PEAP	Preliminary Endangerment Assessment in Progress.
	NFA	No Further Action Required
	VTERM	VCP agreement Terminated was terminated prior to the completion of the scope of work in the agreement.
	BZHW	Border Zone/Hazardous Waste Properties chapter 6.5 of the Health and Safety Code, commencing with section 25220.
	COM	Certified, but still in Operation & Maintenance mode
	CERT	Certified after remediation
	HWDLU	Hazardous Waste Disposal Land Use with a voluntary deed restrictions.
	NA	CalMortgage Properties. DTSC is conducting a Phase I Assessment

No listings within half of a mile radius of the subject site.

FE Properties Needing Further Evaluation

This category of The Site Mitigation and Brownfields Reuse Program Database (SMBRPD), contains properties that are suspected of being contaminated. These are unconfirmed contaminated properties that need to be assessed using the PEA process.

Status Codes:	PEAP	Preliminary Endangerment Assessment (PEA) in Progress
	PEAR	Preliminary Endangerment Assessment (PEA) is Required
	RR	Removal Action Required

No listings within half of a mile radius of the subject site.

REF Referred Unconfirmed Properties

This category of The Site Mitigation and Brownfields Reuse Program Database (SMBRPD), contains properties where contamination has not been confirmed and which were determined as not requiring direct DTSC Site Mitigation Program action or oversight. Accordingly, these sites have been referred to another state or local regulatory agency.

Status Codes:	REFRW	Referred to Regional Water Quality Control Board
	REFRC	Referred to DTSC's Hazardous Waste Program (RCRA).
	REFOA	Referred to other agencies.

No listings within half of a mile radius of the subject site.

CALS CALSITES - No Further Action

This section includes the sites on the Calsite list, which have been flagged for no further action by the California Environmental Protection Agency, Department of Toxic Substance Control (DTSC) in accordance with Section 25359.6 of the California Health and Safety Code.

Status Codes: NFA No Further Action for DTSC
RED Closed Case marked for removal from list

This list has been researched within a quarter of a mile radius of the subject site.

CORTESE State of California Office of Planning and Research

This database is a consolidation of information from various sources. It is maintained by the State Office of Planning and Research and lists potential and confirmed hazardous waste or substances sites.

Facilities that have been reported elsewhere in this report will not be included in the listing below.

Status Codes: WRCBT Tank leaks.
Compiled by Water Resource Control Board
DHS1 Abandoned hazardous waste site.
Compiled by Toxic Substance Control Div. of DHS
DHS2 Contaminated public water drinking wells serving less than 200 connections.
Compiled by Env. Health Div. of DHS
DHS3 Contaminated public water drinking wells serving more than 200 connections
DHS5 Sites pursuant to section 25356 of the Health and Safety Code (see BEP)
CWMB Solid waste disposal sites with known migration of hazardous waste

No listings within half of a mile radius of the subject site.

LUST Leaking Underground Storage Tanks - California State

The Leaking Underground Storage Tanks Information System is maintained by the State Water Resource Board pursuant to Section 25295 of the Health and Safety Code.

Status Codes: 0 No action
1 Leak being confirmed
3A Prel site assessment workplan submitted
3B Prel site assessment underway
5C Pollution characterization

5R	Remediation plan
7	Remedial action underway
8	Post remedial action monitoring
9	Case closed
P	Case purged from agency list

This list has been researched within half of a mile radius of the subject site.

Site: AFRC BLDG 27,34,158,43,25,2,37
Address: AFRC LOS ALAMITOS
City: LOS ALAMITOS
Map Loc: 20 - about .55 mile SW of the subject
Status: 5C - Pollution characterization.
It was discovered during tank closure. The aquifer is potentially impacted. The case, 05900572, is managed by the Regional Water Quality Board.

EMGR. GENERATOR FUEL SUPPLY TANK, 1-2,000 GAL STEEL, UST REMOVED AND SITE RESTORED TO GR

ADE

Site: AFRC POST HEADQUARTERS
Address: AFRC LOS ALAMITOS BLD #57
City: LOS ALAMITOS
Map Loc: 21 - about .55 mile SW of the subject
Status: INACT -

Site: AFRC FUEL FARM #89
Address: AFRC LOS ALAMITOS BLD#201
City: LOS ALAMITOS
Map Loc: 21 - about .55 mile SW of the subject
Status: 3B - Prelim Site Assessment underway.
The aquifer is potentially impacted. The free product floating on the water table will be removed. The site is remediated by vacuum extracting by means of pump or blowers. The case, 05900553, is managed by the Regional Water Quality Board.

FORMER JP-4 & AV GAS TANK FARM, 3 REMOVED-210,000 GAL USTS 87(A), 88(B) & 89(C)

Site: AFRC BUILDING 244
Address: AFRC LOS ALAMITOS BLD#244
City: LOS ALAMITOS
Map Loc: 21 - about .55 mile SW of the subject
Status: 1 - Leak being confirmed.
It was discovered during tank closure. Only the soil is impacted. The case, 05901297, is managed by the Regional Water Quality Board.

GASOLINE STATION, 3-10,000 GAL. FIBERGLASS USTS & 500 GAL. WASTE UST

Site: ORANGE CO FIRE STATION # 17
Address: 4991 CERRITOS AVE
City: CYPRESS
Map Loc: 19 - about .53 mile NW of the subject
Status: 9 - Case Closed.
A release from a tank, of Diesel was reported. It was, and stopped by closing the tank. The case, 05902092, is managed by a Local agency.

SWIS Solid Waste Information System

As legislated under the Solid Waste Management and Resource Recovery Act of 1972, the California Waste Management Board maintains lists of certain facilities, i.e. Active solid waste disposal sites, Inactive or Closed solid waste disposal sites and Transfer facilities.
This list has been researched within 1 mile radius of the subject site.

Site: ARMED FORCES RESERVE CTR LF
Address: LEXINGTON & FARQUHART
City: LOS ALAMITOS
Map Loc: 22 - about .79 mile W of the subject
Status: id: 30-AB-0029
Unit: 01
Activity: SOLID WASTE DISPOSAL SITE
Status: CLOSED (Operational)
PERMITTED (Regulatory)
Inspection: QUARTERLY

Waste: CONSTRUCTION/DEMOLITION,GREEN MATERIALS,INDUSTRIAL,INERT,METALS,MIXED MU
NICIPAL,TIRES

Acreage: 19 (total)
Closure: 12/31/88 ESTIMATED
Owner: CALIFORNIA ARMY NATIONAL GUARD

WIP Well Investigation Program

The Well Investigation Program (AB1803) identifies groundwater that is already contaminated and empowers the California Department of Health Services and local health officers to order ongoing monitoring programs. The focus of this program is to monitor and protect drinking water.
This list has been researched within 1 mile radius of the subject site.

Site: WELL 01 dhs3
Address: LOS ALAMITOS RACE COURSE
City: 04S/11W-20R02 S
Map Loc: 3 - about .11 mile NW of the subject

Status: 4.0 ppb of CHLOROFORM (action level 100.0) was reported on 09/24/87 by DHS-AB1803.

WQ Drinking Water Program

The California Health and Safety Code section 116275-116300 stipulates that it is the intent of the Legislature to improve laws governing drinking water quality to improve upon the minimum requirements of the federal Safe Drinking Water Act Amendments of 1986, to establish primary drinking water standards that are at least as stringent as those established under the federal Safe Drinking Water Act, and to establish a program under this chapter that is more protective of public health than the minimum federal requirements.

In order to provide for the orderly and efficient delivery of safe drinking water the State Department of Health Services collect information on the quality of public drinking water wells under the California Drinking Program.

Below, the latest and maximum analysis of contaminants are reported (only positive reading are included). MCL is the Maximum Contaminant Level or enforceable drinking water standard. RPHL is the Recommended Public Health Level. Additional information is available upon request.

This list has been researched within half of a mile radius of the subject site.

Owner: LOS ALAMITOS RACE COURSE/

SCH School Property Evaluation Program Properties

This category of The Site Mitigation and Brownfields Reuse Program Database (SMBRPD) contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category depending on the level of threat to public health and safety or the environment they pose.

Status Codes:	VCP	Active school property where DTSC has entered into a VCP Agreement.
	PEAR	Preliminary Endangerment Assessment (PEA) required.
	PEAP	Preliminary Endangerment Assessment (PEA) in Progress
	VCOMP	The scope of work in the VCP Agreement has been completed.
	NA	No Action - potential school property where a Phase I has been completed.
	NFA	The property does not pose a problem to the public health or the environment.
	CERT	The potential school property was previously identified as a confirmed release site and it has been subsequently certified by DTSC as having been remediated satisfactorily under DTSC oversight.

No listings within a quarter of a mile radius of the subject site.

REGIONAL SOURCES

NT Toxic Releases

The California Regional Water Quality Control Boards or local Department of Health Services keeps track of toxic releases to the environment. These lists are known as Unauthorized Releases, Spill, Leaks, Investigations and Cleanups (SLIC), Non-Tank Releases, Toxics List or similar, depending on the local agency.

No listings within half of a mile radius of the subject site.

TPC Toxic Pits

The Toxic Pits Clean-Up Act (Katz Bill) places strict limitations on the discharge of liquid hazardous wastes into surface impoundment, toxic ponds, pits and lagoons. Regional Water Quality Control Boards are required to inspect all surface impoundment annually, in addition, every facility was required to file a Hydrogeological Assessment Report. Recent legislation allows the Department of Health Services to exempt facilities that closed on or before December 31, 1985, if a showing is made that no significant environmental risk remains (AB1046).

Special exemption provisions have been created for surface impoundment that receive mining wastes.

This list has been researched within 1 mile radius of the subject site.

Status:

SWAT Solid Waste Assessment Test - Regional

This program, provided for under the Calderon legislation (Section 13273 of the Water Code), requires that disposal sites with more than 50,000 cubic yards of waste provide sufficient information to the regional water quality control board to determine whether or not the site has discharged hazardous substances which will impact the environment.

Site operators are required to file Solid Waste Assessment Test reports on a staggered basis. Operators of the 150 highest ranking (Rank 1) sites were required to submit Solid Waste Assessment Tests by July 1, 1987, Rank 2 in 1988 and so on.

Operators submit water quality tests to the Regional Water Quality Control Board, describing surface and groundwater quality and supply; and the geology within 1 mile of the site. Air quality tests are submitted to the local Air Quality Management District or Air Pollution Control District.

This program is currently not funded and thus not updated.

Status Codes: Facilities or sites are ranked within each region on a scale 1-15 according to priority.

No listings within 1 mile radius of the subject site.

OPERATING PERMITS

Various agencies issue operating permits or regulate the handling, movements, storage and disposal of hazardous materials and require mandatory reporting. The inclusion in this section does not imply that an environmental problem exists presently or has in the past.

RCRA-G Resource Conservation and Recovery Information System - Generators

The Environmental Protection Agency regulates generators of hazardous material through the Resource Conservation and Recovery Act (RCRA). All hazardous waste generators are required to notify EPA of their existence by submitting the Federal Notification of Regulated Waste Activity Form (EPA Form 8700-12) or a state equivalent form. The notification form provides basic identification information and specific waste activities.

Status Codes: L - Generators who generate at least 1000 kg/mo of non-acutely hazardous waste (or 1 kg/mo of acutely hazardous waste).
S - Generators who generate 100 kg/mo but less than 1000 kg/mo of non-acutely haz waste.
T - Transporter.

This list has been researched within a quarter of a mile radius of the subject site.

SARA SARA Title III,section 313 (TRIS)

Title III of the Superfund Amendments and Reauthorization Act,Section 313, also known as Emergency Planning and Community Right-to-Know Act of 1986 requires owners or operators of facilities with more than 10 employees and are listed under Standard Industrial Classification(SIC) Codes 20 through 39 to report the manufacturing, processing or use of more than a threshold of certain chemical or chemical categories listed under section 313. This data base is also known as Toxic Release Information System (TRIS).

Below summary information for the last five year period is reported grouping the releases into air, water, underground injection, land, public offsite treatment (potw) and transportation offsite.

No listings within a quarter of a mile radius of the subject site.

NC Nuclear Regulatory Commission Licensees

The Nuclear Regulatory Commission, Office of Nuclear Material Safety and Safeguards has been mandated (10 CFR Ch 1.42) to protect the public health and safety, the common defense and security, and the environment by licensing, inspection, and environmental impact assessment for all nuclear facilities and activities, and for the import and export of special nuclear material.

No listings within a quarter of a mile radius of the subject site.

PCB PCB Waste Handlers Database

The U.S. Environmental Protection Agency tracks generators, transporters, commercial stores and/or brokers and disposers of PCB's in accordance with the Toxic Substance Control Act.

No listings within 1 mile radius of the subject site.

PCS Permit Compliance System

PCS is a database which contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS was developed by The U.S. Environmental Protection Agency to meet the information needs of the NPDES program under the Clean Water Act. PCS tracks permit, compliance, and enforcement states of NPDES facilities.
This list has been researched within a quarter of a mile radius of the subject site.

SIC Codes: 7948

AFS AIRS Facility System

AFS contains emissions and compliance data on air pollution point sources tracked by the U.S. EPA and state and local environmental regulatory agencies. There are seven "criteria pollutants" for which data must be reported to EPA and stored in AIRS: PM10 (particulate matters less than 10 microns in size), carbon monoxide, sulfur dioxide, nitrogen dioxide, lead, reactive volatile organic compounds (VOC), and ozone.

AFS replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aeromatic Data (SAROAD).

No listings within a quarter of a mile radius of the subject site.

PE Section Seven Tracking System (SSTS)

SSTS evolved from the FIFRA and TSCA Enforcement System (FATES). SSTS tracks the registration of all pesticide producing establishments and tracks annually the types and amounts of pesticides, active ingredients, and devices that are produced, sold or distributed each year.

No listings within a quarter of a mile radius of the subject site.

FIFRA FIFRA/TSCA Tracking System/ National Compliance Database (FTTS/NCDB)

NCDB supports implementation of the Federal Insecticide, Fungicide and Rodenticide Control Act (FIFRA) and the Toxic Substance Control Act (TSCA).
This list has been researched within a quarter of a mile radius of the subject site.

Map Loc: 12 - about .24 mile W of the subject
Status: Permit id#: CAD981684483
SIC Codes: 7948

FFIS Federal Facilities Information System (FFIS)

Federal Facilities Information System (FFIS) contains a list of all Treatment Storage and Disposal Facilities (TSDs) owned and operated by federal agencies.

No listings within a quarter of a mile radius of the subject site.

CICIS Chemicals in Commerce Information System (CICIS)

Chemicals in Commerce Information System contains an inventory of chemicals manufactured in commerce or imported for Toxic Substances Control Act regulated commercial purposes. CICIS allows EPA to maintain a comprehensive listing of over 70,000 chemical substances that are manufactured or imported and are regulated under TSCA.

No listings within a quarter of a mile radius of the subject site.

FINDS FINDS EPA Facility Index System

The U.S. Environmental Protection Agency maintains an index system of all facilities which are regulated or have been assigned an identification number for other purposes.

Facilities that have been reported elsewhere in this report will not be listed under this category.

No listings within a quarter of a mile radius of the subject site.

HWIS Hazardous Waste Information System

The Department of Toxic Substance Control, California Environmental Protection Agency, maintains a a data base keeping track of the movement and disposal of hazardous waste. The data is used to support the Tanner legislation, AB 2948.

Status Codes: EPA Facility Permit Number
CAL - State permanent number
CAC - State provisional or emergency number
CAH - State prov or perm number for household hazardous waste collections
CAI - State permanent number for exotic pest detection
CAS - State permanent number issued by county for emergency response
CAE - State prov number for hazardous waste removal caused by natural disasters

CAX - State permanent or provisional number issued prior to 1987. No longer used.
CLU - State permanent number issued by county for clandestine lab cleanup
CAR - Federal permanent number
CA - Federal permanent number
CAD - Federal permanent or provisional number. State provisional before 1988.
CAT - Federal permanent number
CAP - Federal provisional or emergency number

This list has been researched within a quarter of a mile radius of the subject site.

UST Permitted Underground Storage Tanks - State Water Quality Control Board

The Corteses Bill (AB2013), enacted in 1983, required registration of all underground storage tanks (UST) with the State Water Quality Control Board by July 1, 1984. About 176,000 tanks and surface impounds were registered between 1984 and 1987. An amendment (AB 1413) was passed in 1987, effectively removing the State Board from the registration process starting January 1, 1988. The data reflects the information collected by the state between 1984 and 1987 as well as recent time and includes all tanks and surface impounds in use or closed after 1974.

Home and farm heating fuel tanks with capacities of 1,100 gallons or less and "structures such as sumps, separators, storm drains, catch basins, oil field gathering lines, refinery pipelines, lagoons, evaporation ponds, well cellars, separation sumps, lined and unlined pits, sumps and lagoons" except those defined as UST under HSWA or may be regulated to protect water quality under the Porter-Cologne Water Quality Control Act are excluded.
This list has been researched within a quarter of a mile radius of the subject site.

Environmental Contractor's Certification

ENVIRONMENTAL CONTRACTOR'S CERTIFICATION

Contractor's Name: DCI Services

Contractor's Address: 9795 Cabrini Drive, Suite 104, Burbank, CA. 91504

1. **Name and title of person performing the audit:** Brett A. Herion, REA # 7603
   - **Attach a statement of how long the person has been performing environmental assessments and the education and training the person has received.**
2. **Identify any certifications and approvals issued to contractor pursuant to an official Federal, State, or local program or policy to conduct environmental assessments:**

California Environmental Protection Agency REA # 7603

3. **Describe the generally recognized standards which the contractor will use to perform the assessment.**
ASTM 1527-00

4. **Disclose the nature of any previous environmental inspections contractor has ever performed for the seller of the property:** None

   Or the buyer of the property: None

5. **Disclose the nature of any affiliation or association contractor now has or ever had, with the above referenced seller of the property, or the above referenced buyer of the property.**

NA

6. **Describe/Attach evidence of the liability insurance carried by contractor to cover claims in the event that it fails to discover adverse environmental conditions during an environmental inspection.**

American Safety Casualty Insurance (policy #ENV011614-05-01)

(Please use attachments if needed).

The undersigned hereby certifies, under penalty of the criminal and/or civil penalties in 18 U.S.C.# 1001 for false statements to the United States Government, that the above information is true and correct.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Disclaimer - Copyright and Trademark Notice

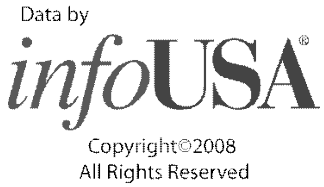
This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OR DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction orforecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

Copyright 2017 by Environmental Data Resources, Inc. All rights reserved. Reproduction in any media or format, in whole or in part, of any report or map of Environmental Data Resources, Inc. or its affiliates is prohibited without prior written permission.

EDR and its logos (including Sanborn and Sanborn Map) are trademarks of Environmental Data Resources, Inc. or its affiliates. All other trademarks used herein are the property of their respective owners.

EXECUTIVE SUMMARY



DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Roux Associates were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

RE: Request Number EPA-HQ-2019-005604

Dear Ms. Truong:

This letter is in response to your Freedom of Information Act (FOIA) request, identified above, that you submitted to the U.S. Environmental Protection Agency (EPA). Your request is seeking records concerning a specific property that does not contain a street address.

The MyProperty database below will provide you with information concerning records the EPA has about a specific property address, and it can be accessed at the website at the link below:

http://www.epa.gov/myproperty/

Because the information on a specific address is publicly available, your FOIA request for this information will be closed. Agencies are not required to provide FOIA requesters with records that fall within the proactive disclosure provision of the FOIA, subsection (a)(2), and which are already made available to the public, typically on the agency's website. See, 5 U.S.C. § 552(a)(3); 40 C.F.R. § 2.101(c).

If no responsive records are identified for a specific property address, MyProperty will generate a "No Records Certificate."

If MyProperty identifies responsive records that you cannot retrieve them through MyProperty or if you need help with the MyProperty website, please contact EPA's FOIA Public Liaison at hq.foia@epa.gov or (202) 566-1667.

This letter concludes our response to your request. You may appeal this response by email at hq.foia@epa.gov, or by mail to the EPA's National FOIA Office, U.S. EPA, 1200 Pennsylvania Avenue, N.W. (2310A), Washington, DC 20460 or through FOIAonline if you are an account holder. If you are submitting your appeal by hand delivery, courier service, or overnight delivery, you must address your correspondence to 1200 Pennsylvania Avenue, N.W., Room 5315, Washington, DC 20460. Your appeal must be in writing, and it must be received no later than 90 calendar days from the date of this letter. The Agency will not consider appeals received after the 90-calendar-day limit. Appeals received after 5:00 p.m. EST will be considered received the next business day. The appeal letter should include the FOIA tracking number listed above. For quickest possible handling, the subject line of your email, the appeal letter, and its envelope, if applicable, should be marked "Freedom of Information Act Appeal." Additionally, you may seek dispute resolution services from EPA's FOIA Public Liaison at hq.foia@epa.gov or (202) 566-1667, or from the Office of Government Information Services (OGIS). You may contact OGIS in any of the following ways: by mail, Office of Government Information Services, National Archives and Records Administration, Room 2510, 8610 Adelphi Road, College Park, MD 20740-6001; email, ogis@nara.gov; telephone, (202) 741-5770 or (877) 684-6448; or fax, (202) 741-5769.

Cordially,

Larry F. Gottesman
National FOIA Officer

Subject: Public Records Request :: P000881-050819

This message originated outside your organization. Please use caution!

--- Please respond above this line ---

Dear Angela,

The Orange County Sanitation District (OCSD) has completed its review of your May 08, 2019 Public Records Request.

Request Description:

"Hello,

We are conducting a Phase I Environmental Site Assessment at a property in City of Cypress. There is no address associated with the property.

We are interested in obtaining documents related to the APNs:
• 241-091-22
• 241-091-23
• 241-091-24
• 241-091-25
• 241-091-26

Can you please notify us if you have any records?

Thank you."

Request Determination:

OCSD has reviewed its files and has determined that there are no responsive records associated with this request. If you have any questions regarding this request you may send a message via your Request Portal account or contact us directly at (714) 593-7050.

Sincerely,

Jana Gutierrez

Orange County Sanitation District

Please log in to review.

To monitor the progress or update this request please log into the Public Records and Information Center.

Orange County Public Records

Hi there

A message was sent to you regarding record request #19-1378:

This is in response to your California Public Records Act request 19-1378, which OC Waste & Recycling received on May 8, 2019. The request seeks the following records:

"We are interested in obtaining documents related to the APNs: 241-091-22; 241-091-23; 241-091-24; 241-091-25; 241-091-26"

OC Waste & Recycling is not in possession of records responsive to your request. You may contact the Orange County Health Care Agency, which may have responsive records related to your request.

Here is contact information for the HCA custodian of records: (714) 834-3536 of COR@ochca.com

With this response, we consider your PRA request to OC Waste & Recycling closed.

Best regards,

Ruth Wardwell

Public Records Request Number: 1-051019-13
Location(s): northwest corner of Katella Avenue and Winners Circle, Cypress, CA

Dear Requestor:

The Sacramento office has received your Public Records Act Request for records from the Department of Toxic Substances Control (DTSC).

After a thorough review of our files, no records were found pertaining to the sites/facilities referenced above.

We would like to inform you about EnviroStor (www.envirostor.dtsc.ca.gov) which provides non-confidential, public access to DTSC's data management system and may assist with your future research. The system tracks our cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known or potential contamination, providing data and documentation of over 13,000 cleanup and hazardous waste facilities across California.

If you have any questions or would like further information regarding your request, please contact us at (916) 255-3758.

Sincerely,

Andrea Drushell
Regional Records Coordinator

Dear Ms. Truong:

This letter is written in response to your Public Records Act request dated May 8, 2019 and received in my office on March 9, 2019, wherein you request that the City make available environmental records including underground storage tanks, aboveground storage tanks, "tiered" and/or other environmental permits, enforcement orders, and reports and correspondence related to site investigation/assessment, soil sampling, monitoring, cleanup/remediation, removal actions, closures, or any records related to conditions in air, soil, surface water, groundwater, or other environmental media regarding APNs 241-091-22, 241-091-23, 241-091-24,241-091-25, and 241-091-26.

After a diligent search of records, the City has determined that there are no documents in its possession that would be responsive to your request.

If you have any additional questions, or need any additional assistance, please contact my office directly at (714) 229-6685.

Sincerely,

Alisha Farnell
Acting City Clerk

J-5. Looking north from the eastern edge of the Site along Winners Circle (5/13/2019).

J-6. Looking west across the Site toward the adjacent Costco facility; unpaved surface with apparent base fill visible in foreground (5/13/2019).

J-7. Looking south along the eastern edge of the Site; elevation difference between Site and Winners Circle is visible (5/13/2019).

J-8. Looking north from the northern edge of the Site toward the adjacent parking lot (5/13/2019).

J-9. Looking northwest from the northwest corner of the Site (5/13/2019).

J-10. Looking south along the western edge of the Site with *de minimis staining* visible in foreground (5/13/2019).

J-11. Western adjacent retail businesses (5/13/2019).

J-12. Looking north across Site, with apparent boring location marked on pavement (5/13/2019).

J-13. Looking south across Site, with drainage swale visible in foreground and parked trucks visible in background (5/13/2019).

J-14. Looking southeast across unpaved portion of Site (5/13/2019).

J-15. Truck parking area of Site with recently patched boring visible in foreground (5/13/2019).

J-16. Looking north across Site, with geotechnical drilling operations visible (5/13/2019).

J-17. Transformer located in southwest portion of Site; transformer label indicates manufacturing date of January 2010 (5/13/2019).

J-18. Ponding liquid presumed to be irrigation water in the southwest portion of the Site (5/13/2019).

J-19. One of two drainage areas observed in the southern portion of Site (5/13/2019).

J-20. Cover of subsurface pipe labeled "LASCO PVC 8" " in southern portion of Site (5/13/2019).

APPENDIX K

Personnel Qualifications

ROUX

PROFESSIONAL PROFILE

Mauricio H. Escobar, P.G.

Principal Geologist

TECHNICAL SPECIALTIES

Professional Geologist with over twenty years of experience designing, managing, and implementing environmental soil and groundwater investigations and remediation strategies for public and private clients. Experience as in-house consultant assisting with management of a $25MM yearly remediation portfolio for a Fortune 100 Company. Practice developing and implementing high-level strategies that consider legal and regulatory issues, communications and government relations, as well as technical challenges and costs. Significant assignments representing clients during Working Group meetings for Superfund sites and participation in technical committee meetings. Expertise in design and field implementation of in-situ chemical oxidation (ISCO) in hard rock and porous media-flow aquifers.

Substantial experience evaluating and remediating industrial, commercial and residential sites impacted with numerous contaminants in multiple media, including crude oil, fuels, volatile organic compounds, chromium VI, 1,4-dioxane, and PCBs. Extensive experience managing implementation of remediation programs that utilize and consider multiple technologies including soil vapor extraction, dual phase extraction, traditional pump and treat, in-well stripping, air sparging, chemical oxidation and reduction, thermal treatment, and natural attenuation. Experience managing large-scale remedial excavations involving the use of heavy earth moving equipment. Significant field experience using numerous drilling, soil sampling, groundwater sampling, and soil vapor sampling techniques.

EXPERIENCE SUMMARY

21 years of consulting experience: Principal Geologist with Roux Associates (2011 to Present); Senior Manager, Manager, and Senior Associate with ENVIRON International Corporation (2004 to 2011); Project Geologist with URS Corporation (2001 to 2004); Geologist with Hart Crowser (1998 to 2001).

CREDENTIALS

Bachelor of Arts, Earth Science, 1995
University of California, Berkeley
Professional Geologist, State of California, No. 07506
OSHA 40-Hour Hazardous Waste Operations and Emergency Response (HAZWOPER) Certified
Research Assistant to UC Berkeley Ph.D. Candidate Dawnika L. Blatter and Professor Ian S. E. Carmichael in Study of Continental Crustal Deformation from Subduction of the Cocos Plate in Western Mexico and Study of Upper Mantle Petrology in Central Mexico, January to April 1996

CONTINUING EDUCATION

Compounds of Emerging Concern in Groundwater, California Groundwater Resources Association, Concord, California, February 2012
The Remediation Course, Princeton Groundwater, Las Vegas, Nevada, April 2010
Vapor Intrusion Pathway: A Practical Guideline, Interstate Technology and Regulatory Council (ITRC) in conjunction with the California Department of Toxic Substances (DTSC) and California Water Boards, Long Beach, California, June 2009
The Groundwater Pollution and Hydrology Course, Princeton Groundwater, Orlando, Florida, February 2007
Hydrogeologic Analysis of Fractured Bedrock Systems, Midwest GeoSciences Group, University of Nevada Las Vegas and Nevada Test Site at Yucca Mountain, March 2006

TECHNICAL PRESENTATIONS

Prevalence and Persistence of Hexavalent Chromium During In-Situ Chemical Oxidation of Trichloroethylene with Permanganate, Antony D. G. Jones and Carol L. Serlin, ENVIRON, Irvine, CA; Mauricio H. Escobar, ENVIRON, Los Angeles, CA; George D. Havalias and Maria C. Echarte, American Analytics, Inc., Chatsworth, CA. The 19th Annual AEHS Meeting and West Coast Conference on Soils, Sediments, & Water, San Diego, California, March 2009

Assessment of Microbial Community Composition Throughout In-Situ Chemical Oxidation of Trichloroethylene with Permanganate, Bram Sercu and Patricia Holden, UCSB, Santa Barbara, CA; Antony D. G. Jones and Carol L. Serlin, ENVIRON, Irvine, CA; Mauricio H. Escobar, ENVIRON, Los Angeles, CA. The 19th Annual AEHS Meeting and West Coast Conference on Soils, Sediments, & Water, San Diego, California, March 2009

Evaluation of the Effects of ISCO on TCE Impacted Ground Water in Weathered Granitic Mass, Mauricio H. Escobar, ENVIRON, Los Angeles, CA; Antony D. G. Jones and Carol L. Serlin, ENVIRON, Irvine, CA. The 6th International Conference on Oxidation and Reduction Technologies for In-Situ Treatment of Soil and Groundwater, San Diego, California, September 2008

Assessing Sources of Hexavalent Chromium during In-Situ Chemical Oxidation of Trichloroethylene with Permanganate, Antony D. G. Jones and Carol L. Serlin, ENVIRON, Irvine, CA; Mauricio H. Escobar, ENVIRON, Los Angeles, CA. The 6th International Conference on Oxidation and Reduction Technologies for In-Situ Treatment of Soil and Groundwater, San Diego, California, September 2008

Aggressive DNAPL Remedial Program Replaces Conventional Methods and Facilitates Property Transaction, Mauricio H. Escobar, Bita Tabatabai, and Douglas Jones, ENVIRON, Irvine, CA. The 4th International Conference on Oxidation and Reduction Technologies for In-Situ Treatment of Soil and Groundwater, Chicago, Illinois, October 2005

Mauricio H. Escobar, P.G.
Principal Geologist

KEY PROJECTS

- **PRP Representation of Fortune 100 Company, Omega Chemical Superfund Site, Whittier, California**

  Provide ongoing technical consulting to a Fortune 100 Company and major PRP at the Omega Chemical Superfund Site in Whittier, California. Active participant of the Omega PRP Group (OPOG) Technical Committee. Attend all pertinent technical meetings and provide Client with technical and strategic input that protects their best interests. Maintain constant interaction with the legal and finance teams as necessary to ensure the technical and legal strategies are in agreement and that adequate funding is reserved well in advance of regulatory commitments and OPOG cash calls. Pertinent technical issues include soil gas and vapor intrusion, and a regional groundwater plume. Regulatory oversight is provided by USEPA Region IX.

- **PRP Representation of Fortune 100 Company, BKK Corporation Class I Landfill Organized Group, West Covina, California**

  Provide ongoing technical consulting to a Fortune 100 Company at the former BKK Corporation Class I Landfill site in West Covina, California. Participant in the BKK Technical Committee and attendant of pertinent technical meetings. Maintain constant communication with the Client's legal and finance teams and responsible for informing Client on the direction the Organized Group is headed. Responsible for identifying financial commitments made as part of technical decisions. Trusted with voicing opinions, concerns, and/or offering direction to the Group (if and when necessary), to ensure the Organized Group's direction is consistent with the Client's strategy. Pertinent technical issues include upgrades to the landfill infrastructure and groundwater remedial investigations in and around the landfill prism. Regulatory oversight is provided by the Department of Toxic Substances Control.

- **Portfolio Project Control – Fortune 100 Company, Torrance, CA**

  Three years of experience working as a full-time in-house consultant for a Fortune 100 Company assisting with management of all aspects of a complex multi-site portfolio. General role included communication with alliance partners, vendors, corporate finance, attorneys, public relations/communications, and procurement to track and facilitate progress of 9 major projects ($400,000 to $1 MM/year) and 3 mega projects ($3MM to $10MM+/year) that were unique in nature and complexity. Portfolio included former chemical sites, landfills, aerospace facilities, and other heavy use industrial facilities that were undergoing State and RCRA closure, as well as sites under CERCLA Superfund actions with PRP commitments. Charged with helping to develop, evaluate, and refine remedial strategies and lifecycle costs for sites that utilized various cleanup technologies such as application of oxidants and reducing agents, thermal oxidation, groundwater pump and treat, dual-phase and 2-PHASE™ extraction, soil vapor extraction, air sparging, and in-well air stripping. Major role included verifying adequate funding and maintaining documentation consistent with Sarbanes Oxley.

- **Strategy Expert Consulting – Fortune 100 Company, Los Angeles, CA**

  Ongoing third-party technical and strategic support to a Fortune 100 company for a major project involving former bulk storage and distribution facilities converted to open public space and residential uses. Site is undergoing remedial investigations and remedial alternatives evaluations under heavy regulatory and public scrutiny. Charged with providing opinions and recommendations as to the direction the current consultant and the regulatory agencies want to take the project and evaluating the conceptual site model and long term technical strategy. Active participant on technical team calls and ongoing direct communications with internal legal team.

- **Shipyard Decommissioning – Subsurface Assessment, Remedial Investigation, Demolition and Closure, Campbell Shipyard – Marco, Port of San Diego, California.**

  Lead geologist in the preparation of a comprehensive subsurface study of the former Campbell Shipyard property at the Port of San Diego, California. Over 200 borings were necessary to delineate the extent of impacted soils. Relevant environmental issues included a former coal works gasification plant immediately adjacent to the Site, a 2 to 4-foot thick lens of polynuclear aromatic hydrocarbon (PAH) laden sediment present throughout the Site below the water table, a former on-site diesel and kerosene tank farm, and numerous leaking fuel USTs. Responsibilities also included management of shipyard abandonment activities, such as abatement of asbestos and lead-based paint containing materials, demolition of on-site structures, crushing of asphalt and concrete into Class II base, and a comprehensive geophysical survey to locate all on-site utilities and buried structures. The work was performed under the regulatory oversight of the San Diego Regional Water Quality Control Board and the San Diego Unified Port District. Total cost of the work was approximately $1.3MM, implemented over a 15 month period.

- **Neutral Third Party Oversight of Remediation Work, ITT Corporation and Home Depot, Glendale, California.**

  Provided third party oversight for a site undergoing major remediation of VOCs and chromium VI in soils and

5150 East Pacific Coast Highway, Suite 450 | Long Beach, CA 90804
Main: 310-879-4900 | Direct: 310-879-4920
E-mail: mescobar@rouxinc.com | Website: www.rouxinc.com

groundwater. The site was a former electronics manufacturing facility redeveloped as a major box retailer in Glendale, California. Services were provided on behalf of the former facility owners/operators and the current property owners, both of whom had differing interests and views on the remedial work being performed. Viewed all fieldwork and construction of remediation systems and attended quarterly meetings with consultants, attorneys, and clients to gauge progress, discuss ongoing work, and evaluate projected schedules for completion of remediation. Technical challenges to remediation included dewatering of 20-foot thick perched zone impacted with VOC contamination, despite a leaking slurry wall originally designed to prevent onsite migration from upgradient sources.

- **ISCO Demonstration Plan Using Permanganate, Wyle Laboratories, Riverside County, California.**

  Designed, managed, and implemented an ISCO Demonstration Plan using sodium permanganate injection at a former industrial manufacturing facility in Southern California. Main goals of the application were to demonstrate effective oxidation of trichloroethene (TCE) in alluvium and fractured granitic bedrock, evaluate potential mobilization of naturally occurring reduced metals, and evaluate the potential application of ISCO at other areas of the Site, including off-site beneath residential homes. Twelve thousand gallons of 10% permanganate solution were delivered to the subsurface through 47 multi-depth permanent injection probes over a 22 day field event. TCE concentrations were reduced from a maximum of 30,000 microgram per liter (µg/L) to non-detect at the source area. Significantly, elevated hexavalent chromium [Cr(VI)] concentrations were observed in the area of injection and immediately downgradient.

  Following field observations, a Bench Scale Assessment (BSA) was conducted to evaluate potential significant sources of Cr(VI), evaluate the capacity of the aquifer to naturally attenuate Cr(VI), and provide data sufficient to estimate distance and time Cr(VI) would revert to its trivalent form. BSA and field data showed that principal source of Cr(VI) was from the raw product, with secondary contribution from chromium in the native rock, and deterioration of stainless steel well screens. Natural attenuation of Cr(VI) to background concentrations was estimated at 2 to 3 years post injection. Monitoring of the Demonstration Plan area for the 2+ years has proved those predictions accurate and a Remedial Action Plan (RAP) recommending full-scale on- and off-site treatment of TCE with permanganate was submitted to the California Department of Toxic Substances Control (DTSC). Total cost of the work was $1.0MM+.

- **Remedial Excavation and ISCO Used to Facilitate Property Transfer, Sanmina, Inc., Irvine, California.**

  Managed and implemented an aggressive remedial strategy for a former electronics manufacturing facility in Southern California. The site had TCE concentrations in groundwater suggestive of dense non-aqueous phase liquid (DNAPL) and required expedited soil and groundwater remediation, in lieu of ongoing 2-PHASE™ and dual-phase extraction (DPE) efforts, to accommodate its divesture and redevelopment. Groundwater was generally encountered at 15 feet below ground surface (bgs) and contained TCE concentrations in the source area as high as 77,000 µg/L. The project was successfully completed by installing a 90-well dewatering system, excavating 13,000 cubic yards (cy) of soils, and removing 3,200 cy of TCE impacted soil along the axis of a residual TCE DNAPL mass; total depth of the excavation was 32 feet bgs. ISCO using sodium and potassium permanganate was used to remediate residual TCE-impacted soil and groundwater outside the area of excavation. Following implementation of the aggressive remedial strategy, TCE concentrations in groundwater were reduced by one to three orders of magnitude, suggesting the DNAPL had been removed and/or destroyed. The Orange County Health Care Agency (OCHCA) provided soils closure and the Santa Ana Regional Water Quality Control Board provided groundwater closure for the site 16 months after completion of remediation. The site was sold and redeveloped. Total cost of excavation and ISCO application was approximately $1.4MM.

- **Assessment, Remediation and Closure of Former Industrial Facility for Residential Re-development, Former Boeing Plant, Los Angeles, California.**

  Managed the assessment, remediation, and closure of a former asphalt batch plant and defense contractor facility on behalf of a residential developer. The work was performed simultaneously with planning and entitlement of the property, under the oversight of the County of Los Angeles Fire Department, Hazardous Materials Division. Unique challenges included the discovery of 15+ feet of buried asphalt debris and soils with elevated arsenic and chromium concentrations requiring off-site disposal. Developed site-specific cleanup thresholds for VOCs and heavy metals by preparing a limited human health risk assessment and incorporating Risk Based Screening Levels (RBSLs) developed by the San Francisco Regional Water Quality Control Board. The entire project was implemented in 15 months from initial assessment to site closure at a cost of $250,000.

- **Hydrocarbon Release Characterization and Remedial Investigation, Kinder Morgan Energy Partners, La Habra, California.**

5150 East Pacific Coast Highway, Suite 450 | Long Beach, CA 90804
Main: 310-879-4900 | Direct: 310-879-4920
E-mail: mescobar@rouxinc.com | Website: www.rouxinc.com

Mauricio H. Escobar, P.G.
Principal Geologist

Designed, managed, and implemented a subsurface investigation with the primary focus of characterizing lateral and vertical distribution of hydrocarbon impacts to the groundwater and unsaturated zone. The release was related to a pipeline booster station flange rupture dating to the early 1980s. Fractured siltstone bedrock presented unique subsurface conditions and as a result, special consideration was given to drilling techniques and boring/well installations. The project involved 12 months of fieldwork for the installation of soil vapor probes, backhoe trenches, soil borings, and monitoring wells. Discovery of up to 15-feet of light non-aqueous phase liquids (LNAPL) resulted in amendments to the original work scope to provide for LNAPL removal and assessment of pneumatic and hydraulic properties of the soil/rock. A high vacuum DPE test was performed at selected wells to evaluate the feasibility of this technology for the removal of hydrocarbons. All work was conducted under the oversight of the Los Angeles Regional Water Quality Control Board in consideration of future residential development. Work was performed over a 2 year period at an approximate cost of $1.0MM.

- **Resource Conservation and Recovery Act (RCRA) Facility Investigation Work Plan for Bunker C Tank Farm Redevelopment, Long Beach, California.**

  Managed the preparation of a RCRA Facility Investigation Work Plan for a former power plant tank farm facility in Long Beach, California. The site was being planned for redevelopment with a retail box store and restaurant uses. The RFI Work Plan was prepared as part of a Corrective Action Consent Agreement between the Client and the DTSC. The purpose of the RFI was to determine the nature and extent of releases at the site and to gather all the necessary data to support completion and implementation of a Corrective Measures Study (CMS).

- **Remedial Investigation of Former Transformer Washing Facility, General Electric and City of Los Angeles Redevelopment Agency, Los Angeles, California.**

  Prepared, managed, and implemented a Remedial Investigation Work Plan for a former transformer washing facility under the oversight of the DTSC. The field investigation was intended to evaluate and delineate the nature and extent of residual VOC, PCB, and dioxin impacts at the Site, to support decisions regarding the need for, and extent of, future removal or remedial actions. The field program showed that shallow soils at the site were significantly impacted with PCBs and deep soils and groundwater were significantly impacted with TCE and tetrachloroethene (PCE).ISCO Demonstration Plan Using Permanganate, Riverside County, California.

- **Remedial Investigation and Remedial Action Plan for Former Small Arms Firing Range, City of Huntington Beach Community Development Office, Huntington Beach, California.**

  Managed the preparation of a Remedial Investigation and RAP for the City of Huntington Beach in their effort to assess the extent of contamination and remedial options for a former public and police firing range. The project was performed under the oversight of the OCHCA. Relevant issues included soil berms and coal-tar treated wood posts impregnated with lead-shot, shallow landfill conditions (<5-feet), lack of a landfill cap, heavy hydrocarbon contamination, and landfill gas issues. The RAP included remedial options, costing, and an outline for implementation. Special consideration was given to the fact that the City intended to use the property for future Central Park recreational uses. The project was awarded on technical merit following a public bidding process that required the submittal of a formal proposal and interviews with City officials. Total cost of the project was $150,000, implemented over a 2 year period.

ROUX

PROFESSIONAL PROFILE

Mark A. Edwards

Staff Assistant Geologist

EXPERIENCE SUMMARY

Joined Roux's Long Beach office in September 2018. Previously worked as a Graduate Student Researcher at the University of California at Santa Barbara, culminating in an M.S. in Geochemistry in September 2018.

CREDENTIALS

M.S. Earth Science with concentration in Geochemistry, University of California at Santa Barbara, September 2018

B.S. Earth Science with concentration in Climate and Environment (with Honors), University of California at Santa Barbara, June 2014

Geologist in Training (GIT) Certificate, March 2019

OSHA HAWZOPER 40-hour training completed September 2018 (29 CFR 1910.120)

AQMD Fugitive Dust Control Certificate issued January 2019

RELEVANT COURSEWORK

Graduate: Mathematical Methods in Earth Science (Matlab), Soil Genesis, Isotope Geochemistry

Undergraduate: Sedimentation and Stratigraphy, The Earth from Above (Remote Sensing), Introduction to Geological and Geophysical Data Analysis, Introduction to Geographic Information Systems, Introduction to Geochemistry, Geomaterials (Mineralogy), Geological Applications of GIS, Fundamentals of Structural Geology, Field Studies in Geological Methods, Earth's Climate: Past and Present, Earth System: Ocean–Atmosphere

ADDITIONAL EXPERIENCE

Graduate research experience at UCSB includes geochemical analysis and lab work, specifically quantitative EPMA characterization, measurement of isotopic ratios using (LA)ICP-MS and TIMS, and wet chemistry in Class-1000 clean-lab environments.

Performed a summer research internship at the University of Chicago in 2014 assisting with experimental photo-oxidation of reduced iron in an aqueous solution to simulate and study the origins of Banded Iron Formations.

As an undergraduate student, completed a research project while at the University of Copenhagen investigating the redox-sensitive trace-element signatures of Neoproterozoic carbonates from the Wonoka Formation, Australia.

ACADEMIC HONORS

UCSB Earth Research Institute Summer Research Fellowship (June 2017)

UCSB Department of Earth Science Graduate Opportunity Award (May 2017)

UCSB Department of Earth Science Global Field Travel Fund Award (May 2017)

UCSB Department of Earth Science Preston Cloud Memorial Award (May 2017)

UCSB Department of Earth Science Outstanding Academic Achievement Award (June 2014)

UCSB Department of Earth Science Outstanding Graduating Senior Award (June 2014)

University of California Regent's Scholar (September 2009 – June 2013)

ROUX KEY PROJECTS

- Air Monitoring for Geotechnical Drilling at Superfund Site

  Field geologist responsible for performing worker breathing zone and perimeter air monitoring at a Superfund site in Santa Fe Springs, CA.

- Phase II Investigation of Vacant Property

  Field geologist for Phase II investigation of vacant property in Norwalk, CA. Conducted soil, stockpile, and soil vapor sampling across the site, including an area with suspected illegal dumping impacts.

- Fecal Coliform Groundwater Monitoring

  Responsible for overseeing quarterly groundwater monitoring and reporting for a site in Malibu, CA under RWQCB oversight.

- Stormwater Sampling and Facility Inspections

  Perform ongoing monthly facility inspections and stormwater sampling at two cryogenic gas manufacturing plants in Los Angeles County, CA. Assist with uploading stormwater results to SMARTS and drafting annual reports.

This Water Quality Management Plan (WQMP) has been prepared for Shea Properties by Kimley-Horn. The WQMP is intended to comply with the requirements of the County of Orange NPDES Stormwater Program requiring the preparation of the plan.

The undersigned, while it owns the subject property, is responsible for the implementation of the provisions of this plan , including the ongoing operation and maintenance of all best management practices (BMPs), and will ensure that this plan is amended as appropriate to reflect up-to-date conditions on the site consistent with the current Orange County Drainage Area Management Plan (DAMP) and the intent of the non-point source NPDES Permit for Waste Discharge Requirements for the County of Orange, Orange County Flood Control District and the incorporated Cities of Orange County within the Santa Ana Region. Once the undersigned transfers its interest in the property, its successors-in-interest shall bear the aforementioned responsibility to implement and amend the WQMP. An appropriate number of approved and signed copies of this document shall be available on the subject site in perpetuity.

Project Infomation			
Permit/Application No. (If applicable)		Grading or Building Permit No. (If applicable)	
Address of Project Site (or Tract Map and Lot Number if no address) and APN	4961 Katella Ave, Cypress, CA 241-091-22, 241-091-25 241-091-23, 241-091-26 241-091-24		
Water Quality Conditions of Approval or Issuance			
Water Quality Conditions of Approval or Issuance applied to this project. (Please list verbatim.)	Currently there are no Water Quality Conditions of Approval applied to this Project.		
Conceptual WQMP			
Was a Conceptual Water Quality Management Plan previously approved for this project?	Yes, a previously approved WQMP was prepared by Development Resource Consultants, Inc. in July 13, 2007. The project has changed in nature from retail-only to a mixed-use development including retail, hotel, and multi-family residential uses.		

Watershed-Based Plan Conditions	
Provide applicable conditions from watershed - based plans including WIHMPs and TMDLS.	The Project falls within the San Gabriel – Coyote Creek Watershed. The are no applicable TMDLS for the receiving water body

Section II Project Description

II.1 Project Description

Description of Proposed Project				
Development Category (From Model WQMP, Table 7.11-2; or -3):	Redevelopment Project, Higher Density, In-Fill and Mixed Use			
Project Area (ft2): 580,619	Number of Dwelling Units: 251		SIC Code: 5900, 7011, 7830, 5812,	
Project Area	Pervious		Impervious	
	Area (acres or sq ft)	Percentage	Area (acres or sq ft)	Percentage
Pre-Project Conditions	1.33	10%	12.00	90%
Post-Project Conditions	1.33	10%	12.00	90%
Drainage Patterns/Connections	**Existing Conditions:** In the existing condition, the site is a portion of an existing asphalt parking lot serving LARC that extends to the without a visible demarcation of the property line. The overall parking lot area drains to two separate concrete ribbon gutters that flow from north to south. The parking lot pavement sheet flows in east/west orientations to the two ribbon gutters along the length of each gutter. Each gutter terminates at separate existing catch basins that connect to an existing City 48" storm drain that runs on the north edge Katella Avenue from east to west. These catch basins are located in within the proposed Project site boundary. Run-off in excess of the capacity of inlets ponds up in the parking lot before ultimately overflowing and discharging overland at an existing driveway into the Katella Avenue curb and gutter. The on-site ponding is limited to 12 to 18 inches. The ponding has little to no detention effects during large storm events – the 100-year peak will essentially pass through the driveway into the street in the existing condition.			

The on-site portion of the existing parking lot is approximately 13.3 acres in area. The off-site area tributary to the ribbon gutters upstream of the site is approximately 11.8 acres. The 13.3-acre Project site area is relatively flat generally sloping from the north to the south with approximately 2 feet of fall across the site.

An existing storm drain in Winner's Circle accommodates street drainage. The approved storm drain plan for the Winner's Circle storm drain depicts a proposed extension to the north, past the end of the cul-de sac, and then west across the existing parking lot. Th drain would be located just north of the Project site. Only the portion of the drain in Winner's Circle was actually constructed. The proposed drain extension is designed to accommodate the restricted flows (0.3 cfs/acre) from the property north of the Project site.

Proposed Conditions:

In the proposed condition, drainage will flow away from the proposed buildings and into one of several low points across the site, as depicted on the water quality site plan. Runoff will be collected into an on-site private underground storm drain system. The allowable discharge from the site is restricted to 0.3 cfs/acre per City requirements. To accommodate developed peak flows that exceeds the allowable discharge, the project storm water management system incorporates on-site underground detention basins. These detention basins have been designed to attenuate the 100-year storm event peak flow difference between the developed flow from the project and allowable discharge flow. See the proposed water quality site plan for the conceptual locations of the basins. A storm drain pump will be used to drain the detention systems and meet the 0.3 cfs/acre runoff restriction by limiting the pump discharge to 4.0 cfs. The site will ultimately discharge via a new storm drain connection to the existing 48" Katella storm drain. A hydrodynamic separator will be installed upstream of the detention system to remove trash and debris prior to entering into the system.

In addition to the site high-flow detention system, a low-flow detention system will be installed to capture and treat the "first flush" storm event. A bifurcation manhole will be placed upstream of the first flush detention system and divert the first flush volume into a separate detention system. This system will be pumped separately and the runoff will slowly discharge through a manufactured bioretention system over a 48-hour period. The outlet pipe from the biofiltration

	system will connect separately to the existing 48" Katella Avenue storm drain. The existing off site flows draining toward the site will be captured by extending the Winner's Circle drain, per the approved plans, to two proposed catch basins along the north property line and routed through a proposed 18" storm drain running east, ultimately connecting to the existing 24" storm drain in Winners Circle. In the event run-off from the area north of the site exceeds the capacity of the catch basins and drain, proposed curb and gutter and an approximately 2' high berm installed north of the property line will block offsite flow from entering the site. The off-site flows will pond approximately 1.25' along the north property line before discharging to the west, into Siboney Street, ultimately flowing overland to the south into Katella Avenue. This will be a temporary condition until the area to the north has been developed and a storm water management and detention system is constructed for the future development. The storm water management system for the future site will likely connect to the extended Winner's Circle storm drain. The runoff diverted around the site in the proposed condition would have reached Katella Avenue in the existing condition at a similar location. Instead of overflowing at the existing catch basins and running off through the existing project driveway, the overflows will instead flow into Katella Avenue at Siboney Street. Since the on-sit portion of the area tributary to Katella Avenue is limited to 4.0 cfs connecting directly into the storm drain, the amount of flows that will reach the Katella Avenue curb and gutter is greatly reduced compared to the existing condition.
Narrative Project Description: (Use as much space as necessary.)	This development is a is a proposed retail, theater, multi-family, and hotel site. The site is bounded by an existing parking lot to the north, Winner's Circle on the east, Katella Avenue to the south, and Siboney Street to the west. This development is comprised of approximately 63,795 SF of general commercial, 96,800 SF (120 keys) of hotel, and 251 multi-family apartments. The surface parking field within the interior of the site will serve the hotel, retail and restaurant customers; while and above ground parking structure will accommodate the parking needs of the residential units. The site consists of approximately 13.3 acres.

