(1) All sewage sludge generated by the discharger shall be disposed in a municipal solid waste landfill that meets the requirements of 40 CFR 258, land applied in accordance with the requirements in 40 CFR 503 Subpart B, or delivered to a composter for treatment and land application in accordance with the requirements in 40 CFR 503 Subpart B. The Discharger shall notify USEPA and the Regional Water Board 60 days prior to any change in use or disposal practices.

(2) Sludge treatment, storage, and disposal or reuse shall not create a nuisance, such as objectionable odors or flies, or result in groundwater contamination.

(3) The Discharger shall take all reasonable steps to prevent or minimize any sludge use or disposal that has a likelihood of adversely affecting human health or the environment.

(4) The discharge of sludge shall not cause waste material to be in a position where it is or can be carried from the sludge treatment and storage site and deposited in waters of the United States.

(5) The sludge treatment and storage site shall have facilities adequate to divert surface runoff from adjacent areas, to protect boundaries of the site from erosion, and to prevent any conditions that would cause drainage from the materials in the temporary storage site. Adequate protection is defined as protection from at least a 100-year storm and protection from the highest possible tidal stage that may occur.

(6) For sludge applied to land, placed on a surface disposal site, or fired in a sludge incinerator as defined in 40 CFR 503, the Discharger shall submit an annual report to USEPA and the Regional Water Board containing monitoring results and pathogen and vector attraction reduction requirements as specified by 40 CFR 503, by February 19 of each year, for the period covering the previous calendar year.

(7) Sludge disposed of in a municipal solid waste landfill shall meet the requirements of 40 CFR 258. In the annual self-monitoring report, the Discharger shall include the amount of sludge disposed of and the landfill to which it was sent.

(8) Permanent on-site sludge storage or disposal activities are not authorized by this Order. A report of Waste Discharge shall be filed and the site brought into compliance with all applicable regulations prior to commencement of any such activity.

(9) Sludge Monitoring and Reporting Provisions of this Order (Attachment G) apply to sludge handling, disposal, and reporting practices.

(10) The USEPA and the Regional Water Board may amend this Order prior to expiration if changes occur in applicable state and federal sludge regulations.

6. Combined Sewer Overflow (CSO) Control Policy Requirements (Wet Weather Controls)

In accordance with the Nine Minimum Controls of the USEPA *Combined Sewer Overflow Control Policy* (1994) and the Discharger's Long Term Control Plan, the Discharger shall maximize flow to the Plant and pollutant removal during wet weather.

a. Combined Sewer Operations and Maintenance Plan. The Discharger shall revise and update its Combined Sewer Operations and Maintenance Plan as necessary to ensure compliance with the Nine Minimum Controls and the Long Term Control Plan requirements of the Combined Sewer Overflow Control Policy. The Discharger shall submit a revised plan to the Regional Water Board by September 30, 2010, and following any subsequent revisions during the term of this Order.

b. Nine Minimum Controls. The Discharger shall continue to implement and comply with the following technology-based requirements.

(1) *Conduct Proper Operations and Regular Maintenance Programs*. The Discharger shall implement its Combined Sewer Operations and Maintenance Plan, which shall include the elements described below. The Discharger shall update the plan to incorporate changes to the system and shall operate and maintain the system according to the plan. The Discharger shall maintain records to document the implementation of the Combined Sewer Operations and Maintenance Plan.

(i) *Designation of a Manager for CSOs.* The Discharger shall designate a person to be responsible for the wastewater collection system and serve as the contact person regarding the operation of the combined sewer system. The Discharger shall notify USEPA and the Regional Water Board within 90 days of the designation of a new contact person.

(ii) *Inspection and Maintenance of the Combined Sewer System.* The Discharger shall:

- Inspect and maintain all overflow structures, regulators, pumping stations, and tide gates to ensure that they are in good working condition and adjusted to minimize overflows and prevent tidal inflow.

- Inspect each overflow outfall at least once per year. The inspection shall include, but not be limited to, entering the regulator structure, if accessible; determining the extent of debris and grit buildup; and removing any debris that may constrict flow, cause blockage, and result in a dry weather CSO. For overflow outfalls that are inaccessible,

the Discharger may perform a visual check of the overflow pipe to determine whether CSOs have occurred or could potentially occur during dry weather flow conditions.

- Record the results of the inspections in a maintenance log.

(iii) *Provision for Trained Staff*. The Discharger shall provide adequate staff to carry out the operation, maintenance, repair, and testing functions required to ensure compliance with the terms and conditions of this Order. Each member of the staff shall receive appropriate training.

(iv) *Allocation of Funds for Operation and Maintenance*. The Discharger shall allocate adequate funds specifically for CSO operation and maintenance activities.

(2) *Maximize Use of the Collection System for Storage.* The Discharger shall continue to maximize the use of the collection system for in-line storage. (Note that this provision refers to the use of collection system piping, not the storage basins/transports, for storage.)

(3) *Review and Modify Pretreatment Program*. The Discharger shall continue to implement selected controls to minimize the impact of non-domestic discharges to its collection system. At three-year intervals, the Discharger shall re-evaluate whether additional modifications to its pretreatment program are feasible or practical. The Discharger shall maintain records to document this evaluation and to document implementation of the selected controls to minimize non-domestic discharges to its collection system.

(4) *Maximize Flow to Plant*. The Discharger shall operate the Plant at maximum treatable flow during wet weather flow conditions. The Discharger shall report rainfall and influent flow data to USEPA and the Regional Water Board with SMRs required by the attached Monitoring and Reporting Program (Attachment E.)

Consistent with the objectives of the Combined Sewer Operations and Maintenance Plan, the Discharger shall ensure that the facility Operation and Maintenance Plan is implemented to maximize the volume of wastewater treated at the Plant and discharged via Discharge Point 001, consistent with the hydraulic capacities of the storage, transport, treatment, and disposal facilities.

(5) *Prohibit CSOs During Dry Weather*. Dry weather CSOs from Discharge Points CSO-001 through CSO-007 or other locations are prohibited. All CSOs must be responded to in accordance with Regional Standard Provisions, and Monitoring, and Reporting Requirements (Section V.E.2) as provided in Attachment G. The Discharger shall document in the inspection log each CSO event, the duration of the event, the cause of the event and the corrective measures taken.

(6) *Control Solid and Floatable Materials in CSODs.* The Discharger shall continue to implement measures to control solid and floatable materials in CSODs. These measures shall include:

(i) ensuring that all the CSO structures are baffled or that other means are used to reduce the volume of floatable materials in CSOs, and

(ii) removing solid or floatable materials captured in the storage/transport system in an acceptable manner prior to discharge to receiving waters.

(7) *Develop and Implement a Pollution Prevention Program*. The Discharger shall continue to implement a Pollution Prevention Program focused on reducing the impact of CSOs on receiving waters. This Pollution Prevention Program is authorized by federal regulations on CSOs. This program shall be developed and implemented in accordance with Provision VI.C.3.

(8) *Notify the Public of Overflows*. The Discharger shall continue to implement a public notification plan to inform citizens of when and where CSOs occur. The process shall include:

(i) a mechanism to alert persons using all receiving waters affected by overflows.

(ii) a system to determine the nature and duration of conditions resulting from overflows that are potentially harmful to users of these receiving waters.

Specifically, warning signs must be posted at beach locations where water contact recreation occurs whenever there is a discharge from the diversion structures. Such warning signs shall be posted on the same days as the overflow events unless the overflow occurs after 4:00 p.m., in which case, signs shall be posted by 8:00 a.m. The Discharger shall maintain records documenting public notification.

(9) *Monitor to Effectively Characterize CSO Impacts and the Efficacy of CSO Controls*. To comply with the Nine Minimum Controls as well as post construction compliance monitoring under the CSO Control Policy, the Discharger shall continue regular monitoring necessary to evaluate CSO controls. The monitoring shall build on the efforts and results of the Discharger described in its August 30, 2007, report, *Westside Study to Effectively Characterize Overflow Impacts and the Efficacy of Combined Sewer Overflow Controls.* The Discharger shall provide a summary report annually and submit a final report to USEPA and the Regional Water Board by September 30, 2014. The report shall include:

(i) Summary of existing data in order to show status and trends;
(ii) Monitoring of wet weather discharges;
(iii) Evaluation of results in order to effectively characterize CSO impacts and efficacy of CSO controls;

(iv) Review of CSO impacts and, if necessary, proposal of revisions to the CSOD control program, including the Nine Minimum Controls;
(v) Recreational use surveys, as described in the MRP, following CSO events, to track changes in uses over time; and
(vi) Summary of post-construction monitoring results and an analysis of CWA compliance with water quality standards and the protection of beneficial uses.

If water quality standards are not being attained, the Discharger shall submit a revised CSO control program that, once implemented, will attain water quality standards. The Discharger may also wish to consider the review and appropriate revision of water quality standards and implementation procedures on CSO-impacted waters.

c. Long-Term Control Plan. The Discharger shall comply with the following provisions:

(1) The Discharger shall optimize the operation of its system to minimize combined sewer discharges and maximize pollutant removal during all wet weather conditions.

(2) The Discharger shall capture for treatment, or storage and subsequent treatment, 100 percent of the combined sewage flow collected in the combined sewage system during precipitation events. Captured combined sewage shall be directed to either the Plant or the storage/transports. All combined sewage captured shall receive a minimum of the following treatment:

- Secondary treatment (at Plant), or
- Primary treatment (at Plant), or
- Flow-through treatment (in storage/transports).

(3) The Discharger shall comply with the following for wet weather Plant operations:

(i) The Plant shall have an influent flow rate of at least 43 MGD prior to initiating decant from the Westside Transport to Discharge Point 001.

(ii) The flow rate at Discharge Point 001 shall be at least 165 MGD within 2 hours of a discharge into the Pacific Ocean from Discharge Point CSD-002 or CSD-003.

(iii) The Sea Cliff Pump Station I shall be operated at maximum capacity prior to an overflow at Discharge Point CSD-005.

(iv) The Sea Cliff Pump Station II shall be operated at maximum capacity prior to an overflow at Discharge Point CSD-007.

(4) The Discharger shall comply with the following after rains subside:

(i) Treatment at the Plant shall continue until the Westside Drainage Basin storage/transports are empty of stormwater flows.

(ii) If the National Weather Service predicts a 30 percent chance of rain within the next 24 hours:

- Pumping shall be maximized from the Westside storage/transport via the Westside Pump Station to the Oceanside Plant and Discharge Point 001 until the level of combined sewage in the East Box is between 5 and 10 feet.

- Pumping shall be maximized from the Westside storage/transport via the Westside Pump Station to the Plant and/or Discharge Point 001 until the level of combined sewage in the West Box is essentially zero.

(iii) If the National Weather Service does not predict rain within the next 24 hours:

- Pumping shall be maximized from the Westside storage and transport until the level of combined sewage in the West Box is zero and total flow to the Oceanside Plant is less than 43 MGD.

7. Sensitive Areas Feasibility Report for Overflows

The Discharger shall submit a report, by December 31, 2011, implementing the "consideration of sensitive areas" section of the Combined Sewer Overflow Control Policy. At a minimum, the Discharger shall assess techniques (including green infrastructure and low impact development) to eliminate or relocate CSODs from sensitive areas and discuss the level of treatment for any remaining CSODs necessary to meet water quality standards.

VII. COMPLIANCE DETERMINATION

Compliance with the effluent limitations contained in section IV of this Order will be determined as specified below:

A. General

Compliance with effluent limitations for priority pollutants shall be determined using sample reporting protocols defined in the Monitoring and Reporting Program (Attachment E) and Fact Sheet Section VI. For purposes of reporting and administrative enforcement, the Discharger shall be deemed out of compliance with single-sample effluent limitations if the concentration of the pollutant in the monitoring sample is greater than the effluent limitation. For averaged or median-based effluent limitations, the Discharger shall be deemed out of compliance if the average or median concentration in the data set is greater than the effluent limitation.

B. Multiple Sample Data

When determining compliance with a pollutant limit and more than one sample result is available, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of “Detected, but Not Quantified” (DNQ) or “Not Detected” (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

1. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

2. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle, unless one or both of these points are ND or DNQ, in which case the median value shall be the lower of the two data points, where DNQ is lower than a value, and ND is lower than DNQ.

ATTACHMENT A – DEFINITIONS

Acute Toxicity

a. Acute Toxicity (TUa)

Expressed in Toxic Units Acute (TUa)

$$TUa = \frac{100}{\text{96-hr LC 50\%}}$$

b. Lethal Concentration 50% (LC 50)

LC 50 (percent waste giving 50% survival of test organisms) shall be determined by static or continuous flow bioassay techniques using standard marine test species as specified in Ocean Plan Appendix III. If specific identifiable substances in wastewater can be demonstrated by the discharger as being rapidly rendered harmless upon discharge to the marine environment, but not as a result of dilution, the LC 50 may be determined after the test samples are adjusted to remove the influence of those substances.

When it is not possible to measure the 96-hour LC 50 due to greater than 50 percent survival of the test species in 100 percent waste, the toxicity concentration shall be calculated by the expression:

$$TUa = \frac{\log (100 - S)}{1.7}$$

where:

S = percentage survival in 100% waste. If S > 99, TUa shall be reported as zero.

Areas of Special Biological Significance (ASBS)
Those areas designated by the State Water Board as ocean areas requiring protection of species or biological communities to the extent that alteration of natural water quality is undesirable. All Areas of Special Biological Significance are also classified as a subset of STATE WATER QUALITY PROTECTION AREAS.

Average Dry Weather Discharge
The average dry weather discharge is the average discharge rate over three consecutive months of dry weather (i.e., a wet weather day has not occurred)

Average Monthly Effluent Limitation (AMEL)
The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL)
The highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Chlordane
Shall mean the sum of chlordane-alpha, chlordane-gamma, chlordene-alpha, chlordene-gamma, nonachlor-alpha, nonachlor-gamma, and oxychlordane.

Chronic Toxicity
This parameter shall be used to measure the acceptability of waters for supporting a healthy marine biota until improved methods are developed to evaluate biological response.

a. Chronic Toxicity (TUc)

Expressed as Toxic Units Chronic (TUc)

$$TUc = \frac{100}{NOEL}$$

b. No Observed Effect Level (NOEL)

The NOEL is expressed as the maximum percent effluent or receiving water that causes no observable effect on a test organism, as determined by the result of a critical life stage toxicity test listed in Ocean Plan Appendix III.

Combined Sewer System
A combined sewer system (CSS) is a wastewater collection system owned by a State or municipality which conveys sanitary wastewaters (domestic, commercial, and industrial wastewaters) and stormwater through a single-pipe system to a Publicly Owned Treatment Works (POTW) Treatment Plant.

Combined Sewer Overflow
A combined sewer overflow (CSO) is the discharge from a combined sewer system at a point prior to the POTW Treatment Plant.

Combined Sewer Overflow Discharge
A combined sewer discharge (CSOD) is an authorized, treated discharge from the near-shore discharge structures, offshore discharge structures, or treatment facilities during a wet weather day.

Daily Discharge
Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

DDT
Shall mean the sum of 4,4'DDT, 2,4'DDT, 4,4'DDE, 2,4'DDE, 4,4'DDD, and 2,4'DDD.

Degrade
Degradation shall be determined by comparison of the waste field and reference site(s) for characteristic species diversity, population density, contamination, growth anomalies, debility, or supplanting of normal species by undesirable plant and animal species. Degradation occurs if there are significant differences in any of three major biotic groups, namely, demersal fish, benthic invertebrates, or attached algae. Other groups may be evaluated where benthic species are not affected, or are not the only ones affected.

Detected, but Not Quantified (DNQ)
Sample results that are less than the reported Minimum Level, but greater than or equal to the laboratory's MDL.

Dichlorobenzenes
Shall mean the sum of 1,2- and 1,3-dichlorobenzene.

Downstream Ocean Waters
Waters downstream with respect to ocean currents.

Dredged Material
Any material excavated or dredged from the navigable waters of the United States, including material otherwise referred to as "spoil".

Dry Weather Day
Any day that is not a wet weather day. During dry weather, all wastewater collected is treated to secondary levels at the Plant and discharged at Discharge Point 001.

Enclosed Bays
Indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. This definition includes but is not limited to: Humboldt Bay, Bodega Harbor, Tomales Bay, Drakes Estero, San Francisco Bay, Morro Bay, Los Angeles Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay.

Endosulfan
The sum of endosulfan-alpha and -beta and endosulfan sulfate.

Estuaries and Coastal Lagoons are waters at the mouths of streams that serve as mixing zones for fresh and ocean waters during a major portion of the year. Mouths of streams that are temporarily separated from the ocean by sandbars shall be considered as estuaries. Estuarine waters will generally be considered to extend from a bay or the open ocean to the upstream limit of tidal action but may be considered to extend seaward if significant mixing of fresh and salt water occurs in the open coastal waters. The waters described by this definition include but are not limited to the Sacramento-San Joaquin Delta as defined by Section 12220 of the California Water Code, Suisun Bay, Carquinez Strait downstream to Carquinez Bridge, and appropriate areas of the Smith, Klamath, Mad, Eel, Noyo, and Russian Rivers.

Halomethanes shall mean the sum of bromoform, bromomethane (methyl bromide) and chloromethane (methyl chloride).

HCH shall mean the sum of the alpha, beta, gamma (lindane) and delta isomers of hexachlorocyclohexane.

Initial Dilution
The process that results in the rapid and irreversible turbulent mixing of wastewater with ocean water around the point of discharge.

For a submerged buoyant discharge, characteristic of most municipal and industrial wastes that are released from the submarine outfalls, the momentum of the discharge and its initial buoyancy act together to produce turbulent mixing. Initial dilution in this case is completed when the diluting wastewater ceases to rise in the water column and first begins to spread horizontally.

For shallow water submerged discharges, surface discharges, and non-buoyant discharges, characteristic of cooling water wastes and some individual discharges, turbulent mixing results primarily from the momentum of discharge. Initial dilution, in these cases, is considered to be completed when the momentum induced velocity of the discharge ceases to produce significant mixing of the waste, or the diluting plume reaches a fixed distance from the discharge to be specified by the Regional Water Board, whichever results in the lower estimate for initial dilution.

Instantaneous Maximum Effluent Limitation
The highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation
The lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

Kelp Beds
For purposes of the bacteriological standards of the Ocean Plan, are significant aggregations of marine algae of the genera Macrocystis and Nereocystis. Kelp beds include the total foliage canopy of Macrocystis and Nereocystis plants throughout the water column.

Mariculture
The culture of plants and animals in marine waters independent of any pollution source.

Material
(a) In common usage: (1) the substance or substances of which a thing is made or composed (2) substantial; (b) For purposes of the Ocean Plan relating to waste disposal, dredging and the disposal of dredged material and fill, MATERIAL means matter of any kind or description which is subject to regulation as waste, or any material dredged from the navigable waters of the United States. See also, DREDGED MATERIAL.

Maximum Daily Effluent Limitation (MDEL)
The highest allowable daily discharge of a pollutant.

Method Detection Limit (MDL)
The minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in title 40 of the Code of Federal Regulations, Part 136, Attachment B.

Minimum Level (ML)
The concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Natural Light
Reduction of natural light may be determined by the Regional Water Board by measurement of light transmissivity or total irradiance, or both, according to the monitoring needs of the Regional Water Board.

Not Detected (ND)
Those sample results less than the laboratory's MDL.

Ocean Waters
The territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. If a discharge outside the territorial waters of the state could affect the quality of the waters of the State, the discharge may be regulated to assure no violation of the Ocean Plan will occur in ocean waters.

PAHs (polynuclear aromatic hydrocarbons)
The sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo[k]fluoranthene, 1,12-benzoperylene, benzo[a]pyrene, chrysene, dibenzo[ah]anthracene, fluorene, indeno[1,2,3-cd]pyrene, phenanthrene and pyrene.

PCBs (polychlorinated biphenyls)
The sum of chlorinated biphenyls whose analytical characteristics resemble those of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254 and Aroclor-1260.

Pollutant Minimization Program (PMP)
PMP means waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of the PMP shall be to reduce

all potential sources of pollutants of concern through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. The Regional Water Board may consider cost effectiveness when establishing the requirements of a PMP. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), shall be considered to fulfill the PMP requirements.

Reported Minimum Level
The ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Regional Water Board either from Appendix II of the Ocean Plan in accordance with section III.C.5.a. of the Ocean Plan or established in accordance with section III.C.5.b. of the Ocean Plan. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the reported ML.

Satellite Collection System
The portion, if any, of a sanitary sewer system owned or operated by a different public agency than the agency that owns and operates the wastewater treatment facility that a sanitary sewer system is tributary to.

Shellfish
Organisms identified by the California Department of Public Health as shellfish for public health purposes (i.e., mussels, clams and oysters).

Significant Difference
Defined as a statistically significant difference in the means of two distributions of sampling results at the 95 percent confidence level.

Six-Month Median Effluent Limitation
The highest allowable moving median of all daily discharges for any 180-day period.

State Water Quality Protection Areas
Non-terrestrial marine or estuarine areas designated to protect marine species or biological communities from an undesirable alteration in natural water quality. All AREAS OF SPECIAL BIOLOGICAL SIGNIFICANCE (ASBS) that were previously designated by the State Water Board in Resolution Numbers 74-28, 74-32, and 75-61 are now also classified as a subset of State Water Quality Protection Areas and require special protections afforded by the Ocean Plan.

TCDD Equivalents
In this Order, TCDD Equivalents means the sum of the concentrations of chlorinated dibenzodioxins and chlorinated dibenzofurans multiplied by their Toxicity Equivalency Factor

(TEF) and their Bioaccumulation Equivalency Factor (BEF). This is based on 40 CFR Part 132, Appendix F, Procedure 4, Tables 1 and 2.

$(TEC)_{TCDD}$= The sum of $(C)_x(TEF)_x(BEF)_x$

Where $(TEC)_{TCDD}$ = TCDD Equivalents concentration in effluent

$(C)_x$ = concentration of total congener x in effluent

$(TEF)_x$ =TCDD toxicity equivalency factor for congener x

$(BEF)_x$ = TCDD bioaccumulation equivalency factor for congener x

Toxicity Equivalency Factor and Bioaccumulative Equivalency Factors are listed in the table below.

Congener	Toxicity Equivalency Factor (TEF)	Bioaccumulation Equivalency Factors (BEF)
2,3,7,8-TCDD	1.0	1.0
1,2,3,7,8-Pe-CDD	0.5	0.9
1,2,3,4,7,8-HxCDD	0.1	0.3
1,2,3.6,7,8-HxCDD	0.1	0.1
1,2,3,7,8,9-HxCDD	0.1	0.1
1,2,3,4,6,7,8-HpCDD	0.01	0.05
OCDD	0.0003	0.01
2,3,7,8-TCDF	0.1	0.8
1,2,3,7,8-PeCDF	0.03	0.2
2,3,4,7,8-PeCDF	0.3	1.6
1,2,3,4,7,8-HxCDF	0.1	0.08
1,2,3,6,7,8-HxCDF	0.1	0.2
2,3,4,6,7,8-HxCDF	0.1	0.7
1,2,3,7,8,9-HxCDF	0.1	0.6
1,2,3,4,6,7,8-HpCDF	0.01	0.01
1,2,3,4,7,8,9-HpCDF	0.01	0.4
OCDF	0.0003	0.02

Toxicity Reduction Evaluation (TRE)
A study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation

of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. (A TIE is a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.)

Waste
As used in the Ocean Plan, waste includes a discharger's total discharge, of whatever origin, i.e., gross, not net, discharge.

Water Reclamation
The treatment of wastewater to render it suitable for reuse, the transportation of treated wastewater to the place of use, and the actual use of treated wastewater for a direct beneficial use or controlled use that would not otherwise occur.

Wet Weather Day
A wet weather day is any day in which one of the following conditions exists as a result of rainfall:

1. Instantaneous influent flow to the Plant exceed 43 MGD; or

2. The average daily influent flow concentration of TSS or BOD is less than 100 mg/L; or

3. The Westside storage/transport flow elevation exceeds 0 feet in the West Box or 18 feet in the East Box. (Flow is decanted to the West Box from the East Box only when the East Box storage level exceeds 18 feet.)

ATTACHMENT D – STANDARD PROVISIONS

I. STANDARD PROVISIONS – PERMIT COMPLIANCE

A. Duty to Comply

1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application. (40 CFR §122.41(a).)

2. The Discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 CFR §122.41(a)(1).)

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order, 40 CFR §22.41(c).

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment, 40 CFR §122.41(d).

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order, 40 CFR §122.41(e).

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 CFR §122.41(g).)

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 CFR §122.5(c).)

F. Inspection and Entry

The Discharger shall allow the Regional Water Board, State Water Board, United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (40 CFR §122.41(i); Water. Code, §13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (40 CFR. § 122.41(i)(1));

2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (40 CFR §122.41(i)(2));

3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (40 CFR §122.41(i)(3)); and

4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (40 CFR §122.41(i)(4).)

G. Bypass

1. Definitions

a. “Bypass” means the intentional diversion of waste streams from any portion of a treatment facility. (40 CFR §122.41(m)(1)(i).)

b. “Severe property damage” means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 CFR §122.41(m)(1)(ii).)

2. Bypass not exceeding limitations. The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 CFR §122.41(m)(2).)

3. Prohibition of bypass. Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless (40 CFR §122.41(m)(4)(i)):

a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 CFR §22.41(m)(4)(i)(A));

b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 CFR §122.41(m)(4)(i)(B)); and

c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions – Permit Compliance I.G.5 below. (40 CFR §122.41(m)(4)(i)(C).)

4. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above. (40 CFR §122.41(m)(4)(ii).)

5. Notice

a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass. (40 CFR §122.41(m)(3)(i).)

b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice). (40 CFR §122.41(m)(3)(ii).)

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation, 40 CFR §122.41(n)(1).

Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review, 40 CFR §122.41(n)(2).

6. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 CFR §122.41(n)(3)):

a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 CFR §122.41(n)(3)(i));

b. The permitted facility was, at the time, being properly operated (40 CFR §122.41(n)(3)(ii));

c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b below (24-hour notice) (40 CFR §122.41(n)(3)(iii)); and

d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above,. 40 CFR §122.41(n)(3)(iv).

7. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 CFR § 122.41(n)(4).)

II. STANDARD PROVISIONS – PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition,. 40 CFR §122.41(f).

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit,. 40 CFR §122.41(b).

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code, 40 CFR §122.41(l)(3); §122.61.

III. STANDARD PROVISIONS – MONITORING

A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 CFR §122.41(j)(1).)

B. Monitoring results must be conducted according to test procedures under Part 136 or, in the case of sludge use or disposal, approved under Part 136 unless otherwise specified in Part 503 unless other test procedures have been specified in this Order, 40 CFR §122.41(j)(4); §122.44(i)(1)(iv).

IV. STANDARD PROVISIONS – RECORDS

A. Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by Part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time. (40 CFR §122.41(j)(2))

B. Records of monitoring information shall include:

1. The date, exact place, and time of sampling or measurements (40 CFR §122.41(j)(3)(i));

2. The individual(s) who performed the sampling or measurements (40 CFR §122.41(j)(3)(ii));

3. The date(s) analyses were performed (40 CFR §122.41(j)(3)(iii));

4. The individual(s) who performed the analyses (40 CFR §122.41(j)(3)(iv));

5. The analytical techniques or methods used (40 CFR §122.41(j)(3)(v)); and

6. The results of such analyses, 40 CFR §122.41(j)(3)(vi).

C. Claims of confidentiality for the following information will be denied (40 CFR § 122.7(b)):

1. The name and address of any permit applicant or Discharger (40 CFR §122.7(b)(1)); and

2. Permit applications and attachments, permits and effluent data. (40 CFR §122.7(b)(2).)

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Regional Water Board, State Water Board, or USEPA within a reasonable time, any information which the Regional Water Board, State Water Board, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or USEPA copies of records required to be kept by this Order, 40 CFR §122.41(h); Water Code, §13267.

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or USEPA shall be signed and certified in accordance with Standard Provisions – Reporting V.B.2, V.B.3, V.B.4, and V.B.5 below. (40 CFR §122.41(k).)

2. All permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA). (40 CFR §122.22(a)(3).).

3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or USEPA shall be signed by a person described in Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

a. The authorization is made in writing by a person described in Standard Provisions – Reporting V.B.2 above (40 CFR §122.22(b)(1));

b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 CFR §122.22(b)(2)); and

c. The written authorization is submitted to the Regional Water Board and State Water Board. (40 CFR §122.22(b)(3).)

4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions – Reporting V.B.3 above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 CFR §122.22(c).)

5. Any person signing a document under Standard Provisions – Reporting V.B.2 or V.B.3 above shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware

that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." (40 CFR §122.22(d).)

C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program (Attachment E) in this Order. (40 CFR §122.22(l)(4).)

2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. (40 CFR §122.41(l)(4)(i).)

3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under Part 136 or, in the case of sludge use or disposal, approved under Part 136 unless otherwise specified in Part 503, or as specified in this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board. (40 CFR §122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 CFR §122.41(l)(4)(iii).)

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date, 40 CFR §122.41(l)(5).

E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. (40 CFR §122.41(l)(6)(i).)

2. The following shall be included as information that must be reported within 24 hours under this paragraph (40 CFR §122.41(l)(6)(ii)):

   a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 CFR §122.41(l)(6)(ii)(A).)

b. Any upset that exceeds any effluent limitation in this Order. (40 CFR §122.41(l)(6)(ii)(B).)

3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 CFR §122.41(l)(6)(iii).)

F. Planned Changes

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 CFR § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in section 122.29(b) (40 CFR §122.41(l)(1)(i)); or

2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are not subject to effluent limitations in this Order. (40 CFR §122.41(l)(1)(ii).)

3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. (40 CFR§ 122.41(l)(1)(iii).)

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with General Order requirements, 40 CFR §122.41(l)(2).

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E above, 40 CFR §122.41(l)(7).

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, State Water Board, or USEPA, the Discharger shall promptly submit such facts or information, 40 CFR §122.41(l)(8).

VI. STANDARD PROVISIONS – ENFORCEMENT

The Regional Water Board is authorized to enforce the terms of this permit under several provisions of the Water Code, including, but not limited to, sections 13385, 13386, and 13387.

Additional Provisions – Notification Levels

A. Publicly-Owned Treatment Works (POTWs)

All POTWs shall provide adequate notice to the Regional Water Board of the following (40 CFR §122.42(b)):

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to sections 301 or 306 of the CWA if it were directly discharging those pollutants (40 CFR §122.42(b)(1)); and

2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of the Order. (40 CFR §122.42(b)(2).)

3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW. (40 CFR §122.42(b)(3).)

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

NPDES regulations at 40 CFR 122.48 require that all NPDES permits specify monitoring and reporting requirements. California Water Code (CWC) §13267 and §13383 authorize the Regional Water Quality Control Board (Regional Water Board) to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements, that implement the federal and California regulations.

I. GENERAL MONITORING PROVISIONS

A. The Discharger shall comply with the MRP and *Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits*, July 2009 (**Attachment G**). The MRP may be amended by the Executive Officer pursuant to USEPA regulations 40 CFR122.62, 122.63, and 124.5. If any discrepancies exist between the MRP and the Regional Standard Provisions, the MRP prevails.

B. Sampling is required during the entire year when discharging. All analyses shall be conducted using current USEPA methods, or methods that have been approved by the USEPA Regional Administrator pursuant to 40 CFR 136.4 and 136.5, or if 40 CFR 136 methods are not available, equivalent methods that are commercially and reasonably available. Analytical methods shall provide sufficient quantification of sampling parameters and constituents to evaluate compliance with applicable effluent limits and to perform reasonable potential analyses. Equivalent methods shall be more sensitive than those specified in 40 CFR 136, shall be specified in the permit, and shall be approved for use by the Executive Officer following consultation with the State Water Quality Control Board's Quality Assurance Program.

C. For compliance and reasonable potential monitoring, analyses shall be conducted using commercially available and reasonably achievable detection levels that are lower than applicable water quality objectives or criteria, or the effluent limitations, whichever are lower. The objective is to provide quantification of constituents sufficient to allow evaluation of observed concentrations with respect to the Minimum Levels (MLs).

MLs are the concentrations at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

As shown in Table II-3 of Ocean Plan Appendix II, the test method the Discharger may use for compliance with mercury effluent limitations and reasonable potential monitoring is Cold Vapor Atomic Absorbance with a ML of 0.2 µg/L.

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Table E-1. Monitoring Station Locations

Discharge Point Name	Monitoring Location Name	Monitoring Location Description
--	INF-001	Formerly Sampling Station A-003. At any point in the facility headworks at which all waste tributary to the system is present and preceding any phase of treatment, and exclusive of any return flows or process side streams that would significantly impact the quantity or quality of the influent.
001	EFF-001	Formerly Sampling Station E-007. At any point in the sewerage system following all phases of treatment and prior to contact with the receiving water or any effluent from the Westside Wet Weather Facilities.
CSD-001 through CSD-007	EFF-CSD	A representative monitoring location for the Westside Wet Weather Facilities, previously identified as a point prior to discharge from the Vicente Box, where all waste tributary to the diversion structure is present and treatment is complete.
---	SRF-15 east	Near shore receiving water along Baker Beach, in the surf east of SRF-15
---	SRF-15	Near shore receiving water along Baker Beach, in the surf at the terminus of Lobos Creek
---	SRF-16	Near shore receiving water along Baker Beach, in the surf opposite the Sea Cliff 2 Pump Station
---	SRF-17	Near shore receiving water in the surf along China Beach opposite the Sea Cliff 1 Pump Station
---	SRF-18	Near shore receiving water along Ocean Beach, in the surf at the foot of Balboa Street
---	SRF-19	Near shore receiving water along Ocean Beach, in the surf at the foot of Lincoln Way, opposite the Lincoln Overflow Discharge Structure
---	SRF-20	Near shore receiving water along Ocean Beach, in the surf at the foot of Pacheco Street
---	SRF-21	Near shore receiving water along Ocean Beach, in the surf at the foot of Vicente Street, opposite the Vicente Overflow Discharge Structure
---	SRF-21.1	Near shore receiving water along Ocean Beach, in the surf at the foot of Sloat Blvd
---	SRF-22	Near shore receiving water along Ocean Beach, in the surf at Fort Funston, opposite the Lake Merced Overflow Discharge Structure.

III. INFLUENT MONITORING REQUIREMENTS

The Discharger shall monitor Plant influent at Monitoring Location INF-001 in accordance with the following table.

Table E-2. Influent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Flow rate [1]	MGD	Continuous	Daily	Meter
$BOD^{(2)}_5$	mg/L	C-24	1/W	[3]
TSS[4]	mg/L	C-24	5/W	[3]
pH	Standard units	Grab	5/W	[3]

[1] For influent flows, the following shall be reported:

Daily: Total Daily Flow Volume (million gallons) plus total daily influent flow originating as effluent/decant from the Westside Transport

Monthly: Minimum, Average, and Maximum Daily Flow (MGD)

Monthly: Total Flow Volume (million gallons) plus total monthly influent flow originating as effluent/decant from the Westside Transport

[2] Biochemical Oxygen Demand

[3] Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136.

[4] Total Suspended Solids

IV. EFFLUENT MONITORING REQUIREMENTS

A. Monitoring Location EFF-001

The Discharger shall monitor effluent at Monitoring Location EFF-001 as follows.

Table E-3. Effluent Monitoring, Monitoring Location EFF-001

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Method
Flow rate [1]	MGD	Cont.	Daily	Meter
BOD_5	mg/L	C-24	1/W	[2]
TSS	mg/L	C-24	5/W	[2]
Grease and Oil [3]	mg/L	C-24	1/Q	[2]
Turbidity	NTU	C-24	1/Q	[2]
pH	Standard Units	Grab	5/W	[2]
Ammonia, total	mg/L N	C-24	1/Q	[2]
Chronic Toxicity [4]	TUc	C-24	1/Q	[2]
Mercury [5]	µg/L	C-24	1/M	[2]
TCDD Equivalents	µg/L	C-24	1/Y	[2]
Table B Inorganic Pollutants [6]	µg/L	C-24	1/Q	[2]
Remaining Table B Pollutants [7]	µg/L	C-24	1/Y	[2]

[1] For effluent flows, the following shall be reported:

Daily: Total Daily Flow Volume (million gallons)

Monthly: Minimum, Average, and Maximum Daily Flow (MGD)

Monthly: Total Flow Volume (million gallons)

(2) Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136. The methods shall meet the lowest minimum levels (MLs) specified in Ocean Plan Appendix II. Where no method is specified for a given pollutant, the method shall be approved by the Regional Water Board. For TCDD congeners, the Discharger shall use USEPA Method 1613 and the MLs shall be as given below. Estimated congener concentrations (below the ML) shall not be included when adding the congener concentrations to calculate TCDD equivalents.

Parameter	Minimum Level
2,3,7,8-TetraCDD	5 pg/L
1,2,3,7,8-PentaCDD	25 pg/L
1,2,3,4,7,8-HexaCDD	25 pg/L
1,2,3,6,7,8-HexaCDD	25 pg/L
1,2,3,7,8,9-HexaCDD	25 pg/L
1,2,3,4,6,7,8-HeptaCDD	25 pg/L
OctaCDD	50 pg/L
2,3,7,8-TetraCDF	5 pg/L
1,2,3,7,8-PentaCDF	25 pg/L
2,3,4,7,8-PentaCDF	25 pg/L
1,2,3,4,7,8-HexaCDF	25 pg/L
1,2,3,6,7,8-HexaCDF	25 pg/L
1,2,3,7,8,9-HexaCDF	25 pg/L
2,3,4,6,7,8-HexaCDF	25 pg/L
1,2,3,4,6,7,8-HeptaCDF	25 pg/L
1,2,3,4,7,8,9-HeptaCDF	25 pg/L
OctaCDF	50 pg/L

(3) Grease and oil samples shall consist of 3 grab samples taken at 8 hour intervals during the sample day, with each grab being collected in a glass container and analyzed separately. Results shall be expressed as a weighted average of the three results, based on the instantaneous flow rates at the time each sample was collected.

(4) Samples for whole effluent toxicity tests shall be collected coincident with routine composite effluent samples. Refer to Section V of this MRP for whole effluent toxicity testing requirements.

(5) The Discharger may, at its option, sample effluent mercury either as grab or as 24-hour composite samples.

(6) The Table B inorganic pollutants are those inorganic constituents listed in Ocean Plan Table B, excluding mercury.

(7) The remaining Table B pollutants are the pollutants listed in Ocean Plan Table B, excluding those pollutants with monitoring requirements established elsewhere in this table (i.e., inorganics, mercury, chronic toxicity, and radioactivity). Because effluent is not chlorinated, chlorine is also excluded.

B. Monitoring Locations EFF-CSD-0xx

1. During each CSOD occurrence, the Discharger shall monitor discharges at the appropriate Monitoring Location EFF-CSD-0xx in accordance with the following elements established by Table E-4. Monitoring is required only during discharge events, which may last for less than one hour or for more than one day. Composite sampling shall commence within one hour after a discharge begins or as soon as

reasonably practicable with due consideration for safety. and shall continue until the discharge stops; however, the compositing period shall not exceed 24 hours.

Table E-4. Effluent Monitoring, Monitoring Location EFF-CSD

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Method
Flow	MGD	Cont.	Continuous during discharge	Meter (1)
BOD_5	mg/L	C-X (2)	1/occurrence	(7)
Total Suspended Solids	mg/L	C-X (2)	1/occurrence	(7)
Ammonia	mg/L N	C-X (2)	1/occurrence	(7)
Grease and Oil	mg/L	C-X (2)	1/occurrence	(7)
pH	Std Units	C-X (2)	1/occurrence	(7)
Table B Inorganics (3)	µg/L	C-X (2)	1/occurrence	(7)
Pesticides and PCBs (4)	µg/L	C-X (2)	1/occurrence	(7)
PAHs (5)	µg/L	C-X (2)	1/occurrence	(7)
Remaining Table B Pollutants (6)	µg/L	C-X (2)	1/year	(7)

(1) Alternately, flow may be estimated using models.

(2) Composite sample of 1 grab sample per hour over X hours, where X = the duration of the discharge but not exceeding 24 hours

(3) The Table B inorganic pollutants are those inorganic constituents listed in Table B of the 2005 Ocean Plan - arsenic, cadmium, hexavalent chromium, copper, lead, mercury, nickel, selenium, silver, zinc, and cyanide.

(4) As identified in EPA Method 608,

(5) As identified by the Ocean Plan and by Attachment A of this Order (Definitions).

(6) The remaining Table B pollutants are those listed in Ocean Plan Table B, excluding those with monitoring requirements established elsewhere in this table, and radioactivity. These pollutants shall be monitored during a CSOD occurrence.

(7) Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136.

2. The Discharger shall record the following information for each combined sewer overflow discharge event from discharge points CSD-001, CSD-002, CSD-003, CSD-005, and CSD-007.

a. Date and time that CSOD started;

b. Frequency, duration, and volume of CSOD;

c. Rainfall intensity and amount (hourly data, aggregated);

d. Data to support discharge volume estimate (if estimated); and

e. Documentation of conformance with the Operation Plan for wet weather facilities.

V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS

A. Chronic Toxicity Monitoring Requirements

1. *Sampling.* The Discharger shall collect 24-hour composite samples of the effluent for critical life stage toxicity testing as indicated below. For toxicity tests requiring renewals, 24-hour composite samples collected on consecutive days are required.

2. *Test Species.* The Discharger shall utilize the echinoderm embryo development test, with either the sand dollar (*Dendraster excentricus*) or the purple sea urchin (*Strongylocentrotus purpuratus*), such that the test species used is in gravid condition. The Discharger is required to re-screen for the most sensitive species once during the term of this permit and shall submit the chronic toxicity screening report to the Regional Water Board no later than 180 days prior to the Order expiration date with the application for permit reissuance.

3. *Methodology.* Sample collection, handling and preservation shall be in accordance with USEPA protocols. In addition, bioassays shall be conducted in compliance with the most recently promulgated test methods, as shown in **Appendix E-2**. These are "Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms," currently EPA/600/R-95/136, August 1995. Any methodology exceptions must be granted by the Executive Officer and the Environmental Laboratory Accreditation Program (ELAP).

4. *Dilution Series*. The Discharger shall conduct tests at the in-stream waste concentration (IWC), four concentrations bracketing the IWC, and a control.

B. Chronic Toxicity Reporting Requirements

1. Routine Reporting. Toxicity test results for the current reporting period shall include, at a minimum, for each test:

   (i) Sample date(s)

   (ii) Test initiation date

   (iii) Test species

   (iv) End point values for each dilution (e.g., number of young, growth rate, percent survival)

   (v) NOEC value(s) in percent effluent

   (vi) IC15, IC25, IC40, and IC50 values (or EC15, EC25 ... etc.) as percent effluent

   (vii) TUc values (100/NOEC)

(viii) Mean percent mortality (±s.d.) after 96 hours in 100% effluent (if applicable)

(ix) NOEC and LOEC values for reference toxicant test(s)

(x) IC50 or EC50 value(s) for reference toxicant test(s)

(xi) Available water quality measurements for each test (pH, D.O., temperature, conductivity, hardness, salinity, ammonia)

2. Compliance Summary. The results of the chronic toxicity testing shall be provided in the self-monitoring report and shall include a summary table of chronic toxicity data from at least eleven of the most recent samples. The information in the table shall include items listed above under 1 specifically item numbers (i), (iii), (v), (vi) (IC25 or EC25) and (vii).

C. Quality Assurance

1. Concurrent testing with reference toxicants shall be conducted.

2. If either the reference toxicant test or effluent test does not meet all test acceptability criteria as specified in the test method manual, then the Discharger must re-sample and re-test at the earliest time possible.

3. Control and dilution water should be obtained from an unaffected area of the receiving water. If the dilution water used is different from the culture water, a second control using culture water should be used. If it is not practicable to collect samples from the unaffected area of the receiving water then a laboratory prepared control and dilution water should be used.

4. If the effluent sample is significantly different from the control sample, and the minimum significant difference (% MSD) is less than 5%, the Discharger at its option may exclude this result and re-test. If control sample variability in the effluent test exceeds the upper limit of 20% MSD which is the same as the reference toxicant, the Discharger shall re-sample and re-test as soon as possible.

D. Toxicity Reduction Evaluation (TRE)

If monitoring shows a violation of the chronic toxicity effluent limitation, the Discharger shall conduct a TRE and take all reasonable steps to reduce toxicity once the source of toxicity is identified. The Discharger shall initiate a TRE in accordance with the following:

1. ,To be ready to respond to a toxicity event the Discharger shall prepare a generic TRE work plan within 90 days of the effective date of this Order and update it as necessary.

2. Within 60 days of exceeding the effluent limitation for chronic toxicity, the Discharger shall submit to USEPA a TRE work plan that should be the generic work plan revised for this toxicity event after considering discharge data.

3. Within 30 days of the date of completion of the accelerated monitoring tests observed to exceed the effluent limitation, the Discharger shall initiate a TRE in accordance with a TRE work plan that incorporates any and all comments from USEPA. Accelerated monitoring can be achieved by the Discharger conducting six additional toxicity tests using the same species and test method, approximately every two weeks, over a 12 week period. This testing shall begin within 145 days of receipt of test results exceeding the toxicity effluent limit. If none of the additional tests exceed the toxicity limitation, then the Discharger may return to the regular testing frequency.

4. The TRE shall be specific to the discharge and be prepared in accordance with current technical guidance and reference materials, including USEPA guidance materials. The TRE shall be conducted as a tiered evaluation process as summarized below:

a. Tier 1 consists of basic data collection (routine and accelerated monitoring).

b. Tier 2 consists of evaluation of optimization of the treatment process, including operation practices and in-plant process chemicals.

c. Tier 3 consists of a toxicity identification evaluation (TIE).

d. Tier 4 consists of evaluation of options for additional wastewater treatment processes.

e. Tier 5 consists of evaluation of options for modifications of in-plant treatment processes.

f. Tier 6 consists of implementation of selected toxicity control measures, and follow- up monitoring and confirmation of implementation success.

5. The TRE may be ended at any stage if monitoring finds there is no longer consistent toxicity (complying with requirements of Section VI.C.2.a of this Order).

6. The objective of a TIE shall be to identify the substance or combination of substances causing the observed toxicity. All reasonable efforts using currently available TIE methodologies shall be employed.

7. As toxic substances are identified or characterized, the Discharger shall continue the TRE by determining the sources and evaluating alternative strategies for reducing or eliminating the substances from the discharge. All reasonable steps shall be taken to reduce toxicity to levels consistent with the toxicity effluent limitations.

8. Many recommended TRE elements parallel required or recommended efforts of source control, pollution prevention, and stormwater control programs. TRE efforts

should be coordinated with such efforts. To prevent duplication of efforts, evidence of complying with requirements or recommended efforts of such programs may be acceptable to comply with TRE requirements.

9. Chronic toxicity may be episodic and identification of causes of, and reduction of sources of, toxicity may not be successful in all cases. Enforcement action will be based in part on the Discharger's responses and efforts to identify and control or reduce sources of consistent toxicity.

VI. LAND DISCHARGE MONITORING REQUIREMENTS

Not Applicable.

VII. RECLAMATION MONITORING REQUIREMENTS

Not Applicable.

VIII. RECEIVING WATER MONITORING REQUIREMENTS

The Discharger shall conduct routine shoreline monitoring for bacteria at six monitoring locations from Baker Beach along the San Francisco County shoreline perimeter to Sloat Blvd. on Ocean Beach one day per week in accordance with the schedule established in Table E-5, below.

During CSOD events, the Discharger shall post the beach in the vicinity of the CSOD event and shall conduct shoreline monitoring for bacteria at monitoring locations in the vicinity of the CSOD event from Baker Beach along the San Francisco County shoreline perimeter to Fort Funston on Ocean Beach in accordance with the schedule established in Table E-5, below.

During CSOD events, shoreline monitoring shall be initiated as soon as reasonable, with due consideration for safety. (Darkness, tidal conditions and storm related wave activity may prevent samples from safely being collected immediately after initiation of a CSOD event.) Shoreline monitoring shall be conducted at those locations in closest proximity to the CSOD. Daily shoreline monitoring during and following CSOD events and beach posting shall continue until bacteria concentrations in the receiving water at those locations fall below single sample maximum limits.

Table E-5. Receiving Water Surf Monitoring Requirements

Routine Monitoring					
Monitoring Locations	**Bacteria Type**	**Units**	**Minimum Monitoring Frequency**	**Sample Type**	**Analytical Method**
SRF-15 east SRF-15 SRF-17 SRF-18 SRF-19 SRF-21.1	Total Coliform *E. coli* Enterococcus	MPN/100 mLs	Once / week (1)	Grab	Quanti-Tray Method - Colilert 18™ Medium (total coliform and *E. coli*), Enterolert™ Medium (enterococcus)
CSOD Event Monitoring(1)					
SRF-15 east SRF-15 SRF-16 SRF-17 SRF-18 SRF-19 SRF-20 SRF-21 SRF-21.1 SRF-22	Total Coliform *E. coli* Enterococcus	MPN/100 mLs	Daily	Grab	Quanti-Tray Method - Colilert 18™ Medium (total coliform and *E. coli*), Enterolert™ Medium (enterococcus)

(1) Monitoring is only required at those locations in the vicinity of the CSOD.

IX. PRETREATMENT AND BIOSOLIDS MONITORING REQUIREMENTS

The Discharger shall comply with the pretreatment requirements specified in Table E-2 for influent (at Monitoring Location INF-001), effluent (at Monitoring Location EFF-001), and biosolids monitoring.

Table E-6. Pretreatment and Biosolids Monitoring Requirements

Constituents	**Influent INF-001**	**Effluent(3) EFF-001**	**Biosolids(4)**	**Sample Type**	
				INF-001 & EFF-001	**Biosolids(d)**
VOC	1/quarter	1/quarter	2/year	multiple grabs(5a)	grabs
BNA	1/quarter	1/quarter	2/year	multiple grabs(5a)	grabs
Metals(1)	1/month	1/month	2/year	24-hour composite(5b)	grabs
Hexavalent Chromium(2)	1/month	1/month	2/year	multiple grabs(5a)	grabs
Mercury	1/month	1/month	2/year	24-hour composite(5b,5c)	grabs
Cyanide	1/month	1/month	2/year	multiple grabs(5a)	grabs

Legends

VOC	= volatile organic compounds
BNA	= base/neutrals and acids extractable organic compounds
1/month	= once per month
1/quarter	= once per quarter
2/year	= twice per year

Footnotes:

(1) The parameters are arsenic, cadmium, copper, lead, nickel, silver, zinc, and selenium.

(2) The Discharger may elect to run total chromium instead of hexavalent chromium. Sample collection for total chromium measurements may also use 24-hour composite sampling.
(3) Effluent monitoring conducted in accordance with Table E-3 can be used to satisfy these pretreatment monitoring requirements.
(4) Since the Discharger operates its solar drying operations only during the dry season, the biosolids monitoring frequency is once per year during those times when it does not stockpile biosolids (i.e., the dry season). However, if and when the Discharger stockpiles biosolids (e.g., during wet weather), it shall report biosolids monitoring results for the stockpile during the wet season monitoring as well (i.e., twice per year).
(5) Sample types:
   a. Multiple grabs samples for VOC, BNA, hexavalent chromium, and cyanide, must be made up of a minimum of four (4) discrete grab samples, collected equally spaced over the course of a 24-hour period, with each grab analyzed separately and the results mathematically flow-weighted or with grab samples combined (volumetrically flow-weighted) prior to analysis.
   b. 24-hour composite sample may be made up discrete grab samples and may be combined (volumetrically flow-weighted) prior to analysis, or they should be mathematically flow-weighted. If automatic compositor is used, 24-hour composite samples must be obtained through flow-proportioned composite sampling.
   c. Automatic compositors are allowed for mercury if either 1) the compositing equipment (hoses and containers) comply with ultra-clean specifications, or 2) appropriate equipment blank samples demonstrate that the compositing equipment has not contaminated the sample. This direction is consistent with the Regional Water Board's October 22, 1999, letter on this subject.
   d. Biosolids collection should comply with those requirements specified in Attachment H, Appendix H-3 of this Order for sludge monitoring. The biosolids analyzed shall be a composite sample of the biosolids for final disposal. The Discharger shall also comply with biosolids monitoring requirements required by 40 CFR 503.

X. OTHER MONITORING REQUIREMENTS

1. **Off-Shore Monitoring Areas**. The Discharger shall continue to monitor the area outside San Francisco Bay between Rocky Point in Marin County and Point San Pedro in San Mateo County to identify any environmental effects of the discharge on receiving waters, sediment, or aquatic life.

2. **Frequency of Sampling**. The Discharger shall continue the Ocean Outfall Offshore Monitoring Program, sampling annually in the fall, when sediments are least disturbed.

3. **Specific Monitoring Points**. Monitoring locations are identified in Table E-6, below. (The Discharger selected locations using the USEPA's EMAP grid system, with 15 fixed locations and 36 random locations.)

Table E-7. Ocean Outfall Offshore Monitoring Locations

EMAP Station Number	Southwest Ocean Outfall (SWOO) Station Number	Latitude	Longitude
Fixed Locations			
1	---	37º 42' 12.00''	-122º 34' 31.20''
2	---	37º 42' 37.80''	-122º 34' 30.00''
4	---	37º 42' 42.00''	-122º 35' 42.00''
6	---	37º 40' 00.00''	-122º 32' 15.00''

25	---	37º 42’ 13.80’’	-122º 34’ 30.00’’
28	---	37º 41’ 54.00’’	-122º 34’ 28.80’’
31	---	37º 43’ 28.80’’	-122º 34’ 01.80’’
Random Locations			
R1	32	37º 52’ 04.77’’	-122º 38’ 28.60’’
R2	33	37º 51’ 06.14’’	-122º 36’ 00.87’’
R3	34	37º 51’ 04.65’’	-122º 38’ 50.77’’

R26	57	37º 42’ 33.84’’	-122º 31’ 08.82’’
R27	58	37º 42’ 15.49’’	-122º 34’ 55.24’’
R28	59	37º 41’ 35.66’’	-122º 32’ 11.82’’
R29	60	37º 41’ 20.89’’	-122º 36’ 06.47’’
R30	61	37º 40’ 55.35’’	-122º 33’ 29.05’’
R31	62	37º 40’ 56.18’’	-122º 37’ 43.15’’
R32	63	37º 39’ 31.65’’	-122º 33’ 41.41’’
R33	64	37º 39’ 14.63’’	-122º 32’ 04.75’’
R34	65	37º 38’ 02.91’’	-122º 32’ 27.99’’
R35	66	37º 37’ 42.23’’	-122º 36’ 40.08’’
R36	67	37º 37’ 34.73’’	-122º 33’ 53.51’’
R37	68	37º 37’ 00.97’’	-122º 36’ 55.75’’
R38	69	37º 36’ 52.15’’	-122º 35’ 28.81’’
R39	70	37º 36’ 32.16’’	-122º 32’ 01.35’’
R40	71	37º 36’ 16.73’’	-122º 33’ 03.03’’

4. **Sediment Sampling**. The Discharger shall collect benthic samples from seven historical fixed locations (1, 2, 4, 6, 25, 28, 31) to maintain time series data, and 30 out of the 36 random locations (R1- R9, R12, R16 – R17, R19 – R40), for a total of 45 samples. Samples shall be collected using a 0.1 m^2 Smith McIntyre grab sampler. Two grabs shall be collected at each station and the top 5 centimeters of sediment shall be composited from each grab prior to analysis. Analysis of the sediment samples shall include:

    - Total volatile solids
    - Total organic carbon
    - Kjeldahl nitrogen
    - Grain size
    - Inorganic toxic pollutants [Al, As, Cd, Cr, Cr(VI), Cu, Fe, Pb, Mn, Hg, Ni, Se, Ag, Zn] [The Discharger may elect to report total chromium in lieu of chromium (VI).].
    - DDT, PCBs, and PAHs

5. **Infaunal Sampling**. One benthic grab sample collected from each of the above locations shall be analyzed for infaunal organisms. This sample shall be passed through a 1.0 mm and a 0.5 mm sieve. Organisms retained on each sieve shall be relaxed and preserved for later enumeration and taxonomic determination to the lowest taxon.

6. **Trawls***.* The Discharger shall conducts trawls once per year in the fall to assess the presence or absence of demersal fish and epibenthic invertebrates in the vicinity of the ocean outfall, and to determine any bioaccumulation of priority pollutants in these organisms.

    A fish community analysis shall be conducted at a minimum of one of four fixed sampling locations (SWOO 1, 2, 25, or 28) and at one reference location outside of the influence of the discharge. Fish and invertebrates shall be collected, identified to the lowest identifiable taxon, and enumerated. The following information shall be recorded.

    - Fish
        - Abnormalities and disease symptoms, such as fin erosion, lesions, or tumors
        - Standard length of all fish specimens; disk width for skates and rays

    - Invertebrates
        - Carapace length and identification of unsexed or gravid females of shrimp
        - Carapace width and sex of crabs

    Tissue samples to assess the bioaccumulation of pollutants shall be composite samples collected at one of four fixed sampling locations (SWOO 1, 2, 25, 28) and at one or more reference locations outside of the influence of the discharge. Three composite samples shall be collected of one fish species and one macroinvertebrate species at each location. Each composite sample shall consist of ten or more organisms of each species, with the preferred species being English sole (*Pleuronectes vetulus)* and dungeness crab (*Cancer magister).* Muscle and liver/hepatopancreas tissues shall be

analyzed for inorganic pollutants (As, Cd, Cr, Cu, Pb, Hg, Se, Ag, and Zn), and DDT, PCBs, and PAHs.

7. **Adaptive Management**. The Discharger shall confer with USEPA and the Regional Water Board regarding any proposed changes to the monitoring program in response to ongoing analyses of monitoring data to maximize the amount of relevant and useful data that can be collected within the five year permit term.

8. **Reporting**. All offshore monitoring data shall be reported to USEPA and the Regional Water Board in an Annual Report submitted by August 30 of the year following sampling to allow for time to make modifications, if necessary, for the following sampling event. The report shall include raw data tables and summaries for each monitoring component. A comprehensive cumulative summary report shall be submitted with the next application for permit reissuance.

XI. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

The Discharger shall comply with all Standard Provisions (Attachment D) and Regional Standard Provisions, and Monitoring Requirements (Attachment G) related to monitoring, reporting, and recordkeeping.

B. Self Monitoring Reports (SMRs)

1. At any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit Self-Monitoring Reports (SMRs) using the State Water Board's California Integrated Water Quality System (CIWQS) Program Web site (http://www.waterboards.ca.gov/ciwqs/index.html) or to any other Internet web site specified by the Regional Water Board or USEPA. Until such notification is given, the Discharger shall submit paper copy SMRs. The CIWQS Web site will provide additional directions for SMR submittal in the event there will be service interruption for electronic submittal.

2. The Discharger shall submit monthly SMRs including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this Order for each calendar month. Monthly SMRs shall be due on the 30th day following the end of each calendar month, covering samples collected during that calendar month; Annual Reports shall be due on February 1 following each calendar year.

3. The Discharger shall comply with the following schedule of monitoring periods and reporting.

Table E-8. Monitoring Periods

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
Continuous	Day after permit effective date	All
Cont./D	Day after permit effective date	All
Daily	Day after permit effective date	(Midnight through 11:59 PM) or any 24-hour period that reasonably represents a calendar day for purposes of sampling.
Weekly	Sunday following permit effective date or on permit effective date if on a Sunday	Sunday through Saturday
5/Week	Sunday following permit effective date or on permit effective date if on a Sunday	Sunday through Saturday
Monthly	First day of calendar month following permit effective date or on permit effective date if that date is first day of the month	1st day of calendar month through last day of calendar month
2/Month	First day of calendar month following permit effective date or on permit effective date if that date is first date of the month	1st day of calendar month through last day of calendar month
Quarterly	Closest of January 1, April 1, July 1, or October 1 following (or on) permit effective date	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31
Annually	January 1 following (or on) permit effective date	January 1 through December 31. July 1 through June 30 for shoreline CSD and other rainfall initiated data.
<X> / Discharge Event	As soon as possible after discharge begins	For the duration of the discharge event

4. The Discharger shall report with each sample result the applicable reported Minimum Level (ML) and the current Method Detection Limit (MDL) as determined by the procedure in Part 136.

The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

a. Sample results greater than or equal to the reported ML shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

b. Sample results less than the ML, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported.

For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ as well as the words "Estimated

Concentration" (which may be shortened to "Est. Conc."). The laboratory may, if such information is available, include numeric estimates of the data quality for the reported result. Numeric estimates of data quality may be percent accuracy (± a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.

c. Sample results less than the laboratory's MDL shall be reported as "Not Detected" or ND.

d. Dischargers are to instruct laboratories to establish calibration standards so that the ML (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve except in reporting estimated sample results less than the RL, but greater than or equal to the laboratory MDL as stated in 4.b. above.

5. The Discharger shall comply with effluent limitations for reportable pollutants determined using sample reporting protocols defined above and in Attachment A of this Order. For purposes of reporting and administrative enforcement, the Discharger shall be deemed out of compliance with single-sample effluent limitations if the concentration of the reportable pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the ML. For averaged or median-based effluent limitations, the Discharger shall be deemed out of compliance if the average or median concentration in the data set is greater than the effluent limitation

6. The Discharger shall submit SMRs in accordance with the following requirements:

a. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations. The Discharger is not required to duplicate the submittal of data that is entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format within the system, the Discharger shall electronically submit the data in a tabular format as an attachment.

b. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of this Order; corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations shall include the requirement violated and a description of the violation.

c. If the Discharger wishes to invalidate any measurement, the letter of transmittal shall include identification of the measurement suspected to be invalid and notification of intent to submit a formal request to invalidate the measurement , within 60 days. This request shall include the original measurement in question, the reason for invalidating the measurement, all relevant documentation that supports the invalidation (e.g., laboratory sheet, log entry, test results etc.), and discussion of the corrective actions taken or planned (with time schedule for

completion) to prevent recurrence of the sampling or measurement problem. The invalidation of a measurement by USEPA or Regional Water Board staff will be based solely on the documentation submitted at that time.

d. SMRs must be submitted to the Regional Water Board, signed and certified as required by the Standard Provisions (Attachment D), to the address listed below:

Executive Officer
California Regional Water Quality Control Board
San Francisco Region
1515 Clay Street, Suite 1400
Oakland, CA 94612
ATTN: NPDES Wastewater Division

C. Discharge Monitoring Reports (DMRs)

1. As described in Section X.B.1 above, at any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit SMRs that will satisfy federal requirements for submittal of DMRs. Until such notification is given, the Discharger shall submit DMRs in accordance with the requirements described below.

2. DMRs must be signed and certified as required by the standard provisions (Attachment D). The Discharger shall submit the original DMR and one copy of the DMR to the address listed below:

STANDARD MAIL	FEDEX/UPS/ OTHER PRIVATE CARRIERS
State Water Resources Control Board Division of Water Quality c/o DMR Processing Center PO Box 100 Sacramento, CA 95812-1000	State Water Resources Control Board Division of Water Quality c/o DMR Processing Center 1001 I Street, 15th Floor Sacramento, CA 95814

3. All discharge monitoring results must be reported on the official USEPA pre-printed DMR forms (EPA Form 3320-1). Forms that are self-generated will not be accepted unless they follow the exact same format of EPA Form 3320-1.

APPENDIX E-1
CHRONIC TOXICITY
DEFINITION OF TERMS AND SCREENING PHASE REQUIREMENTS

I. Definition of Terms

A. No observed effect level (NOEL) for compliance determination is equal to IC_{25} or EC_{25}. If the IC_{25} or EC_{25} cannot be statistically determined, the NOEL shall be equal to the NOEC derived using hypothesis testing.

B. Effective concentration (EC) is a point estimate of the toxicant concentration that would cause an adverse effect on a quantal, "all or nothing," response (such as death, immobilization, or serious incapacitation) in a given percent of the test organisms. If the effect is death or immobility, the term lethal concentration (LC) may be used. EC values may be calculated using point estimation techniques such as probit, logit, and Spearman-Karber. EC_{25} is the concentration of toxicant (in percent effluent) that causes a response in 25 percent of the test organisms.

C. Inhibition concentration (IC) is a point estimate of the toxicant concentration that would cause a given percent reduction in a nonlethal, nonquantal biological measurement, such as growth. For example, an IC_{25} is the estimated concentration of toxicant that would cause a 25 percent reduction in average young per female or growth. IC values may be calculated using a linear interpolation method such as USEPA's Bootstrap Procedure.

D. No observed effect concentration (NOEC) is the highest tested concentration of an effluent or a toxicant at which no adverse effects are observed on the aquatic test organisms at a specific time of observation. It is determined using hypothesis testing.

II. Chronic Toxicity Screening Phase Requirements

A. The Discharger shall perform screening phase monitoring:

1. Subsequent to any significant change in the nature of the effluent discharged through changes in sources or treatment, except those changes resulting from reductions in pollutant concentrations attributable to source control efforts, and at least once during the Order term.

2. Screening phase monitoring data shall be included in the NPDES permit application for reissuance. The information shall be as recent as possible, but may be based on screening phase monitoring conducted within 5 years before the permit expiration date.

B. Design of the screening phase shall, at a minimum, consist of the following elements:

1. Use of test species specified in **Appendix E-2**, attached, and use of the protocols referenced in those tables, or as approved by the Executive Officer.

2. Two stages:

a. Stage 1 shall consist of a minimum of one battery of tests conducted concurrently. Selection of the type of test species and minimum number of tests shall be based on **Appendix E-2** (attached).

b. Stage 2 shall consist of a minimum of two test batteries conducted at a monthly frequency using the three most sensitive species based on the Stage 1 test results and as approved by the Executive Officer.

3. Appropriate controls.

4. Concurrent reference toxicant tests.

5. Dilution series should include the IWC, and four concentrations that bracket the IWC, or other concentrations approved by the Executive Officer.

C. The Discharger shall submit a screening phase proposal acceptable to the Regional Water Board. The proposal shall address each of the elements listed above. If within 30 days neither USEPA nor the Regional Water Board staff comments, the Discharger shall commence with screening phase monitoring.

APPENDIX E-2
SUMMARY OF TOXICITY TEST SPECIES REQUIREMENTS
Critical Life Stage Toxicity Tests for Marine and Estuarine Waters

Species	(Scientific Name)	Effect	Test Duration	Reference
Alga	*(Skeletonema costatum)* *(Thalassiosira pseudonana)*	Growth rate	4 days	1
Red alga	*(Champia parvula)*	Number of cystocarps	7–9 days	3
Giant kelp	*(Macrocystis pyrifera)*	Percent germination; germ tube length	48 hours	2
Abalone	*(Haliotis rufescens)*	Abnormal shell development	48 hours	2
Oyster Mussel	*(Crassostrea gigas)* *(Mytilus edulis)*	Abnormal shell development; percent survival	48 hours	2
Echinoderms - Urchins Sand dollar	*(Strongylocentrotus purpuratus, S. franciscanus)* *(Dendraster excentricus)*	Percent fertilization Development test	1 hour 72 hours	2
Shrimp	*(Mysidopsis bahia)*	Percent survival; growth	7 days	3
Shrimp	*(Holmesimysis costata)*	Percent survival; growth	7 days	2
Topsmelt	*(Atherinops affinis)*	Percent survival; growth	7 days	2
Silversides	*(Menidia beryllina)*	Larval growth rate; percent survival	7 days	3

Toxicity Test Requirements for Stage One Screening Phase

Requirements	Receiving Water Characteristics		
	Discharges to Coast	Discharges to San Francisco Bay[2]	
	Ocean	Marine/Estuarine	Freshwater
Taxonomic diversity	1 plant 1 invertebrate 1 fish	1 plant 1 invertebrate 1 fish	1 plant 1 invertebrate 1 fish
Number of tests of each salinity type: Freshwater[1] Marine/Estuarine	0 4	1 or 2 3 or 4	3 0
Total number of tests	4	5	3

[1] The freshwater species may be substituted with marine species if:

(a) The salinity of the effluent is above 1 part per thousand (ppt) greater than 95 percent of the time, or

(b) The ionic strength (TDS or conductivity) of the effluent at the test concentration used to determine compliance is documented to be toxic to the test species.

[2] (a) Marine/Estuarine refers to receiving water salinities greater than 1 ppt at least 95 percent of the time during a normal water year.

(b) Fresh refers to receiving water with salinities less than 1 ppt at least 95 percent of the time during a normal water year.

ATTACHMENT F – FACT SHEET

As described in section II of this Order, this Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order.

This Order has been prepared under a standardized format to accommodate a broad range of discharge requirements for dischargers in California. Only those sections or subsections of this Order that are specifically identified as "not applicable" have been determined to not apply to this discharger. Sections or subsections of this Order not specifically identified as "not applicable" are fully applicable to this discharger.

I. PERMIT INFORMATION

The following table summarizes administrative information related to the facility.

Table F-1. Facility Information

WDID	2 386009001
Discharger	City and County of San Francisco
Name of Facility	Oceanside Water Pollution Control Plant, and Collection System including the Westside Wet Weather Facilities
Facility Address	3500 Great Highway
	San Francisco, CA 94132
	San Francisco County
Facility Contact, Title and Phone	Tommy Moala, Assistant General Manager, Wastewater Enterprise (415) 554-2465
Authorized Person to Sign and Submit Reports	Arleen Navarret, Regulatory Manager, (415) 934-5731
Mailing Address	San Francisco Public Utilities Commission/Wastewater Enterprise 1155 Market St., 11th Floor, San Francisco CA 94103
Billing Address	Same as above
CIWQS Place ID	256498
CIWQS Party ID	39680
Billing Address	Same as above
Type of Facility	Publicly Owned Treatment Works
Major or Minor Facility	Major
Threat to Water Quality	2
Complexity	A
Pretreatment Program	Y
Receiving water	Pacific Ocean
Receiving Water Type	Main discharge starting at about 3.4 nautical miles from shore, CSO discharges at shoreline
Reclamation Requirements	NA
Facility Permitted Flow	43 million gallons per day (MGD), average dry weather
Facility Design Flow	Oceanside Plant 43 MGD, average dry weather design flow (providing secondary treatment) 65 MGD maximum wet weather design flow (providing secondary treatment for 43 MGD, and primary treatment for an additional 22 MGD)

	Westside Wet Weather Facilities Collection system flows greater than 65 MGD and less than 175 MGD receive the equivalent of wet weather primary treatment in the Westside Wet Weather Facilities (storage/transports) and are discharged at the Southwest Ocean Outfall. Flows greater than 175 MGD receive the equivalent of wet weather primary treatment in the Westside Wet Weather Facilities and are discharged at authorized combined sewer overflow discharge (CSOD) points.
Watershed	San Mateo Coastal
Receiving Water	Pacific Ocean
Receiving Water Type	Ocean waters

A. The City and County of San Francisco (hereinafter the Discharger) is the owner and operator of the Oceanside Water Pollution Control Plant (Plant) and Westside Wet Weather Facilities, a publicly owned treatments works (POTW). For the purposes of this Order, references to the "discharger" or "permittee" in applicable federal and State laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

B. The facility discharges wastewater to the Pacific Ocean, waters of the United States, and is currently regulated by Order No. R2-2003-0073, which was adopted on August 20, 2003, expiring on September 30, 2008.

C. On March 28, 2008, the Discharger filed a report of waste discharge and submitted an application for renewal of its Waste Discharge Requirements (WDRs) and National Pollutant Discharge Elimination System (NPDES) permit.

II. FACILITY DESCRIPTION

A. Description of Wastewater and Biosolids Treatment or Controls

The Discharger is the owner and operator of the Oceanside Plant and its associated collection system, a combined sewer system that includes the Westside Wet Weather Facilities. The collection system includes approximately 300 miles of sewer pipes on the west side watershed of the city that covers the areas of Richmond, Sunset, and Lake Merced as well as a small portion of Daly City. The system also includes four all weather pump stations, Seacliff #1, Seacliff #2, Pine Lake and Westside and two wet weather pump stations, Seacliff #3 and the Zoo Wet-Weather Lift Station. There are no satellite systems.

Treatment at the Oceanside Plant, which has a peak secondary treatment capacity of 43 MGD, includes coarse screening at the Westside Pump Station, fine screening and grit removal at the Plant headworks, primary sedimentation, activated sludge treatment by a pure oxygen process, and secondary clarification. Secondary treated wastewater is discharged to the Pacific Ocean, 3.4 to 3.6 nautical miles offshore, at Discharge Point 001 - the Southwest Ocean Outfall. These receiving waters are waters of the United States but are beyond the territorial waters of the State of California. During wet weather periods of high influent flow, the Oceanside Plant can provide primary treatment for an additional 22 MGD of influent flow, which, following treatment, is

blended with secondary treated wastewater (i.e., a total treatment capacity of 65 MGD) and discharged at Discharge Point 001.

The Discharger's collection system includes three large storage/transport structures – the Westside Transport, a 49.3 million gallon box-like structure located beneath the Great Highway; the Richmond Transport, a 12 million gallon structure located to the north; and the Lake Merced Transport, a 10 million gallon structure located to the south. The combined storage capacity of these "Westside Wet Weather Facilities" is 73.5 million gallons, which includes 2.2 million gallons of capacity within the sewer lines.

Collection system flows that exceed the Oceanside Plant's treatment capacity of 65 MGD, are stored in the Westside Wet Weather Facilities, which provide the equivalent of wet weather primary treatment through solids settling, skimming of floatable solids, and screening at pump stations. Combined wastewater from the storage/transport structures is pumped via the Westside Pump Station to Discharge Point 001, until the pumping capacity of the combined sewer system facilities to the outfall is reached at 175 MGD. Combined wastewater flows greater than 175 MGD also receive (the equivalent of wet weather primary treatment) treatment in the storage/transport structures but are discharged at the seven, near-shore combined sewer overflow discharge structures, authorized by this Order. These receiving waters are waters of the United States and territorial waters of the State of California. To be considered a discrete combined sewer overflow discharge event, the combined sewer overflow discharge must be separated by six hours in time from any other combined sewer overflow discharge. For the purposes of this permit, authorized treated combined sewer overflow discharges from the near-shore overflow discharge structures are referred to as combined sewer overflow discharges (CSODs). Unauthorized untreated combined sewer overflows from combined sewer systems are referred to as combined sewer overflows (CSOs).

Wastewater solids removed by settling in the Westside Wet Weather Facilities are flushed to the Plant when wet weather flows subside. Primary and secondary solids from the Plant are blended and thickened using gravity belt thickeners, anaerobically digested, dewatered, and beneficially re-used at permitted sites.

Attachment B provides a map of the area around the Plant. Attachment C provides a flow schematic of the Plant.

Based on 70 years of historical rainfall records, the Westside Wet Weather Facilities were designed to achieve a long term average of eight discrete CSOD events per year. State Water Board Order No. WQ 79-16 defines a discrete combined sewer overflow discharge event as one separated from any other combined sewer overflow discharge by at least six hours. CSOD information for the period of January 2007 through December 2007 is summarized in Table F- 2, below.

Table F-2. CSOD Summary 2007

Overflow Discharge Point	CSD-001	CSD-002	CSD-003	CSD-004	CSD-005	CSD-006	CSD-007
CSOD Structure Name	Lake Merced	Vicente St.	Lincoln Way	Mile Rock	Sea Cliff 1	Sea Cliff Sewer	Sea Cliff 2
Days with Rainfall	63	63	63	63	63	63	63
Discharge Events	2	2	2	NA	0	NA	1
Average Duration (hours)	1.64	1.71	2.19	NA	NA	NA	1.1
Average Volume/Event (million gallons.)	5.98	5.83	6.17	NA	NA	NA	7.11

B. Discharge Points and Receiving Waters

The locations of the discharge points and their receiving waters are listed in Table F-3, below.

Table F-3. Outfall Locations

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water
001	Secondary Treated Wastewater, Combined Primary and Secondary Treated Wastewater and Stormwater, and the equivalent of wet weather primary treated combined Wastewater and Stormwater decant flow from a combined sewer system.	37 º 42’ 18” N	122 º 34’ 39” W	Pacific Ocean
CSD-001	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 42’ 55” N	122 º 30’ 16” W	Pacific Ocean (Fort Funston, Ocean Beach)
CSD-002	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 44’ 16” N	122 º 30’ 29” W	Pacific Ocean (Vicente St., Ocean Beach)
CSD-003	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 45’ 50” N	122 º 30’ 42” W	Pacific Ocean (Lincoln Way, Ocean Beach)
CSD-004	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 47’ 5” N	122 º 30’ 37” W	Pacific Ocean (Mile Rock)

CSD-005	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 47' 16" N	122 º 29' 30" W	Pacific Ocean (China Beach)
CSD-006	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 47' 22" N	122 º 29' 16" W	Pacific Ocean (Baker Beach)
CSD-007	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 47' 22" N	122 º 29' 13" W	Pacific Ocean (Baker Beach)

Discharge Point 001 is located beginning about 3.4 nautical miles offshore, beyond the three nautical mile limit of the State's territorial waters. CSOD outfalls are located in the nearshore waters of the San Mateo Coastal Watershed.

C. Summary of Existing Requirements and Self-Monitoring Report (SMR) Data

1. Effluent limitations contained in the existing Order for discharges from Discharge Point 001 (formerly Discharge Point 007) and representative monitoring data for Monitoring Location EFF-001 (formerly E-007) from the term of the previous permit are as follows:

Table F-4. Historic Effluent Limitations and Monitoring Data

Parameter	Unit	Effluent Limitation				Monitoring Data (From 12/03 to 12/07)		
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Maximum	Highest Average Monthly Discharge	Highest Average Weekly Discharge	Highest Daily Discharge
BOD_5	mg/L	30	45	---	---	33	40	---
TSS	mg/L	30	45	---	---	19	30	
Grease and Oil	mg/L	25	40	---	75	9.7	9.7	9.7
Turbidity	NTU	75	100	225	---	11	25	38
pH	s.u.	Between 6 and 9 at all times			---	5.7 minimum 8.0 maximum		
Acute Toxicity	TUa	---	---	2.58	---	---	---	1.58
Chronic Toxicity	TUc	---	---	76	---	---	---	50

2. The previous permit contained weekly monitoring requirements for bacteria in the receiving water at several surf stations, and additional surf monitoring requirements for bacteria in response to CSOD events. Requirements of the previous permit included posting notices at beaches with elevated bacteria levels until monitoring indicated bacteria were below water quality objectives. The following table summarizes periods of elevated bacteria levels during the term of the previous permit.

Table F-5. Receiving Water Surf Monitoring Summary

Wet Weather Season	Rainfall (inches)	Number of Discrete[(1)] Combined Sewer Discharges	Total Number of Days Per Year One or More Beaches Were Posted for Elevated Bacteria Counts
2003-2004	18.77	8	33
2004-2005	26.2	12	31
2005-2006	31.83	13	53
2006-2007	14.76	3	12
Average	22.89	9	32.3

(1) Discrete events are separated by at least six hours between discharges, as defined in State Water Board Order No. WQ 79-16.

D. Compliance Summary

1. **Compliance with Numeric Effluent Limitations.** During the term of Order No. R2-2003-0073, the Discharger reported exceedances of effluent limitations for BOD_5 and pH as summarized in Table F-6.

Table F-6. Summary of Effluent Violations

Date of Violation	Parameter	Effluent Limitation	Reported Value
December 31, 2005	BOD_5	30 mg/L	32.5 mg/L
December 31, 2005	BOD_5 Percent Removal	85% Removal Minimum	76% Removal
October 10, 2007	pH	Between 6 and 9 at all times	5.7

Rainfall records for San Francisco indicate that 2.12 inches of rain fell on December 31, 2005, and 0.82 inches fell on the preceding day. This may have been a "wet weather" day, in which case no exceedance occurred. Similarly on October 10, 2007, the reported date of the pH exceedance, the rainfall was 0.18 inches and the rainfall for the preceding day was 0.43 inches. This rainfall could have contributed to the low pH values. Under these circumstances, Regional Water Board staff did not recommend formal enforcement.

2. **Compliance with Permit Provisions.** A list of special activities required by Order No. R2-2003-0073 and the status toward completing those requirements are shown in Table F-7, below.

Table F-7. Permit Provisions Compliance

Provision Number	Requirement	Status of Completion
F.2 [A]	Marine Mammal Report identifying monitoring methodologies to determine presence of pathogens with potential to affect marine mammals.	Report submitted October 28, 2005.
F.4.i	Nine Minimum Controls (A) Study Plan to monitor CSOD Impacts and Controls due December 1, 2003 (B) Annual Status Reports summarizing data, evaluating CSOD impacts and controls, and proposing revisions to nine minimum controls, if necessary, due August 30 annually. (C) Final Report due 1 year prior to permit expiration.	Submitted November 26, 2003 Submitted 2004, 2005, 2006, 2007 Submitted August 30, 2007

[A] In response to concerns expressed by the National Oceanic Atmospheric Administration (NOAA) Fisheries and US Fish and Wildlife Service regarding the potential of stormwater and undisinfected wastewater from the Southwest Ocean Outfall to transmit pathogens to marine mammals, the previous permit required investigation of methods to determine impacts of human pathogens on marine mammals and conveyance of the findings in a Marine Mammal Report. On October 28, 2005, the Discharger submitted a report that concluded that little information is available regarding the environmental occurrence, fate, and transport of *T. gondii*, *S. neurona*, and Morbilliviruses, microbes of concern to marine mammals, in part because methods for detection of these microbes in the environment are insufficient.

E. Planned Changes

No changes are planned

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements contained in the proposed Order are based on the requirements and authorities described in this section.

A. Legal Authorities

This Order is issued pursuant to the federal Clean Water Act (CWA) §402 and implementing regulations adopted by the U.S. Environmental Protection Agency (USEPA) and California Water Code (CWC) Chapter 5.5, Division 7 (commencing with §13370). It shall serve as an NPDES permit for point source discharges from this facility to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to CWC Article 4, Chapter 4, Division 7 (commencing with §13260). USEPA and the Regional Water Board are jointly issuing this permit. It covers Discharge Point 001, the Southwest Ocean Outfall, which is 3.4 to 3.6 nautical miles offshore in Federal waters. (The territorial waters of the State end three nautical miles from shore.) It also covers Discharge Points CSD-001 through CSD-007, which are near-shore in State waters.

Under Water Code §13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA. Likewise, pursuant to CWA §511(c), this action to reissue an NPDES permit does not trigger the requirements of the National Environmental Policy Act (NEPA) [42 U.S.C. 4321 et seq.].

B. State and Federal Regulations, Policies, and Plans

1. **Water Quality Control Plans.** The *Water Quality Control Plan for the San Francisco Bay Basin* is the Regional Water Board's master water quality control planning document. It designates beneficial uses and water quality objectives for waters of the State, including surface waters and groundwater. It also includes programs of implementation to achieve water quality objectives. The Basin Plan was duly adopted by the Regional Water Board and approved by the State Water Board, USEPA, and the Office of Administrative Law where required.

   Beneficial uses established by the Basin Plan for waters within the San Mateo Coastal Watershed are as follows:

Table F-8. Basin Plan Beneficial Uses

Receiving Water	Basin Plan Beneficial Uses
Territorial waters of the State of California within the Pacific Ocean	• Industrial Service Supply • Ocean, Commercial, and Sport Fishing • Shellfish Harvesting • Marine Habitat • Fish Migration • Preservation of Rare and Endangered Species • Fish Spawning • Wildlife Habitat • Water Contact Recreation • Noncontact Water Recreation • Navigation

   Requirements of this Order implement the Basin Plan.

2. **California Ocean Plan.** The State Water Board adopted the *Water Quality Control Plan for Ocean Waters of California* (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, and 2005. The State Water Board adopted the latest amendment on April 21, 2005, and it became effective on February 14, 2006. The Ocean Plan applies, in its entirety, to point source discharges to the territorial waters of the State as defined by California law to the extent that these waters are outside of enclosed bays, estuaries, and coastal lagoons. The Ocean Plan identifies the following beneficial uses of ocean waters of the State: Industrial Water Supply; Water Contact and Non-contact Recreation, Including Aesthetic Enjoyment; Navigation; Commercial and Sport Fishing; Mariculture; Preservation and Enhancement of Designated Areas of Special Biological Significance; Rare and Endangered Species; Marine Habitat; Fish Migration; Fish Spawning; and Shellfish Harvesting. To protect beneficial uses, the Ocean Plan establishes water quality objectives and a program of implementation for discharges to state territorial waters.

   Discharge Point 001, the deep water outfall, is 3.4 to 3.6 nautical miles offshore in federal waters. The territorial waters of the State end three nautical miles from shore. The Ocean Plan (Appendix 1, Ocean Waters) states, "If a discharge outside the territorial waters of the State could affect the quality of the waters of the State, the discharge may be regulated to assure no violation of the Ocean Plan will occur in

ocean waters." For the reasons set forth below, the Regional Water Board finds that the discharge at Discharge Point 001 could not affect the quality of the waters of the State during dry weather. During wet weather, the Ocean Plan defers to the Combined Sewer Overflow Control Policy, discussed in Finding K. Therefore, this Order does not regulate the discharge at Discharge Point 001 directly through the Water Board's Ocean Plan authorities.

The Discharger has compiled information demonstrating that the discharge at Discharge Point 001 during dry weather could not affect the quality of the waters of the State ("Assessment of Effects on California State Waters from the Oceanside Southeast Ocean Outfall," September 26, 2008). Regional Water Board staff has supplemented the Discharger's information with independent analysis.

a. **Receiving Water Monitoring.** The Discharger has monitored the receiving waters since the 1970s, before and after the installation of the Southwest Ocean Outfall in 1986. Aquatic biological communities, including benthic communities, do not appear to be any different near the outfall than at reference locations. Sediment quality appears to be similar as well. Since the discharge does not appear to affect water quality in the vicinity of the outfall, there is no evidence that it could affect the quality of State waters.

b. **Dilution.** This Order uses a minimum initial dilution of effluent from Discharge Point 001 of 150:1. The Discharger has submitted a study indicating that initial dilution could be over 170:1 ("Dilution Modeling for the San Francisco Southwest Ocean Outfall," City and County of San Francisco, June 2007). Substantial additional dilution occurs between the outfall and State waters, which are 0.36 nautical miles (2,200 feet) away. A worst-case estimate of this far-field dilution is over 400:1. Regional Water Board staff has concluded that such highly diluted effluent from the deep water outfall could not affect the quality of State waters.

c. **Ocean Currents.** Ocean currents at the Southwest Ocean Outfall typically move parallel to the coast, not toward State waters.

d. **Effluent Toxicity Monitoring.** The Discharger routinely monitors acute and chronic toxicity in the effluent to ensure that it complies with effluent limitations. This monitoring has never indicated a violation of toxicity limitations at the outfall. Therefore, the discharge could not cause toxicity in State waters 0.36 nautical miles away. Receiving water sediment toxicity test results corroborate this conclusion.

e. **Bacteria Monitoring.** In the 1980s, the Discharger completed an extensive study to determine how discharging primary treated effluent from the deep water outfall was affecting receiving water bacteria levels (*Wastefield Transport and Bacteriological Compliance Studies of the San Francisco Ocean Outfall CH2MHill March 1989*). The Discharger now treats its wastewater to secondary treatment standards during dry weather. Regional Water Board staff used data from that study representing primary treatment to estimate the potential effects of discharging secondary-treated effluent (staff memorandum, October 10, 2008). Estimated bacteria levels in federal waters were below Ocean Plan water quality

objectives. Therefore, the deep water discharge could not affect bacteria levels in State waters.

3. **Determination of Unreasonable Degradation of the Marine Environment.** Discharges from the Southwest Ocean Outfall are to waters of the United States beyond the territorial waters of the State of California. Federal regulations at 40 CFR 125.122 require the permitting authority to determine whether a discharge will cause unreasonable degradation of the marine environment. Based on 40 CFR 125.22(b), USEPA conducted a reasonable potential analysis using Ocean Plan objectives and included numeric permit limitations, based on the Ocean Plan's dilution procedures, for toxicity and mercury, the only numeric Ocean Plan objectives for which USEPA found reasonable potential to cause or contribute to an exceedance of water quality standards. USEPA also included narrative receiving water limitations for the Ocean Plan narrative objectives for which it found reasonable potential. For determining reasonable potential for the dioxins, USEPA based its analysis on 40 CFR 125.122(a) and used recently updated Toxicity Equivalency Factors (TEFs) published by the World Health Organization in 2005, as well as the congener-specific Bioconcentration Equivalency Factors (BEFs) used for the Great Lakes System. The "Bay Area Clean Water Agencies' Draft Dioxin Issue Paper: Expert Panel Response and Recommendations," dated April 4, 2008 recommended the use of TEFs and BEFs to develop NPDES permit limits for dioxins. This approach incorporates recent scientific information for dioxins on a congener-specific basis, while continuing to use the Ocean Plan water quality objective for dioxins (TCDD equivalents) and standards implementation procedures. Given the unique issues dioxins present, USEPA has prepared a determination of unreasonable degradation for the ten factors under 40 CFR 125.122(a) (Appendix 1 of this Fact Sheet). USEPA has determined that no unreasonable degradation of the marine environment will result from the discharges of dioxins through the Southwest Ocean Outfall as authorized under this Order, with all the limitations, conditions, and monitoring requirements in effect.

4. **Combined Sewer Overflow Control Policy.** Wet weather flows from combined sewer systems are subject to CWA §301(b)(1)(A) and are not subject to secondary treatment regulations. Wet weather flows from combined sewer systems are addressed by the Combined Sewer Overflow Control Policy (59 Federal Register 18688-18698). The *Wet Weather Water Quality Act of 2000* incorporated this policy into the CWA.

   The policy establishes a consistent national approach for controlling discharges from combined sewers to the nation's water. Using the NPDES permit program, the policy initiates a two-phased process. During the first phase, the Discharger is required to implement "nine minimum controls" (e.g., prevent dry weather overflows). These controls constitute the technology-based requirements of the Clean Water Act as applied to combined sewer facilities (i.e., best conventional pollutant control technology, BCT, and best available control technology economically achievable, BAT). The controls are intended to provide immediate and relatively low-cost water quality improvements for facilities that, unlike the Discharger, have not implemented a long-term control plan. During the first phase, the Discharger is required to initiate development of a long-term control plan to select controls to comply with water quality standards, based on consideration of the Discharger's financial capabilities.

The second phase of the process involves implementation of the long-term control plan developed in the first phase. The purpose of this long-term control plan is to comply with the CWA water quality requirements. The Discharger's program, which continues to implement the Discharger's long-term plan, is consistent with the policy. This Order implements the policy and is consistent with the Regional Water Board policy on wet weather overflows described in Basin Plan Section 4.9. During wet weather, CSODs from shoreline discharge points CSD-001 through CSD-007 and the Southwest Ocean Outfall are subject to this policy.

Ocean Plan Section III.A.4 acknowledges, "Not withstanding any other provisions in this plan, discharges from the City of San Francisco's combined sewer system are subject to the USEPA's Combined Sewer Overflow Policy." In large part, this acknowledgement is a response to State Water Board Order No. WQ 79-16 (March 23, 1979), which granted an exception from the Ocean Plan for wet weather discharges from the Discharger's diversion structures in the western-most portion of the Discharger's combined sewer system. The exception was necessary because CSODs are inherently inconsistent with certain Ocean Plan standards. In accordance with Ocean Plan procedures for granting exceptions, the State Water Board found that there were unusual circumstances not anticipated at the time of the plan's adoption (the Ocean Plan had failed to address CSODs), that beneficial uses would be protected, and that the public interest would be served. Of particular importance to the State Water Board in granting the exception was the Discharger's proposal to improve its wet weather facilities to allow only an average of eight CSODs per year. The exception was subject to several conditions, including:

- The Discharger needed self-monitoring in accordance with Regional Water Board specifications (this Order requires this in Attachment E),

- Beaches and shellfish harvesting areas potentially affected by CSODs needed to be posted (this Order requires this in Section VI.C.6.b(8)),

- To the greatest extent practical, the Discharger needed to design, construct, and operate wet weather facilities to comply with Ocean Plan requirements (this Order requires this in Section VI.C.4),

- Aside from the average of eight CSOD events per year, all other storm water runoff needed to be contained, and the discharge of all other untreated waste to waters of the State was to be prohibited (this Order requires this in Section III; the provision for eight overflow events per year is the design basis of the effluent treatment system).

5. **Alaska Rule.** On March 30, 2000, USEPA revised its regulation that specifies when new and revised state and tribal water quality standards (WQS) become effective for CWA purposes [65 Fed. Reg. 24641 (April 27, 2000), codified at 40 CFR §131.21]. Under the revised regulation (also known as the Alaska rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards

already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.

6. **Stringency of Requirements for Individual Pollutants.** This Order contains both technology-based and water quality-based effluent limitations for individual pollutants. This Order's technology-based pollutant restrictions implement the minimum applicable federal technology-based requirements. In addition, this Order contains effluent limitations more stringent than the minimum federal technology-based requirements. The water quality-based limits are necessary to meet water quality standards. They are not more stringent than required by the CWA.

   Water quality-based effluent limitations have been derived to implement water quality objectives that protect beneficial uses. Both beneficial uses and water quality objectives in State waters have been approved pursuant to federal law and are the applicable federal water quality standards. The procedures used for this Order to calculate individual water quality-based effluent limitations for State waters are based on the California Ocean Plan, which was approved by USEPA on February 14, 2006.

7. **Antidegradation Policy.** NPDES regulations at 40 CFR§131.12 require that the State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16, which incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. Water quality plans implement, and incorporate by reference, both the State and federal antidegradation policies. The permitted discharge is consistent with the antidegradation provision of 40 CFR§131.12 and State Water Board Resolution No. 68-16 because there is no increase in authorized flow and effluent limitations are at least as stringent as in the previous permit.

8. **Anti-Backsliding Requirements.** CWA Sections 402(o)(2) and 303(d)(4) and NPDES regulations at 40 CFR §122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. With the exception of acute and chronic toxicity, all effluent limitations in this Order are at least as stringent as the effluent limitations in the previous permit. Compliance with anti-backsliding requirements is discussed in section IV.C.6.

9. **Endangered Species Act.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code sections 2050 to 2097) or the federal Endangered Species Act (16 U.S.C.A. sections 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the State. The Discharger is responsible for meeting all

requirements of applicable State and federal law pertaining to threatened and endangered species.

§7(a)(2) of the federal Endangered Species Act requires USEPA, in reissuing this NPDES permit, to ensure, after consultation with appropriate agencies, that discharges at the Southwest Ocean Outfall are not likely to jeopardize the continued existence of any threatened or endangered species or result in the destruction or adverse modification of critical habitat for such species. USEPA has initiated informal consultation with National Oceanic Atmospheric Administration (NOAA).

C. Impaired Water Bodies on CWA 303(d) List

On November 30, 2006, USEPA approved a revised list of impaired water bodies prepared by the State [hereinafter referred to as the 303(d) list] pursuant to CWA section 303(d), which requires identification of specific water bodies where it is expected that water quality standards will not be met after implementation of technology-based effluent limitations on point sources. Receiving waters for discharges from CSOD outfalls authorized by this Order are listed as impaired for indicator organisms at Baker Beach, specifically at the mouth of Lobos Creek.

1. Total Maximum Daily Loads

The Regional Water Board plans to adopt Total Maximum Daily Loads (TMDLs) for pollutants on the 303(d) list within ten years. Future review of the 303(d) list may provide schedules or result in revision of schedules for adoption of TMDLs.

2. Waste Load Allocations

The TMDLs will establish waste load allocations (WLAs) for point sources and load allocations for non-point sources, which will result in achieving the water quality standards for waterbodies. Future water quality-based effluent limitations for 303(d) listed pollutants will be based on WLAs contained in the respective TMDLs. If a TMDL is developed and WLAs are established independently for discharges of stormwater and wastewater, these WLAs may be combined to be met collectively by the wastewater and stormwater effluent loads.

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations in the Code of Federal Regulations: section 122.44(a) requires that permits include applicable technology-based limitations and standards; and section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water.

A. Discharge Prohibitions

1. **Discharge Prohibition III.A**. (No discharge other than that described in this Order). This prohibition is retained from the previous permit and is based on CWC §13260, which requires filing a Report of Waste Discharge before discharges can occur. Discharges not described in the Report of Waste Discharge, and subsequently in the Order, are therefore prohibited.

2. **Discharge Prohibition III.B**. (No discharge from Discharge Point 001 that does not receive an initial dilution of at least 150:1). This prohibition is retained from the previous permit. In addition, the Order accounts for dilution of 150:1 in the reasonable potential analysis and calculation of WQBELs. The limitations in this Order may not be protective of water quality if the discharge were to not actually achieve a 150:1 initial dilution.

3. **Discharge Prohibition III.C**. (Bypass of secondary treatment is prohibited except as described by the Order on wet weather days or as provided in 40 CFR §122.41(m)(4) and in Regional Standard Provisions, and Monitoring and Reporting Requirements [Attachment G]). This prohibition is retained from the previous permit and is based on NPDES regulations at 40 CFR §122.41(m)(4).

4. **Discharge Prohibition III.D**. (Discharge at a location other than Discharge Point 001 is prohibited except for wet weather days). This prohibition is retained from Order No. R2-2003-0073 and reflects a principle objective of USEPA's *Combined Sewer overflow Control Policy* (1994) to ensure that, if CSODs occur, they are only a result of wet weather and such discharges only occur at specified locations.

5. **Discharge Prohibition III.E**. (Discharge at Discharge Points CSOD-001 through CSOD-007 is prohibited except on wet weather days). This prohibition is retained from the previous permit and reflects a principle objective of USEPA's *Combined Sewer Overflow Control Policy* (1994) to ensure that, if CSODs occur, they are only a result of wet weather.

6. **Discharge Prohibition III.F**. (Average dry weather flow not to exceed 43 MGD). This prohibition is retained from the previous permit, and is based on the design treatment capacity of the Plant. Exceedance of the design capacity may result in lowering the reliability of achieving compliance with effluent limitations.

7. **Discharge Prohibition III.G**. (CSOs are prohibited). CSOs, as opposed to CSODs, are unauthorized discharges from the combined sewer system. This prohibition is necessary because CSOs result in the release of untreated sewage.

8. **Discharge Prohibition III.H**. (Discharge of municipal or industrial sludge to the ocean is prohibited). This prohibition implements Ocean Plan discharge prohibition III.H.3.

9. **Discharge Prohibition III.J**. (Degradation of harvestable shellfish resulting from dry weather discharges is prohibited). This prohibition is retained from the previous permit and implements Ocean Plan discharge prohibition II.B.2.

B. Technology-Based Effluent Limitations

1. Scope and Authority

a. CWA section 301(b) requires USEPA to develop secondary treatment standards for publicly owned wastewater treatment facilities. These standards implement the level of effluent quality attainable through application of secondary or equivalent treatment. USEPA promulgated technology-based effluent guidelines for POTWs at 40 CFR §133. These Secondary Treatment Regulations include the following minimum requirements, which apply to the Plant during dry weather.

Table F-9. Secondary Treatment Requirements

Parameter	30-Day Average Limitation	7-Day Average Limitation
BOD_5 (1)	30 mg/L	45 mg/L
$CBOD_5$ (2)	25 mg/L	40 mg/L
TSS (1)	30 mg/L	45 mg/L
pH	6.0 – 9.0	

(1) The 30-day average percent removal shall not be less than 85 percent.

(2) At the option of the permitting authority, these effluent limitations for $CBOD_5$ may be substituted for BOD_5 limitations.

b. The USEPA Combined Sewer Overflow Control Policy establishes the technology based requirements for combined sanitary sewer systems, which requires implementation of the Nine Minimum Controls. Related requirements are included in section VI.C.6.b. of this Order.

2. Applicable Technology-Based Effluent Limitations

This Order retains the following technology-based effluent limitations, applicable to discharges at Discharge Point 001 during dry weather, as determined at Monitoring Location EFF-001.

a.. **Compliance with limits.** The Discharger shall comply with the following effluent limitations shown in Table F-10.

Table F-10.Technology-based Effluent Limitations – Discharge Point 001

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
BOD_5 @ 20°C	mg/L	30	45	---	---	---
TSS[(1)]	mg/L	30	45	---	---	---
pH	Standard units	---	---	9.0	6.0	9.0

The pH requirement is retained from the previous permit and is established by USEPA's Secondary Treatment Regulations at 40 CFR Part 133 and by Ocean Plan Table A.

b. Percent Removal. Based on Secondary Treatment Regulation at 40 CFR §133.102 and 133.103 and previous permit limits the average monthly percent removal of BOD_5 at 20°C and TSS shall not be less than 85%.

C. Water Quality-Based Effluent Limitations (WQBELs)

1. Scope and Authority

CWA section 301(b) and section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards. This Order contains requirements, expressed as a technology equivalence requirement, more stringent than secondary treatment requirements that are necessary to meet applicable water quality standards.

Section 122.44(d)(1)(i) mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) must be established using: (1) USEPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in section 122.44(d)(1)(vi).

The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated uses of the receiving water as specified in the Basin Plan, and achieve applicable water quality objectives and criteria that are contained in the Ocean Plan.

2. Minimum Initial Dilution

In accordance with the Ocean Plan, water quality-based effluent limits reflect the minimum initial dilution of the effluent as it reaches the receiving water. The minimum initial dilution can be estimated by experimental observation and computer

simulation. The reasonable potential calculation for this Order is based on a dilution ratio of 150:1. This is based on an updated dilution model submitted by the Discharger that averaged UM3 and NRFIELD results and utilized averaged oceanographic data from 1988. If the Discharger provides new information to use with new dilution modeling (see provision VI.C.2.b of this Order), any new results based on updated oceanographic data may be considered for the next permit reissuance.

3. Determining the Need for WQBELs

This Order is based on a reasonable potential analysis based on procedures described in Ocean Plan Section III.C and Ocean Plan Appendix VI to determine the need for WQBELs. In general, the procedure is a statistical method that evaluates an effluent data set while taking into account the averaging period of water quality objectives, the long term variability of pollutants in the effluent, limitations associated with sparse data sets, and uncertainty associated with censored data sets. The procedure assumes a lognormal distribution of the effluent data set and compares the 95th percentile concentration at 95 percent confidence for each pollutant in Ocean Plan Table B, accounting for dilution, to the applicable water quality criterion in Ocean Plan Table B. The reasonable potential analysis results in one of three endpoints.

Endpoint 1 – There is “reasonable potential,” and a WQBEL and monitoring are required.

Endpoint 2 – There is no “reasonable potential.” A WQBEL is not required, but monitoring may be required.

Endpoint 3 – The analysis is inconclusive. There are less than 3 detects or more than 80% of samples are non-detect. Any existing WQBEL is retained, and monitoring is required.

The Ocean Plan reasonable potential analysis involves five paths:

a. First Path

If available information about the receiving water or the discharge supports a finding of reasonable potential without analysis of effluent data, the permitting authority may decide that WQBELs are necessary after a review of such information. Such information may include the facility or discharge type, solids loading, lack of dilution, history of compliance problems, potential toxic effects, fish tissue data, 303(d) status of the receiving water, presence of threatened or endangered species or their critical habitat, or other information.

b. Second Path

If any pollutant concentration, adjusted to account for dilution, is greater than the most stringent applicable water quality criterion, there is reasonable potential for

that pollutant to cause or contribute to exceedances of water quality standards, and a WQBEL is required.

c. Third Path

If the effluent data contains three or more detected and quantified values (i.e., values that are at or above the Minimum Level [ML]), and all values in the data set are at or above the ML, a parametric reasonable potential analysis is conducted to project the range of possible effluent values. The 95th percentile concentration is determined at 95 percent confidence for each pollutant, and compared to the most stringent applicable criterion to determine reasonable potential. A parametric analysis assumes that the range of possible effluent values is distributed lognormally. If the 95th percentile value is greater than the most stringent applicable criterion, there is reasonable potential for that pollutant to cause or contribute to exceedances of water quality standards and a WQBEL is required.

d. Fourth Path

If the effluent data contains three or more detected and quantified values (i.e., values that are at or above the ML), but at least one value in the data set is less than the ML, a parametric reasonable potential analysis is conducted according to the following steps.

(1) If the number of censored values (those expressed as a “less than” value) account for less than 80 percent of the total number of effluent values, calculate the M_L (the mean of the natural log of transformed data) and S_L (the standard deviation of the natural log of transformed data) and conduct a parametric reasonable potential analysis, as described above for the Third Path.

(2) If the number of censored values account for 80 percent or more of the total number of effluent values, conduct a non-parametric reasonable potential anlaysis, as described below for the Fifth Path. (A non-parametric analysis becomes necessary when the effluent data are limited, and no assumptions can be made regarding its possible distribution.)

e. Fifth Path

A non-parametric reasonable potential analysis is conducted when the effluent data set contains less than three detected and quantified values, or when the effluent data set contains three or more detected and quantified values but the number of censored values account for 80 percent or more of the total number of effluent values. A non-parametric analysis is conducted by ordering the data, comparing each result to the applicable criterion, and accounting for ties. The sample number is reduced by one for each tie, when the dilution-adjusted method detection limit (MDL) is greater than the criterion. If the adjusted sample number, after accounting for ties, is greater than 15, the pollutant has no reasonable potential to exceed the water quality standards. If the sample number

is 15 or less, the analysis is inconclusive, monitoring is required, and any existing effluent limits in the expiring permit are retained.

4. Reasonable Potential Analysis

Table F-11 presents results of the reasonable potential analysis. Data used for this analysis are from October 2003 to December 2007 for most inorganics, and from November 2003 to November 2007 for most organics. A dilution of 150:1 was assumed as explained above. The analysis was performed in accordance with Ocean Plan procedures. The endpoint for each criterion is identified. Results show "reasonable potential" for mercury, and as a result, this Order establishes an effluent limitation for mercury. An effluent limit is retained for chronic toxicity because monitoring under the previous permit showed toxicity levels close to the limit.

As shown in the table, the reasonable potential analysis commonly resulted in Endpoint 3, meaning that the analysis is inconclusive, when a majority of the effluent data is reported as ND (not detected). In these circumstances, the "inconclusive" result is an indication of no concern for a particular pollutant; however, continued monitoring is required during the term of the permit.

a. TCDD Equivalents. The calculations to complete a reasonable potential analysis for TCDD equivalents were more complicated than the analysis for other individual pollutants since each sample is analyzed for 16 congeners (Attachment E Section IV.A). For each of the 18 samples (collected between March 2003 and November 2007) the TCDD equivalent of each congener was calculated. When a congener was identified as DNQ (detected but not quantified), then the detection limit value was used in determining the TCDD equivalent for that sample. For each congener in each sample, the TCDD equivalent was calculated using the TEF and BEF as described in Attachment A TCDD equivalents. To determine the TCDD equivalent for each sample, the TCDD equivalents of each congener in that sample were summed.

The State Water Board has developed a reasonable potential calculator (RPcalc 2.0) for use with the Ocean Plan. The use of this program is described at http://www.waterboards.ca.gov/water_issues/programs/ocean/docs/trirev/stakeholder050505/rphelp20.pdf The calculator is available at the State Water Board's web site: www.waterboards.ca.gov/plnspols/docs/oplans/rpcalc.zip. The calculator was used to determine the need for TCDD equivalents limits in this Order.

To determine the upper 95th upper confidence bound for the 95th percentile the TCDD equivalent value for the set of 18 samples, the TCDD equivalent value for each sample, or zero for samples with no congeners detected, was entered into the RPcalc program. The results, using a dilution ratio of 76:1, showed no reasonable potential for TCDD equivalents. Therefore, there would also be no reasonable potential assuming 150:1 dilution.

b. Chronic Toxicity. The reasonable potential analysis shown in Table F-11 does not show reasonable potential for chronic toxicity when accounting for at least 150:1 dilution; however, USEPA finds reasonable potential by the first path identified above because monitoring data collected during the term of the previous permit showed chronic toxicity at levels close to the limit and because similar excursions could occur in the future.

c. Total Chlorine Residual. On May 17, 1989, the Regional Water Board adopted Order No. 89-71, amending Order No. 88-106 to delete disinfection requirements for the effluent. The Regional Water Board action was based on the Discharger's technical report dated April 3, 1989, *Wastefield Transport and Bacteriological Compliance Studies of the San Francisco Ocean Outfall*. The studies were conducted in 1987 and 1988. The findings indicated that the non-disinfected wastewater discharge from the Discharge Point 001 did not violate the Ocean Plan bacteriological body-contact standards. There is no disinfection of the effluent and thus no potential for disinfectant residuals or by-products, for example from chlorine, to impact the effluent.

Table F-11. Reasonable Potential Analysis Results for the Discharge Point 001

Table B Pollutant	Most Stringent WQO (µg/L)[1]	No. of Samples	No. of Non-Detects	Max Effluent Conc. (µg/L)	Result, Comment

Trichloroethylene	27	20	20	ND	Endpoint 2
Vinyl Chloride	36	20	19	1.3	Endpoint 2

Table notes

(1) Ocean Plan Table B Water Quality Objectives limiting concentrations are 6-month median values.
(2) Chronic toxicity is based on a daily maximum.
(3) Measured in pCi/L, radioactivity not to exceed limits specified in Title 17, Division 1, Chapter 5, Subchapter 4, Group 3, Article 3, Section 30253 of the CCR§30253.
(4) Reasonable Potential was not found by calculation but was an issue in the previous permit and effluent limits retained, also monitoring is required in the Ocean Plan (Section III.C.c.(4))
(5) Chlorine is not added to the effluent for disinfection, or any other purpose, and there is no monitoring for residual chlorine
(6) The Ocean Plan does not require monitoring for acute toxicity and previous monitoring did not show reasonable potential.

- NA indicates that effluent data is not available.
- ND indicates that the pollutant was not detected.

5. WQBEL Calculations

As described by Section III. C of the Ocean Plan, Effluent limits for Table B pollutants that show reasonable potential are calculated according to the following equation.

$$Ce = Co + Dm (Co – Cs)$$

Where

Ce = the effluent limitation (µg/L)

Co = the concentration (the water quality objective) to be met at the completion of initial dilution (µg/L).

Cs = background seawater concentration (µg/L)

Dm = minimum probable initial dilution expressed as parts seawater per part wastewater

a. **Mercury**

The reasonable potential analysis showed reasonable potential for mercury because the maximum monthly average mercury concentration in the effluent was 12 µg/L, which when accounting for dilution of 150:1, results in a concentration of 0.08 µg/L, which is above the six-month median water quality objective of 0.04 µg/L. Therefore, this Order establishes mercury WQBELs as described below:

Co (6-month median) = 0.04 µg/L
Co (daily maximum) = 0.16 µg/L
Dm = 149 (based on a dilution of 150:1)
Cs = 0.0005 µg/L (based on Ocean Plan Table C)

Ce (6-month median) = Co (6-month median) + Dm (Co – Cs) = 5.9 µg/L
Ce (daily maximum) = Co (daily maximum) + Dm (Co – Cs) = 24 µg/L

b. **Chronic Toxicity**

The reasonable potential analysis using the Ocean Plan calculation method did not show reasonable potential for chronic toxicity (accounting for at least 150:1 dilution); however, USEPA finds reasonable potential because monitoring under the previous permit showed chronic toxicity at levels close to the limit and since similar excursions may occur that limit is retained in this Order. A chronic toxicity WQBEL may be calculated as follows:

Co (daily maximum) = 1.0 TUc
Dm = 149 (based on a dilution of 150:1)
Cs = 0 TUc (based on Ocean Plan Table C)
Ce (daily maximum) = Co (daily maximum) + Dm (Co – Cs) = 150 TUc

6. Anti-Backsliding/Antidegradation

Most effluent limitations established by this Order are at least as stringent as limitations in the previous permit; and therefore, CWA anti-backsliding requirements are not triggered. As for acute toxicity, monitoring required under the previous permit did not show any reasonable potential. Also, the Ocean Plan does not require acute toxicity limits for this type of discharge, but does require monitoring and an effluent limit for chronic toxicity. Thus, this permit does not contain an acute toxicity limit but does require continued monitoring, and it imposes a chronic toxicity limit.

As for chronic toxicity, the new limit is higher than the limit in the previous permit; however, this is permissible under anti-backsliding regulations. Although the permittee did not exceed the chronic toxicity limit in the previous permit, the previous permit allowed the removal of ammonia prior to chronic toxicity testing. This Order does not allow removal of ammonia prior to toxicity testing because ammonia may contribute to toxicity in the receiving water. Accordingly, the Discharger's toxicity monitoring requirements have been modified. Data provided by the Discharger

indicate that a chronic toxicity limit of 76 cannot consistently be met without ammonia removal. Therefore, this Order applies the new dilution factor of 150:1 to calculate the chronic toxicity limit and relies on the backsliding exceptions under CWA Sections 402(o)(2)(B)(i) and 402(o)(2) (E), and 40 CFR 122.44(l)(2)(b)(1) and 122.44(l)(2)(i)(E).

Because this Order does not authorize an increased rate of discharge or increased pollutant loadings to receiving waters, the antidegradation requirements of 40 CFR 131.13 and State Water Board Resolution No. 68-16 are also satisfied.

D. Land Discharge Specifications

Not Applicable.

E. Reclamation Specifications

Not Applicable.

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

This Order is designed to minimize the influence of the discharge on the receiving water. Ocean Plan Section II serves as the basis for the receiving water limitations specified in Section V.A of the Order. These limits are needed to ensure that the receiving water complies with Ocean Plan water quality objectives and therefore protects beneficial uses.

VI. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

NPDES regulations at 40 CFR 122.48 require that all NPDES permits specify requirements for recording and reporting monitoring results. CWC §13267 and §13383 authorize the Regional Water Board to require technical and monitoring reports. In addition, the Ocean Discharge Criteria (40 CFR Part 125, subpart M) authorize actions necessary to prevent unreasonable degradation of the marine environment. The Monitoring and Reporting Program (MRP), Attachment E, establishes monitoring and reporting requirements to implement federal and State requirements. The rationale for the monitoring and reporting requirements contained in the MRP for this facility is presented below.

A. Influent Monitoring

In general, influent monitoring requirements are unchanged from the previous permit. Influent monitoring requirements for BOD_5 and TSS are necessary to determine compliance with this Order's 85 percent removal requirement. Influent monitoring for tributyltin and TCDD equivalents are no longer required because previous monitoring has provided for characterization of these pollutants in influent wastewater.

The influent monitoring location remains unchanged, but this Order revises its name for consistency with other NPDES permits in California.

B. Effluent Monitoring

In general, effluent monitoring requirements for discharges from Discharge Point 001 are retained from the previous permit, with the following exceptions:

- Monitoring for toxic pollutants has been updated to reflect the most recent list of pollutants in Ocean Plan Table B.
- Monitoring for mercury is required one time per month to determine compliance with new mercury effluent limitations.
- The monitoring frequency for chronic toxicity has been set at once per quarter. Monitoring data collected each month during the term of the previous permit showed results consistently below effluent limitations.

The effluent monitoring location for Discharge Point 001 has not changed; however, its name has been changed from E-007 to EFF-001, for consistency with other NPDES permits in California.

Monitoring requirements for discharges at a representative CSOD outfall are retained from the previous permit. However, this Order establishes an additional requirement to monitor for the Table B pollutants not currently monitored at this outfall to further characterize these discharges for future reasonable potential analysis.

C. Whole Effluent Toxicity Testing Requirements

The Discharger is required to conduct chronic toxicity tests as described in the MRP (Attachment E) using the Echinoderm Embryo Development test in accordance with the USEPA approved method in 40 CFR 136 (currently *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms*, August 1995).

The Discharger performed a screening phase study prior to the expiration of the previous permit for the most sensitive West Coast marine species. The results of this study indicated that the giant kelp germination and growth test was the most sensitive, but suggested the test was variable in part due to the availability and quality of field-collected organisms, and suggested the use of the echinoderm embryo development test because gravid species of two alternate echinoderms, the sand dollar and the purple urchin, could alternately be obtained year-round.

This Order retains the requirement to conduct chronic toxicity monitoring with the echinoderm embryo development test and requires the Discharger to re-screen for the most sensitive species once during the term of this Order.

D. Receiving Water Monitoring

Receiving water monitoring is necessary to ensure compliance with the receiving water limits specified in Section V.A of the Order. Requirements to monitor bacteria in shoreline receiving waters and to conduct recreational use surveys, in the Provisions of

the Order, Section VI.6.(9), during and immediately after CSOD events are retained from the previous permit. The monitoring requirements in MRP (Attachment E) sections IV, VIII, and X are sufficient to characterize receiving water quality.

E. Other Monitoring Requirements

Requirements of the Southwest Ocean Outfall Offshore Monitoring Program are retained from the previous permit to determine the effect of the discharge on sediment quality in the vicinity of the outfall and to determine whether pollutants are bioaccumulating in fauna. The program includes monitoring at 45 locations, including 24 reference locations that are unaffected by the discharge. Monitoring includes chemical and physical analysis of sediment, analysis of the benthic (bottom) community, and analysis of fish and macroinvertebrate species collected by trawling.

1. Offshore Monitoring Program History

In 1986, the Southwest Ocean Outfall was completed to transport primary treated wastewater from the Richmond-Sunset Plant, which was replaced in 1993 by the Oceanside Plant. Monitoring conducted from 1986 to 1996 indicated that a single reference location was inadequate to fully characterize background conditions and to determine whether observed differences between monitoring locations were attributable to natural variation or to the discharge. These early studies also showed that the season or time of year had the greatest impact on study results, and that the relatively close proximity of the Southwest Ocean Outfall to the mouth of the San Francisco Bay confounded interpretation of monitoring results due to the effects of outflow near the Golden Gate.

Following collaboration between the Discharger and USEPA, when the Discharger's permit was reissued in 1997, the study area was expanded to include multiple reference sites, and monitoring frequency was reduced to once per year, in the Fall. In the permit, seven fixed monitoring sites were retained, and an additional 40 monitoring locations were added using USEPA's Environmental Monitoring Assessment Program (EMAP) random sample site selection process. The expanded study area included reference locations in the Gulf of the Farallones and the Monterey Bay National Marine Sanctuaries.

In 2002, additional benthic monitoring locations, south of the discharge pipe, were included in the program to investigate whether the pipe structure itself was affecting benthic infauna abundance through an induced reef affect. When the Discharger's permit was reissued in 2003, the number of required trawls was reduced from eight to two, following observation of no differences among mobile organisms between outfall and reference locations, and in an effort to reduce mortality of collected organisms. At that time, some sediment monitoring locations were also removed from the program because they were found to be inconsistent with the rest of the study area.

As stated in Order No. R2-2003-0073, "This program will be implemented dynamically to maximize the amount of relevant and useful data that can be gathered within the five-year permit life by allowing the EPA, the Regional Water Board, and the City and

County of San Francisco to agree to program corrections in response to ongoing analyses of monitoring data."

2. Monitoring Results from Previous Permit

In January 2006, the Discharger submitted the most recent summary report covering the years from 1997 through 2004. The report indicates no adverse trends in sediment characteristics as a result of the discharge. The mean particle sizes at the outfall area have not changed since pre-construction and pre-discharge periods, which suggests that the Southwest Ocean Outfall does not affect sediment grain size distribution. Additional data collected in 2005 and 2006 show that the outfall area continues to reflect pre-construction and pre-discharge sediment grain size distribution.

Chemical analysis for total solids; total volatile solids; total organic carbon; total Kjeldahl nitrogen; organic pollutants, such as PAHs, PCBs, and DDTs; and trace metals were used to assess the chemical quality of the sediment. Total volatile solvent measurements correlated with areas with high fractions of silt and clay, while total organic carbon and total Kjeldahl nitrogen results correlated with areas of fine sand. All three parameters are historically highest in the northern reference region, indicating little influence of the Southwest Ocean Outfall discharge on these parameters. Sediment chemical quality data collected in 2005 and 2006 indicate that reference stations exceeded tolerance bounds derived from previous monitoring data for percent silt and clay and total organic carbon, but outfall areas were within tolerance bounds for all constituents.

PAH contaminants were present in the sediments prior to discharge and, over the 8 years of measurements, appear to be transitory and affected by sediment movement via currents and winter storms. Concentrations were compared to the Effects Range Medium (ERM) of Sediment Quality Guidelines, which are concentrations of individual compounds that demonstrate the 50% probability of toxic effects. No ERM values for any individual PAH, PCB, or DDT were exceeded during the eight year period. Trace metal analysis of the sediment resulted in consistent exceedances of the ERM values for nickel during the eights years of monitoring; however, nickel occurs naturally in large amounts in the San Francisco Bay area. Overall, the sediment data for the eight years between 1997 an 2004 indicate that the Southwest Ocean Outfall discharge has not negatively affected sediment quality. In 2005, concentrations of 18 PAHs and three PCBs were detected throughout the study area, and total DDTs were detected at three stations. One DDT and 18 PAH compounds were detected in the sediment in 2006. Cadmium, nickel, zinc, and selenium were significantly lower at outfall stations in 2005 over the 2004 results, while nickel concentrations were elevated at all stations in the study area in 2005 and 2006, similar to previous years. Arsenic, selenium, and silver were significantly higher at outfall stations in 2006 versus 2005, while aluminum and mercury were significantly lower at outfall stations in 2006 versus 2005.

The trend of the benthic community analysis over the eight year period indicated that community abundance was more affected by climate than by the discharge, because decreases in abundance correlated with reduced upwelling of the California Current, associated with oceanographic events like El Niño. Analyses of demersal fish and

epibenthic invertebrate communities for the eight year period did not indicate any apparent effects related to the Southwest Ocean Outfall and observed differences in species composition and abundance correlated with El Niño and La Niña events. Benthic infauna community abundance decreased in 2005 and 2006 to the lowest documented overall abundance for the previous ten years. The local upwelling index in 2004 through 2006 was lower than normal, and the sequential years of decreased summer current upwelling occurrences may be related to an overall increase in infauna abundance. Trawl organisms collected in 2005 and 2006 represented a general assortment of native species common to central California near-shore communities; however, the demersal fish community measures of abundance and diversity were at or below the lower tolerance bounds for the outfall location in 2006. Physical anomalies of collected species were similar in all the 2004, 2005, and 2006 sample events.

Samples were screened for physical anomalies, and tissues were analyzed for bioaccumulative substances. Overall organism conditions were similar between the outfall locations and reference locations. The English sole and the Dungeness crab were species selected for bioaccumulation analysis. Three DDTs, 11 PAHs, and 31 PCB congeners were detected in the liver and hepatopancreas tissues. PCB concentrations were statistically significantly higher in the livers of fish collected from the outfall area over those of fish collected in the reference area throughout the study years, and total PAHs frequently exceeded the screening value in all tissue types in organisms from both the reference and outfall areas. There were not any statistically significant trends in bioaccumulation in any organism from either the reference or outfall areas, nor any trends between organism tissue and sediment concentrations. Mercury levels in fish muscle and zinc concentrations in the fish liver at the outfall area were significantly greater than those sampled in the reference area; however, all concentrations were below the mercury screening value the Discharger chose for the purposes of the study (mercury 0.5 ppm wet weight, and zinc 1500 ppm wet weight). Total PAH concentrations above the screening value were detected in every tissue type (except for fish liver) at both the reference and outfall locations in 2005, and were detected above the screening value in fish liver in 2006. Trace metal concentrations in 2005 and 2006 were similar to previous years and were similar to California coastal organisms in other studies.

VII. RATIONALE FOR PROVISIONS

A. Standard Provisions

Standard Provisions, which apply to all NPDES permits in accordance with section 122.41, and additional conditions applicable to specified categories of permits in accordance with section 122.42, are provided in Attachment D to the Order.

Section 122.41(a)(1) and (b) through (n) establish conditions that apply to all State issued NPDES permits. These conditions must be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to the regulations must be included in the Order. Section 123.25(a)(12) allows the state to omit or modify conditions to impose more stringent requirements. In accordance with section 123.25, this Order omits federal conditions that address enforcement authority specified

in sections 122.41(j)(5) and (k)(2) because the enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates by reference Water Code section 13387(e).

B. Monitoring and Reporting Program

The rationale for these requirements is described in Section VI, above and in Attachment G, Regional Standard Provisions and Monitoring Requirements for NPDES Wastewater Discharge Permits, July 2009.

C. Special Provisions

1. Reopener Provisions

These provisions are based on 40 CFR Part 123 and allow future modification of this Order and its effluent limitations as necessary.

2. Special Studies, Technical Reports and Additional Monitoring Requirements

a. Combined Sewage Collection System Overflow Study

The combined sewer system commingles storm water and domestic and industrial sewage. Heavy storm events can potentially result in flows that exceed the collection system capacity, at least in some areas. Although all overflows would be captured by the collection system at another point and not be discharged to surface waters, the presence of storm water and sewage on and around streets and sidewalks where human exposure could occur would constitute a nuisance as defined by CWC §13050. Such nuisances are prohibited by Regional Standard Provisions, and Monitoring and Reporting Requirements for NPDES Wastewater Discharge Permits (Attachment G). The purpose of this study is to determine whether nuisance conditions occur during wet weather and, if so, the extent to which they occur and what can be done to minimize or eliminate them.

b. Dilution Model Update and Stratification Data Collection

The available ambient data to determine stratification for the purposes of dilution modeling for this discharge is out-dated and incomplete. This provision requires the Discharger to submit updated data during the next permit reissuance to support new findings related to the most appropriate dilution allowance.

3. Best Management Practices and Pollution Prevention

The provision to continue implementation of a Pollutant Minimization Program is retained from the previous permit and is based on Ocean Plan Section C.9. The provision for pollution prevention is also required as one of the Nine Minimum Controls for combined sewer systems, described in under item 6, below.

4. Construction, Operation, and Maintenance Specifications

a. Wastewater Facilities, Review and Evaluation, and Status Reports

This provision is retained from the previous permit.

b. Operations and Maintenance (O&M) Manual, Review and Status Reports

This provision is based on 40 CFR Part 122 and is retained from the previous permit.

c. Contingency Plan, Review, and Status Reports

This provision is required by Regional Water Board Resolution No. 74-10 and 40 CFR Part 122, and is retained from the previous permit.

5. Special Provisions for Municipal Facilities

a. Pretreatment Program Requirements. This provision requires the Discharger to implement and enforce its approved pretreatment program in accordance with federal pretreatment regulations at 40 CFR Part 403.

b. Sludge Management Practices Requirements. This provision is based on the Basin Plan Chapter IV, Section 14.17, and 40 CFR Parts 257 and 503.

6. Combined Sewer Overflow Control Policy Requirements

The requirements of this provision specify performance criteria for operating the Combined Sewer System under wet weather controls, and are retained from the previous permit. The USEPA *Combined Sewer Overflow Control Policy* (59 FR 18688) regulates the operation of combined sewer systems. The Discharger has designed, constructed, and implemented control and treatment strategies that effectively address wet weather flow conditions, including treatment for 100% of the combined effluent.

The requirements of the USEPA *Combined Sewer Overflow Control Policy* are summarized below:

a. CSO Operation Plan. The Operation Plan is required as part of the Nine Minimum Controls and is revised as necessary to include the long term controls implemented in the long term control plan. This Order retains a provision to revise and update this Plan.

b. Nine Minimum Controls. The Combined Sewer Overflow Control Policy requires "Nine Minimum Controls" to satisfy the CWA technology-based requirements regarding CSOs. These are specifically stated in the provisions of this Order (Section VI.C.6.b) and described generally below .

(1) Conduct proper operations and regular maintenance programs. This control includes a requirement for continuing development and implementation of an Operations Plan.

(2) Maximize use of the collection system for storage. This control refers specifically to the sewer lines, which provide 2.2 million gallons of storage.

(3) Review and modify pretreatment program. This control is intended to minimize the impacts of non-domestic discharges.

(4) Maximize flow to the Plant. Maximizing flow to the Plant maximizes the volume of combined sewer flow treated.

(5) Prohibit CSOs during dry weather. The CWA prohibits CSOs during dry weather, and that prohibition is implemented as one of the Nine Minimum Controls.

(6) Control solid and floatable materials in the CSOs. The control of solids and floatable material is implemented via a baffle system within the combined sewer system and removal of the collected solids captured in the storage/transports.

(7) Develop and implement a Pollution Prevention Program. The Discharger is required to implement a Pollution Prevention Program, as described in section VI.C.3.a. of this Order.

(8) Notify the public of overflows. The Discharger's current notification process fulfills these requirements. The process includes permanent information signs at all beach locations around the perimeter of San Francisco. These signs inform the public in English, Spanish, and Chinese that international NO SWIMMING signs will be posted when it is unsafe to enter the water, and they warn users that bacteria concentrations may be elevated during periods of heavy rainfall. NO SWIMMING signs are posted at beach locations whenever an overflow occurs in the vicinity. These signs remain posted until water sampling indicates that bacteria concentrations have dropped below the level of concern for water contact recreation. Both signs reference the Discharger's toll-free water quality hotline (1-877-SFBEACH), which is updated weekly or whenever beach conditions change. The Discharger also provides color coded indicators (green/open; red/posted) of beach water quality conditions on the Internet (http://beaches.sfwater.org).

(9) Monitor to effectively characterize overflow impacts and the efficacy of CSOD controls. Monitoring requirements established by this Order include all of the Ocean Plan Table B toxic pollutants to better characterize the potential impacts of CSODs on the receiving water.

c. Long-Term Control Plan. In conformance with the *Combined Sewer Overflow Control Policy*, the Discharger developed a long-term control plan to select CSOD controls to comply with water quality standards, based on consideration of the Discharger's financial capability. The purpose of the long-term control plan is to fulfill the water quality-based requirements of the Clean Water Act. The Discharger's program is consistent with the USEPA *Combined Sewer Overflow Control Policy* Presumptive Approach, which presumes that an adequate level of

control is provided to meet the water quality requirements of the CWA contingent upon the satisfaction of any of the following criteria: (1) no more than an average of four overflow events per year, provided that the permitting authority may allow up to two additional overflow events per year (for the purpose of this criterion, an overflow event is one or more CSOs as a result of a precipitation event that does not receive the minimum treatment provided below); (2) the elimination or capture for treatment of no less than 85 percent by volume of the combined sewage collected in the system during precipitation events on a system-wide annual average basis; or (3) the elimination or removal of no less than the mass of pollutants, identified as causing water quality impairment through the sewer system characterization, monitoring, and modeling effort, for the volumes that would be eliminated or captured for treatment under (2) above. Combined sewer overflow treatment shall be a minimum of primary clarification for removal of floatables and settleable solids, solids and floatables disposal, and if necessary to meet water quality standards, disinfection.

The Discharger will continue to implement the Long-Term Control Plan and will characterize combined sewer discharges and the efficacy of the Long-Term-Control-Plan controls through combined sewer discharge monitoring, a requirement that is carried over from the previous permit.

The CSODs are consistent with the requirements of the Presumptive Approach because the Discharger captures and provides treatment to 100 percent of the combined sewer flow, which is greater than the minimum treatment requirement of 85 percent specified under the Presumptive Approach, and results in zero untreated CSOs per year. The effluent is not disinfected because State Water Board Order No.79-16 concluded that allowing an average of eight CSODs per year from Ocean Plan requirements would serve the public interest and would not compromise beneficial uses of the receiving waters.

7. Sensitive Areas Feasibility Report for Overflows

Under the Combined Sewer Overflow Control Policy, the combined sewer discharge points for the Oceanside plant are located in a sensitive area where primary contact recreation occurs. Section II. C. 3 of the Combined Sewer Overflow Control Policy, “Consideration of Sensitive Areas,” states that the Discharger’s long-term combined sewer overflow control plan should:

a. Prohibit new or significantly increased overflows;

b. (1) Eliminate and relocate overflows that discharge to sensitive areas wherever physically possible and economically achievable, except where elimination or relocation would provide less environmental protection than additional treatment.

(2) Where elimination or relocation is not physically possible and economically achievable, or would provide less environmental protection than additional treatment, provide the level of treatment for remaining

overflows deemed necessary to meet WQS for full protection of existing and designated uses. In any event, the level of control should not be less than those described in Evaluation of Alternatives below; and

c. Where elimination or relocation has been proven not to be physically possible and economically achievable, permitting authorities should require, for each subsequent permit term, a reassessment based on new or improved techniques to eliminate or relocate, or on changed circumstances that influence economic achievability."

The Discharger is to submit a report, no later than two years after the effective date of this Order, implementing the "consideration of sensitive areas" section of the Combined Sewer Overflow Control Policy. At a minimum, the discharger is to assess techniques to eliminate or relocate CSODs to sensitive areas, and discuss the level of treatment for any remaining CSODs necessary to meet water quality standards.

VIII. PUBLIC PARTICIPATION

The Regional Water Board is considering the issuance of waste discharge requirements (WDRs) that will serve as a National Pollutant Discharge Elimination System (NPDES) permit for City and County of San Francisco Oceanside Water Pollution Control Plant and Collection System, including the Westside Wet Weather Facilities. As a step in the WDR adoption process, Regional Water Board staff has developed tentative WDRs. The Regional Water Board encourages public participation in the WDR adoption process.

A. Notification of Interested Parties

The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe WDRs for the discharge and has provided an opportunity to submit their written comments and recommendations. Notification was provided through a public notice in the San Francisco Recorder during the time period June 8 to June 14, 2009.

Staff determinations are tentative. Interested persons are invited to submit written comments concerning these tentative WDRs. Comments must be submitted either in person or by mail or email to

Derek Whitworth
San Francisco Bay Regional Water Quality Control Board
1515 Clay St., Suite 1400
Oakland, CA 994612

Phone: 510 622 2349
Email: DWhitworth@waterboards.ca.gov

Written comments must be received at the Regional Water Board offices by 5:00 p.m. on July 6, 2009, to be given full consideration and to be fully responded to by Regional Water Board staff.

B. Public Hearings

The Regional Water Board will hold a public hearing on the tentative WDRs during its regular meeting on the following date and time and at the following location:

Date: August 12, 2009
Time: 9:00 a.m.
Location: Elihu Harris State Office Building
1515 Clay Street, 1st Floor Auditorium
Oakland, CA 94612

Interested persons are invited to attend. At this public hearing, the Regional Water Board will hear testimony, if any, on this Tentative Order.. Oral testimony will be heard; however, for accuracy of the record, important testimony should be in writing.

The Order may then be adopted by the Regional Water Board and USEPA at the subsequent hearing to be held on September 9, 2009, at the same time and place.

Please be aware that dates and venues may change. One can access the current agenda for any changes at: www.waterboards.gov/sanfranciscobay.

C. Waste Discharge Requirements Petitions

Any aggrieved person may petition the State Water Resources Control Board to review the decision of the Regional Water Board regarding the final WDRs. The petition must be submitted within 30 days of the Regional Water Board's action to the following address:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

D. Information and Copying

The Report of Waste Discharge, related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the address above at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday. Copying of documents may be arranged by calling 510-622-2300.

E. Register of Interested Persons

Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference this facility, and provide a name, address, and phone number.

F. Additional Information

Requests for additional information or questions regarding this order should be directed to Derek Whitworth at 510-622-2349 or email DWhitworth@waterboards.ca.gov.

Appendix 1

Ocean Discharge Criteria Evaluation
NPDES Permit CA0037681
City and County of San Francisco
Oceanside Water Pollution Control Plant (Southwest Ocean Outfall)
Prepared by EPA, Region 9 Water Division
April 27, 2009

Background and Purpose

The purpose of this analysis is to provide supporting documentation for the EPA's evaluation of unreasonable degradation of the marine environment under Section 403 of the Clean Water Act (CWA) for the City and County of San Francisco's Oceanside draft permit. This draft permit is jointly proposed by the EPA and the State of California's San Francisco Bay Regional Water Quality Control Board (Water Board). This analysis applies to the discharge to Federal waters from the Southwest Ocean Outfall.

EPA Region 9 is proposing to comply with the CWA evaluation of unreasonable degradation for this discharge by applying State water quality standards contained in the California Ocean Plan (COP) to the discharge from the Southwest Ocean Outfall, with the exception of the pollutant TCDD equivalents (dioxin). In calculating NPDES permit limitations and conditions for dioxin for this discharge, EPA is using the COP numeric criterion for this pollutant, as well as the COP standard implementation procedures, such as dilution procedures. However, we are proposing to use additional, more recent scientific information that has not yet been considered for inclusion in the COP water quality standards, based on EPA's ocean discharge criteria regulations at 40 CFR 125.122(a). For the calculation of NPDES permit limitations for dioxin, we are proposing to use recently updated toxicity equivalency factors (TEFs), published by the World Health Organization in 2005, as well as the congener-specific bioconcentration equivalency factors (BEFs) used for the Great Lakes System. This approach to developing NPDES permit limits for dioxin was recommended in the "Bay Area Clean Water Agencies' Draft Dioxin Issue Paper: Expert Panel Response and Recommendations," dated April 4, 2008. It incorporates recent scientific information for dioxins on a congener-specific basis, while continuing to use the COP criterion and standards implementation procedures. Region 9's use of the TEFs and BEFs in the draft permit at this time does not constitute EPA endorsement of this approach in other situations.

Because we are proposing to supplement the State water quality standards with some additional information for dioxin, we have developed an analysis of the 10 factors under 40 CFR 125.122(a) to determine unreasonable degradation of the marine environment. The definition of unreasonable degradation of the marine environment in 40 CFR 125.121(e) states:

Unreasonable degradation of the marine environment means:

(1) Significant adverse changes in ecosystem diversity, productivity and stability of the biological community within the area of discharge and surrounding biological communities,
(2) Threat to human health through direct exposure to pollutants or through consumption of exposed aquatic organisms, or
(3) Loss of esthetic, recreational, scientific or economic values which is unreasonable in relation to the benefit derived from the discharge.

The remainder of this evaluation discusses each of the 10 factors and describes our conclusion that the discharge of dioxin will not cause unreasonable degradation of the marine environment under the Federal regulations.

Evaluation of the Ten Ocean Discharge Criteria under 40 CFR 125.122(a)(1)-(10)

Factor 1: Quantities, Composition, and Potential for Bioaccumulation or Persistence of Pollutants to be Discharged

The quantities and composition of the discharge reflect the main source of dioxins to the plant influent, which appears to be stormwater collected in the combined sewer system. In addition to effluent monitoring, the prior NPDES permit for the Southwest Ocean Outfall required a sampling program to assess dioxin in the City's wastewater discharged to the ocean, and the discharger completed a City-wide dioxin monitoring and assessment report in 2000 (Rourke et. al., 2000). The City's combined sewer system commingles wastewater from homes and businesses with stormwater. The sampling results show that stormwater has significantly higher concentrations of dioxins than dry weather wastewater influent flowing to the plant.

Because all of the City's stormwater receives some level of treatment prior to discharge, the discharge of dioxin to the environment is less than would be expected in a similar community with separate storm sewers. In fact the City's monitoring report (Rourke et. al., 2000) estimated that the wastewater control facilities remove more than 80% of dioxin contained in all stormwater runoff from the City. Communities with separate storm sewers are not categorically required to provide treatment and therefore generally remove no dioxin from their stormwater.

According to the discharger's report, influent to the City's Southeast plant was significantly higher in dioxin on wet weather days than the influent to the Oceanside plant. The sampling report attributed this result to the fact that the service area for the Southeast plant is primarily industrial, so the eastern side of the City would be expected to have a heavier loading due to emissions from diesel engines and other combustion sources. Influent to the Southeast plant during wet weather was on average 35 pg/l TEQ. The report measured average untreated dry weather influent to the Oceanside plant as 1.3 pg/l TEQ, while the average influent during wet weather was 16 pg/l TEQ. At the Oceanside Plant, wet weather effluent (primary/secondary blend) averaged 1.7 pg/l TEQ, while dry weather effluent was less than 0.06 pg/l.

The quantities and composition of the dioxin discharge from the Southwest Ocean Outfall are fairly well characterized, as the discharger has monitored Southwest Ocean Outfall effluent for the dioxin congeners specified in the COP for over 10 years. However, because the detection levels for available quantitation methods (EPA method 1613 is typically used) are often one or more orders of magnitude higher than the water quality criterion, there is some scientific

uncertainty associated with the analysis. Of the 18 sample points used to develop this draft permit, the sample taken on February 13, 2007 contained the highest measured level of TCDD equivalents at 1.35x10-7ug/l with the BEFs and TEFs applied, and 1.0x10-6 ug/l with only TEFs applied. On this day, 6 dioxin congeners were detected: 1,2,3,4,6,7,8-HpCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 2,3,4,6,7,8-HxCDF, OCDD, and OCDF. The most toxic congener, 2,3,7,8-TCDD, was not detected on any of the days. On most days, most of the congeners were not detected, with the exception of OCDD, which is the most commonly detected congener in the effluent.

Results from the dry weather effluent monitoring data required as a condition of the previous NPDES permit show levels of dioxin consistent with dry weather data from other wastewater treatment plants. Using EPA method 1613, the samples shows a majority of non-detect values, with the congener OCDD most commonly detected. The Water Board and EPA applied COP reasonable potential procedures to the dry weather effluent data, with the addition of updated TEF values and the use of the default Great Lakes BEF values. The result of the analysis was no reasonable potential for the discharge of dioxin to cause or contribute to a water quality exceedance, and thus a water quality-based effluent limitation for TCDD equivalents is not required.

Factor 1 also includes the potential for bioaccumulation or persistence. Dioxin is a bioaccumulative and persistent pollutant. The COP water quality criterion was developed to take this into account, and the BEFs quantify the bioaccumulative properties of each congener regulated under the COP. EPA and the Water Board appropriately considered the bioaccumulative properties of the dioxin congeners in the development of the proposed NPDES permit provisions. Additionally, the location of the outfall along with the diffuser ensures that mixing and dispersion occur, and thus it is unlikely that dioxin in the water column or sediments will build to levels expected to threaten human health due to the consumption of exposed aquatic organisms.

In summary, because the main source of dioxin to the Southwest Ocean Outfall discharge appears to be stormwater and because all the stormwater receives treatment, EPA believes the discharge of dioxin to the environment is less than that from other similar communities with separate storm sewers. While the introduction of dioxins continues to be of concern on a global scale, the dioxin contribution from the Southwest Ocean Outfall discharge is not likely to be a significant source in comparison to that from other urban communities.

Factor 2: Potential for Biological, Physical, or Chemical Transport

Biological transport could occur through the bioaccumulative properties of dioxin. This is taken into account by the COP criterion, as human health impacts through the consumption of aquatic organisms are the bases for the most limiting COP criterion for dioxin relevant to this discharge.

As is the case for many organic pollutants in wastewater, dioxin is associated with effluent suspended solids. Thus, physical transport can occur through the movement of sediment, as well as through the water column. The Westside Wet Weather Facilities treatment, which

consists of solids settling, is effective in removing some dioxin from the discharge (Rourke et. al., 2000).

Because dioxins are persistent compounds that remain stable in the environment, chemical transport is not significant.

The Southwest Ocean Outfall discharges 3.4 to 3.6 nautical miles from the shore, which provides dilution, mixing, and dispersion of pollutants into the open ocean environment. These processes decrease the likelihood that dioxin concentrations in the water column or in sediment would build to levels of concern. The San Francisco Bay is listed as impaired for dioxins under section 303(d) of the CWA, but the receiving waters for the Southwest Ocean Outfall are not listed as impaired. The San Francisco Bay is surrounded by urban development, with more sources of dioxins and fewer opportunities for dispersion into the ocean than the Southwest Ocean Outfall discharge. A comparison of data from the San Francisco Bay's Regional Monitoring Program to sediment and fish tissue data collected as part of the prior NPDES permit's Southwest Ocean Outfall receiving water monitoring requirements concludes that organic pollutants in fish and sediments from San Francisco Bay were higher than those in fish and sediments on the coast (Melwani, undated).

Although the Southwest Ocean Outfall receiving water monitoring does not directly measure dioxins in the sediment and fish tissue of the receiving waters, analysis of bioaccumulative compounds such as mercury and PCBs, including dioxin-like PCBs, was conducted. Based on data collected over ten years, the discharger's analysis did not find any upward trends in the levels of bioaccumulative pollutants in sediments or fish tissue, or any differences between the outfall stations and the reference stations that would indicate an outfall effect (SFPUC, 2006). Thus, EPA does not believe the potential for biological, physical, or chemical transport will cause unreasonable degradation of the ocean environment.

Factor 3: Composition and Vulnerability of Biological Communities

The discharger has conducted benthic infauna community monitoring as well as trawl studies. Fishes collected in the study area represent a general assortment of native species common to central California near-shore waters, with occasional occurrences of species from warmer, southern waters. The biological communities in the vicinity of the discharge appear to be similar to those in other sandy bottom ocean environments off the coast of central California. Federally-listed species under the Endangered Species Act as well as Essential Fish Habitat species under the Magnuson-Stevens Fishery Conservation and Management Act occur in the vicinity of the discharge. EPA is in the process of informal consultation with NOAA Fisheries for this permit reissuance. EPA received a "not likely to adversely affect" determination from NOAA Fisheries for the last two re-issuances of this NPDES permit. Accordingly, EPA is unaware of any specific concerns regarding dioxin for species of concern in the vicinity of the discharge.

Factor 4: Importance of the Receiving Water to the Surrounding Biological Community

EPA is unaware of any unique habitat in the area of the discharge, such as spawning sites, kelp beds, or "hauling out" sites for marine mammals.

Factor 5: Existence of Special Aquatic Sites

The Monterey Bay National Marine Sanctuary (MBNMS) is located in the vicinity of the discharge. However, the Southwest Ocean Outfall discharge itself is not located within the sanctuary boundary. Instead, it is located within an exclusion zone that extends from off the north coast of San Mateo County and the City and County of San Francisco between Point Bonita and Point San Pedro (NOAA 1992, 1999a). Accordingly, the discharge from the Southwest Ocean Outfall is not expected to have a significant adverse effect on the MBNMS.

Factor 6: Potential Impacts on Human Health

As described in factor 10 below, the proposed NPDES permit is based on a water quality criterion for dioxin TEQ developed for the COP which considers the risk to human health from consuming fish and shellfish. Because dioxin congeners are persistent, bioaccumulative pollutants, the discharger will continue to monitor Southwest Ocean Outfall effluent for the presence of dioxin congeners. However, the reasonable potential analysis conducted using reasonable potential procedures developed for COP water quality objectives indicate that dioxin in the Southwest Ocean Outfall effluent has no reasonable potential to cause or contribute to the exceedance of the receiving water quality standard for dioxin.

Factor 7: Recreational and Commercial Fisheries

Recreational and commercial fishing is common in the Pacific Ocean right outside the San Francisco Bay. For this reason, the discharger has been monitoring sediments and fish tissue for bioaccumulative pollutants for over 10 years as part of the Southwest Ocean Outfall monitoring program. No significant outfall effects or upward trends in pollutant concentrations have been found.

Factor 8: Coastal Zone Management Plan

The California Coastal Zone Management Plan (CZMP) incorporates the COP. Because the COP implements water quality standards for dioxin in the Southwest Ocean Outfall discharge, the COP contains the most relevant and specific CZMP requirements. As previously stated, this draft permit proposes to implement the COP criteria and policies, including the policy on dilution, with the addition of the application of TEFs and BEFs for determining reasonable potential for dioxin under the NPDES program.

The Coastal Zone Management Act requires that states make consistency determinations for any federally licensed or permitted activity affecting the coastal zone of a state with an approved CZMP. California's Coastal Management Program was approved in 1978 and established the California Coastal Commission (CCC) as lead agency for program implementation. However, CCC staff has stated that the CCC does not conduct consistency reviews for wastewater treatment plants that operate at secondary treatment levels and thus the CCC will not be providing a consistency determination for the proposed permit

Factor 9: Other Factors Relating to Effects of the Discharge

EPA is proposing to include additional, more recent scientific information that has not yet been considered for inclusion in the COP water quality standards, based on EPA's ocean discharge criteria regulations at 40 CFR 125.122(a). For the calculation of NPDES permit limitations for dioxin, we are proposing to use recently updated toxicity equivalency factors (TEFs), published by the World Health Organization in 2005, as well as the congener-specific bioconcentration equivalency factors (BEFs) used for the Great Lakes System. As explained above, this approach for developing NPDES permit limits for dioxin was recommended in the "Bay Area Clean Water Agencies' Draft Dioxin Issue Paper: Expert Panel Response and Recommendations," dated April 4, 2008, and it incorporates updated scientific information for dioxins on a congener-specific basis, while continuing to use the COP criterion and standards implementation procedures. While Region 9 has the discretion to use these factors under the ocean discharge regulations, Region 9's use of the TEFs and BEFs in the draft permit at this time does not constitute EPA endorsement of this approach in other situations.

Factor 10: Marine Water Quality Criteria Under CWA 304(a)(1)

The current recommended EPA marine water quality criteria for dioxin are 5.1E-09 ug/l for consumption of organisms only, and 5.0E-09 ug/l for consumption of water and organisms. These recommended criteria are based on a carcinogenicity of 10-6 risk. The water quality criteria adopted for dioxin in the COP is 3.9E-09 ug/l for TCDD equivalents on a 30 day average basis. Applying the TEFs and BEFs as well as a conservative 76:1 dilution, under the COP reasonable potential (RP) procedure, which closely parallels the RP procedure in "EPA's Technical Support Document for Water Quality-Based Toxics Control (TSD, USEPA 1991)," EPA and the Water Board conclude the discharge does not have RP for dioxin, and thus the draft permit contains no numeric limits for dioxin. Because the COP criterion for dioxin is more stringent than the EPA recommended criteria, this discharge would not be expected to cause exceedances of the EPA criteria.

Conclusion: Determination of No Unreasonable Degradation of the Marine Environment

Based on consideration of the ten factors discussed above, Region 9 has determined that no unreasonable degradation of the marine environment will result from the discharges of dioxin through the Southwest Ocean Outfall as proposed under NPDES permit CA003768, with all the limitations, conditions, and monitoring requirements in effect.

EPA recognizes that bioaccumulative pollutants such as dioxin are of concern in the receiving waters of the Pacific Ocean, as commercial and recreational fishing takes place in these waters. However, monitoring over a 10 year period has not shown increasing concentrations of bioaccumulative substances in sediment or fish tissue in the vicinity of the discharge. Further, EPA expects that the contribution of dioxins from the Southwest Ocean Outfall discharge is lower than in other urban areas of similar size, due to the City's stormwater treatment facilities and residential service area which, unlike industrial areas, is expected to generate fewer dioxins. The proposed NPDES permit will require continued effluent monitoring for dioxin congeners. The Southwest Ocean Outfall monitoring program will continue to monitor for selected bioaccumulative pollutants in sediment and fish tissue, including dioxin-like PCBs. Finally, because stormwater is significantly higher in dioxin than dry-weather flows, the

proposed permit requirement that the discharger develop options to reduce pollutant loading in stormwater, such as green infrastructure efforts, is expected to reduce dioxin loading to the receiving water.

REGIONAL STANDARD PROVISIONS, AND MONITORING AND REPORTING REQUIREMENTS (SUPPLEMENT TO ATTACHMENT D)

FOR

NPDES WASTEWATER DISCHARGE PERMITS

APPLICABILITY

This document applies to dischargers covered by a National Pollutant Discharge Elimination System (NPDES) permit. This document does not apply to Municipal Separate Storm Sewer System (MS4) NPDES permits.

The purpose of this document is to supplement the requirements of Attachment D, Standard Provisions. The requirements in this supplemental document are designed to ensure permit compliance through preventative planning, monitoring, recordkeeping, and reporting. In addition, this document requires proper characterization of issues as they arise, and timely and full responses to problems encountered. To provide clarity on which sections of Attachment D this document supplements, this document is arranged in the same format as Attachment D.

I. STANDARD PROVISIONS - PERMIT COMPLIANCE

A. Duty to Comply – Not Supplemented

B. Need to Halt or Reduce Activity Not a Defense – Not Supplemented

C. Duty to Mitigate – This supplements I.C. of Standard Provisions (Attachment D)

1. **Contingency Plan -** The Discharger shall maintain a Contingency Plan as originally required by Regional Water Board Resolution 74-10 and as prudent in accordance with current municipal facility emergency planning. The Contingency Plan shall describe procedures to ensure that existing facilities remain in, or are rapidly returned to, operation in the event of a process failure or emergency incident, such as employee strike, strike by suppliers of chemicals or maintenance services, power outage, vandalism, earthquake, or fire. The Discharger may combine the Contingency Plan and Spill Prevention Plan into one document. Discharge in violation of the permit where the Discharger has failed to develop and implement a Contingency Plan as described below will be the basis for considering the discharge a willful and negligent violation of the permit pursuant to California Water Code Section 13387. The Contingency Plan shall, at a minimum, contain the provisions of a. through g. below.

    a. Provision of personnel for continued operation and maintenance of sewerage facilities during employee strikes or strikes against contractors providing services.

b. Maintenance of adequate chemicals or other supplies and spare parts necessary for continued operations of sewerage facilities.

c. Provisions of emergency standby power.

d. Protection against vandalism.

e. Expeditious action to repair failures of, or damage to, equipment and sewer lines.

f. Report of spills and discharges of untreated or inadequately treated wastes, including measures taken to clean up the effects of such discharges.

g. Programs for maintenance, replacement, and surveillance of physical condition of equipment, facilities, and sewer lines.

2. **Spill Prevention Plan** - The Discharger shall maintain a Spill Prevention Plan to prevent accidental discharges and minimize the effects of such events. The Spill Prevention Plan shall:

   a. Identify the possible sources of accidental discharge, untreated or partially treated waste bypass, and polluted drainage;

   b. Evaluate the effectiveness of present facilities and procedures, and state when they became operational; and

   c. Predict the effectiveness of the proposed facilities and procedures, and provide an implementation schedule containing interim and final dates when they will be constructed, implemented, or operational.

   This Regional Water Board, after review of the Contingency and Spill Prevention Plans or their updated revisions, may establish conditions it deems necessary to control accidental discharges and to minimize the effects of such events. Such conditions may be incorporated as part of the permit upon notice to the Discharger.

D. Proper Operation & Maintenance – This supplements I.D of Standard Provisions (Attachment D)

1. **Operation and Maintenance (O&M) Manual** - The Discharger shall maintain an O&M Manual to provide the plant and regulatory personnel with a source of information describing all equipment, recommended operational strategies, process control monitoring, and maintenance activities. To remain a useful and relevant document, the O&M Manual shall be kept updated to reflect significant changes in treatment facility equipment and operational practices. The O&M Manual shall be maintained in usable condition and be available for reference and use by all relevant personnel and Regional Water Board staff.

2. **Wastewater Facilities Status Report** - The Discharger shall regularly review, revise, or update, as necessary, its Wastewater Facilities Status Report. This report shall document how the Discharger operates and maintains its wastewater collection, treatment, and disposal facilities to ensure that all facilities are adequately staffed, supervised, financed, operated,

maintained, repaired, and upgraded as necessary to provide adequate and reliable transport, treatment, and disposal of all wastewater from both existing and planned future wastewater sources under the Discharger's service responsibilities.

3. **Proper Supervision and Operation of Publicly Owned Treatment Works (POTWs) -** POTWs shall be supervised and operated by persons possessing certificates of appropriate grade pursuant to Division 4, Chapter 14, Title 23 of the California Code of Regulations.

E. Property Rights – Not Supplemented

F. Inspection and Entry – Not Supplemented

G. Bypass – Not Supplemented

H. Upset – Not Supplemented

I. Other – This section is an addition to Standard Provisions (Attachment D)

1. Neither the treatment nor the discharge of pollutants shall create pollution, contamination, or nuisance as defined by California Water Code Section 13050.

2. Collection, treatment, storage, and disposal systems shall be operated in a manner that precludes public contact with wastewater, except in cases where excluding the public is infeasible, such as private property. If public contact with wastewater could reasonably occur on public property, warning signs shall be posted.

3. If the Discharger submits a timely and complete Report of Waste Discharge for permit reissuance, this permit continues in force and effect until a new permit is issued or the Regional Water Board rescinds the permit.

J. Storm Water – This section is an addition to Standard Provisions (Attachment D)

These provisions apply to facilities that do not direct all storm water flows from the facility to the wastewater treatment plant headworks.

1. **Storm Water Pollution Prevention Plan (SWPP Plan**)

The SWPP Plan shall be designed in accordance with good engineering practices and shall address the following objectives:

a. To identify pollutant sources that may affect the quality of storm water discharges; and

b. To identify, assign, and implement control measures and management practices to reduce pollutants in storm water discharges.

The SWPP Plan may be combined with the existing Spill Prevention Plan as required in accordance with Section C.2. The SWPP Plan shall be retained on-site and made available upon request of a representative of the Regional Water Board.

2. Source Identification

The SWPP Plan shall provide a description of potential sources that may be expected to add significant quantities of pollutants to storm water discharges, or may result in non-storm water discharges from the facility. The SWPP Plan shall include, at a minimum, the following items:

a. A topographical map (or other acceptable map if a topographical map is unavailable), extending one-quarter mile beyond the property boundaries of the facility, showing the wastewater treatment facility process areas, surface water bodies (including springs and wells), and discharge point(s) where the facility's storm water discharges to a municipal storm drain system or other points of discharge to waters of the State. The requirements of this paragraph may be included in the site map required under the following paragraph if appropriate.

b. A site map showing the following:

1) Storm water conveyance, drainage, and discharge structures;

2) An outline of the storm water drainage areas for each storm water discharge point;

3) Paved areas and buildings;

4) Areas of actual or potential pollutant contact with storm water or release to storm water, including but not limited to outdoor storage and process areas; material loading, unloading, and access areas; and waste treatment, storage, and disposal areas;

5) Location of existing storm water structural control measures (i.e., berms, coverings, etc.);

6) Surface water locations, including springs and wetlands; and

7) Vehicle service areas.

c. A narrative description of the following:

1) Wastewater treatment process activity areas;

2) Materials, equipment, and vehicle management practices employed to minimize contact of significant materials of concern with storm water discharges;

3) Material storage, loading, unloading, and access areas;

4) Existing structural and non-structural control measures (if any) to reduce pollutants in storm water discharges; and

5) Methods of on-site storage and disposal of significant materials.

d. A list of pollutants that have a reasonable potential to be present in storm water discharges in significant quantities.

3. Storm Water Management Controls

The SWPP Plan shall describe the storm water management controls appropriate for the facility and a time schedule for fully implementing such controls. The appropriateness and priorities of controls in the SWPP Plan shall reflect identified potential sources of pollutants. The description of storm water management controls to be implemented shall include, as appropriate:

a. Storm water pollution prevention personnel

Identify specific individuals (and job titles) that are responsible for developing, implementing, and reviewing the SWPP Plan.

b. Good housekeeping

Good housekeeping requires the maintenance of clean, orderly facility areas that discharge storm water. Material handling areas shall be inspected and cleaned to reduce the potential for pollutants to enter the storm drain conveyance system.

c. Spill prevention and response

Identify areas where significant materials can spill into or otherwise enter storm water conveyance systems and their accompanying drainage points. Specific material handling procedures, storage requirements, and cleanup equipment and procedures shall be identified, as appropriate. The necessary equipment to implement a cleanup shall be available, and personnel shall be trained in proper response, containment, and cleanup of spills. Internal reporting procedures for spills of significant materials shall be established.

d. Source control

Source controls include, for example, elimination or reduction of the use of toxic pollutants, covering of pollutant source areas, sweeping of paved areas, containment of potential pollutants, labeling of all storm drain inlets with “No Dumping” signs, isolation or separation of industrial and non-industrial pollutant sources so that runoff from these areas does not mix, etc.

e. Storm water management practices

Storm water management practices are practices other than those that control the sources of pollutants. Such practices include treatment or conveyance structures, such as drop inlets, channels, retention and detention basins, treatment vaults, infiltration galleries, filters, oil/water separators, etc. Based on assessment of the potential of various sources to contribute pollutants to storm water discharges in significant quantities, additional storm water management practices to remove pollutants from storm water discharges shall be implemented and design criteria shall be described.

f. Sediment and erosion control

Measures to minimize erosion around the storm water drainage and discharge points, such as riprap, revegetation, slope stabilization, etc., shall be described.

g. Employee training

Employee training programs shall inform all personnel responsible for implementing the SWPP Plan. Training shall address spill response, good housekeeping, and material management practices. New employee and refresher training schedules shall be identified.

h. Inspections

All inspections shall be done by trained personnel. Material handling areas shall be inspected for evidence of, or the potential for, pollutants entering storm water discharges. A tracking or follow up procedure shall be used to ensure appropriate response has been taken in response to an inspection. Inspections and maintenance activities shall be documented and recorded. Inspection records shall be retained for five years.

i. Records

A tracking and follow-up procedure shall be described to ensure that adequate response and corrective actions have been taken in response to inspections.

4. Annual Verification of SWPP Plan

An annual facility inspection shall be conducted to verify that all elements of the SWPP Plan are accurate and up-to-date. The results of this review shall be reported in the Annual Report to the Regional Water Board described in Section V.C.f.

K. Biosolids Management – This section is an addition to Standard Provisions (Attachment D)

Biosolids must meet the following requirements prior to land application. The Discharger must either demonstrate compliance or, if it sends the biosolids to another party for further treatment or distribution, must give the recipient the information necessary to ensure compliance.

1. Exceptional quality biosolids meet the pollutant concentration limits in Table III of 40 CFR Part 503.13, Class A pathogen limits, and one of the vector attraction reduction requirements in 503.33(b)(1)-(b)(8). Such biosolids do not have to be tracked further for compliance with general requirements (503.12) and management practices (503.14).

2. Biosolids used for agricultural land, forest, or reclamation shall meet the pollutant limits in Table I (ceiling concentrations) and Table II or Table III (cumulative loadings or pollutant concentration limits) of 503.13. They shall also meet the general requirements (503.12) and management practices (503.14) (if not exceptional quality biosolids) for Class A or Class B pathogen levels with associated access restrictions (503.32) and one of the 10 vector attraction reduction requirements in 503.33(b)(1)-(b)(10).

3. Biosolids used for lawn or home gardens must meet exceptional quality biosolids limits.

4. Biosolids sold or given away in a bag or other container must meet the pollutant limits in either Table III or Table IV (pollutant concentration limits or annual pollutant loading rate limits) of 503.13. If Table IV is used, a label or information sheet must be attached to the biosolids packing that explains Table IV (see 503.14). The biosolids must also meet the Class A pathogen limits and one of the vector attraction reduction requirements in 503.33(b)(1)-(b)(8).

II. STANDARD PROVISIONS – PERMIT ACTION – Not Supplemented

III. STANDARD PROVISIONS – MONITORING

A. Sampling and Analyses – This section is a supplement to III.A and III.B of Standard Provisions (Attachment D)

1. Use of Certified Laboratories

Water and waste analyses shall be performed by a laboratory certified for these analyses in accordance with California Water Code Section 13176.

2. Use of Appropriate Minimum Levels

Table C lists the suggested analytical methods for the 126 priority pollutants and other toxic pollutants that should be used, unless a particular method or minimum level (ML) is required in the MRP.

For priority pollutant monitoring, when there is more than one ML value for a given substance, the Discharger may select any one of those cited analytical methods for compliance determination provided the ML is below the effluent limitation and the water quality objective. If no ML value is below the effluent limitation and water quality objective, then the Regional Water Board will assign the lowest ML value indicated in Table C, and its associated analytical method for inclusion in the MRP. For effluent monitoring, this alternate method shall also be U.S. EPA-approved (such as the 1600 series) or one of those listed in Table C. All monitoring instruments and equipment shall be properly calibrated and maintained to ensure accuracy of measurements.

3. Frequency of Monitoring

The minimum schedule of sampling analysis is specified in the MRP portion of the permit.

a. Timing of Sample Collection

i. The Discharger shall collect samples of influent on varying days selected at random and shall not include any plant recirculation or other sidestream wastes, unless otherwise stipulated by the MRP.

ii. The Discharger shall collect samples of effluent on days coincident with influent sampling unless otherwise stipulated by the MRP or the Executive Officer. The Executive Officer may approve an alternative sampling plan if it is demonstrated to be representative of plant discharge flow and in compliance with all other permit requirements.

iii. The Discharger shall collect grab samples of effluent during periods of day-time maximum peak effluent flows (or peak flows through secondary treatment units for facilities that recycle effluent flows).

iv. Effluent sampling for conventional pollutants shall occur on at least one day of any multiple-day bioassay test the MRP requires. During the course of the test, on at least one day, the Discharger shall collect and retain samples of the discharge. In the event a bioassay test does not comply with permits limits, the Discharger shall analyze these retained samples for pollutants that could be toxic to aquatic life and for which it has effluent limits.

