Chapter 8, Comments and Responses

8.1 Introduction **8.1-1**
8.1.1 Purpose of the Comments and Responses Document 8.1-1
8.1.2 Environmental Review Process 8.1-2
8.1.3 Method of Organization 8.1-3
8.1.4 Draft EIR Recirculation Not Required 8.1-4

8.2 Agencies, Organizations and Individuals Commenting on the Draft EIR **8.2-1**
8.2.1 List of Commenters on the Draft EIR 8.2-2
8.2.1.1 List of Public Agencies Commenting in Writing on the Draft EIR 8.2-2
8.2.1.2 List of Organizations Commenting in Writing on the Draft EIR 8.2-3
8.2.1.3 List of Individuals Commenting in Writing on the Draft EIR 8.2-4
8.2.1.4 List of Individuals Commenting Orally at the Public Hearing on the Draft EIR 8.2-6

8.3 Master Responses **8.3-1**
8.3.1 Introduction 8.3-1
8.3.2 Summary of Master Responses 8.3-1

Page

8.3 Master Responses (continued)

8.3.3 Master Responses 8.3-2
8.3.3.1 Master Response 1: Non-CEQA Comments 8.3-2
8.3.3.2 Master Response 2: General Comments on EIR and Environmental Topics 8.3-3
8.3.3.3 Master Response 3: COVID-19 8.3-3
8.3.3.4 Master Response 4: Space Ceiling and Population 8.3-8
8.3.3.5 Master Response 5: EIR Alternatives 8.3-9
8.3.3.6 Master Response 6: Public Resources Code 21099 8.3-20
8.3.3.7 Master Response 7: Aesthetic Impacts 8.3-23
8.3.3.8 Master Response 8: Wind Impacts 8.3-28
8.3.3.9 Master Response 9: Shadow Impacts 8.3-31
8.3.3.10 Master Response 10: Bird Strikes 8.3-36
8.3.3.11 Master Response 11: Toland Hall Murals 8.3-38
8.3.3.12 Master Response 12: Stormwater, Wastewater, and Water Quality 8.3-39
8.3.3.13 Master Response 13: Land Use Impacts 8.3-44
8.3.3.14 Master Response 14: Population and Housing Impacts 8.3-48
8.3.3.15 Master Response 15: Indirect Displacement and Gentrification Impacts 8.3-53
8.3.3.16 Master Response 16: Transportation Significance Criteria 8.3-56
8.3.3.17 Master Response 17: Mode Share Assumptions & Methodology 8.3-57
8.3.3.18 Master Response 18: Analysis of Parking Impacts 8.3-60
8.3.3.19 Master Response 19: Project Effects (i.e., Population Increase) on Transportation System 8.3-61
8.3.3.20 Master Response 20: Project Effects on Transit 8.3-63
8.3.3.21 Master Response21: Project Effects on Ambulance Delays and Access 8.3-63

8.4 Written and Spoken Comments on the Draft EIR, and Responses to Comments 8.4-1

8.4.1 Introduction 8.4-1
8.4.2 Comments and Responses 8.4-1
8.4.2.1 Draft EIR Comment Letters – Agencies 8.4.1.2-1
Comment Letter A-SFHPC – San Francisco Historic Preservation Commission 8.4.2.1-2
Responses to Comments from San Francisco Historic Preservation Commission 8.4.2.1-4
Comment Letter A-SFP – San Francisco Planning Department 8.4.2.1-6
Responses to Comments from San Francisco Planning Department 8.4.2.1-15
8.4.2.2 Draft EIR Comment Letters – Organizations 8.4.2.2-1
Comment Letter O-LD1 – Lozeau Drury LLP 8.4.2.2-2
Responses to Comments from Lozeau Drury LLP 8.4.2.2-3
Comment Letter O-LD2 – Lozeau Drury LLP 8.4.2.2-4
Responses to Comments from Lozeau Drury LLP 8.4.2.2-141
Comment Letter O-LD3 – Lozeau Drury LLP 8.4.2.2-181
Responses to Comments from Lozeau Drury LLP 8.4.2.2-183
Comment Letter O-TL1 – Law Offices of Thomas N. Lippe, APC 8.4.2.2-184
Responses to Comments from Law Offices of Thomas N. Lippe, APC 8.4.2.2-189

CHAPTER 8
Comments and Responses

8.1 Introduction

8.1.1 Purpose of the Comments and Responses Document

The Comprehensive Parnassus Heights Plan (CPHP) is a conceptual, flexible plan to meet projected space needs for critical programs in research, patient care, and education at the Parnassus Heights campus site while improving the functional and aesthetic design of the campus environment. The Plan also includes planning for development of much-needed on-campus housing. The CPHP includes an Initial Phase that primarily comprises: 1) Irving Street Arrival improvements, 2) Research and Academic Building (RAB), 3) New Hospital, and 4) initial Aldea Housing Densification; as well as certain other Initial Phase improvements. This phase is anticipated to be completed by approximately year 2030. Beyond the Initial Phase, the Future Phase encompasses the remaining development described in the CPHP envisioned for completion by the horizon year of 2050.

Because the CPHP proposes to modify the Parnassus Heights development plan identified in the 2014 LRDP, an amendment of the 2014 Long Range Development Plan (LRDP) is proposed. This amendment would incorporate the CPHP into the 2014 LRDP, replacing the Parnassus Heights chapter of the 2014 LRDP and making other necessary conforming changes.

As required by the California Environmental Quality Act (CEQA), this EIR: (1) assesses the potentially significant direct and indirect environmental impacts, as well as the potentially significant cumulative impacts, associated with implementation of the CPHP; (2) identifies feasible means of avoiding or substantially lessening significant adverse impacts; and (3) evaluates a range of reasonable alternatives to the proposed CPHP, including the required No Project Alternative.

The University of California (University or UC) is the "lead agency" for the environmental review of the CPHP and for the LRDP amendment to incorporate concepts and proposals identified in the CPHP. UC is governed by the Board of Regents of UC (UC Regents), which under Article IX, Section 9, of the California Constitution, has "full powers of organization and government" subject only to very specific areas of legislative control. The UC Regents has the responsibility for certifying this Final EIR, and approving the LRDP amendment.

As described in greater detail under Section 8.1.2, Environmental Review Process, below, UCSF published a Draft EIR on the proposed CPHP on July 13, 2020, and the public review period for

that document ended on September 11, 2020. The Draft EIR, as revised (see consolidated Draft EIR in Volume 1 of this Final EIR), together with this Comments and Responses document (Volume 2 of this Final EIR), and appendices to these documents – see Section 8.1.2.3, below, constitute the Final EIR for the proposed CPHP in fulfillment of requirements of CEQA and consistent with CEQA Guidelines Section 15132. The Final EIR will be considered by decision-makers before deciding whether to approve the proposed LRDP amendment to incorporate the CPHP and reflects the Lead Agency's independent judgment and analysis of the physical impacts of the Project on the environment (CEQA Guidelines, Section 15090).

This Comments and Responses document provides written responses to comments received during the public review period for the Draft EIR. It contains a list of agencies, organizations and persons that commented on the Draft EIR; copies of comments received on the Draft EIR; and written responses to those comments. It also contains revisions to the Draft EIR to clarify or correct information in the Draft EIR. Section 8.1.3, Method of Organization, below, provides a description of the overall contents and organization of this Comments and Responses document.

8.1.2 Environmental Review Process

8.1.2.1 Notice of Preparation and Public Scoping

On January 14, 2020, a Notice of Preparation (NOP), including an Initial Study, was published for the CPHP EIR. A 38-day public comment period ended on February 21, 2020. A copy of the NOP/Initial Study is included in Appendix A, and also in this Final EIR. A scoping meeting was held on February 10, 2020, at Millberry Union on the Parnassus Heights campus site, to accept public input on environmental topics to be analyzed in the EIR and approaches to the impact analyses. Written comments received on the NOP, and a transcript of the scoping meeting, are included in Appendix B in the Draft EIR, and also in this Final EIR.

8.1.2.2 Draft EIR Public Review

On July 13, 2020, UCSF released for public review the Draft EIR on the CPHP. A 60-day public review and comment period on the Draft EIR began on July 13 and closed on September 11, 2020. During the public review period, UCSF received two comment letters from governmental agencies, 20 comments letters from organizations, and 59 comment letters from individuals. UCSF also held a public hearing on August 26, 2020 via Zoom to receive oral comments on the Draft EIR.

8.1.2.3 Final EIR: Consolidated Draft EIR and Comments and Responses Document

This Final EIR consists of two parts (Volumes 1 and 2):

- Volume 1 of this Final EIR is a consolidated Draft EIR that incorporates staff-initiated changes and revisions made in response to comments that were received on the Draft EIR; and includes associated appendices.

- Volume 2 of this Final EIR consists of this Comments and Responses document, as described under Section 8.1.1, above, and Section 8.1.3, below; and includes associated appendices.

The UC Regents will hold a public hearing to consider whether to certify the Final EIR as complying with the requirements of CEQA, and whether to approve the LRDP amendment to incorporate the CPHP. UCSF notify all agencies that submitted comments on the Draft EIR of the availability of the Final EIR at least 10 days prior to the UC Regents meeting on the Final EIR (CEQA Guidelines, Section 15088(b)). Additionally, as a courtesy, UCSF all will notify all others who submitted comments on the Draft EIR of the availability of the Final EIR at least 10 days prior to the UC Regents meeting on the Final EIR.

The UC Regents must certify the Final EIR before deciding whether to approve the LRDP amendment to incorporate the CPHP. Prior to approval of a project for which the EIR identifies significant environmental effects, CEQA requires the adoption of Findings of Fact (CEQA Guidelines, Sections 15091 and 15092). If the Findings of Fact identify significant adverse impacts that cannot be avoided or substantially lessened, the UC Regents must adopt a statement of overriding considerations for those impacts (CEQA Guidelines, Section 15093(b)).

8.1.3 Method of Organization

This Response to Comments Document is organized as follows:

- Chapter 8, *Comments and Responses*, organized as follows
  - Section 8.1, *Introduction*, describes the purpose of the Response to Comments Document, the environmental review process, and the organization of this document.
  - Section 8.2, *Agencies, Organizations and Individuals Commenting on the Draft EIR*, lists all agencies, organizations, and persons that submitted written and/or spoken comments on the Draft EIR during the public review period.
  - Section 8.3, *Master Responses*, contains comprehensive responses on topics that were discussed frequently in public comments on the Draft EIR.
  - Section 8.4, *Written and Spoken Comments on the Draft EIR, and Responses to Comments*, contains all comment letters received, and a copy of the public hearing transcripts held, during the public review period for the Draft EIR, and the UCSF's responses to significant environmental points raised in these letters and the public hearing.
  - Section 8.5, *Revisions to the Draft EIR*, presents changes and revisions to the Draft EIR. UCSF made changes and revisions to the Draft EIR either in response to comments received on the document, or as necessary to clarify statements and conclusions made in the document. None of the changes and revisions in in Section 8.5 substantially affect the analysis or conclusions presented in the Draft EIR.
- Chapter 9, *Mitigation Monitoring and Reporting Program*, presents the Mitigation Monitoring and Reporting Program (MMRP) required under CEQA, which identifies the specific timing and roles and responsibilities for implementation of adopted mitigation measures.

8.1.4 Draft EIR Recirculation Not Required

CEQA Guidelines Section 15088.5 requires Draft EIR recirculation when "significant new information" is added to an EIR because the EIR is changed in a way that deprives the public of a meaningful opportunity to comment on a project's significant environmental effects or feasible mitigation measures or alternatives to reduce or avoid such effects that are not proposed for adoption. The comments, responses, and Draft EIR revisions presented in this document do not constitute such "significant new information;" instead, they clarify, amplify, or make insignificant modifications to the Draft EIR. For example, none of the comments, responses, and Draft EIR revisions disclose new or substantially more severe significant environmental effects of the proposed CPHP, or new feasible mitigation measures or alternatives considerably different than those analyzed in the Draft EIR that would clearly lessen the proposed CPHP's significant effects.

8.2 Agencies, Organizations and Individuals Commenting on the Draft EIR

This Comments and Responses document provides written responses to comments received on the Draft EIR during its public review period (July 13, 2020 through September 11, 2020), including all written comments submitted either by letter or email, and all oral comments presented at the public hearing for this document.

This section lists all agencies, organizations, and individuals ("persons") who submitted comments on the Draft EIR. Persons who submitted written comments are grouped according to whether they represent a public agency, organization, or an individual citizen, as well as persons who provided oral comments at the public hearing.

For each commenter on the Draft EIR, the person's name, agency or organization as applicable, comment format, comment date, and a commenter code are provided. The commenter codes were assigned to facilitate the preparation of responses, and there is a unique commenter code for each comment letter, email, and public hearing transcript based on the name of the agency, organization, or individual submitting the comment. Comments submitted by mail, email, or orally at the public hearing (as transcribed in the official public hearing transcript) are all coded and numbered the same way.

The commenter code for comments on the Draft EIR begins with a prefix indicating whether the commenter represents a public agency (A), an organization (O), an individual (I), or a speaker at the public hearing (PH). This is followed by a hyphen and the acronym of the agency or organization, or the individual's last name. Within each category, commenters are listed in alphabetical order by code.

The commenter codes are used to identify individual comments on separate topics within each comment letter, email, comment card, or public hearing transcript. Each individual comment from each commenter are bracketed and numbered sequentially following the commenter code. The bracketed comments and corresponding comment codes are shown in the margins of the comments. There is a unique comment code for each distinct comment.

8.3 Master Responses

8.3.1 Introduction

This section presents "master responses" addressing a number of similar or recurring topics in the comments received on the Draft EIR. The intent of the master responses is to avoid repetition within this document and improve readability by giving a single, comprehensive response to these comments. Responses to the individual comments that raise these recurring topics refer the reader to the master responses in this chapter.

8.3.2 Summary of Master Responses

- **Master Response 1: Non-CEQA Comments**
- **Master Response 2: General Comments on EIR and Environmental Topics**
- **Master Response 3: COVID-19**
- **Master Response 4: Space Ceiling and Population**
- **Master Response 5: EIR Alternatives**
- **Master Response 6: Public Resources Code Section 21099**
- **Master Response 7: Aesthetic Impacts**
- **Master Response 8: Wind Impacts**
- **Master Response 9: Shadow Impacts**
- **Master Response 10: Bird Strikes**
- **Master Response 11: Toland Hall Murals**
- **Master Response 12: Stormwater, Wastewater, and Water Quality**
- **Master Response 13: Land Use Impacts**
- **Master Response 14: Population and Housing Impacts**
- **Master Response 15: Indirect Displacement and Gentrification Impacts**
- **Master Response 16: Transportation Significance Criteria**
- **Master Response 17 Mode Share Assumptions and Methodology**
- **Master Response 18: Analysis of Parking Impacts**
- **Master Response 19: Project Effects (i.e., Population Increase) on Transportation System**
- **Master Response 20: Project Effects on Transit**
- **Master Response 21: Project Effects on Ambulance Delays and Access**

8.3.3 Master Responses

8.3.3.1 Master Response 1: Non-CEQA Comments

Under CEQA, the lead agency "shall evaluate comments on environmental issues" received from people who have reviewed a draft EIR and prepare written responses that "describe the disposition of each significant environmental issue that is raised by commenters" (Pub. Res. Code Section 21091(d); CEQA Guidelines Section 15088(c)). CEQA does not require that substantive responses be provided for comments that do not address the adequacy or accuracy of the environmental analysis in the Draft EIR or that do not raise a significant environmental issue (Id.).

A number of comments were received on the Draft EIR that did not question the adequacy or accuracy of the environmental analysis or raise a significant environmental issue requiring a response. Examples include but are not limited to:

- ***Opinions on the Project, and other Miscellaneous Opinions:*** Comments were received that express support for, or opposition to, the proposed CPHP, and/or on the perceived merits or demerits of the CPHP. Other comments express opinions and observations, or editorialize on non-environmental issues that are beyond the purview of CEQA and the EIR. These comments do not address the adequacy or accuracy of the environmental analysis in the Draft EIR, or pertain to environmental effects of the proposed CPHP, including the Initial Phase projects.

- ***Socioeconomic Comments:*** A number of comments were received related to socioeconomic issues. As discussed on pages 4.0-4 to 4.0-5 in Section 4.0, Introduction to Environmental Analysis, in the Draft EIR, under CEQA, economic and social effects of a proposed project by themselves are not considered to be significant impacts, and are relevant only insofar as they may serve as a link in a chain of cause and effect that may connect the proposed project with a physical environmental effect, or they may be part of the factors considered in determining the significance of a physical environmental effect. In addition, economic and social factors may be considered in the determination of feasibility of a mitigation measure or an alternative to the proposed project (see CEQA Guidelines Section 15064(e)). As such, the potential effect of the CPHP on economic and social issues, in and of themselves, such as tax revenues, the cost of public services, cost of housing or property values, are not part of this EIR.

- ***Quality of Life Comments:*** Comments were received that increased growth at the Parnassus Heights campus site under the proposed CPHP would have an adverse effect on the quality of life of the local residents and on the character of the community. Potential effects of a proposed project on the quality of life and related conditions, in and of themselves, are not considered environmental impacts under CEQA. See *San Franciscans for Reasonable Growth v. City and County of San Francisco* (1989) 209 Cal.App.3d 1502. Similarly, changes in community character are not environmental effects under CEQA. See *Preserve Poway v. City of Poway*, 245 Cal. App. 4th 560, 575-82 (2016) (changes in community character are not effects under CEQA). CEQA does require that the environmental document evaluate and disclose significant impacts, among others, on transportation, air quality, noise, and public services at the project site and its vicinity. Those effects are fully analyzed and disclosed in the Draft EIR.

UCSF acknowledges the public's concerns about these types of issues. UCSF generally does not provide individual responses to these comments in this Comments and Responses chapter of the

Final EIR. In some cases, UCSF has elected to provide individual responses to certain non-CEQA issues for informational purposes. In all cases, these non-CEQA comments are part of the record on the CPHP, and will be considered by the UC decision-makers as part of the project consideration process.

8.3.3.2 Master Response 2: General Comments on EIR and Environmental Topics

A number of general, unsubstantiated statements were received regarding overall concerns with the Draft EIR, including, but not limited to, potential impacts on various environmental topics, mitigation measures, and alternatives. Due to the lack of specificity in these comments, the responses to these comments are generally incorporated in the responses to specific comments raised on the same general topics.

UCSF acknowledges the receipt of these types of comments. While UCSF generally does not provide individual responses to these comments in this Comments and Responses chapter of the Final EIR, they are part of the record on the CPHP, and will be considered by the UC decision-makers as part of the project consideration process.

8.3.3.3 Master Response 3: COVID-19

Comments raised regarding Coronavirus disease 2019 (COVID-19) addressed a number of topics, including the CEQA baseline used in the Draft EIR to evaluate potential impacts, the need to address impacts of COVID-19 itself, including the pandemic's effect on building design, health care delivery, and overall population density (i.e., the number of residents, students, faculty, staff) in the City and at the Parnassus Heights campus site. Many comments suggested that UCSF should "take a pause" and re-envision the proposed CPHP when more is known about long-term effects of COVID-19 on our society, questioning the need for the CPHP and concluding that the EIR is not "operationally adequate for the next 30 years" (**I-Kushner-3**). These comments are responded to under several topic headings below.

Topic 1: CEQA Baseline

One commenter suggests that the Draft EIR analysis incorrectly relies on a pre-pandemic baseline, pointing out that the Notice of Preparation (NOP) was issued in mid-January 2020, while COVID-19 was first reported in Wuhan, China on December 31, 2019. The commenter suggests that as "a health based organization… [UCSF was] fully aware early on of the implications of the Wuhan outbreak" **(O-LD2-11** and **O-LD2-55**), later suggesting that the EIR baseline either be updated "to reflect conditions Pre-COVID 19 and Post emergence of COVID 19," [emphasis added] or that the project be delayed "until more is known about the COVID crisis" (see **O-LD2-56** and **I-BaldaufH-1**).

While these comments acknowledge that environmental conditions at the time an NOP is issued are generally used as the environmental setting or "baseline" for evaluating potential impacts of a project (CEQA Guidelines Section 15125(a)(1)), they conflate an initial report of COVID-19 in China two weeks before the NOP was issued with a full understanding of likely permanent social

and physical manifestations of the pandemic for UCSF and Parnassus Heights into the future. This is clearly at odds with the CEQA Guidelines, which suggest that projected future conditions may be used as a baseline in lieu of existing conditions only when they are not hypothetical, but are supported by reliable projections, based on substantial evidence in the record (CEQA Guidelines Section 15125(a)(2) and (3)). In this instance, there remains profound uncertainty about ways in which the pandemic will affect human behavior in the long term, as stated on page 1-9 of the EIR:

> The current Coronavirus disease 2019 (COVID-19) pandemic has introduced a substantial amount of uncertainty in human lives. The pandemic has directly affected human behavior, requiring people to shelter in place, implement social distancing, and make other changes to the manner in which they live. Indirectly it has affected the economy resulting in reduced consumer spending, business closures, and widespread unemployment. While some of these trends are considered short-term and are expected to reverse, it is likely that there could be more permanent changes in the ways humans live and behave in the post pandemic world. As with humans, institutions such as UCSF are also expected to make changes to the manner in which they operate. As a result of the pandemic, UCSF will likely consider operational changes such as increases in telework and telehealth services, especially primary and secondary health care services. At the same time, the pandemic has highlighted the importance of biomedical research and advanced tertiary and quaternary health care, along with the need for more doctors and increased and improved inpatient facilities. The net effect of the pandemic on the Parnassus Heights campus site development and operations cannot be predicted at this point in time without speculation.

Suggestions that the EIR should re-evaluate issues based on "reasonable assumptions of a post Covid world" (**I-BaldaufH-1**) run counter to CEQA Guidelines Section 15064(f)(5), which states "speculation…shall not constitute substantial evidence" and cannot support the determination as to whether there are one or more significant impacts. Instead, agencies are directed to note their conclusion when "a particular impact is too speculative for evaluation" and terminate discussion of the impact" (CEQA Guidelines Section 15145). Agencies are also expected to comply with CEQA "at the earliest feasible time" (CEQA Guidelines Section 15004(b)(1)). While recognizing the need for a "balancing of competing factors," the CEQA Guidelines do not anticipate halting the environmental review process until baseline environmental conditions change or stabilize (CEQA Guidelines Section 15004((b)).

For all of the above these reasons, the environmental setting at the time the NOP was issued is appropriately used in the Draft EIR as the baseline from which to evaluate potential impacts of the proposed CPHP and its Initial Phase projects. Even if the EIR were to include, as one commenter suggested (**I-Maerki-7**), preliminary findings of a UCSF committee looking at lessons learned regarding clinical services delivery and workforce strategy based on the institution's experience of COVID-19 thus far, this information would be descriptive and preliminary rather than definitive, and could not be used as the baseline for evaluating impacts under CEQA.

Topic 2: Impacts of COVID-19 and Need for a "Pause" and/or Re-envisioning

Many comments suggest that impacts of COVID-19 such as the "danger and challenges" associated with a centralized hospital system should be included in the EIR (**I-BaldaufH-1**), both because they affect the need for the project and because they have implications for the project's design/components. (See for example, **I-Jacobs-3, I-Leonard-20, O-SUT-8**.)

The same commenters often request that UCSF "pause" its planning process to allow a fuller understanding and consideration of COVID-19 impacts, and "re-envision" the proposed CPHP, including the New Hospital, and evaluate other alternatives (**O-LD2-11 & 55**). One comment describes the pandemic as the "defining event of our generation… [with] far reaching impacts not just on healthcare provision and medical research, but on every aspect of urban planning," and then goes on to say that UCSF "should pause, study and reflect" because COVID-19 has "impaired… [UCSF's] ability to produce a thorough and complete analysis" and undercut the justification for the CPHP (**I-Kessler**). Many similar comments suggest that COVID-19 will lead to permanent changes in health care and building design, including not just increased use of "telehealth" and increased remote working/learning, but also use of separate, smaller facilities rather than "one big hospital." (See **I-Sandler-5, I-Jones-7, I-Zeff-13,** and **I-Lebus-4**.)

A couple of comments address project features other than the New Hospital, for example, suggesting that the design of UC Hall should be studied and potentially retained, saying that its design is "perfect to minimize the spread of infections" and was built when tuberculosis was "raging, and the pandemic of 1918 flu was just around the corner" (**I-Kushner1-4**). Another comment suggests that the pandemic will limit the need for increased housing, eliminating the need to densify Aldea Housing and avoid short term displacement of residents during phase one of that project (**O-SUT-8**).

Several comments also point to process issues, suggesting that an ongoing stakeholder process is a good reason to pause and "discuss an appropriately scaled Project" (**O-LD2-56**) or that COVID-19 affected outreach efforts, limiting people to the internet (**O-86D-3**).

As discussed in Section 4.0, Introduction to Environmental Analysis, in the Draft EIR, CEQA case law is clear that an EIR is intended to identify impacts of a proposed project on the environment, rather than impacts of the environment on a project [*California Building Industry Association v. Bay Area Air Quality Management District (2015)*, 62 Cal.4th 369, 386]. For this reason, suggested "impacts" of COVID-19 are not impacts requiring analysis and disclosure under CEQA, but are offered by the commenters as reasons for UCSF to reconsider the characteristics of the proposed project itself or alter/delay the planning process.

Any proposed project such as the CPHP is under consideration until the CEQA review is complete and the decision-makers (in this case, the Regents) make a decision to approve, disapprove, or modify a proposed project. UCSF's objectives for the CPHP and the need for the proposed project are provided in Sections 3.5 and 3.6 of the EIR, and will be available to the decision-makers, along with the comments questioning their currency in light of the pandemic. Decision-makers will also consider the range of alternatives included in the EIR, including alternatives like Alternative 1B: No Project – Development Under the 2014 LRDP, Alternative 2:

Reduced Project Alternative, and Alternative 4: CPHP with New Hospital – Phased Option, which all include smaller versions of the New Hospital included in the CPHP. And decision-makers will have to decide whether the benefits of the project outweigh the unavoidable adverse environmental effects (CEQA Guidelines Section 15093), a decision that will focus on the impacts and benefits of the project, rather than the impacts of COVID-19, as suggested by one commenter (**I-Leonard-20**).

It's also important to note that the CPHP is a long-term development framework or plan that is likely to build-out over 30 years or longer with various changes and refinements over time. With this expectation, the EIR provides a "program-level" review based on the level of detail available at this time, and only evaluates certain "Initial Phase" projects with "project level" specificity. As noted in the Draft EIR, pages 1-7 and 1-8, the New Hospital will be the subject of a separate, project-specific EIR when more details about its design become available and all future phase projects will be evaluated when sufficient detail is known to determine whether additional environmental review is required, and if so, whether such review would entail an EIR, a Mitigated Negative Declaration or an Addendum. Use of a program-level EIR ensures that the EIR's analysis will be supplemented as needed based on new information about individual projects and the circumstances which exist at the time they move forward. In this way, the EIR will remain valid as a foundation for any further analysis needed as permanent impacts of COVID-19 on our society and environment are experienced and understood, and as modifications to concepts and future projects included in the CPHP are proposed if/as warranted.

Topic 3: Impacts of COVID-19 on EIR Impacts and Mitigation

Certain commenters suggest that COVID-19 has changed impacts and mitigation that are included in the EIR, requiring revisions. For example, comments suggest decreases in transit ridership and increase in auto use warrant re-analysis of transportation impacts and that MUNI's financial crisis could have significant impacts on congestion, VMT, parking, and emissions (**I-BaldaufH-1, I-Craig-6, I-Hanley-3, I-Welborn-1, I-Kushner1-1**). Comments also suggest the need for revisions to construction and operational traffic mitigation as a result of these changes (**I-Craig-6**), noting that parking and transportation issues that are "supposed to be mitigated by MUNI expansion" are unlikely to be addressed with lower transit ridership (**I-Zeff-12**). Issues other than transportation are also raised, including the suggestion that the EIR incorporate revised growth projections (**I-Leonard-9**), and "effects of airborne pollutants on respiratory health in the setting of a virus that targets the lungs" (**I-Kessler-4**).

Most of these comments relate to the CEQA baseline issue discussed in Topic 1, above, since impacts are determined by comparing anticipated conditions after the project is implemented to the pre-project baseline or to a specific threshold and the EIR cannot speculate about a future that includes currently unknown long term consequences of the pandemic, if any. For example, if faculty, staff, patients, and visitors come to the Parnassus Heights campus site at a lower rate in the future because of increased telehealth and telecommuting, transportation impacts in the form of VMT per capita could be lower than presented in the EIR. However, if faculty, staff, patients and visitors access the Parnassus Heights campus site by automobile (rather than transit) at a

higher rate in the future, transportation impacts in the form of VMT per capita could be higher.[1] If travel patterns change in both ways, transportation impacts in the form of VMT could be lower, higher, or the same. It is not possible, nor is it appropriate, for the EIR to conjecture about which of these futures will come to pass and the EIR appropriately considers the potential impacts of the project based on travel demand and mode choices as they were before the pandemic using a pre-pandemic "existing" baseline and as they are projected to be in 2040 using a transportation model (and threshold) that reflects local and regional travel projections developed by the San Francisco County Transportation Authority (SFCTA) and the Metropolitan Planning Commission (MTC).

Just as it is not possible to re-assess transportation impacts based on conjecture about long term effects of COVID-19, it is also not possible to revise growth projections used in the EIR or the evaluation of air pollutant emissions. Nonetheless, as suggested by a commenter, the text of the EIR describing potential health consequences of particulate emissions on page 4.2-4 has been amended; please refer to Section 8.5 of this Comments and Responses document for proposed additions. It should be noted that this information is preliminary and has not resulted in changes to the thresholds of significance for air pollutant emissions established by BAAQMD or related impacts presented in the Draft EIR Section 4.2.3.

While it is not possible to re-evaluate the effectiveness of mitigation based on conjecture about the long term consequences of the pandemic on transit agencies or travel patterns, it is also not necessary to do so because mitigation measures (and related impact conclusions) in the EIR have been drafted to be durable as the CPHP is implemented over time and will be re-evaluated in the future if/as needed (see Draft EIR page 1-7). For example, mitigation measures provided to address air pollutant emissions in Impact AIR-2 include project-level operational measures (CPHP Mitigation Measure AIR-2a) requiring specific improvements such as secure bike parking and preferential parking for carpools and vanpools, or include a performance standard (CPHP Mitigation Measure AIR-2b) specifying the reduction in average daily vehicle trips that UCSF must achieve through a variety of transportation demand management (TDM) program enhancements. Once the mitigation measures are adopted, the actions and performance standard they contain must be implemented/met regardless of changes to travel patterns or transit agency funding, and even with implementation of this mitigation, which collectively represent all feasible measures to reduce criteria pollutant emissions association with project operations, the impact would remain Significant and Unavoidable.

The effectiveness of other mitigation in the EIR is also clearly unrelated to the (currently unknown) future consequences of COVID-19, either because the measures relate to existing physical conditions that will not change as a result of the pandemic (e.g. measures regarding geologic hazards and historic buildings), or because they are structured in such a way to require future/ongoing analysis as implementation of the CPHP occurs over time (e.g. measures to require project-specific health risk analysis and ongoing GHG monitoring and offset purchases).

[1] As shown in Draft EIR Table 4.15-16, existing and projected future VMT per capita are well below the threshold of significance, such that it would take a substantial increase in VMT per capita of over 30 percent for employees and over 60 percent for residents to change the EIR's conclusion that Impact TRANS-2 is less than significant.

8.3.3.4 Master Response 4: Space Ceiling and Population

This master response addresses the issues raised in Comments **O-LD2-2B, O-LD2-4** through **O-LD2-10, O-LD2-54, I-Travis-4, I-Robertson-2, I-Robertson-3, I-Robertson-5, I-Cole-6, I-Goodman-2, I-Goodman-5, I-Goodman-6, I-Goodman-14, I-Kessler-2, I-Kessler-3, I-Jacobs-2, I-Jacobs-8, I-Leonard-2, I-Leonard-6, I-Leonard-14, I-Maerki-5,** and **I-Scatena-3**.

As discussed in Section 3.7.2 of the Project Description, the 1976 Regents' Resolution adopted a limit on the amount of built space at the Parnassus Heights campus site (with some housing excluded), commonly referred to as the "space ceiling," within the newly designated campus site boundaries. The resolution set the space ceiling at 3.55 million gross square feet (gsf). The 2014 LRDP amended the Regents' Resolution to exclude other residential square footage within the campus site from the space ceiling. Currently, the Parnassus Heights campus site contains approximately 3.68 million gsf of space (excluding housing), approximately 128,600 gsf or 3.6 percent above the space ceiling.

The 1976 Regents' Resolution also recognized the principle of limiting the average daily population at the Parnassus Heights campus site to be substantially in accordance with the level projected in the 1976 LRDP, which was estimated to be about 13,400 persons. The 1996 LRDP increased the limit on average daily population to 16,000. The 2014 LRDP amended the Regents' Resolution to tie the average daily population goal for the Parnassus Heights campus site to population projections contained in the most recent LRDP EIR. At the time of adoption of the 2014 LRDP, the average daily population at Parnassus Heights was estimated at approximately 17,950 persons, and projected to increase to about 18,500 by the LRDP horizon year of 2035.

The space ceiling of 3.55 million gsf was first identified in the 1976 Regents' Resolution, now 44 years ago when health care standards were vastly different compared to standards of care today. The reader is referred to Draft EIR section 3.5 Project Need regarding the need for additional space to meet modern standards for clinical, research, and education space; to serve the Bay Area's growing and aging population; and to have flexibility in its facilities to meet health care challenges such as the current COVID-19 pandemic.

Land use planning provisions are not permanent, and are subject to revision to meet the current and projected needs of their communities. In 1976, the Regents directed that the LRDP be amended to include the parameters set forth in the 1976 Regents' Resolution. Per the University of California Facilities Manual, Section 3.1.5, "LRDPs may be amended either for individual building projects or area plans, or it may be totally revised when it becomes out of date."

Aspects of the 1976 Regents' Resolution have been amended in the past. For example, since its inception in 1973 as open space, the acreage and configuration of the UCSF Mount Sutro Open Space Reserve was modified several times, in 1975, 1976, and 2008. Additionally, the average daily population goal for the Parnassus Heights campus site was increased in 1996 and 2014, as referenced above. Also as discussed above, as part of the 2014 LRDP, all residential space was excluded from the space ceiling calculation to help foster the development of campus housing and pave the way for UCSF to improve its job-housing balance, lessen traffic impacts, and enhance campus vitality.

The UC Regents under Article IX, Section 9 of the California Constitution has "full powers of organization and government" subject only to very specific areas of legislative control. As the UC Regents imposed the space ceiling at the Parnassus Heights campus site, it has the full authority to amend it or eliminate it altogether. UCSF is proposing that the Regents amend the 2014 LRDP to incorporate the concepts and proposals of the CPHP, and, relative to the Regents' Resolution, to increase the space ceiling from the current limit of 3.55 million gsf to a proposed 5.05 million gsf and to update the projected average daily population from approximately 18,500 in horizon year 2035 to about 25,300 in horizon year 2050. These actions are fully within the Regents' authority.

As CEQA is concerned with physical impacts on the environment, the issue of the change to the Regents' Resolution and space ceiling are irrelevant to the Draft EIR. The Draft EIR adequately analyzes the potential physical impacts that would result from the proposed CPHP, including those related to the increased space ceiling and higher projected daily population, in the various impact discussions.

Comments **O-LD2-4** through **O-LD2-10** make several assertions regarding the legal nature of the Regents' Resolution, including that the space ceiling is enforceable under the legal doctrines of promissory estoppel and equitable estoppel. These comments do not address the adequacy of the Draft EIR, and therefore no response is necessary. However, these comments are part of the administrative record and will be provided to the decision-makers.

8.3.3.5 Master Response 5: EIR Alternatives

A number of comments focused on the subject of EIR alternatives, including comments that summarized CEQA requirements for providing a reasonable range of alternatives, comments that argued in favor of adoption a particular alternative, and comments suggesting that the Draft EIR improperly rejected alternatives. Many comments provided suggestions and arguments in favor of various project alternatives, focusing mainly on alternatives that would construct the New Hospital off-site (i.e., somewhere other than the Parnassus Heights campus site). These comments are responded to under several topic headings below.

Topic 1: CEQA Requirements for Alternatives; Reasonable Range of Alternatives; Environmentally Superior Alternative

As discussed in Chapter 6, Alternatives, pages 6-1 to 6-2 in the Draft EIR and noted in Comment **O-LD2-12**, CEQA requires that an EIR describe and evaluate a range of reasonable alternatives to the proposed project, or to the location of the proposed project, and evaluate the comparative merits of the alternatives (CEQA Guidelines Section 15126.6(a), (d)). While several commenters suggested that the Draft EIR does not meet CEQA's requirement for a "reasonable range of alternatives" (**O-LD2-75, I-Leonard-10, I-Goodman-23**), this issue is governed by the "rule of reason," which requires the EIR to describe and consider only those alternatives necessary to permit informed public participation, and an informed and reasoned choice by the decision-making body (CEQA Guidelines Section 15126.6(a), (f)). In this instance, the EIR analyzes two "no project" alternatives and three alternatives to the proposed CPHP; it also describes three alternatives that were considered but were not carried forward for analysis for specific reasons.

Specifically, the alternatives that were selected for evaluation in the Draft EIR were:

- Alternative 1: No Project Alternative, consisting of:
  - 1A: No Project - No Development; and
  - 1B: No Project - Development under the 2014 LRDP;
- Alternative 2: Reduced Project;
- Alternative 3: CPHP Including New Hospital – 19-Story Option; and
- Alternative 4: CPHP including New Hospital – Phased Option.

Alternatives considered in the Draft EIR but dismissed from further consideration for reasons explained in Draft EIR Section 6.4 include the following:

- No New Hospital at Parnassus Heights Campus Site / Implement Phase 2 of Medical Center at Mission Bay;
- New Hospital on UC Hall Site; and
- New Hospital at Mount Zion Campus Site.

Two of these alternatives are discussed further below in the context of off-site alternatives.

As the commenters point out, the range of alternatives must, at a minimum, include alternatives that could feasibly attain most of the basic objectives of the project and could avoid or substantially lessen any of the significant effects of the project (CEQA Guidelines Section 15126.6(a)-(c)). Objectives for the Parnassus Heights campus site, the CPHP, and its Initial Phase projects are listed in Section 3.6 and Section 6.2.1 of the Draft EIR and far from being "overly restrictive" (**I-Goodman-23**), appropriately focus on UCSF's goals for the campus site, since the proposed project is a plan for that campus site. The objectives contain such statements as:

- Revitalize the aging Parnassus Heights campus to enhance its place as a premier educational, research, and clinical institution – one that draws in research and clinical faculty, staff, students, and trainees;
- Ensure that adequate space is provided to foster collaboration and to facilitate the interdependence and connectivity for operational efficiency and effectiveness of instruction, clinical, research and support uses in close physical proximity to each other;
- Increase the quantity and improve the quality of research space, to enhance synergies between research and clinical activities at Parnassus Heights for UCSF to maintain its stature as a world-class hub of basic, translational, and clinical research; and
- Develop a new inpatient facility that has sufficient space to accommodate modern regulatory requirements and industry standards of contemporary hospitals, such as construction codes, sizes of operating rooms, ratio of operating rooms to pre- and post-recovery areas, and space for privacy and infection control issues.

Section 3.5 of the Draft EIR also describes the "need" for the project, articulating the reasons that UCSF prepared the proposed CPHP and is pursuing development at Parnassus Heights above and beyond what was included in the 2014 LRDP. These include (1) aging and outdated facilities;

(2) the need for adequate and appropriately designed space for research programs; (3) the need for adequate and appropriately designed space for education programs; (4) the need for adequate and appropriately designed space for clinical programs; (5) the need for co-location of instructional, research, and clinical spaces; (6) the need for affordable on-campus housing; (7) the need for expanded support space; and (8) the need for improved community space.

CEQA generally defines "feasible" to mean an alternative that is capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, technological, and legal factors. In addition, the following may be taken into consideration when assessing the feasibility of alternatives: site suitability; economic viability; availability of infrastructure; general plan consistency; other plans or regulatory limitations; jurisdictional boundaries; and the ability of the proponent to attain site control (CEQA Guidelines Section 15126.6(f)(1)). The concept of "feasibility" also encompasses the question of whether a particular alternative or mitigation measure would feasibly attain most of the basic objectives of the project, even if those alternatives would impede to some degree the attainment of the project objectives or would be more costly (CEQA Guidelines Section 15126.6(a), (b)). See also *City of Del Mar v. City of San Diego* (1982) 133 Cal.App.3d 410; *Sierra Club v. County of Napa* (2004) 121 Cal.App.4th 1490; *California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 957.

Also, if the lead agency concludes that no feasible alternative locations exist, it must disclose the reasons for this conclusion, and should include the reasons in the EIR (CEQA Guidelines Section 15126.6(f)(2)(B). Reasons provided in Draft EIR Section 6.4 comply with this requirement and provide a foundation for, but are not equivalent to the written findings which are required for a lead agency to approve a project with significant and unavoidable impacts and reject alternatives as infeasible (CEQA Guidelines Section 15091(a)(3)). As described in Comment **O-LD2-13** and Comment **O-LD2-14**, these agency findings must explain the specific reasons for rejecting alternatives and support their findings with substantial evidence (CEQA Guidelines Section 15091(c) and (b)).

It's important to note that the description or evaluation of alternatives does not need to be exhaustive, and an EIR need not consider alternatives for which the effects cannot be reasonably determined and for which implementation is remote or speculative (CEQA Guidelines Section 15126.6(f)(3)). Also, an EIR need not consider multiple variations on the alternatives that have been presented. Instead, the relative advantages and disadvantages of other alternatives can be assessed from a review of the alternatives presented in the EIR as long as other alternatives fall within the range that has been evaluated. See *Village Laguna of Laguna Beach, Inc. v. Board of Supervisors* (1982) 134 Cal App. 3d 1022. For example, one comment (**O-LD2-46**) suggests that the alternatives should include "project proposals to conform to [City] land use and zoning requirements to the maximum extent feasible, including height limitations." Yet, by including the Reduced Project Alternative and alternatives that vary the height and phasing of the New Hospital, the Draft EIR presents a range of possible densities and building heights, allowing the reader to understand the relative impacts. (Also, as discussed in Draft EIR Section 4.10, UCSF is not subject to the City's land use and zoning requirements, although one of the 2014 LRDP campus-wide objectives is to "Acknowledge and respond to local zoning and height and bulk limitations to the extent possible.")

The "no project" alternative must be evaluated and is required to include a discussion of the continuation of existing conditions as well as what could be reasonably be expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services (CEQA Guidelines Section 15126.6(e)(2)). Both approaches to the no project alternative are evaluated in the EIR, which appropriately considers impacts of implementing the 2014 LRDP as the existing plan for Parnassus Heights in keeping with this requirement (**I-Kessler-29**).

CEQA also requires that an environmentally superior alternative be selected from among the alternatives. The environmentally superior alternative is the alternative with the fewest or least severe adverse environmental impacts. As identified in Section 6.6.1 of the Draft EIR, from the alternatives evaluated, the EIR identified the environmentally superior alternative would be the No Project - No Development Alternative. However, this alternative would not achieve any of the proposed CPHP objectives. Of the remaining alternatives that are not the no project alternative, Section 6.6.2 of the Draft EIR indicates the Reduced Project Alternative is considered the environmentally superior alternative; this alternative is described and analyzed in Section 6.3.3 of the Draft EIR. In this section, a discussion of the alternative's relationship to UCSF's project objectives points out that this alternative would not fully meet the proposed CPHP objectives. The discussions for both alternatives are provided to inform the public and decision-makers, and are not intended to take the place of the written findings required for a lead agency to approve a project and reject alternatives as infeasible (CEQA Guidelines Section 15091(a)(3)).

Topic 2: Off-Site Alternatives

As noted above, the proposed project is a plan for the Parnassus Heights campus site, and for that reason alternatives appropriately focus on that campus site. However, consistent with CEQA Guidelines Section 15126.6(f)(2)(B), Section 6.4 of the EIR considers two off-site alternatives, and provides reasons for not analyzing these alternatives in detail. A number of commenters suggested that these two off-site alternatives warrant further analysis (for example Comments **O-LD2-15**, **I-Sandler-6**, **I-Goodman-23**, **I-Kessler-31**, **I-Leonard-13**, **I-Leonard-15**) and some suggested other off-site alternatives that UCSF should consider (for example Comments **O-LD2-16**, **O-LD2-74**, **O-LD2-76**, **O-YBNC-1**, **I-Robertson-6**, **I-Goodman-24**, **I-Leonard-12, I-Leonard-16**) or suggested that "reimagining Parnassus Heights" with the New Hospital "at an another more suitable location" would allow UCSF to reuse Langley Porter "to emphasize its education and research functions" (Comment **I-Leonard-11**). While most of these comments generally propose implementation of the CPHP with development of the New Hospital at another location, some suggested a smaller hospital at Parnassus Heights with another hospital at an alternative site (Comment **I-Kessler-32**) or specifically requested development at Parnassus Heights be limited to the square footage anticipated in the 2014 LRDP EIR, with the balance of needed space (including the New Hospital) being developed at another location (Comment **O-YBNC-1**). These comments and suggestions are addressed below.

New Hospital at Mission Bay

In Section 6.4, the Draft EIR considers an alternative called No New Hospital at Parnassus Heights Campus Site / Implement Phase 2 of Medical Center at Mission Bay Campus Site,

generally describing this alternative as adoption and implementation of the CPHP without construction of a New Hospital at Parnassus Heights. Instead, this alternative would advance development of "Phase 2" of the Medical Center at the Mission Bay campus site as analyzed in the 2008 Final EIR for the UCSF Medical Center at Mission Bay. As discussed in the Draft EIR and pointed out by the commenters, this alternative would reduce significant and unavoidable impacts at the Parnassus Height's campus such as the wind impact identified in the vicinity of the New Hospital site and Parnassus Heights, and with demolition of the LPPI, which is a historic resource. This alternative would also reduce or avoid other impacts associated with the CPHP such as temporary construction and operational impacts associated with the New Hospital. However, many construction and operational effects that were identified to occur at the Parnassus Heights campus site under the CPHP would be shifted to the Mission Bay campus site under this potential alternative. Also, while some transportation and air quality impacts experienced at Parnassus Heights would be reduced because of the smaller amount of development at the campus site, other transportation and air quality impacts could be greater overall due to increased cross-town traffic between the two campus sites, as students, faculty, staff, and patients travel between the facilities. As noted in the space needs assessment included in Appendix SNA to the Draft EIR (p. 10), co-location of clinical uses proposed with the CPHP project "would allow UCSF to operate more efficiently, allow the [Moffitt, Long, and New] hospitals to share resources, and also minimize intra-campus travel for patients and staff."

Commenters pointed out that the Mission Bay hospital was justified in part by the development cap at Parnassus Heights (Comment **O-LD2-15**), and suggested that because this alternative would reduce impacts of the proposed project and is feasible, it should be fully evaluated in the EIR and ultimately adopted in lieu of the proposed project. However, the Draft EIR does not conclude that this alternative is feasible, recognizing that "failure to meet most of the basic project objectives" is "among the factors that may be used to eliminate alternatives from detailed consideration" (CEQA Guidelines Section 15126.6(c)). In this instance, an alternative that would adopt and implement the CPHP without construction of a New Hospital at Parnassus Heights and build a new hospital at Mission Bay would not address one specific need identified in Section 3.5 of the EIR, which is the need for co-location of instructional, research, and clinical spaces, and would not achieve most of the basic project objectives as shown in **Table 8.3-1** below.

Also, as explained in Section 6.4.1 of the Draft EIR, this alternative would result in an estimated 284 fewer overall beds at the Parnassus Heights campus and UCSF campus-wide than with the proposed CPHP, thereby not fully addressing existing bed shortages in San Francisco and the region. This alternative would also not address growing demand for emergency, surgical, interventional radiology, and imaging services at Parnassus Heights and would not help achieve the benefits that can be realized through interdisciplinary collaboration by continued co-location clinical care, research, and education. Such interdisciplinary collaboration is a hallmark of UCSF and key to the many breakthrough scientific discoveries by the institution. As all five professional programs (Medicine, Nursing, Pharmacy, Dentistry, and Physical Therapy) are established at Parnassus Heights, this alternative would not foster collaboration to the extent proposed in the CPHP.

For all of the above reasons, the Draft EIR appropriately dismisses this suggested off-site alternative (for the new hospital) from further in-depth analysis.

TABLE 8.3-1
BASIC OBJECTIVES MET/NOT MET WITH THE
NEW HOSPITAL AT MISSION BAY CAMPUS SITE OR OTHER OFF-SITE LOCATIONS[a]

Basic Objective (Excerpted from Draft EIR Project Description)	Met/Not Met
Parnassus Heights (from the 2014 LRDP and FEIR)	
A. Continue to promote excellence and leadership in health science education, maintaining the Parnassus Heights campus site as the central location for classroom instruction.	**Met** – The Parnassus Heights campus would retain professional programs of medicine, dentistry, nursing, pharmacy, and physical therapy whether or not the new hospital is located on site.
B. Ensure that adequate space is provided to foster collaboration and to facilitate the inter-dependence and connectivity for operational efficiency and effectiveness of instruction, clinical, research and support uses in close physical proximity to each other.	**Not Met** – Collaboration, operational efficiency, and effectiveness would not be fostered between clinical uses and other uses if the new hospital is located elsewhere.
C. Ensure that Long Hospital and the New Hospital Addition have adequate clinical and administrative support and are aligned with education, research and specialized care programs and support that remain at the campus site.	**Not Met** – The new hospital would not be aligned with Parnassus Heights education, research and specialized care programs if it is located off-site.
D. Provide additional campus housing and improve campus life amenities including outdoor space.	**Met** – The Parnassus Heights campus would include additional housing and improvements to campus amenities such as outdoor space whether or not the new hospital is located on site.
E. ~~Strive to better achieve the remaining unfulfilled components of the 1976 Regents' Resolution by reducing space, minimizing population growth, and improving transportation-related programs.~~ Conform to the space limits and population estimates established in the Regents' Resolution Regarding the Parnassus Heights Campus Site, as amended.	**Met** – Proposed amendments to the Regents' Resolution would result in conformance with space limits and population estimates whether or not the new hospital is located on site.
F. Preserve the Mount Sutro Open Space Reserve as permanent open space, and serve as the steward of the Reserve by maintaining and expanding the trail system and by ensuring the safety of visitors and neighboring structures.	**Met** – The Sutro Open Space Reserve would be preserved, the trail system would be maintained and expanded, and safety would be ensured whether or not the new hospital is located on site.
Objectives for the CPHP - Space	
• Revitalize the aging Parnassus Heights campus to enhance its place as a premier educational, research, and clinical institution -- one that draws in research and clinical faculty, staff, students, and trainees.	**Not Met** – The campus' place as a premier educational, research, and clinical institution would not be enhanced if the new hospital is located off-site.
• Fulfill the need for contemporary research, educational, clinical, and support spaces that have been lacking at Parnassus Heights for decades.	**Not Met** – The need for contemporary research, educational, clinical, and support spaces would not be fulfilled if the new hospital is located off-site.
• Increase the quantity and improve the quality of research space, to enhance synergies between research and clinical activities at Parnassus Heights for UCSF to maintain its stature as a world-class hub of basic, translational, and clinical research.	**Not Met** – Synergies between research and clinical activities at Parnassus Heights would not be enhanced if the new hospital is located off-site.
• Connect buildings and spaces at multiple levels to foster collaboration that facilitates learning and scientific discoveries.	**Not Met** – The new hospital would not be connected to other Parnassus Heights buildings/spaces to foster collaboration that facilitates learning and scientific discoveries if the hospital is located off-site.
• Facilitate patient/pedestrian safety and functional efficiency by connecting campus buildings across and under Parnassus Avenue.	**Not Fully Met** – The new hospital would not be connected across and under Parnassus Avenue to facilitate patient/pedestrian safety and functional efficiency if the hospital is located off-site.
• Increase the on-campus supply of housing for students, faculty and staff, thereby minimizing the impact of UCSF-demand for housing on adjoining neighborhoods.	**Met** – The Parnassus Heights campus would include additional housing and improvements to campus amenities such as outdoor space whether or not the new hospital is located on site.

NOTES:

[a] In this context, "basic objectives" are those objectives established for the Parnassus Heights campus site in the 2014 LRDP as proposed for revision, and objectives of the CPHP related to space. Other objectives presented in Section 3.6 and 6.2.1 of the Draft EIR relate to urban design, mobility, and specific Initial Phase projects, including the New Hospital.

SOURCE: ESA, October 2020

New Hospital at Mount Zion Campus Site

In Section 6.4, the Draft EIR considers an alternative called New Hospital at Mount Zion Campus Site, generally describing this alternative as adoption and implementation of the CPHP without construction of a new hospital at Parnassus Heights. Instead, this alternative would construct a New Hospital at UCSF's Mount Zion campus site as previously studied in the 2002 UCSF Mount Zion Master Planning Study, either on the main block (bounded by Divisadero, Post, Scott, and Sutter Streets) or on the south block (bounded by Divisadero, Geary, Scott, and Post Streets).

As discussed in the Draft EIR and pointed out by the commenters, this alternative would reduce significant and unavoidable impacts at the Parnassus Height's campus site such as the wind impact identified in the vicinity of the New Hospital site, and demolition of the LPPI, which is a historic resource. This alternative would also reduce or avoid other impacts associated with the project such as temporary construction and operational impacts associated with the New Hospital, although many of these impacts would shift to the Mount Zion campus site. Also, while some transportation and air quality impacts experienced at Parnassus Heights would be reduced because of the smaller amount of development at the campus site, other transportation and air quality impacts could be somewhat greater due to increased traffic between the two campus sites, as students, faculty, staff, and patients travel between the facilities.

Commenters pointed out that outdated space at the Mount Zion campus site must be retrofitted or demolished due to seismic issues and new, and replacement space was discussed in the 2014 LRDP "as way to accommodate clinical programs at Parnassus" that may be relocated to Mount Zion (Comment **O-LD2-15**). Commenters also suggested that because this alternative would reduce impacts of the proposed project and is feasible, it should be fully evaluated in the EIR and potentially adopted in lieu of the proposed project. However, the Draft EIR does not conclude that this alternative is feasible, recognizing that "failure to meet most of the basic project objectives" is "among the factors that may be used to eliminate alternatives from detailed consideration" (CEQA Guidelines Section 15126.6(c)). In this instance, an alternative that would adopt and implement the CPHP without construction of a New Hospital at Parnassus Heights and build a New Hospital at Mount Zion would not address one specific need identified in Section 3.5 of the EIR, which is the need for co-location of instructional, research, and clinical spaces, and similar to the alternative that would place the new hospital at Mission Bay, would not achieve most of the basic project objectives as shown in **Table 8.3-1**. As explained above, interdisciplinary collaboration is a hallmark of UCSF and key to the many breakthrough scientific discoveries by the institution. As all four programs (Medicine, Nursing, Pharmacy, Dentistry, and Physical Therapy) are established at Parnassus Heights, this alternative would not foster collaboration to the extent proposed in the CPHP.

Also, as explained in Section 6.4.3 of the Draft EIR, UCSF does not own the Mount Zion south block sites, making it unclear whether UCSF can reasonably acquire or have access to that site (CEQA Guidelines Section 15126.6(f)(1)).

For all of the above reasons, the EIR appropriately dismisses this suggested off-site alternative (for the new hospital) from further in-depth analysis.

Two Hospital Alternative

One commenter suggested building two new hospitals: a smaller facility at Parnassus Heights and another facility at either the Mission Bay or Mount Zion campus site, locations which are both described above (Comment I-Kessler-33). The commenter's rationale included flexibility in strain/crisis scenarios, spreading out traffic, providing more beds to serve more patients, allowing for a smaller project with less impacts [at Parnassus Heights], and allowing construction to occur away from existing inpatient facilities, avoiding interruption in clinical services.

The proposal for a New Hospital at Parnassus Heights in fact would implement the second step in the two-hospital plan that has been decades in the making following the adoption by the State Legislature of Senate Bill 1953 establishing new seismic safety standards for inpatient facilities in California. A campus-wide assessment of inpatient facilities across UCSF's campus sites was undertaken in the early 2000s. In 2005, the Regents approved LRDP Amendment #2 to the 1996 LRDP, which envisioned a two-hospital plan with potential new inpatient facilities both at Mission Bay and at Parnassus Heights. The plan further envisioned that Mount Zion would be transitioned to primarily an outpatient hub. In 2008, the Regents approved LRDP Amendment #3 to the 1996 LRDP to provide an update to the two-hospital plan, as well as to share details regarding the plans for the new hospital at Mission Bay. LRDP Amendment #3 summarizes (p. 3) "The Initial Phase ('LRDP Phase') of those recommendations, which were adopted in LRDP Amendment #2, are to: 1) develop three integrated specialty hospitals with about 210 beds at Mission Bay by 2012; 2) maintain tertiary and quaternary care with about 600 beds at Parnassus Heights for a total of about 810 beds during the LRDP phase; 3) provide ambulatory care facilities at both Parnassus Heights and Mission Bay; and 4) populate both sites with basic and translational disease oriented research programs."[2] UCSF is implementing this plan, first with the opening of Phase I of the Mission Bay hospitals in 2015, followed by other clinical facilities to complete the Initial Phase of the Medical Center at Mission Bay. The proposed New Hospital at Parnassus Heights is the next step.

Regarding the CPHP Draft EIR, construction of a smaller, new hospital at the Parnassus Heights campus site was considered in several alternatives in the Draft EIR, as shown in **Table 8.3-2**, below. Specifically, Alternative 1B: No Project - Development under the 2014 LRDP analyzed in the Draft EIR would construct a New Hospital that would be 308,000 gsf, or less than one third the size of the New Hospital in the proposed project. Alternative 2: Reduced Project analyzed in the Draft EIR would construct a 629,000 gsf New Hospital, approximately two thirds the size of the New Hospital under the proposed CPHP, and Alternative 3: New Hospital – Phased Option analyzed in the Draft EIR would construct a 585,000 gsf New Hospital, about half the size of the New Hospital in the proposed project, along with demolition and replacement of Moffitt Hospital.

TABLE 8.3-2
PROPOSED NEW HOSPITAL AT PARNASSUS HEIGHTS CAMPUS SITE UNDER CPHP COMPARED TO EIR ALTERNATIVES WITH SMALLER HOSPITALS AT PARNASSUS HEIGHTS CAMPUS SITE

		New Hospital under Alternatives Analyzed in Chapter 6 of the Draft EIR		
	Proposed New Hospital under CPHP	**Alternative 1B: No Project – Development under the LRDP**	**Alternative 2: Reduced Project**	**Alternative 3: CPHP with New Hospital – Phased Option**
New Hospital Gross Square Feet (gsf)	955,000 gsf	308,000 gsf	629,000 gsf	585,000 gsf at LPPI 370,000 gsf at Moffitt Hospital
New Hospital Height	16 stories 294 feet	7 stories 110 feet	12 stories 212 feet	13 stories at LPPI 10 stories at Moffitt Hospital
New Hospital and Total Parnassus Heights Beds	384 New Hospital 291 Long Hospital 675 Total Beds	140 New Hospital 299 Long Hospital 439 Total Beds	288 New Hospital 96 Moffitt Hospital 291 Long Hospital 675 Total Beds	252 New Hospital 132 New Hospital 291 Long Hospital 675 Total Beds

SOURCE: ESA, October 2020.

As noted earlier, an EIR need not consider multiple variations on the alternatives that have been presented. Instead, the relative advantages and disadvantages of other alternatives can be assessed from a review of the alternatives presented in the EIR as long as other alternatives fall within the range that has been evaluated. See *Village Laguna of Laguna Beach, Inc. v. Board of Supervisors* (1982) 134 Cal App. 3d 1022. In this instance, the commenter's suggestion of a smaller hospital at Parnassus Heights falls within the range of alternatives that have been analyzed in the EIR and further analysis is not necessary.

New Hospital at Hunters Point

A number of commenters pointed out that UCSF owns 3.8 acres of land at the former Hunters Point Shipyard and suggested that the site should be considered for conversion from the current low-intensity uses, to include a New Hospital and other uses, suggesting that "healthcare, a hospital, and economic development would be greatly needed in this community" (Comment **O-LD2-16**) and "provide jobs and health care to a disadvantaged and underserved community" (Comment **O-LD2-76**).

This suggestion does not represent a feasible alternative for consideration in the CPHP EIR because similar to the off-site alternative at the Mission Bay campus site, it would not meet most of the basic objectives of the project as shown in **Table 8.3-1**. As explained above, interdisciplinary collaboration is a hallmark of UCSF and key to the many breakthrough scientific discoveries by the institution. As all five professional programs (Medicine, Nursing, Pharmacy, Dentistry, and Physical Therapy) are established at Parnassus Heights, this alternative would not foster collaboration given the distance of the Hunters Point site from UCSF's main facilities.

New Hospital at Seton Medical Center

A commenter suggested that the Draft EIR's omission of an alternative that would implement the New Hospital at the Seton Medical Center[3] was improper, given that the facility currently stands empty (Comments **O-LD2-76**) and another commenter suggested that UCSF should acquire the Seton Medical Center because it has 357 hospital beds and is well located with access to the Parnassus Heights and Mission Bay campus site, pointing out that it could serve "an important underserved community of color and would broaden the reach of UCSF beyond the city limits of San Francisco" (Comment **I-Leonard-16**).

This suggestion does not represent a feasible alternative for consideration in the CPHP EIR because similar to the off-site alternative at the Mission Bay campus site, it would not meet most of the basic objectives of the project as shown in **Table 8.3-1**, and because UCSF does not control the site of the facility, which is in Daly City. According to recent news reports, the new ownership, AHMC Healthcare, is obligated to keep Seton open for at least five and a half years.[4]

New Hospital at Laurel Heights

One commenter suggested that the EIR should discuss development of an additional campus site at Laurel Heights to accommodate the expansion proposed at Parnassus Heights (Comment **I-Robertson 6**). This suggestion does not represent a feasible alternative for consideration in the CPHP EIR because similar to the off-site alternative at the Mission Bay campus site, it would not meet most of the basic objectives of the project, as shown in **Table 8.3-1**, and because UCSF does not control the site, which was acquired by a private developer in 2018 and recently approved for development of residential and commercial uses and open space.

New Hospital and Other Development at Locations Along Third Street

One commenter suggested that the EIR evaluate alternatives that implement the 2014 LRDP with 400,000 sf of new development at the Parnassus Heights campus site plus additional development along the Third Street corridor at one or more of the sites currently proposed for development (Mission Rock, Pier 70, Potrero Power Station, or Candlestick Redevelopment) stating that all "could readily be modified to fully accommodate expanded UCSF development…" (Comment **O-YBNC-1**). This suggestion does not represent a feasible alternative for consideration in the CPHP EIR because similar to the off-site alternative at the Mission Bay campus site, it would not meet most of the basic objectives of the project, as shown in **Table 8.3-1**, and because UCSF does not control any of the sites referenced.

Topic 3: Other Suggested Alternatives

A number of commenters had suggestions for alternatives that should be considered in the EIR that did not relate to placing the New Hospital or other development at an off-site location. These included a suggestion that one or more alternatives be crafted to preserve the Toland Hall Zakheim murals and provide for their public display. This would include possible implementation

[3] Comment Letter O-LD2 refers to a "Seton Hall Hospital Facility." However, it is assumed the commenter meant to refer to the Seton Medical Center (in Daly City).

[4] Woo, Erin. "AHMC Healthcare finalizes purchase of Seton Medical Center," *San Jose Mercury News*, August 14, 2020.

of the CPHP without those elements requiring demolition of UC Hall, or a portion of UC Hall, so that the murals could remain intact at their current location; or identification of an alternate location at Parnassus Heights where the murals could be installed (Comment **I-Yap-1**). Another suggestion was to identify and analyze an alternative that would avoid displacement and loss of housing at the Aldea Housing complex during construction (Comment **O-SUT-10**).

Preservation of the murals in place was analyzed in the No Project Alternative, comprised of the Alternative 1A: No Project – No Development; and Alternative 1B: No Project – Development under the 2014 LRDP, in which UC Hall would be retained and adaptively reused for housing. This analysis would be adequate should UCSF ultimately opt to retain the murals in place, although that is not proposed. Retaining Toland Hall and the murals in place and development of the proposed research facility around it is not practical or feasible.

Retaining Toland Hall while constructing the new Research and Academic Building around it would be a complex endeavor essentially requiring that UC Hall be cut from Toland Hall and demolished around it.[5] Given Toland Hall's location within UC Hall and the steep slope underlying the site, the retention of Toland Hall and the murals in situ would require extensive shoring to keep the structure in place while excavating below it. Toland Hall would need to undergo a seismic retrofit with shotcrete walls added to the exterior of the existing walls, demolition of the existing seating bowl slab, and extensive temporary shoring of the building on beams and piles. The work would be extremely costly, increase the complexity of the construction of the new Research and Academic Building, extend the overall construction schedule, and result in sub-optimal seismic performance of the final building. Block outs in the Research and Academic Building structure, areas inaccessible by crane or other equipment, and added complications for lowering and incorporating Toland Hall would add to the overall cost and schedule of the Research and Academic Building.

It would also put the murals at risk of damage throughout the construction process due to vibrations from the demolition of UC Hall, demolition of the seating bowl slab, installation of piles, and construction of the new Research and Academic Building; differential settlement of the supporting piles; or potential water intrusion. While there are no CalTrans vibration standards specific to murals or frescoes, CalTrans' most stringent vibration standards are those related to vibration impacts on "extremely fragile historic buildings, ruins, and ancient monuments."[6] As these standards address maintenance of vulnerable historical structures, it is reasonable to assume that such stringent standards would also serve as an appropriate criterion for the plaster frescoes throughout the demolition and construction process. There are substantial measures that would need to be taken in protecting the murals that would require further review and analysis by art and preservation consultants: i.e., humidity control once the slab and roof of Toland Hall are removed, and vibration and stability control at the walls when the lateral supports are removed. The consultant concluded that there would be no stage in this complex process where the murals would not be at some level of risk for damage.

[5] Degenkolb Engineers, *University of California San Francisco Toland Hall Reuse Evaluation*, December 4, 2020.
[6] Caltrans, *Transportation and Construction Vibration Guidance Manual* (Table 19, p.38), September 2013.

For these reasons, and for the reason that the retention of Toland Hall would be an extremely limiting factor in the design, construction, and utility of the new Research and Academic Building, and because the cost of retaining Toland Hall is estimated to be $37.8 million, UCSF finds that the retention of Toland Hall would not be practical or feasible.

As discussed under Master Response 11: Toland Hall Murals, outside of the CEQA process, UCSF continues to assess how best to safety relocate the murals. UCSF has recently selected a historic preservation firm to design and implement the process of relocating the murals to a storage facility until a permanent home can be found. Assuming removal and relocation of the murals to a temporary storage facility is successful, UCSF will explore options to either return the murals to the Parnassus Heights campus in a future new building that can accommodate them, or to relocate them to a museum or other institution where they can be maintained by experts and made accessible to a broad public audience. Potential options for returning the murals to the Parnassus Heights campus site include one of the planned new building sites under the CPHP, provided public access and sufficient space are available and do not conflict with critical clinical, research, and educational needs. Potential options for off-site locations include a museum or similar institutional setting, which would expand accessibility to scholars and the public, possibly providing a greater opportunity for the public to learn about the murals' creation and the history they depict.

Regarding the Aldea Housing complex, as discussed in Draft EIR Chapter 3, Project Description, and Section 4.12, Population and Housing, the proposed CPHP proposes to add 762 new housing units to the Parnassus Heights campus, including 332 net new units achieved via densification of Aldea Housing complex and 430 new units on the campus west side. The densification of the Aldea Housing complex would be phased over time to minimize displacement of existing residents and loss of housing units as the current buildings are demolished and replaced. Specifically, this project would include removal of 42 units in the initial phase of the Aldea Housing Densification project, followed by replacement with 184 units (142 more than currently exist). This would temporarily displace 42 households and make new units available during development of future phases, limiting the potential for displacement in those future phases.

Draft EIR Impact POP-2 (see also Master Response 14: Population and Housing, below, for additional detail), showed that approximately 42 households, or about 100 residents, would be temporarily displaced for about 2 years as a result of the initial Aldea Housing Densification project. The displaced households would be provided UC-controlled housing for the 2-year duration and then would be able to return to housing at the Parnassus Heights campus site. Accordingly, this impact was determined to be less than significant, and no alternative analyzing West Side housing development first is needed.

8.3.3.6 Master Response 6: Public Resources Code 21099

A number of comments were received that asserted that Public Resources Code (PRC) Section 21099 did not apply to the proposed CPHP, and therefore, aesthetics and parking impacts should have been analyzed in the Draft EIR. Certain comments claim that the proposed CPHP did not meet the eligibility requirements for Section 21099 because the CPHP is a planning document and not a project; that the CPHP does not meet the definition of a residential, mixed-use

residential, or employment center project; and that the CPHP is not located on an infill site. Other comments assert that the Draft EIR improperly minimizes its aesthetics impacts by dissuading the public from commenting on this issue and misleads decision-makers. Other comments claim that because the Draft EIR was processed under PRC Section 21099, that the aesthetics impact analysis was not addressed seriously in the Draft EIR.

As explained in the Draft EIR, Section 4.0, Introduction to Environmental Analysis, pages 4.0-3 to 4.0-4, PRC Section 21099(d) states that "Aesthetic and parking impacts of a residential, mixed-use residential, or employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment." Accordingly, aesthetics and parking are not considered in determining if a project has the potential to result in significant environmental effects for projects that meet all of the following three criteria:

a. The project is in a transit priority area
b. The project is on an infill site; and
c. The project is residential, mixed-use residential, or an employment center.

The Draft EIR explains that the proposed CPHP meets each of the above three criteria, and that, on this basis, the Draft EIR did not consider aesthetics and the adequacy of parking in determining the significance of project impacts under CEQA.

Comments **O-PARKIN-2** and **O-PARKIN-3** assert that the proposed CPHP does not meet the eligibility requirements for PRC Section 21099 because the CPHP is a planning document and not a project, and because it includes an amendment to the 2014 LRDP. The Draft EIR Project Description is clear in describing the various plan and project-level components of the CPHP, including its proposed land use development program, and amendment to the 2014 LRDP. However, PRC Section 21099 does not exclude the CPHP from being eligible for this section by virtue of it being a plan. Rather, as indicated above, the eligibility requirements of the CPHP are associated with meeting those criteria specified in PRC Section 21099 related to it being in a transit priority area, being on an infill site, and consisting of either a residential, mixed-use residential or an employment center.

Comments **O-LD2-27**, **O-PARKIN-6**, **I-Goodman-8**, and **I-Leonard-18** dispute the Draft EIR's determination of the CPHP meeting the definition in Section 21099 of being an employment center. As explained in Section 4.0 in the Draft EIR, PRC Section 21099(a)(1) defines an employment center as a project located on property zoned for commercial uses with a floor area ratio of no less than 0.75 and located within a transit priority area. The commenters assert that the reference to zoning refers to local zoning of the campus, and that the campus site is not zoned for commercial use by the City of San Francisco. The Draft EIR clearly specifies that pursuant to the University of California's constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation, including those of the City of San Francisco. Furthermore, the Draft EIR Chapter 3, Project Description, and Section 4.10, Land Use and Planning are clear in distinguishing the zoning designated by the City for the campus site versus UCSF's classification of land use development on the campus site. The Draft EIR explains on page 4.0-4 that the CPHP

would include a variety of commercial uses. The campus core is also currently densely developed and density would be further increased under the CPHP. Lastly, as specified in the Draft EIR page 4.0-3, the campus site is located within a transit priority area, as it is located within one-half mile of the Irving Street and Arguello Boulevard stop on the N-Judah Muni line which has service of 15 minutes or less (among other transit services). Taken together, the CPHP substantially meets the definition of an employment center.

O-PARKIN-2, **O-PARKIN-4**, **O-PARKIN-5** and **I-Goodman-8** further assert that the CPHP does not meet the definition in Section 21099 of being a residential or mixed-use residential project. PRC Section 21099 does not require the CPHP to meet the definition of a residential, mixed-use residential *and* employment center; rather, it need only meet one of the three categories, and accordingly, the Draft EIR focuses on the CPHP substantially meeting the definition of an employment center. Nevertheless, despite the characterization by Comment **O-PARKIN-4** that housing would represent a "relatively small component of the CPHP," the CPHP in fact proposes substantial new on-campus housing, consisting of 772 net new housing units. This is consistent with the CPHP's objectives to increase the on-campus supply of housing for students, faculty and staff, and minimize the impact of UCSF-demand for housing in the City. As Comment **O-PARKIN-5** notes, "Section 21099 does not define 'mixed-use residential project.' " However, when considering the range of uses that would be provided under the CPHP, including clinical, research, instruction, housing and open space, the CPHP appears to substantially meet the residential and mixed-use categories in PRC Section 21099 as well.

O-PARKIN-2 and **I-Leonard-18** also claim the campus site does not meet the definition of an infill site given the project is adjacent to the Mount Sutro Open Space Reserve. However, as indicated in the Draft EIR Section 4.0, PRC Section 21099(a)(4) defines an "infill site" as a lot located within an urban area that has been previously developed. . ." The vast majority of new development under the CPHP would occur within the urbanized campus core and within Aldea Housing complex, both of which have been previously developed, and consequently, the CPHP meets this criterion.

O-PARKIN-7 asserts that the Draft EIR improperly minimizes its aesthetics impacts by dissuading the public from commenting on this issue, misleads decision-makers and that the aesthetics analysis was not addressed seriously in the Draft EIR. However, the Draft EIR notes on page 4.0-4 and 4.1-20 that notwithstanding the determination that the proposed CPHP substantially meets the criteria set forth in PRC Section 21099(d), the Draft EIR provides a complete assessment of potential aesthetic impacts. In fact, Section 4.1 in the Draft EIR includes a thorough and lengthy aesthetic impact analysis of the CPHP that analyzes all aesthetic issues listed in the CEQA Appendix G checklist, aided by visual simulations that show the changes to the campus site with the implementation of the CPHP as viewed from a number of important view points in the City. As demonstrated in Section 4.1 in the Draft EIR, the proposed CPHP would not have a substantial adverse effect on scenic vistas, nor conflict with applicable zoning and other regulations governing scenic quality, and accordingly, these impacts would be less than significant. In addition, the Draft EIR also determines that with implementation of mitigation measures identified in the Draft EIR to minimize light and glare associated with new buildings under the CPHP, potential lighting/glare impacts would be less than significant. As such, the Draft EIR provides full disclosure of potential

aesthetic impacts to the public and decision-makers, and where required, identifies enforceable mitigation to reduce aesthetic impacts to the extent feasible.

8.3.3.7 Master Response 7: Aesthetic Impacts

This master response responds to the following organization, individual and public hearing comments: **O-LD2-28, O-LD2-43, O-LD2-71, O-LD2-78, O-LD2-79, O-LD2-80, O-LD2-82, O-PARKIN-8** through **O-PARKIN-12, O-PARKIN-18, O-SFFA-3, I-Hanley-4, I-DeSnoo-4, I-DeSnoo-5, I-Goodman-9, I-Kessler-7** through **I-Kessler-12, I-Jones-4, I-Leonard-19, I-Lebus-6, I-Scatena-5, I-Scatena-7, PH-Kessler-17, PH-Kessler-18,** and **PH-Scatena-35**.

Comments state that the Draft EIR improperly determined aesthetic impacts of the proposed CPHP on scenic vistas and scenic quality to be less than significant. Notably, the two appellate court cases cited by one commenter for the proposition that a negative change in views or other aesthetic features necessarily rises to the level of significance (*Ocean View Estates* and *Quail Botanical Gardens*) involved instances in which the lead agency had prepared a negative declaration or mitigated negative declaration. In such an instance, a commenter need only present a fair argument that a project *could* result in a significant impact in order for a court to invalidate the CEQA document. Here, however, UCSF has already prepared an EIR, has fully evaluated the CPHP's aesthetic effects, and has determined, based on substantial evidence in the record that the aesthetic effects would be less than significant. One observer's conclusions regarding a project's effects differs from another does not invalidate the EIR's analysis. As stated in the State CEQA Guidelines, "Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts" (CEQA Guidelines Section 15151). The conclusions of the EIR authors are clearly explained in the Draft EIR, as summarized below.

The Draft EIR focused its analysis of effects on scenic vistas on well-known and well-used public vantage points that offer long-range panoramic views of scenic resources. Based on this analysis, the Draft EIR concluded that, while new development pursuant to the CPHP would be visible as part of the scenic vistas identified, "these scenic vistas would not be substantially or adversely impacted."

The Draft EIR found that the most visible project components, depending on viewpoint, would include the New Hospital, Research and Academic Building (RAB), Millberry Union improvements, West Side development, and patient/family hotel. The Draft EIR analyzed the effect on scenic views of these and other components from publicly accessible locations chosen for the long-range panoramic views, including Grandview Park, the Tank Hill natural area, Buena Vista Park, and Corona Heights Park.[7] From Grandview Park, the Draft EIR found that CPHP development would partially obstruct views of the lower portion of Mount Sutro's north slope. However, the vegetated hillside of the Mount Sutro Open Space Reserve "would continue to be a prominent scenic resource from this view due to its elevation and visibility from long distance" (see Draft EIR Figure 4.1-9, Draft EIR page 4.1-26). CPHP development would obscure a small portion of the view of downtown San Francisco but would not alter other scenic views from

[7] All four of these viewpoints are identified in the San Francisco General Plan Urban Design Element (Map 1) as being important vista points to be protected.

Grandview Park, including those of the Pacific Ocean, Golden Gate Park, the Marin Headlands, and the Presidio. From the other identified viewpoints, all of which are generally east of the campus site, the Draft EIR found that some CPHP development, particularly the New Hospital, would be visible; however, no scenic views would be obscured. This view is generally illustrated in Draft EIR Figure 4.1-17, Draft EIR page 4.1-39. From 17th and Clayton Streets, the proposed New Hospital would be clearly visible and would occupy a prominent place on the horizon. However, it would not obscure any scenic views. The Draft EIR found that other long-range views from these parks, including those of the Marin Headlands, downtown San Francisco, and the East Bay Hills would not be affected by CPHP development.

The Draft EIR acknowledged (page 4.1-35) that the proposed New Hospital would be visible from streets close to the New Hospital site, including Edgewood and Belmont Avenues and Willard Street. However, long-range views westward from these streets are generally obscured by Mount Sutro and by existing homes and vegetation.

The Draft EIR also found that CPHP development would change views from certain more distant streets in the vicinity of the campus site. However, even where the CPHP would make a noticeable change—such as from certain locations along Lincoln Way, from where the view of Sutro Tower would be partially or completely obscured (see Draft EIR Figures 4.1-12 and 4.1-14, Draft EIR pages 4.1-33 and 4.1-36)—comparable views would be available to an observer from locations a few blocks in either direction. In the context of an urban area, view changes of this magnitude would not be considered significant. One comment (**I-Kessler-11**) regarding these figures states that the views shown are on the route of San Francisco's 49-Mile Scenic Drive. The 49-Mile Scenic Drive "was created in 1938 by the Downtown Association to highlight the city's beauty and to promote it as a tourist destination … as a way for visitors to see San Francisco while they were here for the Golden Gate International Exposition from 1939-1940. Over the years, the route has changed many times."[8,9] Given the origins of the 49-Mile Scenic Drive, its length, and the fact that both the Drive and views from the Drive along its length and in the vicinity of Parnassus Heights have changed over time, a location on the Drive does not necessarily increase the visual sensitivity of that location or suggest that visual changes from the Drive are necessarily significant impacts. In addition, the Appendix G threshold addresses substantial damage to scenic resources within a state scenic highway, and 49-Mile Scenic Drive is not a state scenic highway.

One comment (**O-LD2-28**) states that the commenter's expert consultant reviewed the Draft EIR and "concluded that the Project will result in a significant change to public views and will change the visible skyline. *See* Exhibit D." Exhibit D (Comments **O-LD2-78** through **O-LD2-80**) offers no evidence, but instead offers conclusory statements such as, that the CPHP's "substantial increase in building area, mass, and height … will undoubtedly create significant visual impacts" and "In review of this plan and DEIR, it is apparent that the proposed building plan and particularly the new 16 story hospital would have significant visual impacts (see figures 1 and 2)."

8 SF Travel website. https://www.sftravel.com/article/49-mile-scenic-drive. Accessed October 18, 2020.

9 The Downtown Association of San Francisco, a business group, was "devoted to the betterment of San Francisco and its Downtown Business District from 1907 to approximately 2004." (Online Archive of California website. https://oac.cdlib.org/findaid/ark:/13030/c8k07905/. Accessed October 18, 2020).

Exhibit D explains, "The visual simulations shown here have been constructed within Google Earth and incorporate scale models of the building masses and heights identified in the EIR."

Figures 1 and 2 in Comment **O-LD2-72** purport to show the "Existing view west from adjacent neighborhood" and "View west with proposed new hospital." However, these images, as well as the other "visual simulations" presented in Exhibit D are not from ground level, but rather, from aerial vantage points—estimated to be at an altitude of at least 900 feet in Figures 1 and 2 and thus more than 500 feet above Parnassus Avenue. The distance that an observer can see from this height, without existing buildings and vegetation to block the line-of-sight, as occurs at ground level, is much greater and substantially unobstructed, compared to a ground-level view from the same horizontal coordinates (i.e., the same location, but at grade). This renders the aerial view substantially unrepresentative of what a ground-level observer would see.

Other "simulations" presented in Comments **O-LD2-79** and **O-LD2-80**—purportedly from the west end of Farnsworth Lane, Hill Point Way, Tank Hill natural area, Buena Vista Park, and Corona Heights Park—depict viewpoints between about 55 feet and 110 feet above the purported viewpoints. Therefore, the "simulations" presented in Exhibit D are generally inapplicable to an evaluation of public scenic vistas or, for that matter, views from any *publicly accessible viewpoint*. Rather, the "simulations" misrepresent the effect of the proposed New Hospital by making it appear as though the hospital building would block views that, in fact, do not exist from at-grade viewpoints. While the proposed New Hospital would certainly be visible from these locations, it would take up a small portion of the horizon and only from Tank Hill would the new building obscure any ocean view at all from publicly accessible viewpoints.

Regarding the change in views from the Farnsworth trailhead at the west end of Farnsworth Lane, the commenter is correct that the New Hospital, if developed at a mass comparable to that analyzed programmatically in the Draft EIR,[10] would block the view westward from the trailhead. However, this view is already partially obscured by vegetation and offers a relatively narrow field of view between the existing hospital buildings and the medical office building at 400 Parnassus Avenue. In addition, the medical office building at 350 Parnassus Avenue blocks the view to the northwest, views to the north and east are also largely obscured by vegetation, and views to the southeast are blocked by existing residences. The view to the south is primarily of a trail in a forest. As a result, the Farnsworth trailhead does not offer high-quality scenic views, nor panoramic views, but rather a somewhat limited view to the west through vegetation and between buildings. This location is therefore not considered a high-quality viewpoint and the potential visual change is not considered significant.

Farnsworth Trail, which begins at the Farnsworth trailhead, extends southward for about 400 feet to UCSF's Surge parking lot, from where a walker can descend to the UCSF campus via the Campus trailhead or can continue southward through the parking lot and its driveway and on

[10] As explained in the Draft EIR Project Description, on page 3-2, the analysis of the New Hospital is not based on an actual building design, but rather on a conceptual massing model: "Broad parameters for the New Hospital project (location, size, mass, height …) are accounted for in the CPHP and are analyzed at a program level in this Draft EIR. Further details of the New Hospital are being developed, including the specific design. Those elements of the New Hospital will be the subject of a subsequent project-specific environmental review when more details become available."

Medical Center Way to either the Historic Trail or the Edgewood Trail. Views westward from most of the Farnsworth Trail are obscured by the existing Moffitt and Long Hospitals, as well as by the Health Science and Medical Science Buildings. While the New Hospital would change the westward view from the Farnsworth trailhead, this represents a single location in the Mount Sutro Open Space Reserve, which includes an extensive trail network. Because the remainder of the trail network is considerably to the south of the Farnsworth Trail, neither the New Hospital nor other CPHP components would affect westward views from other trail locations on Mount Sutro. As explained in the Draft EIR, from some locations within the Reserve, the proposed New Hospital would be visible and would obstruct northward scenic views across the campus core. However, many existing views northward from within the Reserve are partially or substantially obstructed by dense vegetation and/or topography; in general, therefore, the Reserve does not provide long range scenic views that would be affected by proposed CPHP development.

Several comments (**O-LD2-28**, **O-LD2-43**, **O-LD2-71**, **O-LD2-80**, **O-PARKIN-9**, and **I-Kessler-10**) state that the Draft EIR fails to acknowledge alleged conflicts with the San Francisco General Plan Urban Design Element and/or the San Francisco Planning Code and that these conflicts would result in a significant aesthetic impact. The Draft EIR discusses the Urban Design Element (pages 4.1-17 – 4.1.18). The San Francisco Planning Code is also discussed (pages 4.1-18 – 4.1-19). As stated on page 4.1-17, "Although the University is constitutionally exempt from local land use regulation when using properties under its control in furtherance of its educational mission, the University strives to be substantially consistent with local policies where feasible."

Because UCSF is constitutionally exempt from local land use regulations, the San Francisco General Plan is not a plan that is "applicable" to the proposed CPHP, although it was taken into consideration during development of the CPHP. The same is true with respect to the San Francisco Planning Code, including the Zoning [use and height] Maps. The purpose of an EIR is "to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment; to list ways in which the significant effects of such a project might be minimized; and to indicate alternatives to such a project" (CEQA Section 21061). CEQA defines a significant effect as "a substantial, or potentially substantial, adverse change in the environment," and the "environment" consists of "the physical conditions that exist within the area which will be affected by a proposed project" (CEQA Sections 21068 and 21060.5). Thus, even a conflict with a plan or policy that is applicable to the project does not, in and of itself, indicate a significant effect on the environment. Rather, that conflict is an indication that a potential physical effect could occur and serves as guidance to the EIR preparer that further investigation of such physical effect may be warranted. Here, despite the fact that neither the San Francisco General Plan nor the San Francisco Planning Code is applicable to the proposed CPHP, and notwithstanding the fact that the Draft EIR properly explains that this EIR is not required to consider aesthetics in determining the significance of CPHP impacts under CEQA in accordance with CEQA Section 21099(d) (see Master Response 6: Public Resources Section 21099), the Draft EIR nevertheless analyzes potential physical impacts related to aesthetics, and identifies, as feasible, mitigation measures to mitigate potential significant aesthetic impacts.

One comment (**O-LD2-80**) states that it is unclear whether the CPHP has undergone review by the San Francisco Planning Department's Urban Design Advisory Team. Because the University is not subject to Planning Department jurisdiction, the CPHP is not required to undergo such review.

One comment (**O-PARKIN-10**) states that the Draft EIR's analysis of aesthetics does not adequately account for the removal of existing trees pursuant to UCSF's adopted Mount Sutro Open Space Reserve Vegetation Management Plan. The Vegetation Management Plan was adopted in 2018 and is being implemented over a period of approximately 20 years. The Vegetation Management Plan has four goals:

- Protect the safety of users of the Mount Sutro Open Space Reserve and adjacent campus and residential properties;
- Improve and enhance the health and stability of the ecosystem;
- Enhance the visual design and aesthetic experience; and
- Maintain and ensure public access to the Reserve.

To this end, the initial years of Vegetation Management Plan implementation will include "1) removing dead, dying, unhealthy and structurally unsound trees, 2) controlling low-growing vines and shrubs that would compete with desired vegetation, 3) preventing sprouts from decayed stumps (these sprouts would also contain decay), and 4) planting new trees."[11] Based on review of the Vegetation Management Plan and the Final EIR[12] prepared for the Plan, the condition of the blue gum eucalyptus trees, the dominant tree species in the Reserve, has declined over the past decade due to overcrowded growing conditions, many years of drought, forest pathogen infestation, and the age of the stand. More than 25 percent of the standing trees in the Reserve are dead, and many of the remaining trees are declining in health with high risk of mortality or are structurally unsound. In the interest of public safety, tree removal efforts would focus on dead and dying trees near trails and buildings. Thinning of the Mount Sutro Reserve forest would be selective, based on the health of the forest across the mountain. The great majority of existing live trees— would remain following implementation of the plan. In general, the northernmost area of the Reserve, which is closest to the New Hospital site and the other principal campus buildings, would be less aggressively thinned than would other areas higher up on Mount Sutro. Therefore, while there would be some change in views from within the Reserve, such changes closest to development proposed pursuant to the CPHP, including the proposed New Hospital, would be limited. Furthermore, the majority of the Aldea Housing perimeter would only be subject to individual tree removal of specific dead or dying trees, and thus views of Aldea Housing would also not be dramatically affected by the Vegetation Management Plan. Therefore, the conclusions of the Draft EIR with respect to views from within the Reserve are valid.

Other comments (**O-PARKIN-11**, **I-Kessler-9**) object to the CPHP's proposed amendment to the UCSF LRDP to "clarify that sub-objectives 1B and 1C would not apply to the New Hospital project, in recognition of the substantial amount of space required for the New Hospital, although UCSF would make efforts during the design process to come as close as possible to meeting these objectives, if feasible." Sub-objective 1B states, "Acknowledge and respond to local zoning and height and bulk limitations to the extent possible" and sub-objective 1C states, "Design new buildings to be sensitive to the surrounding neighborhood and landscape, taking into account use, scale, potential noise generation, and density." This comment does not address the adequacy of the Draft EIR's analysis of aesthetics but instead is directed at the merits of the proposed project. The comment will be considered by the Regents in their deliberations concerning project approval. Moreover, as noted in the context of the San Francisco General Plan, above, a policy inconsistency does not necessarily indicate a significant effect under CEQA. Finally, the LRDP does not set forth EIR significance standards. Physical effects of the proposed CPHP with respect to aesthetics are fully analyzed in the Draft EIR, as explained above throughout this response.

One comment (**I-Leonard-19**) states that the proposed New Hospital would encroach into the Reserve. The Draft EIR acknowledges that the New Hospital may encroach into the Reserve in Chapter 3, Project Description, on page 3-26; and in Section 4.1, Aesthetics, on page 4.1-35.

Another comment (**O-SFFA-3**) states that redevelopment of the Aldea Housing complex would "certainly lose its charming woodsy character of wood-shingled low buildings." The comment does not address the adequacy or accuracy of the Draft EIR, but rather states an opinion regarding the proposed CPHP. The comment will be considered by the decision-makers in their deliberations on the proposed project and the Draft EIR fully analyzes aesthetics in keeping with the thresholds presented on page 4.1-19 of the Draft EIR.

In light of the foregoing, the Draft EIR reasonably concluded that the impact of the CPHP on scenic vistas and scenic quality would be less than significant. Because the effects related to scenic vistas and scenic quality were determined to be less than significant, no mitigation measures are required and none are identified in the Draft EIR. Likewise, no alternatives are required to address these aesthetic effects. However, it is noted that Alternative 1B, No Project—Development Under 2014 LRDP, and Alternative 2, Reduced Project, would both have lesser effects with respect to aesthetics than would the proposed CPHP, including effects on scenic vistas and scenic quality.

8.3.3.8 Master Response 8: Wind Impacts

This master response responds to the following organization and individual responses: **O-LD2-20, O-LD2-45, O-LD2-73**, **O-PARKIN-15,** and **I-Goodman-10**.

Comments **O-LD2-20** and **O-PARKIN-15** state that the Draft EIR, despite finding wind effects to be significant and unavoidable, "defers the formulation of actual mitigation measures to lessen the Project's wind impacts to an undetermined future time" (O-LD2-20). However, the proposed CPHP does not include approval of a specific design for any new building, including the CPHP Initial Phase components. As stated on Draft EIR page 3-20, "It is important to note that building

sizes, heights, and massing are conceptual and remain approximate as the buildings are not yet designed." Particularly as to the proposed New Hospital, as stated on page 3-2, "Broad parameters for the New Hospital project (location, size, mass, height …) are accounted for in the CPHP and are analyzed at a program level in this Draft EIR. Further details of the New Hospital are being developed, including the specific design. Those elements of the New Hospital will be the subject of a subsequent project-specific environmental review when more details become available." Because precise evaluation of a building's wind effects can only be undertaken in a wind-tunnel analysis, and because such an analysis provides useful information only when an actual specific building design is evaluated, it is not possible to provide more detail regarding potential wind impacts and potential mitigation measures, if required, at this time, absent the development of specific building designs. As explained on Draft EIR page 4.1-21, the Draft EIR's wind analysis was based on computational wind engineering, a computer simulation methodology. The analysis was based on a simple massing model of proposed CPHP development, and not on actual building designs, which, as noted, have not yet been prepared. As stated on page 4.1-21:

> The computational analysis provides information regarding wind flows over the entire site, unlike the individual point-based analysis undertaken in a wind tunnel, and thus is able to reliably predict wind comfort conditions across a relatively wide area, such as the Parnassus Heights campus site. Computational wind engineering does not, however, account for turbulence (variation in wind speed and direction) in the same manner as does wind-tunnel testing, which is more appropriate for evaluation of actual specific designs of tall buildings. Moreover, computational analysis cannot identify exceedances of the wind hazard criterion due to its inability to reliably simulate turbulence using currently accepted methods. Therefore, the analysis evaluates compliance with the pedestrian comfort criterion, which generally characterizes wind conditions, although inferences can be drawn concerning potential locations of hazardous wind conditions. However, at the planning level of the CPHP, computational wind engineering is a valid tool for generalized evaluation of potential wind effects.

Comment **O-PARKIN-15** requests what would essentially be a meaningless wind-tunnel analysis of a building that has yet to be designed. Such an analysis would not provide actionable information. That is, such an analysis would *not* answer the question as to whether the building massing that is ultimately proposed as the design for the New Hospital would result in exceedances of the 26-miles-per-hour significance threshold, nor would it allow for formulation of mitigation measures or alternatives should such exceedances(s) be revealed. This is because it is simply not possible to derive accurate wind speeds for individual test points—the approved methodology for wind tunnel testing in San Francisco—absent an actual specific building design, which, as noted above, is not yet available. The same holds true for other potential new, relatively tall buildings, including the Irving Street Arrival, Research and Academic Building, and Initial Aldea Housing Densification project. In the context of point-specific wind hazard evaluation, as is done in a wind tunnel analysis, the commenter's statement that "it is obvious that analysis of a structure without any features or articulation could be examined to determine how significant the environmental impact may be without any mitigations" is simply incorrect because changes in building height, shape, and massing do not produce changes in pedestrian-level winds in a linear fashion (unlike, for example, shadow, the length of which is entirely dependent on building location and massing).

Winds interact with a building, and with surrounding buildings, in ways that are not easily predictable and it is for this reason that wind-tunnel testing is specific to the design of an individual structure. Given the foregoing, the Draft EIR adequately analyzes wind effects of the proposed project in the context of the information available.

Draft EIR CPHP Mitigation Measure AES-4 explains in detail the wind-tunnel evaluation that would be required for any building 80 feet or more in height that is proposed for development pursuant to the CPHP. Specifically, Draft EIR CPHP Mitigation Measure AES-4 includes a precise performance standard—the City of San Francisco's 26-mph pedestrian wind hazard criterion—against which such buildings would be evaluated. The mitigation measure also requires that any such exceedances be eliminated or reduced "to the maximum feasible extent." Because it cannot be known in advance of wind-tunnel evaluation of specific building designs whether, and to what degree, the buildings would cause exceedances of the wind hazard criterion, Draft EIR CPHP Mitigation Measure AES-4 allows for UCSF to reject as infeasible wind reduction strategies if "they would unduly restrict the proposed building's space program, result in operational inefficiencies, and/or substantially higher costs." Accordingly, in the absence of certainty that all future wind hazard exceedances could be avoided or fully mitigated, the Draft EIR concludes that wind effects would be significant and unavoidable.

CEQA requires that a project not be approved unless the lead agency adopts mitigation measures or alternative(s) that would avoid a project's significant effects; the lead agency determines that such measures or alternative(s) are within the jurisdiction of another agency and can and should be adopted by that agency; or the lead agency adopts findings of overriding considerations that specific economic, legal, social, technological, or other considerations make infeasible such mitigation measures or alternative(s) (CEQA Section 21081). Here, the only project under consideration for approval is the CPHP via an amendment of the LRDP. The proposed New Hospital will undergo a separate environmental analysis in its own EIR. Other specific projects, such as the proposed RAB, Irving Street Arrival, and Initial Aldea Housing Densification will be subject to further evaluation to ensure that they fit within the parameters analyzed in this EIR and, where necessary, imposition of feasible mitigation strategies to reduce or avoid significant wind impacts, pursuant to Draft EIR CPHP Mitigation Measure AES-4.

Two comments (**O-LD2-45** and **O-LD2-73**) state that the fact that the project proposes an amendment to the Parnassus Heights campus site building space and population ceiling does not excuse the EIR from having to analyze physical effects of the amendment's allowance for increased scale of development, such as effects on pedestrian winds. As explained above, wind effects are fully analyzed in the Draft EIR to the extent feasible, given the programmatic nature of project design. The wind analysis is based on building sizes and mass that reflect the revised space program that is subject of the proposed amendment to the space ceiling. As also explained above, subsequent wind analysis will be required for any building 80 feet or more in height, pursuant to CPHP Mitigation Measure AES-4, as specific individual building designs are put forth.

One comment (**I-Goodman-10**) states that CPHP Mitigation Measure AES-4 does not provide "any meaningful discussion" of what the measure means by requiring buildings to "minimize wind impacts at pedestrian level." But the text of the mitigation measure does precisely what the

commenter requests: as explained above, CPHP Mitigation Measure AES-4 includes a precise performance standard—the City of San Francisco's 26-mph pedestrian wind hazard criterion—against which such buildings would be evaluated. The measure continues, "If the wind tunnel analysis determines that the building(s)' design or buildout conditions would increase the hours of wind hazard exceedance or the number of test points subject to hazardous winds, compared to then-existing conditions, UCSF shall work with the wind consultant to identify feasible mitigation strategies, including design changes (e.g., setbacks, rounded/chamfered building corners, stepped facades, etc.), to eliminate or reduce wind hazards to the maximum feasible extent." Thus, the direction of CPHP Mitigation Measure AES-4 is to design buildings to avoid exceedances of the 26-mph pedestrian wind hazard criterion. Only if UCSF finds that "these changes or other wind speed reduction strategies are not feasible as they would unduly restrict the proposed building's space program, result in operational inefficiencies, and/or substantially higher costs" may a new building nevertheless be approved. Because this condition would result in a significant, unavoidable project impact, UCSF would have to adopt a written statement of overriding considerations for such subsequent individual building, documenting the reasons that the individual building is nevertheless being approved, as is required by, and permitted under, CEQA Section 21081 and CEQA Guidelines Section 15191.

8.3.3.9 Master Response 9: Shadow Impacts

This master response responds to the following agency, organization, individual, and public hearing comments: **A-SFP-37, O-LD2-29, O-LD2-44, O-LD2-45**, **O-LD2-73, O-LD2-72, O-LD2-81, O-LD2-82, O-PARKIN-16, I-Anderson-1, I-DeSnoo-1, I-DeSnoo-3, I-Goodman-11, I-Zeff-5,** and **PH-Scatena-33**.

Comment **A-SFP-37** states that the Draft EIR fails to include a quantitative analysis of shadow on San Francisco Recreation and Park Department property and overlooks three open spaces: the Interior Greenbelt, a Recreation and Park Department property located between Edgewood Avenue and Stanyan Street, south of 17th Street, on the east slope of Mount Sutro and southeast of the UCSF campus site; and two open spaces not owned by the Recreation and Park Department—the Garden for the Environment and White Crane Springs, located north and south of Lawton Street, respectively, on the east side of Seventh Avenue, southwest of the campus.

Comments **O-LD2-29** and **O-PARKIN-16** state that the Draft EIR's shadow analysis is inadequate because it fails to discuss the San Francisco General Plan Urban Design Element, the uses of park areas that would be shaded, and compliance with San Francisco Planning Code Section 295. Comments **L-LD2-44** and **O-LD2-72** state that the Draft EIR incorrectly concludes that the proposed project would not result in adverse shadow impacts on public open spaces and streets and sidewalks and would therefore not comply with San Francisco Planning Code Section 101.1. Comments **O-LD2-29, O-PARKIN-16**, and **I-Goodman-11** state that the Draft EIR's shadow analysis fails to properly account for the uses of park areas that would be shaded. Comment **O-PARKIN-16** also states that the Draft EIR is inconsistent with respect to its discussion of rooftop mechanical features. Several comments (**O-LD2-81, I-DeSnoo-1, I-DeSnoo-3, I-Zeff-5**, and **PH-Scatena-33**) state that the Draft EIR should consider shadow effects on streets and sidewalks and/or the neighborhoods surrounding the UCSF campus, including changes in solar

radiation. Comment **PH-Scatena-33** requests that UCSF provide neighbors with video shadow animation to that "the neighbors can actually see the shadow impacts of putting the Salesforce Tower in Cole Valley and the Inner Sunset." Comment I-Anderson-1 points out a map labeling error on one of the Draft EIR shadow figures. Comments **O-LD2-29, O-LD2-81**, and **I-DeSnoo-1** state that the Draft EIR should include mitigation for shadow impacts.

The three open spaces referenced in Comment **A-SFP-37**—the Interior Greenbelt, the Garden for the Environment and White Crane Springs—are not discussed in Impact AES-5 (shadow) because these three open spaces are all too far south of the campus site for any CPHP development shadow to reach. That the Interior Greenbelt would not be shaded by the CPHP is stated on Draft EIR page 4.1-14: "As shown in the shade and shadow study prepared by Prevision Design, no portion of the Interior Greenbelt would be affected by shadowing associated with the CPHP, and therefore, this open space is not addressed further in this section as it relates to shadow." The other two open spaces are not explicitly referenced, but it can be seen in the Full-Year Shadow Fan (see Draft EIR page 1,632, first image in Appendix SHDW) that shadow from CPHP development would not extend south beyond Kirkham Street at Seventh Avenue, and thus would not reach either the Garden for the Environment or White Crane Springs.[13]

Regarding the San Francisco General Plan Urban Design Element and San Francisco Planning Code Section 295, as explained on page 4.1-17, "Although the University is constitutionally exempt from local land use regulation when using properties under its control in furtherance of its educational mission, the University strives to be substantially consistent with local policies where feasible." Therefore, neither the San Francisco General Plan nor Planning Code Section 295 are "applicable" to the proposed CPHP. It is also noted that the statement in Comment **O-LD2-29** that "San Francisco's Shadow Policy states that a project over 40 feet in height has a significant impact if it will cause shadows on a property under the jurisdiction of San Francisco's Department of Recreation and Parks" is incorrect. The condition noted by the commenter is cause for a project to be subject to shadow analysis. However, the City and County finds a significant shadow impact only if shadow cast by a project would "substantially and adversely affects the use and enjoyment of publicly accessible open spaces."

Although the proposed CPHP is not subject to San Francisco Planning Code Section 295, the shadow analysis in the Draft EIR follows the Planning Department's analysis methodology set forth for implementation of Section 295. A substantive difference with respect to determination of significance is that Section 4.1 of the Draft EIR does not rely on quantification of the amount of shadow on Recreation and Park Department properties, as is typically required for projects under the jurisdiction of the City and County of San Francisco. CEQA does not require this analysis; in fact, nothing in CEQA makes reference to analysis of shadow impacts, and many lead agencies do not even consider shadow as part of CEQA analysis. The City and County of San Francisco has a voter-approved Planning Code requirement for shadow analysis (Section 295), and also

[13] The Garden for the Environment, located on San Francisco Public Utilities Commission land, was created in 1990 as a location for gardening and composting education. It operates a community garden as a non-profit organization under the administrative aegis of the San Francisco Parks Alliance. White Crane Springs is located on property owned by the San Francisco Unified School District. Also a community garden, White Crane Springs is managed by the Recreation and Park Department.

incorporates the analysis into its CEQA documents; both the Section 295 analysis and the CEQA analysis present quantification of shadow, measured in square-foot-hours.[14] Although UCSF has elected to undertake a qualitative analysis of shadow effects, based on graphical representation of shadow on affected open spaces, for purposes of CEQA analysis, quantification of shadow on all open spaces that would be affected is included, for informational purposes, in Appendix SHDW. The results of that analysis are summarized in **Table 8.3-3** below. As can be seen in the table, none of the five spaces evaluated (three parks and two school play yards) would sustain an increase in net new shadow due to CPHP development of as much as one-third of one percent, and most would receive far less new shadow.

TABLE 8.3-3
QUANTIFICATION OF SHADOW EFFECTS

Open Space/Location	Size (sq. ft.)	Existing Shadow		Net New Project Shadow	
		Square-Foot Hours	Pct. TAAS[1]	Square-Foot Hours	Pct. TAAS[1]
Golden Gate Park	44,728,912	217,422,029	0.131	8,091,947	0.005
Grattan Playground	66,249	34,143,738	13.85	716,661	0.29
Gamble Park	26,245	14,872,388	15.227	801	0.001
Grattan Elementary Sch.	30,398	31,685,678	28.01	72,263	0.06
Independence High Sch.	20,211	20,691,122	27.51	71,604	0.10

NOTE:
[1] Percent of Theoretical Annual Available Sunlight which the CPHP would eliminate with net new shadow

SOURCE: Prevision Design

Regarding San Francisco Planning Code Section 101.1, as noted by commenters, this section was added to the Code through voter approval of Proposition M in 1986. The addition of Section 101.1 added eight priority policies to the Planning Code: (1) preservation and enhancement of neighborhood-serving retail uses; (2) protection of neighborhood character; (3) preservation and enhancement of affordable housing; (4) discouragement of commuter automobiles; (5) protection of industrial and service land uses from commercial office development and enhancement of resident employment and business ownership; (6) maximization of earthquake preparedness; (7) landmark and historic building preservation; and (8) protection of open spaces and their access to sunlight and vistas. Prior to issuing a permit for any project that requires an Initial Study under CEQA, the City is required to find that the proposed project or legislation is consistent with the Priority Policies. However, as with the San Francisco General Plan and other San Francisco Planning Code sections discussed above, Section 101.1 is not applicable to the University, and no further discussion of Section 101.1 is required. Nevertheless, the priority policy applicable to shadow, Policy 8, is discussed on Draft EIR p. 4.1-18, and the Draft EIR contains a complete analysis of the physical effects of shadow on parks and other publicly accessible open spaces, as discussed both above and

[14] A square-foot-hour is one hour of sunlight on an area one square foot in size. The San Francisco Planning Department calculates the percentage of the Theoretical Annual Available Sunlight (TAAS) that would be eliminated by a project. TAAS for any given open space is 3,721.4 times the total area (square footage) of the park, 3,721.4 being the number of hours in the shadow year as defined by Section 295 (from one hour after sunrise to one hour before sunset).

below in this master response. (It is noted that the comments concerning Section 101.1 also make reference to shadows on streets and sidewalks, which are not covered under Section 101.1. Please see below for a discussion of the Draft EIR's treatment of shadow on streets and sidewalks.)

Concerning the Urban Design Element, what the commenters (**O-LD2-29, O-LD2-80, O-LD2-81**) refer to as "Urban Design Guidelines" ("plazas or parks located in the shadows cast by large buildings are unpleasant for users and large buildings can be oriented to minimize shadows falling on public or semi-public open space") are taken from the "Fundamental Principles for Major New Development" under Urban Design Element Objective 3, "Moderation of Major New Development to Complement the City Pattern, the Resources to be Conserved, and the Neighborhood Environment." As noted previously, the San Francisco General Plan is not applicable to the proposed CPHP. Nevertheless, for information, it would appear that the language in the Urban Design Element is intended to avoid placement of new tall buildings of substantial bulk so close to parks and plazas as to cast substantial amounts of shadow on these open spaces, as this is what is illustrated by the images that accompany the text in the Urban Design Element. Here, as explained in Draft EIR Section 4.1 and in this response, minimal new shadow, at limited times of the day and year, would fall on any of the three parks that would be newly shaded by CPHP development.

Usage of parks and other open spaces is relevant to the consideration of shadow effects. Comment **O-LD2-29** states that the area of Golden Gate Park that would be shaded by the proposed New Hospital—specifically, Big Rec ballfield—is used for many things other than baseball. The commenter indicates Big Rec ballfield is heavily used for soccer, tai-chi, frisbee, running and other activities at all hours of the day and at all times of the year. The commenter further indicates the shadowed area includes hiking/jogging trails which are very popular for dog walking, running, hiking and other activities at all hours; and that this is one of the most heavily used areas of the popular park. Comment **O-Parkin-16** notes that Big Rec "may be used for other activities [than baseball] in the morning, such as walking or exercise, and that shadow during the winter will cause an impact." Comment I-Goodman-11 makes a similar claim. As shown in Draft EIR Figure 4.1-35 on page 4.1-68, shadow from the proposed New Hospital would cover a relatively small area of the ballfield. Moreover, long shadows early in the morning are fast moving: as can be seen in the shadow diagrams in Draft EIR Appendix SHDW, shadow would leave the ballfields shortly after 8:30 a.m., and recede entirely from Golden Gate Park by a few minutes after 9:30 a.m. The relatively minimal area and duration of shading means that park users desiring sunlight could easily move a short distance to a non-shaded location. Therefore, the Draft EIR reasonably concluded that the effect of shadow cast on Golden Gate Park by the proposed New Hospital would not substantially and adversely affects the use and enjoyment of publicly accessible areas of Golden Gate Park, and therefore the impact would be less than significant.

Concerning rooftop mechanical equipment, the proposed New Hospital may have some rooftop mechanical equipment, although, as noted in footnote 3 on Draft EIR Chapter 3, Project Description on page 3-26; footnote 8 in Section 4.1, Aesthetics, Wind and Shadow on page 4.1-23; and Section 4.10, Land Use and Planning on page 4.10-16, it is anticipated that "the majority of mechanical equipment would be contained within various levels of the New Hospital to minimize the amount of equipment located on the roof." As also stated in the footnote, the New Hospital

may have a rooftop observation deck and elevator vestibule. It is noted that commenter identifies an inconsistency in footnote 11 on Draft EIR Section 4.1, Aesthetics, Wind and Shadow on page 4.1-67 that incorrectly states that the 294-foot height excludes potential rooftop observation deck and vestibule; and that no rooftop equipment/enclosures are proposed for the New Hospital. Please refer to Section 8.5 of this Comments and Responses document for proposed revisions to this footnote.

It is likely that most, if not all, rooftop equipment would be set back some distance from the building façades. As a result, these appurtenances would likely cast little or no additional shadow beyond that cast by the overall building mass except in the early morning and late afternoon, around the winter solstice. This is because the sun is too high in the sky during much of the day for shadow to be cast by, for example, a 20-foot-tall mechanical enclosure that is set back 25 feet from the building façade. Moreover, rooftop equipment and enclosures would likely cover a relatively small portion of the New Hospital roof, further reducing the amount of shadow that could potentially be cast by such structures. The net result would not substantially increase the amount of shadow in comparison to that cast by the 294-foot-tall building mass and, therefore, would not affect the conclusions of the Draft EIR's shadow analysis. It is noted that the actual building design that is eventually put forward for the proposed New Hospital will undergo its own detailed shadow analysis as part of the separate EIR for the New Hospital.

Regarding shadow on streets and sidewalks and other neighborhood locations, as explained on Draft EIR page 4.1-50, "The CEQA threshold of significance for shadow impacts used in this EIR is whether a project would create new shadow in a manner that would substantially and adversely affect the use and enjoyment of publicly accessible open spaces. Therefore, the significance of shadow cast on streets, sidewalks, and private properties is not used as the basis for determining shadow impacts." Nevertheless, the shadow diagrams in Draft EIR Section 4.1, and the more complete set of 116 shadow diagrams in Draft EIR Appendix SHDW, graphically portray the extent of net new shadow that would fall on all locations throughout the Parnassus campus vicinity. As can be seen from the Full-Year Shadow Fan (see Draft EIR page 1,632, first image in Appendix SHDW), for the most part, areas one block or more distant from the campus site would be subject to only occasional shadow during the course of a year. This means that these areas would be shaded only before about 7:30 a.m. and after about 6:00 p.m. around the summer solstice; before about 9:00 a.m. and after about 4:00 p.m. around the spring and fall equinoxes; and, around the winter solstice, before about 10:30 a.m., except that the proposed New Hospital would continue to cast small amounts of net new shadow farther than one block away throughout the remainder of the day on the winter solstice, as can also be seen on Draft EIR Figures 4.1-32, -33, and -34.

Because the Draft EIR identifies no significant effects resulting from shadow cast by development pursuant to the CPHP, no mitigation is required.

Regarding the request for video shadow animation, this is a comment on the merits of the proposed CPHP and not on the adequacy or accuracy of the Draft EIR. It is noted that an animation of sorts is available to the reader by scrolling (electronically) through a PDF version of Appendix SHDW. Appendix Shadow on pages 1,633 to 1,669 of the Draft EIR present hour-by-

hour shadow diagrams for the solstices and equinoxes. These diagrams generally bracket the shadow effects over the course of a year. For the record, it is noted that the proposed New Hospital, at 294 feet, would slightly over one-fourth as tall as Salesforce Tower.

Two comments (**O-LD2-45** and **O-LD2-73**) state that the fact that the project proposes an amendment to the Parnassus Heights campus site building space and population ceiling does not excuse the EIR from having to analyze physical effects of the amendment's allowance for increased scale of development, such as shadow effects. As explained above, shadow effects on parks and open spaces, as well as streets and sidewalks, are fully analyzed in the Draft EIR, based on building sizes and mass that reflect the revised space program that is subject of the proposed amendment to the space ceiling.

One comment (**I-Scatena-5**) states that the proposed New Hospital would increase shading on Sutro Forest. As can be seen in Draft EIR Figures 4.1-20 through 4.1-34, and in Draft EIR Appendix SHDW, the New Hospital would cast very little shadow on Sutro Forest because the forest is generally located due south of the hospital site. The proposed New Hospital would therefore shade only the narrow portion of the Sutro Forest Open Space Reserve that is west of Edgewood Avenue and north of approximately a line drawn west from the intersection of Belmont Avenue and Willard Street. Development pursuant to the CPHP would also add a small amount of shadow in a narrow band east of Koret Way. Project shading on both of these areas would occur in the late afternoon, year-round.

Regarding the incorrect street names noted in Comment **I-Anderson-1**, the comment is correct that two streets in the shadow figure for Grattan Elementary School are incorrectly labeled in Draft EIR Figure 4.1-38, page 4.1-73. Please refer to Section 8.5 of this Comments and Responses document for proposed revision. In addition, corresponding shadow figures for Grattan Elementary School included in Appendix SHDW are revised as well in Section 8.5. These figures are otherwise correct and this error does not alter the conclusions of the shadow analysis.

8.3.3.10 Master Response 10: Bird Strikes

This master response responds to Comments **O-LD2-32, O-LD2-33, O-LD2-36, O-LD2-37, O-LD2-86, O-LD2-88, O-LD2-89, O-LD2-90, O-LD2-93, O-LD2-94**, and **O-PARKIN-23**. Commenters expressed concern about an increase in bird strikes from the larger buildings proposed under the CPHP. These comments considered the Draft EIR analysis of bird strike impacts to be inadequate because it did not quantify the magnitude of this potential impact. Comment **O-LD2-89** includes California Academy of Sciences window strike data to emphasize the numbers and variety of birds impacted by window strikes. Comments **O-LD2-32** and **O-LD2-89** estimate that full buildout of the CPHP could result in 6,716 (3,208 – 8,823) bird deaths per year, assuming a certain amount of glass façade per foot of office space based on other buildings in San Francisco, and adding 20 percent to account for the "growing demand" for glass facades. Comment **O-LD2-89** further states the CPHP could result in a 100-year toll from this average annual fatality rate of more than half a million birds. The analysis of the potential for bird strikes to increase at the Parnassus Heights campus site under the CPHP is programmatic. Most buildings in the CPHP are not

immediately adjacent to the Reserve and would replace mid-rise buildings with more mid-rise buildings, which would not represent a substantial new barrier. The exception is the New Hospital, which will be analyzed in a later project-level EIR. Because the specific materials, size and massing of the buildings that would be built under the CPHP are not known at this time, it is not possible to quantify this impact.

The Draft EIR Section 4.3, Biological Resources, Impact BIO-2 discusses the potential for bird window collisions, noting the location of San Francisco along the Pacific Flyway, and citing that approximately 100 million to 1 billion birds die in North America as a result of collisions each year. The Draft EIR acknowledges that construction of taller development on the campus site under the CPHP, most notably the New Hospital, which would be developed adjacent to, and could require modification of, the Reserve boundary, would increase the likelihood of birds striking windows of that building during flight. The Draft EIR states that in addition, potential construction night lighting, and building night lighting associated with operation of the new development under the CPHP can attract migratory birds and increase the likelihood of strike injuries or mortality. The Draft EIR also notes potential indirect effects for migratory birds include delayed arrival at breeding or wintering grounds, and reduced energy stores necessary for migration, winter survival, or subsequent reproduction. Accordingly, the Draft EIR considers the impact of the CPHP to result in bird strikes as significant, and identifies implementation of CPHP Mitigation Measure BIO-2a to reduce construction-phase impacts to birds, by avoiding night construction in habitat areas and reducing lighting, and CPHP Mitigation Measure BIO-2b to design buildings using less reflecting glass, reduce lighting, and site them to reduce reflectivity. These measures are derived from San Francisco's *Standards for Bird-Safe Buildings* (2011), and would reduce impacts for bird strikes to a less than significant level.

Comment **O-LD2-93** supports the element of CPHP Mitigation Measure BIO-2b as it would minimize the use of glass facades. However, the commenter asserts that the mitigation measure is considered inadequate because building designs have not been determined. As stated in the Draft EIR, Section 1, Introduction, page 1-7, the CPHP EIR provides a program-level analysis of the environmental impacts that could result from the development of the entire space program under the CPHP, and identifies Plan-level mitigation measures to reduce potential significant effects of the CPHP. The CPHP does provide a project-level analysis for certain CPHP Initial Phase developments, including the Irving Street Arrival, RAB, and initial Aldea Housing Densification; and certain Initial Phase improvements. Regardless, the same mitigation measures (CPHP Mitigation Measures BIO-2a and -2b) would apply to both the Plan and these Initial Phase projects and improvements to adequately reduce the potentially significant impact from bird strikes to a less than significant level. As discussed in Chapter 1, Introduction, on pages 1-7 to 1-8 in the Draft EIR, the New Hospital will be the subject of a project level EIR when more details about this project, including building design become available. Similarly, when details of CPHP Future Phase projects are known, each Future Phase project would be reviewed in light of the CPHP Final EIR to determine the appropriate level of additional environmental review, if any, needed before approval and implementation of the particular project. The project level analysis will analyze the potential for bird strikes in more detail and incorporate CPHP mitigation measures to avoid and minimize impacts on birds.

Comments **O-LD2-33** and **O-LD2-93** also considered the taller buildings on the Flyway to pose a significant threat to bird and bat movement along the Pacific Flyway. It is acknowledged that taller buildings are more likely to cause collisions with migrating birds and bats, however, this potential impact is highly localized within the context of the Pacific Flyway, which encompasses the whole western United States. Comment **O-LD2-93** recommends surveys of the project area to characterize flight patterns and reactions to existing buildings and timing of bird and bat flights prior to development of mitigation measures for bird collisions, as well as detailed studies of siting to minimize collisions and energy expenditure during migration. It should be noted that UCSF will consider potential impacts to migratory birds in siting proposed buildings as part of CPHP Mitigation Measure BIO-2b. Siting of buildings in the CPHP will also be influenced by the needs of the campus, the limitations of available space, and other factors. The recommendation for more detailed flight pattern studies is noted, however, CPHP Mitigation Measures BIO-2a and -2b will reduce the potential bird strikes to occur under the CPHP to a less than significant level by siting buildings to limit collision and by designing buildings to limit light and reflectivity, thus minimizing bird strikes.

8.3.3.11 Master Response 11: Toland Hall Murals

This master response addresses the issues raised in Comments **A-SFHPC-2** through **A-SFHPC-4, A-SFP-2** through **A-SFP-9, O-LD2-21, O-TL1-1** through **O-TL1-5, O-NZA-2, O-NZA-4** through **O-NZA-6, O-NNDPA-2, O-NNDPA-4, O-NNDPA-6, O-SFPC-1** through **O-SFPC-4, O-NAACP-1, O-SFH-2** through **O-SFH-8, I-Calvin-1, I-Calvin-2, I-Cherny-2** through **I-Cherny-5, I-Kelly-2, I-Rothstein-2** through **I-Rothstein-4, I-McMorris-1** through **I-McMorris-3, I-Ungaretti-2** through **I-Ungaretti-7, I-Marcuse-1, I-Marcuse-3, I-Marcuse-4, I-Hutchinson-1** through **I-Hutchinson-3, I-Klein-2** through **I-Klein-4, I-Vernitsky-2** through **I-Vernitsky-5, I-Denney-2, I-Denney-3, I-Cohen-1, I-Horton-1, I-Rothman-2** through **I-Rothman-4, I-Rothman-6, I-Rothman-7, I-Yap-1, I-Yap-3** through **I-Yap-9, I-Cater-1, I-Plane-2** through **I-Plane-7, I-Wrynn-3** through **I-Wrynn-6, I-George-2** through **I-George-4, I-Starn-1** through **I-Starn-4, I-Scatena-8, I-Brown2-1, I-Yang-1, PH-Quick-6, PH-Quick-7, PH-Ungaretti-11, PH-Rothman-12, PH-Rothman-13, PH-Yap-14** through **PH-Yap-16, PH-Semler-30,** and **PH-Zakheim-37**.

The University is currently assessing how best to relocate the large 10-panel set of murals, the "History of Medicine in California," painted on the walls of Toland Hall auditorium in the century-old UC Hall. UC Hall is seismically deficient and functionally obsolescent, and is proposed to be replaced by a new facility that meets California's seismic codes.

The Draft EIR discusses that two historical preservation firms retained by the University independently concluded that the murals' fragile condition, large size, the curved walls on which most of them are painted, ground movements, and the aging of UC Hall make it likely that any attempt to relocate them could result in irreparable damage to at least some of the panels such that the integrity of the entire series could be destroyed. Based on these independent evaluations, UCSF has determined that it may be infeasible to remove and relocate the murals as there is no guarantee that any effort to remove them would be successful.

For reasons discussed in the Draft EIR, UC Hall and the murals are considered historical resources for CEQA purposes. To provide a conservative analysis, the Draft EIR described the potential worst-case scenario that the murals may be damaged or destroyed in the process of removing them, potentially resulting in a significant impact on historical resources. The Draft EIR identified a mitigation measure to address the impact on the murals, requiring the implementation of a digital imaging and virtual preservation program. Assuming the project to remove the murals would be implemented, the Draft EIR conservatively assumes the impact on historical resources would be unavoidable, given their fragile condition and other considerations discussed above, even with the implementation of the identified mitigation measure.

Nonetheless, outside of the CEQA process, the University continues to assess how best to safely relocate the murals, given that UC Hall is proposed to be demolished. UCSF has recently selected a historic preservation firm to design and implement the process of relocating the murals to a storage facility until a permanent home can be found. Assuming removal of the murals to a temporary storage facility is successful, UCSF will explore options to either return the murals to the Parnassus Heights campus site to be incorporated in a future new building that can accommodate them, or to relocate them to a museum or other institution where they can be maintained by experts and made accessible to a broad public audience. Potential options for returning the murals to the Parnassus Heights campus site include one of the planned new building sites under the CPHP, provided public access and sufficient space are available in the proposed building and do not conflict with critical clinical, research, and educational needs outlined in the CPHP. Potential options for off-site locations include a museum or similar institutional setting, which would expand accessibility to scholars and the public possibly providing a greater opportunity for the public to learn about the murals' creation and the history they depict.

Throughout the planning process for the murals, UCSF has reached out to a number of stakeholders, including Bernard Zakheim's family, historic preservationists, conservation groups, and the U.S. General Services Administration (GSA) —which is responsible for stewardship of artworks created under the New Deal art programs of the 1930s and '40s. Furthermore, the murals contain a portrayal of Bridget "Biddy" Mason, a formerly enslaved woman who rose to become a pioneering midwife, entrepreneur, and philanthropist in Los Angeles, and who is depicted in the murals as a medical authority. UCSF learned about Ms. Mason's extraordinary life story and achievements from the Biddy Mason Charitable Foundation and is in dialogue with them. Separately, Ms. Mason's descendants have reached out to UCSF and are involved in the discussion about the options being explored for the murals.

8.3.3.12 Master Response 12: Stormwater, Wastewater, and Water Quality[15]

Comments submitted by the San Francisco Planning Department (**A-SFP-31** through **A-SFP-36**), and the Law Offices of Thomas N. Lippe on behalf of San Franciscans for Balanced and Livable Communities (**O-TL3-1** through **O-TL3-14**) raised issues related to anticipated increases in

[15] Information in this master response in based in part on a *Wastewater/Stormwater Performance Standards Technical Memorandum* prepared by Hydroconsult Engineers, Inc., December 10, 2020. See **Appendix PS** in this Comments and Responses document.

stormwater and wastewater flows as a result of the CPHP. Among other things, comment letter O-TL3 objected to the Draft EIR's conclusion that impacts from increases in flows under the CPHP would be less than significant on the bases of the relatively small volume of the flows, the available excess dry weather capacity of the City's treatment plants that would receive the flows, and the applicable regulatory requirements governing those treatment plants. The comments also addressed City requirements that might apply to the CPHP, requested modeling of flows in cooperation with the San Francisco Public Utilities Commission (SFPUC), and proposed a number of possible mitigation measures, including stormwater detention, wastewater recycling and reuse, payment for necessary downstream improvements, and payment of a wastewater capacity charge and water capacity charge to offset impacts to the City's infrastructure. These comments are responded to under several topic headings below.

Topic 1: CEQA Baseline, Regulatory Setting, and UCSF Practice

As noted in the Draft EIR Section 4.9, Hydrology and Water Quality, and Section 4.16, Utilities and Service System (pages 4.9-1 and 4.16-5), the Parnassus Heights campus site is served by the City of San Francisco's combined sewer system (CSS), which conveys stormwater and sanitary sewage flows to two of the City's treatment plants for treatment. Depending on the drainage basin on the campus site that UCSF's wastewater and stormwater are generated within, these flows are directed to the City's CSS and conveyed either east to the Southeast Treatment Plant (SEP) or west to the Oceanside Treatment Plant (OSP). The SEP discharges treated effluent to the San Francisco Bay and the OSP discharges treated effluent to the Pacific Ocean. The Draft EIR (pages 4.9-1 to 4.9-3, and pages 4.16-5 to 4.16-6) indicates the capacity of each treatment plant in dry and wet weather, and also notes that "depending on individual storm characteristics and timing, the treatment plants can be overwhelmed, which results in discharge of minimally treated flows to the Bay and/or Ocean." Discharges to receiving waters are subject to requirements and limitations included in permits issued by the Regional Water Quality Control Board (RWQCB). Comment letter O-TL3 provided data regarding observed non-compliance, permit violations, and past, present, and likely future enforcement actions. While UCSF is not in a position to verify observed non-compliance or opine on potential future enforcement actions, the commenter makes the valid point that existing water quality in the Bay and the Ocean is negatively affected by wet weather discharges, and that condition is part of the CEQA baseline for evaluation of impacts.

As noted on page 4.9-3 of the Draft EIR, UCSF owns and maintains the stormwater collection system internal to the Parnassus Heights campus site, which discharges to the City's CSS at points of connection along Parnassus Avenue, Kirkham Street, Irving Street, and Clarendon Avenue. The Draft EIR explains (page 4.9-6) that UCSF's stormwater system is subject to the State Water Resources Control Board (SWRCB) General Permit from Storm Water Discharges from Small Municipal Separate Storm Sewer Systems (MS4s) permit (Order No. 2003-0005-DWQ, as revised by 2013-0001-DWQ in 2013). The revised Phase II General Stormwater Permit requires UCSF to develop, implement and enforce a Stormwater Management Plan with certain required measures for projects which create or replace more than 5,000 square feet of impervious surfaces. These requirements include, among other things, site design measures aimed at reducing the volume of runoff, and low impact design (LID) features aimed at reducing runoff volume and pollutants.

While UCSF is (contrary to a commenter's assertion) not subject to the City's Stormwater Management Ordinance, in practice, UCSF has a long history of cooperative engineering and design interactions with the SFPUC regarding infrastructure connections associated with planned development wherever necessary. Most recently, more than 4 million square feet of UCSF developments at the Mission Bay campus site over the past 15 years have involved UCSF working intensively to ensure SFPUC can successfully transition from San Francisco's CSS to a separated system district at Mission Bay, where stormwater and wastewater are handled in separate collection systems, thereby reducing polluted runoff into the Bay. Other recent and past UCSF projects at its Mount Zion, Zuckerberg San Francisco General Hospital and Trauma Center (ZSFG), and other campus sites have conformed with City standards and infrastructure plans in the context of the City's CSS. UCSF will continue to work with SFPUC during implementation of the CPHP. Specifically, UCSF anticipates modeling increased sewer demand for proposed development projects under the CPHP that have the potential to affect the City's CSS capacity, and providing the SFPUC with documentation that the capacity of the City's adjoining CSS system will not be exceeded. If the modeling determines that the CSS capacity would be exceeded, the University would pay its proportional share of the costs of expanding the sewer system to accommodate the increased flows from the campus site. UCSF pays all of the applicable SFPUC capital facilities fees per Government Code Section 54999.

As discussed on Draft EIR page 4.9-7, UCSF is also subject to the UCOP Sustainable Practices Policy, which requires that UCSF prepare and maintain a Water Action Plan for each campus, identifying long-term strategies for achieving sustainable water systems. Consistent with this Water Action Plan, UCSF has reduced its use of potable water at the Parnassus Heights campus site by an estimated 40 percent over the last 10 years.[16]

Topic 2: Anticipated Stormwater and Wastewater Flow Increases

As indicated in Impacts HYD-1 and HYD-2 in the Draft EIR, development under the CPHP is anticipated to increase impervious surfaces on the Parnassus Heights campus site by about one acre, thereby incrementally increasing stormwater flows over existing conditions.[17] Under the CPHP, these flows would be directed to the City's CSS and hence, to either the City's OSP and/or SEP, depending on the location of the point(s) of discharge. UCSF would implement measures included in its Stormwater Management Program, including LID measures such as green roofs, permeable paving, and/or other infiltration-based stormwater features, to effectively reduce expected offsite volume of discharges and pollutants, and make the necessary upgrades to its sewer collection facilities, where needed, on the campus site (Draft EIR Impact HYD-1 on page 4.9-10 to 4.2-12, Impact HYD-2 on pages 4.9-13 to 4.9-15, and Impact UTIL-1 on pages 4.16-4 to 4.16-15).

16 UCSF, *University of California San Francisco Water Action Plan 2018*.

17 As part of this Comments and Responses document, preliminary estimates of the increase in peak stormwater flow rates and volumes generated at the campus site under the CPHP as a result of increases in impervious surfaces were calculated for several design storms (including 1-, 2-and 5-year, 24-hour storms) using the U.S. Army Corps of Engineers HEC-HMS v4.4.1 program (see **Appendix HMA** in this Comments and Responses document.). In each of these scenarios, the increase in peak stormwater flow rates generated within the campus core under the CPHP was less than or equal to 0.3 cubic feet per second (a 0.8 percent or less increase over existing conditions), and the estimated increase in volume was 0.1 acre-feet (a 1.2 percent or less increase over existing conditions).

As indicated in Impact UTIL-2 in the Draft EIR (page 4.16-22), development under the CPHP is anticipated to increase wastewater flows by 0.18 mgd (90 percent of the increased water use) by CPHP buildout. This is likely an over-estimate given UCSF's commitment to water conservation and its continued investigation of a variety of strategies that will be implemented at the Parnassus Heights campus site, including replacing or retrofitting equipment, capturing roof drainage for irrigation purposes, connecting sump pumps to the Institute for Regeneration Medicine (IRM) rainwater water tanks and connecting the tanks to the central plant or irrigation.[18] It should be noted that UCSF investigated potential use of non-potable (recycled) water distribution lines within medical facilities at Mission Bay, and concluded that dual plumbing requirements would be infeasible in an outpatient medical setting because of the cost and concerns about cross connections and monitoring requirements. These conclusions would be applicable to medical facilities at the Parnassus Heights campus site as well.

Topic 3: CEQA Significance and Mitigation

As indicated by comment letter O-TL3, increases in stormwater or wastewater flows could contribute to degraded water quality if they would increase the volume or frequency of combined sewer overflows (CSOs). This has been acknowledged in a text change on page 4.9-12 of the Draft EIR (please refer to Section 8.5 of this Comments and Responses document for the proposed revision). As noted in Impact UTIL-1 on page 4.16-15 of the Draft EIR, increases in stormwater or wastewater flows could also result in significant impacts if infrastructure improvements are required, the construction of which would result in significant impacts.

To help address the potential for increased CSOs, under the CPHP, UCSF would have the ability to control where it makes sewer connections for the campus site to the City's CSS system, and therefore, control the flows it would send to either the OSP or the SEP, whichever the SFPUC deems to be better in terms of reducing the potential contribution to CSO occurrences. This ability to select the drainage basin has been reflected in a text change on page 4.16-22 of the Draft EIR (please refer to Section 8.5 of this Comments and Responses document for the proposed revision). In addition, UCSF plans to undertake the water conservation and reuse strategies identified above in the near term, with more in the future. UCSF is also aware that there may be improvements to the City's CSS periodically that increase the capacity of storage, pumping, or treatment, reducing the potential for CSO discharges into receiving waters.

Nonetheless, the increases in stormwater and wastewater flows to the City's system under the CPHP could impact water quality if they were to increase the volume or frequency of wet weather overflows from the CSS. To address this potential, UCSF has agreed to implement a mitigation measure that would commit the Parnassus Heights campus site to reduce stormwater flows into the CSS sufficiently to offset any increases in wastewater flows resulting from development under the CPHP and/or to demonstrate via use of the SFPUC's citywide Integrated Catchment Model (ICM) model that flows into the CSS would not cause or contribute to any increase in overflow volumes. This performance standard would effectively eliminate the potential that increased stormwater and/or wastewater discharges to the City's CSS due to the CPHP could

[18] List of future water conservation projects provided by UCSF staff on November 2, 2020, with a total projected annual water savings of over 15 million gallons per year.

contribute to overflows. The Parnassus Heights campus site would meet this standard by continuing to implement water conservation measures, by reducing stormwater flows via stormwater retention and/or reuse on the campus site, by reducing stormwater peak flows via stormwater detention, and could utilize off-campus capacity in the City's CSS if available.

UCSF would establish a baseline by using the SFPUC's model to estimate flows to the City's CSS prior to development of the CPHP, and would ensure compliance by repeating the modeling effort at every major phase of the CPHP (starting with the Initial Phase) or every five years, whichever is more frequent, through CPHP buildout. UCSF may choose to conduct the modeling analysis on its own and submit the analysis to the SFPUC for review, or request that the SFPUC conduct the analysis on UCSF's behalf, subject to reimbursement of the SFPUC's costs by UCSF. If, based on such analysis, UCSF determines that increased flows will not meet the specified hydraulic performance standards, UCSF will pay its proportional share of the costs of expanding the CSS to accommodate the increased flows from the Parnassus Heights campus site. If, based on the analysis, UCSF determines that flows will not meet the specified hydrologic performance standard, UCSF will modify its designs to incorporate additional retention/detention features until the performance standard is met.

There are several indicators that the performance standards can be feasibly met. First, as discussed in the Draft EIR Project Description, the proposed CPHP includes a 0.11 million gallon on-site emergency sewer effluent storage tank. This alone would represents over 60 percent of the CPHP's estimated average daily wastewater production at full buildout. This also indicates that construction of additional storage is an option (given ground conditions, available area, etc.).

Secondly, a cumulative analysis performed in support of the 19th Avenue Corridor Study in conjunction with the Parkmerced Project Final EIR, determined that overall flows to the CSS on the City's Westside will decrease over time due to the construction of several major projects that will include separation of sewers (from combined to separate system).[19] Furthermore, the City has enacted several ordinances (e.g., Non-potable Ordinance, Water Efficient Irrigation Ordinance, Residential Water Conservation and Commercial Water Conservation Ordinance), requiring new and redevelopment projects City-wide reduce potable water use, and secondarily decrease wastewater flow to the CSS.

Finally, the CPHP is located along the north-south ridge that separates the City's Western and Eastern drainage basins. Being at the upstream end of each basin increases the likelihood that the increased flows will have less of a volumetric impact than at the downstream end as there is more opportunity for balancing of available storage. It also allows for UCSF to allocate flow by basin to minimize overall impact.

UCSF would also construct and implement stormwater management controls consistent with the requirement of the City's Stormwater Management Ordinance (Article 4.2 of the San Francisco Public Works Code) and consult with SFPUC to ensure the capacity of the adjoining sewer system will not be exceeded. See Section 8.5 of this Comments and Responses document for the

[19] Hydroconsult Engineers, Inc., *Technical Memorandum, 19th Avenue Corridor Study Area – Cumulative Utilities Analysis*, January 14, 2010, Table 4.2.

agreed upon new mitigation measure (CPHP Mitigation Measure HYD-1). This mitigation measure would also address potential increases in impervious surfaces and stormwater flows due to improvements off-campus, which the Draft EIR notes would be subject to City requirements (Draft EIR p. 4.9-12).

Please also see Section 8.5 of this Comments and Responses document for corresponding edits made to Draft EIR for Impact HYD-1, Impact HYD-2, Cumulative Impacts C-HYD-1 and C-HYD-2; Impact UTIL-3; and for references to the hydrology and water quality impacts in the Alternatives chapter of Draft EIR.

As noted on page 4.16-15 of the Draft EIR, construction activities associated with utility improvements such as those necessitated by this mitigation measure would have the potential to result in significant or potentially significant impacts. However, compliance with mitigation measures and other construction-related regulatory requirements discussed in the EIR, including Section 4.2, *Air Quality*; Section 4.3, *Biological Resources*; Section 4.4, *Cultural Resources*; Section 4.6, *Geology and Soils*; Section 4.8, *Hazards and Hazardous Materials*; Section 4.9, *Hydrology and Water Quality*; Section 4.11, *Noise and Vibration*; and Section 4.15, *Transportation*, would reduce construction-related effects associated with utility improvements to a less than significant level.

With implementation of new CPHP Mitigation Measure HYD-1 presented above, and because construction of any related infrastructure improvements would not result in a significant environmental impact for the reasons cited here, the revisions to the text of the Draft EIR to address Comments A-SFP-31 through A-SFP-36 and O-TL3-1 through O-TL3-14 do not constitute significant new information per CEQA Section 15088.5 and do not necessitate recirculation.

8.3.3.13 Master Response 13: Land Use Impacts

This master response addresses the issues raised in Comments **O-LD2-41** through **O-LD2-43, O-LD2-68** through **O-LD2-71,** and **O-PARKIN-17** and **O-PARKIN-18, I-Craig-3,** and **I-Goodman-15** which assert that the Draft EIR fails to adequately analyze the CPHP's land use impacts in different respects.

Comments **O-LD2-41** and **O-LD2-69** reference the 1987 Memorandum of Understanding (MOU) entered into between UCSF and the City of San Francisco. As discussed on Draft EIR, Section 4.10, Land Use and Planning, page 4.10-6, the intent of the 1987 MOU is to foster harmonious relations between the City and UCSF regarding the growth and development of UCSF facilities within the City. UCSF has included those policies that are germane to the analysis of land use impacts in the Draft EIR. It is UCSF's intent to adhere to the extent practicable to City zoning codes, including building use, height, and bulk limitations; floor area ratios; and parking requirements or restrictions for the purpose of ensuring compatibility with the surrounding uses.

However, the 1987 MOU does not provide the City with approval authority over the 2014 LRDP, the proposed CPHP, or future projects proposed under the CPHP. Further, the 1987 MOU does

not require that the 2014 LRDP, the proposed CPHP, or future projects proposed under the CPHP comply with City land use and General Plan policies or City zoning codes. As plainly stated on Draft EIR, page 4.10-9, pursuant to the University of California's constitutional autonomy, development and uses on property under the control of the University that are in furtherance of the University's educational purposes are not subject to local land use regulation. Consequently, the controlling UC land use documents at the Parnassus Heights campus site are the 2014 LRDP and the 1976 Regents' Resolution. The exception to this would be for work to be implemented within the City's right-of-way, such as the Parnassus Streetscape Plan.

Impact LU-1 in the Draft EIR addresses the significance criteria of whether the CPHP would cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Accordingly, Draft EIR Impact LU-1 appropriately focuses on consistency of the CPHP with the 2014 LRDP and the 1976 Regents' Resolution. A consistency discussion of the CPHP with the 2014 LRDP provided on Draft EIR pages 4.10-10 to 4.10-11 shows that the proposed CPHP would be generally consistent with the planning principles and concepts set forth in the 2014 LRDP. The Draft EIR explains that UCSF's functional zone changes proposed under the CPHP are all internal to the campus site and do not involve a functional zone change that would place a new use adjacent to existing developed land uses outside of the campus site boundaries in such a way to create a land use conflict. Further, the zone changes would not result in land use conflicts with adjacent existing land uses on the campus site, because compatibility between adjacent existing and proposed functional zones was taken into consideration in developing the proposed zones in the CPHP. Existing land use patterns reflect campus development guided by the planning principles embodied in the previous LRDPs. The CPHP remains consistent with the same planning principles. On these bases, the Draft EIR concluded that implementation of the CPHP would have a less-than-significant impact regarding conflict with land use plans and policies adopted for the purpose of avoiding or mitigating an environmental effect.

The Draft EIR also discusses the consistency of the CPHP with the space ceiling limit set forth in the 1976 Regents' Resolution. The Draft EIR explains that to accommodate the proposed CPHP, the space ceiling in the resolution would need to be revised, and it reaffirms the University's continuing commitments in the Resolution by 1) maintaining the designation of the Mount Sutro Open Space Reserve as permanent open space; 2) continuing to respect the Parnassus Heights campus site boundary established in 1976; and 3) continuing to adhere to the expansion restriction area within which UCSF would not acquire property or lease residential property (Draft EIR p. 4.10-12).

Amendment of the Regents' Resolution would be required for the CPHP to proceed, resolving any policy conflict, and the Draft EIR acknowledges that the CPHP would increase both the space ceiling and population commitments, which in turn would result in environmental impacts. All potential environmental impacts associated with these policy changes are adequately disclosed in the CPHP Draft EIR, and mitigated to the maximum extent feasible. This is consistent with CEQA Guidelines Appendix G, which indicates that a policy conflict in and of itself is not a significant impact, rather, the question is whether the conflict would result in a significant environmental impact (Checklist Item XI, b). In this instance, there would be significant impacts which are

disclosed under other topic headings throughout the Draft EIR, and no significant environmental impacts were identified having to do with a land use policy conflict because the project could not proceed if it conflicted with governing policies adopted by the Regents. The CPHP Draft EIR concluded that the proposed CPHP would be consistent with the space and population commitments for the Parnassus Heights campus site, as amended, and the land use impact would therefore be less than significant. The Draft EIR also notes that with the open space swap proposed under the CPHP, there would be no decrease in the size of the Reserve.

It should be noted that it is not uncommon for agencies and local jurisdictions to consider amendments to their policy documents and regulations (e.g. general plans and zoning ordinances) in conjunction with and to accommodate major developments, such as is proposed in the case of the CPHP and the Regents' Resolution. This provides decision-makers and the public an opportunity to consider the potential impacts and objectives of policy changes with a specific project in front of them, rather than in the abstract.

Comment **O-LD2-41** incorrectly states that the Draft EIR ignores City land use and general plan policies, suggesting that compliance with these policies "are a key indicator of whether the Project is or is not compatible with the surrounding neighborhood." Comments **O-LD2-42** and **O-LD2-70** incorrectly list a number of UCSF 2014 LRDP Community Planning Principles (i.e., Land Use Principles LU2, LU3, and LU10) within a table labeled "General Plan/Zoning Changes" and "San Francisco General Plan and Zoning Code Excerpts," respectively. However, Community Planning Principles (included in Appendix D of the 2014 LRDP) are not City General Plan policies. Further, as correctly noted on Draft EIR pages 4.10-3 to 4.10-4, these Community Planning Principles are also not formal objectives or regulations of UCSF or its 2014 LRDP. Similarly Comment **O-PARKIN-17** lists Community Planning Principles LU1 and LU3. These Community Planning Principles were developed in collaboration with the UCSF Community Advisory Group, and accordingly, are advisory in nature only, and not used for judging significance of impacts.

In the same table, Comments **O-LD2-42, O-LD2-43, O-LD2-70,** and **O-LD2-71** list certain San Francisco General Plan Urban Design Element policies (Policy 3.5 and 3.6), and City zoning and height and bulk districts (RH-2, 25-X, 40-X, 65-X, 80-D, 130-D and 220-F), and dispute the consistency discussion in Impact LU-2. **I-Craig-3** indicates the New Hospital would be in violation of prescribed height and bulk restrictions and in direct conflict with the Planning Code. **I-Goodman-15** indicates the New Hospital is inconsistent with applicable zoning requirements.

As noted above, given that development and uses on property under the control of the University that are in furtherance of the University's educational purposes are not subject to local land use regulation, there is no requirement that the 2014 LRDP, the proposed CPHP, or future projects proposed under the CPHP, comply with City land use and General Plan policies or City zoning codes. As plainly stated on Draft EIR, page 4.10-9, pursuant to the University of California's constitutional autonomy, development and uses on property under the control of the University that are in furtherance of the University's educational purposes are not subject to local land use regulation. The Draft EIR cites and does not ignore City land use and General Plan policies. Draft EIR pp. 4.10-6 through 4.10-8, and Impact LU-1 on pages 4.10-13 to 4.10-15 provide a consistency discussion of the CPHP's proposed off-campus improvements within the City right-

of-way with those City General Plan and Better Streets Plan policies governing City streets. The Draft EIR concludes that the planned off-campus improvements along Parnassus Avenue would be consistent with the City of San Francisco policies for streets found in the General Plan and the Better Streets Plan.

Impact LU-2 in the Draft EIR addresses the 2014 LRDP Final EIR significance criteria of whether the CPHP would conflict with local land use regulations such that a significant incompatibility is created with adjacent land uses. Toward that end, the Draft EIR uses the City's height and bulk zoning regulations to assist in evaluating the CPHP's compatibility with adjacent land uses. Impact LU-2 discloses where development proposed under the CPHP would exceed the City height and/or bulk limits; this includes the proposed New Hospital (also noted by Comments **O-LD2-42**, **O-LD2-70** and **I-Craig-3**); as well as the Aldea Housing Densification project; and portions of the Millberry Union Towers project, Irving Street Arrival, and West Side Development.

With respect to the New Hospital, Impact LU-2 notes that due to the SB 1953 mandate at the Parnassus Heights campus site, inpatient uses currently at Moffitt Hospital must be relocated prior to 2030, necessitating the construction of the New Hospital. Impact LU-2 also describes the modern clinical, space and code requirements that necessitate the New Hospital to be of the size and location proposed under the CPHP (as further described in Draft Chapter 3, Project Description, Project Needs; and in Draft EIR Appendix SNA – Space Needs Assessment). Impact LU-2 affirms that while the University is exempt from local zoning whenever using property under its control in furtherance of its educational mission, UCSF strives to adhere to City zoning codes to the extent possible in accordance with 2014 LRDP objectives. Impact LU-2 also states that UCSF would design the New Hospital to avoid or minimize the effects of the conflict with the City's Planning Code, to the extent feasible. For these reasons, and because the CPHP would redevelop sites that are already built-out with buildings that provide educational, research, and clinical land uses in large, non-residential structures, the Draft EIR concludes that, on balance, the proposed New Hospital would be compatible with adjacent land uses.

Impact LU-2 acknowledges that the New Hospital would result in certain aesthetic, wind and noise effects at nearby residential land uses. Comments **O-LD2-42** and **O-LD2-70** also note these impacts, and also make reference to an analysis conducted by Jared Ikeda included in Comment Letter O-LD2, Exhibit D. These comments, and Comment **O-PARKIN-17** also take issue with the proposed LRDP amendment to LRDP sub-objectives 1B and/or 1C. As explained in Impact LU-2, Sections 4.1 and 4.11 in the Draft EIR address the aesthetic, wind and noise impacts of the New Hospital, and demonstrate that with incorporation of the amendments to the 2014 LRDP proposed under the CPHP; implementation of identified mitigation measures identified in the Draft EIR [CPHP Mitigation Measure AES-3 (to reduce light and glare effects), CPHP Mitigation Measure AES-4 (to reduce wind effects), and CPHP Mitigation Measure NOI-2 (to reduce operational noise effects)]; along with compliance with applicable codes, these effects would be mitigated to the extent feasible. With respect to the proposed LRDP amendment, it would clarify that sub-objectives 1B and 1C would not apply to the New Hospital project, in recognition of the substantial amount of space required for the New Hospital, although UCSF would make efforts during the design process to come as close as possible to meeting these objectives, if feasible. Please also refer to Master Response 7: Aesthetics, Master Response 8: Wind Impacts.

With respect to other development proposed under the CPHP, Impact LU-2 indicates that the proposed Irving Street Arrival and Millberry Union towers exceedance of the City height limits along Irving Street would be relatively small, and when considered in conjunction with the access benefits provided, these developments would be generally compatible with adjacent land uses. Impact LU-2 also finds that with respect to the West Side development, when considering the proposed buffering and stepped back design of the proposed structures from Fifth Avenue, the West Side development also would be compatible with adjacent land uses. Lastly, Impact LU-2 finds that when considering the proposed new Aldea Housing structures would be located in generally the same location as the existing housing structures, and given the setbacks and presence of substantial intervening vegetation, the Aldea Housing Densification project would be generally compatible with adjacent land uses.

Lastly, Impact LU-2 notes that for any potential CPHP encroachment into the Reserve, the CPHP-proposed Reserve land swap would ensure there would be no reduction in protected open space at the campus site. In consideration of all the above reasons, Impact LU-2 concludes that development under the proposed CPHP would not conflict with local land use regulations such that a significant incompatibility with adjacent land uses would be created.

8.3.3.14 Master Response 14: Population and Housing Impacts

This master response addresses the issues raised in Comments **A-SFP-29, O-LD2-47** and **O-LD2-48, O-LD2-58** through **O-LD2-67, O-Parkin-20, I-Welch-1, I-Goodman-17** and **I-Goodman-18**, and **I-Liederman-3** through **I-Liederman-5**. The commenters assert that the CPHP would create more jobs than housing, and would exacerbate the existing shortfall in housing in San Francisco and the broader Bay Area, and that the Draft EIR does not address how the demand for housing would be fully met and/or mitigated. Several comments misinterpret the CEQA requirements with respect to impacts on population and housing. Some of the comments (**O-LD2-47** and **O-LD2-48**, **O-LD2-58** through **O-LD2-67**) conflate the CPHP's impacts on population and housing with the issue of the CPHP's growth inducing effects. These are two separate areas of impact analysis under CEQA and are subject to different types of review and evaluations.

The master response below first explains the scope of population and housing impacts under CEQA and demonstrates that the Draft EIR's analysis is consistent with the CEQA requirements. The master response then sets forth the scope of growth inducing effects under CEQA and demonstrates that the analysis in the Draft EIR is consistent with the CEQA requirements.

Topic 1: CPHP Population and Housing Impacts

As stated on page 4.12-6, the Draft EIR analyzes the impacts of the CPHP on population and housing by addressing the following three questions. As indicated below (emphasis added), would the project:

a) Induce **substantial unplanned population growth** in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

b) Displace **substantial numbers of existing people or housing**, necessitating the construction of replacement housing elsewhere?

c) Exceed the LRDP EIR standard of significance by creating **a demand for housing outside the market area** where the facilities or site are located?

Note that the first two criteria are taken directly from Appendix G of the State CEQA Guidelines and reflect the State's guidance relative to what types of impacts related to population and housing would constitute significant environmental impacts. The third criterion was developed by UCSF during the preparation of the 2014 LRDP EIR, and is not derived from the State CEQA Guidelines. As stated in the Draft EIR, criteria a) and c) are addressed in Impact POP-1, and criterion b) is addressed in Impact POP-2.

Impact POP-1 analyzes whether the employment created by the CPHP would (1) cause substantial unplanned population growth, and (2) create a demand for housing outside the market area. To determine whether the CPHP would cause substantial unplanned population growth, the Draft EIR estimates and reports the total increase in the population at the Parnassus Heights campus site, which is about 5,184 additional students, faculty and staff by CPHP buildout in 2050. Note that the growth in the campus site population would not occur immediately upon plan approval, but incrementally over a period of 30 years (2021 through 2050) as new facilities are built on the campus site, existing educational, clinical and research programs are expanded, and new programs are implemented. Further, the Draft EIR conservatively assumes that all of the 5,184-person increase (plus their estimated 2,146 dependents associated with new on-campus housing) added to the campus site would be "new" to the 5-county study area and would represent additional population; it does not deduct from this number students and employees who could be already living in the study area at the time that they first enroll at UCSF as graduate students or are hired by UCSF to fill the new jobs. Further, the Draft EIR states that although the employment growth at Parnassus Heights campus site is potentially accounted for in the *Plan Bay Area 2040* projections, conservatively for purposes of analysis, it assumes that the increase under the CPHP is not included in the projections. Next, the Draft EIR analyzes the distribution of this new population under two scenarios. Under the first scenario, the Draft EIR analysis assumes that this new population would reside in a manner similar to that of the existing UCSF employees, with about 60 percent living within the City and County of San Francisco (City), and about 40 percent in the communities in Alameda, San Mateo, Marin, and Contra Costa Counties. Using this distribution, the Draft EIR demonstrates that the CPHP-related new population (through buildout in 2050) would make a small fraction of the projected population increase[20] in the City (about 2 percent) and the surrounding counties (less than 1 percent) through 2040[21], and therefore would not represent substantial unplanned population growth in the City and the four surrounding counties. Under the second scenario, the Draft EIR analysis conservatively assumes that all of the CPHP-related new population would live in San Francisco and demonstrates that the new

[20] This projected population increase is derived from *Plan Bay Area 2040*, a regional plan developed by ABAG and MTC which is based on an analysis of regional economic trends likely to affect the amount of development and population/employment increases over the life of the plan and input from local jurisdictions.

[21] As noted in the Draft EIR on page 4.12-8, while the proposed CPHP has a horizon year of 2050, growth projections provided by ABAG are only available to 2040, so as a conservative approach, the analysis assumed the full CPHP population increase expected by 2050 would occur in 2040.

population would still make a small fraction of the projected population increase (about 3 percent) through 2040, and similarly, would not represent substantial unplanned population growth.

Impact POP-1 also analyzes whether the CPHP-related population increase would create a demand for housing outside the market area. The Draft EIR analysis compares the housing needs of the CPHP-related new population to the projected growth in households in the City and the four surrounding counties through 2040 and finds that the housing demand associated with population growth under the proposed CPHP would be satisfied by the housing that could be added in San Francisco and in other parts of the study area. As stated in the Draft EIR, between 2010 and 2040, San Francisco is expected to add about 137,900 new households, which would represent a 40 percent increase over its 2010 household levels. Assuming the current pattern of residential location preferences, the housing demand in San Francisco associated with UCSF student and employment growth under the CPHP by 2030 would represent approximately 1.8 percent of the projected household growth, and by 2050 would represent about 2.3 percent of the projected household growth — shares that would not be anticipated to trigger shifts of demand to other parts of the study area or beyond the regional housing market area. As noted above, the analysis is based on a conservative assumption that all of the CPHP-related population would be new to the study area and require housing; in reality some of the students and employees would likely be living in the area at the time of enrollment or hire. Further, these percentages are conservative as they do not take into account the increase in on-campus housing proposed under the CPHP as well as other housing that UCSF is developing or leasing in other locations within the City. If the 762 housing units added under the CPHP by 2050 are taken into account, the CPHP's off-campus housing needs would equal about 4,422 housing units. If 60 percent of this need is met within San Francisco and the rest in the surrounding four counties, the CPHP-related housing demand would represent about 1.9 percent of the projected household growth in the City by 2040.

Impact POP-2 analyzes whether the implementation of the CPHP would result in the displacement of a substantial number of existing people or housing, necessitating the construction of replacement housing elsewhere. That analysis conservatively assumes that approximately 42 households in UCSF campus housing at the Aldea Housing complex, or about 100 residents, would be temporarily displaced for about 2 years as a result of the initial Aldea Housing Densification project. The displaced households would be provided UC-controlled housing. For concerns related to potential indirect displacement and gentrification impacts, please see Master Response 15: Indirect Displacement and Gentrification Impacts.

Impact C-POP-1 analyzes the cumulative impact of the CPHP to assess whether the new population added to the City and the five-county study area would be considerable relative to the projected population of the City and the five-county study area. The analysis concludes that the CPHP-related new population would be relatively small and therefore not "considerable" compared to the 2040 population projections for the study area included in the *Plan Bay Area 2040*, and therefore the CPHP would not contribute considerably to a cumulative impact related to unplanned population growth.

All of the impact analysis in the Draft EIR is conservative as it assumes that the employment growth and the related population growth at the campus site under the CPHP, and the corollary

demand for housing are not accounted for in the *Plan Bay Area 2040* projections and are incremental. However, review of the methodology used in *Plan Bay Area 2040* to develop employment, population, household, and housing projections for the nine-county region as well as for the individual local jurisdictions suggests that the CPHP-related employment and population growth is accounted for in the plan projections. As stated by ABAG in the Regional Forecast Supplemental Report, "To better understand growth dynamics in the nine-county Bay Area region, the Association of Bay Area Governments (ABAG) tracks and projects the region's demographic and economic trends. The regional forecast is an important component of the *Plan Bay Area 2040*, the Bay Area Sustainable Communities Strategy (SCS), and provides a set of common regional assumptions informing the discussion among regional and local jurisdictions and organizations of how the region might grow. The forecast describes changes in employment, population, households, and income distribution over three decades for the region, focusing on long-term trends, rather than cyclical variations. The regional forecast also serves as the control totals for the scenario analysis in which the estimated increment of growth is econometrically distributed to jurisdictions and smaller geographic areas within the region according to a set of policy assumptions."

As a first step, ABAG used a suite of customized and in-house models, including a population model (Pitkin Myers model) and an economic model (REMI) to project economic activity, including changes in employment, population growth and composition, household growth, income distribution, and the regional housing control total at the regional level. Regarding employment projections, both national and Bay Area data were input into the economic model to develop regional projections of employment by major sector, including health and education services sector. Once regional projections were developed, in a second step, they were used as control to develop small area projections (i.e., at the local jurisdiction level such as the City of San Francisco). Due to the top down approach used by ABAG to develop the regional and local area projections, it is reasonable to conclude that the projected employment growth at the Parnassus Heights campus site and the related population growth and housing demand are accounted for in the ABAG projections that form the basis of *Plan Bay Area 2040*, and the CPHP-related population growth does not represent unplanned population growth.

All of the criteria provided in the State CEQA Guidelines related to population and housing impacts are fully addressed by the analysis in the Draft EIR. As the Appendix G CEQA Checklist questions listed above show, CEQA does not require a CEQA document to analyze how a project's demand for housing would be met. CEQA also does not require an environmental document to analyze whether affordable housing would be available to the project-related population.

Topic 2: CPHP Growth Inducing Effects

CEQA Guidelines Section 15126.2(e) sets forth guidance with respect to the evaluation of a project's growth inducing effects. The section includes the following key points (emphasis added).[22]

[22] Please note the Draft EIR Section 5.4 inadvertently referred to "CEQA Guidelines Section 15126.2(d)" instead of "CEQA Guidelines Section 15126.2(e)." Please refer to Section 8.5 in this Comments and Responses document for a staff-initiated change to the Draft EIR correcting that error.

1) "Discuss the ways in which the proposed project could foster **economic or population growth, or the construction of additional housing**, either **directly or indirectly**, in the surrounding environment.

2) Included in this are projects which would **remove obstacles to population growth** (a major expansion of a wastewater treatment plant might, for example, allow for more construction in service areas)."

The analysis in Section 5.4, Growth Inducing Effects in the Draft EIR addresses the above points. In Section 5.4.1, it sets forth the **direct employment and population growth** that would be supported by the CPHP, and finds that the new households would create a demand for housing that would not be entirely accommodated by the existing and new housing on the Parnassus Heights campus site, and would result in a housing demand (and associated population growth) beyond the campus site. The Draft EIR explains that while the City and County of San Francisco is the primary area that would be affected directly by CPHP-related population and housing effects, effects would extend beyond San Francisco to neighboring counties in the Bay Area. The Draft EIR explains that it would be speculative to characterize the site-specific environmental effects resulting from the development of such off-site housing as the development would occur over a large five-county area and over a period of time (note that the CPHP covers a period of 30 years), and then describes the general types of environmental impacts that would be associated with the development of new housing in the City and the broader study area. The Draft EIR further states that the General Plans of the jurisdictions where new off-site housing would be developed contain policies and other measures that address the environmental effects of new housing development. Specific housing development projects also would be subject to the environmental review process of affected jurisdictions. Similarly, in Sections 5.4.2 and 5.4.3, the Draft EIR presents an analysis of the **indirect and induced employment and population growth** that could occur due to the CPHP and the general effects of that growth on housing and services and the environmental effects related to the development of housing and services. Finally, in Section 5.4.4, the Draft EIR explains why the CPHP would not **induce growth by removing any existing obstacles to growth**.

Note that CEQA does not require an EIR to evaluate the significance of a project's growth inducing impacts. Further, as borne out by the guidance in CEQA Guidelines Section 15126.2(e), it does not require an EIR to evaluate the effects of the project's direct or indirect employment or population growth on affordable housing.

Comments **O-LD2-48**, **O-LD2-65**, and **O-LD2-65** conflate the conclusions of the population and housing analysis in Draft EIR Section 4.12 with the CPHP's growth inducing effects analyzed in Section 5.4, to assert that the Draft EIR is seeking to diminish the significance of the effects of the project on housing. As the response above shows, even though both analyses focus on the employment and/or population added to a community by a project, the two analyses are distinctly different in the impacts that they address. The population and housing impacts are accurately analyzed in Section 4.12 consistent with the CEQA Guidelines Appendix G, and the growth inducing impacts are accurately analyzed in Section 5.4 consistent with CEQA Guidelines Section 15126.2(e).

8.3.3.15 Master Response 15: Indirect Displacement and Gentrification Impacts

This master response addresses the issues raised in Comments **O-LD2-58** through **O-LD2-60, O-LD2-62, O-LD2-64** through **O-LD2-66, I-Goodman-17, I-Goodman-18,** and **I-Liederman-5**. The commenters assert that the Draft EIR is deficient in its analysis of population and housing impacts because it does not analyze the indirect displacement impacts on residents living in the vicinity of the Parnassus Heights campus site. Commenters assert that through their demand for nearby housing, the CPHP-related new population would increase housing prices, displace households in the surrounding neighborhoods, and result in the gentrification of the surrounding neighborhoods. Commenters state that the Draft EIR must include an analysis of loss of affordable housing through gentrification. The response provided here first explains the concepts of gentrification and indirect displacement and then provides an explanation as to why it would be speculative to conclude that there would be indirect displacement attributable to the CPHP as well as any physical impacts from indirect displacement.

"Gentrification" is a shift in an urban community/neighborhood toward higher income residents and/or businesses and increasing property values, often at the expense of the lower income residents of the community. Gentrification is often associated with increases in educational attainment and household incomes, as well as higher housing prices. It is also often associated with, but not directly linked to, an overall change in the racial or ethnic makeup of a community. Gentrification often raises property values and rents, making the housing less affordable to lower income groups, and while it does not necessarily include any level of displacement, it can occur as a result of or in conjunction with indirect displacement.

"Indirect displacement" refers to the potential displacement of residents or businesses due to economic reasons such as higher and unaffordable rents and housing prices that are driven up by the advent of investors and higher income households. As housing or business costs become increasingly unaffordable, existing tenants may be forced to find more affordable housing or business locations elsewhere, if available. By comparison, direct displacement is that associated with planned changes in land use or redevelopment of existing homes or business properties. Direct displacement is discussed under Impact POP-2 in the Draft EIR. Also see Master Response 14, Population and Housing.

CEQA requires an EIR to "identify the significant effects on the environment of a project, to identify alternatives to the project, and to indicate the manner in which those significant effects can be mitigated or avoided." (Public Resources Code Section 21002.1). CEQA Guidelines Section 15382 defines a significant effect as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant."

CEQA Guidelines define the parameters under which consideration of socio-economic impacts is included in an EIR. Section 15131(a) of the Guidelines states that "Economic or social effects of a project shall not be treated as significant effects on the environment. An EIR may trace a chain of cause and effect from a proposed decision on a project, through anticipated economic or social changes resulting from the project, to physical changes caused in turn by the economic or social changes…. The focus of the analysis shall be on the physical changes." Similarly, CEQA Guidelines Section 15064(e) states that a CEQA document must consider the reasonably foreseeable environmental consequences of physical changes resulting from a project's economic or social changes. In other words, social and economic effects are only relevant under CEQA if they would result in, or are caused by, an adverse physical impact to the environment that is reasonably foreseeable. An impact that is speculative or unlikely to occur as a result of a project is not reasonably foreseeable (CEQA Guidelines Section 15046(d)(3)).

The courts have ruled affirmatively in a number of cases that social or economic changes that do not relate to an adverse physical change are not subject to CEQA analysis [Joshua Tree Downtown Business Alliance v. County of San Bernardino (2016) 1 Cal.App.5th 677, 685 (the fact that new big-box retail may drive other retailers out of business, absent evidence that any urban decay would occur, is not an environmental impact covered by CEQA); Maintain Our Desert Environment v. Town of Apple Valley(2004) 124 Cal.App.4th 430, 446 ("social, economic and business competition concerns are not relevant to CEQA analysis unless it is demonstrated that those concerns will have a significant effect on the physical environment"); and Goleta Union School District v. Regents of U.C.(1995) 37 Cal.App.4th 1025 (increased K–12 school enrollment that may lead to classroom crowding is a social effect, not a significant effect that must be addressed in the university's long range master plan EIR)]. In Preserve Poway v. City of Poway (2016) 245 Cal.App.5th 560, the Court of Appeal found that there was no substantial evidence to support a fair argument that the residential project would have any adverse effects on environmental resources. Although there was substantial evidence of the project resulting in a change in community character, that was a social issue not an environmental issue subject to CEQA.

Gentrification is a social and economic phenomenon that falls outside the purview of a CEQA document and the Draft EIR appropriately focuses instead on whether there would be physical impacts on the environment as a result of the project. As the commenters suggest [see for example, **O-LD2-66**], indirect displacement could occur if the new students, faculty, and staff who come to Parnassus Heights because of the CPHP (see Table 4.12-2 in the Draft EIR) seek to live in the vicinity of the campus site and are able to displace existing residents in the surrounding neighborhood, or if there is redevelopment in the area to meet the demands of these individuals, which results in displacement. However, the extent of any such displacement that would be attributable to the project, the locations of the displacement or redevelopment, and the locations to which any displaced residents may move are not known.

As reported on Draft EIR pages 4.12-1 and 4.12-2, San Francisco and the Bay Area witnessed much faster employment growth (22 percent and 15 percent) than housing growth (5.5 percent and 3.6 percent) between 2010 and 2018, a trend that partially explains the dramatic increases in housing costs in recent years. The increased demand for housing and the increased cost has in turn lead to economic insecurities for many in the region, and longer commutes as households

seek housing they can afford.[23] While the CPHP would add to the number of students and employees on site (as well as add some housing to the campus site), the extent to which the project might contribute to these larger, ongoing, and regional challenges would be impossible to discern. As noted in Master Response 14, Population and Housing Impacts, and as suggested in the analysis of Impact POP-1 on p. 4.12-8 of the Draft EIR, some of the new students, faculty, and staff would already have homes in the Bay Area, and are therefore unlikely to seek housing in the Parnassus Heights vicinity. Others who might seek to relocate to the surrounding neighborhoods are likely to find housing too costly or simply unavailable. Should an analysis attempt to examine the potential for indirect displacement due to increased housing demand in proximity to the campus site, it would require extensive data regarding existing residents and residential tenancies in the campus vicinity, including the number of homeowners vs. renters, the prevalence of rent control, the vacancy rate, and the average duration of tenancies, as well as speculation regarding the potential for new employees or students to have the income, opportunity, and desire to acquire or lease existing units. While proximity to place of work is an important consideration, a number of other variables play a role in a household's place of residence decision, including the type of housing, access to good schools, preference for urban or suburban living, and a desire to be close to family and friends. These considerations, variables, and data points are either not knowable or not available and it would be speculative either to determine the number of new employees and students at the Parnassus Heights campus site who would choose to live in the surrounding neighborhoods or to determine the number of households that might be indirectly displaced due to the project. CEQA advises against such speculative analyses (CEQA Guidelines Section 15145).

Some commenters noted that gentrification and indirect displacement have the potential to result in increased vehicle miles traveled (VMT), congestion, air pollutant and greenhouse gas emissions as displaced residents may have to commute farther. However, any change in VMT or traffic-related emissions due to indirect displacement and gentrification cannot be reasonably estimated for two reasons: first, for reasons presented above, the EIR cannot develop a reasonable estimate of the magnitude of indirect displacements (if any) that could result due to the CPHP, and second, even if the number of displaced households could be estimated, it cannot be known with any certainty whether displacement would translate into increased VMT. Displaced residents could already be commuting long distances and may not be working in or near the neighborhood. The effects on VMT or traffic-related emissions from potential indirect displacement or gentrification cannot be modeled or otherwise determined with specificity, and an EIR is not required to speculate about possible outcomes that are not reasonably foreseeable.

The University does, however, understand the community concerns and will continue to work with the neighboring communities and invest in neighborhood improvements that benefit the area. Further, UCSF, as an anchor institution in San Francisco, will continue to leverage its economic power alongside its human and intellectual resources to improve the long-term health and social welfare of San Francisco. Over the decades, UCSF has led a broad spectrum of public service programs. UCSF collaborated with San Francisco Unified School District to establish the

[23] Sarah Truehaft with Jessica Pizarek, Angel Ross, and Justin Scoggins, Solving the Housing Crisis is Key to Inclusive Prosperity in the Bay Area, a report prepared as part of the Bay Area Equity Atlas, a partnership between the San Francisco Foundation, PolicyLink, and the Program for Environmental and Regional Equity at the University of Southern California, 2018.

Science & Health Education Partnership (SEP), which enables UCSF scientists and educators to work with the SFUSD to support quality science education. Under the Excellence through Community Engagement & Learning (EXCEL) Program, UCSF has trained more than 280 people for jobs at UCSF since 1998, and in 2011, UCSF voluntarily implemented a local hiring goal similar to those of the City and County of San Francisco. In 2017, UCSF teamed with the City and other groups to launch SF CAN, an initiative that aims to fight against cancers affecting certain racial and ethnic minorities by reducing inequities in prevention, screening rates, access to quality health care and outcomes. UCSF continues to evaluate the potential to increase its capacity to train, hire, and promote people from under-resourced populations; analyze UCSF's purchasing power so that more spending can be sourced from small, local businesses that are owned by or employ under-resourced populations; and explore social impact investment options. UCSF will continue with the existing and new programs for the benefit of San Francisco residents.

8.3.3.16 Master Response 16: Transportation Significance Criteria

This response addresses issues raised in Comments O-**SM-20, A-SFP-15, A-SFP-16, A-SFP-20, A-SFP-22, A-SFP-26, I-Kessler-28, I-Jones-5**, and **I-Wellborn-3**. These comments assert that the Draft EIR does not use significance criteria set forth by other agencies or in state guidance, particularly with respect to evaluating the CPHP's compliance with plans, ordinances, and policies and evaluating the CPHP's VMT impacts.

CEQA provides for lead agencies to adopt their own thresholds of significance and to evaluate the significance of a project's impact based on substantial evidence. The Regents of the University of California (UC or University) is unique among public agencies because it is a constitutionally created entity of the State of California with "full powers of organization and government" (Cal. Const. Art. IX, Section 9), and typically acts as both the project proponent and lead agency under CEQA. Under UC's significance thresholds, the CPHP would have a significant effect on the environment if the CPHP would:

- Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities
- Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)
- Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)
- Result in inadequate emergency access
- Adversely affect travel conditions along sidewalks and roadways serving the project site due to construction activities

The first four of these criteria are based on those set forth in *State CEQA Guidelines* Appendix G, and are presented in the Draft EIR on page 4.15-27. With respect to analysis of potential impacts relative to each of these criteria, the Draft EIR discusses relevant programs, plans, ordinances and policies in Section 4.15.2 of the Draft EIR, on pages 4.15-24 through 4.15-27. The CPHP's compliance with each of these programs, plans, ordinances and policies is discussed in Impact

TRANS-1 on pages 4.15-37 through 4.15-41. While this section discusses local plans and policies, including the City of San Francisco's Transit First Policy and Better Streets Plan, the University of California is constitutionally exempt from local land use control and other local plans, policies, and ordinances whenever using property under its control in furtherance of its educational mission. City plans, ordinances and policies are not applicable to UCSF; however, certain policies are discussed in the Draft EIR as a means of presenting information and analysis that may be of value to the City in its planning processes.

The Draft EIR discusses the project's consistency with CEQA Guidelines section 15064.3, subdivision (b) in Impact TRANS-2 on pages 4.15-41 to 4.15-46. Some comments assert that the increase in project VMT per capita from Existing conditions to 2040 Cumulative conditions should represent a significant VMT impact. This suggested approach to evaluating a project's VMT impact is not consistent with the State's guidance regarding the analysis of VMT impacts as well as the approach used by the City and County of San Francisco. The Draft EIR assesses VMT impacts based on the recommendations presented in the Office of Planning and Research's *Technical Advisory on Evaluating Transportation Impacts in CEQA*, which states that a project would "generate substantial additional VMT" if it would exceed regional household VMT per capita minus 15 percent or regional work-based VMT per employee minus 15 percent. The City also uses these thresholds to evaluate a project's VMT impacts. As discussed on page 4.15-41 in the Draft EIR, this threshold is based on statewide air quality and greenhouse gas emissions targets and is therefore reasonable for assessing project VMT. As presented in Tables 4.15-16 and 4.15-17 on pages 4.15-42 and 4.15-45, respectively, the Parnassus Heights campus site at full development under the proposed CPHP would generate VMT at rates substantially below the regional averages. Therefore, the Draft EIR appropriately finds the impact related to VMT to be less than significant.