The Site includes several buildings, interconnected parking lots and drive aisles, pedestrian hardscape improvements, and typical commercial landscaping throughout, including the site perimeter and within parking lot islands. Parking stalls and drive aisles typically consist of asphalt pavement with limited areas of decorative interlocking pavers at the site entrances. Hardscape typically consists of concrete with area of pedestrian interlocking pavers. The landscaped areas within the parking lot areas include typical commercial-style landscape. The perimeter landscape along all four sides also consists of typical commercial landscape. These areas are relatively flat.

No depressed loading docks are proposed, though at-grade loading areas will be present throughout the site. Outdoor trash enclosures are proposed for the non-residential uses and the residential trash will be internal to the residential parking structure area. For preparation area are anticipated in the commercial buildings (tenant spaces are not yet conformed), the theater building, and the hotel building. Material and outdoor storage areas are not anticipated.

Outdoor activities generally include parking, outdoor dining areas, common areas and seated areas; no outdoor storage area, vehicle maintenance, washing or repair areas, or fuel stations are proposed.

II.2 Potential Stormwater Pollutants

Pollutants of Concern			
Pollutant	**Check One for each: E=Expected to be of concern** **N=Not Expected to be of concern**		**Additional Information and Comments**
Suspended-Solid/ Sediment	E ☒	N ☐	Due to landscape.
Nutrients	E ☒	N ☐	Due to landscape.
Heavy Metals	E ☒	N ☐	Due to parking lots.

Pathogens (Bacteria/Virus)	E ☒	N ☐	Due to parking lots and food uses.
Pesticides	E ☒	N ☐	Due to landscape.
Oil and Grease	E ☒	N ☐	Due to parking lots.
Toxic Organic Compounds	E ☒	N ☐	Due to parking lots and commercial development type.
Trash and Debris	E ☒	N ☐	

II.3 Hydrologic Conditions of Concern

☒ No – Show map

☐ Yes – Describe applicable hydrologic conditions of concern below. *Refer to Section 2.2.3 in the Technical Guidance Document (TGD).*

The site is located at the edge of the hydromodification boundary line as defined the in Orange County Technical Guidance Document. The area just east of the site drains easterly toward a hydromodification-susceptible watershed. The site connects to a storm drain system that drains westerly toward the Coyote Creek/San Gabriel River water shed that is not susceptible to hydromodification. The site not in a hydromodification zone; therefore, only the 100-year storm is analyzed.

See Appendix B for Map

II.4 Post Development Drainage Characteristics

In the proposed condition, drainage will flow away from the proposed buildings and into one of several low points across the site, as depicted on the water quality site plan. Runoff will be collected into an on-site private underground storm drain system. The allowable discharge from the site is restricted to 0.3 cfs/acre per City requirements. To accommodate developed peak flows that exceeds the allowable discharge, the project storm water management system incorporates on-site underground detention basins. These detention basins have been designed to attenuate the 100-year storm event peak flow difference between the developed flow from the project and allowable discharge flow. See the proposed water quality site plan for the conceptual locations of the basins. A storm drain pump will be used to drain the detention systems and meet the 0.3

cfs/acre runoff restriction by limiting the pump discharge to 4.0 cfs. The site will ultimately discharge via a new storm drain connection to the existing 48" Katella storm drain. A hydrodynamic separator will be installed upstream of the detention system to remove trash and debris prior to entering into the system. In the event of pump failure, the overflows will drain into the Katella Avenue street section, as in the existing condition, with a maximum of 18 inches of ponded depth before flows break over into the street.

In addition to the site high-flow detention system, a low-flow detention system will be installed to capture and treat the "first flush" storm event. A bifurcation manhole will be placed upstream of the first flush detention system and divert the first flush volume into a separate detention system. This system will be pumped separately and the runoff will slowly discharge through a manufactured bioretention system over a 48-hour period. The outlet pipe from the biofiltration system will connect separately to the existing 48" Katella Avenue storm drain.

The existing off site flows draining toward the site will be captured by extending the Winner's Circle drain, per the approved plans, to two proposed catch basins along the north property line and routed through a proposed 18" storm drain running east, ultimately connecting to the existing 24" storm drain in Winners Circle. In the event run-off from the area north of the site exceeds the capacity of the catch basins and drain, proposed curb and gutter and an approximately 2' high berm installed north of the property line will block offsite flow from entering the site. The off-site flows will pond approximately 1.25' along the north property line before discharging to the west, into Siboney Street, ultimately flowing overland to the south into Katella Avenue. This will be a temporary condition until the area to the north has been developed and a storm water management and detention system is constructed for the future development. The storm water management system for the future site will likely connect to the extended Winner's Circle storm drain.

The runoff diverted around the site in the proposed condition would have reached Katella Avenue in the existing condition at a similar location. Instead of overflowing at the existing catch basins and running off through the existing project driveway, the overflows will instead flow into Katella Avenue at Siboney Street. Since the on-sit portion of the area tributary to Katella Avenue is limited to 4.0 cfs connecting directly into the storm drain, the amount of flows that will reach the Katella Avenue curb and gutter is greatly reduced compared to the existing condition.

The site LID requirement, for the 85th percentile, 24-hour strom, will be met through the installation of a Modular Wetlands proprietary biofiltration unit. The DCV will be diverted and detained in a separate detention system and discharged over 48 hours to the proposed Modular Wetland Unit. Due to the shallow groundwater at the site, infiltration is infeasible.

II.5 Property Ownership/Management

Shea Properties will be the owner, builder and manager of the proposed retail and residential, which is being designed as a "Class A" apartment. The proposed hotel site will be sold to hotel developer/operator. A CC&R or REOA document and property owner's association (POA) will be established for common area maintenance and operations. The POA will fund and be responsible for maintenance.

Section III Site Description

III.1 Physical Setting

Name of Planned Community/Planning Area (if applicable)	Cypress Business & Professional Center Specific Plan (CBPC-SP)
Location/Address	North East corner of Siboney Street and Katella Avenue.
	4961 Katella Avenue, Cypress CA
General Plan Land Use Designation	Professional Office
Zoning	Mixed Use Commercial/Residential
Acreage of Project Site	13.33
Predominant Soil Type	Hydrologic Soil Group D (per geotechnical report)

III.2 Site Characteristics

Site Characteristics	
Precipitation Zone	Design Capture Storm Depth 0.85" (24 Hr, 85th Percentile Rainfall)
Topography	The existing site topography is very flat with an average slope in the north-south direction of 0.1% and a fall of approximately one foot.
Drainage Patterns/Connections	In the existing condition, the site drains to two ribbon gutters that run in a north/south orientation. Both gutters convey drainage from the parking lot area to the north of the Project. Each gutter terminates at an existing catch basin that connected to an existing City 48" storm drain that runs on the north edge

	Katella Avenue from east to west. The existing storm drain system discharges into a Bolsa Chica Channel.
Soil Type, Geology, and Infiltration Properties	Hydrologic Soil Group D. It has a minimal infiltration rate when thoroughly wetted.
Hydrogeologic (Groundwater) Conditions	The historic high groundwater is less than 5 feet below ground surface. The depth to seasonal high groundwater table beneath the project falls within the normal high range and precludes infiltration.
Geotechnical Conditions (relevant to infiltration)	Infiltration is not recommended due to high ground water levels.
Off-Site Drainage	The project site will intercept off-site drainage from the parking lot to the north and will be conveyed through a separate offsite storm drain pipe that will be diverted around the proposed BMPs so that it is not treated. The offsite pipe will discharge into an existing storm drain pipe in Winner's Circle. The off-site flows will not be detained or treated.
Utility and Infrastructure Information	There are existing public water mains in Katella Avenue, Winner's Circle and private Siboney Street along the project frontages. The City has an 18-inch VCP sewer main in Katella Avenue sloping from east to west along the Project frontage and an 8-inch sewer in Winner's Circle sloping from north to south that connects into the Katella sewer. Implementation of the proposed Mixed-Use development is not anticipated to create any new impacts or require additional wastewater treatment beyond what has already been anticipated in the General Plan and the Cypress Business and Professional Center Specific Plan EIR. There is a 39-inch RCP storm drain in Katella Ave that slopes from east to west. Two on-site catch basins connect to this storm pipe. The City also has a 24-inch storm drain in Winner's Circle. In total, flows from the site into the City storm drain system will be limited to a maximum of 0.3 cfs/acre of on-site area.

III.3 Watershed Description

Receiving Waters	San Gabriel River, Reach 1, Estuary
303(d) Listed Impairments	Copper, Dioxin, Indicator Bacteria, Nickel, Dissolved Oxygen. pH, Temperature
Applicable TMDLs	Metals (Copper)
Pollutants of Concern for the Project	Suspended-Solid/ Sediment, Nutrients, Heavy Metals, Oil and Grease, Pesticides, Pathogens (Bacteria/Virus), Toxic Organic Compounds and Trash and Debris.
Environmentally Sensitive and Special Biological Significant Areas	Not applicable

Section IV Best Management Practices (BMPs)

IV. 1 Project Performance Criteria

(NOC Permit Area only) Is there an approved WIHMP or equivalent for the project area that includes more stringent LID feasibility criteria or if there are opportunities identified for implementing LID on regional or sub-regional basis?		YES ☐	NO ☒
If yes, describe WIHMP feasibility criteria or regional/sub-regional LID opportunities.	N/A		

Project Performance Criteria	
If HCOC exists, list applicable hydromodification control performance criteria (Section 7.II-2.4.2.2 in MWQMP)	N/A
List applicable LID performance criteria (Section 7.II-2.4.3 from MWQMP)	Infiltrate, harvest and reuse, evapotranspiration, or biotreat/biofilter the 85th percentile, 24-hour storm event (DCV).
List applicable treatment control BMP performance criteria (Section 7.II-3.2.2 from MWQMP)	N/A
Calculate LID design storm capture volume for Project.	C = (0.90x0.75+.15)=0.825 D=0.85″ A=13.33 V=34,000 After 50% reduction (see below for credits): V=17,000

IV.2. Site Design and Drainage

DMA Number	Area (AC)	DCV (CF)	Q (CFS)	Treatment Device	Device Capacity (CFS)
1	13.33	17,000		Modular Wetland Model No. MWS-L-8-16 (discharged over a 48-hour period)	0.052
1	13.33		1.43	Hydrodynamic	

IV.3 LID BMP Selection and Project Conformance Analysis

IV.3.1 Hydrologic Source Controls (HSCs)

If required HSCs are included, fill out applicable check box forms. If the retention criteria are otherwise met with other LID BMPs, include a statement indicating HSCs not required.

Name	Included?
Localized on-lot infiltration	☐
Impervious area dispersion (e.g. roof top disconnection)	☐
Street trees (canopy interception)	☒
Residential rain barrels (not actively managed)	☐
Green roofs/Brown roofs	☐
Blue roofs	☐
Impervious area reduction (e.g. permeable pavers, site design)	☒

Localized on-lot infiltration: Due to the multiple constraints to infiltration, localized on-lot infiltration is not proposed.

Impervious area dispersion (e.g. roof top disconnection): Due to the multiple constraints to infiltration, localized impervious area dispersion is not proposed. However, proprietary biofiltration BMPs with some evapotranspiration benefits are proposed.

Street trees (canopy interception) Significant canopy coverage is proposed on-site. Parking lot and perimeter trees are proposed throughout the Project.

Residential rain barrels (not actively managed): This does not apply to large commercial sites. Also, reclaimed water will be used for irrigation.

Green roofs/Brown roofs: Green roofs are not proposed due to cost and maintenance concerns and the arid environment of Southern California that does not lend itself to their use.

Blue roofs: In lieu of blue roofs, which have limited use in retail and hotel architecture, a vault and pump system is used to control project outflows.

*Impervious area reduction (e.g. permeable pavers, site design): T*he overall site substantially exceeds existing landscape ratio and unit pavers are proposed in certain locations on-site.

IV.3.2 Infiltration BMPs

Identify infiltration BMPs to be used in project. If design volume cannot be met, state why.

Name	Included?
Bioretention without underdrains	☐
Rain gardens	☐
Porous landscaping	☐
Infiltration planters	☐
Retention swales	☐
Infiltration trenches	☐
Infiltration basins	☐
Drywells	☐
Subsurface infiltration galleries	☐
French drains	☐
Permeable asphalt	☐
Permeable concrete	☐
Permeable concrete pavers	☐
Other:	☐
Other:	☐

No infiltration BMPs are to be used in this project. Infiltration is not feasible due to high ground water table. The proposed underground detention systems will be designed to resist buoyant forces caused by high ground water. Permanent dewatering is not anticipated at this time.

A proprietary Modular Wetland biofiltration system will treat the site DCV. See WQMP site plan for size.

IV.3.3 Evapotranspiration, Rainwater Harvesting BMPs

If the full Design Storm Capture Volume cannot be met with infiltration BMPs, describe any evapotranspiration and/or rainwater harvesting BMPs included.

Name	Included?
All HSCs; See Section IV.3.1	☐
Surface-based infiltration BMPs	☐
Biotreatment BMPs	☒
Above-ground cisterns and basins	☐
Underground detention	☒
Other:	☐
Other:	☐
Other:	☐

Evapotranspiration and rainwater harvesting BMPs are not feasible.
See calculations in Attachment E.

A proprietary Modular Wetland biofiltration system will treat the site DCV. An underground detention and pump system upstream of the modular wetland will control the flow into the device and allow the device to be sized on a volume basis. The underground detention system volume corresponds to the adjusted DCV. See WQMP site plan for size.

IV.3.4 Biotreatment BMPs

If the full Design Storm Capture Volume cannot be met with infiltration BMPs, and/or evapotranspiration and rainwater harvesting BMPs, describe biotreatment BMPs included. Include sections for selection, suitability, sizing, and infeasibility, as applicable.

Name	Included?
Bioretention with underdrains	☐
Stormwater planter boxes with underdrains	☒
Rain gardens with underdrains	☐
Constructed wetlands	☐
Vegetated swales	☐
Vegetated filter strips	☐
Proprietary vegetated biotreatment systems	☒
Wet extended detention basin	☐
Dry extended detention basins	☐
Other:	☐
Other:	☐

The on-site storm drain system will include parallel detention systems and pumps. The low flows will be diverted to a low flow storage tank that is sized for the adjusted DCV. The outlet pump for the low flow storage tank will be sized and designed to drain the tank in 48 hours. The pump will discharge stormwater into a single high-efficiency Modular Wetland biofiltration BMP. The flows in excess of the adjusted DCV will enter a second tank with a separate discharge pump. The high flow pump will be sized and designed to discharge up to a maximum of 4.0 cfs. The outlet pipe from the high flow pump and the outlet pipe from the Modular Wetland unit will join and connect to the existing Katella Avenue storm drain at a single point.

The Modular Wetland system has been independently tested by the State of Washington DOT and treats a wide range of pollutants at a high efficiency level through biological and chemical processes. See calculation in attachment E

IV.3.5 Hydromodification Control BMPs

Not applicable.

IV.3.6 Regional/Sub-Regional LID BMPs

Describe regional/sub-regional LID BMPs in which the project will participate. *Refer to Section 7.II-2.4.3.2 of the Model WQMP.*

Regional/Sub-Regional LID BMPs
N/A

IV.3.7 Treatment Control BMPs

Not applicable due to the use of biofiltration BMPs. The hydrodynamic separator is used to remove trash and debris prior to entering the detention system. For the purposes of this report the hydrodynamic separator is intended to be for maintenance benefit purposes only and is not counted as stormwater treatment. The entire DCV is treated by the Modular Wetland System.

IV.3.8 Non-structural Source Control BMPs

Fill out non-structural source control check box forms or provide a brief narrative explaining if non-structural source controls were not used.

Non-Structural Source Control BMPs				
Identifier	Name	Check One		If not applicable, state brief reason
		Included	Not Applicable	
N1	Education for Property Owners, Tenants and Occupants	☒	☐	
N2	Activity Restrictions	☒	☐	
N3	Common Area Landscape Management	☒	☐	
N4	BMP Maintenance	☒	☐	
N5	Title 22 CCR Compliance (How development will comply)	☐	☒	No hazardous waste will be handled onsite.
N6	Local Industrial Permit Compliance	☐	☒	Industrial uses are not present on-site.
N7	Spill Contingency Plan	☒	☐	
N8	Underground Storage Tank Compliance	☐	☒	No USTs proposed.
N9	Hazardous Materials Disclosure Compliance	☐	☒	No hazardous material will be handled onsite.
N10	Uniform Fire Code Implementation	☒	☐	
N11	Common Area Litter Control	☒	☐	
N12	Employee Training	☒	☐	
N13	Housekeeping of Loading Docks	☐	☒	No depressed loading docks are proposed.
N14	Common Area Catch Basin Inspection	☒	☐	

N15	Street Sweeping Private Streets and Parking Lots	☒	☐	
N16	Retail Gasoline Outlets	☐	☒	Fueling stations are not proposed.

Implementation of Non-Structural BMPS

N1. Education of Property Owners, Tenants and Occupants.

Responsible Party for Implementation of BMP: Property Owner's Association.

Implementation Frequency: Ongoing. Orientation shall be given to new owners, tenants, and occupants within 30 days of startup.

Educational material and information shall be provided by the property owner to new owners/tenants/occupants on general good housekeeping BMPs and other practices that contribute to protection of storm water quality. This WQMP shall be provided with emphasis placed on the materials included in, but not limited to, Sections N, V, VI and VII of this report. For additional information, see the BMP Maintenance Responsibility /Frequency Matrix in Section V. Educational Materials to be used include, but are not limited to, SC-10, Non-Stormwater Discharges, SC- 30, Outdoor Loading/Unloading, SC-34, Waste Handling & Disposal, SC-41, Building & Grounds Maintenance, SC-43, Parking/Storage Area Maintenance, The Ocean Begins at Your Front Door, After the Storm, Protecting Water Quality from Urban Runoff, Preventing Pollution Through Efficient Water Use, and Your Business and the County- Partners in Protecting the Ocean. In addition to the attachments, the following resource can be contacted to obtain updated educational information free of charge http://ocwatersheds.com/PublicEd. See Table V-1 in Section V for inspection and maintenance activity requirements.

N2. Activity Restrictions.

Responsible Party for Implementation of BMP: Property Owner's Association.

Implementation Frequency: Daily management of operation. Orientation shall be given to new owners, tenants, and occupants within 30 days of startup. Refreshing orientation shall be given annually.

Onsite activities shall be restricted to those currently granted by the City of Cypress and as stated in the Conditions, Covenants, and Restrictions (CCRs), which will be available in the near future. Parking restrictions include, but are not limited to, provisions regulating vehicle and truck deliveries, vehicle and truck parking, loading and unloading activities, etc. Some other common restrictions to be adhered to are as follows:

- No discharges of fertilizer, pesticides, and wastes to streets or storm drains
- No blowing or sweeping of debris into streets or storm drains

- No hosing down of paved surfaces
- No vehicle washing or maintenance.
- Do not perform paint cleanup activities in paved areas or allow rinse water from these activities to enter the storm drain system. Clean brushes containing water-based paint in a sink that is connected to the sanitary sewer system.
- Do not use detergents or other chemical additives when washing concrete sidewalks or building exteriors, use potable water only and collect wash water runoff using a vacuum truck, for proper offsite disposal.
- Keep premises, as well as trash container areas, free of litter. See Table V -1 in Section V for inspection and maintenance activity requirements.

In addition, onsite activities shall be limited to the requirements of this WQMP as described herein.

N3. Common Area Landscape Management.

Responsible Party for Implementation of BMP: Property Owner's Association.

Implementation Frequency: Landscape areas shall be maintained on a weekly basis through Grounds and Maintenance personnel.

All maintenance shall be consistent with the City of Cypress Water Quality Ordinance and Cypress Municipal Code General guidelines include the following: Plant vegetation that reduces water, fertilizer, herbicide, and pesticide use. Waste shall be disposed of by composting or at a permitted landfill and shall not be raked or blown into the street, gutter, or storm drains. Irrigation systems shall be inspected monthly for leaks. Leaks shall be repaired as soon as they are observed. A void over-watering of vegetation. If excessive runoff is observed, automatic timers shall be adjusted. Fertilizers, herbicides, and pesticides shall be used as directed on the label. If fertilizer is spilled on a paved surface it should be swept up immediately and placed in its container. Water shall not be used to clean fertilizer spills unless necessary and only after the area has been thoroughly cleaned using dry cleaning methods. Pesticides, herbicides, and fertilizers shall not be applied within 48 hours prior to rain or if wind speeds exceed 5 mph. For additional information, see Help Prevent Ocean Pollution - Proper Maintenance Practices for Your Business included in Section VII of this report. Also refer to BMP SC-41, Building & Grounds Maintenance, included in Section VII and the BMP Maintenance Responsibility /Frequency Matrix in Section V for details.

N4. BMP Maintenance.

Responsible Party for Implementation of BMP: Property Owner's Association.

Implementation Frequency: Individual BMPs shall be inspected based on the required frequency of each BMP as suggested in the Maintenance Responsibility /Frequency Matrix. See the BMP Maintenance Responsibility /Frequency Matrix in Section V for details.

N11. Common Area Litter Control

Responsible Party for Implementation of BMP: Property Owner's Association.

Implementation Frequency: On a weekly basis through a maintenance firm.

To reduce the likelihood of polluting storm water runoff, regular maintenance will be conducted. This will consist of, at a minimum, site-wide litter control, emptying of trash receptacles in common areas, sweeping of dumpster enclosure areas, and reporting trash disposal violations to the owner or POA for investigation. The landscape maintenance may be contracted for common area litter control as well. See Table V-1 in Section V for inspection and maintenance activity requirements. Trash enclosures will include roofs.

N12 Employee Training

Responsible Party for Implementation of BMP: Property Owner's Association.

Implementation Frequency: Education of applicable employees for the tenants shall continue an ongoing basis and shall be done within 30 days of startup. Each new applicable onsite employee shall be given a water quality orientation within 30 days of hire using this WQMP Report as a reference. At a minimum, each applicable onsite employee shall have an annual review of the provisions of the WQMP Report for this project

See Table V -1 in Section V for inspection and maintenance activity requirements.

N14. Common Area Catch Basin Inspection.

Responsible Party for Implementation of BMP: Property Owner's Association.

Implementation Frequency: Twice a month to remove debris and after every major storm event.

The site's proposed drainage is picked up in catch basins at various places and is transported underground to the main storm drain. These catch basins are to be maintained a at the frequency

N15. Street Sweeping Private Streets and Parking Lots.

Responsible Party for Implementation of BMP: Property Owner's Association.

Implementation Frequency: Twice a month to remove debris.

The Property Owners' Association shall be responsible for sweeping the surrounding parking lot on a regular basis to remove debris. At minimum, the streets and parking lots will be required to be swept prior to the storm season, in late summer or early fall, prior to the start of the rainy season, or equivalent as required by the governing jurisdiction. For additional information, see BMP SC-34,

Waste Handling and · Disposal and BMP SC-43, Parking/Storage Area Maintenance, included in Section VII, and the BMP Maintenance Responsibility /Frequency Matrix in Section V.

IV.3.9 Structural Source Control BMPs

Fill out structural source control check box forms or provide a brief narrative explaining if structural source controls were not used.

Structural Source Control BMPs				
Identifier	Name	Check One		If not applicable, state brief reason
		Included	Not Applicable	
S1	Provide storm drain system stenciling and signage	☒	☐	Catch basins will be stenciled.
S2	Design and construct outdoor material storage areas to reduce pollution introduction	☐	☒	Outdoor material storage areas are not proposed.
S3	Design and construct trash and waste storage areas to reduce pollution introduction	☒	☐	Trash enclosures will be fully walled and gated
S4	Use efficient irrigation systems & landscape design, water conservation, smart controllers, and source control	☒	☐	Efficient irrigation and a drought-resistant plant palette are proposed.
S5	Protect slopes and channels and provide energy dissipation	☒	☐	Katella Ave. roadway embankment will be landscaped to protect the slope from erosion.
	Incorporate requirements applicable to individual priority project categories (from SDRWQCB NPDES Permit)	☐	☒	Project is in North Orange County
S6	Dock areas	☐	☒	No proposed depressed loading dock
S7	Maintenance bays	☐	☒	Maintenance bays are not proposed.
S8	Vehicle wash areas	☐	☒	Vehicle wash areas are not proposed.
S9	Outdoor processing areas	☐	☒	Outdoor processing areas are not proposed.
S10	Equipment wash areas	☐	☒	Equipment wash areas are not proposed.

S11	Fueling areas	☐	☒	Fueling areas are not proposed.
S12	Hillside landscaping	☒	☐	Hillside landscaping will be provided on the Katella Ave. roadway embankment.
S13	Wash water control for food preparation areas	☐	☒	Outdoor wash areas are not proposed.
S14	Community car wash racks	☐	☒	Car wash racks are not proposed.

IV.4 Alternative Compliance Plan (If Applicable)

IV.4.1 Water Quality Credits

Description of Proposed Project				
Project Types that Qualify for Water Quality Credits (Select all that apply):				
☒Redevelopment projects that reduce the overall impervious footprint of the project site.	☐Brownfield redevelopment, meaning redevelopment, expansion, or reuse of real property which may be complicated by the presence or potential presence of hazardous substances, pollutants or contaminants, and which have the potential to contribute to adverse ground or surface WQ if not redeveloped.		☒ Higher density development projects which include two distinct categories (credits can only be taken for one category): those with more than seven units per acre of development (lower credit allowance); vertical density developments, for example, those with a Floor to Area Ratio (FAR) of 2 or those having more than 18 units per acre (greater credit allowance).	
☒ Mixed use development, such as a combination of residential, commercial, industrial, office, institutional, or other land uses which incorporate design principles that can demonstrate environmental benefits that would not be realized through single use projects (e.g. reduced vehicle trip traffic with the potential to reduce sources of water or air pollution).		☐ Transit-oriented developments, such as a mixed use residential or commercial area designed to maximize access to public transportation; similar to above criterion, but where the development center is within one half mile of a mass transit center (e.g. bus, rail, light rail or commuter train station). Such projects would not be able to take credit for both categories, but may have greater credit assigned		☐ Redevelopment projects in an established historic district, historic preservation area, or similar significant city area including core City Center areas (to be defined through mapping).
☐Developments with dedication of undeveloped portions to parks, preservation areas and other pervious uses.	☐ Developments in a city center area.	☐ Developments in historic districts or historic preservation areas.	☐ Live-work developments, a variety of developments designed to support residential and vocational needs together – similar to criteria to mixed use development; would not be able to take credit for	☒In-fill projects, the conversion of empty lots and other underused spaces into more beneficially used spaces, such as residential or commercial areas.

			both categories.	
Calculation of Water Quality Credits (if applicable)	The Cypress Mixed Use development is eligible for a 50% reduction in water quality volume because it meets the redevelopment, higher density development, mixed use development, and in-fill development requirements. A 50% credit has been applied to all treatment flow rates and volumes.			

IV.4.2 Alternative Compliance Plan Information

An alternative compliance plan based on water quality credits is proposed based on several factors. In general, reduction of the surface area of the Modular Wetland BMP allows for the greatest density and mix of uses possible on the site. A decription of indiviual water quality credits follows:

Redevelopment: The site is currently developed as a fully paved parking lot with no internal landscape and no landscape along the north edge of the property. The proposed site plan includes a new landscae strip alng the north property line and landscape dipersed throughout the proposed parking field.

Higher density development projects (20% credit): 251 apartment units are proposed on the 13.33 acres, yielding a density of 18.8 units per acre for the residential density alone. Significant uses in addition to the residential add to the overall project density.

Mixed-Use Development (20% credit) : The project includes a true mix of uses including residentail (wrap apartment building, retail and restaurant (multi-tenant buildings), entertainment (theater building), and hospitality (hotel building). All uses will be connected by walkable paths of travel, helping to reduce project trips and provide other mixed-use environmentla benefits.

In-Fill Projects (10% credit): The project is proposed on a parking lot the is vacant nearly 100% of the time, but is also nearly 100% impervious. The space is extremely underutilized and will be transformed into a vibrant, mixed-use development.

Section V Inspection/Maintenance Responsibility for BMPs

The following tables indicate BMP inspection and maintenance responsibility. These tables identify the party responsible for inspection and maintenance, a description of the inspection and/or maintenance activity, and a frequency for the inspection and/or maintenance activity. Records of maintenance and inspections shall be kept for a period of five years and shall be made available for review by government agencies.

Responsible party details are to be determined during the final WQMP. At this time a Property Management Association is assumed to take responsibility for the Maintenance of all onsite BMPs.

Property Management Association

Name: TBD

Title: TBD

Company: TBD

Address: TBD

Phone Number: TBD

Note: The rainy season occurs from October 1st to April 15th.

BMP Name and BMP Implementation, Maintenance, and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Inspection / Maintenance Activities Required	Person or Entity with Operation & Maintenance Responsibility
Non-Structural Source Control BMPs			
N1. Education for Property Owners, Tenants and Occupants	Upon Tenant Occupancy	Educational material shall be provided to all employees and tenants.	Property Management Association
N2. Activity Restriction	Monthly	The owner shall develop activity restrictions to minimize the threat of hazardous waste or contamination into the storm drainage system. Car washing is not allowed on-site at any time.	Property Management Association
N3. Common Area Landscape Management	Weekly	Training on landscape management consistent with County Water Conservation Resolution or City equivalent, plus Management Guidelines for Fertilizers (DAMP Section 5.5) shall be conducted for all new field landscape maintenance personnel.	Property Management Association
N4. BMP Maintenance	Weekly	Maintenance of BMPs implemented at the project site shall be performed at the frequency prescribed in this WQMP.	Property Management Association
N11. Common Area Litter Control	Daily	Litter patrol, violations investigation, reporting and other litter control activities shall be performed in conjunction with maintenance activities.	Property Management Association
N12. Employee Training	Yearly for all employees and within 6 months of hire date for new employees.	Education programs shall be implemented as they apply to future employees and training of current employees.	Property Management Association
N14. Common Area Catch Basin Inspection	Minimum of once a year prior to rainy season.	Litter and debris removal, illicit discharge violations investigation and reporting shall be performed in conjunction with maintenance activities.	Property Management Association

BMP Name and BMP Implementation, Maintenance, and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Inspection / Maintenance Activities Required	Person or Entity with Operation & Maintenance Responsibility
N15. Street Sweeping Private Streets and Parking Lots	Monthly	Private streets and parking area within the project shall be swept at a minimum frequency of once a month.	Property Management Association
Structural Source Control BMPs			
S1. Provide Storm Drain System Stenciling and Signage	Yearly	All proposed inlets shall be marked with the appropriate "No Dumping. Drains to Ocean." Stencil. The stencils must be repainted when they becomes illegible, but at a minimum once every five years.	Property Management Association
S3. Design and Construct Outdoor Material Storage Areas to Reduce Pollutant Introduction	Weekly	Trash receptacles shall be placed on a paved area. Sweep trash area at least once per week. Maintain area clean of trash and debris.	Property Management Association
S4. Use Efficient Irrigation Systems & Landscape Design	Monthly	Verify that landscape design continues to function properly by correctly adjusting to eliminate overspray to hardscape areas, and to verify that irrigation timing and cycle lengths are adjusted in accordance with water demands, given time of year, and day or night time temperatures.	Property Management Association
S5. Protect Slopes and Channels	Monthly	Maintain area and clear any accumulated sediment or trash during the summer, or early fall, before October 1st.	Property Management Association
Medium Term Erosion Control BMPs			
EC5. Soil Stabilization	Monthly and after large storms.	Inspect graded building pads and reapply stabilization if signs of erosion are present.	Property Management Association
Low Impact Development (LID) and Treatment Control BMPs			
Modular Wetland	Bi- annual	Inspect and remove trash and debris from outlet pipe and vault twice a year.	Property Management Association
Hydrodynamic Separator	Bi-annual	Inspect and remove trash and debris from the collection chamber twice a year.	Property Management Association

BMP Name and BMP Implementation, Maintenance, and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Inspection / Maintenance Activities Required	Person or Entity with Operation & Maintenance Responsibility
Diversion Structure	Every two months	Inspect and remove trash and debris as necessary from the diversion box every two months.	Property Management Association
Underground Detention System	Bi-annual	Inspect and remove trash and debris from the detention system twice a year.	Property Management Association
Strom Drain Pump Systems	TBD	TBD	Property Management Association

Vector note: Vector control is provided through the proper sizing of BMPs. BMPs are designed to drain completely within 48 hours. Any ponded water on-site in excess of a 24-hour period is an indication that storm drain system maintenance and inspection is required.

ATTACHMENT A

303d LIST OF IMPAIRED WATER BODIES

Final California 2014 and 2016 Integrated Report (303(d) List/305(b) Report)

Supporting Information

Regional Board 8 - Santa Ana Region

Water Body Name: Los Alamitos Channel
Water Body ID: **CAR8456100020161109050078**
Water Body Type: **River & Stream**

DECISION ID **65265** **Region 8**
Los Alamitos Channel

Pollutant: **Arsenic**
Final Listing Decision: **Do Not List on 303(d) list (TMDL required list)**
Last Listing Cycle's Final Listing Decision: New Decision
Revision Status Revised
Impairment from Pollutant or Pollution: Pollutant

Regional Board Conclusion:

This pollutant is being considered for placement on the CWA section 303(d) List under section 3.1 of the Listing Policy. Under section 3.1, a single line of evidence is necessary to assess listing status.

One line of evidence is available in the administrative record to assess this pollutant. Zero (0) of the one (1) sample exceeds the beneficial use criterion.

Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List.

This conclusion is based on the staff findings that:
1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy.
2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy.
3. Zero (0) of the one (1) sample exceeds the beneficial use criterion and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples are needed to determine if a beneficial use is fully supported using table 3.1.
4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.

Regional Board Decision Recommendation: After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.

State Board Review of Regional Board Conclusion and Recommendation:

State Board Decision Recommendation: After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65265, Arsenic **Region 8**
Los Alamitos Channel

LOE ID:	95772
Pollutant:	Arsenic
LOE Subgroup:	Pollutant-Sediment
Matrix:	Sediment
Fraction:	Total
Beneficial Use:	Warm Freshwater Habitat
Number of Samples:	1
Number of Exceedances:	0
Data and Information Type:	PHYSICAL/CHEMICAL MONITORING
Data Used to Assess Water Quality:	Water Board staff assessed SWAMP data for Los Alamitos Channel to determine beneficial use support and results are as follows: 0 of 1 samples exceed the criterion for Arsenic.
Data Reference:	Statewide Stream Pollution Trends Study 2008
SWAMP Data:	SWAMP
Water Quality Objective/Criterion:	Water Quality Control Plan for the San Diego Basin (SDRWQCB 2007): All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in, human, plant, animal, or aquatic life.
Objective/Criterion Reference:	Water Quality Control Plan, Santa Ana River Basin
Evaluation Guideline:	In freshwater sediments the probable effect concentration (predictive of sediment toxicity for sediment-dwelling organisms) for arsenic is 33 mg/Kg dry weight (MacDonald et al. 2000).
Guideline Reference:	Development and evaluation of consensus-based sediment quality guidelines for freshwater ecosystems. Environmental Contamination and Toxicology. 39: 20-31
Spatial Representation:	Data for this line of evidence for Los Alamitos Channel was collected at 1 monitoring site [Drainage East of San Gabriel River at Hgwy22 station (845SGRDRE).]
Temporal Representation:	Data was collected on a single day 5/20/2008.
Environmental Conditions:	Staff is not aware of any special conditions that might affect interpretation of the data.
QAPP Information:	SWAMP data collected before September 2008 followed the QAMP (2002), however there may have been overlap in QA.
QAPP Information Reference(s):	Quality Assurance Management Plan for the State of California's Surface Water Ambient Monitoring Program. Sacramento, CA. State Water Resources Control Board. SWAMP. December 2002 (1st version)

DECISION ID 65266 **Region 8**
Los Alamitos Channel

Pollutant:	**Bifenthrin**
Final Listing Decision:	**Do Not List on 303(d) list (TMDL required list)**
Last Listing Cycle's Final Listing Decision:	New Decision
Revision Status	Revised
Impairment from Pollutant or Pollution:	Pollutant
Regional Board Conclusion:	This pollutant is being considered for placement on the CWA section 303(d) List under section 3.1 of the Listing Policy. Under section 3.1, a single line of evidence is necessary to assess listing status. One line of evidence is available in the administrative record to assess this pollutant. One (1) of the one (1) sample exceeds the beneficial use criterion. Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List. This conclusion is based on the staff findings that: 1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy. 2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy. 3. Zero (0) of the one (1) sample exceeds the beneficial use criterion and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples are needed to determine if a beneficial use is fully supported using table 3.1. 4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.
Regional Board Decision Recommendation:	After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.
State Board Review of Regional Board Conclusion and Recommendation:	
State Board Decision Recommendation:	After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65266, Bifenthrin **Region 8**
Los Alamitos Channel

LOE ID:	95779
Pollutant:	Bifenthrin
LOE Subgroup:	Pollutant-Sediment
Matrix:	Sediment
Fraction:	Total
Beneficial Use:	Warm Freshwater Habitat
Number of Samples:	1
Number of Exceedances:	1
Data and Information Type:	PHYSICAL/CHEMICAL MONITORING
Data Used to Assess Water Quality:	Water Board staff assessed SWAMP data for Los Alamitos Channel to determine beneficial use support and results are as follows: 1 of 1 samples exceed the criterion for Bifenthrin.
Data Reference:	Statewide Stream Pollution Trends Study 2008
SWAMP Data:	SWAMP
Water Quality Objective/Criterion:	Water Quality Control Plan for the San Diego Basin (SDRWQCB 2007): All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in, human, plant, animal, or aquatic life.
Objective/Criterion Reference:	Water Quality Control Plan, Santa Ana River Basin
Evaluation Guideline:	The evaluation guideline for bifenthrin is the median lethal concentration (LC50) of 0.43 ug/g and is normalized by the percentage of organic carbon in the sediment sample. The LC50 0.43 ug/g is the geometric mean of LC50 values for bifenthrin from Amweg et al. (2005) and Amweg and Weston (2007).
Guideline Reference:	Use and Toxicity of Pyrethroid Pesticides in the Central Valley, California, USA. Environmental Toxicology and Chemistry, 24:966-972, with erratum 24:No. 5 Whole-sediment toxicity identification evaluation tools for pyrethroid insecticides: I. piperonyl butoxide addition. Environ. Toxicol. Chem. 26:2389-2396.
Spatial Representation:	Data for this line of evidence for Los Alamitos Channel was collected at 1 monitoring site [Drainage East of San Gabriel River at Hgwy22 station (845SGRDRE).]
Temporal Representation:	Data was collected on a single day 5/20/2008.
Environmental Conditions:	Staff is not aware of any special conditions that might affect interpretation of the data.
QAPP Information:	SWAMP data collected before September 2008 followed the QAMP (2002), however there may have been overlap in QA.
QAPP Information Reference(s):	Quality Assurance Management Plan for the State of California's Surface Water Ambient Monitoring Program. Sacramento, CA. State Water Resources Control Board. SWAMP. December 2002 (1st version)

DECISION ID 65267 **Region 8**
Los Alamitos Channel

Pollutant:	**Cadmium**
Final Listing Decision:	**Do Not List on 303(d) list (TMDL required list)**
Last Listing Cycle's Final Listing Decision:	New Decision
Revision Status	Revised
Impairment from Pollutant or Pollution:	Pollutant
Regional Board Conclusion:	This pollutant is being considered for placement on the CWA section 303(d) List under section 3.1 of the Listing Policy. Under section 3.1, a single line of evidence is necessary to assess listing status. One line of evidence is available in the administrative record to assess this pollutant. Zero (0) of the one (1) sample exceeds the beneficial use criterion.

Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List.

This conclusion is based on the staff findings that:
1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy.
2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy.
3. Zero (0) of the one (1) sample exceeds the beneficial use criterion and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples are needed to determine if a beneficial use is fully supported using table 3.1.
4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.

Regional Board Decision Recommendation: After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.

State Board Review of Regional Board Conclusion and Recommendation:

State Board Decision Recommendation: After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65267, Cadmium **Region 8**
Los Alamitos Channel

LOE ID:	95780
Pollutant:	Cadmium
LOE Subgroup:	Pollutant-Sediment
Matrix:	Sediment
Fraction:	Total
Beneficial Use:	Warm Freshwater Habitat
Number of Samples:	1
Number of Exceedances:	0
Data and Information Type:	PHYSICAL/CHEMICAL MONITORING
Data Used to Assess Water Quality:	Water Board staff assessed SWAMP data for Los Alamitos Channel to determine beneficial use support and results are as follows: 0 of 1 samples exceed the criterion for Cadmium.
Data Reference:	Statewide Stream Pollution Trends Study 2008
SWAMP Data:	SWAMP
Water Quality Objective/Criterion:	Water Quality Control Plan for the San Diego Basin (SDRWQCB 2007): All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in, human, plant, animal, or aquatic life.
Objective/Criterion Reference:	Water Quality Control Plan, Santa Ana River Basin
Evaluation Guideline:	In freshwater sediments the probable effect concentration (predictive of sediment toxicity for sediment-dwelling organisms) for cadmium is 4.98 mg/Kg dry weight (MacDonald et al. 2000).
Guideline Reference:	Development and evaluation of consensus-based sediment quality guidelines for freshwater ecosystems. Environmental Contamination and Toxicology. 39: 20-31
Spatial Representation:	Data for this line of evidence for Los Alamitos Channel was collected at 1 monitoring site [Drainage East of San Gabriel River at Hgwy22 station (845SGRDRE).]
Temporal Representation:	Data was collected on a single day 5/20/2008.
Environmental Conditions:	Staff is not aware of any special conditions that might affect interpretation of the data.

DECISION ID **65268** **Region 8**
Los Alamitos Channel

Pollutant: **Chlorpyrifos**
Final Listing Decision: **Do Not List on 303(d) list (TMDL required list)**
Last Listing Cycle's Final Listing Decision: New Decision
Revision Status Revised
Impairment from Pollutant or Pollution: Pollutant

Regional Board Conclusion: This pollutant is being considered for placement on the CWA section 303(d) List under section 3.1 of the Listing Policy. Under section 3.1, a single line of evidence is necessary to assess listing status.

One line of evidence is available in the administrative record to assess this pollutant. Zero (0) of the one (1) sample exceeds the beneficial use criterion.

Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List.

This conclusion is based on the staff findings that:
1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy.
2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy.
3. Zero (0) of the one (1) sample exceeds the beneficial use criterion and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples are needed to determine if a beneficial use is fully supported using table 3.1.
4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.

Regional Board Decision Recommendation: After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.

State Board Review of Regional Board Conclusion and Recommendation:

State Board Decision Recommendation: After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65268, Chlorpyrifos **Region 8**
Los Alamitos Channel

LOE ID:	95790
Pollutant:	Chlorpyrifos
LOE Subgroup:	Pollutant-Sediment
Matrix:	Sediment

Zero (0) of the one (1) sample exceeds the beneficial use criterion. Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List. This conclusion is based on the staff findings that: 1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy. 2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy. 3. Zero (0) of the one (1) sample exceeds the beneficial use criterion and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples are needed to determine if a beneficial use is fully supported using table 3.1. 4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.
Regional Board Decision Recommendation:	After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.
State Board Review of Regional Board Conclusion and Recommendation:	
State Board Decision Recommendation:	After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65271, Cyfluthrin Region 8
Los Alamitos Channel

LOE ID:	95793
Pollutant:	Cyfluthrin
LOE Subgroup:	Pollutant-Sediment
Matrix:	Sediment
Fraction:	Total
Beneficial Use:	Warm Freshwater Habitat
Number of Samples:	1
Number of Exceedances:	0
Data and Information Type:	PHYSICAL/CHEMICAL MONITORING
Data Used to Assess Water Quality:	Water Board staff assessed SWAMP data for Los Alamitos Channel to determine beneficial use support and results are as follows: 0 of 1 samples exceed the criterion for Cyfluthrin, total.
Data Reference:	Statewide Stream Pollution Trends Study 2008
SWAMP Data:	SWAMP
Water Quality Objective/Criterion:	Water Quality Control Plan for the San Diego Basin (SDRWQCB 2007): All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in, human, plant, animal, or aquatic life.
Objective/Criterion Reference:	Water Quality Control Plan, Santa Ana River Basin
Evaluation Guideline:	The evaluation guideline for cyfluthrin is the median lethal concentration (LC50) of 1.1 ug/g and is normalized by the percentage of organic carbon in the sediment sample. The LC50 1.1 ug/g is the geometric mean of LC50 values for cyfluthrin from Amweg et al. (2005).
Guideline Reference:	Use and Toxicity of Pyrethroid Pesticides in the Central Valley, California, USA. Environmental Toxicology and Chemistry, 24:966-972, with erratum 24:No. 5
Spatial Representation:	Data for this line of evidence for Los Alamitos Channel was collected at 1 monitoring site [Drainage East of San Gabriel River at Hgwy22 station (845SGRDRE).]
Temporal Representation:	Data was collected on a single day 5/20/2008.
Environmental Conditions:	Staff is not aware of any special conditions that might affect interpretation of the data.
QAPP Information:	SWAMP data collected before September 2008 followed the QAMP (2002), however there may have been overlap in QA.
QAPP Information Reference(s):	Quality Assurance Management Plan for the State of California's Surface Water Ambient Monitoring Program. Sacramento, CA. State Water Resources Control Board. SWAMP. December 2002 (1st version)

DECISION ID 65272 Region 8
Los Alamitos Channel

Pollutant:	**Cyhalothrin, Lambda**
Final Listing Decision:	**Do Not List on 303(d) list (TMDL required list)**
Last Listing Cycle's Final Listing Decision:	New Decision
Revision Status	Revised
Impairment from Pollutant or Pollution:	Pollutant
Regional Board Conclusion:	This pollutant is being considered for placement on the CWA section 303(d) List under section 3.1 of the Listing Policy. Under section 3.1, a single line of evidence is necessary to assess listing status. One line of evidence is available in the administrative record to assess this pollutant. Zero (0) of the one (1) sample exceeds the beneficial use criterion. Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List. This conclusion is based on the staff findings that: 1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy. 2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy. 3. Zero (0) of the one (1) sample exceeds the beneficial use criterion and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples are needed to determine if a beneficial use is fully supported using table 3.1. 4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.
Regional Board Decision Recommendation:	After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.
State Board Review of Regional Board Conclusion and Recommendation:	
State Board Decision Recommendation:	After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65272, Cyhalothrin, Lambda **Region 8**

Los Alamitos Channel

LOE ID:	95794
Pollutant:	Cyhalothrin, Lambda
LOE Subgroup:	Pollutant-Sediment
Matrix:	Sediment
Fraction:	Total
Beneficial Use:	Warm Freshwater Habitat
Number of Samples:	1
Number of Exceedances:	0
Data and Information Type:	PHYSICAL/CHEMICAL MONITORING
Data Used to Assess Water Quality:	Water Board staff assessed SWAMP data for Los Alamitos Channel to determine beneficial use support and results are as follows: 0 of 1 samples exceed the criterion for Cyhalothrin, lambda, total.
Data Reference:	Statewide Stream Pollution Trends Study 2008
SWAMP Data:	SWAMP
Water Quality Objective/Criterion:	Water Quality Control Plan for the San Diego Basin (SDRWQCB 2007): All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in, human, plant, animal, or aquatic life.
Objective/Criterion Reference:	Water Quality Control Plan, Santa Ana River Basin
Evaluation Guideline:	The evaluation guideline for lambda-cyhalothrin is the median lethal concentration (LC50) of 0.44 ug/g and is normalized by the percentage of organic carbon in the sediment sample. The LC50 0.44 ug/g is the geometric mean of LC50 values for lambda-cyhalothrin from Amweg et al. (2005).
Guideline Reference:	Use and Toxicity of Pyrethroid Pesticides in the Central Valley, California, USA. Environmental Toxicology and Chemistry, 24:966-972, with erratum 24:No. 5
Spatial Representation:	Data for this line of evidence for Los Alamitos Channel was collected at 1 monitoring site [Drainage East of San Gabriel River at Hgwy22 station (845SGRDRE).]
Temporal Representation:	Data was collected on a single day 5/20/2008.
Environmental Conditions:	Staff is not aware of any special conditions that might affect interpretation of the data.

DECISION ID **65274** **Region 8**
Los Alamitos Channel

Pollutant: **DDD (Dichlorodiphenyldichloroethane)**
Final Listing Decision: **Do Not List on 303(d) list (TMDL required list)**
Last Listing Cycle's Final Listing Decision: New Decision
Revision Status Revised
Impairment from Pollutant or Pollution: Pollutant

Regional Board Conclusion: This pollutant is being considered for placement on the CWA section 303(d) List under section 3.1 of the Listing Policy. Under section 3.1, a single line of evidence is necessary to assess listing status.

One line of evidence is available in the administrative record to assess this pollutant. Zero (0) of the one (1) sample exceeds the beneficial use criterion.

Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List.

This conclusion is based on the staff findings that:
1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy.
2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy.
3. Zero (0) of the one (1) sample exceeds the beneficial use criterion and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples are needed to determine if a beneficial use is fully supported using table 3.1.
4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.

Regional Board Decision Recommendation: After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.

State Board Review of Regional Board Conclusion and Recommendation:

State Board Decision Recommendation: After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65274, DDD (Dichlorodiphenyldichloroethane) **Region 8**
Los Alamitos Channel

LOE ID:	95769
Pollutant:	DDD (Dichlorodiphenyldichloroethane)
LOE Subgroup:	Pollutant-Sediment
Matrix:	Sediment
Fraction:	Total
Beneficial Use:	Warm Freshwater Habitat
Number of Samples:	1
Number of Exceedances:	0
Data and Information Type:	PHYSICAL/CHEMICAL MONITORING
Data Used to Assess Water Quality:	Water Board staff assessed SWAMP data for Los Alamitos Channel to determine beneficial use support and results are as follows: 0 of 1 samples exceed the criterion for DDD.
Data Reference:	Statewide Stream Pollution Trends Study 2008
SWAMP Data:	SWAMP
Water Quality Objective/Criterion:	Water Quality Control Plan for the San Diego Basin (SDRWQCB 2007): All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in, human, plant, animal, or aquatic life.
Objective/Criterion Reference:	Water Quality Control Plan, Santa Ana River Basin
Evaluation Guideline:	In freshwater sediments the probable effect concentration (predictive of sediment toxicity for sediment-dwelling organisms) for sum of DDD is 28.0 ug/Kg dry weight (MacDonald et al. 2000).
Guideline Reference:	Development and evaluation of consensus-based sediment quality guidelines for freshwater ecosystems. Environmental Contamination and Toxicology. 39: 20-31
Spatial Representation:	Data for this line of evidence for Los Alamitos Channel was collected at 1 monitoring site [Drainage East of San Gabriel River at Hgwy22 station (845SGRDRE).]
Temporal Representation:	Data was collected on a single day 5/20/2008.
Environmental Conditions:	Staff is not aware of any special conditions that might affect interpretation of the data.