1) The Discharger shall perform bioassay tests on final effluent samples; when chlorine is used for disinfection, bioassay tests shall be performed on effluent after chlorination-dechlorination; and

2) The Discharger shall analyze for total ammonia nitrogen and calculate the amount of un-ionized ammonia whenever test results fail to meet the percent survival specified in the permit.

b. Conditions Triggering Accelerated Monitoring

i. If the results from two consecutive samples of a constituent monitored in a 30-day period exceed the monthly average limit for any parameter (or if the required sampling frequency is once per month and the monthly sample exceeds the monthly average limit), the Discharger shall, within 24 hours after the results are received, increase its sampling frequency to daily until the results from the additional sampling shows that the parameter is in compliance with the monthly average limit.

ii. If any maximum daily limit is exceeded, the Discharger shall increase its sampling frequency to daily within 24 hours after the results are received that indicate the exceedance of the maximum daily limit until two samples collected on consecutive days show compliance with the maximum daily limit.

iii. If final or intermediate results of an acute bioassay test indicate a violation or threatened violation (e.g., the percentage of surviving test organisms of any single acute bioassay test is less than 70 percent), the Discharger shall initiate a new test as soon as practical, and the Discharger shall investigate the cause of the mortalities and report its findings in the next self-monitoring report (SMR).

iv. The Discharger shall calibrate chlorine residual analyzers against grab samples as frequently as necessary to maintain accurate control and reliable operation. If an effluent violation is detected, the Discharger shall collect grab samples at least every 30 minutes until compliance with the limit is achieved, unless the Discharger monitors chlorine residual continuously. In such cases, the Discharger shall continue to conduct continuous monitoring as required by its permit.

v. When any type of bypass occurs, the Discharger shall collect samples on a daily basis for all constituents at affected discharge points that have effluent limits for the duration of the bypass, unless otherwise stipulated by the MRP.

c. Storm Water Monitoring

The requirements of this section only apply to facilities that are not covered by an NPDES permit for storm water discharges and where not all site storm drainage from process areas (i.e., areas of the treatment facility where chemicals or wastewater could come in contact with storm water) is directed to the headworks. For storm water not directed to the headworks during the wet season (October 1 to April 30), the Discharger shall:

i. Conduct visual observations of the storm water discharge locations during daylight hours at least once per month during a storm event that produces significant storm water discharge to observe the presence of floating and suspended materials, oil and grease, discoloration, turbidity, and odor, etc.

ii. Measure (or estimate) the total volume of storm water discharge, collect grab samples of storm water discharge from at least two storm events that produce significant storm water discharge, and analyze the samples for oil and grease, pH, TSS, and specific conductance.

The grab samples shall be taken during the first 30 minutes of the discharge. If collection of the grab samples during the first 30 minutes is impracticable, grab samples may be taken during the first hour of the discharge, and the Discharger shall explain in the Annual Report why the grab sample(s) could not be taken in the first 30 minutes.

iii. Testing for the presence of non-storm water discharges shall be conducted no less than twice during the dry season (May 1 to September 30) at all storm water discharge locations. Tests may include visual observations of flows, stains, sludges, odors, and other abnormal conditions; dye tests; TV line surveys; or analysis and validation of accurate piping schematics. Records shall be maintained describing the method used, date of testing, locations observed, and test results.

iv. Samples shall be collected from all locations where storm water is discharged. Samples shall represent the quality and quantity of storm water discharged from the facility. If a facility discharges storm water at multiple locations, the Discharger may sample a reduced number of locations if it establishes and documents through the monitoring program that storm water discharges from different locations are substantially identical.

v. Records of all storm water monitoring information and copies of all reports required by the permit shall be retained for a period of at least three years from the date of sample, observation, or report.

d. Receiving Water Monitoring

The requirements of this section only apply when the MRP requires receiving water sampling.

i. Receiving water samples shall be collected on days coincident with effluent sampling for conventional pollutants.

ii. Receiving water samples shall be collected at each station on each sampling day during the period within one hour following low slack water. Where sampling during lower slack water is impractical, sampling shall be performed during higher slack water. Samples shall be collected within the discharge plume and down current of the discharge point so as to be representative, unless otherwise stipulated in the MRP.

iii. Samples shall be collected within one foot of the surface of the receiving water, unless otherwise stipulated in the MRP.

B. Biosolids Monitoring – This section supplements III.B of Standard Provisions (Attachment D)

When biosolids are sent to a landfill, sent to a surface disposal site, or applied to land as a soil amendment, they must be monitored as follows:

1. Biosolids Monitoring Frequency

Biosolids disposal must be monitored at the following frequency:

Metric tons biosolids/365 days	Frequency
0-290	Once per year
290-1500	Quarterly
1500-15,000	Six times per year
Over 15,000	Once per month

(Metric tons are on a dry weight basis)

2. Biosolids Pollutants to Monitor

Biosolids shall be monitored for the following constituents:

Land Application: arsenic, cadmium, chromium, copper, mercury, molybdenum, nickel, lead, selenium, and zinc

Municipal Landfill: Paint filter test (pursuant to 40 CFR 258)

Biosolids-only Landfill or Surface Disposal Site (if no liner and leachate system): arsenic, chromium, and nickel

C. Standard Observations – This section is an addition to III of Standard Provisions (Attachment D)

1. Receiving Water Observations

The requirements of this section only apply when the MRP requires standard observations of the receiving water. Standard observations shall include the following:

a. *Floating and suspended materials* (e.g., oil, grease, algae, and other macroscopic particulate matter): presence or absence, source, and size of affected area.

b. *Discoloration and turbidity*: description of color, source, and size of affected area.

c. *Odor*: presence or absence, characterization, source, distance of travel, and wind direction.

d. *Beneficial water use*: presence of water-associated waterfowl or wildlife, fisherpeople, and other recreational activities in the vicinity of each sampling station.

e. *Hydrographic condition*: time and height of corrected high and low tides (corrected to nearest National Oceanic and Atmospheric Administration location for the sampling date and time of sample collection).

f. *Weather conditions*:

1) Air temperature; and

2) Total precipitation during the five days prior to observation.

2. Wastewater Effluent Observations

The requirements of this section only apply when the MRP requires wastewater effluent standard observations. Standard observations shall include the following:

a. *Floating and suspended material of wastewater origin* (e.g., oil, grease, algae, and other macroscopic particulate matter): presence or absence.

b. *Odor*: presence or absence, characterization, source, distance of travel, and wind direction.

3. Beach and Shoreline Observations

The requirements of this section only apply when the MRP requires beach and shoreline standard observations. Standard observations shall include the following:

a. *Material of wastewater origin*: presence or absence, description of material, estimated size of affected area, and source.

b. *Beneficial use*: estimate number of people participating in recreational water contact, non-water contact, or fishing activities.

4. Land Retention or Disposal Area Observations

The requirements of this section only apply to facilities with on-site surface impoundments or disposal areas that are in use. This section applies to both liquid and solid wastes, whether confined or unconfined. The Discharger shall conduct the following for each impoundment:

a. Determine the amount of freeboard at the lowest point of dikes confining liquid wastes.

b. Report evidence of leaching liquid from area of confinement and estimated size of affected area. Show affected area on a sketch and volume of flow (e.g., gallons per minute [gpm]).

c. Regarding odor, describe presence or absence, characterization, source, distance of travel, and wind direction.

d. Estimate number of waterfowl and other water-associated birds in the disposal area and vicinity.

5. Periphery of Waste Treatment and/or Disposal Facilities Observations

The requirements of this section only apply when the MRP specifies periphery standard observations. Standard observations shall include the following:

a. *Odor*: presence or absence, characterization, source, and distance of travel.

b. *Weather conditions*: wind direction and estimated velocity.

IV. STANDARD PROVISIONS – RECORDS

A. Records to be Maintained – This supplements IV.A of Standard Provisions (Attachment D)

The Discharger shall maintain records in a manner and at a location (e.g., wastewater treatment plant or Discharger offices) such that the records are accessible to Regional Water Board staff. The minimum period of retention specified in Section IV, Records, of the Federal Standard Provisions shall be extended during the course of any unresolved litigation regarding the subject discharge, or when requested by the Regional Water Board or Regional Administrator of USEPA, Region IX.

A copy of the permit shall be maintained at the discharge facility and be available at all times to operating personnel.

B. Records of monitoring information shall include – This supplements IV.B of Standard Provision (Attachment D)

1. Analytical Information

Records shall include analytical method detection limits, minimum levels, reporting levels, and related quantification parameters**.**

2. Flow Monitoring Data

For all required flow monitoring (e.g., influent and effluent flows), the additional records shall include the following, unless otherwise stipulated by the MRP:

a. Total volume for each day; and

b. Maximum, minimum, and average daily flows for each calendar month.

3. Wastewater Treatment Process Solids

a. For each treatment unit process that involves solids removal from the wastewater stream, records shall include the following:

1) Total volume or mass of solids removed from each unit (e.g., grit, skimmings, undigested biosolids) for each calendar month or other time period as appropriate, but not to exceed annually; and

2) Final disposition of such solids (e.g., landfill, other subsequent treatment unit).

b. For final dewatered biosolids from the treatment plant as a whole, records shall include the following:

1) Total volume or mass of dewatered biosolids for each calendar month;

2) Solids content of the dewatered biosolids; and

3) Final disposition of dewatered biosolids (disposal location and disposal method).

4. Disinfection Process

For the disinfection process, these additional records shall be maintained documenting process operation and performance:

a. For bacteriological analyses:

1) Wastewater flow rate at the time of sample collection; and

2) Required statistical parameters for cumulative bacterial values (e.g., moving median or geometric mean for the number of samples or sampling period identified in this Order).

b. For the chlorination process, when chlorine is used for disinfection, at least daily average values for the following:

1) Chlorine residual of treated wastewater as it enters the contact basin (mg/L);

2) Chlorine dosage (kg/day); and

3) Dechlorination chemical dosage (kg/day).

5. **Treatment Process Bypasses**

A chronological log of all treatment process bypasses, including wet weather blending, shall include the following:

a. Identification of the treatment process bypassed;

b. Dates and times of bypass beginning and end;

c. Total bypass duration;

d. Estimated total bypass volume; and

e. Description of, or reference to other reports describing, the bypass event, the cause, the corrective actions taken (except for wet weather blending that is in compliance with permit conditions), and any additional monitoring conducted.

6. **Treatment Facility Overflows**

This section applies to records for overflows at the treatment facility. This includes the headworks and all units and appurtenances downstream. The Discharger shall retain a chronological log of overflows at the treatment facility and records supporting the information provided in section V.E.2.

C. Claims of Confidentiality – Not Supplemented

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information – Not Supplemented

B. Signatory and Certification Requirements – Not Supplemented

C. Monitoring Reports – This section supplements V.C of Standard Provisions (Attachment D)

1. Self-Monitoring Reports

For each reporting period established in the MRP, the Discharger shall submit an SMR to the Regional Water Board in accordance with the requirements listed in this document and at the frequency the MRP specifies. The purpose of the SMR is to document treatment performance, effluent quality, and compliance with the waste discharge requirements of this Order.

a. Transmittal letter

Each SMR shall be submitted with a transmittal letter. This letter shall include the following:

1) Identification of all violations of effluent limits or other waste discharge requirements found during the reporting period;

2) Details regarding violations: parameters, magnitude, test results, frequency, and dates;

3) Causes of violations;

4) Discussion of corrective actions taken or planned to resolve violations and prevent recurrences, and dates or time schedule of action implementation (if previous reports have been submitted that address corrective actions, reference to the earlier reports is satisfactory);

5) Data invalidation (Data should not be submitted in an SMR if it does not meet quality assurance/quality control standards. However, if the Discharger wishes to invalidate any measurement after it was submitted in an SMR, a letter shall identify the measurement suspected to be invalid and state the Discharger's intent to submit, within 60 days, a formal request to invalidate the measurement. This request shall include the original measurement in question, the reason for invalidating the measurement, all relevant documentation that supports invalidation [e.g., laboratory sheet, log entry, test results, etc.], and discussion of the corrective actions taken or planned [with a time schedule for completion] to prevent recurrence of the sampling or measurement problem.);

6) If the Discharger blends, the letter shall describe the duration of blending events and certify whether blended effluent was in compliance with the conditions for blending; and

7) Signature (The transmittal letter shall be signed according to Section V.B of this Order, Attachment D – Standard Provisions.).

b. Compliance evaluation summary

Each report shall include a compliance evaluation summary. This summary shall include each parameter for which the permit specifies effluent limits, the number of samples taken during the monitoring period, and the number of samples that exceed applicable effluent limits.

c. Results of analyses and observations

1) Tabulations of all required analyses and observations, including parameter, date, time, sample station, type of sample, test result, method detection limit, method minimum level, and method reporting level, if applicable, signed by the laboratory director or other responsible official.

2) When determining compliance with an average monthly effluent limitation and more than one sample result is available in a month, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of detected but not quantified (DNQ) or nondetect (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

i. The data set shall be ranked from low to high, reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

ii. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

If a sample result, or the arithmetic mean or median of multiple sample results, is below the reporting limit, and there is evidence that the priority pollutant is present in the effluent above an effluent limitation and the Discharger conducts a Pollutant Minimization Program, the Discharger shall not be deemed out of compliance.

3) Dioxin-TEQ Reporting: The Discharger shall report for each dioxin and furan congener the analytical results of effluent monitoring, including the quantifiable limit (reporting level), and the method detection limit, and the measured concentration. Estimated concentrations shall be reported for individual congeners, but shall be set equal to zero in determining the dioxin-TEQ value. The Discharger shall multiply each measured or estimated congener concentration by its respective toxicity equivalency factor (TEF) shown in Table A and report the sum of these values.

Table A: Toxic Equivalency Factors for 2,3,7,8-TCDD Equivalents

Congener	**TEF**
2,3,7,8-TetraCDD	1
1,2,3,7,8-PentaCDD	1.0
1,2,3,4,7,8-HexaCDD	0.1
1,2,3,6,7,8-HexaCDD	0.1
1,2,3,7,8,9-HexaCDD	0.1
1,2,3,4,6,7,8-HeptaCDD	0.01
OctaCDD	0.0001
2,3,7,8-TetraCDF	0.1
1,2,3,7,8-PentaCDF	0.05
2,3,4,7,8-PentaCDF	0.5
1,2,3,4,7,8-HexaCDF	0.1
1,2,3,6,7,8-HexaCDF	0.1
1,2,3,7,8,9-HexaCDF	0.1
2,3,4,6,7,8-HexaCDF	0.1
1,2,3,4,6,7,8-HeptaCDF	0.01
1,2,3,4,7,8,9-HeptaCDF	0.01
OctaCDF	0.0001

d. Data reporting for results not yet available

The Discharger shall make all reasonable efforts to obtain analytical data for required parameter sampling in a timely manner. Certain analyses require additional time to complete analytical processes and report results. For cases where required monitoring parameters require additional time to complete analytical processes and reports, and results are not available in time to be included in the SMR for the subject monitoring period, the Discharger shall describe such circumstances in the SMR and include the data for these parameters and relevant discussions of any observed exceedances in the next SMR due after the results are available.

e. Flow data

The Discharger shall provide flow data tabulation pursuant to Section IV.B.2.

f. Annual self-monitoring report requirements

By the date specified in the MRP, the Discharger shall submit an annual report to the Regional Water Board covering the previous calendar year. The report shall contain the following:

1) Annual compliance summary table of treatment plant performance, including documentation of any blending events;

2) Comprehensive discussion of treatment plant performance and compliance with the permit (This discussion shall include any corrective actions taken or planned, such as changes to facility equipment or operation practices that may be needed to achieve compliance, and any other actions taken or planned that are intended to improve performance and reliability of the Discharger's wastewater collection, treatment, or disposal practices.);

3) Both tabular and graphical summaries of the monitoring data for the previous year if parameters are monitored at a frequency of monthly or greater;

4) List of approved analyses, including the following:

(i) List of analyses for which the Discharger is certified;

(ii) List of analyses performed for the Discharger by a separate certified laboratory and copies of reports signed by the laboratory director of that laboratory shall not be submitted but retained onsite;

(iii) List of "waived" analyses, as approved;

5) Plan view drawing or map showing the Discharger's facility, flow routing, and sampling and observation station locations;

6) Results of annual facility inspection to verify that all elements of the SWPP Plan are accurate and up to date (only required if the Discharger does not route all storm water to the headworks of its wastewater treatment plant); and

7) Results of facility report reviews (The Discharger shall regularly review, revise, and update, as necessary, the O&M Manual, the Contingency Plan, the Spill Prevention Plan, and Wastewater Facilities Status Report so that these documents remain useful and relevant to current practices. At a minimum, reviews shall be conducted annually. The Discharger shall include, in each Annual Report, a description or summary of review and evaluation procedures, recommended or planned actions, and an estimated time schedule for implementing these actions. The Discharger shall complete changes to these documents to ensure they are up-to-date.).

g. Report submittal

The Discharger shall submit SMRs to:

California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612
Attn: NPDES Wastewater Division

h. Reporting data in electronic format

The Discharger has the option to submit all monitoring results in an electronic reporting format approved by the Executive Officer. If the Discharger chooses to submit SMRs electronically, the following shall apply:

1) *Reporting Method*: The Discharger shall submit SMRs electronically via a process approved by the Executive Officer (see, for example, the letter dated December 17, 1999, "Official Implementation of Electronic Reporting System [ERS]" and the progress report letter dated December 17, 2000).

2) *Monthly or Quarterly Reporting Requirements*: For each reporting period (monthly or quarterly as specified in the MRP), the Discharger shall submit an electronic SMR to the Regional Water Board in accordance with the provisions of Section V.C.1.a-e, except for requirements under Section V.C.1.c(1) where ERS does not have fields for dischargers to input certain information (e.g., sample time). However, until USEPA approves the electronic signature or other signature technologies, Dischargers that use ERS shall submit a hard copy of the original transmittal letter, an ERS printout of the data sheet, and a violation report (a receipt of the electronic transmittal shall be retained by the Discharger). This electronic SMR submittal suffices for the signed tabulations specified under Section V.C.1.c(1).

3) *Annual Reporting Requirements*: Dischargers who have submitted data using the ERS for at least one calendar year are exempt from submitting the portion of the annual report required under Section V.C.1.f(1) and (3).

D. Compliance Schedules – Not supplemented

E. Twenty-Four Hour Reporting – This section supplements V.E of Standard Provision (Attachment D)

1. Spill of Oil or Other Hazardous Material Reports

a. Within 24 hours of becoming aware of a spill of oil or other hazardous material that is not contained onsite and completely cleaned up, the Discharger shall report by telephone to the Regional Water Board at (510) 622-2369.

b. The Discharger shall also report such spills to the State Office of Emergency Services [telephone (800) 852-7550] only when the spills are in accordance with applicable reporting quantities for hazardous materials.

c. The Discharger shall submit a written report to the Regional Water Board within five working days following telephone notification unless directed otherwise by Regional Water Board staff. A report submitted electronically is acceptable. The written report shall include the following:

1) Date and time of spill, and duration if known;

2) Location of spill (street address or description of location);

3) Nature of material spilled;

4) Quantity of material involved;

5) Receiving water body affected, if any;

6) Cause of spill;

7) Estimated size of affected area;

8) Observed impacts to receiving waters (e.g., oil sheen, fish kill, water discoloration);

9) Corrective actions taken to contain, minimize, or clean up the spill;

10) Future corrective actions planned to be taken to prevent recurrence, and schedule of implementation; and

11) Persons or agencies notified.

2. Unauthorized Discharges from Municipal Wastewater Treatment Plants[1]

The following requirements apply to municipal wastewater treatment plants that experience an unauthorized discharge at their treatment facilities and are consistent with and supercede requirements imposed on the Discharger by the Executive Officer by letter of May 1, 2008, issued pursuant to California Water Code Section 13383.

a. Two (2)-Hour Notification

For any unauthorized discharges that result in a discharge to a drainage channel or a surface water, the Discharger shall, as soon as possible, but not later than two (2) hours after becoming aware of the discharge, notify the State Office of Emergency Services (telephone 800-852-7550), the local health officers or directors of environmental health with jurisdiction over the affected water bodies, and the Regional Water Board. The notification to the Regional Water Board shall be via the Regional Water Board's online reporting system at www.wbers.net, and shall include the following:

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

1) Incident description and cause;

2) Location of threatened or involved waterway(s) or storm drains;

3) Date and time the unauthorized discharge started;

4) Estimated quantity and duration of the unauthorized discharge (to the extent known), and the estimated amount recovered;

5) Level of treatment prior to discharge (e.g., raw wastewater, primary treated, undisinfected secondary treated, and so on); and

6) Identity of the person reporting the unauthorized discharge.

b. 24-hour Certification

Within 24 hours, the Discharger shall certify to the Regional Water Board, at www.wbers.net, that the State Office of Emergency Services and the local health officers or directors of environmental health with jurisdiction over the affected water bodies have been notified of the unauthorized discharge.

c. 5-Day Written Report

Within five business days, the Discharger shall submit a written report, via the Regional Water Board's online reporting system at www.wbers.net, that includes, in addition to the information required above, the following:

1) Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;

2) Efforts implemented to minimize public exposure to the unauthorized discharge;

3) Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted;

4) Corrective measures taken to minimize the impact of the unauthorized discharge;

5) Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future;

6) Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges; and

7) Quantity and duration of the unauthorized discharge, and the amount recovered.

d. Communication Protocol

To clarify the multiple levels of notification, certification, and reporting, the current communication requirements for unauthorized discharges from municipal wastewater treatment plants are summarized in Table B that follows.

F. Planned Changes – Not supplemented

G. Anticipated Noncompliance – Not supplemented

H. Other Noncompliance – Not supplemented

I. Other Information – Not supplemented

VI. STANDARD PROVISIONS – ENFORCEMENT – Not Supplemented

VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS – Not Supplemented

Table B

Summary of Communication Requirements for Unauthorized Discharges[1] from Municipal Wastewater Treatment Plants

Discharger is required to:	Agency Receiving Information	Time frame	Method for Contact
1. Notify	State Office of Emergency Services (OES)	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Telephone – (800) 852-7550 (obtain a control number from OES)
	Local health department	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Depends on local health department
	Regional Water Board	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Electronic[2] www.wbers.net
2. Certify	Regional Water Board	As soon as possible, but not later than **24 hours** after becoming aware of the unauthorized discharge.	Electronic[3] www.wbers.net
3. Report	Regional Water Board	Within **5 business days** of becoming aware of the unauthorized discharge.	Electronic[4] www.wbers.net

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

[2] In the event that the Discharger is unable to provide online notification within 2 hours of becoming aware of an unauthorized discharge, it shall phone the Regional Water Board's spill hotline at (510) 622-2369 and convey the same information contained in the notification form. In addition, within 3 business days of becoming aware of the unauthorized discharge, the Discharger shall enter the notification information into the Regional Water Board's online system in electronic format.

[3] In most instances, the 2-hour notification will also satisfy 24-hour certification requirements. This is because the notification form includes fields for documenting that OES and the local health department have been contacted. In other words, if the Discharger is able to complete all the fields in the notification form within 2 hours, certification requirements are also satisfied. In the event that the Discharger is unable to provide online certification within 24 hours of becoming aware of an unauthorized discharge, it shall phone the Regional Water Board's spill hotline at (510) 622-2369 and convey the same information contained in the certification form. In addition, within 3 business days of becoming aware of the unauthorized discharge, the Discharger shall enter the certification information into the Regional Water Board's online system in electronic format.

[4] If the Discharger cannot satisfy the 5-day reporting requirements via the Regional Water Board's online reporting system, it shall submit a written report (preferably electronically in pdf) to the appropriate Regional Water Board case manager. In cases where the Discharger cannot satisfy the 5-day reporting requirements via the online reporting system, it must still complete the Regional Water Board's online reporting requirements within 15 calendar days of becoming aware of the unauthorized discharge.

VIII. DEFINITIONS – This section is an addition to Standard Provisions (Attachment D)

More definitions can be found in Attachment A of this NPDES Permit.

1. Arithmetic Calculations

   a. Geometric mean is the antilog of the log mean or the back-transformed mean of the logarithmically transformed variables, which is equivalent to the multiplication of the antilogarithms. The geometric mean can be calculated with either of the following equations:

   $$\text{Geometric Mean} = Anti\log\left(\frac{1}{N}\sum_{i=1}^{N} Log(C_i)\right)$$

   or

   $$\text{Geometric Mean} = (C_1 * C_2 * \ldots * C_N)^{1/N}$$

   Where "N" is the number of data points for the period analyzed and "C" is the concentration for each of the "N" data points.

   b. Mass emission rate is obtained from the following calculation for any calendar day:

   $$\text{Mass emission rate (lb/day)} = \frac{8.345}{N}\sum_{i=1}^{N} Q_i C_i$$

   $$\text{Mass emission rate (kg/day)} = \frac{3.785}{N}\sum_{i=1}^{N} Q_i C_i$$

   In which "N" is the number of samples analyzed in any calendar day and "Q_i" and "C_i" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" grab samples that may be taken in any calendar day. If a composite sample is taken, "C_i" is the concentration measured in the composite sample and "Q_i" is the average flow rate occurring during the period over which the samples are composited. The daily concentration of a constituent measured over any calendar day shall be determined from the flow-weighted average of the same constituent in the combined waste streams as follows:

   $$C_d = \text{Average daily concentration} = \frac{1}{Q_t}\sum_{i=1}^{N} Q_i C_i$$

   In which "N" is the number of component waste streams and "Q" and "C" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" waste streams. "Q_t" is the total flow rate of the combined waste streams.

   c. Maximum allowable mass emission rate, whether for a 24-hour, weekly 7-day, monthly 30-day, or 6-month period, is a limitation expressed as a daily rate determined with the

formulas in the paragraph above, using the effluent concentration limit specified in the permit for the period and the specified allowable flow.

d. POTW removal efficiency is the ratio of pollutants removed by the treatment facilities to pollutants entering the treatment facilities (expressed as a percentage). The Discharger shall determine removal efficiencies using monthly averages (by calendar month unless otherwise specified) of pollutant concentration of influent and effluent samples collected at about the same time and using the following equation (or its equivalent):

Removal Efficiency (%) = 100 × [1-(Effluent Concentration/Influent Concentration)]

2. Biosolids means the solids, semi-liquid suspensions of solids, residues, screenings, grit, scum, and precipitates separated from or created in wastewater by the unit processes of a treatment system. It also includes, but is not limited to, all supernatant, filtrate, centrate, decantate, and thickener overflow and underflow in the solids handling parts of the wastewater treatment system.

3. Blending is the practice of recombining wastewater that has been biologically treated with wastewater that has bypassed around biological treatment units.

4. Bottom sediment sample is (1) a separate grab sample taken at each sampling station for the determination of selected physical-chemical parameters, or (2) four grab samples collected from different locations in the immediate vicinity of a sampling station while the boat is anchored and analyzed separately for macroinvertebrates.

5. Composite sample is a sample composed of individual grab samples collected manually or by an automatic sampling device on the basis of time or flow as specified in the MRP. For flow-based composites, the proportion of each grab sample included in the composite sample shall be within plus or minus five percent (+/-5%) of the representative flow rate of the waste stream being measured at the time of grab sample collection. Alternatively, equal volume grab samples may be individually analyzed with the flow-weighted average calculated by averaging flow-weighted ratios of each grab sample analytical result. Grab samples comprising time-based composite samples shall be collected at intervals not greater than those specified in the MRP. The quantity of each grab sample comprising a time-based composite sample shall be a set of flow proportional volumes as specified in the MRP. If a particular time-based or flow-based composite sampling protocol is not specified in the MRP, the Discharger shall determine and implement the most representative sampling protocol for the given parameter subject to Executive Officer approval.

6. Depth-integrated sample is defined as a water or waste sample collected by allowing a sampling device to fill during a vertical traverse in the waste or receiving water body being sampled. The Discharger shall collect depth-integrated samples in such a manner that the collected sample will be representative of the waste or water body at that sampling point.

7. Flow sample is an accurate measurement of the average daily flow volume using a properly calibrated and maintained flow measuring device.

8. Grab sample is an individual sample collected in a short period of time not exceeding 15 minutes. Grab samples represent only the condition that exists at the time the wastewater is collected.

9. Initial dilution is the process that results in the rapid and irreversible turbulent mixing of wastewater with receiving water around the point of discharge.

10. Overflow is the intentional or unintentional spilling or forcing out of untreated or partially treated wastes from a transport system (e.g., through manholes, at pump stations, and at collection points) upstream from the treatment plant headworks or from any part of a treatment plant facility.

11. Priority pollutants are those constituents referred to in 40 CFR Part 122 as promulgated in the Federal Register, Vol. 65, No. 97, Thursday, May 18, 2000, also known as the California Toxics Rule, the presence or discharge of which could reasonably be expected to interfere with maintaining designated uses.

12. Storm water means storm water runoff, snow melt runoff, and surface runoff and drainage. It excludes infiltration and runoff from agricultural land.

13. Toxic pollutant means any pollutant listed as toxic under federal Clean Water Act section 307(a)(1) or under 40 CFR 401.15.

14. Untreated waste is raw wastewater.

15. Waste, waste discharge, discharge of waste, and discharge are used interchangeably in the permit. The requirements of the permit apply to the entire volume of water, and the material therein, that is disposed of to surface and ground waters of the State of California.

Table C

List of Monitoring Parameters and Analytical Methods

CTR No.	Pollutant/Parameter	Analytical Method[1]	Minimum Levels[2] (µg/l)											
			GC	GCMS	LC	Color	FAA	GFAA	ICP	ICP MS	SPGFAA	HYD RIDE	CVAA	DCP
1.	Antimony	204.2					10	5	50	0.5	5	0.5		1000
2.	Arsenic	206.3				20		2	10	2	2	1		1000
3.	Beryllium						20	0.5	2	0.5	1			1000
4.	Cadmium	200 or 213				10	0.5	10	0.25	0.5				1000
5a.	Chromium (III)	SM 3500												
5b.	Chromium (VI)	SM 3500				10	5							1000
6.	Copper	200.9					25	5	10	0.5	2			1000
7.	Lead	200.9					20	5	5	0.5	2			10,000
8.	Mercury	1631 (note)[3]												
9.	Nickel	249.2					50	5	20	1	5			1000
10.	Selenium	200.8 or SM 3114B or C						5	10	2	5	1		1000
11.	Silver	272.2					10	1	10	0.25	2			1000
12.	Thallium	279.2					10	2	10	1	5			1000
13.	Zinc	200 or 289					20		20	1	10			
14.	Cyanide	SM 4500 CN^- C or I				5								
15.	Asbestos (only required for dischargers to MUN waters)[4]	0100.2 [5]												
16.	2,3,7,8-TCDD and 17 congeners (Dioxin)	1613												
17.	Acrolein	603	2.0	5										
18.	Acrylonitrile	603	2.0	2										
19.	Benzene	602	0.5	2										
33.	Ethylbenzene	602	0.5	2										

[1] The suggested method is the USEPA Method unless otherwise specified (SM = Standard Methods). The discharger may use another USEPA-approved or recognized method if that method has a level of quantification below the applicable water quality objective. Where no method is suggested, the Discharger has the discretion to use any standard method.

[2] Minimum levels are from the *State Implementation Policy*. They are the concentration of the lowest calibration standard for that technique based on a survey of contract laboratories. Laboratory techniques are defined as follows: GC = Gas Chromatography; GCMS = Gas Chromatography/Mass Spectrometry; LC = High Pressure Liquid Chromatography; Color = Colorimetric; FAA = Flame Atomic Absorption; GFAA = Graphite Furnace Atomic Absorption; ICP = Inductively Coupled Plasma; ICPMS = Inductively Coupled Plasma/Mass Spectrometry; SPGFAA = Stabilized Platform Graphite Furnace Atomic Absorption (i.e., U.S. EPA 200.9); Hydride = Gaseous Hydride Atomic Absorption; CVAA = Cold Vapor Atomic Absorption; DCP = Direct Current Plasma.

[3] The Discharger shall use ultra-clean sampling (USEPA Method 1669) and ultra-clean analytical methods (USEPA Method 1631) for mercury monitoring. The minimum level for mercury is 2 ng/l (or 0.002 ug/l).

[4] MUN = Municipal and Domestic Supply. This designation, if applicable, is in the Findings of the permit.

[5] *Determination of Asbestos Structures over 10 [micrometers] in Length in Drinking Water Using MCE Filters*, U.S. EPA 600/R-94-134, June 1994.

ATTACHMENT H

Pretreatment Program Provisions

1. The Discharger shall implement all pretreatment requirements contained in 40 CFR 403, as amended. The Discharger shall be subject to enforcement actions, penalties, and fines as provided in the Clean Water Act (33 USC 1351 et seq.), as amended. The Discharger shall implement and enforce its Approved Pretreatment Program or modified Pretreatment Program as directed by the Regional Water Board's Executive Officer or the USEPA. The USEPA and/or the State may initiate enforcement action against an industrial user for noncompliance with applicable standards and requirements as provided in the Clean Water Act.

2. The Discharger shall enforce the requirements promulgated under Sections 307(b), 307(c), 307(d) and 402(b) of the Clean Water Act. The Discharger shall cause industrial users subject to Federal Categorical Standards to achieve compliance no later than the date specified in those requirements or, in the case of a new industrial user, upon commencement of the discharge.

3. The Discharger shall perform the pretreatment functions as required in 40 CFR Part 403 and amendments or modifications thereto including, but not limited to:

   i) Implement the necessary legal authorities to fully implement the pretreatment regulations as provided in 40 CFR 403.8(f)(1);

   ii) Implement the programmatic functions as provided in 40 CFR 403.8(f)(2);

   iii) Publish an annual list of industrial users in significant noncompliance as provided per 40 CFR 403.8(f)(2)(vii);

   iv) Provide for the requisite funding and personnel to implement the pretreatment program as provided in 40 CFR 403.8(f)(3); and

   v) Enforce the national pretreatment standards for prohibited discharges and categorical standards as provided in 40 CFR 403.5 and 403.6, respectively.

4. The Discharger shall submit annually a report to USEPA Region 9, the State Water Board and the Regional Water Board describing its pretreatment program activities over the previous twelve months. In the event that the Discharger is not in compliance with any conditions or requirements of the Pretreatment Program, the Discharger shall also include the reasons for noncompliance and a plan and schedule for achieving compliance. The report shall contain, but is not limited to, the information specified in Appendix A entitled, "Requirements for Pretreatment Annual Reports," which is made a part of this Order. The annual report is due on the last day of February each year.

5. The Discharger shall submit semiannual pretreatment reports to USEPA Region 9, the State Water Board and the Regional Water Board describing the status of its significant industrial users (SIUs). The report shall contain, but not is limited to, the information specified in Appendix B entitled, "Requirements for Semiannual Pretreatment Reports," which is made part of this Order. The semiannual reports are due July 31st (for the period January through June) and January 31st (for the period July through December) of each year. The Executive Officer may exempt a Discharger from the semiannual reporting requirements on a case by case basis subject to State Water Board and USEPA's comment and approval.

6. The Discharger may combine the annual pretreatment report with the semiannual pretreatment report (for the July through December reporting period). The combined report shall contain all of the information requested in Appendices A and B and will be due on January 31st of each year.

7. The Discharger shall conduct the monitoring of its treatment plant's influent, effluent, and sludge as described in Appendix C entitled, "Requirements for Influent, Effluent and Sludge Monitoring," which is made part of this Order. The results of the sampling and analysis, along with a discussion of any trends, shall be submitted in the semiannual reports. A tabulation of the data shall be included in the annual pretreatment report. The Executive Officer may require more or less frequent monitoring on a case by case basis.

APPENDIX A

REQUIREMENTS FOR PRETREATMENT ANNUAL REPORTS

The Pretreatment Annual Report is due each year on the last day of February. [If the annual report is combined with the semiannual report (for the July through December period) the submittal deadline is January 31st of each year.] The purpose of the Annual Report is 1) to describe the status of the Publicly Owned Treatment Works (POTW) pretreatment program and 2) to report on the effectiveness of the program, as determined by comparing the results of the preceding year's program implementation. The report shall contain at a minimum, but is not limited to, the following information:

1) **Cover Sheet**

The cover sheet must contain the name(s) and National Pollutant Discharge Elimination Discharge System (NPDES) permit number(s) of those POTWs that are part of the Pretreatment Program. Additionally, the cover sheet must include: the name, address and telephone number of a pretreatment contact person; the period covered in the report; a statement of truthfulness; and the dated signature of a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for overall operation of the POTW (40 CFR 403.12(j)).

2) **Introduction**

The Introduction shall include any pertinent background information related to the Discharger, the POTW and/or the industrial user base of the area. Also, this section shall include an update on the status of any Pretreatment Compliance Inspection (PCI) tasks, Pretreatment Performance Evaluation tasks, Pretreatment Compliance Audit (PCA) tasks, Cleanup and Abatement Order (CAO) tasks, or other pretreatment-related enforcement actions required by the Regional Water Board or the USEPA. A more specific discussion shall be included in the section entitled, "Program Changes."

3) **Definitions**

This section shall contain a list of key terms and their definitions that the Discharger uses to describe or characterize elements of its pretreatment program.

4) **Discussion of Upset, Interference and Pass Through**

This section shall include a discussion of Upset, Interference or Pass Through incidents, if any, at the POTW(s) that the Discharger knows of or suspects were caused by industrial discharges. Each incident shall be described, at a minimum, consisting of the following information:

a) a description of what occurred;
b) a description of what was done to identify the source;
c) the name and address of the IU responsible
d) the reason(s) why the incident occurred;
e) a description of the corrective actions taken; and
f) an examination of the local and federal discharge limits and requirements for the purposes of determining whether any additional limits or changes to existing requirements may be necessary to prevent other Upset, Interference or Pass Through incidents.

5) **Influent, Effluent and Sludge Monitoring Results**

This section shall provide a summary of the analytical results from the "Influent, Effluent and Sludge Monitoring" as specified in Appendix C. The results should be reported in a summary matrix that lists monthly influent and effluent metal results for the reporting year.

A graphical representation of the influent and effluent metal monitoring data for the past five years shall also be provided with a discussion of any trends.

6) **Inspection and Sampling Program**

This section shall contain at a minimum, but is not limited to, the following information:

a) Inspections: the number of inspections performed for each type of IU; the criteria for determining the frequency of inspections; the inspection format procedures;
b) Sampling Events: the number of sampling events performed for each type of IU; the criteria for determining the frequency of sampling; the chain of custody procedures.

7) **Enforcement Procedures**

This section shall provide information as to when the approved Enforcement Response Plan (ERP) had been formally adopted or last revised. In addition, the date the finalized ERP was submitted to the Regional Water Board shall also be given.

8) **Federal Categories**

This section shall contain a list of all of the federal categories that apply to the Discharger. The specific category shall be listed including the subpart and 40 CFR section that applies. The maximum and average limits for the each category shall be provided. This list shall indicate the number of Categorical Industrial Users (CIUs) per category and the CIUs that are being regulated pursuant to the category. The information and data used to determine the limits for those CIUs for which a combined waste stream formula is applied shall also be provided.

9) **Local Standards**

This section shall include a table presenting the local limits.

10) **Updated List of Regulated SIUs**

This section shall contain a complete and updated list of the Discharger's Significant Industrial Users (SIUs), including their names, addresses, and a brief description of the individual SIU's type of business. The list shall include all deletions and additions keyed to the list as submitted in the previous annual report. All deletions shall be briefly explained.

11) **Compliance Activities**

a) **Inspection and Sampling Summary:** This section shall contain a summary of all the inspections and sampling activities conducted by the Discharger over the past year to gather information and data regarding the SIUs. The summary shall include:

(1) the number of inspections and sampling events conducted for each SIU;

(2) the quarters in which these activities were conducted; and

(3) the compliance status of each SIU, delineated by quarter, and characterized using all applicable descriptions as given below:

(a) in consistent compliance;

(b) in inconsistent compliance;

(c) in significant noncompliance;

(d) on a compliance schedule to achieve compliance, (include the date final compliance is required);

(e) not in compliance and not on a compliance schedule;

(f) compliance status unknown, and why not.

b) **Enforcement Summary:** This section shall contain a summary of the compliance and enforcement activities during the past year. The summary shall include the names of all the SIUs affected by the following actions:

(1) Warning letters or notices of violations regarding SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements. For each notice, indicate whether it was for an infraction of a federal or local standard/limit or requirement.

(2) Administrative Orders regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements. For each notice, indicate whether it was for an infraction of a federal or local standard/limit or requirement.

(3) Civil actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements. For each notice, indicate whether it was for an infraction of a federal or local standard/limit or requirement.

(4) Criminal actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements. For each notice, indicate whether it was for an infraction of a federal or local standard/limit or requirement.

(5) Assessment of monetary penalties. Identify the amount of penalty in each case and reason for assessing the penalty.

(6) Order to restrict/suspend discharge to the POTW.

(7) Order to disconnect the discharge from entering the POTW.

12) **Baseline Monitoring Report Update**

This section shall provide a list of CIUs that have been added to the pretreatment program since the last annual report. This list of new CIUs shall summarize the status of the respective Baseline Monitoring Reports (BMR). The BMR must contain all of the information specified in 40 CFR 403.12(b). For each of the new CIUs, the summary shall indicate when the BMR was due; when the CIU was notified by the POTW of this requirement; when the CIU submitted the report; and/or when the report is due.

13) **Pretreatment Program Changes**

This section shall contain a description of any significant changes in the Pretreatment Program during the past year including, but not limited to: legal authority, local limits, monitoring/ inspection program and frequency, enforcement protocol, program's administrative structure, staffing level, resource requirements and funding mechanism. If the manager of the pretreatment program changes, a revised organizational chart shall be included. If any element(s) of the program is in the process of being modified, this intention shall also be indicated.

14) **Pretreatment Program Budget**

This section shall present the budget spent on the Pretreatment Program. The budget, either by the calendar or fiscal year, shall show the amounts spent on personnel, equipment, chemical analyses and any other appropriate categories. A brief discussion of the source(s) of funding shall be provided.

15) **Public Participation Summary**

This section shall include a copy of the public notice as required in 40 CFR 403.8(f)(2)(vii). If a notice was not published, the reason shall be stated.

16) **Sludge Storage and Disposal Practice**

This section shall have a description of how the treated sludge is stored and ultimately disposed. The sludge storage area, if one is used, shall be described in detail. Its location, a description of the containment features and the sludge handling procedures shall be included.

17) **PCS Data Entry Form**

The annual report shall include the PCS Data Entry Form. This form shall summarize the enforcement actions taken against SIUs in the past year. This form shall include the following information: the POTW name, NPDES Permit number, period covered by the report, the number of SIUs in significant noncompliance (SNC) that are on a pretreatment compliance schedule, the number of notices of violation and administrative orders issued against SIUs, the number of civil and criminal judicial actions against SIUs, the number of SIUs that have been published as a result of being in SNC, and the number of SIUs from which penalties have been collected.

18) **Other Subjects**

Other information related to the Pretreatment Program that does not fit into one of the above categories should be included in this section.

Signed copies of the reports shall be submitted to the Regional Administrator at USEPA, the State Water Board and the Regional Water Board at the following addresses:

Regional Administrator
United States Environmental Protection Agency
Region 9, Mail Code: WTR-7
Clean Water Act Compliance Office
Water Division
75 Hawthorne Street
San Francisco, CA 94105

Pretreatment Program Manager
Regulatory Unit
State Water Resources Control Board
Division of Water Quality

Sacramento, CA 95814

Pretreatment Coordinator
NPDES Permits Division
SF Bay Regional Water Quality Control Board
1515 Clay Street, Suite 1400
Oakland, CA 94612

APPENDIX B:

REQUIREMENTS FOR SEMIANNUAL PRETREATMENT REPORTS

The semiannual pretreatment reports are due on July 31st (for pretreatment program activities conducted from January through June) and January 31st (for pretreatment activities conducted from July through December) of each year, unless an exception has been granted by the Regional Water Board's Executive Officer. The semiannual reports shall contain, at a minimum, but is not limited to, the following information:

1) **Influent, Effluent and Sludge Monitoring**

The influent, effluent and sludge monitoring results shall be included in the report. The analytical laboratory report shall also be included, with the QA/QC data validation provided upon request. A description of the sampling procedures and a discussion of the results shall be given. (Please see Appendix C for specific detailed requirements.) The contributing source(s) of the parameters that exceed NPDES limits shall be investigated and discussed. In addition, a brief discussion of the contributing source(s) of all organic compounds identified shall be provided.

The Discharger has the option to submit all monitoring results via an electronic reporting format approved by the Executive Officer. The procedures for submitting the data will be similar to the electronic submittal of the NPDES self-monitoring reports as outlined in the December 17, 1999 Regional Water Board letter, Official Implementation of Electronic Reporting System (ERS). The Discharger shall contact the Regional Water Board's ERS Project Manager for specific details in submitting the monitoring data.

If the monitoring results are submitted electronically, the analytical laboratory reports (along with the QA/QC data validation) should be kept at the discharger's facility.

2) **Industrial User Compliance Status**

This section shall contain a list of all Significant Industrial Users (SIUs) that were not in consistent compliance with all pretreatment standards/limits or requirements for the reporting period. The compliance status for the previous reporting period shall also be included. Once the SIU has determined to be out of compliance, the SIU shall be included in the report until consistent compliance has been achieved. A brief description detailing the actions that the SIU undertook to come back into compliance shall be provided.

For each SIU on the list, the following information shall be provided:

a. Indicate if the SIU is subject to Federal categorical standards; if so, specify the category including the subpart that applies.

b. For SIUs subject to Federal Categorical Standards, indicate if the violation is of a categorical or local standard.

c. Indicate the compliance status of the SIU for the two quarters of the reporting period.

d. For violations/noncompliance occurring in the reporting period, provide (1) the date(s) of violation(s); (2) the parameters and corresponding concentrations exceeding the limits and the discharge limits for these parameters and (3) a brief summary of the noncompliant event(s) and the steps that are being taken to achieve compliance.

3) **POTW's Compliance with Pretreatment Program Requirements**

This section shall contain a discussion of the Discharger's compliance status with the Pretreatment Program Requirements as indicated in the latest Pretreatment Compliance Audit (PCA) Report, Pretreatment Compliance Inspection (PCI) Report or Pretreatment Performance Evaluation (PPE) Report. It shall contain a summary of the following information:

a. Date of latest PCA, PCI or PPE and report.
b. Date of the Discharger's response.
c. List of unresolved issues.
d. Plan and schedule for resolving the remaining issues.

The reports shall be signed by a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for the overall operation of the Publicly Owned Treatment Works (POTW) (40 CFR 403.12(j)). Signed copies of the reports shall be submitted to the Regional Administrator at USEPA, the State Water Board and the Regional Water Board at the following addresses:

Regional Administrator
United States Environmental Protection Agency
Region 9, Mail Code: WTR-7

APPENDIX C

REQUIREMENTS FOR INFLUENT, EFFLUENT AND SLUDGE MONITORING

The Discharger shall conduct sampling of its treatment plant's influent, effluent and sludge at the frequency as shown in Table E-5 of the Monitoring and Reporting Program (MRP, Attachment E).

The monitoring and reporting requirements of the POTW's Pretreatment Program are in addition to those specified in Table E-2 (influent) and Table E-3 (effluent) of the MRPTable 1 of the SMP. Any subsequent modifications of the requirements specified in Tables E-2 and E-3 shall be adhered to and shall not affect the requirements described in this Appendix unless written notice from the Regional Water Board is received. When sampling periods coincide, one set of test results, reported separately, may be used for those parameters that are required to be monitored by both Tables E-2 and E-3 in the Pretreatment Program. The Pretreatment Program monitoring reports shall be sent to the Pretreatment Program Coordinator.

1. **Influent and Effluent Monitoring**

The Discharger shall monitor for the parameters using the required test methods listed in Table E-5 (the pretreatment table) Any test method substitutions must have received prior written Regional Water Board approval. Influent and Effluent sampling locations shall be the same as those sites specified in the MRP.

2. **Influent and Effluent Monitoring**

The Discharger shall monitor for the parameters using the required test methods listed in Table E-5 (the pretreatment table) of the MRP. Any test method substitutions must have received prior written Regional Water Board approval. Influent and Effluent sampling locations shall be the same as those sites specified in the MRP.

The influent and effluent sampled should be taken during the same 24-hour period. All samples must be representative of daily operations. Grab samples shall be used for volatile organic compounds, cyanide and phenol. In addition, any samples for oil and grease, polychlorinated biphenyls, dioxins/furans, and polynuclear aromatic hydrocarbons shall be grab samples. For all other pollutants, 24-hour composite samples must be obtained through flow-proportioned composite sampling. Sampling and analysis shall be performed in accordance with the techniques prescribed in 40 CFR Part 136 and amendments thereto. For effluent monitoring, the reporting limits for the individual parameters shall be at or below the minimum levels (MLs) as stated in the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (2000) [also known as the State Implementation Policy (SIP)]; any revisions to the MLs shall be adhered to. If a parameter does not have a stated minimum level, then the Discharger shall conduct the analysis using the lowest commercially available and reasonably achievable detection levels.

The following standardized report format should be used for submittal of the influent and effluent monitoring report. A similar structured format may be used but will be subject to Regional Water Board approval. The monitoring reports shall be submitted with the Semiannual Reports.

A. Sampling Procedures – This section shall include a brief discussion of the sample locations, collection times, how the sample was collected (i.e., direct collection using vials or bottles, or other types of collection using devices such as automatic samplers, buckets, or beakers), types of containers used, storage procedures and holding times.

Include description of prechlorination and chlorination/dechlorination practices during the sampling periods.

B. Method of Sampling Dechlorination – A brief description of the sample dechlorination method prior to analysis shall be provided.

C. Sample Compositing – The manner in which samples are composited shall be described. If the compositing procedure is different from the test method specifications, a reason for the variation shall be provided.

D. Data Validation – All quality assurance/quality control (QA/QC) methods to be used shall be discussed and summarized. These methods include, but are not limited to, spike samples, split samples, blanks and standards. Ways in which the QA/QC data will be used to qualify the analytical test results shall be identified. A certification statement shall be submitted with this discussion stating that the laboratory QA/QC validation data has been reviewed and has met the laboratory acceptance criteria. The QA/QC validation data shall be submitted to the Regional Water Board upon request.

E. A tabulation of the test results shall be provided.

F. Discussion of Results – The report shall include a complete discussion of the test results. If any pollutants are detected in sufficient concentration to upset, interfere or pass through plant operations, the type of pollutant(s) and potential source(s) shall be noted, along with a plan of action to control, eliminate, and/or monitor the pollutant(s). Any apparent generation and/or destruction of pollutants attributable to chlorination/dechlorination sampling and analysis practices shall be noted.

3. **Sludge Monitoring**

Sludge should be sampled in the same 24-hour period during which the influent and effluent are sampled except as noted in (C) below. The same parameters required for influent and effluent analysis shall be included in the sludge analysis. The sludge analyzed shall be a composite sample of the sludge for final disposal consisting of:

A. Sludge lagoons – 20 grab samples collected at representative equidistant intervals (grid pattern) and composited as a single grab, or

B. Dried stockpile – 20 grab samples collected at various representative locations and depths and composited as a single grab, or

C. Dewatered sludge- daily composite of 4 representative grab samples each day for 5 days taken at equal intervals during the daily operating shift taken from a) the dewatering units or b) from each truckload, and shall be combined into a single 5-day composite.

The USEPA manual, POTW Sludge Sampling and Analysis Guidance Document, August 1989, containing detailed sampling protocols specific to sludge is recommended as a guidance for sampling procedures. The USEPA manual Analytical Methods of the National Sewage Sludge Survey, September 1990, containing detailed analytical protocols specific to sludge, is recommended as a guidance for analytical methods.

In determining if the sludge is a hazardous waste, the Dischargers shall adhere to Article 2, "Criteria for Identifying the Characteristics of Hazardous Waste," and Article 3, "Characteristics of Hazardous Waste," of Title 22, California Code of Regulations, Sections 66261.10 to 66261.24 and all amendments thereto.

Sludge monitoring reports shall be submitted with the appropriate Semiannual Report. The following standardized report format should be used for submittal of the report. A similarly structured form may be used but will be subject to Regional Water Board approval.

A. Sampling procedures – Include sample locations, collection procedures, types of containers used, storage/refrigeration methods, compositing techniques and holding times. Enclose a map of sample locations if sludge lagoons or stockpiled sludge is sampled.

B. Data Validation – All quality assurance/quality control (QA/QC) methods to be used shall be discussed and summarized. These methods include, but are not limited to, spike samples, split samples, blanks and standards. Ways in which the QA/QC data will be used to qualify the analytical test results shall be identified. A certification statement shall be submitted with this discussion stating that the laboratory QA/QC validation data has been reviewed and has met the laboratory acceptance criteria. The QA/QC validation data shall be submitted to the Regional Water Board upon request.

C. Test Results – Tabulate the test results and include the percent solids.

D. Discussion of Results – The report shall include a complete discussion of test results. If the detected pollutant(s) is reasonably deemed to have an adverse effect on sludge disposal, a plan of action to control, eliminate, and/or monitor the pollutant(s) and the known or potential source(s) shall be included. Any apparent generation and/or destruction of pollutants attributable to chlorination/ dechlorination sampling and analysis practices shall be noted.

The Discharger shall also provide any influent, effluent or sludge monitoring data for nonpriority pollutants that the permittee believes may be causing or contributing to Interference, Pass Through or adversely impacting sludge quality.

ORDER No. R2-2019-0028
NPDES No. CA0037681

WASTE DISCHARGE REQUIREMENTS AND NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PERMIT FOR CITY AND COUNTY OF SAN FRANCISCO OCEANSIDE WATER POLLUTION CONTROL PLANT, WASTEWATER COLLECTION SYSTEM, AND WESTSIDE RECYCLED WATER PROJECT

The following Discharger is authorized to discharge from the locations listed in Table 2 in accordance with the waste discharge requirements (WDRs) and federal National Pollutant Discharge Elimination System (NPDES) permit requirements set forth in this Order:

Table 1. Discharger Information

Discharger	City and County of San Francisco
Facility Name	Oceanside Water Pollution Control Plant, Wastewater Collection System, and Westside Recycled Water Project
Facility Address	3500 Great Highway San Francisco, CA 94132 San Francisco County
CIWQS Place Number	256498

Table 2. Discharge Locations

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water
001	Treated effluent, including the following: ● Secondary-treated effluent from Oceanside Water Pollution Control Plant (dry weather); ● Primary- and secondary-treated effluent from Oceanside Water Pollution Control Plant (wet weather); ● Equivalent-to-primary-treated effluent from Westside Transport/Storage Structure (wet weather); and ● Reverse osmosis concentrate from Westside Recycled Water Project, when operational (dry and wet weather).	37.70500	-122.57750	Pacific Ocean, Offshore
CSD-001	Equivalent-to-primary-treated effluent (wet weather)	37.71528	-122.50444	Pacific Ocean (Fort Funston, Ocean Beach)

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water
CSD-002	Equivalent-to-primary-treated effluent (wet weather)	37.73778	-122.50806	Pacific Ocean (Vicente St., Ocean Beach
CSD-003	Equivalent-to-primary-treated effluent (wet weather)	37.76389	-122.51167	Pacific Ocean (Lincoln Way, Ocean Beach)
CSD-004	Equivalent-to-primary-treated effluent (wet weather)	37.78472	-122.51028	Pacific Ocean (Mile Rock)
CSD-005	Equivalent-to-primary-treated effluent (wet weather)	37.78778	-122.49167	Pacific Ocean (China Beach)
CSD-006	Equivalent-to-primary-treated effluent (wet weather)	37.78944	-122.48778	Pacific Ocean (Baker Beach)
CSD-007	Equivalent-to-primary-treated effluent (wet weather)	37.78944	-122.48694	Pacific Ocean (Baker Beach)

Table 3. Administrative Information

The U.S. Environmental Protection Agency, Region IX, issued this Order on:	
The San Francisco Bay Regional Water Quality Control Board adopted this Order on:	September 11, 2019
This Order shall become effective on:	November 1, 2019
This Order shall expire on:	October 31, 2024
The Discharger shall file a Report of Waste Discharge as an application for reissuance of WDRs in accordance with California Code of Regulations, title 23, and an application for reissuance of a National Pollutant Discharge Elimination System (NPDES) permit no later than:	February 1, 2024
This discharge is classified as follows:	Major

The signatures below certify that this Order with all attachments is a full, true, and correct copy of the Order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on the date indicated above, and an NPDES permit issued by the U.S. Environmental Protection Agency, Region IX, on the date above.

7/12/2019

I. FACILITY INFORMATION

Information describing the Oceanside Water Pollution Control Plant, Wastewater Collection System, and Westside Recycled Water Project (collectively, the Facility) is summarized in Table 1 and in Fact Sheet (Attachment F) sections I and II.

II. FINDINGS

The California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board), and the U.S. Environmental Protection Agency (U.S. EPA) find:

A. Legal Authorities. This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260). This Order is also issued pursuant to federal Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA and Water Code chapter 5.5, division 7 (commencing with § 13370). It shall serve as a National Pollutant Discharge Elimination System (NPDES) permit authorizing the Discharger to discharge into waters of the United States as listed in Table 2 subject to the WDRs and NPDES permit requirements in this Order.

B. Background and Rationale for Requirements. The Regional Water Board and U.S. EPA developed the requirements in this Order based on information the Discharger submitted as part of its application, information obtained through monitoring and reporting programs, and other available information. The Fact Sheet contains background information and rationale for the requirements in this Order and is hereby incorporated into and constitutes findings for this Order. Attachments A through E, G, and H are also incorporated into this Order.

C. Notification of Interested Parties. The Regional Water Board and U.S. EPA notified the Discharger and interested agencies and persons of their intent to jointly issue WDRs and NPDES permit requirements, and provided an opportunity to submit written comments and recommendations. The Fact Sheet provides details regarding the notification.

D. Consideration of Public Comment. The Regional Water Board, in a public meeting, heard all comments pertaining to the discharge. The Fact Sheet provides details regarding the public hearing. The Regional Water Board and U.S. EPA considered all comments pertaining to the discharge.

THEREFORE, IT IS HEREBY ORDERED that Order No. R2-2009-0062 (previous order) is rescinded upon the effective date of this Order, except for enforcement purposes, and in order to meet the provisions of Water Code division 7 (commencing with § 13000) and regulations adopted thereunder and the provisions of the CWA and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order. The Regional Water Board intends that joint issuance of this Order with U.S. EPA will serve as its certification under CWA section 401 that discharges pursuant to this Order comply with 33 U.S.C. sections 1311, 1312, 1313, 1316, and 1317. This action in no way prevents the Regional Water Board or U.S. EPA from taking enforcement action for past violations of the previous order.

III. DISCHARGE PROHIBITIONS

A. Discharge of treated wastewater at a location or in a manner different than described in this Order is prohibited.

B. Bypass of untreated or partially-treated wastewater to waters of the United States is prohibited, except as provided for in Attachment D section I.G. Combined sewer discharges during wet weather (as defined in Attachment A) authorized by this Order are not subject to this prohibition.

Blended wastewater is biologically-treated wastewater blended with wastewater diverted around biological treatment units at the Oceanside Water Pollution Control Plant. These anticipated discharges are approved under the bypass conditions when (1) the Discharger's instantaneous wet weather influent flow exceeds the capacity of the biological treatment units of 43 MGD, (2) all wet weather flows passing the headworks of the plant receive at least primary treatment, and (3) the discharge complies with the applicable effluent and receiving water limitations contained in this Order. Furthermore, the Discharger shall operate its Facility as designed and in accordance with the Operation and Maintenance Manual for the Facility. This means it shall optimize storage and use of equalization units and shall fully utilize the biological treatment units. The Discharger shall report incidents of blended effluent discharges in monthly self-monitoring reports and shall conduct monitoring of this discharge as specified in the attached Monitoring and Reporting Program (MRP) (Attachment E).

C. Discharge at Discharge Point No. 001 is prohibited when the discharge does not receive a minimum initial dilution of at least 148:1 (parts seawater per part wastewater), as modeled assuming no currents. Compliance shall be achieved by proper operation and maintenance of the discharge outfall to ensure that it (or its replacement, in whole or part) is in good working order and is consistent with, or can achieve better mixing than, 148:1. The Discharger shall describe measures taken to ensure compliance in its Report of Waste Discharge and application for permit reissuance.

D. Discharge to a water of the United States from any location other than Discharge Point No. 001 is prohibited, except from Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007 during wet weather (as defined in Attachment A) in accordance with the requirements in this Order.

E. Average dry weather Oceanside Water Pollution Control Plant influent flow in excess of 43 MGD is prohibited. Average dry weather influent flow shall be determined from three consecutive dry weather months each year, with compliance measured at Monitoring Location INF-001A as described in the MRP.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Technology-Based Effluent Limitations

1. Oceanside Water Pollution Control Plant

During dry weather, the Discharger shall comply with the following effluent limitations for discharges from the Oceanside Water Pollution Control Plant, with compliance measured at Monitoring Location EFF-001A as described in the MRP, as follows:

Table 4. Effluent Limitations - Oceanside Water Pollution Control Plant

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Carbonaceous Biochemical Oxygen Demand, 5-day @ 20°C ($CBOD_5$)	mg/L	25	40	---	---	---
Total Suspended Solids (TSS)	mg/L	30	45	---	---	---
$CBOD_5$ Removal [1]	%	85 (minimum)	---	---	---	---
TSS Removal [1]	%	85 (minimum)	---	---	---	---
pH [2]	s.u.	---	---	---	6.0	9.0

Abbreviations:

mg/L = milligrams per liter
s.u. = standard units
% = percent

Footnotes:

[1] The arithmetic mean of $CBOD_5$ and TSS, by concentration, of effluent samples collected at Monitoring Location EFF-001A as described in the MRP shall not exceed 15 percent of the arithmetic mean of the $CBOD_5$ and TSS, by concentration, of influent samples collected at Monitoring Location INF-001A as described in the MRP, at approximately the same times during the same periods.

[2] If the Discharger monitors pH continuously, pursuant to 40 C.F.R. § 401.17 the Discharger shall be in compliance with this pH limitation provided that both of the following conditions are satisfied: (i) the total time during which the pH is outside the required range shall not exceed 7 hours and 26 minutes in any calendar month; and (ii) no individual excursion from the required pH range shall exceed 60 minutes.

During wet weather, the Discharger shall comply with the narrative technology-based effluent limitations contained in Provision VI.C.5.a (Nine Minimum Controls).

2. Westside Recycled Water Project

When recycled water is being produced, the Discharger shall comply with the following effluent limitations for discharges from the Westside Recycled Water Project, with compliance measured at Monitoring Location EFF-001R as described in the MRP, as follows:

Table 5. Effluent Limitations - Westside Recycled Water Project

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
TSS	mg/L	60	---	---	---	---
pH [1]	s.u.	---	---	---	6.0	9.0
Oil and Grease	mg/L	25	40	---	---	75
Settleable Solids	mL/L	1.0	1.5	---	---	3.0
Turbidity	NTU	75	100	---	---	225

Abbreviations:

mg/L = milligrams per liter
mL/L = milliliters per liter
NTU = nephelometric turbidity units
s.u. = standard units

Footnote:

[1] If the Discharger monitors pH continuously, pursuant to 40 C.F.R. § 401.17 the Discharger shall be in compliance with this pH limitation provided that both of the following conditions are satisfied: (i) the total time during which the pH is outside the required range shall not exceed 7 hours and 26 minutes in any calendar month; and (ii) no individual excursion from the required pH range shall exceed 60 minutes.

B. Water Quality-Based Effluent Limitations

During dry weather, the Discharger shall comply with the following effluent limitation for discharges at Discharge Point No. 001, with compliance measured at Monitoring Location EFF-001C as described in the MRP, as follows:

Table 6. Effluent Limitations - Discharge Point No. 001

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Chronic Toxicity [1]	Pass or Fail	---	---	Pass	---	---

Footnote:

[1] MRP section V sets forth chronic toxicity monitoring requirements. The discharge is subject to determination of "Pass" or "Fail" from a single chronic toxicity test conducted at the in-stream waste concentration (IWC) defined in MRP section V.A.2 using the Test of Significant Toxicity (TST) statistical approach (Welch's t-test) in *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010), Appendix A, Figure A-1 and Table A-1, and Appendix B, Table B-1.

The TST null hypothesis shall be the following:

Mean discharge IWC response ≤ 0.75 × Mean control response

A test result that rejects this null hypothesis shall be reported as "Pass." A test result that does not reject this null hypothesis shall be reported as "Fail." The relative "Percent Effect" at the discharge IWC shall also be reported as:

([Mean control response - Mean discharge IWC response] ÷ Mean control response) × 100

During wet weather, the Discharger shall comply with the narrative water quality-based effluent limitations contained in Provision VI.C.5.c (Long-Term Control Plan) for the Discharge Points in Table 2.

V. RECEIVING WATER LIMITATIONS

Discharge shall not cause or contribute to a violation of any applicable water quality standard (with the exception set forth in State Water Board Order No. WQ 79-16) for receiving waters adopted by the Regional Water Board, State Water Resources Control Board (State Water Board), or U.S. EPA as required by the CWA and regulations adopted thereunder. If more stringent water quality standards are promulgated or approved pursuant to CWA section 303, or amendments thereto, the Regional Water Board and U.S. EPA may revise or modify this Order in accordance with the more stringent standards.

VI. PROVISIONS

A. Standard Provisions

1. The Discharger shall comply with all "Standard Provisions" included in Attachment D. In Attachment D, references to "Regional Water Board" shall be interpreted as "Regional Water Board and U.S. EPA," and references to "Regional Water Board Executive Officer" shall be interpreted as "Regional Water Board Executive Officer and U.S. EPA."

2. The Discharger shall comply with all applicable provisions of the "Regional Standard Provisions, and Monitoring and Reporting Requirements" (Attachment G), except as follows:

a. Attachment G section V.C.1.d.iv (Dioxin-TEQ). The Discharger shall calculate and report dioxin-TEQs using the definition of TCDD Equivalents in Attachment A, which supersedes the definition in Attachment G.

b. Attachment G section III.A.2 (Minimum Levels). The Discharger shall comply with the minimum levels listed in Ocean Plan Appendix II in lieu of those listed in Attachment G Table B.

c. Attachment G section III.A.3.b.v(b) (Approved Wet Weather Bypasses). The Discharger shall comply with the monitoring requirements for wet weather secondary bypasses in MRP Table E-5 (Monitoring Location EFF-001B) in lieu of those listed in Attachment G section II.A.3.b.v(b).

In Attachment G, references to "Regional Water Board" shall be interpreted as "Regional Water Board and U.S. EPA," and references to "Regional Water Board Executive Officer" shall be interpreted as "Regional Water Board Executive Officer and U.S. EPA."

B. Monitoring and Reporting

The Discharger shall comply with the MRP, and future revisions thereto, and applicable sampling and reporting requirements in Attachments D and G.

C. Special Provisions

1. Reopener Provisions

The Regional Water Board or U.S. EPA may modify or reopen this Order prior to its expiration date in any of the following circumstances, as allowed by law:

a. If present or future investigations demonstrate that the discharges governed by this Order have or will have a reasonable potential to cause or contribute to, or will cease to have, adverse impacts on water quality or beneficial uses of the receiving waters.

b. As new or revised water quality standards or total maximum daily loads (TMDLs) come into effect for surface waters of the State (whether statewide, regional, or site-specific). In such cases, effluent limitations in this Order may be modified as necessary to reflect updated water quality standards and wasteload allocations in TMDLs. Adoption of effluent limitations contained in this Order is not intended to restrict in any way future modifications based on legally adopted water quality objectives, TMDLs, or as otherwise permitted under federal regulations governing NPDES permit modifications.

c. If translator, dilution, or other water quality studies provide a basis for determining that a permit condition should be modified.

d. If State Water Board precedential decisions, new policies, new laws, or new regulations are adopted.

e. If an administrative or judicial decision on a separate NPDES permit or WDRs addresses requirements similar to this discharge.

f. If combined sewer system discharge controls fail to meet water quality standards or protect designated uses.

g. Or as otherwise authorized by law.

The Discharger may request a permit modification based on any of the circumstances above. With any such request, the Discharger shall include antidegradation and anti-backsliding analyses.

2. Effluent Characterization Study and Report

a. Study Elements. The Discharger shall characterize and evaluate the dry weather discharge from Discharge Point No. 001 to verify that the reasonable potential analysis conclusions of this Order remain valid and to inform the next permit reissuance. The Discharger shall monitor Ocean Plan Table 1 pollutants as described in the MRP and evaluate on an annual basis whether concentrations of any Ocean Plan Table 1 pollutants significantly increase over past performance. The Discharger shall investigate the cause of any such increases. The investigation may include, but need not be limited to, increasing the monitoring frequency, monitoring internal process streams, and monitoring of influent sources. The Discharger shall establish remedial measures addressing any increases resulting in reasonable potential to cause or contribute to an exceedance of

applicable water quality objectives (see Fact Sheet Tables F-9 and F-10 for the objectives). This requirement to establish remedial measures may be satisfied through identification of the constituent as a "pollutant of concern" in the Discharger's Pollutant Minimization Program, described in Provision VI.C.3.

b. Reporting Requirements

i. Routine Reporting. The Discharger shall, within 45 days of receipt of analytical results, report the identity of any Ocean Plan Table 1 pollutant detected at or above the applicable water quality objective to the Regional Water Board and U.S. EPA.

ii. Annual Reporting. The Discharger shall summarize the annual data evaluation and source investigation in its annual self-monitoring report (see MRP § VIII.B).

3. Pollutant Minimization Program

a. The Discharger shall continue to improve its Pollutant Minimization Program to promote minimization of pollutant loadings to the sewer system and therefore to the receiving waters.

b. The Discharger shall submit an annual report no later than February 28 each year. Each annual report shall include at least the following information:

i. Brief description of treatment plant. The description shall include the service area and treatment plant processes.

ii. Discussion of current pollutants of concern. Periodically, the Discharger shall analyze its circumstances to determine which pollutants are currently a problem and which pollutants may be potential future problems. This discussion shall include the reasons for choosing the pollutants. At a minimum, the Discharger shall consider copper and zinc as pollutants of concern.

iii. Identification of sources for pollutants of concern. This discussion shall include how the Discharger intends to estimate and identify pollutant sources. The Discharger shall include sources or potential sources not directly within the ability or authority of the Discharger to control, such as pollutants in the potable water supply and air deposition.

iv. Identification of tasks to reduce the sources of pollutants of concern. This discussion shall identify and prioritize tasks to address the Discharger's pollutants of concern. The Discharger may implement the tasks by itself or participate in group, regional, or national tasks that address its pollutants of concern. The Discharger is strongly encouraged to participate in group, regional, or national tasks that address its pollutants of concern whenever it is efficient and appropriate to do so. An implementation timeline shall be included for each task.

v. Outreach to employees. The Discharger shall inform employees about the pollutants of concern, potential sources, and how they might be able to help reduce the

discharge of these pollutants of concern into the Facility. The Discharger may provide a forum for employees to provide input.

vi. **Continuation of Public Outreach Program.** The Discharger shall continue a pollution prevention public outreach program for its service area. Outreach may include participation in existing community events, such as county fairs; initiating new community events, such as displays and contests during Pollution Prevention Week; conducting school outreach programs; conducting plant tours; and providing public information in newspaper articles or advertisements, radio or television stories or spots, newsletters, utility bill inserts, or web sites. Information shall be specific to target audiences. The Discharger shall coordinate with other agencies as appropriate.

vii. **Discussion of criteria used to measure Pollutant Minimization Program and task effectiveness.** The Discharger shall establish criteria to evaluate the effectiveness of its Pollutant Minimization Program. This discussion shall identify the specific criteria used to measure the effectiveness of each task in Provisions VI.C.3.b.iii, iv, v, and vi.

viii. **Documentation of efforts and progress.** This discussion shall detail all of the Discharger's Pollutant Minimization Program activities during the reporting year.

ix. **Evaluation of Pollutant Minimization Program and task effectiveness.** The Discharger shall use the criteria established in Provision VI.C.3.b.vii to evaluate the program and task effectiveness.

x. **Identification of specific tasks and timelines for future efforts.** Based on the evaluation, the Discharger shall explain how it intends to continue or change its tasks to more effectively reduce the amount of pollutants flowing to the Facility, and subsequently in its effluent.

c. The Discharger shall develop and conduct a Pollutant Minimization Program as further described below when there is evidence that a priority pollutant is present in the effluent above an effluent limitation (e.g., sample results reported as detected but not quantified [DNQ] when the effluent limitation is less than the method detection limit [MDL], sample results from analytical methods more sensitive than those methods required by this Order, presence of whole effluent toxicity, health advisories for fish consumption, or results of benthic or aquatic organism tissue sampling) and either:

i. A sample result is reported as DNQ and the effluent limitation is less than the Reporting Level (RL); or

ii. A sample result is reported as not detected (ND) and the effluent limitation is less than the MDL using definitions in Attachment A and reporting protocols described in the MRP.

d. If triggered by the reasons set forth in Provision VI.C.3.c, the Discharger's Pollutant Minimization Program shall include, but not be limited to, the following actions and submittals:

i. Annual review and semiannual monitoring of potential sources of the reportable pollutant, which may include fish tissue monitoring and other bio-uptake sampling, or alternative measures when source monitoring is unlikely to produce useful analytical data;

ii. Quarterly monitoring for the reportable pollutant in treatment plant influent. The Regional Water Board Executive Officer and U.S. EPA may approve alternative measures when influent monitoring is unlikely to produce useful analytical data;

iii. Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable pollutant in the effluent at or below the effluent limitation;

iv. Implementation of appropriate cost-effective control measures for the reportable pollutant, consistent with the control strategy; and

v. Inclusion of the following within the annual report required by Provision VI.C.3.b:

(a) All Pollutant Minimization Program monitoring results for the previous year;
(b) List of potential sources of the reportable pollutant;
(c) Summary of all actions undertaken pursuant to the control strategy; and
(d) Description of actions to be taken in the following year.

4. Special Provisions for Publicly-Owned Treatment Works (POTWs)

a. Sludge and Biosolids Management. The Discharger shall manage its sludge and biosolids in accordance with federal regulations (40 C.F.R. parts 258 and 503) and Attachment H.

i. Sludge and biosolids treatment and storage shall not create a nuisance, such as objectionable odors or flies, or result in groundwater contamination.

ii. Sludge and biosolids treatment and storage facilities shall be adequate to divert surface runoff from adjacent areas, to protect site boundaries from erosion, and to prevent conditions that would cause drainage from stored materials. Adequate protection is defined as protection from at least a 100-year storm and the highest possible tidal state that may occur.

iii. This Order does not authorize permanent onsite sludge or biosolids storage or disposal. A Report of Waste Discharge shall be filed and the site brought into compliance with applicable regulations prior to commencement of any such activity.

b. Pretreatment Program. The Discharger shall implement and enforce its approved pretreatment program in accordance with federal pretreatment regulations (40 C.F.R. part 403); pretreatment standards promulgated under CWA sections 307(b), 307(c), and 307(d); pretreatment requirements specified under 40 C.F.R. section 122.44(j); and the requirements in Attachment H, "Pretreatment Requirements." The Discharger's responsibilities include, but are not limited to, the following:

i. Enforcement of the National Pretreatment Standards of 40 C.F.R. sections 403.5 and 403.6;

ii. Implementation of its pretreatment program in accordance with legal authorities, policies, procedures, and financial provisions described in the National Pretreatment Program (40 C.F.R. part 403);

iii. Submission of reports to the State Water Board, the Regional Water Board, and U.S. EPA as described in Attachment H; and

iv. Evaluation of the need to revise local limits as required under 40 C.F.R. sections 122.44(j)(2)(ii) and 403.5(c)(1) and, by November 1, 2020, submission of a report describing the changes to local limits with a plan and schedule for implementation, or the rationale for making no changes to local limits.

c. Anaerobically-Digestible Material. If the Discharger receives hauled-in anaerobically-digestible material for injection into an anaerobic digester, the Discharger shall notify the Regional Water Board and develop and implement Standard Operating Procedures for this activity. The Standard Operating Procedures shall be developed prior to initiation of hauling. The Standard Operating Procedures shall address material handling, including unloading, screening, or other processing prior to anaerobic digestion; transportation; spill prevention; spill response; avoidance of the introduction of materials that could cause interference, pass through, or upset of the treatment processes; avoidance of prohibited material; vector control; odor control; operation and maintenance; and the disposition of any solid waste segregated from introduction to the digester. The Discharger shall train its staff on the Standard Operating Procedures and maintain records for a minimum of three years for each load received, describing the hauler, waste type, and quantity received. In addition, the Discharger shall maintain records for a minimum of three years for the disposition, location, and quantity of cumulative pre-digestion segregated solid waste hauled offsite.

d. Separate Sanitary Sewer Systems. The Discharger shall properly operate and maintain its separate sanitary collection systems (see Attachments D and G, section I.D), report any noncompliance with respect to its separate sanitary collection systems (see Attachments D and G, sections V.E.1 and V.E.2), and mitigate any discharges in violation of this Order associated with its separate sanitary collection systems (see Attachments D and G, section I.C).

State Water Board Order No. 2006-0003-DWQ, Statewide General Waste Discharge Requirements for Sanitary Sewer Systems, as amended by State Water Board Order No. WQ 2013-0058-EXEC (statewide WDRs), contains requirements for operation and maintenance of collection systems and for reporting and mitigating sanitary sewer overflows. The statewide WDRs clearly and specifically stipulate requirements for operation and maintenance and for reporting and mitigating sanitary sewer overflows. Implementing the requirements for operation and maintenance and mitigation of sanitary sewer overflows set forth in the statewide WDRs (and any subsequent order updating those requirements) shall satisfy the corresponding federal NPDES requirements

specified in Attachments D and G of this Order for the separate sanitary collection systems. Following the reporting requirements set forth in the statewide WDRs (and any subsequent order updating these requirements) shall satisfy the NPDES reporting requirements for sanitary sewer overflows specified in Attachments D and G.

5. Combined Sewer System

a. Nine Minimum Controls. The Discharger shall implement the following nine minimum controls:

i. Control No. 1: Conduct Proper Operations and Maintenance Program. The Discharger shall implement an operations and maintenance program that establishes operation, maintenance, and inspection procedures to ensure that the combined sewer system is operated and maintained in a manner that complies with the requirements of this Order. The program shall include the elements listed below:

(a) Organizational Structure. The Discharger shall maintain an up-to-date directory of operations and maintenance staff, and a designated primary contact person for the Facility. The Discharger shall notify the Regional Water Board and U.S. EPA within 90 days of designating a new primary contact person.

(b) Budget. The Discharger shall allocate sufficient funds and personnel for routine operations and maintenance, and to provide for possible emergencies.

(c) Critical Facilities and Major System Components. The Discharger shall maintain a written inventory of critical facilities and major system components (i.e., those facilities and system components that affect the performance of the combined sewer system). The inventory shall include force mains, pump stations, major treatment plant units, transport/storage structures, combined sewer discharge outfalls, Discharge Point No. 001 outfall, tide gates, overflow weirs, and baffles. The Discharger shall include the following information for each critical facility and major system component in the inventory:

(1) Physical description (e.g., capacity, dimensions, age) and location;
(2) Status (e.g., elements out of service or planned to be taken out of service); and
(3) Description of preventative maintenance planned and completed.

At a minimum, the Discharger shall review and update the inventory once every 12 months. The Discharger may combine the inventory and the Wastewater Facilities Status Report (see Attachment G section I.D.2) into one document.

(d) Procedures for Routine Maintenance. The Discharger shall document procedures for routine maintenance and timely repair of the critical facilities and major system components listed in the inventory required by Provision VI.C.5.a.i(c). Routine maintenance shall focus on preventative maintenance to avoid failures during critical times.

(e) Non-Routine Maintenance and Emergency Situations. The Discharger shall develop and implement an emergency response plan for each critical facility to

minimize the likelihood and adverse impacts of failure to the maximum extent practicable. The emergency response plan shall be consistent with the Contingency Plan required by Attachment G section I.C.1.

(f) Inspections. The Discharger shall conduct an inspection program of the combined sewer system to provide reasonable assurance that unpermitted discharges, obstructions, and damage will be discovered. At a minimum, the Discharger shall do the following:

(1) Inspect each critical facility and major system component identified in accordance with Provision VI.C.5.a.i(c), above, at least once every 12 months to ensure they are in good working condition. The inspection shall include, but not be limited to, entering the regulator structure, if accessible; determining the extent of any structural defects or debris and grit buildup; removing any debris that may constrict flow, cause blockage, or result in a prohibited discharge; and adjusting tide gates to minimize combined sewer discharges and to prevent tidal inflow.

(2) Record all inspection results, including the date and time of the inspection, the inspection findings, and description of any corrective actions taken.

(g) Training. The Discharger shall provide training to operations and maintenance staff regarding operation and maintenance duties and standard operation procedures. Training shall be consistent with the Discharger's Operation and Maintenance Manual required by Attachment G section I.D.1 (Operation and Maintenance Manual).

(h) Operation and Maintenance Program Review. The Discharger shall review and modify its operations and maintenance program as necessary and in accordance with sections I.C (Duty to Mitigate) and I.D (Proper Operation and Maintenance) of Attachments D and G. At a minimum, the Discharger shall review and update the Operation and Maintenance Manual required by Attachment G section I.D.1 (Operation and Maintenance Manual) once per calendar year.

ii. Control No. 2: Maximize Use of Collection System for Storage

(a) The Discharger shall maximize use of the combined sewer system for in-line storage to reduce the magnitude, frequency, and duration of combined sewer discharges. At a minimum, the Discharger shall implement the following controls:

(1) Prevent intrusion of receiving waters into the combined sewer system;

(2) Use all facilities, including any inoperative or unused treatment facilities, to store or treat wet weather flows to the maximum extent practicable; and

(3) Implement programs to remove and prevent flow obstructions in the combined sewer system, including but not limited to catch basin cleaning; gravity sewer cleaning; fats, oils and grease control; gravity sewer condition assessment;

gravity sewer rehabilitation and replacement; and disconnection of illegal connections.

(b) The Discharger shall notify and report sewer overflows from the combined sewer system by implementing the following within six months of the effective date of this Order:

(1) The Discharger shall complete the CIWQS Online Collection System Questionnaire, as required by the CIWQS system, and enter information regarding all sewer overflows from the combined sewer system into the CIWQS Online SSO Database, including all required database fields. The Discharger's Legally Responsible Official, as required by the CIWQS system, shall certify all information submitted. The Discharger shall update and certify the Collection System Questionnaire at least every 12 months.

(2) For sewer overflows from the combined sewer system with volumes 1,000 gallons or greater, the Discharger shall submit draft reports through the CIWQS Online SSO database within 3 business days of becoming aware of the sewer overflow from the combined sewer system and certify the reports within 15 calendar days of the end date of the sewer overflow from the combined sewer system.

(3) For sewer overflows from the combined sewer system with volumes 50,000 gallons or greater that reach surface waters, the Discharger shall submit a technical report within 45 calendar days of the end date for such overflows that further explains the causes and circumstances, including the method and data used to calculate the volume, and lists response actions completed and planned.

(4) For sewer overflows from the combined sewer system with volumes less than 1,000 gallons, the Discharger shall submit certified reports to the CIWQS Online SSO database within 30 calendar days of the end of the month during which such overflows occur.

(5) For each month during which no sewer overflow from the combined sewer system occurs, the Discharger shall certify, within 30 calendar days of the end of the month during which no sewer overflow from the combined sewer system occurred, that no sewer overflow from the combined sewer system occurred.

Following the reporting requirements set forth above shall satisfy the reporting requirements for sewer overflows from the combined sewer system specified in Attachments D and G.

iii. Control No. 3: Review and Modify Pretreatment Program. The Discharger shall implement controls to minimize the impact of non-domestic discharges to its collection system. At three-year intervals, the Discharger shall re-evaluate whether additional modifications to its pretreatment program, such as requirements for

detention during wet weather, are feasible or practical. The Discharger shall document this re-evaluation in the annual report required by Provision VI.C.4.b and Attachment H.

iv. **Control No. 4: Maximize Flow to Treatment Plant.** During wet weather, the Discharger shall maximize the volume of wastewater that receives treatment at the Oceanside Water Pollution Control Plant (i.e., secondary treatment for 43 MGD and primary treatment for an additional 22 MGD) and is discharged at Discharge Point No. 001.

v. **Control No. 5: Prohibit Dry Weather Combined Sewer Overflows.** Dry weather discharges at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007 are prohibited (see Discharge Prohibition III.D). During any dry weather discharge at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, or CSD-007, the Discharger shall inspect the associated outfall structure each day until the unauthorized discharge stops. For each prohibited dry weather discharge, the Discharger shall submit the information required by Attachment G section V.C.1.a (e.g., duration, cause, corrective actions taken or planned).

vi. **Control No. 6: Control Solid and Floatable Materials in Combined Sewer Discharges.** The Discharger shall implement measures to minimize the volume of solid and floatable materials in combined sewer discharges (e.g., equip Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007 with baffles, screens, racks, or other means to reduce the volume of solid and floatable materials). The Discharger shall also remove and properly dispose of solid and floatable materials captured in the combined sewer system.

vii. **Control No. 7: Develop and Implement Pollution Prevention Program.** The Discharger shall implement a pollution prevention program focused on reducing the amount of pollutants that enter the combined sewer system. The Discharger shall develop and implement this program in accordance with Provision VI.C.3 (Pollutant Minimization Program). As part of this program, the Discharger shall implement a street sweeping program and clean catch basins at a frequency sufficient to minimize large accumulations of pollutants and debris.

viii. **Control No. 8: Notify Public of Combined Sewer Discharges.** The Discharger shall inform the public of the location of combined sewer discharge outfalls (i.e., Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-005, CSD-006, and CSD-007), the actual occurrences of combined sewer discharges, the possible health and environmental impacts of combined sewer discharges, and the recreational or commercial activities (e.g., swimming, shellfish harvesting) curtailed as a result of combined sewer discharges. Notification shall include the following, at a minimum:

(a) The Discharger shall maintain permanent identification signs at the locations of Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-005, CSD-006, and CSD-007, and at public access points. The Discharger shall inspect, and replace as necessary, all permanent signs at least once per calendar year to ensure

that the signs are visible and readable. New or replacement signs shall be visible and legible from a distance of 50 feet onshore and offshore, and contain the following information, at a minimum:

- Discharge Point No. (discharge identification number).
- Telephone number to report dry weather discharges.
- Description of discharge, including the words "sewage" and "pathogens that can cause illness."
- Warning, alert, caution, or other term to notify the public that caution is needed.

(b) The Discharger shall post warning signs, including "No Swimming" signs, at beach locations whenever a combined sewer discharge occurs to inform users that bacteria concentrations may be elevated. The Discharger shall post warning signs within four hours of the time the discharge commences unless the discharge begins after 4:00 p.m., in which case, the Discharger shall post warning signs by 8:00 a.m. the following day. Signs shall remain posted until analysis indicates that water quality meets bacteriological criteria for recreation.

(c) The Discharger shall post warning signs at public access points where shellfish may be harvested for human consumption whenever a combined sewer discharge occurs. The Discharger shall post warning signs within four hours of the time the discharge commences unless the discharge begins after 4:00 p.m., in which case, the Discharger shall post warning signs by 8:00 a.m. the following day. Signs shall be posted until the City and County Health Department indicates that posting is no longer required.

(d) The Discharger shall provide electronic notification of combined sewer discharges through a free-access website and telephone hotline. The electronic notification shall include information about the location and impacts of combined sewer discharges, and provide a telephone number for the public to report discharges.

ix. Control No. 9: Monitor to Characterize Combined Sewer Discharge Impacts and Efficacy of Controls. The Discharger shall monitor to determine the occurrence and apparent impacts of combined sewer discharges, and the efficacy of controls, as described in Provision VI.C.8 and the MRP.

b. Documentation of Nine Minimum Controls. The Discharger shall maintain records documenting implementation of the nine minimum controls described in Provision VI.C.5.a. By February 1 each year, the Discharger shall submit a report to the Regional Water Board and U.S. EPA covering the prior October 1 through September 30. The first such report shall be due February 1, 2021, and cover November 1, 2019, through September 30, 2020. The report shall summarize actions taken and planned to implement the nine minimum controls.

c. Long-Term Control Plan (LTCP). The Discharger shall implement its Long-Term Control Plan (LTCP) and shall comply with the following provisions:

i. The Discharger shall optimize system operations to minimize combined sewer discharges and maximize pollutant removal during wet weather.

ii. The Discharger shall use all facilities, including any inoperative or unused facilities, to store or treat wet weather flows to the maximum extent practicable.

iii. The Discharger shall capture for treatment, or storage and subsequent treatment, 100 percent of the combined wastewater and stormwater flow collected in the combined sewer system during precipitation events. Captured flows shall receive the minimum treatment specified in Table 2.

iv. The Discharger shall operate the facilities as set forth below and maintain records documenting implementation. If the Discharger demonstrates that changes to these operating parameters will result in additional storage or treatment, it shall implement such changes after receiving written concurrence from the Regional Water Board Executive Officer and U.S. EPA.

(a) The Oceanside Water Pollution Control Plant shall have an instantaneous influent flow rate of at least 43 MGD prior to discharging primary-treated effluent from the plant to Discharge Point No. 001.

(b) The Oceanside Water Pollution Control Plant shall have an instantaneous influent flow rate of at least 60 MGD prior to initiating discharge from the Westside Transport/Storage Structure to Discharge Point No. 001.

(c) The flow at Discharge Point No. 001 shall be at least 165 MGD within 2 hours of a discharge from Discharge Point No. CSD-002 or CSD-003.

(d) The Discharger shall ensure that two duty pumps at the Sea Cliff No. 1 Pump Station are operating at maximum capacity prior to discharging at Discharge Point No. CSD-005.

(e) The Discharger shall ensure that the Sea Cliff No. 2 Pump Station is operating at maximum capacity and at least 1,100 gallons per minute prior to discharging at Discharge Point Nos. CSD-006 and CSD-007.

(f) The Discharger shall comply with the following after rain and combined sewer discharges subside:

(1) If the National Weather Service predicts at least a 30 percent chance of rain within the next 24 hours, the Discharger shall maximize storage capacity for predicted rain by pumping down the Westside Transport/Storage Structure to dry weather levels (i.e., ten feet or less in the East Box).

(2) If the National Weather Service predicts less than a 30 percent chance of rain within the next 24 hours, the Discharger shall maximize secondary treatment

at the Oceanside Water Pollution Control Plant by ceasing the discharge of primary-treated plant effluent and Westside Transport/Storage Structure effluent to Discharge Point No. 001.

d. LTCP Update. The Discharger shall update its LTCP by implementing the following tasks based on the *Combined Sewer Overflow (CSO) Control Policy* and shall submit the required reports to the Regional Water Board and U.S. EPA as specified in the table below. In doing so, the Discharger may use previously completed studies to the extent that they accurately provide the required information.

Table 7. Tasks to Update Long-Term Control Plan (LTCP)

Task	Compliance Date
1. Post-Construction Characterization, Monitoring, and Modeling of Combined Sewer System The Discharger shall submit a System Characterization Report with a comprehensive characterization of the combined sewer system developed through records review, monitoring, modeling, and other means as appropriate to establish the existing conditions upon which the Consideration of Sensitive Areas Report (Task 3) will be based. At a minimum, the System Characterization Report shall include the following: **a.** Thorough description of the entire combined sewer system, including how it responds during a modeled typical year and various precipitation events (including 3-hour duration, 5-year and 10-year return frequency storms). This description will consider the volume and frequency of combined sewer system discharges and sewer overflows from the combined sewer system, and the impacts of climate change and sea level rise; **b.** Description of each model used, including a discussion of model calibration and validation; **c.** Location, frequency, and characteristics of actual combined sewer discharges and sewer overflows from the combined sewer system, and their locations relative to sensitive areas, for at least the last 10 years; **d.** Description of any temporal or spatial trends of sewer overflows from the combined sewer system; **e.** Based on available information, evaluation of how combined sewer discharges affect receiving water quality. At a minimum, the Discharger shall compare wet weather average and maximum discharge characteristics and receiving water monitoring data with Ocean Plan Table 1 water quality objectives; and **f.** Evaluation of combined sewer discharge control efficacy (e.g., using TSS as a proxy for pollutant removal efficiency), including a description of any method used.	Within 48 months of this Order's effective date
2. Public Participation The Discharger shall submit a description of its completed and planned public participation efforts to actively involve the affected public in its decision-making process related to capital planning, including implementation of any additional long-term combined sewer system controls based on the results of the Consideration of Sensitive Areas Report. The affected public includes rate-payers (including rate-payers in separate sanitary sewer system service areas), industrial users, persons who use the receiving waters, and any other interested persons. The public participation efforts may include outreach through methods such as public meetings, direct mailers, billing inserts, press releases, postings of information on the Discharger's website, and development of advisory committees.	Within 48 months of this Order's effective date

Task	Compliance Date
3. Consideration of Sensitive Areas Based on the findings of the System Characterization Report (Task 1), the Discharger shall submit a Consideration of Sensitive Areas Report that evaluates, prioritizes, and proposes control alternatives needed to eliminate, relocate, or reduce the magnitude or frequency of discharges to sensitive areas from Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-005, CSD-006, and CSD-007. The Consideration of Sensitive Areas Report shall include the following, at a minimum: **a.** Provide updated water contact recreational use surveys, focusing particularly on recreational use following combined sewer discharges; **b.** Identify control alternatives for each combined sewer discharge structure and the combined sewer system as a whole, including but not limited to the following: **i.** Green infrastructure and low impact development; **ii.** Increased storage within the combined sewer system and at the Oceanside Water Pollution Control Plant; **iii.** Increased treatment capacity; **iv.** Operational changes; **v.** Increased pumping capacity at the Westside Pump Station; and **vi.** Use of high-rate treatment technologies and disinfection to minimize pollutant loads. **c.** Evaluate the practical and technical feasibility of the proposed alternatives; **d.** Using a model, simulate existing conditions and expected conditions after construction and operation of each proposed alternative, including how the alternative would be expected to affect water quality and combined sewer discharge volumes and frequencies at each combined sewer discharge outfall, and incorporating consideration of climate change and sea level rise; **e.** Evaluate the feasibility, costs, and benefits of the alternatives. Evaluate financial capabilities (e.g., using U.S. EPA's *Combined Sewer Overflows, Guidance for Financial Capability Assessment and Schedule Development* [EPA 832-B-97-004, February 1997] or other appropriate guidance); **f.** Consider costs relative to water quality and other public benefits, financial capabilities, other infrastructure needs, and integrated planning considerations, and prioritize and propose for implementation alternatives to eliminate, relocate, or reduce the magnitude or frequency of discharges from Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-005, CSD-006, and CSD-007 based on Tasks 3.a through 3.e, above; and **g.** Provide an implementation schedule that includes interim milestones.	Within 48 months of this Order's effective date
4. Operational Plan **a.** The Discharger shall submit a Wet Weather Operations Report that proposes a set of operational parameters to be used as performance measures to ensure that wet weather operations maximize pollutant removal and minimize the frequency, volume, and duration of combined sewer discharges and sewer overflows from the combined sewer system. The performance measures may include all or a portion of those listed in Provision VI.C.5.c.iv and shall include measures to evaluate compliance. The Discharger shall provide the technical basis for proposing new performance measures or retaining the existing ones. **b.** Within 90 days of receiving written concurrence from the Regional Water Board Executive Officer and U.S. EPA, the Discharger shall update its Operation and Maintenance Manual, implement the proposed performance measures in lieu of those in Provision VI.C.5.c.iv, and demonstrate compliance.	Within 24 months of this Order's effective date Within 90 days of receiving written concurrence

Task	Compliance Date
5. Post-Construction Compliance Monitoring Program The MRP contains post-construction compliance monitoring requirements. The Discharger shall submit a Post-Construction Compliance Monitoring Plan proposing modifications, as appropriate, to the MRP for the next permit term to verify compliance with applicable water quality standards and protection of designated uses, as well as to ascertain the effectiveness of combined sewer system controls. At a minimum, the Post-Construction Compliance Monitoring Plan shall evaluate whether any reduction or increase in monitoring, or alternative monitoring, is appropriate.	With Report of Waste Discharge

6. Westside Recycled Water Project Operations Notification

The Discharger shall notify the Regional Water Board and U.S. EPA at least 30 days prior to commencing Westside Recycled Water Project operations. The notification shall include the following:

a. Date that operations will commence;

b. Description of the project as constructed, including a description and flow diagram of all treatment processes;

c. Description and line diagram of how and where the concentrate from the reverse osmosis process is to be discharged to Discharge Point No. 001;

d. Description of anticipated changes in the quality of effluent discharged to Discharge Point No. 001; and

e. Verification that effluent discharged to Discharge Point No. 001 will comply with this Order's requirements.

If pollutant concentrations are expected to increase by more than considered in the reasonable potential analysis based on future effluent quality with the Westside Recycled Water Project (see Fact Sheet § IV.C.4.b), the notification shall also summarize anticipated maximum receiving water concentrations and compare them to the water quality objectives listed in Fact Sheet Tables F-9 and F-10.

7. Flame Retardant Special Study

The Discharger shall propose a special study to evaluate Oceanside Water Pollution Control Plant effluent flame retardant concentrations and flame retardant mass loadings to the Pacific Ocean from Discharge Point No. 001. The Discharger shall submit a special study work plan to the U.S. EPA Water Division Director within one year of the effective date of this Order and shall submit the special study final report with the application for permit reissuance.

8. Efficacy of Combined Sewer System Controls Special Study

By August 1, 2023, the Discharger shall submit a report to the Regional Water Board and U.S. EPA evaluating the quality of the combined sewer discharges and the efficacy of the combined sewer discharge controls during wet weather (i.e., control of solid and floatable

material in combined sewer discharges) at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-005, CSD-006, and CSD-007. At a minimum, the Discharger shall monitor for TSS, copper, lead, and zinc. The Discharger shall also evaluate floatables removal.

ATTACHMENT A – DEFINITIONS

Areas of Special Biological Significance (ASBS)
Areas designated by the State Water Resources Control Board as ocean areas requiring protection of species or biological communities to the extent that maintenance of natural water quality is assured. All Areas of Special Biological Significance are also classified as a subset of State Water Quality Protection Areas.

Average Monthly Effluent Limitation (AMEL)
Highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL)
Highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Bioaccumulative
Taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

Chlordane
Sum of chlordane-alpha, chlordane-gamma, chlordene-alpha, chlordene-gamma, nonachlor-alpha, nonachlor-gamma, and oxychlordane.

Combined Sewer Discharge
Authorized combined sewer overflow during a wet weather day from an approved combined sewer discharge point. Table 2 of the Order lists approved combined sewer discharge points.

Combined Sewer Discharge Event
Discharge from one or more approved combined sewer discharge points during wet weather separated by at least six hours from any other combined sewer discharge event. Table 2 of the Order lists approved combined sewer discharge points.

Combined Sewer Overflow
The *Combined Sewer Overflow (CSO) Control Policy* defines a combined sewer overflow as the discharge from a combined sewer system at a point prior to the POTW's treatment plant.

Daily Discharge
Either: (1) total mass of the constituent discharged over a calendar day (12:00 a.m. through 11:59 p.m.) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit) for a constituent with limitations expressed in units of mass; or (2) unweighted arithmetic mean measurement of the constituent over a day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of a day.

For composite sampling, if a day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

DDT
Sum of 4,4'DDT, 2,4'DDT, 4,4'DDE, 2,4'DDE, 4,4'DDD, and 2,4'DDD.

Degrade
Degradation shall be determined by comparison of the waste field and reference site or sites for characteristic species diversity, population density, contamination, growth anomalies, debility, or supplanting of normal species by undesirable plant and animal species. Degradation occurs if there are significant differences in any of three major biotic groups, namely, demersal fish, benthic invertebrates, or attached algae. Other groups may be evaluated where benthic species are not affected, or are not the only ones affected.

Detected, but Not Quantified (DNQ)
Sample results that are less than the reported Minimum Level, but greater than or equal to the laboratory's method detection limit (MDL). Sample results reported as DNQ are estimated concentrations.

Dichlorobenzenes
Sum of 1,2-dichlorobenzene and 1,3-dichlorobenzene.

Dilution Credit
Amount of dilution granted to a discharge in the calculation of a water quality-based effluent limitation based on the allowance of a specified mixing zone. It is calculated from the dilution ratio, or determined by conducting a mixing zone study or modeling the discharge and receiving water.

Downstream Ocean Waters
Waters downstream with respect to ocean currents.

Dredged Material
Any material excavated or dredged from the navigable waters of the United States, including material otherwise referred to as "spoil."

Dry Weather
Any weather not defined as wet weather (determined on a day-by-day basis).

Effective Concentration (EC)
Point estimate of the toxicant concentration that would cause an adverse effect on a quantal, "all or nothing," response (such as death, immobilization, or serious incapacitation) in a given percent of the test organisms. If the effect is death or immobility, the term lethal concentration (LC) may be used. EC values may be calculated using point estimation techniques such as probit, logit, and Spearman-

Karber. EC_{25} is the concentration of toxicant (in percent effluent) that causes a response in 25 percent of the test organisms.

Enclosed Bays
Indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. This definition includes, but is not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drakes Estero, San Francisco Bay, Morro Bay, Los Angeles Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay.

Endosulfan
Sum of endosulfan-alpha, endosulfan-beta, and endosulfan sulfate.

Estuaries and Coastal Lagoons
Waters at the mouths of streams that serve as mixing zones for fresh and ocean waters during a major portion of the year. Mouths of streams that are temporarily separated from the ocean by sandbars shall be considered as estuaries. Estuarine waters will generally be considered to extend from a bay or the open ocean to the upstream limit of tidal action but may be considered to extend seaward if significant mixing of fresh and salt water occurs in the open coastal waters. The waters described by this definition include, but are not limited to, the Sacramento-San Joaquin Delta as defined by California Water Code section 12220, Suisun Bay, Carquinez Strait downstream to Carquinez Bridge, and appropriate areas of the Smith, Klamath, Mad, Eel, Noyo, and Russian Rivers.

Halomethanes
Sum of bromoform, bromomethane (methyl bromide), and chloromethane (methyl chloride).

HCH
Sum of the alpha, beta, gamma (lindane), and delta isomers of hexachlorocyclohexane.

Initial Dilution
Process that results in the rapid and irreversible turbulent mixing of wastewater with ocean water around the point of discharge.

For a submerged buoyant discharge, characteristic of most municipal and industrial wastes that are released from the submarine outfalls, the momentum of the discharge and its initial buoyancy act together to produce turbulent mixing. Initial dilution in this case is completed when the diluting wastewater ceases to rise in the water column and first begins to spread horizontally.

For shallow water submerged discharges, surface discharges, and non-buoyant discharges, characteristic of cooling water wastes and some individual discharges, turbulent mixing results primarily from the momentum of discharge. Initial dilution, in these cases, is considered to be completed when the momentum induced velocity of the discharge ceases to produce significant mixing of the waste, or the diluting plume reaches a fixed distance from the discharge to be specified by the Regional Water Board, whichever results in the lower estimate for initial dilution.

Instantaneous Maximum Effluent Limitation
Highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation
Lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

In-Stream Waste Concentration (IWC)
The concentration of a toxicant in the receiving water after mixing.

Kelp Beds
For purposes of the Ocean Plan bacteriological standards, significant aggregations of marine algae of the genera *Macrocystis* and *Nereocystis*. Kelp beds include the total foliage canopy of *Macrocystis* and *Nereocystis* plants throughout the water column.

Mariculture
Culture of plants and animals in marine waters independent of any pollution source.

Material
(a) In common usage: (1) the substance or substances of which a thing is made or composed, (2) substantial;

(b) For Ocean Plan purposes relating to waste disposal, dredging, and the disposal of dredged material and fill: matter of any kind or description that is subject to regulation as waste or any material dredged from the navigable waters of the United States. See "dredged material."

Maximum Daily Effluent Limitation (MDEL)
Highest allowable daily discharge of a pollutant.

Method Detection Limit (MDL)
Minimum concentration of a substance that can be reported with 99 percent confidence that the measured concentration is distinguishable from method blank results, as defined in 40 C.F.R. part 136, Appendix B.

Minimum Level (ML)
Concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Natural Light
Reduction of natural light may be determined by measurement of light transmissivity or total irradiance, or both, according to the monitoring needs of the Regional Water Board or U.S. EPA.

No Observed Effect Concentration (NOEC)
Highest tested concentration of an effluent or a toxicant at which no adverse effects are observed on the aquatic test organisms at a specific time of observation. It is determined using hypothesis testing.

Not Detected (ND)
Sample results less than the laboratory's MDL.

PAHs (polynuclear aromatic hydrocarbons)
Sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo[k]fluoranthene, 1,12-benzoperylene, benzo[a]pyrene, chrysene, dibenzo[ah]anthracene, fluorene, indeno[1,2,3-cd]pyrene, phenanthrene, and pyrene.

PCBs (polychlorinated biphenyls)
Sum of chlorinated biphenyls whose analytical characteristics resemble those of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260.

Pollutant Minimization Program (PMP)
Waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The PMP goal shall be to reduce potential sources through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. The Regional Water Board and U.S. EPA may consider cost effectiveness when establishing PMP requirements. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), fulfill the PMP requirements.

Reporting Level (RL)
Minimum Level (ML) and its associated analytical method chosen by the Discharger for reporting and compliance determination from the MLs included in this Order, including an additional factor if applicable as discussed herein (also known as the "Reported Minimum Level"). The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected either from Ocean Plan Appendix II in accordance with Ocean Plan chapter III.C.5.a or established in accordance with Ocean Plan chapter III.C.5.b. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

Sewer Overflow from the Combined Sewer System
Release or diversion of untreated or partially-treated wastewater or combined wastewater and stormwater from the combined sewer collection system. Sewer overflows from the combined sewer system can occur in public rights of way or on private property. Sewer overflows from the combined sewer system do not include releases due to failures in privately-owned sewer laterals or authorized combined sewer discharges at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, or CSD-007.

Shellfish
Organisms identified by the California Department of Public Health as shellfish for public health purposes (i.e., mussels, clams and oysters).

Significant Difference
Statistically significant difference in the means of two distributions of sampling results at the 95 percent confidence level.

Six-Month Median Effluent Limitation
Highest allowable moving median of all daily discharges for any 180-day period.

State Water Quality Protection Areas (SWQPAs)
Non-terrestrial marine or estuarine areas designated to protect marine species or biological communities from an undesirable alteration in natural water quality. All "Areas of Special Biological Significance" (ASBS) previously designated by the State Water Board in Resolutions 74-28, 74-32, and 75-61 are now also classified as a subset of SWQPAs and require the special protections the Ocean Plan affords.

TCDD Equivalents
Sum of the concentrations of chlorinated dibenzodioxins (2,3,7,8-CDDs) and chlorinated dibenzofurans (2,3,7,8-CDFs) multiplied by their respective Toxicity Equivalency Factors (TEFs) and Bioaccumulation Equivalency Factors (BEFs), as defined in Table A-1. When calculating TCDD Equivalents, the Discharger shall set congener concentrations below the minimum levels to zero. This approach is based on 40 C.F.R. part 132, Appendix F, Procedure 4, Tables 1 and 2, and TEFs listed in the Ocean Plan. This TCDD equivalents definition supersedes the dioxin-TEQ definition in Attachment G section V.C.1.d.iv.

Table A-1. Minimum Levels, Toxicity Equivalency Factors, and Bioaccumulation Equivalency Factors

Isomer Group	Minimum Level (pg/L)	Toxicity Equivalency Factor (TEF)	Bioaccumulation Equivalency Factor (BEF)
2,3,7,8-TCDD	10	1.0	1.0
1,2,3,7,8-PeCDD	50	0.5	0.9
1,2,3,4,7,8-HxCDD	50	0.1	0.3
1,2,3,6,7,8-HxCDD	50	0.1	0.1
1,2,3,7,8,9-HxCDD	50	0.1	0.1
1,2,3,4,6,7,8-HpCDD	50	0.01	0.05
OCDD	100	0.001	0.01
2,3,7,8-TCDF	10	0.1	0.8
1,2,3,7,8-PeCDF	50	0.05	0.2
2,3,4,7,8-PeCDF	50	0.5	1.6
1,2,3,4,7,8-HxCDF	50	0.1	0.08
1,2,3,6,7,8-HxCDF	50	0.1	0.2
1,2,3,7,8,9-HxCDF	50	0.1	0.6
2,3,4,6,7,8-HxCDF	50	0.1	0.7
1,2,3,4,6,7,8-HpCDF	50	0.01	0.01
1,2,3,4,7,8,9-HpCDF	50	0.01	0.4
OCDF	100	0.001	0.02

Test of Significant Toxicity (TST)
A statistical approach used to analyze toxicity test data. The TST statistical approach is described in *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010).

Toxicity Reduction Evaluation (TRE)
Study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. (A TIE is a set of procedures to identify the specific chemical or chemicals responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.)

Waste
As used in the Ocean Plan, a Discharger's total discharge, of whatever origin (i.e., gross, not net, discharge).

Water Recycling
Treatment of wastewater to render it suitable for reuse, the transportation of treated wastewater to the place of use, and the actual use of treated wastewater for a direct beneficial use or controlled use that would not otherwise occur.

Wet Weather
Weather in which any one of the following conditions exists as a result of rain (determined on a day-by-day basis):

1. Instantaneous influent flow to the Oceanside Water Pollution Control Plant exceeds 43 MGD; or

2. Average daily influent concentration of TSS is less than 100 mg/L; or

3. Westside Transport/Storage Structure flow elevation exceeds 0 feet in the West Box or 18 feet in the East Box. (Flow from the East Box to the West Box occurs only when the East Box storage level exceeds 18 feet.)

ATTACHMENT B – FACILITY AND RECEIVING WATER MAPS

Figure B-1. Facility Overview Map

The Facility subject to this Order is shown in light red (western area) and includes the Oceanside Water Pollution Control Plant, wastewater collection system, and Westside Recycled Water Project. The Southeast Water Pollution Control Plant, North Point Wet Weather Facility, and Bayside Wet Weather Facilities are shown only for reference in light green (eastern area).

ATTACHMENT D – STANDARD PROVISIONS

I. STANDARD PROVISIONS—PERMIT COMPLIANCE

A. Duty to Comply

1. The Discharger must comply with all of the terms, requirements, and conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application; or a combination thereof. (40 C.F.R. § 122.41(a); Wat. Code §§ 13261, 13263, 13265, 13268, 13000, 13001, 13304, 13350, 13385.)

2. The Discharger shall comply with effluent standards or prohibitions established under CWA section 307(a) for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 C.F.R. § 122.41(a)(1).)

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. (40 C.F.R. § 122.41(c).)

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 C.F.R. § 122.41(d).)

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order. (40 C.F.R. § 122.41(e).)

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 C.F.R. § 122.41(g).)

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 C.F.R. § 122.5(c).)

F. Inspection and Entry

The Discharger shall allow the Regional Water Board, State Water Board, U.S. EPA, or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (33 U.S.C. § 1318(a)(4)(B); 40 C.F.R. § 122.41(i); Wat. Code, §§ 13267, 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (33 U.S.C. § 1318(a)(4)(B)(i); 40 C.F.R. § 122.41(i)(1); Wat. Code, §§ 13267, 13383);

2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (33 U.S.C. § 1318(a)(4)(B)(ii); 40 C.F.R. § 122.41(i)(2); Wat. Code, §§ 13267, 13383);

3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (33 U.S.C. § 1318(a)(4)(B)(ii); 40 C.F.R. § 122.41(i)(3); Wat. Code, §§ 13267, 13383); and

4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (33 U.S.C. § 1318(a)(4)(B); 40 C.F.R. § 122.41(i)(4); Wat. Code, §§ 13267, 13383.)

G. Bypass

1. Definitions

a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. (40 C.F.R. § 122.41(m)(1)(i).)

b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 C.F.R. § 122.41(m)(1)(ii).)

2. Bypass not exceeding limitations. The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions—Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 C.F.R. § 122.41(m)(2).)

3. **Prohibition of bypass.** Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless (40 C.F.R. § 122.41(m)(4)(i)):

   a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 C.F.R. § 122.41(m)(4)(i)(A));

   b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 C.F.R. § 122.41(m)(4)(i)(B)); and

   c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions—Permit Compliance I.G.5 below. (40 C.F.R. § 122.41(m)(4)(i)(C).)

4. **Approval.** The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions—Permit Compliance I.G.3 above. (40 C.F.R. § 122.41(m)(4)(ii).)

5. **Notice**

   a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit prior notice, if possible at least 10 days before the date of the bypass. The notice shall be sent to the Regional Water Board. As of December 21, 2020, a notice shall also be submitted electronically to the initial recipient defined in Standard Provisions—Reporting V.J below. Notices shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(m)(3)(i).)

   b. Unanticipated bypass. The Discharger shall submit a notice of an unanticipated bypass as required in Standard Provisions—Reporting V.E below (24-hour notice). The notice shall be sent to the Regional Water Board. As of December 21, 2020, a notice shall also be submitted electronically to the initial recipient defined in Standard Provisions—Reporting V.J below. Notices shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(m)(3)(ii).)

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology-based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. (40 C.F.R. § 122.41(n)(1).)

1. **Effect of an upset.** An upset constitutes an affirmative defense to an action brought for noncompliance with such technology-based permit effluent limitations if the requirements of Standard Provisions—Permit Compliance I.H.2 below are met. No determination made

during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. (40 C.F.R. § 122.41(n)(2).)

2. **Conditions necessary for a demonstration of upset.** A discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 C.F.R. § 122.41(n)(3)):

   a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 C.F.R. § 122.41(n)(3)(i));

   b. The permitted facility was, at the time, being properly operated (40 C.F.R. § 122.41(n)(3)(ii));

   c. The Discharger submitted notice of the upset as required in Standard Provisions—Reporting V.E.2.b below (24-hour notice) (40 C.F.R. § 122.41(n)(3)(iii)); and

   d. The Discharger complied with any remedial measures required under Standard Provisions—Permit Compliance I.C above. (40 C.F.R. § 122.41(n)(3)(iv).)

3. **Burden of proof.** In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 C.F.R. § 122.41(n)(4).)

II. STANDARD PROVISIONS—PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition. (40 C.F.R. § 122.41(f).)

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit. (40 C.F.R. § 122.41(b).)

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 C.F.R. §§ 122.41(l)(3), 122.61.)

III. STANDARD PROVISIONS—MONITORING

A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 C.F.R. § 122.41(j)(1).)

B. Monitoring must be conducted according to test procedures approved under 40 C.F.R. part 136 for the analyses of pollutants unless another method is required under 40 C.F.R. chapter 1, subchapter N. Monitoring must be conducted according to sufficiently sensitive test methods approved under 40 C.F.R. part 136 for the analysis of pollutants or pollutant parameters or required under 40 C.F.R. chapter 1, subchapter N . For the purposes of this paragraph, a method is sufficiently sensitive when:

1. The method minimum level (ML) is at or below the level of the effluent limitation established in the permit for the measured pollutant or pollutant parameter, and either (a) the method ML is at or below the level of the applicable water quality criterion for the measured pollutant or pollutant parameter, or (b) the method ML is above the applicable water quality criterion but the amount of the pollutant or pollutant parameter in a facility's discharge is high enough that the method detects and quantifies the level of the pollutant or pollutant parameter in the discharge; or

2. The method has the lowest ML of the analytical methods approved under 40 C.F.R. part 136 or required under 40 C.F.R. chapter 1, subchapter N, for the measured pollutant or pollutant parameter.

In the case of pollutants or pollutant parameters for which there are no approved methods under 40 C.F.R. part 136 or otherwise required under 40 C.F.R. chapter 1, subchapter N, monitoring must be conducted according to a test procedure specified in this Order for such pollutants or pollutant parameters. (40 C.F.R. §§ 122.21(e)(3), 122.41(j)(4), 122.44(i)(1)(iv).)

IV. STANDARD PROVISIONS—RECORDS

A. The Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time. (40 C.F.R. § 122.41(j)(2).)

B. Records of monitoring information shall include the following:

1. The date, exact place, and time of sampling or measurements (40 C.F.R. § 122.41(j)(3)(i));

2. The individual(s) who performed the sampling or measurements (40 C.F.R. § 122.41(j)(3)(ii));

3. The date(s) the analyses were performed (40 C.F.R. § 122.41(j)(3)(iii));

4. The individual(s) who performed the analyses (40 C.F.R. § 122.41(j)(3)(iv));

5. The analytical techniques or methods used (40 C.F.R. § 122.41(j)(3)(v)); and

6. The results of such analyses. (40 C.F.R. § 122.41(j)(3)(vi).)

C. Claims of confidentiality for the following information will be denied (40 C.F.R. § 122.7(b)):

1. The name and address of any permit applicant or Discharger (40 C.F.R. § 122.7(b)(1)); and

2. Permit applications and attachments, permits, and effluent data. (40 C.F.R. § 122.7(b)(2).)

V. STANDARD PROVISIONS—REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Regional Water Board, State Water Board, or U.S. EPA within a reasonable time, any information which the Regional Water Board, State Water Board, or U.S. EPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or U.S. EPA copies of records required to be kept by this Order. (40 C.F.R. § 122.41(h); Wat. Code, §§ 13267, 13383.)

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or U.S. EPA shall be signed and certified in accordance with Standard Provisions—Reporting V.B.2, V.B.3, V.B.4, V.B.5, and V.B.6 below. (40 C.F.R. § 122.41(k).)

2. For a corporation, all permit applications shall be signed by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures. (40 C.F.R. § 122.22(a)(1).)

For a partnership or sole proprietorship, all permit applications shall be signed by a general partner or the proprietor, respectively. (40 C.F.R. § 122.22(a)(2).)

For a municipality, State, federal, or other public agency, all permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of U.S. EPA). (40 C.F.R. § 122.22(a)(3).).

3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or U.S. EPA shall be signed by a person described in Standard Provisions—Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

a. The authorization is made in writing by a person described in Standard Provisions—Reporting V.B.2 above (40 C.F.R. § 122.22(b)(1));

b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 C.F.R. § 122.22(b)(2)); and

c. The written authorization is submitted to the Regional Water Board and State Water Board. (40 C.F.R. § 122.22(b)(3).)

4. If an authorization under Standard Provisions—Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions—Reporting V.B.3 above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 C.F.R. § 122.22(c).)

5. Any person signing a document under Standard Provisions—Reporting V.B.2 or V.B.3 above shall make the following certification:

> "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." (40 C.F.R. § 122.22(d).)

6. Any person providing the electronic signature for documents described in Standard Provisions—V.B.1, V.B.2, or V.B.3 that are submitted electronically shall meet all relevant requirements of Standard Provisions—Reporting V.B, and shall ensure that all relevant requirements of 40 C.F.R. part 3 (Cross-Media Electronic Reporting) and 40 C.F.R. part 127 (NPDES Electronic Reporting Requirements) are met for that submission. (40 C.F.R § 122.22(e).)

C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program in this Order. (40 C.F.R. § 122.22(l)(4).)

2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board. As of December 21, 2016, all reports and forms must be submitted electronically to the initial recipient defined in Standard Provisions—Reporting V.J and comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(l)(4)(i).)

3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 C.F.R. part 136, or another method required for an industry-specific waste stream under 40 C.F.R. chapter 1, subchapter N, the results of such monitoring shall be included in the calculation and reporting of the data submitted in the DMR reporting form specified by the Regional Water Board or State Water Board. (40 C.F.R. § 122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 C.F.R. § 122.41(l)(4)(iii).)

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date. (40 C.F.R. § 122.41(l)(5).)

E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written report shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written report shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

For noncompliance related to combined sewer overflows, sanitary sewer overflows, or bypass events, these reports must include the data described above (with the exception of time of discovery) as well as the type of event (i.e., combined sewer overflow, sanitary sewer overflow, or bypass event), type of overflow structure (e.g., manhole, combined sewer overflow outfall), discharge volume untreated by the treatment works treating domestic sewage, types of human health and environmental impacts of the event, and whether the noncompliance was related to wet weather.

As of December 21, 2020, all reports related to combined sewer overflows, sanitary sewer overflows, or bypass events must be submitted to the Regional Water Board and must be

submitted electronically to the initial recipient defined in Standard Provisions—Reporting V.J. The reports shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. The Regional Water Board may also require the Discharger to electronically submit reports not related to combined sewer overflows, sanitary sewer overflows, or bypass events under this section. (40 C.F.R. § 122.41(l)(6)(i).)

2. The following shall be included as information that must be reported within 24 hours:

a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(A).)

b. Any upset that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(B).)

3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 C.F.R. § 122.41(l)(6)(iii).)

F. Planned Changes

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 C.F.R. § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 C.F.R. section 122.29(b) (40 C.F.R. § 122.41(l)(1)(i)); or

2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are not subject to effluent limitations in this Order. (Alternatively, for an existing manufacturing, commercial, mining, or silvicultural discharge as referenced in 40 C.F.R. section 122.42(a), this notification applies to pollutants that are subject neither to effluent limitations in this Order nor to notification requirements under 40 C.F.R. section 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1).) (40 C.F.R. § 122.41(l)(1)(ii).)

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with this Order's requirements. (40 C.F.R. § 122.41(l)(2).)

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions—Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provisions—Reporting V.E above. For noncompliance related to combined sewer overflows, sanitary sewer overflows, or bypass events, these reports shall contain the information described in Standard Provisions—

Reporting V.E and the applicable required data in appendix A to 40 C.F.R. part 127. The Regional Water Board may also require the Discharger to electronically submit reports not related to combined sewer overflows, sanitary sewer overflows, or bypass events under this section. (40 C.F.R. § 122.41(l)(7).)

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, State Water Board, or U.S. EPA, the Discharger shall promptly submit such facts or information. (40 C.F.R. § 122.41(l)(8).)

J. Initial Recipient for Electronic Reporting Data

The owner, operator, or duly authorized representative is required to electronically submit NPDES information specified in appendix A to 40 C.F.R. part 127 to the initial recipient defined in 40 C.F.R. section 127.2(b). U.S. EPA will identify and publish the list of initial recipients on its website and in the Federal Register, by state and by NPDES data group (see 40 C.F.R. § 127.2(c)). U.S. EPA will update and maintain this list. (40 C.F.R. § 122.41(l)(9).)

VI. STANDARD PROVISIONS—ENFORCEMENT

A. The Regional Water Board is authorized to enforce the terms of this Order under several provisions of the Water Code, including, but not limited to, sections 13268, 13350, 13385, 13386, and 13387.

VII. ADDITIONAL PROVISIONS—NOTIFICATION LEVELS

A. Non-Municipal Facilities

Existing manufacturing, commercial, mining, and silvicultural dischargers shall notify the Regional Water Board as soon as they know or have reason to believe (40 C.F.R. § 122.42(a)):

1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(1)):

a. 100 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(1)(i));

b. 200 µg/L for acrolein and acrylonitrile; 500 µg/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(1)(ii));

c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(1)(iii)); or

d. The level established by the Regional Water Board in accordance with section 40 C.F.R. section 122.44(f). (40 C.F.R. § 122.42(a)(1)(iv).)

2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(2)):

a. 500 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(2)(i));

b. 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(2)(ii));

c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(2)(iii)); or

d. The level established by the Regional Water Board in accordance with 40 C.F.R. section 122.44(f). (40 C.F.R. § 122.42(a)(2)(iv).)

B. Publicly-Owned Treatment Works (POTWs)

All POTWs shall provide adequate notice to the Regional Water Board of the following (40 C.F.R. § 122.42(b)):

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to CWA sections 301 or 306 if it were directly discharging those pollutants (40 C.F.R. § 122.42(b)(1)); and

2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of this Order. (40 C.F.R. § 122.42(b)(2).)

3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW. (40 C.F.R. § 122.42(b)(3).)

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

Clean Water Act section 308 and 40 C.F.R. sections 122.41(h), 122.41(j)-(l), 122.44(i), and 122.48 require that all NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. This MRP establishes monitoring, reporting, and recordkeeping requirements that implement federal and State laws and regulations.

I. GENERAL MONITORING PROVISIONS

A. The Discharger shall comply with this MRP. The Regional Water Board Executive Officer and U.S. EPA may amend this MRP pursuant to 40 C.F.R. sections 122.62, 122.63, and 124.5. If any discrepancies exist between this MRP and the "Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits" (Attachment G), this MRP shall prevail.

B. The Discharger shall conduct all monitoring in accordance with Attachment D section III, as supplemented by Attachment G. Equivalent test methods must be more sensitive than those specified in 40 C.F.R. part 136 and must be specified in this permit.

C. The Discharger shall ensure that results of the Discharge Monitoring Report-Quality Assurance (DMR-QA) Study or most recent Water Pollution Performance Evaluation Study are submitted annually to the State Water Board at the following address or as otherwise directed:

State Water Resources Control Board
Quality Assurance Program Officer
Office of Information Management and Analysis
1001 I Street, Sacramento, CA 95814

D. The Discharger shall implement a Quality Assurance-Quality Control Program for any onsite field tests (e.g., turbidity, pH, temperature, dissolved oxygen, conductivity, disinfectant residual) analyzed by a noncertified laboratory. The Discharger shall keep a manual onsite containing the steps followed in this program and must demonstrate sufficient capability to adequately perform these field tests (e.g., qualified and trained employees, properly calibrated and maintained field instruments). The program shall conform to U.S. EPA guidelines or other approved procedures.

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Table E-1. Monitoring Locations

Monitoring Location Type	Monitoring Location Name	Monitoring Location Description [1]
Oceanside Water Pollution Control Plant Influent (dry weather)	INF-001A	During dry weather, any point in the plant headworks where all waste tributary to the plant is present and preceding any phase of treatment at the plant, exclusive of any return flows or process side streams.

Monitoring Location Type	Monitoring Location Name	Monitoring Location Description [1]
Oceanside Water Pollution Control Plant Influent (wet weather)	INF-001B	During wet weather, any point in the plant headworks where all waste tributary to the plant is present and preceding any phase of treatment at the plant, exclusive of any return flows or process side streams.
Oceanside Water Pollution Control Plant Effluent (dry weather)	EFF-001A	During dry weather, any point at the plant following all phases of treatment, prior to contact with Westside Recycled Water Project concentrate and the receiving water at Discharge Point No. 001.
Oceanside Water Pollution Control Plant Effluent (wet weather)	EFF-001B	During wet weather, any point at the plant following all phases of treatment, prior to contact with Westside Transport/Storage Structure effluent, Westside Recycled Water Project concentrate, and the receiving water at Discharge Point No. 001.
Oceanside Water Pollution Control Plant Effluent and Westside Recycled Water Project Concentrate (dry weather)	EFF-001C	During dry weather, any point at which all plant effluent and Westside Recycled Water Project concentrate tributary to Discharge Point No. 001 is present and after all phases of treatment. The Discharger may combine 24-hour composite samples from Monitoring Locations EFF-001A and EFF-001R to create a volumetrically flow-weighted representative sample for Monitoring Location EFF-001C.
Westside Transport/Storage Structure Effluent (wet weather) (identified in the previous order as "decant")	EFF-001D	During wet weather, any point following the Westside Pump Station wet weather pumps, prior to contact with treated plant effluent, Westside Recycled Water Project concentrate, and the receiving water at Discharge Point No. 001.
Westside Recycled Water Project Reverse Osmosis Concentrate	EFF-001R	Any point at the Westside Recycled Water Project following all phases of treatment, prior to contact with plant effluent, Westside Transport/Storage Structure effluent, and the receiving water at Discharge Point No. 001.
Combined Sewer Discharge Effluent	EFF-CSD	A monitoring location representative of combined sewer discharges from the Westside Transport/Storage Structure.
Shoreline Receiving Water	SRF-15	Nearshore receiving water along Baker Beach, in the surf at the terminus of Lobos Creek.
Shoreline Receiving Water	SRF-15 east	Nearshore receiving water along Baker Beach, in the surf east of Monitoring Location SRF-15.
Shoreline Receiving Water	SRF-16	Nearshore receiving water along Baker Beach, in the surf opposite the Sea Cliff No. 2 Pump Station.
Shoreline Receiving Water	SRF-17	Nearshore receiving water along China Beach, in the surf opposite the Sea Cliff No. 1 Pump Station.
Shoreline Receiving Water	SRF-18	Nearshore receiving water along Ocean Beach, in the surf at the foot of Balboa Street.
Shoreline Receiving Water	SRF-19	Nearshore receiving water along Ocean Beach, in the surf at the foot of Lincoln Way, opposite the Lincoln Combined Sewer Discharge Structure.
Shoreline Receiving Water	SRF-20	Nearshore receiving water along Ocean Beach, in the surf at the foot of Pacheco Street.
Shoreline Receiving Water	SRF-21	Nearshore receiving water along Ocean Beach, in the surf at the foot of Vicente Street, opposite the Vicente Combined Sewer Discharge Structure.
Shoreline Receiving Water	SRF-21.1	Nearshore receiving water along Ocean Beach, in the surf at the foot of Sloat Boulevard.

Monitoring Location Type	Monitoring Location Name	Monitoring Location Description [1]
Shoreline Receiving Water	SRF-22	Nearshore receiving water along Ocean Beach, in the surf at Fort Funston, opposite the Lake Merced Combined Sewer Discharge Structure.

Monitoring Location Type	Monitoring Location Name	Monitoring Location Description [1]
Biosolids	BIO-001	Biosolids (treated sludge)

Footnote:

[1] Latitude and longitude information is approximate.

III. INFLUENT MONITORING REQUIREMENTS

The Discharger shall monitor Oceanside Water Pollution Control Plant influent at Monitoring Location INF-001A during dry weather and Monitoring Location INF-001B during wet weather as follows:

Table E-2. Plant Influent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency [2]
Flow [1]	MG/MGD	Continuous	Continuous/D
Carbonaceous Biochemical Oxygen Demand (5-day @ 20°C)($CBOD_5$) [3]	mg/L	C-24	1/Week
Total Suspended Solids (TSS)	mg/L	C-24	5/Week

Abbreviations:

MG = million gallons
MGD = million gallons per day
mg/L = milligrams per liter

Sample Types and Frequencies:

Continuous = measured continuously
Continuous/D = measured continuously, and recorded and reported daily
C-24 = 24-hour composite
1/Week = once per week
5/Week = five times per week

Footnotes:

[1] The following information shall be reported in monthly self-monitoring reports:

- Daily average flow (MGD)
- Total monthly flow volume (MG)

[2] The minimum sampling frequency is the total number of influent samples to be collected during the specified sampling period, including samples collected during dry and wet weather at Monitoring Locations INF-001A and INF-001B.

[3] The Discharger may monitor Chemical Oxygen Demand at Monitoring Location INF-001B in lieu of $CBOD_5$ during wet weather.

IV. EFFLUENT MONITORING REQUIREMENTS

A. Oceanside Water Pollution Control Plant

1. **Dry and Wet Weather.** The Discharger shall monitor plant effluent at Monitoring Location EFF-001A during dry weather and at Monitoring Location EFF-001B during wet weather as follows:

Table E-3. Plant Effluent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency [3]
Flow [1]	MG/MGD	Continuous	Continuous/D
$CBOD_5$ [2]	mg/L	C-24	1/Week
TSS	mg/L	C-24	5/Week
pH	standard units	Continuous or Grab	1/Week

Abbreviations:

MG = million gallons
MGD = million gallons per day
mg/L = milligrams per liter

Sample Types and Frequencies:

Continuous = measured continuously
Continuous/D = measured continuously, and recorded and reported daily
C-24 = 24-hour composite
Grab = grab sample
1/Week = once per week
5/Week = five times per week

Footnotes:

[1] The following information shall be reported in monthly self-monitoring reports:

- Daily average flow (MGD)
- Total monthly flow volume (MG)

[2] The Discharger may monitor Chemical Oxygen Demand at Monitoring Location EFF-001B in lieu of $CBOD_5$ during wet weather.

[3] The minimum sampling frequency is the total number of effluent samples to be collected during the specified sampling period, including samples collected during dry and wet weather at Monitoring Locations EFF-001A and EFF-001B.

2. **Dry Weather.** During dry weather, the Discharger shall monitor plant effluent at Monitoring Location EFF-001A as follows:

Table E-4. Dry Weather Plant Effluent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Oil and Grease	mg/L	Grab	1/Quarter
Ammonia, total	mg/L as N	C-24	1/Quarter
Arsenic	µg/L	C-24	1/Quarter
Cadmium	µg/L	C-24	1/Quarter
Copper	µg/L	C-24	1/Quarter
Lead	µg/L	C-24	1/Quarter
Nickel	µg/L	C-24	1/Quarter
Selenium	µg/L	C-24	1/Quarter
Silver	µg/L	C-24	1/Quarter
Zinc	µg/L	C-24	1/Quarter
Remaining Ocean Plan Table 1 Pollutants [1]	µg/L	C-24 [2]	1/Year

Abbreviations:

mg/L = milligrams per liter
mg/L as N = milligrams per liter as nitrogen
µg/L = micrograms per liter

Sample Types and Frequencies:

C-24 = 24-hour composite
Grab = grab sample
1/Quarter = once per quarter
1/Year = once per year

Footnotes:

[1] The Discharger shall monitor for the pollutants listed in Ocean Plan Table 1, except chlorine, tributyltin, radioactivity, acute toxicity, and chronic toxicity. The Discharger may monitor for total chromium in lieu of hexavalent chromium.

[2] For mercury and other parameters with analytical methods that require grab sampling, the Discharger may collect a grab sample instead of a 24-hour composite sample.

3. **Wet Weather.** During wet weather, the Discharger shall monitor plant effluent at Monitoring Location EFF-001B as follows:

Table E-5. Wet Weather Plant Effluent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Duration of Blending [1]	minutes	Calculated	Continuous/D
Volume of Blended Wastewater Discharged [1]	MG	Calculated	Continuous/D
Ocean Plan Table 1 Pollutants [2]	µg/L	C-24 [3]	1/Year

Abbreviations:

MG = million gallons
µg/L = micrograms per liter

Sample Types and Frequencies:

Continuous/D = measured continuously, and recorded and reported daily
C-24 = 24-hour composite
1/Year = once per year

Footnotes:

[1] Blended wastewater is biologically-treated wastewater blended with wastewater diverted around biological treatment units at the Oceanside Water Pollution Control Plant. For each day on which blending occurs, the Discharger shall report the duration of blending and the volume of primary-only-treated wastewater blended.

[2] The Discharger shall monitor for the pollutants listed in Ocean Plan Table 1, except chlorine, tributyltin, radioactivity, acute toxicity, and chronic toxicity. The Discharger may monitor for total chromium in lieu of hexavalent chromium.

[3] For mercury and other parameters with analytical methods that require grab sampling, the Discharger may collect a grab sample instead of a 24-hour composite sample.

B. Combined Sewer System

1. **Westside Transport/Storage Structure Effluent.** During wet weather, the Discharger shall monitor Westside Transport/Storage Structure effluent at Monitoring Location EFF-001D as shown in Table E-6.

Table E-6. Westside Transport/Storage Structure Effluent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow Volume [1]	MG	Continuous	Continuous/D
TSS	mg/L	C-X [3]	3/Year
Ammonia, total	mg/L as N	C-X [3]	3/Year
Arsenic	µg/L	C-X [3]	3/Year

Parameter	Units	Sample Type	Minimum Sampling Frequency
Cadmium	µg/L	C-X [3]	3/Year
Copper	µg/L	C-X [3]	3/Year
Lead	µg/L	C-X [3]	3/Year
Nickel	µg/L	C-X [3]	3/Year
Selenium	µg/L	C-X [3]	3/Year
Silver	µg/L	C-X [3]	3/Year
Zinc	µg/L	C-X [3]	3/Year
Remaining Ocean Plan Table 1 Pollutants [2]	µg/L	C-X [3,4]	1/Year

Abbreviations:

MG = million gallons
mg/L = milligrams per liter
mg/L as N = milligrams per liter as nitrogen
µg/L = micrograms per liter

Sample Types and Frequencies:

Continuous = measured continuously
Continuous/D = measured continuously, and recorded and reported daily
C-X = composite sample comprised of individual grab samples collected at equal intervals of no more than one hour at least until a sufficient sample volume for the required analyses is obtained.
1/Year = once per year
3/Year = three times per year

Footnotes:

[1] The following information shall be reported in monthly self-monitoring reports:
- Total daily flow volume from the Westside Transport/Storage Structure to Discharge Point No. 001
- Total monthly flow volume from the Westside Transport/Storage Structure to Discharge Point No. 001

[2] The Discharger shall monitor for the pollutants listed in Ocean Plan Table 1, except chlorine, tributyltin, radioactivity, acute toxicity, chronic toxicity, and volatile organic compounds. The Discharger may monitor for total chromium in lieu of hexavalent chromium.

[3] If the discharge lasts less than 24 hours, the Discharger shall sample at equal intervals for as long as possible and record the duration. The Discharger shall begin collecting aliquots or grab samples within two hours of commencing discharge from the Westside Transport/Storage Structure directly to Discharge Point No. 001.

[4] For mercury and other parameters with analytical methods that require grab sampling, the Discharger may collect a grab sample instead of a 24-hour composite sample.

2. Combined Sewer Discharges

a. During combined sewer discharge events, the Discharger shall monitor combined sewer discharge effluent at Monitoring Location EFF-CSD as follows:

Table E-7. Combined Sewer Discharge Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
TSS	mg/L	C-X [2]	1/Event
Ammonia, total	mg/L as N	C-X [2]	1/Event
Arsenic	µg/L	C-X [2]	1/Event
Cadmium	µg/L	C-X [2]	1/Event
Copper	µg/L	C-X [2]	1/Event
Lead	µg/L	C-X [2]	1/Event
Nickel	µg/L	C-X [2]	1/Event

Parameter	Units	Sample Type	Minimum Sampling Frequency
Selenium	µg/L	C-X [2]	1/Event
Silver	µg/L	C-X [2]	1/Event
Zinc	µg/L	C-X [2]	1/Event
Remaining Ocean Plan Table 1 Pollutants [1]	µg/L	C-X [2,3]	1/Year

Abbreviations:

mg/L = milligrams per liter
mg/L as N = milligrams per liter as nitrogen
µg/L = micrograms per liter

Sample Types and Frequencies:

C-X = composite sample comprised of individual grab samples collected at equal intervals of no more than one hour at least until a sufficient sample volume for the required analysis is obtained.
Grab = grab sample
1/Event = once per combined sewer discharge event
1/Year = once per year

Footnotes:

[1] The Discharger shall monitor for the pollutants listed in Ocean Plan Table 1, except chlorine, tributyltin, radioactivity, acute toxicity, chronic toxicity, and volatile organic compounds. The Discharger may monitor for total chromium in lieu of hexavalent chromium.

[2] If the discharge lasts less than 24 hours, the Discharger shall sample for as long as possible at equal intervals and record the duration. If the discharge lasts less than one hour, the Discharger shall collect at least one grab sample.

[3] For mercury and other parameters with analytical methods that require grab sampling, the Discharger may collect a grab sample instead of a composite sample.

b. The Discharger shall record and report in each self-monitoring report the following information for each discharge at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007:

i. Date and time the combined sewer discharge started;

ii. Event duration (in minutes) and volume (in million gallons);

iii. Rainfall intensity and amount (in inches per day and peak hourly rainfall intensity per day) at representative locations where rainfall was measured;

iv. Information supporting discharge volume estimates (if estimated); and

v. Documentation of compliance or noncompliance with each wet weather operational requirement in Provision VI.C.5.c of the Order.

C. Westside Recycled Water Project

When the Westside Recycled Water Project is operating, the Discharger shall monitor reverse osmosis concentrate at Monitoring Location EFF-001R as follows:

Table E-8. Westside Recycled Water Project Concentrate Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow [1]	MG/MGD	Continuous	Continuous/D

Parameter	Units	Sample Type	Minimum Sampling Frequency
TSS	mg/L	C-24	1/Month
pH	standard units	Continuous or Grab	1/Month
Settleable Solids	mL/L	Grab or C-24	1/Month
Turbidity	NTU	C-24	1/Month
Oil and Grease	mg/L	Grab	1/Quarter
Ocean Plan Table 1 Pollutants [2]	µg/L	C-24 [3]	1/Year

Abbreviations:

MG = million gallons
MGD = million gallons per day
mg/L = milligrams per liter
mL/L = milliliters per liter
µg/L = micrograms per liter
NTU = nephelometric turbidity units

Sample Types and Frequencies:

Continuous = measured continuously
Continuous/D = measured continuously, and recorded and reported daily
C-24 = 24-hour composite
Grab = grab sample
1/Month = once per month
1/Quarter = once per quarter
1/Year = once per year

Footnotes:

[1] The following information shall be reported in monthly self-monitoring reports:

- Daily average flow (MGD)
- Total monthly flow volume (MG)

[2] The Discharger shall monitor for the pollutants listed in Ocean Plan Table 1, except chlorine, tributyltin, radioactivity, acute toxicity, and chronic toxicity. The Discharger may monitor for total chromium in lieu of hexavalent chromium.

[3] For mercury and other parameters with analytical methods that require grab sampling, the Discharger may collect a grab sample instead of a 24-hour composite sample.

D. Discharge Point No. 001

During dry weather, the Discharger shall monitor discharges at Discharge Point No. 001 at Monitoring Location EFF-001C as specified in Table E-9, below. If during the year the discharge at Discharge Point No. 001 is ever entirely reverse osmosis concentrate, the Discharger shall collect at least one sample during that time, if feasible. Otherwise, the Discharger shall collect samples when the Recycled Water Project is operating, if possible.

Table E-9. Dry Weather Discharge Point No. 001 Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Chronic Toxicity [1]	Pass or Fail and Percent Effect	C-24	1/Quarter

Sample Type and Frequency:

C-24 = 24-hour composite
1/Quarter = once per quarter

Footnote:

[1] Chronic toxicity test samples shall be collected coincident with routine composite effluent samples and analyzed in accordance with MRP section V.

V. CHRONIC TOXICITY MONITORING REQUIREMENTS

A. Methodology

1. The Discharger shall conduct static non-renewal chronic toxicity tests with the purple sea urchin (*Strongylocentrotus purpuratus*) or the sand dollar (*Dendraster excentricus*) with the embryo-larval development test method. Bioassays shall be conducted in compliance with the most recently promulgated test methods, currently *Short-Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms* (EPA 600/R-95/136, 1995). If these protocols prove unworkable, the Regional Water Board and U.S. EPA may grant exceptions in writing upon the Discharger's request with justification.

2. The in-stream waste concentration (IWC) shall depend on the amount of recycled water being produced. When the Westside Recycled Water Project produces less than 1.0 MGD of recycled water for distribution, the IWC shall be 0.67 percent effluent. When the Westside Recycled Water Project produces at least 1.0 MGD of recycled water for distribution, the IWC shall be 0.37 percent effluent. Recycled water production for this purpose shall be determined based on the volume of recycled water produced during the 24-hour composite sampling period for the chronic toxicity test.

3. If an effluent toxicity test does not meet all test acceptability criteria in the test methods manual, the Discharger shall resample and retest within 14 days.

4. Dilution and control water, including brine controls, shall be 1-µm-filtered uncontaminated natural seawater, hypersaline brine prepared using uncontaminated natural seawater, or laboratory water prepared and used as specified in the test methods manual. If dilution water and control water are different from test organism culture water, the Discharger shall test a second control using culture water.

5. The Discharger shall conduct concurrent reference toxicant tests at least quarterly. The Discharger shall review and report all reference toxicant test results using the EC_{25} and EC_{50}.

B. Compliance Determination

Samples collected during routine and accelerated monitoring shall be used to evaluate compliance. Compliance with the chronic toxicity effluent limitation shall be evaluated using the TST statistical approach at the discharge IWC. The Discharger shall determine "Pass" or "Fail" and "percent effect" from a toxicity test at the discharge IWC using the TST statistical approach in *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010), Appendix A, Figure A-1 and Table A-1. The TST null hypothesis shall be the following:

$$\text{mean discharge IWC response} \leq 0.75 \times \text{mean control response}$$

The Discharger shall report a test that rejects this null hypothesis as "Pass" and a test that does not reject this null hypothesis as "Fail." The relative "percent effect" at the discharge IWC shall be calculated and reported as:

([mean control response – mean discharge response] / mean control response) x 100%

C. Accelerated Monitoring

If a chronic bioassay test indicates a violation of the chronic toxicity effluent limitation, the Discharger shall retest within five days of receiving test results, or within seven days if the sample is contracted out to a commercial laboratory. Accelerated monitoring shall consist of four toxicity tests conducted at approximately two-week intervals. The Discharger shall return to routine monitoring if all four monitoring test results are "Pass."

If any accelerated monitoring test violates the chronic toxicity effluent limitation, the Discharger shall immediately initiate toxicity reduction evaluation (TRE) procedures in accordance with MRP section V.E. Accelerated monitoring is not required once the Discharger has initiated a TRE; however, the Discharger shall continue to conduct routine effluent monitoring for compliance determination purposes during the TRE.

D. Reporting Requirements

For each chronic toxicity test, whether identified as valid or not, the Discharger shall report the following, at a minimum, in monthly self-monitoring reports:

1. Sample date;

2. Test initiation date;

3. Test species;

4. TST statistical results (i.e., "Pass" or "Fail," and "percent effect" at the IWC);

5. Other biological and statistical endpoint values as appropriate (e.g., number of young, growth rate, NOEC, EC_{25});

6. Summary of water quality measurements for each toxicity test (e.g., pH, dissolved oxygen, temperature, conductivity, hardness, salinity, and ammonia);

7. Statistical program output results for each toxicity test, including tabular data and graphical plots;

8. Tabular data and graphical plots showing the laboratory's performance for (1) the reference toxicant for the previous 20 tests; and (2) the control mean, control standard deviation, and control coefficient of variation for the previous 12 months; and

9. Status of any ongoing TRE work, including completed and planned investigative activities.

E. Toxicity Reduction Evaluation (TRE)

1. Generic TRE Work Plan. The Discharger shall prepare and submit an initial investigation TRE work plan within 90 days of the effective date of this Order. The Discharger shall prepare the work plan based on *Toxicity Reduction Evaluation Guidance for Municipal*

Wastewater Treatment Plants (EPA/833/B-99/002, 1999), or the most current version. The work plan shall describe the steps the Discharger intends to follow if toxicity is detected. At a minimum, the work plan shall include a description of the following:

a. Investigation and evaluation techniques that will be used to identify potential causes and sources of toxicity, effluent variability, and treatment system efficiency;

b. Methods of maximizing in-house treatment efficiency and good housekeeping practices, and a list of all chemicals used in the operation of the Facility; and

c. Staff responsible for conducting TIEs (e.g., in-house expert, outside contractor).

2. **Specific TRE Work Plan.** If an accelerated monitoring test violates the chronic toxicity effluent limitation, the Discharger shall immediately initiate a TRE and submit a specific TRE work plan within 15 days. The specific work plan shall be the generic work plan revised as appropriate for this toxicity event. The Discharger shall implement the TRE in accordance with the work plan, incorporating any comments received from the Regional Water Board Executive Officer or U.S. EPA. The specific TRE work plan shall include the following:

   a. Actions to investigate, identify, and correct the causes of toxicity;

   b. Actions to mitigate the effects of the discharge and prevent the recurrence of toxicity; and

   c. Schedule for these actions, progress reports, and the final report.

3. **Toxicity Identification Evaluation (TIE).** The Discharger may initiate a TIE as part of a TRE to identify the cause of toxicity. The Discharger shall employ all reasonable efforts using currently available TIE methodologies (*Toxicity Identification Evaluation: Characterization of Chronically Toxic Effluents, Phase I* [EPA 600/6-91/005F, 1992]; *Methods for Aquatic Toxicity Identification Evaluations, Phase II Toxicity Identification Procedures for Samples Exhibiting Acute and Chronic Toxicity* [EPA 600/R-92/080, 1993]; *Methods for Aquatic Toxicity Identification Evaluations, Phase III Toxicity Confirmation Procedures for Samples Exhibiting Acute and Chronic Toxicity* [EPA 600/R-92/081, 1993]; and *Marine Toxicity Identification Evaluation [TIE]: Phase I Guidance Document* [EPA 600/R-96-054, 1996]).

F. Species Screening

1. The Discharger shall conduct a chronic toxicity screening test as described below (or as described in applicable State Water Board plan provisions that become effective after adoption of this Order) following any significant change in the nature of the effluent, except a change that reduces pollutant concentrations or a change resulting from operation of the Westside Recycled Water Project. If there is no significant change in the nature of the effluent, the Discharger shall conduct a screening test prior to submitting an application for permit reissuance.

2. Prior to undertaking a screening test, the Discharger shall submit a screening test proposal. The proposal shall address the elements below. If within 30 days the Regional Water Board

Executive Officer and U.S. EPA do not comment on the proposal, the Discharger shall commence the screening test.

3. The screening test shall use the protocols described in *Short-term Methods for Estimating the Chronic Toxicity of Effluent and Receiving Waters to West Coast Marine and Estuarine Organisms* (EPA 600/R-95/136, 1995) and test species specified in the table below:

Table E-10. Critical Life Stage Toxicity Tests

Species	Scientific Name	Effect	Test Duration
Giant kelp	*Macrocystis pyrifera*	Percent germination; germ tube length	48 hours
Abalone	*Haliotis rufescens*	Abnormal shell development	48 hours
Oyster Mussel	*Crassostrea gigas* *Mytilus edulis*	Abnormal shell development; percent survival	48 hours
Echinoderms - Urchins Sand dollar	*Strongylocentrotus purpuratus, Strongylocentrotus franciscanus, or Dendraster excentricus*	Percent fertilization or larval development	1 hour (fertilization) or 72 hours (development)
Shrimp	*Holmesimysis costata*	Percent survival; growth	7 days
Topsmelt	*Atherinops affinis*	Percent survival; growth	7 days

4. The Discharger shall conduct screening tests in two stages:

a. Stage 1 shall consist of a minimum of one battery of at least four tests conducted concurrently. Test species shall include at least one plant, one invertebrate, and one fish.

b. Stage 2 shall consist of a minimum of two test batteries initiated in different calendar months using the three most sensitive species determined based on the stage 1 test results.

5. The Discharger shall use appropriate controls and conduct concurrent reference toxicant tests.

6. The Discharger shall conduct screening tests at 75, 20, 0.67, 0.37, and 0.17 percent effluent.

VI. RECEIVING WATER MONITORING REQUIREMENTS

A. Shoreline Monitoring

1. The Discharger shall monitor shoreline receiving waters at Monitoring Locations SRF-15 east, SRF-15, SRF-17, SRF-18, SRF-19, and SRF-21.1 as follows:

Table E-11. Ambient Shoreline Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Enterococcus [1]	MPN/100 mL [2]	Grab	1/Week
Fecal coliform [3]	MPN/100 mL [2]	Grab	1/Week
Total coliform	MPN/100 mL [2]	Grab	1/Week

Abbreviation:

MPN/100 mL = most probable number per 100 milliliters

Sample Type and Frequency:

Grab = grab sample
1/Week = once per week

Footnotes:

[1] The Discharger shall monitor for enterococcus using U.S. EPA-approved methods, such as the IDEXX Enterolert method. When replicate analyses are made, the reported result shall be the geometric mean of the replicate results.

[2] Results may be reported as Colony Forming Units (CFU)/100 mL if the laboratory method used provides results in CFU/100 mL.

[3] The Discharger shall begin monitoring fecal coliform on October 1, 2020.

2. Following any combined sewer discharge at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-005, CSD-006, or CSD-007, the Discharger shall monitor shoreline receiving waters as indicated in the table below. Monitoring shall be conducted at each specified location for up to seven days or until the single-sample bacteriological standards of Cal. Code of Regs. tit. 17, section 7958(a)(1), are met (i.e., the enterococcus density is less than 104 most probable number (MPN)/100 mL, the fecal coliform density is less than 400 MPN/100 mL, and the total coliform density is less than 10,000 MPN/100 mL).

Table E-12. Post-CSD Event Shoreline Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Enterococcus [1]	MPN/100 mL [2]	Grab	1/Day [3]
Fecal coliform [4]	MPN/100 mL [2]	Grab	1/Day [3]
Total coliform	MPN/100 mL [2]	Grab	1/Day [3]
Standard observations [5]	---	---	1/Day [3]

Abbreviation:

MPN/100 mL = most probable number per 100 milliliters

Sample Type and Frequency:

Grab = grab sample
1/Day = once per day

Footnotes:

[1] The Discharger shall monitor for enterococcus using U.S. EPA-approved methods, such as the IDEXX Enterolert method. When replicate analyses are made, the reported result shall be the geometric mean of the replicate results.

[2] Results may be reported as Colony Forming Units (CFU)/100 mL if the laboratory method used provides results in CFU/100 mL.

[3] Sampling is only required at the monitoring locations indicated below when there is a combined sewer discharge at the discharge points indicated below:

Discharge Point	Monitoring Locations
CSD-001	SRF-22
CSD-002	SRF-20, SRF-21, and SRF-21.1
CSD-003	SRF-18, SRF-19, and SRF-20
CSD-005	SRF-17

CSD-006	SRF-15 east, SRF-15, and SRF-16
CSD-007	SRF-15 east, SRF-15, and SRF-16

[4] The Discharger shall begin monitoring fecal coliform on October 1, 2020.

[5] Standard observations are defined in Attachment G section III.B.3 and shall include any apparent fish kills. The estimated size of the affected area is not required.

B. Offshore Monitoring

The Discharger shall continue the Southwest Ocean Outfall Regional Monitoring Program, monitoring the area outside San Francisco Bay between Rocky Point in Marin County and Point San Pedro in San Mateo County, to identify any environmental effects of the discharge on receiving waters, sediment, or aquatic life.

1. **Sampling Frequency.** The Discharger shall sample annually in the fall when sediments are least disturbed and benthic infauna are most abundant.

2. **Sediment Chemistry Sampling**. The Discharger shall collect benthic samples from the seven historical monitoring locations (Stations 1, 2, 4, 6, 25, 28, and 31) to maintain time series data, and a minimum of 23 out of the 37 other monitoring locations (Stations 32 through 80). Samples shall be collected using a 0.1-square meter Smith-McIntyre grab sampler. The Discharger shall collect two grab samples at each station and composite the top 5 centimeters of sediment from each grab prior to analysis. The Discharger shall analyze the sediment samples for the following:

   - Total volatile solids
   - Total organic carbon
   - Kjeldahl nitrogen
   - Grain size
   - Inorganic toxic pollutants: aluminum, arsenic, cadmium, chromium, chromium (VI), copper, iron, lead, manganese, mercury, nickel, selenium, silver, and zinc. The Discharger may elect to report total chromium in lieu of chromium (VI).
   - DDT, PCBs, and PAHs

3. **Infaunal Sampling.** The Discharger shall analyze one benthic grab sample collected from each of the locations identified in the paragraph above for infaunal organisms. This sample shall be passed through 1.0- and 0.5-millimeter sieves. The Discharger shall relax organisms retained on each sieve and preserve them for later enumeration and taxonomic determination to the lowest taxon.

4. **Bioaccumulation Monitoring.** The Discharger shall conduct bioaccumulation monitoring to assess whether the concentrations of priority pollutants in marine life bioaccumulate to levels harmful to human health or the marine community. Tissue samples to assess bioaccumulation shall be collected at two locations: one at Station 1, 2, 25, or 28, and one at a reference location outside the influence of the discharge. At each location, three composite samples shall be collected of one macroinvertebrate species. Each composite sample shall consist of ten or more organisms of each species, with the preferred species being Dungeness crab (*Metacarcinus magister*). Muscle and hepatopancreas tissues shall be analyzed for inorganic

pollutants (i.e., arsenic, cadmium, chromium, copper, lead, mercury, selenium, silver, and zinc), DDT, PCBs, and PAHs.

5. **Reporting.** All offshore monitoring data shall be reported to the Regional Water Board and U.S. EPA in an Annual Report submitted by August 30 of the year following sampling. The report shall include raw data tables and summaries for each monitoring component. In addition to the annual reporting requirements, a comprehensive cumulative summary report shall be submitted with the application for permit reissuance.

VII. PRETREATMENT AND BIOSOLIDS MONITORING REQUIREMENTS

The Discharger shall comply with the following pretreatment monitoring requirements for influent at Monitoring Location INF-001A, effluent at Monitoring Location EFF-001A, and biosolids at Monitoring Location BIO-001. The Discharger shall report summaries of analytical results in pretreatment reports in accordance with Attachment H. If instructed to do so, the Discharger shall report biosolids analytical results with its electronic self-monitoring reports by manual entry, by EDF/CDF, or as an attached file.

Table E-13. Pretreatment and Biosolids Monitoring

Constituents	Influent INF-001A	Effluent EFF-001A [1]	Biosolids BIO-001	Sample Type	
				Influent and Effluent	Biosolids [7a]
VOC [2]	2/Year	2/Year	2/Year	Grab	Grab
BNA [3]	2/Year	2/Year	2/Year	Grab	Grab
Metals and Other Elements [4]	1/Month	1/Month	2/Year	C-24 [7b]	Grab
Hexavalent Chromium [5]	1/Month	1/Month	2/Year	Grab	Grab
Mercury	1/Month	1/Month [6]	2/Year	Grab	Grab
Cyanide	1/Month	1/Month	---	Grab	---
Molybdenum	---	---	2/Year	---	Grab
Organic Nitrogen	---	---	2/Year	---	Grab
Ammonia Nitrogen	---	---	2/Year	---	Grab
Total Solids	---	---	2/Year	---	Grab

Sample Types and Frequencies:

C-24 = 24-hour composite
Grab = grab sample
1/Month = once per month
2/Year = twice per year

Footnotes:

[1] Effluent monitoring conducted in accordance with Table E-4 may be used to satisfy these pretreatment monitoring requirements.

[2] VOC: volatile organic compounds.

[3] BNA: base/neutrals and acid extractable organic compounds.

[4] The metals and other elements are arsenic, cadmium, copper, lead, nickel, selenium, silver, and zinc.

[5] The Discharger may elect to monitor total chromium instead of hexavalent chromium and may elect to collect 24-hour composite samples instead of grab samples for total chromium.

[6] The Discharger shall use ultra-clean sampling (U.S. EPA Method 1669) and ultra-clean analytical methods (U.S. EPA Method 1631) for mercury monitoring, except when concentrations are expected to exceed 10 µg/L, in which case use of ultra-clean sampling and analysis methods is optional.

[7] Sample types:

a. The biosolids sample shall be a composite of the biosolids to be disposed. Biosolids sample collection and monitoring shall comply with the requirements in Attachment H, Appendix H-4. The Discharger shall also comply with the biosolids monitoring requirements in 40 C.F.R. part 503.

b. If an automatic compositor is used, the Discharger shall obtain 24-hour composite samples through flow-proportioned composite sampling. Alternatively, 24-hour composite samples may consist of discrete grab samples combined (volumetrically flow-weighted) prior to analysis or analyzed separately with the results mathematically flow-weighted.

VIII. RECYCLED WATER MONITORING REQUIREMENTS

A. Influent Monitoring

The Discharger shall monitor the monthly volume of influent to the Oceanside Water Pollution Control Plant.

B. Production Monitoring

The Discharger shall monitor the monthly volumes of effluent from the Oceanside Water Pollution Control Plant and Westside Recycled Water Project for each level of treatment.

C. Discharge Monitoring

The Discharger shall monitor the monthly volumes of effluent from the Oceanside Water Pollution Control Plant and Westside Recycled Water Project discharged to each of the following, for each level of treatment:

1. Inland surface waters, specifying volume required to maintain minimum instream flow;

2. Enclosed bays, estuaries and coastal lagoons, and ocean waters;

3. Natural systems, such as wetlands, wildlife habitats, and duck clubs, where augmentation or restoration has occurred, and that are not part of a wastewater treatment plant or water recycling treatment plant;

4. Underground injection wells, such as those classified by U.S. EPA's Underground Injection Control Program, excluding groundwater recharge via subsurface application intended to reduce seawater intrusion into a coastal aquifer with a seawater interface; and

5. Land, where beneficial use is not taking place, including evaporation or percolation ponds, overland flow, or spray irrigation disposal, excluding pasture or fields with harvested crops.

D. Reuse Monitoring

The Discharger shall monitor the following:

1. Monthly volume of recycled water distributed; and

2. Annual volumes of treated wastewater distributed for beneficial use in compliance with California Code of Regulations, title 22, in each of the use categories listed below:

a. Agricultural irrigation: pasture or crop irrigation;

b. Landscape irrigation: irrigation of parks, greenbelts, and playgrounds; school yards; athletic fields; cemeteries; residential landscaping, common areas; commercial landscaping; industrial landscaping; and freeway, highway, and street landscaping;

c. Golf course irrigation: irrigation of golf courses, including water used to maintain aesthetic impoundments within golf courses;

d. Commercial application: commercial facilities, business use (such as laundries and office buildings), car washes, retail nurseries, and appurtenant landscaping that is not separately metered;

e. Industrial application: manufacturing facilities, cooling towers, process water, and appurtenant landscaping that is not separately metered;

f. Geothermal energy production: augmentation of geothermal fields;

g. Other non-potable uses: including but not limited to dust control, flushing sewers, fire protection, fill stations, snow making, and recreational impoundments;

h. Groundwater recharge: the planned use of recycled water for replenishment of a groundwater basin or an aquifer that has been designated as a source of water supply for a public water system. Includes surface or subsurface application, except for seawater intrusion barrier use;

i. Seawater intrusion barrier: groundwater recharge via subsurface application intended to reduce seawater intrusion into a coastal aquifer with a seawater interface;

j. Reservoir water augmentation: the planned placement of recycled water into a raw surface water reservoir used as a source of domestic drinking water supply for a public water system, as defined in Health and Safety Code section 116275, or into a constructed system conveying water to such a reservoir (Wat. Code § 13561);

k. Raw water augmentation: the planned placement of recycled water into a system of pipelines or aqueducts that delivers raw water to a drinking water treatment plant that provides water to a public water system as defined in Health and Safety Code section 116275 (Wat. Code § 13561); and

l. Other potable uses: both indirect and direct potable reuse other than for groundwater recharge, seawater intrusion barrier, reservoir water augmentation, or raw water augmentation.

IX. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

The Discharger shall comply with all Standard Provisions (Attachments D, G, and H) related to monitoring, reporting, and recordkeeping.

B. Self-Monitoring Reports (SMRs)

1. **SMR Format.** The Discharger shall electronically submit SMRs using the State Water Board's California Integrated Water Quality System (CIWQS) Program website (http://www.waterboards.ca.gov/water_issues/programs/ciwqs). The CIWQS website will provide additional information for SMR submittal in the event of a service interruption for electronic submittal.

2. **SMR Due Dates and Contents.** The Discharger shall submit SMRs by the due dates, and with the contents, specified below:

   a. Monthly SMRs. Monthly SMRs shall be due 30 days after the end of each calendar month, covering that calendar month. The monthly SMR shall contain the applicable items described in sections V.B and V.C of both Attachments D and G of this Order.

   Monthly SMRs shall include all new monitoring results obtained since the last SMR was submitted. If the Discharger monitors any pollutant more frequently than required by this Order, the Discharger shall include the results of such monitoring in the calculations and reporting for the SMR.

   b. Annual SMR. Annual SMRs shall be due February 1 each year, covering the previous calendar year. The annual SMR shall contain the items described in Attachment G section V.C.1.f. See also Provision VI.C.2 (Effluent Characterization Study and Report) of the Order for requirements to submit reports with the annual SMR.

   c. Specifications for Submitting SMRs to CIWQS. The Discharger shall submit analytical results and other information using one of the following methods:

Table E-14. CIWQS Reporting

Parameter	Method of Reporting	
	EDF/CDF data upload or manual entry	Attached File
All parameters identified in influent, effluent, and receiving water monitoring tables (except Dissolved Oxygen and Temperature)	Required for all results	
Dissolved Oxygen Temperature	Required for monthly maximum and minimum results only [1]	Discharger may use this method for all results or keep records

Parameter	Method of Reporting	
	EDF/CDF data upload or manual entry	**Attached File**
Antimony, Arsenic, Beryllium, Cadmium, Chromium, Copper, Cyanide, Lead, Mercury, Nickel, Selenium, Silver, Thallium, Zinc, Dioxins &Furans (by U.S. EPA Method 1613), Other Pollutants (by U.S. EPA Methods 601, 602, 608, 610, 614, 624, and 625)	Required for all results [2]	
Volume and Duration of Blended Discharge [3]	Required for all blended effluent discharges	
Analytical Method	Not required (Discharger may select "data unavailable") [1]	
Collection Time Analysis Time	Not required (Discharger may select "0:00") [1]	

Footnotes:

[1] The Discharger shall continue to monitor at the minimum frequency specified in this MRP, keep records of the measurements, and make the records available upon request.

[2] These parameters require EDF/CDF data upload or manual entry regardless of whether monitoring is required by this MRP or other provisions of this Order (except for biosolids, sludge, or ash provisions).

[3] The requirement for volume and duration of blended discharge applies only if this Order authorizes the Discharger to discharge blended effluent.

The Discharger shall arrange all reported data in a tabular format and summarize the data to clearly illustrate whether the Facility is operating in compliance with effluent limitations. The Discharger is not required to duplicate the submittal of data entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format, the Discharger shall electronically submit the data in a tabular format as an attachment.

3. **Monitoring Periods.** Monitoring periods for all required monitoring shall be as set forth below unless otherwise specified:

Table E-15. Monitoring Periods

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
Continuous	Order effective date	All times
1/Day	Order effective date	Every 24-hour period, beginning at midnight and continuing through 11:59 p.m. (or any 24-hour period that reasonably represents a calendar day for purposes of sampling)
1/Week 5/Week	First Sunday following or on Order effective date	Sunday through Saturday

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
1/Month	First day of calendar month following or on Order effective date	First day of calendar month through last day of calendar month
1/Quarter	Closest of January 1, April 1, July 1, or October 1 following or on Order effective date	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31
1/Year 3/Year	Closest January 1 following or on Order effective date	January 1 through December 31
2/Year	Closest January 1 or July 1 following or on Order effective date	January 1 through June 30 July 1 through December 31
1/Event	As soon as possible after combined sewer discharge event begins	Duration of the combined sewer discharge event

4. **RL and MDL Reporting.** The Discharger shall report with each sample result the Reporting Level (RL) and Method Detection Limit (MDL) as determined by the procedure in 40 C.F.R. part 136. The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

   a. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

   b. Sample results less than the RL, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported.

   For purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ. The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (+/- a percentage of the reported value), numerical ranges (low to high), or any other means the laboratory considers appropriate.

   c. Sample results less than the laboratory's MDL shall be reported as "Not Detected", or ND.

   d. The Discharger shall instruct laboratories to establish calibration standards so that the minimum level (ML) value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.