8.3.3.17 Master Response 17: Mode Share Assumptions & Methodology

This response addresses issues raised in Comments **A-SFP-16, A-SFP-18, O-SM-11, I-Goodman-21, I-Kessler-25, I-Kessler-26, I-Welborn-4,** and **I-Welborn-8**.

Several comments express concern about the validity of the sources used to establish the share of travel by various modes, as presented in the Draft EIR. As indicated on page 4.15-30 of the Draft EIR, the existing mode choice data was derived from the UCSF employee commute survey conducted in 2018; a survey of patients and visitors at the Parnassus Heights campus site conducted in 2017 and 2018; and a survey of UCSF residential tenants conducted in 2013. UCSF regularly conducts transportation surveys of employees, visitors and patients at its San Francisco locations, as a way to monitor, and adjust if necessary, its robust TDM program. In addition, UCSF uses this information to conduct short-, mid- and long-term planning for its various campus sites, such as that done in the 2014 LRDP, and any subsequent amendments. As such, the use of recent employee, patients, and visitor transportation surveys, such as these, is considered a valid approach for EIR purposes. (Travel demand associated with proposed market-rate housing and hotel uses were based on San Francisco's *Transportation Impact Analysis Guidelines for Environmental Review*.) A summary of the inputs to the transportation analysis, based on survey

results is included in **Appendix TR** in this Comments and Responses document.[24] The transportation analysis estimates presented in Appendix TR reflect population estimates presented in Table 4.12-2, and correct a minor error in the Draft EIR whereby the population inputs to the transportation analysis diverged slightly from those presented in Table 4.12-2.[25] Therefore, the results presented in Appendix TR differ slightly from what is presented in the Draft EIR. However, these minor corrections would not change any transportation impact determinations or conclusions reached in the Draft EIR. As shown in Appendix TR, in the Initial Phase, the average VMT per employee estimates have been adjusted from 10.0 to 9.6 miles and average VMT per resident estimates have been adjusted from 5.4 to 6.8 miles; these minor adjustments reflect a slightly smaller employee population and updated resident travel assumptions (that reflect leaseholder and spouse travel patterns consistent with the Future Phase scenario analysis), as compared to the results presented in the Draft EIR. In the Future Phase scenario, the average VMT per employee and average VMT per resident are consistent with the Draft EIR – 10.9 and 8.5 miles, respectively – with minor population corrections incorporated. The VMT per capita estimates presented in both the Draft EIR and Appendix TR for both the Initial Phase and Future Phase are below the project significance threshold of 15 percent below the regional average VMT per capita, as presented in Table 4.15-16.

Similarly, these minor corrections would not change any impact determinations or conclusions reached in any other technical sections in the Draft EIR that relied in part on the transportation analysis, such as air quality and greenhouse gas emissions. Accordingly, these minor corrections are presented in Comments and Responses document for informational purposes, but do not merit being included in Section 8.5, Revisions to the Draft EIR.

Multiple comments express concern about the process used to develop future mode of travel assumptions. As described on pages 4-15-30 and 4.15-31, a methodology was developed to estimate future modes of travel using the existing mode split as a pivot point. The methodology accounted for an observed reduction over the years in drive alone travel by faculty and staff, as well as a trending increase in taxi, TNC and drop-off trips associated with both faculty/staff and patients/visitors. In addition, the methodology took into account the 400 space reduction in total parking supply at the Parnassus Heights campus site that is expected to result from the implementation of the CPHP, and the potential for employees and visitors to change their mode of travel given the reduction in parking supply. Through an iterative process, the expected increase in drive alone trips resulting from the CPHP was progressively allocated to taxi, TNC

[24] Detailed survey results by sub-populations and the most up-to-date (2018) campus population estimates were used to estimate existing mode split and inform the transportation analyses. Since the transportation analyses employed the most up-to-date population estimates to weight survey results by population, existing mode split estimates used in the DEIR may differ slightly from published survey results which were weighted using previous population estimates.

[25] Table 4.12-2 presents the Parnassus Heights campus site existing and projected average daily population for students, faculty and staff, patients, and visitors. The transportation analysis also includes resident populations based on the Draft EIR Chapter 3, Project Description (see Initial Aldea Housing Densification, Future Phase of Aldea Housing, and West Side Housing sections). The Initial Phase transportation analyses includes populations associated with the Irving Street Arrival, Research and Academic Building, and initial Aldea Housing Densification projects and other Initial Phase improvements. As described in Chapter 3, the New Hospital is also an Initial Phase project, but is analyzed at a program level in this EIR. The New Hospital will be analyzed in more detail – at a project level – in a future, separate EIR. Therefore, the population estimates for the Initial Phase transportation analysis exclude populations associated with the New Hospital, and differ from the Projected 2030 population presented in Table 4.12-2, which includes population associated with the New Hospital.

and drop off modes (i.e. vehicle modes that do not result in a demand for parking), until an equilibrium was reached where the expected number of vehicle trips that result in parking demand matched the projected availability of parking at the campus site. This was informed by parking characteristic data (e.g. average turnover, average length of stay, average ins and outs by time of day) from the two campus site parking garages collected by UCSF in October 2019. This is a valid approach given the constrained on- and off-street parking environment both currently and as the CPHP is implemented. Specifically, it accounts for the fact that people who desire to travel to/from the campus in a vehicle both now and in the future arrive at their decision of whether to drive or be driven in a privately-owned vehicle and try to park or be dropped off from a privately-owned or for-hire vehicle by taking into account that there is not enough parking to accommodate everyone to drive and park a vehicle who desire to. People take this deficit into account just as they do their preferences for comfort and convenience and their value of time when deciding how and when to travel. It also represents a conservative approach to estimating the total number of vehicle trips associated with the CPHP since each taxi, TNC or drop-off trip generates twice the number of vehicle trips per person compared to drive alone trips (for example, one trip when the vehicle arrives to the site to drop-off a passenger, and a second trip when the vehicle departs empty; the process is reversed for the return trip).

Two comments assert that maintaining the current mode split share for public transit is a false assumption, and that lower shares should be assumed for transit in the future, particularly if the transit system is at capacity. Another comment states that a decrease in transit share and other non-automobile modes in the future should not be assumed. Since no substantial changes are expected to the public transit services in the area, the share of travel by public transit was assumed to remain the same or be slightly reduced from current levels, a commonly accepted practice. While the transit share is projected to remain the same, CPHP implementation will result in an increase in the daily population at the campus site, which would result in new transit riders. These new riders would distribute among multiple Muni routes in the immediate vicinity of the campus site, including the N Judah, 6 Haight/Parnassus, 7 Haight/Noriega, and 43 Masonic, all of which operate within a 7- to 11-minute headways during the peak periods, or about six vehicles per hour on each line. Further, it is important to note that the increase in campus population due to CPHP implementation is expected to occur over a 30+ year timeline when considering how people may alter their travel behavior if the transit system is at capacity. As described in Master Response 20, while UCSF does not control the provision of public transit service provided by Muni and SFMTA, it does monitor transportation conditions at all campus sites where development is proposed and would continue to monitor vehicle traffic conditions (that could affect Muni), employee and patient mode split, and shuttle ridership within and surrounding the Parnassus Heights campus site. To the degree that demand for transit and/or shuttle services increases in the future, UCSF would also increase shuttle services to better match demand and serve UCSF populations such as employees, patients, and visitors.

A comment states that the expected increase in trips due to the CPHP would be substantially dependent on the provision of public transit. As described in the previous paragraph, it has been assumed that the mode share of public transit would be maintained or would slightly decrease by the time the CPHP is implemented; this is a reasonable assumption and an accepted practice. Due to a constrained availability of parking, and other incentive measures presented in UCSF's TDM

program (see Table 4.15-2 on page 4.15-13), CPHP-related new person trips would instead shift to shared travel modes that do not require parking, such as travel by taxi or TNC, or drop off.

A comment indicates that the detailed calculations supporting the future mode of travel assumptions have not been provided in the Draft EIR, which prevents the readers from verifying the accuracy of the results. It also questions whether the survey results are still valid because they were conducted prior to the onset of the COVID-19 pandemic. The existing modal split percentages are presented in Table 4.15-8 (page 4.15-30) of the Draft EIR, while the future phase assumptions are presented in Table 4.15-9 (page 4.15-32). Additional information has been added to Appendix TR in this Comments and Responses document to detail the source data and the process by which the future phase modal split percentages were developed. This information also includes how many individuals within each population category (faculty, staff, patients and visitors) would arrive and depart the campus site by various modes under the CPHP. For a discussion of the effect of COVID-19 on travel behavior, please see Master Response 3: COVID-19.

A comment indicates that the CPHP would result in an increase in cars parked on the street as (implied from the comment) off-street campus parking policies and availability would change with implementation of the CPHP. As stated on page 4.15-22 of the Draft EIR, the majority of the on-street spaces in the area are subject to Residential Parking Permit (Zone "J") restrictions (two-hour parking, except for residents, Mondays through Friday from 8 a.m. to 5 or 6 p.m.); about 90 percent of the spaces are occupied, on average, throughout the day. As such, no additional on-street parking demand has been assumed to occur as a result of the CPHP. As described above, the off-street parking supply has been used instead to establish the future mode of travel assumptions.

Another comment asserts that the assignment of trips to various modes is inaccurate due to the infeasibility of continuing the existing UCSF TDM program and the reliance of patients and visitors on private vehicles, while another asserts that some populations are unlikely to use non-automobile modes. UCSF plans to continue implementing, and improve as necessary, its robust TDM program, which is described on pages 4.15-12 and 4.15-13 in the Draft EIR. As explained above, the program has resulted in a historical trend of reduction in drive alone travel by faculty and staff. It is true that patients and visitors are more reliant on travel by private and for-hire vehicles than faculty and staff as shown in Table 4.15-8 (page 4.15-30) of the Draft EIR. As indicated before in the response, the heavily constrained parking environment expected at the completion of the CPHP would result in a forced reduction in travel by modes that require vehicle parking, such as drive alone and carpool, and a shift to travel by taxi, TNC, and other drop off modes, which do not require parking.

8.3.3.18 Master Response 18: Analysis of Parking Impacts

This response addresses parking related issues raised in Comments **I-Sandler-3, I-BaldaufM-7, I-Kessler-25, I-Jones-5, I-Zeff-9**, and **I-Robertson-4**. Numerous comments express concerns about the adequacy of the Draft EIR in fully assessing the effects of the CPHP on parking occupancy and availability in the surrounding neighborhoods. As noted in the comments, the CPHP plans for an increase in the employee, visitor, and student populations and a decrease in parking supply. The comments also assert that the increase in private vehicle travel to the campus site will

be higher than analyzed in the Draft EIR, especially because the COVID-19 pandemic will cause a shift away from transit and other modes towards driving in a personal vehicle. As such, comments express concerns that the amount of parking included in the CPHP will be inadequate.

Please see Master Response 16 above which lists the CEQA Appendix G checklist questions related to transportation. Impacts on parking are not included in the checklist; CEQA does not require that a project's effect on parking be analyzed. Further, CPHP development would be located in a transit priority area, on an infill site, and at an existing employment center where more jobs (and housing) would be provided. Therefore, as discussed on pages 4.0-3 to 4.0-4 in the Draft EIR as well as in Master Response 6: Public Resources Code Section 21099, the CPHP meets the eligibility requirements for PRC Section 21099. Per PRC Section 21099(d), parking impacts of the CPHP shall not be considered significant impacts on the environment. The adequacy of parking was not studied in the Draft EIR, and its absence does not result in an inadequate analysis.

Please note that although parking was not considered in determining if the project has the potential to result in significant environmental impacts, the Draft EIR presents information regarding the existing parking supply in relation to the parking demand, both on- and off-street facilities, in the Parking Conditions section, pages 4.15-22 to 4.15-24 for context and for informational purposes. Furthermore, the supply of parking is fully considered in developing the changes in mode choice that would occur with CPHP development; i.e., parking supply is factored into the analysis of how people choose to travel at the present time and how they would travel in the future as a result of a smaller increase in parking relative to the population increase (Mode Choice section, pages 4.15-29 to 4.15-33). Further discussion of the mode share and vehicle travel is provided in Master Response 17 and Master Response 19. For the effect of COVID-19 on travel behavior, please see Master Response 3: COVID-19.

8.3.3.19 Master Response 19: Project Effects (i.e., Population Increase) on Transportation System

This response addresses issues raised in Comments **O-SM-9, O-SM-21, I-Sandler-3, I-BaldaufM-7, I-Hanley-2, I-HofmannP-6, I-Cole-5, I-Goodman-19, I-Goodman-22, I-Kessler-23, I-Kessler-24, I-Kessler-27, I-Jones-5, I-Liederman-7, I-Liederman-9, I-Zeff-6, I-Lebus-2, I-Welborn-3**, and **I-Maerki-6**. These comments express concerns about the adequacy of the Draft EIR in fully analyzing the effects of the CPHP's general increase in land use and activity, with a primary focus on the amount of vehicular traffic generated by the increase in employee and patient/visitor population that could result from the implementation of the CPHP. These comments state that the Draft EIR fails to provide a complete analysis of how this increased traffic would impact air quality, pedestrian safety, vehicular operations in the study area, and public transportation operations.

As noted in the comments, the increases in employee, student and patient/visitor populations as a result of the CPHP are likely to lead to an overall increase in travel activity, inclusive of all modes of travel. This increase in travel activity is estimated and reported in the Draft EIR on page 4.15-29, in Table 4.15-7. In total, the Draft EIR estimates an increase of about 52,200 daily person trips on an average weekday, which corresponds to 28,800 additional daily vehicle trips as

shown on page 4.15-32 of the Draft EIR. These estimates are used throughout Section 4.15 of the Draft EIR, and as such the analysis adequately addresses the population growth and the related increase in travel activity associated with the CPHP. It is also important to note that this increase in population is expected to develop over a 30+ year timeline. Further discussion of how the increase in daily travel is distributed among the various modes, and how it considers the planned parking supply, is addressed in Master Response 17.

The transportation impact analyses presented in the Draft EIR use these estimates of total travel demand to evaluate the direct, indirect, and cumulative impacts of the CPHP on all modes of transportation in the study area around the campus site. As discussed in Master Response 16, the scope of the transportation analyses conforms to the requirements of the *State CEQA Guidelines* as set forth in *Appendix G*. The Draft EIR discloses the impacts of the CPHP, including its associated growth in employee and patient/visitor populations, on various transportation modes, including the impacts on vehicle miles traveled (VMT), pedestrians, bicycle traffic, and safety hazards.

Comments discussing the proposed level of growth associated with the CPHP also include concerns around the effects of vehicular traffic on surrounding roadways. The Draft EIR discusses this increase in vehicular traffic in Section 4.15. The primary effect of increased vehicular traffic is increased levels of delay and increased total travel times for drivers using surrounding facilities. However, per *State CEQA Guidelines* Section 15064.3, a project's effect on automobile delay shall not constitute a significant environmental impact. Therefore, transportation impacts based on vehicular delay are appropriately not analyzed in the Draft EIR, and the absence of such analysis does not render the EIR inadequate. Relating to the potential secondary effects of the increase in traffic volumes, the following findings apply:

- The effects of the increase in traffic volumes on transit delay would not constitute a significant impact under the criteria set forth in *State CEQA Guidelines* Appendix G and presented in the Draft EIR on page 4.15-27. Further discussion of transit delay is included in Master Response 20.
- The effects of increased traffic volumes on bicyclists and pedestrians in the area would not constitute a significant impact based on compliance with local plans and policies, such as the Better Streets Plan. As discussed in the Draft EIR on page 4.15-40, the CPHP incorporates multiple design elements to improve conditions for both bicyclists and pedestrians; these design elements would not be affected by increased vehicular traffic.
- Increased traffic volumes do not constitute a safety hazard based on the significance criteria set forth on page 4.15-27 of the Draft EIR, as traffic increases would not include geometric design elements that could cause new or exacerbate existing safety hazards.

The effects of the increase in vehicular traffic on air quality are analyzed in Section 4.2, and result in a finding of a significant air quality impact, as shown on page 4.2-33 of the Draft EIR. Mitigation is presented in the Draft EIR to reduce the effect on air quality to the maximum extent feasible. However, as described in the Draft EIR on pages 4.2-33 to 4.2-37, a residual air quality impact is expected to occur.

8.3.3.20 Master Response 20: Project Effects on Transit

This response addresses issues raised in Comments **A-SFP-16, A-SFP-18, A-SFP-19, A-SFP-20, A-SFP-25, A-SFP-26, O-LD2-50, O-SM-1, O-SM-11, O-SM-12, O-SM-13, O-SM-14, O-SM-16, O-SM-21, I-Cole-5, I-Goodman-19,** and **I-Kessler-28**. These comments express concerns that the Draft EIR does not analyze the effects of the CPHP on transit capacity and transit delay, both within the immediate study area and citywide.

Master Response 16 notes that CEQA provides for lead agencies, such as UC, to adopt their own thresholds of significance and to evaluate the significance of a project's impact based on substantial evidence. As discussed in Master Response 16, UC's significance criteria for the CPHP are based on Appendix G of the State CEQA Guidelines. The Appendix G checklist does not include a question related to a project's effect on transit capacity or delay. Further, as noted in Master Response 19, a project's effect on automobile delay shall not constitute a significant environmental impact per *State CEQA Guidelines* Section 15064.3. While the Draft EIR does include a brief assessment of potential effects of the CPHP on transit operations in Appendix TRANS, this assessment is included as a qualitative discussion for informational purposes only.

It is important to note that the increase in campus population due to CPHP implementation is expected to occur over a 30+ year timeline. UCSF monitors transportation conditions at all campus sites where development is proposed and would continue to monitor vehicle traffic conditions, employee and patient mode split, and shuttle ridership within and surrounding the Parnassus Heights campus site. To the degree that demand for transit and/or shuttle services increases in the future, UCSF could increase shuttle services to better match demand and serve UCSF populations such as employees, patients, and visitors

In contrast, UCSF does not control the provision of public transit service provided by Muni and SFMTA. UCSF understands that Muni relies on regularly-collected passenger data to inform their service planning and occasionally makes modifications to best match service to its customers. This type of flexibility and responsiveness is necessary in order to provide the most efficient transit service possible. As the CPHP would be implemented over a long-term 30+ year horizon, and other conditions would change across the City of San Francisco, SFMTA would likely continue to reevaluate key factors, including annual ridership, vehicle availability and resource availability, to determine the most efficient provision of transit service at that time. Additionally, Muni's operational costs are not a CEQA concern. For a discussion of the effect of COVID-19 on travel behavior, please see Master Response XX: COVID-19.

8.3.3.21 Master Response21: Project Effects on Ambulance Delays and Access

This response addresses issues raised in **Comments O-SM-19, I-HofmannR-2, I-HofmannP-7, I-Kessler-27, I-Zeff-6,** and **I-Welborn-5**. The comments express concern that emergency vehicle access to the New Hospital could be compromised because of existing and future traffic conditions on Parnassus Avenue. As described in Impact TRANS-4 in the Draft EIR (page 4.15-48), implementation of the CPHP would not result in inadequate emergency access. This analysis

takes into consideration all times of day, but particularly when more people are traveling such as "rush" or commute hours as noted in a comment. Further, the "emergency vehicles" analyzed in Impact TRANS-4 includes law enforcement, such as SFPD, firefighting and life safety, such as SFFD, and medical vehicles, such as ambulances.

As stated in the impact analysis, the proposed CPHP would not make any changes to city streets leading to or from the campus site or include elements that would conflict with adopted codes regarding street widths and turning movements. Furthermore, the proposed CPHP would not include any design features that would hinder or preclude emergency vehicle access. This includes any potential changes to Parnassus Avenue pursuant to the Parnassus Avenue Streetscape Plan, which was proposed and analyzed as part of the 2014 LRDP Final EIR. Though no changes have been identified as part of the CPHP at this point in time, should slight modifications to the Parnassus Avenue Streetscape Plan be made to conform to new development proposals they would be designed to conform to San Francisco's Better Streets Plan, which takes into account the operation of emergency vehicles as part of its standards.

With respect to additional requests for analysis made in the comments, specifically, travel time on Parnassus Avenue before and after street enhancements and the effect of responding emergency vehicles on street traffic, these effects concern vehicle delay which is not within the scope of transportation impacts under CEQA. Please see Master Response 16which explains the basis of the transportation significance criteria used in this Draft EIR.

8.4 Written and Spoken Comments on the Draft EIR, and Responses to Comments

8.4.1 Introduction

This section contains copies of the written comment letters (including emails) received from agencies, organizations and individuals, and copies of the public hearing transcript during the public review period on the Draft Environmental Impact Report (July 13, 2020 through September 11, 2020). Each letter received during this comment period is reproduced here in its entirety, with the exception of certain exhibits and/or attachments to ten comment letters (Comment Letters O-LD2, O-TL1, O-TL2, O-TL3, O-SM, O-NZA, O-EBPA, I-Cherny, I-Robertson, and I-Maerki) (in those instances, the subject attachments and appendices are included in their entirety in Appendix O-LD2, Appendix O-TL1, Appendix O-TL2, Appendix O-TL3, Appendix O-SM, Appendix O-NZA, Appendix O-EBPA, Appendix I-Cherny, Appendix I-Robertson, and Appendix I-Maerki, in this Comments and Responses document).

8.4.2 Comments and Responses

Each written comment letter is designated with commenter code in upper right-hand corner of the letter. As discussed in Section 8.2 in this Comments and Responses document, the commenter code begins with a prefix indicating whether the commenter represents a public agency (A), an organization (O), an individual (I), or a speaker at the public hearing (PH). This is followed by a hyphen and the acronym of the agency or organization, or the individual's last name.

Within each written comment letter, individual comments are labeled with a number in the margin. Immediately following each comment letter is a corresponding individual response to each numbered comment.

Within the public hearing transcript, individual speaker comments are labeled with the name of the speaker followed by the numbered comment of the speaker in the margin. Immediately following the public hearing transcript is a corresponding individual response to each numbered comment.

Where responses have resulted in changes to the Draft EIR, the reader is referred to changes that appear in Section 8.5 of this Comments and Responses document. Where the individual response refers to the reader to one or more master responses, the reader is referred to the applicable master response(s) in Section 8.3 of this Comments and Responses document.

Re: **UCSF Comprehensive Parnassus Heights Plan Draft EIR**
Planning Department File No. 2020-005090OTH

Dear Ms. Wong,

On August 19, 2020, the Historic Preservation Commission (HPC) held a public hearing on the Draft Environmental Impact Report (DEIR) for the proposed University of California, San Francisco, Comprehensive Parnassus Heights Plan. The DEIR was prepared by UCSF and the lead agency for the purposes of the California Environmental Quality Act (CEQA) is the Regents of the University of California. The San Francisco Planning Department ("the Planning Department") is a responsible agency. Under CEQA, the duties of a responsible agency include providing comments on the DEIR. 1

After discussion, the HPC arrived at the comments below:

- The HPC unanimously affirmed that the Depression-era frescoes created by painter Bernard Zakheim (the Zakheim Murals) in UC Hall collectively constitute the most significant historic resource located on the UCSF Parnassus Heights campus. However, the HPC is concerned that the evaluations on which the significance of UC Hall is based, completed in 2003 and 2005, are too old to reflect current thinking on the resource's full significance and do not include an evaluation of either the building's or the murals' eligibility for listing in the National Register of Historic Places. The HPC requests that the DEIR include an evaluation of National Register eligibility for both UC Hall and the Zakheim Murals. The evaluations must incorporate the latest methodologies and all applicable historic contexts, such as those that focus on representations of historically marginalized communities such as Native Americans and African Americans. 2

- Overall, the HPC found that the DEIR did not adequately consider alternatives that focused on the preservation of historic resources. Specifically, the DEIR did not analyze an alternative that retained just UC Hall, the building where the Zakheim murals are located, or just Toland Hall, the part of UC Hall where the Zakheim murals are located. Although the HPC would not feel comfortable endorsing an alternative that resulted in a reduction of hospital services, the HPC stated that the DEIR be revised to include an alternative that evaluates the impact on plan objectives of retaining just UC Hall, and an alternative the evaluates the impact of retaining just the Zakheim murals, such as retaining just the 3

中文詢問請電 Para información en Español llamar al Para sa impormasyon sa Tagalog tumawag sa 628.652.7550

Toland Hall portion of UC Hall. 3 cont.

- The HPC requests that the DEIR be revised to include a mitigation measure that requires that salvage of the Zakheim Murals, if UC Hall is to be demolished in its entirety. This mitigation measure must include a provision requiring that all of the murals be kept together in campus in a public space. The Irving Street Arrival, a new campus feature proposed by the CPHP, could be an appropriate location for such a display. 4

- The HPC is pleased to see that the designs of the proposed new buildings, as represented in the renderings in the DEIR, contain some reference to the existing historical architecture on the campus. To ensure that this aspect of the design is implemented in the final campus build-out, the HPC requests that UCSF require that new buildings be subjected to a design review process that ensures historic compatibility, and that UCSF consider adopting this requirement as a mitigation measure. 5

The HPC appreciates the opportunity to participate in review of this environmental document.

Sincerely,

Aaron Hyland, President
Historic Preservation Commission

Responses to Comments from San Francisco Historic Preservation Commission

A-SFHPC-1 The Historic Preservation Commission indicates it held a hearing on the Draft EIR for the proposed CPHP; and that the San Francisco Planning Department is a responsible agency under CEQA, and that one of the responsibilities of a responsible agency under CEQA is to comment on the Draft EIR. These comments are acknowledged; no response is required.

A-SFHPC-2 The commenter notes that the Zakheim Murals were determined by the HPC to be "the most significant historic resources located on the UCSF Parnassus Heights campus" and requested that UC Hall and the Zakheim Murals be evaluated for the National Register of Historic Places. Please see Master Response 11: Toland Hall Murals for responses to comments regarding the Zakheim Murals. The Historic Preservation Commission is requesting that both UC Hall and the Zakheim Murals be evaluated for National Register eligibility. UC Hall has been determined eligible for the California Register with the Zakheim Murals as a character-defining feature (Carey & Co., Inc., 2003). This determination means that UC Hall and the Zakheim Murals are already considered historical resources per 14 CCR § 15064.5 and further evaluation is not necessary. Nonetheless, while ESA has not prepared an independent evaluation of UC Hall or the murals for eligibility on the National Register, the technical memo prepared by ESA's architectural historians in conjunction with these responses to comments indicates that the information in the record would support their listing if an evaluation were prepared.

It should be noted that on November 25, 2020, the Mayor of San Francisco approved Ordinance 241-20 amending the Planning Code to designate the Zakheim Murals as a City Landmark consistent with the standards set forth in Article 10 of the Planning Code. This has been noted in a revision to the Draft EIR. Please refer to Section 8.5 of this Comments and Responses document for the proposed revision.

The Zakheim Murals' eligibility and/or listing in the National Register (and as a San Francisco Landmark) would not alter the conclusions presented in the Draft EIR, which considers UC Hall and the murals as an historical resource pursuant to CEQA Section 21084.1.

A-SFHPC-3 The commenter requests that the EIR consider an alternative that retains UC Hall and an alternative that retains Toland Hall, where the Zakheim Murals are located. Please see Master Response 11: Toland Hall Murals for responses to comments regarding the Zakheim Murals. Please also see Master Response 5: EIR Alternatives, for a discussion of the reasonable range of alternatives included in the Draft EIR. As noted in this Master Response 11, two historical preservation firms retained by the University independently found the murals to be in fragile condition and susceptible to damage from ground movements. While

these evaluations were completed to assess potential relocation of the murals, the same conditions identified would make their preservation in place infeasible if the building around them (UC Hall) were to be demolished and replaced.

A-SFHPC-4 The commenter requests that the EIR contain a mitigation measure providing for salvage of the Zakheim Murals if UC Hall is demolished, indicating that the mitigation measure should provide for the murals to be kept together in a public space such as the Irving Street Arrival. Please see Master Response 11: Toland Hall Murals for responses to comments regarding the Zakheim Murals. Please also see CPHP Mitigation Measure CUL-1c, which provides for public interpretation and salvage for all historic resources that would be affected by the CPHP.

A-SFHPC-5 The Historic Preservation Commission is requesting that the new buildings at Parnassus Heights campus site be "subjected to a design review process that ensures historic compatibility" and that this process be included in the EIR as mitigation. Projects on the UCSF Parnassus Heights campus are not subject to the City's design review process. Also, the Draft EIR did analyze impacts to eligible resources resulting from any near term projects covered by the CPHP. As noted in the Draft EIR Project Description, if the CPHP is adopted, it "would guide the development of the Parnassus Heights campus through the next 30 years" (page 3-9). As explained on Draft EIR page 4.0-3, Future Phase projects under the CPHP are not known with certainty, and therefore the CPHP EIR provides a programmatic analysis, anticipating that future projects will be reviewed to determine the appropriate level of additional environmental review, if any, at the time they are proposed (page 4.0-3). Given that UCSF will evaluate future projects to determine whether there are impacts necessitating additional review, a mitigation measure requiring this review is not necessary.

Re: **City and County of San Francisco Comment Letter on the Comprehensive Parnassus Heights Plan DEIR**

Dear Ms. Wong,

The City and County of San Francisco (City) appreciates the University of California, San Francisco (UCSF) and the Regents of the University of California (Regents) for their ongoing contributions to San Francisco and for engaging the City and San Francisco community in the planning process for the Comprehensive Parnassus Heights Plan (the plan). As a municipal and responsible agency, the City is interested in working with UCSF and the Regents to mitigate environmental impacts from implementation of the plan and address the City and its residents' concerns.

It is in that spirit that the City submits these comments on the plan's Draft Environmental Impact Report (DEIR). These comments reflect combined comments from the San Francisco Planning Department, San Francisco Historic Preservation Commission, San Francisco Municipal Transportation Agency (SFMTA), San Francisco Public Utilities Commission (SFPUC), the Office of Economic and Workforce Development and the Recreation and Parks Department.

The City recognizes the need to upgrade and modernize older medical facilities as well as the services and benefits that UCSF provides to the City and the residents of San Francisco and welcomes this opportunity to help plan for the Parnassus campus's future needs. The City is particularly supportive of UCSF's plan to add new on-campus housing and to redesign and reorient public spaces to improve pedestrian access and integrate the campus with the surrounding neighborhood and open spaces.

At the same time, the plan represents a substantial increase to the existing development at Parnassus Heights (greater than 50 percent increase in gross floor area), and the City is concerned about the plan's impacts on Muni, important cultural resources, San Francisco's job-housing balance, downstream stormwater and wastewater systems, and recreational facilities. The City has shared many of these concerns with UCSF previously. We are optimistic that UCSF can ameliorate these impacts through mitigation measures and other commitments, including a memorandum of understanding between the City and UCSF. We look forward to continued collaboration for decades to come.

1

Cultural Resources

The History of Medicine in California Frescos (Zakheim Murals)

UCSF can advance its educational mission while also protecting cultural resources that have significance to the broader community. Amongst the cultural resources on the UCSF campus, the History of Medicine in California frescos by renowned 20th Century Jewish artist Bernard Zakheim (Zakheim murals) are particularly noteworthy. The murals depict vivid images of doctors, lab scientists, and suffering and recovered patients throughout California's medical history, including a central depiction of Biddy Mason, a Black mid-wife from the late 1800's who was born as an enslaved person but who died as an influential and prominent citizen of Los Angeles. The murals were completed in 1938 as part of the Federal Art Project, a New Deal program designed to employ artists and fund visual art in the United States. 2

The San Francisco Board of Supervisors has taken steps to designate the Zakheim murals as a local historic landmark. In Resolution No. 355-20, effective July 31, 2020, the Board unanimously resolved to initiate Landmark Designation of the murals. On August 19, 2020 the city's Historic Preservation Commission voted unanimously to recommend that the Board approve the Landmark Designation of the murals. We anticipate that the Board will finalize the Landmark Designation by mid-December. The DEIR should be updated to note these developments. 3

The baseline approved condition for the campus is the retention of UC Hall for conversion to residential use under the 2014 Long Range Development Plan. The DEIR states that "UCSF has determined that it will not attempt to remove the Zakheim murals." However, such a determination cannot be made prior to a full evaluation under CEQA of the changes to baseline conditions. We are concerned that UCSF has prematurely decided the outcome for the murals and effectively limited the DEIR's responsibility under CEQA to identify ways to preserve these historic resources. 4

The DEIR identifies a significant and unavoidable impact to the murals due to the demolition of UC Hall. The DEIR states that no feasible mitigations are available to reduce this impact to less than significant. However, the DEIR provides no evidence to support its conclusion that the estimated $7.6 million to preserve, remove, and relocate the mural is prohibitive, particularly in light of the overall cost of the plan. CEQA requires the DEIR to include all potentially feasible mitigation measures. A determination of actual feasibility occurs at plan adoption. 5

The City proposes multiple feasible ways that the murals could be preserved: through modification of the reduced project alternative and through mitigation measures. These options meet CEQA requirements and are feasible given their minimal costs compared to the substantial cost of the overall plan.

First, the DEIR must include an alternative that retains and rehabilitates UC Hall. Although the DEIR studies a reduced density alternative that adaptively reuses UC Hall and thus potentially preserves the murals, the reduced density alternative assumes preservation of multiple other buildings, includes a much smaller new hospital, and renovates Moffit Hospital, a series of proposals which are, collectively, unlikely to meet UCSF's objectives. Therefore, the DEIR should include an alternative that consists of the project with the larger hospital and only preserves UC Hall, or at least preserves Toland Hall—the section of UC Hall in which the Zakheim Murals are located—including the murals themselves. This alternative should include protection of Toland Hall during construction and the restoration of the murals using appropriate conservation treatments that ensure their historic integrity and long-term stability. This alternative should also provide public access to Toland Hall and a comprehensive interpretive program. 6

UCSF may not need to create a new alternative and recirculate the DEIR for public comment to address the alternative proposed above, but instead may be able to combine existing alternatives to respond to this comment in the Final EIR. However, UCSF must present such an alternative to the public and the Regents so they may make an informed decision. 7

Second, if UCSF's preferred project includes demolition of UC and Toland Halls, the DEIR must include a mitigation measure requiring salvage of the murals. This mitigation measure would require UCSF to salvage all sections of the murals and require UCSF to reinstall them as a complete group in a publicly accessible location on the UCSF Parnassus Campus. The mitigation measure would also require a conservator experienced in mural conservation to work with the historical architect to develop a detailed plan for the extraction, moving, storage, reinstallation, and ongoing maintenance of the murals, as well as a comprehensive interpretive program. 8

In summary, UCSF must do everything it can to preserve the Zakheim murals. The alternatives and mitigation measures described above are some feasible options to preserve the murals while still allowing UCSF to meet its project objectives.

Following the publication of the DEIR, the City understands that the Regents opened a Request for Proposals for the removal, conservation, and transportation of the murals to an off-site storage facility to preserve the murals. However, the City strongly prefers that the murals not only be preserved but that they remain publicly displayed for all to enjoy. We look forward to working with UCSF to preserve this invaluable cultural resource. 9

Other Cultural Resource Comments

The following includes additional comments and recommendations on the DEIR cultural resources section.

Page #	Comments and Recommendations	
4.4-19	MM CUL-1a. The DEIR should have established character defining features of known historical resources prior to identifying impacts and determining mitigation. The comments and responses document should identify character-defining features of historic properties under the California Register criteria instead of deferring this to future mitigation, except as it relates to CUL-2.	10
4.4-22	Impact CUL-2. The City recommends modifying mitigation measure CUL-1a to state that prior to the demolition of one of the age-eligible buildings, a qualified professional would evaluate the building for eligibility and, if it is determined to be eligible, the remainder of mitigation measure CUL-1a and mitigation measures CUL-1b and -1c shall apply.	11
4.4-23	Impact CUL-3. The Planning Department's GIS prehistoric archeological modeling assesses the central portion of the main campus (approximately where the UCSF Medical Center and UCSF Health Sciences West are) as moderately sensitive for buried and surface prehistoric resources, not low sensitivity as stated in the DEIR. The Planning Department's assessment is based on topography and slope, distance from water sources and other factors. The area designated as moderately sensitive in our model is much less steep than the rest of the project area and is the location of most of the proposed development. As we have seen demonstrated on numerous projects in San Francisco, past disturbance from use and development does not necessarily equate with destruction of all potential resources. The presence of potential resources depends on the extent of grading, mass excavation and soil improvement associated with the existing and prior development and the nature of ground disturbance for the proposed project. Pockets of significant archaeological deposits may survive even in areas where substantial prior ground disturbance has taken place.	12

Page #	Comments and Recommendations	
	Thus, please amend the mitigation measure to require (1) increased awareness training for the more sensitive areas, and (2) inspection of the site by an archaeologist after each demolition or during site grading and prior to new construction, especially in areas of moderate sensitivity.	12 cont.
4.4-24	MM CUL-3. The phrase "as appropriate to the discovered prehistoric resource" is unclear in the context of this statement, since it covers all resources. Thus, we suggest deleting "prehistoric."	13
6-22	Reduced Project Alternative. The City typically requires an assessment of a "full preservation" alternative that preserves all historic resources, including those significant for association with events (not just architecturally significant buildings). We also typically require that all rehabilitations conform to the Secretary of Interior Standards for Rehabilitation. We recommend UCSF explain whether such an alternative was considered, but rejected, but at a minimum require all rehabilitations conform to the Secretary's Standards.	14

Transportation

The City appreciates the decrease in the total amount of off-street parking supply compared to existing conditions, which will discourage single-occupancy vehicle trips and encourage future users to use sustainable transportation solutions, such as public transit. However, for unexplained reasons, the DEIR transportation analysis does not follow the city's Transportation Impact Analysis (TIA) Guidelines.[1] Most glaringly, the DEIR does not analyze the project's transit and loading impacts at all. For the reasons described below, the plan could have significant effects on the environment related to transit and loading, and the DEIR analysis of consistencies with City transportation policies is inadequate. 15

Transit

San Francisco's Muni public transit system provides vital bus and rail service for the City, including to the Parnassus Heights campus. Today, about 32 percent of students, 17 percent of faculty, and 25 percent of residents travel to and from the campus via Muni (DEIR Table 4.15-8).

For Muni to remain an attractive transportation option for existing and future students, faculty, and residents of the campus, buses and trains serving the campus must operate effectively and people must have the opportunity to board the vehicle. This requires a combination of factors to occur, including funding to support Muni capacity expansions (e.g., increased fleet) and limiting private vehicle conflicts with Muni (i.e., delay). However, the DEIR does not assess the plan's impacts on Muni capacity or delay or consider what improvements could mitigate those impacts. As an initial matter, the San Francisco TIA Guidelines require that large projects like this identify the potential for public transit to accommodate the project's estimated transit trips and adjust estimates as needed if transit capacity is unavailable (TIA Guidelines, p. F-14). The DEIR does not include any such analysis. The DEIR assumes a 55 percent increase in daily external person trips.[2] The DEIR assumes a similar mode split as existing conditions under plan implementation, with 33 percent of 16

[1] In most instances in the DEIR, UCSF uses significance criteria consistent with City guidance despite the differences between the City's guidance and the UC system overall; for instance, wind and shadow impacts are evaluated in the DEIR consistent with City guidance.

[2] The DEIR provides no additional details (e.g., an appendix) to allow verification of the accuracy of numerous calculations or to estimate transit trips to inform the City's planning and to allow the City to participate meaningfully in the environmental review process.

students, 15 percent of faculty, and 25 percent of residents using Muni. This is a false assumption because the DEIR does not assess the ability for Muni to meet this increased demand from the plan's increase in population in a reliable manner. As a result, the DEIR lacks substantial evidence for this assumption, and other topics that rely on this mode split assumption are also flawed (e.g., air quality, noise).[3] 16 cont.

Large development projects in San Francisco are generally subject to the Transportation Sustainability Fee and other fees and agreements to improve transit infrastructure and Muni service, which includes transit capital maintenance, expansion, and reliability. The department preliminarily estimates that if UCSF were a private developer it would owe over $30 million in the Transportation Sustainability Fee alone based on the plan.[4] 17

UCSF will be unable to successfully execute its plan if Muni is over capacity or substantially delayed. This DEIR does not identify whether Muni can accommodate the project's estimated transit trips, nor does it address the effects of people switching modes to private vehicles, which would lead to additional air pollution and noise impacts. Furthermore, Muni cannot commit to providing an increase in service to the campus without additional funding. 18

Additionally, the DEIR fails to identify the transit delay impacts from the plan. As stated above, if Muni is delayed, Muni is less attractive for students, faculty, residents, visitors, and patients of the campus, and potentially makes the DEIR's future mode split assumptions flawed. 19

To determine transit delay impacts on individual Muni routes, the City uses a transit delay significance threshold of greater than or equal to four minutes. This threshold is based on the City Charter,[5] a local policy that the DEIR did not assess. The methodology assesses three sources of transit delay: general congestion at intersections ("congestion"), the additional time required for a transit vehicle to re-enter the flow of traffic ("reentry"), and increased time needed for alighting and departing a transit vehicle ("ridership"). The supplemental "informational" analysis (DEIR Appendix TRANS) shows that the project could exceed this threshold by congestion alone. Several intersections in the project area would degrade in performance from LOS B or C to LOS E or F. This includes Parnassus Avenue, which serves the 6-Parnassus and 43-Masonic Muni routes, and Irving Street, which serves the N-Judah. As for delays caused by increases in ridership, the TIA Guidelines use a factor of 2.5 seconds for boarding and alighting delay that would further result in delays to Muni service due to the several thousand net new transit trips from the project. 20

UCSF must revise the DEIR to include an analysis of the plan's impact on Muni service and transit delay. Without this analysis, the DEIR is inadequate and fails to inform the decision makers of the environmental consequences of the plan. 21

Loading

The City uses the following significance criterion when assessing whether a project would have impacts related to loading: Would the project result in a loading deficit and the secondary effects would create potentially 22

[3] The DEIR air quality and noise analysis rely on vehicle trip estimates consistent with the transportation section to estimate mobile source emissions and traffic noise. As stated here, the DEIR underestimates the plan's vehicle trips because it falsely assumes that the plan would result in similar mode splits as existing conditions.

[4] Calculated as different between existing conditions and plan conditions, based on numbers presented in DEIR tables 3-1 and 3-2.

[5] San Francisco Charter. *SEC. 8A.103(c)(1). Service Standards and Accountability.*

hazardous conditions to people walking, bicycling, or driving, or substantially delay transit? The DEIR did not assess such impacts. 22 cont.

As documented in the DEIR, the project is anticipated to increase p.m. peak hour passenger loading demand by 240 percent. The DEIR does not explain how or whether this loading demand would be adequately accommodated. In comparing the anticipated passenger loading demand (DEIR Table 4.15-13) with the anticipated passenger loading supply (DEIR Table 4.15-14), the data suggests that there would be a passenger loading deficit. Regarding commercial loading, there is no analysis of whether the plan would adequately accommodate its loading needs. 23

Under existing conditions, on-street loading in the project vicinity is impacted. SFMTA transit collision data include nine collisions in the past five years between light rail vehicles and vehicles parked and stopped in the middle of intersections near the Parnassus campus. SFMTA data also show that the N-Judah and nearby routes already experience delays at the Arguello/Carl/Irving intersection under existing conditions when trucks and private vehicles are double parked in the travel lane and obstruct light rail vehicles behind them. When travel lanes are obstructed often, buses and vehicles are forced to make maneuvers to circumvent double-parked vehicles, which in turn may lead to potentially hazardous conditions for substantial numbers of people walking, biking, and driving nearby. The DEIR acknowledges the existing loading deficit in the project vicinity but does not discuss how the project will address the project's contributions this problem. As evidenced here, without addressing the loading issues, the plan could exacerbate the number of collisions and cause additional delay to transit. 24

Lastly, Muni operates as a system; the impacts on one point of a route affect other parts of the route. The DEIR does not disclose the effects of Mitigation Measure AIR-2b and whether the implementation of additional shuttles and TNC subsidies will impact transit in San Francisco in areas farther out from the Parnassus campus. These shuttles and transportation network company (TNC) trips would be additional sources of delay to Muni along their routes and at their loading zones, a fact which is not disclosed or analyzed in the DEIR. 25

Next Steps

UCSF must revise its analysis and identify and analyze mitigation measures to account for the project's transit and loading impacts. The City has significant concerns about the plan's impact on Muni, how the project's passenger and commercial loading demand will be accommodated, and how resulting secondary impacts that could occur from unmet loading demand will be addressed. Potential mitigation measures could include in-kind payment of a transportation impact fee to help offset the project's impact on Muni, and direct contributions to public right-of-way improvements to the surrounding area. Such physical improvements could include: 26

- Roadway infrastructure improvements to signals, bikeway improvements, or pedestrian infrastructure in the Parnassus campus vicinity;
- Improvements and/or contributions to impacted transit lines, including 6-Parnassus, 43-Masonic, and N-Judah;
- A loading plan that demonstrates how the project would fully accommodate expected growth in TNC use and growth in additional demand for other types of loading; and
- Improved TDM measures that could include public use of UCSF shuttles or an institutional transit pass program.

We look forward to working with UCSF to implement the project while supporting the surrounding neighborhood. 26 cont.

Population Growth, Jobs, and Housing

According to the DEIR, the number of students, faculty, and staff at the campus would grow to 16,262, or an increase of 5,184 persons above existing conditions. The DEIR provides no evidence to support its assertion that this increase in jobs was "potentially accounted for" in *Plan Bay Area 2040*. This growth was not accounted for in Planning Department projections for *Plan Bay Area 2040*. 27

The City adopted a Jobs-Housing Nexus Study and linkage fee in 2019 that assumes that 100 percent of all new workers in new developments in San Francisco would generate demand for housing within San Francisco. Thus, the DEIR should assume students, faculty, and staff would seek housing within San Francisco, not the five-county DEIR study area. 28

The City supports the additional housing units that UCSF is constructing on-campus. However, there is a large deficit between the unplanned growth in the number of students, faculty, and staff that UCSF would attract to San Francisco and the amount of housing available on-campus under the plan. The plan would result in a net increase of only 762 housing units and would meet less than 20 percent of the net new housing demand UCSF is creating. This is on top of an existing unmet demand from UCSF. 29

This amount of unplanned growth would require unplanned transportation and utility infrastructure upgrades, which are not discussed in the DEIR. Of particular concern to the City are the project's impacts on the City's transportation system, combined sewer system, and recreational facilities, as documented elsewhere in this letter. UCSF must work with the City to help alleviate the effects of population growth within San Francisco. 30

Stormwater and Wastewater Utilities

The DEIR incorrectly assumes the project is in an area of separated sanitary and storm sewers, and that compliance with State requirements for Municipal Storm Sewer Systems (MS4) is required (see DEIR page 4.9-6). As noted in the DEIR, UCSF is in fact served by the City's combined sewer system. The Parnassus Heights Plan is wholly within the combined sewer area, not MS4. Thus, the State's MS4 Phase II permit requirements do not apply this this project, and any DEIR text relying that assumption should be corrected. Project demolition and construction activities should be coordinated with the SFPUC to ensure that city infrastructure can adequately accommodate the project's stormwater and wastewater needs. 31

To support the DEIR's conclusion of no hydrological impacts or cumulative utility impacts from the proposed project, the DEIR should be revised to include project compliance with the San Francisco Stormwater Management Ordinance (or LEED[6] 6.1). The Stormwater Management Ordinance achieves similar stormwater detention/retention improvements to those contemplated by the DEIR through MS4 compliance; those stormwater controls, in turn, have the potential to mitigate the potential effects of the increased sanitary flows. 32

Conformance with San Francisco Stormwater Management Requirements would typically help offset potential impacts from increased sanitary flows and changes in net impervious surfaces and modified connection points. Furthermore, these stormwater management requirements, as amended in 2016 through Board of 33

[6] LEED (Leadership in Energy and Environmental Design) is a green building certification program developed by the non-profit U.S. Green Building Council that is used worldwide.

Supervisor legislation, apply to State projects.[7] Alternatively, since UCSF already states in the DEIR that the project is pursuing some elements of LEED for the development plan (e.g., energy efficiency), a documented project commitment to the stormwater control element of LEED (SSc6.1) would typically provide a similar offset to potential impacts from increased sanitary flows. UCSF must demonstrate conformance with San Francisco Stormwater Management Requirements or conformance to the stormwater control element of LEED. 33 cont.

In addition, for typical large projects in San Francisco, modeling of increased sewer demand is required for building permit approvals. When project sponsors propose new or replacement sewer connections, the capacity of the adjoining sewer system must be analyzed to ensure that the system can accommodate increased flows and/or modified connection points. For large projects, the project sponsor has the option of conducting the analysis on its own and providing the analysis to the SFPUC for review, or SFPUC can complete the analysis on the sponsor's behalf, subject to reimbursement. If UCSF elects to conduct the modeling and analysis on its own, the modeling must be submitted to the SFPUC Wastewater Enterprise for review and approval. In the event that the analysis finds that increased flows exceed conveyance capacity of the adjoining downstream sewer, additional mitigation would be required from the project. UCSF must work with SFPUC to perform the requisite modeling and ensure that the combined sewer system has adequate downstream capacity. 34

Next Steps

As discussed above, UCSF must model the plan's increased sewer demand and contact the SFPUC to verify whether the combined sewer system has capacity to accommodate the proposed plan, which is substantial unplanned growth from the perspective of the SFPUC. If downstream improvements are required to help accommodate the proposed project, UCSF must contribute funds to help construct necessary utility infrastructure. All development projects in San Francisco are required to pay a wastewater capacity charge and water capacity charge to offset their impacts to the city's utility infrastructure. Such upgrades are vital to the plan's successful implementation. 35

In addition to serving the UCSF Parnassus campus, the combined sewer system is a critical utility that serves the greater San Francisco community. It is imperative that UCSF conform with city stormwater regulations and that it work with the City to ensure that the combined sewer system can perform effectively. 36

Recreation

UCSF's acknowledges its policy to be "generally consistent" with applicable local plans, policies and regulations to the extent feasible. Under Section 295 of the San Francisco Planning Code, projects that are over 40 feet tall must disclose the impacts from shadows cast on Recreation and Park Department property. Although the DEIR provides shadow analyses for many surrounding parks and open spaces, the DEIR fails to provide quantitative shadow on all surrounding city open spaces and properties, including: the Garden For The Environment, White Crane Springs, and the Interior Greenbelt, which is subject to Section 295 Planning Code requirements. Consequently, further analysis is needed to determine whether the plan would adversely impact the use and enjoyment of these open spaces and properties. 37

[7] Ordinance no. 64-16 (File no. 160155) states: Large Development Projects not subject to City building or planning approvals, including, but not limited to, State and Federal projects, must submit a Stormwater Control Plan and receive approval from the General Manager before undertaking any construction activity. For more information: https://sfwater.org/modules/showdocument.aspx?documentid=9077

The City is also concerned that unplanned population growth from the proposed plan would cause increased pressures on city parks and recreational facilities, especially those in the area surrounding the Parnassus campus. The plan would increase the daytime population of the campus by approximately 5,490 persons by 2030 (a 33 percent increase) and 7,850 persons by 2050 (a 45 percent increase). Daytime visitors, students, and employees would likely use nearby recreational facilities. While on-campus recreational facilities would offset some of the demand for recreation and open space, people will likely use off-campus, city-owned facilities as well. The DEIR must analyze whether the unplanned growth would adversely impact city recreational facilities. 38

Next Steps

Large projects in the city typically pay impact fees to help the city maintain and expand recreational facilities and mitigate impacts on city facilities. Consistent with other major projects in the San Francisco, UCSF should contribute funds to help offset physical impacts on recreational facilities from UCSF users due to increased demand. Such fees would help alleviate the project's impact on recreational facilities in the city. 39

Conclusion

The City recognizes the need to upgrade and modernize older medical and research facilities on the UCSF Parnassus Campus. We support this endeavor, but we also have concerns about the plan's impact on San Francisco, impacts which would be significant if left unaddressed. We are optimistic that our concerns about the plan's impacts to cultural resources, public transit, population growth, stormwater utilities and infrastructure, and recreation can be mitigated without hindering UCSF efforts to achieve its overall goals, and we have outlined several approaches that would alleviate these concerns. We look forward to continued engagement with UCSF and working on a mutual memorandum of understanding to plan a healthier, sustainable future for our common community. 40

Please contact Planning Department staff Ryan Shum (ryan.shum@sfgov.org) to discuss any comments in this letter, or Joshua Switzky (joshua.switzky@sfgov.org) regarding the memorandum of understanding.

Sincerely,

Lisa Gibson

Responses to Comments from San Francisco Planning Department

A-SFP-1 The City indicates that as a municipal and responsible agency under CEQA, it is interested in working with UCSF and the Regents to mitigate environmental impacts that could result from implementation of the CPHP and address the City and residents' concerns. The City also indicates it recognizes the need to upgrade and modernize older medical facilities, and the benefits UCSF provides to the City and residents of San Francisco, and supports UCSF's plans to add new on-campus housing and redesign public spaces to improve pedestrian access and integrate the campus with the surrounding neighborhood and open spaces. These comments are acknowledged; no response is required.

The City indicates it is concerned about the CPHP's impacts on Muni, important cultural resources, the City's jobs-housing balance, stormwater and wastewater systems, and recreational facilities. For responses related to CPHP effects on Muni, please see Responses A-SFP-16 through A-SFP-21, and Response A-SFP-26. For responses associated with CPHP effects on cultural resources, please see Responses A-SFP-2 through A-SFP-14. For responses related to CPHP effects on the job-housing balance, please see Responses A-SFP-27 through A-SFP-30. For responses associated with CPHP effects on stormwater and wastewater systems, please see Responses A-SFP-31 through A-SFP-36. For responses concerning the CPHP effects on recreational facilities, please see Reponses A-SFP-37 to A-SFP-39.

The City indicates UCSF can ameliorate the above-referenced impacts through mitigation measures and other commitments, including a memorandum of understanding between the City and UCSF, and that it looks forward to continued collaboration. These comments are acknowledged; no response is required.

The commenter also indicates the City's appreciation for UCSF's ongoing contribution to San Francisco, expresses the City's concern about possible impacts, and requests a memorandum of understanding between the City and UCSF. Please see the responses below regarding individual comments on the Draft EIR.

A-SFP-2 The commenter describes the Zakheim Murals. This is not a comment on the adequacy of the EIR. The comment has been noted and will be forwarded to decision-makers. Please see Master Response 11: Toland Hall Murals for responses to comments regarding the Zakheim Murals.

A-SFP-3 The commenter notes that the City is in the process of listing the Zakheim Murals as a Landmark. The comment is noted. In fact, on November 25, 2020, the Mayor of San Francisco approved Ordinance 241-20 amending the Planning Code to designate the Zakheim Murals as a City Landmark consistent with the standards set forth in Article 10 of the Planning Code. This has been noted in a

revision to the Draft EIR. Please refer to Section 8.5 of this Comments and Responses document for the proposed revision.

However, this does not change the status of the Zakheim Murals with regards to CEQA; they were already considered historical resources due to their identification as character-defining features of UC Hall, which is California Register-eligible. Please see Master Response 11: Toland Hall Murals for responses to comments regarding the Zakheim Murals.

A-SFP-4 The comment describes "baseline approved conditions" with preservation of the Zakheim Murals in the 2014 LRDP and suggests that UCSF has "prematurely decided the outcome for the murals." UC Hall is seismically deficient and was proposed for demolition in two prior LRDPs preceding the 2014 LRDP, which proposed that the building be retained and retrofitted for residential use. The CPHP again proposes removal of UC Hall and its replacement with a new, state of the art research and academic building. Please see Master Response 11: Toland Hall Murals for responses to comments regarding the Zakheim Murals. UCSF is currently assessing how best to relocate the murals, and the Draft EIR's conclusion is conservative in the sense that it assumes that despite the best efforts of UCSF and qualified professionals retained to move the murals, they may be damaged.

A-SFP-5 The comment requests evidence to support the Draft EIR's conclusion that there is no feasible mitigation to reduce the impact associated with demolition of UC Hall to less than significant. The proposed CPHP includes demolition of UC Hall, and would therefore have an adverse change on the historical resource. Despite inclusion of CPHP Mitigation Measures CUL-1a, 1b, 1c, and 1d, this impact would remain significant and unavoidable. UCSF has not identified any additional mitigation measures that could reduce the severity of this impact to less than significant, up to and including moving the murals, which based on the two studies referenced on Draft EIR pages 4.4-14 through -15, may be too fragile to survive the move without serious damage. Please see Master Response 11: Toland Hall Murals for additional responses to comments regarding the Zakheim Murals.

A-SFP-6 The commenter proposes multiple ways that the murals could be preserved via revisions to the reduced project alternative and through mitigation measures. Please see Master Response 11: Toland Hall Murals for responses to comments regarding the Zakheim Murals and Master Response 5: EIR Alternatives for responses to comments regarding the reasonable range of alternatives presented in the Draft EIR. Among these alternatives, both the No Project – Development Under the 2014 LRDP and the Reduced Project Alternative would preserve UC Hall and could retain the murals in situ.

A-SFP-7 The commenter suggests that Draft EIR alternatives could be combined to preserve the murals. Please see Master Response 11: Toland Hall Murals for responses to comments regarding the Zakheim Murals and Master Response 5: EIR Alternatives for responses to comments regarding the reasonable range of alternatives presented in the Draft EIR. Among these alternatives, both the No Project – Development Under the 2014 LRDP and the Reduced Project Alternative would preserve UC Hall and could retain the murals in situ.

A-SFP-8 The commenter requests the addition of a mitigation measure requiring salvage of the murals and reinstallation in a publicly accessible location on campus. Please see Master Response 11: Toland Hall Murals for responses to comments regarding the Zakheim Murals. Please also see CPHP Mitigation Measure CUL-1c, which provides for public Interpretation and Salvage for all historic resources that would be affected by the CPHP.

A-SFP-9 The commenter reiterates the commenter's request for alternatives and mitigation measures to preserve the murals, stating the City's strong preference that the murals be preserved and "remain publically displayed for all to enjoy." Please see Master Response 11: Toland Hall Murals for responses to comments regarding the Zakheim Murals and see CPHP Mitigation Measure CUL-1c, which would require preparation of public interpretation and salvage plan prior to demolition or substantial alteration.

Please also see new CPHP Mitigation Measure CUL-1e added to the Draft EIR that states that should the Zakheim murals be successfully removed from Toland Hall and stored, a Task Force will be convened to advise on options for the display of the murals in a publicly accessible setting, either on a UCSF campus or at a museum or other institution. Please refer to Section 8.5 of this Comments and Responses document for the full text of this new mitigation measure.

A-SFP-10 The commenter suggests that the EIR should identify character-defining features of known historic resources prior to identifying impacts and mitigation. Demolition of historical resources in their entirety is a significant and unavoidable impact, and the EIR does not need to include additional information regarding character-defining features of the historic resources in order to reach this conclusion. As listed on page 4.4-12 and 13, buildings proposed for demolition include UC Hall, Millberry Union, School of Dentistry, LPPI, and Aldea San Miguel Housing Buildings 8, 10, and 12. Per CPHP Mitigation Measure CUL1a (on page 4.4-19 of the Draft EIR), the character-defining features for each resource will be identified and this information will be used to fulfill CPHP Mitigation Measure CUL-1b (Document Historical Resources Prior to Demolition or Alteration) and CPHP Mitigation Measure CUL-1c (Public Interpretation and Salvage Plan).

As noted in the Draft EIR Project Description, if the CPHP is adopted, it "would guide the development of the Parnassus Heights campus through the next

30 years" (page 3-9). As explained on Draft EIR page 4.0-3, Future Phase projects under the CPHP are not known with certainty, and therefore the CPHP EIR provides a programmatic analysis, anticipating that future projects will be reviewed to determine the appropriate level of additional environmental review, if any, at the time they are proposed (page 4.0-3).

The proposed project includes alterations to Saunders Court, the Mount Sutro Open Space Reserve (Reserve), HSIR East, HSIR West, and the Medical Sciences Building; however, the details of those alterations are not known at this time. A detailed description of Saunders Court is located on page 50 of Carey & Co., Inc.'s 2011 *UCSF Historic Resources Survey report* (2011 Report), in the 2010 DPR form attached to the 2011 Report, and in the DPR update form that has been prepared in response to the commenter's request and included in a technical memo provided in conjunction with these responses to comments. Saunders Court is also discussed in the DPR forms for HSIR West, Medical Services Building, and School of Nursing in the Carey & Co., Inc.'s 2011 Report as that space related to those buildings. Carey & Co., Inc.'s 2011 Report includes detailed descriptions of the HSIR East, HSIR West, and Medical Sciences Building. Per the impact analysis beginning on page 4.4-18 of the DEIR, "In addition, in the absence of detailed plans at this stage, other historical resources, including cultural landscapes, could be significantly physically altered under the CPHP: Saunders Court, Reserve, HSIR East, HSIR West, and Medical Sciences building. The demolition or significant alteration of these individually eligible resources would be considered a significant impact because, once demolished or significantly altered, they would no longer be eligible as historical resources under CEQA."

In response to the commenter's request, an Historic Resources Technical Memo has been prepared containing a summary of each of the existing technical reports that have evaluated resources on Parnassus Heights Campus Site, ESA's methodology for review of these evaluations, how each of the reports was used to inform the EIR analysis, as well as DPR update forms for four of the buildings that had not been evaluated previously (Millberry Union, Saunders Court, HSIR West, and HSIR East) and a list of character-defining features for each of the historic resources that could be impacted by the CPHP.

A-SFP-11 The commenter recommends the modification of CPHP Mitigation Measure CUL-1a to "state that prior to the demolition of one of the age-eligible buildings, a qualified professional would evaluate the building for eligibility and, if it is determined to be eligible, the remainder of CPHP Mitigation Measure CUL-1a and CPHP Mitigation Measures CUL-1b and -1c shall apply." Impact CUL-1 and CPHP Mitigation Measures CUL-1a through 1c are in place to mitigate potentially significant impacts to known historic resources that have already been determined to be historic resources, thus an additional evaluation for eligibility is not needed and the CPHP Mitigation Measures CUL-1b and 1c would apply. Impact CUL-2 addresses potential impacts to potential historic resources that

have not been evaluated (some are not currently age-eligible), but may become eligible for listing in the National and/or California registers and may be affected during the Future Phase of the CPHP. In response to the commenters' requests, the Historic Resources Technical Memo updates the evaluations of the buildings that have become of historic-age. As noted in Response A-SFHPC-5 above, future projects will be evaluated to determine whether additional environmental review is required. If actions affecting potentially historic buildings are later proposed that are not addressed by the proposed mitigation, additional CEQA review would be required, including any necessary evaluations.

A-SFP-12 In this comment, the Planning Department indicates that the Department's GIS prehistoric archaeological modeling assesses the central portion of the main campus as moderately sensitive for buried and surface prehistoric resources, based on topography and slope, distance from water sources and other factors. The Planning Department requests the mitigation measure be revised to require (1) increased awareness training for the more sensitive areas, and (2) inspection of the site by an archaeologist after each demolition or during site grading and prior to new construction, especially in areas of moderate sensitivity.

The geologic context of the main campus includes Quaternary beach and dune sand deposits and hillslope deposits. These types of geologic formations do have a moderate potential to contain archaeological resources buried by natural processes and there have been buried archaeological discoveries in these types of geologic formations in the eastern part of the San Francisco Peninsula. However, the areas proposed for development on the campus site have been substantially disturbed from development of the existing facilities; the campus site is over one mile from any historic perennial water sources or other potential resource procurement areas important to prehistoric populations; and there have been no archaeological discoveries within several miles of the campus site. Therefore, the potential for buried or surface prehistoric archaeological resources to be in the project vicinity is substantially lessened and monitoring was not recommended during demolition or site grading.

The Draft EIR includes CPHP Mitigation Measure CUL-3: Inadvertent Discovery of Archaeological Resources and Tribal Cultural Resources. This mitigation measure includes an awareness training for all on-site personnel that outlines general archaeological and tribal cultural sensitivity, and what to do in the event of a discovery. The Draft EIR also includes provisions to halt work within 100 feet of a find of potential cultural significance so the contractor can notify the UCSF Environmental Coordinator (EC).

A-SFP-13 The City notes that the phrase "as appropriate to the discovered prehistoric resource" is unclear in CPHP Mitigation Measure CUL-3 because the measure is related all resource types, including prehistoric and historic-era finds as well as tribal cultural resources.

CPHP Mitigation Measure CUL-3 is revised to delete the word "prehistoric" when referring to discovered resources; please refer to Section 8.5 of this Comments and Responses document for the proposed revision.

A-SFP-14 The commenter notes that EIRs prepared by the City and County of San Francisco typically include an alternative that would preserve all historic resources and require all rehabilitations to conform to the Secretary of Interior's Standards for Rehabilitation. The commenter then recommends inclusion of an explanation whether such an alternative was considered and rejected, and also imposition of a requirement for conformance with the Standards.

The CPHP Draft EIR includes a No Project Alternative consisting of Alternative 1A, No Project – No Development and Alternative 1B, No Project – Development Under the 2014 LRDP. As discussed in Chapter 6 of the EIR, the first of these alternatives would include no development and would thus not affect cultural resources. The second No Project alternative, would include development as called for in the 2014 LRDP and would not demolish the School of Dentistry, Aldea and San Miguel Housing Buildings 8, 10, and 12, UC Hall, or Millberry Union. Overall, this alternative would constitute a "preservation alternative" in every sense except that it would include demolition of the LPPI, which has been determined to be an historical resource since adoption of the 2014 LRDP. Similarly, the Reduced Project Alternative would constitute a "preservation alternative" in every sense except that it would include demolition of the LPPI and Millberry Union, both of which are significant for reasons other than their architecture. Another alternative that would retain and reuse all historic resources, including both the LPPI and Millberry Union would be infeasible if Parnassus Heights were to accommodate development anticipated in the proposed CPHP, with its new hospital, and UCSF's desire to improve the North Side Gateway district, making way for new building on opportunity sites in the core campus (Draft EIR Figure 3-6) necessary to provide adequate and appropriately designed space for research, educational, and clinical programs.

A-SFP-15 The comment expresses support for the CPHP's proposed parking supply. This portion of the comment is noted.

The comment then asserts that the Draft EIR does not adequately assess the CPHP's transportation impacts due to the fact that it utilizes significance criteria that differ from those used by the City and County of San Francisco, and that the Draft EIR does not adequately assess compliance with applicable plans, policies, and programs. Refer to Master Response 16 for a response that discusses the study topics and significance criteria used in the Draft EIR. For reasons set forth in Master Response 16, UCSF need not comply with the City's environmental review guidance for assessment of the CPHP. The Draft EIR is in compliance with the standards set by the University of California Board of Regents as the

lead agency, and as such presents an adequate analysis of the CPHP's impacts, and no additional analysis is needed.

A-SFP-16 The comment asserts that the Draft EIR does not adequately analyze or disclose the CPHP's effects on public transit service, specifically service provided by San Francisco Muni. Refer to Master Response 16 for a discussion of why UCSF is not required to analyze the CPHP's effects on transit capacity or delay for purposes of assessing environmental impacts. In addition, refer to Master Response 20 for additional discussion of why Muni operational issues are not a CEQA concern, and therefore analysis of these effects is not required in the EIR.

The comment further asserts that because the Draft EIR does not include a capacity analysis for Muni services, that it lacks substantial evidence backing its mode share assumptions, specifically the share of new trips that would be made by transit. Please refer to Master Response 20 for a response to this comment, and to Master Response 17 for discussion of methods used in mode share assignments.

A-SFP-17 The comment states that projects under the jurisdiction of the City and County of San Francisco are required to pay a Transportation Sustainability Fee, and estimates the amount of that fee for a project similar to the Comprehensive Parnassus Heights Plan. The CPHP is under the jurisdiction of the University of California and per Planning Code Sec. 411A.3(b)(4) is not required to pay a Transportation Sustainability Fee; as such, the comment is noted, and no changes are necessary to the Draft EIR.

A-SFP-18 The comment reiterates statements presented in Comment A-SFP-16, and asserts that the Draft EIR's future travel demand analysis is inadequate because it does not account for Muni's capacity to accommodate the estimated transit demand. See Response A-SFP-16 and Master Response 20 for responses to the issues raised in this comment.

A-SFP-19 The comment reiterates and expands on statements presented in Comment A-SFP-16, and states that the Draft EIR's future travel demand analysis is inadequate because it does not account for how future changes in Muni travel times would affect the CPHP travel demand. See Response A-SFP-16 and Master Response 20.

A-SFP-20 The comment provides a summary of how the City of San Francisco analyzes transit delay for projects for which it is the lead agency, and asserts that the Draft EIR should use similar methods and thresholds to comply with policies set forth in the San Francisco City Charter, specifically SFMTA's Service Standards for Muni Service. However, the City's transit delay significance criteria do not apply to the CPHP for reasons explained in Master Response TR-16. Further, as discussed in Master Response 20, UCSF does not control the provision of public transit service provided by Muni and whether Muni's Service Standards are met; UCSF does not consider this operational concern to be a CEQA matter.

A-SFP-21 The comment asserts that the Draft EIR presents an inadequate assessment of the CPHP's environmental consequences based on lack of analysis of transit capacity and delay. Neither of these topic areas are included in Appendix G of the CEQA Guidelines, and UCSF does not consider Muni operational concerns to be a CEQA concern, as discussed in Master Response 16 and Master Response 20. The DEIR adequately addresses the required topic areas outlined in Appendix G and as such, the Draft EIR's assessment of the CPHP's transportation-based impacts on the environment is adequate and complete.

A-SFP-22 The comment describes the significance criteria used by the City of San Francisco to assess loading impacts in projects where it is the lead agency, and further states that the Draft EIR did not assess such impacts. However, the City is not the lead agency for the CPHP and does not have the authority to set significance criteria. See Master Response 16 for a response that discusses the study topics and significance criteria used in the Draft EIR.

A-SFP-23 The comment summarizes findings from pages 4.15-34 through 4.15-35 of the Draft EIR, where the Draft EIR acknowledges that loading demand may exceed supply during the peak minute of the day and states that there is no analysis of commercial loading demand in the Draft EIR. See Master Response 16 that discusses the study topics and significance criteria used in the Draft EIR; loading demand does not fall within the scope of the issues identified in the Appendix G checklist. Further, it is important to note that the increase in campus population under the CPHP is expected to occur over a 30+ year timeline and the loading demand discussion refers to a projection of a peak minute within a peak hour (the referenced 240 percent increase in the comment). UCSF monitors transportation conditions at all campus sites where development is proposed and would continue to monitor vehicle traffic conditions, inclusive of passenger and commercial loading and seek to remedy potential effects of any recurring shortfall. However, UCSF does not believe this operational concern to be a CEQA matter.

A-SFP-24 The comment describes two existing operational concerns in the vicinity of the Parnassus Heights campus. The first relates to a history of collisions between N-Judah light rail vehicle and unidentified vehicles along the light rail tracks. The second refers to delays to N-Judah light rail vehicles due to parked trucks and vehicles in the vicinity of the intersection of Arguello Boulevard, Carl Street, and Irving Street. UCSF appreciates this additional information. UCSF does not have a record of its vehicles being involved in collisions with Muni light rail vehicles in the vicinity of the campus.

However, UCSF does not believe this existing operational concern to be a CEQA matter. Master Response 16 notes that CEQA provides for lead agencies, such as UC, to adopt their own thresholds of significance and to evaluate the significance of a project's impact based on substantial evidence. UC's significance thresholds

for the CPHP are presented and discussed in Master Response 16. The DEIR adequately addresses the required topic areas outlined in Appendix G and as such, the Draft EIR's assessment of the CPHP's transportation-based impacts on the environment is adequate and complete.

A-SFP-25 The comment asserts that the Draft EIR's assessment of transportation impacts is inadequate and incomplete because it does not consider the secondary effects on transit from the programs included in CPHP Mitigation Measure AIR-2b. See Master Response 20 regarding transit concerns.

A-SFP-26 The comment summarizes the transportation issues raised in Comments A-SFP-15 through A-SFP-25, and requests revisions to the analysis and identification of mitigation measures for the CPHP's impacts on transit and loading. See Master Response 20 regarding transit concerns. As defined by UCSF significance criteria, presented on page 4.15-27 of the Draft EIR, and further discussed in Master Response 16, there are no significance criteria related to transit delay, transit crowding, or inadequate loading supply. As such, the Draft EIR is not lacking in its omission of detailed discussion of those items, and the analysis presented therein is adequate and complete.

However, please also see new measure added to CPHP Mitigation Measure AIR-2b: TDM Program Enhancements that would provide for implementation of a patient transit pass program by June 30, 2025 to further reduce CPHP operational increases in criteria air pollutants. Please refer to Section 8.5 of this Comments and Responses document for the full text of this new mitigation measure.

A-SFP-27 The commenter states that because employment growth at the Parnassus Heights campus site under the CPHP is not accounted for in the Planning Department projections included in *Plan Bay Area 2040*, the growth is not in the regional projections.

Please see Master Response 14: Population and Housing as to why the Draft EIR states that the increase in jobs at the Parnassus Heights campus site under the CPHP is potentially accounted for in *Plan Bay Area 2040*. The master response summarizes the methodology used by ABAG to develop the regional employment projections. Based on that methodology, it is reasonable to assume that the employment growth at Parnassus Heights campus site under the CPHP is included in *Plan Bay Area 2040* projections.

A-SFP-28 The commenter states that UCSF should use the same approach as the City of San Francisco and assume that all new employees under the CPHP would seek housing in San Francisco.

The City, as a lead agency for CEQA documents under its jurisdiction, may elect to assume that 100 percent of new workers in new developments in San Francisco would create a demand for housing only in San Francisco. However,

the University, as lead agency for the CPHP EIR, conducted the impact analysis based on observed patterns of residence of UCSF students and employees. Based on the observed patterns, about 60 percent of the new students and employees would live in San Francisco and the rest in a 4-county area. This is a reasonable analysis as not all new UCSF employees and students would choose to live in San Francisco; rather, place of residence decisions are based on a number of variables, including availability, cost and type of housing, as well as a number of other factors such as access to good schools, preference for suburban living, and proximity to family and friends. Note that the Draft EIR presents an estimate of the population increase in San Francisco based on this residence pattern, in addition to an analysis which conservatively assumes that all of the new students and employees would choose to live in San Francisco. Please see Draft EIR page 4.12-8.

A-SFP-29 The commenter states that the CPHP includes a small number of new housing units at the campus site and would create an additional demand for housing in San Francisco.

Please see Master Response 14: Population and Housing regarding the analysis of population and housing impacts in the Draft EIR. Due to space constraints at the Parnassus Heights campus site, UCSF cannot plan for substantially more than the approximately 762 new housing units that are included in the CPHP. However, UCSF continues to explore and develop additional housing in other parts of the City to accommodate UCSF students and employees, including those that study and/or work at Parnassus Heights campus site. By Summer 2021, 71 units of faculty housing will be provided at 2130 Post Street. In collaboration with UC Hastings, about 230 units will be provided in the Civic Center area at UC Hastings. Also, as part of a memorandum of understanding with the City, UCSF is committed to facilitating the delivery of 200 additional units. Therefore, UCSF would increase the total number of University-controlled housing in San Francisco by about 1,263 net new housing units.

A-SFP-30 The Draft EIR fully addresses the impacts of the projected population growth under the CPHP on the transportation system, utilities (including the combined sewer system), and recreational facilities. Please also see Responses A-SFP-15 through A-SFP-26 with respect to the CPHP's impacts on transportation; Responses A-SFP-31 through A-SFP-36 with respect to the CPHP's impacts on utilities; and Responses A-SFP-37 through A-SFP-29 regarding CPHP's impacts on recreation.

A-SFP-31 The commenter believes that the Draft EIR assumes that the project is in an area of separated sanitary and storm sewers, which is incorrect, and indicates that compliance with State requirements for an MS4 permit is not required. The commenter also states that demolition and construction activities "should be coordinated with the SFPUC to ensure that city infrastructure can adequately

accommodate the project's stormwater and wastewater needs." Please see Master Response 12: Stormwater, Wastewater, and Overflows.

A-SFP-32 The commenter suggests that the EIR should be revised to include compliance with the San Francisco Stormwater Management Ordinance, which achieves detention/retention similar to those contemplated by UCSF and could mitigate the potential effects of increased sanitary flows. Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

A-SFP-33 The commenter suggests that San Francisco's stormwater management requirements apply to State projects, and that the project must either demonstrate conformance with San Francisco's Stormwater Management Ordinance or the stormwater control element of LEED. Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

A-SFP-34 The commenter indicates that modeling of increased sewer demand is required for building permit approval of large projects in San Francisco to determine if the system can accommodate increased flows and/or modified connection points. The commenter also indicates that UCSF has the option of conducting the analysis for SFPUC's review, or paying for SFPUC to do the analysis, and that "if the analysis finds that increased flows exceed conveyance capacity of the adjoining downstream sewer, additional mitigation would be required." Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

A-SFP-35 The commenter states that UCSF's plan is "substantial unplanned growth" from the SFPUC's perspective and that UCSF must model the plan's increased sewer demand and contact the SFPUC to verify there is capacity. Also, if downstream improvements are required, UCSF must contribute funds for their construction. The commenter also indicates that all development projects in San Francisco are required to pay a wastewater capacity charge and water capacity charge to offset impacts to the City's infrastructure. Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

A-SFP-36 The commenter emphasizes the critical nature of the City's combined sewers system, stating "it is imperative that UCSF conform with city stormwater regulations and that it work with the City to ensure that the combined sewer system can perform effectively." Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

A-SFP-37 The commenter indicates the Draft EIR fails to assess shadow effects on the Garden for the Environment, White Crane Springs, and the Interior Greenbelt. Please refer to Master Response 9: Shadow Impacts.

A-SFP-38 The commenter expresses concern that unplanned population growth from the proposed CPHP would cause increased pressures on City parks and recreation facilities, particularly those in the area surrounding the campus site.

As addressed in Impact REC-1 in the Draft EIR, Section 4.14 Recreation, the increase in the population at Parnassus Heights, particularly, but not limited to, the population that would live on-campus, would increase demand for recreational facilities. As discussed in Section 4.14, the Parnassus Heights campus site features substantial open space and recreation opportunities – including the 61-acre Mount Sutro Open Space Reserve. The Reserve includes a 5-mile network of public, multi-use trails that serve hikers, runners, cyclists, and dogs on leash year-round. Much of the campus housing, including that located within the Aldea Housing complex, is located in proximity to the Reserve. As discussed in Impact REC-1, UCSF would provide a net increase in publically accessible open space within the campus core over existing conditions, including the proposed Millberry Terrace, expanded Saunders Court, an open space connection from 5th Avenue to the Reserve, and a proposed Promenade to the south of the current UC Hall. In addition, under the CPHP, additional indoor recreational opportunities would be created, such as a proposed new wellness center (including a fitness studio and pool).

It is acknowledged that some increase in the use of nearby City recreational facilities (e.g., Golden Gate Park, and the Interior Greenbelt) would be associated with the daytime population (e.g., visitors and employees); as with the increase in on-campus residential population, such increase in usage is unlikely to be so large as to result in significant physical deterioration of the facilities.

A-SFP-39 The commenter indicates that UCSF should contribute funds to help offset physical impacts on recreational facilities from UCSF users due to increased demand. As explained in Response A-SFP-38, and demonstrated in Impact REC-1 in the Draft EIR, implementation of the CPHP would not increase use of existing neighborhood parks or other existing off-campus recreational facilities such that substantial physical deterioration would occur or be accelerated; and as such, the impact would be less than significant, and no mitigation is required. Nevertheless, this suggestion from the commenter is part of the public record on the CPHP, and will be considered by the UC decision-makers prior to considering CPHP approval.

A-SFP-40 The commenter repeats a number of comments made in the opening of the comment letter. Please see Response to Comment A-SFP-1.

RE: Request for Extension of Draft EIR Comment Period for UCSF Comprehensive Parnassus Heights Plan (SCH 2020010175)

Dear Ms. Wong:

We write on behalf of The Parnassus Neighborhood Coalition ("PNC"), a group of residents living near the UCSF Parnassus Heights campus. PNC intends to comment on the recently-released Draft Environmental Impact Report ("DEIR") for the Comprehensive Parnassus Heights Plan (SCH 2020010175). As you can imagine the current COVID-19 pandemic has made coordination and communication with neighbors, consultants and others quite difficult. Even the California Judicial Council has recognized the need to extend CEQA deadlines due to the COVID-19 pandemic. (See, California Rule of Court Emergency Rule No. 9). Given this situation, we request a 30-60 day extension of the comment period for the DEIR to allow for a full and adequate public comment, as intended by CEQA. Thank you for considering this request. 1

Sincerely,

Richard Toshiyuki Drury
LOZEAU DRURY LLP

Responses to Comments from Lozeau Drury LLP

O-LD1-1 The commenter requests a 30- to 60-day extension of the public comment period. As the commenter is aware, the typical Draft EIR public review period is 30 to 45 days. The University provided an extended review period of 60 days for the CPHP Draft EIR, ending on September 11, 2020. As many community meetings have been held over the past couple of years regarding the CPHP, including robust public education materials on the details of the CPHP, the University believes that the 60-day public comment period for the Draft EIR is appropriate. Throughout the pandemic, the University has made public access to information as easy as possible by providing materials online, by holding community meetings online, and by frequent outreach to its neighbors.

Re: Comment on Draft Environmental Impact Report, UCSF Comprehensive Parnassus Heights Plan (SCH 2020010175)

"The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent."

-Resolution of the Board of Regents of the University of California, May 21, 1976 (Exhibit A)

Dear Chair Pérez, Vice Chair Estolano, and Honorable Regents:

This letter is submitted on behalf of the Parnassus Neighborhood Coalition ("PNC"), a group of residents living near the University of California, San Francisco ("UCSF") Parnassus Heights campus, regarding the Draft Environmental Impact Report ("DEIR") prepared for the Comprehensive Parnassus Heights Plan ("CPHP") (SCH 2020010175) (the "Project"). After reviewing the DEIR, we conclude that the EIR fails as an informational document and fails to impose all feasible mitigation measures to reduce the Project's impacts. PNC requests that the University address these shortcomings in a revised draft environmental impact report ("RDEIR") and recirculate the RDEIR prior to considering approvals for the Project. We reserve the right to supplement these comments during review of the Final EIR for the Project and at public hearings concerning the Project. *Galante Vineyards v. Monterey Peninsula Water Management Dist*. (2007) 60 Cal.App.4th 1109, 1121. 1

I. PROJECT DESCRIPTION

In 2014, the University of California prepared a Long Range Development Plan ("2014 LRDP") setting forth concepts, principles, and plans to guide future growth for the UCSF campus, outlining projected development levels and patterns for UCSF at all of its main campus sites through 2035. Available at https://ucsf.app.box.com/s/h6f3cfzsznl1bl3kk0am5k9gtc5lila8/file/701727549327. The Regents certified the FEIR for the LRDP in November 2014, which included an analysis of the potential environmental impacts from then-envisioned development at the Parnassus Heights campus site. However, at some point after this, UCSF undertook a planning process to re-envision and revitalize the Parnassus Heights campus as a whole, resulting in the development of the CPHP, which provides a long-term development framework for the "revitalization" of the Parnassus Heights campus.

This Project proposes to develop approximately 2.9 million gross square feet ("gsf") of new building space at Parnassus Heights. The CPHP includes an "Initial Phase" that comprises of: 1) Irving Street Arrival improvements, 2) Research and Academic Building ("RAB"), 3) initial Aldea Housing Densification, and 4) New Hospital. This Initial Phase is anticipated to be completed by approximately 2030. Beyond the Initial Phase, the "Future Phase" encompasses the remaining development described in the CPHP envisioned for completion by the horizon year of 2050. However, when accounting for existing campus site development, demolition that was approved under the UCSF 2014 LRDP but not yet implemented, and potential additional building demolition that would occur under the CPHP, the total amount of campus space upon full implementation of the CPHP would be 6.0 million gsf. The Project will add over 2 million square feet of additional space. To put this in perspective, this is equivalent to placing both the Salesforce Tower and the Transamerica Pyramid on this highly congested site in a residential neighborhood.

2A

The CPHP for the first time reneges on the promise made by the UC Regents in 1976 to the City of San Francisco and the community of Parnassus Heights to resolve a CEQA lawsuit that the Parnassus campus would never exceed 3.55 million square feet. The CPHP would exceed this Space Ceiling by over 2 million square feet, making a mockery of this false promise.

2B

II. LEGAL BACKGROUND

CEQA requires that an agency analyze the potential environmental impacts of its proposed actions in an environmental impact report ("EIR") (except in certain limited circumstances). *See, e.g.*, Pub. Res. Code § 21100. The EIR is the very heart of CEQA. *Dunn-Edwards v. BAAQMD* (1992) 9 Cal.App.4th 644, 652. "The 'foremost principle' in interpreting CEQA is that the Legislature intended the act to be read so as to afford the fullest possible protection to the environment within the reasonable scope of the

3

statutory language." *Communities for a Better Environment v. Calif. Resources Agency* (2002) 103 Cal. App. 4th 98, 109.

CEQA has two primary purposes. First, CEQA is designed to inform decision makers and the public about the potential, significant environmental effects of a project. 14 Cal. Code Regs. ("CEQA Guidelines") § 15002(a)(1). "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions before they are made. Thus, the EIR 'protects not only the environment but also informed self-government.'" *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal. 3d 553, 564. The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return." *Berkeley Keep Jets Over the Bay v. Bd. of Port Comm'rs*. (2001) 91 Cal. App. 4th 1344, 1354 ("Berkeley Jets"); *County of Inyo v. Yorty* (1973) 32 Cal.App.3d 795, 810.

Second, CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring "environmentally superior" alternatives and all feasible mitigation measures. CEQA Guidelines § 15002(a)(2) and (3); see also, *Berkeley Jets*, 91 Cal. App. 4th 1344, 1354; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564. The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced." CEQA Guidelines §15002(a)(2). If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns." Pub. Res. Code § 21081; CEQA Guidelines § 15092(b)(2)(A) & (B). The lead agency may deem a particular impact to be insignificant only if it produces rigorous analysis and concrete substantial evidence justifying the finding. *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 732 (Cal. App. 5th Dist. 1990).

3 cont.

The EIR is the very heart of CEQA "and the integrity of the process is dependent on the adequacy of the EIR." *Berkeley Jets*, 91 Cal. App. 4th 1109, 1355. CEQA requires that a lead agency analyze all potentially significant environmental impacts of its proposed actions in an EIR. Pub. Res. Code § 21100(b)(1); Guidelines § 15126(a); *Berkeley Jets*, 91 Cal.App.4th 1344, 1354. The EIR must not only identify the impacts, but must also provide "information about how adverse the impacts will be." *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831. The lead agency may deem a particular impact to be insignificant only if it produces rigorous analysis and concrete substantial evidence justifying the finding. *Kings County Farm Bureau*, 221 Cal.App.3d 692, 732. "The 'foremost principle' in interpreting CEQA is that the Legislature intended the act to be read so as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language." *Communities for a Better Env't*, 103 Cal.App.4th 98, 109.

The California Supreme Court has noted that "the adequacy of an EIR's discussion of environmental impacts is an issue distinct from the extent to which an agency is correct in its determination whether the impacts are significant" and, as such, "adequacy of discussion claims are not typically amenable to substantial evidence review." *Sierra Club v. Co. of Fresno* (2018) 6 Cal. 5th 502, at 514-15. Rather, such claims are reviewed de novo to determine "whether the discussion sufficiently performs the function of facilitating 'informed agency decisionmaking and informed public participation.'" *Id*. at 513 [quoting *California Native Plant Soc'y v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, 988].

"[T]he reviewing court is not to 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A 'clearly inadequate or unsupported study is entitled to no judicial deference.'" *Berkeley Jets*, 91 Cal. App. 4th 1344, 1355 (emphasis added), quoting, *Laurel Heights Improvement Assn. v. Regents of University of California*, 47 Cal. 3d 376, 391 409, fn. 12 (1988). A prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decisionmaking and informed public participation, thereby thwarting the statutory goals of the EIR process." *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal. App. 4th 713, 722; *Galante Vineyards v. Monterey Peninsula Water Management Dist*. (1997) 60 Cal. App. 4th 1109, 1117; *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal. App. 4th 931, 946. As discussed below, and in the attached expert comment letters of expert Dr. Smallwood, expert consulting firm SWAPE, Mr. Ikeda, and Ms. Watt, the EIR for this Project fails to adequately analyze and mitigate the Project's impacts.

In general, mitigation measures must be designed to minimize, reduce or avoid an identified environmental impact or to rectify or compensate for that impact. CEQA Guidelines § 15370. Where several mitigation measures are available to mitigate an impact, each should be discussed and the basis for selecting a particular measure should be identified. *Id.* at § 15126.4(a)(1)(B). A lead agency may not make the required CEQA findings unless the administrative record clearly shows that all uncertainties regarding the mitigation of significant environmental impacts have been resolved.

3 cont.

III. DISCUSSION

A. Space Ceiling.

The most glaring shortcoming of the CPHP is that it reneges on the Regents' promise to the City of San Francisco and the community of Parnassus Heights never to exceed 3.55 million square feet of development at the Parnassus Heights campus. This promise was made by the Regents themselves to resolve a lawsuit in 1976, and has been reaffirmed countless times thereafter, most recently in the 2014 LRDP. In May 21, 1976, the Regents adopted a resolution stating the following:

4

> The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and ***this limit shall be permanent.*** These restrictions prohibit expansion by UCSF by purchase or condemnation or gift of any property or lease of private residential property not only contiguous with the new campus boundaries, but anywhere within the surrounding area bounded by Golden Gate Park, Oak Street, Ninth Avenue, Clayton and Clarendon. This does not prohibit the use of commercial properties or the affiliation with other public agencies within the area described.

1976 Resolution, ¶ 2 (emphasis added) (Exhibit A). The Regents directed that these commitments be amended into the 1975 Long Range Development Plan. Id., ¶ 6 ("That the Long Range Development Plan for the San Francisco campus, as approved by The Regents in October, 1975, be amended to reflect the described changes in designation of open space, boundaries, and use of housing").

The Space Ceiling was reaffirmed by the Regents in the Long Range Development Plans (LRDPs) of 1982 and 1994. It was reaffirmed in 2014, though amended to exclude certain residential properties from the calculation of the Campus' gross square feet. UC has relied on the Space Ceiling as a justification to develop other sites throughout the City. In *Laurel Heights II*, the Regents represented to the Supreme Court that the expansion to Laurel Heights was necessary since the Space Ceiling prohibited any further development at the Parnassus Campus. *Laurel Heights Impr. Assoc. v. Regents of Univ. of Calif.* (1993) 6 Cal.4th at 1120 (*Laurel Heights II*). The Supreme Court noted in the *Laurel Heights I and II* cases that development of the new Laurel Heights campus was necessary due to the Regents' representation of "serious space constraints at the Parnassus campus and concluded there was a need to develop off-campus locations." *Laurel Heights II,* 6 Cal.4th at 1120; *Laurel Heights Impr. Assoc. v. Regents of Univ. of Calif*. (1988) 47 Cal.3d at 388 (*Laurel Heights I*). Having benefitted by relying on the Space Ceiling to develop other locations, the Regents now want to disregard the Space Ceiling and its prior declaration to the Court, notwithstanding the reliance of the community on the commitment. The Space Ceiling was negotiated because the campus was too small to accommodate future growth, and that remains even more pressing today.

4 cont.

In 2014, the Regents adopted a Long Range Development Plan ("LRDP") that recognized the need to comply with the Space Ceiling, and to "decompress" the Parnassus Campus by moving certain functions to other locations. However, in order to more readily comply with the Space Ceiling, the Regents amended the 1976 Resolution's development ceiling to exclude specific residential development at Aldea Housing and University House from the ceiling calculation. The 1976 Resolution had not excluded these specific residential buildings from the development ceiling calculation, although other residential areas were excluded. See 2014 LRDP, p. 51 ("The total

amount of structured space within the campus boundaries is not to exceed 3.55 million gsf, excluding space committed to residential use on Third, Fourth, Fifth, and Parnassus avenues and Kirkham and Irving streets.") The 2014 LRDP "identifies strategies to reduce the space ceiling overage over the life of the LRDP by: 1) converting some existing office space (UC Hall and Millberry Union towers) to residential use; 2) demolishing a number of buildings and either moving occupants and programs to other campus sites or absorbing them into other buildings at Parnassus Heights; and 3) excluding all residential space from the space ceiling calculation." 2014 LRDP, p. 57 (emphasis added). The 2014 LRDP included an amendment to the 1976 Resolution which stated, "3. The space ceiling for the Parnassus Heights campus site is 3.55 million gross square feet. The space ceiling includes space in non-residential buildings within the boundary of the Parnassus Heights campus site." 2014 LRDP, p. 64. Although the 2014 LRDP was intended to guide the University's growth through 2035, the University is now proposing to abandon the 2014 LDRP at the Parnassus Campus to allow dramatic expansion of development approved in 2014 and proposed as the UCSF Comprehensive Parnassus Heights Plan. The Plan proposes to further amend the 1976 Resolution to "Increase the space ceiling limit from the current 3.55 million gsf to a proposed 5.05 million gsf, excluding housing (an increase of approximately 1.5 million gsf above the current space ceiling limit) in recognition of the tremendous need for program space at the campus site in order for UCSF to retain its leadership position in patient care, research, and education." Plan DEIR, p. 3-44.

4 cont.

As discussed below, under the doctrine of promissory estoppel, the Regents cannot abandon their solemn promise to the community to adopt a "permanent" Space Ceiling of 3.55 million square feet.

1. The Space Ceiling is Enforceable Under the Doctrine of Promissory Estoppel

a. Elements of Promissory Estoppel

Promissory estoppel involves "'[a] promise which the promisor should reasonably expect to induce action or forbearance of a definite and substantial character on the part of the promisee and which does induce such action or forbearance is binding if injustice can be avoided only by enforcement of the promise.' This rule is applicable in California." *Hilltop Properties, Inc. v. State* (1965) 233 Cal.App.2d 349, 362. "The elements of promissory estoppel are (1) a promise, (2) the promisor should reasonably expect the promise to induce action or forbearance on the part of the promisee or a third person, (3) the promise induces action or forbearance by the promisee or a third person, and (4) injustice can be avoided only by enforcement of the promise." *Kajima/Ray Wilson v. Los Angeles County Metropolitan Transportation Authority* (2000) 23 Cal.4th 305, 310.

5

The purpose of promissory estoppel is “to make a promise binding even though there was no consideration in the sense of something that is bargained for and given in exchange. Reasonable reliance serves to hold the offeror in lieu of the consideration ordinarily required to make the offer binding." *Id*. “Promissory estoppel is a theory of recovery which is allowed where injustice can be avoided only by enforcement of the promise, this usually occurring where the plaintiff has made a complete and substantial change of position in reliance upon the promise.” *Id*. The doctrine only applies where there was no bargained for reliance by the promissee. *Id*. at 363.

“[E]stoppel has been applied with some reluctance insofar as its application against a governmental body is concerned, since it is the general rule that a governmental agency may not be estopped by the conduct of its officers and employees.” *Id*. at 364. Here, however, the Regents adopted the resolution at issue, so there would not be a problem regarding a promise of an employee or officer. The promise at issue was made by the University’s ultimate decision-making body, not by a subordinate employee. There was a written promise, especially given the emphatic statement that the development ceiling of 1976 was “permanent.”

The Space Ceiling Resolution meets all of the elements of promissory estoppel:

(1) There is no dispute that the Space Ceiling Resolution was a promise never to build more than 3.55 million square feet at the campus;
(2) The Regents reasonably expected the promise to induce action or forbearance on the part of the promisee or a third person -- namely the dismissal of the 1976 CEQA lawsuit;
(3) The promise induced action or forbearance by the promisee or a third person -- namely the Petitioners did in fact dismiss their lawsuit; and
(4) Injustice can be avoided only by enforcement of the promise. There is no way for the Petitioners or anyone else to revive the 1976 lawsuit at this point since the limitations period is long expired. The only way avoid injustice is to enforce the promise.

5 cont.

The adoption of the Space Ceiling induced a forbearance “of a definite and substantial character” by any neighbors or organizations. In particular, the neighbors forbore from prosecuting their CEQA lawsuit challenging the 1975 LRDP.

First, there can be no question that the Space Ceiling Resolution was a “promise.” Second, the Regents clearly reasonably expected the petitioners in the 1975 LRDP case to drop their lawsuit in exchange for the promise of a “permanent” Space Ceiling. There is no way to avoid the injustice other than to enforce the Regents’ solemn promise, since the 1976 CEQA petitioners cannot now reinstitute their action. All of the elements of promissory estoppel are satisfied. The Regents therefore cannot simply disregard the promise made to the City and the neighborhood in 1976 simply because they find it no longer convenient to keep their promise.

b. The 1976 Space Ceiling Does Not Impair the Police Power.

The Regents may contend that the 1976 Resolution improperly surrenders or impairs the Regents' delegated governmental power sitting as a legislative body. As a general rule, "a local government may not contract away its right to exercise its police power in the future, and land use regulations involve the exercise of police power." See *Alameda Cty. Land Use Assn. v. City of Hayward* (1995) 38 Cal.App.4th 1716, 1724. Courts '"will not read into the contract[ ] an abrogation of the potential future exercise of the sovereign police power." *Richeson v. Helal* (2007) 158 Cal.App.4th 268, 280 (involving effort to enforce covenants to remove nonconforming use despite issuance of use permit), and will construe a contract, if possible, in a manner that preserves the police power. *Id*. at p. 281, citing *Delucchi v. County of Santa Cruz* (1986) 179 Cal.App.3d 814, 823-824 (rejecting interpretation of Williamson Act contract which sought "wholesale freeze of zoning" changes). "A contract that purports to do so is invalid as contrary to public policy if the contract amounts to a municipality's 'surrender' or 'abnegation' of its control of a municipal function." *108 Holdings, Ltd. v. City of Rohnert Park* (2006) 136 Cal.App.4th 186, 195.

First, it is unclear whether the Regents even possess police powers. There is no case law discussing whether the University wields any police powers. "The definition of 'police power' is broad and rather nebulous." *Goldbaum v. Regents of Univ. of California* (2011) 191 Cal.App.4th 703, 712. "The police power is the authority to enact laws to promote the public health, safety, morals and general welfare. [Citation.] Legislation is within the police power if it is reasonably related to a proper legislative goal." *Id*., quoting C*ommunity Memorial Hospital v. County of Ventura* (1996) 50 Cal.App.4th 199, 206, 56 Cal.Rptr.2d 732. "As noted in Witkin's Summary of California Law, 'It has been said that the police power is simply the power of sovereignty or power to govern—the inherent reserved power of the state to subject individual rights to reasonable regulation for the general welfare.'" *Churchill v. Parnell* (1985) 170 Cal.App.3d 1094, 1098 (quoting 5 Witkin, Summary of Cal. Law (8th ed. 1974) Constitutional Law, § 435, p. 3734). Most of the cases touching on police power and the Regents involves whether statutes enacted by the Legislature pursuant to its police powers are applicable to the Regents. 6

Second, even if the Regents possess police powers, they were not exercising police powers in adopting the Space Ceiling, but merely limiting their own use of their own property as a market participant. The Space Ceiling is an act of the Regents placing limitations on themselves. It limits the Regents use of their own property. It does not restrict the general public or anyone else in any manner, as would a general plan or zoning ordinance. A governmental entity's role in regulating the use of its own property is not an exercise of its police power or its power as a government per se, but as a market participant engaged in what were historically called proprietary activities. *City of Oakland v Burns* (1956) 46 C2d 401, 407 ("When a governmental entity is authorized to exercise a power purely proprietary, the law leans to the theory that it has

full power to perform it in the same efficient manner as a private person would"). Governmental entities have broad discretion over the use of their own property. *Laura Vincent Co. v City of Selma* (1941) 43 CA2d 473. 43 CA2d at 476; see also *Irwin v City of Manhattan Beach* (1966) 65 C2d 13.

The courts have recognized the validity of permanent deed restrictions on public property donated to the public by private entities. Thus, when land is donated to the city with a restriction on its use, the city usually cannot divert the use of the property to purposes inconsistent with the terms of the grant, including transferring an interest in the donated land to private parties for nonpublic uses. *Big Sur Props. v Mott* (1976) 62 CA3d 99. Thus, a public entity should be equally in its right to impose permanent restrictions on its own property.

The Space Ceiling was not an attempt to "subject individual rights to reasonable regulation for the general welfare." Instead, it was simply the Regents' decision regarding how to use its own property. Instead of exercising any non-delegable police powers, the Regents used their "virtual plenary power" to manage and dispose of their property by entering into a "permanent" commitment to maintain a Space Ceiling of 3.55 million square feet. There is no reason that this promise should not be enforceable.

6 cont.

2. The Space Ceiling is Enforceable Under the Doctrine of Equitable Estoppel.

The California Supreme Court has articulated the doctrine of equitable estoppel as follows: "[o]ne cannot justly or equitably lull his adversary into a false sense of security, and thereby cause his adversary to subject his claim to the bar of the statute of limitations, and then be permitted to plead the very delay caused by his course of conduct as a defense to the action when brought. [Citations]" *Lantzy v. Centrex Homes* (2003) 31 Cal.4th 363, 383. The Court further noted: "[a]n estoppel may arise although there was no designed fraud on the part of the person sought to be estopped. [Citation.] To create an equitable estoppel, 'it is enough if the party has been induced to refrain from using such means or taking such action as lay in his power, by which he might have retrieved his position and saved himself from loss.' ... Where the delay in commencing action is induced by the conduct of the defendant it cannot be availed of by him as a defense. [Citations]" *Id*. at 384.

7

In this case, the elements of equitable estoppel are present. To establish equitable estoppel, a Plaintiff must show: 1) the Defendant knew the relevant facts; 2) the Defendant made a misrepresentation bearing on the necessity of bringing a timely suit; 3) the Defendant intended its words or conduct would be acted upon or led Plaintiff to believe it was so intended; 4) Plaintiff was ignorant of the true state of facts; and 5) Plaintiff reasonably relied thereon in delaying commencement of the action. *Doheny Park Terrace Homeowners Ass'n, Inc. v. Truck Ins. Exch.* (2005) 132 Cal.App.4th 1076,

1099. Finally, 6) the exception applies here to the rule that estoppel is not ordinarily applied against a city for the conduct of its officials. 7 cont.

a. The Regents knew the relevant facts.

The Regents were aware that they had been sued under CEQA over the 1975 LRDP. To settle that case, the Regents adopted a resolution imposing a permanent space ceiling on the Parnassus Campus. The Regents knew that this would induce the petitioners to drop their lawsuit, which they did. As the court held in *Lantzy v. Centrex Homes* (2003) 31 Cal.4th 363, 383, "[a]n estoppel may arise although there was no designed fraud on the part of the person sought to be estopped. [Citation.] To create an equitable estoppel, 'it is enough if the party has been induced to refrain from using such means or taking such action as lay in his power, by which he might have retrieved his position and saved himself from loss.' ... Where the delay in commencing action is induced by the conduct of the defendant it cannot be availed of by him as a defense. [Citations]" *Id*. at 384.

b. Regents made a misrepresentation bearing on the necessity of bringing a timely suit

The Regents made their promise to settle a lawsuit, but reneged on the promise long after the time had passed to refile or revive the lawsuit. The Petitioners are not able to bring a timely suit at this point since the statute of limitation has expired. 8

c. Regents intended their words or conduct would be acted upon or led Petitioners to believe it was so intended.

The Regents obviously intended the adoption of the Space Ceiling Resolution to induce the petitioners to dismiss their CEQA lawsuit challenging the 1975 LRDP.

d. Petitioners were ignorant of the true state of facts.

The petitioners in the 1975 lawsuit were ignorant of the fact that the Regents would renege upon their commitment to a "permanent" space ceiling of 3.55 million square feet.

e. Petitioners reasonably relied upon the commitment.

The petitioners in the 1975 lawsuit reasonably believed that when the Regents adopted a Resolution stating that development would never exceed 3.55 million square feet, and that this commitment would be "permanent," that the Resolution meant what it said.

f. The Regents may not rely on the rule relating to the conduct of government officials because its application would work a grave injustice in this case.

As the California Supreme Court has stated, there is a general rule that a "government agency may not be estopped by the conduct of its officers or employees." *Farrell v. Co. of Placer* (1944) 23 Cal.2d 624, 627 ("*Farrell*"). However, the Court held in that same case that "there are many instances in which an equitable estoppel in fact will run against the government where justice and right require it. [Citations]" Id. at 627-628; see also *California Cigarette Concessions, Inc. v. City of Los Angeles* (1960) 53 Cal.2d 865, 869 ("estoppel against a city is appropriate "when the facts clearly establish that a grave injustice would be done if an equitable estoppel were not applied. [Citation]"). The court noted that the government should be held to a similar standard as ordinary citizens in the conduct of its business, quoting Justice Holmes thus: "…[i]t has been aptly said: 'If we say with Mr. Justice Holmes, 'Men must turn square corners when they deal with the Government', it is hard to see why the government should not be held to a like standard of rectangular rectitude when dealing with its citizens. (48 Harv.L.Rev. 1299.)" *Farrell* at 628.

Here, there is no issue of the University being bound by promises made by their officers of employees. The promise at issue was made at the highest level by the Regents themselves. 9

In *Farrell*, counsel for two defendant Counties in a personal injury case advised the plaintiff suing for defective condition of a bridge that she need not bring an action until after she had ascertained the amount of her damages. Plaintiff then waited until after the relevant statute of limitations had expired to file her claim. The Defendants demurred on the grounds that the statutory period to file a claim had run. In reversing the trial court's sustaining of the demurrer, the court emphasized that the Plaintiff's reasonable reliance on the representations of the Defendants worked an injustice which a court of equity was empowered to correct.

Moreover, courts have held that "strong considerations of policy" are needed to deny the application of estoppel where government entities have misled the public. *Co. of San Diego v. Cal. Water and Telephone Co.* (1947) 30 Cal.2d 817. Here, failure to estop the Regents from rescinding their Space Ceiling Resolution will result a manifest injustice. The time has long passed for reviving the lawsuit that was dismissed in exchange for the Space Ceiling. Also, countless neighbors have purchased homes and businesses in the area in reasonable reliance on the permanent Space Ceiling. The permanent commitment made in 1976 should be enforced exactly as it was written - permanent.

3. The Violation of the Space Ceiling Policy is a Significant Impact Under CEQA.

Where a local or regional policy of general applicability, is adopted in order to avoid or mitigate environmental effects, a conflict with that policy in itself indicates a potentially significant impact on the environment. *Pocket Protectors v. Sacramento* (2005) 124 Cal.App.4th 903. Indeed, any inconsistencies between a proposed project and applicable plans must be discussed in an EIR. CEQA Guidelines § 15125(d); *City of Long Beach v. Los Angeles Unif. School Dist.* (2009) 176 Cal. App. 4th 889, 918; *Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal. App. 4th 859, 874 (EIR inadequate when Lead Agency failed to identify relationship of project to relevant local plans). A Project's inconsistencies with local plans and policies constitute significant impacts under CEQA. *Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 783-4. The recent *Georgetown Preservation Society v. County of El Dorado* (2018) 30 Cal.App.5th 358 follows *Pocket Protectors* in holding that the fair argument standard applies to a potential inconsistency with a plan adopted for environmental protection. 10

The Space Ceiling is a policy adopted by the Regents to address the campus' environmental impacts in almost every area: traffic, population, growth inducement, air pollution, noise, etc. The violation of the Space Ceiling is therefore a significant impact that must be analyzed and mitigated under CEQA. The most obvious alternative is for the University to continue to abide by the Space Ceiling. This is a feasible alternative since it was deemed feasible only a few short years ago in the 2014 LRDP.

B. The EIR Fails to Consider Impacts of COVID-19 In the Baseline.

The DEIR dismisses the impacts of COVID-19 on the Project. A revised draft EIR is required to analyze whether and how COVID-19 will impact the need for this massive expansion Project. COVID-19 has dramatically impacted our work practices, increasing the use of telecommuting from home, telemedicine, and remote learning. All of these developments have the potential to reduce the need for office, classroom and clinical space as people are increasingly inclined to work and learn from home. These developments may dramatically and permanently change the nature and need for the Project. 11

Every CEQA document must start from a "baseline" assumption. The CEQA "baseline" is the set of environmental conditions against which to compare a project's anticipated impacts. Section 15125(a) of the CEQA Guidelines states in pertinent part that a lead agency's environmental review under CEQA:

> "…must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time [environmental analysis] is commenced, from both a local and regional perspective. This environmental

> setting will normally constitute the baseline physical conditions by which a Lead Agency determines whether an impact is significant." (Emphasis added.)

CEQA Guidelines § 15125(a); see, *Save Our Peninsula Committee v. County of Monterey* (2001) 87 Cal.App.4th 99, 124-125 ("*Save Our Peninsula"*). As the court of appeal has explained, "the impacts of the project must be measured against the 'real conditions on the ground,'" and not against hypothetical permitted levels. *Save Our Peninsula, supra*, 87 Cal.App.4th 99, 121-123.

The outbreak of COVID 19 was first reported on December 31, 2019 in Wuhan China. The Notice of Preparation (NOP) for the UCSF Parnassus Heights campus was issued January 14, 2020. The NOP for the proposed CPHP was published in January 2020, and the baseline conditions contained in this CPHP EIR are generally taken from this time period. However, the CEQA Guidelines and applicable case law recognize that the date for establishing an environmental baseline cannot always be rigid." DEIR at 4.6-6. UCSF is a health based organization, therefore fully aware early on of the implications of the Wuhan outbreak. The DEIR itself acknowledged the potential implications of COVID 19, concluding that:

> "The net effect of the pandemic on the Parnassus Heights campus site development and operations cannot be predicted at this point in time without speculation." DEIR, p. 1-9.

11 cont.

The DEIR concedes COVID 19 has implications for the Project. For example, the objectives for the New Hospital, objectives used in part to dismiss some alternatives, include an increase in beds to provide for inpatient health care in times of severe strain such as the current pandemic. DEIR, p. 6-4. The brief discussion at page 1-9 also acknowledges that UCSF will likely consider operational changes such as increases in telehealth services and telework, among others.

COVID 19 was known at the time of the issuance of the NOP and certainly, as reflected in Section 1.7 of the DEIR, was known prior to circulation of the DEIR for public comment. COVID 19 warrants changes and updates to existing environmental setting information, critical to complete an accurate impact analysis, as well as to the Project Description (e.g., space needs changes given a likely transition as noted in the discussion to telework and telehealth). Significant questions are raised by COVID 19 that have implications to the Project and related impacts – including but not limited to an acknowledgement that UCSF is likely to increase telework, telehealth consultations and remote learning. These are but a few of the changes warranting UCSF to hit pause both to revise the DEIR and to re-engage the public and experts, right-size the Project and evaluate other alternatives that would reduce or eliminate impacts while adhering to the existing space ceiling.

C. The EIR's Alternatives Analysis is Legally Deficient.

An EIR must describe a range of reasonable alternatives to the Project, or to the location of the Project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. "An EIR's discussion of alternatives must contain analysis sufficient to allow informed decision making." *Laurel Heights I*, 47 Cal.3d at 404. An EIR must also include "detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." *Id*. at 405.

CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring "environmentally superior" alternatives and all feasible mitigation measures. CEQA Guidelines § 15002(a)(2) and (3); *see also*, *Berkeley Jets*, 91 Cal. App. 4th 1344, 1354; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564. The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced." CEQA Guidelines § 15002(a)(2). If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns." Pub. Res. Code § 21081; CEQA Guidelines § 15092(b)(2)(A) & (B). A "feasible" alternative is one that is capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social and technological factors. Pub. Res. Code § 21061.1; CEQA Guidelines § 15364. 12

The lead agency is required to select the environmentally preferable alternative unless it is infeasible. As explained by the Supreme Court, an environmentally superior alternative may not be rejected simply because it is more expensive or less profitable:

> The fact that an alternative may be more expensive or less profitable is not sufficient to show that the alternative is financially infeasible. What is required is evidence that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project.

Citizens of Goleta Valley v. Bd. of Supervisors (1988) 197 Cal.App.3d 1167, 1180-81; *see also*, *Burger v. County of Mendocino* (1975) 45 Cal.App.3d 322; *County of El Dorado v. Dept. of Transp*. (2005) 133 Cal.App.4th 1376 (agency must consider small alternative to casino project); *Preservation Action Counsel v. San Jose* (2006) 141 Cal. App. 4th 1336.

In addition, an environmentally superior alternative may not be rejected because it does not meet all of the Project's objectives. Inconsistency with only some of the

Project Objectives is not necessarily an appropriate basis to eliminate impact-reducing project alternatives from analysis in an EIR. CEQA Guidelines § 15126.6(c), (f); *see also Watsonville Pilots Assn. v. City of Watsonville* (2010) 183 Cal.App.4th 1059, 1089. Here, the DEIR fails to adopt the environmentally superior alternatives and fails to describe a reasonable range of alternatives. 12 cont.

First, the EIR identifies several significant environmental impacts the Project will have, as well as the project alternatives that may alleviate some of these impacts. However, UCSF failed to adopt the environmentally superior alternative, or any other alternative, that would reduce the Project's impacts and failed to include and analyze several feasible alternatives that are available and would reduce some of the Project's significant impacts. The DEIR refuses to adopt the environmentally superior alternative, Alternative 2: the Reduced Project Alternative, because it would "fail to fully achieve certain Project objectives, and in particular, would not fully meet the CPHP project objectives, for space, urban design and mobility, or for the New Hospital, RAB or Aldea Housing Densification." DEIR, p. 6-71. This justification is insufficient and does not constitute substantial evidence that the environmentally superior alternative is infeasible. 13

Second, the DEIR fails to select the 2014 LRDP Alternative. The environmental impacts of the 2014 LRDP Alternative were already analyzed in the 2014 LRDP EIR, and this alternative would result in less significant impacts than the proposed Project. However, UCSF did not select this alternative because it "would not achieve the proposed CPHP objectives." DEIR, p. 6-20. Numerous objectives from the 2014 LRDP FEIR remain valid with respect to the proposed Project. *See id*. at 3-13. Dismissing this alternative for this reason fails to demonstrate how this alternative is not feasible. 14

Additionally, Urban Planner Terrell Watt, a member of the American Institute of Certified Planners, reviewed the DEIR, including the alternatives analysis, and concluded that the DEIR is legally deficient because it "fails to describe a reasonable range of alternatives, or to the location of the Project, which would feasibly attain most of the basic objectives of the Project but would avoid or substantially lessen any of the significant effects of the Project, and evaluate the merits of the alternatives." Exhibit B,,p. 21. Specifically, the DEIR improperly rejected feasible off-site alternatives and omits other feasible off-site alternatives. *Id*. at 22. For example, feasible alternatives to the Project that would reduce or eliminate the Project's significant impacts that the DEIR briefly considered but dismissed include the following: (1) No New Hospital at Parnassus Heights Campus Site/Implement Phase 2 of Medical Center at Mission Bay Campus Site; and (2) New Hospital at Mount Zion Campus Site. *Id*. 15

The reasons provided for dismissing the alternative of a new hospital at Mission Bay comes down to the alternative's reported failure to meet every focused Project objective and a purported conflict with the 2014 LRDP and CPHP. *Id*. Specifically, the DEIR states that the alternative would not meet some of the Project objectives and

would conflict with several 2014 LRDP and CPHP objectives including but not limited to adequate space to foster collaboration and to facilitate inter-dependence and connectivity for operational efficiency, adequate clinical and administrative support and alignment with other programs, increase in beds, and modern industry standards including seismic activity. *See* DEIR, p. 6-55. The discussion concedes that the alternative would reduce significant wind, cultural, and construction impacts, but that in doing so, it would likely also result in increased cross-town traffic between the Parnassus and Mission Bay campus sites. However, the discussion failed to analyze a combination of a smaller, new hospital at Parnassus in combination with Mission Bay, which is a feasible option that has the potential to address total need and allow phasing to accommodate patients and services. Exhibit B, p. 22. The DEIR's justification for dismissing this alternative is not justified. First, the alternative would meet most of the Project's objectives. *Id*. Second, the argument that the alternative would increase cross-town traffic is not supported by any evidence or analysis. *Id*. at 22-23. Lastly, the conflicts with the 2014 LRDP are not persuasive since that document is being amended to break the space ceiling and this alternative would not require that significant amendment to the LRDP. *Id*. at 23. "In fact, the Mission Bay Hospital was justified in part by the development cap at the Parnassus Campus." *Id*. This alternative must be fully analyzed in a revised and recirculated DEIR, including additional facts and analysis to support the arguments concerning the alternatives analysis.

The DEIR also dismisses the alternative of a new hospital at the Mount Zion Campus Site without actually analyzing the alternative, stating that it "would be less than ideal and inefficient" to have UCSF hospitals at three different sites, and that it would not help achieve the benefits realized through interdisciplinary collaboration and convergence between clinical care, research and education, land acquisition would be difficult, and citing undisclosed conflicts with the 2014 LRDP and CPHP objectives. DEIR, p. 6-57. Locating the proposed hospital at the Mount Zion campus would "reduce the significant wind impact . . ., avoid demolition of the LPPI (individually eligible for listing in the National and California Registers), and avoid a number of temporary construction and operational impacts associated with the New Hospital at the Parnassus Heights campus site." *Id*. The Mount Zion campus site is 2 miles from the Parnassus campus site and several of the existing buildings, including the hospital, must be retrofitted or demolished due to seismic issues. *See* UCSF 2014 LRDP, p. 89. The 2014 LRDP even states that the demolition of outdated and seismically compromised buildings would allow for the construction of new space to accommodate clinical programs at the Parnassus site. *Id*. at 91. The DEIR must analyze the feasibility of this alternative due and compare it with the other identified alternatives.

Rejection of the Mission Bay and Mount Zion sites for a new hospital, either in lieu of or in combination with a smaller hospital at the Parnassus campus, is not supported by the evidence and analysis provided and both require full analyses in a revised and recirculated DEIR.

15 cont.

Lastly, the DEIR also fails to mention their Hunters Point site. UCSF owns 3.8 acres in Hunters Point with two single story buildings used for an animal care facility. UCSF 2014 LRDP, p. 117. At the time the 2014 LRDP was published, the City had approved the Candlestick-Hunters Point Shipyard Development Plan, an extensive mixed-use redevelopment plan for the area that would include housing, retail, office, commercial, industrial, and open use spaces. *See id*. Due to UCSF's facilities at this site being in relatively poor condition, UCSF was exploring the possible relocation of those functions and occupants and potential relinquishment of the site. *Id*. However, healthcare, a hospital, and economic development would be greatly needed in this community, especially with the progression of the Candlestick-Hunters Point Shipyard Development Plan. Since UCSF does not have future plans for this site, it should consider the feasibility of locating a portion of the proposed Project at this location. 16

The DEIR rejects many of the off-site alternatives because they are off-site. This makes a mockery of CEQA's requirement for consideration of off-site alternatives. The courts have held that if environmentally superior alternative sites are available for a project, it would be inconsistent with CEQA's purposes to ignore off-site alternatives simply because on-site alternatives have been considered. In *Citizens of Goleta Valley v Board of Supervisors* (1988) 197 Cal.App.3d 1167, 1179 (*Goleta I*), the court held that the EIR for a proposed resort hotel should have considered alternative locations for the project. Observing that the public need for the hotel should be served at minimal environmental expense, the court concluded that "[r]eason requires that the agency charged with the duty to protect the environment compare impacts at feasible alternative locations." *Id*. at 1180. If off-site alternatives can be rejected simply because they are off-site, then the CEQA requirement for analysis of off-site alternatives becomes meaningless. A revised draft EIR is required to analyze and consider the above alternatives and to select the environmentally superior alternative unless it is truly infeasible. 17

D. The EIR Improperly Delays the Analysis of the Hospital.

The DEIR fails to describe details of several elements of the hospital, contending that sufficient details are not known to allow a detailed analysis of impacts such as wind. However, the DEIR reveals that the University of aware of many of the details of the Project, including the specific height and sizes of buildings - the extent that it was possible to create visual representations of all of the buildings. Since the University is aware of these details, a more detailed analysis must be provided in the DEIR. 18

The courts have consistently held that an "accurate and stable project description" is a bedrock requirement of CEQA—the *sine qua non* (that without which there is nothing) of an adequate CEQA document:

> Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost,

> consider mitigation measures, assess the advantage of terminating the proposal (i.e., the "no project" alternative) and weigh other alternatives in the balance. An accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR.

Inyo v. Los Angeles (1977) 71 Cal.App.3d 185, 192-93. The ability of informed citizens to participate in environmental review is a key component of CEQA. *Washoe Meadows v. Dept. of Parks and Rec*. (2017) 17 Cal.App.5th 277, 285 ["Informed public participation is essential to environmental review under CEQA."]; *Inyo*, 71 Cal.App.3d at 192 ["The EIR process facilitates CEQA's policy of supplying citizen input."]. Through the EIR process, CEQA "provide[s] public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment." *Washoe, supra*, 17 Cal.App.5th at 286 [quoting Pub. Res. Code § 21061].

The court recently noted that the requirement for an accurate, stable, and finite project description has been "reiterated in a number of cases since *County of Inyo*." *Stop the Millenium Hollywood v. Los Angeles* (2019) 39 Cal.App.5th 1, 17. In *Millennium*, the court evaluated the project description for a large mixed-use development, which described three conceptual development scenarios that would satisfy the project's Development Agreement. *Id*. at 9-10. The scenarios presented in the DEIR only depicted potential massing options that might have been developed and, thus, "the public had no idea how many buildings or towers would be built and where they would be located on the project site." *Id*. at 11. The court held that the DEIR did not meet CEQA's requirement for an accurate, stable or finite proposed project because "it fails to describe the siting, size, mass, or appearance of any building proposed to be built at the project site" and "presents different conceptual scenarios that Millennium or future developers may follow for the development of this site." *Id*. at 18. Notably, the court noted that the failure to include an accurate, stable, and finite project description "was an obstacle to informed public participation 'even if we cannot say such input would have changed the project ultimately selected and approved.'" *Id*. at 20 [quoting Washoe, supra, 17 Cal.App.5th at 290] [emphasis added]. 18 cont.

The DEIR for CPHP is similar to the one rejected in *Millenium*. It fails to provide detail of the project, hampering informed public comment. A revised draft EIR is required to provide requisite details of the Project and its impacts.

E. The EIR Impermissibly Defers Mitigation.

Feasible mitigation measures for significant environmental effects must be set forth in a CEQA document for consideration by the lead agency's decision makers and the public before certification of the CEQA document and approval of a project. The formulation of mitigation measures generally cannot be deferred until after certification and approval of a project. CEQA Guidelines, section 15126.4(a)(1)(B) states: "Formulation of mitigation measures should not be deferred until some future time. 19

However, measures may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way."

"A study conducted after approval of a project will inevitably have a diminished influence on decisionmaking. Even if the study is subject to administrative approval, it is analogous to the sort of post hoc rationalization of agency actions that has been repeatedly condemned in decisions construing CEQA." *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 307. "[R]eliance on tentative plans for future mitigation after completion of the CEQA process significantly undermines CEQA's goals of full disclosure and informed decisionmaking; and[,] consequently, these mitigation plans have been overturned on judicial review as constituting improper deferral of environmental assessment." *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 92. Moreover, by deferring the development of specific mitigation measures, UCSF is effectively precluding public input into the development of those measures. CEQA prohibits this approach. 19 cont.

Here, The DEIR is rife with impermissible deferred mitigation for several of the Project's environmental impacts.

1. The EIR defers mitigation of the Project's wind impacts.

The DEIR admits the Project's wind impacts will be significant and unavoidable with mitigation. DEIR, p. 4.1-46. However, the DEIR defers the formation of actual mitigation measures to lessen the Project's wind impacts to an undetermined future time. *See id*. at 4.1-47. Specifically, mitigation measure AES-4 requires UCSF to engage a qualified wind consultant to conduct wind tunnel testing of the proposed buildings with facades 80 feet high or over to determine whether the buildings would result in exceedances of San Francisco's 26-mph pedestrian wind hazard criterion. *Id*. If the consultant does find an exceedance, UCSF shall work with the consultant to identify feasible mitigation strategies such as design changes. *Id*. UCSF's delay in mitigating the Project's potential wind impacts undermines CEQA's goals of full disclosure and informed decisionmaking. Moreover, UCSF is preventing the public from providing input on the development of these measures and leaving them up to the sole discretion of UCSF and the wind consultant it hires, violating CEQA. 20

2. The EIR defers mitigation of the Project's impacts on cultural resources.

The DEIR also admits that the Project as proposed would result in a significance and unavoidable adverse change in the significance of known historical resources, in particular the UC Hall which includes the Bernard Zakheim murals. DEIR, p. 4.4-12. During the 1930s, Zakheim, a student of Diego Rivera, was one of the leading artists in the area who were creating major public art under the auspices of the New Deal art 21

programs. *See* Exhibit C. The ten murals that make up Zakheim's *History of Medicine* (1936-39) constitute one of this region's largest New Deal art projects by a single artist. *See id*. Despite housing such important artwork, the Project proposes to demolish UC Hall. DEIR, p. 4.4-12.

The DEIR contains several mitigation measures for the project's impacts to cultural resources, but all of them are improperly deferred to an uncertain time. For example, mitigation measure CUL-1a requires, at some point prior to any demolition work or significant alterations initiated at the known historical resources, "UCSF shall ensure that a qualified architectural historian who meets the Secretary of the Interior's Professional Qualification Standards identifies character-defining features of each historical resource." *Id*. at 4.4-19. The DEIR provides no justification for delaying this mitigation measure until after the EIR has been certified. The identification of character-defining features for historical resources on the Project site can and must be done prior to the approval of the Project so decision-makers and the public have sufficient information to determine the Project's impacts on cultural resources.

Mitigation measure CUL-1b also improperly defers mitigation by requiring a qualified architectural historian to thoroughly document each building and associated landscaping setting, which will include photography and a written documentary record of the buildings, at some point "[p]rior to any demolition work or significant alterations initiated at the known historical resources." *Id*. This measure suffers the same fatal flaws as CUL-1a – the DEIR does not provide any justification why this measure must be performed at some uncertain time, and should in fact be performed prior to the approval of the Project. 21 cont.

Mitigation measure CUL-1c requires UCSF to determine whether any character defining features of an individual historic resource may be salvaged "[p]rior to the demolition or significant alteration activities." *Id*. at 4.4-20. If features can be salvaged, "a Salvage Plan shall be prepared by a qualified architectural historian or historic architect." *Id*. The identification of historic resources on the Project site that can be salvaged must be done prior to the preparation of an EIR. The DEIR's conclusion that the Project will have significant and unavoidable impacts on cultural resources cannot be supported without such an analysis. Further, by deferring this analysis and the preparation of Salvage Plans for such resources, UCSF is undermining the full disclosure of the Project's impacts to decision-makers and the public, and preventing them from commenting on or analyzing the substantive mitigation measures for such impacts.

Lastly, mitigation measure CUL-1d requires UCSF Planning staff to work with a conservator to develop and implement a digital imaging and virtual preservation proposal for the Zakheim murals at some point "[p]rior to the commencement of demolition activities at UC Hall." *Id*. Not only does this measure suffer the same deferred mitigation flaws as identified for the other measures above, but it is attempting

to stand in place of feasible mitigation that would in fact preserve the murals. The DEIR states that the cost to physically preserve the murals by removing and relocating them, $7.6 million, "is prohibitive in light of UCSF's primary responsibility to support its academic health care mission." *Id*. at 4.4-15. UCSF instead is threatening to destroy the murals unless another third party, including Zakheim's family, will pay to preserve the murals. *Id*. $7.6 million is a drop in the bucket for the cost of the Project and the many measures UCSF proposes to implement for the Project that have nothing to do with its "primary responsibility to support its academic health care mission." UCSF has failed to otherwise explain why preserving the murals is not feasible.

21 cont.

3. The EIR defers mitigation of the Project's hazards and hazardous materials impacts.

The DEIR states that the Project may have impacts due to naturally occurring asbestos but any impact will be mitigated to less than significant due to the implementation of mitigation measure HAZ-1. DEIR, p. 4.8-16. However, HAZ-1 requires an Excavation Management Plan to be prepared at a later time. *See id*. at 4.8-18. This Excavation Management Plan is to be prepared to determine the absence or presence of naturally occurring asbestos in materials to be excavated yet the DEIR fails to provide a justification or explanation for why this Excavation Management Plan has not already been conducted in order to inform the decision-makers and the public reviewing the DEIR. UCSF should prepare the Excavation Management Plan prior to the approval of the Project so that the Project's potential hazardous impacts are known and fully analyzed in the DEIR, and so decision-makers and the public can propose mitigation measures and comment on the analysis.

22

The DEIR also proposes mitigation measure HAZ-4, which requires an environmental consulting firm to prepare a Soil Management Plan to include measures to address protocols for identifying, handling, and characterizing suspect contaminated soils at some point "[p]rior to development of the [Project]." *Id*. at 4.8-23. Again, this mitigation measure is improperly deferred and UCSF fails to provide an explanation why this Soil Management Plan could not be prepared prior to the DEIR. By deferring the development of this plan, UCSF is precluding the decision-makers and the public from reviewing the plan and commenting on its adequacy.

4. The EIR defers mitigation of the Project's noise impacts.

The DEIR includes mitigation measures NOI-1a, NOI-1b, and NOI-1c to reduce the Project's construction noise impacts. DEIR, p. 4.11-18. However, NOI-1a and NOI-1b are improperly deferred. For example, NOI-1a requires UCSF contractors to employ site-specific noise attenuation measures during construction of the Project, which will be included in a Noise Control Plan "that shall be submitted for review and approval by UCSF to ensure that construction noise is consistent with the standards set forth in the City's Noise Ordinance." *Id*. The DIER goes on to list several noise control strategies

23

that must be included in the Noise Control Plan. *Id*. UCSF again improperly excludes decision-makers and the public from participating in the review of this plan, and fails to explain why this plan could not be prepared prior to the DEIR. In deferring the formation of the mitigation measure to an unknown future time, UCSF cannot conclude that NOI-1a will in fact mitigate construction noise.

Further, NOI-1b suffers from similar flaws in that measures to minimize potential impacts of construction noise occurring outside the established work hour limits will be determined at a later time. *See id*. at 4.11-19. Additionally, NOI-1b lists several mitigation measures that *may be* included to reduce these impacts, but fails to include any concrete measures to show this impact will be mitigated. *Id*. 23 cont.

The DEIR also concludes that the Project's operational noise impacts will be less than significant with mitigation. *Id*. at 4.11-26. However, NOI-2 also improperly defers mitigation. For example, an acoustical consultant will be retained to review mechanical noise to determine specific noise reduction measures to reduce noise to comply with the City's Police Code. *Id*. at 4.11-28. NOI-2 also contains a list of possible noise reduction measures but fails to make them requirements. *Id*. Again, the deferment of the analysis of the operational noise and selection of mitigation measures prevents the disclosure of the Project's impacts and potential mitigation measures to decision-makers and the public. Without concrete and required mitigation, this measure cannot be relied upon to conclude that the Project will have less than significant operational noise impacts. 24

Lastly, the DEIR concludes that the Project's groundborne vibration and noise levels due to construction activities will be less than significant with mitigation. DEIR, p. 4.11-30. However, measure NOI-3b improperly defers this mitigation. NOI-3b requires UCSF to evaluate the presence of vibration-sensitive equipment within 150 feet of construction and demolition areas, and any sensitive equipment shall be evaluated for the existing extent of vibration isolation and relocated or further embellish isolation, as it is warranted. *Id*. The Project already lays out where construction will take place, even on future projects within the CPHP, so there is no reason why the evaluation of vibration-sensitive equipment is deferred to an unknown future time. Again, UCSF is preventing decision-makers and the public the opportunity to evaluate the Project's impacts and commenting on the proposed mitigation measures. Without this analysis and the deferred mitigation, this measure cannot be relied upon to conclude the Project will have less than significant groundborne vibration and noise levels. 25

5. The EIR defers mitigation of the Project's travel condition impacts.

The DEIR states that the Project's construction activities will have a less than significant impact with mitigation on the travel conditions along sidewalks and roadways serving the Project site. DEIR, p. 4.15-49. The DEIR relies on mitigation measure TRANS-5 to reduce this to a less than significant impact. *Id*. TRANS-5 requires construction contractors to prepare a traffic control plan for major phases of the 26

Project's construction, as well as meet with City agencies to coordinate feasible measures to reduce traffic congestion. *Id*. at 4.15-49. UCSF fails to provide an explanation for why the traffic control plan could not be prepared prior to the DEIR and why decision-makers and the public are excluded from reviewing and commenting on the mitigation measures that will be selected for the traffic control plan. By deferring this mitigation and excluding decision-makers and the public from reviewing and commenting on such measures, UCSF cannot rely on TRANS-5 to conclude the Project will have less than significant impact on the travel conditions along sidewalks and roadways serving the Project site during construction. 26 cont.

F. The EIR Impermissibly Relies on CEQA Section 21099.

The DEIR states that under CEQA section 21099, aesthetics and parking impacts do not need to be considered because this is an "employment center project" on an "infill site." DEIR, p. 4.0-3. The DEIR's conclusions are erroneous, and a revised EIR is required to analyze aesthetic and parking impacts. PRC 21099(d)(1) defines "employment center project" as follows:

> (a) For purposes of this section, the following terms mean the following:
> 1. 'Employment center project' means a project located on property **zoned for commercial uses** with a floor area ratio of no less than 0.75 and that is located within a transit priority area.

The Project area is not zoned for commercial uses. The DEIR at 4.10-7 states that the "campus site is primarily located in the City's P (Public) Zoning District…. Housing located along Third and Fifth Avenues is designated by the City as Residential House District, Two-Family (RH-2)." Since the Project site is not zoned commercial, 21099 does not apply at all. 27

Furthermore, 21099(e) states, "This section does not affect the authority of a public agency to establish or adopt thresholds of significance that are more protective of the environment." San Francisco has adopted thresholds that are more protective of the environment. The voters adopted Measure M, adding Planning Code section 101.1, which protects public open space vistas. General Plan Urban Design Element Policy 1.1 protects public views of open space and water. Since the City and voters of San Francisco have adopted more protective thresholds, those thresholds apply and must be considered.

The DEIR is therefore misleading as an informational document since it falsely states that 21099 applies to the Project and that aesthetic and parking impacts need not be considered. A revised draft EIR is required to correct this misinformation and to fully analyze and mitigate the Project's significant aesthetic and parking impacts.

G. The EIR Fails to Adequately Analyze the Project's Aesthetic Impacts.

If a project has any substantial negative effect on views and other features of beauty, it may have a significant environmental impact under CEQA. *See Ocean View Estates Homeowners Association, Inc. v. Montecito Water District* (2004) 116 Cal.App.4th 396, 401; *see also Quail Botanical Gardens Foundation, Inc. v. City of Encinitas* (1994) 29 Cal.App.4th 1597, 1604. If a project has a substantial adverse effect on a scenic vista, will substantially damage scenic resources, including scenic highways, or substantially degrade the existing visual character or quality of the site and its surroundings, it may have a significant aesthetic impact. *See* CEQA Guidelines, Appendix G.

The DEIR states that the Project would have a less than significant impact on scenic vistas. DEIR, p. 4.1-27. However, land use planner and Principal of Ikeda Consulting Jared Ikeda reviewed the DEIR and the Project's visual impacts and concluded that the Project will result in a significant change to public views and will change the visible skyline. *See* Exhibit D.

Specifically, a "particularly significant local view point is the trail head near the intersection of Farnsworth Lane and Edgewood." *Id*. at 3. The addition of a 294 foot high hospital will be seen from this vantage point and blocks views to the west, which "is a significant change to the public view and the inherent quality of the trail head and experience of accessing and walking this trail." *Id*. at 4. While the existing trees in this area and along the trail leading down screen and filter the vistas, the new hospital will entirely block scenic vistas and dominate the view. *Id*. This is a significant impact that must be analyzed and mitigated in the DEIR. 28

Additionally, the neighborhoods to the east, and views from streets such as Edgewood and Belmont and Willard will also be visually impacted by the new hospital. *Id*. The hospital will also "block views to Mt Sutro and the forest reserve from areas north of Parnassus Ave and Irving Street, and the visual experience of seeing a natural setting of a forested hillside from the local sidewalks and streets will be changed to one of a large urban building." *Id*. Furthermore, the addition of the new hospital "will undoubtedly change the visible skyline." *Id*. at 5. This is a noticeable chance and should be addressed in the context of the San Francisco General Plan Urban Design Element. *Id*. at 5-6.

San Francisco's General Plan Urban Design Element first policy is to "recognize and protect major views in the city, with particular attention to those of open space and water." San Francisco General Plan, Urban Design Element, Policy 1.1. Specifically, "[p]rotection should be given to major views whenever it is feasible, with special attention to the characteristic views of open space and water that reflect the natural setting of the city and give a colorful and refreshing contrast to man's development." *Id*.

However, the DEIR ignores this policy and fails to acknowledge the proposed hospital's impact on views of the Pacific Ocean. *See* Exhibit D, pp. 4-5.

A revised and recirculated draft EIR is required to analyze and mitigate the Project's significant aesthetic impacts. Feasible mitigation would include reducing the height or moving the 297 foot proposed hospital since it is responsible for most of the Project's adverse aesthetic impacts. 28 cont.

H. The EIR Fails to Adequately Analyze the Project's Impacts on Shadows.

The DEIR states that implementation of the Project would not create new shadows in a manner that would substantially and adversely affect the use and enjoyment of publicly accessible open spaces. DEIR, p. 4.1-74. However, as Mr. Ikeda points out, shadows affect the direct exposure to sun radiation, which can affect the temperature of the surface that is struck by sunlight. Exhibit D, p. 6. The comfort and attractiveness of these areas to pedestrians may be adversely affected yet are not addressed in the EIR. *Id*. Further, the city's Urban Design Guidelines state that plazas or parks located in the shadows cast by large buildings are unpleasant for users and large buildings can be oriented to minimize shadows falling on public or semi-public open space. *See id*. The EIR should take this into account and mitigate the Project's shadows in such a way as to minimize them on public or semi-public open spaces. Also, the DEIR clearly shows that the massive new hospital will cast shadows deep into Golden Gate Park. *See* DEIR, pp. 4.1-62, 4.1-68). The shadow renderings show shadows extending far into Golden Gate Park, near the baseball diamonds known as "Big Rec." The DEIR dismisses this impact arguing that the impact is on baseball fields that are rarely used in the morning. But this area is used for many things other than baseball. It is heavily used for soccer, tai-chi, frisbee, running and other activities at all hours of the day and at all times of the year. The shadowed area includes hiking/jogging trails which are very popular for dog walking, running, hiking and other activities at all hours. This is one of the most heavily used areas of the popular park. 29

San Francisco's Shadow Policy states that a project over 40 feet in height has a significant impact if it will cause shadows on a property under the jurisdiction of San Francisco's Department of Recreation and Parks. San Francisco Planning Department Shadow Analysis Procedure, July 2014; San Francisco Planning Code section 295.

Since the DEIR's own analysis shows that the massive 300- foot hospital casts shadows deep into Golden Gate Park, this is a significant impact that must be analyzed and mitigated in a revised DEIR. An obvious mitigation that should be analyzed in the revised DEIR is to relocate the hospital or make it much shorter to reduce its shadow impacts.

I. The DEIR Fails to Adequately Analyze the Project's Impacts on Biological Resources and Fails to Mitigate Impacts of the Project on Numerous Sensitive Species.

Expert biologist Shawn Smallwood, Ph.D. has reviewed the DEIR's discussion of biological resources. *See* Exhibit E. Drawing on his familiarity with the project area and decades of studying and surveying many of the species encountered at the site, Dr. Smallwood has prepared a critique of the DEIR, pointing out numerous shortcomings in the baseline assessment of the presence of species at the site, failures to evaluate impacts that will result from the Project, and numerous instances where the DEIR's assertions are insufficient or not supported by substantial evidence. 30

1. The DEIR provides an inadequate baseline and fails to adequately analyze the Project's impacts on biological resources.

In visiting the Project site, Dr. Smallwood observed at least 23 species of vertebrate wildlife, including 5 special-status species. Exhibit E, p. 2. The Golden Gate Audubon Society ("GGAS") tallied 47 species of birds on Mount Sutro Open Space Reserve in 2020. *See id*. at 5. eBird records further indicate a long list of species use Mount Sutro Open Space Reserve, the Parnassus Campus, and Aldea Housing. *Id*. While these sources documented 40 special-status species of birds, the EIR only addresses 6 special-status species. *Id*. at 9. Of these 6 special-status species, the EIR dismisses the likelihood of occurrence of two of them, assigns low likelihood of occurrence to another three, and assigns only a moderate likelihood of another, despite all of these species being documented on the site or surrounding area. *Id*. Furthermore, in a report prepared for UCSF, GGAS reported sighting 7 special-status species of birds that are not addressed in the EIR. *Id*. at 9-10. The EIR's attempts to justify this by claiming the Project site and surrounding area lacks the habitats necessary to support special-status species. *See* DEIR, pp. 4.3-14-4.3-15. However, as Dr. Smallwood notes, the EIR describes artificially narrow habitat needs for these species. *See* Exhibit E, p. 10. By narrowing down the species the EIR states is found at the Project site, the EIR also narrows its analysis of the Project's impacts to biological resources. In failing to establish an adequate baseline of biological resources, the EIR fails to adequately analyze the Project's impacts to biological resources. 31

The EIR also states that 0.15 acres of the Mount Sutro Open Space Reserve would be removed to facilitate the tallest of the proposed buildings on the campus, but would redesignate 0.4 acres to Open Space Reserve from Support. DEIR, p. 3-39. However, this 0.4 acres is already forested and otherwise indistinguishable from the forested landscape of the surrounding areas of Mount Sutro Open Space Reserve. Exhibit E, p. 7. "From the perspective of wildlife, the swap in land designations results in a 0.15-acre habitat loss," which the EIR fails to analyze. *Id*. Although "[m]uch more substantial impacts than mere acreage loss would result from the heights, extent, and structural attributes of the proposed new buildings." *Id*. Erecting tall structures into the

aerohabitat of volant wildlife results in collision mortality and interference with wildlife movement, as further described below. 31 cont.

2. The DEIR fails to adequately address the Project's impacts on wildlife resulting from bird strikes.

Migratory or dispersing birds attempting to stop over at the habitat island that Mount Sutro represents in San Francisco, and most birds leaving Mount Sutro to continue their migration or dispersal, "would expend extra energy – energy needed for long-distance flights – negotiating their way around the [Project's] buildings, but some would collide with the buildings after becoming disoriented or misled by the buildings' nighttime lights and by transparent and reflective glass windows." Exhibit E, p. 8. The DEIR acknowledges that the Project could result in an increase in bird collisions with buildings on the campus site, but concludes that by implementing mitigation measures BIO-2a, Prevention of Harm to Migrating Birds during Construction, and BIO-2b, Bird-Safe Building Treatments, the potential impacts to birds will be less than significant. Specifically, "[i]mplementation of these measures would reduce the potential adverse effect on resident and migrating birds to a less than significant level by reducing injuries associated with night lighting during construction and operation of the new facilities, and requiring design features be incorporated into new structures that would make buildings more visible to birds." DEIR, p. 4.3-19. This discussion of the Project is not sufficient to describe the Project's impacts on birds colliding with the building's windows. By failing to adequately quantify the Project's impacts due to bird collisions, the DEIR misrepresents the Project's potential impacts and fails to give any sense of the magnitude of this potential impact. 32

Full disclosure of the potential impact on wildlife of window collisions is especially important because "[w]indow collisions are often characterized as either the second or third largest source of human-caused bird mortality." Exhibit E, p. 17. Dr. Smallwood reviewed the DEIR, and even though it lacking details about the design of the proposed buildings, including the amount of glass, types of glass, and structural contexts of glass, predicted the Project will result in 6,176 bird deaths per year as a result of bird collisions. *Id*. at 16. The vast majority of these deaths are protected under Fish and Game Code section 3513. *Id*. If the Project moves forward as proposed, the Project will cause significant impacts on birds as a result of window collisions, despite the proposed mitigation measures. *Id*.

3. The DEIR fails to adequately analyze the Project's impacts on wildlife movement.

The DEIR asserts that since the Mount Sutro Open Space Reserve "does not provide contiguous habitat for any terrestrial species," the Project's "activities would have overall minimal impact on the Reserve's function as a migratory stopover," and implementation of several mitigation measures designed to address window collisions 33

would result in a less than significant impact on wildlife movement. DEIR, p. 4.3-19. However, the primary phrase of the CEQA wildlife corridor standard goes to wildlife movement regardless of whether the movement is channeled by a corridor. Exhibit E, p. 17. Sites such as the Project site "is critically important for wildlife movement because it composes a diminishing patch of natural cover within an expanse of anthropogenic land uses, forcing more volant wildlife to use the site as a stopover and staging habitat during migration, dispersal, and home range patrol." *Id*.

Further, even if mitigation measures do succeed in lessening bird-window collision mortality, "it will have no effect on the project's impacts to movement of wildlife that survive their encounters with the buildings." *Id*. Beyond window collisions, the Project's tall buildings would pose an additional barrier. "Many birds and bats attempting to fly to or from Mount Sutro would have to detour around the buildings, risking predation by peregrine falcons which exploit these types of situations, and costing valuable energy needed for long-distance travel. Inserting multiple tall buildings into the aerohabitat of birds and bats would cause significant adverse impacts to those birds and bats." *Id*.UCSF must therefore go back and adequately analyze the Project's impacts on wildlife movement.

33 cont.

4. No meaningful discussion of the Project's cumulative effects on wildlife is included in the DEIR.

Recognizing that several projects may together have a considerable impact, CEQA requires an agency to consider the "cumulative impacts" of a project along with other projects in the area. Pub. Res. Code § 21083(b); CEQA Guidelines § 15355(b). If a project may have cumulative impacts, the agency must prepare an EIR, since "a project may have a significant effect on the environment if '[t]he possible side effects of a project are individually limited but cumulatively considerable.'" *CBE*, 103, Cal.App.4th at 98; *Kings County Farm Bur*., 221 Cal.App.3d at 721. It is vital that an agency assess "'the environmental damage [that] often occurs incrementally from a variety of small sources . . . .'" *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1214 ("*Bakersfield Citizens*").

34

Rather than assess the cumulative wildlife impacts of the Project, the DEIR states that due to the urban setting, implementation of the Mount Sutro Open Space Vegetation Management Plan, and the 2014 LRDP EIR mitigation measures, the Project would have a less than significant cumulative impact on biological resources. *See* DEIR, pp. 4.3-23-4.3-24. As Dr. Smallwood points out, "[i]f cumulative effects were indeed merely residual impacts of inadequately mitigation, then CEQA would require an inadequate mitigation analysis instead of a cumulative impact analysis." Exhibit E, p. 18.

Redevelopment of existing structures in already developed areas does in fact pose potentially severe bird-window collision impacts despite the assertion that redeveloped areas have already removed all biological resources. *Id*. As Dr. Smallwood

points out, "[j]ust as the project proposes potentially severe bird-window collision impacts, so too do new buildings going up in place of older buildings. New buildings in San Francisco are glass-covered." *Id*. An adequate cumulative impacts analysis would therefore "include a tally of predicted or estimated fatality rates of birds colliding with glass facades of recently built, planned, and foreseeable buildings in San Francisco." *Id*. Due to the Project's impacts, and those of other buildings in San Francisco, a serious cumulative impacts analysis is warranted. Bird abundance across North America has declined 29% over the last 48 years, which will result in substantial ecological and economic consequences. *See id*. Since windows are recognized as one of the principal anthropogenic sources of bird mortality, their cumulative effects among San Francisco's new buildings must be analyzed and mitigated. As a result, the DEIR's discussion of cumulative wildlife impacts is entirely deficient. 34 cont.

5. The DEIR's proposed mitigation measures will not reduce impacts to biological resources to less-than-significant levels.

The EIR proposes to mitigate potentially significant impacts to birds and bats through mitigation measures BIO-1c and BIO-1d, in which a biologist will conduct pre-construction surveys for nesting birds within 250 feet of the construction area and for roosting bats within 50 feet of the construction area within 7 days prior to initiation of construction activities. *See* DEIR, pp. 4.3-15-4.3-16. However, Dr. Smallwood disagrees that these measures would reduce the Project's impacts to less than significant because preconstruction surveys are limited in their mitigation effect as they detect only small fractions of bird nests and roosting bats occurring on a project site. Exhibit E, p. 18. 35

"Preconstruction surveys alone fail to prevent the deaths of most of the animals at risk, nor do they do anything to prevent habitat destruction and lost reproductive capacity." *Id*. at 19. Instead, detection surveys should be performed, and early enough to not only inform preconstruction surveys but also the public and decision-makers about potential project impacts. *Id*. "Take avoidance surveys cannot lessen impacts to nesting birds and roosting bats without first informing the public and decision-makers of the magnitude of potential impacts, nor without informing survey personnel where to look." *Id*.

The EIR also proposes to mitigate the Project's potentially significant impacts to birds due to collisions with the Project's windows through mitigation measure BIO-2b. BIO-2b includes the following measures: (1) minimizing unnecessary light emissions from interior and exterior portions of buildings; (2) exploring and adopting window glazing options such as marked glass or UV-reflective glass; and (3) minimizing light and glare of facades through orientation of the building, choice of materials, and landscaping. *See* DEIR, p. 4.3-20. However, Dr. Smallwood does not believe this mitigation measure will reduce the Project's impacts to birds due to window collisions to less than significant. San Francisco's 2011 standards for bird-safe buildings included glass and façade treatments and lighting treatment measures that were often of 36

uncertain efficacy and much has been learned by research performed since 2011. Exhibit E, p. 19. As for the third of the proposed measures in the EIR, minimizing light and glare of facades through orientation of buildings, etc., the EIR fails to identify the materials to be used and is unclear about whether and how building orientation would be decided to minimize collision risk, nor does it indicate the structural materials to be used on any particular portions of buildings. *See id*. at 19-20. While the building orientations are already decided, the decision of materials to be used are deferred to an unspecified later date. *Id*. at 20. In order to inform this measure, behavioral ecologists need to survey the project area to adequately characterize flight patterns and reactions to existing buildings, and surveys are needed to learn how many of each bird species fly through the area and at what times of day and night. *Id*.

36 cont.

6. The DEIR fails to analyze all potential feasible mitigation measures to reduce the project's impacts to biological resources.

As Dr. Smallwood points out, the most effective measure to minimize collision fatalities is careful siting. *Id*., at 21.

> There are two types of siting: Macro and micro. Macro-siting refers to selection of a project site, whereas micro-siting refers to selection of locations for project components within the boundary of a project site. Both levels of siting can substantially mitigate impacts to wildlife, but macro-siting usually offers the greatest opportunity for minimizing impacts. Applying macro-siting to the proposed project would consider impacts to wildlife if the new square footage was located at the site of UCSF's Medical Center at Mount Zion, or in Bayview at the Hunters Point shipyard, as examples. Of course, macro-siting must also consider project objectives but can also consider collateral opportunities for students and host communities. Other factors considered, siting the project farther from Mount Sutro Open Space Reserve would vastly lessen impacts to birds.

37

Id. Micro-siting at the Project site to reduce the Project's impacts to birds would require reducing the size of the Project and minimizing the extent of windows on building facades, reducing building heights, and siting the taller buildings farther from the steep, forested slopes of Mount Sutro. *Id*. UCSF should investigate these siting measures and implement them if determined to be feasible.

J. Air Quality.

We submit herewith the expert comments of Dr. Paul Rosenfeld, Ph.D., and Matthew Hagemann, C.Hg., of the consulting firm, Soil Water Air Protection Enterprise (SWAPE). *See* Exhibit F. SWAPE demonstrates that the air quality analysis in the DEIR is patently inadequate. The SWAPE comments show that the air modelling supporting the DEIR was manually manipulated and altered in many respects to make

38

the modelling fundamentally inaccurate and misleading. This renders the DEIR inadequate as an informational document. A revised draft EIR is required to include accurate air modelling and analysis.

In this letter we highlight just some of the more egregious examples of "tinkering" that were performed on the air models in the DEIR.

- The energy-generating utilities for the Project were manually adjusted to show a CH4 (methane) and N2O (nitrous oxide) intensity factor of zero. Exhibit F, p. 2. Of course, this is impossible, and vastly understates the greenhouse gas (GHG) emissions of the Project.
- The DEIR's model fails to include all of the 25,000 to 45,000 square feet of construction offices, again understating Project emissions of many types, particularly volatile organic compounds (VOCs).
- The Aldea Housing Densification will include 184 parking spaces (DEIR, p. 3-28), yet the DEIR's air model assumes zero parking for these units. Exhibit F, p. 3.
- The Project involves demolition of 42 existing student housing structures in order to construct 184 new housing structures. But the DEIR calculated the demolished housing as "Research and Development," which overstates the baseline emissions. *Id*. at 4.
- The DEIR models all 3.9 million square feet of existing land use space as "hospital." However, much of that space is housing, lecture halls, commercial space, library, parking and other functions that generate lower levels of emissions. This results in an overstatement of baseline emissions. *Id*. at 5.
- The DEIR vastly undercounts the emissions from Phase I of the Project. The Initial Phase calculation assumes 412,000 square feet of only research and development and residential space. But Phase I will actually include 1.43 million square feet of new building development. Thus, the DEIR undercounts the Phase I land use space by over 1 million square feet, and fails to include any hospital or parking space and related emissions. *Id*. at 6.
- The DEIR makes massive manual manipulations to the CalEEMod default construction schedule - extending the construction schedule out dramatically. The longer construction schedule results in lower emission numbers since emissions are calculated on a maximum daily basis. For example, the architectural coating (painting) phase was increased by over 5100% from the default value of 10 days to 521 days. The building construction phase was increased by over 400% from 200 to 1043 days. The grading phase was increased by 3700% from the default value of 4 to 152 days. The site preparation phase was increased by 7500% from the default value of 2 to 152 days. *Id*. at 7. SWAPE lists many other manipulations that were made to the air model, all resulting in lower daily emission rates by spreading out construction emissions over a longer time period.
- The DEIR underestimated the total amount of demolition emission and hauling trips. *Id*. at 8.

38 cont.

- The DEIR calculated emission assuming the use of Tier 4 Final Construction equipment, which is the cleanest construction equipment currently available. However, the DEIR does not require Tier 4 Final Construction equipment. It only required Tier 4 Construction equipment. There are two types of Tier 4 construction equipment: Tier 4 Interim and Tier 4 Final. These are actually quite different. Tier 4 Final equipment is up to 80% cleaner than Tier 4 Interim equipment. Therefore, by assuming the use of Tier 4 Final equipment, when only Tier 4 Interim is required, the DEIR underestimates Project construction emissions by up to 5 times. *Id*. at 11. SWAPE points out the there is very little Tier 4 Final equipment available in the market, so assuming that a contractor will voluntarily use it when it is not required is unrealistic. *Id*. at 12.
- The DEIR air model was manually manipulated to reduce vehicle emissions, thereby underestimating emissions from cars and trucks. *Id*. at 13.
- The DEIR was manually manipulated to reduce emission from consumer products, such as hair sprays, deodorants, air fresheners and other products that may be used by future residents. *Id*. at 14.
- The DEIR reduced the "silt-loading factor" for road dust by more than half. The DEIR states that it is using a San Francisco-specific silt loading factor. However SWAPE determined that the EIR relied on a San Diego factor, not a San Francisco factor. *Id*. at 15.
- The DEIR underestimates operations vehicle emissions by manually adjusting the default vehicle trip rates. *Id*.
- The DEIR underestimates the Project energy use. Operational energy use values were manually reduced to ZERO kilowatt hours. The DEIR justifies this by citing to UCSF's zero net electricity goal for 2025. However, the zero electricity goal is simply a goal, it is not a requirement of commitment. 2025 is less than five years away. It is preposterous to assume that the Project will use zero electricity in just five years from now. *Id*. at 16.
- The DEIRs cancer risk assessment is inaccurate for several reasons: First, it assumes the use of Tier 4 Final construction equipment, which is not required; second, it fails to consider the cumulative impacts of the various construction projects; third, it fails to consider the health risk impacts from the entire operation, which includes 52,200 daily vehicle trips and related diesel particulate matter emissions and other pollutants.

38 cont.

K. Greenhouse Gas Impacts.

The Project will have significant greenhouse gas ("GHG") emissions of 61,815 metric tons of carbon dioxide equivalents per year (MT CO2/yr), which indicates a significant impact. DEIR, p. 4.7-36. To mitigate this impact, the DEIR proposes mitigation measure GHG-1c, requiring offsets for emissions above the existing inventory of 125,426 MT CO2/year. However, the Court of Appeal recently held that emission offsets alone cannot justify a finding of a less than significant impact. *Golden Door v. San Diego* (2018) 27 Cal.App.5th 892. The Golden Door court held that offset credits

39

may not adequately mitigate GHG emissions since they may be generated out of state or even out of country and may not represent real, verifiable and quantifiable emission reductions.

The DEIR also relies on alleged consistency with the 2017 California Air Resources Board ("CARB") Scoping Plan to determine GHG significance. However, SWAPE demonstrates that the Project does not demonstrate compliance with the 2017 Scoping Plan and appears to violate numerous provisions of the Plan. Exhibit F, pp. 21-25.

The DEIR relies on the Project's alleged compliance with Plan Bay Area 2040. CEQA Guidelines section 15064.4(b)(3) and 15183(b) allow lead agencies to consider a project's consistency with regional plans for mitigation of GHG emissions. However, Plan Bay Area 2040 is not a GHG reduction plan or a Climate Action Plan at all. It includes none of the required elements of such as plan as set forth in 15183.5(b)(1). *Id*. at 26.

39 cont.

L. Energy Impacts.

Lead agencies are required to analyze a project's energy impacts, and relying on existing energy-reduction requirements in buildings codes, and on the beneficial side effects of reducing greenhouse gases, to demonstrate a project's energy impacts will not be significant is not sufficient under CEQA. In *Spring Valley Lake Association v. City of Victorville* (2016) 248 Cal.App.4th 91, 103, the court determined that an EIR could not demonstrate greenhouse gas reductions from increasing Title 24 energy efficiency by 15 perfect if it could not show that the project "will, in fact, exceed Title 24 standards by 15 percent." While this case involves claimed greenhouse gas reductions, the result is applicable to the type of analysis required for energy reductions.

Here, the DEIR concludes that the Project will have less than significant energy impacts. DEIR, pp. 4.5-19, 4.5-28. This conclusion is in part based on the Project's compliance with UC's Sustainable Practices Policy provisions "that are designed to conserve and reduce energy consumption." *Id*. at 4.5-28. The DEIR states that all individual projects under the proposed CPHP would be required to comply with the UC Policy on Sustainable Practices, which requires new construction of facilities to meet a minimum standard of LEED-NC Silver and strive for LEED-NC Gold when possible and requires 20 percent better energy performance than Title 24. *See id*. However, the UC Policy on Sustainable Practices establishes goals, not requirements. *See* University of California - Policy on Sustainable Practices, p. 2. By solely relying on these goals, the DEIR's explanation fails to demonstrate how an increase in Title 24 efficiency and implementation of LEED-NC Silver or Gold will in fact reduce the Project's energy impacts. The DEIR also fails to calculate the reductions such measures would provide and whether they are sufficient to conclude the Project will in fact have a less than significant energy impact. Failure to provide such information renders the DEIR's

40

energy impacts analysis legally inadequate because it is not based on substantial evidence.

40 cont.

M. The EIR Fails to Adequately Analyze the Project's Land Use Impacts.

The DEIR concludes that the Project will result in a less than significant impact to Land Use and Planning. DEIR, pp. 4.10-9, 4.10-15. However, this ignores the fact that the Project is flatly inconsistent with a vast array of land use and general plan policies - most obviously the Project vastly exceeds applicable height limits. The DEIR justifies ignoring these policies by arguing that the University is not required to comply with local land use and zoning. Even if this were true, this does not mean that there is no impact resulting from the plan inconsistencies. CEQA is concerned with environmental impacts, not with legal requirements. The environmental impacts exist regardless of whether the University is bound to comply with the land use requirements at issue.

Also, in a 1987 Memorandum of Understanding ("MOU"), UCSF agreed to advise and consult with the City of San Francisco on any proposed construction projects. *See* Exhibit G. The MOU states that the City Planning Commission will advise UCSF about the "conformance of such development with the Master Plan of San Francisco and Planning Code Section 304.5 (Institutional Master Plans) with recommendations, of any, for amendment to the proposal… Should the City Planning commission and UCSF disagree on any matter which is the subject of this MOU, either party may request the participation of the Mayor and the Chancellor in attempting to resolve the dispute." *Id*. ¶ IV. Thus, UCSF has agreed to attempt to resolve any inconsistencies with the City's land use and zoning requirements. Also, UCSF has indicated that it intends to adhere to local policies and regulations to the extent practicable and to review policies germane to the analysis of land use impacts. DEIR, p. 4.10-6.

41

Where a local or regional policy of general applicability is adopted in order to avoid or mitigate environmental effects, a conflict with that policy in itself indicates a potentially significant impact on the environment. *Pocket Protectors v. Sacramento* (2005) 124 Cal.App.4th 903; *Georgetown Preservation Society v. County of El Dorado* (2018) 30 Cal.App.5th 358.

The San Francisco General Plan provides policies and objectives to guide land use decisions and, along with the San Francisco Planning Code, prescribes the permitted uses and development standards to carry out the City's policies for the 107-acre Parnassus Campus site. The DEIR must therefore include a complete and forthright analysis of the Project's consistency with the General Plan and other applicable planning documents, ordinances and regulations so that UCSF can honor its intent to adhere to the extent practicable, the City's policies and "zoning codes related to building use, height, and bulk limitations; floor areas; and parking requirements or restrictions for the purpose of ensuring compatibility with the surrounding uses." DEIR, p. 4.10-6.

Compliance with the City's adopted policies and regulations are a key indicator of whether the Project is or is not compatible with the surrounding neighborhood. Here, after discussing only some of the applicable plans, the DEIR incorrectly concludes that the Project would be compatible with the adjacent land uses and impacts would be insignificant. Urban Planner Terrell Watt lists numerous inconsistencies with the General Plan and Planning Code. *See* Exhibit B, pp. 15-21.

41 cont.

GENERAL PLAN/ZONGING PROVISION	INCONSISTENCY
Land Use and Urban Design Elements LU-2: Plan for growth and renovations that are substantially consistent with use limitations and bulk limitations in City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects…UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns. LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density and do not negatively affect surrounding land uses. LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights campus site. Policy 3.5: Relate the height of buildings to important attributes of the city pattern and to the height and character of existing development. Policy 3.6: Relate the bulk of buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction. San Francisco Planning Code – Use Districts City's P (Public) Zoning District Housing along Third and Fifth Avenues – see also Residential House District, Two-Family (RH-2) Code sections Height and Bulk Districts: 25-X, 40-X, 65-D, 80-D, 130-D and 220-F. Floor areas rations are determined by allowable height and coverage.	The DEIR correctly concludes that the New Hospital, as well as Millberry Union, certain West Side development and the Aldea Housing densification project would not be consistent with City Planning Code height and/or bulk regulations for their respective building sites. DEIR at 4.10-16. The DEIR continues on to incorrectly conclude despite evidence to the contrary, that these conflicts would not result in significant incompatibility with adjacent land uses or impacts on surrounding uses. Taking just the New Hospital as an example, at about 955,000 gross square feet and up to 294 feet in height, the New Hospital clearly demonstrates the Project's incompatibility with the surrounding area resulting in significant adverse environmental impacts including but not limited to, wind, visual and environmental impacts associated with an inadequate supply of housing affordable to new students, faculty and staff. The New Hospital is patently inconsistent with SF Land Use and Design policies and height and bulk requirements in multiple ways. First, the New Hospital is within three height and bulk districts and exceeds height limits for portions of the site within two of these, the 65-D and 22-F Height and Bulk districts, by over 70 feet and X stories. Second, the New Hospital would require use of a portion of the Reserve and would be located even closer to the off-site residences on Edgewood. The DEIR concedes: Impact AES-2 finds that the New Hospital would be the most noticeable visual change under the CPHP program, and would contrast sharply both in height and scale with the nearby residential development…". DEIR at 4.10-17. In justifying the conclusion that the New Hospital is compatible with adjacent land uses, the DEIR points to the proposed amendments to the 2014 LRDP which increase the space ceiling. In addition, the DEIR (Impact AES-3) finds that with implementation of appropriate design standards and exterior materials light and glare and other impacts would be reduced to less than significant. Even so, the DEIR concedes that the New Hospital will still result in significant unavoidable wind

42

	hazards. Analysis by Jared Ikeda provides clear evidence the New Hospital with also result in significant and unavoidable visual impacts. See Attachment 7. There are clear inconsistencies between the New Hospital and the City's General Plan policies and Code resulting in documented significant and unavoidable impacts associated with wind hazard, visual and housing, among other impacts. <u>These inconsistencies and the associated physical environmental impacts are not resolved by the amendment to the LRDP to raise the space ceiling</u>. Combined with other Project elements – Millberry Union, West Side – and the Project scale and bulk overall, the Project is clearly incompatible with the surrounding area resulting in significant and unavoidable impacts including those omitted from the DEIR but disclosed (wind) and some revealed by expert analysis (e.g., visual, cultural, housing). A revised and recirculated DEIR must re-analyze Project consistency with these and other applicable provisions of the City's Plans and Codes and Impact LU-2 must be found to be a significant and unavoidable impact. In addition, the Project is clearly inconsistent with CPHP Policy 3.6, which states that the height of buildings should be related to the prevailing scale and character of existing development. The New Hospital at nearly 100 feet taller than the tallest existing building on the campus, Moffit Hospital, is clearly inconsistent with this Policy. A revised DEIR must include in a revised Land Use and Planning section a systematic and thorough analysis of inconsistencies with all applicable (City, UC, other) policies and regulations.

42 cont.

Urban Design Element Policy 1.1: Recognize and protect major views in the city, with particular attention to those of open space and water. Policy 3.4: Promote building forms that will respect and improve the integrity of open spaces and other public areas.	The DEIR incorrectly concludes the project will not conflict with these policies and specifically that "[d]evelopment under the CPHP would not have a substantial adverse effect on a scenic vista" (AES-1) or "conflict with the applicable zoning and other regulations governing scenic quality" (AES-2) and therefore no mitigation is required. In his analysis of visual impacts, Jared Ikeda concludes that the New 16-story Hospital would result in significant visual impacts including specifically that it would block views to Mt Sutro and the Reserve and would block views of the ocean and Golden Gate Park from trails and other public vantage points resulting in policy inconsistencies with direct significant environmental impacts. See Attachment 7. A revised DEIR must change the disposition of these impacts (AES-1 and 2) to significant and unavoidable and identify feasible mitigation measures including alternatives to the Project.	43
Shadow Proposition M, adopted by the voters in 1986, added section 101.1 to the SF Planning Code and established 8 priority policies. Priority Policy No. 8 calls for the protection of parks and open space and their access to sunlight and vistas.	The DEIR incorrectly states that the implementation of the Project would not create new shadow that substantially and adversely affects the use and enjoyment of publicly accessible open spaces. In his analysis of aesthetic impacts, Jared Ikeda reviewed the DEIR's analysis with respect to shadows and reached a different conclusion documented in his letter: "It appears though that certain areas along Parnassus Avenue and Irving Street will be subject to frequent shadows throughout the year." See Attachment 7. These more frequent shadows will clearly affect the use and enjoyment of these public spaces and as such should be called out as a Significant and Unavoidable impacts of the Project as proposed. Feasible mitigation measures must be identified.	44

Regents' Resolution: Space Ceiling of 3.55 Million Gross Square Feet	The DEIR conveniently concludes that the impacts associated with the Project's significant increase in gross square feet (an increase of approximately 1.5 million GSF about the existing space ceiling) and population increase from 18,500 to nearly 25,000, would be less than significant because the LRDP would be amended to increase both space and population. An amendment to the space and population ceiling does not eliminate the physical environmental impacts described in the table above associated with the increased scale of the Project. Such impacts include wind hazard (found SU by the DEIR), cultural (found SU by the DEIR) and additionally, aesthetic (visual and shadows) and housing, among others. A revised DEIR must identify this as an inconsistency, re-analyze the associated environmental impacts and identify feasible mitigation including alternatives to Project components such as the New Hospital.

45

All of these inconsistencies are significant impacts under CEQA. A revised DEIR must include an expanded and forthright analysis of the Project's potential inconsistencies with applicable plans and policies, including the City's, and disclose the significant unavoidable environmental impacts associated with those inconsistencies. The revised DEIR must also include feasible mitigation measures and alternatives to reduce or eliminate these impacts. Alternatives should include alternative project proposals to conform to land use and zoning requirements to the maximum extent feasible, including height limitations.

46

N. Growth Inducing Impacts, Population and Housing Impacts.

CEQA requires the lead agency to determine whether the "environmental effects of a project will cause substantial adverse effects on human beings, either directly or indirectly," Pub. Res. Code § 21083(b)(3), (d)), and to "take immediate steps to identify any critical thresholds for the health and safety of the people of the state and take all coordinated actions necessary to prevent such thresholds being reached." *See* Pub. Res. Code § 21000 et seq. CEQA requires that an EIR include a detailed statement setting forth the growth-inducing impacts of a proposed project. *Id*. § 21100(b)(5). A proposed project is either directly or indirectly growth inducing if it: (1) **fosters economic or population growth or requires additional housing;** (2) removes obstacles to growth; (3) taxes community services or facilities to such an extent that new services or facilities would be necessary; or (4) encourages or facilitates other activities that cause significant environmental effects. CEQA Guidelines § 15126.2(d).

47

While growth inducing impacts of a project need not be labeled as adverse, the secondary impacts of growth (e.g., gentrification and displacement, demand for additional housing and services, traffic, air pollution, etc.) may be significant and adverse. In such cases, the secondary impacts of growth inducement must be disclosed as significant secondary or indirect impacts of the project. The analysis required is similar in many respects to the analysis required to analyze impacts associated with population and housing. CEQA Guidelines Appendix G, Section XII provides that a project will have significant impacts where it will:

> • **Induce substantial population growth or concentration of population in an area, either directly (for example, by proposing new housing or businesses), or indirectly (for example, through extension of roads or other infrastructure);**
> • Displace substantial numbers of existing housing necessitating the construction of replacement housing elsewhere; or
> • **Displace substantial numbers of people**, necessitating the construction of replacement housing elsewhere.

47 cont.

The City of San Francisco Department of Public Health has issued a policy paper concluding that a Housing Impact Assessment should be conducted under CEQA. San Francisco Dept. of Public Health, *The Case of Housing Impacts Assessment: The Human Health and Social Impacts of Inadequate Housing and Their Consideration in CEQA Policy and Practice* (PHES Technical Research Report) (May 2004), Exhibit H. The Housing Impact Report grounds its conclusion in CEQA's requirement that an agency must consider reasonably foreseeable "environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly." Pub. Res. Code § 210983(b)(3).

Urban Planner Terrell Watt explains that the DEIR contains a short, 3 and 1/2-page discussion of Growth Inducing Effects. Exhibit B, pp. 8-12. Ms. Watt concludes that the Project will generate demand for housing that will vastly outstrip the amount of housing that will be constructed as part of the Project. The DEIR's discussion acknowledges the Project will increase the campus population by approximately 4,100 persons by 2030 and an additional 1,080 persons by 2050, including students and faculty and staff. The DEIR also calculates the multiplier of 0.73 for an additional 3,420 jobs that could be indirectly caused or induced by the Project. The Project includes construction of 142 net new housing units/beds within the Aldea housing complex and an additional 620 new residential units for a net total of 984 new units by 2050.

48

The DEIR concedes "[c]ampus population growth under the proposed CPHP would not be entirely accommodated by the existing and new housing on site, and therefore would result in indirect housing demand beyond the campus site." DEIR, p. 5-5. The discussion provides little real analysis of the Project's potential to induce

growth in accordance with CEQA, nor does the discussion reach any conclusions as to the significance of growth inducing impacts instead relying on the assertion that the growth allowed by the Project is not substantial when "compared to the study area growth projections and to the extent that demand for new housing would exceed the capacity of the market area." DEIR, p. 4.12-10. Yet, the discussion does not identify any potentially significant impacts associated with population growth as a result of the elimination of the existing space ceiling and implementation of the Plan.

The DEIR goes on to state:

> "Generally, the housing demand associated with employment growth under the proposed CPHP would be satisfied by the housing that could be added in San Francisco and in other parts of the region." DEIR at 4.12-8.

Ms. Watt points out that the San Francisco and the region has been grossly underbuilding planned housing while generating significant new jobs; facts not disclosed by the DEIR. There is no information in the DEIR about the current housing crisis in San Francisco and region as summarized below. Nor does the DEIR contain any information about housing availability in the surrounding neighborhood and City, or information about housing affordability. Moreover, the DEIR fails to describe the breakdown of new students, faculty and staff in terms of numbers by typical jobs and salaries; information critical to estimating the percent of new staff, faculty and students who qualify as low income or very low income requiring lower cost housing options. Finally, the DEIR fails to acknowledge that UCSF is a major contributor to the affordable housing crisis, and will exacerbate that crisis by building out its expansion plan without building additional units affordable to new students, faculty, staff and employees of supporting services. *See* Jobs Housing Nexus Analysis SF, Kaiser Marston Associates, 2018. 48 cont.

Instead of the required analysis, the DEIR points to the Population and Housing Section conclusion to support its cursory overview of growth inducement impacts:

> "Implementation of the proposed CPHP would induce population growth in the Bay Area, but the population growth would **not be** substantial in comparison to growth that is projected and planned for San Francisco and the four study area counties in Plan Bay Area 2040 and the local general plans for the study area communities. Further, the population growth would not result in a demand for new housing that would exceed the capacity of the five-county market area." DEIR, p. 4.12-9. Emphasis added.