DECISION ID 65276 Region 8
Los Alamitos Channel

Pollutant:	**DDT (Dichlorodiphenyltrichloroethane)**
Final Listing Decision:	**Do Not List on 303(d) list (TMDL required list)**
Last Listing Cycle's Final Listing Decision:	New Decision
Revision Status	Revised
Impairment from Pollutant or Pollution:	Pollutant
Regional Board Conclusion:	This pollutant is being considered for placement on the CWA section 303(d) List under section 3.1 of the Listing Policy. Under section 3.1, a single line of evidence is necessary to assess listing status. Two lines of evidence are available in the administrative record to assess this pollutant. Zero (0) of the one (1) sample exceeds the beneficial use criterion for DDT and Total DDT. Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List. This conclusion is based on the staff findings that: 1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy. 2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy. 3. Zero (0) of the one (1) sample exceeds the beneficial use criterion for DDT and Total DDT and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples are needed to determine if a beneficial use is fully supported using table 3.1. 4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.
Regional Board Decision Recommendation:	After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.
State Board Review of Regional Board Conclusion and Recommendation:	
State Board Decision Recommendation:	After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65276, DDT (Dichlorodiphenyltrichloroethane) Region 8
Los Alamitos Channel

LOE ID:	95786

DECISION ID **65277** **Region 8**
Los Alamitos Channel

Pollutant:	**Deltamethrin**
Final Listing Decision:	**Do Not List on 303(d) list (TMDL required list)**
Last Listing Cycle's Final Listing Decision:	New Decision
Revision Status	Revised
Impairment from Pollutant or Pollution:	Pollutant
Regional Board Conclusion:	This pollutant is being considered for placement on the CWA section 303(d) List under section 3.1 of the Listing Policy. Under section 3.1, a single line of evidence is necessary to assess listing status. One line of evidence is available in the administrative record to assess this pollutant. Zero (0) of the one (1) sample exceeds the beneficial use criterion. Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List. This conclusion is based on the staff findings that: 1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy. 2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy. 3. Zero (0) of the one (1) sample exceeds the beneficial use criterion and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples are needed to determine if a beneficial use is fully supported using table 3.1. 4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.
Regional Board Decision Recommendation:	After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.
State Board Review of Regional Board Conclusion and Recommendation:	
State Board Decision Recommendation:	After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65277, Deltamethrin **Region 8**
Los Alamitos Channel

LOE ID:	95771
Pollutant:	Deltamethrin
LOE Subgroup:	Pollutant-Sediment

Matrix:	Sediment
Fraction:	Total
Beneficial Use:	Warm Freshwater Habitat
Number of Samples:	1
Number of Exceedances:	0
Data and Information Type:	PHYSICAL/CHEMICAL MONITORING
Data Used to Assess Water Quality:	Water Board staff assessed SWAMP data for Los Alamitos Channel to determine beneficial use support and results are as follows: 0 of 1 samples exceed the criterion for Deltamethrin.
Data Reference:	Statewide Stream Pollution Trends Study 2008
SWAMP Data:	SWAMP
Water Quality Objective/Criterion:	Water Quality Control Plan for the San Diego Basin (SDRWQCB 2007): All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in, human, plant, animal, or aquatic life.
Objective/Criterion Reference:	Water Quality Control Plan, Santa Ana River Basin
Evaluation Guideline:	The evaluation guideline for deltamethrin is the median lethal concentration (LC50) of 0.79 ug/g and is normalized by the percentage of organic carbon in the sediment sample. The LC50 0.79 ug/g is the geometric mean of LC50 values for deltamethrin from Amweg et al. (2005).

DECISION ID 65278 Region 8
Los Alamitos Channel

Pollutant:	**Diazinon**
Final Listing Decision:	**Do Not List on 303(d) list (TMDL required list)**
Last Listing Cycle's Final Listing Decision:	New Decision
Revision Status	Revised
Impairment from Pollutant or Pollution:	Pollutant
Regional Board Conclusion:	This pollutant is being considered for placement on the CWA section 303(d) List under section 3.1 of the Listing Policy. Under section 3.1, a single line of evidence is necessary to assess listing status. One line of evidence is available in the administrative record to assess this pollutant. Zero (0) of the one (1) sample exceeds the beneficial use criterion. Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List. This conclusion is based on the staff findings that: 1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy. 2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy. 3. Zero (0) of the one (1) sample exceeds the beneficial use criterion and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples are needed to determine if a beneficial use is fully supported using table 3.1. 4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.
Regional Board Decision Recommendation:	After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.
State Board Review of Regional Board Conclusion and Recommendation:	
State Board Decision Recommendation:	After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65278, Diazinon Region 8
Los Alamitos Channel

LOE ID:	95774
Pollutant:	Diazinon
LOE Subgroup:	Pollutant-Sediment
Matrix:	Sediment
Fraction:	Total
Beneficial Use:	Warm Freshwater Habitat
Number of Samples:	1
Number of Exceedances:	0
Data and Information Type:	PHYSICAL/CHEMICAL MONITORING
Data Used to Assess Water Quality:	Water Board staff assessed SWAMP data for Los Alamitos Channel to determine beneficial use support and results are as follows: 0 of 1 samples exceed the criterion for Diazinon.
Data Reference:	Statewide Stream Pollution Trends Study 2008
SWAMP Data:	SWAMP

Water Quality Objective/Criterion:	Water Quality Control Plan for the San Diego Basin (SDRWQCB 2007): All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in, human, plant, animal, or aquatic life.
Objective/Criterion Reference:	Water Quality Control Plan, Santa Ana River Basin
Evaluation Guideline:	The evaluation guideline for diazinon is the median lethal concentration (LC50) of 11 ug/g and is normalized by the percentage of organic carbon in the sediment sample. The LC50 11 ug/g is the geometric mean of LC50 values for diazinon from Ding et al. (2011).
Guideline Reference:	Toxicity of Sediment-Associated Pesticides to Chironomus dilutus and Hyalella azteca. Arch. Environ. Contam. Toxicol. 61:83?92.

DECISION ID 65286 Region 8
Los Alamitos Channel

Pollutant:	**Methyl Parathion**
Final Listing Decision:	**Do Not List on 303(d) list (TMDL required list)**
Last Listing Cycle's Final Listing Decision:	New Decision
Revision Status	Revised
Impairment from Pollutant or Pollution:	Pollutant

Regional Board Conclusion:

This pollutant is being considered for placement on the CWA section 303(d) List under section 3.1 of the Listing Policy. Under section 3.1, a single line of evidence is necessary to assess listing status.

One line of evidence is available in the administrative record to assess this pollutant. Zero (0) of the one (1) sample exceeds the beneficial use criterion.

Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List.

This conclusion is based on the staff findings that:
1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy.
2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy.
3. Zero (0) of the one (1) sample exceeds the beneficial use criterion and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples are needed to determine if a beneficial use is fully supported using table 3.1.
4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.

Regional Board Decision Recommendation:

After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.

State Board Review of Regional Board Conclusion and Recommendation:

State Board Decision Recommendation:

After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65286, Methyl Parathion **Region 8**
Los Alamitos Channel

LOE ID:	95784
Pollutant:	Methyl Parathion
LOE Subgroup:	Pollutant-Sediment
Matrix:	Sediment
Fraction:	Total
Beneficial Use:	Warm Freshwater Habitat
Number of Samples:	1
Number of Exceedances:	0
Data and Information Type:	PHYSICAL/CHEMICAL MONITORING
Data Used to Assess Water Quality:	Water Board staff assessed SWAMP data for Los Alamitos Channel to determine beneficial use support and results are as follows: 0 of 1 samples exceed the criterion for Parathion, Methyl.
Data Reference:	Statewide Stream Pollution Trends Study 2008
SWAMP Data:	SWAMP
Water Quality Objective/Criterion:	Water Quality Control Plan for the San Diego Basin (SDRWQCB 2007): All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in, human, plant, animal, or aquatic life.
Objective/Criterion Reference:	Water Quality Control Plan, Santa Ana River Basin
Evaluation Guideline:	The evaluation guideline for methyl parathion is the median lethal concentration (LC50) of 6 ug/g and is normalized by the percentage of organic carbon in the sediment sample. The LC50 6 ug/g is the geometric mean of LC50 values for methyl parathion from Ding et al. (2011).
Guideline Reference:	Toxicity of Sediment-Associated Pesticides to Chironomus dilutus and Hyalella azteca. Arch. Environ. Contam. Toxicol. 61:83?92.
Spatial Representation:	Data for this line of evidence for Los Alamitos Channel was collected at 1 monitoring site [Drainage East of San Gabriel River at Hgwy22 station (845SGRDRE).]
Temporal Representation:	Data was collected on a single day 5/20/2008.
Environmental Conditions:	Staff is not aware of any special conditions that might affect interpretation of the data.
QAPP Information:	SWAMP data collected before September 2008 followed the QAMP (2002), however there may have been overlap in QA.

DECISION ID **65287** **Region 8**
Los Alamitos Channel

Pollutant:	**Nickel**
Final Listing Decision:	**Do Not List on 303(d) list (TMDL required list)**
Last Listing Cycle's Final Listing Decision:	New Decision
Revision Status	Revised
Impairment from Pollutant or Pollution:	Pollutant

Regional Board Conclusion:

This pollutant is being considered for placement on the CWA section 303(d) List under section 3.1 of the Listing Policy. Under section 3.1, a single line of evidence is necessary to assess listing status.

One line of evidence is available in the administrative record to assess this pollutant. Zero (0) of the one (1) sample exceeds the beneficial use criterion.

Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List.

This conclusion is based on the staff findings that:

1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy.
2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy.
3. Zero (0) of the one (1) sample exceeds the beneficial use criterion and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples are needed to determine if a beneficial use is fully supported using table 3.1.
4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.

Regional Board Decision Recommendation: After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.

State Board Review of Regional Board Conclusion and Recommendation:

State Board Decision Recommendation: After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65287, Nickel **Region 8**
Los Alamitos Channel

DECISION ID **65549** **Region 8**
Los Alamitos Channel

Pollutant:	**Toxicity**
Final Listing Decision:	**Do Not List on 303(d) list (TMDL required list)**
Last Listing Cycle's Final Listing Decision:	New Decision
Revision Status	Revised
Impairment from Pollutant or Pollution:	Pollutant
Regional Board Conclusion:	This pollutant is being considered for placement on the CWA section 303(d) List under section 3.6 of the Listing Policy. Under section 3.6 at least one line of evidence is necessary to assess listing status for toxicity, and waters may be placed on the CWA section 303(d) List for toxicity alone. One line of evidence is available in the administrative record to assess sediment toxicity. One of the one samples exhibited sediment toxicity. Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification against placing this water segment-pollutant combination on the CWA section 303(d) List. This conclusion is based on the staff findings that: 1. The data used satisfies the data quality requirements of section 6.1.4 of the Policy. 2. The data used satisfies the data quantity requirements of section 6.1.5 of the Policy. 3. One of the one samples exhibited sediment toxicity, and this sample size is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating. A minimum of 16 samples is needed to determine if a beneficial use is fully supported using table 3.1. 4. Pursuant to section 3.11 of the Listing Policy, no additional data and information are available indicating that standards are not met.
Regional Board Decision Recommendation:	After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should not be placed on the section 303(d) list. The readily available data and information is insufficient to determine, with the power and confidence of the Listing Policy, the applicable beneficial use support rating.
State Board Review of Regional Board Conclusion and Recommendation:	
State Board Decision Recommendation:	After review of this Regional Board decision, SWRCB staff recommend the decision be approved by the State Board.

Line of Evidence (LOE) for Decision ID 65549, Toxicity **Region 8**
Los Alamitos Channel

LOE ID:	95787
Pollutant:	Toxicity
LOE Subgroup:	Toxicity
Matrix:	Sediment
Fraction:	None
Beneficial Use:	Warm Freshwater Habitat
Number of Samples:	1
Number of Exceedances:	1
Data and Information Type:	TOXICITY TESTING

Data Used to Assess Water Quality:	One sample was collected to evaluate sediment toxicity. The sample exhibited significant toxicity. The toxicity test included survival of Hyalella azteca. One sample can have multiple toxicity test results but will be counted only once.
Data Reference:	Statewide Stream Pollution Trends Study 2008
SWAMP Data:	SWAMP
Water Quality Objective/Criterion:	All waters shall be maintained free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in, human, plant, animal, or aquatic life. Region 4 Basin Plan.
Objective/Criterion Reference:	Water Quality Control Plan, Santa Ana River Basin
Evaluation Guideline:	Toxicity is defined as a statistically significant effect in the sample exposure compared to the control using EPA-recommended hypothesis testing. For SWAMP data exceedances are counted with the significant effect code SL. SL is defined as the result being significant compared to the negative control based on a statistical test, less than stated the alpha level, AND less than the evaluation threshold.
Guideline Reference:	Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Freshwater Invertebrates, Second Edition. U.S. Environmental Protection Agency Office of Research and Development, Duluth, MI , U.S. Environmental Protection Agency Office of Water, Washington, DC EPA-600/R-99/064
Spatial Representation:	The samples were collected at station 845SGRDRE.
Temporal Representation:	The samples were collected in May 2008.
Environmental Conditions:	
QAPP Information:	All data was collected following the Standard Operating Procedures and Data Quality Objectives outlined in the SWAMP QAMP, (Puckett, 2002). QA data are included in submission.

GEOTECHNICAL REPORT

NMG Geotechnical, Inc.

June 13, 2019

Project No. 19046-01

To: Shea Properties
130 Vantis, Suite 200
Aliso Viejo, California, 92656

Attention: Mr. Rick Rutecki, Vice President of Commercial Construction

Subject: Geotechnical Due Diligence Study for Proposed Mixed-Use Development at NE Quadrant of Siboney Street and Katella Avenue, City of Cypress, California

INTRODUCTION

In accordance with your request and authorization, NMG Geotechnical, Inc. (NMG) has performed a geotechnical feasibility study for the subject mixed-use development site in the City of Cypress, California. The approximately 13-acre site, located on the northeastern corner of Siboney Street and Katella Avenue, is currently a vacant lot covered primarily with mature asphalt pavement. The primary purpose of our study was to provide a summary of the geologic and geotechnical conditions of the site, along with an evaluation of the feasibility of the project with respect to geotechnical constraints. From these data, this report provides preliminary design recommendations to be used for your development cost estimating.

The site geologic conditions include the following:

- Predominantly silty and sandy soils in the upper 2 to 10 feet with relatively low expansion potentials;
- Compressible clayey and silty alluvium with some sand layers below 10 feet;
- Shallow groundwater;
- Located in a mapped liquefaction hazard zone;
- Not located within an Alquist-Priolo Fault Zone;
- No mapped faults in the immediate site area; and
- Subject to seismic shaking resulting from earthquakes produced by nearby active faults.

Seismic shaking, potential liquefaction induced ground settlement/deformation, shallow groundwater, and settlement of the heavier structures planned at the site are the primary geotechnical design constraints. Some type of ground improvement, such as rammed aggregate piers or stone columns, will significantly mitigate these constraints. Groundwater and wet soil conditions will require proactive measures during grading and construction of underground infrastructure. Based on our review, we conclude that the subject property is feasible for the planned development from a geotechnical viewpoint provided the recommendations herein are utilized during design and implemented during grading and construction.

Appendix D - Liquefaction Analysis

SCOPE OF SERVICES

Our scope of services for this study included the following:

- Research and review of in-house data (referenced in Appendix A) and our recent experience of this locale pertaining to the geologic conditions in the vicinity of the project, including underlying soil types, recent and historic groundwater levels, and grading impacts of saturated soil;
- Review of historic, site-specific project geotechnical reports related to prior studies at the site (referenced in Appendix A);
- Archive search for prior geotechnical reports through the City of Cypress;
- Site reconnaissance to observe existing conditions, locate existing groundwater observation wells and obtain current groundwater data;
- Observation and measurement of groundwater level in open excavation at construction site on the south side of Katella across from the subject site;
- Review of available online historic aerial photographs and topographic maps dating back to 1927;
- Obtaining a groundwater well permit from the County of Orange;
- Excavation of 5 small-diameter borings (one hollow-stem-auger boring to 20 feet below ground surface (bgs) and four hand-augered borings to 5 feet bgs). Disturbed bulk soil samples were collected from the upper 5 feet of each boring. After hand-augering the upper 5 feet, the deeper boring (OW-1) was excavated with a truck-mounted drill rig. Soil was sampled at select intervals using a California-type, split-spoon sampler with 2.5-inch-diameter brass rings, driven with a 140-pound automatic hammer dropping 30 inches. Resistance to driving was recorded in blows per foot and is shown on the boring logs in Appendix B. The drill rig was also used to collect ring samples from the bottom of the four hand-excavated borings.
- Collection of bulk soil samples and relatively undisturbed soil samples in the five borings;
- Laboratory testing of selected soil samples for classification and engineering properties;
- Conversion of the 20 foot boring (OW-1) to a groundwater observation well;
- Evaluation of site seismicity;

- Liquefaction analyses using cone penetrometer (CPT) data from a prior study (Leighton, 2017);
- Seismic settlement analysis;
- Static settlement analysis of planned major structures using the above mentioned CPT test results, along with assumed typical foundation loads;
- Review of ground improvement alternatives, including proposal from Western Ground Improvement;
- Preparation of this report summarizing our findings, conclusions and recommendations.

The approximate location of the borings excavated for this study and the three groundwater observation wells are shown on Figure 2, Boring, Well and CPT Location Map, at rear of text. The CPT soundings used in our settlement and liquefaction analyses are also shown on that figure. The CPT logs are included in Appendix B and the liquefaction analysis and settlement analyses from the CPT data are included in Appendix D.

SITE DESCRIPTION

The subject site is located just south of the Los Alamitos Race Track in the city of Cypress, California. Specifically, the site is bounded by Winners Circle street on the east, a large asphalt parking area to the north, Siboney Street on the west and Katella Avenue on the south. The site location is shown on Figure 1, Site Location Map.

The site is currently vacant and used for event parking. Temporary parking of trucks and trailers for a commercial business on a portion of the site (southwestern quadrant) was also observed during this study. Most of the site is covered by older degraded asphalt, with a small unpaved dirt area adjacent to the terminus of Winners Circle (cul-du-sac). The south and southwestern boundaries of the site along Katella Avenue consist of some landscaping, including mature eucalyptus trees, shrubs, and turf. There are existing light poles and various electrical utility boxes and lines within the site. The site is drained by two sets of drainage ditches that flow south toward storm drain grates that flow into underground storm drain pipes. A water main valve is present along Siboney Street near the southwest corner of the site. There are two groundwater observation wells which were installed by an unknown party sometime before 2008, during a previous investigation (GPI, 2008). Also, NMG recently installed a groundwater observation well in the southwest quadrant of the site.

PROPOSED DEVELOPMENT

The conceptual site plan (Option 1) by Architects Orange shows a mixed-use development with the following:

- A rectangular-shaped four-story hotel approximately 50 to 60 feet wide by 300 feet long at the southwest corner;
- Three stand-alone retail buildings ranging from 5,000 to 7,000 square feet each at the southeast corner; a 842-seat theater at the northeast corner;
- A four-story multi-family residential wrap-type structure roughly 380 feet by 370 feet, including an internal five-story parking structure, pool and two open court yard areas.

These proposed buildings are connected with pedestrian walkways and parking areas. Vehicular access to the site will be from multiple entry points off Katella Avenue (one), Siboney Street (two), and Winner's Circle (two off the cul-du-sac).

The preliminary grading plan by the project civil engineer, Kimley-Horn, shows large areas of fill on the order of 1 to 1.5 feet thick above existing elevations. Existing 4- to 5-foot-high berms along Katella Avenue and Siboney Street will be removed during grading.

We understand that an onsite below-ground storm water retention system, such as a Contech corrugated metal pipe system (8-foot-diameter pipes), will be required. The preliminary sizing of this system is on the order of 90 feet wide and over 300 feet long.

SITE HISTORY

Historic aerial photographs of the vicinity show that the subject site was used for agriculture prior to 1962. A ranch house, approximately ¼ mile to the west, was constructed in 1931. Plow rows can also be seen within the site as early as 1927. In 1947, a small horse-racing track was constructed near the ranch house. In 1953, a large horse-racing track was being constructed just north of the site. In 1963, the racetrack was completed, and the site was paved and used as a parking area for the track. During this time, residential neighborhoods were also constructed south of the site. By 1972, the horse race track had moved slightly to its current location. By 1994, Siboney Street was extended toward the race track and marked the western boundary of the site. The existing landscaped areas were also present by this time. By 2002, Winner's Circle was constructed, marking the eastern boundary of the site. By 2005, the retail buildings on the west of the subject site were constructed. The Costco store on the east was also being constructed in 2005. Since 2005, the site has remained in the same condition as present day.

PRIOR GEOTECHNICAL STUDIES

Available reports of prior geotechnical investigations of the subject site include those by Geotechnical Professionals, Inc., in 2008, and later by Leighton and Associates for potential commercial land developers in 2017 and 2019. A summary of these studies is provided below:

- The 2008 study evaluated the site for a potential retail development. It included subsurface exploration consisting of 10 CPTs to 50 feet and 8 hollow-stem borings up to 31.5 feet deep. Laboratory testing was performed on samples collected from the borings. They also measured groundwater levels in the borings and reported the existence of two previously installed groundwater monitoring wells (no origin given). The report provided recommendations for the retail development planned at that time (GPI, 2008).
- The 2017 study was performed to assist in a due diligence review for a different commercial development. The subsurface exploration consisted of 12 CPTs to 50 feet and shallow hand excavations for near-surface soil sampling. Limited laboratory testing was performed on those bulk soil samples. The report provided recommendations for the commercial development planned at that time (Leighton, 2017).
- The geotechnical study in 2019 was performed to evaluate a different potential retail development. This study included 8 new CPTs to 50 feet and 9 hollow-stem borings up to 53 feet deep. Laboratory testing was performed on samples collected from the borings. They also measured groundwater levels in the borings. The report provided recommendations for the retail development planned at that time (Leighton, 2019).

Additional studies and associated reports may exist but they were not discovered during this study. NMG explored and graded the Lyon Homes project currently being constructed near the subject site (NMG, 2017a, 2017b, 2018a, 2018b, 2018c). A list of these and other references are included in Appendix A.

SUMMARY OF GEOTECHNICAL CONDITIONS

Regional Geologic Setting: The subject site is located within the Downey Plain, a sub-basin of the larger Los Angeles basin. The site is underlain by approximately 100 feet of Holocene sediments and a total of approximately 2,600 feet of Quaternary sediments (CDMG, 1980).

Earth Units and Soil Characteristics: Below the asphalt pavement, prior studies reported between 2 to 9 feet of undocumented artificial fill consisting of moist to wet, moderately to poorly compacted sand, silty to clayey sands and silty clays. Borings across the site indicate the undocumented fill is generally 2 to 5 feet thick with dry densities in the upper 5 feet over 100 pcf (only one test of 98 pcf and one as high as 114 pcf). The deepest undocumented fill appears to be in the southeast corner of the site where two borings encountered 7 to 9 feet of fill. The boring logs reported fragments of fabric, asphalt, brick, concrete and clay pipe (GPI, 2008 and Leighton, 2019). The underlying alluvium consists of similar materials: sands, and silts to 10 feet below ground surface (bgs), and silty clays and clay with thin sand layers from 10 to 30 feet. The alluvial material was described as moist to wet and medium dense/stiff to firm. Significant sand

layers were observed below 30 feet interlayered with the silty clay and clay. The near-surface soil (undocumented fill) is predominantly silty and sandy.

Moisture contents of soil at 5 feet bgs ranged from ranged from 20.8 to 26.9 percent. Dry densities ranged from 92.0 to 102.7 pcf. Four expansion index tests for this study resulted in "very low" potentials. Soluble sulfate contents were in the "S0" category (negligible). Two R-value tests had R-values of 16 and 60. Test results are included and summarized in Appendix C and the boring logs are included in Appendix B.

Settlement analyses using prior CPT data resulted in static settlements on the order of 2 to 3 inches for shallow foundations with assumed typical structural loads for the proposed buildings. In addition, seismically induced settlements were calculated to be on the order of 1 to 3 inches.

Existing Asphalt Section: Existing asphalt concrete (AC) and aggregate base (AB) was observed in three of the five borings for this study. AC thicknesses ranged from 2 to 3 inches and the AB layer was approximately 2 inches thick.

At the two other boring locations, the existing pavement was so deteriorated that there were no distinct AC or AB sections. Prior borings by others did not report any AC or AB thicknesses.

Groundwater: Groundwater at the site is very shallow, ranging from approximately 4½ to 6 feet bgs as measured on April 16, 2019 in two groundwater monitoring wells (MW-1 and MW-2) located onsite (Figure 1). In addition, we measured groundwater at approximately 6 feet BGS in an open trench at the construction site on the southwest corner of Katella Avenue and Winners Circle on April 16, 2019. These measured levels are consistent with the prior study by GPI in 2008, where they measured very similar depths, and NMG's recent subsurface exploration and grading experience (2017 through 2019) at the Ovation Flora Park development located ¼ mile to the west, where we encountered groundwater as shallow as 3½ feet bgs. Also, Geotracker data from sites near the subject property have reported groundwater anywhere from 1 to 7 feet bgs in recent years. These recent data indicate that historic high groundwater reported by CGS (approximately 10 feet bgs) is obsolete.

Groundwater level readings for our study from the two existing wells and the newly installed well are summarized below:

Well No.	Approximate Ground Elevation in Feet Above msl	Depth to Groundwater (Below Ground Surface)	
		April 16, 2019	*May 21, 2019*
OW-1	31	--	4.75
MW-1	32	4.6'	4.55'
MW-2	32	5.92'	5.8'

The direction of groundwater flow appears to have a slight gradient toward the south to southwest.

Seismicity, Faulting, and Seismic Hazards: Based on background review, no known active faults are located within or immediately adjacent to the subject site, nor is it located within an Alquist-Priolo Fault Rupture Hazard Zone (CGS, 2007). Therefore, the potential for primary ground rupture is considered very low at the site.

The site is mapped by the State of California as having potentially liquefiable soil (CGS, 1998). Leighton reported a PGA of 0.55 at the site with a seismic category of D according to their draft report. The primary seismic hazard at the subject site is ground shaking due to a future earthquake on one of the major regional active faults and potential ground deformation due to liquefaction.

Using the USGS de-aggregation computer program (USGS, 2017) and the site coordinates of 33.804 degrees north latitude and 118.042 degrees west longitude, the closest major active faults to the site are the Newport-Inglewood Fault, approximately 4.6 miles southwest of the site, and the Puente Hills Blind-Thrust Fault (Coyote Hills) located 6.1 miles northeast of the site, at depth.

The site is not located within a zone of earthquake induced landslide as mapped by the (CGS, 1998).

Tsunami and seiche are not considered secondary seismic hazards at this site due to the elevation and location.

Historic Seismicity: Based on the Environmental Geology of Orange County California (CDMG, 1976), there were reports of water/sand boils, earth and pavement cracks in the city of Cypress and surrounding cities during the March 10, 1933, Long Beach earthquake. Seismic settlement (induced subsidence) from this earthquake was measured to be approximately 0.5 inch through Los Alamitos, Cypress, and La Habra (CDMG, 1976). This earthquake occurred along the Newport-Inglewood Fault system.

Storm Water Treatment/Storage: The subject site is underlain by relatively fine sands, silts and clays in the upper 20 feet, with low permeabilities and shallow groundwater ranging from 4½ to 6 feet bgs. Therefore, the site is not suitable for storm water infiltration systems.

Underground treatment and/or storage systems must account for hydrostatic uplift (buoyant) forces due to the shallow groundwater.

CONCLUSIONS AND GENERAL RECOMMENDATIONS

Based on our feasibility-level study, the proposed development is feasible provided the main geotechnical constraints of compressible soils, seismically induced settlement, and seismic shaking are mitigated. The primary grading and construction phase issue will be the presence of shallow groundwater and associated saturated soil conditions which will be encountered during excavations for remedial removals and underground improvements. These and other conditions are discussed below.

1. Site Demolition

Aggregate derived from crushing existing AC and the existing AB may be suitable for stabilizing saturated excavation bottoms or as bedding under pipelines. These materials often can be tested and classified for use as crushed miscellaneous base (CMB), which can also be used for future pavements and below structural slabs-on-grade.

Existing buried structures, foundations, utilities and pipelines and prior backfill should be removed, with resulting excavations backfilled with engineered fill.

2. Foundation Types and Remedial Measures

Compressible and liquefiable soils at the site will require either deep foundations or some type of ground improvement for the larger buildings. The best suited ground improvement to mitigate settlement of the large structures should be stone columns or rammed aggregate piers (RAP) on the order of 15 feet deep. For the RAP method, we concur with the preliminary design values provided to you by a RAP specialty contractor using Geopier brand RAPs: bearing value of 7,000 psf; a coefficient of sliding resistance of 0.40; and total static and differential settlements limited to less than 1 inch and 1/2 inch in 30 feet, respectively. Additional differential seismic settlement on the order of 1 to 1.5 inches may be expected with RAPs.

Building areas where ground is improved with RAPs or stone columns should be provided with a minimum 2-foot-thick layer of newly compacted fill. Commonly, a surface layer of aggregate is recommended with RAPs or stone columns. This layer may be counted toward the 2-foot-thick layer recommendation. In other words, building pads may be graded with a 1-foot-thick layer of fill, left low by one foot, then capped with one foot of aggregate following RAP installation.

The smaller retail buildings may be supported on a combination of newly compacted fill and shallower ground improvement, such as aggregate and geogrid reinforcement. The fill material, including aggregate, should be a minimum of 5 feet below finish grade or 3 feet below bottom of foundations, whichever is deeper. The bottom of the excavation should have a layer of geogrid, such as Tensar 130 or BX1515 and a minimum of 2 feet of aggregate base. The remaining fill may be compacted native soil. The deeper undocumented fill in the southeast corner of the site (future retail shops area) as described in the Summary of Geotechnical Conditions, should be completely removed and replaced with engineered fill. Significant amounts of debris and/or larger sized debris should be culled from the removed soil prior to it being placed as compacted fill. These removals and replacement operations very likely will be below the groundwater table. Therefore, local dewatering and excavation bottom stabilization should be anticipated. With the

aforementioned remedial measures, total and differential settlements of the smaller retail buildings should be less than 1-inch and ½-inch over a 30-foot span.

RAPs or the above described geogrid and aggregate system is also recommended for larger walls, monuments, signs, etc. if designed with shallow spread footings.

3. Remedial Grading of Non-structural Areas

All other areas of the site which may have vehicular paving or hardscape improvements should be provided with a minimum of 2 feet of newly compacted fill below the bottom of pavements and slabs-on-grade. This grading should not be impacted by groundwater or wet soil conditions unless it is during the rainy season.

4. Shallow Groundwater and Wet Soil

Excavations deeper than 3 feet in some areas and 4 feet in others are likely to encounter shallow groundwater and/or soft, wet soil. Grading in these conditions will require some type of ground stabilization, such as cement treatment or aggregate or a combination of both. (Onsite soils are not suitable for lime treatment due to the primarily sandy composition.) Geofabric or geogrid is recommended in combination with aggregate to reduce the required depth of treatment, amount of aggregate and time required to backfill the excavations. Excavations and grading from existing ground surface to within 2 feet of the groundwater table, such as the grading for parking lot areas, will likely not require soft ground stabilization.

From our experience, 1.5 to 2 feet of cement-treated soil mixed at 6 percent cement content by weight was sufficient to stabilize wet excavation bottoms. For aggregate method, a geogrid, such as Tensar 130 placed on the bottom with approximately 1 to 2 feet aggregate, was sufficient to stabilize the bottoms enough to place native soil as compacted fill. Success factors for these methods included experienced contractor/operators for excavating wet ground without getting equipment mired; placement and spreading of stabilization materials; skilled soil treatment contractors using proper equipment and techniques; and good planning/staging for timely excavation and stabilization/fill placement.

Site soil conditions are not suited for pre-construction dewatering using a well point system; while there are abundant sandy soils, many of the sands have high silt and some clay content, which result in low permeabilities. Local sump pumps should be sufficient for areas where groundwater rises in an excavation. At the nearby Lyon Homes (Ovation) site, smaller excavation areas allowed for more rapid stabilization and backfilling without the need for significant use of sumps. Deeper excavations left open for longer periods or overnight will be prone to filling with standing groundwater.

Larger underground structures may require extra thickness of aggregate bedding due to the shallow groundwater and saturated soils. Cement-treated soil stabilization is also a viable option. Buried structures, such as storm water retention/treatment systems, must consider potential hydrostatic uplift forces in their design.

5. Slabs-on-Grade for Structures

Concrete slabs-on-grade under the structures should be a minimum of 4 inches thick and may be constructed over the aggregate layer above the RAPs or stone columns. The smaller retail building slabs may be constructed over the anticipated sandy subgrade fill.

6. Vehicular Pavements

Prior studies did not perform any R-value tests of onsite soil for vehicular paving design but assumed R-values are in the 40 to 60 range, owing to the near-surface soil being predominantly sandy. We believe these assumptions to be overly optimistic based on our local experience. The sands at the site are predominantly fine sands with significant amounts of silt and some clay. From our very limited testing (two R-value tests), we used a design R-value of 25 and assumed traffic indices (TIs) in order to arrive at the following preliminary pavement sections:

- Parking Stalls (little or no potential for heavier truck traffic): 3.5" AC/6" AB.
- Drive Aisles/Secondary Loop Roads (passenger cars, light duty trucks): 3.5" AC/ 7" AB.
- Main Entry Drives with Some Truck Traffic: 4" AC over 10" AB.

Final sections may change depending on postgrading soil testing for R-values and site specific traffic index values, which should be calculated by a traffic engineer. Truck ramps and loading docks will require thicker AC/AB sections or PCC pavements.

7. Earthwork Bulking and Shrinkage Factors

For estimating grading quantities, the following shrinkage factors are provided:

- Existing Fill: 0 to 2 percent shrinkage
- Native Alluvium: 10 to 15 percent shrinkage

Ground subsidence due to grading operations should be less than 0.1 inch due to the age and prior use of the site.

8. Cement Type and Corrosivity

Soluble sulfate contents of soil at this and adjacent sites are in the "S0" category (negligible) and soil corrosivity is in the "moderately corrosive" category. Other soil chemical constituent contents, such as chlorides, were not particularly high as reported by others (Leighton, 2019 and GPI, 2008).

9. Exterior Hardscape

Following site grading, near-surface fills are expected to have "very low" to "low" expansion potential, though some occurrences of "medium" expansive soils cannot be completely ruled out. For estimating purposes, you may assume concrete hardscape designed and constructed for "low" expansion potentials, overall. Final hardscape design should be based on soil sampling and laboratory testing following the completion of site grading.

Concrete flatwork for people spaces, walkways, sidewalk, etc., may be 4 inches thick with appropriate control and expansion joints, as specified by a landscape architect to mitigate concrete shrinkage cracking. No reinforcement, subbase or AB is required from an expansive soil standpoint.

10. Additional Exploration, Testing, and Analyses

- The need for additional exploration (borings, test pits or CPTs) and laboratory testing of soil should be evaluated once the development plan is finalized, especially the structural characteristics and structure locations.
- Exploration with a backhoe is recommended to further investigate the extent and depths of the undocumented fill.
- Settlement analyses should be refined once actual rather than the assumed structural foundation loads are available.
- The final grading plan should be reviewed by the geotechnical consultant and the remedial grading recommendations in this report should be re-evaluated in light of the planned cuts and fills and extent of ground improvement measures.
- Pavement designs should be finalized based on TIs provided by a traffic engineer and R-value testing of near-surface soil following grading of the site.
- The groundwater monitoring wells should be read periodically leading up to the start of grading. We recommend two readings during the summer months and two in the fall and winter.
- The design parameters and recommendations herein are based on the anticipated engineering properties of the onsite soil. Import soils, if required, should be evaluated and tested as necessary to verify their engineering properties are similar or better than the onsite soils.

11. Limitations

This report has been prepared for the exclusive use of our client, Shea Properties, within the specific scope of services requested by them for the Cypress mixed use project. This report or its contents should not be used or relied upon for other projects or purposes or by other parties without the written consent of Shea Properties and NMG. Our methodology for this study is based on local geotechnical standards of practice, care, and requirements of governing agencies for a given time. No warranty or guarantee, express or implied is given.

The findings, conclusions, and recommendations are professional opinions based on interpretations and inferences made from geologic and engineering data from specific locations and depths, observed or collected at a given time. By nature, geologic conditions can be very different in between data points, and can also change over time. Our conclusions and recommendations are subject to verification and/or modification with more exploration and/or during grading and construction when more subsurface conditions are exposed.

NMG's expertise and scope of services did not include assessment of potential subsurface environmental contaminants or environmental health hazards.

If you have any questions regarding this report, please contact our office. We appreciate the opportunity to provide our services.

Respectfully submitted,

Sampler and Symbol Descriptions

- Modified California sample (D-#)
- Standard Penetration Test (S-#)
- Undisturbed pushed tube sample (U-#)
- Large bulk sample (B-#)
- Small bulk sample (b-#)
- Approximate depth of groundwater during drilling
- Approximate depth of static groundwater

Note: Number of blows required to advance driven sample 12 inches (or length noted) is recorded.

Laboratory and Field Test Abbreviations

AL	Atterberg limits
CC	Chemical Testing incl. Soluble Sulfate
CN	Consolidation test
DS	Direct shear test
EI	Expansion Index
GS	Grain Size Analysis (Sieve, Hydro. and/or -No. 200)
MD	Compaction test
RV	Resistance Value (R-Value)
SE	Sand Equivalent
UU	Unconsolidated Shear Strength

GENERAL NOTES

1. Soil classifications are based on the Unified Soil System and include color, moisture, and relative density or consistency. Field descriptions have been modified to reflect results of laboratory tests where deemed appropriate. Bedrock descriptions are based on visual classification and include rock type, moisture, color, grain size, strength, and weathering.
2. Descriptions on these boring logs apply only at the specific boring locations and at the time the borings were made. They are not warranted to be representative of subsurface conditions at other locations or times.

Test Method:
ASTM D4829

HACH SF-1 (Turbidimetric)

Notes:
1. Expansion Index (EI) method of determination:
   [A] E.I. determined by adjusting water content to achieve a 50 ±1% degree of saturation
   [B] E.I. calculated based on measured saturation within the range of 40% and 60%
2. ASTM D4829 *(Classification of Expansive Soil)*
3. ACI-318-14 Table 19.3.1.1 *(Requirement for Concrete Exposed to Sulfate-Containing Solutions)*

Expansion Index and Soluble Sulfate Test Results

(FRM001 Rev.5)

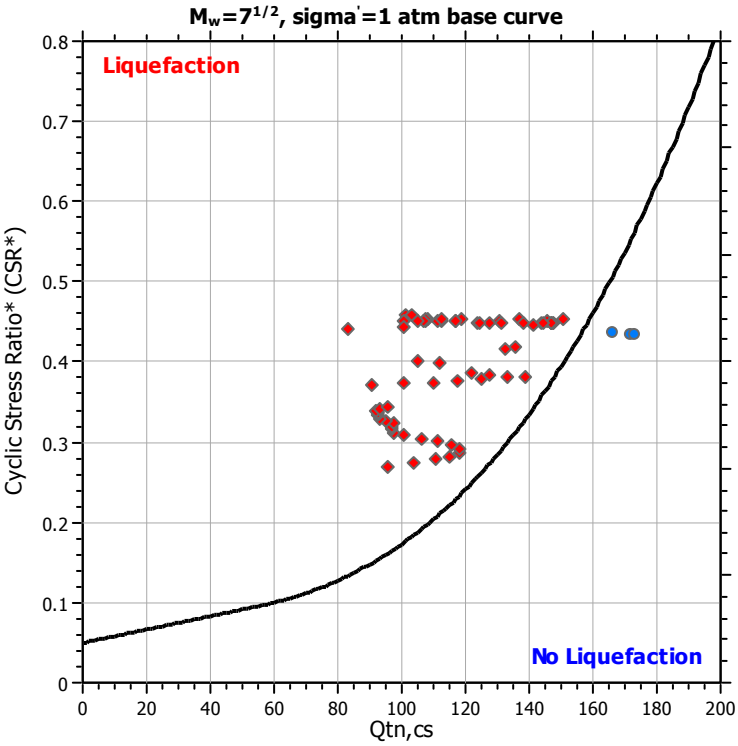
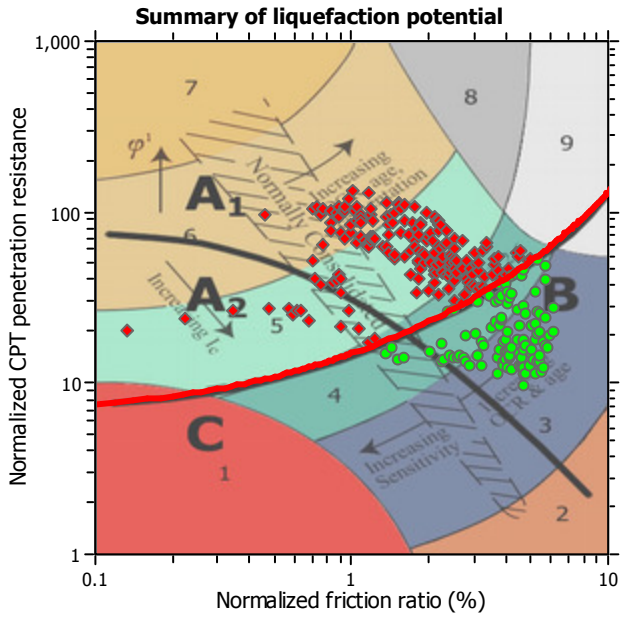
LIQUEFACTION ANALYSIS REPORT



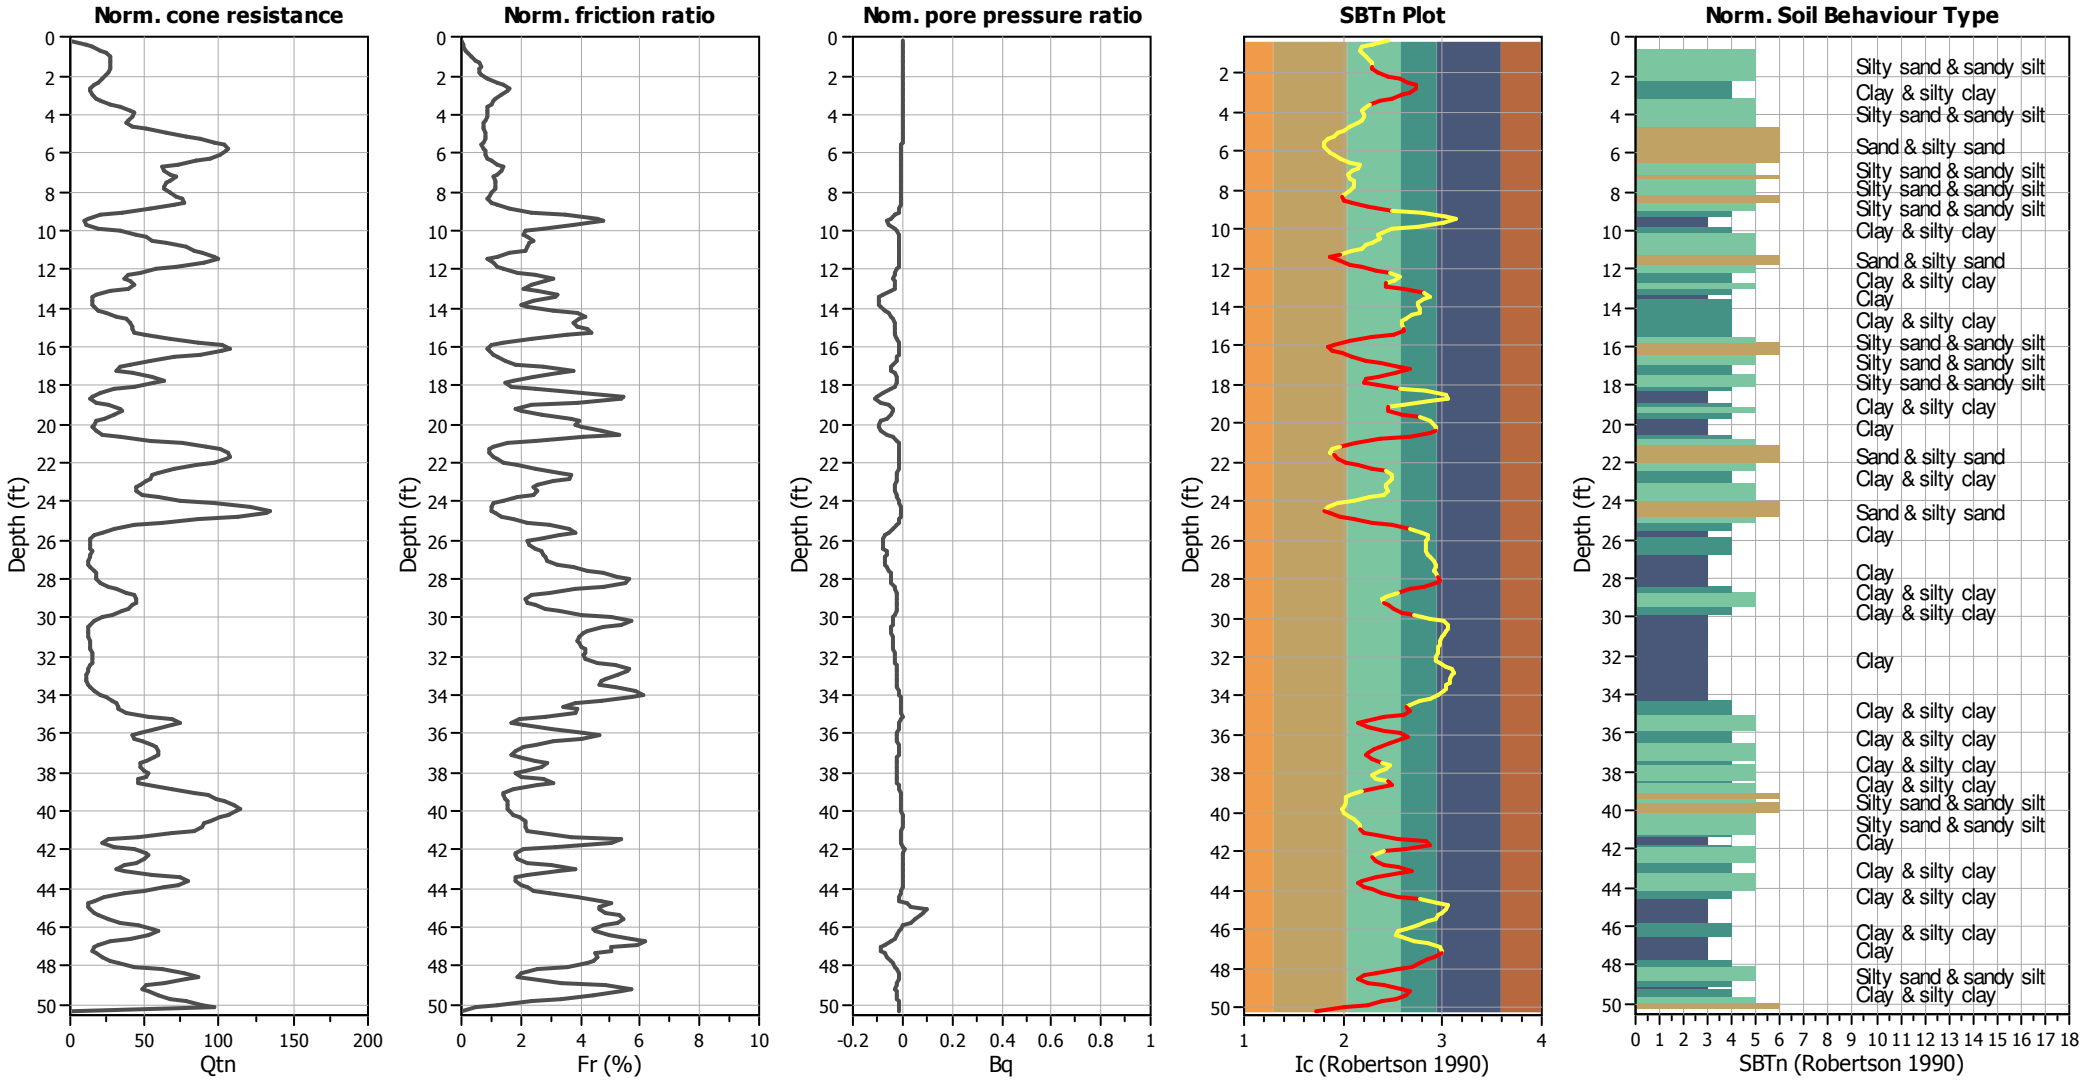
Project title : Shea Properties/Cypress **Location : Cypress, California**



CPT file : CPT- 1

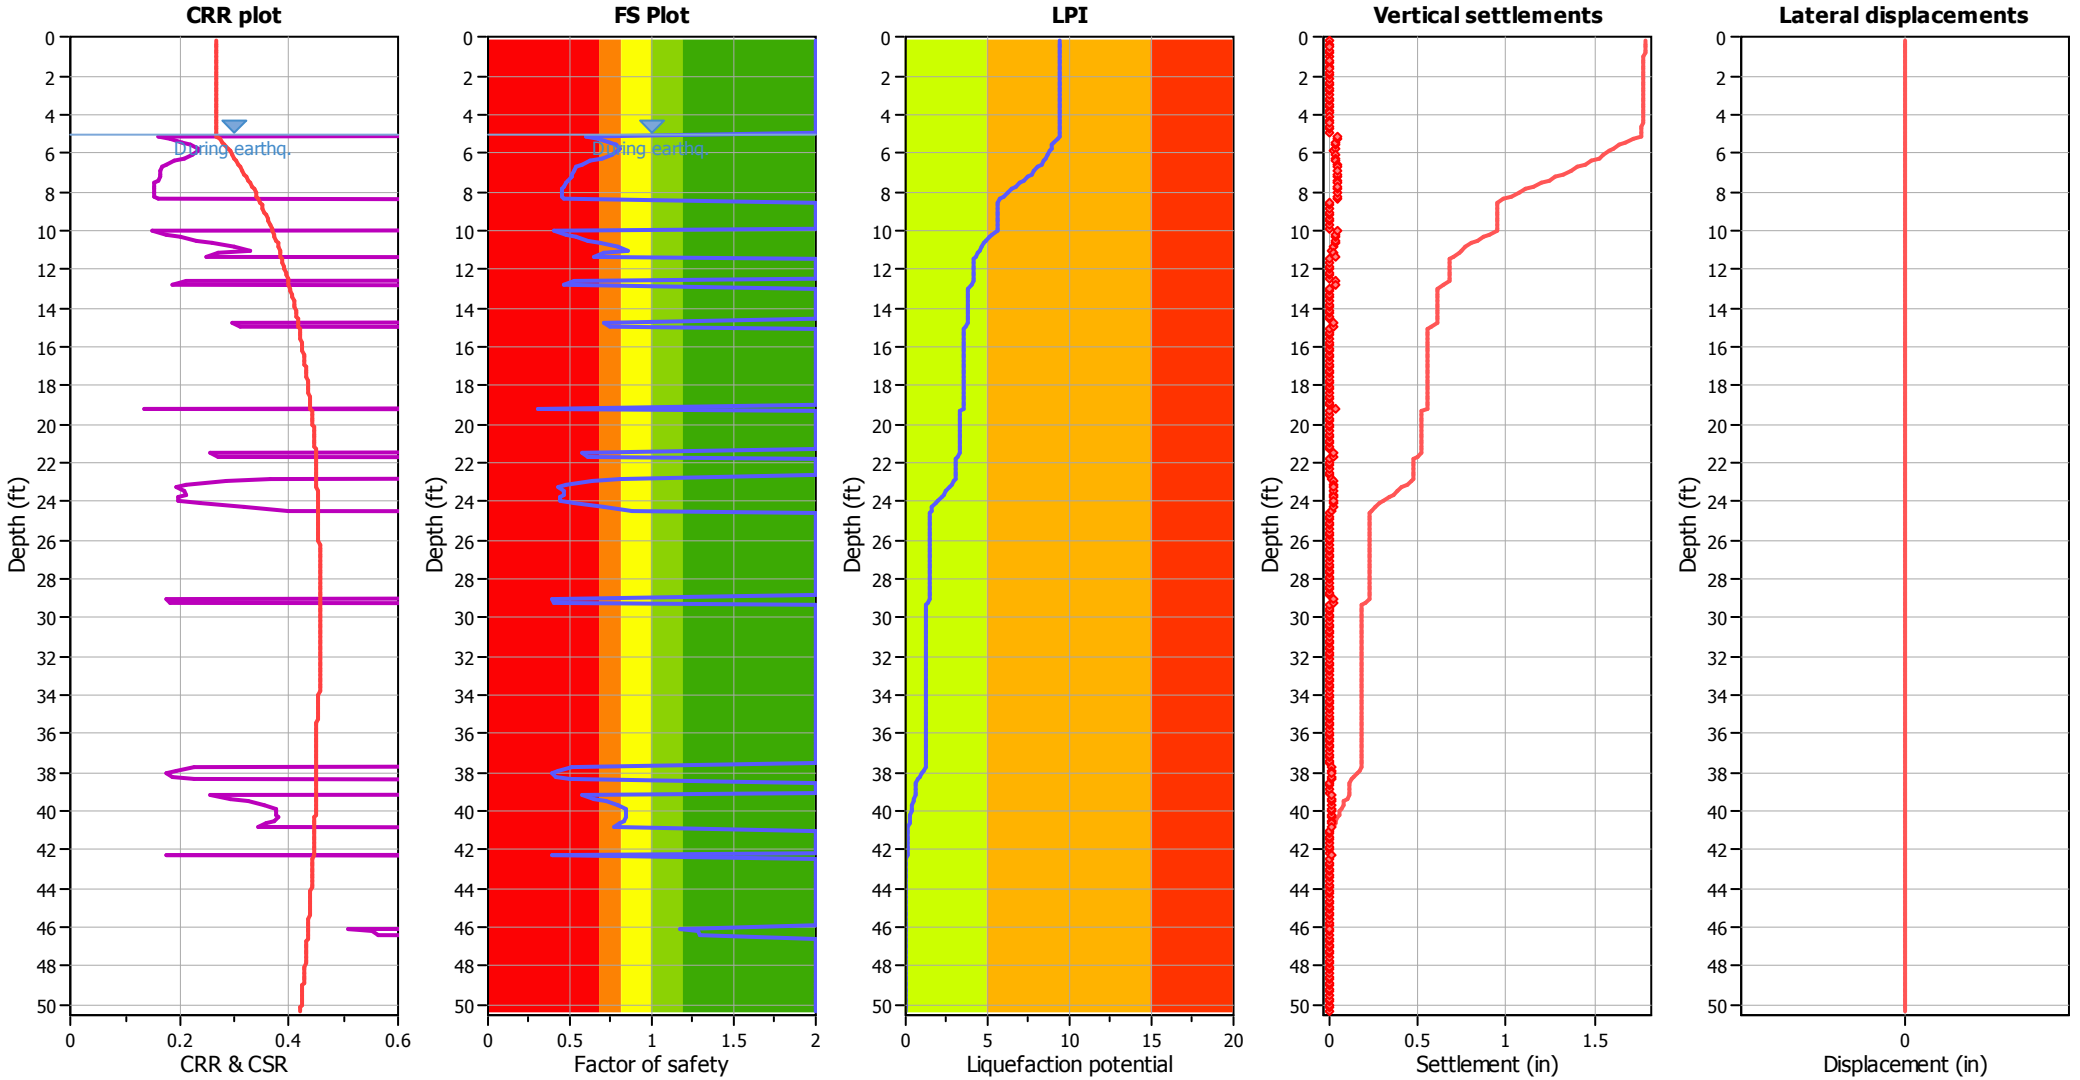
Input parameters and analysis data

Analysis method:	NCEER (1998)	G.W.T. (in-situ):	5.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	NCEER (1998)	G.W.T. (earthq.):	5.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	6.70	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method based
Peak ground acceleration:	0.55	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots (normalized)