5. **Compliance Determination.** Compliance with effluent limitations shall be determined using sample reporting protocols defined above and in the Fact Sheet and Attachments A, D, and G. For purposes of reporting and administrative enforcement by the Regional Water Board, State Water Board, or U.S. EPA, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the RL.

C. Discharge Monitoring Reports (DMRs)

DMRs are U.S. EPA reporting requirements. The Discharger shall electronically certify and submit DMRs together with SMRs using the Electronic Self-Monitoring Reports module eSMR 2.5 or the latest upgraded version. Electronic DMR submittal shall be in addition to electronic SMR submittal. Information about electronic DMR submittal is available at the DMR website at http://www.waterboards.ca.gov/water_issues/programs/discharge_monitoring.

D. Annual Recycled Water Reports

The Discharger shall electronically submit annual reports to the State Water Board by April 30 each year covering the previous calendar year using the State Water Board's GeoTracker website (http://geotracker.waterboards.ca.gov) under a site-specific global identification number. For the 2019 calendar year, the Discharger shall submit a report by April 30, 2020, covering January through December 2019. The annual report shall include the elements specified in Attachment E section VIII.

ATTACHMENT F – FACT SHEET

This Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order. As described in section II.B of this Order, the Regional Water Board and U.S. EPA incorporate this Fact Sheet as findings supporting the issuance of this Order.

I. PERMIT INFORMATION

The following table summarizes administrative information related to the facility.

Table F-1. Facility Information

WDID	2 386009001
CIWQS Place ID	256498
Discharger	City and County of San Francisco
Name of Facility	Oceanside Water Pollution Control Plant, Wastewater Collection System, and Westside Recycled Water Project
Facility Address	3500 Great Highway San Francisco, CA 94132 San Francisco County
Facility Contact, Title and Phone	Dale Miller, Operations Superintendent, Wastewater Enterprise, (415) 242-2225
Authorized Person to Sign and Submit Reports	Greg Norby, Assistant General Manager, Wastewater Enterprise, (415) 554-2465
Mailing Address	San Francisco Public Utilities Commission/Wastewater Enterprise 525 Golden Gate Ave., 13th Floor, San Francisco, CA 94102
Billing Address	Same
Type of Facility	Publicly-Owned Treatment Works (POTW) and Combined Sewer System
Major or Minor Facility	Major
Threat to Water Quality	2
Complexity	A
Pretreatment Program	Yes
Reclamation Requirements	State Water Board Order WQ 2016-0068-DDW
Facility Permitted Flow	43 million gallons per day (MGD), maximum dry weather flow
Facility Design Flow	<u>Oceanside Water Pollution Control Plant</u> 43 MGD maximum dry weather design flow (secondary treatment) 65 MGD maximum wet weather design flow (secondary treatment for 43 MGD and primary treatment for an additional 22 MGD) <u>Westside Recycled Water Project</u> 4 MGD maximum design flow (1.6 MGD annual average)
Watershed	San Mateo Coastal Basin
Receiving Water	Pacific Ocean
Receiving Water Type	Ocean waters

A. The City and County of San Francisco (Discharger) owns and operates the Oceanside Water Pollution Control Plant and its wastewater collection system. The Discharger plans to construct, own, and operate the Westside Recycled Water Project during this Order's term. Collectively, the Oceanside Water Pollution Control Plant, wastewater collection system, and Westside

Recycled Water Project are referred to as the Facility. The Facility discharges to the Pacific Ocean, a water of the United States.

For the purposes of this Order, references to the "discharger" or "permittee" in applicable federal and state laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

B. The Discharger is regulated pursuant to National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037681. It was previously subject to Order No. R2-2009-0062 (previous order). The Discharger filed a Report of Waste Discharge and submitted an application for reissuance of its waste discharge requirements (WDRs) and NPDES permit on April 3, 2014, and the previous order was administratively extended by operation of law. Order No. R2-2010-0054 amended the previous order to update the Regional Standard Provisions (Attachment G); Order No. R2-2011-0009 amended the previous order to update the pretreatment program requirements (Attachment H).

The Discharger is authorized to discharge subject to the WDRs and NPDES permit requirements in this Order at the discharge locations described in Table 2 of this Order. Regulations at 40 C.F.R. section 122.46 limit the duration of NPDES permits to a fixed term not to exceed five years. Accordingly, Table 3 of this Order limits the duration of the discharge authorization. Pursuant to California Code of Regulations, title 23, section 2235.4, the terms and conditions of an expired permit are automatically continued pending reissuance of the permit if the Discharger complies with all requirements for continuation of expired permits. (See 40 C.F.R § 122.6[d].)

II. FACILITY DESCRIPTION

A. Wastewater and Biosolids Treatment

1. **Location and Service Area.** The Oceanside Water Pollution Control Plant is located at 3500 Great Highway, San Francisco. The plant provides wastewater treatment for western San Francisco and a small portion of Daly City owned and operated by the North San Mateo County Sanitation District. The service area population is approximately 250,000. The Discharger is constructing a recycled water project at the plant site during this Order's term. The wastewater collection system is located throughout the western side of San Francisco. Attachment B shows maps of the Facility area.

2. **Collection System.** The Discharger's collection system is predominantly a combined sewer system with some limited separate sanitary sewers. The combined sewer system consists of approximately 250 miles of pipe, one major pump station (Westside Pump Station), six minor pump stations (four all-weather pump stations: Westside, Sea Cliff No. 1, Sea Cliff No. 2, and Pine Lake; and two wet weather pump stations: Sea Cliff No. 3 and Zoo Wet Weather Lift Station), and three large transport/storage structures (Westside Transport/Storage Structure, a 49.3-million-gallon box-like structure located beneath the Great Highway; Richmond Tunnel, a 12.0-million-gallon tunnel located to the north; and Lake Merced Tunnel, a 10.0-million-gallon tunnel located to the south). The separate sanitary sewer systems serve isolated areas and are also regulated under State Water Board

Order No. 2006-0003-DWQ as amended by State Water Board Order No. WQ 2013-0058-EXEC.

3. Wastewater Treatment

a. Oceanside Water Pollution Control Plant. During dry weather, the plant provides secondary treatment. The treatment processes include coarse screening at the Westside Pump Station, fine screening and grit removal at the plant headworks, primary sedimentation, activated sludge treatment by a high-purity oxygen process, and secondary clarification. The effluent is not disinfected. The plant has a maximum secondary treatment design capacity of about 43 million gallons per day (MGD). During wet weather, the plant can provide primary treatment for about 22 MGD more, which is combined with the secondary-treated effluent prior to discharge for a total treatment capacity of 65 MGD. Plant effluent flows to Discharge Point No. 001 by gravity.

b. Combined Sewer System. The combined storage capacity of the three transport/storage structures is about 71 million gallons. Collection system piping provides about 2 million gallons of additional storage. The transport/storage structures provide flow equalization and convey combined sewer system flows up to 65 MGD to the plant by way of the Westside Pump Station.

Flows above the plant's 65-MGD treatment capacity receive equivalent-to-primary treatment through solids settling, skimming of floatable solids, and in some cases screening within the combined sewer system. In addition to pumping up to 65 MGD to the plant, the Westside Pump Station can also pump flow from the Westside Transport/Storage Structure to Discharge Point No. 001 during wet weather (identified in the previous order as "decant"). The design capacity of the Westside Pump Station wet weather pumps ranges from 98 to 133 MGD depending on the number and model of pumps operating when there are high water levels in the West Box of the Westside Transport/Storage Structure (typically observed during wet weather operations). Flows that exceed the capacities of the Oceanside Water Pollution Control Plant and combined sewer system may discharge from Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007. Four of these discharge points are directly connected to transport/storage structures (Discharge Point Nos. CSD-001, CSD-002, CSD-003, and CSD-004), and three are associated with pump station sumps (Discharge Point Nos. CSD-005, CSD-006, and CSD-007). After wet weather events, stored combined sewer system flows and accumulated solids remaining in the transport/storage structures are conveyed to the plant for treatment.

4. Sludge and Biosolids Management. The Discharger uses temperature-phased anaerobic digestion, which is capable of producing Class A biosolids. Primary sludge, waste activated sludge, and secondary scum are mixed and co-thickened using gravity belt thickeners prior to being fed to the anaerobic digestion system. The digestion system accepts hauled-in batches of primary and secondary sludge from the Treasure Island Wastewater Treatment Plant. Digested biosolids are dewatered using screw presses and stored in hoppers prior to being loaded into covered trucks for transport. During the wet season, the majority of biosolids are hauled to a landfill for storage and eventual use as interim cover, final cover, or landfill

building material; a small percentage is reused for agricultural land application. During the dry season, biosolids are hauled offsite for agricultural land application.

5. **Water Recycling and Reclamation**. The Discharger is constructing a recycled water project at the Oceanside Water Pollution Control Plant site during this Order's term. Secondary-treated effluent will be treated further with membrane filtration, reverse osmosis, and ultraviolet (UV) light disinfection to produce recycled water. The concentrate from the reverse osmosis process will be commingled with plant effluent prior to discharge at Discharge Point No. 001. Filter backwash water generated at the Westside Recycled Water Project will be directed to the plant headworks for treatment. The project is expected to produce and deliver an annual average flow of 1.6 MGD of recycled water for distribution in the western portion of San Francisco, with peak deliveries of up to 4 MGD during summer. Water recycling operations will not increase the mass of pollutants discharged at Discharge Point No. 001, but will increase the concentration of pollutants discharged. The requirements of this Order account for the discharge from this water recycling project. Reclamation requires waste discharge requirements beyond those specified here, such as those in State Water Board Order No. WQ 2016-0068-DDW (Water Reclamation Requirements for Recycled Water Use).

B. Discharge Points and Receiving Waters

1. **Discharge Point No. 001.** During dry weather, secondary-treated effluent is discharged at Discharge Point No. 001. During wet weather, the discharge at Discharge Point No. 001 comprises primary-treated and secondary-treated effluent from the Oceanside Water Pollution Control Plant and equivalent-to-primary-treated effluent from the Westside Transport/Storage Structure. When the Westside Recycled Water Project becomes operational, reverse osmosis concentrate will also be discharged at Discharge Point No. 001.

   Discharge Point No. 001 is a 4.5-mile-long (3.9 nautical mile-long) deepwater outfall that terminates with a diffuser that begins approximately 3.8 miles (3.3 nautical miles) from shore at a depth of 78 feet below mean lower low water (MLLW). The diffuser has 85 risers spread along a 3,000-foot outfall pipe. Each riser has eight ports. Discharge Point No. 001 discharges to the Pacific Ocean beyond the territorial waters of the State, which end three nautical miles from MLLW at shore.

2. **Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007.** During wet weather, equivalent-to-primary-treated wastewater is discharged to the Pacific Ocean at Discharge Point Nos. CSD-001, CSD-002, CSD-003, and CSD-004 when the Westside Pump Station capacity is exceeded, and at Discharge Point Nos. CSD-005, CSD-006, and CSD-007 when the capacities of the corresponding pump stations (i.e., Sea Cliff No. 1 and Sea Cliff No. 2 Pump Stations) are exceeded, including the capacity of the wet well connected to Discharge Point No. CSD-006. These discharge points are located within the territorial waters of the State.

C. Summary of Previous Requirements and Self-Monitoring Data

1. **Dry Weather.** Dry weather effluent limitations and representative monitoring data from the previous order term are presented below for discharges from the Oceanside Water Pollution Control Plant at Discharge Point No. 001:

Table F-2. Previous Dry Weather Effluent Limitations and Monitoring Data

Parameter	Units	Effluent Limitations				Monitoring Data (1/2011 – 12/2017)				
		6-Month Median	Monthly Average	Weekly Average	Daily Max.	Median	Highest 6-Month Median	Highest Monthly Average	Highest Weekly Average	Highest Daily Max.
Biochemical Oxygen Demand, 5-day @ 20°C (BOD_5)	mg/L	---	30	45	---	15	---	29	51 [1]	---
Total Suspended Solids (TSS)	mg/L	---	30	45	---	10	---	18	26	---
BOD_5 percent removal	%	---	85 (min.)	---	---	95	---	87 [2]	---	---
TSS percent removal	%	---	85 (min.)	---	---	96	---	92 [2]	---	---
pH	s.u.	Within a range of 6.0 – 9.0				Within a range of 6.0 – 8.3				
Chronic Toxicity	TU_c	---	---	---	150	50	---	---	---	149
Mercury	µg/L	5.9	---	---	24	0.0068	0.0093	---	---	0.071

Abbreviations:

Max. = maximum
min. = minimum
mg/L = milligrams per liter
µg/L = micrograms per liter
s.u. = standard units
TU_c = chronic toxicity units

Footnotes:

[1] The Discharger exceeded the weekly average effluent limitation three times during the previous order term, in October 2013, July 2014, and June 2017. The Discharger attributes these exceedances to the presence of nitrifying bacteria since carbonaceous biochemical oxygen demand ($CBOD_5$) concentrations were within the expected range. This Order allows $CBOD_5$ effluent limitations to be substituted for BOD_5 effluent limitations to address this concern, as described in Fact Sheet section IV.B.2, below.

[2] Lowest monthly average.

2. **Wet Weather.** Wet weather requirements from the previous order term included implementation of the nine minimum controls and the long-term control plan. The combined sewer system was designed to achieve a long-term average of eight combined sewer discharges per year. The following two tables summarize combined sewer discharges over a 20-year period and average combined sewer discharge durations for wet season 2012-2013.

Table F-3. Combined Sewer Discharge Frequency

Year (July 1 – June 30)	Rain (inches)	Number of Combined Sewer Discharges [1]						
		Lake Merced CSD-001	Vicente CSD-002	Lincoln CSD-003	Mile Rock CSD-004	Sea Cliff No. 1 CSD-005	Sea Cliff Sewer CSD-006	Sea Cliff No. 2 CSD-007
1997-1998	41.1	10	13	13	[2]	2	[3]	10

Year (July 1 – June 30)	Rain (inches)	Number of Combined Sewer Discharges [1]						
		Lake Merced CSD-001	Vicente CSD-002	Lincoln CSD-003	Mile Rock CSD-004	Sea Cliff No. 1 CSD-005	Sea Cliff Sewer CSD-006	Sea Cliff No. 2 CSD-007
1998-1999	18.9	6	7	7	[2]	0	[3]	0
1999-2000	23.2	5	6	6	[2]	1	[3]	1

Footnotes:

[1] This table reflects rain and discharge frequencies reported in monthly self-monitoring reports.

[2] The previous order did not require monitoring at Discharge Point No. CSD-004.

[3] The Discharger did not monitor combined sewer discharge frequency at Discharge Point No. CSD-006 until it installed telemetry in 2010.

Table F-4. Combined Sewer Discharge Duration (July 1, 2012, through June 30, 2013)

	Lake Merced CSD-001	Vicente CSD-002	Lincoln CSD-003	Mile Rock CSD-004	Sea Cliff No. 1 CSD-005	Sea Cliff Sewer CSD-006	Sea Cliff No. 2 CSD-007
Days with Rainfall	53	53	53	[1]	53	53	53
Discharge Events	6	6	6 [2]	[1]	3	1	3
Average Duration (hours)	2.39	3.28	3 [2]	[1]	0.08	0.58	0.28
Average Volume/Event (million gallons)	2.75	3.16	[2]	[1]	0.002	0.08	0.01

Footnotes:

[1] The previous order did not require monitoring at Discharge Point No. CSD-004.

[2] Telemetry equipment for Discharge Point No. CSD-003 was not operational in December 2012. Due to similar weir heights and positions within the system, discharges likely occur simultaneously at Discharge Point Nos. CSD-002 and CSD-003. As such, about six discharges likely occurred from Discharge Point No. CSD-003 between July 1, 2012, and June 30, 2013, lasting an average duration of about 3 hours.

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

A. Legal Authorities

This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260) for discharges to waters of the State. This Order is also issued pursuant to federal Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA, and Water Code chapter 5.5, division 7 (commencing with § 13370). It serves as an NPDES permit for point source discharges from the Facility to surface waters.

B. California Environmental Quality Act

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act, Public Resources Code division 13, chapter 3 (commencing with § 21100). On September 3, 2015, the San Francisco Planning Commission certified the Final Environmental Impact Report for the Westside Recycled Water Project, finding that the Discharger, acting through the San Francisco Planning Department, fulfilled all California Environmental Quality Act procedural requirements.

C. State and Federal Laws, Regulations, Policies, and Plans

1. **Water Quality Control Plan.** The Regional Water Board adopted the *Water Quality Control Plan for the San Francisco Bay Basin* (Basin Plan), which designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters in the San Francisco Bay Region. Requirements of this Order implement the Basin Plan. The table below lists the beneficial uses the Basin Plan attributes to the Pacific Ocean:

Table F-5. Basin Plan Beneficial Uses

Receiving Water	Beneficial Uses
Pacific Ocean	• Industrial Service Supply (IND) • Commercial and Sport Fishing (COMM) • Shellfish Harvesting (SHELL) • Marine Habitat (MAR) • Fish Migration (MIGR) • Preservation of Rare and Endangered Species (RARE) • Fish Spawning (SPWN) • Wildlife Habitat (WILD) • Water Contact Recreation (REC1) • Noncontact Water Recreation (REC2) • Navigation (NAV)

Basin Plan Table 4-1, Discharge Prohibition 1, prohibits wastewater discharges with particular characteristics of concern to beneficial uses at any point at which the wastewater does not receive a minimum initial dilution of at least 10:1. Basin Plan section 4.2 provides for exceptions under certain circumstances:

- An inordinate burden would be placed on the Discharger relative to the beneficial uses protected, and an equivalent level of environmental protection can be achieved by alternate means;
- A discharge is approved as part of a reclamation project;
- Net environmental benefits will be derived as a result of the discharge; or
- A discharge is approved as part of a groundwater cleanup project.

The Basin Plan further states:

> Significant factors to be considered by the Regional Water Board in reviewing requests for exceptions will be the reliability of the discharger's system in preventing inadequately treated wastewater from being discharged to the receiving water and the environmental consequence of such discharges.

During wet weather, this Order grants an exception to Basin Plan Discharge Prohibition 1 for discharges at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007 for the following reasons:

- Eliminating all wet weather combined sewer discharges or ensuring that these discharges receive a minimum initial dilution of 10:1 would be an inordinate burden disproportionate to the beneficial uses protected. The Discharger continues to invest in infrastructure to improve the combined sewer system (San Francisco Public Utilities Commission Wastewater Enterprise, *Report of Waste Discharge, Supplemental Information, Capital Improvements and Operational Changes*, April 3, 2014). This Order continues to require capture and treatment of all combined wastewater and stormwater. This Order also requires the Discharger to evaluate control alternatives to eliminate, relocate, or reduce the magnitude or frequency of combined sewer discharges.

- An equivalent level of environmental protection is provided because operating a combined sewer system, as opposed to a separate sewer system, removes many pollutants in urban runoff that elsewhere in the Region are discharged through stormwater outfalls with little or no treatment. This additional treatment comes at the cost of occasionally discharging partially-treated combined sewage and stormwater through Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007. The Monitoring and Reporting Program (MRP) (Attachment E) requires the Discharger to monitor combined sewer discharges and receiving waters to verify that an equivalent level of environmental protection is provided.

2. **California Ocean Plan.** The State Water Board adopted the *Water Quality Control Plan for Ocean Waters of California, California Ocean Plan* (Ocean Plan) in 1972 and has amended it several times, including in 1978 and most recently in 2018. The most recent changes became effective February 4, 2019. The Ocean Plan establishes water quality objectives and a program of implementation to protect beneficial uses of the Pacific Ocean within the territorial waters of the State.

   The territorial waters of the State end 3 nautical miles from shore. Discharge Point No. 001 is approximately 3.8 miles (3.3 nautical miles) offshore in federal waters. The Ocean Plan

(Appendix 1, Ocean Waters) states, "If a discharge outside the territorial waters of the State could affect the quality of the waters of the State, the discharge may be regulated to assure no violation of the Ocean Plan will occur in ocean waters." This Order contains discharge prohibitions, effluent limitations, receiving water limitations, and other provisions to ensure that discharges from Discharge Point No. 001 do not affect State waters. This Order's requirements related to Discharge Point No. 001 are based on U.S. EPA's federal authorities pursuant to the Clean Water Act.

a. Beneficial Uses. The table below lists the beneficial uses the Ocean Plan assigns to the Pacific Ocean:

Table F-6. Ocean Plan Beneficial Uses

Receiving Water	Beneficial Uses
Pacific Ocean	• Industrial Water Supply • Water Contact and Non-Contact Recreation, including Aesthetic Enjoyment • Navigation • Commercial and Sport Fishing • Mariculture • Preservation and Enhancement of Designated Areas of Special Biological Significance (ASBS) • Rare and Endangered Species • Marine Habitat • Fish Migration • Fish Spawning • Shellfish Harvesting

b. State Water Board Order No. WQ 79-16. During wet weather, State Water Board Order No. WQ 79-16 sets forth requirements for discharges from Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007. Ocean Plan chapter III.J allows the State Water Board to grant exceptions to Ocean Plan requirements on a case-by-case basis if the public interest is served and the exception does not compromise beneficial uses (exceptions are listed in Ocean Plan Table VII-1). In 1979, the State Water Board granted the Discharger an exception from Ocean Plan requirements and imposed conditions, including but not limited to the following:

- Except for the bacteriological standards, to the greatest extent practical, the Discharger is to design, construct, and operate facilities to conform to the remaining standards set forth in chapter II of the 1978 Ocean Plan. These standards relate to physical characteristics (i.e., floating particulates, discoloration, natural light, and inert solids deposition), chemical characteristics (i.e., dissolved oxygen, pH, dissolved sulfide, toxic and organic chemicals in marine sediments, and nutrients), biological characteristics (i.e., marine communities and taste, odor, and color of marine resources used for human consumption), and radioactivity. Provisions V and VI.C.5 of this Order, and Attachments D and G sections I.C and I.D, require the Discharger to design, construct, and operate its facilities to conform to these standards to the greatest extent practical.

- To the greatest extent practical, the Discharger is to design, construct, and operate facilities to comply with the conditions controlled by the requirements set forth in chapter III, sections A and B, of the 1978 Ocean Plan. These requirements call for waste management systems to be designed and operated in a manner that will maintain indigenous marine life and a healthy and diverse marine community. They also call for waste discharges to be essentially free of floatable and settleable material, substances toxic to marine life due to increases in concentrations in water or sediments, substances that significantly decrease natural light, and materials that result in esthetically undesirable discoloration of the ocean surface. Provisions V and VI.C.5 of this Order and Attachments D and G sections I.C and I.D require the Discharger to design, construct, and operate its facilities to conform to these requirements to the greatest extent practical.

- The Discharger is to design and construct facilities to contain all stormwater runoff beyond that associated with an average of eight combined sewer discharges per year. Section III and Provision VI.C.5.c of this Order implement this condition.

- Beaches affected by combined sewer discharges are to be posted with warning signs beginning when the discharge commences until analysis indicates that water quality meets Ocean Plan bacteriological standards for recreation. Provision VI.C.5.a.viii of this Order implements this condition.

- Shellfish areas harvested for human consumption that may be affected by combined sewer discharges are to be posted with warning signs beginning when the discharge commences until the City and County Health Department indicates that no further posting is required. Provision VI.C.5.a.viii of this Order implements this condition.

- The Discharger is to comply with federal and State source control programs to minimize the entry of toxic substances into the waste collection system from industrial sources. Provisions VI.C.4.b and VI.C.5.a.iii of this Order and Attachment H implement this condition.

- The Discharger is to implement a self-monitoring program in accordance with Regional Water Board specifications. Provision VI.B of this Order and Attachment E implement this condition.

State Water Board Order No. WQ 79-16 explains the rationale for this exception and its conditions. It also states that the Regional Water Board or U.S. EPA may require construction of additional facilities or modification of existing Facility operations if it finds (1) changes in the location, intensity, or importance of affected beneficial uses, or (2) demonstrated unacceptable adverse impacts result from Facility operations as currently constructed.

3. **Combined Sewer Overflow (CSO) Control Policy.** On April 11, 1994, U.S. EPA adopted the *Combined Sewer Overflow (CSO) Control Policy* to establish a national approach for controlling combined sewer discharges and overflows (59 Fed. Reg. 18688-18698, April 19, 1994). The Wet Weather Water Quality Act of 2000 amended the CWA to require that

permits issued after December 21, 2000, for discharges from combined sewer systems conform to the *Combined Sewer Overflow (CSO) Control Policy* (33 U.S.C. § 1342[q][1]). Requirements of this Order implement the *Combined Sewer Overflow (CSO) Control Policy*, including the implementation of the nine minimum controls, a Long-Term Control Plan, and a post-construction monitoring program. (See Fact Sheet § VI.C.5.)

4. **Antidegradation Policy.** Federal regulations at 40 C.F.R. section 131.12 require that state water quality standards include an antidegradation policy consistent with stated requirements. The State Water Board established California's antidegradation policy through State Water Board Resolution No. 68-16, "*Statement of Policy with Respect to Maintaining High Quality of Waters in California*," which meets the federal antidegradation policy requirements. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The Basin Plan implements, and incorporates by reference, the antidegradation policy. Permitted discharges must be consistent with the antidegradation provisions of 40 C.F.R. section 131.12 and Resolution No. 68-16. (See Fact Sheet § IV.D.2.)

5. **Anti-Backsliding Requirements.** CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l) restrict backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed. (See Fact Sheet § IV.D.1.)

6. **Endangered Species Act Requirements.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code §§ 2050 to 2097) or the federal Endangered Species Act (16 U.S.C. §§ 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other provisions to protect beneficial uses, including protecting rare and endangered species. The Discharger is responsible for meeting all Endangered Species Act requirements.

   U.S. EPA's reissuance of this NPDES permit is subject to certain requirements of the federal Endangered Species Act of 1973 and the Magnuson-Stevens Fishery Conservation and Management Act. In October 2017, U.S. EPA requested updated information from the National Marine Fisheries Service and the U.S. Fish and Wildlife Service (collectively, the Services) related to (1) essential fish habitat and managed and associated species, and (2) threatened and endangered species and their designated critical habitats near Discharge Point No. 001. U.S. EPA made a "may affect, not likely to adversely affect" determination for the southern California steelhead, Central California Coho salmon, Central Valley, spring-run chinook salmon, Sacramento River winter-run chinook salmon, humpback whale, leatherback turtle, green sea turtle, loggerhead turtle, white abalone, and olive ridley sea turtle; and a "no effect" determination for the remaining listed species under the Services' jurisdictions (*U.S. EPA Biological Evaluation*, September 2018). U.S. EPA provided a revised biological evaluation to the Services in April 2019. U.S. EPA may decide that changes to this Order are warranted based on the results of the completed consultation, and may modify or reopen it prior to the expiration date as described in Provision VI.C.1 of this Order.

7. **Sludge and Biosolids.** U.S. EPA administers 40 C.F.R. part 503, "Standards for the Use or Disposal of Sewage Sludge," which regulates the final use or disposal of sewage sludge generated during the treatment of domestic sewage in a municipal wastewater treatment facility. This Order does not authorize any act that violates those requirements. The Discharger is responsible for meeting all applicable requirements of 40 C.F.R. part 503.

8. **Ocean Discharge Criteria Evaluation.** CWA section 403(c) and implementing regulations at 40 C.F.R. part 125, subpart M, establish ocean discharge criteria for preventing unreasonable degradation of the marine environment of the territorial seas, contiguous zones, and oceans. The regulations at 40 C.F.R. section 125.122(b) allow a permitting authority to presume that a discharge will not cause unreasonable degradation for specific pollutants or conditions if the discharge complies with state water quality standards. This Order implements State water quality standards for discharges from Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007. This Order also implements State water quality standards for discharges from Discharge Point No. 001, with the modifications described below.

   This Order's requirements for Discharge Point No. 001 are consistent with the Ocean Plan, except with respect to chronic toxicity and TCDD equivalents. In all other respects, therefore, U.S. EPA presumes that the discharge will not cause unreasonable degradation. With respect to chronic toxicity and TCDD equivalents, U.S. EPA is required to consider the site-specific factors listed in 40 C.F.R. section 125.122(a). U.S. EPA prepared an evaluation under CWA section 403(c) for chronic toxicity and TCDD equivalents and concluded that no unreasonable degradation of ocean waters will occur.

9. **Coastal Zone Management Act.** The California Coastal Commission has indicated that it is unnecessary to obtain a consistency certification pursuant to the Coastal Zone Management Act (16 U.S.C. § 1451 et seq.).

D. Impaired Waters on CWA 303(d) List

On April 6, 2018, U.S. EPA approved a revised list of California's impaired waters pursuant to CWA section 303(d), which requires identification of specific waters where it is expected that water quality standards will not be met after implementation of technology-based effluent limitations on point sources. Where it has not done so already, the Regional Water Board plans to adopt total maximum daily loads (TMDLs) for waters on the 303(d) list. TMDLs establish wasteload allocations for point sources and load allocations for nonpoint sources, and are established to achieve the water quality standards for the impaired waters. This Order does not authorize any discharge to receiving waters on California's list of impaired waters.

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations: 40 C.F.R. section 122.44(a) requires that permits include applicable technology-based limitations and standards; and 40 C.F.R.

section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water.

A. Discharge Prohibitions

1. **Prohibition III.A (Discharge different than described).** This prohibition is based on 40 C.F.R. section 122.21(a) and Water Code section 13260, which require filing an application and Report of Waste Discharge before a discharge can occur. Discharges not described in the application and Report of Waste Discharge, and subsequently in this Order, are prohibited.

2. **Prohibition III.B (Bypass of untreated or partially-treated wastewater).** This prohibition is based on the *Combined Sewer Overflow (CSO) Control Policy* and 40 C.F.R. section 122.41(m) (see Attachment D section I.G). Pursuant to 40 C.F.R. section 122.41(m)(4)(ii), the Regional Water Board and U.S. EPA approve bypass of the biological treatment units (i.e., blending primary-treated effluent with biologically-treated effluent) during wet weather, when treatment plant influent flow exceeds 43 MGD (the hydraulic capacity of the biological treatment units), because such bypass meets the criteria for approval set forth in 40 C.F.R. sections 122.41(m)(4)(i)(A)-(C):

   - When influent flow exceeds 43 MGD, bypass of biological treatment is unavoidable to prevent loss of life, personal injury, or severe property damage. Such bypass prevents the washout of solids and the microbial population from the biological treatment system and thus ensures treatment reliability. Moreover, such bypass prevents backups and flooding in the community that could cause personal injury or severe property damage.

   - There are no feasible alternatives to bypass when influent flow exceeds 43 MGD. Provisions VI.C.5.c and VI.C.5.d require the Discharger to implement all feasible measures to maximize treatment. As long as the Discharger complies with these provisions, it is implementing all feasible alternatives to avoid bypass during wet weather.

   - The Discharger provided notice at least ten days before any wet weather bypass in its *Report of Waste Discharge, Oceanside Water Pollution Control Plant and Westside Wet Weather Facilities* (April 3, 2014) and *Wastewater Enterprise Westside Operations Summary Baseline Report* (March 2014).

3. **Prohibition III.C (Discharge at Discharge Point No. 001 without minimum initial dilution of at least 148:1).** This prohibition is necessary to ensure that the assumptions used to derive the dilution credits established through this Order for Discharge Point No. 001 remain substantially the same so the effluent limitations at Discharge Point No. 001 remain protective of water quality. This Order considered a dilution credit of 148:1, as modeled assuming no currents, based on the Discharger's *Southwest Ocean Outfall Dilution Modeling Report, Final Report* (April 2014) to conduct the reasonable potential analysis described in Fact Sheet section IV.C.4. Moreover, the in-stream waste concentration (IWC) to be used to evaluate compliance with this Order's chronic toxicity effluent limitation is based on this dilution credit. When the Discharger produces 1.0 MGD of recycled water and discharges

reverse osmosis concentrate, the IWC for chronic toxicity testing reflects a dilution credit of 266:1, as modeled assuming currents. Both dilution credits correspond to the same outfall configuration, which this prohibition seeks to maintain.

4. **Prohibition III.D (Discharge from location other than Discharge Point No. 001, except during wet weather).** This prohibition clarifies that any discharges other than those to Discharge Point No. 001 are unauthorized, except those to Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007 as explicitly authorized during wet weather in accordance with the *Combined Sewer Overflow (CSO) Control Policy*.

5. **Prohibition III.E (Discharge in excess of permitted flow).** This Order prohibits an average dry weather effluent flow greater than 43 MGD based on the plant's secondary treatment design capacity. Exceeding the secondary treatment design capacity could result in lowering the reliability of achieving this Order's treatment requirements.

B. Technology-Based Effluent Limitations

1. **Scope and Authority.** CWA section 301(b) and 40 C.F.R. section 122.44 require that permits include conditions meeting applicable technology-based requirements, at a minimum, and any more stringent effluent limitations necessary to meet water quality standards.

2. **Oceanside Water Pollution Control Plant.** During dry weather, the technology-based requirements for the Oceanside Water Pollution Control Plant are based on the Secondary Treatment Standards at 40 C.F.R. section 133.102, listed in the following table:

Table F-7. Secondary Treatment Requirements

Parameter	Monthly Average	Weekly Average
BOD_5 [1,2]	30 mg/L	45 mg/L
$CBOD_5$ [1,2]	25 mg/L	40 mg/L
TSS [2]	30 mg/L	45 mg/L
pH	6.0 – 9.0 standard units	

Abbreviation:

mg/L = milligrams per liter

Footnotes:

[1] $CBOD_5$ effluent limitations may be substituted for BOD_5 effluent limitations.

[2] The monthly average percent removal, by concentration, is not to be less than 85 percent.

This Order does not include the additional technology-based effluent limitations established in Ocean Plan chapter III.B.1 (i.e., oil and grease, turbidity, settleable solids) because the plant provides secondary treatment.

During wet weather, the *Combined Sewer Overflow (CSO) Control Policy* establishes the minimum technology-based requirements for combined sewer systems as the implementation of the nine minimum controls based on 40 C.F.R. section 125.3. Provision VI.C.5.a of this Order contains these requirements.

3. **Westside Recycled Water Project.** Ocean Plan chapter III.B.1 establishes technology-based effluent limitations for publicly-owned treatment works and industrial discharges for which effluent limitation guidelines have not been established pursuant to CWA sections 301, 302, 304, or 306. This Order requires Westside Recycled Water Project discharges to meet the minimum technology-based effluent limitations established in Ocean Plan Table 2, listed in the following table:

Table F-8. Ocean Plan Table 2 Effluent Limitations

Parameter	Units	Monthly Average	Weekly Average	Instantaneous
Oil and Grease	mg/L	25	40	75
TSS	mg/L	60 [1]	---	---
Settleable Solids	mL/L	1.0	1.5	3.0
Turbidity	NTU	75	100	225
pH	standard units	within 6.0 to 9.0 range (all times)		

Abbreviations:

mg/L = milligrams per liter
mL/L = milliliters per liter
NTU = nephelometric turbidity units

Footnote:

[1] Ocean Plan Table 2 notes state, "Suspended Solids: Dischargers shall, as a 30-day average, remove 75% of suspended solids from the influent stream before discharging wastewaters to the ocean, except that the effluent limitation to be met shall not be lower than 60 mg/L." Because the monthly average effluent limitation for suspended solids has been established as 60 mg/L, the Discharger is not required to remove 75% of influent suspended solids.

4. **Combined Sewer System.** The Westside Transport/Storage Structure and combined sewer discharge points discharge only during wet weather. As such, the *Combined Sewer Overflow (CSO) Control Policy* establishes the minimum technology-based requirements for combined sewer systems as the implementation of nine minimum controls based on 40 C.F.R. section 125.3. Provision VI.C.5.a of this Order contains these requirements.

C. Water Quality-Based Effluent Limitations (WQBELs)

1. Scope and Authority

CWA section 301(b) and 40 C.F.R. section 122.44(d) require that permits include limitations more stringent than federal technology-based requirements where necessary to achieve applicable water quality standards. According to 40 C.F.R. section 122.44(d)(1)(i), permits must include effluent limitations for all pollutants that are or may be discharged at levels that have a reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective, WQBELs must be established using (1) U.S. EPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, which may be derived using a proposed state criterion or policy interpreting a state narrative water quality criterion, supplemented with other relevant information (40 C.F.R. § 122.44[d][1][vi]). The process for determining reasonable potential and calculating WQBELs is intended to achieve applicable water quality objectives and criteria, protect the

designated uses of receiving waters as specified in the Basin Plan and Ocean Plan, and ensure no unreasonable degradation under CWA section 403(c) and 40 C.F.R. part 125, subpart M.

During dry weather, this Order imposes numeric effluent limitations at Discharge Point No. 001 for pollutants with reasonable potential to cause or contribute to exceedances of water quality standards.

During wet weather, this Order imposes narrative effluent limitations, not numeric limitations. In accordance with the *Combined Sewer Overflow (CSO) Control Policy*, this Order requires the Discharger to implement and update its Long-Term Control Plan. The *Combined Sewer Overflow (CSO) Control Policy* describes the presumption and demonstration approaches regarding water quality-based requirements and requires that a post-construction water quality monitoring program be in place to verify compliance with applicable water quality standards. This Order requires the combined sewer system to capture 100 percent of combined wastewater and stormwater and provide equivalent-to-primary treatment consisting of floatables and settleable solids removal. Provision VI.C.5.d (Task 3.b) of the Order requires the Discharger to assess the feasibility and necessity of disinfecting combined sewer discharges.

2. Beneficial Uses and Water Quality Objectives

Fact Sheet sections III.C.1 and III.C.2, above, identify the beneficial uses of the Pacific Ocean. Ocean Plan chapter II (including Table 1) lists water quality objectives for the Pacific Ocean.

3. Minimum Initial Dilution

In accordance with Ocean Plan chapter III.C, the minimum initial dilution at Discharge Point No. 001 can be estimated by experimental observation or computer simulation. The Discharger submitted an updated dilution study in April 2014, *Southwest Ocean Outfall (Discharge Point No. 001) Dilution Modeling Report – Final*, which estimated dilution based on NRFIELD and UM3 models and ambient water data measured from April 2012 through October 2013. Based on the more conservative estimate assuming no currents, the minimum initial dilution ratio is 148:1 (148 parts seawater per 1 part wastewater). This represents the minimum 30-day average dilution during the period of maximum stratification, observed from November 2012 through January 2013. The Discharger's dilution study also estimated dilution based on existing current velocity data measured at mid-depth of the water column. Accounting for ocean currents, the more conservative estimate of the minimum 30-day average dilution during the period of maximum stratification is 266:1.

A minimum initial dilution of 148:1 is used in the reasonable potential analysis described in Fact Sheet section III.C.4, below. The IWC to be used in chronic toxicity testing is also based on this minimum initial dilution, except when the Westside Recycled Water Project operates at full capacity to produce 1.0 MGD of recycled water, in which case the IWC is to be based on a minimum initial dilution of 266:1 as described in MRP section V.A.2. This increase in minimum initial dilution accounts for ocean currents, which move parallel to the coast, not

toward State waters (*Assessment of Effects on California State Waters from the Oceanside Southeast Ocean Outfall*, September 26, 2008).

4. Need for Water Quality-Based Effluent Limitations (Reasonable Potential Analysis)

a. Methodology

i. Dry Weather. Ocean Plan Appendix VI sets forth a procedure for reasonable potential analyses applicable to dry weather discharges from Discharge Point No. 001. The procedure assumes a lognormal distribution for the effluent data and compares the 95th percentile concentration at 95 percent confidence for each parameter listed in Ocean Plan Table 1, accounting for dilution, to the applicable water quality objective listed in Ocean Plan Table 1. The analysis results in one of three endpoints for each pollutant based on four triggers:

- Endpoint 1 – There is reasonable potential. WQBELs and monitoring are required.
- Endpoint 2 – There is no reasonable potential. WQBELs are not required, but monitoring may be required.
- Endpoint 3 – The analysis is inconclusive. Any existing WQBELs are retained and monitoring is required.

The four triggers are as follows:

(a) Trigger 1. If any detected value after adjustment for dilution (X) is greater than the applicable water quality objective (Co), then Endpoint 1 applies.

For Table 1 pollutants: $X = (Ce + Dm\ Cs) / (Dm + 1)$

For acute toxicity: $X = Ce / (0.1\ Dm + 1)$

Where: Ce is the effluent concentration

Dm is the minimum initial dilution expressed as parts seawater per part wastewater (148:1)

Cs is the background seawater concentration from Ocean Plan Table 3.

(b) Trigger 2. If there are three or more detected values and the number of non-detected (ND) or detected but not quantified (DNQ) values (c) is less than or equal to 80 percent of the number of data points (n) (i.e., if $c/n \leq 80\%$), a parametric reasonable potential analysis is performed. If the calculated upper confidence bound is greater than Co, then Endpoint 1 is concluded; otherwise Endpoint 2 is concluded.

(c) Trigger 3. If there are less than three detected values or if there are more than three detected values but the percentage of non-detected (ND) or detected but not quantified (DNQ) values is more than 80 percent (i.e., if $c/n > 80\%$), a non-

parametric reasonable potential analysis is performed. Depending on the results, either Endpoint 2 or Endpoint 3 is concluded.

(d) Trigger 4. If any other information about the receiving water or the discharge supports a finding of reasonable potential, then the reasonable potential analysis may be based on best professional judgment. If data or other information is unavailable or insufficient to determine if a WQBEL is required, Endpoint 3 is concluded. Otherwise, either Endpoint 1 or Endpoint 2 is concluded.

ii. Wet Weather. For wet weather discharges from Discharge Point No. 001 and the combined sewer discharge points, the requirements described in Provision VI.C.5.c of the Order serve as narrative WQBELs.

b. Effluent Data. Since the Westside Recycled Water Project is expected to become operational during this permit term, two reasonable potential analyses were performed based on the Ocean Plan methodology: one based on current effluent quality and one based on potential future Westside Recycled Water Project effluent quality. In both cases, the analyses were based on dry weather effluent monitoring data the Discharger collected for Discharge Point No. 001 from January 2011 through December 2017. However, with full operation of the Westside Recycled Water Project, the Discharger anticipates that the discharge could potentially consist entirely of reverse osmosis concentrate approximately 1.4 percent of the time. Under these rare circumstances, the effluent could be as much as four times more concentrated when compared to existing conditions. For purposes of the Westside Recycled Water Project reasonable potential analysis, however, existing effluent data were multiplied by a concentration factor of 1.5, which reflects the foreseeable increase based on a 30-day averaging period. This concentration factor is sufficient to evaluate reasonable potential when the most stringent objectives (those with six-month averaging periods) apply.

c. Reasonable Potential Analysis Results. The following tables present the results of the two reasonable potential analyses performed (i.e., existing conditions and potential future Westside Recycled Water Project conditions). The analyses show reasonable potential for chronic toxicity based on Trigger 4. Chronic toxicity tests are intended to detect toxicity from a wide range of pollutants, and since the Facility has a municipal combined sewer system, there is a reasonable potential that unanticipated pollutants could be discharged into the system. Moreover, effluent monitoring data collected during the previous order term showed chronic toxicity at levels close to the previous order's effluent limit (see Table F-2) and similar toxicity could occur in the future.

Table F-9. Reasonable Potential Analysis No. 1 - Existing Conditions

Table 1 Pollutant	Most Stringent WQO (µg/L)	No. of Samples	No. of Non-Detects	Max Effluent Concentration (µg/L)	Max Effluent Concentration After Mixing (µg/L)	Projected 95th Percentile (µg/L)	Result

Abbreviations:

WQO = water quality objective
µg/L = micrograms per liter
TUc = chronic toxicity units

Footnotes:

[1] The previous order did not require acute toxicity monitoring.

[2] The previous order did not require monitoring for radioactivity.

[3] Chlorine is not added for disinfection, and the previous order did not require monitoring for residual chlorine.

[4] The previous order did not require monitoring for chromium (III); however, the maximum detected concentration of total chromium (8.1 µg/L) is less than the water quality objective for chromium (III) of 190,000 µg/L.

Abbreviations:

WQO = water quality objective
µg/L = micrograms per liter

Footnotes:

[1] The previous order did not require monitoring for acute toxicity.

[2] The projection is particularly uncertain because chronic toxicity may occur as a result of various pollutants within the effluent and their toxic effects may not be linearly related to discharge concentrations.

[3] The previous order did not require monitoring for radioactivity.

[4] The previous order did not require monitoring for total residual chlorine.

[5] The previous order did not require monitoring for chromium (III); however, the maximum projected concentration of total chromium (12 µg/L) is less than the water quality objective for chromium (III) of 190,000 µg/L.

5. WQBELs

a. Dry Weather. For dry weather discharges from Discharge Point No. 001, the Ocean Plan calls for chronic toxicity WQBELs based on "toxic units" derived from multi-concentration toxicity tests. This Order introduces an updated approach. In 2010, U.S. EPA published the Test of Significant Toxicity (TST) statistical approach in *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010). The TST statistical approach relies on the same U.S. EPA toxicity test methods. For example, section 9.4.1.2 of *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms* (EPA/600/R-95/0136, 1995) states, "the statistical methods recommended in this manual are not the only possible methods of statistical analysis."

To comply with the chronic toxicity WQBEL, effluent must "Pass" a single chronic toxicity test conducted at the IWC as defined in MRP section V.A.2 using the Test of Significant Toxicity (TST) statistical approach (Welch's t-test). The test result must reject the following null hypothesis:

H_0: mean discharge IWC response $\leq 0.75 \times$ mean control response.

In other words, the mean chronic toxicity response for a test sample must be statistically determined to be less than or equal to 75 percent of the response for a control sample. The 75 percent response level reflects a regulatory management decision intended to ensure that differences observed between test sample responses and control sample responses are meaningful. A test result that fails to reject the null hypothesis would not comply with the chronic toxicity WQBEL.

The chronic toxicity WQBEL is expressed as a single-sample maximum. For publicly-owned treatment works, 40 C.F.R. section 122.45(d) requires monthly and weekly effluent limitations unless impracticable. In this case, the single-sample WQBEL is necessary to protect against short-term effects. Limits expressed with monthly or weekly averaging periods could allow chronic toxicity to occur over shorter periods. This approach is comparable to that of the Ocean Plan, which calls for a daily maximum chronic toxicity limit. Single-sample and maximum daily chronic toxicity limits are comparable because chronic toxicity tests can take several days to complete, depending on the test species used. U.S. EPA recommends this approach in *EPA Regions 8, 9 and 10 Toxicity Training Tool* (January 2010).

b. Wet Weather. For wet weather discharges from Discharge Point No. 001 and the combined sewer discharge points, the Long-Term Control Plan required pursuant to the *Combined Sewer Overflow (CSO) Control Policy* and described in Provision VI.C.5.c of the Order serves as narrative WQBELs.

D. Discharge Requirement Considerations

1. Anti-Backsliding. This Order complies with the anti-backsliding provisions of CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l), which generally require

effluent limitations in a reissued permit to be as stringent as those in the previous permit. The requirements of this Order are at least as stringent as those in the previous order, with the exception of mercury. This Order does not contain dry weather mercury effluent limitations because there is no longer reasonable potential to exceed water quality objectives based on mercury effluent data. Removing the mercury WQBELs is consistent with State Water Board Order No. WQ 2001-16. Consistent with State Water Board Order No. WQ 2001-06, reliance on the TST statistical approach to evaluate chronic toxicity for dry weather discharges from the Oceanside Water Pollution Control Plant is not backsliding because this Order's effluent limitation is not comparable to the effluent limitation in the previous order.

2. **Antidegradation.** This Order complies with the antidegradation provisions of 40 C.F.R. section 131.12 and State Water Board Resolution No. 68-16. It continues the status quo with respect to the level of discharge authorized in the previous order, which was adopted in accordance with antidegradation policies, and thus serves as the baseline by which to measure whether degradation will occur. This Order does not allow for a flow increase or a reduced level of treatment. The only potentially less stringent effluent limitation is the chronic toxicity WQBEL after Westside Recycled Water Project operations commence. The Westside Recycled Water Project is expected to concentrate, but not increase, existing pollutant loads; therefore, it will not degrade Pacific Ocean water quality.

3. **Stringency of Requirements for Individual Pollutants.** This Order contains both technology-based and water quality-based effluent limitations. This Order's technology-based requirements implement minimum, applicable federal technology-based requirements. This Order also contains more stringent effluent limitations as necessary to meet water quality standards. These limitations are no more stringent than the CWA requires.

   This Order's WQBELs have been derived to implement water quality objectives that protect beneficial uses. The beneficial uses and water quality objectives set forth in the Ocean Plan and Basin Plan have been approved pursuant to federal law and are federal water quality standards. U.S. EPA approved the Ocean Plan on February 14, 2006, and also approved subsequent amendments. Most Basin Plan beneficial uses and water quality objectives were approved under State law and submitted to and approved by U.S. EPA prior to May 30, 2000. Beneficial uses and water quality objectives submitted to U.S. EPA prior to May 30, 2000, but not approved by U.S. EPA before that date, are nonetheless "applicable water quality standards for purposes of the CWA" pursuant to 40 C.F.R. section 131.21(c)(1). U.S. EPA approved the remaining beneficial uses and water quality objectives implemented by this Order so they are applicable water quality standards pursuant to 40 C.F.R. section 131.21(c)(2).

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

This Order's receiving water limitations are based on Ocean Plan chapters II.C, II.D, and II.E, and State Water Board Order No. WQ 79-16. These limits are necessary to ensure compliance with applicable water quality standards in accordance with the CWA and regulations adopted thereunder.

VI. RATIONALE FOR PROVISIONS

A. Standard Provisions

Attachment D contains standard provisions that apply to all NPDES permits in accordance with 40 C.F.R. section 122.41 and additional conditions applicable to specific categories of permits in accordance with 40 C.F.R. section 122.42. The Discharger must comply with these provisions.

In accordance with 40 C.F.R. section 123.25(a)(12), permits may impose more stringent requirements. Attachment G contains standard provisions that supplement the federal standard provisions in Attachment D.

In addition to federal conditions that address enforcement authority specified in 40 C.F.R. sections 122.41(a)(2), 122.41(j)(5), and (k)(2), this Order incorporates Water Code section 13387(e) by reference.

B. Monitoring and Reporting Program (MRP) Requirements

CWA section 308 and 40 C.F.R. sections 122.41(h), 122.41(j)-(l), 122.44(i), and 122.48 require that NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. The Monitoring and Reporting Program (Attachment E) of this Order establishes monitoring, reporting, and recordkeeping requirements that implement federal and State requirements. For more background regarding these requirements, see Fact Sheet section VII.

C. Special Provisions

1. Reopener Provisions

These provisions are based on 40 C.F.R. sections 122.62 and 122.63 and allow modification of this Order and its effluent limitations as necessary in response to updated water quality objectives, regulations, or other new and relevant information that may become available in the future, and other circumstances as allowed by law. Provision VI.C.1.f is based on *Combined Sewer Overflow (CSO) Control Policy* section IV.B.2.g.

2. Effluent Characterization Study and Report

This Order does not include effluent limitations for Ocean Plan Table 1 pollutants that do not demonstrate reasonable potential, but this provision requires the Discharger to evaluate monitoring data to verify that the reasonable potential analysis conclusions of this Order remain valid. This requirement is authorized pursuant to 40 C.F.R. section 122.41(h) and Water Code section 13267, and is necessary to inform the next permit reissuance and to

ensure that the Discharger takes timely steps in response to any unanticipated change in effluent quality during the term of this Order.

3. Pollutant Minimization Program

This provision is based on *Combined Sewer Overflow (CSO) Control Policy* section II.B.7, Basin Plan section 4.13.2, Ocean Plan chapter III.C.9, State Water Board Order No. WQ 79-16, and Water Code section 13263. The provision requires the Discharger to include copper and zinc as pollutants of concern because concentrations are often elevated in combined sewer discharges.

4. Special Provisions for Publicly-Owned Treatment Works (POTWs)

a. Sludge and Biosolids Management. This provision is based on Basin Plan section 4.17. "Sludge" refers to the solid, semisolid, and liquid residue removed during primary, secondary, and advanced wastewater treatment processes. "Biosolids" refers to sludge that has been treated and may be beneficially reused.

b. Pretreatment Program. This provision is based on 40 C.F.R. part 403. The Discharger implements a pretreatment program due to the nature and volume of its industrial influent. This provision lists the Discharger's responsibilities regarding its pretreatment program and requires compliance with the provisions in Attachment H.

c. Anaerobically-Digestible Material. Standard Operating Procedures are required for dischargers that accept hauled waste food, fats, oil, and grease for injection into anaerobic digesters. The development and implementation of Standard Operating Procedures for management of these materials is intended to allow the California Department of Resources Recycling and Recovery to exempt operations from separate and redundant permitting programs. If the Discharger does not accept fats, oil, and grease for resource recovery purposes, it is not required to develop and implement Standard Operating Procedures.

Some publicly-owned treatment works choose to accept organic material, such as waste food, fats, oils, and grease, into their anaerobic digesters to increase production of methane and other biogases for energy production and to prevent such materials from being discharged into the collection system and potentially causing sanitary sewer overflows. The California Department of Resources Recycling and Recovery has proposed to exclude publicly-owned treatment works from Process Facility/Transfer Station permit requirements when the same activities are regulated under waste discharge requirements or NPDES permits. The proposed exclusion is restricted to anaerobically-digestible materials that have been prescreened, slurried, processed, and conveyed in a closed system for co-digestion with regular sewage sludge. The exclusion assumes that the facility has developed Standard Operating Procedures for proper handling, processing, tracking, and management.

d. Separate Sanitary Sewer System. This provision requires compliance with Attachments D and G and states that these requirements may be satisfied by complying

with State Water Board Order No. 2006-0003-DWQ, Statewide General Waste Discharge Requirements for Sanitary Sewer Systems, as amended by State Water Board Order No. WQ 2013-0058-EXEC and any subsequent order updating these requirements. These statewide WDRs require public agencies that own or operate sanitary sewer systems with greater than one mile of sewer lines to enroll for coverage and comply with requirements to develop sanitary sewer management plans and report sanitary sewer overflows, among other provisions and prohibitions. The statewide WDRs contain requirements for operation and maintenance of collection systems, and for reporting and mitigating sanitary sewer overflows, that are more extensive and, therefore, more stringent than the standard provisions in Attachments D and G.

5. Combined Sewer System Controls

a. Nine Minimum Controls. The *Combined Sewer Overflow (CSO) Control Policy* establishes nine minimum controls as the minimum technology-based requirements during wet weather for combined sewer systems based on 40 C.F.R. section 125.3:

- Conduct Proper Operations and Maintenance Program
- Maximize Use of Collection System for Storage
- Review and Modify Pretreatment Program
- Maximize Flow to Treatment Plant
- Prohibit Dry Weather Combined Sewer Overflows
- Control Solid and Floatable Materials in Combined Sewer Discharges
- Develop and Implement Pollution Prevention Program
- Notify Public of Combined Sewer Discharges
- Monitor to Characterize Combined Sewer Discharge Impacts and Efficacy of Controls

These nine minimum controls are the best conventional pollutant control technology (BCT) and the best available technology economically achievable (BAT). Provision VI.C.5.a of this Order requires implementation of these nine minimum controls and is consistent with U.S. EPA's guidance document, *Combined Sewer Overflows, Guidance for Nine Minimum Controls* (EPA 832-B-95-003, May 1995).

Provision VI.C.5.a.viii(a) contains specific signage and reporting requirements to inform the public of the location, occurrence, and possible health impacts of combined sewer discharges. The required signage language includes a telephone number so the public can report dry weather discharges to help ensure that corrective actions are taken and warning language to reduce public exposure to potential health risks. This provision contains requirements to protect the shellfish harvesting beneficial use in the Pacific Ocean (see Fact Sheet sections III.C.1 and III.C.2). This provision is consistent with State Water Board Order No. 79-16, U.S. EPA's *NPDES Compendium of Next Generation Compliance Examples* (September 2016), and 40 C.F.R. section 122.38 (*Public Notification Requirements for Combined Sewer Overflows to the Great Lakes Basin*, considered here as guidance).

For sewer overflows from the combined sewer system, Provision VI.C.5.a.ii(b) requires the Discharger to notify and report sewer overflows from the combined sewer system using the State's CIWQS database. Water Code sections 13267 and 13383, 40 C.F.R. section 122.41(h), and the *Combined Sewer Overflow (CSO) Control Policy* authorize the Regional Water Board and U.S. EPA to require information about releases of untreated or partially-treated wastewater. This information is necessary to evaluate combined sewer system performance, and operations and maintenance practices; to determine whether any diversions of untreated or partially-treated wastewater result in a discharge to surface waters; to satisfy public notification requirements; to identify whether the public could be affected; and to establish whether sewer overflows from the combined sewer system result in a nuisance as defined by Water Code section 13050.

b. Documentation of Nine Minimum Controls. Provision VI.C.5.b is based on section II.B of the *Combined Sewer Overflow (CSO) Control Policy*, which states that Dischargers should submit appropriate documentation demonstrating implementation of the nine minimum controls. Consistent with U.S. EPA's guidance document, *Combined Sewer Overflows, Guidance for Nine Minimum Controls* (EPA 832-B-95-003, May 1995), a community that has made substantial progress in implementing the nine minimum controls is still expected to provide documentation to the permitting authority to demonstrate how its program addresses each minimum control.

c. Long-Term Control Plan (LTCP). The *Combined Sewer Overflow (CSO) Control Policy* requires implementation of a Long-Term Control Plan (LTCP) to satisfy water quality-based requirements during wet weather. *Combined Sewer Overflow (CSO) Control Policy* section IV.B.2.f specifies that permits should contain requirements for maximizing the treatment of wet weather flows, as appropriate. The operational requirements in Provision VI.C.5.c of this Order are unchanged from the previous order, except that this Order requires the instantaneous influent flow rate to the Oceanside Water Pollution Control Plant prior to initiating discharge from the Westside Transport/Storage Structure to Discharge Point No. 001 to be 60 MGD to reflect the treatment capacity of the Oceanside Water Pollution Control Plant and operational considerations. This provision allows the Discharger to request changes to these operational parameters to ensure the Discharger's LTCP continues to minimize combined sewer discharges and maximize pollutant removal during wet weather.
Provision VI.C.5.d (Task 4) of this Order requires the Discharger to re-evaluate each operational requirement and propose additional performance measures within 24 months of this Order's effective date to ensure wet weather operations are optimized based on current information.

d. LTCP Update. The Discharger's report *San Francisco Wastewater Long Term Control Plan Synthesis* (March 30, 2018) summarizes the various documents that comprise the Discharger's historical planning process and LTCP. Provision VI.C.5.d requires the Discharger to update its LTCP with respect to the elements listed in *Combined Sewer Overflow (CSO) Control Policy* section II.C. *Combined Sewer Overflow (CSO) Control Policy* section IV.B describes the major elements that should be included in NPDES permits to implement the policy and ensure protection of water quality. This provision is consistent with U.S. EPA's guidance document *Combined Sewer Overflows, Guidance*

for Long-Term Control Plan (EPA 832-B-95-002, September 1995). This provision also implements State Water Board Order No. WQ 79-16, which sets forth specific conditions to be implemented during wet weather (see Fact Sheet § III.C.2.b).

This provision requires the Discharger to update its LTCP for the following reasons:

- *Combined Sewer Overflow (CSO) Control Policy* section IV.B.2.b specifies that the permit should contain narrative requirements to ensure that selected controls are implemented, operated, and maintained as described in the Discharger's LTCP.

- *Combined Sewer Overflow (CSO) Control Policy* section IV.B.2.d specifies that the permit should contain a requirement to monitor and collect sufficient information to demonstrate compliance with water quality standards and protect designated uses, as well as to determine the effectiveness of combined sewer system controls.

- *Combined Sewer Overflow (CSO) Control Policy* section IV.B.2.e specifies that the permit should contain a requirement to reassess combined sewer discharges to sensitive areas in those cases where elimination or relocation was previously found to be not physically possible and economically achievable.

- *Combined Sewer Overflow (CSO) Control Policy* section IV.B.2.f specifies that the permit should contain requirements for maximizing the treatment of wet weather flows at the treatment plant, as appropriate.

- State Water Board Order No. WQ 79-16 requires the Discharger to design, construct, and operate facilities to the greatest extent practical to conform to the standards set forth in chapter II of the 1978 Ocean Plan, except for the bacteriological standards (see Fact Sheet § III.C.2.b).

- State Water Board Order No. WQ 79-16 requires the Discharger to design, construct, and operate facilities to the greatest extent practical to comply with the conditions controlled by the requirements set forth in chapter III, sections A and B, of the 1978 Ocean Plan (see Fact Sheet § III.C.2.b).

- An updated LTCP is necessary to document that the Discharger's LTCP is based on the most current information to assess whether water quality standards are being met and that wet weather discharges are not causing unreasonable degradation of the marine environment (40 C.F.R. § 125.122).

6. Westside Recycled Water Project Operations Notification

The effluent limitations and specifications in this Order are based on information available during the permit reissuance process. Assumptions regarding how effluent quality could change after commencement of Westside Recycled Water Project operations were based on information the Discharger provided prior to completion of project planning and construction. This provision is necessary to evaluate whether the assumptions made during the permitting process remain valid and to ensure that the permit continues to be protective of water quality standards. Moreover, because some requirements of this Order are contingent

upon Westside Recycled Water Project operations, notification is necessary for the Regional Water Board and U.S. EPA to know when such requirements apply.

7. Flame Retardant Special Study

This special study is necessary to evaluate the potential impacts of flame retardants (i.e., polybrominated diphenyl ethers and chlorinated organophosphate flame retardants) in receiving waters. During U.S. EPA consultation with the National Marine Fisheries Service pursuant to the Endangered Species Act and Magnuson-Stevens Act, the National Marine Fisheries Service expressed concern about the presence of flame retardants in plant effluent and flame retardant mass loadings to the Pacific Ocean because organophosphates have been widely detected in San Francisco Bay water, sediment, and aquatic life tissue, and because polybrominated diphenyl ether (PBDE) and tris(1,3-dichloro-2-propyl)phosphate (TDCP) concentrations in San Francisco Bay water have regularly exceeded predicted no effect concentrations for marine settings (*U.S. EPA Biological Evaluation*, April 2019). This special study is consistent with other NPDES permits that authorize discharge to the Pacific Ocean.

8. Efficacy of Combined Sewer System Controls Special Study

This special study is necessary to characterize the quality of the combined sewer discharges and the efficacy of the combined sewer system controls during wet weather. It is based on the *Combined Sewer Overflow (CSO) Control Policy*, which requires "a post-construction water quality monitoring program adequate to verify compliance with water quality standards and protection of designated uses as well as to ascertain the effectiveness of CSO controls."

VII. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

CWA section 308 and 40 C.F.R. sections 122.41(h), 122.41(j)-(l), 122.44(i), and 122.48 require that all NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. The *Combined Sewer Overflow (CSO) Control Policy* requires monitoring to ascertain the effectiveness of controls and to verify compliance with water quality standards and protection of beneficial uses. The Monitoring and Reporting Program (MRP) in Attachment E of this Order establishes monitoring, reporting, and recordkeeping requirements that implement federal and State requirements. Specified monitoring frequencies take into account the quantity and variability of the discharge, past compliance, significance of pollutants, and cost of monitoring. The following provides the rationale for the monitoring and reporting requirements contained in the MRP.

A. Influent Monitoring. Influent flow monitoring is necessary to understand Facility operations and to evaluate compliance with Discharge Prohibition III.D. Influent $CBOD_5$ and TSS monitoring is necessary to evaluate compliance with this Order's 85 percent removal requirement. Influent monitoring is also necessary to identify wet weather days, as defined in Attachment A.

B. Effluent Monitoring. Dry weather monitoring is necessary to evaluate compliance with this Order's effluent limitations and to provide data for future reasonable potential analyses. Wet weather monitoring is necessary to characterize the efficacy of combined sewer system controls and assess receiving water impacts. Effluent flow monitoring is necessary to understand Facility operations and to assess impacts to receiving waters.

C. Toxicity Testing. Dry weather effluent chronic toxicity monitoring is necessary to evaluate compliance with this Order's chronic toxicity effluent limitation and to provide data for future reasonable potential analyses. Routine and accelerated chronic toxicity monitoring frequencies and Toxicity Reduction Evaluation requirements are based on the implementation provisions in Ocean Plan chapter III.C and the standard monitoring procedures guidance in section 7.1 of Ocean Plan Appendix III.

A tiered approach to determine the required effluent concentration in test samples removes impediments for the Discharger to construct and operate the Westside Recycled Water Project. When recycled water production exceeds 1.0 MGD, toxicity test samples are to contain an effluent concentration based on the dilution at Discharge Point No. 001 as modeled using observed ocean currents. This flexibility accounts for potential increases in pollutant concentrations as recycled water is removed from the discharge.

D. Receiving Water Monitoring. Receiving water monitoring is necessary to characterize the effects of the discharges authorized in this Order on the receiving water and species listed under the California Endangered Species Act or federal Endangered Species Act. The requirements are based on the monitoring guidance in Appendix III of the Ocean Plan. The MRP requires the Discharger to continue its Southwest Ocean Outfall Regional Monitoring Program to collect data on chemical and physical sediment quality, benthic infauna community structure, and physical anomalies and bioaccumulation of contaminants in organism tissues.

The MRP requires shoreline monitoring following combined sewer discharge events at beach locations where water contact recreation takes place. This monitoring is necessary to assess the possible effects of combined sewer discharges on the water contact recreation beneficial use and to establish when public notification is required pursuant to Provision VI.C.5.a.viii of this Order. The bacteria indicators, *Enterococcus* and fecal coliform, are consistent with the revised bacteria provisions approved by U.S. EPA on March 22, 2019. An additional bacteria indicator, total coliform, is required for shoreline monitoring following combined sewer discharges because monitoring for total coliform is consistent with the indicators identified by the California Department of Public Health.

The MRP no longer requires the Discharger to collect data on demersal fish and epibenthic invertebrate community structure because trawl sampling does not provide data that are useful in determining discharge effects (*Southwest Ocean Outfall Regional Monitoring Program 1997-2012 Summary Report,* April 2014). The MRP also no longer includes 12 offshore receiving water monitoring locations. Seven discontinued locations (Stations 73, 74, 75, 76, 77, 78, and 79) were part of a special study conducted from 2002 through 2016; the Discharger demonstrated that these locations are not significantly different from other reference monitoring locations (*A Review of Benthic Macrofaunal Assemblage and Sediment Conditions in the Reef-Effect Region of the SWOO-RMP,* August 2018). Sediment and infaunal sampling at the other

five discontinued locations (Stations 41, 42, 44, 46, 49) has historically provided very little information because of their location in a unique, high energy environment with little to no fine sediment or animals (Pang, Jennie, email communication, December 14, 2018).

E. Pretreatment and Biosolids Monitoring. The pretreatment and biosolids monitoring requirements for influent, effluent, and biosolids are necessary to evaluate compliance with the Discharger's U.S. EPA-approved pretreatment program. Biosolids monitoring is also required pursuant to 40 C.F.R. part 503.

F. Other Monitoring Requirements. Pursuant to CWA section 308, U.S. EPA requires dischargers to participate in a Discharge Monitoring Report-Quality Assurance (DMR-QA) Study Program. The program annually evaluates the analytical abilities of laboratories that perform or support NPDES permit-required monitoring. The program applies to discharger laboratories and contract laboratories. There are two options to comply: (1) dischargers can obtain and analyze DMR-QA samples, or (2) pursuant to a waiver U.S. EPA issued to the State Water Board, dischargers can submit results from the most recent Water Pollution Performance Evaluation Study. Dischargers must submit results annually to the State Water Board, which then forwards the results to U.S. EPA.

Recycled water monitoring and reporting requirements are required to be incorporated into this Order by State Water Board Order No. WQ 2019-0037-EXEC (Amending Monitoring and Reporting Programs for Waste Discharge Requirements, NPDES Permits, Water Reclamation Requirements, Master Recycling Permits, and General Waste Discharge Requirements) issued on July 24, 2019, pursuant to Water Code sections 13267 and 13383.

VIII. PUBLIC PARTICIPATION

The Regional Water Board and U.S. EPA considered the issuance of WDRs and an NPDES permit for the Facility. As a step this process, U.S. EPA and Regional Water Board staff developed a tentative order and encouraged public participation in the reissuance process.

A. Notification of Interested Parties. The Regional Water Board and U.S. EPA notified the Discharger and interested agencies and persons of their intent to adopt an order reissuing the NPDES permit for the Discharger's discharges and provided an opportunity to submit written comments and recommendations. Notification was provided through the *San Francisco Chronicle* and http://www.epa.gov/region9/water/npdes/pubnotices.html. The public had access to the Regional Water Board agenda and any changes in dates and locations through the Regional Water Board's website at http://www.waterboards.ca.gov/sanfranciscobay and U.S. EPA's website at http://www.epa.gov/region9/water/npdes/pubnotices.html.

B. Written Comments. Interested persons were invited to submit written comments concerning the tentative order as explained through the notification process. Comments to the Regional Water Board and U.S. EPA were to be submitted either in person or by mail to the U.S. EPA NPDES Permits Office (WTR 2-3) at 75 Hawthorne Street, San Francisco, California 94105, to the attention of Becky Mitschele, and to the Regional Water Board office at 1515 Clay Street, Suite 1400, Oakland, California 94612, to the attention of Jessica Watkins.

For full staff response and Regional Water Board and U.S. EPA consideration, the written comments were due by 5:00 p.m. on May 20, 2019.

C. Public Hearing. The Regional Water Board held a public hearing on the tentative order during its regular meeting at the following date and time, and at the following location:

Date:	Wednesday, September 11, 2019
Time:	9:00 a.m.
Location:	Elihu Harris State Office Building 1515 Clay Street, 1st Floor Auditorium Oakland, CA 94612
Contact:	Jessica Watkins, (510) 622-2349, jessica.watkins@waterboards.ca.gov

Interested persons were invited to attend. At the public hearing, the Regional Water Board heard testimony pertinent to the discharge, WDRs, and permit. For accuracy of the record, important testimony was requested to be in writing.

Dates and venues change. The Regional Water Board web address is http://www.waterboards.ca.gov/sanfranciscobay, where one could access the current agenda for changes in dates and locations.

D. Reconsideration of Waste Discharge Requirements. Any aggrieved person may petition the State Water Board to review the Regional Water Board decision regarding the final WDRs. The State Water Board must receive the petition at the following address within 30 calendar days of the Regional Water Board's action:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

For instructions on how to file a petition for review, see http://www.waterboards.ca.gov/public_notices/petitions/water_quality/wqpetition_instr.shtml.

E. Federal NPDES Permit Appeals. When U.S. EPA issues a final NPDES permit, it becomes effective on its effective date unless a request for review is filed. If a request for review is filed, only those permit conditions that are uncontested go into effect pending disposition of the request for review. Requests for review must be filed within 33 days following the date the final permit is mailed and must meet the requirements of 40 C.F.R. section 124.19. Requests for review should be addressed to the Environmental Appeals Board and sent through the U.S. Postal Service addressed to the Environmental Appeals Board's mailing address:

U.S. Environmental Protection Agency
Clerk of the Board
Environmental Appeals Board (MC 1103B)
Ariel Rios Building
1200 Pennsylvania Avenue, N.W.
Washington, D.C. 20460-0001

Alternatively, filings delivered by hand or courier, including Federal Express, UPS, and U.S. Postal Express Mail, should be directed to the following address:

Environmental Appeals Board
U.S. Environmental Protection Agency
Colorado Building
1341 G Street, N.W., Suite 600
Washington, D.C. 20460

Persons filing a request for review must have filed written comments on the draft permit. Otherwise, any such request for review may be filed only to the extent that the request pertains to changes from the draft to the final permit decision.

F. Information and Copying. The Report of Waste Discharge, related supporting documents, and comments received are on file and may be inspected at the Regional Water Board office at 1515 Clay Street, Suite 1400, Oakland, California at any time between 8:00 a.m. and 5:00 p.m. (except noon to 1:00 p.m.), Monday through Friday, and at the U.S. EPA Region IX office at 75 Hawthorne Street, San Francisco, California at any time between 9:00 a.m. and 5:00 p.m., Monday through Friday. Copying of documents may be arranged by calling the Regional Water Board at (510) 622-2300 or U.S. EPA at (415) 972-3524.

G. Register of Interested Persons. Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board and U.S. EPA, reference this Facility, and provide a name, address, and phone number.

H. Additional Information. Requests for additional information or questions regarding this Order should be directed to Jessica Watkins at (510) 622-2349 or jessica.watkins@waterboards.ca.gov, or Becky Mitschele at (415) 972-3492 or mitschele.becky@epa.gov.

ATTACHMENT G

REGIONAL STANDARD PROVISIONS, AND MONITORING AND REPORTING REQUIREMENTS (SUPPLEMENT TO ATTACHMENT D)

November 2017

Contents

I. STANDARD PROVISIONS – PERMIT COMPLIANCE G-1
A. Duty to Comply G-1
B. Need to Halt or Reduce Activity Not a Defense G-1

VIII. DEFINITIONS G-13

REGIONAL STANDARD PROVISIONS, AND MONITORING AND REPORTING REQUIREMENTS

APPLICABILITY

This document supplements the requirements of Federal Standard Provisions (Attachment D). For clarity, these provisions are arranged using to the same headings as those used in Attachment D.

I. STANDARD PROVISIONS - PERMIT COMPLIANCE

A. Duty to Comply – Not Supplemented

B. Need to Halt or Reduce Activity Not a Defense – Not Supplemented

C. Duty to Mitigate – Supplement to Attachment D, Provision I.C.

1. **Contingency Plan**. The Discharger shall maintain a Contingency Plan as prudent in accordance with current facility emergency planning. The Contingency Plan shall describe procedures to ensure that existing facilities remain in, or are rapidly returned to, operation in the event of a process failure or emergency incident, such as employee strike, strike by suppliers of chemicals or maintenance services, power outage, vandalism, earthquake, or fire. The Discharger may combine the Contingency Plan and Spill Prevention Plan (see Provision I.C.2, below) into one document. In accordance with Regional Water Board Resolution No. 74-10, discharge in violation of the permit where the Discharger has failed to develop and implement a Contingency Plan as described below may be the basis for considering the discharge a willful and negligent violation of the permit pursuant to California Water Code section 13387. The Contingency Plan shall, at a minimum, provide for the following:

   a. Sufficient personnel for continued facility operation and maintenance during employee strikes or strikes against contractors providing services;

   b. Maintenance of adequate chemicals or other supplies, and spare parts necessary for continued facility operations;

   c. Emergency standby power;

   d. Protection against vandalism;

   e. Expeditious action to repair failures of, or damage to, equipment, including any sewer lines;

   f. Reporting of spills and discharges of untreated or inadequately treated wastes, including measures taken to clean up the effects of such discharges; and

   g. Maintenance, replacement, and surveillance of physical condition of equipment and facilities, including any sewer lines.

2. **Spill Prevention Plan.** The Discharger shall maintain a Spill Prevention Plan to prevent accidental discharges and to minimize the effects of any such discharges. The Spill Prevention Plan shall do the following:

   a. Identify the possible sources of accidental discharge, untreated or partially-treated waste bypass, and polluted drainage;

   b. State when current facilities and procedures became operational and evaluate their effectiveness; and

   c. Predict the effectiveness of any proposed facilities and procedures and provide an implementation schedule with interim and final dates when the proposed facilities and procedures will be constructed, implemented, or operational.

D. Proper Operation and Maintenance – Supplement to Attachment D, Provision I.D

1. **Operation and Maintenance Manual.** The Discharger shall maintain an Operation and Maintenance Manual to provide the plant and regulatory personnel with a source of information describing all equipment, recommended operational strategies, process control monitoring, and maintenance activities. To remain a useful and relevant document, the Operation and Maintenance Manual shall be kept updated to reflect significant changes in treatment facility equipment and operational practices. The Operation and Maintenance Manual shall be maintained in usable condition and be available for reference and use by all relevant personnel and Regional Water Board staff.

2. **Wastewater Facilities Status Report.** The Discharger shall maintain a Wastewater Facilities Status Report and regularly review, revise, or update it, as necessary. This report shall document how the Discharger operates and maintains its wastewater collection, treatment, and disposal facilities to ensure that all facilities are adequately staffed, supervised, financed, operated, maintained, repaired, and upgraded as necessary to provide adequate and reliable transport, treatment, and disposal of all wastewater from both existing and planned future wastewater sources under the Discharger's service responsibilities.

3. **Proper Supervision and Operation of Publicly-Owned Treatment Works (POTWs).** POTWs shall be supervised and operated by persons possessing certificates of appropriate grade pursuant to Title 23, section 3680, of the California Code of Regulations.

E. Property Rights – Not Supplemented

F. Inspection and Entry – Not Supplemented

G. Bypass – Not Supplemented

H. Upset – Not Supplemented

I. Other – Addition to Attachment D

1. Neither the treatment nor the discharge of pollutants shall create pollution, contamination, or nuisance as defined by California Water Code section 13050.

2. Collection, treatment, storage, and disposal systems shall be operated in a manner that precludes public contact with wastewater. If public contact with wastewater could reasonably occur on public property, warning signs shall be posted.

3. If the Discharger submits a timely and complete Report of Waste Discharge for permit reissuance, this permit shall continue in force and effect until the permit is reissued or the Regional Water Board rescinds the permit.

II. STANDARD PROVISIONS – PERMIT ACTION – Not Supplemented

III. STANDARD PROVISIONS – MONITORING

A. Sampling and Analyses – Supplement to Attachment D, Provisions III.A and III.B

1. Certified Laboratories. Water and waste analyses shall be performed by a laboratory certified for these analyses in accordance with California Water Code section 13176.

2. Minimum Levels. For the 126 priority pollutants, the Discharger should use the analytical methods listed in Table B unless the Monitoring and Reporting Program (MRP, Attachment E) requires a particular method or minimum level (ML). All monitoring instruments and equipment shall be properly calibrated and maintained to ensure accuracy of measurements.

3. Monitoring Frequency. The MRP specifies the minimum sampling and analysis schedule.

a. Sample Collection Timing

i. The Discharger shall collect influent samples on varying days selected at random and shall not include any plant recirculation or other sidestream wastes, unless otherwise stipulated in the MRP. The Executive Officer may approve an alternative influent sampling plan if it is representative of plant influent and complies with all other permit requirements.

ii. The Discharger shall collect effluent samples on days coincident with influent sampling, unless otherwise stipulated by the MRP. If influent sampling is not required, the Discharger shall collect effluent samples on varying days selected at random, unless otherwise stipulated in the MRP. The Executive Officer may approve an alternative effluent sampling plan if it is representative of plant discharge and in compliance with all other permit requirements.

iii. The Discharger shall collect effluent grab samples during periods of daytime maximum peak flows (or peak flows through secondary treatment units for facilities that recycle effluent).

iv. Effluent sampling for conventional pollutants shall occur on at least one day of any multiple-day bioassay the MRP requires. During the course of the bioassay, on at least one day, the Discharger shall collect and retain samples of the discharge. In the event that a bioassay result does not comply with effluent limitations, the Discharger

shall analyze the retained samples for pollutants that could be toxic to aquatic life and for which it has effluent limitations.

(a) The Discharger shall perform bioassays on final effluent samples; when chlorine is used for disinfection, bioassays shall be performed on effluent after chlorination and dechlorination; and

(b) The Discharger shall analyze for total ammonia nitrogen and calculate the amount of un-ionized ammonia whenever test results fail to meet effluent limitations.

b. Conditions Triggering Accelerated Monitoring

i. Average Monthly Effluent Limitation Exceedance. If the results from two consecutive samples of a constituent monitored in a particular month exceed the average monthly effluent limitation for any parameter (or if the required sampling frequency is once per month or less and the monthly sample exceeds the average monthly effluent limitation), the Discharger shall, within 24 hours after the results are received, increase its sampling frequency to daily until the results from the additional sampling show that the parameter complies with the average monthly effluent limitation.

ii. Maximum Daily Effluent Limitation Exceedance. If a sample result exceeds a maximum daily effluent limitation, the Discharger shall, within 24 hours after the result is received, increase its sampling frequency to daily until the results from two samples collected on consecutive days show compliance with the maximum daily effluent limitation.

iii. Acute Toxicity. If final or intermediate results of an acute bioassay indicate a violation or threatened violation (e.g., the percentage of surviving test organisms of any single acute bioassay is less than 70 percent), the Discharger shall initiate a new test as soon as practical or as described in applicable State Water Board plan provisions that become effective after adoption of these Regional Standard Provisions. The Discharger shall investigate the cause of the mortalities and report its findings in the next self-monitoring report.

iv. Chlorine. The Discharger shall calibrate chlorine residual analyzers against grab samples as frequently as necessary to maintain accurate control and reliable operation. If an effluent violation is detected, the Discharger shall collect grab samples at least every 30 minutes until compliance with the limitation is achieved, unless the Discharger monitors chlorine residual continuously. In such cases, the Discharger shall continue to conduct continuous monitoring.

v. Bypass. Except as indicated below, if a Discharger bypasses any portion of its treatment facility, it shall monitor flows and collect samples at affected discharge points and analyze samples for all constituents with effluent limitations on a daily basis for the duration of the bypass. The Discharger need not accelerate chronic toxicity monitoring. The Discharger also need not collect and analyze samples for mercury, dioxin-TEQ, and PCBs after the first day of the bypass. The Discharger may

satisfy the accelerated acute toxicity monitoring requirement by conducting a flow-through test or static renewal test that captures the duration of the bypass (regardless of the method specified in the MRP). If bypassing disinfection units only, the Discharger shall only monitor bacteria indicators daily.

(a) Bypass for Essential Maintenance. If a Discharger bypasses a treatment unit for essential maintenance pursuant to Attachment D section I.G.2, the Executive Officer may reduce the accelerated monitoring requirements above if the Discharger (i) monitors effluent at affected discharge points on the first day of the bypass for all constituents with effluent limitations, except chronic toxicity; and (ii) identifies and implements measures to ensure that the bypass will continue to comply with effluent limitations.

(b) Approved Wet Weather Bypasses. If a Discharger bypasses a treatment unit or permitted outfall during wet weather with Executive Officer approval pursuant to Attachment D section I.G.4, the Discharger shall monitor flows and collect and retain samples for affected discharge points on a daily basis for the duration of the bypass. The Discharger shall analyze daily for TSS using 24-hour composites (or more frequent increments) and for bacteria indicators with effluent limitations using grab samples. If TSS exceeds 45 mg/L in any composite sample, the Discharger shall also analyze daily the retained samples for all other constituents with effluent limitations, except oil and grease, mercury, PCBs, dioxin-TEQ, and acute and chronic toxicity. Additionally, at least once each year, the Discharger shall analyze the retained samples for one approved bypass for all other constituents with effluent limitations, except oil and grease, mercury, PCBs, dioxin-TEQ, and acute and chronic toxicity. This monitoring shall be in addition to the minimum monitoring specified in the MRP.

B. Standard Observations – Addition to Attachment D

1. **Receiving Water Observations.** The following requirements only apply when the MRP requires standard observations of receiving waters. Standard observations shall include the following:

   a. **Floating and Suspended Materials** (e.g., oil, grease, algae, and other macroscopic particulate matter) **—** presence or absence, source, and size of affected area.

   b. **Discoloration and Turbidity —** color, source, and size of affected area.

   c. **Odor —** presence or absence, characterization, source, and distance of travel.

   d. **Beneficial Water Use —** estimated number of water-associated waterfowl or wildlife, fisherpeople, and other recreational activities.

   e. **Hydrographic Condition —** time and height of high and low tides (corrected to nearest National Oceanic and Atmospheric Administration location for the sampling date and time).

f. Weather Conditions — wind direction, air temperature, and total precipitation during five days prior to observation.

2. **Wastewater Effluent Observations.** The following requirements only apply when the MRP requires standard observations of wastewater effluent. Standard observations shall include the following:

   a. Floating and Suspended Material of Wastewater Origin (e.g., oil, grease, algae, and other macroscopic particulate matter) **—** presence or absence.

   b. Odor — presence or absence, characterization, source, distance of travel, and wind direction.

3. **Beach and Shoreline Observations.** The following requirements only apply when the MRP requires standard observations of beaches or shorelines. Standard observations shall include the following:

   a. Material of Wastewater Origin — presence or absence, description of material, estimated size of affected area, and source.

   b. Beneficial Use — estimate of number of people participating in recreational water contact, non-water contact, and fishing activities.

4. **Waste Treatment and/or Disposal Facility Periphery Observations.** The following requirements only apply when the MRP requires standard observations of the periphery of waste treatment or disposal facilities. Standard observations shall include the following:

   a. Odor — presence or absence, characterization, source, and distance of travel.

   b. Weather Conditions — wind direction and estimated velocity.

IV. STANDARD PROVISIONS – RECORDS

A. Records to be Maintained – Supplement to Attachment D, Provision IV.A

The Discharger shall maintain records in a manner and at a location (e.g., the wastewater treatment plant or the Discharger's offices) such that the records are accessible to Regional Water Board staff. The minimum retention period specified in Attachment D, Provision IV, shall be extended during the course of any unresolved litigation regarding permit-related discharges, or when requested by Regional Water Board or U.S. EPA, Region IX, staff.

A copy of the permit shall be maintained at the discharge facility and be available at all times to operating personnel.

B. Records of Monitoring – Supplement to Attachment D, Provision IV.B

Monitoring records shall include the following:

1. **Analytical Information.** Records shall include analytical method detection limits, minimum levels, reporting levels, and related quantification parameters.

2. **Disinfection Process.** For the disinfection process, records shall include the following:

   a. For bacteriological analyses:

      i. Wastewater flow rate at the time of sample collection; and

      ii. Required statistical parameters for cumulative bacterial values (e.g., moving median or geometric mean for the number of samples or sampling period identified in the MRP).

   b. For the chlorination process (when chlorine is used for disinfection), at least daily average values for the following:

      i. Chlorine residual of treated wastewater as it enters the chlorine contact basin (mg/L);

      ii. Chlorine dosage (kg/day); and

      iii. Dechlorination chemical dosage (kg/day).

3. **Wastewater Treatment Process Solids.** For each treatment unit process that involves solids removal from the wastewater stream, records shall include the following:

   a. Total volume or mass of solids removed from each collection unit (e.g., grit, skimmings, undigested biosolids, or combination) for each calendar month or other time period as appropriate, but not to exceed annually; and

   b. Final disposition of such solids (e.g., landfill, other subsequent treatment unit).

4. **Treatment Process Bypasses.** For all treatment process bypasses, including wet weather blending, records shall include the following:

   a. Chronological log of treatment process bypasses;

   b. Identification of treatment processes bypassed;

   c. Beginning and ending dates and times of bypasses;

   d. Bypass durations;

   e. Estimated bypass volumes; and

   f. Description of, or reference to other reports describing, the bypasses, their cause, the corrective actions taken (except for wet weather blending explicitly approved within the permit and in compliance with any related permit conditions), and any additional monitoring conducted.

5. **Treatment Plant Overflows.** The Discharger shall retain a chronological log of overflows at the treatment plant, including the headworks and all units and appurtenances downstream, and records supporting the information provided in accordance with Provision V.E.2, below.

C. Claims of Confidentiality – Not Supplemented

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information – Not Supplemented

B. Signatory and Certification Requirements – Not Supplemented

C. Monitoring Reports – Supplement to Attachment D, Provision V.C

1. Self-Monitoring Reports. For each reporting period established in the MRP, the Discharger shall submit a self-monitoring report to the Regional Water Board in accordance with the requirements listed in the MRP and below:

a. Transmittal Letter. Each self-monitoring report shall be submitted with a transmittal letter that includes the following:

i. Identification of all violations of effluent limitations or other waste discharge requirements found during the reporting period;

ii. Details regarding the violations, such as parameters, magnitude, test results, frequency, and dates;

iii. Causes of the violations;

iv. Corrective actions taken or planned to resolve violations and prevent recurrences, and dates or time schedules for implementation (the Discharger may refer to previously submitted reports that address the corrective actions);

v. Explanation for any data invalidation. Data should not be submitted in a self-monitoring report if it does not meet quality assurance/quality control standards. However, if the Discharger wishes to invalidate a measurement after submitting it in a self-monitoring report, the Discharger shall identify the measurement suspected to be invalid and state the Discharger's intent to submit, within 60 days, a formal request to invalidate the measurement. The formal request shall include the original measurement in question, the reason for invalidating the measurement, all relevant documentation that supports invalidation (e.g., laboratory sheet, log entry, test results), and a discussion of the corrective actions taken or planned (with a time schedule for completion) to prevent recurrence of the sampling or measurement problem;

vi. Description of blending, if any. If the Discharger blends, it shall describe the duration of blending events and certify whether the blending complied with all conditions for blending;

vii. Description of other bypasses, if any. If the Discharger bypasses any treatment units (other than blending), it shall describe the duration of the bypasses and effluent quality during those times; and

viii. Signature. The transmittal letter shall be signed in accordance with Attachment D, Provision V.B.

b. Compliance Evaluation Summary. Each self-monitoring report shall include a compliance evaluation summary that addresses each parameter for which the permit specifies effluent limitations, the number of samples taken during the monitoring period, and the number of samples that exceed the effluent limitations.

c. More Frequent Monitoring. If the Discharger monitors any pollutant more frequently than required by the MRP, the Discharger shall include the results of such monitoring in the calculation and reporting of the data submitted in the self-monitoring report.

d. Analysis Results

i. Tabulation. Each self-monitoring report shall include tabulations of all required analyses and observations, including parameters, dates, times, sample stations, types of samples, test results, method detection limits, method minimum levels, and method reporting levels (if applicable), signed by the laboratory director or other responsible official.

ii. Multiple Samples. Unless the MRP specifies otherwise, when determining compliance with effluent limitations (other than instantaneous effluent limitations) and more than one sample result is available, the Discharger shall compute the arithmetic mean. If the data set contains one or more results that are "Detected, but Not Quantified (DNQ) or "Not Detected" (ND), the Discharger shall instead compute the median in accordance with the following procedure:

(a) The data set shall be ranked from low to high, reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

(b) The median of the data set shall be determined. If the data set has an odd number of data points, the median is the middle value. If the data set has an even number of data points, the median is the average of the two values around the middle, unless one or both of these values is ND or DNQ, in which case the median shall be the lower of the two results (where DNQ is lower than a quantified value and ND is lower than DNQ).

iii. Duplicate Samples. The Discharger shall report the average of duplicate sample analyses when reporting for a single sample result (or the median if one or more of the duplicates is DNQ or ND [see Provision V.C.1.d.ii, above]). For bacteria indicators, the Discharger shall report the geometric mean of the duplicate analyses.

iv. Dioxin-TEQ. The Discharger shall report for each dioxin and furan congener the analytical results of effluent monitoring, including the reporting level, the method detection limit, and the measured concentration. The Discharger shall report all measured values of individual congeners, including data qualifiers. When calculating dioxin-TEQ, the Discharger shall set congener concentrations below the minimum levels (MLs) to zero. The Discharger shall calculate and report dioxin-TEQ using the

following formula, where the MLs, toxicity equivalency factors (TEFs), and bioaccumulation equivalency factors (BEFs) are as provided in Table A:

$$\text{Dioxin-TEQ} = \Sigma\ (C_x \times TEF_x \times BEF_x)$$

where: C_x = measured or estimated concentration of congener *x*
TEF_x = toxicity equivalency factor for congener *x*
BEF_x = bioaccumulation equivalency factor for congener *x*

Table A

Minimum Levels, Toxicity Equivalency Factors,
and Bioaccumulation Equivalency Factors

Dioxin or Furan Congener	Minimum Level (pg/L)	2005 Toxicity Equivalency Factor (TEF)	Bioaccumulation Equivalency Factor (BEF)
2,3,7,8-TCDD	10	1.0	1.0
1,2,3,7,8-PeCDD	50	1.0	0.9
1,2,3,4,7,8-HxCDD	50	0.1	0.3
1,2,3,6,7,8-HxCDD	50	0.1	0.1
1,2,3,7,8,9-HxCDD	50	0.1	0.1
1,2,3,4,6,7,8-HpCDD	50	0.01	0.05
OCDD	100	0.0003	0.01
2,3,7,8-TCDF	10	0.1	0.8
1,2,3,7,8-PeCDF	50	0.03	0.2
2,3,4,7,8-PeCDF	50	0.3	1.6
1,2,3,4,7,8-HxCDF	50	0.1	0.08
1,2,3,6,7,8-HxCDF	50	0.1	0.2
1,2,3,7,8,9-HxCDF	50	0.1	0.6
2,3,4,6,7,8-HxCDF	50	0.1	0.7
1,2,3,4,6,7,8-HpCDF	50	0.01	0.01
1,2,3,4,7,8,9-HpCDF	50	0.01	0.4
OCDF	100	0.0003	0.02

e. Results Not Yet Available. The Discharger shall make all reasonable efforts to obtain analytical data for required parameter sampling in a timely manner. Certain analyses may require additional time to complete analytical processes and report results. In these cases, the Discharger shall describe the circumstances in the self-monitoring report and include the data for these parameters and relevant discussions of any violations in the next self-monitoring report due after the results are available.

f. Annual Self-Monitoring Reports. By the date specified in the MRP, the Discharger shall submit an annual self-monitoring report covering the previous calendar year. The report shall contain the following:

i. Comprehensive discussion of treatment plant performance, including documentation of any blending or other bypass events, and compliance with the permit. This discussion shall include any corrective actions taken or planned, such as changes to facility equipment or operation practices that may be needed to achieve compliance,

and any other actions taken or planned that are intended to improve the performance and reliability of wastewater collection, treatment, or disposal practices;

ii. List of approved analyses, including the following:

(a) List of analyses for which the Discharger is certified;

(b) List of analyses performed for the Discharger by a separate certified laboratory (copies of reports signed by the laboratory director of that laboratory need not be submitted but shall be retained onsite); and

(c) List of "waived" analyses, as approved;

iii. Plan view drawing or map showing the Discharger's facility, flow routing, and sampling and observation station locations; and

iv. Results of facility report reviews. The Discharger shall regularly review, revise, and update, as necessary, the Operation and Maintenance Manual, Contingency Plan, Spill Prevention Plan, and Wastewater Facilities Status Report so these documents remain useful and relevant to current practices. At a minimum, reviews shall be conducted annually. The Discharger shall describe or summarize its review and evaluation procedures, recommended or planned actions, and estimated time schedule for implementing these actions. The Discharger shall complete changes to these documents to ensure that they remain up-to-date.

D. Compliance Schedules – Not supplemented

E. Twenty-Four Hour Reporting – Supplement to Attachment D, Provision V.E

1. Oil or Other Hazardous Material Spills

a. Within 24 hours of becoming aware of a spill of oil or other hazardous material not contained onsite and completely cleaned up, the Discharger shall report as follows:

i. If the spill exceeds reportable quantities for hazardous materials listed in 40 C.F.R. part 302. The Discharger shall call the California Office of Emergency Services (800-852-7550).

ii. If the spill does not exceed reportable quantities for hazardous materials listed in 40 C.F.R., part 302, the Discharger shall call the Regional Water Board (510-622-2369).

b. The Discharger shall submit a written report to the Regional Water Board within five working days following either of the above telephone notifications unless directed otherwise by Regional Water Board staff. A report submitted electronically is acceptable. The written report shall include the following:

i. Date and time of spill, and duration if known;

ii. Location of spill (street address or description of location);

iii. Nature of material spilled;

iv. Quantity of material spilled;

v. Receiving water body affected, if any;

vi. Cause of spill;

vii. Estimated size of affected area;

viii. Observed impacts to receiving waters (e.g., oil sheen, fish kill, water discoloration);

ix. Corrective actions taken to contain, minimize, or clean up the spill;

x. Future corrective actions planned to prevent recurrence, and implementation schedule; and

xi. Persons or agencies notified.

2. Unauthorized Municipal Wastewater Treatment Plant Discharges[1]

a. Two-Hour Notification. For any unauthorized discharge that enters a drainage channel or surface water, the Discharger shall, as soon as possible, but not later than two hours after becoming aware of the discharge, notify the California Office of Emergency Services (800-852-7550) and the local health officer or director of environmental health with jurisdiction over the affected water body. Notification shall include the following:

i. Incident description and cause;

ii. Location of threatened or involved waterways or storm drains;

iii. Date and time that the unauthorized discharge started;

iv. Estimated quantity and duration of the unauthorized discharge (to the extent known), and estimated amount recovered;

v. Level of treatment prior to discharge (e.g., raw wastewater, primary-treated wastewater, or undisinfected secondary-treated wastewater); and

vi. Identity of person reporting the unauthorized discharge.

[1] California Code of Regulations, Title 23, section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially-treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment, or disposal system.

b. Five-Day Written Report. Within five business days following the two-hour notification, the Discharger shall submit a written report that includes, in addition to the information listed in Provision V.E.2.a, above, the following:

i. Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;

ii. Efforts implemented to minimize public exposure to the unauthorized discharge;

iii. Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of receiving water) and extent of sampling if conducted;

iv. Corrective measures taken to minimize the impact of the unauthorized discharge;

v. Measures to be taken to minimize the potential for a similar unauthorized discharge in the future;

vi. Summary of Spill Prevention Plan or Operation and Maintenance Manual modifications to be made, if necessary, to minimize the potential for future unauthorized discharges; and

vii. Quantity and duration of the unauthorized discharge, and the amount recovered.

F. Planned Changes – Not supplemented

G. Anticipated Noncompliance – Not supplemented

H. Other Noncompliance – Not supplemented

I. Other Information – Not supplemented

VI. STANDARD PROVISION – ENFORCEMENT – Not Supplemented

VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS – Not Supplemented

VIII. DEFINITIONS – Addition to Attachment D

More definitions can be found in Attachment A of this NPDES Permit.

A. Arithmetic Calculations

1. **Geometric Mean**. The antilog of the log mean or the back-transformed mean of the logarithmically transformed variables, which is equivalent to the multiplication of the antilogarithms. The geometric mean can be calculated with either of the following equations:

Geometric Mean $= Anti\log\left(\frac{1}{N}\sum_{i=1}^{N} Log(C_i)\right)$

or

Geometric Mean $= (C_1 \times C_2 \times \ldots \times C_N)^{1/N}$

Where "N" is the number of data points for the period analyzed and "C" is the concentration for each of the "N" data points.

2. **Mass Emission Rate.** The rate of discharge expressed in mass. The mass emission rate is obtained from the following calculation for any calendar day:

$$\text{Mass emission rate (lb/day)} = \frac{8.345}{N}\sum_{i=1}^{N} Q_i C_i$$

$$\text{Mass emission rate (kg/day)} = \frac{3.785}{N}\sum_{i=1}^{N} Q_i C_i$$

In which "N" is the number of samples analyzed in any calendar day and "Q_i" and "C_i" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" grab samples that may be taken in any calendar day. If a composite sample is taken, "C_i" is the concentration measured in the composite sample and "Q_i" is the average flow rate occurring during the period over which the samples are composited. The daily concentration of a constituent measured over any calendar day shall be determined from the flow-weighted average of the same constituent in the combined waste streams as follows:

$$C_d = \text{Average daily concentration} = \frac{1}{Q_t}\sum_{i=1}^{N} Q_i C_i$$

In which "N" is the number of component waste streams and "Q" and "C" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" waste streams. "Q_t" is the total flow rate of the combined waste streams.

3. **Removal Efficiency.** The ratio of pollutants removed by the treatment facilities to pollutants entering the treatment facilities (expressed as a percentage). The Discharger shall determine removal efficiencies using monthly averages (by calendar month unless otherwise specified) of pollutant concentration of influent and effluent samples collected at about the same time and using the following equation (or its equivalent):

   Removal Efficiency (%) = 100 × [1-(Effluent Concentration/Influent Concentration)]

B. Blending – the practice of bypassing biological treatment units and recombining the bypass wastewater with biologically-treated wastewater.

C. Composite Sample – a sample composed of individual grab samples collected manually or by an automatic sampling device on the basis of time or flow as specified in the MRP. For flow-based composites, the proportion of each grab sample included in the composite sample shall be within plus or minus five percent (+/-5%) of the representative flow of the waste stream being measured at the time of grab sample collection. Alternatively, equal volume grab samples may

be individually analyzed with the flow-weighted average calculated by averaging flow-weighted ratios of each grab sample analytical result. Grab samples comprising time-based composite samples shall be collected at intervals not greater than those specified in the MRP. The quantity of each grab sample comprising a time-based composite sample shall be a set of flow proportional volumes as specified in the MRP. If a particular time-based or flow-based composite sampling protocol is not specified in the MRP, the Discharger shall determine and implement the most representative protocol.

D. Duplicate Sample – a second sample taken from the same source and at the same time as an initial sample (such samples are typically analyzed identically to measure analytical variability).

E. Grab Sample – an individual sample collected during a short period not exceeding 15 minutes. Grab samples represent only the condition that exists at the time the sample is collected.

F. Overflow – the intentional or unintentional spilling or forcing out of untreated or partially-treated waste from a transport system (e.g., through manholes, at pump stations, or at collection points) upstream of the treatment plant headworks or from any part of a treatment plant.

G. Priority Pollutants – those constituents referred to in 40 C.F.R. part 122 as promulgated in the Federal Register, Vol. 65, No. 97, Thursday, May 18, 2000, also known as the California Toxics Rule.

H. Untreated waste – raw wastewater.

Table B

List of Monitoring Parameters and Analytical Methods

CTR No.	Pollutant/Parameter	Analytical Method[2]	Minimum Levels[3] (µg/l)											
			GC	GCMS	LC	Color	FAA	GFAA	ICP	ICP MS	SPGFAA	HYD RIDE	CVAA	DCP

[2] The suggested method is the U.S. EPA Method unless otherwise specified (SM = Standard Methods). The Discharger may use another U.S. EPA-approved or recognized method if that method has a level of quantification below the applicable water quality objective. Where no method is suggested, the Discharger has the discretion to use any standard method.

[3] Minimum levels are from the *State Implementation Policy*. They are the concentration of the lowest calibration standard for that technique based on a survey of contract laboratories. Laboratory techniques are defined as follows: GC = Gas Chromatography; GCMS = Gas Chromatography/Mass Spectrometry; LC = High Pressure Liquid Chromatography; Color = Colorimetric; FAA = Flame Atomic Absorption; GFAA = Graphite Furnace Atomic Absorption; ICP = Inductively Coupled Plasma; ICPMS = Inductively Coupled Plasma/Mass Spectrometry; SPGFAA = Stabilized Platform Graphite Furnace Atomic Absorption (i.e., U.S. EPA 200.9); Hydride = Gaseous Hydride Atomic Absorption; CVAA = Cold Vapor Atomic Absorption; DCP = Direct Current Plasma.

[4] Analysis for total chromium may be substituted for analysis of chromium (III) and chromium (VI) if the concentration measured is below the lowest hexavalent chromium criterion (11 ug/l).

[5] The Discharger shall use ultra-clean sampling (U.S. EPA Method 1669) and ultra-clean analytical methods (U.S. EPA Method 1631) for mercury monitoring. The minimum level for mercury is 2 ng/l (or 0.002 ug/l).

[6] MUN = Municipal and Domestic Supply. This designation, if applicable, is in the Findings of the permit.

Attachment H: Pretreatment Program Provisions

A. The Discharger shall be responsible and liable for the performance of all Control Authority pretreatment requirements contained in 40 C.F.R. 403, including any regulatory revisions to Part 403. Where a Part 403 revision is promulgated after the effective date of the Discharger's permit and places mandatory actions upon the Discharger as Control Authority but does not specify a timetable for completion of the actions, the Discharger shall complete the required actions within six months from the issuance date of this permit or six months from the effective date of the Part 403 revisions, whichever comes later.

(If the Discharger cannot complete the required actions within the above six-month period due to the need to process local adoption of sewer use ordinance modifications or other substantial pretreatment program modifications, the Discharger shall notify the Executive Officer in writing at least 60 days prior to the six-month deadline. The written notification shall include a summary of completed required actions, an explanation for why the six month deadline cannot be met, and a proposed timeframe to complete the rest of the required actions as soon as practical but not later than within twelve months of the issuance date of this permit or twelve months of the effective date of the Part 403 revisions, whichever comes later. The Executive Officer will notify the Discharger in writing within 30 days of receiving the request if the extension is not approved.)

The United States Environmental Protection Agency (U.S. EPA), the State and/or other appropriate parties may initiate enforcement action against a nondomestic user for noncompliance with applicable standards and requirements as provided in the Clean Water Act (Act).

B. The Discharger shall enforce the requirements promulgated under Sections 307(b), 307(c), 307(d) and 402(b) of the Act with timely, appropriate and effective enforcement actions. The Discharger shall cause nondomestic users subject to Federal Categorical Standards to achieve compliance no later than the date specified in those requirements or, in the case of a new nondomestic user, upon commencement of the discharge.

C. The Discharger shall perform the pretreatment functions as required in 40 C.F.R. 403 and amendments or modifications thereto including, but not limited to:

1. Implement the necessary legal authorities to fully implement the pretreatment regulations as provided in 40 C.F.R. 403.8(f)(1);

2. Implement the programmatic functions as provided in 40 C.F.R. 403.8(f)(2);

3. Publish an annual list of nondomestic users in significant noncompliance as provided per 40 C.F.R. 403.8(f)(2)(viii);

4. Provide for the requisite funding and personnel to implement the pretreatment program as provided in 40 C.F.R. 403.8(f)(3); and

5. Enforce the national pretreatment standards for prohibited discharges and categorical standards as provided in 40 C.F.R. 403.5 and 403.6, respectively.

D. The Discharger shall submit annually a report to U.S. EPA Region IX, the State Water Board and the Regional Water Board describing its pretreatment program activities over the previous calendar year. In the event that the Discharger is not in compliance with any conditions or requirements of the Pretreatment Program, the Discharger shall also include the reasons for noncompliance and a plan and schedule for achieving compliance. The report shall contain, but is not limited to, the information specified in Appendix H-1 entitled, "Requirements for Pretreatment Annual Reports." The annual report is due each year on February 28.

E. The Discharger shall submit a pretreatment semiannual report to U.S. EPA Region IX, the State Water Board and the Regional Water Board describing the status of its significant industrial users (SIUs). The report shall contain, but is not limited to, information specified in Appendix H-2 entitled, "Requirements for Pretreatment Semiannual Reports." The semiannual report is due July 31 for the period January through June. The information for the period July through December of each year shall be included in the Annual Report identified in Appendix H-1. The Executive Officer may exempt the Discharger from the semiannual reporting requirements on a case by case basis subject to State Water Board and U.S. EPA's comment and approval.

F. The Discharger shall conduct the monitoring of its treatment plant's influent, effluent, and sludge (biosolids) as described in Appendix H-4 entitled, "Requirements for Influent, Effluent and Sludge (Biosolids) Monitoring." (The term "biosolids," as used in this Attachment, shall have the same meaning as wastewater treatment plant "sludge" and will be used from this point forward.) The Discharger shall evaluate the results of the sampling and analysis during the preparation of the semiannual and annual reports to identify any trends. Signing the certification statement used to transmit the reports shall be deemed to certify the Discharger has completed this data evaluation. A tabulation of the data shall be included in the pretreatment annual report as specified in Appendix H-4. The Executive Officer may require more or less frequent monitoring on a case by case basis.

APPENDIX H-1

REQUIREMENTS FOR PRETREATMENT ANNUAL REPORTS

The Pretreatment Annual Report is due each year on February 28 and shall contain activities conducted during the previous calendar year. The purpose of the Annual Report is to:

- Describe the status of the Discharger's pretreatment program; and
- Report on the effectiveness of the program, as determined by comparing the results of the preceding year's program implementation.

The report shall contain, at a minimum, the following information:

A. Cover Sheet

The cover sheet shall include:

1. The name(s) and National Pollutant Discharge Elimination Discharge System (NPDES) permit number(s) of the Discharger(s) that is part of the Pretreatment Program;

2. The name, address and telephone number of a pretreatment contact person;

3. The period covered in the report;

4. A statement of truthfulness; and

5. The dated signature of a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for overall operation of the Publicly Owned Treatment Works (POTW) (40 C.F.R. 403.12(m)).

B. Introduction

This section shall include:

1. Any pertinent background information related to the Discharger and/or the nondomestic user base of the area;

2. List of applicable interagency agreements used to implement the Discharger's pretreatment program (e.g., Memoranda of Understanding (MOU) with satellite sanitary sewer collection systems); and

3. A status summary of the tasks required by a Pretreatment Compliance Inspection (PCI), Pretreatment Compliance Audit (PCA), Cleanup and Abatement Order (CAO), or other pretreatment-related enforcement actions required by the Regional Water Board or the U.S. EPA. A more detailed discussion can be referenced and included in the section entitled, "Program Changes," if needed.

C. Definitions

This section shall include a list of key terms and their definitions that the Discharger uses to describe or characterize elements of its pretreatment program, or the Discharger may provide a reference to its website if the applicable definitions are available on-line.

D. Discussion of Upset, Interference and Pass Through

This section shall include a discussion of Upset, Interference or Pass Through incidents, if any, at the Discharger's treatment plant(s) that the Discharger knows of or suspects were caused by nondomestic user discharges. Each incident shall be described, at a minimum, consisting of the following information:

1. A description of what occurred;
2. A description of what was done to identify the source;
3. The name and address of the nondomestic user responsible;
4. The reason(s) why the incident occurred;
5. A description of the corrective actions taken; and
6. An examination of the local and federal discharge limits and requirements for the purposes of determining whether any additional limits or changes to existing requirements may be necessary to prevent other Upset, Interference or Pass Through incidents.

E. Influent, Effluent and Biosolids Monitoring Results

The Discharger shall evaluate the influent, effluent and biosolids monitoring results as specified in Appendix H-4 in preparation of this report. The Discharger shall retain the analytical laboratory reports with the Quality Assurance and Quality Control (QA/QC) data validation and make these reports available upon request.

This section shall include:

1. Description of the sampling procedures and an analysis of the results (see Appendix H-4 for specific requirements);
2. Tabular summary of the compounds detected (compounds measured above the detection limit for the analytical method used) for the monitoring data generated during the reporting year as specified in Appendix H-4;
3. Discussion of the investigation findings into any contributing sources of the compounds that exceed NPDES limits; and
4. Graphical representation of the influent and effluent metal monitoring data for the past five years with a discussion of any trends.

F. Inspection, Sampling and Enforcement Programs

This section shall include at a minimum the following information:

1. Inspections: Summary of the inspection program (e.g., criteria for determining the frequency of inspections and inspection procedures);

2. Sampling Events: Summary of the sampling program (e.g., criteria for determining the frequency of sampling and chain of custody procedures); and

3. Enforcement: Summary of Enforcement Response Plan (ERP) implementation including dates for adoption, last revision and submission to the Regional Water Board.

G. Updated List of Regulated SIUs

This section shall contain a list of all of the federal categories that apply to SIUs regulated by the Discharger. The specific categories shall be listed including the applicable 40 C.F.R. subpart and section, and pretreatment standards (both maximum and average limits). Local limits developed by the Discharger shall be presented in a table including the applicability of the local limits to SIUs. If local limits do not apply uniformly to SIUs, specify the applicability in the tables listing the categorical industrial users (CIUs) and non-categorical SIUs. Tables developed in Sections 7A and 7B can be used to present or reference this information.

1. CIUs - Include a table that alphabetically lists the CIUs regulated by the Discharger as of the end of the reporting period. This list shall include:

   a. Name;

   b. Address;

   c. Applicable federal category(ies);

   d. Reference to the location where the applicable Federal Categorical Standards are presented in the report;

   e. Identify all deletions and additions keyed to the list submitted in the previous annual report. All deletions shall be briefly explained (e.g., closure, name change, ownership change, reclassification, declassification); and

   f. Information, calculations and data used to determine the limits for those CIUs for which a combined waste stream formula is applied.

2. Non-categorical SIUs - Include a table that alphabetically lists the SIUs not subject to any federal categorical standards that were regulated by the Discharger as of the end of the reporting period. This list shall include:

   a. Name;

b. Address;

c. A brief description of the type of business;

d. Identify all deletions and additions keyed to the list submitted in the previous annual report. All deletions shall be briefly explained (e.g., closure, name change, ownership change, reclassification, declassification); and

e. Indicate the applicable discharge limits (e.g., different from local limits) to which the SIUs are subject and reference to the location where the applicable limits (e.g., local discharge limits) are presented in the report.

H. SIU (categorical and non-categorical) Compliance Activities

The information required in this section may be combined in the table developed in Section 7 above.

1. **Inspection and Sampling Summary:** This section shall contain a summary of all the SIU inspections and sampling activities conducted by the Discharger and sampling activities conducted by the SIU over the reporting year to gather information and data regarding SIU compliance. The summary shall include:

   a. The number of inspections and sampling events conducted for each SIU by the Discharger;

   b. The number of sampling events conducted by the SIU. Identify SIUs that are operating under an approved Total Toxic Organic Management Plan;

   c. The quarters in which the above activities were conducted; and

   d. The compliance status of each SIU, delineated by quarter, and characterized using all applicable descriptions as given below:

      (1) Consistent compliance;

      (2) Inconsistent compliance;

      (3) Significant noncompliance;

      (4) On a compliance schedule to achieve compliance (include the date final compliance is required);

      (5) Not in compliance and not on a compliance schedule; and

      (6) Compliance status unknown, and why not.

2. **Enforcement Summary:** This section shall contain a summary of SIU compliance and enforcement activities during the reporting year. The summary may be included in the summary

table developed in section 8A and shall include the names and addresses of all SIUs affected by the actions identified below. For each notice specified in enforcement action "i" through "iv," indicate whether it was for an infraction of a federal or local standard/limit or requirement.

a. Warning letters or notices of violations regarding SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

b. Administrative Orders regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

c. Civil actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

d. Criminal actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

e. Assessment of monetary penalties. Identify the amount of penalty in each case and reason for assessing the penalty;

f. Order to restrict/suspend discharge to the Discharger; and

g. Order to disconnect the discharge from entering the Discharger.

3. July-December Semiannual Data: For SIU violations/noncompliance during the semiannual reporting period from July 1 through December 31, provide the following information:

a. Name and facility address of the SIU;

b. Indicate if the SIU is subject to Federal Categorical Standards; if so, specify the category including the subpart that applies;

c. For SIUs subject to Federal Categorical Standards, indicate if the violation is of a categorical or local standard;

d. Indicate the compliance status of the SIU for the two quarters of the reporting period; and

e. For violations/noncompliance identified in the reporting period, provide:

(1) The date(s) of violation(s);

(2) The parameters and corresponding concentrations exceeding the limits and the discharge limits for these parameters; and

(3) A brief summary of the noncompliant event(s) and the steps that are being taken to achieve compliance.

I. Baseline Monitoring Report Update

This section shall provide a list of CIUs added to the pretreatment program since the last annual report. This list of new CIUs shall summarize the status of the respective Baseline Monitoring Reports (BMR). The BMR must contain the information specified in 40 C.F.R. 403.12(b). For each new CIU, the summary shall indicate when the BMR was due; when the CIU was notified by the Discharger of this requirement; when the CIU submitted the report; and/or when the report is due.

J. Pretreatment Program Changes

This section shall contain a description of any significant changes in the Pretreatment Program during the past year including, but not limited to:

1. Legal authority;
2. Local limits;
3. Monitoring/ inspection program and frequency;
4. Enforcement protocol;
5. Program's administrative structure;
6. Staffing level;
7. Resource requirements;
8. Funding mechanism;
9. If the manager of the Discharger's pretreatment program changed, a revised organizational chart shall be included; and
10. If any element(s) of the program is in the process of being modified, this intention shall also be indicated.

K. Pretreatment Program Budget

This section shall present the budget spent on the Pretreatment Program. The budget, either by the calendar or fiscal year, shall show the total expenses required to implement the pretreatment program. A brief discussion of the source(s) of funding shall be provided. In addition, the Discharger shall make available upon request specific details on its pretreatment program expense amounts such as for personnel, equipment, and chemical analyses.

L. Public Participation Summary

This section shall include a copy of the public notice as required in 40 C.F.R. 403.8(f)(2)(viii). If a notice was not published, the reason shall be stated.

M. Biosolids Storage and Disposal Practice

This section shall describe how treated biosolids are stored and ultimately disposed. If a biosolids storage area is used, it shall be described in detail including its location, containment features and biosolids handling procedures.

N. Other Pollutant Reduction Activities

This section shall include a brief description of any programs the Discharger implements to reduce pollutants from nondomestic users that are not classified as SIUs. If the Discharger submits any of this program information in an Annual Pollution Prevention Report, reference to this other report shall satisfy this reporting requirement.

O. Other Subjects

Other information related to the Pretreatment Program that does not fit into any of the above categories should be included in this section.

P. Permit Compliance System (PCS) Data Entry Form

The annual report shall include the PCS Data Entry Form. This form shall summarize the enforcement actions taken against SIUs in the past year. This form shall include the following information:

1. Discharger's name,
2. NPDES Permit number,
3. Period covered by the report,
4. Number of SIUs in significant noncompliance (SNC) that are on a pretreatment compliance schedule,
5. Number of notices of violation and administrative Orders issued against SIUs,
6. Number of civil and criminal judicial actions against SIUs,
7. Number of SIUs that have been published as a result of being in SNC, and
8. Number of SIUs from which penalties have been collected.

APPENDIX H-2

REQUIREMENTS FOR JANUARY-JUNE PRETREATMENT SEMIANNUAL REPORT

The pretreatment semiannual report is due on July 31 for pretreatment program activities conducted from January through June unless an exception has been granted by the Regional Water Board's Executive Officer (e.g., pretreatment programs without any SIUs may qualify for an exception to the pretreatment semiannual report). Pretreatment activities conducted from July through December of each year shall be included in the Pretreatment Annual Report as specified in Appendix H-1. The pretreatment semiannual report shall contain, at a minimum the following information:

A. Influent, Effluent and Biosolids Monitoring

The influent, effluent and biosolids monitoring results shall be evaluated in preparation of this report. The Discharger shall retain analytical laboratory reports with the QA/QC data validation and make these reports available upon request. The Discharger shall also make available upon request a description of its influent, effluent and biosolids sampling procedures. Violations of any parameter that exceed NPDES limits shall be identified and reported. The contributing source(s) of the parameters that exceed NPDES limits shall be investigated and discussed.

B. Significant Industrial User Compliance Status

This section shall contain a list of all SIUs that were not in consistent compliance with all pretreatment standards/limits or requirements for the reporting period. For the reported SIUs, the compliance status for the previous semiannual reporting period shall be included. Once the SIU has determined to be out of compliance, the SIU shall be included in subsequent reports until consistent compliance has been achieved. A brief description detailing the actions that the SIU undertook to come back into compliance shall be provided.

For each SIU on the list, the following information shall be provided:

1. Name and facility address of the SIU;

2. Indicate if the SIU is subject to Federal Categorical Standards; if so, specify the category including the subpart that applies;

3. For SIUs subject to Federal Categorical Standards, indicate if the violation is of a categorical or local standard;

4. Indicate the compliance status of the SIU for the two quarters of the reporting period; and

5. For violations/noncompliance identified in the reporting period, provide:

    a. The date(s) of violation(s);

    b. The parameters and corresponding concentrations exceeding the limits and the discharge limits for these parameters; and

c. A brief summary of the noncompliant event(s) and the steps that are being taken to achieve compliance.

C. Discharger's Compliance with Pretreatment Program Requirements

This section shall contain a discussion of the Discharger's compliance status with the Pretreatment Program Requirements as indicated in the latest Pretreatment Compliance Audit (PCA) Report or Pretreatment Compliance Inspection (PCI) Report. It shall contain a summary of the following information:

1. Date of latest PCA or PCI report;

2. Date of the Discharger's response;

3. List of unresolved issues; and

4. Plan(s) and schedule for resolving the remaining issues.

APPENDIX H-3

SIGNATURE REQUIREMENTS FOR PRETREATMENT ANNUAL AND SEMIANNUAL REPORTS

The pretreatment annual and semiannual reports shall be signed by a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for the overall operation of the Discharger [POTW - 40 C.F.R. 403.12(m)]. Signed copies of the reports shall be submitted to the State Water Board and the Regional Water Board through the electronic self-monitoring report (eSMR) module of the California Integrated Water Quality System (CIWQS). Signed copies of the reports shall also be submitted electronically to U.S. EPA at R9Pretreatment@epa.gov or as instructed otherwise.

APPENDIX H-4

REQUIREMENTS FOR INFLUENT, EFFLUENT AND BIOSOLIDS MONITORING

The Discharger shall conduct sampling of its treatment plant's influent, effluent and biosolids at the frequency shown in **the pretreatment requirements table** of the Monitoring and Reporting Program (MRP, Attachment E). When sampling periods coincide, one set of test results, reported separately, may be used for those parameters that are required to be monitored by both the influent and effluent monitoring requirements of the MRP and the Pretreatment Program. The Pretreatment Program monitoring reports as required in Appendices H-1 and H-2 shall be transmitted to the Pretreatment Program Coordinator.

A. Reduction of Monitoring Frequency

The minimum frequency of Pretreatment Program influent, effluent, and biosolids monitoring shall be dependent on the number of SIUs identified in the Discharger's Pretreatment Program as indicated in Table H-1.

Table H-1: Minimum Frequency of Pretreatment Program Monitoring	
Number of SIUs	Minimum Frequency
< 5	Once every five years
> 5 and < 50	Once every year
> 50	Twice per year

If the Discharger's required monitoring frequency is greater than the minimum specified in Table H-1, the Discharger may request a reduced monitoring frequency for that constituent(s) as part of its application for permit reissuance if it meets the following criteria:

The monitoring data for the constituent(s) consistently show non-detect (ND) levels for the effluent monitoring and very low (i.e., near ND) levels for influent and biosolids monitoring for a minimum of eight previous years' worth of data.

The Discharger's request shall include tabular summaries of the data and a description of the trends in the industrial, commercial, and residential customers in the Discharger's service area that demonstrate control over the sources of the constituent(s). The Regional Water Board may grant a reduced monitoring frequency in the reissued permit after considering the information provided by the Discharger and any other relevant information.

B. Influent and Effluent Monitoring

The Discharger shall monitor for the parameters using the required sampling and test methods listed in **the pretreatment table** of the MRP. Any test method substitutions must have received prior written Executive Officer approval. Influent and effluent sampling locations shall be the same as those sites specified in the MRP.

The influent and effluent samples should be taken at staggered times to account for treatment plant detention time. Appropriately staggered sampling is considered consistent with the requirement for collection of effluent samples coincident with influent samples in Section III.A.3.a(2) of Attachment D. All samples must be representative of daily operations. Sampling and analysis shall be performed in accordance with the techniques prescribed in 40 C.F.R. 136 and amendments thereto. For effluent monitoring, the reporting limits for the individual parameters shall be at or below the minimum levels (MLs) as stated in the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (2000) [also known as the State Implementation Policy (SIP)]; any revisions to the MLs shall be adhered to. If a parameter does not have a stated ML, then the Discharger shall conduct the analysis using the lowest commercially available and reasonably achievable detection levels.

The following report elements should be used to submit the influent and effluent monitoring results. A similarly structured format may be used but will be subject to Regional Water Board approval. The monitoring reports shall be submitted with the Pretreatment Annual Report identified in Appendix H-1.

1. Sampling Procedures, Sample Dechlorination, Sample Compositing, and Data Validation (applicable quality assurance/quality control) shall be performed in accordance with the techniques prescribed in 40 C.F.R. 136 and amendments thereto. The Discharger shall make available upon request its sampling procedures including methods of dechlorination, compositing, and data validation.

2. A tabulation of the test results for the detected parameters shall be provided.

3. Discussion of Results – The report shall include a complete discussion of the test results for the detected parameters. If any pollutants are detected in sufficient concentration to upset, interfere or pass through plant operations, the type of pollutant(s) and potential source(s) shall be noted, along with a plan of action to control, eliminate, and/or monitor the pollutant(s). Any apparent generation and/or destruction of pollutants attributable to chlorination/dechlorination sampling and analysis practices shall be noted.

C. Biosolids Monitoring

Biosolids should be sampled in a manner that will be representative of the biosolids generated from the influent and effluent monitoring events except as noted in (3. below. The same parameters required for influent and effluent analysis shall be included in the biosolids analysis. The biosolids analyzed shall be a composite sample of the biosolids for final disposal consisting of:

1. Biosolids lagoons – 20 grab samples collected at representative equidistant intervals (grid pattern) and composited as a single grab, or

2. Dried stockpile – 20 grab samples collected at various representative locations and depths and composited as a single grab, or

3. Dewatered biosolids - daily composite of 4 representative grab samples each day for 5 days taken at equal intervals during the daily operating shift taken from a) the dewatering units or b) each truckload, and shall be combined into a single 5- day composite.

The U.S. EPA manual, POTW Sludge Sampling and Analysis Guidance Document, August 1989, containing detailed sampling protocols specific to biosolids is recommended as a guidance for sampling procedures. The U.S. EPA manual Analytical Methods of the National Sewage Sludge Survey, September 1990, containing detailed analytical protocols specific to biosolids, is recommended as a guidance for analytical methods.

In determining if the biosolids are a hazardous waste, the Discharger shall adhere to Article 2, "Criteria for Identifying the Characteristics of Hazardous Waste," and Article 3, "Characteristics of Hazardous Waste," of Title 22, California Code of Regulations, sections 66261.10 to 66261.24 and all amendments thereto.

The following report elements should be used to submit the biosolids monitoring results. A similarly structured form may be used but will be subject to Regional Water Board approval. The results shall be submitted with the Pretreatment Annual Report identified in Appendix H-1.

- Sampling Procedures and Data Validation (applicable quality assurance/quality control) shall be performed in accordance with the techniques prescribed in 40 C.F.R. 136 and amendments thereto. The Discharger shall make available upon request its biosolids sampling procedures and data validation methods.

- Test Results – Tabulate the test results for the detected parameters and include the percent solids.

- Discussion of Results – Include a complete discussion of test results for the detected parameters. If the detected pollutant(s) is reasonably deemed to have an adverse effect on biosolids disposal, a plan of action to control, eliminate, and/or monitor the pollutant(s) and the known or potential source(s) shall be included. Any apparent generation and/or destruction of pollutants attributable to chlorination/dechlorination sampling and analysis practices shall be noted.

The Discharger shall also provide a summary table presenting any influent, effluent or biosolids monitoring data for non-priority pollutants that the Discharger believes may be causing or contributing to interference, pass through or adversely impacting biosolids quality.

EXHIBIT 6

CALIFORNIA Water Boards

EDMUND G. BROWN JR. GOVERNOR

MATTHEW RODRIQUEZ SECRETARY FOR ENVIRONMENTAL PROTECTION

San Francisco Bay Regional Water Quality Control Board

ORDER No. R2-2013-0029
NPDES No. CA0037664

The following discharger is subject to waste discharge requirements (WDRs) set forth in this Order.

Table 1. Discharger Information

Discharger	City and County of San Francisco
Facility Name	Southeast Water Pollution Control Plant, North Point Wet Weather Facility, Bayside Wet Weather Facilities, and Wastewater Collection System
Facility Address	San Francisco Public Utilities Commission / Wastewater Enterprise 750 Phelps Street San Francisco, CA 94124
CIWQS Place Number	256499

Table 2. Discharge Locations

Discharge Point	Effluent Description	Discharge Point Latitude (North)	Discharge Point Longitude (West)	Receiving Water
Treatment Plant Discharge Points				
001 (Pier 80 Outfall)	Secondary-treated effluent (dry weather); Primary-treated and secondary-treated effluent (wet weathter)	37.749444	-122.372778	Lower San Francisco Bay
002 (Quint Street Outfall)	Secondary-treated effluent (wet weathter)	37.747222	-122.386944	Islais Creek
003 and 004 (Pier 33 Outfall)	Primary-treated effluent (wet weathter)	37.806944	-122.403056	Central San Francisco Bay
005 and 006 (Pier 35 Outfall)	Primary-treated effluent (wet weathter)	37.810000	-122.405556	Central San Francisco Bay
Combined Sewer Discharge Points				
009 (Baker Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.808056	-122.446667	Marina Beach North Shore Drainage Basin
010 (Pierce Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.806944	-122.440000	Marina Beach North Shore Drainage Basin
011 (Laguna Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.811667	-122.43189	Yacht Harbor #2 North Shore Drainage Basin

Discharge Point	Effluent Description	Discharge Point Latitude (North)	Discharge Point Longitude (West)	Receiving Water
013 (Beach Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.808333	-122.406667	Pier 39 North Shore Drainage Basin
015 (Sansome Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.806667	-122.403056	Pier 31 North Shore Drainage Basin
017 (Jackson Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.798333	-122.39472	Pier 3 North Shore Drainage Basin
018 (Howard Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.793056	-122.390000	Pier 14 Central Drainage Basin
019 (Brannan Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.785278	-122.373333	Pier 32 Central Drainage Basin
022 (Third Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.777222	-122.389444	Mission Creek Central Drainage Basin
023 (Fourth Street North Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.775556	-122.391389	Mission Creek Central Drainage Basin
024 (Fifth Street North Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.773889	-122.393889	Mission Creek Central Drainage Basin
025 (Sixth Street North Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.771944	-122.396111	Mission Creek Central Drainage Basin
026 (Division Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.770278	-122.397500	Mission Creek Central Drainage Basin
027 (Sixth Street South Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.771389	-122.395000	Mission Creek Central Drainage Basin
028 (Fourth Street South Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.775000	-122.391111	Mission Creek Central Drainage Basin
029 (Mariposa Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37764722	-122.385278	Central Basin Central Drainage Basin
030 (20th Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.761111	-122.380000	Central Basin Central Drainage Basin
030A (22nd Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.757778	-122.380278	Central Basin Central Drainage Basin
031 (Third Street North	Equivalent-to-primary-treated effluent (wet weathter)	37.747778	-122.386111	Islais Creek Central Drainage Basin

Discharge Point	Effluent Description	Discharge Point Latitude (North)	Discharge Point Longitude (West)	Receiving Water
031A (Islais Creek North Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.747778	-122.387500	Islais Creek Central Drainage Basin
032 (Marin Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.748611	-122.390833	Islais Creek Central Drainage Basin
033 (Selby Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.747778	-122.390833	Islais Creek Central Drainage Basin
035 Third Street South Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.747222	-122.386111	Islais Creek Central Drainage Basin
037 (Evans Avenue Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.735833	-122.373889	India Basin Southeast Drainage Basin
038 (Hudson Avenue Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.733333	-122.373839	India Basin Southeast Drainage Basin
040 (Griffith Street South Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.723056	-122.382222	Yosemite Creek Southeast Drainage Basin
041 (Yosemite Avenue Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.723889	-122.385556	Yosemite Creek Southeast Drainage Basin
042 (Fitch Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.722222	-122.381944	South Basin Southeast Drainage Basin
043 (Sunnydale Avenue Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.747222	-122.386944	Candlestick Cove Southeast Drainage Basin

Table 3. Administrative Information

This Order was adopted on:	August 14, 2013
This Order shall become effective on:	October 1, 2013
This Order shall expire on:	September 30, 2018
The Discharger shall file a Report of Waste Discharge as an application for reissuance of WDRs in accordance with California Code of Regulations, title 23, and an application for reissuance of a National Pollutant Discharge Elimination System (NPDES) permit no later than:	March 30, 2018
The U.S. Environmental Protection Agency (U.S. EPA) and the California Regional Water Quality Control Board, San Francisco Bay Region, have classified this discharge as follows:	Major

I, Bruce H. Wolfe, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of the Order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on the date indicated above.

I. FACILITY INFORMATION

Information describing the Southeast Water Pollution Control Plant (Southeast Plant), North Point Wet Weather Facility (North Point Facility), Bayside Wet Weather Facilities, and Wastewater Collection System (collectively, the Facility) is summarized in Table 1 and in Fact Sheet (Attachment F) sections I and II.

II. FINDINGS

The California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board), finds:

A. Legal Authorities. This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260). This Order is also issued pursuant to federal Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA, and Water Code chapter 5.5, division 7 (commencing with § 13370). It shall serve as an NPDES permit for point source discharges from the Facility to surface waters.

B. Background and Rationale for Requirements. The Regional Water Board developed the requirements in this Order based on information the Discharger submitted as part of its application, information obtained through monitoring and reporting programs, and other available information. The Fact Sheet (Attachment F) contains background information and rationale for the requirements in this Order and is hereby incorporated into and constitutes findings for this Order. Attachments A through E, G, and H are also incorporated into this Order.

C. Provisions and Requirements Implementing State Law. No provisions and requirements in this Order are included to implement State law only.

D. Notification of Interested Parties. The Regional Water Board notified the Discharger and interested agencies and persons of its intent to prescribe these WDRs and provided an opportunity to submit written comments and recommendations. The Fact Sheet provides details regarding the notification.

E. Consideration of Public Comment. The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. The Fact Sheet provides details regarding the public hearing.

THEREFORE, IT IS HEREBY ORDERED that Order No. R2-2008-0007 (previous order) is rescinded upon the effective date of this Order except for enforcement purposes, and, in order to meet the provisions of Water Code division 7 (commencing with § 13000) and regulations adopted thereunder, and the provisions of the CWA and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order. This action in no way prevents the Regional Water Board from taking enforcement action for past violations of the previous order.

III. DISCHARGE PROHIBITIONS

A. Discharge of treated wastewater at a location or in a manner different from that described in this Order is prohibited.

B. Discharge at Discharge Point No. 001 is prohibited when treated wastewater does not receive a dilution of at least 231:1, as modeled. Compliance shall be achieved by proper operation and maintenance of the discharge outfall to ensure that it (or its replacement, in whole or part) is in good working order and is consistent with or can achieve better mixing than that described in Fact Sheet section IV.C.4.a. The Discharger shall address measures taken to ensure this in its application for permit reissuance.

C. The bypass of untreated or partially-treated wastewater to waters of the United States is prohibited, except during wet weather (as defined in Attachment A) and as provided for in the conditions stated in Attachment D section I.G.

D. Except during wet weather, discharges from Discharge Point Nos. 002 through 043 are prohibited.

E. Average dry weather effluent flow in excess of 85.4 MGD is prohibited at Discharge Point No. 001. Average dry weather effluent flow shall be determined from three consecutive dry weather months each year, with compliance measured at Monitoring Location EFF-001A as described in the Monitoring and Reporting Program (MRP).

F. Any sanitary or combined sewer discharge of untreated or partially-treated wastewater to waters of the United States not expressely authorized by this Order is prohibited.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Effluent Limitations—Dry Weather

1. During dry weather, the Discharger shall comply with the following effluent limitations at Discharge Point No. 001, with compliance measured at Monitoring Location EFF-001A as described in the MRP.

Table 4. Effluent Limitations—Dry Weather

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Biochemical Oxygen Demand, 5-day @ 20°C (BOD_5)	mg/L	30	45	---	---	---
Total Suspended Solids (TSS)	mg/L	30	45	---	---	---
Oil and Grease	mg/L	10	---	20	---	---
pH [1]	s.u.	---	---	---	6.0	9.0
Total Residual Chlorine	mg/L	---	---	---	---	0.0 [2]
Copper, Total Recoverable	µg/L	53	---	76	---	---
Cyanide, Total	µg/L	20	---	43	---	---
Dioxin-TEQ	µg/L	1.4×10^{-8}	---	2.8×10^{-8}	---	---
1,2-Diphenylhydrazine	µg/L	5.4	---	11	---	---

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Total Ammonia, as N	mg/L	190	---	290	---	---

Unit Abbreviations:

mg/L = milligrams per liter
µg/L = micrograms per liter
s.u. = standard units
% = percent

Footnotes:

[1] If the Discharger monitors pH continuously, pursuant to 40 C.F.R. section 401.17 the Discharger shall be in compliance with this pH limitation provided that both of the following conditions are satisfied: (i) the total time during which the pH is outside the required range shall not exceed 7 hours and 26 minutes in any calendar month; and (ii) no individual excursion from the required pH range shall exceed 60 minutes.

[2] Effluent residual chlorine concentrations shall be monitored continuously or, at a minimum, every hour. The Discharger shall report for each day the maximum residual chlorine concentration observed following dechlorination using all values measured during that day. However, if monitoring continuously, for the purpose of mandatory minimum penalties required by Water Code section 13385(i), compliance shall be based only on discrete readings from the continuous monitoring every hour on the hour. The Discharger shall retain continuous monitoring readings for at least three years. The Regional Water Board reserves the right to use all continuous monitoring data for discretionary enforcement.

The Discharger may elect to use a continuous on-line monitoring system for measuring or determining that residual dechlorinating agent is present. This monitoring system may be used to prove that anomalous residual chlorine exceedances measured by on-line chlorine analyzers are false positives and are not violations of this total residual chlorine limit because it is chemically improbable to have chlorine present in the presence of sodium bisulfite.

2. **Percent Removal.** During dry weather, the average monthly percent removal of biochemical oxygen demand (BOD_5) and total suspended solids (TSS) at Discharge Point No. 001 shall not be less than 85 percent (i.e., in each calendar month, the arithmetic mean of BOD_5 and TSS, by concentration, for effluent samples collected at Monitoring Location EFF-001A as described in the MRP shall not exceed 15 percent of the arithmetic mean of the BOD_5 and TSS, by concentration, for influent samples collected at Monitoring Location INF-001 as described in the MRP at approximately the same times during the same period).

3. **Bacteria.** Dry weather discharges at Discharge Point No. 001, with compliance measured at Monitoring Location EFF-001A as described in the MRP, shall meet the following limitations:

   a. **Enterococcus.** The geometric mean enterococcus bacteria concentration of all samples in a calendar month shall not exceed 35 most probable number per 100 milliliters (MPN/100 mL).

   b. **Fecal Coliform.** The median fecal coliform density of all samples in any calendar month shall not exceed 500 MPN/100 mL, and no more than 10 percent of the samples in any calendar month shall contain a fecal coliform density equal to or greater than 1,100 MPN/100 mL.

4. **Whole Effluent Acute Toxicity.** During dry weather, discharges at Discharge Point No. 001 shall comply with the following limitations, with compliance measured at Monitoring Location EFF-001A as described in the MRP:

a. An 11-sample median value of not less than 90 percent survival; and

b. An 11-sample 90th percentile value of not less than 70 percent survival.

These acute toxicity limitations are defined as follows:

- **11-sample median.** A bioassay test showing survival of less than 90 percent represents a violation of this effluent limit if five or more of the past ten or fewer bioassay tests also show less than 90 percent survival.

- **11-sample 90th percentile.** A bioassay test showing survival of less than 70 percent represents a violation of this effluent limit if one or more of the past ten or fewer bioassay tests also show less than 70 percent survival.

Bioassays shall be performed using the most up-to-date U.S. EPA protocols and species as specified in the MRP. If these protocols prove unworkable, the Executive Officer and the Environmental Laboratory Accreditation Program may grant exceptions in writing upon the Discharger's request with justification.

If the Discharger can demonstrate that toxicity exceeding the levels cited above is caused by ammonia and that the ammonia in the discharge complies with the ammonia effluent limits in Section IV.A.1 of this Order, then such toxicity does not constitute a violation of this effluent limitation.

5. **Whole Effluent Chronic Toxicity.** During dry weather, discharges at Discharge Point No. 001, with compliance measured at Monitoring Location EFF-001A as described in the MRP, shall not contain chronic toxicity at a level that would cause or contribute to toxicity in the receiving water. Chronic toxicity is a detrimental biological effect on growth rate, reproduction, fertilization success, larval development, or any other relevant measure of the health of an organism population or community. Compliance with this limit shall be determined by analysis of indicator organisms and toxicity tests as described in the MRP.

B. Effluent Limitations—Wet Weather

During wet weather, the Discharger shall comply with the following effluent limitations at Discharge Point Nos. 001 through 006, with compliance measured at Monitoring Locations EFF-001B, EFF-002, and EFF-003 as described in the MRP. Provision VI.C.5 of this Order imposes additional technology-based and water quality-based wet weather requirements.

Table 5. Effluent Limitations—Wet Weather

		Effluent Limitations	
Parameter	**Units**	**Monthly Geometric Mean**	**Instantaneous Maximum**
Total Residual Chlorine	mg/L	---	0.0 [1]
Enterococcus	MPN/100 mL	35 [2]	---

Unit Abbreviation:

mg/L = milligrams per liter

Footnote:

[1] Effluent residual chlorine concentrations shall be monitored continuously or, at a minimum, every hour. The Discharger shall report for each day the maximum residual chlorine concentration observed following dechlorination using all values measured during that day. However, if monitoring continuously, for the purpose of mandatory minimum penalties required by Water Code section 13385(i),

compliance shall be based only on discrete readings from the continuous monitoring every hour on the hour. The Discharger shall retain continuous monitoring readings for at least three years. The Regional Water Board reserves the right to use all continuous monitoring data for discretionary enforcement.

The Discharger may elect to use a continuous on-line monitoring system for measuring or determining that residual dechlorinating agent is present. This monitoring system may be used to prove that anomalous residual chlorine exceedances measured by on-line chlorine analyzers are false positives and are not violations of this total residual chlorine limit because it is chemically improbable to have chlorine present in the presence of sodium bisulfite.

[2] Data from both wet and dry weather shall be included when calculating the geometric mean for compliance with this monthly wet weather limitation. For days with discharge but no sampling, the enterococcus densities shall be assumed to be the same as the densities of the most recent discharge samples. For days with no discharge, enterococcus densities shall be assumed to be 1 MPN/100 mL for calculational purposes.

V. RECEIVING WATER LIMITATIONS

A. The discharge shall not cause the following conditions to exist in receiving waters at any place outside the near-field mixing zone (i.e., where mixing is not controlled by effluent discharge momentum and buoyancy):

1. Floating, suspended, or deposited macroscopic particulate matter or foams;

2. Bottom deposits or aquatic growths to the extent that such deposits or growths cause nuisance or adversely affect beneficial uses;

3. Alteration of temperature, turbidity, or apparent color beyond present natural background levels;

4. Visible, floating, suspended, or deposited oil or other products of petroleum origin; or

5. Toxic or other deleterious substances in concentrations or quantities that cause deleterious effects on wildlife, waterfowl, or other aquatic biota, or render any of these unfit for human consumption, either at levels created in the receiving waters or as a result of biological concentration.

B. The discharge shall not cause the following limits to be exceeded in receiving waters at any place within one foot of the water surface outside the near-field mixing zone (i.e., where mixing is not controlled by effluent discharge momentum and buoyancy):

1. Dissolved Oxygen — 5.0 mg/L, minimum

The median dissolved oxygen concentration for any three consecutive months shall not be less than 80% of the dissolved oxygen content at saturation. When natural factors cause concentrations less than that specified above, the discharge shall not cause further reduction in ambient dissolved oxygen concentrations.

2. Dissolved Sulfide — Natural background levels

3. pH — The pH shall not be depressed below 6.5 or raised above 8.5. The discharge shall not cause changes greater than 0.5 pH units in normal ambient pH levels.

4. Nutrients — Waters shall not contain biostimulatory substances in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses.

C. The discharge shall not cause a violation of any water quality standard for receiving waters adopted by the Regional Water Board or State Water Board as required by the CWA and regulations adopted thereunder (including the *Combined Sewer Overflow (CSO) Control Policy*) outside near-field mixing zones (i.e., where mixing is not controlled by effluent discharge momentum and buoyancy). If more stringent water quality standards are promulgated or approved pursuant to CWA section 303, or amendments thereto, the Regional Water Board may revise or modify this Order in accordance with the more stringent standards.

VI. PROVISIONS

A. Standard Provisions

1. The Discharger shall comply with all "Standard Provisions" in Attachment D.

2. The Discharger shall comply with all applicable provisions of the "Regional Standard Provisions, and Monitoring and Reporting Requirements for NPDES Wastewater Discharge Permits" (Attachment G). Attachment G provisions I.J (Storm Water) and III.A.3.c (Storm Water Monitoring) do not apply.

B. Monitoring and Reporting

The Discharger shall comply with the MRP (Attachment E), and future revisions thereto, and applicable sampling and reporting requirements in Attachments D and G.

C. Special Provisions

1. Reopener Provisions

The Regional Water Board may modify or reopen this Order prior to its expiration date in any of the following circumstances as allowed by law:

a. If present or future investigations demonstrate that the discharges governed by this Order have or will have a reasonable potential to cause or contribute to, or will cease to have, adverse impacts on water quality or beneficial uses of the receiving waters.

b. If new or revised water quality objectives or total maximum daily loads (TMDLs) come into effect for San Francisco Bay and contiguous water bodies (whether statewide, regional, or site-specific). In such cases, effluent limitations in this Order may be modified as necessary to reflect the updated water quality objectives and wasteload allocations in the TMDLs. Adoption of the effluent limitations in this Order is not intended to restrict in any way future modifications based on legally-adopted water quality objectives or TMDLs, or as otherwise permitted under federal regulations governing NPDES permit modifications.

c. If translator, dilution, or other water quality studies provide a basis for determining that a permit condition should be modified.

d. If State Water Board precedential decisions, new policies, new laws, or new regulations are adopted.

e. If an administrative or judicial decision on a separate NPDES permit or waste discharge requirements addresses requirements similar to this discharge.

f. Or as otherwise authorized by law.

The Discharger may request a permit modification based on any of the circumstances above. With any such request, the Discharger shall include antidegradation and anti-backsliding analyses.

With the consent of the Discharger, the Executive Officer may make minor modifications to this Order for the purposes set forth in 40 C.F.R. section 122.63.

2. Effluent Characterization Study and Report

a. Study Elements. The Discharger shall continue to characterize and evaluate the dry weather discharge from the following discharge point to verify that the "no" or "cannot determine" reasonable potential analysis conclusions of this Order remain valid and to inform the next permit reissuance. The Discharger shall collect representative samples at the monitoring stations set forth below, as defined in the MRP, at no less than the frequency specified below:

Discharge Point	Monitoring Station	Minimum Frequency
001	EFF-001A	Once per calendar year

The samples shall be analyzed for the priority pollutants listed in Attachment G, Table C, except for those priority pollutants with effluent limitations where the MRP already requires more frequent monitoring. Compliance with this requirement shall be achieved in accordance with the specifications of Attachment G, sections III.A.1 and III.A.2.

The Discharger shall evaluate on an annual basis if concentrations of any of these priority pollutants significantly increase over past performance. The Discharger shall investigate the cause of any such increase. The investigation may include, but need not be limited to, an increase in monitoring frequency, monitoring of internal process streams, and monitoring of influent sources. The Discharger shall establish remedial measures addressing any increase resulting in reasonable potential to cause or contribute to an exceedance of applicable water quality objectives during dry weather. This requirement may be satisfied through identification of the constituent as a "pollutant of concern" in the Discharger's Pollutant Minimization Program, described in Provision VI.C.3.

b. Reporting Requirements

i. Routine Reporting. The Discharger shall, within 30 days of receipt of analytical results, report the following in the transmittal letter for the appropriate self-monitoring report:

(a) Indication that a sample for this characterization study was collected; and

(b) Identity of priority pollutants detected at or above applicable water quality criteria (see Fact Sheet Table F-9 for the criteria), and the detected concentrations of those pollutants.

ii. Annual Reporting. The Discharger shall summarize the annual data evaluation and source investigation in the annual self-monitoring report.

iii. Final Report. The Discharger shall submit a final report that presents all these data with the application for permit reissuance.

3. Pollutant Minimization Program

a. The Discharger shall continue to improve its existing Pollutant Minimization Program to promote minimization of pollutant loadings to the treatment plant and therefore to the receiving waters.

b. The Discharger shall submit an annual report no later than February 28 each year. Each annual report shall include at least the following information:

i. Brief description of treatment plant. The description shall include the service area and treatment plant processes.

ii. Discussion of current pollutants of concern. Periodically, the Discharger shall analyze its circumstances to determine which pollutants are currently a problem and which pollutants may be potential future problems. This discussion shall include the reasons for choosing the pollutants.

iii. Identification of sources for pollutants of concern. This discussion shall include how the Discharger intends to estimate and identify pollutant sources. The Discharger shall include sources or potential sources not directly within the ability or authority of the Discharger to control, such as pollutants in the potable water supply and air deposition.

iv. Identification of tasks to reduce the sources of pollutants of concern. This discussion shall identify and prioritize tasks to address the Discharger's pollutants of concern. The Discharger may implement the tasks by itself or participate in group, regional, or national tasks that address its pollutants of concern. The Discharger is strongly encouraged to participate in group, regional, or national tasks that address its pollutants of concern whenever it is efficient and appropriate to do so. An implementation timeline shall be included for each task.

v. Outreach to employees. The Discharger shall inform employees about the pollutants of concern, potential sources, and how they might be able to help reduce the discharge of these pollutants of concern into the Facility. The Discharger may provide a forum for employees to provide input.

vi. Continuation of Public Outreach Program. The Discharger shall prepare a pollution prevention public outreach program for its service area. Outreach may

include participation in existing community events, such as county fairs; initiating new community events, such as displays and contests during Pollution Prevention Week; conducting school outreach programs; conducting plant tours; and providing public information in newspaper articles or advertisements, radio or television stories or spots, newsletters, utility bill inserts, or web sites. Information shall be specific to target audiences. The Discharger shall coordinate with other agencies as appropriate.

vii. **Discussion of criteria used to measure Pollutant Minimization Program and task effectiveness.** The Discharger shall establish criteria to evaluate the effectiveness of its Pollutant Minimization Program. This discussion shall idenify the specific criteria used to measure the effectiveness of each task in Provisions VI.C.3.b.iii, iv, v, and vi.

viii. **Documentation of efforts and progress.** This discussion shall detail all of the Discharger's Pollutant Minimization Program activities during the reporting year.

ix. **Evaluation of Pollutant Minimization Program and task effectiveness.** This Discharger shall use the criteria established in Provision VI.C.3.b.vii to evaluate the program and task effectiveness.

x. **Identification of specific tasks and timelines for future efforts.** Based on the evaluation, the Discharger shall explain how it intends to continue or change its tasks to more effectively reduce the amount of pollutants flowing to the Facility, and subsequently in its effluent.

c. The Discharger shall develop and conduct a Pollutant Minimization Program as further described below when there is evidence that a priority pollutant is present in the effluent above an effluent limitation (e.g., sample results reported as detected but not quantified [DNQ] when the effluent limitation is less than the method detection limit [MDL], sample results from analytical methods more sensitive than those methods required by this Order, presence of whole effluent toxicity, health advisories for fish consumption, or results of benthic or aquatic organism tissue sampling) and either:

i. A sample result is reported as DNQ and the effluent limitation is less than the Reporting Level (RL); or

ii. A sample result is reported as not detected (ND) and the effluent limitation is less than the MDL using definitions in Attachment A and reporting protocols described in the MRP.

d. If triggered by the reasons set forth in Provision VI.C.3.c, above, the Discharger's Pollutant Minimization Program shall include, but not be limited to, the following actions and submittals:

i. Annual review and semi-annual monitoring of potential sources of the reportable priority pollutants, which may include fish tissue monitoring and other bio-uptake sampling, or alternative measures when source monitoring is unlikely to produce useful analytical data;

ii. Quarterly monitoring for the reportable priority pollutants in the influent to the Facility. The Executive Officer may approve alternative measures when influent monitoring is unlikely to produce useful analytical data;

iii. Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable priority pollutants in the effluent at or below the effluent limitation;

iv. Implementation of appropriate cost-effective control measures for the reportable priority pollutants, consistent with the control strategy; and

v. Inclusion of the following specific items within the annual report required by Provision VI.C.3.b above:

(a) All Pollutant Minimization Program monitoring results for the previous year;
(b) List of potential sources of the reportable priority pollutants;
(c) Summary of all actions undertaken pursuant to the control strategy; and
(d) Description of actions to be taken in the following year.

4. Special Provisions for Municipal Facilities

a. Pretreatment Program. The Discharger shall implement and enforce its approved pretreatment program in accordance with federal pretreatment regulations (40 C.F.R. part 403); pretreatment standards promulgated under CWA sections 307(b), 307(c), and 307(d); pretreatment requirements specified under 40 C.F.R. section 122.44(j); and the requirements in Attachment H, "Pretreatment Requirements." The Discharger's responsibilities include, but are not limited to, the following:

i. Enforcement of the National Pretreatment Standards of 40 C.F.R. sections 403.5 and 403.6;

ii. Implementation of its pretreatment program in accordance with legal authorities, policies, procedures, and financial provisions described in the National Pretreatment Program (40 C.F.R. part 403).

iii. Submission of reports to the State Water Board and the Regional Water Board as described in Attachment H.

iv. Evaluation of the need to revise local limits under 40 C.F.R. section 403.5(c)(1) and, within 180 days following the effective date of this Order, submission of a report describing the changes, with a plan and schedule for implementation. To ensure no significant increase in copper discharges, and thus compliance with antidegradation requirements, the Discharger shall not consider eliminating or relaxing local limits for copper.

b. Sludge and Biosolids Management

i. All sludge and biosolids shall be disposed of, managed, or used in a municipal solid waste landfill; through land application; as a Class A compost; through a waste-to-

energy facility or another recognized and approved technology; in a sludge-only landfill; or in a sewage sludge incinerator in accordance with 40 C.F.R. part 503.

ii. Sludge and biosolids treatment, storage, and disposal, or use, shall not create a nuisance, such as objectionable odors or flies, or result in groundwater contamination.

iii. The sludge and biosolids treatment and storage site shall have facilities adequate to divert surface runoff from adjacent areas, to protect site boundaries from erosion and rising sea levels, and to prevent any conditions that would cause drainage from the materials in the storage site. Adequate protection is defined as protection from at least a 100-year storm and the highest possible tidal stage that may occur.

iv. Sludge or biosolids disposed in a municipal solid waste landfill shall meet the requirements of 40 C.F.R. part 258. In the annual self-monitoring report, the Discharger shall provide the amount of sludge or biosolids disposed and indicate the landfill to which it was sent.

v. This Order does not authorize permanent onsite sludge or biosolids storage or disposal. A Report of Waste Discharge shall be filed and the site brought into compliance with all applicable regulations prior to commencement of any such activity.

c. Collection System Management. The Discharger shall properly operate and maintain its entire collection system (see Provision VI.C.5 and Attachment D, section I.D). The Discharger shall report any noncompliance (see Attachment D, sections V.E.1 and V.E.2) and mitigate any discharge from its collection system that violates this Order (see Attachment D, section I.C).

i. Separate Sanitary Sewer System. The *General Waste Discharge Requirements for Wastewater Collection Agencies* (General Collection System WDRs), State Water Board Order 2006-0003 DWQ as amended by State Water Board Order WQ 2008-0002-EXEC, has requirements for operation and maintenance of separate sanitary sewer collection systems and for reporting and mitigating sanitary sewer overflows from the separate sanitary sewer portion of the Discharger's collection system. While the Discharger must comply with both the General Collection System WDRs and this Order, the General Collection System WDRs more clearly and specifically stipulate requirements for operation and maintenance and for reporting and mitigating sanitary sewer overflows. Implementation of the General Collection System WDRs for proper operation and maintenance and mitigation of sanitary sewer overflows will satisfy the corresponding federal NPDES requirements specified in Attachment D (as supplemented by Attachment G). Following the notification and reporting requirements in the General Collection System WDRs will satisfy NPDES the corresponding reporting requirements specified in Attachment D (as supplemented by Attachment G) for sanitary sewer overflows from the separate sanitary sewer portion of the collection system.

ii. Combined Sewer System. For purposes of this Order, a combined sewer system "excursion" is a release or diversion of untreated or partially-treated wastewater from

the combined sewer system that exits the system temporarily and then re-enters it. Excursions are caused by blockages or flow conditions within the publicly-owned portion of the combined sewer system and can occur in public rights of way or on private property. Excursions do not include releases from privately-owned sewer laterals or authorized combined sewer discharges from Discharge Point Nos. 009 through 043.

(a) Excursion Database. By January 1, 2014, the Discharger shall develop and maintain a database containing information about each excursion that occurs within the Southeast Plant's service area. The Discharger may limit these data to excursions occurring within the City and County of San Francisco. The Discharger may, at its option, include information concerning releases from private sewer laterals. The database shall contain the following information for each excursion:

(1) Location, including latitude and longitude, street address (if available), zip code, cross street, and asset number;

(2) Destination (if known), including whether the excursion was fully captured and returned to the combined sewer system and whether any portion of it entered a drainage channel or surface water;

(3) Estimated volume, in gallons, including volume that reached a surface water or drainage channel and volume recovered (all spills to drainage channels or surface waters are subject to MRP section IX.B, which modifies Attachment G section V.E.2);

(4) Date and time excursion was reported to the San Francisco Public Utilities Commission;

(5) Operator arrival date and time;

(6) End date and time of excursion, if known;

(7) Source (e.g., manhole, catch basin, vent trap);

(8) Cause (e.g., mainline blockage, roots, broken pipe);

(9) Corrective actions taken, including steps taken or planned to reduce, eliminate, and prevent reoccurrence;

(10) Parameters for which samples were analyzed and results (if applicable);

(11) Whether the County Health Officer was notified and health warnings were posted (if known);

(12) Whether a beach was affected and, if so, which one (if applicable);

(13) California Emergency Management Agency (CalEMA) control number, and date and time CalEMA was called (if applicable);

(14) Date and time County Health Officer was notified (if applicable).

If the Discharger chooses to include information regarding releases from private sewer laterals, it should also record responsible party contact information, if known.

(b) Routine Reporting. The Discharger shall report any excursion greater than 1,000 gallons, regardless of whether it enters a drainage channel or surface water, to the Regional Water Board and the San Francisco Department of Public Health not later than two hours after becoming aware of the discharge. The Discharger shall make this report as soon as (1) it has knowledge of the excursion, (2) reporting is possible, and (3) a report can be provided without impeding cleanup or other emergency measures. The Discharger shall report excursions by calling the Regional Water Board's spill hotline (currently 510-622-2369) and following standard procedures developed by the San Francisco Public Utilities Commission and the San Francisco Department of Public Health. (Spill to drainage channels or surface waters are subject to MRP section IX.B, which modifies Attachment G section V.E.2.)

(c) Annual Report. The Discharger shall submit a report no later than August 15 each year that compiles and summarizes information from the excursion database for the preceding 12 months ending June 30. Within the report, the Discharger shall review collection system performance, evaluate excursion trends in terms of time and location, summarize actions taken within the preceding year to minimize excursions, and identify specific tasks for the coming year to further minimize excursions.

(d) Record Keeping. The Discharger shall maintain documentation supporting the database records for at least three years following each excursion. The Executive Officer may extend this period if necessary. Documentation shall include, but need not be limited to, work orders and other maintenance records associated with responses and investigations. The Discharger shall make all excursion records available for review upon Regional Water Board staff request.

If the Discharger collects water quality samples for analysis, it shall maintain the following information:

- Date, exact place, and time of sampling or measurement;
- Individual who performed sampling or measurement;
- Date of analysis;
- Individual who performed analysis;
- Analytical technique or method used; and
- Analysis results.

5. Combined Sewer Sytem Controls

The Discharger shall maximize flows to the Southeast Plant and pollutant removal during wet weather in accordance with the Nine Minimum Controls and the Discharger's Long-Term Control Plan.

a. Combined Sewer Operations and Maintenance Plan. The Discharger shall revise and update its *Combined Sewer Operations and Maintenance Plan* as necessary to ensure compliance with the Nine Minimum Controls and the Long-Term Control Plan requirements of the *Combined Sewer Overflow Control Policy*. The Discharger shall submit the updated plan by August 15, 2015, and following any subsequent revision.

b. Nine Minimum Controls. The Discharger shall continue implementing the following controls:

i. Conduct Proper Operations and Maintenance Programs. The Discharger shall implement its *Combined Sewer Operations and Maintenance Plan*, which shall include the elements described below. The Discharger shall operate and maintain the system according to the plan and in accordance with Provision VI.C.4.c.ii of this Order. The Discharger shall maintain records to document plan implementation.

(a) Designate Manager for Combined Sewer Discharges and Overflows. The Discharger shall designate a person to be responsible for the wastewater collection system and serve as the contact person regarding the operation of the combined sewer system. The Discharger shall notify the Regional Water Board within 90 days of the designation of a new contact person.

(b) Inspect and Maintain Combined Sewer System. The Discharger shall properly operate and maintain the collection system and the combined sewer discharge outfalls to reduce the magnitude, frequency, and duration of combined sewer discharges. The Discharger shall perform the following:

- Regularly clean sewers and catch basins, and repair or replace, as necessary, sewers and related equipment;
- Disconnect any illegal connections;
- Inspect and maintain discharge structures, regulators, pumping stations, and tide gates to ensure that they are in good working condition and adjusted to minimize combined sewer discharges, prevent combined sewer overflows, and prevent tidal inflow;
- Inspect each combined sewer discharge outfall at least once per year. The inspection shall include, but not be limited to, entering the regulator structure, if accessible; determining the extent of any structural defect or debris and grit buildup; and removing any debris that may constrict flow, cause blockage, or result in a dry weather combined sewer overflow. For outfalls that are inaccessible, the Discharger may perform a visual check of the discharge pipe to determine whether combined sewer overflows have occurred or could potentially occur during dry weather; and

- Record all inspection results in a maintenance log.

(c) Provide Trained Staff. The Discharger shall provide adequate staff to carry out the operation, maintenance, repair, and testing required to ensure compliance with the terms and conditions of this Order. The Discharger shall provide appropriate training for each staff member.

(d) Allocate Funds for Operation and Maintenance. The Discharger shall allocate adequate funds for operation and maintenance activities.

ii. Maximize Use of Collection System for Storage. The Discharger shall continue to maximize the use of the collection system (i.e., collection system piping, not only the storage/transports) for in-line storage to reduce the magnitude, frequency, and duration of combined sewer discharges.

iii. Review and Modify Pretreatment Program. The Discharger shall continue to implement controls to minimize the impact of non-domestic discharges to its collection system. At three-year intervals, the Discharger shall re-evaluate whether additional modifications to its pretreatment program are feasible or practical. The Discharger shall maintain records to document this evaluation and implementation of controls.

iv. Maximize Flow to Southeast Plant and North Point Facility. The Discharger shall operate the Southeast Plant at maximum treatable flow during wet weather. The Discharger shall ensure that the *Combined Sewer Operation and Maintenance Plan* is implemented to maximize the volume of wastewater treated at the Southeast Plant and the North Point Facility and discharged via deep water outfalls, consistent with the hydraulic capacities of the storage, transport, treatment, and disposal facilities. The Discharger shall report rainfall with the self-monitoring reports the MRP requires.

v. Prohibit Dry Weather Combined Sewer Overflows. Dry weather combined sewer overflows from Discharge Point Nos. 002 through 043 are prohibited. The Discharger shall respond to dry weather combined sewer overflows in accordance with MRP section IX.B, which modifies Attachment G section V.E.2. During any dry weather combined sewer overflow, the Discharger shall inspect the overflow point each day until the overflow stops. The Discharger shall document in the inspection log each combined sewer overflow event, its duration, its cause, and the corrective measures taken.

vi. Control Solid and Floatable Materials in Combined Sewer Discharges. The Discharger shall continue to implement measures to control solid and floatable materials in combined sewer discharges, including the following:

(a) Ensuring that overflow structures are baffled or using other means to reduce the volume of floatable materials in combined sewer discharges, and

(b) Removing solid or floatable materials captured in the storage/transports prior to discharge.

vii. Develop and Implement Pollution Prevention Program. The Discharger shall continue to implement a Pollution Prevention Program focused on reducing the impact of combined sewer discharges and overflows on receiving waters. It shall develop and implement this program in accordance with Provision VI.C.3.

The Discharger shall also continue to implement a street sweeping program and clean catch basins at a frequency sufficient to prevent large accumulations of pollutants and debris.

viii. Notify Public of Combined Sewer Discharges. The Discharger shall continue to implement a public notification plan to inform citizens of when and where combined sewer discharges occur. The plan shall include the following:

(a) A mechanism to alert persons using receiving waters affected by combined sewer discharges for recreation; and

(b) A system to determine the nature and duration of conditions resulting from combined sewer discharges potentially harmful to receiving water users.

Warning signs shall be posted at beach locations where water contact recreation occurs whenever a combined sewer discharge occurs that could affect recreational users at that location. Warning signs shall be posted on the same day as the combined sewer discharge event unless the combined sewer discharge occurs after 4:00 p.m., in which case, signs shall be posted by 8:00 a.m. the next day. The Discharger shall maintain records documenting public notification.

ix. Monitor to Characterize Wet Weather Discharge Impacts and Efficacy of Controls. The Discharger shall continue monitoring wet weather discharges to characterize their impacts and the efficacy of wet weather discharge controls. The monitoring shall build upon the efforts and results the Discharger described in *Special Study: Overflow Impacts and Efficacy of Combined Sewer Overflow Controls for the San Francisco Bayside System, Southeast Water Pollution Control Plant, North Point Wet Weather Facility and Bayside Wet Weather Facilities* (June 29, 2012).

(a) Monitoring Requirements. Compliance with the following monitoring requirements shall be achieved in accordance with the specifications of Attachment D, section III, and Attachment G, sections III.A.1 and III.A.2. Samples shall be composites comprised of individual grab samples collected at equal intervals of no more than one hour for the duration of each discharge event, but not exceeding 24 hours. If an event does not last at least 24-hours, the Discharger shall sample for as long as possible and report the duration.

(1) Southeast Plant and North Point Facility Discharges. When Southeast Plant or North Point Facility discharges occur during wet weather, the Discharger shall collect effluent samples representing Discharge Point Nos. 001 through 006 at Monitoring Locations EFF-001B, EFF-002, and

EFF-003, as defined in the MRP. In addition to the monitoring required in MRP Table E-4, the Discharger shall monitor for the priority pollutants listed in Attachment G, Table C, at least once per year.