By comparing the Project's growth to the entire City and region, the DEIR seeks to diminish the significance of housing demand generated by the Project. CEQA prohibits this type of "drop in the bucket" analysis. No single project would ever have a significant impact if its effects were compared to an entire region. In *Friends of Oroville*

v. City of Oroville, 219 Cal. App. 4th 832 (2013), the Court of Appeal held that the agency failed to adequately analyze a project's cumulative contribution to significant GHG impacts by concluding, without adequate analysis, that the project's "miniscule" emissions were insignificant in light of the state's cumulative, state-wide GHG emissions, thus "applying a meaningless, relative number to determine insignificant impact." 219 Cal. App. 4th at 841-842. The Regents make the same error here by comparing the Project's impacts on housing to the entire Bay Area. In fact, given that the entire Bay Area is facing an extreme housing shortage, the cumulative impacts of this Project are worse, not better.

There is no question the Project will generate substantial additional growth in a highly constrained neighborhood, by increasing the daily average population by approximately 45%, nearly 5,200 students, faculty and staff. DEIR, p. 4.12-1. In addition, the Project generates an additional 3,420 jobs based on a multiplier of 0.73%; jobs that will put additional demand on a tight housing market. No information is provided about the nature of these jobs or the associated salary ranges of employees. The Project will also increase likely increase the demand for housing in the immediately surrounding neighborhoods and City as people avoid transit in a COVID worried world and seek to walk and or bike to work.

According to Urban Planner Ms. Watt, the Project most certainly will induce growth that will in turn significantly impact housing. Total new housing demand could be as high as 6,000+ units assuming that the majority of students, faculty, staff and indirect job employees are people who need housing. Lower demand for new housing, assuming all new students need housing and only 50% of faculty and staff need housing, at 4,000+ units, would still constitute a significant impact on a highly constrained housing market and could result in displacing local residents due to competition and gentrification. If demand is lower, due to a higher percent of new students, staff, faculty and indirect job employees are already housed (50%) the impact at 4,000+ units will still be significant due to the housing crisis because under either scenario, UCSF would be generating between 4 and 8 jobs for each new unit constructed. Added to the existing jobs-housing deficit in San Francisco and the region and the even greater deficit of housing affordable to low and very low income households, the growth induced by the Project would result in a significant impact on housing. Salaries disclosed for the Mission Bay Project for UCSF's workforce, suggest the majority of new students, staff and faculty will need housing affordable to low incomes. See www.payscale.com/research/USEmployer=UCSFMedicalCenter.

48 cont.

Housing Demand Range			
Direct/Multiplier Growth at 2040 DEIR page 4.12-7	Students 504	Faculty and Staff 4,680	Multiplier/Indirect Employees: 3,420
Housing Demand Estimates	High Demand (worst case scenario 100 require housing): 504 units Low Demand (50% not housed, new demand) 252 units	High Demand: (worst case scenario 80% not housed, net new): 3,744 units Low Demand (50% not housed, new demand) 2,340 units	High Demand: 50% not housed, new demand): 1,760 units

These housing-related impacts are more than glossed over by a discussion that excludes any information about the dire housing crisis. 48 cont.

Substantial new non-residential and residential growth in San Francisco includes total population growth based on household size assumptions, in addition to new students, staff and faculty estimated in the DEIR to be as high as 12,220 people by 2050. DEIR, p. 4.12-8. This estimate does not include indirect growth associated with the multiplier, but does assume all new growth is in San Francisco. This significant new growth will require additional public services, likely including expansion and therefore construction of facilities in the neighborhood or adjacent neighborhoods of a myriad of services. Yet the DEIR provides cursory information about these services and facilities and fails to analyze the associated impacts, including fiscal impacts. CEQA requires that if new construction of housing will occur to accommodate the Project's employees or services beyond that included in the Project, then the EIR must analyze the environmental impacts of that construction. The appropriate components for an adequate analysis include: (1) estimating the amount, location and time frame for growth that may result from the implementation of the Project (e.g., additional housing); (2) considering whether the new population would place additional demands on public services such as fire, police, recreation, emergency, health, childcare or schools; (3) applying impact assessment methodology to determine the significance of secondary or indirect impacts as a result of growth inducement; and (4) identifying mitigation measures or alternatives to address significant secondary or indirect impacts. CEQA Guidelines Appx. G § XIII(a).

The DEIR must be revised to provide this analysis and based on this analysis, to revise other environmental analyses including but not limited to population and housing, transportation, air quality, among other topics where impacts are derived in part from direct and indirect growth assumptions.

The DEIR's dismissal of likely growth inducing impacts because the impacts are "impossible to determine" violates CEQA. Virtually the sum total of the discussion, below, lacks analysis and supporting facts and evidence while at the same time identifying the potential areas of significant impacts associated with significant growth:

> "While it is acknowledged above that the precise nature, location, and magnitude of effects of indirect and induced growth cannot be determined, the proposed CPHP would likely increase overall demand in the region for housing, commercial and industrial space, and associated infrastructure. Potential effects could include increased traffic congestion; increased air pollutant emissions; loss of agricultural land and open space; loss of habitat and associated flora and fauna; increased demand on public utilities and services, such as fire and police protection, water, recycled water, wastewater, solid waste, energy, and natural gas; and increased demand for housing. An increase in housing demand in the Bay Area region would also require governmental services including, but not limited to schools, libraries, and parks to serve new commercial and residential development." DEIR, p. 5-7.

48 cont.

The discussion also acknowledges that this growth could contribute to a loss of open space by converting those lands to housing, commercial space and infrastructure, but attempts to discount the many impacts associated with conversion of natural and working lands by pointing out without evidence that "most jurisdictions have adopted smart-growth policies that discourage or prohibit this type of development." DEIR, p. 5-7.

Given that human beings must live somewhere, the increased demand for housing created by the Project will result in either displacement of local residents, who will in turn be forced to move elsewhere where additional housing will be required, or construction of additional housing in San Francisco. In either case, this will have significant impacts that must be analyzed in a revised EIR.

Ms. Watt concludes, "Based on accurate information about the pre-Covid SF and Bay Area housing crisis (summarize above), it can reasonably be concluded that the addition of 5,200 students, faculty and staff by 2050 and only 984 units produced, the housing need generated constitutes a significant impact. Demand for housing is further exacerbated by the job multiplier of 0.73 creating an additional 3,420 jobs induced by the Project. Total new housing demand could be as high as 6,000+ units assuming that the majority of students, faculty, staff and indirect job employees are people who need

housing. Lower demand for new housing, based on more new staff and faculty already housed, at an estimated 4,000+ units, would still constitute a significant impact. If demand is lower, due to a higher percent of new students, staff, faculty and indirect job employees are already housed (50%) the impact at 4,000+ units will still be significant due to the housing crisis. Under either scenario, UCSF would be generating between 4 and 8 jobs for each new unit constructed. Added to the existing jobs-housing deficit in San Francisco and the region and the even greater deficit of housing affordable to low and very low income households, the growth induced by the Project would result in a significant impact on housing.

A revised growth inducing analysis must be included in a revised and recirculated DEIR. The analysis must analyze the Project's likely impacts on generating housing demand and causing displacement of existing residents. The EIR must analyze feasible mitigation measures, such as the construction of additional affordable housing units to meet the additional demand generated by the Project, or contribution to a fund to facilitate construction of such new housing. Such measures are clearly feasible and therefore must be required. Since these measures will have environmental impacts of their own, this requires a recirculated draft EIR. CEQA Guidelines § 15088.5; *Mountain Lion Coalition v. Fish and Game Com*. (1989) 214 Cal.App.3d 1043.

48 cont.

O. The EIR Fails to Adequately Analyze the Project's Impacts on Public Services.

The DEIR concludes that the Project will result in a less than significant impact on public services. DEIR, pp. 4.13-7, 4.13-19. The DEIR makes this conclusion despite the fact that the total population at the Parnassus Heights campus will increase by nearly 7,500 by 2050. *Id*. at 4.13-7. Additionally, the DEIR limits its public services analyses to impacts on fire protection facilities and public school facilities. The DEIR states that since the increase in population at the Project site will increase over time, the Project "would result in an incremental increase in demand for fire protection." *Id*. at 4.13-8. Additionally, the DEIR only analyzed the impacts to schools based on the number of children anticipated to live in campus housing, and not the impact to school from children of students or employees not living on campus. *Id*. at 4.13-10. These analyses fail to provide substantial evidence that these impacts would be less than significant because the analyses are limited in scope and fail to include evidence supporting the conclusions. Lastly, with regards to other public facilities, with the exception to police facilities, the DEIR merely states "campus development under the proposed CPHP would not affect any other public facilities . . . and therefore, will not be evaluated further in this section." *Id*. at 4.13-6. The DEIR provides no further explanation for this omission, and the justification provided fails to support the DEIR's conclusion that the Project will have less than significant impacts on public services.

49

P. The EIR Fails to Adequately Analyze the Project's Transportation Impacts.

The DEIR concludes that the Project will have a less than significant transportation impact because the Project would "be consistent with the transportation-related goals and policies set forth in the *UC Sustainable Practices Policy* and the 2014 LRDP," and "would not conflict with San Francisco's Transit First Policy, Better Streets Plan, or the San Francisco Bicycle Strategy." DEIR, p. 4.15-38, 4.15-40. However, this analysis ignores the practical implications of the Project on transportation impacts. The Project will increase the campus' daily population by 5,790 by the year 2030 and by 7,850 by the year 2050. *Id*. at 4.12-7. The DEIR also anticipates an increase in public transportation use and a decrease in personal vehicle travel to the Project site, and promotes the use of the N Judah by UCSF personnel and visitors yet fails to discuss the impacts this increase in daily population will have on public transit. The N Judah is the busiest line in the Muni Metro System and adding thousands of daily users will result in a significant impact. A revised EIR is required to analyze and mitigate this impact. 50

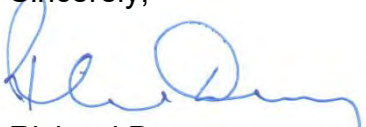
IV. UCSF SHOULD PREPARE AND RECIRCULATE A REVISED DEIR

A revised draft environmental impact report ("RDEIR") should be prepared and circulated for full public review to address the impacts identified above and to propose feasible mitigation measures. CEQA requires re-circulation of an EIR when significant new information is added to the EIR following public review but before certification. Pub. Res. Code § 21092.1. The CEQA Guidelines clarify that new information is significant if "the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project" including, for example, "a disclosure showing that . . . [a] new significant environmental impact would result from the project." CEQA Guidelines § 15088.5. The above significant environmental impacts have not been analyzed in the EIR and must be addressed in an RDEIR that is re-circulated for public review. 51

V. CONCLUSION

For the foregoing reasons, PNC believes that the Draft EIR for the UCSF Comprehensive Parnassus Heights Plan is wholly inadequate and urges the Regents to require a Revised Draft EIR to be prepared to address the concerns raised herein. Thank you for considering our comments and please include this letter in the record of proceedings for this project. 52

Sincerely,



Richard Drury

RE: Comments on Draft Environmental Impact Report for Proposed UCSF Comprehensive Parnassus Heights Plan

Dear Mr. Drury,

At your request, I have reviewed the Draft Environmental Impact Report ("DEIR") for the proposed UCSF Comprehensive Parnassus Heights Plan ("Project").[1] My review focused on the DEIR's treatment of:

- Population and Housing
- Growth Inducement
- Land Use and Planning
- Alternatives

In preparing these comments, I have reviewed the following information:

1. Draft Environmental Impact Report for the Plan and Appendices
2. 2014 LARDP
3. CPHP
4. 1976 Regents' Resolution
5. January 16, 2020 Letter from Mayor London Breed to Chancellor Sam Hawgood citing the 2007 MOU and 1987 and 2007 MOU's

After carefully reviewing the DEIR for the Project I have concluded the DEIR fails in numerous respects to comply with CEQA and to fulfill CEQA's fundamental mandate. As described below, the DEIR violates this law because it fails to analyze adequately the significant environmental impacts of the Project or propose sufficient mitigation measures. Where, as here, the EIR fails

53

[1] See Attachment 1 for Watt Qualifications

to fully and accurately inform decision-makers and the public of the environmental consequences of proposed actions, it does not satisfy the basic goals of the statute. Because of the DEIR's numerous and serious inadequacies, the Lead Agency must revise and recirculate the document to permit an adequate understanding of the environmental issues and potential solutions, including feasible mitigation measures and alternatives.

53 cont.

I. Context and Introduction

A. UCSF Should Honor the Space Ceiling and Other Commitments

UCSF should honor its commitment to the space ceiling and to development compatible with surrounding uses at the Parnassus Heights campus by selecting an alternative within the existing space ceiling. The Parnassus Heights campus site, the oldest and largest of the UCSF campuses, is located in among some of the oldest neighborhoods in San Francisco, which are characterized by a mix of unique residential areas ranging from single family to multi-family housing and neighborhood serving commercial districts such as located along Irving and Judah Streets and 9th Avenue. In addition to Mount Sutro Open Space Reserve, several park and open space areas are located near the campus. This area surrounding the Parnassus Heights campus is further characterized by local serving streets plagued with traffic, parking congestion and lack of transit. Approximately 43% of the main campus (exclusive of the Aldea area) borders the Reserve, breaking the City's normal grid pattern and limiting ingress and egress routes to the main campus. The surrounding neighborhoods, like all of San Francisco, also suffer from a lack of affordable housing and available sites to build new housing. Recognizing the unique and constrained location the Parnassus Heights campus occupies, the Regents adopted a sensible "space ceiling" for the campus in its 1976 Regents Resolution, stating in pertinent part:

54

> "The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent." See Attachment 2.

The Regent's Resolution recognized the transportation problems in the area and committed funds to develop a plan to alleviate transportation problems including traffic, parking congestion and lack of transit. Concern for the impacts of the Project on the neighborhood is an ongoing concern. In a letter to Chancellor Hawgood, dated January 16, 2020, Mayor London Breed, President of the Board of Supervisors Norman Yee and Supervisor Dean Preston note the need for a revised MOU to adopt and formalize arrangements for coordination and consideration of both our interests and inputs in the context of land use approvals, transportation needs and ongoing service provisions, noting the common challenges faced include housing supply, affordability and climate and seismic related risks. See Attachment 3. According to a June 4th Staff Report to the Planning Commission, the Planning Department and UCSF are engaged in ongoing conversations about how to structure a stakeholder process to achieve the Mayor and Supervisor's objectives, expected to culminate in an MOU.

While not part of the objectives or regulations in the UCSF 2014 LRDP, reference is made in the DEIR to the Community Planning Principles including:

- Land Use LU1. Plan for growth and renovations that are substantially consistent with use limitations and height and bulk limitations in the City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects. The University should consider City planning proposals that are underway. UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns.
- LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density, and that do not negatively affect surrounding land uses.
- LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights Campus site.

54 cont.

DEIR at page 4.10-3 to 4.10-4.

Although the University is constitutionally exempt from local land use regulation whenever using properties under its control in furtherance of its "educational mission," the University has committed to substantial consistency with local policies where feasible. This dual commitment – to the space ceiling and to adherence where feasible to local policy – is one UCSF should and can honor given the very real constraints to development in the area surrounding the Parnassus Heights campus. There are feasible alternatives to the Project, including a new hospital at Mount Zion, Mission Bay or Hunters Point, that should be fully considered in a revised and recirculated DEIR before the decision is made to break the space ceiling commitment and significantly impacting the surrounding neighborhoods.

B. The DEIR Should be Revised and Recirculated to Address the Outbreak in December 2019 of COVID 19

The outbreak of COVID 19 was first reported on December 31, 2019 in Wuhan China. The Notice of Preparation (NOP) for the UCSF Parnassus Heights campus was issued January 14, 2020. As described at page 4.0-6 of the DEIR, "[n]ormally, the baseline condition is the physical condition that exists when the Notice of Preparation ("NOP") is published. The NOP for the proposed CPHP was published in January 2020, and the baseline conditions contained in this CPHP EIR are generally taken from this time period. However, the CEQA Guidelines and applicable case law recognize that the date for establishing an environmental baseline cannot always be rigid." DEIR at 4.6-6. UCSF is a health based organization, therefore fully aware early on of the implications of the Wuhan outbreak. The DEIR itself acknowledged the potential implications of COVID 19, concluding that:

55

> "The net effect of the pandemic on the Parnassus Heights campus site development and operations cannot be predicted at this point in time without speculation." DEIR at page 1-9.

The DEIR concedes COVID 19 has implications for the Project. For example, the objectives for the New Hospital, objectives used in part to dismiss some alternatives, include an increase in beds to provide for inpatient health care in times of severe strain such as the current pandemic. DEIR at page 6-4. The brief discussion at page 1-9 also acknowledges that UCSF will likely consider operational changes such as increases in telehealth services and telework, among others.

COVID 19 was known or should have been known at the time of the issuance of the NOP and certainly, as reflected in Section 1.7 of the DEIR, was known prior to circulation of the DEIR for public comment. COVID 19 warrants changes and updates to existing environmental setting information, critical to complete an accurate impact analysis, as well as to the Project Description (e.g., space needs changes given a likely transition as noted in the discussion to telework and telehealth). Significant questions are raised by COVID 19 that have implications to the Project and related impacts – including but not limited to an acknowledgement that UCSF is likely to increase telework, telehealth consultations and remote learning. These are but a few of the changes warranting UCSF to hit pause both to revise the DEIR and to re-engage the public and experts, right-size the Project and evaluate other alternatives that would reduce or eliminate impacts while adhering to the existing space ceiling.

55 cont.

II. The Project Violates the California Environmental Quality Act

A. The Project Description is In Flux

A fundamental requirement of CEQA is that an EIR contain an accurate, complete and stable project description. Without a complete and stable project description, an agency and the public cannot be assured that all the project's environmental impacts have been revealed and mitigated. Further, CEQA and the CEQA Guidelines mandate that an EIR include a description of the "physical environmental conditions . . . from both a local and a regional perspective. . . Knowledge of the regional setting is critical to the assessment of environmental impacts." CEQA Guidelines Section 15125(a) and (c). This requirement derives from the principle that without an adequate description of the project's local and regional context, the EIR – and thus the decision-makers, agencies and public who rely on the EIR – cannot accurately assess the potentially significant impacts of the proposed Project.

56

As discussed above, the Project is likely changing in fundamental ways due to COVID 19 – including adjustments to the Project due to a likely increase in telework and telehealth, among other adjustments:

> "UCSF will likely consider operational changes such as increases in telework and telehealth services, especially primary and secondary health care services." DEIR at 1-9.

In addition to telehealth and telework, distance learning also appears likely on the increase. The overall space needs and allocations for the Project should be revisited in light of COVID 19 and other rapidly changing conditions due to COVID. The emerging stakeholder process referenced in the June 2020 Staff Memo to the San Francisco Planning Commission provides another good reason to pause the proposed Project entitlement process and discuss an appropriately scaled Project for the Parnassus campus site. 56 cont.

B. The DEIR Includes Incomplete and Inadequate Baseline Information to Support the Analysis of Project Impacts

The DEIR fails to adequately describe baseline (environmental setting) conditions. Setting or environmental baseline information is as essential to adequately disclosing and analyzing project-related and cumulative impacts as a complete and consistent Project description. Without adequate and complete information about the environmental setting, it is not possible to determine whether the Project improves or makes worse existing environmental conditions or the extent of the Project-related and cumulative impacts. The Project NOP was issued January 14, 2020 after the COVID 19 pandemic was a known crisis. As such, the DEIR's baseline or existing environmental setting information must be updated to reflect conditions Pre-COVID 19 and Post emergence of COVID 19. Another option is to postpone the Project until more is known about the COVID crisis. Both pre- and post- emergence of COVID 19 information is critical if adequate analyses are to be completed for topics ranging from land use, housing and population to transportation. 57

Examples of baseline setting information that is missing from the DEIR includes but is not limited to the following.

1. Students, Faculty and Staff

The DEIR omits information essential to analysis of whether the Project will result in significant impacts to housing supply as well as related impacts of displacement due to increased demand for housing and gentrification. Such information includes at a minimum the general salary ranges of new students, faculty and staff. Such information was provided in the Mission Bay Hospital environmental documents and fiscal impact analysis, hereby incorporated by reference. . In addition, the DEIR should provide information about the current student, staff and faculty to inform analysis of new housing demand (e.g., where do current staff, faculty and students live? Etc.). 58

2. Demographics in the Surrounding Neighborhood and City

Basic demographic information must be part of the DEIR's revised baseline in order to support and inform analysis of Project impacts on housing. The DEIR includes no information about the surrounding area demographics or demographics in the City and study area, making adequate analysis of impacts impossible. 59

3. Affordable, Student, Workforce and Family Friendly Housing

The Project will significantly increase students, staff and faculty at the campus adding to the demand for scarce housing affordable to new students, staff and faculty in the areas surrounding the Project, the City and the region. In addition the Project will nearly double projected new job growth due to the multiplier effect. The DEIR must analyze the potential for the Project to raise housing prices, contribute to gentrification and displacement due to price increases and competition for scarce housing in the surrounding area, San Francisco and the region. Very little setting information is provided to support analysis in the short, 13 page section on Population and Housing and the even shorter, 8-page discussion of growth inducement.

To perform an adequate analysis of Project and cumulative impacts to population and housing and growth inducement, it is essential the DEIR include in the description of the Project baseline (setting) details concerning existing vacancy rates for affordable units, including deed restricted housing, family housing, and housing affordable to the workforce[2] in the surrounding neighborhoods[3], the City as well as the broader five-county study area. Little setting information is provided in support of the DEIR's across the board conclusions that impacts associated with project growth will be less than significant. The DEIR contains no information concerning affordable housing and workforce housing whatsoever.

60

Without current and complete information about the existing housing stock in the surrounding neighborhoods, the City and the study area, the DEIR cannot adequately analyze the Project's impact on affordable, workforce and family friendly housing and households, and the DEIR's conclusions concerning the insignificance of Project-related and cumulative impacts cannot be supported by facts and evidence. The DEIR must be revised to include this and other baseline information, including changes in housing stock and availability pre- and post- emergence of COVID 19. While long term effects of COVID 19 maybe speculative, some effects are known and should be disclosed where possible.

In addition to the above information, the DEIR must discuss and include in its revised analysis, the locations of disadvantaged communities. Such information is essential to support analysis of the extent to which the Project could further impact these DACs and exacerbate existing housing inequity. Sources of this information are readily available. See e.g., Urban Displacement Project www.urbandisplacement.org/map/sf. Project such as this one have a high potential to contribute to the gentrification and displacement of disadvantaged communities

[2] Workforce housing is housing at the lower end of market rate serving households with up to 200% of median income and often referred to as the "missing middle" or gap in affordable housing in San Francisco. Voters recently approved funding to build more housing, including for the SF workforce.

[3] Increasingly with the COVID 19 threat, workers and students choosing to avoid transit are increasingly putting pressure on nearby housing. This warrants adjustment of the DEIR's analysis of housing impacts in the surrounding neighborhoods.

due to the influx of additional students, staff and faculty who most likely will be seeking housing within walking and biking distance to the campus in a post COVID world. 60 cont.

4. Existing Jobs-Housing Balance and Fit within the Surrounding Neighborhood, City and Regional Study Area

The DEIR must analyze the potential for the Project to make worse the existing imbalance of jobs and housing. Little information is provided in the DEIR on jobs housing imbalance pre- or post-emergence of COVID 19. The DEIR fails to cite readily available information for San Francisco and Region concerning the growing imbalance. Specifically, San Francisco or more accurately in the SF-Oakland-Hayward census area, created only one new home per 6.8 new jobs between 2010 and 2015. Source: US Census Data. Looking just at San Francisco, it comes out to 8.2 jobs per new home during that same period, further increasing an enormous gap in the already out of balance housing to jobs ratio in the Bay Area. Not surprising rents increased by 43% over the same period due to housing scarcity and competition from new employees. Source: U.S. Census Data 2010 and 2015. This data is readily available and must be included in a revised DEIR to support a credible analysis of the Project's impacts on housing and growth. 61

C. Finding the right jobs-housing balance has long been an important concern for urban planners and an important policy consideration for general and area plans. More recently, attention has turned to jobs-housing fit – the extent to which housing price and rent is well matched to local job salary and quality. The DEIR are silent on the matter of jobs housing fit and fails to adequately address the issue of jobs housing balance. The DEIR should be revised to describe the existing job-housing balance and fit for the surrounding neighborhoods, the City and region. Updated baseline (environmental setting) information must include a description of changes in demand for housing in San Francisco Pre- and Post-Emergence of COVID 19. This information is not only necessary to adequately analyze environmental topics such as displacement and Project demand for new housing, but it is also essential to determining the extent to which the Project will increase commuting, traffic, transit demand, and vehicle miles traveled. Without this information, the full impacts associated with air quality and greenhouse gas emissions, among other impacts cannot be adequately analyzed and conclusions concerning the significance of Project-relation and cumulative impacts cannot be supported by facts and evidence. The DEIR must be revised to include this and other baseline information to inform revised impact analyses and conclusions. The DEIR's Analysis of, and Mitigation for, the Impacts of the Project Are Inadequate 62

The discussion of a project's environmental impacts is at the core of an EIR. See CEQA Guidelines Section 15126(a). As explained below, the DEIR's analysis of the Project's environmental impacts are deficient under CEQA because the DEIR fails to provide the necessary facts and analysis to support informed decisions about the Project, mitigation 63

measures and alternatives. An EIR must contain facts and analysis, not just bare conclusions. A conclusion regarding the significance of an environmental impact that is not based on analysis of the relevant facts fails to fulfill CEQA's information mandate.

Additionally, an EIR must identify feasible mitigation measures to mitigate significant environmental impacts. CEQA Guidelines Section 15126.4. Under CEQA, "public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects. . . ." Pub. Res. Code Section 21002.

63 cont.

As explained below, the DEIR fails to provide detailed, accurate information about the full breadth of the Project's potentially significant impacts with respect to growth inducement, population and housing and land use and planning. The DEIR's cumulative analysis of these impacts is also deficient. Where the DEIR fails to adequately analyze the Project-related impacts, the cumulative analysis cannot be adequate. Further, the DEIR does not identify and analyze feasible mitigation measures that would reduce or avoid such impacts.

1. The DEIR's Analysis of the Project's Growth-Inducing and Population and Housing Impacts is Flawed

The DEIR's analysis of growth inducing and population and housing impacts is flawed and conclusions reached by the DEIR that all impacts are less than significant incorrect. These topics are closely related and the two sections contain multiple cross references. Therefore, these impact topics are discussed together in this section.

CEQA requires that an EIR include a detailed statement setting forth the growth-inducing impacts of a proposed project. Pub. Res. Code Section 21100(b)(5). A proposed project is either directly or indirectly growth inducing if it: (1) fosters economic or population growth or requires additional housing; (2) removes obstacles to growth; (3) taxes community services or facilities to such an extent that new services or facilities would be necessary; or (4) encourages or facilitates other activities that cause significant environmental effects. CEQA Guidelines Section 15126.2(d). While growth inducing impacts of a project need not be labeled as adverse, the secondary impacts of growth (e.g., gentrification and displacement, demand for additional housing and services, traffic, air pollution, etc.) may be significant and adverse. In such cases, the secondary impacts of growth inducement must be disclosed as significant secondary or indirect impacts of the project. The analysis required is similar in many respects to the analysis required to analyze impacts associated with population and housing.

64

a. Growth Inducement Analysis is Woefully Lacking

The DEIR contains a short, 3 and 1/2-page discussion of Growth Inducing Effects. The discussion acknowledges the Project will increase the campus population by approximately 4,100 persons by 2030 and an additional 1,080 persons by 2050, including students and faculty and staff. The DEIR also calculates the multiplier of 0.73 for an additional 3,420 jobs that could

65

be indirectly caused or induced by the Project. The Project includes construction of 142 net new housing units/beds within the Aldea housing complex and an additional 620 new residential units for a net total of 984 new units by 2050.

The DEIR concedes "[c]ampus population growth under the proposed CPHP would not be entirely accommodated by the existing and new housing on site, and therefore would result in indirect housing demand beyond the campus site." DEIR at 5-5. The discussion provides little real analysis of the Project's potential to induce growth in accordance with CEQA, nor does the discussion reach any conclusions as to the significance of growth inducing impacts instead relying on the assertion that the growth allowed by the Project is not substantial when "compared to the study area growth projections and to the extent that demand for new housing would exceed the capacity of the market area.[4]" DEIR at page 4.12-10. Yet, the discussion does not identify any potentially significant impacts associated with population growth as a result of the elimination of the existing space ceiling and implementation of the Plan.

The DEIR goes on to state:

> "Generally, the housing demand associated with employment growth under the proposed CPHP would be satisfied by the housing that could be added in San Francisco and in other parts of the region." DEIR at 4.12-8.

65 cont.

San Francisco and the region has been grossly underbuilding planned housing while generating significant new jobs; facts not disclosed by the DEIR. There is no information in the DEIR about the current housing crisis in San Francisco and region as summarized below. Nor does the DEIR contain any information about housing availability in the surrounding neighborhood and City, or information about housing affordability. Moreover, the DEIR fails to describe the breakdown of new students, faculty and staff in terms of numbers by typical jobs and salaries; information critical to estimating the percent of new staff, faculty and students who qualify as low income or very low income requiring lower cost housing options. Finally, the DEIR fails to acknowledge that UCSF is a major contributor to the affordable housing crisis, and will exacerbate that crisis by building out its expansion plan without building additional units affordable to new students, faculty, staff and employees of supporting services. See Jobs Housing Nexus Analysis SF, Kaiser Marston Associates, 2018 submitted under separate cover

Instead of the required analysis, the DEIR points to the Population and Housing Section conclusion to support its cursory overview of growth inducement impacts:

> "Implementation of the proposed CPHP would induce population growth in the Bay Area, but the population growth would not be substantial in comparison to growth that is projected and planned for San Francisco and the four study area counties in Plan Bay Area 2040 and the local general plans for the study area communities. Further, the population

[4] Five county study area.

growth would not result in a demand for new housing that would exceed the capacity of the five-county market area." DEIR at 4.12-9. Emphasis added.

By comparing the Project's growth to the entire City and region, the DEIR seeks to diminish the significance of housing demand generated by the Project. There is no question the Project will generate substantial additional growth in a highly constrained neighborhood[5], by increasing the daily average population by approximately 45%, nearly 5,200 students, faculty and staff. DEIR at page 4.12-1. In addition, the Project generates an additional 3,420 jobs based on a multiplier of 0.73%; jobs that will put additional demand on a tight housing market. No information is provided about the nature of these jobs or the associated salary ranges of employees. The Project will also increase likely increase the demand for housing in the immediately surrounding neighborhoods and City as people avoid transit in a COVID worried world and seek to walk and or bike to work.

The Project most certainly will induce growth that will in turn significantly impact housing. Total new housing demand could be as high as 6,000+ units assuming that the majority of students, faculty, staff and indirect job employees are people who need housing. Lower demand for new housing, assuming all new students need housing and only 50% of faculty and staff need housing, at 4,000+ units, would still constitute a significant impact on a highly constrained housing market and could result in displacing local residents due to competition and gentrification. If demand is lower, due to a higher percent of new students, staff, faculty and indirect job employees are already housed (50%) the impact at 4,000+ units will still be significant due to the housing crisis because under either scenario, UCSF would be generating between 4 and 8 jobs for each new unit constructed. Added to the existing jobs-housing deficit in San Francisco and the region and the even greater deficit of housing affordable to low and very low income households, the growth induced by the Project would result in a significant impact on housing. Salaries disclosed for the Mission Bay Project for UCSF's workforce, suggest the majority of new students, staff and faculty will need housing affordable to low incomes. See www.payscale.com/research/USEmployer=UCSFMedicalCenter

65 cont.

Housing Demand Range			
Direct/Multiplier Growth at 2040 DEIR page 4.12-7	Students 504	Faculty and Staff 4,680	Multiplier/Indirect Employees: 3,420
Housing Demand Estimates	High Demand (worst case scenario 100 require housing): 504 units	High Demand: (worst case scenario 80% not housed, net new): 3,744 units	High Demand: 50% not housed, new demand):

[5] Constrained in terms of circulation and housing.

	Low Demand (50% not housed, new demand) 252 units	Low Demand (50% not housed, new demand) 2,340 units	1,760 units

These housing-related impacts are more than glossed over by a discussion that excludes any information about the dire housing crisis.

Substantial new non-residential and residential growth in San Francisco includes total population growth based on household size assumptions[6], in addition to new students, staff and faculty estimated in the DEIR to be as high as 12,220 people by 2050. DEIR at page 4.12-8. This estimate does not include indirect growth associated with the multiplier, but does assume all new growth is in San Francisco. This significant new growth will require additional public services, likely including expansion and therefore construction of facilities in the neighborhood or adjacent neighborhoods of a myriad of services. Yet the DEIR provide cursory information about these services and facilities and fails to analyze the associated impacts, including fiscal impacts. CEQA requires that if new construction of housing will occur to accommodate the Project's employees or services beyond that included in the Project, then the EIR must analyze the environmental impacts of that construction. The appropriate components for an adequate analysis include: (1) estimating the amount, location and time frame for growth that may result from the implementation of the Project (e.g., additional housing); (2) considering whether the new population would place additional demands on public services such as fire, police, recreation, emergency, health, childcare or schools; (3) applying impact assessment methodology to determine the significance of secondary or indirect impacts as a result of growth inducement; and (4) identifying mitigation measures or alternatives to address significant secondary or indirect impacts. CEQA Guidelines Appx. G Section XIII(a). The DEIR must be revised to provide this analysis and based on this analysis, to revise other environmental analyses including but not limited to population and housing, transportation, air quality, among other topics where impacts are derived in part from direct and indirect growth assumptions.

65 cont.

The DEIR dismissal of likely growth inducing impacts because the impacts are "impossible to determine" violates CEQA. Virtually the sum total of the discussion, below, lacks analysis and supporting facts and evidence while at the same time identifying the potential areas of significant impacts associated with significant growth:

> "While it is acknowledged above that the precise nature, location, and magnitude of effects of indirect and induced growth cannot be determined, the proposed CPHP

[6] 2.36 persons per HH; assumes only one student per HH. DEIR at page 4.12-8.

> would likely increase overall demand in the region for housing, commercial and industrial space, and associated infrastructure. Potential effects could include increased traffic congestion; increased air pollutant emissions; loss of agricultural land and open space; loss of habitat and associated flora and fauna; increased demand on public utilities and services, such as fire and police protection, water, recycled water, wastewater, solid waste, energy, and natural gas; and increased demand for housing. An increase in housing demand in the Bay Area region would also require governmental services including, but not limited to schools, libraries, and parks to serve new commercial and residential development." DEIR at 5-7.

65 cont.

The discussion also acknowledges that this growth could contribute to a loss of open space by converting those lands to housing, commercial space and infrastructure, but attempts to discount the many impacts associated with conversion of natural and working lands by pointing out without evidence that "most jurisdictions have adopted smart-growth policies that discourage or prohibit this type of development." DEIR at 5-7.

A revised growth inducing analysis must be included in a recirculated DEIR. The impacts of growth must also be considered in new analysis concerning the social equity impacts of the Project. See Attachment 4, Draft Planning Commission Resolution.

b. The DEIR's Analysis of and Mitigation for the Project's Population and Housing Impacts is Inadequate

The DEIR's approach to analysis of population and housing does not adequately analyze Project-related impacts associated with changes that would occur with Project implementation to the population, including employment and residential growth. Instead of actually analyzing the Project's impacts related to population and housing, the DEIR asserts that all impacts both direct and indirect will be less than significant. The DEIR lacks facts, analysis and evidence to support this conclusion. The result is a lack of information about the actual severity and extent of impacts associated with significant growth in population including students, faculty, staff and patients and visitors. For a Project that will guide development of the campus for 30+years and likely be the basis of streamlined permitting for project facilities and infrastructure, it is especially important that the DEIR comprehensively identify and analyze its impacts on growth, population, housing and employment.

66

In determining impact significance associated with growth in population, employment and housing, CEQA requires analysis of the following topics (substantially similar in DEIR at page 4.12-6):

- Would the project induce substantial population growth in the area, either directly (for example by proposing new homes and businesses) or indirectly (for example, through extension of roads and other infrastructure)?

- Would the project displace substantial number of existing housing units or create demand for additional housing, necessitating the construction of replacement housing?
- Would the project displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

In order to analyze the above significance thresholds, the DEIR must also address the following questions:

- Would the project result in the net loss of any existing housing units affordable to very low income or low income households through any means including gentrification?
- What is the net change in affordable versus market rate units in the surrounding neighborhoods as a result of the Project?
- Would the Project impact a disadvantaged community (DAC)?
- Would the project result in a greater imbalance between jobs and housing, including jobs housing fit?[7]

Finally, the DEIR fails to disclose the Project's inconsistency with the UCSF 2014 LRDP Community Planning Principle HI which calls for projects to make a positive contribution to San Francisco's affordable housing stock…in order to relieve housing demand in the local community. DEIR at page 4.12-4.

66 cont.

The DEIR's analysis of these potential impacts associated with population, employment and housing is inadequate starting with the lack of any credible environmental setting or context for the discussion including the following basic facts:

- San Francisco and the region added more jobs than housing over the last decade. Census data shows that San Francisco added 8.2 jobs per home since 2010. Overall, the Bay Area has added 2 jobs for every home built since 1990. See also Plan Bay Area Final Plan 2040, Attachment 5.
- Between 2011 and 2017, the region added 658,000 jobs and 140,000 housing units, or on average 4.7 jobs for every housing unit. SPUR Regional Strategy, Attachment 6.
- The shortfall of housing units is estimated by SPUR to be nearly 700,000 units including units to meet the needs of both middle income and lower income households. Id.

[7] Jobs-Housing fit means the extent to which housing prices or rents are matched to the local job salary ranges. Jobs-Housing balance provides a general sense of how in or out of balance housing to fit the local workforce may be. Jobs-Housing fit provides an essential and more granular sense of whether – even if in balance – local employees are able to reside locally or must commute long distances for housing affordable to them and their families. Without jobs-housing fit information, readily available using Census and other data, it is not possible for the DEIR to adequately analyze many Project-related and cumulative impacts including demand for new housing and vehicle miles traveled, among others.

- In order to meet the unmet past need plus future needs for housing, the Bay Area would need to build 45,000 units per year to produce an additional 2.2 millions units by 2070. Id.
- The production of affordable housing has lagged behind production of housing affordable to higher incomes, with significant shortfalls of housing production for moderate or middle income wage earners and lower income wage earners. From 1999 to 2014, the Bay area issued permits for only about 35% of the units to meet the needs of vulnerable populations such as low-income families. Id.
- Much of the older housing stock located in higher density areas such as San Francisco have experienced gentrification pressures due to competition from new and higher income wage earners. Id.

A revised DEIR must provide baseline information about the housing crisis and re-analyze housing-related impacts of the Project in light of that information. Based on accurate information about the pre-Covid SF and Bay Area housing crisis (summarize above), it can reasonably be concluded that the additional of 5,200 students, faculty and staff by 2050 and only 984 units produced, the housing need generated constitutes a significant impact. Demand for housing is further exacerbated by the job multiplier of 0.73 creating an additional 3,420 jobs induced by the Project. Total new housing demand could be as high as 6,000+ units assuming that the majority of students, faculty, staff and indirect job employees are people who need housing. Lower demand for new housing, based on more new staff and faculty already housed, at an estimated 4,000+ units, would still constitute a significant impact. If demand is lower, due to a higher percent of new students, staff, faculty and indirect job employees are already housed (50%) the impact at 4,000+ units will still be significant due to the housing crisis. Under either scenario, UCSF would be generating between 4 and 8 jobs for each new unit constructed. Added to the existing jobs-housing deficit in San Francisco and the region and the even greater deficit of housing affordable to low and very low income households, the growth induced by the Project would result in a significant impact on housing. 66 cont.

The Project is also inconsistent with the Community Planning Principle HI directed at relieving housing demand on the local community. The DEIR's conclusion that "population growth would not result in a demand for new housing that would exceed the capacity of the five-county market area," and that "CPHP's impact related to population and housing would be less than significant" is clearly incorrect.

c. A Revised DEIR Must Include Feasible Mitigation Measures and Alternatives to Address Significant Impacts to Housing

The DEIR must identify feasible mitigation measures and alternatives capable of reducing or eliminating significant impacts. The DEIR fails to do so. 67

In reaction to the housing crisis, SF voters passed Measure E in March 2020, limiting construction of new office building unless affordable housing goals are met. Measure E is instructive as to the kinds of mitigation measures UCSF should consider in addressing the increased imbalance of housing and jobs the Project would foster.

Feasible mitigation measures that should be included in a revised DEIR include the following:

- Increase Project housing to provide sufficient and affordable housing for new students, faculty and staff as well as a portion of induced demand (multiplier) by increasing housing proposed by the Project and decreasing new jobs.
- Provide sufficient housing in advance of the development and occupation of non-residential buildings (in line with Measure E).
- Adopt a project that adheres to the existing space ceiling thereby reducing increased staff and faculty and associated housing demand.

These and other feasible mitigation measures must be identified in a revised DEIR to address the significant population and housing impacts of the Project and cumulative development on the Project area, the City and region. A Financial Analysis should accompany the revised Plan and DEIR setting forth costs associated with housing, services and other community benefits of the Project and laying out a revised approach to funding implementation of these Project elements.

- Would the project displace substantial number of existing housing units or create demand for additional housing, necessitating the construction of replacement housing?

67 cont.

2. The DEIR's Analysis of Land Use and Planning Is Incomplete and Inadequate, Thereby Failing to Disclose and Mitigate Significant Impacts

The DEIR incorrectly identifies as Less Than Significant the Project's Land Use and Planning impacts. At the heart of the analysis of land use and planning impacts is the question of the Project's consistency with applicable policies and other provisions including UC's as well as the City's. Contrary to the DEIR's conclusions, the Project is incompatible with the surrounding area and conflicts with numerous policies and provisions of San Francisco's General Plan and Planning Code, as well as UC policies. Due to UC's constitutional autonomy, development and uses on property under the control of the University that are in furtherance of the University's educational purposes are not subject to local land use regulations. However, UCSF has indicated its intent to adhere to local policies and regulations to the extent practicable and to review policies germane to the analysis of land use impacts. DEIR at page 4.10-6. In the pertinent topical sections (e.g., Land Use and Planning, Noise, Aesthetics) the DEIR does describe pertinent policies and regulations, finding in each case that the Project is compatible with surrounding land uses and as such would not create any significant impacts. As described below, the analysis of land use and policy consistency is flawed and the conclusions

68

unsupported by evidence. Contrary to conclusions reached in the DEIR, there is evidence of policy and regulation inconsistency resulting in significant environmental impacts, only two of which – wind and cultural – are disclosed and acknowledged.

68 cont.

Planning and Land Use Context: The *San Francisco General Plan* provides policies and objectives to guide land use decisions and along with the San Francisco Planning Code prescribes the permitted uses and development standards to carry out the City's policies for the 107-acre Parnassus Campus site. In a 1987 Memorandum of Understanding (MOU), UCSF agree to advise and consult with the City of San Francisco on any proposed construction projects. The MOU states that the City Planning Commission will advise UCSF about the "conformance of such development with the Master Plan of San Francisco and Planning Code Section 304.5 (Institutional Master Plans) with recommendations, of any, for amendment to the proposal… Should the City Planning commission and UCSF disagree on any matter which is the subject of this MOU, either party may request the participation of the Mayor and the Chancellor in attempting to resolve the dispute." (MOU, para. IV). The DEIR must, include a complete and forthright analysis of the Project's consistency with the General Plan and other applicable planning documents, ordinances and regulations so that UCSF can honor its intent to adhere to the extent practicable, the City's policies and "zoning codes related to building use, height, and bulk limitations; floor areas; and parking requirements or restrictions for the purpose of ensuring compatibility with the surrounding uses." DEIR at page 4.10-6. Inconsistencies between the Project and the General Plan or other applicable planning documents that were enacted to protect the environment may constitute significant impacts in themselves and can also be evidence of other significant impacts that must be analyzed in the DEIR. Where elements of the Project are not part of its educational mission, and are inconsistent with the General Plan it may not be lawfully adopted or approved. Additional information is needed about the Project elements in order to describe and document how the entirety of the Project is in support of UCSF's educational mission. It is not possible to determine that without more details about how the new space will be used and occupied and for what specific purposes.

69

While not considered by UCSF objectives or regulations, reference is made in the UCSF 2014 LRDP, to the Community Planning Principles which were produced in collaboration with the UCSF Community Advisory Group. These Principles include the following:

- Land Use LU1. Plan for growth and renovations that are substantially consistent with use limitations and height and bulk limitations in the City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects. The University should consider City planning proposals that are underway. UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns.

70

- LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density, and that do not negatively affect surrounding land uses.
- LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights Campus site.

DEIR at page 4.10-3 to 4.10-4.

The Parnassus Heights campus site, the oldest and largest of the UCSF campuses, is located in among some of the oldest neighborhoods in San Francisco, characterized by unique physical characteristics and mix of land uses including residential areas ranging from single family to multi-family housing and charming neighborhood serving commercial districts such as located along Irving and Judah Streets and 9th Avenue. In addition to Mount Sutro Open Space Reserve, several park and open space areas are located near the campus. This area is characterized by local serving streets fraught with traffic, parking congestion and lack of transit.

Compliance with the City of San Francisco's adopted policies and regulations are a key indicator of whether the Project is or is not compatible with the surrounding neighborhood. UCSF clearly understood the breaking point for compatibility in its 1976 Regents' Resolution. Recognizing the unique and constrained location the Parnassus Heights campus occupies, the Regents adopted a sensible "space ceiling" for the campus in its 1976 Regents Resolution, stating in pertinent part: "The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent." See Attachment 2.

In addition, the Resolution recognizes the transportation problems in the area and commits funds to develop a plan to alleviate transportation problems including traffic, parking congestion and lack of transit.

In a letter to Chancellor Hawgood, dated January 16, 2020, Mayor London Breed, President of the Board of Supervisors Norman Yee and Supervisor Dean Preston note the need for a revised MOU to adopt and formalize arrangements for coordination and consideration of both our interests and inputs in the context of land use approvals, transportation needs and ongoing service provisions, noting the common challenges faced include housing supply, affordability and climate and seismic related risks. See Attachment 3.

In this case, after discussing only some of the applicable plans, the DEIR incorrectly concludes across the board that the Project would be compatible with adjacent lands uses and impacts would be insignificant. Some examples of the Project's glaring inconsistencies with the General Plan and Code include, but are not limited to, the following:

70 cont.

San Francisco General Plan and Zoning Code Excerpt	Inconsistency
Land Use and Urban Design Elements LU-2: Plan for growth and renovations that are substantially consistent with use limitations and bulk limitations in City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects…UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns. LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density and do not negatively affect surrounding land uses. LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights campus site. Policy 3.5: Relate the height of buildings to important attributes of the city pattern and to the height and character of existing development. Policy 3.6: Relate the bulk of buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction. San Francisco Planning Code – Use Districts City's P (Public) Zoning District Housing along Third and Fifth Avenues – see also Residential House District, Two-Family (RH-2) Code sections Height and Bulk Districts: 25-X, 40-X, 65-D, 80-D, 130-D and 220-F. Floor areas rations are determined by allowable height and coverage.	The DEIR correctly concludes that the New Hospital, as well as Millberry Union, certain West Side development and the Aldea Housing densification project would not be consistent with City Planning Code height and/or bulk regulations for their respective building sites. DEIR at 4.10-16. The DEIR continues on to incorrectly conclude despite evidence to the contrary, that these conflicts would not result in significant incompatibility with adjacent land uses or impacts on surrounding uses. Taking just the New Hospital as an example, at about 955,000 gross square feet and up to 294 feet in height, the New Hospital clearly demonstrates the Project's incompatibility with the surrounding area resulting in significant adverse environmental impacts including but not limited to, wind, visual and environmental impacts associated with an inadequate supply of housing affordable to new students, faculty and staff. The New Hospital is patently inconsistent with SF Land Use and Design policies and height and bulk requirements in multiple ways. First, the New Hospital is within three height and bulk districts and exceeds height limits for portions of the site within two of these, the 65-D and 22-F Height and Bulk districts, by over 70 feet and X stories. Second, the New Hospital would require use of a portion of the Reserve and would be located even closer to the off-site residences on Edgewood. The DEIR concedes: Impact AES-2 finds that the New Hospital would be the most noticeable visual change under the CPHP program, and would contrast sharply both in height and scale with the nearby residential development…". DEIR at 4.10-17. In justifying the conclusion that the New Hospital is compatible with adjacent land uses, the DEIR points to the proposed amendments to the 2014 LRDP which increase the space ceiling. In addition, the DEIR (Impact AES-3) finds that with implementation of appropriate design standards and exterior materials light and glare and other impacts would be reduced to less than significant.

70 cont.

	Even so, the DEIR concedes that the New Hospital will still result in significant unavoidable wind hazards. Analysis by Jared Ikeda provides clear evidence the New Hospital with also result in significant and unavoidable visual impacts. See Attachment 7. There are clear inconsistencies between the New Hospital and the City's General Plan policies and Code resulting in documented significant and unavoidable impacts associated with wind hazard, visual and housing, among other impacts. <u>These inconsistencies and the associated physical environmental impacts are not resolved by the amendment to the LRDP to raise the space ceiling</u>. Combined with other Project elements – Millberry Union, West Side – and the Project scale and bulk overall, the Project is clearly incompatible with the surrounding area resulting in significant and unavoidable impacts including those omitted from the DEIR but disclosed (wind) and some revealed by expert analysis (e.g., visual, cultural, housing). A revised and recirculated DEIR must re-analyze Project consistency with these and other applicable provisions of the City's Plans and Codes and Impact LU-2 must be found to be a significant and unavoidable impact. In addition, the Project is clearly inconsistent with CPHP Policy 3.6, which states that the height of buildings should be related to the prevailing scale and character of existing development. The New Hospital at nearly 100 feet taller than the tallest existing building on the campus, Moffit Hospital, is clearly inconsistent with this Policy. A revised DEIR must include in a revised Land Use and Planning section a systematic and thorough analysis of inconsistencies with all applicable (City, UC, other) policies and regulations.	70 cont.
Urban Design Element Policy 1.1: Recognize and protect major views in the city, with particular attention to those of open space and water.	The DEIR incorrectly concludes the project will not conflict with these policies and specifically that "[d]evelopment under the CPHP would not have a substantial adverse effect on a scenic vista" (AES-1) or "conflict with the applicable zoning and other	71

Policy 3.4: Promote building forms that will respect and improve the integrity of open spaces and other public areas.	regulations governing scenic quality" (AES-2) and therefore no mitigation is required. In his analysis of visual impacts, Jared Ikeda concludes that the New 16-story Hospital would result in significant visual impacts including specifically that it would block views to Mt Sutro and the Reserve and would block views of the ocean and Golden Gate Park from trails and other public vantage points resulting in policy inconsistencies with direct significant environmental impacts. See Attachment 7. A revised DEIR must change the disposition of these impacts (AES-1 and 2) to significant and unavoidable and identify feasible mitigation measures including alternatives to the Project.	71 cont.
Shadow Proposition M, adopted by the voters in 1986, added section 101.1 to the SF Planning Code and established 8 priority policies. Priority Policy No. 8 calls for the protection of parks and open space and their access to sunlight and vistas.	The DEIR incorrectly states that the implementation of the Project would not create new shadow that substantially and adversely affects the use and enjoyment of publicly accessible open spaces. In his analysis of aesthetic impacts, Jared Ikeda reviewed the DEIR's analysis with respect to shadows and reached a different conclusion documented in his letter: "It appears though that certain areas along Parnassus Avenue and Irving Street will be subject to frequent shadows throughout the year." See Attachment 7. These more frequent shadows will clearly affect the use and enjoyment of these public spaces and as such should be called out as a Significant and Unavoidable impacts of the Project as proposed. Feasible mitigation measures must be identified.	72
Regents' Resolution: Space Ceiling of 3.55 Million Gross Square Feet	The DEIR conveniently concludes that the impacts associated with the Project's significant increase in gross square feet (an increase of approximately 1.5 million GSF about the existing space ceiling) and population increase from 18,500 to nearly 25,000, would be less than significant because the LRDP would be amended to increase both space and population. An amendment to the space and population ceiling does not eliminate the physical environmental impacts described in the table above associated with the increased scale of the Project. Such impacts include wind hazard (found SU by the DEIR), cultural (found SU by the DEIR) and additionally,	73

	aesthetic (visual and shadows) and housing, among others. A revised DEIR must identify this as an inconsistency, re-analyze the associated environmental impacts and identify feasible mitigation including alternatives to Project components such as the New Hospital.

73 cont.

A revised DEIR must include expanded and forthright analysis of the Project's potential inconsistencies with applicable plans and policies including the City of San Francisco's, and disclose the significant and significant and unavoidable, environmental impacts associated with those inconsistencies.

In addition, a revised DEIR must include feasible mitigation measures and alternatives to reduce or eliminate the significant impacts associated with those inconsistencies. Mitigation measures including, but not limited to the following should be considered:

74

- Retain the space ceiling and adopt an Alternative consistent with the space ceiling and other UCSF commitments.
- Seismically upgrade the existing hospital at Parnassus in combination with a New Hospital off-site (Mission Bay, Hunters Point, see other options in Alternatives discussion below).

3. The DEIR Alternatives Analysis is Legally Deficient

Alternatives are optional ways that the Project could achieve most of the objectives while also reducing or eliminating the environmental impacts of the Project. (California Public Resources Code Section 21002). Typically, alternatives to the Project involve changes to the location, scope, design, and intensity but can also include method of construction and/or operation. Where the Project includes a mix of land use types as in the case of this Project, alternatives may also include alterations in the mix of land uses proposed in order to reduce or eliminate impacts (e.g., increase Project housing to meet demand for growth within the space ceiling).

75

The fundamental mandate is that "public agencies should not approve projects if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of the project" (PRC Section 21002, 21081). Government agencies are required to consider alternatives to proposed actions affecting the environment. (PRC Section 21001 (g)).

The DEIR's alternatives analysis is legally deficient because it fails to describe a reasonable range of alternatives, or to the location of the Project, which would feasibly attain most of the basic objectives of the Project but would avoid or substantially lessen any of the significant effects of the Project, and evaluate the merits of the alternatives. "An EIR's discussion of alternatives must contain analysis sufficient to allow informed decision-making." (*Laurel*

Heights I, 47 Cal.3d at 404). An EIR must also include "detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." (*Id. At 405*.)

In developing a list of alternatives for analysis, both project objectives and known or likely significant impacts of the Project must be factored in. Alternatives need not meet all of the objectives and their fundamental purpose is to reduce or eliminate Project impacts. The Project setting can also influence the range and choice of alternatives. Offsite alternatives should be considered. Offsite alternatives must be feasible (e.g., site control by Project proponent or possible for the proponent to acquire the property).

Alternatives may not be rejected merely because they are beyond an agency's authority, would require new legislation or would be too expensive. An alternative may be eliminated from further review where it fails to meet most of the basic project objectives; is infeasible; does not avoid significant environmental impacts; and implementation cannot be reasonably ascertained or is remote and speculative. (CEQA Guidelines Section 15126.6 (f)).

75 cont.

The DEIR's Alternatives Analysis is Legally Deficient Because it Improperly Rejects Feasible Off-Site Alternatives and Omits Others Feasible Off-Site Alternatives

Feasible alternatives to the Project that would reduce or eliminate significant Project impacts including those acknowledged by the DEIR briefly considered but dismissed include:

- No New Hospital at Parnassus Heights Campus Site/Implement Phase 2 of Medical Center at Mission Bay Campus Site
- New Hospital at Mount Zion Campus Site

Omitted from the list of feasible offsite options are:

- Seton Hall Hospital Facility, which stands empty
- New Hospital at Hunters Point, which would provide jobs in and health services to an underserved and disadvantaged community

76

The reasons provided in the short approximately one-page discussion dismissing the alternative of a new hospital at Mission Bay comes down to the alternatives' reported failure to meet very focused Project objectives and a purported conflict with the 2014 LRDP and CPHP. Specifically the DEIR states that the alternative would not meet some of the Project objectives (e.g., expansion of some services and other benefits from an interdisciplinary program) and would conflict with several 2014 LRDP and CPHPs objectives for Parnassus Heights campus including but not limited to adequate space to foster collaboration and to facility inter-dependence and connectivity for operational efficiency, adequate clinical and administrative support and aligned with other programs, increase in beds, and modern industry standards including seismic safety. Page 6-55 to 6-55. The discussion concedes that the alternative would reduce the significant

wind impacts, cultural and construction impacts, but that in so doing, it would likely also result in increased cross town traffic between the Parnassus and Mission Bay campus sites. Not analyzed was a combination of a smaller, new hospital at Parnassus in combination with Mission Bay; another feasible option that has the potential to address total need and allow phasing to accommodate patients and services.

Dismissal of these alternatives (New Hospital at Mission Bay and Combination of New Hospital at Mission Bay and Reduced Hospital at Parnassus) is not justified. First, the alternative would meet most of the Project objectives. If a New Hospital at Mission Bay is combined with a rebuilt smaller hospital at Parnassus, the alternative could meet the need for additional beds and services as well. The argument that this alternative would increase cross town traffic is not supported by any evidence or analysis. Finally, the conflicts with the 2014 LRDP are not persuasive since that document is being amended to break the space ceiling and this alternative would not require that significant amendment to the LRDP. In fact, the Mission Bay Hospital was justified in part by the development cap at the Parnassus Campus. These alternatives must be fully analyzed in a revised and recirculated DEIR, including additional facts and analysis to support the arguments concerning the alternatives conflicts.

The DEIR similarly dismisses the alternative of a new hospital at the Mount Zion Campus Site, stating that this alternative would result in UCSF hospitals operating at three different campus sites which would be "less than ideal and inefficient," would not help achieve the benefits realized through interdisciplinary collaboration and convergence between clinical care, research and education, land acquisition would be difficult and citing undisclosed conflicts with LRDP and CPHP objectives. The discussion concedes that the alternative would reduce the significant wind impacts, cultural and construction impacts, but that in so doing, it would likely also result in localized impacts at the Mt. Zion site and increased cross town traffic between the Parnassus and Mission Bay campus sites. This alternative also merits full analysis in a revised and recirculated DEIR because it would reduce or eliminate Project impacts and could be carried out in combination of seismic retrofits to the existing hospital at Parnassus to meet objectives and remain consistent with the space ceiling.

76 cont.

Alternatives may not be rejected merely because they are beyond an agency's authority, would require new legislation or would be too expensive. An alternative may be eliminated from further review where it fails to meet most of the basic project objectives; is infeasible; does not avoid significant environmental impacts; and implementation cannot be reasonably ascertained or is remote and speculative. (CEQA Guidelines Section 15126.6 (f)). Rejection of the Mission Bay and Mt. Zion sites for a new hospital, either in lieu of or in combination with a smaller hospital at Parnassus, is not supported by the evidence and analysis provided and both require full analysis in a revised and recirculated DEIR.

In addition, the revised and recirculated DEIR should also fully analyze a new hospital at Hunters Point and reuse of Seton Hall. A new hospital at Hunters point would eliminate the

significant impacts associated with the Project and provide jobs and health care to a disadvantaged and underserved community.

Since the Mission Bay alternative reduces the Project's significant impacts, while achieving almost all Project objectives, the DEIR is arbitrary and capricious for dismissing this alternative in particular from full review and in rejecting this alternative. In addition, the Mission Bay Campus was justified by the cap at Parnassus, making this alternative essential for full review. In light of the development cap at Parnassus, each of these alternatives warrants review in a revised and recirculated DEIR with priority on Mission Bay and Hunters Point.

76 cont.

III. The DEIR Must be Revised and Recirculated

Decision makers and the public cannot possibly assess the Project's impacts through the present DEIR which is riddled with omissions, errors and inconsistencies. Among other fundamental deficiencies, the DEIR repeatedly understates the Project's significant environmental impacts and therefore fails to formulate feasible mitigation to reduce these impacts. To resolve these issues, a revised DEIR that would necessarily include substantial new information must be prepared and recirculated.

77

Sincerely,

Terry Watt

RE: Comments on Draft Environmental Impact Report for Proposed UCSF Comprehensive Parnassus Heights Plan

Dear Mr. Drury,

At your request, I have reviewed the Draft Environmental Impact Report ("DEIR") for the proposed UCSF Comprehensive Parnassus Heights Plan ("Project")[1]. My review focused on the DEIR's treatment of visual and shadow impacts. My comments are attached as follows:

[1] See appendix for Jared Ikeda qualifications

VISUAL IMPACT

As described in the Comprehensive Parnassus Heights Plan Draft Environmental Impact Report, the proposed plan would provide 2.9 million gross square feet (gsf) of new building space. Currently, there is approximately 3.92 million gsf of building space. With full implementation of the CPHP, the total gross square feet would be approximately 5.97 million, including instruction, research, clinical and support space, housing and structured parking. This is a substantial increase in building area, mass and height, and will undoubtedly create significant visual impacts.

Within this plan a new 16 story hospital is to be constructed at the far east end of the campus and rise to 294 feet in height. As stated in the Draft EIR, this new hospital will be subject to a subsequent project specific environmental review as more details of this project becomes available. However, the Draft EIR states (*pg 4.1-23*) that development under the CPHP would not have a substantial adverse effect on scenic vistas. A significant effect on a scenic vista as defined in the DEIR, is a substantial block or degrade of scenic view from public vantage points. In review of this plan and DEIR, it is apparent that the proposed building plan and particularly the new 16 story hospital would have significant visual impacts. (*see figure 1 and 2*)

Fig 1 Existing view west from adjacent neighborhood

78

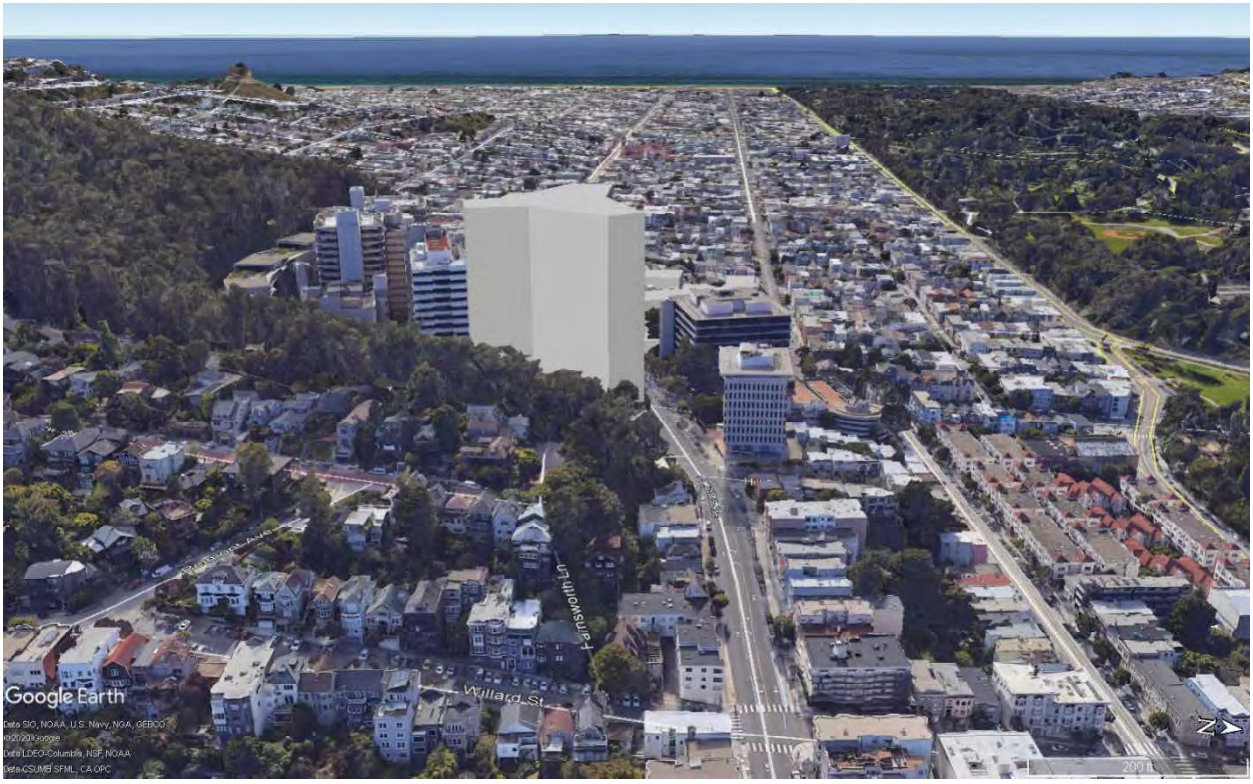

Fig 2 View west with proposed new hospital

78 cont.

By including this new hospital plan within this DEIR and concluding that it would not have a substantial adverse impact on a scenic vista, avoids discussion and possible mitigation measures in subsequent environmental review. This is not the intent of CEQA. Environmental review is a means to avoid or lessen adverse environmental effects at the outset, and by dismissing this issue at this time implies that it will not be address at a project level EIR in the future.

The topography of Mount Sutro and the green of the forested reserve are major elements that visually shape the adjacent neighborhoods as well as the overall city scape as seen from a distance. The views from publically accessible areas in and around the proposed UCSF Parnussus campus to these landmarks are of importance in establishing the quality of the environment here. One particularly significant local view point is the trail head near the intersection of Farnsworth Lane and Edgewood.

Public Trail Head at the end of Farnsworth Lane

79

The proximity and mass of the proposed new hospital will substantially impact this viewpoint. The 294 ft height and form of the proposed building will be seen and will block views to the west. The existing tree masses in this area and subsequently along the trail leading down, may tend to screen and filter the vistas but, the new proposed hospital will entirely block scenic vistas and dominate the view. This is a significant change to the public view and the inherent quality of the trail head and experience of accessing and walking this trail. This impact to the environmental quality of this publically accessible trail is significant and should be taken into account in considering mitigation measures or alternatives.

Furthermore the entire neighborhoods to the east, and views from streets such as Edgewood and Belmont and Willard and areas to the north of Parnassus Ave such as Hill Point Way will also be visually impacted by the large dominant mass of the new hospital. The size and height of the new hospital will also block views to Mt Sutro and the forest reserve from areas north of Parnassus Ave and Irving Street, and the visual experience of seeing a natural setting of a forested hillside from the local sidewalks and streets will be changed to one of a large urban building.

The visual simulations shown here have been constructed within Google Earth and incorporate scale models of the building masses and heights identified in the DEIR.

Figure 3 View west from end of Farnsworth

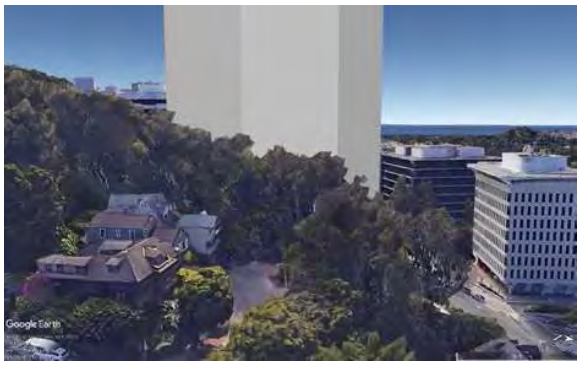

Figure 4 View west from end of Farnsworth with new hospital

Figure 5 View south from Hill Point Way

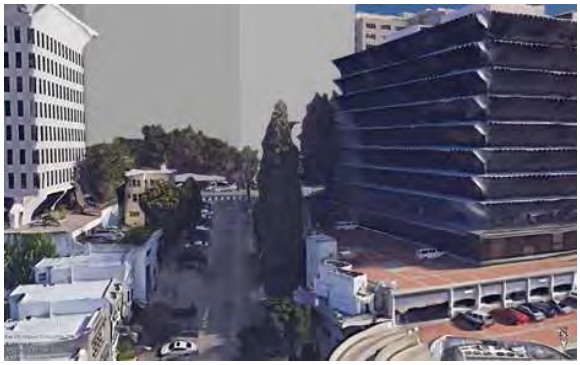

Figure 6 view south from Hill Point Way with new hospital

The views from the trailhead at the end of Farnsworth and adjacent residential neighborhood will become dominated by the mass of the new proposed hospital.

By stating that impacts to publically available scenic vistas are less than significant, the DEIR does not provide any possible mitigation measures or alternatives. This precludes further discussion and possible mitigation measures in future specific project environmental review and essentially allows development of the height and massing of the proposed buildings at this stage of the review process.

79 cont.

Views from other Prominent Vantage Points

The DEIR also identifies several other prominent publically accessible vantage points. These include Tank Hill natural area, Buena Vista Park, and Corona Heights Park. These are all located to the east of the Parnassus Heights campus. The DEIR states that the implementation of the CPHP would not result in a substantial adverse impact to scenic vistas from these publically accessible vantage points. However, in review it is again apparent that the new proposed hospital would change the skyline. (*see figures 7 through 12)*

Fig 7 view westward from Tank Hill natural area

Fig 8 view from Tank Hill natural area with proposed new hospital

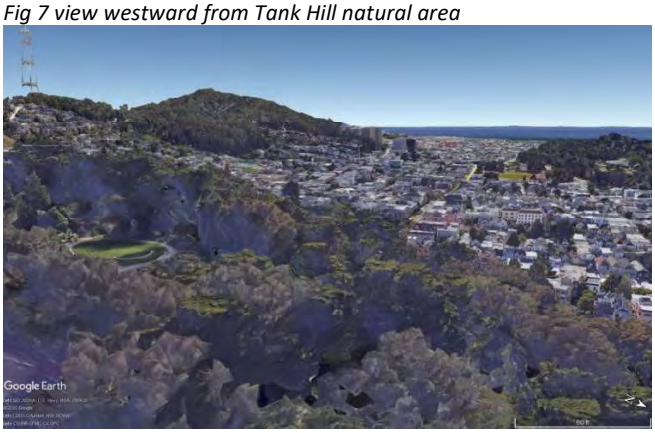

Figure 3 view from Buena Vista Park

Figure 5 view from Buena Vista Park with proposed hospital

Figure 4 View from Corona Heights Park

Figure 6 View from Corona Heights Park with proposed hospital

The development of the CPHP will undoubtedly change the visible skyline by addition of the new 294 foot high hospital. This is a noticeable change and should be addressed in the context of the Urban Design

80

Element of the San Francisco General Plan. The height and mass of the proposed new hospital will be highly visible as a new feature in the skyline from these public parks as well as from various other locations and streets within the surrounding neighborhoods. The Urban Design Element includes a policy to: "*Recognize and protect major views in the city, with particular attention to those of open space and water. Views contribute immeasurably to the quality of the city and to the lives of its residents. Protection should be given to major views whenever it is feasible, with special attention to the characteristic views of open space and water that reflect the natural setting of the city and give a colorful and refreshing contrast to man's development.*"

The Urban Design Element of the city's General Plan states that shape, height and bulk of tall building with respect to views from important vantage points around the city should contribute to the beauty of the skyline. While views from private property are not protected in city regulations, the General Plan does protect specific view corridors from the public realm.

It is not clear in the DEIR whether the CPHP has undergone an initial Preliminary Project Assessment by the city's Urban Design Advisory Team (UDAT) to determine consistency with Urban Design Guidelines and other relevant design regulations, the Planning Code, and other policies in the General Plan. Is this review to come at a later environmental review as the project evolves? If so, does this mean that the height and mass of the new hospital is a given if this plan is approved. Since the proposed new hospital will be seen from several publically accessible view points and parks, it seems that such a major feature that will change the visible skyline should be reviewed and assessed by UDAT prior to further project level environmental review.

80 cont.

Overall Impact on Shadow

The DEIR states that implementation of the CPHP would not create new shadows in a manner that would substantially and adversely affect the use and enjoyment of publically accessible open spaces. The DEIR provides description and diagrams of shadow impacts onto various public locations during different seasons and times of day. These public locations include parks and schools which are some distance away and will receive "occasional shadow". The DEIR states that these areas would not be adversely affected and the impact is considered less than significant.

It appears though that certain areas along Parnassus Ave and Irving St. will be subject to "frequent shadows" throughout the year. (*Fan 1 of the Shadow Study Appendix within the DEIR*) Although these are not officially called out as "publically accessible open spaces" needing to be addressed within the city's Urban Design Element guidelines, they are public sidewalk and streets that are frequented by pedestrians and passerbys. These areas currently receive shadows from existing structures but, it can be expected that the increased height of the proposed new hospital and Milberry Terrace and Irving St Gateway projects will further increase the time and frequency of the shadows along Irving St and Parnassus Ave.
Although shadows do not directly affect change in air temperature, they do affect the direct exposure to sun radiation and the resulting feeling of warmth to a person's body. Further, sun radiation can affect the temperature of a surface struck by sunlight and increase that temperature and it's surroundings. The comfort and attractiveness of these particular areas to pedestrians and passerbys may be adversely affected and should be addressed in the EIR. The city's Urban Design Guidelines state that plazas or parks located in the shadows cast by large buildings can be unpleasant for the user and large buildings can be oriented to minimize shadows falling on public or semi-public open space. The guidelines state that the height and mass of tall, closely packed buildings can be shaped to permit sunlight to reach open spaces.

81

The CPHP does provide new open pedestrian areas within the campus and that is welcomed and appreciated and is a positive. But, discussion of the impact to the existing local areas and circulation patterns should still be noted and made aware to the public. There should be a discussion of how impact to these public areas might be mitigated.

81 cont.

Conclusion

The existing features of Mt Sutro and the Forest Reserve provide form and a sense of place and living within the environment to the UCSF campus and adjacent neighborhoods. The new CPHP with its heights and mass of proposed buildings would alter and change that sense. As noted in the city's Urban Design Element:

"The uses and benefits of the city pattern are many and profound. This pattern is, first of all, bound up in the image and character of the city. To weaken or destroy the pattern would make San Francisco a vastly different place. Second, the city pattern has important psychological effects upon residents of the city. It provides organization and measured relationships that give a sense of place and purpose and reduce the degree of stress in urban life. Outlooks upon a pleasant and varied pattern provide for an extension of individual consciousness and personality, and give a comforting sense of living with the environment."

The visual change from the implementation of the CPHP will be seen from many locations throughout the adjacent neighborhoods as well as other areas and parks within the city including areas of Golden Gate Park. The impact of the shadow patterns to the adjacent neighborhoods will also affect the quality experiences of spaces and pedestrian walkways by the public. These should be considered in the approval process and given recognition in the EIR.

RE: Comprehensive Parnassus Heights Plan

Dear Ms. Wong,

I write to comment on UCSF's (2020) Environmental Impact Report ("EIR") prepared for the Parnassus Heights Plan, which I understand would add 2.04 million square feet of new floor space to 168 acres of land between the Parnassus Campus, Aldea Housing, and Mount Sutro Open Space Reserve. The buildings would vary in height, up to 294 feet. Given trends in the use of structural glass on the façades of Bay Area multi-story buildings, and the trend in using extensive glass on University buildings throughout the USA, I anticipate the buildings of the proposed project would add extensive new glass windows that would threaten birds with collision mortality. I write to comment on this and other potential project impacts to special-status species of vertebrate wildlife. 83

My qualifications for preparing expert comments are the following. I hold a Ph.D. degree in Ecology from University of California at Davis, where I subsequently worked for four years as a post-graduate researcher in the Department of Agronomy and Range Sciences. My research has been on animal density and distribution, habitat selection, habitat restoration, interactions between wildlife and human infrastructure and activities, and conservation of rare and endangered species. I perform research on wildlife mortality caused by wind turbines, electric distribution lines, agricultural practices, and road traffic, among other human activities and structures. I authored numerous papers on special-status species issues. I served as Chair of the Conservation Affairs Committee for The Wildlife Society – Western Section. I am a member of The Wildlife Society and the Raptor Research Foundation, and I've been a part-time lecturer at California State University, Sacramento. I was Associate Editor of wildlife biology's premier scientific journal, The Journal of Wildlife Management, as well as of Biological Conservation, and I was on the Editorial Board of Environmental Management. I have performed wildlife surveys in California for thirty-three years, including at many proposed project sites. My CV is attached.

SITE VISIT

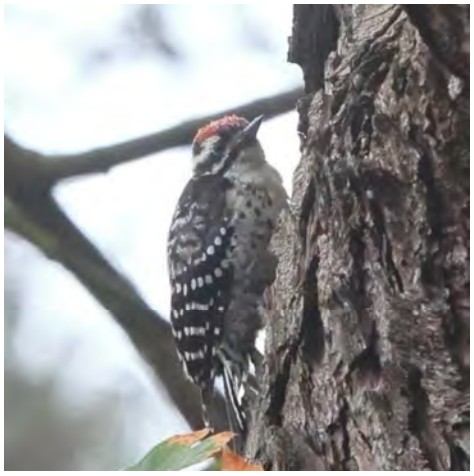
I visited Aldea Housing, Mount Sutro Open Space Reserve, and the Parnassus Campus for 3 hours and 30 minutes, starting at 08:17 hours on 20 August 2020. The Marine Layer dominated the sky until the last 90 minutes or so. I surveyed on foot, using binoculars to scan for wildlife. 84

Campus buildings occur immediately north of the steeply sloped Mount Sutro (Figure 1) and the densely forested environment of Mount Sutro Open Space Reserve (Figure 2). Aldea Housing is likewise tucked into the forested slopes of Mount Sutro, but on the southeast aspect.

Figures 1 and 2. *A building proposed for replacement (left) looms near the densely forested Mount Sutro Open Space Reserve (right).*

Not surprisingly, given its forestation and the fact that Mount Sutro Open Space Reserve is one of the last remaining substantial patches of open space in San Francisco, I saw and heard many birds during my visit. Among other species, I detected Anna's hummingbirds (Figure 3), Nuttall's woodpecker (Figure 4), pygmy nuthatches (Figure 5), common ravens (Figure 6), Wilson's warbler (Figure 7), song sparrows (Figure 8), dark-eyed juncos (Figure 9), and house finches (Figure 10). Many of the birds I detected were fledglings accompanied by their parents, thus proving the site is productive for birds (Figure 11). Foraging on the site was abundantly evident (Figure 12). In all, I detected at least 23 species of vertebrate wildlife (Table 1), including 5 special-status species and only 2 non-native species. Both of the non-native species were within built-over areas, including a rock pigeon on the Parnassus Campus and house sparrows at Aldea Housing.

84 cont.



Figures 3 and 4. *Anna's hummingbird (left) and Nuttall's woodpecker (right) on the project site, 20 August 2020.*

Figures 5 and 6. *Pygmy nuthatch (left) and common raven (right) on the project site, 20 August 2020.*

Figures 7 and 8. *Wilson's warbler (left) and song sparrow (right) on the project site, 20 August 2020.*

84 cont.

Figures 9 and 10. *Dark-eyed junco (left) and house finch (right) on the project site, 20 August 2020.*

Figures 11 and 12. *A fledgling house finch (left) and a song sparrow with worm (right).*

Most of the species of birds I detected had also recently been detected by Golden Gate Audubon Society ("GGAS") (2020), who tallied 47 species of birds on Mount Sutro Open Space Reserve in about 54 hours of surveys between 16 March and 29 December 2019. I detected 5 bird species that GGAS (2020) did not, including peregrine falcon, Nuttall's woodpecker, acorn woodpecker, house sparrow, and American goldfinch. However, the peregrine falcon I detected was atop Sutro Tower, which might not have been detectable from the stations used by GGAS, or alternatively GGAS might have declined to include detections on Sutro Tower due to its location outside the Reserve. The house sparrows I detected were at Aldea Housing, which is another area outside GGAS's survey space. Some of the species detected by GGAS and not by me, and some of those I detected but GGAS did not, could have been represented by birds using the Reserve as stop-over habitat. If the Reserve was surveyed over several years, the number of bird species would likely far exceed the 52 species GGAS and I detected altogether. eBird records further indicate a long list of species use Mount Sutro Open Space Reserve, the Parnassus Campus and Aldea Housing.

84 cont.

GGAS (2020) confirmed breeding by 11 species, and suspected breeding by another 5 species. One of the species suspected of breeding was red-shouldered hawk, which I observed reacting defensively to the arrival of a red-tailed hawk. The red-shouldered hawk's reaction, including sustained calling each time the red-tailed hawk circled close to the red-shouldered hawk's tree, was typical of a breeding member of this species defending its nest. I concur with GGAS that Mount Sutro Open Space Reserve is an important breeding area for birds.

GGAS (2020) also tallied 136 observations of birds foraging on the Reserve, or about 2.5 foraging events per hour of survey. During my site visit I witnessed foraging at a minimum 1.4 events per hour. I was not specifically attempting to record foraging

events, so I did not record how many members of a flock of pygmy nuthatches I observed peel back bark for a food reward; I simply counted their foraging as one event. I also saw foraging by Wilson's warbler, Nuttall's woodpecker, song sparrow, and common raven. The Reserve is obviously an important foraging area for birds.

The western gray squirrel I saw (Table 1) was the only record of this species I could find for Mount Sutro Open Space Reserve. At the time of my observation, I had no doubt of my species identification, but I was unable to capture a photo. Another sighting of western gray squirrel was reported to iNaturalist in 2020 -- along with a photo -- for a site just northwest of the UCSF Parnassus Campus at 10th Ave. and Irving St.

Table 1. *Species of wildlife I observed during my site visit on 20 August 2020.*

Species	***Scientific name***	**Status[1]**	**GGAS 2019**
Red-tailed hawk	*Buteo jamaicensis*	FGC 3503.5	Yes
Red-shouldered hawk	*Buteo lineatus*	FGC 3503.5	Yes
Peregrine falcon	*Falco peregrinus*	CE, CFP, FGC 3503.5	No
Rock pigeon	*Columba livia*	Non-native	Yes
Anna's hummingbird	*Calypte anna*		Yes
Nuttall's woodpecker	*Picoides nuttallii*	BCC	No
Acorn woodpecker	*Melanerpes formicivorus*		No
Steller's jay	*Cyanocitta stelleri*		Yes
California scrub-jay	*Aphelocoma californica*		Yes
Common raven	*Corvus corax*		Yes
Chestnut-backed chickadee	*Poecile rufescens*		Yes
Pygmy nuthatch	*Sitta pygmaea*		Yes
Pacific wren	*Thryomanes pacificus*		Yes
Ruby-crowned kinglet	*Regulus calendula*		Yes
American robin	*Turdus migratorius*		Yes
Yellow warbler	*Setophaga petechia*	SSC2, BCC	Yes
Wilson's warbler	*Wilsonia pusilla*		Yes
House sparrow	*Passer domesticus*	Non-native	No
Lincoln's sparrow	*Melospiza lincolnii*		No
Song sparrow	*Melospiza melodia*		Yes
Dark-eyed junco	*Junco hyemalis*		Yes
House finch	*Carpodacus mexicanus*		Yes
American goldfinch	*Carduelis tristis*		No
Western gray squirrel	*Sciurus griseus*		

[1] BCC = US Fish and Wildlife Serv ice's Birds of Conservation Concern, CE = California Endangered, CFP = California Fully Protected, SSC2 = California Species of Special Concern priority level 2, FGC 3503.5 = California Department of Fish and Wildlife Code -- Birds of prey.

84 cont.

The 23 species of birds I detected represented a fraction of those I would have detected had I been able to devote more time to the effort (Figure 13). The model in Figure 13 predicts I would have detected 47 species – equal to the number detected by GGAS – in

11 hours and 40 minutes. It also predicts I would have detected 117 species of birds had I surveyed as long as GGAS. The difference in detection rates did not result from any differences in skill levels, but rather in method. GGAS applied standard point count methods, which are suited for comparing species detections among locations or time periods; it is a method I often use. The survey method I implemented at Mount Sutro was a more aggressive move-and-encounter approach. Had GGAS implemented this method, they would have detected well over 100 species of birds.

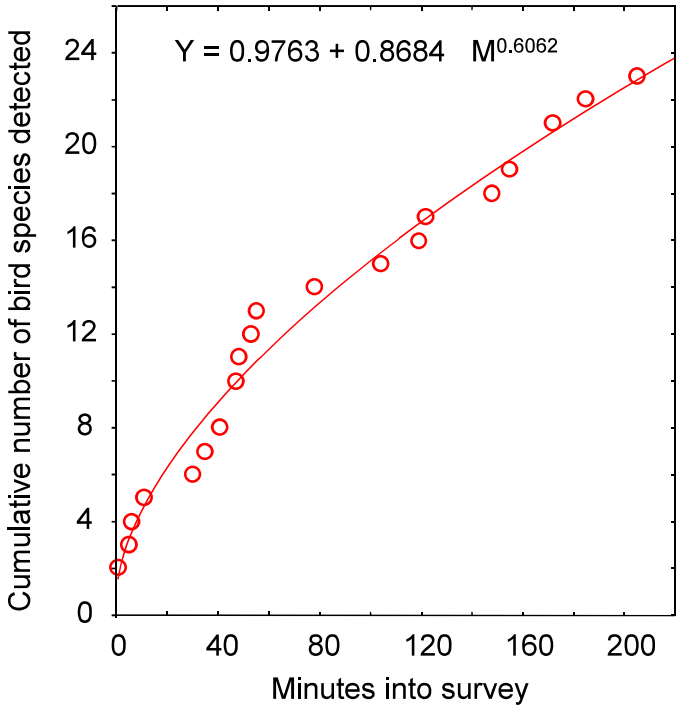

Figure 13. *Cumulative number of bird species detected as a power function of the number of minutes devoted to the survey. The model explained 98% of the variation, with a root mean square error of 17.71. Had I been able to commit more time to the survey, I am confident a different model would have better fit the resulting data – a model more expressive of an asymptote.*

84 cont.

BIOLOGICAL IMPACTS ASSESSMENT

The project would mostly redevelop areas that are already built-up, including new buildings on campus and larger, taller buildings at Aldea Housing. To facilitate the tallest of the proposed buildings on Campus, the project would remove 0.15 acres from the Open Space Reserve, but would re-designate 0.4 acres to Open Space Reserve from another nearby area designated as Support. This other area designated as Support, however, is already forested and otherwise indistinguishable from the forested landscape of the surrounding areas of Mount Sutro Open Space Reserve. From the perspective of wildlife, the swap in land designations results in a 0.15-acre habitat loss.

85

Much more substantial habitat impacts than mere acreage loss would result from the heights, extent, and structural attributes of the proposed new buildings. In my experience, erecting tall structures into the aerohabitat of volant wildlife results in collision mortality and interference with wildlife movement. New, tall structures erected at the proposed locations would intercept many birds attempting to fly to or away from Mount Sutro Open Space Reserve. Most migratory or dispersing birds

86

attempting to stop-over at the habitat island that Mount Sutro represents in San Francisco, and most birds leaving Mount Sutro to continue their migration or dispersal, would expend extra energy – energy needed for long-distance flights – negotiating their way around the buildings, but some would collide with the buildings after becoming disoriented or misled by the buildings' nighttime lights and by transparent and reflective glass windows. Proposed mitigation measures should prevent numerous collisions (more on this later), but they cannot prevent enough of them to lessen the project's impacts to less-than-significant.

An example of what would be in store for birds encountering buildings of the new project was presented in San Francisco's bird-safe building standards (San Francisco Planning Department 2011). On page 15 is a photo of New York City's most dangerous building to birds, which is the Morgan Mail Building located next to a landscaped park. Though the Morgan Mail Building is not particularly tall for Manhattan, nor does it include more window space than other buildings, its location next to the park is what makes it more dangerous to birds than other buildings. The locations of the proposed new buildings on the Parnassus Campus and Aldea Housing would be proximal to a much more substantial habitat area than the small park next to the Morgan Mail Building in Manhattan.

Another example can be found practically next door to the Parnassus Campus, where a bird-window collision study was performed recently at California Academy of Sciences ("CAS") (Kahle et al. 2016). Like the Morgan Mail Building, CAS is located next to landscaped park – Golden Gate Park. Its fatalities were represented by 37 species. Its pre-mitigation bird-window collision rate of 0.0654 fatalities per m^2 of glass per year averaged close to the national average (more on this below). This rate translates to 62 bird-window collision fatalities per year before attempting to adjust the estimate for the proportion of fatalities not found by searchers due searcher error and removals of carcasses by scavengers. Assuming the scavenging community functions at Golden Gate Park as effectively as it does in the Altamont Pass Wind Resource Area, where carcass detection rates were carefully measured, and assuming the fatality searchers were equally skilled, then the 62 bird-window collisions per year estimated for CAS would be adjusted to 835 (95% CI: 429-3,689) bird-window collisions per year.[1] A principal reason for the large difference between adjusted and unadjusted fatality rates at CAS was the preponderance of small-bodied birds among window casualties. The species most often found as fatalities was Anna's hummingbird, including 131 carcasses. Averaging about 4.5 g, Anna's hummingbird carcasses can be picked up and removed by a much larger array of vertebrate scavengers than could a 322-g rock pigeon. A feral cat could consume 25 Anna's hummingbirds per day, but only about a third of a rock

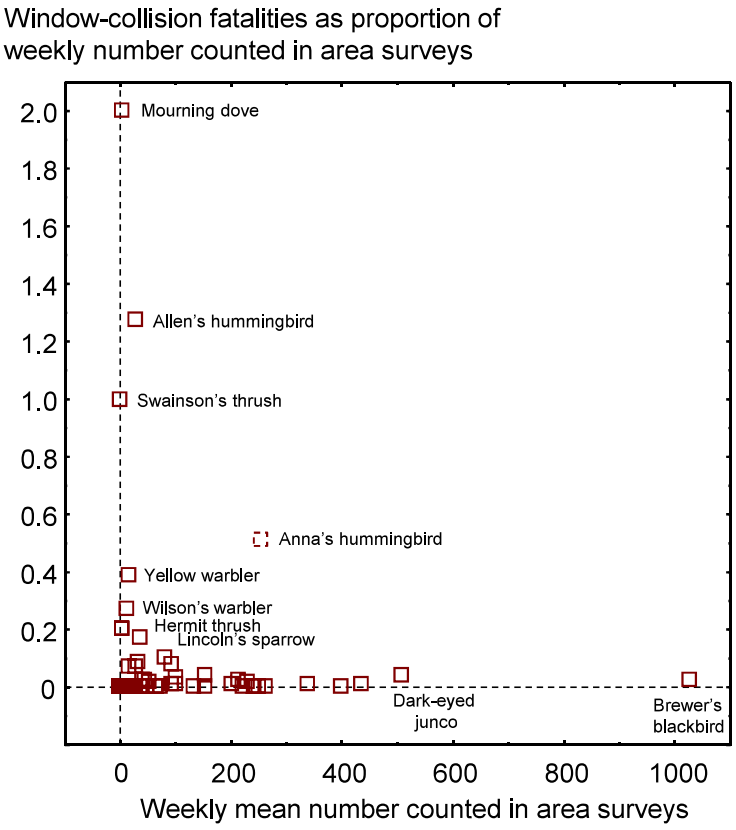
86 cont.

[1] The fatality search interval at CAS was the same as that of half the wind turbines in the Vasco Winds Energy Project in Contra Costa County (Brown et al. 2016). To derive an overall detection rate for weekly search intervals, I selected detection trial carcasses that had been placed on open ground, which I assumed best represented the ground searched for fatalities at CAS. I fit a model to overall carcass detection rates as a function of body mass, and applied the model predictions to the numbers of fatalities of each species found as window collision victims at CAS (see Smallwood et al. 2018 for methodological details).

pigeon. Common ravens likely remove most of the carcasses of small birds around CAS, and likely do so without leaving any trace evidence of the fatality ever having happened.

Although relative abundance of bird species serves as a poor predictor of bird-window collision fatalities (Figure 14), a bird species must use the airspace occupied by a building before the species can become a collision victim of that building. Therefore, learning which species occur in the project area is an important first step in analyzing potential impacts of bird-window collisions. Learning which special-status species occur in the project area is even more important. Learning which species are known to be vulnerable to windows would also inform an analysis of potential project impacts. Table 2 identifies special-status species documented in the project area, as well as species detected as window collision victims at CAS or at other buildings.

Figure 14. *The ratio of window-collision fatalities to relative abundance related inversely to relative abundance, where some of the least abundant species contributed disproportionately to window-collision fatalities and some of the most abundant species contributed least to fatalities (data from Kahle et al. 2016). Data at the o-intercept represent bird species either recorded as fatalities but never seen in relative abundance surveys or counted in relative abundance surveys and never recorded as fatalities.*



86 cont.

The EIR inadequately analyzes potential impacts to wildlife. Of the 40 special-status species of birds documented by eBird, GGAS, and myself, the EIR addresses only 6 (15%) of them. Of the 6 bird species that are addressed, the EIR dismisses the likelihood of occurrence of 2 of them: northern harrier and San Francisco common yellowthroat, both of which have been seen on site (Table 2). The EIR assigns low likelihood of occurrence to another 3 of the 6 species it addresses, even though all 3 have been documented in the area (Table 2). The EIR assigns only moderate occurrence likelihood to peregrine falcon, a species I saw looking down at the project site from Sutro Tower. Furthermore, in a report prepared for UC San Francisco, GGAS reported having seen 7

87

special-status species of birds that are not addressed in the EIR (Table 2). I also note that the EIR addresses only 5 of the 8 special-status species of mammals I consider likely to occur at the project site at one time or another (Table 3).

The EIR argues that most special-status species of wildlife in San Francisco would not occur on the project site due to specialized habitat requirements which are lacking at the project site. The EIR summarizes habitat needs of those few species it addresses, but for each species it describes an artificially narrow portion of the environment that defies reality. For example, it says short-eared owls require marsh or meadow habitat, which is not present at the project site. I have certainly encountered short-eared owls in marsh and meadow, but I have also observed them in annual grassland and, more relevant to this project, in oak woodland. The short-eared owl I encountered in oak woodland might have been using the woodland for cover or perhaps it was moving through the area on migration or dispersal. That short-eared owls similarly use Mount Sutro Open Space Reserve is suggested by eBird, which shows sightings very close to the project site.

87 cont.

In another example, the EIR commits northern harrier to marsh. Most of the northern harriers I have recorded have been on annual grassland, but I have seen them in various environments, including over urban areas. Northern harrier has been documented on the project site (Table 2).

The EIR also argues that the project site lacks nesting habitat for various special-status species. However, the implied distinction between nesting and foraging habitat, or between nesting and stopover habitat, is more contrivance than real, because no animals can successfully breed without also successfully foraging or migrating. To breed successfully, birds must find sufficient forage and they must survive migration and non-breeding seasons by finding suitable stopover habitat and all the other habitat elements needed. Arguing that the habitat value of a place is somehow lesser because it lacks nest substrate is fallacious where the species can satisfy other needs that are critical for successful nesting elsewhere or later in the year.

Of the 40 special-status species of birds that have been documented at or near the project site, 16 (40%) have also been documented as window collision victims. Five of these species were documented as window collision victims at CAS, located very close to the project site. Of these species, I estimated Allen's hummingbird to have died from window collision at a rate of 179 per year until any mitigation measures were implemented. Prior to any mitigation, CAS windows killed an estimated 223 members of special-status species, or 27% of all birds.

88

Table 2. *eBird (https://eBird.org) reports of special-status species near the project site and species reported as window-collision victims at the nearby California Academy of Sciences (CAS) buildings (Kahle et al. 2016).*

88 cont.

Project Impact Prediction from Bird-Window Collisions

An empirical basis for robustly predicting bird-window collision mortality exists, not only in the research that was done at the nearby CAS, but also among all of the studies performed across North America. I reviewed reports of avian fatality monitoring among building structures in a wide variety of environmental settings, types of structures, and types of glass on structural façades. Specifically, I reviewed reports of bird collision monitoring at 181 buildings and façades for which bird collisions per m^2 of glass per year could be calculated and averaged (Johnson and Hudson 1976, O'Connell 2001, Somerlot 2003, Hager et al. 2008, Borden et al. 2010, Hager et al. 2013, Porter and Huang 2015, Parkins et al. 2015, Kahle et al. 2016, Ocampo-Peñuela et al. 2016, Sabo et al. 2016, Barton et al. 2017, Schneider et al. 2018). These study results averaged 0.077 bird deaths per m^2 of glass per year (95% CI: 0.04-0.11), before any adjustments were attempted to account for the proportion of fatalities not found due to searcher error and carcass removal by scavengers. This average and its 95% confidence interval provide a robust basis for predicting minimum fatality rates at a proposed new project.

A major shortfall of the EIR is its omission of any details about the design of proposed buildings, including the amount of glass, types of glass, and structural contexts of glass. The only detail I have to work with is the intended 2.04 million square feet of floor space. I applied this figure to an average rate (and 95% CI) of glass extents on 12 recently proposed buildings intended for use as offices hotels and mixed-use in California. The mean was 0.0328 m^2 of glass façade per ft^2 of floor space (95% CI: 0.0052-0.0603). To this extent of glass, I multiplied 2.04 million ft^2 of project floorspace to get 66,838 m^2 of glass façade (95% CI: 8,783-117,327 m^2). However, in my experience, both hospital and university buildings tend to use more glass on their façades (Figure 14). Additionally, recent advances in structural glass engineering have contributed to a proliferation of glass windows on building façades. This proliferation is readily observable in newer buildings, and it is represented by a worldwide 20% increase in glass manufacturing for building construction since 2016. Increasing window-to-wall ratios and glass façades have become popular for multiple reasons, including a growing demand for 'daylighting.' To account for these trends, I increased my estimated extent of glass composing façades of the proejct's buildings by anotehr 20%, to 80,206 m^2 of glass façade (95% CI: 10,594-140,792 m^2).

89

To the above prediction of the mean amount of glass composing the project's building façades, I multiplied the mean rate of bird collisions per m^2 of glass façade to predict **6,176 bird deaths per year (95% CI: 3,208-8,823)** at the Parnassus Campus. The 100-year toll from this average annual fatality rate would be **617,586 bird deaths (95% CI: 320,824-882,266)**, which would continue until the buildings are either renovated to reduce bird collisions or they come down. The vast majority of these deaths would be of birds newly protected under Fish and Game Code section 3513 (see above). If the project moves forward as proposed, and annually kills more than half a million birds protected by AB 454, the project will cause significant unmitigated impacts.

If the adjustment factors I applied to the CAS fatality data also apply to the proposed project, then we would predict much higher fatality rates caused by window collisions. The adjustment factors applied to CAS fatalities found by searchers increased the mean estimated annual fatalities by a factor of 13.5. If fatalities at the project's buildings are similarly represented by more small-bodied birds, then the mean annual fatlity rate would be 83,376 birds. Even if the project implemented mitigation measures that were 90% effective, it would still kill >8,000 birds per year.

Given the predicted bird-window fatality predictions for the project, it is understandable why window collisions are often characterized as either the second or third largest source or human-caused bird mortality. The numbers behind these characterizations are often attributed to Klem's (1990) and Dunn's (1993) estimates of about 100 million to 1 billion bird fatalities per year in the USA, or more recently Loss et al.'s (2014) estimate of 365-988 million bird fatalities in the USA or Calvert et al.'s (2013) and Machtans et al.'s (2013) estimates of 22.4 million and 25 million bird fatalities in Canada, respectively. However, these national estimates were based largely on study-specific fatality estimates that were not adjusted for the proportion of fatalities not found. These national estimates, as large as they are, are likely biased low.

89 cont.

Wildlife Movement

I concur with UCSF's (2020:4.3-3) conclusion, "*The San Francisco Peninsula is an important migratory stopover for birds along the Pacific Flyway—one of the four major migratory routes in North America*." However, I disagree with the EIR where it implies that lack of an established wildlife corridor contributes to its alleged less-than-significant impact on wildlife movement in the region. With this argument, the EIR introduces a false standard. The primary phrase of the CEQA standard goes to wildlife movement regardless of whether the movement is channeled by a corridor. A site such as the proposed project site is critically important for wildlife movement because it composes a diminishing patch of natural cover within an expanse of anthropogenic land uses, forcing more volant wildlife to use the site as stopover and staging habitat during migration, dispersal, and home range patrol (Warnock 2010, Taylor et al. 2011, Runge et al. 2014).

90

The other argument leading to the EIR's less-than-significant determination is that proposed mitigation will lessen bird-window collision mortality. Even if mitigation measures *do* succeed in lessening bird-window collision mortality, it will have no effect on the project's impacts to movement of wildlife that survive their encounters with the buildings. The tall buildings on the Campus would pose a barrier to movement that is additional to the threat of window collision. Many birds and bats attempting to fly to or from Mount Sutro would have to detour around the buildings, risking predation by peregrine falcons which exploit these types of situations, and costing valuable energy needed for long-distance travel. Inserting multiple tall buildings into the aerohabitat of birds and bats would cause significant adverse impacts to those birds and bats.

CUMULATIVE IMPACTS

The EIR mischaracterizes cumulative impacts as merely residual impacts of mitigation that was incompletely effective. The EIR claims that because the impacts of the Mount Sutro Open Space Vegetation Management Plan were fully mitigated, there would be no cumulative impacts. If cumulative effects were indeed merely residual impacts of inadequate mitigation, then CEQA would require an inadequate mitigation analysis instead of a cumulative impacts analysis.

The other argument used in the EIR to dismiss cumulative impacts is that the only projects that could be listed or assessed in San Francisco would be redevelopment of areas already built. The EIR claims that redevelopment contributes no cumulative impacts because redeveloped areas already removed all biological resources. But this argument neglects the very impact that is likely the largest posed by the project to biological resources. Just as the project poses potentially severe bird-window collision impacts, so too do new buildings going up in place of older buildings. New buildings in San Francisco are glass-covered. An appropriate cumulative impacts analysis would include a tally of predicted or estimated fatality rates of birds colliding with glass façades of recently built, planned, and foreseeable buildings in San Francisco. 91

The nature of the project's likely impacts, and those of other buildings in San Francisco, warrant a serious cumulative impacts analysis. Bird abundance across North America has declined 29% over the last 48 years (Rosenberg et al. 2019). This decline will result in substantial ecological and economic consequences, the magnitude of which has yet to be understood. Because windows are recognized as one of the principal anthropogenic sources of bird mortality, their cumulative effects among San Francisco's new buildings must be analyzed and mitigated.

MITIGATION

BIO-1c and BIO-1d: Preconstruction Surveys for Bird Nests and Bat Roosts

I understand that the EIR proposes to mitigate potentially significant impacts by having a biologist conduct pre-construction surveys for nesting birds within 250 feet of the construction area and for roosting bats within 50 feet of the construction area within 7 days prior to initiation of construction activities. I disagree, however, that the proposed measures would reduce impacts to less-than-significant. 92

Preconstruction surveys should be performed. However, it needs to be understood that preconstruction surveys, which are also often referred to as take-avoidance surveys, are really just last-minute salvage efforts to prevent injury or death of the most readily detectable individuals. Preconstruction surveys are limited in their mitigation effect as they detect only small fractions of bird nests and roosting bats occurring on a project site. Bird nests are usually concealed so that they are not discovered and their

occupants destroyed by predators. Locating hummingbird nests, for example, can be nearly impossible. Locating roosting bats is likewise very difficult (Kunz and Lumsden 2003). Preconstruction surveys alone fail to prevent the deaths of most of the animals at risk, nor do they do anything to prevent habitat destruction and lost reproductive capacity.

Preconstruction surveys perform better when they are informed by earlier detection surveys, which have been carefully designed by species' experts and natural resource agency biologists. Detection surveys should be performed early enough to not only inform preconstruction surveys, but also the public and decision-makers about potential project impacts. This early timing of detection surveys is also needed to inform the formulation of mitigation measures, including compensatory mitigation for those impacts than cannot be avoided.

Take-avoidance surveys cannot lessen impacts to nesting birds and roosting bats without first informing the public and decision-makers of the magnitudes of potential impacts, nor without informing survey personnel where to look. The effort needs to be made to map out where birds are nesting and bats roosting, and it needs to be made according to biologically appropriate protocols rather than in a rush to stay just ahead of the tractor blade.

92 cont.

BIO-2b: Bird-Safe Building Treatments

I understand that the EIR proposes to mitigate potentially significant impacts by (1) minimizing unnecessary light emissions from interior and exterior portions of buildings; (2) exploring and adopting window glazing options such as marked glass or UV-reflective glass; and (3) minimizing light and glare of façades through orientation of the building, choice of materials, and landscaping. I disagree, however, that the proposed measures would reduce impacts to less-than-significant.

City of San Francisco (2011) prepared excellent standards for bird-safe buildings, which the EIR cites. City of San Francisco (2011) presents options that include (1) glass and façade treatments to mitigate the effects of transparent and reflective glass; and (2) lighting treatments. But much has been learned by research performed since 2011. For example, mitigation applied to CAS substantially reduced bird-window collision mortality (Kahle et al. 2016), yet the measure implemented was not covered in City of San Francisco (2011). Furthermore, the measures that were recommended in City of San Francisco (2011) were often of uncertain efficacy. Most of the evidence of mitigation efficacy has been anecdotal, although it always helps when the magnitude of effect is very large. As an example of convincing anecdotal evidence, the recent replacement of window panels with fritted glass reduced bird-window collision fatalities by 90% at New York City's Javits Center – a notoriously dangerous building to birds. More often, sound evidence of mitigation efficacy derives from experimentation. I will discuss experimentation further, but first I will recommend mitigation that should precede the measures proposed in the EIR.

93

The third of the three proposed measures in the EIR is minimizing light and glare of façades through orientation of the building, choice of materials, and landscaping. However, this approach needs to be informed by how birds would encounter and perceive the buildings. The EIR does not identify materials to be used, but it does illustrate building orientations that appear to have been decided already. The EIR is unclear about whether and how building orientation would be decided to minimize collision risk, nor does it indicate the structural materials to be used on any particular portions of buildings. It seems these decisions are either already decided, in the case of building orientation, or in the case of materials to be used, they are deferred to an unspecified later date. Neither are performance standards are linked to any of these measures.

To inform the third measure, as well as to inform of the relative hazards of building locations and building heights, behavioral ecologists need to survey the project area to adequately characterize flight patterns and reactions to existing buildings. Surveys are needed to learn how many of each bird species fly through the area and at what times of day and night. Nocturnal surveys can be performed using a thermal-imaging camera or radar. Such surveys would inform of collision risk, and could inform mitigation strategies involving light management and design of façades facing the prevailing approach directions of migrating birds.

Once it is better understood how birds use their aerohabitat at the project site, and after reasonable measures have been taken to minimize collision risk due to building location, height and orientation, structural measures need to be considered with the understanding that most remain highly uncertainty in their efficacy. An exception would be the decision to minimize the extent of glass on building façades; minimizing glass is surely the most effective measure other than building locations, heights and orientation. If some other measure is universally applied, and if it later proves ineffective, the cost to wildlife and to the University could be very high. Although I do not know the exact cost of the replacement of clear glass panels with fritted glass at the Javits Center, it was likely a major portion of a $1.5 billion renovation.

93 cont.

In the face of high predicted fatality rates, and in the face of high uncertainty over mitigation efficacy, erring on the side of caution would be the prudent approach. Informed decisions are needed. Implementation of measures according to tenets of experimental design would most quickly and most convincingly facilitate tests of efficacy. If fatality monitoring was initiated immediately and if it covered both old and new buildings, then opportune before-after, control-impact (BACI) experimental designs could be used to test the efficacy of various measures. As BACI tests are completed, mitigation measures could be revised for buildings yet to be built. Regardless of whether mitigation measures are experimentally tested, post-construction fatality monitoring should be performed.

The predicted magnitude of bird-window collision fatalities is so large that even if one or more mitigation measures reduce fatalities by 90%, the 10% of fatalities that could not be avoided will still be more than enough to warrant compensatory mitigation. UCSF

should mitigate bird-window collision impacts by purchasing easements or fee title to open space to be preserved as wildlife habitat.

Compensatory mitigation ought also to include funding contributions to wildlife rehabilitation facilities to cover the costs of injured animals that will be delivered to these facilities for care. Most of the wildlife injuries will likely be caused by window collisions.

93 cont.

Recommendations on Siting

For birds encountering tall buildings, the project site is inherently dangerous due to its location at the base of a steeply-sloped, forested open space reserve, which is also one of the last remaining patches of open space for migrating and dispersing birds to find stop-over habitat in San Francisco. Even if mitigation measures could reduce bird collision fatalities by 90%, the unavoidable 10% of fatalities and the energetic costs of the barrier effect of the buildings would cause significant, long-term impacts to birds. What I found to be most effective at minimizing collision fatalities caused by wind turbines was careful siting (Smallwood et al. 2017). The same approach would likely prove most effective at minimizing building impacts on wildlife.

There are two types of siting: Macro and micro. Macro-siting refers to selection of a project site, whereas micro-siting refers to selection of locations for project components within the boundary of a project site. Both levels of siting can substantially mitigate impacts to wildlife, but macro-siting usually offers the greatest opportunity for minimizing impacts. Applying macro-siting to the proposed project would consider impacts to wildlife if the new square footage was located at the site of UCSF's Medical Center at Mount Zion, or in Bayview at the Hunters Point shipyard, as examples. Of course, macro-siting must also consider project objectives but can also consider collateral opportunities for students and host communities. Other factors considered, siting the project farther from Mount Sutro Open Space Reserve would vastly lessen impacts to birds.

94

Micro-siting also bears considerable capacity for reducing project impacts to birds, but probably not without reducing the size of the project and minimizing the extent of windows on building façades. Building heights would need to be reduced, both on the Parnassus Campus and Aldea Housing. The tallest of buildings would best be sited as far north as possible on the Parnassus Campus to minimize bird impacts. The tallest building in Aldea Housing would kill fewer birds if it was placed lower on the slope, closer to Clarendon Avenue, and if the shortest buildings were placed higher on the slope. In both cases, the micro-siting strategy would be to site the taller buildings farther from the steep, forested slopes of Mount Sutro in order to give birds more room to negotiate their ways hazard-free to or from Mount Sutro.

Thank you for your attention,

_____

Subject: Comments on UCSF Comprehensive Parnassus Heights Plan (SCH No. 2020010175)

Dear Mr. Drury,

We have reviewed the July 2020 Draft Environmental Impact Report ("DEIR") for the UCSF Comprehensive Parnassus Heights Plan ("Project") located in the City of San Francisco ("City"). The Project proposes to demolish 287,000-SF of existing buildings and construct the Irving Street Arrival Project, which includes 25,000-SF of multi-story vertical circulation space; a 270,000-SF Research and Academic Building ("RAB"); a 955,000-SF New Hospital; and the Initial Aldea Housing Densification, including 184 residential dwelling units and 184 parking spaces, all on the 107-acre Project site.

Our review concludes that the DEIR fails to adequately evaluate the Project's air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project are underestimated and inadequately addressed. An updated EIR should be prepared to adequately assess and mitigate the potential air quality, health risk, and greenhouse gas impacts that the project may have on the surrounding environment. 95

Air Quality

Unsubstantiated Input Parameters Used to Estimate Project Emissions

The DEIR's air quality analysis relies on emissions calculated with CalEEMod.2016.3.2.[1] CalEEMod provides recommended default values based on site-specific information, such as land use type, 96

[1] CAPCOA (November 2017) CalEEMod User's Guide, http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4.

meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence.[2] Once all of the values are inputted into the model, the Project's construction and operational emissions are calculated, and "output files" are generated. These output files disclose to the reader what parameters were utilized in calculating the Project's air pollutant emissions and make known which default values were changed as well as provide justification for the values selected.[3]

96 cont.

Review of the Project's air modeling demonstrates that the DEIR underestimates emissions associated with Project activities. As previously stated, the DEIR's air quality analysis relies on air pollutant emissions calculated using CalEEMod. When reviewing the Project's CalEEMod output files, provided as Appendix AIR to the DEIR, we found that several model inputs were not consistent with information disclosed in the DEIR. As a result, the Project's construction and operational emissions are underestimated. An updated EIR should be prepared to include an updated air quality analysis that adequately evaluates the impacts that construction and operation of the Project will have on local and regional air quality.

Unsubstantiated Utility Company and Intensity Factors

Review of the Project's CalEEMod output files demonstrates that the utility company was modeled as "User Defined" with a manually-inputted CO_2 intensity factor of 605.78 pounds per megawatt hour ("lbs/MWh"), a CH_4 intensity factor of 0 lbs/MWh, and an N_20 intensity factor of 0 lbs/MWh (see excerpt below) (Appendix AIR, pp. 1172, 1250, 1264, 1282, 1357, 1371).

97

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[4] According to the "User Entered Comments & Non-Default Data" table, the CO_2, CH_4, and N_20 intensity factors reflect the "UCSF specific CO2 EF prior to 2025 net zero" (Appendix AIR, pp. 1250). However, this is incorrect for two (2) reasons. First, this justification fails to provide a source for the intensity factors assumed by the model and as a result, we cannot verify the updated intensity factors. Second, the CH_4 and N_20 were *not* inputted and instead incorrectly left as 0 lbs/MWh. According to the CalEEMod User's Guide:

[2] CAPCOA (November 2017) CalEEMod User's Guide, http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 1, 9.
[3] CAPCOA (November 2017) CalEEMod User's Guide, http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, fn 1, p. 11, 12 – 13. A key feature of the CalEEMod program is the "remarks" feature, where the user explains why a default setting was replaced by a "user defined" value. These remarks are included in the report.
[4] CalEEMod User Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 2, 9

"[I]f the utility for the project is not in the drop down list, the user may select User Defined and *the user will need to manually enter the various intensity factors*" (emphasis added).[5]

As you can see in the excerpt above, if "User Defined" is selected as the utility company, the CO_2, CH_4, and N_20 intensity factors should be manually inputted. Here, however, the CH_4 and N_20 values were incorrectly left as 0 lbs/MWh. Inputting an unsupported CO_2 intensity factor, as well as failing to input CH_4 and N_20 intensity factors, presents an issue, as CalEEMod uses the CO_2, CH_4, and N_20 intensity factors to calculate the Project's greenhouse gas ("GHG") emissions associated with electricity use. [6] As a result, the models may underestimate the Project's GHG emissions and should not be relied upon to determine Project significance. 97 cont.

Failure to Include All Proposed Land Uses

According to the DEIR, the Project would include a temporary construction office between 25,000- and 45,000-SF in size (p. 3-27). However, review of the Project's CalEEMod output files demonstrates that this land use was not modeled or evaluated whatsoever (Appendix AIR, pp. 1085, 1112, 1146, 1172, 1297, 1327, 1357, 1371). This presents an issue, as the land use type and size features are used throughout CalEEMod to determine default variable and emission factors that go into the model's calculations.[7] For example, the square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy impacts). Furthermore, CalEEMod assigns each land use type with its own set of energy usage emission factors.[8] Thus, by failing to include the proposed temporary construction office in any of the CalEEMod models, the DEIR fails to account for the Project's construction-related and operational emissions associated with this land use and should not be relied upon to determine Project significance. 98

Failure to Model Parking

According to the DEIR, the Initial Aldea Housing Densification component of the Project would include one parking space per unit (p. 3-28). Given that the Initial Aldea Housing Densification includes 184 student housing units, the corresponding model should have included 184 parking spaces (p. 3-28).[9] However, review of the Project's CalEEMod output files demonstrates that the models fail to include any amount of parking (see excerpt below) (Appendix AIR, pp. 1085, 1357). 99

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area
Apartments High Rise	184.00	Dwelling Unit	2.97	184,000.00

[5] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 17.
[6] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* CalEEMod.com, p. 17.
[7] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/upgrades/2016.3/01_user-39-s-guide2016-3-1.pdf?sfvrsn=2, p. 17
[8] "CalEEMod User's Guide, Appendix D." CAPCOA, September 2016, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/upgrades/2016.3/05_appendix-d2016-3-1.pdf?sfvrsn=2
[9] Calculated: (184 residential units) * (1 parking space per residential unit) = 184 parking spaces.

This presents an issue, as the land use type and size features are used throughout CalEEMod to determine default variable and emission factors that go into the model's calculations.[10] For example, the square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy impacts). Furthermore, CalEEMod assigns each land use type with its own set of energy usage emission factors.[11] Thus, by failing to include the proposed parking associated with the Initial Aldea Housing Densification, the models underestimate the Project's construction-related and operational emissions and should not be relied upon to determine Project significance.

99 cont.

Incorrect Land Use Sizes

According to the DEIR, 24,000-SF of demolition would be required for the construction of new student housing structures associated with the Initial Aldea Housing Densification component of the Project (p. 3-37). Thus, the "Existing Emissions Aldea Housing Initial Phase Demolition" should have included 24,000-SF of residential land use space to be demolished. However, review of the Project's CalEEMod output files demonstrates that the "Existing Emissions Aldea Housing Initial Phase Demolition" model incorrectly includes 145,000-SF of "Research & Development" land use space (see excerpt below) (Appendix AIR, pp. 1282).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area
Research & Development	145.00	1000sqft	3.33	145,000.00

100

As you can see in the excerpt above, the existing land use to be demolished for the Initial Aldea Housing Densification is overestimated in size and modeled using an incorrect land use type. This presents an issue, as the land use type and size features are used throughout CalEEMod to determine default variable and emission factors that go into the model's calculations.[12] For example, the square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy impacts). Furthermore, CalEEMod assigns each land use type with its own set of energy usage emission factors.[13] By including an overestimated existing land use size and incorrect land use type, the model overestimates the emissions associated with the existing land use. As a result, the DEIR may *underestimate the net increase* in operational emissions resulting from the Initial Aldea Housing Densification component of the Project and the air quality significance determination should not be relied upon.

Incorrect Operational Land Use Types & Sizes

Review of the Project's CalEEMod output files demonstrates that the land use types and sizes were inputted incorrectly into the Project's four (4) operational models. Specifically, review of the "CPHP Operational Existing" model demonstrates that that ***all*** of the Project's existing land use space was modeled as "Hospital" (see excerpt below) (Appendix AIR, pp. 1217).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Hospital	3,900.00	1000sqft	89.53	3,900,000.00	0

As you can see in the excerpt above, all 3,900,000-SF of the existing land use space was modeled as "Hospital" in the "CPHP Operational Existing" model. Second, review of the "CPHP Operational CPHP Campus Wide 2050" model demonstrates that ***all*** of the Project's land use space was again modeled as "Hospital" (see excerpt below) (Appendix AIR, pp. 1297).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Hospital	6,000.00	1000sqft	137.74	6,000,000.00	0

As you can see in the excerpt above, all 6,000,000-SF of the land use space was modeled as "Hospital" in the "CPHP Operational CPHP Campus Wide 2050" model. Third, review of the "CPHP Operational 2050 No Project" model demonstrates that ***all*** of the Project's land use space was again modeled as "Hospital" (see excerpt below) (Appendix AIR, pp. 1387).

101

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Hospital	3,900.00	1000sqft	89.53	3,900,000.00	0

As you can see in the excerpt above, all 3,900,000-SF of the land use space was modeled as "Hospital" in the "CPHP Operational 2050 No Project" model. However, modeling ***all*** of the proposed and existing Projects' 3.9 million and 6 million square feet of land use space, respectfully, as "Hospital" in these three (3) operational models is incorrect. According to the DEIR:

> "Currently, there is approximately 3.92 million gsf of building space on the campus site. The total amount of campus building space upon full implementation of the CPHP would be approximately 5.97 million gsf (*including instruction, research, clinical, and support space; housing; and structured parking*), when accounting for existing campus site development, demolition, and proposed new development" (emphasis added) (p. 2-2 – 2-3).

As you can see in the excerpt above, modeling the ***entirety*** of the existing and proposed Projects' operational space as "Hospital" is incorrect and unsubstantiated. Instead, these models should have included ***all*** of the land use spaces described, including Housing, University/College, Library, Parking, Hospital, Medical Office Building, and Research and Development space.

Furthermore, review of the "UCSF Initial Phase Projects Operational" model demonstrates that the model only includes a total of 270,000-SF of "Research & Development" land use space and 142,000-SF of "Apartments High Rise" land use space (see excerpt below) (Appendix AIR, pp. 1327).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Research & Development	270.00	1000sqft	2.50	270,000.00	0
Apartments High Rise	142.00	Dwelling Unit	2.29	142,000.00	406

As you can see in the excerpt above, that the model only includes a total of 270,000-SF of "Research & Development" land use space and 142,000-SF of "Apartments High Rise" land use space *in total*. However, only including these two (2) land use types for the Project's Initial Phase is incorrect. Specifically, according to the DEIR:

> "The Plan includes an "Initial Phase" that comprises: 1) Irving Street Arrival improvements, 2) RAB, 3) New Hospital, and 4) initial Aldea Housing Densification, and as well as other Initial Phase improvements. The Initial Phase would account for approximately 1.43 million gsf of new building development" (p. 2-3).

As you can see in the excerpt above, the Project's Initial Phase comprises a total of approximately 1.43 million gsf of new development, including Hospital, Research & Development, Residential, and Parking land use space. However, as previously described, the "UCSF Initial Phase Projects Operational" model only includes a *total* of 412,000-SF, comprised of *only* Research & Development and Residential space. This is incorrect, as the model underestimates the proposed Project's Initial Phase's land use space by approximately 1,018,000-SF and fails to include any Hospital or Parking space.

The incorrect land use type and size inputs throughout these four (4) models present an issue, as the land use type and size features are used throughout CalEEMod to determine default variable and emission factors that go into the model's calculations.[14] The square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy impacts). By underestimating the floor surface area and failing to model the correct land use types as indicated by the DEIR, the models may underestimate the Project's construction-related and operational emissions and should not be relied upon to determine Project significance.

101 cont.

Unsubstantiated Changes to Construction Phase Lengths

The Project's CalEEMod output files demonstrate that three (3) of the models include unsubstantiated changes to the Project's anticipated individual construction phase lengths. As a result, the models may underestimate the Project's construction-related emissions.

First, the "New Hospital Construction" model includes five (5) changes to the Project's anticipated construction schedule (see excerpt below) (Appendix AIR, pp. 1113-1114).

102

New Hospital Construction, Annual:

Table Name	Column Name	Default Value	New Value
tblConstructionPhase	NumDays	10.00	521.00

[14] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.caleemod.com/, p. 18.

tblConstructionPhase	NumDays	200.00	522.00
tblConstructionPhase	NumDays	200.00	1,043.00
tblConstructionPhase	NumDays	4.00	152.00
tblConstructionPhase	NumDays	2.00	152.00

Specifically, the architectural coating phase was increased by approximately 5,110%, from the default value of 10 to 521 days; the "Foundations/Concrete Pour" building construction phase was increased by approximately 161%, from the default value of 200 to 522 days; the "Building Construction" phase was increased by approximately 422%, from the default value of 200 to 1,043 days; the grading phase was increased by approximately 3,700%, from the default value of 4 to 152 days; and the site preparation phase was increased by approximately 7,500%, from the default value of 2 to 152 days.

Second, the "UCSF Irving Street Arrival Construction Only" model includes five (5) changes to the Project's anticipated construction schedule (see excerpt below) (Appendix AIR, pp. 1147-1148).

UCSF Irving Street Arrival Construction Only, Annual:

Table Name	Column Name	Default Value	New Value
tblConstructionPhase	NumDays	10.00	66.00
tblConstructionPhase	NumDays	5.00	132.00
tblConstructionPhase	NumDays	1.00	66.00
tblConstructionPhase	NumDays	100.00	326.00
tblConstructionPhase	NumDays	5.00	152.00

102 cont.

Specifically, the architectural coating phase was increased by approximately 2,940%, from the default value of 5 to 152 days; the building construction phase was increased by approximately 226%, from the default value of 100 to 326 days; the paving phase was increased by approximately 2,540% from 5 to 132 days; the grading phase was increased by approximately 560%, from the default value of 10 to 66 days; and the site preparation phase was increased by approximately 6,500%, from the default value of 1 to 66 days.

Third, the "UCSF CPHP RAB Construction" model includes six (6) changes to the Project's anticipated construction schedule (see excerpt below) (Appendix D, pp. 1173-1174).

UCSF CPHP RAB Construction, Annual:

Table Name	Column Name	Default Value	New Value
tblConstructionPhase	NumDays	10.00	523.00
tblConstructionPhase	NumDays	220.00	130.00
tblConstructionPhase	NumDays	220.00	675.00
tblConstructionPhase	NumDays	20.00	66.00
tblConstructionPhase	NumDays	6.00	219.00
tblConstructionPhase	NumDays	3.00	66.00

Specifically, the architectural coating phase was increased by approximately 5,130%, from the default value of 10 to 523 days; the "Foundations/Concrete Pour" building construction phase was decreased by approximately 41%, from the default value of 220 to 130 days; the "Building Construction" phase was increased by approximately 207%, from the default value of 220 to 675 days; the grading phase was increased by approximately 3,550%, from the default value of 6 to 219 days; the site preparation phase was increased by approximately 2,100%, from the default value of 3 to 66 days; and the demolition phase was increased by approximately 230%, from the default value of 20 to 66 days.

Thus, as you can see in the excerpts above, the "New Hospital Construction" model, the "UCSF Irving Street Arrival Construction Only" model, and the "UCSF CPHP RAB Construction" model contain several unsubstantiated changes to the individual construction phase lengths. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[15] According to the corresponding "User Entered & Comments & Non-Default Data" tables for the models, the justifications provided for these changes are: "Construction Schedule per applicants RFI response. LPPI Demo in 2014 LRDP," Construction schedule per applicant RFI response," and "Construction schedule provided by applicant," respectively (Appendix AIR, pp. 1112, 1146, 1172). However, the DEIR and associated documents fail to disclose the referenced RFI response, as indicated by the above justifications, or the Project's anticipated construction schedule, including individual phase lengths. Furthermore, while the DEIR mentions the tentative start and end date of each Project component, the DEIR fails to provide the specific *individual construction phase lengths* (p. 3-36 – 3-37). As a result, we cannot verify the reivsed construction schedules and individual construction phase lengths included in the models.

102 cont.

These unsubstantiated changes improperly spread out construction emissions over a longer period than is expected for the Project, which results in an underestimation of the maximum daily emissions associated with construction. In addition, according to the CalEEMod User's Guide, each construction phase is associated with different emissions activities (see excerpt below).[16]

> *Demolition* involves removing buildings or structures.
>
> *Site Preparation* involves clearing vegetation (grubbing and tree/stump removal) and removing stones and other unwanted material or debris prior to grading.
>
> *Grading* involves the cut and fill of land to ensure that the proper base and slope is created for the foundation.
>
> *Building Construction* involves the construction of the foundation, structures and buildings.
>
> *Architectural Coating* involves the application of coatings to both the interior and exterior of buildings or structures, the painting of parking lot or parking garage striping, associated signage and curbs, and the painting of the walls or other components such as stair railings inside parking structures.
>
> *Paving* involves the laying of concrete or asphalt such as in parking lots, roads, driveways, or sidewalks.

[15] CalEEMod User Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 2, 9

[16] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 31.

As such, by disproportionately altering individual construction phase lengths without proper justification, the models' calculations are altered and underestimate emissions. Thus, by including unsubstantiated changes to the Project's anticipated individual construction phase lengths, the model may underestimate the Project's maximum daily construction-related emissions and should not be relied upon to determine the significance of the Project's air quality impacts.

102 cont.

Failure to Include Total Amount of Demolition

According to the DEIR, 254,000-SF of demolition would be required for the construction of the proposed RAB component of the Project (p. 3-37). However, review of the Project's "UCSF CPHP RAB Construction" CalEEMod model demonstrates that the model fails to include the total amount of required demolition for RAB construction. As a result, the model underestimates the Project's construction-related emissions and should not be relied upon to determine Project significance.

According to the CalEEMod User's Guide, "[h]aul trips are based on the amount of material that is demolished, imported or exported assuming a truck can handle 16 cubic yards of material."[17] Therefore, the air model calculates a default number of hauling trips based upon the amount of demolition material inputted into the model. Inputting 254,000-SF of building demolition would result in a default demolition hauling truck trip number of 1,155 trips. However, review of the Project's "UCSF CPHP RAB Construction" CalEEMod output files demonstrates that the model calculated a default value of only 1,060 hauling truck trips (see excerpt below) (Appendix AIR, pp. 1179).

103

Phase Name	Offroad Equipment Count	Worker Trip Number	Vendor Trip Number	Hauling Trip Number	Worker Trip Length	Vendor Trip Length	Hauling Trip Length
Demolition	5	13.00	0.00	1,060.00	10.80	7.30	20.00
Site Preparation	3	8.00	0.00	4,954.00	10.80	7.30	20.00
Grading	4	10.00	0.00	3,420.00	10.80	7.30	20.00
Drainage/Utilities/Subgrade			0.00	0.00	10.80	7.30	
Foundations/Concrete Pour	8	86.00	44.00	0.00	10.80	7.30	20.00
Building Construction	8	86.00	44.00	0.00	10.80	7.30	20.00
Architectural Coating	1	17.00	0.00	0.00	10.80	7.30	20.00

As you can see in the excerpt above, the model for RAB construction fails to account for the full amount of demolition required for the Project. This presents an issue, as the total amount of demolition material is used by CalEEMod to determine the fugitive dust emissions associated with this phase of construction.[18] By failing to account for the demolition of all existing structures, the model underestimates the Project's fugitive dust emissions associated with demolition. Thus, the model underestimates the Project's construction-related emissions and should not be relied upon to determine the significance of air quality impacts.

[17] http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14
[18] CalEEMod User Guide, Appendix A, *available at:* http://www.caleemod.com/, p. 34.

Unsubstantiated Changes to Acres of Grading Values

Review of the Project's CalEEMod output files demonstrates that the "New Hospital Construction" and "UCSF CPHP RAB Construction" models include unsubstantiated reductions to the anticipated acres of grading values and as a result, the models may underestimate the Project's construction-related emissions.

First, the "New Hospital Construction" model includes reductions to the default acres of grading values (see excerpt below) (Appendix AIR, pp. 1114).

Table Name	Column Name	Default Value	New Value
tblGrading	AcresOfGrading	76.00	2.00
tblGrading	AcresOfGrading	228.00	3.00

As you can see in the excerpt above, the acres of grading value was reduced by roughly 97% during the grading phase of construction, from a default value of 76 acres to 2 acres, and by roughly 99% during the site preparation phase of construction, from a default value of 228 acres to 3 acres.

Second, the "UCSF CPHP RAB Construction" model includes reductions to the default acres of grading values (see excerpt below) (Appendix AIR, pp. 1174).

Table Name	Column Name	Default Value	New Value
tblGrading	AcresOfGrading	109.50	3.00
tblGrading	AcresOfGrading	99.00	4.50

104

As you can see in the excerpt above, the acres of grading value was reduced by roughly 97% during the grading phase of construction, from a default value of 109.5 acres to 3 acres, and by roughly 96% during the site preparation phase of construction, from a default value of 99 acres to 4.5 acres.

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[19] According to the "User Entered Comments & Non-Default Data" table for the "New Hospital Construction" model, the justification provided for these changes is: "Project site is two acres" (Appendix AIR, pp. 1112). Furthermore, according to the "User Entered Comments & Non-Default Data" table for the "UCSF CPHP RAB Construction" model, the justification provided for these changes is: "Excavation volume provided by applicant" (Appendix AIR, pp. 1172). However, these justifications are insufficient, as neither the dimensions of the Project site, nor the excavation volume, are utilized to determine the correct acres of grading values. According to the CalEEMod User's Guide:

> "[T]he dimensions (e.g., length and width) of the grading site have no impact on the calculation, only the total area to be graded. In order to properly grade a piece of land multiple passes with equipment may be required. The acres is based on the equipment list and days in grading or site

[19] CalEEMod User Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 2, 9

> preparation phase according to the anticipated maximum number of acres a given piece of equipment can pass over in an 8-hour workday."[20]

As you can see in the excerpt above, the acres of grading value is calculated based on the equipment list and grading or site preparation phase length, not the dimensions of the Project or grading site or excavation volume. As a result, these justifications are insufficient, and we cannot verify the revised acres of grading values. This presents an issue, as the acres of grading values are used by CalEEMod to estimate the dust emissions associated with grading.[21] Thus, by including unsubstantiated reductions to the Project's default acres of grading values, the models may underestimate the Project's construction-related emissions and should not be relied upon to determine the significance of air quality impacts.

104 cont.

Unsubstantiated Reduction of Hauling Trips

Review of the Project's CalEEMod output files demonstrates that the number of hauling trips required for construction of the Initial Aldea Housing Densification was reduced from 313- to 312-acres in the "UCSF Aldea Housing Initial Phase Construction" model (see excerpt below) (Appendix AIR, pp. 1087).

Table Name	Column Name	Default Value	New Value
tblTripsAndVMT	HaulingTripNumber	313.00	312.00

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[22] However, no justification is provided in the corresponding "User Entered Comments & Non-Default Data" table (Appendix AIR, pp. 1086). Furthermore, the DEIR fails to mention or substantiate this change whatsoever, and as a result, we cannot verify the revised hauling trip number. This unsubstantiated reduction presents an issue, as the number of hauling trips and associated vehicle miles traveled ("VMT") are used by CalEEMod to determine both the exhaust emissions associated with on-road vehicle use and fugitive dust emissions.[23] By including an unsubstantiated reduction to the Project's anticipated hauling trip number, the model may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

105

Incorrect Application of Tier 4 Final Mitigation

According to the DEIR, the Project would implement CPHP Mitigation Measure AIR-1a, which states:

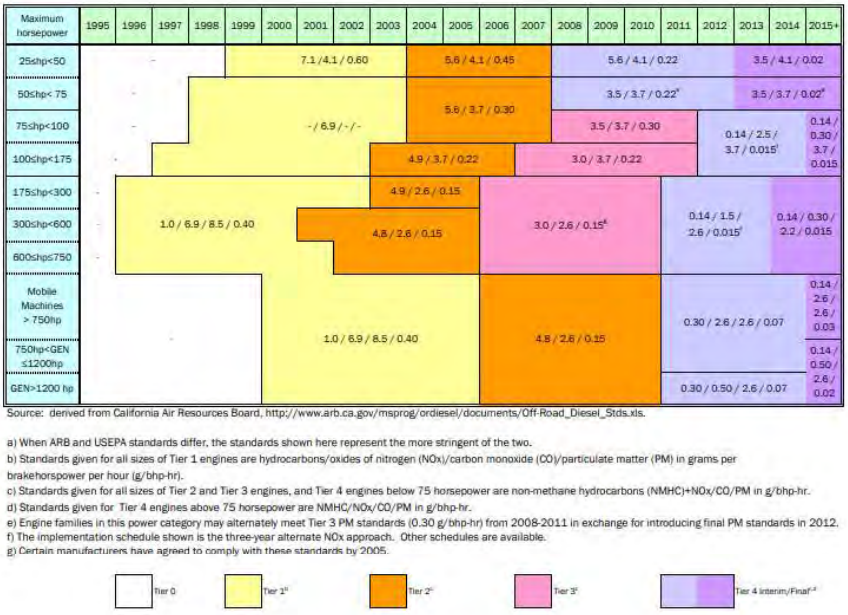
> "All mobile diesel-powered off-road equipment larger than 25 horsepower and operating on the project site for more than two days continuously shall be equipped with engines meeting USEPA emissions standards for ***Tier 4 engines*** or equivalent" (emphasis added) (p. 2-13, Table 2-3).

As the above excerpt demonstrates, CPHP Mitigation Measure AIR-1a requires the use of *Tier 4* equipment, but does not specify whether the Project would implement Tier 4 *Interim* or Tier 4 *Final*

106

[20] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 9.
[21] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 9.
[22] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[23] CalEEMod User Guide, Appendix A, *available at:* http://www.caleemod.com/, p. 13.

mitigation. However, review of the Project's CalEEMod output files demonstrates that the models estimated emissions assuming that the more efficient Tier 4 *Final* equipment would be used (Appendix AIR, pp. 1086-1087, 1113, 1147, 1173). This presents an issue, as the DEIR does not commit to the use of the more efficient Tier 4 *Final* equipment. The United States Environmental Protection Agency ("U.S. EPA") has slowly adopted more stringent standards to lower the emissions from off-road construction equipment since 1994. Since that time, Tier 1, Tier 2, Tier 3, Tier 4 *Interim*, and Tier 4 *Final* construction equipment has been phased in over time. Tier 4 *Final* represents the *cleanest* burning equipment and therefore has the lowest emissions compared to other tiers, including Tier 4 *Interim* equipment (see excerpt below):[24]



Source: derived from California Air Resources Board, http://www.arb.ca.gov/msprog/ordiesel/documents/Off-Road_Diesel_Stds.xls.

a) When ARB and USEPA standards differ, the standards shown here represent the more stringent of the two.
b) Standards given for all sizes of Tier 1 engines are hydrocarbons/oxides of nitrogen (NOx)/carbon monoxide (CO)/particulate matter (PM) in grams per brakehorspower per hour (g/bhp-hr).
c) Standards given for all sizes of Tier 2 and Tier 3 engines, and Tier 4 engines below 75 horsepower are non-methane hydrocarbons (NMHC)+NOx/CO/PM in g/bhp-hr.
d) Standards given for Tier 4 engines above 75 horsepower are NMHC/NOx/CO/PM in g/bhp-hr.
e) Engine families in this power category may alternately meet Tier 3 PM standards (0.30 g/bhp-hr) from 2008-2011 in exchange for introducing final PM standards in 2012.
f) The implementation schedule shown is the three-year alternate NOx approach. Other schedules are available.
g) Certain manufacturers have agreed to comply with these standards by 2005.

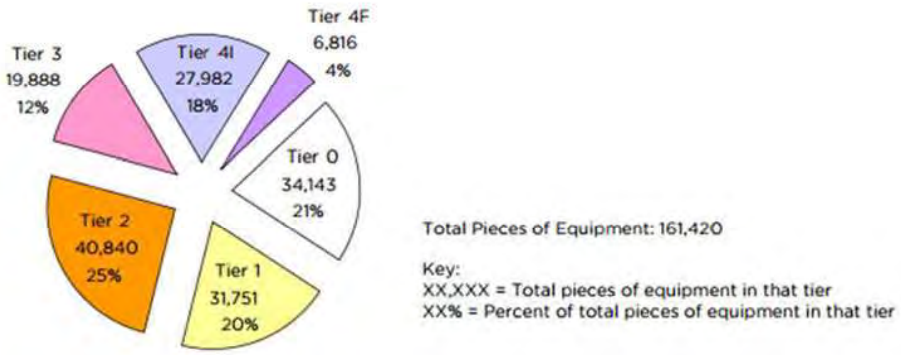
As demonstrated in the figure above, Tier 4 *Interim* equipment has greater emission levels than Tier 4 *Final* equipment. Therefore, by modeling construction emissions assuming nearly a full Tier 4 *Final* equipment fleet, the DEIR failed to account for higher emissions that may occur as a result of the use of Tier 4 *Interim* equipment. Since CPHP Mitigation Measure AIR-1a fails to specify whether the Project will use Tier 4 *Interim* or Tier 4 *Final* equipment, it is incorrect to model emissions assuming that the *more efficient* Tier 4 *Final* equipment will be used. Until the DEIR demonstrates that the Project will actually use Tier 4 *Final* engines during all phases of construction, and not Tier 4 *Interim* equipment, the DEIR's modeling should not be relied upon to determine Project significance.

106 cont.

[24] "San Francisco Clean Construction Ordinance Implementation Guide for San Francisco Public Projects." August 2015, *available at:* https://www.sfdph.org/dph/files/EHSdocs/AirQuality/San_Francisco_Clean_Construction_Ordinance_2015.pdf, p. 6

Furthermore, the DEIR failed to evaluate the *feasibility* of obtaining Tier 4 equipment. Due to the limited amount of Tier 4, especially Tier 4 ***Final***, equipment available, the DEIR should have assessed the feasibility in obtaining equipment with Tier 4 engines (see excerpt below).[25]

Figure 4: 2014 Statewide All Fleet Sizes (Pieces of Equipment)



As demonstrated in the figure above, the Tier 4 *Final* and *Interim* equipment only account for 4% and 18%, respectively, of all off-road equipment currently available in California. Thus, emissions are modeled assuming that the Project will be able to obtain Tier 4 ***Final*** equipment even though this equipment only accounts for 4% of available off-road equipment currently available in California. As a result, the model represents the best-case scenario even though obtaining these types of equipment may not be feasible. Until the Project evaluates the feasibility of obtaining Tier 4 equipment, the model may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

106 cont.

Unsubstantiated Changes to Vehicle Emission Factors

Review of the Project's CalEEMod output files demonstrates that numerous operational vehicle emission factors were manually altered in several of the models (Appendix AIR, pp. 1218-1232, 1298-1312, 1329-1343, 1389-1402). As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[26] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is: "EMFAC 2017" (Appendix AIR, pp. 1327). Furthermore, the DEIR states:

> "Operational emissions for the Irving Street Arrival, RAB and initial Aldea Housing Densification projects were estimated using the CalEEMod (version 2016.3.2) adjusted with recently EPA-approved Emfac2017 emissions factors" (p. 4.2-23).

107

However, these justifications are insufficient, as EMFAC refers to an ***entire database***, not a specific set of vehicle emission factors.[27] Thus, the DEIR and associated appendices should have either specified which

[25] "San Francisco Clean Construction Ordinance Implementation Guide for San Francisco Public Projects." August 2015, *available at:* https://www.sfdph.org/dph/files/EHSdocs/AirQuality/San_Francisco_Clean_Construction_Ordinance_2015.pdf.
[26] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[27] "EMFAC2017 Web Database." CARB, *available at:* https://arb.ca.gov/emfac/2017/.

input parameters were used to obtain the vehicle emission factors inputted in the model or disclosed the specific set of emission factors inputted into the model from the database. Without specific input parameters or a specific set of emission factors, we cannot verify the revised operational vehicle emission factors inputted into the models. This presents an issue, as the vehicle emission factors are used by CalEEMod to calculate the Project's emissions associated with operational on-road vehicles.[28] Thus, by including unsubstantiated changes to the Project's operational vehicle emission factors, the models may underestimate the Project's operational emissions and should not be relied upon to determine Project significance.

107 cont.

Unsubstantiated Change to Consumer Product Emission Factors

Review of the Project's CalEEMod output files demonstrates that the models include a manual reduction to the Project's anticipated consumer product reactive organic gas/volatile organic compound ("ROG/VOC") emission factor ("ROG_EF") value (see excerpt below) (Appendix AIR, pp. 1218, 1251, 1298, 1388).

Table Name	Column Name	Default Value	New Value
tblConsumerProducts	ROG_EF	2.14E-05	1.51E-05

As you can see in the excerpt above, the ROG_EF value was reduced by 29%, from 2.14E-05 to 1.51E-5 pounds of ROG/VOC per square foot per day ("lb ROG/SF/day"). As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[29] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is: "SF specific ROG Factor" (Appendix AIR, pp. 1218, 1250, 1297, 1388). However, this justification fails to provide a source for the revised emission factor or disclose what "SF specific" even means. In addition, the DEIR fails to mention this change whatsoever. As a result, we cannot verify the updated emission factor. This presents an issue, as consumer product emission factors are used by CalEEMod to calculate the Project's ROG/VOC emissions.[30] Thus, by including an unsubstantiated change to the Project's anticipated consumer product emission factor, the models underestimate the Project's area-source operational emissions and should not be relied upon to determine Project significance.

108

Unsubstantiated Reduction to Road Silt Loading Value

Review of the Project's CalEEMod output files demonstrates that the road silt loading value was manually reduced from the default value of 0.1- to 0.048-grams per square meter ("g/m^2") in the "CPHP Operational Existing," "CPHP Operational CPHP Campus Wide 2050," "UCSF Initial Phase Projects Operational," and "CPHP Operational 2050 No Project" models (see excerpt below) (Appendix AIR, pp. 1218, 1298, 1329, 1388).

Table Name	Column Name	Default Value	New Value
tblRoadDust	RoadSiltLoading	0.1	0.048

109

[28] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[29] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[30] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

As you can see in the excerpt above, the Road Silt Loading value was reduced from the default value of 0.1- to 0.048-g/m^2. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[31] According to the "User Entered Comments & Non-Default Data" table, the justification provided for this change is "CARB Method 7.9" (pp. 1218, 1297, 1328, 1388). However, review of the DEIR demonstrates that neither the road silt loading value nor CARB Method 7.9 is mentioned whatsoever.

Furthermore, review of CARB's *Miscellaneous Process Methodology 7.9* ("CARB Method 7.9") reveals that this change is unsubstantiated and incorrect for two (2) reasons. First, CARB Method 7.9 demonstrates that the Road Silt Loading values provided are outdated and have not been updated since 2008. As CalEEMod was most recently updated in 2016, values from 2008 would already be considered and should not be used to "update" the model. Second, review of CARB Method 7.9 reveals that a Road Silt Loading value of 0.048 applies to *San Diego*, not San Francisco (see excerpt below).[32]

109 cont.

Air Basin	County	Air District	2012 VMT (million VMT per year)	2008 HPMS Travel Fractions (2)			
				Freeway	Major	Collector	Local, Local Urban (3)
SD	San Diego	SD	30,297	0.553	0.319	0.080	0.048

As you can see in the excerpt above, the Road Silt Loading value of 0.048, as manually inputted into the models for the proposed Project, applies to *San Diego*, not San Francisco. As a result, we cannot verify the revised road silt loading value.

This presents an issue, as the road silt loading value is used by CalEEMod to calculate the fugitive dust emissions associated with operational vehicle trips on paved roads.[33] Thus, by including an unsubstantiated reduction to the Project's anticipated road silt loading value, the models may underestimate the Project's operational emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Trip Rates

Review of the Project's CalEEMod output files demonstrates that the operational vehicle trip rates were manually reduced in the "UCSF Initial Phase Project's Operational" model (see excerpt below) (Appendix AIR, pp. 1343).

110

Table Name	Column Name	Default Value	New Value
tblVehicleTrips	ST_TR	10.18	9.00
tblVehicleTrips	SU_TR	8.91	8.55
tblVehicleTrips	WD_TR	13.22	12.00

[31] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[32] https://ww3.arb.ca.gov/ei/areasrc/fullpdf/full7-9_2016.pdf, Table 6, pp. 18.
[33] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.caleemod.com/, p. 29.

As a result, the model calculated Weekday, Saturday, and Sunday daily trip numbers of 2,734.28 (see excerpt below) (Appendix AIR, pp. 1349).

Land Use	Weekday	Saturday	Sunday
Apartments High Rise	147.68	147.68	147.68
Research & Development	2,586.60	2,586.60	2586.60
Total	2,734.28	2,734.28	2,734.28

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[34] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is: "Rate changes to match Adavant VMT" (Appendix AIR, pp. 1327). However, while the DEIR provides estimates of daily vehicle miles traveled ("VMT") per capita, the DEIR fails to indicate the *number of daily trips* that the Initial Phase of the proposed Project is expected to generate (p. 4.15-37, 4.15-42, 4.15-45). Furthermore, the DEIR indicates that the CPHP Future Phase would generate 52,200 daily trips, which is 1,809% higher than the number of trips included in the CPHP Initial Phase model (p. 4.15-29). As a result, we cannot verify the revised trip rates utilized in the model. By including unsubstantiated reductions to the Project's operational vehicle trip rates, the model may underestimate the Project's mobile-source operational emissions and should not be relied upon to determine Project significance.

110 cont.

Unsubstantiated Changes to Energy Use Values

Review of the Project's CalEEMod output files demonstrates that two (2) of the Project's operational models include unsubstantiated reductions to the Project's anticipated energy use values. As a result, the models may underestimate the Project's operational emissions.

First, the operational energy use values were manually reduced to 0 kilowatt hours per land use size per year ("KWhr/size/yr") in the "UCSF Initial Phase Project's Operational" model (see excerpt below) (Appendix AIR, pp. 1328).

Table Name	Column Name	Default Value	New Value
tblEnergyUse	LightingElect	741.44	0.00
tblEnergyUse	LightingElect	2.99	0.00
tblEnergyUse	NT24E	3,054.10	0.00
tblEnergyUse	NT24E	3.36	0.00
tblEnergyUse	T24E	426.45	0.00

111

As you can see in the excerpt above, the lighting electricity ("LightingElect"), Nontitle-24 electricity energy intensity ("NT24E"), and Title-24 electricity energy intensity ("T24E") values were each reduced to 0 KWhr/size/yr. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[35] According to the "User Entered Comments & Non-Default Data" table for the

[34] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[35] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

"UCSF Initial Phase Project's Operational" model, the justification provided for these changes is: "UCSF Net zweo electricity by 2030" (Appendix AIR, pp. 1328). Furthermore, regarding the Project's energy use, the DEIR states:

> "UCSF has committed to net zero electricity by 2025 and no GHG emissions are predicted from electrical usage under full buildout of the CPHP" (p. 4.7-36, Table 4.7-3).

However, simply because UCSF has a zero net electricity *goal* for *2025* or *2030*, does not guarantee that it will be achieved locally on the Project site. Furthermore, without a substantial justification, the proposed Project cannot claim that the *campus-wide* zero net electricity *goal* will result in a project-level reduction in electricity use. Moreover, we are unable to verify if this goal is for 2025 or 2030, as the DEIR and "User Entered Comments & Non-Default Data" table provide contradictory years. Finally, the DEIR acknowledges that this goal is for 2025, which is 5 years away, and the "User Entered Comments & Non-Default Data" table acknowledges that this goal is for 2030, which is 10 years away. As a result, we cannot verify that the Project would result in zero electricity use throughout the Project's *entire* operation.

Second, the operational energy use values were manually reduced in the "RAB Energy Emissions Only" model (see excerpt below) (Appendix AIR, pp. 1371-1372).

Table Name	Column Name	Default Value	New Value
tblEnergyUse	T24E	1.21	0.97
tblEnergyUse	T24NG	17.85	14.28

111 cont.

As you can see in the excerpt above, the T24E and Title-24 natural gas energy intensity ("T24NG") values were each reduced by 20%. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[36] According to the "User Entered Comments & Non-Default Data" table for the "RAB Energy Emissions Only" model, the justification provided for these changes is: "UCSF to meet 20% reduction over Title 24. ADjuste T24 demand 20%" (Appendix AIR, pp. 1371). Furthermore, while CPHP Mitigation Measure AIR-2a requires the Project to "[i]ncrease building energy efficiency below Title 24," CPHP Mitigation Measure AIR-2a fails to specify *what specific percentage below Title 24 standards would be required* (p. 2-15, Table 2-3). The DEIR and associated documents also fail to disclose any of the assumptions or calculations used to conclude this 20% reduction. Without disclosing this information, including an analysis of the feasibility of achieving this reduction, we are unable to confirm that it will actually be achieved on the Project site. As a result, we cannot verify the revised T24E and T24NG energy use values.

These unsubstantiated changes present an issue, as the energy use values are used by CalEEMod to calculate the Project's emissions associated with building electricity and natural gas usage.[37] Thus, by including unsubstantiated reductions to the Project's anticipated energy use values, the models

[36] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[37] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 43

underestimate the Project's operational emissions and should not be relied upon to determine Project significance. 111 cont.

Diesel Particulate Matter Health Risk Emissions Inadequately Evaluated

The DEIR includes health risk assessments ("HRAs") for construction of the Irving Street Arrival, RAB, New Hospital, and Initial Aldea Housing Densification components of the Initial Phase of the Project and concludes that the resulting cancer risks would be 1.17, 2.91, 4.72, and 0.67 in one million, respectively, after the implementation of CPHP Mitigation Measure AIR-1a (see excerpts below) (p. 4.2-53-56, Table 4.2-15, Table 4.2-16, Table 4.2-17, Table 4.2-18). 112

Irving Street Arrival Construction:

TABLE 4.2-15
MITIGATED PROJECT HEALTH IMPACTS ESTIMATED, IRVING STREET ARRIVAL CONSTRUCTION

Receptor Type[a]	Cancer Risk	Chronic Hazard Index[b,c]	$PM_{2.5}$ Concentration ($\mu g/m^3$)[c]
Resident – Offsite Receptor			
Project Construction[d]	1.17	<0.01	<0.01
Significance Threshold	10	1.0	0.3
Significant (Yes or No)?	No	No	No

RAB Construction:

TABLE 4.2-16
MITIGATED PROJECT HEALTH IMPACTS ESTIMATED, RAB CONSTRUCTION

Receptor Type[a]	Cancer Risk	Chronic Hazard Index[b,c]	$PM_{2.5}$ Concentration ($\mu g/m^3$)[c]
Resident – Offsite Receptor			
Project Construction[d]	2.91	<0.01	0.01
Significance Threshold	10	1.0	0.3
Significant (Yes or No)?	No	No	No

New Hospital Construction:

TABLE 4.2-17
MITIGATED PROJECT HEALTH IMPACTS ESTIMATED, NEW HOSPITAL CONSTRUCTION

Receptor Type[a]	Cancer Risk	Chronic Hazard Index[b,c]	$PM_{2.5}$ Concentration ($\mu g/m^3$)[c]
Resident – Offsite Receptor			
Project Construction[d]	4.72	<0.01	0.01
Significance Threshold	10	1.0	0.3
Significant (Yes or No)?	No	No	No

Initial Aldea Housing Densification Construction:

TABLE 4.2-18
MITIGATED PROJECT HEALTH IMPACTS ESTIMATED, INITIAL ALDEA HOUSING DENSIFICATION CONSTRUCTION

Receptor Type[a]	Cancer Risk	Chronic Hazard Index[b,c]	$PM_{2.5}$ Concentration ($\mu g/m^3$)[c]
Resident – Offsite Receptor			
Project Construction[d]	0.67	<0.01	<0.01
Significance Threshold	10	1.0	0.3
Significant (Yes or No)?	No	No	No

As you can see in the excerpts above, the DEIR concludes that the construction of Irving Street Arrival, RAB, New Hospital, Initial Aldea Housing Densification components of the Project would result in mitigated cancer risks of 1.17, 2.91, 4.72, and 0.67 in one million, respectively. As a result, the DEIR concludes that the Project's mitigated construction-related cancer risks would not exceed the BAAQMD threshold of 10 in one million (p. 4.2-53-56, Table 4.2-15, Table 4.2-16, Table 4.2-17, Table 4.2-18). Furthermore, regarding the Project's operational health risk impacts, the DEIR states:

> "[P]otential incremental cancer risks associated with operation of the RAB were estimated. As discussed below, no new TAC sources such as emergency generators are included in the Irving Street Arrival or for the Aldea Housing Densification projects and therefore, these projects are not analyzed below for potential cancer risk from operational TAC sources" (p. 4.2-61).

Thus, as a result of an operational HRA prepared to evaluate the health risk impacts associated with the *emergency generators* included in the RAB component of the Project *only*, the DEIR concludes that the Project would result in an operational cancer risk of 0.26 in one million (see excerpt below) (p. 4.2-62, Table 4.2-19).

112 cont.

TABLE 4.2-19
ESTIMATED OPERATIONAL HEALTH IMPACTS OF THE RAB

Receptor Type	Cancer Risk	Chronic Hazard Index	Acute Hazard Index	$PM_{2.5}$ Concentration ($\mu g/m3$)[d]
Resident – Offsite Receptor				
Project Operations	0.26	<0.01	<0.01	0.01
Significance Threshold	10	1.0	1.0	0.3
Significant (Yes or No)?	No	No	No	No
Resident – Onsite Residence				
Project Operations	0.04	<0.01	<0.01	<0.01
Significance Threshold	10	1.0	1.0	0.3
Significant (Yes or No)?	No	No	No	No

As a result, the DEIR concludes that the Project's operational cancer risk would not exceed the BAAQMD threshold of 10 in one million (p. 4.2-62, Table 4.2-19). However, the DEIR's evaluation of the Project's health risk impacts, as well as the subsequent less-than-significant impact conclusion is incorrect for four (4) reasons.

First, as previously discussed, the DEIR's mitigated construction-related cancer risks rely upon the implementation of CPHP Mitigation Measure AIR-1a, which is included in the Project's CalEEMod models

as Tier 4 *Final* construction equipment. However, this is incorrect, as CPHP Mitigation Measure AIR-1a fails to indicate whether Tier 4 *Interim* or Tier 4 *Final* construction equipment would be required and as such, impacts may be reduced by an overestimated amount. Furthermore, as discussed above, the DEIR fails to evaluate the feasibility of obtaining a construction fleet of entirely Tier 4 *Final* equipment. As a result, the application of Tier 4 *Final* mitigation in the DEIR's CalEEMod models is unsupported, and the DEIR's reliance upon this mitigation measure is incorrect. As such, without specifying which type of Tier 4 mitigation would be implemented and evaluating the feasibility of obtaining this equipment, the DEIR should not rely on CPHP Mitigation Measure AIR-1a to reduce the health risk impacts associated with Project construction to a less than significant level.

Second, while DEIR includes an HRA assessing the health risk impacts associated with the *emergency generators* associated with the operation of the RAB component of the Initial Phase of the Project, the DEIR fails to evaluate the health risk impacts resulting from the Project's *entire* operation. This is incorrect, as the DEIR indicates that the CPHP would result in 52,200 daily vehicle trips throughout operation, which will result in additional exhaust (p. 4.15-29, Table 4.15-7). Furthermore, while the DEIR indicates that operational emissions of toxic air contaminants ("TACs") would occur as a result of mobile sources, in addition to stationary sources, the DEIR fails to provide any evaluation of the potential health risk impacts associated with these emissions whatsoever (p. 4.2-58). As such, this *partial* operational HRA cannot be used to determine impacts from the *entire* Project's operations, and the DEIR's less than significant health risk impact should not be relied upon. As such, we recommend that an updated assessment of health risk impacts posed to nearby sensitive receptors from Project operation be included in an updated EIR for the Project.

Third, review of the DEIR demonstrates that, while the Project did conduct several *partial* construction HRAs, as well as one *partial* operational HRA, that evaluate the health risk impacts to nearby, existing receptors, the HRA fails to evaluate the *cumulative* lifetime cancer risk to nearby, existing receptors as a result of Project construction and operation *together*. According to OEHHA guidance, as referenced by the DEIR, "the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location".[38] However, the HRAs conducted in the DEIR fail to sum each age bin to evaluate the total cancer risk over the course of the Project's construction and operation, as is required by the guidance. This is incorrect and thus, an updated analysis should quantify the Project's construction and operational health risks and then sum them to compare to the BAAQMD threshold of 10 in one million, as referenced by the DEIR (p. 4.2-16).

112 cont.

Greenhouse Gas

Failure to Adequately Evaluate Greenhouse Gas Impacts

The DEIR concludes that the Project would result in an annual increase in greenhouse gas ("GHG") emissions of 61,815 metric tons of carbon dioxide equivalents per year ("MT CO_2e/year"), as well as a service population efficiency of 10.9 metric tons of carbon dioxide equivalents per service population

113

[38] "Guidance Manual for preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf p. 8-4

per year ("MT CO_2e/SP/year"), which indicates a significant GHG impact (p. 4.7-36). As a result, the DEIR includes CPHP Mitigation Measure GHG-1c, which states:

> "[Mitigation Measure GHG-1c] is identified to reduce GHG emissions under the CPHP to a net zero increase and a less than significant impact with mitigation. To achieve the net zero increase, CPHP Mitigation Measure GHG-1c sets forth a numerical performance standard based on the existing GHG emissions inventory for the Parnassus Heights campus site and requires any GHG emissions in excess of the existing inventory of 125,426 MT CO2e per year to be offset" (p. 4.7-37).

Furthermore, the DEIR relies upon the Project's consistency with CARB's 2017 *Scoping Plan* and the Plan Bay Area 2040 in order to conclude that the Project would result in a less than significant GHG impact (p. 4.7-44 – 4.7-45). Specifically, the DEIR states:

> "By implementing the updated GHGRS and CPHP Mitigation Measures GHG-1a through 1c, thereby achieving consistency with UCSF's CNI, the CPHP would be consistent with CARB's 2017 Scoping Plan Update and with Executive Order S-3-05, which established a goal of reducing California's GHG emissions to 80 percent below the 1990 level by the year 2050. The CPHP would also be consistent with Plan Bay Area 2040, which includes the Regional Transportation Plan, and was adopted as the Bay Area's Sustainable Communities Strategy pursuant to California Senate Bill 375" (p. 4.7-44 – 4.7-45).

However, the DEIR's quantitative and qualitative GHG analyses, as well as the subsequent less than significant impact conclusion, are incorrect for the following three (3) reasons:

1) The DEIR's quantitative analysis of the Project's GHG emissions relies upon an incorrect and unsubstantiated air model;
2) The DEIR incorrect relies upon the Project's consistency with CARB's 2017 *Scoping Plan* to determine Project significance; and
3) The DEIR incorrect relies upon the Project's consistency with the Plan Bay Area 2040 to determine Project significance.

113 cont.

1) Incorrect and Unsubstantiated Analysis of Emissions

As discussed above, the DEIR concludes that the proposed Project would generate net annual GHG emissions of 61,815 MT CO_2e/year, as well as a service population efficiency of 10.9 MT CO_2e/SP/year. However, the DEIR's quantitative GHG analysis is underestimated and unsubstantiated. As previously discussed, when we reviewed the Project's CalEEMod output files, provided as Appendix AIR to the DEIR, we found that several of the values inputted into the model are not consistent with information disclosed in the DEIR and associated documents. As a result, the model underestimates the Project's GHG emissions, and the DEIR's quantitative GHG analysis should not be relied upon to determine Project significance. An updated EIR should be prepared that adequately assesses the potential GHG impacts that construction and operation of the proposed Project may have on the surrounding environment.

114

2) Incorrect Reliance upon CARB's 2017 Scoping Plan

As previously discussed, the DEIR relies upon the Project's consistency with CARB's *Scoping Plan* to determine the Project's GHG significance. However, this is incorrect for two (2) reasons.

First, many of the measures include future reduction targets at the city, state, and local levels. However, just because the *state/region/agency* have these *goals* does not mean that they will be achieved locally on the Project site. As such, the DEIR cannot claim that the Project complies with these measures, when they may not even be achieved.

Two, review of CARB's *Scoping Plan* demonstrates that the proposed Project is inconsistent with several measures, including but not limited to the analysis below:

CARB 2017 Scoping Plan[39]	
Measures – Construction	
Divert and recycle construction and demolition waste, and use locally-sourced building materials with a high recycled material content to the greatest extent feasible	Here, the DEIR fails to mention or discuss the feasibility of diverting and recycling construction and demolition waste. Furthermore, the DEIR also fails to mention or discuss the feasibility of using locally-sourced building materials with a high recycled material content. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Utilize existing grid power for electric energy rather than operating temporary gasoline/diesel powered generators	Here, the DEIR fails to mention the use of existing grid power for electric energy rather than operational gasoline or diesel powered generators. Furthermore, the DEIR discusses how the Project site contains two gas turbine generators and 14 diesel generators (Table 4.2-4, p. 4.2-13). As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Measures – Operation	
Allow for new construction to install fewer on-site parking spaces than required by local municipal building code, if appropriate	Here, the DEIR fails to mention or allow the Project to install fewer on-site parking spaces than required by local municipal building code. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.

115

[39] California Air Resources Board ("CARB") (Jan. 2017) 2017 Scoping Plan, Appendix B-Local Action, *available at:* https://ww3.arb.ca.gov/cc/scopingplan/2030sp_appb_localaction_final.pdf, p. 8-10.

Require on-site renewable energy generation	Here, the DEIR states that "CPHP operations would require long-term consumption of energy in the form of electricity, natural gas, gasoline, and diesel fuel" and that "the CPHP would not require additional power generation plants… to be constructed" (p. 4.5-20, 4.5-25). Thus, the DEIR fails to require or discuss the feasibility of on-site renewable energy generation. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require solar-ready roofs	Here, the DEIR fails to mention or require solar-ready roofs. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require low-water landscaping in new developments (see CALGreen Divisions 4.3 and 5.3 and the Model Water Efficient Landscape Ordinance [MWELO], which is referenced in CALGreen). Require water efficient landscape maintenance to conserve water and reduce landscape waste.	Here, while the DEIR states that UCSF "shall *strive* to reduce potable water used for irrigation by converting to recycled water, implementing efficient irrigation systems, drought tolerant planting selections, and/or by removing turf," the Project fails to require or commit to the implementation of water efficient landscape. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Achieve Zero Net Energy performance building standards prior to dates required by the Energy Code	Here, the DEIR fails to mention or discuss the feasibility of achieving Zero Net Energy performance building standards prior to dates required by the Energy Code. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Develop a rideshare program targeting commuters to major employment centers	Here, the DEIR fails to mention developing a rideshare program to target commuters to major employment centers. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require gas outlets in residential backyards for use with outdoor cooking appliances such as gas barbeques if natural gas service is available	Here, the DEIR fails to mention or discuss the feasibility of requiring gas outlets in residential backyards for use with outdoor cooking appliances. As such, the proposed Project is not consistent

115 cont.

	with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require the installation of electrical outlets on the exterior walls of both the front and back of residences to promote the use of electric landscape maintenance equipment	Here, the DEIR fails to mention or discuss the feasibility of requiring the design of electric outlets on the exterior walls of both the front and back of residences to promote electric landscape maintenance equipment. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require the design of the electric outlets and/or wiring in new residential unit garages to promote electric vehicle usage	Here, the DEIR fails to mention or discuss the feasibility of requiring the design of electric outlets and/or wiring in residential unit garages to promote electric vehicle usage. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Provide electric outlets to promote the use of electric landscape maintenance equipment to the extent feasible on parks and public/quasi-public lands	Here, the DEIR fails to mention or discuss the feasibility of providing electric outlets to promote the use of electric landscape maintenance equipment. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require each residential unit to be "solar ready," including installing the appropriate hardware and proper structural engineering	Here, the DEIR fails to mention or discuss the feasibility of requiring each residential unit to be "solar ready." The DEIR also fails to mention or discuss the feasibility of requiring the appropriate hardware and proper structural engineering to be "solar ready." As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require the installation of energy conserving appliances such as on-demand tank-less water heaters and whole-house fans	Here, the DEIR discusses Energy Efficiency Reduction Measures, specifically that "UCSF *could* establish energy efficiency criteria for appliances installed on the Parnassus Heights campus site" (p. 4.7-37). While the DEIR states that the Project will comply with this measure because "CPHP [is] considered to have net zero electricity by 2025" (p. 4.7-37), this is incorrect. Net zero electricity by 2025 is in reference to the UC system-wide Carbon Neutrality Initiative goal of carbon neutrality across all UC campuses by 2025. Because this is a UC system-wide *goal* for net zero carbon emissions,

115 cont.

	we are unable to verify that this will result in energy efficient appliances locally at the Project site. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require each residential and commercial building equip buildings with energy efficient AC units and heating systems with programmable thermostats/timers	Here, while the DEIR discusses "improvements that involve building renovations are likely to improve building efficiency with potential reduction of operational emissions of the CUP for heating and cooling," DEIR fails to mention or discuss the feasibility of requiring Project to include energy efficient AC units and heating systems (p. 4.2-43). The DEIR also fails to mention or discuss the feasibility of requiring these AC units and heating systems to include programmable thermostats/timers. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require large-scale residential developments and commercial buildings to report energy use, and set specific targets for per-capita energy use	Here, the DEIR fails to mention or require the Project to report energy use or set specific targets for per-capita energy use. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require the use of energy-efficient lighting for all street, parking, and area lighting	Here, the DEIR fails to provide any explanation of how this measure would be implemented, monitored, and enforced on the Project site. As such, we cannot verify that the proposed Project is consistent with this measure, and the DEIR lacks substantial evidence to support its consistency determination.
Require the landscaping design for parking lots to utilize tree cover and compost/mulch	Here, the DEIR fails to mention or discuss the feasibility of requiring the landscape design for the Project's proposed parking to utilize tree cover and compost/mulch. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Incorporate water retention in the design of parking lots and landscaping, including using compost/mulch	Here, the DEIR fails to mention or discussion the incorporation of water retention in the design of parking lots and landscaping, specifically including using compost or mulch. As such, the proposed Project is not consistent with this measure and the

115 cont.

	DEIR lacks substantial evidence to support its consistency determination.

As the table above indicates, the DEIR fails to provide sufficient information and analysis to determine Project consistency with numerous measures under CARB's *Scoping Plan*. Thus, we cannot verify that the proposed Project will result in less than significant GHG impacts, as claimed in the DEIR. As a result, we recommend that an updated EIR include further information and analysis in order to conclude that the proposed Project would be consistent with CARB's *Scoping Plan*.

115 cont.

3) Failure to Demonstrate Consistency with Plan Bay Area 2040

As discussed above, the DEIR relies upon the Project's consistency with the Plan Bay Area 2040 (p. 4.7-45). However, this is incorrect for two (2) reasons.

First, according to the Plan Bay Area 2040:

> "It is important to emphasize that the region's cities and counties retain local land use authority and that local jurisdictions will continue to determine where future development occurs. Plan Bay Area 2040 is supported through implementation efforts such as neighborhood-level planning grants for PDAs and local technical assistance. *The plan does not mandate any changes to* local zoning rules, general plans *or processes for reviewing projects; nor is the plan an enforceable direct or indirect cap on development locations or targets in the region*. As is the case across California, the Bay Area's cities, towns and counties maintain control of all decisions to adopt plans and to permit or deny development projects" (emphasis added).[40]

As you can see in the excerpt above, the Plan Bay Area 2040 does not have the jurisdiction to *require* any changes. The Plan instead states that it *cannot* be used for reviewing projects or as an enforceable cap on development targets. As such, the DEIR's claim that the Project is consistent with the Plan Bay Area 2040 and can be used to determine less than significant impacts is incorrect and unsubstantiated.

116

Second, the Plan Bay Area 2040 does not qualify as an adequate GHG reduction plans or Climate Action Plan ("CAP"). CEQA Guidelines §§ 15064.4(b)(3) and 15183(b) allows a lead agency to consider a project's consistency with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. When read in conjunction, CEQA Guidelines §§ 15064.4(b)(3) and 15183.5(b)(1) make clear qualified GHG reduction plans or CAPs should include the following features:

(1) **Inventory**: Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities (e.g., projects) within a defined geographic area (e.g., lead agency jurisdiction);

[40] "Plan Bay Area 2040." Metropolitan Transportation Commission (MTC) and Association of Bay Area Governments (ABAG), July 2017, *available at:* http://2040.planbayarea.org/sites/default/files/2020-02/Final_Plan_Bay_Area_2040.pdf, p. 44.

(2) **Establish GHG Reduction Goal**: Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;
(3) **Analyze Project Types**: Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;
(4) **Craft Performance Based Mitigation Measures**: Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;
(5) **Monitoring**: Establish a mechanism to monitor the CAP progress toward achieving said level and to require amendment if the plan is not achieving specified levels;

Collectively, the above-listed features tie qualitative measures to quantitative results, which in turn become binding via proper monitoring and enforcement by the jurisdiction—all resulting in real GHG reductions for the jurisdiction as a whole, and substantial evidence demonstrating that a project's incremental contribution is not cumulatively considerable. Here, however, the DEIR fails to demonstrate that the Plan Bay Area 2040 includes the above-listed requirements to be considered a qualified GHG Reduction Plan for the City. As such, the DEIR leaves an analytical gap showing that compliance with said plan can be used for a project-level significance determination. Thus, the DEIR's GHG analysis regarding the Plan Bay Area 2040 should not be relied upon.

116 cont.

Third, the Plan Bay Area 2040's EIR discloses potential environmental impacts of the Plan, and provides mitigation measures in a Mitigation, Monitoring, and Reporting Program ("MMRP") for the Project. However, review of the Plan Bay Area 2040 EIR reveals that the proposed Project fails to address and is inconsistent with numerous mitigation measures, including but not limited to those listed below:

Plan Bay Area 2040[41]
EIR Mitigation Measures
Transportation
Mitigation Measure 2.1-3-3(b) Transportation demand management (TDM) strategies shall be incorporated into individual land use and transportation projects and plans, as part of the planning process. Local agencies shall incorporate strategies identified in the Federal Highway Administration's publication: Integrating Demand Management into the Transportation Planning Process: A Desk Reference (August 2012) into the planning process (FHWA 2012). For example, the following strategies may be included to encourage use of transit and non-motorized modes of transportation and reduce vehicle miles traveled on the region's roadways:

[41] "Plan Bay Area 2040 Draft Environmental Impact Report." MTC and ABAG, April 2017, *available at:* http://2040.planbayarea.org/sites/default/files/2017-07/PBA%202040%20DEIR_0_1.pdf, p. ES-11, Table ES-2.

- incorporate supporting infrastructure for non-motorized modes, such as, bike lanes, secure bike parking, sidewalks, and crosswalks;
- provide incentives to use alternative modes and reduce driving, such as, universal transit passes, road and parking pricing;
- implement parking management programs, such as parking cash-out;
- develop TDM-specific performance measures to evaluate project-specific and system-wide performance;
- incorporate TDM performance measures in the decision-making process for identifying transportation investments;
- implement data collection programs for TDM to determine the effectiveness of certain strategies and to measure success over time; and
- set aside funding for TDM initiatives.

The increase in per capita VMT on facilities experiencing LOS F represents a significant impact compared to existing conditions. To assess whether implementation of these specific mitigation strategies would result in measurable traffic congestion reductions, implementing actions may need to be further refined within the overall parameters of the proposed Plan and matched to local conditions in any subsequent project-level environmental analysis.

Mitigation Measure 2.1-7

Implementing agencies and/or project sponsors shall implement the following measure, where feasible and necessary based on project- and site-specific considerations. Implementing agencies shall require implementation of best practice strategies regarding construction activities on the transportation system and apply recommended applicable mitigation measures as defined by state and federal agencies. Examples of mitigation measures include, but are not limited to, the following:

- prepare a transportation construction plan for all phases of construction;
- identify arrival/departure times for trucks and construction workers to avoid peak periods of adjacent street traffic and minimize traffic affects;

encourage construction workers to use transit, carpool, and other sustainable transportation modes when commuting to and from the site.

Air Quality

Mitigation Measure 2.2-2)

When screening levels are exceeded (see Table 2.2-8 or those most currently updated by BAAQMD), implementing agencies and/or project sponsors shall implement measures, where applicable, feasible, and necessary based on project- and site-specific considerations, that include, but are not limited to the following:

Construction Best Practices for Exhaust:

- The applicant/general contractor for the project shall submit a list of all off-road equipment greater than 25 horsepower (hp) that would be operated for more than 20 hours over the entire duration of project construction, including equipment from subcontractors, to BAAQMD for

116 cont.

review and certification. The list shall include all information necessary to ensure the equipment meets the following requirement:

1. Be zero emissions OR
2. have engines that meet or exceed either EPA or ARB Tier 2 off-road emission standards; and
3. have engines that are retrofitted with an ARB Level 3 Verified Diesel Emissions Control Strategy (VDECS), if one is available for the equipment being used. Equipment with engines that meet Tier 4 Interim or Tier 4 Final emission standards automatically meet this requirement; therefore, a VDECS would not be required

- All construction equipment shall be maintained and properly tuned in accordance with the manufacturers' specifications.
- Portable diesel generators shall be prohibited. Grid power electricity should be used to provide power at construction sites; or propane and natural gas generators may be used when grid power electricity is not feasible.