Input parameters and analysis data

Analysis method:	NCEER (1998)	Depth to water table (erthq.):	5.00 ft	Fill weight:	N/A
Fines correction method:	NCEER (1998)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	6.70	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.55	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	5.00 ft	Fill height:	N/A	Limit depth:	N/A

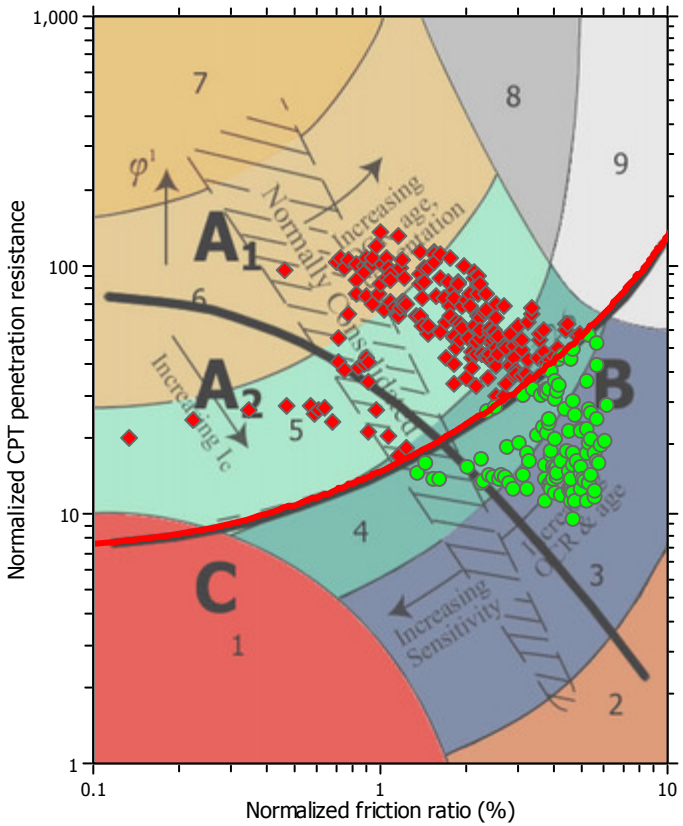
SBTn legend

1. Sensitive fine grained
2. Organic material
3. Clay to silty clay
4. Clayey silt to silty
5. Silty sand to sandy silt
6. Clean sand to silty sand
7. Gravely sand to sand
8. Very stiff sand to
9. Very stiff fine grained

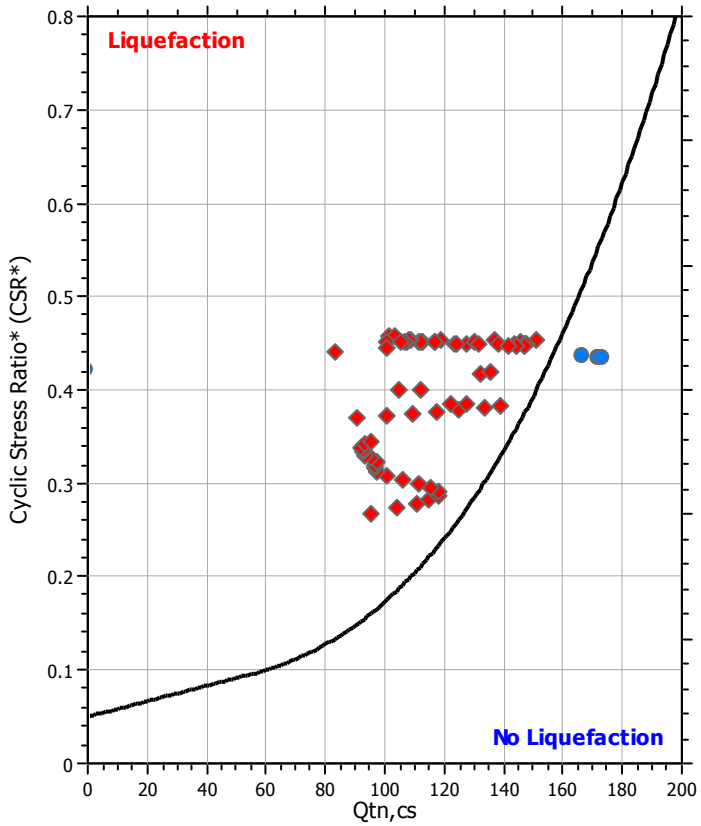
Liquefaction analysis overall plots

Input parameters and analysis data

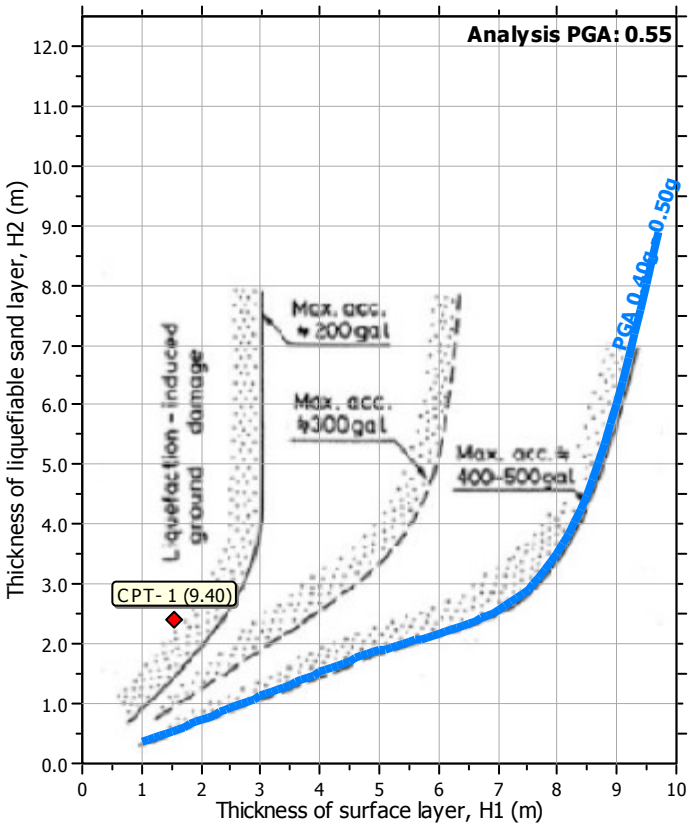
Analysis method:	NCEER (1998)	Depth to water table (erthq.):	5.00 ft	Fill weight:	N/A
Fines correction method:	NCEER (1998)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	6.70	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.55	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	5.00 ft	Fill height:	N/A	Limit depth:	N/A



F.S. color scheme



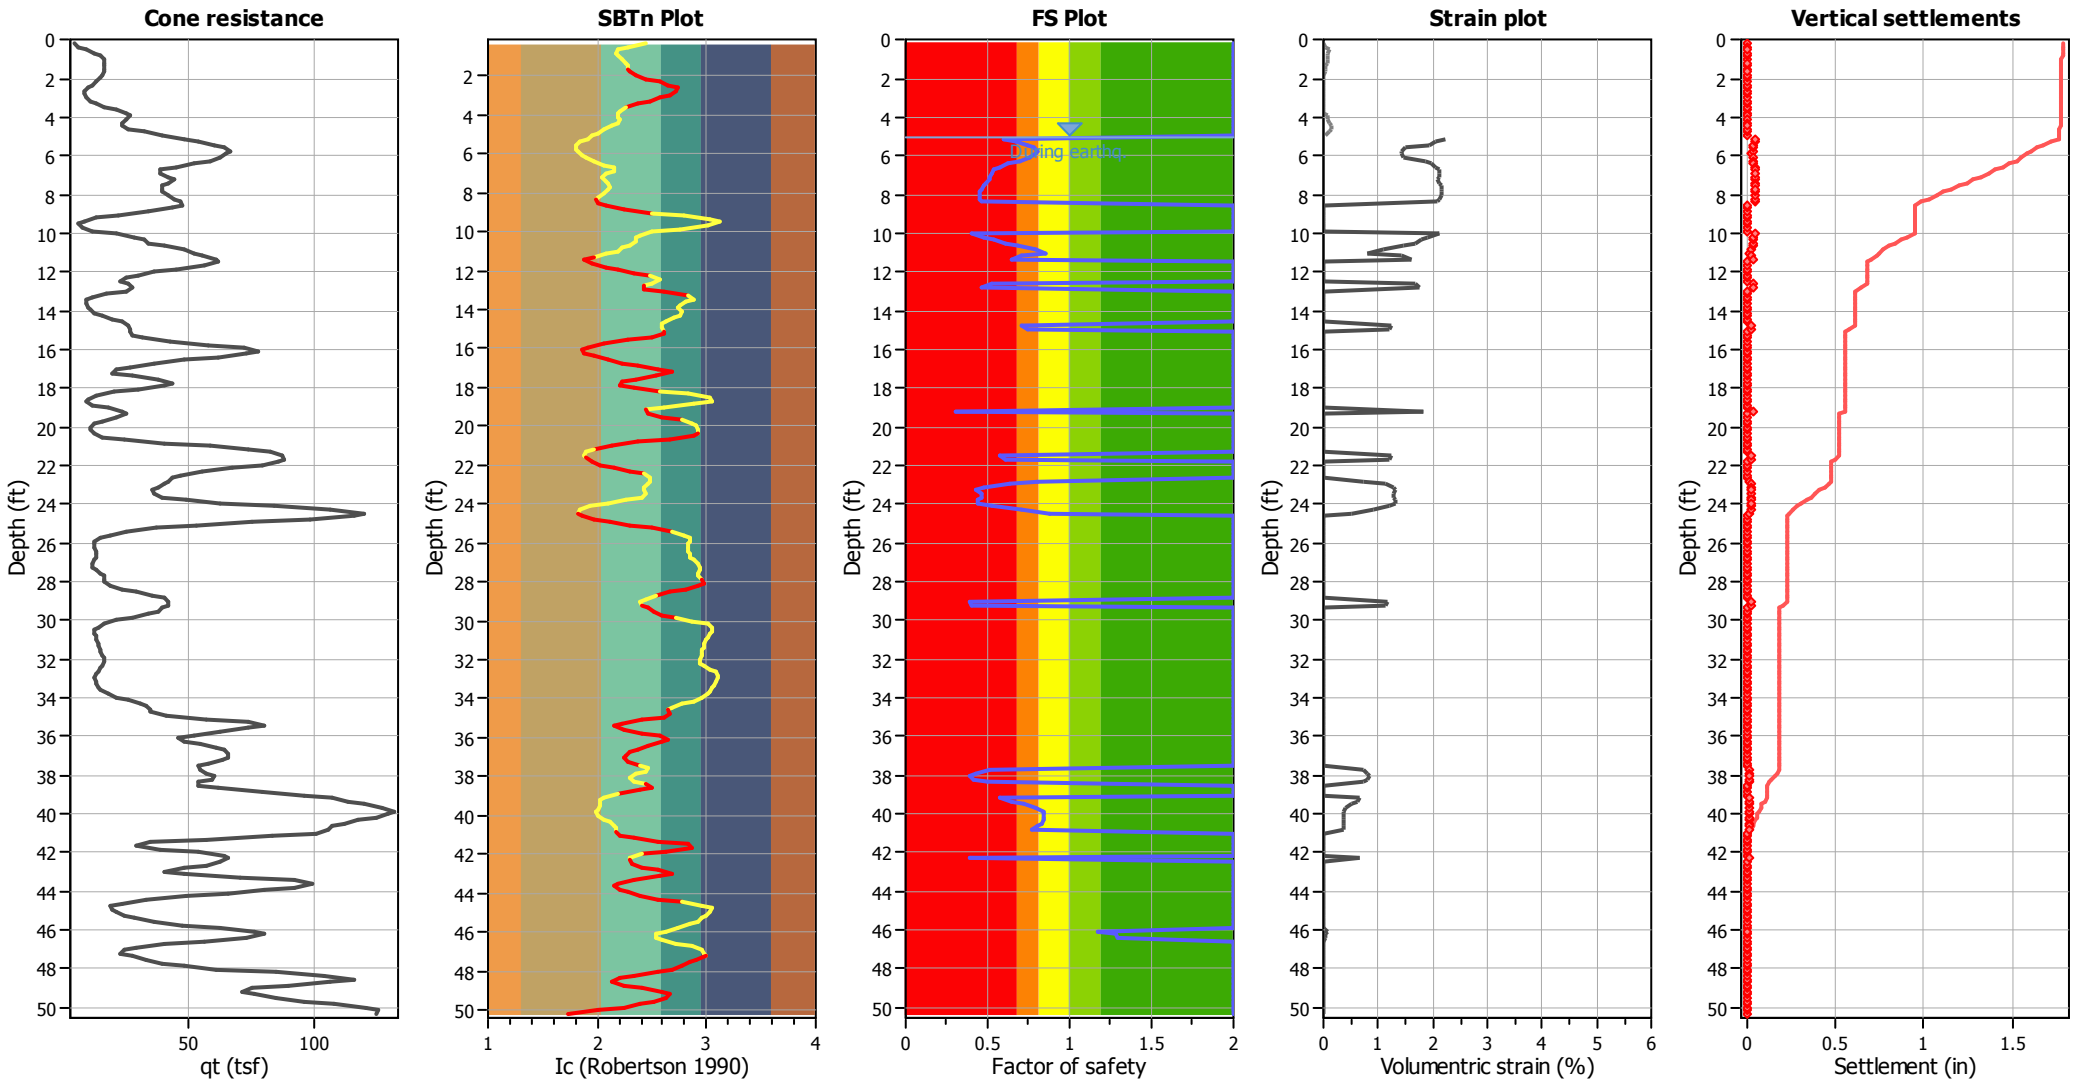
- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy



LPI color scheme

- Very high risk
- High risk
- Low risk

Liquefaction analysis summary plots



Input parameters and analysis data

Analysis method:	NCEER (1998)	Depth to water table (erthq.):	5.00 ft	Fill weight:	N/A
Fines correction method:	NCEER (1998)	Average results interval:	3	Transition detect. applied:	Yes

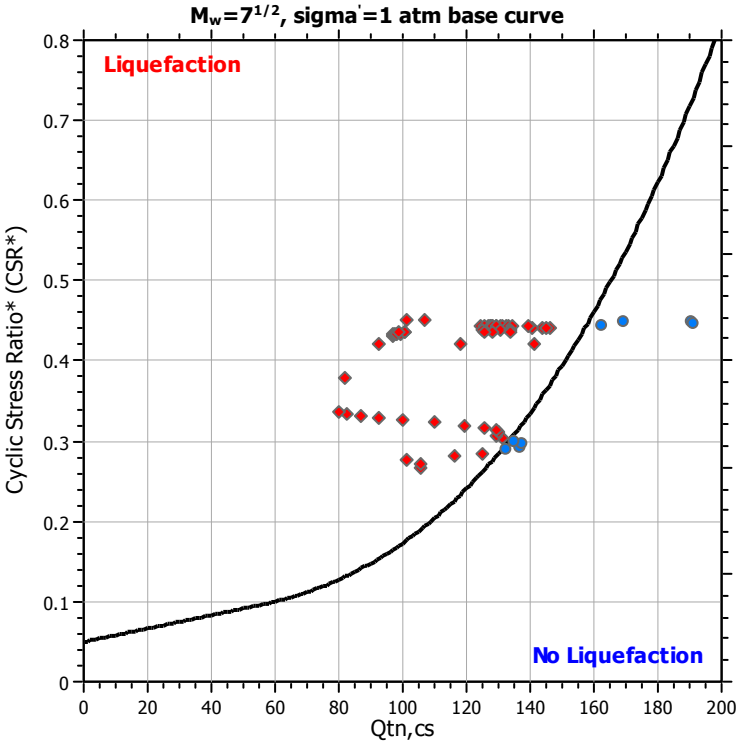
LIQUEFACTION ANALYSIS REPORT



Project title : Shea Properties/Cypress **Location : Cypress, California**

CPT file : CPT- 9

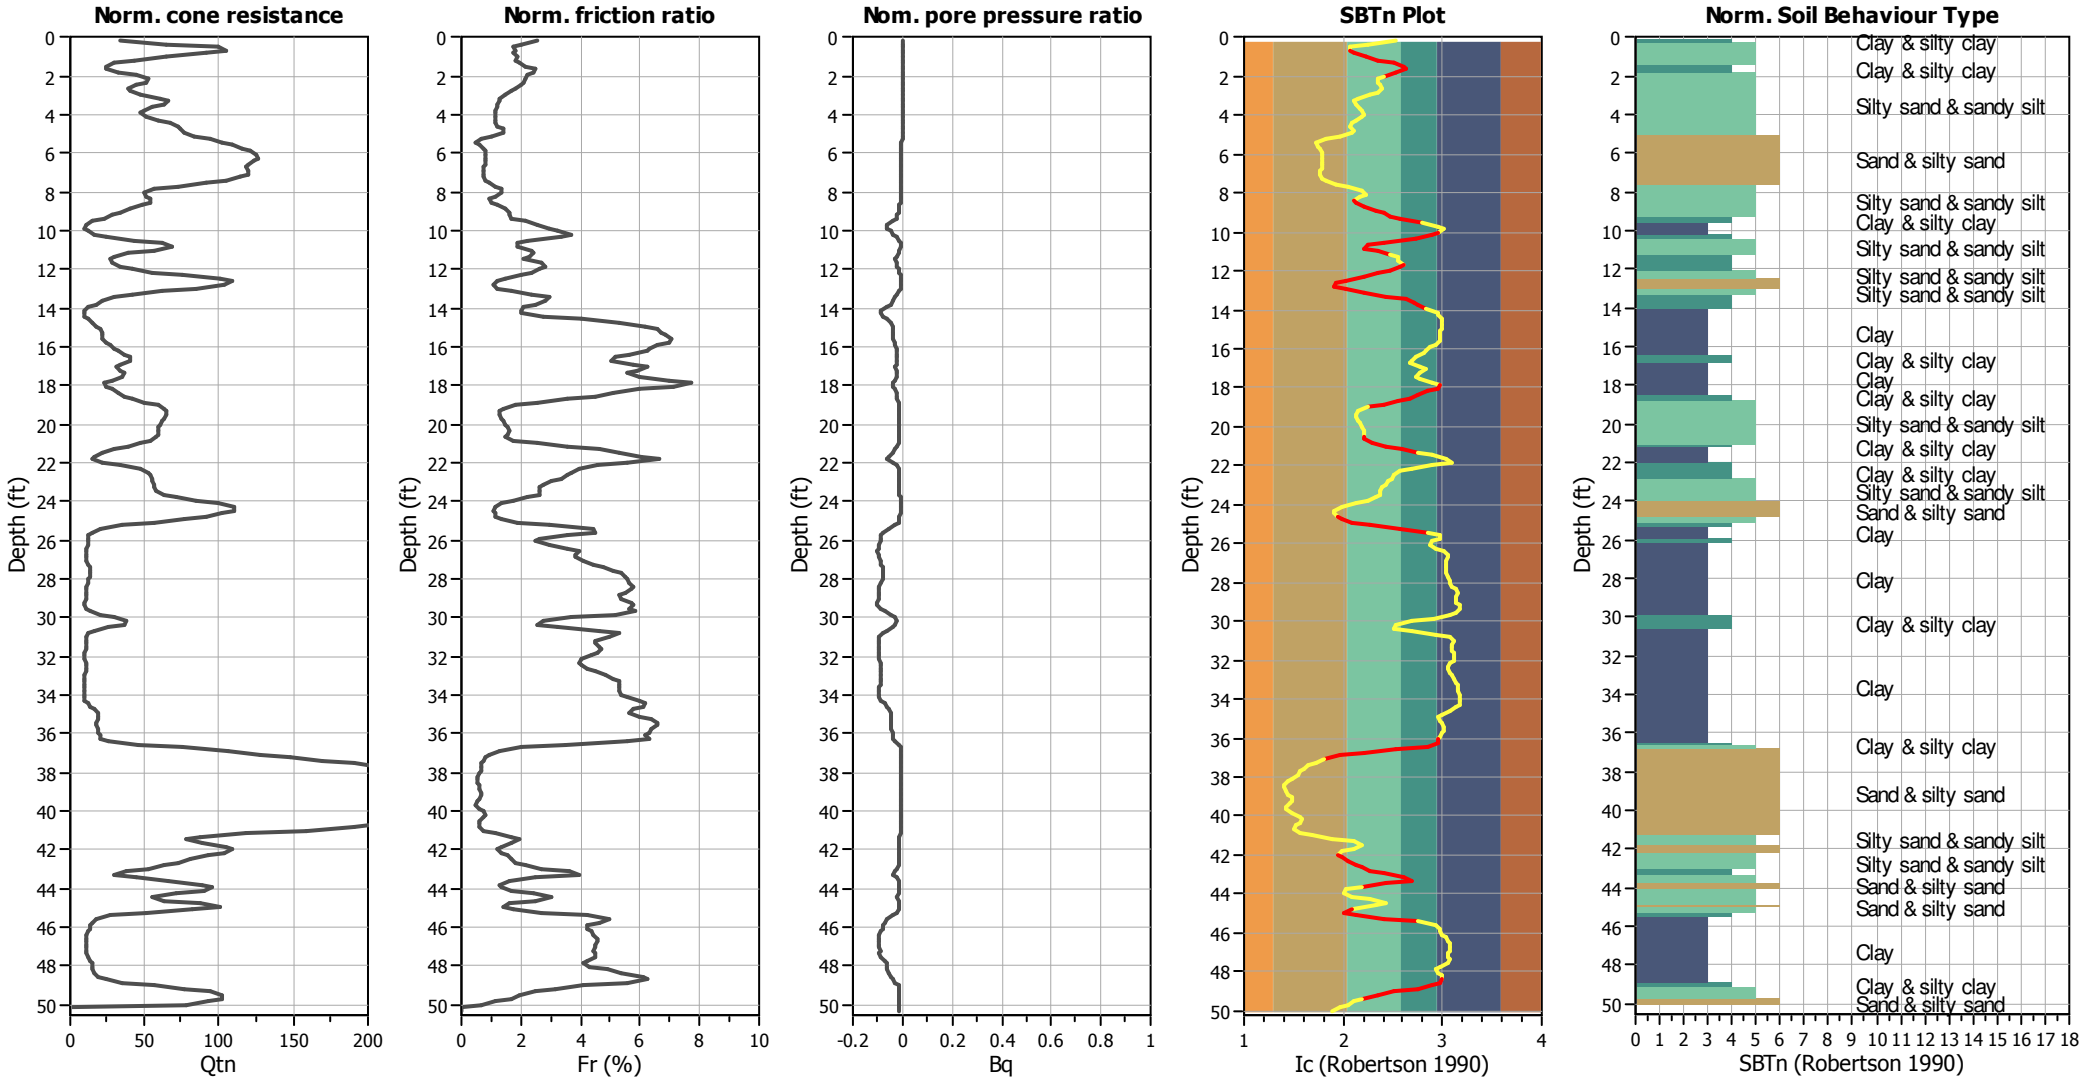
Input parameters and analysis data

Analysis method:	NCEER (1998)	G.W.T. (in-situ):	5.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	NCEER (1998)	G.W.T. (earthq.):	5.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	6.70	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method based
Peak ground acceleration:	0.55	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots (normalized)

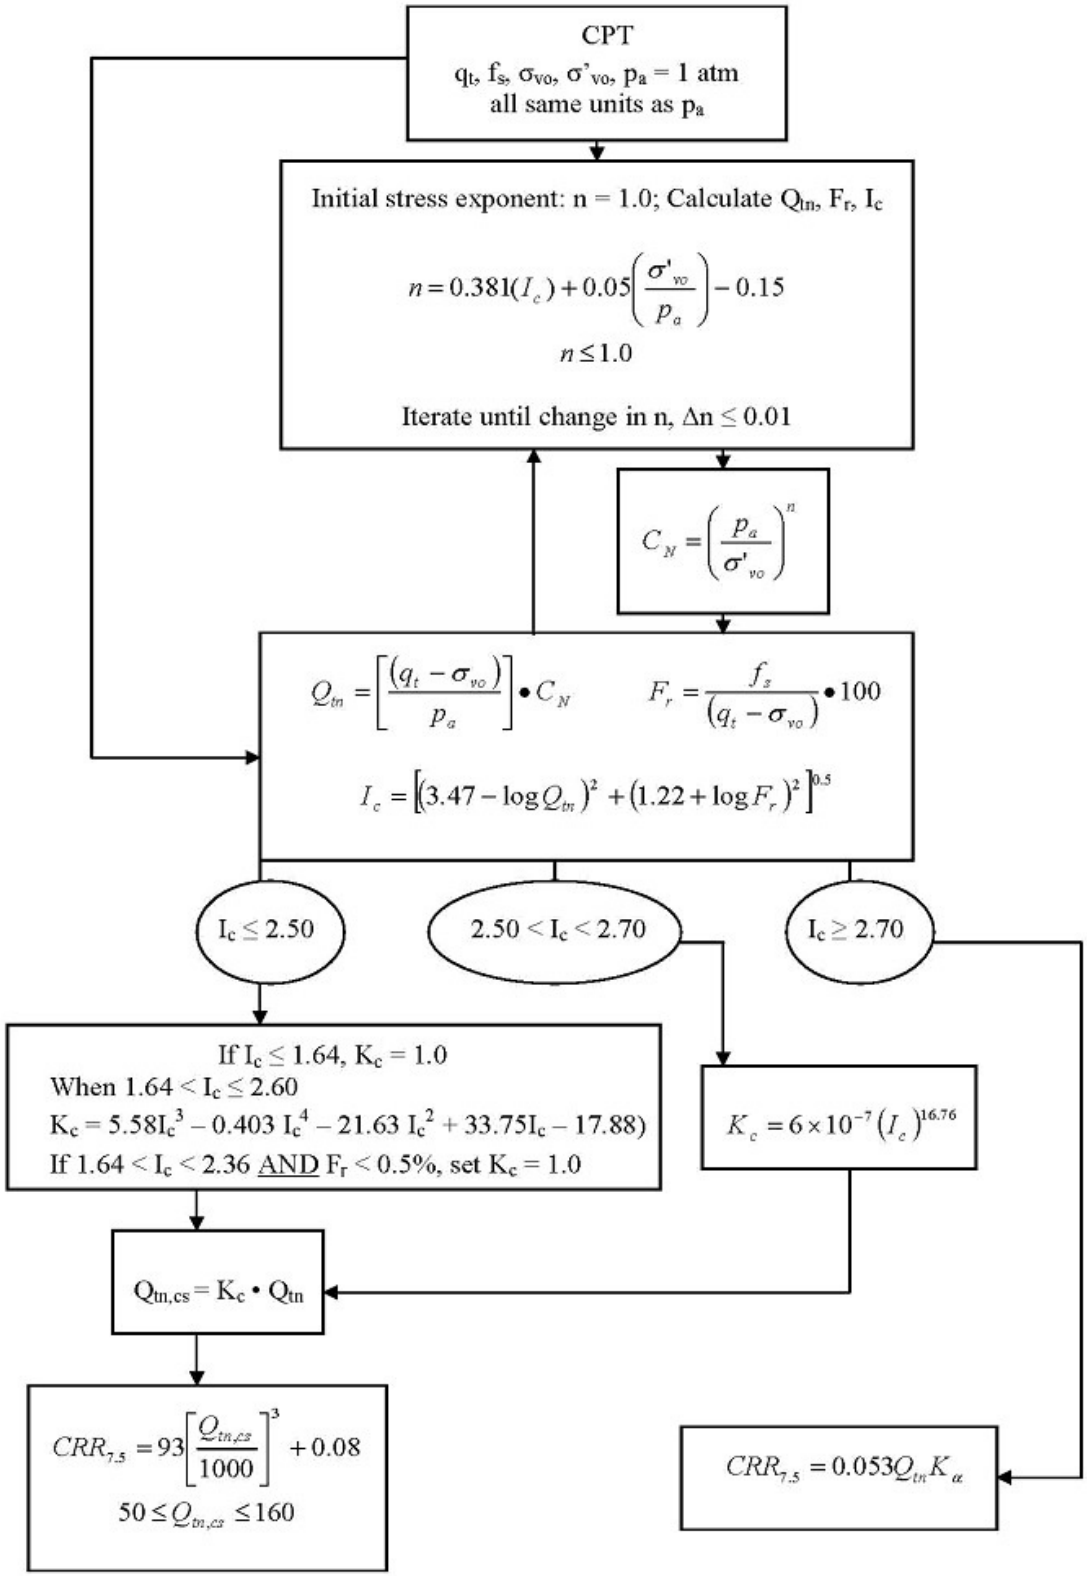
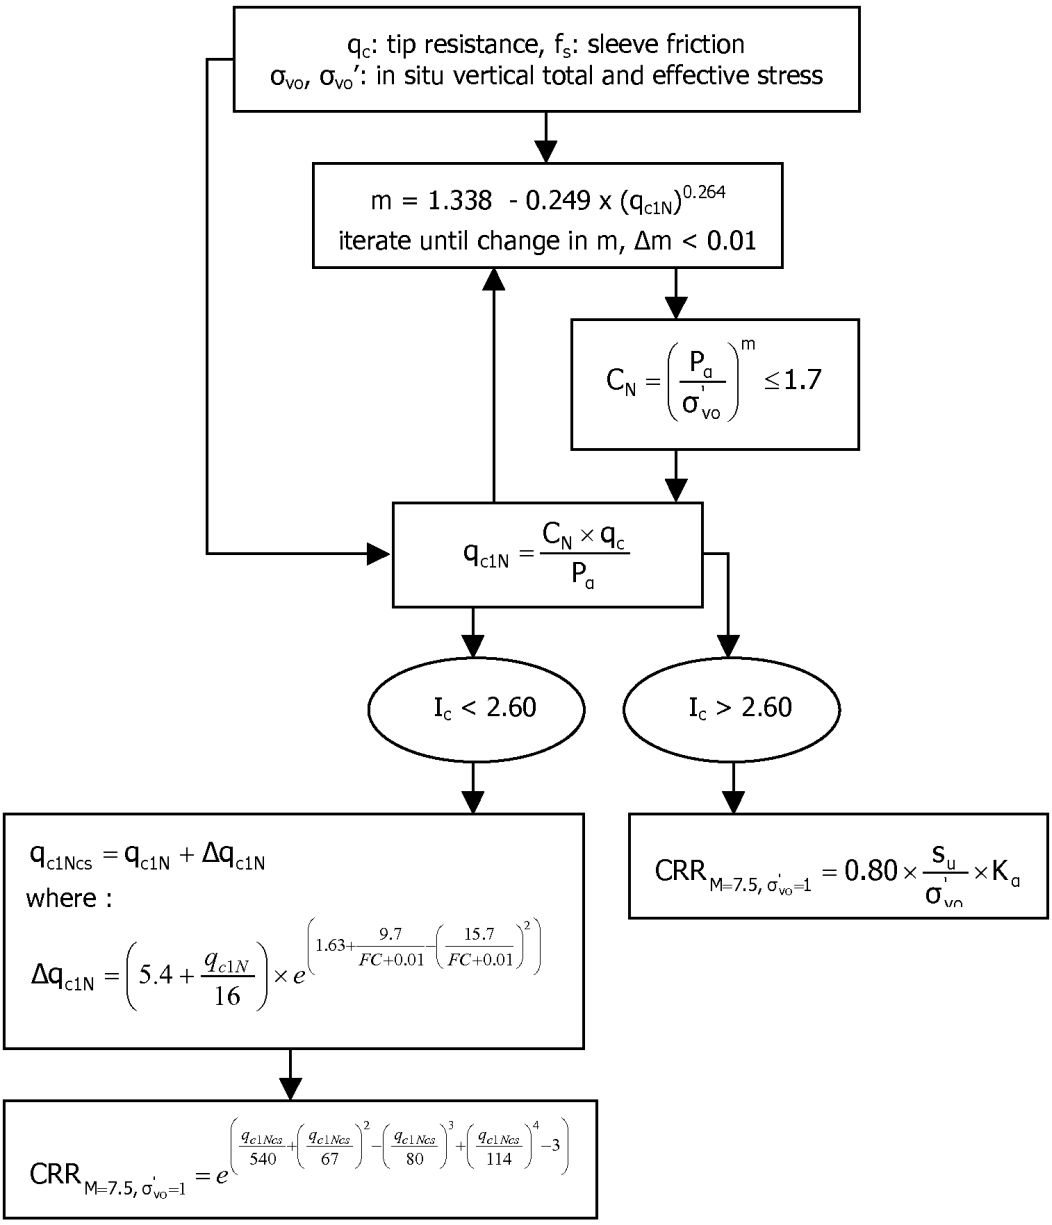
Procedure for the evaluation of soil liquefaction resistance, NCEER (1998)



Calculation of soil resistance against liquefaction is performed according to the Robertson & Wride (1998) procedure. The procedure used in the software, slightly differs from the one originally published in NCEER-97-0022 (Proceedings of the NCEER Workshop on Evaluation of Liquefaction Resistance of Soils). The revised procedure is presented below in the form of a flowchart[1]:

[1] "Estimating liquefaction-induced ground settlements from CPT for level ground", G. Zhang, P.K. Robertson, and R.W.I. Brachman



Procedure for the evaluation of soil liquefaction resistance (all soils), Robertson (2010)

Calculation of soil resistance against liquefaction is performed according to the Robertson & Wride (1998) procedure. This procedure used in the software, slightly differs from the one originally published in NCEER-97-0022 (Proceedings of the NCEER Workshop on Evaluation of Liquefaction Resistance of Soils). The revised procedure is presented below in the form of a flowchart[1]:

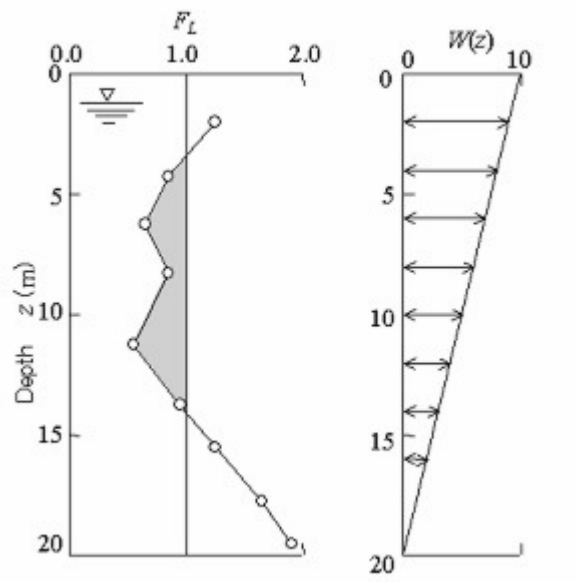
Procedure for the estimation of seismic induced settlements in dry sands

Robertson, P.K. and Lisheng, S., 2010, "Estimation of seismic compression in dry soils using the CPT" FIFTH INTERNATIONAL CONFERENCE ON RECENT ADVANCES IN GEOTECHNICAL EARTHQUAKE ENGINEERING AND SOIL DYNAMICS, Symposium in honor of professor I. M. Idriss, San Diego, CA

Liquefaction Potential Index (LPI) calculation procedure

Calculation of the Liquefaction Potential Index (LPI) is used to interpret the liquefaction assessment calculations in terms of severity over depth. The calculation procedure is based on the methology developed by Iwasaki (1982) and is adopted by AFPS.



To estimate the severity of liquefaction extent at a given site, LPI is calculated based on the following equation:

$$\mathbf{LPI} = \int_0^{20} (10 - 0{,}5_z) \times F_L \times d_z$$

where:
F_L = 1 - F.S. when F.S. less than 1
F_L = 0 when F.S. greater than 1
z depth of measurment in meters

Values of LPI range between zero (0) when no test point is characterized as liquefiable and 100 when all points are characterized as susceptible to liquefaction. Iwasaki proposed four (4) discrete categories based on the numeric value of LPI:

- LPI = 0 : Liquefaction risk is very low
- 0 < LPI <= 5 : Liquefaction risk is low
- 5 < LPI <= 15 : Liquefaction risk is high
- LPI > 15 : Liquefaction risk is very high

Graphical presentation of the LPI calculation procedure

Shear-Induced Building Settlement (Ds) calculation procedure

The shear-induced building settlement (Ds) due to liquefaction below the building can be estimated using the relationship developed by Bray and Macedo (2017):

$$Ln(Ds) = c1 + c2 * LBS + 0.58 * Ln\left(Tanh\left(\frac{HL}{6}\right)\right) + 4.59 * Ln(Q) - 0.42 * Ln(Q)^2 - 0.02 * B + 0.84 * Ln(CAVdp) + 0.41 * Ln(Sa1) + \varepsilon$$

where Ds is in the units of mm, c1= -8.35 and c2= 0.072 for LBS ≤ 16, and c1= -7.48 and c2= 0.014 otherwise. Q is the building contact pressure in units of kPa, HL is the cumulative thickness of the liquefiable layers in the units of m, B is the building width in the units of m, CAVdp is a standardized version of the cumulative absolute velocity in the units of g-s, Sa1 is 5%-damped pseudo-acceleration response spectral value at a period of 1 s in the units of g, and ε is a normal random variable with zero mean and 0.50 standard deviation in Ln units. The liquefaction-induced building settlement index (LBS) is:

$$LBS = \sum W * \frac{\varepsilon_{shear}}{z} dz$$

where z (m) is the depth measured from the ground surface > 0, W is a foundation-weighting factor wherein W = 0.0 for z less than Df, which is the embedment depth of the foundation, and W = 1.0 otherwise. The shear strain parameter (ε_shear) is the liquefaction-induced free-field shear strain (in %) estimated using Zhang et al. (2004). It is calculated based on the estimated Dr of the liquefied soil layer and the calculated safety factor against liquefaction triggering (FSL).

ATTACHMENT D

GROUNDWATER FEASIBILITY

A layer of medium dense, fine silty sand was found in all exploration locations below the fills, down to a depth ranging from 7 to 9 feet. Based on grain size analyses, the silt (fines) content of the majority of this layer is in the range of 13 to 47 percent. Cleaner sands with lower silt content and sandy silts with higher silt content were found within thinner interbeds within this layer. The moisture content of these materials was found to be in the range of 14 to 26 percent, well above optimum.

A thin layer of compressible silty clay was found in most subsurface explorations, below the silty sand layer. The thickness of this compressible clay layer was limited to 1 to 2 feet.

A layer of sandy silt was found at all exploration locations down to depths ranging from 11 feet to 13 feet. This material can be characterized as medium dense and stiff to very stiff.

The soil profile below a depth of 11 to 13 feet and extending down to a depth of 32 to 35 feet consists mostly of relatively compressible, firm to stiff clays, interbedded with silty sands and sandy silts of variable thickness. The sandy soils are medium dense.

A layer of medium dense to very dense silty sand was found at all exploration locations below depths of 32 to 35 feet. The thickness of this layer was on the order of 7 feet.

Very stiff to hard clays and silts, and dense sands underlie the dense sand layer.

3.4 GROUNDWATER LEVELS

At the time of our field investigation (July 2008), groundwater levels were detected in the borings at approximate depths of 5 to 6 feet below the ground surface. In two groundwater monitoring wells, installed during a previous geotechnical investigation, the depth to groundwater ranged from 4.6 feet in the northern parts of the site (MW-1 in Figure 2) to 6.0 feet in the southeastern parts of the site (MW-2). These depths correspond to a water surface elevation of +27 to +27.5 feet. The observed water levels are generally consistent with the "historically Highest Groundwater" levels published by the State of California for the site area (Reference 1).

Worksheet I: Summary of Groundwater-related Feasibility Criteria

1	Is project large or small? (as defined by **Table VIII.2**) circle one	(Large)		Small
2	What is the tributary area to the BMP?	A	13.33	acres
3	What type of BMP is proposed?			
4	What is the infiltrating surface area of the proposed BMP?	A_{BMP}		sq-ft
5	What land use activities are present in the tributary area (list all)			
6	What land use-based risk category is applicable?	L	M	H
7	If M or H, what pretreatment and source isolation BMPs have been considered and are proposed (describe all):			
8	What minimum separation to mounded seasonally high groundwater applies to the proposed BMP? See Section **VIII.2** (circle one)	5 ft		10 ft
9	Provide rationale for selection of applicable minimum separation to seasonally high mounded groundwater:			
10	What is separation from the infiltrating surface to seasonally high groundwater?	SHGWT		ft
11	What is separation from the infiltrating surface to mounded seasonally high groundwater?	Mounded SHGWT		ft
12	Describe assumptions and methods used for mounding analysis:			
13	Is the site within a plume protection boundary (See **Figure**	Y	N	N/A

Worksheet I: Summary of Groundwater-related Feasibility Criteria

	VIII.2)?	
14	Is the site within a selenium source area or other natural plume area (See Figure VIII.2)?	Y N N/A
15	Is the site within 250 feet of a contaminated site?	Y N N/A
16	If site-specific study has been prepared, provide citation and briefly summarize relevant findings:	
17	Is the site within 100 feet of a water supply well, spring, septic system?	Y N N/A
18	Is infiltration feasible on the site relative to groundwater-related criteria?	Y N
Provide rationale for feasibility determination: The historic high groundwater is less than 5 feet below ground surface. The depth to seasonal high groundwater table beneath the project falls within the normal high range and precludes infiltration.		

Note: if a single criterion or group of criteria would render infiltration infeasible, it is not necessary to evaluate every question in this worksheet.

ATTACHMENT E

CALCULATIONS

Worksheet B: Simple Design Capture Volume Sizing Method

Step 1: Determine the design capture storm depth used for calculating volume				
1	Enter design capture storm depth from Figure III.1, *d* (inches)	d=	0.85	inches
2	Enter the effect of provided HSCs, d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0.0	inches
3	Calculate the remainder of the design capture storm depth, $d_{remainder}$ (inches) (Line 1 – Line 2)	$d_{remainder}$=	0.85	inches
Step 2: Calculate the DCV				
1	Enter Project area tributary to BMP (s), *A* (acres)	A=	13.33	acres
2	Enter Project Imperviousness, *imp* (unitless)	imp=	0.90	
3	Calculate runoff coefficient, *C= (0.75 x imp) + 0.15*	C=	0.825	
4	Calculate runoff volume, V_{design}= *(C x* $d_{remainder}$ *x A x 43560 x (1/12))*	V_{design}=	17,000	cu-ft
Step 3: Design BMPs to ensure full retention of the DCV			Note: 50% credit see section IV.4.1	
Step 3a: Determine design infiltration rate				
1	Enter measured infiltration rate, $K_{observed}$[1] (in/hr) (**Appendix VII**)	$K_{observed}$=	N/A	In/hr
2	Enter combined safety factor from Worksheet H, S_{total} (unitless)	S_{total}=	N/A	
3	Calculate design infiltration rate, $K_{design} = K_{observed} / S_{total}$	K_{design}=	N/A	In/hr
Step 3b: Determine minimum BMP footprint				
4	Enter drawdown time, *T* (max 48 hours)	T=	N/A	Hours
5	Calculate max retention depth that can be drawn down within the drawdown time (feet), $D_{max} = K_{design} \times T \times (1/12)$	D_{max}=	N/A	feet
6	Calculate minimum area required for BMP (sq-ft), $A_{min} = V_{design} / d_{max}$	A_{min}=	N/A	sq-ft

[1] $K_{observed}$ is the vertical infiltration measured in the field, before applying a factor of safety. If field testing measures a rate that is different than the vertical infiltration rate (for example, three-dimensional borehole percolation rate), then this rate must be adjusted by an acceptable method (for example, Porchet method) to yield the field estimate of vertical infiltration rate, $K_{observed}$. See Appendix VII.

Note: Proposed modular wetland is designed to draw down the DCV over a 48 hour period. See Modular Wetland treatment capacity chart in Appendix E

Table X.8: Minimum Irrigated Area for Potential Partial Capture Feasibility

General Landscape Type	Conservation Design: K_L = 0.35			Active Turf Areas: K_L = 0.7		
Closest ET Station	*Irvine*	*Santa Ana*	*Laguna*	*Irvine*	*Santa Ana*	*Laguna*

1.00	1.10	1.12	1.20	0.55	0.56	0.60

Worksheet J: Summary of Harvested Water Demand and Feasibility

1	What demands for harvested water exist in the tributary area (check all that apply):			
2	Toilet and urinal flushing		☑	
3	Landscape irrigation		☑	
4	Other:_____		☐	
5	What is the design capture storm depth? (**Figure III.1**)	d	0.85	inches
6	What is the project size?	A	13.33	ac
7	What is the acreage of impervious area?	IA	12.00	ac
	For projects with multiple types of demand (toilet flushing, indoor demand, and/or other demand)			
8	What is the minimum use required for partial capture? (**Table X.6**)			gpd
9	What is the project estimated wet season total daily use?			gpd
10	Is partial capture potentially feasible? (Line 9 > Line 8?)			
	For projects with only toilet flushing demand			
11	What is the minimum TUTIA for partial capture? (**Table X.7**)		121/AC (average across site)	
12	What is the project estimated TUTIA?		50/AC	

Worksheet J: Summary of Harvested Water Demand and Feasibility

13	Is partial capture potentially feasible? (Line 12 > Line 11?)	No	
	For projects with only irrigation demand		
14	What is the minimum irrigation area required based on conservation landscape design? (**Table X.8**)	11.4	ac
15	What is the proposed project irrigated area? (multiply conservation landscaping by 1; multiply active turf by 2)	1.3	ac
16	Is partial capture potentially feasible? (Line 15 > Line 14?)	No	

Provide supporting assumptions and citations for controlling demand calculation:

Site does not have enough toilets or landscape area to support harvested water BMPs

Cypress Mixed Use
WQMP Flow Rate and Volume Calculations

DMA ID	% Impervious	A (acres)	C	I (in/hr)	Adj Volume (cubic feet)	Selected Modular Wetland	Modular Wetland Treatment Voulme
DMA 1	90%	13.33	0.83	0.26	17,000	MWS-L-8-16	20,145

Note: The Cypress Mixed used development is eligible for a water quality Credit of 50%, per the Model WQMP pg. 7.II 3-5-3-5. This development meets the higher density development, mixed use development, and in-fill development requirments.

SPECIFICATIONS

VOLUME-BASED

Many states require treatment of a water quality volume and do not offer the option of flow-based design. The MWS Linear and its unique horizontal flow makes it the only biofilter that can be used in volume-based design installed downstream of ponds, detention basins, and underground storage systems.

The Ocean Begins at Your Front Door

Follow these simple steps to help reduce water pollution:

Household Activities

- Do not rinse spills with water. Use dry cleanup methods such as applying cat litter or another absorbent material, sweep and dispose of in the trash. Take items such as used or excess batteries, oven cleaners, automotive fluids, painting products and cathode ray tubes, like TVs and computer monitors, to a Household Hazardous Waste Collection Center (HHWCC).
- For a HHWCC near you call (714) 834-6752 or visit www.oclandfills.com.
- Do not hose down your driveway, sidewalk or patio to the street, gutter or storm drain. Sweep up debris and dispose of it in the trash.

Automotive

- Take your vehicle to a commercial car wash whenever possible. If you wash your vehicle at home, choose soaps, cleaners, or detergents labeled non-toxic, phosphate- free or biodegradable. Vegetable and citrus-based products are typically safest for the environment.
- Do not allow washwater from vehicle washing to drain into the street, gutter or storm drain. Excess washwater should be disposed of in the sanitary sewer (through a sink or toilet) or onto an absorbent surface like your lawn.
- Monitor your vehicles for leaks and place a pan under leaks. Keep your vehicles well maintained to stop and prevent leaks.
- Never pour oil or antifreeze in the street, gutter or storm drain. Recycle these substances at a service station, a waste oil collection center or used oil recycling center. For the nearest Used Oil Collection Center call 1-800-CLEANUP or visit www.1800cleanup.org.

Pool Maintenance

- Pool and spa water must be dechlorinated and free of excess acid, alkali or color to be allowed in the street, gutter or storm drain.
- When it is not raining, drain dechlorinated pool and spa water directly into the sanitary sewer.
- Some cities may have ordinances that do not allow pool water to be disposed of in the storm drain. Check with your city.

Landscape and Gardening

- Do not over-water. Water your lawn and garden by hand to control the amount of water you use or set irrigation systems to reflect seasonal water needs. If water flows off your yard onto your driveway or sidewalk, your system is over-watering. Periodically inspect and fix leaks and misdirected sprinklers.
- Do not rake or blow leaves, clippings or pruning waste into the street, gutter or storm drain. Instead, dispose of waste by composting, hauling it to a permitted landfill, or as green waste through your city's recycling program.
- Follow directions on pesticides and fertilizer, (measure, do not estimate amounts) and do not use if rain is predicted within 48 hours.
- Take unwanted pesticides to a HHWCC to be recycled. For locations and hours of HHWCC, call (714) 834-6752 or visit www.oclandfills.com.

Trash

- Place trash and litter that cannot be recycled in securely covered trash cans.
- Whenever possible, buy recycled products.
- Remember: Reduce, Reuse, Recycle.

Pet Care

- Always pick up after your pet. Flush waste down the toilet or dispose of it in the trash. Pet waste, if left outdoors, can wash into the street, gutter or storm drain.
- If possible, bathe your pets indoors. If you must bathe your pet outside, wash it on your lawn or another absorbent/permeable surface to keep the washwater from entering the street, gutter or storm drain.
- Follow directions for use of pet care products and dispose of any unused products at a HHWCC.