(2) Combined Sewer Discharges. The Discharger shall collect effluent samples representing Discharge Point Nos. 009 through 043 at Monitoring Locations CSD-010 through CSD-043, as defined in the MRP. The Discharger shall collect samples at a monitoring location whenever a combined sewer discharge event of at least one hour in duration occurs at that location (and may also collect samples representing shorter events). In addition to the monitoring required in MRP Table E-5, the Discharger shall monitor each sample for the following:

- total suspended solids
- settleable matter
- pH
- metals (arsenic, cadmium, copper, lead, nickel, selenium, silver, and zinc)
- cyanide
- ammonia (total)

The Discharger shall also monitor a combined sewer discharge at Monitoring Location CSD-41 for the remaining priority pollutants listed in Attachment G, Table C, at least once per year.

(3) Shoreline Monitoring. The Discharger shall collect shoreline receiving water grab samples at Monitoring Locations S-202.4, S-202.5, S-210, S-211, S-300.1, S-301.1, and S-301.2, as defined in the MRP. In addition to the monitoring required in MRP Table E-6, the Discharger shall monitor enterococcus and fecal coliform at a frequency sufficient to characterize ambient conditions (e.g., weekly).

(b) Reporting Requirements

(1) Routine Reporting. The Discharger shall, within 60 days of receipt of analytical results, indicate in the transmittal letter for the appropriate self-monitoring report that a sample for this study was collected.

(2) Final Report. The Discharger shall report its findings by September 30, 2017. The report shall include the following:

- All wet weather discharge monitoring data collected, including acute toxicity data (the Discharger shall include data that do not necessarily conform to the test procedures in 40 C.F.R. part 136 and explain these circumstances to provide context for data interpretation);

- All shoreline monitoring data collected and any discharge-related beach closures;

- Updated water contact recreational use surveys, focusing particularly on recreational use following combined sewer discharge events;

- Evaluation of combined sewer discharge control efficacy (e.g., using TSS as a proxy for pollutant removal efficiency); and

- Evaluation of combined sewer discharge impacts (e.g., comparing average and maximum discharge and receiving water monitoring data with water quality objectives, translated as appropriate using available metals translators and water effects ratios).

c. Long-Term Control Plan. The Discharger shall comply with the following provisions, consistent with implementation of its Long-Term Control Plan.

i. The Discharger shall optimize sytem operations to minimize combined sewer discharges and maximize pollutant removal during wet weather.

ii. The Discharger shall capture for treatment, or storage and subsequent treatment, 100 percent of the combined sewage flow collected in the combined sewage system during precipitation events. Captured combined sewage shall be directed to either the Southeast Plant, the North Point Facility, or the storage/transports. All combined sewage captured shall receive a minimum of the following treatment:

(a) Secondary treatment,
(b) Primary treatment, or
(c) Equivalent-to-primary treatment (in storage/transports).

iii. The Discharger shall operate the wet weather facilities as set forth below. If the Discharger can demonstrate (e.g., through modeling conducted as part of its Sewer System Improvement Program) that changes to these operating parameters will result in additional storage or treatment, it may implement such changes. Written acknowledgement that the Executive Officer concurs with the Discharger's demonstration must be obtained prior to implementation.

(a) North Shore Drainage Basin. Activation and operation of the North Point Facility shall depend on rainfall, forecasts, and storage conditions in the North Shore Drainage Basin and the Central Drainage Basin.

- The North Point Facility shall be activated when the level of combined sewage and stormwater in the North Shore Storage/Transport Box is at 200 inches.

- The North Point Facility shall be activated to treat 135 to 145 MGD of combined in-flow within 60 minutes of any combined sewer discharge through Discharge Point Nos. 013 to 017.

- The North Point Facility shall remain operational as long as necessary to minimize the likelihood of storage/transport combined sewer discharges in the Central or Southeast Drainage Basins.

(b) Central Drainage Basin. Activation and operation of the Channel Pump Station shall depend on rainfall, forecasts, and storage conditions in the Central Drainage Basin and the Southeast Drainage Basin.

- The Channel Pump Station shall pump 80 MGD to the Southeast Plant or Southeast Plant influent shall be at 250 MGD (from the Channel and Flynn Pump Stations and the Southeast Plant Lift Station) before there is any storage/transport combined sewer discharge to Mission Creek (Discharge Point Nos. 022 to 027).

- Flow from the Channel Pump Station to the Southeast Plant may be reduced to prevent a combined sewer discharge from the Southeast Drainage Basin storage/transport structures if the flows between the Central Drainage Basin structures and the Southeast Drainage Basin structures (Griffith Pump Station and/or Flynn Pump Station) become unbalanced, e.g., Griffith and/or Flynn storage levels continue to rise while the Southeast Plant is at maximum flow.

- The Mariposa Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point No. 029.

- The 20th St. Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point 030 or 030A.

(c) Southeast Drainage Basin. Southeast Plant operation shall depend on rainfall, forecasts, and storage conditions in the Central Drainage Basin and the Southeast Drainage Basin. The Southeast Plant shall have an influent flow of 240 to 250 MGD prior to any combined sewer discharge into Islais Creek from Discharge Point Nos. 031 through 035.

- The Griffith Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point Nos. 040 through 042. Flows from the Griffith Pump Station to the Southeast Plant may be reduced to maximize storage in the Southeast Drainage Basin if flows between the Central Drainage Basin and the Southeast Drainage Basin become unbalanced (e.g., if unused storage capacity exists in the Southeast Drainage Basin while the Southeast Plant is at maximum flow).

- The Sunnydale Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point No. 043. Flows from the Sunnydale Pump Station to the Griffith Pump Station may be reduced to maximize storage in the Southeast Drainage Basin if flows between the Central Drainage Basin and the Southeast Drainage Basin become unbalanced (e.g., if unused storage capacity exists in the Southeast Drainage Basin while the Southeast Plant is at maximum flow).

iv. The Discharger shall comply with the following after rains subside:

(a) Treatment at the Southeast Plant and North Point Facility shall continue until North Shore, Central, and Southeast Drainage Basin storage/transports are essentially empty of stormwater flows.

(b) If the National Weather Service predicts a 30 percent or greater chance of rain within the next 24 hours, the following provisions shall apply:

- Pumping shall occur until the wastewater level in the Channel Pump Station Box is between 100 to 150 inches,
- Pumping shall occur until the wastewater level in the North Shore Box is at 100 inches, and
- Pumping shall occur until the Islais Creek storage is essentially empty.

(c) If the National Weather Service predicts a less than 30 percent chance of rain within the next 24 hours, the following provisions shall apply:

- Pumping shall occur until the wastewater level in the Channel Pump Station Box is below 150 inches,
- Pumping shall occur until the wastewater level in the North Shore Box is below 150 inches, and
- Pumping shall occur until the Islais Creek storage is essentially empty.

v. By March 30, 2018, the Discharger shall synthesize and update its Long-Term Control Plan into one document that reflects current circumstances. The synthesis and update shall include the following elements.

(a) The Long-Term Control Plan shall continue to reflect the historical long-term average annual design goals for combined sewer discharges:

- Four combined sewer discharge events along the North Shore (Discharge Point Nos. 009 through 017);
- Ten combined sewer discharge events within the Central Basin (Discharge Point Nos. 018 through 036); and
- One combined sewer discharge event along the Southeast Sector (Discharge Point Nos. 037 through 043).

(b) The Discharger shall set forth operational requirements similar to those listed in Provisions VI.C.5.c.iii and VI.C.5.c.iv, above, to optimize system operations so as to maximize pollutant removal during wet weather and minimize combined sewer discharges.

(c) The Discharger shall set forth additional measures, to the extent technically and economically feasible, to maximize pollutant removal and minimize combined sewer discharges (e.g., implementing and promoting green infrastructure and low impact development that enhances stormwater detention and percolation).

(d) The Discharger shall develop and propose a metric to evaluate the performance of its wet weather disinfection systems for Discharge Point Nos. 001 through 006.

(e) The Discharger shall propose a plan for post-construction compliance monitoring of all wet weather discharges consistent with the *Combined Sewer Overflow Control Policy*.

vi. The Discharger shall submit a report implementing *Combined Sewer Overflow Control Policy* section II.C.3, "Consideration of Sensitive Areas." At a minimum, the Discharger shall explore how it could eliminate or relocate combined sewer discharges that discharge to sensitive areas. The Discharger shall base its assessment on any new or improved techniques (including but not limited to green infrastructure and low impact development) that can reduce, eliminate, or relocate combined sewer discharges from sensitive areas. The Discharger shall submit the report with its application for permit reissuance.

d. If the Executive Officer determines that the Discharger has caused a violation of any water quality standard for receiving waters, the Discharger shall evaluate its Long-Term Control Plan and its Combined Sewer Operations and Maintenance Plan, and submit a report identifying additional measures, considering its financial capabilities, to address the violation. The report shall include information on the technical and economic feasibility of the additional measures. The Discharger shall submit this report within 180 days after the Executive Officer provides notification of the violation, and the Discharger shall begin implementing the additional measures described in the report, as may be modified by the Executive Officer, within 60 days after report submittal.

6. Other Special Provisions

a. Copper Action Plan. The Discharger shall implement pretreatment, source control, and pollution prevention for copper in accordance with the following tasks and time schedule.

Table 6. Copper Action Plan

Task	Compliance Date
1. Review Potential Copper Sources The Discharger shall submit an inventory of potential copper sources to the treatment plant.	*Completed June 2009*
2. Implement Copper Control Program The Discharger shall submit a plan for and begin implementation of a program to reduce copper sources identified in Task 1. The plan shall consists, at a minimum, of the following elements: a. Provide education and outreach to the public (e.g., focus on proper pool and spa maintenance and plumbers' roles in reducing corrosion); b. If corrosion is determined to be a significant copper source, work cooperatively with local water purveyors to reduce and control water	*Completed February 2011*

Task	Compliance Date
corrosivity, as appropriate, and ensure that local plumbing contractors implement best management practices to reduce corrosion in pipes; and c. Educate plumbers, designers, and maintenance contractors for pools and spas to encourage best management practices that minimize copper discharges.	
3. Implement Additional Measures If the Regional Water Board notifies the Discharger that the three-year rolling mean copper concentration in Central or Lower San Francisco Bay exceeds 2.2 µg/L, then within 90 days of the notification, the Discharger shall evaluate the effluent copper concentration trend and, if it is increasing, develop and begin implementation of additional measures to control copper discharges. The Discharger shall report on the progress and effectiveness of actions taken, and provide a schedule for actions to be taken in the next 12 months.	With annual pollution prevention report due February 28 following 90 days after notification
4. Undertake Studies to Reduce Copper Pollutant Impact Uncertainties. The Discharger shall submit an updated study plan and schedule to conduct or cause to be conducted technical studies to investigate possible copper sediment toxicity and to investigate sub-lethal effects on salmonids. Specifically, the Discharger shall include the manner in which the above will be accomplished and describe the studies to be performed with an implementation schedule. To satisfy this requirement, the Discharger may collaborate and conduct these studies as a group.	*Completed January 2011*
5. Report Status of Copper Control Program. The Discharger shall submit an annual report documenting copper control program implementation and addressing the effectiveness of the actions taken, including any additional copper controls required by Task 3 above, and provide a schedule for actions to be taken in the next 12 months. Additionally, the Discharger shall report the findings and results of the studies completed, planned, or in progress under Task 4. Regarding Task 4 studies, dischargers may collaborate and provide this information in a single report to satisfy this requirement for an entire group.	With annual pollution prevention report due February 28 each year

b. Cyanide Action Plan. The Discharger shall implement monitoring and surveillance, pretreatment, source control and pollution prevention for cyanide in accordance with the following tasks and time schedule.

Table 7. Cyanide Action Plan

Task	Compliance Date
1. Review Potential Cyanide Sources The Discharger shall submit an inventory of potential cyanide sources to the treatment plant. If no cyanide sources are identified, Tasks 2 and 3 are not required, unless the Discharger receives a request to discharge detectable levels of cyanide to the sewer. If so, the Discharger shall notify the Executive Officer and implement Tasks 2 and 3.	*Completed June 2008*
2. Implement Cyanide Control Program The Discharger shall submit a plan and begin implementation of a program to minimize cyanide discharges to its treatment plant consisting, at a minimum, of the following elements: a. Inspect each potential source to assess the need to include that source in the control program. b. Inspect contributing sources included in the control program annually.	*Completed February 2011*

Task	Compliance Date
Inspection elements may be based on U.S. EPA guidance, such as Industrial User Inspection and Sampling Manual for POTWs (EPA 831-B-94-01). c. Develop and distribute educational materials to sources and potential sources regarding the need to prevent cyanide discharges. d. Prepare an emergency monitoring and response plan to be implemented if a significant cyanide discharge occurs. For purposes of this Order, a "significant cyanide discharge" is occurring if cyanide is found in the Southeast Plant's influent above 21 µg/L.	
3. Implement Additional Cyanide Control Measures If the Regional Water Board notifies the Discharger that ambient monitoring shows cyanide concentrations are 1.0 µg/L or higher in the main body of San Francisco Bay, then within 90 days of the notification, the Discharger shall commence actions to identify and abate cyanide sources responsible for the elevated ambient concentrations, and shall report on the progress and effectiveness of actions taken, and provide a schedule for actions to be taken in the next 12 months.	With next annual pollution prevention report due February 28 (at least 90 days following notification)
4. Report Status of Cyanide Control Program The Discharger shall submit an annual report documenting cyanide control program implementation and addressing the effectiveness of actions taken, including any additional cyanide controls required by Task 3, above, and provide a schedule for actions to be taken in the next 12 months.	With annual pollution prevention report due February 28 each year

c. Standard Operating Procedures for Resource Recovery. If the Discharger receives hauled-in anaerobically-digestible material for injection into an anaerobic digester, the Discharger shall notify the Regional Water Board and develop and implement Standard Operating Procedures for this activity. The Standard Operating Procedures shall be developed by February 1, 2014, or prior to initiation of hauling. The Standard Operating Procedures shall address material handling, including unloading, screening or other processing prior to anaerobic digestion, and transportation; spill prevention; spill response; avoidance of the introduction of materials that could cause interference, pass through, or upset of the treatment processes; avoidance of prohibited material; vector control; odor control; operation and maintenance; and the disposition of any solid waste segregated from introduction to the digester. The Discharger shall provide training to its staff on the Standard Operating Procedures and shall maintain records for a minimum of three years for each load received, describing the hauler, waste type, and quantity received. In addition, the Discharger shall maintain records for a minimum of three years for the disposition location and quantity of cumulative pre-digestion segregated solid waste hauled offsite.

ATTACHMENT A – DEFINITIONS

Arithmetic Mean (μ)
Also called the average, the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

Arithmetic mean = $\mu = \Sigma x / n$ where: Σx is the sum of the measured ambient water concentrations, and n is the number of samples.

Average Monthly Effluent Limitation (AMEL)
The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL)
The highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Bioaccumulative
Taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

Carcinogenic
Known to cause cancer in living organisms.

Coefficient of Variation
Measure of data variability calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

Combined Sewer Discharge
Authorized discharge during a wet weather day from an approved combined sewer discharge point. Refer to Table 2 of the Order for a list of approved combined sewer discharge points.

Combined Sewer Discharge Event
Wet weather event that results in an authorized discharge from one or more approved combined sewer discharge points. A discrete combined sewer discharge event is separated by at least six hours from any other combined sewer discharge event. Refer to Table 2 of the Order for a list of approved combined sewer discharge points.

Combined Sewer System Excursion
Release or diversion of untreated or partially treated wastewater from the combined sewer system that exits the system temporarily and then re-enters it. Excursions do not include releases from privately owned sewer laterals, or authorized combined sewer discharges.

Daily Discharge
Either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit) for a constituent with limitations expressed in units of mass; or (2) the

unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period is considered the result for the calendar day in which the 24-hour period ends.

Detected, but Not Quantified (DNQ)
Sample result less than the RL, but greater than or equal to the laboratory's MDL. Sample results reported as DNQ are estimated concentrations.

Dilution Credit
Amount of dilution granted to a discharge in the calculation of a water quality-based effluent limitation, based on the allowance of a specified mixing zone. It is calculated from the dilution ratio or determined by conducting a mixing zone study or modeling the discharge and receiving water.

Dry Weather
Any weather not defined as wet weather (determined on a day-by-day basis).

Effluent Concentration Allowance (ECA)
Value derived from the water quality criterion/objective, dilution credit, and ambient background concentration that is used, in conjunction with the CV for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as waste load allocation (WLA) as used in U.S. EPA guidance (*Technical Support Document For Water Quality-based Toxics Control*, March 1991, second printing, EPA/505/2-90-001).

Enclosed Bay
Indentation along the coast that encloses an area of oceanic water within a distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake's Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

Estimated Chemical Concentration
Concentration that results from the confirmed detection of the substance below the ML value by the analytical method.

Estuaries
Waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars are considered estuaries. Estuarine waters are considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater.

Estuarine waters include, but are not limited to, the Sacramento-San Joaquin Delta, as defined in Water Code section 12220, Suisun Bay, Carquinez Strait downstream to the Carquinez Bridge, and appropriate areas of the Smith, Mad, Eel, Noyo, Russian, Klamath, San Diego, and Otay rivers. Estuaries do not include inland surface waters or ocean waters.

Inland Surface Waters
All surface waters of the state that do not include the ocean, enclosed bays, or estuaries.

Instantaneous Maximum Effluent Limitation
Highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation
Lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

Maximum Daily Effluent Limitation (MDEL)
Highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Median
Middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements (n) is odd, then the median = $X_{(n+1)/2}$. If n is even, then the median = $(X_{n/2} + X_{(n/2)+1})/2$ (i.e., the midpoint between n/2 and n/2+1).

Method Detection Limit (MDL)
Minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in in 40 C.F.R. part 136, Attachment B, revised as of July 3, 1999.

Minimum Level (ML)
Concentration at which the entire analytical system gives a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Mixing Zone
Limited volume of receiving water allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

Not Detected (ND)
Sample results less than the laboratory's MDL.

Persistent Pollutants
Substances for which degradation or decomposition in the environment is nonexistent or very slow.

Pollutant Minimization Program
Program of waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of the Pollutant Minimization Program is to reduce all potential sources of a priority pollutant through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. Cost effectiveness may be considered when establishing the requirements of a Pollutant Minimization Program. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), is considered to fulfill Pollutant Minimization Program requirements.

Pollution Prevention
Any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant that is discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation (as defined in Water Code section 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the State Water Board or Regional Water Board.

Reporting Level (RL)
ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order, including an additional factor if applicable as discussed herein. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Regional Water Board either from SIP Appendix 4 in accordance with SIP section 2.4.2 or established in accordance with SIP section 2.4.3. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

Source of Drinking Water
Any water designated as having a municipal or domestic supply (MUN) beneficial use.

Standard Deviation (σ)
Measure of variability calculated as follows:

$$\sigma = (\sum[(x - \mu)^2]/(n - 1))^{0.5}$$

where:

x is the observed value;
μ is the arithmetic mean of the observed values; and
n is the number of samples.

Toxicity Reduction Evaluation (TRE)
Study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to

the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. A TIE is a set of procedures to identify the specific chemicals responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

Wet Weather
Weather in which any one of the following conditions exists as a result of rain (determined on a day-by-day basis):

1. Instantaneous influent flow to the Southeast Plant (at Monitoring Location INF-001 as defined in the Monitoring and Reporting Program) exceeds 110 MGD and discharge occurs at Discharge Point No. 002;

2. Average influent biochemical oxygen demand (BOD_5) or total suspended solids (TSS) concentration at the Southeast Plant is less than 100 mg/L; or

3. North Shore storage/transport wastewater elevation exceeds 100 inches.

ATTACHMENT B – FACILITY MAP

The Facility subject to this Order is shown in the light green (eastern) area of the map and includes the Southeast Water Pollution Control Plant, the North Point Wet Weather Facility, and the Bayside Wet Weather Facilities. The remaining collection system subject to this Order is not shown. The Oceanside Water Pollution Control Plant, Westside Wet Weather Facilities, and Treasure Island Wastewater Treatment Plant are shown only for reference.

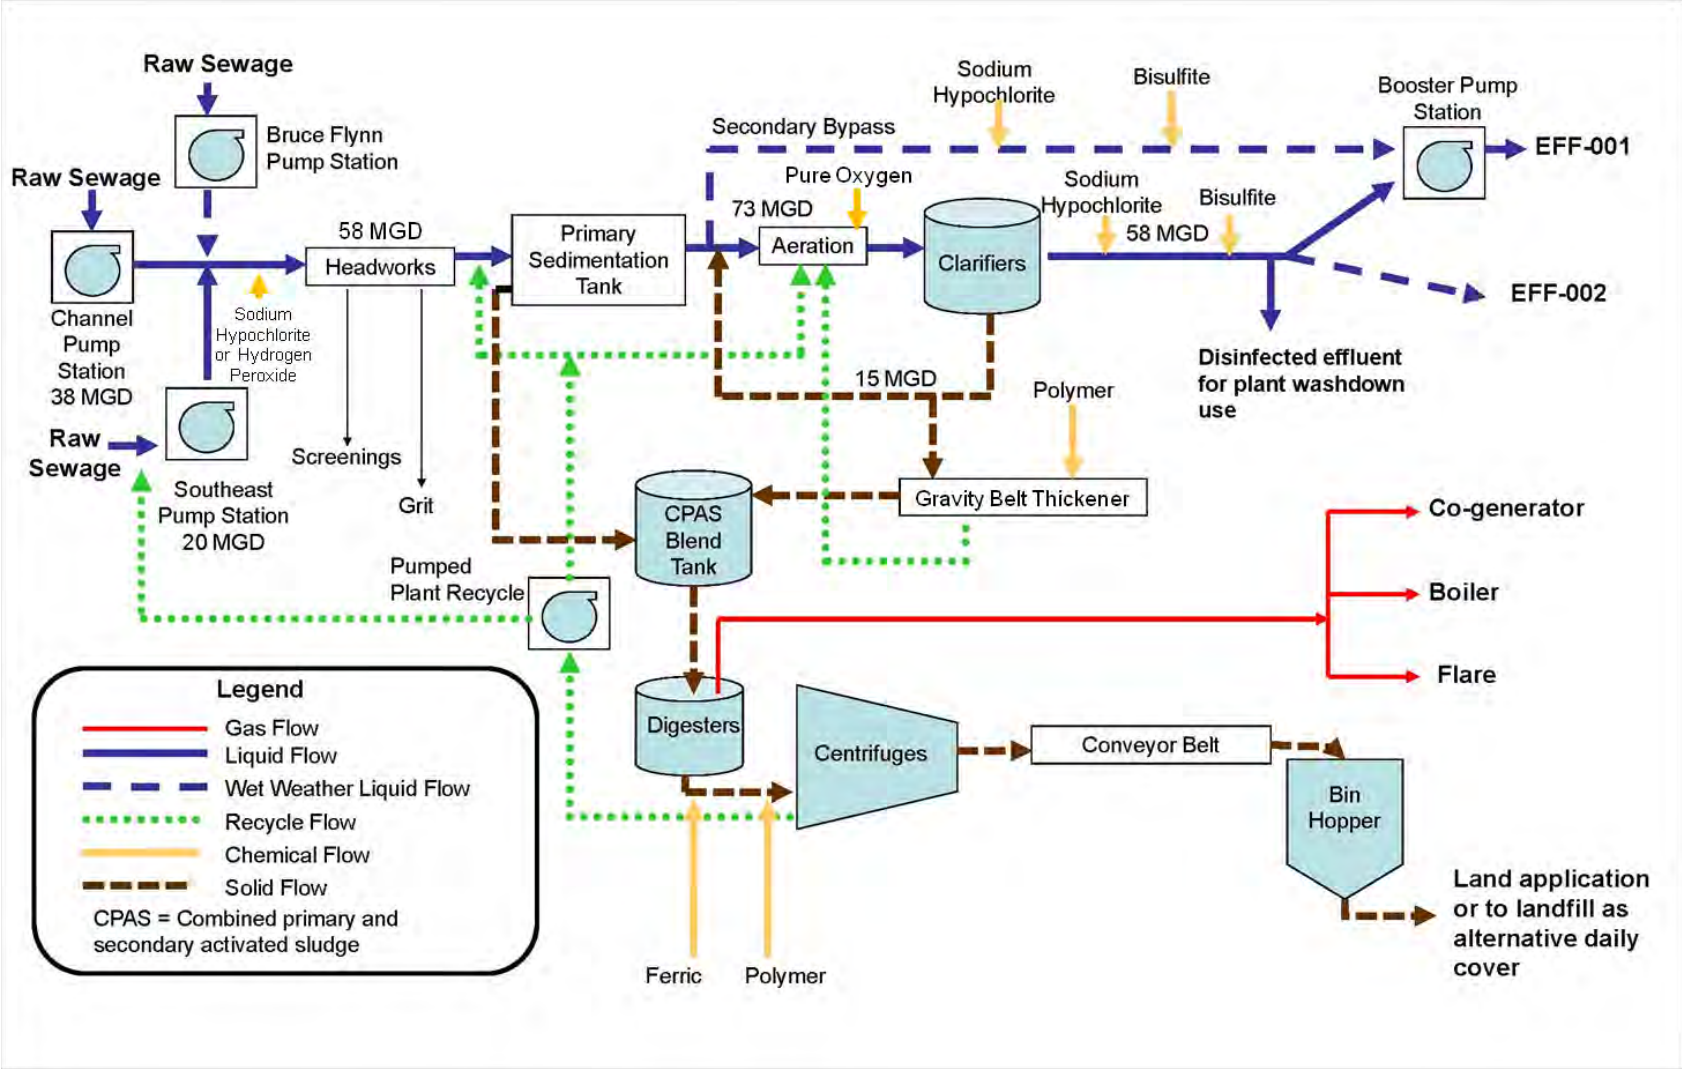
ATTACHMENT C – PROCESS FLOW DIAGRAM



ATTACHMENT D –STANDARD PROVISIONS

I. STANDARD PROVISIONS – PERMIT COMPLIANCE

A. Duty to Comply

1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application. (40 C.F.R. § 122.41(a).)

2. The Discharger shall comply with effluent standards or prohibitions established under CWA section 307(a) for toxic pollutants and with standards for sewage sludge use or disposal established under CWA section 405(d) within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 C.F.R. § 122.41(a)(1).)

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. (40 C.F.R. § 122.41(c).)

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 C.F.R. § 122.41(d).)

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order. (40 C.F.R. § 122.41(e).)

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 C.F.R. § 122.41(g).)

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 C.F.R. § 122.5(c).)

F. Inspection and Entry

The Discharger shall allow the Regional Water Board, State Water Board, U.S. EPA, or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (40 C.F.R. § 122.41(i); Wat. Code, § 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (40 C.F.R. § 122.41(i)(1));

2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (40 C.F.R. § 122.41(i)(2));

3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (40 C.F.R. § 122.41(i)(3)); and

4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (40 C.F.R. § 122.41(i)(4).)

G. Bypass

1. Definitions

a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. (40 C.F.R. § 122.41(m)(1)(i).)

b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 C.F.R. § 122.41(m)(1)(ii).)

2. Bypass not exceeding limitations. The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 C.F.R. § 122.41(m)(2).)

3. Prohibition of bypass. Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless (40 C.F.R. § 122.41(m)(4)(i)):

a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 C.F.R. § 122.41(m)(4)(i)(A));

b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of

equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 C.F.R. § 122.41(m)(4)(i)(B)); and

c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions – Permit Compliance I.G.5 below. (40 C.F.R. § 122.41(m)(4)(i)(C).)

4. Approval. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions—Permit Compliance I.G.3 above. (40 C.F.R. § 122.41(m)(4)(ii).)

5. Notice

a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass. (40 C.F.R. § 122.41(m)(3)(i).)

b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice). (40 C.F.R. § 122.41(m)(3)(ii).)

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. (40 C.F.R. § 122.41(n)(1).)

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. (40 C.F.R. § 122.41(n)(2).)

2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 C.F.R. § 122.41(n)(3)):

a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 C.F.R. § 122.41(n)(3)(i));

b. The permitted facility was, at the time, being properly operated (40 C.F.R. § 122.41(n)(3)(ii));

c. The Discharger submitted notice of the upset as required in Standard Provisions—Reporting V.E.2.b below (24-hour notice) (40 C.F.R. § 122.41(n)(3)(iii)); and

d. The Discharger complied with any remedial measures required under Standard Provisions—Permit Compliance I.C above. (40 C.F.R. § 122.41(n)(3)(iv).)

3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 C.F.R. § 122.41(n)(4).)

II. STANDARD PROVISIONS—PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition. (40 C.F.R. § 122.41(f).)

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit. (40 C.F.R. § 122.41(b).)

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 C.F.R. § 122.41(l)(3); § 122.61.)

III. STANDARD PROVISIONS – MONITORING

A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 C.F.R. § 122.41(j)(1).)

B. Monitoring results must be conducted according to test procedures under 40 C.F.R. part 136 or, in the case of sludge use or disposal, approved under 40 C.F.R. part 136 unless otherwise specified in 40 C.F.R. part 503 unless other test procedures have been specified in this Order. (40 C.F.R. § 122.41(j)(4); § 122.44(i)(1)(iv).)

IV. STANDARD PROVISIONS—RECORDS

A. Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 C.F.R. part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years

from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time. (40 C.F.R. § 122.41(j)(2).)

B. Records of monitoring information shall include the following:

1. The date, exact place, and time of sampling or measurements (40 C.F.R. § 122.41(j)(3)(i));

2. The individual(s) who performed the sampling or measurements (40 C.F.R. § 122.41(j)(3)(ii));

3. The date(s) the analyses were performed (40 C.F.R. § 122.41(j)(3)(iii));

4. The individual(s) who performed the analyses (40 C.F.R. § 122.41(j)(3)(iv));

5. The analytical techniques or methods used (40 C.F.R. § 122.41(j)(3)(v)); and

6. The results of such analyses. (40 C.F.R. § 122.41(j)(3)(vi).)

C. Claims of confidentiality for the following information will be denied (40 C.F.R. § 122.7(b)):

1. The name and address of any permit applicant or Discharger (40 C.F.R. § 122.7(b)(1)); and

2. Permit applications and attachments, permits, and effluent data. (40 C.F.R. § 122.7(b)(2).)

V. STANDARD PROVISIONS—REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Regional Water Board, State Water Board, or U.S. EPA within a reasonable time, any information which the Regional Water Board, State Water Board, or U.S. EPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or U.S. EPA copies of records required to be kept by this Order. (40 C.F.R. § 122.41(h); Wat. Code, § 13267.)

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or U.S. EPA shall be signed and certified in accordance with Standard Provisions—Reporting V.B.2, V.B.3, V.B.4, and V.B.5 below. (40 C.F.R. § 122.41(k).)

2. For a corporation, all permit applications shall be signed by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and

regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures. (40 C.F.R. § 122.22(a)(1).)

For a partnership or sole proprietorship, all permit applications shall be signed by a general partner or the proprietor, respectively. (40 C.F.R. § 122.22(a)(2).)

For a municipality, state, federal, or other public agency, all permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of U.S. EPA). (40 C.F.R. § 122.22(a)(3).).

3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or U.S. EPA shall be signed by a person described in Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

a. The authorization is made in writing by a person described in Standard Provisions—Reporting V.B.2 above (40 C.F.R. § 122.22(b)(1));

b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 C.F.R. § 122.22(b)(2)); and

c. The written authorization is submitted to the Regional Water Board and State Water Board. (40 C.F.R. § 122.22(b)(3).)

4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions—Reporting V.B.3 above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 C.F.R. § 122.22(c).)

5. Any person signing a document under Standard Provisions—Reporting V.B.2 or V.B.3 above shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly

responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." (40 C.F.R. § 122.22(d).)

C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program in this Order. (40 C.F.R. § 122.22(l)(4).)

2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. (40 C.F.R. § 122.41(l)(4)(i).)

3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 C.F.R. part 136, or another method required for an industry-specific waste stream under 40 C.F.R. subchapters N or O, the results of such monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board. (40 C.F.R. § 122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 C.F.R. § 122.41(l)(4)(iii).)

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date. (40 C.F.R. § 122.41(l)(5).)

E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. (40 C.F.R. § 122.41(l)(6)(i).)

2. The following shall be included as information that must be reported within 24 hours under this paragraph (40 C.F.R. § 122.41(l)(6)(ii)):

a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(A).)

b. Any upset that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(B).)

3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 C.F.R. § 122.41(l)(6)(iii).)

F. Planned Changes

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 C.F.R. § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 C.F.R. section 122.29(b) (40 C.F.R. § 122.41(l)(1)(i)); or

2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are not subject to effluent limitations in this Order. (Alternatively, for an existing manufacturing, commercial, mining, or silvicultural discharge as referenced in 40 C.F.R. section 122.42(a), this notification applies to pollutants that are subject neither to effluent limitations in this Order nor to notification requirements under 40 C.F.R. section 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1).) (40 C.F.R. § 122.41(l)(1)(ii).)

3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. (40 C.F.R. § 122.41(l)(1)(iii).)

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with this Order's requirements. (40 C.F.R. § 122.41(l)(2).)

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions—Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision—Reporting V.E above. (40 C.F.R. § 122.41(l)(7).)

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the

Regional Water Board, State Water Board, or U.S. EPA, the Discharger shall promptly submit such facts or information. (40 C.F.R. § 122.41(l)(8).)

VI. STANDARD PROVISIONS – ENFORCEMENT

A. The Regional Water Board is authorized to enforce the terms of this Order under several provisions of the Water Code, including, but not limited to, sections 13385, 13386, and 13387.

VII. ADDITIONAL PROVISIONS—NOTIFICATION LEVELS

A. Non-Municipal Facilities

Existing manufacturing, commercial, mining, and silvicultural Dischargers shall notify the Regional Water Board as soon as they know or have reason to believe (40 C.F.R. § 122.42(a)):

1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(1)):

a. 100 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(1)(i));

b. 200 µg/L for acrolein and acrylonitrile; 500 µg/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(1)(ii));

c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(1)(iii)); or

d. The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(1)(iv).)

2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(2)):

a. 500 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(2)(i));

b. 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(2)(ii));

c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(2)(iii)); or

d. The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(2)(iv).)

B. Publicly-Owned Treatment Works (POTWs)

All POTWs shall provide adequate notice to the Regional Water Board of the following (40 C.F.R. § 122.42(b)):

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to CWA sections 301 or 306 if it were directly discharging those pollutants (40 C.F.R. § 122.42(b)(1)); and

2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of this Order. (40 C.F.R. § 122.42(b)(2).)

3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW. (40 C.F.R. § 122.42(b)(3).)

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

The Code of Federal Regulations (40 C.F.R. § 122.48) requires that all NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements that implement federal and State regulations.

I. GENERAL MONITORING PROVISIONS

A. The Discharger shall comply with this MRP. The Executive Officer may amend this MRP pursuant to 40 C.F.R. sections 122.62, 122.63, and 124.5. If any discrepancies exist between this MRP and the "Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits" (Attachment G), this MRP shall prevail.

B. The Discharger shall conduct all monitoring in accordance with Attachment D, section III, as supplemented by Attachment G. Equivalent test methods must be more sensitive than those specified in 40 C.F.R. section 136 and must be specified in this permit.

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Table E-1. Monitoring Locations

Type of Sampling Location	Monitoring Location Name	Monitoring Location Description [1]
Influent	INF-001	Any point at the Southeast Plant upstream of the primary sedimentation basins at which all waste tributary to the treatment system is present, and preceding any phase of treatment. *Latitude 37.744611 Longitude -122.392111*
Influent	INF-002	Any point at the North Point Facility upstream of the primary sedimentation basins at which all waste tributary to the treatment system is present, and preceding any phase of treatment. *Latitude 37.806333 Longitude -122.409389*
Effluent	EFF-001A	During dry weather, any point at the Southeast Plant between the point at which all wastes have gone through complete secondary treatment, including disinfection, and Discharge Point No. 001 (deep water outfall). *Latitude 37.743611 Longitude -122.390000*
Effluent	EFF-001B	During wet weather, any point at the Southeast Plant at which adequate disinfection is assured and Discharge Point No. 001 (deep water outfall) (may be the same as Monitoring Location EFF-001A). *Latitude 37.743611 Longitude -122.390000*
Effluent	EFF-002	During wet weather, any point at the Southeast Plant between the point at which all wastes have gone through complete secondary treatment, including disinfection, and Discharge Point No. 002 (Islais Creek outfall). *Latitude 37.746944 Longitude -122.388056*

Type of Sampling Location	Monitoring Location Name	Monitoring Location Description [1]
Effluent	EFF-003	During wet weather, any point at the North Point Facility between Discharge Point Nos. 003 and 004 (Pier 33 outfalls) and 005 and 006 (Pier 35 outfalls) and the point at which all waste tributary to those outfalls is present and adequate disinfection is assured. *Latitude 37.806667 Longitude -122.407500*
Combined Sewer Discharge	CSD-010	During wet weather, any point between Discharge Point No. 010 (Pierce Street outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.806944 Longitude -122.440000*
Combined Sewer Discharge	CSD-025	During wet weather, any point between Discharge Point No. 025 (Sixth Street North outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.071944 Longitude -122.396111*
Combined Sewer Discharge	CSD-029	During wet weather, any point between Discharge Point No. 029 (Mariposa Street outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.764722 Longitude -122.385278*
Combined Sewer Discharge	CSD-031A	During wet weather, any point between Discharge Point No. 031A (North Islais North outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.747778 Longitude -122.387500*
Combined Sewer Discharge	CSD-041	During wet weather, any point between Discharge Point Nos. 041 or 042 (Yosemite Avenue or Fitch Street outfalls) and the point at which all waste tributary to the outfalls is present. *Latitude 37.723889 Longitude -122.381389* or *Latitude 37.722222 Longitude -122.381389*
Combined Sewer Discharge	CSD-043	During wet weather, any point between Discharge Point No. 043 (Sunnydale Avenue outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.747222 Longitude -122.386944*
Shoreline	S-202.5	Crissy Field West *Latitude 37.811667 Longitude -122.490000*
Shoreline	S-202.4	Crissy Field (east of Lagoon) *Latitude 37.810278 Longitude -122.452778*
Shoreline	S-210.1	Aquatic Park (Hyde St. Pier) *Latitude 37.8150DW00 Longitude -122.425833*
Shoreline	S-211	Aquatic Park Beach East End *Latitude 37.814722 Longitude -122.424167*
Shoreline	S-300.1	Candlestick Point SRA (Sunnydale Cove Beach) *Latitude 37.715833 Longitude -122.394167*
Shoreline	S-301.1	Candlestick Point SRA (Windsurfer Circle) *Latitude 37.715278 Longitude -122.366607*
Shoreline	S-301.2	Candlestick Point SRA (Jack Rabbit Beach) *Latitude 37.718611 Longitude -122.366667*
Biosolids	BIO-001	Biosolids (treated sludge)

Footnote:

[1] Latitude and longitude information is approximate for administrative purposes.

III. INFLUENT MONITORING REQUIREMENTS

The Discharger shall monitor Southeast Plant influent at Monitoring Location INF-001 as follows. Only flow monitoring is required during wet weather.

Table E-2. Influent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow [1]	MGD	Continuous	Continuous/D [3]
Biochemical Oxygen Demand (5-day @ 20°C)(BOD_5)	mg/L	C-24	1/Week [3]
Total Suspended Solids (TSS)	mg/L	C-24	5/Week [3]
Cyanide, Total [2]	µg/L	Grab	1/Month [3]

Unit Abbreviations:

MGD = million gallons per day
MG = million gallons
mg/L = milligrams per liter
µg/L = micrograms per liter

Sample Type:

Continuous = measured continuously
C-24 = 24-hour composite sample
Grab = Grab sample

Sampling Frequency:

Continuous/D = measured continuously, and recorded and reported daily
1/Week = once per week
5/Week = five times per week
1/Month = once per month

Footnotes:

[1] Flow shall be monitored continuously and the following information shall be reported in monthly self-monitoring reports:
- Daily average flow (MGD)
- Monthly average flow (MGD)
- Total monthly flow volume (MG)
- Maximum and minimum daily average flow rates (MGD)

[2] Influent cyanide monitoring may be used to satisfy the pretreatment monitoring requirements in Table E-7.

[3] BOD_5, TSS, and total cyanide monitoring is required only during dry weather.

IV. EFFLUENT MONITORING REQUIREMENTS

A. Dry Weather

During dry weather, the Discharger shall monitor Southeast Plant effluent at Monitoring Location EFF-001A as follows:

Table E-3. Effluent Monitoring — Dry Weather

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow [1]	MGD	Continuous	Continuous/D
BOD_5	mg/L	C-24	1/Week [2]
TSS	mg/L	C-24	5/Week
Chemical Oxygen Demand (COD)	mg/L	C-24	5/Week [2]
Oil and Grease [3]	mg/L	Grab	1/Month

Parameter	Units	Sample Type	Minimum Sampling Frequency
pH [4]	standard units	Continuous or Grab	Continuous or 5/Week
Enterococcus [9]	MPN/100 mL	Grab	4/Year [8]
Fecal Coliform [9]	MPN/100 mL	Grab	1/Week
Total Residual Chlorine [5]	mg/L	Continuous or Grab	Continuous/H or 1/Hour
Acute Toxicity [6]	% Survival	Flow through	1/Month
Chronic Toxicity [7]	TUc	C-24	2/Year
Ammonia, Total	mg/L as N	Grab or C-24	1/Month
Copper, Total Recoverable	µg/L	C-24	1/Month
Cyanide, Total	µg/L	Grab	1/Month
Dioxin-TEQ	µg/L	Grab	2/Year
1,2-Diphenylhydrazine	µg/L	Grab	1/Month

Unit Abbreviations:

MGD = million gallons per day
mg/L = milligrams per liter
mg/L as N = milligrams per liter as nitrogen
MPN/100 mL = most probable number per 100 milliliters
TUc = chronic toxicity units, equal to 100/NOEL, where NOEL = IC_{25}, EC_{25}, or NOEC
µg/L = micrograms per liter

Sample Type:

Continuous = measured continuously
C-24 = 24-hour composite sample
Grab = grab sample

Sampling Frequency:

Continuous/H = measured continuously, and recorded and reported hourly
Continuous/D = measured continuously, and recorded and reported daily
1/Hour = once per hour
1/Week = once per week
3/Week = three times per week
5/Week = five times per week
1/Month = once per month
5/Month = five times per month
2/Year = twice per year
4/Year = four times per year

Footnotes:

[1] Flow shall be monitored continuously and the following information shall be reported in monthly self-monitoring reports:
- Daily average flow (MGD)
- Monthly average flow (MGD)
- Total monthly flow volume (MG)
- Maximum and minimum daily average flow rates (MGD)

[2] If the COD concentration exceeds 75 mg/L on two consecutive days, the Discharger shall increase the BOD_5 sampling frequency to daily until it demonstreates that the BOD_5 concentration is below 30 mg/L.

[3] Each oil and grease sampling and analysis event shall be conducted in accordance with U.S. EPA Method 1664.

[4] If pH is monitored continuously, the minimum and maximum pH values for each day shall be reported in self-monitoring reports.

[5] Effluent residual chlorine concentrations shall be monitored continuously or, at a minimum, every hour. The Discharger shall report for each day the maximum residual chlorine concentration observed following dechlorination. However, if monitoring continuously, the Discharger shall report for each day the maximum residual chlorine concentration based only on discrete readings from the continuous monitoring taken every hour on the hour. The Discharger shall retain continuous monitoring readings for at least three years. The Regional Water Board reserves the right to use all other continuous monitoring data for discretionary enforcement.

[6] Acute bioassay tests shall be performed in accordance with MRP section V.A.

[7] Critical life stage toxicity tests shall be performed in accordance with MRP section V.B.

[8] The four samples shall be collected in different calendar months during the higher recreational water contact season (June through October). If the enterococcus effluent limitation is exceeded, the Discharger shall conduct 5/Month accelerated sampling for at least three consecutive months. If full compliance is demonstrated after the three months, the Discharger may return to the 4/Year sampling.

[9] Results may be reported as Colony Forming Units/100 milliliters (CFU/100 mL) if the laboratory method used provides results in CFU/100 mL.

B. Wet Weather

1. **Southeast Plant and North Point Facility Outfalls.** During wet weather, when wet weather facilities are operating, the Discharger shall monitor Southeast Plant effluent at Monitoring Locations EFF-001B and EFF-002, and North Point Facility effluent at Monitoring Location EFF-003, as follows:

Table E-4. Effluent Monitoring — Wet Weather

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow [1]	MGD	Continuous	Continuous/D
TSS	mg/L	C-X	1/Month
COD	mg/L	C-X	1/Month
Oil and Grease	mg/L	Grab	1/Month
pH	standard units	Continuous or Grab	Continuous or 1/Month
Enterococcus [5]	MPN/100 mL [2]	Grab	1/Day [4]
Fecal Coliform	MPN/100 mL [2]	Grab	1/Day [4]
Total Residual Chlorine	mg/L	Continuous or Grab	Continuous/H or 1/Hour
Acute Toxicity [3]	% Survival	Grab	1/Month
Copper, Total Recoverable	µg/L	C-X	1/Month
Cyanide, Total	µg/L	C-X	1/Month
Ammonia, Total	mg/L as N	Grab	1/Month

Unit Abbreviations:

MGD = million gallons per day
mg/L = milligrams per liter
mg/L as N = milligrams per liter as nitrogen
µg/L = micrograms per liter
MPN/100 mL = most probable number per 100 milliliters

Sample Type:

Continuous = measured continuously
C-X = composite sample comprised of individual grab samples collected at equal intervals of no more than one hour for the duration of the discharge event but not exceeding 24 hours. If an event does not last at least 24-hours, the Discharger shall sample for as long as possible and note the duration in its self-monitoring report.
Grab = grab sample

Sampling Frequency:

Continuous/H = measured continuously, and recorded and reported hourly
Continuous/D = measured continuously, and recorded and reported daily
1/Hour = once per hour
1/Month = once per month
1/Day = once per wet weather day

Footnotes:

[1] Flow shall be monitored continuously and the following information shall be reported in monthly self-monitoring reports:
- Daily average flow (MGD)
- Monthly average flow (MGD)
- Total monthly flow volume (MG)
- Maximum and minimum daily average flow rates (MGD)

[2] Results may be reported as colony forming units (CFU)/100 mL if the laboratory method used provides results in CFU/100 mL.

[3] Acute bioassay tests shall be performed only at Monitoring Location EFF-001B and EFF-003 in accordance with MRP section V.A.

[4] Wet weather effluent samples shall be collected within 4 hours after discharges start (when discharges start between 4:00 a.m. and 2:00 p.m.). If the wet weather facility begins operation after 2:00 p.m., samples shall be collected first thing the next morning during business hours (by 9:00 a.m.), provided that the discharge is still occurring.

[5] Data from both wet and dry weather shall be included when calculating the geometric mean for compliance with this monthly wet weather limitation. For days with discharge but no sampling, the enterococcus densities shall be assumed to be the same as the densities of the most recent discharge samples. For days with no discharge, enterococcus densities shall be assumed to be 1 MPN/100 mL for calculational purposes.

2. **Combined Sewer Discharge Outfalls.** During wet weather, when combined sewer discharges are occurring, the Discharger shall monitor combined sewer discharges at Monitoring Locations CSD-010 through CSD-043 as follows:

Table E-5. Combined Sewer Discharge Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Event Duration	minutes	---	1/Event
Flow Volume [1]	MG	Continuous	1/Event

Unit Abbreviations:

MG = million gallons

Sample Type:

Continuous = measured continuously

Sampling Frequency:

1/Event = once per combined sewer discharge event

Footnote:

[1] Flow volume may be estimated using models.

The Discharger shall also record and report in its self-monitoring reports the following information for each combined sewer discharge event at Monitoring Locations CSD-010 through CSD-043:

a. Date and time that combined sewer discharge started;

b. Rainfall intensity and amount (aggregated hourly data); and

c. Information supporting discharge volume estimate (if estimated).

V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS

The Discharger shall monitor whole effluent acute and chronic toxicity as follows.

A. Whole Effluent Acute Toxicity

1. During dry weather, acute toxicity at Discharge Point No. 001 (Monitoring Location EFF-001A) shall be evaluated by measuring survival of test organisms exposed to 96-hour continuous flow-through bioassays. The Discharger may stop a bioassay if wet weather occurs during a 96-hour test. If so, the Discharger shall initiate another test as soon as possible (i.e., as soon as approximately 96 hours of dry weather is forecasted). The Discharger may choose to continue a test during wet weather unless the instantaneous influent flow to the Southeast Plant (at Monitoring Location INF-001 as defined in the MRP) exceeds 110 MGD and discharge occurs at Discharge Point No. 002.

During wet weather, acute toxicity at Discharge Point Nos. 001 and 003 through 006 (Monitoring Locations EFF-001B and EFF-003) shall be evaluated by measuring survival of test organisms exposed to 96-hour static bioassays.

2. Test organisms shall be rainbow trout (*Oncorhynchus mykiss*) or fathead minnow (*Pimphales promelas*). The Executive Officer may specify a more sensitive organism or, if testing a particular organism proves unworkable, the most sensitive organism available.

3. All bioassays shall be performed according to the most up-to-date protocols in 40 C.F.R. part 136, currently *Methods for Measuring the Acute Toxicity of Effluents and Receiving Water to Freshwater and Marine Organisms,* 5th Edition (EPA-821-R-02-012).

4. If the Discharger demonstrates that specific identifiable substances in the discharge are rapidly rendered harmless upon discharge to the receiving water, compliance with the acute toxicity limit may be determined after test samples are adjusted to remove the influence of those substances. Written acknowledgement that the Executive Officer concurs with the Discharger's demonstration and that the adjustment will not remove the influence of other substances must be obtained prior to any such adjustment. The Discharger may manually adjust the pH of whole effluent acute toxicity samples prior to performing bioassays to minimize ammonia toxicity interference.

5. Bioassay water monitoring shall include, on a daily basis, pH, dissolved oxygen, ammonia (if toxicity is observed), temperature, hardness, and alkalinity. These results shall be reported. If a violation of an acute toxicity limit occurs, the bioassay test shall be repeated with new fish as soon as practical and shall be repeated until a test fish survival rate of 90 percent or greater is observed. If the control fish survival rate is less than 90 percent, the bioassay test shall be restarted with new fish and shall continue as soon as practical until an acceptable test is completed (i.e., control fish survival rate is 90 percent or greater).

B. Whole Effluent Chronic Toxicity

1. Monitoring Requirements

a. Sampling. During dry weather, the Discharger shall collect 24-hour composite effluent samples at Monitoring Location EFF-001A for critical life stage toxicity testing as indicated below. For toxicity tests requiring renewals, the Discharger shall collect 24-hour composite samples on consecutive days.

b. Test Species. The test species shall be purple sea urchin (*Strongylocentroltus purpuratus*) or, if gravid purple sea urchin are unavailable, sand dollar (*Dendraster excentricus*), unless a more sensitive species is identified.

The Discharger shall conduct a screening chronic toxicity test as described in Appendix E-1 following any significant change in the nature of the effluent. If there is no significant change in the nature of the effluent, the Discharger shall conduct a screening test and submit the results with its application for permit reissuance.

c. Frequency. Chronic toxicity monitoring shall be as specified below:

i. The Discharger shall monitor routinely twice per year.

ii. The Discharger shall accelerate monitoring to monthly after either exceeding a three-sample median of 10 TUC or a single-sample maximum of 20 TU_c. Based on the TUc results, the Executive Officer may specify a different frequency for accelerated monitoring to ensure that accelerated monitoring provides useful information.

iii. The Discharger shall return to routine monitoring if accelerated monitoring does not exceed either trigger in ii, above.

iv. If accelerated monitoring confirms consistent toxicity in excess of either trigger in ii, above, the Discharger shall continue accelerated monitoring and initiate toxicity reduction evaluation (TRE) procedures in accordance with section V.B.3, below.

v. The Discharger shall return to routine monitoring after implementing appropriate elements of the TRE, and either the toxicity drops below both triggers in ii, above, or, based on the TRE results, the Executive Officer determines that accelerated monitoring would no longer provide useful information.

Monitoring conducted pursuant to a TRE shall satisfy the requirements for routine and accelerated monitoring while the TRE is underway.

d. Methodology. Sample collection, handling, and preservation shall be in accordance with U.S. EPA protocols. In addition, bioassays shall be conducted in compliance with the most recently promulgated test methods, as shown in Appendix E-1. These are *Short-Term Methods for Estimating the Chronic Toxcicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms*, currently first edition (EPA/600/R-95-136). If these protocols prove unworkable, the Executive Officer and the Environmental Laboratory Accreditation Program may grant exceptions in writing upon the Discharger's request with justification. If the Discharger demonstrates that specific identifiable substances in the discharge are rapidly rendered harmless upon discharge to the receiving water, compliance with the chronic toxicity limit may be determined after test samples are adjusted to remove the influence of those substances. Written acknowledgement that the Executive Officer concurs with the Discharger's demonstration and that the adjustment will not remove the influence of other substances must be obtained prior to any such adjustment.

e. Dilution Series. The Discharger shall conduct tests at 20%, 15%, 10%, 5%, and 2.5%. The "%" represents percent effluent as discharged. Test sample pH may be controlled to the level of the effluent sample as received prior to being salted up.

2. Reporting Requirements

a. The Discharger shall provide toxicity test results for the current reporting period in the self-monitoring report and shall include the following, at a minimum, for each test.

i. Sample date

ii. Test initiation date

iii. Test species

iv. End point values for each dilution (e.g., number of young, growth rate, percent survival)

v. No Observable Effect Level (NOEL) values in percent effluent. The NOEL shall equal the IC_{25} or EC_{25} (see MRP Appendix E-1). If the IC_{25} or EC_{25} cannot be statistically determined, the NOEL shall equal to the No Observable Effect Concentration (NOEC) derived using hypothesis testing. The NOEC is the maximum percent effluent concentration that causes no observable effect on test organisms based on a critical life stage toxicity test.

vi. IC_{15}, IC_{25}, IC_{40}, and IC_{50} values (or EC_{15}, EC_{25}, EC_{40}, and EC_{50}) as percent effluent

vii. TUc values (100/NOEL, where NOEL = IC_{25}, EC_{25}, or NOEC

viii. Mean percent mortality (±s.d.) after 96 hours in 100% effluent (if applicable)

ix. IC_{50} or EC_{50} values for reference toxicant tests

x. Available water quality measurements for each test (e.g., pH, dissolved oxygen, temperature, conductivity, hardness, salinity, and ammonia)

b. The Discharger shall provide the results of the most recent three chronic toxicity tests and the 3-sample median in the self-monitoring report as TUc's.

3. Toxicity Reduction Evaluation (TRE)

a. The Discharger shall prepare a generic TRE work plan within 90 days of the effective date of this Order to be ready to respond to toxicity events. The Discharger shall review and update the work plan as necessary so that it remains current and applicable to the discharge and discharge facilities.

b. Within 30 days of exceeding either chronic toxicity trigger in section V.B.1.c.ii, above, the Discharger shall submit a TRE work plan, which shall be the generic work plan revised as appropriate for this toxicity event after consideration of available discharge data.

c. Within 30 days of completing an accelerated monitoring test observed to exceed either trigger in section V.B.1.c.ii, above, the Discharger shall initiate a TRE in accordance with a TRE work plan that incorporates any and all comments from the Executive Officer.

d. The TRE shall be specific to the discharge and be in accordance with current technical guidance and reference materials, including U.S. EPA guidance materials. The Discharger shall conduct the TRE as a tiered evaluation as summarized below.

i. Tier 1 shall consist of basic data collection (routine and accelerated monitoring).

ii. Tier 2 shall consist of evaluation of treatment process optimization, including operational practices and in-plant process chemicals.

iii. Tier 3 shall consist of a toxicity identification evaluation (TIE).

iv. Tier 4 shall consist of evaluation of options for additional effluent treatment processes.

v. Tier 5 shall consist of evaluation of options for modifications of in-plant treatment processes.

vi. Tier 6 shall consist of implementation of selected toxicity control measures, and followup monitoring and confirmation of implementation success.

e. The Discharger may end the TRE at any stage if monitoring finds there is no longer consistent toxicity (i.e., compliance with Provision IV.A.5 of the Order).

f. The objective of the TIE shall be to identify the substance or combination of substances causing the observed toxicity. The Discharger shall employ all reasonable efforts using currently available TIE methodologies.

g. As toxic substances are identified or characterized, the Discharger shall continue the TRE by determining the sources and evaluating alternative strategies for reducing or eliminating the toxic substances from the discharge. The Discharger shall take all reasonable steps to reduce toxicity to levels below the chronic toxicity limit.

h. Many recommended TRE elements parallel required or recommended efforts related to source control, pollution prevention, and stormwater control programs. TRE efforts should be coordinated with such efforts. To prevent duplication of efforts, evidence of complying with requirements or recommended efforts of such programs may be acceptable to demonstrate compliance with TRE requirements.

i. Chronic toxicity may be episodic and identification of causes of and reduction of sources of chronic toxicity may not be successful. Regional Water Board enforcement considerations will be based in part on the Discharger's actions and efforts to identify and control or reduce sources of consistent toxicity.

VI. RECEIVING WATER MONITORING REQUIREMENTS

A. Regional Monitoring. The Discharger shall continue to participate in the Regional Monitoring Program, which collects data on pollutants and toxicity in San Francisco Bay water, sediment, and biota.

B. Shoreline Monitoring. Following any combined sewer discharge event at Discharge Point Nos. 009, 010, 011, 013, or 015, the Discharger shall monitor shoreline receiving waters at Monitoring Locations S-202.4, S-202.5, S-210, and S-211. Following any combined sewer discharge event at Discharge Point Nos. 040, 041, or 042, the Discharger shall monitor at Monitoring Location S-301.2. Following any combined sewer discharge event at Discharge Point No. 043, the Discharger shall monitor at Monitoring Locations S-300.1 and S-301.1. Monitoring shall be conducted at each location as follows for up to seven days or until the single-sample bacteriological standards of Cal. Code of Regs. tit. 17, section 7958(a)(1), are met at that location (i.e., the enterococcus density is less than 104 most probable number (MPN)/100 mL and the fecal coliform density is less than 400 MPN/100 mL). Samples shall be collected between 8:00 a.m. and 4:00 p.m.

Table E-6. Shoreline Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Enterococcus [1]	MPN/100 mL [3]	Grab	1/Day
Fecal Coliform [2]	MPN/100 mL [3]	Grab	1/Day

Unit Abbreviations:

MPN/100 mL = most probable number per 100 milliliters

Sample Type:

Grab = Grab sample

Sampling Frequency:

1/Day = once per day

Footnotes:

[1] The Discharger shall monitor for enterococcus using U.S. EPA-approved methods, such as the IDEXX Enterolert method. When replicate analyses are made, the reported result shall be the geometric mean of the replicate results.

[2] Alternatively, the Discharger may measure *E. coli* as recommended for the U.S. EPA Beach Monitoring Program. *E. coli* may be measured using the IDEXX Colilert method.

[3] Results may be reported as CFU/100 mL if the test method used provides results in CFU/100 mL.

VII. PRETREATMENT AND BIOSOLIDS MONITORING REQUIREMENTS

The Discharger shall comply with the following pretreatment monitoring requirements for influent (at Monitoring Location INF-001), effluent (at Monitoring Location EFF-001A), and biosolids (at Monitoring Location BIO-001). The Discharger shall report summaries of analytical results in annual and semi-annual pretreatment reports in accordance with Attachment H. At its option, the Discharger may also report biosolids analytical results in its electronic self-monitoring reports by manual entry, by EDF/CDF, or as an attached file.

Table E-7. Pretreatment and Biosolids Monitoring

Constituents	Sampling Frequency			Sample Type	
	Influent INF-001 [1]	Effluent EFF-001A [1]	Biosolids BIO-001	Influent and Effluent	Biosolids
VOC [2]	2/Year	2/Year	2/Year	Grab	Grabs [6c]
BNA [3]	2/Year	2/Year	2/Year	Grab	Grabs [6c]
Metals [4]	1/Month	1/Month	2/Year	C-24 [6a]	Grabs [6c]
Hexavalent Chromium [5]	1/Month	1/Month	2/Year	Grab	Grabs [6c]
Mercury	1/Month	1/Month	2/Year	Grab or C-24 [6a][6b]	Grabs [6c]
Cyanide, Total	1/Month	1/Month	---	Grab	Grabs [6c]

Sample Type:

C-24 = 24-hour composite sample
Grab = Grab sample

Sampling Frequency:

1/Month = once per month
2/Year = twice per year

Footnotes:

[1] Influent and effluent monitoring conducted in accordance with Tables E-2 and E-3 may be used to satisfy these pretreatment monitoring requirements.

[2] VOC: volatile organic compounds

[3] BNA: base/neutrals and acids extractable organic compounds

[4] The metals are arsenic, cadmium, copper, lead, nickel, silver, zinc, and selenium.

[5] The Discharger may elect to report total chromium instead of hexavalent chromium. Samples collected for total chromium measurements shall be 24-hour composites.

[6] Sample types:

a. If an automatic compositor is used, the Discharger shall obtain 24-hour composite samples through flow-proportioned composite sampling. Alternatively, 24-hour composite samples may consist of discrete grab samples combined (volumetrically flow-weighted) prior to analysis or mathematically flow-weighted.

b. The Discharger may use automatic compositors for mercury if either (1) the compositing equipment (hoses and containers) complies with ultra-clean specifications, or (2) equipment blank samples demonstrate that the compositing equipment has not contaminated the sample.

c. The biosolids sample shall be a composite of the biosolids to be disposed. Biosolids collection and monitoring shall comply with the requirements specified in Attachment H, Appendix H-4. The Discharger shall also comply with the biosolids monitoring requirements of 40 C.F.R. part 503.

VIII. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

The Discharger shall comply with all Standard Provisions (Attachments D and G) related to monitoring, reporting, and recordkeeping, with modifications shown in section IX, below.

B. Self-Monitoring Reports (SMRs)

1. **SMR Format.** The Discharger shall electronically submit SMRs using the State Water Board's California Integrated Water Quality System (CIWQS) Web site (http://www.waterboards.ca.gov/ciwqs/index.html). The CIWQS website will provide additional information for SMR submittal in the event of a planned service interruption for electronic submittal.

2. **SMR Due Dates and Contents.** The Discharger shall submit SMRs by the due dates, and with the contents, specified below:

   a. **Monthly SMRs —** Monthly SMRs shall be due 30 days after the end of each calendar month, covering that calendar month. The monthly SMR shall contain the applicable items described in sections V.B and V.C of both Attachments D and G of this Order. See Provision VI.C.2 (Effluent Characterization Study and Report) of this Order for information that must also be reported with monthly SMRs.

   Monthly SMRs shall include all new monitoring results obtained since the last SMR was submitted. If the Discharger monitors any pollutant more frequently than required by this Order, the Discharger shall include the results of such monitoring in the calculations and reporting for the SMR.

   b. **Annual SMR —** Annual SMRs shall be due February 1 each year, covering the previous calendar year. The annual SMR shall contain the items described in sections V.C.1.f of Attachment G. See also Provisions VI.C.2 (Effluent Characterization Study and Report) and VI.C.5.b.ix (Monitor to Characterize Wet Weather Discharge Impacts and Efficacy of Controls) of the Order for requirements to submit reports with the annual SMR.

   c. **Specifications for Submitting SMRs to CIWQS —** The Discharger shall submit analytical results and other information using one of the following methods.

Table E-8. CIWQS Reporting

Parameter	Method of Reporting	
	EDF/CDF data upload or manual entry	**Attached File**
All parameters identified in influent, effluent, and receiving water monitoring tables (except Dissolved Oxygen and Temperature)	Required for all results	
Dissolved Oxygen Temperature	Required for monthly maximum and minimum results only [1]	Discharger may use this method for all results or keep records
Cyanide Arsenic Cadmium Chromium Copper Lead Mercury Nickel Selenium Silver Zinc Dioxins and Furans (by U.S. EPA Method 1613)	Required for all results [2]	
Antimony Beryllium Thallium Other Pollutants (by U.S. EPA Methods 601, 602, 608, 610, 614, 624, and 625)	Not required (unless identified in influent, effluent, or receiving water monitoring tables), but encouraged [1]	Discharger may use this method and submit results with application for permit reissuance, unless data are submitted by CDF/EDF upload
Volume and Duration of Blended Discharge [3]	Required for all blended effluent discharges	

Parameter	Method of Reporting	
	EDF/CDF data upload or manual entry	**Attached File**
Analytical Method	Not required (Discharger may select "data unavailable") [1]	
Collection Time Analysis Time	Not required (Discharger may select "0:00") [1]	

Footnotes:

[1] The Discharger shall continue to monitor at the minimum frequency specified in this MRP, keep records of the measurements, and make the records available upon request.

[2] These parameters require EDF/CDF data upload or manual entry regardless of whether monitoring is required by this MRP or other provisions of this Order (except for biosolids, sludge, or ash provisions).

[3] The requirement for volume and duration of blended discharge applies only if this Order authorizes the Discharger to discharge blended effluent.

The Discharger shall arrange all reported data in a tabular format and summarize data to clearly illustrate whether the Facility is operating in compliance with effluent limitations. The Discharger is not required to duplicate the submittal of data entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format, the Discharger shall electronically submit the data in a tabular format as an attachment.

3. **Monitoring Periods.** Monitoring periods for all required monitoring shall be as set forth below unless otherwise specified:

Table E-9. Monitoring Periods

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
Continuous	Permit effective date	All
1/Hour	Permit effective date	Hourly
1/Day	Permit effective date	Midnight through 11:59 p.m. or any 24-hour period that reasonably represents a calendar day for purposes of sampling.
1/Week or 2/Week or 5/Week	Sunday following permit effective date or on permit effective date if on Sunday	Sunday through Saturday
1/Month	First day of calendar month following permit effective date or on permit effective date if on first day of month	First day of calendar month through last day of calendar month
1/2 Months	First day of calendar month following permit effective date or on permit effective date if that date is first day of month	First day of calendar month through last day of next calendar month
1/Year	January 1	January 1 through December 31
2/Year	Closest January 1 or July 1 following (or on) permit effective date	November 1 through April 30 May 1 through October 31
4/Year	Closest January 1, April 1, July 1, or October 1 following (or on) permit effective date	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
1/5 Years	Permit effective date	Once during the Order term no more than 12 months prior to applying for permit reissuance.

4. **RL and MDL Reporting.** The Discharger shall report with each sample result the Reporting Level (RL) and Method Detection Limit (MDL) as determined by the procedure in 40 C.F.R. part 136. The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

   a. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

   b. Sample results less than the RL, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported. The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (+/- a percentage of the reported value), numerical ranges (low to high), or any other means the laboratory considers appropriate.

   c. Sample results less than the laboratory's MDL shall be reported as "Not Detected" or ND.

   d. The Discharger shall instruct laboratories to establish calibration standards so that the minimum level (ML) value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.

5. **Compliance Determination.** Compliance with effluent limitations for priority pollutants shall be determined using sample reporting protocols defined above and in the Fact Sheet and Attachments A, D, and G. For purposes of reporting and administrative enforcement by the Regional Water Board and State Water Board, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reporting level (RL).

C. Discharge Monitoring Reports (DMRs)

1. At any time during the term of this Order, the State Water Board or Regional Water Board may notify the Discharger to electronically submit DMRs. Until such notification is given, the Discharger shall submit DMRs in accordance with the requirements described below.

2. Once notified by the State Water Board or Regional Water Board, the Discharger shall submit hard copy DMRs. The Discharger shall sign and certify DMRs as Attachment D requires. The Discharger shall submit original DMRs to one of the addresses listed below:

Standard Mail	FedEx/UPS/Other Private Carriers
State Water Resources Control Board Division of Water Quality c/o DMR Processing Center PO Box 100 Sacramento, CA 95812-1000	State Water Resources Control Board Division of Water Quality c/o DMR Processing Center 1001 I Street, 15th Floor Sacramento, CA 95814

3. All discharge monitoring results shall be reported on official U.S. EPA pre-printed DMR forms (EPA Form 3320-1) or self-generated forms that follow the exact same format as EPA Form 3320-1.

IX. MODIFICATIONS TO ATTACHMENT G

This MRP modifies Attachment G as indicated below:

A. Attachment G sections V.C.1.f and V.C.1.g are revised as follows, and section V.C.1.h (Reporting data in electronic format) is deleted.

f. Annual self-monitoring report requirements

By the date specified in the MRP, the Discharger shall submit an annual report to the Regional Water Board covering the previous calendar year. The report shall contain the following:

1) Annual compliance summary table of treatment plant performance (this summary table is not required if the Discharger has submitted the year's monitoring results to CIWQS in electronic reporting format by EDF/CDF upload or manual entry);

2) Comprehensive discussion of treatment plant performance and compliance with the permit (this discussion shall include any corrective actions taken or planned, such as changes to facility equipment or operation practices that may be needed to achieve compliance, and any other actions taken or planned that are intended to improve performance and reliability of the Discharger's wastewater collection, treatment, or disposal practices);

3) Both tabular and graphical summaries of the monitoring data for the previous year if parameters are monitored at a frequency of monthly or greater (this item is not required if the Discharger has submitted the year's monitoring results to CIWQS in electronic reporting format by EDF/CDF upload or manual entry);

4) List of approved analyses, including the following:

(i) List of analyses for which the Discharger is certified;

(ii) List of analyses performed for the Discharger by a separate certified laboratory (copies of reports signed by the laboratory director of that laboratory shall not be submitted but be retained onsite); and

(iii) List of "waived" analyses, as approved;

5) Plan view drawing or map showing the Discharger's facility, flow routing, and sampling and observation station locations;

6) Results of annual facility inspection to verify that all elements of the SWPP Plan are accurate and up to date (only required if the Discharger does not route all stormwater to the headworks of its wastewater treatment plant); and

7) Results of facility report reviews (The Discharger shall regularly review, revise, and update, as necessary, the O&M Manual, the Contingency Plan, the Spill Prevention Plan, and Wastewater Facilities Status Report so that these documents remain useful and relevant to current practices. At a minimum, reviews shall be conducted annually. The Discharger shall include, in each Annual Report, a description or summary of review and evaluation procedures, recommended or planned actions, and an estimated time schedule for implementing these actions. The Discharger shall complete changes to these documents to ensure they are up-to-date.).

g. Report submittal

The Discharger shall submit SMRs addressed as follows, unless the Discharger submits SMRs electronically to CIWQS:

California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612
Attn: NPDES Wastewater Division

h. Reporting data in electronic format – *Deleted*

B. Attachment G sections V.E.2, V.E.2.a, and V.E.2.c are revised as follows, and sections V.E.2.b (24-hour Certification) and V.E.2.d (Communication Protocol) are deleted.

2. Unauthorized Discharges from Municipal Wastewater Treatment Plants[1]

The following requirements apply to municipal wastewater treatment plants that experience an unauthorized discharge at their treatment facilities and

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

supersede requirements imposed on the Discharger by the Executive Officer by letter of May 1, 2008.

a. Two (2)-Hour Notification

For any unauthorized discharges that enter a drainage channel or a surface water, the Discharger shall, as soon as possible, but not later than two (2) hours after becoming aware of the discharge, notify the California Emergency Management Agency (CalEMA, currently 800-852-7550), the local health officers or directors of environmental health with jurisdiction over the affected water bodies, and the Regional Water Board. Timely notification by the Discharger to CalEMA also satisfies notification to the Regional Water Board. Notification shall include the following:

1) Incident description and cause;

2) Location of threatened or involved waterway(s) or storm drains;

3) Date and time the unauthorized discharge started;

4) Estimated quantity and duration of the unauthorized discharge (to the extent known), and the estimated amount recovered;

5) Level of treatment prior to discharge (e.g., raw wastewater, primary treated, undisinfected secondary treated, and so on); and

6) Identity of the person reporting the unauthorized discharge.

b. 24-hour Certification – *Deleted*

c. 5-day Written Report

Within five business days, the Discharger shall submit a written report that includes, in addition to the information required above, the following:

1) Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;

2) Efforts implemented to minimize public exposure to the unauthorized discharge;

3) Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted;

4) Corrective measures taken to minimize the impact of the unauthorized discharge;

5) Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future;

6) Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges; and

7) Quantity and duration of the unauthorized discharge, and the amount recovered.

d. Communication Protocol – *Deleted*

X. MODIFICATIONS TO ATTACHMENT H

This MRP modifies Attachment H as indicated below.

A. Attachment H, Appendix H-3, Signature Requirements for Pretreatment Annual and Semiannual Reports, is revised as follows.

The pretreatment annual and semiannual reports shall be signed by a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for the overall operation of the Discharger (POTW - 40 C.F.R. section 403.12[m]). Signed copies of the reports shall be submitted to the State Water Board and the Regional Water Board through the electronic self-monitoring report (eSMR) module of the California Integrated Water Quality System (CIWQS).

APPENDIX E-1
CHRONIC TOXICITY
DEFINITION OF TERMS AND SCREENING PHASE REQUIREMENTS

I. Definition of Terms

A. No observed effect level (NOEL) for compliance determination is equal to IC_{25} or EC_{25}. If the IC_{25} or EC_{25} cannot be statistically determined, the NOEL shall be equal to the NOEC derived using hypothesis testing.

B. Effective concentration (EC) is a point estimate of the toxicant concentration that would cause an adverse effect on a quantal, "all or nothing," response (such as death, immobilization, or serious incapacitation) in a given percent of the test organisms. If the effect is death or immobility, the term lethal concentration (LC) may be used. EC values may be calculated using point estimation techniques such as probit, logit, and Spearman-Karber. EC_{25} is the concentration of toxicant (in percent effluent) that causes a response in 25 percent of the test organisms.

C. Inhibition concentration (IC) is a point estimate of the toxicant concentration that would cause a given percent reduction in a nonlethal, nonquantal biological measurement, such as growth. For example, an IC_{25} is the estimated concentration of toxicant that would cause a 25 percent reduction in average young per female or growth. IC values may be calculated using a linear interpolation method such as U.S. EPA's Bootstrap Procedure.

D. No observed effect concentration (NOEC) is the highest tested concentration of an effluent or a toxicant at which no adverse effects are observed on the aquatic test organisms at a specific time of observation. It is determined using hypothesis testing.

II. Chronic Toxicity Screening Phase Requirements

A. The Discharger shall perform screening phase monitoring:

1. Subsequent to any significant change in the nature of the effluent discharged through changes in sources or treatment, except those changes resulting from reductions in pollutant concentrations attributable to source control efforts, or

2. Prior to permit reissuance. Screening phase monitoring data shall be included in the NPDES permit application for reissuance. The information shall be as recent as possible, but may be based on screening phase monitoring conducted within 5 years before the permit expiration date.

B. Design of the screening phase shall, at a minimum, consist of the following elements:

1. Use of test species specified in Appendix E-2, attached, and use of the protocols referenced in those tables.

2. Two stages:

a. Stage 1 shall consist of a minimum of one battery of tests conducted concurrently. Selection of the type of test species and minimum number of tests shall be based on Appendix E-2 (attached).

b. Stage 2 shall consist of a minimum of two test batteries conducted at a monthly frequency using the three most sensitive species based on the Stage 1 test results.

3. Appropriate controls.

4. Concurrent reference toxicant tests.

5. Dilution series of 100%, 50%, 25%, 12.5%, 6.25%, and 0%, where "%" is percent effluent as discharged, or as otherwise approved by the Executive Officer if different dilution ratios are needed to reflect discharge conditions.

C. The Discharger shall submit a screening phase proposal. The proposal shall address each of the elements listed above. If within 30 days, the Executive Officer does not comment, the Discharger shall commence with screening phase monitoring.

APPENDIX E-2
SUMMARY OF TOXICITY TEST SPECIES REQUIREMENTS

Table AE-1. Critical Life Stage Toxicity Tests for Estuarine Waters

Species	(Scientific Name)	Effect	Test Duration	Reference
Alga	*(Skeletonema costatum)* *(Thalassiosira pseudonana)*	Growth rate	4 days	1
Red alga	*(Champia parvula)*	Number of cystocarps	7–9 days	3
Giant kelp	*(Macrocystis pyrifera)*	Percent germination; germ tube length	48 hours	2
Abalone	*(Haliotis rufescens)*	Abnormal shell development	48 hours	2
Oyster Mussel	*(Crassostrea gigas)* *(Mytilus edulis)*	Abnormal shell development; percent survival	48 hours	2
Echinoderms - Urchins Sand dollar	*(Strongylocentrotus purpuratus, S. franciscanus)* *(Dendraster excentricus)*	Percent fertilization or larval development	1 hour (fertilization) or 72 hours (development)	2
Shrimp	*(Americamysis bahia)*	Percent survival; growth	7 days	3
Shrimp	*(Holmesimysis costata)*	Percent survival; growth	7 days	2
Topsmelt	*(Atherinops affinis)*	Percent survival; growth	7 days	2
Silversides	*(Menidia beryllina)*	Larval growth rate; percent survival	7 days	3

Table AE-3. Toxicity Test Requirements for Stage One Screening Phase

Requirements	Receiving Water Characteristics		
	Discharges to Coast	Discharges to San Francisco Bay [1]	
	Ocean	Marine/Estuarine	Freshwater
Taxonomic diversity	1 plant 1 invertebrate 1 fish	1 plant 1 invertebrate 1 fish	1 plant 1 invertebrate 1 fish
Number of tests of each salinity type: Freshwater [2] Marine/Estuarine	0 4	1 or 2 3 or 4	3 0
Total number of tests	4	5	3

[1] (a) Marine refers to receiving water salinities greater than 1 part per thousand (ppt) at least 95 percent of the time during a normal water year.

(b) Freshwater refers to receiving water with salinities less than 1 ppt at least 95 percent of the time during a normal water year.

(c) Estuarine refers to receiving water salinities that fall between those of marine and freshwater, as described above.

[2] The freshwater species may be substituted with marine species if:

(a) The salinity of the effluent is above 1 ppt greater than 95 percent of the time, or

(b) The ionic strength (TDS or conductivity) of the effluent at the test concentration used to determine compliance is documented to be toxic to the test species.

ATTACHMENT F – FACT SHEET

This Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order. As described in section II.B of the Order, the Regional Water Board incorporates this Fact Sheet as its findings supporting the issuance of the Order.

I. PERMIT INFORMATION

The following table summarizes administrative information related to the facility.

Table F-1. Facility Information

WDID	2 386010001
CIWQS Place ID	256499
Discharger	City and County of San Francisco
Facility Name	Southeast Water Pollution Control Plant, North Point Wet Weather Facility, Bayside Wet Weather Facilities, and Wastewater Collection System
Facility Address	San Francisco Public Utilities Commission / Wastewater Enterprise 750 Phelps Street San Francisco, CA 94124
	San Francisco County
Facility Contact, Title, Phone	Tommy Moala, Assistant General Manager, Wastewater Enterprise, (415) 554-2465
Authorized Person to Sign and Submit Reports	Same as Facility Contact
Mailing Address	San Francisco Public Utilities Commission 525 Golden Gate Ave., 13th Floor San Francisco, CA 94102
Billing Address	Same as Mailing Address
Facility Type	Publicly Owned Treatment Works
Major or Minor Facility	Major
Threat to Water Quality	1
Complexity	A
Pretreatment Program	Yes
Reclamation Requirements	Not Applicable
Mercury and PCBs Requirements	NPDES Permit No. CA0038849
Permitted Flow	85.4 million gallons per day (MGD)
Design Flow	Southeast Water Pollution Control Plant: 85.4 MGD – Average dry weather design flow capacity; 250 MGD – Wet weather design flow capacity: 150 MGD receives primary and secondary treatment, and additional 100 MGD receives only primary treatment. North Point Wet Weather Facility: 150 MGD – Wet weather design flow capacity (only primary treatment).
Watershed	San Francisco Bay
Receiving Water	San Francisco Bay
Receiving Water Type	Marine

A. The City and County of San Francisco (Discharger) is the owner and operator of the Southeast Water Pollution Control Plant (Southeast Plant), North Point Wet Weather Facility (North Point Facility), Bayside Wet Weather Facilities, and wastewater collection system (collectively Facility).

For the purposes of this Order, references to the "discharger" or "permittee" in applicable federal and State laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

B. The Discharger is regulated pursuant to National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037664. It was previously subject to Order No. R2-2008-0007 (previous order), which was adopted on January 30, 2008, and expired on March 31, 2013. The Facility discharges wastewater to Central and Lower San Francisco Bay, waters of the United States within the San Francisco Bay watershed. Attachment B provides a map of the area around the Facility. Attachment C provides a Facility flow schematic.

The Discharger must file a petition with the State Water Resources Control Board (State Water Board), Division of Water Rights, and receive approval for any change in the point of discharge, place of use, or purpose of use of treated wastewater that decreases the flow in any portion of a watercourse. The State Water Board retains the jurisdictional authority to enforce such requirements under Water Code section 1211.

C. The Discharger filed a Report of Waste Discharge and submitted an application for reissuance of its WDRs and NPDES permit on October 2, 2012.

D. The discharge is also regulated under NPDES Permit No. CA0038849, which establishes requirements on mercury and polychlorinated biphenyls (PCBs) from wastewater discharges to San Francisco Bay. This Order does not affect the mercury and PCBs permit.

II. FACILITY DESCRIPTION

A. Wastewater and Biosolids Treatment and Controls

1. **Location and Service Area.** The Facility serves eastern San Francisco and portions of Brisbane and Daly City (served by the City of Brisbane, the Bayshore Sanitary District, and the North San Mateo County Sanitation District). The service area population is approximately 580,000.

   The Southeast Plant is located on Phelps Street at Jarrold Avenue near the Islais Creek Channel. It provides primary and secondary treatment of combined wastewater and stormwater. The North Point Facility is located on Bay Street near The Embarcadero. It provides primary treatment of combined wastewater and stormwater during wet weather. The Bayside Wet Weather Facilities are located throughout the eastern side of San Francisco, primarily near the shore. They provide equivalent-to-primary treatment during wet weather.

2. **Collection System.** The collection system is primarily a combined sewer system that conveys wastewater and stormwater to the Southeast Plant, North Point Facility, and Bayside Wet Weather Facilities. It consists of approximately 600 miles of pipe, and 7 major and 11 minor pump stations. Separate sanitary and storm drains serve isolated areas, including parts of Candlestick Point and Mission Bay. The Facility also receives wastewater from three satellite wastewater collection systems: the Bayshore Sanitary District (portions of Brisbane and Daly City), the City of Brisbane (residential sector), and the North San Mateo County Sanitation District (portions of Daly City). For the purposes of this Order, the Facility does not include the satellite collection systems.

3. **Wastewater Treatment.** The Discharger operates the Southeast Plant, North Point Facility, and Bayside Wet Weather Facilities to maximize treatment.

   a. **Southeast Plant.** During dry weather, the Southeast Plant provides secondary wastewater treatment. The treatment processes include a headworks (with coarse and fine bar screens, and grit removal), primary sedimentation tanks, pure oxygen aeration basins, secondary clarifiers, and chlorine contact basins (for chlorination using sodium hypochlorite and dechlorination using sodium bisulfite). These processes are shown in the diagram in Attachment C. The Southeast Plant has a dry weather design capacity of 85.4 MGD. From June 2010 through August 2012, its average dry weather flow was 58 MGD.

      During wet weather, the Southeast Plant processes up to 250 MGD of combined wastewater (i.e., sewage, industrial wastewater, and stormwater). Up to 150 MGD receives both primary and secondary treatment; the remaining flow (up to 100 MGD) receives only primary treatment. The entire volume is disinfected prior to discharge.

   b. **North Point Facility.** The North Point Facility discharges only during wet weather and provides primary treatment of combined wastewater. The treatment consists of bar screens, sedimentation tanks equipped with skimmers (clarification, removal of floatables), sodium hypochlorite injection, and dechlorination using sodium bisulfite addition. The North Point Facility can provide primary treatment for up to 150 MGD of combined wastewater. The entire volume of treated wastewater is disinfected and dechlorinated prior to discharge. Solids are directed to the Southeast Plant for digestion.

      The North Point Facility discharges under the following circumstances:

      - the North Shore Storage/Transport Box is at 200 inches;
      - within 60 minutes of any combined sewer discharge through Discharge Point Nos. 013 through 017; or
      - as necessary to minimize the likelihood of combined sewer discharges in the Central and Southeast Drainage Basins.

   c. **Bayside Wet Weather Facilities.** During dry weather, storage/transport structures transport wastewater to the Southeast Plant. During wet weather, these structures transfer combined wastewater to the Southeast Plant and, if necessary, the North Point Facility. They also provide storage for more than 120 million gallons of combined wastewater. In the event that the capacities of the Southeast Plant, North Point Facility, and storage/transport structures are exceeded, the combined wastewater receives the equivalent of primary treatment in the storage/transport structures and is discharged to San Francisco Bay through any one of 29 shoreline combined sewer discharge structures. The treatment in the storage/transport structures consists of settling solids with a series of baffles and weirs that also remove floatable materials prior to discharge. This process equates to the minimum treatment specified in U.S. EPA's *Combined Sewer Overflow Control Policy* (see Fact Sheet section III.C.8). After the wet weather is over, wastewater and accumulated solids remaining in the storage/transport structures are sent to the Southeast Plant for secondary treatment.

4. **Sludge and Biosolids Management.** Sludge from the primary and secondary clarification operations is processed using anaerobic digestion. The process consists of gravity belt thickeners for waste activated sludge thickening, mesophilic anaerobic digesters, and horizontal bowl centrifuges for dewatering. After digestion, the sludge is conditioned with ferric chloride and polymer, dewatered, and stored in cake hoppers for hauling. The digested and dewatered biosolids are beneficially used at a permitted landfill or land-applied at a permitted site. A portion of the biosolids is blended with green waste to create Class A compost. Class B biosolids are land-applied on farms in Solano and Sonoma counties or used at a landfill.

B. Discharge Points and Receiving Waters

1. **Dry Weather Discharges.** During dry weather, all flow receives secondary treatment and is discharged to Lower San Francisco Bay (a tidally-influenced, marine waterbody) through a deep water outfall (Discharge Point No. 001) at Pier 80, which is immediately north of the Islais Creek Channel. The outfall is approximately 810 feet east of Pier 80 at a depth of approximately 43 feet below mean lower low water. A diffuser at the outfall consists of 18 ports placed 15.9 feet apart on center along the terminal end of the outfall. The length of the diffuser is oriented approximately 90 degrees off north, perpendicular to the predominant current direction. The diffuser port openings are 8 inches in diameter, located at an elevation 42 inches above the sediment bed, and set at 0 degrees from horizontal.

   Following a September 2010 inspection that discovered that some fittings on the diffuser risers had broken off, the Discharger began replacing the discharge ports on the diffuser. The number of ports will remain the same, but the new ports will be equipped with duckbill valves to prevent rocks and debris from entering. The duckbill valves will likely increase dilution at the outfall.

2. **Wet Weather Discharges.** During wet weather, when secondary treatment capacity at the Southeast Plant has been exceeded, a portion of the primary-treated effluent bypasses aeration and secondary clarification. The bypassed primary effluent is chlorinated and dechlorinated, and then blended with disinfected secondary-treated wastewater and discharged through Discharge Point No. 001. The discharge from the Southeast Plant through Discharge Point No. 001 is maximized up to 110 MGD. Effluent flows in excess of 110 MGD are discharged via the Quint Street shallow water outfall into Islais Creek (Discharge Point No. 002). All effluent discharged through Discharge Point No. 002 receives secondary treatment, and all primary treated effluent is directed to the deep water outfall. Up to 140 MGD of secondary-treated wastewater may be discharged through Discharge Point No. 002. Under the most critical circumstances, up to 100 MGD of disinfected primary-treated effluent may be blended with 10 MGD of disinfected secondary-treated effluent and discharged through Discharge Point No. 001.

   When necessary, treated wastewater from the North Point Facility is discharged into San Francisco Bay through four deepwater outfalls, two of which discharge at the end of Pier 33 (Discharge Point Nos. 003 and 004) and two of which discharge at the end of Pier 35 (Discharge Point Nos. 005 and 006). If the capacities of the Southeast Plant, the North Point Facility, and the storage/transport structures are exceeded, wastewater in the storage/transport structures is discharged to San Francisco Bay through one or more of the 29 combined sewer discharge structures (Discharge Point Nos. 009 through 043).

C. Summary of Existing Requirements and Monitoring Data

Effluent limitations contained in the previous order and representative monitoring data from the previous order term are presented below:

Table F-2. Previous Effluent Limitations and Monitoring Data

Parameter	Units	Effluent Limitations					Monitoring Data (4/08–9/12)
		Monthly Average	Weekly Average	Daily Maximum	Instant-aneous Maximum	Instant-aneous Minimum	Highest Daily Discharge
Dry Weather (Discharge Point No. 001)							
Biochemical Oxygen Demand, 5-day @ 20°C (BOD_5)	mg/L	30	45	---	---	---	47 [6]
Total Suspended Solids (TSS)	mg/L	30	45	---	---	---	62 [6]
Oil and Grease	mg/L	10	---	20	---	---	17
pH	s.u.	---	---	---	9.0	6.0	6.1 – 7.7
Total Residual Chlorine	mg/L	---	---	---	0.0	---	0.0
Enterococcus	MPN/ 100 mL	35 [1]	---	---	---	---	16 [4]
Fecal Coliform	MPN/ 100 mL	500 [2]	---	---	---	---	270
Copper	µg/L	53 [3]	---	76 [3]	---	---	37
Lead	µg/L	36	---	89	---	---	1.6
Silver	µg/L	7	---	22	---	---	2.6
Zinc	µg/L	490	---	720	---	---	55
Cyanide	µg/L	20 [4]	---	43 [4]	---	---	9.5
Dioxin-TEQ	mg/yr			[5]			0 [5]
Tetrachloroethylene	µg/L	84	---	240	---	---	0.79
Bis (2-ethylhexyl) phthalate	µg/L	55	---	110	---	---	1.7
Ammonia	mg/L as N	190	---	290	---	---	42
Tributyltin	µg/L	0.032	---	0.065	---	---	< 0.0026
Wet Weather (Discharge Point No. 001)							
Total Residual Chlorine	mg/L	---	---	---	0.0	---	0.0
Enterococcus	MPN/ 100 mL	---	---	---	104	---	600
Fecal Coliform	MPN/ 100 mL	500 [2]	---	---	---	---	450
Wet Weather (Discharge Point No. 002)							
Total Residual Chlorine	mg/L	---	---	---	0.0	---	0.0
Enterococcus	MPN/ 100 mL	---	---	---	104	---	>24,000

Parameter	Units	Effluent Limitations					Monitoring Data (4/08–9/12)
		Monthly Average	Weekly Average	Daily Maximum	Instant-aneous Maximum	Instant-aneous Minimum	Highest Daily Discharge
Fecal Coliform	MPN/ 100 mL	500 [2]	---	---	---	---	680 [7]
Wet Weather (Discharge Point Nos. 004 through 006)							
Total Residual Chlorine	mg/L	---	---	---	0.0	---	0.0
Enterococcus	MPN/ 100 mL	---	---	---	104	---	5,800
Fecal Coliform	MPN/ 100 mL	500 [2]	---	---	---	---	>16,000 [7]

Unit Abbreviations:

mg/L = milligrams per liter
µg/L = micrograms per liter
s.u. = standard units
CFU/100 mL = colony forming units per 100 milliliters
MPN/100 mL = Most Probable Number per 100 milliliters
mg/L as N = milligrams per liter as nitrogen
mg/yr = milligrams per year

Footnotes:

[1] Monthly geometric mean.

[2] The 30-day moving median value was not to exceed 500 MPN/100 mL and no more than 10 percent of the samples in any 30-day period were to equal or exceed 1,100 MPN/100 mL.

[3] Final effluent limitations for copper became effective on the effective date of the copper site-specific objectives (January 6, 2009).

[4] Final effluent limitations for cyanide became effective on the effective date of the cyanide site specific objectives (July 22, 2008).

[5] Final effluent limitations for dioxin-TEQ became effective on June 30, 2012. The dioxin-TEQ limit was 1.6 mg/year. Compliance was to be based on the product of the average concentration in samples collected each year and the annual dry weather flow. No dioxin or furan congener was detected above the ML in Attachment G, Table A; therefore, in accordance with Attachment G section V.C.1.c.3, the 2012 dioxin-TEQ discharge was 0 mg/year.

[6] The monthly and weekly average BOD_5 and TSS concentrations at these times complied with BOD_5 and TSS effluent limitations.

[7] The 30-day median and 10th percentile fecal coliform densities at these times complied with fecal coliform effluent limitations.

Table F-3. Additional Wet Weather Monitoring Data

Parameter	Units	Discharge Point No. 001		Discharge Point No. 002		Discharge Point Nos. 003 through 006	
		Range	Median [1]	Range	Median [1]	Range	Median [1]
Chemical Oxygen Demand (COD)	mg/L	53 – 200	120	25 – 100	52	74 – 360	160
Oil and Grease	mg/L	--	--	--	--	<5 – 43	9.5
Total Residual Chlorine	mg/L	0	0	0	0	0	0
Enterococcus	MPN/ 100 mL	<10 – 600	<10	<10 – >24,000	31	<10 – 5,800	<10
Fecal Coliform	MPN/ 100 mL	<2 – 450	<10	<2 – 680	<10	<2 – >16,000	<10
Copper	µg/L	3 – 64	35	1 – 17	8	5 – 99	45
Lead	µg/L	1 – 43	12	0.1[2] – 2	1	1 – 31	13

Mercury	µg/L	<0.2 – 0.40	<0.2	<0.2	<0.2	<0.2 – 0.30[2]	<0.2
Silver	µg/L	0.04 – 2.6	0.28	0.03[2] – 0.51	0.14	0.04[2] – 0.75	0.32
Zinc	µg/L	12 – 230	100	4 – 64	32	14 – 290	130
Cyanide	µg/L	<3 – 3.3[2]	<3	<3	<3	1.9[2] – 12	<3
Ammonia	mg/L as N	3 – 29	5	7 – 41	32	2 – 14	5

Unit Abbreviations:

mg/L = milligrams per liter
µg/L = micrograms per liter
MPN/100 mL = Most Probable Number per 100 milliliters
mg/L as N = milligrams per liter as nitrogen

Footnotes:

[1] Median calculation reflects inclusion of estimated concentrations (i.e., detected but not quantified, DNQs) and nondetects (at the detection limit).

[2] Estimated concentration (i.e., detected but not quantified, DNQ)

D. Summary of Combined Sewer Discharge Events

The following tables summarize combined sewer discharge events over a 14-year period and estimated average combined sewer discharge event durations for wet season 2008-2009 through wet season 2012-2013:

Table F-4. Frequency of Combined Sewer Discharge Events

Year	Rainfall (inches)	Number of Combined Sewer Discharge Events		
		North Shore Basin [2]	Central Basin [3]	Southeast Basin [3]
1998-1999	17.0	1	13	0
1999-2000	20.9	3	12	1
2000-2001	15.8	0	8	0
2001-2002	19.3	2	9	2
2002-2003	21.1	3	14	4
2003-2004	16.9	4	8	2
2004-2005	28.2	4	15	1
2005-2006	28.9	3	16	2
2006-2007	15.1	1	5	1
2007-2008	17.4	3	7	2
2008-2009	15.6	3	4	1
2009-2010	22.4	5	11	3
2010-2011	26.3	6	21	0
2011-2012	15.9	2	8	1
14-Year Median	**18.4**	**3**	**10**	**1**
Design Criterion [1]		**4**	**10**	**1**

Footnotes:

[1] These criteria were based on 70 years of historic rainfall data and used to design the the Bayside Wet Weather Facilities. They are useful in evaluating system performance.

[2] North Shore Basin combined sewer discharges occur from Discharge Point Nos. 009 through 017.

[3] Central Basin combined sewer discharges occur from Discharge Point Nos. 018 through 035.

[4] Southeast Basin combined sewer discharges occur from Discharge Point Nos. 037 through 043.

Table F-5. Durations of Combined Sewer Discharge Events

Northshore Basin		Central Basin		Southeast Basin	
Discharge Point	Estimated Average Duration (Hours)	Discharge Point	Estimated Average Duration (Hours)	Discharge Point	Estimated Average Duration (Hours)
009	2	018	3	037	5
010	2	019	3	038	5
011	0	022	3	040	1
013	4	023	3	041	1

		031	4		
		031A	4		
		032	4		
		033	4		
		035	4		

E. Compliance Summary

1. **Effluent Limitation Violations.** The Discharger violated its wet weather enterococcus limit ten times during the previous order term, as listed in the following table:

Table F-6. Wet Weather Enterococcus Effluent Limitation Violations

Violation Date	Monitoring Location	Unit	Effluent Limit	Reported Value
December 16, 2008	EFF-002	MPN/100mL	104	110
January 22, 2009	EFF-002	MPN/100mL	104	8,664 [1]
April 7, 2009	EFF-002	MPN/100mL	104	>24,196 [1]
January 29, 2010	EFF-002	MPN/100mL	104	11,199 [1]
December 5, 2010	EFF-001B	MPN/100mL	104	402
January 30, 2011	EFF-001B	MPN/100mL	104	598
March 19, 2011	EFF-001B	MPN/100mL	104	784 [1]
March 15, 2011	EFF-003	MPN/100mL	104	1,317 [2]
March 24, 2011	EFF-003	MPN/100mL	104	5,794 [2]
November 16, 2012	EFF-003	MPN/100mL	104	108

Footnotes:

[1] The Discharger asserts that these values may be false positives since simultaneous fecal coliform results were relatively low.

[2] These violations may be subject to minimum penalties of $3,000 each pursuant to California Water Code §13385(i).

The Discharger asserts that four reported values may be false positives due to matrix interference because, in each case, simultaneous fecal coliform results were relatively low.

However, the Discharger certified these results and, to date, has presented no corroborating information to invalidate them pursuant to MRP section XI.D.2 or Attachment G section V.C.1.a.5 of the previous order. The Discharger modified its sampling practices in early 2010 to test for interference before completing enterococcus analyses. As for the other violations, the Discharger points to the challenge of adding sufficient chlorine when operating at maximum hydraulic capacity, indicating that sudden stormwater surges make predicting the chlorine dose necessary for compliance difficult. The Discharger is considering options but has not proposed corrective actions.

The March 15 and 24, 2011, violations may be subject to minimum penalties of $3,000 each pursuant to California Water Code section 13385(i) because they are the fourth and fifth effluent limit violations within six months. Regional Water Board staff will evaluate relevant evidence and present the matter for Regional Water Board consideration as a separate action in the near future, as appropriate.

2. **Inspections.** The Facility is subject to annual compliance evaluation inspections. During the previous order term, there were five inspections, four of which focused on treatment plant operations at the Southeast Plant. The treatment plant inspections concluded with satisfactory ratings for compliance. An October 2010 inspection focused on the collection system.

   The collection system inspection addressed two main issues: (1) accumulation of grease and debris in the storage/transports; and (2) Discharger responsiveness to reports of collection system excursions onto sidewalks and streets. The Discharger responded to the inspection report by describing its routine collection system maintenance practices and programs addressing fats and grease and by pointing out that the number of apparent collection system problems reported was very high because all of its emergency hotline calls were included, whether or not they related to actual collection system problems. At the time, the Discharger was developing a new computer-based asset management system to allow it to better track and respond to calls.

   To follow up on the inspection and the Discharger's response, the Executive Officer issued an order requiring additional information pursuant to Water Code section 13267. This 13267 order required information on the extent and causes of excursions onto sidewalks and streets, and progress toward collection system improvements, asset management system development and implementation, and collection system cleaning and maintenance.

   In response, the Discharger submitted several reports, including a special study on combined sewer system excursions during the period from October 1, 2011, through September 30, 2012. Using its computer-based asset management system, it reported how many calls it received and how many of the calls related to collection system issues. Most (98 percent) of the reports related to private sewer laterals for which others were responsible. Nevertheless, the Discharger often resolved these problems on behalf of the other parties. The rest (about 70) related to the Discharger's collection system.

   The Discharger described specific maintenance activities, improvements, and repairs to its collections system; tracked the effectiveness of its fats, oil, and grease control program; and

described program improvements. Grease buildup is the main cause of the Discharger's sewer system blockages.

F. Planned Changes

The Discharger has started several infrastructure projects. In October 2012, the Discharger began the Southeast Plant Northside Facility Reliability Upgrade (Phase 2) project, which is an $11.5-million project to replace aging secondary sludge handlers and aeration-related electrical systems and to modify the secondary clarification process. The project is expected to be completed in August 2014. The Discharger began an Oxygen Generation Plant Replacement project in December 2012 and plans to complete this $12-million project in December 2013. The Discharger began dewatering facility corrosion repairs in August 2012, a $9.1-million project to address corrosion damage to concrete, the sludge piping network, and the electrical system at the sludge dewatering building. This project is expected to be completed in January 2014. The Discharger is also designing a project to begin in August 2013 to replace and relocate the sodium hypochlorite storage tanks for disinfection.

The Discharger's Sewer System Improvement Program is a three-phase, $6.9-billion effort over the next 20 years to address deficiencies, improve operational flexibility, provide seismic reliability, and ensure future compliance with anticipated environmental regulatory requirements. The program will address aging infrastructure and technologies at the treatment plants and increase the ability of the collection system to convey wastewater.

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements in this Order are based on the requirements and authorities described below:

A. Legal Authorities

This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260). This Order is also issued pursuant to Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA, and Water Code chapter 5.5, division 7 (commencing with § 13370). It shall serve as an NPDES permit for point source discharges from this facility to surface waters.

B. California Environmental Quality Act

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act, Public Resources Code division 13, chapter 3 (commencing with § 21100).

C. State and Federal Regulations, Policies, and Plans

1. **Water Quality Control Plan.** The Regional Water Board adopted the *Water Quality Control Plan for the San Francisco Bay Basin* (Basin Plan), which designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. Requirements in this Order implement the Basin Plan. In addition, this Order is consistent with State Water Board Resolution No. 88-63, which established State policy that all waters, with certain exceptions,

should be considered suitable or potentially suitable for municipal or domestic supply. Because of the marine influence on San Francisco Bay, total dissolved solids levels exceed 3,000 mg/L; therefore, San Francisco Bay meets an exception to State Water Board Resolution No. 88-63.

Beneficial uses for the receiving waters of each Facility discharge point are listed below:

Table F-7. Basin Plan Beneficial Uses

Discharge Points	Receiving Water	Beneficial Uses
001, 002, 019, 043	Lower San Francisco Bay	Industrial Service Supply (IND) Ocean, Commercial, and Sport Fishing (COMM) Shellfish Harvesting (SHELL) Estuarine Habitat (EST) Fish Migration (MIGR) Preservation of Rare and Endangered Species (RARE) Fish Spawning (SPWN) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
003, 004, 005, 006, 009, 010, 011, 013, 015, 017, 018	Central San Francisco Bay	Industrial Service Supply (IND) Industrial Process Supply (PROC) Ocean, Commercial, and Sport Fishing (COMM) Shellfish Harvesting (SHELL) Estuarine Habitat (EST) Fish Migration (MIGR) Preservation of Rare and Endangered Species (RARE) Fish Spawning (SPWN) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
022, 023, 024, 025, 026, 027, 028	Mission Creek	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
029, 030, 030A	Central Basin	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
031, 031A, 032, 033, 035	Islais Creek	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)

037, 038	India Basin	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
040, 042	South Basin	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
041	Yosemite Creek	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2)

2. **Sediment Quality.** The State Water Board adopted the *Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality* on September 16, 2008, and it became effective on August 25, 2009. This plan supersedes other narrative sediment quality objectives, and establishes new sediment quality objectives and related implementation provisions for specifically defined sediments in most bays and estuaries. This Order implements the sediment quality objectives of this plan.

3. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** U.S. EPA adopted the NTR on December 22, 1992, and amended it on May 4, 1995 and November 9, 1999. About 40 criteria in the NTR apply in California. On May 18, 2000, U.S. EPA adopted the CTR. The CTR promulgated new toxics criteria for California and incorporated the previously adopted NTR criteria that applied in the State. U.S. EPA amended the CTR on February 13, 2001. These rules contain water quality criteria for priority pollutants.

4. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria U.S. EPA promulgated for California through the NTR and the priority pollutant objectives the Regional Water Board established in the Basin Plan. The SIP became effective on May 18, 2000, with respect to the priority pollutant criteria U.S. EPA promulgated through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives, and provisions for chronic toxicity control. Requirements of this Order implement the SIP for dry weather discharges.

5. **Antidegradation Policy.** Federal regulations at 40 C.F.R. section 131.12 requires that state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy through State Water Board Resolution 68-16, which is deemed to incorporate the federal antidegradation policy where the federal policy applies under federal law. Resolution 68-16 requires that existing

water quality be maintained unless degradation is justified based on specific findings. The Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies. Permitted discharges must be consistent with the antidegradation provisions of 40 C.F.R. section 131.12 and State Water Board Resolution 68-16.

6. **Anti-Backsliding Requirements.** CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l) restrict backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed.

7. **Endangered Species Act Requirements.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code §§ 2050 to 2097) or the Federal Endangered Species Act (16 U.S.C.A. §§ 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the State, including protecting rare, threatened, or endangered species. The Discharger is responsible for meeting all applicable Endangered Species Act requirements.

8. **Combined Sewer Overflow Control Policy.** U.S. EPA's *Combined Sewer Overflow Control Policy* (59 Fed. Reg. 18688-18698, April 19, 1994). The policy establishes a national approach for controlling combined sewer discharges and overflows and calls for a two-phased process. During the first phase, dischargers operating combined sewer systems were required to implement the Nine Minimum Controls, which were to constitute CWA technology-based requirements as applied to combined sewer systems (best conventional pollutant control technology [BCT] and best available control technology economically achievable [BAT]). Dischargers were also required to develop Long-Term Control Plans based on their financial capabilities. During the second phase, dischargers were required to implement the Long-Term Control Plans, thus providing a basis for demonstrating or presuming attainment of water quality objectives protective of beneficial uses. This Order requires the Discharger to continue operating its combined sewer system in accordance with the Nine Minimum Controls and its Long-Term Control Plan.

D. Impaired Waters on CWA 303(d) List

In October 2011, U.S. EPA approved a revised list of impaired waters prepared pursuant to CWA section 303(d), which requires identification of specific water bodies where it is expected that water quality standards will not be met after implementation of technology-based effluent limitations on point sources. Where it has not done so already, the Regional Water Board plans to adopt Total Maximum Daily Loads (TMDLs) for pollutants on the 303(d) list. TMDLs establish wasteload allocations for point sources and load allocations for non-point sources, and are established to achieve the water quality standards for the impaired waters.

Central and Lower San Francisco Bay are listed as impaired waters. The pollutants impairing Central San Francisco Bay are chlordane, DDT, dieldrin, dioxins and furans, exotic species, mercury, dioxin-like PCBs and PCBs, selenium, and trash. The pollutants impairing Lower San Francisco Bay are chlordane, DDT, dieldrin, exotic species, dioxins and furans, mercury, trash, and dioxin-like PCBs and PCBs. On February 12, 2008, U.S. EPA approved a TMDL for

mercury in San Francisco Bay. On March 29, 2010, U.S. EPA approved a TMDL for PCBs in San Francisco Bay. The TMDLs for mercury and PCBs are incorporated into the Basin Plan and apply to this discharge; however, mercury and PCBs discharges are not covered by this Order. Instead, they are regulated under NPDES Permit No. CA0038849.

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants discharged into waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations: 40 C.F.R. section 122.44(a) requires that permits include applicable technology-based limitations and standards; and 40 C.F.R. section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of receiving waters.

A. Discharge Prohibitions

1. Prohibitions in this Order

a. Discharge Prohibition III.A (No discharge other than as described in this Order): This prohibition is based on 40 C.F.R. section 122.21(a) and Water Code section 13260, which require filing an application and Report of Waste Discharge before a discharge can occur. Discharges not described in the application and Report of Waste Discharge, and subsequently in this Order, are prohibited.

b. Discharge Prohibition III.B (Minimum initial dilution of 231:1): This Order is based on a modeled dilution ratio of 231:1 for the calculation of one or more effluent limitations reflecting available information regarding the dilution achieved at Discharge Point No. 001 (see section IV.C.4.a of this Fact Sheet). Therefore, this prohibition is necessary to ensure that the assumptions used to derive the dilution credit remain substantially the same so the limitations remain protective of water quality.

c. Discharge Prohibition III.C (No bypass of secondary treatment): This prohibition is based on 40 C.F.R. section 122.41(m) and U.S. EPA's *Combined Sewer Overflow Control Policy*. Bypass of secondary treatment is prohibited except during wet weather as defined in Attachment A or in accordance with 40 C.F.R. section §122.41(m) (see Attachment D section I.G.)

d. Discharge Prohibition III.D (No dry weather discharges at Discharge Point Nos. 002 through 043): This prohibition reflects the principle objective of U.S. EPA's *Combined Sewer overflow Control Policy* (i.e., to ensure that combined sewer discharges only result from wet weather and that such discharges only occur at specified locations). Dry weather discharges must receive full secondary treatment prior to discharge through Discharge Point No. 001.

e. Discharge Prohibition III.E (Average dry weather effluent flow not to exceed dry weather design capacity): This prohibition is based on the Southeast Plant's design

treatment capacity (i.e., the historic and tested reliability of the treatment plant). Exceeding the average dry weather flow design capacity could result in lowering the reliability of achieving compliance with water quality requirements.

This Order prohibits an average dry weather effluent flow greater than 85.4 MGD. The previous order prohibited an average dry weather flow greater than 84.5 MGD. That value was a typographical error. The prohibitions in earlier orders (e.g., Order No. R2-2002-0073) specified 85.4 MGD. Federal regulations allow correction of this error (40 C.F.R. § 122.63).

f. Discharge Prohibition III.F (No sewer overflows): Basin Plan Table 4-1, Discharge Prohibition 15, and the CWA prohibit the discharge of wastewater to surface waters except as authorized under an NPDES permit. Publicly owned treatment works must achieve secondary treatment at a minimum and any more stringent limitations necessary to meet water quality standards (33 U.S.C. § 1311[b][1][B and C]). A sanitary sewer or combined sewer overflow that results in the discharge of raw sewage or wastewater not meeting this Order's effluent limitations to surface waters is therefore prohibited under the CWA and the Basin Plan. This prohibition does not apply to combined sewer discharges explicitly authorized in this Order pursuant to U.S. EPA's *Combined Sewer Overflow Control Policy*.

2. Exception to Shallow Water and Dead-End Slough Discharge Prohibition

Basin Plan Table 4-1, Discharge Prohibition 1, prohibits discharges not receiving a minimum of 10:1 initial dilution and discharges to dead-end sloughs. Basin Plan section 4.2 provides for exceptions under certain circumstances:

- An inordinate burden would be placed on the Discharger relative to the beneficial uses protected, and an equivalent level of environmental protection can be achieved by alternate means;
- A discharge is approved as part of a reclamation project;
- Net environmental benefits will be derived as a result of the discharge; or
- A discharge is approved as part of a groundwater cleanup project.

Discharges to Discharge Point Nos. 001 and 003 through 006 receive a minimum of at least 10:1 dilution[1]; therefore, they are not subject this discharge prohibition. During wet weather, this Order grants an exception for discharges to Discharge Point Nos. 002 and 009 through 043 for the following reasons:

a. Wet weather discharges to Discharge Point Nos. 002 and 009 through 043 occur as a result of the Discharger's efforts to maximize treatment of sanitary and industrial wastewater *and* stormwater. To eliminate all combined sewer discharges would place an inordinate burden on the Discharger, which has invested heavily in infrastructure that

[1] Dilution at Discharge Point No. 001 is discussed in section IV.C.4.a of this Fact Sheet. Discharge Point Nos. 003 through 006 are located off of Piers 33 and 35 and discharge at a depth of about 10 feet below mean low low water (MLLW). In August 1973, the Discharger completed a study that estimated dilution ratios to be at least 10:1 at each outfall when discharging at a maximum flow of 170 MGD.

captures and treats most combined wastewater and stormwater. Providing additional deepwater discharge capacity is unwarranted for the relatively small portion of the combined wastewater not discharged to deep water. Such a burden would be wholly disproportional relative to the beneficial uses protected because this Order's requirements are sufficient to protect beneficial uses.

b. An equivalent level of environmental protection has been achieved because Provision VI.C.5 specifies controls that ensure the reliability of the Discharger's system in maximizing treatment and minimizing discharges not receiving at least 10:1 initial dilution. Combined sewer discharges at Discharge Point Nos. 009 through 043 receive equivalent-to-primary treatment, but before any combined sewer discharges occur, the Discharger optimizes discharges at Discharge Point Nos. 001 through 006. Discharges to Discharge Point Nos. 001 and 003 through 006 receive at least 10:1 dilution. When Discharge Point No. 001 (the Pier 80 deepwater outfall) is at capacity, the Discharger redirects only its highest quality effluent (secondary-treated wastewater) to Discharge Point No. 002.

Furthermore, in 1999 the Discharger took steps to enhance San Francisco Bay's beneficial uses by contributing $1 million to the Port of San Francisco to restore a 25-acre wetland at Heron's Head Park (Pier 98). Enhancing beneficial uses in this way provides environmental protection equivalent to providing at least 10:1 dilution for additional flows.

c. Net environmental benefits result from the operation of a combined sewer system. The system removes many pollutants in urban runoff, which elsewhere in the Region are discharged through stormwater outfalls with little or no treatment. For example, the system removes almost 2,000 tons, or 84 percent, of suspended sediment from the stormwater component of its influent each year (*Special Study Overflow Impacts and Efficacy of Combined Sewer Overflow Controls for the San Francisco Bayside System, Southeast Water Pollution Control Plant, North Point Wet Weather Facility and Bayside Wet Weather Facilities*, June 29, 2012).

B. Conventional and Non-Conventional Pollutant Effluent Limitations

1. Scope and Authority

a. Dry Weather Discharges. CWA section 301(b) and 40 C.F.R. section 122.44 require that permits include conditions meeting technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet water quality standards. The dry weather discharges authorized by this Order must meet minimum federal technology-based requirements based on Secondary Treatment Standards at 40 C.F.R. section 133 as summarized below. In addition, the 30-day average percent removal for biochemical oxygen demand (BOD_5) (or carbonaceous biochemical oxygen demand, $CBOD_5$) and total suspended solids (TSS), by concentration, is not to be less than 85 percent. The Basin Plan contains additional requirements for certain pollutants.

Table F-8. Secondary Treatment Requirements

Parameter	Monthly Average	Weekly Average
BOD_5	30 mg/L	45 mg/L
$CBOD_5$ [1]	25 mg/L	40 mg/L
TSS	30 mg/L	45 mg/L
pH	6.0 – 9.0 standard units [2]	

Footnotes:

[1] $CBOD_5$ effluent limitations may be substituted for BOD_5 limitations.

[2] The pH is to be between 6.0 and 9.0 unless inorganic chemicals are added during treatment or industrial sources cause the pH to be less than 6.0 or greater than 9.0.

b. Wet Weather Discharges. Discharges from combined sewer systems are point sources subject to NPDES permit requirements; however, such wet weather discharges are not subject to the Secondary Treatment Standards. The *Combined Sewer Overflow Control Policy* establishes technology-based requirements for combined sewer systems based on 40 C.F.R. section 125.3. The Policy requires the Discharger to implement Nine Minimum Controls, which represent the best conventional technology and best available technology economically achievable. Provision VI.C.5.b of this Order contains these requirements. This Order contains total residual chlorine and enterococcus limits for disinfected effluent from Discharge Point Nos. 001 through 006 to ensure proper operations and maintenance consistent with the Nine Minimum Controls.

2. Effluent Limitations

a. Dry Weather Discharges (Discharge Point No. 001)

i. BOD_5 and TSS. The dry weather BOD_5 and TSS effluent limitations, including the 85 percent removal requirements, are based on the Secondary Treatment Standards and Basin Plan Table 4-2.

ii. Oil and Grease. The oil and grease effluent limitations are based on Basin Plan Table 4-2.

iii. pH. The pH effluent limitations are based on the Secondary Treatment Standards and Basin Plan Table 4-2.

iv. Total Residual Chlorine. The total residual chlorine effluent limitation is based on Basin Plan Table 4-2. The allowance for determining false positives when using continuous devices is based on the fact that continuous instruments occasionally have anomalous spikes, and it is chemically improbable to have free chlorine present in the presence of sodium bisulfite.

v. Enterococcus. Basin Plan Table 4-2A requires the enterococcus effluent limitation for discharges to receiving waters with the water contact recreation beneficial use.

vi. Fecal Coliform. Basin Plan Table 4-2A requires total coliform effluent limitations for discharges to receiving waters with the shellfish harvesting beneficial use, but Basin Plan Table 4-2A, footnote c, allows substituting fecal coliform limitations for

total coliform limitations provided that the substitution will not result in unacceptable adverse impacts on beneficial uses. This Order contains the following fecal coliform effluent limits:

- The median fecal coliform density in any calendar month is not to exceed 500 MPN/100 mL); and
- no more than 10 percent of the samples in any calendar month may contain a fecal coliform density equal to or greater than 1,100 MPN/100 mL.

The Fact Sheet for Regional Water Board Order No. 94-149 attributes these limits to "recommendations for the Department of Health Services (Memorandum from Don Womeldorf, Chief Environmental Management Branch to James Baetge SWRCB dated Octover 24, 1990) and the initial dilution achieved at the Pier 80 Outfall."

These limits will not result in unacceptable adverse impacts on beneficial uses, including water contact recreation and shellfish harvesting. The enterococcus limit discussed above adequately protects water contact recreation. As for shellfish harvesting, Southeast Plant effluent is diluted at least 50:1 at the Pier 80 outfall (*Dilution Model for the San Francisco Southeast Treatment Plant Bay Outfall [Pier 80]*, December 6, 2007) and the nearest shellfish beds are near Candlestick Point, more than three miles away (*San Francisco Bay Subtidal Habitat Goals Report*, 2010). Basin Plan Table 3-1 contains a 30-day median fecal coliform objective of 14 MPN/100 mL and a 90th percentile fecal coliform objective of 43 MPN/100 mL to protect shellfish harvesting. Therefore, accounting for mixing and dilution, the fecal coliform limits in this Order will protect shellfish harvesting. Moreover, in April 1993, the Discharger decreased its chlorine residual for a time and observed that total coliform and fecal coliform levels near Candlestick Point remained equal to San Francisco Bay background levels ("NPDES Limits for Bacteria," *Water Environment & Technology*, Vol. 8, August 1996, pp 69-73). Other Lower San Francisco Bay dischargers have conducted similar receiving water impact studies and found no relationship between effluent and shoreline fecal coliform densities (City of San Mateo, November 1997; South Bayside System Authority, January 1998). Apparently, other fecal coliform sources (e.g., birds, wildlife, urban runoff) more directly affect shoreline fecal coliform levels. The studies evaluated a range of effluent discharges that included fecal coliform densities considerably higher than those allowed by this Order.

The Monitoring and Reporting Program requires weekly monitoring, but samples may be collected more frequently. The 10 percent requirement will be interpreted as follows. If up to nine samples are collected in a calendar month, a single sample with a fecal coliform density equal to or greater than 1,100 MPN/100 mL would violate the 10 percent limit; if 10 to 19 samples are collected, two samples at or above 1,100 MPN/100 mL would violate the limit; if 20 to 29 samples are collected, three samples at or above 1,100 MPN/100 mL would violate the limit; and if 30 or 31 samples are collected, four samples at or above 1,100 MPN/100 mL would violate the limit.

b. Wet Weather Discharges (Discharge Point Nos. 001 through 006)

i. **Total Residual Chlorine.** The total residual chlorine effluent limitation is based on Basin Plan Table 4-2, as guidance, to ensure that Southeast Plant and North Point Facility treatment, including disinfection, is conducted in a manner consistent with proper operations and maintenance as required by the Nine Minimum Controls. The allowance for determining false positives when using continuous devices accounts for the fact that continuous instruments occasionally have anomalous spikes, and it is chemically improbable to have free chlorine present in the presence of sodium bisulfite.

ii. **Enterococcus.** To ensure that Southeast Plant and North Point Facility disinfection is conducted in a manner consistent with proper operations and maintenance, as required by the Nine Minimum Controls, this Order contains an enterococcus effluent limitation. Disinfection performance is to be evaluated using a monthly geometric mean enterococcus limit of 35 MPN/100 mL, chosen based on the receiving water quality objective for water contact recreation in Basin Plan Table 3-1.

This Order does not retain the previous order's single-sample maximum enterococcus limit because, in the context of using single-sample maxima for enterococcus, U.S. EPA states in part:

> Other than in the beach notification and closure decision context, the geometrice mean is the more relevant value for ensuring that appropriate actions are taken to protect and improve water quality because it is a more reliable measure, being less subject to random variation, and more directly linked to the underlying studies on which the 1986 bacteria criteria were based. (69 Fed. Reg. 67224, November 16, 2004.)

This change is not subject to anti-backsliding requirements because the two limits reflect different averaging periods and both are consistent with Basin Plan Table 3-1 water quality objectives.

This Order also does not retain the previous order's fecal coliform limits. The enterococcus limit is sufficient to evaluate treatment performance. Anti-backsliding requirements do not apply because this Order replaces the fecal coliform limits with a new enterococcus limit; therefore, a direct comparison is impossible.

C. Toxic Pollutant Effluent Limitations

1. Scope and Authority

For toxic pollutants, this Order contains water quality-based effluent limitations (WQBELs) that implement water quality objectives that protect beneficial uses. CWA section 301(b) and 40 C.F.R. section 122.44(d) require that permits include limitations more stringent than federal technology-based requirements where necessary to achieve applicable water quality standards. According to 40 C.F.R. section 122.44(d)(1)(i), permits must include effluent limitations for all pollutants that are or may be discharged at levels that have a reasonable potential to cause or

contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective, WQBELs must be established using (1) U.S. EPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting a narrative criterion, supplemented with relevant information (40 C.F.R. § 122.44[d][1][vi]). The process for determining reasonable potential and calculating WQBELs is intended to achieve applicable water quality objectives and criteria and protect designated uses of receiving waters as specified in the Basin Plan.

During dry weather, this Order imposes numeric effluent limitations at Discharge Point No. 001 for toxic pollutants with reasonable potential to cause or contribute to exceedances of water quality standards. During wet weather, this Order imposes narrative effluent limitations for toxic pollutants, not numeric limitations. In accordance with the *Combined Sewer Overflow Control Policy*, this Order requires the Discharger to implement its Long-Term Control Plan to control combined sewer discharges and overflows. The plan calls for meeting CWA water quality-based requirements by providing a minimum level of treatment. The *Combined Sewer Overflow Control Policy* presumes that CWA water quality-based requirements will be met if the Discharger implements at least primary clarification of at least 85 percent of collected wastewater (unless data indicate otherwise). U.S. EPA describes this "presumption approach" as follows:

> A program that meets any of the criteria listed below would be presumed to provide an adequate level of control to meet the water quality-based requirements of the CWA, provided the permitting authority determines that such presumption is reasonable in light of the data and analysis conducted in the characterization, monitoring, and modeling of the system and the consideration of sensitive areas described above. These criteria are provided because data and modeling of wet weather events often do not give a clear picture of the level of [combined sewer overflow] controls necessary to protect [water quality standards].
>
> i. No more than an average of four overflow events per year, provided that the permitting authority may allow up to two additional overflow events per year. For the purpose of this criterion, an overflow event is one or more overflows from a CSS (Combined Sewer System) as the result of a precipitation event that does not receive the minimum treatment specified below; or
>
> ii. The elimination or the capture for treatment of no less than 85% by volume of the combined sewage collected in the Combined Sewer System during precipitation events on a system-wide annual average basis; or
>
> iii. The elimination or removal of no less than the mass of the pollutants, identified as causing water quality impairment through the sewer system characterization, monitoring, and modeling effort, for the volumes that would be eliminated or captured for treatment under paragraph ii above.

> Combined sewer overflows remaining after implementation of the nine minimum controls and within the criteria specified at [i or ii], should receive a minimum of:
>
> - Primary clarification (Removal of floatables and settleable solids may be achieved by any combination of treatment technologies or methods that are shown to be equivalent to primary clarification.);
> - Solids and floatables disposal; and
> - Disinfection of effluent, if necessary, to meet [water quality standards], protect designated uses and protect human health, including removal of harmful disinfection chemical residuals, where necessary."

The Discharger's Long-Term Control Plan exceeds the specifications for the presumption approach. The Discharger's system is designed to capture 100 percent of combined wastewater within the storage/transport boxes and to provide treatment consisting of floatables and settleable solids removal. Therefore, no untreated combined sewer overflows occur (combined sewer discharges receive equivalent-to-primary treatment). Provision VI.C.5.c of this Order requires the Discharger to continue implementing its Long-Term Control Plan.

2. Beneficial Uses and Water Quality Criteria and Objectives

Discharge Point No. 001 discharges to Lower San Francisco Bay. Section III.C.1, above, identifies the beneficial uses of Lower San Francisco Bay. Water quality criteria and objectives to protect these beneficial uses are described below:

a. Basin Plan Objectives. The Basin Plan specifies numeric water quality objectives for 10 priority pollutants and narrative water quality objectives for toxicity and bioaccumulation. The narrative toxicity objective states, "All waters shall be maintained free of toxic substances in concentrations that are lethal to or that produce other detrimental responses in aquatic organisms." The narrative bioaccumulation objective states, "Controllable water quality factors shall not cause a detrimental increase in concentrations of toxic substances found in bottom sediments or aquatic life. Effects on aquatic organisms, wildlife, and human health will be considered."

b. CTR Criteria. The CTR specifies numeric aquatic life and human health criteria for numerous priority pollutants. These criteria apply to inland surface waters and enclosed bays and estuaries. Some human health criteria are for consumption of "water and organisms" and others are for consumption of "organisms only." The criteria applicable to "organisms only" apply to Lower San Francisco Bay because it is not a source of drinking water.

c. NTR Criteria. The NTR establishes numeric aquatic life and human health criteria for a number of toxic pollutants for San Francisco Bay waters upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta. The NTR criteria apply to Lower San Francisco Bay.

d. Sediment Quality Objectives. The *Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality* contains a narrative water quality objective: "Pollutants in sediments shall not be present in quantities that, alone or in combination, are toxic to benthic communities in bays and estuaries of California." This objective is to be implemented by integrating three lines of evidence: sediment toxicity, benthic community condition, and sediment chemistry. The policy requires that if the Regional Water Board determines that a discharge has reasonable potential to cause or contribute to an exceedance of this objective, it is to impose the objective as a receiving water limit.

e. Receiving Water Salinity. Basin Plan section 4.6.2 (like the CTR and NTR) states that the salinity characteristics (i.e., freshwater vs. saltwater) of the receiving water are to be considered in determining the applicable water quality objectives. Freshwater criteria apply to discharges to waters with salinities equal to or less than one part per thousand (ppt) at least 95 percent of the time. Saltwater criteria apply to discharges to waters with salinities equal to or greater than 10 ppt at least 95 percent of the time in a normal water year. For discharges to waters with salinities between these two categories, or tidally-influenced freshwaters that support estuarine beneficial uses, the water quality objectives are the lower of the salt or freshwater objectives (the latter calculated based on ambient hardness) for each substance.

Lower San Francisco Bay is a salt water environment based on salinity data generated through the Regional Monitoring Program (RMP). Salinity data collected at the Alameda (BB70) sampling location between 1993 and 2001 indicate that the salinity was greater than 10 ppt in 100 percent of the samples. Lower San Francisco Bay is therefore classified as saltwater, and the reasonable potential analysis and WQBELs are based on saltwater water quality criteria and objectives.

f. Site-Specific Metals Translators. Effluent limitations for metals must be expressed as total recoverable metal (40 C.F.R. § 122.45[c]). Since the water quality objectives for metals are typically expressed as dissolved metal, translators must be used to convert metals concentrations from dissolved to total recoverable and vice versa. The CTR contains default translators; however, site-specific conditions, such as water temperature, pH, suspended solids, and organic carbon may affect the form of metal (dissolved, non-filterable, or otherwise) present and therefore available to cause toxicity. In general, dissolved metals are more available and more toxic to aquatic life than other forms. Site-specific translators can account for site-specific conditions, thereby preventing overly stringent or under-protective water quality objectives. For copper, Basin Plan Table 7.2.1-2 contains site-specific translators for deep water discharges to Lower San Francisco Bay: 0.73 and 0.87 (monthly and daily). For nickel, this Order uses site-specific translators the Clean Estuary Partnership developed, as set forth in *North of Dumbarton Bridge Copper and Nickel Development and Selection of Final Translators* report (March 2005): 0.65 and 0.85 (monthly and daily). For silver, this Order uses a site-specific translator based on RMP data collected from 1993 through 2001 at the Alameda sampling station (BB70): 0.66.

3. Need for Water Quality-Based Effluent Limitations (Reasonable Potential Analysis)

Assessing whether a pollutant has reasonable potential to exceed a water quality objective is the fundamental step in determining whether a WQBEL is required.

a. Methodology. For dry weather discharges, SIP section 1.3 sets forth the methodogy used for this Order for assessing whether a pollutant has reasonable potential to exceed a water quality objective. The analysis begins with identifying the maximum effluent concentration (MEC) observed for each pollutant based on available effluent concentration data and the ambient background concentration (B). SIP section 1.4.3 states that ambient background concentrations are either the maximum ambient concentration observed or, for water quality objectives intended to protect human health, the arithmetic mean of observed concentrations.There are three triggers in determining reasonable potential:

i. Trigger 1 is activated if the maximum effluent concentration is greater than or equal to the lowest applicable water quality objective (MEC $\geq$ water quality objective).

ii. Trigger 2 is activated if the ambient background concentration observed in the receiving water is greater than the water quality objective (B > water quality objective) *and* the pollutant is detected in any effluent sample.

iii. Trigger 3 is activated if a review of other information indicates that a WQBEL is needed to protect beneficial uses.

b. Effluent Data. The reasonable potential analysis for this Order is based on effluent monitoring data the Discharger collected from April 2008 through September 2012. The copper data were collected from October 2009 through September 2012 because these more recent three years of data better represent current discharge conditions.

c. Ambient Background Data. The reasonable potential analysis for this Order is based on RMP data collected at the Yerba Buena Island station (BC10) from 1993 through 2011, and additional Bay Area Clean Water Agencies data from *San Francisco Bay Ambient Water Monitoring Interim Report* (2003) and *Ambient Water Monitoring: Final CTR Sampling Update* (2004). These reports contain monitoring results from 2002 and 2003 for priority pollutants the RMP did not monitor at the time. For ammonia, the ambient concentration at the RMP station nearest to the discharge point, the Alameda RMP station (BB70), was used because, as described in section IV.C.4.a.iii of this Fact Sheet, this Order grants full dilution credit for ammonia.

d. Reasonable Potential Analysis for Toxic Pollutants. The maximum effluent concentrations, most stringent applicable water quality criteria and objectives, and ambient background concentrations used in the analysis are presented in the following table, along with the reasonable potential analysis results (yes or no) for each pollutant. Reasonable potential was not determined for all pollutants because there are not water quality objectives for all pollutants, and monitoring data are unavailable for others. The pollutants that exhibit reasonable potential are copper, cyanide, dioxin-TEQ, 1,2-diphenylhydrazine, and total ammonia.

Table F-9. Reasonable Potential Analysis

CTR #	Priority Pollutants	Governing criterion or objective (µg/L)	MEC or Minimum DL [1][2] (µg/L)	B or Minimum DL [1][2] (µg/L)	Results [3]
1	Antimony	4,300	0.71	1.8	No

Footnotes:

[1] The maximum effluent concentration and ambient background concentration are the actual detected concentrations unless preceded by a "<" sign, in which case the value shown is the minimum detection level (DL).

[2] The maximum effluent concentration or ambient background concentration is "Unavailable" when there are no monitoring data for the constituent.

[3] RPA Results = Yes, if MEC ≥ WQC, B > WQC and MEC is detected, or Trigger 3
= No, if MEC and B are < WQC or all effluent data are undetected
= Undetermined (Ud), if no criteria have been promulgated or data are insufficient.

[4] SIP section 1.3 excludes from its reasonable potential analysis procedure priority pollutants for which a TMDL has been developed. TMDLs have been developed for mercury and PCBs in San Francisco Bay. Mercury and PCBs from wastewater discharges are regulated by NPDES Permit No. CA0038849, which implements the San Francisco Bay Mercury and PCBs TMDLs.

[5] Units for total ammonia are milligrams per liter as nitrogen.

e. Reasonable Potential Analysis for Sediment Quality. Pollutants in some receiving water sediments may be present in quantities that alone or in combination are toxic to benthic communities. Efforts are underway to identify stressors causing such conditions. However, to date there is no evidence directly linking compromised sediment conditions to the discharges subject to this Order; therefore, the Regional Water Board cannot draw a conclusion about reasonable potential for these discharges to cause or contribute to exceedances of the sediment quality objectives. Nevertheless, the Discharger continues to participate in the RMP, which monitors San Francisco Bay sediment and seeks to identify stressors responsible for degraded sediment quality. Thus far, the monitoring has provided only limited information about potential stressors and sediment transport. The Regional Water Board is exploring options for obtaining additional information that may inform future analyses.

f. Constituents with limited data. In some cases, reasonable potential cannot be determined because effluent data are limited or ambient background concentrations are unavailable. Provision VI.C.2 of the Order requires the Discharger to continue monitoring for these constituents in its effluent using analytical methods that provide the best feasible detection limits. When additional data become available, further analysis will be conducted to determine whether numeric effluent limitations are necessary.

g. Pollutants with No Reasonable Potential. This Order does not contain WQBELs for constituents that do not demonstrate reasonable potential; however, Provision VI.C.2 of the Order still requires monitoring for those pollutants. If concentrations are found to have increased significantly, Provision VI.C.2 of the Order requires the Discharger to investigate the sources of the increases and implement remedial measures if the increases pose a threat to receiving water quality.

4. Water Quality-Based Effluent Limitations

For dry weather discharges, WQBELs were developed for the pollutants determined to have reasonable potential to cause or contribute to exceedances of water quality objectives. The WQBELs are based on the procedures specified in SIP section 1.4.

a. Dilution Credits. SIP section 1.4.2 allows dilution credits under certain circumstances. The Discharger submitted a dilution study titled *Dilution Model for the San Francisco Southeast Treatment Plant Bay Outfall (Pier 80)*, dated December 6, 2007. The study contains estimates of initial dilution based on the UM3 model as implemented with the U.S. EPA-supported Visual PLUMES modeling package. The study used the average dry weather flow, 62 MGD, to estmate the initial dilution representing chronic (long-term average) conditions, and the 95th percentile of dry weather flows, 72 MGD, to calculate the initial dilution representing acute (short-term) conditions. Estimated initial dilution ratios are 231:1 (230 parts ambient water to one part effluent) at 62 MGD and 51:1 at 72 MGD.

i. Bioaccumulative Pollutants. For certain bioaccumulative pollutants, dilution credit is significantly restricted or denied. Specifically, these pollutants include dioxin and furan compounds, which appear on the CWA section 303(d) list for Lower San Francisco Bay because, based on available data on the concentrations of these pollutants in aquatic organisms, sediment, and the water column, they impair San Francisco Bay beneficial uses. The following factors suggest insufficient assimilative capacity in San Francisco Bay for these pollutants.

Tissue samples taken from San Francisco Bay fish show the presence of these pollutants at concentrations greater than screening levels (*Contaminant Concentrations in Fish from San Francisco Bay*, May 1997). The results of a 1994 San Francisco Bay pilot study, presented in *Contaminated Levels in Fish Tissue from San Francisco Bay* (Regional Water Board, 1994) also show elevated levels of chemical contaminants in fish tissues. The Office of Environmental Health and Hazard Assessment (OEHHA) completed a preliminary review of the data in the 1994 report and in December 1994 issued an interim consumption advisory covering certain fish species in San Francisco Bay due to the levels of some of these pollutants.

OEHHA updated this advisory in a May 2011 report, *Health Advisory and Safe Eating Guidelines for San Francisco Bay Fish and Shellfish*, which still suggests insufficient assimilative capacity in San Francisco Bay for 303(d)-listed pollutants. Therefore, dilution credits are denied for bioaccumulative pollutants on the 303(d) list for which data are lacking on sources and significant uncertainty exists about how different sources contribute to bioaccumulation.

ii. Non-Bioaccumulative Pollutants (except ammonia). For non-bioaccumulative pollutants (except ammonia), a conservative dilution credit of 10:1 (D = 9) has been assigned. The 10:1 dilution credit is based, in part, on Basin Plan Prohibition 1 (Table 4-1), which prohibits discharges with less than 10:1 dilution. SIP section 1.4.2 allows for limiting the dilution credit. The dilution credit is limited for the following reasons:

(a) San Francisco Bay is a complex estuarine system with highly variable and seasonal upstream freshwater inflows and diurnal tidal saltwater inputs. SIP section 1.4.3 allows background conditions to be determined on a discharge-by-discharge or water body-by-water body basis. A water body-by-water body approach is taken here due to inherent uncertainties in characterizing ambient background conditions in a complex estuarine system on a discharge-by-discharge basis.

(b) Because of the complex hydrology of San Francisco Bay, there are uncertainties in accurately determining an appropriate mixing zone. The models used to predict dilution do not consider the three dimensional nature of San Francisco Bay currents resulting from the interaction of tidal flushes and seasonal fresh water outflows. Being heavier and colder than fresh water, ocean salt water enters San Francisco Bay on a twice-daily tidal cycle, generally beneath the warmer fresh water that flows seaward. When these waters mix and interact, complex circulation patterns occur due to the varying densities of the fresh and ocean waters. The complex patterns occur throughout San Francisco Bay, but are most prevalent in San Pablo Bay, Carquinez Strait, and Suisun Bay. The locations of this mixing and interaction change, depending on the strength of each tide. Additionally, sediment loads from the Central Valley change on a long-term basis, affecting the depth of different parts of San Francisco Bay, resulting in alteration of flow patterns, mixing, and dilution at the outfall.

For non-bioaccumultive pollutants (except ammonia), the Yerba Buena Island RMP monitoring station (BC10), relative to other RMP stations, fits SIP guidance for establishing background conditions. SIP section 1.4.3 requires that background water quality data be representative of the ambient receiving water that will mix with the discharge. Because the WQBELs for non-bioaccumultive pollutants (except ammonia) are based on a restricted dilution credit, water quality data from the Yerba Buena Island monitoring station best represents the water that will mix with the discharge.

iii. Ammonia. For ammonia, a conservative estimate of actual initial dilution was used to calculate the effluent limitations. This is justified because ammonia, a non-

persistent pollutant, quickly disperses and degrades to a non-toxic state, and cumulative toxicity is unlikely. The 231:1 dilution ratio is appropriate for calculating limits based on the chronic water quality objective because that objective is an annual median; the dilution ratio associtated with the long-term average flow best represents long-term (chronic) conditions. The 51:1 dilution ratio is appropriate for calculating limits based on the acute water quality objective because that objective is an absolute maximum; the dilution associated with the maximum flow best represents short-term (acute) conditions.

For ammonia, the Alameda RMP monitoring station (BB70), relative to other RMP stations, fits SIP guidance for establishing background conditions. SIP section 1.4.3 requires that background water quality data be representative of the ambient receiving water that will mix with the discharge. Because the ammonia WQBELs are based on actual dilution at the edge of the initial mixing zone, data from the Alameda RMP station best represents the water at the edge of the initial mixing zone.

b. WQBEL Development. For those pollutants with reasonable potential, average monthly effluent limitations (AMELs) and maximum daily effluent limitations (MDELs) were developed as explained below:

i. Copper

(a) Water Quality Objectives. Basin Plan Table 3-3A contains chronic and acute marine water quality objectives for copper of 6.0 and 9.4 µg/L (site-specific objectives for San Francisco Bay), expressed as dissolved metal and accounting for a Water Effects Ratio of 2.4. Converting these water quality objectives to total recoverable metal using the site-specific translators of 0.73 (chronic) and 0.87 (acute) results in water quality criteria of 8.2 µg/L (chronic) and 10.8 µg/L (acute).

(b) Reasonable Potential Analysis. This Order establishes copper WQBELs because the maximum effluent concentration (13 µg/L) exceeds the governing water quality objective (8.2 µg/L), demonstrating reasonable potential by Trigger 1, and because Basin Plan section 7.2.1.2 requires that individual NPDES permits for municipal and industrial wastewater treatment facilities include copper WQBELs.

(c) WQBELs. Copper WQBELs, calculated according to SIP procedures with an effluent data coefficient of variation of 0.28 and a dilution credit of D = 9 (dilution ratio = 10:1), are an AMEL of 53 µg/L and an MDEL of 76 µg/L.

(d) Anti-backsliding. Anti-backsliding requirements are satisfied because this Order's copper WQBELs are the same as those in the previous order.

ii. Cyanide

(a) Water Quality Objectives. Basin Plan Table 3-3C contains chronic and acute marine water quality objectives for cyanide of 2.9 µg/L and 9.4 µg/L (site-specific objectives for San Francisco Bay).

(b) Reasonable Potential Analysis. This Order establishes cyanide WQBELs because the maximum effluent concentration (9.5 µg/L) exceeds the governing water quality objective (2.9 µg/L), demonstrating reasonable potential by Trigger 1.

(c) WQBELs. Cyanide WQBELs, calculated according to SIP procedures with an effluent data coefficient of variation of 0.80 and a dilution credit of D = 9, are an AMEL of 20 µg/L and an MDEL of 45 µg/L. This MDEL is less stringent than the one in the previous order (43 µg/L); therefore, this Order retains the previous MDEL to avoid backsliding.

(d) Anti-backsliding. Anti-backsliding requirements are satisfied because this Order's cyanide WQBELs are at least as stringent as those in the previous order.

iii. Dioxin-TEQ

(a) Water Quality Objective. The Basin Plan narrative water quality objective for bioaccumulative substances states, "Many pollutants can accumulate on particulates, in sediments, or bioaccumulate in fish and other aquatic organisms. Controllable water quality factors shall not cause a detrimental increase in concentrations of toxic substances found in bottom sediments or aquatic life. Effects on aquatic organisms, wildlife, and human health will be considered."

Because it is the consensus of the scientific community that dioxins and furans associate with particulates, accumulate in sediments, and bioaccumulate in the fatty tissue of fish and other organisms, the Basin Plan's narrative bioaccumulation water quality objective applies to these pollutants. Elevated levels of dioxins and furans in San Francisco Bay fish tissue demonstrate that the narrative bioaccumulation water quality objective is not being met. U.S. EPA has therefore placed Lower San Francisco Bay on its 303(d)-list of receiving waters where water quality objectives are not being met after imposition of applicable technology-based requirements.

When the CTR was promulgated, U.S. EPA stated its support of the regulation of dioxin and dioxin-like compounds through the use of toxicity equivalencies (TEQs). U.S. EPA stated, "For California waters, if the discharge of dioxin or dioxin-like compounds has reasonable potential to cause or contribute to a violation of a narrative criterion, numeric WQBELs for dioxin or dioxin-like compounds should be included in NPDES permits and should be expressed using a TEQ scheme" (65 Fed. Reg. 31695-31696, May 18, 2000). This Order uses a TEQ scheme based on a set of toxicity equivalency factors (TEFs) the World Health Organization developed in 1998, and a set of bioaccumulation equivalency factors (BEFs) U.S. EPA developed for the Great Lakes region (40 C.F.R. part 132, Appendix F) to convert the concentration of any congener of dioxin or furan into an equivalent concentration of 2,3,7,8-tetrachlorinated dibenzo-p-dioxin (2,3,7,8-TCDD). Although the 1998 World Health Organization scheme includes TEFs for dioxin-like PCBs, they are not included in this Order's TEQ scheme.

The CTR has established a specific water quality criterion for PCBs, and dioxin-like PCBs are included in the analysis of total PCBs.

The CTR establishes a numeric water quality objective for 2,3,7,8-TCDD of 1.4×10^{-8} µg/L for the protection of human health when aquatic organisms are consumed. The CTR criterion is used as a criterion for dioxin-TEQ because dioxin-TEQ represents a toxicity weighted concentration equivalent to 2,3,7,8-TCDD, thus translating the narrative bioaccumulation objective into a numeric criterion.

(b) Reasonable Potential Analysis. TEFs and BEFs were used to express measured concentrations of 16 dioxin congeners in effluent and background samples as equivalent 2,3,7,8-TCDD concentrations. For each sample, the sum of these equivalent concentrations is the dioxin-TEQ concentration. This Order establishes dioxin-TEQ WQBELs because the ambient background receiving water dioxin-TEQ concentration (5.3×10^{-8} µg/L) exceeds the CTR numeric criterion for 2,3,7,8-TCDD (1.4×10^{8} µg/L) and dioxin-TEQ was detected in the effluent, demonstrating reasonable potential by Trigger 2.

(c) WQBELs. Dioxin-TEQ WQBELs, calculated according to SIP procedures with a default coefficient of variation of 0.60 and no dilution credit, are an AMEL of 1.4×10^{-8} µg/L and an MDEL of 2.8×10^{-8} µg/L.

(d) Anti-backsliding. The previous order contained an annual mass-based dioxin-TEQ effluent limit based on a dry weather flow of 85.4 MGD and a monthly average effluent concentration of 1.4×10^{-8} µg/L. Anti-backsliding requirements are satisfied because this Order's dioxin-TEQ WQBELs are as stringent as the previous mass-based limitation (the new AMEL is the same as the concentration used to derive the prevous mass-based limit).

iv. 1,2-Diphenylhydrazine

(a) Water Quality Objectives. The CTR contains a human health water quality criterion for 1,2-diphenylhydrazine of 0.54 µg/L when organisms only (not water) are consumed from the receiving water.

(b) Reasonable Potential Analysis. This Order establishes WQBELs for 1,2-diphenylhydrazine because the maximum effluent concentration (1.1 µg/L) exceeds the governing water quality objective (0.54 µg/L), demonstrating reasonable potential by Trigger 1.

(c) WQBELs. WQBELs for 1,2-diphenylhydrazine, calculated according to SIP procedures with a default coefficient of variation of 0.60 and a dilution credit of D = 9, are an AMEL of 5.4 µg/L and an MDEL of 11 µg/L.

(d) Anti-backsliding. Anti-backsliding requirements are satisfied because the previous order did not contain 1,2-diphenylhydrazine limitations.

v. Ammonia

(a) Water Quality Objectives. The discharge into Lower San Francisco Bay occurs south of the San Francisco Bay Bridge. For these waters, Basin Plan section 3.3.20 contains water quality objectives for un-ionized ammonia of 0.025 mg/L as an annual median and 0.4 mg/L as a maximum. These objectives were translated from un-ionized ammonia concentrations to equivalent total ammonia concentrations (as nitrogen) since (1) sampling and laboratory methods are unavailable to analyze for un-ionized ammonia, and (2) the fraction of total ammonia that exists in the toxic un-ionized form depends on the pH, salinity, and temperature of the receiving water.

To translate the un-ionized ammonia objectives, pH, salinity, and temperature data were obtained from the RMP station nearest to the outfall (Alameda station, BB70). The un-ionized fraction of total ammonia was calculated as follows:

$$\text{For salinity} > 10 \text{ ppt: fraction of } NH_3 = \frac{1}{1+10^{(pK-pH)}}$$

Where:

$$pK = 9.245 + 0.116(I) + 0.0324\,(298 - T) + \frac{0.0415(P)}{(T)}$$

$$I = \text{Molal ionic strength of saltwater} = \frac{19.9273(S)}{(1{,}000 - 1.005109(S))}$$

S = Salinity (parts per thousand)

T = Temperature (degrees Kelvin)

P = Pressure (one atmosphere)

The median and 90th percentile un-ionized ammonia fractions were then used to express the daily maximum and the annual average un-ionized objectives as chronic and acute total ammonia criteria. This approach is consistent with U.S. EPA guidance on translating dissolved metal water quality objectives to total recoverable metal water quality objectives (U.S. EPA, 1996, *The Metals Translator: Guidance for Calculating a Total Recoverable Limit from a Dissolved Criterion*, EPA Publication 823-B-96-007).

The equivalent total ammonia chronic and acute criteria are 1.1 mg/L and 8.5 mg/L as nitrogen.

(b) Reasonable Potential Analysis. This Order relies on the SIP methodology as guidance to perform the reasonable potential analysis. This Order establishes total ammonia WQBELs because the maximum effluent concentration (42 mg/L as nitrogen) exceeds the governing water quality criterion (1.1 mg/L as nitrogen), demonstrating reasonable potential by Trigger 1.

(c) WQBELs. This Order relies on the SIP methodology as guidance to calculate the total ammonia WQBELs. The WQBELs are the more stringent AMEL and MDEL based on independent calculations using the chronic and acute objectives. To calculate an AMEL and MDEL based on the chronic objective, the median background concentration at the Alameda RMP station (BB70) (0.11 mg/L) and the minimum dilution based on the average flow (231:1) were used. To calculate an AMEL and MDEL based on the acute objective, the maximum background concentration (0.22 mg/L) and the minimum dilution based on the maximum flow (51:1) were used. Because the Basin Plan's chronic un-ionized ammonia objective is an annual median, the median background concentration and long-term average dilution represent ambient conditions better than a daily maximum concentration and minimum dilution.

The total ammonia WQBELs in this Order are based on the chronic objective. Calculated using an effluent data coefficient of variation of 0.15 and a dilution credit of D = 230, they are an AMEL of 220 mg/L and an MDEL of 300 mg/L.

Statistical adjustments were made to the total ammonia WQBEL calculations. The SIP assumes a 4-day average concentration and a monthly sampling frequency of 4 days per month to calculate effluent limitations based on chronic criteria, but the Basin Plan's chronic water quality objective for un-ionized ammonia is based on an annual median instead of the typical 4-day average. Therefore, a 365-day average and a monitoring frequency of 30 days per month (the maximum daily sampling frequency in a month since the averaging period for the chronic criteria is longer than 30 days) were used. These statistical adjustments are supported by U.S. EPA's *Water Quality Criteria; Notice of Availability; 1999 Update of Ambient Water Quality Criteria for Ammonia* (64 Fed. Reg. 71974-71980, December 22, 1999).

The newly calculated AMEL and MDEL are less stringent than those in the previous order (190 µg/L and 290 µg/L); therefore, this Order retains the previous AMEL and MDEL to avoid backsliding.

(d) Anti-backsliding. Anti-backsliding requirements are satisfied because this Order's total ammonia WQBELs are the same as those in the previous order.

(e) Growing Regional Concern with Nutrients. As described above and in section IV.C.4.a.iii of this Fact Sheet, a translated Basin Plan un-ionized ammonia objective and a conservative estimate of actual initial dilution were used to calculate the total ammonia effluent limitations. In the future, the Regional Water Board may grant less dilution credit or change the ammonia limitations in other ways to address growing concerns about nutrients in the receiving water. Currently, a region-wide effort is underway to study and evaluate potential effects. This effort, which is referred to as the San Francisco Bay Nutrient Strategy, includes developing a nutrient assessment framework that can be used to calculate WQBELs for nutrients. The Regional Water Board, through its Executive Officer, has also required wastewater dischargers, including this Discharger, to monitor nutrients, including ammonia, in their influent and

effluent. This information will be used to compare nutrient loads from wastewater discharges to loads from other sources, to support modeling and evaluation of load reduction scenarios, and to determine the need for additional wastewater treatment to address nutrients.

c. Effluent Limit Calculations. The following table shows the WQBEL calculations:

Table F-10. WQBEL Calculations

PRIORITY POLLUTANTS	Copper	Cyanide	Dioxin TEQ	1,2-Diphenyl-hydrazine	Total Ammonia (acute)	Total Ammonia (chronic)

5. Whole Effluent Acute Toxicity

This Order includes dry weather effluent limitations for whole effluent acute toxicity based on Basin Plan Table 4-3. All bioassays are to be performed according to the U.S. EPA approved method in 40 C.F.R. section 136, currently *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms*, 5th Edition (EPA-821-R-02-012). The approved test species specified in the MRP are rainbow trout (*Oncorhynchus mykiss*) and fathead minnow (*Pimephales promelas*).

Based on Basin Plan section 3.3.20, if the Discharger can demonstrate that ammonia causes acute toxicity in excess of the acute toxicity limitations in this Order, and that the ammonia in the discharge complies with the ammonia effluent limitations in this Order, then such toxicity does not constitute a violation of the effluent limitations for whole effluent acute toxicity.

6. Whole Effluent Chronic Toxicity

a. Water Quality Objective. Basin Plan section 3.3.18 states, "There shall be no chronic toxicity in ambient waters. Chronic toxicity is a detrimental biological effect on growth rate, reproduction, fertilization success, larval development, population abundance, community composition, or any other relevant measure of the health of an organism, population, or community."

b. Reasonable Potential Analysis. The Discharger conducted semiannual chronic toxicity tests during the previous order term using the echinoderm larval development test. The previous order contained chronic toxicity triggers (three-sample median of 10 TUc or single-sample maximum of 20 TUc) for accelerated chronic toxicity testing. The maximum single-sample chronic toxicity result during the previous order term was 10 TUc in July 2009. The relatively low toxicity indicates low reasonable potential for

chronic toxicity so this Order contains only a narrative chronic toxicity limit. A numeric limit is unwarranted.

c. Requirements. The Order contains a narrative chronic toxicity effluent limitation based on the Basin Plan's narrative toxicity water quality objective. The Order also includes requirements for chronic toxicity monitoring to ensure attainment of the narrative toxicity objective and a monitoring "trigger" for initiation of accelerated monitoring requirements when exceeded. The Discharger is required to implement a chronic toxicity reduction evaluation in some circumstances. These requirements are consistent with CTR and SIP requirements.

d. Screening Phase Study and Monitoring Requirement. The MRP requires the Discharger to conduct a chronic toxicity screening phase study, as described in MRP Appendix E-1, prior to permit reissuance. The Discharger's April 2012 chronic toxicity screening study did not indicate the presence of toxicity effects in the effluent for the test species examined. Therefore, the Discharger will continue to using the echinoderm larval development test (i.e., purple sea urchin [*Strongylocentroltus purpuratus*] or sand dollar [*Dendraster excentricus*]. The accelerated monitoring triggers are based on Basin Plan Table 4-5.

D. Effluent Limitation Considerations

1. Anti-backsliding. This Order complies with the anti-backsliding provisions of CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l), which generally require effluent limitations in a reissued permit to be as stringent as those in the previous permit. Most requirements of this Order are at least as stringent as those in the previous order, with some exceptions:

- This Order does not retain silver, lead, zinc, tetrachloroethylene, tributyltin, and bis(2-ethylhexyl)phthalate limits from the previous order because data no longer indicate that these pollutants have reasonable potential to exceed water quality objectives. This is consistent with State Water Board Order WQ 2001-16.

- This Order replaces the previous order's wet weather enterococcus and fecal coliform limits with a new wet weather enterococcus limit. The change from an instantaneous maximum enterococcus limit to a geometric mean is not subject to anti-backsliding requirements because the two limits reflect different averaging periods, both are consistent with Basin Plan Table 3-1 water quality objectives, and a direct comparison between the two types of limits is impossible. Likewise, the change from fecal coliform limits to an enterococcus limit is not subject to anti-backsliding requirements because a direct comparison between these two types of limits is also impossible.

- This Order does not retain mercury limits from the previous order because NPDES Permit No. CA0038849 now covers mercury discharges.

2. Antidegradation. This Order complies with the antidegradation provisions of 40 C.F.R. section 131.12 and State Water Board Resolution No. 68-16. It continues the status quo with respect to the level of discharge authorized in the previous order, which is the baseline by

which to measure whether degradation will occur. This Order does not allow for a reduced level of treatment relative to the previous order.

This Order corrects a typographical error in the previous order. Discharge Prohibition III.E allows the average dry weather flow to increase from 84.5 MGD to 85.4 MGD. Earlier orders (e.g., Order No. R2-2002-0073) allowed this slightly higher flow. This change will not affect water quality, particularly since the effluent limitations and other provisions of this Order require the Discharger to maintain its existing treatment performance. Therefore, discharges subject to this Order will not degrade water quality, and findings authorizing degradation are unnecessary.

This Order replaces the previous order's wet weather enterococcus and fecal coliform limits with a new wet weather enterococcus limit. This change will not degrade receiving water quality because the old and new limits are all consistent with Basin Plan Table 3-1 water quality objectives, and any difference in effects would be temporally limited and would not result in any long-term deleterious effect on water quality (e.g., they would cease after wet weather is over).

3. **Stringency of Requirements for Individual Pollutants.** This Order contains both technology-based and water quality-based effluent limitations for individual pollutants. This Order's technology-based requirements implement minimum, applicable federal technology-based requirements. In addition, this Order contains more stringent effluent limitations as necessary to meet water quality standards. Collectively, this Order's restrictions on individual pollutants are no more stringent than required to implement CWA requirements.

   This Order's WQBELs have been derived to implement water quality objectives that protect beneficial uses. The beneficial uses and water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that WQBELs were derived from the CTR, the CTR is the applicable standard pursuant to 40 C.F.R. section 131.38. The procedures for calculating these WQBELs are based on the CTR, as implemented in accordance with the SIP, which U.S. EPA approved on May 18, 2000. U.S. EPA approved most Basin Plan beneficial uses and water quality objectives prior to May 30, 2000. Beneficial uses and water quality objectives submitted to U.S. EPA prior to May 30, 2000, but not approved by U.S. EPA before that date, are nonetheless "applicable water quality standards for purposes of the CWA" pursuant to 40 C.F.R. section 131.21(c)(1). U.S. EPA approved the remaining beneficial uses and water quality objectives so they are applicable water quality standards pursuant to 40 C.F.R. section 131.21(c)(2).

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

The receiving water limitations in sections V.A.1 and V.A.2 of the Order are based on Basin Plan narrative and numeric water quality objectives. The receiving water limitation in section V.A.3 of the Order requires compliance with federal and State water quality standards in accordance with the CWA and regulations adopted thereunder.

VI. RATIONALE FOR PROVISIONS

A. Standard Provisions

Attachment D contains standard provisions that apply to all NPDES permits in accordance with 40 C.F.R. section 122.41 and additional conditions applicable to specific categories of permits in accordance with 40 C.F.R. section 122.42. The Discharger must comply with these provisions. The conditions set forth in 40 C.F.R. sections 122.41(a)(1) and (b) through (n) apply to all state-issued NPDES permits and must be incorporated into the permits either expressly or by reference.

In accordance with 40 C.F.R. section 123.25(a)(12), states may omit or modify conditions to impose more stringent requirements. Attachment G contains standard provisions that supplement the federal standard provisions in Attachment D.

This Order omits federal conditions that address enforcement authority specified in 40 C.F.R. sections 122.41(j)(5) and (k)(2) because the State's enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates Water Code section 13387(e) by reference.

B. Monitoring and Reporting

Pursuant to 40 C.F.R. section 122.48, NPDES permits must specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383, and 40 C.F.R. sections 122.41(h) and (j), authorize the Regional Water Board to require technical and monitoring reports. This Order establishes monitoring and reporting requirements, contained in the Monitoring and Reporting Program (Attachment E), that implement federal and State requirements. For more background regarding these requirements, see section VII of this Fact Sheet.

C. Special Provisions

1. Reopener Provisions

These provisions are based on 40 C.F.R. sections 122.62 and 122.63 and allow modification of this Order and its effluent limitations as necessary in response to updated water quality objectives, regulations, or other new and relevant information that may become available in the future, and other circumstances as allowed by law.

2. Effluent Characterization Study and Report

This Order does not include effluent limitations for priority pollutants that do not demonstrate reasonable potential, but this provision requires the Discharger to continue monitoring for these pollutants during dry weather as described in the MRP and Attachment G. Dry weather monitoring data are necessary to verify that the "no" and "cannot determine" reasonable potential analysis conclusions of this Order remain valid. This requirement is authorized pursuant to CWC section 13267, and is necessary to inform the

next permit reissuance and to ensure that the Discharger takes timely action in response to any unanticipated change in effluent quality during the term of this Order.

3. Pollutant Minimization Program

This provision is based on Basin Plan section 4.13.2 and SIP section 2.4.5.

4. Special Provisions for Municipal Facilities

a. Pretreatment Program. This provision is based on 40 C.F.R. part 403. The Discharger implements a pretreatment program due to the nature and volume of industrial influent to the Southeast Plant. Two significant industrial users discharge to the Facility and are subject to the Discharger's pretreatment program. This provision lists the Discharger's responsibilities regarding its pretreatment program and requires compliance with the provisions in Attachment H, "Pretreatment Requirements."

b. Sludge and Biosolids Management. "Sludge" refers to the solid, semisolid, and liquid residue removed during primary, secondary, and advanced wastewater treatment processes. "Biosolids" refers to sludge that has been treated and may be beneficially used. This provision is based on Basin Plan section 4.17 and 40 C.F.R. parts 257 and 503.

c. Collection System Management. The Discharger's collection system is predominantly a combined sewer system with some limited separate sanitary sewers. It is part of the Facility regulated through this Order. This provision explains this Order's requirements as they relate to the Discharger's collection system and promotes consistency with the State Water Board's *Statewide General Waste Discharge Requirements for Sanitary Sewer Systems* (General Collection System WDRs), Order 2006-0003-DWQ as amended by WQ 2008-0002-EXEC.

i. Separate Sanitary Sewer System. The General Collection System WDRs require public agencies that own or operate sanitary sewer systems with greater than one mile of pipes or sewer lines to enroll for coverage under the General Collection System WDRs. The General Collection System WDRs contain requirements for collection system operation and maintenance and for reporting and mitigating sanitary sewer overflows. They also require agencies to develop sanitary sewer management plans and report all sanitary sewer overflows. The Discharger must comply with both the General Collection System WDRs and this Order. To the extent that the Discharger's separate sanitary sewer collection system is part of the Facility subject to this Order, certain provisions apply, as specified in Provision VI.C.4.c.i.

ii. Combined Sewer System. For purposes of this Order, an "excursion" is a release or diversion of untreated or partially treated wastewater from the combined sewer system that exits the system temporarily and then re-enters it. The Discharger and U.S. EPA developed the collection system excursion reporting requirement in this Order so the information would be available.

5. Combined Sewer Overflow Controls

The *Combined Sewer Overflow Control Policy* addresses combined sewer system operations. Its requirements are summarized below as they relate to this Order. The Discharger has designed, constructed, and implemented control strategies that address wet weather flows. This provision specifies performance criteria for wet weather combined sewer system operations.

a. Combined Sewer Operations and Maintenance Plan. This provision is necessary to ensure that combined sewer system operations and maintenance comply with the Nine Minimum Controls and the Long-Term Control Plan requirements of the *Combined Sewer Overflow Control Policy*.

b. Nine Minimum Controls. The *Combined Sewer Overflow Control Policy* requires these "Nine Minimum Controls" to satisfy CWA technology-based requirements:

- Conduct proper operations and maintenance programs,
- Maximize use of collection system for storage,
- Review and modify pretreatment program,
- Maximize flow to Southeast Plant and North Point Facility,
- Prohibit dry weather combined sewer overflows,
- Control solid and floatable materials in combined sewer discharges,
- Develop and implement pollution prevention program,
- Notify public of combined sewer discharges, and
- Monitor to characterize wet weather discharge impacts and efficacy of controls.

The *Combined Sewer Overflow Control Policy* requires monitoring to ascertain the effectiveness of controls and to verify compliance with water quality standards and protection of beneficial uses. If implemented controls do not result in attainment of water quality standards, including beneficial uses, a discharger must evaluate its operating practices. If monitoring indicates that water quality standards are not met, the data may be used to identify additional controls necessary to achieve water quality standards.

Over the previous order term, the Discharger monitored combined sewer discharges (*Special Study: Overflow Impacts and Efficacy of Combined Sewer Overflow Controls for the San Francisco Bayside System, Southeast Water Pollution Control Plant, North Point Wet Weather Facility and Bayside Wet Weather Facilities*, June 29, 2012). It found that average combined sewer discharge pollutant concentrations are below acute water quality objectives for metals and other priority pollutants, with the exceptions of copper and zinc. The average dissolved zinc concentration was 91 µg/L (based on the default CTR acute translator), compared to the water quality objective of 90 µg/L. The average dissolved copper concentration was 19 µg/L (based on the Basin Plan Table 7.2.1-2 acute translator), compared to the water quality objective of 10.8 µg/L. Water quality objectives apply in the receiving water, not combined sewer discharges *per se*. Therefore, given the relatively short duration of combined sewer discharges (i.e., just a few hours each time), and accounting for the inevitable dilution within the receiving waters during wet weather, water quality standards appear to be maintained.

The Order requires the Discharger to continue monitoring wet weather discharges to characterize their impacts and evaluate the efficacy of its wet weather controls. The Order also requires receiving water monitoring for enterococcus and fecal coliform at recreational use locations to determine the impacts of wet weather discharges on water contact recreation. The data collected may be used to document current conditions and evaluate whether beneficial uses are protected.