Construction Best Practices for Dust:

- All excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 mph.
- Wind breaks (e.g., trees, fences) shall be installed on the windward side(s) of actively disturbed areas of construction. Wind breaks should have at maximum 50 percent air porosity.
- Vegetative ground cover (e.g., fast-germinating native grass seed) shall be planted in disturbed areas as soon as possible and watered appropriately until vegetation is established.
- The simultaneous occurrence of excavation, grading, and ground-disturbing construction activities on the same area at any one time shall be limited. Activities shall be phased to reduce the amount of disturbed surfaces at any one time.
- All trucks and equipment, including their tires, shall be washed off before leaving the site.
- Site accesses to a distance of 100 feet from the paved road shall be treated with a 6- to 12-inch compacted layer of wood chips, mulch, or gravel.
- Sandbags or other erosion control measures shall be installed to prevent silt runoff to public roadways from sites with a slope greater than one percent.

These BMPs are consistent with recommendations in BAAQMD's CEQA guidelines and Planning Healthy Places (BAAQMD 2010b, BAAQMD 2016). Applicable mitigation measures shall be required at the time grading permits are issued.
Here, the

As such, the DEIR is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency evaluation.

Mitigation Measure 2.2-5(a)

116 cont.

When locating sensitive receptors in TAC risk areas, implementing agencies and/or project sponsors shall implement measures, where feasible and necessary based on project- and site-specific considerations that include, but are not limited to the following:

- Install, operate and maintain in good working order a central heating, ventilation and air conditioning (HVAC) system or other air intake system in the building, or in each individual unit, that meets or exceeds a minimum efficiency reporting value (MERV) of 13 (MERV-16 for projects located in the West Oakland Specific Plan area) or higher. The HVAC system shall include the following features: Installation of a high efficiency filter and/or carbon filter to filter particulates and other chemical matter from entering the building. Either high efficiency particulate air (HEPA) filters or American Society of Heating, Refrigeration, and Air-Conditioning Engineers (ASHRAE) certified 85% supply filters shall be used.
- Maintain, repair and/or replace HVAC system on an ongoing and as needed basis or shall prepare an operation and maintenance manual for the HVAC system and the filter. The manual shall include the operating instructions and the maintenance and replacement schedule. This manual shall be included in the Covenants, Conditions and Restrictions (CC&Rs) for residential projects and/or distributed to the building maintenance staff. In addition, the applicant shall prepare a separate homeowners manual. The manual shall contain the operating instructions and the maintenance and replacement schedule for the HVAC system and the filters.
- Install passive electrostatic filtering systems with low air velocities (i.e., less than 1 mph).
- Individual and common exterior open space and outdoor activity areas proposed as part of individual projects shall be located as far away as possible within the project site boundary, face away major freeways, and shall be shielded from the source (i.e., the roadway) of air pollution by buildings or otherwise buffered to further reduce air pollution for project occupants.
- Locate air intakes and design windows to reduce PM exposure (e.g., windows nearest to the roadway do not open).
- If sensitive receptors are located near a distribution center, residents shall not be located immediately adjacent to a loading dock or where trucks concentrate to deliver goods.
- Sensitive receptors within buildings shall be located in areas upwind of major roadway traffic to reduce exposure to reduce cancer risk levels and exposure to PM2.5.
- Planting trees and/or vegetation between sensitive receptors and pollution source. Trees that are best suited to trapping PM shall be planted, including one or more of the following species: Pine (Pinus nigra var. maritima), Cypress (X Cupressocyparis leylandii), Hybrid popular (Populus deltoids X trichocarpa), California pepper tree (Schinus molle) and Redwoods (Sequoia sempervirens).
- Loading docks shall be required to include electric hookups for visiting trucks.
- Idling of heavy duty diesel trucks at these locations shall be prohibited or limited to no more than 2 minutes.
- If within the project site, existing and new diesel generators shall meet ARB's Tier 4 emission standards.

116 cont.

• Emissions from diesel trucks shall be reduced through establishing truck routes to avoid residential neighborhoods or other land uses serving sensitive populations, such as hospitals, schools, and child care centers. A truck route program, along with truck calming, parking and delivery restrictions, shall be implemented to direct traffic activity at non-permitted sources and large construction projects. These BMPs are consistent with recommendations in BAAQMD's CEQA guidelines and Planning Healthy Places (BAAQMD 2011, BAAQMD 2016).
Climate Change and Greenhouse Gases
Mitigation Measure 2.5-4(b) Implementing agencies and/or project sponsors shall implement measures, where feasible and necessary based on project- and site-specific considerations that include, but are not limited to, coordination with BCDC, Caltrans, local jurisdictions (cities and counties), and other transportation agencies to develop Transportation Asset Management Plans that consider the potential impacts of sea level rise over the life cycle of threatened assets.
Mitigation Measure 2.5-4(c) Implementing agencies shall require project sponsors to incorporate the appropriate adaptation strategy or strategies to reduce the impacts of sea level rise on specific local transportation and land use development projects, where feasible, based on project- and site-specific considerations. Potential adaptation strategies are included in the Adaptation Strategies (see Appendix F of this Draft EIR).

116 cont.

As the above table indicates, the DEIR fails to provide sufficient information and analysis to determine Project consistency with the required mitigation measures of the Plan Bay Area 2040. Thus, we cannot verify that the Project is consistent with the Plan, as claimed in the DEIR. As a result, we recommend that the Project not be approved until an updated EIR provide further information and analysis in order to conclude consistency for the proposed Project.

SWAPE has received limited discovery regarding this project. Additional information may become available in the future; thus, we retain the right to revise or amend this report when additional information becomes available. Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. No other warranty, expressed or implied, is made as to the scope of work, work methodologies and protocols, site conditions, analytical testing results, and findings presented. This report reflects efforts which were limited to information that was reasonably accessible at the time of the work, and may contain informational gaps, inconsistencies, or otherwise be incomplete due to the unavailability or uncertainty of information obtained or provided by third parties.

Sincerely,

Matt Hagemann, P.G., C.Hg.

Paul E. Rosenfeld, Ph.D.

Responses to Comments from Lozeau Drury LLP

O-LD2-1 The commenter raises general comments, including that the Draft EIR fails as informational document, and fails to impose mitigation measures. The commenter is referred to the individual responses to the comment letter that follow; see also Master Response 2: General Comments on EIR and Environmental Topics.

The commenter also makes a general comment that a revised draft EIR be prepared and recirculated. As demonstrated in the individual responses provided to the comments raised, and further in Section 8.1.4 in this Comments and Responses document, none of the specific issues identified in the comments, or response to these comments, result in any of the conditions of Section 15088.5(a) being met. Thus, UCSF has determined that recirculation of the Draft EIR on the issues raised by the comments is not warranted.

O-LD2-2A The commenter briefly summarizes certain historical aspects of the 2014 LRDP and development of the CPHP, and describes certain CPHP project characteristics. No response is required; see Master Response 1: Non-CEQA Comments.

O-LD2-2B The commenter asserts the CPHP reneges on the promise made by the UC Regents in 1976 to the City of San Francisco and the community to resolve a CEQA lawsuit that he Parnassus campus site would never exceed 3.55 million square feet, and the proposed exceedance of this space ceiling by over 2 million square feet would make a mockery of this false promise. Please refer to Master Response 4: Space Ceiling and Population.

O-LD2-3 The commenter references certain CEQA Guidelines sections and cites several court decisions on CEQA, but which do not specifically comment on the Draft EIR. No response is required to these comments; see Master Response 1: Non-CEQA Comments.

The commenter also makes a general comment that comments included in Comment Letter O-LD2-2 find that the EIR adequately analyzes and mitigates the CPHP impacts. The commenter is referred to the individual responses to the comment letter that follow; see also Master Response 2: General Comments on EIR and Environmental Topics.

O-LD2-4 The commenter asserts the CPHP reneges on the UC Regents promise to City of San Francisco and the community never to exceed the 3.55 million square feet at the Parnassus Heights campus site. The commenter also summarizes the historical aspects of the 1976 Regents' Resolution and subsequent revisions to it. Please refer to Master Response 4: Space Ceiling and Population.

O-LD2-5 The commenter asserts that the space ceiling is enforceable under the doctrine of promissory estoppel. Please refer to Master Response 4: Space Ceiling and Population.

O-LD2-6 The commenter asserts that the space ceiling does not impair the police power. Please refer to Master Response 4: Space Ceiling and Population.

O-LD2-7 The commenter asserts that the space ceiling is enforceable under the doctrine of equitable estoppel. Please refer to Master Response 4: Space Ceiling and Population.

O-LD2-8 The commenter makes a number of claims regarding the lawsuit over the 1975 LRDP. Please refer to Master Response 4: Space Ceiling and Population.

O-LD2-9 The commenter asserts that the Regents may not rely on the rule of relating to the conduct of government officials because its application would result in a grave injustice in this case. Please refer to Master Response 4: Space Ceiling and Population.

O-LD2-10 The commenter claims that the violation of the space ceiling policy is a significant impact under CEQA. Please refer to Master Response 4: Space Ceiling and Population.

O-LD2-11 The commenter asserts the Draft EIR fails to consider the impacts of COVID-19 in the baseline. The commenter is referred to Master Response 4: COVID-19.

O-LD2-12 The commenter summarizes various case law regarding EIR alternatives. The commenter is referred to Master Response 5: EIR Alternatives.

O-LD2-13 The commenter asserts UCSF failed to adopt the environmentally superior alternative. EIRs do not adopt alternatives, it is the responsibility of the lead agency to approve the project or an alternative and to make findings regarding feasibility. The commenter is referred to Master Response 5: EIR Alternatives.

O-LD2-14 The commenter asserts the Draft EIR fails to select the 2014 LRDP Alternative. The commenter is referred to Master Response 5: EIR Alternatives.

O-LD2-15 The commenter asserts the Draft EIR alternatives analysis is legally deficient because fails describe a reasonable range of alternatives. The commenter is referred to Master Response 5: EIR Alternatives.

O-LD2-16 The commenter asserts the Draft EIR alternatives analysis fails to mention the Hunters Point site. The commenter is referred to Master Response 5: EIR Alternatives.

O-LD2-17 The commenter claims the Draft EIR rejects many of the off-site alternatives because they are off-site. The commenter is referred to Master Response 5: EIR Alternatives.

O-LD2-18 The commenter asserts that the Draft EIR fails to describe details of several elements of the proposed New Hospital, despite the Draft EIR presenting information on the height and size of the building. The commenter does not identify what specific details of the New Hospital are not described in the Draft EIR. Regardless, as described in the Draft EIR Chapter 1, Introduction page 1-7, a program EIR has been prepared for the CPHP that establishes a framework for tiered or project-program environmental review. Accordingly, this EIR provides a program-level analysis of the environmental impacts that could result from the development of the entire space program under the CPHP (including the New Hospital), and identifies Plan-level mitigation measures to reduce potential significant effects of the CPHP. UCSF has begun to plan the New Hospital, and broad parameters for the New Hospital project (location, size, mass, height, and projected population) are accounted for at a program level in the CPHP and analyzed in this EIR. Further details of the New Hospital are being developed, including the specific design. Those elements of the New Hospital will be the subject of a subsequent project-specific environmental review when more details become available. It is anticipated that sufficient detail will be available to publish a project-level Draft EIR for the New Hospital in the summer of 2021.

O-LD2-19 The commenter references certain CEQA case law, and then makes a general comment that the Draft EIR contains impermissible deferred mitigation for several impacts. Please see the responses to specific comments made by the commenter regarding deferral of mitigation of wind impacts (Response O-LD2-20), cultural resource impacts (Response O-LD2-21), hazards and hazardous materials impacts (Response O-LD2-22), noise impacts (Response O-LD2-23), and travel conditions (Response O-LD2-24).

O-LD2-20 The comment states that the Draft EIR defers mitigation of effects related to pedestrian wind conditions. Please refer to Master Response 8: Wind Impacts.

O-LD2-21 The commenter asserts that the Draft EIR improperly defers CPHP Mitigation Measures CUL-1a, 1b, 1c, and 1d. The mitigation measures specify that they shall be implemented prior to demolition work or alterations to historic resources; however, the commenter claims that this results in improper deferral to an uncertain time and the measures should be implemented prior to project approval. With regard to CPHP Mitigation Measure CUL-1c, the commenter claims that the Draft EIR's conclusion of significant and unavoidable impacts on cultural resources cannot be supported without the preparation of a salvage plan. The commenter also claims that CPHP Mitigation Measure CUL-1d stands in place of mitigation that would preserve the murals and questions UCSF's explanation that the cost to preserve and relocate the murals is prohibitive. Please

refer to Master Response 11: Toland Hall Murals. Please also refer to Response A-SFP-10.

O-LD2-22 With respect to CPHP Mitigation Measure HAZ-1 in the Draft EIR, the commenter inquires why the Excavation Management Plan included in the measure has not already been conducted in order to inform decision-makers and the public reviewing the Draft EIR. This CPHP mitigation is identical to Mitigation Measure HAZ-LRDP-1 included in the 2014 LRDP Final EIR, and implemented for projects under the 2014 LRDP. CPHP Mitigation Measure HAZ-1 is not intended to be implemented prior to project approval, but rather, would be implemented prior to any excavation, demolition or construction activities. Regardless, the measure provides the appropriate mechanisms to ensure that the Excavation Management Plan would be prepared, and that the California Air Resources Board (CARB) Airborne Toxic Control Measures (ATCM) would be implemented. The ATCM measures address minimizing asbestos emissions from such activities where naturally-occurring asbestos is found or is likely to be found, and minimizing the release of asbestos fibers during activities involving the handling of asbestos. Implementation of CPHP Mitigation Measure HAZ-1 would reduce naturally-occurring asbestos exposure risks to a less than significant level.

With respect to CPHP Mitigation Measure HAZ-4 in the Draft EIR, the commenter inquires why the Soil Management Plan is not prepared prior to the Draft EIR. This CPHP mitigation measure is similar to Mitigation Measure HAZ-LRDP-2 included in the 2014 LRDP Final EIR, but modified for use at the Parnassus Heights campus site for construction activities that would occur under the CPHP. CPHP Mitigation Measure HAZ-4 is not intended to be implemented prior to the Draft EIR, but rather, would be implemented prior to any excavation, demolition or construction activities at the campus site under the CPHP. As specified in CPHP Mitigation Measure HAZ-4, the Soil Management Plan would include measures to address protocols for identifying, handling, and characterizing suspect contaminated soils, and if needed, removal and remediation, in accordance with the applicable overseeing agency requirements. Implementation of CPHP Mitigation Measure HAZ-4 would reduce exposure risks to previously unknown contamination or hazardous release sites to a less than significant level.

O-LD2-23 This comment asserts that CPHP Mitigation Measures NOI-1a and NOI-1b defer mitigation because the mitigation measures requires that a Noise Control Plan be implemented without presenting the Plan in detail within the EIR for decision-makers and the public to review, and therefore that it cannot be concluded that these mitigation measures will mitigate the impact of construction noise.

CPHP Mitigation Measure NOI-1a as presented on Draft EIR page 4.11-18 requires UCSF contractors to employ site-specific noise attenuation measures during construction of projects under the CPHP to reduce the generation of

construction noise. This mitigation measure specifies, at a minimum, four commonly used and practical construction noise control measures to be included within the Noise Control Plan that are consistent with the standards set forth in the City's Noise Ordinance, and does not preclude the incorporation of additional measures. It should be noted that the commenter does not suggest any additional measures to be incorporated into the required Noise Control Plan. CPHP Mitigation Measure NOI-1b addresses restrictions in construction hours to prohibit construction noise during the most noise sensitive periods for surrounding receptors. Although the commenter does not assert that CPHP Mitigation Measure NOI-1c is deferred mitigation, note that this measure is included in the mitigation proposal to address pile installation noise-reducing techniques during project construction.

The Draft EIR sets forth a program-level analysis and mitigation measures that would be implemented as applicable when specific projects are proposed for construction on the campus site. It is for that reason that the Draft EIR does not include a Noise Control Plan. Each Noise Control Plan will be developed specific to the project that is approved for construction and will be designed to include noise control measures that address that project's specific noise producing activities and take into account the project's relationship to the nearest sensitive receptors. As stated above, the mitigation measure does identify the standard construction noise control measures that are commonly used, including on projects in the City. Therefore, none of the mitigation measures included in CPHP Mitigation Measure NOI-1 are deferred mitigation.

Note that the Draft EIR does not conclude that the impact associated with construction activities under the CPHP would be reduced to a less than significant level. The Draft EIR on page 4.11-19 acknowledges that while implementation of CPHP Mitigation Measure NOI-1a and NOI-1b are projected to reduce noise levels associated with demolition and construction activities for CPHP construction by 5 to 10 dBA, and that CPHP Mitigation Measure NOI-1c would reduce noise levels associated with pile installation activities by 17 dBA, it would still be likely that during peak construction activities, noise levels in excess of the 10 dBA over ambient significance criterion may occur at some sensitive receptors on or near the Parnassus Heights campus site after mitigation. Therefore, the CPHP's construction noise impact is identified as significant and unavoidable with mitigation.

O-LD2-24 This comment asserts that CPHP Mitigation Measure NOI-2 defers mitigation by requiring that an acoustical study be prepared because the mitigation measure only identifies a menu of potential noise control measures, rather than requiring specific noise control measures. The commenter also asserts that based on this mitigation measure, the Draft EIR cannot conclude the operational noise impact to be less than significant.

As stated above, the Draft EIR sets forth a program-level analysis of campus development under the CPHP. Impact NOI-2 on Draft EIR page 4.11-28 addresses potential stationary source (mechanical equipment) noise impacts that includes the programmatic analysis of the entire CPHP. As discussed in Impact NOI-2, it is not possible to perform a project-specific quantitative assessment of noise impacts because there are no specific building details available that might make such an analysis possible. Such details would include the location (lateral and vertical) of necessary fixed mechanical equipment, as well as noise emission specifications of such equipment. Accordingly, CPHP Mitigation Measure NOI-2 identifies potential noise control measures that could be instituted to mitigate noise from fixed mechanical equipment, and also identifies a performance standard to be achieved in order to reduce the impact to a less than significant level. As this performance standard is tied directly to the City Police Code requirements, because effective sound control features can be incorporated into proposed CPHP development in the form of mechanical penthouses, acoustical shielding, baffles and silencers,[1] and there is substantial evidence that noise from mechanical equipment can be effectively controlled, it is reasonable to assume that this performance standard will be met. Therefore, the Draft EIR appropriately finds the stationary source operational noise impact to be less than significant with mitigation.

O-LD2-25 This comment claims that CPHP Mitigation Measure NOI-3b defers mitigation. The commenter states that because the location of construction is already known, the evaluation of vibration-sensitive equipment should be included in the EIR, and by not doing so UCSF is depriving decision-makers and the public of the opportunity to evaluate the impact and mitigation measures.

As stated above, the Draft EIR sets forth a program-level analysis of campus development under the CPHP. There is no detailed construction plan for all of the proposed CPHP development available at this time. As indicated in Impact NOI-3, the generalized development scheme for CPHP Future Phase projects does not lend itself to a direct assessment of specific construction activity and location for determining specific construction-generated vibration effects at sensitive land uses, including uses involving sensitive equipment. Therefore, the Draft EIR concludes that future construction projects on the campus site could result in construction-phase vibration that could affect nearby sensitive uses, including vibration-sensitive equipment. To address this potential impact, CPHP Mitigation Measure NOI-3b on Draft EIR page 4.11-31 clearly lays out a distance of concern for equipment to be considered (within 150 feet of construction and demolition areas). This measure provides UCSF with a tool with which to consider and address the potential impacts on the operation of its own equipment. As discussed in the Response O-SM-37, CPHP Mitigation Measure NOI-3b is

[1] As an example of the effectiveness of silencers, industrial grade silencers can reduce exhaust noise by 12-18 dBA; residential grade silencers can reduce exhaust noise by 18-25 dBA; and critical grade silencers can reduce exhaust noise by 25-35 dBA (ASREAE, 2006).

modified to provide UCSF the option to suspend use of vibration-sensitive equipment during substantial vibration-generating activities within 150 feet. Please refer to Section 8.5 of this Comments and Responses document for this modification.

O-LD2-26 The comment states that UCSF cannot rely on CPHP Mitigation Measure TRANS-5 to conclude that the CPHP will have a less than significant impact on travel conditions along sidewalks and roadways serving the campus site during construction as the traffic control plan for major phases that serves as the foundation of the mitigation has not been developed yet and thus cannot be considered by decision-makers as part of the environmental review process. It is important to note that the CPHP will be developed over a 30-year timeline. The mitigation measure provides the structure for the traffic control plan which will be developed and shared with stakeholders at the appropriate time before and during each major phase during implementation. UCSF's contractor would be required to comply with the City of San Francisco's Regulations for Working in San Francisco Streets, which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic. This process follows past precedent for construction activities at the campus site and is appropriate for both a plan- and program-level EIR.

O-LD2-27 The commenter disputes the Draft EIR's determination of the CPHP meeting the definition in Section 21099 of being an employment center. Please see Master Response 6: Public Resources Code 21099.

O-LD2-28 The comment states that the Draft EIR's analysis of aesthetic impacts is inadequate, particularly with respect to views from the trailhead at the west end of Farnsworth Lane and from Edgewood and Belmont Avenues and Willard Street. The comment also states that the Draft EIR fails to acknowledge alleged conflicts with the San Francisco General Plan Urban Design Element. Please refer to Master Response 7: Aesthetic Impacts.

O-LD2-29 The comment states that the Draft EIR's analysis of shadow impacts is inadequate. The comment states that the Draft EIR fails to properly account for the uses of park areas that would be shaded and that the Draft EIR should consider shadow effects on streets and sidewalks and/or the neighborhoods surrounding the UCSF campus, including changes in solar radiation. The comment also states that "a project over 40 feet in height has a significant impact if it will cause shadows on a property under the jurisdiction of San Francisco's Department of Recreation and Parks." Please refer to Master Response 9: Shadow Impacts.

O-LD2-30 These paragraphs are introductions to the biological resource comments from the commenter, and do not comment on the adequacy of the Draft EIR.

O-LD2-31 The commenter details results of a bird survey conducted by the commenter's consultant in the Reserve on August 20, 2020, which identified 23 bird species. All these birds with the exception of Lincoln's sparrow (*Melospiza lincolnii*) are known to occur in the Reserve and listed in eBird (2020), which includes 99 species for the Reserve. The commenter also cites a Golden Gate Audubon study from 2019 which identified 47 species in the Reserve. The commenter states that the Draft EIR includes only 6 birds; that is incorrect as the Draft EIR mentions 20 species of birds, but only considers one special-status bird, peregrine falcon (*Falco peregrinus*) to have moderate or higher potential to occur in the project area. The commenter states that the Draft EIR neglects to include birds known to occur in the Reserve. The Draft EIR project area includes bordering areas of the Reserve, but does not include the entire Reserve; birds such as northern harrier (*Circus hudsonius*) which have been observed in the Reserve, are unlikely in the areas of the campus site where CPHP development is proposed.

The commenter claims that the Draft EIR omitted discussion of certain special-status birds and bats. Special-status birds were identified as such in the Draft EIR if they were federal or State listed species, or state species of special concern in California. All native migratory bird species are protected under the Migratory Bird Treaty Act, both special-status and common birds. Thus, all bird species identified by the commenter, eBird, Audubon, and others, are included in the environmental baseline and will be protected from impacts to active nests, consistent with State and federal regulations, as provided under CPHP Mitigation Measure BIO-1c in the Draft EIR. Nevertheless, for informational purposes, the Draft EIR Environmental Setting discussion has been revised to include the eBird bird observations for the Reserve. Please refer to Section 8.5 of this Comments and Responses document for the proposed revision.

O-LD2-32 The commenter states that the Draft EIR discussion of bird strike impacts is insufficient because it lacks quantitative estimation of collision risk. The commenter estimates that more than 6,000 birds could strike the campus buildings annually. Please refer to Master Response 10: Bird Strikes.

O-LD2-33 The commenter states that the Draft EIR discussion of wildlife movement corridors lacks sufficient discussion of the energetic expense to birds and bats of navigating around the campus site. Please refer to Master Response 10: Bird Strikes.

O-LD2-34 The commenter states that the cumulative effects analysis should address the issue of bird window strikes by quantifying bird fatalities from recent, planned or foreseeable buildings in San Francisco. Although window strikes are a major source of bird mortality nationwide, no federal or State law protects birds from strike impacts. As discussed in the Draft EIR, Section 4.3, page 4.3-12, the City of San Francisco published bird-safe guidance in 2011. As noted in Section 4.3, UCSF is not subject to local land use regulation whenever using land under its

control in furtherance of its educational mission. However, UCSF has voluntarily elected to implement mitigation (CPHP Mitigation Measures BIO-2a and 2b) that is generally consistent with the City's *Standards for Bird-Safe Buildings* for new construction in order to protect birds from window strikes to the maximum extent feasible, and would reduce this impact to a less than significant level. While buildout of the CPHP would increase the likelihood of bird strikes from the larger structures, in the context of the Pacific Flyway, used by an estimated billion birds per year, these impacts are minor, and not cumulatively considerable. A study estimating fatality rates for birds for all San Francisco buildings recently built, planned, or foreseeable, is not required for this EIR.

O-LD2-35 The commenter asserts that CPHP Mitigation Measures BIO-1c and -1d are inadequate because preconstruction surveys are limited in their mitigation effect and they detect only small fractions of bird nests and roosting bats occurring on a project site. While the commenter is correct regarding the difficulty of identifying bird nests and bat roosts in dense vegetation, however, CPHP Mitigation Measures BIO-1c and BIO-1d require a qualified biologist to perform the survey, who is experienced in identification of active nests and roosts. Furthermore, for the CPHP, tree and shrub removal would primarily occur in developed areas of the campus site where nests and roosts are less likely and are easier to observe. For additional protection in the Reserve, CPHP Mitigation Measure BIO-1c has been revised to require a qualified biologist to monitor all vegetation removal in the Reserve during the nesting season. Please refer to Section 8.5 of this Comments and Responses document for the proposed revision.

The preconstruction bat surveys identified in CPHP Mitigation Measure BIO-1d will detect signs of current or recent bat use, or potential for bat presence, and are based on survey methodologies that meet California Department of Fish and Wildlife guidance. Any potential bat habitat areas will be removed using bat-safe two-stage approach in CPHP Mitigation Measure BIO-1d. These mitigation measures will protect nesting birds and roosting bats in the path of construction.

O-LD2-36 The commenter believes that CPHP Mitigation Measure BIO-2b would be inadequate to reduce impacts of bird window strikes to a less than significant level. Please refer to Master Response 10: Bird Strikes.

O-LD2-37 The commenter requests consideration of alternative locations for large buildings (macro-siting) and reducing building size (micro-siting) in order to reduce the risk of bird strikes. Please refer to Master Response 10: Bird Strikes.

O-LD2-38 The commenter states that an examination of the Draft EIR air quality modeling by Soil Water Air Protection Enterprise (SWAPE) shows that a number of adjustments were made to default modeling values, which, the commenter asserts, makes the air quality modeling inaccurate. The commenter lists these

adjustments in a series of bullets under this comment. This list is the same as the list of adjustments identified by SWAPE in Comments O-LD2-97 through O-LD2-112. Please see Responses O-LD2-97 through O-LD2-112 below where each item is specifically addressed. As those responses show, the adjustments made were appropriate and are supported by substantial evidence. Further, to the extent that there were minor errors of reporting or presentation, they do not increase the estimated construction or operational emissions of both criteria pollutants and greenhouse gases above levels reported in the Draft EIR where the adjustments do not affect the emissions used in a particular model run (e.g., GHG emissions for electricity are not salient to the EIR inventories, as UCSF will use only carbon free electricity by completion of Initial Phase projects). Therefore, the air quality modeling is accurate, and the air quality impacts that are based on the modeling are accurately analyzed in the Draft EIR. A revised Draft EIR is not required.

O-LD2-39 This comment summarizes specific comments from SWAPE that suggests that the Court of Appeal decision in *Golden Door v. San Diego* (2018) 27 Cal.App.5th 892 held that emission offsets alone cannot justify a finding of a less than significant impact. The Golden Door court decision held that offset credits may not adequately mitigate GHG emissions since they may be generated out of state or even out of country and may not represent real, verifiable, and quantifiable emission reductions. Additionally, this comment asserts that the Draft EIR inappropriately relies on consistency with the 2017 California Air Resources Board ("CARB") Scoping Plan to evaluate the significance of the impact related to GHG emissions. The comment also disputes that Plan Bay Area 2040 is a GHG reduction plan or a Climate Action Plan for the purpose of evaluating consistency with GHG reduction plans.

With regard to the assertion that the offset mitigations identified in the Draft EIR may not adequately mitigate CPHP's GHG emissions impact since they may be generated out of state or even out of country and may not represent real, verifiable and quantifiable emission reductions, CPHP Mitigation Measure GHG-1c on pages 4.4-39 and 4.7-40 specifically states "Prioritize local (within the air district) and in-state offset credits over in-nation offset credits. Offset credits shall be third-party verified by a major registry recognized by CARB such as CAR (Climate Action Reserve). If sufficient local and in-state offset credits are not available, UCSF will purchase CARB conforming national offset credits registered with an approved registry."

Please refer to Response O-LD2-115 with regard to the appropriateness of inclusion of the 2017 CARB Scoping Plan in the Draft EIR's assessment of whether the CPHP would conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases. Please refer to Response O-LD2-116 with regard to the appropriateness of inclusion of the Plan Bay Area 2040 in the Draft EIR's assessment of whether the CPHP

would conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

O-LD2-40 The commenter asserts that the Draft EIR's conclusion about a less than significant impact on energy resources is based on a reliance of compliance with the UC Sustainable Practices Policy and that the EIR analysis does not quantify the reductions in energy use that would be achieved through compliance with UC policy and therefore the less than significant impact conclusion is not supported by substantial evidence. This assertion is incorrect for several reasons, as explained below.

The Draft EIR provides an extensive analysis of the CPHP's energy demand, and reports conservative estimates of various types of energy use that would be associated with the CPHP development, and does not rely on one analysis alone to demonstrate a less than significant impact. The commenter is referred to Draft EIR pages 4.5-19 through -28, which present a detailed analysis of the CPHP's energy demand relative to each impact guidance factor in Appendix F of the CEQA Guidelines. The impact conclusion is based on the entirety of the analysis, and not just the one analysis that is highlighted in the comment.

With regard to the UC Sustainable Practices Policy, please note that the policy is discussed in the context of consumption of purchased electricity and natural gas on the campus site under existing and future conditions. The Draft EIR qualitatively describes reductions in energy use that are anticipated due to compliance with the Sustainable Practices Policy. As stated on Draft EIR page 4.5-23, the CPHP's operational electricity demand estimates exclude the benefits of LEED design that would occur pursuant to the CPHP's commitment that all new buildings achieve a LEED silver certification at a minimum, as well as due to future revisions to Title 24 energy standards, which would further reduce electricity demand. Therefore, the energy analysis is conservative in that it considers an energy demand that may be greater than what would actually occur under the proposed CPHP at final buildout. Quantification of the reductions from compliance with the Sustainable Practices Policy is not required as it was not relied upon to arrive at the impact conclusion.

While compliance with the Sustainable Practices Policy was not used in the quantification of energy demand, it should be noted that key energy-related goals in the policy are incorporated into all development at UCSF via UCSF's *Greenhouse Gas Reduction Strategy (GHGRS)*. As stated on Draft EIR, Project Description page 3-44, UCSF's 2014 Long Range Development Plan (LRDP) included *Appendix E: UCSF Greenhouse Gas Reduction Strategy (GHGRS)* to ensure that the LRDP is implemented in alignment with UC Sustainable Practices Policy. Additionally, as stated on page 4.7-28 of the Draft EIR, an updated GHGRS was prepared and is contained as Appendix GHGRS to the Draft EIR to be considered as part of the proposed amendment of the LRDP. The requirement

for all projects to achieve a minimum LEED silver certification or equivalent is therefore a part of the CPHP. As a result, and as stated on Draft EIR page 4.5-29, UCSF has committed to implement the energy reduction measures within its GHGRS as part of the LRDP and the CPHP to improve efficiency of existing buildings, including the requirement that new buildings be designed to surpass Title 24 energy efficiency standards and, at a minimum, attain LEED "Silver" certification or equivalent. Therefore, the energy analysis for the proposed CPHP does not solely rely on the Sustainable Practices Policy goals; but, is instead based on substantial evidence that the CPHP development would achieve at a minimum LEED silver certification or equivalent since this is also a requirement of the proposed CPHP by virtue of UCSF's commitment to implement energy reduction measures within its GHGRS. The Draft EIR analysis appropriately concludes that the CPHP would not result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of fuel or energy.

O-LD2-41 The commenter asserts that the Draft EIR fails to analyze the project's land use impacts, and that the CPHP is inconsistent with City General Plan policies and objectives. Please refer to Master Response 13: Land Use Impacts.

O-LD2-42 The commenter disputes the Draft EIR's assessment of the CPHP's consistency with the City General Plan policies, Planning Code and 2014 LRPD Community Planning Principles. Please refer to Master Response 13: Land Use Impacts.

O-LD2-43 The comment states that the Draft EIR incorrectly concludes that the project would not conflict with the San Francisco General Plan Urban Design Element and that the proposed New Hospital would have significant visual impacts, including blocking views to Mount Sutro and the Mount Sutro Open Space Reserve and views of the ocean and Golden Gate Park from trails and other public vantage points. The comment states that the Draft EIR fails to acknowledge the policy inconsistencies from these environmental impacts and fails to identify mitigation measures for these impacts. Please refer to Master Response 7: Aesthetic Impacts.

O-LD2-44 The comment states that the Draft EIR incorrectly concludes that the project would not result in adverse shadow impacts on public open spaces and streets and sidewalks and would therefore not comply with San Francisco Planning Code Section 101.1. Please refer to Master Response 9: Shadow Impacts.

O-LD2-45 The comment states that the EIR fails to identify wind and shadow impacts of the proposed increase in the Parnassus Heights space ceiling. Please refer to Master Response 8: Wind Impacts; and Master Response 9: Shadow Impacts.

O-LD2-46 The commenter asserts that a revised DEIR must include an expanded analysis of the Project's potential inconsistencies with applicable plans and policies, and disclose the significant unavoidable environmental impacts associated with those

inconsistencies. The commenter further asserts that the revised Draft EIR must also include feasible mitigation measures and alternatives to reduce or eliminate these impacts. Alternatives should include alternative project proposals to conform to land use and zoning requirements to the maximum extent feasible, including height limitations. Please see Responses O-LD2-41 through O-LD2-45. Please also see Master Response 5: EIR Alternatives. As demonstrated in the responses provided to the comments raised, and further in Section 8.1.4 in this Comments and Responses document, none of the specific issues identified in the comments, or response to these comments, result in any of the conditions of Section 15088.5(a) being met. Thus, UCSF has determined that recirculation of the Draft EIR on the issues raised by the comments is not warranted.

O-LD2-47 The commenter cites Public Resources Code (PRC) Sections 21093(b)(3), and (d), then proceeds to state CEQA requirements related to growth inducing impacts and cites PRC 21100(b)(5), and also reproduces Appendix G Section XII related to population and housing. The commenter further states that the City of San Francisco Public Health Department has issued a policy paper concluding that a Housing Impact Assessment should be conducted under CEQA.

PRC Sections 21093(b)(3), and (d) are part of the CEQA statute that directs and guides the Office of Planning and Research in its development of CEQA guidelines. These sections do not guide the analysis of a project's growth inducing or population and housing impacts. With regard to growth inducing impacts vs population and housing impacts under CEQA, please refer to Master Response 14: Population and Housing Impacts which explains the distinct differences in the CEQA requirements related to evaluation and disclosure of a project's population and housing impacts, and a project's growth inducing effects. Please note that the University, a constitutionally created State entity, is not subject to municipal regulations, plans, and policies of the City of San Francisco for uses on property owned or controlled by UCSF that are in furtherance of the University's educational purposes, including any policy papers prepared by the City stating that a Housing Impact Assessment should be conducted under CEQA.

O-LD2-48 The commenter asserts that the Draft EIR does not accurately analyze the growth inducing impacts of the proposed CPHP, that it does not reach any conclusions as to the significance of the growth inducing impacts, and that a revised analysis must be prepared. The commenter switches back and forth between the project's direct population and housing impacts and the project's growth inducing impacts, transferring conclusions from one analysis to the other. The commenter argues that the Draft EIR does not talk about the housing crisis in the Bay Area, that it does not analyze the availability and affordability of housing near the campus site and in the City, that the EIR uses the entire City and the region to analyze the "significance of the housing demand generated by the project" and thereby uses a

"drop in the bucket" approach which is discouraged under CEQA (Note that this comment relies on and summarizes Comment O-LD2-65).

The commenter improperly conflates two separate types of analyses required under CEQA. Please see Master Response 14: Population and Housing Impacts which explains why the analysis of the CPHP's direct population and housing impacts is presented in Draft EIR Section 4.12, and the CPHP's indirect and induced growth impacts are appropriately presented in Draft EIR Section 5.4, Growth Inducing Effects. That master response also explains what the requirements are for each type of analysis, and that CEQA does not require a significance conclusion with regard to a project's growth inducing impacts. Please also see Responses O-LD2-58 through O-LD2-67 below. Response O-LD2-65 is particularly relevant as it addresses all the issues listed in this comment and explains why it is appropriate for the project's population and housing effects to be evaluated within a five-county study area. CEQA supports the use of an accurately defined study area to analyze a project's impact, and therefore the analysis in the Draft EIR does not represent a drop in the bucket approach.

An analysis of the supply of affordable housing or an analysis of the income levels of the projected new population at the Parnassus Heights campus site to determine if they would require low cost housing options is not required under CEQA. There is no CEQA requirement to evaluate whether a project would cause or contribute to an affordable housing crisis.

O-LD2-49 The commenter asserts that the Draft EIR did not adequately analyze the CPHP effects on public services, including fire protection facilities. It should be noted that the San Francisco Fire Department (SFFD) was consulted to assist in determining potential effects of the CPHP on the City's fire protection services, and the SFFD is appropriately cited. In consultation with the SFFD, based on the CPHP description, the modest anticipated increase in calls for service, and the adequacy of SFFD's fire protection services and facilities, Impact PUB-1 in the Draft EIR determined that the anticipated population increase associated with implementation of the proposed CPHP would neither adversely affect SFFD service standards nor require an increase in SFFD staff and/or equipment that would require the construction of new fire protection facilities. Accordingly, implementation of the proposed CPHP would have a less than significant impact regarding the construction of new or physically altered fire protection facilities.

The commenter also asserts that the Draft EIR did not analyze the impact to schools from children of students or employees not living on campus. The Draft EIR Section 5.4 Growth-Inducing Effects, acknowledges that potential effects would be associated with an increase in students, faculty and staff living off-site, including but not limited to, effects on public schools. It is assumed that a proportion of this off-campus population is already living in the Bay Area, and consequently, creating a demand for public schools. However, it would be

speculative to characterize the specific environmental effects resulting from this component of the project population on public schools.

O-LD2-50 The comment asserts that the finding of less than significant for Impact TRANS-1 (pages 4.15-37 through 4.15-70 of the Draft EIR) is based on incomplete analysis, as it does not include an adequate discussion of the effects of additional workers and patients associated with the CPHP. As discussed in Master Response 19, the EIR fully accounts for the effects of increased employment, visitors, and residents in assessing CPHP's transportation impacts. The comment further asserts that the Draft EIR's assumptions for transit use are flawed as they do not account for the effect of additional passengers on public transit, especially CPHP-related increases in ridership on the N-Judah. This comment is addressed in Master Comment TR-5, which notes that Muni operations are not a CEQA concern. As such, the analysis presented in the Draft EIR is adequate and complete for purposes of identifying transportation impacts.

O-LD2-51 The commenter asserts that a revised draft EIR be prepared and recirculated to address the issues discussed in the comment letter and propose feasible mitigation measures. As demonstrated in the individual responses provided to the comments raised, and further in Section 8.1.4 in this Comments and Responses document, none of the specific issues identified in the comments, or response to these comments, result in any of the conditions of Section 15088.5(a) being met. Thus, UCSF has determined that recirculation of the Draft EIR on the issues raised by the comments is not warranted.

O-LD2-52 The commenter makes a general comment that the Draft EIR is wholly inadequate, and that a revised Draft EIR be prepared to address concerns raised in the letter. The commenter is referred to the individual responses prepared to this comment letter. See also Response O-LD2-51, above, regarding why recirculation of the Draft EIR is not required.

O-LD2-53 The comment makes general introductory comments that the Draft EIR fails to adequately analyze the significant environmental impacts of the CPHP; fails to propose sufficient mitigation measures, fails to inform decision-makers and the public of the environmental consequences of the proposed actions; and must be revised and recirculated. The commenter is referred to the responses to specific issues raised, below.

As demonstrated in the individual responses provided to the comments raised, below, and further in Section 8.1.4 in this Comments and Responses document, none of the specific issues identified in the comments, or response to these comments, result in any of the conditions of Section 15088.5(a) being met. Thus, UCSF has determined that recirculation of the Draft EIR on the issues raised by the comments is not warranted.

O-LD2-54 The commenter asserts that UCSF should honor the space ceiling and other commitments, including the 1976 Regents' Resolution and 2014 LRDP Community Planning Principles. Please refer to Master Response 4: Space Ceiling and Population.

O-LD2-55 The commenter indicates that COVID-19 warrants changes and updates to the environmental setting, and to the Project Description. Please see Master Response 3: COVID-19.

O-LD2-56 The commenter indicates that the project is fundamentally changing due to COVID-19, including telework and telehealth, such that UCSF should pause the CPHP process. Please see Master Response 3: COVID-19.

O-LD2-57 The commenter indicates the Draft EIR fails to describe baseline conditions that includes COVID-19. Please see Master Response 3: COVID-19.

O-LD2-58 The commenter asserts that the Draft EIR should include information regarding the income levels of the new employees and students at Parnassus Heights and about the current pattern of residence of existing employees and students, as this information would inform the analysis of potential displacement impacts due to housing demand and gentrification near the campus site.

Please see Master Response 15: Indirect Displacement and Gentrification Impacts.

O-LD2-59 The commenter asserts that demographic data must be presented for the City and the neighborhood surrounding the campus site.

Demographic data for the City and the five-county study area are presented in the Draft EIR; see pages 4.12-1 through 4.12-3. Please see Master Response 15: Indirect Displacement and Gentrification Impacts, which explains why the analysis of such impacts is not within the scope of a CEQA document. Therefore, demographic data at a neighborhood level is not needed in the EIR.

O-LD2-60 The commenter asks that the Draft EIR include a vast amount of baseline information regarding vacancy rates for affordable housing, deed restricted housing, workforce housing and disadvantaged communities at the City, study area, and neighborhood levels, so that the project's effects on affordable housing and housing prices can be evaluated at both the broader study area level and at the local (neighborhood) level.

CEQA does not require an environmental document to analyze effects on affordable housing or housing prices. Please see Master Response 1: Non-CEQA Comments regarding socio-economic impacts. Please also see Master Response 15: Indirect Displacement and Gentrification Impacts, which explains why the analysis of such impacts is not within the scope of a CEQA document, and

Master Response 14: Population and Housing which sets forth the CEQA requirements with respect to the scope of the CPHP's impacts on population and housing. Therefore, demographic data and data regarding affordable and deed restricted housing is not needed in the EIR.

O-LD2-61 The commenter states that the Draft EIR should include more information about jobs housing imbalance in order to provide an analysis of the project's impacts on housing and growth.

CEQA does not stipulate that an environmental document include a project's effect on the jobs-housing balance in an area. As explained in Master Response 14: Population and Housing Impacts, according to the guidance provided in the CEQA Appendix G Checklist, a lead agency is required to evaluate whether a project would "induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)." That CEQA checklist question does not ask for an evaluation of the project's effect on housing or the jobs-housing balance.

The Draft EIR does include an analysis of the CPHP's effect on housing based on a significance threshold put forth in the 2014 LRDP EIR by UCSF. As presented on Draft EIR page 4.12-6, the significance threshold asks whether implementation of the CPHP would "exceed the LRDP EIR standard of significance by creating a demand for housing outside the market area where the facilities or site are located?" The analysis under that threshold does not require a consideration of the CPHP's effect on the jobs-housing balance.

O-LD2-62 The commenter asks that the Draft EIR include baseline information (both pre- and post Covid-19) on the existing jobs-housing balance and jobs-housing fit in the surrounding neighborhoods, City and the region as that information is needed to analyze indirect displacement impacts and impacts on housing.

Please see Response O-LD2-61 above regarding jobs-housing balance and Master Response 14: Population and Housing, regarding the scope of the analysis of a project's population and housing impacts. Please see Master Response 15: Indirect Displacement and Gentrification Impacts which explains why the analysis of such impacts is not within the scope of a CEQA document. With respect to the request for baseline information regarding housing conditions existing before and since the outbreak of COVID-19 and the commenter's concerns about the analysis of transportation, air quality, and greenhouse gas emissions impacts, please Master Response 3: COVID-19.

O-LD2-63 The commenter asserts that the Draft EIR analysis of population and housing and growth inducement is inadequate as it does not provide necessary facts, that the cumulative impact analysis is also deficient, and that the EIR does not identify mitigation measures that would avoid or reduce impacts.

Please see Master Response 14: Population and Housing Impacts regarding the analysis of population and housing impacts in the Draft EIR, including cumulative population and housing impacts. That master response also provides evidence that the growth inducing impacts of the project are analyzed consistent with the CEQA Guidelines. The commenter inaccurately asserts that Draft EIR presents bare conclusions and does not contains facts and analysis. The Draft EIR presents data that is relevant to the analysis and does not put forth baseline information that does not inform the impact analysis. Please also see Responses O-LD2-64 through O-LD2-67 below. As no significant impacts are identified, the Draft EIR does not include any mitigation measures for population and housing impacts of the proposed CPHP.

O-LD2-64 The commenter asserts that the Draft EIR's analysis of growth inducement and population and housing impacts is flawed, summarizes the CEQA requirements related to growth inducing impact analysis, and then argues that the secondary effects of growth may be significant and adverse, and that they must be acknowledged as significant secondary/indirect impacts of a project.

As with other similar comments above, the commenter conflates the analysis of growth inducement with the analysis of the project's impact on population and housing. Please see Master Response 14: Population and Housing Impacts regarding the distinctions between the analysis of population and housing impacts and a project's growth inducing impacts. The growth inducing effects analysis appropriately cross-references the population impact analysis to discuss the direct population increase due to the project; both analyses depend on the same set of population estimates. Beyond that, the two analyses are different in their focus and approach. Note that CEQA does not require that an EIR include a significance conclusion regarding a project's growth impacts; it simply requires that they be disclosed. Regarding issues listed by the commenter as secondary impacts of growth (gentrification and displacement, demand for housing and services, traffic, air pollution), please see Master Response 15: Indirect Displacement and Gentrification Impacts.

O-LD2-65 The commenter asserts that the Draft EIR does not accurately analyze the growth inducing impacts of the proposed CPHP, that it does not reach any conclusions as to the significance of the growth inducing impacts, and that a revised analysis must be prepared. The commenter switches back and forth between the project's direct population and housing impacts and the project's growth inducing impacts, transferring conclusions from one analysis to the other. The commenter argues that the Draft EIR does not talk about the housing crisis in the Bay Area, that it does not analyze the availability and affordability of housing near the campus site and in the City, that the Draft EIR uses the entire City and the region to analyze the significance of the housing demand generated by the project in order to diminish the significance of the impact.

Please see Master Response 14: Population and Housing Impacts regarding the distinctions between the analysis of population and housing impacts and a project's growth inducing impacts. The commenter is conflating the two analyses, transferring the conclusions of one analysis to the other, and making assertions that are not made in the Draft EIR.

An analysis of the supply of affordable housing or an analysis of the income levels of the projected new population at Parnassus Heights to determine if they would require low cost housing options is not required under CEQA. There is no CEQA requirement to evaluate whether a project would cause or contribute to an affordable housing crisis.

The commenter asserts that by comparing the CPHP's population growth to the entire City and region, the Draft EIR seeks to diminish the significance of the housing demand generated by the CPHP. The Draft EIR analyzes the population growth effects of the proposed project within a five-county study area, which includes San Francisco, Alameda, Marin, San Mateo, and Contra Costa Counties. This is appropriate because as stated in the Draft EIR, based on the latest (2018) UCSF Transportation Commute Survey, approximately 60 percent of UCSF students and employees commute from places within San Francisco, and therefore likely reside in San Francisco, and besides San Francisco, employee commuters largely travel from four other Bay Area counties: Alameda, Contra Costa, Marin, and San Mateo. The new students and employees would be expected to reside in a similar manner and therefore the population growth effects would be experienced in the five-county area.

The commenter asserts that the project would add 5,200 students and employees to a "highly constrained neighborhood." While the CPHP would add that population to the campus site's daytime population, most of that population would not reside on the campus or necessarily in the adjoining neighborhoods and would be expected to live in the five-county study area, similar to the pattern of residence of the current UCSF employees and students. Please also see Master Response 15: Indirect Displacement and Gentrification Impacts.

The commenter then brings up the 3,420 indirect and induced jobs (estimated and reported in the section on growth inducing effects) and asserts that they would create a demand for housing. Please note that the indirect and induced jobs are created in a much wider area than where the primary jobs are created. The Draft EIR explains what constitutes an indirect job and what is considered an induced job, and states "As an additional example, when a staff member from the campus site goes out to lunch, the person who serves the student or employee lunch holds a job that was indirectly caused by the proposed CPHP. When the server then goes out and spends money in the economy, the jobs generated by this third-tier effect are considered induced." In this example, while the server's job may be in San Francisco, the server may not necessarily reside in the City, and the server's

expenditures may, in turn, occur in the community he/she lives in, creating induced jobs in that community. Therefore, the employment multiplier effects (and any resultant demand for housing) are typically experienced over an area that is larger than the area affected by a project's direct jobs. Further, many of the indirect and induced jobs are typically filled by people already living in the study area and do not result in an influx of new workers into a city or region. As a result, induced growth does not necessarily result in a demand for housing that equals the number of indirect and induced jobs.

The commenter proceeds to develop estimates of the total number of housing units that would be demanded by the direct, indirect and induced job holders and reports a high estimate of over 6,000 housing units and a low estimate of about over 4,000 units, and asserts that these housing impacts are not discussed in the Draft EIR. As explained in Master Response 14: Population and Housing Impacts, Impact POP-1 focuses on the direct jobs associated with the project and the effect of those jobs on housing in the five-county study area, and not on indirect and induced jobs which appropriately belong under the discussion of growth inducing effects. With respect to the combined direct, indirect and induced employment effects, those are addressed in Section 5.4, Growth Inducing Effects in the Draft EIR. The Draft EIR section does not quantify the number of housing units that could be associated with the indirect and induced jobs as several simplifying assumptions would need to be made to develop any estimates and any estimates that are developed could be questioned for their accuracy (CEQA discourages analysis that requires speculation). The Draft EIR complies with CEQA and report the general types of environmental effects that could occur in the communities in the five-county study area from the development of housing and other services to serve the direct, indirect, and induced population related to the CPHP.

The commenter cites Appendix G, Section XIII (a) and asserts that this section of the checklist requires that a population and housing analysis include an estimate of the amount of growth/housing that would be required due to the project, that the effects of the project population on public services be analyzed, and that indirect and secondary effects due to growth inducement be analyzed and mitigation measures be put forth. That is not accurate. The scope of the analysis under Appendix G, Section XIII (a) does not extend to these types of analyses. Please see Master Response 14: Population and Housing Impacts for the scope of analysis under Section XIII (a). Also note that Appendix G, Section XV sets forth the requirements regarding the analysis of a project's impact on public services. Consistent with that section of the checklist, the CPHP's effects on public services are analyzed in Section 4.13 of the Draft EIR.

The growth inducing effects of the CPHP are fully addressed in Section 5.4 in the Draft EIR and a new analysis is not needed. The University, as a constitutionally created State entity, is not subject to municipal regulations, plans, and policies of the City of San Francisco for uses on property owned or controlled by UCSF that

are in furtherance of the University's educational purposes, including any resolution passed by the City concerning social equity impacts.

O-LD2-66 The commenter lists the CEQA checklist questions related to population and housing (Section XIII), and then argues that to analyze the project's impacts based on these thresholds, the EIR must include an analysis of loss of affordable housing through gentrification, effects of the project on cost of housing in surrounding neighborhoods, effects on a disadvantaged community, and on jobs-housing balance. The commenter asserts that the impact on housing must be reanalyzed taking into account the housing crisis in the Bay Area.

Please see Master Response 14: Population and Housing Impacts regarding the scope of population and housing impacts under CEQA and the consistency of the analysis of these impacts in the Draft EIR with CEQA requirements. With regard to loss of affordable housing due to gentrification, changes in housing affordability in the neighborhoods surrounding the campus site, and effects on disadvantaged communities, please see Master Response 15: Indirect Displacement and Gentrification Impacts. Regarding effect on jobs-housing balance, please see Response O-LD2-61 above.

The commenter also asserts that the Draft EIR does not disclose the CPHP's inconsistency with the LRDP Community Planning Principle HI which calls for projects to make a positive contribution to the City's affordable housing stock. Consistency with plans and policies is not part of the analysis of impacts on population and housing under CEQA and is therefore not discussed in Section 4.12 in the Draft EIR. However, the housing developed under the CPHP would be designed to be affordable to the UCSF population that would reside in that housing.

O-LD2-67 The commenter suggests some mitigation measures, stated to be derived from San Francisco Measure E, to reduce the project's impact on housing.

The Draft EIR analysis does not find the population and housing impacts of the proposed CPHP to be significant and therefore does not include mitigation measures as none are required. With regard to the mitigation measures listed by the commenter, note that while UCSF is not subject to Measure E, it does plan to add more on-campus housing with the development of non-residential space at the Parnassus Heights campus site. Also note that the Draft EIR, Chapter 6, Alternatives evaluates in detail Alternative 1B: No Project – Development under 2014 LRDP Alternative, which excludes a change to the space ceiling, and Alternative 2: Reduced Project, which requires a smaller change to the space ceiling than the proposed CPHP. Both are reduced project alternatives and would further reduce the less than significant population and housing impacts of the CPHP. Finally, regarding the suggested mitigation measure for UCSF to provide housing for not only for all the new direct population but also for "a portion of

induced demand," please note that CEQA does not require an EIR to draw a conclusion regarding the significance of a project's growth inducing impacts and nor does it require that mitigation be set forth for growth inducing impacts.

No financial analysis focused on the costs associated with housing, services and community benefits is required under CEQA.

O-LD2-68 The commenter asserts that the Draft EIR's analysis of land use impacts is incomplete and inadequate, thereby failing to disclose and mitigate significant impacts. The commenter claims the project is incompatible with policies and provisions of the San Francisco General Plan, and Planning Code, as well as UC Policies. Please refer to Master Response 13: Land Use Impacts.

O-LD2-69 The commenter asserts that Draft EIR must include an analysis of the CPHP's consistency with the City General Plan policies and objectives. Please refer to Master Response 13: Land Use Impacts.

O-LD2-70 The commenter disputes that the Draft EIR's assessment of the CPHP's consistency with the City General Plan policies, Planning Code, and 2014 LRPD Community Planning Principles. Please refer to Master Response 13: Land Use Impacts.

O-LD2-71 The comment states that the Draft EIR incorrectly concludes that the project would not conflict with the San Francisco General Plan Urban Design Element and that the proposed New Hospital would have significant visual impacts, including blocking views to Mount Sutro and the Mount Sutro Open Space Reserve and views of the ocean and Golden Gate Park from trails and other public vantage points. The comment states that the Draft EIR fails to acknowledge the policy inconsistencies from these environmental impacts and fails to identify mitigation measures for these impacts. Please refer to Master Response 7: Aesthetic Impacts.

O-LD2-72 The comment states that the Draft EIR incorrectly concludes that the project would not result in adverse shadow impacts on public open spaces and streets and sidewalks and would therefore not comply with San Francisco Planning Code Section 101.1. Please refer to Master Response 9: Shadow Impacts.

O-LD2-73 The comment states that the EIR fails to identify wind and shadow impacts of the proposed increase in the Parnassus Heights space ceiling. Please refer to Master Response 8: Wind Impacts, and Master Response 9: Shadow Impacts.

O-LD2-74 The commenter indicates a Draft EIR must include mitigation measures and alternatives to reduce or eliminate significant impacts associated with inconsistencies with City of San Francisco General Plan and zoning. Please see Master Response 5: EIR Alternatives.

O-LD2-75 The commenter asserts that the Draft EIR alternatives analysis is legally deficient because it fails to consider a reasonable range of alternatives. Please see Master Response 5: EIR Alternatives.

O-LD2-76 The commenter asserts that the Draft EIR alternatives analysis is legally deficient because it improperly rejects feasible off-site alternatives and omits other feasible off-site alternatives. Please see Master Response 5: EIR Alternatives.

O-LD2-77 The commenter makes a general concluding statement that decision-makers and the public cannot assess the CPHP impacts from the Draft EIR; that the Draft EIR understates the CPHP environmental impacts and fails to formulate feasible mitigation measures; and that a revised Draft EIR be prepared and recirculated. The commenter is referred to the responses to specific issues raised, above.

As demonstrated in the individual responses provided to the comments raised, and further in Section 8.1.4 in this Comments and Responses document, none of the specific issues identified in the comments, or response to these comments, result in any of the conditions of Section 15088.5(a) being met. Thus, UCSF has determined that recirculation of the Draft EIR on the issues raised by the comments is not warranted.

O-LD2-78 The comment states that the Draft EIR inappropriately concludes proposed project's visual effects would be less than significant. The comment particularly references view blockage that would result from the proposed New Hospital. Please refer to Master Response 7: Aesthetic Impacts.

O-LD2-79 The comment states that the Draft EIR inappropriately concludes proposed project's visual effects would be less than significant. The comment particularly references view blockage that would result from the proposed New Hospital. Please refer to Master Response 7: Aesthetic Impacts.

O-LD2-80 The comment states that the Draft EIR inappropriately concludes proposed project's visual effects would be less than significant. The comment particularly references view blockage that would result from the proposed New Hospital. Please refer to Master Response 7: Aesthetic Impacts.

O-LD2-81 The comment states that the Draft EIR inappropriately concludes proposed project's visual effects would be less than significant. The comment also states that the Draft EIR should consider shadow effects on streets and sidewalks and/or the neighborhoods surrounding the UCSF campus, including changes in solar radiation, that the project would be inconsistent with the San Francisco General Plan, and that mitigation for shadow impacts should be included in the EIR. Please refer to Master Response 9: Shadow Impacts.

O-LD2-82 The comment states that the proposed project would result in visual change seen from many locations and that shadow cast by project structures impact would

affect open spaces and pedestrian walkways. Please refer to Master Response 7: Aesthetic Impacts; and Master Response 9: Shadow Impacts.

O-LD2-83 These paragraphs are introductions to the biological resource comments from the commenter, and do not comment on the adequacy of the Draft EIR.

O-LD2-84 The commenter describes the numerous species of birds observed during his site visit to the Mount Sutro Open Space Reserve and notes the large number of species observed during other surveys. Please see Response O-LD2-31.

O-LD2-85 The commenter indicates the land to be redesignated as Open Space Reserve is already forested and otherwise indistinguishable from the forested landscape of surrounding areas of the Reserve; and therefore that proposed 0.15 acres of land that would be removed from the Reserve under the CPHP would be a net wildlife habitat loss.

The Draft EIR Chapter 3, Project Description states on page 3-19 that there is the potential for the New Hospital and widening of Medical Center Way to result in the need to modify the Reserve boundary. UCSF proposes to replace any area of the Reserve that is lost due to new development under the CPHP by designating new Reserve area elsewhere on the campus site in an amount equal to or greater than the area lost.

The area that the commenter characterizes as forested is currently designated as a "Support" zone in UCSF's existing functional zone map, and under the CPHP would be designated as an "Open Space Reserve" zone. Accordingly, the CPHP would provide permanent open space reserve protection that is not currently provided for this area.

O-LD2-86 The commenter describes bird window strike mortality findings from other facilities, including the California Academy of Sciences in Golden Gate Park to evaluate the window strike potential posed by UCSF structures to various bird species. Please refer to Master Response 10: Bird Strikes.

O-LD2-87 The commenters claims that the Draft EIR only mentions six species of birds and improperly considers several species to have low likelihood of occurrence on the campus site. Please see Response O-LD2-31.

O-LD2-88 The commenter provides tables of the number and species of birds and bats killed by window strikes at the California Academy of Sciences in Golden Gate Park. Please refer to Master Response 10: Bird Strikes.

O-LD2-89 The commenter provides a general quantitative estimate of bird window strike fatalities based on the total square footage planned and the amount of glass used at recent buildings in San Francisco. Please refer to Master Response 10: Bird Strikes.

O-LD2-90 The commenter states that the Draft EIR discussion of wildlife movement corridors lacks sufficient discussion of the energetic expense to birds and bats of navigating around the campus site. Please refer to Master Response 10: Bird Strikes.

O-LD2-91 The commenter considers the cumulative analysis of biological resources in the Draft EIR inadequate because it lacks evaluation of bird strike fatalities among new buildings in San Francisco. Please see Response O-LD2-34.

O-LD2-92 The commenter considers CPHP Mitigation Measures BIO-1c and 1d inadequate because preconstruction surveys have limited ability to detect nesting birds or roosting bats and do not provide full population estimates. Please see Response O-LD2-35.

O-LD2-93 The commenter recommends additional mitigation for minimizing bird window strikes, including behavioral ecological studies of bird flight patterns. Please refer to Master Response 10: Bird Strikes.

O-LD2-94 The commenter requests consideration of alternative locations for large buildings (macro-siting) and reducing building size (micro-siting) in order to reduce the risk of bird strikes. Please refer to Master Response 10: Bird Strikes.

O-LD2-95 In this introductory comment from SWAPE, the commenter states that their review of the air quality modeling included in the Draft EIR appendix concludes that the emissions from the construction and operation of the proposed CPHP are underestimated and therefore the project's air quality, health risk and GHG impacts are inadequately analyzed in the Draft EIR. The commenter is referred to Responses O-LD2-97 through O-LD2-112, below, which show that the air quality modeling in the Draft EIR is accurate. Therefore, the air quality, health risk, and GHG impacts in the Draft EIR are accurately analyzed, and an updated EIR is not required.

O-LD2-96 The commenter reiterates that adjustments to default modeling values have rendered the air quality modeling inaccurate. The commenter agrees that while CalEEMod provides default values, if project-specific information is available, the user can change the default values, provided there is substantial evidence in the record in support of using the project-specific values. The commenter is referred to Responses O-LD2-97 through O-LD2-112, below, which specifically address each of the issues identified by the commenter regarding the air quality modeling in the Draft EIR and show that the adjustments to the model inputs are appropriate and are supported by substantial evidence.

O-LD2-97 This comment is related to six separate output files produced by CalEEMod model. The commenter asserts that a justification for the adjustment to the CO_2 intensity factor that was input in the model is not provided. The commenter is

also concerned that emission factors for methane (CH_4) and nitrous oxide (N_2O) were set to zero and therefore GHG emissions are underestimated.

The CO_2 intensity factor in the output fields cited reflect a UCSF-specific CO_2 intensity as calculated for their previous inventory submittals, prior to 2019. This emission factor is already in terms of carbon dioxide equivalents (CO_2e) and therefore is inclusive of CH_4 and N_2O. Therefore, these two contributors to CO_2e were, appropriately, zeroed out. Additionally, as discussed below, the specific model runs cited in the comment were used for other purposes than for estimating GHG emissions and are, therefore, not salient to any of the GHG emissions or air pollutant emissions reported in the Draft EIR.

With regard to the six model run outputs cited by the comment, these model runs were used for a variety of purposes, it is best to address each output individually as to what extent these values have a bearing on the emissions reported in the Draft EIR. One important aspect of these emission factors in question is that they were used by the model to calculate GHG emissions associated with electrical demand only. However, they have no bearing on the air pollutant emissions calculated and presented in Section 4.2, Air Quality of the Draft EIR, as discussed below.

Page 1,172 of the Draft EIR: This output file is generated to estimate the construction-related emissions specifically associated with construction of the CPHP's proposed Research and Academic Building (RAB). CalEEMod calculates construction emissions resulting from the operation of off-road equipment and the operation of on road trucks and vehicles. CalEEMod does not calculate electrical emissions associated with construction. Therefore, for the purposes of estimating GHG emissions associated with the construction of the RAB, the electrical emission factors are not used by the model, and are irrelevant to construction activities captured by the model run.

Page 1,250 of the Draft EIR: This output file was generated to estimate the existing criteria air pollutant emissions specifically associated with Aldea Housing proposed to be demolished in the Initial Phase under the CPHP. This model run was not used to generate the estimates of GHG emissions in Section 4.7, Greenhouse Gases of the Draft EIR. Therefore, for the purposes of GHG emissions associated with the operations of the project, the GHG emission factors are irrelevant as the inventory approach used to calculate operational GHG emissions presented in Table 4.7-5 of the Draft EIR used existing campus-wide inventory data reported by UCSF for the existing (2018) condition. As UCSF will offset all of its electrical emissions after 2025 pursuant to its Sustainable Practices Policy, there would be no electrical emissions in the 2030 or 2050 with project conditions and these emission factors in the CalEEMod model are irrelevant to the estimates of GHG emissions in Section 4.7, Greenhouse Gases of the Draft EIR.

Page 1,264 of the Draft EIR: This output file was generated to estimate the existing air pollutant emissions specifically associated with School of Nursing building proposed to be demolished. This model run was not used to generate the estimates of GHG emissions in Section 4.7, Greenhouse Gases of the Draft EIR, and the electrical GHG emission factors are irrelevant to the analysis in this section of the Draft EIR.

Page 1,282 of the Draft EIR: This output file was generated to estimate the existing air pollutant emissions specifically associated with UC Hall proposed to be demolished. This model run was not used to generate the estimates of GHG emissions in Section 4.7, Greenhouse Gas Emissions of the Draft EIR and the GHG electrical emission factors are irrelevant to the analysis in this section of the Draft EIR. (Please note the title header that refers to Aldea Housing on this page was inadvertently mistitled. Please refer to Section 8.5 of this Comments and Responses document for the proposed correction to this error.)

Page 1,357 of the Draft EIR: This output file was generated to estimate the additional air pollutant emissions specifically associated with the proposed initial Aldea Housing Densification project. This model run was not used to generate the estimates of GHG emissions in Section 4.7 Greenhouse Gases of the Draft EIR and the GHG electrical emission factors are irrelevant to the analysis in this section of the Draft EIR for the reasons stated above for page 1,250 of the Draft EIR.

Page 1,371 of the Draft EIR: This output file was generated to estimate the additional air pollutant emissions specifically associated with the proposed RAB. This model run was not used to generate the estimates of GHG emissions in Section 4.7, Greenhouse Gases of the Draft EIR and the GHG electrical emission factors are irrelevant to the analysis in this section of the Draft EIR for the reasons stated above for page 1,250 of the Draft EIR.

O-LD2-98 This comment raises concern that the estimated construction-related emissions did not consider the erection of the proposed temporary construction office. As discussed in the Draft EIR Project Description, page 3-27, the temporary construction office (Integrated Center for Design & Construction) is an interior renovation project that would be developed on two floors of the Kalmanovitz Library Garage, and hence, would not require excavation or foundation work. The emissions associated with the development of this temporary space are not expected to substantially contribute to the emissions presented in Table 4.2-7 on page 4.2-32 of the Draft EIR.

O-LD2-99 This comment raises concern that new parking associated with the initial Aldea Housing Densification project was not considered in the modeling of air pollutant emissions. Page 20 of the CalEEMod users guide specifically states that “no separate parking land use for a driveway or garage needs to be identified for

residential land uses because parking is already included in the calculation." Therefore, the air quality modeling in the Draft EIR was correct not to include the underground parking that would be part of the initial Aldea Housing Densification project.

O-LD2-100 This comment expresses concern that the CalEEMod output file on page 1,282 of the Draft EIR, which is titled "Existing Emissions Aldea Housing Initial Phase Demolition," incorrectly characterizes the land use as 145,000 square feet of research and development instead of the 42 units of existing housing proposed to be demolished at the Aldea housing complex. As noted in Response O-LD2-97, above, this CalEEMod output file was inadvertently mistitled. The appropriate title for this output file should be "Existing Emissions UC Hall Demolition." Accordingly, page 1,282 of the Draft EIR presents existing area and energy emissions for 145,000 square-foot UC Hall research laboratory. (Please refer to Section 8.5 of this Comments and Responses document for the proposed correction to this error.)

Please refer to page 1,250 of the Draft EIR, which contains the CalEEMod output for the existing area and energy emissions from the Aldea Residences to be demolished in the Initial Phase.

In any case, the emissions reported in Table 4.2-10 on page 4.2-44 of the Draft EIR correctly reflect the emissions reductions associated with the demolition of UC Hall and existing initial Aldea housing to be removed. No changes are required in the emissions reported in Section 4.2, Air Quality, or to the less than significant impact determination associated with operational criteria air pollutant emissions associated with the Initial Phase projects.

O-LD2-101 This comment states that the four CalEEMod output files indicate that only a hospital land use designation was used in the calculation of operational emissions and that this likely resulted in an underestimate of the CPHP's construction and operational emissions. The comment also states that in estimating the emissions from the Initial Phase projects, the modeling outputs indicate that only some amount of research and development land use and some amount of residential land use was analyzed, and that all four Initial Phase projects were not analyzed. Please note that the output files cited in this comment were run to estimate operational emissions and not construction emissions. Therefore, the response below is focused on estimated operational emissions and not on construction emissions.

The output files in question were run to estimate emissions from 1) mobile sources, 2) area sources, and 3) natural gas combustion not associated with the central utility plant (CUP), as presented in Table 4.2-9 on page 4.2-35 of the Draft EIR for the analysis of the full CPHP buildout. For the analysis of the Initial Phase projects, separate, land-use-specific model runs were generated, as the comment suggests.

With respect to mobile source emissions, the CalEEMod default values for vehicle trip generation were adjusted to match the estimated daily vehicle miles travelled (VMT) as calculated for the transportation analysis and multiplied by 365 to conservatively capture the annual VMT for the existing and 2050 scenarios of the full buildout of the CPHP. Because the transportation analysis did not parse-out VMT specific to each land use, it was not possible to run separate, land use-specific model runs for the full CPHP buildout. Regardless, the mobile emission estimates capture the appropriate VMT for the existing and 2050 scenarios and the mobile source emissions in Table 4.2-9 in the Draft EIR are valid.

With respect to area source emissions, these emissions include landscape maintenance (equipment used for these activities such as gasoline-powered lawnmowers and blowers), maintenance application of paints and other interior and exterior surface coatings, and increased use of consumer products that result in emissions of ROG. Application of a hospital land use for the entirety of the square footage of new development represents a worst-case analysis. CalEEMod calculates these emissions solely on the basis of square footage, so this generalization is justified for the purposes of these emissions.

With respect to natural gas combustion not associated with the CUP, a hospital land use can reasonably be expected to represent a worst-case analysis compared to residential, university or other research and development land uses. Appendix D of the CalEEMod user's manual indicates 85 kBTU/square foot of natural gas demand in San Francisco's climate for a hospital land use. This may be compared to 33k BTU/square foot for university land uses or 18 kBTU/square foot for research and development uses. Therefore, basing the operational emissions solely on a hospital land use is conservative and likely overestimates project-related emissions from natural gas combustion.

With respect to the operational model runs for the Initial Phase projects, only the New Hospital and the RAB would generate operational emissions because the Irving Street Arrival project would not generate meaningful operational emissions. As stated on page 4.2-22 of the Draft EIR, while the proposed New Hospital is a CPHP Initial Phase project, it is considered programmatically in this EIR with respect to operations, because adequate operational details of that project are not available at this time for a project-level analysis.

While a land-use specific inventory approach would be more accurate, the lack of specific data for future phase projects (e.g., square feet of specific building use, location of emission sources) precluded such an approach. As indicated above, the emissions presented in Table 4.2-9 on page 4.2-35 of the Draft EIR for the analysis of the full CPHP build-out are valid and likely overly conservative, and consequently, no changes to the significant and unavoidable criteria pollutant impact determination for the operational emissions associated with the full CPHP buildout in 2050 are warranted.

O-LD2-102 This comment expresses concern that changes made to the default construction phase lengths may have resulted in maximum daily construction emissions that are underestimated.

Default construction phase lengths were adjusted to match those of the project description. The CalEEMod web site contains a "user-tips" document that states:

> "For construction equipment calculations, the user should evaluate whether the default equipment list, including equipment types and numbers, horsepower ratings, hours of operation, and duration of phases, are appropriate. If changes are made to the equipment list, the program will not automatically compensate by changing the construction time. Nor will the program automatically revise the equipment list to reflect a revised construction time. Changes to one of these must accompany revisions of the other based on project-specific data."

Therefore, adjustment of construction phases may be made as warranted. Because the construction phases were adjusted to a longer duration, without reducing the hours of equipment operation, calculated emissions are greater than they would have been if default values were used. It should be noted the BAAQMD guidance for assessing construction-related air quality impacts applies to average daily emissions and not maximum daily emissions as suggested in the comment. Therefore, extending the duration of construction phases does not result in an underestimation of construction emissions. Construction details were provided by UCSF and the construction dates are summarized on pages 3-36 and 3-37 of the Project Description in the Draft EIR. Therefore, construction emissions were modeled on a project-specific schedule provided by UCSF and accurately reflect the emissions associated with the proposed CPHP.

O-LD2-103 This comment cites a discrepancy between the square footage used in the CalEEMod modeling run for demolition included in the RAB project (233,000 square feet) and the value presented on page 3-37 of the Project Description (254,000 square feet). The correct value was used in estimating the emissions from the demolition for the RAB project, and the emissions estimate in the Draft EIR is accurate. The Draft EIR Project Description inadvertently overstated the estimated demolition volume associated with UC Hall and School of Nursing as 254,000 gsf. Please refer to Section 8.5 of this Comments and Responses document for the revisions made to the project description text to correct this error.

O-LD2-104 This comment cites the difference between the default number of acres graded within the CalEEMod model and those indicated in the model output on page 1,114 of the Draft EIR for the New Hospital and on page 1,174 for the RAB, and that the change from the default values to other values may have resulted in the underestimation of construction-related emissions reported in the Draft EIR.

There is an anomaly in the CalEEMod program that populates adjusted values in the acres graded input file. These adjustments were not input by the model operator. Notwithstanding these discrepancies, the acres graded value only affects the calculation of fugitive dust within the CalEEMod model. As described in Table 4.2-6 on page 4.2-21 of the Draft EIR, the BAAQMD's recommended methodology of impact assessment of criteria pollutants from construction applies solely to exhaust emissions and not fugitive dust. Impacts from construction-related fugitive dust from grading and other operations are addressed in Impact AIR-1 on pages 4.2-28 through 4.2-30 of the Draft EIR. Because fugitive dust impacts are qualitatively assessed per BAAQMD guidance, quantification of fugitive dust emissions is not required and therefore was not presented in the Draft EIR. The acres graded component of the CalEEMod model only contributes to the models calculation of fugitive dust. This value has no contribution to the model's calculation of exhaust emissions and hence has no effect on the calculation of criteria air pollutants. Therefore, any discrepancies in grading acreage do not affect the findings of the Draft EIR with respect to fugitive dust impacts or criteria pollutant impacts from construction.

O-LD2-105 This comment points to a difference between the default number of haul trips associated with grading phase of construction for the initial phase Aldea housing densification project (313) and the value used in the analysis (312).

This discrepancy is due to rounding of the resultant number of one-way trips (312.5) and is inconsequential relative to the overall emissions associated with the construction phase and the construction impact determination in the Draft EIR for the initial Aldea housing densification project.[2]

O-LD2-106 The commenter states that there is a difference in construction equipment engines with Tier 4 Interim certification and Tier 4 Final certification, and that CPHP Mitigation Measure AIR-1a in the Draft EIR is non-specific relative to its requirement of Tier 4 equipment. The commenter also asserts that construction equipment with Tier 4 final certification may not be available. The commenter is correct regarding this difference in certification, and CPHP Mitigation Measure AIR-1a has been revised to specifically require off-road equipment with Tier 4 Final certified engines. Please refer to Section 8.5 of this Comments and Responses document for the applicable revision made.

With respect to the availability of Tier 4 final equipment, the commenter is presenting data compiled for 2014. The most recent update to this data[3], from

[2] As shown on page 1,096 of the Draft EIR, emissions of nitrogen oxides (NO_x) associated with haul truck trips with the 312 trips is estimated to be 0.0283 tons per year from the grading phase. If the value is rounded up to 313 trips, the resultant contribution is 0.0284 tons per year in 2028, a difference of 0.0001 ton in 2028. This compares to a total of 0.6984 tons per year in 2028 (page 1,088 of the Draft EIR). This rounding error is inconsequential to the calculated emissions.

[3] San Francisco Department of Environmental Planning, 2020 Off-Road Construction Equipment Vehicle Inventory, 2020.

2020, indicates that equipment with Tier 4 Final engines had increased to 33 percent of the San Francisco Bay Area Air Basin-wide fleet and it may reasonably be expected that the percentage is higher for large fleets in urban areas, such as San Francisco. Furthermore, many construction projects in San Francisco are requiring Tier 4 Final equipment as mitigation and are being monitored for compliance, thus demonstrating feasibility.

O-LD2-107 The commenter states that adjustments were made to several models by replacing the default vehicle emission factors with mobile source emission factors from EMFAC and requests more information about the specific factors that were taken from EMFAC.

As stated on page 4.2-23 of the Draft EIR, operational emissions for the Irving Street Arrival, RAB, and initial Aldea Housing Densification projects were estimated using the CalEEMod (version 2016.3.2) adjusted with EMFAC2017 emissions factors recently approved by EPA. Specifically, the EMFAC2017 model was run for the following parameters to obtain the emission factors that were input into the CalEEMod model:

- On-road Emission Rates
- San Francisco Bay Area Region
- Calendar years 2018 or 2030, as appropriate
- Aggregate model years
- Aggregate Speed
- All fuel types

The above parameters are consistent with those that are embedded in the CalEEMod model for the older EMFAC2014 factors. Therefore, the air quality modeling used the latest EPA-approved factors and model inputs were appropriately adjusted for the analysis.

O-LD2-108 The commenter states that an adjustment was made to the emission factor for reactive organic gases (ROGs) from consumer products and requests more information on the source of the emission factor that was input into the model. The emission factor adjustment is consistent with in-depth air quality analysis conducted for EIRs within the City of San Francisco and has been derived with input from the City of San Francisco's Department of Environmental Planning. San Francisco's ROG emissions from consumer products in 2008 was 5.30 tons;[4] and San Francisco's assumed square footage was 703,541,231 square feet. Therefore, the emission factor used was 1.51e-5 lbs/(sq.ft.-day). The total building space that the City of San Francisco Environmental Planning Department relied

[4] California Air Resources Board, 2009 *Estimated Annual Average Emissions, San Francisco County,* https://www.arb.ca.gov/app/emsinv/emssumcat_query.php?F_=2008&F_DIV=-4&F_SEASON=A&SP=2009&F_AREA=CO&F_CO=38&F_COAB

upon in developing this emission factor is San Francisco Planning Department 2011 Land Use data.

This derivation of the refined emission factor is consistent with that derived in Appendix E of the CalEEMod User's Manual for the ROG emission factor within the South Coast Air Quality Management District that uses data points from 1993 to 2002.

The use of this emission factor does not result in the underestimation of ROG emissions nor does it result in an incorrect impact conclusion regarding the project's ROG emissions.

O-LD2-109 The commenter states that adjustments were made to the silt loading factor for entrained road dust, and suggests that the silt factor used may not be appropriate for a project in San Francisco, and may therefore underestimate operational emissions of particulate matter from mobile sources.

The silt loading factors that were manually input into CalEEMod were derived using Miscellaneous Process Methodology 7.9 of the California Air Resources Board[5] which was last revised and updated in March of 2018, and is therefore more recent than the silt loading in the latest version of CalEEMod (2016.3.2.) which uses EPA values dating from January 2011. Therefore, the air quality analysis used the latest available methodology for estimating particulate matter emissions from road entrained road dust from paved roads.

Because the UCSF hospital would draw regionally from throughout the Bay Area and beyond, the derivation of silt loadings used geographical data of its visitor origins provided by UCSF. **Table 8.4.2.2-1** below provides the derivation of the composite regional silt loading factor:

TABLE 8.4.2.2-1
DERIVATION OF COMPOSITE REGIONAL SILT LOADING FACTOR

Distribution by County	
Point of origin	**Emissions Allocation per Ramboll**
San Francisco	6.00%
Peninsula (San Mateo)	15%
South Bay(Santa Clara)	5%
North Bay 1 (Marin/Sonoma)	9%
North Bay 2 (Contra Costa)	5%
East Bay (Alameda)	21%
Outside Bay Area	39%
	100.00%

5 https://ww3.arb.ca.gov/ei/areasrc/fullpdf/full7-9_2018.pdf

TABLE 8.4.2.2-1 (CONTINUED)
DERIVATION OF COMPOSITE REGIONAL SILT LOADING FACTOR

Silt Loading by County		
Point of origin	**Silt Loading**	**Contribution to Composite**
San Francisco	0.09696	0.005818
San Mateo	0.038269	0.006818
Santa Clara	0.043086	0.001077
Marin	0.042847	0.003856
Alameda	0.037642	0.010314
Contra Costa	0.046795	0.004272
Solano	0.039229	0.007803
Yolo	0.120295	0.007976
Project-Specific Composite Silt Loading		0.047933

Using the above methodology, a project-specific composite silt loading factor was developed using the latest available data sources and accounting for project-specific geography. Even with these refinements, as indicated in Impact AIR-2 on pages 4.2-33 through 4.2-37 of the Draft EIR, vehicle travel associated with buildout under the full CPHP in 2050 would result in particulate matter emissions that would exceed the significance criteria and result in a significant and unavoidable air quality impact.

O-LD2-110 The commenter states that adjustments were made to trip rates used to estimate operational mobile source emissions, and expresses concern that these adjustments may have resulted in underestimating project emissions.

As discussed on page 4.2-43 of the Draft EIR, mobile source emissions in CalEEMod are based solely on VMT calculated in the transportation analysis. Criteria pollutant emissions would also be generated by the increase in vehicle traffic by the CPHP's Initial Phase projects. Similar to the VMT estimated for the CPHP as a whole, the net increase in VMT used to estimate vehicle-related emissions for the proposed RAB and initial Aldea Housing Densification project was derived from the transportation analysis in Draft EIR Section 4.15, *Transportation*. Based on the transportation analysis, the proposed RAB and initial Aldea Housing Densification projects would generate approximately 51,900 additional daily VMT. Total daily VMT as estimated by the transportation analysis for the Initial Phase projects was multiplied by 365 to arrive at an annual VMT which is the metric used by CalEEMod in its calculation of mobile emissions. Based on the transportation analysis, daily VMT under existing conditions was estimated to be 51,852 miles resulting in annual VMT of 1.8926e+7 miles. This value is shown on page 1,349 of the Draft EIR Appendix AIR. Consequently, the trip rates of the model were adjusted to match the annual VMT predicted by the transportation analysis. Therefore, the air quality emissions for the CPHP Initial

Phase projects presented in Table 4.2-10 on page 4.2-44 of the Draft EIR were directly based on VMT data from the transportation analysis, and the mobile emissions were accurately estimated.

O-LD2-111 This comment raises concerns that adjustments to energy usage rates in the CalEEMod input file for the CPHP Initial Phase projects may result in underestimating air pollutant emissions and are based on UCSF goals that may not be justifiable.

The first adjustment cited addresses the zeroing out of electricity demand values. It should first be pointed out that electrical demand affects the assessment of GHG emissions as an indirect source of GHGs, but is not an element of criteria pollutant analysis under BAAQMD methodology. Notwithstanding this distinction, these values were set to zero because UCSF has committed to net zero electrical energy by 2025. This commitment is not a goal, but rather, a commitment. As stated on page 4.7-20 of Section 4.7 Greenhouse Gases of the Draft EIR, this is the current commitment made under the *American College and University Presidents' Climate Commitment* and the commitment is referenced in UCSF's Annual Progress Report to the UC Regents. Therefore, as a commitment, it may reasonably be expected that there will no electrical emissions of GHGs resulting from the proposed CPHP Initial Phase projects in the 2030 horizon year.

The second adjustment cited addresses the 20 percent adjustment applied to Title 24 natural gas and electricity use for the operation of the CPHP Initial Phase projects indicated on page 1,371 of the Draft EIR, in Appendix AIR. This reduction is indicated as a note within the model. CalEEMod has a restriction on the number of characters allowed in the "notes" field and extended explanations of adjustments are not possible within the model. However, as stated on page 4.7-21 of the Draft EIR, the UC *Sustainable Practices Policy* provides that all new building projects, other than acute care facilities, shall be designed, constructed, and commissioned to outperform the CBC energy-efficiency standards by at least 20 percent or meet the whole-building energy performance targets. Therefore, a 20 percent reduction beyond the 2016 Title 24 demand embedded in the model was applied. This is conservative because updated 2019 Title 24 requirements became effective in 2020 and would result in further reductions not considered. Ultimately, CPHP Mitigation Measure GHG-1c would require monitoring of GHG emissions annually and acquisition of carbon offset credits in conformance with CARB guidance, prioritizing local and in-State offsets to achieve and maintain carbon neutrality for the Parnassus Heights campus site under the CPHP. Therefore, because the proposed CPHP would meet net zero GHG emissions with implementation of mitigation measures, the Initial Phase of the CPHP would have a less than significant impact with respect to GHG emissions.

O-LD2-112 This comment summarizes the results of the construction HRAs prepared and reported in the Draft EIR for the Initial Phase projects and the operational HRAs prepared for the RAB project, and asserts that the analysis of health risk impacts in the Draft EIR is flawed. The comment points out three alleged flaws which are addressed below.

The comment asserts that CPHP Mitigation Measure AIR-1a fails to indicate whether Tier 4 Interim or Tier 4 Final construction equipment would be required and hence it is erroneously used in the analysis of health risk impact. As discussed under Response O-LD2-106 above, CPHP Mitigation Measure AIR-1a has been revised to specifically require off-road equipment with Tier 4 Final certified engines. Please refer to Section 8.5 in this Comments and Responses document for the applicable revision made. As UCSF will comply with CPHP Mitigation Measure AIR-1a and require the use of Tier 4 Final certified construction equipment during the construction of the individual projects under the CPHP, the reductions in construction-phase health risk from the implementation of this measure will be realized.

The commenter also asserts that the Draft EIR fails to evaluate health risk impacts resulting from the CPHP's entire operations and contends that the partial HRA prepared for the RAB project cannot be used to determine impacts from the operations of all of the development under the CPHP. As discussed on page 4.2-20 of the Draft EIR, the proposed overall CPHP air quality impacts are analyzed at the plan-level, while the Irving Street Arrival, RAB and initial Aldea Housing Densification projects are analyzed at the project level (the Irving Street Arrival and the Aldea Housing Densification projects would not include any sources of TACs). Further, on page 4.2-25, the Draft EIR explains that the New Hospital and all Future Phase projects will undergo separate environmental review under CEQA. In those subsequent environmental reviews, health risk from operations will be assessed.

Lastly, the commenter contends that the HRA fails to evaluate the cumulative lifetimes cancer risk to nearby, existing receptors as a result of the project construction and operation together. The commenter also asserts that the analysis should sum construction and operational health risks and compare to the BAAQMD threshold of 10 in one million. As part of the environmental review for the Initial Phase projects, the University of California, as the lead agency, selected to use a quantitative project level significance criterion of an incremental cancer risk of 10 in one million adopted by BAAQMD, as documented on page 4.2-24 of the Draft EIR. When evaluating the cumulative risk from all sources, the University used a cumulative significance criterion of an incremental cancer risk of 100 in one million, which has also been put forth by BAAQMD.

For each of the Initial Phase projects, including the New Hospital, a construction health risk assessment was completed and compared to the BAAQMD project-

level increased cancer risk significance criterion of 10 per million. With respect to operational emissions, as affirmed on page 4.2-25, toxic air contaminants associated with the Irving Street Arrival, RAB, and initial Aldea Housing Densification projects would be emitted from emergency generator engine reliability procedures, fume hood activity, and increased natural gas combustion at the Central Utility Plant. For these Initial Phase projects, the RAB project is the majority contributor to the operational TACs and therefore the operational emissions from all three initial phase projects were conservatively evaluated together and compared to BAAQMD's significance criterion of 10 per million for project-level increase in cancer risk.

Impact C-AIR-2 on pages 4.2-69 to 4.2-71 of the Draft EIR evaluates the cumulative impacts of construction and operations of the full CPHP plus previously approved development under the 2014 LRDP, foreseeable off-site construction projects in the vicinity, and existing background risk of the campus site and surrounding areas. On page 4.2-70 of the Draft EIR, the construction cumulative analysis notes that the demolition of the LPPI as authorized under the 2014 LRDP would be the only notable cumulative construction project to occur along with a CPHP project in the same year, and would occur within approximately 200 feet of each other. The analysis concludes that construction of the Irving Street Arrival project would result in a cancer risk of approximately 2 in one million, and the LPPI demolition would result in a cancer risk of about 0.51 in one million. On page 4.2-70 of the Draft EIR, it is stated that the operational cancer risk from the CPHP full buildout would be similar to that of the campus site under the 2014 LRDP as assessed in the 2014 LRDP Final EIR which was 10 in one million. Under the existing conditions, the Parnassus Heights campus site and its surrounding area have a cancer risk of less than 100 in one million cancer risk since it is not located within an APEZ. The analysis therefore concludes that the cumulative increase in cancer risk for all sources would be well below 100 in one million and the project-level contributions would be less than 10 in one million and therefore, the impact related to the cumulative lifetime cancer risk to nearby, existing receptors as a result of the CPHP construction and operation was evaluated in the Draft EIR and was found to be less than significant.

O-LD2-113 This is an introductory comment that identifies three issues with the Draft EIR analysis in Section 4.7, Greenhouse Gas Emissions, on the basis of which the commenter questions the Draft EIR's conclusion of a less than significant impact with respect to GHG emissions. Each of these three issues are addressed separately in the following three responses.

O-LD2-114 This comment claims that GHG emissions in Section 4.7 in the Draft EIR are underestimated because, as pointed out in previous comments regarding the air emissions modeling, several of the values that were input into the model to estimate GHG emissions do not agree with information in the project description.

As explained above in the Responses O-LD2-97 through O-LD2-113 with respect to air quality, the adjustments made to the CalEEMod model were appropriate and reflect expected conditions during project construction and operation and are based on substantial evidence. Therefore, the adjustments made are also appropriate to the estimate of emissions of GHGs and updated emissions estimates are not required or warranted.

O-LD2-115 The commenter asserts that the Draft EIR's analysis of the project's consistency with the Scoping Plan Update is incorrect for two reasons: first, because policies and goals set forth in the 2017 Update may not be achieved at a local (i.e., campus level), and secondly, because there are several measures in the 2017 Scoping Plan Update that the proposed project does not comply with.

Consistency of the CPHP with the 2017 Update to the Climate Change Scoping Plan is discussed on pages 4.7-43 and 4.7-44 of the Draft EIR. GHG impact assessment in this Draft EIR with respect to the year 2030 and 2050 reduction targets is based on guidance in the CARB's 2017 Scoping Plan Update regarding implementation of available measures to reduce GHG emissions. The 2017 Scoping Plan Update states that "there are recent examples of land use development projects in California that have demonstrated that it is feasible to design projects that achieve zero net additional GHG emissions." In the 2017 Scoping Plan Update, CARB recognizes that achieving no net increase in GHG emissions compared to existing conditions would demonstrate that a project is not contributing to climate change impacts, and is a recommended objective for land use development projects that are able to feasibly achieve this goal. Accordingly, the CPHP was considered to result in a significant impact on the environment if GHG emissions from construction and operations of the Parnassus Heights campus site would exceed a threshold of zero net additional GHG emissions compared to the existing conditions. CPHP Mitigation Measure GHG-1c would require monitoring of emissions annually and acquisition of carbon offset credits in conformance with CARB guidance, prioritizing local and in-State offsets to achieve and maintain carbon neutrality for the Parnassus Heights campus site under the CPHP. Therefore, because the proposed CPHP would meet net zero GHG emissions with implementation of mitigation measures, the CPHP would have a less than significant impact with respect to the goals of the 2017 Scoping Plan Update and assessment of individual measures within the Scoping Plan Update is not warranted, particularly given that many of these measures are already identified in Table 4.7-4 on pages 4.7-37 through 4.7-39 of the Draft EIR relative to the UC *Sustainable Practices Policy*.

O-LD2-116 The commenter opines that the regional Sustainable Communities Strategy, the 2040 Plan Bay Area, is inappropriate to be used for reviewing specific projects or development targets and that it does not qualify as a Climate Action Plan under CEQA. However, the comment goes on to suggest that several mitigation

measures from the EIR for the 2040 Plan Bay Area are not addressed in the Draft EIR for the proposed CPHP.

The proposed CPHP was qualitatively assessed for consistency with the 2040 Plan Bay Area on page 4.7-45 of the Draft EIR with respect to its role as a Sustainable Communities Strategy and not as a Climate Action Plan. As stated on page 4.7-31 of the Draft EIR, MTC adopted growth geographies for several new Priority Development Areas (PDAs), including a "Central City Neighborhoods PDA" in San Francisco that includes a portion of the Parnassus Heights campus site. This and other new PDAs are not included in the *Plan Bay Area 2040*, but will be studied in the *Draft Plan Bay Area 2050 Blueprint* (MTC, 2020). The proposed CPHP is consistent with *Plan Bay Area 2040* by virtue of being located within a Transit Priority Area (TPA), which is defined as an area within one-half mile of an existing or planned major transit stop (Public Resources Code Section 21099(a)(7)), where "major transit stop" is defined as a site containing any of the following: an existing rail or bus rapid transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods (Public Resources Code Section 21064.3).

With respect to mitigation measures identified in the EIR for the 2040 Plan Bay Area, all of these measures are already part of UC *Sustainable Practices Policy* or are identified as mitigation measures in Section 4.2 Air Quality, Section 4.7 Greenhouse Gases, or Section 4.15 Transportation in the Draft EIR, as indicated below:

> *Plan Bay Area Transportation Mitigation Measure 2.1-3-3(b): TDM Measures.* Addressed on page 4.2-64 of the CPHP Draft EIR as 12 items of the existing UCSF's existing TDM Program and as CPHP Mitigation Measure AIR-2b: TDM Program Enhancements.
>
> *Plan Bay Area Air Quality Mitigation Measure 2.2-2: Best Practices.* Addressed on page 4.2-29 of the CPHP Draft EIR as CPHP Mitigation Measure AIR-1a: Clean Construction Equipment for CPHP Projects; as CPHP Mitigation Measure AIR-1b: Best Management Practices for Controlling Particulate Emissions during Construction, and as CPHP Mitigation Measure AIR-3: Project-Specific Health Risk Analysis.
>
> *Plan Bay Area Climate Change and Greenhouse Gases Mitigation Measure 2.5-4(b): Transportation Management Plans.* Addressed in Impact TRANS-1 (Implementation of the CPHP would not conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities) on page 4.15-37 of the Draft EIR.
>
> *Plan Bay Area Climate Change and Greenhouse Gases Mitigation Measure 2.5-4(c): Sea Level Rise.* This topic was dismissed as having no impact on page 35 of the Initial Study in Appendix A of the CPHP Draft EIR.

Please note Comment Letter O-LD2 contained several exhibits (Exhibit A, Exhibit C, Exhibit G, Exhibit H), attachments to Exhibit B (Attachments 1 through 6) and attachments to Exhibit E and Exhibit F which did not comment directly on the Draft EIR. These exhibits and attachments are included in Appendix O-LD2 in this Comments and Responses document.

Re: Comment on Draft Environmental Impact Report, UCSF Comprehensive Parnassus Heights Plan (SCH 2020010175); *Save Berkeley's Neighborhoods v. The Regents of the University of California* (2020) 51 Cal.App.5th 226

Dear Chair Pérez, Vice Chair Estolano, and Honorable Regents:

This letter is submitted on behalf of the Parnassus Neighborhood Coalition ("PNC"), a group of residents living near the University of California, San Francisco ("UCSF") Parnassus Heights campus, regarding the Draft Environmental Impact Report ("DEIR") prepared for the Comprehensive Parnassus Heights Plan ("CPHP") (SCH 2020010175) (the "Project"). This letter supplements our comment letter of September 11, 2020. Our September 11 letter argued that the proposed Project would have growth inducing, population and housing impacts that must be analyzed in a supplemental or revised EIR. The letter argued that the Project would create a demand for approximately 6,000 housing units, but would be constructing less than 1,000. As a result, the Project would result in displacement of existing residents and other adverse impacts that must be analyzed and mitigated in a revised EIR. 1

On the day after the comment deadline, with the denial of Supreme Court review, the case of *Save Berkeley's Neighborhoods v. The Regents of the University of California* (2020) 51 Cal.App.5th 226 became citable. That case held that enrollment increases above previously reviewed levels at the University of California at Berkeley could result in the impacts including "increased use of off-campus housing by U.C. Berkeley students (leading to increases in off-campus noise and trash), displacement of tenants and a consequent increase in homelessness, more traffic, and increased burdens on the City of Berkeley's public safety services (police, fire, and ambulance)." 2

Id. at 233. These are precisely the types of impacts that must be analyzed with respect to the massive proposed expansion of the UCSF Parnassus campus. 2 cont.

For the foregoing reasons, PNC believes that the Draft EIR for the UCSF Comprehensive Parnassus Heights Plan is wholly inadequate and urges the Regents to require a Revised Draft EIR to be prepared to address the concerns raised herein. Thank you for considering our comments and please include this letter in the record of proceedings for this project. 3

Sincerely,

Richard Drury
LOZEAU DRURY LLP

Responses to Comments from Lozeau Drury LLP

O-LD3-1 The commenter reiterates the commenter's comments in a previous comment letter (O-LD2).

Please see Master Response 14: Population and Housing Impacts, and Responses O-LD2-47 and O-LD2-48, O-LD2-58 through O-LD2-67.

O-LD3-2 The commenter stated that based on the recently decided case of *Save Berkeley's Neighborhood v. The Regents of the University of California*, the CPHP EIR must analyze impacts related to increased use of off-campus housing by project population, displacement of tenants, and increased burden on city services.

The comment incorrectly asserts that in the case of *Save Berkeley's Neighborhood v. The Regents of the University of California*, the Court of Appeal ruled that enrollment increases could result in impacts including "increased use of off-campus housing…, displacement of tenants and a consequent increase in homelessness… and increased burden of …public safety services." This quoted language is merely a recitation of the petitioner's allegations in its pleadings. The court ruled only on one issue which was that the petitioner's claims that the environmental impacts from increased enrollment should be evaluated under CEQA could support a cause of action that could withstand a demurrer. The court did not rule on the scope of the environmental impacts that need to be analyzed in an EIR, because the matter was briefed in the absence of an administrative record and was appropriately remanded to the trial court for further proceedings. As set forth in responses to comments in Letter O-LD2 and Master Response 15: Indirect Displacement and Gentrification Impacts, many of the impacts that the commenter lists are outside the scope of population and housing impact analysis under CEQA. With respect to other environmental effects, such as effects on transportation, public services, and noise, those are fully analyzed in other sections of the Draft EIR.

O-LD3-3 The commenter asserts that the Draft EIR is inadequate and that a revised Draft EIR must be prepared to address the commenter's concerns.

Please see Responses O-LD3-1 and O-LD3-2 above. The Draft EIR analysis complies fully with CEQA requirements and a revised Draft EIR is not required.

Re: Comprehensive Parnassus Heights Plan Draft Environmental Impact Report: Comments on Cultural and Historic Resources; the Zakheim Murals.

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents. I write on its behalf to comment on the Draft Environmental Impact Report (DEIR) for the Comprehensive Parnassus Heights Plan (CPHP) with respect to its analysis of project impacts on the Zakheim Murals located in UC Hall/Toland auditorium.

1. The Zakheim Murals.

The Project proposes to demolish UC Hall and the series of Zakheim murals located within Toland Hall auditorium in UC Hall. The DEIR finds that UC Hall and the Zakheim murals are historically and culturally significant and their demolitions represent significant environmental impacts. The DEIR also finds that significant environmental impacts are "unavoidable" because preserving these resources would be infeasible. The DEIR's finding that preserving these resources is infeasible is based on errors of law and is not supported by substantial evidence.

1

a. The DEIR fails to disclose the severity of the significant impacts caused by demolishing the Zakheim murals.

The DEIR describes the Zakheim Murals as follows:

The series of Zakheim murals are located within the single-story Toland Hall auditorium in UC Hall. These murals were commissioned as part of the Works Progress Administration (WPA) Federal Art Project and depict, in 10 panels, scenes of the history of science and medicine in California — including portrayals of traditional Native American medicine; scenes from Spanish, early American and Gold Rush California; and the founders of the UC Medical School. The murals were painted using the same traditional method of creating frescoes developed during the Italian Renaissance in which pigment is rapidly applied

2

> directly to wet plaster so that it becomes an integral part of the plaster, resulting in a chemical reaction that forms a surface of calcium carbonate on top of the pigment. Original skylights also remain in the auditorium, and the two surviving original interior stairwells feature marble treads and steel balustrades topped by a clear varnished wood handrail. A "Carved Frame" oak carving (Carved Frame) by Michael Von Meyer and James Warrender was also commissioned as part of the WPA Federal Art Project and is located in Toland Hall. Although UC Hall's interior has been extensively modified, Toland Hall and its corresponding murals remain intact (UCSF, 2005).

(DEIR 4.4-14, pdf 328.)

2 cont.

This description does not begin to do justice to the historical, cultural, and artistic significance of the murals, as shown in the September 3, 2020, letter from Dr. Robert Cherny, attached as Exhibit 1, and the publication entitled "Toland Hall Frescos - Illustrated Guide," dated July 26, 2020, by Robert S. Sherins, MD, a copy of which is attached as Exhibit 2.

Thus, the DEIR fails to lawfully disclose the severity of the significant impact caused by demolishing these murals. (See e.g., *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 519 ["a sufficient discussion of significant impacts requires not merely a determination of whether an impact is significant, but some effort to explain the nature and magnitude of the impact"]; *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 514–515; *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123 ["a more detailed analysis of how adverse the impact will be is required"].)

b. The DEIR cannot lawfully conclude that conserving and moving the murals is infeasible because UCSF has not conducted a reasonable investigation of the question.

Regarding the feasibility of conserving and moving the murals, UCSF has not conducted and presented the results of a reasonable investigation of the question. Therefore, the DEIR is so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment are precluded. (*Mountain Lion Coalition v. Fish & Game Com.* (1989) 214 Cal.App.3d 1043; CEQA Guideline 15088.5(a)(4).)

3

The DEIR describes UCSF's commencement of its investigation into the feasibility of conserving and moving the murals, as follows:

> Although a search of UCSF's records did not indicate that any interest to the Zakheim murals was preserved by GSA on behalf of the United States, UCSF provided notice of the Zakheim murals' potential destruction in accordance with GSA's stated policies and guidance for disposal of artwork and sculptures

> commissioned under the WPA. (Legal Title to Art Work Produced Under the 1930s and 1940s New Deal Administration, 2019.) Following receipt of UCSF's notice to GSA regarding the potential destruction of the Zakheim murals, GSA has now asserted an ownership interest in the Zakheim murals on behalf of the United States, and has indicated that documentation exists to demonstrate that the Zakheim murals and the Carved Frame are on loan to UCSF. UCSF will continue to discuss the federal ownership claim of the Zakheim murals and the Carved Frame directly with GSA.
>
> UCSF also analyzed the Visual Artists' Rights Act (17 U.S.C. § 106A et seq.) and the California Art Preservation Act (California Civil Code § 987 et seq.) to identify their applicability to the Zakheim murals. While UCSF has determined that both sets of laws likely have limited or no application to the Zakheim murals, UCSF extended a written notice of UCSF's intent to demolish UC Hall and the Zakheim murals contained therein as a courtesy to the family of Bernard Zakheim.
>
> Finally, UCSF will publish a written notice as a display advertisement in the San Francisco Chronicle informing the public of its intention to demolish UC Hall and the Zakheim murals. (Cal. Civ. Code, § 989(e)(2)(A).) An existing organization with an art-related purpose will then have the opportunity to contact UCSF within 30 calendar days of the date that the notice is published in the San Francisco Chronicle, if such an organization wishes to preserve, remove and relocate the Murals.

(DEIR 4.4-15; pdf 329.)

3 cont.

Also, in August, 2020, UCSF made an Advertisement for Proposals available to certain art conservators to solicit bids to conserve and remove the murals.[1]

UCSF was required to complete these investigations before preparing the Draft EIR, because "an agency must use its best efforts to find out and disclose all that it reasonably can" (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 428; *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 398–399; CEQA Guideline 15144), and the EIR must include the evidence supporting a conclusion that a mitigation measure is infeasible (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 527).

[1]A true and correct copy of UCSF's Advertisement for Proposals for UCSF Project No.: PRJ-000293; Contract No.: PRJ-000293-CC-001, as made available to certain art conservators in August, 2020, is attached as Exhibit 3.

c. The DEIR's conclusion that conserving and moving the murals is infeasible is not supported by substantial evidence.

The DEIR's conclusion that conserving and moving the murals is infeasible is not supported by substantial evidence. The DEIR states:

> [I]n 2020, UCSF completed two independent studies that include detailed technical assessments on how the Zakheim murals could be physically preserved, removed and relocated from their current location in UC Hall. (Page & Turnbull, 2020; Architectural Resources Group 2020.) Given the nature of the frescoes and their vulnerability to cracking, the physical condition of some of the panels which have experienced water damage over the years, the murals' large size, the curved shape of the walls on which most of the panels are painted, ground movements, and the aging of UC Hall (all described in the above noted studies), UCSF has determined that it may be infeasible to remove and relocate the Zakheim murals as there is no guarantee that any effort to remove the Zakheim murals would be successful. Based on those independent studies, there is a likelihood that removal of the Zakheim murals may potentially cause serious damage to at least some of the panels such that the integrity of the entire series is destroyed (Page & Turnbull, 2020). In addition, UCSF has determined that the estimated $7.6 million cost of physical preservation, removal and relocation is prohibitive in light of UCSF's primary responsibility to support its academic health care mission.

(DEIR 4.4-14, 15; pdf 328-329.)

The DEIR admits that The Regents previously adopted a mitigation measure, as part of their 2005 adoption of an LRDP Amendment, requiring "removal of the Zakheim murals from UC Hall's Toland Hall prior to demolition and their subsequent conservation at an appropriate facility." (DEIR 4.4-14, pdf 328.)[2]

When deleting a previously approved mitigation measure, the lead agency must find it infeasible and support this finding with substantial evidence and "the deference provided to governing bodies with respect to land use planning decisions must be tempered by the presumption that the governing body adopted the mitigation measure in the first place only after due investigation and consideration." (*Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal.App.4th 342, 359.)

4

[2]The certified Environmental Impact Report for LRDP Amendment #2 – Hospital Replacement (2005 EIR), includes the following mitigation measure: "Preservation. The Depression-era murals in UC Hall's Toland Hall shall be removed from UC Hall and conserved at an appropriate facility." (2005 EIR, p. 4.3-22.) San Franciscans requests that the 2005 EIR be included in the record of proceedings for the Project.

Here, the DEIR relies on two studies for its conclusion (Page & Turnbull, 2020; Architectural Resources Group 2020 (ARG)), but neither study concludes or opines that it is infeasible to conserve and remove these murals. In fact, the ARG study finds it is feasible to conserve and remove these murals.[3]

The DEIR presents no evidence support the $7.6 million dollar cost estimate. This figure is contradicted by UCSF's own Advertisement for Proposals that USCF circulated to certain art conservators in August, 2020, to solicit bids to conserve and remove the murals. UCSF's Advertisement for Proposals established $1,800,000 as the "Maximum Acceptance Cost." This Advertisement for Proposals is attached as Exhibit 3. Therefore, UCSF itself has concluded it can be done for only $1,800,000.

4 cont.

Also, the letter dated September 8, 2020, from Nathan Zakheim, the artist's son and a prominent art conservator, conclusively demonstrates that it is technically and financially feasible to conserve and remove the murals. This letter is attached hereto as Exhibit 4.

5

Thank you for your attention to this matter.

Very Truly Yours,

Tom Lippe

Thomas N. Lippe

2. Toland Hall Frescos - Illustrated Guide, July 26, 2020, Robert S. Sherins, MD.

3. Advertisement for Proposals for UCSF Project No.: PRJ-000293; Contract No.: PRJ-000293-CC-001.

4. Letter dated September 8, 2020, from Nathan Zakheim.

C002c DEIR Murals.wpd

---

[3]"As with any large scale art moving project, there is significant risk to the art during de-installation, moving or transportation processes. As large, curved frescos, these works are particularly vulnerable. Attempts have been made to consider as many of these risks as possible at this stage, and the work plan below has been designed accordingly." (ARG 2020, p. 4.) San Franciscans requests that Page & Turnbull 2020 and Architectural Resources Group 2020 be included in the record of proceedings for the Project.

Responses to Comments from Law Offices of Thomas N. Lippe, APC

O-TL1-1 The commenter asserts that the Draft EIR's finding that preserving UC Hall and Zakheim murals are infeasible is not supported by substantial evidence. Please refer to Master Response 11: Toland Hall Murals.

O-TL1-2 The commenter claims that the Draft EIR's description of the Zakheim murals does not convey the significance of the murals and therefore fails to disclose the severity of the significant impacts. Please refer to Master Response 11: Toland Hall Murals.

O-TL1-3 The commenter asserts that the UCSF has not conducted a reasonable investigation regarding the feasibility of conserving and moving the Zakheim murals. The commenter notes that UCSF issued an Advertisement for Proposals in August 2020 to certain art conservators for the purpose of soliciting bids to conserve and remove the murals. The commenter claims that the investigation was required to be completed before preparing the Draft EIR. Please refer to Master Response 11: Toland Hall Murals.

O-TL1-4 The commenter asserts that the Draft EIR's conclusion that conserving and moving the Zakheim murals is infeasible is not supported by substantial evidence. The commenter states that neither of the two studies the Draft EIR relied on concludes that it is infeasible to conserve and remove the murals. With regard to the $7.6 million cost, the commenter asserts that there is no evidence to support this estimate and claims that because the Advertisement for Proposals established a $1.8 million "maximum acceptance cost", that UCSF concludes that the conservation and removal of the murals can be done for this amount. Please refer to Master Response 11: Toland Hall Murals.

O-TL1-5 The commenter provided a letter from Nathan Zakheim, which states that it is technically and financially feasible to conserve and remove the murals. Please refer to Master Response 11: Toland Hall Murals.

Please note Comment Letter O-TL1 contained several exhibits (Exhibits 1 through 3) which did not comment directly on the Draft EIR. These exhibits and attachments are included in Appendix O-LD2 in this Comments and Responses document. In addition, Comment Letter O-TL1 contained a comment letter on the Draft EIR from Nathan Zakheim Associates (in Exhibit 4), that was also submitted separately by its author. Please see Comment Letter O-NZA, and applicable responses that follow that letter.

Re: Comprehensive Parnassus Heights Plan Draft Environmental Impact Report: Comments on Cultural and Historic Resources: Buildings.

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities, a citizen's group composed of San Francisco residents. I write on its behalf to comment on the Draft Environmental Impact Report (DEIR) for the Comprehensive Parnassus Heights Plan (CPHP) with respect to its analysis of project impacts on cultural and historic resources.

1. The DEIR Fails to Evaluate the Historic Significance of Buildings Over 45 Years Old.

DEIR Table CUL-1 provides an inventory of buildings on the Parnassus Campus which were either "evaluated" or "not evaluated" in two reports prepared by Carey & Co. (Carey), one in 2003 and another in 2011. The buildings that Carey evaluated are classified as either listed on the California Register of Historical Resources (CRHR) or National Register of Historic Places (NRHP), eligible for listing on the CRHR, or not eligible for such listing.

Carey found many buildings "not eligible" in part because they were not more than forty-five (45) years old in either 2003 or 2011 when the evaluations were made. Some of these buildings are now more than forty-five (45) years old and are proposed for demolition or "addition." These buildings include Medical Building 1 (Ambulatory Care Center), School of Nursing, Moffitt Hospital, and Woods. (DEIR, Table CUL-1, p. CUL-2.)

For these buildings, the DEIR's determination of their eligibility is outdated and must be updated to evaluate them for historic significance. The letter dated September 10, 2020, from architectural historian Kara Brunzell, which is attached hereto as Exhibit 1, explains this point in greater detail. (See Exhibit 1.)

UCSF was required to complete these investigations and present the results in the Draft EIR, because "An EIR must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published." (CEQA Guidelines, § 15125; *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority*

1

(2013) 57 Cal.4th 439, 448; *Association of Irritated Residents v. Kern County Bd. of Supervisors* (2017) 17 Cal.App.5th 708, 725 ["the text of CEQA and the Guidelines identify existing conditions as the starting point (i.e., baseline) for determining and quantifying the proposed project's changes to the environment. Furthermore, the Guidelines amplify the statutory text by specifying the point in time normally used to identify existing physical conditions"].) Moreover, "an agency must use its best efforts to find out and disclose all that it reasonably can" (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 428; *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 398–399; CEQA Guideline 15144).

1 cont.

2. The DEIR Fails to Evaluate the Historic Significance of Millbury Union Garage.

The Project proposes to demolish Millbury Union Garage. The DEIR admits this building has never been evaluated for cultural and historic significance (DEIR, p. 4.4-12) and that it is more than forty-five (45) years old (DEIR, CUL02). The DEIR then "presumes" this demolition will result in a significant impact to historical resources. (DEIR, p. 4.4-12)

The DEIR fails to disclose the nature and severity of the significant impact caused by demolishing this buildingg, which is an omission of essential information under CEQA. (See e.g., *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 519 ["a sufficient discussion of significant impacts requires not merely a determination of whether an impact is significant, but some effort to explain the nature and magnitude of the impact"]; *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 514–515, 529 ["An EIR's failure to explain the precise nature and extent of that harm can affect —and ... limit—the alternative measures that the agency offers to the public"]; *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123 ["a more detailed analysis of how adverse the impact will be is required"].)

2

3. The DEIR Fails to Evaluate UCSF's Parnassus Campus as Historic Resource or Historic District.

Chapter 4.4 of the DEIR and the two Carey & Co, reports on which its analysis of historic buildings conduct and present the analysis one building at a time and fail to evaluate UCSF's Parnassus campus as a "historic resource" or "historic district" (defined in Public Resources Code section 5020.1, subdivisions (j) and (h), respectively) in its own right. Indeed, of the many "Form 523s" attached to the 2003 and 2011 Carey reports, not one checks the box for "District." The letter dated September 10, 2020, from architectural historian Kara Brunzell, attached hereto as Exhibit 1, explains this point in greater detail.[1]

3

[1]The EIR's approach stands in stark contrast to Chapter 4.1, regarding aesthetic impacts, which subdivides the campus into several "districts." (DEIR pp. 4.1-4 to 4.1-10.) Thus, it is inarguable that the site is more than a collection of unrelated buildings.

Thus, the DEIR omits essential information regarding the environmental setting and fails to assess the significance of a potentially significant impact on the affected environment.

3 cont.

4. The DEIR's "Not Eligible" Determinations for Many Building Are Not Supported by Substantial Evidence.

The DEIR determines that many buildings are not eligible for listing on the CRHR based on the two Carey & Co. reports. (See DEIR, Table CUL-1, p. CUL-2.) Two of these buildings are proposed for demolition (i.e., Proctor and Moffitt Hospital). The DEIR's ineligibility determination for these buildings are not supported by substantial evidence because the Carey & Co. evaluations do not meet minimum professional standards. The letter dated September 10, 2020, from architectural historian Kara Brunzell, attached hereto as Exhibit 1, explains this point in greater detail. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 409 ["A clearly inadequate or unsupported study is entitled to no judicial deference"].)

4

5. The DEIR's Conclusions That it Is Infeasible to Avoid Demolishing the Campus' Many Historically Significant Buildings Are Based on Errors of Law and Are Not Supported by Substantial Evidence.

The Project proposes to demolish numerous buildings that it concedes are historically and culturally significant, are eligible for listing on the CRHR or are already so listed, and as to which the demolition represents a significant environmental impact. These buildings include UC Hall, Millberry Union, School of Dentistry, Langley Porter Psychiatric Institute, Aldea San Miguel Housing Buildings 8, 10, and 12, and Saunders Court. (DEIR 4.4-13 to 4.4-4.4-18.) The DEIR also finds these significant impacts unavoidable because it is purportedly infeasible to continue to use these buildings.

Just six years ago, the 2014 Long Range Development Plan (2014 LRDP) did not propose to demolish UC Hall, Millberry Union, School of Dentistry, Aldea San Miguel Housing Buildings 8, 10, and 12, and Saunders Court. Therefore, it was presumptively feasible to continue to use these buildings in 2014. Nothing has changed to make it infeasible to avoid demolishing these buildings. "[T]he deference provided to governing bodies with respect to land use planning decisions must be tempered by the presumption that the governing body adopted the mitigation measure in the first place only after due investigation and consideration." (*Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal.App.4th 342, 359.)

5

One of CEQA's core purposes is to avoid *unnecessary* environmental harm. CEQA does this by requiring that significant adverse environmental impacts be substantially reduced or avoided where feasible. (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 524–525 ["Even when a project's benefits outweigh its unmitigated effects, agencies are still required to implement all mitigation measures unless those measures are truly infeasible"]; *City of San*

Diego v. Board of Trustees of California State University (2015) 61 Cal.4th 945, 967; *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 62 Cal.4th 204, 231 ["the lead agency must adopt feasible mitigation measures or project alternatives to reduce the effect to insignificance."]

Mitigation measures or alternatives are not infeasible unless they make it impractical to proceed with the project. (*Citizens of Goleta Valley v. Board of Supervisors* (1988) 197 Cal.App.3d 1167, 1181; *Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 599; *Preservation Action Council v. City of San Jose* (2006) 141 Cal.App.4th 1336 [city's finding that reduced-size alternative was infeasible because it would produce a competitive disadvantage was not supported by substantial evidence where neither the EIR nor the administrative record contained any data about the size of other home improvement warehouses in the area with which the applicant would compete].)

5 cont.

Here, the DEIR presents no evidence that is it infeasible to avoid demolishing each or any of these buildings. Given the stark contrast between the CPHP and the 2014 LRDP and its EIR, this is a significant omission of essential information. (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 527 (EIR must include evidence supporting conclusion that a mitigation measure is infeasible).)

Thank you for your attention to this matter.

Very Truly Yours,

Tom Lippe

RE: Comments on Draft Environmental Impact Report for Proposed UCSF Comprehensive Parnassus Heights Plan

Dear Mr. Lippe,

At your request, I have reviewed the Draft Environmental Impact Report ("DEIR") for the proposed UCSF Comprehensive Parnassus Heights Plan ("Project"). My review focused on the DEIR's treatment of historical resources.

INTRODUCTION

In March 1995, California's State Office of Historic Preservation (SHPO) published *Instructions for Recording Historical Resources,* which was intended to provide official guidelines for the systematic recordation of cultural resources. The document establishes the DPR 523 series forms as the universal format for recordation of all types of cultural resources as well as for the evaluation of historical resources. It provides detailed methodological instructions for historical resource evaluation using these forms. *Instructions for Recording Historical Resources* is widely utilized by qualified professional architectural historians and historians as a manual for the proper production of such evaluations for historical resource located in California. The majority of California's state and local agencies (including Caltrans, the Department of General Services, and most city/county governments) require production of DPR 523 forms according to the standards outlined in this document. (A few agencies have adopted their own local guidelines for historical resource evaluation.) Larger agencies often have professionally qualified historians/architectural historians on staff who review historic resource evaluations to ensure proper preparation by professionally qualified consultants. Smaller agencies (such as small cities) typically require a peer review for historical resource evaluations (especially where a historical consultant is employed directly by a project proponent.) Proposed projects subject to CEQA review will not move forward under most California agencies until:

1. professionally qualified staff approves a historical evaluation, OR
2. peer review-identified deficiencies in a historical evaluation are addressed.

6

The letter report that follows outlines deficiencies in the DEIR's treatment of historical resources according to the *Instructions for Recording Historical Resources* as well as departures from generally accepted professional standards. A comprehensive historical resource study of a complex campus like this one should be undertaken for planning purposes and in order to outline appropriate maintenance plans for historical resources even in the absence of an undertaking that qualifies as a project under CEQA. The current project outlined by the DEIR proposes demolition or alteration of several historic-age buildings that were either recommended ineligible or not evaluated in the

7

studies; deficiencies in the historical resource evaluations must therefore be corrected in order to comply with CEQA. Moffitt Hospital (1955) designed by Milton T. Pflueger, Proctor Foundation (1956) designed by Higgins & Root, Medical Building 1 (1972) designed by Reid Rockwell Banwell, & Tarics, and the School of Nursing (1972) designed by George Matsumoto have all been recommended ineligible. Millberry Union Garage (1955) has never been evaluated. Demolition of these buildings cannot proceed until they have been properly evaluated according to professional standards. Specific flaws in the historical studies are discussed in detail below. The most significant deficiencies fall under the following categories:

7 cont.

1. Historical Resource Evaluations do not meet professional standards
2. Technical studies fail to evaluate the campus as a potential historic district
3. Historical resources were not evaluated or were evaluated before they were age-eligible

HISTORICAL RESOURCE EVALUATION DO NOT MEET PROFESSIONAL STANDARDS

The DEIR's treatment of historical resources is based on two technical reports, both prepared by Carey & Co. Inc. Architecture: *UCSF Parnassus Heights Campus, San Francisco, California, Draft Historic Resources Evaluation, September 2003* and *UCSF Historic Resources Survey, San Francisco, California, February 8, 2011*. Carey & Co. Inc. Architecture is a well-respected firm that employs professionally qualified architectural historians and historic architects. However, neither of their UCSF studies meets currently-accepted professional standards for historical evaluation, nor does either study conform to the standards outlined in *Instructions for Recording Historical Resources.*

8

Study Design Flaws

The DEIR and its technical reports are required under CEQA to evaluate all historic-age buildings on the Parnassus Heights Campus for potential eligibility to the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR). Neither study undertook evaluation of all buildings and structures that had reached historic age in 2003 and 2011 (when the studies where completed); no rationale or explanation is offered for this failure to undertake a comprehensive study (or two studies that would together comprehensively document the site's historical resources.)

The boundaries of each study should be clearly delineated; a lack of appropriate maps and graphics obscure the boundaries of the study area for both technical studies.

9

Details of each technical report are discussed in below.

Carey & Co, September 2003

The intensive survey undertook the evaluation of seven buildings on Parnassus Heights Campus that were over 45 years old and slated for demolition or other significant impacts. Milberry Union Garage was 48 years old but was excluded from the study without rationale.

A typical professionally-prepared historical evaluation report would include (at a minimum) a location map showing the site's relationship to the region and a more detailed map showing building footprints and site layout with all features clearly labeled. Most consultants would also provide additional maps (including historic aerial photographs/site plans as well as custom graphics) to visually demonstrate eras of development, historical site plans, and other relevant information. The maps in DPR 523 forms highlight each building individually and are inadequate for a basic understanding of the site as a whole.

10

Carey & Co, February 2011
The intensive survey undertook the evaluation of 53 buildings located on Parnassus Heights Campus as well as four other UCSF sites. A superficial review of the document would suggest that all the historic-period buildings on the Parnassus Heights Campus were included in the study, but several were excluded. No rationale is provided for why a number of buildings were excluded from the report. It is apparently focused on buildings not included in the 2003 survey. If that is the reason for the omission of many historic buildings from the 2011 study, the reason should be explained, the results of the 2003 study summarized and updated where necessary, and the previously prepared DPRs appended. The preparers appropriately reference a handful of unrelated previous studies for specific buildings but do not reference their own company's document of a decade earlier. "Appendix B. List of Buildings, Building Types, and Significance" appears to be intended as a complete list of buildings on the campus since it includes most of the buildings evaluated in the earlier study, but one of the oldest and most significant buildings on campus (UC Hall) is missing. A reader of this study who was not intimately familiar with the site could potentially be unaware that several buildings on the campus had previously been determined eligible to the NRHP.

11

The structure of the report, in which UCSF's various campuses are discussed under subheadings, is extremely awkward and confusing. If these disparate sites were to be handled appropriately in one report (an extremely challenging task), a substantial historic context focused on the administrative and institutional history would be required in order to explain how the disparate locations are related and why the institution spread to multiple locations. Rigorous hierarchical organization of this complex information could have made this report much more comprehensible.

The boundaries of a survey should be clearly delineated (ideally in graphics and in text) and a rationale provided when portions of a site such as a campus are excluded. Although a "survey area" is referenced in the technical report it is not mapped or otherwise defined within the body of the report. Adequate maps were included in the appendix, but would have been much more useful integrated into the text as exhibits.

Historic Context Deficiencies
Instructions for Recording Historical Resources defines historic context and clearly states its centrality to the evaluation of historical resources.

> The significance of a historical resource is best understood and judged in relation to a historic context. A historic context consists of: theme, pattern, or research topic; geographic area; and chronological period. The theme, pattern or research topic provides a basis for evaluating the significance of a resource when it is defined in relation to established criteria. A historical resource is considered significant, and hence, eligible for the National Register if it is associated with an important historic context… (SHPO 1995, 9).

12

"The statement of significance should explain why the resource is important in relation to its historic context(s)" (SHPO 1995, 12).

The above professional guidance demonstrates that the DEIR and its technical reports should include historic context and a brief site history that describes the eras of development. A historic context statement has a specific purpose: providing a framework that allows for assessment of historical significance of the built environment. The Parnassus Heights Campus was developed

beginning in the 1890s and therefore the most relevant era its evaluation is 1890 – 1970. An understanding of the Parnassus Heights Campus sufficient for historical evaluation would require (at a minimum) brief historic contexts of: medical education in the US, the City of San Francisco, the UC system, and UCSF as an institution as well as a site history describing the evolution of the campus built environment. These various contexts would typically be separated thematically, and clearly-defined periods of significance would be established in order to provide the required framework for evaluation and to organize complex report information into a comprehensible format. The DEIR's full page of discussion of the Spanish, Mexican and Early American periods of California history (UCSF 2020, 4.4-3) ends in 1850 and thus does not add to the reader's understanding of potential project impacts on historical resources and should be eliminated or condensed. The four-paragraph site history (UCSF p. 4.4-4) fails to explain the importance of the site, outline its periods of development, or even to describe its construction history in adequate detail. These serious flaws in the DEIR text stem from the failures of the technical reports to address historic context according to professional standards as discussed in detail below.

12 cont.

Carey & Co, September 2003

While there is no specific length requirement for a historic context, the Historical Overview section (Carey & Co 2003, 5 – 13) is inadequate to the purpose of the document according to current professional standards. It does not attempt to place the campus and UCSF within the context of the University of California, American medical education, or the development of other medical schools within the region. Biographical information on the few important individuals it names is too minimal to provide an understanding of their professional accomplishments or impact on the campus. The narrative provided is mainly a site history, with dates and descriptions of construction projects connected thinly by background information and a very small number of historic photographs. It does not fully explain why specific buildings were constructed at particular times.

The report is focused on buildings slated for demolition, a significant flaw. While the buildings not threatened by projects planned at the time of the study could have been exempted from detailed evaluation, they should have been included in the site history and historic overview. The narrative history of the campus simply does not make sense without a broad discussion of the development of the site. The historical information presented is based on just four sources, two of which are UCSF planning documents, and almost the entire narrative appears to have been adapted from a history on the UCSF website. No specific number of references is required, but a historian who meets the professional standards for this type of work would be expected to consult multiple primary sources (e.g. newspapers, maps, photographs, university correspondence) as well as secondary sources like published histories and journal articles.

13

The historic context section for a professionally-prepared historical evaluation would provide at least a paragraph on each architectural style present on the property, discussing its development, period of use, and character-defining features. Master architect's professional biographies provided are minimally adequate. Architects not assumed to be masters, furthermore, should have been discussed; if the preparer has concluded an architect was not significant, evidence demonstrating this must be provided. This information would assist in comparative analysis that should be undertaken to determine whether buildings are important for their architecture.

Carey & Co, February 2011

The opening line of the introduction to the Carey & Company report acknowledges the essentiality of historic context to historical evaluation of this site: "UCSF has engaged Carey & Co. to produce a

14

comprehensive historic context of the UCSF campuses…" (Carey & Co. 2011, 1). Preparers go on to describe the themes and research methodology used to produce this historic context. Themes identified in the introduction are "the history of the University of California, the Affiliated Colleges, and UCSF; the development of the neighborhood immediately adjacent to the Parnassus Heights campus; …and mid-century modernist and Bay Tradition architecture (Carey & Co. 2011, 3)." The preparers list primary- and secondary-source references consulted as including "historical maps; the United States census and the California Register of Voters; historic photographs; Calisphere, an online repository of primary sources from archival repositories throughout the state of California; correspondence with architects involved in the creation of buildings at the Parnassus Heights campus; and historic publications, including newspapers, journals, and books." Preparers also conducted research through the Environmental Design Archives at the University of California, Berkeley, UCSF archives, and the NWIC (SHPO's repository for cultural resource studies.)

The historic context of the neighborhood adjacent to campus (Carey & Co. 2011, 9-19) is adequately addressed and placed generally within the context of San Francisco's development. Although (like the DEIR) it is too focused on the period between the prehistoric era and the 1860s (since the campus was not developed until the 1890s) the themes in this section are detailed, well-footnoted, and appear to be based on substantial research. However, despite the preparers' clear demonstration in this section and in the introduction of a professional understanding of historic context requirements, sections devoted to the campus proper are too brief, poorly referenced, and disorganized.

No report section is devoted to the important historic context of the University of California despite its introduction by preparers as an important theme; its establishment and first thirty years of history are not discussed and it is merely mentioned as seeking land for a medical college in the 1890s (Carey & Co. 2011, 13). And the University of California is barely referenced as the report progresses. The history of the Affiliated Colleges (another theme introduced by the preparers as significant) receives two brief paragraphs (Carey & Co. 2011, 13-14) sandwiched between sections about the city and neighborhood. No references are provided for this bare-bones history of the inception of the site.

14 cont.

UCSF's history is never introduced in its own heading, but rather is discussed under the heading Postwar Expansion (Carey & Co. 2011, 16 -19). The section begins with a paragraph discussing site history *before* the postwar era (between 1890 and 1945) which provides no explanatory context for construction projects, no institutional history, and includes just one build date. UC Hall (1917) is mentioned briefly with no discussion of when it was built, why it was built, or who designed it. Historical resources like Clinical Sciences (1933) and Faculty Alumni House (1915) are not mentioned (here or elsewhere in the context), nor are the significant Zakheim murals. Important historic contexts like the 1920s master plan and development of the site in the Great Depression are never introduced.

The postwar site history that follows is far too brief for a site of this complexity. An adequate architectural history is provided, discussing designers, styles, materials, and building materials in appropriate detail. Sufficient historic context, however, is lacking, and the reader is given only the most glancing view into subjects like medical research on the campus, changes to medical education over time, establishment of UCSF as an independent campus in 1964, and the demographics of the student body. References are scanty; site history paragraphs have no footnotes and for architectural history no contemporaneous sources are cited prior to the 1960s. Few of the sources listed in the

methodology section are referenced in footnotes, and Wikipedia (not typically used as a reference by professional historians) is cited in one footnote. Rather than synthesizing multiple sources and providing analysis about the architecture of the School of Dentistry Building (which was constructed only 31 years prior to the study and therefore should not have been a main subject), the preparers quote the project architect for several unbroken paragraphs (Carey & Co. 2011, 20-22).

Organization of this section (the most important in the report) is chaotic, forcing the reader to skip from page to page in order to gain a coherent understanding of the information presented. LPPI (1941-3), Medical Sciences (1954), Moffitt Hospital (1955), and Surge (1966), and Health Sciences (1964-6) are all discussed under the main Postwar Expansion heading. The School of Nursing (1972) and School of Dentistry (1980) each receives its own section. As in the sections introductory paragraph, themes are often discussed using confusing backward-looking language rather than straightforward chronological narrative. For example, discussing the growth of the postwar student population, "In addition to benefiting from new revenue sources, resulting in expanded research programs and raising the prestige of the university, UCSF reintroduced the first two years of instruction to the San Francisco campus; since the 1906 earthquake, general courses in anatomy, biochemistry, and physiology had been taught at the Berkeley campus" (Carey & Co. 2011, 22).

14 cont.

Individuals important to UCSF history are not introduced in the narrative except a single reference to a provost that lists his dates of employment, birth, and death but does not explain his significance. Later in the report, several important individuals are listed with only names and dates of birth and death. The report should include a paragraph for each describing their professional accomplishments and impact on the campus.

Evaluation Deficiencies

Instructions for Recording Historical Resources states that:

> Evaluation requires three basic steps: (1) identification of a significant historic context associated with the resource; (2) identification of the types of resources important in illuminating that context, and the physical characteristics those resources must possess to reflect the significance of the historic context; and (3) an assessment of whether the resource being evaluated has those required physical characteristics (SHPO 1995, 10)

Since the DEIR and its technical reports did not establish adequate historic contexts (as discussed in detail above), evaluations for historic significance (Criterion A/1 and Criterion B/2) have not been undertaken to a standard that meets the basic requirements of CEQA. Both Carey & Company reports do not even bother to specifically evaluate many of the resources in the study under Criteria A/1 and B/2. Where buildings have been found architecturally significant, this can be dismissed as a technical deficiency that does not affect the outcome for the building (since a resource is eligible if it meets one *or more* criteria).

15

For some buildings recommended ineligible, however, only a conclusory statement that the building "does not appear to be eligible" under the first two criteria is provided without reference to supporting evidence.

The 2003 evaluation of Moffitt Hospital states "At the time of its completion, Moffitt Hospital was the largest and most modern teaching hospital in the western United States" but does not go on to explain why if that is true it is not historically significant. It asserts that the building's designer was "renowned San Francisco architect Milton Pflueger" and says the building is not one of his

masterworks without offering any comparative analysis to support this assertion. It states that the building lacks integrity, but does not specifically document original condition and alterations (Carey & Co. 2003 Appendix A).

The study's evaluation of the Proctor Foundation offers a statement that the building is not eligible for its architecture without any evidence or analysis. It is even weaker in it evaluation under A/1 and B/2: it does not cite specific evidence or even make a definitive recommendation of ineligibility, stating that "… research has not revealed whether the Foundation or Dr. Proctor have made contributions of the broad patterns of history significant enough to deem the building eligible for the California Register..."

The study's conclusions that these two buildings are ineligible do not meet professional standards because they are not supported by adequate investigations or evidence.

15 cont.

UCSF'S PARNASSUS HEIGHTS CAMPUS WAS NOT EVALUATED AS A HISTORIC DISTRICT

Instructions for Recording Historical Resources states that, [Historic] "Districts consist of a significant concentration or continuity of associated historical resources" (SHPO 1995, 15). California Public Resources Code section 5020.1, subdivision (h) provides a similar but more detailed definition of a historic district as "a definable unified geographic entity that possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development." Preparers of the DEIR were clearly aware of the importance of looking at the campus as a whole. The document acknowledges districts as one of the important categories of historical resources in its Section 4.4.1 Definitions: "Architectural resources include buildings, structures, objects, and historic districts." Additionally, Section 4.1 (Aesthetics) describes the characteristics of the site in terms of "a collection of hospitals, medical office buildings, laboratories, service buildings, and housing which were constructed between the late 1910s and early 2000s" and divides the campus into six districts "based in part on existing land use patterns."

An adequate cultural resources DEIR section would bring a similar intellectual rigor to the investigation of the potential historical significance of the campus as an entity in its own right, using a district (or districts) to organize the discussion of the built environment's significance. This would allow the cultural resources section to reflect the spatial and historical relationships between buildings, the street grid, open spaces, and other features of the site. The DEIR and its technical reports did not look at the campus as a potential historic district, a failure to assess the campus as it exists in the real world. The attempt to evaluate each building individually without considering context, setting, or the site as whole means that the DEIR has not considered a potential historical resource: the Parnassus Heights Campus. This flaw reflects the failure of historical technical reports to evaluate the site as a historic district. The preparers clearly understand the importance of historic districts: the 2011 report recommends the early twentieth century neighborhood adjacent to the campus eligible as a historic district. Failure to evaluate the campus within a similar framework is not explained in the DEIR or its technical reports.

16

HISTORICAL RESOURCES HAVE NEVER BEEN EVALUATED OR REQUIRE RE-EVALUATION

One historical resource, the Millbury Union Garage (1955) was not evaluated in either technical study. No rationale is provided for the DEIR's failure to evaluate this building. Any age-eligible building or structure can qualify as a historical resource; its use as a parking garage is not a valid reason to skip evaluation. Parking garages have been listed on the NRHP and every other level of

17

historic register. CEQA requires the evaluation of this building prior to any project that may alter its character-defining features.

In addition to the flaws detailed above, several buildings slated for demolition by the DEIR were evaluated before they were age-eligible. (The historic period begins 50 years before the present and therefore changes every year. For planning purposes, 45 years is typically used to allow studies to remain relevant as a project moves forward over several years.)

Medical Building 1 (Ambulatory Care Center) and the School of Nursing were both constructed in 1972 and evaluated in 2010 when they were only 38 years old. Their evaluations stated that the buildings did not meet the Criterion G "exceptional significance" standard that applies to buildings of unusual importance before they age into the historic period. These buildings are now 48 years old and they must be re-evaluated under the regular criteria now that "exceptional significance" is not required for eligibility.

Moffitt Hospital (1955) and Woods (1962) were both evaluated in 2003. Both buildings were on the cusp of being considered historic-age at the time and are now 65 and 58 years old. Scholarship on postwar architectural styles has progressed substantially since the buildings were evaluated 17 years ago. The passage of additional time also allows for a fuller assessment of their potential historical significance. Both buildings should therefore be re-evaluated before demolition is undertaken.

Reevaluation (and initial evaluation for the Millbury Union Garage) of all of the buildings discussed in this section is required to meet minimum professional standards.

17 cont.

HISTORIC BUILDINGS MISSING FROM THE DEIR

Two buildings are identified on the SHPO's Built Environment Resource Directory (BERD) for San Francisco as "Determined eligible for separate listing through a consensus determination by a federal agency and the State Historic Preservation Officer." Buildings 2274 and 2275 "Children's Hospital" are listed at 501 Parnassus Avenue, and were studied in 2010. Their location is unclear, and they were not included in the DEIR or Carey & Co.'s technical reports. Unless they have been demolished since the 2010 study in which they were determined eligible, the DEIR needs to consider these buildings as historical resources.

18

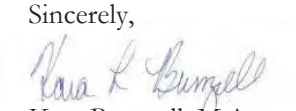
PREPARER'S QUALIFICATIONS

I meet the Secretary of Interior's Professional Qualifications for both History and Architectural History. I hold a Master's degree in Public History and have worked in multiple facets of historic preservation and cultural resource evaluation since 2007. My experience includes municipal preservation planning and working as the lead staff member of a non-profit preservation organization. Since 2012, I have worked full-time as a historical consultant, completing dozens of evaluations for CEQA and Section 106 compliance. Additionally, I regularly submit local and national register nominations, prepare historic context statements, and have managed HAER recordation projects. The greater Bay Area region is the center of my practice, but I frequently work in Sacramento, Santa Clara County, Monterey County, and Southern California. I have also completed projects in Oregon, Nevada, New York, and Puerto Rico. In addition to my work with historic-period residential, agricultural, and commercial properties for private clients, I have evaluated dozens of post offices and several military bases as well as university campuses, hospitals, church properties, and a NASA site. I am listed as a Historian and Architectural Historian on the

California Office of Historic Preservation's roster of qualified consultants for every county in California.

Please contact me by phone at 707/290-2918 or e-mail at kara.brunzell@yahoo.com with any questions or comments.

Sincerely,



Kara Brunzell, M.A.
Brunzell Historical

Responses to Comments from Law Offices of Thomas N. Lippe, APC

O-TL2-1 The commenter suggests that the Draft EIR does not evaluate the historic significance of buildings over 45 years old and should do so. Table CUL-1 in Appendix CUL provides an accounting of the eligibility status of each known historic resource on the Parnassus Campus and has been updated to reflect the DPR Update forms prepared in 2020 by ESA. Additionally, Impact CUL-2, addresses the potential that a building that has previously not been evaluated either is or will become an historic resource by assuming that demolition or substantial alteration of the buildings would be a significant and unavoidable impact, requiring feasible mitigation. In response to the commenter's request, an Historic Resources Technical Memo has been prepared (see Appendix HR) containing a summary of each of the existing technical reports that have evaluated resources on Parnassus Heights campus site, ESA's methodology for review of these evaluations, how each of the reports was used to inform the EIR analysis, as well as DPR update forms for four of the buildings (Millberry Union, Saunders Court, HSIR West, HSIR East,) and a list of character-defining features for each of the historic resources that could be impacted by the CPHP. None of the impact conclusions presented in the Draft EIR would change as a result of the updated evaluations for these four buildings, and no additional mitigation would be required.

O-TL2-2 The commenter states that the Draft EIR did not evaluate the historic significance of the Millberry Union Garage. Millberry Union Garage is an integral part of the Millberry Union, which was evaluated in Carey & Co., Inc.'s 2011 Report and the Millberry Union Garage is discussed in that report. See Historic Resources Technical Memo in Appendix HR, which includes a DPR523 update of the Millberry Union to clarify this information. Changes to the Millberry Union Garage were analyzed as part of the Irving Street Arrival project (beginning on page 4.4-20) and was determined to be a less-than-significant impact. The demolition of the Millberry Union Garage was analyzed as part of the Millberry Union New Towers project in the Future Phase (beginning on page 4.4-16 of the Draft EIR) and was determined to be a significant and unavoidable impact with the implementation of CPHP Mitigation Measures CUL-1a through 1c. Please also refer to Section 8.5 of this Comments and Responses document for additional explanation provided with respect to effects as a result of these projects.

O-TL2-3 The commenter claims that the Parnassus Heights campus site was not evaluated as a historic resource or historic district. In Carey & Co.'s 2011 Report on page 2, in the methodology section of the report it states, "Digital photographs were taken of each structure visible from the public right-of-way, and the firm noted the overall environment and relationships of the buildings to determine if the campuses contain potential historic districts" [emphasis added]. In the Regulatory and Planning Framework section on page 4, the report states, "The

regulatory background outlined below offers an overview of federal and state laws and regulations and the criteria used to assess the historic significance and eligibility of a building, structure, object, site, or district for listing in the National Register of Historic Places (NRHP) and in the California Register of Historical Resources (CRHR)." All of this indicates that Carey & Co. did consider the possibility of a historic district(s) at the Parnassus Heights campus site, and did not find sufficient evidence to identify an historic district.

The Draft EIR section was based on the existing technical reports as well as the expertise of ESA's own architectural historians. In the process of preparing the Draft EIR, ESA did consider whether or not the Parnassus Heights campus site should be considered a historic district, in which the individual buildings would have been considered as either contributing or non-contributing, rather than considering each of the buildings/structures/landscapes as potentially significant individual resources. Given the wide range of architectural styles and uses of the buildings, the long period of development (1917-2010), and a lack over overall thematic context or initial master plan guiding development from the beginning, it was determined that the campus as a whole did not constitute a historic district. Therefore, the individual buildings evaluations were the best approach in determining potential significance. See Historic Resources Technical Memo (Appendix HR).

O-TL2-4 The commenter claims that the "not eligible determinations for many buildings are not supported by substantial evidence." An Historic Resources Technical Memo (see Appendix HR) has been prepared to provide summaries of each of the technical reports used as a basis of the EIR's analysis, ESA's methodology for review of these reports and their prior evaluations, how each of the reports was used to inform the EIR analysis, as well as DPR update forms for four of the buildings (Millberry Union, Saunders Court, HSIR West, and HSIR East) and a list of character-defining features for each of the historic resources that could be impacted by the CPHP. All of this information together affirms conclusions presented in the Draft EIR, and amplifies the evidence relied upon. Two buildings that were specifically called out in the comment, Proctor and Moffitt, and are discussed below.

Proctor – This building was evaluated for eligibility for the California Register by Carey & Co. Inc. beginning on page 26 of their 2003 report (*UCSF Parnassus Heights Campus Historic Resources Evaluation*) and documented on a DPR523 form set in Appendix A of that report. Additionally, impacts from the demolition of Proctor were included in the 2014 LRDP EIR. "In November 2014, the Regents of the University of California (Regents) adopted the 2014 LRDP for the San Francisco campus, which outlines projected development levels and patterns for UCSF at all of its main campus sites through the year 2035. The 2014 LRDP Final EIR (FEIR) was certified by the Regents in November 2014…" (Draft EIR page 3-1, paragraph 1).

Moffitt – This building was evaluated for eligibility for the California Register by Carey & Co. Inc. beginning on page 25 of their 2003 report (*UCSF Parnassus Heights Campus Historic Resources Evaluation*) and documented on a DPR523 form set in Appendix A of that report. Please see the Historic Resources Technical Memo for a summary of the Carey & Co. reports, and a summary of how they were used by ESA to support the analysis presented in the EIR. The Draft EIR discloses that renovation and reuse of Moffitt Hospital was previously approved under the 2014 LRDP.

O-TL2-5 The commenter points out that the 2014 LRDP did not propose to demolish UC Hall, Millberry Union, School of Dentistry, Aldea Buildings 8, 10, and 12, and Saunders Court, and that the CPHP is now proposing to do so. The commenter argues that preservation of the buildings was clearly deemed feasible in 2014 and "nothing has changed to make it infeasible to avoid demolishing these buildings." The commenter goes on to say that the Draft EIR presents "no evidence that is infeasible to avoid demolishing each of these buildings."

The commenter's observations do not acknowledge that the CPHP EIR evaluates a different project than the 2014 LRDP EIR, with different objectives and different component parts. As stated on pages 3-9 and 3-10 of the Draft EIR, "Although the 2014 LRDP planned for a modest growth in clinical and research space at the Parnassus Heights campus site, UCSF has since then determined that in order to ensure continued excellence of the University, stay competitive and remain a leading health science institution both nationally and internationally, and build on the outstanding instructional, research, and clinical programs that are present at Parnassus Heights, improvements must be made at this campus site" that were not anticipated in 2014. The need for these improvements and UCSF's objectives for the CPHP project are outlined on Draft EIR pages 3-10 through 3-15 and components of the project are described elsewhere in Chapter 3. In addition, precisely because the CPHP is now proposing demolition of historic resources that were previously proposed for retention, the Draft EIR identifies significant impacts that were not previously identified, presents mitigation to reduce the severity of these impacts to the extent feasible, and includes alternatives that would avoid and substantially lessen the impacts. See Draft EIR Chapter 6 for a full evaluation of Alternative 1B: No Project – Development under the 2014 LRDP Alternative, and Alternative 2: Reduced Project. The feasibility of these alternatives will be considered by the Regents when they consider adoption of the proposed CPHP.

O-TL2-6 This is not a comment on the adequacy of the EIR. It provides an introduction to the letter and notes the establishment of use of DPR523 forms. No response is required.

O-TL2-7 This paragraph primarily established what the remainder of the letter will discuss, with the commenter suggesting that the Draft EIR's evaluation of historic

resources does not conform with generally accepted professional standards, that the campus should be evaluated as a potential historic district, and that historic resources were either not evaluated or were evaluated before they were age-eligible. Contrary to the commenter's opinions, the Draft EIR contains the information and analysis necessary to evaluate impacts associated with the potential loss or alteration of historic resources on the Parnassus Heights campus site over the life of the proposed CPHP. Please see Responses O-TL2-8 through O-TL2-18 for more information.

O-TL2-8 The commenter claims that the historical resource evaluation does not meet professional standards because two studies prepared by Carey & Co. Inc. Architecture in 2003 and 2011 do not meet currently-accepted professional standards "or standards outlined in *Instructions for Recording Historic Resources*" published by the State Historic Preservation Officer in 1995. Specific bases for this claim are addressed in responses to Comments O-TL2-9 through 18 below. The commenter also fails to acknowledge the peer review and analysis undertaken by ESA's architectural historians in preparing the information and conclusions presented in the Draft EIR based on the earlier studies. To explain the professional qualifications and review of ESA's staff, please see Historic Resources Technical Memo (Appendix HR).

O-TL2-9 The commenter claims that there are study design flaws, specifically that "neither study [prepared by Carey & Co.] undertook evaluation of all buildings and structures that had reached historic age in 2003 and 2011." Neither the scope of the prior studies, nor their omission of a map of the study area, create a deficiency in the program-level EIR for the CPHP. As stated on p. 4.0-2 of the Draft EIR, the EIR "has been prepared for the CPHP that discloses the impacts that could result from the approval and implementation of the CPHP and also establishes a framework for tiered or project level environmental documents that would be prepared in accordance with the overall program." As such, any potential historical resources that could be impacted by the CPHP were evaluated or (for the few that were not evaluated or were not age-eligible at the time the Draft EIR was prepared) were presumed to be significant in Impact CUL-2, and would be subject to mitigation to reduce the severity of impacts associated with demolition or substantial alteration. In addition, the EIR has been based not only on a number of prior studies, but on their review and supplemental analysis by ESA's qualified architectural historians. Please refer to the Historic Resources Technical Memo for summaries of each of the prior technical reports, ESA's methodology for review, how each of the reports was used to inform the EIR analysis, and supplementary evaluations that support conclusions presented in the Draft EIR.

O-TL2-10 The commenter notes that the Millberry Union Garage was not included in the 2003 Carey & Co. Inc. report and notes a variety of maps and graphics that are generally used in historical evaluation reports to assist with "a basic understanding of the site."

Millberry Union Garage is an integral part of the Millberry Union, which was evaluated in Carey & Co, Inc.'s 2011 Report, although the evaluation of the garage was not noted in Table 4.4-1 of the Draft EIR and the garage was described as not being previously evaluated on p. 4.4-22 of the Draft EIR. Changes to the Millberry Union Garage were analyzed as part of the Irving Street Arrival project (beginning on page 4.4-20) and was determined to be a less-than-significant impact. The demolition of the Millberry Union Garage was analyzed as part of the Millberry Union New Towers project in the Future Phase (beginning on page 4.4-16 of the Draft EIR) and was determined to be a significant and unavoidable impact with the implementation of CPHP Mitigation Measures CUL-1a through 1c. Please also refer to Section 8.5 of this Comments and Responses document for additional explanation provided with respect to effects as a result of these projects.

To clarify the significance of the garage, and at the request of commenters, the Historic Resources Technical Memo in Appendix HR includes an updated evaluation of the Millberry Union to include the Garage, supporting conclusions in the EIR. See Section 8.5 for text changes to the Draft EIR that include edits to Table 4.4-1 and Table CUL-1 in Appendix CUL, as well as on page 4.4-17 to clarify that Millberry Union Garage is included in the Millberry Union Complex.

In addition to the narratives provided in the Draft EIR and technical reports maps, photos, and other graphics are located throughout these documents:

- Draft EIR - Chapter 3 – Project Description (Figure 3-2: Parnassus Heights Campus Site, Figure 3-3: North Portion of Parnassus Heights Campus Site, and Figure 3-4: Southeast Portion of Parnassus Heights Campus Site).
- Carey & Co. Inc.'s 2011 Report – historic maps, architectural sketches and plans, and historic and modern photographs throughout the body of the report as well as maps in Appendix C - Location Maps of Surveyed Properties. The location maps in Appendix C of the report clearly label all buildings on the campus, color coding those that have been included in the survey. Location maps are also provided in each of the DPRs in Appendix D.
- *Mount Sutro Open Space Reserve: Cultural Landscape Evaluation Report* (2013) prepared by Denise Bradley, ASLA, and Knapp & VerPlank Preservation Architects includes current and historic maps and photographs.

O-TL2-11 The commenter notes that not all age-eligible buildings on campus were included in the 2011 Report, which instead focuses on buildings that were not evaluated in 2003. The commenter is also critical of the overall structure and organization of the report, its failure to summarize the prior study, and its placement of maps in an appendix rather than the body of the report. As stated above (in Response Comment O-TL2-9), neither the scope of the prior studies, nor their omission of a map of the study area in the body of their text, create a deficiency in the program-level EIR for the CPHP. As stated on page 4.0-2 of the Draft EIR, the EIR "has been prepared for the CPHP that discloses the impacts that could result

from the approval and implementation of the CPHP and also establishes a framework for tiered or project level environmental documents that would be prepared in accordance with the overall program." As such, any potential historical resources that could be impacted by the CPHP were evaluated or (for the few that were not evaluated or were not age-eligible at the time the Draft EIR was prepared) were presumed to be significant in Impact CUL-2, and would be subject to mitigation to reduce the severity of impacts associated with demolition or substantial alteration. In addition, the EIR has been based not only on a number of prior studies, but on their review and supplemental analysis by ESA's qualified architectural historians. Please refer to the Historic Resources Technical Memo in Appendix HR for summaries of each of the technical reports, ESA's methodology for review, and how each of the reports was used to inform the EIR analysis.

O-TL2-12 The commenter suggests that there are deficiencies in the Carey & Co. reports and the Draft EIR because they do not include historic context and a brief history describing the eras of development. The commenter apparently overlooked the scope and historic context provided in the 2011 report, which states: "The University of California, San Francisco (UCSF) has engaged Carey & Co. to produce a comprehensive historic context of the UCSF campuses and conduct an intensive survey of 53 buildings located on its Parnassus Heights, Laurel Heights, Mt. Zion, Mission Center, Buchanan Street, Hunters Point, and Oyster Point campuses. These buildings range in type and scale, from turn-of-the-century single-family houses to mid-century modernist Bay Tradition housing, to large-scale modernist medical and research buildings. The oldest building dates to 1905, while the newest building dates to 1982. Many were designed by prominent architects and landscape architects, such as Timothy Pflueger, George Rockrise, George Matsumoto, Anshen & Allen, Esherick Homsey Dodge & Davis (EHDD), Robert Royston, and Lawrence Halprin. Although several of the buildings are not yet 45 years old, they may be affected by an update to the UCSF LRDP. This report provides a historic context statement of UCSF's campuses and an evaluation of 53 buildings for potential listing in the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR)" (Carey & Co., Inc., 2011). In addition, the Draft EIR contains an overview of the historic development of the site on pages 4.4-4 and 4.4-5.

With the provided information, the EIR has sufficient detail to provide an informed reader with the background necessary to understand the historic architectural resources that have been evaluated, those that may be present and were not evaluated prior to publication of the Draft EIR, and potential impacts of the CPHP. Please refer to the Historic Resources Technical Memo in Appendix HR for summaries of each of the technical reports, ESA's methodology for review, and how each of the reports was used to inform the EIR analysis.

O-TL2-13 The commenter critiques the historic context in the 2003 Carey & Co., Inc. report, and by viewing that report in isolation, fails to consider additional information and analysis provided in other reports and undertaken during preparation of the Draft EIR. For example, the 2011 Report provides a more extensive historic context than the 2003 report and is part of the record supporting the information and analysis in the EIR. See Historic Resources Technical Memo for summaries of each of the prior technical reports, ESA's methodology for review, how each of the reports was used to inform the EIR analysis, as well as DPR update forms for four of the buildings (Millberry Union, Saunders Court, HSIR West, and HSIR East) and a list of character-defining features for each of the historic resources that could be impacted by the CPHP, all of which affirm conclusions regarding potential impacts reached in the Draft EIR.

O-TL2-14 The commenter acknowledges the historic context statement included in the 2011 Report and then critiques its sections devoted to the campus as "too brief, poorly referenced, and disorganized," also pointing to the absence of information about important individuals. As noted in earlier responses, the scope of the prior study does not create a deficiency in the program-level EIR for the CPHP, which has relied on multiple studies and the professional judgment of ESA's architectural historians, and has provided sufficient information and analysis to support conclusions in the Draft EIR. See Historic Resources Technical Memo in Appendix HR for summaries of each of the technical reports, ESA's methodology for review, how each of the reports was used to inform the EIR analysis, as well as DPR update forms for four of the buildings (Millberry Union, Saunders Court, HSIR West, and HSIR East) and a list of character-defining features for each of the historic resources that could be impacted by the CPHP, all of which affirm conclusions regarding potential impacts reached in the Draft EIR.

O-TL2-15 The commenter critiques the evaluations of many of the buildings based on previous arguments about the inadequacy of the historic context, suggesting that building recommended as ineligible were found to be such based on inadequate information. The commenter specifically points to Moffitt Hospital and the Proctor Foundation as examples.

As noted by the commenter early in her critique, "Carey & Co. Inc. Architecture is a well-respected firm that employs professionally qualified architectural historians and historic architects." As such, their work describes an evaluation appropriate to the scope of each study, and sufficient background information to reach the conclusions presented. In addition, each report has been reviewed by ESA's architectural historians during preparation of the EIR, who found their conclusions appropriate. See Historic Resources Technical Memo in Appendix HR for summaries of each of the technical reports, ESA's methodology for review, how each of the reports was used to inform the EIR analysis, as well as DPR update forms for four of the buildings (Millberry Union, Saunders Court, HSIR West, and HSIR East) and a list of character-defining features for each of

the historic resources that could be impacted by the CPHP, all of which affirm conclusions regarding potential impacts reached in the Draft EIR.

O-TL2-16 The commenter states that Parnassus Heights was not evaluated as a historic district.

In Carey & Co.'s 2011 report on page 2, in the methodology section of the report it states, "Digital photographs were taken of each structure visible from the public right-of-way, and the firm noted the overall environment and relationships of the buildings to determine if the campuses contain potential historic districts." In the Regulatory and Planning Framework section on page 4 states, "The regulatory background outlined below offers an overview of federal and state laws and regulations and the criteria used to assess the historic significance and eligibility of a building, structure, object, site, or district for listing in the National Register of Historic Places (NRHP) and in the California Register of Historical Resources (CRHR)." All of this indicates that Carey & Co. did consider the possibility of a historic district(s) at the Parnassus Heights campus site and did not find sufficient evidence to identify an historic district. Additionally, in the course of reviewing Carey & Co.'s reports and preparing the Draft EIR, ESA's architectural historians considered the possibility of a historic district at the Parnassus Heights campus site in which the individual buildings would have been considered as either contributing or non-contributing, rather than considering each of the buildings/structures/landscapes as potentially significant individual resources. Given the wide range of architectural styles and uses of the buildings, the long period of development (1917-2010), and a lack over overall thematic context or initial master plan guiding development from the beginning it was determined that the campus as a whole did not constitute a historic district. Therefore, the individual buildings evaluations were the best approach in determining potential significance.

The Draft EIR section was based on the existing technical reports as well as the expertise of ESA's own architectural historians, as described in the Historic Resources Technical Memo in Appendix HR.

O-TL2-17 The commenter questions the lack of separate evaluation of the Millberry Union Garage and the evaluations of the Medical Building 1, School of Nursing, Moffitt Hospital, and Woods buildings, requesting their reevaluation.

As noted in the response to comment O-TL2-10, Millberry Union Garage is an integral part of the Millberry Union, which was evaluated in Carey & Co, Inc.'s 2011 Report, although it was identified as "not evaluated" in Table 4.4-1 and on the list on page 4.4-22 of the Draft EIR. Nonetheless, the Millberry Union Garage was presumed to be an historic resource and its demolition or substantial alteration was analyzed (beginning on page 4.4-22 of the Draft EIR) and was determined to be a significant and unavoidable impact with the implementation

of CPHP Mitigation Measures CUL-1a through 1c. To clarify the eligibility of the garage as an historic resource, a DPR 523 update was prepared and included in the Historic Resources Technical Memo in Appendix HR affirming the assumption and conclusions in the Draft EIR.

Medical Building 1 (Ambulatory Care Center) was constructed in 1972, as such it was 39 years old when it was previously evaluated by Carey & Co. in 2011 for eligibility under criteria A/1 through C/3 as well as criterion G. As of 2020 the building is 48 years old. ESA reviewed all of the existing documentation and determined that the 2011 evaluation is still valid. The 2011 evaluation determined that there were no significant events (Criterion A/1) or people (Criterion B/2) associated with the building and that "although designed by a well-known local firm…the building's design is not unique or ground-breaking in any way." Because it was not 50 years old in 2011 Carey & Co. went the extra step and evaluated Medical Building 1 using Criteria Consideration G (Properties that Have Achieved Significance within the Last 50 Years), but this was not the only criterion they used. As of 2020, the building is still less than 50 years old. ESA reviewed all of the existing documentation and determined that the 2011 evaluation is still valid.

The School of Nursing was constructed in 1972, as such it was 39 years old when it was previously evaluated by Carey & Co. in 2011; as of 2020 it is 48 years old. The 2011 evaluation determined that there were no significant events (Criterion A/1) or people (Criterion B/2) associated with the building and that although it was designed by a master architect the loss of integrity had disqualified it from eligibility under Criterion C/3. The School of Nursing Building is still not historic-age, the condition of the building has not changed substantially, and the 2011 provided sufficient context to evaluate it; therefore, the previous evaluation is still valid.

Moffitt Hospital was constructed in 1955, as such it was 48 years old when it was previously evaluated by Carey & Co in 2003; as of 2020 it is 65 years old. Carey & Co. determined that although it was designed by Milton Pflueger with Blanchard & Maher that it did not "represent a master work of Pflueger's nor does it possess high artistic values in terms of mid-century Modern design." Their evaluation used California Register criteria 1, 2, 3, and 4. Additionally, Carey & Co. noted significant alterations, such was the Long Hospital addition in 1983, that severely impacted the integrity of Moffitt Hospital. ESA reviewed all of the existing documentation and determined that the 2003 evaluation is still valid.

The Woods building was constructed in 1962, as such it was 49 years old when it was previously evaluated by Carey & Co. in 2011; as of 2020 it is 58 years old. The 2011 evaluation determined that there were no significant events (Criterion A/1) or people (Criterion B/2) associated with the building. The Carey & Co. report stated,

> *While Nick Forell rose to the ranks of most prominent structural engineers in the San Francisco Bay, heading a practice that pursued work in the international area, this building does not appear to be associated with any significant aspect of that career and is not a good example of notable feats in engineering. William Gillis does not appear to have achieved much significance and the design, though typical of its era, does it not rise to the level of a sophisticated work that embodies high artistic values.*

Therefore, it was found to be ineligible under Criterion C/3. ESA reviewed all of the existing documentation and determined that the 2011 evaluation is still valid.

See Historic Resources Technical Memo in Appendix HR for summaries of each of the technical reports, ESA's methodology for review, how each of the reports was used to inform the EIR analysis, as well as DPR update forms for four of the buildings (Millberry Union, Saunders Court, HSIR West, and HSIR East).

O-TL2-18 The comment references SHPO's Built Environment Resource Directory (BERD) and states that Buildings 2274 and 2275, listed at 501 Parnassus Avenue were studied in 2010 and were not included "in the Draft EIR or Carey & Co.'s technical reports."

The *Attachment to SHPO Review of Proposed FCC Undertaking* document for EBI Project #61097519 (FCC: 100413A) includes a concurrence of eligibility for Buildings 2274 and 2275 at 501-505 Parnassus Avenue, San Francisco, CA 94143. Building 2274 refers to Long Hospital and Building 2275 refers to Moffitt Hospital. The construction dates for both buildings are incorrect. The document states that Moffitt Hospital was constructed in 1976 when it was actually constructed in 1955. The document states that Long Hospital was constructed in ca 1950 when it was actually constructed in 1982. The *Attachment to SHPO Review of Proposed FCC Undertaking* document appears to confuse Moffitt Hospital with the LPPI, stating the following:

> *X Eligible:*
>
> *UCSF Campus*
> *Buildings 2274 and 2275 [Moffitt Hospital]*
> *501-505 Parnassus Avenue, San Francisco, CA 94143*
>
> *Criterion A: For its association with the development of clinical research related to psychiatry*
>
> *Criterion B: For its association with noted physician Robert Langley Porter and his role in the development of the first state psychiatric research institute*
>
> *Criterion C: For its Modernist architectural design*

X Eligible:

UCSF Campus
Building 2290 [LPPI]
401-405 Parnassus Avenue, San Francisco, CA 94143

Criterion A: For its association with the development of the UCSF campus and the integration of medical science into the university realm of teaching and education.

Criterion C: For its association with the prominent San Francisco architectural firm of Timothy and Milton T. Pflueger.

Note: At this time, I do not concur in the eligibility of Building 2290 under Criterion B for its association with the career of Herbert C. Moffitt.

The Criterion discussion for Moffitt Hospital and the LPPI are apparently switched with the incorrect building identifiers (address and building number) indicated above.

There is a DPR form for Moffitt Hospital (UCSF Medical Center/Children's Hospital, 501-505 Parnassus Avenue), prepared by Dana E. Supernowicz of Historic Resource Associates (HRA) in February 2010, on file at the Northwest Information Center that is associated with the EBI Project #61097519 (FCC: 100413A), but none for Long Hospital as indicated in the comment. Additionally, the DPR form for Moffitt Hospital does not mention Long Hospital by name, and there is no history provided for this building. The Moffitt Hospital evaluation claims that it is "individual eligible for the National Register of Historic Places (NRHP) under Criteria A, B, and C, due to the buildings association with Moffitt and the Pluegers'. *Attachment to SHPO Review of Proposed FCC Undertaking* document does not concur with the evaluation under Criteria B (see above). With regards to the evaluation under Criteria A, the 2010 HRA evaluation fails to provide sufficient context by which to evaluate this buildings contribution to the medical field. Merely being associated with Herbert C. Moffitt is not enough. Additionally, the building was constructed after Moffitt's retirement indicating that this was more likely a commemorative gesture, not that he was associated with the development of the facility. With regards to the evaluations under Criteria C, the HRA evaluation fails to include any comparative analysis in the context of Pfluegers' body of work. Per the *National Register Bulletin: How to Apply the National Register Criteria for Evaluation*, "The criterion is generally restricted to those properties that illustrate (rather than commemorate) a person's important achievements." The 2010 HRA analysis failed to provide a significant linkage between Herbert C. Moffitt's work and Moffitt Hospital. Finally, the evaluation lacks an integrity analysis using all seven aspects as discussed starting on page 44 of *National Register Bulletin: How to Apply the National Register Criteria for Evaluation*. For a resource to be eligible for the National Register of

Historic Places it must be significant under one or more of the criteria as well as retain sufficient integrity to convey that significance.

There is no new information in the *Attachment to SHPO Review of Proposed FCC Undertaking* document or the associated DPRs, discussed above, that changes the analysis or conclusions in the Draft EIR. ESA concurs with Carey & Co.'s analysis of Moffitt Hospital as disclosed in the Draft EIR and its appendices.

Please note Comment Letter O-TL2 contained an attachment to Exhibit 1, and an Exhibit 2 which did not comment directly on the Draft EIR. This attachment and exhibit are included in Appendix O-TL2 in this Comments and Responses document.

Re: Comprehensive Parnassus Heights Plan Draft Environmental Impact Report: Comments on Water Quality, Water Recreation, and Wastewater Public Services.

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents. I write on its behalf to comment on the Draft Environmental Impact Report (DEIR) for the Comprehensive Parnassus Heights Plan (CPHP) with respect to its analysis of project impacts on water quality, water recreation, and wastewater public services.

This letter incorporates by reference the September 10, 2020, letter from Dr. Larry Russell, environmental engineer, which is attached hereto as Exhibit 1. In total, this letter attaches and incorporates 14 exhibits, which are listed at the end. Due to the size of Exhibit 13 and Exhibit 14, we are transmitting those it to you by email under separate cover.

The DEIR fails to assess the Project's impact on beach water quality, which is an important component of the Project's affected environment. 1

In Chapter 4.16, regarding potential impacts on wastewater treatment facility capacity, the DEIR discloses that the project will add about 2.0 million square feet of new space, and generate about 0.18 mgd (million gallons per day) of new wastewater/sewage. The DEIR assesses the impacts of this increase solely in terms of whether the increase will require the construction of new wastewater treatment capacity, the construction of which might cause secondary environmental impacts. The EIR concludes that construction of new wastewater treatment capacity will not be needed because: 2

> Assuming wastewater generation as 90 percent of water usage, the overall increase in wastewater resulting from the 2.0 million gsf net increase of building space associated with the proposed CPHP would be roughly 0.18 mgd. Wastewater flows from the Parnassus Heights campus site would be directed to the OSP [Oceanside Treatment Plant]. The OSP has a dry weather capacity of 43 mgd and is currently treating approximately 17 mgd. Therefore, based on current sewage flows, the plant has about 26 mgd of excess dry weather treatment

> capacity, which is adequate to accommodate the increase in flow generated by the net new development envisioned under the proposed CPHP. As a result, the proposed CPHP would not result in a determination by the SFPUC that it has inadequate capacity to serve the projected demand, and the impact would be less than significant. Mitigation: None required.

(DEIR p. 4.16-22 [pdf p. 672].)

With respect to stormwater discharge, Chapter 4.9 of the DEIR discloses that the campus drains both to the west to the Oceanside Treatment Plant (OSP) and to the east to the Southeast Treatment Plant (SEP) and that San Francisco operates a combined sewer system (CSS) that combines stormwater with sewage for treatment at these plants. This chapter concludes the Project's impacts on surface water quality are less than significant because the Project-induced increase in the acreage of impervious surfaces is only 4% compared to the current acreage of impervious surfaces on campus, and because the San Francisco Public Utilities Commission's (SFPUC) operation of the CSS, the OSP, and the SEP is regulated by the San Francisco Regional Water Quality Control Board (Water Board) through permits issued pursuant to the National Pollutant Discharge Elimination System (NPDES) established by the federal Clean Water Act and the state Porter-Cologne Water Quality Control Act.

The DEIR states:

> The campus core, where the majority of development and redevelopment under the CPHP is proposed, is largely developed and covered in impervious surfaces (estimated at approximately 86 percent impervious). Preliminary estimates indicate additional building development under the CPHP could incrementally increase the amount of impervious surfaces across the campus core by an additional 4 percent (about one acre) over existing conditions. Elsewhere on the campus site, the CPHP is not expected to notably increase impervious surfaces, as the proposed new housing buildings in the Aldea Housing complex would be sited largely within existing housing building footprints.

(DEIR p. 4.9-11.)

Using these numbers, one can calculate the number of current and future impervious acres in the campus core, as follows:

Table 1

Campus Impervious Surfaces	Percent of Campus	Acres
Pre-Project Condition	86%	21.5 acres
Project to Add	4%	1 acre
Post-Project Condition	90%	22.5 acres

2 cont.

The DEIR does not quantify the increase in stormwater discharge associated with this increase in impervious surface.

2 cont.

In addition to the quantified increase in impervious surfaces and unquantified stormwatrer runoff from the "campus core," the DEIR discloses that there will be additional increases in impervious surface outside the campus core. For example, the DEIR states:

> Development associated with the Irving Street Arrival, RAB, and initial Aldea Housing Densification projects, and Initial Phase improvements would be subject to the same or similar regulatory requirements as those described above during construction and operation. Furthermore, as applicable, any Initial Phase improvements that would be constructed outside the campus site boundary would be subject to construction site runoff requirements and post-construction stormwater controls in accordance with the City Public Works Code and in compliance with the City's Stormwater Management Ordinance. As such, the potential to violate water quality standards or waste discharge requirements, or otherwise substantially degrade surface or groundwater quality would be less than significant.

(DEIR, p. 4.9-12.)

3

This singularly uninformative paragraph indicates there will be additional increases in impervious surfaces in several different areas, including outside the campus boundary, but provides no clues as to their magnitude. As it did with the increases in runoff from the campus core area, the DEIR again does not quantify the increase in runoff associated with the increase in impervious surfaces. Also, while the paragraph intimates that UCSF's off-campus facilities will be subject to San Francisco's "post-construction stormwater controls," it provides no information on the extent to which these controls may be expected to reduce Project-generated operational increases in stormwater runoff.

As it does with Project-generated increases in sewage, the DEIR also relies on "the relatively small change" in Project-generated increases in stormwater discharge to conclude the impact is less than significant, stating:

> Due to the relatively small change in impervious surfaces and the flow reductions that would be achieved with the implementation of LID stormwater features, storm water flows from the campus site would not adversely affect stormwater drainage capacity. In fact, the CPHP includes upgrades to the existing CSS within the campus core as discussed further in Section 4.16, Utilities. Therefore, considering the minor change in impervious surfaces, incorporation of LID stormwater features, and proposed improvements to the existing CSS that would occur with the program, the potential impacts related to flooding on- or off-site, stormwater drainage capacity, or additional sources of polluted runoff would be

4

less than significant.

(DEIR, p. 4.9-14.)

There are many legal deficiencies in the DEIR's handling of the Project's impacts on water quality, water recreation, and wastewater related public services.

The DEIR fails to describe the most important components of the environmental and regulatory settings, which are the severely degraded water quality conditions at San Francisco's beaches, in both the bay and the ocean, and the demonstrated inability of San Francisco's CSS to prevent these conditions.

The DEIR fails to describe the Project in enough detail to inform any analysis of water quality impacts, most egregiously with respect to increases in impervious surfaces outside the campus core.

The DEIR's assessment pf Project impacts on water quality fails to account for the fact that sewage and stormwater are combined in the same pipes for conveyance to the OSP and SEP. Instead, the DEIR assesses these waste streams separately.

After committing these legal errors, the DEIR bases its conclusion that water quality impacts will be less than significant on two errors of law: the relatively small change in Project-generated increases in sewage and stormwater discharges (i.e., the "ratio theory") and reliance on another agency's regulatory program.

4 cont.

The DEIR fails to describe the severely degraded water quality conditions at San Francisco's beaches.