Common Pollutants

Home Maintenance

- Detergents, cleaners and solvents
- Oil and latex paint
- Swimming pool chemicals
- Outdoor trash and litter

Lawn and Garden

- Pet and animal waste
- Pesticides
- Clippings, leaves and soil
- Fertilizer

Automobile

- Oil and grease
- Radiator fluids and antifreeze
- Cleaning chemicals
- Brake pad dust

The Ocean Begins at Your Front Door

Never allow pollutants to enter the street, gutter or storm drain!

Did You Know?

- Most people believe that the largest source of water pollution in urban areas comes from specific sources such as factories and sewage treatment plants. In fact, the largest source of water pollution comes from city streets, neighborhoods, construction sites and parking lots. This type of pollution is sometimes called “non-point source” pollution.
- There are two types of non-point source pollution: stormwater and urban runoff pollution.
- Stormwater runoff results from rainfall. When rainstorms cause large volumes of water to rinse the urban landscape, picking up pollutants along the way.
- Urban runoff can happen any time of the year when excessive water use from irrigation, vehicle washing and other sources carries trash, lawn clippings and other urban pollutants into storm drains.

Where Does It Go?

- Anything we use outside homes, vehicles and businesses – like motor oil, paint, pesticides, fertilizers and cleaners – can be blown or washed into storm drains.
- A little water from a garden hose or rain can also send materials into storm drains.
- Storm drains are separate from our sanitary sewer systems; unlike water in sanitary sewers (from sinks or toilets), water in storm drains is not treated before entering our waterways.

Sources of Non-Point Source Pollution

- Automotive leaks and spills.
- Improper disposal of used oil and other engine fluids.
- Metals found in vehicle exhaust, weathered paint, rust, metal plating and tires.
- Pesticides and fertilizers from lawns, gardens and farms.
- Improper disposal of cleaners, paint and paint removers.
- Soil erosion and dust debris from landscape and construction activities.
- Litter, lawn clippings, animal waste, and other organic matter.
- Oil stains on parking lots and paved surfaces.

The Effect on the Ocean

Non-point source pollution can have a serious impact on water quality in Orange County. Pollutants from the storm drain system can harm marine life as well as coastal and wetland habitats. They can also degrade recreation areas such as beaches, harbors and bays.

Stormwater quality management programs have been developed throughout Orange County to educate and encourage the public to protect water quality, monitor runoff in the storm drain system, investigate illegal dumping and maintain storm drains.

Support from Orange County residents and businesses is needed to improve water quality and reduce urban runoff pollution. Proper use and disposal of materials will help stop pollution before it reaches the storm drain and the ocean.

Printed on Recycled Paper

Preventing water pollution at your commercial/industrial site

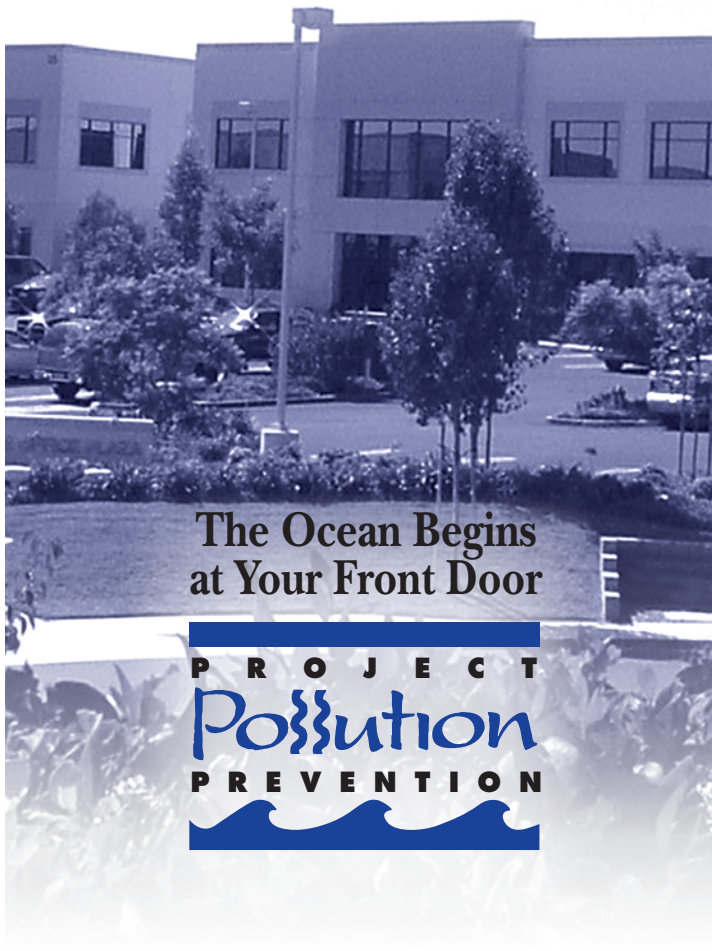
Clean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. However, many landscape and building maintenance activities can lead to water pollution if you're not careful. Paint, chemicals, plant clippings and other materials can be blown or washed into storm drains that flow to the ocean. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways.

You would never pour soap or fertilizers into the ocean, so why would you let them enter the storm drains? Follow these easy tips to help prevent water pollution.

Some types of industrial facilities are required to obtain coverage under the State General Industrial Permit. For more information visit: **www.swrcb.ca.gov/stormwater/industrial.html**

For more information, please call the **Orange County Stormwater Program** at **1-877-89-SPILL** (1-877-897-7455) or visit **www.ocwatersheds.com**

To report a spill, call the **Orange County 24-Hour Water Pollution Problem Reporting Hotline** at **1-877-89-SPILL** (1-877-897-7455).



For emergencies, dial 911.

Help Prevent Ocean Pollution:

Proper Maintenance Practices for Your Business

The Ocean Begins at Your Front Door

PROJECT Pollution PREVENTION

Proper Maintenance Practices for your Business

Landscape Maintenance

- Compost grass clippings, leaves, sticks and other vegetation, or dispose of it at a permitted landfill or in green waste containers. Do not dispose of these materials in the street, gutter or storm drain.
- Irrigate slowly and inspect the system for leaks, overspraying and runoff. Adjust automatic timers to avoid overwatering.
- Follow label directions for the use and disposal of fertilizers and pesticides.
- Do not apply pesticides or fertilizers if rain is expected within 48 hours or if wind speeds are above 5 mph.
- Do not spray pesticides within 100 feet of waterways.
- Fertilizers should be worked into the soil rather than dumped onto the surface.
- If fertilizer is spilled on the pavement or sidewalk, sweep it up immediately and place it back in the container.

Building Maintenance

- Never allow washwater, sweepings or sediment to enter the storm drain.
- Sweep up dry spills and use cat litter, towels or similar materials to absorb wet spills. Dispose of it in the trash.
- If you wash your building, sidewalk or parking lot, you **must** contain the water. Use a shop vac to collect the water and contact your city or sanitation agency for proper disposal information. Do not let water enter the street, gutter or storm drain.
- Use drop cloths underneath outdoor painting, scraping, and sandblasting work, and properly dispose of materials in the trash.
- Use a ground cloth or oversized tub for mixing paint and cleaning tools.
- Use a damp mop or broom to clean floors.
- Cover dumpsters to keep insects, animals, rainwater and sand from entering. Keep the area around the dumpster clear of trash and debris. Do not overfill the dumpster.
- Call your trash hauler to replace leaking dumpsters.
- Do not dump any toxic substance or liquid waste on the pavement, the ground, or near a storm drain. Even materials that seem harmless such as latex paint or biodegradable cleaners can damage the environment.

Never Dispose of Anything in the Storm Drain.

- Recycle paints, solvents and other materials. For more information about recycling and collection centers, visit **www.oclandfills.com**.
- Store materials indoors or under cover and away from storm drains.
- Use a construction and demolition recycling company to recycle lumber, paper, cardboard, metals, masonry, carpet, plastic, pipes, drywall, rocks, dirt, and green waste. For a listing of construction and demolition recycling locations in your area, visit **www.ciwmb.ca.gov/recycle.**
- Properly label materials. Familiarize employees with Material Safety Data Sheets.

PROJECT Pollution PREVENTION

Clean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. However, many common activities can lead to water pollution if you're not careful. Fertilizers, pesticides and other chemicals that are left on yards or driveways can be blown or washed into storm drains that flow to the ocean. Overwatering lawns can also send materials into storm drains. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways.

You would never pour gardening products into the ocean, so don't let them enter the storm drains. Follow these easy tips to help prevent water pollution.

Help Prevent Ocean Pollution:

Tips for Landscape & Gardening

The Ocean Begins at Your Front Door

PROJECT Pollution PREVENTION

Tips for Landscape & Gardening

Never allow gardening products or polluted water to enter the street, gutter or storm drain.

General Landscaping Tips

- Protect stockpiles and materials from wind and rain by storing them under tarps or secured plastic sheeting.
- Prevent erosion of slopes by planting fast-growing, dense ground covering plants. These will shield and bind the soil.
- Plant native vegetation to reduce the amount of water, fertilizers, and pesticide applied to the landscape.

- Never apply pesticides or fertilizers when rain is predicted within the next 48 hours.

Garden & Lawn Maintenance

- Do not overwater. Use irrigation practices such as drip irrigation, soaker hoses or micro spray systems. Periodically inspect and fix leaks and misdirected sprinklers.
- Do not rake or blow leaves, clippings or pruning waste into the street, gutter or storm drain. Instead, dispose of green waste by composting, hauling it to a permitted landfill, or recycling it through your city's program.

- Use slow-release fertilizers to minimize leaching, and use organic fertilizers.
- Read labels and use only as directed. Do not over-apply pesticides or fertilizers. Apply to spots as needed, rather than blanketing an entire area.
- Store pesticides, fertilizers and other chemicals in a dry covered area to prevent exposure that may result in the deterioration of containers and packaging.

- Rinse empty pesticide containers and re-use rinse water as you would use the product. Do not dump rinse water down storm drains. Dispose of empty containers in the trash.
- When available, use non-toxic alternatives to traditional pesticides, and use pesticides specifically designed to control the pest you are targeting. For more information, visit **www.ipm.ucdavis.edu**.
- If fertilizer is spilled, sweep up the spill before irrigating. If the spill is liquid, apply an absorbent material such as cat litter, and then sweep it up and dispose of it in the trash.
- Take unwanted pesticides to a Household Hazardous Waste Collection Center to be recycled. Locations are provided below.

Household Hazardous Waste Collection Centers

Anaheim:	1071 N. Blue Gum St.
Huntington Beach:	17121 Nichols St.
Irvine:	6411 Oak Canyon
San Juan Capistrano:	32250 La Pata Ave.

For more information, call (714) 834-6752 or visit www.oclandfills.com

Clean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. However, many common activities such as pest control can lead to water pollution if you're not careful. Pesticide treatments must be planned and applied properly to ensure that pesticides do not enter the street, gutter or storm drain. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways.

You would never dump pesticides into the ocean, so don't let it enter the storm drains. Pesticides can cause significant damage to our environment if used improperly. If you are thinking of using a pesticide to control a pest, there are some important things to consider.

For more information,
please call
University of California Cooperative
Extension Master Gardeners at
(714) 708-1646
or visit these Web sites:

Help Prevent Ocean Pollution:

Responsible Pest Control

Tips for Pest Control

Key Steps to Follow:

Step 1: Correctly identify the pest (insect, weed, rodent, or disease) and verify that it is actually causing the problem.

Three life stages of the common lady beetle, a beneficial insect.

This is important because beneficial insects are often mistaken for pests and sprayed with pesticides needlessly.

Consult with a Certified Nursery Professional at a local nursery or garden center or send a sample of the pest to the Orange County Agricultural Commissioner's Office.

Determine if the pest is still present – even though you see damage, the pest may have left.

Step 2: Determine how many pests are present and causing damage.

Small pest populations may be controlled more safely using non-pesticide techniques. These include removing food sources, washing off leaves with a strong stream of water, blocking entry into the home using caulking and replacing problem plants with ones less susceptible to pests.

Integrated Pest Management (IPM) usually combines several least toxic pest control methods for long-term prevention and management of pest problems without harming you, your family, or the environment.

UC CE University of California Cooperative Extension

Step 3: If a pesticide must be used, choose the least toxic chemical.

Obtain information on the least toxic pesticides that are effective at controlling the target pest from the UC Statewide Integrated Pest Management (IPM) Program's Web site at www.ipm.ucdavis.edu.

Seek out the assistance of a Certified Nursery Professional at a local nursery or garden center when selecting a pesticide. Purchase the smallest amount of pesticide available.

Apply the pesticide to the pest during its most vulnerable life stage. This information can be found on the pesticide label.

Step 4: Wear appropriate protective clothing.

Follow pesticide labels regarding specific types of protective equipment you should wear. Protective clothing should always be washed separately from other clothing.

Step 5: Continuously monitor external conditions when applying pesticides such as weather, irrigation, and the presence of children and animals.

Never apply pesticides when rain is predicted within the next 48 hours. Also, do not water after applying pesticides unless the directions say it is necessary.

Apply pesticides when the air is still; breezy conditions may cause the spray or dust to drift away from your targeted area.

In case of an emergency call 911 and/or the regional poison control number at (714) 634-5988 or (800) 544-4404 (CA only).

For general questions you may also visit www.calpoison.org.

Step 6: In the event of accidental spills, sweep up or use an absorbent agent to remove any excess pesticides. Avoid the use of water.

Be prepared. Have a broom, dust pan, or dry absorbent material, such as cat litter, newspapers or paper towels, ready to assist in cleaning up spills.

Contain and clean up the spill right away. Place contaminated materials in a doubled plastic bag. All materials used to clean up the spill should be properly disposed of according to your local Household Hazardous Waste Disposal site.

Step 7: Properly store and dispose of unused pesticides.

Purchase Ready-To-Use (RTU) products to avoid storing large concentrated quantities of pesticides.

Store unused chemicals in a locked cabinet.

Unused pesticide chemicals may be disposed of at a Household Hazardous Waste Collection Center.

Empty pesticide containers should be triple rinsed prior to disposing of them in the trash.

Household Hazardous Waste Collection Center

PROJECT Pollution PREVENTION

IC7. LANDSCAPE MAINTENANCE

Best Management Practices (BMPs)

A BMP is a technique, measure or structural control that is used for a given set of conditions to improve the quality of the stormwater runoff in a cost effective manner[1]. The minimum required BMPs for this activity are outlined in the box to the right. Implementation of pollution prevention/good housekeeping measures may reduce or eliminate the need to implement other more costly or complicated procedures. Proper employee training is key to the success of BMP implementation.

MINIMUM BEST MANAGEMENT PRACTICES

Pollution Prevention/Good Housekeeping

- Properly store and dispose of gardening wastes.
- Use mulch or other erosion control measures on exposed soils.
- Properly manage irrigation and runoff.
- Properly store and dispose of chemicals.
- Properly manage pesticide and herbicide use.
- Properly manage fertilizer use.

Stencil storm drains

Training

- Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.
- Provide on-going employee training in pollution prevention.

The BMPs outlined in this fact sheet target the following pollutants:

Targeted Constituents	
Sediment	x
Nutrients	x
Floatable Materials	x
Metals	
Bacteria	x
Oil & Grease	
Organics & Toxicants	
Pesticides	x
Oxygen Demanding	x

Provided below are specific procedures associated with each of the minimum BMPs along with procedures for additional BMPs that should be considered if this activity takes place at a facility located near a sensitive waterbody. In order to meet the requirements for medium and high priority facilities, the owners/operators must select, install and maintain appropriate BMPs on site. Since the selection of the appropriate BMPs is a site-specific process, the types and numbers of additional BMPs will vary for each facility.

1. **Take steps to reduce landscape maintenance requirements.**
    - Where feasible, retain and/or plant native vegetation with features that are determined to be beneficial. Native vegetation usually requires less maintenance than planting new vegetation.
    - When planting or replanting consider using low water use flowers, trees, shrubs, and groundcovers.
    - Consider alternative landscaping techniques such as naturescaping and xeriscaping.
2. **Properly store and dispose of gardening wastes.**
    - Dispose of grass clippings, leaves, sticks, or other collected vegetation as garbage at a permitted landfill or by composting.
    - Do not dispose of gardening wastes in streets, waterways, or storm drainage systems.
    - Place temporarily stockpiled material away from watercourses and storm drain inlets, and berm and/or cover.
3. **Use mulch or other erosion control measures on exposed soils.**

[1] EPA " *Preliminary Data Summary of Urban Stormwater Best Management Practices"*

4. **Properly manage irrigation and runoff.**
    - Irrigate slowly or pulse irrigate so the infiltration rate of the soil is not exceeded.
    - Inspect irrigation system regularly for leaks and to ensure that excessive runoff is not occurring.
    - If re-claimed water is used for irrigation, ensure that there is no runoff from the landscaped area(s).
    - If bailing of muddy water is required (e.g. when repairing a water line leak), do not put it in the storm drain; pour over landscaped areas.
    - Use automatic timers to minimize runoff.
    - Use popup sprinkler heads in areas with a lot of activity or where pipes may be broken. Consider the use of mechanisms that reduce water flow to broken sprinkler heads.
5. **Properly store and dispose of chemicals.**
    - Implement storage requirements for pesticide products with guidance from the local fire department and/or County Agricultural Commissioner.
    - Provide secondary containment for chemical storage.
    - Dispose of empty containers according to the instructions on the container label.
    - Triple rinse containers and use rinse water as product.
6. **Properly manage pesticide and herbicide use.**
    - Follow all federal, state, and local laws and regulations governing the use, storage, and disposal of pesticides and herbicides and training of applicators and pest control advisors.
    - Follow manufacturers' recommendations and label directions.
    - Use pesticides only if there is an actual pest problem (not on a regular preventative schedule). When applicable use less toxic pesticides that will do the job. Avoid use of copper-based pesticides if possible. Use the minimum amount of chemicals needed for the job.
    - Do not apply pesticides if rain is expected or if wind speeds are above 5 mph.
    - Do not mix or prepare pesticides for application near storm drains. Prepare the minimum amount of pesticide needed for the job and use the lowest rate that will effectively control the targeted pest.
    - Whenever possible, use mechanical methods of vegetation removal rather than applying herbicides. Use hand weeding where practical.
    - Do not apply any chemicals directly to surface waters, unless the application is approved and permitted by the state. Do not spray pesticides within 100 feet of open waters.
    - Employ techniques to minimize off-target application (e.g. spray drift) of pesticides, including consideration of alternative application techniques.
    - When conducting mechanical or manual weed control, avoid loosening the soil, which could lead to erosion.
    - Purchase only the amount of pesticide that you can reasonably use in a given time period.
    - Careful soil mixing and layering techniques using a topsoil mix or composted organic material can be used as an effective measure to reduce herbicide use and watering.
7. **Properly manage fertilizer use.**
    - Follow all federal, state, and local laws and regulations governing the use, storage, and disposal of fertilizers.
    - Follow manufacturers' recommendations and label directions.
    - Employ techniques to minimize off-target application (e.g. spray drift) of fertilizer, including consideration of alternative application techniques. Calibrate fertilizer distributors to avoid excessive application.
    - Periodically test soils for determining proper fertilizer use.
    - Fertilizers should be worked into the soil rather than dumped or broadcast onto the surface.
    - Sweep pavement and sidewalk if fertilizer is spilled on these surfaces before applying irrigation water.
    - Use slow release fertilizers whenever possible to minimize leaching

8. **Incorporate the following integrated pest management techniques where appropriate:**
    - Mulching can be used to prevent weeds where turf is absent.
    - Remove insects by hand and place in soapy water or vegetable oil. Alternatively, remove insects with water or vacuum them off the plants.
    - Use species-specific traps (e.g. pheromone-based traps or colored sticky cards).
    - Sprinkle the ground surface with abrasive diatomaceous earth to prevent infestations by soft-bodied insects and slugs. Slugs also can be trapped in small cups filled with beer that are set in the ground so the slugs can get in easily.
    - In cases where microscopic parasites, such as bacteria and fungi, are causing damage to plants, the affected plant material can be removed and disposed of (pruning equipment should be disinfected with bleach to prevent spreading the disease organism).
    - Small mammals and birds can be excluded using fences, netting, and tree trunk guards.
    - Promote beneficial organisms, such as bats, birds, green lacewings, ladybugs, praying mantis, ground beetles, parasitic nematodes, trichogramma wasps, seedhead weevils, and spiders that prey on detrimental pest species.

Training

1. **Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements.**
2. **Educate and train employees on the use of pesticides and pesticide application techniques. Only employees properly trained to use pesticides can apply them.**
3. **Train and encourage employees to use integrated pest management techniques.**
4. **Train employees on proper spill containment and cleanup.**
    - Establish training that provides employees with the proper tools and knowledge to immediately begin cleaning up a spill.
    - Ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
    - Fact sheet IC17 discusses Spill Prevention and Control in detail.
5. **Establish a regular training schedule, train all new employees, and conduct annual refresher training.**
6. **Use a training log or similar method to document training.**

Stencil storm drains

Storm drain system signs act as highly visible source controls that are typically stenciled directly adjacent to storm drain inlets. Stencils should read "No Dumping Drains to Ocean".

Non-Stormwater Discharges SC-10

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Description

Non-stormwater discharges are those flows that do not consist entirely of stormwater. Some non-stormwater discharges do not include pollutants and may be discharged to the storm drain. These include uncontaminated groundwater and natural springs. There are also some non-stormwater discharges that typically do not contain pollutants and may be discharged to the storm drain with conditions. These include car washing, air conditioner condensate, etc. However there are certain non-stormwater discharges that pose environmental concern. These discharges may originate from illegal dumping or from internal floor drains, appliances, industrial processes, sinks, and toilets that are connected to the nearby storm drainage system. These discharges (which may include: process waste waters, cooling waters, wash waters, and sanitary wastewater) can carry substances such as paint, oil, fuel and other automotive fluids, chemicals and other pollutants into storm drains. They can generally be detected through a combination of detection and elimination. The ultimate goal is to effectively eliminate non-stormwater discharges to the stormwater drainage system through implementation of measures to detect, correct, and enforce against illicit connections and illegal discharges of pollutants on streets and into the storm drain system and creeks.

Targeted Constituents

Sediment	
Nutrients	✓
Trash	
Metals	✓
Bacteria	✓
Oil and Grease	✓
Organics	✓

Approach

Initially the industry must make an assessment of non-stormwater discharges to determine which types must be eliminated or addressed through BMPs. The focus of the following approach is in the elimination of non-stormwater discharges.

CASQA California Stormwater Quality Association

Pollution Prevention

- Ensure that used oil, used antifreeze, and hazardous chemical recycling programs are being implemented. Encourage litter control.

Suggested Protocols

Recommended Complaint Investigation Equipment

- Field Screening Analysis
  - pH paper or meter
  - Commercial stormwater pollutant screening kit that can detect for reactive phosphorus, nitrate nitrogen, ammonium nitrogen, specific conductance, and turbidity
  - Sample jars
  - Sample collection pole
  - A tool to remove access hole covers
- Laboratory Analysis
  - Sample cooler
  - Ice
  - Sample jars and labels
  - Chain of custody forms
- Documentation
  - Camera
  - Notebook
  - Pens
  - Notice of Violation forms
  - Educational materials

General

- Develop clear protocols and lines of communication for effectively prohibiting non-stormwater discharges, especially those that are not classified as hazardous. These are often not responded to as effectively as they need to be.
- Stencil or demarcate storm drains, where applicable, to prevent illegal disposal of pollutants. Storm drain inlets should have messages such as “Dump No Waste Drains to Stream” stenciled or demarcated next to them to warn against ignorant or intentional dumping of pollutants into the storm drainage system.

- See SC44 Stormwater Drainage System Maintenance for additional information.

Illicit Connections

- Locate discharges from the industrial storm drainage system to the municipal storm drain system through review of "as-built" piping schematics.
- Isolate problem areas and plug illicit discharge points.
- Locate and evaluate all discharges to the industrial storm drain system.

Visual Inspection and Inventory

- Inventory and inspect each discharge point during dry weather.
- Keep in mind that drainage from a storm event can continue for a day or two following the end of a storm and groundwater may infiltrate the underground stormwater collection system. Also, non-stormwater discharges are often intermittent and may require periodic inspections.

Review Infield Piping

- A review of the "as-built" piping schematic is a way to determine if there are any connections to the stormwater collection system.
- Inspect the path of floor drains in older buildings.

Smoke Testing

- Smoke testing of wastewater and stormwater collection systems is used to detect connections between the two systems.
- During dry weather the stormwater collection system is filled with smoke and then traced to sources. The appearance of smoke at the base of a toilet indicates that there may be a connection between the sanitary and the stormwater system.

Dye Testing

- A dye test can be performed by simply releasing a dye into either your sanitary or process wastewater system and examining the discharge points from the stormwater collection system for discoloration.

TV Inspection of Drainage System

- TV Cameras can be employed to visually identify illicit connections to the industrial storm drainage system.

Illegal Dumping

- Regularly inspect and clean up hot spots and other storm drainage areas where illegal dumping and disposal occurs.
- On paved surfaces, clean up spills with as little water as possible. Use a rag for small spills, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to a certified laundry (rags) or disposed of as hazardous waste.

- Never hose down or bury dry material spills. Sweep up the material and dispose of properly.
- Use adsorbent materials on small spills rather than hosing down the spill. Remove the adsorbent materials promptly and dispose of properly.
- For larger spills, a private spill cleanup company or Hazmat team may be necessary.

Once a site has been cleaned:

- Post "No Dumping" signs with a phone number for reporting dumping and disposal.
- Landscaping and beautification efforts of hot spots may also discourage future dumping, as well as provide open space and increase property values.
- Lighting or barriers may also be needed to discourage future dumping.
- See fact sheet SC11 Spill Prevention, Control, and Cleanup.

Inspection

- Regularly inspect and clean up hot spots and other storm drainage areas where illegal dumping and disposal occurs.
- Conduct field investigations of the industrial storm drain system for potential sources of non-stormwater discharges.
- Pro-actively conduct investigations of high priority areas. Based on historical data, prioritize specific geographic areas and/or incident type for pro-active investigations.

Reporting

- A database is useful for defining and tracking the magnitude and location of the problem.
- Report prohibited non-stormwater discharges observed during the course of normal daily activities so they can be investigated, contained, and cleaned up or eliminated.
- Document that non-stormwater discharges have been eliminated by recording tests performed, methods used, dates of testing, and any on-site drainage points observed.
- Document and report annually the results of the program.
- Maintain documentation of illicit connection and illegal dumping incidents, including significant conditionally exempt discharges that are not properly managed.

Training

- Training of technical staff in identifying and documenting illegal dumping incidents is required.
- Consider posting the quick reference table near storm drains to reinforce training.
- Train employees to identify non-stormwater discharges and report discharges to the appropriate departments.

- Educate employees about spill prevention and cleanup.
- Well-trained employees can reduce human errors that lead to accidental releases or spills. The employee should have the tools and knowledge to immediately begin cleaning up a spill should one occur. Employees should be familiar with the Spill Prevention Control and Countermeasure Plan.
- Determine and implement appropriate outreach efforts to reduce non-permissible non-stormwater discharges.
- Conduct spill response drills annually (if no events occurred to evaluate your plan) in cooperation with other industries.
- When a responsible party is identified, educate the party on the impacts of his or her actions.

Spill Response and Prevention

- See SC11 Spill Prevention Control and Cleanup.

Other Considerations

- Many facilities do not have accurate, up-to-date schematic drawings.

Requirements

Costs (including capital and operation & maintenance)

- The primary cost is for staff time and depends on how aggressively a program is implemented.
- Cost for containment and disposal is borne by the discharger.
- Illicit connections can be difficult to locate especially if there is groundwater infiltration.
- Indoor floor drains may require re-plumbing if cross-connections to storm drains are detected.

Maintenance (including administrative and staffing)

- Illegal dumping and illicit connection violations requires technical staff to detect and investigate them.

Supplemental Information

Further Detail of the BMP

Illegal Dumping

- Substances illegally dumped on streets and into the storm drain systems and creeks include paints, used oil and other automotive fluids, construction debris, chemicals, fresh concrete, leaves, grass clippings, and pet wastes. All of these wastes cause stormwater and receiving water quality problems as well as clog the storm drain system itself.
- Establish a system for tracking incidents. The system should be designed to identify the following:
  - Illegal dumping hot spots

- Types and quantities (in some cases) of wastes
- Patterns in time of occurrence (time of day/night, month, or year)
- Mode of dumping (abandoned containers, "midnight dumping" from moving vehicles, direct dumping of materials, accidents/spills)
- Responsible parties

One of the keys to success of reducing or eliminating illegal dumping is increasing the number of people at the facility who are aware of the problem and who have the tools to at least identify the incident, if not correct it. Therefore, train field staff to recognize and report the incidents.

What constitutes a "non-stormwater" discharge?

- Non-stormwater discharges to the stormwater collection system may include any water used directly in the manufacturing process (process wastewater), air conditioning condensate and coolant, non-contact cooling water, cooling equipment condensate, outdoor secondary containment water, vehicle and equipment wash water, sink and drinking fountain wastewater, sanitary wastes, or other wastewaters.

Permit Requirements

- Facilities subject to stormwater permit requirements must include a certification that the stormwater collection system has been tested or evaluated for the presence of non-stormwater discharges. The State's General Industrial Stormwater Permit requires that non-stormwater discharges be eliminated prior to implementation of the facility's SWPPP.

Performance Evaluation

- Review annually internal investigation results; assess whether goals were met and what changes or improvements are necessary.
- Obtain feedback from personnel assigned to respond to, or inspect for, illicit connections and illegal dumping incidents.

Outdoor Loading/Unloading SC-30

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Description

The loading/unloading of materials usually takes place outside on docks or terminals; therefore, materials spilled, leaked, or lost during loading/unloading may collect in the soil or on other surfaces and have the potential to be carried away by stormwater runoff or when the area is cleaned. Additionally, rainfall may wash pollutants from machinery used to unload or move materials. Implementation of the following protocols will prevent or reduce the discharge of pollutants to stormwater from outdoor loading/unloading of materials.

Targeted Constituents

Sediment	✓
Nutrients	✓
Trash	
Metals	✓
Bacteria	
Oil and Grease	✓
Organics	✓

Approach

Reduce potential for pollutant discharge through source control pollution prevention and BMP implementation. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

Pollution Prevention

- Keep accurate maintenance logs to evaluate materials removed and improvements made.
- Park tank trucks or delivery vehicles in designated areas so that spills or leaks can be contained.
- Limit exposure of material to rainfall whenever possible.
- Prevent stormwater run-on.
- Check equipment regularly for leaks.

CASQA California Stormwater Quality Association

Suggested Protocols

Loading and Unloading – General Guidelines

- Develop an operations plan that describes procedures for loading and/or unloading.
- Conduct loading and unloading in dry weather if possible.
- Cover designated loading/unloading areas to reduce exposure of materials to rain.
- Consider placing a seal or door skirt between delivery vehicles and building to prevent exposure to rain.
- Design loading/unloading area to prevent stormwater run-on, which would include grading or berming the area, and position roof downspouts so they direct stormwater away from the loading/unloading areas.
- Have employees load and unload all materials and equipment in covered areas such as building overhangs at loading docks if feasible.
- Load/unload only at designated loading areas.
- Use drip pans underneath hose and pipe connections and other leak-prone spots during liquid transfer operations, and when making and breaking connections. Several drip pans should be stored in a covered location near the liquid transfer area so that they are always available, yet protected from precipitation when not in use. Drip pans can be made specifically for railroad tracks. Drip pans must be cleaned periodically, and drip collected materials must be disposed of properly.
- Pave loading areas with concrete instead of asphalt.
- Avoid placing storm drains in the area.
- Grade and/or berm the loading/unloading area to a drain that is connected to a deadend.

Inspection

- Check loading and unloading equipment regularly for leaks, including valves, pumps, flanges and connections.
- Look for dust or fumes during loading or unloading operations.

Training

- Train employees (e.g., fork lift operators) and contractors on proper spill containment and cleanup.
- Have employees trained in spill containment and cleanup present during loading/unloading.
- Train employees in proper handling techniques during liquid transfers to avoid spills.
- Make sure forklift operators are properly trained on loading and unloading procedures.

Spill Response and Prevention

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Contain leaks during transfer.
- Store and maintain appropriate spill cleanup materials in a location that is readily accessible and known to all and ensure that employees are familiar with the site's spill control plan and proper spill cleanup procedures.
- Have an emergency spill cleanup plan readily available.
- Use drip pans or comparable devices when transferring oils, solvents, and paints.

Other Considerations (Limitations and Regulations)

- Space and time limitations may preclude all transfers from being performed indoors or under cover.
- It may not be possible to conduct transfers only during dry weather.

Requirements

Costs

Costs should be low except when covering a large loading/unloading area.

Maintenance

- Conduct regular inspections and make repairs as necessary. The frequency of repairs will depend on the age of the facility.
- Check loading and unloading equipment regularly for leaks.
- Conduct regular broom dry-sweeping of area.

Supplemental Information

Further Detail of the BMP

Special Circumstances for Indoor Loading/Unloading of Materials

Loading or unloading of liquids should occur in the manufacturing building so that any spills that are not completely retained can be discharged to the sanitary sewer, treatment plant, or treated in a manner consistent with local sewer authorities and permit requirements.

- For loading and unloading tank trucks to above and below ground storage tanks, the following procedures should be used:
  - The area where the transfer takes place should be paved. If the liquid is reactive with the asphalt, Portland cement should be used to pave the area.
  - The transfer area should be designed to prevent run-on of stormwater from adjacent areas. Sloping the pad and using a curb, like a speed bump, around the uphill side of the transfer area should reduce run-on.

- The transfer area should be designed to prevent runoff of spilled liquids from the area. Sloping the area to a drain should prevent runoff. The drain should be connected to a dead-end sump or to the sanitary sewer. A positive control valve should be installed on the drain.

- For transfer from rail cars to storage tanks that must occur outside, use the following procedures:

  - Drip pans should be placed at locations where spillage may occur, such as hose connections, hose reels, and filler nozzles. Use drip pans when making and breaking connections.

  - Drip pan systems should be installed between the rails to collect spillage from tank cars.

Waste Handling & Disposal SC-34

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Description

Improper storage and handling of solid wastes can allow toxic compounds, oils and greases, heavy metals, nutrients, suspended solids, and other pollutants to enter stormwater runoff. The discharge of pollutants to stormwater from waste handling and disposal can be prevented and reduced by tracking waste generation, storage, and disposal; reducing waste generation and disposal through source reduction, reuse, and recycling; and preventing run-on and runoff.

Targeted Constituents

Sediment	
Nutrients	
Trash	
Metals	✓
Bacteria	✓
Oil and Grease	✓
Organics	✓

Approach

Pollution Prevention

- Accomplish reduction in the amount of waste generated using the following source controls:
  - Production planning and sequencing
  - Process or equipment modification
  - Raw material substitution or elimination
  - Loss prevention and housekeeping
  - Waste segregation and separation
  - Close loop recycling
- Establish a material tracking system to increase awareness about material usage. This may reduce spills and minimize contamination, thus reducing the amount of waste produced.
- Recycle materials whenever possible.

CASQA California Stormwater Quality Association

Suggested Protocols

General

- Cover storage containers with leak proof lids or some other means. If waste is not in containers, cover all waste piles (plastic tarps are acceptable coverage) and prevent stormwater run-on and runoff with a berm. The waste containers or piles must be covered except when in use.
- Use drip pans or absorbent materials whenever grease containers are emptied by vacuum trucks or other means. Grease cannot be left on the ground. Collected grease must be properly disposed of as garbage.
- Check storage containers weekly for leaks and to ensure that lids are on tightly. Replace any that are leaking, corroded, or otherwise deteriorating.
- Sweep and clean the storage area regularly. If it is paved, do not hose down the area to a storm drain.
- Dispose of rinse and wash water from cleaning waste containers into a sanitary sewer if allowed by the local sewer authority. Do not discharge wash water to the street or storm drain.
- Transfer waste from damaged containers into safe containers.
- Take special care when loading or unloading wastes to minimize losses. Loading systems can be used to minimize spills and fugitive emission losses such as dust or mist. Vacuum transfer systems can minimize waste loss.

Controlling Litter

- Post "No Littering" signs and enforce anti-litter laws.
- Provide a sufficient number of litter receptacles for the facility.
- Clean out and cover litter receptacles frequently to prevent spillage.

Waste Collection

- Keep waste collection areas clean.
- Inspect solid waste containers for structural damage regularly. Repair or replace damaged containers as necessary.
- Secure solid waste containers; containers must be closed tightly when not in use.
- Do not fill waste containers with washout water or any other liquid.
- Ensure that only appropriate solid wastes are added to the solid waste container. Certain wastes such as hazardous wastes, appliances, fluorescent lamps, pesticides, etc., may not be disposed of in solid waste containers (see chemical/ hazardous waste collection section below).

- Do not mix wastes; this can cause chemical reactions, make recycling impossible, and complicate disposal.

Good Housekeeping

- Use all of the product before disposing of the container.
- Keep the waste management area clean at all times by sweeping and cleaning up spills immediately.
- Use dry methods when possible (e.g., sweeping, use of absorbents) when cleaning around restaurant/food handling dumpster areas. If water must be used after sweeping/using absorbents, collect water and discharge through grease interceptor to the sewer.

Chemical/Hazardous Wastes

- Select designated hazardous waste collection areas on-site.
- Store hazardous materials and wastes in covered containers and protect them from vandalism.
- Place hazardous waste containers in secondary containment.
- Make sure that hazardous waste is collected, removed, and disposed of only at authorized disposal areas.
- Stencil or demarcate storm drains on the facility's property with prohibitive message regarding waste disposal.

Run-on/Runoff Prevention

- Prevent stormwater run-on from entering the waste management area by enclosing the area or building a berm around the area.
- Prevent waste materials from directly contacting rain.
- Cover waste piles with temporary covering material such as reinforced tarpaulin, polyethylene, polyurethane, polypropyleneor hypalon.
- Cover the area with a permanent roof if feasible.
- Cover dumpsters to prevent rain from washing waste out of holes or cracks in the bottom of the dumpster.
- Move the activity indoor after ensuring all safety concerns such as fire hazard and ventilation are addressed.

Inspection

- Inspect and replace faulty pumps or hoses regularly to minimize the potential of releases and spills.
- Check waste management areas for leaking containers or spills.

- Repair leaking equipment including valves, lines, seals, or pumps promptly.

Training

- Train staff in pollution prevention measures and proper disposal methods.
- Train employees and contractors in proper spill containment and cleanup. The employee should have the tools and knowledge to immediately begin cleaning up a spill should one occur.
- Train employees and subcontractors in proper hazardous waste management.

Spill Response and Prevention

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Have an emergency plan, equipment and trained personnel ready at all times to deal immediately with major spills
- Collect all spilled liquids and properly dispose of them.
- Store and maintain appropriate spill cleanup materials in a location known to all near the designated wash area.
- Ensure that vehicles transporting waste have spill prevention equipment that can prevent spills during transport. Spill prevention equipment includes:
  - Vehicles equipped with baffles for liquid waste
  - Trucks with sealed gates and spill guards for solid waste

Other Considerations (Limitations and Regulations)

Hazardous waste cannot be reused or recycled; it must be disposed of by a licensed hazardous waste hauler.

Requirements

Costs

Capital and O&M costs for these programs will vary substantially depending on the size of the facility and the types of waste handled. Costs should be low if there is an inventory program in place.

Maintenance

- None except for maintaining equipment for material tracking program.

Supplemental Information

Further Detail of the BMP

Land Treatment System

Minimize runoff of polluted stormwater from land application by:

- Choosing a site where slopes are under 6%, the soil is permeable, there is a low water table, it is located away from wetlands or marshes, and there is a closed drainage system

- Avoiding application of waste to the site when it is raining or when the ground is saturated with water
- Growing vegetation on land disposal areas to stabilize soils and reduce the volume of surface water runoff from the site
- Maintaining adequate barriers between the land application site and the receiving waters (planted strips are particularly good)
- Using erosion control techniques such as mulching and matting, filter fences, straw bales, diversion terracing, and sediment basins
- Performing routine maintenance to ensure the erosion control or site stabilization measures are working

Examples

The port of Long Beach has a state-of-the-art database for identifying potential pollutant sources, documenting facility management practices, and tracking pollutants.

Building & Grounds Maintenance SC-41

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Targeted Constituents

Sediment	✓
Nutrients	✓
Trash	
Metals	✓
Bacteria	✓
Oil and Grease	
Organics	

Description

Stormwater runoff from building and grounds maintenance activities can be contaminated with toxic hydrocarbons in solvents, fertilizers and pesticides, suspended solids, heavy metals, abnormal pH, and oils and greases. Utilizing the protocols in this fact sheet will prevent or reduce the discharge of pollutants to stormwater from building and grounds maintenance activities by washing and cleaning up with as little water as possible, following good landscape management practices, preventing and cleaning up spills immediately, keeping debris from entering the storm drains, and maintaining the stormwater collection system.

Approach

Reduce potential for pollutant discharge through source control pollution prevention and BMP implementation. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

Pollution Prevention

- Switch to non-toxic chemicals for maintenance when possible.
- Choose cleaning agents that can be recycled.
- Encourage proper lawn management and landscaping, including use of native vegetation.

CASQA California Stormwater Quality Association

- Encourage use of Integrated Pest Management techniques for pest control.
- Encourage proper onsite recycling of yard trimmings.
- Recycle residual paints, solvents, lumber, and other material as much as possible.

Suggested Protocols

Pressure Washing of Buildings, Rooftops, and Other Large Objects

- In situations where soaps or detergents are used and the surrounding area is paved, pressure washers must use a water collection device that enables collection of wash water and associated solids. A sump pump, wet vacuum or similarly effective device must be used to collect the runoff and loose materials. The collected runoff and solids must be disposed of properly.
- If soaps or detergents are not used, and the surrounding area is paved, wash runoff does not have to be collected but must be screened. Pressure washers must use filter fabric or some other type of screen on the ground and/or in the catch basin to trap the particles in wash water runoff.
- If you are pressure washing on a grassed area (with or without soap), runoff must be dispersed as sheet flow as much as possible, rather than as a concentrated stream. The wash runoff must remain on the grass and not drain to pavement.

Landscaping Activities

- Dispose of grass clippings, leaves, sticks, or other collected vegetation as garbage, or by composting. Do not dispose of collected vegetation into waterways or storm drainage systems.
- Use mulch or other erosion control measures on exposed soils.

Building Repair, Remodeling, and Construction

- Do not dump any toxic substance or liquid waste on the pavement, the ground, or toward a storm drain.
- Use ground or drop cloths underneath outdoor painting, scraping, and sandblasting work, and properly dispose of collected material daily.
- Use a ground cloth or oversized tub for activities such as paint mixing and tool cleaning.
- Clean paintbrushes and tools covered with water-based paints in sinks connected to sanitary sewers or in portable containers that can be dumped into a sanitary sewer drain. Brushes and tools covered with non-water-based paints, finishes, or other materials must be cleaned in a manner that enables collection of used solvents (e.g., paint thinner, turpentine, etc.) for recycling or proper disposal.
- Use a storm drain cover, filter fabric, or similarly effective runoff control mechanism if dust, grit, wash water, or other pollutants may escape the work area and enter a catch basin. This is particularly necessary on rainy days. The containment device(s) must be in place at the beginning of the work day, and accumulated dirty runoff and solids must be collected and disposed of before removing the containment device(s) at the end of the work day.

- If you need to de-water an excavation site, you may need to filter the water before discharging to a catch basin or off-site. If directed off-site, you should direct the water through hay bales and filter fabric or use other sediment filters or traps.
- Store toxic material under cover during precipitation events and when not in use. A cover would include tarps or other temporary cover material.

Mowing, Trimming, and Planting

- Dispose of leaves, sticks, or other collected vegetation as garbage, by composting or at a permitted landfill. Do not dispose of collected vegetation into waterways or storm drainage systems.
- Use mulch or other erosion control measures when soils are exposed.
- Place temporarily stockpiled material away from watercourses and drain inlets, and berm or cover stockpiles to prevent material releases to the storm drain system.
- Consider an alternative approach when bailing out muddy water: do not put it in the storm drain; pour over landscaped areas.
- Use hand weeding where practical.

Fertilizer and Pesticide Management

- Follow all federal, state, and local laws and regulations governing the use, storage, and disposal of fertilizers and pesticides and training of applicators and pest control advisors.
- Use less toxic pesticides that will do the job when applicable. Avoid use of copper-based pesticides if possible.
- Do not use pesticides if rain is expected.
- Do not mix or prepare pesticides for application near storm drains.
- Use the minimum amount needed for the job.
- Calibrate fertilizer distributors to avoid excessive application.
- Employ techniques to minimize off-target application (e.g., spray drift) of pesticides, including consideration of alternative application techniques.
- Apply pesticides only when wind speeds are low.
- Fertilizers should be worked into the soil rather than dumped or broadcast onto the surface.
- Irrigate slowly to prevent runoff and then only as much as is needed.
- Clean pavement and sidewalk if fertilizer is spilled on these surfaces before applying irrigation water.
- Dispose of empty pesticide containers according to the instructions on the container label.

- Use up the pesticides. Rinse containers, and use rinse water as product. Dispose of unused pesticide as hazardous waste.
- Implement storage requirements for pesticide products with guidance from the local fire department and County Agricultural Commissioner. Provide secondary containment for pesticides.

Inspection

- Inspect irrigation system periodically to ensure that the right amount of water is being applied and that excessive runoff is not occurring. Minimize excess watering and repair leaks in the irrigation system as soon as they are observed.

Training

- Educate and train employees on pesticide use and in pesticide application techniques to prevent pollution.
- Train employees and contractors in proper techniques for spill containment and cleanup.
- Be sure the frequency of training takes into account the complexity of the operations and the nature of the staff.

Spill Response and Prevention

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Place a stockpile of spill cleanup materials, such as brooms, dustpans, and vacuum sweepers (if desired) near the storage area where it will be readily accessible.
- Have employees trained in spill containment and cleanup present during the loading/unloading of dangerous wastes, liquid chemicals, or other materials.
- Familiarize employees with the Spill Prevention Control and Countermeasure Plan.
- Clean up spills immediately.

Other Considerations

Alternative pest/weed controls may not be available, suitable, or effective in many cases.

Requirements

Costs

- Cost will vary depending on the type and size of facility.
- Overall costs should be low in comparison to other BMPs.

Maintenance

Sweep paved areas regularly to collect loose particles. Wipe up spills with rags and other absorbent material immediately, do not hose down the area to a storm drain.

Supplemental Information

Further Detail of the BMP

Fire Sprinkler Line Flushing

Building fire sprinkler line flushing may be a source of non-stormwater runoff pollution. The water entering the system is usually potable water, though in some areas it may be non-potable reclaimed wastewater. There are subsequent factors that may drastically reduce the quality of the water in such systems. Black iron pipe is usually used since it is cheaper than potable piping, but it is subject to rusting and results in lower quality water. Initially, the black iron pipe has an oil coating to protect it from rusting between manufacture and installation; this will contaminate the water from the first flush but not from subsequent flushes. Nitrates, poly-phosphates and other corrosion inhibitors, as well as fire suppressants and antifreeze may be added to the sprinkler water system. Water generally remains in the sprinkler system a long time (typically a year) and between flushes may accumulate iron, manganese, lead, copper, nickel, and zinc. The water generally becomes anoxic and contains living and dead bacteria and breakdown products from chlorination. This may result in a significant BOD problem and the water often smells. Consequently dispose fire sprinkler line flush water into the sanitary sewer. Do not allow discharge to storm drain or infiltration due to potential high levels of pollutants in fire sprinkler line water.

Parking/Storage Area Maintenance SC-43

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Targeted Constituents

Sediment	✓
Nutrients	
Trash	✓
Metals	✓
Bacteria	
Oil and Grease	✓
Organics	✓

Description

Parking lots and storage areas can contribute a number of substances, such as trash, suspended solids, hydrocarbons, oil and grease, and heavy metals that can enter receiving waters through stormwater runoff or non-stormwater discharges. The protocols in this fact sheet are intended to prevent or reduce the discharge of pollutants from parking/storage areas and include using good housekeeping practices, following appropriate cleaning BMPs, and training employees.

Approach

The goal of this program is to ensure stormwater pollution prevention practices are considered when conducting activities on or around parking areas and storage areas to reduce potential for pollutant discharge to receiving waters. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

Pollution Prevention

- Encourage alternative designs and maintenance strategies for impervious parking lots. (See New Development and Redevelopment BMP Handbook)
- Keep accurate maintenance logs to evaluate BMP implementation.

CASQA California Stormwater Quality Association

SC-43 Parking/Storage Area Maintenance

Suggested Protocols

General

- Keep the parking and storage areas clean and orderly. Remove debris in a timely fashion.
- Allow sheet runoff to flow into biofilters (vegetated strip and swale) and/or infiltration devices.
- Utilize sand filters or oleophilic collectors for oily waste in low quantities.
- Arrange rooftop drains to prevent drainage directly onto paved surfaces.
- Design lot to include semi-permeable hardscape.
- Discharge soapy water remaining in mop or wash buckets to the sanitary sewer through a sink, toilet, clean-out, or wash area with drain.

Controlling Litter

- Post "No Littering" signs and enforce anti-litter laws.
- Provide an adequate number of litter receptacles.
- Clean out and cover litter receptacles frequently to prevent spillage.
- Provide trash receptacles in parking lots to discourage litter.
- Routinely sweep, shovel, and dispose of litter in the trash.

Surface Cleaning

- Use dry cleaning methods (e.g., sweeping, vacuuming) to prevent the discharge of pollutants into the stormwater conveyance system if possible.
- Establish frequency of public parking lot sweeping based on usage and field observations of waste accumulation.
- Sweep all parking lots at least once before the onset of the wet season.
- Follow the procedures below if water is used to clean surfaces:
  - Block the storm drain or contain runoff.
  - Collect and pump wash water to the sanitary sewer or discharge to a pervious surface. Do not allow wash water to enter storm drains.
  - Dispose of parking lot sweeping debris and dirt at a landfill.
- Follow the procedures below when cleaning heavy oily deposits:
  - Clean oily spots with absorbent materials.
  - Use a screen or filter fabric over inlet, then wash surfaces.

- Do not allow discharges to the storm drain.
- Vacuum/pump discharges to a tank or discharge to sanitary sewer.
- Appropriately dispose of spilled materials and absorbents.

Surface Repair

- Preheat, transfer or load hot bituminous material away from storm drain inlets.
- Apply concrete, asphalt, and seal coat during dry weather to prevent contamination from contacting stormwater runoff.
- Cover and seal nearby storm drain inlets where applicable (with waterproof material or mesh) and manholes before applying seal coat, slurry seal, etc. Leave covers in place until job is complete and all water from emulsified oil sealants has drained or evaporated. Clean any debris from these covered manholes and drains for proper disposal.
- Use only as much water as necessary for dust control, to avoid runoff.
- Catch drips from paving equipment that is not in use with pans or absorbent material placed under the machines. Dispose of collected material and absorbents properly.

Inspection

- Have designated personnel conduct inspections of parking facilities and stormwater conveyance systems associated with parking facilities on a regular basis.
- Inspect cleaning equipment/sweepers for leaks on a regular basis.

Training

- Provide regular training to field employees and/or contractors regarding cleaning of paved areas and proper operation of equipment.
- Train employees and contractors in proper techniques for spill containment and cleanup.

Spill Response and Prevention

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Place a stockpile of spill cleanup materials where it will be readily accessible or at a central location.
- Clean up fluid spills immediately with absorbent rags or material.
- Dispose of spilled material and absorbents properly.

Other Considerations

Limitations related to sweeping activities at large parking facilities may include high equipment costs, the need for sweeper operator training, and the inability of current sweeper technology to remove oil and grease.

SC-43 Parking/Storage Area Maintenance

Requirements

Costs

Cleaning/sweeping costs can be quite large. Construction and maintenance of stormwater structural controls can be quite expensive as well.

Maintenance

- Sweep parking lot regularly to minimize cleaning with water.
- Clean out oil/water/sand separators regularly, especially after heavy storms.
- Clean parking facilities regularly to prevent accumulated wastes and pollutants from being discharged into conveyance systems during rainy conditions.

Supplemental Information

Further Detail of the BMP

Surface Repair

Apply concrete, asphalt, and seal coat during dry weather to prevent contamination from contacting stormwater runoff. Where applicable, cover and seal nearby storm drain inlets (with waterproof material or mesh) and manholes before applying seal coat, slurry seal, etc. Leave covers in place until job is complete and all water from emulsified oil sealants has drained or evaporated. Clean any debris from these covered manholes and drains for proper disposal. Only use only as much water as is necessary for dust control to avoid runoff.