Among other requirements, the Nine Minimum Controls require the Discharger to notify the public when combined sewer discharges occur. The Discharger's current notification process fulfills these requirements. It includes posting permanent signs at San Francisco beaches that inform the public in English, Spanish, and Chinese that international "No Swimming" signs will be posted when it is unsafe to enter the water and to warn users that bacteria concentrations may be elevated during heavy rain. The Discharger posts "No Swimming" signs at beaches whenever a combined sewer discharge occurs in the area. These signs remain posted until water sampling indicates that bacteria concentrations have dropped below levels of concern for water contact recreation (i.e., the single-sample bacteriological standards of Cal. Code of Regs. tit. 17, § 7958[a][1]). Both types of signs provide the Discharger's toll-free water quality hotline (1-877-SFBEACH) that the Discharger updates weekly and whenever new bacteria results are available. The Discharger also provides color-coded indicators (green/open; red/posted) of beach water quality conditions on the Internet (http://beaches.sfwater.org).

The Discharger has designated Lewis Harrison as the contact person responsible for the wastewater collection system. The Order allows the Discharger to designate a different contact person as long as the Discharger notifies the Regional Water Board within 90 days.

c. Long-Term Control Plan. The *Combined Sewer Overflow Control Policy* requires implementation of a Long-Term Control Plan to to satisfy CWA water quality-based requirements (see section IV.C.1 of this Fact Sheet). The Discharger designed and built a combined sewer system that provides for long-term control and treatment. This provision specifies how the combined sewer system is to be operated, consistent with implementation of the Long-Term Control Plan. The Discharger designed the system based on historical rainfall to achieve the following long-term average annual goals:

- Four combined sewer discharge events along the North Shore (Discharge Point Nos. 009 through 017);
- Ten combined sewer discharge events within the Central Basin (Discharge Point Nos. 018 through 036); and
- One combined sewer discharge event along the Southeast Sector (Discharge Point Nos. 037 through 043).

Some years are wetter than others and may contribute more or less flow than anticipated by these design goals; therefore, these goals are not intended for determining compliance.

This provision requires the Discharger to synthesize and update its Long-Term Control Plan into one document that reflects current circumstances. The updated plan is necessary to optimize system operations so as to maximize pollutant removal during wet weather

and minimize combined sewer discharges. This requirement recognizes that circumstances have changed since the plan was first developed and implemented. However, the Order maintains the historical long-term average annual design goals for combined sewer discharges.

In addition to the system design elements of the plan, the Discharger is to describe additional measures, to the extent technically and economically feasible, to minimize combined sewer discharges (e.g., implementing and promoting low-impact development measures that enhance stormwater percolation and slow stormwater runoff to the combined sewer system).

The Discharger is also to develop and propose a mechanism to evaluate the performance of its wet weather disinfection system for Discharge Point Nos. 001 through 006. Based on the proposal, the Regional Water Board may consider replacing the wet weather enterococcus limits in this Order when it next takes up this permit for reissuance.

This provision also requires the Discharger to review its approach to protecting sensitive areas, which include waters with threatened or endangered species and their habitat, waters with primary contact recreation, and waters with shellfish beds, among others. This provision implements *Combined Sewer Overflow Control Policy* section II.C.3, "Consideration of Sensitive Areas," which requires the following with each permit reissuance:

i. Prohibit new or significantly increased combined sewer discharges;

ii. Eliminate and relocate combined sewer discharges that discharge to sensitive areas wherever physically possible and economically achievable, except where elimination or relocation would provide less environmental protection than additional treatment (where elimination or relocation is not physically possible and economically achievable, or would provide less environmental protection than additional treatment, treatment for remaining combined sewer discharges must be sufficient to protect beneficial uses); and

iii. Where elimination or relocation is not physically possible and economically achievable, reassess the situation, based on new or improved techniques to eliminate or relocate the combined sewer discharges, or based on changed circumstances that influence economic achievability, with each subsequent permit term.

d. This provision sets forth steps the Discharger must take if the Executive Offer finds that its discharges cause violations of water quality standards in receiving waters.

6. Other Special Provisions

a. Copper Action Plan. This provision is based on Basin Plan section 7.2.1.2 and is necessary to ensure that use of copper site-specific objectives is consistent with antidegradation policies. Data the San Francisco Estuary Institute compiled for 2008-2010 indicate no degradation of San Francisco Bay water quality with respect to copper (http://www.sfei.org/content/copper-site-specific-objective-3-year-rolling-averages).

b. Cyanide Action Plan. This provision is based on Basin Plan section 4.7.2.2 and is necessary to ensure that use of cyanide site-specific objectives is consistent with antidegradation policies. The threshold for considering influent cyanide concentrations to indicate a possible "significant cyanide discharge" in the Discharger's service area is set at 21 µg/L. This concentration is about 1.5 times the maximum cyanide concentration (14 µg/L) found in the facility's influent during the previous order term. Because the Discharger has not observed influent cyanide concentrations greater than 14 µg/L, if influent concentrations 1.5 times this level were observed, there could be a significant cyanide source.

c. Standard Operating Procedures Requirement for Resource Recovery. Standard Operating Procedures are required for dischargers that accept hauled waste fats, oil, and grease for injection into anaerobic digesters. The development and implementations of Standard Operating Procedures for management of these materials is intended to allow the California Deparment of Resources Recycling and Recovery to exempt operations from separate and redundant permitting programs. If the Discharger does not accept fats, oil, and grease for resource recovery purposes, it is not required to develop and implement Standard Operating Procedures.

VII. RATIONALE FOR MONITORING AND REPORTING PROGRAM (MRP)

Attachment E contains the MRP for this Order. It specifies sampling stations, pollutants to be monitored (including all parameters for which effluent limitations are specified), monitoring frequencies, and reporting requirements. The following provides the rationale for the MRP requirements.

A. MRP Requirements Rationale

1. **Influent Monitoring.** Influent flow monitoring is necessary to identify wet weather as defined in Attachment A and to evaluate implementation of Long-Term Control Plan requirements. BOD_5 and TSS monitoring is necessary to evaluate compliance with this Order's 85 percent removal requirement. Basin Plan section 4.7.2.2 requires cyanide monitoring because this Order is based on site-specific cyanide water quality objectives.

2. **Effluent Monitoring.** Effluent flow monitoring is necessary to evaluate compliance with Prohibition III.E (average dry weather flow) and to understand Facility operations. During dry weather, monitoring for the other parameters in Table E-3 is necessary to evaluate compliance with this Order's effluent limitations applicable to Discharge Point No. 001. During wet weather, enterococcus and total residual chlorine monitoring is necessary to evaluate compliance with this Order's effluent limitations applicable to Discharge Point Nos. 001 through 006. Fecal coliform monitoring will provide additional information regarding the efficacy of controls. During combined sewer discharge events, duration and flow volume monitoring is necessary to characterize combined sewer discharges. Provision VI.C.2 of the Order requires monitoring for additional priority pollutants for which there are no effluent limits to inform the next permit reissuance and to ensure that the Discharger takes timely steps in response to any unanticipated change in effluent quality.

Provision VI.C.5.b.ix(a) of the Order requires monitoring to characterize combined sewer discharge impacts and efficacy of controls.

3. **Whole Effluent Toxicity Testing**. Acute and chronic whole effluent toxicity tests are necessary to evaluate compliance with acute and chronic toxicity effluent limitations during dry weather. Chronic toxicity tests during dry weather are also necessary to evaluate whether chronic toxicity triggers the need for a Toxicity Reduction Evaluation. Acute toxicity tests during wet weather are necessary to evaluate the efficacy of wet weather controls.

4. **Receiving Water Monitoring.** The Discharger is required to continue participating in the RMP, which involves collecting data on pollutants and toxicity in San Francisco Bay water, sediment, and biota. This monitoring is necessary to characterize the receiving water and the effects of the discharges authorized in this Order. The Discharger is also required to monitor shoreline locations where water contact recreation takes place. This monitoring is necessary to assess the possible effects of combined sewer discharges and to comply with Provisions VI.C.5.b.viii, "Notify Public of Combined Sewer Discharges," and VI.C.5.b.ix, "Monitor to Characterize Combined Sewer Discharge Impacts and Efficacy of Controls."

5. **Pretreatment and Biosolids Monitoring.** The pretreatment and biosolids monitoring requirements for influent, effluent, and biosolids are necessary to evaluate compliance with the Discharger's U.S. EPA-approved pretreatment program. Biosolids monitoring is also required pursuant to 40 C.F.R. part 503.

B. Monitoring Requirements Summary. The table below summarizes routine monitoring requirements. This table is for informational purposes only. The actual requirements are specified in the MRP and elsewhere in this Order.

Table F-11. Monitoring Requirements Summary

Parameter	Influent INF-001	Effluent EFF-001A	Effluent EFF-001B, EFF-002, and EFF-003	Effluent CSD-010 through CSD-043	Biosolids BIO-001	Receiving Water
Flow	Continuous[1]	Continuous[1]	Continuous[1]	1/Event[1]		
BOD_5	1/Week[2]	1/Week[3]				
TSS	5/Week[2]	5/Week	1/Month	1/Event		
Chemical Oxygen Demand (COD)		5/Week[3]	1/Month			
Oil and Grease		1/Month	1/Month			
pH		Continuous or 5/Week	Continuous or 1/Month	1/Event		Support RMP
Total Residual Chlorine		Continuous or 1/Hour	Continuous or 1/Hour			
Acute Toxicity		1/Month	1/Month[8]			Support RMP
Chronic Toxicity		2/Year				Support RMP
Enterococcus		4/Year[4]	1/Day			1/Day[6]
Fecal Coliform		1/Week	1/Day			1/Day[6]
Dissolved Oxygen						Support RMP
Sulfides						Support RMP
Temperature						Support RMP
Copper, Total Recoverable		1/Month	1/Month			Support RMP
Cyanide, Total	1/Month[2]	1/Month	1/Month	1/Event		Support RMP

Parameter	Influent INF-001	Effluent EFF-001A	Effluent EFF-001B, EFF-002, and EFF-003	Effluent CSD-010 through CSD-043	Biosolids BIO-001	Receiving Water
Ammonia, Total		1/Month	1/Month	1/Event		Support RMP
Dioxin-TEQ		2/Year				Support RMP
1,2-Diphenylhydrazine		1/Month				Support RMP
Settleable Matter				1/Event		
All other priority pollutants		1/Year	1/Year	1/Year[7]		Support RMP
Volatile Organic Compounds	2/Year	2/Year			2/Year	
Base/Neutrals Acid Extractable Organic Compounds	2/Year	2/Year			2/Year	
Metals[2]	1/Month	1/Month		1/Event	2/Year	Support RMP
Hexavalent Chromium	1/Month	1/Month			2/Year	Support RMP
Mercury	1/Month	1/Month			2/Year	Support RMP
Metric tons/year					See Attach. G, § III.B.1	
Paint filter test					See Attach. G, § III.B.2	

Footnotes:

[1] The following flow information is to be reported:

- Daily average flow (MGD)
- Monthly average flow (MGD)
- Total monthly flow volume (MG)
- Maximum and minimum daily average flow rates (MGD)

For Monitoring Locations CSD-010 through CSD-043, only total flow volume (MG) and event duration are to be reported.

[2] The metals are arsenic, cadmium, copper, lead, nickel, selenium, silver, and zinc.

[3] If the COD_5 concentration exceeds 75 mg/L on two consecutive days, the Discharger is to increase the BOD_5 sampling frequency to daily until it demonstreates that the BOD_5 concentration is below 30 mg/L.

[4] If the enterococcus effluent limitation is exceeded, the Discharger is to conduct 5/Month accelerated sampling for at least three consecutive months. If full compliance is demonstrated after the three months, the Discharger may return to the 4/Year sampling.

[5] Influent monitoring is only required during dry weather.

[6] Monitoring is to be once per day following nearby combined sewer discharges. Otherwise, monitoring is to be sufficient to characterize ambient background conditions (e.g., weekly).

[7] Monitoring is only required at Monitoring Location CSD-041.

[8] Monitoring is only required at Monitoring Locations EFF-001B and EFF-003.

VIII. PUBLIC PARTICIPATION

The Regional Water Board considered the issuance of WDRs that will serve as an NPDES permit for the Facility. As a step in the WDR adoption process, Regional Water Board staff developed tentative WDRs and encouraged public participation in the WDR adoption process.

A. Notification of Interested Parties. The Regional Water Board notified the Discharger and interested agencies and persons of its intent to prescribe WDRs for the discharge and provided an opportunity to submit written comments and recommendations. Notification was provided through *The Recorder*. The public had access to the agenda and any changes in dates and locations through the Regional Water Board's website at http://www.waterboards.ca.gov/sanfranciscobay.

B. Written Comments. Interested persons were invited to submit written comments concerning the tentative WDRs as explained through the notification process. Comments were due either in person or by mail at the Regional Water Board office at 1515 Clay Street, Suite 1400, Oakland, California 94612, to the attention of Derek Whitworth.

For full staff response and Regional Water Board consideration, the written comments were due at the Regional Water Board office by 5:00 p.m. on July 1, 2013.

C. Public Hearing. The Regional Water Board held a public hearing on the tentative WDRs during its regular meeting at the following date and time, and at the following location:

Date: Wednesday, August 14, 2013
Time: 9:00 a.m.
Location: Elihu Harris State Office Building
1515 Clay Street, 1st Floor Auditorium
Oakland, CA 94612

Contact: Derek Whitworth, (510) 622-2349, DWhitworth@waterboards.ca.gov

Interested persons were invited to attend. At the public hearing, the Regional Water Board heard testimony pertinent to the discharge, WDRs, and permit. For accuracy of the record, important testimony wasrequested to be in writing.

Dates and venues change. The Regional Water Board web address is http://www.waterboards.ca.gov/sanfranciscobay, where one could access the current agenda for changes in dates and locations.

D. Reconsideration of Waste Discharge Requirements. Any aggrieved person may petition the State Water Board to review the Regional Water Board decision regarding the final WDRs. The State Water Board must receive the petition at the following address within 30 calendar days of the Regional Water Board action:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

For instructions on how to file a petition for review, see http://www.waterboards.ca.gov/public_notices/petitions/water_quality/wqpetition_instr.shtml.

E. Information and Copying. The Report of Waste Discharge, related supporting documents, and comments received are on file and may be inspected at the address above at any time between 9:00 a.m. and 5:00 p.m., Monday through Friday. Copying of documents may be arranged by calling (510) 622-2300.

F. Register of Interested Persons. Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference the Facility, and provide a name, address, and phone number.

G. Additional Information. Requests for additional information or questions regarding this Order should be directed to Derek Whitworth at (510) 622-2349 or DWhitworth@waterboards.ca.gov.

REGIONAL STANDARD PROVISIONS, AND MONITORING AND REPORTING REQUIREMENTS (SUPPLEMENT TO ATTACHMENT D)

FOR

NPDES WASTEWATER DISCHARGE PERMITS

APPLICABILITY

This document applies to dischargers covered by a National Pollutant Discharge Elimination System (NPDES) permit. This document does not apply to Municipal Separate Storm Sewer System (MS4) NPDES permits.

The purpose of this document is to supplement the requirements of Attachment D, Standard Provisions. The requirements in this supplemental document are designed to ensure permit compliance through preventative planning, monitoring, recordkeeping, and reporting. In addition, this document requires proper characterization of issues as they arise, and timely and full responses to problems encountered. To provide clarity on which sections of Attachment D this document supplements, this document is arranged in the same format as Attachment D.

I. STANDARD PROVISIONS - PERMIT COMPLIANCE

A. Duty to Comply – Not Supplemented

B. Need to Halt or Reduce Activity Not a Defense – Not Supplemented

C. Duty to Mitigate – This supplements I.C. of Standard Provisions (Attachment D)

1. Contingency Plan - The Discharger shall maintain a Contingency Plan as originally required by Regional Water Board Resolution 74-10 and as prudent in accordance with current municipal facility emergency planning. The Contingency Plan shall describe procedures to ensure that existing facilities remain in, or are rapidly returned to, operation in the event of a process failure or emergency incident, such as employee strike, strike by suppliers of chemicals or maintenance services, power outage, vandalism, earthquake, or fire. The Discharger may combine the Contingency Plan and Spill Prevention Plan into one document. Discharge in violation of the permit where the Discharger has failed to develop and implement a Contingency Plan as described below will be the basis for considering the discharge a willful and negligent violation of the permit pursuant to California Water Code Section 13387. The Contingency Plan shall, at a minimum, contain the provisions of a. through g. below.

a. Provision of personnel for continued operation and maintenance of sewerage facilities during employee strikes or strikes against contractors providing services.

b. Maintenance of adequate chemicals or other supplies and spare parts necessary for continued operations of sewerage facilities.

c. Provisions of emergency standby power.

d. Protection against vandalism.

e. Expeditious action to repair failures of, or damage to, equipment and sewer lines.

f. Report of spills and discharges of untreated or inadequately treated wastes, including measures taken to clean up the effects of such discharges.

g. Programs for maintenance, replacement, and surveillance of physical condition of equipment, facilities, and sewer lines.

2. Spill Prevention Plan - The Discharger shall maintain a Spill Prevention Plan to prevent accidental discharges and minimize the effects of such events. The Spill Prevention Plan shall:

a. Identify the possible sources of accidental discharge, untreated or partially treated waste bypass, and polluted drainage;

b. Evaluate the effectiveness of present facilities and procedures, and state when they became operational; and

c. Predict the effectiveness of the proposed facilities and procedures, and provide an implementation schedule containing interim and final dates when they will be constructed, implemented, or operational.

This Regional Water Board, after review of the Contingency and Spill Prevention Plans or their updated revisions, may establish conditions it deems necessary to control accidental discharges and to minimize the effects of such events. Such conditions may be incorporated as part of the permit upon notice to the Discharger.

D. Proper Operation & Maintenance – This supplements I.D of Standard Provisions (Attachment D)

1. Operation and Maintenance (O&M) Manual - The Discharger shall maintain an O&M Manual to provide the plant and regulatory personnel with a source of information describing all equipment, recommended operational strategies, process control monitoring, and maintenance activities. To remain a useful and relevant document, the O&M Manual shall be kept updated to reflect significant changes in treatment facility equipment and operational practices. The O&M Manual shall be maintained in usable condition and be available for reference and use by all relevant personnel and Regional Water Board staff.

2. Wastewater Facilities Status Report - The Discharger shall regularly review, revise, or update, as necessary, its Wastewater Facilities Status Report. This report shall document how the Discharger operates and maintains its wastewater collection, treatment, and disposal facilities to ensure that all facilities are adequately staffed, supervised, financed, operated, maintained, repaired, and upgraded as necessary to provide adequate and reliable transport, treatment, and disposal of all wastewater from both existing and planned future wastewater sources under the Discharger's service responsibilities.

3. Proper Supervision and Operation of Publicly Owned Treatment Works (POTWs) - POTWs shall be supervised and operated by persons possessing certificates of appropriate grade pursuant to Division 4, Chapter 14, Title 23 of the California Code of Regulations.

E. Property Rights – Not Supplemented

F. Inspection and Entry – Not Supplemented

G. Bypass – Not Supplemented

H. Upset – Not Supplemented

I. Other – This section is an addition to Standard Provisions (Attachment D)

1. Neither the treatment nor the discharge of pollutants shall create pollution, contamination, or nuisance as defined by California Water Code Section 13050.

2. Collection, treatment, storage, and disposal systems shall be operated in a manner that precludes public contact with wastewater, except in cases where excluding the public is infeasible, such as private property. If public contact with wastewater could reasonably occur on public property, warning signs shall be posted.

3. If the Discharger submits a timely and complete Report of Waste Discharge for permit reissuance, this permit continues in force and effect until a new permit is issued or the Regional Water Board rescinds the permit.

J. Storm Water – This section is an addition to Standard Provisions (Attachment D)

These provisions apply to facilities that do not direct all storm water flows from the facility to the wastewater treatment plant headworks.

1. Storm Water Pollution Prevention Plan (SWPP Plan)

The SWPP Plan shall be designed in accordance with good engineering practices and shall address the following objectives:

a. To identify pollutant sources that may affect the quality of storm water discharges; and

b. To identify, assign, and implement control measures and management practices to reduce pollutants in storm water discharges.

The SWPP Plan may be combined with the existing Spill Prevention Plan as required in accordance with Section C.2. The SWPP Plan shall be retained on-site and made available upon request of a representative of the Regional Water Board.

2. Source Identification

The SWPP Plan shall provide a description of potential sources that may be expected to add significant quantities of pollutants to storm water discharges, or may result in non-storm water discharges from the facility. The SWPP Plan shall include, at a minimum, the following items:

a. A topographical map (or other acceptable map if a topographical map is unavailable), extending one-quarter mile beyond the property boundaries of the facility, showing the wastewater treatment facility process areas, surface water bodies (including springs and wells), and discharge point(s) where the facility's storm water discharges to a municipal storm drain system or other points of discharge to waters of the State. The requirements of this paragraph may be included in the site map required under the following paragraph if appropriate.

b. A site map showing the following:

   1) Storm water conveyance, drainage, and discharge structures;

   2) An outline of the storm water drainage areas for each storm water discharge point;

   3) Paved areas and buildings;

   4) Areas of actual or potential pollutant contact with storm water or release to storm water, including but not limited to outdoor storage and process areas; material loading, unloading, and access areas; and waste treatment, storage, and disposal areas;

   5) Location of existing storm water structural control measures (i.e., berms, coverings, etc.);

   6) Surface water locations, including springs and wetlands; and

   7) Vehicle service areas.

c. A narrative description of the following:

   1) Wastewater treatment process activity areas;

   2) Materials, equipment, and vehicle management practices employed to minimize contact of significant materials of concern with storm water discharges;

   3) Material storage, loading, unloading, and access areas;

   4) Existing structural and non-structural control measures (if any) to reduce pollutants in storm water discharges; and

   5) Methods of on-site storage and disposal of significant materials.

d. A list of pollutants that have a reasonable potential to be present in storm water discharges in significant quantities.

3. Storm Water Management Controls

The SWPP Plan shall describe the storm water management controls appropriate for the facility and a time schedule for fully implementing such controls. The appropriateness and priorities of controls in the SWPP Plan shall reflect identified potential sources of pollutants. The description of storm water management controls to be implemented shall include, as appropriate:

a. Storm water pollution prevention personnel

Identify specific individuals (and job titles) that are responsible for developing, implementing, and reviewing the SWPP Plan.

b. Good housekeeping

Good housekeeping requires the maintenance of clean, orderly facility areas that discharge storm water. Material handling areas shall be inspected and cleaned to reduce the potential for pollutants to enter the storm drain conveyance system.

c. Spill prevention and response

Identify areas where significant materials can spill into or otherwise enter storm water conveyance systems and their accompanying drainage points. Specific material handling procedures, storage requirements, and cleanup equipment and procedures shall be identified, as appropriate. The necessary equipment to implement a cleanup shall be available, and personnel shall be trained in proper response, containment, and cleanup of spills. Internal reporting procedures for spills of significant materials shall be established.

d. Source control

Source controls include, for example, elimination or reduction of the use of toxic pollutants, covering of pollutant source areas, sweeping of paved areas, containment of potential pollutants, labeling of all storm drain inlets with “No Dumping” signs, isolation or separation of industrial and non-industrial pollutant sources so that runoff from these areas does not mix, etc.

e. Storm water management practices

Storm water management practices are practices other than those that control the sources of pollutants. Such practices include treatment or conveyance structures, such as drop inlets, channels, retention and detention basins, treatment vaults, infiltration galleries, filters, oil/water separators, etc. Based on assessment of the potential of various sources to contribute pollutants to storm water discharges in significant quantities, additional storm water management practices to remove pollutants from storm water discharges shall be implemented and design criteria shall be described.

f. Sediment and erosion control

Measures to minimize erosion around the storm water drainage and discharge points, such as riprap, revegetation, slope stabilization, etc., shall be described.

g. Employee training

Employee training programs shall inform all personnel responsible for implementing the SWPP Plan. Training shall address spill response, good housekeeping, and material management practices. New employee and refresher training schedules shall be identified.

h. Inspections

All inspections shall be done by trained personnel. Material handling areas shall be inspected for evidence of, or the potential for, pollutants entering storm water discharges. A tracking or follow up procedure shall be used to ensure appropriate response has been taken in response to an inspection. Inspections and maintenance activities shall be documented and recorded. Inspection records shall be retained for five years.

i. Records

A tracking and follow-up procedure shall be described to ensure that adequate response and corrective actions have been taken in response to inspections.

4. Annual Verification of SWPP Plan

An annual facility inspection shall be conducted to verify that all elements of the SWPP Plan are accurate and up-to-date. The results of this review shall be reported in the Annual Report to the Regional Water Board described in Section V.C.f.

K. Biosolids Management – This section is an addition to Standard Provisions (Attachment D)

Biosolids must meet the following requirements prior to land application. The Discharger must either demonstrate compliance or, if it sends the biosolids to another party for further treatment or distribution, must give the recipient the information necessary to ensure compliance.

1. Exceptional quality biosolids meet the pollutant concentration limits in Table III of 40 CFR Part 503.13, Class A pathogen limits, and one of the vector attraction reduction requirements in 503.33(b)(1)-(b)(8). Such biosolids do not have to be tracked further for compliance with general requirements (503.12) and management practices (503.14).

2. Biosolids used for agricultural land, forest, or reclamation shall meet the pollutant limits in Table I (ceiling concentrations) and Table II or Table III (cumulative loadings or pollutant concentration limits) of 503.13. They shall also meet the general requirements (503.12) and management practices (503.14) (if not exceptional quality biosolids) for Class A or Class B pathogen levels with associated access restrictions (503.32) and one of the 10 vector attraction reduction requirements in 503.33(b)(1)-(b)(10).

3. Biosolids used for lawn or home gardens must meet exceptional quality biosolids limits.

4. Biosolids sold or given away in a bag or other container must meet the pollutant limits in either Table III or Table IV (pollutant concentration limits or annual pollutant loading rate limits) of 503.13. If Table IV is used, a label or information sheet must be attached to the biosolids packing that explains Table IV (see 503.14). The biosolids must also meet the Class A pathogen limits and one of the vector attraction reduction requirements in 503.33(b)(1)-(b)(8).

II. STANDARD PROVISIONS – PERMIT ACTION – Not Supplemented

III. STANDARD PROVISIONS – MONITORING

A. Sampling and Analyses – This section is a supplement to III.A and III.B of Standard Provisions (Attachment D)

1. Use of Certified Laboratories

Water and waste analyses shall be performed by a laboratory certified for these analyses in accordance with California Water Code Section 13176.

2. Use of Appropriate Minimum Levels

Table C lists the suggested analytical methods for the 126 priority pollutants and other toxic pollutants that should be used, unless a particular method or minimum level (ML) is required in the MRP.

For priority pollutant monitoring, when there is more than one ML value for a given substance, the Discharger may select any one of the analytical methods cited in Table C for compliance determination, or any other method described in 40 CFR part 136 or approved by U.S. EPA (such as the 1600 series) if authorized by the Regional Water Board. However, the ML must be below the effluent limitation and water quality objective. If no ML value is below the effluent limitation and water quality objective, then the method must achieve an ML no greater than the lowest ML value indicated in Table C. All monitoring instruments and equipment shall be properly calibrated and maintained to ensure accuracy of measurements.

3. Frequency of Monitoring

The minimum schedule of sampling analysis is specified in the MRP portion of the permit.

a. Timing of Sample Collection

1) The Discharger shall collect samples of influent on varying days selected at random and shall not include any plant recirculation or other sidestream wastes, unless otherwise stipulated by the MRP.

2) The Discharger shall collect samples of effluent on days coincident with influent sampling unless otherwise stipulated by the MRP or the Executive Officer. The Executive Officer may approve an alternative sampling plan if it is demonstrated to be representative of plant discharge flow and in compliance with all other permit requirements.

3) The Discharger shall collect grab samples of effluent during periods of day-time maximum peak effluent flows (or peak flows through secondary treatment units for facilities that recycle effluent flows).

4) Effluent sampling for conventional pollutants shall occur on at least one day of any multiple-day bioassay test the MRP requires. During the course of the test, on at least one day, the Discharger shall collect and retain samples of the discharge. In the event a bioassay test does

not comply with permit limits, the Discharger shall analyze these retained samples for pollutants that could be toxic to aquatic life and for which it has effluent limits.

i. The Discharger shall perform bioassay tests on final effluent samples; when chlorine is used for disinfection, bioassay tests shall be performed on effluent after chlorination-dechlorination; and

ii. The Discharger shall analyze for total ammonia nitrogen and calculate the amount of un-ionized ammonia whenever test results fail to meet the percent survival specified in the permit.

b. Conditions Triggering Accelerated Monitoring

1) If the results from two consecutive samples of a constituent monitored in a 30-day period exceed the monthly average limit for any parameter (or if the required sampling frequency is once per month and the monthly sample exceeds the monthly average limit), the Discharger shall, within 24 hours after the results are received, increase its sampling frequency to daily until the results from the additional sampling show that the parameter is in compliance with the monthly average limit.

2) If any maximum daily limit is exceeded, the Discharger shall increase its sampling frequency to daily within 24 hours after the results are received that indicate the exceedance of the maximum daily limit until two samples collected on consecutive days show compliance with the maximum daily limit.

3) If final or intermediate results of an acute bioassay test indicate a violation or threatened violation (e.g., the percentage of surviving test organisms of any single acute bioassay test is less than 70 percent), the Discharger shall initiate a new test as soon as practical, and the Discharger shall investigate the cause of the mortalities and report its findings in the next self monitoring report (SMR).

4) The Discharger shall calibrate chlorine residual analyzers against grab samples as frequently as necessary to maintain accurate control and reliable operation. If an effluent violation is detected, the Discharger shall collect grab samples at least every 30 minutes until compliance with the limit is achieved, unless the Discharger monitors chlorine residual continuously. In such cases, the Discharger shall continue to conduct continuous monitoring as required by its permit.

5) When a bypass occurs (except one subject to provision III.A.3.b.6 below), the Discharger shall monitor flows and collect samples on a daily basis for all constituents at affected discharge points that have effluent limits for the duration of the bypass (including acute toxicity using static renewals), except chronic toxicity, unless otherwise stipulated by the MRP.

6) Unless otherwise stipulated by the MRP, when a bypass approved pursuant to Attachment D, Standard Provisions, Sections I.G.2 or I.G.4, occurs, the Discharger shall monitor flows and, using appropriate procedures as specified in the MRP, collect and retain samples for affected discharge points on a daily basis for the duration of the bypass. The Discharger shall analyze for total suspended solids (TSS) using 24-hour composites (or more frequent increments) and for bacteria indicators with effluent limits using grab samples. If TSS exceeds 45 mg/L in any composite sample, the Discharger shall also analyze the retained samples for that discharge

for all other constituents that have effluent limits, except oil and grease, mercury, dioxin-TEQ, and acute and chronic toxicity. Additionally, at least once each year, the Discharger shall analyze the retained samples for one approved bypass discharge event for all other constituents that have effluent limits, except oil and grease, mercury, dioxin-TEQ, and acute and chronic toxicity. This monitoring shall be in addition to the minimum monitoring specified in the MRP.

c. Storm Water Monitoring

The requirements of this section only apply to facilities that are not covered by an NPDES permit for storm water discharges and where not all site storm drainage from process areas (i.e., areas of the treatment facility where chemicals or wastewater could come in contact with storm water) is directed to the headworks. For storm water not directed to the headworks during the wet season (October 1 to April 30), the Discharger shall:

1) Conduct visual observations of the storm water discharge locations during daylight hours at least once per month during a storm event that produces significant storm water discharge to observe the presence of floating and suspended materials, oil and grease, discoloration, turbidity, and odor, etc.

2) Measure (or estimate) the total volume of storm water discharge, collect grab samples of storm water discharge from at least two storm events that produce significant storm water discharge, and analyze the samples for oil and grease, pH, TSS, and specific conductance.

   The grab samples shall be taken during the first 30 minutes of the discharge. If collection of the grab samples during the first 30 minutes is impracticable, grab samples may be taken during the first hour of the discharge, and the Discharger shall explain in the Annual Report why the grab sample(s) could not be taken in the first 30 minutes.

3) Testing for the presence of non-storm water discharges shall be conducted no less than twice during the dry season (May 1 to September 30) at all storm water discharge locations. Tests may include visual observations of flows, stains, sludges, odors, and other abnormal conditions; dye tests; TV line surveys; or analysis and validation of accurate piping schematics. Records shall be maintained describing the method used, date of testing, locations observed, and test results.

4) Samples shall be collected from all locations where storm water is discharged. Samples shall represent the quality and quantity of storm water discharged from the facility. If a facility discharges storm water at multiple locations, the Discharger may sample a reduced number of locations if it establishes and documents through the monitoring program that storm water discharges from different locations are substantially identical.

5) Records of all storm water monitoring information and copies of all reports required by the permit shall be retained for a period of at least three years from the date of sample, observation, or report.

d. Receiving Water Monitoring

The requirements of this section only apply when the MRP requires receiving water sampling.

1) Receiving water samples shall be collected on days coincident with effluent sampling for conventional pollutants.

2) Receiving water samples shall be collected at each station on each sampling day during the period within one hour following low slack water. Where sampling during lower slack water is impractical, sampling shall be performed during higher slack water. Samples shall be collected within the discharge plume and down current of the discharge point so as to be representative, unless otherwise stipulated in the MRP.

3) Samples shall be collected within one foot of the surface of the receiving water, unless otherwise stipulated in the MRP.

B. Biosolids Monitoring – This section supplements III.B of Standard Provisions (Attachment D)

When biosolids are sent to a landfill, sent to a surface disposal site, or applied to land as a soil amendment, they must be monitored as follows:

1. Biosolids Monitoring Frequency

Biosolids disposal must be monitored at the following frequency:

Metric tons biosolids/365 days	Frequency
0-290	Once per year
290-1500	Quarterly
1500-15,000	Six times per year
Over 15,000	Once per month

(Metric tons are on a dry weight basis)

2. Biosolids Pollutants to Monitor

Biosolids shall be monitored for the following constituents:

- Land Application: Arsenic, cadmium, copper, mercury, molybdenum, nickel, lead, selenium, and zinc
- Municipal Landfill: Paint filter test (pursuant to 40 CFR 258)
- Biosolids-only Landfill or Surface Disposal Site (if no liner and leachate system): arsenic, chromium, and nickel

C. Standard Observations – This section is an addition to III of Standard Provisions (AttachmentD)

1. Receiving Water Observations

The requirements of this section only apply when the MRP requires standard observations of the receiving water. Standard observations shall include the following:

a. *Floating and suspended materials* (e.g., oil, grease, algae, and other macroscopic particulate matter): presence or absence, source, and size of affected area.

b. *Discoloration and turbidity*: description of color, source, and size of affected area.

c. *Odor*: presence or absence, characterization, source, distance of travel, and wind direction.

d. *Beneficial water use*: presence of water-associated waterfowl or wildlife, fisherpeople, and other recreational activities in the vicinity of each sampling station.

e. *Hydrographic condition*: time and height of corrected high and low tides (corrected to nearest National Oceanic and Atmospheric Administration location for the sampling date and time of sample collection).

f. *Weather conditions*:

1) Air temperature; and

2) Total precipitation during the five days prior to observation.

2. Wastewater Effluent Observations

The requirements of this section only apply when the MRP requires wastewater effluent standard observations. Standard observations shall include the following:

a. *Floating and suspended material of wastewater origin* (e.g., oil, grease, algae, and other macroscopic particulate matter): presence or absence.

b. *Odor*: presence or absence, characterization, source, distance of travel, and wind direction.

3. Beach and Shoreline Observations

The requirements of this section only apply when the MRP requires beach and shoreline standard observations. Standard observations shall include the following:

a. *Material of wastewater origin*: presence or absence, description of material, estimated size of affected area, and source.

b. *Beneficial use*: estimate number of people participating in recreational water contact, non-water contact, or fishing activities.

4. Land Retention or Disposal Area Observations

The requirements of this section only apply to facilities with on-site surface impoundments or disposal areas that are in use. This section applies to both liquid and solid wastes, whether confined or unconfined. The Discharger shall conduct the following for each impoundment:

a. Determine the amount of freeboard at the lowest point of dikes confining liquid wastes.

b. Report evidence of leaching liquid from area of confinement and estimated size of affected area. Show affected area on a sketch and volume of flow (e.g., gallons per minute [gpm]).

c. Regarding odor, describe presence or absence, characterization, source, distance of travel, and wind direction.

d. Estimate number of waterfowl and other water-associated birds in the disposal area and vicinity.

5. Periphery of Waste Treatment and/or Disposal Facilities Observations

The requirements of this section only apply when the MRP specifies periphery standard observations. Standard observations shall include the following:

a. *Odor*: presence or absence, characterization, source, and distance of travel.

b. *Weather conditions*: wind direction and estimated velocity.

IV. STANDARD PROVISIONS – RECORDS

A. Records to be Maintained – This supplements IV.A of Standard Provisions (Attachment D)

The Discharger shall maintain records in a manner and at a location (e.g., wastewater treatment plant or Discharger offices) such that the records are accessible to Regional Water Board staff. The minimum period of retention specified in Section IV, Records, of the Federal Standard Provisions shall be extended during the course of any unresolved litigation regarding the subject discharge, or when requested by the Regional Water Board or Regional Administrator of U.S. EPA, Region IX.

A copy of the permit shall be maintained at the discharge facility and be available at all times to operating personnel.

B. Records of monitoring information shall include – This supplements IV.B of Standard Provision (Attachment D)

1. Analytical Information

Records shall include analytical method detection limits, minimum levels, reporting levels, and related quantification parameters.

2. Flow Monitoring Data

For all required flow monitoring (e.g., influent and effluent flows), the additional records shall include the following, unless otherwise stipulated by the MRP:

a. Total volume for each day; and

b. Maximum, minimum, and average daily flows for each calendar month.

3. Wastewater Treatment Process Solids

a. For each treatment unit process that involves solids removal from the wastewater stream, records shall include the following:

1) Total volume or mass of solids removed from each collection unit (e.g., grit, skimmings, undigested biosolids, or combination) for each calendar month or other time period as appropriate, but not to exceed annually; and

2) Final disposition of such solids (e.g., landfill, other subsequent treatment unit).

b. For final dewatered biosolids from the treatment plant as a whole, records shall include the following:

1) Total volume or mass of dewatered biosolids for each calendar month;

2) Solids content of the dewatered biosolids; and

3) Final disposition of dewatered biosolids (disposal location and disposal method).

4. Disinfection Process

For the disinfection process, these additional records shall be maintained documenting process operation and performance:

a. For bacteriological analyses:

1) Wastewater flow rate at the time of sample collection; and

2) Required statistical parameters for cumulative bacterial values (e.g., moving median or geometric mean for the number of samples or sampling period identified in this Order).

b. For the chlorination process, when chlorine is used for disinfection, at least daily average values for the following:

1) Chlorine residual of treated wastewater as it enters the contact basin (mg/L);

2) Chlorine dosage (kg/day); and

3) Dechlorination chemical dosage (kg/day).

5. Treatment Process Bypasses

A chronological log of all treatment process bypasses, including wet weather blending, shall include the following:

a. Identification of the treatment process bypassed;

b. Dates and times of bypass beginning and end;

c. Total bypass duration;

d. Estimated total bypass volume; and

e. Description of, or reference to other reports describing, the bypass event, the cause, the corrective actions taken (except for wet weather blending that is in compliance with permit conditions), and any additional monitoring conducted.

6. Treatment Facility Overflows

This section applies to records for overflows at the treatment facility. This includes the headworks and all units and appurtenances downstream. The Discharger shall retain a chronological log of overflows at the treatment facility and records supporting the information provided in section V.E.2.

C. Claims of Confidentiality – Not Supplemented

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information – Not Supplemented

B. Signatory and Certification Requirements – Not Supplemented

C. Monitoring Reports – This section supplements V.C of Standard Provisions (Attachment D)

1. Self Monitoring Reports

For each reporting period established in the MRP, the Discharger shall submit an SMR to the Regional Water Board in accordance with the requirements listed in this document and at the frequency the MRP specifies. The purpose of the SMR is to document treatment performance, effluent quality, and compliance with the waste discharge requirements of this Order.

a. Transmittal letter

Each SMR shall be submitted with a transmittal letter. This letter shall include the following:

1) Identification of all violations of effluent limits or other waste discharge requirements found during the reporting period;

2) Details regarding violations: parameters, magnitude, test results, frequency, and dates;

3) Causes of violations;

4) Discussion of corrective actions taken or planned to resolve violations and prevent recurrences, and dates or time schedule of action implementation (if previous reports have been submitted that address corrective actions, reference to the earlier reports is satisfactory);

5) Data invalidation (Data should not be submitted in an SMR if it does not meet quality assurance/quality control standards. However, if the Discharger wishes to invalidate any measurement after it was submitted in an SMR, a letter shall identify the measurement suspected to be invalid and state the Discharger's intent to submit, within 60 days, a formal request to invalidate the measurement. This request shall include the original measurement in question, the reason for invalidating the measurement, all relevant documentation that

supports invalidation [e.g., laboratory sheet, log entry, test results, etc.], and discussion of the corrective actions taken or planned [with a time schedule for completion] to prevent recurrence of the sampling or measurement problem.);

6) If the Discharger blends, the letter shall describe the duration of blending events and certify whether blended effluent was in compliance with the conditions for blending; and

7) Signature (The transmittal letter shall be signed according to Section V.B of this Order, Attachment D – Standard Provisions.).

b. Compliance evaluation summary

Each report shall include a compliance evaluation summary. This summary shall include each parameter for which the permit specifies effluent limits, the number of samples taken during the monitoring period, and the number of samples that exceed applicable effluent limits.

c. Results of analyses and observations

1) Tabulations of all required analyses and observations, including parameter, date, time, sample station, type of sample, test result, method detection limit, method minimum level, and method reporting level, if applicable, signed by the laboratory director or other responsible official.

2) When determining compliance with an average monthly effluent limitation and more than one sample result is available in a month, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of detected but not quantified (DNQ) or nondetect (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

i. The data set shall be ranked from low to high, reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

ii. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

If a sample result, or the arithmetic mean or median of multiple sample results, is below the reporting limit, and there is evidence that the priority pollutant is present in the effluent above an effluent limitation and the Discharger conducts a Pollutant Minimization Program, the Discharger shall not be deemed out of compliance.

3) Dioxin-TEQ Reporting: The Discharger shall report for each dioxin and furan congener the analytical results of effluent monitoring, including the quantifiable limit (reporting level), the method detection limit, and the measured concentration. The Discharger shall report all measured values of individual congeners, including data qualifiers. When calculating dioxin-TEQ, the Discharger shall set congener concentrations below the minimum levels (ML) to zero. The Discharger shall calculate and report dioxin-TEQs using the following formula,

where the MLs, toxicity equivalency factors (TEFs), and bioaccumulation equivalency factors (BEFs) are as provided in Table A:

$$\text{Dioxin-TEQ} = \Sigma\ (C_x \times TEF_x \times BEF_x)$$

where: C_x = measured or estimated concentration of congener *x*
TEF_x = toxicity equivalency factor for congener x
BEFx = bioaccumulation equivalency factor for congener *x*

Table A

Minimum Levels, Toxicity Equivalency Factors,
and Bioaccumulation Equivalency Factors

Dioxin or Furan Congener	Minimum Level (pg/L)	1998 Toxicity Equivalency Factor (TEF)	Bioaccumulation Equivalency Factor (BEF)
2,3,7,8-TCDD	10	1.0	1.0
1,2,3,7,8-PeCDD	50	1.0	0.9
1,2,3,4,7,8-HxCDD	50	0.1	0.3
1,2,3,6,7,8-HxCDD	50	0.1	0.1
1,2,3,7,8,9-HxCDD	50	0.1	0.1
1,2,3,4,6,7,8-HpCDD	50	0.01	0.05
OCDD	100	0.0001	0.01
2,3,7,8-TCDF	10	0.1	0.8
1,2,3,7,8-PeCDF	50	0.05	0.2
2,3,4,7,8-PeCDF	50	0.5	1.6
1,2,3,4,7,8-HxCDF	50	0.1	0.08
1,2,3,6,7,8-HxCDF	50	0.1	0.2
1,2,3,7,8,9-HxCDF	50	0.1	0.6
2,3,4,6,7,8-HxCDF	50	0.1	0.7
1,2,3,4,6,7,8-HpCDF	50	0.01	0.01
1,2,3,4,7,8,9-HpCDF	50	0.01	0.4
OCDF	100	0.0001	0.02

d. Data reporting for results not yet available

The Discharger shall make all reasonable efforts to obtain analytical data for required parameter sampling in a timely manner. Certain analyses require additional time to complete analytical processes and report results. For cases where required monitoring parameters require additional time to complete analytical processes and reports, and results are not available in time to be included in the SMR for the subject monitoring period, the Discharger shall describe such circumstances in the SMR and include the data for these parameters and relevant discussions of any observed exceedances in the next SMR due after the results are available.

e. Flow data

The Discharger shall provide flow data tabulation pursuant to Section IV.B.2.

f. Annual self monitoring report requirements

By the date specified in the MRP, the Discharger shall submit an annual report to the Regional Water Board covering the previous calendar year. The report shall contain the following:

1) Annual compliance summary table of treatment plant performance, including documentation of any blending events;

2) Comprehensive discussion of treatment plant performance and compliance with the permit (This discussion shall include any corrective actions taken or planned, such as changes to facility equipment or operation practices that may be needed to achieve compliance, and any other actions taken or planned that are intended to improve performance and reliability of the Discharger's wastewater collection, treatment, or disposal practices.);

3) Both tabular and graphical summaries of the monitoring data for the previous year if parameters are monitored at a frequency of monthly or greater;

4) List of approved analyses, including the following:

(i) List of analyses for which the Discharger is certified;

(ii) List of analyses performed for the Discharger by a separate certified laboratory (copies of reports signed by the laboratory director of that laboratory shall not be submitted but be retained onsite); and

(iii) List of "waived" analyses, as approved;

5) Plan view drawing or map showing the Discharger's facility, flow routing, and sampling and observation station locations;

6) Results of annual facility inspection to verify that all elements of the SWPP Plan are accurate and up to date (only required if the Discharger does not route all storm water to the headworks of its wastewater treatment plant); and

7) Results of facility report reviews (The Discharger shall regularly review, revise, and update, as necessary, the O&M Manual, the Contingency Plan, the Spill Prevention Plan, and Wastewater Facilities Status Report so that these documents remain useful and relevant to current practices. At a minimum, reviews shall be conducted annually. The Discharger shall include, in each Annual Report, a description or summary of review and evaluation procedures, recommended or planned actions, and an estimated time schedule for implementing these actions. The Discharger shall complete changes to these documents to ensure they are up-to-date.).

g. Report submittal

The Discharger shall submit SMRs to:

California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612
Attn: NPDES Wastewater Division

h. Reporting data in electronic format

The Discharger has the option to submit all monitoring results in an electronic reporting format approved by the Executive Officer. If the Discharger chooses to submit SMRs electronically, the following shall apply:

1) *Reporting Method*: The Discharger shall submit SMRs electronically via a process approved by the Executive Officer (see, for example, the letter dated December 17, 1999, "Official Implementation of Electronic Reporting System [ERS]" and the progress report letter dated December 17, 2000).

2) *Monthly or Quarterly Reporting Requirements*: For each reporting period (monthly or quarterly as specified in the MRP), the Discharger shall submit an electronic SMR to the Regional Water Board in accordance with the provisions of Section V.C.1.a-e, except for requirements under Section V.C.1.c(1) where ERS does not have fields for dischargers to input certain information (e.g., sample time). However, until U.S. EPA approves the electronic signature or other signature technologies, Dischargers that use ERS shall submit a hard copy of the original transmittal letter, an ERS printout of the data sheet, and a violation report (a receipt of the electronic transmittal shall be retained by the Discharger). This electronic SMR submittal suffices for the signed tabulations specified under Section V.C.1.c(1).

3) *Annual Reporting Requirements*: Dischargers who have submitted data using the ERS for at least one calendar year are exempt from submitting the portion of the annual report required under Section V.C.1.f(1) and (3).

D. Compliance Schedules – Not supplemented

E. Twenty-Four Hour Reporting – This section supplements V.E of Standard Provision (Attachment D)

1. Spill of Oil or Other Hazardous Material Reports

a. Within 24 hours of becoming aware of a spill of oil or other hazardous material that is not contained onsite and completely cleaned up, the Discharger shall report by telephone to the Regional Water Board at (510) 622-2369.

b. The Discharger shall also report such spills to the State Office of Emergency Services [telephone (800) 852-7550] only when the spills are in accordance with applicable reporting quantities for hazardous materials.

c. The Discharger shall submit a written report to the Regional Water Board within five working days following telephone notification unless directed otherwise by Regional Water Board staff. A report submitted electronically is acceptable. The written report shall include the following:

1) Date and time of spill, and duration if known;

2) Location of spill (street address or description of location);

3) Nature of material spilled;

4) Quantity of material involved;

5) Receiving water body affected, if any;

6) Cause of spill;

7) Estimated size of affected area;

8) Observed impacts to receiving waters (e.g., oil sheen, fish kill, water discoloration);

9) Corrective actions taken to contain, minimize, or clean up the spill;

10) Future corrective actions planned to be taken to prevent recurrence, and schedule of implementation; and

11) Persons or agencies notified.

2. Unauthorized Discharges from Municipal Wastewater Treatment Plants[1]

The following requirements apply to municipal wastewater treatment plants that experience an unauthorized discharge at their treatment facilities and are consistent with and supercede requirements imposed on the Discharger by the Executive Officer by letter of May 1, 2008, issued pursuant to California Water Code Section 13383.

a. Two (2)-Hour Notification

For any unauthorized discharges that result in a discharge to a drainage channel or a surface water, the Discharger shall, as soon as possible, but not later than two (2) hours after becoming aware of the discharge, notify the State Office of Emergency Services (telephone 800-852-7550), the local health officers or directors of environmental health with jurisdiction over the affected water bodies, and the Regional Water Board. The notification to the Regional Water Board shall be via the Regional Water Board's online reporting system at www.wbers.net, and shall include the following:

1) Incident description and cause;

2) Location of threatened or involved waterway(s) or storm drains;

3) Date and time the unauthorized discharge started;

4) Estimated quantity and duration of the unauthorized discharge (to the extent known), and the estimated amount recovered;

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

5) Level of treatment prior to discharge (e.g., raw wastewater, primary treated, undisinfected secondary treated, and so on); and

6) Identity of the person reporting the unauthorized discharge.

b. 24-hour Certification

Within 24 hours, the Discharger shall certify to the Regional Water Board, at www.wbers.net, that the State Office of Emergency Services and the local health officers or directors of environmental health with jurisdiction over the affected water bodies have been notified of the unauthorized discharge.

c. 5-Day Written Report

Within five business days, the Discharger shall submit a written report, via the Regional Water Board's online reporting system at www.wbers.net, that includes, in addition to the information required above, the following:

1) Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;

2) Efforts implemented to minimize public exposure to the unauthorized discharge;

3) Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted;

4) Corrective measures taken to minimize the impact of the unauthorized discharge;

5) Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future;

6) Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges; and

7) Quantity and duration of the unauthorized discharge, and the amount recovered.

d. Communication Protocol

To clarify the multiple levels of notification, certification, and reporting, the current communication requirements for unauthorized discharges from municipal wastewater treatment plants are summarized in Table B that follows.

Table B

Summary of Communication Requirements for Unauthorized Discharges[1] from Municipal Wastewater Treatment Plants

Discharger is required to:	Agency Receiving Information	Time frame	Method for Contact
1. Notify	California Emergency Management Agency (Cal EMA)	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Telephone – (800) 852-7550 (obtain a control number from Cal EMA)
	Local health department	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Depends on local health department
	Regional Water Board	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Electronic[2] www.wbers.net
2. Certify	Regional Water Board	As soon as possible, but not later than **24 hours** after becoming aware of the unauthorized discharge.	Electronic[3] www.wbers.net
3. Report	Regional Water Board	Within **5 business days** of becoming aware of the unauthorized discharge.	Electronic[4] www.wbers.net

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

[2] In the event that the Discharger is unable to provide online notification within 2 hours of becoming aware of an unauthorized discharge, it shall phone the Regional Water Board's spill hotline at (510) 622-2369 and convey the same information contained in the notification form. In addition, within 3 business days of becoming aware of the unauthorized discharge, the Discharger shall enter the notification information into the Regional Water Board's online system in electronic format.

[3] In most instances, the 2-hour notification will also satisfy 24-hour certification requirements. This is because the notification form includes fields for documenting that OES and the local health department have been contacted. In other words, if the Discharger is able to complete all the fields in the notification form within 2 hours, certification requirements are also satisfied. In the event that the Discharger is unable to provide online certification within 24 hours of becoming aware of an unauthorized discharge, it shall phone the Regional Water Board's spill hotline at (510) 622-2369 and convey the same information contained in the certification form. In addition, within 3 business days of becoming aware of the unauthorized discharge, the Discharger shall enter the certification information into the Regional Water Board's online system in electronic format.

[4] If the Discharger cannot satisfy the 5-day reporting requirements via the Regional Water Board's online reporting system, it shall submit a written report (preferably electronically in pdf) to the appropriate Regional Water Board case manager. In cases where the Discharger cannot satisfy the 5-day reporting requirements via the online reporting system, it must still complete the Regional Water Board's online reporting requirements within 15 calendar days of becoming aware of the unauthorized discharge.

F. Planned Changes – Not supplemented

G. Anticipated Noncompliance – Not supplemented

H. Other Noncompliance – Not supplemented

I. Other Information – Not supplemented

VI. STANDARD PROVISION – ENFORCEMENT – Not Supplemented

VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS – Not Supplemented

VIII. DEFINITIONS – This section is an addition to Standard Provisions (Attachment D)

More definitions can be found in Attachment A of this NPDES Permit.

1. Arithmetic Calculations

   a. Geometric mean is the antilog of the log mean or the back-transformed mean of the logarithmically transformed variables, which is equivalent to the multiplication of the antilogarithms. The geometric mean can be calculated with either of the following equations:

   $$\text{Geometric Mean} = Anti\log\left(\frac{1}{N}\sum_{i=1}^{N} Log(C_i)\right)$$

   or

   $$\text{Geometric Mean} = (C_1 * C_2 * \ldots * C_N)^{1/N}$$

   Where "N" is the number of data points for the period analyzed and "C" is the concentration for each of the "N" data points.

   b. Mass emission rate is obtained from the following calculation for any calendar day:

   $$\text{Mass emission rate (lb/day)} = \frac{8.345}{N}\sum_{i=1}^{N} Q_i C_i$$

   $$\text{Mass emission rate (kg/day)} = \frac{3.785}{N}\sum_{i=1}^{N} Q_i C_i$$

   In which "N" is the number of samples analyzed in any calendar day and "Q_i" and "C_i" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" grab samples that may be taken in any calendar day. If a composite sample is taken, "C_i" is the concentration measured in the composite sample and "Q_i" is the average flow rate occurring during the period over which the samples are composited. The daily concentration of a constituent measured over any calendar day shall be determined from the flow-weighted average of the same constituent in the combined waste streams as follows:

$$\text{Cd} = \text{Average daily concentration} = \frac{1}{Q_t}\sum_{i=1}^{N} Q_i C_i$$

In which "N" is the number of component waste streams and "Q" and "C" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" waste streams. "Q_t" is the total flow rate of the combined waste streams.

c. Maximum allowable mass emission rate, whether for a 24-hour, weekly 7-day, monthly 30-day, or 6-month period, is a limitation expressed as a daily rate determined with the formulas in the paragraph above, using the effluent concentration limit specified in the permit for the period and the specified allowable flow.

d. POTW removal efficiency is the ratio of pollutants removed by the treatment facilities to pollutants entering the treatment facilities (expressed as a percentage). The Discharger shall determine removal efficiencies using monthly averages (by calendar month unless otherwise specified) of pollutant concentration of influent and effluent samples collected at about the same time and using the following equation (or its equivalent):

Removal Efficiency (%) = 100 × [1-(Effluent Concentration/Influent Concentration)]

2. Biosolids means the solids, semi-liquid suspensions of solids, residues, screenings, grit, scum, and precipitates separated from or created in wastewater by the unit processes of a treatment system. It also includes, but is not limited to, all supernatant, filtrate, centrate, decantate, and thickener overflow and underflow in the solids handling parts of the wastewater treatment system.

3. Blending is the practice of recombining wastewater that has been biologically treated with wastewater that has bypassed around biological treatment units.

4. Bottom sediment sample is (1) a separate grab sample taken at each sampling station for the determination of selected physical-chemical parameters, or (2) four grab samples collected from different locations in the immediate vicinity of a sampling station while the boat is anchored and analyzed separately for macroinvertebrates.

5. Composite sample is a sample composed of individual grab samples collected manually or by an automatic sampling device on the basis of time or flow as specified in the MRP. For flow-based composites, the proportion of each grab sample included in the composite sample shall be within plus or minus five percent (+/-5%) of the representative flow rate of the waste stream being measured at the time of grab sample collection. Alternatively, equal volume grab samples may be individually analyzed with the flow-weighted average calculated by averaging flow-weighted ratios of each grab sample analytical result. Grab samples comprising time-based composite samples shall be collected at intervals not greater than those specified in the MRP. The quantity of each grab sample comprising a time-based composite sample shall be a set of flow proportional volumes as specified in the MRP. If a particular time-based or flow-based composite sampling protocol is not specified in the MRP, the Discharger shall determine and implement the most representative sampling protocol for the given parameter subject to Executive Officer approval.

6. Depth-integrated sample is defined as a water or waste sample collected by allowing a sampling device to fill during a vertical traverse in the waste or receiving water body being sampled. The Discharger shall collect depth-integrated samples in such a manner that the collected sample will be representative of the waste or water body at that sampling point.

7. Flow sample is an accurate measurement of the average daily flow volume using a properly calibrated and maintained flow measuring device.

8. Grab sample is an individual sample collected in a short period of time not exceeding 15 minutes. Grab samples represent only the condition that exists at the time the wastewater is collected.

9. Initial dilution is the process that results in the rapid and irreversible turbulent mixing of wastewater with receiving water around the point of discharge.

10. Overflow is the intentional or unintentional spilling or forcing out of untreated or partially treated wastes from a transport system (e.g., through manholes, at pump stations, and at collection points) upstream from the treatment plant headworks or from any part of a treatment plant facility.

11. Priority pollutants are those constituents referred to in 40 CFR Part 122 as promulgated in the Federal Register, Vol. 65, No. 97, Thursday, May 18, 2000, also known as the California Toxics Rule, the presence or discharge of which could reasonably be expected to interfere with maintaining designated uses.

12. Storm water means storm water runoff, snow melt runoff, and surface runoff and drainage. It excludes infiltration and runoff from agricultural land.

13. Toxic pollutant means any pollutant listed as toxic under federal Clean Water Act section 307(a)(1) or under 40 CFR 401.15.

14. Untreated waste is raw wastewater.

15. Waste, waste discharge, discharge of waste, and discharge are used interchangeably in the permit. The requirements of the permit apply to the entire volume of water, and the material therein, that is disposed of to surface and ground waters of the State of California.

Table C

List of Monitoring Parameters and Analytical Methods

CTR No.	Pollutant/Parameter	Analytical Method[1]	Minimum Levels[2] (µg/l)											
			GC	GCMS	LC	Color	FAA	GFAA	ICP	ICP MS	SPGFAA	HYD RIDE	CVAA	DCP
1.	Antimony	204.2					10	5	50	0.5	5	0.5		1000

13.	Zinc	200 or 289					20		20	1	10			
14.	Cyanide	SM 4500 CN^- C or I				5								
15.	Asbestos (only required for dischargers to MUN waters)[5]	0100.2 [6]												
16.	2,3,7,8-TCDD and 17 congeners (Dioxin)	1613												
17.	Acrolein	603	2.0	5										
18.	Acrylonitrile	603	2.0	2										
19.	Benzene	602	0.5	2										
33.	Ethylbenzene	602	0.5	2										
39.	Toluene	602	0.5	2										
20.	Bromoform	601	0.5	2										
21.	Carbon Tetrachloride	601	0.5	2										
22.	Chlorobenzene	601	0.5	2										
23.	Chlorodibromomethane	601	0.5	2										
24.	Chloroethane	601	0.5	2										

[1] The suggested method is the U.S. EPA Method unless otherwise specified (SM = Standard Methods). The Discharger may use another U.S. EPA-approved or recognized method if that method has a level of quantification below the applicable water quality objective. Where no method is suggested, the Discharger has the discretion to use any standard method.

[2] Minimum levels are from the *State Implementation Policy*. They are the concentration of the lowest calibration standard for that technique based on a survey of contract laboratories. Laboratory techniques are defined as follows: GC = Gas Chromatography; GCMS = Gas Chromatography/Mass Spectrometry; LC = High Pressure Liquid Chromatography; Color = Colorimetric; FAA = Flame Atomic Absorption; GFAA = Graphite Furnace Atomic Absorption; ICP = Inductively Coupled Plasma; ICPMS = Inductively Coupled Plasma/Mass Spectrometry; SPGFAA = Stabilized Platform Graphite Furnace Atomic Absorption (i.e., U.S. EPA 200.9); Hydride = Gaseous Hydride Atomic Absorption; CVAA = Cold Vapor Atomic Absorption; DCP = Direct Current Plasma.

[3] Analysis for total chromium may be substituted for analysis of chromium (III) and chromium (VI) if the concentration measured is below the lowest hexavalent chromium criterion (11 ug/l).

[4] The Discharger shall use ultra-clean sampling (U.S. EPA Method 1669) and ultra-clean analytical methods (U.S. EPA Method 1631) for mercury monitoring. The minimum level for mercury is 2 ng/l (or 0.002 ug/l).

[5] MUN = Municipal and Domestic Supply. This designation, if applicable, is in the Findings of the permit.

[6] Determination of Asbestos Structures over 10 [micrometers] in Length in Drinking Water Using MCE Filters, U.S. EPA 600/R-94-134, June 1994.

Attachment H: Pretreatment Program Provisions

A. The Discharger shall be responsible and liable for the performance of all Control Authority pretreatment requirements contained in 40 CFR 403, including any regulatory revisions to Part 403. Where a Part 403 revision is promulgated after the effective date of the Discharger's permit and places mandatory actions upon the Discharger as Control Authority but does not specify a timetable for completion of the actions, the Discharger shall complete the required actions within six months from the issuance date of this permit or six months from the effective date of the Part 403 revisions, whichever comes later.

(If the Discharger cannot complete the required actions within the above six-month period due to the need to process local adoption of sewer use ordinance modifications or other substantial pretreatment program modifications, the Discharger shall notify the Executive Officer in writing at least 60 days prior to the six-month deadline. The written notification shall include a summary of completed required actions, an explanation for why the six month deadline cannot be met, and a proposed timeframe to complete the rest of the required actions as soon as practical but not later than within twelve months of the issuance date of this permit or twelve months of the effective date of the Part 403 revisions, whichever comes later. The Executive Officer will notify the Discharger in writing within 30 days of receiving the request if the extension is not approved.)

The United States Environmental Protection Agency (U.S. EPA), the State and/or other appropriate parties may initiate enforcement action against a nondomestic user for noncompliance with applicable standards and requirements as provided in the Clean Water Act (Act).

B. The Discharger shall enforce the requirements promulgated under Sections 307(b), 307(c), 307(d) and 402(b) of the Act with timely, appropriate and effective enforcement actions. The Discharger shall cause nondomestic users subject to Federal Categorical Standards to achieve compliance no later than the date specified in those requirements or, in the case of a new nondomestic user, upon commencement of the discharge.

C. The Discharger shall perform the pretreatment functions as required in 40 CFR 403 and amendments or modifications thereto including, but not limited to:

1. Implement the necessary legal authorities to fully implement the pretreatment regulations as provided in 40 CFR 403.8(f)(1);

2. Implement the programmatic functions as provided in 40 CFR 403.8(f)(2);

3. Publish an annual list of nondomestic users in significant noncompliance as provided per 40 CFR 403.8(f)(2)(viii);

4. Provide for the requisite funding and personnel to implement the pretreatment program as provided in 40 CFR 403.8(f)(3); and

5. Enforce the national pretreatment standards for prohibited discharges and categorical standards as provided in 40 CFR 403.5 and 403.6, respectively.

D. The Discharger shall submit annually a report to U.S. EPA Region 9, the State Water Board and the Regional Water Board describing its pretreatment program activities over the previous calendar year. In the event that the Discharger is not in compliance with any conditions or requirements of the Pretreatment Program, the Discharger shall also include the reasons for noncompliance and a plan and schedule for achieving compliance. The report shall contain, but is not limited to, the information specified in Appendix H-1 entitled, "Requirements for Pretreatment Annual Reports." The annual report is due each year on February 28.

E. The Discharger shall submit a pretreatment semiannual report to U.S. EPA Region 9, the State Water Board and the Regional Water Board describing the status of its significant industrial users (SIUs). The report shall contain, but is not limited to, information specified in Appendix H-2 entitled, "Requirements for Pretreatment Semiannual Reports." The semiannual report is due July 31 for the period January through June. The information for the period July through December of each year shall be included in the Annual Report identified in Appendix H-1. The Executive Officer may exempt the Discharger from the semiannual reporting requirements on a case by case basis subject to State Water Board and U.S. EPA's comment and approval.

F. The Discharger shall conduct the monitoring of its treatment plant's influent, effluent, and sludge (biosolids) as described in Appendix H-4 entitled, "Requirements for Influent, Effluent and Sludge (Biosolids) Monitoring." (The term "biosolids," as used in this Attachment, shall have the same meaning as wastewater treatment plant "sludge" and will be used from this point forward.) The Discharger shall evaluate the results of the sampling and analysis during the preparation of the semiannual and annual reports to identify any trends. Signing the certification statement used to transmit the reports shall be deemed to certify the Discharger has completed this data evaluation. A tabulation of the data shall be included in the pretreatment annual report as specified in Appendix H-4. The Executive Officer may require more or less frequent monitoring on a case by case basis.

APPENDIX H-1

REQUIREMENTS FOR PRETREATMENT ANNUAL REPORTS

The Pretreatment Annual Report is due each year on February 28 and shall contain activities conducted during the previous calendar year. The purpose of the Annual Report is to:

- Describe the status of the Discharger's pretreatment program; and
- Report on the effectiveness of the program, as determined by comparing the results of the preceding year's program implementation.

The report shall contain, at a minimum, the following information:

A. Cover Sheet

The cover sheet shall include:

1. The name(s) and National Pollutant Discharge Elimination Discharge System (NPDES) permit number(s) of the Discharger(s) that is part of the Pretreatment Program;

2. The name, address and telephone number of a pretreatment contact person;

3. The period covered in the report;

4. A statement of truthfulness; and

5. The dated signature of a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for overall operation of the Publicly Owned Treatment Works (POTW) (40 CFR 403.12(m)).

B. Introduction

This section shall include:

1. Any pertinent background information related to the Discharger and/or the nondomestic user base of the area;

2. List of applicable interagency agreements used to implement the Discharger's pretreatment program (e.g., Memoranda of Understanding (MOU) with satellite sanitary sewer collection systems); and

3. A status summary of the tasks required by a Pretreatment Compliance Inspection (PCI), Pretreatment Compliance Audit (PCA), Cleanup and Abatement Order (CAO), or other pretreatment-related enforcement actions required by the Regional Water Board or the U.S. EPA. A more detailed discussion can be referenced and included in the section entitled, "Program Changes," if needed.

C. Definitions

This section shall include a list of key terms and their definitions that the Discharger uses to describe or characterize elements of its pretreatment program, or the Discharger may provide a reference to its website if the applicable definitions are available on-line.

D. Discussion of Upset, Interference and Pass Through

This section shall include a discussion of Upset, Interference or Pass Through incidents, if any, at the Discharger's treatment plant(s) that the Discharger knows of or suspects were caused by nondomestic user discharges. Each incident shall be described, at a minimum, consisting of the following information:

1. A description of what occurred;
2. A description of what was done to identify the source;
3. The name and address of the nondomestic user responsible;
4. The reason(s) why the incident occurred;
5. A description of the corrective actions taken; and
6. An examination of the local and federal discharge limits and requirements for the purposes of determining whether any additional limits or changes to existing requirements may be necessary to prevent other Upset, Interference or Pass Through incidents.

E. Influent, Effluent and Biosolids Monitoring Results

The Discharger shall evaluate the influent, effluent and biosolids monitoring results as specified in Appendix H-4 in preparation of this report. The Discharger shall retain the analytical laboratory reports with the Quality Assurance and Quality Control (QA/QC) data validation and make these reports available upon request.

This section shall include:

1. Description of the sampling procedures and an analysis of the results (see Appendix H-4 for specific requirements);
2. Tabular summary of the compounds detected (compounds measured above the detection limit for the analytical method used) for the monitoring data generated during the reporting year as specified in Appendix H-4;
3. Discussion of the investigation findings into any contributing sources of the compounds that exceed NPDES limits; and
4. Graphical representation of the influent and effluent metal monitoring data for the past five years with a discussion of any trends.

F. Inspection, Sampling and Enforcement Programs

This section shall include at a minimum the following information:

1. Inspections: Summary of the inspection program (e.g., criteria for determining the frequency of inspections and inspection procedures);

2. Sampling Events: Summary of the sampling program (e.g., criteria for determining the frequency of sampling and chain of custody procedures); and

3. Enforcement: Summary of Enforcement Response Plan (ERP) implementation including dates for adoption, last revision and submission to the Regional Water Board.

G. Updated List of Regulated SIUs

This section shall contain a list of all of the federal categories that apply to SIUs regulated by the Discharger. The specific categories shall be listed including the applicable 40 CFR subpart and section, and pretreatment standards (both maximum and average limits). Local limits developed by the Discharger shall be presented in a table including the applicability of the local limits to SIUs. If local limits do not apply uniformly to SIUs, specify the applicability in the tables listing the categorical industrial users (CIUs) and non-categorical SIUs. Tables developed in Sections 7A and 7B can be used to present or reference this information.

1. CIUs - Include a table that alphabetically lists the CIUs regulated by the Discharger as of the end of the reporting period. This list shall include:

   a. Name;

   b. Address;

   c. Applicable federal category(ies);

   d. Reference to the location where the applicable Federal Categorical Standards are presented in the report;

   e. Identify all deletions and additions keyed to the list submitted in the previous annual report. All deletions shall be briefly explained (e.g., closure, name change, ownership change, reclassification, declassification); and

   f. Information, calculations and data used to determine the limits for those CIUs for which a combined waste stream formula is applied.

2. Non-categorical SIUs - Include a table that alphabetically lists the SIUs not subject to any federal categorical standards that were regulated by the Discharger as of the end of the reporting period. This list shall include:

   a. Name;

b. Address;

c. A brief description of the type of business;

d. Identify all deletions and additions keyed to the list submitted in the previous annual report. All deletions shall be briefly explained (e.g., closure, name change, ownership change, reclassification, declassification); and

e. Indicate the applicable discharge limits (e.g., different from local limits) to which the SIUs are subject and reference to the location where the applicable limits (e.g., local discharge limits) are presented in the report.

H. SIU (categorical and non-categorical) Compliance Activities

The information required in this section may be combined in the table developed in Section 7 above.

1. **Inspection and Sampling Summary:** This section shall contain a summary of all the SIU inspections and sampling activities conducted by the Discharger and sampling activities conducted by the SIU over the reporting year to gather information and data regarding SIU compliance. The summary shall include:

   a. The number of inspections and sampling events conducted for each SIU by the Discharger;

   b. The number of sampling events conducted by the SIU. Identify SIUs that are operating under an approved Total Toxic Organic Management Plan;

   c. The quarters in which the above activities were conducted; and

   d. The compliance status of each SIU, delineated by quarter, and characterized using all applicable descriptions as given below:

      (1) Consistent compliance;

      (2) Inconsistent compliance;

      (3) Significant noncompliance;

      (4) On a compliance schedule to achieve compliance (include the date final compliance is required);

      (5) Not in compliance and not on a compliance schedule; and

      (6) Compliance status unknown, and why not.

2. **Enforcement Summary:** This section shall contain a summary of SIU compliance and enforcement activities during the reporting year. The summary may be included in the summary

table developed in section 8A and shall include the names and addresses of all SIUs affected by the actions identified below. For each notice specified in enforcement action "i" through "iv," indicate whether it was for an infraction of a federal or local standard/limit or requirement.

a. Warning letters or notices of violations regarding SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

b. Administrative Orders regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

c. Civil actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

d. Criminal actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

e. Assessment of monetary penalties. Identify the amount of penalty in each case and reason for assessing the penalty;

f. Order to restrict/suspend discharge to the Discharger; and

g. Order to disconnect the discharge from entering the Discharger.

3. **July-December Semiannual Data:** For SIU violations/noncompliance during the semiannual reporting period from July 1 through December 31, provide the following information:

   a. Name and facility address of the SIU;

   b. Indicate if the SIU is subject to Federal Categorical Standards; if so, specify the category including the subpart that applies;

   c. For SIUs subject to Federal Categorical Standards, indicate if the violation is of a categorical or local standard;

   d. Indicate the compliance status of the SIU for the two quarters of the reporting period; and

   e. For violations/noncompliance identified in the reporting period, provide:

      (1) The date(s) of violation(s);

      (2) The parameters and corresponding concentrations exceeding the limits and the discharge limits for these parameters; and

(3) A brief summary of the noncompliant event(s) and the steps that are being taken to achieve compliance.

I. Baseline Monitoring Report Update

This section shall provide a list of CIUs added to the pretreatment program since the last annual report. This list of new CIUs shall summarize the status of the respective Baseline Monitoring Reports (BMR). The BMR must contain the information specified in 40 CFR 403.12(b). For each new CIU, the summary shall indicate when the BMR was due; when the CIU was notified by the Discharger of this requirement; when the CIU submitted the report; and/or when the report is due.

J. Pretreatment Program Changes

This section shall contain a description of any significant changes in the Pretreatment Program during the past year including, but not limited to:

1. Legal authority;
2. Local limits;
3. Monitoring/ inspection program and frequency;
4. Enforcement protocol;
5. Program's administrative structure;
6. Staffing level;
7. Resource requirements;
8. Funding mechanism;
9. If the manager of the Discharger's pretreatment program changed, a revised organizational chart shall be included; and
10. If any element(s) of the program is in the process of being modified, this intention shall also be indicated.

K. Pretreatment Program Budget

This section shall present the budget spent on the Pretreatment Program. The budget, either by the calendar or fiscal year, shall show the total expenses required to implement the pretreatment program. A brief discussion of the source(s) of funding shall be provided. In addition, the Discharger shall make available upon request specific details on its pretreatment program expense amounts such as for personnel, equipment, and chemical analyses.

L. Public Participation Summary

This section shall include a copy of the public notice as required in 40 CFR 403.8(f)(2)(viii). If a notice was not published, the reason shall be stated.

M. Biosolids Storage and Disposal Practice

This section shall describe how treated biosolids are stored and ultimately disposed. If a biosolids storage area is used, it shall be described in detail including its location, containment features and biosolids handling procedures.

N. Other Pollutant Reduction Activities

This section shall include a brief description of any programs the Discharger implements to reduce pollutants from nondomestic users that are not classified as SIUs. If the Discharger submits any of this program information in an Annual Pollution Prevention Report, reference to this other report shall satisfy this reporting requirement.

O. Other Subjects

Other information related to the Pretreatment Program that does not fit into any of the above categories should be included in this section.

P. Permit Compliance System (PCS) Data Entry Form

The annual report shall include the PCS Data Entry Form. This form shall summarize the enforcement actions taken against SIUs in the past year. This form shall include the following information:

1. Discharger's name,

2. NPDES Permit number,

3. Period covered by the report,

4. Number of SIUs in significant noncompliance (SNC) that are on a pretreatment compliance schedule,

5. Number of notices of violation and administrative orders issued against SIUs,

6. Number of civil and criminal judicial actions against SIUs,

7. Number of SIUs that have been published as a result of being in SNC, and

8. Number of SIUs from which penalties have been collected.

APPENDIX H-2

REQUIREMENTS FOR JANUARY-JUNE PRETREATMENT SEMIANNUAL REPORT

The pretreatment semiannual report is due on July 31 for pretreatment program activities conducted from January through June unless an exception has been granted by the Regional Water Board's Executive Officer (e.g., pretreatment programs without any SIUs may qualify for an exception to the pretreatment semiannual report). Pretreatment activities conducted from July through December of each year shall be included in the Pretreatment Annual Report as specified in Appendix H-1. The pretreatment semiannual report shall contain, at a minimum the following information:

A. Influent, Effluent and Biosolids Monitoring

The influent, effluent and biosolids monitoring results shall be evaluated in preparation of this report. The Discharger shall retain analytical laboratory reports with the QA/QC data validation and make these reports available upon request. The Discharger shall also make available upon request a description of its influent, effluent and biosolids sampling procedures. Violations of any parameter that exceed NPDES limits shall be identified and reported. The contributing source(s) of the parameters that exceed NPDES limits shall be investigated and discussed.

B. Significant Industrial User Compliance Status

This section shall contain a list of all SIUs that were not in consistent compliance with all pretreatment standards/limits or requirements for the reporting period. For the reported SIUs, the compliance status for the previous semiannual reporting period shall be included. Once the SIU has determined to be out of compliance, the SIU shall be included in subsequent reports until consistent compliance has been achieved. A brief description detailing the actions that the SIU undertook to come back into compliance shall be provided.

For each SIU on the list, the following information shall be provided:

1. Name and facility address of the SIU;

2. Indicate if the SIU is subject to Federal Categorical Standards; if so, specify the category including the subpart that applies;

3. For SIUs subject to Federal Categorical Standards, indicate if the violation is of a categorical or local standard;

4. Indicate the compliance status of the SIU for the two quarters of the reporting period; and

5. For violations/noncompliance identified in the reporting period, provide:

    a. The date(s) of violation(s);

    b. The parameters and corresponding concentrations exceeding the limits and the discharge limits for these parameters; and

c. A brief summary of the noncompliant event(s) and the steps that are being taken to achieve compliance.

C. Discharger's Compliance with Pretreatment Program Requirements

This section shall contain a discussion of the Discharger's compliance status with the Pretreatment Program Requirements as indicated in the latest Pretreatment Compliance Audit (PCA) Report or Pretreatment Compliance Inspection (PCI) Report. It shall contain a summary of the following information:

1. Date of latest PCA or PCI report;

2. Date of the Discharger's response;

3. List of unresolved issues; and

4. Plan(s) and schedule for resolving the remaining issues.

APPENDIX H-3

SIGNATURE REQUIREMENTS FOR PRETREATMENT ANNUAL AND SEMIANNUAL REPORTS

The pretreatment annual and semiannual reports shall be signed by a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for the overall operation of the Discharger [POTW - 40 CFR 403.12(m)]. Signed copies of the reports shall be submitted to the U.S. EPA, the State Water Board, and the Regional Water Board at the following addresses unless the Discharger is instructed by any of these agencies to submit electronic copies of the required reports:

Pretreatment Program Reports
Clean Water Act Compliance Office (WTR-7)
Water Division
Pacific Southwest Region
U.S. Environmental Protection Agency
75 Hawthorne Street
San Francisco, CA 94105-3901

Submit electronic copies only to State and Regional Water Boards:
Pretreatment Program Manager
Regulatory Unit
State Water Resources Control Board
Division of Water Quality-15th Floor
1001 I Street
Sacramento, CA 95814
DMR@waterboards.ca.gov
NPDES_Wastewater@waterboards.ca.gov

Pretreatment Coordinator
NPDES Wastewater Division
SF Bay Regional Water Quality Control Board
1515 Clay Street, Suite 1400
Oakland, CA 94612
(Submit the report as a single Portable Document Format (PDF) file to the Pretreatment Coordinator's folder in the Regional Water Board's File Transfer Protocol (FTP) site. The instructions for using the FTP site can be found at the following internet address:
http://www.waterboards.ca.gov/sanfranciscobay/publications_forms/documents/FTP_Discharger_Guide-12-2010.pdf.)

APPENDIX H-4

REQUIREMENTS FOR INFLUENT, EFFLUENT AND BIOSOLIDS MONITORING

The Discharger shall conduct sampling of its treatment plant's influent, effluent and biosolids at the frequency shown in **the pretreatment requirements table** of the Monitoring and Reporting Program (MRP, Attachment E). When sampling periods coincide, one set of test results, reported separately, may be used for those parameters that are required to be monitored by both the influent and effluent monitoring requirements of the MRP and the Pretreatment Program. The Pretreatment Program monitoring reports as required in Appendices H-1 and H-2 shall be transmitted to the Pretreatment Program Coordinator.

A. Reduction of Monitoring Frequency

The minimum frequency of Pretreatment Program influent, effluent, and biosolids monitoring shall be dependent on the number of SIUs identified in the Discharger's Pretreatment Program as indicated in Table H-1.

Table H-1: Minimum Frequency of Pretreatment Program Monitoring

Number of SIUs	Minimum Frequency
< 5	Once every five years
> 5 and < 50	Once every year
> 50	Twice per year

If the Discharger's required monitoring frequency is greater than the minimum specified in Table H-1, the Discharger may request a reduced monitoring frequency for that constituent(s) as part of its application for permit reissuance if it meets the following criteria:

The monitoring data for the constituent(s) consistently show non-detect (ND) levels for the effluent monitoring and very low (i.e., near ND) levels for influent and biosolids monitoring for a minimum of eight previous years' worth of data.

The Discharger's request shall include tabular summaries of the data and a description of the trends in the industrial, commercial, and residential customers in the Discharger's service area that demonstrate control over the sources of the constituent(s). The Regional Water Board may grant a reduced monitoring frequency in the reissued permit after considering the information provided by the Discharger and any other relevant information.

B. Influent and Effluent Monitoring

The Discharger shall monitor for the parameters using the required sampling and test methods listed in **the pretreatment table** of the MRP. Any test method substitutions must have received prior written Executive Officer approval. Influent and effluent sampling locations shall be the same as those sites specified in the MRP.

The influent and effluent samples should be taken at staggered times to account for treatment plant detention time. Appropriately staggered sampling is considered consistent with the requirement for

collection of effluent samples coincident with influent samples in Section III.A.3.a(2) of Attachment G. All samples must be representative of daily operations. Sampling and analysis shall be performed in accordance with the techniques prescribed in 40 CFR 136 and amendments thereto. For effluent monitoring, the reporting limits for the individual parameters shall be at or below the minimum levels (MLs) as stated in the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (2000) [also known as the State Implementation Policy (SIP)]; any revisions to the MLs shall be adhered to. If a parameter does not have a stated ML, then the Discharger shall conduct the analysis using the lowest commercially available and reasonably achievable detection levels.

The following report elements should be used to submit the influent and effluent monitoring results. A similarly structured format may be used but will be subject to Regional Water Board approval. The monitoring reports shall be submitted with the Pretreatment Annual Report identified in Appendix H-1.

1. Sampling Procedures, Sample Dechlorination, Sample Compositing, and Data Validation (applicable quality assurance/quality control) shall be performed in accordance with the techniques prescribed in 40 CFR 136 and amendments thereto. The Discharger shall make available upon request its sampling procedures including methods of dechlorination, compositing, and data validation.

2. A tabulation of the test results for the detected parameters shall be provided.

3. Discussion of Results – The report shall include a complete discussion of the test results for the detected parameters. If any pollutants are detected in sufficient concentration to upset, interfere or pass through plant operations, the type of pollutant(s) and potential source(s) shall be noted, along with a plan of action to control, eliminate, and/or monitor the pollutant(s). Any apparent generation and/or destruction of pollutants attributable to chlorination/dechlorination sampling and analysis practices shall be noted.

C. Biosolids Monitoring

Biosolids should be sampled in a manner that will be representative of the biosolids generated from the influent and effluent monitoring events except as noted in (3. below. The same parameters required for influent and effluent analysis shall be included in the biosolids analysis. The biosolids analyzed shall be a composite sample of the biosolids for final disposal consisting of:

1. Biosolids lagoons – 20 grab samples collected at representative equidistant intervals (grid pattern) and composited as a single grab, or

2. Dried stockpile – 20 grab samples collected at various representative locations and depths and composited as a single grab, or

3. Dewatered biosolids - daily composite of 4 representative grab samples each day for 5 days taken at equal intervals during the daily operating shift taken from a) the dewatering units or b) each truckload, and shall be combined into a single 5- day composite.

The U.S. EPA manual, POTW Sludge Sampling and Analysis Guidance Document, August 1989, containing detailed sampling protocols specific to biosolids is recommended as a guidance for sampling procedures. The U.S. EPA manual Analytical Methods of the National Sewage Sludge Survey, September 1990, containing detailed analytical protocols specific to biosolids, is recommended as a guidance for analytical methods.

In determining if the biosolids are a hazardous waste, the Discharger shall adhere to Article 2, "Criteria for Identifying the Characteristics of Hazardous Waste," and Article 3, "Characteristics of Hazardous Waste," of Title 22, California Code of Regulations, sections 66261.10 to 66261.24 and all amendments thereto.

The following report elements should be used to submit the biosolids monitoring results. A similarly structured form may be used but will be subject to Regional Water Board approval. The results shall be submitted with the Pretreatment Annual Report identified in Appendix H-1.

- Sampling Procedures and Data Validation (applicable quality assurance/quality control) shall be performed in accordance with the techniques prescribed in 40 CFR 136 and amendments thereto. The Discharger shall make available upon request its biosolids sampling procedures and data validation methods.

- Test Results – Tabulate the test results for the detected parameters and include the percent solids.

- Discussion of Results – Include a complete discussion of test results for the detected parameters. If the detected pollutant(s) is reasonably deemed to have an adverse effect on biosolids disposal, a plan of action to control, eliminate, and/or monitor the pollutant(s) and the known or potential source(s) shall be included. Any apparent generation and/or destruction of pollutants attributable to chlorination/dechlorination sampling and analysis practices shall be noted.

The Discharger shall also provide a summary table presenting any influent, effluent or biosolids monitoring data for non-priority pollutants that the Discharger believes may be causing or contributing to interference, pass through or adversely impacting biosolids quality.

CERTIFIED MAIL
RETURN RECEIPT REQUESTED

Mr. Harlan Kelly, Jr.
General Manager
San Francisco Public Utilities Commission
525 Golden Gate Avenue
San Francisco, CA 94102

Re: Notice of Violation of National Pollutant Discharge Elimination System permits

Dear Mr. Kelly:

This letter serves to notify you that the EPA has identified Clean Water Act (CWA) violations of the City and County of San Francisco's (City's) National Pollutant Discharge Elimination System (NPDES) permits regulating discharges from the City's wastewater treatment plants, 36 combined sewer discharge (CSD) facilities and its combined sewer system. The permits in question are: (1) Waste Discharge Requirements for the City and County of San Francisco Oceanside Water Pollution Control Plant (Southwest Ocean Outfall) and Collection System, Including the Westside Wet Weather Facilities Order No. R2-2009-0062/NPDES No. CA0037681 (Oceanside Permit); and (2) Waste Discharge Requirements for the City and County of San Francisco Southeast Water Pollution Control Plant, North Point Wet Weather Facility, Bayside Wet Weather Facilities, and Wastewater Collection System Order No. R2-2013-0029/NPDES No. CA0037664 (Southeast Permit).

Historically, the City's data, which we also note are materially incomplete in numerous ways that likely masks the true nature and scope of certain violations, show it is discharging approximately one and a half billion gallons of combined sewage annually onto beaches and other sensitive areas, including areas where recreation takes place. Recent data show that the annual combined sewer discharges are closer to two billion gallons. The failure to properly operate and maintain the City's sewage collection and treatment facilities creates public health risks. For example, lack of proper operation and maintenance has caused force main and pump station failures that have diverted substantial volumes of raw and partially-treated sewage to flow across beaches and into the San Francisco Bay and the Pacific Ocean. There have been instances of sewage flowing in the streets and entering people's homes. Moreover, the City's data also show other pollutants of significant concern such as copper, zinc, lead, cyanide and ammonia that can threaten the water quality of the Bay and the ocean.

The City has violated and in many cases continues to violate the terms of its NPDES permits, including but not limited to the following:

1. Failure to properly operate and maintain its facilities including the associated collection systems as required by sections VI.C.4.c, VI.C.5.b.i.b, and Attachment D.I.D. of the

Printed on 100% Postconsumer Recycled Paper; Process Chlorine Free

Southeast Permit and sections VI.C.4.a.1, VI.C.6.b.1.ii, and Attachment D.I.D. of the Oceanside Permit. For example, the City has not cleaned, repaired and replaced sewer pipes on a schedule to ensure they remain in proper working order, the City does not inspect all accessible CSD outfalls every year, and the City has not provided adequate back-up power at critical facilities. Also, Attachment G.I.I.2 of the Southeast and Oceanside Permits requires that "[c]ollection, treatment, storage, and disposal systems shall be operated in a manner that precludes public contact with wastewater, except in cases where excluding the public is infeasible, such as private property," and EPA has documented several incidents when public contact with wastewater occurred, evidencing that the systems are not being properly operated and maintained.

2. Failure to comply with wet weather operational requirements to maximize use of the collection system for storage and to maximize flows to treatment plants pursuant to sections VI.C.5.b.ii, VI.C.5.b.iv, and VI.C.5.c.iii of the Southeast Permit and sections VI.C.6.b.(2), VI.C.6.b.(4), and VI.C.6.c.(3) of the Oceanside Permit. For example, critical pumps were not activated in order to maximize storage and treatment that could have avoided or reduced sewage discharges, and which resulted in unpermitted discharges.

3. Failure to post warning signs when public contact with wastewater could reasonably occur as required by Attachment G.I.I.2 of both the Southeast and Oceanside permits. For example, the City has failed to post warning signs when excursions have occurred on public property.

4. Failure to comply with reporting and recordkeeping requirements related to releases or diversions of untreated or partially-treated sewage from the combined sewer system pursuant to sections VI.C.4.c.ii.(a), VI.C.4.c.ii.(b), and VI.C.4.c.ii.(c) of the Southeast Permit. For example, the City has not collected or provided all required information about such releases or diversions in the Excursion Annual Report and has not reported all applicable releases and diversions that have occurred. The City has also failed to report all applicable releases and diversions greater than 1,000 gallons to the Regional Water Board and Department of Public Health.

5. Failure to comply with CSD monitoring and reporting as required by section VI.B of both the Southeast and Oceanside permits. For example, the City failed to monitor for all required parameters, did not monitor at the required frequency and failed to use a data-driven analysis of the pollutant removal efficacy of CSD structures.

6. Failure to notify the public of CSDs as required by section VI.C.5.b.viii of the Southeast Permit and section VI.C.6.b.(8) of the Oceanside Permit. For example, signs have been obscured, posted in inconspicuous areas, or unreadable from a reasonable distance, and warning signs have not been posted as required.

7. Failure to comply with water quality standards as required by section V.C of the Southeast Permit. For example, combined sewer discharges have exceeded water quality standards for pH, heavy metals, and bacteria

The City must operate in full compliance with the requirements of the CWA, including its NPDES permits. The violations identified in this letter may result in liability for appropriate

injunctive relief pursuant to CWA Section 309(b), 33 U.S.C. § 1319(b), and statutory civil penalties under CWA Section 309(d), 33 U.S.C. § 1319(d), as modified by 40 C.F.R. Part 19. Please note that the EPA is coordinating with the California Regional Water Quality Control Board, San Francisco Bay Region, to ensure that timely and appropriate enforcement action is taken and compliance with the permits is achieved.

The EPA takes CWA violations at municipal treatment plants very seriously and has pursued vigorous enforcement actions against other municipalities within California as well as elsewhere in the nation. The EPA expects the City to share its concern for the protection of public health and surface water resources and expects the City to address its ongoing CWA violations with significant and meaningful measures to ensure a prompt return to full compliance.

The notice provided in this letter is not an election by the EPA to forgo any remedies available to it under the law, including without limit any administrative, civil or criminal action to seek penalties, fines, or other appropriate injunctive relief under the CWA, and specifically any authority under CWA sections 309 and 504, 33 U.S.C. §§ 1319 and 1364. The EPA reserves all available legal and equitable rights and remedies to enforce any violations identified in this letter, as well as any other violations not specifically identified herein.

Sincerely,

Michael Stoker
Regional Administrator

cc: Michael Montgomery
Executive Officer SFRWQCB

EXHIBIT 8

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
WASHINGTON, D.C. 20460

NOV 21 2019

Harlan L. Kelly, Jr.
General Manager
San Francisco Public Utilities Commission
525 Golden Gate Avenue, 13th Floor
San Francisco, California 94102

Dear Mr. Kelly:

Your Deputy General Manager, Michael Carlin, copied the U.S. Environmental Protection Agency's Office of Water on his September 9, 2019 letter to Michael Stoker, Region 9 Regional Administrator, on behalf of the San Francisco Public Utilities Commission (SFPUC) regarding the reissuance of the SFPUC Oceanside NPDES permit. The Oceanside permit was issued on October 1, 2009 and expired on September 30, 2014. It has been continued administratively since that date. In his letter, Mr. Carlin requested a delay in the adoption of the renewed permit to allow a path forward "that is consistent with the intent of the Combined Sewer Overflow (CSO) Policy, protects receiving water quality, and creates improved regulatory certainty for the benefit of all parties." Given the national policy and consistency issues raised in his letter, we are responding on behalf of Mr. Stoker. EPA Administrator Andrew Wheeler also has asked us to respond on his behalf to the October 1, 2019, letter that you sent to him. The analysis set forth below applies not only to the Oceanside Publicly Owned Treatment Plant (POTW), but also to the Southeast (Bayside) POTW, which similarly is operating under an expired permit that has been continued administratively.

In summary, the interpretation of the CSO Policy set forth in the SFPUC letters, as well as the objection to permit terms that require compliance with water quality standards (WQS), have been reviewed by the EPA at the Headquarters level because they raise national issues. As articulated below, your asserted positions are inconsistent with the approach taken with respect to CSO and water quality issues across the country. If adopted, the EPA would be holding the City and County of San Francisco to a different and much lower standard than other communities that are addressing CSO issues.

In the September 9 letter, the SFPUC objects to permit conditions that require compliance with WQS and states that such permit conditions would impose "unlimited liability risk." According to that letter, the SFPUC does not need to comply with WQS because, following implementation of a Long-Term Control Plan (LTCP), "all parties should be assured that water quality standards and beneficial uses are being protected." Such an assertion is a complete misstatement of the CSO Policy, which was incorporated by reference into the Clean Water Act (CWA) in 2000. *See* 59 Fed. Reg. 18,688 (Apr. 19, 1994); CWA section 402(q), 33 U.S.C. 1342(q).

The CSO Policy does not waive any CWA requirements. Rather, the CSO Policy provides guidance on the planning, selection, and implementation of CSO controls "that meet the requirements of the CWA." 59 Fed. Reg. at 18,688. The Policy establishes nine minimum controls that are the minimum technology-based requirements for CSO discharges. 59 Fed Reg. at 18,695. Water quality-based requirements "are to be established based on applicable water quality standards." *Id.*

Recycled/Recyclable • Printed with Vegetable Oil Based Inks on 100% Recycled Paper (40% Postconsumer)

To develop a LTCP to meet WQS, the Policy lays out two alternative approaches to evaluate CSO controls: the "presumption" approach and the "demonstration" approach. The City and County of San Francisco began constructing CSO controls before the issuance of the CSO Policy and completed those controls in 1997. However, the CSO Policy still applies. As stated in the Policy, "[i]f, after monitoring, it is determined that WQS are not being attained, the permittee should be required to submit a revised CSO control plan that, once implemented, will attain WQS." *Id.* at 18,690. Moreover, the Policy specifically states that preexisting CSO controls "should be reviewed and modified to be consistent with the sensitive area, financial capability, and post-construction monitoring provisions of this Policy." *Id.* For example, far from waiving WQS, the CSO Policy specifies that a permit must include a post-construction monitoring program that is sufficient "to demonstrate compliance with WQS and protection of designated uses as well as to determine the effectiveness of CSO controls." *Id.* at 18,696. Permits also must include "[a] reopener clause authorizing the NPDES authority to reopen and modify the permit upon determination that the CSO controls fail to meet WQS or protect designated uses." *Id.* The Policy also specifies that "[t]he selected controls should be designed to allow cost effective expansion or cost-effective retrofitting if additional controls are subsequently determined to be necessary to meet WQS, including existing and designated uses." 59 Fed. Reg. at 18,691.

The SFPUC's September 9 letter states that the collection system exceeds its "design objectives" and that SFPUC believes that the discharges are "consistent with applicable water quality standards." "Consistent with" standards is not the same as meeting standards and the CWA requires compliance with WQS. WQS, their applicability, and policies generally affecting their application and implementation (such as mixing zones) are all established by state law, subject to EPA approval. The EPA is well aware that since 1979, California has provided San Francisco with a variance from the bacteria standards applicable to the Oceanside POTW and even allows "floatables" (i.e., fecal matter and other organic and inorganic substances) in the water that can directly impact beaches with recreation impacts. The CWA requires that states review applicable WQS, including variances, at least every three years. 33 U.S.C. 1313(c)(1); 40 CFR 131.20(a). The EPA's WQS regulations also require that a variance longer than five years be reevaluated at least every five years. *See* 40 CFR 131.14(b)(v). EPA Headquarters' review of the history of the variance seems to indicate that there have been no attempts to update this variance since its initial implementation in 1979. The EPA notified California in writing on August 14, 2017 and again on August 12, 2019 that the variance must be reviewed to ensure compliance with the CWA and the EPA's WQS regulations. That review must take place and if California cannot demonstrate that this variance meets the requirements set forth in 40 CFR 131.14, it should remove the variance.

The September 9 letter also argues that the Pacific Ocean is not impaired, including for bacteria, and that the Basin Plan and the San Francisco Bay Bacteria Total Maximum Daily Load (TMDL) found that combined sewer discharges are not a significant source of bacteria to the receiving waters. The attainment status of the receiving water does not obviate the need for a CSO discharge to meet WQS. The CWA is designed to protect receiving waters that already meet WQS, as well as to restore waters that are impaired. Further, reliance on the San Francisco Bay Bacteria TMDL to create a presumption that the Oceanside plant is not a significant source of bacteria is inapposite. First, the Oceanside plant discharges were not analyzed under the San Francisco Bay Bacteria TMDL. Second, the State of California has given the Oceanside POTW a variance from bacteria and must comply with other WQS to the extent practical. Third, the prior Oceanside permits had even given SFPUC an exemption from monitoring for bacteria in effluent so the utility has no factual basis for quantifying its bacteria loading. Finally, as applied to the Southeast plant, the TMDL assumes compliance with the existing permit. That assumption has been seriously called into question by the October 2, 2019 Notice of Violation issued to the SFPUC by EPA Region 9.

In addition to requiring discharges to meet WQS, the CSO Policy requires that permits must include "[a] requirement to reassess overflows to sensitive areas in those cases where elimination or relocation of the overflows is not physically possible and economically achievable. The reassessment should be based on consideration of new or improved techniques to eliminate or relocate overflows or changed circumstances that influence economic achievability." 59 Fed. Reg. at 18,696. The SFPUC has combined sewer overflow outfalls that discharge into the Pacific Ocean at Ocean Beach (Discharge Point Nos. CSD-001, CSD-002, and CSD-003), China Beach (Discharge Point No. CSD-005), and Baker Beach (Discharge Point Nos. CSD-006 and CSD-007). These are popular recreation areas used by the community and tourists throughout the year. As noted in Region 9's comments on the draft Oceanside permit, SFPUC has conducted a study that suggests that elimination of CSOs in the typical year at Baker Beach and China Beach is achievable. *See Westside Drainage Basin Urban Watershed Technical Opportunities Technical Memorandum* (Feb. 2015). However, the SFPUC's permit would continue to authorize those outfalls as well as other outfalls that are near other beaches. Like most beaches, these sites are used for primary contact recreation and thus are considered sensitive areas under the CSO Policy. 59 Fed. Reg. at 18,692. To comply with the CSO Policy, the physical possibility and economic achievability of the elimination or relocation of CSOs that discharge to primary contact recreation beaches must be addressed. The fact that Baker Beach was formerly impaired and may now be meeting WQS, as noted in your October 1, 2019 letter, does not obviate the need to determine if these combined sewer discharges can be eliminated or relocated. The revised Oceanside permit appropriately requires SFPUC to evaluate that elimination or relocation. Further, the beaches on the Bayside remain impaired.

The October 1, 2019 SFPUC letter argues in favor of continuing to use the same controls developed in the 1970s to addressing combined sewer discharges. Upgrading publicly owned treatment works from primary to secondary treatment was a significant impetus for the 1972 amendments to the CWA. Since that time, the vast majority of cities have made enormous investments to meet the secondary treatment standard. While secondary treatment standards do not apply to CSOs, the CSO Policy, technology-based limits based on best available technology economically achievable and best conventional technology, and WQS do.[1] We all might agree that in 1994 San Francisco was ahead of the curve in addressing CSOs. However, after 25 years of implementing the CSO Policy, San Francisco is now far behind.

As discussed above, the CSO Policy requires compliance with water quality standards. The EPA's concerns regarding WQS exceedances are clearly identified in the October 2, 2019 Notice of Violation. The EPA is also concerned that the approach adopted by San Francisco in the 1970s, with its continued reliance on primary treatment, does not even meet the "presumption" approach under the CSO Policy.[2] Under the presumption approach a city may initially presume compliance with WQS by either reducing the number of CSO overflows each year to no more than four to six, by eliminating or capturing for treatment no less than 85% of the volume of the combined sewage collected, or by eliminating or removing the mass of pollutants causing water quality impairments. 59 Fed. Reg. at 18,692-93. SFPUC's system is designed to route 100% of the sewage that does not receive treatment at a POTW to storage/transport and diversion structures that are intended to provide equivalent to primary treatment before sending the sewage to the combined sewer discharge outfalls. These structures are equipped with baffles that are intended to retain "floatables" instead of flowing through the outfall. However, if the structures fill with water it is unclear whether they operate as designed. Further, after a rainfall event, it

---

[1] *Montgomery Environmental Coalition v. Costle*, 646 F.2d 568, 592 (D.C. Cir. 1980).

[2] Under CSO Control Policy I.C.1 and 2, communities such as San Francisco that were already constructing or operating controls as of the date of the policy are not subject to the initial planning and construction provisions in the policy. "Such programs, however, should be reviewed and modified to be consistent with the sensitive area, financial capability, and post-construction monitoring provisions of this Policy." 59 Fed. Reg. at 18,690.

is unclear whether SFPUC cleans out the storage/transport structures to prevent "floatables" from the last storm from being discharged during the next storm. These operation and maintenance issues are among the subjects raised by the October 2, 2019 Notice of Violation.

Even if operated as designed, these structures do not constitute 85% "capture for treatment" that the CSO Policy identifies as an option for initially presuming WQS are met. Under the CSO Policy, capture for treatment means capture for *secondary* treatment. This is clear from the text of the Policy that requires that any combined sewer overflows *remaining after 85% is captured for treatment* receive at least *primary* clarification, i.e., treatment. 59 Fed. Reg. at 18,693. If "capture for treatment" meant primary treatment, this additional condition would have no meaning. Thus, the SFPUC's design for CSO treatment does not even warrant a presumption that WQS are met because it only achieves primary treatment. Of course, even if applicable, any presumption may be rebutted and the October 2, 2019 Notice of Violation rebuts that presumption.

The October 1, 2019 letter further argues that the SFPUC's combined sewer outfalls each discharge between one and 10 times a year. According to SFPUC's September 2017 Bayside System Efficacy Report, CSOs have occurred from discharge points CSD 009-043 an average of 17.6 times per year between 2012 and 2017, and according to SFPUC's September 2013 Monitoring Study to Effectively Characterize Overflow Impacts and Efficacy of CSD Controls for Oceanside, CSOs occurred from discharge points CSD 001-007 25 times in 2012-2013. SFPUC's own data show that the design and actual performance of San Francisco's combined sewer system exceed the four to six overflow events per year contemplated under the approach for presuming an adequate level of control to meet WQS under the CSO Policy. 59 Fed. Reg. at 18,692.

Finally, we need to address the claim in your October 1, 2019 letter that operational deficiencies by SFPUC "do not result in routine exposure to raw sewage." We would certainly hope that even when flooding occurs, basement backups are not "routine" for the residents of San Francisco. However, the fact that they exist may well be an indication that the City is not properly operating and maintaining its system. This issue also is a subject of the October 2, 2019 Notice of Violation.

These issues do not preclude reissuance of the Oceanside permit. However, they may prevent the SFPUC from being able to demonstrate compliance with the terms of both the Oceanside and Southeast permits immediately. Indeed, the October 2, 2019 Notice of Violation issued to the SFPUC by EPA Region 9 alleges that you are currently in violation of the terms of your expired 2009 Oceanside permit. The CSO Policy states that "[i]f compliance with the Phase II permit is not possible, an enforceable schedule, consistent with the Enforcement and Compliance Section of this policy, should be issued in conjunction with the Phase II permit which specifies the schedule and implementation of the long-term CSO control plan." *Id.* at 18,696. At present, we do not see how SFPUC can demonstrate compliance with WQS, its NPDES permits, or the CSO Policy in the near term. Accordingly, we strongly urge you to enter into such an enforceable agreement with the EPA.

Sincerely,

David P. Ross

Previous Permit # CA0037681 (R2-2009-0062)

Date of Violation	Description of Violation	Permit Term Violated	Page Number of Exhibit 13
01/08/2017	Power interruption caused five lift pumps to be inactivated for 11 hours, causing 8.275MG discharged as CSDs through the Westside Transport system rather than through the SWOO	Section III.A. Order Conditions	OSP0092, 100 OSP0140, 141
01/10/2017	Beach posting for a discharge at the Seacliff 2 Pump Station occurred late due to miscommunication	Section VI.C.6.b.(8)	OSP0140, 141
02/07/2017	Sampling for CSD discharges at Vicente did not result in usable data due to unsterilized sample bottles	Section VI.B.MRP Section IV.B	OSP0140, 141
02/07/2017	Sampling for CSD discharges at Lincoln did not result in usable data due to unsterilized sample bottles	Section VI.B.MRP Section IV.B	OSP0140, 141
02/07/2017	Sampling for CSD discharges at Seacliff Pump Station did not result in usable data due to unsterilized sample bottles	Section VI.B.MRP Section IV.B	OSP0140, 141

Exhibit 10

All Instances of Non-Compliance of the Relevant NPDES Permits for the OSP

Previous Permit # CA0037681 (R2-2009-0062)

Date of Violation	Description of Violation	Permit Term Violated	Page Number of Exhibit 13
03/23/2017 **Violation**	Unauthorized dry weather discharge occurred due to loss of power to the pump station at CSD-005 China Beach. Station was posted and sampled the next day, but not on the 23rd. Discharge occurred at 9:44PM. **Violation#1030362**	Section III.A. Order Conditions **Corrective Action: None**	OSP0104 OSP0106-8 OSP0140, 141
06/21/2017 **Violation**	Exceedance of weekly average BOD_5 @ 20 C° at 49mg/L. Possible presence of nitrifiers in the sample bottle and on the sampling tube biofilm. Limit in permit is 45 mg/L weekly average. Category 1 Pollutant (Effluent Violation for Group 1 Pollutant) **Violation#1030360**	Section IV.A.1.a. **Corrective Action:** Actions were taken to address the potential presence of nitrifiers in the sample bottle and on the sampling tube	OSP0121-2 OSP0140, 141
09/27/2017	Sample for this day for Table B pollutants in the ocean plan results not available for September SMR	Section VI.B. MRP Section XI.B.	OSP0131

Exhibit 10

All Instances of Non-Compliance of the Relevant NPDES Permits for the OSP

Previous Permit # CA0037681 (R2-2009-0062)

Date of Violation	Description of Violation	Permit Term Violated	Page Number of Exhibit 13
01/08/2018	Valve (V3) between the East and West Transport Storage boxes did not respond to the Distributed Control System and was stuck in the open position. This allowed water to flow between the boxes, during which there were CSDs.	Section III.A. Order Conditions	OSP0161
01/22/2018	No access to China Beach site due to locked gate, no sampling or posting conducted	Section VI.C.6.b.(8) & Section VI.B.MRP Section VIII	OSP0139
03/17/2018 **Violation**	Exceedance of weekly TSS average. Total Suspended Solids (TSS) Weekly Average limit is 45 mg/L and reported value was 67 mg/L at EFF-001A. **Violation#1043973**	Section IV.A.1.a. **Corrective Action: None**	OSP0173-4 OSP0212, 213
04/06/2018	An AT&T communications interruptions with Sea Cliff 2 pump station (CSD-007) occurred prior to the rain event of April 6th. As a result, CSDs occurred on April 6th and April 7th: the staff could not record CSD end times, resulting in preventions of duration and volume estimations.	Section VI.B.MRP Section IV.B.2.	OSP0179 OSP0212, 213

Exhibit 10

All Instances of Non-Compliance of the Relevant NPDES Permits for the OSP

Previous Permit # CA0037681 (R2-2009-0062)

Date of Violation	Description of Violation	Permit Term Violated	Page Number of Exhibit 13
04/06/2018	During the 4/6/18 CSD event, staff collected CSD samples at Monitoring Point EFF-CSD (located at Westside Pump Station). Sample volume was insufficient to perform all required analyses. Unable to analyze for oil & grease, pesticide & PCBs, and PAHs as identified in the NPDES permit.	Section VI.B. MRP Section IV.B.1.	OSP0179
04/17/2018 – 04/20/2018	Flow rate data for the final effluent not collected continuously due to data communication lines being relocated for the construction of the Westside Enhanced Water Recycling Project.	5/25/18 mSMR Folder 025	OSP0179
04/30/2018	Shoreline bacteriological report for this day was inadvertently omitted from the April 2019 SMR	Section VI.B.MRP Section XI.B.2.	OSP0184-5
09/12/2018	Final effluent (EFF-001A) sample for 5-day biochemical oxygen demand (BOD_5) did not meet quality assurance/quality control (QA/QC) specifications	Section VI.B.MRP Section V.C.	OSP0189 OSP0212, 213
10/03/2018	Plant shutdown prevented the collection of 24-hour representative composite samples for total suspended solids (TSS) for INF-001A and EFF-001	Section VI.B.MRP Section III. & Section VI.B.MRP Section IV.	OSP0194

Exhibit 10

Date of Violation	Description of Violation	Permit Term Violated	Page Number of Exhibit 13
01/25/2019 **Violation**	Unauthorized discharge of untreated wastewater combined with secondary treated effluent were discharged at EFF-001 due to equipment failure **Violation #1064928**	Section III.A. Order conditions **Corrective Action:** Secondary bypass drain valve was closed. Dewatering pump returned to service to prevent high sump level. Updated standing orders and procedures to ensure valve remains closed during dewatering	OSP0222 OSP0224 OSP0235 OSP0240 OSP0288, 290
01/29/2019	Unauthorized discharge of untreated wastewater combined with secondary treated effluent were discharged at EFF-001 due to equipment failure	Section III.A. Order conditions	OSP0224 OSP0235 OSP0240 OSP0288, 290
02/02/2019	Beach postings delayed a few hours at Baker Beach.	Section VI.C.6.b.(8)	OSP0234

Exhibit 10

All Instances of Non-Compliance of the Relevant NPDES Permits for the OSP

Previous Permit # CA0037681 (R2-2009-0062)

Date of Violation	Description of Violation	Permit Term Violated	Page Number of Exhibit 13
03/13/2019	BOD_5 results for INF-001A and EFF-001A samples did not meet the BOD method SM5210B specification of a minimum dissolved oxygen depletion of 2.0 mg/L for the seed banks. This violation is 1 of 2 QA/QC specifications that were not met for these samples on this day	Section VI.B. MRP Section V.C.3.	OSP0246 OSP0288, 291
03/13/2019	BOD_5 results for INF-001A and EFF-001A samples did not meet the BOD method SM5210B specification of a maximum dissolved oxygen depletion of .20 mg/L for the dilution water blanks. This violation is 2 of 2 QA/QC specifications that were not met for these samples on this day	Section VI.B. MRP Section V.C.3.	OSP0246 OSP0288, 291
07/07/2019 – 07/13/2019	BOD_5 results for INF-001 and EFF-001A samples did not meet the BOD method SM5210B specification of a maximum dissolved oxygen depletion of .20 mg/L for the dilution water blanks.	Section VI.B. MRP Section III. & Section VI.B. MRP Section IV.	OSP0253 OSP0288, 291
07/28/2019 – 08/03/2019	Only four INF-001 samples were collected this week for pH due to unplanned plant shutdown on July 29-30, necessitated by a PG&E issue, prevented the collection of grab samples on those days. The permit requires 5/week minimum monitoring	Section VI.B. MRP Section III.	OSP0253, 254 OSP0288, 291

Exhibit 10

All Instances of Non-Compliance of the Relevant NPDES Permits for the OSP

Previous Permit # CA0037681 (R2-2009-0062)

Date of Violation	Description of Violation	Permit Term Violated	Page Number of Exhibit 13
07/28/2019 – 08/03/2019	Only four INF-001 samples were collected this week for TSS due to unplanned plant shutdown on July 29-30, necessitated by a PG&E issue, prevented the collection of composite samples on those days, and a sampler setup issue prevented collection of a sample on July 31st. The permit requires 5/week minimum monitoring frequency.	Section VI.B. MRP Section III.	OSP0253, 254 OSP0288, 291
08/02/2019	For dry weather compliance monitoring, incomplete composite samples were collected for monitoring locations INF-001A and EFF-001Adue to plant shutdowns. Only TSS could be calculated.	Section IV.A. & Section VI.B. MRP Section III	OSP0258
08/17/2019	Unauthorized discharge of an estimate 1.8 MG of primary treated wastewater bypassed secondary treatment facilities and discharged through Discharge Point 001 for 13 hours due to equipment and programming failure.	Section III.A. Order conditions	OSP0251 OSP0258, 259 OSP0288, 290
08/17/2019	For dry weather compliance monitoring, incomplete composite samples were collected for monitoring locations INF-001A and EFF-001Adue to plant shutdowns. Only TSS could be calculated.	Section IV.A. & Section VI.B. MRP Section III	OSP0258

Previous Permit # CA0037681 (R2-2009-0062)

Date of Violation	Description of Violation	Permit Term Violated	Page Number of Exhibit 13
11/27/2019	Shoreline sampling did not occur at SRF-22 (Fort Funston) because of heavy surf..	Section VI.B.MRP Section VIII	OSP0275-6, 275, 277 OSP0288, 291
11/28/2019	Shoreline sampling and posting did not occur at SFR-21 (OB @ Vicente) because preliminary results from 11/27/19 indicated low concentrations for all three fecal indicator bacteria. Because of testing times (18-24 hours), the SFPUC found out later (afternoon of 11/28) that the 11/27 sample final result did indeed have an exceedance of enterococcus. In the end, this location should have been posted and sampled on 11/28/19 but it was not.	Section VI.C.6.b.(8) & Section VI.B.MRP Section VIII	OSP0275-6, 275, 277 OSP0288, 291
12/18/2019	Shoreline monitoring and posting were not conducted after a CSD at CSD-005 (Seacliff 1/China Beach) because the on-call biologist were not notified due to the CSD not being detected and therefore a lack of notification. The water elevation trigger was slightly greater than the actual surveyed level.	Section VI.C.6.b.(8) & Section VI.B.MRP Section VIII	OSP0282-3, 282, 284 OSP0288, 291

Re: Comprehensive Parnassus Heights Plan Draft Environmental Impact Report: Comments on Water Quality, Water Recreation, and Wastewater Public Services – Exhibit 13a

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents.

We submitted to you by email a letter of today's date under separate cover regarding "Comments on Water Quality, Water Recreation, and Wastewater Public Services."

Due to the file size of Exhibit 13 to that letter, we are transmitting Exhibit 13 to you by email in three (3) separate electronic files, designated "Exhibit 13a," "Exhibit 13b" and "Exhibit 13c."

Attached, hereto, please find Exhibit 13a (page nos. OSP0001 through OSP0056).

Thank you for your attention to this matter.

Sincerely,

Kelly Marie

DATE: February 10, 2016

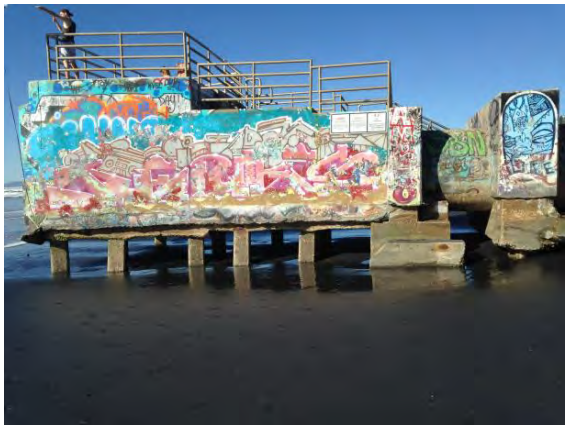
SUBJECT: Complaint-Related Inspection—San Francisco Oceanside Sewer System

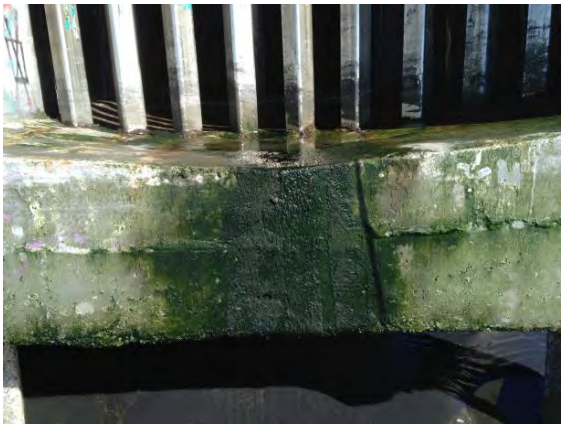
I inspected a portion of the San Francisco sewer system in response to a complaint received from William Rasmussen on Saturday, February 6, 2016. Mr. Rasmussen reported two concerns: (1) a sewage odor on Ocean Beach at Vicente St. and (2) sewage flowing into the street at Wawona St. and 46th Ave.

On Monday morning, February 8, we forwarded the complaint to Laura Pagano at the San Francisco Public Utilities Commission for investigation and follow-up. She provided status reports that afternoon and on Wednesday, February 10. She mentioned conditions at Wawona St. and 47th Ave. The complaint and subsequent correspondence is attached.

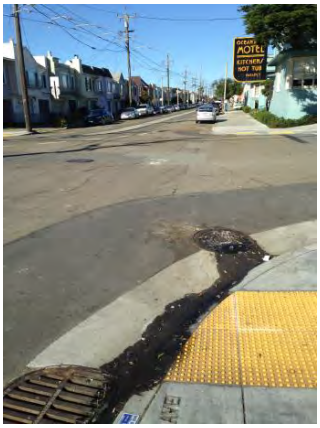
On February 8, I inspected Ocean Beach at Vicente St. and the intersection of Wawona St. and 46th Ave. between 2:00 and 2:30 p.m. On February 9, I returned at about 8:30 a.m. to inspect the intersections of Wawona St. and 46th and 47th Aves. Each time, the weather was sunny and unseasonably warm. On February 8, there was an offshore breeze. No precipitation had occurred for several days.

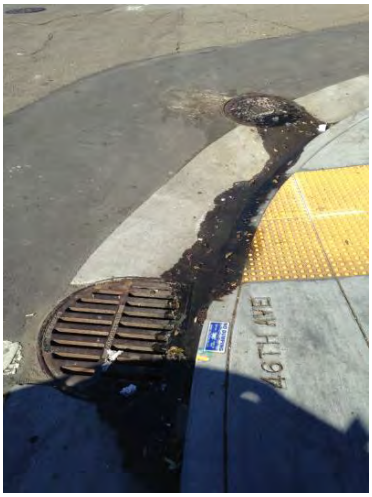
I smelled sewage at Ocean Beach. The smell came from the combined sewer system outfall at Vicente St. The odor was faint at the sides of the structure, but considerably stronger at its opening. Water dripped from the outfall, which was green with algae.





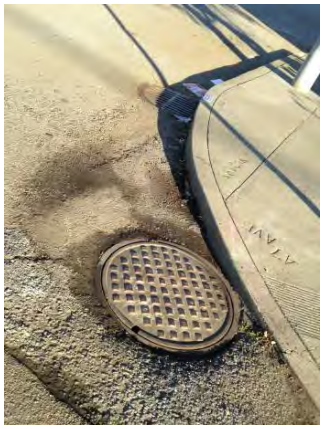
On February 8, an “excursion” was taking place at Wawona St. and 46th Ave. Wastewater flowed from a manhole at the southeast corner of the intersection to a storm drain about 9 feet away at the same corner of the intersection. Based on reference photos of sewer manhole overflows, the flow probably exceeded 5 gallons per minute (gpm), but was considerably less than 25 gpm. The wastewater was fairly clear, with relatively little suspended solids. Pavement stains and debris suggested that somewhat larger flows may have occurred recently. The other corners of the intersection were dry.

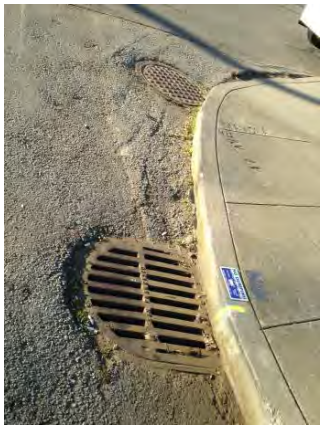


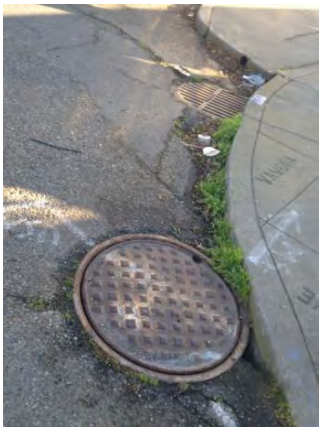


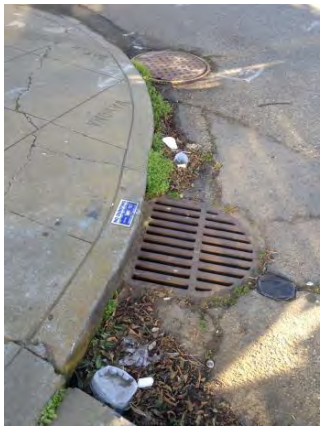
On February 9, the manhole and storm drain at the southeast corner of Wawona St. and 46th Ave. were dry. However, there was a long puddle at the southwest corner with no obvious source.

On February 9, I inspected each corner of the intersection of Wawona St. and 47th Ave. and observed no clear evidence of an excursion.









My observations corroborate Ms. Pagano's reports.

Subject: RE: Effuent on Ocean Beach SF CA

P.S. Laura – While at the Board meeting, I thought of two more issues. Please add these to the first report I requested this morning:

1. Address the issue Mr. Rasmussen brought up in his complaint about no response from the City to his 311 reports, including any measures necessary to improve response. I understand that this may take more than the next few days to track down; if so, then please note in the first report to us the process the City will follow to investigate and its plan to report on it in the status reports.
2. Explain the PUC's current routine inspection, and the date and findings of the last inspection, of the Vicente outfall, and include address if improvements to Oceanside O&M plan would be necessary.

P.P.S. If it would be the City's privacy policy also, please redact Mr. Rasmussen's personal email address from the City's public records. I had erred in failing to do so when I forwarded his complaint. This would be consistent with the State's personal information policy, though in a grey area of the State's policy.

Thanks Laura for the updates and it appears PUC is satisfactorily addressing the problems. For clearer documention in our records, would puc provide by end of week or next Tu a written report of actions completed, actions planned w projected schedule, and then follow up with status reports until problems are fixed. I will defer to Jeasica when she returns to establish the frequency for the status reports.

>
> (2) Excursion at 46th and Wawona

There are a number of workorders for this situation beginning February 6, as well as follow-up inspections which took place over the last several days. Piecing it together, this is our understanding of the situation. There is a collapsed pipe on the south side of the intersection of 47th and Wawona. This pipe failure is causing a decrease in flow capacity which in turn is causing the upstream flow to overwhelm the system. As a result the upstream manholes at 47th & Wawona (SE corner) and 46th & Wawona (both the SW and SE corners) have been intermittently excursioning. Most of the flows in this system are water from construction dewatering and the Sloat Garden Center, although there is some sanitary flow from one block upstream which consists of apartments and the United Irish Cultural Center.

In response our crews have:

- Cleared manholes and lines both up and downstream of the collapse to increase capacity as much as possible
- Created a temporary pump around to take flows from the failed system and send them to a fully functioning local sewer in the area
- Have put a rush request to dig up and replace the collapsed pipe. Currently still within the USA utility marking period for safety. Dig up is scheduled begin this Thursday (February 11). Crews will CCTV the surrounding system to confirm that no other failures have been caused by the nearby construction site
- Sewer Operations is continuing to monitor the manhole and surrounding areas for containment

Please let me know if you have questions or concerns. Best regards, --Laura

Subject: RE: Effluent on Ocean Beach SF CA

Hi Lila,

I wanted to give you a status update about the situation(s) below.
(1) odors near Vicente discharge box structure

Staff inspected the site and were able to confirm an occasional sewage odor near the Vicente discharge structure. Inspection of the discharge box structure revealed that the parts of the gates at the end of the discharge structure are not intact, which could be letting odors from the Vicente box escape. Staff will determine the most appropriate fix for the gates tomorrow morning and draw up a work order.
(2) manhole discharge at 46th and Wawona

There are multiple workorders which have been initiated for work over the last 3 days at 46th and Wawona and a block away downstream at 47th and Wawona. Our staff cleared the main sewer once (2/7/16 in the morning). They also marked the downstream sewer for a rush digup as part of the

solution (we are awaiting utility markups for safety reasons, and hope to have them by Wednesday February 10).

There is more investigation at the site underway. I will provide another update as soon as I have more information.

Best regards, --Laura

Subject: Effluent on Ocean Beach SF CA

February 6th 2016: Strong oder of sewage on Ocean Beach at an old sewer pipe at Vicente the city emergency services were not available, meanwhile children are playing on that beach. There is a treatment plant at the end of Great Highway but the oder actually fades in that direction and is strongest at the old sewer line. I have contacted 311 (on several occasions in the last week) and the city of SF and the GGNRA. Neither were available. There has also been sewage overflowing into the street at Wawona and 46th for a week and complaints have been made but nothing has been done. As this area is adjacent to the large catchment under Great Highway (paralleling Ocean Beach) I think it may be evidence of the catchment being damaged or overtaxed or issues with the Sloat pumping station or the treatment plant itself. I realize you are probably unwilling or unable (likely both) to test the water but it would be nice to know if the kids are safe. So in the event that we see a spike of sewage related illness in the area I will at least be able to say we contacted you.

Oakland CA 94612

Dear Ms. Tang,

This report is being submitted to you pursuant to your request that the SFPUC summarize its efforts in addressing the following issues you asked us to investigate: (1) a reoccurring excursion at 46th and Wawona; (2) an odor complaint near the Vicente outfall structure; (3) 311 availability; (4) trickle of water from the Vicente outfall structure in dry weather; and (5) sign free of graffiti notifying the public about the possibility combined sewage discharges at Vicente outfall structure

(1) Excursion at 46th and Wawona

In response to a reoccurring excursion at 46th and Wawona, SFPUC crews generated work orders and responded multiple times to the site beginning February 6, 2016. Staff diagnosed the underlying problem to be a collapsed pipe on the south side of the intersection of 47th and Wawona which was causing a decrease in flow capacity which in turn was causing the upstream flow to overwhelm the system. As a result the upstream manholes at 47th & Wawona (SE corner) and 46th & Wawona (both the SW and SE corners) were been intermittently excursioning. Most of the flows in this system were water from construction dewatering and the Sloat Garden Center, although there was some sanitary flow from one block upstream which consists of apartments and the United Irish Cultural Center.

In response to the situation, our crews took the following actions:

- Cleared manholes and lines both up and downstream of the collapse to increase capacity as much as possible, through multiple visits to the site
- Created a temporary pump around to take flows from the failed system and send them to a fully functioning local sewer in the area
- Put a rush request to dig up and replace the collapsed pipe, although the pipe needed to have USA utility marking period for safety, which took a couple of days.
- Monitored the site and surrounding areas for containment

On February 11, 2016, crews began the dig-up as planned and repaired the collapsed pipe on 47th and Wawona. It is now functioning. As part of the repair, crews discovered that the slurry had been dumped down the pipe between 46th and 47th, which constrains the capacity of the pipe. Staff is now in the process of investigating to try to identify the responsible party. The work order to address the slurry will be scheduled for repair according to the Collection System Planning priority system.

(2) Odor complaint near Vicente outfall structure

Staff inspected the site and confirmed an occasional sewage odor on February 8, 2016 near the Vicente discharge structure. Inspection of the discharge box structure revealed that the parts of the gates at the end of the discharge structure were damaged, which could have been letting odors from the Vicente box escape. Staff ordered parts to repair the flapper gate, which are expected to be delivered in 3-4 weeks. Staff will repair the flapper gate as soon as the parts come in and tides allow.

The Vicente outfall structure is inspected annually, per our permit requirement. The last two dates of the inspection were 7/30/2014 and 10/26/2015. The following were the findings of the 2015 inspection:

Observations - Both pipes appear to be in good condition, with smooth clean concrete and evidence of flow up to springline. Some flap gates are damaged/missing.
Short-Term Outlook – Primary integrity and functionality are intact. Concrete and rebar may not have been properly installed at upstream end of southern barrel. Recommend refurbishment within 5 years to maximize service life, and installation of new flap gates.

(3) 311 availability

311 is available 24-hours a day, and one can submit a service request in a number of ways including calling 311, the 311 web page, 311 app, and email. Our 311 operations report that there was no break in service (e.g., no fire drill, power outage, etc.) between January 28 and February 11, 2016. I do not know what Mr. Rasmussen meant when he stated in his email to you in regards to "the city of SF and the GGNRA" that "Neither was available," but without any specific facts it is hard to conclude that 311 wasn't available to him.

There were no reports submitted (via phone, email, or other) by either William Rasmussen, the email address he used to contact you, or the address found for this name in the white pages. Presuming that he did call in service requests, he must have done so anonymously. Our research reveals that there were several anonymously reported service requests on or around February 6 regarding an odor complaint at Vicente at Ocean Beach and an excursion at 46th and Wawona. All Mr. Rasmussen would need to do to get an update

about his service requests (even if made anonymously), would be to call 311 and ask the operator for an update using the tracking number he would have been given at the time he made the service request. He could also use the web for this purpose or the app.

It is not clear from his email whether Mr. Rasmussen ever called 311 to find out the status of the service requests he made (or tried through other means such as the web or the 311 app). Accordingly, we do not have any facts that would point to a need to modify the 311 procedures. One potential explanation for Mr. Rasmussen's experience is that while Sewer Ops came out several times to the 46th and Wawona site in response to the service requests, the excursions continued to occur intermittently due to the collapsed pipe downstream at 47th and Wawona restricting capacity. Fixing the root cause with the dig up required several days to get the utilities marked to be able to perform the work safely. Mr. Rasmussen could have seen the intermittent excursions and erroneously concluded that no-one was responding to his service requests, without necessarily calling to check up on his service requests through 311.

(4) Trickle of water from Vicente outfall in dry weather

At high tide portions of the Vicente outfall structure are submerged by the ocean. The trickle of water observed by Regional Board staff from the Vicente outfall structure after high tide was confirmed by sample tests to be seawater and not sewage.

(5) Sign free of graffiti notifying the public about the possibility combined sewage discharges at Vicente outfall structure

The SFPUC put up a new sign on the Vicente outfall structure after the Regional Board staff site visit last year. Below is a picture taken of the sign on the Vicente structure on February 8, 2016 which, as you can see, is free of graffiti.

Please contact me with any questions or concerns at 415-554-3109.

Sincerely,

Laura Pagano

Transmitted herein is the Oceanside Water Pollution Control Plant (Oceanside Plant) Self-Monitoring Report for January, 2016.
During the month of January, there were eighteen days of measurable precipitation totaling 5.79 inches. The Oceanside Plant treated 758.88 million gallons (MG) of wastewater. A total of 383.33 MG of decanted wet weather flow was pumped to the Southwest Ocean Outfall (SWOO). There were four combined sewer overflow discharges (CSOD) during this reporting period.

Subject: Oceanside WPCP (NPDES/CA0037681) 5-Day Written Report

Dear Ms. Watkins,

This is the 5-Day Written Report for the unauthorized discharge incident caused by the clogged lateral of a single family home which is assumed to have occurred on Saturday, March 12, 2016 through Tuesday, March 15, 2016 at 11:30 am at the Seacliff 1 Combined Sewer Discharge (CSD) Outfall. This is a follow-up to the verbal notification sent to the Regional Board on March 15, 2016 following the discovery of this event.

1) Incident description and cause:

On March 15, 2016 at approximately 9:00 am, the Oceanside Operations Chief (Mark Lauer) observed flow coming out of an air vent on a sewer lateral across from the Seacliff 1 Pump Station. The residence is located at 475 Seacliff Avenue. It was determined that there was a clog on the sewer lateral downstream of the vent, preventing flow from the residence to reach the main sewer line that flows to the pump station. This caused intermittent flow from the residence to exit through the vent and onto the street to a catch basin (see Attachment 1 for diagram). The catch basin, which normally captures runoff, bypasses the pump station and discharges onto China Beach at CSD-005. SFPUC Staff investigated, including interviews. According to the resident at 475 Seacliff, flow had been going through the vent three days prior. She reported it to her landlord when she first saw the problem.

2) Location of threatened or involved waterway(s) or storm drains:

The discharge location was CSD-005, located at China Beach. Discharge was onto the beach, with an unknown portion of the discharge reaching the Pacific Ocean.

3) Date and time the unauthorized discharge started:

Edwin M. Lee
Mayor
Francesca Vietor
President
Anson Moran
Vice President
Ann Moller Caen
Commissioner
Vince Courtney
Commissioner
Ike Kwon
Commissioner
Harlan L. Kelly, Jr.
General Manager

The discharge is estimated to have started sometime on March 12, 2016. The exact time is uncertain.

4) Estimated quantity and duration of the unauthorized discharge (to the extent known), and the estimated amount recovered:

Approximately 840 gallons; the unauthorized discharge occurred intermittently for approximately three days (ended March 15 @ 11:30 am) with 0% recovery. The estimation assumes that the average American household uses 400 gallons of water per day, with 70% of the water used indoors (based on EPA Watersense Article, Attachment 2).

5) Level of treatment prior to discharge (e.g., raw wastewater, primary treated, undisinfected secondary treated, and so on):

Raw wastewater

6) Identity of the person reporting the unauthorized discharge:

Mark Lauer, Operations Chief

5-Day Written Report

1) Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters:

There were no visible signs of raw wastewater found on the beach or floating in the receiving waters. All bacteria results from ocean shoreline samples collected on March 15 were below State standards for water contact recreation. Additionally, samples were collected from the outfall seepage and results were negative for urea and odor.

2) Efforts implemented to minimize public exposure to the unauthorized discharge:

An SFPUC Biologist was dispatched to take samples and notification of the discharge was posted at the beach on March 15 at 11:30 am. Email notification was sent and the website was updated. The beach was de-posted on March 16 at 9:30 am.

3) Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted:

No negative impacts were observed on March 15, when the SFPUC became aware of the situation and investigated.

4) Corrective measures taken to minimize the impact of the unauthorized discharge:

Once the Operations Chief identified the incident, he coordinated with Sewer Operations to unclog the sewer lateral. The sewer lateral was unclogged on March 15 at approximately 11:30 am.

5) Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future:

In response to this incident, the following measures will be taken:
Private sewer lateral issues are the responsibility of the homeowner, not the SFPUC. However, to protect water quality, SFPUC Staff performed the work to reduce the clog rather than wait for the homeowner to address the problem.

6) Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges:

To minimize the chances of future unauthorized discharges, the following modifications and actions will be taken:
The residents at 475 Seacliff Avenue are being provided with materials advising them to call 311 if a similar situation occurs again. SFPUC Staff is also investigating to see if there are measures (curbing, etc.) which could be taken to route outflow from the vent away from the catch basin. No modifications to the Spill Prevention Plan or O&M Manual need to be made at this time.

If you have any questions concerning this report, please contact me at (415) 242-2225.

Sincerely,

Jeff Yee

Jeff Yee
Operations Superintendent

EPA WaterSense

Indoor Water Use in the United States

Americans use large quantities of water inside their homes. A family of four can use 400 gallons of water every day, and, on average, approximately 70 percent of that water is used indoors.

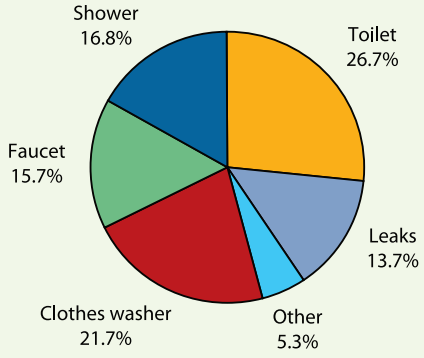
The bathroom is the largest consumer of indoor water. The toilet alone can use 27 percent of household water. Almost every activity or daily routine that happens in the home bathroom uses a large quantity of water. For example:

- Older toilets use between 3.5 and 7 gallons of water per flush. However, WaterSense® labeled toilets use at least 60 percent less water.
- A leaky toilet can waste about 200 gallons of water every day.
- A bathroom faucet generally runs at 2 gallons of water per minute. By turning off the tap while brushing your teeth or shaving, a person can save more than 200 gallons of water per month.

Outside the bathroom, there are many opportunities to save water. Here are some common water-efficiency measures, along with a few solutions to those problems you may not have known existed:

- High-efficiency washing machines can conserve large amounts of water. Traditional models can use 50 gallons or more of water per load, but newer, energy- and water-conserving models (front-loading or top-loading, non-agitator ones) use less than 27 gallons per load.

How Much Water Do We Use?



Source: American Water Works Association Research Foundation, "Residential End Uses of Water," 1999

- Washing the dishes with an open tap can use up to 20 gallons of water, but filling the sink or a bowl and closing the tap saves 10 of those gallons.
- Keeping a pitcher of water in the refrigerator saves time and water instead of running the tap until it gets cold.
- Not rinsing dishes prior to loading the dishwasher could save up to 10 gallons per load.

WaterSense, a partnership program sponsored by the U.S. Environmental Protection Agency, seeks to help families and businesses realize that they can reduce water use by doing just a few simple things, such as upgrading to higher quality, more efficient products. For more information, visit <www.epa.gov/watersense>.

Self-Monitoring Report March, 2016

Attention: NPDES Division

Transmitted herein is the Oceanside Water Pollution Control Plant (Oceanside Plant) Self-Monitoring Report for March, 2016.
During the month of March, there were twelve days of measurable precipitation totaling 5.75 inches. The Oceanside Plant treated 718.11 million gallons (MG) of wastewater. A total of 397.28 MG of decanted wet weather flow was pumped to the Southwest Ocean Outfall (SWOO). There were three combined sewer overflow discharges (CSOD) during this reporting period.

Drainage Area CSOD	Westside
This Month	3
2015-16 Season	9
Design Criteria	8

The Chronic Toxicity Test conducted from March 9, 2016 through March 12, 2016 was invalidated due to poor control development. The subsequent chronic test was valid for Quarter 1, 2016 and has been reported to Linda Candelaria.
A private sewer lateral discharge to the Seacliff 1 Combined Sewer Discharge (CSD) Outfall occurred on Saturday, March 12, 2016 through Tuesday, March 15, 2016. It was first reported as an unauthorized discharge incident and a 5-Day Written Report was submitted to Jessica Watkins on March 21, 2016. Upon further investigation, the discharge was identified as an illicit discharge from a private sewer lateral to a storm drain system. It will be reported in the MS4 Annual Report.
If you have any questions concerning this report, please call (415) 920-4600 and enter the appropriate extension number: Superintendent Jeff Yee, x 6-2225, Operations Manager Tony Flores, x 6-4902, Supervising Chemist Linda Candelaria, x 6-2204, or Laboratory Manager Kenneth Lee, x 6-4965.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

Jeff Yee
Operations Superintendent

Subject: Oceanside WPCP (NPDES/CA0037681) 5-Day Written Report

Dear Ms. Watkins,

This is the 5-Day Written Report for the discharge that occurred on Monday, October 17, 2016 at approximately 10:53 a.m. to 11:05 a.m. from the Seacliff 2 Pump Station Outfall (CSD-007). This report follows up on the notification voicemail and email to you from Mark Lauer (Oceanside Treatment Plant Operations Chief) on October 17, 2016 following the discovery of this event.

(1) Event Description and Cause

On Monday, October 17, Oceanside plant staff reviewed plant and pump station data for a wet weather event which had occurred over the weekend. Staff saw data which indicated that a CSD at Seacliff 2 (CSD-006) could be occurring and immediately went out to the pump station to investigate (An alarm from the Seacliff 2 outfall weir (CSD-006) occurred on Sunday October 16, 2016, at approximately 1:00 p.m. Staff did not physically investigate the pump station at that time). Investigation revealed that the overflow side of the weir was dry, and that the sump level trend had not exceeded the overflow level. Accordingly, plant staff has concluded that no discharge from CSD-006 had occurred.

While investigating the potential discharge, staff discovered that the inlet valve to the pump station was failing to open. To prevent a discharge occurring at CSD-006, staff opened the valve manually to lower the level. During this time, the pump station lift pumps failed due to the scheduled PG&E interruption described below. This power failure caused a discharge to occur at CSD-007.

Oceanside Treatment Plant (OSP) Electricians, who were on site standing by to be able to respond to any issues caused by the power interruption, were able to restore emergency power to the station within approximately five minutes and stop the overflow.

A planned PG&E Electric Service Interruption for the Seacliff area was scheduled that day between 9:00 a.m. to 11:00 a.m. The purpose of the service interruption was to switch circuits to work around a transformer that was being replaced.

(2) Time Period of the Event

The discharge at CSD-007 began at approximately 10:53 a.m. and ended at 11:05 a.m. on Monday, October 17, 2016 with 0% recovery.

OSP Staff estimate that approximately 8,011 gallons of combined wastewater was discharged through CSD-007 to Baker Beach as a result of this event.

Receiving water samples were collected at three separate locations along Baker Beach including point zero within two hours of the reported discharge. These samples were analyzed for Total coliforms, *E. coli* and *Enterococcus*. The results indicated that bacterial concentrations were below State standards for recreational waters at all three locations.

Visual observations were made as receiving water samples were collected. No evidence of adverse effects was observed.

Baker Beach was posted 10/16/2016 to 10/18/2016 and the public was notified via email and the web.

(3) Anticipated time Event is expected to continue if the Issue has not been resolved

N/A: The issue has been resolved.

(4) Steps taken or planned to reduce, eliminate and prevent reoccurrence

Staff responded appropriately to the discharge which occurred at CSD-007. Emergency repairs have been made to the inlet valve to the pump station so that it is now functioning properly.

To address the issue of timely performing physical inspections when alarms occur, the following measures will be taken:

- Operations staff will be re-trained on existing SOPs regarding appropriate steps to take in investigating alarms.
- A new logsheet will be created that requires hourly readings of all pump station sump levels and alarm status.

In addition, all of the alarm probes monitoring these areas have been tested and recalibrated by the I&C staff. An examination of the Spill Prevention Plan and O&M Manual has been made and staff has determined that no changes are needed

If you have any questions concerning this report, please call Jeff Yee at (415) 242-2225.

Sincerely,

Jeff Yee

Jeff Yee
Operations Superintendent

Self-Monitoring Report October, 2016

Attention: NPDES Division

Transmitted herein is the Oceanside Water Pollution Control Plant (Oceanside Plant) Self-Monitoring Report for October, 2016.

During the month of October, there were fifteen days of measurable precipitation totaling 2.92 inches. The Oceanside Plant treated 534.10 million gallons (MG) of wastewater. A total of 178.52 MG of decanted wet weather flow was pumped to the Southwest Ocean Outfall (SWOO). There were three combined sewer overflow discharges (CSODs) during this reporting period.

An unauthorized discharge incident occurred on Monday, October 17, 2016 from the Seacliff 2 Pump Station Overflow/Outfall (CSD-007). The estimated amount discharged through the overflow/outfall was approximately 8,011 gallons of combined wastewater. A 5-Day Written Report was submitted to Jessica Watkins of the San Francisco Bay Regional Water Quality Control Board on October 24, 2016.

Re: Comprehensive Parnassus Heights Plan Draft Environmental Impact Report: Comments on Water Quality, Water Recreation, and Wastewater Public Services – Exhibit 13b

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents.

We submitted to you by email a letter of today's date under separate cover regarding "Comments on Water Quality, Water Recreation, and Wastewater Public Services."

Due to the file size of Exhibit 13 to that letter, we are transmitting Exhibit 13 to you by email in three (3) separate electronic files, designated "Exhibit 13a," "Exhibit 13b" and "Exhibit 13c."

Attached, hereto, please find Exhibit 13b (page nos. OSP0057 through OSP0137).

Thank you for your attention to this matter.

Sincerely,

Kelly Marie Perry

Self-Monitoring Report December, 2016

Attention: NPDES Division

Transmitted herein is the Oceanside Water Pollution Control Plant (Oceanside Plant) Self-Monitoring Report for December, 2016.

During the month of December, there were eight days of measurable precipitation totaling 4.98 inches. The Oceanside Plant treated 628.47 million gallons (MG) of wastewater. A total of 302.48 MG of decanted wet weather flow was pumped to the Southwest Ocean Outfall (SWOO). There were three combined sewer discharges (CSDs) during this reporting period.

Drainage Area CSDs	Westside
This Month	3
2016-17 Season	8
Design Criteria	8

There were posting and sampling delays and omissions for Vicente and Lincoln CSDs as follows:

- Lincoln was posted on December 10th, and deposted and not sampled on December 11th, and Vicente was posted and sampled one day late (on December 11th), and due to a miscommunication about the CSD location and confusion about whether a discharge had occurred at Lincoln
- No posting or sampling occurred following a CSD at Vicente and Lincoln on Dec 23rd, due to overflow sensor calibration issues

Staff is meeting regularly to address the calibration issues, and Millbrae Dispatch and Operators have received additional instruction regarding communication of CSD events to the field biologist.

If you have any questions concerning this report, please call (415) 920-4600 and enter the appropriate extension number: Superintendent Jeff Yee, x 6-2225, Acting Supervising Chemist Lily Chan, x 6-2220, or Laboratory Manager Kenneth Lee, x 6-4965.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

Jeff Yee

2016 Annual Report

RE: Oceanside Water Pollution Control Plant 2016 Annual Self-Monitoring Report

Dear Jessica:

Transmitted herewith is the Annual Self-Monitoring Report for the Oceanside Water Pollution Control Plant (WPCP) for the calendar year 2016.

A. Treatment Plant Compliance and Performance

1. Volume Treated

The Oceanside WPCP treated a total of 6.0 billion gallons of wastewater (combined sanitary, industrial and storm water) in 2016. The average dry weather flow was calculated as 12.5 million gallons per day (MGD), calculated using flows from three consecutive dry weather months (July, August, and September).

The Oceanside WPCP final effluent was in compliance with all dry and wet weather discharge permit numeric limits for the entire calendar year of 2016.

2. Combined Sewer Discharges

The table below shows the frequency of combined sewer discharges (CSDs) during 2016. A complete wet weather annual report covering the wet weather season from July 2016 through June 2017 will be submitted in July 2017 and will include all the wet weather events for that period.

2016 Combined Sewer Discharge Frequency

	Month												Total
Basin	J	F	M	A	M	J	J	A	S	O	N	D	
West Side	4	1	3	0	0	0	0	0	0	3	2	3	16

3. Discussion of Treatment Plant Performance and Compliance (Jeff)

The San Francisco Public Utilities Commission (SFPUC) is exempt from submittal of an annual compliance summary table and tabular and graphical summaries of monitoring data because all data for the Oceanside WPCP are reported electronically. See Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D), Attachment G (2010) at G-19.

Summary of Compliance
Due to communication issues between treatment plant operators, Millbrae Dispatch, and field staff biologist, not all of the relevant public notification and/or sampling occurred or was conducted within a day of the CSD during the January 18, 2016 and December 10, 2016 rain events. Specifically:

- Fort Funston Beach (January 5, 2016; January 18, 2016) and Baker Beach (January 18, 2016) were not posted or sampled following a CSD.
- Ocean Beach was posted 1-2 hours later than normal (January 18, 2016)
- Fort Funston Beach was posted and the public notified 4-5 hours later than normal (January 19, 2016)
- Following a CSD on December 10, 2016, Lincoln was posted, then deposted and not sampled on December 11th, and Vicente was posted and sampled one day late (on December 11th), due to a miscommunication about the CSD location and confusion about whether a discharge had occurred at Lincoln

In addition, no posting or sampling occurred following a CSD at Vicente and Lincoln on Dec 23, 2016, due to overflow sensor calibration issues.

To improve communication, the SFPUC implemented an I-Info email/text notification program in January 2016. These alerts from Plant Operations are now directed to both Millbrae Dispatch and to the responding on-call Biologist. In addition, a back-up notification method has been developed and launched. This method uses level and other sensor data from the Distributed Control System (DCS) and PI Coresight (PI) to automatically send an email to Millbrae Dispatch when information indicates that a CSD is occurring or imminent. For example, PI can be used to automatically generate an email that discharges from Lake Merced are imminent when levels at in Lake Merced Transport/Storage structure reach a specified level. Implementation of this back-up notification method is being refined. Staff is meeting regularly to address the calibration issues, and Millbrae Dispatch and Operators have received additional instruction regarding communication of CSD events to the field biologist.

A private sewer lateral discharge to the Seacliff 1 Outfall occurred on March 12, 2016, which was first reported as an unauthorized discharge. Upon further investigation, however, the discharge was identified as an illicit discharge from a private sewer lateral to a storm drain system. It was reported in the 2016 MS4 Annual Report.

An unauthorized discharge incident occurred on Monday, October 17, 2016 from the Seacliff 2 Pump Station Outfall. The estimated volume was approximately 8,011 gallons of combined wastewater. A 5-Day Written Report was submitted to Jessica Watkins of the San Francisco Bay Regional Water Quality Control Board on October 24, 2016. The SFPUC provided additional information about this event on December 1, 2016 in response to regulator communication.

4. Actions Taken or Planned to Improve Plant Performance & Reliability

The following projects are planned for, underway or recently completed for the Oceanside WPCP and associated collection system:

Temperature-Phased Anaerobic digestion (TPAD) Conversion: The startup is 75% completed. The SFPUC will be seeking Class A certification from the EPA in 2017.

WW-589 Total Solid Control & Waste Activated Sludge System Upgrade (TF78): The installation of seven Total Solids (TS) Analyzers, new Waste Activated Sludge (WAS) Pumps and a Solids Retention Time (SRT) Control System was completed

in March 2016. The SRT is now controlled automatically and the thickening process polymer dosage has been automated.

WW-572R WSS Discharge Pipe Manifold Upgrade (TF47): The scope of the project includes rehabilitation of the discharge pipe manifold including new lining, valves, actuators and a hydraulic power unit. Other items include rehabilitation of the surge tank, installation of submersible chopper pumps, sump pump replacement, new flood alarms, lighting, walkway grating and railings. The project reached substantial completion in December 2016.

WW-559 Fixed Gas Monitoring System Upgrades (TF30): This project furnishes and installs fixed gas monitoring devices at various wastewater treatment facilities, including the Oceanside Treatment Plant. The project was substantially complete as of November 2015 with an ongoing maintenance.

WW-625 OSP Flare Control and Stack Upgrade (TF46): The existing waste gas burners will be replaced with two Varec Biogas flares to be located outside of the existing Waste Gas Burner Building 821. The project received construction Notice to Proceed on October 2016.

WW-580 W2/W3 Water System Improvements (TF69): The project is to upgrade W2 and W3 water system by installing new filters and associated mechanical and electrical equipment. The W2 water system that uses millions of gallons of potable water every month has been upgraded to use W3 water instead. The W3 water chlorination dosing and monitoring system have been upgraded as part of this project. As a result of this project, the plant potable water consumption has been decreased by more than 75%. The project reached substantial completion August 2016.

WW-570 OSP & WSS HVAC Upgrades (TF48): This project includes replacement of the existing deficient and deteriorated Heating, Ventilating and Air Conditioning units, associated ductwork and plumbing modifications and duct cleaning, electrical power, instrumentation and controls, and related equipment structural support work at OSP and Westside Pump Station (WSS). The project received construction Notice-to-Proceed on July 2016.

WW-643 OSP Building 620 Safety Improvements (TF92): This project is to replace the digester recirculating pumps in OSP Building 620 with associated mechanical and electrical improvements. The project team completed 95% design September 2016.

WW-648 OSP042 Primary Clarifier Improvements (TF93): This project is to replace the helical scum skimmers, W3 spray water system, compressed air system, bubbler system, primary influent flowmeter signal converters, 30" effluent butterfly valves, lighting system, piping, valves, fittings and appurtenances. The project team completed 95% design October 2016.

Pine Lake Pump Station Upgrade (TF79): The project is to build a wet weather detention tank for additional capacity of the existing pump station. The additional capacity is intended to minimize the potential for overflows during large wet weather events. Work includes but is not limited to cast in place concrete work, excavation, electrical and mechanical improvements. The

project was substantially complete in June 2016 with fencing work targeted to be complete January 2017.

WW-606R2 OSP Building 930 Exterior And Awning Improvements (TF67): The scope of this project is to repair and replace the original Oceanside Plant Building 930 1st and 2nd floor awning systems. OSP 930 Admin HVAC Improvements, corrosion stain removal, corrosion rehabilitation and electrical lighting replacement are additional work scope items. Construction Notice to Proceed is anticipated February 2017.

OSP 011 Grit Classifier and Primary Influent Improvements (TFA2): This project will improve grit removal system, restore functionality to the primary influent flow and aeration tank process. This goal will achieved by the replacement of the existing (E) two (2) grit classifiers, six (6) cyclone separators, five (5) primary influent slide gates, pressure gauges, process ductile iron piping, fittings, six (6) grit pump overhead discharge clean out lines with an isolation (grooved end type) plug valve, blind flange, flushing port (cam-lock type) to improve ease of maintenance, three (3) Pista Tank grit blowers. The project team is evaluating conceptual needs associated with the grit classifier system.

JOC 47R 17 OSP 620 Screw Press Day Tank Improvements (TF46): This project included cleaning of the secondary bypass flowmeter and installed an overflow pipe at the screw press day tanks to improve removal of sludge. Project was completed July 2016.

Wemco Model C Grit Pump Replacements (TF07.51): This project procured new pumps to replace existing dilapidated grit pumps. The new pumps were installed by in-house WWE staff August 2016.

WSS East (Dry Weather) Bar screen Replacement Parts (TF07.47): This project procured a new dry weather bar screen top section to improve the existing operation at WSS. The project was completed January 2016.

OSP Manual Valve Replacement (TF07.39): This project procured twenty (20) manual valves to replace existing dilapidated valves at OSP Building 042. The project was completed by WWE in-house staff February 2016.

Recycled Water Facility: The project scope is to build a new recycled water facility that will include microfiltration, reverse osmosis, and UV disinfection of the OSP final effluent. The project has been advertised and construction is scheduled to start in 2017.

Digester Gas Utilization Upgrade: The project scope will replace the Oceanside Plant cogeneration engines and gas holder, and add a new digester gas cleanup system. The project is currently at the 95% Design Phase.

5. Effluent Characteristics for Selected Constituents

For this evaluation, all constituents with required minimum sampling frequency of less than once a month that were detected above the method Minimum Levels (ML) were evaluated. Estimated concentrations of constituents detected below the MLs

were excluded from this evaluation because the uncertainty in the result when a constituent is detected below the ML prevents useful comparison.

There were eight constituents detected above the method MLs: Antimony, Cadmium, Chloroform, Chromium III, Copper, Lead, Nickel, and Zinc. The 2016 maximum detected level of the eight constituents were compared to the Maximum Effluent Concentration (MEC) as presented in Table F-11 of the Oceanside Permit (Reasonable Potential Analysis). The MECs were used as the general indicators of past performance of the detected constituents.

Seven of the eight detected constituents showed deceases or no statistically significant changes or increases compared to the corresponding MECs.

Antimony and Nickel increased from 0.94 to 2.75 µg/L and 7.2 to 27.3 µg/L respectively. No obvious reasons were identified for the increases and the increases were less than one order of magnitude of the MEC. The increases were potentially statistical variations caused by variability in sampling and analytical procedures. The constituents will be monitored and evaluated again in 2017.

The detected constituents and evaluations are summarized below.

Constituent	Method Minimum Level (ML, µg/L)	2016 Maximum Detected Level (µg/L)	Past Performance[1] (µg/L)	Governing Criterion or Objective (µg/L)	Comment
Antimony	0.5	2.75	0.94	1200	Continue to Monitor
Cadmium	0.25	1.22	1.9	1	Decrease
Chloroform	0.5	1.08	9.8	130	Decrease
Chromium III	0.5	1.2	5.4	190000	Decrease
Copper	0.5	21	70	3	Decrease
Lead	0.5	1.21	8.6	2	Decrease
Nickel	1	27.3	7.2	5	Continue to Monitor
Zinc	1	97.3	146	20	Decrease

1. The Maximum Effluent Concentration (MEC) as listed in Table F-11. Reasonable Potential Analysis Results for the Discharge Point 001 in the Oceanside Permit, NPDES NO. CA0037681, Order No. R2-2009-0062, is used as an indicator for past performance.

6. Sludge Disposal

In 2016, the Oceanside Treatment Plant disposed of 2,911 dry metric tons of sludge at the following locations:

Location	**Dry Metric Tons**
Solano County Land Application	745
Sacramento County Land Application	58
Landfill Beneficial Use	2,109
Vasco	346
Potrero	1,021

Altamont	712
Central Valley Compost	30
TOTAL	**2,911**

B. List of Approved Analyses
See Attachment A for a list of analyses for which the SFPUC is certified.

1. List of Analyses Performed for the Discharger
   - Dioxin, method EPA 1613, Frontier Analytical
   - Semi-volatile Organic Compounds, EPA 625, Caltest Analytical; and
   - Tributyltin by Gas Chromatography/Mass Spectrometry, Calscience

2. List of Waived Analyses
   - None

C. Facility Information

1. Plan View Drawing or Map of Facility

See Attachment B - OSP Site Plan and Attachment C - OSP Process Diagram.

2. Results of Annual Facility Inspection to Verify Stormwater Pollution Prevention Plan Elements

Oceanside WPCP is exempt from this requirement because it routes all storm water which falls on the facility property to the head works of its wastewater treatment plant. See Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D), Attachment G (2010) at G-3.

3. Results of Annual Facility Report Reviews

- **Contingency Plan and Spill Prevention Plan review**

The SFPUC updated the OSP Contingency Plan in November 2016. An update for OSP's Spill Control Plan is being finalized.

- **O&M Manual Updates**

The O&M Manuals for the Primary Sedimentation, Secondary System, Anaerobic Digestion and Dewatering System were updated in October 2016. An update for the O&M Manual and SOPs for Solids Thickening is being finalized.

- **Wastewater Facilities Status Report**

San Francisco is utilizing a Wastewater Asset Management Program to enhance reliability of the plant process equipment and optimize its maintenance and operations activities by assessing the criticality of the equipment based on which equipment carries the most risk. Based on the risk of the equipment, the appropriate Maintenance, and Repair and Rehabilitation (R&R) Program strategy can be implemented to enhance plant reliability. The highest risk equipment will have the more rigorous maintenance procedures including Routine and Preventive Maintenance, Predictive Maintenance, Condition-based Maintenance, and Reliability-Centered Maintenance. The R&R Program sets priorities based on the

highest risk equipment, and the equipment at the end of its useful life. San Francisco uses a CMMS (Computerized Maintenance Management Software) to plan, schedule, initiate and track preventive and corrective work, and record equipment condition assessments.

- **Status of Special Studies**

All special studies required under the permit have been completed.

- **Collection System Update**

Launched in 2007, the SFGreasecycle program aims to minimize the amount of FOG discharged to the sewer system by providing a free waste grease pickup service for commercial establishments and free drop-off services for residents. The program was developed to address both source control, through collection services and public outreach, and end use, through the production of biodiesel from waste grease. To date, SFGreasecycle has collected approximately 2.4 million gallons of waste grease from 838 participating food service establishments and 8 residential drop-off points located throughout San Francisco. Since 2007, the program has generated over $4 million in revenue for San Francisco and is expected to reduce the annual costs expended on grease related sewer blockages by sewer operations maintenance crews.

The FSEs currently participating in the program represent approximately 35% of the total number of FSEs in San Francisco and new commercial accounts continue to sign up daily. The annual grease collected from commercial FSEs began at 6,000 gallons in 2007, grew to 400,896 gallons in 2013, and has remained steady since. The residential recycling program component has focused on resident outreach and education and now collects over 11,000 gallons a year from 8 convenient drop-off sites located throughout San Francisco at such retail vendors as Whole Foods Market and Costco. In 2016, SFGreasecycle's annual two-month holiday outreach campaign captured over 1,100 gallons of residential grease or roughly 19 gallons a day.

If you have any questions concerning this report, please contact one of the following people: Operations Superintendent, Jeff Yee, 415-242-2225, Acting Supervising Chemist, Lily Chan, 415-242-2220 or Laboratory Manager, Kenneth Lee, 415-920-4965.

Self-Monitoring Report January, 2017

Attention: NPDES Division

Transmitted herein is the Oceanside Water Pollution Control Plant (Oceanside Plant) Self-Monitoring Report for January, 2017.

During the month of January there were sixteen days of measurable precipitation totaling 8.40 inches. The Oceanside Plant treated 939.96 million gallons (MG) of wastewater. A total of 606.74 MG of decanted wet weather flow was pumped to the Southwest Ocean Outfall (SWOO). There were four combined sewer discharges (CSDs) during this reporting period.

Subject: Oceanside WPCP (NPDES/CA0037681) 5-Day Written Report for event of March 23, 2017 at Seacliff 1 Pump Station (CDS-005)

Dear Ms. Watkins,

This is the 5-Day Written Report for the Seacliff 1 (CSD-005) discharge that began on Thursday, March 23, 2017 shortly after 9:44 p.m. and ended at approximately 1:45 a.m. on Friday, March 24, 2017. This report follows up on the notification phone call to you from Laura Pagano (Regulatory Program Manager) on March 24th regarding this event.

(1) Event Description and Cause

On Thursday, March 23rd at approximately 9:44 p.m., the Seacliff 1 Pump Station lost power. This caused the lift pumps to fail, which in turn caused wastewater in the sump to overflow into CSD-005 and discharge to China Beach. Staff electricians believe that the outage was caused by a power glitch of unknown origin; PG&E reported no known power outages in the area. The plant was in dry weather at this time.

The loss of power triggered an alarm which was received at the Oceanside Treatment Plant (OSP) at 9:46 p.m. Operations staff noted that the DCS data from the Seacliff 1 Sump had flatlined (indicating a loss of communication) and at 9:50 p.m. sent two staff out to investigate the pump station. They reported the station power loss and that the station sump was overflowing through the outfall.

At approximately 11:00 p.m., OSP Operations reached a staff electrician in the East Bay. The electrician came to the plant, picked up his tools, and went to Seacliff 1 Pump Station. After performing voltage checks, he cycled the power on and off several times which resolved the issue. Power was restored to the station approximately 1:45 a.m. on Friday, March 24th, at which time the sump was pumped down and the discharge ended.

Based on the average dry weather flows to the station at the time of the event, staff calculate that approximately 275-425 gallons of wastewater were discharged through CSD-005 to China Beach.

Bacteria receiving water samples were collected along China Beach at approximately 7:49 a.m. on March 24, 2017. The results indicated that all sample bacterial concentrations were below State standards for recreational waters (Total coliforms 132 mpn; *E. coli* 20 mpn; *Enterococcus* <10 mpn).

Visual observations were made (for erosion, discoloration, impact on aquatic life, flowing or suspended matter, visible sheens, films or coatings, potential nuisance

conditions, or materials of sewage origin) at the same time receiving water samples were collected. No evidence of adverse effects was observed.

China Beach was posted on March 24, 2017 at approximately 8:00 a.m. and the public was notified via email and the web. China Beach was deposted on March 25, 2017, due to the low bacteria sampling results.

(2) Time Period of the Event

The discharge at CSD-005 began shortly after the power loss at 9:44 p.m. on March 23rd and ended at approximately 1:45 a.m. on Friday, March 24, 2017 with 0% recovery. Based on the average dry weather flows to the station at the time of the event, staff calculate that approximately 275-425 gallons of wastewater were discharged through CSD-005 to China Beach.

(3) Anticipated time Event is expected to continue if the Issue has not been resolved

N/A: The issue has been resolved.

(4) Steps taken or planned to reduce, eliminate and prevent reoccurrence

An examination of the Spill Prevention Plan and O&M Manual has been made and staff has determined that no changes are needed. Staff responded appropriately to the Seacliff 1 Pump Station event.

If you have any questions concerning this report, please call Jeff Yee at (415) 242-2225.

Sincerely,

Jeff Yee

Jeff Yee
Operations Superintendent

Self-Monitoring Report March, 2017

Attention: NPDES Division

Transmitted herein is the Oceanside Water Pollution Control Plant (Oceanside Plant) Self-Monitoring Report for March, 2017.

During the month of March there were ten days of measurable precipitation totaling 3.74 inches. The Oceanside Plant treated 634.01 million gallons (MG) of wastewater. A total of 214.77 MG of decanted wet weather flow was pumped to the Southwest Ocean Outfall (SWOO). There were three combined sewer discharges (CSDs) during this reporting period.