The SFPUC, in cooperation with the San Francisco Department of Public Health, routinely monitors shoreline bacteria (i.e., total coliform, e. coli or enterococcus) at 16 stations around the perimeter of San Francisco where water contact recreation occurs, including additional monitoring whenever a treated discharge from the City's combined sewer system occurs that affects a recreational beach. When monitoring shows that bacterial contamination exceeds state health standards, the affected beach is "posted" to discourage water contact recreation.

The SFPUC's beach water quality monitoring data from January of 2016 through June of 2020 shows that between January of 2016 and June of 2020, there were 131 days on which at least one ocean side beach was posted for exceeding state health standards for any of the three types of bacteria tested; 333 days on which at least one bay side beach was posted, and 464 days

5

on which at least one SF beach was posted.[1]

Figures 1 through 15, attached hereto, summarize the SFPUC's beach water quality monitoring data for the last 4 ½ years by presenting monthly totals of days on which San Francisco ocean side and bay side beaches exceeded state health standards for any of the three types of bacteria tested.[2] Figures 1 through 5 show monthly totals for San Francisco ocean side beaches between January 1, 2016, and June 30, 2016. Figures 6 through 10 show monthly totals for San Francisco bay side beaches for the same period. Figures 11 through 15 show monthly totals for San Francisco ocean and bay side beaches in this period.

- Blue bars show the number of days when at least one beach was posted for at least one exceedance of a state health standard.
- Yellow bars show the number of beach postings for exceedances of state health standards or due to combined sewer system (CSS) overflow.
- Red bars show the number of exceedances of any state health standard at any beach.

Table 2 [Summary of Figures 1-15]

January 1, 2016, through June 30, 2020	**Days when at least one beach was posted for at least one exceedance of a state health standard [Blue Bars]**	**Beach postings for exceedances of state health standards or due to combined sewer system (CSS) overflow [Yellow Bars]**	**Red bars show the number of exceedances of any state health standard at any beach [Red Bars]**
Ocean Side beaches	131	210	298
Bay Side beaches	333	546	936
Ocean and Bay Side beaches	464	756	1,234

Remarkably, the DEIR also fails to disclose that the waters of San Francisco Bay are listed as impaired for bacterial contamination under section 303(d) of the Clean Water Act, or that in 2016, the State Water Resources Control Board adopted a Total Maximum Daily Load for

5 cont.

[1]The SFPUC's raw water quality monitoring data for this time period is attached hereto as Exhibit 12.

[2]Ocean side beaches are: Baker, China, Ocean, and Fort Funston. Bay side beaches are: Crissy Field, Aquatic Park, Mission Creek, Candlestick Point State Recreation Area, and Islais Creek.

bacterial contamination for the bay.[3] Thus, any discharge that exceeds the City's load allocation for bacterial contamination violates the Clean Water Act.

Thus, the current environmental setting (i.e., baseline) at San Francisco's ocean side and bay side beaches is one of severe environmental degradation. The DEIR ignores this elephant in the room.

5 cont.

The DEIR fails to describe severely dysfunctional regulatory setting of San Francisco's sewage treatment plants.

The Water Board regulates San Francisco's operation of the OSP and SEP through NPDES permits. The OSP is governed by NPDES Permit No. CA0037681, by way of Water Board Orders R2-2009-0062 and R2-2019-0028 (attached as Exhibits 4 and 5, respectively).[4] The permit for the SEP is NPDES Permit No. CA0037664; Order No. R2-2013-0029 (attached as Exhibit 6).[5]

The NPDES permits require the SFPUC to submit monthly and annual self-monitoring reports (SMRs) to the Water Board, by online upload to the California Integrative Water Quality System database (CIWQS). The SMRs include raw data regarding water quality and narrative cover letters. The cover letters describe any instances of non-compliance of the permit. The CIWQS database also includes notices of violations issued by the Water Board.

6

[3]The Water Board's Order and Basin Plan Amendment to establish a TMDL for Bacteria at San Francisco bay beaches are attached as Exhibits 2 and 3, respectively.

[4]Order No. R2-2009-0062 for the OSP became effective on October 1, 2009, and expired on September 30, 2014. The Water Board continued this permit's effective period administratively until November 1, 2019. R2-2019-0028 for the OSP became effective on November 1, 2019, for discharges to waters of the state from the OSP near-shore combined sewer discharge locations. The U.S. EPA, however, did not approve the jointly-issued order until December 10, 2019, with an effective date of February 1, 2020, for discharges to waters of the United States from the OSP deep water outfall (Discharge Point 001), which is 3.4 to 3.6 nautical miles offshore. The 'SFPUC' is challenging certain permit conditions in Order No. R2-2019-0028. The uncontested permit conditions that govern discharges into federal waters became effective on March 9, 2020.
Although the uncontested permit conditions for state waters for Order No. R2-2019-0028 became effective on November 1, 2019, the monthly self-monitoring reports for November and December of 2019 indicate that they continued to assess compliance against the R2-2009-0068 Order for these months regardless.

[5]Permit No. CA0037664 (Order No. R2-2013-0029) for the SEP became effective on October 1, 2013, and remains in effect at this time.

Notices of violations are issued for certain instances of non-compliance and not for others, suggesting either inconsistent enforcement or the existence of unknown, unpublished enforcement criteria.

For example, on February 6, 2016, a member of the public reported a strong odor of sewage coming from the combined sewer system outfall at Vicente Street on Ocean Beach, as well as discovery of sewage overflowing into the street at Wawona and 46th Street. These instances violate the permit (Order No. R2-2009-0062, Section 3.A. Order Conditions) and should have been issued a notice of violation as an unauthorized discharge of untreated wastewater. While this instance of non-compliance is reported, the Water Board did not issue a notice of violation.

Another instance of unauthorized unanticipated discharge occurred on October 17, 2016, when approximately 8,011 gallons of combined treated stormwater and wastewater was discharged from the Seacliff 2 Pump Station Outfall. The Water Board issued a notice of violation for this event (violation ID No. 1022988 as subsequently reported to CIWQS). The same pattern is apparent at the SEP.

6 cont.

My office has reviewed the Water Board's enforcement files for the period 2008 to 2014 and the period January 2016 through June 2020 for the NPDES permits issued to the SFPUC for operation of the OSP and SEP. This review identified all instances recorded in these files when the SFPU's operation of the OSP or SEP failed to comply with the terms of the applicable NPDES permit, including instances for which the Water Board issued a notice of violation and instances for which the Water Board did not issue a notice of violation.

Table 3 shows the total number of instances of non-compliance and notices of violations at each plant recorded in these files for the period between January 1, 2016, and June 30, 2020.

Table 3

Plant	Instances of Non-Compliance	Notices of Violation
OSP	71	8
SEP	100	36
Totals	1701	44

Exhibits 10 and 11 show all instances of non-compliance at the OSP and SEP recorded in these files for the period between January 1, 2016, and June 30, 2020.[6] The documents from the

[6]Exhibit 9 shows all instances of non-compliance with then applicable NPDES permits at the OSP and SEP recorded in the Water Board's enforcement files for the period between 2008 and 2014. The supporting documentation referenced in Exhibit 9 as "Ex #" is not included in this letter, but is available upon request.

Water Board's enforcement files evidencing these instances of non-compliance are attached as Exhibit 13, for the OSP, and Exhibit 14, for the SEP, and are referenced as such in Exhibits 10 and 11.

In short, for at least the past 10 plus years (i.e., the only period studied), San Francisco has consistently failed to comply with its NPDES permits for the OSP and SEP plants, including permit terms limiting bacterial contamination in the OSP's effluent discharges to the ocean and the SEP's effluent discharges to the bay.

6 cont.

The U.S. EPA sent two Notice of Violation letters to San Francisco in the fall of 2019 detailing the most egregious violations of federal and state water pollution control laws due to bacterial contamination. These letters are attached as Exhibits 7 and 8.

Remarkably, and egregiously, the DEIR ignores all of this. Therefore, the DEIR must be revised and recirculated to include an analysis of Project impacts on beach water quality based on these required categories of information to inform meaningful public comment.

The DEIR's reliance on the "ratio theory" is an error of law.

As discussed above, regardless of the DEIR's assertion that the OSP has sufficient *dry weather capacity* to meet current and projected demand, and regardless of the fact that San Francsico's CSS is regulated by NPDES permits enforced by the Water Board, there are many days every year when bacterial contamination in the waters at San Francisco beaches exceeds state health standards.

7

The DEIR's reliance on the relatively small increases in Project-generated sewage to be conveyed to the OSP and the relatively small increases in Project-generated stormwater to be conveyed to the OSP and SEP to conclude that the Project's water quality impacts are less than significant are errors of law. (*Communities For a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 114 ["the guiding criterion on the subject of cumulative impact is whether any additional effect caused by the proposed project should be considered significant given the existing cumulative effect"]; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 718.)[7]

[7] The decision in *Kings County* repudiates the "ratio theory," stating:
The [ ] EIR concludes the project's contributions to ozone levels in the area would be immeasurable and, therefore, insignificant because the [cogeneration] plant would emit relatively minor amounts of [ozone] precursors compared to the total volume of [ozone] precursors emitted in Kings County. The EIR's analysis uses the magnitude of the current ozone problem in the air basin in order to trivialize the project's impact ... The relevant question to be addressed in the EIR is not the relative amount of precursors emitted by the project when compared with

The DEIR's reliance on San Francisco's NPDES permits is an error of law.

The DEIR to find that water quality impacts are less than significant based on the NPDES regulatory program, especially where, as here, that regulatory program is failing to prevent severe environmental harm, is another error of law. (*Ebbetts Pass Forest Watch v. California Dept. of Forestry and Fire Protection* (*Ebbetts Pass*) (2008) 43 Cal.4th 936, 957 (error to conclude that compliance with pesticide restrictions precludes significant impact); *Californians for Alternatives to Taxies v. Department of Food & Agriculture* (2005) 136 CaL.App.4th 1, 16.)

8

Thank you for your attention to this matter.

Very Truly Yours,

Tom Lippe

ATTN: Tom Lippe, Esquire

Subject: Draft Comment on the UCSF-CPHP-Draft-EIR

Dear Mr. Lippe:

My name is Dr. Larry L. Russell, P.E.,T3 and my C.V. is attached as Appendix A. As with many environmental issues, the impacts of a development of over 2,000,000 square feet of new buildings are many fold. The potential impacts on the environmental compliance under the City of San Francisco Oceanside sewage treatment plant of adding this level of discharge are relatively straightforward. While the average dry weather flow of the treatment facility is reported to be 17 million gallons per day (MGD) and the design capacity is reported to be 43 MGD, the issue as shown by the water quality monitoring done by the City shows that there have been numerous violations of the National Pollution Discharge System (NPDES) expired permit, especially during the winter quarters. These violations have been noted and reported to the City by the Environmental Protection Agency (EPA) and are the subject of future (and present) enforcement actions (November 21, 2019, Notice of Violation October 2, 2019).

9

The EPA sternly reminded the City that the EPA CSO policy does not relieve them of their responsibility to meet all applicable Water Quality Standards (WQS) during CSO events. The EPA reminded the City that its CSO discharges occur in sensitive areas at Ocean Beach, China Beach and Baker Beach. The EPA also reminded the City that while in 1994 they were ahead of the CSO compliance curve, after 25 years, the City is well behind the nationwide compliance curve standards for CSO's. The EPA also made it painfully clear that the City is not even close to meeting the required 85 percent treatment levels required today for allowing CSO discharge, nor are the Beach WQS being met during events that were predicted to occur four to six times per year, but actually occur over 20 times per year releasing over 1.5 billion gallons of raw to partially treated but un-disinfected sewage into the beach receiving waters.

The NOV reported the following violations (edited for brevity) as follows:

1. Failure to properly operate and maintain its facilities including the associated collection systems...

2. Failure to comply with wet weather operational requirements to maximize use of the collection system for storage and to maximize flows to treatment plants...

10

3. Failure to post warning signs when public contact with wastewater could reasonably occur...

4. Failure to comply with reporting and record keeping requirements related to releases or diversions of untreated or partially-treated sewage from the combined sewer system...

5. Failure to comply with CSD [combined sewage discharge] monitoring and reporting...

6. Failure to notify the public of CSDs...

7. Failure to comply with water quality standards...

These Combined Sewer Overflows (CSO) discharges result from the impact of over loaded and aged sewage collection system that results in CSO's during wet weather which results in high wastewater flows. The problem with CSO's are many fold. First, a CSO occurs whenever the collection system and/or the treatment plant is (are) overwhelmed by the quantity of sewage that is moving through that section of pipe or the treatment plant. Second, a CSO results in the discharge of untreated sewage and all of its constituents without treatment or disinfection. These CSO discharges enter the watershed and henceforth into the Ocean and onto the City's beaches and other areas, which are used for recreation.

10 cont.

While there is a Total Maximum Daily Load (TMDL) for coliform bacteria in the Bay (which the City is also violating at the Southeast Plant), the Oceanside plant's NPDES permit in reality can be conceived as acting in a manner similar to a San Francisco Bay TMDL for bacteria (the Bay TMDL could also apply if UCSF (or the City) decide to route their wastewater to the Southeast Wastewater treatment plant which is also troubled with CSO issues). When a CSO occurs, the NPDES permit is violated when the Beaches receive the un-disinfected wastewater containing excessive coliform levels that are above the California Ocean Plan standards (summarized in Appendix B), resulting in a potentially significant impact on human and aquatic health.

How does all of this impact UCSF expansion plans? As noted previously, the UCSF EIR calls for the discharge of an additional 180,000 gpd (likely an underestimate) into a frequently overloaded sewage system. Under the TMDL concept and enforcement process, it is illegal to discharge any contaminants regulated by the TMDL into an already impaired water body (under section 503), which is exactly what the City is doing when the CSO's occur and cause the receiving water to violate the State's WQS. Therefore, adding more sewage to this already over taxed collection and treatment system during wet weather events, simply makes the situation worse. The intent of the EPA NOV letter is clear. It is clear that enforcement action (which could include hook up moratoriums) is coming in the very near future. It is possible that the enforcement action may include a prohibition on additional sewer hook ups until the CSO issue is addressed, by incorporation of the concept of the City's Article 12 C.

11

Therefore, due to the obvious impact of the coming enforcement action, the proposed project should not proceed without significant wastewater/storm water mitigation controls. The basic mitigation that should occur would begin with voluntary compliance with the City's Article 12 C, which requires all large developments over 250,000 square feet to incorporate grey (and or black) water treatment systems and recycle into their design. In addition to providing recycled water for toilet flush, Article 12 C incorporates design improvements to provide 24 hour storm and grey water on-site storage to allow for the delayed discharge of the development's grey water into the City's combined sewage collection system. It should also be noted that the UCSF EIR includes the replacement of the on-site 180,000 gallon water storage tanks, without comment on their cost or any anticipated difficulties with re-

12

constructing essentially the same size tanks that would be required to store the grey/black wastewater from the facility.

12 cont.

An additional consideration that should be taken into account regarding CSO discharges is that they occur in the surf zone on the recreational beaches of the western side of San Francisco. Thus, during a CSO, the low density (low salinity) untreated sewage is discharged at the ocean's surface where it floats. Therefore, the un-disinfected untreated wastewater floats onto the beaches and is slowly mixed into the water column by wave action rather than having the treated and disinfected wastewater being discharged via an outfall diluted with diffusers which result in substantial dilution into the water column offshore.

13

The proposed UCSF project increases impervious surface area from 21.5 to at least 22.5 acres. This increase should be considered to be "cumulatively considerable". The critical issue is that UCSF is still thinking of storm water as a "waste" that should be removed from the property, as soon as possible, instead of thinking of stormwater, as a resource. The 22.5 acres of impervious land based on normal SF rainfall (21 inches) results in the potential to allow for easily collecting and reusing approximately 13 million gallons (per year) of very fresh water that only requires storage and minimal treatment to be easily recycled as toilet flush water (this supply would eliminate the need for approximately 20 percent of their estimated fresh water needs). Combined with grey water recycling, UCSF could likely reduce their fresh water demand by more than 50 percent (and perhaps more than 90 percent depending upon how seriously UCSF approach the incorporation of state of the art grey and black water recycling).

Normally the operation of these onsite systems include onsite reuse of the treated grey water to flush toilets and urinals. If due to perceived health concerns UCSF is unwilling to install dual plumbing systems (which would be a mistake not to do in the long run as the additional construction cost of dual plumbing is minimal during initial construction), then UCSF should look to the onsite treatment of the their black and grey water and on site storage of at least 180,000 gallons and reuse in Golden Gate Park (1,000 feet down hill from the Parnassus facility and owned by the City) or pumped to the existing housing complex at the UCSF Parnassus campus to be recycled there.

14

Thus fresh water demand at the UCSF facility would be dramatically reduced and uncontrolled sewage discharge into the City's sewer system could be essentially eliminated at minimal additional expense to the UCSF campus. The generated wastewater and storm water management resulting from this expansion project on the City's potential for increasing the potential for increasing the magnitude and frequency of violations of the City waste discharge requirements is significant, and these impacts require mitigation. At the very minimum UCSF should agree to be bound by the conditions of the City's Article 12C which requires gray and storm water collection, retention, and recycling for buildings larger than 250,000 square feet in size.

Responses to Comments from Law Offices of Thomas N. Lippe, APC

O-TL3-1 The commenter indicates that beach water quality is an "important component of the Project's affected environment" and should be assessed in the EIR. Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

O-TL3-2 The commenter cites several sections of the Draft EIR, noting that the document assesses the impact of about 0.18 million gallons per day (mgd) of additional wastewater by considering whether additional treatment capacity would be needed, the construction of which might have secondary impacts, and assesses the significance of additional stormwater flows due to increased impervious surfaces by noting the small size of the increase and associated regulations and permits issued by the San Francisco Regional Water Quality Control Board. As this comment simply cites the Draft EIR, no response is required.

O-TL3-3 The commenter cites the Draft EIR indicating that increases in impervious surfaces outside the campus core would be subject to construction site runoff requirements in accordance with the City's Public Works Code and post-construction controls in compliance with the City's Stormwater Management Ordinance. The commenter then questions the magnitude of expected increases and the extent to which regulatory requirements would reduce Project-generated increases in runoff. Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

O-TL3-4 The commenter suggests that the Draft EIR's reliance on the small magnitude of stormwater increases is inadequate, and identifies "legal deficiencies" with the analysis of "water quality, water recreation, and wastewater related public services." Summarizing, the commenter states that the Draft EIR fails to adequately describe the environmental setting, fails to describe the project in sufficient detail, fails to account for the City's combined sewer system, and improperly relies on the relatively small size of the environmental change and regulatory requirements of another agency. Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

O-TL3-5 The commenter provides data regarding beach water quality for ocean side and bay side beaches in San Francisco, indicating that "the current environmental setting (i.e. baseline) at San Francisco's ocean side and bay side beaches is one of severe environmental degradation," which should have been noted in the Draft EIR. Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

O-TL3-6 The commenter provides data regarding beach water quality for ocean side and bay side beaches in San Francisco, indicating that "the current environmental setting (i.e. baseline) at San Francisco's ocean side and bay side beaches is one of severe environmental degradation," which should have been noted in the Draft EIR. Please see Master Response 12: Stormwater, Wastewater, and Water

Quality. The commenter describes the NPDES permits by which the Water Board regulates San Francisco's treatment plants, as well as instances of non-compliance and notices of violation, concluding "for at least the past 10 plus years… San Francisco has failed to comply with its NPDES permits… including permit terms limiting bacterial contamination" in discharges to the ocean and the bay. The commenter also provides two Notices of Violation sent by the US EPA in the fall of 2019, and suggests that the Draft EIR "must be revised and recirculated to include an analysis of Project impacts on beach water quality...." Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

O-TL3-7 The commenter objects to the Draft EIR's reliance on the small size of increases in stormwater and wastewater generated by the project, citing two court decisions. Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

O-TL3-8 The commenter objects to the Draft EIR's reliance on San Francisco's conformance with NPDES permits, which he suggests are "failing to prevent severe environmental harm," citing two court decisions. Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

O-TL3-9 The commenter refers to "the potential impacts on the environmental compliance under the City of San Francisco Oceanside sewage treatment plant" and describes violations reported to the City by the US EPA. Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

O-TL3-10 The commenter summarizes the US EPA's notices of violation issued to City in 2019, describes the occurrence of Combined Sewer Overflows (CSOs), and coliform bacteria levels posing "a potentially significant impact on human and aquatic health." Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

O-TL3-11 The commenter suggests that by adding a small amount of additional discharges to the City's sewer system, UCSF "simply makes the situation worse" and that the US EPA is likely to take enforcement actions in the future. Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

O-TL3-12 The commenter suggests that UCSF's project should include "significant wastewater/stormwater mitigation controls" including incorporation of wastewater recycling and reuse and delayed discharge. The commenter also notes that the water storage tanks proposed for replacement by UCSF are "essentially the same size tanks that would be required to store the grey/black wastewater from the facility." Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

O-TL3-13 The commenter indicates that CSOs occur near the beach where they are slowly mixed into the water column, rather than treated and disinfected discharges which

occur "via an outfall diluted with diffusers." Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

O-TL3-14 The commenter suggests that the increase in impervious surfaces due to the CPHP should be considered "cumulatively considerable" and can be addressed by collecting and reusing stormwater. If UCSF is not willing to install dual plumbing, the commenter suggests that the recycled water could be provided for reuse in Golden Gate Park or at "the existing housing complex" at Parnassus Heights, and at a minimum, UCSF should "agree to be bound by the conditions of the City's Article 12C which requires gray and storm water collection, retention, and recycling for buildings large than 250,000 square feet in size." Please see Master Response 12: Stormwater, Wastewater, and Water Quality.

Please note Comment Letter O-TL-3 contained several figures (Figures 1 through 15) and exhibits (Exhibits 1 through 14) which did not comment directly on the Draft EIR. These figures and exhibits are included in Appendix O-TL3 in this Comments and Responses document.

Re: Comprehensive Parnassus Heights Plan Draft Environmental Impact Report: Comments on Air Quality.

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents. I write on its behalf to comment on the Draft Environmental Impact Report (DEIR) for the Comprehensive Parnassus Heights Plan (CPHP) with respect to its analysis of Project impacts on air quality.

San Franciscans objects to the approval of this Project. The DEIR fails to comply with the California Environmental Quality Act (CEQA) for the reasons described below and in my previous letters dated yesterday and today and submitted today. 1

1. The DEIR's Cancer Risk Impact Assessment Is Based on Legal Errors and Not Supported by Substantial Evidence.

a. The DEIR's thresholds of significance for cancer risk.

The DEIR establishes a threshold of significance for toxic air contaminant (TAC) related cancer risk as follows: "Exceed the LRDP EIR standard of significance by exposing receptors to toxic air contaminant emissions that (1) result in a cancer risk greater than 10 cancer cases per 1 million people exposed in a lifetime...." The DEIR also establishes more general threshold of significance, as follows: "Expose sensitive receptors to substantial pollutant concentrations." (DEIR 4.2-19 [pdf 233].) 2

The DEIR elaborates on the TAC-caused cancer risk as follows:

> In addition to criteria air pollutants, individual projects may emit TACs during construction and operation. As part of assessment of Initial Phase projects, a HRA [Health Risk Assessment] was conducted to provide quantitative estimates of health risks from exposures to TACs.

CEQA provides the lead agency with discretion in selecting significance

> thresholds for the purposes of assessing impacts. For the analysis of health risk and localized impacts, UCSF uses quantitative significance thresholds adopted by BAAQMD [Bay Area Air Quality Management District]. These thresholds are based on substantial evidence identified in Appendix D of the 2017 BAAQMD CEQA Guidelines and its 2009 Justification Report. These thresholds were applied for the analysis of health risk and localized impacts in the Final EIR for the 2014 UCSF Long Range Development Plan and are also applied in this document. Specifically, if a proposed project would result in increased cancer risks exceeding 10 in one million or, a hazard index exceeding 1.0 or a localized PM2.5 concentration exceeding 0.3 ìg/m3 then it would be considered to result in a significant impact with regard to exposure of sensitive receptors to substantial pollutant concentrations. The 0.3 ìg/m3 PM2.5 concentration and the excess cancer risk of 10.0 per million persons exposed are the levels below which BAAQMD considers new sources not to make a considerable contribution to cumulative health risks (BAAQMD, 2017a).
>
> As described by BAAQMD, USEPA considers a cancer risk of 100 per one million or less to be within the "acceptable" range of cancer risk. A cumulative cancer risk of 100 in one million is also used by the City of San Francisco for projects within its jurisdiction to determine the location of APEZ's. Therefore, a *cumulative increase* in cancer risk from all sources would occur if the total of all risks exceeds in one million [sic].

2 cont.

(DEIR 4.2-24 [pdf 238] (italics added).)

The last sentence of this passage appears to have a missing word. Presumably it is supposed to read "the total of all risks exceeds *100* in one million." It is also not clear what the DEIR means when it states that "a cumulative increase" in cancer risk would occur. Presumably it means that "cumulatively *considerable* increase in cancer risk from all sources would occur if the total of all risks exceeds *100* in one million."

For the Project's cumulative cancer risk impact, the DEIR confirms that it uses a threshold of 100 per one million, stating:

> As discussed above, cumulative health risks are analyzed in accordance with BAAQMD's threshold and guidance. As described by BAAQMD considers a cancer risk of 100 per one million or less to be within the "acceptable" range of cancer risk.

(DEIR 4.2-24 [pdf 238] (italics added).)

b. The DEIR's description of the existing conditions (i.e., baseline) for cancer risk.

The DEIR describes the existing conditions (i.e., baseline) for TAC related cancer risk from ambient concentrations of carcinogenic toxic air contaminants as 248.3 cases per million. (DEIR 4.2-10 [pdf 224].)

The DEIR describes the existing conditions (i.e., baseline) for TAC related cancer risk from diesel particulates (DPM) as 480 in one million in the year 2000 in the Bay Area; and 520 in one million in the year 2012 statewide. (DEIR 4.2-11 [pdf 225].) The DEIR indicates that in 2000, CARB approved a Diesel Risk Reduction Plan that it anticipated would result in an 80 percent decrease in statewide diesel health risk in 2020 as compared with the diesel risk in 2000. The DEIR does not disclose what the statewide diesel risk was in 2000, so it is not possible to calculate what an 80% reduction would look like in 2020. The DEIR also does not disclose what the statewide diesel risk is in 2020. 3

The EIR's description of the DPM baseline risk is insufficient because it is not current as of the date of the Notice of Preparation of the EIR.

c. The DEIR's impact assessment for cancer risk is based on legal error and not supported by substantial evidence.

(1) The DEIR's assessment of the Project's incremental increased cancer risk is based on legal error and not supported by substantial evidence.

The DEIR's impacts analysis concludes that the Project's incremental and cumulative increased cancer risk impacts are less than significant. These conclusions are based on errors of law and are not supported by substantial evidence.

The DEIR's threshold of significance for the Project's incremental cancer risk impact is any increase in cancer risk over 10 cases per million. The DEIR borrows this threshold from the BAAQMD CEQA Guidelines and then deploys it without regard for the extreme baseline cancer risk in San Francisco. The DEIR thereby commits the fundamental error of failing to add the Project's effects to the baseline for purposes of determining significance. (*San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 722-723; *Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th 859, 881-882.) 4

In addition to this fundamental legal error, the DEIR's use of this threshold regardless of baseline cancer risk is not supported by substantial evidence. The baseline cancer risk in San Francisco is 248.3 cases per million plus the unquantified DPM related risk. The DEIR's uncritical use of the 10 cases per million BAAQMD threshold implies that an increase of less than 10 cases per million is always less than significant, regardless of the baseline risk, which

presumably is very different in rural suburban parts of the Bay Area (e.g., Blackhawk) than it is in San Francisco. There is no substantial evidence to support this implicit factual finding.

There is no substantial evidence to support this implicit factual finding because the BAAQMD threshold is a policy, based on a value judgment, not a finding of fact based on evidence. This violates CEQA. Determinations of significance must be based on evidence, not value judgments and policy. (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108–1109 (*Amador Waterways*) ["such thresholds cannot be used to determine automatically whether a given effect will or will not be significant"].)

Here, other than pointing to the BAAQMD threshold, the DEIR fails to explain why the Project's admitted incremental increase in cancer risk is not significant given that it is being added to a severe baseline cancer risk. "[I]n preparing an EIR, the agency must consider and resolve every fair argument that can be made about the possible significant environmental effects of a project, irrespective of whether an established threshold of significance has been met with respect to any given effect." (*Amador Waterways, supra,* 116 Cal.App.4th at 1109.)

4 cont.

(2) The DEIR's assessment of the Project's cumulative increased cancer risk is based on legal error and not supported by substantial evidence.

As discussed above, for the Project's cumulative increased cancer risk, the DEIR uses threshold of any exceedance of 100 cases per one million because "BAAQMD considers a cancer risk of 100 cases per one million or less to be within the 'acceptable' range of cancer risk." (DEIR 4.2-24 [pdf 238],) The DEIR also confirms this on page 4.2-27, stating:

> As discussed above, cumulative health risks are analyzed in accordance with BAAQMD's threshold and guidance. As described by BAAQMD considers a cancer risk of 100 per one million or less to be within the "acceptable" range of cancer risk.

Assuming *arguendo* that this is an appropriate threshold for assessing whether the Project's cumulative cancer risk impact is significant, the DEIR fails to apply it. After stating this threshold on DEIR pages 4.2-24 and page 4.2-27, the DEIR shiftily alters the threshold on page 4.2-70, stating:

> Because the cumulative increase in cancer risk from all sources would be well below 100 in one million ... the CPHP's cumulative impact to local health risk and hazards would be reduced to less than significant with identified mitigation.

Thus, instead of considering any resulting cancer risk above 100 cases per one million to be significant, the DEIR shifts to requiring that the cumulative "increase" in cancer risk contributed by the Project in combination with other projects exceed 100 cases per one million to

5

be found significant. This shift reflects several legal errors. 5 cont.

First, the DEIR is just plain confusing as to what the cumulative threshold is, which frustrates meaningful public comment. Therefore, the DEIR must be revised and recirculated using a clear and stable cumulative threshold. 6

Second, the threshold as employed on page 4.2-70 (for both construction and operation) suffers the same legal defect as the incremental standard, i.e., it is employed without regard to the baseline cancer risk. The baseline cancer risk in San Francisco is 248.3 cases per million plus the unquantified DPM caused risk. According BAAQMD and this DEIR, this baseline risk is "unacceptable." The cumulative increase in cancer risk contributed by the Project in combination with other projects will make this existing severe condition worse. Other than pointing to the BAAQMD threshold, the DEIR fails to explain why the Project's admitted cumulative increase in cancer risk is not significant given that it is being added to a severe baseline cancer risk. (*Communities For a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 114 ["the guiding criterion on the subject of cumulative impact is whether any additional effect caused by the proposed project should be considered significant given the existing cumulative effect"]; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 718.)[1] 7

This legal error is illustrated by considering the math. According the DEIR, the threshold of a cumulative *increase* of 100 cases per million applies regardless of baseline risk. Thus, a project with a baseline cancer risk of 50 cases per million would need a post-project cancer risk of 150 cases per million for the cumulative impact to be deemed significant, while a project with a baseline cancer risk of 100 cases per million would need a post-project cancer risk of 200 cases per million for the cumulative impact to be deemed significant. Thus, a project with the higher baseline risk (100 per million) *would not be deemed* to have a significant cumulative impact with a post-project cancer risk of 150 cases per million, but a project with the lower baseline risk (50 per million) *would be deemed* to have a significant cumulative impact with a post-project cancer 8

---

[1] The decision in *Kings County* repudiates the "ratio theory," stating:

> The [ ] EIR concludes the project's contributions to ozone levels in the area would be immeasurable and, therefore, insignificant because the [cogeneration] plant would emit relatively minor amounts of [ozone] precursors compared to the total volume of [ozone] precursors emitted in Kings County. The EIR's analysis uses the magnitude of the current ozone problem in the air basin in order to trivialize the project's impact ... The relevant question to be addressed in the EIR is not the relative amount of precursors emitted by the project when compared with preexisting emissions, but whether any additional amount of precursor emissions should be considered significant in light of the serious nature of the ozone problems in this air basin.

(*Kings County, supra*, 221 Cal.App.3d at 718).

risk of 150 cases per million.

In short, the widely repudiated "ratio theory" in which "the greater the overall problem, the less significance a project has in a cumulative impacts analysis" is embedded in the threshold of significance applied by the DEIR to the Project's cumulative cancer risk impact. (*Kings County, supra*, 221 Cal.App.3d 692, 721 ["We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's "ratio" theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis"].)

8 cont.

Needless to day, the environmental justice implications of the DEIR's use of this threshold are dire.

Third, like the incremental threshold, the cumulative threshold, represents a value judgement, not a threshold for making a factual findings based on evidence. And this is true for both the DEIR's initial formulation of the threshold as a post-project condition in which cancer risk exceeds 100 cases per one million, and its later formulation of the threshold as the cumulative increase in cancer risk contributed by the Project in combination with other projects exceeds 100 cases per one million.

9

CEQA neither requires nor allows the DEIR to use the BAAQMD's or EPA's judgment of "acceptable" cancer risk to determine the significance of the Project's impacts. UCSF's discretion to decide that significant environmental harm is "acceptable" in light of the project's benefits arises at the end of the CEQA analysis, in the context of a statement of overriding considerations, not at the beginning of the process, in determining whether impacts are significant.

> A statement of overriding considerations is required, and offers a proper basis for approving a project despite the existence of unmitigated environmental effects, only when the measures necessary to mitigate or avoid those effects have properly been found to be infeasible. (Pub. Resources Code, § 21081, subd. (b).) Given our conclusion the Trustees have abused their discretion in determining that CSUMB's remaining effects cannot feasibly be mitigated, that the Trustees' statement of overriding circumstances is invalid necessarily follows. CEQA does not authorize an agency to proceed with a project that will have significant, unmitigated effects on the environment, based simply on a weighing of those effects against the project's benefits, unless the measures necessary to mitigate those effects are truly infeasible. Such a rule, even were it not wholly inconsistent with the relevant statute (id., § 21081, subd. (b)), would tend to displace the fundamental obligation of "each public agency [to] mitigate or avoid the significant effects on the environment of projects that it carries out or approves

10

whenever it is feasible to do so" (id., § 21002.1, subd. (b)).

City of Marina v. Board of Trustees of the California State University (2006) 39 Cal.4th 341, 368-69.

This is a critical distinction, because where the Project does not exceed thresholds of significance that are erroneously inflated by the concept of "acceptable risk," UCSF is absolved of further legal obligation to mitigate the impact. As a result, the public cannot know whether UCSF will allow an unknown number of cancer cases to occur that it could have feasibly avoided had it scrupulously followed CEQA. Nor does the public know, had the EIR determined the Project's additional cancer risk is significant, whether or not UCSF would have found the Project's benefits outweigh its environmental and adverse human health effects.

10 cont.

Thank you for your attention to this matter.

Very Truly Yours,

Tom Lippe

Thomas N. Lippe

C005c DEIR AQ.wpd

Responses to Comments from Law Offices of Thomas N. Lippe, APC

O-TL4-1 In this introductory comment, the commenter states that the Draft EIR fails to comply with CEQA for the reasons set forth in the nine comments that follow. Please refer to the individual comment responses below which clearly show that the Draft EIR fully complies with CEQA.

O-TL4-2 This comment asks for clarification regarding the significance criteria applied in the Draft EIR and discussed on page 4.2-24 to evaluate the cumulative health risk from TAC emissions associated with the proposed CPHP, and suggests a text revision to clarify it.

The recommended revisions to the last sentence of the fourth paragraph on page 4.2-24 of the Draft EIR are noted. Please refer to Section 8.5 of this Comments and Responses document for the proposed revisions.

O-TL4-3 The commenter states that the Draft EIR does not disclose what the statewide diesel particulate matter (DPM) risk was in 2000 or is predicted to be in 2020 and as such the DPM baseline in the Draft EIR is not sufficiently established.

The California Air Resources Board (CARB) has published projected trends of DPM emissions for the San Francisco Bay Area Air Basin.[6] Based on this latest trends document, basin-wide emissions of DPM are predicted to decrease from 10 tons per day in 2000 to 2 tons per day in 2020, an 80 percent reduction. As stated on page 4.2-11 of the Draft EIR, as of 2000, the average Bay Area cancer risk from exposure to DPM based on a population-weighted average ambient DPM concentration was approximately 480 in one million. Consequently, one may expect that the current (2020) basin-wide risk solely from DPM to be on the order of 96 in one million. Other toxic air contaminant emissions within the basin will further contribute to this estimated risk. These basin-wide risks are also inclusive of transport emissions from outside the basin. Consequently, BAAQMD methodology established the 100 in one million increased cancer risk criterion to only apply to sources within 1,000 feet of a given receptor[7].

However, as the impact analysis in Impact C-AIR-2 in the Draft EIR uses the BAAQMD's recommended cumulative contribution significance criterion of 100 in one million, the predicted existing risk levels attributable solely to DPM are not a factor in the impact assessment of the Draft EIR.

O-TL4-4 This comment contends that the Draft EIR's significance criteria for the CPHP's incremental cancer risk of 10 in one million is inappropriate because it does not

6 California Air Resources Board, *California Almanac of Emissions and Air Quality—2013 Edition*, 2013, Table 4-16. Available at https://ww2.arb.ca.gov/our-work/programs/resource-center/technical-assistance/air-quality-and-emissions-data/almanac-4.

7 BAAQMD, 2009. *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*, October, 2009, p. 5.

consider the baseline cancer risk in San Francisco and also claims that it is not supported by substantial evidence. Under CEQA, lead agencies have discretion in determining the appropriate threshold of significance to determine the severity of a particular impact. "A threshold of significance is an identifiable, quantitative, qualitative, or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant." (CEQA Guidelines, § 15064.7 subd. (a).) CEQA Guidelines further state, "When adopting or using thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence." (CEQA Guidelines, § 15064.7 subd. (c.)

As lead agency, the University of California has discretion to rely on BAAQMD's recommended thresholds of significance and the use of those thresholds is supported by substantial evidence. In consideration of State and federal air quality standards, and based on its own independent review of thresholds of significance for air quality impacts recommended by the BAAQMD, UCSF has determined that BAAQMD's recommended significance thresholds are appropriate to use to evaluate potentially significant air quality impacts associated with the proposed project. While others may disagree, such disagreement does not alter the fact that UCSF, and BAAQMD's expert conclusions developed in its 2009 document *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance* referenced in the Draft EIR (pp. 4.2-22 to 4.2-27) constitute substantial evidence upon which UCSF may rely. (See *Center for Biological Diversity v. Department of Forestry & Fire Protection* (2014) 232 Cal.App.4th 931, 948 ["disagreement is insufficient… [a challenger must] *affirmatively show* there was no substantial evidence in the record…" (original emphasis)].) BAAQMD's 2009 Justification Report develops and considers a variety of air quality thresholds and recommends numeric significance criteria that BAAQMD staff believe provide a fair share of emission reductions protective of human health from land use development.

The 10.0 in one million cancer risk criterion for a single source is supported by EPA's guidance for conducting air toxics analyses and making risk management decisions at the facility and community-scale level. It is also the level set by the Project Risk Requirement in the Air District's Regulation 2, Rule 5 new and modified stationary sources of TAC, which states that the Air Pollution Control Officer shall deny an Authority to Construct or Permit to Operate for any new or modified source of TACs if the project risk exceeds a cancer risk of 10.0 in one million.[8] Similar to its thresholds for criteria air pollutants, which also do not

8 BAAQMD, 2017a. *CEQA Air Quality Guidelines*. May 2017, p. D-40.

require that existing background emissions be considered in evaluating the significance of a project's incremental emissions, the BAAQMD's excess cancer risk level of more than 10 in one million represents a significant cumulatively considerable contribution.[9]

With respect to a San Francisco-specific baseline, as stated on Draft EIR pages 4.2-8 to 4.2-9, the City and County of San Francisco partnered with BAAQMD to inventory and assess air pollution exposure from vehicles, stationary sources, and area sources within San Francisco. Citywide dispersion modeling was conducted to assess the emissions from the following primary sources: vehicles on local roadways, permitted stationary sources, port and maritime sources, and diesel emissions from Caltrain. Modeling results were used to identify areas in the city with poor air quality, which are designated as the *Air Pollutant Exposure Zone* (APEZ). The methodology and technical documentation for modeling citywide air pollution are available in a recently updated draft document entitled *San Francisco Citywide Health Risk Assessment: Technical Support Documentation*. (SFDPH, 2020). These most recent citywide modeling results indicate that the Parnassus Heights campus site and its surrounding area are not located within an APEZ. Therefore, the commenter's contention that the significance criterion of 10 in one million incremental cancer risk is inappropriate because the project site is in an area of high baseline risk is unfounded.

O-TL4-5 This comment contends that the cumulative health risk analysis of the Draft EIR only considers incremental contributions of the project with respect to application of the cumulative significance criterion of 100 in one million increased cancer risk.

The cumulative analysis on page 4.2-70 of the Draft EIR cites both the proposed CPHP cancer risk contributions as well as cancer risk contributions identified in the 2014 LRDP Final EIR. The only other sources of toxic air contaminants (TACs) within the 1,000-foot exposure zone recommended in BAAQMD methodology for the evaluation of health risks would be mobile sources on local roadways with traffic volumes exceeding 10,000 average daily traffic. BAAQMD guidance states that a project would have a cumulative considerable impact if the aggregate total of all past, present, and foreseeable future sources within a 1,000-foot radius from the fence line of a source plus the contribution from the project, exceeds an excess cancer risk levels of more than 100 in one million.[10] Therefore, this criterion is independent of regional sources of DPM health risk outside of the 1000-foot zone of influence and, similar to the BAAQMD criteria for evaluation of a project's criteria pollutant emissions, uses a cumulatively considerable contribution that can be reasonably estimated.

9 BAAQMD, 2017a. *CEQA Air Quality Guidelines*. May 2017, p. 5-3.
10 BAAQMD, 2017a. *CEQA Air Quality Guidelines*. May 2017, p. 2-5.

Table 6.2-5 on page 6-23 of the 2014 LRDP Final EIR identifies an increased cancer risk value of 0.9 in one million associated with Parnassus Avenue. This contribution is included in the overall LRDP increased cancer risk contribution of 10 in one million cited on page 4.2-70 of the Draft EIR. Therefore, the cumulative health risk evaluation of the Draft EIR correctly considered all appropriate sources within 1,000 feet zone of influence, consistent with BAAQMD methodology.

O-TL4-6 This comment asserts that the threshold of significance used in the Draft EIR to evaluate the cumulative TAC impact is confusing.

The Draft EIR identifies the significance criteria for evaluating cumulative health risk impacts in a number of locations. As discussed in Response O-TL4-2, the criterion for evaluating the cumulative cancer risk from TAC emissions identified on page 4.2-24 of the Draft EIR under the subheading "Thresholds for Evaluating TAC impacts," has been corrected (please refer to Section 8.5 of this Comments and Responses document for the proposed revisions). Please note, however, the cumulative threshold is accurately described on page 4.2-27 under the subheading "Approach to Analysis of Cumulative Impacts;" and on page 4.2-70 of the Draft EIR in the analysis of Impact C-AIR-2.

O-TL4-7 The comment disputes the validity of using the 100 in one million incremental cancer risk as the significance criterion for evaluating cumulative impacts from TAC emissions, and specifically, its application as an incremental standard above the background risk.

Because the 100 in one million incremental cancer risk significance criterion used in the analysis of the Draft EIR is used as a cumulative threshold that considers multiple sources not typically considered by EPA in a facility analysis, such as contributions from roadways and railways, as well as from multiple stationary sources from multiple operators as well as from construction activity, the 100-in-one-million incremental cancer risk criterion serves as an appropriately conservative threshold for such an analysis.

It should be noted that when BAAQMD developed its 100-in-one-million incremental cancer risk cumulative criterion in its CEQA Air Quality Guidelines, it characterized this level of risk as reflective of air quality in a "pristine" portion of the Bay Area. It was originally designated as its "Point Reyes" approach,[11] reflecting the air quality in this National Seashore that the National Park Service identifies as a Class I Park and wilderness area. This demonstrated that even such pristine areas as Point Reyes National Seashore can have a sizeable background cancer risk, largely due to cumulative global atmospheric transport.

[11] BAAQMD, Bay Area Air Quality Management District CEQA Guidelines Public Workshop Presentation, "Developing Thresholds of Significance", Slide 10, February 26, 2009.

Further, BAAQMD guidance states that a project would have a cumulative considerable impact if the aggregate total of all past, present, and foreseeable future sources within a 1,000-foot radius from the fence line of a source plus the contribution from the project, exceeds an excess cancer risk levels of more than 100 in one million.[12] Therefore, this criterion is independent of regional sources of DPM health risk outside of the 1000-foot zone of influence and, similar to the BAAQMD criteria for evaluation of a project's criteria pollutant emissions, uses a cumulatively considerable contribution that can be reasonably estimated.

The most recent citywide modeling results indicate that the Parnassus Heights campus site and its surrounding area are not located within an APEZ and is therefore not an area of San Francisco with a background air quality burden of concern.

Page 5-15 of the BAAQMD's 2017 Air Quality CEQA Guidelines states the following with respect to cumulative assessment of health risks:

> A Lead Agency shall examine TAC and/or $PM_{2.5}$ sources that are located within 1,000 feet of a proposed project site. Sources of TACs include, but are not limited to, land uses such as freeways and high volume roadways, truck distribution centers, ports, rail yards, refineries, chrome plating facilities, dry cleaners using perchloroethylene, and gasoline dispensing facilities. A Lead Agency should determine what the combined risk levels are from all nearby TAC sources in the vicinity of sensitive receptors.

There are no truck distribution centers, ports, rail yards, refineries, chrome plating facilities, dry cleaners using perchloroethylene, and gasoline dispensing facilities within 1,000 feet of the project site or non-UCSF stationary sources within 1,000 feet of the campus site. As stated above in Response O-TL4-5, the 2014 LRDP Final EIR identified an increased cancer risk value of 0.9 in one million associated with Parnassus Avenue; and this contribution is included in the overall LRDP increased cancer risk contribution of 10 in one million cited on page 4.2-70 of the CPHP Draft EIR. Therefore, the cumulative health risk analysis of the Draft EIR considered high volume roadways in the area and their contribution is nominal. The analysis of cumulative health risk from the proposed CPHP and the existing background sources in the project vicinity in the Draft EIR is consistent with BAAQMD methodology.

O-TL4-8 The commenter is concerned that the analysis in the Draft EIR does not include the appropriate contribution to the baseline cancer risk from DPM.

This comment suggests that all contributions to the baseline risk should be included in the cumulative assessment of increased health risk. However BAAQMD guidance clearly states that a project would have a cumulative

[12] BAAQMD, 2017a. *CEQA Air Quality Guidelines*. May 2017, p. 2-5.

considerable impact if the aggregate total of all past, present, and foreseeable future sources within a 1,000-foot radius from the fence line of a source plus the contribution from the project, exceeds an excess cancer risk levels of more than 100 in one million.[13] Sources outside of the 1,000-foot zone of influence are not readily identifiable and include emissions transported regionally and across the Pacific Ocean. As discussed in the Response O-TL4-7 above, page 5-15 of the BAAQMD's 2017 Air Quality CEQA Guidelines states the following with respect to cumulative assessment of health risks:

> A Lead Agency shall examine TAC and/or PM2.5 sources that are located within 1,000 feet of a proposed project site. Sources of TACs include, but are not limited to, land uses such as freeways and high volume roadways, truck distribution centers, ports, rail yards, refineries, chrome plating facilities, dry cleaners using perchloroethylene, and gasoline dispensing facilities. A Lead Agency should determine what the combined risk levels are from all nearby TAC sources in the vicinity of sensitive receptors.

The above sources represent the sources identified by the BAAQMD for consideration in estimating a project's cumulative health risk impact and these sources were considered in the Draft EIR. Contributions from cumulative global atmospheric transport of DPM are not an element to be considered in the BAAQMD's methodology or relative to the 100 in one million increased cancer risk cumulative threshold.

The commenter is asserting a math error and is misinterpreting the cumulative excess cancer risk threshold and methodology provided by the BAAQMD. According to the BAAQMD, a project's cumulative cancer risk would be significant if the increase in cancer risk from the project, when combined with the risk from other sources within 1,000 feet of the project, exceeds 100 in a million.

Further, the use of the BAAQMD threshold relative to increased cancer exposure from toxic air contaminants does not rely on a "ratio theory" considered by the court in *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 718 which was a decision that addressed contributions of ozone precursors, as part of a criteria pollutant impact analysis. In that decision the court found that, for the analysis of that case, the relevant question to be addressed in that EIR was whether any additional amount of precursor emissions should be considered significant in light of the serious nature of the ozone problems in this air basin. With respect to localized TAC exposure, as stated on page 4.2-9 of the CPHP Draft EIR, the most recent citywide modeling results indicate that the Parnassus Heights campus site and its surrounding area are not located within an Air Pollution Exposure Zone or a health vulnerable zip code. Therefore, there is

[13] BAAQMD, 2017a. *CEQA Air Quality Guidelines*. May 2017, p. 2-5

no special consideration to be given and application of a threshold and methodology established by the governing Air District is an adequate tool for analysis under CEQA.

O-TL4-9 This comment contends that the incremental 100 in one million cancer risk cumulative impact criterion represents a value judgment, not a threshold for making a factual findings based on evidence.

Please see Response O-TL4-4 above regarding the BAAQMD recommended numeric significance criteria used in the Draft EIR and the information and substantial evidence considered by UCSF before applying these criteria. All of the criteria used in the evaluation of air quality impacts do not represent value judgments on the part of UCSF, but are thresholds developed by the BAAQMD based on analysis of extensive amount of data and modeling of existing air quality conditions in the Bay Area and after consideration of a variety of threshold and methodology options[14] With regard to the commenter's assertion about multiple thresholds used in the Draft EIR to evaluate the cumulative cancer risk impact, please see Response O-TL4-6 above.

O-TL4-10 This comment opines that CEQA does not allow an EIR to use the judgment of a local air district or the EPA to define a health risk increment as acceptable and asserts that any statements about the acceptability of a significant impact must be made "at the end of the CEQA analysis… not at the beginning."

Please see Response O-TL4-4 above. As noted in that response, contrary to the commenter's assertion, CEQA does provide that a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, such as the BAAQMD. The BAAQMD is the leading authority on air quality in the Bay Area. It regulates stationary sources of air pollution in the nine counties, and develops policies and other guidance for the control of air pollution within the air basin. The BAAQMD lists the following among its goals: reduce and eliminate health problems caused by air pollution; achieve and maintain air quality standards for all criteria pollutants; create high-quality, relevant regulatory programs and ensure they comply with federal, state, and local laws; through incentives and partnerships, establish the Bay Area as a leading area for emissions reductions in mobile sources, land-use planning, innovative technology, and energy; and serve as an air quality authority in the development of policy and information.[15] Therefore, the Draft EIR appropriately uses the numeric significance criteria put forth by the BAAQMD to analyze the potential air quality impacts of the CPHP, including the 100-in-one-

[14] BAAQMD, 2009. *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*, October, 2009.

[15] BAAQMD, Mission Statement, Available online at: https://www.baaqmd.gov/about-the-air-district/mission-statement accessed November 18, 2020.

million incremental cancer risk criterion and associated published methodology for the evaluation of a project's cumulative health risk impacts.

Please also note that, on August 12, 2016 the California Court of Appeal in CBIA v. BAAQMD concluded that "the challenged thresholds are not invalid on their face, but may not be used for the primary purpose envisioned by District, namely, to routinely assess the effect of existing environmental conditions on future users or occupants of a project" (CBIA v. BAAQMD [2016] 1 Cal.App.5th 715). Ergo, the Court of Appeal recognizes that such thresholds are valid and may be applied to the assessment of a project's effect on the environment, as was done in the CPHP Draft EIR.

The Draft EIR systematically applies the numeric significance criteria to evaluate the project's impacts and arrives at an impact conclusion based on whether the significance criterion is exceeded or not. The Draft EIR does not make any statements about the "acceptability" of any significant impacts. It only presents all the information regarding the project's impacts for review by the public and for review and consideration by the decision makers when making a decision to approve or deny the project.

RE: Comprehensive Parnassus Heights Plan Draft Environmental Impact Report: Comments on Transportation, Energy, Greenhouse Gases, and Noise

Dear Ms. Wong:

This office represents San Franciscans for Balanced and Livable Communities, a citizen's group composed of San Francisco residents. I write on its behalf to comment on the Draft Environmental Impact Report (DEIR) for the Comprehensive Parnassus Heights Plan ("CPHP" or "Project") with respect to the analysis of the Project's impacts on transportation, energy, greenhouse gas emissions, and noise.

1. Transportation

This letter incorporates by reference the comments on the DEIR's transportation section prepared by traffic engineer Tom Brohard, which are attached to this letter. (See **Exhibit A**, Tom Brohard Comments.) In addition to the deficiencies identified by Mr. Brohard, the DEIR fails as an informational document because it omits consideration of whether the Project will result in significant impacts to transit service. The DEIR states in relevant part:

> Consistent with the CEQA Guidelines and the SF Guidelines, the transportation impact analysis in this EIR analyzes the change to VMT that would result from the implementation of the CPHP at the Parnassus Heights campus site. Changes to traffic operations in the study area (i.e., the level of service of project area intersections) and ***transit operations (e.g. project generated transit ridership and effect on capacity utilization, potential delay to transit vehicles) is outside the scope of the CEQA analysis*** and are not discussed below.

(DEIR, p. 4.5-27 (emphasis added).)

While the DEIR is correct that automobile delay or "level of service" is no longer a significant impact under CEQA, this does not also apply to analysis of whether a Project will result in significant project-level or cumulative impacts to transit facilities. CEQA Guidelines

1

section 15064.3, subdivision (a) states, "Other relevant considerations may include the effects of the project on transit." Subdivision (b)(3) of that same Guideline states that even a qualitative analysis of transportation impacts "would evaluate factors such as the availability of transit, proximity to other destinations, etc." OPR's Technical Guidance, upon which the DEIR purports to follow, includes a section entitled "Impacts to Transit" and states in relevant part:

> Because criteria for determining the significance of transportation impacts must promote "the development of multimodal transportation networks" pursuant to Public Resources Code section 21099, subd. (b)(1), lead agencies should consider project impacts to transit systems and bicycle and pedestrian networks.

(OPR Technical Guidance, p. 19.)

Disregarding applicable law and OPR Guidance, the DEIR states that impacts to transit are analyzed "for informational purposes only" in an appendix to the DEIR that "is provided for decision-makers' consideration, independent of the environmental review process." (DEIR, p. 4.5-28.) As explained above, it is legal error for the DEIR to not analyze impacts to transit. That legal error is prejudicial because the purported analysis of transit impact contained in the appendix falls well short of providing necessary information to assess the impact.

1 cont.

The only purported analysis of transit impacts is set forth in two paragraphs on DEIR Appendix TRANS-14 and 15. The paragraphs disclose that Project's generated vehicle trips and passenger loading activities "may periodically:

- Result in transit delay on Parnassus Avenue (6 Haight/Parnassus, 43 Masonic) and Irving Street (N Judah)

- Reduce accessibility by blocking multimodal transportation facilities, such as crosswalks, bicycle lanes, and/or transit stops."

(DEIR Appendix TRANS-14.)

The Appendix further notes, "[T]here may be peak passenger travel periods where demand, either for the campus site overall, or for specific locations is greater than supply. During these periods there would be a higher chance of delay to transit or a reduction in access to transportation facilities."

In short, the DEIR's appendix discloses for "informational purposes only" that the Project may result in vehicles blocking transit stops as well as overwhelming the transit system. But because this analysis is provided "independent of the environmental review process," no significance standard is applied to this impact, much less substantial

evidence disclosing existing transit capacity, the Project's incremental demand on that existing capacity, or whether that incremental contribution will overwhelm (and if so by how much) transit capacity. This truncated analysis utterly fails to provide the public with necessary information about the Project's impact on transit, including disclosure about the magnitude of the impact. (*Sierra Club v. County of Fresno* (2016) 6 Cal.5th 502, 521.)

It is possible that the DEIR fails to analyze transit impacts based on an incorrect reading of OPR's *Technical Advisory on Evaluating Transportation Impacts In CEQA* ("OPR Advisory"). While it is true that the OPR Advisory states, "Lead agencies generally should not treat the addition of new transit users as an adverse impact," the mere addition of riders is not the same as overwhelming transit capacity. Even if the OPR Advisory is intended to conflate those two issues, the document is informal guidance and not a regulation that was promulgated pursuant to the APA. Accordingly, the OPR Advisory is properly disregarded when inconsistent with CEQA or the CEQA Guidelines.

Analysis of impacts to transit capacity is required because, as Traffic Engineer Tom Brohard explains, overwhelming the transit system will increase the Project's VMT. The CEQA Guidelines are in accord, noting that even a purely qualitative analysis of VMT "would evaluate factors such as the availability of transit." (CEQA Guidelines, § 15064.3, subd. (b)(3.) Of course, a bare, qualitative analysis is only allowed "if existing models or methods are not available." (*Ibid*.) Quantitative modeling is readily available for both estimating VMT and impacts to transit, and so must be utilized here. (*Berkeley Jeep Jets Over the Bay Comm. V. Board of Port Commissioners* (2001) 91 Cal.App.4th 1344, 1381.) As Mr. Brohard explains, and the DEIR itself obliquely acknowledges, the existing transit system in the Project area may already be overwhelmed, and so the Project may result in higher VMT than disclosed in the DEIR. The DEIR's revised analysis will also need to account for predicted MUNI service reductions, which could result in a further overwhelmed transit system that is exacerbated by the Project.

1 cont.

In summary, the DEIR's transportation analysis will need to be substantially revised and recirculated to include the Project's impacts to transit. This may, in turn, require revisions to the DEIR's reported VMT for the Project.

2. Energy

Commencing in 2019, the CEQA Guidelines expressly require substantive analysis of a project's energy impacts. (CEQA Guidelines, § 15126.2, subd. (b)). CEQA now requires:

2

> Energy Impacts. If analysis of the project's energy use reveals that the project may result in significant environmental effects due to wasteful, inefficient, or unnecessary use of energy, or wasteful use of energy resources, the EIR shall mitigate that energy use. This analysis should include the project's energy use for all project phases and components, including transportation-related energy, during construction and operation. In addition to building code compliance, other relevant considerations may include, among others, the project's size, location, orientation, equipment use and any renewable energy features that could be incorporated into the project. (Guidance on information that may be included in such an analysis is presented in Appendix F.) This analysis is subject to the rule of reason and shall focus on energy use that is caused by the project.

(CEQA Guidelines, § 15126.2, subd. (b).)

Thus, an EIR must affirmatively analyze a project's use, and energy use efficiency, for the purpose of determining whether there is any "wasteful, inefficient, or unnecessary use of energy." The DEIR's perfunctory analysis of energy falls well short of these substantive mandates, and therefore fails as an informational document.

The DEIR purports to quantify the Project's energy consumption, which reveals that the Project will dramatically increase energy consumption. For example, Table 4.5-2 discloses that electricity use will increase from 5,091 to 10,976 MWh/year, natural gas use will increase from 1,044,485 to 1,686,549 MMBtu/year, diesel use will increase from 681,823 to 1,198,763 gallons per year, and even gasoline use will increase from 4,246,449 to 5,178,022 gallons per years. These numbers translate to a 116 percent increase in electricity use, 61 percent increase in natural gas use, 76 percent increase in diesel use and 22 percent increase in gasoline use.

The Project's drastic increases in energy use are set in the context of much more modest statewide growth rates in energy consumption. For example, statewide energy consumption statewide has a "growth rate of 1.27 percent," (DEIR, p. 4.5-23) and natural gas demand will actually "decrease at an annual rate of 1.1 percent to 2026" (DEIR, p. 4.5-24.) In other words, the Project's energy use will be dramatically higher than the statewide average – and thus should be a significant impact under CEQA Guidelines section 15126.2, subdivision (b).

2 cont.

To avoid the inescapable significance determination for energy use, however, the DEIR relies on the long-repudiated "ratio theory" analysis. (*San Francisco Baykeeper, Inc. v. State Lands Com.* (2015) 242 Cal.App.4th 202, 223.) With respect to electricity usage, for example, the DEIR states: "This represents 0.002 percent of the total 2018 state-wide electricity usage and

3

0.11 percent of San Francisco electricity usage." (DEIR , p. 4.5-23.)[1] But the Project's percentage statewide or even regional electricity use is irrelevant – and even misleading – on the question of whether the Project's individual energy consumption of energy is "wasteful, inefficient, or unnecessary." (CEQA Guidelines, § 15126.2, subd. (b); see *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 721.) Indeed, CEQA Guideline 15126.2 directly cautions against this "ratio theory" approach to the energy analysis by stating, "This analysis . . . shall focus on energy use that is caused by the project" (CEQA Guidelines, § 15126.2, subd. (b).)

3 cont.

The DEIR relies on the same flawed and misleading strategy to dismiss the Project's cumulative impact on energy consumption. (DEIR, p. 4.5-29 ("Given the relatively small percentage of the CPHP's other fuel and energy uses compared to existing fuel and energy use in the region. . .").) This strategy is flawed and misleading precisely because the purpose of a cumulative impacts analysis is to avoid considering projects "in a vacuum" since failure to consider cumulative harm may risk "environmental disaster." (*Whitman v Board of Supervisors* (1979) 88 Cal.App.3d 397, 408.) "[T]he greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant." (*Communities for a Better Env't v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120.) "One of the most important environmental lessons evident from past experience is that environmental damage often occurs incrementally from a variety of small sources. These sources appear insignificant, assuming threatening dimensions only when considered in light of the other sources with which they interact." (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720.)

4

The DEIR's analysis of energy use will need to be substantially revised and recirculated in order to meaningfully disclose whether the Project's energy consumption is inefficient, wasteful or unnecessary.

3. Greenhouse Gas Emissions

This letter incorporates by reference the comments on the DEIR's GHG and Energy Sections prepared by SCS Engineers, which are attached to this letter. (See **Exhibit B**, Comments of SCS Engineers.) This letter also provides additional analysis explaining the DEIR's legal error in its approach to analyzing GHG emissions.

5

As explained above, the Project would result in a massive increase in the consumption of energy. (See DEIR 4.5-2.) This increase in non-renewable energy consumption translates to comparable increases in GHG emissions. (See DEIR Table 4.7-3 (CO_2e increases from 125,426

[1] This same impermissible ratio theory is used for electricity usage (DEIR, p. 4.5-23), natural gas (DEIR, p. 4.5-24) and diesel consumption (DEIR, p. 4.5-24.)

to 187,241 metric tons per year).)[2] These drastic increases in GHG emissions are problematic for the DEIR's analysis of GHG emissions since California policy is to reduce GHG emissions over the next several decades.

Specifically, the state's policy is to reduce state-wide greenhouse gas emissions to 1990 levels by the year 2020 (Health and Safety Code § 38550), 40 percent below 1990 levels by the 2030 (Health and Safety Code § 38566), 80 percent below 1990 levels by 2050 (Executive Order S-3-05). (*Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497 ["These targets were based on a scientific consensus that climate change was largely caused by human activity resulting in elevated levels of carbon dioxide and other heat-trapping gases in the atmosphere and that drastic reductions in greenhouse gas emissions were required to stabilize the climate"].) Although the CEQA Guideline Appendix G significance threshold asks whether a project would "conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases," these straightforward and applicable standards are not used in the DEIR for assessing the Project's impact on GHG emissions. Rather, the DEIR explains that its "approach to analysis" of GHG impacts is to analyze consistency with CARB's 2017 Scoping Plan Update ("Scoping Plan"). 5 cont.

This curious strategy is explained by the following statement in the DEIR: "In the 2017 Scoping Plan Update, CARB recognizes that achieving no net increase in GHG emissions compared to existing conditions would demonstrate that a project is not contributing to climate change impacts." (DEIR, p. 4.7-34.) In other words, the DEIR's approach is to require mitigation only to the "net zero goal of CARB" (DEIR, p. 4.7-41) and not the State Policy reductions of 40 and 80 percent, respectively.

The DEIR's approach is legal error. The Scoping Plan is simply not "an applicable plan, policy or regulation" for the Project, which is demonstrated with clarity in the plain text of the Scoping Plan itself. The specific text of the Scoping Plan quoted on page 4.7-34 of the DEIR is contained within a section of the Scoping Plan entitled "Climate Action through Local Planning and Permitting," and explains: 6

> To support local governments in their efforts to reduce GHG emissions, the following guidance is provided. This guidance should be used in coordination with OPR's General Plan Guidelines guidance in Chapter 8, Climate Change. While this guidance is provided out of the recognition that local policy makers are critical in reducing the carbon footprint of ***cities and counties***, the decision to

[2] The reported 187,241 metric tons per year of CO_2e under 2050 conditions is false and misleading because it assigns no CO_2e to electricity generation. A footnote to Table 4.7-3 states that this is because "UCSF has committed to net zero electricity by 2025." Such conclusory predictions, unsupported by substantial evidence in the record, are not allowed under CEQA.

> follow this guidance is voluntary and should not be interpreted as a directive or mandate to local governments.

(Scoping Plan, p. 99 (Emphasis added).)

On its face, the guidance that the DEIR attempts to rely upon only applies to "cities and counties." As the DEIR explains, "UCSF is a constitutionally created state entity," (DEIR, p. 4.4-15) and therefore not a city, county or local government. As such, guidance to cities and counties on how to review and approve private development projects within their jurisdictions simply has no applicability to UCSF as part of its CEQA review for its own project. Second, the Scoping Plan is inapplicable for the simple reason that it does not even purport to address 2050 emission targets. (Scoping Plan, p. ES4 ("This Plan establishes a path that will get California to its 2030 target").) 6 cont.

In summary, UCSF's cynical attempt to analyze and mitigate GHG emissions based on an inapplicable GHG plan constitutes legal error. The DEIR will need to analyze consistency with applicable plans or policies. Case law establishes that the time-limited 40 percent reduction by 2030 and 80 percent reduction by 2050 constitute applicable policies serving as the basis for proper CEQA thresholds of significance. (See e.g., *Cleveland National Forest, supra*; *Center for Biological Diversity v. California Dept. of Fish and Wildlife* (2015) 62 Cal.4th 204, 219; *Center for Biological Diversity v. Department of Fish and Wildlife* (2016) 1 Cal.App.5th 452, 469; (*Newhall Ranch II*); *Spring Valley Lake Association v. City of Victorville* (2016) 248 Cal.App.4th 91, 101; *Sierra Club v. County of San Diego* (2014) 231 Cal.App.4th 1152, 1168; *Friends of Oroville v. City of Oroville* (2013) 219 Cal.App.4th 832, 841); *Citizens for Responsible Equitable Environmental Development v. City of Chula Vista* (2011) 197 Cal.App.4th 327, 335–336.) As a "constitutionally created state entity," UCSF must apply these significance standards for its revised analysis of GHG emissions. 7

4. Noise

This letter incorporates by reference the comments on the DEIR's noise and vibration section prepared by acoustics and vibration engineer Frank Hubach, which are attached to this letter. (See **Exhibit C**, UCSF Parnassus DEIR Review by Frank Hubach Associates.) Mr. Hubach identified several technical deficiencies in the DEIR's analysis and mitigation for noise and vibration impacts. 8

Mr. Hubach also identified relevant health-based noise standards that must be addressed in a revised and recirculated DEIR. This letter provides additional legal argument explaining why CEQA requires greater analysis of these health-based impacts and significance thresholds.

The DEIR acknowledges that increased noise emissions can result in human health risks. In a section entitled "Health Effects of Environmental Noise," the DEIR provides in relevant part:

> Other potential health effects of high noise levels identified by WHO include decreased performance for complex cognitive tasks, such as reading, attention span, problem solving, and memorization; physiological effects such as hypertension and heart disease (after many years of constant exposure, often by workers, to high noise levels); and hearing impairment (again, generally after long-term occupational exposure, although shorter-term exposure to very high noise levels, for example, exposure several times a year to concert noise at 100 dBA, can also damage hearing). Finally, noise can cause annoyance and can trigger emotional reactions like anger, depression, and anxiety. WHO reports that, during daytime hours, few people are seriously annoyed by activities with noise levels below 55 dBA or moderately annoyed with noise levels below 50 dBA.

(DEIR, p. 4.11-3.)

As a threshold matter, the DEIR's references section for noise (section 4.11.4) discloses that the DEIR is relying on a 1999 version of the WHO guidelines, which was "accessed December, 2019." This violates CEQA because the 1999 WHO guidance was replaced with a new guidance in 2018. (See **Exhibit D**, *Environmental Noise Guidelines for the European Region.* World Health Organization (2018) ("WHO 2018").) Lead agencies have a duty to inform themselves about current methodologies for analyzing an impact and cannot, as here, rely on 20 year-old WHO guidance rather than guidance that is much more recent.[3] This deficiency is prejudicial to informed decision-making because the WHO 2018 guidance identifies additional health impacts associated with noise such increased incidence of stroke, metabolic effects such as type 2 diabetes, and adverse birth outcomes. (See Exhibit D.) Further, WHO 2018 provides updated information correlating noise emissions to all of these identified health effects.

8 cont.

While the DEIR briefly mentions some of these "other potential health effects" from noise emissions, the DEIR does not correlate these various health effects (and others as reflected in WHO 2018) to noise emissions. The California Supreme Court recently addressed the need to correlate air emissions to human health conditions in *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 516 (*Sierra Club*). *Sierra Club* explains:

> The EIR's discussion of health impacts of the named pollutants provides only a general description of symptoms that are associated with exposure to the ozone, particulate

[3] The DEIR's reported hyperlink for the 1999 WHO report does not work, and so it is not possible to determine whether the DEIR authors relied on the 1999 or 2018 WHO guidance.

> matter (PM), carbon monoxide (CO), and nitrogen dioxide (NOx), and the discussion of health impacts regarding each type of pollutant is at most a few sentences of general information. The disclosures of the health effects related to PM, CO, and sulfur dioxide ***fail to indicate the concentrations at which such pollutants would trigger the identified symptoms***.

(*Id*. at 519, emphasis added.)

The same criticism applies to the DEIR's analysis of human health impacts resulting from noise emissions. Although generally acknowledging that there are health impacts associated with noise emissions, this generalized discussion "fail[s] to indicate the concentrations at which such pollutants would trigger the identified symptoms" from noise emissions. Our Supreme Court in *Sierra Club* held that this failed to comply with CEQA's duty to inform, stating in relevant part:

> The EIR must provide an adequate analysis to inform the public how its bare numbers translate to create potential adverse impacts or it must adequately explain what the agency does know and why, given existing scientific constraints, it cannot translate potential health impacts further.

(*Id*. at 522, emphasis added.) 8 cont.

As in *Sierra Club*, the DEIR here fails to adequately correlate noise emissions to identified health impacts, or explain why it is infeasible to do so. The possible correlation of noise levels to health impacts also imposes a duty to adopt significance standards that reflect such correlation. As explained by Frank Hubach, the significance standards applied in the DEIR do not account for human health impacts from noise. While the *Mission Bay Alliance* upheld an "increment above ambient" significance standard for noise emissions based in part on a local noise ordinance (6 Cal.App.5th at 193), "[c]ompliance with the threshold does not relieve a lead agency of the obligation to consider substantial evidence indicating that the project's environmental effects may still be significant." (CEQA Guidelines, § 15064, subd. (b)(2); see also *East Sacramento Partnership for a Livable City v. City of Sacramento* (2016) 5 Cal.App.5th 281, 300.) Further, "[I]n preparing an EIR, the agency must consider and resolve every fair argument that can be made about the possible significant environmental effects of a project" (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109).)

In summary, the DEIR will need to be revised and recirculated to correlate noise levels to identified health impacts, or explain why it is infeasible to do so. Second, the revised DEIR will need to include significance standards that are based on human health impacts from noise emissions.

SUBJECT: UCSF Parnassus Heights Plan (CPHP) Draft EIR – Transportation Issues and Comments

Dear Mr. Soluri:

Tom Brohard, P.E., has reviewed the transportation portions of the July 13, 2020 Draft Environmental Impact Report (Draft EIR) for the University of California, San Francisco (UCSF) Parnassus Heights Plan in the City of San Francisco. The Proposed Project (CPHP) provides for development of approximately 2.9 million square feet of new building space at Parnassus Heights. The total campus building space will increase to nearly 6 million square feet including instruction, research, clinical, and support space; housing; and structured parking.

My review disclosed many transportation and traffic issues have not been thoroughly and/or properly studied. This letter points out those deficiencies, errors, and inconsistencies that must be addressed before considering the UCSF Parnassus Heights Plan (CPHP) further.

Education and Experience

Since receiving a Bachelor of Science in Engineering from Duke University in Durham, North Carolina in 1969, I have gained over 50 years of professional traffic engineering and transportation planning experience. I am licensed as a Professional Civil Engineer both in California and Hawaii and as a Professional Traffic Engineer in California. I formed Tom Brohard and Associates in 2000 and have served many diverse communities as the City Traffic Engineer and/or the Transportation Planner. During my career in both the public and private sectors, I have reviewed numerous environmental documents and traffic studies for various projects as shown in a short summary of my experience in the enclosed resume.

Transportation Issues and Comments

Page 4.15-24 of the Draft EIR, Regulatory Framework, indicates UCSF is situated on land owned or controlled by the Regents of the University of California. As such, "Transportation improvements or modifications required to mitigate impacts of the CPHP under the authority of the City of San Francisco would be the responsibility of the City and would need to be

9

81905 Mountain View Lane, La Quinta, California 92253-7611
Phone (760) 398-8885
Email tbrohard@earthlink.net

approved by the applicable City agencies. However, UCSF consults and coordinates on a regular basis with the City... when planning new development within the City..." For the CPHP, there is no discussion of what communications have occurred, if any, during preparation of the Draft EIR.

All aspects of traffic and transit in and around UCSF already suffer from extreme congestion and overcrowding, and each of these will get much worse with implementation of the CPHP. Key transportation issues have not been properly studied and evaluated for the CPHP. As the second largest employer in San Francisco (as noted on Page 4.15-26), UCSF can significantly improve its coordination with other stakeholders in addressing future issues and problems looming in the 30-year planning horizon.

9 cont.

With the addition of 2.9 million square feet of development proposed in the CPHP, Table 4.15-7 on Page 4.15-29 of the Draft EIR forecasts the total number of external daily and PM peak hour person trips made on all modes of transportation including automobile, transit, bicycle, and pedestrian will increase by 50% with buildout by 2050. Overall, there will be about 52,200 daily external person trips, an average of about 2 daily external person trips made by the increased population of 26,400. PM peak person trips are forecast to increase to 7,100, an increase of 50% over existing conditions.

As discussed throughout this letter, these additional person trips will create significant traffic and transportation impacts on all portions of the existing infrastructure. While the Draft EIR hints at these impacts, there are virtually no mitigation measures planned or proposed to address them. It is certainly to the benefit of all stakeholders to help mitigate issues that will be created by CPHP.

10

Information provided in the Draft EIR regarding mode choice in Table 4.15-8 is based on two prior surveys, one involving employees in 2018 and the other involving patients and visitors in 2017-18. CPHP Mode Split in Year 2050 is presented in Table 4.15-9 but those estimates are not supported by evidence. The table assigns relatively high percentages for transit use for faculty/staff/students as well as residents. The higher transit percentages will likely go down if the transit system is overwhelmed and automobile use goes up as discussed further below. The Draft EIR must support the data that it merely summarizes and cannot rely on it for future conditions without full disclosure, significant additional study, and analysis.

11

Based on the information in the July 13, 2020 Draft EIR, each of the following traffic and transportation issues must be fully addressed and evaluated in a revised Draft EIR:

12

1) **<u>Regional Transit Service</u>** – Beginning on Page 4.15-3, the Draft EIR briefly describes regional transit service offered by Golden Gate Transit, AC Transit,

Sam Trans, BART, and Caltrain. The Draft EIR notes that riders must transfer to Muni or UCSF shuttles to access the campus. No analysis of the available capacity on any of these regional providers has been provided and it is unknown how much transit capacity is available. Measures should be offered to UCSF users to facilitate transfers to Muni or UCSF shuttles to encourage the use of regional transit and decrease solo vehicle trips. 12 cont.

2) **Local Transit Services** – Beginning on Page 4.15-6, the Draft EIR briefly describes local transit service with Table 4.15-1 summarizing the services provided on the five local Muni lines. Three of these five Muni lines run at the edge of the UCSF campus. It is my understanding that the "N-Judah" line is the busiest in the Muni system. From the Table, this line has the longest hours of operation and the shortest peak hour headways. Even so, it is commonly acknowledged that the "N-Judah" line is operating over capacity in peak hours. As of now, no feasibility study has been conducted on how much capacity is available to serve the UCSF expansion or how additional transit capacity can be provided to decrease solo vehicle trips. 13

In addition to Muni services, UCSF provides a shuttle service that operates 63 vehicles throughout San Francisco. The average daily boardings for the 14 shuttle lines are shown in Figure 4.15-4 and range from 22 to 1,710. No data is presented to determine if and at what times capacity for additional passengers exists within the UCSF shuttle service or how additional transit capacity can be provided. 14

3) **Transportation Demand Management (TDM) Program** – Table 4.15-13 on Page 4.15-13 of the Draft EIR provides an outline of strategies and brief descriptions of the various elements in the existing UCSF TDM Program. While many different strategies are identified, the Table does not summarize how often these strategies are monitored or describe the expected solo vehicle trip reductions. Without regular monitoring and corrective measures for those that are under performing, the overall effectiveness of the TDM Program is cannot be assessed. TDM Programs for other public agencies are periodically monitored and adjusted based on the effectiveness and/or ineffectiveness of the various measures, but this TDM Program does not appear to have been modified since its inception. 15

In response to the Notice of Preparation, the January 29, 2020 letter from Caltrans listed 19 strategies to reduce vehicle trips. The following five strategies suggested by Caltrans are not included in the UCSF TDM Program and should be added:

- Real-time transit information system
- Transit subsidies on an ongoing basis
- Charging stations and designated parking spaces for electric vehicles

- Employee transportation coordinator
- Aggressive trip reduction targets with monitoring and enforcement

15 cont.

4) **Pedestrian Circulation** – The Draft EIR indicates 16 percent of UCSF employees commute by walking. The text beginning on Page 4.15-14 describes some pedestrian facilities in the area and provides June 2019 pedestrian counts at certain locations. From the Draft EIR discussion, it appears that some pedestrian crossing facilities may not be up to currently accepted standards and some sidewalk widths may be deficient. The Draft EIR must inventory pedestrian facilities on and adjacent to the UCSF campus and provide recommendations to bring deficient facilities up to current standards. The proposed pedestrian bridge and tunnel crossings of Parnassus Avenue must be coordinated with the streetscape project to preclude pedestrian crossings at grade at random locations and force pedestrians to use the proposed bridge and tunnel.

   Page 4.15-16 briefly describes the locations of the 12 pedestrian collisions in the vicinity of UCSF between 2008 and 2017. The Draft EIR essentially dismisses these collisions indicating they occurred on roadway segments that are not a part of the city-wide High-Injury Network and evaluation is unnecessary. Each of these pedestrian collisions should be evaluated to identify collision trends in the UCSF area and then develop remedial measures. The Draft EIR must update the data from 2017 to the present and then evaluate what additional pedestrian safety measures can be incorporated into the CPHP.

16

5) **Bicycle Circulation** – Page 4.15-16 describes the different types of bicycle facilities and the discussion indicates that bicycling is a viable and common travel mode in reducing congestion and pollution. However, only 6% of employees travel to and from the campus by bicycle, perhaps because of the steep topography. Page 4.15-18 indicates designated bicycle parking areas are well utilized and some bikes have been observed parked at parking meters and sign poles, indicating a high demand for bicycle parking facilities. To encourage additional people to use bicycles, free, secured bicycle parking must be provided at key locations in the transportation network, and improvements must be made in the network of bicycle lanes.

17

6) **Loading Conditions** – Beginning on Page 4.15-18, the Draft EIR describes the existing loading facilities for service vehicles and passenger loading. A number of these loading areas attempt to serve both uses, resulting in conflicts between them. About 2% of employees are dropped off at work, and another 4% use Uber/Lyft/Taxi in competition for the limited available space. The loading area in front of Medical Building 1 also attempts to serve emergency vehicles and valet, further compounding congestion and blocking the adjacent lane of traffic throughout the day.

18

As part of the CPHP, additional passenger loading facilities are planned but they will be insufficient to accommodate the peak loading demand. According to Page 4.15-35, the peak minute loading demand for the CPHP will range from 35 to 45 vehicles. While 30 to 35 loading spaces will be provided with the CPHP, the peak loading demand will not even be marginally satisfied as it will be spread out among four separate areas. Furthermore, some of the future passenger loading spaces may be used for other purposes such as service vehicle loading and valet. Additional loading spaces must be provided to meet the forecast demand for passenger and service loading. 18 cont.

7) **Emergency Vehicle Access** – Page 4.15-19 indicates emergency transport vehicles use major streets that allow other traffic to move out of the way as required by the California Vehicle Code. However, wider streets can be gridlocked, do not offer freedom of movement for other vehicles, and do not favor emergency vehicles at traffic signals. Additional measures such as emergency vehicle preemption systems at traffic signals should be considered as part of the expansion CPHP to facilitate emergency vehicles. 19

8) **Vehicle Miles Traveled** – Vehicle miles traveled (VMT) is a measurement of the amount and distance that a resident, employee, or visitor drives. The transportation model used by the Draft EIR estimates daily VMT for residential, office, and retail land use types. Table 4.15-4 provides data on VMT for residential and for office uses but it does not provide data supporting the use of medical work as an office use or any information on medical visits. VMT tables are footnoted by "SOURCE: Adavant Consulting, 2020" but no data has been provided to support VMT, the most critical item in the Draft EIR. At minimum, accepted practice recommends gathering local data to support VMT assumptions but this approach has not been used here.

   Table 4.15-15 on Page 4.15-37 of the Draft EIR provides existing and Year 2040 VMT for residential and office uses. For the Parnassus Heights campus site (the second entry in the Table), VMT significantly increases between existing and Year 2040. For residential, VMT increases from 6.9 to 8.5 (+1.6, +23%) and VMT increases from 9.4 to 10.9 (+1.5, +16%) for office. 20

   With VMT, agencies typically require a decrease of 15% when comparing current conditions to future conditions. Here, VMT is shown to increase by 23% and 15% for the CPHP. This is directly contrary to measures to reduce VMT by 15% used by the City of San Francisco and other agencies. Table 4.15-16 should compare the forecast VMT for UCSF for residents and office uses for existing conditions to Year 2040 conditions rather than compare that data to the San Francisco Bay Regional Average.

9) **Vehicle Delay** – Vehicle delay and intersection level of service are no longer required by the California Environmental Quality Act (CEQA) to determine 21

significant project impacts and necessary mitigation measures. However, vehicle delay and level of service calculations continue to be evaluated by some agencies as part Draft EIR's to inform decision-makers and the public.

For information purposes, Appendix TRANS compares current vehicle delay and Level of Service to CPHP conditions at 17 intersections in Parnassus Heights. While all intersections now operate at acceptable levels of LOS D or better, performance drops at all intersections with CPHP traffic added. The additional roadway congestion caused by the Proposed Project will have an indirect effect of reducing the efficiency of transit in the study area. Five of the intersections become gridlocked at LOS F. While new traffic signals would mitigate the significant traffic impacts at two intersections, the Draft EIR indicates these measures require coordination with SFMTA and then incorrectly defers proper study and evaluation until a later time when Project-Level Draft EIR's are planned to be prepared.

21 cont.

10) **Fourth Avenue Extension** – Page 4.15-43 of the Draft EIR indicates the CPHP includes the extension of Fourth Avenue between Parnassus Avenue and Kirkham Street. While the roadway extension will provide access into the CPHP, it will also create a pathway for vehicles cutting through the campus. With gridlocked traffic conditions, the Fourth Avenue extension will induce vehicle trips and will increase VMT, a topic that has not been addressed, studied, or accounted for in the Draft EIR.

22

The UCSF Parnassus Heights Plan (CPHP) in the City of San Francisco creates significant transportation impacts that have not been properly disclosed, analyzed, or mitigated. The Draft EIR errors identified in this letter require that each of these issues be reanalyzed and reevaluated through additional study in a revised Draft Environmental Impact Report. If you have questions regarding these comments, please contact me at your convenience.

23

Respectfully submitted,

Tom Brohard and Associates

September 11, 2020
File No. 01220191.00 Task 00002

MEMORANDUM

TO: Patrick Soluri, Soluri Meserve

FROM: Ray Huff, SCS Engineers
Pat Sullivan, SCS Engineers
John Henkelman, SCS Engineers

SUBJECT: Draft Environmental Impact Report Review, Comprehensive Parnassus Heights Plan, University of California, San Francisco

SCS Engineers (SCS) has reviewed the greenhouse gas (GHG) and Energy analyses prepared for the proposed University of California, San Francisco (UCSF) Comprehensive Parnassus Heights Plan (Project) Draft Environmental Impact Report (DEIR). SCS has performed many GHG analyses for purposes of permitting, mandatory reporting, verification, California Environmental Quality Act (CEQA) and other requirements, and we used this experience and expertise to assess the GHG analysis for the Project.

The documents reviewed included the following:

- *UCSF Comprehensive Parnassus Heights Plan, Draft Environmental Impact Report*, UCSF, July 2020.
- *USCF Climate Action Plan and GHG Reduction Strategy*, UCSF, July 2020.
- *USCF Climate Action Plan and GHG Reduction Strategy*, UCSF, April 2017.
- *Sustainable Practices Policy (SSP)*, University of California Office of the President (UCOP), July 2020

In general, SCS does not agree with the evaluation and mitigation approach contained in the DEIR for GHG and Energy impact evaluation. UCSF is choosing only portions of certain climate reduction plans to follow for this CEQA review, while choosing to ignore other components of the plans, and choosing to ignore other plans entirely. This results in a GHG and energy analysis that is inconsistent, incomplete, and difficult to follow.

The core of this issue is identified by the choice of UCSF to comply with only the UCOP Climate Action Plan (CAP), which includes the UCOP Sustainable Practices Policy and Carbon Neutrality Initiative (CNI), yet excludes local, regional, and statewide climate policies and plans. We understand this is more of a legal applicability question, but it is important to point out that there are several climate impact reduction policies that we believe should be considered in evaluation of the Project. These include, but are not limited to:

24

- *Climate Action Plan for San Francisco, San Francisco Department of the Environment, September 2004*
- *Final 2017 Clean Air Plan*, Bay Area Air Quality Management District (BAAQMD), April 2017

We believe that these other plans should at least be considered for the evaluation of the Project. While the DEIR does mention these plans and programs, it chooses to evaluate the Project under the UCSF GHG Reduction Strategy (GHGRS) and 2017 Scoping Plan Update only.

In addition to this general concern, we have also listed specific comments and concerns with the GHG and Energy sections of the DEIR. These are detailed in the sections that follow.

24 cont.

GHG SECTION COMMENTS

Unenforceable Goals of the SSP

It is unclear how the Project will show achievement of the aspirational goals listed in the UCOP CAP. As detailed in the DEIR, the SSP contains aspirational goals associated with new buildings (DEIR pg. 4.7-21) and sustainable transportation (DEIR, pg. 4.7-22). It is unclear how achievement of these goals will be measured for the Project and what enforceable conditions can be implemented to limit GHG impacts to less than significant levels.

For example, the SSP states that UCSF shall "strive" to reduce its percentage of employees and students commuting by single occupancy vehicles (SOVs) by 10% relative to its 2015 comparative commute rates by 2025. In the event that the Project results in an increase in SOV commuting, UCSF will only have to say that they "tried" to reduce by 10% to have been consistent with the SSP, and there will be no mechanism to enforce actual GHG reductions from reduced SOV use.

25

Construction Emissions Amortization

As stated on page 4.7-34 of the DEIR, construction emissions were amortized over 30 years and then added to annual operational emissions. By amortizing construction emissions, the Project is effectively reducing them over the time period presented. A more widely accepted method of construction analysis would be to evaluate the worst-case year, which is what is typically done for CEQA evaluations for air quality impact analyses (AQIA).

26

GHGRS Inconsistency

As stated in the note to Table 4.7-3 of the DEIR, "*Emission calculations vary from those presented in proposed revisions to the GHGRS due to the inclusion here of all vehicle trips, and not just those associated with staff and students.*" This implies that the GHGRS does not include all trips (e.g. patient trips), so the large number of patient trips associated with the Project would seem to present an inherent conflict with the GHGRS. This type of inconsistency indicates that relying on the GHGRS to evaluate GHG emissions from the Project is not appropriate because the Project emissions are not wholly contained within the GHGRS and were not evaluated by the GHGRS.

27

CPHP Mitigation Measure GHG-1c

Mitigation measure GHG-1c proposes to, "acquire carbon offset credits in conformance with CARB guidance," from the CARB Cap and Trade Program for the Project. This provides another example of

28

the selective nature of UCSF's use of regulations and guidance, however this time, in mitigation selection.

Under Section 95854 of the Cap and Trade Regulation, compliance instruments (e.g., credits) are subject to a quantitative usage limit when used to meet a compliance obligation. However, UCSF does not mention these limits in the use of carbon credits as a mitigation measure. Thus, while in one section of the mitigation measure UCSF states that they will comply with the Cap and Trade Regulation, they fail to meet the requirements of the regulation in the same section. This is an example of selective application of guidance/regulation.

Mitigation Measure GHG-1c also on carbon credits from The Climate Action Reserve (CAR), American Carbon Registry (ACR), or Verra could be used for mitigation, which may not be sufficiently robust for CEQA, specifically in light of the recent court ruling on the validity of credits used for CEQA purposes. These are voluntary registries, and most of the credits created under them would not qualify under Cap and Trade. This seems to conflict with their commitment above for Cap and Trade credits.

28 cont.

GHGRS

The DEIR references the 2017 GHGRS, yet the 2020 update is appended to the DEIR. We are uncertain of which document should be referenced and if the 2020 update has been approved. Further to this point, we wonder why the 2017 GHGRS needed to be updated to accommodate the Project. This would seem to infer that the Project was somehow inconsistent with the 2017 GHGRS. At a minimum, the DEIR should address any inconsistencies of the project with the previously approved 2017 GHGRS and confirm that the GHGRS was updated solely to show that the Project was compliant with it. Also, in the event that the GHGRS was revised, per the DEIR then the GHGRS may not meet the qualification of a "previously approved plan" under 15183.5 of the California Environmental Quality Act Guidelines.

In addition, rather than perform CEQA review based on the "previously adopted" 2017 GHGRS (refer to paragraph above), UCSF proposes to analyze Project GHG impacts by using the framework of the CARB 2017 Scoping Plan Update. The DEIR provides, "In lieu of a GHGRS that is qualified per CEQA Guidelines section 15183.5 through the year under the pending adoption as part of the LRDP amend, GHG impact assessment in this EIR with respect to the year 2030 and 2050 reduction targets is based on guidance in the CARB's 2017 Scoping Plan Update."

It does not appear that the CARB 2017 Scoping Plan even applies to the UC Regents. The section cited in the DEIR provides, "To support local governments in their efforts to reduce GHG emissions, the following guidance is provided." We are unclear if and how UCSF qualifies as a "local government." In addition, note that CARB's 2017 Scoping Plan does not purport to address the mandated 2050 emission target.

Lastly, note that the 2017 GHGRS established a midpoint between the 2020 and 2050 levels (2035). It doesn't address the 2050 levels. In the event that the DEIR is reliant upon the UCOP Climate Plan, the Project must address compliance with the 2050 goal.

29

UCSF CAP

Page 4.7-20 of the DEIR cites an outdated version of the UCSF CAP, specifically one dated from 2009. It is unclear if DEIR is making a historical citation or were erroneously citing an older version of the Climate Plan. 30

ENERGY SECTION COMMENTS

Energy Supplies

Comparative electricity/natural gas use predictions were completed in the DEIR using a series of ratios referencing statewide usage and predictions compared to utility ratios for the City of San Francisco. We believe that a simpler, direct ratio would be more appropriate for the Project, such as possibly just determining the percentage that UCSF represents of the current statewide total, and scaling that up by the projected increase in statewide usage. 31

Other ratios and scaling methodologies can be completed, and we would recommend selection of a methodology that is clear and easy to follow and thus more transparent.

Impact ENE-2

Referencing back to our general comment regarding the consideration of local, regional, and statewide plans, Impact ENE-2 does not address state/local energy plans. It incorporates by reference to UC Sustainable Practices Policy, but none of the other plans that were discussed in our general comment (BAAQMD, City, and CARB plans). 32

EXHIBIT C

UCSF Parnassus
DEIR Review
10 September 2020

A review of noise and vibration concerns in the DEIR has been completed. This is a summary of those findings.

NOISE

NOI-1: construction noise

Given the high noise levels, sensitive receptors and close proximity a detailed Construction Noise Management Program should be developed further as part of the EIR. 33

DEIR page 4.11-21

"…*along Irving Street where, as discussed in the Environmental Setting, existing noise levels were monitored to be* ***69 dBA*** *due to frequent Muni* ***light rail*** *operations on this street."*

The World Health Organization (WHO) Environmental Noise Guidelines (2018) makes recommendations for various types of noise.

[WHO] strongly recommends reducing noise levels produced by **railway** traffic below 54 dB L_{den}, as railway noise above this level is associated with adverse health effects. 34

[WHO] strongly recommends reducing noise levels produced by **railway** traffic during night time below 44 dB L_{night}, as night-time railway noise above this level is associated with adverse effects on sleep.

Given 15 dB outside to inside noise reduction (4.11-3), the exterior WHO values would be 69 dB Lden and 59 dB Lnight. The nighttime **WHO criterion is possibly exceeded.**

DEIR page 4.11-34 –

TABLE 4.11-8

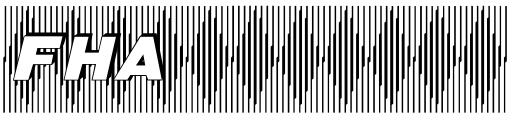
Kirkham Street between 5th Avenue and 7th Avenue –
Difference between Cumulative Plus CPHP and Existing – 2.7 [dBA] 35

There are five other road segments that will increase by 2 dBA, or more, in this table.

Frank Hubach Associates, Inc *4905 Central Ave, Ste 100*
Richmond, CA 94804

Acoustics and Vibration
Engineering Consultants

Phone 510-528-1505
Fax 510-528-1506
Email: info@fha-eng.com



[WHO] strongly recommends reducing noise levels produced by road **traffic** below 53 decibels (dB) L_{den}, as road traffic noise above this level is associated with adverse health effects.

[WHO] strongly recommends reducing noise levels produced by road **traffic** during night time below 45 dB L_{night}, as night-time road traffic noise above this level is associated with adverse effects on sleep.

Given 15 dB outside to inside noise reduction (4.11-3), the exterior WHO values would be 68 dB Lden and 60 dB Lnight. The **WHO criteria are already exceeded** at several locations.

35 cont.

DEIR page 4.11-37 –

Impact C-NOI-4: *Implementation of the CPHP combined with cumulative development in the project area **could** exceed an LRDP EIR operational standard of significance by contributing to an increase in average daily noise levels (L_{dn}) of 3 dB(A) **or more** at property lines, **if** ambient noise levels in areas adjacent to proposed development **already exceed** local noise levels set forth in local general plans or ordinances for such areas based on their use. (**Less than Significant**)*

So, if conditions already exceed criteria levels, it is less than significant, and is it allowed to get even louder?

*As shown in **Table 4.11-8**, the increase in peak` traffic noise in the vicinity of the Parnassus Heights campus site from the Existing Plus Cumulative CPHP traffic scenario compared to the Existing traffic scenario would be **less than 3 dBA** on all roadway segments. Overall, traffic noise increases associated with the CPHP and cumulative development along all analyzed roadway segments in the vicinity of the Parnassus Heights campus site would be **less than 3 dBA** and the cumulative impact related to traffic noise would be **less than significant**.*

The 3 dB is too great an increment above ambient.

36

VIBRATION

DEIR page 4.11-4 *"…and the threshold of perception for humans is approximately **65 VdB**."* This is the same level given for vibration-sensitive equipment.

DEIR page 4.11-15 "*The criterion for vibration-sensitive equipment is **65 VdB**, as published by FTA.*" This equates to 2,000 micro-inches per second (mips) which is appropriate criterion for normal microscopes using 100X magnification. Truly vibration-sensitive equipment, i.e. electron microscopes, is 250 mips (48 VdB). **Clearly this 65 VdB criterion is an order of magnitude too high.**

37

DEIR page 4.11-31 "*UCSF also operates vibration sensitive equipment in some of its existing buildings, such as MRI machines and **electron microscopes**. Demolition and construction activities in close proximity to such equipment could generate vibration levels of 65 VdB or greater that could affect these operations, depending on the degree of vibration isolation designed into their systems. Therefore, there is a potential for a significant impact to vibration-sensitive equipment and mitigation measure is identified to reduce such impacts to a less than significant level."*

CPHP Mitigation Measure NOI-3b: Assessment and Relocation/Retrofitting of Vibration-Sensitive Equipment

*UCSF shall evaluate the presence of vibration-sensitive equipment within 150 feet of construction and demolition areas. Any sensitive equipment shall be evaluated for the existing extent of vibration isolation and **relocated or further embellish isolation**, as warranted."* Most sensitive equipment e.g. electron microscopes already employ isolation systems. There is no room for improvement and these would have to be re-located – a non-trivial exercise.

World Health Organization (WHO) Environmental Noise Guidelines

The WHO publishes a number of documents regarding developing research of various environmental noise sources, and offers a host of impacts to health and quality of life. There are strong reasons to employ WHO recommendations for noise criteria on this project.

The following recent document is cited: "WHO Environmental Noise Guidelines for the European Region – Executive Summary" (2018) (noise-guidelines-exec-sum-eng.pdf, attached)

Below are excerpts from the Executive Summary:

Page 2 –
Abstract
*"The main purpose of these guidelines is to provide recommendations for protecting human **health** from exposure to environmental **noise** originating from various sources: …"*

The full publication of the guidelines can be downloaded here:
www.euro.who.int/en/env-noise-guidelines

Page 3 –
Objectives

The following two key questions identify the issues addressed by the guidelines.

*•In the general population exposed to environmental noise, what is the **exposure–response relationship** between exposure to environmental noise (reported as various indicators) and the proportion of people with a validated measure of health outcome, when adjusted for confounders?*

38

UCSF Parnassus
DEIR Review
10 September 2020

*•In the general population exposed to environmental noise, are interventions effective in reducing exposure to and/or **health outcomes** from environmental noise?*

*In light of these questions, the guidelines set out to **define recommended exposure levels** for environmental noise in order to protect population health.*

38 cont.

Methods used to develop the guidelines

*The process of developing the WHO guidelines followed a rigorous methodology involving several groups with separate roles and responsibilities. Throughout the process, the Grading of Recommendations Assessment, Development and Evaluation (**GRADE**) approach was followed.*

In particular, the different steps in the development of the guidelines included:

•formulation of the scope and key questions of the guidelines;

•review of the pertinent literature;

•selection of priority health outcome measures;

•a systematic review of the evidence;

•assessment of certainty of the bodies of evidence resulting from systematic reviews;

•identification of guideline exposure levels; and

•setting of the strength of recommendations.

Subsequently, the Guideline Development Group (GDG) formulated recommendations, guided by the Systematic Review Team's assessment and informed by of a number of additional contextual parameters.

38 cont.

Page 7 & 8 –
Target audience

*The guidelines are published by the WHO Regional Office for Europe. In terms of their health implications, the recommended exposure levels can be considered applicable in other regions and suitable for a global audience, as a large body of the evidence underpinning the recommendations was derived not only from European noise effect studies but **also from research in other parts of the world – mainly in America**, Asia and Australia.*

*The main purpose of these guidelines is to provide **recommendations for protecting human health from exposure to environmental noise** originating from various sources: …*

***In terms of their health implications, the recommended exposure levels can be considered applicable in other regions and suitable for a global audience**.*

A rigorous methodology has been used in developing these guidelines. That effort is reflected in "Annex 2. Systematic reviews and background documents used in preparation of the guidelines" of the Environmental Noise Guidelines. In summary, Annex 2 indicates: Systematic reviews included numerous studies:

"review on environmental noise and effects on **sleep**."
"review of transport noise interventions and their **impacts on health**."
"review on environmental noise and **cognition**."
"review on environmental noise and **quality of life, wellbeing and mental health**."
"review on environmental noise and **annoyance**."
"review on environmental noise and **adverse birth outcomes**."
"review on environmental noise and **permanent hearing loss and tinnitus**."
"review on environmental noise and **cardiovascular and metabolic effects**: a summary."

Responses to Comments from Soluri Meserve, A Law Corporation

O-SM-1 The comment asserts that the analysis presented in the Draft EIR is inadequate for a number of reasons. First, the comment asserts that the Draft EIR should include a determination of project impacts based on transit ridership, capacity, and delay, arguing that the language in CEQA Guidelines Section 15064.3, subdivisions (a) and (b)(3) requires a transit analysis. The comment further asserts that the Draft EIR analysis is inadequate with respect to assessment of how transit capacity and potential increased demand for transit due to the CPHP would result in impacts based on overloading the transit system, delaying transit vehicles, or inducing vehicle demand and increased VMT due to these capacity and delay issues.

CEQA Guidelines Section 15064.3 indicates that a project's effect on transit "may" be a "relevant consideration," and by no means requires its assessment. UCSF has established its thresholds of significance based on the CEQA Guidelines and OPR Technical Advisory, as discussed in Master Response 16.

In addition, although analysis of transit ridership, capacity, and delay are not required under CEQA, the Guidelines indicates that if a project's impacts to the transit system are assessed, analysis "would evaluate factors such as the availability of transit, proximity to other destinations, etc." This analysis is included in the Draft EIR. Transit availability is discussed thoroughly in the Draft EIR on pages 4.15-3 through 4.15-4 and pages 4.15-6 through 4.15-12. The CPHP would not physically affect the services described on those pages and all existing transit infrastructure would remain the same under the CPHP. The proximity between UCSF and other destinations via transit would also remain unchanged, and several elements of the CPHP would facilitate pedestrian access to existing transit facilities, including the Irving Street Arrival project.

A discussion of why the Draft EIR is not required to address impacts to transit capacity and transit delay is provided in Master Response 16 and Master Response 20.

As noted in the comment and in OPR's Technical Advisory, increased ridership on transit should not be considered an adverse effect. The Technical Advisory continues to note that this increased ridership should not be considered an adverse effect, even if it results in increased travel times. As discussed in Master Response 17, the CPHP would result in new transit riders that would distribute among four Muni routes in the immediate vicinity of the campus site, including the N Judah, 6 Haight/Parnassus, 7 Haight/Noriega, and 43 Masonic. However, the requirement of additional or expanded transit infrastructure has not been identified based on these new riders. The CPHP is not responsible for analyzing the potential effects of Muni operational issues or changes, and Muni is expected to adjust operations accordingly in response to changes in demand on a citywide basis over the thirty-year implementation of the CPHP. There is no evidence to

suggest that transit crowding alone leads to an increase in VMT that would result in a significant impact under the CPHP; even if such an effect were present, CPHP VMT would need to increase by more than 60 percent for residents and more than 30 percent for employees to exceed the threshold for a significant VMT impact. As such, the analysis presented in the Draft EIR is both adequate and complete, and no additional analysis is required.

O-SM-2 The commenter states that the EIR should identify a significant energy impact pursuant to CEQA Guidelines section 15126.2, subdivision (b), because the Project's energy use would be "dramatically higher than the statewide average."

It is not clear what is meant by the premise that the CPHP's energy use would be dramatically higher than the statewide average. As stated in the Draft EIR, to provide context so that the reader may better understand the magnitude of the CPHP's 30-year program of energy demand growth, the existing state-wide demand of electricity and natural gas are provided. The numbers are not presented to argue that the CPHP's demand would be a small fraction of the state's demand for electricity and natural gas.

CEQA Guidelines section 15126.2, subdivision (b), focuses on the potential for a project to result in significant environmental effects due to wasteful, inefficient, or unnecessary use of energy, and includes no recommendation for analyses to consider a comparison of the project's energy use to annual average statewide energy use trends. It does, however, recommend that in addition to building code compliance, other relevant considerations may include, among others, the project's size, location, orientation, equipment use, and any renewable energy features that could be incorporated into the project, and that the analysis should be subject to the rule of reason and shall focus on energy use that would be caused by the project.

Please note that the CPHP's energy demand impact is analyzed in the Draft EIR utilizing Appendix F guidance. The commenter is referred to Draft EIR pages 4.5-19 through -28, which present a detailed analysis of the CPHP's energy demand relative to each impact guidance factor in Appendix F of the CEQA Guidelines. The impact conclusion is based on the entirety of the analysis. The EIR analysis relative to whether the CPHP would cause significant environmental effects due to wasteful, inefficient, or unnecessary use of energy has been appropriately analyzed per the recommendations of CEQA Guidelines section 15126.2, subdivision (b) and CEQA Guidelines Appendix F (see Draft EIR pages 4.5-19 through 4.5-28 for the Impact ENE-1 analysis).

O-SM-3 The commenter asserts that by comparing the CPHP's projected energy demand to state-wide demand, the Draft EIR is relying on the "ratio theory" analysis. In the case referenced by the commenter, the Court found the EIR preparers concluded that the project would not have a significant air quality cumulative

impact because it would contribute less than one percent of area emissions for all criteria pollutants in the valley, and that this "ratio theory improperly focused upon the individual project's relative effects and omitted facts relevant to an analysis of the collective effect this and other sources will have upon air quality." The Draft EIR does not rely on ratio theory for its significance determinations relative to energy use. The EIR comparisons of the energy use that would be caused by the CPHP relative to statewide and regional energy use amounts are provided for informational purposes to establish a frame of reference relative to the proposed project's energy use, and the impact determinations are primarily based on other factors relevant to the analysis, including those recommended in CEQA Guidelines section 15126.2, subdivision (b), and CEQA Guidelines Appendix F.

In addition, it is noted that Exhibit B in the commenter's letter provides a recommendation to include "a simpler, direct ratio" relative to the percentage of energy use that UCSF represents of the current statewide total, and scaling that up by the projected increase in statewide usage (see Comment O-SM-31). Therefore, the expert retained by the commenter in Exhibit B appears to be at odds with the commenter, and consistent with the EIR with respect to ratios of project energy use relative to documented statewide use.

O-SM-4 The comment includes a partial quote from the Draft EIR to support an assertion that the Draft EIR relies on a flawed and misleading strategy to dismiss the CPHP's cumulative impact on energy consumption. However, when the full text of that discussion is considered, it is evident that the purpose of the statement is to not only describe the estimated consumption rates as "not substantial," but to also reflect the facts relevant to the collective effect of the project, in terms of whether or not it would use fuel or energy in a wasteful or inefficient manner, combined with the other cumulative projects discussed in Draft EIR Section 4.0:

> "Given the relatively small percentage of the CPHP's other fuel and energy uses compared to existing fuel and energy use in the region, the CPHP's less-than-significant incremental impacts related to the use of other forms of fuel or energy in a wasteful or inefficient manner would not be expected to combine with the incremental impacts of other projects to cause an adverse cumulative impact. The operational electricity requirements of the CPHP would not be cumulatively considerable and the estimated consumption rates would not be substantial compared to the 2018 citywide consumption."

The Draft EIR cumulative analysis for energy goes on to also discuss how vehicle use associated with operations of the CPHP would be reduced due to implementation of UCSF's Transportation Demand Management (TDM) program, which would include reductions in transportation and associated energy usage at full buildout, and how the "cumulative projects" would be subject to the same applicable federal, state, and local energy efficiency requirements (e.g., the

State's Title 24 requirements) that would be required of the CPHP, which would result in efficient energy use during their construction and operation. Therefore, the Draft EIR cumulative energy impact analysis does not consider the CPHP "in a vacuum," but rather, considers it with the combined effects of other cumulative projects.

O-SM-5 This comment opines that the use of a net zero increase significance criterion is inappropriate to determine whether the proposed CPHP would conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The commenter is conflating two separate CEQA thresholds with respect to greenhouse gas emissions. As stated in the Draft EIR Section 4.7, Greenhouse Gas Emissions on page 4.7-33, there are two significance criteria identified in CEQA Guidelines Appendix G for greenhouse emissions and used in the Draft EIR. Specifically, would implementation of the CPHP:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

The commenter claims that the net zero significance criterion applied in the Draft EIR is inappropriate to address CEQA criterion b) above with respect to conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases. However, the net zero significance criterion is applied in Impact GHG-1 on Draft EIR pages 4.7-34 through 4.7-43 to assess whether implementation of the CPHP would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment, and the analysis concludes that the impact would be significant due to the increase in emissions. However, mitigation is included in the Draft EIR to reduce the effect to less than significant. The determination with respect to whether the proposed CPHP would conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases is presented in Impact GHG-2 on Draft EIR pages 4.7-43 through 4.7-45. The analysis of whether the proposed CPHP would conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases utilizes a qualitative approach that first addresses consistency of the proposed CPHP with UC plans and policies, including the UC *Sustainable Practices Policy*, the Carbon Neutrality Initiative (CNI), UC Regents Direct Access Program, and purchase of carbon-free electricity. The analysis in Impact GHG-2 then qualitatively addresses consistency with other plans, including 2040 Plan Bay Area, CARB's 2017 Scoping Plan Update, and with Executive Order S-3-05.

With mitigation, the proposed CPHP is consistent with UCSF's efforts to achieve the GHG reduction goals mandated by SB 32 (40 percent reduction in GHGs, compared to 1990 levels by 2030). It is not the role of the Draft EIR to demonstrate that the proposed CPHP would result in such a reduction, but rather to demonstrate that even with the resultant development and growth under the CPHP, UCSF can still achieve carbon neutrality for its development projects, while implementing plans and policies such as the revised GHGRS that to reduce GHG emissions throughout its campus sites. An updated Greenhouse Gas Reduction Strategy included as part of the CPHP in Appendix GHGRS of the DEIR is intended to minimize the effects of GHGs at a programmatic level across the Parnassus Heights campus site through 2050 and includes a target for climate neutrality for Scope 3 emissions from business airline travel and commuting by UCSF staff and students by 2050.

With respect to the 2050 reduction goals, the California Supreme Court in *Cleveland National Forest Foundation, et al v. San Diego Association of Governments* ((2017) 3 Cal. 5th 497, Supreme Court Case No. 5223603), upheld SANDAG's EIR in its approach of not determining project impacts for 2050 based on Executive Order No. S-3-05 goal for 2050, noting that "the [Executive Order No. S-3-05] lacks the force of a legal mandate binding on SANDAG in the preparation of its EIR" and that the EIR was not required to "explicitly engage in an analysis of the consistency of projected 2050 emissions" with Executive Order No. S-3-05. Therefore, determining impacts based on the CPHP's consistency with Executive Order No. S-3-05 is not required under CEQA.

O-SM-6 This comment avers that the 2017 Scoping Plan update is not an applicable plan policy or regulation for this project but, rather, applies to cities and counties, and therefore should not be considered relative to the greenhouse emissions significance criterion b) "would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases."

The language of greenhouse gas emissions significance criteria b) "conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases" does not specify any particular type of plan that is appropriate for the CPHP, and the Draft EIR addressed a variety of plans in order to address this topic robustly. Consequently, as stated above in Response O-SM-5, the analysis of whether the proposed CPHP would conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases is addressed on Draft EIR pages 4.7-43 through 4.7-45 by first analyzing the CPHP's consistency with UC plans and policies, followed by consistency of the CPHP with other plans, including 2040 Plan Bay Area, CARB's 2017 Scoping Plan Update, and with Executive Order S-3-05 in order to fully consider the range of local, regional and statewide planning efforts. Please refer to Response O-SM-5, above, with respect to the proposed CPHP's

consistency with UCSF's efforts to achieve the GHG reduction goals mandated by SB 32 (40 percent reduction in GHGs compared to 1990 levels by 2030) and the goals established by Executive Order S-3-05.

O-SM-7 This comment repeats the ideas stated in Comment O-SM-6 above in terms of the Draft EIR assessing impact relative to the 2017 Scoping Plan Update of the CARB. Please refer to the Response O-SM-6 which addresses the Draft EIR approach to assessing whether the proposed CPHP would conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases. Please refer to Response O-SM-5, above, with respect to the proposed CPHP's consistency with UCSF's efforts to achieve the GHG reduction goals mandated by SB 32 (40 percent reduction in GHGs compared to 1990 levels by 2030) and the goals established by Executive Order S-3-05.

O-SM-8 This comment asserts that the Draft EIR fails to fully analyze the health effects of high noise levels and challenges the thresholds of significance applied to assess noise-related impacts and suggests that the Draft EIR should apply recommendations of the World Health Organization (WHO) as significance criteria with respect to noise impacts assessed in Draft EIR Section 4.11, Noise and Vibration.

The Draft EIR broadly discusses the health effects of environmental noise on Draft EIR pages 4.11-3 and 4.11-4 as introductory information. The analysis of noise impacts in the Draft EIR addresses the CEQA Guidelines Appendix G checklist question as to whether the proposed CPHP would generate "a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies." Because the Parnassus Heights campus site is located within the City of San Francisco, the impact analysis applies the standards established in the City's Police Code and General Plan. As stated on Draft EIR page 4.11-13, "with respect to criterion a) above, this analysis applies the restrictions of the City of San Francisco Police Code Sections 2907 and 2908 and the 90 dBA daytime construction noise criteria of the FTA for residential uses. Additionally, an increase of 10 dBA representing a doubling of perceived loudness is also considered, although not a regulatory threshold." After identifying the significant and unavoidable construction noise impact relative to these criteria, the Draft EIR presents a section entitled "*Potential Health Effects of Significant CPHP Construction Noise Impacts*" on page 4.11-26. This discussion addresses how project construction noise would not result in adverse health effects related to pain, the onset of hearing loss or other significant health effects.

As stated on Draft EIR page 4.11-15 regarding assessment of operational noise impacts, "UCSF voluntarily strives to meet the City's Police Code, according to

which stationary mechanical equipment noise for commercial and industrial uses is limited to 8 dB(A) in excess of the ambient noise environment. The Code also provides an interior noise limit, stating that noise levels from mechanical sources may not exceed 45 dB(A) between the hours of 10:00 PM and 7:00 AM or 55 dB(A) between the hours of 7:00 AM and 10:00 PM with windows open except where building ventilation is achieved through mechanical systems that allow windows to remain closed."

By applying the local standards of the City noise ordinance where off-site receptors would have a potential to be impacted by the proposed project, the analysis of the Draft EIR directly addresses the checklist question regarding noise impacts in CEQA Guidelines Appendix G.

The WHO-published documentation cited by the commenter represents updated information that can also be used for the generalized discussion of the health effects of environmental noise on Draft EIR pages 4.11-3 and 4.11-4. However, with respect to the thresholds of significance, as lead agency, the University of California has discretion to rely on the General Plan and noise ordinance standards of the local jurisdiction and the use of those standards is supported by substantial evidence.

O-SM-9 The comment states that the EIR does not include a discussion of communication that has occurred between UCSF, the City of San Francisco, and other stakeholders during preparation of the EIR. Information about public process, including public meetings and noticing, NOP, etc. in development of the Draft EIR can be found in the Draft EIR Chapter 1, Introduction, pages 1-6 to 1-7. Additional information about UCSF's robust public outreach process can be found at https://www.ucsf.edu/cphp/community#tabs-2.

The comment also asserts that key transportation issues such as traffic congestion and transit have not been properly studied and evaluated. As discussed in Master Response 16, there are no significance criteria related to these topics and as such, the Draft EIR is not lacking and the analysis presented therein is adequate and complete. Refer to Master Response 19 and Master Response 20 for additional discussion of the CPHP's effects on the transportation system and transit.

O-SM-10 The comment asserts that the Draft EIR does not adequately identify transportation impacts caused by the increase in the number of person trips from the implementation of the CPHP. Refer to Master Response 19 for a discussion of the analysis of the transportation effects of the population increase. The comment also asserts that the Draft EIR hints at transportation impacts but does not put forth mitigation for the impacts of the CPHP. All of the transportation impacts of the CPHP are fully evaluated and disclosed in the Draft EIR. Please refer to Master Response 16 for a discussion of the scope of the impact analysis and transportation significance criteria used in the Draft EIR to analyze impacts. With the exception

of a potentially significant transportation impact during construction, no significant impacts were identified, and therefore no mitigation measures, other than that for the construction-related impact, are required.

O-SM-11 The comment asserts that analysis of transportation impacts is inadequate because it does not account for how travel behavior might change if the transit system is at capacity in its future year mode assumptions. The methodology for assigning the future year transit mode share is discussed in Master Response 17. It is based on real, observed trends in travel behavior of UCSF staff, students, residents and visitors; this locally collected recurring data serves as high quality evidence for travel behavior preferences that is specific to both the nature of the CPHP and the project location.

O-SM-12 The comment asserts that the regional transit analysis/findings included in the Draft EIR are inadequate. For a discussion of why the Draft EIR is not required to address impacts to transit capacity, please see Master Response 20. The comment further states that the CPHP should offer measures to facilitate transfers between regional transit and Muni or UCSF shuttles. UCSF operates a robust shuttle program, described on pages 4.15-10 through 4.15-12 of the Draft EIR, which serves this purpose, particularly for connections between UCSF campuses and 16th Street BART Station. In addition, UCSF implements a robust TDM program that encourages transit use and discourages drive-alone vehicle use, as described on pages 4.15-12 through 4.15-14 of the Draft EIR.

O-SM-13 The comment expresses concern that the Draft EIR does not adequately incorporate crowding or capacity on the N-Judah into its analysis. Refer to Master Response 20 for additional discussion of why Muni operational issues are not a CEQA concern, and therefore analysis of these effects is not required in the EIR.

O-SM-14 The comment requests additional information on planned changes in shuttle service to accommodate the projected demand for shuttle service under the CPHP. The shuttle service is one component of UCSF's TDM strategy, and UCSF will continue to revise and adjust shuttle services to best serve its employee and patient populations as growth occurs over a 30-year period. As noted on page 4.15-10 of the Draft EIR, "UCSF has made and will continue to make periodic minor operational changes to improve operations, expand service to accommodate new facilities or to respond to specific community concerns."

O-SM-15 The comment requests additional information on how UCSF implements and monitors its TDM program. As noted on page 4.15-30, UCSF's robust TDM program resulted in a reduction in drive alone commute percentage from 32 to 23 percent of employees in the five-year period from 2013 to 2018. As a comparison, the 2018 *San Francisco Travel Demand Update* study found that office workers drove alone at a rate of approximately 28 and 56 percent, respectively, in Place Type 2 and Place Type 3 areas of San Francisco; UCSF is

located on the border of Place Type 2 and Place Type 3, and currently has a lower employee drive alone rate than these local averages. The TDM program is monitored via annual surveys, as noted in Table 4.15-2. The success of this program demonstrates that UCSF is dedicated to reducing drive alone trips as a percentage of total trips to each of its campuses. Exclusion of some measures from a blanket list suggested by Caltrans does not mean that the TDM program is inadequate. For the record, UCSF does maintain a real-time information system so that users can track UCSF shuttle arrivals, and SFMTA provides a similar service for all SF Muni bus and light rail services.

O-SM-16 The comment suggests that the Draft EIR does not appropriately inventory pedestrian facilities on and adjacent to the campus site and that the Draft EIR does not provide recommendations to bring deficient facilities up to current standards. Documentation of existing pedestrian facilities at the campus site is included in the Draft EIR on pages 4.15-14 through 4.15-16, and follows past precedents, is thorough, and is appropriate for both a plan- and program-level EIR. As discussed in Impact TRANS-1 on pages 4.15-38 through 4.15-42, implementation of the CPHP would not result in a conflict with a program, plan, ordinance or policy addressing the circulation system, including pedestrian facilities. As discussed in Impact TRANS-3, on pages 4.15-47 through 4.15-49, implementation of the CPHP would not substantially increase hazards due to a geometric design feature or incompatible uses. Therefore, no impact related to pedestrian facilities was identified and no mitigation measures are required. Further, the CPHP includes the Parnassus Streetscape Plan (previously evaluated and approved as part of the 2014 LRDP and 2014 LRDP Final EIR) and the Irving Street Arrival project, which would improve pedestrian circulation and access on the campus site along Parnassus Avenue, along Irving Street and between Irving Street and Parnassus Avenue.

O-SM-17 The comment notes that some designated bicycle parking areas are currently well utilized on the campus site. As noted in Impact TRANS-1 in the Draft EIR, under the CPHP, UCSF would maintain existing short-term and long-term bicycle parking facilities as well as provide additional short-term and long-term bicycling parking facilities in convenient locations, as needed to maintain adequate bicycling parking facilities on campus.

O-SM-18 The comment describes portions of the existing conditions loading discussion presented on Draft EIR pages 4.15-18 to 4.15-19, travel demand estimates analysis presented on pages 4.15-29 to 4.15-33, and loading demand discussion presented on pages 15-34 to 4.15-35 in support of the assertion that additional loading spaces must be provided to meet future passenger and service loading demands.

It is important to note that with implementation of the CPHP, the increase in campus population is expected to occur over a 30-year timeline and the loading

demand discussion refers to a projection of a peak minute within a peak hour. UCSF monitors transportation conditions at all campus sites where development is proposed and would continue to monitor vehicle traffic conditions, inclusive of passenger and commercial loading and seek to remedy potential effects of any recurring shortfall. However, UCSF does not believe this operational concern to be a CEQA matter. Master Response 16 notes that CEQA provides for lead agencies, such as UC, to adopt their own thresholds of significance and to evaluate the significance of a project's impact based on substantial evidence. UC's significance thresholds for the CPHP are presented and discussed in Master Response 16, and do not include a significance threshold related to loading.

O-SM-19 The comment suggests that as part of the CPHP, preemptive systems at signals should be considered to facilitate emergency vehicles. This comment is not on the adequacy or completeness of the transportation-based impacts found in the Draft EIR. However, UCSF may consider changes to existing or proposed new Parnassus Avenue traffic signals as part of the New Hospital project, which will be studied at a project-level in the future.

O-SM-20 The comment states that sufficient evidence to support the Draft EIR's VMT analysis is not provided in the Draft EIR. More specifically, the comment asserts that the Draft EIR does not provide data supporting the use of medical work as an office use, does not provide information related to medical visits, and does not provide local data to support VMT assumptions Finally, the comment asserts that the Draft EIR should compare the projected VMT to the existing VMT for the campus site to evaluate the significance of the change in VMT, and should not evaluate the impact by comparing the projected VMT to regional forecasts.

The evaluation of medical work VMT as an office use is consistent with the City of San Francisco's *Transportation Impact Analysis Guidelines* ("SF TIA Guidelines"); Appendix L ("Vehicle Miles Traveled/Induced Automobile Travel Memorandum") to the SF TIA Guidelines states "medical… land uses should be treated as office for screening and analysis." While the City of San Francisco is not the lead agency for the CPHP, UCSF has opted to its guidance for purposes of VMT analysis, per CEQA Guidelines section 15065.7(c). Use of the work VMT per employee metric represents a comparison of the VMT efficiency of a land use's location relative to elsewhere in the region; land use that results in shorter per capita trips for employees would also be expected to result in less VMT per capita for visitors as well due to centralized locations, availability of transit, and other infill-related efficiencies in the transportation system. Finally, while the Draft EIR opted to present VMT per capita results, the Parnassus Heights campus site is also located immediately adjacent to a major transit stop and a high quality transit corridor; as such, transportation impacts are presumed to be less than significant unless there is a clear reason to find otherwise per CEQA Guidelines section 15064.3(b)(1).

The VMT analysis presented in the Draft EIR is based on real, observed trends in travel behavior of UCSF staff, students, residents and visitors (see Master Response 17 for more information on robust travel behavior survey data that UCSF routinely collects). This locally collected data serves as high quality evidence for travel behavior preferences that is specific to both the nature of the CPHP and the project location. Additional information has been added to Appendix TR, to detail local data used in the Draft EIR's VMT assessment. Therefore, the Draft EIR did in fact collect local data, and used it in the assessment of VMT impacts.

The comment further asserts that the Draft EIR should compare the CPHP's estimated VMT per capita (an efficiency metric) for employees and residents to the estimated existing VMT per capita for the campus site. The Draft EIR correctly compares the estimated VMT per capita at buildout of the CPHP to the significance threshold of 15 percent below regional VMT per capita, as presented in Table 4.15-17, which is consistent with the *OPR Technical Advisory* and the SF TIA Guidelines.

Master Response 16 notes that CEQA provides for lead agencies, such as UC, to adopt their own thresholds of significance and to evaluate the significance of a project's impact based on substantial evidence. UC's significance thresholds used to evaluate impacts of the CPHP are presented and discussed in Master Response 16. As such, the analysis presented in the Draft EIR is both adequate and complete.

O-SM-21 The comment states that vehicle delay and intersection level of service analysis, which are included in Appendix TRANS for informational purposes only, are no longer required by CEQA. It then summarizes some of the traffic and transit operations discussion from the Appendix, including that addition of CPHP-generated traffic could cause five study intersections to operate at LOS F during the weekday PM peak hour and may periodically result in transit delay on Parnassus Avenue, as described in the Appendix. As noted in the comment and discussed in Master Response 19, a project's effect on automobile delay shall not constitute a significant environmental impact under CEQA. Therefore, transportation impacts based on congestion and vehicular delay are appropriately not analyzed in the Draft EIR A discussion of why the Draft EIR is not required to address impacts to transit delay is provided in Master Response 16 and Master Response 20.

O-SM-22 The comment asserts that the Fourth Avenue extension (one-block extension between Parnassus Avenue and Kirkham Street) will induce vehicle trips and VMT and that this was not assessed in the transportation impact analysis of the project.

An evaluation of the effects of the Fourth Avenue extension on VMT is discussed as part of Impact TRANS-2 on page 4.15-44:

> *"The CPHP would add a new section of roadway between Parnassus Avenue and Kirkham Street and provide access to the future planned uses in the West End. This roadway would be a local street, primarily designed to provide access to the Parnassus Heights campus site and would include traffic-calming design elements such as narrow lanes, pedestrian crosswalks, full sidewalks, and bicycle infrastructure. In addition, the primary purpose of this roadway would be to provide access to the site, and not to provide a pathway for through traffic. The extension of Fourth Avenue would also provide access for service vehicles to/from the proposed multi-level service corridor between Medical Center Way and the Fourth Avenue extension. As such, this transportation improvement would not be expected to result in a significant impact on VMT."*

As noted, the Fourth Avenue Extension is not expected to result in a significant impact on VMT since this one-block roadway extension would be designed primarily for local-access and with traffic-calming design elements. Additionally, the Fourth Avenue Extension does not change the results of the development of the VMT per capita at buildout of the CPHP given that it will not alter commute travel behavior to/from the campus or the comparison to the significance threshold of 15 percent below regional VMT per capita, as presented in Table 4.15-17. No impact has been identified per UCSF established thresholds of significance based on the CEQA Guidelines and OPR Technical Advisory, as discussed in Master Response 16. The analysis found in the transportation (4.15) section of the EIR follows past accepted practices, is thorough, and is appropriate and adequate for a program-level EIR.

O-SM-23 The comment asserts that the Draft EIR does not adequately assess the transportation impacts of the project and that the Draft EIR errors that are identified in the letter require reanalysis and reevaluation in a revised EIR. As Responses O-SM-9 to O-SM-22 above demonstrate, there are no errors in the Draft EIR transportation impact assessment. Therefore, reanalysis in a revised Draft EIR is not required.

O-SM-24 This comment asserts that the GHG analysis of the Draft EIR focused its analysis of the CPHP's consistency with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases on a few applicable plans and excludes other plans that should have been included. Specifically, the comment suggests that the assessment of plan consistency should also include the City of San Francisco s 2004 Climate Action Plan and the Final 2017 Clean Air Plan of the Bay Area Air Quality Management District (BAAQMD).

As a statewide entity, the University of California Office of the President (UCOP) addresses GHG planning and strategy through its own efforts as it is

independent of the governance of cities and counties where its campuses exist, such as the City of San Francisco. Therefore, consistency with the City of San Francisco's Greenhouse Gas Reduction Strategy (which supersedes the 2004 Climate Action Plan) is not applicable to the proposed CPHP and does not represent an applicable plan to be considered relative to the development under the CPHP.

With respect to the Final 2017 Clean Air Plan of the BAAQMD, consistency with this document is detailed measure-by-measure in Table 4.2-20 on Draft EIR pages 4.2-66 and 4.2-67. For clarity, text is added on page 4.7-45 of the Draft EIR referring the reader to this consistency discussion. Please refer to Section 8.5 of this Comments and Responses document for this staff-initiated change.

O-SM-25 This comment is concerned that the goals of the UC Sustainable Practices Policy (SPP) may not be achieved, including the goal related to single-occupancy vehicle trip reduction.

For decades, UCSF's Transportation Demand Management (TDM) program has been successful at reducing single-occupancy vehicle trips. Through improvements to the UCSF shuttle system, increases in parking fees, dissemination of alternative transportation information, and a full suite of TDM offerings (guaranteed ride home, car and bike-share, etc.), UCSF's employee drive-alone rate in 2018 was approximately 23 percent. By comparison, the UCSF employee drive-alone rate in 1990 was about 48 percent. The University intends to continue building on this success and explore ways to further reduce commuter trips by single-occupancy vehicle.

The Draft EIR addresses whether implementation of the CPHP would conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases on pages 4.7-43 through 4.7-45. In this discussion, the Draft EIR demonstrated that the proposed CPHP does not include development that would conflict with the goals of applicable plans for reducing GHGs. Reduction of single occupancy vehicles associated with the CPHP would be predominantly achieved through implementation of mitigation measures. As discussed on Draft EIR pages 4.2-36 and 4.2-37 in Section 4.2, Air Quality, CPHP Mitigation Measure AIR-2b: (TDM) Program Enhancements would be implemented to reduce on- and off-campus vehicle trips and resulting air quality impacts, and correspondingly, reduce GHG impacts as well. UCSF would implement TDM program enhancements such that the number of new average daily vehicle trips to and from the campus site is reduced by at least 15 percent from the estimated new average daily vehicle trips without these program enhancements. It is not the role of the Draft EIR to demonstrate that the proposed CPHP would achieve all of the goals of the SPP to demonstrate a less than significant finding, but rather, to demonstrate that there are no inconsistencies between the proposed CPHP and applicable plans to reduce GHGs.

As specified in Draft EIR CPHP Mitigation Measure AIR-2b, the TDM program enhancements/strategies shall be monitored annually for their combined effectiveness in meeting the performance standard. The annual monitoring and reporting program shall include: (a) an annual calculation of baseline new average daily vehicle trips without TDM program enhancements for each year starting in 2030[16]; (b) an annual calculation of new average daily vehicle trips with the TDM program enhancements; and (c) a comparison of the results of (a) and (b) against the "existing" average daily vehicle trips to determine whether the performance standard of a 15 percent reduction in new average daily vehicle trips is achieved.

Implementation of CPHP Mitigation Measure AIR-2b: TDM Program Enhancements would ensure the number of new average daily vehicle trips to and from the campus site is reduced by at least 15 percent from the estimated new average daily vehicle trips which would contribute to the achievement of the trip reduction goals and performance standards of the SPP.

O-SM-26 This comment takes issue with the methodology used in the Draft EIR of amortizing temporary construction emissions over the life of the project, and suggests that instead the Draft EIR should have evaluated GHG emissions for the "worst year" of construction, as is done for criteria pollutant emissions. The comment asserts that by amortizing over 30 years, the effect of the CPHP's construction-phase GHG emissions is being minimized.

The analysis of the CPHP's construction GHG emissions is provided in Section 4.7, Greenhouse Gas Emissions, on page 4.7-34 of the Draft EIR. As stated on page 4.6-36, the BAAQMD has not put forth a significance criterion that may be used to evaluate the significance of a project's construction emissions which are by nature short-term. Therefore, the computed total construction-phase emissions or the worst-year emissions (as suggested by the commenter) cannot be evaluated for their significance. In the absence of a significance criterion and with a view to making sure that these emissions are not overlooked, lead agencies commonly amortize these emissions over the life of the project; amortization of temporary construction-related GHG emissions over the lifetime of the project is now a standard practice under CEQA. This method was first developed in 2008 by the South Coast Air Quality Management District (SCAQMD).[17] Since that time several other jurisdictions have formally adopted this methodology including the City of Oakland[18], and the Sacramento Metropolitan Air Quality Management District (SMAQMD).[19]

16 The baseline new average daily vehicle trips without TDM program enhancements would be based on the average daily vehicle trip estimates for "Existing Conditions" and "CPHP (Future Phase)" scenarios, as presented in Appendix TRANS.

17 SCAQMD Draft Guidance Document Interim CEQA Greenhouse Gas Significance Threshold, October, 2008.

18 City of Oakland, CEQA Thresholds of Significance Guidelines, October 17, 2016.

19 SMAQMD, Guide to Air Quality Assessment in Sacramento County, April 2020, pages 6-15.

The SCAQMD guidance recognizes that "GHG emission reduction measures for construction equipment are relatively limited." In recognition of the short-term duration of construction GHG emissions, the relatively small contribution to a project's overall lifetime GHG emissions, and the limited options for reducing construction GHG emissions, the SCAQMD guidance recommends that construction project GHG emissions should be "amortized over a 30-year project lifetime, so that GHG reduction measures will address construction GHG emissions as part of the operational GHG reduction strategies."

As the evaluation of construction-related GHG emissions is consistent with multiple guidance documents in California, in lieu of any direct guidance from BAAQMD with respect to construction-related GHG emissions, the University of California, as lead agency, has determined that the amortization of construction GHG emissions is a reasonable approach and is based on substantial evidence.

CPHP Mitigation Measure GHG-1c, identified on pages 4.7-39 through 4.7-41 of the Draft EIR, would require acquisition of carbon offset credits in conformance with the California Air Resources Board (CARB) guidance, prioritizing local and in-State offsets to achieve and maintain carbon neutrality for the Parnassus Heights campus site under the CPHP, inclusive of construction-related emissions. Therefore, the net increase in construction emissions over the lifetime of the CPHP would be offset though implementation of CPHP Mitigation Measure GHG-1c.

O-SM-27 This comment states that there is a potential inconsistency in the number of vehicle trips considered in the GHGRS and those considered in the CPHP CEQA analysis, as the former does not consider patient trips.

The assessment of GHG emissions is provided on pages 4.7-34 through 4.7-43 of the Draft EIR, and includes all VMT associated with full buildout of the CPHP, including VMT associated with patient and visitor trips to the campus site. CPHP Mitigation Measure GHG-1c, identified on pages 4.7-39 through 4.7-41 of the Draft EIR, would require acquisition of carbon offset credits in conformance with CARB guidance, prioritizing local and in-State offsets to achieve and maintain carbon neutrality for the Parnassus Heights campus site under the CPHP and would fully mitigate the emissions associated with new trips generated by patients and visitors to the Parnassus Heights campus site under buildout of the CPHP. Accordingly, the Draft EIR identified a less than significant impact with implementation of CPHP Mitigation Measure GHG-1c.

Please note, however, as stated on page 30 of the GHGRS in Draft EIR Appendix GHGRS, UCSF has no authority to restrict or otherwise control the VMT generated by patients and visitors through implementation of its GHGRS and, as a result, that component of VMT is not included in the GHGRS. The exclusion of GHG emissions associated with the Parnassus Heights patient and visitor trips from the GHGRS does not create any inconsistency between the Draft EIR

analysis of the CPHP and the GHGRS because all of the emissions associated with all trip types as analyzed in the Draft EIR with respect to CEQA would be fully mitigated by implementation of the mitigation set forth in CPHP Mitigation Measure GHG-1c.

O-SM-28 This comment asserts that CPHP Mitigation Measure GHG-1c identified on pages 4.7-39 through 4.7-41 of the Draft EIR is selective in identification of Cap and Trade requirements inclusive of quantitative limits on usage established by the Cap and Trade regulation cited.

CPHP Mitigation Measure GHG-1c makes it clear that UCSF is making separate, though overlapping, GHG emission reduction commitments that include the use of offsets: "(1) As a CARB-covered entity, UCSF will maintain compliance with CARB's cap and trade program; (2) Per existing UC Policy, UCSF's Scope 1 and Scope 2 GHG emissions shall, commencing in 2050, be entirely carbon neutral; (3) Also per existing UC Policy, commencing in 2020, UCSF's Scope 1, Scope 2, and Scope 3 emissions from commuters and air travel shall be voluntarily offset; and (4) UCSF's total GHG operational emissions from all Scope 1, 2, and 3 sources (as defined in this EIR) shall not exceed the Parnassus Heights campus's baseline emissions from these sources in 2018."

CEQA and California's Cap and Trade program represent different statutes with different goals and different rules for compliance. The Cap and Trade program applies to large industrial sources and power generating facilities, including UCSF's Central Utility Plant (CUP). For the CUP, UCSF can retire offsets for up to 8 percent of its compliance obligation under CARB's Cap and Trade Program – anything in excess of that is not allowed under the law. For emissions from its CUP which is under the Cap and Trade program, UCSF must use compliance offsets, known as California Carbon Offsets, which are not intended to be used in the voluntary carbon offset market, or for the purposes of CEQA mitigation. In fact, Section 95820(d) of the Cap and Trade regulation stipulates that compliance instruments can only be used for the purposes of Cap and Trade, which means they cannot be retired for compliance with CEQA or any projects under CEQA jurisdiction.

As shown in the Draft EIR Table 4.7-3 on page 4.7-36, the CPHP includes emissions from a range of sources that include CUP natural gas use, but also includes on-road vehicles, purchased electricity, non-CUP natural gas, solid waste, emergency power generators, water, and wastewater. Once UCSF reaches the 8 percent limit on the use of offsets for its CUP obligation under the Cap and Trade program, it will necessarily have to utilize the voluntary carbon market to offset the remainder of the emissions from the CPHP that are above the project significance criterion.

CPHP Mitigation Measure GHG1-c specifically indicates that any carbon offset credits purchased for the purpose of compliance with CARB's Cap and Trade program (i.e., California Carbon Offsets) shall be purchased from an Offset Project Registry approved by the California Air Resources Board as defined in 17 California Code of Regulations § 95802(a). For compliance with UC's Carbon Neutrality Initiative and its SPP to reduce Scope 1, 2, and certain transportation-related Scope 3 emissions below 1990 levels pursuant to AB 32 and SB 32, CPHP Mitigation Measure GHG-1c states that carbon offsets will come from the voluntary carbon offset market, which is separate from the compliance offset market. Per the guidelines of UC's Carbon Neutrality Initiative, any voluntary carbon offsets used for mitigation must be publicly reported and tracked through the Climate Registry (TCR), and shall originate from a voluntary carbon credit registry that is recognized by TCR, including the Climate Action Reserve (CAR), the American Carbon Registry (ACR) and Verra. These are the same three registries that are currently approved by CARB to help administer the Compliance Offset Program. Both CARB and TCR approve of these offset project registries because of their commitment to the highest quality in ensuring that the offsets they contain are real, permanent, additional, quantifiable, enforceable, and third-party verified.

O-SM-29 This comment requests clarification as to the referencing of the 2017 GHGRS, and the updated 2020 GHGRS appended to the Draft EIR, requests to know why the 2017 GHGRS needed to be updated, and raises concern that the 2020 update may not represent a "previously approved plan" relative to CEQA Guidelines Section 15183.5. The comment further raises concern that CARB's 2017 Scoping Plan Update and its reduction targets may not apply to the UC Regents and as such, that the 2050 reduction target is not an element of CARB's 2017 Scoping Plan Update and so the CPHP's consistency with the 2050 reduction target must be addressed in another way.

First, as stated on Draft EIR page 4.7-33, the 2017 GHGRS provides a framework for meeting the new (in 2017) statewide 2030 GHG emissions reduction target of 40 percent below 1990 levels and maintaining its status as a qualified GHG reduction plan per CEQA Guidelines Section 15183.5, through the year 2035.

As discussed in Draft EIR Chapter 3, *Project Description*, a 2020 update to the GHGRS has been prepared as part of a proposed amendment to the LRDP that incorporates CPHP construction and operations emissions. As stated on page 4.7-43 of the Draft EIR Section 4.7, Greenhouse Gas Emissions, the updated GHGRS addresses UCSF's achievement of goals set forth in the adopted Carbon Neutrality Initiative (CNI), which has goals more stringent than the statewide target of achieving 80 percent below 1990 emission levels by 2050. In compliance with the *Sustainable Practices Policy*, as well as the CNI, UCSF currently undergoes annual inventories of GHG.

This 2020 updated GHGRS is not a "previously approved plan" under CEQA Guidelines Section 15183.5, but rather is part of the proposed project. This 2020 updated GHGRS is contained in Appendix GHGRS of the Draft EIR. The purpose of the 2020 updated GHGRS is stated in pages 1 and 2 of the GHGRS:

> "This document is an update of the 2014 *Long Range Development Plan* (LRDP) Greenhouse Gas Reduction Strategy Reduction Strategy and the subsequent 2017 UCSF Climate Action Plan & Greenhouse Gas Reduction Strategy. The 2014 document was prepared to ensure that the LRDP is implemented in alignment with the UC Sustainable Practices Policy[20]; in particular the policies on greenhouse gases (GHGs), to fulfill the GHG reduction requirements of the State of California (AB 32)[21], and, to allow for CEQA analysis of the necessary actions to meet University policy while implementing the projects outlined in the campus 2014 LRDP as amended.
>
> UC San Francisco (UCSF) has prepared this update to reflect changes that have occurred since 2014 and 2017 in both the goals outlined in the UC Sustainable Practices Policy and, in the addition of new campus projects unforeseen at the time of LRDP adoption. The plan also updates the underlying quantitative analyses.
>
> Relevant changes since 2014 include:
>
> - As of June 2015, the UC Sustainable Practices Policy required each campus to develop strategies for meeting the following UC goals: 1. Climate neutrality from scope 1 and 2 sources by 2025, 2. Climate neutrality from specific scope 3 sources by 2050 or sooner.
> - The University of California began directly supplying electricity under a wholesale power program as part of the initiative to achieve carbon neutrality by 2025. Specifically making Clean Carbon free electricity (0 lbs/CO_2/MWh) available to its individual campuses in 2019.[22]
> - Voluntary purchase of carbon offsets at UCSF beginning in 2018. Revisions to policy on the purchase of carbon offsets to mitigate GHG emissions starting in 2020.[23]
> - Five amendments to the 2014 LRDP to accommodate campus projects unforeseen or not fully developed at the time of 2014 LRDP.
> - The development of the Comprehensive Parnassus Heights Plan (CPHP). A proposal that would provide for development of approximately 2.04 million gsf of net new building space with

20 UC Office of the President (UCOP). http://policy.ucop.edu/doc/3100155/Sustainable%20Practices

21 State of California. www.leginfo.ca.gov/pub/05-06/bill/asm/ab_0001-0050/ab_32_bill_20060927_chaptered.pdf

22 https://www.universityofcalifornia.edu/press-room/university-california-supply-electricity-select-campuses-medical-centers

23 https://ucop.edu/carbon-neutrality-initiative/_files/overcoming-barriers-to-carbon-neutrality.pdf

significant new clinical, research, and housing facilities at that campus site.

This *GHG Reduction Strategy*:

- Consolidates GHG reduction efforts already underway and planned by UCSF over the life of the LRDP (through 2035); and reflects the growth planned at Parnassus under the Comprehensive Parnassus Heights Plan (through 2050)
- Quantifies the impact on GHG emissions of projected land use as represented by the LRDP as amended
- Reflects and reinforces the policy direction regarding GHG reduction provided by the regular ongoing public meetings with the UCSF campus community and the annual reporting to the UC Regents
- Creates a framework for the ongoing monitoring and revision of this Greenhouse Gas Reduction Strategy; and
- Helps streamline California Environmental Quality Act (CEQA) review of future campus development projects as consistent with the LRDP growth projections and the GHG reduction policies and programs contained in the GHG Reduction Strategy."

With respect to the 2017 CARB Scoping Plan Update, the first Climate Change Scoping Plan and its subsequent two updates were prepared pursuant to Assembly Bill 32, the California Global Warming Solutions Act of 2006 – California Global Warming Solutions Act. AB 32 requires that *statewide* GHG emissions be reduced to 1990 levels by 2020. Not only are UC campuses located within the State of California, they are State entities, and it is, therefore, reasonable to expect that all UC campuses would be subject to its conditions and developed reduction targets.

It is acknowledged that the 2017 Scoping Plan only identifies how the State can substantially advance toward the State's 2050 climate goal to reduce GHG emissions by 80 percent below 1990 levels and not, necessarily, meet them. However, as stated on page 4.7-15 of the Draft EIR, in the 2017 Scoping Plan Update, CARB recommends statewide targets of no more than six metric tons CO_2e per capita by 2030 and no more than two metric tons CO_2e per capita by 2050.

As stated on page 15 of the Draft EIR Appendix GHGRS, "this updated GHGRS includes strategies to meet UC goals to achieve climate neutrality from Scope 1 and Scope 2 emissions by 2025, and from Scope 3 emissions by 2050, incorporating the new proposed CPHP development at Parnassus Heights." Parnassus Heights-campus site-wide carbon neutrality by 2050 would be consistent with the compliance goals of the UCOP Climate Plan as well as the state's 2050 climate goals. Further, with respect to the 2050 reduction goals, the California Supreme Court in *Cleveland National Forest Foundation, et al v. San Diego Association of Governments* ((2017) 3 Cal. 5th 497, Supreme Court Case

No. 5223603), upheld SANDAG's EIR in its approach of not determining project impacts for 2050 based on Executive Order No. S-3-05 goal for 2050, noting that "the [Executive Order No. S-3-05] lacks the force of a legal mandate binding on SANDAG in the preparation of its EIR" and that the EIR was not required to "explicitly engage in an analysis of the consistency of projected 2050 emissions" with Executive Order No. S-3-05. Therefore, determining impacts based on the CPHP's consistency with Executive Order No. S-3-05 is not required under CEQA.

O-SM-30 The commenter states that the Draft EIR cites an outdated version of the UCSF Climate Action Plan on page 4.7-20 of the Draft EIR and asks for clarification.

The citation on page 4.7-20 of the Draft EIR is referencing the original Climate Action Plan that first introduced the adoption of the *Policy on Sustainable Practices (Sustainable Practices Policy)* in 2007. The text in which this citation resides is purely a chronological explanation of Policies and Plans of the UC Regents and UCOP, as identified in the sub-header above it.

O-SM-31 The commenter does not provide a compelling reason to support the recommendation that the Draft EIR should possibly disclose the energy use percentage that UCSF represents of the current statewide total, and scaling that up by the projected increase in statewide usage. The Draft EIR comparisons of the energy use that would be caused by the CPHP relative to existing statewide and regional energy use amounts are adequate for informational purposes and to provide a frame of reference of the proposed project's energy use relative to existing statewide and regional conditions. Therefore, the suggested additional ratios are not required to be added to the Draft EIR energy analysis.

O-SM-32 Pursuant to the University of California's constitutional autonomy, development and uses on property under the control of the University that are in furtherance of the University's educational purposes are not subject to local regulations or plans; therefore, City plans are not applicable to the proposed CPHP.

Regarding the potential for the CPHP to conflict with or obstruct Bay Area Air Quality Management District (BAAQMD) and California Air Resources Board (CARB) plans, those issues are addressed in Draft EIR Section 4.2, *Air Quality*, and Section 4.7, *Greenhouse Gas Emissions*, respectively. Draft EIR Impact AIR-5 addresses whether the CPHP could conflict with or obstruct implementation of the BAAQMD's 2017 Clean Air Plan (see Draft EIR pages 4.2-63 through 4.2-68), and Impact GHG-2 addresses CPHP consistency with CARB's 2017 Scoping Plan Update, which describes how the State will achieve the 2030 GHG emission reduction goal for California of 40 percent below 1990 levels by 2030 as mandated by Senate Bill 32, and with Plan Bay Area 2040, which includes the Regional Transportation Plan, and was adopted as

the Bay Area's Sustainable Communities Strategy pursuant to California Senate Bill 375 (see Draft EIR pages 4.7-44 and 4.7-45).

O-SM-33 This comment suggests that the Construction Noise Management Plan should be further developed as part of the Draft EIR.

The Construction Noise Management Plan is identified as a part of CPHP Mitigation Measure NOI-1a: Construction Noise Control Measures, on page 4.11-18 of the Draft EIR. This measure identifies four specific components to be included within a Construction Noise Management Plan for the CPHP and was developed based on UCSF's history of conducting construction activities in a dense urban area and proximate to residential land uses. The contents identified for this Construction Noise Management Plan are consistent with measures used for similar types of construction proposed under the 2014 LRDP, including projects at both the Parnassus Heights and Mission Bay campus sites over the past several years. The comment does not suggest any specific additional measures to be considered.

O-SM-34 This comment states that existing noise levels from the Muni railway along Irving Street exceed exposure recommendations published by the World Health Organization (WHO).

The proposed CPHP does not propose any increased rail activity along the N-Judah Muni rail line. In addition, operations of the rail line are under the purview of Muni and not UCSF. Therefore, Muni rail noise is not an impact that would result from implementation of the CPHP, but is included in the Draft EIR as part of the existing noise environment.

O-SM-35 This comment refers to the increases in traffic noise presented in Table 4.11-8 on Draft EIR page 4.11-34 and notes that resultant noise levels may exceed noise levels recommended by the WHO.

The analysis of noise impacts in the Draft EIR addresses the CEQA Guidelines Appendix G checklist question as to whether the proposed CPHP would generate "a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies." As the proposed CPHP would be implemented at the Parnassus Heights campus site in San Francisco, the noise analysis uses the City's General Plan to establish the ambient noise standards that apply to the neighborhoods surrounding the campus site, and does not use criteria set forth by the WHO. Further, as lead agency, the University of California has discretion to use an appropriate quantitative significance criterion to establish what level of noise increase would constitute a substantial increase. Traffic noise has been extensively analyzed by Caltrans. According to Caltrans, outside of the laboratory, a 3 dB change in noise levels is

considered a barely perceptible increase in environmental roadway noise.[24] Because the 3-dBA increase is based on Caltrans' (a State of California entity) definition of perceptibility, the analysis in the Draft EIR uses a noise increase of 3 dBA to represent a substantial noise increase.

As stated on Draft EIR page 4.11-16, traffic noise modeling to address the effects of the traffic generated by the CPHP was completed using a spreadsheet based on the FHWA Traffic Noise Model and the significance of the change in noise levels was determined by comparing the increase in noise levels (traffic contribution only) to a permanent increase of 3 dBA or more if noise levels without the project already exceed those identified as appropriate for a given land use within the San Francisco General Plan, as presented in Figure 4.11-2 of the Draft EIR. Increases in roadway noise levels of less than 3 dBA represent a less than significant noise impact.

O-SM-36 This comment is concerned that significance criteria used to assess traffic noise impacts imposes a more lenient criterion if receptors are located in an already noise-impacted area, and asserts that the 3 dBA increase in noise is an increment that is too great.

The significance criteria used to assess increases in traffic noise is based on guidance on the significance of transportation-related changes to ambient noise levels, provided by the 1992 findings of the Federal Interagency Committee on Noise (FICON), which assessed the annoyance effects of changes in ambient noise levels caused by aircraft operations.[25] Although the FICON recommendations were specifically developed to assess aircraft noise impacts, they apply to all sources of transportation noise described in terms of cumulative noise exposure metrics such as the DNL. **Table 8.4.2.2-2**, below presents the FICON's recommended criteria. If the existing sound level is below 60 dBA, DNL, which is the standard for normally acceptable residential noise exposure in the San Francisco General Plan, then an increase of 5 dBA or more is considered significant. However, because existing transportation noise levels along impacted roadways are generally between 60 and 65 dBA, a more restrictive criterion of a 3 dBA increase is applied in the Draft EIR. In this way, more restrictive criteria are applied to noise-impacted environments. As stated above with Response O-SM-35, according to Caltrans, outside of the laboratory, a 3 dB change in noise levels is considered a barely perceptible increase in environmental roadway noise.

[24] Caltrans, 2013. *Technical Noise Supplement to the Traffic Noise Analysis Protocol*, September 2013

[25] Federal Interagency Committee on Noise, *Federal Agency Review of Selected Airport Noise Analysis Issues*, August 1992.

TABLE 8.4.2.2-2
MEASURES OF A SUBSTANTIAL INCREASE IN TRANSPORTATION NOISE EXPOSURE

Ambient Noise Level without Project (DNL)	Significant Impact Assumed to Occur if Project Site Development Increases Ambient Noise Levels by:
<60 dB	+ 5.0 dB or more
60–65 dB	+ 3.0 dB or more
>65 dB	+ 1.5 dB or more[a]

NOTES:

dB = decibels; DNL = day-night average noise level

[a] According to the Federal Interagency Committee on Noise report, the 1.5 A-weighted decibel (dBA) increase in environments that exceed 65 dBA is not necessarily a significant increase but, rather, an increase warranting further investigation.

SOURCE: Federal Interagency Committee on Noise, *Federal Agency Review of Selected Airport Noise Analysis Issues*, August 1992.

O-SM-37 This comment takes issue with the significance criterion of 65 VdB used to evaluate vibration impacts to vibration-sensitive equipment on page 4.11-15 of the Draft EIR and suggests an alternative threshold of 48 VdB. The comment also expresses concern that CPHP Mitigation Measure NOI-3b: Assessment and Relocation/Retrofitting of Vibration-Sensitive Equipment**,** on Draft EIR page 4.11-31 may be onerous.

The significance criterion for vibration-sensitive equipment is a standard criterion under CEQA analysis and is published in a 2018 guidance document, as indicated on page 4.11-15 of the Draft EIR. The commenter does not cite a source for the suggested alternative criterion and as such provides no substantial evidence to support its use.

The commenter also indicates that most sensitive equipment already employs isolation systems, and as a result, there is no room for improvement and would have to be relocated. With respect to the requirements of CPHP Mitigation Measure NOI-3b, the University of California, as lead agency, would be responsible for implementing this measure as it is expected to affect equipment operated by UCSF. Vibrations during construction under the CPHP would primarily occur during demolition activities which are temporary and temporary suspension in the use of the equipment during proximate demolition activities may represent an additional option. Accordingly, CPHP Mitigation Measure NOI-3b is modified to provide UCSF the option to suspend use of vibration-sensitive equipment during substantial vibration-generating activities within 150 feet. Please refer to Section 8.5 of this Comments and Responses document for this modification.

O-SM-38 This comment provides numerous noise exposure recommendations published by the WHO.

Please refer to the Response O-SM-8, above, with respect to significance criteria applied in Section 4.11, Noise and Vibration of the Draft EIR as it concerns noise exposure to humans, the potential health effects, and the requirements of CEQA.

Please note Comment Letter O-SM contained an Exhibit D, and attachments to Exhibits A, B and C which did not comment directly on the Draft EIR. These attachments are included in Appendix O-SM in this Comments and Responses document.

Re: Comments on Draft EIR for UCSF Comprehensive Parnassus Heights Plan

Dear Ms. Wong:

This law firm represents San Franciscans for Balanced and Livable Communities, a citizen's group composed of San Francisco residents. We are submitting these comments on behalf of our client with respect to the Draft Environmental Impact Report (DEIR) for the Comprehensive Parnassus Heights Plan (CPHP). Our comments are limited to aesthetics, wind, shadow, land use, population and housing, and biological resources. Others are submitting separate comments on other sections of the DEIR.

For the reasons stated below, the DEIR is fatally flawed in that it fails to comply with the California Environmental Quality Act (CEQA). Therefore, it must be revised to correct the infirmities identified herein and must be recirculated for further public review and comment. 1

A. The DEIR Incorrectly Claims that the CPHP is a Project as Defined by Public Resources Code Section 21099, and Thus Claims That Aesthetic and Parking Impacts are not Required to be Analyzed Under CEQA

Page 4.0-3 of the DEIR states that "aesthetic and parking impacts are not be considered in determining if a project has the potential to result in significant environmental effects pursuant to Public Resources Code section 21099(d) because the project is in a transit priority area, is an infill site, and is a residential, mixed-use residential, or an employment center project." It is true that section 21099(d)(1) states that "Aesthetic and parking impacts of a residential, mixed use-residential, or employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment." Leaving aside the question of whether this is truly an infill site given the project is adjacent to the Mount Sutro Open Space Reserve, the CPHP clearly does not qualify as a residential, mixed-use residential or employment center project. 2

While the term "project" as a stand-alone term is interpreted broadly under CEQA, the

term "project" in section 21099 is modified by the terms "residential, mixed-use residential, or employment center." The interpretation of the narrower meaning of "project" under section 21099 must be viewed in the context of CEQA's purpose.

The California Supreme Court has held that CEQA is to "'be interpreted in such manner as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language.'" *Friends of Mammoth v. Board of Supervisors* (1972) 8 Cal.3d 247, 259 (disapproved on other grounds); *Laurel Heights Improvement Ass'n v. Regents of Univ. of California* (1988) 47 Cal.3d 376, 390; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 563. In the analogous context of exemptions, which likewise limit the application of CEQA, courts have reviewed them narrowly. "Because the exemptions operate as exceptions to CEQA, they are narrowly construed. [Citation.]" *San Lorenzo Valley Community Advocates for Responsible Education v. San Lorenzo Valley Unified School Dist. (San Lorenzo Valley)* (2006) 139 Cal. App. 4th 1356, 1382. According to the California Supreme Court, CEQA exemptions must be narrowly construed and "[e]xemption categories are not to be expanded beyond the reasonable scope of their statutory language." *Mountain Lion Foundation v. Fish & Game Comm.* (1997) 16 Cal.4th 105, 125; *San Lorenzo Valley, supra,* 139 Cal.App.4th at 1382. *see also, McQueen v. Board of Directors* (1988) 202 Cal.App.3d 1136, 1148. Erroneous reliance by an agency on an exemption constitutes a prejudicial abuse of discretion and a violation of CEQA. *Azusa Land Reclamation Co. v. Main San Gabriel Basin Watermaster* (1997) 52 Cal.App.4th 1165, 1192. Similarly, the CPHP does not qualify as a "residential, mixed-use residential or employment center project."

2 cont.

First and foremost, the CPHP is a planning document that also amends the Long Range Development Plan (LRDP). It is more akin to a General Plan than a specific residential, mixed use residential or employment center project. Section 21099 assumes that general plan's and local zoning underwent environmental review. In other words, aesthetics and parking are not now considered in the context of the narrow set of projects when they were likely considered for overarching planning documents. It is noteworthy that Education Code 67504(b)(1) states that

> The Legislature further finds and declares that the expansion of campus enrollment and facilities may negatively affect the surrounding environment. Consistent with the requirements of ... CEQA, it is the intent of the Legislature that the University of California sufficiently mitigate significant off-campus impacts related to campus growth and development.

UCSF cannot fulfill this mandate if they are permitted to excuse or dismiss aesthetic and parking impacts for the CPHP, which includes an amendment to the LRDP.

3

Second, the CPHP is clearly not solely a residential project. Housing is a relatively small component of the CPHP. Thus, the project does not qualify as a "residential project."

4

Third, the CPHP cannot qualify as a mixed-use residential project. Section 21099 does

5

not define "mixed-use residential project." However, elsewhere in CEQA, mixed-use residential projects are defined. Public Resources Code section 21159.25(a)(1) provides that a "'Residential or mixed-use housing project' means a project consisting of multifamily residential uses only or a mix of multifamily residential or nonresidential uses, ***with at least two-thirds of the square footage of the development designated for residential use***." (Emphasis added.)[1] Public Resources Code section 21159.28(d) related to a sustainable communities strategy defines "A residential or mixed-use residential project is a project ***where at least 75 percent of the total building square footage of the project*** consists of residential use or a project that is a transit priority project as defined in Section 21155." Regardless of what standard is applicable, the CPHP does not qualify as mixed-use residential project under any standard as the residential component is dwarfed by other development envisioned under the CPHP. The existing square footage of housing at the Parnassus Heights Campus is 241,900 and will increase by 673,400 square feet for a total square footage in 2060 of 915,300. However, the total of all other development on the campus is currently 3,678,600 square feet, with an increase of 1,371,400 square feet to 5,050,000 square feet. (DEIR p. 3-42.) These numbers are simply raw number comparisons of total square footage when the actual development is greater than the increase in square footage as development will also involve demolition of existing structures. Nevertheless, the residential component of the project is overwhelmed by other development. Moreover, mixed-use projects are considered residential/commercial developments, not a plan for development of a university campus.

5 cont.

Finally, the CPHP cannot qualify as an employment center project. Section 21099(a)(1) defines an "employment center project" as "a project located on property ***zoned for commercial uses with a floor area ratio of no less than 0.75*** and that is located within a transit priority area." A prerequisite for an employment center project is that it be on property ***zoned for commercial use***. The reference to zoning clearly refers to local zoning, not UCSF's designation of campus uses in the LRDP or the CPHP. Moreover, the LRDP does not have commercial designation (see DEIR, p. 3-41, 42), and if did, UCSF would lose its alleged status as an institution that would not have to comply with local zoning. UCSF's claim that it is constitutionally exempt for local land use regulation is limited in nature.[2] As the DEIR at page 4.7-32 admits, "Pursuant to Article 9, Section 9 of the California State Constitution, UCSF is constitutionally exempt from local land use regulations whenever using property under its control in furtherance of its educational purposes." A UC campus must be used solely for educational purposes to be exempt from local land use regulation. *Regents of University of California v. City of Santa Monica* (1978) 77 Cal.App.3d 130. Since section 21099(a)(1) is referring to local zoning, there is no local

6

[1] Similarly, Government Code section 65589.5(h)(2)(B), defines "Mixed-use "developments related to affordable housing as development containing at least two-thirds of the square footage for residential uses.

[2] As will be noted by other commenters, UCSF has made previous commitments to the community that call into question the assertions that it can blithely dismiss local land use regulations.

commercial zoning for the Parnassus Campus. The DEIR at 4.10-7 states that the "campus site is primarily located in the City's P (Public) Zoning District…. Housing located along Third and Fifth Avenues is designated by the City as Residential House District, Two-Family (RH-2)."

6 cont.

The DEIR states that it will perform aesthetic analysis despite claiming that is unnecessary. We anticipate the response to comments may note that the DEIR nonetheless provided the analysis. However, by asserting that there is no requirement to provide the analysis in the first place, the DEIR improperly minimizes the impacts. (The DEIR, page 4.1-30, makes the same fatal flaw with respect to examination of consistency with the City of San Francisco General Plan and Planning Code, and states that the DEIR provides analysis "for informational purposes" as if the standard is somehow lower.) First, by mistakenly claiming that aesthetic analysis need not be performed, the DEIR dissuaded the public from commenting on aesthetics, so the error of law is prejudicial (i.e., it prevents meaningful public comment.)

Moreover, decisionmakers are misled. One of the stated purposes of CEQA is to "[i]nform governmental decision makers and the public about the potential, significant environmental effects of proposed activities." 14 Cal. Code Regs. § 15002(a)(1). "The courts have repeatedly stated that informed decision making and public participation are fundamental purposes of the CEQA process." Kostka & Zischke, Practice Under the California Environmental Quality Act (Cont. Ed. Bar 2014) § 1.18, *citing Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, *Laurel Heights Improvement Ass'n v. Regents of Univ. of California* (1988) 47 Cal.3d 376, and *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal.3d 68.

7

Furthermore, the DEIR's incorrect assertion that aesthetics does not need to be analyzed renders the conclusions questionable as the preparers of the DEIR may not have taken their charge seriously enough. This renders the analysis questionable. If the DEIR took aesthetic impacts seriously, the conclusions regarding aesthetic impacts would have recognized the serious visual intrusions and impacts that are going to occur as a result of the massive increase in development on the Parnassus Heights campus.

B. The Aesthetic Impact Analysis is Inadequate and Fatally Flawed

As stated above, the aesthetic impacts are downplayed as unnecessary analysis in the DEIR. As an example of the carelessness of the aesthetic impact analysis, the DEIR at page 4.1-27 states that "development under the CPHP may obstruct northerly and westerly views of the Marin Headlands or Golder Gate Park from the corner of Edgewood Avenue and Belmont Avenue, but not obstruct views of downtown San Francisco from any vantage point on Clarendon Avenue or Willard Street." But unlike other vantage points, the DEIR does not provide any simulations with respect to views from Edgewood and Belmont. The impacts cannot be judged based on the absence of information.

8

As the DEIR acknowledges, the City's General Plan considers the vicinity of the Parnassus Heights campus to have excellent quality street views. Even if UCSF does not have to comply with the City's General Plan, it cannot ignore the impact associated with destruction of these views. 9

Furthermore, Figure 4.1-10 on page 4.1-28 of the DEIR shows potentially significant aesthetic impacts from an existing trail in the Mount Sutro Open Space Reserve by providing a simulation of the development. The picture and simulation show eucalyptus trees as somewhat screening, however ineffectively, the large development that would result from the CPHP. However, the DEIR on page 4.3-3 states:

> UCSF determined there were too many trees in the Reserve to support a healthy canopy, and that more small-diameter trees were needed to diversify the forest. To address this, UCSF developed the Mount Sutro Open Space Reserve Vegetation Management Plan, a 20-year plan to achieve short- and long-term goals to improve ecosystem health, regenerate the forest, maintain and ensure public access to the Reserve, and minimize fire risk (see Section 4.3.2 for more detail), small diameter trees were required to diversify forest.

Given that the forest will obviously be thinned, the figure needs to reflect potential removal of trees. The simulations are misleading if the intervening eucalyptus trees are affected by the Forest Management Plan. The simulation underestimates the impacts of the large development that will loom over the trail. Moreover, any mitigations for the large building need to incorporate design mitigations that will reduce significant impacts. 10

The DEIR on page 4.1-29 also concludes that while the Aldea Housing Densification

> may be visible from Tank Hill, it is likely that intervening vegetation would largely obstruct views of this Initial Phase project (surrounding dense vegetation and eucalyptus trees can grow to over 100 feet tall in the Aldea Housing complex). Therefore, the initial Aldea Housing Densification project would not be expected to substantially or adversely affect scenic vistas.

Again, this assumption does not account for the fact that the Forest Management Plan will reduce the density of trees.

Perhaps the most troubling aesthetic impact analysis related to the New Hospital project. The 2014 LRDP objectives include the following sub-objectives: 11

> 1B. Acknowledge and respond to local zoning and height and bulk limitations to the extent possible.
>
> 1C. Design new buildings to be sensitive to the surrounding neighborhood and

landscape, taking into account use, scale, potential noise generation, and density.

The DEIR states that the "proposed LRPD Amendment would clarify that sub-objectives 1B and 1C would not apply to the New Hospital project, in recognition of the substantial amount of space required for the New Hospital, although UCSF would make efforts during the design process to come as close as possible to meeting these objectives, if feasible." (DEIR, p. 4.1-31.) This flimsy, and contradictory, assertion ignores that the New Hospital will result in an enormous aesthetic impact as shown by the simulations provided. (*See* Figures 4.1-14, 4.1-16, 4.1-17, 4.18.) As the DEIR admits, "The proposed New Hospital would also be nearly 100 feet taller than other existing buildings on the campus site (adjacent Moffitt Hospital is currently the tallest building at 197 feet). In addition, the proposed New Hospital would also be a prominent newly visible feature in the viewsheds from nearby neighborhoods...." (DEIR, p. 4.1-35.) The DEIR cannot argue that a massive building could "come as close to meeting" the very objectives from which it is being exempted. Moreover, many of the buildings exceed the height limits imposed by San Francisco zoning. (DEIR, p. 4.1-31, 4.1-42; *see also*, 4.10-20, Initial Aldea Housing exceeds height limit.) Then the DEIR makes the absurd statement that "from a use perspective, the proposed CPHP would be generally consistent with the surrounding neighborhood." (DEIR, p. 4.1-31.) In other instances, the DEIR declares that in other instances there is only a "nominal exceedance" of City height limits as if some exceedance is of no consequence. (DEIR, p. 4.1-41; see also, 4.10-18, 19.)

11 cont.

Despite these admitted, and obvious, enormous visual impacts, the DEIR concludes throughout the Aesthetics section that no mitigations are required. Indeed, the DEIR concludes that "To the extent the CPHP would be inconsistent with applicable 2014 LRDP objectives as described above, UCSF would seek amendments to the 2014 LRDP to bring the CPHP and 2014 LRDP into conformity." (DEIR, p. 4.1-41.) This includes amending sub-objectives 1B and 1C. Therefore, the DEIR concludes the impact is less-than-significant and no mitigations are required. However, amending the LRPD does not resolve the aesthetic impacts from the proposed buildings wildly exceeding the City's height limits and all other development in the vicinity. Scrapping the current LRDP policies does not simply mitigate what are significant aesthetic impacts on the ground. Moreover, the DEIR glosses over the inconsistencies with City zoning concerning height limits due to its claimed constitutional authority. This is all the more frustrating for the community because the DEIR assumes there will be no cumulative aesthetic impacts as a result of the project because other projects would have to comply with the City's General Plan and Zoning regulations, including 40-foot height limits. (DEIR, p. 4.1-77.) UCSF flaunts local policies and zoning to suit it and attempts to minimize cumulative impacts because others must comply with City requirements.

12

C. Other Aesthetic Impacts are not Adequately Analyzed or Mitigated

The DEIR ignores certain potentially significant aesthetic impacts without analysis or mitigation.

1) Page 4.1-42 of the DEIR states that the initial Aldea Housing Densification "would be developed in a way that would reinforce its connection with Mount Sutro, respect the existing wooded setting and open space areas, refrain from impacting the extent of the Reserve, and establish discrete facade treatments to embrace the surrounding context." Therefore, the DEIR concludes that impacts would not be less-than-significant, and mitigations are not required. However, nothing in the DEIR explains the design elements that would mitigate these impacts. The simulation in Figure 4.1-19 does not show any actual design that would allow UCSF to make the conclusions made regarding the aesthetic impacts of this component of the project. Environmental review is inadequate when "it fails to provide sufficient evidence or analysis of the potential environmental effects of the [Project]. 'The agency should not be allowed to hide behind its own failure to gather relevant data.'" *City of Redlands v. County of San Bernardino* (2002) 96 Cal.App.4th 398, 408. The DEIR cannot conclude that no mitigations are needed when the analysis was not done in the first place. Bare conclusions that the Aldea Housing Densification will "reinforce its connection with Mount Sutro, respect the existing wooded setting and open space areas, refrain from impacting the extent of the Reserve, and establish discrete facade treatments to embrace the surrounding context," are inadequate. 13

2) Page 4.1-45 of the DEIR states that mitigation for light and glare would include "Reflective metal walls and mirrored glass walls shall not be used as ***primary*** building materials for facades." (Emphasis added.) The term "primary" allows wiggle room that could result in significant impacts from glare. The mitigation should prohibit such materials to reduce glare. 14

D. The DEIR's Analysis of Wind Impacts is Inadequate and the DEIR Improperly Defers the Formulation of Mitigations

The DEIR at page 4.1-12 concludes that wind is already uncomfortable on Parnassus Avenue in the vicinity of Moffitt-Long Hospital and Medical Building 1. The DEIR then analyzes the wind impacts in the vicinity of the New Hospital and other buildings and concludes that wind would exceed the comfort criterion for pedestrians. (DEIR, p. 4.1-46.) However, the DEIR makes a fatal mistake when it fails to examine with particularity the wind impacts associated with the most significant structure proposed on the Parnassus Heights campus. 15

> Although compliance with the wind hazard criterion was not evaluated as a design of the New Hospital is not yet available, it can be reasonably predicted that, depending on the ultimate design, the hazard criterion could be exceeded around the northeast corner of the

> New Hospital, where the greatest increases in pedestrian-level wind speeds would be anticipated. This would be a significant impact. **CPHP Mitigation Measure AES-4** would require that wind-tunnel testing of specific building designs for structures 80 feet tall or greater be implemented to reduce wind impacts as feasible. However, in the absence of wind tunnel testing of specific building designs, it cannot be concluded that effects would be reduced to a less than significant level. Therefore, this impact would be significant and unavoidable with mitigation.
>
> It is noted that, as stated above in the Approach to Analysis, this analysis is likely conservative in that it was based on a simple massing model of the proposed CPHP, and not on actual building designs, which have not yet been prepared. ***In general, a more likely building scenario includes building setbacks and other building sculpting features, such as podiums, would be expected to result in less substantial wind effects.*** (DEIR, p. 4.1-47.)

The mitigation proposed then states that:

> UCSF shall work with the wind consultant to identify feasible mitigation strategies, including design changes (e.g., setbacks, rounded/chamfered building corners, stepped facades, etc.), to eliminate or reduce wind hazards to the maximum feasible extent. If UCSF finds that these changes or other wind speed reduction strategies are not feasible as they would unduly restrict the proposed building's space program, result in operational inefficiencies, and/or substantially higher costs, the building(s) may nonetheless be approved provided that the project incorporates wind speed reduction strategies to the maximum feasible extent, as determined by UCSF in consultation with the wind consultant. (DEIR, p. 4.1-47; see also 4.10-17.)

15 cont.

The DEIR kicks the proverbial can down the road. The DEIR identifies possible ways to mitigate impacts associated with wind, but then decides not to do the analysis and claims that the analysis and formulation of mitigation measures will be done later. This is improper deferral of mitigation.

The DEIR does the same thing with respect to wind impacts associate with the Irving Street Arrival, RAB and Initial Aldea Housing Densification in that "no separate analysis was undertaken for each project on its own. However, the analysis did evaluate the Irving Street Arrival and the RAB projects, along with the New Hospital, absent other longer-term campus development, to identify the impacts of these projects from other longer-term development." (DEIR, p. 4.1-48.) Then the DEIR requires wind-tunnel testing of the specific designs and concludes again that the impact is significant and unavoidable. (DEIR, p. 4.1-49.)

The problem with the DEIR is that on the one hand it states that setbacks and other features could reduce wind impacts but claims that the analysis cannot be done without a specific building design. However, it is obvious that analysis of a structure without any features or

articulation could be examined to determine how significant the environmental impact may be without any mitigations. Indeed, the DEIR touts the ability to do the analysis. "The screening-level analysis involved computer simulation of wind effects using a tool known as computational wind engineering, a specialized sub-set of computational fluid dynamics." (DEIR, p. 4.1-21.)