Drainage System Maintenance SC-44

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize

Description

As a consequence of its function, the stormwater conveyance system collects and transports urban runoff and stormwater that may contain certain pollutants. The protocols in this fact sheet are intended to reduce pollutants reaching receiving waters through proper conveyance system operation and maintenance.

Targeted Constituents

Sediment	✓
Nutrients	
Trash	✓
Metals	
Bacteria	✓
Oil and Grease	
Organics	

Approach

Pollution Prevention

Maintain catch basins, stormwater inlets, and other stormwater conveyance structures on a regular basis to remove pollutants, reduce high pollutant concentrations during the first flush of storms, prevent clogging of the downstream conveyance system, restore catch basins' sediment trapping capacity, and ensure the system functions properly hydraulically to avoid flooding.

Suggested Protocols

Catch Basins/Inlet Structures

- Staff should regularly inspect facilities to ensure compliance with the following:
  - Immediate repair of any deterioration threatening structural integrity.
  - Cleaning before the sump is 40% full. Catch basins should be cleaned as frequently as needed to meet this standard.
  - Stenciling of catch basins and inlets (see SC34 Waste Handling and Disposal).

- Clean catch basins, storm drain inlets, and other conveyance structures before the wet season to remove sediments and debris accumulated during the summer.
- Conduct inspections more frequently during the wet season for problem areas where sediment or trash accumulates more often. Clean and repair as needed.
- Keep accurate logs of the number of catch basins cleaned.
- Store wastes collected from cleaning activities of the drainage system in appropriate containers or temporary storage sites in a manner that prevents discharge to the storm drain.
- Dewater the wastes if necessary with outflow into the sanitary sewer if permitted. Water should be treated with an appropriate filtering device prior to discharge to the sanitary sewer. If discharge to the sanitary sewer is not allowed, water should be pumped or vacuumed to a tank and properly disposed. Do not dewater near a storm drain or stream.

Storm Drain Conveyance System

- Locate reaches of storm drain with deposit problems and develop a flushing schedule that keeps the pipe clear of excessive buildup.
- Collect and pump flushed effluent to the sanitary sewer for treatment whenever possible.

Pump Stations

- Clean all storm drain pump stations prior to the wet season to remove silt and trash.
- Do not allow discharge to reach the storm drain system when cleaning a storm drain pump station or other facility.
- Conduct routine maintenance at each pump station.
- Inspect, clean, and repair as necessary all outlet structures prior to the wet season.

Open Channel

- Modify storm channel characteristics to improve channel hydraulics, increase pollutant removals, and enhance channel/creek aesthetic and habitat value.
- Conduct channel modification/improvement in accordance with existing laws. Any person, government agency, or public utility proposing an activity that will change the natural (emphasis added) state of any river, stream, or lake in California, must enter into a Steam or Lake Alteration Agreement with the Department of Fish and Game. The developer-applicant should also contact local governments (city, county, special districts), other state agencies (SWRCB, RWQCB, Department of Forestry, Department of Water Resources), and Federal Corps of Engineers and USFWS.

Illicit Connections and Discharges

- Look for evidence of illegal discharges or illicit connections during routine maintenance of conveyance system and drainage structures:
  - Is there evidence of spills such as paints, discoloring, etc?

- Are there any odors associated with the drainage system?
- Record locations of apparent illegal discharges/illicit connections?
- Track flows back to potential dischargers and conduct aboveground inspections. This can be done through visual inspection of upgradient manholes or alternate techniques including zinc chloride smoke testing, fluorometric dye testing, physical inspection testing, or television camera inspection.
- Eliminate the discharge once the origin of flow is established.

- Stencil or demarcate storm drains, where applicable, to prevent illegal disposal of pollutants. Storm drain inlets should have messages such as "Dump No Waste Drains to Stream" stenciled next to them to warn against ignorant or intentional dumping of pollutants into the storm drainage system.
- Refer to fact sheet SC-10 Non-Stormwater Discharges.

Illegal Dumping

- Inspect and clean up hot spots and other storm drainage areas regularly where illegal dumping and disposal occurs.
- Establish a system for tracking incidents. The system should be designed to identify the following:
  - Illegal dumping hot spots
  - Types and quantities (in some cases) of wastes
  - Patterns in time of occurrence (time of day/night, month, or year)
  - Mode of dumping (abandoned containers, "midnight dumping" from moving vehicles, direct dumping of materials, accidents/spills)
  - Responsible parties
- Post "No Dumping" signs in problem areas with a phone number for reporting dumping and disposal. Signs should also indicate fines and penalties for illegal dumping.
- Refer to fact sheet SC-10 Non-Stormwater Discharges.

Training

- Train crews in proper maintenance activities, including record keeping and disposal.
- Allow only properly trained individuals to handle hazardous materials/wastes.
- Have staff involved in detection and removal of illicit connections trained in the following:
  - OSHA-required Health and Safety Training (29 CFR 1910.120) plus annual refresher training (as needed).

- OSHA Confined Space Entry training (Cal-OSHA Confined Space, Title 8 and Federal OSHA 29 CFR 1910.146).

- Procedural training (field screening, sampling, smoke/dye testing, TV inspection).

Spill Response and Prevention

- Investigate all reports of spills, leaks, and/or illegal dumping promptly.
- Clean up all spills and leaks using "dry" methods (with absorbent materials and/or rags) or dig up, remove, and properly dispose of contaminated soil.
- Refer to fact sheet SC-11 Spill Prevention, Control, and Cleanup.

Other Considerations (Limitations and Regulations)

- Clean-up activities may create a slight disturbance for local aquatic species. Access to items and material on private property may be limited. Trade-offs may exist between channel hydraulics and water quality/riparian habitat. If storm channels or basins are recognized as wetlands, many activities, including maintenance, may be subject to regulation and permitting.
- Storm drain flushing is most effective in small diameter pipes (36-inch diameter pipe or less, depending on water supply and sediment collection capacity). Other considerations associated with storm drain flushing may include the availability of a water source, finding a downstream area to collect sediments, liquid/sediment disposal, and prohibition against disposal of flushed effluent to sanitary sewer in some areas.
- Regulations may include adoption of substantial penalties for illegal dumping and disposal.
- Local municipal codes may include sections prohibiting discharge of soil, debris, refuse, hazardous wastes, and other pollutants into the storm drain system.

Requirements

Costs

- An aggressive catch basin cleaning program could require a significant capital and O&M budget.
- The elimination of illegal dumping is dependent on the availability, convenience, and cost of alternative means of disposal. The primary cost is for staff time. Cost depends on how aggressively a program is implemented. Other cost considerations for an illegal dumping program include:

  - Purchase and installation of signs.

  - Rental of vehicle(s) to haul illegally-disposed items and material to landfills.

  - Rental of heavy equipment to remove larger items (e.g., car bodies) from channels.

  - Purchase of landfill space to dispose of illegally-dumped items and material.

- Methods used for illicit connection detection (smoke testing, dye testing, visual inspection, and flow monitoring) can be costly and time-consuming. Site-specific factors, such as the level of impervious area, the density and ages of buildings, and type of land use will determine the level of investigation necessary.

Maintenance

- Two-person teams may be required to clean catch basins with vactor trucks.
- Teams of at least two people plus administrative personnel are required to identify illicit discharges, depending on the complexity of the storm sewer system.
- Arrangements must be made for proper disposal of collected wastes.
- Technical staff are required to detect and investigate illegal dumping violations.

Supplemental Information

Further Detail of the BMP

Storm Drain Flushing

Flushing is a common maintenance activity used to improve pipe hydraulics and to remove pollutants in storm drainage systems. Flushing may be designed to hydraulically convey accumulated material to strategic locations, such as an open channel, another point where flushing will be initiated, or the sanitary sewer and the treatment facilities, thus preventing resuspension and overflow of a portion of the solids during storm events. Flushing prevents "plug flow" discharges of concentrated pollutant loadings and sediments. Deposits can hinder the designed conveyance capacity of the storm drain system and potentially cause backwater conditions in severe cases of clogging.

Storm drain flushing usually takes place along segments of pipe with grades that are too flat to maintain adequate velocity to keep particles in suspension. An upstream manhole is selected to place an inflatable device that temporarily plugs the pipe. Further upstream, water is pumped into the line to create a flushing wave. When the upstream reach of pipe is sufficiently full to cause a flushing wave, the inflated device is rapidly deflated with the assistance of a vacuum pump, thereby releasing the backed up water and resulting in the cleaning of the storm drain segment.

To further reduce impacts of stormwater pollution, a second inflatable device placed well downstream may be used to recollect the water after the force of the flushing wave has dissipated. A pump may then be used to transfer the water and accumulated material to the sanitary sewer for treatment. In some cases, an interceptor structure may be more practical or required to recollect the flushed waters.

It has been found that cleansing efficiency of periodic flush waves is dependent upon flush volume, flush discharge rate, sewer slope, sewer length, sewer flow rate, sewer diameter, and population density. As a rule of thumb, the length of line to be flushed should not exceed 700 feet. At this maximum recommended length, the percent removal efficiency ranges between 65-75% for organics and 55-65% for dry weather grit/inorganic material. The percent removal efficiency drops rapidly beyond that. Water is commonly supplied by a water truck, but fire hydrants can also supply water. To make the best use of water, it is recommended that reclaimed water be used or that fire hydrant line flushing coincide with storm sewer flushing.

Road and Street Maintenance SC-70

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Targeted Constituents

Sediment	☑
Nutrients	
Trash	☑
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	☑
Oxygen Demanding	☑

Description

Streets, roads, and highways are significant sources of pollutants in stormwater discharges, and operation and maintenance (O&M) practices, if not conducted properly, can contribute to the problem. Stormwater pollution from roadway and bridge maintenance should be addressed on a site-specific basis. Use of the procedures outlined below, that address street sweeping and repair, bridge and structure maintenance, and unpaved roads will reduce pollutants in stormwater.

Approach

Pollution Prevention

- Use the least toxic materials available (e.g. water based paints, gels or sprays for graffiti removal)
- Recycle paint and other materials whenever possible.
- Enlist the help of citizens to keep yard waste, used oil, and other wastes out of the gutter.

Suggested Protocols

Street Sweeping and Cleaning

- Maintain a consistent sweeping schedule. Provide minimum monthly sweeping of curbed streets.
- Perform street cleaning during dry weather if possible.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Avoid wet cleaning or flushing of street, and utilize dry methods where possible.
- Consider increasing sweeping frequency based on factors such as traffic volume, land use, field observations of sediment and trash accumulation, proximity to water courses, etc. For example:
  - Increase the sweeping frequency for streets with high pollutant loadings, especially in high traffic and industrial areas.
  - Increase the sweeping frequency just before the wet season to remove sediments accumulated during the summer.
  - Increase the sweeping frequency for streets in special problem areas such as special events, high litter or erosion zones.
- Maintain cleaning equipment in good working condition and purchase replacement equipment as needed. Old sweepers should be replaced with new technologically advanced sweepers (preferably regenerative air sweepers) that maximize pollutant removal.
- Operate sweepers at manufacturer requested optimal speed levels to increase effectiveness.
- To increase sweeping effectiveness consider the following:
  - Institute a parking policy to restrict parking in problematic areas during periods of street sweeping.
  - Post permanent street sweeping signs in problematic areas; use temporary signs if installation of permanent signs is not possible.
  - Develop and distribute flyers notifying residents of street sweeping schedules.
- Regularly inspect vehicles and equipment for leaks, and repair immediately.
- If available use vacuum or regenerative air sweepers in the high sediment and trash areas (typically industrial/commercial).
- Keep accurate logs of the number of curb-miles swept and the amount of waste collected.
- Dispose of street sweeping debris and dirt at a landfill.
- Do not store swept material along the side of the street or near a storm drain inlet.
- Keep debris storage to a minimum during the wet season or make sure debris piles are contained (e.g. by berming the area) or covered (e.g. with tarps or permanent covers).

Street Repair and Maintenance

Pavement marking

- Schedule pavement marking activities for dry weather.

- Develop paint handling procedures for proper use, storage, and disposal of paints.
- Transfer and load paint and hot thermoplastic away from storm drain inlets.
- Provide drop cloths and drip pans in paint mixing areas.
- Properly maintain application equipment.
- Street sweep thermoplastic grindings. Yellow thermoplastic grindings may require special handling as they may contain lead.
- Paints containing lead or tributyltin are considered a hazardous waste and must be disposed of properly.
- Use water based paints whenever possible. If using water based paints, clean the application equipment in a sink that is connected to the sanitary sewer.
- Properly store leftover paints if they are to be kept for the next job, or dispose of properly.

Concrete installation and repair

- Schedule asphalt and concrete activities for dry weather.
- Take measures to protect any nearby storm drain inlets and adjacent watercourses, prior to breaking up asphalt or concrete (e.g. place san bags around inlets or work areas).
- Limit the amount of fresh concrete or cement mortar mixed, mix only what is needed for the job.
- Store concrete materials under cover, away from drainage areas. Secure bags of cement after they are open. Be sure to keep wind-blown cement powder away from streets, gutters, storm drains, rainfall, and runoff.
- Return leftover materials to the transit mixer. Dispose of small amounts of hardened excess concrete, grout, and mortar in the trash.
- Do not wash sweepings from exposed aggregate concrete into the street or storm drain. Collect and return sweepings to aggregate base stockpile, or dispose in the trash.
- When making saw cuts in pavement, use as little water as possible and perform during dry weather. Cover each storm drain inlet completely with filter fabric or plastic during the sawing operation and contain the slurry by placing straw bales, sandbags, or gravel dams around the inlets. After the liquid drains or evaporates, shovel or vacuum the slurry residue from the pavement or gutter and remove from site. Alternatively, a small onsite vacuum may be used to pick up the slurry as this will prohibit slurry from reaching storm drain inlets.
- Wash concrete trucks off site or in designated areas on site designed to preclude discharge of wash water to drainage system.

Patching, resurfacing, and surface sealing

- Schedule patching, resurfacing and surface sealing for dry weather.
- Stockpile materials away from streets, gutter areas, storm drain inlets or watercourses. During wet weather, cover stockpiles with plastic tarps or berm around them if necessary to prevent transport of materials in runoff.
- Pre-heat, transfer or load hot bituminous material away from drainage systems or watercourses.
- Where applicable, cover and seal nearby storm drain inlets (with waterproof material or mesh) and maintenance holes before applying seal coat, slurry seal, etc. Leave covers in place until job is complete and until all water from emulsified oil sealants has drained or evaporated. Clean any debris from covered maintenance holes and storm drain inlets when the job is complete.
- Prevent excess material from exposed aggregate concrete or similar treatments from entering streets or storm drain inlets. Designate an area for clean up and proper disposal of excess materials.
- Use only as much water as necessary for dust control, to avoid runoff.
- Sweep, never hose down streets to clean up tracked dirt. Use a street sweeper or vacuum truck. Do not dump vacuumed liquid in storm drains.
- Catch drips from paving equipment that is not in use with pans or absorbent material placed under the machines. Dispose of collected material and absorbents properly.

Equipment cleaning maintenance and storage

- Inspect equipment daily and repair any leaks. Place drip pans or absorbent materials under heavy equipment when not in use.
- Perform major equipment repairs at the corporation yard, when practical.
- If refueling or repairing vehicles and equipment must be done onsite, use a location away from storm drain inlets and watercourses.
- Clean equipment including sprayers, sprayer paint supply lines, patch and paving equipment, and mud jacking equipment at the end of each day. Clean in a sink or other area (e.g. vehicle wash area) that is connected to the sanitary sewer.

Bridge and Structure Maintenance

Paint and Paint Removal

- Transport paint and materials to and from job sites in containers with secure lids and tied down to the transport vehicle.
- Do not transfer or load paint near storm drain inlets or watercourses.

- Test and inspect spray equipment prior to starting to paint. Tighten all hoses and connections and do not overfill paint container.
- Plug nearby storm drain inlets prior to starting painting where there is significant risk of a spill reaching storm drains. Remove plugs when job is completed.
- If sand blasting is used to remove paint, cover nearby storm drain inlets prior to starting work.
- Perform work on a maintenance traveler or platform, or use suspended netting or tarps to capture paint, rust, paint removing agents, or other materials, to prevent discharge of materials to surface waters if the bridge crosses a watercourse. If sanding, use a sander with a vacuum filter bag.
- Capture all clean-up water, and dispose of properly.
- Recycle paint when possible (e.g. paint may be used for graffiti removal activities). Dispose of unused paint at an appropriate household hazardous waste facility.

Graffiti Removal

- Schedule graffiti removal activities for dry weather.
- Protect nearby storm drain inlets prior to removing graffiti from walls, signs, sidewalks, or other structures needing graffiti abatement. Clean up afterwards by sweeping or vacuuming thoroughly, and/or by using absorbent and properly disposing of the absorbent.
- When graffiti is removed by painting over, implement the procedures under Painting and Paint Removal above.
- Direct runoff from sand blasting and high pressure washing (with no cleaning agents) into a landscaped or dirt area. If such an area is not available, filter runoff through an appropriate filtering device (e.g. filter fabric) to keep sand, particles, and debris out of storm drains.
- If a graffiti abatement method generates wash water containing a cleaning compound (such as high pressure washing with a cleaning compound), plug nearby storm drains and vacuum/pump wash water to the sanitary sewer.
- Consider using a waterless and non-toxic chemical cleaning method for graffiti removal (e.g. gels or spray compounds).

Repair Work

- Prevent concrete, steel, wood, metal parts, tools, or other work materials from entering storm drains or watercourses.
- Thoroughly clean up the job site when the repair work is completed.
- When cleaning guardrails or fences follow the appropriate surface cleaning methods (depending on the type of surface) outlined in SC-71 Plaza & Sidewalk Cleaning fact sheet.

- If painting is conducted, follow the painting and paint removal procedures above.
- If graffiti removal is conducted, follow the graffiti removal procedures above.
- If construction takes place, see the Construction Activity BMP Handbook.
- Recycle materials whenever possible.

Unpaved Roads and Trails

- Stabilize exposed soil areas to prevent soil from eroding during rain events. This is particularly important on steep slopes.
- For roadside areas with exposed soils, the most cost-effective choice is to vegetate the area, preferably with a mulch or binder that will hold the soils in place while the vegetation is establishing. Native vegetation should be used if possible.
- If vegetation cannot be established immediately, apply temporary erosion control mats/blankets; a comma straw, or gravel as appropriate.
- If sediment is already eroded and mobilized in roadside areas, temporary controls should be installed. These may include: sediment control fences, fabric-covered triangular dikes, gravel-filled burlap bags, biobags, or hay bales staked in place.

Non-Stormwater Discharges

Field crews should be aware of non-stormwater discharges as part of their ongoing street maintenance efforts.

- Refer to SC-10 Non-Stormwater Discharges
- Identify location, time and estimated quantity of discharges.
- Notify appropriate personnel.

Training

- Train employees regarding proper street sweeping operation and street repair and maintenance.
- Instruct employees and subcontractors to ensure that measures to reduce the stormwater impacts of roadway/bridge maintenance are being followed.
- Require engineering staff and/or consulting A/E firms to address stormwater quality in new bridge designs or existing bridge retrofits.
- Use a training log or similar method to document training.
- Train employees on proper spill containment and clean up, and in identifying non-stormwater discharges.

Spill Response and Prevention

- Refer to SC-11, Spill Prevention, Control & Cleanup.
- Keep your Spill Prevention Control and countermeasure (SPCC) plan up-to-date, and implement accordingly.
- Have spill cleanup materials readily available and in a known location.
- Cleanup spills immediately and use dry methods if possible.
- Properly dispose of spill cleanup material.

Other Considerations

- Densely populated areas or heavily used streets may require parking regulations to clear streets for cleaning.
- No currently available conventional sweeper is effective at removing oil and grease. Mechanical sweepers are not effective at removing finer sediments.
- Limitations may arise in the location of new bridges. The availability and cost of land and other economic and political factors may dictate where the placement of a new bridge will occur. Better design of the bridge to control runoff is required if it is being placed near sensitive waters.

Requirements

Costs

- The maintenance of local roads and bridges is already a consideration of most community public works or transportation departments. Therefore, the cost of pollutant reducing management practices will involve the training and equipment required to implement these new practices.
- The largest expenditures for street sweeping programs are in staffing and equipment. The capital cost for a conventional street sweeper is between $60,000 and $120,000. Newer technologies might have prices approaching $180,000. The average useful life of a conventional sweeper is about four years, and programs must budget for equipment replacement. Sweeping frequencies will determine equipment life, so programs that sweep more often should expect to have a higher cost of replacement.
- A street sweeping program may require the following.
  - Sweeper operators, maintenance, supervisory, and administrative personnel are required.
  - Traffic control officers may be required to enforce parking restrictions.
  - Skillful design of cleaning routes is required for program to be productive.
  - Arrangements must be made for disposal of collected wastes.

- If investing in newer technologies, training for operators must be included in operation and maintenance budgets. Costs for public education are small, and mostly deal with the need to obey parking restrictions and litter control. Parking tickets are an effective reminder to obey parking rules, as well as being a source of revenue.

Maintenance

- Not applicable

Supplemental Information

Further Detail of the BMP

Street sweeping

There are advantages and disadvantages to the two common types of sweepers. The best choice depends on your specific conditions. Many communities find it useful to have a compliment of both types in their fleet.

Mechanical Broom Sweepers - More effective at picking up large debris and cleaning wet streets. Less costly to purchase and operate. Create more airborne dust.

Vacuum Sweepers - More effective at removing fine particles and associated heavy metals. Ineffective at cleaning wet streets. Noisier than mechanical broom sweepers which may restrict areas or times of operation. May require an advance vehicle to remove large debris.

Street Flushers - Not affected by biggest interference to cleaning, parked cars. May remove finer sediments, moving them toward the gutter and stormwater inlets. For this reason, flushing fell out of favor and is now used primarily after sweeping. Flushing may be effective for combined sewer systems. Presently street flushing is not allowed under most NPDES permits.

Cross-Media Transfer of Pollutants

The California Air Resources Board (ARB) has established state ambient air quality standards including a standard for respirable particulate matter (less than or equal to 10 microns in diameter, symbolized as PM10). In the effort to sweep up finer sediments to remove attached heavy metals, municipalities should be aware that fine dust, that cannot be captured by the sweeping equipment and becomes airborne, could lead to issues of worker and public safety.

Bridges

Bridges that carry vehicular traffic generate some of the more direct discharges of runoff to surface waters. Bridge scupper drains cause a direct discharge of stormwater into receiving waters and have been shown to carry relatively high concentrations of pollutants. Bridge maintenance also generates wastes that may be either directly deposited to the water below or carried to the receiving water by stormwater. The following steps will help reduce the stormwater impacts of bridge maintenance:

- Site new bridges so that significant adverse impacts to wetlands, sensitive areas, critical habitat, and riparian vegetation are minimized.

- Design new bridges to avoid the use of scupper drains and route runoff to land for treatment control. Existing scupper drains should be cleaned on a regular basis to avoid sediment/debris accumulation.
- Reduce the discharge of pollutants to surface waters during maintenance by using suspended traps, vacuums, or booms in the water to capture paint, rust, and paint removing agents. Many of these wastes may be hazardous. Properly dispose of this waste by referring to CA21 (Hazardous Waste Management) in the Construction Handbook.
- Train employees and subcontractors to reduce the discharge of wastes during bridge maintenance.

De-icing

- Do not over-apply deicing salt and sand, and routinely calibrate spreaders.
- Near reservoirs, restrict the application of deicing salt and redirect any runoff away from reservoirs.
- Consider using alternative deicing agents (less toxic, biodegradable, etc.).

Site Design & Landscape Planning SD-10

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- ☑ Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Each project site possesses unique topographic, hydrologic, and vegetative features, some of which are more suitable for development than others. Integrating and incorporating appropriate landscape planning methodologies into the project design is the most effective action that can be done to minimize surface and groundwater contamination from stormwater.

Approach

Landscape planning should couple consideration of land suitability for urban uses with consideration of community goals and projected growth. Project plan designs should conserve natural areas to the extent possible, maximize natural water storage and infiltration opportunities, and protect slopes and channels.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment.

Design Considerations

Design requirements for site design and landscapes planning should conform to applicable standards and specifications of agencies with jurisdiction and be consistent with applicable General Plan and Local Area Plan policies.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

Designing New Installations

Begin the development of a plan for the landscape unit with attention to the following general principles:

- Formulate the plan on the basis of clearly articulated community goals. Carefully identify conflicts and choices between retaining and protecting desired resources and community growth.
- Map and assess land suitability for urban uses. Include the following landscape features in the assessment: wooded land, open unwooded land, steep slopes, erosion-prone soils, foundation suitability, soil suitability for waste disposal, aquifers, aquifer recharge areas, wetlands, floodplains, surface waters, agricultural lands, and various categories of urban land use. When appropriate, the assessment can highlight outstanding local or regional resources that the community determines should be protected (e.g., a scenic area, recreational area, threatened species habitat, farmland, fish run). Mapping and assessment should recognize not only these resources but also additional areas needed for their sustenance.

Project plan designs should conserve natural areas to the extent possible, maximize natural water storage and infiltration opportunities, and protect slopes and channels.

Conserve Natural Areas during Landscape Planning

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Cluster development on least-sensitive portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants.
- Promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

Maximize Natural Water Storage and Infiltration Opportunities Within the Landscape Unit

- Promote the conservation of forest cover. Building on land that is already deforested affects basin hydrology to a lesser extent than converting forested land. Loss of forest cover reduces interception storage, detention in the organic forest floor layer, and water losses by evapotranspiration, resulting in large peak runoff increases and either their negative effects or the expense of countering them with structural solutions.
- Maintain natural storage reservoirs and drainage corridors, including depressions, areas of permeable soils, swales, and intermittent streams. Develop and implement policies and

regulations to discourage the clearing, filling, and channelization of these features. Utilize them in drainage networks in preference to pipes, culverts, and engineered ditches.

- Evaluating infiltration opportunities by referring to the stormwater management manual for the jurisdiction and pay particular attention to the selection criteria for avoiding groundwater contamination, poor soils, and hydrogeological conditions that cause these facilities to fail. If necessary, locate developments with large amounts of impervious surfaces or a potential to produce relatively contaminated runoff away from groundwater recharge areas.

Protection of Slopes and Channels during Landscape Design

- Convey runoff safely from the tops of slopes.
- Avoid disturbing steep or unstable slopes.
- Avoid disturbing natural channels.
- Stabilize disturbed slopes as quickly as possible.
- Vegetate slopes with native or drought tolerant vegetation.
- Control and treat flows in landscaping and/or other controls prior to reaching existing natural drainage systems.
- Stabilize temporary and permanent channel crossings as quickly as possible, and ensure that increases in run-off velocity and frequency caused by the project do not erode the channel.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion. Energy dissipaters shall be installed in such a way as to minimize impacts to receiving waters.
- Line on-site conveyance channels where appropriate, to reduce erosion caused by increased flow velocity due to increases in tributary impervious area. The first choice for linings should be grass or some other vegetative surface, since these materials not only reduce runoff velocities, but also provide water quality benefits from filtration and infiltration. If velocities in the channel are high enough to erode grass or other vegetative linings, riprap, concrete, soil cement, or geo-grid stabilization are other alternatives.
- Consider other design principles that are comparable and equally effective.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define “redevelopment” in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of “ redevelopment” must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under “designing new installations” above should be followed.

Redevelopment may present significant opportunity to add features which had not previously been implemented. Examples include incorporation of depressions, areas of permeable soils, and swales in newly redeveloped areas. While some site constraints may exist due to the status of already existing infrastructure, opportunities should not be missed to maximize infiltration, slow runoff, reduce impervious areas, disconnect directly connected impervious areas.

Efficient Irrigation SD-12

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Irrigation water provided to landscaped areas may result in excess irrigation water being conveyed into stormwater drainage systems.

Approach

Project plan designs for development and redevelopment should include application methods of irrigation water that minimize runoff of excess irrigation water into the stormwater conveyance system.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Designing New Installations

The following methods to reduce excessive irrigation runoff should be considered, and incorporated and implemented where determined applicable and feasible by the Permittee:

- Employ rain-triggered shutoff devices to prevent irrigation after precipitation.
- Design irrigation systems to each landscape area's specific water requirements.
- Include design featuring flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines.
- Implement landscape plans consistent with County or City water conservation resolutions, which may include provision of water sensors, programmable irrigation times (for short cycles), etc.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Design timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the storm water drainage system.
- Group plants with similar water requirements in order to reduce excess irrigation runoff and promote surface filtration. Choose plants with low irrigation requirements (for example, native or drought tolerant species). Consider design features such as:
  - Using mulches (such as wood chips or bar) in planter areas without ground cover to minimize sediment in runoff
  - Installing appropriate plant materials for the location, in accordance with amount of sunlight and climate, and use native plant materials where possible and/or as recommended by the landscape architect
  - Leaving a vegetative barrier along the property boundary and interior watercourses, to act as a pollutant filter, where appropriate and feasible
  - Choosing plants that minimize or eliminate the use of fertilizer or pesticides to sustain growth
- Employ other comparable, equally effective methods to reduce irrigation water runoff.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Storm Drain Signage SD-13

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- ☑ Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Waste materials dumped into storm drain inlets can have severe impacts on receiving and ground waters. Posting notices regarding discharge prohibitions at storm drain inlets can prevent waste dumping. Storm drain signs and stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets.

Approach

The stencil or affixed sign contains a brief statement that prohibits dumping of improper materials into the urban runoff conveyance system. Storm drain messages have become a popular method of alerting the public about the effects of and the prohibitions against waste disposal.

Suitable Applications

Stencils and signs alert the public to the destination of pollutants discharged to the storm drain. Signs are appropriate in residential, commercial, and industrial areas, as well as any other area where contributions or dumping to storm drains is likely.

Design Considerations

Storm drain message markers or placards are recommended at all storm drain inlets within the boundary of a development project. The marker should be placed in clear sight facing toward anyone approaching the inlet from either side. All storm drain inlet locations should be identified on the development site map.

Designing New Installations

The following methods should be considered for inclusion in the project design and show on project plans:

- Provide stenciling or labeling of all storm drain inlets and catch basins, constructed or modified, within the project area with prohibitive language. Examples include “NO DUMPING

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

– DRAINS TO OCEAN" and/or other graphical icons to discourage illegal dumping.

- Post signs with prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area.

Note - Some local agencies have approved specific signage and/or storm drain message placards for use. Consult local agency stormwater staff to determine specific requirements for placard types and methods of application.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. If the project meets the definition of "redevelopment", then the requirements stated under " designing new installations" above should be included in all project design plans.

Additional Information

Maintenance Considerations

- Legibility of markers and signs should be maintained. If required by the agency with jurisdiction over the project, the owner/operator or homeowner's association should enter into a maintenance agreement with the agency or record a deed restriction upon the property title to maintain the legibility of placards or signs.

Placement

- Signage on top of curbs tends to weather and fade.

- Signage on face of curbs tends to be worn by contact with vehicle tires and sweeper brooms.

Supplemental Information

Examples

- Most MS4 programs have storm drain signage programs. Some MS4 programs will provide stencils, or arrange for volunteers to stencil storm drains as part of their outreach program.

Other Resources

A Manual for the Standard Urban Stormwater Mitigation Plan (SUSMP), Los Angeles County Department of Public Works, May 2002.

Model Standard Urban Storm Water Mitigation Plan (SUSMP) for San Diego County, Port of San Diego, and Cities in San Diego County, February 14, 2002.

Model Water Quality Management Plan (WQMP) for County of Orange, Orange County Flood Control District, and the Incorporated Cities of Orange County, Draft February 2003.

Ventura Countywide Technical Guidance Manual for Stormwater Quality Control Measures, July 2002.

Trash Storage Areas SD-32

Description

Trash storage areas are areas where a trash receptacle (s) are located for use as a repository for solid wastes. Stormwater runoff from areas where trash is stored or disposed of can be polluted. In addition, loose trash and debris can be easily transported by water or wind into nearby storm drain inlets, channels, and/or creeks. Waste handling operations that may be sources of stormwater pollution include dumpsters, litter control, and waste piles.

Approach

This fact sheet contains details on the specific measures required to prevent or reduce pollutants in stormwater runoff associated with trash storage and handling. Preventative measures including enclosures, containment structures, and impervious pavements to mitigate spills, should be used to reduce the likelihood of contamination.

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Design requirements for waste handling areas are governed by Building and Fire Codes, and by current local agency ordinances and zoning requirements. The design criteria described in this fact sheet are meant to enhance and be consistent with these code and ordinance requirements. Hazardous waste should be handled in accordance with legal requirements established in Title 22, California Code of Regulation.

Wastes from commercial and industrial sites are typically hauled by either public or commercial carriers that may have design or access requirements for waste storage areas. The design criteria in this fact sheet are recommendations and are not intended to be in conflict with requirements established by the waste hauler. The waste hauler should be contacted prior to the design of your site trash collection areas. Conflicts or issues should be discussed with the local agency.

Designing New Installations

Trash storage areas should be designed to consider the following structural or treatment control BMPs:

- Design trash container areas so that drainage from adjoining roofs and pavement is diverted around the area(s) to avoid run-on. This might include berming or grading the waste handling area to prevent run-on of stormwater.
- Make sure trash container areas are screened or walled to prevent off-site transport of trash.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Use lined bins or dumpsters to reduce leaking of liquid waste.
- Provide roofs, awnings, or attached lids on all trash containers to minimize direct precipitation and prevent rainfall from entering containers.
- Pave trash storage areas with an impervious surface to mitigate spills.
- Do not locate storm drains in immediate vicinity of the trash storage area.
- Post signs on all dumpsters informing users that hazardous materials are not to be disposed of therein.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Additional Information

Maintenance Considerations

The integrity of structural elements that are subject to damage (i.e., screens, covers, and signs) must be maintained by the owner/operator. Maintenance agreements between the local agency and the owner/operator may be required. Some agencies will require maintenance deed restrictions to be recorded of the property title. If required by the local agency, maintenance agreements or deed restrictions must be executed by the owner/operator before improvement plans are approved.

Other Resources

A Manual for the Standard Urban Stormwater Mitigation Plan (SUSMP), Los Angeles County Department of Public Works, May 2002.

Model Standard Urban Storm Water Mitigation Plan (SUSMP) for San Diego County, Port of San Diego, and Cities in San Diego County, February 14, 2002.

Model Water Quality Management Plan (WQMP) for County of Orange, Orange County Flood Control District, and the Incorporated Cities of Orange County, Draft February 2003.

Ventura Countywide Technical Guidance Manual for Stormwater Quality Control Measures, July 2002.

Outdoor Material Storage Areas SD-34

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- ✓ Contain Pollutant
- Collect and Convey

Description

Proper design of outdoor storage areas for materials reduces opportunity for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to enter the stormwater conveyance system. Materials may be in the form of raw products, by-products, finished products, and waste products. The type of pollutants associated with the materials will vary depending on the type of commercial or industrial activity.

Approach

Outdoor storage areas require a drainage approach different from the typical infiltration/detention strategy. In outdoor storage areas, infiltration is discouraged. Containment is encouraged. Preventative measures include enclosures, secondary containment structures and impervious surfaces.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment.

Design Considerations

Some materials are more of a concern than others. Toxic and hazardous materials must be prevented from coming in contact with stormwater. Non-toxic or non-hazardous materials do not have to be prevented from stormwater contact. However, these materials may have toxic effects on receiving waters if allowed to be discharged with stormwater in significant quantities. Accumulated material on an impervious surface could result in significant impact on the rivers or streams that receive the runoff.

Material may be stored in a variety of ways, including bulk piles, containers, shelving, stacking, and tanks. Stormwater contamination may be prevented by eliminating the possibility of stormwater contact with the material storage areas either through diversion, cover, or capture of the stormwater. Control measures may also include minimizing the storage area. Design requirements

for material storage areas are governed by Building and Fire Codes, and by current City or County ordinances and zoning requirements. Control measures are site specific, and must meet local agency requirements.

Designing New Installations

Where proposed project plans include outdoor areas for storage of materials that may contribute pollutants to the stormwater conveyance system, the following structural or treatment BMPS should be considered:

- Materials with the potential to contaminate stormwater should be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the stormwater conveyance system, or (2) protected by secondary containment structures such as berms, dikes, or curbs.
- The storage area should be paved and sufficiently impervious to contain leaks and spills.
- The storage area should slope towards a dead-end sump to contain spills and direct runoff from downspouts/roofs should be directed away from storage areas.
- The storage area should have a roof or awning that extends beyond the storage area to minimize collection of stormwater within the secondary containment area. A manufactured storage shed may be used for small containers.

Note that the location(s) of installations of where these preventative measures will be employed must be included on the map or plans identifying BMPs.

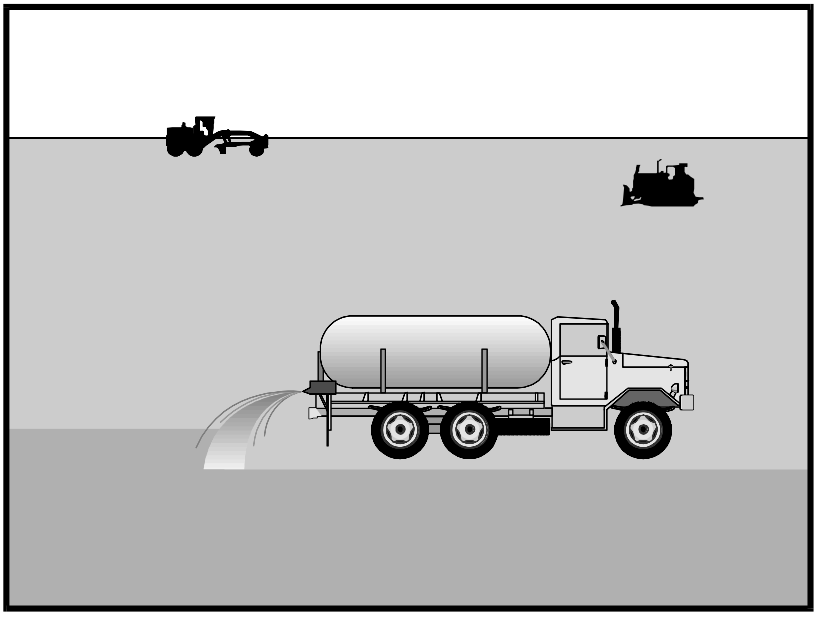
Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Additional Information

Stormwater and non-stormwater will accumulate in containment areas and sumps with impervious surfaces. Contaminated accumulated water must be disposed of in accordance with applicable laws and cannot be discharged directly to the storm drain or sanitary sewer system without the appropriate permits.

Other Resources



A Manual for the Standard Urban Stormwater Mitigation Plan (SUSMP), Los Angeles County Department of Public Works, May 2002.

Model Standard Urban Storm Water Mitigation Plan (SUSMP) for San Diego County, Port of San Diego, and Cities in San Diego County, February 14, 2002.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Soil binding consists of application and maintenance of a soil stabilizer to exposed soil surfaces. Soil binders are materials applied to the soil surface to temporarily prevent water and wind induced erosion of exposed soils on construction sites.

Suitable Applications

Soil binders are typically applied to disturbed areas requiring temporary protection. Because soil binders, when used as a stand-alone practice, can often be incorporated into the soil, they are a good alternative to mulches in areas where grading activities will soon resume. Soil binders are commonly used in the following areas:

- Rough graded soils that will be inactive for a short period of time
- Soil stockpiles
- Temporary haul roads prior to placement of crushed rock
- Compacted soil road base
- Construction staging, materials storage, and layout areas

Limitations

- Soil binders are temporary in nature and may need reapplication.
- Soil binders require a minimum curing time until fully effective, as prescribed by the manufacturer. Curing time

may be 24 hours or longer. Soil binders may need reapplication after a storm event.

- Soil binders will generally experience spot failures during heavy rainfall events. If runoff penetrates the soil at the top of a slope treated with a soil binder, it is likely that the runoff will undercut the stabilized soil layer and discharge at a point further down slope.
- Plant-material-based soil binders do not generally hold up to pedestrian or vehicular traffic across treated areas as well as polymeric emulsion blends or cementitious-based binders.
- Soil binders may not sufficiently penetrate compacted soils.
- Some soil binders are soil texture specific in terms of their effectiveness. For example, polyacrylamides (PAMs) work very well on silt and clayey soils but their performance decreases dramatically in sandy soils.
- Some soil binders may not perform well with low relative humidity. Under rainy conditions, some agents may become slippery or leach out of the soil.
- Soil binders may not cure if low temperatures occur within 24 hours of application.
- The water quality impacts of some chemical soil binders are relatively unknown and some may have water quality impacts due to their chemical makeup. Additionally, these chemical may require non-visible pollutant monitoring. Products should be evaluated for project-specific implementation by the SWPPP Preparer. Refer to the product Material Safety Data Sheet for chemical properties.

Implementation

General Considerations

- Soil binders should conform to local municipality specifications and requirements.
- Site soil types will dictate appropriate soil binders to be used.
- A soil binder must be environmentally benign (non-toxic to plant and animal life), easy to apply, easy to maintain, economical, and should not stain paved or painted surfaces. Soil binders should not pollute stormwater when cured. Obtain a Material Safety Data Sheet (MSDS) from the manufacturer to ensure non-toxicity.
- Stormwater runoff from PAM treated soils should pass through one of the following sediment control BMP prior to discharging to surface waters.
    - When the total drainage area is greater than or equal to 5 acres, PAM treated areas should drain to a sediment basin.
    - Areas less than 5 acres should drain to sediment control BMPs, such as a sediment trap, or a series of check dams. The total number of check dams used should be maximized to achieve the greatest amount of settlement of sediment prior to discharging from the site. Each check dam should be spaced evenly in the drainage channel through which stormwater flows are discharged off site.

- Performance of soil binders depends on temperature, humidity, and traffic across treated areas.
- Avoid over spray onto roads, sidewalks, drainage channels, existing vegetation, etc.
- Additional guidance on the comparison and selection of temporary slope stabilization methods is provided in Appendix F of the Handbook.

Selecting a Soil Binder

Properties of common soil binders used for erosion control are provided on Table 1 at the end of this Fact Sheet. Use Table 1 to select an appropriate soil binder. Refer to WE-1, Wind Erosion Control, for dust control soil binders.

Factors to consider when selecting a soil binder include the following:

- Suitability to situation - Consider where the soil binder will be applied, if it needs a high resistance to leaching or abrasion, and whether it needs to be compatible with any existing vegetation. Determine the length of time soil stabilization will be needed, and if the soil binder will be placed in an area where it will degrade rapidly. In general, slope steepness is not a discriminating factor for the listed soil binders.
- Soil types and surface materials - Fines and moisture content are key properties of surface materials. Consider a soil binder's ability to penetrate, likelihood of leaching, and ability to form a surface crust on the surface materials.
- Frequency of application - The frequency of application is related to the functional longevity of the binder, which can be affected by subgrade conditions, surface type, climate, and maintenance schedule.
- Frequent applications could lead to high costs. Application frequency may be minimized if the soil binder has good penetration, low evaporation, and good longevity. Consider also that frequent application will require frequent equipment clean up.

Plant-Material-Based (Short Lived, <6 months) Binders

Guar: Guar is a non-toxic, biodegradable, natural galactomannan-based hydrocolloid treated with dispersant agents for easy field mixing. It should be mixed with water at the rate of 11 to 15 lb per 1,000 gallons. Recommended minimum application rates are as follows:

Application Rates for Guar Soil Stabilizer

Slope (H:V):	Flat	4:1	3:1	2:1	1:1
lb/acre:	40	45	50	60	70

Psyllium: Psyllium is composed of the finely ground muciloid coating of plantago seeds that is applied as a dry powder or in a wet slurry to the surface of the soil. It dries to form a firm but rewettable membrane that binds soil particles together, but permits germination and growth of seed. Psyllium requires 12 to 18 hours drying time. Application rates should be from 80 to 200 lb/acre, with enough water in solution to allow for a uniform slurry flow.

Starch: Starch is non-ionic, cold water soluble (pre-gelatinized) granular cornstarch. The material is mixed with water and applied at the rate of 150 lb/acre. Approximate drying time is 9 to 12 hours.

Plant-Material-Based (Long Lived, 6-12 months) Binders

Pitch and Rosin Emulsion: Generally, a non-ionic pitch and rosin emulsion has a minimum solids content of 48%. The rosin should be a minimum of 26% of the total solids content. The soil stabilizer should be non-corrosive, water dilutable emulsion that upon application cures to a water insoluble binding and cementing agent. For soil erosion control applications, the emulsion is diluted and should be applied as follows:

- For clayey soil: 5 parts water to 1 part emulsion
- For sandy soil: 10 parts water to 1 part emulsion

Application can be by water truck or hydraulic seeder with the emulsion and product mixture applied at the rate specified by the manufacturer.

Polymeric Emulsion Blend Binders

Acrylic Copolymers and Polymers: Polymeric soil stabilizers should consist of a liquid or solid polymer or copolymer with an acrylic base that contains a minimum of 55% solids. The polymeric compound should be handled and mixed in a manner that will not cause foaming or should contain an anti-foaming agent. The polymeric emulsion should not exceed its shelf life or expiration date; manufacturers should provide the expiration date. Polymeric soil stabilizer should be readily miscible in water, non-injurious to seed or animal life, non-flammable, should provide surface soil stabilization for various soil types without totally inhibiting water infiltration, and should not re-emulsify when cured. The applied compound typically requires 12 to 24 hours drying time. Liquid copolymer should be diluted at a rate of 10 parts water to 1 part polymer and the mixture applied to soil at a rate of 1,175 gallons/acre.

Liquid Polymers of Methacrylates and Acrylates: This material consists of a tackifier/sealer that is a liquid polymer of methacrylates and acrylates. It is an aqueous 100% acrylic emulsion blend of 40% solids by volume that is free from styrene, acetate, vinyl, ethoxylated surfactants or silicates. For soil stabilization applications, it is diluted with water in accordance with the manufacturer's recommendations, and applied with a hydraulic seeder at the rate of 20 gallons/acre. Drying time is 12 to 18 hours after application.

Copolymers of Sodium Acrylates and Acrylamides: These materials are non-toxic, dry powders that are copolymers of sodium acrylate and acrylamide. They are mixed with water and applied to the soil surface for erosion control at rates that are determined by slope gradient:

Slope Gradient (H:V)	lb/acre
Flat to 5:1	3.0 – 5.0
5:1 to 3:1	5.0 – 10.0
2:1 to 1:1	10.0 – 20.0

Poly-Acrylamide (PAM) and Copolymer of Acrylamide**:** Linear copolymer polyacrylamide for use as a soil binder is packaged as a dry flowable solid, as a liquid. Refer to the manufacturer's recommendation for dilution and application rates as they vary based on liquid or dry form, site conditions and climate.

- Limitations specific to PAM are as follows:
  - Do not use PAM on a slope that flows into a water body without passing through a sediment trap or sediment basin.
  - The specific PAM copolymer formulation must be anionic. Cationic PAM should not be used in any application because of known aquatic toxicity problems. Only the highest drinking water grade PAM, certified for compliance with ANSI/NSF Standard 60 for drinking water treatment, should be used for soil applications.
  - PAM designated for erosion and sediment control should be "water soluble" or "linear" or "non-cross linked".
  - PAM should not be used as a stand-alone BMP to protect against water-based erosion. When combined with mulch, its effectiveness increases dramatically.

Hydro-Colloid Polymers: Hydro-Colloid Polymers are various combinations of dry flowable poly-acrylamides, copolymers and hydro-colloid polymers that are mixed with water and applied to the soil surface at rates of 55 to 60 lb/acre. Drying times are 0 to 4 hours.

Cementitious-Based Binders

Gypsum: This is a formulated gypsum based product that readily mixes with water and mulch to form a thin protective crust on the soil surface. It is composed of high purity gypsum that is ground, calcined and processed into calcium sulfate hemihydrate with a minimum purity of 86%. It is mixed in a hydraulic seeder and applied at rates 4,000 to 12,000 lb/acre. Drying time is 4 to 8 hours.

Applying Soil Binders

After selecting an appropriate soil binder, the untreated soil surface must be prepared before applying the soil binder. The untreated soil surface must contain sufficient moisture to assist the agent in achieving uniform distribution. In general, the following steps should be followed:

- Follow manufacturer's written recommendations for application rates, pre-wetting of application area, and cleaning of equipment after use.
- Prior to application, roughen embankment and fill areas.
- Consider the drying time for the selected soil binder and apply with sufficient time before anticipated rainfall. Soil binders should not be applied during or immediately before rainfall.
- Avoid over spray onto roads, sidewalks, drainage channels, sound walls, existing vegetation, etc.

- Soil binders should not be applied to frozen soil, areas with standing water, under freezing or rainy conditions, or when the temperature is below 40°F during the curing period.
- More than one treatment is often necessary, although the second treatment may be diluted or have a lower application rate.
- Generally, soil binders require a minimum curing time of 24 hours before they are fully effective. Refer to manufacturer's instructions for specific cure time.
- For liquid agents:
  - Crown or slope ground to avoid ponding.
  - Uniformly pre-wet ground at 0.03 to 0.3 gal/yd^2 or according to manufacturer's recommendations.
  - Apply solution under pressure. Overlap solution 6 to 12 in.
  - Allow treated area to cure for the time recommended by the manufacturer; typically at least 24 hours.
  - Apply second treatment before first treatment becomes ineffective, using 50% application rate.
  - In low humidities, reactivate chemicals by re-wetting with water at 0.1 to 0.2 gal/yd^2.

Costs

Costs vary according to the soil stabilizer selected for implementation. The following are approximate installed costs:

Soil Binder	Cost per Acre (2004)[1]	Estimated Cost per Acre (2009)[2]
Plant-Material-Based (Short Lived) Binders	$700-$900	$770-$990
Plant-Material-Based (Long Lived) Binders	$1,200-$1,500	$1,320-$1,650
Polymeric Emulsion Blend Binders	$700 -$1,500	$770-$1,650
Cementitious-Based Binders	$800-$1,200	$880-$1,350

1. Source: Cost information received from individual product manufacturers solicited by Geosyntec Consultants (2004).

2. 2009 costs reflect a 10% escalation over year 2004 costs. Escalation based on informal survey of industry trends. Note: Expected cost increase is offset by competitive economic conditions.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Areas where erosion is evident should be repaired and BMPs re-applied as soon as possible. Care should be exercised to minimize the damage to protected areas while making repairs, as any area damaged will require re-application of BMPs.
- Reapply the selected soil binder as needed to maintain effectiveness.

Table 1 Properties of Soil Binders for Erosion Control

Evaluation Criteria	Binder Type			
	Plant Material Based (Short Lived)	**Plant Material Based (Long Lived)**	**Polymeric Emulsion Blends**	**Cementitious-Based Binders**
Relative Cost	Low	Moderate to High	Low to High	Low to Moderate
Resistance to Leaching	High	High	Low to Moderate	Moderate
Resistance to Abrasion	Moderate	Low	Moderate to High	Moderate to High
Longevity	Short to Medium	Medium	Medium to Long	Medium
Minimum Curing Time before Rain	9 to 18 hours	19 to 24 hours	0 to 24 hours	4 to 8 hours
Compatibility with Existing Vegetation	Good	Poor	Poor	Poor
Mode of Degradation	Biodegradable	Biodegradable	Photodegradable/ Chemically Degradable	Photodegradable/ Chemically Degradable
Labor Intensive	No	No	No	No
Specialized Application Equipment	Water Truck or Hydraulic Mulcher	Water Truck or Hydraulic Mulcher	Water Truck or Hydraulic Mulcher	Water Truck or Hydraulic Mulcher
Liquid/Powder	Powder	Liquid	Liquid/Powder	Powder
Surface Crusting	Yes, but dissolves on rewetting	Yes	Yes, but dissolves on rewetting	Yes
Clean Up	Water	Water	Water	Water
Erosion Control Application Rate	Varies (1)	Varies (1)	Varies (1)	4,000 to 12,000 lbs/acre

BIO-7: Proprietary Biotreatment

Proprietary biotreatment devices are devices that are manufactured to mimic natural systems such as bioretention areas by incorporating plants, soil, and microbes engineered to provide treatment at higher flow rates or volumes and with smaller footprints than their natural counterparts. Incoming flows are typically filtered through a planting media (mulch, compost, soil, plants, microbes, etc.) and either infiltrated or collected by an underdrain and delivered to the storm water conveyance system. Tree box filters are an increasingly common type of proprietary biotreatment device that are installed at curb level and filled with a bioretention type soil. For low to moderate flows they operate similarly to bioretention systems and are bypassed during high flows. Tree box filters are highly adaptable solutions that can be used in all types of development and in all types of soils but are especially applicable to dense urban parking lots, street, and roadways.