An unauthorized discharge incident occurred on Thursday, March 23, 2017 from the Seacliff 1 Pump Station Overflow/Outfall (CSD-005). The estimated amount discharged through the overflow/outfall was approximately 275-425 gallons of wastewater. A 5-Day Written Report was submitted to Jessica Watkins of the San Francisco Bay Regional Water Quality Control Board on March 28, 2017.

NPDES/CA0037681
Self-Monitoring Report June, 2017

Attention: NPDES Division

Transmitted herein is the Oceanside Water Pollution Control Plant (Oceanside Plant) Self-Monitoring Report for June, 2017.

During the month of June there was one day of measurable precipitation totaling 0.20 inches. The Oceanside Plant treated 398.68 million gallons (MG) of wastewater. There were no wet weather flows or combined sewer discharges (CSDs) during this reporting period.

Drainage Area CSDs	Westside
This Month	0
2016-17 Season	18
Design Criteria	8

The BOD sample taken on June 21st had a high concentration of 49 mg/l. The inhibited BOD concentration, however, was 21 mg/l, indicating normal plant function. Actions were taken to address the possible presence of nitrifyers in the sample bottle and on the sampling tube biofilm. Thorough cleaning of the sampling apparatus was initiated immediately and additional samples were taken during the following weeks. These samples were below permit limits. Please see the table below. The original sample was taken during a plant shutdown.

Date	Final Effluent Total BOD Concentration, mg/L	Final Effluent Inhibited BOD Concentration, mg/L
6/28/17	35.2	20
6/29/17	19.5	10.9
6/30/17	13.6	7
7/5/17	16.3	7.7
7/12/17	14.3	10.2
7/19/17	18.9	12

If you have any questions concerning this report, please call (415) 920-4600 and enter the appropriate extension number: Operations Superintendent Jeff Yee, x 6-2225, Supervising Chemist Lily Chan, x 6-2220, or Laboratory Manager Kenneth Lee, x 6-4965.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

Jeff Yee

Self-Monitoring Report October, 2017

Attention: NPDES Division

Transmitted herein is the Oceanside Water Pollution Control Plant (Oceanside Plant) Self-Monitoring Report (SMR) for October, 2017.

During the month of October there were two days of measurable precipitation totaling 0.28 inches. The Oceanside Plant treated 427.11 million gallons (MG) of wastewater. There were no wet weather flows or combined sewer discharges (CSDs) during this reporting period.

Drainage Area CSDs	Westside
This Month	0
2017-18 Season	0
Design Criteria	8

Annually required samples were collected on September 27th for Table B Pollutants in the Ocean Plan. The samples are being processed; results are not available to be submitted with this SMR.

If you have any questions concerning this report, please call (415) 920-4600 and enter the appropriate extension number: Operations Superintendent Jeff Yee, x 6-2225, Supervising Chemist Lily Chan, x 6-2220, or Laboratory Manager Kenneth Lee, x 6-4965.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

Jeff Yee

Re: Comprehensive Parnassus Heights Plan Draft Environmental Impact Report: Comments on Water Quality, Water Recreation, and Wastewater Public Services – Exhibit 13c

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents.

We submitted to you by email a letter of today's date under separate cover regarding "Comments on Water Quality, Water Recreation, and Wastewater Public Services."

Due to the file size of Exhibit 13 to that letter, we are transmitting Exhibit 13 to you by email in three (3) separate electronic files, designated "Exhibit 13a," "Exhibit 13b" and "Exhibit 13c."

Attached, hereto, please find Exhibit 13c (page nos. OSP0138 through OSP0320).

Thank you for your attention to this matter.

Sincerely,

Kelly Marie

2017 Annual Report

RE: Oceanside Water Pollution Control Plant 2017 Annual Self-Monitoring Report

Dear Jessica:

Transmitted herewith is the Annual Self-Monitoring Report for the Oceanside Water Pollution Control Plant (WPCP) for the calendar year 2017.

A. Treatment Plant Compliance and Performance

1. Volume Treated

The Oceanside WPCP treated a total of 6.4 billion gallons of wastewater (combined sanitary, industrial and storm water) in 2017. The average dry weather flow was calculated as 12.9 million gallons per day (MGD), calculated using flows from three consecutive dry weather months (July, August and September).

2. Combined Sewer Discharges

The table below shows the frequency of combined sewer discharges (CSDs) during 2017. A complete wet weather annual report covering the wet weather season from July 2017 through June 2018 will be submitted in July 2018 and will include all the wet weather events for that period.

2017 Combined Sewer Discharge Frequency

	Month											
Basin	J	F	M	A	M	J	J	A	S	O	N	D
Westside T/S Boxes	3	2	2	1	0	0	0	0	0	0	1	0
Seacliff Area	4	3	3	0	0	0	0	0	0	0	1	0

3. Discussion of Treatment Plant Performance and Compliance

The San Francisco Public Utilities Commission (SFPUC) is exempt from submittal of an annual compliance summary table and tabular and graphical summaries of monitoring data because all data for the Oceanside WPCP are reported

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

electronically. See Regional Standard Provisions and Monitoring and Reporting Requirements (Supplement to Attachment D), Attachment G (2010) at G-19.

Summary of Compliance

On January 8, 2017, during a wet weather event, the Westside Pump Station experienced a power interruption that intermittently inactivated five lift pumps over a period of approximately 11 hours before the plant staff got them fully operational again. As a result of this event, 8.275 MG was discharged as CSDs through the Westside Transport system that would have otherwise been discharged through the SWOO.

On January 10, 2017, sign posting for a discharge at the Seacliff 2 Pump Station occurred late in the day due to miscommunication with the biology staff.

Sampling for CSD discharges at Vicente, Lincoln and the Seacliff 2 Pump Station on February 7, 2017 was performed but did not result in usable data due to the use of unsterilized sample bottles. These stations were sampled again on February 8, 2017.

A dry weather discharge incident occurred on March 23, 2017 from the Seacliff 1 Pump Station Overflow/Outfall (CSD-005) due to a loss of power to the pump station. The estimated amount discharged through the overflow/outfall was approximately 275-425 gallons of wastewater. A 5-Day Written Report was submitted to Jessica Watkins of the San Francisco Bay Regional Water Quality Control Board on March 28, 2017.

The BOD sample taken on June 21, 2017 had a high concentration of 49 mg/L. The inhibited BOD concentration, however, was 21 mg/L, indicating normal plant function. Actions were taken to address the possible presence of nitrifyers in the sample bottle and on the sampling tube biofilm. Thorough cleaning of the sampling apparatus was initiated immediately and additional samples were taken during the following weeks. These samples were below permit limits.

4. Actions Taken or Planned to Improve Plant Performance & Reliability

The following projects are planned for, underway or recently completed for the Oceanside WPCP and associated collection system:

Temperature-Phased Anaerobic Digestion (TPAD) Conversion: The startup is 75% completed. The SFPUC is undergoing Class A certification from the U.S. EPA in 2018.

WW-625 OSP Flare Control and Stack Upgrade (TF46): The existing waste gas burners will be replaced with two Varec Biogas flares to be located outside of the existing Waste Gas Burner Building 821. The project is 89% complete with the startup of the new flares anticipated in February 2018.

WW-570 OSP & WSS HVAC Upgrades (TF48): This project includes replacement of the existing Heating, Ventilating and Air Conditioning units, associated

ductwork and plumbing modifications and duct cleaning, electrical power, instrumentation and controls, and related equipment structural support work at OSP and Westside Pump Station (WSS). The project is expected to be completed in 2018.

WW-643 OSP Building 620 Safety Improvements (TF92): This project is to replace the digester recirculating pumps in OSP Building 620 with associated mechanical and electrical improvements. A contractor was recently selected for this project with NTP to follow shortly.

WW-648 OSP 042 Primary Clarifier Improvements (TF93): This project is to replace the helical scum skimmers, W3 spray water system, compressed air system, bubbler system, primary influent flowmeter signal converters, 30" effluent butterfly valves, lighting system, piping, valves, fittings and appurtenances. The project is scheduled to be released for bid in FY2019.

WW-606R2 OSP Building 930 Exterior and Awning Improvements (TF67): The scope of this project is to repair and replace the original Oceanside Plant Building 930 1st and 2nd floor awning systems as well as OSP 930 HVAC Improvements, corrosion stain removal, corrosion rehabilitation and electrical lighting replacement. Construction of this project is 34% complete with final completion expected in 2018.

WD-2776 Recycled Water Facility: The project scope is to build a new 3-MGD Recycled Water Facility that will include microfiltration, reverse osmosis, and UV disinfection of the OSP final effluent. The NTP has been issued and the contractor is mobilizing on site.

WW-639 Digester Gas Utilization Project: The project will replace the existing (2) Cogen units with (3) new Cogen units, provide a Digester Gas Conditioning System and relocate the existing boilers. The project is at 100% Design and advertisement is anticipated in March 2018.

JOC-51-05 Repair Air Handling Units (2) in Building 620 Digester Basement: The project has been awarded and material is on order. Completion of the project is anticipated in April 2018.

CWWSIPTPOP06 Odor Control Optimization: The project is at 35% Design and is scheduled for advertisement in Phase 2 of the SSIP.

WW-645 Westside Pump Station Reliability Improvements: The project will increase the size of the Wet Weather Wet Well, provide redundancy for Wet Weather Pumping and add a redundant power feed to Westside Pump Station. The project is at 95% Design and the anticipated project advertisement is scheduled for the beginning of FY19.

5. Effluent Characteristics for Selected Constituents

For this evaluation, all constituents with required minimum sampling frequency of less than once a month that were detected above the method Minimum Levels (ML) were evaluated. Estimated concentrations of constituents detected below the MLs

were excluded from this evaluation because the uncertainty in the result when a constituent is detected below the ML prevents useful comparison.

There were eight constituents detected above the method MLs: Antimony, Cadmium, Chloroform, Chromium III, Copper, Lead, Nickel and Zinc. The 2017 maximum detected level of the eight constituents were compared to the Maximum Effluent Concentration (MEC) as presented in Table F-11 of the Oceanside Permit (Reasonable Potential Analysis). The MECs were used as the general indicators of past performance of the detected constituents.

All eight detected constituents showed decreases or no statistically significant changes or increases compared to the corresponding MECs.

The detected constituents and evaluations are summarized below.

Constituent	Method Minimum Level (ML, µg/L)	2017 Maximum Detected Level (µg/L)	Past Performance[1] (µg/L)	Governing Criterion or Objective (µg/L)	Comment
Antimony	0.5	0.665	0.94	1200	Decrease
Cadmium	0.25	0.304	1.9	1	Decrease
Chloroform	0.5	0.936	9.8	130	Decrease
Chromium III	0.5	1.4	5.4	190000	Decrease
Copper	0.5	17.6	70	3	Decrease
Lead	0.5	0.93	8.6	2	Decrease
Nickel	1	3.85	7.2	5	Decrease
Zinc	1	34.9	146	20	Decrease

[1]The Maximum Effluent Concentration (MEC) as listed in Table F-11. Reasonable Potential Analysis Results for the Discharge Point 001 in the Oceanside Permit, NPDES NO. CA0037681, Order No. R2-2009-0062, is used as an indicator for past performance.

6. Biosolids

In 2017, the Oceanside WPCP beneficially reused 2,965 dry metric tons of biosolids at the following locations:

Location	**Dry Metric Tons**
Land Application	1,465
Solano County Land Application	878
Sacramento County Land Application	587
Landfill Beneficial Use	1,253
Vasco	379
Potrero	866
Altamont	7
Lystek – Liquid Biofertilizer	241
Central Valley Compost	5.5
TOTAL	**2,965**

B. LIST OF APPROVED ANALYSES

See Attachment A for a list of analyses for which the SFPUC is certified.

1. List of Analyses Performed for the Discharger
   - Dioxin, method EPA 1613, Frontier Analytical
   - Semi-volatile Organic Compounds, EPA 625, Caltest Analytical; and
   - Tributyltin by Gas Chromatography/Mass Spectrometry, Eurofins Calscience

2. List of Waived Analyses
   - None

C. Facilities Information

1. Plan View Drawing or Map of Facility

See Attachment B (OSP Site Plan) and Attachment C (OSP Process Diagram).

2. Results of Annual Facility Inspection to Verify Stormwater Pollution Prevention Plan Elements

Oceanside WPCP is exempt from this requirement because it routes all stormwater which falls on the facility property to the headworks of its wastewater treatment plant. See Regional Standard Provisions and Monitoring and Reporting Requirements (Supplement to Attachment D), Attachment G (2010) at G-3.

3. Results of Annual Facility Report Reviews

- **Contingency Plan and Spill Prevention Plan Review**

The SFPUC updated the OSP Contingency Plan in April 2017 and includes a finalized Spill Prevention Plan.

- **O&M Manual Updates**

A comprehensive update of the O&M Manual was completed during 2015-16. As the Temperature-Phased Aerobic Digestion Process got underway, new operating procedures were created and documented.

- **Wastewater Facilities Status Report**

San Francisco is implementing a Wastewater Asset Management Program to enhance reliability of the plant process equipment and optimize its maintenance and operations activities by assessing the criticality of the equipment based on which equipment carries the most risk. Based on the risk of the equipment, the appropriate Maintenance and Repair and Rehabilitation (R&R) Program strategy can enhance plant reliability. Under the process being implemented, the highest risk equipment will have the more rigorous maintenance procedures including Routine and Preventive Maintenance, Condition-based Maintenance and Reliability-Centered Maintenance. The R&R Program sets priorities based on the highest risk equipment and the equipment at the end of its useful life. San Francisco uses a CMMS

(Computerized Maintenance Management Software) to plan, schedule, initiate and track preventive and corrective work and record equipment condition assessments.

- **Status of Special Studies**

All special studies required under the permit have been completed.

- **Collection System Fats, Oils, and Grease (FOG) Update**

Launched in 2007, the SFGreasecycle program aims to minimize the amount of FOG discharged to the sewer system by providing a free waste grease pickup service for commercial establishments and free drop-off services for residents. The program was developed to address both source control, through collection services and public outreach, and end use through the production of biodiesel from waste grease. To date, SFGreasecycle has collected approximately 2.9 million gallons of waste grease from over 1,000 participating food service establishments and 7 residential dropoff points located throughout San Francisco. Since 2007, the program has generated over $4.7 million in revenue for San Francisco and is expected to reduce the annual costs expended on grease related sewer blockages by Sewer Operations Maintenance Crews.

The Food Service Establishments (FSE) currently participating in the program represent approximately 35% of the total number of FSEs in San Francisco. The annual grease collected from commercial FSEs began at 6,000 gallons in 2007, grew to 300,000 gallons in 2011 and has remained steady since. The residential recycling program component has focused on resident outreach and education and now collects over 11,000 gallons a year from 8 convenient dropoff sites located throughout San Francisco at such retail vendors as Whole Foods Market and Costco.

If you have any questions concerning this report, please contact one of the following people: Operations Superintendent, Jeff Yee, 415-242-2225, Supervising Chemist, Lily Chan, 415-242-2204 or Laboratory Manager, Kenneth Lee, 415-920-4965.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Jeff Yee

Self-Monitoring Report January, 2018

Attention: NPDES Division

Transmitted herein is the Oceanside Water Pollution Control Plant (Oceanside Plant) Self-Monitoring Report (SMR) for January, 2018.

During the month of January, there were eleven days of measurable precipitation totaling 5.35 inches. The Oceanside Plant treated 588.64 million gallons (MG) of wastewater. A total of 221.24 MG of decanted wet weather flow pumped to the Southwest Ocean Outfall (SWOO). The combined sewer discharges (CSDs) during this reporting period are listed below.

Basin	CSDs
Westside T/S Boxes	1
Seacliff Area	1

During the rainstorm on January 8-9, 2018, one of the valves (V3) located between the East and West Transport Storage boxes did not respond to the Distributed Control System and was stuck in an open position. This allowed water to flow between the boxes during the rain event, during which there were CSDs from this Transport/Storage box. On January 10, 2018, staff entered the box and repaired the valve.

If you have any questions concerning this report, please call (415) 920-4600 and enter the appropriate extension number: Operations Superintendent Jeff Yee, x 6-2225, Supervising Chemist Lily Chan, x 6-2220, or Laboratory Manager Kenneth Lee, x 6-4965.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

Jeff Yee

Monitoring Report
March 2018

Attention: NPDES Division

Transmitted herewith is the Oceanside Water Pollution Control Plant (OSP) March, 2018 Monthly Self-Monitoring Report (SMR) for March, 2018.

The combined sewer discharges (CSDs) during this reporting period are listed below.

During the week of March 11-17, 2018, the Oceanside plant's weekly total suspended solids (TSS) average was 67 mg/L, exceeding the permit limit of 45 mg/L. As part of the Oceanside plant's new flare construction project the current flare had to be shutdown on March 13 to tie in the natural gas line to the new system. During this phase of construction, therefore, the digester gas could not be flared. To minimize the potential for digester gas production that would have required venting directly to the atmosphere, solids were intentionally held back in primary and secondary to avoid minimize the generation of digester biogas. Under normal dry weather flows, the secondary system could have handled the solids accumulation. However, the plant experienced a multiple day wet weather event during which the secondary influent flow was maxed out to 43 MGD. The hydraulic surge led to biological solids entrainment in the final effluent on March 14th. Although these were unusual circumstances, the addition of polymer might have helped reduce TSS, so staff will be further trained on triggers to implement a polymer drip as a measure to help avoid future TSS issues.

Monitoring Report
April 2018

Attention: NPDES Division

Transmitted herewith is the Oceanside Water Pollution Control Plant (OSP) April, 2018 Monthly Self-Monitoring Report (SMR).

The Oceanside Plant treated 524.21 million gallons (MG) of wastewater. An AT&T communications interruption with Sea Cliff 2 pump station occurred prior to the rain event of April 6th. In response, Operations staffed the pump station, beginning in advance of the rain. Logbook entries indicate combined sewer discharges (CSD) occurred on April 6th and April 7th. Although staff recorded the start times of the CSDs, they did not note the end times (which prevented duration and volume estimations). Communications were restored after the rain event using a wireless communication system; in addition, a fiber optics line is in the process of being installed. Prior to the start of next wet weather season, Operations staff will be provided with refresher training regarding the need to have discharge beginning and end times to comply with duration and volume reporting requirements.

During the April 6th combined sewer discharge event, staff collected a sample at Monitoring Point EFF-CSD (located at Westside Pump Station). Sample volume was insufficient to perform all required analyses. Laboratory staff analyzed the sample for BOD5, total suspended solids, ammonia, pH, and Table 1 inorganics, but were unable to analyze for oil & grease, pesticides and PCBs, and PAHs as identified in the NPDES permit. Staff are currently investigating how to modify the current sampler system to retrieve larger sample volumes at an increased frequency.

From April 17th through April 20th, the flow rate data for the final effluent was not collected continuously. Construction for the Westside Enhanced Water Recycling Project required relocation of the data communication lines used for the final effluent flow meter. Continuous flow rate monitoring was re-established on April 20th at 12:00 p.m. Final effluent flow rates have been estimated by using flow rate data for the secondary clarification influent.

The combined sewer discharges (CSDs) during this reporting period are listed below.

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

If you have any questions concerning this report, please call: Superintendent, Dale Miller, at 415-850-6622, Supervising Chemist, Lily Chan, at 415-242-2220, or Laboratory Manager, Kenneth Lee, at 415-920-4965.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Dale Miller
Superintendent, Operations

SUBJECT: September 2018 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681] Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the self-monitoring report for the month of September 2018 for the Oceanside Water Pollution Control Plant.

Compliance with Effluent Limitations. Compliance with the effluent limitation was achieved during this monitoring period.

Compliance with Monitoring Requirements. Compliance monitoring was completed as required by the NPDES permit. All results have been submitted in CIWQS except for the result of a final effluent (EFF-001A) sample for 5-day biochemical oxygen demand (BOD_5) collected on September 12, which did not meet quality assurance/quality control (QA/QC) specifications. On September 18, upon test completion, laboratory staff discovered that the sample did not meet a QA/QC specification for method SM5210B (i.e., dissolved oxygen depletion criteria of 2.0 mg/L). Staff subsequently analyzed a composite sample for September 17 (16.9 mg/L). An additional sample that week was collected and analyzed for September 18 (13.5 mg/L).

Combined Sewer Discharge Summary. There were no combined sewer discharges during this monitoring period as summarized in the table below and described in the Wet Weather Summary.

SUBJECT: October 2018 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681] Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the self-monitoring report for the month of October 2018 for the Oceanside Water Pollution Control Plant.

Compliance with Effluent Limitations. Compliance with the effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Compliance monitoring was completed as required by the NPDES permit. October 2 was a wet weather day as defined by the levels in the East Box exceeding 18 feet because of rainfall. Accordingly, data collected on this day is being reported for INF-001B and EFF-001B.

All results have been submitted in CIWQS except for the result of a final effluent (EFF-001A) sample for 5-day biochemical oxygen demand (BOD_5) collected on October 24, which did not meet quality assurance/quality control (QA/QC) specifications. The test results, which were available on October 30, did not meet a QA/QC specification for method SM5210B (i.e., an average standard recovery of 77%, outside of the acceptable QC range of 85-115%). Staff subsequently analyzed a composite sample collected on October 31 (17.3 mg/L). An additional sample that week was collected and analyzed on November 1; the results of which will be submitted on with the November 2018 Self-Monitoring Report.

During the first week of October, only four INF-001A and EFF-001 samples were collected and analyzed for total suspended solids because plant shutdowns on

SUBJECT: November 2018 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681], Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the self-monitoring report for the month of November 2018 for the Oceanside Water Pollution Control Plant.

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period with one exception. The average of four total suspended sediment (TSS) samples collected at EFF-001A during the week of November 18-24 was 55 mg/L, which exceeds the average weekly effluent limitation of 45 mg/L. TSS concentrations were elevated on November 18 and 19.

Date	Monitoring Location	TSS (mg/L)	Effluent Flow (mgd)	Rainfall (in)
11/18/2018	EFF-001A	97	11.23	0.00
11/19/2018	EFF-001A	96	12.84	0.00
11/20/2018	EFF-001A	14.8	15.32	0.00
11/21/2018	EFF-001B	62.5	44.73	0.95
11/22/2018	EFF-001B	30	29.30	0.79
11/23/2018	EFF-001B	56	56.69	0.40
11/24/2018	EFF-001A	13	23.23	0.02

An investigation was initiated on the morning of November 19, after receipt of the TSS results for November 18. The investigation confirmed that elevated TSS concentrations were caused by accumulation of sludge in a secondary clarifier. This accumulation was the result of an uneven withdrawal of return activated sludge (RAS) across the secondary clarifiers due to improper valve position on the RAS pumps. The issue was corrected, and daily sampling was performed. TSS

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

concentrations returned to more typical values by November 20, but wet weather prevented sampling again at EFF-001A until November 24. Subsequent EFF-001A TSS monitoring during the week of November 25-December 1 were in compliance with the average weekly effluent limitations.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

Wet Weather Operations and Monitoring

Combined Sewer Discharges. There were three combined sewer discharge events during this monitoring period as summarized in the table below and described in the Wet Weather Summary.

Count of Drainage Areas CSDs	Westside T/S Boxes	Seacliff Area	Westside Total
This reporting period	3	2	3
Total for 2018-2019 Wet Weather Season	3	2	3

System Operations of Wet Weather Facilities. The operation of wet weather facilities during the storm event was consistent with the requirements in NPDES permit Provision VI.C.6.c(3) - VI.C.6.c(4).

OSP Wet Weather Monitoring. The Westside system experienced wet weather days on November 21, 22, 23, 27, 28, and 29. Required monitoring occurred at INF-001B and EFF-001B.

CSD Monitoring. Samples were collected at monitoring location EFF-CSD on November 22 and 29, the dates on which discharges occurred from CSD-002 and 003. The November 22 sample was analyzed for all parameters except for Biological Oxygen Demand (BOD). The hold time for BOD analysis was exceeded due to the Thanksgiving holiday. Results for EPA 625 (SVOC) are not yet available; data will be uploaded with the December 2018 SMR.

The November 29 sample was analyzed for BOD_5, pH, and inorganic Table 1 pollutants but sample volume was insufficient for other analyses due to the short CSD duration (i.e., CSD duration less than one hour).

Shoreline Monitoring and Posting. There were no issues with shoreline monitoring and posting with one exception. On November 21 CSD-001 (Lake Merced) discharged for appropriately 14 minutes. Operations staff did not notify the on-call biologists of this CSD and back-up automatic notifications generated by PI Coresight had been disabled during summertime maintenance of the sensors at CSD-001. Operations staff have been reminded of notification procedures and the PI notifications for this location have been re-enabled.

If you have any questions concerning this report, please contact Superintendent, Dale Miller at (415) 920-4948 or Dmiller@sfwater.orgor Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew M. Clark
Superintendent, Operations

SUBJECT: December 2018 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681], Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the self-monitoring report for the month of December 2018 for the Oceanside Water Pollution Control Plant (OSP).

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of OSP and the Westside wet weather facilities.

Combined Sewer Discharges. There was one combined sewer discharge (CSD) event during this monitoring period as summarized in the table below and described in the Wet Weather Summary.

Count of Drainage Areas CSDs	Westside T/S Boxes	Seacliff Area	Westside Total
This reporting period	0	1	1
Total for 2018-2019 Wet Weather Season	3	3	4

System Operations of Wet Weather Facilities. The operation of wet weather facilities was consistent with the requirements in NPDES permit Provision VI.C.6.c(3) - VI.C.6.c(4).

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Wet Weather Monitoring. The Westside system experienced wet weather days on December 5, 16, 17, 24, and 25. Required monitoring occurred at INF-001B and EFF-001B.

CSD Monitoring. Results for EPA Method 625 (SVOC) for the November 22, 2018 EFF-CSD samples were not available for the November 2018 SMR submission; these data have been uploaded with this SMR.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit, except from December 24-31 at SRF-17 (China Beach). This shoreline monitoring location was not accessible (i.e., locked gate) during this time due to partial federal government shutdown.

If you have any questions concerning this report, please contact Superintendent, Dale Miller at (415) 920-4948 or Dmiller@sfwater.org or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Dale Miller
Superintendent, Westside Operations

Notes:

1) Maintenance was performed on the OSP effluent meter on 12/20 from 9:20 AM to 9:50 AM . The sensor was placed in manual (meaning flow reading will not change from last auto reading) so that the I&C group can perform maintenance on the flow meter.
2) Instrumentation anomalies occured on 12/5 from 2:07 PM to 2:11 PM. Influent to OSP, OSP Effluent and WSPS Pumping to SWOO volumes during this timeframe were estimated using interpolated values.
3) Instrumentation anomalies occured on 12/17 from 10:14 AM to 12:16 PM for the OSP Effluent Meter. The OSP Effluent Volume during this time period was estimated from the Influent to OSP sensor reading assuming a 20 minute time shift

Attachment C: Plant Process Schematic

1 Treatment Plant Performance

1.1 Volume Treated

The Oceanside Water Pollution Control Plant (OSP) is permitted to discharge an average dry weather flow of 43 million gallons per day (MGD). The 2018 average dry weather flow was 12.4 MGD, calculated using flows from three consecutive dry weather months (June, July, and August). The facility treated an estimated 5.6 billion gallons of combined wastewater and stormwater in 2018.

1.2 Permit Compliance and Actions Taken or Planned

The San Francisco Public Utilities Commission (SFPUC) is exempt from submittal of an annual compliance summary table and tabular and graphical summaries of monitoring data because all data for the OSP are reported electronically. See Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D), Attachment G (2010) at G-19.

1.2.1 Effluent Limitation Exceedances and Unauthorized Discharges

The SFPUC reported two exceedances of the Average Weekly Effluent Limitation (AWEL) for total suspended solids (TSS) in 2018.

During the week of March 11-17, 2018, the weekly total suspended solids (TSS) average was 67 mg/L because of a March 14 sample with a TSS concentration of 121 mg/L. The elevated concentration was inadvertently caused by implementation of an operational strategy intended to minimize biogas production. On March 13, the OSP biogas flare was shutdown to tie a natural gas line into the new system. In anticipation of this shutdown, solids were retained in the primary and secondary clarifiers to reduce biogas production. On March 14 influent flow to OSP reached capacity (42 mgd) because of rainfall, resulting in entrainment of solids into the final effluent.

During the week of November 18-24, the weekly TSS average was 55 mg/L because of samples collected on November 18 and 19, which had concentrations of 97 and 96 mg/L respectively. The elevated TSS concentrations are believed to be have been due to an accumulation of sludge in a secondary clarifier, which was the result of human error in configuring the valves connecting the clarifiers and return activated sludge (RAS) pumps. Further investigations and identification of potential corrective actions are ongoing. More information will be provided in future reports.

1.2.2 Monitoring Issues

During the week of September 9-15, the 5-day biochemical oxygen demand (BOD_5) sample was collected on September 12 for EFF-001A. The results, available September 18, did not meet the method SM5210B quality assurance/quality control requirement related to dissolved oxygen depletion. Staff subsequently analyzed samples collected on September 17 (16.9 mg/L) and September 18 (13.5 mg/L).

In 2018, there were four identified issues with implementation of combined sewer discharge (CSD) triggered monitoring requirements. First, the estimated duration and volume of an April 6 discharge at CSD-007 (Sea Cliff 2) was not reported because the CSD end time was unavailable due to a disruption in AT&T communications between the Sea Cliff 2 pump station and the Distributed Control System (DCS). Communications have been restored via installation of a new fiber optics communications line.

Second, on November 21, Operations staff did not notify on-call biologists of a fourteen-minute CSD at CSD-001 (Lake Merced) and, as a result, the required beach sampling and public notifications did not occur. This error was compounded by the disabling of back-up automatic notifications (via PI Coresight) during summer maintenance of the sensors at CSD-001. Operations staff were verbally reminded of notification procedures, and the automatic notifications for this location have been re-enabled.

Third, a November 22 EFF-CSD sample was analyzed for all parameters except for Biological Oxygen Demand (BOD); the hold time for BOD analysis was exceeded due to the Thanksgiving holiday.

Finally, due to the partial federal government shutdown (December 22, 2018 - January 25, 2019), shoreline monitoring and posting could not be conducted from December 24-31 at SRF-17 (China Beach) as the monitoring location was not accessible (i.e., locked gate).

1.3 Effluent Characterization Study

For this evaluation, all constituents with required minimum sampling frequency of less than once a month that were detected above the method Minimum Levels (MLs) were evaluated. Estimated concentrations of constituents detected below the MLs were excluded from this evaluation because the uncertainty in the result when a constituent is detected below the ML prevents useful comparison.

Nine of the tested constituents were detected above the method MLs: Antimony, Cadmium, Chloroform, Chromium III, Copper, Lead, Nickel, chlorinated phenolics, and Zinc. The 2018 maximum detected level of the nine constituents were compared to the Maximum Effluent Concentration (MEC) as presented in Table F-11 of the OSP Permit (Reasonable Potential Analysis). The MECs were used as the general indicators of past performance of the detected constituents.

Eight of the nine detected constituents showed decreases or no statistically significant changes or increases compared to past performance (the corresponding MECs are used as an indicator of past performance). Chlorinated phenolics is a sum of four constituents; of those constituents, only pentachlorophenol was detected. Although the maximum detected level is greater than the most stringent water quality objective, the concentration after mixing is well below the water quality objective. Monitoring for chlorinated phenolics will continue to be conducted as required.

The detected constituents and evaluations are summarized below.

Trends for Selected Constituents

Constituent	Method Minimum Level (ML, µg/L)	2018 Maximum Detected Level (µg/L)[1]	Past Performance[2] (µg/L)	Criterion or Objective (µg/L)	Statistically Significant Increase
Antimony	0.5	0.55	0.94	1200	No
Cadmium	0.25	0.45	1.9	1	No
Chloroform	0.5	0.89	9.8	130	No
Chromium III	0.5	2.5	5.4	190,000	No
Copper	0.5	18	70	3	No
Lead	0.5	1.2	8.6	2	No
Nickel	1	3.6	7.2	5	No
Chlorinated Phenolic s	NA[3]	1.3[4]	ND	1	Potential, continue to monitor
Zinc	1	30	146	20	No

Note:

1. Results have been rounded to two significant figures.
2. The Maximum Effluent Concentration (MEC) as listed in Table F-11. Reasonable Potential Analysis Results for the Discharge Point No. 001 in the OSP Permit, NPDES NO. CA0037681, Order No. R2-2009-0062, is used as an indicator for past performance.
3. This Ocean Plan Table 1 pollutant is the summation of four constituents and does not have an applicable method ML.
4. The only constituent detected was pentachlorophenol.

1.4 Biosolids

In 2018, the OSP beneficially re-used 2,760 dry metric tons of biosolids at the following locations:

Location	Dry Metric Tons[1]
Land Application	
Solano County Land Application	900
Sacramento County Land Application	440
Landfill Beneficial Use	
Vasco	180
Potrero	480
Lystek – Liquid Biofertilizer	760
TOTAL	**2,760**

Note:

1. Tonnage has been rounded to two significant figures.

2 Approved Laboratory Analyses

List of approved analyses include the following:

1. List of analyses for which SFPUC is certified: See **Attachment A**.
2. List of analyses performed for SFPUC by a separate certified laboratory (copies of reports signed by the laboratory director of the separate certified laboratories are not included with the annual report but are retained onsite and available upon request):
    a. Dioxin, method EPA 1613, is performed by Frontier Analytical; and
    b. Semi-volatile Organic Compounds, method EPA 625, is performed by Caltest Analytical.
3. List of waived analyses: None.

3 Facility Information

3.1 Plan View Drawing or Map of Facility

A Plant Site Plan is included in **Attachment B**, and a Plant Process Schematic is included in **Attachment C**.

3.2 Results of Annual Facility Report Reviews

3.2.1 Contingency Plan and Spill Prevention Plan

The OSP's Contingency Plan was reviewed throughout 2018 and made available on SharePoint in December 2018. Updates to the plan include:

- Changes in staffing and roles and responsibilities;
- Spill Prevention Plan addendum;
- Process management updates; and
- Updates to the listed emergency contacts.

3.2.2 Operations and Maintenance Manual

Review of OSP related manuals, training, and other guidance materials was completed, resulting in updates to and development of the materials described in the table below.

Document	Sections
SOPs Developed	• Polymer Super Sac Changeout • Cogeneration Plant Emergency Shutdown • Temperature-Phased Anaerobic Digestion (TPAD) Operation Guide
Other Guidance & Training Materials Developed	• 2018 Biosolids Spill Packet • TPAD Process Classroom Videos, Chapters 1 & 2 • Personal Protective Equipment and Atmospheric Hazards Monitoring and Safety Awareness Posters • Atmospheric Hazards Monitoring and Safety Awareness Video • OSP Waste Gas Flare Operation Classroom PowerPoint Presentation • Awareness Quick Guide Posters for Plant and Pump Station Control Rooms • Confined Space Entry & Rescue Awareness Classroom Presentation
Associated Training Conducted	• Annual Wet Weather Training • Semi-annual Wet Weather Training Refresher

3.2.3 Wastewater Facilities Status

The table below summarizes key construction activities related to the Westside facilities. The projects listed below do not comprise a comprehensive list of all upgrades completed or underway. Planning, design and construction of numerous other mechanical, electrical, structural, and communications improvements are ongoing.

Facility/Process	Project Description	Construction Update
OSP Secondary	Upgrade and repair oxygen generation compressors and associated mechanical, instrumentation and controls.	Construction was substantially completed in 2018 and expected to be complete in 2019.
OSP Solids Handling	Replace pumps and make associated mechanical and electrical improvements.	Construction expected to be complete in 2019.
OSP Digester Gas Management	Replace existing waste gas burners with two low-emission, natural-draft type biogas flare burner assemblies.	Construction was substantially completed in 2018 and expected to complete in 2019.
Recycled Water Facility	Construct a recycled water facility that will include microfiltration, reverse osmosis, and UV disinfection of the OSP final effluent.	Construction began in 2018.
Westside Pump Station (WSS)	Make multiple improvements to the pump station, including replacement of existing bar screens and wet weather pumps, and providing a redundant power source.	Construction was expected to begin in 2019, but bids received substantially exceeded the project budget. The SFPUC is evaluating the bids and the financial viability of the original scope.

Facility/Process	Project Description	Construction Update
	Replace existing dry weather pumps' variable frequency drives.	Construction expected to be complete in 2019.

SUBJECT: Unauthorized Discharge Report (5-Day) for the Discharges of Partially Treated Effluent from the Oceanside Water Pollution Control Plant (NPDES CA0037681)

Dear Ms. Watkins,

Attached please find a summary of currently available information regarding multiple discharges of untreated wastewater from the Oceanside Water Pollution Control Plant (OSP) to the Pacific Ocean, as required by National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037681, Attachment G (2010), Section V.E.2.c.

A single report is being submitted for multiple discharges – believed to have occurred on January 25, 29, and 30, 2019 – because they appear to have been caused by the same circumstances. The SFPUC became aware of the possibility of a discharge on January 25 but only confirmed the discharges and identified the cause on January 30. Accordingly, the SFPUC is still collecting information about these discharges, and corrective and preventative actions. A supplemental report will be provided no later than March 1, 2019 because not all required and relevant information is currently available.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Amy Chastain

ATTACHMENT: OSP Discharge Incident Report
February 1, 2019

1. Discharge description and cause

As shown in the simplified schematics below, the OSP primary clarifiers and the secondary bypass pipe can be dewatered, with the water pumped back to the headworks, using the same pumps. During primary clarifier dewatering on January 25, 29, and 30, 2019, the dewatering pump sump levels were sufficiently high to allow water to backup into the secondary bypass dewatering line and into the secondary bypass pipe. Once in the secondary bypass pipe, the water from the primary clarifiers mixed with secondary treated effluent and discharged through the secondary effluent channel.

2. Location of involved waterway

The discharge reached the Pacific Ocean and was discharged from the Southwest Ocean Outfall (SWOO) at Discharge Point No. 001, approximately three miles offshore.

3. Date and time discharges started

Based on information available at the time of this submittal, the SFPUC believes that that discharges occurred on the following dates (all start times are approximate): January 25, 2019 at 3:00 pm; January 29, 2019 at 10:20 am; and January 30, 2019 at 10:15 am. This information will be confirmed or corrected as appropriate in the supplemental report.

4. Estimated quantity and duration of the discharge, including amounts recovered

The quantity and duration are being estimated and will be included in the supplemental report. No volume could be contained and recovered because of the location of the discharge.

5. Level of treatment prior to discharge

The discharge consisted of wastewater that had passed through the OSP headworks and entered the primary clarifiers. Prior to the point of discharge, this wastewater mixed with fully (primary and secondary) treated wastewater.

6. Identity of persons reporting the discharge

SFPUC Regulatory staff reported the suspected discharge to Regional Water Board staff by email communication on January 28 and January 30, 2019.

7. Methods used to delineate the geographical extent of the discharge in receiving waters

This information depends on the volume and duration and will be included in the supplemental report.

8. Efforts implemented to minimize public exposure to the discharge

The OSP final effluent pipe discharges more than three miles offshore, therefore no efforts to minimize public exposure were feasible or appropriate.

9. Visual observations of the impacts noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted

The OSP final effluent pipe discharges more than three miles offshore, therefore performing receiving water observations was not feasible.

10. Corrective measures taken to minimize the impact of the discharge

Information on corrective actions and related measures undertaken are being compiled and will be described in the supplemental report.

11. Measures to be taken to minimize the chances of a similar discharge occurring in the future

The potential for future discharges has been eliminated by the closure of the secondary bypass valve when the secondary bypass pipe is not being dewatered. Additional preventative measures are currently being evaluated and will be described in the supplemental report.

12. Summary of Spill Prevention Plan or Operation & Maintenance Manual modifications to be made, if necessary, to minimize the chances of future discharges

Modifications to operating procedures may be appropriate and are being evaluated. The specific actions to be taken will be described in the supplemental report.

SUBJECT: Resubmittal of November 2018 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681], Regional Water Quality Control Board Order No. R2-2009-0062

Dear Ms. Watkins:

This transmittal is in response to your December 28, 2018 email request for additional information about the average weekly effluent limitation (AWEL) exceedance for Total Suspended Solids (TSS) that occurred at the Oceanside Water Pollution Control Plant (OSP) the week of November 18-24.

Submitted with this transmittal, as an attachment, is the original December 28 self-monitoring report (SMR) cover letter, dated December 28, 2018. All information in the original submittal remains accurate.

Discharge Description
During the week of November 18 through the 24, the average weekly TSS concentration being discharged at OSP was 55 mg/L, which exceeded the AWEL of 45 mg/L.

Receiving Water Observations and Impacts
The OSP final effluent pipe discharges more than three miles offshore, so no receiving water observations were feasible. No receiving water impacts from this discharge are expected because the OSP TSS effluent limitations are technology, not water quality, based; and because of the substantial mixing and dilution that occurs at the point of discharge.

Cause & Corrective Actions Taken
The primary cause of the effluent exceedance appears to be human error. As described in more detail below, a valve that should have been closed was open,

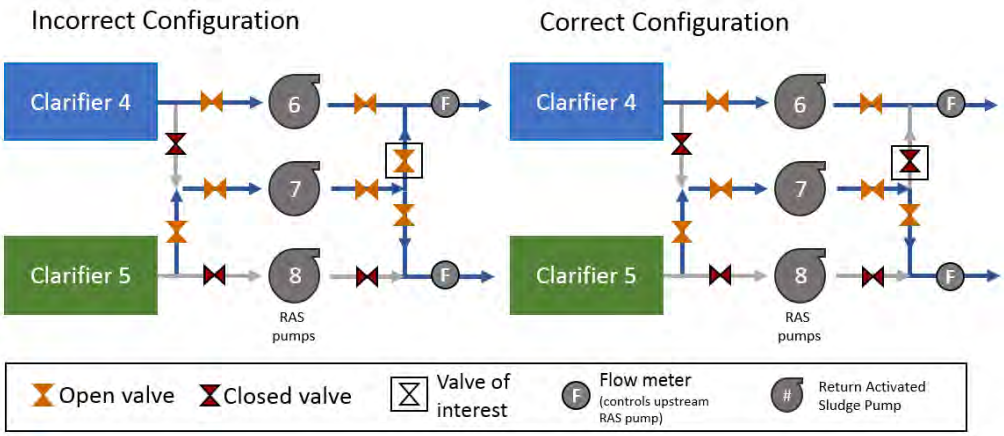
OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

which resulted in a build-up of solids in a secondary clarifier and subsequent elevated TSS concentrations in the final effluent.

OSP has seven secondary clarifiers. The purpose of secondary clarification is to allow microorganisms to flocculate and settle out of the treated wastewater after aeration. During clarification, solids settle out of the treated wastewater to form a sludge blanket. This sludge, or activated sludge (AS), is continuously pumped out of the bottom of the clarifiers. A portion of the AS is recycled to the aeration process in order to seed the biological reactor with new active biomass; this is called return activated sludge (RAS). The RAS pump rate is partly controlled by measurements of flow meters located downstream of the RAS pumps.

In this instance, the accumulation of sludge in Clarifier 4 caused the elevated TSS concentrations in the final effluent. Clarifier 4 and 5 are each served by a RAS pump (RAS pump 6 and 8, respectively). They also share a "swing" pump (RAS pump 7), which can serve either Clarifier 4 or 5. During the event, RAS pump 6 was in service to pump from Clarifier 4 and RAS pump 7 was in service to pump from Clarifier 5.

On November 30 a visual inspection of the clarifiers, RAS pumps, and associated manifolds resulted in the identification of the cause. A valve downstream of RAS pumps 6 and 7, but upstream of the flow meter, was open. As a result, the flow meter downstream of Clarifier 4 was measuring a flow rate corresponding to flow out of Clarifier 4 and a portion of Clarifier 5 (when it should have been reading only the Clarifier 4 flow rate). This greater than expected flow rate led to the automatic control system directing RAS pump 6 to pump less than necessary activated sludge from Clarifier 4. This deficit of sludge being removed allowed solids to accumulate in Clarifier 4. The valve was closed upon discovery. A simplified schematic below shows the incorrect and correct configuration of the system.



After elevated sludge levels in Clarifier 4 were initially identified RAS pumping from Clarifier 4 was manually increased on November 17. The elevated levels persisted, resulting in high TSS concentrations on November 18 and 19. On November 20 the condition of the chains and flights (equipment that removes the sludge from the bottom of the clarifier) associated with Clarifier 4 were inspected. The equipment was found to be in good condition. Because the valve status is not visible through the Distributed Control System screen in the main control room, the issue was only identified after a visual assessment of the valves occurred on November 30.

Preventative Actions Taken & Planned

The individual responsible for the incorrect valve configuration has not been identified because the date and time the valve was opened is unknown. The same day as the issue was found, all senior stationary engineers were informed of the cause and reminded to check the valve status when changing clarifier and RAS pump configurations.

Additionally, a continuous online turbidity meter on secondary effluent has been installed for real-time monitoring of the performance of the secondary clarifiers. This meter is currently being tested but would assist in more quickly identifying trends, and in evaluating potential causes of observed increases in solids.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Dale Miller

SUBJECT: Unauthorized Discharge - Supplemental Report for the Discharges of Partially Treated Effluent from the Oceanside Water Pollution Control Plant (NPDES CA0037681)

Dear Ms. Watkins,

Attached please find a supplement to the unauthorized discharge report submitted on February 1, 2019 regarding multiple discharges of untreated wastewater from the Oceanside Water Pollution Control Plant to the Pacific Ocean, as required by National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037681, Attachment G (2010), Section V.E.2.c. This supplement is being submitted because not all relevant information was available at the time of the original submittal. All information in the original submittal remains accurate and is not repeated in the attached.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Dale Miller, Superintendent

ATTACHMENT: OSP Discharge Incident Supplemental Report
March 1, 2019

Discharge description and cause.
On January 25, 29, and 30 a small volume of untreated wastewater from a primary clarifier mixed with secondary treated effluent and discharged through the Southwest Ocean Outfall (SWOO). As described in more detail below, the January 25 and 29 discharges were the result of dewatering sump discharge levels being elevated because one of two dewatering pumps were not operational. The three-minute January 30 discharge was intentionally induced to confirm a hypothesis of the cause of the previous events.

As shown in the simplified schematics below, the Oceanside Water Pollution Control Plant (OSP) primary clarifiers and secondary bypass pipe are dewatered using the same dewatering pumps, which return flows to OSP headworks. Under normal conditions, the secondary bypass drain valve is always left open, with intentional wet weather secondary bypasses controlled by the secondary bypass valve.

Secondary Bypass Pipe Dewatering Flow Path

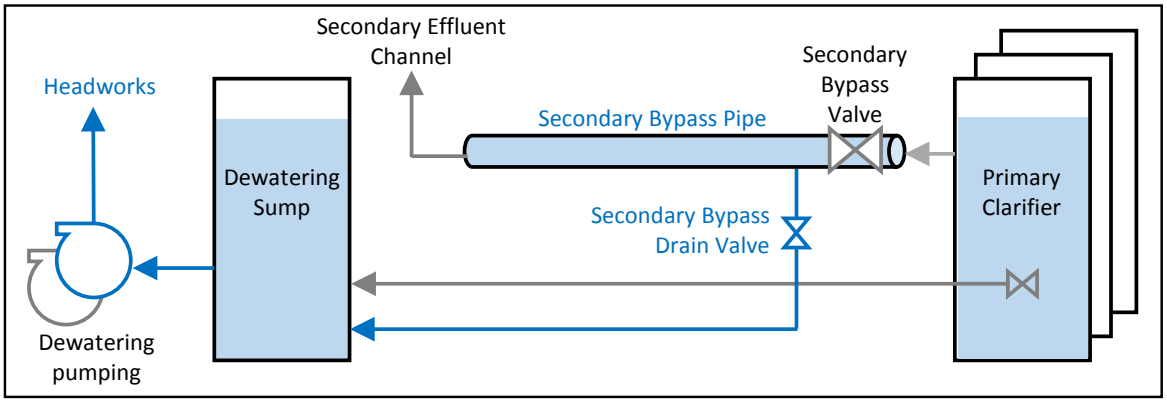

*Diagram provided for illustration purposes only. Not to Scale.

Primary Clarifier Dewatering Flow Path

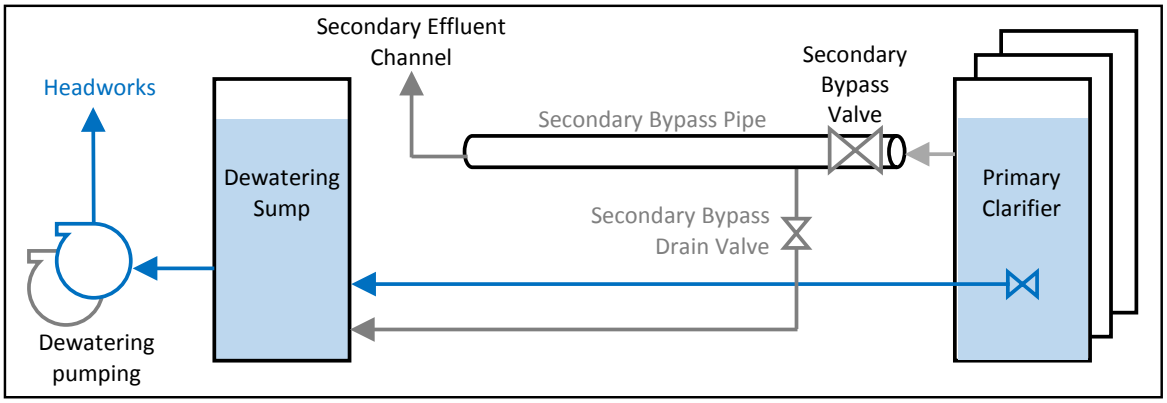

*Diagram provided for illustration purposes only. Not to Scale.

ATTACHMENT: OSP Discharge Incident Supplemental Report
March 1, 2019

On January 25 and 29, one of the primary clarifiers at OSP was being dewatered. One of the two dewatering pumps was not operational, which resulted in high dewatering sump levels. The high sump levels then allowed water to backup into the secondary bypass dewatering line, through the open secondary bypass drain valve, and into the secondary bypass pipe. Once in the secondary bypass pipe, the water from the primary clarifiers mixed with secondary treated effluent and discharged through the secondary effluent channel. This flow path is depicted in the schematic below.

Flow Path During 1/25, 1/29, 1/30 Events

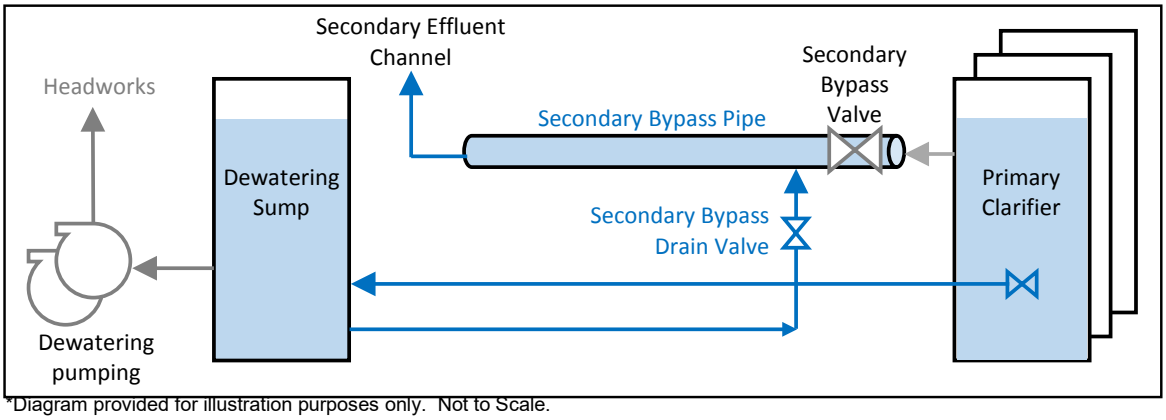

*Diagram provided for illustration purposes only. Not to Scale.

The January 25 and 29 events were identified in near real-time because of the recent installation of a continuous turbidity analyzer on the secondary effluent channel. The cause was identified on January 29 after Operations and Engineering staff identified a correlation between the timing of primary clarifier dewatering and the elevated turbidity. On January 30, staff tested this hypothesis by intentionally dewatering one of the primary clarifiers, allowing the sump levels to rise, and concurrently observing flow through the secondary bypass pipe.

Discharge date, time, duration, volume, and characteristics.
The SPUC estimated the date, time and duration of the January 25 and 29 discharges based on the final effluent channel turbidity analyzer readings, which also correlated to the duration of elevated sump levels. The duration of the January 30 event was based on visual observations because the contribution of the discharge was too small to be detected by the turbidity meter. The discharge volumes were estimated based on the dimensions of the dewatering sump and sump level measurements; information about each event is summarized in the table below.

ATTACHMENT: OSP Discharge Incident Supplemental Report
March 1, 2019

Date	Estimated Start Time	Estimated End Time	Estimated Duration	Estimated Unauthorized Discharge Volume (gallons)	Total Effluent Volume Discharged at EFF 001A (MG)	Percent Secondary Treated Effluent
25-Jan-19	2:55 PM	5:00 PM	125 min	36,000	10.0	99.6%
29-Jan-19	10:10 AM	12:35 PM	145 min	42,000	16.4	99.7%
30-Jan-19	9:12 AM	9:15 AM	3 min	900	17.5	99.995%

Total suspended solids (TSS) results for composite samples collected on the discharge dates are summarized in the table below. The OSP final effluent pipe discharges more than three miles offshore; substantial mixing and dilution occurs at the point of discharge within minutes. The effect of these discharges on receiving water quality is expected to be minimal to none.

Date	TSS Concentration	Sampling Location	Notes
25-Jan-19	31 mg/L	EFF-001A	Composite sample or part of the day. Sampler was stopped at approximately 5:15 pm because plant flows had been secured.
29-Jan-19	36 mg/L	EFF-001A	24-hour composite
30-Jan-19	27 mg/L	EFF-001B	24-hour composite

Corrective measures taken.
Investigation of the cause began immediately after the continuous analyzer showed elevated turbidity readings at around 3:00 pm on January 25. Shortly after Operations staff observed the elevated turbidity readings, a Senior Operator was dispatched to take a field turbidity reading of the final effluent, which confirmed the elevated turbidity readings of the online analyzer.

At 4:15 pm, the Chief on watch requested the support of the off-duty, on-call Operations Chief. The Operations Chief arrived on site at 4:30 pm and performed and/or directed the following activities:

- Visual check of effluent flowing over the secondary clarifier launders which looked normal, confirming that secondary treatment was not compromised.
- Visual check of the final effluent sampler, which confirmed that the effluent appeared turbid, similar to primary effluent.
- Check the secondary bypass screen on the Distributed Control System (DCS), which indicated that the secondary bypass was closed.

- Check the secondary bypass valve Foxboro controller, which indicated that the secondary bypass valve was closed.
- Secure (stop) influent flow into OSP at approximately 5:00 pm pending further investigation.
- Bring in on-call instrumentation and controls staff, who inspected the secondary bypass valve, including all actuators to all valves in the bypass systems and confirmed that all aspects of the system appeared normal.

The following day (Saturday), staff continued to investigate how primary wastewater could have entered the final effluent channel but were unsuccessful. At approximately 3:15 pm, influent pumping was resumed while staff continuously checked for evidence of elevated turbidity or a bypass. No issues were observed.

On January 29, elevated turbidity was again observed and the correlation between turbidity and primary clarifier dewatering was identified. The following morning, staff tested this hypothesis by intentionally dewatering one of the primary clarifiers, allowing the sump levels to rise, and concurrently observing flow through the secondary bypass pipe.

Preventative measures taken or planned.
During the unauthorized discharges, one of the dewatering pumps was out of service. As of February 14, the pump was back in service, which should allow sump levels to be better managed to maintain them at a level below the secondary bypass valve drain elevation.

Immediately after the incident cause was confirmed on December 30, the secondary bypass drain valve was closed at 10:06 am. As a precaution, this incident and the cause has been explained to all Senior operators.

Summary of Spill Prevention Plan or Operation & Maintenance Manual modifications to be made, if necessary, to minimize the chances of future discharges
OSP daily standing orders, which provide updates about and direction regarding critical facilities, now instruct Operations staff to ensure that the secondary bypass drain valve is closed during primary clarifier dewatering.

Attention: NPDES Wastewater Division

SUBJECT: January 2019 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681] Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of January 2019 for the Oceanside Water Pollution Control Plant (OSP).

Compliance with Effluent Limitations. Compliance with the effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit except for the result of a final effluent (EFF-001A) sample for 5-day biochemical oxygen demand (BOD_5) collected on January 23, which did not meet quality assurance/quality control (QA/QC) specifications. The test results, which were available on January 29, did not meet a QA/QC specification for method SM5210B (i.e., an average standard recovery of 77%, outside of the acceptable QC range of 85-115%). Staff subsequently analyzed a composite sample collected on January 28 (17.5 mg/L). An additional sample that week was collected and analyzed on January 29 (31.6 mg/L).

Discharge Incidents.
On January 25, 29, and 30 small volumes of untreated wastewater from the primary effluent clarifiers, mixed with secondary treated effluent, were discharged through EFF-001. The discharge resulted from one of two dewatering sumps being out of service, which caused the dewatering sump levels to rise and allowed flow to enter the secondary bypass pipe. The details

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

were provided in a report of unauthorized discharge submitted on February 1 and a supplemental report submitted on March 1.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of OSP and the Westside wet weather facilities.

Combined Sewer Discharges.
There were three combined sewer discharges (CSDs) during this monitoring period as summarized in the table below and described in the Wet Weather Summary.

Count of Drainage Areas CSDs	Westside T/S Boxes	Seacliff Area	Westside Total
This reporting period	2	2	3
Total for 2018-2019 Wet Weather Season	5	5	7

System Operations of Wet Weather Facilities.
During the January 16 storm event, the Sea Cliff 2 Pump Station (SC2) did not consistently pump flows from the local watershed to the Richmond Transport/Storage Tunnel due to a power outage. The CSD at Discharge Point No. CSD-007 (Sea Cliff #2) initiated at 7:24pm. SC2 was pumping at maximum capacity until about 7:35pm, when a local power outage occurred. The power outage was caused by PG&E SFPUC staff arrived at SC2 to restart the pumps and pumps began to pump at approximately 8:46pm, coinciding with end of the discharge to CSD-007.

This event did not cause a CSD or otherwise increase the CSD volume discharged on the Westside during this storm event. Additionally, the Westside Transport/Storage Structure was full and CSDs occurred shortly thereafter at Discharge Point Nos. CSD-002 and CSD-003 (7:50 pm and 8 pm, respectively). Even if the power outage had not occurred and SC2 maintained capacity during the discharge, the Sea Cliff #2 CSD would have still occurred with a lesser CSD volume with the remaining portion discharged through the ongoing CSDs to Ocean Beach.

Wet Weather Monitoring. The Westside system experienced wet weather days on 1/5, 1/6, 1/7, 1/9, 1/15, 1/16, 1/17, 1/30, and 1/31. Required monitoring occurred at INF-001B and EFF-001B.

CSD Monitoring. A sample was not collected during the January 6 CSD event due to issues with sampler programming. Shortly before the overflow commenced, SFPUC staff reset the sampler in preparation for the anticipated CSD event. However, the sampler was reprogrammed incorrectly, resulting in

a low sample volume that was insufficient for laboratory analysis. Field staff investigated the sampler programming and subsequently modified the program to collect a composite sample to achieve collection of sufficient sample volume.

During the subsequent CSD event at Discharge Point No. CSD-002, the sampler successfully collected a full sample volume and laboratory analyses were conducted to complete the once per event compliance monitoring required by the NPDES permit for the January 16 event.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit except on January 1-22 at SRF-17 (China Beach) and SRF-22 (Fort Funston). This shoreline monitoring location was not accessible (i.e., locked gate) during this time due to partial federal government. The public was notified of CSDs at this location via phone hotline, email, and the sfwater.org website.

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Dale Miller
Superintendent, Westside Operations

Attention: NPDES Wastewater Division

SUBJECT: March 2019 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681] Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of March 2019 for the Oceanside Water Pollution Control Plant (OSP).

Compliance with Effluent Limitations. Compliance with the effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit except for the result of influent (INF-001A) and final effluent (EFF-001A) samples for the 5-day biochemical oxygen demand (BOD_5) samples collected on March 13. The tests did not meet two quality assurance/quality control (QA/QC) specifications:

1. BOD method SM5210B requires a minimum dissolved oxygen (DO) depletion of 2.0 mg/L for the seed blanks. This requirement was not met; the cause may have been weak seed control. The seed used for the test is replenished with influent samples, and seed control may have been weakened by influent diluted from recent wet weather events. To prevent reoccurrence, OSP laboratory staff have set up a separate seed bottle to be replenished by dry weather only influent. Staff have also ensured that routine maintenance on the influent sampler is occurring regularly.

2. BOD method SM5210B also requires a maximum DO depletion of 0.20 mg/L for the dilution water blanks. This requirement was not met due to an unknown cause such

Mayor
Ann Moller Caen
President
Francesca Vietor
Vice President
Anson Moran
Commissioner
Harlan L. Kelly, Jr.
General Manager

as contamination or calibration error. Laboratory staff have been retrained on the proper laboratory procedures related to this method and subsequent BOD analyses have met QC requirements.

These two matters were not discovered until test results were available on March 19. Staff subsequently analyzed extra INF-001 and EFF-001 composite samples collected on March 18. Additional samples that week were collected and analyzed on March 19.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of OSP and the Westside wet weather facilities.

Combined Sewer Discharges. There were multiple combined sewer discharges (CSDs) during this monitoring period as summarized in the table below and described in the Wet Weather Summary.

Count of Drainage Areas CSDs	Westside T/S Boxes	Seacliff Area	Westside Total
This reporting period	0	2	2
Total for 2018-2019 Wet Weather Season	7	11	13

System Operations of Wet Weather Facilities.
The operation of wet weather facilities during the storm event was conducted consistent with the requirements in NPDES permit Provision VI.C.6.c(3) - VI.C.6.c(4).

Wet Weather Monitoring. The Westside system experienced wet weather days on March 2-6, 9, 20, 22, 23, and 27. Required monitoring occurred at INF-001B and EFF-001B.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit.

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Dale Miller
Superintendent, Westside Operations

Mr. Samuel Plummer
California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612

SUBJECT: 5-Day Report for the Discharges of Partially Treated Effluent from the Oceanside Water Pollution Control Plant (NPDES CA0037681)

Dear Mr. Plummer:

Attached please find information regarding a discharge of partially treated wastewater from the Oceanside Water Pollution Control Plant (OSP) to the Pacific Ocean, as required by National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037681, Order No. R2-2009-0062.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

George Engel

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

ATTACHMENT: OSP Discharge Incident 5-Day Report
August 26, 2019

1. Discharge description and cause

On Saturday, August 17, 2019, an estimated 1.8 million gallons (MG) of primary treated wastewater bypassed the secondary treatment facilities and discharged through the Southwest Ocean Outfall (Discharge Point No. 001) of the Oceanside Water Pollution Control Plant (OSP).

The bypass is believed to have been caused by an inconsistent power supply unit feeding the bypass valve that caused the valve to intermittently and erratically open and close. As described below, this power unit has been replaced, and a function test of the unit that was removed will be performed later this month to confirm the cause.

2. Period of Noncompliance (if noncompliance has not been correct, anticipated time it is expected to continue)

Primary treated wastewater was discharged from approximately 5:30 a.m. until 6:40 p.m.; the bypass period was approximately 13 hours. The 1.8 MG of primary treated wastewater was comingled with approximately 8 MG of secondary treated wastewater.

Compliance with weekly and monthly numeric effluent limits is not believed to have been affected based on a 24-hour composite sample collected on August 17. This sample was analyzed for total suspended solids and had a concentration of 27 milligrams per liter (mg/L), which is below both the average weekly and average monthly effluent limits of 45 and 30 mg/L respectively.

3. Steps Taken or Planned to Reduce, Eliminate, and Prevent Reoccurrence of Noncompliance

The bypass was stopped at 6:37 p.m. by securing influent flow to the plant.

To prevent reoccurrence during investigation of the cause, the automatic bypass valve was isolated using manual valves located upstream and downstream. Once the power supply was identified as the likely cause, the power supply unit was replaced.

The status of the bypass valve is visible from the Distributed Control System (DCS) main screen. San Francisco Public Utilities Commission (SFPUC) is investigating whether the status was visible to the OSP Watch Supervisor while the bypass was occurring. If not, SFPUC will take steps to resolve it. If so, SFPUC will provide additional training to the OSP Watch Supervisor relating to responding to the bypass valve status.

Attention: NPDES Wastewater Division

SUBJECT: July 2019 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681] Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of July 2019 for the Oceanside Water Pollution Control Plant (OSP).

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit with the following exceptions:

BOD_5. The results for 5-day biochemical oxygen demand (BOD_5) during the week of July 7-13 are not available. The BOD_5 tests were conducted for the influent (INF-001) and effluent (EFF-001A) samples collected on July 10. However, the tests did not meet quality assurance/quality control (QA/QC) specifications. BOD method SM5210B requires a maximum DO depletion of 0.20 mg/L for the dilution water blanks. This requirement was not met due to an unknown cause, but contamination is suspected. Laboratory staff have since thoroughly cleaned the laboratory equipment used for the BOD analysis. This issue was not discovered until test results were available on July 16, and staff subsequently analyzed extra INF-001 and EFF-001A composite samples collected on July 16. Additional samples were collected and analyzed for July 20.

London N. Breed, Mayor
Ann Moller Caen, President
Francesca Vietor, Vice President
Anson Moran, Commissioner
Sophie Maxwell, Commissioner
Tim Paulson, Commissioner
Harlan L. Kelly, Jr., General Manager

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

pH. During the last week of July (July 28 – August 3), only four INF-001 and EFF-001A samples were collected for pH (Jul 31, Aug 1, Aug 2, Aug 3) because an unplanned plant shutdown on July 29-30, necessitated by a PG&E issue, prevented the collection of grab samples on those days. Grab sampling was not conducted on July 28 because it had not been scheduled. Results for samples collected on August 1-3 will be submitted with the August 2019 SMR.

TSS. During the last week of July (July 28 – August 3), only four INF-001 samples were collected (Jul 28, Aug 1, Aug 2, Aug 3) for total suspended solids because the unplanned plant shutdown prevented the collection of composites on July 29-30, and a sampler setup issue prevented collection of a sample on July 31. Results for samples collected on August 1-3 will be submitted with the August 2019 SMR.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of OSP and the Westside wet weather facilities.

Combined Sewer Discharges. There were no combined sewer discharges (CSDs) during this monitoring period as described in the Wet Weather Summary.

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew M. Clark
Operations Superintendent

SUBJECT: August 2019 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681] Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of August 2019 for the Oceanside Water Pollution Control Plant (OSP).

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit except for 5-day biochemical oxygen demand (BOD_5) described below. Due to plant shutdowns, incomplete composite samples were collected for monitoring locations INF-001A and EFF-001A on August 2, 17, 18, and 30; the sample results for total suspended solids (TSS) are available and have been uploaded to CIWQS.

$\underline{BOD_5}$. The results for 5-day biochemical oxygen demand (BOD_5) during the week of August 18-24 are not available. The BOD_5 tests were conducted for the influent (INF-001) and effluent (EFF-001A) samples collected on August 21. However, the test results did not meet a QA/QC specification for method SM5210B (i.e., an average standard recovery of 77%, outside of the acceptable QC range of 85-115%). Laboratory staff investigated the cause and discovered equipment contamination in the probe membrane of the DO meter. Laboratory staff have since replaced the probe membrane. This issue was not discovered until test results were available on August 27, and staff subsequently analyzed extra INF-001 and EFF-001A composite samples

London N. Breed, Mayor

Harlan L. Kelly, Jr., General Manager

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

collected on August 26. Additional samples were collected and analyzed for August 27.

Discharge Incidents. As reported in a 5-day report submitted August 26, an estimated 1.8 million gallons (MG) of primary treated wastewater bypassed the secondary treatment facilities and was discharged through the Southwest Ocean Outfall (Discharge Point No. 001) on August 17. The bypass is believed to have been caused by an inconsistent power supply unit feeding the bypass valve and the power unit was replaced. Upon further investigation, including a function test on the former unit, the cause was determined to be related to a DCS programming issue.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of OSP and the Westside wet weather facilities.

Combined Sewer Discharges. There were no combined sewer discharges (CSDs) during this monitoring period as summarized in the attached wet weather summary.

If you have any questions concerning this report, please contact Operations Division Manager, George Engel at (415) 920-4923 or GEngel@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. SUBJECT: September 2019 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681] Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of September 2019 for the Oceanside Water Pollution Control Plant (OSP).

Compliance with Effluent Limitations. Compliance with the effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit. Due to plant shutdowns on September 6, 11, 14 and 15, incomplete composite samples were collected for monitoring locations INF-001A and EFF-001A; composite sample results for total suspended solids (TSS), 5-day biochemical oxygen demand (BOD_5), and turbidity on some of these days are available and have been uploaded to CIWQS.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of OSP and the Westside wet weather facilities.

Combined Sewer Discharges. There were no combined sewer discharges (CSDs) during this monitoring period as described in the Wet Weather Summary.

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Dale Miller
Superintendent, Westside Operations

Notes

1. Instrumentation anomalies occurred on 9/3 for OSP Effluent Secondary Bypass, and on 9/11 and 9/26 for Westside Transport/Storage Structure Effluent, and were zeroed out per confirmation with SFPUC Operations.
2. OSP shutdowns on 9/6 from 09:00 AM to 15:00 PM, on 9/11 from 07:40 AM to 10:25 AM, on 9/12 from 09:00AM to 15:00PM, on 9/14 from 06:35 AM to 07:30AM and from 08:20 AM to 09:10 AM, and on 9/15 from 06:35 AM to 08:40 AM.
3. There was a gap in recorded data on 9/16 from 14:08 PM to 20:40 PM; flow to OSP was continuous through this period in DCS as confirmed by SFPUC Operations.

Attention: NPDES Wastewater Division

SUBJECT: October 2019 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681] Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of October 2019 for the Oceanside Water Pollution Control Plant (OSP).

Compliance with Effluent Limitations. Compliance with the effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit except for 5-day biochemical oxygen demand (BOD_5) described below. Due to an unplanned plant shutdown on October 21 that lasted for less than 4.5 hours, 24-hour composite samples collected for monitoring locations INF-001A and EFF-001A were incomplete but still representative of the influent and effluent. The composite sample results for total suspended solids (TSS), turbidity, and chronic toxicity are available and have been uploaded to CIWQS.

BOD_5. The results for 5-day biochemical oxygen demand (BOD5) during the week of October 13-19 are not available. The BOD_5 tests were conducted for the influent (INF-001) and effluent (EFF-001A) samples collected on October 14. However, the test results did not meet a QA/QC specification for method SM5210B (i.e., an average standard recovery of 80%, outside of the acceptable QC range of 85-115%). Staff investigated the cause and discovered that the laboratory analyst may not have prepared the BOD bottles with the proper reagents. To prevent reoccurrence, the analyst was retrained. This issue was not discovered until test results were available on October 21,

London N. Breed, Mayor
Ann Moller Caen, President
Francesca Vietor, Vice President
Anson Moran, Commissioner
Sophie Maxwell, Commissioner
Tim Paulson, Commissioner
Harlan L. Kelly, Jr., General Manager

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

and staff subsequently analyzed extra INF-001 and EFF-001A composite samples collected on October 22. Additional samples were collected and analyzed for October 23.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of OSP and the Westside wet weather facilities.

Combined Sewer Discharges. There were no combined sewer discharges (CSDs) during this monitoring period as described in the Wet Weather Summary.

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Dale Miller
Superintendent, Westside Operations

Notes

1. Instrumentation anomalies occurred on 10/2 for OSP Effluent Secondary Bypass, and on 10/4, 10/8, and 10/9 for Westside Transport/Storage Structure Effluent and have been zeroed per confirmation with Operations.
2. OSP shutdowns on 10/2 from 1:00AM to 5:00PM, on 10/21 from 3:00PM to 7:00PM, and on 10/24 from 2:00AM to 6:40PM.
3. OSP influent flow data anomalous on 10/29 from 4:17PM to 4:37PM and has been replaced per confirmation with Operations.
4. OSP rain gauge recorded anomalous data on 10/17 and 10/23 and has been zeroed per confirmation with Operations.

Violations

Violation ID	Violation Date	Violation Type	Description(-)	Corrective Action	Created By	Last Modified By
1068871	11/26/2019	Order Conditions	Did not comply with wet weather plant operational requirements, as described in Provision VI.C.6.c.3.ii. EFF-001 only reached 134 MGD before discharging at CSD-002 & CSD-003 (165 MGD required at EFF-001 before discharging at CSD-002 & CSD-003).	Investigation revealed an issue with two main disconnect switches left in "neutral" position--fixed issue and added routine maintenance check to prevent this issue from occurring again.	Case Worker	Water Board Staff

SUBJECT: November 2019 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681]

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of November 2019 for the Oceanside Water Pollution Control Plant (OSP). During the month of November there was substantial uncertainty regarding the applicability of Regional Water Board Order No. R2-2009-0062 and subsequent Order No. R2-2019-0028. The Regional Water Board approved R2-2019-0028 in September 2019 with an effective date of November 1, however, U.S. EPA did not sign the order until December 10, 2019. For purposes of this monthly report the SFPUC has assessed compliance against the 2009 order.

Compliance with Effluent Limitations. Compliance with the effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of OSP and the Westside wet weather facilities.

Combined Sewer Discharges. There were combined sewer discharges (CSDs) during this monitoring period as described in the attached Wet Weather Summary.

System Operations of Wet Weather Facilities.

London N. Breed Mayor
Ann Moller Caen President
Francesca Vietor Vice President
Anson Moran Commissioner
Sophie Maxwell Commissioner
Tim Paulson Commissioner
Harlan L. Kelly, Jr. General Manager

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

During a storm on November 26 the total flow rate at Discharge Point No. 001 did not reach 165 million gallons per day (MGD) within two hours of discharges at CSD-002 and CSD-003. Two of the wet weather "decant" pumps at the Westside Pump Station were activated but were not pumping due to an electrical issue. The result was that the average flow to Discharge Point No. 001 during the CSDs was 134 MGD and approximately 0.95 MG of additional combined flows discharged through the CSD outfalls.

After investigation staff identified an issue with two main disconnect switches. A main disconnect switch is an electrical component that acts as a safety device to ensure that an electrical circuit is completely de-energized for service, maintenance or emergency response. During the November 26 storm, Operations staff remotely activated all four decant pumps at the Westside Pump Station, but the main disconnect switches for the variable frequency drives for pump nos. 6 and 7 were in a neutral position. SFPUC staff reset the switches and added specific mechanical activities to routine preventative maintenance to further increase future reliability.

Wet Weather Monitoring. The Westside system experienced wet weather days on November 26, 27, and 30. Required monitoring occurred at INF-001B and EFF-001B. Monitoring was also conducted for effluent from the Westside Transport/Storage Structure ("decant" or monitoring location EFF-001D in the 2019 order). No EFF-001D data have been uploaded because the CIWQS database has not been updated to accept submission of water quality data for this monitoring location.

CSD Monitoring. Samples were collected at Monitoring Location EFF-CSD and sufficient volume was available to perform all required analyses.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit, but in two instances, internal procedures could not be followed because of conditions outside the SFPUC's control.

- Shoreline sampling station SRF-22 (Fort Funston) was not sampled on November 27 because heavy surf conditions made physical sample collection unsafe. The site was posted on November 27 and 28 and samples collected on November 28 had fecal indicator bacteria concentrations below the posting threshold.

- Shoreline sampling station SRF-21 (south Ocean Beach at Vicente Street) was sampled and posted on November 27 after a CSD occurred at Discharge Point No. CSD-001 on November 26. However, sampling

and posting did not occur on the morning of November 28 because the preliminary results indicated that the November 27 sample concentrations were below the sampling and posting triggers for all three fecal indicator bacteria. Decisions to post and sample must often be made on preliminary results because the laboratory tests require 18 to 24-hour incubation periods. In this instance the preliminary enterococcus results for the November 27 afternoon sample indicated concentrations below 104 MPN/100mL, but the final result – which was unavailable until the afternoon of November 28 – was 119 MPN/ 100 mL. The station was sampled and re-posted on November 29. Sample results from November 29 were below the posting and re-sampling thresholds for all fecal indicator bacteria.

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew M. Clark
Superintendent, Wastewater Enterprise

SUBJECT: December 2019 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681] Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of December 2019 for the Oceanside Water Pollution Control Plant (OSP). During the month of December there was substantial uncertainty regarding the applicability of Regional Water Board Order No. R2-2009-0062 and subsequent Order No. R2-2019-0028. The Regional Water Board approved Order No. R2-2019-0028 in September 2019 with an effective date of November 1, 2019; however, U.S. EPA did not sign approve the jointly-issued order until December 10, 2019, with an effective date of February 1, 2020. For purposes of this monthly report the SFPUC has assessed compliance against the 2009 order.

Compliance with Effluent Limitations. Compliance with the effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of OSP and the Westside wet weather facilities.

Combined Sewer Discharges. There were combined sewer discharges (CSDs) during this monitoring period as described in the Wet Weather Summary.

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

System Operations of Wet Weather Facilities.
The operation of wet weather facilities during the storm event was conducted consistent with the requirements in NPDES permit Provision VI.C.6.c(3) - VI.C.6.c(4).

Wet Weather Monitoring. The Westside system experienced wet weather days on December 2, 4, 6, 7, 8, 10, 11, 12, 18, 19, 22, 25, 29, and 30. Required monitoring occurred at INF-001B and EFF-001B.

CSD Monitoring. Combined sewer discharge monitoring occurred as required on December 7.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit with one exception. On December 18, there was a CSD event at Discharge Point No CSD-005 (Sea Cliff I/China Beach) for appropriately 4 minutes (<0.01 MG). Operations staff did not notify the on-call biologists of this CSD because the water elevation trigger was slightly greater than the actual surveyed level. The trigger has since been corrected to the correct value.

If you have any questions concerning this report, please contact Operations Superintendent, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Operations Superintendent, Wastewater Enterprise

NOTES

1. Instrumentation anomalies occurred on 12/13 for OSP Effluent Secondary Bypass and were zeroed per confirmation with Operations.
2. OSP effluent flow meter was out of service from 12/27 08:50AM to 12/30 09:09AM (Pi Tag OS3SULFITE:30FIT3.PNT); used redundant flow meter data during those dates (Pi Tag ON3CL2_W3:30FIT4.PNT).

SUBJECT: Annual Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681], Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the annual self-monitoring report (SMR) for the calendar year of 2019 for the Oceanside Water Pollution Control Plant. During the months of November and December there was substantial uncertainty regarding the applicability of Regional Water Board Order No. R2-2009-0062 and subsequent Order No. R2-2019-0028. The Regional Water Board approved Order No. R2-2019-0028 in September 2019 with an effective date of November 1, 2019; however, U.S. EPA did not sign approve the jointly-issued order until December 10, 2019, with an effective date of February 1, 2020. For purposes of this annual report the SFPUC has assessed compliance against the 2009 order.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Dale Miller
Operations Superintendent

Attachment C: Plant Process Schematic

1 Treatment Plant Performance

1.1 Volume Treated

The Oceanside Water Pollution Control Plant (OSP) is permitted to discharge an average dry weather flow of 43 million gallons per day (MGD). The 2019 average dry weather flow was 11.6 MGD, calculated using flows from three consecutive dry weather months (June, July, and August). The facility treated an estimated 6.4 billion gallons of combined wastewater and stormwater in 2019.

This report was prepared by SFPUC to satisfy the annual reporting requirement set forth in Attachment G, Section V.C.1.f of San Francisco Regional Water Quality Control Board (RWQCB) Order No. R2-2009-0062, NPDES No. CA0037681 as amended by RWQCB Order No. R2-2010-0054 (Regional Standard Provisions, and Monitoring and Reporting Requirements).

1.2 Permit Compliance and Actions Taken or Planned

The San Francisco Public Utilities Commission (SFPUC) is exempt from submittal of an annual compliance summary table and tabular and graphical summaries of monitoring data because all data for the OSP are reported electronically. See Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D), Attachment G (2010) at page G-19.

1.2.1 Compliance with Effluent Limitations and Unauthorized Discharges

The SFPUC reported no effluent limit exceedances and two unauthorized discharge incidents in 2019. These incidents were reported to the Regional Water Board as required.

On January 25, 29, and 30, small volumes of untreated wastewater from the primary effluent clarifiers, mixed with secondary treated effluent, were discharged to Discharge Point No. 001 during dry weather. Investigation of the cause began immediately after a continuous analyzer showed elevated turbidity readings on January 25. The discharges on January 25 and 29 resulted from one of two dewatering pumps being out of service, which caused the dewatering sump levels to rise and allowed flow to enter the secondary bypass pipe. The three-minute January 30 discharge was intentionally induced to confirm a hypothesis of the cause of the previous events. Preventative measures taken were to prioritize keeping the dewatering pumps in service, to inform all senior operations staff regarding the possible flow path, and to include in daily instructions to Operations staff that the secondary bypass drain valve must be closed during primary clarifier dewatering. Diagrams and details of the wastewater flow were provided in an unauthorized discharge report submitted on February 1 and a supplemental report submitted on March 1.

On August 17, an estimated 1.8 million gallons (MG) of primary treated wastewater bypassed the secondary treatment facilities and was discharged through the Southwest Ocean Outfall (Discharge Point No. 001) during dry weather. This incident was caused by an inconsistent power supply unit feeding the bypass valve control system. Subsequently, the power supply unit, which provides long-term voltage conversion, was replaced. A function test was also conducted on the entire facility control system; the test confirmed that secondary bypass controls continued to be reliable and verified that the root cause was in fact the failure of the power supply for the secondary bypass controls. Corrective actions were undertaken to improve response time, including lowering the turbidity concentration that triggers an alarm. Additional corrective actions were undertaken to prevent reoccurrence, including implementing additional alarms for the upstream isolation valve, downstream isolation valve, and bypass valve.

1.2.2 Monitoring Issues

In 2019, there were four types of monitoring issues that have been reported in the monthly self-monitoring reports:

- **Lack of CSD Sample (1):** Insufficient sample volume was collected during the January 6 combined sewer discharge (CSD) event due to issues with sampler programming. Shortly before the discharge commenced, SFPUC staff reset the sampler in preparation for the anticipated CSD event. However, the sampler was reprogrammed incorrectly, resulting in a sample volume that was insufficient for the required laboratory analyses. The sampler program has since been modified and subsequent CSD sampling was successful.

- **BOD_5 Analyses QA/QC Issues (4):** In 2019, there were multiple instances of 5-day biochemical oxygen demand (BOD_5) samples not meeting quality assurance/quality control (QA/QC) specifications for different reasons: week seed control, suspected contamination, equipment contamination in the dissolved oxygen probe membrane, and improper reagent preparation. Discovery of these instances resulted in more frequent monitoring during the subsequent week. Preventative measures included set-up of a separate dry weather-only seed bottle, retraining staff on proper laboratory procedures, thorough cleaning of laboratory equipment, and replacement of the membrane probe.

- **Monitoring Frequency Not Met (2):** During the last week of July (July 28 – August 3), the permit-required 5/week minimum monitoring frequencies for pH and total suspended solids (TSS) were not met due to an unplanned plant shutdown. The shutdown on July 29-30, necessitated by PG&E activities, prevented the collection of samples on those days and caused a subsequent sampler setup issue.

- **Shoreline Monitoring and Posting Not Conducted (4):** Shoreline monitoring and posting were not conducted a handful of times during 2019 due to the partial federal government shutdown (January 1-22; SRF-17, SRF-22), surf conditions making sample collection unsafe (November 27; SRF-22; posting occurred), preliminary bacteria concentration results that did not exceed single-sample thresholds (November 28, SRF-21), and lack of internal notification of a CSD event (December 18, SRF-17). In first three instances, the public was notified of CSDs via phone hotline, email, and the sfwater.org website. For the last instance, the triggers for automatic internal notification of a CSD at that location were corrected.

1.3 Effluent Characterization Study

For this evaluation, all constituents with required minimum sampling frequencies of less than once a month that were detected above the method Minimum Levels (MLs) were evaluated. Estimated concentrations of constituents detected below the MLs were excluded from this evaluation because the uncertainty in the result when a constituent is detected below the ML prevents useful comparison.

Seven of the tested constituents were detected above the method MLs: antimony, chloroform, chromium (total recoverable), copper, lead, nickel, and zinc. The 2019 maximum detected level of these constituents were compared to the Maximum Effluent Concentration (MEC) as presented in Table F-11 of the OSP Permit (Reasonable Potential Analysis). The MECs were used as the general indicators of past performance of the detected constituents.

All seven detected constituents showed deceases or no statistically significant increases compared to the corresponding MECs.

The detected constituents and evaluations are summarized below.

Trends for Selected Constituents

Priority Pollutant	Method Minimum Level (ML, µg/L)	2019 Maximum Detected Level (µg/L)[1]	Past Performance[2] (µg/L)	Criterion or Objective (µg/L)	Statistically Significant Increase
Antimony	0.5	0.72	0.94	1200	No
Chloroform	0.5	1.3	9.8	130	No
Chromium (III) Chromium (VI)	0.5 0.5	0.83 (total recoverable)	5.4 (DNQ) 5.4 (DNQ)	190,000 2	No No
Copper	0.5	13	70	3	No
Lead	0.5	0.69	8.6	2	No
Nickel	1	2.6	7.2	5	No
Zinc	1	46	146	20	No

Note:

1. Results have been rounded to two significant figures.
2. The Maximum Effluent Concentration (MEC) as listed in Table F-11. Reasonable Potential Analysis Results for the Discharge Point No. 001 in the OSP Permit, NPDES NO. CA0037681, Order No. R2-2009-0062, is used as an indicator for past performance.
3. This Ocean Plan Table 1 pollutant is the summation of four constituents and does not have an applicable method ML.
4. The only constituent detected was pentachlorophenol.

1.4 Biosolids

In 2019, the OSP beneficially re-used 3,120 dry metric tons of biosolids at the following locations:

Location	Dry Metric Tons[1]
Land Application	
Solano County	900
Sacramento County	230
Landfill Beneficial Use	
Potrero Hills	1,220
Vasco Road	50
Landfill Beneficial Use	
Hay Road	10
Lystek – Liquid Biofertilizer	710
TOTAL	**3,120**

Note:

1. Tonnage has been rounded to two significant figures.

2 Approved Laboratory Analyses

List of approved analyses include the following:

1. Analyses for which SFPUC is certified: See **Attachment A**.
2. Analysis performed for SFPUC by a separate certified laboratory (copies of reports signed by the laboratory director of the separate certified laboratories are not included with the annual report but are retained onsite and available upon request):
    - Dioxin, method EPA 1613, performed by Frontier Analytical; and

- Tributyltin, performed by Eurofins Calscience.

3. Waived analyses: None.

3 Facility Information

3.1 Plan View Drawing or Map of Facility

A Plant Site Plan is included in **Attachment B**, and a Plant Process Schematic is included in **Attachment C**.

3.2 Results of Annual Facility Report Reviews

3.2.1 Contingency Plan and Spill Prevention Plan

The OSP's Contingency Plan was reviewed throughout 2019. Updates to the plan include:

- Changes in staffing and roles and responsibilities;
- Process management updates; and
- Updates to the listed emergency contacts.

3.2.2 Operations and Maintenance Manual

Review of OSP related manuals, training, and other guidance materials was completed, resulting in updates to and development of the materials described in the table below.

Category	Activities
Manuals	OSP Primary & Secondary Operations Manual Updates Biosolids Management System Manual Updates
Training	Videos were created to facilitate training on the TPAD Oceanside Wastewater Plant Operations training included in Annual Wet Weather training for all SFPUC operators held in Sep and Oct 2019

3.2.3 Wastewater Facilities Status Report

The table below summarizes key construction activities related to the Westside facilities. The projects listed below do not comprise a comprehensive list of all upgrades completed or underway. Planning, design and construction of numerous other mechanical, electrical, structural, and communications improvements are ongoing.

Facility/Process	Project Description	Construction Update
OSP Plantwide	Replacement of expendable carbon media within the Plant Odor Control Units.	Construction completed in 2019.
	Replacement of preliminary and final ventilation filter media plantwide.	Construction completed in 2019.
	Electrical preventive maintenance at main power services and substations.	Construction completed in 2019.
	Replacement of lighting fixtures plantwide, from high-intensity diffused (HID) and fluorescent types to more efficient Light-Emitting Diode (LED) types.	Construction anticipated to be complete in 2020.
	Replacement of pedestrian access doors, frames and hardware.	Construction anticipated to be complete in 2020.

Facility/Process	Project Description	Construction Update
OSP Administration / Laboratory Spaces	Replacement of HVAC systems at Bioassay room, server room, and equipment serving occupied spaces at the lab, offices, and control room.	Construction anticipated to be complete in 2020.
	Replacement of building exterior awning and construct exterior improvements.	Construction completed in 2019.
OSP Primary	Replacement of air supply ductwork in the primary treatment area and lighting fixture replacement.	Construction completed in 2019.
OSP Secondary	Upgrade and repair of oxygen generation compressors and associated mechanical instrumentation and controls.	Construction completed in 2019.
	Upgrade of Programmable Logic Controllers (PLCs) for Pressure-Swing Absorption (PSA) compressors and aeration systems.	Construction completed in 2019.
OSP Solids Handling	Repair of gravity belt thickener (GBT) and replace a GBT with a rotary drum thickener.	Construction anticipated to be complete in 2020.
	Replacement of pumps and associated mechanical and electrical improvements.	Construction expected to be complete in 2020.
	Replacement of interior liner of four digesters. Replacements and repairs of ancillary mechanical equipment.	Completed one digester in 2019. Remaining replacements are anticipated to be complete in 2021.
OSP Digester Gas Management	Replacement of existing waste gas burners with two low-emission, natural-draft type biogas flare burner assemblies.	Construction expected to complete in 2020.
	Replacement of digester gas energy recovery systems, including: installation of three new cogeneration engines, digester gas holder, standby generator, gas conditioning system, electrical substation, and ventilation improvements.	Construction initiated in late 2018 and is expected to be complete in 2021.
Westside Recycled Water Facility	Construction of and connection to a recycled water facility that will include microfiltration, reverse osmosis, and UV disinfection of the OSP final effluent.	Construction began in 2018 and is expected to be complete in 2021.
Sea Cliff #1, #2, and #3 Pump Stations	Communications telemetry gateway improvement among the three pump stations for reliability.	Construction completed in 2019.
Sea Cliff #2 Pump Station	Concrete spall and crack repair at pedestrian access stairs and exterior of process building.	Construction completed in 2019.
Westside Pump Station (WSS)	Multiple improvements to the pump station, including replacement of existing bar screens, construction of new dry weather / wet weather cross-connection structure, ventilation improvements, and provision of a redundant power source.	Rescoped / redesign contract and target to rebid the project in 2020.
	Replacement of existing dry weather pumps' variable frequency drives.	Construction completed in 2019.

Attention: NPDES Wastewater Division

SUBJECT: Annual Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681], Regional Water Quality Control Board Order No. R2-2009-0062

To Whom It May Concern:

Transmitted herewith is the annual self-monitoring report (SMR) for the calendar year of 2019 for the Oceanside Water Pollution Control Plant. During the months of November and December there was substantial uncertainty regarding the applicability of Regional Water Board Order No. R2-2009-0062 and subsequent Order No. R2-2019-0028. The Regional Water Board approved Order No. R2-2019-0028 in September 2019 with an effective date of November 1, 2019; however, U.S. EPA did not sign approve the jointly-issued order until December 10, 2019, with an effective date of February 1, 2020. For purposes of this annual report the SFPUC has assessed compliance against the 2009 order.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Dale Miller
Operations Superintendent

1 Treatment Plant Performance

1.1 Volume Treated

The Oceanside Water Pollution Control Plant (OSP) is permitted to discharge an average dry weather flow of 43 million gallons per day (MGD). The 2019 average dry weather flow was 11.6 MGD, calculated using flows from three consecutive dry weather months (June, July, and August). The facility treated an estimated 6.4 billion gallons of combined wastewater and stormwater in 2019.

This report was prepared by SFPUC to satisfy the annual reporting requirement set forth in Attachment G, Section V.C.1.f of San Francisco Regional Water Quality Control Board (RWQCB) Order No. R2-2009-0062, NPDES No. CA0037681 as amended by RWQCB Order No. R2-2010-0054 (Regional Standard Provisions, and Monitoring and Reporting Requirements).

1.2 Permit Compliance and Actions Taken or Planned

The San Francisco Public Utilities Commission (SFPUC) is exempt from submittal of an annual compliance summary table and tabular and graphical summaries of monitoring data because all data for the OSP are reported electronically. See Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D), Attachment G (2010) at page G-19.

1.2.1 Compliance with Effluent Limitations and Unauthorized Discharges

The SFPUC reported no effluent limit exceedances and two unauthorized discharge incidents in 2019. These incidents were reported to the Regional Water Board as required.

On January 25, 29, and 30, small volumes of untreated wastewater from the primary effluent clarifiers, mixed with secondary treated effluent, were discharged to Discharge Point No. 001 during dry weather. Investigation of the cause began immediately after a continuous analyzer showed elevated turbidity readings on January 25. The discharges on January 25 and 29 resulted from one of two dewatering pumps being out of service, which caused the dewatering sump levels to rise and allowed flow to enter the secondary bypass pipe. The three-minute January 30 discharge was intentionally induced to confirm a hypothesis of the cause of the previous events. Preventative measures taken were to prioritize keeping the dewatering pumps in service, to inform all senior operations staff regarding the possible flow path, and to include in daily instructions to Operations staff that the secondary bypass drain valve must be closed during primary clarifier dewatering. Diagrams and details of the wastewater flow were provided in an unauthorized discharge report submitted on February 1 and a supplemental report submitted on March 1.

On August 17, an estimated 1.8 million gallons (MG) of primary treated wastewater bypassed the secondary treatment facilities and was discharged through the Southwest Ocean Outfall (Discharge Point No. 001) during dry weather. This incident was caused by an inconsistent power supply unit feeding the bypass valve control system. Subsequently, the power supply unit, which provides long-term voltage conversion, was replaced. A function test was also conducted on the entire facility control system; the test confirmed that secondary bypass controls continued to be reliable and verified that the root cause was in fact the failure of the power supply for the secondary bypass controls. Corrective actions were undertaken to improve response time, including lowering the turbidity concentration that triggers an alarm. Additional corrective actions were undertaken to prevent reoccurrence, including implementing additional alarms for the upstream isolation valve, downstream isolation valve, and bypass valve.

1.2.2 Monitoring Issues

In 2019, there were four types of monitoring issues that have been reported in the monthly self-monitoring reports:

- **Lack of CSD Sample (1):** Insufficient sample volume was collected during the January 6 combined sewer discharge (CSD) event due to issues with sampler programming. Shortly before the discharge commenced, SFPUC staff reset the sampler in preparation for the anticipated CSD event. However, the sampler was reprogrammed incorrectly, resulting in a sample volume that was insufficient for the required laboratory analyses. The sampler program has since been modified and subsequent CSD sampling was successful.

- **BOD_5 Analyses QA/QC Issues (4):** In 2019, there were multiple instances of 5-day biochemical oxygen demand (BOD_5) samples not meeting quality assurance/quality control (QA/QC) specifications for different reasons: week seed control, suspected contamination, equipment contamination in the dissolved oxygen probe membrane, and improper reagent preparation. Discovery of these instances resulted in more frequent monitoring during the subsequent week. Preventative measures included set-up of a separate dry weather-only seed bottle, retraining staff on proper laboratory procedures, thorough cleaning of laboratory equipment, and replacement of the membrane probe.

- **Monitoring Frequency Not Met (2):** During the last week of July (July 28 – August 3), the permit-required 5/week minimum monitoring frequencies for pH and total suspended solids (TSS) were not met due to an unplanned plant shutdown. The shutdown on July 29-30, necessitated by PG&E activities, prevented the collection of samples on those days and caused a subsequent sampler setup issue.

- **Shoreline Monitoring and Posting Not Conducted (4):** Shoreline monitoring and posting were not conducted a handful of times during 2019 due to the partial federal government shutdown (January 1-22; SRF-17, SRF-22), surf conditions making sample collection unsafe (November 27; SRF-22; posting occurred), preliminary bacteria concentration results that did not exceed single-sample thresholds (November 28, SRF-21), and lack of internal notification of a CSD event (December 18, SRF-17). In first three instances, the public was notified of CSDs via phone hotline, email, and the sfwater.org website. For the last instance, the triggers for automatic internal notification of a CSD at that location were corrected.

1.3 Effluent Characterization Study

For this evaluation, all constituents with required minimum sampling frequencies of less than once a month that were detected above the method Minimum Levels (MLs) were evaluated. Estimated concentrations of constituents detected below the MLs were excluded from this evaluation because the uncertainty in the result when a constituent is detected below the ML prevents useful comparison.

Seven of the tested constituents were detected above the method MLs: antimony, chloroform, chromium (total recoverable), copper, lead, nickel, and zinc. The 2019 maximum detected level of these constituents were compared to the Maximum Effluent Concentration (MEC) as presented in Table F-11 of the OSP Permit (Reasonable Potential Analysis). The MECs were used as the general indicators of past performance of the detected constituents.

All seven detected constituents showed deceases or no statistically significant increases compared to the corresponding MECs.

The detected constituents and evaluations are summarized below.

Trends for Selected Constituents

Priority Pollutant	Method Minimum Level (ML, µg/L)	2019 Maximum Detected Level (µg/L)[1]	Past Performance[2] (µg/L)	Criterion or Objective (µg/L)	Statistically Significant Increase
Antimony	0.5	0.72	0.94	1200	No
Chloroform	0.5	1.3	9.8	130	No
Chromium (III) Chromium (VI)	0.5 0.5	0.83 (total recoverable)	5.4 (DNQ) 5.4 (DNQ)	190,000 2	No No
Copper	0.5	13	70	3	No
Lead	0.5	0.69	8.6	2	No
Nickel	1	2.6	7.2	5	No
Zinc	1	46	146	20	No

Note:

1. Results have been rounded to two significant figures.
2. The Maximum Effluent Concentration (MEC) as listed in Table F-11. Reasonable Potential Analysis Results for the Discharge Point No. 001 in the OSP Permit, NPDES NO. CA0037681, Order No. R2-2009-0062, is used as an indicator for past performance.
3. This Ocean Plan Table 1 pollutant is the summation of four constituents and does not have an applicable method ML.
4. The only constituent detected was pentachlorophenol.

1.4 Biosolids

In 2019, the OSP beneficially re-used 3,120 dry metric tons of biosolids at the following locations:

Location	Dry Metric Tons[1]
Land Application	
Solano County	900
Sacramento County	230
Landfill Beneficial Use	
Potrero Hills	1,220
Vasco Road	50
Landfill Beneficial Use	
Hay Road	10
Lystek – Liquid Biofertilizer	710
TOTAL	**3,120**

Note:

1. Tonnage has been rounded to two significant figures.

2 Approved Laboratory Analyses

List of approved analyses include the following:

1. Analyses for which SFPUC is certified: See **Attachment A**.
2. Analysis performed for SFPUC by a separate certified laboratory (copies of reports signed by the laboratory director of the separate certified laboratories are not included with the annual report but are retained onsite and available upon request):
    - Dioxin, method EPA 1613, performed by Frontier Analytical; and

- Tributyltin, performed by Eurofins Calscience.

3. Waived analyses: None.

3 Facility Information

3.1 Plan View Drawing or Map of Facility

A Plant Site Plan is included in **Attachment B**, and a Plant Process Schematic is included in **Attachment C**.

3.2 Results of Annual Facility Report Reviews

3.2.1 Contingency Plan and Spill Prevention Plan

The OSP's Contingency Plan was reviewed throughout 2019. Updates to the plan include:

- Changes in staffing and roles and responsibilities;
- Process management updates; and
- Updates to the listed emergency contacts.

3.2.2 Operations and Maintenance Manual

Review of OSP related manuals, training, and other guidance materials was completed, resulting in updates to and development of the materials described in the table below.

Category	Activities
Manuals	OSP Primary & Secondary Operations Manual Updates Biosolids Management System Manual Updates
Training	Videos were created to facilitate training on the TPAD Oceanside Wastewater Plant Operations training included in Annual Wet Weather training for all SFPUC operators held in Sep and Oct 2019

3.2.3 Wastewater Facilities Status Report

The table below summarizes key construction activities related to the Westside facilities. The projects listed below do not comprise a comprehensive list of all upgrades completed or underway. Planning, design and construction of numerous other mechanical, electrical, structural, and communications improvements are ongoing.

Facility/Process	Project Description	Construction Update
OSP Plantwide	Replacement of expendable carbon media within the Plant Odor Control Units.	Construction completed in 2019.
	Replacement of preliminary and final ventilation filter media plantwide.	Construction completed in 2019.
	Electrical preventive maintenance at main power services and substations.	Construction completed in 2019.
	Replacement of lighting fixtures plantwide, from high-intensity diffused (HID) and fluorescent types to more efficient Light-Emitting Diode (LED) types.	Construction anticipated to be complete in 2020.
	Replacement of pedestrian access doors, frames and hardware.	Construction anticipated to be complete in 2020.

Facility/Process	Project Description	Construction Update
OSP Administration / Laboratory Spaces	Replacement of HVAC systems at Bioassay room, server room, and equipment serving occupied spaces at the lab, offices, and control room.	Construction anticipated to be complete in 2020.
	Replacement of building exterior awning and construct exterior improvements.	Construction completed in 2019.
OSP Primary	Replacement of air supply ductwork in the primary treatment area and lighting fixture replacement.	Construction completed in 2019.
OSP Secondary	Upgrade and repair of oxygen generation compressors and associated mechanical instrumentation and controls.	Construction completed in 2019.
	Upgrade of Programmable Logic Controllers (PLCs) for Pressure-Swing Absorption (PSA) compressors and aeration systems.	Construction completed in 2019.
OSP Solids Handling	Repair of gravity belt thickener (GBT) and replace a GBT with a rotary drum thickener.	Construction anticipated to be complete in 2020.
	Replacement of pumps and associated mechanical and electrical improvements.	Construction expected to be complete in 2020.
	Replacement of interior liner of four digesters. Replacements and repairs of ancillary mechanical equipment.	Completed one digester in 2019. Remaining replacements are anticipated to be complete in 2021.
OSP Digester Gas Management	Replacement of existing waste gas burners with two low-emission, natural-draft type biogas flare burner assemblies.	Construction expected to complete in 2020.
	Replacement of digester gas energy recovery systems, including: installation of three new cogeneration engines, digester gas holder, standby generator, gas conditioning system, electrical substation, and ventilation improvements.	Construction initiated in late 2018 and is expected to be complete in 2021.
Westside Recycled Water Facility	Construction of and connection to a recycled water facility that will include microfiltration, reverse osmosis, and UV disinfection of the OSP final effluent.	Construction began in 2018 and is expected to be complete in 2021.
Sea Cliff #1, #2, and #3 Pump Stations	Communications telemetry gateway improvement among the three pump stations for reliability.	Construction completed in 2019.
Sea Cliff #2 Pump Station	Concrete spall and crack repair at pedestrian access stairs and exterior of process building.	Construction completed in 2019.
Westside Pump Station (WSS)	Multiple improvements to the pump station, including replacement of existing bar screens, construction of new dry weather / wet weather cross-connection structure, ventilation improvements, and provision of a redundant power source.	Rescoped / redesign contract and target to rebid the project in 2020.
	Replacement of existing dry weather pumps' variable frequency drives.	Construction completed in 2019.

SUBJECT: April 2020 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681] Regional Water Quality Control Board Order No. R2-2019-0028

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of April 2020 for the Oceanside Water Pollution Control Plant (OSP).

In response to the outbreak of the Novel Coronavirus 2019 (COVID-19) in the general public, which is now a pandemic according to the World Health Organization, the City and County of San Francisco initiated (and has since extended) a shelter-in-place order that began on March 17, 2020. The order and associated social distancing requirements have necessitated major changes to the operations of wastewater facilities that may affect the SFPUC's ability to comply with NPDES permit requirements. Operational changes continue to be made day to day in accordance with updates to federal, state, and local requirements and guidance.

Compliance with Effluent Limitations. Compliance with the effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

Results Not Yet Available. As of May 28, pretreatment influent and effluent priority pollutant samples analyzed using EPA Methods 608 (PCBs and Organochlorine Pesticides), 624 (Volatile Organic Compounds), and 625 (Semi-volatile Organic Compounds) for samples collected on April 23 are not available. Results are anticipated to be reported in a monthly SMR once results are available.

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of OSP and the Westside wet weather facilities.

Combined Sewer Discharges. There were no combined sewer discharges (CSDs) during this monitoring period as described in the Wet Weather Summary.

System Operations of Wet Weather Facilities.
The operation of wet weather facilities during the storm event was conducted consistent with the requirements in NPDES permit Provision VI.C.6.c(3) - VI.C.6.c(4) except for the operation of the Westside Pump Station (WPS). During the April 6 storm event, OSP did not yet have an instantaneous influent flow of at least 60 MGD prior to initiating discharge from the Westside Transport/Storage Structure to Discharge Point No. 001 (decant). Staff initiated the decant discharge sooner than necessary, likely due to the change in this requirement in the new NPDES permit (i.e., requirement was formerly “at least 43 MGD”). Appropriate follow-up training is planned.

Wet Weather Monitoring. The Westside system experienced wet weather days on April 4 and 6. Required monitoring occurred at INF-001B and EFF-001B. As of May 28, two permit-required EFF-001B monitoring parameters – "Duration of Blending" and ”Volume of Blended Wastewater Discharged" – are not available in the California Integrated Water Quality System Project (CIWQS) as SMR tags for data upload. Data entry with Permittee Entry Template (PET) Tool and by manual entry, therefore, is not possible. The data for the two parameters have been submitted in the Wet Weather Summary as the parameters *OSP Effluent – Secondary Bypass (MG)* and *OSP Effluent – Secondary Bypass Duration (minutes)*.

As of May 28, the program coding for the DMR has not been updated to reflect the 2019 permit, therefore, data entry for wet weather influent and effluent at Monitoring Locations INF-001B is not available. We have contacted the DMR Help Desk for the necessary correction. In the meantime, we have uploaded the required data in CIWQS to provide a timely submittal of the SMR (except for the two blending parameters noted above).

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit.

If you have any questions concerning this report, please contact Operations Division Manager, George Engel at (415) 920-4923 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my

knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew M. Clark
Superintendent, Operations

Notes

1. Recorded WST Decant flow on 4/1, 4/2, and 4/3 was anomalous and has been zeroed per confirmation from Operations.
2. There were OSP shutdowns on 4/15 from 06:00AM to 11:15AM and from 4/20 20:00PM to 4/21 12:00PM.
3. OSP data was anomalous on 4/15 from 14:00PM to 16:05PM and from 4/17 20:00PM to 4/18 10:50AM. Plant flow data for these intervals was interpolated from Operator log sheets.

SUBJECT: May 2020 Self-Monitoring Report for the Oceanside Water Pollution Control Plant [NPDES No. CA0037681] Regional Water Quality Control Board Order No. R2-2019-0028

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of May 2020 for the Oceanside Water Pollution Control Plant (OSP).

In response to the outbreak of the Novel Coronavirus 2019 (COVID-19) in the general public, which is now a pandemic according to the World Health Organization, the City and County of San Francisco initiated (and has since extended) a shelter-in-place order that began on March 17, 2020. The order and associated social distancing requirements have necessitated major changes to the operations of wastewater facilities that may affect the SFPUC's ability to comply with NPDES permit requirements. Operational changes continue to be made day to day in accordance with updates to federal, state, and local requirements and guidance.

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit except for 5-day biochemical oxygen demand (BOD_5) described below. The BOD_5 results during the week of May 24-30 are not available. The BOD_5 tests were conducted for the influent (INF-001A) and effluent (EFF-001A) samples collected on May 26 and 27. However, the test results did not meet a quality control (QC) specification for method SM5210B (i.e., a maximum DO depletion of 0.20 mg/L for the dilution water blanks). In addition, the May 27 results did not meet an additional QC specification (i.e., an average standard recovery of 72%, outside of the acceptable QC range of 85-115%). Staff investigated the cause and discovered that the aeration bubble stones in the dilution water carboys had noticeable algae growth, which contaminated the dilution water. A corrective action has been implemented to prevent

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

reoccurrence; the aeration bubble stone was replaced and laboratory staff will clean the bubble stone weekly and replace it quarterly as needed. This issue was not discovered until the May 26 test results were available on June 1, and staff subsequently analyzed extra INF-001A and EFF-001A composite samples collected on June 2. Additional samples were collected and analyzed for June 3.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of OSP and the Westside wet weather facilities.

Combined Sewer Discharges. There were no combined sewer discharges (CSDs) during this monitoring period as described in the Wet Weather Summary.

System Operations of Wet Weather Facilities.
The operation of wet weather facilities during the storm event was conducted consistent with the requirements in NPDES permit Provision VI.C.6.c(3) - VI.C.6.c(4).

Wet Weather Monitoring. The Westside system experienced a wet weather day on May 17. Required monitoring occurred at INF-001B and EFF-001B.

As of June 25, the program coding for the DMR has not been updated to reflect the 2019 permit, therefore, data entry for wet weather influent and effluent at Monitoring Locations INF-001B is not available. We have contacted the DMR Help Desk for the necessary correction. In the meantime, we have uploaded the required data in CIWQS to provide a timely submittal of the SMR (except for the two blending parameters noted above).

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit.

If you have any questions concerning this report, please contact me at (415) 242-2225 or MLauer@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Mark Lauer
Acting Superintendent, Westside Operations

Re: Comprehensive Parnassus Heights Plan Draft Environmental Impact Report: Comments on Water Quality, Water Recreation, and Wastewater Public Services – Exhibit 14a

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents.

We submitted to you by email a letter of today's date under separate cover regarding "Comments on Water Quality, Water Recreation, and Wastewater Public Services."

Due to the file size of Exhibit 14 to that letter, we are transmitting Exhibit 14 to you by email in two (2) separate electronic files, designated "Exhibit 14a," and "Exhibit 14b."

Attached, hereto, please find Exhibit 14a (page nos. SEP0001 through SEP0091).

Thank you for your attention to this matter.

Sincerely,

KellyMarie

Kelly Marie Perry

NT = Not taken

Aeration: source - compressed laboratory air, delivered to exposure solutions through 2ml glass pipets
procedure - gentle aeration (~100 bubbles/min) of effluent and control exposure solutions from 72-hours after test initiation through test-termination to ensure adequate dissolved oxygen levels.

Acute Static-Renewal Bioassay Test -- REPORT

Southeast Plant Wet Weather Discharge

PDS (EFF-001B)

Exposure volume: 4L
Test Organism: Rainbow trout
Organism batch ID: RT-1603
Sample Date: February 18, 2016
Sample Lab-ID: 16-EFF-011

Test Started: February 18, 2016
Test Ended: February 22, 2016
Prepared by: L. Targgart
Approved by: R. Duggan

Survival Results

		0 hours	24 hours		48 hours		72 hours		96 hours		final %

Water Quality Data

Control	0 hours	24 hours	48 hours previous	48 hours renewal	72 hours	96 hours
Temperature (°C)	12.1	11.3	10.9	11.3	10.9	11.0
pH (units)	7.49	7.51	7.42	7.64	7.62	7.52
Dissolved oxygen (mg/L)	10.5	10.7	10.4	10.6	10.9	9.2
Hardness (mg/L)	92			98		98
Alkalinity (mg/L)	50			56		56
Conductivity (µS/cm)	267			294		318

Effluent	0 hours	24 hours	48 hours previous	48 hours renewal	72 hours	96 hours
Temperature (°C)	12.3	11.5	11.4	11.8	11.5	11.5
pH (units)	6.81	7.29	7.24	6.85	7.27	7.33
Dissolved oxygen (mg/L)	9.6	11.5	10.8	9.3	10.3	9.1
Hardness (mg/L)	50			62		56
Alkalinity (mg/L)	38			36		44
Conductivity (µS/cm)	354			358		351
Residual chlorine (mg/L)	-1.4					
Total ammonia (mg/L)	3.9					

Comments: In order to maintain dissolved oxygen levels of at least 60% saturation, control and effluent test solutions were aerated from five- through 96-hours after test initiation.
Effluent exposures (and a concurrent control) were oxygenated from two- through 46-hours after test initiation in order to maintain adequate dissolved oxygen levels.

Subject: Southeast WPCP NPDES/CA0037664 5-day Report

Dear Ms. Watkins:

Consistent with the five-day reporting requirements of the National Pollutant Discharge Elimination System (NPDES) permit for discharges from the Southeast Water Pollution Control Plant (SEP) (NPDES No. CA0037664, Order No. R2-2013-0029), this report provides information regarding a wet weather discharge of equivalent-to-primary-treated effluent at the Mariposa Street Outfall (#029) into San Francisco Bay that occurred on Saturday, March 5, 2016.

This incident was reported to the California Office of Emergency Services (Control #16-1381) within 2-hours of the San Francisco Public Utilities Commission (SFPUC) Wastewater Enterprise being aware of the situation.

1) Incident description and cause;
The NPDES permit states: "The Mariposa Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point No. 029." The Mariposa Pump Station consists of two dry weather pumps and two wet weather pumps. During a wet weather event on March 5, 2016, one wet weather pump ceased operation due to an "overcurrent" state on the variable frequency drive; the pump and equipment performed as designed to protect the equipment from further damage. The wet weather pump was returned into service at 2011. A combined sewer discharge (CSD) event began while this pump was not in service; therefore the "design capacity" was not achieved. Two dry weather pumps and one wet weather pump continued to operate thoughout the event and discharged at a rate of approximately 5.9 to 6.0 MGD which is less than the 10 MGD wet weather design capacity.

An inspection performed after the event discovered debris in the impeller of the wet weather pump which continued operating throughout the event, see picture at left.

2) Location of threatened or involved waterway(s) or storm drains;
San Francisco Bay at the Mariposa Street Outfall (#029) in San Francisco, CA.

3) Date and time the unauthorized discharge started;
Saturday, March 5, 2016 at approximately at 1759.

4) Estimated quantity and duration of the unauthorized discharge (to the extent known), and the estimated amount recovered;
The discharge event started at approximately 1759 and the wet weather pump was returned to service at approximately 2011 (67 minutes duration of intermittent discharge). The CSD volume during this period is estimated at approximately 131,000 gallons. No volume was recovered.

5) Level of treatment prior to discharge (e.g., raw wastewater, primary treated, undisinfected secondary treated, and so on);
The discharge was wet weather equivalent-to-primary-treated effluent which was discharged to the Mariposa Street Outfall (#029).

6) Identity of the person reporting the unauthorized discharge.
George Engel, Operations Superintendent at the Southeast Water Pollution Control Plant.

Within five business days, the Discharger shall submit a written report that includes, in addition to the information required above, the following:
1) Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;
The discharge site is a permitted discharge point in wet weather.

2) Efforts implemented to minimize public exposure to the unauthorized discharge;
The area of discharge is an active maritime industrial facility with limited recreational access. No recreational activities are typical during inclement weather as occurred on March 5, 2016.

3) Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted;
No adverse impacts were observed. The Mariposa Outfall has an automatic sampler that collected samples throughout the discharge event (analysis pending).

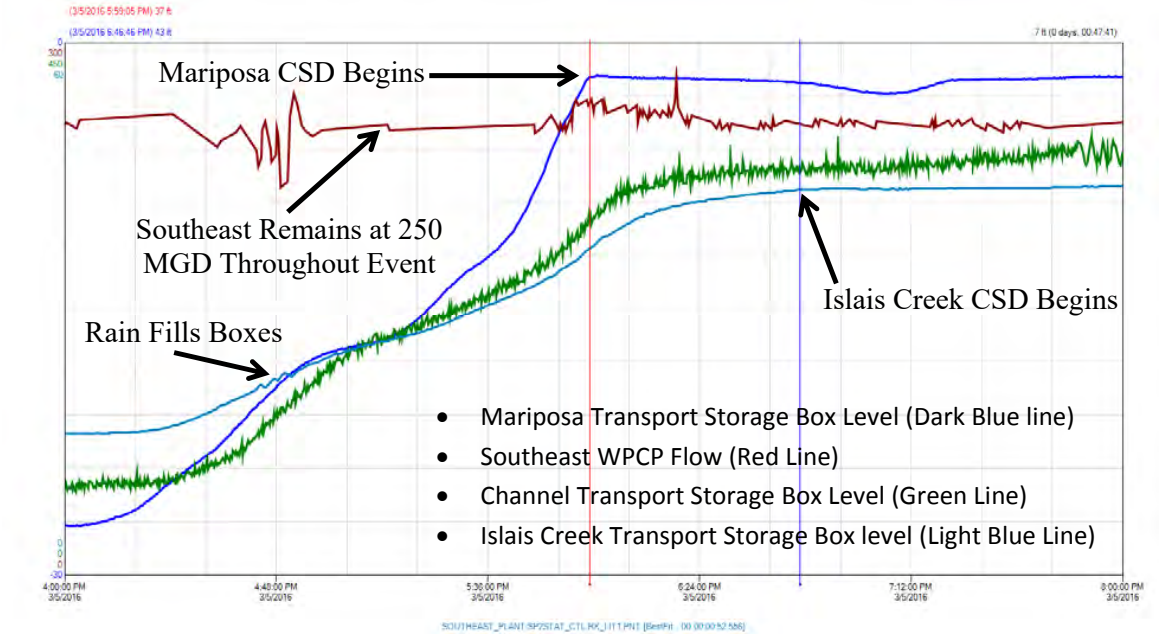
4) Corrective measures taken to minimize the impact of the unauthorized discharge;
An SFPUC electrician was brought onsite to reset the wet weather pump drive and return the pump to service at approximately 2011 (during the discharge event).

5) Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future;
None, the protective system operated as designed.

6) Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges;
No changes are necessary.

7) Quantity and duration of the unauthorized discharge, and the amount recovered.
The discharge event started at approximately 1759 and the wet weather pump was returned to service at approximately 2011 (67 minutes duration of intermittent discharge). The CSD volume during this period is estimated at approximately 131,000 gallons. No volume was recovered.

Prior to the CSD at the Mariposa Street Outfall (#29), the Southeast Water Pollution Control Plant was operating at its' maximum flow of 250 MGD as shown in the image below. Treatment capacity at the Southeast Plant was maximized hours prior to any CSD occurring. Mariposa Pump Station discharges into the Islais Creek drainage basin, and a CSD from the Islais Creek Transport/Storage system began at approximately 1846 (47 minutes after the Mariposa Street CSD). Thus, flows not pumped from the Mariposa Pump Station due to the limited wet weather pump operation, merely discharged at the Mariposa Street Outfall versus the Islais Creek outfalls (#31-35); all storage was maximized as per the NPDES permit language to "maximize the use of the collection system". The system-wide CSD volume will not be adversely affected by this incident (in fact, more volume may have been discharged at Islais Creek if Mariposa Pump Station operated at a higher flow rate or the "design capacity"). The Mariposa Street Outfall (#29) and the Islais Creek outfalls (#31-35) are all located in the Central Basin as defined by the NPDES permit, and the CSD count is unaffected by this incident.



Please contact Laura Pagano at lpagano@sfwater.org, or (415) 554-3109, or me with any questions.

Sincerely,

George W. Engel

Monitoring Report
February 2016

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) February 2016 Monthly Discharge Monitoring Report.

Two acute toxicity flow-through bioassay tests, started on February 8 and February 22, were conducted with results of 65% and 85% final survival, respectively. The 11-sample median for January was 85% which was below the minimum limit of 90%. The 11-sample 90th percentile for February was 45% which was below the minimum limit of 70%.

Pursuant to the Regional Board letter of August 21, 2015 approving adjusted acute toxicity accelerated monitoring, on February 8 through 12, an additional investigative flow-through bioassay was conducted with twice the effluent flow of the compliance test performed on the same dates; the result was 40% final survival. On February 22 through 26, two additional investigative flow-through bioassays were conducted; one with twice the effluent flow of the compliance test performed on the same dates resulted in 40% final survival, and another with effluent passed through a zeolite filter resulted in 90% final survival. Additionally, 48-hour static tests were performed in the laboratory on February 19 and 22 to determine if pH can be maintained under static conditions; preliminary results indicate that it is possible to maintain effluent pH under static conditions.

In February, 0.76 inch of rain was recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility operated during one wet weather event and processed a total of 30.66 MG. There were no combined sewer discharge (CSD) events.

Monitoring Report
March 2016

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) March 2016 Monthly Discharge Monitoring Report.

One acute toxicity flow-through bioassay test, started on March 15, was conducted with the result of 100% final survival. Another bioassay, started on March 22, was not valid due to wet weather conditions.

A total of seven mercury samples were collected in March. An elevated result of 0.0431 µg/L was detected from the first sample collected on March 15; accelerated monitoring was performed as required, with all sample results returning below monitoring and effluent limits. The monthly average for mercury was 0.00983 µg/L (below the permit limit).

On March 10, 2016, the SFPUC submitted a 5-day Written Report regarding a wet weather discharge of equivalent-to-primary-treated effluent at the Mariposa Street Outfall (#029) into San Francisco Bay that occurred on Saturday, March 5, 2016. During this incident, only one of two wet weather pumps was operational during a combined sewer discharge event and the Mariposa Pump Station did not maintain the design capacity of the facility as required in the NPDES permit. The cause of the pump failure was an "overcurrent" state detected on the variable frequency drive, likely attributable to wet weather debris. The pump was returned to service during the discharge event after being checked by a SFPUC operator and electrician. It was estimated that the relevant volume of discharge was 131,000 gallons over 67 minutes.

The quarterly PCB congener report is included with this submission.

Wet weather samples were collected and monitored for priority pollutants in March.

In March, 5.63 inches of rain were recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility operated during five wet weather event and processed a total of 365.67 MG. There were three combined sewer discharge (CSD) events in the North Shore Basin, four CSD events in the Central Basin, and no CSD event in the Southeast Basin.

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) April 2016 Monthly Discharge Monitoring Report.

One acute toxicity flow-through bioassay test, started on April 4, was conducted with the result of 90% final survival. Two additional tests conducted during the month were invalidated due to wet weather operations.

A non-compliance chronic kelp sporophyll test was conducted April 19 to April 21. This test was invalidated as it did not meet acceptability criteria.

As directed by the Regional Board in a letter dated November 10, 2014, the semi-annually required chronic toxicity results with comments (zeolite treated effluent - 5 TUc and untreated effluent - 40 TUc) are included with this report as attachments in CIWQS. A report of ammonia add-back testing at 10% effluent toxicity is also included as an attachment. No result was/could be uploaded to CIWQS for ammonia add-back testing at 10% effluent.

In April, 0.98 inch of rain was recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility operated during two wet weather events and processed a total of 33.18 MG. There were no combined sewer discharge (CSD) events in the North Shore Basin, Central Basin, or Southeast Basin.

Wet Weather Discharge Summary

Drainage Area CSDs	North Shore Basin	Central Basin	Southeast Basin

Subject: Southeast WPCP NPDES/CA0037664 5-day Report

Dear Ms. Watkins:

Consistent with the five-day reporting requirements of the National Pollutant Discharge Elimination System (NPDES) permit for discharges from the Southeast Water Pollution Control Plant (SEP) (NPDES No. CA0037664, Order No. R2-2013-0029), this report provides information regarding an unauthorized discharge of final effluent (secondary treatment with disinfection/dechlorination) near the Pier 80 Outfall into San Francisco Bay that was first identified on Monday, June 20, 2016.

This incident was reported to the California Office of Emergency Services (Control #16-3722) and the San Francisco Department of Public Health within 2 hours of the San Francisco Public Utilities Commission (SFPUC) Wastewater Enterprise being aware of the situation.

1) Incident description and cause;
The final effluent pipeline leading to Discharge Point 001 (Pier 80 Outfall) was observed to have a leak in a section of the pipeline at the end of Pier 80 within 800 feet of the final discharge location. Initial observations are that two joint restraints and a pipe strap failed, and two pipe segments separated. The volume of the leak is variable depending on the discharge conditions (e.g. tide levels) and the operating pressure within the pipeline (e.g. treatment plant flow), at a rate of approximately 0.5 gallons/minute during a higher operating pressure and a rising tide.

2) Location of threatened or involved waterway(s) or storm drains;
San Francisco Bay within 800 feet of the Pier 80 Outfall in San Francisco, CA.

3) Date and time the unauthorized discharge started;
Port of San Francisco personnel notified SFPUC Operations of the observed leak on Monday, June 20, 2016 at 1302.

4) Estimated quantity and duration of the unauthorized discharge (to the extent known), and the estimated amount recovered;
An external inspection on June 21, 2016 by SFPUC and Port of San Francisco personnel revealed no leakage at a low tide and a low pipeline operating pressure, and approximately 0.5 gallon/minute during a higher operating pressure and a rising tide. The respective section of pipe cannot be safely observed from above the Bay during

Vice President
Francesca Vietor
Commissioner
Anson Moran
Commissioner
Art Torres
Commissioner
Harlan L. Kelly, Jr.
General Manager

high tide conditions due to the pipe becoming submerged and the low clearance between the Bay and the bottom of the pier.

5) Level of treatment prior to discharge (e.g., raw wastewater, primary treated, undisinfected secondary treated, and so on);
The discharge is final effluent (secondary treatment with disinfection/dechlorination).

6) Identity of the person reporting the unauthorized discharge.
George Engel, Operations Superintendent at the Southeast Water Pollution Control Plant.

Within five business days, the Discharger shall submit a written report that includes, in addition to the information required above, the following:
1) Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;
The discharge site is at the end of Pier 80 and within 800 feet of the permitted discharge point.

2) Efforts implemented to minimize public exposure to the unauthorized discharge;
Islais Creek Channel has been sampled at the Islais Landing fishing pier from June 20-present date. All results have been below state standards for Rec-1 use. The Pier 80 location was sampled from the northern end of the pier on June 21 and 22, 2016 near the discharge site. Both results were below state standards for Rec-1 use. Sampling at Pier 80 posed safety concerns due the lack of railings on the pier and has been discontinued.

The area of discharge is an active maritime industrial facility with limited recreational access. No recreational activities are typical. The adjacent Islais Creek Channel was physically posted with an international "No Swimming" sign and public notifications (email, hotline, web and mobile app) were performed on June 20, 2016. The site at Islais Creek Channel remains posted with the physical sign and on the web and mobile app even though the bacteria counts have been below the level of concern for water contact recreation. Recreational observations have been recorded when water samples have been collected and so far there are no records of recreational use.

3) Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted;
No adverse impacts were observed. Accessible areas near Pier 80, including public access at the adjacent Islais Creek Channel, have been sampled daily. No elevated bacteria levels have been observed.

4) Corrective measures taken to minimize the impact of the unauthorized discharge;
Port of San Francisco and SFPUC personnel investigated the leak via boat on June 21, 2016. Underwater Resources performed an external inspection via boat under subcontract with the SFPUC on June 23, 2016. An internal inspection by divers to obtain accurate measurements and perform a condition assessment is being planned. A plant shutdown has been scheduled for July 13, 2016, during which we anticipate that Underwater Resources' divers will perform all needed internal and external repairs, pending the results of the internal inspection. Additional dives may be required to finalize repairs.

5) Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future;
Underwater Resources' divers are expected to perform all needed internal and external repairs to the pipeline.

6) Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges;
No changes are necessary.

Please contact Laura Pagano at lpagano@sfwater.org, or (415) 554-3109, or me with any questions.

Sincerely,

George W. Engel
Superintendent, Bayside Operations
Southeast Water Pollution Control Plant

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) June 2016 Monthly Discharge Monitoring Report.

Two acute toxicity flow-through bioassay tests were conducted in June with both resulting in 100% final survival.

It was reported on June 20, 2016 that the final effluent pipeline leading to Discharge Point 001 (Pier 80 Outfall) was observed to have a leak in a section of the pipeline at the end of Pier 80 within 800 feet of the final discharge location (California Office of Emergency Services Control #16-3722). A 5-day report was submitted to the Regional Board on June 24, 2016. The pipeline was repaired and the leak ceased on July 13, 2016.

In June, no rain was recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility did not operate and there were no combined sewer discharge (CSD) events.

Monitoring Report
July 2016

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) July 2016 Monthly Discharge Monitoring Report.

Two acute toxicity flow-through bioassay tests were conducted in July with both resulting in 100% final survival.

The calculated value for the July monthly final effluent TSS was 31 mg/L which is an exceedance of the 30 mg/L limit. The plant upset occurred subsequent to a planned plant shutdown on July 13, 2016. During the shutdown, critical jobs on the chlorine contact channels, the Pier 80 outfall pipeline, the primary sedimentation tanks, the secondary sedimentation tanks, and the electrical system were performed. During the period of July 22-27, 2016, the plant's oxygen generating system experienced malfunctions causing dissolved oxygen level issues in the aeration basins. It was later determined that the activated sludge biomass was depleted based upon microscopic examination. Corrective actions were taken to briefly stop then later resume a lower wasting rate in order to increase the biomass, increase oxygen levels in the aeration basins, provide consistent influent loading rates, and add ferric chloride and polymer to the mixed liquor channels to enhance settling. TSS levels returned to compliance limits. Although another plant shutdown occurred on August 17, 2016, no additional TSS issues have occurred. As of August 25, 2016, the August monthly average TSS value is 24.5 mg/L.

In July, no rain was recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility did not operate and there were no combined sewer discharge (CSD) events.

Monitoring Report
October 2016

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) October 2016 Monthly Discharge Monitoring Report.

An acute toxicity flow-through bioassay test was conducted in October resulting in 80% final survival.

Pursuant to the Regional Board in a letter dated November 10, 2014, the semi-annually required chronic toxicity results with comments (zeolite treated effluent - 5 TUc and untreated effluent-40 TUc) are included with this report as attachments in CIWQS. A report of ammonia add-back testing at 10% effluent toxicity is also included as an attachment. The CWIQS would not accept uploaded ammonia add-back testing at 10% effluent.

A category 3 SSO occurred on October 20, 2016 at Mission Bay Blvd. between 3rd St. and 4th St. Due to a broken sewer line approximately 200 gallons of sewage flowed through to a catch to Mission Bay Pump #4 Pump Station. All flow was captured at Mission Bay PS #4 and pumped to the combined sewer. The event was reported in CIWQS.

In October, 2.32 inches of rain were recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility did operate seven times during wet weather events and processed 184.2 MG. There were two combined sewer discharge (CSD) events.

A bypass was approved by the Regional Board, occurred from approximately October 16, 2016, at 12:16 p.m. to October 17, 2016, at 12:50 a.m. at the Southeast Plant. The bypass occurred due to necessary construction which limited the wet weather capacity of the plant during a rain event.

Ms. Jessica Watkins
California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612

Subject: Southeast Water Pollution Control Plant/ NPDES CA0037664, 5-Day Report

Dear Ms. Watkins:

This letter provides information about an incident at the Southeast Water Pollution Control Plant (SEP) that was reported to the California Office of Emergency Services at 01:40 on November 23, 2016 (Control #16-7096) by Andy Clark, Acting Operations Superintendent. The report stated that SEP was "unable to maintain secondary treatment due to a power outage" and that approximately 4,375,000[1] gallons of primary treated and disinfected effluent was discharged to San Francisco Bay.

The report was made because of a PG&E power outage at SEP that lasted from 00:16 until 01:56 (all times in this report are approximate). At the time of the report, the effects of the power loss were not fully known, but it was understood that secondary treatment processes could be affected. After review of the incident, we believe that all discharges on November 23 received appropriate treatment. More details are provided below and in the attachment, which includes summaries of information available from the Distributed Control System (DCS) and accessed through PI Coresight. We will provide another written update if our continued examination of the event reveals additional relevant information.

Incident description and cause:
PG&E power to SEP was lost at 00:16 and was not restored until 01:56 on November 23, 2016. The outage occurred at the end of a rainstorm. At the time of the outage SEP was in wet weather mode with influent flows exceeding 110 mgd, and was discharging secondary treated and disinfected effluent from EFF-001 (Pier 80 Outfall) and EFF-002 (Quint Street Outfall).

During the power outage, flows continued through all treatment processes and were discharged to San Francisco Bay. Influent flow continued because power to the Channel and Bruce Flynn Pump Stations (PS) was not interrupted. Flow through the primary, secondary, and disinfection processes continued by gravity. Most of the final effluent was discharged through EFF-001 because pumping at the Booster PS was unaffected except for 22 minutes.[2] Effluent flows continued by gravity through EFF-002.

[1] This volume was based on very preliminary assumptions that effluent flow from SEP was 90 mgd and that that the duration of discharge was 70 minutes.
[2] The pumps at the Booster PS were briefly stopped twice because of power interruption. They stopped pumping from 00:16 to 00:32, and from 00:46 to 00:52.

The two liquid treatment processes most affected by power loss are disinfection and secondary aeration. When power is lost, the hypochlorite and sodium bisulfite pumps stop. The stationary engineer assigned to Building 521 must initiate hypochlorite and sodium bisulfite dosing using gravity chemical feed. The dosing is controlled using information from rotameters and colorimetric titrations to determine chlorine concentrations pre and post-dechlorination, and to adjust dosing as needed to meet set targets. Excerpts from the SEP 2015/2016 Operations Manual that describe these protocols are included as an attachment. The assigned stationary engineer followed these protocols and initiated hypochlorite and sodium bisulfite gravity flows at approximately 00:17, one minute after the power outage began, and performed titrations at least hourly. None of the titrations registered a positive chlorine residual in the final effluent.

Secondary treatment processes require power for oxygen generation, mixing, and return activated sludge pumping to support aerobic biological processes. These activities ceased at 00:16 when the outage occurred. Under dry weather conditions, influent flow would typically be stopped and flows would be stored in the transport/storage structures until power is restored and plant start-up procedures completed. On November 23, the Chief ordered pumping to continue because wet weather levels in the Channel Transport/Storage box were high and continued pumping to SEP was needed to prevent a CSD from occurring in Mission Creek. Around 02:40, after the storm was over and Channel box levels had decreased, pumping from the Channel PS and into the secondary aeration tanks was stopped, effectively stopping plant flows. All pumping and processes were back online shortly before 05:00.

Estimated quantity and duration of the discharge:
From the time of the power loss (00:16) until pumping into the secondary aeration tanks was stopped (02:43) approximately 5,370,000 gallons of final effluent were discharged. All effluent passed through primary, secondary and disinfection processes.

Level of treatment prior to discharge:
Flows received primary treatment, secondary treatment, disinfection and dechlorination. The results of 24-hour composite sampling on November 23 were 47 mg/L for COD and 22 mg/L for TSS.

Efforts to minimize public exposure:
No posting occurred because the discharge was disinfected and dechlorinated.

Visual observations of the impacts to receiving waters, and the extent of sampling if conducted:
No visual inspection occurred. A grab sample was collected on November 23 at 07:12 from the Islais Creek kayak launch ramp. The sample had a total coliform concentration of 145 MPN/100 mL, an E. coli concentration of less than 10 MPN/100 mL, and an enterococcus concentration of less than 10 MPN/100 mL.

Corrective measures planned or taken:
During the event, the decision to continue flow through SEP prevented CSDs at Mission Creek.

Additionally, while the details of what caused the PG&E power loss are unknown, the SFPUC has a capital project planned to provide a redundant power feed to SEP that may have prevented or reduced the duration of a similar event. SEP, the Booster Pump Station and the Bruce Flynn Pump Station are each connected to the PG&E Hunter's Point Switchyard through a separate power feed. The planned project would include an additional feed to SEP from PG&E's Potrero Switchyard. A Conceptual Engineer Report has been completed and the project is entering design.

Sincerely,

Mark Harris

NPDES/CA0037664
Monitoring Report
November 2016

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) November 2016 Monthly Discharge Monitoring Report.

Acute toxicity flow-through bioassay test was conducted in November resulting in 90% final survival.

An incident occurred November 23, 2016 and was reported to the California Office of Emergency services at 01:40AM (Control #16-7096). The report stated that SEP was unable to maintain secondary treatment due to a PG&E power outage and that approximately 4,375,000gallons of primary treated and disinfected effluent was discharged to San Francisco Bay.

The five day report was submitted to the California Regional Water Quality Control Board on December 2nd 2016.

In November, there was rain was 1.7 "recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility did operate six times and there were 122.3MGD treated.

Wet Weather Discharge Summary

Drainage Area CSDs	North Shore Basin	Central Basin	Southeast Basin
This Month	0	1	0
2016-17 Season	0	3	0
Design Criteria	4	10	1

If you have any questions concerning this report, please call: Superintendent, Mark Harris, at 415-920-4923, Supervising Chemist, Dolson Kwan, at 415-920-4957, or Laboratory Manager, Kenneth Lee, at 415-920-4965.

Sincerely,

Mark A. Harris
Superintendent, Bayside Operations

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

NPDES/CA 0037664
2016 Annual Report

RE: Southeast Water Pollution Control Plant and Bayside Wet Weather Facilities 2016 Annual Self-Monitoring Report

Dear Jessica:

Transmitted herewith is the annual self-monitoring report for the Southeast Water Pollution Control Plant (WPCP), the North Point Wet Weather Facility (WWF), and Bayside Wet Weather Facilities and Wastewater Collection System for the calendar year 2016, pursuant to Order No. R2-2013-0029, NPDES Permit No. CA0037664 (Southeast WPCP NPDES Permit).

A. Treatment Plant Compliance and Performance

1. Volume Treated

The Southeast WPCP treated a total of 2.47123 billion gallons of combined sanitary, industrial, and storm water in 2016 while the North Point Wet Weather Facility treated a total of 408.1 million gallons of combined sanitary, industrial and storm water. The average dry weather flow for the Southeast WPCP was 54.50 million gallons per day (MGD), calculated using flows from three consecutive dry weather months (July, August, and September).

2. Combined Sewer Discharges

The table below shows the frequency of combined sewer discharges (CSDs) during 2016. A complete wet weather annual report covering the wet weather season from July 2016 through June 2017 will be submitted in July 2017 and will include all the wet weather events for that period.

2016 Combined Sewer Discharge Frequency

	Month												Total
	J	F	M	A	M	J	J	A	S	O	N	D	
North Shore Basin	3	0	3	0	0	0	0	0	0	0	0	1	7
Central Basin	4	0	4	0	0	0	0	0	0	2	1	4	15
Southeast Basin	1	0	0	0	0	0	0	0	0	0	0	0	1

3. Discussion of Treatment Plant Performance and Compliance

Summary of Plant Performance

The San Francisco Public Utilities Commission (SFPUC) is exempt from submittal of an annual compliance summary table and tabular and graphical summaries of monitoring data because all data for the Southeast WPCP are reported electronically. *See* Southeast WPCP NPDES Permit, Monitoring and Reporting Program (MRP), Attachment E at E-17 and Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D, Attachment G (2010) at G-18.

Consistent with the Waste Discharge Requirements for Mercury and PCBs from Municipal and Industrial Wastewater Discharges to San Francisco Bay (Order No. R2-2012-0096, NPDES No. CA0038849), Attachment A summarizes the mercury concentrations of each final effluent sample collected in 2016, the corresponding flow on the dates the sample was collected, and the annual estimated mercury load. The Southeast Plant reported USEPA Method 1668c PCB congener data with the Self-Monitoring Reports for March 2016, May 2016, August 2016, and November 2016.

Discussion of Compliance

During the January 18, 2016 storm event, Plant Operations notified Millbrae Dispatch that CSDs occurred, but did not notify Millbrae Dispatch that they occurred from Northshore. As a result, public notification and/or sampling did not occur or did not occur within a day of the discharge at the beaches potentially affected by these CSDs. Specifically:

- Crissy Field Beach and Aquatic Park Beach were not posted or sampled following a CSD at Baker St on January 6, 2016.
- Crissy Field Beach and Aquatic Park Beach were not posted or sampled following CSDs at Baker St, Pierce St and Sansome on January 18, 2016.
- Jackrabbit Beach was not posted on January 18, 2016 following a CSD at Yosemite on January 18, 2016. Other public notification modes were employed in a timely fashion.

To improve communication, the SFPUC implemented an I-Info email/text notification program in January 2016. These alerts from Plant Operations are now directed to both Millbrae Dispatch and to the responding on-call Biologist. In addition, a back-up notification method has been developed and launched. This method uses level and other sensor data from the Distributed Control System (DCS) and PI Coresight (PI) to automatically send an email to Millbrae Dispatch when information in a transport storage box indicates that a CSD is occurring or imminent. Implementation of this back-up notification method is being tested and refined.

The plant did not meet the acute toxicity 11-sample 90th percentile requirement during January 2016 due to the test result of 60% reported during the November 2015. A test result in February 2016 of 65% survival caused the average to continue to be lower than the requirement in March, April, May, June, and July 2016. The plant met the 11-sample 90th percentile requirement in August 2016 and every month after that in 2016.

The plant did not meet the acute toxicity 11-sample median requirement during 2016 in January, February, March, April and May due to test results below 90%. The plant met the acute toxicity compliance requirement for June 2016 through December 2016. Accelerated testing continued until the end of July when the 11-sample percentile compliance requirement was met.

An elevated result of 0.0431 µg/L for mercury was detected from the first sample collected on March 15; accelerated monitoring was performed as required, with all sample results returning below monitoring and effluent limits. The monthly average for mercury was 0.00983 µg/L (below the permit limit).

On March 5, 2016, during a combined sewer discharge event at the Mariposa outfall, one of two wet weather pumps was operational at the Mariposa Pump Station. The pump failure cause was an overcurrent state detected on the frequency drive, likely attributable to wet weather debris. An estimate volume of 131,000 gallons was discharged over a 67 minute period. As the system was at capacity during this discharge, the pump failure resulted in relocating combined wastewater which would have been discharged at the Islais Creek outfalls to the Mariposa outfall instead; all storage in the system was maximized. On March 10, 2016, the SFPUC submitted a 5-day Written Report regarding this event.

On June 20, 2016, the SFPUC reported that the final effluent pipeline leading to Discharge Point 001 (Pier 80 Outfall) had a small leak in a section of the pipeline at the end of Pier 80 within 800 feet of the final discharge location. This event was reported to California Office of Emergency Services Control (#16-3722) and a 5-day report was submitted to the Regional Board on June 24, 2016. The pipeline was repaired on July 13, 2016.

The calculated value for the July monthly final effluent TSS was 31 mg/L which exceeded the 30 mg/L limit. This result followed a lengthy planned plant shutdown on July 13, 2016 for critical work on the chlorine contact channels, the Pier 80 outfall pipeline, the primary sedimentation tanks, the secondary sedimentation tanks, and the electrical system. In addition to this shutdown, the plant's oxygen generating system experienced malfunctions causing dissolved oxygen level issues in the aeration basins from July 22-27, 2016, which likely contributed to this TSS result.

A category 3 SSO occurred on October 20, 2016 at Mission Bay Blvd. due to a broken sewer line. Approximately 200 gallons of sewage flowed to a catch basin and was captured at the Mission Bay Pump #4 Pump Station which pumped the flow to the combined sewer.

A bypass occurred at the treatment plant on October 17, 2016 during a wet weather event when the plant influent was limited due to necessary construction. This bypass was subsequently approved by the Regional Board.

On November 23, 2016, SFPUC reported a plant power outage during a wet weather event to the California Office of Emergency services (Control #16-

7096). The five day report was submitted to the California Regional Water Quality Control Board on December 2, 2016.

4. Actions Taken or Planned to Improve Plant Performance & Reliability

The following capital projects are planned for, underway or recently completed for the Southeast WPCP, North Point Wet Weather Facility and associated collection system:

2016 Capital Improvement Projects

- Booster Pump Station (SEP 550) Pump-Motor Maintenance/ Repair: This project was to service and repair the four (4)-pump-motor units at the facility. NTP was in December 2014, and Maintenance repair and rehabilitation were completed in 2016.
- Booster Pump Station (SEP 550) Power Cell Upgrades: This project included as-needed repairs and performance testing of fifty (50) existing 700 HP power cells. NTP was September 2015, and the work was completed August 2016.
- Bruce Flynn Pump Station (BFS) VFD Replacement: This project removed and replaced six (6) Wet Weather Robicon Variable Frequency Drive (VFD) controllers. NTP was October 2015, and the project was completed August 2016.
- Bruce Flynn Pump Station (BFS) Bar Screen Parts Replacement: This project replaced chains, rakes, and guide assemblies for both bar screens at the BFS. NTP was July 2016, and the work was completed November 2016.
- Channel Pump Station (CHS) Bubbler Compressor Upgrade and Concrete Repair: This project is to upgrade existing bubbler air compressors and provide concrete repair at the Division Street Outfall (DVO; Discharge Point #026). NTP was September 2016, and the target for substantial completion is August 2017.
- Fixed Gas Monitoring System Upgrades: The project was to install fixed gas detectors and monitoring systems in various process buildings. Construction started in June 2014, and the construction work for Southeast Plant (SEP) and BFS was completed in December 2015. The Contract includes 3-year service and maintenance of the installed fixed gas systems at SEP and BFS, with expected completion in November 2018.
- Instrumentation & Backup Power Systems Improvements: This project includes the replacement of 33 bubbler systems (bubblers) used for level and flow measurement; 29 bubblers are being replaced in-kind while four bubblers are to be replaced with Ultrasonic type systems. The project also includes the replacement of seven Distributed Control System (DCS) Uninterruptible Power Supply (UPS) units for SEP Liquid Treatment and BFS, and installing new ferrous chloride injection system flowmeters and DCS monitoring for Griffith Pump Station and

North Point Facility. NTP was July 2014, and the project was substantially completed October 2016.

- Islais Creek System Flush Control Valve Upgrade: This project re-established the functionality of the flush control valves at the Islais Creek Transport/Storage Box (ICT). Project received NTP March 2016, and the work was substantially completed December 2016, awaiting final testing.
- Mariposa Pump Station (MPS) Roof Replacement: This project replaced the dilapidated roof at MPS. NTP was January 2016, and the project was substantially completed August 2016.
- North Point Wet Weather Facility (NPF) Dewatering Pump Replacement & Electrical Upgrade: This project is to repair and rehabilitate the existing deficient and deteriorated dewatering pumping and electrical systems for NPF sedimentation and chlorination process structures. NTP was November 2015. The project was substantially completed November 2016.
- North Point Outfall (NPO) Rehabilitation: The project is to repair reinforced concrete sewers, reline outfall pipes, remove and dispose of Bay sediments from inside, outside, and surrounding diffusers, install a corrosion protection system for outfall pipes and associated structural supports, and install air release mechanism. The bid opening was in December 2016. Commission approval and contract award is planned for January 2017. The construction duration is one year.
- Pierce Street Weir Structure Improvements: This project pressure-grouted various leaks along the Pierce St. weir structure. Additional improvements were identified for the Pierce Street Outfall (Discharge Point #010). The original project received NTP June 2016, and the work was substantially completed December 2016.
- Selby and Marin Outfall Upgrades: This project is to provide precast covers over the existing outfall structures, including concrete repairs and baffle installation. The project received NTP July 2016, and substantial completion is targeted for June 2017.
- SEP & BFS Fire Alarm Systems: This project which replaces and upgrades the existing deteriorated and outdated fire alarm systems at SEP and BFS to current codes and standards was completed in October 2016. Additionally, the project will provide audible and visible field notification devices in high noise level process equipment areas and install missing fire alarm systems at modular buildings within SEP. The Contract includes 2-year service and maintenance of the installed fire alarm systems at SEP and BFS, with expected completion in November 2018.
- SEP Chemical System Relocation and Facility Upgrades: The scope includes replacing the existing sodium hypochlorite storage tanks, pumping and piping systems, and mixers, for odor control and disinfection, and providing upgrades at the plant's headworks, primary treatment, and secondary treatment facilities to improve process control.

Construction started in March 2014, and the construction work was approximately 95% complete as of December 2016.

- SEP Primary and Secondary Clarifiers Upgrade: The project is to improve the reliability of the equipment and processes at Primary and Secondary Clarifiers. The major scope of work includes the installation of a ventilation system for the primary sedimentation tanks for odor control plus mechanical upgrades to and concrete coating of primary sedimentation tanks and several secondary clarifiers. Other mechanical and electrical works are also included. NTP was March 2016, and the construction work was approximately 45% complete as of December 2016.
- SEP 042 Drum Screen Modification: This project modifies the existing drum screen to allow Operations to safely retrieve primary screenings from ground level. NTP was March 2016, and Substantial Completion was December 2016.
- SEP 042-044 Valve Actuator Improvements: This project replaced eleven (11) existing actuators in the primary sedimentation system with upgraded models to improve personnel safety. NTP was April 2016, and Substantial Completion was December 2016.
- SEP 230 Secondary Clarifier Handrail and Concrete Repairs: NTP was October 2015, and the project was substantially completed July 2016.
- SEP 260 OCU Replacement: Existing Secondary Sludge Control Building Odor Control Unit (OCU) was replaced. The new unit was commissioned/ completed in June 2016.
- SEP 260 RAS Pump VFD Upgrade: Existing Secondary Sludge Control Building RAS pump VFDs are in the process on being upgraded, and pump sensor status is to be reported via the SEP Distributed Control System (DCS). Project completion is expected in March 2017.
- SEP 275 Oxygen Generation Plant Replacement: The project was to install two new Vacuum Pressure Swing Adsorption (VPSA) Oxygen Plants to replace the aging Cryogenic Oxygen Plant. Construction started in January 2013. Excessive noise issues delayed project completion. Substantial Completion was January 2016, and Final Completion was April 2016.
- SEP 521/522 Disinfection Upgrades: The objective is to upgrade the controls and chemical sampling station at SEP 521 – Postchlorination Building, relocate the electrical equipment into a new building (SEP 522 – Disinfection Electrical/HPU Structure), improve the No. 3 water system (process water), and replace valves and actuators. Concrete repair to stop leaks and coating of the chlorine contact channels for corrosion protection are also included. NTP was issued March 2016, and the construction work was approximately 43% complete as of December 2016.
- SEP 785 Gravity Belt Thickener Control Improvements: Existing process controls and fixed gas detectors and controllers were deteriorated. A Job Order Contract (JOC) was used to relocate process

control systems to a new enclosure adjacent to but outside the humid and corrosive process building, SEP 785, and to upgrade the obsolete fixed gas detection system. NTP was in February 2015, and the project was substantially completed January 2016.

- SEP 785 Gravity Belt Thickener Refurbishment: Refurbishment parts were procured in July 2016. Staff targets 2017 for parts installation.

5. Effluent Characterization Study

For this evaluation, all constituents listed in Attachment G, Table C, except for those pollutants with effluent limitations, that were detected above the method Minimum Levels (ML) were evaluated. Estimated concentrations of constituents detected below the MLs were excluded from this evaluation because the uncertainty in the result when a constituent is detected below the ML prevents useful comparison.

Nine constituents were detected above the method MLs: Antimony, Cadmium, Chloroethane, Chloroform, Chromium III, Lead, Nickel, Toluene, and Zinc. The 2016 maximum detected level of each of the nine constituents was compared to the Maximum Effluent Concentration (MEC) as presented in Table F-9 of the Southeast Permit (Reasonable Potential Analysis). The MECs were used as the general indicators of past performance of the detected constituents.

Eight out of the nine detected constituents showed deceases or no statistically significant changes or increases compared to the corresponding MECs.

Antimony increased slightly, from 0.71 to 0.902 µg/L. No obvious reasons were identified for the increase and the increase was less than one order of magnitude of the MEC in Table F-9. The increases were potentially statistical variations caused by variability in sampling and analytical procedures. The constituents will be monitored and evaluated again in 2017.

The detected constituents and evaluations are summarized in the table below.

Trends for Selected Constituents

Constituent	Method Minimum Level (ML, µg/L)	2016 Maximum Detected Level (µg/L)	Past Performance[1] (µg/L)	Governing Criterion or Objective (µg/L)	Comment
Antimony	0.5	0.902	0.71	4300	Continue to Monitor
Cadmium	0.25	0.396	1.3	9.36	Decrease
Chloroethane	0.5	0.654	11	No Criteria	Decrease
Chloroform	0.5	7.53	11	No Criteria	No change or increase
Chromium III	0.5	0.891	3.7	No Criteria	Decrease
Lead	0.5	1.12	1.6	8.5	No change or increase
Nickel	1	5.2	5.1	13	No change or

					increase
Toluene	0.5	1.01	1.5	200,000	No change or increase
Zinc	1	51.9	55	86	No change or increase

1. The Maximum Effluent Concentration (MEC) or the minimum detection level, as listed in Table F-9. Reasonable Potential Analysis in the Southeast Permit, NPDES NO. CA0037664, Order No. R2-2013-0029, is used as an indicator for past performance.

6. Sludge Disposal

In 2016, the Southeast Treatment Plant disposed of 11,832 dry metric tons of sludge at the following locations:

Location	**Dry Metric Tons**
Sonoma County Land Application	3,873
Sacramento County Land Application	937
Landfill Beneficial Use	3,859
Vasco	754
Potrero	2,968
Altamont	3,300
Central Valley Compost	137
TOTAL	**11,832**

B. APPROVED LABORATORY ANALYSES

See Attachment B for a list of analyses for which the SFPUC is certified. All analyses were performed in-house by the SFPUC except for the following:

- Dioxin, method EPA 1613, is performed by Frontier Analytical;
- Semi-volatile Organic Compounds, EPA 625, Caltest Analytical; and
- Tributyltin by Gas Chromatography/Mass Spectrometry, Calscience

C. FACILITY INFORMATION

1. Plan View Drawing or Map of Facility

See Attachment C.

2. Results of Annual Facility Inspection to Verify Stormwater Pollution Prevention Plan Elements

Southeast WPCP is exempt from this requirement because it routes all stormwater that falls on the facility property to the headworks of the treatment plant. *See* Southeast WPCP NPDES Permit, Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D), Attachment G (2010) at G-3.

3. Results of Annual Facility Report Reviews

Contingency Plan

The Contingency Plan was updated in November 2016. Staff are working to update the Spill Prevention Plan.

Operations and Maintenance Manual

The Operations Manual was updated in November 2016. The Operations and Maintenance Manuals for preliminary treatment, primary treatment, cryogenic air separation, secondary treatment, disinfection, solids thickening, anaerobic digestion and solids dewatering are currently being updated.

Wastewater Facilities Status Report

San Francisco is utilizing a Wastewater Asset Management Program to enhance reliability of the plant process equipment and optimize its maintenance and operations activities by assessing the criticality of the equipment based on which equipment carries the most risk. Based on the risk of the equipment, the appropriate Maintenance, and Repair and Rehabilitation (R&R) Program strategy can be implemented to enhance plant reliability. The highest risk equipment will have the more rigorous maintenance procedures including Routine and Preventive Maintenance, Predictive Maintenance, Condition-based Maintenance, and Reliability-Centered Maintenance. The R&R Program sets priorities based on the highest risk equipment, and the equipment at the end of its useful life. San Francisco uses a CMMS (Computerized Maintenance Management Software) to plan, schedule, initiate and track preventive and corrective work, and record equipment condition assessments.

D. Collection System Update

Launched in 2007, the SFGreasecycle program aims to minimize the amount of FOG discharged to the sewer system by providing a free waste grease pickup service for commercial establishments and free drop-off services for residents. The program was developed to address both source control, through collection services and public outreach, and end use, through the production of biodiesel from waste grease. To date, SFGreasecycle has collected approximately 2.4 million gallons of waste grease from 838 participating food service establishments and 8 residential drop-off points located throughout San Francisco. Since 2007, the program has generated over $4 million in revenue for San Francisco and is expected to reduce the annual costs expended on grease related sewer blockages by sewer operations maintenance crews.

The FSEs currently participating in the program represent approximately 35% of the total number of FSEs in San Francisco and new commercial accounts continue to sign up daily. The annual grease collected from commercial FSEs began at 6,000 gallons in 2007, grew to 400,896 gallons in 2013, and has remained steady since. The residential recycling program component has focused on resident outreach and education and now collects over 11,000 gallons a year from 8 convenient drop-off sites located throughout San Francisco at such retail vendors as Whole Foods Market and Costco. In 2016, SFGreasecycle's annual two-month holiday outreach campaign captured over 1,100 gallons of residential grease or roughly 19 gallons a day.

E. Participation in in Regional Efforts

In 2016, the SFPUC continued its financial support of and participation in the San Francisco Estuary Institute's Regional Monitoring Program in order to fulfill the receiving water monitoring requirements of the Southeast WPCP NPDES permit. *See* Southeast WPCP NPDES Permit at E-12.

As a principal member of the Bay Area Clean Water Agencies, the SFPUC also continued to support nutrient receiving water monitoring and science plan development and implementation; participate in the development of Total

Maximum Daily Loads and site-specific objectives; support implementation of the Mercury and PCBs Watershed Permit; and support implementation of the regional copper action plans.

If you have any questions concerning this report, please contact one of the following people: Superintendent, Mark Harris, at 415-920-4923; Laboratory Services Manager Kenneth Lee, at 415-920-4965 or Supervising Chemist, Dolson Kwan, at 415-920-4957.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Mark Harris

Mr. Bruce Wolfe, Executive Officer
San Francisco Bay Regional Water Quality Control Board
1515 Clay Street, 14th Floor
Oakland, CA 94612

Subject: NPDES Permit Requirements for Receiving Water Quality Monitoring, TMDL/SSO Support, Mercury and PCBs Watershed Permit Support, and Implementation of Copper Action Plans

Dear Mr. Wolfe:

I am writing on behalf of the Bay Area Clean Water Agencies (BACWA) and its members that own and operate publicly-owned treatment works (POTWs) and that have National Pollutant Discharge Elimination System (NPDES) permits to discharge to San Francisco Bay Area waters. The NPDES permits issued to these agencies impose some requirements that are most efficiently fulfilled as a group. The purpose of this letter is to report on behalf of BACWA members that those requirements are being met, including permit provisions related to: (A) Receiving Water Quality Monitoring, (B) Support for the RMP through the Alternate Monitoring Requirements (AMR), (C) Total Maximum Daily Load and Site Specific-Objective Support, (D) Mercury and PCBs Watershed Permit Support, (E) Copper Action Plan Support; and (F) Nutrient Watershed Permit Support.

A. Receiving Water Quality Monitoring

Various NPDES permits require that the permittees support the Regional Monitoring Program for Water Quality in the San Francisco Estuary (RMP), administered by the San Francisco Estuary Institute (SFEI), and established by San Francisco Bay Regional Water Quality Control Board (Regional Water Board) Resolution 92-043, adopted April 15, 1992. BACWA members have and continue to fulfill this requirement by participating in and providing funding to the RMP. A letter from SFEI, dated January 18, 2017, confirming BACWA member agencies' contributions to the RMP, is attached for reference.

B. Participation in the Alternate Monitoring Plan

In March 2016, the Regional Water Board adopted the Alternate Monitoring Requirements (AMR)[1], an Order that allows POTWs to reduce monitoring frequencies for specific pollutants in exchange for increased funding to the RMP. The Order calculates the additional fee for each agency to opt into the AMR based on its estimated cost savings associated with reduced

[1] Order No. R2-2016-0008 Alternate Monitoring and Reporting Requirements for Municipal Wastewater Dischargers for the Purpose of Adding Support to the San Francisco Bay Regional Monitoring Program (RMP).

monitoring requirements. The agencies who have opted into the AMR are listed in the attached January 12, 2017 letter from SFEI.

C. Total Maximum Daily Load and Site-Specific Objective Support

Some POTW permits previously included a requirement that permittees report to the Regional Water Board any actions taken in support of the development of Site-Specific Objectives (SSOs) and Total Maximum Daily Loads (TMDLs) for 303(d) listed pollutants. Support for these efforts has been provided largely through support of the RMP.

As part of the site-specific objectives (SSO), NPDES dischargers are required to calculate the 3-event rolling average of total cyanide concentrations in each segment of the Bay, based on RMP data. In 2016, the last three RMP water cruises (2011, 2013, and 2015) were used to update the averages.

In 2014, the RMP convened a Selenium Strategy Team and developed a Selenium Strategy in the Multi-Year Plan, and coordination within the Strategy Team continued in 2016. The new strategy includes measuring selenium in small tissue samples from sturgeon collected using non-lethal methods. In 2016, tissue samples were collected from sturgeon during non-lethal fish trawls in North Bay and during the Sturgeon Derby in Martinez. The tissue samples were analyzed for selenium to track implementation of the North Bay Selenium TMDL.

D. Mercury and PCBs Watershed Permit Support

The Mercury and PCBs Watershed Permit was reissued in 2012, and became effective on January 1, 2013[2]. The reissued permit has no requirements for Mercury Special Studies. BACWA will continue to work with the RMP to develop and implement an updated mercury science strategy.

The Regional Monitoring Program continues to perform the status and trend (S&T) monitoring and special studies needed to support management of mercury and PCBs in the Bay. Recent S&T monitoring for mercury has included sport fish in 2014 and 2015 (report coming in Q2 2017), open Bay sediment in 2014 (to be reported in the 2017 Pulse), water in 2015, margins sediment in 2015 (report coming in Q2 2017), and bird eggs in 2016.

Recent S&T monitoring for PCBs has included the same elements mentioned for mercury, with the addition of bivalves in 2014. Special studies for PCBs have also recently been a significant part of the RMP. The RMP PCB Strategy called for a multi-year study plan beginning in 2015 focusing on monitoring the response of priority margin unit receiving waters to management actions in high-leverage watersheds. Conceptual models and mass balances are being developed for four priority margin units (Emeryville Crescent, San Leandro Bay, Steinberger Slough, and Richmond Harbor). A report on Emeryville Crescent will be completed in January 2017. Using SEP funds, an extensive field study is also being conducted in San Leandro Bay to support development of the conceptual model, a mass balance, and a food web model in support of the possible revision of the PCBs TMDL.

[2] Waste Discharge Requirements for Municipal and Industrial Wastewater Discharges of Mercury to San Francisco Bay, Order No. R2-2012-0096; NPDES No. CA0038849

In 2016 BACWA's Bay Area Pollution Prevention Group (BAPPG) continued to reach out to dental assistant and dental hygienist students to educate them about proper amalgam management and disposal. In 2016, this campaign reached approximated 164 people at 7 speaking engagements. In December 2016, the Dental presentation was updated to reflect the new EPA Dental Rulemaking as well as the FDA's September 2016 ban of triclosan, triclocarban and 17 other antimicrobials in hand soaps and body washes (effective September 2017). In 2017, BAPPG will continue to provide the guest speaker to local colleges. The instructors have come to rely on these annual visits and have interwoven the BAPPG program into their instructional calendar.

The permit requires that permittees conduct or participate in programs to reduce mercury-related risks to humans from the consumption of Bay fish. In 2016 BACWA continued funding two grants worth $25,000 each to the California Indian Environmental Alliance, and APA Family Support Services, to conduct activities related to reducing risk from fish consumption in vulnerable populations. Work related to both grants began in 2015 and will be completed by 2017. BACWA coordinated with the grantees to provide a progress update on their risk reduction activities to the Regional Water Board on October 25, 2016.

E. Copper Action Plan

The copper action plan contained in many Bay Area POTW permits requires permittees to implement a plan to reduce copper discharges, conduct studies to reduce copper pollutant impact uncertainties, and implement additional measures should the three-year rolling mean in various parts of the Bay exceed site-specific concentration triggers. In 2016, the RMP analyzed water and sediment samples for copper to provide data relative to the implementation of the Copper Action Plan.

Regarding studies to reduce uncertainties in terms of the impact of copper on beneficial uses, in 2013, the RMP contracted with the National Oceanic and Atmospheric Administration Northwest Fisheries Science Center in Seattle to study the olfactory toxicity of copper on salmonids. The studies indicate that even at very high concentrations of copper in seawater (> 100 µg/L), Chinook salmon's sense of smell is not impaired. For juvenile salmon, copper concentrations up to 50 µg/L did not have impacts on the olfactory system at salinities >10 ppt. A journal article describing these results was published in 2016[3].

In addition to the measures being taken by individual agencies to reduce copper in discharges in 2015, BAPPG supported one presentation at a plumbing class at Laney Community College, Oakland (15 students) about BAPPG's flux and flushing BMPs.

During the public comment period of the U.S. EPA Review of Pesticides, BACWA asked that U.S. EPA evaluate risks and examine risk mitigation options for Copper products that are used in swimming pool, spa, and fountain treatments because pools, spas, and fountains are often discharged to POTWs in lieu of discharging to gutters/storm drains, and fabric treatments and subsequent discharges to POTWs during washing of the treated end product (e.g., clothing).

[3] Sommers F, Mudrock E, Labenia J, Baldwin D. Effects of salinity on olfactory toxicity and behavioral responses of juvenile salmonids from copper. Aquatic Toxicology. 2016 ;175.

F. Nutrient Watershed Permit Compliance

The Nutrient Watershed Permit[4] was adopted on April 2014, with an effective date of July 1, 2014. Through the nutrient surcharge levied on permittees, BACWA is funding compliance with the following provisions of the Nutrient Watershed Permit on behalf of its members:

- Group Annual Reporting – BACWA submitted the second Group Annual Report on October 1, 2016. All the permittees under the Nutrient Watershed Permit participated in the Group Annual Report.
- Optimization and facilities upgrade studies – Studies are ongoing, and an update was provided to Regional Water Board staff at BACWA's Annual Pardee Technical Seminar in October 2016. A progress update was submitted per permit requirement on July 1, 2016. A Final Report on the studies is expected prior to the July 2018 permit deadline.
- Support of scientific studies as part of the Nutrient Management Strategy – BACWA has provided $880K to SFEI in 2016. An update on the science plan for the 2016 calendar year will be submitted by February 1, 2017.