One of the main purposes of an EIR is to identify ways to mitigate or avoid potentially significant impacts. Pub. Res. Code §§ 21002.1(a), 21061. CEQA therefore requires that the lead agency propose and describe mitigation measures aimed at minimizing any significant impact identified in an EIR. Pub. Res. Code §§ 21002.1(a), 21100(b)(3); 14 CCR §§ 15121(a), 15126.4. The fact that the EIR does not investigate the impacts and analyze the feasibility of mitigation is grave error. Environmental review is inadequate when "it fails to provide sufficient evidence or analysis of the potential environmental effects of the [Project]. 'The agency should not be allowed to hide behind its own failure to gather relevant data.'" *City of Redlands v. County of San Bernardino*, *supra*, 96 Cal.App.4th at 408.

> CEQA advances a policy of requiring an agency to evaluate the environmental effects of a project at the earliest possible stage in the planning process. We conclude that, by failing to accurately describe the agency action and by deferring full environmental assessment of the consequences of such action, the County has failed to comply with CEQA's policy and requirements.

Id. at 410 (emphasis added). "By deferring environmental assessment to a future date, the conditions run counter to that policy of CEQA which requires environmental review at the earliest feasible stage in the planning process. [Citations]." *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 307. "A study conducted after approval of a project will inevitably have a diminished influence on decisionmaking. Even if the study is subject to administrative approval, it is analogous to the sort of *post hoc* rationalization of agency actions that has been repeatedly condemned in decisions construing CEQA. [Citations]." *Id.* at 307; *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 92.

The DEIR's analysis of wind impacts is inadequate as a matter of law. UCSF is required to analyze the impacts in the DEIR, not defer the analysis until there is a formal design. The problem is real, and there are tools to investigate the potential impacts. Moreover, the DEIR can set forth what types of setbacks, features and articulation that could be incorporated into the design to mitigate for these significant impacts. The DEIR admits that such design features exist. Instead, the public and the decisionmakers were deprived of meaningful information that could result in mitigation of these impacts.

15 cont.

E. The Impacts from Shadow Are Improperly Dismissed

The DEIR admits that there would be shadow impacts to Golden Gate Park from the New Hospital in the morning between 8:19 a.m. to 9:30 a.m. on the winter solstice. (DEIR, p. 4.1-67,

16

Table, 4.1-51, Fig. 4.1-30, 4.1-35.) The DEIR dismisses the impact because it is limited to one of the baseball fields. The DEIR argues that "Baseball fields are typically utilized for games or practice during the midday or in the afternoon. While some may use baseball fields early in the morning, the periods of heaviest use would be around midday or in the afternoon when baseball games would be expected to occur." (DEIR, p. 4.1-67.) Therefore, the DEIR concludes that the impact is less-than-significant. This ignores that the baseball field may be used for other activities in the morning, such as walking or exercise, and that shadow during the winter will cause an impact. Moreover, the DEIR admits that the impact analysis excludes consideration of a potential rooftop observation deck and vestibule, but also states that "No rooftop mechanical equipment/enclosures are proposed for the New Hospital." (DEIR, p. 4.1-67, fn. 11.) This is at odds with other information in the DEIR regarding the New Hospital:

> Including potential rooftop observation deck and elevator vestibule that would occupy a portion of the roof. As currently conceived, the majority of mechanical equipment would be contained within various levels of the New Hospital to minimize the amount of equipment located on the roof; ***components of mechanical equipment located on the roof may slightly exceed the 294 feet in height."*** (DEIR, p. 4.10-16, fn. 2.)

16 cont.

With respect to Grattan Park, the DEIR concludes that shadow impacts are less-than-significant because the impact only is for 37 minutes and "this shadow would not substantially and adversely affect the use and enjoyment of this park considering it would occur at the end of the day at a time when park users would expect waning sunlight." (DEIR, p. 4.1-72.)

The DEIR dismisses the fact that these shadow impacts violates section 295 of the City's Planning Code, which regulates solar access. While UCSF claims that it has does not have to abide by local regulation, the conflict does prove that there is a significant environmental impact regarding shadow from development, particularly from the New Hospital.

F. The DEIR Fails to Employ the Correct Legal Standard in Analyzing Impacts Associated with Land Use

The DEIR relies significantly on the concept that UCSF does not need to comply with local land use regulation under Article 9, Section 9 of the California Constitution. Furthermore, with respect to the San Francisco General Plan, the DEIR concludes that "Because of the University's constitutional exemption from local land use regulation, conflicts with City regulations would not constitute significant environmental effects." (DEIR, p. 4.1-42.) This ignores the fact that whether UCSF is required to comply with local land use regulations, conflicts with local land use regulations could cause significant environmental impacts. It also ignores UCSF's promise in its LRDP to consider local land use regulations in development of

17

the Parnassus Heights campus. For instance, sub-objection 1B states "Acknowledge and respond to local zoning and height and bulk limitations to the extent possible." Moreover, the 2014 LRDP included Community Planning Principles that included Principle LU1, which stated that UCSF would "Plan for growth and renovations that are substantially consistent with use limitations and height and bulk limitations in City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects." (DEIR, p. 4.10-3.) Principle LU3 states that UCSF would "Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density, and that do not negatively affect surrounding land uses." (DEIR, p. 4.10-4.) The LRDP also included an objective to "Acknowledge and respond to local zoning and height and bulk limitations to the extent possible." (DEIR, p. 4.10-2.) UCSF cannot now dismiss the grave inconsistencies with local land use regulations as having no environmental impacts because of UCSF's claim of constitutional authority.

Regardless of UCSF's ability to ignore local land use regulation, it must analyze the impacts of the project on the community as a result of the glaring inconsistencies. In fact, the inconsistencies are significant and unavoidable without major revision to the CPHP. As noted earlier, Education Code 67504(b)(1) states that "The Legislature further finds and declares that the expansion of campus enrollment and facilities may negatively affect the surrounding environment. Consistent with the requirements of ... CEQA, it is the intent of the Legislature that the University of California sufficiently mitigate significant off-campus impacts related to campus growth and development." The Legislature envisioned that UCSF would consider the impacts, including the land use impacts, on local communities. UCSF's dismissal of inconsistencies with local land use regulation is also inconsistent with the DEIR's promises: "In addition, it is UCSF's intent to adhere to the extent practicable, to City zoning codes related to building use, height, and bulk limitations; floor area ratios; and parking requirements or restrictions for the purpose of ensuring compatibility with the surrounding areas." This statement is meaningless if the DEIR fails to acknowledge the significant environmental impact associated with the CPHP. It also glosses over the significance criteria set forth in the DEIR at page 4.10-8, to wit, would the CPHP:

1) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

2) Exceed an LRDP EIR standard of significance by conflicting with local land use regulations such that a significant incompatibility is created with adjacent land uses?

(DEIR, p. 4.10-8.)

17 cont.

Furthermore, the DEIR erroneously concludes that "the CPHP does not substantially depart from the planning principles and concepts set forth in the 2014 LRDP." (DEIR, p. 4.10-

18

10.) The CPHP is completely exempting the New Hospital from critical principles and concepts set forth in the 2014 LRDP, which were no doubt part of UCSF's plan to mitigate impacts to the community. Absurdly, the DEIR concludes that "on balance, the proposed New Hospital would be compatible with adjacent land uses and would not create a significant land use impact." It also makes the erroneous assertion that "As described in Section 4.1, Impact AES-2 finds that the New Hospital would be the most noticeable visual change under the CPHP program, and would contrast sharply both in height and scale with the nearby residential development; however, with the proposed amendments to the 2014 LRDP, the CPHP would not conflict with applicable zoning and other regulations governing scenic quality." (DEIR, p. 4.10-17.) This ignores that height and bulk limitations, which the DEIR admits are exceeded and cannot be disputed, are directly related to scenic quality.

18 cont.

Finally, as stated on page 4.10-14 of the DEIR, a pedestrian bridge is proposed to cross Parnassus Avenue. However, the DEIR does not the discuss the applicability of local land use regulation that applies to such a pedestrian bridge. Because the bridge crosses a City street, UCSF must comply with local regulations regardless of UCSF's constitutional authority to control its own land. It cannot control the City's land under the same claimed authority.

19

G. The DEIR Makes Absurd Arguments Regarding Population and Housing

The DEIR makes several assumptions regarding population and housing that is not borne out by common understanding in the City of San Francisco, the Bay Area or in the Legislature. With all of the constant assertions regarding a housing shortfall, the DEIR makes absurd conclusions regarding the jobs/housing imbalance and the CPHP's impact on housing. What is clear is that UCSF will not meet its current housing need with the proposed housing and will exacerbate the problem by creating even more jobs.

The DEIR concludes that jobs in San Francisco increased by 22 percent since 2010. The rate of job growth in the five-county study area was lower, at 15 percent. (DEIR, p. 4.12-2.) Consequently, San Francisco created more jobs than the average in the study area and has the least room for new housing than other areas.

20

The DEIR outlines the 2014 objectives to address the need for housing and increase opportunities for housing. (DEIR, p. 4.12-4.) The DEIR estimates that the CPMP would result in a population increase of 4,100 by 2030 and about 5,180 by 2050. Then the DEIR states that "Assuming only one UCSF employee/student per household and based on 2.36 persons per household for San Francisco, the total population in San Francisco associated with UCSF growth under the proposed CPHP would be approximately 5,800 by 2030 and about 7,330 by 2050." (DEIR, p. 4.12-8.) Clearly, most of the growth will occur in the near-term, which will exacerbate the shortage of housing in the area.

The DEIR dismisses the impact by claiming that "The amount of employment growth at

the Parnassus Heights campus site under the proposed CPHP would not add significantly to the amount of employment forecast for San Francisco during this period." (DEIR, p. 4.12-8.) The DEIR also claims that

> Development of additional residential units on the Parnassus Heights campus sites would allow UCSF to provide more on-campus housing to students, postdoctoral scholars, clinical residents, and faculty near their classrooms and workplaces, thereby reducing demand for off-campus housing in San Francisco and the Bay Area. It would also promote sustainability objectives of the 2014 LRDP by reducing the amount of private vehicle and UCSF shuttle traffic between these and other campus sites. (DEIR, p. 4.12-9.)

These assumptions are absurd.

The DEIR states that the current population of the Parnassus Heights campus, excluding patients and visitors, is 4,900 students and 7,400 faculty and staff. Currently, 580 residents reside on campus. Based on a 2015 Housing Study, there will be a demand for in 2025 of student/trainee housing of 2,030 units and 345 units for faculty. (DEIR, p. 3-12.) The Initial Aldea Housing Densification project would increase the number of dwelling units by 142 units. West Side Housing development under the CPHP proposes 430 units. Future phases of Aldea Housing would increase the number of dwelling units by 332 units. (DEIR, p. 3-34.) The construction of these units does not even meet the demand for housing under the 2014 LRDP as determined in the 2015 Housing Study. The CPHP will only exacerbate the current shortfall. However, the DEIR makes the absurd conclusion that "In addition, some of the additional population associated with the proposed CPHP would be housed in the approximately 762 new units planned under the proposed CPHP on the Parnassus Heights campus site, thereby reducing demand for off-campus housing in San Francisco and the Bay Area." (DEIR, p. 4.12-13.) Then the DEIR concludes that "the population growth would not result in a demand for new housing that would exceed the capacity of the five-county market area. The CPHP's impact related to population and housing would be less than significant." (DEIR, p. 4.12-9.) This is contrary to the everyday assertions of housing shortages throughout Bay Area.

Part of the assumption of the DEIR is that "Implementation of the proposed CPHP would induce population growth in the Bay Area, but the population growth would not be substantial in comparison to the growth that is projected and planned for San Francisco and the four study area counties in *Plan Bay Area 2040* and the local General Plans for the study area communities." (DEIR, p. 4.12-9.) However, not only is there a direct impact because it will exacerbate the lack of housing in San Francisco and induce travel for housing, but the DEIR absurdly concludes that there is no cumulative impact. (DEIR, p. 4.12-13.) To say that the CPHP's contribution to the housing shortage will not result in a cumulative impact because it is not cumulatively

20 cont.

considerable misses the heart of a cumulative impacts inquiry. In San Francisco, the housing shortage is particularly acute. This is undisputable. In an analogous case,

> the significance of an activity depends upon the setting. (Guidelines § 15064, subd. (b)). The relevant question to be addressed in the EIR is not the relative amount of precursors emitted by the project when compared with preexisting emissions, but whether any additional amount of precursor emissions should be considered significant in light of the serious nature of the ozone problems in this air basin.

Kings County Farm Bureau v. City of Hanford, *supra*, 221 Cal.App.3d at 718. Here, the DEIR asserts that the CPHP's contribution to the problem is small, thus, there is no cumulative impact. The whole point of the cumulative impact analysis is to look at those impacts in conjunction with other developments to determine whether the impacts are cumulatively significant. "Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time." 14 Cal. Code Regs. § 15355. UCSF cannot escape this analysis by simply asserting that the CPHP's contribution is small. This failure to conduct a sufficient cumulative impacts analysis renders the DEIR "inadequate as an informational document." *Kings County Farm Bureau v. City of Hanford*, *supra*, 221 Cal.App.3d at 718.

20 cont.

H. The DEIR Fails to Adequately Analyze the Impacts to Biological Resources and Fails to Disclose Critical Information Regarding the Loss of Reserve Lands

The DEIR fails to analyze several impacts associated with biological resources, especially with respect to the Mount Sutro Open Space Reserve. Below is a list of these impacts, all of which must be addressed in the DEIR.

21

1) The DEIR fails to adequately address the impact of light on the Reserve. This impact must be analyzed in the DEIR.

2) The DEIR concludes that coastal triquetrella, a special-status moss, "***may*** occur in open gravel areas along roadsides and hillsides, such as in the Aldea Housing area and in areas adjacent to Surge and Woods buildings." (DEIR, p. 4.3-14, emphasis added.) There was no attempt to determine where the moss is located. Just assertions of where it may occur. The mitigation for potential impacts is to simply conduct surveys prior to construction. Environmental review is inadequate when "it fails to provide sufficient evidence or analysis of the potential environmental effects of the [Project]. 'The agency should not be allowed to hide behind its own failure to gather relevant data.'" *City of Redlands v. County of San Bernardino*, *supra*, 96 Cal.App.4th at 408. "By deferring environmental assessment to a future date, the conditions run counter to that policy of CEQA which requires environmental review at the earliest feasible stage

22

in the planning process. [Citations]." *Sundstrom v. County of Mendocino, supra*, 202 Cal.App.3d at 307. "A study conducted after approval of a project will inevitably have a diminished influence on decisionmaking. Even if the study is subject to administrative approval, it is analogous to the sort of *post hoc* rationalization of agency actions that has been repeatedly condemned in decisions construing CEQA. [Citations]." *Id.* at 307; *Communities for a Better Environment v. City of Richmond, supra,* 184 Cal.App.4th at 92. Determining the location of moss is not a difficult feat and must be done as part of the environmental review.

> Compounding the error, the DEIR then concludes:
>
> If special-status plant species, including coastal triquetrella are observed, the plants will be avoided with a suitable buffer, determined in coordination with CDFW. The buffer zone shall be clearly demarcated using exclusion fencing. If establishing an avoidance buffer is not feasible, individual plants shall be transplanted to an area with suitable physical and biological conditions outside of the work area and monitored and adaptively managed for five years. (DEIR, p. 4.3-16.)

This proves that the failure to analyze the existing of coastal triquetrella is fatal. The DEIR assumes that a buffer is possible and then allows transplanting of the moss if it is determined it is not feasible. The DEIR also fails to analyze where the relocation areas of the moss, or parameter to measure its success.

22 cont.

3) The DEIR again clams that UCSF is not subject to local land use regulations. But then claims that "UCSF will adopt mitigation that is ***generally consistent*** with the City's *Standards for Bird-Safe Buildings* for new construction proposed under the CPHP." (DEIR, p. 4.3-19.) Regardless of UCSF's ability to override local land use regulations, it is incumbent upon UCSF to mitigate for environmental impacts. Bird strikes are a significant environmental impact. To be "generally consistent" with the City's standards is diminishing the importance of mitigations for bird strikes and allows UCSF to ignore aspects of the standards that could reduce bird strikes. For instance, the City's Standards require that "No more than 10 percent untreated glazing is allowed on building façades within the bird collision zone." (DEIR, p. 4.3-12.) However, the DEIR's mitigation simply requires that "Employ glazing options such as use of either fritted glass, Dichroic glass, etched glass, translucent glass, or glass that reflects ultraviolet light in appropriate portions of the building façade." (DEIR, p. 4.3-20.) The DEIR does not define what "appropriate portions of the building facade" means. The DEIR ignores mitigation measures that could reduce potentially significant impacts. The California Supreme Court has stated that the alternatives and mitigation sections are "the core" of an EIR. *Citizens of Goleta Valley v. Board of Supervisors, supra,* 52 Cal.3d at 564; *Los Angeles Unified School Dist. v. City of Los Angeles* (1997) 58 Cal.App.4th 1019, 1029; *Preservation Action Council v. City of San Jose, supra,* 141 Cal.App.4th at 1350.

23

> Our Supreme Court has described the alternatives and mitigation sections as 'the core' of an EIR." (*Los Angeles Unified School Dist. v. City of Los Angeles* (1997) 58 Cal.App.4th 1019, 1029.) In furtherance of this policy, section 21081, subdivision (a), "contains a 'substantive mandate' requiring public agencies to refrain from approving projects with significant environmental effects if 'there are feasible alternatives or mitigation measures' that can substantially lessen or avoid those effects." (*County of San Diego v. Grossmont-Cuyamaca Community College Dist.* (2006) 141 Cal.App.4th 86, 98, italics omitted; *Mountain Lion Foundation v. Fish & Game Com.* (1997) 16 Cal.4th 105, 134.)

Uphold Our Heritage v. Town of Woodside (2007) 147 Cal.App.4th 587, 597-598 (review denied); *Center for Biological Diversity v. County of San Bernardino* (2010) 185 Cal.App.4th 866, 883. The DEIR must incorporate all feasible mitigations. This is especially important given that the New Hospital will be the tallest structure in the area and is adjacent to the Mount Sutro Open Space Reserve and near Golden Gate Park. Moreover, Aldea Housing will be located adjacent to the Reserve. These factors increase the chance of bird strikes. 23 cont.

Furthermore, given the serious nature of bird strikes, the cumulative impact analysis does not include analysis regarding the cumulative impact to birds. (DEIR, p. 4.3-23 to 24.) The failure to include a cumulative impacts analysis is a failure to proceed in a manner required by law. Failure to provide adequate reasoning for exclusion of an environmental topic from further consideration invalidates the EIR: "A statement of reasons is necessary to assure meaningful judicial review in the event, as here, the EIR is challenged in court. 'Mere conclusions simply provide no vehicle for judicial review.'" *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1111 (quoting *Citizens Assn. for Sensible Development of Bishop Area v. County of Inyo* (1985) 172 Cal.App.3d 151, 171). Here, there was not even any conclusion regarding cumulative impacts associated with bird strikes. Crucially, "An EIR ***shall*** identify and focus on the significant effects of the proposed project on the environment . . . . Direct and indirect significant effects of the project on the environment shall be clearly identified and described [in the EIR], giving due consideration to both the short-term and long-term effects." 14 Cal. Code Regs. § 15126.2(a), emphasis added.

4) The DEIR at page 3-34, new "pathways" leading to the Mount Sutro Open Space Reserve. However, the DEIR does not provide any analysis of impacts associated with these additional pathways. These impacts must be discussed in the DEIR. 24

5) The DEIR at page 4.8-7 states "Under the Vegetation Management Plan, vegetation management is conducted in accordance with guidelines established by the San Francisco Fire Department and Cal Fire to create and maintain defensible space between vegetation and buildings." Will additional development adjacent to the Mount Sutro Open Space Reserve, including but not limited to the denser Aldea Housing, create the need for additional defensible space and clearing? The increase in potential for additional clearing of trees, bushes and habitat must be analyzed in the DEIR. 25

I. Request for Notice of Determination

Finally, pursuant to Public Resources Code § 21167(f), we are requesting that UCSF forward a Notice of Determination to this office when the CPHP is approved. Section 21167(f) provides:

> If a person has made a written request to the public agency for a copy of the notice specified in Section 21108 or 21152 prior to the date on which the agency approves or determines to carry out the project, then not later than five days from the date of the agency's action, the public agency shall deposit a written copy of the notice addressed to that person in the United States mail, first class postage prepaid.

26

Thank you for your consideration of these comments. I look forward to UCSF's written responses.

Very truly yours,
WITTWER PARKIN LLP

William P. Parkin

cc: client

Responses to Comments from Wittwer Parkin, LLP

O-PARKIN-1 The commenter makes a general introductory statement that the Draft EIR is fatally flawed; and that the Draft EIR must be revised and recirculated.

As demonstrated in the individual responses provided to the comments raised, below, and further in Section 8.1.4 in this Comments and Responses document, none of the specific issues identified in the comments, or response to these comments, result in any of the conditions of Section 15088.5(a) being met. Thus, UCSF has determined that recirculation of the Draft EIR on the issues raised by the comments is not warranted.

O-PARKIN-2 The commenter asserts that the proposed CPHP does not meet the eligibility requirements for Public Resources Code Section 21099 because it does not meet the definition of being a residential or mixed-use residential project, or employment center; or the definition of an infill site. Please see Master Response 6: Public Resources Code Section 21099. The reference to Education Code Section 67504(b)(1) indicates that the statute is to be interpreted "consistent with the requirements of CEQA."

O-PARKIN-3 The commenter asserts the proposed CPHP does not meet the eligibility requirements for Public Resources Code Section 21099 because the CPHP is a planning document and not a project, and because it includes an amendment to the 2014 LRDP. Please see Master Response 6: Public Resources Code Section 21099.

O-PARKIN-4 The commenter asserts the CPHP does not meet the eligibility requirements for Public Resources Code Section 21099, because it does not meet the definition of being a residential project. Please see Master Response 6: Public Resources Code Section 21099.

O-PARKIN-5 The commenter asserts the CPHP does not meet the eligibility requirements for Public Resources Code Section 21099, because it does not meet the definition of being a mixed-use residential project. Please see Master Response 6: Public Resources Code Section 21099.

O-PARKIN-6 The commenter asserts that the proposed CPHP does not meet the eligibility requirements for Public Resources Code Section 21099 because the CPHP because it does not meet the definition of being an employment center. Please see Master Response 6: Public Resources Code Section 21099.

O-PARKIN-7 The commenter claims that the Draft EIR improperly minimizes its aesthetics impacts by dissuading the public from commenting on this issue, misleads decision-makers and that the aesthetics analysis was not addressed seriously in the Draft EIR. Please see Master Response 6: Public Resources Code Section 21099.

O-PARKIN-8 The comment states that the Draft EIR downplays the aesthetic effects of the proposed project, and notes that the Draft EIR does not include visual simulations from Edgewood and Belmont Avenues. Please refer to Master Response 7: Aesthetic Impacts.

O-PARKIN-9 The comment states that the Draft EIR fails to acknowledge alleged conflicts with the San Francisco General Plan. Please refer to Master Response 7: Aesthetic Impacts.

O-PARKIN-10 The comment states that that the Draft EIR's analysis of aesthetics does not adequately account for the removal of existing trees pursuant to UCSF's adopted Mount Sutro Open Space Reserve Vegetation Management Plan. Please refer to Master Response 7: Aesthetic Impacts.

O-PARKIN-11 The comment objects to the CPHP's proposed amendment to the UCSF LRDP to clarify that sub-objectives 1B and 1C would not apply to the New Hospital project and claims that this change would result in a significant aesthetic impact. Please refer to Master Response 7: Aesthetic Impacts.

O-PARKIN-12 The comment states that the Draft EIR should incorporate mitigation measures for adverse aesthetic effects. Please refer to Master Response 7: Aesthetic Impacts.

O-PARKIN-13 The comment makes reference to a statement in the Draft EIR that the Initial Aldea Housing Densification project component "would be developed in a way that would reinforce its connection with Mount Sutro, respect the existing wooded setting and open space areas, refrain from impacting the extent of the Reserve, and establish discrete façade treatments to embrace the surrounding context," and states that the Draft EIR provides no evidence for this statement supporting the conclusion that the proposed CPHP would have a less-than-significant aesthetic effect. First, the statement quoted is in the discussion of Impact AES-2, and the impact statement reads, "Development under the CPHP, including the proposed open space improvements and street network changes, would occur in an urbanized area and would not conflict with applicable zoning and other regulations governing scenic quality." Therefore, the relevant question is whether the project would "conflict with applicable zoning and other regulations governing scenic quality." The complete paragraph in the Draft EIR, including the quoted passage, reads:

> *As shown in **Figure 4.1-19**, buildings proposed as part of the initial Aldea Housing Densification project would be up to 96 feet in height in an area of the city currently zoned for 40 feet. As such, this project would not align with 2014 LRDP sub-objective 1B because it would not be consistent with local zoning and height and bulk limitations for the site. However, consistent with the CPHP design guidelines, the initial Aldea Housing Densification project* would be developed in a way that

> would reinforce its connection with Mount Sutro, respect the existing wooded setting and open space areas, refrain from impacting the extent of the Reserve, and establish discrete façade treatments to embrace the surrounding context. *This project would also continue the existing use of the Aldea Housing complex site for residential uses. For these reasons, this project would be consistent with 2014 LRDP sub-objective 1C. As a result, the initial Aldea Housing Densification project would not conflict with applicable regulations governing scenic quality.* (*italics* indicates text not quoted by commenter)

As can be seen, the Draft EIR concludes that the proposed project "would not conflict with applicable regulations governing scenic quality," thereby rendering Impact AES-2 less than significant with respect to the Initial Aldea Housing Densification project. For clarification, the paragraph on Draft EIR page 4.1-42 under the Initial Aldea Housing Densification is revised. Please refer to Section 8.5 of this Comments and Responses document for the proposed revision.

O-PARKIN-14 The commenter states that the mitigation measure pertaining to light and glare (CPHP Mitigation Measure AES-3), which requires that reflective metal walls and mirrored glass not be used as primary building materials for facades, could result in significant impacts because the word "primary" allows for wiggle room. The commenter suggests a ban on such materials.

The process of designing buildings is driven by technological, cost, and artistic considerations. A ban on reflective materials is unnecessarily restrictive, as such materials may be innocuous as accent features, in small amounts, in the right location. In designing buildings, the University would abide by the UCSF Parnassus Heights Design Guidelines, which recommends contextuality in material selections and fenestration. In addition, UCSF's practice is to engage a Design Advisory Committee, comprised of local architects outside of the University system, to review proposed campus building designs and to provide critique and advice. UCSF's practice also involves presenting preliminary designs to the community to receive feedback, and to make changes when warranted. This practice has been successful and to date no new buildings at any of UCSF's campus sites have resulted in significant light or glare impacts. Given these circumstances, CPHP Mitigation Measure AES-3 is adequate to mitigate potential light and glare impacts to less than significant levels.

O-PARKIN-15 The comment states that the EIR defers mitigation of effects related to pedestrian wind conditions. Please refer to Master Response 8: Wind Impacts.

O-PARKIN-16 The comment states that the Draft EIR's shadow analysis is inadequate because it fails to fails to properly account for the uses of park areas that would be shaded. Please refer to Master Response 9: Shadow Impacts.

O-PARKIN-17 The commenter assert the Draft EIR fails to employ the correct legal standards in analyzing impacts associated with land use. Please see Master Response 13: Land Use Impacts.

O-PARKIN-18 The commenter disputes language in Draft EIR Impact LU-1 that the CPHP does not substantially depart from the planning principles and concepts set forth in the 2014 LRDP. Please see Master Response 13: Land Use Impacts.

The commenter also objects to language from Draft EIR Impact AES-2 in Section 4.1, Aesthetics, Wind and Shadow that with UCSF's proposed LRDP Amendment, the CPHP would not conflict with applicable zoning and other regulations governing scenic quality. The commenter further asserts that this language ignores the height and bulk limitations. Please see Master Response 7: Aesthetic Impacts.

O-PARKIN-19 The commenter indicates the proposed pedestrian bridge across Parnassus Avenue must comply with local land use regulations regardless of UCSF's constitutional authority to control its own land. As noted on Draft EIR Section 4.10, Land Use and Planning, page 4.110-14, the proposed bridge would need to conform to applicable City standards. Please also see Draft EIR Chapter 1, Introduction, Approvals Required, on pages 1-8 to 1-9, which notes the bridge would be subject to City Board of Supervisors approval for construction within the City right-of-way; including lease air rights above Parnassus Avenue.

O-PARKIN-20 The commenter disagrees with the analysis and conclusions of the Draft EIR with regard to population impacts, arguing that the CPHP will create more jobs than housing, that there is a housing shortage throughout the Bay Area, and that the Draft EIR is incorrect in concluding that the project would not result in a demand for new housing that would exceed the capacity of the five county market area.

Please see Master Response 14: Population and Housing Impacts, which explains the scope of the population and housing impacts, as defined under Appendix G of the State CEQA Guidelines. For a project or plan that would support new jobs, such as the CPHP, CEQA requires that the environmental document evaluate whether the project-related new jobs would result in substantial unplanned population growth. CEQA does not require that the increase in employment be evaluated for its effects on housing supply. The Draft EIR does include an additional analysis of the CPHP's effect on housing based on a significance criterion set forth in the UCSF 2014 LRDP EIR, and finds that the project's demand for housing, which will incrementally develop over the plan period of 30 years, would be small relative to the housing growth projections of the City and the four surrounding counties. Please also see Master Response 14: Population and Housing Impacts regarding cumulative population and housing impacts.

O-PARKIN-21 The commenter states that the Draft EIR fails to analyze the impact of light on the Reserve. The comment does not indicate the nature of the potential impact of light, or cite a specific deficiency in the Draft EIR analysis.

Impacts of artificial light on migrating birds during both CPHP construction and operation is addressed in Section 4.3 in Impact BIO-2 and identified as potentially significant, and mitigated to a less than significant level with implementation of CPHP Mitigation Measure BIO-2a for construction light, and CPHP Mitigation Measure BIO-2b for operational light.

Draft EIR Section 4.1, Aesthetics, Wind and Shadow also addressed potential lighting effects of the CPHP on people, and identified CPHP Mitigation Measure AES-3 to ensure appropriate design standards would be employed to mitigate light impacts on people to a less-than-significant level. CPHP Mitigation Measure AES-3 would also be expected to further minimize potential effects of new lighting on nearby wildlife as well.

O-PARKIN-22 The commenter states that the Draft EIR fails to identify the locations of coastal triquetrella, a rare moss species that may grow along roadsides in gravelly areas. Vegetation surveys conducted for the Mount Sutro Open Space Reserve Vegetation Management Plan Final Environmental Impact Report (2017) did not observe this plant, nor was it observed during biological reconnaissance conducted for the CPHP Draft EIR. Hence, there is no evidence to suggest that this plant is present. However, potentially suitable habitat for this plant is present, therefore, the Draft EIR conservatively concluded that the species could occur within portions of the project site and could be affected by ground disturbing activities. With regard to the commenter's assertion that the survey for the plant should have been done as part of the Draft EIR studies, please note that plant sightings are prone to change from year to year depending on light, hydrology, and other climatic factors. Thus, any currently identified locations of triquetrella may not accurately indicate the locations of this plant at the time of construction; a new survey prior to construction would always be required. For this reason, mitigation for this species calls for a survey prior to construction, with time for relocation and salvage if the plant is identified in an area that will be impacted. If identified during this survey, the removal and damage of the moss will be avoided by establishing a buffer. If avoidance is not possible, the moss will be transplanted. Mosses such as coastal triquetrella can be readily transplanted. Ample relocation sites are available on the Reserve for any plants that are removed during the implementation of projects under the CPHP. As specified in CPHP Mitigation Measure BIO-1a, Botanical Surveys, any translocated plants would be managed and monitored for five years.

O-PARKIN-23 The commenter takes issue with the bird-safe mitigation included in the Draft EIR, and questions why the City's Standards for City's Bird Safe Buildings are not used instead. There is presently no federal or State law protecting birds from

window strikes.t. As discussed in the Draft EIR, Section 4.3, page 4.3-12, the City of San Francisco published bird-safe guidance in 2011. Although, as noted in Section 4.3, UCSF is not subject to local land use regulation whenever using land under its control in furtherance of its educational mission, UCSF has voluntarily elected to implement mitigation (CPHP Mitigation Measures BIO-2a and 2b) generally consistent with the City's Standards for Bird-Safe Buildings for new construction in order to protect birds from window strikes to the maximum extent feasible. While buildout of the CPHP would increase the likelihood of bird strikes from the larger structures, in the context of the Pacific Flyway, used by an estimated billion birds per year, these impacts are minor, and not cumulatively considerable. UCSF is proactively addressing the bird-strike issue by implementing mitigation based on local guidance, and its later New Hospital project-level EIR will address this issue specifically. Please also refer to Master Response 10: Bird Strikes.

O-PARKIN-24 The commenter requests analysis of biological impacts of new pathways leading to the Reserve. The CPHP does not propose any expansion of trails within the Reserve, rather, it would only coordinate planned trailheads to the Reserve, which would not result in adverse effects on the Reserve itself.

O-PARKIN-25 The commenter asks whether the increase in size and density of Aldea Housing structures may necessitate greater clearing for fire avoidance, and that the impacts from that clearing be analyzed in the Draft EIR. As discussed in the Draft EIR Chapter 3, Project Description, the new housing structures are anticipated to use approximately the same footprint as the present housing structures. As discussed in the Draft Section 4.13, Public Services, page 4.13-9, the new Aldea Housing would be designed and constructed to comply with building and fire codes and include appropriate fire safety measures and equipment. This would also apply to any modifications to defensible space and clearing that would be required. As discussed in Section 4.8, Hazards and Hazardous Materials, page 4.8-7, UCSF plans for fire prevention in accordance with guidelines established by the San Francisco Fire Department and Cal Fire to create and maintain defensible space between vegetation and buildings. The Draft EIR Section 4.3, Biological Resources, page 4.3-22 acknowledges that certain vegetation removal would be required at the campus site as a result of clearing, excavation and regrading activities conducted in support of the CPHP. The general removal of non-sensitive vegetation would be considered a less than significant effect. There are no sensitive habitats, including wetlands, riparian areas, or sensitive natural communities, present within the Reserve or elsewhere on the campus site. Potential effects to special-status plants are analyzed in Impact BIO-1, and would be less than significant with mitigation. Regarding replacement of removed trees, UCSF will consider replanting trees in the landscaping plans for each specific project under the CPHP when detailed designs become available.

O-PARKIN-26 The commenter requests the UCSF provide a copy of the Notice of Determination to the commenter when the CPHP is approved. The comment is acknowledged.

RE: Response to UCSF EIR plan for 2020

Element of draft EIR that incomplete :

Housing Element: Student housing does not include all the student housing in San Francisco that is planned to be built, for example the 40% funded housing with UC Hasting planned for completion in phase 1 2022 and phase 2 2024. 1

The use of the projected increase of bay area 9 counties to grow 1% every year. 2

COVID was not included in this EIR; it affected the outreach meeting limit to people on the internet. 3

Also the rapid changes to the California economy,unemployment and population leaving the bay area. 4

UCSF: A total of 239 owned, leased or subleased buildings will be evaluated. For some buildings, simple retrofits could improve their seismic rating. In other cases, engineers may recommend more significant retrofits, or in some cases, vacating and retiring an entire building. Not spelled out reason for these projects. 5

Parnassus Heights is the oldest and largest campus site belonging to UC San Francisco. It comprises approximately 107 acres of land at the base of Mount Sutro. The 61-acre Mount Sutro Open Space Reserve (the Reserve) occupies the central and southern portion of the campus site, reaching 400 feet in elevation above Parnassus Avenue Figure 3-21 changes use of land. Which would affect the current forest, ecosystem and endangered species located on the 107 acres. 6

Lastly the plan does not currently coordinate with the 4 UC Medical Centers and duplicates the services offered at the other locations. 7

Sincerely,

Executive Committee of 86 Dwellers

Responses to Comments from Executive Committee of 86 Dwellers

O-86D-1 The commenter is correct in noting that UCSF is working with UC Hastings to make accessible to UCSF students newly developed student housing on the UC Hastings campus in San Francisco. However, that housing is not a part of the proposed CPHP and is therefore not discussed in the Draft EIR.

O-86D-2 As stated on page 4.12-1 in the Draft EIR, the study area used to evaluate the population and housing impacts of the CPHP includes San Francisco and the four surrounding counties, and not the nine-county Bay Area referenced by the commenter. The reason for using the 5-county study area is that according to the 2018 UCSF Transportation Commute Survey, most of the UCSF students and employees live within the 5-county study area.

O-86D-3 The commenter asserts COVID was not included in the EIR. Please see Master Response 3: COVID-19.

O-86D-4 The commenter references rapid changes to the California economy, unemployment, and population leaving the Bay Area. All potential CPHP impacts on population and housing are adequately addressed in Section 4.12, Population and Housing, in the Draft EIR.

O-86D-5 The commenter makes a statement that 239 owned, leased or subleased building will be evaluated; that for some buildings simple retrofits could improve their seismic rating; and that in other cases, engineers may recommend significant retrofits, or vacating and retiring an entire building. These comments do not specifically address the adequacy of the Draft EIR; please see Master Response 1: Non-CEQA Comments.

O-86D-6 The commenter refers to the Reserve, and Draft EIR Figure 3-21, and then asserts the current forest, ecosystem and endangered species would be affected. All potential impacts on biological resources are adequately addressed in Section 4.3, Biological Resources, in the Draft EIR.

O-86D-7 The commenter indicates the CPHP does not coordinate with the four UC medical centers and duplicates the services offered at the other locations. This comment does not specifically address the adequacy of the Draft EIR; please see Master Response 1: Non-CEQA Comments. However, the comment has been noted and will be forwarded to decision-makers.

From:	SF Forest
To:	Campus Planning - EIR
Subject:	Comment on DEIR for UCSFComprehensive Parnassus Heights Plan
Date:	Thursday, September 10, 2020 12:58:04 AM

Dear UCSF,

We were dismayed to see the planned effects of the amended LRDP, particularly on Sutro Forest.

1) Hundreds of trees will be removed for this project. 1

2) With the removal of Aldea Student Housing from the space ceiling, the plan is to build taller buildings – up to 96 feet high – in an area where other buildings are restricted to 40 feet. The construction space that the process of building these structures will require is likely to destroy more trees. 2

3) Furthermore, an oblique reference to "a completely reconfigured and redesigned site" raises the possibility that this redesigned site may no longer be a forested area at all. It will certainly lose its charming woodsy character of wood-shingled low-rise buildings. 3

4) The revised plan will remove an area of Sutro Forest (near Parnassus and Edgewood). In "compensation" an area that is already de facto part of the forest would be technically included in the forest. 4

5) In addition to the impact on Sutro Forest – the entire redwood grove on Parnassus would be felled. 5

The cumulative effect of all these removals on San Francisco's shrinking tree cover is dismal. At 13.7%, San Francisco has the smallest tree canopy cover of any major city. (This percentage was calculated in 2013, and is likely even lower now with the continuing destruction of trees in Sutro Forest and elsewhere in San Francisco.) 6

In these times of climate change, removing trees is an environmental hazard. Furthermore, the cumulative effect on Sutro Forest is to make it drier and less self-sustaining, and thus, riskier -especially as climate change hits California harder each year. It also sacrifices all the ecosystem services provided by the trees. 7

We ask that these projects be revised to protect the trees. 8

Sincerely

San Francisco Forest Alliance

Responses to Comments from San Francisco Forest Alliance

O-SFFA-1 The commenter states that hundreds of trees will be removed for the project. The Draft EIR Chapter 3, Project Description on page 3-38 acknowledges certain tree removal would be required under the CPHP as a result of clearing, excavation and regrading activities. Regarding replacement of removed trees, UCSF will consider replanting trees in the landscaping plans for each specific project under the CPHP when detailed designs become available.

O-SFFA-2 The commenter suggests that construction of larger and denser housing at Aldea would result in the loss of hundreds of trees. As discussed in the Draft EIR Chapter 3, Project Description, the new housing structures at Aldea are anticipated to use approximately the same footprint as the present housing structures and therefore, tree removal at the Aldea Housing Complex would be minimized. The Draft EIR Section 4.3, Biological Resources, page 4.3-22 acknowledges that certain vegetation removal would be required at the campus site as a result of clearing, excavation and regrading activities conducted in support of the CPHP. The general removal of non-sensitive vegetation would be a less than significant impact. Regarding replacement of removed trees, UCSF will consider replanting trees in the landscaping plans for each specific project under the CPHP when detailed designs become available.

O-SFFA-3 The comment states that redevelopment of the Aldea Housing complex would cause the complex to lose its "charming woodsy character." Please refer to Master Response 7: Aesthetic Impacts.

O-SFFA-4 The commenter indicates the proposed Plan will remove an area of Sutro Forest near Parnassus and Edgewood, and that in compensation, an area that is already defacto part of the forest would be technically included in the forest.

The Draft EIR Chapter 3, Project Description states on page 3-19 that there is the potential for the New Hospital and widening of Medical Center Way to result in the need to modify the Reserve boundary. UCSF proposes to replace any area of the Reserve that is lost due to new development under the CPHP by designating new Reserve area elsewhere on the campus site in an amount equal to or greater than the area lost.

The area that the commenter characterizes as already defacto part of the forest is currently designated as a "Support" zone in UCSF's existing functional zone map, and under the CPHP would be designated as an "Open Space Reserve" zone. Accordingly, the CPHP would provide permanent open space reserve protection that is not currently provided for this area.

O-SFFA-5 The commenter indicates the redwood grove on Parnassus would be felled. The Draft EIR Chapter 3, Project Description on page 3-38 acknowledges certain tree removal would be required under the CPHP as a result of clearing, excavation

and regrading activities, including the redwood grove along Parnassus Avenue west of UC Hall. Regarding replacement of removed trees, UCSF will consider replanting trees in the landscaping plans for each specific project under the CPHP when detailed designs become available.

O-SFFA-6 The commenter notes the low percent cover of trees in San Francisco, and requests analysis of the cumulative effect of tree removal. While the number and types of trees to be removed under the CPHP have not been determined, the redevelopment of the vast majority of the campus buildings would take place primarily in areas which are already developed, thereby minimizing the number of trees requiring removal. As stated above, UCSF will consider replanting trees in the landscaping plans for each specific project under the CPHP when detailed designs become available. As stated in Section 4.3.3, these actions would not result in a cumulatively considerable contribution to impacts on biological resources.

O-SFFA-7 The commenter notes the connection between tree removal and climate change and states that the Sutro Forest may become drier, less "self-sustaining" and lose ecosystem services if trees are removed. While certain trees may be removed within the Reserve to accommodate proposed development (e.g., on the hillside east of the New Hospital, and certain locations adjacent to Medical Center Way), these primarily trees located on the margins of the Reserve, and would not have a significant adverse effect on the Forest as a whole. As discussed in the Draft EIR, UCSF would also continue to implement its Vegetation Management Plan to protect, enhance and restore vegetation in the Reserve; improve ecosystem health; maintain and ensure public access within the Reserve, and minimize fire risk.

Re: Draft Environmental Impact Report for the Comprehensive Parnassus Heights Plan

Dear Ms. Diane Wong,

Thank you for the opportunity to comment on the DEIR for the Comprehensive Parnassus Heights Plan. The Yerba Buena Chapter of the California Native Plant Society is a non-profit organization with over 600 members in San Francisco. Our parent organization has over 10,000 members statewide. The mission of CNPS is to conserve California native plants and their natural habitats, and increase understanding, appreciation, and horticultural use of native plants. Our vision includes a future where Californians can experience thriving biological diversity, even in human-altered landscapes.

We support bringing the campus up to modern seismic standards and transforming it into a world-class scientific research facility. However, we're concerned about the impact the 30-year build out and acceleration of human activity will have on the local breeding birds, butterflies, bees and remnant native plants that reside on, and near, Mount Sutro. 1

We support CPHP Mitigation Measure BIO-1a, Botanical Surveys for coastal triquetrella, a special-status moss, as well as the creation of special buffers to protect it from construction damage. 2

We endorse the creation of the 'Park to Peak' route that will improve access to the Mt. Sutro OSP trail system. We ask that any damage to the mountain that comes from the creation of new trails be mitigated with trailside native plant restoration, with plants preferably coming from locally sourced stock at Sutro Stewards Native Plant Nursery. As a science-based entity, you can appreciate the importance that local genetics may make for maintaining resilience in the face of climate change, for instance. 3

We consider the mitigation measures for the removal of a quarter acre of habitat for the proposed hospital construction to be insufficient when you couple it with the sizable expansion of the campus population, the removal of the redwood grove near UC Hall and other vegetation within the campus community. We encourage UCSF to greatly increase the mitigation acreage. One possibility is green rooftops with native plants. 4

We welcome the long-term plan to green Sanders Court and Promenade, the terrace at Millberry, Parnassus and Irving Streets. Extending the landscaping from the campus to Golden Gate Park as part of the 'Park to Peaks' route is particularly appealing. As you know from U.N. reports[i], the world is in the midst of a biodiversity crisis that has been accelerated by the climate crisis. Prioritizing the creation of a wildlife corridor or habitat highway will go a long way toward staunching the damages caused by this development. 5

CNPS Yerba Buena chapter considers the way the proposed new landscapes may be greened to be a glaring omission. While the CPHP Final Report mentions that native plants may be used, the addition of other "adapted or culturally significant" plants is concerning. Exotic plants are of little or no value to local wildlife. Exotics already proliferate in the city to the extreme. Native plants co-evolved with the local wildlife and supply forage and hosting that most exotic plants cannot provide. We recommend landscaping with 100% local, native plants and comply with the spirit of the San Francisco Board of Supervisors', Biodiversity Resolution (signed April, 2018) and the State of California's Biodiversity Initiative (launched September 2019). If you intend to plant for cultural purposes, we urge you to consider an Ohlone medicinal garden. Since this land we stand on was taken from the Ohlone people, it would be a nominal gesture to honor their traditions. As an added bonus, an Ohlone garden would supply the biodiversity our local wildlife needs. 6

Should the need arise, we'd be delighted to consult with your team on the landscaping plant lists. Please don't hesitate to contact us or use our information-rich website as a resource, http://cnps-yerbabuena.org 7

Sincerely,

Eddie Bartley

Eddie Bartley

President

California Native Plant Society, Yerba Buena chapter

[i] https://www.unenvironment.org/news-and-stories/press-release/natures-dangerous-decline-unprecedented-species-extinction-rates

Responses to Comments from California Native Plant Society, Yerba Buena Chapter

O-CNPS-1 The commenters makes a number of introductory remarks; and expresses support for bringing the campus up to seismic standards. The comments are noted, however, they do not address the adequacy of the Draft EIR. No response is required.

The commenter also expresses concern about impacts to local breeding birds, butterflies, bees and remnant native plants that reside on and near Mount Sutro. All potential impacts to biological resources, including sensitive wildlife and plant species, are adequately addressed and mitigated to the extent feasible in Section 4.3, Biological Resources, in the Draft EIR.

O-CNPS-2 The commenter expresses support for CPHP Mitigation Measure BIO-1a, Botanical Surveys, for coastal triquetrella. The comment is noted; no response is required.

O-CNPS-3 The commenter endorses the creation of the "Park to Peak" routes; and requests that any incidental damage that occurs related to the development of the trail be mitigated with native plant restoration. The comment is acknowledged, however, please note that the Park to Peak route is not specifically an element of the CPHP. Nevertheless, the CPHP would be compatible with the proposed Park to Peak improvements, and furthermore, the CPHP would coordinate with planned trailheads to Mount Sutro.

O-CNPS-4 The commenter asserts that the mitigation for the removal of habitat on the location of the New Hospital is insufficient. As explained in the Draft EIR Chapter 3, Project Description page 3-19, UCSF proposes to replace any area of the Reserve that may be lost due to new development under the CPHP by designating new Reserve area elsewhere on the campus site in an amount equal to or greater than the area lost. Please note this is not a mitigation measure, but rather, an element of the proposed CPHP.

The commenter suggests the use of green rooftops with native plants. The comment is acknowledged. As discussed in the Draft EIR Chapter 3, Project Description page 3-34, the CPHP envisions an increase in the amount of open space on the campus site, including at Millberry Terrace, expanded Saunders Court and proposed Promenade. These and other open spaces within the campus site would provide the opportunity for additional landscape planting, including the use of native plants.

O-CNPS-5 The commenter expresses support for the proposed landscaped improvements for Saunders Court and Promenade, and the Millberry terrace. Regarding the commenter remarks on the Park to Peak trail, please see Response O-CNPS-3, above.

The comments are noted, however, they do not address the adequacy of the Draft EIR. No response is required.

O-CNPS-6 The commenter suggests the use of landscaping with 100 percent local, native plants and complying with the spirit of the San Francisco Board of Supervisors Biodiversity Initiative and State Biodiversity Initiative. The commenter also suggests planting an Ohlone medicinal garden for cultural purposes. These comments are noted and will be forwarded to decision-makers.

O-CNPS-7 The commenter offers to consult with UCSF on landscaping plants lists. The comment is appreciated.

Re: Zakheim Murals and the Comprehensive Parnassus Heights Plan Draft Environmental Impact Report

Dear Ms. Wong:

I write to comment on the discussion of the "Zakheim Murals" in the Draft Environmental Impact Report for the Comprehensive Parnassus Heights Plan (DEIR). These murals are frescoes created and painted by my father, Bernard Zakheim. 1

The DEIR concludes that it is technically and financially infeasible to preserve and remove the murals, starting:

> in 2020, UCSF completed two independent studies that include detailed technical assessments on how the Zakheim murals could be physically preserved, removed and relocated from their current location in UC Hall. (Page & Turnbull, 2020; Architectural Resources Group 2020.) Given the nature of the frescoes and their vulnerability to cracking, the physical condition of some of the panels which have experienced water damage over the years, the murals' large size, the curved shape of the walls on which most of the panels are painted, ground movements, and the aging of UC Hall (all described in the above noted studies), UCSF has determined that it may be infeasible to remove and relocate the Zakheim murals as there is no guarantee that any effort to remove the Zakheim murals would be successful. Based on those independent studies, there is a likelihood that removal of the Zakheim murals may potentially cause serious damage to at least some of the panels such that the integrity of the entire series is destroyed (Page & Turnbull, 2020). In addition, UCSF has determined that the estimated $7.6 million cost of physical preservation, removal and relocation is prohibitive in light of UCSF's primary responsibility to support its academic health care mission.

(DEIR 4.4-14, 15; pdf 328-329.) This conclusion is incorrect. Also, the DEIR's conclusion is not supported by either of the two studies cited (i.e., "Page & Turnbull, 2020" and 2

"Architectural Resources Group 2020") because neither study presents any conclusion or expert opinion that it is infeasible to conserve, remove, and preserve these murals. 2 cont.

My Qualifications

I have been, and I have been recognized as, one of the leading art conservators in the world for over 50 years. My CV is attached.

From 1953-1966 I worked with my father as an apprentice. As a result, I am intimately familiar with the techniques and materials my father used to create the Zakheim murals. Please see the section of my CV entitled "A Brief Summary of the Core Contributions of NZA to the Field of Mural Conservation."

Over the past 50 years I have performed maintenance and restoration conservation work on the Zakheim murals under contract with UCSF on many occasions, including repairing broken fresco plaster and retouching faded or missing fresco paint.

I have also successfully conserved, removed, and preserved many large-scale fresco murals similar to the Zakheim Murals. These projects include the removing and preserving eight major large-scale frescoes, including removal and conservation of the two Cole Hall Frescos (named "Ancient Medicine" and "Rational Medicine") at the University of California, San Francisco. These frescoes were also created and painted by my father, Bernard Zakheim. Over fifty years ago, I successfully relocated these frescoes from Cole Hall to the Health Sciences West building at UCSF. For this conservation project, I developed the techniques for using AIC Conservation Consolidant Resins to stabilize the three layers of plaster in the frescoes. These frescoes remain on display to this day, in fully stable condition and with no need for periodic conservation. These conservation techniques have not changed over the last 50+ years. 3

I have done major conservation work on the (Victor Arnautoff) Coit Tower Frescoes, the City Club Rivera Fresco, the City College Rivera Frescoes, the Jewish Center Fresco, Jose Clemente Orozco fresco (Pomona College), Rico Lebrun Fresco (Pomona College), four major Ramos Martinez frescoes (removed and re-installed), and the Peter Hurd fresco (Houston MD Anderson Building (removed and transported to Artesia Public Library). NZA has also done extensive conservation work in India on Frescoes in Jaipur, and Nanda Kunj, and Kusham Sarova, and I have done extensive conservation studies on the frescoes in the Taj Mahal, the Govinda Deva Temple in Jaipur, and the Jaipur City Palace. Please see the section of my CV entitled "Partial List of Murals and Out of Door Art Conserved."

A. REMOVING AND PRESERVING THE ZAKHEIM MURALS IS TECHNICALLY FEASIBLE. 4

Bernard Zakheim created the frescoes on the interior concrete walls of Toland Hall by installing a wire mesh (also known as an expanded metal lath) across the entire surface of the

concrete wall to be plastered and painted. To this mesh, the artist applied two layers of base plaster (known as the "Arriccio" layers), then a third, surface layer of lime plaster (known as the "Intonaco" layer), on which the artist painted the murals.

The Intonaco layer was plastered a few square feet at a time on each day for 12 hours (open time) for the artist to paint using only earth pigments in water into the fresh lime plaster. Each completed daily section is known as the "Giornata."

The frescoes are held in place and secured to the concrete wall of the building by thin baling wire running through and attached to the exterior surface of the concrete wall. Thus, the frescoes are "floating" on the concrete wall.

There are three structural challenges to be met in order to safely remove the frescoes without damages.

1. There will be areas of "delamination" (separation) of the 1/8-inch-thick marble dust/lime plaster finish layer from the rough plaster layer immediately beneath the finish layer.

The Intonaco plaster layer is hard and brittle, and tends to "separate" from the Arriccio layers when dry. This dynamic is exacerbated by the fact that only a few square feet are plastered for the artist to decorate each day (each completed daily section is known as the "Giornata").

This delamination can and must be treated by both wet saturation (with low viscosity AIC Conservation Resin) of the Intonaco layer, as well as injection by syringe of a higher viscosity AIC Conservation Resin into the gap between the Intonaco and Arriccio layers. This treatment will prevent them from ever separating regardless of shock, weather conditions, temperature variations, storage conditions, etc.

2. There will be a tendency for the two Arriccio (substrate) layers of rough plaster to crack, crumble or be eroded by water exposure, which will weaken these two layers beneath the Intonaco (white lime plaster).

This crumbling and cracking will be consolidated by the AIC Conservation Resins applied by spray and brush. Any remaining separated or crumbled areas can be treated with a further application of AIC Conservation Resins prior to applying Conservation Plaster to the damaged or crumbled areas.

The procedure for addressing these concerns and successfully removing the murals is well-established and technically feasible, as follows:

4 cont.

5

Conserving the Front Surface, Lime plaster Layer and Underlying Plaster Layers.

1. Before removing a fresco, the surface must be cleaned with water miscible cleaners as well as carefully chosen solvent based cleaners. (The cleaning removes, grime, wax, dust and other pollutants from the pristine surface of the 1/8 thick lime plaster surface.)

2. As soon as the surface of the fresco has been carefully cleaned, a saturation of an AIC Museum Grade Conservation Resin in Conservation Solvent is applied, either by brush, spray, or both. This treatment allows the resins to absorb into (or even completely penetrate through the lime plaster/ fresco- paint layer. The resins also fill and strengthens any visible, or even invisible cracks in the lime plaster, so that pieces of painted lime plaster will not fall away from the surface.

Injection of a higher viscosity AIC Conservation Resin in Solvents can be accomplished using a conservation grade syringe with a metal injection tube. The tube introduces the resin between the Arriccio and Intonaco layers.

3. Loss areas (of any size) caused by physical or water damage are then saturated with Conservation Resins to penetrate damaged, underlying plaster layers so that crumbly or shattered areas become quite solid. Loss areas can now be filled with tooling plaster, topped with fresh fresco lime plaster. All such areas are then saturated with the same Conservation Resin in Solvents used on the front surface of the fresco.

4. When completely dry, a “non-woven” fabric is applied in two or more layers to the surface of the conserved fresco, using easily removable adhesives.

Supporting the Front of the Fresco.

5. A wooden platform “drawbridge” is built in front of each fresco panel using 2x12 lumber faced with 5/8” plywood on each side glued in place. Each “drawbridge” platform will have “pivots” below the fresco level so that the “drawbridge” can be raised and lowered easily with chain hoists. A curved plywood shape will be installed on each of the drawbridges to match the curvature of the curved fresco panels (12” from flat by 14’ wide.) The curved support above the drawbridge will be padded with a solid piece of 3" soft foam rubber.

6. The hollow white plaster columns on either side of each curved fresco panel will be removed using fine toothed power saws (and vacuum cleaners). All other white plaster surrounding the frescoes will be removed at this time as well.

7. The drawbridge is then raised from horizontal to vertical (using a chain hoist) and then placed firmly against the fresco surface (with the 3" foam rubber in place.) Each

5 cont.

drawbridge is then bolted with threaded rod to the solid concrete structural wall behind the frescoes.

Separating the Fresco from the Support Wall.

8. Using a long-handled tree trimming hand saw with a metal blade, all wires and thin channels holding the fresco panel to the structural concrete wall will be separated from the frescoes until each Fresco Panel is standing free.

9. Using the chain hoists, each fresco panel will be lowered on the drawbridge to a horizontal position, fully cushioned by the 3" foam rubber over the drawbridge curve.

10. At this point all redundant plaster “globs” poking through the expanded metal lath can be mechanically removed, and all extra metal channels removed in order to make the back of the fresco as smooth as possible without weakening its infrastructure.

Consolidating the Back and Substance of the Fresco.

11. All dust and gravel residue will be vacuumed from the back of each curved fresco panel.

5 cont.

12. Using a wide tapered drill bit, carefully drilled holes (usually 8"x8" from hole to hole) will be drilled through the expanded metal lath and the first two layers of plaster from the rear forward, and all dust will be vacuumed away.

13. A 3/4" inch carbon steel drill bit will be used, very carefully by hand, to "twist down" through the last of the rough plaster until the "white" of the 1/8" lime plaster is encountered, but not penetrated. All dust will be vacuumed away.

14. Thin Viscosity AIC Conservation Resin (Paraloid B-66 or B-44 or B-72) will then be applied to the two rough plaster layers with a brush until full saturation has been accomplished. (Several layers must be applied, and when soaked in, several more layers applied, until the surface will accept no more solvent based resin).

15. When fully dried (to the core) the drill holes are then painted with a high index Acrylic emulsion, and when still wet, the holes are filled with a high-grade tooling plaster such as Hydro Stone, or Ultra Cal.

Completing the Infrastructure and Readying for Transport.

16. A steel grid (composed of galvanized 20-gauge 2"x4" or 2"x6" "wall studs" bolted "back to back") is then applied to the back (and flat) of each curved fresco piece.

17. Polyester resin (or low viscosity epoxy resin) is then used to saturate fiberglass cloth and fiberglass matting that will then adhere the steel structure to the now "solid as a rock" consolidated back each of the curved fresco panels.

18. Plywood will then be attached to the steel studs attached to the fiber-glassed back of each panel with heavy sheet metal screws.

19. Double plywood will then be attached to all four sides of the now encapsulated Fresco Panel, joining the plywood at the back of the panel to the drawbridge at the front of the panel.

20. The drawbridge will remain on the fresco panel during transport and storage. The drawbridge will be removed only when the frescoes are in front of the new installation location, at which point it can be discarded.

Results.

21. The fresco panels are now virtually indestructible. They could be dropped from a truck without damage. They can also be stored without regard to temperature or moisture control.

22. The life expectancy of the frescoes saturated with AIC Conservation Resins should extend (without maintenance or further aesthetic treatment) for at least several hundred years.

23. When re-installed, no maintenance will be required, other than occasional dust removal.

Notes.

The Conservation Resins used to treat the Toland Hall Frescoes will be the same AIC Conservation Resins used more than 20 years ago to consolidate the Sistine Chapel Frescoes of Michelangelo Buonarroti.

The 10'x12' Cole Hall Frescoes (now in HSW 2) were successfully conserved in place, removed, and reinstalled using the exact same techniques described above. In over 55 years, no further conservation work or even routine maintenance has been required, and the two frescoes have endured many earthquakes with absolutely no damage.

5 cont.

B. REMOVING AND PRESERVING THE ZAKHEIM MURALS IS FINANCIALLY FEASIBLE.

6

In my opinion, the work described above to safely and successfully conserve, remove, store, and reinstall the Zakheim Murals can be done by a competent and properly supervised art conservator for less than the $1,500,000 “Target Contract Amount” or the $1,800,000

"Maximum Acceptance Cost" set forth in the Advertisement for Proposals for UCSF Project No.: PRJ-000293; Contract No.: PRJ-000293-CC-001, that I received in early August, 2020. In fact, before UCSF issued its RFP in August, 2020, NZA submitted a bid proposal to UCSF offering to conserve and remove the murals for an amount not to exceed $1,000,000.

Considering the cultural, historic, and artistic value these murals have provided for over seventy years to UCSF, the City of San Francisco, the state of California and the entire country, and considering the vast expenditure that UCSF is undertaking to carry out the Comprehensive Parnassus Heights Plan, the relatively small expense required to preserve these works of art is eminently feasible. 6 cont.

Thank you for your attention to this matter.

Nathan Zakheim
Director, NZA

Responses to Comments from Nathan Zakheim Associates

O-NZA-1 This introductory remark is noted, however, it does not require a response.

O-NZA-2 The commenter asserts that the Draft EIR's conclusion that conserving and moving the Zakheim murals is infeasible is not supported by substantial evidence. The commenter states that the neither of the two studies cited in the Draft EIR presents any conclusion or expert opinion that it is infeasible to conserve, remove, and preserve the murals. Please refer to Master Response 11: Toland Hall Murals.

O-NZA-3 The commenter summarizes his qualifications. This comment is noted; no response is required.

O-NZA-4 The commenter asserts that removing and preserving the Zakheim murals is technically feasible. The commenter describes the process in which the murals were installed and identifies structural challenges that need to be addressed to remove the frescoes. Please refer to Master Response 11: Toland Hall Murals.

O-NZA-5 The commenter states that it is technically feasible to remove and preserve the Zakheim murals and describes a series of steps that would address the structural challenges identified in comment O-NZA-4. Please refer to Master Response 11: Toland Hall Murals.

O-NZA-6 The commenter asserts that removing and preserving the Zakheim murals is financially feasible. The commenter opines that the conservation, removal, storage, and reinstallation of the murals can be done for less than $1.5 million "Target Contract Amount" or the $1.8 million "Maximum Acceptance Cost" set forth in UCSF's August 2020 Advertisement for Proposals. The commenter's suggestions for conserving, removing, and transporting the Murals will be considered by UCSF and its consultants as they implement plans to remove and store the Murals.

Please note Comment Letter O-NZA contained an attachment which did not comment directly on the Draft EIR. This attachment is included in Appendix O-NZA in this Comments and Responses document.

RE: UCSF COMPREHENSIVE PARNASSUS HEIGHTS PLAN
Draft Environmental Impact Report
State Clearinghouse Number 2020010175

Dear Ms. Wong:

The subject Draft EIR is legally inadequate.

The EIR fails to consider a range of reasonable alternatives for all or part of the 2 million square-feet of new development proposed for the Parnassus Heights campus.

The EIR should be revised to identify, fully evaluate, and recirculate for public review and comment potentially-feasible alternatives that:

- Implement only the existing 2014 Long Range Development Plan for the Parnassus Heights campus, totaling approximately 400,000 square feet of new development.

- Locate additional proposed development of about 1,600,000 square feet at one of the four already-approved major development sites along the City's Third Street Corridor:

    - The Mission Rock Project
    - The Pier 70 Project
    - The Potrero Power Plan Project
    - The Candlestick Redevelopment Project

1

All four of these very large master planned projects are in early/planning stages of development and could be readily modified to fully accommodate expanded UCSF development of this scale and meet *fundamental* project objectives. (*In re Bay-Delta* (2008) 43 Cal.4th 1143.) That of course is exactly what happened once before in 1996 with the decision to locate a new UCSF research campus in the already-approved Mission Bay Redevelopment Project.

All four of these sites are inarguably environmentally superior because they are much closer to the Mission Bay campus and directly connect to it by the existing MUNI Metro Third Street route that has far more potential capacity than is now being utilized.

USCF expansion would be accommodated by supplanting and replacing an equal amount of the commercial development currently-proposed on any of these four sites.

There would be little or no net new environmental impacts at the four existing development sites, and the very significant environmental impacts of net new development at the constrained Parnassus Heights campus would be avoided. CEQA mandates no less: Guidelines section 15126.6 (f)(2) pronounces that "the key question and first step" in analysis of alternate sites is whether any of a project's significant effects "would be avoided or substantially lessened by putting the project in another location."

Otherwise, the current UCSF proposal in Parnassus Heights is absolutely insane.

Re: Draft Environmental Report for the Comprehensive Parnassus Heights Plan

Dear Ms. Wong,

Thank you for the opportunity to comment on the DEIR for the CPHP. GGAS is a non-profit organization with over 7,000 members in San Francisco and the East Bay. Our mission is to engage people to experience the wonder of birds and translate that wonder into action to conserve and restore natural ecosystems, focusing on birds, other wildlife, and their habitats for the benefit of humanity and the earth's biological diversity. 1

The Parnassus Heights campus is the oldest UCSF campus, and any project that brings the campus up to current seismic standards and modern research and clinical standards needs to be substantial. The preferred alternative in the CPHP proposes to increase the square footage of the UCSF Parnassus from 3.92 million to 5.97 million. This represents a massive increase in urban development with proposed stages of demolition and construction that span 30 years. The size, scale, and duration of this project will inevitably have a negative effect on birds and other wildlife that inhabit this part of the city. As we have learned from the bird surveys conducted in response to the Vegetative Management Plan, Mount Sutro is an important habitat for both breeding and overwintering bird species. 2

We strongly support the proposed bird safe glass for the buildings and wind screens, lighting, and collision mitigation strategies outlined in the DEIR, and ask that UCSF and their contracted architects use the most up-to-date bird safe design and building practices in both the Aldea renovations and new Hospital design. Without significant mitigation, including placement location of buildings, materials, design, and lighting, the new Hospital and Aldea buildings will be detrimental to birds. 3

One positive aspect of the plan is the 'Park to Peak' route that would be created during the reorganization of the campus. This way through the campus would improve access to the Mount Sutro Trail system. If it can be realized, public transit users, and users from further away, will be able to access the open space without walking up Medical Center Way (very narrow or no sidewalk in the lower portion near the main campus). 4

The new hospital in the preferred alternative will encroach on the Mount Sutro OSP, removing about ¼ acre out of 61 acres. The site of this subtraction is not prime bird nesting territory; however the mature trees in and adjacent to this site provide important habitat for migrating birds and wintering flocks. The proposed mitigation for decrease in the OSP is a small plot that is already effectively part of the open space, and it looks like a change in designation. By itself, this would be insufficient. However, it is adjacent to the sites of the Surge and Woods buildings, which are slated to be torn down and converted into Open Space according to the Long Range Development plan. We would consider the addition of all 5

GOLDEN GATE AUDUBON SOCIETY
2530 San Pablo Avenue, Suite G, Berkeley, CA 94702
phone 510.843.2222 *web* www.goldengateaudubon.org *email* ggas@goldengateaudubon.org

three pieces sufficient mitigation to the ¼ acre removed. Continuity of the OSP is essential as a habitat for wildlife.

5 cont.

The DEIR notes other green spaces on the campus that will also be negatively impacted by demolition and construction outlined in the Plan. Most notable, a small redwood grove adjacent to UC Hall will be eliminated along with street trees at other sites. In the long term, proposed additional green space on the Campus includes an expanded Sanders Court and Promenade, a terrace over Millberry Union, and several small 'pocket' plots. UCSF has mentioned "green roofs' as a building principle. Incorporation of green roofs represents huge opportunity to increase biodiversity while increasing campus space. The cost can be equivalent to a regular rooftop depending on what is planted there. Local native groundcovers would be considered least expensive in terms of installation and maintenance. The plan also proposes extensive street landscaping on Parnassus, around the Irving St entrance, and connecting toward Golden Gate Park as part of the Park to Peaks route. It will take years for these planned landscapes to mature, but in the end the campus does look greener.

6

A glaring omission in the DEIR is how these new green spaces are going to be landscaped. In the Oct 19, 2019 CPHP (Updated June, 2020) Final Report, the use of native plants is mentioned--along with the use of other "adapted or culturally significant" plants. GGAS strongly favors native plants for their much greater value to the ecosystem, providing edible berries and habitat for insects which in turn support birds and other wildlife. Much research has emerged in recent years on the value of native plants in urban settings. Many adapted plants may survive and do not become invasive, but they simply do not add the same ecosystem value. We strongly encourage a commitment to at least 80% natives throughout the new landscaping scheme.

7

We also advocate continued support for the Sutro Stewards and their native plant nursery, which propagates hyper local plants. Craig Dawson, Senior Program Advisor for the Sutro Stewards, voiced a number of concerns about the impact of the increased population density at Aldea and height of new buildings immediately adjacent to the core of the Mount Sutro OSP. We share the Stewards' concerns, and we hope that adjustments can be made to the current plan to mitigate their concerns without impacting the goal of increased housing.

8

Please notify us of all proceedings and materials relating to this project.

Sincerely,

Pam Young

Pam Young
Executive Director

Responses to Comments from Golden Gate Audubon Society

O-GGAS-1 The commenter describes the Golden Gate Audubon Society's purpose and mission. The comment is noted; no response is required.

O-GGAS-2 The commenter notes the increase in size of the campus site at buildout and states that this large and long-duration project will have a negative effect on birds and other wildlife, and that the Reserve is an important breeding and overwintering site for migratory birds. All potential impacts to wildlife, including birds, from construction and operation throughout the duration of the CPHP are adequately addressed in Section 4.3, Biological Resources and feasibly mitigated to a less than significant level.

O-GGAS-3 The commenter expresses support for the proposed bird-safe glass and other measures in CPHP Mitigation Measure BIO-2b, and requests the best feasible design and practices be incorporated into the Aldea Housing Densification and New Hospital projects to mitigate this impact. The potential impact from development under the CPHP to result in bird strikes is addressed in Impact BIO-2 and mitigated by CPHP Mitigation Measure BIO-2b to a less than significant level. As discussed in Impact BIO-2, CPHP Mitigation Measure BIO-2b includes bird-safe design measures generally consistent with the City of San Francisco's *Standards for Bird-Safe Buildings*.

O-GGAS-4 The commenter expresses support for the "Park to Peak" route. The comment is acknowledged, however, please note that the Park to Peak route is not specifically an element of the CPHP. Nevertheless, the CPHP would be compatible with the proposed Park to Peak improvements, and furthermore, the CPHP would coordinate with planned trailheads to Mount Sutro.

O-GGAS-5 The commenter indicates the site of the potential removal of mature trees in the Reserve under the CPHP provides habitat for migrating birds and wintering flocks. As discussed in Responses O-GGAS-2 and O-GGAS-3, above, the Draft EIR analyzes all potential impacts to birds under the CPHP. Please refer to Impact BIO-2 in the Draft EIR which addresses potential effects to migrating birds, including temporary measures to prevent harm to migrating birds during construction, and bird-safe building treatments to reduce potential for bird strikes. In addition, Impact BIO-1 addresses potential effects on nesting birds during construction, including the implementation of pre-construction surveys during the nesting season, and use of buffer zones as needed.

The commenter suggests adding the sites of the Surge and Woods buildings (that are planned to be demolished as authorized under the 2014 LRDP) as additional areas to be designated as Open Space Reserve under the CPHP. As explained in the Draft EIR Chapter 3, Project Description page 3-19, UCSF proposes to replace any area of the Reserve that may be lost due to new development under the CPHP by designating new Reserve area elsewhere on the campus site in an

amount equal to or greater than the area lost. As noted in the Project Description, page 3-39, the CPHP proposes an approximate 0.4-acre area of undeveloped land within the Surge/Woods parking area to be redesignated from Support to Open Space Reserve. As such, it would provide conserved open space that would not be developed for any other purpose. The inclusion of area redesignated Open Space Reserve would adequately offset any potential existing Open Space Reserve land that would be lost under the CPHP. Nevertheless, this suggestion from the commenter is part of the public record on the CPHP, and will be considered by the UC decision-makers prior to considering CPHP approval.

O-GGAS-6 The commenter notes that the Draft EIR discusses other green spaces that would be impacted by the CPHP, including the redwood grove along Parnassus Avenue. All potential environmental effects associated with the tree removal on the campus site under the CPHP, including this redwood grove, are disclosed in the CPHP Draft EIR and mitigated to the extent feasible.

The commenter also refers to increases in green spaces areas on the campus site proposed under the CPHP, including at Millberry Terrace, expanded Saunders Court and proposed Promenade, and indicates the benefits of incorporation of green roofs, including to increase biodiversity. This suggestion from the commenter does not address the adequacy of the Draft EIR but is part of the public record on the CPHP, and will be considered by the UC decision-makers prior to considering CPHP approval.

O-GGAS-7 The commenter indicates an omission in the Draft EIR is how green spaces proposed under the CPHP would be landscaped. Please note that only programmatic information for the proposed open space areas are known at this time; as such, no detailed landscaping plan is available at this time. The commenter notes that the CPHP indicates the use of native plants, and the commenter encourages the use native plants for their value for the ecosystem, and providing edible berries and habitat for insects, which supports birds and other wildlife. This suggestion from the commenter is part of the public record on the CPHP, and will be considered by the UC decision-makers prior to considering CPHP approval.

O-GGAS-8 The commenter notes concerns from the Sutro Stewards about the impact of increased population density at Aldea and the height of new buildings adjacent to the core of the Reserve. Please refer to responses to Comment Letter O-SUT in this Comments and Responses document.

Subject: Comments on UCSF Comprehensive Parnassus Heights Plan Draft EIR – State Clearinghouse Number 2020010175

I write on behalf of the National New Deal Preservation Association, a nonprofit organization created to promote the identification, documentation, preservation and education of people about the New Deal. 1

We have a major issue regarding the Draft Environmental Impact Report (DEIR) dated July 13, 2020 for the proposed Comprehensive Parnassus Heights Plan (CPHP). The DEIR's Chapter 4, Cultural Resources and Tribal Resources Section 4.4.4 "Impacts and Mitigation Measures," proposes a plan to demolish "History of Medicine in California" frescoes created by Bernard Zakheim in the Toland Hall auditorium in UC Hall. The project alternatives provided in this DEIR are inadequate and inappropriate, and new alternatives need to be developed for the final CPHP EIR to preserve these murals and display them for the public on the UCSF Parnassus Heights campus. 2

These murals, created in the 1930s through support from the Works Progress Administration, have educated and inspired generations of the

public and students of UCSF. They are threatened with destruction when UCSF demolishes Toland Hall to make way for a new building. However, the murals are entirely removable and could be conserved, removed, stored, and reinstalled by UCSF in its new facility. Instead UCSF contacted the family of the artist and asked it to remove the murals at the family's expense. Additionally the ownership status is under review by the federal General Services Administration calling into question UCSF's right to destroy artwork it does not own.

We disagree with the actions to UCSF in this matter. We are also aware that the new Mission Bay campus of UCSF has a public art program and a percentage of construction cost was dedicated to mount art in the new facility. Surely a small fraction of new construction cost would fund a public art collection that could include the historic Zakheim murals and many other new art works. Why is this precedent not being followed when UCSF builds a new multi-billion dollar facility on Parnassus Heights?

This is all particularly disturbing because the multicultural content of the murals portrays the long history of the diverse people who have participated in the healing arts within our state. Why would UCSF suppress this history at a time when California is seen as a state that has made some successful strides in tackling the issue of diversity within the health professions?

2 cont.

Although our major issue is with the murals, we are also concerned about the "Carved Frame" oak carving (Carved Frame) by Michael Von Meyer and James Warrender that was also commissioned as part of the WPA Federal Art Project and is located in Toland Hall. Likewise it should be conserved, removed, stored, and reinstalled by UCSF in its new facilities.

3

Both the murals and the wood carving are part of an amazing array of public art in San Francisco created by the New Deal. This heritage is recognized worldwide and brings viewers to the City to see it. Many of them go to Coit Tower where Bernard Zakheim's work is also represented. Stripping part of this legacy from public view is unacceptable; conversely ways of making it more accessible should be sought.

The murals are removable with appropriate care, and this can be done at fraction of the cost estimated in the DEIR. Alternatives to accomplish this should be presented.

4

The DEIR states UCSF is not bound by local landmark status, stating it is above any local regulations or resolutions. In its arrogance, does it also feel it is above local sentiment and local pride in the City's artistic and historical legacy?

We urge the Board of Regents to address the general issue of public art. The purpose of Dr. J. Michael Bishop, Nobel Laureate and Emeritus UCSF Chancellor, in establishing the Mission Bay art collection was "to create an

5

environment that will be a credit and benefit to the entire community, a stimulating and pleasant place to work and visit, and a permanent legacy to the city." This purpose should apply equally to UCSF Parnassus Heights. Why is Chancellor Hawgood not advocating for public art in general and in particular defending the Zakheim murals?

San Francisco and many other California cities have percent for art programs, as do 23 states. California and its public university system do not, and this allows UC at whim to have a percent for art policy or not. Now is the time for the UC Regents to correct this and develop a UC statewide percent for art program, as well as developing an alternative to destroying the art in Toland Hall.

5 cont.

We demand the CPHP EIR include project alternatives that protect all of the art work in Toland Hall and develop a plan for its display in preferably a new location on the UCSF Parnassus Heights campus with increased public accessibility and interpretation.

6

On a personal note as a graduate of UC with a bachelor's and master's degree and a son with a UC doctorate degree, I am frankly embarrassed by the thought of a UC campus proposing the destruction of a work of historic public art. A world-class institution does not behave in this manner.

7

Sincerely,

Harvey Smith, President <!--[if !vml]-->

Responses to Comments from National New Deal Preservation Association

O-NNDPA-1 This introductory remark is noted, however, it requires no response.

O-NNDPA-2 The commenter states that the alternatives in the Draft EIR are inadequate and new alternatives to preserve the murals should be developed. The commenter also asserts that the murals ownership status is under review by the General Services Administration and thus, UCSF does not have the right to destroy artwork it does not own. Please refer to Master Response 11: Toland Hall Murals.

O-NNDPA-3 The commenter notes a carved frame oak carving in Toland Hall. The comment is noted; please refer to Master Response 11: Toland Hall Murals. The podium designed by Michael von Meyer has been relocated and will be reused in an educational setting on campus. The chalkboard surround by the same designer will be removed and stored on campus until an appropriate location is determined.

O-NNDPA-4 The commenter asserts that the Zakheim murals can be removed with appropriate care and done at a fraction of the cost estimated in the Draft EIR. Please refer to Master Response 11: Toland Hall Murals.

O-NNDPA-5 The commenter urges the Board of Regents to address the general issue of public art and states that the purpose of establishing the Mission Bay art collection should apply equally to the UCSF Parnassus Heights campus site. Please refer to Master Response 11: Toland Hall Murals.

O-NNDPA-6 The commenter requests the Draft EIR should include alternatives that would protect all of the art work in Toland Hall and develop a plan to display it in a new location at the UCSF Parnassus Heights campus site. Please refer to Master Response 11: Toland Hall Murals.

O-NNDPA-7 The commenter expresses opinions on the merits of the CPHP, but which do not address the adequacy of the Draft EIR. No response is required.

Subject: Preservation of Zakheim Frescoes in Toland Hall Re: Comprehensive Parnassus Heights Plan Draft EIR (SCN 2020010175)
Date: Friday, September 11, 2020 3:47:15 PM

Dear Ms. Wong:

On behalf of the San Francisco Preservation Consortium (Consortium), I am writing regarding Bernard Zakheim's 1936 ten-panel fresco in Toland Hall depicting the "History of Medicine in California." The frescoes are significant for their association with the history of the Works Project Administration's (WPA) Federal Art Project (FPA); and as an excellent example of the work of master artist and muralist, Bernard Zakheim, that display distinctive characteristics of New Deal-era progressive mural artwork. The Consortium urges UCSF to preserve these federally-funded frescoes and to ensure they remain accessible to the public for viewing--digital preservation is not an acceptable alternative. 1

On July 28, 2020, the San Francisco Board of Supervisors voted unanimously to approve a Resolution to initiate Landmark Designation of the "History of Medicine in California" frescoes per: https://sfbos.org/sites/default/files/r0355-20.pdf

On August 19, 2020, the San Francisco Historic Preservation Commission voted unanimously to recommend to the Board of Supervisors Landmark Designation of the "History of Medicine in California" frescoes in UCSF's Toland Hall as an individual Article 10 Landmark pursuant to Section 1004.2 of the Planning Code per: https://commissions.sfplanning.org/hpcpackets/2020-006641DES.pdf 2

Nathan Zakheim, art conservator, suggested that UCSF should "design a square room in the new campus" specifically for the artwork or put it in the library." per: https://commissions.sfplanning.org/hpcpackets/2020-006641DES.pdf

Further, "The General Services Administration (GSA), responsible for managing the surviving pieces of WPA-era art, has reportedly told the school that it considers the murals on loan from the federal government. UCSF and the GSA are now reportedly in talks to preserve the mural, but if funding fails to come through, the school will reach out to other institutions and museums to gauge their interests. . . ."
per: https://www.archpaper.com/2020/07/federal-government-reaches-out-to-ucsf-over-endangered-wpa-murals 3

Established in 2001, the Consortium works in partnership with individuals, neighborhood groups and other associations to advocate for effective land use legislation and responsible historic, architectural and cultural preservation practices in accordance with accepted professional standards and best practices. The Consortium's advocacy ensures that the city and its neighborhoods sustain their living history and character as they evolve. Towards that end, we urge UCSF to ensure Bernard Zakheim's "History of Medicine in California" frescoes remain accessible to the public. 4

Sincerely,

Cynthia Servetnick, eGroup Moderator
San Francisco Preservation Consortium

Responses to Comments from San Francisco Preservation Consortium

O-SFPC-1 The commenter urges UCSF to preserve the Zakheim murals and keep them accessible for public viewing. The commenter states that digital preservation is not an acceptable alternative. Please refer to Master Response 11: Toland Hall Murals.

O-SFPC-2 The commenter describes the San Francisco Board of Supervisors and San Francisco Historic Preservation Commissions votes to initiate landmark designation of the "History of Medicine in California" frescoes in July and August, 2020. The comment is noted. In fact, on November 25, 2020, the Mayor of San Francisco approved Ordinance 241-20 amending the Planning Code to designate the Zakheim Murals as a City Landmark consistent with the standards set forth in Article 10 of the Planning Code. This has been noted in a revision to the Draft EIR. Please refer to Section 8.5 of this Comments and Responses document for the proposed revision. Please also refer to Master Response 11: Toland Hall Murals.

O-SFPC-3 The commenter summarizes Nathan Zakheim suggestion that UCSF design a room specifically for the artwork or put it in the library and the ongoing discussions between the General Services Administration and UCSF. Please refer to Master Response 11: Toland Hall Murals.

O-SFPC-4 The commenter urges UCSF to ensure the Zakheim frescoes remain accessible to the public. Please refer to Master Response 11: Toland Hall Murals.

SAN FRANCISCO BRANCH *NAACP*

September 3, 2020

The End of History?

Our country is facing a reckoning. In the coming weeks, irreplaceable murals will meet an accounting of their own.

Ten frescoes, created in the mid-1930s by renowned artist Bernard Zakheim, depicting the history of medicine in California, are in a building slated for destruction - which has been deemed seismically unsafe. The murals are located in Toland Hall, a lecture room in UC Hall at the University of California San Francisco.

The university is taking proposals for its removal and storage, but there are currently no plans for their reinstallation. Much of the concern is centered on the haste with which these fresco panels are being removed. Without proper plans for preservation or reinstallation, there is a high risk of damage. Furthermore, if they are removed and allowed to languish in storage, it would be as though they had fallen to the wrecking ball in the first place.

Someday, we will look back at this global pandemic and remember both the actions that saved lives, as well as the inaction that cost us so much. UCSF has a legacy of medical research and breakthroughs, and we appreciate how it has responded to this current health crisis. Likewise, actions are needed to preserve the record of its medical leadership in the Zakheim "History of Medicine in California" murals on the UCSF campus and ensure that this visual legacy is not destroyed.

For our part, one significant historical figure is the renowned African American nurse, midwife, and healer Biddy Mason, one of the founders of the FAME church in Los Angeles.

There is no denying that now, as it has in the past, UCSF is doing great things. However, if our plans for the future destroy our history, even great things are not necessarily good things.

It's ironic in the same year we have a female African-Asian American running as a vice-presidential candidate, UCSF is considering removing New Deal/WPA murals, one of which is of a renowned historical African American female. Then place these murals into an uncontrolled storage environment without a long-term plan of where and when to reinstall these murals for public access. Bernard Zakheim's priceless murals deserve better respect and treatment.

Re: Draft EIR for UCSF Comprehensive Parnassus Heights Plan

Dear Ms. Wong:

On behalf of San Francisco Heritage (Heritage), thank you for the opportunity to comment on the Draft Environmental Impact Report (EIR) for the $3.8 billion UCSF Comprehensive Parnassus Heights Plan.[1] With support from the San Francisco Historic Preservation Fund Committee, Heritage recently completed a citywide historic context statement documenting San Francisco's rich New Deal-era legacy. Authored by Christopher VerPlanck and Donna Graves, the four-year study represents the most comprehensive history of publicly-commissioned art, architecture, and infrastructure in San Francisco in the 1930s and 1940s, including a section on the Bernard Zakheim *History of Medicine in California* frescos. 1

Although the UCSF Comprehensive Parnassus Heights Plan would adversely impact numerous historic resources, Heritage's EIR comments focus on the proposed destruction of the Zakheim frescos in Toland Hall (which is attached to UC Hall). The EIR fails to evaluate the individual significance of the frescos or consider potentially feasible alternatives to their destruction. UCSF has rejected options for their safe removal and reinstallation due to the "prohibitive" cost, despite providing widely varying cost estimates.[2] 2

In addition to its responsibilities under CEQA, UCSF has a heightened legal and moral responsibility as steward of this federally-owned historic artwork, commissioned by and for the enjoyment of the public. Because the Zakheim frescos are on loan from the federal government, any decision regarding their removal and/or disposition requires federal approval and is an "undertaking" requiring prior federal consultation under Section 106 of the National Historic Preservation Act. As a state agency, UCSF must also consult with the 3

[1] UCSF Capital Financial Plan – 2019-2025, pp.94, 97.
[2] The $7.6 million estimate to relocate the frescos in the EIR is more than four times greater than the $1.8 million budget in UCSF's Request for Proposals for the same or similar scope of work.

State Office of Historic Preservation "early in the planning processes" regarding the proposed demolition or alteration of historic resources under the Comprehensive Parnassus Heights Plan.[3] Neither consultation process has been formally initiated by UCSF to date.

3 cont.

A. The site-specific *History of Medicine in California* fresco cycle is an individual historic resource under CEQA

The EIR fails to evaluate the eligibility of the *History of Medicine* fresco cycle as a standalone historic resource under CEQA. Instead, the EIR identifies UC Hall as eligible for the California Register while noting that the Toland Hall murals contribute to the building's significance. It is important for the EIR to recognize the individual eligibility of the frescos—which are arguably more significant than any single building slated for demolition—in order to accurately gauge the project's impacts on historic resources and to focus the development of less-harmful preservation alternatives.

The pending San Francisco City Landmark designation is clear evidence that the frescos are individually eligible for historic designation as a collection of objects. On August 19, 2020, the San Francisco Historic Preservation Commission (HPC) unanimously recommended designation of the frescos "as they are individually eligible for Article 10 Landmark designation for association with the history of the Works Project Administration's Federal Art Project, as an excellent example of New Deal-era progressive mural artwork, and as an important example of the work of master artist and muralist, Bernard Zakheim."[4]

4

In contrast to other New Deal-era artworks, *History of Medicine* is also notable for its positive depictions of Native Americans and African-Americans, especially Bridget "Biddy" Mason (1818–1891), shown working beside U.S. Army Surgeon John S. Griffin. Mason was a formerly enslaved African-American nurse, midwife, and herbal medicine practitioner employed in Dr. Griffin's civil medical practice. In Zakheim's mural the figure now assumed to be Mason is composed in the center of a scene administering treatment, a position of authority: a rare positive and powerful depiction of an African-American in public art for the time.

History of Medicine is a site-specific fresco cycle, with its subject matter and depictions inspired by the mission and history of UCSF's medical school. As noted in the San Francisco New Deal-era historic context statement, the frescos were commissioned by UCSF to educate medical students about the history of their field. They portray an abundance of specific events and details drawn from extensive research by Zakheim and his assistant, Phyllis Wrightson. The University provided them access to medical faculty for interviews and the University's collection on the history of medicine.

Given its ambitious scope, artistic values, and progressive depictions, *History of Medicine* is likely eligible for inclusion in the National Register of Historic Places. There are

[3] PRC Sections 5024, 5024.5; EIR, pp. 4.4-12-4.4-13.
[4] Planning Department Staff Report to HPC, August 19, 2020.

numerous precedents of murals listed in the National Register, including two contemporaneous WPA mural series that are National Historic Landmarks: *Detroit Industry Murals* by Diego Rivera (1932-1933, Detroit Institute of Arts) and *Epic of American Civilization Murals* by José Clemente Orozco (1932-1934, Dartmouth College). Similar to *History of Medicine*, the location of the *Epic of American Civilization Murals* in a New England college founded to educate Native Americans, was intentional for Orozco's depictions of Native peoples and is a character-defining feature of the murals.

4 cont.

B. The EIR fails to establish the infeasibility of preservation, removal, and relocation of the Zakheim frescos

A key policy under CEQA is the lead agency's duty to "take all action necessary to provide the people with…historic environmental qualities…and preserve for future generations… examples of major periods of California history."[5] To this end, CEQA "requires public agencies to deny approval of a project with significant adverse effects when feasible alternatives or feasible mitigation measures can substantially lessen such effects."[6] No public agency may approve a project that will result in one or more significant effects unless "specific economic, legal, social, technological, or other considerations…make infeasible the…alternatives identified in the environmental impact report."[7] The EIR must contain "evidence that additional costs…are sufficiently severe as to render it impractical to proceed with the project."[8]

As applied to the proposed project, UCSF has failed to establish the infeasibility of preservation, removal, and relocation of the Zakheim frescos. In rejecting this option, the EIR states that "the estimated $7.6 million cost…is prohibitive in light of UCSF's primary responsibility to support its academic health care mission."[9] This alleged cost in the EIR is four times the estimate in UCSF's current Request for Proposals (RFP), which sets the maximum budget at $1.8 million for the same scope of work. Even if one were to accept the $7.6 million cost at face value, it represents only a tiny fraction of the $3.8 billion total project budget, undermining UCSF's claim that saving the murals is prohibitive or economically infeasible under CEQA.

5

C. The EIR should consider alternatives to preserve the *History of Medicine* frescos and publicly display them on campus

The EIR for the UCSF Comprehensive Parnassus Heights Plan fails to consider any project alternatives that would avoid destruction of the frescos, with the exception of the "No Project" alternative. In order to fulfill CEQA's informational mandate, Heritage requests consideration of the following preservation alternatives in the EIR:

6

[5] PRC Section 21001 (b), (c).
[6] *Id.*
[7] PRC Section 21081(c).
[8] *Citizens of Goleta Valley v. Board of Supervisors*, 197 Cal.App.3d 1167, 1181 (1988).

1. Removal, conservation, and reinstallation of the frescos on campus

One potential alternative is to remove and reinstall *History of Medicine* elsewhere on the Parnassus Heights campus. Although UCSF has issued an RFP to remove and place the frescos in storage, it has not committed to reinstalling them on campus. Because of Zakheim's site-specific conception, it is essential that any plan to relocate the murals be expressly contingent on their reinstallation within a specific time frame. The HPC emphasized that the complete fresco cycle should be displayed together on campus—albeit not necessarily in Toland Hall—with Commissioner Jonathan Pearlman noting that "one of…the new spaces, especially around Millbury Union, could be designed specifically for the installation around space that would accept them in a very public location."[10]

2. Retain and incorporate Toland Hall into future campus building

A second alternative would retain Toland Hall in place and build around it. Toland Hall is a structure that stands between the two west-most extensions of UC Hall, its north wall adjacent to the south wall of UC Hall. The cost of removal and reinstallation of the frescos could be applied towards stabilization of Toland Hall in place during construction. A similar approach was successfully used to preserve and reincorporate the historic Emporium Dome (1902) into the San Francisco Centre project, completed in 2006.

6 cont.

D. Any disposition of the *History of Medicine* frescos requires federal consultation and approval under Section 106 of the National Historic Preservation Act

The General Services Administration (GSA) has confirmed that the University of California Hospital, San Francisco received a loan of the Zakheim frescos under the WPA, Federal Art Project (1935-1943) in 1937. The original loan documentation preserved the federal government's ownership interest, which was recently reasserted by GSA. If a WPA work of art is on loan to a state agency for display in a public building, as here, the state agency cannot sell or otherwise dispose of the artwork without federal approval.

Section 106 of the NHPA applies to federal "undertakings," broadly defined to include (among other things) any "project, activity or program…requiring a Federal permit, license, or approval."[11] Because GSA must authorize any disposition of the Zakheim frescos, its "approval" qualifies as a federal "undertaking" sufficient to trigger Section 106 review. For the reasons discussed above, permanently relocating the murals to a warehouse would result in an adverse effect under Section 106.[12] However, relocation conditioned on appropriate reinstallation in a new building could qualify for a finding of no adverse effect.[13]

7

[13] 36 CFR 800.5(b).

E. As a state agency, UCSF must consult with the State Office of Historic Preservation under Public Resources Code Section 5024 and Section 5024.5

The California State Legislature enacted Public Resources Code Sections 5024 and 5024.5 as part of a larger effort to establish a state program to preserve historical resources.[14] These code sections require state agencies to take specific actions to ensure preservation of historical resources under their jurisdiction, including evaluating their eligibility for national and state historic designation; maintaining an inventory of eligible and listed resources; and managing historical resources so that they retain their character-defining features.

Section 5024 requires UCSF to submit "for comment documentation for any project having the potential to affect historical resources listed in or potentially eligible for inclusion in the National Register or registered as or eligible for registration as a state historical landmark," and Section 5024.5 requires "the head of the state agency having jurisdiction over the historical resource" and the State Historic Preservation Officer to "adopt prudent and feasible measures that will eliminate or mitigate the adverse effects." UCSF must consult with the State Office of Historic Preservation "early in the planning processes" regarding the proposed demolition or alteration of historic resources under the UCSF Comprehensive Parnassus Heights Plan, including at least twelve historic buildings and structures listed in the EIR at pages 4.4-12 and 4.4-13. 8

Thank you for the opportunity to comment on the EIR for the UCSF Comprehensive Parnassus Heights Plan. Please don't hesitate to contact me at 510/282-1290 (mobile) or mbuhler@sfheritage.org should you have any questions.

Sincerely,

Mike Buhler
President & CEO

cc: Jennifer Gibson, Ph.D., GSA
Julianne Polanco, SHPO

[14] Text of PRC Sections 5024 and 5024.5 can be found at http://ohp.parks.ca.gov/pages/1071/files/Public%20Resources%20Code%205024.pdf.

Responses to Comments from San Francisco Heritage

O-SFH-1 The commenter indicates it completed a citywide historic context statement, which included the Zakheim murals in Toland Hall. The comment is noted; no response is required.

O-SFH-2 The commenter asserts that the Draft EIR fails to evaluate the individual significance of the frescoes or consider feasible alternatives. Please refer to Master Response 11: Toland Hall Murals.

O-SFH-3 The commenter asserts that because the Zakheim frescoes are on loan from the federal government, any decision regarding their removal and/or disposition would require Section 106 consultation under the National Historic Preservation Act as well as consultation with the State Office of Historic Preservation. The commenter alleges that neither consultation process has been initiated to date. Please refer to Master Response 11: Toland Hall Murals.

O-SFH-4 The commenter states that the Draft EIR fails to evaluate the individual eligibility of the "History of Medicine" frescos as a standalone historic resource under CEQA, which would help gauge the project's impacts on historic resources and focus the development of less-harmful preservation alternatives. Please refer to Master Response 11: Toland Hall Murals.

O-SFH-5 The commenter states that the Draft EIR fails to establish the infeasibility of preservation, removal, and relocation of the Zakheim frescoes. The commenter also questions UCSF's statements regarding the economic infeasibility of preserving the murals. Please refer to Master Response 11: Toland Hall Murals.

O-SFH-6 The commenter states the Draft EIR fails to consider alternatives that would preserve and publicly display the Zakheim frescoes and requests two preservation alternatives be analyzed: (1) removal, conservation, and reinstallation of the frescoes elsewhere on the Parnassus Heights campus, and (2) retain Toland Hall and incorporate it into the future campus building. Please refer to Master Response 11: Toland Hall Murals.

O-SFH-7 The commenter asserts that because the Zakheim frescoes are on loan from the federal government and the General Services Administration must authorize its disposition, the project would require section 106 consultation under the National Historic Preservation Act. Please refer to Master Response 11: Toland Hall Murals.

O-SFH-8 The commenter asserts that UCSF is required by Public Resources Code Sections 5024 and 5024.5 to consult with the State Office of Historic Preservation regarding the proposed demolition or alteration of historic resources under the proposed project.

UCSF provided notification to the California State Historic Preservation Officer (SHPO) regarding the proposed CPHP and its potential impact on historical resources by sending the agency the Notice of Preparation/Initial Study and Notice of Completion/Notice of Availability of the Draft EIR. Both notices were sent to SHPO early in the planning process. No response from SHPO was received and no further consultation is required.

September 11, 2020

Diane Wong
Principal Planner/Environmental Coordinator
UCSF Real Estate - Campus Planning
EIR@planning.ucsf.edu

Dear Ms. Wong:

Sutro Stewards has helped UCSF protect and enhance the Mount Sutro Open Space Reserve since our formation in 2006. Our mission is to build community, connect people with nature, and to protect and enhance Mount Sutro, one of the City's wildest and most beautiful green spaces. We are deeply dedicated to keeping Mount Sutro healthy and accessible. Over the past 14 years, we have increased public access through a network of trails and worked to restore and conserve native plant habitat throughout the open space. All of our work has been supported by tens of thousands of volunteers. We have a growing digital outreach base of well over 2,000 people. 1

Because of our commitment to this special place, some aspects of UCSF's proposed Comprehensive Parnassus Heights Plan are of concern, particularly the dramatic increase in the density of Aldea housing from 171 units to 504 units, and up to 762 units by 2050. This increase in population would greatly alter the transportation needs of the Aldea residents. Most impactful to open space visitors and wildlife are the proposed sites where this development would occur. We encourage you to thoroughly study and provide alternatives to the increased density at Aldea. We strongly feel that the primary site for initial housing development should be located within the Inner Sunset community near Parnassus, where residents and families have access to a large number of services and amenities, including public transit, from their front doors. UCSF has informed the community of its commitment to carbon reduction, and alternative housing studies need to clearly prove which potential housing site will meet this goal. Further, provide proof that by constructing housing in the remote Aldea location that there will not be a resulting increase in transportation needs, but rather a reduction, similar to what would result from the housing being located in the Dental School parking lot site at 5th Avenue and Kirkham Streets. We request a full quantitative analysis of both sites with emphasis on carbon footprint over a 50 year period with emphasis on the transportation needs and those impacts on both the residents occupying UCSF housing units and on the surrounding community. 2 3 4

Another concern is about the increased building heights which will potentially alter local climate, wind, and sunlight patterns. We believe all potential impacts related to aesthetics, biological resources, geology, soils, and transportation should be thoroughly evaluated and compared to the current existing conditions in Aldea. We need evaluation of direct comparison for more buildings closer together in between existing structures at lower elevation sites in Aldea so that no development extends higher than current existing rooftops, and the alternate housing site at 5th and Kirkham. We strongly encourage no increase in parking on the mountain at any new housing site, but instead an investment in public transportation as a more efficient use of space. All of these issues need to be compared to impacts of developing housing located in the Dental School parking lot area at 5th Avenue and Kirkham Streets vs Aldea. 5 6 7

Please reflect on the expected, long term impacts to work culture from the Coronavirus, Shelter in Place restrictions like those we have been living under for the last six months. It is likely that virtual work will be preferred well into the future, limiting the need for such a dramatic increase in housing. However the development of additional housing in Aldea will mean the displacement of those already residing there. Please provide details on the timing and period of removal for Aldea residents during construction and the relocation and substitute housing for these students. Why would it not be a better alternative to leave the Aldea housing in place and occupied while new housing is constructed on or close to Parnassus? Can you please provide alternatives to the displacement and loss of housing at Aldea during construction? 8 9 10

Currently, Sutro Stewards relies heavily on the Aldea Center and Aldea parking to run our community volunteer events. Increasing residential density closest to the forest and our nursery will impact our ability to use these spaces and, therefore, our 11

ability to attract volunteers who support our beneficial programs. Incorporating an expanded community space from which to run our programs at, in

a location closer to Parnassus with public transit access, would be a vast improvement to these plans (see our Health in Nature Center proposal submitted to the Office of Real Estate and Planning and the Office of Community and Government Relations, on August 14, 2020) and help reduce the need for parking at Aldea. We are also concerned that densification and increased building heights will undermine the unique aesthetics, views, wildness, and visitor experience that make Mount Sutro such a valuable place for connecting to nature. In addition, we believe that wildlife, including sensitive bird species, butterflies, mammals, and native plant populations could be adversely affected by the proposed building locations, increased light pollution, noise pollution, traffic, and human interaction. As we have learned from the bird surveys conducted in response to the Vegetative Management Plan, Mount Sutro is an important habitat for both breeding and overwintering bird species. Please study and include the impacts of proposed Aldea construction on the wildlife listed in the example above and compared to the no construction in Aldea alternative. This habitat should be prioritized and protected.

Additionally, we'd like to express our support for the 'Park to Peak' route that would be created during the reorganization of the campus. This visionary route would improve non-vehicular access to the Mount Sutro Trail system, and provide increased public nature space for the community. We strongly urge that all landscaping associated with this project and the expansion, generally, be done with San Francisco Native Plants. Furthermore, choosing plants grown by Sutro Stewards would ensure the plants local genetic integrity. Locally native plants are best adapted to our climate and support the highest numbers of local wildlife. Recent U.N. reports attest to the fact that the world is losing species and biodiversity at an alarming rate, which has been accelerated by the climate crisis. Prioritizing the creation of a wildlife corridor or habitat highway will go a long way toward staunching the damages caused by this development.

Sutro Stewards wishes to support UCSF in ensuring that Mount Sutro remains a healthy ecological oasis that provides rare urban habitat to local wildlife while providing UCSF students, faculty, staff, and San Francisco residents a natural refuge for walking, running, biking, and connecting with nature. As our city reels from the increasing impacts of climate change, as well as the Coronavirus, the sanctity of our public nature spaces is more important than ever. Please support our concerns and work to minimize impacts to the Mount Sutro Open Space by incorporating our suggestions and providing answers to our questions regarding your construction plans.

Sincerely,

Ildiko Polony
Executive Director, Sutro Stewards
ildiko@sutrostewards.org

Responses to Comments from Sutro Stewards

O-SUT-1 The commenter summarizes Sutro Stewards' history and role. These comments are noted.

O-SUT-2 The comment states concern about the increase in housing units at the Parnassus Heights campus site included as part of the project; specifically, 332 net new housing units as part of Aldea Housing complex reconstruction and 430 new housing units as part of the West Side Housing project. It then asserts that the increase in population would alter the transportation needs of residents of the Aldea Housing complex. The effect of the additional on-campus housing and related residential population is fully assessed in the transportation impact analysis of the CPHP in Section 4.15 on pages 4.15-37 to 4.15-53. The vehicle trips generated by the new on-campus residents, including those that would reside in the redeveloped Aldea Housing complex, are included in the analysis of the CPHP's impact on VMT. With the exception of Impact TRANS-5 related to construction under the CPHP which was found to be significant but reduced to less than significant with mitigation, all transportation impacts were found to be less than significant.

O-SUT-3 The commenter requests alternatives to the increased density at the Aldea Housing complex, such as locations within the Inner Sunset near Parnassus. Please see Master Response 5: EIR Alternatives.

O-SUT-4 The comment requests additional greenhouse gas emissions and transportation analysis of the effect of building additional housing units in the Aldea Housing complex compared to building housing on other more central locations at the Parnassus Heights campus site, such as the west side. Due to the need for more on-campus housing, the CPHP includes new housing in both the Aldea Housing complex and on the west side of the campus site. Although some of the residents of the 332 new units in the Aldea Housing complex may travel via campus shuttle between their residences and work places in the campus core, as compared to new residents of the West Side housing who would be able to more easily walk or bike to their work places, the distance that the Aldea residents would travel via shuttle is accounted for in the DEIR VMT and greenhouse gas emissions projections. As noted above, the trips and VMT generated by all the new housing, including by spouses that may travel to workplaces outside the campus site are accounted for in the VMT impact analysis.

O-SUT-5 and O-SUT-6: The comment expresses concern that increased building heights would potentially alter local climate, wind, and sunlight patterns. The commenter further indicates all impacts to aesthetics, biological resources, geology, soils, and transportation should be thoroughly evaluated and compared to existing conditions in Aldea. Lastly, the commenter indicates the Draft EIR needs an evaluation of more buildings closer together in between existing structures at

lower elevations in Aldea so that no development extends higher than existing rooftops, and the alternate housing site at Fifth and Kirkham.

All potential effects associated with the proposed height, density, and location of the proposed housing in the Aldea Housing complex under the CPHP, such as aesthetics, wind, shadows, biological resources, geology and soils, and consistency with land use plans and regulations, are adequately addressed and mitigated to the extent feasible in the Draft EIR Sections 4.1, 4.3, 4.6, and 4.10. As discussed on Draft EIR, page 4.0-6, the baseline condition used in the EIR (against which aesthetic, biological resource, geology, soils and transportation impacts are compared) is January 2020, consistent with when the Notice of Preparation was published. For additional information on these topics, please also see Master Response 8: Wind Impacts; Master Response 9: Shadow Impacts; Master Response 13: Land Use Impacts.

O-SUT-7 The commenter encourages no increase in parking on the mountain at any new housing site, but rather, to invest in public transportation. This is a general comment on the project itself, rather than on the adequacy of the Draft EIR. However, please note that the CPHP includes a net decrease in parking spaces at the Parnassus Heights campus site. The proposed CPHP proposes one new parking structure (on the West End of the campus site), which would replace existing parking spaces that would be removed under the CPHP. Consequently, the proposed CPHP would not build parking in excess of demand. Furthermore, as discussed in the Draft EIR Section 4.15, Transportation, UCSF would continue to implementing its comprehensive TDM program, as well as coordinating with applicable local and regional agencies to implement San Francisco's Transit First Policy, and provide viable alternatives to single-occupancy vehicles.

The commenter also indicates the issues raised need to be compared to impacts of developing housing in the Dental School parking lot at 5th Avenue and Kirkham Streets, versus at Aldea. Please see Master Response 5: EIR Alternatives.

O-SUT-8 The commenter requests the EIR consider the long-term impacts to work culture from COVID-19. Please see Master Response 3: COVID-19.

O-SUT-9 The commenter asks that UCSF provide details about the timing of the Aldea Housing Densification project and where substitute housing would be provided for those displaced by the project.

Displacement impacts of the Initial Aldea Housing Densification project, as well as the future phase(s) of Aldea Housing Densification, are discussed under Impact POP-2 on Draft EIR page 4.12-11. As discussed in the Draft EIR, only the residents of the first three buildings demolished under the initial Aldea Housing Densification project would be temporarily displaced. In total, approximately 42 households, or about 100 residents, would be temporarily

displaced. UCSF recently opened the Tidelands residential complex (595 units) south of the Mission Bay campus site in the City's Dogpatch Neighborhood. In addition, UCSF may lease housing units owned by UC Hastings College of the Law. Residents temporarily displaced during the initial phase of the Aldea Housing Densification project could be housed in these units or other available campus housing. Prior to implementing the project, UCSF would develop a plan to ensure that displaced residents receive housing accommodations. The four structures constructed during the initial Aldea Housing Densification project would provide enough units to accommodate the residents who would be displaced due to the demolition of the remaining nine structures within the Aldea Housing complex that would occur under the Future Phase of the Aldea Housing Densification project. The construction timeframe for the Initial Aldea Housing Densification project is from 2028 through 2030. The schedule for the future phase(s) of Aldea Housing Densification is not known at this time.

O-SUT-10 The commenter requests alternatives addressing the displacement and loss of housing at Aldea during construction. Please see Master Response 5: EIR Alternatives.

O-SUT-11 The commenter asserts that increasing residential density closest to the forest and nursery will impact the ability to use Aldea parking and ability to attract volunteers who support its programs; and requests an expanded community space from which to run its programs in a location closer to public transit access and help reduce the need for parking at Aldea.

This comment does not address the adequacy of the Draft EIR. The comment has been noted and will be forwarded to decision-makers.

O-SUT-12 The commenter expresses concern that location, densification and increased heights of buildings in the Aldea will undermine the aesthetics, views, biological resources (including sensitive bird species, butterflies, mammals, and native plant populations), noise, traffic, visitor experience and human interaction.

All potential effects associated with the proposed height, density, and location of the proposed housing in the Aldea Housing complex under the CPHP, including aesthetics and lighting effects, biological resources (both plant and wildlife species), noise and transportation, are adequately addressed and mitigated to the extent feasible in the Draft EIR Sections 4.1, 4.3, 4.6, 4.11, and 4.15. For additional information on CPHP effects on biological resources, please see Response O-SUT-13, below.

The commenter's concerns about visitor experience and human interaction are not considered environmental issues to be addressed in EIRs, but rather quality of life issues. Please see Master Response 1: Non-CEQA Issues.

O-SUT-13 The commenter requests analysis of the impact of construction of Aldea Housing on breeding and overwintering birds, native plants, butterflies and mammals within the Reserve. Impacts on special-status plant species are analyzed in the Draft EIR. If any rare plants are found prior to construction, these will be protected as described in CPHP Mitigation Measure BIO-1a. Monarch butterflies are not known to overwinter in the Reserve, but if suitable monarch butterfly wintering habitat would be impacted, CPHP Mitigation Measure BIO-1b calls for a survey prior to construction, and avoidance of any wintering monarch aggregations. As described in the Draft EIR, nesting birds are protected under the Migratory Bird Treaty Act; overwintering bird species are protected if they have special status in California. The Draft EIR BIO Appendix lists the special-status birds with potential to occur in the project area. Impacts of CPHP construction, including those from the construction at the Aldea Housing site, on birds are described in Section 4.3.3. Impacts to nesting birds from construction at Aldea include temporary loss of nesting habitat and disturbance to nearby nests from construction noise and human activity associated with construction and maintenance. Noise and disturbance impacts would be mitigated to a less-than-significant level under CPHP Mitigation Measure BIO-1c, Protection of Nesting Birds. See also Draft EIR CPHP Mitigation Measures BIO-2a and -2b for prevention of harm to migrating birds during construction, and incorporation of bird-safe building treatments. The only special-status mammals potentially impacted in the Reserve are bat species. Under CPHP Mitigation Measure BIO-1d, pre-construction bat surveys will be conducted in areas of suitable habitat, and bat-safe removal procedures followed if there is evidence of bat habitation,

O-SUT-14 The commenter expresses support for the Park to Peak route. The commenter also urges that all landscaping associated with the CPHP use San Francisco native plants. The comments are acknowledged, however, please note that the Park to Peak route is not specifically an element of the CPHP. Nevertheless, the CPHP would be compatible with the proposed Park to Peak improvements, and furthermore, the CPHP would coordinate with planned trailheads to Mount Sutro.

O-SUT-15 The commenter expresses support to UCSF Sutro Stewards wishes to support UCSF in ensuring that Mount Sutro remains a healthy ecological oasis that provides rare urban habitat to local wildlife while providing UCSF students, faculty, staff, and San Francisco residents a natural refuge for walking, running, biking, and connecting with nature. The comments are noted; no response is required.

From Maxina Ventura ,Chronic Effects Researcher,
East Bay Pesticide Alert

Formal Comments in Response to dEIR re: Deforestation and Pesticiding of Mt. Sutro Eucalyptus Forest

You are receiving many detailed analyses and what EBPA adds as we've hit four weeks of intense fire and smoke particulates from California's Climate Fires is that, every tree is considered a fire mitigation factor according to the experts who produce the "Fire Bible," the National Fire Protection Association Handbook, found in every fire station.
David Maloney, Retired Oakland Fire Department; Chief, Fire Prevention, Oakland Army Base, appointed to 1991 Oakland-Berkeley Mayors' Task Force on Emergency Preparedness and Community Restoration to report on causes of the '91 East Bay Hills conflagration, and to make recommendations so that we do not face this again, referred to the from the National Fire Protection Association Handbook at an event five years ago:

"Dried grass provides the most flammable ground fuel," and, "There's no if's, and's, or but's.... every single tree is a wildfire mitigation factor.... trees block wind, drip fog onto grasses, and block sun so grasses stay moist."

And speaking about the immense danger created by the deforestation of Angel Island a few years ago:
<<
The worst fire in the history of Angel Island in the San Francisco Bay occurred in 2008. Several years before, dozens of highly fire resistant Blue Gum Eucalyptus trees that were almost directly in the path of the fog and cool air that regularly comes through the Golden Gate were cut down. These trees collected and dripped onto the ground 59" of moisture each year – almost six feet of water — which kept the island's grasses moist. When they were removed, the grasses dried out by midday. The ground where the trees were logged for the first time in decades resembled dry ground in Lake County. The people responsible for the removal of these trees proved how little they know about fire science and the role of trees in preventing wildland fires, twice. Once by removing the trees, and again by saying, after the fire, that it would have been worse if the "flammable" trees weren't removed. These are the same people and institutions that are advocating the removal of trees from the East Bay Hills, which will make the East Bay Hills become like the dry, flammable, grassy terrain in Lake County where large, destructive grass fires destroyed Middletown (summer, 2015). >>
That was a Climate Fire which was a human-made environmental mess. The Eucs were keeping the soil moist, fire mitigation, and once the trees were gone, everything heated up and became grasslands, vulnerable to the next lighting strike or other spark.

David Maloney's 2016 paper updating us all on the dangers of continued removal of tall trees in the East Bay Hills is attached here and can be accessed, too, from our website on this page:
http://www.eastbaypesticidealert.org/wildfire.html in the video description on that page, just below the Measure FF information.
UC's plans to keep destroying the healthy Eucs and other trees on Mt. Sutro which are adapted to our modern climate, what has kept residents of SF and UCSF safer from fire danger, is a complete mistake. It is reckless. It is irresponsible.
Please abandon these plans and replant eucalyptus to make up for every tree you've removed over the past years on Mt. Sutro.
Additionally, reference to 'Native Plant Restoration' projects on Mt. Sutro over the past many years never look at

1

2

acclimation of species and healthy habitats which can survive the climate changes humans have created which trees help mitigate, especially tall trees which can transpire many feet of water per year, and sequester carbon while giving off oxygen especially needed in a crowded urban landscape, such as San Francisco. 2 cont.

You must not use any pesticides, whether herbicides or others such as fungicides which have been weakening oaks, making them vulnerable to Sudden Oak Death. The fungicide use was UCB's Garbaletto's dangerous response to Sudden Oak Death which also was a manufactured climate catastrophe borne of drought conditions, particularly Wine Country over-use of water in conventional grape growing that was coming to a head in the mid-90's in Sonoma and around that time Marin was hit, too, after which SOD followed wine grape growing regions and even moved into citrus-growing regions across the state, and beyond. Native, as people like to refer to Oaks, they are not able to survive our climate-changed environment and habitats. They are expected to be all gone by about 20 years from now in the East Bay Hills and would not be expected to fare much better in SF in these times. But Eucs thrive, as can Monterey Pines. 3

Stop the needless destruction of life-giving trees and toxic pesticide use (how ironic by a hospital).

UC is a leader of Climate change, endangering everyone. We respectfully request that UC stop the destruction on Mt. Sutro and replant at least 5 Eucalyptus trees for every tree you've destroyed on Mt. Sutro, or on any UC land. SF needs the cooling water-saturated air it has enjoyed due to drift of water spray riding the ocean breezes. 4

Sincerely,
Maxina Ventura for East Bay Pesticide Alert / Don't Spray California 5

Responses to Comments from East Bay Pesticide Alert

O-EBPA-1 The commenter references different sources discussing fire dangers associated with dried grass, and as a result of tree removal. These comments do not specifically address the adequacy of the Draft EIR. However, please see Response O-EBPA-2, below.

O-EBPA-2 The commenter expresses opinions regarding the past and future removal of eucalyptus trees on Mount Sutro, and potential resultant effects on climate change.

To the extent the commenter is referring to ongoing eucalyptus removal within the Reserve, those activities are being implemented under the UCSF's Mount Sutro Vegetation Management Plan (approved in March 2018, along with certification of its associated Final EIR). The Draft EIR briefly discussed UCSF's Mount Sutro Vegetation Management Plan (see Section 4.3 Biological Resources, pages 4.3-1 to 4.3-11, and Section 4.8, Hazards and Hazardous Materials, page 4.8-7), including the purpose of 20-year phased plan to protect, enhance and restore vegetation in the Reserve; improve ecosystem health; maintain and ensure public access within the Reserve: and minimize fire risk. Please note, however, that the activities occurring under the UCSF's Vegetation Management Plan are separate from, and outside of the purview of, the CPHP and this Draft EIR.

To the extent the CPHP would result in the additional removal of trees at the campus site, the associated impacts are disclosed in the CPHP Draft EIR and mitigated to the extent feasible. For specific effects of the CPHP on climate change, please refer to Section 4.7, Greenhouse Gas Emissions in the Draft EIR.

O-EBPA-3 and O-EBPA-4: The commenter discourages against the use of pesticides, including herbicides and fungicides, which can make oaks vulnerable to Sudden Oak Death. The CPHP does not discuss potential use of pesticides; the Draft EIR discusses pesticides only in the following context: 1) pesticides and herbicides are considered hazardous materials, and any potential use would be required to be carried out in accordance with manufacturers recommendations, and 2) urban stormwater runoff can potentially contain pollutants, including pesticides and herbicides (among other pollutants).

This comment is part of the public record on the CPHP, and will be considered by the UC decision-makers prior to considering CPHP approval.

O-EBPA-5 The comment expresses some personal opinions regarding UC that do not address the adequacy of the Draft EIR; please see Master Response 1: Non-CEQA Comments.

The comment also suggests UC replant at least 5 eucalyptus trees for every tree removed. This suggestion from the commenter is part of the public record on the

project, and will be considered by the UC decision-makers prior to considering CPHP approval.

Please note Comment Letter O-EBPA contained an attachment which did not comment directly on the Draft EIR. This attachment is included in Appendix O-EBPA in this Comments and Responses document.

8.4.2.3 Draft EIR Comment Letters – Individuals

From: Elissa Calvin
To: Campus Planning - EIR
Subject: Zakheim murals
Date: Wednesday, August 5, 2020 1:47:15 PM

To whom it may concern,

I have heard through SF Heritage recently as well as through local news outlets that UCSF has for some reason made a complete about face on their decision to keep the Bernard Zakheim murals and now intend to destroy them along with the building they are in. This is absolutely despicable behavior that is not becoming of a globally known institution that claims to be on the forefront of new discoveries. I am very curious as to why you reversed your decision when before you said it was a priority to keep them. And giving the Zakheim family just 90 days to come up with $8 million dollars or another solution is a joke. You clearly are just looking for a reason to destroy the murals and not have to deal with them. Your "solution" of preserving the murals in a digital format is an ever greater joke. Art of that caliber with that much historical significance will not be dealt any justice by making it digital. 1

The panels can be moved- the artist knew there could be a possibility of it happening one day. While moving them to a museum or other cultural institution is better than them being destroyed, they really should remain where they are, because they are intended to be at a medical and educational facility. The ideal situation would be to keep that room and make it a community space so the public can have access to them. 2

Perhaps UCSF should be stripped of all of its art, because you have shown that you are not worthy caretakers or curators if you really do go through with this. 3

Please come to your senses and do the right thing.

Elissa Calvin

Responses to Comments from Elissa Calvin

I-Calvin-1 The commenter expresses opinions regarding UCSF and does not agree with the proposed digital preservation of the Toland Hall Murals. Please refer to Master Response 11: Toland Hall Murals.

I-Calvin-2 The commenter asserts that the mural panels can be moved, but states their preference is to leave them where they are. Please refer to Master Response 11: Toland Hall Murals.

I-Calvin-3 The commenter expresses an opinion that does not address the adequacy of the Draft EIR. Consequently, no response is required.

Diane Wong
UCSF Real Estate
Campus Planning
654 Minnesota St.
San Francisco, CA 94143-0286

Dear Ms. Wong:

I hope to take part in your EIR hearing. I am providing this written material in case I am not able to do so.

I encourage you to reconsider the decision to demolish Bernard Zakheim's murals at Toland Hall, UCSF. As you undoubtedly know, the San Francisco Historic Preservation Commission has recently voted unanimously to landmark those murals. I am attaching the Planning Department's analysis of the murals and of Toland Hall. 1

I strongly supported that decision because I am confident that those murals meet the standards for landmarking set by the Secretary of the Interior: they are associated with events that have made a significant contribution to the broad patterns of our history (the New Deal arts programs), they are associated with the lives of persons significant in our past (Bernard Zakheim, Chauncey Leake, who participating in commissioning the murals and appears in one of them, and other the historical figures depicted in the murals), they represent the work of a master (Zakheim), and they possess high artistic values. 2

During the 1930s, Zakheim was one of the leading artists in this area who were creating major public art under the auspices of the New Deal arts programs. During the 1930s, Zakheim created the following public art, all still extant: 3

- *Jewish Wedding* also called *Jewish Festival,* private commission, Jewish Community Center, San Francisco, 1933, relocated in the new JCC building in 2004.
- *Library,* Coit Tower, San Francisco, 1934. National Register of Historic Places, 07001468; San Francisco Landmark 165.
- *Community Spirit* and *Growth,* two murals, Alemany Emergency Hospital and Health Center, San Francisco, 1934. San Francisco Landmark 272.
- *Ancient Medicine* and *Modern Medicine,* two murals, Cole Hall, UCSF, San Francisco, 1935, relocated to Health Sciences West, 1966.
- *The Story of California Medicine,* ten murals, Toland Hall, UCSF, San Francisco, 1938.
- *The Horse and Buggy Era Gives Way to Modern Transportation,* Post Office, Mineola, Texas, 1938.

- *Agriculture and Industry,* Post Office, Rusk, Texas, 1939.

After completing his last New Deal commissions, Zakheim did a series of paintings of figures from the American Revolution. The Holocaust was enormously influential for Zakheim, and he began creating works depicting Jewish life and the Holocaust, including two major works of public art: *Songs of the Polish Jews* also called *The History of the Jews Through Song* (mural, 1961, near Warsaw, Poland), and *Memorial to the Six Million* also called *Warsaw Ghetto Memorial* (six sculptures, Mount Sinai Memorial Park, Los Angeles, 1966). Throughout his career, he continued to create oil paintings and watercolors.

Zakheim's murals are also excellent examples of the public art produced by New Deal programs. He included social commentary in several places, something typical of much New Deal art. Bruce Bustard, in his 1997 study of New Deal art programs, specified five themes typical of New Deal art, of which three can be found in the Toland Hall murals: a celebration of ordinary, often working-class, people (including Biddie Mason, a Black woman and former enslaved person); promotion of social change (including a celebration of the first woman to graduate from what became UCSF); and a rediscovery of American history (Zakheim's extensive research is reflected in the murals by scrolls or documents identifying the individuals and events he was depicting). 3 cont.

The proposed alternative, high-resolution photographs of the murals, is unacceptable because a mural that takes up an entire wall has a presence and a power that cannot be captured in a photograph. Public murals were meant to be seen by many people; photographs that record such art are preserved in libraries, where they are consulted by specialists. The New Deal art projects were intended to create art for the people, art that would inspire, inform, and, yes, sometimes even irritate the public at large. Dr. Leake and others wanted generations of students to experience this art. The proposed alternative denies that goal. 4

During the Historic Preservation Commission meeting, Mr. Brian Newman stated that Toland Hall is "in" UC Hall and therefore not separable from other parts of that building. That statement is highly misleading. Toland Hall is a structure that stands between the two west-most extensions of UC Hall. Toland Hall's north wall is adjacent to the south wall of UC Hall. Please review the diagram on page 26 of the Planning Department's description of the murals and of Toland Hall, and you'll see that Toland Hall is not "in" UC Hall but adjacent to it. 5

I hope that I can be present virtually during your meeting to answer any question you may have. 6

Thank you for your consideration.

Sincerely,

Robert W. Cherny

Responses to Comments from Robert W. Cherny

I-Cherny-1 The commenter request UCSF reconsider its decision to demolish the Zakheim murals, and notes the San Francisco Historic Preservation Commission's vote to landmark these murals. The comments are noted. In fact, on November 25, 2020, the Mayor of San Francisco approved Ordinance 241-20 amending the Planning Code to designate the Zakheim Murals as a City Landmark consistent with the standards set forth in Article 10 of the Planning Code. This has been noted in a revision to the Draft EIR. Please refer to Section 8.5 of this Comments and Responses document for the proposed revision. Please also refer to Master Response 11: Toland Hall Murals.

I-Cherny-2 The commenter expresses support for the San Francisco Historic Preservation Commission's decision to landmark the Zakheim murals and believes the murals meet the standards for landmarking set by the Secretary of the Interior. Please refer to Response I-Cherny-1, above, and Master Response 11: Toland Hall Murals.

I-Cherny-3 The commenter provides a list of public art created by Zakheim, a description of his work following the New Deal commissions, and states that the murals are "excellent examples of public art produced by the New Deal programs." Please refer to Master Response 11: Toland Hall Murals.

I-Cherny-4 The commenter states that the proposed alternative of high-resolution photography of the murals is not acceptable. Please refer to Master Response 11: Toland Hall Murals.

I-Cherny-5 The commenter asserts that Toland Hall is adjacent to UC Hall, and not "in" UC Hall as represented during the Historic Preservation Commission meeting. Please refer to Master Response 11: Toland Hall Murals.

I-Cherny-6 The commenter expresses an opinion that does not address the adequacy of the Draft EIR. The comment is noted.

Please note Comment Letter I-Cherny contained attachments which did not comment directly on the Draft EIR. These attachments are included in Appendix I-Cherny in this Comments and Responses document.

Subject:	Protest against development in Mount Sutro/Comments to be included in UCSF"s EIR
Date:	Sunday, August 23, 2020 2:04:40 PM

Please see my comment below, and send me a receipt that you received it, as well as proof that it was included in the EIR, as a protest against UCSF's aim of razing 70% of Mount Sutro Forest, within its expansion of its Parnassus Heights Campus.

Thank you,
Ariane Eroy, Ph. D.
PO Box 460002
San Francisco, CA 94146

++

In this most recent rendition of its longterm development plans, UCSF reveals that it will be laying waste to approximately 2.97 - 4.5 acres of Mount Sutro Forest, to initiate its first stage for expanding Aldea dormitory space by another 184 units, with eventual plans to augment them to over 500 units. 1

In November 2019, the Board of Regents relinquished its Laurel Village Campus to developers, leasing the 10.27 acres of land to the Prado Group, a developer that intends to raze every one of the site's 192 stately trees. Everyone recognizes that developers' main concern is to save time and maximize profits. But what about UCSF's concerns? Or even a belief in conservation? Certainly, there could have been a provision for dorms being built there instead of clearing Mount Sutro. Moreover, the projects' focus is not surprising, with the majority of the space afforded for luxury apartments, offices and retail space. This is occurring at a time when many corporations are downsizing their office space as employees increasingly work from home--perhaps permanently--and when 40% of small businesses have closed their doors permanently. 2

All around the City, residents witness unkempt streets and parking lots as well as boarded-up buildings. Yet while the US economy is spinning towards a deep depression, there are even more important and urgent problems... Humanity is barreling towards extinction--should it not take a 180 degree turn and address the Climate Emergency that imperils all ecosystems, and all species.

Mount Sutro is San Francisco's largest urban forest, composed of approximately 80% Eucalyptus trees. The dense Forest lives off the fog year-long, with its soil remaining damp throughout the hot summer months, and acting as a protective against fire, insects and disease. Long ago, the Forest should have been identified as a national heritage site, as it is part of the

historic legacy of San Francisco. It is a spiritually uplifting and healing space,

As San Francisco has one of the smallest urban canopies of all cities nationwide, Mount Sutro serves a very important role in providing residents with oxygen, and cooling escalating temperatures. The forest provides habitat not only to animals and stressed-out city dwellers, but mitigates the whipping winds that characterize the Sunset District. The towering trees clean the airs of particulates, and sequester carbon dioxide. Eucalyptus are uniquely drought-resistant, and adapted to an increasingly dry and hot environment.

The Forest is located on public land, and as such, must be considered part of the Commons.
Yet over the years, UCSF has promulgated Nativist philosophy, a form of reactionary populism that furthers its development plans. Nativists employ bigoted tropes, claiming that certain trees are invasive, inflammatory, dangerous, dirty, and "just don't belong here." These kind of language should be familiar to us all, as it was used by the European settlers against Native Americans for hundreds of years to justify genocide. At present, developers, speculators and corporate-controlled media relentlessly attempt to condition the Public to hate, if not fear, trees and forests. Nativists deny that deforestation accelerates catastrophic climate change. Eschewing statistics and science itself, the contribute thousands of anecdotal reports to slant the media. By demonizing the Eucalyptus trees, UCSF can more readily pass through radical projects that favor crony-capitalism, that counter the Public good, and that even defy common sense. By transforming the dense, extant Forest into some kind of suburban park with open spaces decorated with native shrubs and grasses , the land can be denigrated and thus laid waste, such that it can be more easily developed over the years ahead.

2 cont.

UCSF already owns plenty of property so there was never any necessity to install native gardens in Mount Sutro--unless it wanted to kill a forest. All around the city, native gardens could have been installed--within the structure of Milberry garage, by opening up its miles of sidewalks, and by landscaping its new Mission Bay Campus accordingly. Yet by radically thinning the forest and installing native gardens and encroach on the forest with its eight-storey high dormitories, it will not only kill vibrant trees, but decimate the underground root structures, desiccate the forest floor, and invite in disease, insects, and fires. Moreover, by weakening the underground root network of the forest, they could trigger landslides onto the homes below, especially in light of increasingly intense, sudden storms.

In its 2013 DEIR, a crushingly-long, 4000+ page document released to the Community within a 6-week window for public comment, UCSF wrote "Under full-implementation or worst-case implementation of management activities under the proposed project, approximately 60% of all existing trees, including large and small trees, could be removed." But the eco-scientist Mary McAllister, of *Million Trees*, remarks that this is even an underestimate:

Should UCSF enforce a 30-foot radius around each tree, they would actually be razing 31,904 trees, or 70.9% of the forest.

Today, carbon dioxide levels hover at 410 ppm--higher than any time in the last 800,000 years. At a time of escalating, human-caused climate change, humanity needs to take a 180-degree turn away from years of reckless development that not only accelerates the planet with massive ecocide, but threatens humanity, itself, with extinction. Humanity cannot continue to destroy all life around us, and expect to live!

Mount Sutro's awe-inspiring Eucalyptus trees give to us, every day of their lives. Visiting the Forest, is like entering a sacred cathedral, with its fragrant, mineralized air, its cool breezes, its magnificent views, its exquisite trees with their silver leaves and muscular, white trunks. Silently, these trees bestow on us all of us the gift of life. When they breathe out, we breathe in. Humbly, they invisibly partner with those of us who are working to fight human-caused, climate change. They are our neighbors, and they are our community. They teach us about love.

How can UCSF pose as the steward of Mount Sutro, a forest which it decimates? UCSF claims to be an internationally-renowned health provider--yet it ignores the fact that pollution is one of the chief causes of mortality, and that the climate catastrophe threatens humanity with extinction. UCSF ignores that it has a duty to protect the Public, and in this case, it eschews its duty by clear-cutting a beneficent forest: By doing so, UCSF vandalizes both our environment and our Future.

2 cont.

Ariane Eroy, Ph. D.
San Francisco

Responses to Comments from Ariane Eroy

I-Eroy-1 The comment asserts that UCSF would "lay to waste" approximately 2.97 to 4.5 acres of Mount Sutro Forest to accommodate proposed development at the Aldea Housing complex. However, the Draft EIR does not report such an area would be affected by proposed development at the Aldea Housing complex. Rather, UCSF's preference is to construct the new student housing buildings in the Aldea Housing complex in the approximate location of existing building foundations, thereby minimizing overall land disturbance within the Aldea Housing area. Accordingly, none of proposed Aldea Housing development would encroach into the surrounding Reserve.

I-Eroy-2 The commenter opines on several topics, including past vegetative management proposals activities within the Reserve, and references to a 2013 Draft EIR on the UCSF Mount Sutro Management. These comments are not directly related to either the CPHP or the adequacy of the CPHP Draft EIR. For these comments, no response is required; please refer to Master Response 1: Non-CEQA Comments. It should be noted the 2013 UCSF Mount Sutro Management document and associated Draft EIR referenced by the commenter were superseded by the 2018 Vegetation Management Plan for the Mount Sutro Open Space Reserve, and its associated Final EIR.

The commenter makes a number of general comments concerning the Reserve's trees, and asserts that the proposed housing will create impacts within the Reserve, including killing trees, decimating underground root structure, desiccating the forest floor, and inviting disease, insects and fire. To the extent the CPHP may potentially affect resources within the Reserve, including trees, it is adequately addressed in the CPHP Draft EIR, including the description of potential encroachment into a portion of the Reserve adjacent to the proposed New Hospital and associated designation of new Reserve area (see Chapter 3, Project Description); and potential direct or indirect impacts on biological resources, geology and soils, hydrology and water quality, and recreation within the Reserve (see Draft EIR Sections 4.3, 4.6, 4.7, 4.8 and 4.14). The commenter also makes certain non-specific comments regarding effects on climate change. Please Draft EIR Section 4.7, for how the Draft EIR addresses effects on greenhouse gas emissions.

From: Dennis Kelly
To: Campus Planning - EIR
Subject: Murals
Date: Tuesday, August 25, 2020 10:12:26 AM

Murals are painted to be seen. Some are decorative and some are educational. But their purpose is to be viewed.

Miguel Covarrubias painted six panels for display on Treasure Island in 1939. There they were seen. When the exhibition on Treasure Island had run its course, Covarrubias''s panels were taken down and put in storage.They were taken out and sent to the east coast so the other side of the country could see them. The six panels told the story of the people and progress of the Pacific, from the Americas to Asia. Only five of the panels came home. And a remarkable decision was made.

Those five panels got a new life within the Ferry Building. They could be seen, and except for the one that was mounted behind the handrail on the steps, they were well preserved. Then the Ferry Building itself needed to be spruced up, and Covarrubias's panels went into storage.

Occasionally they now peep out for a few weeks as part of a show in one place or another, but except for a copy of one panel that graces a Haight Street restaurant, they are no longer seen. They are as lost as the panel that went to the east coast and never returned.

1

This is no way to treat a mural.

UCSF has a chance to learn from this mistake. UCSF has a chance to find a place where their murals can be displayed, their story told, and their legacy continued. I hope that then UCSF murals are not put through the trials of the Covarrubias murals and that UCSF can continue its teaching mission by locating the paintings in a place where they can continue to breathe the life that they display.

2

Dennis Kelly
Former president of
The United Educators of San Francisc

Responses to Comments from Dennis Kelly

I-Kelly-1 The commenter disagrees with the disposition of the Covarrubias painted panels. This comment does not address the adequacy of the Draft EIR, however, the comment is noted.

I-Kelly-2 The commenter opines that the Toland Hall Murals should not be treated the same way the Covarrubias painted panels have been handled. The comment is noted. Please also refer to Master Response 11: Toland Hall Murals.

From: Wong, Diane C.

Subject: Here is a copy of the Comment that I submitted with my Registration

Please scale back your plan for a monstrous new hospital on the Parnassus site. It is cruel and insensitive to propose adding almost 3 million square feet of new building space, and many thousands of people, to the already-overcrowded campus. The plan violates your pledge in the CPHP to "Create building massing to have respectful relationships with neighboring structures and natural features...(and) maintain a similar scale to surrounding structures...(and) create neighborly relations with existing structures at the campus boundaries." It also fails to mitigate what will become a dramatic exacerbation of the current parking and public transportation problems all around the Parnassus campus. Finally, it ignores and disrespects neighbors' concerns by deciding without consultation to blow through the limit of 3.55 million square feet for the Parnassus campus to which UCSF agreed in response to the Parnassus neighbors' objections to UCSF's aggressive expansion, at the expense of the neighborhood, in the 1970's. That agreement does not anticipate an ending date, and the neighbors' concerns have not changed.

Responses to Comments from Cynthia Travis

I-Travis-1 The commenter expresses an opinion about the merits of the proposed CPHP. This comment does not address the adequacy of the Draft EIR; consequently, no response is required. However, the comment has been noted and will be forwarded to decision-makers. Please also refer to the other responses provided herein.

I-Travis-2 The commenter asserts that the CPHP violates certain pledges in the CPHP. The specific text quoted by the commenter are not 2014 LRDP or proposed CPHP project objectives. The Draft EIR does, however, identify those relevant UCSF 2014 LRDP objectives that guide UCSF's physical development at the Parnassus Height campus site. This includes the campus–wide overarching objective: "Objective 1: Respond to the City and Community Context," and the following sub-objectives:

1B. Acknowledge and respond to local zoning and height and bulk limitations to the extent possible; and

1C. Design new buildings to be sensitive to the surrounding neighborhood and landscape, taking into account use, scale, potential noise generation, and density.

As discussed in the Draft EIR, UCSF's proposed LRDP Amendment would clarify that sub-objectives 1B and 1C would not apply to the New Hospital project, in recognition of the substantial amount of space required for the New Hospital, although UCSF would make efforts during the design process to come as close as possible to meeting these objectives, if feasible. Please refer to Master Response X: Aesthetic Impacts, and Master Response 13: Land Use Impacts for additional detail.

I-Travis-3 The commenter indicates the CPHP fails to mitigate what will become a dramatic exacerbation of the current parking and public transportation problems all around the Parnassus campus. Regarding parking, as discussed in the Draft EIR Section 4.0.2, pages 4.0-3 to 4.0-4, pursuant to CEQA Statute Section 21099(d), this EIR does not consider the adequacy of parking in determining the significance of project impacts under CEQA.

Regarding public transportation impacts, the Draft EIR Section 4.15 Transportation assesses the potential for the implementation of the proposed CPHP to conflict with program, plans, ordinances and policies addressing transit facilities, and determines those impacts to be less than significant. Changes to transit operations are outside the scope of the CEQA analysis and are not discussed in Draft EIR Section 4.15. However, Draft EIR Appendix TRANS presents an analysis of the changes to transit operations for informational purposes.

I-Travis-4 The commenter indicates the CPHP departs from the 3.55 million square foot limit which UCSF agreed to in the 1970's. Please refer to Master Response 4: Space Ceiling and Population.

An open letter to the UC San Francisco Chancellor from University of California Faculty
(Sponsored by the Program in Public Historical Studies, UCSB History Department)

August 31, 2020

Sam Hawgood, Chancellor
Office of the Chancellor
513 Parnassus Avenue
MSB
San Francisco, CA 94117

Dear Chancellor Hawgood,

We, the undersigned, are deeply alarmed by the University's expansion plan for its Parnassus Heights campus and destruction of the historically and culturally significant murals as part of the campus redevelopment. We urge UCSF to make an immediate commitment to: 1

- Preserve the mural cycle, *History of Medicine in California* by Bernard Zakheim that is currently threatened with planned demolition of Toland Hall in UC Hall.
- Secure a permanent home for the murals where they can be regularly accessed by the public, preferably by leaving them *in situ*. 2

Produced between 1935 and 1939 with the support of public funds from the Works Progress Administration, the mural cycle of ten panels was described by UCSF's own archivist as "the jewel of the university's art collection," which has served as an enduring backdrop for the teaching of medicine at UCSF over many generations. This mural cycle is both artistically significant and a critical example of this art form. As a student of the famed Mexican muralist Diego Rivera, Zakheim is regarded as a major New Deal artist with deep ties to the Bay Area. The UCSF murals represent his largest and best single work. (1)

Equally important, the murals seek to represent the totality of medical history, and in so doing, they offer a rare memorial to the diversity of these origins. Perhaps most striking is their memorialization of Biddy Mason, an enslaved healer who had to sue for her freedom; she went on to amass wealth and notoriety as a philanthropist in late nineteenth-century Los Angeles (2). As you know, a rare portrait of Mason appears in one of the murals, representing one of the "vanishingly few monuments to women of color" (3). This work—the first known artistic representation of Mason—tells a vital and overlooked story of Black empowerment. Such tributes to women of color from this era are 3

extraordinarily rare and deserve not only preservation but also celebration. The University's plan to demolish these murals is embarrassingly out of step with the national movement over race and representation, particularly for an institution that seeks to create a culturally and socially diverse medical community. Leaders from across the country are demanding an honest reckoning with our past in an effort to forge a more just future. We urge you to join this effort by preserving the murals.

3 cont.

4

On the strength of both its artistic and historic significance, the San Francisco Historic Preservation Commission recently voted unanimously to recommend historic landmark designation for the mural cycle. Many of the commissioners noted in their public comments that the UCSF had the chance to stand on the right side of history by finding a creative architectural solution that would allow the murals to be preserved *in situ*.

5

We hereby endorse the importance of these murals both as irreplaceable works of art representing the best of New Deal Era artistic production and as historical memorials important to the history of UCSF and the history of California. At a moment when we have all been reminded of the power of society's monuments to reflect social values, the "History of Medicine in California" mural cycle represents an earlier era's attempt to represent the history most relevant to UCSF. These murals have become, over time, a central piece of the University's history and of the history of all Californians as well.

6

As students of Public History, Art History, and Black History in the United States, as well as concerned scholars from a variety of allied fields, we urge you to seize this moment and to preserve and make accessible this important artistic legacy. What you do here—or fail to do here—has implications for both the type of University community we build and the society which our graduates go on to serve. We urge you to do the right thing and keep the murals on the Parnassus Heights Campus at a location that makes this mural cycle accessible and available to the diverse communities that are UCSF's future.

7

To: Campus Planning - EIR
Subject: Save The Zackhiem Muruals
Date: Wednesday, September 2, 2020 10:34:26 PM

Dear Chancellor Hawgood and U.C. Regents,

I am writing in opposition to the Draft Environmental Impact Report (DEIR) dated July 13, 2020 for the
proposed Comprehensive Parnassus Heights Plan (CPHP).

I vehemently oppose the removal and/or destruction of these historic and extraordinary works of art.

1

These murals not only represent the history of medicine in California, but further dignify and edify the University of San Fransisco by having them housed at Toland hall.

Below are just a few of the reasons these murals should not be moved but be protected by the University.

• They are an outstanding example of San Francisco's New Deal-era mural tradition of public art.

• The murals are the work of a significant artist, Bernard Zakheim. Zakheim is an important
historical figure in American history, Jewish history, and art history, and the destruction of his
work should not be permitted.

• They were created specifically for Toland Hall, and portray UCSF's role in medical development
and research breakthroughs in California. This visual legacy stands in continuity with UCSF's
plans for continued research and innovation, and should not be sacrificed as a convenience for
redeveloping the site.

• Their depictions of diverse peoples of California questioned the conventional narratives of their
day about the treatment of Native Americans, Mexicans, and people of color. Specifically, one
of the fresco panels portrays Biddy Mason, and celebrates the accomplishments of this
formerly-enslaved nurse and midwife, serving as an equal in a patient's care.

2

I also oppose UCSF's subsequent issuing of a Request for Proposal (RFP) to have

3

the murals removed
and stored in a UCSF storage facility at Oyster Point in South San Francisco with no defined plan for their
reinstallation in a publicly-accessible facility. The DEIR itself states that “removal of the Zakheim murals
may potentially cause serious damage to at least some of the panels such that the integrity of the entire
series is destroyed.” UCSF’s plan to remove and store the murals will likely destroy them. I call on UCSF
to rescind the RFP.

3 cont.

The destruction of the Zakheim “History of Medicine in California” murals in Toland Hall is not
unavoidable, as stated in the DEIR. I demand the CPHP EIR include new project alternatives that more
appropriately protect, conserve and restore all of the murals, and provide for a specific public display of
them – either by retaining the Toland Hall auditorium and incorporating it into the new Research and
Academics Building planned on the same building footprint as UC Hall – or by identifying the specific
location on the UCSF Parnassus Heights campus at which the murals will be reinstalled, and how they
will be made accessible and interpreted to the public.

4

Sincerely,

Julie Louise Rothstein

Responses to Comments from Julie Louise Rothstein

I-Rothstein-1 The commenter opposes the removal of the Zakheim murals. This comment does not address the adequacy of the Draft EIR. However, please refer to Master Response 11: Toland Hall Murals.

I-Rothstein-2 The commenter opposes the removal of the murals and states they should be protected because the murals: are examples of San Francisco's New Deal-era murals; the work of Bernard Zakheim; were created specifically for Toland Hall and portray UCSF's role in medical development and research; and depict diverse people of California. Please refer to Master Response 11: Toland Hall Murals.

I-Rothstein-3 The commenter opposes UCSF's issuance of a Request for Proposal. The commenter asserts that because there is no defined plan for reinstallation of the murals in a publicly-accessible facility, the removal and storage will likely destroy the murals. Please refer to Master Response 1: Toland Hall Murals.

I-Rothstein-4 The commenter requests a new project alterative that would protect, conserve and restore the murals. The two alternatives requested include retaining Toland Hall and incorporating it into the new building or by identifying a specific location on the Parnassus Heights campus where the murals would be reinstalled and made accessible to the public. Please refer to Master Response 11: Toland Hall Murals.

4.1-73 shows shadow study for Grattan School at Stanyan and Rivoli Sts. These streets are each one block away from Grattan School. Are the streets misnamed or is the wrong shadow shown ? 1

4.5-21 shows MWh/year more than double presumably with the old co-generation facility adding more carbon to the atmosphere. Yet, page4.5-30 makes the jaw dropping statement that no mitigation is required. SB 288 is currently proposing to exempt ....from stricter review under CEQA to lessen carbon emissions. The statement on 4.5-16 that " cost effective renewables" will be considered is hardly reassuring. The State commitment to a lower carbon footprint is not reflected in this sloppy draft. 2

Sent from my iPad

Responses to Comments from Henry G. Anderson

I-Anderson-1 The comment points out a map labeling error on one of the Draft EIR shadow figures. Please refer to Master Response 9: Shadow Impacts.

I-Anderson-2 The referenced impact conclusion on page 4.5-30 in the Draft EIR is relative to whether the CPHP, combined with cumulative development in the campus site vicinity and citywide, would result in significant cumulative energy impacts (i.e., result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation; or conflict with or obstruct a state or local plan for renewable energy or energy efficiency). Based on the Impact C-ENE-1 analysis in the Draft EIR, it was determined that the proposed CPHP would not result in a cumulatively considerable energy impact; therefore, mitigation to address that cumulative impact was not required. For analysis of impacts that would be associated with greenhouse gas (GHG) emissions generated by the proposed CPHP, including the GHG emissions from the Campus Utility Plant, and associated CPHP Mitigation Measures GHG-1a, GHG-1b, and GHG-1c, please refer to GHG Impact GHG-1, see Draft EIR pages 4.7-34 and 4.7-43.

Dear Chancellor Hawgood and UC Regents,

RE: USCF Comprehensive Plan and its Draft EIR State Clearinghouse number 2020010075

I am writing in opposition to the demolition (removal and storage) of the BernardZakheim "The History of Medicine in California" fresco in the Tolland Hall auditorium in UC Hall. The project alternatives provided in this DEIR are inadequate and inappropriate. New alternatives to this plan need to be developed for the final CPHP EIR to preserve these murals and display them for public view on the Campus. 1

These Murals were commissioned by our Government and are an outstanding example of San Francisco's "New Deal Era" tradition of Public Art. Bernard Zakheim is a very important historical figure in American history, Jewish history and art history and the destruction of his work would be a travesty.

The mural's depiction of the diverse peoples of California questioned the conventional narratives of that day about the treatment of Native Americans, Mexicans and people of color. In particular, one of the panels portrays Biddy Mason, and celebrates the accomplishments of this previously-enslaved nurse and midwife, serving as an equal in patient care. 2

The removal and "storage " of these murals could potentially cause serious damage to them. I am pressing for new alternatives that continue the Public display of these murals somewhere on the UCSF Campus where the public has access to viewing them. 3

Thank you for this consideration

Susan McMorris

susanmmcmorris@gmail.com

Responses to Comments from Susan McMorris

I-McMorris-1 The commenter opposes the removal and storage of the Zakheim murals. The commenter asserts that the Draft EIR alternatives are inadequate and states that new alternatives to preserve and publicly display the murals should be developed. Please refer to Master Response 11: Toland Hall Murals.

I-McMorris-2 The commenter states the murals are examples of San Francisco's New Deal-era public art, the work of Bernard Zakheim, and depict diverse people of California. Please refer to Master Response 11: Toland Hall Murals.

I-McMorris-3 The commenter reiterates the request for a new alternative that continues the public display of the murals on the UCSF campus. Please refer to Master Response 11: Toland Hall Murals.

From:	LORRI UNGARETTI
To:	Campus Planning - EIR
Subject:	Public Comment: Comprehensive Parnassus Heights Plan and Draft EIR
Date:	Saturday, September 5, 2020 2:46:27 PM

Chancellor Hawgood and U.C. Regents:

This letter is a protest against the UCSF Comprehensive Parnassus Heights Plan and its Draft EIR—State Clearinghouse Number 2020010175. 1

Specifically, I am writing about the plan to demolish "The History of Medicine in California," the historical ten murals created by Bernard Zakheim in the 1930s. I am a San Francisco native, a local historian, and a member of San Francisco City Guides. As a City Guide, I lead a walking tour of the Inner Sunset. The tour used to include visiting and examining these historical New Deal murals. I had a manuscript written by Mr. Zakheim's daughter with details I that helped me explain what many of the images represented. Universally, walkers remembered viewing the murals as one of the best parts of the walking tour. I grew to appreciate the detail of the murals and how invaluable they are to the history of San Francisco and California.

Here are some other reasons I support saving these murals: 2

1. They depict individuals and events in San Francisco and all of California's medical history and include UCSF's role in that history.
2. They represent an earlier era of frescoes, an art form that is now rarely, if ever, used to create murals.
3. Although commissioned by UCSF scientists, they were paid for by the Federal Works of Art Federal Art Project. It is not UCSF's decision to destroy them; that decision should be made by the Federal Government.
4. They depict various sympathetically diverse peoples in California's history.

I am arguing against both the destruction of these ten murals and/or the refusal of UCSF to display them elsewhere. The destruction of the murals is not "unavoidable" (as the EIR states), and they should be on display indefinitely. 3

5. At one time, UCSF was committed to preserving and exhibiting the murals. In 2004, the UCSF website said:

"The murals will enter yet another phase when the UC Hospital—which houses Toland Hall—is demolished. The murals, which were painted on removable panels, are assured preservation—the Long-Range Development Plan specifically addresses this issue. The University, according to the Environmental Impact Report, plans to remove and preserve the Zakheim murals in Toland Hall." 4

However, that statement is no longer on the UCSF website. A 2015 article on the website called UCSF's group of murals by Zakheim "the jewel of the University's Art

Collection." Now, the university plans to destroy the murals—or take them down and put them into storage. 4 cont.

6. Removing the murals, preserving them, and displaying them to the public is a dangerous, tedious task. UCSF has said doing so would cost $8 million; however, Nathan Zakheim (son of the artist) says his plan to preserve and display the murals would cost about $1 million. Why is UCSF not considering this offer? Nathan Zakheim knows what he is talking about; he has preserved several murals of this kind (frescoes) with no damage to the artwork. He also knows these murals well, since he is the artist who restored them in the 1970s, after UCSF had painted and hung portraits over them, damaging about 50 percent of the murals. 5

7. I also oppose UCSF's Request for Proposal (RFP) to start immediate removal of the murals and storing them. Removing and storing them could cause irreparable damage. Instead, they should be cautiously removed to preserve them. They should not be put in storage but should be on permanent display in the new, yet-to-be-designed UCSF buildings. 6

"The History of Medicine in California" is a striking gift to a California medical institution and should be preserved carefully and displayed permanently for current and future generations. 7

Sincerely,
Lorri Ungaretti
2730 Clement Street
San Francisco, CA 94121

Responses to Comments from Lorri Ungaretti

I-Ungaretti-1 The commenter makes a general comment protesting the proposed CPHP and the CPHP Draft EIR. Due to lack of specificity in the comment, no direct response is possible; please see Master Response 2: General Comments on EIR and Environmental Topics.

I-Ungaretti-2 The commenter states the murals should be saved because they: depict individuals and events in San Francisco and California medical history, including UCSF's role; represent an earlier era of frescoes; were paid for by the Federal Works of Art Federal Art Project and therefore the decision should be made by the federal government; they depict diverse people in California's history. Please refer to Master Response 11: Toland Hall Murals.

I-Ungaretti-3 The commenter opposes the removal of the murals and states that they should be on display indefinitely. Please refer to Master Response 11: Toland Hall Murals.

I-Ungaretti-4 The commenter states that UCSF was committed to preserving and exhibiting the murals in 2004. Please refer to Master Response 11: Toland Hall Murals.

I-Ungaretti-5 The commenter questions UCSF's cost estimate for removing, preserving, and displaying the murals. Please refer to Master Response 11: Toland Hall Murals.

I-Ungaretti-6 The commenter opposes UCSF's Request for Proposal for the removal and storage of the murals. The commenter states that removal and storage of the murals would "cause irreparable damage" and instead, the murals should be on permanent display. Please refer to Master Response 11: Toland Hall Murals.

I-Ungaretti-7 The commenter reiterates that the murals should be preserved and permanently displayed. Please refer to Master Response 11: Toland Hall Murals.

San Francisco, CA 94122

Ms. Diane Wong
UCSF Real Estate - Campus Planning
654 Minnesota Street
San Francisco, CA 94143-0286
Email: EIR@ucsf.edu

September 5, 2020

Dear Ms. Wong,

Please accept these comments to the CPHP Draft EIR. I have excerpted, highlighted and italicized EIR text and commented following the text.

Sincerely yours,

Roger Hofmann

Introduction - From Section 1.5

"Similarly, when details on CPHP Future Phase projects are known, each Future Phase project would be reviewed in light of the CPHP Final EIR to determine the appropriate level of additional environmental review, if any, needed before approval and implementation of the particular project. If no new significant effects would occur, all significant effects have been adequately addressed, and no new mitigation measures would be required, the later activities within the scope of the approved CPHP could rely on the environmental analysis provided in the program EIR, and no additional environmental analysis would be required; otherwise, additional environmental analysis must be prepared."

1

This is a "Fox guarding the henhouse" plan. Per this description, the determination of whether additional environmental reviews are required is solely at the discretion of UCSF. Normal EIR review processes are subverted.

Please analyze whether a self-review of CPHP Future Phase projects provides the same level of scrutiny and protections to the public as would be provided by a full EIR review process.

Section 4.11 – From Ambulance Related Noise

"Emergency vehicles currently access the Moffitt Hospital emergency room at the driveway at 505 Parnassus Avenue. Emergency vehicle sirens (associated with ambulances) are characteristic in the general vicinity of hospitals and can produce short-term noise up to 106 dB (CPMC, 2010), but normal practice is for ambulance drivers to turn off their sirens within a few blocks of the hospital emergency access. The proposed New Hospital would also contain emergency room facilities and accommodate emergency ambulance vehicles. The specific ambulance drop-off location and parking lot configuration is not yet known, however, it could be located along Medical Center Way. Similar to existing ambulance drop-off at Moffitt Hospital, it is expected that ambulances dropping off patients at the New Hospital would turn off the sirens within the vicinity of the hospital which would minimize noise effects on surrounding land uses.

With the exception of siren use, patient drop-off events associated with ambulances are assumed to generate noise levels similar to those that would occur from typical parking lot activities. Like typical parking lot activities, patient drop-off events are expected to generate noise from vehicle arrival, idling, occupants exiting the vehicle, door closures, conversations among passengers, occupants entering the vehicle, startup, and departure of the vehicle. Given that existing campus operations already involve ambulance drop-offs, and that the New Hospital would be assumed to only marginally increase the potential frequency of emergency vehicle visits, the operational impact of additional ambulance activities at the campus site associated with the New Hospital would be less than significant."

Please analyze whether the potential frequency of emergency vehicle visits would increase marginally as stated above, or whether these visits would increase in proportion to the increased size of the New Hospital, or whether these visits would increase in proportion to some other metric.

Please analyze whether increased traffic in the vicinity of UCSF due to the increased campus population size and/or reconfiguration of streets adjacent to UCSF and/or reconfiguration of the campus itself would create delays in ambulance delivery, and at what rate traffic delays could impact patient outcomes.

If this analysis of ambulance delivery delays is conducted prior to determination of the location and number of ambulance parking spots, and/or prior to an analysis of the number of emergency vehicle visits, please describe why the public should have confidence in the conclusions of the analysis.

Ambulance access to a hospital is critical. It is literally a matter of life and death. The "To be determined" approach to ambulance access taken by this EIR appears malfeasant.

2

Responses to Comments from Roger Hofmann

I-HofmannR-1 The commenter references the Introduction section of the Draft EIR, and indicates its takes issue with UCSF determining the additional level of environmental review that may be needed for Future Phase projects.

First, as discussed on page 1-2 in the Introduction, the University of California (University) is the lead agency for the environmental review of the CPHP and for the LRDP amendment. The University is governed by the UC Regents, which under Article IX, Section 9, of the California Constitution, has "full powers of organization and government" subject only to very specific areas of legislative control. The UC Regents has the responsibility for certifying this EIR, and approving the LRDP amendment.

As indicated in the Introduction on page 1-3, the Regents or its designee pursuant to its delegation authority is required to consider the information in the EIR, along with any other relevant information, in making its decision to approve the LRDP amendment to incorporate the CPHP and each specific proposed project that may be brought forth for approval in the future to implement the CPHP.

As allowed under CEQA, the CPHP EIR is a program EIR that establishes a framework for tiered or project level environmental documents that would be prepared in the future in accordance with the overall program. As cited on page 1-8 in the Draft EIR by the commenter, when details on CPHP Future Phase projects are known, each Future Phase project would be reviewed in light of the CPHP Final EIR to determine the appropriate level of additional environmental review, if any, needed before approval and implementation of the particular project. If no new significant effects would occur, all significant effects have been adequately addressed in the program EIR, and no new mitigation measures would be required, the later activities within the scope of the approved CPHP could rely on the environmental analysis provided in the program EIR, and no additional environmental analysis would be required; otherwise, additional environmental analysis must be prepared.

Furthermore, as described on page 1-8 of the Introduction, the additional analysis may rely on the program EIR, as appropriate, but would be tiered to allow the analysis to focus on more project- and site-specific impacts of the later project. Appropriate environmental documentation associated with later activities not examined in the program EIR would be prepared pursuant to CEQA and CEQA Guidelines.

I-HofmannR-2 The comment requests additional analysis and discussion of the CPHP's potential impacts on ambulance access to the hospital as well as impacts resulting from ambulance operations. See pages 4.15-48 through 4.15-49 of the Draft EIR and Master Response 21 for a discussion of emergency access.

Subject: Murals on history of medicine
Date: Tuesday, September 8, 2020 11:41:18 AM
Attachments: image.png
image.png

I am writing to urge you to preserve your 1930s murals depicting the history of medicine at UCSF that is slated for destruction. Years ago (in 2000) I tried to prevent the destruction of murals in the former Dachau concentration camp in Germany, which had been painted shortly after the war (probably around 1948) when the main concentration camp building served as a mess hall for the US Eastman barracks installed there after the camp was liberated. Such artifacts help to give us born-afters a sense of how we got to where we are--what came before, what was valued, what was not, how it was treated by the intervening generations.

This is important to anchor our collective identity and move us forward as a society: we can decide whether what happened once should be condemned to the dustbin of history, or resurrected as a model for today.

Please preserve the murals on the history of medicine at UCSF--don't make the same mistake as they did in Dachau!

The identification of the African-American nurse Biddy Mason (see this article in the UCSB Current) contributes to our knowledge and documents the ground in striving for equality that we lost since the 1930s and need to regain.

Harold Marcuse
Professor of History, UC Santa Barbara

Here are two of the lost Dachau murals, fyi:

Diane Wong

UCSF Real Estate Campus Planning

654 Minnesota Street

San Francisco, CA 94143-0286

copy by email sent to: EIR@UCSF.edu

Dear Ms. Wong:

This letter contains my comments on the contents and adequacy of the EIR analysis contained in the approximately 360-page UCSF Comprehensive Parnassus Heights Plan (CPHP). In compliance with your instructions in your letter of July 13th, 2020, which was the first page of the EIR CPHP.

My full name is Armand James Robertson II. My address is 178 Edgewood Avenue, San Francisco, CA 94117. I have lived at this address with my family since 1969, a period of 51 years. Edgewood Avenue is a one-block brick covered street located to the East and abutting the UCSF Parnassus Campus. Because of the proximity of my home to the campus for these many years, I am familiar with the environmental effects of the campus on Edgewood Avenue. 1

I am also familiar with the Regents of the University of California Resolution of 1976, reducing space at the Parnassus Campus, minimizing population growth at that campus, and improving transportation related programs. This Resolution contained space limits and population estimates regarding the Parnassus Heights Campus. This Resolution is referred to at page 3-13 of the draft EIR. However, I was unable to find a copy of this extremely relevant Resolution anywhere within the 360-page draft EIR. I did locate a copy of the Regents of the University of California 1976 Resolution in the Appendix to the Long-Range Development Plan adopted in November of 2014. A copy of that Resolution is attached to this letter (as **Exhibit A**, Appendix F 1976 Regents' Resolution). 2

The Resolution states in relevant part "that the boundaries of the San Francisco Campus be altered to exclude properties on the West side of Third Avenue from 1309-11 Third Avenue to and including 1379 Third Avenue and that the new boundaries be made permanent. The total structures within the Campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on 3rd, 4th, 5th, and Parnassus Avenues and Kirkham and Irving Streets and this limit shall be permanent. These restrictions prohibit expansion by UCSF by purchase or condemnation or gift of any property or lease of private residential property, not only contiguous with the new campus boundaries,

but anywhere within the surrounding areas bounded by Golden Gate Park, Oak Street, Clayton and Clarendon…"(emphasis added).

That 1976 Regents' Resolution at item 7 stated "that the Regents recognize the principal that the San Francisco Campus will be administered so that the annual average of the daily population at the Parnassus site will remain substantially in accordance with the projections set forth in the environmental impact report related to the Long-Range Development Plan for the Campus approved by the Regents in October 1975." (a population of 13,400)

The 1976 Regents' Resolution was entered by the Regents in connection with the settlement of a lawsuit commenced by the Mt. Sutro defense committee against the UC Regents and UCSF's then current Chancellor, Francis A Sooy.

The City and County of San Francisco Superior Court "Heard the case in 1975. This body ruled that all further construction be stopped until the University made further changes to their EIR." The agreement by UCSF in the 1976 Resolution was a "legally binding moratorium on UCSF expansion at the Parnassus Campus… (see pages 4 and 5 of the article, "Bringing DNA into the Neighborhood in San Francisco, a Personal Recollection" by Guenter B. Risse, M.D., PhD. Professor Reiss was employed by UCSF from 1985 to 2001, as Chairperson of the Department of the History of Health Services. This article is attached (as **Exhibit B**). This 19-page article explains not only the Resolution of the Regents in 1976, limiting expansion to 3.55 million gross square feet and a population of 13,400, but also discusses UCSF starting a new campus location at Laurel Heights and later at Mission Bay. 2 cont.

These permanent restrictions of 3.55 million gross square feet are clear and definite. These restrictions were carefully followed by UCSF Parnassus from 1976 to at least November 2014 when the final Long-Range Development Plan for UCSF was adopted. Attached (as **Exhibit C**) are pages 51 to 53 of the UCSF 2014 Final Long-Range Development Plan. The 1976 Regent's Resolution, its relevant elements and status were updated. This update included a specific reference to the Campus boundaries and that buildings within these boundaries are not to exceed 3.55 million gross square feet. The 2014 Long Range Development Plan (LRDP) admitted that the gross square feet in 2014 was 3.65 million gross square feet "about 3.4% over the limit".

The Long-Range Development Plan also noted at item 7 that "the annual average daily population of the Campus site including employees, students, patients and visitors was to remain substantially in accordance to the amount (13,400) projected in the 1976 LRDP environmental impact report."

The Long-Range Development Plan in discussing site specific objectives made clear that UCSF Parnassus was fully aware of the 1976 Regents' Resolution and was striving to follow it. At item E, it is stated as an objective "strive to better achieve the remaining unfulfilled components of the 1976 Regents' Resolution by reducing space, minimizing population growth and improving transportation related programs."

The draft EIR for CPHP is completely deficient and inadequate because it blatantly ignores the requirements of the 1976 Resolution of the Regents of the University of California by stating at page 2 of the draft EIR that the square feet of buildings within the Campus would increase to 5.79 million square feet upon full implementation of the draft EIR. This is an increase of over 2.41 million gross square feet over the permanent limitation of 3.55 million gross square feet contained in the 1976 Resolution of the 3

Regents of the University of California. This is an increase of over 67%. In addition, the draft EIR states the population of the UCSF Parnassus Campus as of 2018 was 17,437 and the projected population as of 2030 would be 23,225. This is an increase of 4,037 as of 2018 above the 13,400 limit and increase of 9,825 over the 13,400 limits. Such a drastic increase in population will have very adverse environmental consequences for residents of Edgewood Avenue, such as myself. In 1969 and for several years thereafter, residents of Edgewood Avenue were acutely aware of the enormous impact the UCSF Parnassus Campus had on their lives based on the parking situation before the preferential parking policy was instituted by the City of San Francisco in the late 1970s. Before preferential parking, because of parking by UCSF employees, it was impossible to park on Edgewood Avenue from about 8:00 AM to 5:30 PM. The increase in population of the UCSF Parnassus Campus by 9,000 by 2030 will cause serious parking problems because the existing garage is inadequate to accommodate that many additional people. There are no plans in the draft EIR to increase the size of the parking garage by 4 or 5 floors to accommodate the additional 9,000 people who will be populating the UCSF Parnassus campus. Preferential Parking will ameliorate the effects but not eliminate them, because even with preferential parking, people can park for two hours during working hours. Enforcing this two-hour limit is difficult because there are not enough parking control officers to enforce this two-hour limit. The result will be a serious impairment of the Edgewood Avenue residents' ability to park on their own street on weekdays.

3 cont.

4

The draft EIR which fails to discuss this Resolution with its limit of 3.55 million gross square feet of buildings and population limit of 13,400 is totally inadequate. These limits which are permanent were put on in 1976 for good reasons, to protect the environment of individuals such as residents of Edgewood Avenue who live near the UCSF Parnassus Campus. The draft EIR does not discuss how this Resolution is not binding on the UCSF Parnassus Campus, at this time. The Resolution states the 3.55 million gross square feet space limitation was to be "permanent". The draft EIR does not discuss the development of additional campus sites at Laurel Heights and Mission Bay. Specifically, there should be some statement as to what the population of Mission Bay is and to what extent that the expansion proposed in the draft EIR for the Parnassus Campus could instead be implemented at Mission Bay.

5

6

For these reasons, the draft EIR is completely deficient. There should be a further supplement to the draft EIR submitted discussing the 1976 Resolution and the other issues pointed out in this letter. After such an amendment of the draft EIR, there should be a further opportunity for public comment.

7

Sincerely,

Armand James Robertson II

Responses to Comments from Armand James Robertson II

I-Robertson-1 The commenter makes a general comment about knowledge of environmental effects of the campus on Edgewood Drive. Please refer to Master Response 2: General Comments on EIR and Environmental Topics. See also responses to individual comments below.

I-Robertson-2 The commenter references different aspects of the 1976 Regents' Resolution. Please refer to Master Response 4: Space Ceiling and Population.

I-Robertson-3 The commenter asserts that the CPHP Draft EIR is deficient and inadequate because it ignores the requirements of the 1976 Regents' Resolution. Please refer to Master Response 4: Space Ceiling and Population.

I-Robertson-4 The comment asserts that the CPHP provides inadequate parking, which would lead to increased difficulty in locating parking on the commenter's residential street and others in the vicinity of the campus site. As stated on page 4.15-33 and in Master Comment TR-3, parking is not a CEQA topic, and additional discussion of parking supply and demand in the campus site vicinity is not required. The CPHP's proposed parking supply was, however, assessed and incorporated into estimates of project travel demand, as explained in Master Comment 19.

I-Robertson-5 The commenter asserts that CPHP Draft EIR fails to discuss the 1976 Regents' Resolution limits on space and population. Please refer to Master Response 4: Space Ceiling and Population.

I-Robertson-6 The commenter requests discussion of alternatives involving development of additional campus sites at Laurel Heights and Mission Bay and whether the proposed CPHP development could be implemented at the Mission Bay campus site rather than Parnassus Heights. Please see Master Response 5: EIR Alternatives.

I-Robertson-7 The commenter provides a concluding statement that the Draft EIR is deficient for the reasons discussed in its comments above; and that a further supplement to the Draft EIR should be submitted discussing the 1976 Regents' Resolution. As demonstrated in the individual responses provided to the comments raised, and further in Section 8.1.4 in this Comments and Responses document, none of the specific issues identified in the comments, or response to these comments, result in any of the conditions of Section 15088.5(a) being met. Thus, UCSF has determined that recirculation of the Draft EIR on the issues raised by the comments is not warranted.

Please note Comment Letter I-Robertson contained several attachments which did not comment directly on the Draft EIR. These attachments are included in Appendix I-Robertson in this Comments and Responses document.

Dear Chancellor Hawgood and the U.C. Board of Regents,

We, the undersigned, are deeply alarmed by the University's expansion plan for its Parnassus Heights campus, a plan that threatens ten historic murals by the artist Bernard Zakheim. The murals, as you know, are showpieces of the New Deal era, rightly regarded as the "jewel of the University's art collection." They portray a rich tapestry of people at pivotal moments in California's history. Of particular significance is the fresco featuring Biddy Mason, a former slave turned nurse, philanthropist, and real estate entrepreneur. This work-the first known artistic representation of Mason-tells a vital and sadly overlooked story of Black empowerment. Such tributes to women of color from this era are extraordinarily rare, and deserve not only preservation, but celebration. 1 2

As such, we find the University's plan embarrassingly out of step with the national movement over race and representation. Leaders from across the country are demanding an honest reckoning with our past in an effort to forge a more just future. We urge you to be one of those leaders. Through these murals, you have the opportunity to honor historically marginalized people and to foster deeper understanding of America's long, fraught relationship with race. 2

We therefore implore you to preserve these irreplaceable works of art. Furthermore, we ask that you engage with specialists to ensure the murals are publicly accessible, so that future generations can draw inspiration from the empowering history they depict. As New Deal public works, they belong to us all. What you do here-or fail to do here-will be seen far beyond the halls of the University. 3

Honor your roles as stewards and educators. Preserve and display these emblems of our shared cultural heritage. 3

Respectfully,

James L. Hutchinson, M.D.

Responses to Comments from James L. Hutchinson

I-Hutchinson-1 The commenter expresses concern regarding the proposed removal of the murals. Please refer to Master Response 11: Toland Hall Murals.

I-Hutchinson-2 The commenter notes the significance of the painting featuring Biddy Mason, a former slave turned nurse, philanthropist, and real estate entrepreneur. The commenter states that the University should preserve and celebrate this mural given the current context of the national movement over race and representation. Please refer to Master Response 11: Toland Hall Murals.

I-Hutchinson-3 The commenter asks that UCSF engage specialists to ensure the murals are preserved and publicly accessible. Please refer to Master Response 11: Toland Hall Murals.

From: Klein, Joel
To: Campus Planning - EIR
Subject: Zakheim Murals
Date: Tuesday, September 8, 2020 3:08:46 PM

Dear Chancellor Hawgood and U.C. Regents,

I am writing in opposition to the Draft Environmental Impact Report (DEIR) dated July 13, 2020 for the proposed Comprehensive Parnassus Heights Plan (CPHP). In particular, In the DEIR's Chapter 4, Cultural Resources and Tribal Resources Section 4.4.4 "Impacts and Mitigation Measures," I oppose the plan to demolish "The History of Medicine in California" frescoes created by Bernard Zakheim in the Toland Hall auditorium in UC Hall. The project alternatives provided in this DEIR are inadequate and inappropriate, and new alternatives need to be developed for the final CPHP EIR to preserve these murals and display them for the public on the UCSF Parnassus Heights campus. 1 2

I am a historian of medicine and the curator responsible for history of medicine collections at The Huntington Library in San Marino, CA, including many items from the Los Angeles County Medical Association (LACMA). The Zakheim murals portray much of the history that is in The Huntington's LACMA collections, including a panel that shows Drs. John S. Griffin and Joseph Pomeroy Widney, two founders of LACMA. We have archival materials by both Griffin and Widney, as well as the original minute books from the first meetings of LACMA. Works of art that feature California medical history are very rare, but what makes these murals especially interesting is subject matter that was ahead of its time when Zakheim was working. In particular, the inclusion of Native Americans, Mexicans, persons of color (e.g., Biddy Mason, a nurse and entrepreneur who was once in the employ of Griffin), and women in the history of medicine was far from common. The murals provoke important questions about the history of medicine and public health that – especially considered in the midst of a global pandemic – must be considered and discussed, especially by health professionals, if our society is to flourish. 3

Beyond this, I agree with the following regarding the murals:

- They are an outstanding example of San Francisco's New Deal-era mural tradition of public art.
- The murals are the work of a significant artist, Bernard Zakheim. Zakheim is an important historical figure in American history, Jewish history, and art history, and the destruction of his work should not be permitted.
- They were created specifically for Toland Hall, and portray UCSF's role in medical development and research breakthroughs in California. This visual legacy stands in continuity with UCSF's plans for continued research and innovation, and should not be sacrificed as a convenience for redeveloping the site.
- Their depictions of diverse peoples of California questioned the conventional narratives of their day about the treatment of Native Americans, Mexicans, and people of color. Specifically, one of the fresco panels portrays Biddy Mason, and celebrates the accomplishments of this formerly-enslaved nurse and midwife, serving as an equal in a patient's care.