Also known as:

- *Catch basin planter box*
- *Bioretention vault*
- *Tree box filter*

Proprietary biotreatment
Source: http://www.americastusa.com /index.php/filterra/

Feasibility Screening Considerations

- Proprietary biotreatment devices that are unlined may cause incidental infiltration. Therefore, an evaluation of site conditions should be conducted to evaluate whether the BMP should include an impermeable liner to avoid infiltration into the subsurface.

Opportunity Criteria

- Drainage areas of 0.25 to 1.0 acres.
- Land use may include commercial, residential, mixed use, institutional, and subdivisions. Proprietary biotreatment facilities may also be applied in parking lot islands, traffic circles, road shoulders, and road medians.
- Must not adversely affect the level of flood protection provided by the drainage system.

OC-Specific Design Criteria and Considerations

☐ Frequent maintenance and the use of screens and grates to keep trash out may decrease the likelihood of clogging and prevent obstruction and bypass of incoming flows.

☐ Consult proprietors for specific criteria concerning the design and performance.

☐ Proprietary biotreatment may include specific media to address pollutants of concern. However, for proprietary device to be considered a biotreatment device the media must be capable of supporting rigorous growth of vegetation.

☐ Proprietary systems must be acceptable to the reviewing agency. Reviewing agencies shall have the discretion to request performance information. Reviewing agencies shall have the discretion to deny the use of a proprietary BMP on the grounds of performance, maintenance considerations, or other relevant factors.

☐ In right of way areas, plant selection should not impair traffic lines of site. Local jurisdictions may also limit plant selection in keeping with landscaping themes.

Computing Sizing Criteria for Proprietary Biotreatment Device

- Proprietary biotreatment devices can be volume based or flow-based BMPs.
- Volume-based proprietary devices should be sized using the Simple Design Capture Volume Sizing Method described in **Appendix III.3.1** or the Capture Efficiency Method for Volume-Based, Constant Drawdown BMPs described in **Appendix III.3.2**.
- The required design flowrate for flow-based proprietary devices should be computed using the Capture Efficiency Method for Flow-based BMPs described in **Appendix III.3.3)**.

In South Orange County, the provided ponding plus pore volume must be checked to demonstrate that it is greater than 0.75 of the remaining DCV that this BMP is designed to address. Many propretary biotreatment BMPs will not be able to meet the definition of "biofiltration" that applies in South Orange County. See Section III.7 and Worksheet SOC-1.

XIV.7. Pretreatment/Gross Solids Removal BMP Fact Sheets (PRE)

PRE-1: Hydrodynamic Separation Device

Hydrodynamic separation devices are inline pretreatment units designed to remove trash, debris, and coarse sediment using screening, gravity settling, and centrifugal forces generated by forcing the influent into a circular motion. Several companies manufacture units with a variety of design components including separate chambers, baffles, sorbent media, screens, and flow control orifices. Therefore, additional constituents may be targeted depending on the design; however, the short residence time and potential for captured materials to be released during high flows limits the acceptable use of this BMP type as a standalone treatment control BMP.

Also known as:

- *Vortex Separators*
- *Swirl Concentrators*
- *Gross solids removal devices (GSRDs)*

Hydrodynamic Separation Device
Source: Contech Stormwater Solution, Inc.

Opportunity Criteria

- Hydrodynamic separation devices are effective for the removal of coarse sediment, trash, and debris, and are useful as pretreatment in combination with other BMP types that target smaller particle sizes. They are most effective in urban areas where coarse sediment, trash, and debris are pollutants of concern.
- Hydrodynamic devices represent a wide range of device types that have different unit processes and design elements (e.g., storage versus flow-through designs, inclusion of media filtration, etc.) that vary significantly within the category. These design features likely have significant effects on BMP performance; therefore, generalized performance data for hydrodynamic devices is not practical.

OC-Specific Design Criteria and Considerations

☐ Proprietary hydrodynamic device BMP vendors are constantly updating and expanding their product lines so refer to the latest design guidance from each of the vendors. General guidelines on the performance, operations and maintenance of proprietary devices are provided by the vendors.

☐ Operations and maintenance requirements include: clearing trash, debris, and sediment around insert grate and inside chamber, and repairing screens and media if damaged or severely clogged.

Computing Sizing Criteria for Hydrodynamic Devices

- Hydrodynamic separation devices should be adequately sized to pretreat the entire design volume or design flow rate of the downstream BMP.
- The required design flowrate should be calculated based on the Capture Efficiency Method for Flow-based BMPs (See **Appendix** III) to achieve 80 percent capture of the average annual stormwater runoff volume.

Proprietary Hydrodynamic Device Manufacturer Websites

- Table XIV.1 is a list of manufacturers that provide hydrodynamic separation devices. The inclusion of these manufacturers does not represent an endorse of their products. Other devices and manufacturers may be acceptable for pretreatment.

Maintenance Summary

- Remove Trash from Screening Device – average maintenance interval is 6 to 12 months.
  - (*5 minute average service time*).
- Remove Sediment from Separation Chamber – average maintenance interval is 12 to 24 months.
  - (*10 minute average service time*).
- Replace Cartridge Filter Media – average maintenance interval 12 to 24 months.
  - (*10-15 minute per cartridge average service time*).
- Replace Drain Down Filter Media – average maintenance interval is 12 to 24 months.
  - (*5 minute average service time*).
- Trim Vegetation – average maintenance interval is 6 to 12 months.
  - (*Service time varies*).

System Diagram

Maintenance Procedures

Screening Device

1. Remove grate or manhole cover to gain access to the screening device in the Pre-Treatment Chamber. Vault type units do not have screening device. Maintenance can be performed without entry.
2. Remove all pollutants collected by the screening device. Removal can be done manually or with the use of a vacuum truck. The hose of the vacuum truck will not damage the screening device.
3. Screening device can easily be removed from the Pre-Treatment Chamber to gain access to separation chamber and media filters below. Replace grate or manhole cover when completed.

Separation Chamber

1. Perform maintenance procedures of screening device listed above before maintaining the separation chamber.
2. With a pressure washer spray down pollutants accumulated on walls and cartridge filters.
3. Vacuum out Separation Chamber and remove all accumulated pollutants. Replace screening device, grate or manhole cover when completed.

Cartridge Filters

1. Perform maintenance procedures on screening device and separation chamber before maintaining cartridge filters.
2. Enter separation chamber.
3. Unscrew the two bolts holding the lid on each cartridge filter and remove lid.
4. Remove each of 4 to 8 media cages holding the media in place.
5. Spray down the cartridge filter to remove any accumulated pollutants.
6. Vacuum out old media and accumulated pollutants.
7. Reinstall media cages and fill with new media from manufacturer or outside supplier. Manufacturer will provide specification of media and sources to purchase.
8. Replace the lid and tighten down bolts. Replace screening device, grate or manhole cover when completed.

Drain Down Filter

1. Remove hatch or manhole cover over discharge chamber and enter chamber.
2. Unlock and lift drain down filter housing and remove old media block. Replace with new media block. Lower drain down filter housing and lock into place.
3. Exit chamber and replace hatch or manhole cover.

Maintenance Notes

1. Following maintenance and/or inspection, it is recommended the maintenance operator prepare a maintenance/inspection record. The record should include any maintenance activities performed, amount and description of debris collected, and condition of the system and its various filter mechanisms.

2. The owner should keep maintenance/inspection record(s) for a minimum of five years from the date of maintenance. These records should be made available to the governing municipality for inspection upon request at any time.

3. Transport all debris, trash, organics and sediments to approved facility for disposal in accordance with local and state requirements.

4. Entry into chambers may require confined space training based on state and local regulations.

5. No fertilizer shall be used in the Biofiltration Chamber.

6. Irrigation should be provided as recommended by manufacturer and/or landscape architect. Amount of irrigation required is dependent on plant species. Some plants may require irrigation.

Maintenance Procedure Illustration

Screening Device

The screening device is located directly under the manhole or grate over the Pre-Treatment Chamber. It's mounted directly underneath for easy access and cleaning. Device can be cleaned by hand or with a vacuum truck.

Separation Chamber

The separation chamber is located directly beneath the screening device. It can be quickly cleaned using a vacuum truck or by hand. A pressure washer is useful to assist in the cleaning process.

Cartridge Filters

The cartridge filters are located in the Pre-Treatment chamber connected to the wall adjacent to the biofiltration chamber. The cartridges have removable tops to access the individual media filters. Once the cartridge is open media can be easily removed and replaced by hand or a vacuum truck.

Drain Down Filter

The drain down filter is located in the Discharge Chamber. The drain filter unlocks from the wall mount and hinges up. Remove filter block and replace with new block.

Trim Vegetation

Vegetation should be maintained in the same manner as surrounding vegetation and trimmed as needed. No fertilizer shall be used on the plants. Irrigation per the recommendation of the manufacturer and or landscape architect. Different types of vegetation requires different amounts of irrigation.

Modular Wetland System Type (Curb, Grate or UG Vault): _____ Size (22', 14' or etc.): _____

Structural Integrity:	**Yes**	**No**	**Comments**
Damage to pre-treatment access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Damage to discharge chamber access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Does the MWS unit show signs of structural deterioration (cracks in the wall, damage to frame)?			
Is the inlet/outlet pipe or drain down pipe damaged or otherwise not functioning properly?			
Working Condition:			
Is there evidence of illicit discharge or excessive oil, grease, or other automobile fluids entering and clogging the unit?			
Is there standing water in inappropriate areas after a dry period?			
Is the filter insert (if applicable) at capacity and/or is there an accumulation of debris/trash on the shelf system?			
Does the depth of sediment/trash/debris suggest a blockage of the inflow pipe, bypass or cartridge filter? If yes, specify which one in the comments section. Note depth of accumulation in in pre-treatment chamber.			Depth:
Does the cartridge filter media need replacement in pre-treatment chamber and/or discharge chamber?			Chamber:
Any signs of improper functioning in the discharge chamber? Note issues in comments section.			
Other Inspection Items:			
Is there an accumulation of sediment/trash/debris in the wetland media (if applicable)?			
Is it evident that the plants are alive and healthy (if applicable)? Please note Plant Information below.			
Is there a septic or foul odor coming from inside the system?			

Waste:	**Yes**	**No**

WASHINGTON STATE DEPARTMENT OF ECOLOGY

April 2014

GENERAL USE LEVEL DESIGNATION FOR BASIC, ENHANCED, AND PHOSPHORUS TREATMENT

For the

MWS-Linear Modular Wetland

Ecology's Decision:

Based on Modular Wetland Systems, Inc. application submissions, including the Technical Evaluation Report, dated April 1, 2014, Ecology hereby issues the following use level designation:

1. General use level designation (GULD) for the MWS-Linear Modular Wetland Stormwater Treatment System for Basic treatment

   - Sized at a hydraulic loading rate of 1 gallon per minute (gpm) per square foot (sq ft) of wetland cell surface area. For moderate pollutant loading rates (low to medium density residential basins), size the Prefilters at 3.0 gpm/sq ft of cartridge surface area. For high loading rates (commercial and industrial basins), size the Prefilters at 2.1 gpm/sq ft of cartridge surface area.

2. General use level designation (GULD) for the MWS-Linear Modular Wetland Stormwater Treatment System for Phosphorus treatment

   - Sized at a hydraulic loading rate of 1 gallon per minute (gpm) per square foot (sq ft) of wetland cell surface area. For moderate pollutant loading rates (low to medium density residential basins), size the Prefilters at 3.0 gpm/sq ft of cartridge surface area. For high loading rates (commercial and industrial basins), size the Prefilters at 2.1 gpm/sq ft of cartridge surface area.

3. General use level designation (GULD) for the MWS-Linear Modular Wetland Stormwater Treatment System for Enhanced treatment

   - Sized at a hydraulic loading rate of 1 gallon per minute (gpm) per square foot (sq ft) of wetland cell surface area. For moderate pollutant loading rates (low to medium density residential basins), size the Prefilters at 3.0 gpm/sq ft of cartridge surface area. For high loading rates (commercial and industrial basins), size the Prefilters at 2.1 gpm/sq ft of cartridge surface area.

4. Ecology approves the MWS - Linear Modular Wetland Stormwater Treatment System units for Basic, Phosphorus, and Enhanced treatment at the hydraulic loading rate listed above. Designers shall calculate the water quality design flow rates using the following procedures:

    - Western Washington: For treatment installed upstream of detention or retention, the water quality design flow rate is the peak 15-minute flow rate as calculated using the latest version of the Western Washington Hydrology Model or other Ecology-approved continuous runoff model.
    - Eastern Washington: For treatment installed upstream of detention or retention, the water quality design flow rate is the peak 15-minute flow rate as calculated using one of the three methods described in Chapter 2.2.5 of the Stormwater Management Manual for Eastern Washington (SWMMEW) or local manual.
    - Entire State: For treatment installed downstream of detention, the water quality design flow rate is the full 2-year release rate of the detention facility.

5. These use level designations have no expiration date but may be revoked or amended by Ecology, and are subject to the conditions specified below.

Ecology's Conditions of Use:

Applicants shall comply with the following conditions:

1. Design, assemble, install, operate, and maintain the MWS – Linear Modular Wetland Stormwater Treatment System units, in accordance with Modular Wetland Systems, Inc. applicable manuals and documents and the Ecology Decision.
2. Each site plan must undergo Modular Wetland Systems, Inc. review and approval before site installation. This ensures that site grading and slope are appropriate for use of a MWS – Linear Modular Wetland Stormwater Treatment System unit.
3. MWS – Linear Modular Wetland Stormwater Treatment System media shall conform to the specifications submitted to, and approved by, Ecology.
4. Maintenance: The required maintenance interval for stormwater treatment devices is often dependent upon the degree of pollutant loading from a particular drainage basin. Therefore, Ecology does not endorse or recommend a "one size fits all" maintenance cycle for a particular model/size of manufactured filter treatment device.

    - Typically, Modular Wetland Systems, Inc. designs MWS - Linear Modular Wetland systems for a target prefilter media life of 6 to 12 months.
    - Indications of the need for maintenance include effluent flow decreasing to below the design flow rate or decrease in treatment below required levels.
    - Owners/operators must inspect MWS - Linear Modular Wetland systems for a minimum of twelve months from the start of post-construction operation to determine site-specific maintenance schedules and requirements. You must conduct inspections monthly during the wet season, and every other month during the dry season. (According to the SWMMWW, the wet season in western Washington is October 1 to April 30. According to SWMMEW, the wet season in eastern Washington is October 1 to June 30). After the

first year of operation, owners/operators must conduct inspections based on the findings during the first year of inspections.

- Conduct inspections by qualified personnel, follow manufacturer's guidelines, and use methods capable of determining either a decrease in treated effluent flowrate and/or a decrease in pollutant removal ability.
- When inspections are performed, the following findings typically serve as maintenance triggers:
    - Standing water remains in the vault between rain events, or
    - Bypass occurs during storms smaller than the design storm.
    - If excessive floatables (trash and debris) are present (but no standing water or excessive sedimentation), perform a minor maintenance consisting of gross solids removal, not prefilter media replacement.
    - Additional data collection will be used to create a correlation between pretreatment chamber sediment depth and pre-filter clogging (see *Issues to be Addressed by the Company* section below)

6. Discharges from the MWS - Linear Modular Wetland Stormwater Treatment System units shall not cause or contribute to water quality standards violations in receiving waters.

Applicant:	Modular Wetland Systems, Inc.
Applicant's Address:	*PO. Box 869* *Oceanside, CA 92054*

Application Documents:

- *Original Application for Conditional Use Level Designation*, Modular Wetland System, Linear Stormwater Filtration System Modular Wetland Systems, Inc., January 2011
- *Quality Assurance Project Plan*: Modular Wetland system – Linear Treatment System performance Monitoring Project, draft, January 2011.
- *Revised Application for Conditional Use Level Designation*, Modular Wetland System, Linear Stormwater Filtration System Modular Wetland Systems, Inc., May 2011
- *Memorandum: Modular Wetland System-Linear GULD Application Supplementary Data, April 2014*
- *Technical Evaluation Report: Modular Wetland System Stormwater Treatment System Performance Monitoring, April 2014.*

Applicant's Use Level Request:

General use level designation as a Basic, Enhanced, and Phosphorus treatment device in accordance with Ecology's Guidance for Evaluating Emerging Stormwater Treatment Technologies Technology Assessment Protocol – Ecology (TAPE) January 2011 Revision.

Applicant's Performance Claims:

- The MWS – Linear Modular wetland is capable of removing a minimum of 80-percent of TSS from stormwater with influent concentrations between 100 and 200 mg/l.
- The MWS – Linear Modular wetland is capable of removing a minimum of 50-percent of Total Phosphorus from stormwater with influent concentrations between 0.1 and 0.5 mg/l.
- The MWS – Linear Modular wetland is capable of removing a minimum of 30-percent of dissolved Copper from stormwater with influent concentrations between 0.005 and 0.020 mg/l.
- The MWS – Linear Modular wetland is capable of removing a minimum of 60-percent of dissolved Zinc from stormwater with influent concentrations between 0.02 and 0.30 mg/l.

Ecology Recommendations:

- Modular Wetland Systems, Inc. has shown Ecology, through laboratory and field-testing, that the MWS - Linear Modular Wetland Stormwater Treatment System filter system is capable of attaining Ecology's Basic, Total phosphorus, and Enhanced treatment goals.

Findings of Fact:

Laboratory Testing

The MWS-Linear Modular wetland has the:

- Capability to remove 99 percent of total suspended solids (using Sil-Co-Sil 106) in a quarter-scale model with influent concentrations of 270 mg/L.
- Capability to remove 91 percent of total suspended solids (using Sil-Co-Sil 106) in laboratory conditions with influent concentrations of 84.6 mg/L at a flow rate of 3.0 gpm per square foot of media.
- Capability to remove 93 percent of dissolved Copper in a quarter-scale model with influent concentrations of 0.757 mg/L.
- Capability to remove 79 percent of dissolved Copper in laboratory conditions with influent concentrations of 0.567 mg/L at a flow rate of 3.0 gpm per square foot of media.
- Capability to remove 80.5-percent of dissolved Zinc in a quarter-scale model with influent concentrations of 0.95 mg/L at a flow rate of 3.0 gpm per square foot of media.
- Capability to remove 78-percent of dissolved Zinc in laboratory conditions with influent concentrations of 0.75 mg/L at a flow rate of 3.0 gpm per square foot of media.

Field Testing

- Modular Wetland Systems, Inc. conducted monitoring of an MWS-Linear (Model # MWS-L-4-13) from April 2012 through May 2013, at a transportation maintenance facility in Portland, Oregon. The manufacturer collected flow-weighted composite

samples of the system's influent and effluent during 28 separate storm events. The system treated approximately 75 percent of the runoff from 53.5 inches of rainfall during the monitoring period. The applicant sized the system at 1 gpm/sq ft. (wetland media) and 3gpm/sq ft. (prefilter).

- Influent TSS concentrations for qualifying sampled storm events ranged from 20 to 339 mg/L. Average TSS removal for influent concentrations greater than 100 mg/L (n=7) averaged 85 percent. For influent concentrations in the range of 20-100 mg/L (n=18), the upper 95 percent confidence interval about the mean effluent concentration was 12.8 mg/L.
- Total phosphorus removal for 17 events with influent TP concentrations in the range of 0.1 to 0.5 mg/L averaged 65 percent. A bootstrap estimate of the lower 95 percent confidence limit (LCL95) of the mean total phosphorus reduction was 58 percent.
- The lower 95 percent confidence limit of the mean percent removal was 60.5 percent for dissolved zinc for influent concentrations in the range of 0.02 to 0.3 mg/L (n=11). The lower 95 percent confidence limit of the mean percent removal was 32.5 percent for dissolved copper for influent concentrations in the range of 0.005 to 0.02 mg/L (n=14) at flow rates up to 28 gpm (design flow rate 41 gpm). Laboratory test data augmented the data set, showing dissolved copper removal at the design flow rate of 41 gpm (93 percent reduction in influent dissolved copper of 0.757 mg/L).

Issues to be addressed by the Company:

1. Modular Wetland Systems, Inc. should collect maintenance and inspection data for the first year on all installations in the Northwest in order to assess standard maintenance requirements for various land uses in the region. Modular Wetland Systems, Inc. should use these data to establish required maintenance cycles.
2. Modular Wetland Systems, Inc. should collect pre-treatment chamber sediment depth data for the first year of operation for all installations in the Northwest. Modular Wetland Systems, Inc. will use these data to create a correlation between sediment depth and pre-filter clogging.

OPERATION AND MAINTENANCE

CatchBasin StormFilter™

Important: These guidelines should be used as a part of your site stormwater plan.

Overview

The CatchBasin StormFilter™ (CBSF) consists of a multi-chamber steel, concrete, or plastic catch basin unit that can contain up to four StormFilter cartridges. The steel CBSF is offered both as a standard and as a deep unit.

The CBSF is installed flush with the finished grade and is applicable for both constrained lot and retrofit applications. It can also be fitted with an inlet pipe for roof leaders or similar applications.

The CBSF unit treats peak water quality design flows up to 0.13 cfs, coupled with an internal weir overflow capacity of 1.0 cfs for the standard unit, and 1.8 cfs for the deep steel and concrete units. Plastic units have an internal weir overflow capacity of 0.5 cfs.

Design Operation

The CBSF is installed as the primary receiver of runoff, similar to a standard, grated catch basin. The steel and concrete CBSF units have an H-20 rated, traffic bearing lid that allows the filter to be installed in parking lots, and for all practical purposes, takes up no land area. Plastic units can be used in landscaped areas and for other non-traffic-bearing applications.

The CBSF consists of a sumped inlet chamber and a cartridge chamber(s). Runoff enters the sumped inlet chamber either by sheet flow from a paved surface or from an inlet pipe discharging directly to the unit vault. The inlet chamber is equipped with an internal baffle, which traps debris and floating oil and grease, and an overflow weir. While in the inlet chamber, heavier solids are allowed to settle into the deep sump, while lighter solids and soluble pollutants are directed under the baffle and into the cartridge chamber through a port between the baffle and the overflow weir.

Once in the cartridge chamber, polluted water ponds and percolates horizontally through the media in the filter cartridges. Treated water collects in the cartridge's center tube from where it is directed by an under-drain manifold to the outlet pipe on the downstream side of the overflow weir and discharged.

When flows into the CBSF exceed the water quality design value, excess water spills over the overflow weir, bypassing the cartridge bay, and discharges to the outlet pipe.

Applications

The CBSF is particularly useful where small flows are being treated or for sites that are flat and have little available hydraulic head to spare. The unit is ideal for applications in which standard catch basins are to be used. Both water quality and catchment issues can be resolved with the use of the CBSF.

Retro-Fit

The retrofit market has many possible applications for the CBSF. The CBSF can be installed by replacing an existing catch basin without having to "chase the grade," thus reducing the high cost of re piping the storm system.

© 2013 Contech Engineered Solutions

CatchBasin StormFilter™

Maintenance Guidelines

Maintenance procedures for typical catch basins can be applied to the CatchBasin StormFilter (CBSF). The filter cartridges contained in the CBSF are easily removed and replaced during maintenance activities according to the following guidelines.

1. Establish a safe working area as per typical catch basin service activity.
2. Remove steel grate and diamond plate cover (weight 100 lbs. each).
3. Turn cartridge(s) counter-clockwise to disconnect from pipe manifold.
4. Remove 4" center cap from cartridge and replace with lifting cap.
5. Remove cartridge(s) from catch basin by hand or with vactor truck boom.
6. Remove accumulated sediment via vactor truck (min. clearance 13" x 24").
7. Remove accumulated sediment from cartridge bay. (min. clearance 9.25" x 11").
8. Rinse interior of both bays and vactor remaining water and sediment.
9. Install fresh cartridge(s) threading clockwise to pipe manifold.
10. Replace cover and grate.
11. Return original cartridges to Contech for cleaning.

Media may be removed from the filter cartridges using the vactor truck before the cartridges are removed from the catch basin structure. Empty cartridges can be easily removed from the catch basin structure by hand. Empty cartridges should be reassembled and returned to Contech as appropriate.

Materials required include a lifting cap, vactor truck and fresh filter cartridges. Contact Contech for specifications and availability of the lifting cap. The vactor truck must be equipped with a hose capable of reaching areas of restricted clearance. the owner may refresh spent cartridges. Refreshed cartridges are also available from Contech on an exchange basis. Contact the maintenance department of Contech at 503-258-3157 for more information.

Maintenance is estimated at 26 minutes of site time. For units with more than one cartridge, add approximately 5 minutes for each additional cartridge. Add travel time as required.

Mosquito Abatement

In certain areas of the United States, mosquito abatement is desirable to reduce the incidence of vectors.

In BMPs with standing water, which could provide mosquito breeding habitat, certain abatement measures can be taken.

1. Periodic observation of the standing water to determine if the facility is harboring mosquito larvae.
2. Regular catch basin maintenance.
3. Use of larvicides containing Bacillus thuringiensis israelensis (BTI). BTI is a bacterium toxic to mosquito and black fly larvae.

In some cases, the presence of petroleum hydrocarbons may interrupt the mosquito growth cycle.

Using Larvicides in the CatchBasin StormFilter

Larvicides should be used according to manufacturer's recommendations.

Two widely available products are Mosquito Dunks and Summit B.t.i. Briquets. For more information, visit http://www.summitchemical.com/mos_ctrl/d efault.htm.

The larvicide must be in contact with the permanent pool. The larvicide should also be fastened to the CatchBasin StormFilter by string or wire to prevent displacement by high flows. A magnet can be used with a steel catch basin.

For more information on mosquito abatement in stormwater BMPs, refer to the following: http://www.ucmrp.ucdavis.edu/publications/managingmosquitoesstormwater8125.pdf

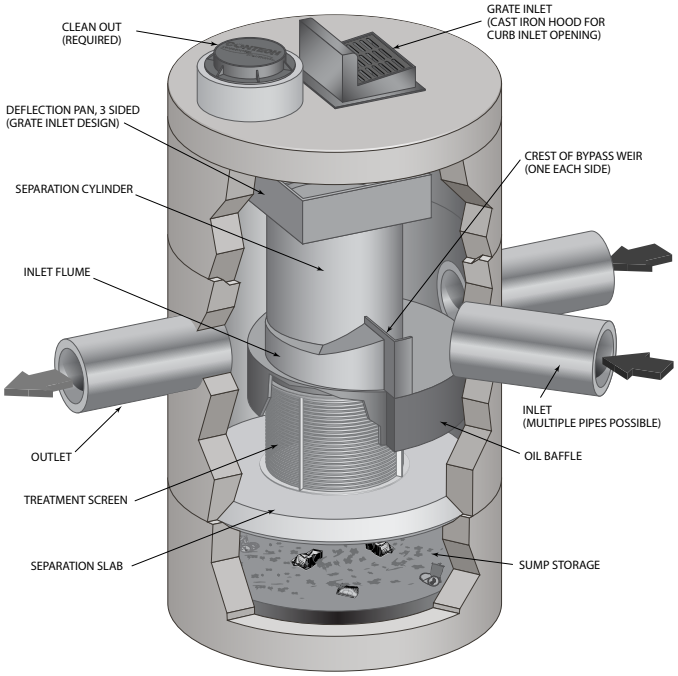
CDS Guide
Operation, Design, Performance and Maintenance

CDS®

Using patented continuous deflective separation technology, the CDS system screens, separates and traps debris, sediment, and oil and grease from stormwater runoff. The indirect screening capability of the system allows for 100% removal of floatables and neutrally buoyant material without blinding. Flow and screening controls physically separate captured solids, and minimize the re-suspension and release of previously trapped pollutants. Inline units can treat up to 6 cfs, and internally bypass flows in excess of 50 cfs (1416 L/s). Available precast or cast-in-place, offline units can treat flows from 1 to 300 cfs (28.3 to 8495 L/s). The pollutant removal capacity of the CDS system has been proven in lab and field testing.



Operation Overview

Stormwater enters the diversion chamber where the diversion weir guides the flow into the unit's separation chamber and pollutants are removed from the flow. All flows up to the system's treatment design capacity enter the separation chamber and are treated.

Swirl concentration and screen deflection force floatables and solids to the center of the separation chamber where 100% of floatables and neutrally buoyant debris larger than the screen apertures are trapped.

Stormwater then moves through the separation screen, under the oil baffle and exits the system. The separation screen remains clog free due to continuous deflection.

During the flow events exceeding the treatment design capacity, the diversion weir bypasses excessive flows around the separation chamber, so captured pollutants are retained in the separation cylinder.

Design Basics

There are three primary methods of sizing a CDS system. The Water Quality Flow Rate Method determines which model size provides the desired removal efficiency at a given flow rate for a defined particle size. The Rational Rainfall Method™ or the and Probabilistic Method is used when a specific removal efficiency of the net annual sediment load is required.

Typically in the Unites States, CDS systems are designed to achieve an 80% annual solids load reduction based on lab generated performance curves for a gradation with an average particle size (d50) of 125 microns (μm). For some regulatory environments, CDS systems can also be designed to achieve an 80% annual solids load reduction based on an average particle size (d50) of 75 microns (μm) or 50 microns (μm).

Water Quality Flow Rate Method

In some cases, regulations require that a specific treatment rate, often referred to as the water quality design flow (WQQ), be treated. This WQQ represents the peak flow rate from either an event with a specific recurrence interval, e.g. the six-month storm, or a water quality depth, e.g. 1/2-inch (13 mm) of rainfall.

The CDS is designed to treat all flows up to the WQQ. At influent rates higher than the WQQ, the diversion weir will direct most flow exceeding the WQQ around the separation chamber. This allows removal efficiency to remain relatively constant in the separation chamber and eliminates the risk of washout during bypass flows regardless of influent flow rates.

Treatment flow rates are defined as the rate at which the CDS will remove a specific gradation of sediment at a specific removal efficiency. Therefore the treatment flow rate is variable, based on the gradation and removal efficiency specified by the design engineer.

Rational Rainfall Method™

Differences in local climate, topography and scale make every site hydraulically unique. It is important to take these factors into consideration when estimating the long-term performance of any stormwater treatment system. The Rational Rainfall Method combines site-specific information with laboratory generated performance data, and local historical precipitation records to estimate removal efficiencies as accurately as possible.

Short duration rain gauge records from across the United States and Canada were analyzed to determine the percent of the total annual rainfall that fell at a range of intensities. US stations' depths were totaled every 15 minutes, or hourly, and recorded in 0.01-inch increments. Depths were recorded hourly with 1-mm resolution at Canadian stations. One trend was consistent at all sites; the vast majority of precipitation fell at low intensities and high intensity storms contributed relatively little to the total annual depth.

These intensities, along with the total drainage area and runoff coefficient for each specific site, are translated into flow rates using the Rational Rainfall Method. Since most sites are relatively small and highly impervious, the Rational Rainfall Method is appropriate. Based on the runoff flow rates calculated for each intensity, operating rates within a proposed CDS system are

determined. Performance efficiency curve determined from full scale laboratory tests on defined sediment PSDs is applied to calculate solids removal efficiency. The relative removal efficiency at each operating rate is added to produce a net annual pollutant removal efficiency estimate.

Probabilistic Rational Method

The Probabilistic Rational Method is a sizing program Contech developed to estimate a net annual sediment load reduction for a particular CDS model based on site size, site runoff coefficient, regional rainfall intensity distribution, and anticipated pollutant characteristics.

The Probabilistic Method is an extension of the Rational Method used to estimate peak discharge rates generated by storm events of varying statistical return frequencies (e.g. 2-year storm event). Under the Rational Method, an adjustment factor is used to adjust the runoff coefficient estimated for the 10-year event, correlating a known hydrologic parameter with the target storm event. The rainfall intensities vary depending on the return frequency of the storm event under consideration. In general, these two frequency dependent parameters (rainfall intensity and runoff coefficient) increase as the return frequency increases while the drainage area remains constant.

These intensities, along with the total drainage area and runoff coefficient for each specific site, are translated into flow rates using the Rational Method. Since most sites are relatively small and highly impervious, the Rational Method is appropriate. Based on the runoff flow rates calculated for each intensity, operating rates within a proposed CDS are determined. Performance efficiency curve on defined sediment PSDs is applied to calculate solids removal efficiency. The relative removal efficiency at each operating rate is added to produce a net annual pollutant removal efficiency estimate.

Treatment Flow Rate

The inlet throat area is sized to ensure that the WQQ passes through the separation chamber at a water surface elevation equal to the crest of the diversion weir. The diversion weir bypasses excessive flows around the separation chamber, thus preventing re-suspension or re-entrainment of previously captured particles.

Hydraulic Capacity

The hydraulic capacity of a CDS system is determined by the length and height of the diversion weir and by the maximum allowable head in the system. Typical configurations allow hydraulic capacities of up to ten times the treatment flow rate. The crest of the diversion weir may be lowered and the inlet throat may be widened to increase the capacity of the system at a given water surface elevation. The unit is designed to meet project specific hydraulic requirements.

Performance

Full-Scale Laboratory Test Results

A full-scale CDS system (Model CDS2020-5B) was tested at the facility of University of Florida, Gainesville, FL. This CDS unit was evaluated under controlled laboratory conditions of influent flow rate and addition of sediment.

Two different gradations of silica sand material (UF Sediment & OK-110) were used in the CDS performance evaluation. The particle size distributions (PSDs) of the test materials were analyzed using standard method "Gradation ASTM D-422 "Standard Test Method for Particle-Size Analysis of Soils" by a certified laboratory.

UF Sediment is a mixture of three different products produced by the U.S. Silica Company: "Sil-Co-Sil 106", "#1 DRY" and "20/40 Oil Frac". Particle size distribution analysis shows that the UF Sediment has a very fine gradation (d50 = 20 to 30 μm) covering a wide size range (Coefficient of Uniformity, C averaged at 10.6). In comparison with the hypothetical TSS gradation specified in the NJDEP (New Jersey Department of Environmental Protection) and NJCAT (New Jersey Corporation for Advanced Technology) protocol for lab testing, the UF Sediment covers a similar range of particle size but with a finer d50 (d50 for NJDEP is approximately 50 μm) (NJDEP, 2003).

The OK-110 silica sand is a commercial product of U.S. Silica Sand. The particle size distribution analysis of this material, also included in Figure 1, shows that 99.9% of the OK-110 sand is finer than 250 microns, with a mean particle size (d50) of 106 microns. The PSDs for the test material are shown in Figure 1.

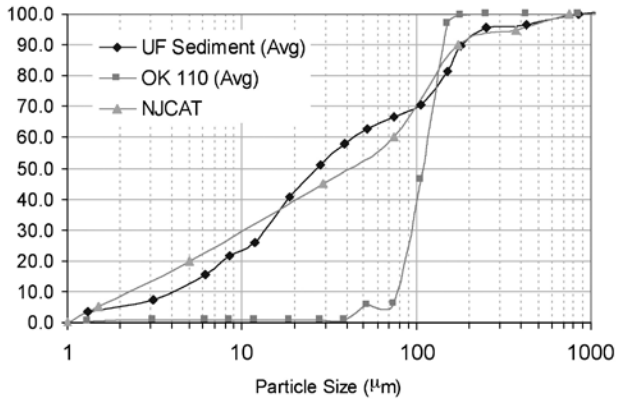


Figure 1. Particle size distributions

Tests were conducted to quantify the performance of a specific CDS unit (1.1 cfs (31.3-L/s) design capacity) at various flow rates, ranging from 1% up to 125% of the treatment design capacity of the unit, using the 2400 micron screen. All tests were conducted with controlled influent concentrations of approximately 200 mg/L. Effluent samples were taken at equal time intervals across the entire duration of each test run. These samples were then processed with a Dekaport Cone sample splitter to obtain representative sub-samples for Suspended Sediment Concentration (SSC) testing using ASTM D3977-97 "Standard Test Methods for Determining Sediment Concentration in Water Samples", and particle size distribution analysis.

Results and Modeling

Based on the data from the University of Florida, a performance model was developed for the CDS system. A regression analysis was used to develop a fitting curve representative of the scattered data points at various design flow rates. This model, which demonstrated good agreement with the laboratory data, can then be used to predict CDS system performance with respect

to SSC removal for any particle size gradation, assuming the particles are inorganic sandy-silt. Figure 2 shows CDS predictive performance for two typical particle size gradations (NJCAT gradation and OK-110 sand) as a function of operating rate.

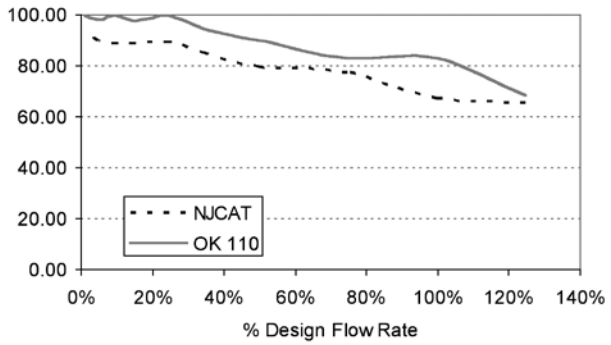

Figure 2. CDS stormwater treatment predictive performance for various particle gradations as a function of operating rate.

Many regulatory jurisdictions set a performance standard for hydrodynamic devices by stating that the devices shall be capable of achieving an 80% removal efficiency for particles having a mean particle size (d50) of 125 microns (e.g. Washington State Department of Ecology — WASDOE - 2008). The model can be used to calculate the expected performance of such a PSD (shown in Figure 3). The model indicates (Figure 4) that the CDS system with 2400 micron screen achieves approximately 80% removal at the design (100%) flow rate, for this particle size distribution (d50 = 125 μm).

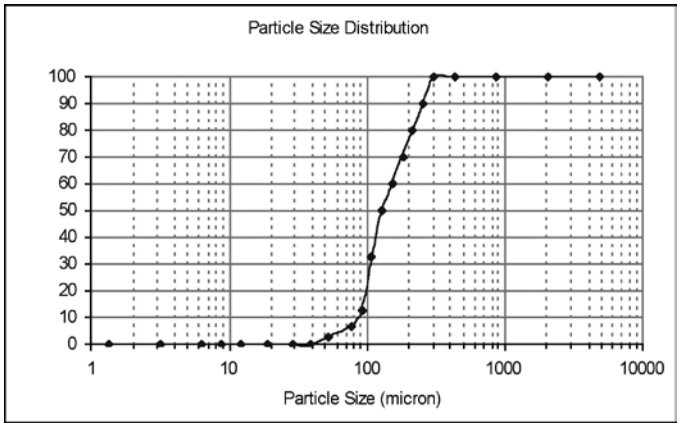

Figure 3. WASDOE PSD

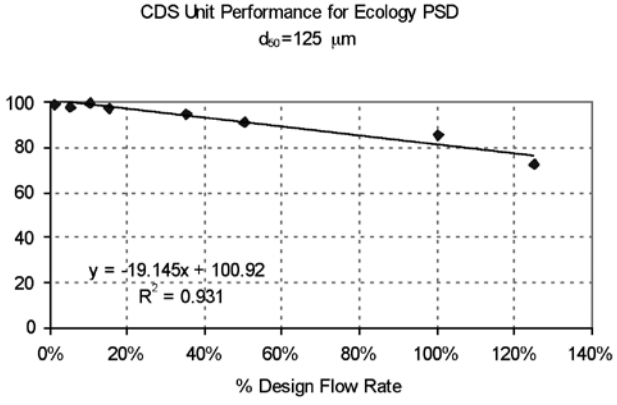

Figure 4. Modeled performance for WASDOE PSD.

Maintenance

The CDS system should be inspected at regular intervals and maintained when necessary to ensure optimum performance. The rate at which the system collects pollutants will depend more heavily on site activities than the size of the unit. For example, unstable soils or heavy winter sanding will cause the grit chamber to fill more quickly but regular sweeping of paved surfaces will slow accumulation.

Inspection

Inspection is the key to effective maintenance and is easily performed. Pollutant transport and deposition may vary from year to year and regular inspections will help ensure that the system is cleaned out at the appropriate time. At a minimum, inspections should be performed twice per year (e.g. spring and fall) however more frequent inspections may be necessary in climates where winter sanding operations may lead to rapid accumulations, or in equipment washdown areas. Installations should also be inspected more frequently where excessive amounts of trash are expected.

The visual inspection should ascertain that the system components are in working order and that there are no blockages or obstructions in the inlet and separation screen. The inspection should also quantify the accumulation of hydrocarbons, trash, and sediment in the system. Measuring pollutant accumulation can be done with a calibrated dipstick, tape measure or other measuring instrument. If absorbent material is used for enhanced removal of hydrocarbons, the level of discoloration of the sorbent material should also be identified

during inspection. It is useful and often required as part of an operating permit to keep a record of each inspection. A simple form for doing so is provided.

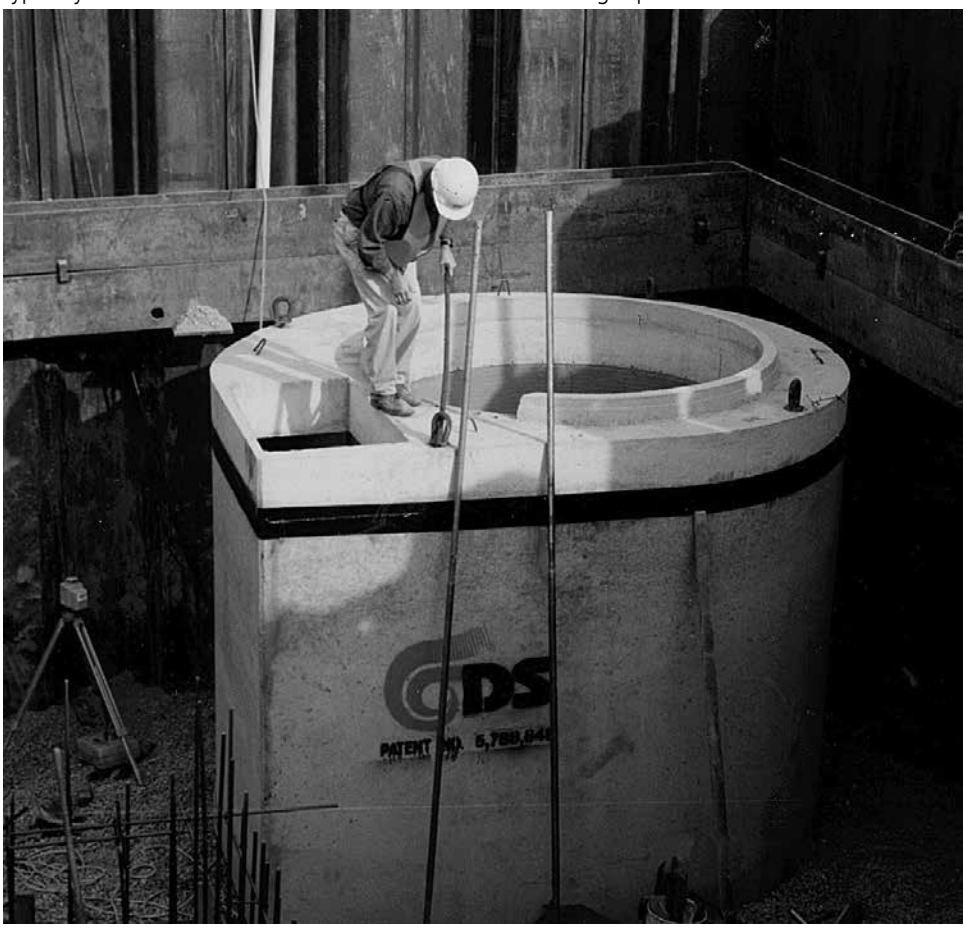
Access to the CDS unit is typically achieved through two manhole access covers. One opening allows for inspection and cleanout of the separation chamber (cylinder and screen) and isolated sump. The other allows for inspection and cleanout of sediment captured and retained outside the screen. For deep units, a single manhole access point would allows both sump cleanout and access outside the screen.

The CDS system should be cleaned when the level of sediment has reached 75% of capacity in the isolated sump or when an appreciable level of hydrocarbons and trash has accumulated. If absorbent material is used, it should be replaced when significant discoloration has occurred. Performance will not be impacted until 100% of the sump capacity is exceeded however it is recommended that the system be cleaned prior to that for easier removal of sediment. The level of sediment is easily determined by measuring from finished grade down to the top of the sediment pile. To avoid underestimating the level of sediment in the chamber, the measuring device must be lowered to the top of the sediment pile carefully. Particles at the top of the pile typically offer less resistance to the end of the rod than consolidated particles toward the bottom of the pile. Once this measurement is recorded, it should be compared to the as-built drawing for the unit to determine weather the height of the sediment pile off the bottom of the sump floor exceeds 75% of the total height of isolated sump.

Cleaning

Cleaning of a CDS systems should be done during dry weather conditions when no flow is entering the system. The use of a vacuum truck is generally the most effective and convenient method of removing pollutants from the system. Simply remove the manhole covers and insert the vacuum hose into the sump. The system should be completely drained down and the sump fully evacuated of sediment. The area outside the screen should also be cleaned out if pollutant build-up exists in this area.

In installations where the risk of petroleum spills is small, liquid contaminants may not accumulate as quickly as sediment. However, the system should be cleaned out immediately in the event of an oil or gasoline spill. Motor oil and other hydrocarbons that accumulate on a more routine basis should be removed when an appreciable layer has been captured. To remove these pollutants, it may be preferable to use absorbent pads since they are usually less expensive to dispose than the oil/water emulsion that may be created by vacuuming the oily layer. Trash and debris can be netted out to separate it from the other pollutants. The screen should be cleaned to ensure it is free of trash and debris.



Manhole covers should be securely seated following cleaning activities to prevent leakage of runoff into the system from above and also to ensure that proper safety precautions have been followed. Confined space entry procedures need to be followed if physical access is required. Disposal of all material removed from the CDS system should be done in accordance with local regulations. In many jurisdictions, disposal of the sediments may be handled in the same manner as the disposal of sediments removed from catch basins or deep sump manholes. Check your local regulations for specific requirements on disposal.

CDS Model	Diameter		Distance from Water Surface to Top of Sediment Pile		Sediment Storage Capacity	
	ft	m	ft	m	y^3	m^3
CDS1515	3	0.9	3.0	0.9	0.5	0.4

Table 1: CDS Maintenance Indicators and Sediment Storage Capacities

Note: To avoid underestimating the volume of sediment in the chamber, carefully lower the measuring device to the top of the sediment pile. Finer silty particles at the top of the pile may be more difficult to feel with a measuring stick. These finer particles typically offer less resistance to the end of the rod than larger particles toward the bottom of the pile.

CDS Inspection & Maintenance Log

CDS Model: _____ Location: _____

Date	Water depth to sediment[1]	Floatable Layer Thickness[2]	Describe Maintenance Performed	Maintenance Personnel	Comments

1. The water depth to sediment is determined by taking two measurements with a stadia rod: one measurement from the manhole opening to the top of the sediment pile and the other from the manhole opening to the water surface. If the difference between these measurements is less than the values listed in table 1 the system should be cleaned out. **Note: to avoid underestimating the volume of sediment in the chamber, the measuring device must be carefully lowered to the top of the sediment pile**.

2. For optimum performance, the system should be cleaned out when the floating hydrocarbon layer accumulates to an appreciable thickness. In the event of an oil spill, the system should be cleaned immediately.

SUPPORT

CONTECH®
ENGINEERED SOLUTIONS

CDS®
Hydrodynamic Separator

The experts you need to solve your stormwater management challenges

Contech is the leader in stormwater management solutions, helping engineers, contractors and owners with infrastructure and land development projects throughout North America.

With our responsive team of stormwater experts, local regulatory expertise and flexible solutions, Contech is the trusted partner you can count on for stormwater management solutions.

Your Contech Team

STORMWATER CONSULTANT

It's my job to recommend the best solution to meet permitting requirements.

STORMWATER DESIGN ENGINEER

I work with consultants to design the best approved solution to meet your project's needs.

REGULATORY MANAGER

I understand the local stormwater regulations and what solutions will be approved.

SALES ENGINEER

I make sure our solutions meet the needs of the contractor during construction.

Contech is your partner in stormwater management solutions

Unique screening technology for stormwater runoff – CDS®

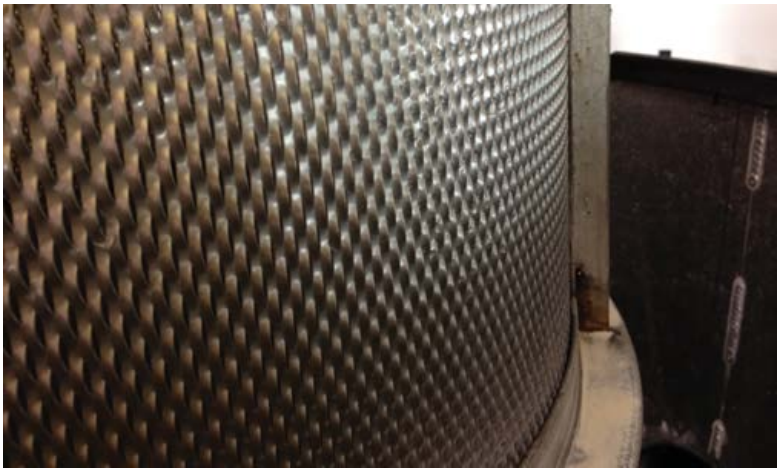
The CDS hydrodynamic separator uses swirl concentration and continuous deflective separation to screen, separate and trap trash, debris, sediment, and hydrocarbons from stormwater runoff.

At the heart of the CDS system is a unique screening technology used to capture and retain trash and debris. The screen face is louvered so that it is smooth in the downstream direction. The effect created is called "Continuous Deflective Separation." The power of the incoming flow is harnessed to continually shear debris off the screen and to direct trash and sediment toward the center of the separation cylinder. This results in a screen that is self-cleaning and provides 100% removal of floatables and neutrally buoyant material debris 4.7 mm or larger, without blinding.

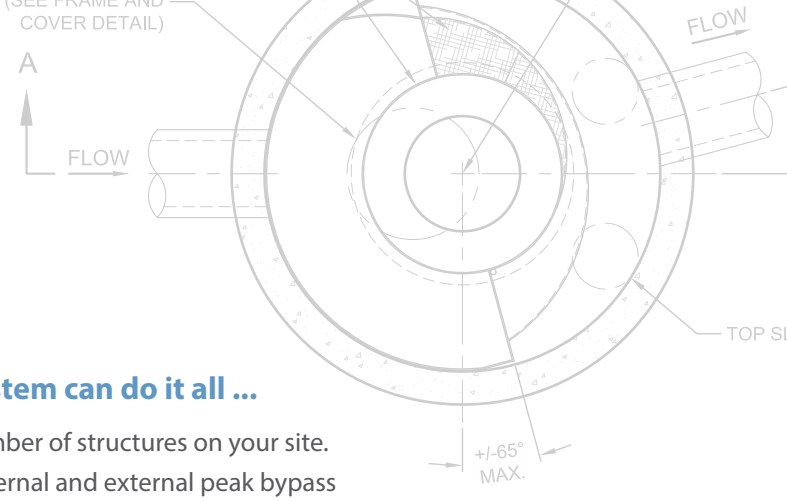
CDS is used to meet trash Total Maximum Daily Load (TMDL) requirements, for stormwater quality control, inlet and outlet pollution control, and as pretreatment for filtration, detention/infiltration, bioretention, rainwater harvesting systems, and a variety of green infrastructure practices.