Please contact me if you have any questions about the information contained in this letter.

Respectfully,

David R. Williams

David R. Williams
Executive Director
Bay Area Clean Water Agencies
PO Box 24055, MS 59
Oakland, CA 94623

Dear Mr. Williams:

The Regional Monitoring Program for Water Quality in San Francisco Bay (RMP) is the only comprehensive environmental monitoring program to measure pollutants and trends in the Bay. The RMP, which began in 1993 and is still going strong, is a successful partnership of scientists, government, municipalities, and industries to understand and improve the health of the Bay.

The goal of the RMP is to collect data and communicate information about water quality in the San Francisco Estuary in support of management decisions. The accomplishments of the RMP over the past two years is summarized in the "RMP Update" report that was published in October 2016. The full report can be downloaded from http://www.sfei.org/rmp/update.

In 2016, 35 wastewater treatment facilities collectively contributed the full amount of the core RMP program costs assigned to publicly owned treatment works ($1,549,043, see Table 1 for a complete list of agencies). The process used to determine the core fees for each participant group are outlined in the Program Charter: http://www.sfei.org/documents/charter-regional-monitoring-program-water-quality-san-francisco-bay.

In March 2016, the Water Board adopted Order R2-2016-0008, establishing an alternative monitoring requirement (AMR) for municipal wastewater discharges to San Francisco Bay and its tributaries, in exchange for a set schedule of increased payments to the RMP. Participating wastewater treatment facilities who opt-in to this alternative are able to reduce their effluent monitoring costs for most organic priority pollutants and chronic toxicity sensitive species rescreening. In exchange for the reduced monitoring requirements, facilities make supplemental payments to the RMP for regional studies to inform management decisions about water quality in the Bay. In 2016, 30 wastewater treatment facilities made supplemental contributions to the Program under Order R2-2016-0008 ($235,077, see Table 1).

This support is essential to the Program. Through these financial contributions, the RMP is able to conduct regional monitoring to assess the cumulative impact of multiple sources of pollutants to the Bay. We thank you and your members for the support and look forward to serving you in 2017.

Sincerely,

Philip Trowbridge, PE
RMP Manager

Subject: 5-Day Report re Pier 80 leak reported February 21, 2017, Southeast Water Pollution Control Plant/ NPDES CA0037664

Dear Ms. Watkins:

This is the 5-Day Report for the Pier 80 final effluent leak for which the San Francisco Public Utilities Commission (SFPUC) received notification about and reported on February 21, 2017.

Incident description and cause:
At approximately 11:00 a.m. on February 21, 2017, the SFPUC received notification by email from a Port employee that there was a leak, possibly from the Southeast Treatment Plant final effluent force main located under Pier 80. See Attachment A for a location map. The notification occurred at the end of a rainstorm. At that time, the Southeast Treatment Plant was in wet weather mode receiving influent flows at approximately 250 MGD and discharging an effluent mixture of primary and secondary disinfected effluent, in compliance with permit requirements. The leak occurred approximately 500 feet from the outfall diffuser discharge point.

SFPUC staff immediately investigated and determined that the cause was a missing section of a vent pipe for SFPUC's final effluent pipe that had broken off from the side of a thrust block. See Attachment B for a schematic drawing of the vent pipe. Staff developed a plan and mobilized a specialty marine inspection and construction company, Underwater Resources Inc., to effectuate a repair. On February 23, Underwater Resources attempted to install a plug in the leak but could not get close enough to the site due to tides. A second, successful repair effort was made on February 24 to install a temporary plug. This plug has halted almost all of the leak flow; however a small leak of approximately 0.5gpm remains. Crews will go out on February 28, 2017, when tides are favorable to attempt to eliminate this leak. A final repair to remove the plug and reconnect the vent to the final effluent outfall pipe is planned in the next two weeks.

Methods used to delineate the geographical extent of the discharge within receiving waters
Staff used the following factors to determine an estimate of the leak flow rate: effluent flow velocity (based on field observation) and area of the pipe hole. Staff calculated a leak flow rate estimate of 1214 gpm.

Efforts implemented to minimize public exposure to the discharge
Public exposure to the discharge is very limited. As indicated in the Attachment A, the leak is from infrastructure located underneath Pier 80 which is inaccessible to the

public. The nearest shoreline access is the kayak ramp located in Islais Creek at the intersection of Quint Street and Cargo Way. This location was posted from February 21-25, 2017.

Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted
Visual observations of the leak and receiving waters were initially conducted on February 21, 2017 at approximately 1:00 p.m. No impacts were observed.

Final effluent was analyzed for fecal indicator bacteria daily from February 20th through February 24th, 2017 as part of the NPDES permit required monitoring for SEP. All results were below permit effluent limitations.

The leak site has accessibility challenges; sampling from the Pier 80 poses unacceptable safety risks to staff and the shoreline nearest the leak is privately owned. Although staff were able to take a sample from the privately owned shoreline area on February 21, 2017, permission for on-going access was not forthcoming, so staff selected the routine shoreline Islais Creek kayak launch ramp as the best location for monitoring water quality where public use is highest. See Attachment A for sampling locations.

Receiving water samples were collected from the Islais Creek kayak launch ramp and analyzed for fecal indicator bacteria. As part of the beach monitoring program administered by the SFPUC and the San Francisco Department of Public Health, sampling and posting is conducted at the ramp after CSDs occur in Islais Creek and every day thereafter if the sample results are above the California Department of Public Health's fecal indicator bacteria standards related to recreational use. CSDs occurred in Islais Creek on January 17th and January 20th. Fecal indicator bacteria concentrations were elevated in samples collected daily at the ramp between January 17th and January 23nd. The elevated concentrations are believed to be caused by the January 20th CSDs, which were very large in volume due to the large amount of rainfall (more than two inches over a 24 hour period). Concentrations were below recreational use standards on January 24th and January 25th. The site was de-posted on January 25th.

The special receiving water sample SFPUC collected from a location closer to the leak on February 21 had elevated fecal indicator bacteria. The concentrations are lower than, but within the same order of magnitude, as the sample collected the same day at the launch ramp. Both receiving water samples are orders of magnitude lower than the final effluent sample collected the same day. This information indicates that the elevated concentrations in the special sample are attributable to the January 20th CSDs and not the final effluent leak.

All sampling results are included in Attachment C.

Corrective measures taken to minimize the impact of the discharge
Staff mobilized quickly to determine infrastructure ownership and to develop a plan to stop the leak. Specific steps involved contracting with Underwater Resources and shutting the plant down twice (one shutdown of one hour and a second shutdown of 6 ½ hours) to make repairs shortly after the leak notification. The discharge was final treated effluent and located only approximately 500 feet from the authorized discharge point, and any potential risk of impacts on receiving waters was minimal.

San Francisco Public Utilities Commission
February 28, 2017

Measures to be taken to minimize the chances of a similar discharge occurring in the future
Staff plans to conduct an investigation and condition assessment of the vent line to determine if additional repair or replacement is necessary. Staff anticipate that this work will take place in the next three months.

Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future discharges
No changes to the Spill Prevention Plan or O&M Manual are needed.

Quantity and duration of the discharge, and the amount recovered
From the time of discovery at 11:00 a.m. on February 21, 2017 until the vent leak was plugged at 6:00 p.m. February 24, 2017, approximately 5.17 MG of final effluent were discharged. A small leak of 0.5 gpm remains which crews will attempt to eliminate on February 28, 2017.

As the leak discharged directly into receiving waters, it was not possible to recover any volume.

Location of threatened or involved waterway(s) or storm drains
San Francisco Bay at Pier 80.

Date and Time the discharge started:
The SFPUC was notified about the leak on February 21, 2017 at approximately 11:00 a.m.

Level of treatment prior to discharge:
All flows received permit-required treatment levels, which was a mixture of primary and secondary treatment, plus disinfection and de-chlorination.

Corrective measures planned or taken:
A plug of cast iron material was successfully installed on February 24, 2017 at 6:00 p.m. to secure the leak. Almost all flow is now discharging through the authorized discharge point at EFF-001 (Pier 80 Outfall); however, a small 0.5 gpm leak remains. Crews will attempt to eliminate this leak on February 28, when the tides are favorable. A final repair to remove the temporary plug and reconnect the vent to the final effluent outfall pipe is planned to take place in the next two weeks, after which staff will conduct a condition assessment of the vent line to determine if additional repair or replacement is needed.

Identity of the person reporting the unauthorized discharge.
Andy Clark, Acting Superintendent of the Southeast Treatment Plant, reported the leak on February 21, 2017 to the California Office of Emergency Services at 12:40 p.m. (Control #17-1591), and the Department of Health Services at approximately 1:15 p.m.

Sincerely,

Mark A. Harris

Monitoring Report
February 2017

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) **February 2017** Monthly Discharge Monitoring Report.

An acute toxicity flow-through bioassay test was conducted in February resulting in 100% final survival.

An incident occurred on February 21, 2017, which was reported to the California Office of Emergency services at 12:40 (Control # 17-1591). The report stated that while the plant was discharging through authorized EFF-001(Pier 80 Outfall), a discharge of fully treated effluent occurred due to a broken vent pipe approximately five hundred feet from the diffuser discharge point. The five day report for this event was submitted to the Regional Water Quality Control Board on February 28, 2017.

In February, 6.85" rain was recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility operated thirteen times and treated 538.5 MG.

Subject: 5-Day Report re Pier 80 leak reported on April 4, 2017 to Cal OES (Control #17-2581), Southeast Water Pollution Control Plant/ NPDES CA0037664

Dear Ms. Watkins:

This letter constitutes the 5-Day Report regarding an intermittent leak from the concrete seawall under Pier 80 near the vent pipe for the Southeast Treatment Plant final effluent outfall pipe, which was discovered on April 4, 2017.

Incident description and cause:

At approximately 2:00 p.m. on April 4, 2017, influent flow to the Southeast Treatment Plant (SEP) was approximately 60 million gallons per day (MGD). Around this time divers were installing structural support to the vent pipe under Pier 80. The vent pipe, which connects to the SEP final effluent outfall pipe (discharge point EFF-001), is scheduled to be replaced in approximately six months. As described in the SFPUC's 5-Day report of February 28, 2017, there was an issue with the vent pipe losing a section, which was repaired on March 16, 2107 as a temporary measure to restore the pressure relief function of the vent pipe. After completing the structural support additions, the divers noticed water flow coming from the sea wall near the vent pipe. SFPUC staff reported this event to Cal EOS on April 4, 2017 at 3:35 p.m. (#17-2581).

After investigation, SFPUC staff have concluded that the water from the seawall leak is final effluent from SEP (fully treated, disinfected and dechlorinated wastewater meeting all effluent limitation requirements at point of discharge from the plant). The water is entering the vent pipe as part of a pressure release function and escaping through a break in the vent pipe line. However, identifying the exact location of the break is problematic because the relevant portion of the vent pipe is embedded in the concrete of the seawall and Pier 80 pavement.

Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters:

SFPUC Engineering and Operations staff tested the circumstances under which the seawall leak occurred by varying the pressure at Booster Pump Station and concluded that the leak happens at a rate of approximately 4 gallons per minute when Booster Pump Station (BPS) exceeds 9 psi. Using information from the Distributed Control System (DCS) to identify the time period where BPS exceeded 9 psi, staff have concluded that approximately 23,488 gallons of final treated effluent has discharged through the seawall leak from April 4-10, 2017.

Subject: 5-Day Report for final effluent pipe leak in Islais Creek reported on April 12, 2017 to Cal OES (Control #17-2765), Southeast Water Pollution Control Plant/ NPDES CA0037664

Dear Ms. Watkins:

This letter constitutes the 5-Day Report regarding a leak into Islais Creek from the Southeast Treatment Plant (SEP) final effluent pipe, which was discovered on April 12, 2017.

Incident description and cause:

At approximately 10:45 a.m. on April 12, 2017, Operations staff in the field observed an upwelling on the surface water near the SFPUC's final effluent pipe where it crosses Islais creek. This section of the line is part the SEP final effluent outfall pipe that transports fully treated, disinfected and dechlorinated wastewater from the plant and discharges at Pier 80 (EFF-001). SFPUC staff reported this event to Cal EOS on April 12, 2017 at 12:28 p.m. (#17-2765), based on the preliminary information available at that time.

To investigate the cause of the upwelling, SFPUC staff shut down the SEP on Saturday morning (April 15), and had divers enter the pipe. Upon proceeding to the location of the upwelling, the divers identified a leak of approximately 48 inches long and one inch wide. The divers were able to install a temporary stainless steel patch that stopped the leak. The SFPUC plans to shut down the plant again on April 19, 2017 to have the divers install an injection patch with additional reinforcements.

In July 2015, the same section of the pipe crossing Islais Creek developed a leak (see the 5-Day Report of July 30, 2015). To address this issue, the SFPUC began a major capital project in September 2015, to replace this section of the outfall pipe costing, as a preliminary estimate, $30 million. Due to design and permitting processes, the project is scheduled to be completed in approximately two years.

Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters:

Using factors including the size of the damaged area (48 inches long by 1 inch wide) and an average of 10 psi, SFPUC Engineering and Operations staff have estimated that approximately 23.2 MG of final treated effluent was discharged through the effluent pipe leak from April 12-15, 2017.

approximately 23.2 MG of final treated effluent was discharged through the effluent pipe leak from April 12-15, 2017. Zero gallons have been recovered.

Location of the threatened or involved waterway(s) or storm drains:
Islais Creek, which flows into San Francisco Bay.

Level of treatment prior to discharge:
Flows received primary treatment, secondary treatment, disinfection and de-chlorination, and met all permit effluent limitation requirements.

Identity of the person reporting the unauthorized discharge: Andy Clark, Superintendent of the Southeast Treatment Plant, Andy Clark, reported the event on April 12, 2017 to the California Office of Emergency Services at 12:28 p.m. (#17-2765).

NPDES/CA0037664
Monitoring Report
March 2017

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) March 2017 Monthly Discharge Monitoring Report.

An acute toxicity flow-through bioassay test was conducted in September resulting in 90% final survival.

On March 20, 2017, Operations staff notified the Office of Emergency Services (OES) at approximately 11:38 pm (#17-2264) of a potential unauthorized discharge. At the time the report was made Operations had limited information but wanted to provide appropriate notification in case an event had occurred. After investigation it was determined that no unauthorized discharged had occurred. A Report regarding this investigation was submitted to Ms. Watkins on March 30, 2017.

The quarterly required PCB report is included with this submission to CIWQS. Oil & Grease exceeded the monthly average limit of 10mg/l at 14mg/l (there were no exceedances of the daily maximum (20mg/l) during the month). Due to this occurrence of an elevated monthly Oil & Grease result we will increase sampling frequency.

In March, 3.85" of rain was recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility operated seven times and treated 563.47 MG. There were three combined sewer discharge (CSD) events.

Monitoring Report
April 2017

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) April 2017 Monthly Discharge Monitoring Report.

An acute toxicity flow-through bioassay test was conducted in April resulting in 50% final survival. Investigative bioassay tests were conducted although initiation of accelerated bioassay was not required at this time (see NPDES permit at IV.A.4 (p8-9)).

Wet weather samples were collected at EFF-001B, EFF-002, and EFF-003 monitored for priority pollutants in March 2017 as required by the permit.

On April 4, 2017, Operations staff notified the Office of Emergency Services (OES) at approximately 14:02 pm (#17-2581) of a leak under Pier 80 near the vent pipe for the Southeast Treatment Plant. A Report regarding this investigation was submitted to Ms. Watkins of the California Regional Water Quality Control Board on April 11, 2017.

On April 12, 2017, Operations staff notified OES at approximately 12:28 pm (#17-2765) of a leak under Pier 80 near the vent pipe for the Southeast Treatment Plant. A Report regarding this investigation was submitted to Ms. Watkins of the California Regional Water Quality Control Board on April 19, 2017.

In April, 2.65" of rain was recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility operated eleven times and treated 87.63 MG. There were two combined sewer discharge (CSD) events.

Monitoring Report
May 2017

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) May 2017 Monthly Discharge Monitoring Report.

An acute toxicity flow-through bioassay test was conducted in September resulting in 90% final survival.

Pursuant to the Regional Board's letter dated November 10, 2014, the semi-annually required chronic toxicity results with comments (zeolite treated effluent-5Uc and untreated effluent -20 TUc) have been uploaded to CIWQS. A report of ammonia add-back testing at 10% effluent toxicity has been included as a pdf to the CIWQS submission. .

The quarterly required PCB report is included with this submission to CIWQS.

In May, no rain was recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility did not operate and there were no combined sewer discharge (CSD) events.

Subject: 5-Day Report for final effluent chlorine exceedance through the Pier 80 outfall (discharge point EFF-001) reported on October 11, 2017 to Cal OES (Control #17-7423), Southeast Water Pollution Control Plant/ NPDES CA0037664.

Dear Ms. Watkins:

This letter constitutes the 5-Day Report regarding an incident at the Southeast Treatment Plant (SEP) that the San Francisco Public Utilities Commission (SFPUC) reported to Cal OES on October11, 2017 at 9:13 pm (#17-7423). SFPUC staff reported that due to a power outage, an estimated 300,000 gallons of effluent with positive chlorine residual were discharged through the Pier 80 final effluent outfall (EFF-001) at approximately 7:41 pm.

Upon investigation, staff has determined that only approximately 41,700 gallons had a positive chlorine residual at Monitoring Location EFF-001A (Monitoring Location EFF-001A is located at the treatment plant approximately two miles from discharge point EFF-001). During the power outage event, staff acted quickly to contain the flow and, upon first notification of the positive chlorine residual, took steps which eliminated the positive residual within two minutes of detection.

As an indication of the impact of this event, the SEP flow through bioassay sampling on October 10, 2017 through October 14, 2017 (which overlapped this event) had a survival rate of ninety percent. The test met all acceptable criteria for our discharge permit.

Incident description and cause:

On October 11, 2017, SEP was in dry weather mode and effluent flow from SEP was approximately 30 million gallons per day (MGD). At approximately 6:44 pm, a PGE power glitch occurred, causing the hypochlorite pumps and bisulfite pumps to fail. The automatic chemical flow controllers were also lost.

Staff opened the V-20 bypass at 6:56 pm (diverting flow from the outfall) and stabilized the hypochlorite and bisulfite dosing manually. Titrations being done approximately every 10 minutes showed no positive chlorine residual. A titration taken at approximately 7:41 pm, however, showed a positive residual of 0.5 (mg/L). Staff immediately increased the bisulfate dosing. The next titration, taken 2 minutes later,

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

showed that the positive chlorine residual had been eliminated (-2.9 mg/L). All subsequent sampling (taken at 7:54 pm, 8:13 pm, then hourly) similarly showed no positive chlorine residual.

Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters:
Staff estimate that with the plant flow at 30 MGD, approximately 41,700 gallons had the potential for a positive chlorine residual at Monitoring Location EFF-001A.[1] Engineering and Operations staff utilized engineering knowledge of the plant infrastructure, log books, and DSC data regarding flow volumes for this calculation.

Efforts implemented to minimize public exposure to the discharge:
Public exposure to the chlorinated effluent was unlikely because the discharge occurred approximately 7,920 feet offshore for approximately two minutes. According to our biologist staff, any chlorine in the discharge would have dissipated shortly after the discharge.

Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted.
A visual inspection of the Bay in the vicinity of the discharge was conducted by vessel on October 12, 2017 at approximately 1:00 p.m. No adverse effects or impacts were observed (e.g., no discoloration or evidence of a fish kill). Birds (pelican, Western gull, cormorant, and tern) and California sea lions were observed in the area.

The event occurred in the evening after dark when it would have been unsafe for staff biologists to take a sample in a timely fashion for accurate testing for chlorine (which would need to be taken within an hour or two of the discharge). A sample was taken the next day (October 12) which did not test positive for chlorine.

Corrective measures taken to minimize the impact of the discharge:
Upon first notification of the positive chlorine residual, staff immediately increased the bisulfate feed. A second sample was taken two minutes later showed no positive chlorine residual. All subsequent samples also showed no positive chlorine residual.

Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future:
To minimize the chance of another power outage at the chlorination/dechlorination station, a project is currently in progress for installing a backup power generator which will increase station reliability. That project is scheduled to be completed within 60 days. Staff's response to this event was appropriate.

Summary of the Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges:
No modifications to the Spill Prevention Plan are needed at this time.

---

[1] This calculation is based on 30 MGD influent flow rate over a two minutes time period during which the positive chlorine residual occurred. This calculation is conservative; the amount discharged through Booster Pump Station was significantly reduced due to the open V-20 bypass. This volume estimate is less than the amount initially reported to CalOES because staff had incomplete information at the time and, in an excess of caution, reported a volume based on longer time period which encompassed potential exposure as understood at that time. The investigation has concluded that the time period of exposure was two minutes, resulting in a lower volume than initially reported to CalOES.

Estimated quantity and duration of the discharge, and the estimated amount recovered:
The estimated quantity was 41,700 gallons. The duration of the discharge was approximately two minutes. Zero gallons were recovered.

Location of the threatened or involved waterway(s) or storm drains:
The discharge point for the water affected by this event was EFF-001 (Latitude 37° 75' 50"N Discharge Point Longitude 122° 37' 25"W).

Level of treatment prior to discharge:
Flows received primary treatment, secondary treatment, disinfection and incomplete dechlorinating for approximately two minutes.

As a measure of the extent to which this had an impact on the final effluent, the results of SEP flow through bioassay sampling on October 10, 2017 through October 14, 2017 (during which this event occurred) had a survival rate of ninety percent. The test met all acceptable criteria for our discharge permit.

Identity of the person reporting the unauthorized discharge:
Carla Godfrey, Chief of Operations at the Southeast Treatment plant

Sincerely,

Mark A. Harris

Subject: 5-Day Report for fully treated discharge through the Quint Street outfall (discharge point EFF-002) reported on October 20, 2017 to Cal OES (Control #17-7634), Southeast Water Pollution Control Plant/ NPDES CA0037664.

Dear Ms. Watkins:

This letter constitutes the 5-Day Report regarding an incident at the Southeast Treatment Plant (SEP) that the San Francisco Public Utilities Commission (SFPUC) staff reported to Cal OES on October 20, 2017.

Incident description and cause:

On October 20, 2017, SEP was in dry weather mode and treated effluent from SEP was discharging through the outfall at a rate of approximately 63 million gallons per day (MGD). Just after midnight, at 12:35 a.m., SEP experienced PG&E power outage (i.e., sustained power loss) which caused Booster Pump Station pumps to cease operation. A Booster Pump Station delivers the plant's final effluent to the outfall pipe which delivers the effluent to the outfall diffusers offshore of Pier 80. The PG&E power outage also stopped the bypass valve (V-20) from operating as well.

Without the ability to operate the Booster Pump Station, or utilize V-20 to keep the effluent within the plant, the final treated effluent built up behind the weir and discharged through EFF-002 (Quint Street outfall) at 12:37 a.m. Plant staff shut down the plant at 1:15 a.m. to stop the discharge. Approximately 228,600 gallons of final treated, disinfected and decholorinated effluent, was discharged through EFF-002 to Islais Creek. Staff reported the event to Cal OES (#17-7634).

Power was restored at approximately 6:00 a.m. and the plant was brought back on line at approximately 7:00 a.m.

Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters:

The volume of discharge that staff reported to CalOES was 13,900 gallons. This estimate was made with limited information and reflected staff's understanding of conditions at the time. Staff has refined the original estimate utilizing an alternative method of calculation, based on a time period of 28 minutes and a flow rate of 63 MGD, and concluded that 228,600 gallons were discharged. Sources of data for this

General Manager

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

conclusion include DCS data, log book entries, log sheet, and engineering knowledge of plant infrastructure.

Efforts implemented to minimize public exposure to the discharge:
Staff posted no swimming advisory signs at the nearest recreational access point to EFF-002, the Islais Creek kayak launch dock, on October 20, 2017, at approximately 8:00 a.m., and provided public notification (e.g., email list, website, hotline). The advisory sign was removed at 9:00 a.m., October 22, 2017 after all bacteria samples results were below state bacteria standards.

Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted.
A visual inspection was conducted on October 20, 2017 at approximately 8:00 a.m. No adverse effects or impacts were observed. Nor were any visible impacts to wildlife observed. Staff took bacteria samples at approximately 8:00 a.m. Samples were taken again on October 21, 2017. The results are as follows:

October 20
Total coliform 17,329 MPN/100mL
E. coli 31 MPN/100mL
Enterococcus 75 MPN/100mL

October 21
Total coliform 717 MPN/100mL
E. coli 41 MPN/100mL
Enterococcus 10 MPN/100mL

The only result which exceeded state bacterial standards was the October 20th Total Coliform (TC) result. Given that the other test results were below state standards, our biologist staff believe that the high TC result was caused by either resuspension of creek sediment due to the flow from the discharge, or a false positive from the IDEXX Colilert test. A sample taken of plant effluent at 9:30 a.m. on October 20, 2017 had a result of 50 MPN/100mL for fecal coliform.

Corrective measures taken to minimize the impact of the discharge:
Operations staff acted to shut down the plant within 40 minutes of the power outage at Booster Pump station to prevent additional discharge at EFF-002.

Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future:
A project has been approved to install a backup power generator which will be available to power V-20. This will improve the plant's ability to contain effluent and prevent it from discharging should Booster Pump Station lose power in the future. This project is scheduled to be completed 2020.

Summary of the Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges:
Staff acted appropriately for the circumstances. No modifications to the Spill Prevention Plan are needed were needed at this time.

Estimated quantity and duration of the discharge, and the estimated amount recovered:

The estimated quantity was 228,600 gallons, with duration of 40 minutes. Zero gallons were recovered.

Location of the threatened or involved waterway(s) or storm drains: South-east Treatment plant Discharge Point E-002 (Latitude 37° 75' 50"N Discharge Point Longitude 122° 37' 25"W).

Level of treatment prior to discharge:
Discharged flows received full primary treatment, secondary treatment, disinfection and complete dechlorinating.

Identity of the person reporting the unauthorized discharge: Andy Clark, Superintendent of Operations at the Southeast Treatment Plant.

Sincerely ,

Mark A. Harris

Monitoring Report
October 2017

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) October 2017 Monthly Discharge Monitoring Report.

An acute toxicity flow-through bioassay test was conducted in October resulting in 90% final survival.

On October 11, 2017, an incident was reported to CalOES (Control #17-17423). The 5-day report for this event (submitted to the Regional Board on October 18, 2017) stated that due to a power glitch, approximately 41,000 gallons with the potential for a positive chlorine residual were discharged through the Pier 80 final effluent outfall (EFF 001).

On October 20, 2017, an incident was reported to CalOES (Control #17-17634). The 5-day report for this event (submitted to the Regional Board on October 27, 2017) stated that due to a power outage, approximately 228,600 gallons of final treated, disinfected and declorinated effluent was discharged through the Quint Street outfall to Islais Creek (EFF 002).

In October, 0.19" rain was recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility operated once but did not discharge any flow. There were no combined sewer discharge (CSD) events.

Wet Weather Discharge Summary

Monitoring Report
November 2017

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) November 2017 Monthly Self-Monitoring Report.

Test organism survival during the November 2017 acute flow-through bioassay was 50%. The bioassay test met all test acceptability criteria. The combination of the May 2017 and November 2017 flow-through test results indicate that the 11-sample 90th percentile requirement for the SEP was not met. Staff initiated accelerated flow-through acute bioassay testing in December 2017 which will continue until the 11-sample 90th percentile requirement has been met. Staff also initiated additional static acute bioassay testing to identify the source of the increased toxicity that occurred during the November test and are investigating plant processes.

Samples were collected on 10/4/2017 at Monitoring Station EFF-001A for the permit required Effluent Characterization Study for dry weather. No priority pollutants tested were detected at or above applicable water quality criteria.

The quarterly required PCB congener report is included with this submission to CIWQS.

Pursuant to the Regional Board's letter dated November 10, 2014, the semi-annually required chronic toxicity results with comments (zeolite treated effluent-10 TUc and untreated effluent -40 TUc) have been uploaded to CIWQS. A report of ammonia add-back testing at 10% effluent toxicity has been included as a pdf attachment to the CIWQS submission.

In November, 2.8" rain was recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility operated and treated 106.3 MG. There were two combined sewer discharge (CSD) events. One discharge occurred in the North Shore Basin and one in the Central Basin.

Re: Comprehensive Parnassus Heights Plan Draft Environmental Impact Report: Comments on Water Quality, Water Recreation, and Wastewater Public Services – Exhibit 14b

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents.

We submitted to you by email a letter of today's date under separate cover regarding "Comments on Water Quality, Water Recreation, and Wastewater Public Services."

Due to the file size of Exhibit 14 to that letter, we are transmitting Exhibit 14 to you by email in two (2) separate electronic files, designated "Exhibit 14a," and "Exhibit 14b."

Attached, hereto, please find Exhibit 14b (page nos. SEP0092 through SEP0383).

Thank you for your attention to this matter.

Sincerely,

Kelly Marie

Monitoring Report
December 2017

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) December 2017 Monthly Self-Monitoring Report.

Two acute toxicity flow-through bioassay tests were conducted in December resulting in 40% and 100% survival rates. The 11-sample 90th percentile permit requirement for SEP was not met in December 2017 due to the acute flow-through test results from May, November and December 2017. Accelerated testing and additional investigations were initiated during December 2017 and will continue until the 11th-sample percentile requirement is met.

In December 0.07" rain was recorded at the Southeast Water Pollution Control Plant. The North Point Wet Weather Facility did not operate. There were no combined sewer discharge (CSD) events.

Wet Weather Discharge Summary

NPDES/CA 0037664
2017 Annual Report

RE: Southeast Water Pollution Control Plant and Bayside Wet Weather Facilities 2017 Annual Self-Monitoring Report

Dear Jessica:

Transmitted herewith is the annual self-monitoring report for the Southeast Water Pollution Control Plant (WPCP), the North Point Wet Weather Facility (WWF), and Bayside Wet Weather Facilities and Wastewater Collection System for the calendar year 2017, pursuant to Order No. R2-2013-0029, NPDES Permit No. CA0037664 (Southeast WPCP NPDES Permit).

A. Treatment Plant Compliance and Performance

1. Volume Treated

The Southeast WPCP treated a total of 25.41 billion gallons of combined sanitary, industrial, and storm water in 2017 while the North Point Wet Weather Facility treated a total of 1.34 billion gallons[1] of combined sanitary, industrial and storm water. The average dry weather flow for the Southeast WPCP was 51.41 million gallons per day (MGD), calculated using flows from three consecutive dry weather months (July, August, and September).

2. Combined Sewer Discharges

The following table shows the frequency of combined sewer discharges (CSDs) during 2017. A complete wet weather annual report covering the wet weather season from July 2017 through June 2018 will be submitted in July 2018 and will include all the wet weather events for that period.

Mark Farrell

Harlan L. Kelly, Jr.
General Manager

[1] In July, the North Point Wet Weather Facility (NPF) used its storage tanks to hold 1.32 million gallons of flow during a SEP shutdown event. This flow was eventually sent to SEP for treatment, not discharged at NPF, so this amount was not included in the NPF treated total.

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

2017 Combined Sewer Discharge Frequency

	Month												Total
	J[2]	F	M	A	M	J	J	A	S	O	N	D	
North Shore Basin	3	3	1	1	0	0	0	0	0	0	1	0	9
Central Basin	5	4	2	1	0	0	0	0	0	0	1	0	13
Southeast Basin	2	0	0	0	0	0	0	0	0	0	0	0	2

3. Discussion of Treatment Plant Performance and Compliance

Summary of Plant Performance

The San Francisco Public Utilities Commission (SFPUC) is exempt from submittal of an annual compliance summary table and tabular and graphical summaries of monitoring data because all data for the Southeast WPCP are reported electronically. *See* Southeast WPCP NPDES Permit, Monitoring and Reporting Program (MRP), Attachment E at E-17 and Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D, Attachment G (2010) at G-18.

Consistent with the Waste Discharge Requirements for Mercury and PCBs from Municipal and Industrial Wastewater Discharges to San Francisco Bay (Order No. R2-2012-0096, NPDES No. CA0038849), Attachment A summarizes the mercury concentrations of each final effluent sample collected in 2017, the corresponding flow on the dates the sample was collected, and the annual estimated mercury load. The Southeast Plant reported USEPA Method 1668c PCB congener data with the Self-Monitoring Reports for March 2017, May 2017, August 2017, and November 2017.

Discussion of Compliance

On January 8, 2017, recreational areas in the North Shore were not sampled or posted due to different initial staff evaluations about whether a discharge had occurred (a discharge occurred but the data which confirmed that was not available at the time). On-call staff responsible for sampling and posting beaches now receive automatically generated notifications when transport/storage boxes reach levels at which a CSD could occur and proactively sample and post based on those notifications.

On January 10, 2017 at approximately 7:10 p.m., while there was a discharge occurring at CSD-029 (Mariposa), the Mariposa Pump Station lost power for fifteen minutes due to PG&E outage. Power was restored fourteen minutes later at 7:24 p.m. During this power outage, 0.1 MG was discharged at CSD-029.

During the rain storm on January 20, 2017, at approximately 4:20 a.m., a HDPE pipe split lengthwise came into the plant and jammed the bar screen at North Point Wet Weather facility, which prevented the facility from achieving influent flow levels of 135-150 MGD within 60 minutes of discharge from CSD-013 (Beach) and CSD-017 (Jackson). The HDPE pipe

[2] The January SMR cover letter listed 4 CSDs for the North Shore Basin and 4 for the Central Basin; the correct count is 3 CSDs for the North Shore Basin and 5 for the Central Basin.

was removed and the bar screen restored to service approximately 120 minutes later. The total volume of North Shore basin discharges (CSD-009 Baker; CSD-010 Pierce; CSD-013 Beach; CSD-015 Sansome; and CSD-017 Jackson) during this time was 6.4 MG.

Also during the rain storm of January 20, 2017, Griffith Pump Station did not reach 125 MGD for approximately 3 hours while discharging at CSD-040 (Griffith), CSD-041 (Yosemite), and CSD-042 (Fitch) due to an electric duct buss failure which caused the loss of one pump. This event resulted in approximately 0.3 MG of additional CSD volume to be discharged in the Southeast basin at these CSD locations. However, as the system was at full capacity at this time, this volume would have been discharged as a CSD at Islais Creek basin had it been pumped from the Griffith Pump Station. Temporary cables have been installed at the pump station which enable operation, and the electric duct buss is in the process of being replaced with work expected to be completed in 2018.

In January, 2017, Oil & Grease exceeded the monthly average limit of 10 mg/L at 11mg/L (there were no exceedances of the daily maximum (20mg/L) during the month).

On February 21, 2017, a discharge of fully treated effluent occurred due to a broken vent pipe located approximately five hundred feet from the diffuser discharge point at EFF 001. This event was reported to CalOES (Control # 17-1591) and staff submitted a 5-Day Report to the Regional Water Quality Control Board on February 28, 2017. Divers installed a new section and reconnected the pipe.

In March, 2017, Oil & Grease exceeded the monthly average limit of 10mg/L at 14mg/L (there were no exceedances of the daily maximum (20mg/L) during the month).

On April 4, 2017, SFPUC staff notified the CalOES (#17-2581) of a leak under Pier 80 near the vent pipe for the Southeast Treatment Plant. A 5-Day Report regarding this event was submitted to the California Regional Water Quality Control Board on April 11, 2017. The SFPUC is in the process of replacing the entire vent pipe both buried and hung under the Pier 80 deck which is in the environmental review process. Currently the project is expected to be completed in 2018.

On April 12, 2017, SFPUC staff notified CalOES (#17-2765) of a leak from its final effluent outfall pipe from the Southeast Treatment Plant into Islais Creek. A 5-Day Report was submitted to the California Regional Water Quality Control Board on April 19, 2017. Divers installed a patch to repair the leak. A major capital project is underway to replace this section of the outfall pipe.

On October 11, 2017, due to a PG&E power interruption, approximately 41,700 gallons with the potential for a positive chlorine residual were discharged through the Pier 80 final effluent outfall (EFF 001). This event was reported to CalOES (#17-17423) and a 5-Day Report was submitted to the Regional Board on October 18, 2017.

On October 20, 2017, due to a PG&E power outage, approximately 228,600 gallons of final treated, disinfected and dechlorinated effluent was discharged through the Quint Street outfall to Islais Creek (EFF 002). This event was reported to CalOES (Control #17-17634) and a 5-Day Report was submitted to the Regional Board on October 27, 2017.

Test organism survival during the November 2017 acute flow-through bioassay was 50%. The combination of the May 2017 and November 2017 flow-through test results indicate that the 11-sample 90th percentile requirement for the SEP was not met. In addition, the 11-sample 90th percentile permit requirement was not met in December 2017 due to the acute flow-through test results from May, November and December 2017. Accelerated testing and additional investigations were initiated during December 2017.

4. Actions Taken or Planned to Improve Plant Performance & Reliability

The following capital projects are planned for, underway or recently completed for the Southeast WPCP, North Point Wet Weather Facility and associated collection system:

2017 Capital Improvement Projects

- Bruce Flynn Pump Station (BFS) Bar Screen Improvements: Mechanical components on the two bar screens were replaced, which included the chain-links, head shaft assemblies, wiper bar assemblies, and return rail and rake assemblies. In addition, the bar fields on the two existing screens were repaired and structurally reinforced in 2017.
- Channel Pump Station (CHS) Bubbler Compressor Upgrade and Concrete Repair: This project was to upgrade existing bubbler air compressor assembly at CHS and provide concrete repair at the Division Street Outfall (DVO; Discharge Point #026). Work was completed in October 2017.
- Fixed Gas Monitoring System Upgrades: The project was to install fixed gas detectors and monitoring systems in various process buildings. Construction started in June 2014, and the construction work for SEP and BFS was completed in December 2015. The Contract includes 3-year service and maintenance of the installed fixed gas systems at SEP and BFS, with expected completion in November 2018.
- Wastewater Enterprise Distributed Control System (DCS) Upgrades Project: This project includes a 15-year Progressive Design-Build contract which was awarded to Emerson Process Management, Inc. in December 2016 with a notice to proceed (NTP) granted in March 2017. The scope of work includes full replacement of an existing Foxboro DCS with an Emerson Ovation DCS at the SEP, including bayside pump stations, BFS and CHS. This contract also includes an option to perform the design of the DCS for the Oceanside Water Pollution Control Plant (OSP) and North Point Wet Weather Facility (NPF). The project is currently completing the pre-design phase and is entering into design activities which are scheduled to be completed during the fourth quarter

of 2018. Final completion of the Emerson Ovation DCS at SEP is estimated to be in the year 2023, with completion of the Sewer System Improvement Program's (SSIP's) Biosolids and Headworks projects.

- Griffith Street Pump Station (GFS) Improvements Project (WW-651): This project is a complete station overhaul, including replacement of Dry Weather Pumps (5), Wet Weather Pumps (5), Ferric Chloride Storage and Distribution System, Electrical Controls and Distribution, station monitoring and communication systems, Bar Screens (2), Sump Dewatering Pump and piping, Influent Channel Gate activation systems, sections of the Dry Weather Pumps' discharge manifold, pumps' discharge check valves (DW/WW manifolds), force main pressure relief valves, station HVAC system, and lighting. In addition, an existing emergency generator will be overhauled. Work will begin in early 2018 and proceed through 2019.
- Islais Creek Transport/Storage (T/S) System Flush Control Valves Upgrade: This project re-established the functionality of flush control valves at the Islais Creek Transport/Storage Box (ICT). Project received NTP March 2016, and the work was substantially complete December 2017; the final testing is targeted for summer 2018.
- Mariposa Pump Station (MPS) Improvements Project (WW-667): This project is to completely rebuild MPS' Dry Weather Pumping Station to meet increased flow projections for the portion of collection system that serves MPS. Dry weather capacity under this project will increase station capacity from 1.7 MGD to a peak capacity of 5 MGD to meet demands following buildout of the Mission Bay area. The project scope includes demolition of the existing Dry Weather Pumping Station and construction of a new dry weather pumping station with new influent sewer routing as well as a larger (14") dry weather pump discharge force main (DW force main). During the construction period (2018-2020), dry weather sanitary flows will be diverted to MPS' Wet Weather Pumping Station and will be discharged through the 20-inch wet weather pump discharge force main (WW force main). The new dry weather pumping station will feature a new trench-style wet well, four (4) dry pit submersible pumps, dewatering pump, bypass piping to the existing 20-inch WW force main, fiber communications, and security upgrades. This project is scheduled for completion in 2021.
- North Point Outfall (NPO) Rehabilitation: The project was to repair reinforced concrete sewers; reline outfall pipes; remove and dispose of Bay sediments from inside, outside, and surrounding diffusers; install a corrosion protection system, and associated structural supports, for outfall pipes; and install an air release mechanism. The project received NTP in March 2017, and the expected completion is February 2018.
- Selby and Marin Outfall Upgrades: This project is to provide pre-cast covers over existing outfall structures, including concrete repairs and baffle installation. The work at Marin Street Outfall (Discharge Point #032) has been completed. The pre-cast concrete covers for Selby Street

Outfall (Discharge Point #033) are still curing and are targeted to be installed in May 2018.

- Southeast Bay Outfall (SEO) Islais Creek Crossing Replacement: The project involves replacing the portion of the SEO that crosses Islais Creek (a.k.a., Islais Creek crossing; crossing, for short) immediately parallel to, and west of, the Third Street Bridge in San Francisco. The existing Islais Creek crossing is comprised of two ductile iron pipes (36-inch and 42-inch). A leak was observed and repaired in 2017. The new Islais Creek crossing will consist of two new 54-inch outside diameter high density polyethylene (HDPE) buried pipes to replace the existing crossing section. New structures on each side of Islais Creek are proposed to tie the new pipes to the existing SEO system. The project will include actuated valves and pipes to divert flow between the new and existing systems as well as associated electrical and mechanical improvements. GHD/AGS, Joint Venture, was awarded the design support contract in May 2017. The project team is currently working on the 35% design submittal. Final completion of the project is scheduled for the year 2022.
- SEP & BFS Fire Alarm Systems: This project which replaced and upgraded the existing deteriorated and outdated fire alarm systems at SEP and BFS to current codes and standards was completed in October 2016. Additionally, the project also provided audible and visible field notification devices in high noise level process equipment areas and install missing fire alarm systems at modular buildings within SEP. The Contract includes 2-year service and maintenance of the installed fire alarm systems at SEP and BFS, with expected completion in November 2018.
- SEP Chemical System Relocation and Facility Upgrades (WW-556): The scope included replacing and relocating existing sodium hypochlorite storage tanks, pumping and piping systems; providing new mixers, for odor control and disinfection; and providing upgrades at the plant's headworks, primary treatment, and secondary treatment facilities to improve process control. Construction started in March 2014, and the construction work was completed in December 2017.
- SEP 250 MGD New Headworks (WW-628): This project involves the construction of a new all-weather 250 MGD headworks facility, consisting of state-of-the-art influent pumping, screening, grit removal, and odor control technologies. The project will include demolition of two existing antiquated headworks facilities and an existing influent lift station. The 250 MGD headworks facility will install coarse screens, fine screens with washer/compactor units, and high-efficiency grit removal units. The new odor control system will comprise of two-stage odor treatment in order to minimize odor impacts. The project will also improve visual aesthetics of associated facilities. The project is divided into three (3) Scopes: Site Preparation (Scope I), Bruce Flynn Pump Station Improvements (Scope II), and Main Headworks (Scope III). NTP for Scope I construction activities was issued on 11/15/17, and

designs for Scope II and Scope III are ongoing. Final completion of the project is scheduled for June 2023.

- SEP Primary and Secondary Clarifiers Upgrade (WW-626): The project objective is to improve reliability of the equipment and processes at SEP's Primary and Secondary Clarifiers. The major scope of work includes (1) installation of a ventilation system for the primary sedimentation tanks for odor control plus (2) mechanical upgrades to and concrete coating of primary sedimentation tanks and several secondary clarifiers. Other mechanical and electrical works are also included. NTP was March 2016, and the construction work was more than 90% complete as of December 2017.
- SEP 260 RAS Pump VFD Upgrade: Existing SEP 260 - Secondary Sludge Control Building's Return Activated Sludge (RAS) pumps' VFDs were upgraded, and RAS pump sensor status is now reported via the SEP's Distributed Control System (DCS). Project completion was in March 2017.
- SEP Cryogenic Oxygen Plant Demolition and Liquid Oxygen System Upgrades (WW-599R): This project will demolish an existing cryogenic oxygen generation plant and liquid oxygen (LOX) storage tanks and vaporizers to install new LOX storage and vaporization systems and a gaseous oxygen (GOX) supply line. In addition, the project will provide a redundant air compressor and dryer for an existing Vacuum Pressure Swing Adsorption (VPSA) plant as well as eight (8) mass flow meters to allow improved process control. Project NTP was issued on 11/27/17.
- SEP 521/522 Disinfection Upgrades (WW-613): The project objective is to upgrade the controls and chemical sampling station at SEP 521 – Postchlorination Building, relocate the electrical equipment into a new building (SEP 522 – Disinfection Electrical/HPU Structure), improve SEP's No. 3 Water system (process water), and replace valves and actuators. Concrete repair (to stop leaks) and coating of the chlorine contact channels (for corrosion protection) are also included. NTP was issued in March 2016, and the construction work was approximately 70% complete as of December 2017.
- SEP Existing Digester Gas Handling Improvements (WW-632): The project consists of Process, Building Systems, Electrical, and Controls Upgrades. Process Upgrades address deficiencies related to digester gas compressors, heat exchangers and controllers; Combined Primary and Activated Sludge (CPAS) tank; boiler and boiler stacks; waste gas flares and cogeneration cooling water system; and biofuel tank. Building Systems Upgrades include replacing roof drains and upgrading ventilation. Electrical Upgrades are related to external lighting and installation of a fire alarm at the building at SEP 800, Controls Upgrades include installation of carbon monoxide gas monitors and replacing digester gas flow meters. NTP was issued in March 2017, and the construction work was approximately 50% complete as of December 2017.

- SEP Polymer System Improvements: Two (2) polymer transfer pumps with variable frequency drives were replaced, and one (1) storage tank dewatering pump and valves were provided to improve operational reliability and flexibility for this ancillary sludge dewatering process. The project was completed in November 2017.

5. Effluent Characterization Study

For this evaluation, all constituents listed in Attachment G, Table C, except for those pollutants with effluent limitations, that were detected above the method Minimum Levels (ML) were evaluated. Estimated concentrations of constituents detected below the MLs were excluded from this evaluation because the uncertainty in the result when a constituent is detected below the ML prevents useful comparison.

Nine constituents were detected above the method MLs: Antimony, Cadmium, Chloroethane, Chloroform, Chromium III, Lead, Nickel, Toluene, and Zinc. The 2017 maximum detected level of each of the nine constituents was compared to the Maximum Effluent Concentration (MEC) as presented in Table F-9 of the Southeast Permit (Reasonable Potential Analysis). The MECs were used as the general indicators of past performance of the detected constituents.

All nine detected constituents showed decreases or no statistically significant changes or increases compared to the corresponding MECs.

The detected constituents and evaluations are summarized in the following table.

Trends for Selected Constituents

Constituent	Method Minimum Level (ML, µg/L)	2017 Maximum Detected Level (µg/L)	Past Performance[1] (µg/L)	Governing Criterion or Objective (µg/L)	Comment
Antimony	0.5	0.737	0.71	4300	Increase
Cadmium	0.25	0.68	1.3	9.36	Decrease
Chloroethane	0.5	0.513	11	No Criteria	Decrease
Chloroform	0.5	7.13	11	No Criteria	Decrease
Chromium III	0.5	0.968	3.7	No Criteria	Decrease
Lead	0.5	1.5	1.6	8.5	Decrease
Nickel	1	4.24	5.1	13	Decrease
Toluene	0.5	0.604	1.5	200,000	Decrease
Zinc	1	39.5	55	86	Decrease

[1]The Maximum Effluent Concentration (MEC) or the minimum detection level, as listed in Table F-9. Reasonable Potential Analysis in the Southeast Permit, NPDES NO. CA0037664, Order No. R2-2013-0029, is used as an indicator for past performance.

6. Biosolids

In 2017, the Southeast Treatment Plant beneficially re-used 11,641 dry metric tons of biosolids at the following locations:

Location	Dry Metric Tons
Land Application	3,773
Solano County Land Application	3,463
Sacramento County Land Application	310
Landfill Beneficial Use	6,895
Vasco Road	2,865
Potrero Hills	3,940
Altamont	90
Lystek – Liquid Biofertilizer	973
TOTAL	**11,641**

B. Approved Laboratory Analyses

See Attachment B for a list of analyses for which the SFPUC is certified.

List of Analyses Performed for the Discharger:

- Dioxin, method EPA 1613, is performed by Frontier Analytical; and
- Semi-volatile Organic Compounds, EPA 625, Caltest Analytical

List of Waived Analyses: None

C. Facility Information

1. Plan View Drawing or Map of Facility

See Attachment C.

2. Results of Annual Facility Inspection to Verify Stormwater Pollution Prevention Plan Elements

Southeast WPCP is exempt from this requirement because it routes all stormwater that falls on the facility property to the headworks of the treatment plant. *See* Southeast WPCP NPDES Permit, Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D), Attachment G (2010) at G-3.

3. Results of Annual Facility Report Reviews

Contingency Plan

The Contingency Plan was updated in April 2017, and includes a finalized Spill Prevention Plan.

Operations and Maintenance Manual

The Chief Operations Manual and the Operations Wet Weather Manual were updated in October 2017.

Wastewater Facilities Status Report
San Francisco is implementing a Wastewater Asset Management Program to enhance reliability of the plant process equipment and optimize its maintenance and operations activities by assessing the criticality of the equipment based on which equipment carries the most risk. Based on the risk of the equipment, the appropriate Maintenance, and Repair and Rehabilitation (R&R) Program strategy can enhance plant reliability. Under the process being implemented, the highest risk equipment will have the more rigorous maintenance procedures including Routine and Preventive Maintenance, Condition-based Maintenance, and Reliability-Centered Maintenance. The R&R Program sets priorities based on the highest risk equipment, and the equipment at the end of its useful life. San Francisco uses a CMMS (Computerized Maintenance Management Software) to plan, schedule, initiate and track preventive and corrective work, and record equipment condition assessments.

D. COLLECTION SYSTEM FATS, OILS AND GREASE (FOG) UPDATE
Launched in 2007, the SFGreasecycle program aims to minimize the amount of FOG discharged to the sewer system by providing a free waste grease pickup service for commercial establishments and free drop-off services for residents. The program was developed to address both source control, through collection services and public outreach, and end use, through the production of biodiesel from waste grease. To date, SFGreasecycle has collected approximately 2.9 million gallons of waste grease from over 1,000 participating food service establishments and 7 residential drop-off points located throughout San Francisco. Since 2007, the program has generated over $4.7 million in revenue for San Francisco and is expected to reduce the annual costs expended on grease related sewer blockages by sewer operations maintenance crews.

The Food Service Establishments (FSE) currently participating in the program represent approximately 35% of the total number of FSEs in San Francisco. The annual grease collected from commercial FSEs began at 6,000 gallons in 2007, grew to 300,000 gallons in 2011, and has remained steady since. The residential recycling program component has focused on resident outreach and education and now collects over 11,000 gallons a year from 7 convenient drop-off sites located throughout San Francisco at such retail vendors as Whole Foods Market and Costco.

E. PARTICIPATION IN REGIONAL EFFORTS
In 2017, the SFPUC continued its financial support of and participation in the San Francisco Estuary Institute's Regional Monitoring Program in order to fulfill the receiving water monitoring requirements of the Southeast WPCP NPDES permit. *See* Southeast WPCP NPDES Permit at E-12.

As a principal member of the Bay Area Clean Water Agencies, the SFPUC also continued to support nutrient receiving water monitoring and science plan development and implementation; participate in the development of Total Maximum Daily Loads and site-specific objectives; support implementation of the Mercury and PCBs Watershed Permit; and support implementation of the regional copper action plans.

If you have any questions concerning this report, please contact one of the following people: Superintendent, Mark Harris, at 415-920-4923; Laboratory Services Manager Kenneth Lee, at 415-920-4965 or Supervising Chemist, Dolson Kwan, at 415-920-4957.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark

Andrew Clark, Superintendent
SFPUC Wastewater Enterprise/Southeast WPCP

Aeration: source - compressed laboratory air, delivered to exposure solutions through 2mL glass pipets
procedure - gentle aeration (~100 bubbles/min) of effluent and control exposure solutions for the first 21-hours of testing.

Monitoring Report
January 2018

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) January 2018 Monthly Self-Monitoring Report.

Two acute toxicity flow-through bioassay tests were conducted in January; the first test resulted in 90% final survival and the second test resulted in 85% final survival. The 11-sample 90th percentile for January was not met due to results from May, November and December 2017. Accelerated testing and additional investigations continued during January 2018.

Subject: 5-Day Report for discharge through Quint Street Outfall (EFF-002) reported on March 13, 2018 to Cal OES (Control #18-1640), Southeast Water Pollution Control Plant/ NPDES CA0037664.

Dear Ms. Watkins:

This is the 5-Day Report for an incident at the Southeast Treatment Plant (SEP) which the San Francisco Public Utilities Commission (SFPUC) reported to Cal OES on March 13, 2018 at approximately 8:30 am (#18-1640). SFPUC staff reported that approximately 2,000 gallons of primary treated, disinfected and dechlorinated primary effluent discharged through the Quint Street Outfall (EFF-002) into Islais Creek, during the plant's transition into full wet weather mode bringing the Primary Disinfection System (PDS) into service.

Upon investigation, staff has determined that the event occurred as result of a recently installed effluent gate not being opened during the plant's transition to full wet weather mode.

Incident description and cause:

On March 13, 2018, at approximately 6:00 am, the treatment plant was in Wet Weather Mode at 150 MGD. Since the forecast predicted at least a 50% chance of more rain, Operations staff made a decision to bring the Primary Disinfection System (PDS) on-line, which would increase plant effluent flow up to 250 MGD.

Gate (G33) (which releases primary treated flow from the PDS channel to Booster P/S which then transports it to the final effluent outfall under Pier 80) was replaced earlier this wet season as part of the Sewer System Improvement Program. G33 went from being electrically to hydraulically actuated, and, as the staged installation has not yet been fully completed, the new gate can be controlled only locally from a nearby station. In addition, the Controller's Office does not yet have DSC communication about the gate status (e.g., open or closed).

During the transition to bringing the PDS system on-line, there was miscommunication regarding readiness to receive flow. G33 still needed to be opened, but Operations staff in the Controller's Office, believing the plant to be ready, opened the PDS channel and brought flow in. Due to the closed gate, the flow in the PDS channel backed up and exited through an open hatch. See Figure 1.

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Figure 1. Hatch along the PDS channel through which flow exited during the event

This flow was fully treated primary, with disinfection and dechlorination. Approximately 2,000 gallons traveled overland to the effluent channel, mixing with secondary treated, disinfected and dechlorinated effluent. Some of this effluent likely discharged through the Quint Street Outfall (EFF-002) to Islais Creek (instead of discharging through the outfall at Pier 80).

Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters:

Staff estimated that between 1,500 to 2,000 gallons flowed into the outfall channel and mixed with secondary-treated effluent, some of which discharged into Islais Creek through EFF-002. This calculation was based on the duration of the flow briefly (estimated time of one minute) overtopping the kicker boards installed around the effluent channel.

Efforts implemented to minimize public exposure to the discharge:

Biologist staff posted the nearest public access site to EFF-002, the Islais Creek kayak launch, at approximately 10:20 am on March 13, 2018. The site was de-posted on March 15 when bacteria samples tested under State standards for water contact recreation.

Due to a miscommunication with staff biologists, information emailed to the public through beachwaterquality@sfwater.org on March 13, 2018 at approximately 1:10 pm incorrectly stated that the discharge was undisinfected. The discharge, however, was fully disinfected.

Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted.

Biologist staff conducted a visual observation of the site at approximately 10:20 am on March 13, 2018. No adverse effects or impacts were observed (e.g., no discoloration or evidences of a fish kill).

Biologist staff also took samples at this time, per procedure for unauthorized discharges. The results were as follows:

3/13/2018[1]

Total coliform: 3654 MPN/100mL
E. Coli: 52 MPN/100mL
Enterococcus: 213 MPN/100mL

3/14/2018

Total coliform: 1137 MPN/100mL
E. Coli: 20 MPN/100mL
Enterococcus: 10 MPN/100mL

Although the Enterococcus sample of March 13, 2018, exceeded the State standard for water contact recreation of 104 MPN/100 mL, staff biologist believe it is unlikely that the discharge from EFF-002 was the cause, as the discharge was fully disinfected and there are multiple potential sources of bacteria in Islais Creek. For instance, the staff member posting the location noted that there were up to 100 birds present at the site.

[1] Early results indicated that the samples were under all the State standards for water contact recreation, so staff de-posted the site on March 14, 2018 at approximately 9:37 a.m. When the laboratory final check revealed that the Enterococcus sample had exceeded 104 MPD/100mL, staff re-posted the site at approximately 2:36 p.m.

Corrective measures taken to minimize the impact of the discharge:

Immediately upon realizing that G33 was not open, Operations staff lowered plant flow to 80 MGD and opened G8 to divert flow away from the PDS channel (back to secondary). Staff also opened G33 locally as quickly as possible.

Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future:

Work orders have been put in to establish DCS communication for G33 status, so that Operations staff in the Controller's Office will be able to see whether or not it is open. This work is expected to be completed by the end of the summer. In addition, training to emphasize the Standing Order in place to address the limitations of the gate situation and address the miscommunication that occurred here will be implemented on March 23 at the SEP Operations Chief's meeting.

Summary of the Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges:

No modifications to the Spill Prevention Plan are needed at this time.

Estimated quantity and duration of the discharge, and the estimated amount recovered:

The estimated quantity was 1,500-2,000 gallons. The duration of the discharge was approximately one minute. Zero gallons were recovered.

Location of the threatened or involved waterway(s) or storm drains:

Southeast Wastewater Treatment Plant Discharge Point E-002 (Latitude 37° 75' 50" N) Discharge Point (Longitudes 122° 37' 25" W)

Level of treatment prior to discharge:

The Combined Wet Weather Discharge received full treated primary effluent, with disinfection and complete dechlorination.

Identity of the person reporting the unauthorized discharge:

Pedro Mendoza, Operations Duty Chief Stationary Engineer, Southeast Treatment Plant

Sincerely,

Mark Harris

NPDES/CA0037664
Monitoring Report
February 2018

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) February 2018 Monthly Self-Monitoring Report.

Two flow-through bioassay tests were performed during February 2018. Test organism survival was 70% for the February 5 - 9 test and 45% for the February 12 - 16 test. Static bioassay testing was performed using composite samples collected during periods of significant toxicity in the flow-through. The results of the static acute testing during both flow-through tests indicate that un-ionized ammonia is likely playing a substantial role in the toxicity response. However, another as yet unidentified confounding constituent may also have a role.

With the assistance of expert consultants, the SFPUC has mapped out a strategy to better understand the role of un-ionized ammonia during flow-through bioassay testing during March 2018. Additionally, attempts will be made to identify other constituents that may be contributing to the acute toxicity.

A chronic toxicity test was also performed during February 13 -16, 2018. The effluent exposures had a TUc value of 40, demonstrating an effect at the 5% effluent concentration. The zeolite-treated effluent exposures had a TUc value of 5 demonstrating no observed effect in any of the effluent dilutions. This data along with the results of the ammonia-addback test indicate that un-ionized ammonia is likely the primary cause of the TUc value of 40 in the effluent dilutions.

Wet weather samples were collected at EFF-001B, EFF-002, and EFF-003 monitored for priority pollutants in January 2018 as required by the permit in section VI.C.5.b.ix.(a)(1).

On February 28, 2018 as result of rain at 11:57 p.m. the plant began discharging to EFF-002 and continued into the next day. The wet weather sample was collected for the event on March 1, 2018, although the discharge began 3 minutes before midnight.

Monitoring Report
March 2018

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) March 2018 Monthly Self-Monitoring Report.

Two flow-through bioassay tests were performed during March 2018. Test organism survival was 55% for the March 5-9 test and 90% for the March 30-April 3 test. The 11-sample median and 90th percentile permit requirements for SEP were not met in March 2018 due to the acute flow-through test results from August, November and December 2017; and February and March 2018. Accelerated testing and additional investigations to identify the toxicants were performed March 2018 and will continue into April 2018. The initial results indicate the un-ionized ammonia plays a significant role influencing test organism survival during the flow-through testing. Equipment is being procured to mitigate the effects of un-ionized ammonia using real-time pH monitoring and automated in-line pH adjustment within the flow-through test.

On March 13, 2018, an incident was reported to Cal OES (Control #18-1640). The 5-day report for this event (submitted to the Regional Board on March 20, 2017) stated that during the plant's transition into wet weather mode, a miscommunication between central control and the station operator resulted in the PDS effluent gate remaining closed. This caused approximately 2,000 gallons of PDS flow to back up, exit the PDS channel through an open hatch, and flow into the secondary effluent channel. As a result, approximately 2,000 gallons of fully treated primary, disinfected and dechlorinated discharged into secondary treated, disinfected and dechlorinated effluent channel; some of this flow discharged through Quint Street Outfall (EFF-002).

On February 28, 2018 as result of rain at 11:57 p.m. the plant began discharging to EFF-002 and continued into the next day. The wet weather sample was collected for the event on March 1, 2018, although the discharge began 3 minutes before midnight.

Aeration: source - compressed laboratory air, delivered to exposure solutions through 2ml glass pipets
procedure - gentle aeration of effluent and control exposure solutions (~60-100 bubble/min) from test-initiation through test-termination.

Monitoring Report
April 2018

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) April 2018 Monthly Self-Monitoring Report.

Two flow-through bioassay tests were performed during April 2018. Test organism survival was 100% for both the April 9-13 test and the April 23-27 test. The 11-sample median and 90th percentile permit requirements for SEP were not met in April 2018 due to the acute flow-through test results from November and December 2017; and February and March 2018. Accelerated testing and additional investigations to identify the toxicants were performed April 2018 and will continue into May 2018.

During the April 6th combined sewer discharge event, no sample was collected at Monitoring Point CSD-031A (Islais Creek North Outfall). The sampler was properly set up but malfunctioned and did not initiate. Field staff were unable to determine the cause. As a precaution, field monitoring staff have replaced the faulty sampler equipment and field-tested the new sampler on site.

Flooded roads created a safety issue on April 7th, causing a delay in collecting a shoreline sample at Jack Rabbit Cove.

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

If you have any questions concerning this report, please call: Superintendent, Andrew Clark, at 415-920-4944, Supervising Chemist, Dolson Kwan, at 415-920-4957, or Laboratory Manager, Kenneth Lee, at 415-920-4965.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Superintendent, Bayside Operations

Aeration: source - compressed laboratory air, delivered to exposure solutions through 2ml glass pipets
procedure - gentle aeration of effluent and control exposure solutions (~60-100 bubble/min) from 69-hours after test-initiation through test-termination.

Note: No mortalities were observed during this test; however, four test organisms were missing from effluent expsoures during the final 24hrs of testing. Those test organisms lost during testing were considered 'dead' for statistical purposes.

Monitoring Report
May 2018

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) May 2018 Monthly Self-Monitoring Report.

Two flow-through bioassay tests were performed during May 2018. Test organism survival was 55% for the May 7th-11th test, which did not meet the 11-sample median and 90th percentile acute toxicity limitations due to the acute flow-through test results from December 2017, and February & March 2018. Test organism survival was 100% for the second acute flow-through bioassay test performed May 21st -25th. Accelerated testing and additional investigations to identify the toxicants were performed during May 2018 and continued into June 2018.

This monthly Shoreline Bacteriological Report contains data for April 30, 2018, which was inadvertently omitted from the April 2018 SMR.

Monitoring Report
June 2018

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) June 2018 Monthly Self-Monitoring Report.

Two flow-through bioassay tests were conducted in June. Organism survival during the first test (June 4th -8th) was 100%. This test did not meet the 11-sample 90th percentile acute toxicity limitation due to the acute flow-through test results from February, March and May 2018. Organism survival during the second test (June 18th-22nd) was 80%, due to unusual circumstances explained in the footnote below.[1] This test did not meet the 11-sample median or the 11-sample 90th percentile acute toxicity limitation due to the acute flow-through test results from February, March and May 2018. Though accelerated testing continued during June, no additional attempts to identify the toxicants were employed since test results did not indicate a toxic component within the final effluent. Accelerated testing will continue into July 2018.

A data error has been identified in the May 2018 SMR. The individual and monthly CSD data were reported correctly; however, due to a spreadsheet error, the May 2018 annual wet weather summary erroneously included a CSD in February and an incorrect CSD volume for January. This SMR contains the correct annual wet weather summary data.

Wet Weather Discharge Summary

Drainage Area CSDs	**North Shore Basin**	**Central Basin**	**Southeast Basin**
This Month	0	0	0
2017-18 Season	3	3	3
Long-Term Average Design Goal	4	10	1

If you have any questions concerning this report, please call: Superintendent, Andrew Clark, at 415-920-4944, Supervising Chemist, Dolson Kwan, at 415-920-4957, or Laboratory Manager, Kenneth Lee, at 415-920-4965.

[1] It should be noted that test organism survival was 100% at the 72 hour assessment. The final test result of 80% survival was due to the absence of four test organisms from the effluent exposure tanks at the 96 hour endpoint. No dead fish were observed by laboratory staff during the entire test, and it is likely that the four fish escaped through unscreened flow outlets in the effluent exposure tank during the last 24 hours of the test. Dead test organisms typically sink to the bottom of the exposure tanks, and it is unlikely they would drift to the surface outflow and out of the tank. The unscreened flow outlet situation has been corrected.

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Superintendent, Bayside Operations

Monitoring Report
July 2018

Attention: NPDES Division

Transmitted herewith is the Southeast Water Pollution Control Plant (SEP) July 2018 Monthly Self-Monitoring Report.

Two flow-through bioassays were conducted in July. The results were 100% survival on both tests.

Due to plant shutdown on July 25, 2018 data for pH was not available for this date.

The plant effluent was in compliance with all permit numerical requirements.

Wet Weather Discharge Summary

Drainage Area CSDs	**North Shore Basin**	**Central Basin**	**Southeast Basin**
This Month	0	0	0
2017-18 Season	0	0	0
Long-Term Average Design Goal	4	10	1

If you have any questions concerning this report, please call: Superintendent, Andrew Clark, at 415-920-4944, Supervising Chemist, Dolson Kwan, at 415-920-4957, or Laboratory Manager, Kenneth Lee, at 415-920-4965.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Superintendent, Bayside Operations

NOTES

Instrumentation anomalies occurring on 7/25, 7/26, 7/27, and 7/30 were zeroed out per confirmation by SFPUC Operations

SEP shutdown on 7/25

Subject: Unauthorized Discharge Report for the Discharge of Treated Effluent from the Southeast Water Pollution Control Plant (NPDES CA0037664)

Dear Ms. Watkins,

Attached please find currently available information regarding a suspected discharge of treated effluent from the Southeast Water Pollution Control Plant (SEP) to Islais Channel, as required by National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037664, Attachment G, Section V.E.2.b.

At approximately 12:30pm on October 18th, 2018, San Francisco Public Utilities Commission (SFPUC) staff observed an upwelling at the surface of Islais Channel near the location of the SEP final effluent force main. SFPUC currently assumes that the upwelling is due to a leak in the underwater force main that conveys treated effluent from SEP to the Pier 80 Outfall (Discharge Point 001). Despite the immediate deployment of resources to initiate assessment of potential damage and develop a repair strategy, SFPUC expects this issue may take several months to resolve. The SFPUC plans to provide weekly status updates in the interim. Additional information as required by Attachment G of the SEP NPDES Permit is provided in the attachment.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Mark A. Harris, Operations Manager

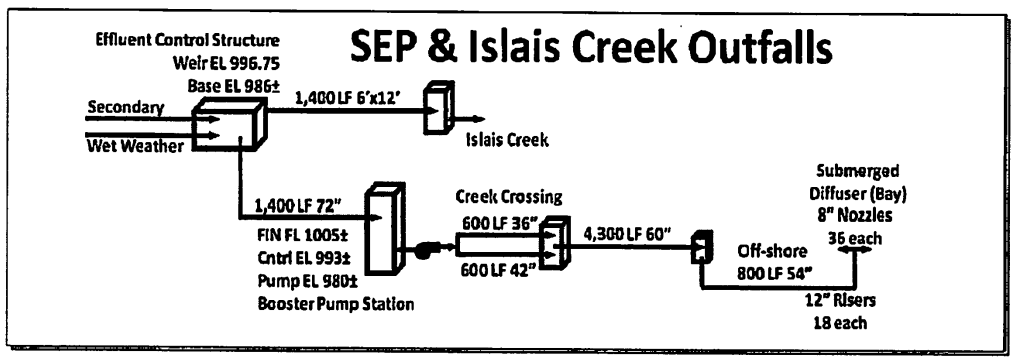
ATTACHMENT: Discharge Incident Report

1. Discharge incident description and cause

The SFPUC suspects that the SEP final effluent force main is damaged and is discharging a portion of SEP secondary treated, chlorinated and dechlorinated effluent to Islais Channel. The force main traverses Islais Channel, in approximately 30 feet of water, running parallel and just west of the Third Street Bridge. It consists of two ductile iron pipes: one 36 inches in diameter, and one 42 inches in diameter. The force main connects the Booster Pump Station (BPS) to a 60-inch reinforced concrete cylinder pipe that eventually discharges through the Pier 80 Outfall via gravity. A schematic of this infrastructure is shown below. It is believed that one of the pipes is leaking based on visual observations of an upwelling in Islais Channel. The cause of the damage is currently unknown.



2. Location of involved waterway

Islais Channel, San Francisco Bay.

3. Date and time discharge started

The upwelling was observed at approximately 12:30pm on October 18th, 2018. The exact start time is unknown.

4. Estimated quantity and duration of the discharge, including amounts recovered

The discharge is ongoing. The quantity of the discharge cannot be estimated at this time. The quantity is likely a portion of the total flow being pumped by BPS, with the remainder being discharged through Discharge Point 001. Recovery of any portion of the discharge is not possible.

5. Level of treatment prior to discharge

The discharge consists of secondary treated, chlorinated and dechlorinated effluent.

ATTACHMENT: Discharge Incident Report

6. Identity of persons reporting the discharge

SFPUC Operations staff reported the suspected discharge to the California Office of Emergency Services (CalOES) (Report #18-7076) on October 18th, 2018 at approximately 1:30pm. Regulatory staff reported the suspected discharge to San Francisco Bay Regional Water Board staff the same day at 5:30pm.

7. Methods used to delineate the geographical extent of the discharge in receiving waters

Visual observations of an upwelling in the Channel, as shown in the photograph on Attachment Page 3.

8. Efforts implemented to minimize public exposure to the discharge

Even though the discharge is disinfected, daily receiving water samples have been collected at the Islais Channel landing [Station 320] starting on October 18th, 2018. The samples were analyzed for total coliform, E. coli, and enterococcus. As of October 24th, 2018, all results have been low. The SFPUC plans to continue sampling daily through Sunday, October 28th, 2018. If all results remain low, only routine weekly sampling will be performed. Sample results are shown in the table below.

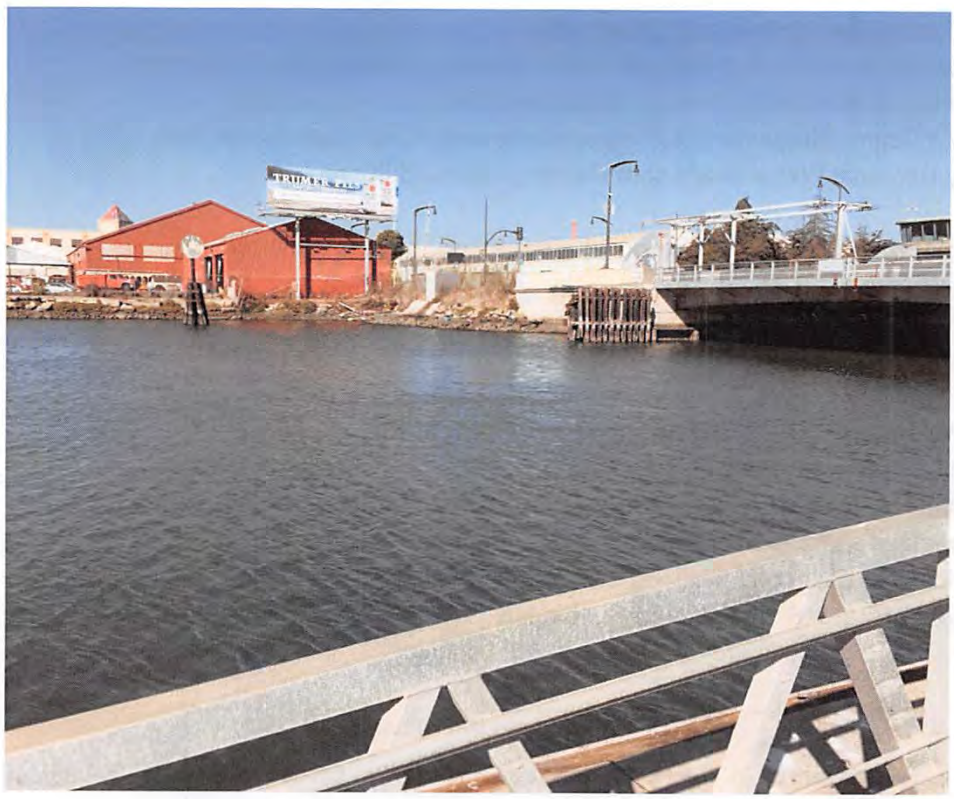
		Analytes (MPN/100mL)		
Sample Date	Station name	Total Coliform	*Escherichia coli*	Enterococcus
18-Oct-18	Islais Landing (320)	20	<10	<10
19-Oct-18	Islais Landing (320)	414	20	<10
20-Oct-18	Islais Landing (320)	199	31	<10
21-Oct-18	Islais Landing (320)	135	10	<10
22-Oct-18	Islais Landing (320)	31	<10	<10
23-Oct-18	Islais Landing (320)	228	63	10

Additionally, signs were posted at the Islais Channel landing, the SFPUC's Recreational Beach Water Quality Hotline was updated and an email notification was circulated. All public notifications were completed at approximately 3:00pm on October 18th, 2018.

9. Visual observations of the impacts noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted

A visual inspection was conducted by a SFPUC Water Quality Division Biologist at approximately 3:11pm on October 18th, 2018. No adverse effects on or impacts to receiving waters or wildlife were observed. See Attachment Page 3 for a photograph taken by the biologist.

ATTACHMENT: Discharge Incident Report



10. Corrective measures taken to minimize the impact of the discharge

The only corrective measure available is to minimize the discharge by repairing or replacing the pipe. The SFPUC contacted a professional diving firm available under contract with the City to discuss inspection and bypass options the same day as becoming aware of the issue. SFPUC General Manager Harlan Kelly has declared an emergency in accordance with the City and County's Admirative Code to ensure expeditious access to the expert resources needed evaluate and address this issue.

11. Measures to be taken to minimize the chances of a similar discharge occurring in the future

The SFPUC approved a project to replace the force main in 2016. This project is currently in preliminary (35%) design. Encroachment and environmental permits from the San Francisco Port have been obtained and geotechnical surveys are underway. Environmental review and permitting has not been completed. The current project schedule estimates completion in 2024.

12. Summary of Spill Prevention Plan or Operation & Maintenance Manual modifications to be made, if necessary, to minimize the chances of future discharges

No changes are needed.

Comments: In order to maintain dissolved oxygen levels of at least 60% saturation, control and effluent exposures were aerated from 4hrs after test initiation through test termination

Effluent and control exposures were also oxygenated intermittently from 4hrs after test initiation through test termination in order to maintain dissolved oxygen levels within protocol requirements.

SUBJECT: October 2018 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report for the month of October 2018 for the Southeast Water Pollution Control Plant.

Compliance with Effluent Limitations. Compliance with the effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Compliance monitoring was completed as required by the NPDES permit.

Combined Sewer Discharge Summary. There were no combined sewer discharges during this monitoring period as summarized in the table below and described in the attached Wet Weather Summary.

Discharge Incident
On October 18, 2018, SFPUC staff observed an upwelling at the surface of Islais Channel near the location of the SEP final effluent force main. The SFPUC suspected that the SEP final effluent force main pipe (to Discharge Point No. 001) may have been damaged, resulting in the discharge of a portion of the SEP secondary treated, chlorinated and dechlorinated effluent to Islais Channel. SFPUC staff subsequently notified Jessica Watkins (Regional Water Board staff) of this

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

incident on October 18, 2018, consistent with the 24-hour notification requirements in the permit, and submitted a 5-day report on October 25, 2018.

Professional divers (SFPUC contractors) performed underwater inspections of the two force main pipes on November 3. The inspection found that a leak is occurring in the 36" force main pipe, and that there is no leak in the 42" pipe. An emergency bypass of the 36" force main pipe is being designed, and completion of the bypass is currently projected to be February 2019, depending on the availability of the pipe and weather.

In addition, since the initial observation, SFPUC staff have been performing weekly fecal indicator bacteria sampling of Islais Channel, and an aluminum sign has been posted to advise the public of the issue and provide contact information for additional information. The SFPUC has been and will continue providing regular updates to Jessica Watkins until the issues is resolved.

If you have any questions concerning this report, please contact Superintendent, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; Laboratory Manager, Kenneth Lee at (415) 920-4965 or KLee@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Superintendent, Bayside Operations

* Includes upto 6 MG of flows stored at the treatment facility and drained back to combined sewer system

NOTES

SEP Plant Shutdown from 10/17 2:00 to 10/18 3:45

Instrumentation anomalies occurring on 10/1 and 10/2 were zeroed out per confirmation by SFPUC Operations

On 10/3 and 10/4, NPF Influent flows were used to flush tanks. There was no NPF effluent flows

SUBJECT: November 2018 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664], Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of November 2018 for the Southeast Water Pollution Control Plant (SEP).

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period with the exception of acute toxicity as described below.

Acute Toxicity**.** Monthly dry weather acute toxicity testing was performed for the period of November 5-9, 2018. The test result of 45% survival did not meet the 11-sample 90th percentile limitation of 70% survival, due to test results from May 2018 (55% survival) as shown in the following table.

Sample Event No.	Flow-through Bioassay Test Dates	Results (% Survival)
1	April 23-27, 2018	100%
2	May 7-11, 2018	55%
3	May 21-25, 2018	100%
4	June 4-8, 2018	100%
5	June 18-22, 2018	80%
6	July 9-13, 2018	100%
7	July 16-20, 2018	100%
8	August 6-10, 2018	100%
9	September 17-21, 2018	90%
10	October 9-13, 2018	100%
11	November 5-9, 2018	45%
11-Sample Median		**100%**
11-Sample 90th percentile		**55%**

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Follow-up accelerated monitoring could not be initiated until the second week of December because of shutdowns for necessary maintenance, and wet weather. A plant shutdown on November 14 prevented testing the week of November 12-16. Wet weather prevented testing the weeks of November 19-23 and November 26-30. A test initiated on December 3 was interrupted by wet weather on December 5. A test was successfully completed the week of December 10-14; results will be reported in the December self-monitoring report.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit. During the week of November 18-24, three pH results are available at EFF-001A (for November 18, 19, and 20). The remaining days of that week were wet weather days.

Discharge Incidents. On October 18, 2018, SFPUC staff observed an upwelling at the surface of Islais Channel near the location of the SEP final effluent force main. Professional contract divers performed underwater inspections of the two force main pipes on November 3 and confirmed a leak in the 36" force main pipe. A five-day written report was submitted on October 25, and status updates were provided on November 8, November 16, November 29, and December 7. Future updates will be provided in SMR cover letters until construction of the bypass is complete. During December, inspections needed to complete design of the bypass continued, including another internal inspection on December 7.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. Multiple combined sewer discharge (CSD) events occurred during this monitoring period as summarized in the table below and described in the Wet Weather Summary.

Count of Drainage Areas CSDs	North Shore Basin	Central Basin	Southeast Basin
This reporting period	2	3	1
Total for 2018-2019 Wet Weather Season	2	3	1

System Operations of Wet Weather Facilities

During the November 28 storm event, Griffith Pump Station (GFS) did not reach its design capacity until 11:08 pm, 16 minutes after a CSD occurred in the Southeast Basin. Operations staff were unable to initiate remote operation of one of the GFS wet weather pumps. Prior to the CSD occurring, staff were deployed to the pump station to manually operate that pump, and the issue was resolved the following day.

This event did not cause a CSD or otherwise increase the CSD volume discharged on the Bayside during this storm event. If GFS had reached its design capacity prior to the first CSD start time of 10:52 pm, GFS would have pumped an additional estimated 0.16 million gallons (MG) to the Islais Transport/Storage Structure. The volume of CSDs in the Southeast Basin was 0.39 MG, meaning that CSDs would have occurred at these locations even if there had been no issue with GFS. Additionally, because the Islais Transport/Storage Structure was full and CSDs were occurring at Islais Creek, the 0.16 MG that discharged to the Southeast Basin would have been discharged as a CSD to the Central Basin.

All other wet weather facilities during the storm event operated consistent with the requirements in NPDES permit Provision VI.C.5.c.i. - VI.C.5.c.iv.

SEP Wet Weather Monitoring. The Bayside system experienced wet weather days on November 21, 22, 23, 24, 27, 28, and 29. Wet weather sampling was conducted during the reporting month. On November 28 a wet weather enterococcus sample was collected at EFF-002 but not EFF-001B because SEP was discharging only secondary treated effluent, so the sample was representative of the effluent being discharged at both Discharge Points Nos. 001 and 002.

CSD Monitoring. CSD samples were collected at each permit-designated location during each CSD event, except for those that occurred on November 22. No samples were collected on November 22 because field staff were not available to deploy during the Thanksgiving Day holiday.

During the November 21 CSD event, a manual grab sample rather than a composite was collected at CSD-025. The sampler was properly set up but the pump did not initiate. Field staff collected a grab sample, and subsequently replaced the appropriate sampler parts and field-tested the sampler.

Shoreline Monitoring and Posting. There was only one issue with shoreline monitoring and posting during November. After the November 28 CSD event, shoreline sampling at S-202.5 (Crissy Field West) was conducted on November 28 and 29. No sample was collected on November 30, however, because the decision not to sample was made based on preliminary enterococcus results that showed the November 29 sample had enterococcus concentrations less than 104 MPN/100 mL. The final enterococcus concentration, which was unavailable until the afternoon of November 30, was 107 MPN/mL. As a precautionary measure, a sample was collected the following day, December 1, and will be reported with next month's SMR.

If you have any questions concerning this report, please contact Superintendent, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; Laboratory Manager, Kenneth Lee at (415) 920-4965 or KLee@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Superintendent, Bayside Operations

SUBJECT: December 2018 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664], Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of December 2018 for the Southeast Water Pollution Control Plant (SEP).

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period with the exception of acute toxicity.

Acute Toxicity**.** Monthly dry weather acute toxicity testing was performed for the periods of December 10-14, 2018 and December 18-22, 2018. The December 10-14 test result of 55% did not meet the 11-sample 90th percentile limitation of 70% survival, as shown in the following table. The December 18-22 test result of 70% met acute toxicity effluent limitations.

Flow-through Bioassay Test Date	Results (% Survival)	11-Sample Median	11-Sample 90th percentile
May 7-11, 2018	55%		
May 21-25, 2018	100%		
June 4-8, 2018	100%		
June 18-22, 2018	80%		
July 9-13, 2018	100%		
July 16-20, 2018	100%		
August 6-10, 2018	100%		
September 17-21, 2018	90%		
October 9-13, 2018	100%		
November 5-9, 2018	45%		
December 10-14, 2018	55%	**100%**	**55%**
December 18-22, 2018	70%	**100%**	**--**

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

Discharge Incidents. On October 18, 2018, SFPUC staff observed an upwelling at the surface of Islais Channel near the location of the SEP final effluent force mains. On November 3, professional divers confirmed that the 36-inch force main had failed in approximately the same area as it had failed in 2015 and 2017. Temporary bypass of the pipe, rather than additional repairs, is being pursued. The likelihood of success of additional repairs was determined to be low due to the condition of the pipe and the failure of previous repairs. Additionally, repairs would necessitate having divers repeatedly enter the pipe itself, which raises significant safety concerns due to the pipe condition. An emergency declaration was approved to expedite contracting and financing. Design of the temporary bypass, including various testing and inspections necessary to inform the design, has been steadily proceeding throughout November and December. As of the date of this submittal, 95% design drawings are being reviewed and the construction contractor is expected to receive notice to proceed in February. Due to the complexity and high-risk scope of the project, the timeframe for completion is uncertain, but is currently projected to be in the fall of 2019.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. One combined sewer discharge (CSD) event occurred during this monitoring period as summarized in the table below and described in the Wet Weather Summary. The Wet Weather Summary includes a potential 1-minute CSD in the Central Basin (Islais Creek) at Discharge Point 035 (Third Street South). However, SFPUC is unable confirm this occurrence due to uncertainty in the level measurements, which include water levels exceeding the weir crest elevation for approximately 1 minute by 0.01-0.05 feet, which is within the aggregate margin of error associated with the movement of water (e.g., ripples) and the surveyed weir elevation measurements.

Count of Drainage Areas CSDs	North Shore Basin	Central Basin	Southeast Basin
This reporting period	0	1	1
Total for 2018-2019 Wet Weather Season	2	4	2

System Operations of Wet Weather Facilities

During the December 16th storm event, Griffith Pump Station (GFS) reached peak wet weather capacity (120 MGD) prior to a CSD from the Yosemite T/S structure,but did not maintain that peak flow rate. As a result, very brief and small volume discharges occurred in the Southeast Basin. The duration of the discharge was 11 minutes for the Griffith CSD outfall and 6 minutes for the Yosemite and Fitch CSD outfalls. The total volume discharged was 0.13 million gallons, less than 0.5% of the total Bayside CSD volume (27.53 MG).

Typically, the operation of GFS is controlled automatically by the Distributed Control System (the SFPUC's SCADA system), with the four individual GFS pumps brought online and taken offline automatically as the Yosemite Transport Storage (T/S) structure levels rise and drop to different set points. This operating logic was established after a 2013 optimization study that identified this staggered approach as a way to better utilize the available storage capacity in the Yosemite T/S structure. Due to ongoing control system upgrades at GFS, the pump station operations are currently controlled by a Human Machine Interface (HMI) system separate from the DCS and controlled from a separate screen within the SEP control room. This HMI was programmed by a contractor with the pre-2013 logic of initiating all four pumps at a single Yosemite T/S box level rather than the staggered approach.

During the December 16th storm event at 8:38 pm, the HMI-controlled GFS was pumping 120 million gallons per day (MGD) to the Islais Creek Transport/Storage Box and SEP. Five minutes later (at 8:43 pm), Operations staff decreased the flow to 40 MGD to better utilize the storage in the Yosemite T/S box and replicate the post-2013 DCS programmed controls. Shortly thereafter, rainfall intensity dramatically increased (about 0.23 inches in 8:43 pm to 9:05 pm), causing the Yosemite T/S structure levels to rise rapidly. Within ten minutes of the Yosemite T/S structure levels rapidly rising, Operations staff used the HMI to increase pumping to 80 MGD at 9:05 pm, which stopped the Yosemite and Fitch CSDs at 9:11 pm and the Griffith CSD by 9:14 pm. If the post-2013 DCS programmed controls had been in place, the staggered increase in pumping would have occurred automatically. The HMI program that controls GFS will be re-programmed to recreate the staggered increase and decrease in pumping based on Yosemite T/S structure levels; the estimated timing for completion is summer 2019. For the remaining wet weather season, Operations staff will pay careful attention to manually operate GFS pumping with the operating logic established in the 2013 optimization study.

Wet Weather Monitoring. The Bayside system experienced wet weather days on December 5, 16, 17, 24, and 25. Wet weather sampling was conducted during the reporting month with the following notes related to fecal indicator bacteria monitoring (see footnote [4] of NPDES permit Table E-4) being provided for clarity:

- On December 5, wet weather enterococcus and fecal coliform samples were collected at EFF-002 but not EFF-001B because SEP was discharging only secondary treated effluent, so the EFF-002 sample was representative of the effluent being discharged at both Discharge Points Nos. 001 and 002.
- On December 16, wet weather enterococcus and fecal coliform samples were not collected because sampling is only required when discharges are occurring between 4 am and 2 pm per footnote [4]. This time frame is paramount to ensure that wet weather bacteria samples are collected on time for laboratory analyses (i.e., for analyses to occur during business hours). SEP did not begin to receive influent flows that indicated significant wet weather until after 2 pm.
- On December 25, wet weather enterococcus and fecal coliform samples were not collected because this sampling is required within 4 hours of the start of the discharges and wet weather discharges (i.e., secondary bypass, discharge through Discharge Point No. 002, and discharge through Discharge Point No. 001 exceeding 85.4MGD) ceased between 4-7am.

CSD Monitoring. CSD samples were collected at each permit-designated location during each CSD event.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit, except for from December 24-31 at E-210.1 (Aquatic Park - Hyde Street Pier). This shoreline monitoring location was not accessible (i.e., locked gate) during this time due to partial federal government shutdown.

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Operations Division Manager, Wastewater Enterprise

MINIMUM DAILY AVERAGE FLOW (MGD)	-	0.00	0.00	-	-	-	50.54	50.47	0.00	-	-	-	-	-
MAXIMUM DAILY AVERAGE FLOW (MGD)	-	32.35	26.35	-	-	-	143.23	103.69	51.58	-	-	-	-	-

* Includes upto 6 MG of flows stored at the treatment facility and drained back to combined sewer system

NOTES

NPF effluent instrumentation anomalies occurred from 12/14 through 12/31. NPF effluent volume for the 12/16-12/17 and 12/24-12/25 events are assumed to be equal to be 6 MG less than the NPF influent volume for each event. The first 6 MG of each event is assumed to be the stored volume of the Northpoint Facility that is drained back to the combined sewer system post-storm event and is not discharged to the bay.

Attention: NPDES Wastewater Division

SUBJECT: Annual Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664], Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the annual self-monitoring report (SMR) for the calendar year of 2018 for the Southeast Water Pollution Control Plant (SEP).

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Operations Division Manager, Wastewater Enterprise

Attachment C: Plant Site Plan
Attachment D: Plant Process Schematic

1 Treatment Plant Performance

1.1 Volume Treated

The Southeast Water Pollution Control Plant (SEP) is permitted to discharge an average dry weather flow of 85.4 million gallons per day (MGD). The average dry weather flow for SEP was 52.6 MGD, calculated using flows from three consecutive dry weather months (July, August, and September). SEP treated an estimated 22.6 billion gallons of combined wastewater and stormwater in 2018. The North Point Wet Weather Facility (NPF) treated an estimated 0.9 billion gallons of combined wastewater and stormwater in 2018.

1.2 Permit Compliance and Actions Taken or Planned

1.2.1 Effluent Limit Exceedances and Unauthorized Discharges

Acute Toxicity

The effluent limitations for acute toxicity were exceeded multiple times during 2018, as summarized in the table below. Static bioassay testing was performed using composite samples collected during periods of significant toxicity in the flow-through in February. The results of the static testing indicate that un-ionized ammonia is likely playing a substantial role in the toxicity response.

In March 2018, the SFPUC worked with outside experts to map out a strategy to better understand the role of un-ionized ammonia in test organism survival. Equipment is being procured and systems are being developed to mitigate the effects of un-ionized ammonia using real-time pH monitoring and automated in-line pH adjustment within the flow-through test.

Flow-through Bioassay Test Date	Results (% Survival)	11-Sample Median (for <90%)*	11-Sample 90th percentile (for <70%)*
January 2-6	90%	N/A	N/A
January 29 - February 2	85%	90%	N/A
February 5-9	70%	90%	N/A
February 12-16	45%	**85%**	**45%**
March 5-9	55%	**85%**	**45%**
March 30 - April 3	90%	N/A	N/A
April 9-13	100%	N/A	N/A
April 23-27	100%	N/A	N/A
May 7-11	55%	**85%**	**45%**
May 21-25	100%	N/A	N/A
June 4-8	100%	N/A	N/A
June 18-22	80%	**85%**	N/A
July 9-13	100%	N/A	N/A
July 16-20	100%	N/A	N/A
August 6-10	100%	N/A	N/A
September 17-21	90%	N/A	N/A
October 9-13	100%	N/A	N/A
November 5-9	45%	100%	**55%**
December 10-14	55%	100%	**55%**

Flow-through Bioassay Test Date	Results (% Survival)	11-Sample Median (for <90%)*	11-Sample 90th percentile (for <70%)*
December 18-22	70%	100%	N/A

*Per the effluent limitation in the NPDES permit, the 11-sample median is calculated for compliance only when the result is less than 90% survival and the 11-sample 90th percentile is calculated for compliance only when the result is less than 70% survival.

Unauthorized Discharges

The SFPUC reported two unauthorized discharges during 2018, which are summarized below. Each of these incidents were described in five-day and self-monitoring reports.

On March 13, 2018 primary treated, disinfected and dechlorinated effluent discharged through EFF-002 (Quint Street Outfall) during wet weather over a period of approximately one minute. The discharge was caused by several factors. First, the primary disinfection system (PDS) channel gate that allows primary treated effluent to flow to the Booster Pump Station for discharge through EFF-001 had to be controlled locally from a nearby station, rather than from the control room through the Distributed Control System (DCS), because of recently completed upgrades. This necessitated communications between an individual in the control room and an individual at the station. As the result of a miscommunication between these two individuals, flow into the PDS channel was started before the gate was opened. This resulted in primary treated combined wastewater and stormwater overflowing the PDS channel and eventually discharging to EFF-002. Control of this gate is still local and will be until other construction activities can be completed in 2019. Further training on interim operations was implemented on March 23, 2018.

On October 18, 2018, SFPUC staff observed an upwelling at the surface of Islais Channel near the location of the SEP final effluent force mains. On November 3, professional divers confirmed that the 36-inch force main had failed in approximately the same area as it had failed in 2015 and 2017. Temporary bypass of the pipe, rather than additional repairs, is being pursued. The likelihood of success of additional repairs was determined to be low due to the condition of the pipe and the failure of previous repairs. Additionally, repairs would necessitate having divers repeatedly enter the pipe itself, which raises significant safety concerns due to the pipe condition. An emergency declaration was approved to expedite contracting and financing. Design of the temporary bypass, including various testing and inspections necessary to inform the design, has been steadily proceeding throughout November and December. As of the date of this submittal, 95% design drawings are being reviewed and the construction contractor is expected to receive notice to proceed in February. Due to the complexity and high-risk scope of the project, the timeframe for completion is uncertain, but is currently projected to be in the fall of 2019.

1.2.2 Monitoring Issues

The only dry weather monitoring issue was due to a plant shutdown on July 25, 2018, which prevented collection of pH data five times during that particular week.

In 2018, a few issues with implementation of combined sewer discharge (CSD) triggered monitoring were identified. In terms of field sampling of combined sewer discharges, there were no samples collected on April 6 at Monitoring Point CSD-031A (Islais Creek North Outfall) because the field sampler malfunctioned for unknown reasons. Samples were also not collected on November 22 because field staff were unavailable on Thanksgiving Day.

There were three instances of identified issues with shoreline sampling and posting. First, on April 7, sampling was delayed at Jack Rabbit Cove because of a safety issue (i.e., flooded roads). Second, after the November 28 CSD event, shoreline sampling at S-202.5 (Crissy Field West) was conducted on November 28 and 29 but not on November 30. The decision not to sample was made based on preliminary enterococcus results that showed the November 29 sample had enterococcus concentrations less than 104 MPN/100 mL. The final enterococcus concentration, which was unavailable until the afternoon of

November 30, was 107 MPN/mL. As a precautionary measure, a sample was collected the following day, December 1. Finally, From December 21 through 31, shoreline sampling and posting did not occur at E-210.1 (Aquatic Park - Hyde Street Pier). This shoreline monitoring location was not accessible because of a gate that remained locked due to the partial federal government shutdown.

1.3 Effluent Characterization Study

For this evaluation, all constituents listed in Attachment G, Table B, except for those pollutants with effluent limitations, that were detected above the method Minimum Levels (ML) were evaluated. Estimated concentrations of constituents detected below the MLs were excluded from this evaluation because the uncertainty in the result when a constituent is detected below the ML prevents useful comparison.

Nine of the tested constituents were detected above the method MLs: Antimony, Chloroethane, Chloroform, Chloromethane, Chromium III, Lead, Nickel, Toluene, and Zinc. The 2018 maximum detected level of each of the nine constituents was compared to the Maximum Effluent Concentration (MEC) as presented in Table F-9 of the SEP Permit (Reasonable Potential Analysis). The MECs were used as the general indicators of past performance of the detected constituents.

All nine detected constituents showed decreases or no statistically significant changes compared to past performance (the corresponding MECs are used as indicators of past performance).

The detected constituents and evaluations are summarized in the table below.

Trends for Selected Constituents

Constituent	Method Minimum Level (ML, µg/L)	2018 Maximum Detected Level (µg/L)[1]	Past Performance[2] (µg/L)	Criterion or Objective (µg/L)	Statistically Significant Increase
Antimony	0.5	0.68	0.71	4300	No
Chloroethane	0.5	0.74	1.1	No Criteria	No
Chloroform	0.5	3.7	11	No Criteria	No
Chloromethane	0.5	0.61	1.1	No Criteria	No
Chromium III	0.5	0.81	3.7	No Criteria	No
Lead	0.5	0.77	1.6	8.5	No
Nickel	1	3.9	5.1	13	No
Toluene	0.5	0.63	1.5	200,000	No
Zinc	1	34	55	86	No

Note:

1. Results have been rounded to two significant figures.
2. The Maximum Effluent Concentration (MEC) or the minimum detection level, as listed in Table F-9, Reasonable Potential Analysis in the SEP Permit, NPDES NO. CA0037664, Order No. R2-2013-0029, is used as an indicator for past performance.

1.4 Biosolids

In 2018, the SEP beneficially re-used a total of 13,500 dry metric tons of biosolids at the following locations:

Location	Dry Metric Tons[1]
Land Application	
Solano County Land Application	4,400
Sacramento County Land Application	1,100
Landfill Beneficial Use (except TIP)	
Vasco	3,100
Potrero	3,000
Lystek – Liquid Biofertilizer	1,900
TOTAL	**13,500**

Note:

1. Tonnage has been rounded to two significant figures.

1.5 Mercury & PCBs

Consistent with the Waste Discharge Requirements for Mercury and PCBs from Municipal and Industrial Wastewater Discharges to San Francisco Bay (Order No. R2-2017-0041, NPDES No. CA0038849), **Attachment A** summarizes the mercury concentrations of each final effluent sample collected in 2018, the corresponding flow on the date the sample was collected, and the annual estimated mercury load. The SEP reported USEPA Method 1668C PCB congener data with the Self-Monitoring Reports for February 2018, May 2018, August 2018, and October 2018.

2 Approved Laboratory Analyses

List of approved analyses include the following:

1. List of analyses for which SFPUC is certified: See **Attachment B**.
2. List of analyses performed for SFPUC by a separate certified laboratory (copies of reports signed by the laboratory director of the separate certified laboratories are not included with the annual report but are retained onsite and available upon request):
    a. Dioxin, method EPA 1613, is performed by Frontier Analytical; and
    b. Semi-volatile Organic Compounds, method EPA 625, is performed by Caltest Analytical.
3. List of waived analyses: None.

3 Facility Information

3.1 Plan View Drawing or Map of Facility

A Plant Site Plan is included in **Attachment C**, and a Plant Process Schematic is included in **Attachment D**.

3.2 Results of Annual Facility Report Reviews

3.2.1 Contingency Plan and Spill Prevention Plan

The SEP's Contingency Plan was reviewed and updated throughout 2018. The updated Contingency Plan was made available for staff electronically on SFPUC's SharePoint in December 2018. Updates to the plan include:

- Changes in staffing and roles and responsibilities;
- Spill Prevention Plan addendum;
- Process management updates; and
- Updates to the listed emergency contacts.

3.2.2 Operations and Maintenance Manual

Review of SEP related manuals, training, and other guidance materials was completed, resulting in updates to and development of the materials described in the table below.

Document	Sections
Manual Updates	• SEP Primary Treatment Process Unit Operations Manual • Northpoint Facility Operations Manual • Bayside Wet Weather Operations Manual • Biosolids Management System Manual
Standard Operating Procedures Developed	• Polymer Super Sac Changeout • Cogenerations Plant Emergency Shutdown
Other Guidance & Training Materials Developed	• 2018 Biosolids Spill Packet • SEP Competency Based Training Operations Personal Qualification Card (Level 1 Basic Operator) • Personal Protective Equipment and Atmospheric Hazards Monitoring and Safety Awareness Posters • Atmospheric Hazards Monitoring and Safety Awareness Video • Wet Weather Permit Compliance & Reporting Trigger Awareness Quick Guide Posters for Plant and Pump Station Control Rooms • SEP Log Sheet Pictorial Equipment Guide • New Headworks Scale Model Flow Test Video • SEP Disinfection Process Unit Training Video • Confined Space Entry & Rescue Awareness Classroom Presentation • DCS Guidance Pages for Overflow and Discharge Response and Reporting
Associated Training Conducted	• Annual Wet Weather Training • Semi-annual Wet Weather Training Refresher

3.2.3 Wastewater Facilities Status

The table below summarizes key construction activities related to the Bayside facilities. The projects listed below do not comprise a comprehensive list of all upgrades completed or underway. Planning, design and construction of numerous other mechanical, electrical, structural, and communications improvements are ongoing.

Facility/Process	Project Description	Construction Update
SEP Headworks	Replace existing dry and all-weather headworks with a single 250 MGD all-weather headworks. Due to the complexity of this project, the scope is proceeding in multiple phases.	Construction on the first phase started in 2018, and construction of the second phase is expected to start in 2019.
SEP Primary	Make various mechanical and electrical upgrades to the wet weather primary system, including new pumps and supporting structural work.	Construction expected to start in 2019.
	Coat concrete of several clarifiers and make mechanical upgrades.	Construction completed in 2018.
SEP Secondary	Coat concrete of several clarifiers and make mechanical upgrades.	Construction completed in 2018.
SEP Disinfection	Demolish existing oxygen generation plant and liquid oxygen storage (LOX) tanks; install new LOX storage and vaporization systems.	Construction expected to be complete in 2019.
	Upgrade controls and chemical sampling station, including coating of chlorine contact channels.	Construction expected to be complete in 2019.
SEP Solids Handling	Replace the existing facilities with new digestion and solids handling processes capable of producing Class A biosolids.	Construction (site preparation) expected to begin in 2019.
	Replace gas sensors, upgrade process equipment/piping/valves and perform various structural repairs.	Construction expected to be complete in 2019.
	Repair damaged solids conveyance and storage systems.	Construction expected to be complete in 2019.
Bruce Flynn Pump Station	Furnish and install new adjustable frequency drive hardware, software, and internal electrical components, upgrade DCS communication systems.	Construction expected to be complete in 2019.
Griffith Pump Station	Overhaul the existing dry weather and wet weather pump stations, including repair or replacement of the dry and weather pumps.	Construction expected to start in 2019.
Mariposa Pump Station	Rebuild the existing dry weather pump station and force main and increase the capacity to accommodate flows from the redevelopment of Mission Bay.	Construction expected to start in 2019.
Northshore Pump station	Modify the pump station, including replacing and upsizing the existing dry weather pumps, to allow dry weather pumps to provide redundancy during wet weather.	Construction expected to start in 2019.
North Point Facility Outfall	Rehabilitate the existing NPF outfall system.	Construction completed in 2018.
SEP (Pier 80) Outfall	Construct an emergency bypass of one (36”) of the two force mains under Islais Creek.	Construction expected to start in 2019.

4 Participation in Regional Efforts

In 2018, the SFPUC continued its financial support of and participation in the San Francisco Estuary Institute's Regional Monitoring Program in order to fulfill the receiving water monitoring requirements of the SEP NPDES permit. See SEP Permit at E-12.

As a principal member of the Bay Area Clean Water Agencies, the SFPUC also continued to support nutrient receiving water monitoring and science plan development and implementation; participate in the development of Total Maximum Daily Loads and site-specific objectives; support implementation of the Mercury and PCBs Permit; and support implementation of the regional copper action plans.

Attention: NPDES Wastewater Division

SUBJECT: February 2019 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of February 2019 for the Southeast Water Pollution Control Plant (SEP).

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

Discharge Incident. Design for a temporary bypass of the SEP final effluent 36-inch force main pipe continues. The results of the bathymetric survey performed in February identified a depression along the bypass alignment. Completion of design is still pending while the designer evaluates two possible solutions: changing the alignment and filling the depression. Further analysis of sediment bed conditions also identified the need to construct full cofferdams at both connections points, rather than the original plans to use Portadam cofferdams, which have a freestanding nature and require no ground penetration. Use of cofferdams will require excavation of Bay mud; soil testing for disposal is being planned.

Interagency coordination is ongoing. The project necessitates raising and lowering of the Islais Creek and Illinois Street bridges on at least three occasions. The SFPUC has been coordinating on the operation of these bridges with San Francisco Public Works, the San Francisco Municipal Transportation Agency, and the Port of San Francisco. Currently it is unclear whether the Islais Creek drawbridge is functional, so other options to deliver materials to the site are being evaluated.

London N. Breed Mayor
Ann Moller Caen President
Francesca Vietor Vice President
Anson Moran Commissioner
Ike Kwon Commissioner
Harlan L. Kelly, Jr. General Manager

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Environmental permitting is also ongoing. All required permit applications have been submitted. Revisions to the submittals may be necessaryif the developments described above necessitate further changes to the design and planning.

Cyanide Action Plan
The February 20 influent result for cyanide was 47.8 µg/L, which is greater than the threshold in the NPDES permit of 21 µg/L for a "significant cyanide discharge". Consistent with the requirements in NPDES permit Provision VI.C.6.b., SFPUC implemented its emergency monitoring and response plan in March 2019 by first conducting follow-up sampling at an increased frequency. The results will be reported in the March 2019 monthly SMR.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were multiple combined sewer discharges during this monitoring period as summarized in the table below and described in the Wet Weather Summary.

Drainage Areas CSDs	**North Shore Basin**	**Central Basin**	**Southeast Basin**
This reporting period	1	2	1
Total for Count 2018-2019 Wet Weather Season	4	11	4

System Operations of Wet Weather Facilities.
The operation of wet weather facilities during the storm events were conducted consistent with the requirements in NPDES permit Provision VI.C.5.c.i. - VI.C.5.c.iv.

Wet Weather Monitoring. The Bayside system experienced wet weather days on February 1-5, 8-10, 12-18, and 25-27. Wet weather sampling was conducted during the reporting month. The following notes related to fecal indicator bacteria monitoring (see footnote [4] of NPDES permit Table E-4) being provided for clarity:

- On February 2 and 26, wet weather enterococcus and fecal coliform samples were collected at EFF-002 but not EFF-001B because SEP was discharging only secondary treated effluent, so the EFF-002 sample was representative of the effluent being discharged at both Discharge Points Nos. 001 and 002.

- On February 10, wet weather enterococcus and fecal coliform samples were collected at EFF-002 but not EFF-001B because SEP was discharging only secondary treated effluent until after 10pm, so the EFF-

002 sample was representative of the effluent being discharged at both Discharge Points Nos. 001 and 002 during the time frame (4am-2pm) for which wet weather bacteria samples can be collected on time for laboratory analyses.

CSD Monitoring. CSD samples were collected at each permit-designated location during each CSD event. During the February 13 CSD event, a single manual grab sample rather than a composite was collected at Monitoring Location CSD-010. The sampler was properly set up, but the liquid level actuators (LLAs), which were previously repositioned and field-tested, did not activate sample collection. Field staff collected a grab sample while the CSD was occurring; they subsequently replaced the appropriate sampler and LLA and field-tested the sampler.

During the morning of February 13 CSD event, a single automatic composite sample was collected at Monitoring Location CSD-025 (Sixth Street North). When a sampler collects a sample, it must be reset prior to collecting another automatic sample and it cannot be reset during an active CSD. Staff then visited the sampler multiple times on February 13 to reset the sampler but were unable to due to the long duration of the February 13 CSD (i.e., an active CSD was occurring during each site visit). The sampler could not be reset to automatically collect an additional sample for the evening February 13 CSD event (through the next day). Field staff who were tracking the CSD event in real time made the effort to travel to the monitoring location during the CSD and collected a grab sample onsite during the morning of February 14.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit.

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

Note
For the storm starting on 2/13, several CSDs in Mission Creek had two discharge events separated by a 6-hour inter-event. For the same storm, there was a single discharge event in Islais Creek. The two CSD events in Mission Creek coincided with the single CSD event in Islais Creek, therefore there is one reported event for Central Basin.

SUBJECT: March 2019 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of March 2019 for the Southeast Water Pollution Control Plant (SEP).

Compliance with Effluent Limitations. Compliance with the effluent limitation was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

Effluent Characterization Study. Per NPDES permit Provision C.2., a sample was collected during February 2019 for the Effluent Characterization study. The study results were not available when the February 2019 SMR was submitted on March 29, 2019. Priority pollutants were not detected at or above the applicable water quality criteria.

Discharge Incident. Final design for a temporary bypass of the SEP final effluent 36-inch force main crossing Islais Creek is complete. Notice to proceed has been issued to the contractor to begin long lead material procurement, special work equipment rental, and continued value engineering solutions. Due to the findings of the bathymetric survey completed in February, the alignment has been slightly modified. Soil characterization needed for temporary cofferdam construction is currently being evaluated, and contractor mobilization is planned to start in June. Interagency coordination for

London N. Breed Mayor
Ann Moller Caen President
Francesca Vietor Vice President
Anson Moran Commissioner
Harlan L. Kelly, Jr. General Manager

environmental permitting is ongoing. The project team is coordinating the raising and lowering of the Islais Creek and Illinois Street bridges while actively seeking alternative site access methodologies.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were multiple combined sewer discharges during this monitoring period as summarized in the table below and described in the Wet Weather Summary.

Drainage Areas CSDs	**North Shore Basin**	**Central Basin**	**Southeast Basin**
This reporting period	0	2	0
Total for Count 2018-2019 Wet Weather Season	4	13	4

System Operations of Wet Weather Facilities.
The operation of wet weather facilities during the storm event was conducted consistent with the requirements in NPDES permit Provision VI.C.5.c.i. - VI.C.5.c.iv.

Wet Weather Monitoring. The Bayside system experienced wet weather days on March 2, 3, 5-7, 9-11, 20, 22, 23, 25, and 26. Required monitoring occurred at EFF-001B, EFF-002, and EFF-003 with one exception. On March 7, staff did not collect wet weather samples for enterococcus at EFF-001B, EFF-002, and EFF-003 and fecal coliform at EFF-003. Per footnote [4] of the NPDES permit Table E-4, sample collection is required when discharges start after 4 am. Wet weather discharges were occurring at Discharge Point Nos. 001, 002 (until ~4:30am), and 003/004 (until ~7:15am). All wet weather bacteria samples were collected for same event on March 6 with numeric results less than the most stringent effluent limitations, and compliance with the wet weather enterococcus effluent limitation with achieved. Senior stationary engineers have been reminded of this monitoring requirement.

In addition, the following notes related to fecal indicator bacteria monitoring are being provided for clarity:

- On March 7, wet weather fecal coliform samples were collected at EFF-002 but not EFF-001B because only secondary treated effluent was being discharged after 1:00am, so the EFF-002 result is representative of effluent being discharged at both Discharge Points Nos. 001 and 002.

- On March 5 and 9, wet weather enterococcus and fecal coliform samples were collected at EFF-002 but not EFF-001B because SEP was discharging only secondary treated effluent, so the EFF-002 sample was representative of the effluent being discharged at both Discharge Points Nos. 001 and 002.

CSD Monitoring. CSD samples were collected at each permit-designated location during each CSD event as required by the NPDES permit.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit.

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Operations Division Manager, Wastewater Enterprise

* Includes upto 6 MG of flows stored at the treatment facility and drained back to combined sewer system

NOTES

-NPF Effluent had data anamolies on a total of 15 days: 3/1, 3/2, 3/3, 3/4, 3/5, 3/6 3/7, 3/9, 3/10, 3/11, 3/12, 3/20, 3/22, 3/23, 3/29. Of the 15 days, NPF effluent is assumed to be equal to NPF influent on 3/1, 3/3, 3/4, 3/6, 3/10, 3/12, 3/23, 3/29. Of the 15 days, NPF effluent is assumed to be 6 MG less than NPF influent on 3/2, 3/5, 3/7, 3/9, 3/11, 3/20, and 3/22.

-Operations confirmed that on 3/25 and 3/26 all plant effluent was discharged at EFF-001 and there was no discharge at EFF-002.

Total ammonia (mg/L)	10.9					

Comments: In order to maintain dissolved oxygen levels of at least 60% saturation, control and effluent were aerated from test-initiation through test-termination
Effluent and control exposures were also oxygenated intermittently from 53- through 68-hours after test-initiation in order to maintain dissolved oxygen levels within protocol requirements.

SUBJECT: April 2019 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of April 2019 for the Southeast Water Pollution Control Plant (SEP).

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period with the exception of acute toxicity.

Acute Toxicity. Monthly dry weather acute toxicity testing was performed for the periods of April 8-12 and April 15-19. The April 8-12 test result of 55% did not meet the 11-sample 90th percentile limitation of 70% survival, as shown in the table below. The April 15-19 test result of 95% met the effluent limitations.

Flow-through Bioassay Test Date	Results (% Survival)	11-Sample Median	11-Sample 90th percentile
July 9-13, 2018	100%	--	--
July 16-20, 2018	100%	--	--
August 6-10, 2018	100%	--	--
September 17-21, 2018	90%	--	--
October 9-13, 2018	100%	--	--
November 5-9, 2018	45%	100%	55%
December 10-14, 2018	55%	100%	55%
December 18-22, 2018	70%	100%	--
February 19-23, 2019	90%	--	--
March 29 - April 2, 2019	85%	90%	--
April 8 - April 12, 2019	**55%**	**90%**	**55%**
April 15-19, 2019	**95%**	**--**	**--**

Sophie Maxwell, Commissioner
Tim Paulson, Commissioner
Harlan L. Kelly, Jr., General Manager

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Investigation of intermittent poor survival results during SEP acute flow-through bioassay testing has identified ammonia as a major factor contributing to lower survivals in the effluent exposures. As a result, an acid dosing system for maintaining the lower pH of the effluent within bioassay exposure chambers will be tested in June. Maintaining the lower effluent pH will reduce the unionized ammonia interference, providing a more reliable assessment of the toxicity of SEP effluent.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

The semi-annually required chronic toxicity results (zeolite treated effluent - 5 TUc and untreated effluent – 20 TUc) with comments have been uploaded to CIWQS. Along with untreated and zeolite treated effluent, the ammonia add-back testing at 10% effluent toxicity report has been uploaded to CIWQS as an attachment; no result could be uploaded directly to CIWQS for ammonia add-back testing at 10% effluent.

Discharge Incidents. Preliminary construction sequencing for a temporary bypass of the SEP final effluent 36-inch force main crossing Islais Creek has begun, with construction expected to begin in June. Coordinating SEP shutdowns needed for construction with shutdowns for construction related to other projects (e.g., Headworks Facility Project and Biosolids Digester Facilities Project) is underway, as is evaluation of whether utilization of the Quint Street outfall for discharging after shutdowns may be needed. A project staging area has been leased from the Port of San Francisco and an encroachment permit is imminent. U.S. Army Corps of Engineers and Bay Conservation and Development Commission permits are expected to be issued in late May and early June respectively. The Regional Water Board has issued a Clean Water Act 401 certification, and the construction contractor is preparing a dewatering plan as required by that certification.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were no combined sewer discharges during this monitoring period as summarized in the table below and described in the Wet Weather Summary.

Drainage Areas CSDs	**North Shore Basin**	**Central Basin**	**Southeast Basin**
This reporting period	0	0	0
Total for Count 2018-2019 Wet Weather Season	4	13	4

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit.

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Operations Division Manager, Wastewater Enterprise

NOTES

-NPF Effluent had data anamolies on a total of 4 days: 4/7, 4/9, 4/10, and 4/15. NPF effluent was zeroed per confirmation from Operations for these 4 days.
-Operations confirmed that on 4/5 and 4/24 all plant effluent was discharged at EFF-001 and there was no discharge at EFF-002.
-SEP planned shutdown on 4/24

Water Quality Data

	CONTROL					EFFLUENT				
	0 hrs	24 hrs	48 hrs	72 hrs	96 hrs	0 hrs	24 hrs	48 hrs	72 hrs	96 hrs
Temperature (°C)	12.5	12.3	11.8	12.1	11.6	12.8	11.8	11.6	11.9	11.7
pH (units)	7.51	7.10	7.95	7.15	7.80	6.59	6.79	6.73	6.89	6.78
Dissolved oxygen (mg/L)	7.9	8.3	8.5	8.6	8.7	6.6	7.5	8.0	7.7	6.6
Residual chlorine (mg/L)	0.0	-0.1	0.0	-0.1	-0.3	-1.6	-1.7	-0.8	-1.5	-2.8
Alkalinity (mg/L)	16				12	232	238	226	248	246
Hardness (mg/L)	32				36	220	200	236	192	164
Conductivity ($\mu S/cm^2$)	83				77	2211	1876	2299	2009	1837
Total ammonia (mg/L)	0.07				<0.02	38.5	38.8	40.9	47.0	51.2

Notes: Effluent and control exposures were gently aerated from two-hours after test initiation through test termination in order to ensure dissolved oxygen levels above the 6 mg/L protocol-recommended level. A short-term, plant-process interruption occurred during the last 24-hours of testing that did not invalidate testing.

SUBJECT: May 2019 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of May 2019 for the Southeast Water Pollution Control Plant (SEP).

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period with the exception of total chlorine residual as described below.

Total Chlorine Residual. On May 29, 2019 for one minute at 11:45 am, the total residual chlorine continuous analyzer for the final effluent being discharged at Discharge Point No. 001 (Pier 80) was 0.2 mg/L, which exceeded the instantaneous maximum effluent limitation of 0.0 mg/L. The exceedance measured by the analyzer was caused by an approximate three-minute (11:38-11:41) loss of the local 24-voltage power supply, which stopped the final effluent flow transmitter. Flow rate from this transmitter determines the rate of sodium bisulfite pumping. The lost signal was interpreted by the sodium bisulfite pumps as a flow rate of zero, so the pumps stopped dosing. Investigation indicates that the power loss was mostly likely caused by a mistake made by an on-site construction contractor.

Once power returned and Operations staff were alerted to the exceedance, they manually turned on the lead sodium bisulfite dosing pump to neutralize the positive chlorine readings by the upstream continuous analyzer, ending the one-minute exceedance.

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

For the purpose of the mandatory minimum penalties, SFPUC understands that the only the maximum value among the discrete hourly readings is used, even if chlorine is measured continuously, per Table 4 footnote [2] of the NPDES permit. The 0.2 mg/L exceedance did not occur on the hour and thus has not been reported in CIWQS as the instantaneous maximum result for compliance with total residual chlorine limit. SFPUC understands the Regional Water Board retains the ability to use all continuous monitoring data for discretionary enforcement.

Discharge Incidents. Mobilization for replacement of the 36" force main crossing Islais Creek began in early June. All environmental permitting was also completed in June, with issuance of permits from the U.S. Army Corp of Engineers and the Bay Conservation and Development Commission on June 4 and 5, respectively. A crane for excavation of the cofferdams has arrived, and excavation is expected to begin in July.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were two combined sewer discharges (CSDs) during this monitoring period as summarized in the table below and described in the Wet Weather Summary.

Drainage Areas CSDs	North Shore Basin	Central Basin	Southeast Basin
This reporting period	0	0	2
Total for Count 2018-2019 Wet Weather Season	4	13	6

System Operations of Wet Weather Facilities. The operation of all other wet weather facilities during the storm events was conducted consistent with the requirements in NPDES permit Provision VI.C.5.c.i. - VI.C.5.c.iv. except on May 18-19 at Griffith Pump Station (GFS).

The SFPUC schedules maintenance and rehabilitation activities on key wet weather assets for the "dry season" in order to ensure that those assets are available to maximize treatment and storage during wet weather. Typically, SFPUC contracts for construction activities affecting wet weather assets identify the dry season as May 15 through October 15 because of the statistically small likelihood of rainfall occurring during this timeframe.

On May 15, the SFPUC initiated construction of a major rehabilitation project at the GFS that includes substantial upgrades to the electrical system, including the electrical switchgear. PG&E is physically connecting the GFS wet weather

pumps to a permanent electrical feed. During these activities, the GFS is being operated with a portable generator supporting the load of powering one or two dry weather pumps with flow rates depending on hydraulic head; the wet weather pumps are not powered. Rescheduling PG&E service was not feasible, because it would result in an unquantifiable delay to project completion as PG&E schedules these activities months in advance. Providing alternative power to the wet weather pumps is not possible because there is no on-site receptacle for a standby generator. Project staff also evaluated powering one or more wet weather pumps using the dry weather pump power feed but determined that the dry weather pump power feed is insufficient to power all the electrical needs of the wet weather pumps (e.g., sumps) and the station as a whole (e.g., HVAC).

A significant storm event occurred on the night of May 18 through the morning of May 19. The available capacity of the two online GFS dry weather pumps were exceeded, and the GFS could not be operated at its wet weather design capacity prior to two combined sewer discharges from the adjacent Yosemite Transport/Storage Structure (Discharge Point Nos. 040-042) due to the essential maintenance described above.

The SFPUC provided advance notification of this unanticipated bypass for essential maintenance to Jessica Watkins of the Regional Water Board regarding this matter on May 14, 2019.

Wet Weather Monitoring. The Bayside system experienced wet weather days on May 15, 16, 18, and 19. Required monitoring occurred at EFF-001B, EFF-002, and EFF-003.

CSD Monitoring. CSD samples were collected at each permit-designated location, except for the event on May 19. No samples were collected for the May 19 CSD event because of back-to-back CSD events. During the late-night Saturday May 18 CSD event, a single composite sample was automatically collected at Monitoring Location CSD-041 (Yosemite Avenue). When a sampler collects a sample, it must be manually reset by staff prior to collecting another automatic sample and it cannot be reset during an active CSD. The next CSD occurred about 6.5 hours later on Sunday morning May 19; staff were not available during these six hours to reset the sampler.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit except for May 19, following the CSDs occurring at Discharge Point Nos. 040, 041, and 042. Staff accidentally sampled at Monitoring Location 301.1 (Windsurfer Circle) instead of at required Monitoring Location 301.2 (Jack Rabbit Beach).

The error was realized immediately, and staff sampled at the correct location on the following day (May 20).

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Operations Division Manager, Wastewater Enterprise

* Includes upto 6 MG of flows stored at the treatment facility and drained back to combined sewer system

NOTES

-Operations confirmed that on 5/21 all plant effluent was discharged at EFF-001 and there was no discharge at EFF-002.

-Plant shutdown on 5/23

SUBJECT: June 2019 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of June 2019 for the Southeast Water Pollution Control Plant (SEP).

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period with the exception of acute toxicity, 5-day biochemical oxygen demand (BOD), total suspended solids (TSS), and fecal coliform.

Acute Toxicity

Monthly dry weather acute toxicity testing was performed for the periods of June 3-7, 2019 and June 28 - July 2, 2019. The June 3-7 test result of 60% survival did not meet the 11-sample median limitation of 90% survival and the 11-sample 90th percentile limitation of 70% survival, as shown in the following table. The June 28 - July 2 test result of 100% met acute toxicity effluent limitations.

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Flow-through Bioassay Test Date	Result (%Survival)	11-Sample Median	11-Sample 90th percentile
September 17-21, 2018	90%		
October 9-13, 2018	100%		
November 5-9, 2018	45%		
December 10-14, 2018	55%		
December 18-22, 2018	70%		
February 19-23, 2019	90%		
March 29 - April 2, 2019	85%		
April 8-12, 2019	55%		
April 15-19, 2019	95%		
May 6-10, 2019	95%		
June 3-7, 2019	**60%**	**85%**	**55%**
June 28 - July 2, 2019	**100%**	**--**	**--**

A follow-up test was initiated on June 28. This was the earliest that a test could be initiated because of organism and staff availability, planned plant shutdowns related to the Southeast Bay Outfall (SEO) Vent Pipe Replacement project, and the temporary loss of power to the bioassay facility due to construction of the Headworks Facility Project.

Investigation of intermittent poor survival results during the SEP acute toxicity flow-through bioassay testing has identified ammonia as a factor contributing to lower survivals in the effluent exposures. As a result, an acid dosing system for maintaining the lower pH of the effluent within bioassay exposure chambers is currently being tested. Maintaining the lower effluent pH will reduce the unionized ammonia interference, providing a more reliable assessment of the toxicity of SEP effluent. The new pH adjustment system is currently in its startup phase and it was first tested in parallel with the June 28 – July 2 test. Modifications to the system are planned to ensure its reliable functionality before it is used for an acute toxicity flow-through compliance test.

<u>BOD, TSS, and Fecal Coliform</u>

In June, SEP experienced a significant disruption of the biological secondary treatment process, resulting in exceedances of TSS, BOD, and fecal coliform effluent limitations as summarized in the tables below. The various events that contributed to the upset are described in the attached memorandum from Wastewater Enterprise Operations Manager George Engel.

Compliance Period	Average BOD Concentration	Average TSS Concentration	Compliance Result
Week - June 9-15, 2019	62 mg/L	78 mg/L	Exceeded AWEL
Week - June 16-22, 2019	59 mg/L	98 mg/L	Exceeded AWEL
Month - June 1-30, 2019	48 mg/L	60 mg/L	Exceeded AMEL
Month - June 1-30, 2019 (percent removal)	84%	80%	Exceeded AMEL

Sample Date and Time	Data Qualifier	Fecal Coliform Result (MPN/ 100 mL)
6/3/19 9:32 AM		500
6/4/19 9:17 AM		7
6/5/19 9:17 AM		30

6/24/19 10:12 AM		23
6/25/19 9:22 AM	<	2
6/26/19 9:32 AM		13
6/27/19 9:23 AM	<	2
6/28/19 9:34 AM		13
Monthly Median:		**30**
% Samples ≥ 1,100 MPN 100 mL:		**15%**

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

Discharge Incidents. Construction is underway for the temporary bypass of the SEP final effluent 36-inch force main crossing Islais Creek. A crane on a floating platform is being used to excavate a cofferdam (one of two) on the north side of Islais Creek. Construction of the northern cofferdam is expected to take several weeks, after which construction of the southern cofferdam will begin.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were no combined sewer discharges during this monitoring period as summarized in the table below and described in the Wet Weather Summary.

Drainage Areas CSDs	North Shore Basin	Central Basin	Southeast Basin
This reporting period	0	0	0
Total for Count 2018-2019 Wet Weather Season	4	13	6

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. MEMORANDUM

DATE: July 30, 2019
TO: Greg Norby, Assistant General Manager; Amy Chastain, Regulatory Manager
FROM: George Engel, Operations Manager

RE: June 2019 Southeast Plant Process Upset

During the month of June, the Southeast Treatment Plant (SEP) experienced a significant disruption of the biological secondary treatment process, resulting in violations of numeric effluent limitations for total suspended solids (TSS) and biological oxygen demand (BOD). Investigations have not identified any single cause; rather, the upset appears to have been the result of multiple events that sequentially and cumulatively compromised the efficacy of the biological process. Each of the contributing factors is described below.

In addition to the TSS and BOD exceedances, SEP effluent exceeded one of the two fecal coliform limitations. Compliance with the monthly median limit of 30 MPN/100 mL was achieved, but concentrations on June 7 and June 10 of 1,600 MPN/100 mL caused an exceedance of the requirement that no more than 10 percent of samples exceed 1,100 MPN/100 mL. The cause of this exceedance is likely the high TSS values in the effluent preventing efficacy of the disinfecting agent.

FACTORS CONTRIBUTING TO THE UPSET

Primary Sedimentation

On May 31, the levels of all the Building 042 primary sedimentation tanks were lowered to enable a rebuild of the mechanical systems in one of the seven tanks. The levels were lowered quickly, leading to a temporary condition of increased hydraulic and solids loading to secondary aeration. The rapid increase in solids loading into secondary aeration increased the food to microorganism ratio in secondary aeration, decreasing the efficacy of the biological process and resulting in elevated, though compliant, TSS concentrations in the final effluent in the first week of June.

In response to the elevated TSS concentrations, on June 5, the wasting rate was reduced from 750 to 700 gpm to increase the biological mass in the secondary system and therefore increase the degradation of solids.

RAS Pumping

On June 9, 10 and 11, Return Activated Sludge (RAS) pumping rates fluctuated and intermittently stopped. Pumping RAS from secondary clarification to aeration is critical for maintaining the health of the activated sludge by returning microorganisms which settle in the secondary clarifiers back into the aeration basins. RAS pumping **is**

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

typically automatically controlled through the Distributed Control System (DCS) based upon a percentage of influent flow. On these dates, there was a loss of communication between the DCS and the RAS pumps. Due to the complexity of the system, Operations was unable to determine the cause of this loss of communication.

The loss of RAS pumping increased the amount of time that solids were retained in the secondary clarifiers during a particularly warm period, further weakening the biological system and again resulting in elevated, though compliant, TSS and BOD concentrations.

In response to the degradation of performance, on Monday June 10, the wasting rate was further reduced from 700 to 650 gpm and RAS pumping was increased by approximately 6% to increase the aeration time. High solids continued to be observed in the effluent. On Tuesday June 11, sodium hypochlorite dosing was increased to ensure adequate disinfection of the effluent. On Thursday, June 13, polymer addition was started.

Mixing

The most significant disruption to the biological process is believed to have been caused by the stoppage of mixing in two of the eight aeration trains for approximately two days (June 11 through June 13). Because there was no mixing, solids settled in the aeration basins and settled microorganisms did not receive oxygen or food, thereby decreasing the efficacy of the biological process. The cause of the mixers stopping is believed to have been due to voltage sags on the power feed to the mixers on June 11. Two voltage sags were recorded at the aeration mixer motor control center on June 11. It is believed that the above referenced mixing stopped at this time; this condition was not discovered until June 13. Likewise, on June 13, the data unit which communicates the status of the mixers to the DCS was found in a “fault” state and was not reporting the status of the mixers to the DCS. Because of the configuration of this system, the DCS showed that the mixers were operational, which was the last state of the mixers at the time that data was being transmitted. It is unknown why the data unit failed.

This issue was discovered when the polymer dosing system was being setup. The aeration process is staffed with a certified operator 24 hours a day, seven days a week. These stationary engineers are responsible to inspect the mixers and log any abnormalities regularly across a 12-hour shift. Neither the stationary engineers nor the log sheets identified any issues. This issue should have been identified by the individuals staffing the secondary process.

The affected aeration trains were immediately isolated from receiving primary effluent and RAS. Work to drain both aeration trains began shortly thereafter to limit an excess of solids being flushed out of the trains once mixing was re-established. One train was returned into service to increase aeration capacity while the second was fully drained and returned into service the next day. The same day, RAS rates were returned to normal and wasting rates were reduced to allow the microorganisms to regrow to normal levels. On Tuesday, June 16, sodium hypochlorite dosing was again increased to maintain the efficacy of disinfection.

Construction Dewatering

The effect of the issues described above on the biological processes seem to be greater than would have been expected under typical operating conditions. Operations and Engineering staff have been investigating other potential factors that may have contributed to the overall weakening of the process. One hypothesis is that intermittent dewatering from SEP construction of the new headworks facility could be inhibiting biological activity in the secondary process.

Construction dewatering began in February of this year. Intermittently, flows from construction are being discharged into SEP influent. Preliminary testing of these flows did not indicate the presence of any constituents of concern, however visual observations indicate that they contain significant amounts of clay. Various types of clay are reported in the literature as impairing the activity of activated sludge and calculations performed by process engineering indicate that the clay particles are likely to accumulate in the mixed liquor over time, further stressing the plant.

The effect of clay on the SEP biological process is a working hypothesis and fits with observations that include a progressive decline in effluent quality in April and May, repeated episodes of viscous bulking in response to rapid increases in organic loading to the plant, and the severity of the June upset. Dewatering is expected to stop in August of this year and trends in treatment performance will continue to be evaluated to assess the strength of this hypothesis and inform future management of construction dewatering flows. In the interim, the settlement boxes that remove sediment prior to discharge will be cleaned more frequently and a filter has been installed on the discharge pipe; discharges are now monitored by Operations personnel.

Oakland, CA 94612

SUBJECT: Discharge Report (5-Day) for July 2019 Exceedance of Oil & Grease Average Monthly Effluent Limitation at the Southeast Water Pollution Control Plant (NPDES No. CA0037664)

Dear Mr. Plummer,

Attached please find a summary of currently available information regarding an exceedance of the average monthly effluent limitation for oil and grease at the Southeast Water Pollution Control Plant, as required by National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037664.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

George Engel

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

ATTACHMENT: SEP Oil & Grease Exceedance (5-Day) Report
August 20, 2019

1. Discharge description and cause

A sample collected on July 2 had an oil and grease (O&G) concentration of 11.9 milligrams per liter (mg/L). No additional samples were collected during July, therefore the average monthly effluent limit (AMEL) was exceeded. The failure to initiate accelerated sampling as required by Attachment G resulted from a failure of laboratory staff to timely identify and communicate the elevated sample result. Accelerated sampling was initiated on August 8, after a sample collected on August 5 also had an elevated O&G concentration.

Investigation into the potential cause of the elevated O&G in the effluent was initiated after receipt of the August 5 sample result. Elevated effluent O&G may be caused by high influent concentrations, ineffective skimming, deficient secondary treatment processes, and/or on-site discharges of O&G from equipment leaks or construction activities. Each of these potential causes was investigated. Influent O&G concentrations were within the expected range, all skimmers were functioning, and the secondary treatment process was stable. After a review of process data, there is great confidence that the process was not the cause of the incident. Several potential on-site sources (such as spills related to ongoing construction or maintenance) were identified and investigated, but the results of these investigations failed to conclusively identify a specific cause of the elevated O&G results.

2. Period of Noncompliance (if noncompliance has not been correct, anticipated time it is expected to continue)

The period of noncompliance is the month of July 2019.

3. Steps Taken or Planned to Reduce, Eliminate, and Prevent Reoccurrence of Noncompliance

No steps have been taken or are planned to prevent a reoccurrence because no cause has been identified. The SFPUC will continue accelerated sampling daily from Monday through Friday through the end of August to assess whether effluent trends may be correlated to potential sources. As of August 20, 2019, available results indicate that the plant is in compliance with the O&G AMEL. If any sources are identified, the SFPUC will provide this information in a future monthly self-monitoring report.

Several actions have been taken to address the failure to perform accelerated monitoring as required by Attachment G. Accelerated monitoring did not occur because the elevated July 2 sample result was not identified until Laboratory staff began preparing data for submittal of the July self-monitoring report. The Analyst performing the O&G analysis was instructed to notify the Supervising Chemist immediately upon completion of any analysis showing concentrations above the effluent limitation. The Supervising Chemist will be re-trained on communications following elevated results. As a final redundant measure, the SFPUC's Laboratory Information Management System (LIMS) will be configured to generate automatic email notifications to Operations, Regulatory, and Laboratory management when elevated concentrations are observed.

SUBJECT: July 2019 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of July 2019 for the Southeast Water Pollution Control Plant (SEP).

Per electronic notification from San Francisco Bay Regional Water Quality Control Board staff member James Parrish, the Regional Water Board is waiving late eSMR submittal violations for the month of July; as of the eSMR due date August 30, the State Water Board had not yet updated the Discharge Monitoring Report (DMR) form for consistency with the San Francisco Bay Nutrients Watershed permit.

As of September 30, the program coding for the DMR has not been updated for consistency with the new nutrients watershed permit effective July 1, 2019 (Order No. R2-2019-0017): the effluent parameters for the 001A location have not been removed, leading to extra form fields for three parameters (Total Nitrogen, TKN, Dissolved Reactive Phosphorus) and duplicative form fields for three other parameters (Total Ammonia, Nitrate-Nitrite, and Total Phosphorus). Accordingly, we are submitting the data with blank fields and with duplicative data to provide a timely submittal of the SMR.

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period except for total suspended solids (TSS) and oil & grease.

London N. Breed Mayor
Ann Moller Caen President
Francesca Vietor Vice President
Anson Moran Commissioner
Sophie Maxwell Commissioner
Tim Paulson Commissioner
Harlan L. Kelly, Jr. General Manager

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Total Suspended Solids
In July, there were two exceedances of the TSS effluent limits as summarized in the table below.

Compliance Period	Average TSS Concentration	Compliance Result
Week – June 30 - July 6	52 mg/L	Exceeded AWEL
Monthly – July 1-31	37 mg/L	Exceeded AMEL

Throughout the month of July, the secondary treatment process was recovering from the process upset that occurred in June. This upset continued to cause high TSS results in the beginning of the month, resulting in an exceedance of the TSS average weekly effluent limit for June 30 – July 6. Details regarding the cause, investigation, and corrective actions were provided in the June 2019 monthly SMR submitted on July 30.

The AMEL was exceeded because of the June process upset, and because of construction activities the week of July 14 that resulted in elevated TSS effluent concentrations in samples collected on July 18, 19 and 20. These construction activities included dewatering of headworks channels the week of July 14 and a plant shutdown on July 17. Cumulatively the effect of these activities was a disruption of the food to microorganism ratio, which adversely impacted the microbiology in the secondary aeration process, thereby decreasing the efficacy of TSS removal.

After these adverse impacts were noted in late July, staff have postponed, re-prioritized, and rescheduled subsequent plant shutdowns to minimize impacts to plant processes.

Oil and Grease. The average monthly effluent limit for oil and grease was exceeded during this monitoring period. Multiple potential causes were identified and investigated, but the results of these investigations failed to conclusively identify a specific cause of elevated results. Details regarding the investigation and corrective actions were provided in a 5-day report submitted on August 19.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit. Due to the July 17 plant shutdown for construction, a 24-hour INF-001 composite sample for TSS, and a 24-hour EFF-001A composite sample for biochemical oxygen demand (BOD), chemical oxygen demand (COD), and TSS analyses were not available. COD and TSS results for incomplete composites are available and have been uploaded to CIWQS.

Discharge Incidents. Substantial progress was made in the construction of the temporary bypass of the SEP final effluent 36-inch force main crossing Islais Creek in August. Cofferdam construction was completed at both northern and southern connection structures, the contractor received delivery of permanent piles and immediately commenced with installation, and the new 42-inch inner diameter HDPE pipe is being fused in preparation to be floated into the Islais Channel while anchor blocks are cast on site. On August 21, two knife valves were installed to isolate the 36-inch force main and to enable preparation of existing infrastructure on both sides of Islais Channel. As communicated to the Regional Water Board case manager Sam Plummer on August 19, this installation required a temporary shutdown of the entire Pier 80 outfall (Discharge Point No. 001) during which secondary treated effluent was discharged through Discharge Point No. 002. The details of this anticipated bypass of Discharge Point No. 001 for essential maintenance, including the results of the required accelerated monitoring, will be reported with the August SMR.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were no combined sewer discharges during this monitoring period as described in the Wet Weather Summary.

If you have any questions concerning this report, please contact Operations Superintendent, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

George Engel

SUBJECT: September 2019 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of September 2019 for the Southeast Water Pollution Control Plant (SEP).

As of October 29, the program coding for the DMR has not been updated for consistency with the new nutrients watershed permit effective July 1, 2019 (Order No. R2-2019-0017): the effluent parameters for the 001A location have not been removed, leading to extra form fields for three parameters (Total Nitrogen, TKN, Dissolved Reactive Phosphorus) and duplicative form fields for three other parameters (Total Ammonia, Nitrate-Nitrite, and Total Phosphorus). In accordance with the DMR Help Desk, we are submitting the nutrients data under limit set 001-A1 and reporting no data with the no data indicator code "NODI(9)" in 001A to provide a timely submittal of the SMR.

Compliance with Effluent Limitations. Compliance with the effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit. Due to plant shutdowns on September 20 and 25, incomplete composite samples were collected for monitoring locations INF-001A and EFF-001A; composite sample results for total suspended solids (TSS), 5-day biochemical oxygen demand (BOD_5), and chemical oxygen demand (COD) on these days are available and have been uploaded to CIWQS.

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Discharge Incidents. Construction is substantially complete for the Southeast Bay Outfall (SEO) Islais Creek Crossing Emergency Bypass project to replace the damaged 36" force main that carries final effluent from the Southeast Treatment Plant to the Pier 80 deepwater outfall (Discharge Point No. 001). As of October 9, the Emergency Bypass was activated to restore full pumping capacity from Booster Pump Station. Contractor is anticipated to fully demobilize remaining construction equipment in November.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were no combined sewer discharges during this monitoring period as described in the Wet Weather Summary.

If you have any questions concerning this report, please contact Operations Superintendent, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

NOTES

1. There was a SEP plant shutdown on 9/20 from 08:00AM to 09:40AM due to a power outage, and on 9/25 from 11:30AM to 18:10PM.
2. GFS rain gauge recorded rainfall depth while being testing on 9/10 and 9/11; this has been zeroed per confirmation from CSD.

Attention: NPDES Wastewater Division

SUBJECT: October 2019 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of October 2019 for the Southeast Water Pollution Control Plant (SEP).

As of November 27, the program coding for the DMR has not been updated for consistency with the new nutrients watershed permit effective July 1, 2019 (Order No. R2-2019-0017): the effluent parameters for the 001A location have not been removed, leading to extra form fields for three parameters (Total Nitrogen, TKN, Dissolved Reactive Phosphorus) and duplicative form fields for three other parameters (Total Ammonia, Nitrate-Nitrite, and Total Phosphorus). In accordance with the DMR Help Desk, we are submitting the nutrients data under limit set 001-A1 and reporting no data with the no data indicator code "NODI(9)" in 001A to provide a timely submittal of the SMR.

Compliance with Effluent Limitations. Compliance with the effluent limitation was achieved during this monitoring period.

Compliance with Monitoring Requirements. Due to plant shutdowns on October 3, 9, and 23, incomplete composite samples were collected for monitoring locations INF-001 and EFF-001A; composite sample results for total suspended solids (TSS), 5-day biochemical oxygen demand (BOD5), and chemical oxygen demand on some of these days are available and have been uploaded to CIWQS.

Harlan L. Kelly, Jr. General Manager

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were no combined sewer discharges during this monitoring period as described in the Wet Weather Summary.

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Bayside Superintendent, Wastewater Enterprise

* Includes upto 6 MG of flows stored at the treatment facility and drained back to combined sewer system

NOTES

1. There were SEP shutdowns on 10/3 from 06:15AM to 2:40PM, on 10/5 from 08:45AM to 10:40AM, on 10/9 from 10:00AM to 12:40PM, and on 10/23 from 4:00AM to 7:00PM.
2. NPF effluent flow sensor data was anomalous from 10/25 - 10/29 and has been zeroed per confirmation with Operations.

Attention: NPDES Wastewater Division

SUBJECT: November 2019 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of November 2019 for the Southeast Water Pollution Control Plant (SEP).

As of December 23, the program coding for the DMR has not been updated to reflect the nutrients watershed permit that took effect on July 1, 2019 (Order No. R2-2019-0017): the effluent parameters for the 001A location have not been removed, leading to extra form fields for three parameters (Total Nitrogen, TKN, Dissolved Reactive Phosphorus) and duplicative form fields for three other parameters (Total Ammonia, Nitrate-Nitrite, and Total Phosphorus). In accordance with the DMR Help Desk direction, we are submitting the nutrients data under limit set 001-A1 and reporting no data with the no data indicator code “NODI(9)” in 001A to provide a timely submittal of the SMR.

Compliance with Effluent Limitations. Compliance with the effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit. Due to plant shutdowns on November 6 and 7, partial composite samples were collected for monitoring locations INF-001 and EFF-001A. The partial composite sample results for total suspended solids (TSS), chemical oxygen demand (COD), and copper on these days are available and have been uploaded to CIWQS.

London N. Breed Mayor
Ann Moller Caen President
Francesca Vietor Vice President
Anson Moran Commissioner
Sophie Maxwell Commissioner
Tim Paulson Commissioner
Harlan L. Kelly, Jr. General Manager

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Effluent pH monitoring at Monitoring Location EFF-001A was interrupted by wet weather during the week of November 24-30. Effluent was monitored for pH five days during the week: monitoring at EFF-001A occurred on November 24, 25, and 29; monitoring at EFF-001B occurred on November 26; and monitoring at EFF-002 occurred on November 26 and 27.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were combined sewer discharges during this monitoring period as described in the attached Wet Weather Summary.

System Operations of Wet Weather Facilities.
The operation of wet weather facilities during the storm event was conducted consistent with the requirements in NPDES permit Provision VI.C.5.c.i. - VI.C.5.c.iv.

Wet Weather Monitoring. The Bayside system experienced wet weather days on November 26 and 27. Required monitoring occurred at EFF-001B, EFF-002, and EFF-003. Bacteriological monitoring for EFF-001B, EFF-002, and EFF-003 was not required on November 26 because the discharges started after 2:00 pm (see footnote [4] of NPDES permit Table E-4). A fecal coliform sample result for November 26 is available for EFF-002 because the dry weather weekly sampling was scheduled for that day and the physical monitoring location is the same as EFF-001A.

CSD Monitoring. During the November 26 CSD event, the composite sampler at Monitoring Location CSD-031A malfunctioned leading to the collection of a sample of insufficient volume (500 mL) for analysis of most laboratory analysis parameters except pH. The sampler head was replaced and tested for functionality on November 27.

Prior to the November 26 CSD event, the composite sampler at Monitoring Location CSD-025 was inaccessible for wet weather set-up because the sampler location is currently within an active construction site. Staff attempted to access the site on November 22, 25, and 26 but were unsuccessful because they could not reach construction personnel over the Thanksgiving holiday. The access issue was resolved prior to the subsequent major storm event on December 7.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit.

If you have any questions concerning this report, please contact Operations Division Manager, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew M. Clark
Superintendent, Wastewater Enterprise

NOTES

1. There was an SEP shutdown from 11/6 03:00AM to 11/7 02:00AM.
2. SEP rain gauge data was anomalous on 11/11 and 11/17 and has been zeroed.
3. NPF effluent flow sensor data was anomalous on 11/13 and has been zeroed.
4. SEP Influent flow data was calculated as the sum of CHS Total Flow (SM3CHS_CTRL:CH_FY1.RO01), SEP 011 Total Flow (SP1RAW_WELL1:01FY7.RO01), BFS Sump 1 Flow (BF01XLA003-S1FLOW), and BFS Sump 2 Flow (BF01XLA003-S2FLOW).

SUBJECT: December 2019 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of December 2019 for the Southeast Water Pollution Control Plant (SEP).

Compliance with Effluent Limitations. Compliance with the effluent limitation was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were combined sewer discharges during this monitoring period as described in the Wet Weather Summary.

System Operations of Wet Weather Facilities.
The operation of wet weather facilities during the storm event was conducted consistent with the requirements in NPDES permit Provision VI.C.5.c.i. - VI.C.5.c.iv. except for operations of the Mariposa Pump Station (MPS).

General Manager

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

During the December 22 CSD event at the Mariposa outfall (Discharge Point No. CSD-029), MPS reached peak wet weather capacity (10 MGD) when the Mariposa CSD started but did not maintain that peak flow rate. As a result, an estimated additional 0.25 million gallons (MG) or an additional 8% was discharged through the Mariposa CSD outfall (3.32 MG).

The flow fluctuations at the pump station were indicative of a ragging event, which cleared without necessitating a need to manually remove the pumps. This type of event may occur again during the wet weather season until the project is complete in 2021. The SFPUC is reviewing pump performance as part of daily onsite inspections at MPS to minimize the likelihood of a future occurrence.

Wet Weather Monitoring. The Bayside system experienced wet weather days on December 2, 4, 6, 7, 8, 10, 11, 12, 18, 19, 22, 25, 29, and 30. Required monitoring occurred at EFF-001B, EFF-002, and EFF-003.
The following notes related to fecal indicator bacteria monitoring (see footnote [4] of NPDES permit Table E-4) being provided for clarity:

- On December 2, 4, 19, 25, and 30, wet weather enterococcus and fecal coliform samples were collected at EFF-002 but not EFF-001B because SEP was discharging only secondary treated effluent, so the EFF-002 sample was representative of the effluent being discharged at both Discharge Points Nos. 001 and 002.

- On December 6, 10, 12, and 29, wet weather enterococcus and fecal coliform samples were not collected because sampling is only required when discharges are occurring between 4 am and 2 pm per footnote [4]. This time frame is paramount to ensure that wet weather bacteria samples are collected on time for laboratory analyses (i.e., for analyses to occur during business hours). SEP (6, 10, 12, 29) and NPF (6, 29) did not begin to receive influent flows that indicated significant wet weather until after 2 pm.

- On December 11, wet weather enterococcus and fecal coliform samples were not collected because sampling is only required when discharges are occurring between 4 am and 2 pm per footnote [4]. Wet weather flows at SEP ceased prior to 4am.

CSD Monitoring. Per NPDES permit Provision C.5.b.ix., wet weather sampling was conducted during the reporting month as required with two exceptions. During the December 7 CSD event, single manual grab samples rather than composites were collected at Monitoring Locations CSD-025 and CSD-031A.

The two samplers were properly set up and tested prior to the event. However, at CSD-025, the liquid level actuator (LLA) malfunctioned and did not activate sample collection. At CSD-031A, the marine battery failed. Field staff collected a grab sample at each location while a CSD was occurring; they subsequently replaced the LLA at CSD-025, replaced the faulty battery CSD-031A, and field-tested the samplers.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit.

If you have any questions concerning this report, please contact Operations Superintendent, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Operations Superintendent, Wastewater Enterprise

* Includes upto 6 MG of flows stored at the treatment facility and drained back to combined sewer system

NOTES

1. There was recorded NPF influent flow on 12/1, 12/3, 12/10-12/13, 12/17, 12/20, and 12/26 that was due to flow stored at treatment facility and drained back to combined sewer system, and has been zeroed per confirmation from WWE Operations.
2. NPF effluent flow sensor data was anomalous on 12/13 and has been zeroed per confirmation from WWE Operations.
3. SEP Influent flow data was calculated as the sum of CHS Total Flow (SM3CHS_CTRL:CH_FY1.RO01), SEP 011 Total Flow (SP1RAW_WELL1:01FY7.RO01), BFS Sump 1 Flow (BF01XLA003-S1FLOW), and BFS Sump 2 Flow (BF01XLA003-S2FLOW).

SUBJECT: Annual Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664], Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the annual self-monitoring report (SMR) for the calendar year of 2019 for the Southeast Water Pollution Control Plant.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew M. Clark
Operations Superintendent

Attachment B: List of Analyses for which the SFPUC Is Certified
Attachment C: Plant Road Map
Attachment D: Plant Process Schematic

1 Treatment Plant Performance

1.1 Volume Treated

The Southeast Water Pollution Control Plant (SEP) is permitted to discharge an average dry weather flow of 85.4 million gallons per day (MGD). The average dry weather flow for SEP was 48.3 MGD, calculated using flows from three consecutive dry weather months (August, September, and October). SEP treated an estimated 23.9 billion gallons of combined wastewater and stormwater in 2019. The North Point Wet Weather Facility (NPF) treated an estimated 1.4 billion gallons of combined wastewater and stormwater in 2019.

This report was prepared by SFPUC to satisfy the annual reporting requirement set forth in Attachment G, Section V.C.1.f of San Francisco Regional Water Quality Control Board (RWQCB) Order No. R2-2013-0029, NPDES No. CA0037664, as amended by RWQCB Order No. R2-2017-0042 (Regional Standard Provisions, and Monitoring and Reporting Requirements).

1.2 Permit Compliance and Actions Taken or Planned

1.2.1 Effluent Limit Exceedances and Unauthorized Discharges

Acute Toxicity

The effluent limitations for acute toxicity were exceeded three times during 2019 as summarized in the table below. Investigation of intermittent poor survival results during bioassay testing has identified ammonia as a factor contributing to lower survivals in the effluent exposures. An acid dosing system for maintaining the lower pH of the effluent within bioassay exposure chambers has been set-up. Maintaining the lower effluent pH will reduce interference from the unionized ammonia, providing a more reliable assessment of the toxicity of SEP effluent. The initial pH adjustment system was first tested in parallel with the June 28 – July 2 test; system modifications and test adjustments were made throughout the fall. Parallel flow-through tests were run in the winter. More tests are needed to confirm the working hypothesis.

Flow-through Bioassay Test Date	Results (% Survival)	11-Sample Median (for <90%)*	11-Sample 90th percentile (for <70%)*
February 19-23, 2019	90%	N/A	N/A
March 29 - April 2, 2019	85%	90%	N/A
April 8-12, 2019	55%	90%	**55%**
April 15-19, 2019	95%	N/A	N/A
May 6-10, 2019	95%	N/A	N/A
June 3-7, 2019	60%	**85%**	**55%**
June 28 - July 2, 2019	100%	N/A	N/A
July 8-12, 2019	95%	N/A	N/A
August 5-9, 2019	100%	N/A	N/A
August 21, 23-24, 2019	85%	90%	N/A
September 17-21, 2019	85%	90%	N/A
October 15-19, 2019	95%	N/A	N/A
November 14-18, 2019	95%	N/A	N/A
December 31, 2019 - January 4, 2020	85%	95%	N/A

*Per the effluent limitation in the NPDES permit, the 11-sample median is calculated for compliance only when the result is less than 90% survival and the 11-sample 90th percentile is calculated for compliance only when the result is less than 70% survival.

Total Residual Chlorine

On May 29, 2019 for one minute at 11:45 am, the total residual chlorine continuous analyzer for the final effluent being discharged at Discharge Point No. 001 (Pier 80) was 0.2 mg/L, which exceeded the instantaneous maximum effluent limitation of 0.0 mg/L. The exceedance measured by the analyzer was caused by an approximate three-minute (11:38-11:41) loss of the local 24-voltage power supply, which stopped the final effluent flow transmitter. Investigation indicates that the power loss was most likely caused by a mistake made by an on-site construction contractor. SFPUC will continue to hold regular meetings to discuss and coordinate on-site contractor work, and review Specific Condition Requests that contractors are required to submit detailing the timing and scope of activities that could affect specific plant processes.

BOD_5, TSS, Fecal Coliform

In June, SEP experienced a significant disruption of the biological secondary treatment process, resulting in exceedances of the TSS, BOD, and fecal coliform effluent limitations as summarized in the table below.

Compliance Period	Average BOD Concentration	Average TSS Concentration	Fecal Coliform % Samples ≥ 1,100 MPN/100 mL	Compliance Result*
Week - June 9-15, 2019	62 mg/L	78 mg/L	--	Exceeded AWEL
Week - June 16-22, 2019	59 mg/L	98 mg/L	--	Exceeded AWEL
Month - June 1-30, 2019	48 mg/L	60 mg/L	--	Exceeded AMEL
Month - June 1-30, 2019 (percent removal)	84%	80%	--	Exceeded AMEL
Month - June 1-30, 2019	--	--	15%	Exceeded acute limit
Week – June 30 - July 6	--	52 mg/L	--	Exceeded AWEL
Monthly – July 1-31	--	37 mg/L	--	Exceeded AMEL

* AWEL = Average Weekly Effluent Limitation
AMEL = Average Monthly Effluent Limitation

Investigations did not identify any single cause; rather, the disruption of secondary treatment appears to have been the result of multiple events that sequentially and cumulatively compromised the efficacy of the biological process: rapid loading in primary sedimentation, loss of Return Activated Sludge (RAS) pumping, loss of mixing, and intermittent construction dewatering. Details related to the cause, response, and corrective actions were described in detail in the June 2019 monthly SMR. Lessons learned have been reviewed and discussed with all watches responsible for the continuous plant operations. Measures to prevent reoccurrence consisted of making use of biosensors on the primary effluent and final effluent to provide real-time feedback on plant performance as a surrogate to chemical oxygen demand (COD), adding additional administrative controls on construction dewatering and activities, and reinforcing expectations for visual observation of all operational equipment by the watches.

Oil and Grease

During the month of July, the AMEL of 10 mg/L for oil and grease was exceeded with a result of 11.9 mg/L. Another elevated result in early August (16.6 mg/L on August 5) alerted staff to the issue and subsequent accelerated sampling yielded 13 non-detect results out of the 15 follow-up samples, leading to compliance with the AMEL in August. Multiple potential causes were identified and investigated, but the results of these investigations failed to conclusively identify a specific cause for the elevated results. To prevent reoccurrence of failing to perform accelerated monitoring (as occurred in July), a Supervising

Chemist was re-trained on communications following elevated results. In addition, the SFPUC's Laboratory Information Management System (LIMS) have been configured to generate automatic email notifications to Laboratory management when elevated concentrations are observed.

Unauthorized Discharges

The SFPUC reported one unauthorized discharge during 2019, which is summarized below and described in the five-day report and multiple 2019 monthly self-monitoring reports.

On October 18, 2018, SFPUC staff observed an upwelling at the surface of Islais Channel near the location of the SEP final effluent force mains. On November 3, professional divers confirmed that the 36-inch force main had failed in approximately the same area as it had failed in 2015 and 2017. Temporary bypass of the pipe rather than additional repairs was pursued, and an emergency declaration was approved to expedite contracting and financing. Design, planning, surveying, permitting, and construction of the temporary bypass was completed in 2019. On August 21, an anticipated bypass for essential maintenance was conducted to facilitate the required tie-ins for the existing 36" and 42" force mains. During this time, fully treated SEP effluent was discharged through Discharge Point No. 002. All required monitoring was performed, and all results were consistent with effluent limitations. SFPUC provided notifications and updates to Regional Water Board staff regarding this bypass on June 7 and August 19.

1.2.2 Monitoring Issues

In 2019, there were four types of monitoring issues:

- **Wet Weather Interruption for Acute Toxicity Bioassay (1):** During the month of January, a dry weather acute toxicity test at EFF-001A could not be completed; scheduled monthly tests were either interrupted due to wet weather or precluded due to forecasted wet weather and plant shutdowns for necessary maintenance and construction. Wet weather continued to delay testing in February until a complete, uninterrupted bioassay test was conducted during the week of February 19 – 23.

- **BOD_5 Analysis QA/QC Issue (1):** During the week of December 30 – January 5, the 5-day biochemical oxygen demand (BOD_5) sample did not meet a quality assurance/quality control (QA/QC) specification due to a laboratory analyst error. Discovery of this issue resulted in more frequent monitoring during the subsequent week and retraining of staff on proper laboratory procedures.

- **CSD Field Sampling (10):** In 2019, a few issues with implementation of combined sewer discharge (CSD) triggered monitoring were identified for different reasons: sampler battery failure, back-to-back CSD events preventing sampler reset, internal miscommunication regarding sample identification, liquid level actuator (LLA) malfunction, sampler malfunction, and inaccessibility due to construction. These issues resulted in the collection of a manual grab sample rather than a composite, no sample, or insufficient sample volume to perform all required analyses. In the case of equipment issues, the sampler head was replaced and tested for functionality prior to the next storm.

- **Shoreline Monitoring and Posting Not Conducted (2):** Shoreline monitoring and posting were not conducted twice during 2019 due to the partial federal government shutdown (January 1-22; S-210.1) and a monitoring location error (May 19; S-301.2). In both instances, the public was notified of CSDs via phone hotline, email, and the sfwater.org website.

1.3 Effluent Characterization Study

For this evaluation, all constituents listed in Attachment G, Table B, except for those pollutants with effluent limitations that were detected above the method Minimum Levels (ML) were evaluated. Estimated concentrations of constituents detected below the MLs were excluded from this evaluation because the uncertainty in the result when a constituent is detected below the ML prevents useful comparison.

Ten of the tested constituents were detected above the method MLs: antimony, cadmium, chloroethane, chloroform, chloromethane, chromium (total recoverable), lead, nickel, toluene, and zinc. The 2019 maximum detected level of each of the constituents was compared to the Maximum Effluent Concentration (MEC) as presented in Table F-9 of the SEP Permit (Reasonable Potential Analysis). The MECs were used as general indicators of past performance of the detected constituents.

All ten detected constituents showed decreases or no statistically significant changes compared to past performance.

The detected constituents and evaluations are summarized in the table below.

Trends for Selected Constituents

Priority Pollutant	Method Minimum Level (ML, µg/L)	2019 Maximum Detected Level (µg/L)[1]	Past Performance[2] (µg/L)	Criterion or Objective (µg/L)	Statistically Significant Increase
Antimony	0.5	0.66	0.71	4,300	No
Cadmium	0.25	3.2	1.3	9.36	No
Chloroethane	0.5	0.76	1.1	No Criteria	No
Chloroform	0.5	4.6	11	No Criteria	No
Chloromethane	0.5	1.5	1.1	No Criteria	No
Chromium (III) Chromium (VI)	0.5 0.5	0.81 (total recoverable)	3.7 1.4	No Criteria 50	No No
Lead	0.5	2.7	1.6	8.5	No
Nickel	1	3.8	5.1	13	No
Toluene	0.5	0.59	1.5	200,000	No
Zinc	1	43	55	86	No

Note:
1. Results have been rounded to two significant figures.
2. The Maximum Effluent Concentration (MEC) or the minimum detection level, as listed in Table F-9, Reasonable Potential Analysis in the SEP Permit, NPDES NO. CA0037664, Order No. R2-2013-0029, is used as an indicator for past performance.

1.4 Biosolids

In 2019, the SEP beneficially re-used a total of 10,710 dry metric tons of biosolids at the following locations:

Location	Dry Metric Tons[1]
Land Application	
Solano County	3,210
Sacramento County	360
Landfill Beneficial Use (except TIP)	
Potrero Hills	3,290
Vasco Road	1,350
Lystek – Liquid Biofertilizer	2,500
TOTAL	**10,710**

Note:
1. Tonnage has been rounded to two significant figures.

1.5 Mercury & PCBs

Consistent with the Waste Discharge Requirements for Mercury and PCBs from Municipal and Industrial Wastewater Discharges to San Francisco Bay (Order No. R2-2017-0041, NPDES No. CA0038849), **Attachment A** summarizes the mercury concentrations of each final effluent sample collected in 2019, the corresponding flow on the date the sample was collected, and the annual estimated mercury load.

2 Approved Laboratory Analyses

List of approved analyses include the following:

1. Analyses for which SFPUC is certified: See **Attachment B**.
2. Analyses performed for SFPUC by a separate certified laboratory (copies of reports signed by the laboratory director of the separate certified laboratories are not included with the annual report but are retained onsite and available upon request):
    a. Dioxin, method EPA 1613, performed by Frontier Analytical;
    b. PCB Congeners by EPA 1668c, performed by Frontier Analytical; and
    c. Nitrate+Nitrite and Nitrite by EPA 300.0, performed by Eurofins.
3. List of waived analyses: None.

3 Facility Information

3.1 Plan View Drawing or Map of Facility

A Plant Road Map is included in **Attachment C**, and a Plant Process Schematic is included in **Attachment D**.

3.2 Results of Annual Facility Report Reviews

3.2.1 Contingency Plan and Spill Prevention Plan

The SEP's Contingency Plan was reviewed and updated throughout 2019. Updates to the plan include:

- Changes in staffing and roles and responsibilities;
- Process management updates; and
- Updates to the listed emergency contacts.

3.2.2 Operations and Maintenance Manual

Review of SEP related manuals, training, and other guidance materials was completed, resulting in updates to and development of the materials described in the table below.

Category	Activities
Manuals	• SEP Primary Treatment Process Unit Operations Manual • SEP Advanced Primary Treatment Process Unit Operations Manual • Bayside Wet Weather Operations Manual • Biosolids Management System Manual
Other Guidance & Training Materials	**Field Guides** • SEP Primary Sedimentation Building 042 Hydraulic Pump & Drum Screen Operation Field Guide • Sludge Judge & Sludge Pumping Field Guide • Titration Field Guide • Bibbigard Field Guide • Gondola Swap Field Guide • ISCO Field Guide • Pista Start Up Field Guide • SED Tank Start Up Field Guide • Bruce Flynn Pump Station Field Guide **Training Videos** • 3D Process Overview 2019 Transitioning from 110 to 150 MGD • 3D Process Overview 2019 Transitioning from 150 to 250 MGD • 3D Sludge Pumping / DCS Trends – 150 MGD • 3D Sludge Pumping / DCS Trends– 366 MGD • 3D Sludge Pumping / DCS Trends– 500 MGD • 3D Sludge Judge Titration Video • Primary Effluent Odor Control Residual Chlorine Titration – Colorimetric Determination • Primary Sedimentation Tank Function & Primary Sampling • Effluent Titration • Bruce Flynn Pump Station Duperon Flexrake Barscreen • Channel Pump Station Bibbigard, Gondolas, Pump Down, and Sand Flush
Training	• Southeast Plant Operations training included in Annual Wet Weather training for all SFPUC operators held in September and October.

Review of NPF related manuals, training, and other guidance materials was completed, resulting in updates to and development of the materials described in the table below.

Category	Sections
Manuals	North Point Wet Weather Facility Operations Manual

Category	Sections
Other Guidance & Training Materials	North Point Facility Wet Weather Process Video
Training	North Point Plant Operations training included in Annual Wet Weather training for all SFPUC operators held in September and October.