I hope very much that a solution can be found for a permanent means of displaying these works of art that tell and important but neglected history of medicine in California. 4

Sincerely,

Dr. Joel A. Klein
Molina Curator for the History of Medicine and Allied Sciences
The Huntington Library, San Marino, CA

Responses to Comments from Joel Klein

I-Klein-1 The commenter expresses opposition to the Draft EIR and the CPHP's proposal to demolish the Zakheim murals in Toland Hall; and indicates that alternatives need to be developed for the EIR that preserve the murals and displays them on the campus site. Please refer to Master Response 11: Toland Hall Murals.

I-Klein-2 The commenter asserts that the project alternatives are inadequate and inappropriate, and that new alternatives should be developed. Please refer to Master Response 11: Toland Hall Murals.

I-Klein-3 The commenter describes the importance of the Toland Hall murals to the Huntington Library in San Marino, California because the murals depict the two founders of the Los Angeles County Medical Association. The commenter notes that art featuring people of color from this time period are rare, and the removal of these murals should not be permitted. Please refer to Master Response 11: Toland Hall Murals.

I-Klein-4 The commenter desires a solution that permanently displays the murals because they represent the history of medicine in California. Please refer to Master Response 11: Toland Hall Murals.

From:	Gregory Vernitsky
To:	Campus Planning - EIR
Subject:	Save Zakheim"s Murals!
Date:	Thursday, September 10, 2020 10:40:17 AM

Dear Chancellor Hawgood and U.C. Regents,

I am writing in opposition to the Draft Environmental Impact Report (DEIR) dated July 13, 2020 for the proposed Comprehensive Parnassus Heights Plan (CPHP), State Clearinghouse Number 2020010175. 1

In the DEIR's Chapter 4, Cultural Resources and Tribal Resources Section 4.4.4 "Impacts and Mitigation Measures," I oppose the plan to demolish "The History of Medicine in California" frescoes created by Bernard Zakheim in the Toland Hall auditorium in UC Hall. The project alternatives provided in this DEIR are inadequate and inappropriate, and new alternatives need to be developed for the final CPHP EIR to preserve these murals and display them for the public on the UCSF Parnassus Heights campus. 2

· They are an outstanding example of San Francisco's New Deal-era mural tradition of public art.

· The murals are the work of a significant artist, Bernard Zakheim. Zakheim is an important historical figure in American history, Jewish history, and art history, and the destruction of his work should not be permitted.

· They were created specifically for Toland Hall, and portray UCSF's role in medical development and research breakthroughs in California. This visual legacy stands in continuity with UCSF's plans for continued research and innovation, and should not be sacrificed as a convenience for redeveloping the site.

· Their depictions of diverse peoples of California questioned the conventional narratives of their day about the treatment of Native Americans, Mexicans, and people of color. Specifically, one of the fresco panels portrays Biddy Mason, and celebrates the accomplishments of this formerly-enslaved nurse and midwife, serving as an equal in a patient's care. 3

I also oppose UCSF's subsequent issuing of a Request for Proposal (RFP) to have the murals removed and stored in a UCSF storage facility at Oyster Point in South San Francisco with no defined plan for their reinstallation in a publicly-accessible facility. The DEIR itself states that "removal of the Zakheim murals may potentially cause serious damage to at least some of the panels such that the integrity of the entire series is destroyed." UCSF's plan to remove and store the murals will likely destroy them. I call on UCSF to rescind the RFP. 4

The destruction of the Zakheim "History of Medicine in California" murals in Toland Hall is not unavoidable, as stated in the DEIR. I demand the CPHP EIR include new project alternatives that more appropriately protect, conserve and restore all of the murals, and provide for a specific public display of them – either by retaining the Toland Hall auditorium and incorporating it into the new Research and Academics Building planned on the same building footprint as UC Hall – or by identifying the specific location on the UCSF Parnassus Heights campus at which the murals will be reinstalled, and how they will be made accessible and interpreted to the public. 5

Sincerely,

Gregory Vernitsky

2447 23rd Ave San Francisco, CA 94116

Responses to Comments from Gregory Vernitsky

I-Vernitsky-1 The commenter makes a general comment expressing opposition to the Draft EIR. Please see Master Response 2: General Comments on EIR and Environmental Topics; and individual responses that follow.

I-Vernitsky-2 The commenter asserts that the project alternatives are inadequate and inappropriate, and that new alternatives should be developed that publicly display the murals. Please refer to Master Response 11: Toland Hall Murals.

I-Vernitsky-3 The commenter notes that the murals are outstanding examples of San Francisco's New Deal-era art, that the artist, Bernard Zakheim is an important historical figure, that they portray UCSF's role in the history of medicine, and that the murals depict people of color, in particular Biddy Mason, which defied conventional narratives of the time. Please refer to Master Response 11: Toland Hall Murals.

I-Vernitsky-4 The commenter opposes UCSF's plan to remove and store the murals in a UCSF storage facility in South San Francisco, and calls on UCSF to rescind the Request for Proposal to undertake the restoration process. Please refer to Master Response 11: Toland Hall Murals.

I-Vernitsky-5 The commenter states that the alternatives in the Draft EIR are inadequate and new alternatives to preserve the murals should be developed. The commenter requests that alternatives should be developed that incorporate the murals into the new Research and Academic Building or by relocating the murals to a publicly accessible location on the campus site. Please refer to Master Response 11: Toland Hall Murals.

From: Carol Denney
To: Campus Planning - EIR
Cc: Lope Yap Jr; Voisin George Laura
Subject: Draft EIR for the UCSF Comprehensive Parnassus Heights Plan SCN 2020010175
Date: Thursday, September 10, 2020 10:43:36 AM

To Chancellor Hawgood and UC Regents,

I oppose the draft EIR for the UCSF Comprehensive Parnassus Heights Plan, SCN 2020010175, specifically the proposed destruction of the Zakheim murals.

First I wish to object to moving forward with this proposal during the pandemic, the free-fall of California's economy, and the current firestorm wreaking heartbreak and havoc statewide. People are scrambling to keep their families alive and safe right now, and my power has been on and off for days because of the firestorms. Please consider that the public has a right to thoughtful consideration of this proposal which is utterly impossible given that access to the materials and the process is partial at best; a pandemic alone should clarify that this is no time to move forward with a project which requires public input. 1

The Zakheim murals, the History of Medicine in California, is a set of New Deal murals that belong to all the nation, and was intended to be enjoyed and examined over time by the students, lecturers, professors and visitor to the campus. This set of murals is part of a public trust and is considered priceless by art historians. The most important proposal required of this plan should be ***a no-build option*** which would keep the original auditorium intact and build around the murals so that the intended setting can be preserved. An educational institution such as UCSF should be especially enthusiastic about this proposal since at the height of the Depression this was a publicly funded project intended to honor the native cultures' healing arts as well as local luminaries such as Biddy Mason, whose inclusion in the murals was only recently clarified thanks to the dedicated research of Laura Voisin George. These works were not intended for a museum; they were intended to be, and should remain, a working element in an educational institution dedicated to honoring all the healing arts and those who contributed to advances in healing in California history. This illustrated set of murals is not replaceable and could never be as powerful in any on-line form, or in any other setting. 2

UCSF leadership actually wallpapered over the murals at one time, which public funding managed to restore afterward, but the wallpapering makes it clear that UCSF's sense of stewardship is seriously wanting. The proposal to move or destroy these priceless works at this moment in time is especially absurd considering that architects and contractors, if so instructed, could easily absorb this part of the current structure into the proposed expansion. After the NO-BUILD option, the SETTING PRESERVATION option should be thoroughly explored. Most architects and contractors would be honored to be part of a project that included, rather than destroyed, these priceless examples of New Deal art which illustrate a part of Black history heretofore unknown. Even to minimize the importance of this part of Black history at this historical moment in time demeans all of us as a nation. But to destroy it, or destroy the congruence of its integration into an educational setting, is an outrage. 3

A further outrage is to suddenly burden the Zakheim family, which has had to step into an impossible situation to try to help rescue the public treasure these murals represent. These murals are part of a public trust, and deserve to be respected as such.

My name is Carol Denney, I am a UC alumna, and I am no stranger to the well known stories 4

of UC's expansion-driven minimization of the crucial role of culture in our efforts to appraise our present and our past. Please consider that we have an opportunity here as a nation, and especially as Californians, to do the right thing. And that history will judge the steps we take to honor our sacred trust. 4 cont.

Sincerely,
Carol Denney
1970 San Pablo Avenue #4
Berkeley, CA 94702
510-548-1512

Responses to Comments from Carol Denney

I-Denney-1 The commenter expresses opposition to the Draft EIR and the CPHP's proposal to demolish the Zakheim murals in Toland Hall; and indicates that alternatives need to be developed for the EIR that preserve the murals and displays them on the campus site. Please refer to Master Response 11: Toland Hall Murals.

The commenter also objects to moving forward with the proposal during the COVID-19 pandemic; indicates the public has a right to thoughtful consideration of the proposal; and that access to the materials and the process is partial at best. The Draft EIR has been prepared pursuant to all applicable requirements under CEQA, including those related to public review and the availability of related project materials. Please refer to Section 8.1.2 in this Comments and Responses document, which provides detail on the extensive public review provided for the EIR. It should be noted that an extended public review period (60 days) was provided for public review of the Draft EIR, exceeding the 45-day minimum requirement. See also Draft EIR Section 1.4 which discusses the campus, public and agency outreach that has occurred for the CPHP.

I-Denney-2 This comment states that the murals are part of a public trust and should be preserved as part of a no-build option that leaves the murals in situ. Please refer to Master Response 11: Toland Hall Murals.

I-Denney-3 This comment prefers the no-build option to preserve the murals, but states that the setting preservation option should be thoroughly explored as well. Please refer to Master Response 11: Toland Hall Murals.

I-Denney-4 The commenter provides a concluding statement that does not address the adequacy of the Draft EIR; consequently, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

From: Anastasia Glikshtern
To: Campus Planning - EIR
Subject: Comment on DEIR for UCSF Comprehensive Parnassus Heights Plan
Date: Thursday, September 10, 2020 2:53:05 PM

Dear Sir/Madam,

The amended LRDP will have detrimental effect on Sutro Forest:

- Hundreds of trees will be removed.
- The construction space required for building up to 96 feet high buildings for Aldea Student Housing (where the space ceiling is to be eliminated) will likely necessitate the destruction of more trees.
- The revised plan removes an area of Sutro Forest (near Parnassus and Edgewood). In "compensation" an area that is already a de facto part of the forest would be technically included in the forest.
- The redwood grove on Parnassus is to be eliminated (in addition to the tree loss in the Sutro Forest itself).

1

As of 2013 the San Francisco tree canopy cover was 13.7% - the lowest of any major city. It is probably lower now with continuing destruction of trees in Sutro Forest and everywhere else in San Francisco.

In the time of climate change, removing trees is an environmental hazard. It also sacrifices all the ecosystem services provided by the trees.
The plan will make Sutro Forest drier and less self-sustaining, and therefore, riskier - as climate change hits California harder each year.

2

Please revise the project to protect the trees.

Sincerely

Anastasia Glikshtern

Responses to Comments from Anastasia Glikshtern

I-Glikshtern-1 The commenter states that hundreds of trees would be removed under the CPHP, including in the Aldea Housing area, and in the redwood grove on Parnassus Avenue. The Draft EIR Chapter 3, Project Description, page 3-38; and Section 4.3, Biological Resources, page 4.3-22 acknowledge that certain vegetation removal would be required at the campus site as a result of clearing, excavation and regrading activities conducted in support of the CPHP. UCSF will consider replanting trees in the landscaping plans for each specific project under the CPHP when detailed designs become available.

The commenter also objects to the replacement of lost acreage in the Reserve, and indicates an area that is already defacto part of the forest would be technically included in the forest. The area that the commenter characterizes as already defacto part of the forest is currently designated as a "Support" zone in UCSF's existing functional zone map, and under the CPHP would be designated as an "Open Space Reserve" zone. Accordingly, the CPHP would provide permanent open space reserve protection that is not currently provided for this area.

I-Glikshtern-2 The commenter states that the removal of trees would make the Sutro Forest drier and less self-sustaining, and would exacerbate impacts of climate change. The tree removal that would occur under the CPHP would be limited to the margins of the Reserve and would not alter the canopy cover of the great majority of Sutro Forest, nor adversely affect moisture levels of the surrounding area, which are largely driven by its presence in the coastal fog belt.

From: S.Sackheim Cohen
To: Campus Planning - EIR
Subject: Zakheim murals
Date: Thursday, September 10, 2020 5:53:05 PM

The murals are art which belong to us all. These WPA treasures must not be destroyed.
To put the burden of saving them upon the family is absurd.
A reasonable solution to preserve this history must be found.
Sincerely,
Susan Sackheim Cohen

Subject: CPHP EIR
Date: Thursday, September 10, 2020 7:22:18 PM

When I saw the Zakheim murals at USSF for the first time I was amazed at their strong expression and beauty. Thus I would like to urge you to prevent that they are destroyed or stored away from public view. The murals are a unique piece of art which should be retained and made available for public viewing. We do not have many similar examples in San Francisco and thus UCSF should take great care of them. 1

Please retain the Zakheim murals at UCSF and find an appropriate location on campus!
Sincerely,
Inge Horton

San Francisco, CA 94116

Responses to Comments from Inge Horton

I-Horton-1 This commenter notes that the murals are unique in San Francisco and requests that the murals are not destroyed or stored away from public view. Please refer to Master Response 11: Toland Hall Murals.

From:	Hans Baldauf
To:	Campus Planning - EIR
Cc:	Marian Baldauf
Subject:	Comments on EIR
Date:	Thursday, September 10, 2020 9:25:45 PM

It is unacceptable that all of the issues in the EIR are not re-evaluated in light of the Covid experiences and reasonable assumptions of a post Covid world. To say that it would be pure speculation at this point is to admit that the entire process should pause until they can be properly addressed. These include the inherent danger of a centralized hospital system and the practical challenges that are now clear that we will confront in a post Covid world. Among these challenges is the massive decrease in ridership of public transportation that has occurred and the dramatic increase in the numbers of cars that are being used and are anticipated being used in the future. The transportation element off the EIR needs to be reanalyzed completely as a result and given the limited site access and lack of parking these problems may not be able to be mitigated on this site. 1

The lack of an a thorough analysis of health care delivery throughout San Francisco and how this campus is part of an integrated health care system is a fundamental flaw. This campus is part of a system not a stand alone parcel. 2

The University pledged for years to live by a space cap that it worked out with the neighbors and the city and was as a result of this self limitation was awarded many parcels of land in Mission Bay. This was a positive way to expand and build a city. 3

The Parnassus plan does not provide the appropriate amount of housing for the new population of users because it can not. The long term impacts on housing costs for renters in the city as a result of the massive work force population increase that this plan envisions needs to both be completely studied and mitigated. If it can not be fully mitigated the project should be adjusted to a scale in which it can - it was for this reason that the neighborhood supported the prior long range plan of 2014. 4

Returning to the issue of Covid 19 - the public process for the project has been half baked at best - a project of this magnitude should be explained and vetted in public meetings that are in person - not on zoom calls at a time when people are preoccupied with their health and loss of jobs. Has the process met all the legal hearing requirements? 5

I look forward to a revised EIR that addresses these topics fully. There are many other topics which need to be addressed that others will detail. 6

As many of us have said in the past and will continue to say, we appreciate the work that UCSF does and support the mission of the institution. The architect that has been chosen for the projects has designed beautiful low scale hospitals. The challenge is one of a program that is just too large. 7

Sincerely
Hans Baldauf

Responses to Comments from Hans Baldauf

I-BaldaufH-1 The commenter requests the EIR be reevaluated in light of COVID-19. Please see Master Response 3: COVID-19.

I-BaldaufH-2 The commenter indicates the lack of a thorough analysis of health care delivery throughout San Francisco and how this campus is part of an integrated health care system is a fundamental flaw. The subject of the Draft EIR is the proposed CPHP at the Parnassus Heights campus site. The assessment of health care delivery throughout the City is not part of the proposed project, and accordingly, is outside of the scope of this Draft EIR. However, the Draft EIR does capture any CPHP contribution to cumulative effects, as appropriate.

I-BaldaufH-3 The commenter references the space cap the University has been subject to. Please refer to Master Response 4: Space Ceiling and Population.

I-BaldaufH-4 The commenter asserts that the CPHP does not provide enough appropriate housing for the new population. The commenter also indicates the long-term impacts on renters in the City as a result of the CPHP work force increase under the CPHP needs to be fully studied and mitigated. Please see Master Response 14: Population and Housing Impacts.

I-BaldaufH-5 The commenter expresses dissatisfaction with the public process for the proposed CPHP, and inquires if the process has met all of the legal hearing requirements. The impact of COVID-19 has required that meetings be held virtually, rather than in-person, due to shelter-in-place orders and social-distancing requirements, in the interest of public health safety. All requirements for the environmental review process under the California Environmental Quality Act have been met.

I-BaldaufH-6 The commenter indicates that he is looking forward to a revised EIR that addresses the topics raised in the comment letter, and issues raised by others. As demonstrated in the individual responses provided to the comments raised, and further in Section 8.1.4 in this Comments and Responses document, none of the specific issues identified in the comments, or response to these comments, result in any of the conditions of Section 15088.5(a) being met. Thus, UCSF has determined that recirculation of the Draft EIR on the issues raised by the comments is not warranted.

I-BaldaufH-7 The commenter expresses an opinion that the CPHP program is too large. This comment does not address the adequacy of the Draft EIR; consequently, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

From:	GRETCHEN SANDLER

Subject:	CPHP EIR
Date:	Thursday, September 10, 2020 9:28:55 PM

Hello,

We would like to comment as a community member and neighbor on the EIR for the proposed new hospital on the UCSF Parnassus Campus.

We are completely against this project. As homeowners on Edgewood Avenue whose property abuts the Surge Lot, we would be impacted tremendously by the proposed hospital's construction. 1

As far as we can tell, there will not be any buffer between our home and the Surge Lot which will be used as the staging area for the project. Our children's bedrooms are on the west side of our home facing the Surge Lot, so they will be highly impacted. In addition, the health and environmental impacts of the project have not been addressed adequately. You say you will use electric vehicles if available. We are quite sure there are not enough of these heavy equipment vehicles controlled electrically to mitigate the problem. And we know that idling gas/diesel vehicles contribute to bad air quality. Even if the vehicles are electric, there will be a large amount of dust particles in the air from the work being done. Will watering it twice daily really reduce the particulate matter? PM2.5 particles are known to cause adverse health effects and premature death and we don't see where in the EIR is the mitigation to address this. With the stress of the current wildfires, air quality is a very important issue for us all and we do not want to be forced to stay in our homes for a prolonged period of time because the air quality is deemed unhealthy due to a construction project. 2

Additionally, the EIR has provided inadequate solutions to the traffic, parking, and public transport needed to bring 8000 extra people onto campus. Now that we are in a pandemic, how is a shuttle from BART feasible if people want to drive their cars to work so that they are safe? There will not be enough parking. Currently, our street is highly impacted as it is by those who are looking for parking. The population increase on campus would put stress on the infrastructure of the neighborhood. 3

As frequent hikers in the Sutro Forest, we feel that the project will adversely affect the forest/green space. There is not much green space left in San Francisco and with climate change it is important to keep the forest and its species intact for the future of our planet. Additionally, as Edgewood residents whose home sits on the west side of the street next to the Surge Lot, we have not seen an adequate study of potential erosion of the back of Edgewood if UCSF digs into the hillside, as planned. What will you do to protect our homes? 4

Additionally, the EIR doesn't address any of the changes in healthcare that have resulted from Covid-19. It is now patently clear that gathering patients together in one big hospital is not a good idea. 5

And lastly, we think that size of the hospital is much too big for the foot print of this residential neighborhood. We feel that UCSF has not thoroughly examined alternatives to a gigantic hospital complex at the Parnassus campus. You need to explore developing alternative locations, such as Mt. Zion. 6

Sincerely,
Gretchen and James Sandler
Edgewood Avenue Residents

Responses to Comments from Gretchen Sandler

I-Sandler-1 The commenter expresses opposition to the project. This comment is noted, however, it does not address the adequacy of the Draft EIR; consequently, no response is required.

The commenter also makes a general statement that the commenter would be tremendously impacted by the proposed hospital's construction. Please see specific responses provided to the comments made on specific construction-related issues, below.

I-Sandler-2 This comment expresses concern regarding the potential air quality impacts from construction activities, and the location of the Surge parking lot staging area adjacent to residences, with specific concern regarding emissions of fugitive dust and fine particulate matter ($PM_{2.5}$).

Construction-related air quality impacts are assessed on pages 4.2-28 through 4.2-33 of Section 4.2, Air Quality, in the Draft EIR. The impact analysis addresses all criteria pollutants, including $PM_{2.5}$ and fugitive dust emissions. CPHP Mitigation Measure AIR-1b: Best Management Practices for Controlling Particulate Emissions during Construction is identified to address construction-phase emissions, including fugitive dust and $PM_{2.5}$ emissions. The Bay Area Air Quality Management District (BAAQMD) is the regional agency with jurisdiction for regulating air quality within the nine-county San Francisco Bay Area Air Basin. As stated on page 4.2-30 of the Draft EIR, implementation of CPHP Mitigation Measure AIR-1b would ensure that dust control measures implemented during construction of CPHP projects, including the frequency of watering, would be consistent with the guidance of BAAQMD to reduce fugitive dust-related impacts to a level that would be less than significant with mitigation. Studies have shown that the application of best management practices (BMPs) at construction sites significantly controls fugitive dust, and individual measures have been shown to reduce fugitive dust by anywhere from 30 to 90 percent.

With regard to $PM_{2.5}$, as indicated in Table 4.2-8 on page 4.2-33 of the Draft EIR, mitigated exhaust emissions of $PM_{2.5}$from construction activities (0.16 pounds per day) would be less than 0.3 percent of the applicable $PM_{2.5}$significance threshold established by BAAQMD (54 pounds per day). Consequently, impacts from both construction-related fugitive dust emissions and exhaust emissions of $PM_{2.5}$were correctly identified in the Draft EIR as less than significant impacts.

With respect to health risk impacts from construction activities, these impacts are assessed on Draft EIR pages 4.2-45 through 4.2-58. Mitigated health risks from construction activities associated with the CPHP Initial Phase projects are presented in Tables 4.2-15, 4.2-16, 4.2-17, and 4.2-18 on pages 4.2-53 through 4.2-56 of the Draft EIR. In all cases, mitigated health risk is below the thresholds established by the BAAQMD. Similar mitigations are identified for CPHP Future

Phase projects. Therefore, the Draft EIR adequately demonstrated that construction-related air quality and health risk impacts would be less than significant.

As stated in Section 4.11, Noise and Vibration on page 4.11-24 of the Draft EIR, the Surge parking lot is located as close as 20 feet from the nearest off-site receptors (on Edgewood Avenue), and would likely be used for staging during the construction of the Aldea Housing Densification project and the New Hospital. The staging area would be used for construction material and off-road equipment storage. Emissions generated from the staging area during construction would be limited to starting of off-road equipment prior to deployment to the work sites, or trucks delivering materials, and would be reasonably expected to be of brief duration and not a substantial source of $PM_{2.5}$emissions. Idling of equipment and vehicles at the staging area is not anticipated. Nonetheless, consistent with CPHP Mitigation Measure AIR-1b, idling of vehicles will be avoided or minimized. CPHP Mitigation Measure NOI-1a would require shielding of the staging area where adjacent sensitive receptors have direct line-of-sight with loading and delivery activities which would reduce both construction-generated noise and off-site transport of fugitive dust emissions. In addition, CPHP Mitigation Measure AIR-1b would require all exposed surfaces to be watered twice a day which would also reduce fugitive dust created at staging areas.

I-Sandler-3 The comment asserts that the Draft EIR does not adequately assess the transportation effects of the increase in campus population that would result from CPHP implementation. For information on the analysis of the transportation impacts of the population increase, please see Master Response19: Project Effects (i.e., Population Increase) on Transportation System. The comment also asserts that the public transit analysis is inadequate due to the effects of the COVID-19 pandemic on travel behavior; this is addressed in Master Response 3: COVID-19. The comment also asserts that the project's parking supply is inadequate; this comment is addressed in Master Response 18.

I-Sandler-4 The commenter makes a general comment that there would be less green space, and the importance of keeping forests intact to avoid climate change. Please refer to Draft EIR Section 4.7 for how the Draft EIR addresses potential impacts of the CPHP on greenhouse gas emissions.

The commenter also indicates that there has been inadequate study of potential erosion on the hillside adjacent to Edgewood Avenue associated with excavation for development of the New Hospital. Impact GEO-4 in the Draft EIR addresses the potential for construction associated with the CPHP, including the New Hospital, to result in erosion. The Draft EIR discusses that the proposed project would be required to file a Notice of Intent with the State Water Resources Control Board (SWRCB) to be covered under the National Pollution Discharge Elimination System (NPDES) Construction General Permit for discharges of

stormwater associated with construction activity (also discussed further in Section 4.9, Hydrology and Water Quality). The Construction General Permit requires the preparation and implementation of a Stormwater Pollution Prevention Plan (SWPPP) which would include erosion control measures in the form of best management practices (BMPs) that would be effective in reducing the potential for erosion during construction. BMPs would include, but would not be limited to, filtering runoff during construction, avoiding heavy grading and earthwork operations during the rainy season, and incorporating landscaping as early as possible. Once construction is completed for each element of the CPHP, the area of disturbance would be either covered by a structure, road or pathway, or landscaped such that the potential for erosion is minimized. Therefore, with adherence to existing regulatory requirements that would require implementation of erosion control BMPs during construction, the potential for erosion or loss of topsoil would be reduced to less than significant levels.

I-Sandler-5 The commenter requests the EIR address changes in healthcare that have resulted as a result of COVID-19. Please see Master Response 3: COVID-19.

I-Sandler-6 The commenter requests discussion of additional alternatives, including alternative locations, such as Mount Zion. Please see Master Response 5: EIR Alternatives.

From:	Marian Baldauf
To:	Campus Planning - EIR
Subject:	opposition to EIR
Date:	Thursday, September 10, 2020 9:33:09 PM

Dear UCSF/Regents:

I am writing to express my strong opposition to the UCSF expansion project. We (my husband and two children) live at 165 Edgewood Avenue, and our house is immediately adjacent to the Surge parking lot. 1

My concerns are:

- The multi-year construction project will be hugely deleterious to us and our neighbors on Edgewood, Willard, Belmont, Farnsworth and Woodland, but especially those of us on Edgewood. 2
- Air quality and increased cancer risk during the multiyear construction project. I am not convinced by the data in the EIR that this risk is meaningfully and significantly mitigated. The watering mitigation strategy does not seem reasonable, effective or environmentally sound for a project of this scale.
- Impact AIR-2 and Impact C-AIR-1 are both Air Quality impacts that are identified as "Significant and Unavoidable" even with mitigation strategies. The operation of the proposed facilities will create significant, ongoing, un-mitigatable, unhealthy air quality in a dense residential neighborhood, which includes families, children, childcare facilities, elder care facilities, and schools - not only for the duration of construction, but essentially, forever. This is unacceptable. 3
- Our house backs up to the Surge parking lot, which has been identified as a construction staging site. What happens to all those cars that park there? What happens to the quality our life and our neighbors' lives when this becomes filled with trucks going in and out, unloading and unloading all through the day, for many years? 4
- Hazardous materials that will be stored onsite adjacent to our house and neighborhood is not sufficiently disclosed and if of significant concern. 5
- The New Hospital is omitted from the section on Land Use and Planning. It is the most significant project of the four phase 1 projects, has a huge impact on the issue of land use and planning of the CPHP, and it must be included in the CPHP program level EIR even if some issues will be revisited/clarified in a future project level EIR. 6
- Transportation: an additional 8,000 people per day will visit this new campus; the parking and traffic analyses provided in this EIR are insufficient to address this massive increase. 7

Sincerely, Marian
Baldauf 165
Edgewood Ave

Responses to Comments from Maria Baldauf

I-BaldaufM-1 The commenter expresses opposition to the project, and notes the commenter's house is located immediately adjacent to the Surge parking lot. These comments are noted, however, they do not address the adequacy of the Draft EIR; consequently, no response is required. Please see, however, responses to specific issues raised by the commenter below.

I-BaldaufM-2 The commenter expresses a general concern that CPHP construction would be deleterious to residents on Edgewood Avenue, Willard Street, Belmont Avenue, Farnsworth Lane, and Woodland Avenue. Please see specific responses provided to the comments made on specific construction-related issues, below.

I-BaldaufM-3 This comment expresses concern that air quality impacts and increased cancer risk are not adequately mitigated, and that watering of the project site is not a reasonable, effective or environmentally sound method of controlling dust for a project of this scale.

Construction-related air quality impacts are assessed on pages 4.2-28 through 4.2-33 of the Draft EIR. CPHP Mitigation Measure AIR-1b: Best Management Practices for Controlling Particulate Emissions during Construction is identified to address fugitive dust emissions. The Bay Area Air Quality Management District (BAAQMD) is the regional agency with jurisdiction for regulating air quality within the nine -county San Francisco Bay Area Air Basin. As stated on page 4.2-30 of the Draft EIR, implementation of CPHP Mitigation Measure AIR-1b would ensure that dust control measures implemented during construction of CPHP projects would be consistent with the guidance of BAAQMD to reduce fugitive dust-related impacts to a level that would be less than significant with mitigation. Studies have shown that the application of best management practices (BMPs) at construction sites significantly controls fugitive dust,[1] and individual measures have been shown to reduce fugitive dust by anywhere from 30 to 90 percent.[2]

With respect to construction-related exhaust emissions of criteria air pollutants, as indicated in Table 4.2-8 on page 4.2-33 of the Draft EIR, mitigated exhaust emissions from construction activities would be below the applicable significance threshold established by BAAQMD for all pollutants during construction of the CPHP Initial Phase projects, and similar mitigation is identified for the CPHP Future Phase projects.

With respect to health risk impacts from construction activities, these impacts are assessed on Draft EIR pages 4.2-45 through 4.2-58. Mitigated health risks from

1 Western Regional Air Partnership, *WRAP Fugitive Dust Handbook*, September 7, 2006, *wrapair.org/forums/dejf/fdh/content/FDHandbook_Rev_06.pdf*, accessed April 23, 2018.

2 Bay Area Air Quality Management District, *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*, October 2009, p. 27.

construction activities associated with the CPHP Initial phase Projects are presented in Tables 4.2-15, 4.2-16, 4.2-17, and 4.2-18 on pages 4.2-53 through 4.2-56 of the Draft EIR. In all cases, mitigated health risk is below the thresholds established by the BAAQMD. Similar mitigations are identified for CPHP Future Phase projects. Therefore, the Draft EIR adequately demonstrated that construction-related air quality and health risk impacts would be less than significant.

This comment also opines that significant and unavoidable operational air quality impacts identified in Impact AIR-2 and Impact C-AIR-1 are unacceptable.

The Draft EIR identified certain significant and unavoidable impacts, as summarized in Tables 5-1 and 5-2 of the Draft EIR. The Regents must certify the Final EIR before making a decision to approve the CPHP. Prior to approval of a project for which the EIR identifies significant environmental effects, CEQA requires the adoption of Findings (CEQA Guidelines, Sections 15091 and 15092). If the Final EIR identifies significant adverse impacts that cannot be mitigated to less-than-significant levels, the findings must include a statement of overriding considerations for those impacts (CEQA Guidelines, Section 15093(b)).

I-BaldaufM-4 This comment expresses concern that houses that are adjacent to the proposed staging area in the Surge parking lot will be exposed to quality of life impacts from trucks and loading and unloading over the duration of the construction period.

As stated in Section 4.11, Noise and Vibration on page 4.11-24 of the Draft EIR, the Surge parking lot is located as close as 20 feet from the nearest off-site receptors (on Edgewood Avenue), and would likely be used for staging during the construction of the Aldea Housing Densification and the New Hospital projects. The staging area would be used for construction material and off-road equipment storage. Emissions from the staging area would be limited to starting of off-road equipment prior to deployment to the work sites or trucks delivering materials and would be reasonably expected to be of brief duration and not a substantial source of $PM_{2.5}$emissions. CPHP Mitigation Measure NOI- 1a: Construction Noise Control Measures would require shielding of the staging area where adjacent sensitive receptors have direct line-of-sight with loading and delivery activities which would reduce off-site transport fugitive dust emissions as would the watering requirement of CPHP Mitigation Measure AIR-1b.

As such, the Draft EIR identifies feasible mitigation to reduce construction-related air quality and noise impacts to the extent feasible. Please note, however, that as discussed in Master Response 1: Non-CEQA Comments, potential effects of a proposed project on the “quality of life” and related conditions, in and of themselves, are not considered environmental impacts under CEQA.

I-BaldaufM-5 The commenter asserts that hazardous materials would be stored on-site adjacent to the commenter's house and is not sufficiently disclosed in the Draft EIR. The commenter is referred to Section 4.8, Hazards and Hazardous Materials in the Draft EIR. This section acknowledges that a variety of hazardous materials are stored and used at the Parnassus Heights campus site, and these activities would continue under the CPHP. This includes storage and use of small quantities of common cleaning, maintenance and landscaping products at the campus site. The Draft EIR also describes that diesel fuel is currently stored in tanks beneath Medical Center Way, and which would be replaced in new code compliant underground tanks by 2025. In addition, the Draft EIR explains that storage and use or larger quantities of hazardous materials for clinical and research purposes at the campus site, including a variety of chemicals, low-level radioactive waste, and medical/biological waste, that are highly regulated. Compliance with hazardous storage and transportation regulations, and continuation of programs and controls currently in place to manage hazardous materials, as mandated by State and federal laws, would minimize potential hazards to the public and environmental to a less than significant level.

I-BaldaufM-6 The commenter incorrectly asserts that the New Hospital is omitted from the Draft EIR Land Use and Planning section. The Draft EIR appropriately addresses the New Hospital programmatically in Impact LU-1 on pages 4.10-10 to 4.10-11, and page 4.10-14; and in Impact LU-2, on pages 4.10-16 to 4.10-17. The New Hospital will also be addressed in the forthcoming project-level EIR for the New Hospital.

I-BaldaufM-7 The comment asserts that the Draft EIR does not adequately assess the transportation and parking effects of the increase in campus population from the implementation of the CPHP. For information regarding the analysis of transportation impacts of the population increase, please see Master Response 19. For concerns related to parking, please see Master Response 18.

Subject:	Comment, Environmental Impact Review, CPHP
Date:	Thursday, September 10, 2020 10:10:32 PM

Ms. Diane Wong,

I live at 191 Edgewood. UCSF is my immediate neighbor to the West. I have reviewed the draft EIR for the CPHP and appreciate the opportunity to provide comments. I believe UCSF is an important part of our neighborhood and a flagship institution for our City and our State. I recognize and support the need to upgrade and modernize the Parnassus Heights campus. Furthermore, I applaud UCSF's selection of Herzog & de Meuron as the lead designer for the New Hospital. However, I am **not supportive of the CPHP** as presented in this draft EIR. Some of my concerns are outlined below. 1

1. **Cumulative Impact on Air Quality**: The cumulative impact on air quality, particularly in regards to electricity generation, was inadequately reviewed in the draft EIR. The decades-old, onsite cogen power plant has a nameplate capacity of 13.75MW. With a summertime peak demand of 22MW, the New Hospital and the entire campus will at times be reliant on PG&E capacity. Extended PG&E blackouts in the Bay Area due to wildfire risk are becoming a frequent and seasonal occurrence. In the event of an unplanned PG&E outage, Emergency Diesel Generators may be required to augment CUP capacity. The combination of smoke from surrounding wildfires augmented by harmful emissions from the onsite cogen plant and EDGs would pose a significant health risk to the neighboring community. With a project of the magnitude of the CPHP, the cumulative impact must be properly reviewed. The impact on air quality will be significantly greater than just occasional EDG testing. Additionally, we live in an era and a region where renewable energy is available and affordable. A utility-scale fossil fuel power plant, whether primary or emergency backup, has no place within such close proximity to a residential neighborhood. A modern hospital should not be reliant on dirty and dangerous fossil fuel burning technologies form the 1990s; alternatives should be explored within the EIR that consider the complete replacement of the CUP and EDGs with renewable energy and grid solutions. 2
2. **City Height and Bulk Districts:** I am aware that UCSF is exempt from local zoning regulations. I applaud UCSF for its commitment to "strive to adhere" to local zoning and planning codes. The current plan falls far short of that commitment to the City and the neighborhood. At 16-stories and 294 feet in height, the New Hospital out of scale with the surrounding residential neighborhoods and the other structures on the campus. It is in blatant violation of prescribed height and bulk restrictions and in direct conflict with the Planning Code. A 294-foot structure in a 220-F district could ostensibly be considered an attempt to adhere to local codes. But a 294-foot structure in a 64-D or Open Space district as a clear disregard for the local codes and neighbors. The New Hosptial will block views and dominate what is now a cohesive and diverse landscape. I would potentially be supportive of Alternative 2: Reduced Project as outlined in the draft EIR, provided my other concerns were appropriately addressed 3
3. **Proposed Open Space Swap:** UCSF's protection and stewardship of the Mt Sutro Open Space Reserve is commendable. It is a wonderful and unique resource for the neighborhood and the City. Which makes encroachment into the Reserve a concerning prospect. Any contemplated land swap should be at a significantly higher ratio than 1:1 and have a meaningful environmental or recreational impact. The proposed land swap 4

acreage between the Woods and Surge parking lots does not meet this threshold. Conversion of the Woods and Surge parking lots to Reserve would better connect the Campus and neighborhood to the Greater Reserve via an extension of the access trail off the Surge lot staircase and from Farnworth.

4 cont.

4. **Surge Parking Lot Construction Staging Area:** I am very concerned by the identification of the Surge parking lot as a construction materials/construction worker staging area. Such a staging area for a multi-year construction project located adjacent to my house and my neighbors would have a significant impact due to noise, dust, lighting, viewshed, and pollution. Mitigation shielding could be inadequate at such a close distance (as close as 20 feet as outlined in the EIR). Additionally, due to Covid-19, many Edgewood residents, myself included, are forced to work from home making such an impact all the more unacceptable. The full impact of siting the staging area at the Surge parking lot was not adequately reviewed in the EIR. Alternative staging sites at a greater distance from sensitive receptors and residential neighborhoods should be identified and studied.

5

5. **Traffic and Covid-19.** The EIR does not adequately contemplate the effects of an extended pandemic on construction and operational traffic mitigation measures. Carpooling and transit options may not be allowed or desirable for the foreseeable future. Similarly, Covid-19 has created a financial crisis for SF Muni, the lasting impacts of which were not contemplated. This could have significant impacts on congestion, vehicle miles traveled, parking, and emissions that were not adequately studied in the EIR.

6

Thank you,
Logan Craig
191 Edgewood

Responses to Comments from Logan Craig

I-Craig-1 The commenter expresses support for the need to upgrade and modernize the campus site, but opposes the CPHP as presented in the Draft EIR. The comment is noted; please see specific responses to issue raised by the commenter below.

I-Craig-2 This comment raises concerns that energy demands of the CPHP may require the use of backup diesel generators as a supplement to electricity provided by the existing Central Utility Plant (CUP) when the supplemental supply from PG&E is interrupted; that the cumulative impact of emissions from the CUP and backup diesel generators was not assessed in the air quality analysis of the Draft EIR. The comment recommends that the CUP be replaced with renewable energy and grid solutions to accommodating electrical demand.

The assessment of impacts associated with operational criteria air pollutant emissions and operational health risk both assumed that the CUP would operate at full capacity, and that the capacity of the CUP would be increased by 61 percent. The basis of this increase is provided in the Appendix AIR on page 1,418 of the Draft EIR. Practically, it is likely that the increase in CUP operations would be less than this, with the remaining electricity purchased from the grid through a renewable energy provider. Emergency backup generators exist on the campus site to provide power for essential services in the event of a power blackout. Historic PG&E data for the campus site for the most recent five years shows a total of 311 minutes of service interruption, or 62 minutes per year on average[3]. This contribution would be equivalent to one 50th of the maintenance emissions assumed in the analysis of the Draft EIR. Because of the rarity and unpredictability of such events, and because BAAQMD does not require the quantification of emergency use of backup diesel generators as part of its permit process, consistent with BAAQMD protocol the air quality impact analysis appropriately includes only the emissions associated with the maintenance testing of the additional emergency generators that would be added to the campus site under the CPHP.

Under no scenario would backup diesel generators provide on-site electricity under anything other than a power outage, as such operations would be outside of UCSF's permitted operational authority granted by BAAQMD. Consequently, the Draft EIR's analysis of criteria air pollutant emissions and operational health risk both applied conservative assumptions in estimating the operational emissions from the changes in on-site electricity generation under the CPHP.

I-Craig-3 The commenter indicates the New Hospital would be out of scale with the surrounding residential neighborhoods and the other structures on campus, and is a violation of prescribed height and bulk restrictions and in direct conflict with

[3] UCSF, email correspondence from Paul Franke, UCSF Principal Planner to ESA, November 19, 2020.

the Planning Code. The commenter is referred to Master Response 13: Land Use Impacts.

The commenter indicates potential support for Alternative 2: Reduced Project, provided the other commenter's concerns are appropriately addressed. The comment has been noted and will be forwarded to decision-makers. Please also refer to the other responses provided herein.

I-Craig-4 The commenter recommends that any proposed open space swap affecting the Reserve should be at a substantially higher ratio that 1:1 and have a meaningful environmental or recreational impact. As discussed in Chapter 3, Project Description, pages 3-19 to 3-20, UCSF proposes to replace any area of the Reserve that is lost due to new development under the CPHP by designating new Reserve area elsewhere on the campus site in an amount equal to *or greater* than the area lost. As it relates to the open space swap associated with the CPHP, as noted on page 3-39, it is preliminarily estimated that approximately 0.15 acres[4] of the Reserve would be changed from Open Space Reserve to a Clinical functional zone to accommodate the proposed New Hospital. In addition, an approximate 0.40-acre of undeveloped land within the Surge/Woods parking area would be redesignated from Support to Open Space Reserve.

The commenter also indicates that conversion of the Woods and Surge parking lots to Reserve would better connect the campus site and neighborhood to the Greater Reserve via an extension of the access trail of the Surge lot staircase and from Farnworth. The comment is noted, however, this suggestion is not proposed or required under the CPHP. The comment has been noted and will be forwarded to decision-makers.

I-Craig-5 This comment asserts that potential significant impacts of the Surge parking lot staging area on noise, dust, viewshed, lighting, and air quality are not adequately addressed in the Draft EIR. The commenter also states that noise from the staging area could interfere with residents' ability to work at home as a result of COVID-19.

As stated in Section 4.11 Noise and Vibration on page 4.11-24 of the Draft EIR, the Surge parking lot is located as close as 20 feet from the nearest off-site receptors (on Edgewood Avenue) and would likely be used for staging for the Aldea Housing Densification project and the New Hospital. The staging area would be used for construction material and off-road equipment storage. Emissions from the staging area would be limited to starting of off-road equipment prior to deployment to the work sites or trucks delivering materials and would be reasonably expected to be of brief duration and not a substantial source of air pollutant exhaust or fugitive dust emissions. CPHP Mitigation

[4] Excluding the widening of Medical Center Way adjacent to the proposed New Hospital, which would be necessary for fire safety purposes. The amount of acreage for the widening of Medical Center Way is to be determined.

Measure NOI-1a: Construction Noise Control Measures would require shielding of the staging area where adjacent sensitive receptors have direct line-of-sight with loading and delivery activities which would reduce both noise and off-site transport of fugitive dust emissions. In addition, CPHP Mitigation Measure AIR-1b would require all exposed surfaces to be watered twice a day which would also reduce fugitive dust created at staging areas. The use of shielding of the staging areas identified in CPHP Mitigation Measure NOI-1a would also serve to reduce visibility of construction staging materials and activities. With respect to lighting, the majority of construction at UCSF would occur during regular daytime hours, not extending past 5:00 p.m. As such, while lighting may be used in the Surge parking lot for security purposes, there would generally not be any lighting associated with potential evening staging operations.

The commenter requests alternative staging sites at greater distances from sensitive receptors and residential neighborhoods be identified and studied. As discussed in the Draft EIR Chapter 3, Project Description on page 3-36, there are several potential on-site CPHP construction materials/construction worker staging areas, including the 1) the existing parking lot area located south of UC Hall (i.e., site of the former Laboratory of Radiobiology building); 2) the Surge parking lot, and/or 3) the top level of the Medical Building 1 parking lot. Feasible areas for staging on the campus site are limited, when taking into account factors such as staging space requirements, proximity to construction areas (to minimize travel distances for movement of trucks, heavy equipment and materials), avoiding undeveloped areas of the campus site for staging, and considering proposed CPHP construction phasing. It should be noted that the greatest construction-related impacts under the CPHP, including construction air emissions and noise, would occur at the construction zones, rather than at construction staging areas. In any case, as described above, the Draft EIR identifies feasible mitigation to reduce construction staging impacts at the staging areas to the extent feasible.

With respect to COVID-19, please refer to Master Response 3: COVID-19.

I-Craig-6 The commenter requests the EIR consider the effects of COVID-19 on construction and operational traffic mitigation measures. Please see Master Response 3: COVID-19.

From:	Emma Hanley
To:	Campus Planning - EIR
Subject:	CPHP EIR
Date:	Thursday, September 10, 2020 10:29:14 PM

Dear Ms. Wong,

I live at 191 Edgewood Avenue, SF and I share a property line with the UCSF campus. Beyond noticeable noise from the power plant and light pollution from the Surge parking lot, UCSF has been a good neighbor. My family has been supportive of the hospital for years (under the name Bowes), but I am very concerned about the scale of the planned new hospital. I am not supportive of the development plan outlined in the draft EIR, most especially the imposing height of the building. I have highlighted below areas of concern where I do not believe the draft EIR adequately addressed impacts or mitigation measures. 1

1. Traffic and Infrastructure: The New Hospital will bring thousands of more people on to the campus every day. The EIR did not provide adequate solutions to traffic, parking and public transportation to accommodate such an increase. The EIR did not explore the long term funding effects on SF Muni as a result of the Covid-19 pandemic. During and post-pandemic, commuters will likely be less inclined to carpool or utilize mass transit. Impacts of such proclivities should be addressed in the EIR. 2 3

2. Aesthetic and View: The size of the proposed new hospital is very out of scale with the rest of the UCSF campus and the neighboring residential community and I believe in violation of existing city codes? The building will have a substantial negative impact on views from Golden Gate Park and the hiking trails of Mt Sutro. Sutro Tower, one of the City's most recognizable landmarks, will be completely blocked from view from the north side of the new hospital. The EIR should contemplate alternative locations both within the Parnassus Heights campus and beyond, and alternative designs with less of a visual impact on the surrounding area such as Alternative 2. 4

3. Surge Parking Lot as Construction Staging Area: A construction staging area in the Surge parking lot is a major concern. The impacts on the neighbors and block of Edgewood Avenue would be severe. The vague mention of noise shielding as a mitigation method is not adequate to address this significant impact. Noise, dust, safety, and pollution from a construction staging area are major problems that need to be addressed in far greater detail (especially as they're about 10 feet from our hours). This doesn't seem like the best place to put it, and the EIR should explore alternative locations further away from neighbors already affected by the hospital's noise. Additionally, locating the construction staging area in the Surge parking lot will cut off the trail from Farnsworth and the Surge lot steps, both highly trafficked access points to the Reserve for the general public and UCSF community. 5

We sincerely appreciate all the impressive research and medical work that is done at UCSF and we want to find a way for the community and hospital to continue coexisting happily as neighbors. 6

Thank you,
Emma

Responses to Comments from Emma Hanley

I-Hanley-1 The commenter indicates sharing a property line with the UCSF Parnassus Heights campus site; expresses a general concern regarding scale and height of the proposed New Hospital; and indicates the Draft EIR has not adequately addressed impacts or mitigation measures. Please see responses to the specific issues raised by the commenter, below.

I-Hanley-2 The comment asserts that the Draft EIR does not adequately assess the effects of the increase in campus population due to the New Hospital. Please note that the total projected increase in campus population under the CPHP includes the projected increase in on-campus population from the development of the New Hospital. For information regarding the analysis of transportation impacts of the CPHP-related population increase, please see Master Response 19. Additionally, the comment asserts that the Draft EIR does not adequately assess the funding effects of COVID-19 on Muni. Refer to Master Response 20 for discussion of why Muni operational issues are not a CEQA concern, and therefore analysis of these effects is not required in the EIR. Refer to and Master Response 3: COVID-19 for a discussion of the effects of COVID-19.

I-Hanley-3 The commenter requests the EIR consider the effects of COVID-19 on public transit. Please see Master Response 3: COVID-19.

I-Hanley-4 The commenter asserts that the New Hospital is very out of scale with the rest of the campus site and neighborhood and will have a substantial negative impact on views. Please refer to Master Response 7: Aesthetic Impacts, and Master Response 13: Land Use Impacts.

I-Hanley-5 This comment asserts that potential significant impacts of the Surge parking lot staging area on noise, dust, viewshed, lighting, and air quality are not identified in the Draft EIR. The comment also states that the use of the parking lot for staging will limit trail access and suggests that other sites be considered for construction staging.

As stated in Section 4.11 Noise and Vibration on page 4.11-24 of the Draft EIR, the Surge parking lot is located as close as 20 feet from the nearest off-site receptors (on Edgewood Avenue), and would likely be used for staging for the Aldea Housing Densification project and the New Hospital. The staging area would be used for construction material and off-road equipment storage. Emissions from the staging area would be limited to starting of off-road equipment prior to deployment to the work sites or trucks delivering materials and would be reasonably expected to be of brief duration and not a substantial source of air pollutant exhaust or fugitive dust emissions. CPHP Mitigation Measure NOI- 1a: Construction Noise Control Measures would require shielding of the staging area where adjacent sensitive receptors have direct line-of-sight with loading and delivery activities which would reduce off-site transport of

fugitive dust emissions. In addition, the watering requirement of CPHP Mitigation Measure AIR-1b would require all exposed surfaces to be watered twice a day which would also reduce fugitive dust created at staging areas. As such, the Draft EIR identifies feasible mitigation to reduce construction phase impacts at the Surge parking lot staging area to the extent feasible.

The commenter requests alternative staging sites at greater distances from sensitive receptors and residential neighborhoods be identified and studied. As discussed in the Draft EIR Chapter 3, Project Description on page 3-36, there are several potential on-site CPHP construction materials/construction worker staging areas, including the 1) the existing parking lot area located south of UC Hall (i.e., site of the former Laboratory of Radiobiology building); 2) the Surge parking lot, and/or 3) the top level of the Medical Building 1 parking lot. Feasible areas for staging on the campus site are limited, when taking into account factors such as staging space requirements, proximity to construction areas (to minimize travel distances for movement of trucks, heavy equipment and materials), avoiding undeveloped areas of the campus site for staging, and considering proposed CPHP construction phasing. It should be noted that the greatest construction-related impacts under the CPHP, including construction air emissions and noise, would occur at the construction zones, rather than at construction staging areas. In any case, as described above, the Draft EIR identifies feasible mitigation to reduce construction staging impacts at the staging areas to the extent feasible.

I-Hanley-6 The commenter expresses support for UCSF research and medical work, and indicates a desire for the community and hospital to coexist. The comments are noted.

From:	Pam Hofmann
To:	Campus Planning - EIR
Subject:	Comments to the CPHP Draft EIR Friday,
Date:	September 11, 2020 12:35:45 AM

Dear Ms. Wong,

Please accept these comments regarding the EIR.

Best regards,
Pam Hofmann

1. **NOISE AND DUST on the west side of campus**

The noise after construction on the west side.

There are three multifamily dwellings adjacent the Parnassus Heights campus on the campus' southwest corner that have not been considered by the EIR. These are 1540, 1550 and 1560 5th Avenue. These buildings face 5th Avenue, but due to the curves in the upper part of 5th Avenue they abut UCSF property.

1540 is horizontally 25 feet from Kirkham Street, and vertically 25 feet higher than Kirkham Street.

1550 is horizontally 30 feet from the UCSF property line at 4th and Kirkham/Koret Way. It is vertically 30 feet higher than the Kirkham/Koret/4th Avenue intersection.

1560 is horizontally 30 feet from UCSF, and vertically 65 feet higher than the Kirkham/Koret/4th Avenue intersection.

Source: Van Meter, Williams, Pollock, LLC drawing for the Kirkham Project.

The CPHP indicates that the Kirkham/Koret Way/4th Ave intersection will have increased noise, dust, pollution and traffic due to the servicing of newly constructed buildings, the proposed connection between Medical Center Way, and the restored 4th Avenue via Koret Way. This directly affects these three buildings.

As an example of proximity, conversations taking place outside the Kirkham Childcare Center on Kirkham at 4th Avenue are easily heard and understood while standing in front of 1550 5th Avenue.

Prevailing winds are from the north and west. Wind from the north will exacerbate noise and pollution issues for these three buildings.

Please analyze the impact of noise, both during and after construction, on the residential housing at 1540, 1550, and 1560 5th Avenue. Please include noise generated by stationary equipment noise sources.

Since deliveries by service vehicles begin at 4:00AM, please analyze the noise from 4:00AM to 9:00AM. Noise levels that may be acceptable during the day are not acceptable during normal sleeping hours.

1

FROM EIR DOCUMENT - *4.11 Noise and Vibration*

For the purposes of this analysis, it is assumed that noise from line and point sources to a distance of 200 feet attenuates at rates of between 3.0 and 6.0 dBA per doubling of distance, and the noise from line and point sources at a distance greater than 200 feet attenuates at a rate of 4.5 to 7.5 dBA per doubling of distance, to account for the absorption of noise waves due to ground surfaces such as

2

soft dirt, grass, bushes, and intervening structures (Caltrans, 2009).

4.7-45 Because community receptors are more sensitive to unwanted noise intrusion during the evening and at night, state law requires that, for planning purposes, an artificial dBA increment be added to "quiet time" noise levels to form a 24-hour noise descriptor called the day-night noise level (Ldn). The Ldn adds a 10-dBA penalty during the night hours (10:00 p.m. to 7:00 a.m.).

4.11 Ambient noise levels on the campus site are also affected by noise generated by stationary equipment noise sources, particularly in the east portion of the campus core where principal campus support functions exist [e.g., Central Utility Plant (CUP)].

4.11 (Updated 2019) - Noise measurement locations are shown in Figure 4.11-1. To characterize ambient noise in the campus site area, short-term measurement data were compiled for three locations in 2019 where existing off-site residential land uses are present near proposed CPHP development on the campus site,

4.11 Long-term monitoring location LT-1 is located at the top of the ridge at the eastern property line of the campus site. The noise environment at this location is dominated by noise generated by mechanical equipment at the CUP and delivery trucks at the loading docks behind Long Hospital at the campus site.

4.11 – Noise levels monitoring

ST-1 - 5th and Judah Time 11:00 AM;

ST-2 - 5th and Kirkham Time 11:33AM;

ST-# - Irving and Arguello Time 10:34 AM

Will LT-1 and LT-2 be moved to the Koret Way/West Side Area?

LT = long term monitoring

ST=short term monitoring

4.11-27 - As discussed in Chapter 3, Project Description, the CPHP proposes a service corridor that would extend from Medical Center Way to Koret Way and hence, to a proposed extension of Fourth Avenue on the west side of the campus site. The proposed service corridor would facilitate transport of goods and materials by freight vehicles for back-of-house functions that would otherwise take a longer route. Notwithstanding the partial shielding provided by existing and proposed buildings at the campus site, and improvement in truck circulation provided by the proposed service corridor, there would be the potential for residences along Edgewood Avenue to be exposed to increased noise generation from increases in vehicle travel, including trucks, along the Medical Center Way.

2 cont.

2. SCENIC VIEW – IMPACT ON Kirkham Heights (1530 – 1585 5th Avenue, especially for 1540, 1550 and 1560 5th Avenue)

The view from Kirkham Heights multifamily residences will be impacted by the new buildings. The replacement for the childcare center will be twice as high. The replacement for the demolished two-story building MR 4 will be 120 feet tall.

Proposed buildings along 4th Avenue from Kirkham to Judah will be visible from and impactful to Kirkham Heights. Currently looking north from Kirkham Heights, residents enjoy views of Golden Gate Park, San Francisco Bay, the Golden Gate Bridge and portions of Marin County.

3

Please analyze whether the line of sight looking north from the residential buildings in Kirkham Heights (1530 – 1585 5th Avenue) will be diminished by proposed CPHP buildings relative to the current line of sight provided by current Dental Clinics building.

It appears the views from Kirkham Heights (1530 - 1585 5th Avenue) will be impacted by the proposed tall buildings that will replace the Kirkham Childcare Center, the Dental Building and the

Koret Building. The proposed structures will range from approximately six to ten stories up to 72 to 120 feet in height. In another statement in the EIR the RAB buildings would range from three to nine stories (up to 45 to 130 feet in height). 3 cont.

2. Project Description page 11 - RAB Building – (Dental Bldg, Koret) Future uses in these new spaces, which would total about 435,000 gsf, would include primarily research and academic space. The buildings would range from three to nine stories (up to 45 to 130 feet in height).

2. Project Description page 11 – West Side Housing – Approximately 281,000 gsf of new housing within the West Side district would be located on both sides of the proposed Fourth Avenue extension. Approximately 430 units of housing are proposed. The structures would range from approximately six to ten stories up to 72 to 120 feet in height, and would step down (east to west) along the slope. 4

3. SENSITIVE RECEPTORS

4.8-2 Off-campus receptors (residences) abut the western, northern and southern campus site boundaries. There are three public schools operated by the San Francisco Unified School District within a quarter mile of the Parnassus Heights campus site boundary: Independence High School is located at 1350 7th Avenue, approximately 500 feet northwest of the campus site boundary; Grattan Elementary School (which also contains Grattan Nursery and School-Age Children's Center) is located at 165 Grattan Avenue, approximately one quarter mile east of the campus site boundary; and Clarendon Alternative Elementary School is located at 500 Clarendon Avenue, approximately 1,100 feet south of the campus site boundary. There are also a number of private child care centers within one-quarter mile of the campus site: the Stepping Stones Preschool is located at 1329 7th Avenue, approximately 800 feet northwest of the campus site boundary; the Haight Ashbury Community Nursery School is located at 1180 Stanyan Street, approximately 1,000 feet east of the campus site boundary; and the ABC Bay Area Child Care facility is located at 115 Lawton Street, approximately 900 feet west of the campus site boundary. 5

Please include Kirkham Heights Apartments (1530 – 1585 5th Avenue) in your analysis of off-campus receptors (residences).

4.GRIDLOCK ON 7th AVENUE, TRAFFIC ON KIRKHAM at 4th Avenue and Koret Way, 4th Avenue and Parnassus

7th Avenue is already grid locked not only during rush hour, but much of the day. As noted in the EIR "The service trucks will further congest Kirkham Street and 7th Avenue."

The EIR states *"The proposed service corridor would facilitate transport of goods and materials by freight vehicles for back-of-house functions that would otherwise take a longer route. Notwithstanding the partial shielding provided by existing and proposed buildings at the campus site, and improvement in truck circulation provided by the proposed service corridor, there would be the potential for residences along Edgewood Avenue to be exposed to increased noise generation from increases in vehicle travel, including trucks, along the Medical Center Way."* 6

The EIR makes no mention of the effect on truck traffic and diesel emissions on Kirkham Street or at the corner of 4th Avenue and Koret Way.

Please analyze the current truck traffic and diesel emissions on Kirkham at 4th Avenue and Koret Way from 4:00AM to 9:00AM.

Please analyze the projected truck traffic and diesel emissions after the proposed service corridor is built on Kirkham, and at 4th Avenue and Koret Way from 4:00AM to 9:00AM.

Please analyze the effect on truck traffic on 7 Avenue and Kirkham after the service corridor is built.

Please analyze the truck traffic at 4th and Parnassus after the service corridor is built.

6 cont.

5. GRIDLOCK ON PARNASSUS AND EMERGENCY VEHICLE ACCESS

Parnassus is grid locked, too. Parnassus is already too narrow for the ambulance traffic. Yet the proposed "Streetscape" makes no mention of ambulance traffic on Parnassus. One of the major purposes of the hospital is the Emergency Room which means there will be ambulances arriving at all hours including rush hours 3:00PM to 7:00PM in the afternoon. At the same time ambulances are arriving there will be people getting off work, patients going home, the street will be filled with bicycles, cars picking up patients and pedestrians. The plan mentions bulb outs for pedestrians to use, but this doesn't take into consideration ambulances trying to navigate a gridlocked street. Reducing vehicular space allows for less maneuverability for the ambulances trying to get to the Emergency Room.

3-32 The 2014 LRDP FEIR analyzed the Parnassus Streetscape Plan, a proposal that calls for improvements along Parnassus Avenue generally between Fifth Avenue and Medical Center Way. The purpose of the proposed improvements is to make crossing the street safer and more convenient for pedestrians; increase bicycle safety; reorganize and improve transit and UCSF shuttle operations; create more usable outdoor pedestrian space; strengthen UCSF's identity; and enhance the public realm as called for in the UCSF Physical Design Framework. Specific improvements include new paving, street furniture, lighting, and street trees, as well as sidewalk and crosswalk widening in certain locations and better defined campus gateways.

3-32 UCSF may voluntarily propose improvements to public streets or other public realm areas that, while not considered mitigation measures under CEQA, may nonetheless improve operations or otherwise enhance conditions at those locations. Such voluntary improvements, or "community investments," may include, but are not limited to, payment to the City of San Francisco for stop signs and/or traffic signals at intersections, turning lanes, curb extensions to improve sightlines and crosswalks to clarify rights-of-way, greening, and other traffic-calming measures or public realm enhancements

7

Please analyze the time it *currently* takes the ambulances to arrive from both the east and west along Parnassus. Please include rush hours as part of the analysis.

Please analyze the time it *will take* for the ambulances to arrive from both east and west Parnassus after the proposed street enhancements are make. Please include rush hours as part of the analysis.

6. DEWATERING PUMPS 24/7 NOISE DURING CONSTRUCTION

Section 3-35 – "Equipment to include use of cranes for pier drilling for foundations, steel and/or precast erection, and building façades. Other mobile equipment such as excavators, backhoes, front-end loaders, dump trucks, concrete boom trucks and forklifts would be used at the project site for a range of other construction tasks on the project site, including site clearing, excavation and grading, building construction, and/or hardscape and landscape materials installation. Project construction would generate off-site truck trips for deliveries of concrete and other building materials, transportation of construction equipment to and from the site, hauling soils and debris from the site, and street sweepers. A variety of other smaller mechanical equipment would also be used at the project site during the construction period, such as saw cutters, chopping saws, tile saws, stud impact guns, impact drills, torque wrenches, welding machines, and concrete boom pumps."

8

4.8-20 only mentions BMPS (Best Management Practices). There is no mention of the placement and noise mitigation with regard to dewatering pumps. These pumps will run 24/7 for 2 years or more as foundation work takes place.

Please analyze the projected location and mitigations for these pumps and their tanks with regard to noise.

8 cont.

7. DUST AND PARTICULATE MATTER FROM CUT AND FILL ON MEDICAL CENTER WAY AND SERVICE ROADS

While Section 3-38 is concerned with a widened Medical Center Way and excavation into the adjacent hillside in the Reserve. *"This would require tree removal, excavation and regrading of a portion of this hillside, and shoring of the hillside around the perimeter of the building footprint."* There seems to be no such concern for the service corridor running along the steep hillside between Medical Center Way Koret Way and 4th Avenue.

Excavation on Mt. Sutro is known to have hazards.

3.6.2 Chert exposed in road cuts typically is moderately weathered and strongly fractured. Much of the rock is friable, with strong rock present where less fracturing has occurred. The bedrock in this area is typically overlain by a thin mantle of weathered slope debris, which generally consists of a very well graded mixture of angular rock fragments in a matrix of sand, silt, and clay.

4.2 - individual projects may emit toxic air contaminants (TACs). TACs collectively refer to a diverse group of air pollutants that may cause chronic (i.e., of long duration) and acute (i.e., severe but short-term) adverse effects on human health, including carcinogenic effects. Human health effects of TACs include birth defects, neurological damage, cancer, and death.

The impacts of excavations are left to be determined during construction. There is mention of leaving tree stumps to mitigate excavation! Section 3-38 Page 120 - 4.8-20 only mentions BMPS (Best Management Practices). This is inadequate. There needs to be looking ahead to the effect of excavations on the hillside before excavation begins**.**

Please analyze the predicted effects of excavation of the new service corridor with regard to landslide risk and concomitant dust and particulate matter released from such a slide.

9

Responses to Comments from Pam Hofmann

I-HofmannP-1 This comment identifies three multi-family residential sensitive receptors on the west side of the campus site and requests analysis of the noise impacts specific to these receptors from construction noise, operational noise and delivery vehicle noise.

With respect to construction noise effects on sensitive receptors, this topic is addressed on pages 4.11-16 through 4.11-26 of Section 4.11, Noise and Vibration, in the Draft EIR and the impact is identified as a significant and unavoidable impact. A programmatic analysis is provided for full development of the CPHP on pages 4.11-16 through 4.11-19 of the Draft EIR, and a project level analysis is provided for the CPHP Initial Phase projects, including the New Hospital, on pages 4.11-19 through 4.11-26 of the Draft EIR.

The project-level analysis of noise impacts examined the impact to the closest sensitive receptors to the building sites for the Irving Street Arrival, RAB, Aldea Housing Densification, and the New Hospital. As indicated in Table 4.11-6 on page 4.11-22, the nearest sensitive land uses would be located 70 to 75 feet away from each of these proposed CPHP Initial Phase projects as a worst-case analysis. The receptors cited in the comment would be approximately 1,400 feet from the proposed Irving Street Arrival, approximately 650 feet from the proposed RAB, approximately 1,500 feet from the proposed Aldea Housing Densification project, and approximately 1,500 feet from the proposed New Hospital. Therefore, the construction noise contributions at the west side residences cited by the commenter would be 20 dBA or less than those identified in Table 4.11-6 of the Draft EIR for receptors at a distance of 70 feet. Consequently, the residences cited by the commenter would not experience the significant and unavoidable construction noise impacts of the CPHP Initial Phase projects identified for the nearest residential receptors in the Draft EIR. In addition, construction haul trucks would use Parnassus Avenue or Clarendon Avenue and would not impact roadways near to these west side receptors.

CPHP Future Phase projects, particularly the proposed buildings along the southern end of the Fourth Avenue extension, could be as close to these receptors identified by the commenter as the distances presented for receptors in Table 4.11-6 for the Initial Phase projects. Therefore, construction noise impacts at the receptors cited by the commenter during Future Phase construction could be similar to those impacts assessed in the Draft EIR for the nearest receptors to the Initial Phase projects. As result, construction noise impacts to the residences cited by the commenter during the Future Phase would be potentially significant and unavoidable, same as the noise impact finding identified in the Draft EIR for both CPHP Initial Phase and Future Phase construction projects. Please note that as and when projects at the west end of the campus site are proposed, they will be

evaluated for their project-specific impacts, including their potential to result in significant noise impacts on nearby sensitive receptors.

With respect to stationary source noise during CPHP operations, these impacts were assessed at a programmatic level for development under the full CPHP buildout on Draft EIR pages 4.11-26 through 4.11-28, and at a project-level of analysis for the Initial Phase projects on Draft EIR pages 4.11-29 through 4.11-30. CPHP Mitigation Measure NOI-2: Operational Noise Control was identified to address potential stationary source impact of both full CPHP development as well as of the Initial Phase projects. This mitigation measure establishes a performance standard consistent with City of San Francisco Police Code requirements to ensure a less than significant impact from stationary source noise on adjacent noise sensitive land uses. This measure would also apply to any stationary sources included in projects proposed by UCSF in the western portion of the campus site in the Future Phase.

With respect to noise from delivery trucks, this potential impact is addressed on page 4.11-27 of the Draft EIR. The CPHP proposes a service corridor that would extend from Medical Center Way to Koret Way and hence, to a proposed extension of Fourth Avenue on the west side of the campus site. The proposed service corridor would facilitate transport of goods and materials by freight vehicles for back-of-house functions. The Draft EIR determined that the increase in noise levels from CPHP traffic, including trucks, on Medical Center Way at the nearest residential receptors would not be significant. It should be noted that this corridor would provide a one-way circuit through the campus site, and thus would preclude two-way truck traffic, and would also likely minimize the need for trucks to utilize their backup alarms, as trucks would proceed in a single direction. When considering these factors, the increase in noise along the service corridor is expected to result in a less than significant impact. Please note, however, that when the proposed service corridor project is advanced in terms of design, it would be subject to additional environmental review, as needed.

I-HofmannP-2 The commenter includes a number of excerpts from Draft EIR Section 4.11, Noise and Vibration. No response is required to these excerpts.

The commenter also appears to inquire if long-term monitoring would be conducted in the Koret Way/West Side area. The Draft EIR presents a number of long- and short-term monitoring results at several locations on the campus and environs. The commenter is referred to short-term monitoring conducted at Kirkham Street and Fifth Avenue (ST-2), which provides a representative noise measurement for this location raised in the comment.

I-HofmannP-3 CEQA Section 21060.5 defines the environment as “the physical conditions that exist within the area which will be affected by a proposed project, including land, air, water, minerals, flora, fauna, noise, or objects of historic or aesthetic

significance." Thus, while scenic vistas can be considered part of the environment, in general, CEQA analysis focuses on views from publicly accessible viewpoints; private views (e.g., from the Kirkham Heights apartments) are normally experienced by fewer members of the public. As defined on Draft EIR page 4.1-1, "scenic vistas are those that are experienced from publicly accessible locations and include urban skylines, valleys, mountain ranges, or large bodies of water," and the EIR reasonably relies on this definition to frame its analysis. (Similarly, the analyses of wind and shadow impacts evaluate potential effects on public sidewalks and publicly accessible open spaces, respectively.)

For information, however, the following is noted: The Kirkham Heights apartments, comprises 11 buildings at 1530-1585 Fifth Avenue, situated to either side of the steeply sloping, curving portion of Fifth Avenue south of Kirkham Street, south across Kirkham Street from the UCSF Parnassus Heights campus core. The Kirkham Heights buildings are at elevations of between about 400 feet and 510 feet above sea level (asl). By way of comparison, the elevation at the intersection of Fourth Avenue and Kirkham Street (southwestern entrance to the campus, and the terminus of the project's proposed Fourth Avenue extension) is approximately 415 feet asl. The upper roof of the existing Dental Clinics Building is at an elevation of approximately 430 feet asl, while the roof of the existing Koret Vision Research building is at approximately 480 feet in elevation asl. The roof of the UCSF Kirkham Childcare Center is at an elevation of about 425 feet asl.

All three of the buildings mentioned above are assumed to be demolished as part of the proposed CPHP. (Demolition of the Koret Vision Center was previously approved under the 2014 LRDP.) New CPHP buildings along the Fourth Avenue extension north of Kirkham Street could range from approximately 45 feet to 120 feet in height. New buildings along the north side of Kirkham Street at the Fourth Avenue Extension under the CPHP, closest to the Kirkham Heights apartments would be approximately 80 to 120 feet tall, or about two to three times as tall as the existing childcare center.

The Kirkham Heights apartment buildings are variously oriented, with some generally east-west (with primarily northerly views), some north-south (with primarily westerly views), and some northeast-southwest (with primarily northwesterly views). Observers in the lower-elevation, generally north- and northwest-facing Kirkham Heights apartment buildings (1530, 1535, 1540, 1545, and 1550 Fifth Avenue) would experience some degree of blockage of views to the north by proposed buildings on the Fourth Avenue extension. Generally, the lower the elevation, the greater the view blockage, although it is also the case that existing vegetation partially obscures some northerly and northwesterly views from lower elevations.

Long-range views from the three Kirkham Heights buildings at the highest elevations would not be substantially affected by the proposed 80-foot-tall building at Fourth Avenue extension and Kirkham Street, as observers would be able to see over the top of this building. However, the proposed 120-foot-tall buildings and the 130-foot-tall RAB would partially obscure views to the north-northwest from 1585 Kirkham Street, which faces generally northward. Other Kirkham Heights buildings, such as on 1570 and 1580 Fifth Avenue generally face westward, and therefore would be less affected.

I-HofmannP-4 The commenter includes certain descriptive information from the Project Description in the Draft EIR (square footages and building heights), but incorrectly cites page 11 from the Project Description as the source, and appears to combine certain development square footages. In any case, these comments do not address the adequacy of the Draft EIR. Consequently, no response is required.

I-HofmannP-5 The commenter presents the sensitive receptors discussion from page 4.8-2 of the Draft EIR, and then requests Kirkham Heights Apartments be included in the analysis of off-campus residences. The Draft EIR already acknowledges that off-campus residences that abut the west border of the campus site are sensitive receptors – this would include those apartments cited in this comment. A similar discussion of sensitive receptors is included in the Draft EIR Section 4.2 Air Quality, page 4.2-12, and in Section 4.12, Noise and Vibration, page 4.11-7. Please see other responses that follow.

I-HofmannP-6 The comment makes an assertion about traffic operations within the vicinity of the campus site, excerpts a portion of the Draft EIR (page 4.11-27) discussing the potential effect of the proposed service corridor effect on noise to nearby residences, and comments on the geographic extents of the greenhouse gas emissions analysis found in Section 4.7. It then makes several requests to expand the temporal and geographic scope of the noise and vibration and greenhouse gas emissions analysis in the EIR; specifically, to include existing truck traffic and diesel emissions Kirkham Street and Fourth Avenue from 4–9 AM and projected truck traffic on Kirkham Street at Fourth Avenue and Koret Way from 4–9 AM and at Kirkham and Seventh Avenue and Parnassus Avenue and Fourth Avenue, all following the opening of the proposed service corridor.

The effect of the service corridor was assessed as part of full implementation of the CPHP. With respect to truck traffic, it was considered that the service corridor would extend from roughly Medical Center Way to Koret Way (and the new extension of Fourth Avenue in the future), and would provide access for freight and utility vehicles to transport goods and materials for back-of house purposes. The service corridor would alter the existing path of truck traffic. This alteration of truck routes – including to routes that could cause truck traffic to pass through intersections at the times requested in the comment – was

considered as part of the transportation analysis; specifically, in the development of peak hour traffic volumes (as included in the Appendix TRANS) that were used as inputs to the noise and vibration and greenhouse gas emissions analysis. Existing truck traffic at the location that is currently Kirkham Street and Koret Way, but which would be intersected by the extension of Fourth Avenue as part of the CPHP was included as part of this process.

The analysis found in these sections follows past accepted practices, is thorough, and is appropriate for a program-level EIR. Please note, however, that when the proposed service corridor project is advanced in terms of design, it would be subject to additional environmental review, including for transportation and noise, as needed.

The commenter also makes a comment about existing congestion on Seventh Avenue and that the CPHP, specifically service trucks would further congest Kirkham Street and Seventh Avenue. As discussed in Master Response 19, a project's effect on automobile delay shall not constitute a significant environmental impact under CEQA. Therefore, transportation impacts based on congestion and vehicular delay are appropriately not analyzed in the Draft EIR.

The assessment of operational air quality impacts of the CPHP, including the service corridor, is performed at a programmatic level, as stated in page 4.2-23 of the Draft EIR. Specific detail regarding the path of the eastern extent of the service corridor is not yet available; and as such, a quantitative assessment of the portion of the corridor is not feasible at this time. However, page 4.2-60 of the Draft EIR identifies CPHP Mitigation Measure AIR-4b: Design for Diesel Delivery Truck Emissions Minimization provides for UCSF to incorporate health risk reduction measures into the project design and construction contracts (as applicable) in order to reduce the potential health risk due to exposure to toxic air contaminant emissions from diesel trucks.

I-HofmannP-7 This comment asserts that the Parnassus Avenue Streetscape plan would cause vehicular congestion on Parnassus Avenue that would delay ambulances and impair emergency access, especially during rush hours. Refer to Master Response 21 for a response to this comment.

I-HofmannP-8 This comment requests construction noise analysis for construction dewatering pumps. Please note the commenter appears to incorrectly reference the Hazards and Hazardous Materials section of the Draft EIR (Section 4.8), instead of Noise and Vibration section of the Draft EIR (Section 4.11).

Construction noise is addressed on pages 4.11-16 through 4.11-26 of the Draft EIR, and the impact is identified as a significant and unavoidable impact. A programmatic analysis of construction noise was provided for full development of the CPHP on Draft EIR pages 4.11-16 through 4.11-19 and a project level

analysis was provided for the initial phase projects, including the New Hospital on pages 4.11-19 through 4.11-26 of the Draft EIR.

As stated on page 4.11-14 of the Draft EIR, the FTA methodology for general assessment of construction noise entails a process for calculating the hourly dBA, Leq for each stage of construction considering (1) the reference noise emission level at 50 feet for equipment to be used for each stage of construction, (2) the usage factor for each piece of equipment, and (3) the distance between construction centerline and receptors. This methodology entails determining the resultant noise levels for the two noisiest pieces of equipment expected to be used in each stage of construction. Off-road equipment is much noisier than submersible dewatering pumps raised in the comment. Accordingly, the Draft EIR analyzed noise from equipment types that generate the highest noise levels and represent a worst-case analysis. The Draft EIR determined that construction activities would result in temporary but significant noise impacts. The Draft EIR identified feasible mitigation, including implementation of construction noise control measures (CPHP Mitigation Measure NOI-1a), restrictions on construction hours (CPHP Mitigation Measure NOI-1b), and pile-installation noise-reducing techniques (CPHP Mitigation Measure NOI-1c). CPHP Mitigation Measure NOI-1a includes a measure for stationary noise sources, such as dewatering pumps, to be located as far from adjacent receptors as possible, and be muffled and enclosed within temporary sheds, incorporate insulation barriers, or include other measures to mitigate noise from such equipment. However, please note that while implementation of CPHP Mitigation Measures NOI-1a through NOI-1-c would reduce the severity of construction noise and reduce potential annoyance and others from this noise, the noise impact from peak construction activities would still be considered significant and unavoidable.

I-HofmannP-9 This comment requests an analysis of the landslide risk associated with excavation of the new service corridor, and associated dust and particulate matter released during such a potential landslide.

The commenter first references an excerpt from the Draft EIR Chapter 3, Project Description page 3-38 that describes that construction of the New Hospital and widening of Medical Center Way would require tree removal, excavation and regrading of a portion of the hillside, and reshoring of the hillside around the perimeter of the New Hospital footprint. The commenter asserts that there is no such concern in the Draft EIR for the proposed service corridor along the hillside between Medical Center Way, Koret Way and Fourth Avenue. The commenter indicates the excavation of Mount Sutro is known to have hazards, and references an excerpt of existing campus site geology on page 4.6-2 in Section 4.6, Geology and Soils of the Draft EIR (apparently incorrectly referenced by the commenter as page 3.6-2), an excerpt of background discussion of toxic air contaminants on page 4.2-7 in Section 4.2 Air Quality of the Draft EIR.

The commenter is referred to Section 4.6, Geology and Soils environmental setting discussion of landslides and slope stability at the campus site, which described the results of 2006 and 2019 site-specific slope stability risk assessments conducted by UCSF's geotechnical consultant, Rutherford & Chekene. The assessments reported that there is evidence of small movements in some cut slopes, especially steep vegetated slopes; and water and trees are the primary agents of observed small movements where root growth tends to open and widen existing cracks in near surface bedrock materials. The Draft EIR also illustrated (Figure 4.6-2, page 4.6-6) the location of previously determined landslide scarps and rockfalls at the campus site, including on the slopes in the vicinity of the proposed service corridor, and other locations.

Impact GEO-3 (page 4.6-20 to 4.6-22) reported that while there continues to be no evidence of a deep seated landslide hazard at the campus site, smaller slope stability hazards could still result in a potentially significant impact. Accordingly, CPHP Mitigation Measure GEO-3 included measures recommended by UCSF's geotechnical consultant. This included a measure for cutting selected trees on the slopes or on the crest of slopes in which tree root wedging decreased slope stability; and leaving stumps such that the root system can rot in situ with minimal disturbance to the surface geology. The Draft EIR concluded that with implementation of CPHP Mitigation Measure GEO-3, the potential impact associated with these landslide hazards would be reduced to a less than significant level.

Impact GEO-3 also acknowledged that slope stability hazards could also be caused by the excavation and grading activities for building construction that would occur under the CPHP, and noted areas of the campus site where notable excavation was proposed, including for the new service corridor. Impact GEO-3 reported that all development that would include excavation and grading would be required to prepare appropriate site specific design-level geotechnical evaluations prior to final design and commencement of construction. Impact GEO-3 also specified that the final design-level geotechnical evaluation would include any necessary recommendations; and, if applicable, the final design-level geotechnical report would be required to adhere to CGS SP 117A. Impact GEO-3 concluded that implementation of appropriate site specific design-level geotechnical evaluations would improve slope stability at the campus site, and reduce the potential landslide hazards to a less than significant level.

As slope instability, including landslides, would be avoided by the implementation of CPHP Mitigation Measure GEO-3, dust and particulate matter would not be released to the environment as a result of landslides or other types of slope instability.

Hello,
I would like to say something here about the murals in Tolland Hall. I think this report does not comprehend fully the problems of the murals in Toland Hall. 1

1) I was always told that the murals would stay in place and that's a new building with built around till win home I do not see why this cannot be done. If you see really wanted to see these murals they could leave them in place. 2

2)I'm concerned about moving of the murals is very dangerous to move the murals there's no guarantee that this will be successful. And why not wait till they find a suitable location on campus to move the murals to if they need to be moved. 3

3) Why is not the University taking out an insurance policy and have them murals appraised? 4

4) These murals show the history of medicine and have great historical value. 5

5)There is nothing written in this report about the oyster point warehouse in the conditions in which the murals will be stored. 6

6) Once the murals are in storage what guarantee do we have that they will be displayed again in a timely manner? 7

Best,
Richard Rothman
415 350-7629

Responses to Comments from Richard Rothman

I-Rothman-1 The commenter states the Draft EIR does not fully comprehend the issues associated with removal of the murals. Please refer to Master Response 11: Toland Hall Murals.

I-Rothman-2 This comment suggests that the murals should remain in situ. Please refer to Master Response 11: Toland Hall Murals.

I-Rothman-3 This comment expresses concern over transporting the murals and suggests UCSF should wait to move the murals until a suitable location on campus is identified. Please refer to Master Response 11: Toland Hall Murals.

I-Rothman-4 This comment suggests that the UCSF should have an appraisal and insurance policy for the murals. Please refer to Master Response 11: Toland Hall Murals.

I-Rothman-5 This comment notes that the murals show the history of medicine and that they have historical value. Please refer to Master Response 11: Toland Hall Murals.

I-Rothman-6 This comment states the Draft EIR does not adequately describe the conditions in which the murals will be stored at the Oyster Point Warehouse. Please refer to Master Response 11: Toland Hall Murals.

I-Rothman-7 The commenter requests that the murals be displayed again in a timely manner. Please refer to Master Response 11: Toland Hall Murals.

From: Joshua Klipp Campus
To: Planning - EIR
Subject: EIR Objection: Tree Felling @ Parnassus Heights
Date: Friday, September 11, 2020 10:47:29 AM

To Whom It Concerns,

I respectfully and strenuously object to the proposed tree felling as part of the Parnassus Heights Plan/EIR. At a time when the sky is choked and orange with the ash of millions of burnt trees, the air is so full of particulate matter that it is not safe for humans to breathe, and people are leaving San Francisco in droves, now is not the time to cut down a single healthy tree in the name of development, period.

San Francisco already has the lowest percentage of urban canopy of any major city in the United States. Now we are staring down the barrel of a major public health crisis, exacerbated by the crushing existential tidal wave slowly bearing down that is climate change. On top of this the City continues to lose trees at record rates, and, post COVID, has even less funding to replace them.

This path is unsustainable, and it is especially egregious when this is done in the name of public health. I know this plan has been in the works for many many years, but please do not plow forward because it is now too far along to consider anything different. We can always change our plans, if we have the will to do so. I respectfully ask you to reconsider this tremendous loss of canopy, at a time our world - and our City - literally cannot afford it. 1

Thank you, Josh Klipp

Responses to Comments from Joshua Klipp

I-Klipp-1 The commenter objects to tree loss that would occur under the CPHP. This is not a comment on the adequacy of the EIR. The comment has been noted and will be forwarded to decision-makers. Please also note that all potential environmental impacts associated with tree loss that would occur at the campus site under the CPHP are addressed and mitigated to the extent feasible. As discussed in Draft EIR Impact BIO-3 on page 4.3-22 to 4.3-23, pursuant to the University of California's constitutional autonomy, on university-controlled property used in furtherance of the University's educational mission, UCSF is not subject to local policies protecting biological resources. However, UCSF will avoid removal of trees that would be considered significant or protected to the maximum extent feasible. Any trees within the public right-of-way that may be removed during the course of off-site construction under the CPHP would conform to the City ordinance governing tree protection. Thus, this impact would be less than significant. Please note UCSF will consider replanting trees in the landscaping plans for each specific project under the CPHP, including the New Hospital, when detailed designs become available.

Cc:	Wong, Lily (University Relations)
Subject:	Comments on Draft EIR for Comprehensive Parnassus Heights Plan
Date:	Friday, September 11, 2020 10:54:47 AM

To whom it may concern:

My name is Jeff Cole and I live with my wife at 277 Edgewood Avenue, a home we have owned since 1989. I have the following comments on the draft EIR:

1. **The Reserve Size and Boundaries:** Our home is on the West side of Edgewood Avenue. Our back yard adjoins a small forest on UCSF's property, between the Woods and Surge parking lots. The draft EIR asserts that, in attempted mitigation of the fact that the proposed new hospital would be built across Medical Center Way and would involve excavation of what is now a forested hillside at the North end of Edgewood Avenue, new forest lands would be added elsewhere on UCSF's property so that the overall size of the "Reserve" would not be reduced. However, no new forest land is identified in the draft EIR. Moreover, Figure 3-21 at page 3-41 purports to illustrate the area behind our home as being changed from "Support" to "Open Space Reserve." This is misleading, and certainly does not represent any additional forest area, as the area is already a forest. The draft EIR should be revised to be clear about this, and UCSF should adhere to its pledge not to reduce the size of the Reserve. The hillside forest at the North end of Edgewood Avenue should be preserved. The proposed new hospital should not be allowed to cross Medical Center Way. 1

2. **Construction Noise:** Section 4.11 of the draft EIR addresses noise, including construction noise, and admits that it will be significant. The draft EIR proposes that, to mitigate the significant adverse impacts of construction noise, consistent with the San Francisco noise ordinance, construction hours be limited as specified on page 4.11-19. The draft EIR represents that noise levels will be measured at the Parnassus and Irving construction locations. However, it is equally important, and perhaps more important, that noise levels also be measured at construction staging areas, and that "construction hours" within which construction noise may occur also be restricted at those staging areas. For example, the Surge parking lot is identified as a "possible" staging area. Without further detail, it is impossible to assess what UCSF might have in mind for that location, but it must be noted that homes on the West side of Edgewood Avenue are adjacent to that parking lot, and bedrooms of residents are very near to the property boundary, within a very short distance of the pavement. It is of critical importance that noise from vehicles, particularly trucks and heavy equipment, not be allowed to occur at that Surge lot location outside of the designated construction hours. Moreover, noise levels should be regularly monitored from that location at regular intervals throughout the construction period, not just from Parnassus or Irving streets. To that end, Figure 4.11-1 shows certain "Noise Monitoring Locations" including one designated "ST-5" that appears to be approximately where our home is located, near the 2

Surge lot. UCSF has already done some noise monitoring at this location for purposes of measuring "existing noise." It is essential that monitoring from this location occur throughout the construction period. 2 cont.

3. **New Roadway Behind Existing Hospitals:** The draft EIR provides little detail about a proposed new roadway that has been mentioned as possibly running between Medical Center Way and 4th Avenue. Any such roadway would have environmental significance, yet that has not been studied or evaluated. Before the project as a whole can be properly evaluated, much more detail is needed about any such new roadway, and its impact on the Reserve. 3

4. **Alternatives Not Really Considered or Evaluated:** Because the proposed new hospital would have significant adverse environmental impacts, UCSF is required to demonstrate that they have considered alternatives to the proposal. While admitting that adverse environmental impacts would be significantly reduced if UCSF reduced the size of the Parnassus project to remain within its longstanding Space Cap commitment, and also admitting that additional space could be constructed at the Mount Zion location, the draft EIR asserts that such an alternative was "considered but dismissed," and concludes that operating at 3 sites would be "less than ideal and inefficient." There is no support for this conclusion, and it needs to be reconsidered in light of the Covid-19 pandemic and all it has changed about how medical services can be rendered in a viable financial model. It is apparent that UCSF executives conceived the proposed plan for an enormous tower at the Parnassus location long before anyone had even heard about Covid-19. It is also probable that, during the last 6 months, UCSF has studied the extent to which a centralized location may be deterring paying patients from scheduling lucrative non-emergency procedures. Having operations at 3 locations, far from being "less than ideal," may actually provide UCSF with a more viable financial model as Covid (or other contagious) patients could be isolated at one location, leaving the other for other patients who would not need to fear being put at risk of contagion. This needs to be fully evaluated before UCSF can be credited with having considered alternatives. 4

5. **Traffic and Transit Impacts:** Although the draft EIR acknowledges that the proposed project would have significant impacts on traffic and transit in the neighborhoods near the Parnassus campus and beyond, its representations that those impacts could be adequately mitigated are purely aspirational and unsupported by professional traffic studies or other support. These adverse impacts are potentially devastating for the neighborhoods and the City of San Francisco as a whole. The draft EIR should be deemed inadequate and insufficient based on the current lack of support for its conclusory assertions about mitigation of adverse traffic and transit impacts. 5

6. **Space Cap:** Finally, I join with other neighborhood groups and individuals who have objected to the proposed project exceeding the Space Cap that has been a commitment of UCSF over many decades. The size and scale of the proposed project are simply not appropriate for a 6

residential neighborhood, and the adverse environmental effects cannot be adequately mitigated.

6 cont.

Very truly yours,

Jeff Cole

Responses to Comments from Jeff Cole

I-Cole-1 The commenter objects to the replacement of lost acreage in the Reserve, and indicates that no new forest land is identified in the Draft EIR. The area of the forest adjacent to the Surge Parking lot illustrated in Figure 3-21 is currently designated as a "Support" zone in UCSF's existing functional zone map, and under the CPHP would be designated as an "Open Space Reserve" zone. Accordingly, the CPHP would provide permanent open space reserve protection that is not currently provided for this area.

The commenter indicates the forest at the north end of Edgewood should be preserved, and that the New Hospital should not be allowed to cross Medical Center Way. These comments do not address the adequacy of the Draft EIR. However, the comments are noted and will be forwarded to decision-makers.

I-Cole-2 This commenter is concerned that noise from vehicles, trucks, and heavy equipment should not be allowed to occur at the Surge lot staging area outside of the designated construction hours and that noise levels should be monitored at that location at regular intervals throughout the construction period.

With respect to the impact from construction noise, this topic is addressed on pages 4.11-16 through 4.11-26 of the Draft EIR and the impact is identified as a significant and unavoidable impact. As stated in Section 4.11 Noise and Vibration on page 4.11-24 of the Draft EIR, the Surge parking lot is located as close as 20 feet from the nearest off-site receptors (on Edgewood Avenue) and would likely be used for staging for the Aldea Housing Densification project and the New Hospital. CPHP Mitigation Measure NOI-1b: Construction Hours is identified on page 4.11-19 of the Draft EIR to restrict the hours of construction to the degree feasible. Material deliveries and equipment start-ups at the staging area would fall within the "not noisy work" category within this mitigation measure and would be restricted to the applicable construction hours. Additionally, CPHP Mitigation Measure NOI- 1a: Construction Noise Control Measures identified on page 4.11-18 of the Draft EIR would require shielding of the staging area where adjacent sensitive receptors have direct line-of-sight of loading and delivery activities. As shown in Table 4.11-5 on page 4.11-17 of the Draft EIR, all construction equipment would operate within the quantitative standards of the City of San Francisco noise ordinance. Therefore, construction noise monitoring was not included as an element of CPHP Mitigation Measure NOI-1a: Construction Noise Control Measures.

I-Cole-3 The commenter asserts that the draft EIR provides little detail about the service corridor that would extend between Medical Center Way and 4th Avenue and that it has not been adequately studied and should be further evaluated.

Available details of the proposed service corridor are described on pages 3-29 to 3-30 of the Draft EIR, including its purpose, conceptual alignment, and which

utilities would be extended within the corridor. The service corridor would provide access for freight and utility vehicles to transport goods and materials for back-of house purposes. Regardless, all potential impacts of this improvement adequately are addressed and mitigated to the extent feasible as its alignment and design have not been finalized. Please note, however, that when the proposed service corridor project is advanced in terms of design, it would be evaluated to determine what, if any, additional environmental would be needed, prior to approval

I-Cole-4 The commenter requests discussion of additional alternatives. Please see Master Response 5: EIR Alternatives. Please also see Master Response 3: COVID-19.

I-Cole-5 The comment asserts that the Draft EIR finds that the CPHP would have significant impacts on traffic and transit and that mitigation measures would be insufficient to address those adverse impacts. This is incorrect, as the Draft EIR does not find that the CPHP would have any significant impacts on transportation or transit. Refer to Master Response 19 and Master Response 20 for a discussion of why the project's effects on automobile delay or transit do not constitute a significant environmental impact. Because the Draft EIR does not find that the CPHP would have significant environmental impacts on traffic or transit, mitigation is not required. As such, the Draft EIR's assessment of transportation effects of the CPHP is both accurate and adequate under CEQA.

I-Cole-6 The commenter objects to the proposed CPHP exceeding the Space Ceiling. Please refer to Master Response 4: Space Ceiling and Population.

September 11, 2020

Save Zakheim "History of Medicine in California" murals at UCSF!

EIR – State Clearinghouse Number 2020010175)

Dear Chancellor Hawgood and UC Regents;

The destruction of the Zakheim "History of Medicine in California" murals in Toland Hall is not unavoidable, as stated in the DEIR. I demand the CPHP EIR include new project alternatives that more appropriately protect, conserve and restore all of the murals, and provide for a specific public display of them – either by retaining the Toland Hall auditorium and incorporating it into the new Research and Academics Building planned on the same building footprint as UC Hall – or by identifying the specific location on the UCSF Parnassus Heights campus at which the murals will be reinstalled, and how they will be made accessible and interpreted to the public. 1

Briefly, after participating in the RFP Zoom meeting, reviewing comments and letters from the GSA and the Zakheim Family "90 Day" demand Letter, etc. I am writing to register concerns with UCSF's questionable positions dealing with the Zakheim murals in Toland Hall: e.g., 2

- **UCSF abdicating your Art stewardship to protect priceless New Deal/WPA Art**
-
- **No reports or studies to verify that leaving Toland Hall and Zakheim murals could be "safely" left in place during the projected excavation of UC Hall and the new seismic compliant construction of a new campus.** 3

- **At present, there is no architect assigned and/or approved master campus plan that**
- **could possibly Include - somewhere on the new campus plan – identifying the permanent (re)instalment of the Toland Hall/Zakheim murals.** 4

- **No proactive plan to move, preserve, curate, atmospheric controlled storage and/or having a permanent reinstalment plan and designated location for "Public Access"** 5

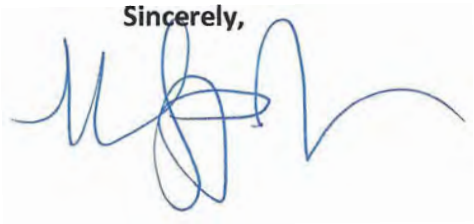
- **Possible California Environmental Quality Act (CEQA) law violations making any significant decisions prior to following all CEQA protocol procedures** 6

Both the Zakheim "90 Day Dead Line" Demand letter and the incremental RFP process must be suspended to ensure that a positive and proactive long term master plan is created first; and, that UCSF follows all the CEQA law/protocols to ensure that the Zakheim Murals are preserved, protected, safely moved (if necessary), curated and safely stored (if necessary). 7

Most importantly, a permanent location must be identified and secured first for reinstalment for "Public Access" before UC Hall is demolished and replaced. 8

In the same year we have a female African-Asian American running as a vice presidential candidate, UCSF is considering permanently removing New Deal/WPA murals, one of which is of a renowned historical African American female. Bernard Zakheim's priceless murals deserve better respect and treatment. 9

Sincerely,



Lope Yap, Jr.

30 Waterbury Lane
Novato, CA 94949-8239
lyjr44@riseup.net
415 755-5271

Responses to Comments from Lope Yap

I-Yap-1 The commenter states that the alternatives in the Draft EIR are inadequate and new alternatives to preserve the murals should be developed. The commenter requests that alternatives should be developed that incorporate the murals into the new Research and Academic Building or by relocating the murals to a publicly accessible location on the campus site. Please refer to Master Response 11: Toland Hall Murals.

I-Yap-2 This comment states UCSF is abdicating its responsibility to protect the Toland Hall Murals. Please refer to Master Response 11: Toland Hall Murals.

I-Yap-3 The commenter states UCSF has not adequately studied an alternative that leaves the murals in place. Please refer to Master Response 11: Toland Hall Murals.

I-Yap-4 This comment indicates there is no plan to identify a permanent on-campus location for the murals. Please refer to Master Response 11: Toland Hall Murals.

I-Yap-5 This comment states there is no relocation plan provided for public access to the murals. Please refer to Master Response 11: Toland Hall Murals.

I-Yap-6 This comment states the Draft EIR has possibly violated the requirements of CEQA. Please refer to Master Response 11: Toland Hall Murals.

I-Yap-7 This comment requests that a plan for mural preservation be developed that preserves and protects the murals. Please refer to Master Response 11: Toland Hall Murals.

I-Yap-8 This comment states that a permanent location must be identified to preserve public access to the murals prior to demolition of UC Hall. Please refer to Master Response 11: Toland Hall Murals.

I-Yap-9 This comment notes that UCSF has decided to pursue removal of the Toland Hall Murals at the same time as the first female Asian- and African-American is running for vice president of the United States. This comment does not address the adequacy of the Draft EIR; no response is necessary.

September 11, 2020

Diane Wong
UCSF Real Estate - Campus Planning
654 Minnesota Street
San Francisco, CA 94143-0286

Via email: EIR@ucsf.edu

Dear Ms. Wong:

Thank you for the opportunity to review the draft EIR for the Parnassus Heights Development Plan.

While we appreciate the need for height to increase density and hospital capacity, we are concerned about the impacts of shadows in the adjacent neighborhoods. We respectfully request that the final EIR address this issue and consider mitigation, perhaps in the form of **increased massing at lower levels and/or achieving a more efficient floor plan.**

We were surprised that there is no reference to the impacts of shadows on the adjacent neighborhoods. The impacts of shadows in the DEIR are limited to public parks. While the City of San Francisco does not require consideration of shading impacts other than with respect to parks, it would be irresponsible not to consider them given the scale of the development. (It should be noted that San Francisco does require consideration of shading impacts to community gardens[1] and the DEIR does not appear to have considered the impact to the garden at Arguello and Lincoln.) 1

Sunlight provides numerous benefits that accrue to society in general, particularly with respect to energy, including: passive heating (there are no energy-related cooling benefits from shading in this area); daylighting; and solar plus storage -- all of which are essential to the City's and State's policy goal of transitioning away from natural gas. 2

As noted in the DEIR, Golden Gate Park will be impacted by shadow until 9 AM during the winter solstice. While this may seem insignificant, the nearest section of the Park Kezar Triangle, is approximately 700 feet from the new hospital. The impacts in the adjacent neighborhoods will be larger and should be understood before approving the plan. For a perspective, it appears that the shadow at dawn on the winter solstice will extend to the infields of Big Rec at 7th Avenue (see illustration). While that shadow will quickly shorten, it illustrates that the impact to the more immediate neighborhoods is not insignificant and needs to be better understood. 3

In addition to the shadows, we also wish to point out that this sixteen-story building, set on a hill, is not only out of character with the neighborhood but will in fact be far larger than anything on this side of the City. 4

[1] July 2014 Planning Department Memo from Schuett and Guy

In terms of mitigation, we recommend considering means of reducing the height of the hospital without reducing its capacity. One approach would be to increase the bed density. Moffit/Long has one bed for every 1,588 sf of floor space. Long itself has one bed per 1,134 sf. The proposed hospital would have one bed for every 1,961 sf. That is 23% more space per bed than Moffit/Long and 73% more space per bed than Long itself.

Another approach would be to increase the massing of the lower floors and reduce the number of floors. This might be done by filling in some of the space between the wings of the new hospital.

While the specifics above relate to the new hospital, the same issues should be explored with the other buildings, most notably the Irving Street Arrival complex. 5

Thank you for your consideration.

Responses to Comments from Neal DeSnoo, et al.

I-DeSnoo-1 The comment states that the Draft EIR does not adequately analyze shadow on neighborhoods surrounding the UCSF campus. Please refer to Master Response 9: Shadow Impacts.

I-DeSnoo-2 and I-DeSnoo-3: The commenter discusses the benefits of sunlight, and indicates that sunlight is essential to the City's and State's policy goal of transitioning away from natural gas. The comment further states that the Draft EIR does not adequately analyze shadow on neighborhoods surrounding the UCSF campus.

Please refer to Master Response 9: Shadow Impacts.

I-DeSnoo-4 The comment states that the proposed New Hospital would be out of character with its neighborhood and larger than any other building on the west side of San Francisco. Please refer to Master Response 7: Aesthetic Impacts.

I-DeSnoo-5 The comment states that the Draft EIR should include mitigation for shadow and aesthetic impacts, such as reducing the height or altering the massing of the proposed New Hospital. Please refer to Master Response 7: Aesthetic Impacts.

The commenter suggests that as a way to reduce the height of the New Hospital without reducing its capacity, that 1) the bed density in the New Hospital could be increased; or 2) the massing and/or number of the lower floors could be reduced.

Please refer to Draft EIR Section 3.5, Project Needs, and Section 3.6, Project Objectives, which describe the need and objectives for providing a New Hospital at the size it is proposed at. The proposed New Hospital requires sufficient space to accommodate modern regulatory requirements and industry standards of contemporary hospitals, such as construction codes, sizes of operating rooms, ratio of operating rooms to pre-and post-recovery areas, and space for privacy and infection control issues. The proposed New Hospital also requires sufficient space to accommodate modern technology, including telemedicine, robotics, and new diagnostic, imaging, testing, treatment, surgery and laboratory equipment, all requiring substantial infrastructure and space. In addition, the New Hospital requires sufficient space to accommodate patient satisfaction requirements of contemporary hospitals, such as private patient rooms of sufficient size. Given these reasons, the suggestions from the commenter about reducing the size of the New Hospital are not considered feasible.

From: Elaine Cater
To: Campus Planning - EIR
Subject: Removal ofZakheim murals
Date: Friday, September 11, 2020 12:28:06 PM

Dear Chancellor Hawgood and U.C. Regents

I, Elaine Bibel Cater, am the daughter of Leon Bibel, an artist who worked with Bernard Zakheim on the History of Medicine murals. I now live in England and have only just today been alerted to the threat currently posed to these famous pieces of art. I am shocked that UCSF is actively considering any procedures, major or minor, that would result in either the demolition or damage to the murals. They represent a great moment in the history of public art in California and should be cherished as an eminent part of the state's fantastic heritage—indeed with a wider significance for the United States as a whole. It would be an act of terrible vandalism to destroy or damage them. I write to demand that these murals be preserved intact and safe for public access in the future. If they must be moved, let it be under the close supervision of conservation experts and let them be integrated into a suitable building, where they can be viewed by countless appreciative viewers long into the future. As the daughter of one of the artists who assisted Zakheim on the painting of the murals I have a personal interest in their preservation. but I feel sure that there is a much wider public interest in the paintings than may have been appreciated by the authors of UCSF's current plan. Please, please heed this call.
Elaine Bibel Cater

Re: UCSF Comprehensive Parnassus Heights Plan

Dear Ms. Wong:

I am submitting these comments on the draft Environmental Impact Report dated July 2020 ("DEIR") concerning the UCSF Comprehensive Parnassus Heights Plan ("CPHP"). The CPHP contemplates a massive expansion of UCSF's Parnassus Heights campus, adding 2.04 million gross square feet of buildings – roughly the combined size of the Sales Force Tower and the Transamerica Building – in the middle of a residential neighborhood. Further, UCSF seeks approval to increase the footprint of the campus far beyond the permanent restrictions on campus growth that the Regents agreed to in 1976. 1 2

The Regents should reject the CPHP because it breaches the Regents' 1976 agreement to permanently restrict the size of the Parnassus Heights campus. The Regents should also reject the DEIR because it fails to comply with the requirements of the California Environmental Quality Act ("CEQA"). 3

I first moved to Cole Valley in 1983, and have lived in the 300 block of Parnassus since 1995. Soon after moving to Cole Valley I learned of the long standing and successful efforts of people in this neighborhood to preserve and maintain its unique character. This included stopping the "Panhandle Freeway,"[1] and resolving litigation with UCSF in the 1970s that resulted in agreements to limit UCSF's further intrusion into and impacts on neighboring residential areas. 4

[1] UCSF was apparently on the wrong side of history then, too, supporting the proposed Panhandle Freeway. *See* "The Panhandle Freeway and the Revolt that Saved the Park," *San Francisco Hoodline*, March 29, 2015(https://hoodline.com/2015/03/panhandle-freeway-revolt)

Among the commitments that the Regents made in 1976 to residents of this area, and the people of San Francisco generally, were that the Regents would permanently maintain open space on Mount Sutro, the Regents would require UCSF to respect specified boundaries of the Parnassus Heights campus, and the Regents would permanently limit nonresidential space on the UCSF campus to no greater than 3.55 million gross square feet ("gsf"). Specifically, the Regents made the following commitment:

> The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) ***and this limit shall be permanent***.

1976 Regents' Resolution (emphasis added). The Regents reaffirmed these commitments a mere four years ago, when they approved the 2014 UCSF Long-Range Development Plan ("2014 LRDP").

5

UCSF has been less than candid with the public, and the Regents, regarding its plans to undermine this permanent space restriction. At the February 11, 2019, meeting of the Regents' Health Services Committee, Chancellor Hawgood represented that modifications to the permanent space limitation "would depend on the terms that UCSF could negotiate with the community and the City."[2] But UCSF never "negotiated" with the community. Rather it unilaterally decided to ask that the Regents breach the 1976 agreement, recasting the permanent space limitation as a "guideline" in a memorandum to the Members of the Finance and Capital Strategies Committee in July 2020.[3] And the DEIR fails to disclose that the 1976 Regents' Resolution provided that 3.55 million gsf limitation on structures within the campus "shall be permanent." (DEIR at 3-43, 3-44)

6

While it is clear that UCSF wants to pick up where it left off in 1976, and radically expand the footprint of the Parnassus Heights campus, the CPHP ignores the clear language of the 1976 Regents' Resolution, which is that the limitation on UCSF's space is "permanent." It does not say, as UCSF plainly wishes it did, that the space limitation applied only until UCSF found it inconvenient, or wished to expand.

The CPHP thus represents an incredible breach of trust. While at the national level we have become accustomed to government officials ignoring legal obligations and breaking norms, it is not something that we expect from the Regents. The CPHP asks the Regents to breach commitments that the Regents made in 1976 to settle a lawsuit, that they

[2] (Minutes of the Health Services Committee, February 11, 2019, p. 25 https://regents.universityofcalifornia.edu/minutes/2019/hs2.pdf.
[3] https://regents.universityofcalifornia.edu/regmeet/july20/f4.pdf

have used to justify UCSF's expansion in other parts of the City, and that those of us who live near the campus have relied on for decades. For that reason alone, the Regents should reject the CPHP, decline to certify the DEIR, and require the leadership of UCSF to develop a plan that is consistent with the prior commitments that the Regents have made. Beyond that, and as described in greater detail below, the DEIR fails to satisfy the requirements of CEQA and the Regents should refuse to certify it for that independent reason. 6 cont.

The CPHP contemplates a massive extension of the UCSF Parnassus Heights campus adding 2 million gsf of buildings to the existing 3,955,200 gsf, expanding the daily population of students, faculty and staff, patients and visitors by more than 6,800, and unleashing nearly 30 years of virtually unending construction on the residential neighborhood that surrounds the campus.

The DEIR contemplates construction of a "New Hospital" that will be 16 stories tall and up to 294 feet tall – more than double the height of the privately owned medical office building across the street, and immediately adjacent to, and across the street from, single-family homes. (DEIR at 3–21, 3-26) The proposed New Hospital would occupy 955,000 gsf, more than triple what was evaluated in the 2014 LRDP, and approved by the Regents. (DEIR at 3-25) Yet the DEIR impermissibly defers many mitigation measures relating to the New Hospital. 7

Aesthetics, Wind and Shadows.

The DEIR claims that Public Resources Code Section 21099(d) exempts UCSF from analyzing aesthetic and parking impacts. (DEIR at 4.0-3). But the Parnassus Heights campus does not meet the statutory definition of a "residential, mixed-use residential, or employment center project," and this statutory provision is inapplicable. Thus, the DEIR's failure to consider aesthetics and the adequacy of parking in determining the significance of impacts of the project is legally defective. 8

The DEIR recognizes that the proposed New Hospital "would contrast sharply both in height and scale with the existing residential development to the east, which is limited to 40 feet in height.…In addition, the proposed New Hospital would be a prominent newly visible feature in the viewsheds from nearby neighborhoods [.]" (DEIR at 4.1-35) The degree to which the New Hospital is out of scale with current development, and impacts public views is demonstrated in Figures 4.1-12 through 4.1-18 of the DEIR. 9

The New Hospital would obliterate public views of Sutro Tower from Kezar Triangle at Lincoln Way and Arguello Boulevard.

Existing

Proposed

Figure 4.1-14
Viewpoint 6: Visual Simulation of the Parnassus Heights Campus Site with CPHP Development from Lincoln Way and Arguello Boulevard, Looking South

9 cont.

The New Hospital is wholly out of character with the surrounding neighborhood. The New Hospital would create a looming presence in what is currently a low rise residential area, bringing a bit of Houston (a city without zoning and where high rises are routinely built next to single family homes) to San Francisco.

Existing | Proposed

Figure 4.1-16
Viewpoint 8: Visual Simulation of the Proposed CPHP New Hospital from Parnassus Avenue and Willard Street, Looking West

9 cont.

The DEIR concedes that these significant aesthetic impacts are inconsistent with objectives of the 2014 LRDP, particularly sub-objective 1B (to be guided by local zoning and height and bulk limitations), and sub-objective 1C (to design new buildings to be "sensitive to the surrounding neighborhood and landscape, taking into account use, scale, potential noise generation, and density.") (DEIR 4.1-30 to 4.1-31) But rather than design a project that is consistent with the LRDP objectives, the DEIR proposes to exempt the New Hospital from these objectives. And because of its incorrect reliance on Public Resources Code Section 21099, the DEIR does not evaluate the significance of these aesthetic impacts, and concludes that no mitigation is required. (DEIR at 4.1-41)

The DEIR acknowledges that the Project will have significant wind impacts, generating winds "in excess of the 11-mph pedestrian comfort criterion." (DEIR at 4.1-46) But the DEIR does not analyze an appropriate range of mitigation measures, deferring

10

mitigation and promising that the new building will be designed to "minimize wind impacts at pedestrian level," without any meaningful discussion of what this means. 10 cont.

The DEIR concedes that the CPHP will cast shadows on Golden Gate Park, Richard Gamble Memorial Park, Grattan Playground, Independent High School and Grattan Elementary School. (DEIR at 4.1-51) But the DEIR inexplicably concludes that these shadow impacts are "less than significant" based on the conclusory statement that the shadows would occur "during the time of day when usage is expected to be lowest," and thus does not "substantially and adversely [affect] the use and enjoyment of publicly accessible open spaces." (DEIR at 4.1-74) But the DEIR offers no empirical evidence to support this conclusory statement. As someone who has lived near and used Golden Gate Park for several decades I have personal knowledge that the areas of the Park that will be subject to the project's shadows. These areas are routinely used by numerous people during the periods when they will be in shadow and the shadows cast over these areas of the Park will substantially and adversely affect the use and enjoyment of this important public space. 11

Cultural Resources.

UCSF proposes to destroy the historically and culturally significant murals painted by Bernard Zakheim in UC Hall, recognizing that this is a significant impact of the Project. (DEIR at 4.4-13 to 4.4-16) But the DEIR concludes that this significant impact is unavoidable, and that it "has determined that it will not attempt to remove the Zakheim murals." *Id*. But the DEIR does not offer any factual support for this conclusory statement. 12

Hazardous Materials.

The DEIR states that the Parnassus Heights campus currently utilizes a wide range of hazardous and toxic materials, including cancer-causing radionuclides. (DEIR at 4.8-5) The DEIR provides no information on the specific hazardous materials currently stored at the Parnassus Heights campus, where they are stored, how they are transported to the campus and how they are disposed of. The DEIR also states that the campus currently stores 150,000 gallons of diesel fuel in underground storage tanks that "do not meet current code requirements." (*Id.*) 13

The DEIR fails to disclose whether the CPHP will result in an increase in usage of such materials, an increase in the transportation of such materials to the campus and where these materials will be stored and used. Nonetheless, the DEIR concludes that – because the "new and expanded facilities would continue to adhere to existing regulatory requirements and UCSF policies"— the use of these unknown quantities of undisclosed hazardous materials at undisclosed locations will not (1) create a significant hazard to the public through the routine transport, use or disposal and (2) will not create a significant

hazard to the public or the environment to reasonably foreseeable upset and accident conditions. (DEIR at 4.8-14, 4.8-19) There is no support for these assertions.

The DEIR should disclose the hazardous materials that are currently used at the Parnassus Heights campus, how these materials are transported to the campus, where they are stored, how they are used and how are they are disposed of. The DEIR should further disclose and analyze what changes are reasonably expected as a result of the massive increase in the size of the Parnassus Heights campus. It is only with this information that the public, and the Regents, can understand whether the use of hazardous materials will present a significant impact on the environment. 13 cont.

Land Use and Planning.

The discussion of "Consistency with UC Plans and Policies" is particularly illogical. The DEIR recognizes that the CPHP – which proposes to increase the square footage of nonresidential space at the Parnassus Heights campus by nearly 2 million gsf – is inconsistent with the 1976 Regents' Resolution. But the DEIR claims that the project is nonetheless "consistent" with this permanent limitation on growth because the Project involves breaching this 1976 commitment. The DEIR fails to analyze the legality of breaching the 1976 commitment by the Regents that the space limitation would be "permanent." Rather, the DEIR reasons that no mitigation is required for this major change, based on the tautology that the project will be consistent with the new policy that the CPHP seeks to implement. 14

The DEIR also concedes that the New Hospital is wholly inconsistent with applicable San Francisco zoning requirements. While the DEIR claims that UCSF "strives to adhere to City zoning codes to the extent possible," the fact that it is unashamedly ignoring those zoning codes belies the statement. 15

Noise and Vibration.

While recognizing that emergency vehicle sirens "can produce short-term noise up to 106 dB," the DEIR fails to disclose and analyze the degree to which the Project will increase ambulance traffic, sirens and associated noise. (DEIR at 4.11-28) The DEIR dismisses these impacts with the conclusory (and unsupported) assertion that "normal practice is for ambulance drivers to turn off their sirens within a few blocks of the hospital emergency access." (*Id.*)[4] 16

[4] As a neighbor of UCSF I have personal knowledge that ambulances routinely do not turn off their sirens "within a few blocks" of the hospital, and that San Francisco Fire Department vehicles never do.

In discussing increased noise from ambulances as well as patient drop-off events, the DEIR states – again with no citation to evidence – that "the New Hospital ***would be assumed*** to only marginally increase the potential frequency of emergency vehicle visits." (*Id*.)(emphasis added) But the DEIR fails to explain how the much larger New Hospital will result in only "marginally" more emergency vehicle visits, and also fails to discuss what the baseline noise impacts of existing emergency vehicle visits are. At a minimum the DEIR should provide information the current average daily, weekly and monthly number of ambulance trips and San Francisco Fire Department calls to UCSF over the past 3 years, and make a reasonable estimate as to the likely increase after completion of CPHP.

16 cont.

Given this lack of any reasoned discussion, analysis or evidence there is no basis for the DEIR's finding that "the operational impact of additional ambulance activities at the campus site associated with the New Hospital would be less than significant." (DEIR at 4.11-28)

Population and Housing.

The CPHP will result in an additional 5,180 students, faculty and staff at the Parnassus Heights campus by 2050, and the CPHP will generate an additional 3,420 jobs in the Bay Area. (DEIR at 4.12-7, 5-7) Yet the CPHP proposes to add a mere 762 new housing units by 2050, which the DEIR concedes will be insufficient to meet the demand that the CPHP will create. (DEIR at 4.12-9, 5-5) There is no analysis of where these new students, faculty and staff will reside. Will it be in San Francisco, which already has a housing crisis? Or will it be somewhere else? The DEIR does not offer any analysis or disclosure. Further, the DEIR claims that fully 16% of faculty, staff and students currently "walk or run" to the Parnassus Heights campus. (DEIR at 4.15-32) Given the post-Covid world it can be reasonably predicted that more people who work at the Parnassus Heights campus will chose to live near it to avoid public transportation, leading to displacement of existing residents.

17

In its discussion of displacement, the DEIR focuses solely on those who live in the Aldea Housing complex, stating that only forty-two households will be "temporarily displaced" and then concluding that implementation of the CPHP will not "displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere." (DEIR at 4.12-11) The DEIR should look more broadly at the Project's impact on housing, both near to the Parnassus Heights campus as well as more broadly. Without that analysis, is no basis for the DEIR's finding that impacts on housing and population will be less than significant.

18

Transportation.

The DEIR estimates that daily and peak hour vehicle trips will increase by 95% and 75% respectively as a result of the CPHP (DEIR at 4.15-35), and that "loading"

19

demand will increase by 240%. (DEIR at 4.15-35). The (unattributed) "Transportation Appendix concludes that

> [t]he CPHP would result in more vehicles at the campus site throughout the day, traveling more slowly, as described in the "Existing Plus CPHP Conditions" and "Local Traffic Operations – Daytime Period" sections above. To the degree to which the CPHP is unable to accommodate vehicle trips in off-street parking and/or passenger loading facilities as described in the "Approach to Analysis" section of the Transportation Section, vehicle queues – or people circling for parking (on-street or in garages) – may periodically:
>
> - Result in transit delay on Parnassus Avenue (6 Haight/Parnassus, 43 Masonic) and Irving Street (N Judah)
> - Reduce accessibility by blocking multimodal transportation facilities, such as crosswalks, bicycle lanes, and/or transit stops

TRANS-14. These impacts are inconsistent with the 2014 LRDP's "community planning principles" to "minimize congestion" and to "take into account transportation impacts on … the neighborhood[.]" (DEIR 5.15-26). These impacts are also inconsistent with San Francisco's "Transit First" policy by negatively affecting transit. However, the DEIR makes no attempt to mitigate these expected impacts, concluding that no mitigation is needed. Further, the DEIR fails to analyze and disclose the impacts of this increased traffic on air quality, safety of pedestrians, and on public transportation that serves the Parnassus Heights campus.

19 cont.

The DEIR concludes that traffic impacts are less than significant based on its conclusions regarding "vehicle miles traveled" ("VMT") per person. But the DEIR acknowledges that due to Covid, if "transit ridership decreases over the long-term, as compared to a 2019 baseline, with more people choosing to drive or be driven, this could result in additional VMT then projected as part of the study." (DEIR at 4.15-33) The DEIR should have evaluated the degree to which these changes would affect the VMT, particularly in regard to construction that is to take place in the nearer term.

20

The discussion of transit routes that serve the Parnassus Heights campus acknowledges likely service limitations resulting from the Covid pandemic, and likely budgetary shortfalls resulting from it, but fails to discuss how that will affect the DEIR's transportation assumptions. (DEIR at 4.15-8 to 4.15-8) The DEIR assumes that there will be a 50% increase in faculty, staff, students, patients, visitors and residents of the Parnassus Heights campus upon buildout of the project. This will result in a 55% increase in daily trips. But these conclusions are drawn from a survey performed in 2017 and 2018 that is not included as part of the DEIR. In particular, there is no discussion or analysis of whether the

21

survey continues to be valid, and whether its results (particularly conclusions about use of carpool, public transit, and "drive alone") are applicable in light of the Covid pandemic. While UCSF proposes to bring a significant number of people to the Parnassus Heights campus, both during construction of the CPHP as well as after development, the DEIR proposes no mitigation measures that will meaningfully reduce the impacts. 21 cont.

The transportation analysis refers to a 16 page "Transportation Appendix," that considers only seventeen intersections, inexplicably not analyzing impacts of the CPHP on the following intersections, that were analyzed in conjunction with the much smaller buildout contemplated in the 2014 LRDP: 22

- Lincoln Way/Ninth Avenue
- Lincoln Way-Kezar Way/Third Avenue
- Frederick Street/Stanyan Street
- Irving Street/Ninth Avenue
- Irving Street/Seventh Avenue
- Judah Street/Ninth Avenue
- Judah Street/Sixth Avenue
- Parnassus Avenue/Stanyan Street
- Kirkham Street/Sixth Avenue

Understanding the traffic impacts at these intersections is critical to the analysis, disclosure and mitigation of the impacts that the dramatic increase in traffic will have on localized air quality and public safety at, and in the vicinity, of these intersections. Accordingly, there is no basis for the DEIR's conclusion that the CPHP will have no significant impacts on transportation.

Alternatives.

The DEIR considered only four alternatives: a no project (or implementation of the project envisioned six years ago in the 2014 LRDP), a so-called "reduced project," a project with a nineteen story hospital, and an alternative with a "phased option" New 23

Hospital. These constricted and overly narrow range of alternatives fail to satisfy CEQA's requirement that a reasonable range of alternatives be considered.[5]

The DEIR considered and dismissed two off-site alternative –Mission Bay and Mt. Zion. (DEIR at 6-54 to 6.57) UCSF currently operates three hospitals at Mission Bay, and has for decades claimed will be the focus of its integrated approach to research and medical care. UCSF also owns the Mt. Zion site, which occupies an entire city block and is only 2.5 miles from the Parnassus Heights campus. But these alternatives were rejected early in the process, largely because they did not meet the objective of consolidating a huge amount of space and people on the Parnassus Heights campus. But this reflects a defect in the narrow project objective – which were tailored in such a way to require a project at the Parnassus Heights campus. The overly restrictive project objectives are contrary to CEQA, and undermine the validity of the alternatives analysis. 23 cont.

Another reasonable and feasible off site alternative that should have been considered was construction of the New Hospital (and other facilities) at the shipyard at Hunters Point. There is clearly space available in that location, and it would have the added benefit of providing a medical center in an underserved community and in close proximity via public transportation to the UCSF Mission Bay campus. 24

[5] This failure to comply with CEQA's requirement to evaluate a full range of alternatives appears to be a consistent practice when UCSF attempts to expand into a neighborhood. *See e.g., Laurel Heights Improvement Association v. Regents of University of California*, 47 Cal.3d 376, 403 ("UCSF's treatment of alternatives was cursory at best.") In that case, when UCSF sought to dramatically expand into a another residential neighborhood in San Francisco, the California Supreme Court took UCSF to task for not including any "discussion of the possibility of purchasing or leasing other facilities, including ones not located in a high-density city residential area such as Laurel Heights." *Id.* at 404

The Regents' commitment in 1976 to permanently limit UCSF's growth has resulted in more than 40 years of relative harmony between UCSF and its neighbors. UCSF's short sighted attempt to ignore this agreement will damage that relationship and likely lead to years of litigation. For the reasons discussed above – and for reasons that will certainly be identified by others commenting on the DEIR – the Regents should reject UCSF's attempt to abrogate the commitments that the Regents made in 1976 and decline to certify this DEIR. 25

Thank you.

Very truly yours,

ROBERT C. GOODMAN

RCG:nca

Responses to Comments from Robert C. Goodman

I-Goodman-1 The commenter refers to the net new increase in development proposed under the CPHP, and indicates UCSF seeks approval to increase the footprint of the campus beyond the permanent restrictions on campus growth that the Regents agreed to in 1976.

Stated differently, Draft EIR Chapter 3, Project Description on page 3-39 indicates the LRDP amendment would increase the future buildout space program at Parnassus Heights from the currently approved 3.61 million gsf (excluding housing) in horizon year 2035 to approximately 5.05 million gsf (excluding housing) in horizon year 2050, a net increase of approximately 1.44 million gsf. When compared to the existing (2019) space developed at the campus site (approximately 3.68 million gsf, excluding housing), the proposed LRDP amendment would result in a net increase in the space program by approximately 1.37 million gsf (excluding housing) by 2050 (approximately 74 percent of which would occur in the Initial Phase).

I-Goodman-2 The commenter asserts that the Regents should reject the CPHP because it breaches the Regents' 1976 agreement to permanently restrict the size of the Parnassus Heights campus. Please refer to Master Response 4: Space Ceiling and Population.

I-Goodman-3 The commenter asserts that the Regents should reject the Draft EIR because it fails to comply with the requirements of the California Environmental Quality Act. Please refer to Master Response 4: Space Ceiling and Population; and individual responses that follow.

I-Goodman-4 The commenter discusses past projects the commenter has been involved in. These comments do no specifically address the adequacy of the Draft EIR. Consequently, no response is required.

I-Goodman-5 The commenter refers to the requirements of the 1976 Regents' Resolution regarding the space ceiling. Please refer to Master Response 4: Space Ceiling and Population.

I-Goodman-6 The commenter expresses a number of opinions regarding the1976 Regents' Resolution. Please refer to Master Response 4: Space Ceiling and Population.

I-Goodman-7 The commenter notes the proposed increase in development and population that would occur under the CPHP, and indicates that the CPHP would result in nearly 30 years of virtually unending construction. The Draft EIR discloses all potential construction- and operational-related environmental effects associated with the CPHP, and identifies mitigation measures to reduce construction-related effects to the extent feasible.

The commenter also notes the proposed height and size of the proposed New Hospital, and asserts that the Draft EIR impermissibly defers many mitigation measures related to the New Hospital. As discussed in the Draft EIR Chapter 1, Introduction on page 1-7, a program EIR has been prepared for the CPHP that establishes a framework for tiered or project-program components. Accordingly, the Draft EIR provides a program-level analysis of the environmental impacts that could result from the development of the entire space program under the CPHP, including from the New Hospital, and identifies Plan-level mitigation measures to reduce potential significant effects of the CPHP. Further details of the New Hospital are being developed, including the specific design. Those elements of the New Hospital will be the subject of a subsequent project-specific environmental review when more details become available. It is anticipated that sufficient detail will be available to publish a project-level Draft EIR for the New Hospital in the summer of 2021.

With respect to a similar commenter assertion regarding of deferral of mitigation as it relates to the topic of wind, please see Response I-Goodman-10, below.

I-Goodman-8 The commenter asserts that the CPHP does not meet the definition in Section 21099 of being a residential, mixed-use residential, or employment center project. Please see Master Response 6: Public Resources Code 21099.

I-Goodman-9 The commenter asserts that the New Hospital would eliminate public views of Sutro Tower from Kezar Triangle; is out of character with the surrounding neighborhood; and the Draft EIR proposes to exempt the New Hospital from 2014 LRDP sub-objectives 1B and 1C. Please refer to Master Response 7: Aesthetic Impacts. The commenter also claims the Draft EIR incorrectly relies on Public Resources Code 21099. Please see Master Response 6: Public Resources Code 21099.

I-Goodman-10 The comment states that the Draft EIR's mitigation measure for wind impacts does not adequately explain how the measure would reduce pedestrian wind impacts. Please refer to Master Response 8: Wind Impacts.

I-Goodman-11 The comment states that the Draft EIR's shadow analysis fails to properly account for the uses of park areas that would be shaded. Please refer to Master Response 9: Shadow Impacts.

I-Goodman-12 The commenter asserts the Draft EIR does not offer adequate support for the conclusion that relocation of the murals is significant and unavoidable. Please refer to Master Response 11: Toland Hall Murals.

I-Goodman-13 The commenter asserts that the Draft EIR provides no information on the specific hazardous materials currently stored at the Parnassus Heights campus site. The Draft EIR Table 4.8-1 presents a list of representative hazardous materials stored and used at the campus site, including radionuclides (radioisotopes), as the

commenter notes. The Draft EIR also presents an extensive description of regulatory requirements and programs governing the storage, transport and use of hazardous materials at the campus site, including for radioactive materials. As indicated on Draft EIR page 4.8-10, the Radiologic Health Branch (RHB) of the California Department of Health Services (CDHS) administers the state's Radiation Control Law, which governs the storage, use, transportation, and disposal radioactive materials, including at the campus site. State regulations concerning radioactive substances are included in 17 CCR, which specify appropriate use and disposal methods for radioactive substances, as well as worker safety precautions and worker health monitoring programs.

The commenter indicates that the campus stores 150,000 gallons of diesel fuel in underground storage tanks that do not meet current code requirements. The Draft EIR notes on page 4.8-17 that the 2014 LRDP authorized the replacement of these diesel tanks with new code-compliant tanks prior to the end of 2025. As such, under the CPHP, the continued storage and use of diesel fuel at the campus site would be carried out in compliance with all applicable State regulations to ensure any potential exposure risks would remain less than significant.

The commenter asserts that the Draft EIR fails to disclose whether the CPHP will result in an increase in the usage of the aforementioned materials. However, in Impact HAZ-1, page 4.18-16, the Draft EIR discloses that the use of hazardous materials would be expanded as part of operation of the new or expanded facilities under the proposed CPHP; it is possible this could include increases in radioactive materials and/or diesel fuel. However, given the programmatic nature of the CPHP, the specific increase in use of hazardous materials that may occur at the campus site under CPHP are not known at this time. Regardless, the Draft EIR demonstrates that compliance with applicable hazardous storage and transportation regulations, and continuation of the programs and controls currently in place to manage hazardous materials, as mandated by State and federal laws, would minimize the hazards to workers, the public, and the environment. Therefore, implementation of the CPHP would result in a less than significant impact related to the use and disposal of hazardous materials and wastes.

I-Goodman-14 The commenter mischaracterizes that the Draft EIR claims the project is consistent with the 1976 Regents' Resolution because the project involves breaching this 1976 commitment. Please refer to Master Response 13: Land Use Impacts; and Master Response 4: Space Ceiling and Population.

I-Goodman-15 The commenter claims that the Draft EIR concedes that the New Hospital is wholly inconsistent with applicable zoning requirements. Please see Master Response 13: Land Use Impacts.

I-Goodman-16 This comment states that the Draft EIR fails to disclose and analyze the degree to which the CPHP will increase ambulance traffic, sirens and associated noise. The commenter acknowledges that the Draft EIR contains a qualitative discussion addressing this topic, but refutes the Draft EIR's statement that normal practice for ambulance drivers is to turn off their sirens within a few blocks of the hospital emergency access. Additionally, the commenter feels that the analysis of the Draft EIR should provide information on the current average number of ambulance trips and San Francisco Fire Department calls to UCSF and make a reasonable estimate as to the likely increase after completion of the CPHP.

The operational noise analysis of the CPHP Draft EIR was appropriately assessed at a programmatic level for development under the full CPHP on Draft EIR pages 4.11-26 through 4.11-28, and at a project-level of analysis for the Irving Street Arrival, RAB, and initial phase Aldea Housing Densification on Draft EIR pages 4.11-29 through 4.11-30. Noise from ambulance operations associated with operation of the New Hospital were addressed as a program-level analysis. However, the level of detail is not available at this time for the New Hospital to make a reasonable estimate of the increases in hospital emergency operations and associated potential increase in ambulance activity in the CPHP EIR. The project-level operational impacts of the New Hospital will be analyzed in a separate hospital-specific EIR that is forthcoming. Accordingly, the CPHP Draft EIR contained only a qualitative analysis of noise from emergency vehicle visitations. This quantitative analysis is supported by the text on page 4.11-28 of the Draft EIR which states that, given that existing campus operations already involve ambulance drop-offs, and that the New Hospital would be assumed to only marginally increase the potential frequency of emergency vehicle visits, the operational impact of additional ambulance activities at the campus site associated with the New Hospital would be less than significant.

I-Goodman-17 The commenter states that the CPHP will increase employees and students at the Parnassus Heights campus site but will not provide enough housing to meet the demand that will be created and that there is no analysis of where these employees and students will reside. The commenter further asserts that the new employees and students would likely live near the campus site.

Please refer to Master Response 14: Population and Housing Impacts, regarding the scope of population and housing impact analysis under CEQA, and the manner in which population and housing impacts are fully analyzed in the Draft EIR. Potential displacement of existing neighboring residents through gentrification is a socio-economic issue outside the purview of CEQA. Please see Master Response 15: Indirect Displacement and Gentrification Impacts.

I-Goodman-18 The commenter states that the Draft EIR focuses only on the displacement impacts of the Aldea Housing Densification and does not analyze broader displacement effects.

The Draft EIR analyzes the potential displacement impacts of the CPHP consistent with Appendix G of the CEQA Guidelines that recommends that the CEQA document analyze whether implementation of a proposed project would "displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere." As the Aldea Housing Densification project would demolish existing housing and displace the residents of those buildings, the impact is analyzed in the Draft EIR. With regard to broader, indirect displacement impacts, please see Master Response 15: Indirect Displacement and Gentrification Impacts.

I-Goodman-19 The comment asserts that the project's effects on transit and accessibility conflict with plans or policies addressing the circulation system – specifically, the UCSF Long Range Development Plan (LRDP) and the City of San Francisco's Transit First policy. Discussion of the project's consistency with UC plans and policies and relevant local plans and policies is included in the Draft EIR (see Impact TRANS-1 in Section 4.15.3, on Draft EIR pages 4.15-43 through 4.15-47).

With respect to the LRDP, the comment refers to two specific Community Planning Goals. These community planning goals represent "what UCSF will strive for," (UCSF LRDP, Appendix D, p. 158) and are generally not binding policies. The text of the goals specifically indicates a commitment to:

- T1: Coordinate with relevant agencies to minimize congestion and provide viable transportation alternatives to single-occupancy vehicles; and
- T5: Take into account transportation impacts at both the neighborhood and citywide levels in planning for UCSF facilities.

The CPHP follows Goal T1 by including ongoing implementation of UCSF's existing Transportation Demand Management program, which serves to reduce the amount of vehicular traffic that would otherwise be associated with the CPHP. This program has been shown to substantially reduce drive alone trips relative to other employers in San Francisco. The CPHP follows Goal T5 through the preparation of the Draft EIR itself, which discloses potential transportation impacts, allowing for UCSF to determine how to take those impacts into account for future planning purposes.

The City's Transit First policy does not contain specific language related to how individual projects may affect Muni operations. Instead, it calls for planning efforts that make public transit an "attractive alternative to travel by private automobile." By restricting the CPHP's parking supply, and continuing the existing TDM program, the CPHP actively seeks to make public transit an attractive alternative, and as such is in compliance with the Transit First policy. Therefore, the CPHP does not conflict with either of the plans and policies included in the comment, and would not have a significant impact on that basis.

Additionally, the comment asserts that the Draft EIR fails to adequately analyze the impacts of traffic on air quality, pedestrian safety, and public transit. The effect of CPHP-related traffic on air quality is analyzed in Impact AIR-2 in the Draft EIR. Master Response 19 discusses the effects of increased vehicular traffic on the transportation system and Master Response 20 discusses the effect of the project on transit.

I-Goodman-20 The comment asserts that the VMT analysis in the Draft EIR is inadequate as it does not account for the effect of the COVID-19 pandemic on travel behavior, for both CPHP-related operational travel and for construction-related travel. The effects of COVID-19, as relevant in both the near-term and through project buildout, are addressed in Master Response 3: COVID-19. Construction impacts are discussed in Impact TRANS-5 in the Draft EIR.

I-Goodman-21 The comment asserts that the Draft EIR does not adequately assess the funding effects of COVID-19 on public transit. Refer to Master Response 20 for discussion of why Muni operational issues are not a CEQA concern, and therefore analysis of these effects is not required in the EIR, and Master Response 3: COVID-19 for a discussion of the effects of COVID-19.

The comment also asserts that the use of UCSF historical travel surveys is inadequate because they are not included in the Draft EIR and because they were conducted prior to the onset of the COVID-19 pandemic. Please refer to Master Response 17 for a discussion of surveys and methods used in mode share assignments and Master Response 3: COVID-19 for a discussion of COVID-19.

The comment states that the Draft EIR does not adequately address the impacts of the effects of population increase or construction on the transportation system. Regarding the effects of population increase, please see Master Response 19. The Draft EIR does find that construction impacts would be potentially significant. The Draft EIR includes three mitigation measures to reduce the impacts of construction: construction contractor(s) shall be required to prepare a traffic control plan, the construction control plan will be required to include methods to encourage construction workers to walk, bicycle, carpool, or use transit to access the campus, and UCSF shall provide Project construction updates for adjacent residents and businesses. These mitigation measures are discussed in Impact TRANS-5 on Draft EIR pages 4.15-49 to 4.15-51.

I-Goodman-22 The comment asserts that the transportation analysis is inadequate because it does not analyze traffic impacts on intersections beyond those included in the Transportation Appendix. As discussed in Master Response 19, a project's effect on automobile delay shall not constitute a significant environmental impact under CEQA. As such, the potential constrained capacity at and around the campus site is not a CEQA concern and transportation impacts based on congestion and vehicular delay are appropriately not analyzed in the Draft EIR. Master Response

19 further discusses the secondary effects of increased vehicular travel, including concerns regarding public safety and localized air quality effects.

The comment also states that the analysis in the Draft EIR is inadequate due to not including a larger study area, in particular the intersections listed in the comment. The intersection operations analysis included in the Draft EIR Appendix was done so voluntarily and for informational purposes. UCSF decided on the scope of the analysis to focus on locations nearest the campus site as those intersections are where CPHP-generated traffic are most concentrated and where change in operations are mostly likely to occur.

I-Goodman-23 The commenter requests that the EIR address off-site alternatives at Mission Bay and Mount Zion. Please see Master Response 5: EIR Alternatives.

I-Goodman-24 The commenter requests that the EIR address an off-site alternative at Hunters Point. Please see Master Response 5: EIR Alternatives.

I-Goodman-25 The commenter expresses opinions about implications of ignoring the 1976 Regents' Resolution, and that the Regents should reject UCSF's attempt to do away with the commitments made in 1976 and decline to certify the EIR. This comment does not address the adequacy of the Draft EIR; however, the comment has been noted and will be forwarded to decision-makers.

RE Comments on the Environmental Impact Report of the Comprehensive Parnassus Heights Plan

Greetings:

I thank you for allowing me to comment on the Draft Environmental Impact Report for UCSF's Comprehensive Parnassus Heights Plan.

I was a post-doctoral scholar at UCSF on the Parnassus campus from 1979 to 1982. I am also a neighbor of the UCSF Parnassus campus. I have received medical care over the years at the Parnassus campus. I know this campus well.

I submit my comments with full enthusiasm and concern for the continued vibrancy of medical science and medical care by UCSF. I share this enthusiasm with most of the neighbors, who are most proud to live near UCSF.

Unfortunately I am deeply disappointed with the EIR because it ignores the dominating reality—the Covid epidemic. In fact, nowhere in the EIR is the word 'contagious.'

With pandemics, large multifaceted medical centers should be modified. They do not promote good health. Small separate centers of specialities appear to be the future of medical research and practice of medicine.

How should the EIR have evaluated Covid changes and, with Covid in mind, the future of medicine?

1

In the introduction, the EIR acknowledges that Covid-19 "will likely [cause] operational changes." In the section on transportation, changes due to Covid-19 are also discussed in the section on public transportation. There is, however, no discussion or data about how public transit trips have shifted to private vehicle trips in the world with Covid (or any other widely spread infectious disease such as H1N1, MERS or ebola). In the other sections of the EIR occasionally there is mention of 'operational changes,' but these are never described and no data are provided. 1 cont.

As examples, Here are a few 'operational changes' that are necessary that the EIR should have included:

Changes in access design: no more stairways and hallways that are enclosed and lack adequate fresh air.

Changes in ventilation system in all areas, including hospital rooms and research laboratories. The operational changes for Covid are likely to be smaller rooms with opening windows that can bring in fresh outside air. 2

Changes in research lab design: no more large, open lab spaces.

Changes in research office and staff office design.

Big changes in the who and why and how the public receives medical care.

In the last 6 months, UCSF has seen dramatic changes in their patient population, the reasons for patient visits, and the manner in which patients receive care, with many visits being virtual and not in person. I find it shocking that this new direction of medical care is not reflected in the EIR.

Perhaps the biggest change for medicine in the Covid world is that large is not better, that Covid indicates, for instance, that a separate campus for infectious diseases is better, similar to the tuberculosis centers of a century ago. 3

Surgeries—essential and elective surgeries—are preferably done at separate, specialized medical centers, very separate from cases of Covid. Other examples, a

UCSF center for organ transplants and a UCSF center for joint replacement, and so on and so forth.

Medical educational facilities have likewise changed dramatically with telecommunications and tele-education and have different operational designs.

Nowhere in the EIR is there a discussion as to whether BIG is ***better***. There is no discussion of the environmental effects of size. That small, single dedicated spaces have fewer risks of incidental, highly contagious infections. That different medical and research disciplines have differing environmental impacts—for instance, that chemistry fume hoods have different environmental hazards than bio lab fume hoods. And so on.

3 cont.

With very few exceptions this EIR pretends there is no reason to consider that future environmental effects will be different from those of the past. The present pandemic has required extensive changes at UCSF and at the Parnassus Heights campus. This EIR ignores the new Covid world. It is based on pre-Covid, pre-pandemic data, and these data are not contemporary any more.

So the question we must ask—Is the EIR operationally adequate for the next 30 years?

Another problem with the EIR concerns UC Hall, which is proposed for demolition. The only reason that the EIR gives to remove UC Hall is that a new large building for research is desired. And this proposed new building with large, interdisciplinary research labs is exactly wrong in a world where pandemics can take place.

There is no study of UC Hall itself—how its design while over 100 years old is perfect to minimize the spread of infections. The architect(s) of 1917 were very wise. 1917 was a time when tuberculosis was raging, and the pandemic of 1918 flu was just around the corner. The building has multiple, open-to-the-air (white marble) stairways, and multiple separate rooms, each with the potential for opening windows capable of bringing in fresh air without mechanical ventilation. Its basic design can accommodate research during a time of a pandemic or a rampant flu. There could be small separate spaces with one or two people per lab space.

4

Curiously the EIR does not discuss the reasons why UC Hall will be removed, and there is no discussion of the seismic state of UC Hall and the feasibility of bringing it to code. 5

One other omission—The EIR does not describe the demands with differing environmental impacts of the different programs at UCSF—the five programs being dentistry, medicine, nursing, pharmacy, and physical therapy. This topic just isn't there. 6

In summary the EIR is inadequate. It is based on a plan that does not provide for the current and future shape of medicine. It uses data that are out of synch with the present. UCSF needs to go back to the drawing board and take on the challenges of pandemics and the changes in the way medicine is **now** done. As a premier **public** medical institution, UCSF must do what is right and smart for the people of the State of California. 7

Sincerely,

Pinky Kushner, PhD

Responses to Comments from Pinky Kushner

I-Kushner1-1 The commenter suggests that the EIR should evaluate changes due to Covid-19, pointing out that the EIR does not discuss how public transit has been affected. Please see Master Response 3: COVID-19.

I-Kushner1-2 The commenter suggests that the EIR should have discussed changes in access design, changes in ventilation system design, changes in lab design, and changes in office design due to the Covid-19 pandemic, as well as the changes in who, why, and how patients receive care. Please see Master Response 3: COVID-19.

I-Kushner1-3 The commenter suggests that essential and elective surgeries should be done at separate medical centers, and that "Covid indicates, for instance, that a separate campus for infectious diseases is better, similar to the tuberculosis centers of a century ago." Please see Master Response 3: COVID-19.

I-Kushner1-4 The commenter indicates that a "new building with large, interdisciplinary research labs" as proposed on the site of UC Hall is not appropriate given the Covid-19 pandemic and that UC Hall "can accommodated research during a time of pandemic or rampant flu." Please see Master Response 3: COVID-19.

I-Kushner1-5 The commenter suggests that UCSF should find an alternative site if it requires a new hospital as big as the one proposed, questioning UCSF's motivation, and indicating that "there are several suitable, if not superior, alternatives to accomplishing UCSF's objectives" that do not require such a large hospital building. The commenter asserts that the Draft EIR does not discuss the reasons why UC Hall would be removed.

UC Hall is over 100 years old, and is one of the oldest buildings at Parnassus Heights and is the oldest extant hospital building in the UC system. As discussed in the 2014 LRDP Final EIR, Chapter 3, Project Description, in 2012, UCSF updated the seismic evaluations of buildings, and identified UC Hall as one of the highest-priority buildings at the Parnassus Height campus site for either seismic retrofit, removal, or other appropriate action.

As discussed in the CPHP Draft EIR, Section 3.5, Project Needs, building codes for accessibility, fire and life safety, seismic performance, and other requirements have become more stringent. Older buildings such as UC Hall have low floor-to-floor heights and do not meet the current standards for contemporary specialized research needs. Modern research space requires larger open spaces that provide flexibility for new programs, space to connect to other research functions, larger floor-to-floor height to accommodate modern infrastructure, and the ability to foster programmatic research interactions in common or shared space. In short, the size and configuration of the UC Hall floor plates, low floor-to-ceiling heights, and infrastructure limitations render the adaptive reuse of UC Hall for contemporary research and academic use infeasible. The RAB, proposed at the

site of UC Hall, would provide new state-of-the-art, flexible research space to replace existing obsolete wet lab space and to satisfy existing demand.

I-Kushner1-6 The commenter asserts that the EIR does not describe the demands with differing environmental impacts of the different programs at UCSF—the five programs being dentistry, medicine, nursing, pharmacy, and physical therapy. The Draft EIR programmatically addresses all physical environmental impacts associated with implementation of the CPHP. This includes changes to the UCSF's five professional programs that would occur under the CPHP, including increases in population and space needs associated with these programs, and associated environmental effects (e.g., increases in traffic, utility demands, etc.).

I-Kushner1-7 The commenter makes assertions that the EIR is inadequate, because it is based on a plan that does not provide for the current and future shape of medicine; and uses data that are out of synch with the present. The commenter is referred to the responses above, which demonstrate that the claims raised by the commenter do not affect the analysis or change any conclusions reached in the Draft EIR.

Comment on CPHP Draft EIR
Attn: Diane Wong, UCSF Campus Planning
September 11, 2020

Waking up yesterday morning to apocalyptic dark orange skies in San Francisco from wildfire smoke, and an unprecedented streak of more than 25 continuous spare-the-air days, I am convinced that the potential environmental effects of a project the size, scope, and duration of the CPHP are more relevant and important than ever. With the Bay Area facing catastrophic climate change, I am grateful for CEQA and this process to ensure that UCSF is held accountable for prioritizing the health, safety, quality of life, and integrity of their community and the environment.

This draft EIR is massive in length but I have done my best to call attention to the many omissions and errors I found in the document. As a neighbor, pediatrician, parent, and UCSF alumna, I am deeply disappointed in UCSF's attempts to overlook the significant health and environmental impacts of the CPHP in order to have it shuttled through and certified by the UC Regents. 1

The CPHP is an aggressive, expensive, and deeply flawed plan. It will forever harm not only the immediate Parnassus Heights neighborhood, but also the entire west side of San Francisco and beyond. This is no normal project - the massive scale of the proposed New Hospital will alter the views and horizon line of Twin Peaks and Mt Sutro from almost every part of the city. I hope UCSF can be convinced of the absurdity of this plan and look more thoughtfully at the many other alternatives to move forward and modernize and improve the Parnassus campus.

Thank you for reading and addressing my comments.

THE SPACE CEILING - A TIMELINE

1976 REGENTS' RESOLUTION

"The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent." (source: 1976 Regents' Resolution)

1982

"'The 1982 draft LRDP proposes a re-siting of already approved buildings in the 1976 plan without changing the total amount of space,' the Chancellor emphasized. 'It retains the commitments made by the campus and the UC Board of Regents in 1976 as to housing, parking and transportation, limitations to campus growth, and maintenance of 58 acres of Mt Sutro as a green belt.'" (1982 LRDP, Chancellor Julius R. Krevans) 2

1996

"This LRDP reaffirms the principles of the 1976 Regents' resolution which has limited development at the Parnassus Heights site. Recognizing constraints to future development at Parnassus Heights, the LRDP has been prepared, in part, to help UCSF

and The Regents to acquire and develop a major new campus site." (Joseph B. Martin, MD, Chancellor)

The 1996 LRDP promised to "respond to The Regents' space ceiling policy by carrying out demolition and new construction projects which reduce the overall space at the Parnassus Heights site, and by demonstrating good faith efforts to meet the space ceiling." (1996 LRDP)

2008

"With regard to the Parnassus Heights campus site options, space planning assumptions were made in order to address the space ceiling, a commitment by The Regents in 1976 that UCSF would not exceed 3.55 million gross square feet (gsf) of structures within the Parnassus Heights campus site boundaries." (2008 LRDP Amendment #2)

2014

"The space ceiling for the Parnassus Heights campus site is 3.55 million gross square feet. The space ceiling includes space in non-residential buildings within the boundary of the Parnassus Heights campus site." (Regents Resolution Regarding the Parnassus Heights Campus Site)

2 cont.

2019

Regarding the new hospital at the Helen Diller Medical Center at Parnassus Heights, the space ceiling was referenced obliquely by UCSF, saying that "complications" to the new hospital project "included the size of this facility and limits established in 1976 on the number of square feet that may be constructed at Parnassus Heights. There would be numerous presentations to the Regents at future meetings and opportunities for the Regents to provide advice and guidance." As recently as last year, it is unclear if even the Regents had been officially informed of UCSF's intent to violate the existing space ceiling and 1976 Regents Resolution. (Minutes from UC Regents Health Services Committee meeting, December 2019)

2020

Now, the current draft EIR calls on the Regents to "Increase the space ceiling limit from the current 3.55 million gsf to a proposed 5.05 million gsf, excluding housing (an increase of approximately 1.5 million gsf above the current space ceiling limit) in recognition of the tremendous need for program space at the campus site in order for UCSF to retain its leadership position in patient care, research, and education." (CPHP draft EIR, 2020)

Inexplicably, UCSF seems to regard the heretofore permanent space ceiling as expendable and the Regents' longstanding commitment to uphold it as revocable. The space ceiling is not an anachronism; it has been reaffirmed over and over again through decades of growth and change. This was a promise made by the Regents of the University of California to the communities around UCSF and the city of San Francisco, a promise honored by over 40 years of Boards of Regents and Chancellors, including Chancellor Hawgood himself in the 2014 LRDP.

The space ceiling was adopted to respect the inherent physical limitations of the Parnassus site - to protect it and the surrounding neighborhood from the ever expanding needs of the university. In fact, in 1996 the space limitations of the Parnassus campus were UCSF's primary justification for the acquisition and development of the new campus at Mission Bay. And although the needs of the university have continued to grow, the Parnassus site has not - it remains a small, urban, hillside campus surrounded by open public greenspace and residential neighborhoods on all sides. UCSF has continuously honored the unique location and character of its Parnassus Heights campus, while still expanding its reach and reputation throughout San Francisco, California, and the world. Until now.

3

COVID-19

The draft EIR specifically mentions COVID-19 but says the effects "cannot be predicted without speculation." However there are some obvious public health and environmental implications of the pandemic on this project that must be addressed, even in this early stage. Specifically (1) the proposed increase in campus population and ability to social distance both on campus and on public transportation, (2) the effects of airborne pollutants on respiratory health in the setting of a pandemic virus that targets the lungs, and (3) the effect of COVID-19 on how medicine and healthcare will be delivered in the future.

4

Of note, one of UCSF's justifications for this project, specifically the new hospital, is to "increase inpatient beds at Parnassus Heights to allow for the capacity to provide inpatient health care in times of severe strain such as the current pandemic, without resorting to reducing or canceling non-essential surgeries to create bed capacity."

This is a misleading statement. UCSF was not limited by bed capacity at Parnassus during COVID-19. It was UCSF's inability to engage safely in both pandemic response and other non-pandemic medical activities on a single small site that strained the system and hampered their ability to provide adequate care. Despite not being at capacity for inpatient or ICU beds, UCSF was forced to move COVID patients off the Parnassus campus (to Mt Zion and the Presidio) to allow for infection control, patient comfort/safety, and space for appropriate social distancing in order to resume non-COVID medical services. Building a bigger hospital only worsens this issue. Densification of the existing site would drastically increase daily population on campus, lead to staggering operational costs of supporting a mostly empty hospital as happened in COVID-19, and create major problems with density, accessibility, and employee and patient safety.

5

COVID-19 has been, and continues to be, the defining event of our generation. It will have far reaching impacts not just on healthcare provision and medical research, but on every aspect of urban planning. If after all these months UCSF *cannot even speculate* about how the global viral pandemic might affect their plans for the Parnassus campus, they should pause, study, and reflect. Looking at this document it is clear that COVID-19 has impaired their ability to produce a thorough and complete analysis of this project. In addition, UCSF's justification for the entire CPHP relies on pre-COVID healthcare, population, and workplace data that is

6

rendered meaningless in the face of so much new uncertainty. It would be foolish to charge ahead with a project of this cost and scale with so little information about what the future holds for medicine and the city of San Francisco in the post-COVID era. 6 cont.

AESTHETICS

Impact AES-1: Development under the CPHP would not have a substantial effect on a scenic vista (Less than significant)

This is misleading and patently false. In each scenario UCSF prioritizes its own views and vistas, at the expense of the views and vistas enjoyed by the general public 7

(1) They state the demolition of the nursing building will create new views of the ocean westward *from within the campus site,* however the new hospital, located at the eastern edge of the campus, will effectively block views westward to the ocean *for everyone else,* including the ocean view from the top of the historic Farnsworth Steps.

(2) The vistas from the trails in the Mt Sutro Forest preserve are <u>significantly</u> affected. Figure 4.1-10 shows *one single viewpoint* along the trail, likely selected to suggest minimal impact because of location and vegetation density. This is not at all representative of the entire trail. There are many other vantage points along these popular public trails that will be very negatively impacted by the massive size and scale of new hospital building. The Edgewood Trail and the Historic Trail specifically are both directly behind the proposed new hospital building. There are indeed areas in the woods with dense vegetation as the EIR states, but there are also many openings along the trail that afford hikers beautiful expansive views across the city that will be blocked and ruined by the huge new hospital building. It is absurd for UCSF to claim that the vistas from Mt Sutro preserve are not affected. The new hospital building will afford scenic vistas for patients and employees *inside the building,* while blocking vistas for everyone else. 8

(3) This statement requires further clarification: “UCSF’s proposed LRDP Amendment would clarify that sub-objectives 1B and 1C *would not apply to the New Hospital project*, in recognition of the substantial amount of space required for the New Hospital, although UCSF would make efforts in the design process to come as close as possible to meeting these objectives, if feasible” This statement does *not* support the claim of Impact AES-2 being “less than significant.” Rather it states that the already agreed upon aesthetic objectives cannot be met simply because the new hospital is too massive in scale to meet them. Why would any building be exempt from aesthetic impacts because of its enormous size? This impact should be reclassified as “Significant and Unavoidable” 9

(4) Impact AES-2. Although as a state institution UCSF doesn’t have to meet the applicable zoning regulations because it has jurisdiction over its own land use, it is disingenuous to state that the impact is “less than significant.” The impact of the New Hospital is completely out of scale and in direct conflict with applicable zoning regulations - in height, square footage, and positioning on Parnassus Ave at the edge of the campus directly at street level. Not only that, it goes against many of the design principles UCSF *set for themselves* in the 2014 LRDP. 10

(5) Viewpoint 4 in 4.1-12 and viewpoint 6 in figure 4.1-14 show the vista from Kezar Triangle and Lincoln Way/Arguello Ave respectively. These viewpoints are both on the route of the <u>designated scenic route of the 49 Mile Scenic Drive</u>. As seen in the simulations, the proposed New Hospital is so tall that it not only blocks the mountaintop view of Twin Peaks, but also blocks *entire structure of the iconic Sutro Tower.* This plan therefore substantially and specifically damages scenic resources from a scenic route. 11

The planners keep referring to the proposed new campus as a “Park-to-Peak” design, but the proposed New Hospital blocks both the view of the park from hikers enjoying the public trails on the peak and the view of the peak from people enjoying the grassy Kezar triangle in the park. The only beneficiary of this supposed Park-to-Peak plan will be UCSF. 12

AIR QUALITY

Wildfire smoke and construction/operations Air Quality
In referencing baselines, the discussion of air quality does not take into account the additive effects of particulate matter from wildfires, which in the last few years have dramatically increased exposure to environmental pollutants all around the Bay Area. Air quality data must be updated to include the significant changes in regional air quality from the last 3 years, *including current data from the 2020 season*, from wildfires. The EIR must also specify the potential health consequences of the additive impacts of construction/operational air quality effects and wildfire smoke, both acutely and over the long term. As part of its mitigation strategies the EIR should specify plans for modification of the construction schedule, *including complete cessation of construction if necessary*, at times when wildfire smoke significantly impacts regional air quality. 13

Health Risks
Multiple tables in section 4.2 show a dramatically increased cancer risk for “Resident - Offsite Receptor” during construction from airborne particulate matter, with a reduction to “less than significant” impact with mitigation. There is insufficient evidence to substantiate this reduction based on the strategies given. In a dense residential neighborhood with many families and children and elderly residents, not to mention UCSF staff and patients, many of whom will be exposed to these carcinogens over the cumulative 10-30 year span of this project (not just 5-6 as years specified in the chart), more substantive data must be provided to support this claim. 14

Mitigation Strategy: Watering
With respect to construction air quality, the primary mitigation strategy offered is watering of “all exposed surfaces (eg. Parking areas, staging areas, soil piles, graded areas, and unpaved access roads) two times per day.” The following questions must be addressed regarding both the feasibility and environmental impact this mitigation strategy:

- Is twice-a-day watering a feasible strategy given the extent of construction, the size and scale of the multi-project site, and the duration of the project?

- How many gallons of water would this strategy require for a project of this scale, and is that an acceptable use of a limited public resource, especially given the fact that California has spent much of the last decade in severe drought conditions and fighting seasonal wildfires? 15

- What is the downstream effect of dousing a construction site of this size, in this location, with water twice a day over a decade or more of construction? Please address what contaminants would be present from demolition, construction debris, and medical research/ clinical waste (including radioactive compounds if applicable), and how each of these chemical substances will affect groundwater, local water supply and safety, and the effect of drainage of this contaminated water into adjacent natural spaces or the bay?

- If water rationing and drought conditions arise, as is almost certain to happen at some point in the project, will the University be able to keep up with the twice a day watering of the entire site, or will they have to stop, thus creating an unacceptable air quality risk for the

entire neighborhood? What would the air quality impact of the construction without the "watering" mitigation?

15 cont.

Sensitive Receptors - Edgewood Ave
It is unclear why the CPHP discussion of air quality believes that "sensitive receptors" to the east of Parnassus campus will be substantially buffered by "varying depths of open space", as this neighborhood is closest to the construction activity and operations of the campus facilities, specifically the new hospital, staging areas, and power plant, than any other sensitive receptors identified in this report. Because of its unique proximity to construction and operations of the proposed facilities, air quality impacts on the residences on Edgewood Ave, Willard Ave, and Woodland Ave must be assessed and quantified. There is in fact no "open space buffer" because the CPHP calls for substantial intrusion into and construction activity within the forest space between the project site and the residences to the east of campus. The Surge Lot in particular, which has been identified as a construction staging site, directly abuts the backyards of the homes on the west side of Edgewood, with no buffer at all between them and construction activities, materials, and vehicles. Air quality (as well as noise and vibration) analyses should be done both for duration of construction and for operations of proposed campus facilities, with specific attention to residential neighborhood on Edgewood Ave, directly adjacent to the eastern boundary of campus.

16

Health Effects of Significant and Unavoidable Impacts
Impact AIR-2 and Impact C-AIR-1 are both Air Quality impacts that are identified as "Significant and Unavoidable" even with mitigation strategies. So the operation of the proposed facilities will create significant, ongoing, un-mitigatable, unhealthy air quality in a residential neighborhood which includes families, children, childcare facilities, elder care facilities, and schools - not only for the duration of construction, but essentially, forever.

The EIR states that it would be only PM10 that is increased in operations of campus facilities (SU), but does not provide sufficient evidence on PM2.5 and other pollutants. As these are dangerous toxins with major health effects, more detailed data is necessary on these substances specifically.

17

UCSF must analyze, with relevant data and outcome information, the specific health effects (immediate and long term) of this anticipated breach of air quality standards, including but not limited to: respiratory effects (please address vulnerable populations such as elderly residents with COPD, or children with existing asthma, or increased risk of children developing asthma, pregnant women) and also long term effects such as increased cancer risk and neurocognitive and developmental effects, especially for children growing up in this neighborhood who will have a cumulative exposure to unsafe air at critical developmental stages.

UCSF has established itself as an international health leader in identifying and calling attention to the impact of regional air quality on community health. Their own faculty in the departments of environmental health, pulmonology, and pediatrics have contributed meaningfully to research on the effects of air quality and particulate matter on respiratory health including the Children's Health and Air Pollution Study, the UCSF Human Exposure Laboratory, and even a recent New England Journal article entitled "The Need for a Tighter Particulate-Matter Air-Quality Standard" (August 2020.) It is unconscionable that a leading health care institution would blatantly disregard the substantial and significant environmental health effects of unhealthy air quality on neighbors, nearby eldercare and childcare facilities, its own faculty and staff, and the community it serves, by knowingly and intentionally violating state and federal air quality standards.

18

HAZARDOUS MATERIALS

Again, the identification of "sensitive receptors" in this section omits mention of the residences on the eastern boundary of campus that are closest to the construction site, staging areas, construction roads, and power plant. The effects of hazardous materials on this dense residential neighborhood must be analyzed and disclosed, including both data on exposures to different substances (asbestos, mercury, PCBs, lead, etc. per Table 4.8-1), detailed mitigation strategies, and detailed description of the health effects of each.

There is enough information about the new hospital construction to include it in this analysis of hazardous materials, and it must be included to give a full picture of the impacts of the CPHP. New hospital data is included in other sections of the draft EIR (air quality, etc.) so it is unlclear why it would be omitted here. The impact of the hazardous materials from the new hospital is significant and as it is to be part of the first phase of construction, it must be included even if a project specific EIR is forthcoming. As they are overlapping, the cumulative environmental and health impacts of hazardous materials of all four initial phase projects (*including any demolition of existing structures*) must also be addressed by this EIR. This cumulative analysis cannot be done without including data regarding construction of the New Hospital. 19

Soil and groundwater contamination - this section states that medical offices, research facilities, and hospitals generate hazardous wastes that affect soil and groundwater, but does not address the impacts of CPHP construction and construction mitigation strategies on the soil and groundwater with hazardous materials. Specifically, demolition of existing medical/ research sites, construction debris, and the environmental impact of the EIR's primary air quality mitigation strategy of watering the site twice daily to control construction debris/air contamination should be fully addressed here. 20

CPHP Mitigation measure HAZ-1
It appears that the mitigation measures put forth in this section are:
(1) Have a qualified professional prepare a plan
(2) Apply "best management practices"

It is unclear how these two extremely non-specific mitigation measures prove their claim of reduction of risk from Hazardous Materials to "less than significant." UCSF cannot base their claim on handwaving and vague language, but must provide sufficient hard data to support it, including specific mitigation strategies for each of the identified contaminants. 21A

Hydrology and Water quality
Addressed in other sections but revisited here, it is unclear whether the draft EIR analysis includes effects of runoff from watering the entire construction site including "all exposed surfaces (eg. Parking areas, staging areas, soil piles, graded areas, and unpaved access roads) two times per day" including what contaminants would be present from demolition, construction debris, and medical research/clinical waste), and how each of these chemical substances will affect groundwater, local water supply and safety, and the effect drainage of this contaminated water into adjacent natural spaces or the bay. 21B

LAND USE AND PLANNING

To omit the New Hospital from the section on Land Use and Planning is unacceptable. It is the most significant of the four early phase projects, has a huge impact on the issue of land use and planning of the CPHP, and it must be included in the CPHP program level EIR even if some issues will be revisited/clarified in a future project level EIR. The sections of the draft EIR on general project description and aesthetics contain a high level of detail about the footprint, square footage, height, and massing of the proposed structure of the New Hospital, so much so that they are able to provide schematic renderings of the proposed building from multiple perspectives. So there is obviously enough information available for UCSF to also include it here. The New Hospital has by far the biggest physical size and most square footage of any project in the CPHP and thus cannot be excluded from the program level EIR. If UCSF cannot provide the necessary information for the new hospital at this stage, they should be required to withdraw the current draft EIR until they are able to provide all relevant information. 22

TRANSPORTATION

As the CPHP proposes to add over 8000 persons per day to the campus census, the parking and traffic analyses provided in this EIR are insufficient to address the massive increase in private vehicles, ride-share vehicles (Uber, Lyft), and demand on public transportation.

Items to be addressed regarding transportation and mobility (for both construction and operations): 23

- Parnassus campus is accessed almost exclusively by small two-lane roads. Given the increase in anticipated daily population coming to and from campus, traffic/accessibility/ safety impacts should be examined for the surrounding streets including, but not limited to, Parnassus Ave (to Clayton), Stanyan (north and south of Parnassus), the inner sunset avenues especially 7th Ave, and Arguello Ave.
- Effects of increased vehicle demand on city “arteries” of 19th Ave and Park Presidio, Lincoln Ave, 17th Street and Clarendon 24
- Parking: off street parking is expected to *decrease* with this project. Interestingly, the EIR claims that “As the total campus population increases in a more parking constrained environment, people will likely change the way they travel to and from the campus site.” This is purely speculation, and even if some people choose ride shares or public transportation, there will still be a major net increase in cars that park in neighboring streets. It should also be noted that off street campus parking is likely to be reserved for high level faculty and administrators, leaving other employees who commute, many from outside the city, to find street parking in local neighborhoods or pay the cost of ride shares. 25
- There is a discussion of bicycle commuters, and it is noted that bicycle use has increased, with reference to a 2018 survey which showed that “6% of employees” ride bicycles to campus. Is this 6% of all employees? A subset of employees? All campuses or only Parnassus? Commute by bicycle every day or sometimes? This number does not include patients. Rather than offering a percentage of an unknown, it would be more helpful to have absolute numbers showing on average how many individuals on the Parnassus campus (employees and staff, accounting for seasonal differences) arrive by bicycle each day. UCSF is at the top of a large hill so estimates of increased bicycle commuting should account for topography. 26
- **Impact TRANS-4: implementation of the CPHP would not result in inadequate emergency access.** It is unclear from this discussion whether emergency vehicles include ambulances traveling to/from UCSF. This section discusses roadway width for passage, but not ambulance traffic volume. Ambulance traffic is an issue unique to hospital planning but should be addressed here. With the massive size of the proposed New Hospital comes a 27

bigger Emergency Department, with more patients arriving by ambulance for emergency services, as well as many more ambulance transfers to and from the estimated 600+ inpatient beds. The anticipated increase in the number of EMS and patient transport vehicles coming to-and-from campus should be quantified and that data included in analysis of the project. Also, what effect will the increased ambulance traffic have on local traffic (when EMS travels with lights and sirens, cars on local 2-lane roads must stop and pull over) and can this increased number of vehicles get to their destinations safely and efficiently.

27 cont.

Public Transportation
UCSF needs to provide a more detailed analysis of the existing public transportation and how this project and the addition of so many additional people on campus would stress the N-Judah, 43, 6 and 7

Does MUNI currently have the capacity and budget to add the number of additional busses/ trains/drivers that UCSF would require to meet their transportation needs? If not, this can not be relied upon as a mitigation strategy.

Effects of COVID-19: MUNI services have been substantially cut back, and the number of passengers must also decrease for safe social distancing. So realistically, any claims of MUNI adding service or carrying extra passengers are wholly unsubstantiated at this time.

28

ALTERNATIVES

Alternative 1B: No Project - Development under 2014 LRDP

This cannot be labeled a “no project” alternative. The 2014 LRDP is a *different* project, but is in no way a “no project” alternative. Like the CPHP, the 2014 LRDP includes full plans for a new hospital on the LPPI site to replace seismically unsound Moffitt Hospital, and includes many updates to the Parnassus Heights campus. It is a fully realized alternate plan, with a certified EIR, that was billed as the “guiding plan for institutional development, including Parnassus Heights, for 20 years” when it was approved by the Regents just 6 years ago. The LRDP contains a significant, meaningful, *already approved* alternative and includes all the updates and improvements necessary to modernize the Parnassus Campus. It is disingenuous to call it “no project”, as it is a full scale plan that accomplishes the goals of the CPHP with drastically reduced environmental impacts.

29

6.4.3 New Hospital at Mt Zion Campus Site

In looking at alternatives it is important to note that UCSF is a multi-campus institution that is woven into the fabric of the city of San Francisco, with existing campuses at Mission Bay and Mt Zion. There is no reason why the entirety of the construction must happen on Parnassus Heights campus when there are several other opportunity sites that could be developed to meet UCSF’s institutional needs. It should also be recognized that UCSF’s need to update, modernize, and meet seismic standards at Parnassus Campus can be completely achieved with the parameters of the existing LRDP.

In examining project alternatives, the EIR must look beyond the Parnassus Heights campus and treat UCSF as the city-wide multi-campus institution that it is. As such, UCSF should fully evaluate the alternative options of: (1) siting the New Hospital at a UCSF location different from Parnassus campus and (2) the possibility of a reduced project on the Parnassus Campus that is supplemented with development of other UCSF sites such as Mt Zion or Mission Bay.

30

1. Draft EIR does not provide reasonable analysis of the alternative project of building the new hospital at Mt Zion.

Although UCSF claims that it would be "inefficient" and "less than desirable" UCSF is already a decentralized, multi-campus institution operating at multiple sites within the city, including Mission Bay which hosts both the Benioff Children's Hospital and Bakar Cancer Hospital. So it is clear that proximity to the Parnassus campus has never been a dealbreaker in other institutional development projects, including, specifically, selecting major hospital sites.

It is also important to note that Mt Zion is only 2.5 miles from the Parnassus campus, and is already part of the existing shuttle network that connects all the UCSF campuses.

Mt. Zion offers unique benefits:

- It is easily accessible by public transportation, car, bicycle, pedestrian traffic, and UCSF's intercampus shuttle system.
- The site and surrounding neighborhood already includes many other UCSF facilities and UCSF-affiliated facilities including doctors offices, outpatient services, pharmacies, and medical supply businesses.
- It is an historically significant and beloved site (former Mt Zion Hospital established in1887), which also used to provide medical and emergency services in the underserved Lower Fillmore/Western Addition neighborhood before it was shuttered during the brief UCSF-Stanford merger in the 1990's
- It allows for construction to occur away from existing inpatient facilities, and solves the "empty chair" problem of having to relocate clinical services without interruption in providing care
- Zoning and accessibility of Divisadero corridor more appropriate for scale of the hospital being proposed

For these reasons, a full analysis of Mt Zion as a project alternative must be included in the EIR.

31

2. Draft EIR does not provide analysis of the alternative project of building a smaller hospital on Parnassus Campus and meeting additional capacity needs by building, remodeling, or acquiring other hospital space elsewhere in the UCSF system.

The alternative of achieving the overall project goals by building a smaller hospital on the Parnassus site and another hospital on a different site (Mt Zion or Mission Bay) was raised multiple times at community meetings, and this alternative should also be included for analysis. In this scenario, building a smaller clinical facility at Parnassus and on another UCSF site could not only effectively address the programmatic needs of the university, but also increase the reach of UCSF and accessibility to health care in San Francisco.

32

There is precedent for this approach - in fact, this scenario was the preferred alternative in UCSF's 2008 LRDP Amendment #2:

3.4.2 PROGRAM SCENARIOS FOR 650 BEDS AT MULTIPLE LOCATIONS

Various combinations of the four hospital site scenarios that could achieve the Hospital Replacement Program's desired 650-bed capacity were considered by UCSF. The combinations selected for study in this EIR are as follows.

- *250-bed hospital at Mission Bay North or at Mission Bay South; and 400-bed hospital at Parnassus East or at Parnassus West*
- *400-bed hospital at Mission Bay North or at Mission Bay South; and 250-bed hospital at Parnassus East or at Parnassus West*
- *650-bed hospital at Mission Bay South*

Although there are many possible combinations to achieve the program's 650-bed goal, decisions regarding the first hospital project, which would begin during the LRDP Phase, would establish a basic direction and planning framework for the future that would influence subsequent options. Table 3-2 presents possible LRDP Phase projects and then traces logical hospital program options for the Future Phase. The combination listed first, above, resembles the current UCSF vision, previously described, with a small hospital at Mission Bay in the LRDP Phase followed later by a hospital at Parnassus Heights developed during the Future Phase.

32 cont.

A campus-wide analysis of multi-site alternatives that address the university's current programatic needs should also be undertaken in this EIR for the CPHP.