CDS® Features and Benefits

FEATURE	BENEFIT
Captures and retains 100% of floatables and neutrally buoyant debris 4.7mm or larger	Superior pollutant removal
Self-cleaning screen	Ease of maintenance
Isolated storage sump eliminates scour potential	Excellent pollutant retention
Internal bypass	Eliminates the need for additional structures
Multiple pipe inlets and 90-180º angles	Design flexibility
Clear access to sump and stored pollutants	Fast, easy maintenance



APPLICATION TIPS

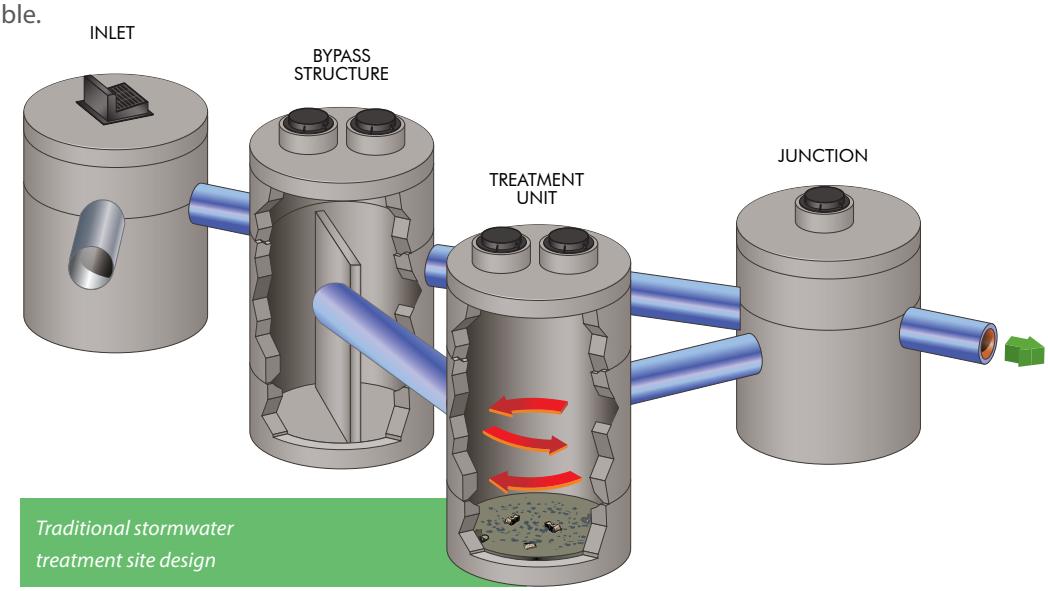


- Because of its internal peak bypass weirs, CDS systems can provide cost savings by eliminating the need for additional structures.
- Pretreating detention, infiltration, and green infrastructure practices with CDS can protect downstream structures and provide for easy maintenance.
- The CDS an ideal solution for retrofit applications due to its compact footprint and configuration flexibility.

The CDS® Screen

A fundamentally different approach to trash control ...

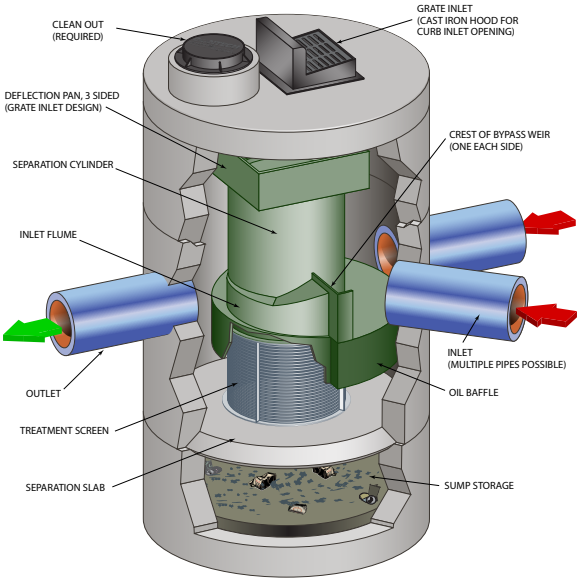
Traditional approaches to trash control typically involve "direct screening" that can easily become clogged, as trash is pinned to the screen as water passes through. Clogged screens can lead to flooding as water backs up. The design of the CDS screen is fundamentally different. Flow is introduced to the screen face which is louvered so that it is smooth in the downstream direction. The effect created is called "Continuous Deflective Separation." The power of the incoming flow is harnessed to continually shear debris off the screen and to direct trash and sediment toward the center of the separation cylinder.



CDS® Design Configuration

Why use traditional stormwater design when ONE system can do it all ...

The CDS effectively treats stormwater runoff while reducing the number of structures on your site. Inline, offline, grate inlet, and drop inlet configurations available. Internal and external peak bypass options also available.



Traditional stormwater treatment site design

A Traditional Stormwater Treatment Site Design would require several structures on your site. With CDS, one system can do it all!

CDS® Advantages

- Grate inlet option available
- Internal bypass weir
- Accepts multiple inlets at a variety of angles
- Advanced hydrodynamic separator
- Captures and retains 100% of floatables and neutrally buoyant debris 4.7 mm or larger
- Indirect screening capability keeps screen from clogging
- Retention of all captured pollutants, even at high flows
- Performance verified by NJCAT, WA Ecology, and ETV Canada

Learn More:
www.ContechES.com/cds

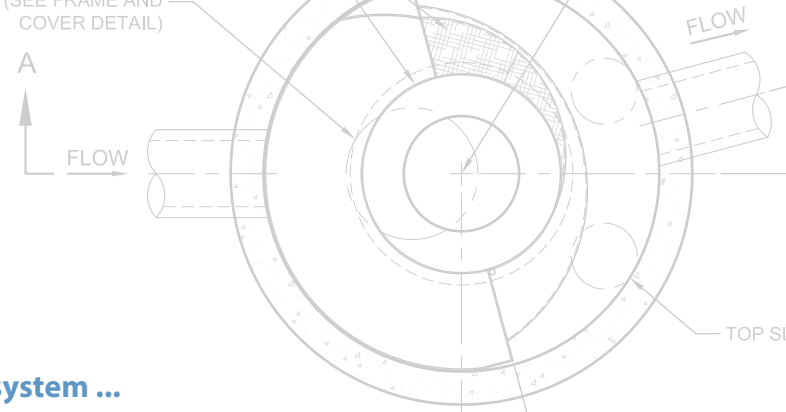
CDS® Applications

CDS is commonly used in the following stormwater applications:

- Stormwater quality control – trash, debris, sediment, and hydrocarbon removal
- Urban retrofit and redevelopment
- Inlet and outlet protection
- Pretreatment for filtration, detention/infiltration, bioretention, rainwater harvesting systems, and Low Impact Development designs

CDS® provides trash control

CDS® pretreats a bioswale



Select CDS® Certifications and Verifications

CDS has been verified by some of the most stringent stormwater technology evaluation organizations in North America, including:

- Washington State Department of Ecology (GULD) - Pretreatment
- New Jersey Department of Environmental Protection (NJ DEP)
- Canadian Environmental Technology Verification (ETV)
- California Statewide Trash Amendments Full Capture System Certified*

**The CDS System has been certified by the California State Water Resources Control Board as a Full Capture System provided that it is sized to treat the peak flow rate from the region specific 1-year, 1-hour design storm, or the peak flow capacity of the corresponding storm drain, whichever is less.*

Save time, space and money with CDS

CDS® Maintenance

Select a cost-effective and easy-to-access treatment system ...

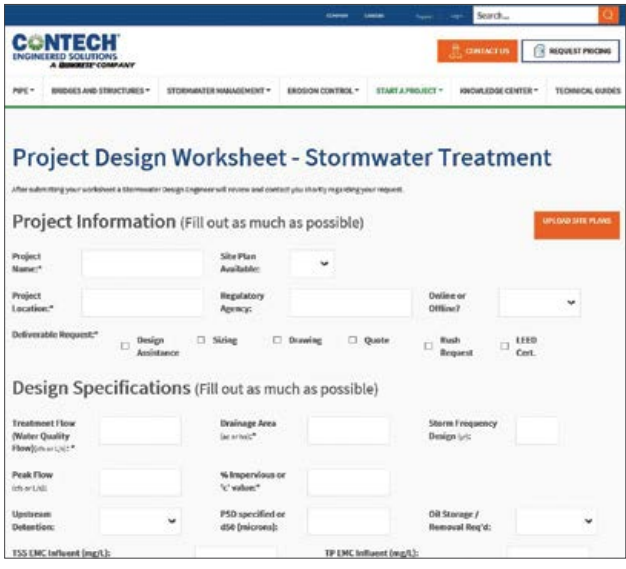
Systems vary in their maintenance needs, and the selection of a cost-effective and easy-to-access treatment system can mean a huge difference in maintenance expenses for years to come.

A CDS unit is designed to minimize maintenance and make it as easy and inexpensive as possible to keep our systems working properly.

Most CDS® units can easily be cleaned within thirty minutes.

INSPECTION

Inspection is the key to effective maintenance. Pollutant deposition and transport may vary from year to year and site to site. Semi-annual inspections will help ensure that the system is cleaned out at the appropriate time. Inspections should be performed more frequently where site conditions may cause rapid accumulation of pollutants.



RECOMMENDATIONS FOR CDS MAINTENANCE

The recommended cleanout of solids within the CDS unit's sump should occur at 75% of the sump capacity. Access to the CDS unit is typically achieved through two manhole access covers – one allows inspection and cleanout of the separation chamber and sump, and another allows inspection and cleanout of sediment captured and retained behind the screen. A vacuum truck is recommended for cleanout of the CDS unit and can be easily accomplished in less than 30 minutes for most installations.

HDS Product Design Worksheets

Our in-house team of engineers can support you through the entire permitting process - and the first step is sending us your project information by filling out one of the Project Design Worksheets. We will forward your information to an in-house engineer who will contact you with specific recommendations for your project.

URBAN POND INSPECTION & MAINTENANCE

Inspection and maintenance of the Urban Pond underground detention, retention, or infiltration system is vital for the performance and life cycle of the stormwater management system. All local, state, and federal permits and regulations must be followed for system compliance. Manway access locations are provided on each system for ease of ingress and egress for routine inspection and maintenance activities. Stormwater regulations require that all BMPs be inspected and maintained to ensure they are operating as designed and providing protection to receiving water bodies. It is recommended that inspections be performed multiple times during the first year to assess the site specific conditions. Inspection after the first significant rainfall event and at quarterly intervals is typical. This is recommended because pollutant loading and pollutant characteristics can vary greatly from site to site. Variables such as nearby soil erosion or construction sites, winter sanding on roads, amount of daily traffic and land use can increase pollutant loading on the system. The first year of inspections can be used to set inspection and maintenance intervals for subsequent years to ensure appropriate maintenance is provided. Without appropriate maintenance a BMP can exceed its storage capacity, become blocked, or damaged, which can negatively affect its continued performance.

Inspection Equipment

Following is a list of equipment to allow for simple and effective inspection of the underground detention, retention, or infiltration system:

- Bio Clean Environmental Inspection and Maintenance Report Form
- Flashlight
- Manhole hook or appropriate tools to access hatches and covers
- Appropriate traffic control signage and procedures
- Measuring pole and/or tape measure
- Protective clothing and eye protection
- Note: Entering a confined space requires appropriate safety and certification. It is generally not required for routine inspections of the system.

Inspection Steps

The key to any successful stormwater BMP maintenance program is routine inspections. The inspection steps required on the Urban Pond underground detention, retention, or infiltration system are quick and easy. As mentioned above, the first year should be seen as the maintenance interval establishment phase. During the first year more frequent inspections should occur in order

to gather loading data and maintenance requirements for that specific site. This information can be used to establish a base for long term inspection and maintenance interval requirements.

The Urban Pond underground detention, retention, or infiltration system can be inspected though visual observation without entry into the system. All necessary pre-inspection steps must be carried out before inspection occurs, especially traffic control and other safety measures to protect the inspector and nearby pedestrians from any dangers associated with an open access hatch or manhole. Once these access covers have been safely opened the inspection process can proceed:

- Prepare the inspection form by writing in the necessary information including project name, location, date & time, unit number and other information (see inspection form).
- Observe the upstream drainage area and look for sources of pollution, sediment, trash and debris.
- Observe the inside of the system through the access manholes. If minimal light is available and vision into the unit is impaired, utilize a flashlight to see inside the system and all of its modules.
- Look for any out of the ordinary obstructions in the inflow and outflow pipes. Check pipes for movement or leakage. Write down any observations on the inspection form.
- Observe any movement of modules.
- Observe concrete for cracks and signs of deterioration.
- In detention and retention systems inspect for any signs of leakage.
- In infiltration systems inspect for any signs of blockage or reasons that the soils are not infiltrating.
- Through observation and/or digital photographs, estimate the amount of floatable debris accumulated in the system. Record this information on the inspection form. Next, utilizing a tape measure or measuring stick, estimate the amount of sediment accumulated in the system. Sediment depth may vary throughout the system, depending on the flow path. Record this depth on the inspection form.
- Finalize inspection report for analysis by the maintenance manager to determine if maintenance is required.

Maintenance Indicators

Based upon observations made during inspection, maintenance of the system may be required based on the following indicators:

- Damaged inlet and outlet pipes.
- Obstructions in the system or its inlet or outlet.
- Excessive accumulation of floatables.
- Excessive accumulation of sediment of more than 6” in depth.

- Damaged joint sealant.

Maintenance Equipment

While maintenance can be done fully by hand it is recommended that a vacuum truck be utilized to minimize time requirements required to maintain the Urban Pond underground detention, retention, or infiltration system:

- Bio Clean Environmental Inspection and Maintenance Report Form
- Flashlight
- Manhole hook or appropriate tools to access hatches and covers
- Appropriate traffic control signage and procedures
- Measuring pole and/or tape measure
- Protective clothing and eye protection
- Vacuum truck
- Trash can
- Pressure washer
- Note: Entering a confined space requires appropriate safety and certification. It is generally not required for routine inspections of the system. Entry into the system will be required if maintenance is required.

Maintenance Procedures

It is recommended that maintenance occurs at least three days after the most recent rain event to allow for drain down of the system and any upstream detention systems designed to drain down over an extended period of time. Maintaining the system while flows are still entering it will increase the time and complexity required for maintenance. Once all safety measures have been set up cleaning of the system can proceed as follows:

- Using an extension on a boom on the vacuum truck, position the hose over the opened manway and lower into the system. Remove all floating debris, standing water (as needed) and sediment from the system. A power washer can be used to assist if sediments have become hardened and stuck to the walls and columns. Repeat the same procedure at each manway until the system has been fully maintained. Be sure not to pressure wash the infiltration area as it may scour.

If maintenance requires entry into the vault:

- Following rules for confined space entry use a gas meter to detect the presence of any hazardous gases. If hazardous gases are present do not enter the vault. Follow appropriate confined space procedures, such as utilizing venting system, to address the hazard. Once it

is determined to be safe, enter utilizing appropriate entry equipment such as a ladder and tripod with harness.

- The last step is to close up and replace all manhole covers and remove all traffic control.
- All removed debris and pollutants shall be disposed of following local and state requirements.

For Maintenance Services please contact Bio Clean at 760-433-7640, or email info@biocleanenvironmental.com.

OVERVIEW

The Bio Clean UrbanPond™ is a technological breakthrough in underground stormwater management.

Its unique square tessellation assembly provides superior strength and material efficiency over traditional rectangular modules. Each module utilizes an offset 3-legged design with two narrow legs running parallel and one wider leg running perpendicular. This unique geometry allows for maximum strength and minimum material usage. The standard design is rated for H-20 loading.

UrbanPond has high void percentages to maximize stormwater volume, and its robust precast form allows systems to be buried deeper without the need for specialized backfill, increased wall thicknesses, or extra rebar reinforcement.

A BREAKTHROUGH SYSTEM FOR MANAGING STORMWATER RUNOFF

ADVANTAGES

- THE SQUARE TESSELLATION PROVIDES SUPERIOR STRENGTH AND LOAD CAPACITY
- DESIGNED TO MEET H-20 LOADING REQUIREMENTS
- CAN BE INSTALLED DEEPER WITHOUT THE NEED TO INCREASE WALL THICKNESS OR ADD ADDITIONAL REBAR
- EVERY MODULE DRAINS DOWN FULLY
- HIGHER VOID PERCENTAGES AND INCREASED MATERIAL EFFICIENCY FOR BEST IN CLASS COST PER CUBIC FOOT STORAGE
- LIGHTER WEIGHT, EASIER TO INSTALL
- A LINKUP SLAB ALLOWS ELIMINATION OF SOME MODULES, FURTHER DECREASING COST AND INSTALLATION TIME

APPLICATIONS

UrbanPond is engineered specifically for:

Detention with controlled discharge utilizing built-in outlet orifice structures.

Retention for long-term retention of runoff onsite to meet strict stormwater requirements.

Harvesting self-contained treatment and reuse of stormwater for irrigation and grey water needs.

Capture & Infiltration of runoff back into underlying native soils for recharge needs.

Treatment utilized as an underground extended detention basin or pond for advanced treatment of stormwater - integrates well with treatment train components (biofiltration, separation, etc.).

Flood Control of peak storm events to minimize downstream flooding and erosion.

Low Impact Development to maximize land use with underground storage - construct an urban infill without a pond at grade.

SPECIFICATIONS

UrbanPond is available from heights of 2 ft. (I.D.) to up to 14 ft. Single UrbanPond modules are available up to 7 ft. height, and the Double UrbanPond modules are available up to 14 ft.

The system's internal offset leg configuration provides channel-less water distribution for stormwater entering and exiting the system.

CONFIGURATIONS

UrbanPond is a modular precast concrete structure which can be assembled from one to several hundred modules in various shapes and configurations to meet site specific constraints and volume requirements.

Each UrbanPond module is 8 ft. wide x 8 ft. long (O.D.) - specifically designed to fit on a standard flatbed truck. UrbanPond can be configured in a combination of modules from as low as 2 ft. to as high as 14 ft. inside height.

View looking down with top slabs removed.

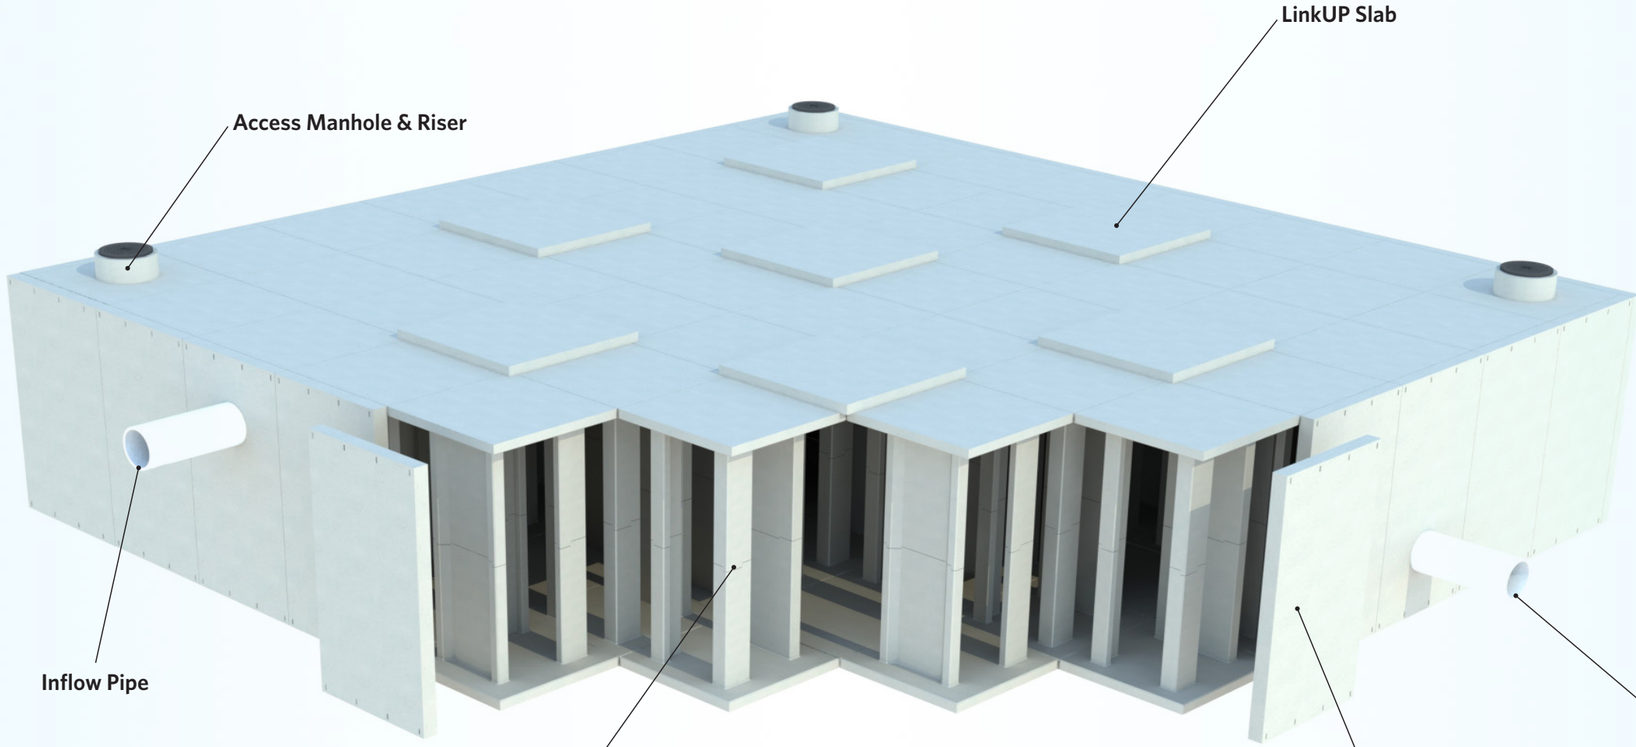
URBANPOND ASSEMBLY

The UrbanPond is based on a square tessellation. A tessellation is created when a shape is repeated over and over again covering a plane without any gaps or overlaps. Because of the self-supporting characteristic of tessellated-shaped structures, Bio Clean has been able to further reduce material usage and costs up to 20% without sacrificing structural strength.

As shown in the image to the right, the offset leg configuration of the modules creates a very open and channel-less internal space.

Each module offers access walkways of greater than 3 ft. in each module and between modules for easy inspection and maintenance.

SINGLE URBANPOND MODULE

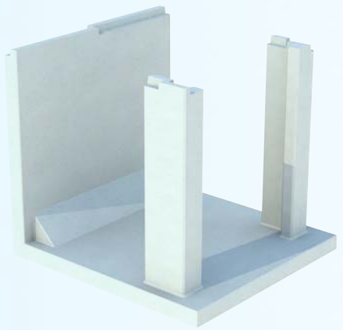


Available in heights from 2 ft. to 7 ft.

LINKUP SLAB

LinkUP Slabs span the open cavities in a 9-module array.

DOUBLE URBANPOND MODULE



Available in heights from 4 ft. to 14 ft.

UrbanPond can be engineered with optional infiltration openings.

SIDE MODULE

Built-in perimeter wall

INSTALLATION

Each Single UrbanPond module is 8 ft. wide by 8 ft. long (O.D.) and easily fits onto a flatbed truck. This size maximizes the space on each truck load. A 10 ft. Double UrbanPond module (two pieces) weighs only 17,000 lbs. total or only 8,500 lbs. per piece.

At least 4 individual pieces can be delivered on a single truckload to reduce shipping costs and minimize crane requirements during install. Most units can be installed using a simple backhoe due to low weights.

MAINTENANCE

UrbanPond is designed to be easily accessed and maintained from finished surface via multiple access ports. Using a standard vacuum truck, each access point is conveniently located, as ports are strategically placed throughout the assembly.

Modules can be modified to act as clear wells or pretreatment chambers for capturing trash, debris, and sediment. This consolidates maintenance requirements to a select few modules. Standard manholes, hinged manholes, and other access hatches are available.

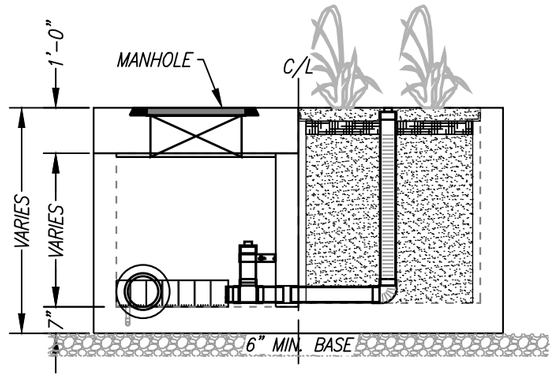
INSTALLATION NOTES



1. CONTRACTOR TO PROVIDE ALL LABOR, EQUIPMENT, MATERIALS AND INCIDENTALS REQUIRED TO OFFLOAD AND INSTALL THE SYSTEM AND APPURTENANCES IN ACCORDANCE WITH THIS DRAWING AND THE MANUFACTURERS SPECIFICATIONS, UNLESS OTHERWISE STATED IN MANUFACTURERS CONTRACT.
2. UNIT MUST BE INSTALLED ON LEVEL BASE. MANUFACTURER RECOMMENDS A MINIMUM 6" LEVEL ROCK BASE UNLESS SPECIFIED BY THE PROJECT ENGINEER. CONTRACTOR IS RESPONSIBLE TO VERIFY PROJECT ENGINEERS RECOMMENDED BASE SPECIFICATIONS.
4. CONTRACTOR TO SUPPLY AND INSTALL ALL EXTERNAL CONNECTING PIPES. ALL PIPES MUST BE FLUSH WITH INSIDE SURFACE OF CONCRETE. (PIPES CANNOT INTRUDE BEYOND FLUSH). INVERT OF OUTFLOW PIPE MUST BE FLUSH WITH DISCHARGE CHAMBER FLOOR. ALL PIPES SHALL BE SEALED WATER TIGHT PER MANUFACTURERS STANDARD CONNECTION DETAIL.
5. CONTRACTOR RESPONSIBLE FOR INSTALLATION OF ALL RISERS, MANHOLES, AND HATCHES. CONTRACTOR TO GROUT ALL MANHOLES AND HATCHES TO MATCH FINISHED SURFACE UNLESS SPECIFIED OTHERWISE.
6. VEGETATION SUPPLIED AND INSTALLED BY OTHERS. ALL UNITS WITH VEGETATION MUST HAVE DRIP OR SPRAY IRRIGATION SUPPLIED AND INSTALLED BY OTHERS.
7. CONTRACTOR RESPONSIBLE FOR CONTACTING BIO CLEAN FOR ACTIVATION OF UNIT. MANUFACTURERS WARRANTY IS VOID WITH OUT PROPER ACTIVATION BY A BIO CLEAN REPRESENTATIVE.

GENERAL NOTES

1. MANUFACTURER TO PROVIDE ALL MATERIALS UNLESS OTHERWISE NOTED.
2. ALL DIMENSIONS, ELEVATIONS, SPECIFICATIONS AND CAPACITIES ARE SUBJECT TO CHANGE. FOR PROJECT SPECIFIC DRAWINGS DETAILING EXACT DIMENSIONS, WEIGHTS AND ACCESSORIES PLEASE CONTACT BIO CLEAN.

Water Quality Management Plan
Notice of Transfer of Responsibility

Tracking No. Assigned by the City of Anaheim: _____

Submission of this Notice of Transfer of Responsibility constitutes notice to the City of Anaheim that responsibility for the Water Quality Management Plan ("WQMP") for the subject property identified below, and implementation of that plan, is being transferred from the Previous Owner (and his/her agent) of the site (or a portion thereof) to the New Owner, as further described below.

I. Previous Owner/Previous Responsible Party Information

Company/Individual Name		Contact Person	
Street Address		Title	
City	State	ZIP	Phone

II. Information about Site Transferred

Name of Project (if applicable)	
Title of WQMP Applicable to site:	
Street Address of Site (if applicable)	
Planning Area (PA) and/or Tract Number(s) for Site	Lot Numbers (if Site is a portion of a tract)
Date WQMP Prepared (and revised if applicable)	

III. New Owner/New Responsible Party Information

Company/Individual Name		Contact Person	
Street Address		Title	
City	State	ZIP	Phone

IV. Ownership Transfer Information

General Description of Site Transferred to New Owner	General Description of Portion of Project/Parcel Subject to WQMP Retained by Owner (if any)
Lot/Tract Numbers of SiteTransferred to New Owner	
Remaining Lot/Tract Numbers Subject to WQMP Still Held by Owner (if any)	
Date of Ownership Transfer	

Note: When the Previous Owner is transferring a Site that is a portion of a larger project/parcel addressed by the WQMP, as opposed to the entire project/parcel addressed by the WQMP, the General Description of the Site transferred and the remainder of the project/parcel not transferred shall be set forth as maps attached to this notice. These maps shall show those

portions of a project/parcel addressed by the WQMP that are transferred to the New Owner (the Transferred Site), those portions retained by the Previous Owner, and those portions previously transferred by Previous Owner. Those portions retained by Previous Owner shall be labeled "Previous Owner," and those portions previously transferred by Previous Owner shall be labeled as "Previously Transferred."

V. Purpose of Notice of Transfer

The purposes of this Notice of Transfer of Responsibility are: 1) to track transfer of responsibility for implementation and amendment of the WQMP when property to which the WQMP is transferred from the Previous Owner to the New Owner, and 2) to facilitate notification to a transferee of property subject to a WQMP that such New Owner is now the Responsible Party of record for the WQMP for those portions of the site that it owns.

VI. Certifications

A. Previous Owner

I certify under penalty of law that I am no longer the owner of the Transferred Site as described in Section II above. I have provided the New Owner with a copy of the WQMP applicable to the Transferred Site that the New Owner is acquiring from the Previous Owner.

Printed Name of Previous Owner Representative	Title
Signature of Previous Owner Representative	Date

B. New Owner

I certify under penalty of law that I am the owner of the Transferred Site, as described in Section II above, that I have been provided a copy of the WQMP, and that I have informed myself and understand the New Owner's responsibilities related to the WQMP, its implementation, and Best Management Practices associated with it. I understand that by signing this notice, the New Owner is accepting all ongoing responsibilities for implementation and amendment of the WQMP for the Transferred Site, which the New Owner has acquired from the Previous Owner.

1. Background

The Cypress Mixed Use development (the "Project") is a proposed retail, theater, multi-family, and hotel site located in Cypress, CA. The site is bounded by an existing parking lot to the north, Winners Circle on the east, Katella Avenue to the south, and Siboney Street to the west. This development is comprised of approximately 63,975 SF of general commercial, 96,800 SF (120 keys) of hotel, and 251 multi-family apartments. The surface parking field within the interior of the site will serve the hotel, retail and restaurant customers; while and above ground parking structure will accommodate the parking needs of the residential units. The site consists of approximately 13.3 acres.

The site is part of the Cypress Business and Professional Center Specific Plan (CBPC), which was originally approved in 1990 and amended and restated in 2012. The site is located in Area 5 of the CBPC, which is designated for professional offices. A portion of Area 5, east of the Project site, was built out as a Costco-anchored shopping center. The CBPC covers the entire Los Alamitos Race Course (LARC) property and adjacent properties. A Specific Plan Amendment is proposed to allow the multi-family residential use on the proposed Project site.

The Cypress Town Center and Commons Specific Plan (CTC), approved in December 2017, overwrote a portion of the CBPC. While the CTC limits do not include the Project site, the area directly north of the Project site is included in the CTC as a Town Center District.

Previous drainage studies related to the CBPC indicate that the downstream storm drain system is significantly under-capacity and that peak discharges from the Project site and the surrounding areas must be restricted to 0.3 cfs per acre.

2. Existing (Predevelopment) Conditions

In the existing condition, the site is a portion of an existing asphalt parking lot serving LARC that extends to the without a visible demarcation of the property line. The overall parking lot area drains to two separate concrete ribbon gutters that flow from north to south. The parking lot pavement sheet flows in east/west orientations to the two ribbon gutters along the length of each gutter. The flow depths in the gutters vary up to 4.5 inches at the northerly site property line.

Each gutter terminates at separate existing catch basins that connect to an existing City 48" storm drain that runs on the north edge Katella Avenue from east to west. These catch basins are located in within the proposed Project site boundary. Run-off in excess of the capacity of inlets ponds up in the parking lot before ultimately overflowing and discharging overland at an existing driveway into the Katella Avenue curb and gutter. The on-site ponding is limited to 12 to 18 inches. The ponding has little to no detention effects during large storm events – the 100-year peak will essentially pass through the driveway into the street in the existing condition.

The on-site portion of the existing parking lot is approximately 13.3 acres in area. The off-site area tributary to the ribbon gutters upstream of the site is approximately 11.8 acres. The 13.3-acre Project site area is relatively flat generally sloping from the north to the south with approximately 2 feet of fall across the site.

An existing storm drain in Winners Circle accommodates street drainage and extends north along the Costco property frontage and accommodates drainage from the north side of the Costco property. The approved storm drain plan for the Winners Circle storm drain depicts a proposed extension to the west across the existing parking lot. Th drain would be located just north of the Project site. Only the portions of the drain in Winners Circle and adjacent to Costco were actually constructed. The proposed drain extension is designed to accommodate the restricted flows (0.3 cfs/acre) from the property north of the Project site.

3. Proposed (Post-development) Conditions

The proposed hydrology analysis includes an evaluation of the on-site hydrology and two different scenarios for the conveyance of off-site flows that drain toward the site. The on-site drainage system is considered a permanent improvement that will exist as long as the Project exists unless replaced by an equivalent system. The off-site flow conveyances include some components that are assumed to be permanent along with temporary improvements that will remain in place until such time that the off-site tributary areas are developed in the future.

On-Site Hydrology

In the proposed condition, drainage will flow away from the proposed buildings and into one of several low points across the site, as depicted on the proposed hydrology map. Runoff will be collected into an on-site private underground storm drain system. The allowable discharge from the site is restricted to 0.3 cfs/acre per City requirements. To accommodate developed peak flows that exceeds the allowable discharge, the project storm water management system incorporates on-site underground detention basins. These detention basins have been designed to attenuate the 100-year storm event peak flow difference between the developed flow from the project and allowable discharge flow. See the proposed hydrology map for the conceptual locations of the basins. A storm drain pump will be used to drain the detention systems and meet the 0.3 cfs/acre runoff restriction by limiting the pump discharge to 4.0 cfs. The site will ultimately discharge via a new storm drain connection to the existing 48” Katella storm drain.

In addition to the site high-flow detention system, a low-flow detention system will be installed to capture and treat the “first flush” storm event. A bifurcation manhole will be placed upstream of the first flush detention system and divert the first flush volume into a separate detention system. This system will be pumped separately and the runoff will slowly discharge through a manufactured bioretention system over a 48-hour period. The outlet pipe from the biofiltration system will connect separately to the existing 48” Katella Avenue storm drain.

Off-Site Hydrology Design Scenario 1-Pipe and Surface Conveyance

Scenario 1 would consist of a combination of an extension of the Winners Circle storm drain to the west that would convey off-site flows with a capacity of up to 0.3 cfs per acre (3.53 cfs total). An overland flow path would direct flows in excess of 0.3 cfs per acre to the west toward Siboney Avenue.

The existing off-site flows draining toward the site would be captured by extending the Winners Circle drain, per the approved plans, to two proposed catch basins along the north property line and routed through a proposed 18" storm drain draining to the east, ultimately connecting to the existing 24" storm drain in Winners Circle. The existing flow depth in the existing ribbon gutters reached 4.5 inches during the 100-year storm. Corresponding depths during the 2-year and 10-year storm were not analyzed.

In the event run-off from the area north of the site exceeds the capacity of the catch basins and drain, proposed curb and gutter and an approximately 2 foot-high berm installed north of the property line would block offsite flow from entering the site and direct flows toward the two catch basins proposed on the Winners Circle Strom drain extension. The off-site flows would pond by variable depths along the north property line before discharging to the west, into Siboney Street. The maximum instantaneous depth ranges for multiple storm events is listed below. These depths do not threaten structures.

Table 1: Overflow Depths

Storm Event	Maximum Overflow (cfs)	Maximum Instantaneous Overflow Depth Range	Existing Condition Flow Depth at PL
2	9.38	2.5" – 10"	N/A
10	19.78	3.5" – 11.5"	N/A
100	31.55	4" – 13"	0"-4.5"

Some regrading of the existing off-site parking lot along the proposed curb and gutter would be proposed. This would keep the ponding to the levels described in the table above. The ponding would occur only during storms that produce more runoff that 0.3 cfs per acre and only during the peak intensity of the storm event. For the 100-year storm, the runoff exceeds the proposed storm drain capacity of 0.3 cfs per acre for approximately 3-4 hours (from hour 13.75 to hour 17.50 of the

storm event.) In addition, the off-site hydrograph peak is very sharp. The overflow rate exceeds 25% of the maximum overflow flow rate for approximately 30 minutes, with timing centered around the time of the maximum overflow rate. For the 100-year strom, the maximum overflow rate is 31.55 cfs. For all but 30 minutes of the 100-year storm event, the overflow rate is less than 8 cfs.

Once the overflows reach Siboney Street, they would ultimately flow overland to the south into Katella Avenue. Siboney Street would be reconstructed with a crown that will contain the overflows on the east side of the street section, adjacent to the site, and convey the fows to the south, decreasing the burden on the existing trench drains on the west side of Siboney Street.

This overflow pattern would be an interim condition until the area to the north has been developed and a storm water management and detention system is constructed for the future development. The storm water management system for the future site would likely connect to the extended Winners Circle storm drain that would be extended as part of Scenario 1. The runoff diverted around the site in Scenario 1 would have reached Katella Avenue in the existing condition at a similar location. Instead of overflowing at the existing catch basins and running off through the existing project driveway, the overflows would instead flow into Katella Avenue at Siboney Street.

Off-Site Hydrology Design Scenario 2-Pipe Conveyance Only

Scenario 2 consists of the same curb and gutter, 2 foot-high berm, and catch basins along the northerly property line as the one proposed in scenario 1. Rather than an off-site overflow drainage pattern for storms that exceed 0.3 cfs per acre, the overflows will be conveyed in an underground storm drain across the project site and discharged through a proposed catch basin in Katella Avenue close to the existing driveway location.

The overflow drain would act as a reverse siphon under the site. No on-site flows would commingle with the off-site flows. A small diameter connection to the Katella storm drain, allowing approximaltey 0.3 cfs per acre (3.53 cfs total). The remaining 31.55 cfs during the 100-year storm event would discharge through the Katella Avenue catch basin into the Katella Avenue curb and gutter. The overflow pipe system would include a 48-inch diameter pipe in a noth-south alignment across the site, a 24-inch diameter storm drain extended west to the west overflow catch basin, and a 36-inch diameter storm drain extended east to the east overflow catch basin. The storm drain sizes are based on an assumed water surface at the top of curb elevation on Katella Avenue.

This overflow pattern would also be an interim condition until the area to the north has been developed and a storm water management and detention system is constructed for the future development. The storm water management system for the future site would likely connect to the extended Winners Circle storm drain that the adjacenet owner would have to install. The overflow system proposed in Scenario 2 would be abandoned. The runoff diverted under the site in Scenario 2 would have reached Katella Avenue in the existing condition at a similar location.

Proposed Condition Hydrology Summary

Since the on-site portion of the area tributary to Katella Avenue is limited to 4.0 cfs connecting directly into the storm drain, the amount of flows that will reach the Katella Avenue curb and gutter is greatly reduced compared to the existing condition. Additionally, both off-site hydrology deisgn scenarios allow for passage of the allowable off-site flow rate (3.53 cfs) into the City's underground strom drain location with overflows in excees of 3.53 cfs contained an directed to the Katella Avenue curb and gutter in a similar location to the existing condition.

4. Hydrologic and Hydraulic Design Criteria

Hydrologic Design Criteria

A 100-year storm event was used to model the peak flow rates since the existing storm drain systems are modeled using the 100-year storm as a design criteria. Soil type D underlies the Site based on input form the soils engineer. The developed site was modeled as 100% impervious conservatively. AES software was used to determine the proposed condition peak flow rates. The site was modeled as a single area with an assumed 10-minute time of concentration. This time of concentration is a reasonable assumption for a 13-acre site. The site plan is conceptual in nature at this stage; therefore, a more generalized single area is more appropriate than detailed subarea delineations. The final hydrology study will analyze the ultimate site plan with multiple subareas. For the preliminary study, the primary goal is to size the on-site detention system and design the temporary diversion for the off-site tributary flows.

The site is located at the edge of the hydromodification boundary line as defined the in Orange County Technical Guidance Document. The area just east of the site drains easterly toward a hydromodification-susceptible watershed. The site connects to a storm drain system that drains westerly toward the Coyote Creek/San Gabriel River water shed that is not susceptible to hydromodification. The site not in a hydromodification zone; therefore, only the 100-year storm is analyzed.

Software and Methodology

AES RATSC rational method software was used to calculate the peak off-site tributary flow rates. AES computational hydrology software is used to calculate the on-site loss rates and on-site hydrograph. A 10-minute time of concentration was assumed for the on-site hydrograph along with a 100% impervious site, which is a conservative assumption. PondPack was used to route the on-site hydrograph through the proposed detention system with a pump modeled that discharges up to 4.0 cfs.

Pipe Hydraulic Design Criteria

Hydraulic calculations were performed for the main storm drain pipes utilizing Flowmaster, developed by Bentley. The software utilizes Manning's equation to determine acceptable friction slopes for design. An allowable friction slope of 0.3% was used to keep the hydraulic grades below ground surface. Catch basins will be sized to accommodate the 100-year storm at the time of final design

Allowable Connection Flow Rates

The proposed flow rate at the connection point will not exceed the allowable Q100 flow rate of 0.3 cfs/acre. The Project site is 13.3 acres; therefore, the allowable discharge rate is 4.0 cfs. In lieu of an existing hydrology calculation setting the allowable flow rate for discharge, the more stringent restricted drain capacity criteria is applied.

5. Conclusions

A comparison table of the allowable and proposed flow rates follows:

Table 2: Hydrologic Comparison Table – Proposed Site

Drainage Condition	100-Year Storm
Developed Undetained	49.8 cfs
Developed Detained	4.0 cfs
Allowable On-Site Discharge*	4.0 cfs
Difference	0.0 cfs
Required Detention Volume	64,000 Cubic Ft.
Total On-Site Runoff Volume	5.57 ac-ft

Table 3: Hydrologic Comparison Table – Upstream Tributary Area	
Drainage Condition	**100-Year Storm**
Off-Site Peak Flow Rate	34.96 cfs
Off-Site Drain Capacity – Winners Circle Extension	3.54 cfs
Off-Site Surface Overflow – West toward Siboney	31.42 cfs

*Note: Allowable 100-year storm is based on the City requirement of 0.3 cfs/acre discharge.

Since the proposed, detained on-site flow rates (4.0 cfs) are equal to the allowable flow rate (4.0 cfs) during the 100-year storm event, the site complies with the hydrologic design requirement. The detention basin is able to accommodate the 100-year storms without exceeding the detention basin capacity or the allowable connection flow rate. An examination of the undetained inflow hydrograph shoes that the undetained discharge would exceed the 4.0 cfs allowable discharge from hour 13.67 to hour 17.50. The detention system will fill for an approximate 4-hour period during the 100-year storm.

In addition, the pipes will be sized according to the table below based on the pipe hydraulic calculations. The flowrate tributary to a pipe size will not exceed the tabulated values listed below:

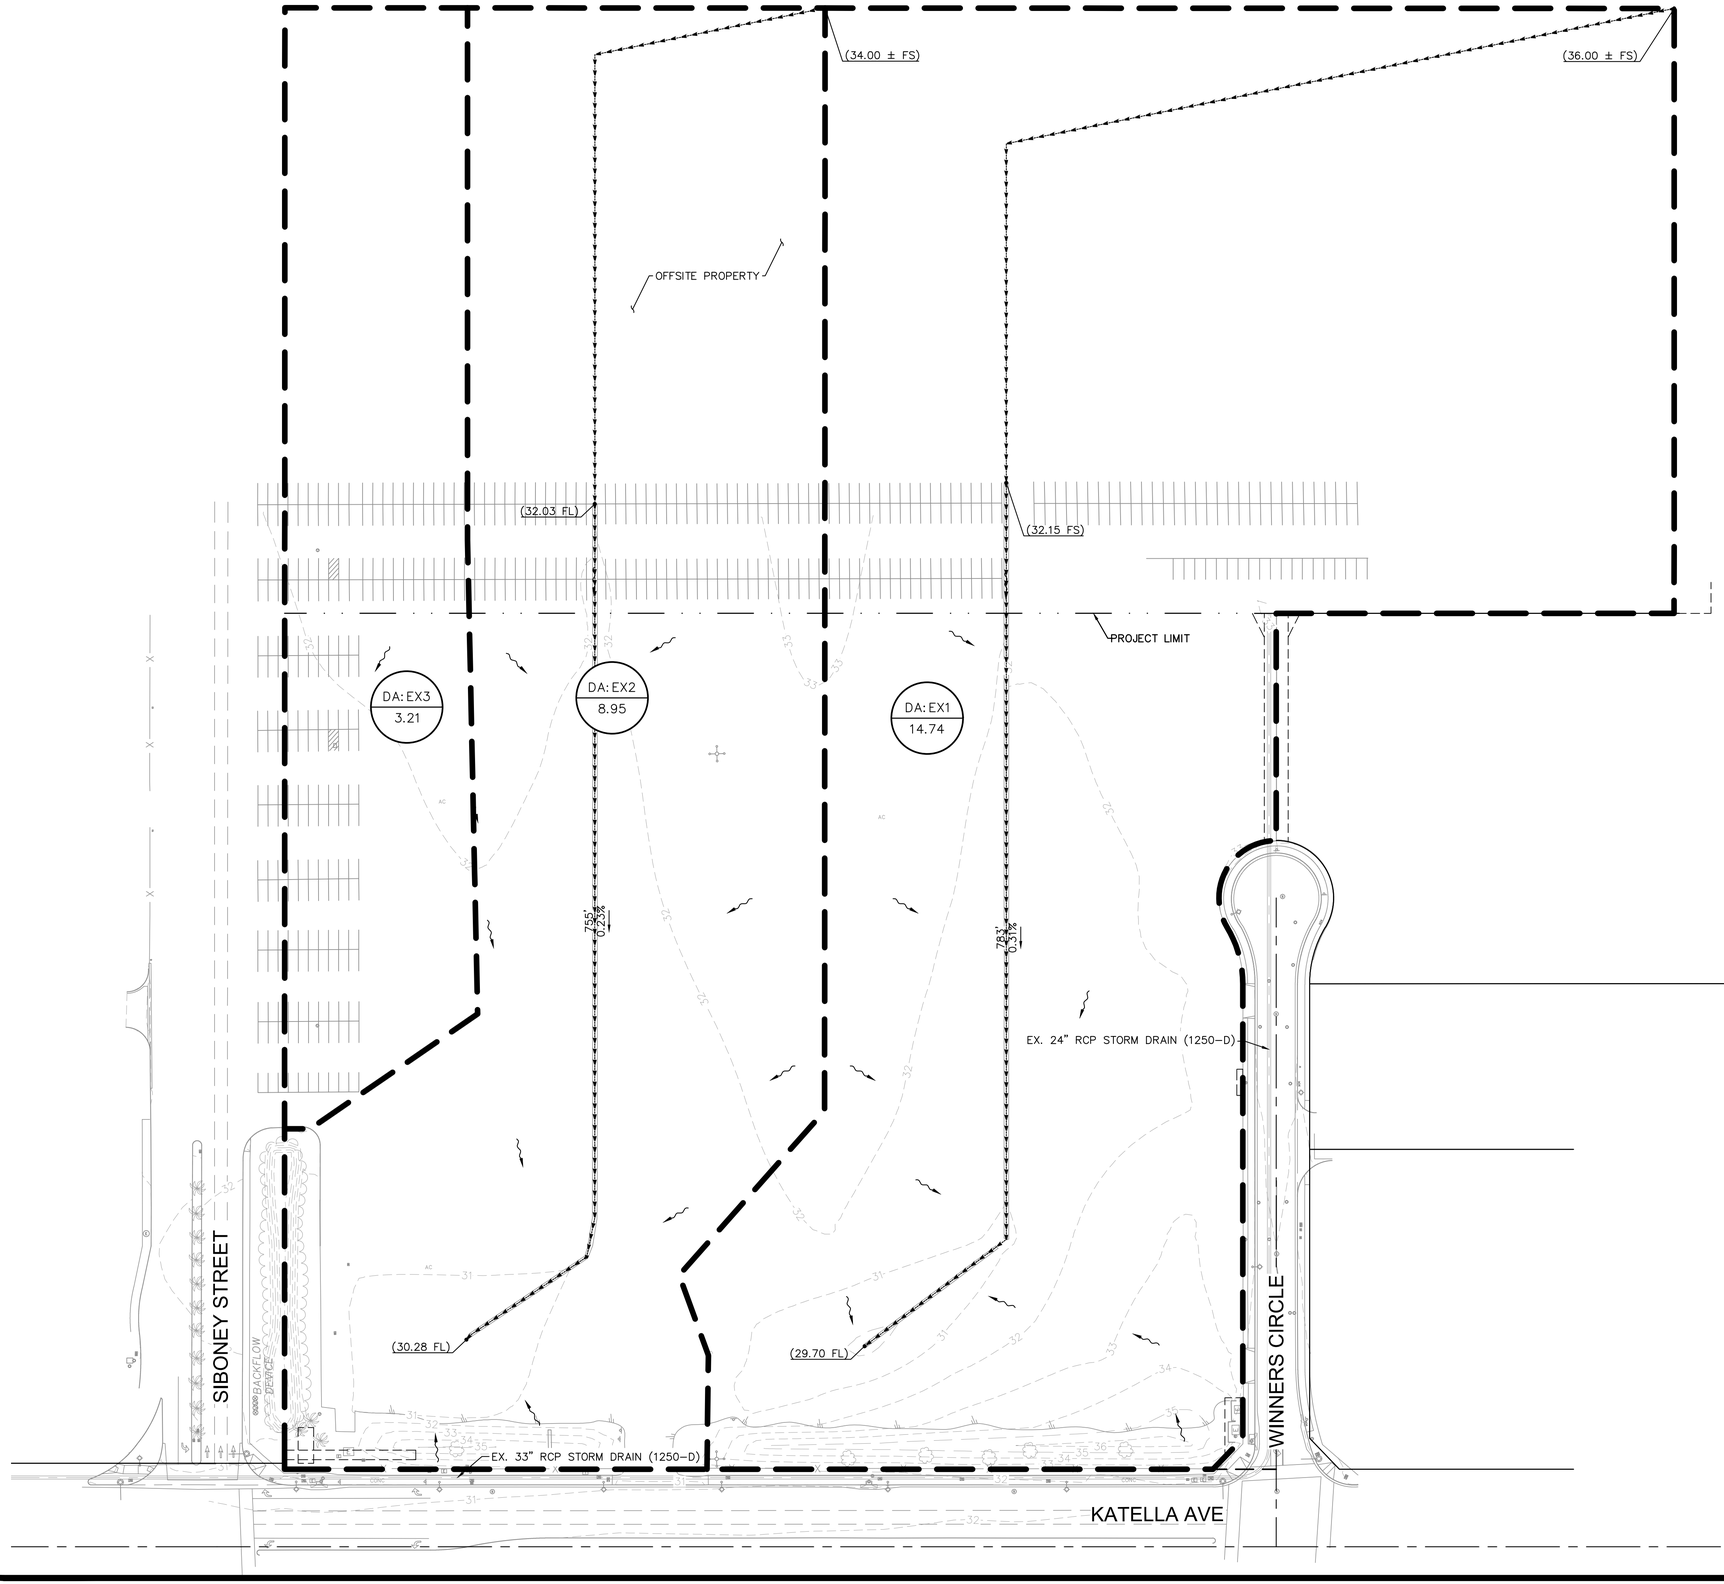

Table 2: Pipe Hydraulics Table		
Pipe Size	**Material**	**Capacity at 0.3% Friction Slope**
12”	HDPE (n=0.011)	2.3 CFS
18”	HDPE (n=0.011)	6.8 CFS
24”	HDPE (n=0.011)	14.6 CFS

30”	HDPE (n=0.011)	26.6 CFS
36”	HDPE (n=0.011)	43.2 CFS
42”	HDPE (n=0.011)	65.1 CFS
48”	HDPE (n=0.011)	93.0 CFS

CEQA Drainage Criteria: An existing hydrology analysis was not prepared due to the more restrictive restricted drainage criteria based on the limited storm drain capacity. The existing flow rate can be approximated by adding the 49.8 cfs on-site undetained flow rate to the 34.96 cfs off-site flow rate, for an existing total of approximately 84.9 cfs. In the proposed condition, the collective discharge can be approximated by adding the 4.0 cfs on-site detained flow rate to the 34.96 cfs off-site flow rate for a proposed total of approximately 39.0 cfs. This is a significant decrease in runoff from the existing condition, and the site will reduce the amount of runoff reaching the Katella Avenue storm drain and street section.

Label: PO-1

Pond Volume Equations

* Incremental volume computed by the Conic Method for Reservoir Volumes.

Volume = (1/3) * (EL2 - El1) * (Area1 + Area2 + sqr(Area1 * Area2))

where:	EL1, EL2	Lower and upper elevations of the increment
	Area1, Area2	Areas computed for EL1, EL2, respectively
	Volume	Incremental volume between EL1 and EL2