3.2.3 Wastewater Facilities Status

The table below summarizes key construction activities related to the Bayside facilities. The projects listed below do not comprise a comprehensive list of all upgrades completed or underway. Planning, design and construction of numerous other mechanical, electrical, structural, and communications improvements are ongoing.

Facility/Process	Project Description	Construction Update
SEP Headworks	Replace existing wet-weather and all-weather headworks with a single 250 MGD all-weather headworks. Due to the complexity of this project, the scope is proceeding in multiple phases.	Construction of the second phase began in 2019.
SEP Primary	Make various mechanical and electrical upgrades to the wet weather primary treatment system, including new pumps and supporting structural work.	Construction began in 2019 and is expected to be complete in 2021.
	Seismic upgrade of SEP 042 Primary Sedimentation Facility, and coating and repair work in SEP 540 (Plant Effluent Control Structure), SEP 525 (Primary Disinfection Facility) and Primary Influent channels.	Construction began in 2019 and is expected to be complete in 2022.
SEP Aeration	Valve Automation of VPSA (Vacuum Pressure Swing Adsorption, Oxygen Generation).	Construction is anticipated to be complete in 2020.
	Demolish existing oxygen generation plant and liquid oxygen storage (LOX) tanks; install new LOX storage and vaporization systems.	Construction completed in 2019.
SEP Disinfection	Upgrade controls and chemical sampling station, including coating of chlorine contact channels.	Construction expected to be complete in 2020.
SEP Solids Handling	Replace the existing facilities with new digestion and solids handling processes capable of producing Class A biosolids.	Construction began in late 2019.
	Replace gas sensors, flow meters, gas compressors, hot water pumps, standby generator, waste gas burner insulation and control panels, boiler burner and boiler control panel, upgrade process equipment/piping/valves, install additional pumps for cogeneration system, and perform various structural repairs.	Planned construction was completed in 2019. Additional needs have been identified and construction is expected to be complete in 2020.
	Repair solids conveyance and storage systems.	Construction completed in 2019.
Bruce Flynn Pump Station	Furnish and install new adjustable frequency drive hardware, software, and internal electrical components; upgrade DCS communication systems.	Construction completed in 2019.
	Replace bar screens, main pumps, and sump dewatering pumps (SEP Headworks Phase II.A)	Construction expected to be complete in 2020.

Facility/Process	Project Description	Construction Update
	Replace roof of electrical structure.	Construction completed in 2019.
Channel Pump Station	Upgrade main pump variable frequency drives.	Replacement of one VFD in 2019. Anticipated replacement of another VFD in 2020.
Griffith Street Pump Station	Extensively improve to existing dry weather and wet weather pumping facilities, including replacement of the dry and wet weather pumps.	Construction began in 2017 and is expected to be complete in 2020.
Mariposa Pump Station	Rebuild existing dry weather pumping facility and force main and increase the capacity to accommodate flows from the redevelopment of Mission Bay.	Construction began in late 2019; expected completion in 2022.
North Shore Pump Station	Modify pump station, including replacing and upsizing the existing dry weather pumps, to allow dry weather pumps to provide partial redundancy to the wet weather pumps.	Construction is expected to begin late 2020; anticipated completion in 2022.
North Point Wet Weather Facility	Replace primary sedimentation tank influent gates and other mechanical and electrical improvements.	Construction anticipated to be complete in 2020.
Southeast Bay Outfall (Pier 80)	Construct an emergency bypass of one (36”) of the two force main sections under Islais Creek.	Construction completed in 2019.

4 Participation in Regional Efforts

In 2019, the SFPUC continued its financial support of and participation in the San Francisco Estuary Institute’s Regional Monitoring Program to fulfill the receiving water monitoring requirements of the SEP NPDES permit. See SEP Permit at page E-12.

As a principal member of the Bay Area Clean Water Agencies (BACWA), the SFPUC also continued to support the Regional Monitoring Program for Water Quality in the San Francisco Estuary (RMP); mercury and PCBs source control and risk reduction programs; nutrient receiving water monitoring and science plan development and implementation; participate in the development of Total Maximum Daily Loads and site-specific objectives; and support implementation of the regional copper and cyanide action plans. BACWA submitted an NPDES compliance report on January 20, 2020 on behalf its members (including the SFPUC), which continues NPDES permit compliance with NPDES permit provisions related to these efforts.

SUBJECT: March 2020 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of March 2020 for the Southeast Water Pollution Control Plant (SEP).

In response to the outbreak of the Novel Coronavirus 2019 (COVID-19) in the general public, which is now a pandemic according to the World Health Organization, the City and County of San Francisco initiated (and has since extended) a shelter-in-place order that began on March 17, 2020. The order and associated social distancing requirements have necessitated major changes to the operations of wastewater facilities that may affect the SFPUC's ability to comply with NPDES permit requirements. Operational changes continue to be made day to day in accordance with updates to federal, state, and local requirements and guidance.

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period with the exception of acute toxicity.

Monthly dry weather acute toxicity testing was performed for the periods of March 2-6 and March 9-13. Both the March 2-6 test result of 25% survival and the subsequent March 9-13 test result of 50% survival did not meet the 11-sample 90th percentile limitation of 70% survival, as shown in the following table.

October 15-19, 2019	95%		
November 14-18, 2019	100%		
December 31, 2019 - January 4, 2020	85%		
January 6-10, 2020	100%		
February 3-7, 2020	90%		
March 2-6, 2020	**25%**	**95%**	**60%**
March 9-13, 2020	**50%**	**95%**	**50%**

As part of our ongoing investigations into the role of ammonia in the intermittently observed acute toxicity, both March tests were run in parallel with (1) a pH-adjusted flow-through test, (2) a pH-adjusted static renewal test, and (3) a static renewal test with unadjusted pH. Significant mortality was observed in all test exposures except for the pH-adjusted static renewal test, which had 100% survival. Neither plant operations nor the results of the chemistry analyses performed on the test samples indicated anything unusual that could be contributing to observed mortality.

As communicated to case manager Sam Plummer on March 23, accelerated monitoring was discontinued due staff limitations resulting from the COVD-19 the shelter-in-place order.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were no combined sewer discharges during this monitoring period as described in the Wet Weather Summary.

System Operations of Wet Weather Facilities. The operation of wet weather facilities during the storm event was conducted consistent with the requirements in NPDES permit Provision VI.C.5.c.i. - VI.C.5.c.iv.

Wet Weather Monitoring. The Bayside system experienced wet weather days on March 14. Required monitoring occurred at EFF-001B, EFF-002, and EFF-003. Wet weather enterococcus and fecal coliform samples were not collected at EFF-001B on March 14 because sampling is only required when discharges are occurring between 4 am and 2 pm per NPDES permit Table E-4 footnote [4]. This time frame is paramount to ensure that wet weather bacteria samples are collected on time for laboratory analyses (i.e., for analyses to occur during business hours). SEP did not start discharging primary-treated effluent until after 2 pm (see footnote [4] of NPDES permit Table E-4).

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit, except for at E-210.1 (Aquatic Park - Hyde Street Pier). This shoreline monitoring location was not accessible (i.e., locked gate and blocked entrance) starting March 17 due to the COVID-19 shelter-in-place order.

If you have any questions concerning this report, please contact Operations Superintendent, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Operations Superintendent, Wastewater Enterprise

MAXIMUM DAILY AVERAGE FLOW (MGD)	-	34.17	26.29	-	-	-	130.24	93.65	40.79	-	-	-	-	-

* Includes upto 6 MG of flows stored at the treatment facility and drained back to combined sewer system

NOTES

1. SEP Influent flow data was anomalous on 3/14 and has been replaced with the sum of CHS Total Flow (SM3CHS_CTRL:CH_FY1.RO01), SEP 011 Total Flow (SP1RAW_WELL1:01FY7.RO01), BFS Sump 1 Flow (BF01XLA003-S1FLOW), and BFS Sump 2 Flow (BF01XLA003-S2FLOW).
2. There was recorded NPF influent that was stored and drained back to the CSS on 3/16, 3/17, 3/18, 3/19, and 3/20 and has been zeroed per confirmation from Operations.
3. There were SEP shutdowns on 3/26 from 12:30PM to 13:50PM and on 3/30 from 12:45PM to 13:35PM. BPS flow indication was lost during the 3/30 shutdown and was not estimated for the shutdown interval per confirmation from Ops.

SUBJECT: April 2020 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of April 2020 for the Southeast Water Pollution Control Plant (SEP).

In response to the outbreak of the Novel Coronavirus 2019 (COVID-19) in the general public, which is now a pandemic according to the World Health Organization, the City and County of San Francisco initiated (and has since extended) a shelter-in-place order that began on March 17, 2020. The order and associated social distancing requirements have necessitated major changes to the operations of wastewater facilities that may affect the SFPUC's ability to comply with NPDES permit requirements. Operational changes continue to be made day to day in accordance with updates to federal, state, and local requirements and guidance.

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit. During the week of April 5-11, dry weather monitoring at EFF-001A for Chemical Oxygen Demand (COD) and pH at the 5/Week required minimum sampling frequency was interrupted by wet weather. Effluent was monitored for COD more than five days during the week: monitoring at EFF-002 occurred on April 5-7 and monitoring at EFF-001A occurred on April 8-11. Effluent was monitored for pH five days during the week: monitoring

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

at EFF-002 occurred on April 6-7 and monitoring at EFF-001A occurred on April 8-10.

As communicated to case manager Sam Plummer on April 16, staff have initiated an alternative acute toxicity testing approach, which includes the April 26-30 test, due staff concerns regarding the exposure to the virus associated with the COVID-19 disease (SARS-CoV2).

Results Not Yet Available. As of May 28, pretreatment influent and effluent priority pollutant samples analyzed using EPA Methods 608 (PCBs and Organochlorine Pesticides), 624 (Volatile Organic Compounds), and 625 (Semi-volatile Organic Compounds) for samples collected on April 23 are not available. Results are anticipated to be reported in a monthly SMR once results are available.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were no combined sewer discharges during this monitoring period as described in the Wet Weather Summary.

System Operations of Wet Weather Facilities.
The operation of wet weather facilities during the storm event was conducted consistent with the intent of the requirements in NPDES permit Provision VI.C.5.c.i. - VI.C.5.c.iv. During the early April storm event, the North Point Wet Weather Facility (NPF) was not activated when the level of combined wastewater in the North Shore Storage/Transport Box exceeded 200 inches because operators sought to provide to maximize the quality of treated wastewater by conveying wastewater to SEP for secondary treatment instead of to NPF for primary treatment. Operators closely tracked rain patterns and box levels as they reached a maximum of 310 inches, and operated pumping to prevent combined sewer discharges.

Wet Weather Monitoring. The Bayside system experienced wet weather days on April 5, 6, and 7. Required monitoring occurred at EFF-001B, EFF-002, and EFF-003. The following notes related to fecal indicator bacteria monitoring (see footnote [4] of NPDES permit Table E-4) being provided for clarity:

- On April 5-7, wet weather fecal indicator bacteria samples were collected at EFF-002 but not EFF-001B because SEP was discharging only secondary treated effluent, so the EFF-002 sample was representative of the effluent being discharged at both Discharge Points Nos. 001 and 002.

- On April 6-7, wet weather enterococcus samples were not collected at EFF-002 because sampling is only required when discharges are occurring between 4 am and 2 pm. This time frame is paramount to ensure that wet weather bacteria samples are collected on time for laboratory analyses (i.e., for analyses to occur during business hours). On April 6, wet weather flows at SEP ceased prior to 4am and began again after 2pm. On April 7, wet weather flows at SEP ceased prior to 4am.

For clarification, wet weather acute toxicity monitoring did not occur because it is required at EFF-001B and EFF-003, and both physical sampling locations did not experience discharges. Monitoring at EFF-001B occurs where primary-treated-only effluent is conveyed from the Primary Disinfection System (PDS); however, only secondary treated effluent was discharged during the monitoring period. Thus, no samples for acute toxicity were available for EFF-001B. Discharges did not occur at Discharge Point Nos. 003-006 (NPF) so monitoring was not conducted at EFF-003.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit, except for at E-210.1 (Aquatic Park - Hyde Street Pier). This shoreline monitoring location was not accessible (i.e., locked gate and blocked entrance) starting March 17 due to the COVID-19 shelter-in-place order.

If you have any questions concerning this report, please contact Operations Superintendent, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Operations Superintendent, Wastewater Enterprise

* Includes upto 6 MG of flows stored at the treatment facility and drained back to combined sewer system

NOTES

1. There was recorded NPF influent that was stored and drained back to the system on 4/3, 4,4, 4/5, 4/11, 4/12, and 4/30 that has been zeroed per confirmation from Operations.
2. There were SEP shutdowns on 4/15 from 05:00AM to 13:45PM and 4/16 from 00:30AM to 01:00AM.

SUBJECT: May 2020 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of May 2020 for the Southeast Water Pollution Control Plant (SEP).

In response to the outbreak of the Novel Coronavirus 2019 (COVID-19) in the general public, which is now a pandemic according to the World Health Organization, the City and County of San Francisco initiated (and has since extended) a shelter-in-place order that began on March 17, 2020. The order and associated social distancing requirements have necessitated major changes to the operations of wastewater facilities that may affect the SFPUC's ability to comply with NPDES permit requirements. Operational changes continue to be made day to day in accordance with updates to federal, state, and local requirements and guidance.

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit.

As communicated to case manager Sam Plummer on April 16, staff have initiated an alternative acute toxicity testing approach, which includes the April 26-30 test, due staff concerns regarding the exposure to the virus associated with the COVID-19 disease (SARS-CoV2).

London N. Breed Mayor
Ann Moller Caen President
Francesca Vietor Vice President
Anson Moran Commissioner
Sophie Maxwell Commissioner
Tim Paulson Commissioner
Harlan L. Kelly, Jr. General Manager

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit , except for at E-210.1 (Aquatic Park - Hyde Street Pier). This shoreline monitoring location was not accessible (i.e., locked gate) starting March 17 due to the COVID-19 shelter-in-place order. Monitoring at the (voluntary) location 220 was not conducted due to COVID-19 accessibility issues (i.e., locked gate at kayak pier).

If you have any questions concerning this report, please contact Operations Superintendent, Andrew Clark at (415) 920-4944 or aclark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Operations Superintendent, Wastewater Enterprise

SUBJECT: June 2020 Self-Monitoring Report for the Southeast Water Pollution Control Plant [NPDES No. CA0037664] Regional Water Quality Control Board Order No. R2-2013-0029

To Whom It May Concern:

Transmitted herewith is the self-monitoring report (SMR) for the month of June 2020 for the Southeast Water Pollution Control Plant (SEP).

In response to the outbreak of the Novel Coronavirus 2019 (COVID-19) in the general public, which is now a pandemic according to the World Health Organization, the City and County of San Francisco initiated (and has since extended) a shelter-in-place order that began on March 17, 2020. The order and associated social distancing requirements have necessitated major changes to the operations of wastewater facilities that may affect the SFPUC's ability to comply with NPDES permit requirements. Operational changes continue to be made day to day in accordance with updates to federal, state, and local requirements and guidance.

Compliance with Effluent Limitations. Compliance with effluent limitations was achieved during this monitoring period.

Compliance with Monitoring Requirements. Dry weather compliance monitoring was completed as required by the NPDES permit. As communicated to case manager Sam Plummer on April 16, staff have initiated an alternative acute toxicity testing approach, which includes the April 26-30 test, due to staff concerns regarding the exposure to the virus associated with the COVID-19 disease (SARS-CoV2).

OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

Discharge Incidents. As reported in a discharge report submitted June 22, on June 10-12, secondary treated and disinfected wastewater was discharged to San Francisco Bay from the SEP final effluent outfall pipe at a point approximately 470 feet upstream of Discharge Point No. 001. The discharge resulted from construction activities related to replacing a vent pipe section. The leak was identified on June 11, and the construction contractor repaired it using hydrophilic waterstop on June 12. The repair areas were monitored for several days after the repairs to confirm that the leak had been successfully repaired.

Wet Weather Operations and Monitoring. Below is a brief summary of activities related to the wet weather performance of SEP and the Bayside wet weather facilities.

Combined Sewer Discharge Summary. There were no combined sewer discharges during this monitoring period as described in the Wet Weather Summary.

Shoreline Monitoring and Posting. Shoreline monitoring and posting were conducted consistent with the requirements in the NPDES permit, except for at E-210.1 (Aquatic Park - Hyde Street Pier). This shoreline monitoring location was not accessible (i.e., locked gate) starting March 17 due to the COVID-19 shelter-in-place order. Monitoring at the (voluntary) location 220 was not conducted due to COVID-19 accessibility issues (i.e., locked gate at kayak pier).

If you have any questions concerning this report, please contact Operations Superintendent, Andrew Clark at (415) 920-4944 or AClark@sfwater.org; or Regulatory Manager, Amy Chastain at (415) 554-1683 or AChastain@sfwater.org.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

Andrew Clark
Operations Superintendent, Wastewater Enterprise

Mr. Samuel Plummer
California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612

SUBJECT: 5-Day Report for Discharge Treated Effluent from the Southeast Water Pollution Control Plant to an Unpermitted Location (NPDES CA0037664)

Dear Mr. Plummer:

As required by National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037664, Order No. R2-2013-0029, enclosed is information regarding two discharges of treated and disinfected wastewater from the Southeast Water Pollution Control Plant (SEP) final effluent outfall at locations upstream of Discharge Point 001. Both discharges were associated with the outfall's air vent pipe. One occurred intermittently between April 4, 2017 and June 25, 2019. The other began on June 10, 2020 and ended on June 12, 2020.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,

George Engel
Operations Division Manager

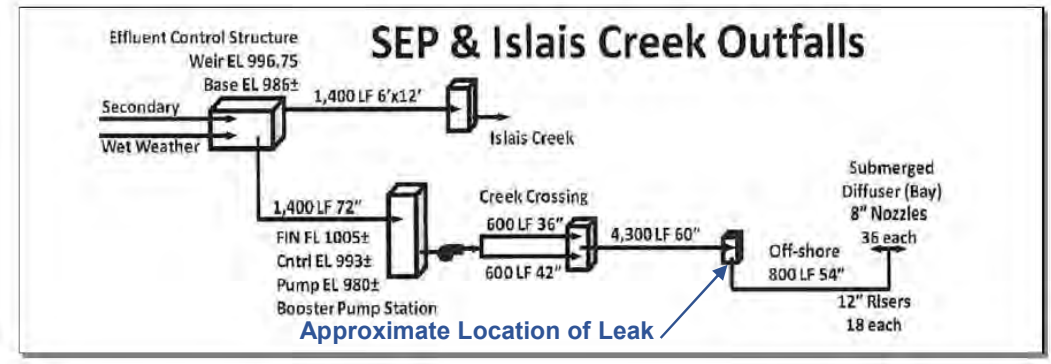
OUR MISSION: To provide our customers with high-quality, efficient and reliable water, power and sewer services in a manner that values environmental and community interests and sustains the resources entrusted to our care.

ATTACHMENT: SEP Discharge Incident 5-Day Report
June 22, 2020

1. Discharge Incident Description and Cause

From approximately 9:00pm on June 10 through 7:15am on June 12, secondary treated and disinfected wastewater discharged to San Francisco Bay from the Southeast Water Pollution Control Plant (SEP) final effluent outfall, at a point approximately 470 feet upstream of Discharge Point No. 001. The discharge resulted from construction activities related to replacing a vent pipe section associated with the outfall. Specifically, the discharge occurred at the connection of the new vent pipe section and the offshore 54" outfall pipe when the connection grouting failed. More details are provided below.

A schematic of the outfall structure and approximate location of the leak is shown below.



The vent pipe allows air entrained in the outfall pipe to be released in the air above Pier 80. A section of the vent pipe is embedded in concrete just below the Pier 80 deck. The section where the vent pipe connects to the outfall is suspended under the Pier 80 deck. The work performed on June 10 was the last step in a multi-year scope of work related to replacement of both sections (embedded and suspended) of the vent pipe.

As described in a 5-day report submitted to the Regional Water Board on February 28, 2017, the SFPUC identified that a section of the vent pipe suspended under the Pier 80 deck had failed, allowing treated effluent to discharge to the Bay. The failed section of the pipe was replaced in March 2017. On April 4, 2017, divers under Pier 80 observed a small and intermittent discharge (figure shown at end) from the seawall at the point where the vent pipe exits the seawall; this was reported to the Regional Water Board in a 5-day report submitted on April 11, 2017. Because the vent pipe behind the seawall is embedded in concrete and not visible, SFPUC sought to confirm that it was coming from the vent pipe by increasing flows through the SEP outfall. After this test indicated that the discharge correlated to SEP flows greater than 90 mgd, the SFPUC proceeded to develop plans to replace the entire vent pipe structure. Planning, design, contracting and permitting of the vent pipe replacement occurred between discovery of the leak in 2017 through summer of 2019.

In the summer of 2019, the contractor completed several stages of work, including replacement of the portion of pipe embedded in the Pier 80 deck and replacing section of pipe suspended under Pier 80. This work addressed the cause of the intermittent discharge observed in 2017. The work remaining included connecting the new vent pipe to the outfall pipe, Installing two new sections of vent pipe, and demolishing portions of the old vent pipe and its tie-in to a manhole. Due to conflicts with shipping schedules, SEP shutdown windows, and tide cycles, this remaining work could not be completed until June 2020.

On June 10, 2020, the contractor commenced work to complete the replacement of the vent pipe. The contractor requested eight hours to complete the remaining work, during which discharge from SEP to Discharge Point No. 001 had to be stopped. Once work began, the contractor discovered that the suspended sections of pipe installed in 2019 had rotated under the Pier 80 deck, and each pipe needed to be unbolted and adjusted. This unforeseen work delayed the subsequent work, including the final step of tying-in the new vent pipe to the SEP outfall pipe. To expedite the tie-in before SEP start-up the contractor used a fast-setting, non-shrink grout. The tie-in was completed at approximately 9:00pm; pumping from Booster Pump Station to the outfall started at approximately 9:45pm.

On the morning of June 11, SFPUC staff inspected the vent pipe area from Pier 80 and noted the sound of trickling water. SFPUC staff then inspected the vent pipe tie-in site by boat and visually confirmed that water was leaking through the grout. The construction contractor was notified in the early morning and arrived shortly thereafter to inspect the site and confirm the leak. Repairs were scheduled for low tide the following day to enable the contractor to mobilize for the repairs and for SEP to treat the wastewater stored during the June 10 shutdown.

The contractor completed the repairs the morning of June 12. The repairs included using hydrophilic waterstop; dry-packing the entire area with non-shrink grout; and forming and pouring reinforced non-shrink grout against the repair area. As a precautionary measure, similar procedures were used at the location where the old vent tied into the outfall pipe. The contractor monitored the repair areas for several days during discharge and did not observe any leaking, including when the contractor returned to the site on June 15 to remove the wooden forms used for the grout and check that the grout curing was complete.

2. Period of Noncompliance (if noncompliance has not been corrected, anticipated time it is expected to continue)

The small leak observable only from the seawall, originally reported on April 11, 2017 is believed to have occurred intermittently between April 4, 2017 and June 25, 2019. The volume of discharge cannot be estimated. No volume was recovered.

The leak resulting from the June 10 construction activities is conservatively assumed to have started June 10 at 9:00pm. The leak stopped on June 12 at approximately 7:15 am when SEP ceased discharge and the contractor initiated the necessary grout repairs. The volume of the discharge is difficult to estimate but is assumed to be approximately two gallons per minute based on visual observations. The total volume discharged is estimated to have been 4,100 gallons. No volume was recovered.

Neither discharge is believed to have posed risk to the Bay or public health. The discharge consisted of fully treated and disinfected wastewater, meeting permit effluent limitations at monitoring location EFF-001A. The discharge volumes were very small. The discharges were to an inaccessible location under Pier 80. Observations performed on June 11 and 12 confirmed that there were no observable impacts to water quality or wildlife in the area.

3. Steps Taken or Planned to Reduce, Eliminate, and Prevent Reoccurrence of Noncompliance

Steps taken to reduce and eliminate both discharges are described in the first section of this report. In both instances, the work was completed as quickly as possible. The seawall leak was repaired as quickly as contracting and scheduling permitted. Scheduling these repairs was extremely challenging because the work can only be performed during the dry season and the schedule had to be coordinated with Pier 80 vessel traffic, tide cycles, and SEP's shutdown schedule. The June 10-12 leak was repaired the day after it was identified.

Preventative measures are inapplicable in this situation because the vent pipe has been replaced, and because the unique construction challenges presented by the location of this infrastructure. Based upon the contractor's assessment, the leak was an isolated incident that was related to construction and there is no reason to believe the leak will reoccur. In advance of the June 10 work, the contractor had prepared for contingencies by having surplus materials ready, as well as materials to create an emergency plug if necessary.

Significance Criteria	<u>*Events:*</u> Associated with events that have made a significant contribution to the broad patterns of our history. <u>*Architecture/Design:*</u> Embodies the distinctive characteristics of a type, period, or method of construction, and/or represents the work of a master.
Period of Significance	The period of significance for the "History of Medicine in California" frescoes is 1936-1938. These dates encompass the painting of the 10-panel (plus two descriptive panels) series of frescoes in Toland Hall.
Statement of Significance	The "History of Medicine in California" frescoes, created by artist Bernard Zakheim and his assistant Phyllis Wrightson onsite at the University of California, San Francisco's Parnassus campus from 1936-1938, are significant for their association with the history of the Works Project Administration's Federal Art Project; and as an excellent example of the work of master artist and muralist, Bernard Zakheim, that displays distinctive characteristics of New Deal-era progressive mural artwork. The "History of Medicine in California" frescoes consist of 12 panels (10 pictorial and 2 descriptive) depicting California medical history with vivid, diverse images of doctors, lab scientists, and other medical professionals, and of suffering and recovered patients.

Assessment of Integrity	The seven aspects of integrity as defined by the National Park Service (NPS) and the National Register of Historic Places (NRHP) are location, design, materials, workmanship, setting, feeling, and association.[1] *"History of Medicine in California,"* painted between 1936 and 1938 by Bernard Zakheim and assistant Phyllis Wrightson, retains a high degree of integrity to convey its artistic and cultural significance. The 12 panels (10 pictorial and 2 descriptive) retain high degree of integrity of location, design, association, workmanship, setting, and feeling. Although the murals have been restored and several currently exhibit water damage, they also retain a high degree of integrity of materials. Overall, the Department has determined that the "History of Medicine in California" frescoes in Toland Hall retain integrity to convey their historical and cultural significance.

[1] "How to Apply the National Register Criteria for Evaluation," *National Register Bulletin,* U.S. Department of the Interior, National Park Service, 1995, p. 44.

Character-Defining Features	The character-defining features of the "History of Medicine in California" frescoes are those physical features associated with structural support, construction, and visual depiction of the 12 mural panels (10 pictorial and 2 descriptive panels), including: • All metal (or other) furring channels that support the mural panels; • All metal lathe and plaster, including the scratch, brown, and other plaster coats that underlie the *fresco buono* artwork of each panel; • The combination of pigment and plaster that forms each *fresco buono* panel; • The size, shape, form, and materials of each mural panel; • The arrangement, or sequence, of the mural panels as they currently exist and as per the artist's written description, as follows: Curved wall, from east to west Fresco 1: Dedication scroll Fresco 2: Doctors of Gold Rush Period/Early San Francisco Doctors Fresco 3: "Invasion of California" - Anza Expedition, 1775/Spanish Surgeon General Soler, 1798/Trapper Peg-Leg Smith Fresco 4: English Explorers of the 16th Century/Native California Herbs Fresco 5: Native Indians and their healing methods Fresco 6: Mission Indians/Portola Expedition, San Diego, 1789/Trapper J.O. Pattie, 1828 Fresco 7: Pioneer Doctors of Southern California/Doctors of Old Los Angeles Fresco 8: Description Scroll Flat wall, from west to east Fresco 9: University of California Medical School Fresco 10: Tribute to Hooper Foundation for Medical Research Fresco 11: Science – Past, Present, Future Fresco 12: San Francisco Medical History Note: Numbers for each panel are from a Key Plan prepared by Architectural Resources Group, Inc. for UCSF and included herein as a reference on page XX.

Statement of Significance Summary

The "History of Medicine in California" frescoes, created by artist Bernard Zakheim and his assistant Phyllis Wrightson onsite at the University of California, San Francisco's Parnassus campus from 1936-1938, are significant for their association with the history of the Works Project Administration's Federal Art Project; and as an excellent example of the work of master artist and muralist, Bernard Zakheim, that displays distinctive characteristics of New Deal-era progressive mural artwork. The "History of Medicine in California" frescoes consist of 12 panels (10 pictorial

and 2 descriptive) depicting California medical history with vivid, diverse images of doctors, lab scientists, and other medical professionals, and of suffering and recovered patients.

Description and History

The mural cycle, "History of Medicine in California," consists of 10 decorated panels and 2 descriptive panels created in *fresco buono* style by artist, Bernard Zakheim, on the curved and flat walls of Toland Hall. Toland Hall is an auditorium that is located on the first floor of UC Hall at the University of California, San Francisco (UCSF) Parnassus Heights campus.

The UCSF Parnassus Heights campus site is the oldest and largest of the UCSF campus sites in the city. This campus site, which comprises approximately 107 acres of land, is in the Inner Sunset mixed-use neighborhood. UCSF's facilities are concentrated at the north end of the campus site with the physical core located along Parnassus Avenue, which extends east-west through this densely developed area. These include Moffitt and Long Hospitals, the Langley Porter Psychiatric Institute (LPPI), and Medical Building 1 as well as other institutional buildings housing clinics, research facilities, housing, parking, and other support services. The 61-acre Mount Sutro Open Space Reserve occupies the central and southern portion of the campus site. The streets adjacent to the developed portion of the campus are occupied by two- to three-story single-family and multi-family residences constructed in the early decades of the 1900s.

UC Hall

The Beaux-Arts style UC Hall (formerly UC Hospital or UCH) is a monumental seven-story building that stands at the south side of Parnassus Avenue between 3rd and 4th Avenues. UC Hall is located at west end of the UCSF Parnassus campus site, adjacent to the courtyard in from of the Dental Clinics building (707 Parnassus Avenue) on west side and Clinical Sciences building (521 Parnassus Avenue) on east side. Opposite UC Hall, on block bounded by 3rd and 4th Avenues, is a small plaza with large Beniamino Bufano sculpture, the low-slung UCSF Marilyn Reed Lucia Childcare Center, and several two-story multi-family residential buildings.

Completed in 1917 by architect Lewis P. Hobart, UC Hall was the first new hospital building and first major addition to the hospital complex and remains the oldest extant building at the University of California, San Francisco's Parnassus Heights site. UC Hall was:

> constructed as a seven-story brick and steel building, which was "fireproof and sound-proof" with natural ventilation in every room. The building featured a machine shop and laundry in the basement; a grand lobby, kitchen, cafeteria and amphitheater [auditorium] (named for Hugh Toland) on the first floor; the surgery department on the second floor; and wards, nursing stations, laboratories, and patient rooms (capable of holding 220 patients) on the third through fifth floors. The building's plan featured a long, double-loaded corridor with four wings [containing the four wards (medical, surgical, women's, and children's)] that extended southward toward the rear of the steeply sloping site.[2]

[2] Page & Turnbull, Inc., *UC Hospital, 533 Parnassus Avenue, University of California, San Francisco Parnassus Heights Campus San Francisco, California, Historic American Building Survey Documentation*, November 22, 2005, 3.

Adjacent to the east end of the larger structure was a small one-story Classical Revival style pavilion with hipped roof and Ionic columns that was used as the hospital's waiting room and admissions desk.[3] This small building was removed/remodeled in 1930s during construction of the adjacent Clinical Sciences building.

The UC Hall building features a tripartite composition with large arched windows, a rusticated base, lavishly ornamented bay windows, and a well-defined classical cornice. The following description is excerpted from the 2003 Carey & Co. historic resource evaluation of the building:[4]

> The primary façade is highlighted by four primary bays that are separated by three narrow bays with lower, modest cornices. The upper bays' painted plaster walls are each symmetrically subdivided by vertically aligned windows framed by profiled trim and a central projecting volume. The historic surviving fenestration primarily features rectangular wood three-lite hoppers over double-hung three-over-three windows. The top story windows all terminate into arches. The five, ornately detailed, prominent terra-cotta framed window boxes at the third and fourth floors were originally designed to illuminate surgical suites with indirect, northern sunlight through the fourteen-lite steel fixed window with two small casements. Terra-cotta detailing accents the north elevation with horizontal banding, festoons, medallions, figure sculptures, engaged pilasters, and cartouches.
>
> The ornate upper story detailing wraps around to encompass the northernmost bay on both the east and west elevations. The remainder of the side and rear elevations are more simply detailed than the north. The painted plaster walls feature a few architectural details. … Numerous windows on the secondary elevations have been replaced with aluminum double-hung units. Other alterations include the addition of ductwork and pipes, air conditioning units, and seismic reinforcing ties.

The south (rear) façade is characterized by several unique architectural features, including the semi-circular massing of Toland Hall in the westernmost courtyard formed by two of the four projecting wings.

<u>Toland Hall</u>

This auditorium (or lecture hall) was named for Hugh H. Toland, founder of Toland Medical College, precursor of University of California (UC) Medical School. Located at the west end of the first floor of UC Hall, the semi-circular Toland Hall appears on the south façade as a "…two-story drum-shaped mass with raised skylights and roof equipment."[5] The room, which has three sections of tiered seating that descends downwards from the outer walls, is accessed via doors at either end of the flat north wall. A semi-circular raised platform extends from the center of the north wall, at the lowest point in the room, out into the curved seating area. This platform is accessed by stair ramps from either side that extend down along the north wall of the room to the platform. Walls are constructed of reinforced concrete with plaster cladding and the only fenestration consists of

metal-and-glass skylights arranged in a starburst pattern on the ceiling. The skylight monitors project above a nearly flat roof with simple parapet.

On the interior, the north wall is flat while the other walls gently curve to form a semi-circle. Wall sections are delimitated by simple plaster pilasters. Due to the configuration and height of the room, the north wall is tallest. The center, lower portion of the north wall, at the platform or speaker's podium, contains whiteboards and a door. Above these features, an elaborately carved wood surround frames a roll-down screen. On either side of the wood surround are large rectangular murals and then murals that are irregular in shape as they follow the slope of the stair ramps. At either end of the north walls are contemporary wood doors. Adjacent to these doors, at either end of the room, are plaster walls with a descriptive mural panel – at east wall is dedication panel and at west end is description panel. The remaining curved plaster walls are occupied by murals. All murals rest on a slightly projecting sill (or chair rail) and are divided by simple plaster pilasters. The ceiling is divided by plaster coffering and the floor coverings are carpet in the seating area and parque in the lecture area.

The carved wood surround and murals were added to Toland Hall in the 1930s as noted in the Page & Turnbull (2005).[6]

> The WPA, through the Federal Art Project, commissioned Bernard Zakheim to paint a series of frescoes in UC Hospital's Toland Hall and in the Medical School Building's Cole Hall. From 1935 to 1938, Zakheim worked on these murals, which depicted the history of medicine in California and included scenes of traditional Native American medicine, the founders of the UC Medical School, and the Berkeley Cyclotron. The Federal Art Project also provided funds for an elaborately carved wood chalkboard surround and podium, which were completed in 1937 by Russian woodcarver and New Deal artist Michael von Meyer.[7]

"History of Medicine in California"

The "History of Medicine in California" mural cycle consists of a series of ten pictorial panels and two descriptive panels on the walls of Toland Hall, a large auditorium or lecture room within UC Hall. Bernard Zakheim completed the Toland Hall frescoes with his assistant Phyllis Wrightson, who compiled much of the historical research, and plasterer Kai Andersen, between 1936 and 1938.[8] In addition to conducting much of medical research for the murals, Wrightson also transferred the

[7] Michael von Meyer (1894-1984) was born in Odessa, Russia and died in Laguna Honda Hospital in San Francisco. He was an artist that carved elaborate wood sculptures for interior installations. In addition to his piece in Toland Hall, his work includes carved stair railings at Beach Chalet, SF; and, garden decoration in Fleishacker Playground, SF. He studied at California School of Fine Arts and taught at the CCAC [California College of the Arts] in the 1940s. Fine Arts Museums of San Francisco website at https://art.famsf.org/michael-von-meyer accessed August 6, 2020.

[8] Page & Turnbull (2005), 17.

cartoon drawings for Zakheim in preparation for painting the final images and added parts of the paintings.[9]

The large frescoes range in size with two of irregular shape due to the stair ramps at the north wall of the auditorium. The murals along the curved wall are approximately 14-feet by 4-feet. Recent investigations of the murals to assess condition and feasibility of removal indicates that "plaster was likely applied to the expanded metal lath in several layers, including a scratch coat, brown coat (arriccio layer), and the finish coat (intonaco layer) that Zakheim painted on."[10] The curved frescos are "installed on a furred wall that has minimal attachment to the existing concrete wall" while the "flat frescos are installed on a furred wall in front of a hollow clay tile wall with areas of brick masonry infill."[11] At curved walls, the furred wall consists of

> vertical black iron furring channels, at least two horizontal black iron furring channels, expanded metal lath, and plaster. The channels and metal lath are tied together with wire. The narrow void between the furred wall and concrete wall is filled with plaster debris from the application of the scratch coat of plaster.[12]

Like many other WPA-era murals, including those at Coit Tower (1 Telegraph Hill Boulevard - listed on the National Register of Historic Places and as San Francisco Landmark No. 165) and the Alemany Health Center (35-45 Onondaga Avenue, San Francisco Landmark No. 272), the "History of Medicine in California" was painted in *fresco buono.* In utilizing the *fresco buono* technique, Zakheim followed

> …the ancient Italian tradition as the Mexican artists [such as Diego Rivera and Jose Orazco] interpreted it. In this process, fine marble dust is mixed with slaked lime to create the painting surface. In *fresco buono*, the plasterer prepares the painting surface with layers of cement and rough lime plaster, a day's worth of work; the artist applies the color as long as the surface remains moist. As the plaster dries, the painting becomes part of the wall.[13]

The fresco process is elaborated further by Nathan and Matthew Zakheim, the sons of artists Bernard Zakheim and Phyllis Wrightson,[14] in their description of the UCSF murals restoration in 1960s, which was originally published in the UCSF student newspaper, "Synapse," and reprinted

[14] Wrightson was Zakheim's assistant during creation of "History of Medicine in California." The two later married and had two sons, Nathan and Matthew.

in a research manuscript on the "History of Medicine in California" frescoes prepared by Robert S. Sherins, MD, in honor of the sesquicentennial of UCSF, School of Medicine (Sherins (2014)):

> For thousands of years frescoes have been a method through which artists paint directly on the wet plaster of walls. Pigments are brushed directly into fresh plaster using only water as a vehicle, the plaster itself being the medium. Once hardened [the] plaster and pigment becomes one. Seen under a microscope, one particle of pigment would be surrounded by ten particles of plaster. The pigments are exclusively earth colors - Indian red, yellow ochre, burnt sienna, terra verte, to name a few. With time the plaster can harden to limestone, remaining as vivid for centuries as when first painted. This durability explained the present-day survival of ancient Byzantine and Italian frescoes.[15]

Zakheim's assistant, and later, his second wife, Phyllis Wrightson notes that Zakheim's affiliation with UCSF followed on his work at Coit Tower as well as at Alemany Health Center (35-45 Onondaga Avenue, 1935).

> during the period following the completion of the Public Works of Art Program, Zakheim was commissioned under the sponsorship of the SERA [State Emergency Relief Administration] to execute two frescoes in the Alemany Health Center, for the San Francisco Department of Public Health. Called, 'Community Spirit' and 'Growth' the excellence of these murals was instrumental in an award to him of subsequent decorations in the University of California Hospital.[16]

Sherin's study also provides first-person accounts of the development of the "History of Medicine in California" murals by Dr. Chauncey Leake, who was one of the primary UCSF staff that spearheaded the Cole Hall and Toland Hall mural projects. At the time these murals were installed, Dr. Chauncey Leake (1896-1978) was a UCSF Professor of Pharmacology and of the History of Medicine and served as Librarian.[17] The following biographical information is from his obituary in the *New York Times:*

> Leake was born in Elizabeth, New Jersey and graduated from Princeton in 1917 and then the University of Wisconsin where he earned a Ph.D. and taught pharmacology and physiology. In 1928, Dr. Leave moved to the University of California, San Francisco, where he established the department of pharmacology. He discovered the anesthetic divinyl ether … and also did research on a wide variety of subjects including leprosy, the action of narcotic drugs, the regulation of the production red blood cells, and the biochemistry of the brain and the central nervous system. In 1942, Dr. Leake gave up his research…to become a full-time administrator. He became executive vice president of the University of Texas Medical School in Galveston, and in 1956, he moved again, to Ohio State University in

[17] "Zakheim Frescoes by Dr. Chauncey Leake," UCSF Student Newspaper, Synapse, Vol 7, No. 7, 19 April 1968. Reprinted in Sherins (2014), 14.

> Columbus, where he stayed until 1962. At that time, he returned to the University of California, San Francisco, and took responsibility there for coordinating the growing programs of research and training for medical students. … Dr. Leake wrote books on the amphetamine drug, the history of yellow fever, ancient Egyptian medicine, Harvey's discovery of the circulatory system, medical ethics and the pioneers of physiology and pharmacology. … He was a popularizer of science, an advocate of strong public health measures … and urged a stronger role for music and the humanities at a time when the world was placing growing emphasis on science.[18]

From a Letter to the Editor by Dr. Leake, originally published in "Synapse," and reprinted in Sherins manuscript:[19]

> It was Dr. Isabella Perry, in 1935, who suggested that we might obtain funds from the Public Works Administration for some artworks around our campus. At the time, during the midst of the [Great] Depression, there was little artistic activity around our campus. We were developing the humanities, particularly through an effort in the History and Philosophy of the Health Professions.
>
> We were able to secure the interest of the WPA and arranged with Bernard Zakheim, the brilliant and then young pupil of Diego Rivera, to attempt fresco decoration on the blank walls of the large auditorium [Cole Hall] on the top floor of the old yellow brick Medical School building [demolished]…

Zakheim's first mural project at UCSF, as noted in the excerpt above, was two mural panels flanking the podium in Cole Hall auditorium (these two murals were removed from Cole Hall prior to its demolition in the 1960s and relocated to the current Health Sciences West building on UCSF, Parnassus Heights site). These two panels, completed in 1935 and titled "Rational Medicine" and "Superstitious Medicine," were meant to contrast the "irrational superstitious and highly emotional approach to sickness and health, which had been characteristic of medicine for so many centuries with the more direct, cool, and clear-cut straight-line scientific approach characteristic of our times…" wrote Dr. Chauncey Leake in 1968.[20]

While Dr. Perry may have made the initial recommendation, Zakheim undertood the murals with the support of UCSF doctors George Lyman and Chauncey D. Leake.[21] Dr. Leake appears to have been particularly important in ensuring funding, facilitating access to UCSF staff and medical history, and promoting and defending the artworks and artist. In addition to interviews with medical staff, Zakheim was provided unrestricted access to the Crummer Room containing

numerous books and on the history of medicine, including recently published *California's Medical Story* by Dr. Henry Harris.[22] Dr. Leake remained a champion of the murals throughout his affiliation with UCSF. After returning to UCSF in 1962 as an administrator, Dr. Leake was an active proponent of having the covered murals restored and returned to public view.

Although the mechanics of the transition from the original two panel commission to the second, larger "History of Medicine in California" commission are unclear, it appears that Zakheim's mural cycle in Toland Hall built-upon his previous work. Given overlaps in timing, funding sources, and the consistent involvement of a small group of UCSF administrative staff, it appears that Zakheim's Toland Hall was intended to be an extension, or expansion, on the original themes outlined for "Rational Medicine" and "Superstitious Medicine." Zakheim wrote to fellow muralist, Jose Clement Orozco, that the "…Toland Hall series followed a specific program 'to use as subject the history of medicine in the state of California…As to the subject, I did not pick only the beautiful or heroic parts of history, because the contrast of good and bad constitutes the dramatic quality of narrative."[23] Besides these lofty goals, there were practical reasons for adding these images to the walls of Toland Hall. Contemporary accounts indicate that the frescoes were added to the space because it was a "dark, ugly cave, very depressing" and the artist's purpose was to "try to lift it, lighten it, give it color, to make it interesting and attractive."[24] Zakheim took advantage of Toland Hall's architectural features, which included curved walls and an articulated ceiling.[25]

In addition to the administrative and medical staff at UCSF, Zakheim worked closely with his assistant, Phyliss Wrightson, on developing the imagery and historical references in the "History of Medicine in California" murals. Sherin's describes Wrightson's role in the "History of Medicine in California" as follows:

> Phyllis Wrightson, a young San Francisco artist in her own right, took the offer to assist Bernard Zakheim on the WPA project in painting frescoes in Toland Hall at the University of California School of Medicine. She researched information about the history of medicine in California by visiting and researching at the institutions, archives and newspaper offices regarding each of the events and specific individuals portrayed in the murals.

In addition to the murals, Zakheim painted a legend (Descriptive Scroll, Fresco 8) [for the purposes of this document, the 12 panels of "History of Medicine in California" have each been assigned a number] that reads:[26]

University of California Medical School [Fresco 9]
San Francisco Medical History [Fresco 12]
Hooper Panel [Fresco 10], Science Panel [Fresco 11]

In addition to the legend, he also painted a dedication scroll [Fresco 1] that reads:[27]

> These interpretations of the History of Medicine in California are the handiwork of Bernard Zakheim and his assistant, Phyllis Wrightson. They are dedicated to California's developing artistic tradition, and were made possible through the Federal Art Project and the progressive scientists of the University of California Medical School. The plastering was done by Kai Andersen. These frescoes were begun April 4, 1936 and completed May 3, 1938.

During the UCSF projects, Wrightson kept a research manuscript that includes the following description of the murals and Toland Hall:

> The space now being decorated by frescoes is a large lecture amphitheater with a curved wall something over one hundred feet in circumference, a straight wall across the front to accommodate a screen and blackboard, and a low ceiling broken by skylights, and supported by large beams radiating from the center of the front wall in sunburst fashion.
>
> …Each of the six panels thus formed is fourteen and one - half by four and one - half feet high, the small height being due to the sharp rise of the tiers of seats from the floor level.

assigned in this document are in the order in which they are placed in Toland Hall for ease in identification throughout this document. The numbers are not intended to demonstrate artistic intentions or significance.

[27] Ibid.

> Repeating the principle of radiation upon which the room is built, the movement of the composition travels to left and right of the center of the curved wall [in back of the room], where a design of the rising sun reflects the sunburst pattern of floor and ceiling, and symbolizes an eastward direction. To the left of this is shown the development of medicine in northern California, and to the right, that of southern California. The six panels are treated somewhat in the manner of a frieze, with a strong wave - like rhythm acting as a connecting force. [28]

This description is expanded on by author Anthony W. Lee who describes the center panel(s) at curved wall – a description that borrows from the extensive documentation of the murals prepared by Dr. Chauncey Leake and included in Sherins (2014) – thusly:

> "The series begins with an Indian figure [that] reaches out to greet the morning sun, his back to the viewer. His gesture – arms flung open – is like a directional cue, and the rest of the panels spread out laterally, curving from the back of the amphitheater and continuing across the flat front wall…" "…The central Indian, from whose open arms the historical parade unfolds, is a figure of pathos. The medical achievements, the notable physicians, the life - saving vaccines and famous surgeries pictured in the amphitheater are set against the brutality of exploration, settlement, and expansion. A narrative of medical progress coexists with a more troubling counter - narrative of corrupt regress. The tension crops up between the scenes, undermining the glorification of events and personalities…"[29]

As presented in Sherins (2014), Lee's analysis indicates that the mural series begins with what we are calling Fresco 4. In his detailed description of the series, however, Dr. Leake appears to consider the center – or beginning – of the mural series to be Fresco 4 and Fresco 5 together, the medical influence of the English explorers juxtaposed – or sharing focus – with Native American healing. To the left of Frescoes 4 and 5, the panels focus on medical history of northern California (Frescoes 2 and 3). To the right of the center frescoes, the panels focus on medical history of southern California (Frescoes 6 and 7). The panels on the north wall detail history of UCSF (Fresco 9), pay tribute to the Hooper Foundation for Medical Research and applications of biological science (Fresco 10), describe science past, present and future (Fresco 11), and outline the history of medicine in San Francisco (Fresco 12).

The "History of Medicine in California" depicts practices and knowledge of native people and acknowledges their skill and recognized medical expertise. In Fresco 4, three Native Americans offer medicinal herbs, and another panel depicts a child-birth ceremony. The frescoes also depict founders, scientists, and educators pivotal to the important and revolutionary breakthroughs in medicine; the individuals noted herein are only a small selection of the medical professionals and practitioners, scientists, researchers, patients, politicians, and founders depicted in the fresco. Many

[28] Phyllis Wrightson's research manuscript of the allegory portrayed in the frescoes was made available to Dr. Robert Sherins (December 2013) - with permission to publish the material - by Nathan Zakheim, son of the Bernard and Phyllis (Wrightson) Zakheim. "Wrightson, Phyllis, Toland Hall Frescoes of the University of California Medical School, self - published, San Francisco, circa 1936. Sherins (2014), 45.

[29] Anthony W. Lee, "Painting on the Left, Diego Rivera, Radical Politics, and San Francisco's Public Murals," University of California Press, Berkeley, California, 1999. Excerpt in Sherins (2014), 52.

friends and family members of Zakheim and his associates are also included in the panels. Among the medical professionals associated with UCSF that are depicted: in different scenes in Fresco 9 are Dr. Lucy M. F. Wanzer, the first woman admitted to the University of California Medical Department in 1873, and Dr. Herbert C. Moffitt with Dr. Robert Langley Porter (namesakes for Moffit Hospital and Langley Psychiatric Hospital, respectively); Dr. Chauncey Leake, Dean of Pharmacology at UCSF and Zakheim's benefactor One figure included in the murals is that of Bridgett "Biddy" Mason (1818-1891) in Fresco 7. A former slave that secured her freedom when she petitioned a Los Angeles Court in 1856, Biddy Mason was skilled healer, midwife, and nurse in addition to being one of the first African-American women to own land in Los Angeles.[30] She was an astute business woman and philanthropist, founding a school and orphanage, and organizing the First AME Church of Los Angeles, the city's first black church. As a nurse, Mason worked with physician John Strother Griffin; Mason and Griffin are shown side-by-side caring for a malaria patient (Fresco 7).

The frescos along curved wall contain imagery of medical practices and procedures in scenes from the history of California. Some selections include of this imagery include: Sir Francis Drake attending over an early autopsy with a ship in the background (Fresco 4); the 1775 Anza Expedition, a crude surgery by Spanish Dr. Don Pablo Soler, and self-amputation of an injured leg (Fresco 3); the first hospital in California, established in 1789 to treat members of the Portola Expedition suffering from scurvy (Fresco 6); covered wagons of settlers and a doctor saving the life of a young miner during Gold Rush along with Dr. Hugh Huber Toland, founder of Toland Medical School, predecessor of UCSF, on horseback, Dr. Victor J. Foureaud, holding title page of his monograph on diptheria, and Dr. John Townsend hanging sign announcing the first medical office in San Francisco in 1846 (Fresco 2).[31] On the flat wall, the panels contain imagery of medical research, education, and conflicts in 19th century San Francisco. The influences of bubonic plague epidemic in San Francisco in 1900 are depicted with images of rats, the source of spread of the disease, and suffering patients juxtaposed with imagery of the politicians and medical professionals fighting the disease and establishing UCSF (Fresco 12). A panel on science with imagery of a science wheel or generator with wheels and belts running on ball bearings inscribed with names of scientists that "…spins out of control, serving military, not humane needs, its products bombs and poisonous gases, its victims the defenseless."[32] The medical achievements, notable physicians, life-saving vaccines and famous surgeries are

> set against the brutality of exploration, settlement, and expansion. A narrative of medical progress coexists with a more troubling counter-narrative of corrupt regress. The tension crops up between the scenes, undermining the glorification of events and personalities.[33]

[31] These descriptions are paraphrased from excerpts from Dr. Chauncy Leake and from UCSF Student Newspaper, "Synapse," reprinted in Sherins (2014).

[32] Antony W. Lee, "Painting on the Left, Diego Rivera, Radical Politics, and San Francisco's Public Murals. University of California Press, 2009. Excerpt quoted in Sherins (2014), 67.

[33] Antony W. Lee (2009). Excerpt quoted in Sherins (2014), 52.

The following is excerpted from Page & Turnbull (2005):

> When the frescoes were completed in 1938, the staff of the University of California hailed them as an excellent addition to their lecture hall and the murals brought thousands of visitors to the UCSF Medical School.[34]
>
> Although the frescoes were initially lauded, their style and politics came under increased scrutiny by the late 1940s. In 1948, the University of California wallpapered Zakheim's murals due to "complaints" that the murals were a distraction for students attending lectures.[35] However, other accounts suggest that the mural's political ideas, socialist overtones, and "subversive" messages were too radical for the University of California, which was recovering from the Depression-era economy and political climate rife with McCarthyism.[36] Zakheim was outraged "History of Medicine in California" frescoes were covered with wallpaper and indicated that he felt this action cost him future commissions.[37]
>
> The Toland Hall murals remained covered for thirteen years until University staff and alumni uncovered them in 1961. From 1961 to 1977, the University alumni association undertook and completed a massive campaign to raise $15,000 for their restoration.[38] The murals were respectfully restored by Nathan B. Zakheim and Jennifer Waechter in August 1978.

Currently, the "History of Medicine in California" murals reside in their original location on the walls of Toland Hall and are in good condition except for some water damage on several panels.

Events

Works Project Administration's Federal Art Project

The "History of Medicine in California" was partially funded through the Works Progress Administration's Federal Art Project, the visual arts component of the Federal Project Number One, a work relief program for thousands of unemployed actors, musicians, writers, historians, and other creative professionals and white-collar workers. Federal One was established in 1935 and operated until 1943. It was the longest and most productive of the New Deal arts programs. Federal One programs included the Federal Theater Project, Federal Writer's Project, Federal Music Project and the Historical Records Survey. The FAP's work focused on three main areas: production of artwork, art education through classes and community centers, and art research through the Index of

American Design. The Federal Art Project employed numerous artists who were or would become famous, including Jacob Lawrence, Alice Neel, Henry Louise Freund, Mark Rothko, Lee Krasner, among many others. [39]

Prior to the establishment of the FAP, unemployed performing and visual artists found work through projects and programs funded through the Federal Emergency Relief Administration (FERA) and the Civil Works Administration (CWA), two of the first New Deal agencies established after FDR took office in 1933. The two administrations employed thousands of San Francisco residents on infrastructure improvement and construction projects, including building, repairing, or upgrading roads, schools, housing complexes, parks, and playgrounds.

The first New Deal program to solely aid unemployed artists was the short-lived Public Works Art Project (PWAP). Also established in 1933 and funded through CWA, the PWAP operated from December 1933 to June 1934 and during that time more than 3,000 artists across the country decorated public buildings with murals and other works depicting everyday American life. The Coit Tower murals are the first known and the largest PWAP/CWA-funded project. Other New Deal-era art programs included the Department of the Treasury's Section of Painting and Sculpture, later known as the Section of Fine Arts (1934-1942), and the Treasury Relief Art Project (TRAP, 1935-1938).[40] The breadth of artworks produced collectively from 1934 to 1942 is truly amazing: with approximately 100,000 paintings, 18,000 sculptures, 13,000 prints, and 4,000 murals.[41]

Through the FAP, artists created works in a variety of mediums, including photography, graphic arts, sculpture, and painting. The FAP operated over 100 community art centers nationwide and commissioned 2,566 murals during the course of the program. The sculpture division employed 500 sculptors and produced 17,744 works and the FAP funded 108,099 easel paintings and produced more than 2 million posters. The output of murals was small in comparison to the other visual arts divisions, but they were the most plentiful public art form and they could be incorporated into the planning of new buildings funded by New Deal agencies or to update existing buildings. The scenes of American life decorating the walls of post offices and other public buildings throughout the country became one of the most recognizable artistic products of the New Deal era, and for many, the "mural division will forever be remembered in the public mind as the primary achievement of the entire project." [42]

Hundreds of murals, sculpture, and other art works were commissioned for public buildings in San Francisco. They included works at several San Francisco public schools: Victor Arnautoff's "Life of George Washington" murals at George Washington High School; murals by Nelson Pool and George Wilson Walker at Roosevelt Junior High School; and Edith Hamlin's murals at Mission High

School. Public works also included Diego Rivera's Pan-American Unity mural at City College; the San Francisco Zoo's Mother's House murals and mosaics by Helen Forbes and Esther Bruton, Margaret Bruton and Helen Bruton; Lucien Labaudt's frescoes at the Beach Chalet; Beniamino Bufano's outdoor granite animal sculptures; and interior and exterior art works at the Aquatic Park Bathhouse, among other locations. [43]

The "History of Medicine in California" murals, which were artist Bernard Zakheim's largest FAP commission, are significant for their association with the WPA's Federal Art Project, a work relief program the provided employment for hundreds of out of work visual artists. The FAP was the longest running New Deal-era arts program and supported artists who were, or would become, leading figures in the twentieth century art world. The murals commissioned by the FAP are some of the most recognizable public art works of the WPA-era.

Architecture/Design

The mural cycle "The History of Medicine in California" is significant as an excellent example of New Deal-era mural artwork displaying the distinctive characteristics of New Deal-era frescos with a consistent earth-toned palette, intense saturated colors, figurative content, rounded forms, and overall stylistic influence of the Mexican mural movement of the 1920s. Zakheim's murals are in an expressionist style that bears considerable similarity to the style of Mexican muralist, Jose Clement Orozco. Although their theme - medicine and medical history - is somewhat unusual, it was typical for fresco or mural installations of the period to reflect a unifying concept that often related to the building or institution that housed or commissioned the artwork.[44]

"History of Medicine in California" is also significant as the work of by master artist and muralist, Bernard Zakheim. In this artwork, Zakheim sought to depict the "…evolution of medicine from medieval concepts to scientifically based principals" with "works [that] were an allegory about the history of California Medicine displayed in art."[45] The "History of Medicine in California" is largest, most immersive *fresco buono* work of Zakheim's career and the last fresco commission that he completed in San Francisco.

Bernard Zakheim

Bernard Baruch (or Boruch) Zakheim (1898-1985) was born in Warsaw, Poland and died at the Jewish Home for the Aged in San Francisco.[46] The youngest son of a wealthy family of Hasidic Jews, his family intended him for the synagogue to be a rabbi. After becoming politically active, and against the wishes of his family, Zakheim began studying art as well as upholstery and furniture

[43] *Draft San Francisco New Deal Historic Context Statement,* 117-130, 167.

[44] Similar New Deal-era frescoes depicting medical history and practices were installed at Harlem Hospital in New York City (Oil on canvas mural, "Modern Medicine" and "Magic in Medicine," Charles Alston, 1940; Fresco buono, "Modern Surgery and Anesthesia," Alfred Crimi, 1936). Zakheim's fellow San Francisco fresco artist, Victor Arnautoff, also did several frescoes in Palo Alto, California depicting scenes of a medical clinic (Stanford Medical Clinic (Roth Building, Palo Alto, California: Frescoes of Medical Clinic, 1932).

design. Zakheim met and married Eda Spiegleman in Poland. The couple had two daughters before divorcing in 1937.[47] In 1941, Zakheim married Phyllis Wrightson (1907-1998), [48] who had worked as his assistant on the Alemany Health Center and UCSF mural projects. The couple had two sons. An article in 1941 notes that Wrightson "exhibited watercolors and oil paintings at many bay region shows, the World's Fair on Treasure Island and San Francisco Museum of Art and been a teacher of art in both public and private schools."[49] In historic documentation about the Alemany Health Center and UCSF murals, Wrightson is noted as an artist – painter – in her own right, but little information has been located about her work or life.

Unless otherwise noted, the following biographical information about Zakheim is from the landmark designation application for the Alemany Health Center:[50]

> During World War I, he joined the Polish Army in 1918, and was later captured and held for nine months in a German prisoner of war camp.[51] After his release, he studied art at the Danzig Polytechnicum where he met and then married Eda Spiegleman, "a young dramatist," with whom he eventually had two daughters.[52] They arrived in New York City in the fall of 1920, staying briefly before traveling to San Francisco. A job in a furniture factory took them to Los Angeles where their first daughter was born in 1921. After three years, they returned to San Francisco where Zakheim studied at the School of Fine Arts, but he became disillusioned by the instruction there which ended his formal art education.
>
> In 1925, at age twenty-seven, he opened a custom furniture business and based it on the European Guild model. His company was the first in San Francisco to offer a 44-hour work week which included paid vacation time. Additionally, he "was the moving spirit in organizing the Yiddish Folkschule at 1057 Steiner Street" and became a "leader in the Yiddish movement in San Francisco." He "rented a small studio at the California School of Fine Arts (the San Francisco Art Institute) for a short period" before sending sketches to Diego Rivera.[53] After [being] invited, he traveled to Mexico to study with Rivera. Zakheim

> returned to San Francisco by June of 1930 with Rivera's encouragement to put "something of his own soil, of his own people" into his art.
>
> In 1931, he left his wife in San Francisco…while he went to Europe -- first Paris, then Florence -- to study art. He visited a small Hungarian town where he met an artist named Professor Gebauer who painted frescoes…with Gebauer's encouragement, Zakheim painted his first fresco titled *Jews in Poland*. … By October 1932 he had returned to San Francisco, but not before begging his European family to leave Poland.[54] Zakheim paid tribute to his 300 relatives lost in the Holocaust in a later work, a sculpture titled *Monument to the Warsaw Ghetto Uprising*.[55]

In the 1930s, Zakheim's art focused on several mural projects, including Coit Tower, San Francisco Jewish Community Center, Alemany Health Center, UCSF, and two post offices in Texas. Except for the Jewish Community Center commission, his other mural projects were all partially or fully funded by PWAP or FAP. His first mural commission, for the Jewish Community Center (discussed below) received positive critiques and appears to have established him in the San Francisco art community. Unfortunately, his entry into this community coincided with the harsh effects of the Great Depression with many artists joining the sizeable ranks of the unemployed and impoverished across the country.

During this period, Zakheim, who long held an interest in worker's rights, became involved with the San Francisco Artists and Writers Union.[56] Along with his leftist politics and interest in workers' rights, Zakheim also brought the Union his experience organizing the Conference of Yiddish-Speaking Organizations and Yiddish Folkschule and the Yiddish Literary and Dramatic Club. Shortly after the formation of the artists union, the group received notice of the formation of the Public Works of Art Program (PWAP – described previously) and authorization of the first PWAP-funded project, the Coit Tower murals. The artist's union picketed and wrote letters in support of artistic freedom of expression during the controversy over several images in the Coit Tower panels, but shortly after the Tower opened to the public, the San Francisco Artists and Writers Union was dissolved. Zakheim remained involved in the artists' labor movement by becoming one of the sponsors of the San Francisco section of the American Artists Congress, a national protective organization of artists that formed in the mid-1930s.[57]

Shortly after completing his fresco in Coit Tower, Zakheim also had a one-man exhibition of watercolors, designs for fresco and drawings at a San Francisco gallery.[58] Press commentary on the

one-man gallery show was mixed, perhaps due to the show coinciding with the controversy over some of the imagery, including Zakheim's, in several Coit Tower murals. One critic wrote that Zakheim was "…neither a cubist nor a sur-realist…he is more what one would call a self-expressionist…and has more interest in recording an ordinary experience as in responding to a psychological power."[59]

In the 1940's Zakheim moved to an apple farm in Sebastopol, California where he continued painting and began sculpting in wood and granite. In later life, he turned increasingly to sculpture and produced a series of six wood sculptures commemorating the Holocaust.[60] His final mural project was done in 1961 where he was invited by the *Jewish Social and Cultural Society* to paint a mural that would be his last. He titled it "Songs of the Polish Jews," saying at the time that "fresco is my main interest...wall painting in the fresh wet cement is really the idiom of drama … For the artist to have a wall to paint fresco is a rare thing."[61]

Zakheim continued to participate in exhibitions with his paintings and sculptures and was recognized for this work.

> He was awarded a Certificate of Honor "in appreciative public recognition of distinction and merit" by the San Francisco Board of Supervisors in July 1972. He had a retrospective exhibition of his paintings at the Judah L. Magnes Memorial Museum in Berkeley in 1973 to celebrate his 75th [sic] birthday and continued to make art until the end of his life.[62] …The Sonoma County Museum had a memorial exhibition of his work in 1986.[63] His work is in the collections of the San Francisco Museum of Modern Art, Brandeis University, and the Jewish Historical Institute in Warsaw, Poland.[64]190 In 2001, during the conservation and move of Zakheim's mural at the Jewish Community Center, *San Francisco Chronicle*'s art critic Allan Temko said of him: "he wasn't a Michelangelo...but his work is good, for what it is, and worth saving."[65]

Assessing a one-man exhibition of Zakheim's watercolors, drawings, and studies for frescoes, Ada Hanifin, art reviewer for the *Examiner*, wrote in an article published on July

17, 1934, "he belongs to no school…His work has vigor, sensitivity, vitality and power. He paints sincerely and spontaneously."[66] In 1937, Ray Boynton, a fresco artist and instructor of Art at the California School of Fine Arts, assessed Zakheim and his work thusly:

> His work has always been concerned with human values and human drama and his point of view has always been sympathetic to human struggle and effort. … I think this work has real social value in that it is charged with positive qualities of believe and protest rather than negative qualities of indifference. …his ideas are alive to his time and environment.[67]

Zakheim's Mural Projects[68]

Jewish Community Center (JCC) Mural

Zakheim's first solo mural commission in San Francisco drew upon his Jewish heritage when, in 1933, he won a commission to paint a mural (extant – relocated) and design a mosaic fountain (demolished) at the new Jewish Community Center. As noted in David Hooper's and Lisa Dunseth's Landmark Designation Application for Alemany Health Center, Zakheim's proposal, which depicts a traditional Jewish wedding and features "folkloric aspects of Jewish culture," was selected by JCC's leaders who were "…interested in reaching out to a 'broader segment of society' with their programming."[69] At the time of the JCC's opening, "newspapers reported that Zakheim's 'vivid colored fresco...attracted much attention from the thousands of visitors who flocked through the building during the dedication week program'."…It was reported that he painted in "the primitive...two-dimensional style of the modern Mexican school," a direct reference to Rivera's influence. [70]

The art critic for the *Argonaut*, a San Francisco newspaper from 1878 to 1956, Joseph A. Danysh, wrote of the mural on August 4, 1933:

> San Francisco has its latest heroic fresco. Bernard Zakheim, [one-time] business man, now turned to art … as a significant way of life, is the painter. … Given a space one hundred feet square in area … No muralist anywhere ever started with a more unsympathetic space to paint … Few artists could have improved upon Zakheim's design. …he has combined the

[66] "Bernard Zakheim," abstract from *California Art Research (1937),* 68.

[67] "Bernard Zakheim," abstract from *California Art Research (1937),* 103.

[68] The following descriptions are for mural projects that were completed and are extant. There is documentation, including sketches, that indicates Zakheim planned to do a four-panel mural, in 1937, at the Union Recreation Center at 32 Clay Street, titled "History of the San Francisco Waterfront." While the historical record is a bit unclear, it is unlikely that this mural was ever completed.

[69] Elizabeth M. Boone, "'Something of his Own Soil': Jewish History, Mural Painting, and Bernard Zakheim in San Francisco," in *American Jewish History* 90.2, 2002, 123-140. Quoted in Hooper and Dunseth (2015), 55.

> technique of true fresco painting with the subject material of the Heroic cult of Hasidim. His composition is conceived primarily in terms of movement. … In this mural, the design has reached outside itself to become an integral part of the architecture, counteracting a large mass here, a rushing line of the building there, moving beautifully in terms of its own irregular frame. …he has also made his wall come alive in the spirited reproduction of his legend. Jugglers…drummer, fiddler and piper playing…chants of the Hasidim; singing maidens; hasty weddings; archers and judges; prayers and dancers; all contribute life and conviction to a finely executed picture.[71]

Glen Wessels, in the *Argonaut* of June 22, 1934, commented on the JCC fresco, saying "Bernard Zakheim has a achieved a style of his own, most evident in the strong rhythms characterizing his drawing and his design…"[72]

This fresco was removed from the original location when the former Jewish Community Center building was demolished. The fresco was moved to the third-floor stairwell when the Jewish Community Center was rebuilt: it was reinstalled and rededicated in 2004 where it is currently open to the public.

Coit Tower Mural

In 1933-1934, Zakheim, along with 24 other master artists, was hired to contribute to the Coit Tower murals that were meant to depict variations on the theme of "the contemporary American Scene in all its various aspects."[73] Of the artist's hired, Zakheim, who had studied with Diego Rivera in Mexico and painted a fresco in Europe, was one of the few with experience creating murals although several of the artists, including Zakheim, had studied fresco with Ray Boynton at the California School of Fine Arts. Zakheim, who was active in workers' and artists' unions of the period, may also have been a proponent of using Coit Tower as the location for the first federally-funding New Deal-era art program, known as PWAP. He was certainly involved in encouraging local officials to put San Francisco artists to work with the newly created PWAP.

The Coit Tower murals, titled "Aspects of Life in California, 1934," depict social, political, and economic concerns of the 1930s as well as San Francisco bay landscapes.[74] Zakheim's contribution to the Coit Tower murals, which is evocative of his social and political views, is described in the amendment to the Coit Memorial Tower National Register Nomination (2018):

> *Library* by Bernard Baruch Zakheim (1896-1985)[75]
> Technique: *fresco buono*
> On a wall opposite the law library fresco, and measuring 10' by 10', this mural speaks to the concepts of freedom of expression based on a scene in a public library reading room. The

> scenevis crowded with well-known figures, book spines, and bold newspaper headlines about such timely topics as the destruction of Rivera's fresco at Rockefeller Center, a commission for sculptor Benjamin Bufano, mortgage foreclosures, and other issues of the day. The muralist included likenesses of artist Fred Olmsted and William Gerstle, a local arts patron and civic leader. The mural abounds with likenesses of Zakheim's colleagues, friends, and family, specifically the artist's young daughter, Ruth, and his assistants for this mural, Julia Rogers and Shirley Staschen. A figure, artist John Langley Howard, removes a copy of Karl Mate's *Das Kapital* from the library shelves. Col. Harold Mack of the PWAP supervisory committee stands in front, carefully monitoring the entire scene. Overall, the library scene pays homage to literature, education, and political awareness.

The inclusion of *Das Kapital* in this mural is one of the elements that contributed to their controversy and delayed the public tower's opening. The following information about this controversy and Zakheim's response is taken from Hooper and Dunseth:

> Zakheim, Victor Arnautoff, Clifford Wight (all of whom had worked with Rivera) and John Langley Howard "scandalized the City by including left-wing political commentary" in their murals.[76] This was happening, of course, at a time of great economic hardship during the Great Depression and just before the violence and upheaval of the Longshoremen's strike, protest, and riots which were to come later that summer. Originally meant to open in April, the building and murals were finally opened to the public in October 1934.
>
> A newspaper article from the period featured a "doctored" photo of Zakheim's mural, adding a hammer and sickle encircled by the slogan "Workers of the World Unite" over which a caption read "Here is the painting in the Coit Memorial Tower that has caused a bitter dispute."[77] Zakheim's response was "I have painted no hammer and sickle over my fresco or anywhere else...and the directors of the Public Works of Art Project have never asked me to change any part of my mural."[78] This was true. However, during the Coit Tower controversy, Fleishhacker had, indeed, asked him to edit his mural. And Zakheim's angry refusal, according to an interview with Lewis Ferbache in 1964, was "I am a hammer and sickle painter."[79]

Zakheim's interest in Communism can be found in his early years in Los Angeles. In the late 1920s he was deeply influenced by his friendship with Kenneth Rexroth who was engaging in Communist debates and organizing the Montgomery Block artists and writers. Together Zakheim and Rexroth assembled "the most coherent leftist group of artists and writers the city had ever seen."[80]

Alemany Health Center Murals
Following the completion of the Public Works of Art Program (PWAP) and his work at Coit Tower, Zakheim was commissioned, in 1934, under the sponsorship of the SERA (State Emergency Relief Administration) to execute two frescoes in the Alemany Health Center, for the San Francisco Department of Public Health. Called "Community Spirit" and "Growth," the murals must have been completed while the center was in operation since it officially opened in August 1933. These murals, painted as decorations in the waiting room on the wide chimney of the room's fireplace with one mural above, and one below, the balcony that divided the chimney, is partially described by Phyllis Wrightson, who called them "…a very beautiful piece of work,":

> The portion below the balcony is adapted in color and literary content to the room and its uses. It is entitled [Growth] and is an arrangement of symbolic figures
> in an elliptical pattern against a background of the slender silvery trunks of young fig trees, an ancient symbol of fertility.

Hooper and Dunseth describe the Alemany Health Center murals as follows:

> The mural on the upper floor is titled *Community Spirit.* This mural is damaged but in relatively good condition. The mural on the first floor, *Growth*, as described by Wrightson, symbolically depicts birth, growth, and parenthood: [no] photographs or drawings depicting the entire mural [have been located]. It was painted over in the mid 1970s -- perhaps because either the theme or the imagery was considered offensive.
>
> In a letter dated 17 February 1976, Zakheim wrote to Herb Caen about the Alemany mural: "Again they amputeded [sic] a part of my soul. This time at the Alemany Baby Health Center...they painted over a half of my frescoe [sic], and this is the third time in a row." On 29 March 1976, Caen mentions Zakheim "frothing with anger" over the Alemany mural. He quotes Zakheim: "An insult! ... Besides, they've covered over the most important part of all -- the fertility rites!"[81]

The buildings and murals have not been open to the public since 2011. The Alemany Health Center Landmark No. 272 in 2016 and the "Community Spirit" and "Growth" murals by Bernard Zakheim are identified as character-defining features of the building.

UCSF Murals – Cole Hall
Unless otherwise noted the following description is from Hooper and Dunseth:

> In 1935-36 Zakheim, again with SERA [and FAP] funding, began two murals in UCSF's Cole Hall (the University of California, Medical School.) It has been suggested that his work at the Alemany Health Center helped him win this job at UCSF. Titled *Superstitious Medicine* and *Rational Medicine*, they were moved, in 1966, to their present location in the Health Sciences Building West at UCSF.

[81] News clipping, Bernard Zakheim collection, 1902-2010 (bulk 1935-1990), MSS, 2014-15, UCSF Library. Quoted in Hooper and Dunseth (2015), 52.

> The Toland Hall amphitheater murals, completed in 1938, became a four-year, ten panel project commissioned by Dr. Isabella Perry, after seeing the Alemany murals, and then spearheaded by Dr. Chauncey Leake. They were partially funded by the WPA. This series of murals is titled the *History of Medicine in California* and they fill the walls of the lecture hall.

Dr. Chauncey Leake, Dean of Pharmacology at UCSF, who spearheaded the institution's support for both of Zakheim's mural projects at UCSF, prepared a comprehensive brochure on the pair of murals painted for Cole Hall, "Rational Medicine" and "Superstitious Medicine." Dr. Leake was motivated to expand the relationship between science and the humanities, desiring that the frescoes might provoke medical students to consider the philosophical and social ideas of their profession.

The Cole Hall frescoes were displayed for the public, along with an exhibition of the watercolor studies Zakheim produced in preparation for the murals, for a week in February 1936. Art critic for the *San Francisco Chronicle*, Alfred Frankenstein, called it "…one of the most extraordinary art exhibitions ever held in this or any other city…" for it was "…unique in subject matter, unique in locale…" and displays "…co-operation, if not the inter-penetration, of science and fine art."[82] Another critic took exception to the murals, stating that "…Zakheim tried to do too much…You can't put in the whole history of medicine in two frescoes. The frescoes are as complicated as a set of viscera to the lay mind."[83] In this comment, perhaps, is the impetus for the second commission at UCSF, which expanded on the theme of medical history in California across 10 pictorial panels.

As noted above, "Rational Medicine" and "Superstitious Medicine" were removed from Cole Hall prior to the building's demolition and moved to their current location(s) on the UCSF Parnassus campus. They are believed to be in good condition.

Texas Post Office Murals

Zakheims last mural projects in the United States were for two post offices in Texas. The first, an oil-on-canvas mural called, "New and Old Methods of Transportation, 1938," in Mineola, Texas. The original Mineola mural was damaged by neglect after it was removed from the post office building and stored. In 2005, the mural was reinstalled in the Mineola Historical Museum after being restored (or recreated) by Nathan Zakheim, and other Zakheim family members.[84] The second, in Rusk, Texas, was titled "Agriculture and Industry, 1939." The "…mural illustrates Rusk's rough agrarian and industrial history from multiple perspectives" capturing how "Native

Office of the President

TO MEMBERS OF THE FINANCE AND CAPITAL STRATEGIES COMMITTEE:

ACTION ITEM

For Meeting of March 18, 2020

PRELIMINARY PLANS FUNDING, THE NEW HOSPITAL AT UCSF HELEN DILLER MEDICAL CENTER AT PARNASSUS HEIGHTS, SAN FRANCISCO CAMPUS

EXECUTIVE SUMMARY

UCSF has been actively engaged in a planning effort to re-envision and revitalize the Parnassus Heights campus site as a whole, to create a place that fosters collaboration among education, research, and patient care activities. The planning process resulted in the development of the Comprehensive Parnassus Heights Plan (CPHP), which provides a long-term development framework for the revitalization of the Parnassus Heights physical environment and cultural vitality of the entire neighborhood. This is one of three items being presented at this meeting that are related to projects supporting the broader plans at Parnassus Heights and the New Hospital Program.

UCSF proposes the New Hospital at UCSF Helen Diller Medical Center at Parnassus Heights Program (Program) to address seismic deficiencies for acute inpatient care and outdated clinical facilities that cannot accommodate the growing patient population. The Program comprises several projects, including seismic upgrade of the Moffitt hospital building; select renovation of Moffitt and Long hospital buildings; and construction of a new acute care hospital building to increase the existing hospital capacity and expand the current emergency, surgical, interventional radiology, and imaging services.

UCSF received a $500 million commitment from the Helen Diller Foundation to support the planning, design, and construction of the new hospital building. The commitment allows UCSF to begin the extensive planning process for an environmentally sustainable hospital building, which is expected to open its doors to patients by 2030.

The Regents are being asked to approve preliminary plans funding in the amount of $181.8 million to be funded with hospital reserves. The proposed funding would allow the campus to engage with an executive architect and construction professionals to refine program and scope, complete environmental analysis, and advance the proposed project through design development. Approval of full budget, external financing, and design following action pursuant to the California Environmental Quality Act would be requested for the project at a future meeting.

RECOMMENDATION

The President of the University recommends that the Finance and Capital Strategies Committee recommend to the Regents that the 2019-20 Budget for Capital Improvements and the Capital Improvement Program be amended to include the following project:

San Francisco: New Hospital at UCSF Helen Diller Medical Center at Parnassus Heights – preliminary plans – $181.8 million funded from hospital reserves.

BACKGROUND

UCSF Health is internationally renowned for providing highly specialized and innovative care. Investing in UCSF Health's future is critical to sustaining its public mission of providing top-quality care to all patients and supporting research and education. By investing in its facilities, UCSF Health is investing in its providers, patients, and staff by creating more inviting, functional, and state-of-art buildings in which to provide care.

Currently, patients on the Parnassus Heights campus receive care at two aging structures known as the Moffitt and Long Hospitals, as well as Medical Building 1 ("Ambulatory Care Center"). Moffitt Hospital was built in 1955 and thus, under State law SB 1953, it must be decommissioned for inpatient care or retrofitted by 2030 to conform to seismic code requirements.

Options for seismically retrofitting the existing Moffitt Hospital are being evaluated, along with the building's future use and function. The existing Long Hospital building will remain in operation as an inpatient hospital. It is anticipated that Long Hospital will require renovations to accommodate the expanded program and connection to the new hospital building. This project was presented to the Regents as a discussion in July 2019 and as part of discussions regarding the Integrated Form of Agreement in September and November 2019.

In 2017-18, a Strategic Clinical Facilities planning process was undertaken to develop achievable and affordable facilities options that would be aligned with UCSF Health's long-term strategy, volume projections, business plans, and financial capabilities. The conclusion of this planning process is that a larger hospital than what had been envisioned in the 2014 LRDP is needed at Parnassus Heights.

UCSF has significant capacity constraints resulting in an overcrowded emergency department, patients remaining in recovery rooms overnight, denial of transfer cases from other hospitals, and patients unable to transfer out of critical care units due to lack of downstream beds. These constraints create patient safety and satisfaction concerns, as well as provider and employee dissatisfaction. In addition to these current capacity issues, patient demand volume is expected to continue to increase. This is due to growth in the aging population as a whole, UCSF's affiliation network expansion, and the Bay Area's population growth, which show the nine-county area outpacing the growth rate in any other part of California.

PROJECT OBJECTIVES

In 2018, guiding principles for the planning and design of the New Hospital at Parnassus Heights were developed and include:

- Reimagining patient care by creating an optimal healing environment that addresses social, psychological, spiritual, and behavioral components of health in one place.

- Designing and constructing buildings based on "whole-patient" needs – from leading-edge diagnostic tests and therapies to the privacy, natural spaces, clean air, and human connection essential to physical and emotional healing.

- Maximizing innovation, quality, productivity, flexibility, and collaboration to create value for cost though use of the current, best-in-class project delivery model for large healthcare programs.

- Building an appropriately sized hospital and surgical intervention platform to meet the needs of the growing Bay Area population and beyond.

In addition, investing in UCSF Health's future is critical to sustaining UCSF Health's vision to be the best provider of health care services, the best place to work, and the best environment for teaching and research.

Based on the 2018 visioning work, the planning and space programming is being developed in the context of functional needs across the UCSF Helen Diller Medical Center at Parnassus Heights, including Long and Moffitt hospitals. The goal is to develop a holistic plan that enables the Parnassus Heights campus site to remain a destination supporting UCSF's excellence in clinical care, life sciences research, and education.

PROJECT DESCRIPTION

The proposed project would construct a new building of approximately 955,000 gross square feet (gsf) of new acute care space and new and expanded central utilities to serve the new building. Initial programming elements include:

- Planned increase in patient beds

- Surgical platform: 40 Operating Rooms and new Pre-Operative and Post-Anesthesia Care Unit support

- Interventional platform: 15 state-of-the-art interventional rooms

- Emergency department: 59 Emergency Department and 12 Clinical Decision Unit bays

- New and/or expanded kitchen, sterile processing, pharmacy, clinical laboratories, and overall support space

- Program space would also include hospital administrative offices, education and research offices, and team workrooms.

- Utility relocation and expansion

- Development of 96-hour water, waste, and power storage/supply to meet regulatory requirements by 2030.

The exact composition of the space program across the new and existing buildings is still being developed; however, the overall program will be designed for the most cost-efficient approach for constructability and operation.

Project Site

The proposed site for the new hospital is the site currently occupied by the Langley Porter Psychiatric Hospital and Clinics (LPPH&C), at the corner of Parnassus Avenue and Medical Center Way. Four buildings (Langley Porter Psychiatric Institute (LPPI), LPPI Butler, LPPI Outpatient Center, and LPPI Paint Shop) would be demolished as part of this project.

Approval Request and Project Schedule

Preliminary plans funding of $181.8 million would enable UCSF to refine and confirm the scope of work, refine the budget, complete environmental analyses, and advance the project through design development. Approval of budget, external financing, and design following action pursuant to the California Environmental Quality Act will be sought at a future meeting.

The master planning and functional and space programming process for the New Hospital program began in March 2019 and is anticipated to conclude in March 2020. Design is scheduled to begin in 2020. Demolition of the LPPH&C buildings is proposed to start in 2022 and subsequent construction is planned to begin in 2023, with the first patient expected to be seen in 2030. Select renovations to Moffitt and Long buildings would likely occur at the same time as the New Hospital construction, with major renovations upon completion of the new building.

Project Delivery

UCSF intends to complete the New Hospital at Parnassus Heights Program using the Integrated Form of Agreement (IFOA) which is an approved Integrated Project Delivery method. The design and construction planning will be performed by an integrated team including UCSF, the architect, general contractor, and key trades working collaboratively on

site in a "big room" environment, also referred to as the Integrated Center for Design & Construction (ICDC), to optimize Program quality within a cost target set by UCSF. The IFOA process optimizes the use of Lean tools and process. In addition to minimizing risk, the IFOA method provides control over design, quality, and managing patient, staff, visitor, and community requests.

Financial Feasibility

The preliminary plans funding is $181.8 million and will be funded from hospital reserves. As of June 30, 2019, UCSF Health has a 5.7 percent operating margin, 9.8x debt service coverage, and 96 days' cash on hand (metrics exclude the non-cash portion of the Pension and Other Post-Employment Benefits). Over a ten-year projection period, days' cash on hand is projected to be greater than or equal to 60 days, which meets the requirements of the University's Debt Policy.

Long Range Development Plan

Since the adoption of the San Francisco campus's current Long Range Development Plan in November 2014 (2014 LRDP), UCSF has been actively engaged in a planning effort to re-envision and revitalize the Parnassus Heights campus site as a whole, to create a place that fosters collaboration among education, research, and patient care activities in ways that continue to promote excellence and advance human health. UCSF's investment in Parnassus Heights has not kept pace with its aging central plant or changes in programmatic need, resulting in infrastructure, buildings, and interior spaces that require significant renewal and investment. The planning process resulted in the development of the Comprehensive Parnassus Heights Plan (CPHP), which provides a long-term development framework for the revitalization of the Parnassus Heights physical environment, with the intention of strengthening the vitality of the campus and the entire neighborhood.

The 2014 LRDP acknowledges the existing limit on the amount of non-residential built space at the Parnassus Heights campus site of 3.55 million gsf, commonly referred to as the "space ceiling." The space ceiling policy was included in an action approved by the Regents in May 1976, in response to neighborhood concerns about development of the Parnassus Heights campus site. The 1976 action imposed limits on the Parnassus Heights campus site, including permanent campus boundaries, designation of the Mount Sutro Open Space Reserve as permanent open space, and limits on physical expansion in surrounding areas. The 1976 action was amended in November 2014 to modify the way space and population are monitored at the Parnassus Heights campus site by excluding all housing within the Parnassus Heights campus site boundaries from the calculation in the space ceiling, and to tie the average daily population goal for the Parnassus Heights campus site to population projections contained in the 2014 LRDP Environmental Impact Report (EIR), as may be updated from time to time.

Based on the CPHP recommendations, the San Francisco campus is evaluating a potential increase of the space ceiling by approximately 1.5 million gsf for a total of 5.05 million gsf, to allow for the New Hospital at Parnassus Heights and to meet additional space needs on campus to fulfill the goals of the CPHP. Pursuant to a new community process that is

underway, UCSF will bring its proposed increase in the space ceiling to the Regents using a proposed LRDP Amendment and EIR for consideration at a future date. The Draft Environmental Impact Report for the CPHP, which incorporates the planning for the New Hospital, is expected to be released for public review and comment in May 2020.

KEY TO ACRONYMS

Attachment 3	Project Drivers
Attachment 4	Alternatives Considered

ATTACHMENT 1

NEW HOSPITAL AT UCSF HELEN DILLER MEDICAL CENTER AT PARNASSUS HEIGHTS

PRELIMINARY PLANS BUDGET

Category	**Total**	**% of Total**
Building [1]	$71,000,000	39.1%
A/E Fees [2]	$74,200,000	40.8%
Campus Administration [3]	$12,500,000	6.9%
Surveys, Tests, Plans [4]	$600,000	0.3%
Special Items [5]	$23,500,000	12.9%
Total	**$181,800,000**	100.0%

Under the Integrated Form of Agreement, the University's staff, design consultants, general contractor and major subcontractors begin the collaborative design process in schematic design to ensure all parties have the opportunity to influence the coordination and planning of the new hospital to increase project outcome certainty and lower risk.

Due to the site constraints, complexity of the space program renovations in Moffitt and Long hospitals, and the utility infrastructure challenges, early collaboration by all major parties in the identification and advancement of parallel design solutions will be critical to the project's budget and schedule.

At the end of design development, all project parties will have validated and contractually agreed to the scope, schedule, and budget of the project. The allocation of preconstruction, coordination, and design dollars is spent earlier in the integrated project approach vs. traditional design and does not increase the approved target budget.

[1] Building construction includes General Contractor, and major subcontractor pre-construction design assist services, Facilities Management consulting.

[2] A/E Fees include the executive architect, MEP and structural engineers basic services fees; and external project management and inspector of record services during design.

[3] Campus Administration includes: project management, contract administration, IT staff, Designated Campus Fire Marshall.

[4] Surveys, Tests, Plans include site surveys, plans & specs printing, and RFQ advertisement.

[5] Special Items include: pre-design studies, project EIR, local utility design fees, special consultants including medical equipment, furniture, physicist, hazardous material and environmental testing, OSHPD initial review fees, and EH&S reviews during design

ATTACHMENT 3

NEW HOSPITAL AT UCSF HELEN DILLER MEDICAL CENTER AT PARNASSUS HEIGHTS

PROJECT DRIVERS

Drivers for a larger hospital than what had been envisioned in the 2014 LRDP include addressing seismic improvements, inadequacies of existing facilities, population growth, demographic changes, and growth in complexity of inpatient services.

- Moffitt Hospital was built in 1955 during a different era of medical practices and philosophies. UCSF physicians and staff are currently working in facilities that are outdated, inflexible, undersized, and functionally and clinically obsolete. Many patient rooms and bathrooms are shared and do not provide the privacy and dignity expected by patients, thus not providing an optimal experience for patients and their families. State seismic law (SB 1953) requires Moffitt Hospital to be structurally retrofitted or decommissioned as an inpatient facility by 2030.

- The Parnassus Heights campus site is the center for the vast majority of UCSF's adult clinical care and the home to all five UCSF professional degree programs. The healthcare landscape is incredibly competitive for providers, staff, and patients. It is essential that UCSF has a world-class medical center on this site to support the convergence of UCSF's clinical care, research, and education missions as it moves into the future. Investment in the future is critical to the survival and continued growth of UCSF Health. UCSF must maintain a competitive edge among other healthcare organizations with newer facilities and more capital investment.

- The Bay Area population has grown steadily over the last ten years (one percent per year), with growth expected to continue at a similar pace over the next five years. The number of patients treated at the Parnassus Heights campus site has increased sharply, due to UCSF's increasing role as an important healthcare provider in San Francisco, the Bay Area, and northern and central California.

- Between 1976 and 2018, the average daily outpatient population at Parnassus Heights increased by almost 100 percent, while the inpatient population increased by 255 percent – a rate of patient growth that outpaced the rate of population growth in San Francisco and the Bay Area. The growth in the number of patients treated by UCSF since the 1970s is due to several factors including overall population growth in San Francisco and the Bay Area; a decline in the number of acute care hospitals serving San Francisco, resulting in UCSF steadily increasing the percentage of the City's overall hospital discharges (from 22 percent in 2001 to 34 percent in 2017); UCSF's increasing role as a regional patient referral center; and the establishment of UCSF's highly regarded liver, kidney, and heart and lung transplant programs.

- Services such as neurosurgery and vascular surgery are expected to see significant increases as the population grows and the percentage of residents of Medicare age increases. The total demand for services that UCSF is targeting is growing due to aging of the population and changes in technology and new treatments. For example, the focus on treating higher-acuity cases in key service lines will lead to an approximately 66 percent increase in the demand for neuroscience services, a 49 percent increase in the demand for heart and vascular services, and a 43 percent increase in the demand for orthopedic services.

- Demographic changes over the next ten years, including an increase in national Medicare enrollment, is expected to increase the acuity and length of stay of patients seen.

- As the percentage of less complex cases who can transition to outpatient settings increases, the medical complexity of patients coming to the hospital is expected to increase, which will mean longer length of stay for each admission and greater bed need.

- Regional network partners and affiliates rely on UCSF to support their complex patients and demand for patient transfers to UCSF continues to grow. In 2017, only 59 percent of medically necessary transfer requests to UCSF were accommodated. A large portion of the requested transfers did not come to UCSF because of a lack of capacity.

- UCSF must retain and recruit top-tier clinicians, staff, researchers, and students by creating an environment where teaching, research, and patient care intersect to deliver the highest level of care and innovation, integrating the patient experience with advancements in clinical quality.

ATTACHMENT 4

NEW HOSPITAL AT UCSF HELEN DILLER MEDICAL CENTER AT PARNASSUS HEIGHTS

ALTERNATIVES CONSIDERED

Other scenarios for meeting the demand for inpatient services at UCSF were considered, two of which are described below; however, these examples would only address a portion of the drivers for the proposed project.

Seismic Retrofit of Moffitt Hospital

Moffitt Hospital was built in 1955 during a different era of medical practices and philosophies. UCSF physicians and staff are currently working in facilities that are outdated, inflexible, undersized, and functionally and clinically obsolete. Structurally retrofitting Moffitt Hospital would allow the facility to continue as an inpatient facility beyond 2030; however, these improvements would not provide an increase in the number of inpatient beds or allow for expansion of emergency, surgical, interventional radiology, or imaging services. The floor to ceiling heights and building layout, for example, limit the amount of renovation that could be accomplished and prevent transformation of the facility into a modern hospital of the future.

The planning and space programming for the New Hospital Program is being developed in the context of the functional needs across the UCSF Helen Diller Medical Center at Parnassus Heights, including Long and Moffitt hospitals. Through this effort, the appropriate functional uses among the three facilities and the requisite renovations to the existing spaces would be identified.

Construction of Phase 2 Medical Center at Mission Bay

The Parnassus Heights campus is the center for the vast majority of adult clinical care and home to all five professional degree programs, necessitating a state-of-the-art hospital to ensure future success in all aspects of UCSF's missions. It is essential that UCSF invest in a world-class medical center at Parnassus Heights to support the convergence of UCSF's clinical care, research, and education missions.

Relocating inpatient beds from Parnassus Heights to Mission Bay would adversely affect the clinical enterprise remaining at Parnassus Heights and eliminate the ability to leverage the functional needs across multiple facilities to maximize the efficient use of the two existing hospitals.

The proposed New Hospital at UCSF Helen Diller Medical Center at Parnassus Heights Program would increase the number of inpatient beds at Parnassus to address the growing demand for services; allow for expansion of emergency, surgical, interventional radiology, and imaging services; create an environment where teaching, research, and patient care intersect to deliver the

highest level of care and innovation; and provide a world-class hospital to continue providing premier care to patients.

F4E

Office of the President

TO MEMBERS OF THE FINANCE AND CAPITAL STRATEGIES COMMITTEE:

ACTION ITEM – CONSENT

For Meeting of March 18, 2020

PRELIMINARY PLANS FUNDING, MISSION BAY EAST CAMPUS PHASE 2 (BLOCK 34) CLINICAL BUILDING, SAN FRANCISCO CAMPUS

EXECUTIVE SUMMARY

The San Francisco campus proposes to construct a new, approximately 190,000-gross-square-foot clinical building on the East Campus Phase 2 parcel (Block 34) at the Mission Bay campus site. In support of UCSF Health's Strategic Plan to increase its market presence, the proposed clinical building would provide an ambulatory surgery center and adult primary and secondary multi-specialty clinics. Other clinical services are also being evaluated as the campus looks to maximize the opportunity to provide clinical space adjacent to like-disciplined clinical and research programs.

The Regents are being asked to approve preliminary plans funding in the amount of $25.5 million to be funded with hospital reserves. The proposed funding would allow the campus to engage with an executive architect and construction professional to refine program and scope, complete environmental analysis, and advance the proposed project through design development. Approval of full budget, external financing, and design following action pursuant to the California Environmental Quality Act would be requested for the project at a future meeting, anticipated for 2021. A separate item for approval of preliminary plans and working drawings funding for the parking garage to be constructed on the Block 34 site also is being proposed at this meeting.

RECOMMENDATION

The President of the University recommends that the Finance and Capital Strategies Committee recommend to the Regents that the 2019-20 Budget for Capital Improvements and the Capital Improvement Program be amended to include the following project:

> San Francisco: Mission Bay East Campus Phase 2 Clinical Building – preliminary plans – $25.5 million funded from hospital reserves.

BACKGROUND

UCSF Health's Strategic Plan, Vision 2025, calls for it to fulfill the health system's unique role in its broader network as the Bay Area's leading complex care provider and destination for tertiary and quaternary care. Specifically, the plan calls for the health system to increase its market share from 11 percent to 16 percent over the next five years. Further growth is limited by both ambulatory and inpatient capacity. The proposed clinical building would allow UCSF to create capacity in an ambulatory setting for both primary and specialty care as well as ambulatory surgery, and this would subsequently free up capacity in UCSF's inpatient facilities.

The development of the Mission Bay campus site has been critical to the success of UCSF's academic and clinical programs. The campus has identified key strategies for projects at Mission Bay and the proposed clinical building and parking garage would be essential to advancing UCSF's strategy to grow outpatient clinical programs and support the adult hospital services and cancer services.

Project Drivers for the Clinical Building

Provide an Ambulatory Surgery Center (ASC)
The capacity of the operating rooms at Mission Bay and Parnassus Heights cannot meet the demand from both inpatient and outpatient surgical services. Outpatient surgical volume has grown at a rate of 7.5 percent per year over the last five years and continued growth is expected. A new ASC at Mission Bay would increase capacity for inpatient surgical services at Parnassus Heights and the Mission Bay Hospital by directing outpatient surgical services to the ASC. Additionally, locating an ASC at Mission Bay would provide consolidation of cancer services at a single facility.

Expand Access to Adult Primary and Secondary Multi-Specialty Clinics
Additional clinic space is needed to address unmet demand across primary care specialties and to meet long-term population health goals. UCSF's faculty practice and ambulatory services have grown between seven percent and 12 percent for the last five years; current new patient referrals far exceed existing capacity. Within the next 24 months, examination room utilization will rise above industry benchmarks and limit ability to serve more patients.

New clinics would support inpatient adult care being provided at Mission Bay. Also, the creation of an adult urgent care clinic would provide services that are lacking in the area and support the Mission Bay Hospital's emergency room by allowing it to direct adult patients to the urgent care clinic. The urgent care clinic will also support cancer services by providing much-needed capacity for the urgent care needs of cancer patients.

PROJECT DESCRIPTION

This project proposes construction of an approximately 190,000-gross-square-foot[1] (gsf) clinical building. Initial programming elements include:

- Ambulatory Surgery Center (approximately 39,000 gsf) – ten operating rooms, two procedure rooms, and 34 recovery bays.

- Clinics (approximately 52,000 gsf) – adult primary and secondary multi-specialty clinics.

- Approximately 99,000 gsf of space has not been programmed yet and is currently designated as additional clinical services, office and administrative support space, and space for future expansion.

The space program would be refined through detailed programming and early design efforts. The East Campus Phase 2 (Block 34) site is one of the last opportunities for construction of clinical space at the Mission Bay campus, with the exception of the Mission Bay Hospital Phase 2 site. Therefore, UCSF proposes to design and construct a building that maximizes its entitlement for the site and the opportunity to provide clinical space adjacent to like-disciplined clinical and research programs. The campus evaluated the process that would be required to seek an increase in the amount of space that could be developed on the site and determined not to pursue an entitlement increase at this time. Authority to make the change is not solely within UCSF's lead agency control and would require negotiations with the City of San Francisco and the Office of Community Investment and Infrastructure (the successor agency to the San Francisco Redevelopment Agency), a complicated process that could significantly delay construction of the building. Opportunities for designing the building for future expansion are being explored within the design phase, in case it becomes possible to increase the entitlement for the site in the future.

Project Site

The proposed clinical building would be located on the UCSF Mission Bay East Campus (which contains both Blocks 33 and 34). The 3.8-acre East Campus is bounded by Third Street to the west, 16th Street to the north, Illinois Street to the east and Mariposa Street to the south. Under the 2014 Long Range Development Plan, the East Campus was projected to accommodate 500,000 gross square feet of development in two buildings and 500 structured parking spaces. The approved Wayne and Gladys Valley Center for Vision and Valley Tower building is currently under construction on the northern portion of the site. The proposed clinical building and the parking garage would be located on the southern portion.

Project Delivery

[1] Total buildable area is limited by the terms the agreement established at the acquisition of this parcel. The 190,000-gsf entitlement would include any programmable space designed into the separate Parking Garage project being presented at this meeting.

The projects would be delivered using the Construction Manager at Risk form of Integrated Project Delivery (IPD) model, emphasizing the same principles used to achieve the successful results of the UCSF Medical Center at Mission Bay project and the Precision Cancer Medical Building project. The design would be performed by an integrated team including UCSF, the architect, contractor, and key subcontractors working collaboratively on site in a "big room" environment to optimize project quality within a cost target set by UCSF. The IPD process optimizes the use of Lean tools, processes, and 3-D modeling. In addition to minimizing risk, the IPD method provides the greatest control over design, quality, and managing patient, staff, visitor, and community requests.

UCSF plans to use the same integrated team for design and construction of both the clinical building and the parking garage and to bid the projects as a single contract to take advantage of economies of scale and efficiencies related to having one contractor on site.

Financial Feasibility

The preliminary plans funding is $25.5 million and will be funded from hospital reserves. As of June 30, 2019, the San Francisco medical center has a 5.7 percent operating margin, 9.8x debt service coverage, and 96 days' cash on hand (metrics exclude the non-cash portion of Pension and Other Post-Employment Benefits). Over a ten-year projection period, days' cash on hand is projected to be to be greater than or equal to 60 days, which meets the requirements of the University's Debt Policy.

Approval Request and Project Schedule

The campus presented the proposed project to the Health Services Committee at its December 2019 meeting. The project was included on the January 2020 agenda as an information item for the Finance and Capital Strategies Committee.

Preliminary plans funding of $25.5 million would enable UCSF to refine and confirm the scope of work, refine the budget, complete the environmental analyses, and advance the project through design development. Approval of budget, external financing, and design following action pursuant to the California Environmental Quality Act is planned for 2021. Following these approvals, it is estimated that construction would commence in fall 2021 with the first patient targeted for 2023-24. (Attachment 3 includes a timeline for both the clinical building and the parking garage.)

ATTACHMENTS

Attachment 1:	Preliminary Plans Budget
Attachment 2:	Project Site Maps
Attachment 3:	Project Timeline for Clinical Building and Parking Garage

ATTACHMENT 1

MISSION BAY EAST CAMPUS PHASE 2 CLINICAL BUILDING
PRELIMINARY PLANS BUDGET

Category	**Total**	**% of Total**
Building [1]	$7,800,000	30.6%
A/E Fees [2]	$13,200,000	51.8%
Campus Administration [3]	$3,000,000	11.7%
Surveys, Tests, Plans [4]	$300,000	1.2%
Special Items [5]	$1,200,000	4.7%
Total	**$25,500,000**	100.0%

Although not a hospital project, the proposed clinical building has a complex program that includes ambulatory surgery. The Integrated Project Delivery model requires early involvement of the General Contractor and Design-Assist/Design-Build Subcontractors at the preliminary design phase for coordination that reduces the risk during construction for cost overruns and schedule delays (pre-construction services). The A/E consultants work collaboratively with these subs providing pre-construction services during the preliminary plans and working drawings phases and this enhanced effort in this process is reflected in the budget.

[1] Building construction includes General Contractor and trades pre-construction design assist services, Facilities Management consulting, lease of existing Integrated Construction and Design Center trailer at Mission Bay)
[2] A/E Fees include the executive architect / engineer's basic services contract fee.
[3] Campus Administration includes: project management and contract administration.
[4] Surveys, Tests, Plans include: hazardous materials survey and testing.
[5] Special Items include: pre-design studies, specialty consultants, environmental review, and CEQA approval.

DEVELOPMENT AGREEMENT

Prepared: June 2010

Development Agreements are negotiated contracts between a project proponent/applicant and the City. A Development Agreement is typically sought to ensure that local regulations pertaining to the project will not change over time. In exchange, local governments negotiate an acceptable "community benefit package."

On June 15, 2009, Stanford submitted a Development Agreement proposal to the City. The City prepared a counter proposal and will continue to negotiate the terms with Stanford. The Development Agreement cannot be approved until after certification of the Final Environmental Impact Report.

Previous City Council Meetings for Discussion of Community Benefits and Development Agreement:

November 26, 2007

March 14, 2009

March 30, 2009

December 7, 2009

April 6, 2010

Reports for these meetings can be found on the SUMC Project website, www.cityofpaloalto.org/sumc

THE SUMC PROJECT SPONSORS (STANFORD) HAVE PROPOSED THE FOLLOWING DEAL TERMS:

- Establishment of two new programs for the exclusive benefit of Palo Alto residents: a $3 million fund to assist qualified low-income residents and a $4 million fund to subsidize community health programs within Palo Alto.
- Construction spending and associated use taxes of $8.3 million and provisions to obtain a use tax direct payment permit that will generate approximately $26,000 annually.
- Purchase of Caltrain GO Passes for all SUMC employees at an estimated annual cost of $1.3 million. (Currently only Stanford University employees are provided this benefit.)
- Expansion of the Marguerite shuttle service by purchasing additional shuttles in the amount of $2 million and by funding additional annual operating costs of $450,000.
- Funding a range of improvements to encourage use of transit and enhance pedestrian and bicycle connections between the hospitals and downtown: $2.25 million for pedestrian and bicycle connections around the Intermodal Transit Center; $400,000 for right of way improvements along Quarry Road; and $700,000 for a pedestrian connection between the Medical Center and Shopping Center (Stanford Barn area).
- Payment of housing in-lieu fees in the amount of $23.1 million, which is what an equivalent commercial project would pay.

For more information please go to *www.cityofpaloalto.org/sumc*, or contact Steven Turner at *steven.turner@cityofpaloalto.org*

As part of preliminary negotiations, the City Staff has developed the following guiding principles for discussions:

1. Minimize the Fiscal Impacts to the City.
2. Require Project Mitigation.
3. Preserve Community Health Care.
4. Enhance City Infrastructure.

SUPPLEMENTAL DEVELOPMENT AGREEMENT TERMS PREPARED BY THE CITY ARE AS FOLLOWS:

HEALTH CARE

- Extend financial assistance subsidy to qualifying residents ($3 million) from 10 years to life of Development Agreement.
- Extend community health programs payment ($4 million) from 10 years to life of Development Agreement.
- Continue appropriate hospital privileges for community practitioners.
- Continue SUMC's current community health/wellness/disease prevention programs.
- Fund co-located Emergency Operations Center (EOC) facility in new buildings within Palo Alto.
- Explore innovative health care initiative/partnership in area of broadband/fiber to the premises.

FISCAL

- Ensure project is at least cost neutral by guaranteeing revenue projections to offset expenditures, funding extra public safety Full-time Equivalents (FTE's) and fully funding mitigations.
- Payment to City in lieu of property tax.

TRANSPORTATION

- Explore re-defining TDM program (Caltrain GO Pass) and re-directing funds toward expanded shuttle program and other Citywide infrastructure improvements.

PEDESTRIAN AND BICYCLE LINKAGES BENEFIT

- These items are covered as SUMC Project mitigations and explained in more detail throughout the EIR document.

HOUSING BENEFIT

- The Hospital District would include additional measures to address the impact on the City's jobs to employed resident's ratio, as identified in Section 3.13 Population and Housing in the EIR.

SCHOOL FEES BENEFIT (PALO ALTO UNIFIED SCHOOL DISTRICT - PAUSD)

- Work with the PAUSD and the City to minimize impacts to schools.

ECONOMIC AND COMMUNITY VITALITY

- Contribute $30 million to help fund needed Citywide infrastructure such as a Public Safety Building, EOC, roadways, and expanded shuttle programs.

Appendix I-Robertson

APPENDIX F: 1976 REGENTS' RESOLUTION

"DESIGNATION OF OPEN SPACE RESERVE, ALTERATION OF CAMPUS BOUNDARIES, COMMITMENT OF HOUSES TO RESIDENTIAL USE, AUTHORIZATION TO NEGOTIATE SALE OF PROPERTIES AND COMMITMENT OF TRANSPORTATION STUDIES."

The following recommendations were approved by the Board of Regents on May 21, 1976:

1. That the reserve on Mount Sutro, which was designated as open space for a twenty-five year period by The Regents in October, 1975, be increased from fifty-two to approximately fifty-eight acres, and that the designation be made permanent.

2. That the boundaries of the San Francisco campus be altered to exclude properties on the west side of Third Avenue from 1309-11 Third Avenue to and including 1379 Third Avenue, and that the new boundaries be made permanent. The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent. These restrictions prohibit expansion by UCSF by purchase or condemnation or gift of any property or lease of private residential property not only contiguous with the new campus boundaries, but anywhere within the surrounding area bounded by Golden Gate Park, Oak Street, Ninth Avenue, Clayton and Clarendon. This does not prohibit the use of commercial properties or the affiliation with other public agencies within the area described.

3. That the Regents redefine their commitment, made as part of the October, 1975, approval of the Long Range Development Plan, to return certain existing houses to residential use as alternative campus space and funds for rehabilitation and relocation become available for the activities now housed therein, and that as part of this commitment: The ten houses on Third Avenue, outside the campus boundaries revised as recommended in 2. above, be sold subject to the provisions set forth in 4. below; the thirty-four houses on Third, Fifth, and Parnassus Avenues and on Irving and Kirkham Streets be rehabilitated as required and leased for residential purposes, with priority given to University students, faculty, and staff; and the seven houses on Fourth Avenue remaining after clearance of the site for the School of Dentistry Building project be retained for non-residential campus use.

4. That the Treasurer be authorized to negotiate the sale of the lots and structures, and other improvements thereon, located at 1309-11, 1319, 1325, 1337, 1343, 1355, 1361-63, 1367-69, 1373, and 1379 Third Avenue; the lot between 1355 and 1343 Third Avenue; and the lot between 1309-11 and 1319 Third Avenue, subject to the provisions listed in 4(a) through 4(e) below and that the results of said negotiations be presented to The Regents for final approval and authority to sell based on offers acceptable to The Regents:

    (a) The offer for sale of the two vacant lots shall commence within six months and the offer for sale of all remaining properties shall commence within thirty-six months, except that no relocation of University activities or tenants or conversion of houses for residential uses shall

be initiated until funds for such purpose are on hand as specified in 4(b) below and until space into which activities or tenants can be relocated is available;

(b) A special fund shall be established to fund projects within the Capital Improvement Program for the purpose of, first, providing accommodation for activities displaced by sale of houses, second, providing accommodation for campus activities displaced by conversion of the structures retained for residential use, and, third, converting and rehabilitating the structures retained for residential use, said fund to be funded from proceeds of the sale of the properties, except as noted in 4(c) below, and, if funds are not on hand from the sale of properties, from an advance, as needed, of not to exceed $50,000 from the University Opportunity Fund, such advance to be on a revolving basis and to be repaid with proceeds, as received, from subsequent sale of properties, it being understood that, at the completion of the sale of the properties, any part of the advance not repaid shall be converted to an appropriation;

(c) The portions of the proceeds of the sales of the lots between 1309-11 and 1319, and between 1343 and 1355 Third Avenue, attributable to the eighteen parking spaces currently located thereon, shall be deposited in the Net Revenue Account of the University of California Parking System;

(d) Funds not to exceed $10,000 shall be allocated by the President obtain an appraisal of market value of the properties for use as residences; and

(e) All properties shall be sold in the then existing condition, it being made clear to the buyer that he or she may be required to conform to all applicable State and City and County of San Francisco codes in converting the structures to residential use;

5. That funds not to exceed $25,000 be allocated to the San Francisco campus from the University Opportunity Fund for the purpose of retaining an independent consultant firm to develop additional plans for the alleviation of transportation problems such as traffic, parking congestion, and availability of public transit, it being the intent that such plans be implemented to the extend feasible within resources normally available to the campus for such purposes or within additional State appropriations that might be made available for such purposes;

6. That the Long Range Development Plan for the San Francisco campus, as approved by The Regents in October, 1975, be amended to reflect the described changes in designation of open space, boundaries, and use of housing;

7. That The Regents recognize the principle that the San Francisco campus will be administered so that the annual average of the daily campus population at the Parnassus site will remain substantially in accordance with the projections set forth in the Environmental Impact Report related to the Long Range Development Plan for the campus, approved by The Regents in October 1975.

"BRINGING DNA INTO THE NEIGHBORHOOD" IN SAN FRANCISCO: A PERSONAL RECOLLECTION

Guenter B. Risse

"Not in My Back Yard" wars have existed almost as long as the notion of private property. Community groups respond that they must fight to protect the quality of life because they cannot count on public officials to do it for them.[1]

ABSTRACT

Based primarily on personal experiences, this essay aims to illustrate the troublesome relationship between the University of California, San Francisco, and its adjoining neighborhoods from the 1960s to the present. Like other University of California campuses, UCSF was not required to conform to local land uses and zoning laws. Only its periodic and mandatory Long Range Development Plans provided clues about future research initiatives and expansion plans. The story, punctuated by indifference to neighborhood concerns, depicts the protracted legal wrangling between a world-renowned medical institution and local civic organizations fearful of its impact on the environment, residential life, and real estate. The featured focus of these disputes centered around UCSF's hasty purchase in 1984 of a large facility located in the Laurel Heights neighborhood of San Francisco to alleviate crowding at the main campus on Parnassus Heights. Confusion, misunderstanding, and outright distrust concerning UCSF's planning for the new research location ensued. In fact, fear of potential chemical emissions and radioactive contamination prompted stiff local resistance. Eventually, after a decade of litigation, the protracted case forced UCSF to redefine and restrict its mission at Laurel Heights. The essay argues that the Medical Center's subsequent leadership learned an important lesson from this costly lawsuit. In its subsequent efforts to expand locally, UCSF created mechanisms designed to prevent opposition and litigation by systematically engaging with San Francisco communities and their leaders. By the early 21st century, such partnerships and alliances paved the way for a successful institutional expansion, thus consolidating UCSF's role as a leader in biomedical research, teaching and practice.

When I arrived in mid 1985 to assume the chairmanship of the History of Health Sciences Department, institutional space at the University of California,

[1] Allyn Stone, "How Citizens Resist Planners-How Neighborhoods Resist Bay Area Planners," *SF Chron*, Nov 17, 1987.

San Francisco (UCSF) was at a very high premium. Our small unit consisted of just five small rooms located on the fourth floor of the UC Hospital, a building completed in 1917 and eventually converted into offices, laboratories and clinics. Now seismically unsafe, it had already been twice slated for closure and eventual demolition. Large warning signs with recommended escape routes placed near the elevators confirmed the potentially hazardous conditions of my future workplace. But we were not alone. To the dismay of local fire marshals, laboratory equipment and bulky refrigerators crowded the hallways. People wandered along the corridors searching for empty spaces in offices, bathrooms, and even hidden closets, ready to pounce and claim them for their program or department. Adjacent to our departmental offices, a communal classroom used for meetings and seminars was slated for other purposes. According to my new colleagues, the space problem appeared to be intractable, yet I knew that UCSF was California's most prominent medical center, an institution with a worldwide reputation for cutting edge biomedical research. What was going on?

Background

Originally a proprietary medical school founded in 1864 without clinical facilities, the institution had been bequeathed to the University of California in 1872, expanding after its relocation to donated land on the north face of Mt Sutro near Golden Gate Park and a few miles from the Pacific Ocean.[2] Its meteoric rise towards a world-class medical Goliath began in the 1960s with the return of basic medical science departments from the UC Berkeley campus. This transfer allowed for a generous infusion of federal grant monies, and after arrival of the jet-age it facilitated bicoastal academic interactions and research collaborations.[3] In truth, UCSF became a successful brand in the 1970s; incoming academics were told that their appointments constituted a license to compete and "hunt" for outside resources. The consequences of such rapid growth were visually obvious: hugging the northern slope of Mount Sutro was an awkwardly laid out building complex called "Parnassus Heights."[4]

---

[2] Sutro's intended to use the site not only for the colleges of medicine, dentistry, pharmacy, veterinary medicine and law, but to build his own private library. Sutro's donation was not only the result of Beverly Cole's tactful persuasion, but is also an expression of gratitude for the successful medical education that his daughter had received at the UC Medical Department.

[3] For details, see *A History of UCSF*, http://www.ucsf.edu

[4] The designation originated with Adolph Sutro,(1830-1898) who adopted the ancient Greek meaning of Mt Parnassus as the home for literature and learning, planning to place his extensive private library at this site. Sutro was an engineer and "king" of the Comstock silver mine in Nevada before coming to San Francisco and purchasing thousands of acres west of Twin Peaks, including Mt. Parnassus, later named after him. He also was Mayor of San Francisco

The UCSF campus was located in the Sunset district, between the Inner Sunset, a "micro neighborhood" of shops and eateries, student housing and private dwellings to the west, and a southeastern upscale residential area, Parnassus Heights. By 1964, the hospitals and clinics formed a solid line of Manhattan style high-rise buildings, towering over the surrounding urban landscape like a symbol of medical power, arrogance and indifference. Deflecting the stiff ocean breezes, the structures created a bracing wind tunnel that greeted patients and staff circulating between the facilities. Historically known as "outside lands," the Sunset consisted of leveled and scrubby sand dunes, tamed with additional vegetation and divided by a rectangular urban grid of streets. Populated mostly with row houses after the 1906 earthquake, the partially gentrified and eternally foggy area featured a multiethnic middle class population.

After the initial shock of coming to terms with our restricted and dangerous academic space in the old University Hospital, an explanation for the congestion and marauding faculty sprees was not hard to obtain. All University of California campuses were required to issue periodic Long Range Development Plans (LRDP) for approval by the full Board of Regents. These official documents, designed for public comment and endorsement, provided a general land use plan based on future academic goals and administrative needs. The first plan, produced during Chancellor John B. C. M. Saunders tenure in the early 1960s, envisioned the purchase of several residential city blocks extending to the southeastern edge of Golden Gate Park. Destruction of private homes for a large parking garage and conversion of several houses into additional offices and clinics were part of the plan.[5]

As the news about the planned expansion reached the community, local groups like the Inner Sunset Action Committee and the Mt. Sutro Defense Committees staged NIMBY protests, vowing to protect real estate values and residential quality. As other state institutions, University of California campuses were not requested to conform to local land uses and zoning laws. Furthermore, their non-profit, tax-exempt status was often perceived as an unfair burden instead of an asset to nearby communities. Any potential development initiated by such a powerful neighbor immediately elicited

---

between 1895-97 and donated 13 acres of land for the construction of the Affiliated Colleges of Medicine and Pharmacy (later UCSF) in July 1895.

[5] John B. de C.M. Saunders (1903-1991) was both Dean of the Medical School and Chancellor from 1956 to 1963. He presided over one of the institution's most critical development phases. See *A History of UCSF*, 1959-1989 Modernization and the Expansion of Scientific and Clinical Training, Updates to Campus Buildings, http://library.ucsf.edu/1959

apprehension, fostered suspicions and nurtured distrust.[6] Decades later, when considering the barriers to neighborhood involvement, the university freely admitted "biomedical research culture overshadows and depreciates the valuing of community engagement."[7]

By the early 1970s, institutional planning in the state became more complicated. Statutes from California's Environmental Act of 1970 now required environmental impact reports (EIR) for the erection of larger structures. UCSF planners responded with a revised LRDP announcing additional hospital remodeling and construction projects. Further down the hill, several houses gave way to a large, multistory parking garage. Alarmed, the neighborhood organizations expressed strong opposition, fearing additional "stealth" acquisitions through the use of eminent domain and private purchase.[8] Consequently, the Mt. Sutro Defense Committee in October 1974 initiated litigation against the UC Regents and the current UCSF Chancellor, Francis A. Sooy. [9] This neighborhood organization and the Inner Sunset Action Committee claimed that the university's current EIR failed to comply with the new mandates contained in the California Environmental Quality Act.[10]

San Francisco's Superior County and City Court heard the case in December 1975. This body ruled that all further construction be stopped until the university made further changes to their EIR. A state legislative threat to withhold funding for the entire University of California emerged. UCSF responded promptly, drafting an amended LRDP in April 1976. With inpatient services vacated, the old UC Hospital would be demolished, allowing the return of "visual connections" to the hill and forest behind the medical center. Moreover, the university agreed to restore a number of its purchased houses for residential use. A terraced landscaped plaza looking towards the neighborhood

[9] In 1964, during the tenure of Francis A. Sooy (1915-1986), the Regents of the University of California awarded the campus administrative and financial independence. In 1970, The University of California San Francisco Medical Center was officially renamed UCSF.

[10] Inner Sunset Action Committee (ISAC), Institutional Expansion Element, Mt. Sutro Community Master Plan, Jan, 1975.

would soften the transition between the medical and residential zones.[11] After the plan found favor with the court, a ruling in August lifted the injunction. To prevent recurrent legal challenges, the UC Regents went further in October, agreeing to a legally-binding moratorium on UCSF's expansions at the Parnassus campus until 1985. A revised LRDP pegged the limits on gross building at 3,55 million square feet with a population of employees not to exceed 13,400. No further leases, purchases, condemnations and even gifted property for the Medical Center would be allowed. In addition, UCSF promised to reconvert all the previously purchased buildings into residential housing. To prevent any subterfuge, the additional 61 acres of mostly eucalyptus forest behind the complex were declared an open public space. The university had purchased this land in the 1950s from the old, much-disputed Sutro estate.[12] The woods hosted a small "aldea" of student housing units as well as the chancellor's mansion, both linked to the campus through a winding road.

Need for Expansion

Stymied in its quest to expand at the Parnassus site because of the 1976 agreement, UCSF had been forced to plan for its future development by adopting a multi-campus model; all additional locations would be sought in other San Francisco neighborhoods and linked by means of shuttle services. By the time of my arrival, the Medical Center campus had rented facilities at Laguna Honda School, Hunter's Point, and as far south near Oyster Point. Some administrative operations were transferred to other city neighborhoods, notably the Mission Center. With faculty pressures intensifying, a new LRDP in 1982 sought to accelerate the forced "balkanization," a source of considerable academic unease and even resistance. Concerned leaders claimed that the "genius of UCSF's success" as a world-class medical center was based on the close proximity of the "best and brightest" researchers and clinicians at the Parnassus site. By unanimous consent, this overcrowded campus would remain the center of all academic operations, secretly enhanced with small and not so subtle breeches of the 1976 accord. In fact, as already noted, the structurally unsafe UC Hospital was converted into laboratories and offices; an adjacent and new terraced School of Dentistry replaced the proposed public plaza in 1980.

---

[11] Amended LRDP, May 1976. Archives and Special Collections, UCSF Library and Center for Knowledge Management.

[12] Details in Lorri Ungaretti, *Stories in the Sand: San Francisco's Sunset District, 1847-1984*, San Francisco: Balangero Bks, 2012.

Marooned in its jammed Parnassus location and despite minor expansions, a world-renowned research and teaching institution such as UCSF could not remain static. Attempts to renegotiate the expiring moratorium with the immediate neighborhood were deemed pointless. With space constraints reaching a crisis point, an opportunity for substantial expansion presented itself in 1984. Two miles north of the campus, in the Laurel Heights neighborhood of San Francisco, the Fireman's Fund Insurance Company was planning to move out of its headquarters, a 354,000 square-foot building. Surrounded by parking lots and ample vegetation, the massive fenced-in structure stood on a 10-acre hilly setting, originally one of the city's fashionable cemeteries removed in 1899. Completely surrounding the site, Laurel Heights had become an upscale residential neighborhood with its own fashionable commercial area organized around California Street, with direct access to the downtown area. Sensing relief, UCSF leaders inquired about leasing space for selective administrative units at the Fireman's building, discovering in the process that the entire complex could be available for purchase. In spite of both logistic and financial caveats—the asking price had ballooned from 35 to 55 million dollars--the Medical Center's academic chairs, guided by current Chancellor Krevans, jumped at the chance, hastily endorsing the acquisition, and the UC Regents purchased the property in December 1984.[13]

At first, the Regents and the Medical Center insisted that there was no need for a new EIR for the Laurel Heights campus since this was merely a relocation of approved Parnassus operations with negligible or no further planned expansions. In his first "get acquainted" session with residents from the neighborhood in February 1985, UCSF's chancellor reassured his audience that the university would use the building for "administrative functions and academic programs." No new hospital would be constructed at the site and some unused portions of the building would be leased to third parties.[14] The crowd seemed reassured and appeared to appreciate UCSF's efforts to become a good neighbor. Perhaps its national and international fame as a biomedical pioneer would enhance local prestige and stabilize the community.[15]

---

[13] Julius Krevans (1924- 2015) was chancellor from 1986 to 1993.

[15] J.L. Pimsleur, "Fireman's Fund Building: UCSF Tries to Soothe Jittery Neighborhood," *SF Chron February* 5, 1986.

Risks and Fears

A year later, however, following my arrival, this positive feeling ebbed. UCSF planners had already decided to move not only administrative offices to the new location but also several basic science research units from the School of Pharmacy. After becoming aware of UCSF's intentions and for legal reasons and public transparency, the UC Regents requested a new environmental impact report before approving the transfer. Thus, UCSF responded by circulating a draft EIR in April 1986. The document contained a detailed description of future wet laboratories with animal facilities to be installed in the Laurel Heights building, together with the use of potentially toxic chemicals, potential carcinogens, and radioactive isotopes, all to be vented from the building through newly installed chimneys.

By June, UCSF sponsored another public hearing intended to stem a growing objection about its plans. "Most of the people I have talked to are bordering on hysteria," commented one resident. The president of the Laurel Heights Neighborhood Improvement Association denounced the Chancellor's previous explanations as lies, calling the inclusion of research laboratories a breach of previous pledges and totally inappropriate for the district, in fact a threat to its quaint residential nature. Others ranted about the potential environmental dangers: the terms "toxic," "radioactive" and "cancer" became rallying code words designed to mobilize an increasingly panicked neighborhood. Someone accused the university for "bringing DNA into the neighborhood."[16] UCSF administrators vainly countered that the institution had ample safety precautions in place for similar laboratories on the Parnassus campus and an excellent track record to prove their effectiveness.[17] No matter, some protesting residents promised to form a human chain around the entire complex to block access for future researchers. Two weeks later, three SF Supervisors joined the chorus of opponents, demanding a delay in the university expansion, but current Mayor Feinstein sided with the university.[18] Taken by surprise by the increasingly negative tone, UCSF representatives promised some mitigation measures and published its final report in June. A month later, the Regents certified the EIR and approved the entire project, including the transfer of laboratories.

[16] David Perlman, "On the Cultural Edge: 125 Years of Medical and Research Breakthroughs at UCSF," SF Chron, Oct 8, 1989. UCSF was also accused of creating the AIDS virus.

[17] Reginald Smith, "Controversy Over UCSF Laboratory Plans," SF Chron Jun 12, 1986.

[18] SF Chron, Jun 28, 1986

.

At this point an editorial in the *SF Chronicle* tried to dissect the widespread public fears of the unknown "involving the mysteries of science, including radioactivity and chemicals of all kinds" considered potential hazards. The newspaper insisted that the research was being conducted by some of the leading scientists in the country under strict controlled conditions with an aim to develop new drugs for the treatment of major diseases such as cancer and heart disease. The paper tried to reassure anxious residents that there would not be any "toxic waste dump."[19] Back at UCSF, the leadership was puzzled and offended by the opposition. Since I was a member of the Dean's Advisory Committee by virtue of my departmental chair position, I heard the refrain at weekly meetings: how could well-educated San Franciscans not understand and respect the basics of scientific research and safe employment of radioactive isotopes?

No matter. In August 1986 the LH Neighborhood Improvement Association filed a lawsuit against UCSF and the UC Regents in San Francisco Superior Court challenging the current EIR, particularly the conditions for operating research laboratories. A temporary restraining order issued by the Court two days later, stopped cold all further UCSF efforts to transfer research facilities to its recently acquired facility. Prominent faculty members, among them two Nobel Prize winners, were dismayed and even outraged by the actions of the Laurel Heights neighborhood. Why would these people distrust their words and good intentions? The Superior Court seemed to agree: it soon denied the LH Neighborhood's request, indicating that the detailed EIR had fully complied with the California Environmental Quality Act.

Legal Battles

Far from admitting defeat, attorneys for the LH neighborhood decided to take their case to the state Court of Appeals. In July 1987, this body overturned the earlier Superior Court ruling, finding that the scope of UCSF's "project" had indeed been inadequately explained in the EIR, particularly regarding the cumulative effects of the laboratory operations to be transferred to the Laurel Height site as well as inadequate mitigation of presumed chemical hazards. Informed of the Appellate Court's decision to strike down the EID, the Regents reacted by requesting in August of that year that the California Supreme Court review the entire case and finally allow the proposed pharmaceutical research at Laurel Heights.[20] At this point, the quarrel had

[19] Editorial, "Nothing to Fear, But…," SF Chron Jun 29, 1986.
[20] *SF Chron* Feb 5 and 9, 1988.

escalated into a bitter contest of wills that featured stubborn leaders on both sides of the divide. The community crusade, led *pro bono* by Kathryn Devincenzi, attorney for the L H Improvement Association, had energized a militant elite from the neighborhood. Opposition to UCSF, an internationally respected academic institution, had become "visceral."[21] On another front, UCSF and the California Department of Health Sciences embarked on a study of the Parnassus neighborhood for any signs of contamination with toxic or radioactive materials. This investigation in June 1988 was mandatory for the renewal of the university's institutional license for the use of such substances in research and medical care, but it now acquired much greater significance in view of the litigation over similar uses at Laurel Heights.[22] Would its findings confirm the prevailing suspicions voiced by Laurel Heights neighbors?

In December 1988, California's Supreme Court agreed with elements of UCSF's revised 1986 EIR, finding that research activities at the Laurel Heights location would not pose undue risks to occupants of the facility as well as the community. Nevertheless, some additional hazards linked to the research operations, especially the use and long term disposal of radioactive materials such isotopes, had not been included. Under such circumstances, the Court ordered both UC Regents and UCSF to prepare a new EIR or consider alternatives uses for the entire facility. In the meantime, the previous ban on laboratory transfers to the Laurel Heights campus remained in place. [23]

Somewhat encouraged, UCSF officials, led by Senior Vice Chancellor Bruce W. Spaulding, began preparing another EIR draft for Laurel Heights in 1989, taking a fresh look at the proposed uses of that facility. In July, the California Health Department reauthorized the use of radioactive isotopes on the Parnassus campus, vindicating the Medical Center's claims of conducting its research safely and without harm to the surrounding neighborhood.[24] UCSF was coincidently celebrating its 125th anniversary, proudly enumerating its cutting edge biomedical accomplishments and their applications to diagnosis and treatment.[25]

[25] David Perlman, "On the Cutting Edge: 125 Years of Medical and Research Breakthroughs at UCSF, *SF Chron*, Oct 8, 1989.

Unfortunately, at 5PM on October 17, the Loma Prieta earthquake shook the entire Bay Area, causing significant damage to several buildings on the Parnassus campus. The temblor found me working in my seismically unsafe office, and as I sat paralyzed on my chair dodging falling books, visions of sailing four stories down to the street prompted an escape through the well-marked exit route. Ironically, the widespread havoc completely exempted the old hospital, proving once again the freakish nature of earthquakes. Yet, the destruction spurred new efforts to persuade the Laurel Heights neighborhood to drop its opposition to the laboratories.

At another contentious public meeting in December, a crowd of nearly 300 people spoke forcefully against the laboratory transfer. More than 700 signed a petitions, demanding that the UC Regents reject any new EIR than included research facilities. This action took place even after the prominent UCSF AIDS researcher, Paul Volberding, sought to impress on opponents the importance of pursuing additional laboratory work for improving the treatment of thousands worldwide suffering from the disease. The faculty member condemned Laurel Heights' bickering about harmless emissions "frivolous" in the face of a ravaging pandemic.[26]

By this time my own impression of the Laurel Heights facility was decidedly negative. Provided with an ample and well-appointed auditorium, UCSF now routinely scheduled meetings and symposia at this venue, giving me opportunities to roam around the rest of this mammoth red brick and tinted glass structure. A veritable maze of long corridors—empty, pastel-colored walls with uniform light brown carpeted floors--sliced through the building, dotted with a myriad of solid, numbered doors that were always closed. Entering such a disorienting, almost Kafkaesque scene, I struggled to imagine how such a spatial arrangement could ever be converted into research laboratories, with all their purposeful clutter, glassware, and animal cages. More importantly, the current staff members working there felt quite isolated and marginalized, seldom leaving the building—it had its own cafeteria—except to climb into shuttles and return to the Parnassus campus. My fervent wish was that some new corporation in search of a prestigious address for its headquarters would make a purchase offer and thus end what was fast becoming UCSF's worst legal nightmare.

Undaunted by the opposition, UCSF' issued a new plan although this EIR retreated from earlier demands for research space, suggesting instead a mix of laboratory (80%) and office –based administrative (20%) space. After another round of public circulation and comment—much of it negative--the draft was

[26] Elaine Herscher, "UCSF Neighbors Oppose AIDS Research Facility," SF Chron, Dec 5, 1989.

finalized and submitted to the Regents for certification in May 1990.[27] Soon, however, the Medical Center was back in SF Superior Court, since the neighborhood association now also challenged the 1990 EIR and wished to block the relocation. This time, however, UCSF emerged triumphant from the lawsuit. In November, the presiding judge ruled in favor of the university. While criticizing its officials for "a regrettable lack of candor" at the first community meeting—the blanket term " academic uses" should have revealed the use of laboratories-- Justice Harry Brauer declared that the university "performs a service for mankind that is of the highest value and great urgency." He rejected the notion of a UCSF conspiracy or deliberate concealment in its dealing with the Laurel Heights community. Moreover, the environmental health risks were minimal; the neighborhood demands were judged to be unreasonable since these contentious laboratories had operated for decades at the Parnassus site without harmful consequences.[28]

Although their challenge had been rejected, the Laurel Heights Association went back to the state Court of Appeals. In May 1992, this Court ordered UCSF to recirculate its EIR for additional review and comment on new studies on air and noise quality. As before, weary UCSF leaders decided once more to appeal the decision to the State Supreme Court for review. In the meantime, part of the building remained unoccupied for fear of a permanent injunction while UCSF, beset with heavy mortgage payments and litigation costs in the millions of dollars, began to waver in its resolve to pursue further litigation. The protracted Laurel Heights fiasco was ill timed: it occurred when all medical centers struggled with the mandates of managed care. The latest EIR had taken 17 months to prepare and cost the university more than a million dollars.[29] Faculty voices suggested an institutional move out of San Francisco.[30] "It often seems easier to pack up and get out of town than it does to endure the nasty, lengthy and expensive struggle to keep operating in a quarrelsome city," commented one newspaper. However, the loss of the LH campus for research would constitute "a serious blow to the city and a serious setback to one of the world's greatest medical centers."[31] Current SF Mayor Frank Jordan

reacted, writing a letter to the UCSF leadership, in which he suggested the possibility of obtaining additional space near the Parnassus campus.

Strategic Retreat

The effects of the protracted legal battles over a white elephant also took their toll on the Medical Center's leadership. Chancellor Krevans who had stubbornly fought to defend what he considered his key achievement, the acquisition of Laurel Heights, retired in May 1993, replaced by the Medical School's dean, Joseph B. Martin. According to Krevans, the space problem was ironically a result of UCSF's success in research and training.[32] Under Martin, the new leadership eagerly sought to find a solution to their lingering space problems and legal battles. Its public image tarnished and threatened by neighbors, UCSF's future in San Francisco was truly in jeopardy.[33] Trapped on the overcrowded Parnassus campus and with no early solution for the space crisis in sight, UCSF's research engines sputtered. "Everybody is depressed by the attitude of the community," explained one prominent departing scientist.[34] Defections of prominent biomedical researchers and their laboratory teams to Stanford and Harvard cost the University millions in lost grant money and more in reputation.

Not surprisingly, the Laurel Heights stalemate also severely impacted UCSF's Parnassus campus, where additional projects had come to fruition in anticipation of the planned removal of School of Pharmacy laboratories. Following the completion of a new library—long in planning and formally dedicated in March 1991—and a vision center, the Parnassus campus came to exceed the agreed 1976 spatial parameters by 140,000 square feet, a breach that invited further legal skirmishes with the Sunset neighborhood. In fact, Mayor Jordan's space recommendation for 200,000 additional square feet had already set off alarm bells with the Haight Ashbury Neighborhood Council, threatening the uneasy truce negotiated in 1976. Nearby residents decried UCSF's traditional lack of good faith and its "purposeful effort to mislead the public."[35]

[35] Sabin Russell, "UCSF Admits it Exceeded Agreement on Size," SF Chron, Sep 15, 1992.

In December 1993, the California Supreme Court ruled in favor of UCSF but the victory was hallow: the case was once more returned to the Court of Appeals for further disposition regarding the adequacy of the EIR. It was essential for the Medical Center to stop the legal wrangling and move on. The objectionable 1990 EIR was therefore withdrawn. Working with a community advisory group. Martin and his associates began drafting a new EIR for Laurel Heights in 1995 that differed substantially from previous plans.[36] Since the use of research laboratories and their potentially harmful effluvia had been at the core of the protracted legal dispute, the new document sought to exclude them completely, pledging to utilize the entire Laurel Heights space solely for administration and office-based instruction and research: "UCSF is committed to developing a plan that benefits the campus and is compatible with the Laurel Heights neighborhood," read the document.[37]

Prominently among the "anchor programs" were the Institute for Health and Aging and Institute for Health Policy Studies, a proposed Center for Social and Behavioral Sciences, supplemented with graduate programs in health psychology and medical anthropology previously housed in the Laguna Honda School. Together, they would occupy half of the building, with another 37% earmarked for administration. Full occupancy of the building would occur by 2000. The retreat had its intended effect: the new EIR was not challenged by the Laurel Heights Improvement Association and thus incorporated into UCSF's 1996 LRDP. The document also reiterated that the Medical Center "has no plans to expand the Laurel Heights building beyond the existing envelope or acquire additional buildings in the surrounding neighborhood," an oblique reference to the earlier wars at the Parnassus site.[38]

Unfortunately, UCSF's peace with the Laurel Heights community eventually claimed one academic victim: the Department of the History of Health Sciences. It origins went back to 1927, second in the nation, established to convey to UC Regents that its humanizing role would sufficiently enrich the Parnassus campus and thus prevent its removal across the Bay to Berkeley. Pivoting from inspirational handmaiden to thoughtful critic, medical history sought to offer context and reemphasize the humanity of the patient-physician

relationship.[39] To fulfill UCSF's 1996 LRDP, this unit was incorporated with previous programs in medical anthropology and social medicine to create a single composite, interdisciplinary entity. Consequently, the former academic unit was forced to relinquish its small perch in the UC Hospital at the Parnassus campus and move to the Laurel Heights site in 1999, far from its own "laboratory," the Archives and Special Collections at new UCSF Library and Center of Knowledge Management at the Parnassus site. As the only representative of the humanities, its exile to Laurel Heights meant losing direct contact with medical students and clinical faculty, while forcing faculty members to use shuttles for carrying out research at the Parnassus campus library. I spent my last year in UCSF's "Siberia," feeling just as marginalized and isolated as the administration staff that had first occupied the monumental facility.

While UCSF was winding down its long legal war with the Laurel Heights Improvement Association, the 1996 LRDP also argued emphatically for "decompression," defined as "relieving existing overcrowded conditions through the provision of additional space." The current need was estimated to be at least 2.65 million square feet to supplement the main Parnassus and Laurel Heights campuses. In 1987 Chancellor Krevans' Faculty Committee on the Future of UCSF had already advocated for the acquisition of a 50-100 acre parcel of land elsewhere, but the distractions of the Laurel Heights litigation had postponed such plans. Now, in 1993, convened by Chancellor Martin, a new faculty and administrative body, the Planning Committee for the 21st Century, went to work on this project. With lessons from the Laurel Heights debacle fresh in their minds, the Committee decided to include the community in its selection of a new campus.

For this purpose, UCSF first held numerous town hall meetings around San Francisco during the winter and spring of 1993-94 to gather suggestions for possible sites. In turn, the institution's Community Advisory group contacted thirty-five neighborhood, labor, ethnic, and business leaders interested in UCSF's expansion plans to provide criteria for selecting new campus sites and evaluating the draft LRDP for the next4-6 years. Additional workshops in eight different locations around the Bay Area followed. A special issue of *UCSF Newsbreak* explained the university's needs and requested comments and suggestions from its readers. A pamphlet with information about the Medical Center titled "To Our Neighbors" was distributed to 170,000 San Francisco households. In the end, three locations made the final list: two of them, in Brisbane and Alameda, were developing business parks eager to attract a

prestigious academic institution wishing to translate laboratory discoveries into next generation therapies while bolstering their prestige and bottom line.[40]

Promised Land

The third site for a future UCSF campus was located in the heart of the city of San Francisco. Mission Bay was a protected cove south of the Bay Bridge and the China Basin channel. Originally a San Francisco Bay salt marsh, the site—around 300 acres--had been gradually filled by the tides. Dock pilings and causeways as well as debris from razed buildings, including those destroyed during the 1906 earthquake supplied the rest. Part of these tidelands had been occupied by polluting slaughterhouses—the notorious 19th century local "Butchertown"—as well as shipbuilding, lumber yards and repair shops. Most of the space became a Southern Pacific Railway yard abandoned since the 1970s following the decline of cargo shipping from the local port.[41] Following the merger with the Santa Fe Railway in 1983, Southern Pacific created a separate entity, the Catellus Development Corporation, charged with rehabilitating and developing what locals referred to as an "industrial wasteland." The company, however, was unsuccessful in obtaining city approval for its plans until 1991, but the financial recession delayed any planning for a few more years.

In 1993, however, the developers offered UCSF space for a 20-acre campus sufficient for a hospital, research laboratories, and administrative facilities, keeping the Mission Bay option alive.[42] With new leadership two years later, Catellus and members of the local business community once more approached the Medical Center. A move to areas outside the city would lead to heavy financial losses and jobs in the city. Subsequent negotiations, therefore, involved Senior Vice Chancellor Bruce Spaulding and the current San Francisco mayor, Willie Brown, who had been a legal advisor for Catellus.[43] Most

---

[40] By 1994-95, UCSF estimated that with a budget of 1.13 billion dollars and 25,000 jobs, it contributed 1.2 billion dollars to the Bay Area economy. UCSF, LRDP 1996.

[43] Willie L. Brown (1934-) was one of the most powerful politicians in California. After representing San Francisco for 30 years in the California State Assembly—the last 15 years as Speaker—he became Mayor of the city between 1996-2004.

importantly, the Bay Area Life Sciences Alliance, a group of investment bankers and biotechnology leaders with links to UCSF, pledged its participation.[44]

In 1997, working closely with Mayor Brown and San Francisco's Redevelopment Agency, Catellus offered to donate nearly 30 acres of land at the center of the Mission Bay zone to UCSF. The new campus was intended to be at the center of a future neighborhood. The area would be provided with new streets, high-rise housing, office and laboratory buildings, together with stores facing a revamped San Francisco Bay shoreline doted with parks and walking paths. The City of San Francisco, for its part, granted 13 acres for a right-of-way grid of streets. As planned, the Mission Bay project was considered one of the largest in city history. Contingent upon the successful conclusion of the deal, UCSF agreed to the offer in March 1997. Two months later, the UC Regents accepted the land donation and approved the creation of a Mission Bay campus. Hampered by the subsequent financial depression, progress for Phase 1 of the project slowed in the late 1990s, but by the early years of the 21st century, the campus flourished. Under the leadership of Nobel Laureate Chancellor J. Michael Bishop, Mission Bay evolved into impressive complex of tall glass buildings, featuring several research laboratories and medical offices, with three hospitals and condominium housing in various stages of construction.[45]

In August 2005, a UCSF Task Force on Community Partnerships presented his report to the Executive Vice Chancellor, illustrating the Medical Center's growing civil engagement with the San Francisco's neighborhoods. Over sixty programs involving 28 departments and units on various campuses ranged from research endeavors to clinical training and science education. The current status represented a remarkable evolution over the past decades. The document stressed the importance of linking the "intellectual capital" reflected by the institutional scholarship and expertise with competent and activist local institutions "favorably disposed" to collaborate. A year later, a retrospective admitted, "one of the more important lessons that UCSF has learned over the past decade is to involve the community early on when planning for major construction projects."[46] Fostering a respectful relationship,

facilitating an ongoing dialogue and reaching a compromise to address neighbors; concerns would prevent opposition and litigation. "The expansion at Mission Bay represents a marked improvement over the neighborly disputes that erupted over planning for facilities at its Parnassus and Laurel Heights campuses."[47]

To that effect, the University's Community Advisory Group (CAG) convened two a series of meetings and workshops between March 2007 and January 2008. Those attending were members of San Francisco's Planning Department, as well as representatives from neighborhoods surrounding the Mission Bay campus, notably South of Market, Potrero Hill, Port of San Francisco and Dogpatch. The purpose was to identify emerging issues related to future developments beyond the site. Since its inception, residents in surrounding communities had expressed concerns about the pace and scope of UCSF's decisions concerning additional real estate acquisitions and developments impacting the entire area.[48] To this day the Dogpatch Neighborhood Association continues to be particularly anxious. Located on the waterfront area south of Mission Bay, Dogpatch—named for the wild dogs that once roamed around the area's slaughterhouses in search of food—features a designated historical district with the oldest remaining Victorian cottages in the city undamaged by the earthquake and fire of 1906. Previously industrial, Dogpatch is planning its own gentrification but fears that, like Mission Bay, it will lose its "soul."[49]

Lessons Learned

CAG remains the primary link to the neighborhoods surrounding both the Parnassus and Mission Bay campuses. Its stated mission is to create "a more respectful and healthier model of community engagement" by "fostering a spirit of honest communication, mutual understanding and creative collaboration"[50] Echoes of the former Parnassus neighborhood wars flared up in 2009 when UCSF applied for a grant from FEMA to fell most of the current trees

[47] Appropriately, the chair of the Task Force was the chair of the Department of Family and Community Medicine.

in the Sutro forest, apparently for "safety" reasons. Planted by landowner Adolph Sutro in the 1880s, this site of eucalyptus, cypress and acacias had already been cleared in the 1930s and logged again during WWII. With a thick underbrush cover of ivy, grass, and flaking from 120 feet tall gum eucalyptus trees, the forest possessed all the ingredients for being a dangerous firetrap. Opposition by so-called "Sutro Stewards" was immediate and vocal, prompting university officials to withdraw their application.[51]

Reflecting the new modus operandi, a new draft LRDP for UCSF's Parnassus campus was discussed during two community workshops in October 2012 and February 2013. To address the still festering "credibility gap," announcements were placed in local newspapers, the *Sunset Beacon* with a circulation of 25,000, together with a postcard mailing to some 2,800 residents. In addition, e-mails were sent to the Parnassus and Sutro list servers. Similar information was also included in the Inner Sunset Neighborhood blog and UCSF website. The open meetings were well attended and the University representatives stressed that UCSF would consider "all comments and questions." Although some attendees commented that the meeting was "well intended", others kept bringing up the "same subjects" and "don't understand compromise." Reacting to skepticism, UCSF officials reminded the audience that their institution had faithfully followed the 1976 moratorium and would only exceed the space ceiling by a mere 5% while San Francisco' population had grown by 19%.[52] More importantly, however, while the truce had prevented rampant Medical Center expansion, this understanding also hindered local commercial development. The neighbors' final message was familiar: "don't do anything until the community agrees to your proposals."[53]

A UCSF draft of a new EIR in 2013 included the previous tree-cutting plan, followed by replacement with natural plants. Once more neighborhood hearings in November were tense and contentious. Some pronounced the pristine grove of "old growth" trees; others termed it a unique "temperate cloud" forest. Predictably, many questioned UCSF's intentions: fire reduction was a red herring; "they"—meaning Medical Center officials-- may have ulterior

[53] UCSF LRDP Parnassus, Community Workshop 2, Jan 28, 2013.

motives. Despite all the efforts to reach out to the surrounding communities, the old animosities between UCSF and its neighbors continues to flare up, a testimony to the earlier expressed notion concerning he difficulties in reaching a proper "alignment" with community interests.

A final addendum: in January 2013, UCSF requested proposals for redeveloping the Lauren Heights campus, pledging to withdraw all faculty and employees to its other sites. Their departure promised an eventual sale. Neighbors reacted with a mix of excitement and dread at the prospects of demolishing the existing property and dividing the jinxed acres into regular city blocks for condominiums.[54] At last, decades of distrust and legal controversy appear to be ending, and the Laurel Heights Improvement Association will undoubtedly claim a final victory over one of the most powerful institutions in San Francisco.

[54] Many Laurel Heights residents still fret about living near the former graveyard. There were stories that people working after hours in the Fireman's building heard or encountered restless ghosts rushing through the corridors.

4.2 EXISTING PLANNING AGREEMENTS

There are several existing planning agreements in place that affect and inform this LRDP as it pertains to the Parnassus Heights campus site. These include the *Designation of Open Space Reserve, Alteration of Campus Boundaries, Commitment of Houses to Residential Use, Authorization to Negotiate Sale of Properties and Commitment to Transportation Studies, San Francisco,* also referred to as the *1976 Regents' Resolution,* and agreements made with the community regarding Aldea Housing, described below. (A more general list of references is provided in **Appendix F**.)

4.2.1 THE 1976 REGENTS' RESOLUTION

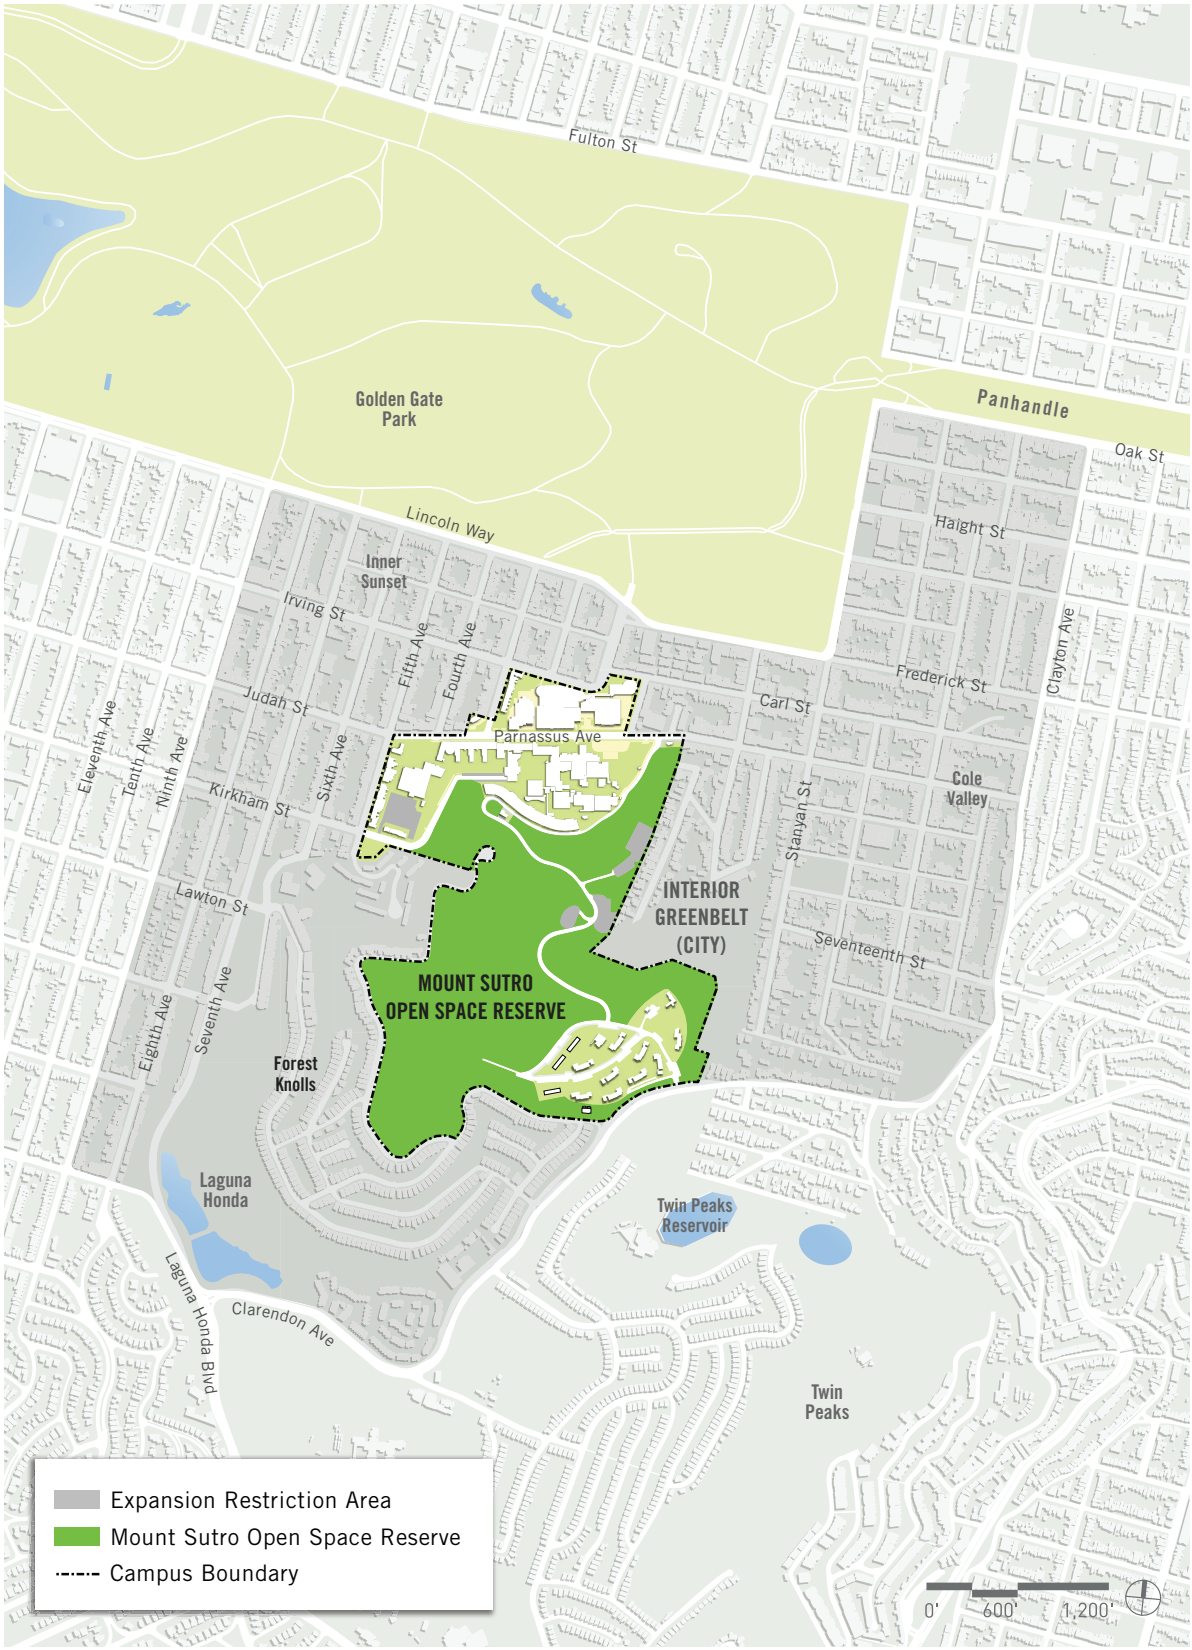
In response to neighborhood concerns about development of the Parnassus Heights campus site, the Board of Regents of the University of California adopted a number of recommendations to limit growth in a resolution adopted in 1976 (*1976 Regents' Resolution*). Elements of these recommendations are described in the matrix below, along with a brief status report.

1976 REGENTS' RESOLUTION: RELEVANT ELEMENTS AND STATUS UPDATES

	Element of Resolution (Paraphrased):	Status (as of 2014):
1.	The Mount Sutro Open Space Reserve to be designated as permanent open space, increased from 52 to 58 acres, and kept free of any permanent structures or facilities except footpaths and appropriate landscape construction intended to enhance its use as a natural area.	UCSF designated 58 acres as permanent open space in the *1976 LRDP* and subsequently increased the size of the Reserve to 61 acres.
2.	The boundaries of the campus site to be altered to exclude properties on the west side of Third Avenue, the new boundaries to be made permanent, and UCSF to be prohibited from physical expansion either by purchase, condemnation, or gift of any property or lease of private residential property anywhere within the surrounding area bounded by Golden Gate Park, Oak Street, Ninth Avenue, Clayton Street, and Clarendon Avenue (**Figure 6**).	As part of the *1976 LRDP*, UCSF altered the campus boundaries accordingly and made them permanent, and has not acquired any property, including residential property, in the restricted area.
3.	The total amount of structured space within the campus boundaries is not to exceed 3.55 million gsf, excluding space committed to residential use on Third, Fourth, Fifth, and Parnassus avenues and Kirkham and Irving streets. (When the *1996 LRDP* was adopted, the amount of space subject to the space ceiling was 3.65 million gsf, about 3.4 percent over the limit.)	UCSF tracks the amount of space subject to the space ceiling of 3.55 million gsf. In the *1976 LRDP* and all subsequent LRDPs, UCSF has proposed to reduce the space ceiling overage by demolishing certain structures over time. While some of these buildings have been demolished, UCSF has also built new space, resulting in a total of 3.845 million gsf [a] and a net overage of approximately 294,800 gsf (or about 8.3 percent) in 2014.
4.	Houses being used as office space on Third, Fifth, and Parnassus avenues and on Irving and Kirkham streets to be converted back to residential use with occupancy priority given to UCSF.	UCSF has completed all of these conversions or demolished the buildings.
5.	Twelve lots with 10 structures located on Third Avenue to be sold, subject to specific timing, funding, and other conditions.	UCSF has sold these properties based on these conditions.
6.	Funds to be allocated to retain a consultant firm to develop additional plans for the alleviation of transportation problems such as traffic, parking congestion, and insufficient availability of public transit.	UCSF coordinated with other transportation entities and implemented a comprehensive plan to address these issues and as of 2014 has one of the best Transportation Demand Management programs in the nation, with only 35 percent of those who commute to and from the campus driving alone.
7.	The annual average daily population of the campus site, including employees, students, patients, and visitors, to remain substantially in accordance with the amount (13,400) projected in the *1976 LRDP* Environmental Impact Report.	In the *1996 LRDP*, UCSF set a new goal of limiting daily population to 16,000. In 2013, the population was estimated at approximately 18,000, exceeding both the *1976 Regents' Resolution* and *1996 LRDP* targets.

[a] Space subject to the Parnassus Heights space ceiling includes some structured parking.

Figure 6: Parnassus Heights Planning Agreements



The 2014 LRDP proposes to update the *1976 Regents' Resolution* and call it the *Regents' Resolution Regarding the Parnassus Heights Campus Site*, as described in Section 4.5.

4.2.2 ALDEA AGREEMENTS

Aldea Housing is located in a wooded area on the southern slope of Mount Sutro. This complex consists of 12 wood-framed buildings, totaling 172 one- and two-bedroom units, largely for UCSF students, but also including postdoctoral scholars, clinical residents, and faculty. Most of the units are for people with families. Unlike other UCSF housing at Parnassus Heights, Aldea Housing is currently counted in the space ceiling imposed by the Regents. The *1996 LRDP* called for replacing the original 14 Aldea Housing buildings, constructed in 1960, with nine new, larger buildings. The new buildings were completed in 1998, and the five remaining original buildings were to be demolished by February 2000.

With the support of the Community Advisory Group (the CAG) and Parnassus Heights neighbors, these five original buildings were occupied for an additional five years until 2005, when new UCSF housing at Mission Bay became available to compensate for the loss of units at Aldea Housing. (This agreement was formalized in a letter from Chancellor Bishop to the CAG in January, 2000.) However, despite the additional housing at Mission Bay, the demand from UCSF populations for affordable housing still far exceeded the available supply in the City. UCSF worked with CAG members and other neighbors to gain consensus on a plan to renovate three of the buildings to include 42 junior one-bedroom apartments, and to demolish the other two buildings. A March 2009 letter of agreement established a 15-year period, through 2024, for the continuing occupation of these three buildings, giving UCSF time to identify additional opportunities elsewhere for new housing. According to the terms of the agreement, UCSF demolished the two Aldea Housing buildings in 2009 and constructed a 2,800-square-foot community center on one of the building pads. In addition, UCSF agreed to return the other empty building pad to the Mount Sutro Open Space Reserve; it is now the site of a plant nursery for the Reserve.

UCSF is aware of the current housing crisis in the City and the need to provide incentives for both the creation and retention of housing units. In light of the scarcity of affordable housing options, UCSF now proposes to retain these three buildings and continue using them as housing to help meet UCSF's housing goals. The 2014 LRDP proposes to amend the Aldea agreements to reflect this change, as described in Section 4.6. The LRDP does not propose to increase the amount of Aldea Housing beyond what already exists.

4.3 PARNASSUS HEIGHTS SITE-SPECIFIC OBJECTIVES

Under the LRDP, Parnassus Heights is to remain UCSF's home for classroom instruction, the four Schools, adult inpatient facilities, a variety of outpatient clinics, research, housing, and support. However, as called for in the *1976 Regents' Resolution* and *1996 LRDP*, the decompression of space at Parnassus Heights is proposed to continue through the periodic demolition of buildings and the relocation to other sites of programs that are not essential to this campus site. New construction would be limited to the need to comply with state seismic legislation and to better meet campus housing goals. UCSF plans to continue to make efforts to reduce its transportation-related impacts on the neighborhood, and Parnassus Avenue is the focus of proposed streetscape improvements to enhance the quality of campus life and the public realm.

Site-specific objectives for the Parnassus Heights campus site are:

A. Continue to promote excellence and leadership in health science education, maintaining the Parnassus Heights campus site as the central location for classroom instruction.
B. Ensure that adequate space is provided to foster collaboration and to facilitate interdependence and connectivity for the operational efficiency and effectiveness of instruction, clinical, research, and support uses in close physical proximity to each other.
C. Ensure that Long Hospital and the New Hospital Addition have adequate clinical and administrative support, and are aligned with the education, research, and specialized care programs that remain at this campus site.
D. Provide additional campus housing and improve campus life amenities, including outdoor space.
E. Strive to better achieve the remaining unfulfilled components of the *1976 Regents' Resolution* by reducing space, minimizing population growth, and improving transportation-related programs.
F. Preserve the Mount Sutro Open Space Reserve as permanent open space, and serve as the steward of the Reserve by maintaining and expanding the trail system and by ensuring the safety of visitors and neighboring structures.

Guenter B. Risse

{{short description|Argentina-born American medical historian]]

Guenter B. Risse (born 28 April 1932) is an American medical historian. He has written numerous books, including his most recent "Driven by Fear: Epidemics and Isolation in San Francisco's House of Pestilence." The American Association for the History of Medicine awarded him the 1988 William H. Welch Medal for his book *Hospital Life in Enlightenment Scotland* and its Lifetime Achievement Award in 2005. He is Professor Emeritus, Department of Anthropology, History and Social Medicine, at the University of California, San Francisco, and currently Affiliate Professor of Bioethics and Humanities at the University of Washington in Seattle.

Education

Risse is a native of Buenos Aires, Argentina, where he obtained his baccalaureate degree from the Colegio Nacional in 1951 prior to gaining admission to the University of Buenos Aires School of Medicine. Following graduation with a magna cum laude M.D. in 1958, he came to the US to complete an internship and training in internal medicine.[1]

In 1962, Risse returned to the classroom, following admission to the University of Chicago. Originally enrolled at the Oriental Institute, he studied ancient Egyptian culture and language under the direction of the distinguished Egyptologist John Wilson. A 1965 plan to participate in an excavation project in Saqqara near the suspected tomb of Imhotep, the ancient god of healing, was not approved by the Egypt Exploration Fund because the dig was restricted to trained archeologists.[2] Such an outcome and shifts in excavation plans following UNESCO's call to save Nubian monuments from the impending flooding caused by the new Aswan Dam, induced him to transfer to the History Department. Here he worked under Professors Allen G. Debus and Lester S. King, obtaining his Ph.D. in 1971. His dissertation dealt with eighteenth-century medical systems, notably the theories of the Scottish physician John Brown and their impact in Germany during the early 1800s.[3]

Career

Risse held academic appointments at the University of Chicago (1963–1967), University of Minnesota (1969–1971), University of Wisconsin–Madison (1972–1985), and University of California San Francisco, and Berkeley, (1985–2001).[4] As chair he developed the Department of the History of Medicine in University of Wisconsin–Madison during the early 1970s. In 1985 he reorganized the Department of the History of Health Sciences in San Francisco. He is a member of the American Association for the History of Medicine, History of Science Society, European Association for the History of Health and Medicine, also holding corresponding memberships in several European and Latin American societies; he was also elected to the now defunct International Academy of Medicine in 1977. A fellowship from the World Health Organization in 1979 allowed him to study the history of Latin America's health care systems. As part of this project, he established close relationships with the Sociedad Mexicana de Historia y Filosofia in the early 1980s.[5] In addition, Risse was a fellow at the Institute for Advanced Studies at the University of Edinburgh in 1986 and the Sir Logan Campbell Distinguished Visitor at the University of Auckland School of Medicine in 1994. He was active in the creation of the European Association for the History of Health and Medicine and co-sponsored the establishment of the International Network for the History of Hospitals. He is also a past president of the American Association for the History of Medicine (1988–1990).