Rationale for the two hospital alternative:

- Allows for flexibility in strain/crisis scenarios, including pandemic or natural disaster. It is important to note that during COVID-19 UCSF was forced to relocate coronavirus patients to Mt Zion *not because of insufficient bed capacity*, but to allow for infection control, patient comfort/safety, and provide space for appropriate social distancing. Having two separate acute care sites allows for institutional flexibility moving forward in an uncertain time. This redundancy would also be an enormous asset in natural disaster scenarios such as earthquakes or fires.
- Spreads out the traffic, public transportation, and population density burden throughout the city
- Provides more beds, and serves more patients, better access for marginalized communities. (including emergency services)
- Again, allows for smaller project, staged construction, which would be less disruptive for the city, adjacent neighborhoods, employees, and patients. Also significantly less environmental impact and ability to "build greener" with smaller scale buildings.
- It allows for construction to occur away from existing inpatient facilities, and solves the "empty chair" problem of having to relocate clinical services without interruption in providing care

33

SUMMARY

This draft EIR is inadequate and fails to meaningfully address major aesthetic, health, safety, and environmental impacts that arise from the proposed CPHP. It also attempts to dodge and delay addressing many potentially problematic issues by inexplicably omitting the New Hospital from most of the analyses, despite the fact that the New Hospital is the most physically and programmatically significant project of the plan. Even if a project specific EIR is forthcoming, the entire CPHP hinges on the building of the New Hospital and at the very least any data UCSF is capable of providing at this time should be included. UCSF should have to go back to the drawing board with this draft EIR. For a multi-billion, thirty year project, which will impact many thousands of residents of San Francisco, UCSF must be compelled to do better. 34

Thank you,
Lisa Kessler, MS, MD

Responses to Comments from Lisa Kessler, MS, MD

I-Kessler-1 The commenter indicates that potential environmental impacts of a project the size, scope, and duration of the CPHP are relevant and important, and expresses gratefulness for the CEQA process to ensure the UCSF is held accountable for prioritizing the health, safety, quality of life and integrity of the community and the environment. The commenter generally asserts there are omissions and errors in the Draft EIR, and asserts that UCSF attempts to overlook the significant health and environmental impacts of the CPHP. The commenter claims the CPHP is aggressive, expensive, deeply flawed, and will harm the immediate Parnassus Heights neighborhood and the entire west side of the City, and beyond.

These comments either do not address the adequacy of the Draft EIR or consist of general comments without specificity, for which no direct response is possible; Please see Master Response 1: Non-CEQA Comments, and Master Response 2: General Comments on EIR and Environmental Topics. These comment are noted and will be forwarded to decision-makers. Please also refer to the other responses provided herein.

The commenter also indicates the scale of the New Hospital will alter the views and the horizon line of Twin Peaks and Mount Sutro from almost every part of the City. Please see Please refer to Master Response 7: Aesthetic Impacts.

I-Kessler-2 The commenter provides a history of the 1976 Regents' Resolution. Please refer to Master Response 4: Space Ceiling and Population.

I-Kessler-3 The commenter indicates the importance of the space ceiling, and that it was adopted to protect the Parnassus Heights campus site and surrounding neighborhood. Please refer to Master Response 4: Space Ceiling and Population.

I-Kessler-4 The commenter requests the EIR evaluate the implications of COVID-19 on the project, including social distancing, effects of airborne pollutants on respiratory health, and the effects of COVID-19 on how the delivery of medicine and healthcare. Please see Master Response 3: COVID-19.

I-Kessler-5 The commenter questions the proposed bed capacity in light of COVID-19. Please see Master Response 3: COVID-19.

I-Kessler-6 The commenter asserts that COVID-19 will have far reaching impacts on healthcare, medical research and urban planning. Please see Master Response 3: COVID-19.

I-Kessler-7 The comment states that the proposed project would result in view blockage that the Draft EIR should identify as a significant aesthetic impact. Please refer to Master Response 7: Aesthetic Impacts.

I-Kessler-8 The comment states that, in particular, view blockage from trails in the Mount Sutro Open Space Reserve would result in a significant aesthetic impact. Please refer to Master Response 7: Aesthetic Impacts.

I-Kessler-9 The comment objects to the CPHP's proposed amendment to the UCSF LRDP to clarify that sub-objectives 1B and 1C would not apply to the New Hospital project and claims that this change would result in a significant aesthetic impact. Please refer to Master Response 7: Aesthetic Impacts.

I-Kessler-10 The comment states that the Draft EIR fails to acknowledge alleged conflicts with the San Francisco Planning Code and that these conflicts would result in a significant aesthetic impact. Please refer to Master Response 7: Aesthetic Impacts.

I-Kessler-11 The comment states that some viewpoints depicted in the Draft EIR represent location on the route of San Francisco's 49-Mile Scenic Drive and that the proposed project would therefore damage scenic resources visible from a scenic route. Please refer to Master Response 7: Aesthetic Impacts.

I-Kessler-12 The comment states that the proposed New Hospital would block views of Golden Gate Park from hikers on Mount Sutro, as well as the view of the peak of Mount Sutro from Golden Gate Park. Please refer to Master Response 7: Aesthetic Impacts.

I-Kessler-13 This comment is concerned that the analysis of air quality impacts does not take into account the additive effects of particulate matter from increased wildfires and requests that air quality data be updated to include the significant changes in regional air quality from the last 3 years, including current data from the 2020 season, from wildfires. The commenter also suggests that the EIR should include the effects of wildfire smoke in the cumulative air quality analysis, both acutely and over the long term. Additionally, the commenter recommends that construction-related air quality mitigation measures of the EIR should include the potential for modification of the construction schedule inclusive of work stoppage at times when wildfire smoke significantly impacts regional air quality.

The existing air quality in the project area is provided in pages 4.2-1 through 4.2-19 of the Draft EIR. Specifically, the existing air quality monitoring data for San Francisco for the past five years that was available at the time of Draft EIR preparation is provided in Table 4.2-1 on page 4.2-3 of the Draft EIR, while a summary of air quality index for the past five years for the entire Bay Area regions is provided in Table 4.2-2 on page 4.2-7 of the Draft EIR. As stated on page 4.2-4 of the Draft EIR, the State 24-hour $PM_{2.5}$ standard was exceeded on 21 days from 2014 through 2018 in San Francisco: 7 days in 2017 and 14 days in 2018. Many of these exceedances of the 24-hour $PM_{2.5}$ standard can be attributed to the October 2017 and November and December 2018 fires in Northern California. As stated on Draft EIR page 4.2-6, historical air district data indicate

that the San Francisco Bay Areas Air Basin experienced air quality in the red level (unhealthy) on 13 days between the years 2013 and 2017. The October 2017 fires in Northern California resulted in the federal 24-hour $PM_{2.5}$ standard being exceeded on up to seven days just in the first part of the month of October 2017 in certain counties. Even though the air district's data have not been validated yet, these levels of $PM_{2.5}$ in many counties have been the highest levels recorded in recent times. As a result, the index in several neighboring counties reached the "very unhealthy" designation, ranging from values of 201 to 300. Consequently, the air quality setting of the Draft EIR's air quality analysis contains several acknowledgements and quantifies the contribution of wildfire smoke to both the localized concentrations of particulate matter and the regional air quality index. Summarized air quality data for year 2020 is currently unavailable from BAAQMD and summarized data for 2019 became available on September 24, 2020, after publication of the Draft EIR. $PM_{2.5}$ data for San Francisco in 2019 indicates no exceedances of the State 24-hour standard for the year.

With respect to assessing cumulative air quality impacts, as lead agency, UCSF has discretion to rely on BAAQMD's recommended thresholds of significance and the use of those thresholds is supported by substantial evidence. In consideration of state and federal air quality standards, and based on its own independent review of thresholds of significance for air quality impacts recommended by the BAAQMD, UCSF and its environmental consultants have determined that BAAQMD's recommended significance thresholds are appropriate to use to evaluate potentially significant air quality impacts associated with the proposed project. BAAQMD's 2009 Justification Report develops and considers a variety of air quality thresholds and recommends thresholds of significance that BAAQMD staff believed to provide a fair share of emission reductions from land use development.

Page 5-15 of the BAAQMD's 2017 Air Quality CEQA Guidelines states the following with respect to cumulative assessment of health risks:

> A Lead Agency shall examine TAC and/or $PM_{2.5}$sources that are located within 1,000 feet of a proposed project site. Sources of TACs include, but are not limited to, land uses such as freeways and high volume roadways, truck distribution centers, ports, rail yards, refineries, chrome plating facilities, dry cleaners using perchloroethylene, and gasoline dispensing facilities. A Lead Agency should determine what the combined risk levels are from all nearby TAC sources in the vicinity of sensitive receptors.

According to the BAAQMD, the above sources are the right sources that a lead agency may use to establish the background risk when conducting a cumulative health risk assessment and these sources were considered in the Draft EIR. Contributions from cumulative global atmospheric transport of DPM or

contributions from wildfire events are not an element to be considered in the BAAQMD's methodology or relative to the 100 in one million increased cancer risk cumulative threshold.

With respect to modification of the construction schedule to include work stoppage at times when wildfire smoke substantially impacts regional air quality, such a stoppage would be the purview of the BAAQMD, which designates spare the air days within the region and has the power to impose certain restrictions

I-Kessler-14 This comment points out that multiple tables in Section 4.2 show a dramatically increased cancer risk during construction from airborne particulate matter for "Resident – Offsite Receptor," with a reduction to "less than significant" impact with mitigation and refutes the validity of the indicated risk reduction with implementation of mitigation. The commenter is also concerned that the analysis does not consider the full chronological extent of cumulative exposure to toxic air contaminants.

Mitigated health risk from construction activities were calculated using the CalEEMod model developed by the California Air Pollution Officers Association (CAPCOA) as described on page 4.2-25. The method of mitigation assumed use of construction equipment with EPA-certified Tier 4 Final engines as described in CPHP Mitigation Measure AIR-1a: Clean Construction Equipment for CPHP Projects on Draft EIR page 4.2-29. The CalEEMod output files are presented in the Appendix AIR on page 1,088 for the Initial Aldea Housing Densification, page 1,115 for the New Hospital, page 1,148 for the Irving Street Arrival, and page 1,175 for construction of the RAB. Taking the output for the New Hospital as the primary example, unmitigated maximum exhaust emissions of PM_{10} are estimated by the model to be 0.1317 tons in year 2026, while the mitigated emissions are estimated to be 0.0218 tons in 2026. This represents an 83 percent reduction in exhaust PM_{10} emissions with using off-road equipment with Tier 4 certified engines. This reduction is commensurate with USEPA estimates that by implementing the federal Tier 4 standards, NO_x and PM emissions will be reduced by more than 90 percent.[5] Reductions in increased cancer risk are consistent with the reduction in diesel emissions from off-road diesel equipment.

With respect to the methodology of construction-related health risks as it affects duration, as stated in the Draft EIR on page 4.2-47, Table 4.2-11, Table 4.2-12, Table 4.2-13 and Table 4.2-14 present the unmitigated HRA results for existing receptors due to construction that represent a 30-year exposure which begins at the start of construction. This methodology compares to a project-level contribution threshold specified by BAAQMD of 10 in one million. Cumulative health risk impacts are addressed on pages 4.2-69 through 4.2-71 of the Draft EIR.

5 USEPA, "Clean Air Nonroad Diesel Rule: Fact Sheet," May 2004.

I-Kessler-15 This comment takes issue with the feasibility of watering of construction site as a mitigation for control of fugitive dust in light of the size of the construction area, the quantity of water required, the potential for water to disseminate contaminants, and the need to conserve water during drought conditions.

As stated on Draft EIR page 4.2-22, studies have shown that the application of best management practices (BMPs) at construction sites substantially control fugitive dust (WRAP, 2006) and individual measures have been shown to reduce fugitive dust by anywhere from 30 percent to 90 percent (BAAQMD, 2009). BAAQMD has identified a number of BMPs to control fugitive dust emissions from construction activities (BAAQMD, 2017a). The analysis in the Draft EIR assumes that UCSF would implement all BAAQMD Best Management Practices (BMPs) and not just watering for individual construction projects, which is the basis for determining the significance of air quality impacts due to fugitive dust emissions.

It should also be noted that the City of San Francisco has adopted San Francisco Health Code Article 22B and San Francisco Building Code Section 106.A.3.2.6, which collectively constitute the Construction Dust Control Ordinance (adopted in July 2008). The ordinance requires that all site preparation work, demolition, or other construction activities within San Francisco that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil comply with specified dust control measures. These control measures almost always include watering of construction sites. Dust suppression activities may include watering of all active construction areas sufficiently to prevent dust from becoming airborne; increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour. Implementation of construction site watering is conducted regularly for all sizeable construction sites in the City of San Francisco pursuant to the Construction Dust Control Ordinance and the element of twice daily watering identified in CPHP Mitigation Measure AIR-1b: Best Management Practices for Controlling Particulate Emissions is feasible and required by law for most construction projects.

With respect to the quantity of water that would be required for dust control, there is no reasonable way to quantify it at this time as it will depend on the size of the construction site, the construction schedule, and numerous other factors. Note that the construction of projects on the campus site would be spread over time and the entire campus site would not be graded or disturbed at one time, requiring excessive amounts of water for dust control.

Regarding the concern that contaminants may be discharged off-site as a result of watering for dust control, that is not likely to occur for two reasons: first, water for dust control is applied in the right amounts so that it does not result in off-site runoff, and second, construction sites that are more than 1 acre in size are subject to NPDES regulations which require that BMPs are implemented to control the

release of any hazardous materials on construction sites and the discharge of any sediment into storm drains and/or other receiving waters. Refer to Impact HYD-1 of Section 4.9 Hydrology on Draft EIR pages 4.9-10 and 4.9-11 for a discussion of measures used to control sediments in runoff and storage and use of hazardous materials during construction to prevent discharge of pollutants into stormwater.

With respect to the use of water as a dust control measure during drought years, the State may impose restrictions on the source of water for such uses. As an example, the City of San Francisco will require some projects to use reclaimed water pursuant to article 21, section 1100 et seq. of the San Francisco Public Works Code in its Dust Control Ordinance. However, the source of water would not affect the effectiveness of use of water as a dust control measure.

I-Kessler-16 This comment takes issue as to the characterization of sensitive receptors to the east of the campus site being substantially buffered by "varying depths of open space," as this neighborhood is closest to the construction activity and operations of the campus site facilities, and demands that air quality, noise, and vibration impacts on the residences on Edgewood Avenue, Willard Avenue, and Woodland Avenue be assessed and quantified.

The description of the sensitive receptors to the east of the campus site, referred to in this comment, is on Draft EIR page 4.2-12 in the "Existing Setting" discussion of the Air Quality section. Currently, there is a vegetated hillside between the campus site and residences to the east, including those on Edgewood Avenue. This vegetated hillside provides approximately 200 feet of buffer between these residences and any structures on the campus site to the west. The Draft EIR acknowledges that the Surge parking lot is proposed as a construction staging area, and is located as close as 20 feet from sensitive land uses (Draft EIR page 4.11-24).

With respect to assessment of potential air quality impacts on the residences to the east, as stated on Draft EIR page 4.2-26, a 20-meter receptor grid co-located with the City of San Francisco's Community Risk Reduction Plan Heath Risk Assessment grid was modeled using a receptor height of 1.8 meters (breathing height). The lateral extent of this modeling effort extended 1,000 feet from the project boundary, consistent with BAAQMD guidance, and included receptors east of the Parnassus Heights campus site to Cole Street. Therefore, residences on Edgewood Avenue, Willard Avenue, and Woodland Avenue were considered in the assessment of health risk. The health risk analysis then identified the maximally impacted receptor for each evaluation based on dispersion modeling that included meteorology and topography. Health risk impacts from construction are presented in Table 4.2-11, Table 4.2-12, Table 4.2-13 and Table 4.2-14 of the Draft EIR which indicate the increased cancer risk for the maximally impacted receptor within the receptor grid identified.

With respect to noise and vibration impacts from construction for receptors in this area, these receptors would be primarily impacted by construction of the New Hospital which is analyzed at a programmatic level in the Draft EIR, as for the whole CPHP, on pages 4.11-16 through 4.11-19 of the Draft EIR. CPHP Mitigation Measures NOI-1a, NOI-1b, and NOI-1c are identified for these impacts which were determined to be significant and unavoidable. Construction vibration impacts are also analyzed at a programmatic level, as for the whole CPHP, on pages 4.11-30 through 4.11-32 of the Draft EIR.

I-Kessler-17 This comment cites the significant and unavoidable impact finding of the Draft EIR with respect to regional emissions of respirable particulate matter (PM_{10}), and raises concern that emissions of other pollutants may also be significant, and requests a discussion of relevant data and outcome information, the specific health effects (immediate and long term) of this anticipated exceedance of air quality standards. This includes but is not limited to: respiratory effects on vulnerable populations and also long term effects such as increased cancer risk and neurocognitive and developmental effects, especially for children growing up in this neighborhood who will have a cumulative exposure to unsafe air at critical developmental stages.

Operational emissions of criteria air pollutants from implementation of the full CPHP are quantified and compared to significance criteria in Table 4.2-9 on page 4.2-35 of the Draft EIR. The significance criteria used in the Draft EIR have been put forth by the BAAQMD, and are based on new source review emission limits for particulate matter and offset requirement limits for non-attainment pollutants established by the US EPA. As can be seen from Table 4.2-9, emissions of ozone precursors of reactive organic gases (ROG) and oxides of nitrogen (NO_x) as well as fine particulate matter ($PM_{2.5}$) from CPHP implementation would increase compared to existing conditions. However, the increases would not exceed the BAAMQD significance criteria. Increases that are below the significance criteria would not result in a substantial effect on air quality in the air basin, including the air quality in the area adjacent to the campus site.

The only non-attainment criteria pollutant emissions that would exceed the applicable BAAQMD criterion would be PM_{10} emissions. The source of the estimated PM_{10} emissions is motor vehicle trips that would increase as a result of CPHP implementation. These emissions would not be localized but would occur on roadways throughout a very large region from where UCSF students, employees, patients and visitors would make trips to and from the campus site. This criteria pollutant analysis was therefore a regional analysis in that it considered the motor vehicle trips throughout the region that would be generated by project improvements.

With respect to the specific health effects (acute and chronic) of the significant and unavoidable regional PM_{10} emissions impact identified in the Draft EIR, the Draft EIR dedicates an entire Health Impact Assessment (HIA) analysis on pages 4.2-37 through 4.2-42. The full HIA is also presented in Appendix HIA. Please refer to these sections of the Draft EIR for the requested discussion of the specific health effects from increased PM_{10} emissions due to CPHP implementation.

Please note that the Draft EIR includes an analysis of likely health risk and localized concentrations of $PM_{2.5}$. Please see Draft EIR pages 4.2-45 through 4.2-63.

I-Kessler-18 The commenter asserts that significant environmental health effects will occur from unhealthy air effects on nearby sensitive receptors, and that State and federal air quality standards are being violated. Please also see Response I-Kessler-17, above.

I-Kessler-19 The commenter indicates that Hazards and Hazardous Materials section discussion of sensitive receptors omits mention of the residences on the east boundary of the campus site. The comment is noted; please refer to Section 8.5 of this Comments and Responses document for the proposed edit to this text to acknowledge off campus residences on the east boundary of the campus site as sensitive receptors.

The commenter also requests the effects of hazardous materials during construction of the New Hospital on the off-campus residences along the eastern boundary of the campus site be analyzed and disclosed. All potential impacts associated with construction and operation of the CPHP to off-campus residences (including those along eastern boundary of the campus site) are adequately disclosed in the Draft EIR. With respect to the potential for excavation, construction or demolition activities under the CPHP to encounter hazardous materials, including those identified by the commenter [asbestos, mercury, polychlorinated biphenyls (PCBs) and lead], this is addressed in the Draft EIR Impact HAZ-1. As described on Draft EIR Impact HAZ-1, page 4.8-15, existing federal, State, and local regulations require demolition or renovation activities that may disturb or require the removal of materials that consist of, contain, or are coated with asbestos containing materials (ACM), lead based paint (LBP), PCBs, mercury, and other hazardous materials to be inspected and/or tested for the presence of hazardous materials. Further, all hazardous materials must be managed and disposed of in accordance with applicable laws and regulations.

The Draft EIR also identifies CPHP Mitigation Measure HAZ-1, which provides the appropriate mechanisms to ensure that an Excavation Management Plan would be prepared, and that the California Air Resources Board (CARB) Airborne Toxic Control Measures (ATCM) would be implemented. In addition,

CPHP Draft EIR CPHP Mitigation Measure HAZ-4 includes preparation of a Soil Management Plan that would include measures to address protocols for identifying, handling, and characterizing suspect contaminated soils, and if needed, removal and remediation, in accordance with the applicable overseeing agency requirements.

For all the reasons listed, compliance with the applicable federal and State regulations, along with implementation of mitigation measures identified in the Draft EIR, would ensure the impact associated with potential exposure to hazardous building materials, and/or previously unknown potentially contaminated soils, would be less than significant.

I-Kessler-20 The commenter asserts that the Draft EIR does not address soil and groundwater contamination effects associated with demolition of existing medical/research sites and construction debris. However, as described in Response I-Kessler-19, above, the Draft EIR discloses potential impacts associated with excavation, construction and demolition activities under the CPHP, including potentially contaminated building materials and/or previously unknown soil contamination. The Draft EIR appropriately references applicable regulatory mechanisms, along with implementation of mitigation measures, to ensure these impacts would be less than significant.

The commenter is also referred to Draft EIR Section 4.9, Hydrology and Water Quality. Impact HYD-1 addresses potential impacts associated with construction on the potential to violate water quality standards or waste discharge requirements, or degrade surface or groundwater quality. In accordance with the National Pollutant Discharge Elimination System (NPDES) Construction General Permit (CGP), UCSF would be required to prepare and implement a Stormwater Pollution Prevention Plan (SWPPP) for proposed development activities to minimize water quality impacts during construction and demolition. The SWPPP will identify pollutant sources within the construction area and recommend site-specific best management practices (BMPs) regarding control of sediments in runoff and storage and use of hazardous materials to prevent discharge of pollutants into stormwater. Compliance with the NPDES CGP permit regulations and UCSF's Storm Water Program would prevent any substantial degradation of water quality during construction of any development associated with the CPHP.

The commenter also references watering sites twice a day. This is one of the suite of measures recommended by the Bay Area Air Quality Management District (BAAQMD) and included in CPHP Mitigation Measure AIR-1b in Draft EIR Section 4.2, Air Quality, for controlling fugitive dust emissions during construction. This is a common and effective measure for controlling construction dust. The measure would only involve use of water in an amount to suppress dust, and would not involve excess water that would create runoff from the sites, or contribute to soil or groundwater contamination. When considering this factor,

and the above-described SWPPP that would be implemented during construction, no adverse secondary effects associated with construction site watering are anticipated.

I-Kessler-21 The commenter indicates it is unclear whether the Draft EIR analysis includes effects of runoff from watering the construction sites. Please refer to I-Kessler-20, above.

I-Kessler-22 The commenter incorrectly asserts that the New Hospital is omitted from the Draft EIR Land Use and Planning section. The Draft EIR appropriately addressed the New Hospital programmatically in Impact LU-1 on pages 4.10-10 to 4.10-11, and page 4.10-14; and in Impact LU-2, on pages 4.10-16 to 4.10-17. The New Hospital will also be addressed in the forthcoming project-level EIR for the New Hospital. Please also see Master Response 13: Land Use Impacts.

The commenter also indicates if UCSF cannot provide the necessary information for the New Hospital at this stage, they should be required to withdraw the current Draft EIR until they are able to provide all relevant information. The comment is noted, however, as explained above, the Draft EIR appropriately addresses land use impacts of the New Hospital programmatically in Draft EIR Section 4.10.

I-Kessler-23 The comment asserts that the parking and traffic analyses in the Draft EIR insufficiently address how the population increase with CPHP implementation will increase vehicle demand on the roadway network. As discussed in Master Response 19, a project's effect on automobile delay shall not constitute a significant environmental impact under CEQA. As such, the capacity of the roadways around the campus site is not a CEQA concern and transportation impacts based on congestion and vehicular delay are appropriately not analyzed in the Draft EIR. Master Response 19 further discusses the secondary effects of increased vehicular travel, including concerns regarding public safety and localized air quality effects. Intersection operations analysis was included in the Draft EIR Appendix voluntarily and for informational purposes.

The comment also asserts that the construction of projects under the CPHP could have impacts on traffic, accessibility, and safety. The Draft EIR does find that construction impacts would be potentially significant. Nonetheless, the Draft EIR includes three mitigation measures to reduce the impacts of construction: construction contractor(s) shall be required to prepare a traffic control plan, the construction control plan will be required to include methods to encourage construction workers to walk, bicycle, carpool, or use transit to access the campus, and UCSF shall provide project construction updates for adjacent residents and businesses. These mitigation measures are discussed in Impact TRANS-5 on Draft EIR pages 4.15-49 to 4.15-51.

I-Kessler-24 The comment asserts that analysis of vehicle demand should include additional streets beyond those included in the transportation appendix. Please see Response I-Kessler-23 above.

I-Kessler-25 The comment asserts that travel behavior assumptions are inadequate due to assumptions made about mode share in a parking constrained environment. This comment is addressed in Master-Response 17. The comment also asserts that the project will result in an increase in cars parked on local streets. This comment is addressed in Master Response 18. The comment asserts that the Project's off-street parking will be reserved for certain employees at UCSF, causing others to pay for ride-share. Allocation of parking to different employees and the cost of ride share to employees does not represent a change to the physical environment, and as such is not a CEQA concern. Additionally, the CPHP is not concerned with how parking permits will be distributed among staff, and as such this comment does not pertain to project elements. The comment is noted.

I-Kessler-26 The comment requests clarification about the bicycle commute mode share of employees presented in Table 4.5-18 of the Mode Choice subsection in the Draft EIR found on pages 4.5-29 to 4.5-33. As stated in the section, 6percent of all faculty, staff, and students as an aggregate group commute to/from the Parnassus Heights campus site by bicycle. Survey participants are asked to identify "What mode(s) of travel do you typically use to get to work?". Of the existing average daily population of 11,078 faculty, staff, and students presented in Table 4-12-2 on page 4.12-7 of the Draft EIR, 6 percent represents an average of 665 daily bicycle commuters. Master Response 17 provides additional discussion of methods used in mode share assignments.

I-Kessler-27 The comment asserts that the impact analysis of emergency access may not include ambulances in its impact analysis of emergency access. As discussed in Master Response 21, the designation of "emergency vehicles" used in the analysis includes ambulances. The comment also asserts that potential changes in the number of emergency vehicles accessing the campus site as a result of the New Hospital should be included in the analysis, and that the effects of that change on local traffic should be analyzed. Refer to Master Response 21 for why the increase in the number of emergency vehicles due to the New Hospital and the effects of ambulances on local traffic are not analyzed in the Draft EIR.

I-Kessler-28 The comment asserts that the Draft EIR does not adequately analyze or disclose the CPHP's effects on public transit service, specifically service provided by San Francisco Muni. Refer to Master Response 16 for a discussion of why an analysis of the CPHP's effects on transit capacity is not required when assessing environmental impacts. In addition, refer to Master Response 20 for additional discussion of why Muni operational issues are not a CEQA concern, and therefore analysis of these effects is not required in the Draft EIR. Additionally, the comment asserts that the Draft EIR does not adequately assess the funding

effects of COVID-19 on Muni. A response to this comment is presented in Master Response 20 and Master Response 3: COVID-19.

I-Kessler-29 The commenter disputes Alternative 1B: No Project – Development under the 2014 LRDP being addressed as a no-project alternative. Please see Master Response 5: EIR Alternatives.

I-Kessler-30 The commenter requests the EIR address alternatives involving siting the New Hospital at UCSF location different than the Parnassus Heights campus site, and the possibility of a reduced project at the Parnassus Heights campus site that is supplemented with development at other UCSF sites. Please see Master Response 5: EIR Alternatives.

I-Kessler-31 The commenter asserts the Draft EIR does not provide a reasonable analysis of an alternative involving building a New Hospital at Mount Zion. Please see Master Response 5: EIR Alternatives.

I-Kessler-32 The commenter asserts the Draft EIR does not provide a reasonable analysis of an alternative involving building a smaller New Hospital at the Parnassus Heights campus site and meeting capacity needs by building, remodeling, or acquiring other hospital space elsewhere in the UCSF system. Please see Master Response 5: EIR Alternatives.

I-Kessler-33 The commenter request the EIR provide a campus wide analysis of multi-site alternatives that address the University's current programmatic needs. Please see Master Response 5: EIR Alternatives.

I-Kessler-34 The commenter claims the Draft EIR is inadequate and fails to meaningfully address major aesthetic, health, safety, and environmental impacts that arise from the proposed CPHP. Please refer to the responses above that address the specific issues raised by the commenter on these topics.

The commenter also asserts that UCSF attempts to avoid and delay addressing problematic issues by omitting the New Hospital from most analyses. As discussed in the Draft EIR Chapter 1, Introduction on page 1-7, a program EIR has been prepared for the CPHP that establishes a framework for tiered or project-program components. Accordingly, the Draft EIR provides a program-level analysis of the environmental impacts that could result from the development of the entire space program under the CPHP, including from the New Hospital, and identifies Plan-level mitigation measures to reduce potential significant effects of the CPHP. Further details of the New Hospital are being developed, including the specific design. Those elements of the New Hospital will be the subject of a subsequent project-specific environmental review when more details become available. It is anticipated that sufficient detail will be available to publish a project-level Draft EIR for the New Hospital in the summer of 2021.

Dear Chancellor Hawgood and U.C. Regents,

I represent the estate of Leon Bibel, who was Bernard Zakheim's assistant on the History of Medicine Frescoes in the Toland Hall Auditorium in UC Hall.

Attached below is a pen and ink drawing done by Leon Bibel of Bernard Zakheim while Zakheim was working on a fresco. 1

The **UCSF Comprehensive Parnassus Heights Plan and its Draft EIR – State Clearinghouse Number 2020010175** is an ill-advised plan. 2

The work created during the Federal Art Project and other divisions of the WPA is an important reminder of when government actually WORKED for the benefit of its citizens. To not save them, or to make the descendants of the artist responsible for removing them is incomprehensible. 3

Can a more reasonable solution be worked on? These projects are part of our history as a nation. The brilliance of the Roosevelt administration officials is so clear. They realized that artists were in tremendous jeopardy when unemployment was at 25%, and created various programs…art instruction, the decoration of federal buildings, theater companies, silk screen poster-making as a way of getting messages to the people…just to name a few. 4

There was a time that destruction of buildings and artifacts of other eras was greeted with a shrug.

I thought that we had learned our lesson, given the huge number of excellent exhibitions of WPA paintings and prints in great museums throughout this country as well as in places like the British Museum. 5

Then, there is the celebration of murals in major spaces like the Brooklyn Museum, rescued and installed, and a wonderful example of mid-century abstraction. Here is the description from the Brooklyn Museum website:

The exceptional murals installed in this area, executed by the pioneer American abstractionists Ilya Bolotowsky, Balcomb Greene, Paul Kelpe, and Albert Swinden, were commissioned by the Works Progress Administration/Federal Art Project in 1936 for Brooklyn's Williamsburg Houses, one of the earliest and best public housing projects in New York City.

Please agree to at least consider the two current alternatives. 6

My very best,
Phyllis Wrynn
Park Slope Gallery
Brooklyn, NY

Responses to Comments from Phyllis Wrynn

I-Wrynn-1 The commenter includes a drawing done by Leon Bibel of Bernard Zakheim while Zakheim was working on a fresco. The comment is noted; no response is required.

I-Wrynn-2 The commenter makes a general assertion that the UCSF Comprehensive Parnassus Heights Plan and its Draft EIR is an ill-advised plan. Due to lack of specificity; no response is required. Please see responses to specific comments raised by the commenter that follow.

I-Wrynn-3 The commenter states that not saving the murals or making descendants of the artists responsible for their removal is incomprehensible. Please refer to Master Response 11: Toland Hall Murals.

I-Wrynn-4 The commenter questions whether a different solution can be developed and notes the historical significance of the Toland Hall murals. Please refer to Master Response 11: Toland Hall Murals.

I-Wrynn-5 This comment describes the history of publicly-supported art in the United States in the mid-twentieth century and describes other publicly-supported murals. Please refer to Master Response 11: Toland Hall Murals.

I-Wrynn-6 The comment asks UCSF to consider the alternatives in the Draft EIR. Please refer to Master Response 11: Toland Hall Murals.

Public Comment on CPHP Draft EIR
Attn: Diane Wong, Environmental coordinator

I want to register my strong dismay at the preliminary plans for UCSF's CPHP. The size of the planned expansion was decided upon by UCSF while completely ignoring UCSF's space ceiling commitment to the surrounding community, even though the ceiling was reaffirmed in the 2014 new hospital plan. Having single-handedly declared the Space Ceiling irrelevant, UCSF has had the nerve to engage in "community outreach", asking whether neighbors would like 8 or 10 more bike racks, to serve the 8000 or so additional people on campus, when the real issues are that the plan is too big for the Parnassus campus and the neighborhood, it reneges on past agreements, and is limited in planning how to deal with the huge increase of demand upon the infrastructure, neighborhoods, and environment that the new building project would engender. 1

1. Noise and air pollution.
The EIR does discuss the many ways air and noise pollution will be increased by the construction and running of the new buildings, but does not address how this air pollution will affect the neighborhoods closest to UCSF, on Edgewood, Willard, Farnsworth, and 5th Ave. The EIR notes that the Sutro Reserve gives a "buffer" to the neighbors on Edgewood, but fails to acknowledge that part of the new hospital will be built within that "buffer zone", and that construction will be staged in the Surge Parking lot, which is separated from homes by a small wooden fence, no trees. The EIR must address how construction will affect the air and noise quality for neighbors on Edgewood. 2

After construction, the new hospital is planned to be within a few feet of the western side of Edgewood houses, and I would like to know what effect of air and noise pollution will be for them, in addition to what serious steps UCSF plans to mitigate those effects.

2. Forest and Green Space
The planned new hospital building in the CPHP will cut directly into the hillside of Sutro Forest to the west of Edgewood Ave., destroying Green Space and paths that are frequently used by visitors from all over the city. UCSF has said that it will replace the Green Space by taking out the Surge Parking lot, after construction is over. As construction is planned to take place over 30 years, please forgive me if I find this a specious argument. In any case, one cannot make up for the destruction of green space in one area, by its extension in another. The trees and animal habitats will be destroyed permanently, and the restoration of green space thirty years later in a separate spot will not in any meaningful way mitigate that loss. 3

3. Aesthetics
Looking through the draft EIR, the photos of how the UCSF project will impact city views and shadows is jawdropping. The view from Golden Gate Park to Sutro Tower is completely blocked by the new hospital. In addition, light and views from the hiking trails in Sutro Forest, where light filters through the trees, and glimpses of the north bay are often visible, will be totally blocked and cut out by the planned structure. This destruction of views goes beyond individual neighbors, and affects residents all over the city, not to mention those who 4

visit from afar.
In addition, the shadows that the new hospital is projected to cast go far beyond the immediate neighboring streets. Particularly striking, Grattan Playground, frequented by families and children from all over the neighborhood, and home to a cooperative preschool, will experience a near total shadowing in the early evening. I have often frequented this park in the early evening with my children, getting the last bit of sunlight and activity before nightfall, and am shocked that the UCSF project would so thoroughly wreck that prospect. 4 cont.

4. Traffic, parking, public transportation
Three streets connect the neighborhood to the east of the Parnassus Campus to the neighborhood to the west: Parnassus, Carl and Frederick. All three are heavily trafficked. The CPHP plans to bring about 8000 new people to campus daily, not to mention new patients, but has very little idea of how people will get there, or where they will park, if they bring their own cars. Even if UCSF manages to greatly mitigate individual drivers, a quarter of that number would mean at least 2000 new cars coming into the neighborhood each day. The proposed parking in no way meets the projected need, and neighbors will be inundated by cars parked throughout the surrounding neighborhoods. In addition, because housing is planned to be the last phase of the building (20 years in to the process), new employees will have to come from far away, perhaps from surrounding towns and cities, putting great pressure on the current transportation infrastructure. The EIR fails to meaningfully address how UCSF plans to manage the new influx of people and vehicles. 5

5. Alternative building spaces
There is no sign that UCSF has meaningfully considered alternatives to building an additional 1.5 million square feet in a small campus footprint, in what is otherwise a residential neighborhood. The Mt Zion or Mission Bay Campuses provide larger spaces in mixed use neighborhoods that could surely be considered for new hospitals and offices. We are all meeting and discussing via Zoom these days, and distance should be no barrier to collaboration. Why the insistence on building a skyscraper, that dwarfs all UCSF's current buildings, in a residential neighborhood? This project is just not in the best interests of the city, or even of UCSF. With so many campuses all over the city, why cram everything here? I would like to see the reasoning and evidence that other locations were considered and explored. 6

6. Covid-19 changes in the way medicine is practiced
We have recently come to understand what will be asked of the medical profession in this new world of pandemics and rolling disasters. The idea that UCSF would want to bring all patients into one huge hospital, regardless of infection vectors, goes against everything we have learned since March. UCSF itself has found that it needed separate hospitals to treat victims of Covid-19 and its Covid negative patients. Why now push to build one enormous hospital? 7

UCSF medical school, research facility and clinical care are a jewel in the crown of San Francisco. There is not a resident who does not appreciate the talent, dedication, and expertise this institution brings to our community. We are not against UCSF as an institution, nor even against UCSF building a new hospital. However, the size and scope of this project, so outsized compared to projects proposed before it, is not in keeping with the best interests of the neighborhood, the city, or UCSF itself. Please consider altering the UCSF CPHP to fit the prior agreed upon Space Ceiling. 8

All the best,
Sarah Smith Jones
190 Edgewood Ave., SF, CA.

Responses to Comments from Sarah Jones

I-Jones-1 The commenter asserts that the planned expansion ignores UCSF's space ceiling commitment. Please see Master Response 4: Space Ceiling and Population.

The commenter also asserts that the CPHP is too big for the Parnassus Heights campus site and its neighborhood, reneges on past agreements, and is limited in planning how to deal with the increase in demand upon the infrastructure, neighborhoods and the environment. This comment does not address the adequacy of the Draft EIR; consequently, no response is required. However, the comment has been noted and will be forwarded to decision-makers. Please also refer to the other responses provided herein.

I-Jones-2 This comment states that the Draft EIR does not address how air pollution will affect the neighborhoods closest to UCSF, on Edgewood Avenue, Willard Street, Farnsworth Lane, and Fifth Avenue; does not acknowledge that part of the New Hospital will be built within the "buffer zone" identified in the Draft EIR; and that construction will be staged in the Surge parking lot, which is adjacent to these residences with no vegetative separation. The commenter requests that the EIR should address how construction will affect the air and noise quality for neighbors on Edgewood Avenue and, once constructed, what the effect of air and noise pollution from the New Hospital will be for these residences, in addition to what steps UCSF plans to mitigate those effect.

The response to much of this comment can be found in Response I-Kessler-16, above. Specifically, Response I-Kessler-16 addresses the characterization of the buffer in the existing setting section of the Draft EIR, the air quality and noise impacts with respect to the use of the Surge parking lot as a staging area and the methods by which the localized air quality impacts for residences of this neighborhood were considered in the Draft EIR. Localized air quality impacts are addressed on Draft EIR pages 4.2-45 through 4.2-63.

As stated in Section 4.11 Noise and Vibration on page 4.11-24 of the Draft EIR, the potential staging at the Surge parking lot would be located as close as 20 feet from the nearest off-site receptors (on Edgewood Avenue). Emissions from the staging area would be limited to starting of off-road equipment prior to deployment to the work sites or trucks delivering materials and would be reasonably expected to be of brief duration and not a substantial source of $PM_{2.5}$ emissions. CPHP Mitigation Measure NOI-1a: Construction Noise Control Measures would require shielding of the staging area where adjacent sensitive receptors have direct line-of-sight with loading and delivery activities which would reduce off-site noise impacts and off-site transport of fugitive dust emissions as would the watering requirement of CPHP Mitigation Measure AIR-1b. Localized noise impacts with respect to operational noise are programmatically addressed on Draft EIR pages 4.2-26 through 4.2-33.

Please also note that air quality and noise impacts from the operation of the New Hospital, including any potential impacts on the neighborhood to the east, will be analyzed and presented in a project-level EIR that will be prepared for that project, and if the programmatic CPHP mitigation measures are not adequate to address the impacts of the project, additional project-specific mitigation measures will be developed to mitigate the impacts of that project.

I-Jones-3 The commenter asserts that the proposed New Hospital would cut directly into the adjacent hillside in the Reserve, and destroy Green Space, including trees and animal habitat, and paths. The CPHP Draft EIR addressed all potential environmental impacts associate with the potential encroachment of the New Hospital into the adjacent reserve, including impacts to biological resources and recreation, and mitigated those impacts to the extent feasible. It should be noted that UCSF will consider replanting trees in the landscaping plans for each specific project under the CPHP, including the New Hospital, when detailed designs become available. Furthermore, as discussed in the Draft EIR Section 4.15, Recreation, page 4.14-7, under the CPHP, UCSF would maintain Reserve trail access to and from the Farnsworth Lane trailhead.

Please also note that while CPHP construction may occur intermittently over the duration of the CPHP, construction of the New Hospital would occur over a duration of approximately 6.5 years (mid 2023 to beginning of 2030). As part of the project approvals for the CPHP, the proposed LRDP Amendment will include revisions to functional zones, include the adjustment to the Reserve boundary, and the proposed open space swap. When the New Hospital is designed, if it is determined that this project would not result in encroachment into the Reserve, UCSF would then reverse that change to the Reserve boundary.

Lastly, the commenter asserts that the Surge parking lot would be removed. The commenter is referring to a prior concept that was briefly under consideration but later rejected. However, as illustrated in the Draft EIR, Chapter 3, Project Description, page 3-40, an approximate 0.40-acre of undeveloped land between the Surge and Woods parking lots would be redesignated from Support to Open Space Reserve.

I-Jones-4 The comment states that the proposed project, and particularly the New Hospital would result in substantial view blockage and substantial shading of Grattan Playground. Please refer to Master Response 7: Aesthetic Impacts, and Master Response 9: Shadow Impacts.

I-Jones-5 The comment asserts that the Draft EIR does not adequately assess the CPHP's transportation impacts due to constrained roadway capacity in the vicinity of the campus site. As discussed in Master Response 16, a project's effect on automobile delay shall not constitute a significant environmental impact under CEQA. As such, the potential constrained capacity at and around the campus site

is not a CEQA concern and transportation impacts based on congestion and vehicular delay are appropriately not analyzed in the Draft EIR.

The comment states that the CPHP includes inadequate parking, which would lead to increase in the number of parked cars on nearby streets. As stated on page 4.15-33 and in Master Response 18, parking is not a CEQA significance topic, and additional discussion of parking supply and demand in the campus site vicinity is not required.

The comment also asserts that the analysis fails to account for how the phasing of the new housing under the CPHP will affect transportation impacts. The comment asserts that employees will travel longer distances and have greater impacts on transportation infrastructure because campus housing will be constructed in a later phase of the CPHP. As noted in Master Response 17, the travel demand and VMT analysis presented in the Draft EIR is based on commute patterns of existing employees, students, patients, and visitors. The Draft EIR transportation impact analysis of the project assesses the potential impacts of the Initial Phase projects and the CPHP, but does not assess project elements in a temporal or sequential fashion. As such, that new campus housing is included in latter stages of the CPHP does not affect the findings of the VMT analysis, of which populations, travel demand, and origins/destinations are all inputs. Thus, the analysis presented in the Draft EIR is both accurate and complete.

I-Jones-6 The commenter asserts the Draft EIR should include alternatives at the Mount Zion and Mission Bay campus sites. Please see Master Response 5: EIR Alternatives.

I-Jones-7 The commenter questions the size of the New Hospital in light of COVID-19. Please see Master Response 3: COVID-19.

I-Jones-8 The commenter indicates that the size and scope of the project is not in keeping with the best interests of the neighborhood, the city or UCSF; and requests UCSF to alter the CPHP to fit the prior agreed upon space ceiling. This comment does not address the adequacy of the Draft EIR. However, the comment has been noted and will be forwarded to decision-makers.

Re: Comment on Draft Environmental Impact Report, UCSF Comprehensive Parnassus Heights Plan (SCH 2020010175)

To Whom It May Concern,

Our family has lived in the Parnassus Heights neighborhood of San Francisco since 2008. We have four young children aged 7 to 14. Our home is located adjacent to the UCSF Parnassus campus – our kids can see the campus buildings and hear the noise from the campus power plant through their bedroom windows.

We submit the following comments on UCSFs Draft Environmental Impact Report ("DEIR") for its Comprehensive Parnassus Heights Plan ("CPHP").

1. We incorporate by reference into this letter the comments contained in the CPHP DEIR Richard Drury of Lozeau Drury LLP, Ed Leonard (resident), Robert C. Goodman (resident), and Dr. Lisa Kessler (resident). 1

2. The Space Ceiling prohibits UCSF from building the additional square footage called for in the CPHP. 2

> *"The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and **this limit shall be permanent."***
>
> *–Resolution of the Board of Regents of the University of California, May 21, 1976 (Exhibit A)*

The CPHP hinges on UCSF reneging on the Regents promise to never exceed 3.55 million square feet of development at the Parnassus Heights campus. Both UCSF and current UCSF Chancellor Sam Hawgood reaffirmed this promise in 2014.

The Space Ceiling is legally enforceable under the doctrines of promissory and equitable estoppel. Additionally, the violation of the Space Ceiling policy is a significant impact under CEQA and must be further analyzed. 2 cont.

3. The DEIR does not consider the impacts of COVID-19. 3

4. The DEIR project alternatives analysis is deficient. 4

5. The DEIR improperly delays the analysis of the hospital. 5

6. The DEIR does not adequately analyze the project's impacts on the following: aesthetics, wind, shadows, land use, public services, biological resources, air quality, and transportation. 6

For the reasons outlined above and incorporated by the reference herein, we believe that the DEIR is so materially flawed and inadequate that proper public review and comment is impossible. Therefore, we believe that UCSF must prepare a new DEIR and recirculate it for comment. 7

We also believe that UCSF is prohibited from building the additional square footage called for in the CPHP due to the Board of Regents 1976 resolution which permanently limits the amount of space that UCSF can build at the Parnassus Heights campus. 8

Thank you for considering these comments and the comments incorporated by the reference herein. We ask that you include this letter in the record of proceedings for this project.

Sincerely,

Scott Jacobs Jing Jacobs

Responses to Comments from Scott and Jing Jacobs

I-Jacobs-1 The commenter indicates incorporation by reference into the comment letter the comments raised by Richard Drury of Lozeau Drury LLP, Ed Leonard, Robert C. Goodman, and Dr. Lisa Kessler. For responses to these comment letters, please see the responses to Comment Letters O-LD1, O-LD2, LD3, I-Leonard, I-Goodman, and I-Kessler.

I-Jacobs-2 The commenter asserts that the space ceiling prohibits UCSF from building the additional square footage called for in the CPHP. Please refer to Master Response 4: Space Ceiling and Population.

I-Jacobs-3 The commenter asserts the Draft EIR does not consider the impacts of COVID-19. Please see Master Response 3: COVID-19.

I-Jacobs-4 The commenter asserts the Draft EIR alternatives analysis is deficient. Please see Master Response 5: EIR Alternatives.

I-Jacobs-5 The commenter asserts that the Draft EIR improperly delays the analysis of the hospital. As discussed in the Draft EIR Chapter 1, Introduction on page 1-7, a program EIR has been prepared for the CPHP that establishes a framework for tiered or project-program components. Accordingly, the Draft EIR provides a program-level analysis of the environmental impacts that could result from the development of the entire space program under the CPHP, including from the New Hospital, and identifies Plan-level mitigation measures to reduce potential significant effects of the CPHP. Further details of the New Hospital are being developed, including the specific design. Those elements of the New Hospital will be the subject of a subsequent project-specific environmental review when more details become available. It is anticipated that sufficient detail will be available to publish a project-level Draft EIR for the New Hospital in the summer of 2021.

I-Jacobs-6 The commenter makes a general comment that the Draft EIR does not adequately analyze the project's impacts on the following: aesthetics, wind, shadows, land use, public services, biological resources, air quality, and transportation. Due to lack of specificity in the comment, no direct response is possible; please see Master Response 2: General Comments on EIR and Environmental Topics.

I-Jacobs-7 The commenter asserts that the Draft EIR is so materially flawed and inadequate that proper public review and comment is impossible, and that UCSF must prepare a new Draft EIR and recirculate it for comment. Due to lack of specificity in the comment, no direct response is possible; please see Master Response 2: General Comments on EIR and Environmental Topics. As indicated in Section 8.1.4 in this Comments and Responses document, none of the specific issues identified in the comments, or response to these comments, result in any of the conditions of

Section 15088.5(a) being met. Thus, UCSF has determined that recirculation of the Draft EIR on the issues raised by the comments is not warranted.

I-Jacobs-8 The commenter asserts that UCSF is prohibited from building additional square footage under the CPHP due to the 1976 Regents' Resolution. Please refer to Master Response 4: Space Ceiling and Population.

UCSF Real Estate-Campus Planning

654 Minnesota Street

San Francisco, CA 94143

Attn: Diane Wong

EIR@UCSF.edu

September 11, 2020

Ladies and Gentlemen:

I am submitting the following comments on UCSF's Draft Environmental Impact Report for its Comprehensive Parnassus Heights Plan. For the reasons set forth below, I believe that the DEIR is so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment is precluded. Therefore, under section 15088.5 of the Guidelines for Implementation of the CEQA, UCSF must prepare and recirculate a new DEIR. I also believe that UCSF is barred from implementing the CPHP by virtue of the Board of Regents 1976 resolution permanently limiting expansion of UCSF's Parnassus Heights campus. 1 2

I. Failures to comply with California Environmental Quality Act which affect multiple sections of the EIR

1. UCSF's DEIR is attempting to create a hybrid EIR, combining elements of a Program EIR and a Project EIR in an attempt to evade specific project descriptions of significant elements of the CPHP, most notably the new hospital. However, the CPHP is within a constrained area with specific buildings and project elements and UCSF already has a high degree of definition of the details of the entire project. Recent California cases have rejected vague project descriptions and required the sponsoring agency to describe "stable, accurate and finite" project to allow informed public participation. The DEIR falls far short of this standard. 3
2. The DEIR analyzes the environmental impact of the CPHP as if each element is an independent project but does not consider the cumulative impact of all the projects, notwithstanding that they are all occurring on the same construction site at essentially the same time. This is contrary to CEQA Guidelines section 15130 (a) which requires that an EIR discuss significant 4

cumulative impacts. Several California cases, most notably *Communities for a Better Environment v. Cal. Resources Agency,* (2002) 103 Cal. App. 4th 98 have upheld these guidelines. While this defect applies to virtually all of the analyses in the DEIR of the environmental impacts of the CPHP, it is particularly troublesome with respect to the treatment of air quality and increased cancer risk. Long term exposure to toxic substances is known to increase both the likelihood of contracting cancer and the severity of the cancer. By failing to consider the cumulative effects of exposure UCSF is both ignoring CEQA guidelines and exposing its neighbors to unnecessary and significant risk.

4 cont.

3. The DEIR contains mitigation measures in many of its sections but essentially contains no discussion of the environmental impact of such mitigation measures. CEQA Guideline Section 15126.4(a)(1)(D) requires an analysis of the environmental impact all mitigation measures.

5

II. The Space Ceiling prohibits the expansion envisioned by the CPHP

In order to induce a citizens group to withdraw a lawsuit opposing an expansion to the Parnassus Heights campus, the Board of Regents in 1976 adopted a resolution permanently establishing a Space Ceiling of 3.55 million square feet on the space it would occupy at that campus. The Regents' resolution states:

"The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use …) **and this limit shall be permanent.**"

6

The CPHP would increase the Space Ceiling to 5.05 million square feet.

UCSF has repeatedly reaffirmed its commitment to the Space Ceiling and to consulting with its neighbors before deciding on major planning decisions. These reaffirmations generally occurred in the context of a UCSF planned expansion which would have exceeded the Space Ceiling if it were not for the objection of local groups. The 1994 Long Range Development Plan explicitly committed to the Space Ceiling and set forth how UCSF would satisfy its obligations. UCSF again reaffirmed this undertaking only six years ago in its 2104 Long Range Development Plan, Appendix D of which commits UCSF to pre-decision consultation.

UCSF also acknowledged and relied on the binding, permanent nature of the Space Ceiling in a filing in a California Supreme Court case, *Laurel Heights Improvement Ass'n v. Regents of University of California ("Laurel Heights II")* (1993) 6 Cal.4th 1112. In the draft EIR for the Laurel Heights project, UCSF stated that it was unable to add to its Parnassus Heights campus because the Space Ceiling prohibited it from doing so. The court relied on the draft EIR and UCSF's reliance on the 1976 resolution in determining that UCSF had an adequate basis for determining that expansion at the Parnassus Campus was not feasible. It is completely disingenuous to declare in a litigation brief to the California Supreme Court that the Space Ceiling has a binding effect preventing the University from expanding at Parnassus then, without consulting the parties who negotiated and relied on the commitment, to later maintain that it is free to disregard it if it so choses.

Notwithstanding these repeated and publicly declared commitments, the CPHP ignores them. Although a series of community meetings was convened on the CPHP, community comments were solicited in a highly scripted and biased manner and, despite repeated demands, the Space Ceiling never became a topic of discussion.

Richard Drury, who is representing the Parnassus Neighborhood Coalition, has submitted a response confirming that the Space Ceiling is a legally enforceable obligation of UCSF. In his comments, Mr. Drury points out that "the Space Ceiling is a policy adopted by the Regents to address the environmental impacts in almost every area: traffic, population, growth inducement, air pollution, noise, etc. The violation of the Space Ceiling is therefore a significant impact that must be analyzed under CEQA. The most obvious alternative is for the University to continue to abide by the Space Ceiling. This is a feasible alternative since it was deemed feasible only a few years ago in the 2014 LRPD."

6 cont.

III. Specific sections of the EIR which fail to meet CQEA requirements

***Air Quality*.** Dr. Lisa Kessler has submitted detailed comments on this section, pointing out that multiple tables in section 4.2 of the DEIR show dramatically increased cancer risk to surrounding neighborhoods with a reduction to "less than significant" impact based on mitigation strategies. However, the DEIR does little to show how these mitigation strategies will reduce the health risks. The standard

7

for analyzing these risks was set forth in *Sierra Club v County of Fresno 6 Cal 5th 502 (2018),* which held that an EIR must provide facts or analysis to support the inference that mitigation will have a quantifiable substantial impact on reducing adverse effects, not just rely on "bare conclusions or opinions." The DEIR contains only conclusions and opinions and does not meet this standard. Dr. Kessler also notes that the DEIR mentions the impact of toxic emissions on the Haight Ashbury pre-school several blocks beyond Edgewood Avenue but does not mention the impacts on Edgewood Avenue, notwithstanding that Edgewood Avenue is both proximate to the construction and is a neighborhood whose population includes small children and elderly residents.

The *Sierra Club* decision cited above stated that "CEQA requires that the EIR have made a reasonable effort to discuss relevant specifics regarding the connection between two segments of information already contained in the EIR, the general health effects associated with a particular pollutant and the estimated amount of that pollutant the project will likely produce." UCSF's DEIR makes no attempt to connect these two segments and thus fails to meet the *Sierra Club* standard.

7 cont.

Alternatives to the CPHP. In the published CPHP, UCSF makes the unsupported assertion that a massive hospital is necessary on the Parnassus Heights site in order to foster communication and collaboration between all three elements of its business; research, education and patient care. It also conflates the very real requirement of upgrading one of its existing hospitals to current seismic standards with its desire to increase revenues by adding a significant number of hospital beds through the construction of a new hospital on the site. There are several suitable, if not superior, alternatives to accomplishing UCSF's objectives, not requiring the building of an elephantine structure, completely unsuitable for the space it will occupy, in a residential neighborhood. **If UCSF really requires a hospital as big as it claims, it should find an appropriately scaled new site.**

8

UCSF has produced an unimaginative plan to address its potential future growth and many other, more creative and forward-looking, as well as practical, alternatives exist. Further, UCSF's projections of future population growth in San Francisco are all pre-Covid-19. Many commercial and residential real estate developers are revising their projections of population growth in the Bay Area in

9

the light of Covid-19 and other urban problems and the increasing acceptance of remote work. UCSF's Draft Environmental Impact Report acknowledges that the impact of the pandemic cannot be predicted without speculation at this point, yet it nevertheless intends to implement the CPHP relying on pre-Covid-19 growth projections. No one knows what post Covid-19 medical care will look like. The damage to the Parnassus Heights neighborhood and the City will be permanent and the effectiveness of the UCSF's plan in the post Covid-19 world is highly uncertain.

9 cont.

CEQA Guidelines require that an EIR "[d]escribe a reasonable range of alternatives to the project, or to the location of the project, which could feasibly attain the basic objectives of the project and evaluate the comparative merits of the alternatives." (Guidelines, § 15126, subd. (d).) These alternatives must be discussed, "even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly." UCSF's Draft EIR did not consider a reasonable range of alternatives and therefore the DEIR fails to comply with CEQA requirements. Of those alternatives considered, UCSF generally dismissed them as being inefficient or impeding project objectives. All of the alternatives below are "feasible project alternatives … considerably different from others previously analyzed [which] would clearly lessen the significant environmental impacts of the project", the standard under the CQEA guidelines for requiring an analysis of an alternative to a project.

10

Alternatives which should have been seriously considered include:

Reimagining Parnassus Heights. The CPHP envisions a hospital centric Parnassus Heights, dominated by a 16 story structure replacing the current four story Langley Porter Psychiatric Hospital and Clinics facility. Moving the proposed hospital to another more suitable location would enable UCSF to emphasize its education and research functions by building or converting spaces to classrooms and spaces appropriate for learning and research. In the process it would both enhance its ability attract high caliber students who would appreciate the rustic character of the existing neighborhood and avoid destroying those attributes that make Parnassus Heights special. The Moffit/Long hospital complex, planned to be upgraded to comply with seismic requirements, should be more than adequate to fulfill UCSF's collaboration objectives and its desire to maintain an emergency

11

room in the western portion of the city (several emergency rooms, as well as urgent care facilities which serve many of the same needs as those fulfilled by emergency rooms, already exist nearby).

11 cont.

The Shipyard at Hunters Point. There are hundreds of acres available for development at the Shipyard. UCSF could build an entire campus on the site. A new UCSF campus could be designed to accommodate all of the existing activities at Parnassus Heights, the expansion proposed in the CPHP, as well as future growth. UCSF could acquire enough space that future buildings could be constructed without demolishing existing structures as is required at Parnassus Heights. In order to finance a development at the Shipyard, all or a portion of the Parnassus campus could be sold. It is a desirable location for housing and would easily attract a buyer. The Shipyard is an easy commute via 3rd Street to UCSF's Mission Bay campus, facilitating collaboration between the various divisions at the two locations. Further, the Shipyard could easily accommodate a helicopter landing pad for emergency medical treatment and a ferry landing for visitor access to patients.

In addition, locating a UCSF campus at the Shipyard would provide a much-needed health care facility in that district. Current trends in health care emphasize providing long term preventative consultation, improving the overall health of a population thus both reducing the need for acute care and improving the economics of hospitals. Poor communities, such as those surrounding the Shipyard, have traditionally not had good access to preventative care. Locating the hospital and supporting outpatient facilities to the Shipyard has the potential of significantly improving the overall health of that population and reducing the need for acute interventions.

12

Locating a the hospital and perhaps other elements of UCSF's current Parnassus campus at the Shipyard would also help to economically revitalize the entire area. The Cleveland Clinic is a model for how an academic, research and patient care organization, similar in prestige and size to UCSF, revived an entire section of the city by locating most of its operations to a previously disadvantaged area.

Prior contamination at the Shipyard has been remediated and the only parcel which remains untreated would not interfere in any way with a new UCSF campus. Two former San Francisco Mayors support a UCSF development at the

Shipyard, one of whom, Mayor Art Agnos, made a serious proposal for UCSF to expand at the Shipyard to then Chancellor Julie Krevans 30 years ago. 12 cont.

Mount Zion. UCSF owns Mt. Zion, which was sitting empty until it was reopened in early 2020 to care for Covid-19 patients. The reopening demonstrates the usefulness of having two separate locations to provide continuity of care and revenue. It also demonstrates that two smaller hospitals are a superior alternative to one huge hospital. Mt. Zion occupies an entire city block and is easily accessible by public transportation as well as being surrounded by existing UCSF medical offices. UCSF did not make a detailed evaluation of this alternative citing, among other things, decreased efficiency for UCSF staff and students. (Mt. Zion is only 2.5 miles from the Parnassus Heights campus.) 13

The 2014 Long Range Development Plan. In 2014, only six years ago, UCSF adopted the 2014 LRDP which complies with the Space Ceiling and is currently in effect. Under the LRDP, Parnassus Heights was to remain UCSF's home for classroom instruction, the four schools, adult inpatient facilities, a variety of outpatient clinics, research, housing and support. However, as called for in the *1976 Regents Resolution* and the 1996 LRDP, the **decompression** of space at Parnassus Heights was proposed to continue. New buildings would be added only if old ones were demolished and programs not essential to the campus would be relocated to other sites. Since both the 2014 LRDP and the Space Ceiling are currently in effect and the local community has relied on them, UCSF should not be allowed to dramatically breach them as proposed in the CPHP. 14

Mission Bay. UCSF currently operates three hospitals at Mission Bay and has stated that it expected future expansion to take place at this location. UCSF's promotional literature extolls Mission Bay as bringing together leading physicians and scientists to accelerate the translation of laboratory discoveries into actual treatments and cures, the same rationale given for the new hospital's location at Parnassus Heights. Why would the addition of a large hospital at a location already dedicated to an integrated approach not more effectively accomplish this objective? 15

Seton Medical Center. UCSF does not own the Seton Medical Center but may be able to acquire it. It has 357 hospital beds and is located on Highway 280 with good access to both Parnassus Heights and Mission Bay. It serves an important 16

underserved community of color and would broaden the reach of UCSF beyond the city limits of San Francisco, one of UCSF's stated goals. 16 cont.

Inadequate Information and Analysis of Adverse Biological Impacts. Shawn Smallwood, PhD, has submitted comments, attached to those of Richard Drury, counsel for the Parnassus Neighborhood Coalition. Mr. Smallwood finds that the DEIR inadequately analyzes the potential impacts to wildlife. Of the 40 special-status species of birds in the Mt. Sutro Open Space Reserve documented by the Golden Gate Audubon Society and Mr. Smallwood, the EIR addresses only 6 of them. Mr. Smallwood also finds the DEIR deficient in that it fails to consider the cumulative impact of bird collisions of the project together with other buildings in San Francisco. The DEIR also omits any details about the design of the proposed new hospital which would permit an accurate assessment of the probable increase in bird fatalities resulting from collisions. 17

Inadequate Analysis of Aesthetic and Parking Impacts. The DEIR states at Section 4.0.3 that the impact on the environment of Aesthetics and Parking are not required to be considered under CEQA but that UCSF has included an analysis in the DEIR as the public and decision makers "may be interested" in such an analysis. The DEIR then goes on, without a complete analysis of the aesthetic impacts, to dismiss such impacts as insignificant and does not analyze parking impacts at all. However, the DEIR incorrectly relies on Section 21099 of the CEQA Guidelines which exempts "employment center projects" on an "infill" from the requirement to consider aesthetic and parking impacts. An employment center project is defined in Section 21099 as project on property zoned for commercial uses. The Parnassus campus in not zoned for commercial uses, the exemption does not apply and therefore the EIR must be revised to fully analyze the aesthetic and parking impacts and to correct the misinformation that the parking and aesthetic impacts need not be considered. 18

Perhaps because UCSF maintained it was not required to provide analysis meeting CEQA's full requirements, the analysis UCSF did supply is conclusory and does not take into account the full effect of its new hospital on the City of San Francisco and the neighborhoods surrounding the Parnassus campus. The new hospital encroaches on the Mt. Sutro Open Space Reserve across Medical Center Way. In 19

addition to physically intruding on the reserve, the proposed gigantic structure will be a complete obstruction of the public view of the western portion of City from the Farnsworth tailhead, a view which now extends all the way to the Pacific Ocean. On its website, UCSF describes the Parnassus area as an oasis in the city but the new hospital will transform the initial access to a popular hiking trail from an entry point to the natural world to an experience reminiscent to the view of the happily long ago demolished Embarcadero Freeway. The Draft EIR also shows, not surprisingly, that the new hospital will block a number of other public views, most importantly views of the Mt. Sutro Open Space Reserve from Lincoln Way. San Francisco's public views of land, water and open space provide its inhabitants and visitors a sense of serenity and distinguish San Francisco from most other important cities. UCSF's expansion plan undermines these precious qualities and unnecessarily contributes to the Manhattanization of the City.

19 cont.

The DEIR Fails to consider the Impact of Covid-19. The DEIR concedes that Covid-19 has implications for the project but avoids analyzing them because it would be "too speculative." However, the likely implications of Covid-19 are enormous, possibly dramatically reducing the need for office, classroom and clinical space. The CPHP has significant adverse effects on the environment of San Francisco and the neighborhoods near UCSF's Parnassus Heights campus. CEQA requires that these effects be weighed against the potential benefits of the project. This cannot be done without a thorough analysis of the impact of Covid-19.

20

For the foregoing reasons, I, and the PNC, believe that the Draft EIR is wholly inadequate. UCSF should prepare a revised DEIR to address the concerns raised in this letter and those of PNC's attorney, Richard Drury. Thank you for considering our comments.

21

Very truly yours,

Edward Leonard

Responses to Comments from Edward Leonard

I-Leonard-1 The commenter asserts that for the reasons set forth in the comment letter, that the Draft EIR is fundamentally and basically inadequate, and conclusory in nature, that meaningful public review and comment is precluded; and therefore, under Section 15088.5 of the CEQA Guidelines, UCSF must prepare and recirculate a new Draft EIR. As demonstrated in the individual responses provided to the comments raised, and further in Section 8.1.4 in this Comments and Responses document, none of the specific issues identified in the comments, or response to these comments, result in any of the conditions of Section 15088.5(a) being met. Thus, UCSF has determined that recirculation of the Draft EIR on the issues raised by the comments is not warranted.

I-Leonard-2 The commenter asserts that UCSF is barred from implementing the CPHP by virtue of the 1976 Regents' Resolution permanently limiting expansion of UCSF's Parnassus Heights campus site. Please refer to Master Response 4: Space Ceiling and Population.

I-Leonard-3 The commenter assert that the Draft EIR is attempting to create a hybrid EIR in an attempt to evade specific project description of elements of the CPHP, including the New Hospital.

As allowed under Section 15168 of the CEQA Guidelines, the CPHP EIR is a program EIR that establishes a framework for tiered or project level environmental documents that would be prepared in the future in accordance with the overall CPHP program. Accordingly, this EIR provides a program-level analysis of the environmental impacts that could result from the development of the entire space program under the CPHP – including the New Hospital - and identifies Plan-level mitigation measures to reduce potential significant effects of the CPHP.

In addition, this EIR includes project-level analysis for the following CPHP Initial Phase developments: Irving Street Arrival, RAB, and initial Aldea Housing Densification; and certain Initial Phase improvements (e.g., utility improvements, Parnassus Avenue Streetscape Plan, building renovations of existing buildings, and community investments). The analysis of these Initial Phase development projects and improvements at the project-level is intended to provide sufficient detail to permit project approval and implementation following certification of the CPHP Final EIR.

The commenter's assertion that UCSF has a high degree of definition of the details of the entire project is a mischaracterization. As noted in the Section 1.5 of the Draft EIR, UCSF has begun to plan the New Hospital at Parnassus Heights. Further details of the New Hospital are being developed, including the specific design. Those elements of the New Hospital will be the subject of a subsequent project-specific environmental review when more details become available. It is anticipated that sufficient detail will be available to publish a

project-level Draft EIR for the New Hospital in the summer of 2021. Details of the CPHP Future Phase projects are expected to be developed later, as those CPHP components are not intended to be developed until between 2030 and buildout of the CPHP in 2050. When details on CPHP Future Phase projects are known, each Future Phase project would be reviewed in light of the CPHP Final EIR to determine the appropriate level of additional environmental review, if any, needed before approval and implementation of the particular project.

I-Leonard-4 The commenter's claims that the Draft EIR does not discuss cumulative impacts is incorrect. The commenter is referred to Section 4.0, pages 4.0-7 to 4.0-8 in the Draft EIR for a description of the EIR's approach to its cumulative impact analysis. As explained there, each technical section in the Draft EIR includes a description of the cumulative analysis methodology and the geographic or temporal context in which the cumulative impact is analyzed. Consistent with CEQA Guidelines Section 15130(b), the cumulative impact analysis considers the CPHP's effects in combination with the projections contained within previously approved planning documents and forecasting models, regional planning documents, as well as applicable associated environmental review documents. In addition, consistent with CEQA Guidelines Section 15130(b), the cumulative impact analysis also considers other known or reasonably foreseeable projects that could combine with potential impacts from implementation of the CPHP within the pertinent geographic area. As with the programmatic and project-level impacts, mitigation is identified to mitigate cumulative impacts to the extent feasible.

Three separate analyses are included in all sections of the Draft EIR. The first analysis presents the environmental impacts that would result from campus site buildout under the CPHP. Impacts from the entire development program are analyzed at a program level– this program level analysis is the "cumulative analysis" requested by the commenter; it covers all potential development under the CPHP that would occur on the campus site, following CPHP approval through buildout in approximately 2050. The second analysis in the Draft EIR is a project-level analysis of three of the Initial Phase projects (Irving Street Arrival, RAB, and initial Aldea Densification project) and certain Initial Phase improvements. The third analysis in the Draft EIR analyzes the cumulative impacts of all of the CPHP development, when combined with other past, present and reasonably foreseeable future development in the pertinent project area.

The Draft EIR does not fail to disclose cumulative air quality impacts of the CPHP, including exposure to toxic air contaminant emissions. Please refer to Draft EIR page 4.2-69 for the discussion of cumulative air quality impacts with respect to regional emissions of criteria air pollutants. This impact is identified in the Draft EIR as significant and unavoidable. Please refer to Draft EIR pages 4.2-69 through 4.2-72 for the discussion of cumulative air quality impacts with respect to localized health impacts from the proposed CPHP. This impact is identified in the Draft EIR as less than significant with implementation of CPHP Mitigation Measures AIR-1a and AIR-1b.

I-Leonard-5 The commenter asserts that the Draft EIR contains no discussion of the environmental impacts of mitigation measures; no specific mitigation measures are cited in the comment. In fact, there are no mitigation measures identified in the Draft EIR which would result in one or more significant environmental effects in addition to those that would be caused by the project as proposed.

I-Leonard-6 The commenter asserts that the space ceiling prohibits the expansion envisioned by the CPHP, but UCSF ignores the space ceiling commitment. Please refer to Master Response 4: Space Ceiling and Population.

I-Leonard-7 This comment reiterates a comment included in Comment Letter I-Kessler with respect to health risk reductions resulting from implementation of CPHP Mitigation Measure AIR-1a, but then goes on to state that CEQA requires that the EIR have made a reasonable effort to discuss relevant specifics regarding the connection between two segments of information already contained in the EIR, the general health effects associated with a particular pollutant and the estimated amount of that pollutant the project will likely produce.

Please refer to the Response I-Kessler-14 for a discussion substantiating the health risk reductions resulting from implementation of CPHP Mitigation Measure AIR-1a in the Draft EIR.

Please refer to Response I-Kessler-17 with respect to the specific health effects (acute and chronic) related to the significant and unavoidable regional PM_{10} emissions impact identified in the Draft EIR.

As a part of the Draft EIR analysis, UCSF commissioned a Health Impact Assessment (HIA) to address concerns of the decision of the California Supreme Court in *Sierra Club v. County of Fresno*, (2018) 6 Cal.5th 502 ("Friant Ranch"). The results of the HIA are summarized on pages 4.2-37 through 4.2-42 of the Draft EIR and the full HIA is located in Appendix HIA of the Draft EIR. Please refer to these section with respect to the health effects of the significant and unavoidable air quality impact identified for the proposed CPHP.

I-Leonard-8 The commenter suggests that UCSF should find an alternative site if it requires a new hospital as big as the one proposed, questioning UCSF's motivation, and indicating that "there are several suitable, if not superior, alternatives to accomplishing UCSF's objectives" that do not require such a large hospital building. Please see Master Response 5: EIR Alternatives.

I-Leonard-9 The commenter questions the UCSF's population projections in light of COVID-19. Please see Master Response 3: COVID-19.

I-Leonard-10 The commenter asserts the Draft EIR did not include a reasonable range of alternatives. Please see Master Response 5: EIR Alternatives.

I-Leonard-11 The commenter asserts the New Hospital should be at a more suitable location. Please see Master Response 5: EIR Alternatives.

I-Leonard-12 The commenter indicates an alternative site involving the Shipyard at Hunters Point should be addressed in the EIR. Please see Master Response 5: EIR Alternatives.

I-Leonard-13 The commenter indicates an alternative site involving the Mount Zion campus site should be addressed in the EIR. Please see Master Response 5: EIR Alternatives.

I-Leonard-14 The commenter asserts that since both the 2014 LRDP and the Space Ceiling are currently in effect and the local community has relied on them, UCSF should not be allowed to dramatically breach them as proposed in the CPHP. Please refer to Master Response 4: Space Ceiling and Population.

I-Leonard-15 The commenter indicates an alternative site involving the Mission Bay campus site should be addressed in the EIR. Please see Master Response 5: EIR Alternatives.

I-Leonard-16 The commenter indicates an alternative site involving the Seton Medical Center should be addressed in the EIR. Please see Master Response 5: EIR Alternatives.

I-Leonard-17 The commenter refers to comments in Comment Letter O-LD2 regarding the number of species of special-status birds in the Open Space Reserve, and cumulative impacts of bird collisions with structures. Please see Response O-LD2–31.

The commenter also takes issue with the lack of detail of the design of the proposed New Hospital. Please see Response I-Leonard-3, above.

I-Leonard-18 The commenter asserts that the CPHP does not meet the definition in Section 21099 of being an employment center project, or being on an infill site. Please see Master Response 6: Public Resources Code 21099.

I-Leonard-19 The comment states that the Draft EIR's aesthetics analysis is inadequate and that the proposed New Hospital would substantially obstruct views. Please refer to Master Response 7: Aesthetic Impacts.

I-Leonard-20 The commenter asserts the Draft EIR fails to consider the impact of COVID-19. Please see Master Response 3: COVID-19.

I-Leonard-21 The commenter asserts that for the reasons identified in the comment letter, that the Draft EIR is wholly inadequate, and that UCSF should prepare a revised Draft EIR to address the concerns raised in this letter and those of Richard Drury's letter. Please see Response I-Leonard-1, above. For responses to the Richard Drury comment letters, please see the responses to Comment Letters O-LD1, O-LD2, and LD3.

Re: Comments on DEIR for proposed UCSF Comprehensive Parnassus Heights Plan (CPHP)

Dear Ms. Wong:

I am submitting a few both general and specific comments on the DEIR.

In reviewing the document, two patterns struck me as broadly inadequate.

1. Several proposed mitigations under one CEQA category are likely to enhance problems under different CEQA categories. Example:

    - Section 4.15 Transportation: The CPHP discourages private one-person auto-use hoping to mitigate increases in air pollutants and impacts on circulation. However, it simultaneously anticipates and encourages an increase in TNC utilization, which will offset any improvements gained in those two categories from reduced personal vehicle use.

1

2. Several proposed mitigations appear to be voluntary or encouraged but easily ignored, either by UCSF or by some of the numerous contractors and workers on site.

    - Section 4.2 Air Quality: "Signs shall be posted stating "diesel trucks are prohibited from idling more than 5 minutes". *[This is unenforceable}*

    - Under Section 4.15 Transportation: "UCSF shall require the construction contractor to include in the Construction Traffic control Plan methods to **encourage** walking, bicycling, carpooling, and transit access to the campus site by construction workers." *[Emphasis added – also unenforceable]*

2

Specific CEQA categories are addressed as follows:

Population and Housing

Table 2-3: Summary of CPHP Impacts and Mitigation Measures
EIR Section 4.12 Population and Housing.

Under this heading the DEIR submits that

- No mitigation is required with respect to an increased demand for housing outside the market area and would not displace substantial numbers of existing people or housing. It further asserts that it would not result in a cumulatively considerable contribution to significant cumulative population and housing impacts.

3

The DEIR downplays impacts on population and housing. While stating that the project will generate a direct need for 2,030 units by the year 2025, the only planned housing units in the first phase of the project are for 142 additional units at the Aldea complex, hardly scraping the surface of the stated need. Even by the end of the 30-year construction period, the total number of projected units is considerably short of the stated need.

Page 3-12
"Currently across all UCSF sites there are 1,251 units of faculty and student/trainee housing. Based on a Housing Study conducted in 2015, the estimated demand in 2025 for student/trainee housing would be about 2,030 units. Estimated demand for faculty housing would be 345 units. The estimated demand far exceeds what is currently available across UCSF sites."

The DEIR claims to "address the needs of the Parnassus Hts community and to offset the pressures on San Francisco's existing inventory"

4

In fact UCSF projects a direct need for a total increase of 1,124 new units by 2025, solely for student/trainees and faculty but only has plans to add 142 in phase 1 and a final total of 762, the great majority of these to be built in the later phases of the project, long after the 2025 projected need is likely to be eclipsed. (pp. 3-34: Total increase at Aldea = 332 units, plus 430 units along 4th Ave. extension)

Further, the stated need refers exclusively to projected student/trainees and faculty and fails to consider workforce housing for additional staff (many in low-paid jobs) or the secondary impacts of that increased population. It has been well established that every 100 market rate units generate a need for 30 affordable units, based on the types of services that are needed to support those residents. UCSF's calculations fail to take those secondary impacts into consideration. Simultaneously there is no recognition of the need for deeply affordable housing to accommodate the low to moderate-paid administrative and support staff who will be required to provide support services in the new hospital, labs, and schools. Relying on the City and private developers to build nearby housing that will be available to UCSF staff is unrealistic. San Francisco already faces a severe shortage of affordable housing for seniors, transitional age youth, families and low to middle income workers. The neighborhoods adjacent to the Parnassus campus have little to no available land for construction. Any

5

demolition would inevitably lead to displacement of current residents within these neighborhoods and if new construction is not deeply affordable it will contribute to further gentrification, which has been repeatedly shown to accelerate displacement. 5 cont.

In summary, the DEIR fails to reasonably address the impacts of the proposed CPHP on population and housing. 6

Transportation/Vehicle miles driven:

4.15-29: Daily peak hour external person trips are expected to increase by approximately 50 percent. While carrots and sticks are contemplated (incentives and costs) to discourage individuals from driving to the campus, the increase in population will add to total vehicle miles driven even if many of those vehicles are TNC's or private cars that park away from Parnassus Hts and then use public transit, "bike-share" or walk to reach the campus. This is already a common practice for many employees and students at large institutions in San Francisco who commute from out of the city, and it will doubtless increase among those working and studying at UCSF. Many of those using automobiles will be commuting from long distances due to the high cost of housing in the urban core and nearby communities. Reducing the immediate access to UCSF for private vehicles will not reduce the overall impact on the environment and specifically on air quality generated by the increased daily population and their use of all modes of transportation. 7

The CPHP anticipates incentives and restrictions in order to limit private single occupant automobile travel to the campus. Whether or not net reductions can be achieved given the substantial increase in daily population is doubtful, but if some percentage of reduction in private auto use is achieved, the net increase in dependence upon public transit will be significant. Commensurate financial support to MUNI is essential in order for the mass transit option to be viable not only for UCSF but also for the neighborhoods relying on affected lines. 8

Unlike the Mission Bay campus Parnassus is adjacent to well-established and already congested neighborhoods. Existing streets and public transit will not support a significant daily long-term increase in circulation. 9

The 30-year construction period will generate a continuous and dramatic increase to congestion not only in the adjacent streets but also on all major routes used to access the sites. This will be most challenging when diesel trucks are carrying out loads from demolition and returning empty for more loads throughout the day, and when vast quantities of construction materials are being supplied. 10

During the construction period vehicle miles driven by construction workers will be significant. The mitigations proposed in the DEIR are entirely voluntary and likely to provide only a slight constraint on single occupancy vehicles traveling to the worksite or other nearby locations. A shuttle service should be established for construction workers, possibly from Mission Bay or other location with easier access to BART, Cal Train, SamTrans, AC Transit and Golden Gate Transit. A parking area for those workers who do drive regularly or occasionally from out of San Francisco needs to be provided to reduce impacts on the immediate neighborhoods. This should be considered as a reasonable and necessary mitigation. 11

The wear and tear on both nearby streets and all major truck routes warrants substantial mitigation to maintain and repair damaged roadways during and after construction. 11 cont.

NOISE AND VIBRATION

While regular work hours are established in the DEIR, the project gives itself permission to violate those hours on a regular basis as long as neighbors receive prior notification. This is an utterly inadequate "mitigation". In fact it is no mitigation at all. 12

As more residents work from home and we increasingly see potential for temporary school closures due to an ever-lengthening annual fire-season, the hardships imposed on residents from near-constant significant noise will doubtless have adverse health impacts. 13

The site is surrounded on 3 sides by residential neighborhoods and on its 4th side by an open-space preserve, which is home to numerous bird and animal species. Constant noise is likely to interfere with animal behavior that relies heavily on sensitive hearing. Mt. Sutro is also an important recreational area, where workers and residents seek much needed respite from the intensities of an urban environment. This otherwise calm preserve will be substantially disturbed during the many extended periods of construction. 14

The Parnassus site is on a hill adding even greater impacts from vehicle noise as loaded trucks strain up the hill and empties barrel and bounce down. 15

All sensitive receptors will be adversely impacted by the continuous noise and frequent vibration generated during much of the construction period. 16

Additional more stringent mitigations must include but not be limited to: 17

- Regular construction hours strictly adhered to with no exceptions during periods that require frequent truck trips, heavy equipment use and other loud or frequent noise producing activities. Extended construction hours must be limited to quiet interior work.
- Advance notice required/provided even during regular working hours when heavy truck traffic and/or loud and/or vibration producing equipment use is scheduled so that adversely impacted residents and workers can attempt to schedule adjustments to their routines in advance.
- UCSF must be prepared to fully compensate nearby property owners for any and all damage attributable to construction-generated vibrations.

Please provide due consideration to these concerns and suggestions in your environmental review process. 18

Sincerely,
Lori Liederman

Responses to Comments from Lori Liederman

I-Liederman-1 The comment states that UCSF will continue to discourage drive-alone vehicle use as part of its robust TDM program (as described on pages 4.15-12 through 4.15-14 of the Draft EIR) while at the same time the transportation analysis forecasts increased used of taxi, TNC and drop off modes, which could lead to increases in vehicle trips with an increasing campus population. These phenomena are both accounted for in the Travel Demand Estimates subsection of the Draft EIR on pages 4.5-29 to 4.5-33 and the subsequent transportation impact analysis and findings included in the Draft EIR. Please also see Master Response 17: Mode Share Assumptions and Methodology.

I-Liederman-2 This comment states that one air quality mitigation measure and one transportation-related mitigation measure in the Draft EIR are not enforceable.

The air quality mitigation measure requires posting of signs at loading dock areas. Enforcement of this measure would be accomplished though implementation of the CPHP mitigation monitoring and reporting program.

CPHP Mitigation Measure TRANS-5 provides a list of measures for the University to implement that would be expected to reduce the construction-related transportation impacts. Given the difficulty in enforcing this specific aspect of the mitigation measure, this component is phrased such that UCSF shall require that the construction contractor shall include in the Construction Control Plan methods to encourage that walking, bicycling, carpooling and transit to be used to access the campus site by construction workers. Nevertheless, this measure, in conjunction with the required other measures identified in CPHP Mitigation Measure TRANS-5, are anticipated to effectively reduce the construction related transportation impacts to a less than significant level.

I-Liederman-3 The commenter states that the Draft EIR downplays the CPHP's impacts on population and housing, as the project would add more jobs and not enough housing.

Please refer to Master Response 14: Population and Housing Impacts, regarding the scope and approach to the analysis of population and housing impacts in the Draft EIR.

I-Liederman-4 The commenter states that the CPHP would result in a direct need for more housing for employees and students in the near term but that only a small number of units would be built during that time period.

Please refer to Master Response 14: Population and Housing Impacts, regarding the scope and approach to the analysis of population and housing impacts in the Draft EIR.

I-Liederman-5 The commenter states that the Draft EIR analysis does not take into account the housing demand associated with the additional staff that would be added to the campus site or the housing demand associated with the secondary (indirect and induced) jobs that would result from the increase in students and faculty at Parnassus Heights. The commenter also asserts that the CPHP would result in displacement of residents near the campus site and gentrification of the area.

Please refer to Master Response 14: Population and Housing Impacts, regarding the CPHP's impact on population and housing. The analysis of population impacts does take into account the increase in staff at the Parnassus Heights campus site. The effects of secondary jobs (indirect and induced) are appropriately addressed in Section 5.4, Growth Inducing Effects. Regarding indirect displacement and gentrification, please see Master Response 15: Indirect Displacement and Gentrification Impacts.

I-Liederman-6 The commenter makes a general summary statement that the Draft EIR fails to reasonably address the impacts of the proposed CPHP on population and housing. Please see Response I-Liederman-3 to I-Liederman-5, above.

I-Liederman-7 The comment asserts that due to the increase in population, the CPHP will increase VMT, regardless of what modes of travel people use to reach the campus. Master Response 16 discusses criteria to determine if the Project has a significant VMT impact. As noted therein, UCSF uses a per capita efficiency metric to evaluate the significance of transportation impacts due to VMT. However, the increase in total VMT resulting from the CPHP, including the increase due to increased campus population, is analyzed for its impacts on air quality and greenhouse emissions in the Air Quality and Greenhouse Gas Emissions sections of the Draft EIR.

I-Liederman-8 The comment asserts that any reductions in the single occupant vehicle trips due to incentives/disincentives by UCSF will result in a significant increase in Muni use, and that UCSF should provide financial support to Muni in response to increased transit demand from the CPHP. For the methodology used to develop the future mode split, please see Master Response 17. As discussed in Master Response 20, Muni operational costs are not a CEQA concern.

I-Liederman-9 The comment asserts that roadway and public transit capacity are not sufficient to support the increase in travel demand due to the CPHP. Master Response 19 presents a discussion about roadway capacity. For public transit impacts, please see Master Response 20.

I-Liederman-10 The comment asserts that the CPHP will increase vehicle congestion on surrounding streets and major routes used to access the campus site, and that construction-related trips will exacerbate this situation. As discussed in Master Response 16, a project's effect on automobile delay shall not constitute a significant environmental impact under CEQA. As such, the potential

constrained capacity at and around the campus site is not a CEQA concern and transportation impacts based on congestion and vehicular delay are appropriately not analyzed in the Draft EIR. The effects of construction activity, including truck traffic, are analyzed in the Draft EIR under Impact TRANS-5, on pages 4-15.49 through 4-15.51. As noted under that impact, the Draft EIR analysis concluded that there would be a significant impact due to construction activities, which would be mitigated to a less-than-significant level with the implementation of CPHP Mitigation Measure TRANS-5.

I-Liederman-11 The comment asserts that the vehicle miles traveled by construction workers will have a significant impact on the surrounding area and proposes additional mitigation measures to discourage driving. As shown on Draft EIR page 4.15-27, the project's significance criterion with regard to construction impacts does not include the effect on vehicle miles traveled due to construction workers. Impact TRANS-5 on page 4.15-50-51 discusses the impact that construction activities would have on travel conditions along sidewalks and roadways serving the project site. As this impact is potentially significant, UCSF shall require its construction contractor to include methods in its Construction Traffic Control Plan to encourage construction workers to walk, bike, carpool, or use transit to access the site as a mitigation measure.

The comment asserts that UCSF should provide additional parking for construction workers to mitigate their parking impacts on the neighborhood. As noted on page 4.15-33 of the Draft EIR, parking is not a CEQA topic, and as such the Draft EIR does not include an assessment of parking impacts.

The comment asserts that UCSF should provide mitigation measures to account for roadway damage caused by construction trucks. Roadway damage is not an environmental impact under CEQA, and no mitigation is required.

I-Liederman-12 This comment objects to the potential for construction under the proposed CPHP to occur outside the hour restrictions identified in CPHP Mitigation Measure NOI-1b: Construction Hours.

As stated on Draft EIR page 4.11-19, in rare circumstances, work may need to occur outside of these work hour limits. In such cases, UCSF Community and Government Relations will receive advance notice from the project manager, at least one week in advance as feasible, and will engage the community to identify measures to minimize potential impacts. Although UCSF plans for construction to occur during normal daytime hours, certain time-specific construction activities, such as large concrete pours, may require earlier start or later finish times as, once started, such activities must continue to completion for effective curing. As stated in the mitigation measure, these occurrences would be rare. Please note that the construction noise impact is identified in the Draft EIR as significant and unavoidable.

I-Liederman-13 This comment raises concern that as more residents work from home and given an increased potential for temporary school closures due to lengthening of the annual fire season, the significant construction noise impact on nearby residents will have adverse health impacts.

This comment is noted. The construction noise impact is identified in the Draft EIR as significant and unavoidable even with the feasible measures identified in CPHP Mitigation Measure NOI-1a: Construction Noise Control Measures, CPHP Mitigation Measure NOI-1b: Construction Hours, and CPHP Mitigation Measure NOI-1c: Pile-Installation Noise-Reducing Techniques.

The potential health consequences of noise impacts associated with construction-related noise impacts on sensitive receptors are addressed on Draft EIR page 4.11-26 under the subheading Potential Health Effects of Significant CPHP Construction Noise Impacts.

I-Liederman-14 The commenter indicates that construction noise is likely to interfere with animal behavior that relies heavily on sensitive hearing. Please refer to Impact BIO-1 in the Draft EIR Section 4.3, Biological Resources. As discussed in Impact BIO-1, under the CPHP, the predominant potential impacts on biological resources within the Reserve from construction activities would be to nesting birds and to roosting bats. Impacts to nesting birds from construction activities include temporary loss of nesting habitat and disturbance to nearby nests from construction noise and activity. Noise and disturbance impacts would be mitigated to a less-than-significant level under CPHP Mitigation Measure BIO-1c, Protection of Nesting Birds. Construction activities could also directly impact roosting bats, and elevated sound levels from heavy construction equipment could cause adult bats to abandon maternity roosts. Noise and disturbance activities would be mitigated to a less-than-significant level with implementation of CPHP Mitigation Measure BIO-1d, Protection of Roosting Bats. Mitigation measures discussed in the Draft EIR, Section 4.11, Noise and Vibration, would further serve to minimize overall noise impacts, including to wildlife.

The commenter also asserts that there would be construction related impacts to workers and residents using the Reserve for recreation. Compliance with mitigation-measures and other construction-related regulatory requirements discussed in the Draft EIR, including Section 4.2, *Air Quality*; Section 4.3, *Biological Resources*; Section 4.11, *Noise and Vibration*; and Section 4.15, *Transportation,* would reduce construction-related effects to users of the Reserve to the extent feasible.

I-Liederman-15 This comment states that the Parnassus Heights campus site is on a hill adding even greater impacts from construction vehicle noise as loaded trucks strain up the hill and empties barrel and bounce down.

As stated on page 4.11-20 of the Draft EIR, the three Initial Phase projects (Irving Street Arrival, RAB, and initial Aldea Housing Densification) are evaluated at a project-level. While proposed New Hospital is also an Initial Phase and considered programmatically in this EIR operationally, given the anticipated concurrent construction of New Hospital its construction was considered at the project level. Construction haul trucks would be used to remove demolition debris and excavated soil. Haul trucks for demolition and construction of the Irving Street Arrival, the RAB and the Hospital would queue for loading on Irving Street and Parnassus Avenue and would proceed generally at a level grade along these established arterials to access 19th Avenue to off-haul materials. Thus, construction haul trucks would not be expected to encounter meaningful steep grades such as Medical Center Way (for which operational truck noise from the incline was considered on page 4.11-27 of the Draft EIR) that might exacerbate conventional operational engine noise. Construction trucks conducting demolition and excavation off-haul for the Aldea Housing Densification would access the site from the southern side of campus via Clarendon Avenue, and construction noise from these activities was analyzed on page 4.11-24 of the Draft EIR and was found to be less than significant.

I-Liederman-16 This comment asserts that all sensitive receptors will be adversely impacted by the continuous noise and frequent vibration generated during much of the construction period.

The construction noise impact is identified in the Draft EIR as significant and unavoidable even with the feasible measures identified in CPHP Mitigation Measure NOI-1a: Construction Noise Control Measures, CPHP Mitigation Measure NOI-1b: Construction Hours and CPHP Mitigation Measure NOI-1c: Pile-Installation Noise-Reducing Techniques. As a practical matter, only sensitive receptors within approximately 500 feet of construction would be exposed to a significant construction noise increase exceeding 10 decibels over ambient based on the lowest existing noise levels monitored in Table 4.11-2 of the Draft EIR.

Construction-related vibration impacts are assessed on Draft EIR pages 4.11-30 through 4.11-33. As indicated in Table 4.11-7, only receptors within 100 feet of vibratory compaction activities or 50 feet of other activities would exceed the applicable annoyance criterion of 0.04 inches per second peak particle velocity. However, none of the vibration inducing equipment would be operating during nighttime hours and annoyance human impacts are identified as less than significant.

I-Liederman-17 This comment recommends the consideration of three mitigation measures.

The first suggested measure is for strict adherence to regular construction hours with no exceptions during periods that require frequent truck trips, heavy equipment use and other loud or frequent noise producing activities and that extended construction hours must be limited to quiet interior work. As stated above in Response I-Liederman-12, although UCSF plans for construction to occur during normal daytime hours, certain time-specific construction activities, such as large concrete pours, may require earlier start or later finish times as, once started, such activities must continue to completion for effective curing. As stated in the mitigation measure, these occurrences would be rare. Therefore, the suggested changes to CPHP Mitigation Measure NOI-1b Construction Hours are not feasible.

The second suggested measure is for advance notice required/provided even during regular working hours when heavy truck traffic and/or loud and/or vibration producing equipment use is scheduled so that adversely impacted residents and workers can attempt to schedule adjustments to their routines in advance. Please note that as a general practice, UCSF updates its neighbors regularly on the status of construction, and advises them of any construction that may result in noticeable impacts (including noise, vibration, traffic, etc.). UCSF's website maintains a webpage dedicated to informing the public of available construction-related information for projects at https://constructionimpacts.ucsf.edu/. In addition, UCSF's Community Relations office sends out regular updates by email, and as feasible, holds community meetings to discuss the status of project construction. These current practices, which would continue to be implemented during the construction of projects under the CPHP, preclude the need for the measure suggested by the commenter.

The third suggested measure is for UCSF to be prepared to fully compensate nearby property owners for any and all damage attributable to construction-generated vibration. Most of the construction activities at the campus site would not produce substantial vibrations and would occur at considerable distances from nearby residences, as a result of which most of the construction would result in a less than significant vibration impact. However, certain construction activities that occur at sites close to the edges of the campus core would have the potential to result in off-site vibration, that could affect off-site receptors and structures. As demonstrated in the Draft EIR, CPHP Mitigation Measure NOI-3a would effectively reduce vibration levels by replacing vibration intensive equipment when compaction is required adjacent to historic or older structures. This measure, and other construction vibration mitigation included in the Draft EIR, would ensure all potential vibration-related impacts for CPHP development would be less than significant. No additional vibration mitigation is required.

I-Liederman-18 The commenter requests consideration of the concerns and suggestions raised above in the environmental review process. The comment is noted; please see responses to the specific comments raised above.

From:	Maury Zeff
To:	Campus Planning - EIR
Subject:	CPHP EIR
Date:	Friday, September 11, 2020 3:12:38 PM

Dear Ms. Wong,

I am submitting comments on the draft EIR from July 2020 related to the proposed massive expansion of UCSF's Parnassus campus. I have lived at 119 Edgewood Ave since 2018 and, as a member of the immediate community, I have multiple concerns about UCSF's plan. I will address the concerns point by point: 1

1. The impact of building a massive (19 stories?) hospital at the edge of campus adjacent to a residential neighborhood of 2-4 story homes can't be overstated. The EIR does not adequately address or suggest mitigations to the following 2

- Construction noise, debris, congestion, and disruption for many years to your neighbors and the community in general
- The pollutants that the construction will put into the air for years
- The pollutants that the building will put into the air once built

2. I am extremely concerned about the geological stability and structural integrity of our homes if UCSF proceeds with its proposal to cross Medical Center Way and excavate the hill on which our wood-framed houses have sat for nearly 120 years. It seems that even the best seismologist or geologist couldn't safely predict how each house in the neighborhood will perform structurally during this level of geological disruption. 3

3. In line with my last point, there is no way of knowing how the houses may be seismically compromised by the removal of a large part of the hill on which they sit. If there is a major earthquake in San Francisco in the years following this excavation and there is significant damage to our homes, the homeowners would be left to consider how that damage was maximized by UCSF's geological disruption of the hill. 4

4. The shadows this behemoth structure will be casting on our neighborhood and surrounding areas, depending upon time of day and of year, have been inadequately addressed by the EIR. Speaking for your Edgewood neighbors, our quality of life would be dramatically diminished by having a skyscraper that blocks out much of our western sunlight overlooking our homes. 5

5. The EIR does not adequately address the impact of an additional 8,000 people coming to UCSF's campus every day post-construction. As it is, Parnassus is already badly congested during normal business hours (when shelter-in-place is not in effect). Aside from the daily traffic jam this increase in campus population would turn Parnassus into, it would negatively impact the timely arrival of ambulances to the ER. 6

6. Speaking of the ER, your current plan calls for the emergency room to be on Medical Center Way, at the base of the hill on which our homes sit. The EIR doesn't address the noise disruption that this location will cause with arriving ambulances day and night. 7

7. On the subject of noise, I didn't see where the EIR addresses the significant noise pollution the new hospital will emit once completed. 8

8. As with the issue of campus congestion, your plan does not adequately address additional parking needs. In a post-covid world, it is quite likely that many more people will choose to drive rather than take public transportation. 9

9. Nor does your plan address the increased housing needs of a greatly expanded campus. My understanding is that the housing expansion--paltry as it is relative to the daily population increase--would take place over decades, being essentially meaningless to the dramatic growth UCSF Parnassus is proposing. 10

10. UCSF's proposal to remove forest and, if I read the EIR correctly, setting up an equivalent amount of greenspace elsewhere on campus seems to miss the point of having an area of unmolested forest in a major city. It's not about acreage of forest. It's about the fact that the woods east and south of Medical Center Way represent a jewel for the community, the city, and for UCSF that has miraculously avoided development to this day. There is no mitigation I can imagine for developing on this rare forested area. 11

11. The proposal and EIR don't at all take into account the uncertainty of a post-covid world. Many of the parking/transportation issues are supposed to be mitigated by MUNI expansion. We have no idea if or when people will be comfortable standing shoulder to shoulder again on buses. As you know, MUNI and BART are suffering considerably with its drastically diminished ridership. It is impossible to say how work, transit, telemedicine, working from home, and other interrelated issues will play out in an age in which we are faced with regularly recurring global pandemics. To plan a massive and massively expensive rebuild of your campus that will be immensely disruptive and detrimental to your neighbors without knowing what the world will look like in the years to come appears dangerously shortsighted and risky. 12

12. Similarly, I understand one of the reasons for building the hospital in the proposed site is to integrate the hospital, clinics, and labs into one big building. In a socially distanced world, would this plan make any sense going forward? Separating sick people from front line workers from other employees from the public would seem to be the priority, not bringing them together. The EIR doesn't address this issue at all. 13

13. The EIR does not adequately consider other geographical areas for UCSF to build its new hospital that would be so much less disruptive and transgressive for your neighbors. I understand that there are multiple alternative sites you could consider. 14

14. The EIR doesn't consider that building a massive building that dwarfs the rest of the campus and the entire neighborhood (pretty much every structure west of Van Ness Avenue) that sits at the edge of campus violates basic principles of urban design. My understanding is that institutional campuses adjacent to residential neighborhoods are supposed to taper out from the center, with buildings on the perimeter of the campus getting progressively lower in height as they approach people's homes. Aesthetically and functionally, the reasons for this principle seem clear as day. It's also a matter of having a harmonious relationship with your neighbors. 15

While I am grateful for the opportunity to share my comments about the EIR, I want to state that the "community input" portion of this process has felt quite superficial. My neighbors and I have been raising the same sets of concerns about this expansion plan since we became aware of the proposal early this year. Yet none of these issues seem to have been addressed in 16 17

your plans or the EIR. Our concerns have been dismissed with mitigations that appear woefully inadequate. And the meetings in which we were allowed to give input (the breakout meetings) corralled us into small groups that covered what felt like ancillary issues (e.g., additional bicycle parking) to our main concerns and also inhibited open dialogue around those main concerns. I hope you will take my and my neighbors' comments to heart. 17 cont. 18

Thank you for allowing me to comment.

Best regards,
Maury Zeff
119 Edgewood Avenue

Responses to Comments from Maury Zeff

I-Zeff-1 This introductory comment refers to multiple concerns about UCSF's CPHP that follow. Please see the following responses to the specific concerns raised by the commenter, below.

I-Zeff-2 This comment states that the EIR does not adequately address or suggest mitigations for construction noise, debris, congestion, and disruption impacts to neighbors and the community and is concerned about the pollutants that would be generated by construction and operation of the New Hospital.

Air quality impacts related to construction of the New Hospital are presented in Draft EIR pages 4.2-31 through 4.2-33 for criteria air pollutants, and on Draft EIR pages 4.2-47 through 4.2-58 for construction-related health risk impacts. Operational air quality impacts associated with the New Hospital are assessed at a programmatic level on Draft EIR pages 4.2- 33 through 4.2-42 for criteria air pollutants and on Draft EIR pages 4.2-45 through 4.2-47 for localized health risk impacts. Mitigation measures identified in the Draft EIR for construction impacts from the New Hospital include CPHP Mitigation Measures AIR-1a and AIR-1b. Mitigation measures identified in the Draft EIR for operational impacts from the New Hospital include CPHP Mitigation Measures AIR-2a and 2b for criteria air pollutants and CPHP Mitigation Measures AIR-3 for localized health risk impacts.

A project level analysis of construction noise impacts is provided for the Initial Phase projects, including the New Hospital, on pages 4.11-19 through 4.11-26 of the Draft EIR.

I-Zeff-3 The commenter expresses a general concern about the geological stability and structural integrity of homes on Edgewood Avenue if UCSF excavates the hill across Medical Center Way; and indicates it cannot be safely predicted how each house will perform structurally during the geological disruption.

The commenter is referred to Section 4.6, Geology and Soils, which addresses all potential geologic risks associated with development proposed under the CPHP, including risks from strong seismic groundshaking (Impact GEO-1); seismic-related ground failure (Impact GEO-2); potential landslides (Impact GEO-3), potential erosion (Impact GEO-4); and potential unstable geologic units or soil (Impact GEO-5). Section 4.6 relies on the several sources of information, including the regulatory framework that the CPHP would be subject to, and preliminary geologic studies conducted at the campus site that addressed landslides and slope stability risks.

As discussed in Section 4.6, in compliance with the California Building Code (CBC), all structural improvements and associated improvements that would occur under the CPHP would be subject to appropriate design-level geotechnical

evaluations prior to final design and construction. As discussed in Impact GEO-1, the final design-level geotechnical evaluation would include any necessary recommendations for site preparations and/or foundation systems necessary to reduce seismic-related hazards to less than significant. Impact GEO-2 notes that the geotechnical investigation would also determine the potential for liquefaction present on a site specific basis, and identify both site preparation measures and foundation design measures in a final design level geotechnical report, also reducing potential ground failure impacts to a less than significant level.

Furthermore, as discussed in Impact GEO-3, for any proposed development that might occur adjacent to or within the Reserve that coincides with areas mapped as susceptible to earthquake-induced landslides, construction would also require compliance with the Seismic Hazards Mapping Act and CGS SP 117A. The final design-level geotechnical evaluation would include any necessary recommendations for shoring and anchoring of sidewalls to ensure that the impact due to slope stability hazards is reduced to a less than significant level. Moreover, CPHP Mitigation Measure GEO-3 also identifies several geotechnical recommendations contained within UCSF geotechnical engineer consultant's 2019 report to further improve slope stability. Lastly, Impact GEO-5 notes that adherence to CBC requirements and the design-level geotechnical report recommendations for site preparation and foundation design would be sufficient to reduce lateral spreading and liquefaction hazards to less than significant levels.

Compliance with the regulatory requirements, implementation of geotechnical design recommendations required in geotechnical investigations prepared for each new development project under the CPHP, and implementation of mitigation measures identified in the CPHP EIR, would ensure that new construction at the campus site would not result in deleterious effects on geology and soils on- and off-campus.

I-Zeff-4 The commenter indicates there is no way of knowing how nearby houses may be seismically compromised by the removal of a large part of the hill on which they sit; and that if there is a major earthquake, the homeowners would be left to consider how that damage was maximized by geological disruption of the hill under the CPHP. Please see Response I-Zeff-3, above.

I-Zeff-5 The comment states that the Draft EIR does not adequately analyze shadow on neighborhoods surrounding the UCSF campus. Please refer to Master Response 9: Shadow Impacts.

I-Zeff-6 The comment asserts that the Draft EIR does not adequately address how the CPHP will impact vehicle congestion. As discussed in Master Response 16, a project's effect on automobile delay shall not constitute a significant environmental impact under CEQA. As such, the potential constrained capacity

at and around the campus site is not a CEQA concern and transportation impacts based on congestion and vehicular delay are appropriately not analyzed in the Draft EIR.

The comment also asserts that emergency vehicle access to UCSF could be impacted by vehicle congestion. Refer to Master Response 21 for a response to this issue.

I-Zeff-7 This comment states that Draft EIR does not address the noise disruption that the proposed location of the emergency room in the New Hospital would cause with ambulances arriving day and night.

Noise impacts from ambulance operations associated with operation of the New Hospital were addressed as a program-level analysis. However, the level of detail is not available at this time for the New Hospital to make a reasonable estimate of the hospital emergency operations and associated potential increase in ambulance activity in the CPHP EIR. The project-level operational impacts of the New Hospital, including the noise impact from increases in ambulance activity, will be analyzed in a separate hospital-specific EIR that is forthcoming. Accordingly, the CPHP Draft EIR contained only a qualitative analysis of noise from emergency vehicle visitations. This quantitative analysis is supported by the text on page 4.11-28 of the Draft EIR which states that, given that existing campus operations already involve ambulance drop-offs, and that the New Hospital would be assumed to only marginally increase the potential frequency of emergency vehicle visits, the operational impact of additional ambulance activities at the campus site associated with the New Hospital would be less than significant.

I-Zeff-8 This comment states that the EIR does not address the significant noise pollution the New Hospital will result in, once completed. Operational noise impacts are addressed on pages 4.11-26 through 4.11-30 of the Draft EIR in Impact NOI-2, which addresses if implementation of the CPHP would generate substantial permanent increases in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

I-Zeff-9 The comment asserts that the CPHP does not provide adequate parking. The comment also asserts that the analysis is inadequate because it does not address the effects of the COVID-19 pandemic on travel behavior which will increase private vehicle use and decrease transit use. As stated on page 4.15-33 and Master Response 18, parking is not a CEQA topic, and additional discussion of parking supply and demand in the campus site vicinity is not required. The CPHP's proposed parking supply was, however, assessed and incorporated into estimates of project travel demand, as discussed in Master Response 17. For the effects of COVID-19 on travel behavior, please see Master Response 3: COVID-19.

I-Zeff-10 The commenter asserts that the CPHP does not addressed the increased housing needs of an expanded campus; and that the proposed housing expansion is small relative to the daily population increase. Please see Master Response 14: Population and Housing.

I-Zeff-11 The commenter opines that UCSF proposal to replace any area of the Reserve that is lost due to new development under the CPHP by designating new Reserve area elsewhere on the campus site misses the point, and that there is no mitigation for developing on this rare forested area. UCSF's proposal under the CPHP would provide permanent open space reserve protection that is not currently provided for this area adjacent to the Surge parking lot, and ensure there is no net loss in protected areas at the campus site. Nevertheless, the commenter's opinion is noted and will be forwarded to decision-makers.

I-Zeff-12 The commenter questions how public transit transportation mitigation will be affected in light of COVID-19, and questions how other interrelated issues will play out in the future in light of global pandemics. Please see Master Response 3: COVID-19.

I-Zeff-13 The commenter questions the proposed integration of the hospital, clinics and labs in one building in light of COVID-19. Please see Master Response 3: COVID-19.

I-Zeff-14 The commenter requests other geographical areas for UCSF to build its New Hospital be considered. Please see Master Response 5: EIR Alternatives.

I-Zeff-15 The commenter indicates that the proposed New Hospital violates basic principles of urban design, and indicates that buildings on the perimeter of the campus should get progressively lower in height as they approach peoples' homes. The comment is acknowledged, and to the extent the CPHP development, including the New Hospital, would result in environmental impacts to adjacent residences, they are adequately addressed in the Draft EIR. Please see Draft EIR Section 4.1, Aesthetics, Wind and Shadow; and Section 4.10, Land Use and Planning. Please also see Master Response 13: Land Use Impacts. In addition, please note that an approximate massing of the New Hospital was assumed for purposes of analysis in the Draft EIR. When a preliminary design of the New Hospital becomes available, it will be further analyzed in a project-level EIR.

I-Zeff-16 and I-Zeff-17: The comments are appreciated and will be shared with the CPHP planning team. The extensive community process for the CPHP began two years ago, and is ongoing. During the past two years, UCSF received feedback on the plan and incorporated desired concepts such as more open space, better access to the UCSF Mount Sutro Open Space Reserve, and consideration of other amenities that benefit neighborhood visitors. This feedback has helped to shape the plan. Additionally, through the community process, UCSF has identified community investment ideas such as public transit improvements and bike path

improvements in the public right-of-way that it further evaluates with the City and County of San Francisco. UCSF also continues to consider Transportation Demand Management measures to minimize vehicular trips to/from the campus. There will be further opportunities for public input as the community process continues.

In regard to the EIR, the analyses were conducted pursuant to the California Environmental Quality Act (CEQA) and the significance standards set forth in the CEQA Guidelines Appendix G. The Draft EIR identifies adequate mitigation measures for those impacts that would exceed the significance standards.

I-Zeff-18 Thank you for your comment. As discussed in Response I-Zeff-16, the community process began two years ago. Prior to the shelter-in-place and social distancing mandates when in-person community meetings occurred, there were opportunities for dialogue among the entire group, as well as in small breakout groups. The purpose of the small breakout groups was to encourage more dialogue and ensure a broad representation of ideas and concerns, as some community members may be reluctant to speak in front of a large group but may be comfortable speaking in small groups. Your comment will be shared with the UCSF community meeting organizers to consider as future community meetings are planned.

Re: UCSF Comprehensive Parnassus Heights Plan and its Draft EIR – State Clearinghouse Number 2020010175

Dear Chancellor Hawgood and the U.C. Board of Regents,

We, the undersigned, are deeply alarmed by the University's expansion plan for its Parnassus Heights campus, a plan that threatens ten historic murals by the artist Bernard Zakheim. The murals, as you know, are showpieces of the New Deal era, rightly regarded as the "jewel of the University's art collection." They portray a rich tapestry of people at pivotal moments in California's history. Of particular significance is the fresco featuring Biddy Mason, a former slave turned nurse, philanthropist, and real estate entrepreneur. This work—the first known artistic representation of Mason—tells a vital and sadly overlooked story of Black empowerment. Such tributes to women of color from this era are extraordinarily rare, and deserve not only preservation, but celebration. 1 2

As such, we find the University's plan embarrassingly out of step with the national movement over race and representation. Leaders from across the country are demanding an honest reckoning with our past in an effort to forge a more just future. We urge you to be one of those leaders. Through these murals, you have the opportunity to honor historically marginalized people and to foster deeper understanding of America's long, fraught relationship with race. 3

We therefore implore you to preserve these irreplaceable works of art. Furthermore, we ask that you engage with specialists to ensure the murals are publicly accessible, so that future generations can draw inspiration from the empowering history they depict. As New Deal public works, they belong to us all. What you do here—or fail to do here—will be seen far beyond the halls of the University. 4

Honor your roles as stewards and educators. Preserve and display these emblems of our shared cultural heritage. ↑ 4 cont.

Responses to Comments from Laura Voisin George, et al.

I-George-1 The commenter expresses alarm that the CPHP will threaten the Zakheim murals. Please refer to Master Response 11: Toland Hall Murals.

I-George-2 This comment notes that the mural of Biddy Mason is unique and rare example of a tribute to a woman of color from this era. Please refer to Master Response 11: Toland Hall Murals.

I-George-3 This commenter states UCSF's plan is out-of-step with the current national movement regarding race and representation and that UCSF has the opportunity to honor historically marginalized people. Please refer to Master Response 11: Toland Hall Murals.

I-George-4 This comment asks that UCSF ensure the murals remain publicly accessible. Please refer to Master Response 11: Toland Hall Murals.

From: Frances Starn Campus
To: Planning - EIR
Subject: DEIR UCSF Comprehensive Parnassus Heights Plan
Date: Friday, September 11, 2020 3:50:31 PM

Regarding DEIR, UCSF Comprehensive Parnassus Heights Plan
State Clearinghouse Number 2020010175

Dear Chancellor Hawgood and UC Regents,

New alternatives need to be provided for preservation and public display of Bernard Zakheim's important frescoes of "The History of Medicine in California" in the auditorium of UC Hall, now slated for demolition. 1

Not only is the 1936 mural a significant example of San Francisco's New Deal public art projects, by an artist whose works appear in Coit Tower and other local landmarks.The social and historical content of the mural is even more important than its art.

Zakheim's frescoes show in one panel a former slave, Bridget (Biddy) Mason, ministering to a plague-stricken citizen. She stands elbow-to-elbow with various bearded white elders of the Gold Rush state.To the right is a laboratory table where they appear to be researching a vaccine or a cure. Biddy Mason, a former slave, was also a church founder, a philanthropist and real estate entrepreneur. True, she was active in Los Angeles, not San Francisco--but the topic is the history of medicine in California, where she, a Black woman, a midwife, and a healer remains uniquely important. 2

Rather than demolishing the frescoes, they should be carefully removed and integrated, even highlighted, within the new Parnassus Heights campus. Transfer is a simple enough process for conservationists with a working knowledge of fresco technique. The "History of Medicine in California" is meant for public display. 3

Particularly in this time of bitterness over racial inequities, including unequal health care, a work of public art honoring a former slave, a Black nurse and civic leader, can surely not be destroyed by a public university. 4

Sincerely yours,

Randolph Starn
Professor emeritus of History and Italian Studies
University of California, Berkeley

Responses to Comments from Frances Starn

I-Starn-1 The commenter indicates that new alternatives need to be provided for preservation and public display of the Zakheim murals in the Toland Hall auditorium. Please refer to Master Response 11: Toland Hall Murals.

I-Starn-2 The commenter discusses that the murals are a significant example of San Francisco's New Deal public art projects, and that one of the frescoes depicts Biddy Mason. Please refer to Master Response 11: Toland Hall Murals.

I-Starn-3 The commenter indicates the Zakheim murals should be carefully removed and integrated within the Parnassus Heights campus site. Please refer to Master Response 11: Toland Hall Murals.

I-Starn-4 This comment suggests the mural depicting Biddy Mason should not be removed given the current context of the Black Lives Matter in the United States today. Please refer to Master Response 11: Toland Hall Murals.

From: Scott Lebus
To: Campus Planning - EIR
Subject: CPHP Draft EIR Comments
Date: Friday, September 11, 2020 3:58:35 PM

Notwithstanding that I am an alumnus and value the institution of UCSF, I have concerns about the scale and scope of the CPHP. 1

My concerns are as follows:

- Inadequate solutions to the traffic, parking, and public transport needed to bring 8,000 extra people onto campus. 2
- The population increases on campus, putting stress on the infrastructure of the neighborhood. And not providing adequate housing for new workers. 3
- EIR does not address any of the changes in healthcare that have resulted from COVID-19. Is the historical model of gathering patients together into one large building still safe and appropriate? 4
- Air quality degradation during construction and operations. 5
- Inadequate study of potential erosion of the back of Edgewood Avenue if UCSF digs into the hillside on the Eastern side of Medical Center Way, as planned. 6
- The aesthetic effect of blocking views south from the Golden Gate Park, and north from the trails in Sutro Forest. 7
- While the Parnassus campus can benefit from a “face lift,” has UCSF thoroughly explored alternative locations, such as Mt. Zion or elsewhere, for a gigantic hospital complex? 8

Thank you for your consideration of these concerns.

Sincerely,

Scott Lebus, DDS, MS
1543 Willard Street, San Francisco, CA 94117

Responses to Comments from Scott Lebus, DDS, MS

I-Lebus-1 The commenter indicates that new alternatives need to be provided for preservation and public display of the Zakheim murals in the Toland Hall auditorium. Please refer to Master Response 11: Toland Hall Murals.

I-Lebus-2 The comment expresses concern about the adequacy of the Draft EIR in analyzing the effects of the CPHP-related increase in population size on traffic, parking, and public transport. Refer to Master Response 18 and Master Response 19 for a response to this concern.

I-Lebus-3 The commenter states that the population increase at the campus site would place stress on the infrastructure of the neighborhood and the project would not provide enough housing for the new workers.

Please refer to Master Response 14: Population and Housing Impacts, regarding the CPHP's impact on population and housing. The impacts of the proposed CPHP on the infrastructure within and surrounding the campus site are analyzed in Section 4.15, Transportation, and Section 4.16, Utilities and Service Systems in the Draft EIR.

I-Lebus-4 The commenter asserts the Draft EIR does not address the changes in healthcare that have resulted from COVID-19. Please see Master Response 3: COVID-19.

I-Lebus-5 This comment expresses concern regarding air quality degradation during construction and operations.

Construction-related air quality impacts are assessed on pages 4.2-28 through 4.2-33 of the Draft EIR. Operational quality impacts are assessed o pages 4.2-33 through 4.2-45 of the Draft EIR. Localized construction-related health risk impacts are addressed on Draft EIR pages 4.2-45 through 4.2-58, while operational health risk impacts are addressed on Draft EIR pages 4.2-58 through 4.2-63.

I-Lebus-6 The commenter indicates that there has been inadequate study of potential erosion on the hillside adjacent to Edgewood Avenue associated with excavation for development of the New Hospital. Impact GEO-4 in the Draft EIR addresses the potential for construction associated with the CPHP, including the New Hospital, to result in erosion. The Draft EIR discusses that the proposed project would be required to file a Notice of Intent with the State Water Resources Control Board (SWRCB) to be covered under the National Pollution Discharge Elimination System (NPDES) Construction General Permit for discharges of stormwater associated with construction activity (also discussed further in Section 4.9, Hydrology and Water Quality). The Construction General Permit requires the preparation and implementation of a Stormwater Pollution Prevention Plan (SWPPP) which would include erosion control measures in the

form of best management practices (BMPs) that would be effective in reducing the potential for erosion during construction. BMPs would include, but would not be limited to, filtering runoff during construction, avoiding heavy grading and earthwork operations during the rainy season, and incorporating landscaping as early as possible. Once construction is completed for each element of the CPHP, the area of disturbance would be either covered by a structure, road or pathway, or landscaped such that the potential for erosion is minimized. Therefore, with adherence to existing regulatory requirements that would require implementation of erosion control BMPs during construction, the potential for erosion or loss of topsoil would be reduced to less than significant levels.

I-Lebus-7 The comment expresses concern that the proposed project would block views south from the Golden Gate Park and north from the trails in Sutro Forest. Please refer to Master Response 7: Aesthetic Impacts.

I-Lebus-8 The commenter inquires if UCSF has explored alternative locations, such Mount Zion campus site, for the New Hospital. Please see Master Response 5: EIR Alternatives.

Dear Ms. Wong,

Please accept these comments regarding the EIR, attached and pasted in below.

EIR Comments Teresa Welborn

September 11, 2020

Section 4.15 TRANSPORTATION

REGIONAL AND LOCAL TRANSIT SERVICE

Due to Covid-19, all regional and local transit service has been decimated. Due to local and state balanced budget requirements, it is extremely unlikely that a return to even as much as 50% of prior service levels. This means that all reliance on public transit must be reconsidered. And that there will be increases in privately-owned vehicles, impacting roadways and parking, not reducing traffic. 1

UCSF has so far refused to pay its fair share of increasing MUNI services. 2

LOCAL ROADWAY NETWORK

These "consist[s] primarily two-lane roadways," and are already completely congested during weekday work hours. In particular, Parnassus is at saturation. Parnassus consists of two lanes, one in each direction. A vast medical center, near industrial use, as proposed, requires a minimum of a four-lane roadway.

Parnassus is also a major cross-town route.
Patients, construction workers, and hospital staff of all levels are unlikely to arrive by bicycle or on foot. This is particularly so, given that UCSF has offered to build a patently inadequate number of on-campus housing units. The few hundred offered are at Aldea, which is poorly served by a weekday only shuttle and privately-owned vehicles. 3

UCSF states that streets feeding into Parnassus are sometimes as large as four-lane; but fails to address that all mus still funnel into two-lane streets such as Parnassus and Kirkham.

UCSF TRANSPORTATION MANAGMENT PLAN [TDM]

The TDM, while in the past it has in many ways mitigated traffic impacts, is adequate to address a 50% increase in average daily campus population.
Even if UCSF shuttles were expanded to include some segment of the increased patient population, most current hospital patients arrive and leave by privately-owned vehicles. 4

EMERGENCY VEHICLE ACCESS

The emergency vehicle access refers only to SFFD. Ambulances and privately-owned vehicles can/are emergency vehicles. Even SFPD can be emergency vehicles. 5

Again, UCSF has failed to consider the impacts of various likely disaster scenarios. Presumably they do 6

not want to acknowledge their failings. A major fire on Mt. Sutro has already occurred once. Another major earthquake is expected in the greater San Francisco Bay area, as well as in the City of San Francisco. Displacement, injury and death of hundreds of thousands of people are forecast. UCSF has a duty to provide the City of San Francisco [at least] with disaster services. We have been extraordinarily fortunate that the Covid-19 cases in San Francisco have been low, and that UCSF has been able to provide a variety of services. Nevertheless, UCSF should rethink putting all of its “adult care” hospital services into one basket, on a mere two-lane road, which is likely to be blocked by a major fire or earthquake, gas explosion, etc.

6 cont.

IMPACT TRANSPORTATION- 2 MULTI-LEVEL SERVICE CORRIDOR

Proposals of how such a corridor could be constructed and serve both campus, staff, patients, and deliveries are non-existent. This means that the community is unable to evaluate such proposals.

7

IMPACT TRANSPORTATION- 3 Including Aldea Housing Densification

While adding some housing at Aldea may be of some value, doing so will result in more use of privately-owned vehicles. There are no nearby neighborhood services, such as grocers, pharmacy, restaurants, and other household shopping and service needs, conveniently accessible by transit, bike or foot. Current UCSF shuttle operate only on weekdays, during the day, as I found out one day, and had to do a long walk back to the Parnassus campus.

8

CUMMULATIVE IMPACTS

UCSF states that “there are no identified land use development projects within the vicinity of the Parnassus Heights campus, or population change projected, which will result in traffic growth and/or changing travel patterns...”

While true in the present sense, this statement ignores the past proposed development at Kirkham Heights, which may resurface, and recent local and Sacramento legislation that offer incentives for both future affordable and market-rate housing. Both categories are likely to particularly impact San Francisco's West Side, which UCSF has said that it serves [along with serving the Bay Area and areas further flung.

9

IN CONCLUSION

UCSF staff, in the recent Community Advisory Group [CAG] meeting, said that “UCSF wants to go where patients are.” Significant revision of the Parnassus Heights overly ambitious plan could assist in that goal.

10

Responses to Comments from Teresa Welborn

I-Welborn-1 The commenter indicates the reliance on public transit must be reconsidered in light of COVID-19. Please see Master Response 3: COVID-19.

I-Welborn-2 The comment asserts that UCSF has not contributed adequately to providing MUNI service. UCSF's historical funding of transportation services is not a CEQA concern, nor is it related to the CPHP analyzed in the Draft EIR. Please see Master Response 20. The comment is noted.

I-Welborn-3 The comment asserts that the Draft EIR does not adequately assess impacts due to constrained roadway capacity in the vicinity of the campus site. As discussed in Master Response 16, a project's effect on automobile delay shall not constitute a significant environmental impact under CEQA. As such, the potential constrained capacity at and around the campus site is not a CEQA concern and transportation impacts based on congestion and vehicular delay are appropriately not analyzed in the Draft EIR. The comment also asserts that certain populations are unlikely to use certain modes, such as bicycle or walking, which are more likely to be used by populations that live in on-campus housing. The comment then states that the CPHP includes an inadequate number of net new on-campus housing units and that residents of the new housing units at the Aldea Housing complex are poorly served by UCSF shuttles and will be more likely to drive private vehicles. Mode assignment was estimated for individual populations, and produced separately for employees, students, and residents. As such, the comments concern about travel mode are accounted for in the analysis presented in the Draft EIR on pages 4.15-29 through 4.15-33 and in Table 4.15-9. Although some of the residents of the new units in the Aldea Housing complex would be required to travel via private vehicle and campus shuttle between their residences and work places in the campus core, as compared to new residents of the West Side housing who would be able to walk or bike to their work places, the distance that the Aldea residents would travel is not long and would not result in a substantial increase in VMT or greenhouse gas emissions due to this intra-campus travel.

I-Welborn-4 The comment asserts that despite the existing UCSF Transportation Demand Management program which may influence the travel behavior of some of the patients traveling to the campus site, patients and visitors will continue to rely on private vehicles. As shown in Table 4.15-8 of the Draft EIR (page 4.15-30) currently 73 percent of patient/visitor trips occur in private- or for-hire vehicles such as taxi or TNC. In the future, as shown in Table 4.15-9 of the Draft EIR (page 4.15-32), 75 percent of patient/visitor trips are forecast to occur in private- or for-hire vehicles. The methodology used to estimate future modes of travel is described on pages 4-15-30 and 4.15-31 of the Draft EIR and discussed in further detail in Master Response 17.

I-Welborn-5 The comment asserts that the Emergency Access section did not adequately account for vehicles other than those operated by the San Francisco Fire Department. This is incorrect, as discussed in Master Response 21.

I-Welborn-6 The commenter asserts that various disaster scenarios were not considered in the Draft EIR, including major fires, earthquake or gas explosion. The commenter indicated a major fire has already occurred once on Mount Sutro; and that UCSF should rethink putting all of its adult care hospital services in one location, on a two lane road.

As explained in the Draft EIR Appendix A, Initial Study, under topic IX, Hazards and Hazardous Materials, checklist item f), and repeated in Draft EIR Section 4.8, Hazards and Hazardous Materials, page 4.8-13, all projects and improvements would be designed to ensure appropriate emergency access to and egress from all areas. Additionally, all project-specific designs, including private internal circulation and building site plans, would be subject to review and approval by the State Fire Marshall for emergency response and evacuation concerns. UCSF design criteria and existing emergency response requirements are sufficient to ensure that the potential health and safety effects resulting from possible impairment or interference with any emergency response or evacuation plans would remain less than significant.

In addition, as explained in the Draft EIR Appendix A, Initial Study, under topic IX, Hazards and Hazardous Materials, checklist item g), and repeated in Draft EIR Section 4.8, Hazards and Hazardous Materials, page 4.8-13, implementation of UCSF's Mount Sutro Open Space Vegetative Management Plan would change fire hazards and fire behavior within the Reserve, and fire hazards within the Reserve would generally decrease as a result of vegetation management activities, such as creating defensible space, removing diseased and/or dead trees, and increasing the diversity of tree types. The remainder of the Parnassus Heights campus site is not located within a fire hazard severity zone. Continued implementation of the Vegetation Management Plan, in conjunction with compliance with all California Fire Code requirements, would mitigate the wildfire risk to new development under the CPHP, and consequently, the impact associated with the exposure of people or structures developed under the proposed CPHP, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires would be less than significant.

I-Welborn-7 The commenter asserts that the details of how the proposed service corridor would serve campus, staff, patients and deliveries do not exist. The CPHP indicates (page 107) that the goals of the proposed service corridor are to: 1) create a long-term design for the corridor to address connectivity, emergency vehicle access, maintenance access, delivery, logistics, and phasing for implementation, and 2) manage risks of service interruptions through creation of a utility loop to support overall stability of campus service as a whole. Available

details of the proposed service corridor are described on pages 3-29 to 3-30 of the Draft EIR, including its purpose, conceptual alignment, and which utilities would be extended within the corridor. Regardless, all potential impacts of this improvement adequately are addressed and mitigated to the extent feasible. Please note, however, that when the proposed service corridor project is advanced in terms of design, it would be evaluated to determine what additional environmental review, if any, is needed prior to approval.

I-Welborn-8 The comment asserts that the Draft EIR does not adequately account for the Aldea Housing Densification project's distance to transit and other locations in determining the project's travel demand. As discussed on page 4.15-33 of the Draft EIR, analysis of new travel associated with the Aldea Housing complex was based on travel surveys of existing residents. Because existing residents have similar access issues to those anticipated for future residents, they represent an accurate source of travel data for use in future projects. Therefore, the analysis presented in the Draft EIR is adequate, fact-based, and accounts for the issues raised in the comment. See Master Response 17 for more information on how travel behavior survey data that UCSF routinely collects is incorporated into mode share assignments.

I-Welborn-9 The commenter asserts that Draft EIR ignores certain cumulative projects, including past proposed development at Kirkham Heights that could resurface, and recent local and State legislation that offer incentives for future affordable and market-rate housing.

With respect to specific projects, no application has been submitted to the City for a potential resurfaced Kirkham Heights proposal, and a result, the inclusion of it as a cumulative project in the Draft EIR would be speculative. With respect to legislation for incentives for future affordable and market-rate housing, to the extent that this housing is anticipated by the applicable planning agency, it is included their respective approved planning document and/or forecasting models.

I-Welborn-10 The commenter makes a concluding statement that significant revision of the CPHP could assist in UCSF goals that "UCSF wants to go where patients are." This comment does not address the adequacy of the Draft EIR; consequently, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

Date:	Friday, September 11, 2020 5:01:15 PM

September 11, 2020

TO: Diane Wong UCSF EIR@ucsf.edu.

FROM: Nancy Wuerfel, 2516 23rd Avenue, San Francisco, CA 94116

RE: Draft EIR for UCSF Comprehensive Parnassus Heights Plan

Please include this email in the Public Comments for the Draft Environmental Impact Report (DEIR) for the CPHP. The following comments are arranged to correspond with the sections of the California Public Resources Code, Division 13, CEQA as amended in 2019. The issues I raise are in response to the findings and declarations of the Legislature for some of the code sections.

Sec. 21001.1 - Use of Environmental Impact Reports (EIR); Policy
(a) "The purpose of an EIR is to identify the significant effects on the environment..."
(e) "To provide more meaningful public disclosure, reduce the time and cost required to prepare an EIR, and focus on potentially significant effects on the environment of a proposed project..."

COMMENT - EIRs must include accurate information in the analysis of existing conditions and the potential changes to the environment of a new project. Significant effects cannot be properly evaluated if the basis for the decision is flawed or inadequate. The DEIR contains numerous examples of misleading or wrong information that I can provide to reviewers if requested to do so. The EIR reports live forever and are relied on by the public as a source of accurate information. Unfortunately, this trust is misplaced if the DEIR is not corrected before it becomes final. 1

Sec. 21003 - Planning and Environmental Review Procedures etc
(b) "Documents prepared pursuant to his division be organized and written in a manner that will be meaningful and useful to decision makers and to the public"
(d) "Information developed in individual EIRs be incorporated into a data base which can be used to reduce delay and duplication in preparation of subsequent EIRs"
(e) "... which may be used to make subsequent or supplemental environmental determinations."

COMMENT - Again, EIRs with insufficient analysis or lack of substantial evidence does not benefit the project or the public's understanding of the potential environmental risks. Putting inaccurate information from an EIR that then becomes part of a data base is wrong and must not be allowed to happen. There needs to be a 2

check and balance on the data going into a data base. 2 cont.

Sec. 21003.1 - Environmental Effects of Projects; Comments from Public ...
(a) "Comments from the public and public agencies on the environmental effects of a project shall be made to lead agencies as soon as possible in the review of environmental documents ... in order to allow the lead agencies to identify, at the earliest possible time in the environmental review process, potential significant effects of a project..."

COMMENT - The Scoping and Initial Study public comments were recorded but were not addressed in the DEIR such as: "take into account that high winds can turn "moderate risk" into "disaster" [fires]" "study how slope, normal winds, and high winds can spread fires" "study potential slides and impacts of broken water mains." "The San Francisco Fire Marshal did an audit in 2015 found that the situation in a drought on Mount Sutro was considered extra hazardous and made some recommendations." These comments were made in a timely fashion, but were not acknowledged in the DEIR. 3

The following comments are arranged to correspond with the sections in the DEIR, with page numbers.

1.1 Purpose of the CPHP EIR
pg 1-2 -- To inform the general public ...of the nature of the CPHP and potential environmental effects... -- To serve as a reference document...
--"This EIR is an informational document..."

COMMENT - To be a reference document, EIRs must include accurate information in the analysis of existing conditions and the potential changes to the environment of a new project. The EIR reports live forever and are relied on by the public as a source of accurate information. Unfortunately, this trust is misplaced if the DEIR is not corrected before it becomes final. 4

pg 1-4 --This EIR analyzes the potential significant environmental impacts that could result if the LRDP FEIR amendment is approved ... some information from the 2014 LRDP FEIR is still relevant and has been used to characterize existing conditions and inform the impact analysis...

COMMENT - There are no citations that alert the reader as to what information is "still relevant" and currently "used to characterize existing conditions". Therefore, in case the reader wants to challenge the characterization because the information is out of date, the EIR should clearly indicate what information is from 2014. 5

1.3.1 Notice of Preparation and Public Scoping
pg 1-4 -- The NOP public comment period ended on February 21, 2020. The NOP and Initial Study announcement was published on January 14, 2020.

COMMENT - Six months ***before*** the NOP and IS were announced, the San Francisco 2018-2019 Civil Grand Jury (CGJ) published their report on July 17, 2019 entitled: ACT NOW BEFORE IT IS TOO LATE: AGGRESSIVELY EXPAND AND ENHANCE OUR HIGH-PRESSURE EMERGENCY FIREFIGHTING WATER SYSTEM. 6

The DEIR makes no mention of the 63 page CGJ report or its findings and recommendations that are directly relevant to discussions *for informational purposes (not for mitigation purposes)* of the potential risks in the following EIR sections:

4.6 Geology and Soils - potential seismic occurrence risks that include fires following earthquakes affecting people and structures. 7

4.13 Public Services - need for expansion of the auxiliary water supply system (AWSS) "AWSS is designed to provide water at higher pressures than the [domestic] potable water system, allowing firefighters to use water from the AWSS hydrants without requiring a fire engine." 8

4.16 Utilities and Service Systems - need to distinguish between the domestic low- pressure pipeline and hydrant system using potable water, and the AWSS high-pressure pipeline and hydrant system using non-potable from Twin Peaks Reservoir and saltwater pumped from the bay. In assessing existing Use and Infrastructure services, accuracy is needed to characterize where the low pressure domestic mains are and where the multiple AWSS pipeline locations are. Also, the additional demand for CPHP water supply is mischaracterized and understated in the West and Yost report appendix B since the volume of water needed for Utilities and Infrastructure for the entire project is not stated, and listed as N/A. The volume of water for fight post-earthquake fires must be estimated.

1) The CGJ makes the following recommendations, among others which are more fully discussed herein: " Recommendation R1. A detailed plan to ensure the City is well prepared to fight fires *in all parts* of San Francisco in the event of a 1906 magnitude (7.8) earthquake" and "The City should aggressively develop a high-pressure, multi- sourced, seismically safe emergency water supply for those parts of the City that don't currently have one, with a targe completion date of no later than 2034." 9

2) The CGJ states in the section on Background and Problem Statement: "Fire Following Earthquake is a Major Risk to The City" and "San Francisco will sustain major damage from fires following future earthquakes, in addition to the damage caused by the shaking." "San Francisco is highly vulnerable to fire after an earthquake more than any other city in the country." "Water supply is critical to firefighting."

Responses to Comments from Nancy Wuerfel

I-Wuerfel-1 The commenter makes a general statement that the Draft EIR contains numerous examples of misleading or wrong information that the commenter can provide to reviewers if requested to do so. The comment is noted; however, in the absence of any specific comment in this matter as it relates to the CPHP Draft EIR, no direct response can be provided. Please see Master Response 2: General Comments on EIR and Environmental Topics.

I-Wuerfel-2 The commenter makes a general statement that EIRs with insufficient analysis or lack of substantial evidence does not benefit the project or the public's understanding of the potential environmental risks; that putting inaccurate information from an EIR that then becomes part of a data base is wrong and must not be allowed to happen; and that there needs to be a check and balance on the data going into a data base. The comment is noted; however, in the absence of any specific comment in this matter as it relates to the CPHP Draft EIR, no direct response can be provided. Please see Master Response 2: General Comments on EIR and Environmental Topics.

I-Wuerfel-3 The commenter indicates that the Draft EIR should take into account high winds that can turn moderate risk into disaster fires; study how slope, normal winds and high winds can spread fires; study potential slides and impacts of broken water mains; and that San Francisco Fire Marshall did an audit in 2015 and found that conditions in a drought on Mount Sutro were considered extra hazardous and made recommendations.

Please refer to Draft EIR Section 4.8, Hazards and Hazardous Materials, pages 4.8-6 to 4.8-7 under the topic Wildland Fire. In September 2018, UCSF began implementing the Mount Sutro Open Space Reserve Vegetation Management Plan, a 20-year phased plan to improve ecosystem health, regenerate the forest, maintain and ensure public access to the Reserve, and minimize fire risk. In accordance with UCSF's established risk-reduction program, the Vegetation Management Plan is intended to protect the safety of Reserve users and adjacent structures with vegetation management to reduce the risk of both tree failure and fire. Under the Vegetation Management Plan, vegetation management is conducted in accordance with guidelines established by the San Francisco Fire Department and Cal Fire to create and maintain defensible space between vegetation and buildings.

The Draft EIR also notes that UCSF Facilities Services conducts ongoing, regular maintenance in the Reserve including: removal of storm debris, downed trees or branches, hazardous trees, trash, campsites; managing overgrown vegetation, including near roads, trails, parking areas, walkways, stairs, and buildings; scheduled tree pruning every two years or as necessary. This serves to keep buildings, roads and pathways safe, and further reduce fire risks.

In addition, as explained in the Draft EIR Appendix A, Initial Study, under topic IX, Hazards and Hazardous Materials, checklist item g), and repeated in Draft EIR Section 4.8, page 4.8-13, implementation of UCSF's Mount Sutro Open Space Vegetative Management Plan would change fire hazards and fire behavior within the Reserve, and fire hazards within the Reserve would generally decrease as a result of vegetation management activities, such as creating defensible space, removing diseased and/or dead trees, and increasing the diversity of tree types. The remainder of the Parnassus Heights campus site is not located within a fire hazard severity zone. Continued implementation of the Vegetation Management Plan, in conjunction with compliance with all California Fire Code requirements, would mitigate the wildfire risk to new development under the CPHP, and consequently, the impact associated with the exposure of people or structures developed under the proposed CPHP, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires would be less than significant.

With respect to landslides, please also refer to Draft EIR Section 4.6, Geology and Soils, for how the Draft EIR addresses the potential impact of the CPHP on landslide potential. Impact GEO-3 reports the results of slope stability risk assessments conducted by UCSF, which indicate the presence of small slope stability hazards on the campus site. Impact GEO-3 demonstrates that with the inclusion of recommendations in the 2019 slope stability report, as incorporated in CPHP Mitigation Measure GEO-3, the impact associated with landslide hazards would be reduced to a less than significant level.

With respect to the comment about broken water mains, as described in the Draft EIR Chapter 3, Project Description, page 3-31, fire water lines and systems within the campus site would be replaced in order to serve the new development envisioned under the proposed CPHP. This includes, but not limited, two new 180,000-gallon emergency water tanks (replacing two existing 20,000 gallon tanks) to serve the western portion of the campus core; and a new 110,000-gallon tank to provide emergency and domestic water storage for the existing hospitals and proposed New Hospital.

I-Wuerfel-4 The commenter makes a general statement that the EIRs must include accurate information in the analysis of existing conditions and the potential changes to the environment of a new project; that EIR reports live forever and are relied on by the public as a source of accurate information; and that this trust is misplaced if the Draft EIR is not corrected before it becomes final. The comment is noted; however, in the absence of any specific comment in this matter as it relates to the CPHP Draft EIR, no direct response can be provided. Please see Master Response 2: General Comments on EIR and Environmental Topics.

I-Wuerfel-5 The commenter indicates there are no citations that alert the reader as to what information from the 2014 LRDP Final EIR is still relevant and currently used to characterize existing conditions.

First, it should be noted that the CPHP Draft EIR contains a substantial amount of new information to update the baseline conditions from 2014 from the 2014 LRDP Final EIR to 2020 for the CPHP EIR, and in a majority of instances, new information is presented when characterizing baseline conditions for the CPHP EIR. Also, as indicated in Chapter 1, Introduction page 1-4, the CPHP EIR will replace in full the program-level impact analysis for the Parnassus Heights campus site contained in the 2014 LRDP FEIR. However, there are instances where the CPHP Draft EIR cites the 2014 LRDP Final EIR for background information that still may be appropriate for either representing baseline conditions, or otherwise for presentation of relevant background information. Section 4.1, Aesthetics, Wind and Shadow cites the 2014 LRDP Final EIR with respect to relevant historical wind conditions in San Francisco (page 4.1-11); and Section 4.11, Noise and Vibration acknowledges where certain baseline noise measurement data from the 2014 LRDP Final EIR was used. In addition, Chapter 3, Project Description describes where certain demolition projects at the campus site were previously analyzed in the 2014 LRDP Final EIR (page 3-37).

In addition, the Draft EIR notes where 2014 LRDP Final EIR-specific significance thresholds are also being used in the CPHP EIR (see 2014 LRDP Final EIR thresholds for toxic air contaminant emissions in Section 4.2, Air Quality on page 4.2-19 of the Draft EIR; 2014 LRDP Final EIR standard for damage or removal of heritage trees or native oaks in Section 4.3, Biological Resources on page 4.3-13; 2014 LRDP Final EIR standard for exposure of people to structural hazards in Section page 4.5, Geology and Soils on page 4.6-14; 2014 LRDP Final EIR standard for conflicts with local land use regulations in Section 4.10, Land Use and Planning on page 4.10-8; 2014 LRDP Final EIR standard for increases in average daily noise levels at property lines in Section 4.11, Noise and Vibration, page 4.11-13; and 2014 LRDP Final EIR standard for creating a demand for housing outside the market area in Section 4.12, Population and Housing on page 4.12-6.

I-Wuerfel-6 The commenter indicates the Draft EIR makes no mention of the 2019 San Francisco Civil Grand Jury report. This report identified that areas of the City, including in the western and southern districts, were not adequately covered by the City's Auxiliary Water Supply System (AWSS).

As described in the Draft EIR, Section 4.16 Utilities and Service Systems, pages 4.16-4 to 4.16-5, City AWSS facilities currently serve the Parnassus Heights campus site vicinity, including a 12-inch AWSS fire main in Parnassus Avenue that serves the AWSS hydrants on the south side of Parnassus Avenue. The AWSS fire main is fed by the Ashbury Street tank that has a direct

connection to the Twin Peaks Reservoir. Aside from the City's AWSS system, there are also City domestic water lines that serve hydrants in the campus vicinity. This includes 8-inch domestic water mains that serve fire hydrants along Parnassus and Fifth Avenues, and Kirkham Street; a 30-inch water transmission main along Parnassus Avenue that serves a hydrant on the east side of the campus site; and a 12-inch high pressure domestic water line along Clarendon Avenue that supplies water to fire hydrants in the Aldea Housing complex, on Medical Center Way.

Please note the SFPUC, in collaboration with the San Francisco Fire Department and San Francisco Public Works, have completed a number of AWSS construction projects within the City to improve the reliability of the AWSS following an earthquake or other disaster. These improvements, which utilize Earthquake Safety and Emergency Response Bond funds, have included repairs to existing cisterns and installation of new cisterns to improve coverage throughout the City; seismic strengthening of core facilities, and repair and expansion of pipelines and tunnel components.[6]

In addition, as described in Response I-Wuerfel-3, above, under the CPHP, a number of UCSF fire water lines and emergency water tanks within the campus site would be replaced to serve the campus core.

When considering the existing City AWSS and domestic water systems in the campus site vicinity, UCSF's on-campus emergency water system, ongoing improvements being implemented by the City for its AWSS system, and emergency water supply and distribution improvements proposed by UCSF at the campus site under the CPHP, it is not anticipated that there would be any notable deficiencies in emergency water systems serving the campus site under the CPHP.

I-Wuerfel-7 The commenter indicates the potential for seismic occurrence risks that include fires following earthquakes, affecting people and structures. As discussed under Approach to Analysis in Section 4.6, Geology and Soils, CEQA does not generally require analysis of impacts of the existing environment on the future residents or users of a project, including seismic impacts, unless the project were to exacerbate such condition. Nevertheless, Section 4.6 included a discussion of the potential for increased exposure of people or structures to risks associated with seismic occurrences for informational purposes. Impacts GEO-1 and GEO-2 in the Draft EIR demonstrate that with compliance with the regulatory requirements and the implementation of geotechnical design recommendations consistent with seismic design criteria, impacts relative to seismic shaking associated with earthquakes that may occur over the course of the CPHP would

6 San Francisco Public Utilities Commission website, Emergency Firefighting Water System Projects, https://sfwater.org/index.aspx?page=468, accessed October 26, 2020.

be less than significant. Correspondingly, potential secondary effects of earthquakes would also be less than significant.

I-Wuerfel-8 The commenter asserts a need for expansion of the City AWSS system. Please refer to Response I-Wuerfel-6, above.

I-Wuerfel-9 The commenter indicates the City's domestic low pressure water system needs to be distinguished from the City's AWSS high pressure water system. A discussion of each of these City water systems in the campus site vicinity was included in Draft EIR Section 4.16, Utilities and Service Systems; please see Response I-Wuerfel-6, above, as well.

The commenter asserts the CPHP water demand is mischaracterized and understated because the Water Supply Evaluation (WSE) completed in support of the EIR indicated that the water demand associated with water needed for Utilities and Infrastructure is listed as N/A. As documented in Section 4.16 Utilities and Service Systems in the Draft EIR, page 4.16-22, The Initial Phase improvements include certain potable water conveyance improvements, heating and chilled water conveyance improvements, and new water tanks to better accommodate water demands of CPHP development, but the Initial Phase improvements are not in and of themselves a notable source of water demand. Consequently, the Initial Phase improvements would not result in a significant impact with respect to water supply, and the impact would be less than significant. Correspondingly, the WSE similarly documented that this element of the CPHP would not generate a notable water demand.

It is acknowledged that water would be required to help suppress fires, including those that could be a result of earthquakes. As indicated in Response I-Wuerfel-7, above, effects of hazards such as earthquakes and related effects on the CPHP would not be a result of the CPHP itself. Similarly, any water demand associated with suppressing fires associated with earthquakes would not be a water demand of the CPHP. Please also see Response I-Wuerfel-6, above.

From: Rick Hodgkins Campus
To: Planning - EIR
Subject: The revitalization of the Parnassus Heights campus:
Date: Friday, September 11, 2020 5:03:53 PM

To whom this may concern.

While I live in stinking stupid Sacramento County of California, I have been a patient at UCSF ever since I was an infant. And I have known since last year about the universities ambitions to revitalize UCSF main campus at Parnassus Heights. Besides that is definitely the only campus that I have ever been to. I better mention that pretty soon I will be visiting their satellite campus at Berkeley, that which is one of their many different satellite campuses. I have two suggestions but one question. My first suggestion has to do with the Langley porter psychiatric clinics and hospital. With regards to the department of psychiatry, I feel as a person with a developmental disability that perhaps general psychiatry auto be held in its own building. In other words all of the general psychiatry clinics dealing solely with patients with mental illness like bipolar, depression and schizophrenia, that who don't have any conquering disabilities including the forensic population. Those clinics should be housed in one building. When it comes to those doctors that see patients for both family medicine, OB/GYN, that which stands for obstetrics and gynecology and perhaps psychiatry, because there are doctors that are Crosstrained in either family medicine and psychiatry or family medicine, OB/GYN and psychiatry, then those doctors perhaps odyssey patients that fit all those criteria in family medicine. And then you have psychiatrists that deal with patients like myself who are developmentally disabled and those would be your neuropsychiatrists, who can diagnose both adults and children with developmental disabilities including autism. And speaking of children, pediatric psychiatry also known as child psychiatry oddity within the department of pediatrics. And the rest of neuropsychiatry audit be within the department of neurology. As far as Langley Porter Hospital, shouldn't that be part of the main hospital? And finally, being blind and visually impaired, I would like to see as far as wayfinding around campus, I would like to see along with print labels on signs, what about braille labels on signs and doors not only signs around campus, but doors so that a blind person no matter if they're a faculty member, a staff, a visitor or a patient find their way around. Those are my questions and suggestions. Thank you very much. 1

Respectfully yours,

Richard/Rick Hodgkins: patient of Dr.Lewis Blevins: Nuro endocrinologist, Dr. Craig Hoyt: Nuro ophthalmologist hopefully Dr. Jonathan Carter bariatric surgeon and Dr. Melissa Neuwelt: Soon to be retinal specialist.

Sent from my iPhone

Responses to Comments from Rick Hodgkins

I-Hodgkins-1 The commenter makes a number of suggestions to improve psychiatry services at UCSF. This comment does not address the adequacy of the Draft EIR; consequently, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

The commenter also requests improved wayfinding around campus, and suggests braille labels on signs and doors for the visually impaired. The comment is appreciated. As discussed in the Draft EIR, one of the Urban Design objectives of the CPHP is to improve the campus's functional organization and foster intuitive wayfinding; and the CPHP includes circulation improvements to facilitate intuitive wayfinding and easy navigation between buildings, including better pedestrian connections and addition of wayfinding signage. The suggestion from the commenter has been noted and will be forwarded to decision-makers.

IN RE: Comments UCSF Comprehensive Parnassus Heights Plan, Environmental Impact Report Prepared July 13, 2020

DATE: September 11, 2020

VIA EMAIL: EIR@ucsf.edu

Background

These comments are not based on a comprehensive review of the UCSF Comprehensive Parnassus Heights Draft Environmental Impact Report (Draft EIR), but rather reflect comments on specific sections of the Draft EIR that 1) did not fully respond to requests comments submitted for the Notice of Preparation or 2) seem insufficient or incomplete in the Draft EIR. 1

Items Requested But Not Fully Addressed

1. **CPHP Environmental Impact Report must include a UCSF commitment to more project specific scoping over the CPHP time period.**

The Draft EIR is supposed to be a document to guide Parnassus Heights development over the next 30 years and attempts the difficult task of making some projections to 2050. It focuses on the near-term Phase 1 projects expected to be completed by 2030, but provides no provision for additional project specific analysis or any expectation that the 2020 assumptions will be reviewed and rebased as the University completes Phase 1 and 2

- The draft EIR proposes project level analysis for the projects in the Initial Phase – Irving Street entrance, Research Academic Building, and Aldea Housing– but only commits to "determine the appropriate level of additional review, *if any (emphasis added*), needed" for additional projects.
- The new hospital is the only project that the draft scoping document identifies for a project specific EIR.
- The proposal for the 420 units of housing on the Fourth Avenue extension appears to warrant a project specific EIR.
- The excavation and potential undergrounding of the service road to connect Medical Center Way and Koret Way is likely another candidate for separate subproject evaluation.

- I request a UCSF commitment to additional project specific review that will provide touchpoints to reassess changes to "baseline" conditions over the timeframe and permit identification of cumulative effects.

2 cont.

2. CPHP impact timeline must be clarified to quantify the expected "front loading" and the overlap or concurrent demolition/construction impacts.

A large proportion of the population and transportation growth is expected within the Initial phase. While it is acknowledged that approximately 75% of the impact will occur during between 2020-2030, through the completion of the Moffitt Hospital replacement

- Include timeline of proposed demolitions and replacement buildings. This should include discussion of changes relative to the 2014 LRDP.

  o For example, the 2014 LRDP proposed demolition of Woods and Surge in the 2014-2019 timeframe and demolition of Proctor and Langley Porter in the 2020 - 2024 timeframe. Obviously, the Surge and Woods buildings are still standing. How will the demolition and construction timelines differ?

- Incorporate timeline of expected concurrent renovations/upgrades to buildings included in the 2014 LRDP but not addressed in CPHP.

  o For example, the 2014 LRDP proposed renovation of the Faculty Alumni House and Moffitt Hospital, as well as smaller projects (medical gas storage tanks, retaining wall) by 2035. Where will these occur in the CHCP timeline?

3

3. The Space Needs Assessment Appendix and presentations to the CHCP Community Advisory Group do not provide sufficient detail and justification for the hospital replacement with a 200 inpatient bed increase and large increase in square foot assumptions.

For example, the Draft EIR indicates that UCSF has had to refuse an increasing number of requested transfers. Based on numbers on Page 3-11, accommodating all medically necessary transfers by 2030, assuming the acceptance drops to 50%, with 6-day ALOS and 80% occupancy would require approximately 75 more inpatient beds. Also, the 2019 numbers on this page are nearly 3x higher than the 2019 medically necessary transfers turned away included in the June 12, 2020 presentation included in the Space Needs Assessment Appendix.

- In addition to the inpatient bed detail, provide current assumptions regarding the number of Emergency Department bays. Observation beds, number and size of intensive care units and operating rooms. Some of this information was provided to the members of the UC Regents Finance and Capital Strategies Committee in the meeting on March 18, 2020, but was not included in presentations to the CHCP Advisory Group or included in the Draft EIR. (See attachment)

4

- Provide more detailed information on the specific regulations and best practices regarding factors that increase the hospital size, such as ceiling height, operating room size, and radiology, laboratory and other ancillary support services.
- Provide assumptions regarding staffing (relative to licensed) and planned occupancy of inpatient services at the Parnassus campus
- Clarify how the proposed expansion of specialty service clinics and ambulatory surgery capacity at Mission Bay (Block 34) offsets space needs and proposed size of the replacement hospital. Again, some of this information has been provided to the Regents, but has not been shared with the CHCP Advisory Group or included as part of Mission Bay expansion in the Draft EIR. (see attachment)

4 cont.

Items Not Sufficiently Addressed

1. **Although there are frequent references to requesting an amendment to the 1976 Regents Resolution regarding the space ceiling, the proposed CPHP also would break commitments under the Community Planning Principles – specifically those with regard to height and building density.**

5

While some of the proposed building heights are within the current zoning height and density guidelines, most are not. Based on Figure 3-9 (page 3-21) new construction would be 25% to 250% higher than current buildings. The replacement hospital, at 16 stories would be nearly 50% higher and the Westside housing would be approximately 200% to 300% greater than the 40 foot zoning height for the surrounding residential neighborhood.

2. **The transportation analysis is insufficient and shows significant project impact. The EIR should develop enhancements to the Transportation Demand Management programs to mitigate these impacts.**
    - The near-term analysis does not include a traffic count of 6th Avenue between the turn from 7th at Lawton to Irving, a major commute route from the South to the Campus.
    - Because the pedestrian counts required people to use the crosswalk, it does not include counts of passengers boarding the N Judah inbound.
    - Shuttle trips and volume do not include frequency of operation – some which run three to four times an hour and add to congestion on Parnassus. Please add that detail for Parnassus Avenue trips.
    - The Noise Analysis (appendix page 2) shows 35%to over 50% increases in peak hour vehicle traffic on blocks of Kirkham, Judah, 7th Avenue and Stanyan.
    - It does not incorporate an analysis of traffic impacts expected from the opening of 4th Avenue and the westside housing. This is another reason to require the University to conduct a separate EIR for subprojects of the CPHP.
    - Future campus mode split (Table 4.25-9, page 4.15-32) projects a *decrease* in use of public transportation, car pool and shuttle. It assumes a paltry 2% will telecommute.

6

- Despite these projections, the EIR concludes that No Mitigation is required and there are no comments re possible changes in the Transportation Demand Management plan.

6 cont.

3. **The Draft EIR does not attempt to comment on the recent and ongoing lessons of clinical services delivery and workforce strategy that are emerging from the experience of preparation and ongoing management of the COVID-19 pandemic. It glosses over this issue as a matter of uncertainty or assumes that it means only increased clinical capacity and the need for larger facilities.**
    - The University has developed a committee to examine this issue. Preliminary findings should be included in the revised Draft EIR.
    - Address alternative workforce schedules, including partial and near full time telecommute options for segments of the workforce
    - Comment on further infrastructure development and projections for use of telehealth for patient visits, physician referrals and consultations, and other remote/distance applications.
    - Comment on how increasing telecommuting and telehealth capabilities may offset proposed office, administrative, research (dry lab), parking or other space needs.

7

4. **The Draft EIR has a limited discussion of possible components of a revised Memorandum of Understanding with the City and County of San Francisco and has taken a limited view of possible mitigation and community benefits. I expect that the MOU will be finalized before the CPHP EIR is presented to the UC Regents and must be incorporated in the final EIR document.**
    - For example, the 2019 Anchor Institution Report commits the University to be an employer of low income and people of color. What commitments will the University make regarding "local hire" for the demolition, construction and renovation projects proposed in the CPHP?
    - What commitments will the University make that new staff hires associated with the hospital and space expansion will be San Francisco residents, from low income neighborhoods and are people of color?
    - The members of the SF Planning Commission have asked staff to develop a report that would identify mitigation measures that the city would request if the CPHP was a proposal from a private non-profit or for-profit organization. The University should review the terms of the final agreement with Sutter for the Van Ness replacement hospital and the terms between the City of Palo Alto and Stanford University Hospital. (see attachment)

Responses to Comments from Susan Maerki

I-Maerki-1 The commenter provides an introductory statement that specific sections of the Draft EIR did not fully respond to requests and comments submitted for the Notice of Preparation or seem insufficient or incomplete in the Draft EIR. Please refer to responses provided below to specific comments raised by commenter.

I-Maerki-2 The commenter requests specificity as to the level of environmental review that would be required for each project under the CPHP, and cites as examples that the proposed CPHP's proposed West Side Housing appears to warrant a project-specific EIR; and that excavation and potential undergrounding of the service corridor also appears to require a separate evaluation.

As noted on Draft EIR Introduction, Section 1.5, page 1-8, when details on CPHP Future Phase projects are known, each Future Phase project (including the proposed West Side Housing and service corridor) would be reviewed in light of the CPHP Final EIR to determine the appropriate level of additional environmental review, if any, needed before approval and implementation of the particular project.

The process for determining the specific level of later environmental review for Future Phase projects is addressed in Section 15168 of the CEQA Guidelines. Per Section 15168(c)(1), if a Future Phase project would have effects that were not examined in the CPHP EIR, an Initial Study would be prepared leading to either an EIR or a Negative Declaration; and such analysis may tier from the program EIR as provided in Section 15152 of the CEQA Guidelines. Per Section 15168(c)(2), if the University finds that this later analysis shows that any following criteria pursuant to Section 15162 would be met, then a subsequent EIR would be required:

- Substantial changes are proposed in the project, or substantial changes occur with respect to the circumstances under which the project is undertaken, which will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or
- New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete shows any of the following:
  - The project will have one or more significant effects not discussed in the previous EIR;
  - Significant effects previously examined will be substantially more severe than shown in the previous EIR;
  - Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, or which are considerably different from those analyzed in the previous EIR, would substantially reduce one or more

significant effects of the project, but the University declines to adopt the mitigation measure or alternative.

If, however, the University finds that pursuant to Section 15162, no subsequent EIR would be required, then the UC decision-makers can approve the activity as being within the scope of the project covered by the CPHP EIR, and no new environmental document would be required.

The commenter also requests that additional project-specific review will provide touchpoints to reassess changes to baseline conditions over the timeframe and permit identification of cumulative effects. The process for considering the specific level of later environmental review for Future Phase projects would take into account any new information of substantial importance that may have since arisen, including related to baseline or cumulative conditions.

I-Maerki-3 The commenter requests specific timelines of proposed demolitions and replacement buildings, relative to the 2014 LRDP.

Available details, to the extent known, on demolition, new construction and renovations under the CPHP are presented in the Draft EIR Chapter 3, Project Description on pages 3-36 to 3-37. This includes specific timelines for the Irving Street Arrival, RAB, New Hospital (including proposed bridge and tunnel), and the initial Aldea Housing Densification.

Since demolition of the LPPI is required prior to construction of the New Hospital, demolition of that building is anticipated in 2022. Renovation of Moffitt Hospital is anticipated to occur in conjunction with the construction of the New Hospital.

Specific timelines for other CPHP components are not yet defined, other than that renovation of buildings would be on-going, and construction of Future Phase projects would occur between 2030 and 2050. Similarly, specific timelines for other buildings authorized under the 2014 LRDP to be demolished or renovated, including demolition of the Proctor building, and renovation of the Faculty Alumni House, and smaller projects are anticipated to be prior to 2030.

I-Maerki-4 The commenter asserts that the Space Needs Appendix and presentations to the CHCP Community Advisory Group do not provide sufficient detail and justification for the hospital replacement with a 200 inpatient bed increase and large increase in square foot assumptions. Please refer to Master Response 4: Space Ceiling and Population.

I-Maerki-5 The commenter indicates that although there are frequent references to requesting an amendment to the 1976 Regents' Resolution regarding the space ceiling, the proposed CPHP also would break commitments under the Community Planning Principles – specifically those with regard to height and building density. Please refer to Master Response 4: Space Ceiling and Population.

I-Maerki-6 The comment makes several observations about the content and analysis methodologies used in Section 4.15 Transportation of the Draft EIR, requests an expansion of the geographic scope and revision of analysis methodologies to said sections, and observes that with the exception of CPHP Mitigation Measure TRANS-5 Construction Coordination and Monitoring Measures, mitigations were not identified in Section 4.15 of the Draft EIR.

The analysis of CPHP transportation impacts follows past accepted practices, is thorough, and is appropriate for a program-level EIR. The transportation impacts of the Initial Phase projects are also adequately analyzed and disclosed in the Draft EIR. The effects of the Fourth Avenue Extension and Westside housing are evaluated as part of full implementation of the CPHP. Additional analysis, as required by CEQA, would occur as part of future project-level study of individual projects, including the Westside housing development, as and when it is proposed.

With the exception of a significant impact from construction activities under the CPHP for which mitigation is set forth in the Draft EIR, all transportation impacts of the CPHP would be less than significant, and no mitigation is required. Note that further improvements to UCSF's TDM program are required under CPHP Mitigation Measure AIR-2b to reduce average daily vehicle trips to the campus site and mitigate significant air quality impacts of the CPHP.

I-Maerki-7 The commenter asserts that the Draft EIR did not consider clinical services delivery and workforce strategy as a result of COVID-19. Please see Master Response 3: COVID-19.

I-Maerki-8 The commenter inquires about hiring practices related to construction personnel for demolition, construction and renovation activities under the CPHP. These comments are not related to the adequacy of the Draft EIR; no response is required. However, the comments have been noted and will be forwarded to decision-makers.

Please note Comment Letter I-Maerki contained several attachments which did not comment directly on the Draft EIR. These attachments are included in Appendix I-Maerki in this Comments and Responses document.

From:	Eleanor Kaplan
To:	Campus Planning - EIR
Subject:	Draft of latest EIR submitted by UCSF8
Date:	Friday, September 11, 2020 5:10:18 PM

As a resident of a neighboring community for the past 40 years and prior employment at Region 9 of EPA in the Air Division, my responsibility, as an Environmental Specialist ,Was to review Implementation plans for areas that were seeking to move from nonattainment to attainment for various pollutants. I looked forward to seeing what this EIR contained. I was very disappointed because:

The Eir does not put ay enough attention to the importance Of maintaining Air quality In planning future activities that may have serious consequences for the areas covered in the Plan and in other areas as well. The EIR is meticulous in proving visual aids but does not provide projections showing the effects of inadequate planning on areas hat could be impacted . Control measures that have been on the books for years are not updated to reflect more advanced technology. The E IR in my opinion seems to be a static document rather than one that looks to the future in a rapidly changing world. 1

Sent from my iPad latest yment

Responses to Comments from Eleanor Kaplan

I-Kaplan-1 This comment opines that the Draft EIR does not address the importance of maintaining air quality in its analysis and air quality planning for the region. The commenter feels that the Draft EIR does not provide projections showing the effects of inadequate planning on areas that could be impacted and that control measures that have been on the books for years are not updated to reflect more advanced technology.

The Draft EIR addresses all potential environmental impacts associated with the proposed CPHP, including air quality. The impact of whether the proposed CPHP could conflict with or obstruct implementation of the *2017 Clean Air Plan* are addressed on Draft EIR pages 4.2-63 through 4.2-68.

Comments on UCSF Comprehensive Parnassus Heights Plan (CPHP) Draft EIR

I would like to express my views after reviewing the CPHP draft EIR. I am a resident of Cole Valley, an extensive user of the Sutro open space, and a UCSF patient.

In my view, none of the plans discussed in the draft EIR are appropriate. Though multiple plans are discussed, they essentially still present a bit of a "Hobson's Choice." The CPHP and the alternative plans that contemplate a substantial increase in the space ceiling and a massive new hospital building on the eastern end of campus have unacceptably detrimental environmental effects on the campus itself, the open space reserve, and neighboring areas. But UCSF is not a viable, modern, 22nd century hospital and research campus under the no development, or possibly even the reduced development, plans. The UC Regents should reject all the plans discussed in the draft EIR. UCSF should be required to go back and rethink the reduced and phased options to figure out how to enhance the campus in line with UCSF long-term goals, without the dire environmental impacts of the CPHP, and particularly the CPHP New Hospital Plan or the 19 story New Hospital plan. 1 2

It is not appropriate for UCSF to simply toss away the 1976 agreement about the space ceiling and then slowly and steadily increase the gross square footage of this proposed plan over the last 2 years of the planning process, so that it now is almost double the prior space ceiling. The CPHP appears to be a recipe for litigation along the lines of the years of litigation that preceded the 1976 agreement. 3

It is not appropriate for UCSF to intrude **anywhere** into the habitat of the existing open space reserve boundary. The implemented plan should remain within a footprint that does not do so, and it is not sufficient mitigation to simply make a vague promise of replacing the open space somewhere else on campus. "Mitigation" is meaningless to the current animal and bird denizens in those sections of the open space boundary. 4

It is not appropriate for UCSF to blithely assume that creating man-made scenic view areas in other parts of the campus compensates for or mitigates putting a hospital building of such massive scale and footprint on the east end of campus. How can that not dramatically affect the Sutro forest, not just from a view perspective but also, more importantly, as a result of increased shadows, light illumination, and noise? Noise not just from construction, but from the ongoing operation of the New Hospital and the rest of the sizably expanded campus (the existing campus already produces substantial ambient noise). 5 6

There seems to have been an intense concern about the views from Grandview Park, maybe because of NIMBY participation on the advisory committees or in community meetings. The more immediate neighborhoods will have dramatically impacted views related to the increased height and density of the new campus buildings, particularly the new hospital building. I am not talking about looking down from above, but rather looking up from below. The surrounding neighborhoods are not currently dominated by buildings of such a massive height and scale. The images of the CPHP plan reveal a change in the landscape that will be felt and seen all the way across the Sunset and the neighborhoods east and north of UCSF. From Golden Gate Park or the surrounding neighborhoods, we will look up at the hulking presence of UCSF, and in particular a building that is substantially wider and 100 feet taller than any other building currently on the campus. Buildings (particularly the proposed New Hospital) that will cast extensive and widespread new shadows, and even eviscerate views of the Sutro Tower landmark. 7

It is not appropriate for UCSF to contemplate tearing down the UC Hall without a plan for paying for and attempting to achieve safe removal of the historically and artistically significant Zakheim murals. The 8

mitigation plan, which contemplates simply creating a virtual, digital representation of those murals, is woefully inadequate. Digital representations simply cannot capture the artistic essence of fresco murals. 8 cont.

The ultimate UCSF plan should not contemplate removing a single Redwood tree from the hospital campus or any trees from within the current open space boundary, without **adequate** environmental impact mitigation. For every removed tree, UCSF should be required to bear the cost of replacement with equivalent new trees elsewhere on the campus or in the Sutro open space and bear the cost of tending those new trees into adult growth stages. 9

The housing plans are inadequate. They do not produce enough housing for the added influx of staff and students to the campus, and they are overly reliant on putting higher, more dense buildings in the Aldea Housing project which will inevitably affect the Sutro open space reserve. Higher, denser housing structures should be placed elsewhere on or off campus, not in Aldea, within the Sutro forest. 10

Are there any real plans to mitigate the transportation impacts of the CPHP? 11

Shadows, wind tunnels, noise, air quality, construction-stage pollutants, potential seismic issues from underground tunnels, landslide risk, etc. etc. From all aspects, the CPHP is a brain-dead plan that does not "get" the city we live in during the climate change era (hope this plan is being prepared with a projection of the force of 2050 winds). 12

I read with interest the transcript of the EIR Scoping Meeting held on February 10, 2020 (beginning on page 993 of the draft EIR), where I can see that many of my concerns were already raised by members of the community. And yet, we have all received this draft EIR. I laughed at some of the comments (e.g., Hilary Gitelman, Kevin Siegel, and others) telling people to be patient and wait to read the 2000+ pages of the EIR and somehow that would make a big difference in how we regular humans who live in the surrounding neighborhoods feel about UCSF's plan. 13

This actually seems to be a ridiculous process, with seemingly inadequate checks and balances. UCSF simply negotiates within itself and pushes out a plan that the UC Board of Regents apparently can approve and it does not seem that any other government agency is able to stop it. Therefore, the report is able, in multiple places, to blithely assume that there is less than significant (LTS, LTS, LTS) impact from things that obviously have significant impact on the forest creatures, the surrounding neighborhoods, and the city overall. 14

Lastly, so many of the neighbor comments in those meeting notes resonate with me. I'm not a NIMBY, I don't care about the CPHP because of personal, real property interests. I care about the effects on the overall environment in the surrounding neighborhoods and I intensely care about preservation of the habitat in the Sutro open space. Suggested mitigations may (or may not) meet the letter of environmental law, but this EIR draft does not capture the true impacts of this plan on those environments. It leaves out all the best mitigations, which would be to stick closer to the agreed space ceiling, stay outside the existing reserve boundary, work around the existing (particularly redwood) trees, reduce the height and footprint of the largest buildings, and please figure out a way to save the Zakheim murals!! 15

Sincerely,

Pat Scatena
Cole Valley, San Francisco

Responses to Comments from Pat Scatena

I-Scatena-1 The commenter makes general statements, including that the CPHP and alternative plans discussed in the Draft EIR are not appropriate, and the substantial increase in the space ceiling and the New Hospital would have deleterious environmental effects on the campus, the Reserve, and neighboring areas. Given the lack of specificity in the comment, no direct response is possible; see Master Response 2: General Comments on EIR and Environmental Topics. See also responses to specific comments raised below.

I-Scatena-2 The commenter asserts that the UC Regents should reject all the plans discussed in the draft EIR; and that UCSF should revise its plans to enhance the campus in line with UCSF long-term goals, without the dire environmental impacts of the CPHP, and particularly the CPHP New Hospital Plan or the 19 story New Hospital plan. These comments are on the merits of the proposed CPHP, and not on the adequacy of the Draft EIR. Please see Master Response 1: Non-CEQA Comments.

I-Scatena-3 The commenter asserts that it is not appropriate to toss away the 1976 agreement about the space ceiling and then increase the space of this proposed plan over the last 2 years of the planning process. Please refer to Master Response 4: Space Ceiling and Population.

I-Scatena-4 The commenter objects to the potential encroachment into the Reserve under the CPHP. This comment does not address the adequacy of the Draft EIR. However, the comment has been noted and will be forwarded to decision-makers.

The commenter also asserts that the proposed open space swap is a vague promise for replacing open space on campus. As part of the project approvals for the CPHP, the proposed LRDP Amendment will include revisions to functional zones, include the adjustment to the Reserve boundary, and the proposed open space swap. Accordingly, the CPHP would provide permanent open space reserve protection that is not currently provided for this area.

I-Scatena-5 The comment states that the proposed New Hospital would block views from Sutro Forest and would also increase shading and lighting in the forest. Please refer to Master Response 7: Aesthetic Impacts.

I-Scatena-6 This comment suggests that there would be potential significant noise impacts to the Sutro Forest.

With respect to the construction impact of the CPHP on biological resources, including those within the Reserve, please refer to Impact BIO-1 in the Draft EIR Section 4.3, Biological Resources. As discussed in Impact BIO-1, under the CPHP, the predominant potential impacts on biological resources within the Reserve from construction activities would be to nesting birds and to roosting

bats. Impacts to nesting birds from construction activities include temporary loss of nesting habitat and disturbance to nearby nests from construction noise and activity. Noise and disturbance impacts would be mitigated to a less-than-significant level under CPHP Mitigation Measure BIO-1c, Protection of Nesting Birds. Construction activities could also directly impact roosting bats, and elevated sound levels from heavy construction equipment could cause adult bats to abandon maternity roosts. Noise and disturbance activities would be mitigated to a less-than-significant level with implementation of CPHP Mitigation Measure BIO-1d, Protection of Roosting Bats. Mitigation measures discussed in the Draft EIR, Section 4.11, Noise and Vibration, would further serve to minimize overall noise impacts, including to wildlife.

With respect to construction-related impacts to users of the Reserve for recreation, compliance with mitigation-measures and other construction-related regulatory requirements discussed in the Draft EIR, including Section 4.2, *Air Quality*; Section 4.3, *Biological Resources*; Section 4.11, *Noise and Vibration*; and Section 4.15, *Transportation,* would reduce construction-related effects to users of the Reserve to the extent feasible.

There are no adverse noise impacts identified in the Draft EIR with respect to operations of the CPHP development. As under existing conditions, the majority of new development under the CPHP would be located within either the previously disturbed areas within the campus core or Aldea Housing complex.

I-Scatena-7 The comment states that neighborhoods proximate to the campus, and particularly those close to the proposed New Hospital, would see dramatically altered views as a result of the proposed project. Please refer to Master Response 7: Aesthetic Impacts.

I-Scatena-8 The commenter states it is not appropriate for UCSF to demolish UC Hall without a plan to preserve the murals, and that creating a digital representation of the murals is inadequate. Please refer to Master Response 11: Toland Hall Murals.

I-Scatena-9 The commenter indicates that no redwood trees from the New Hospital site, or any trees within the open space boundary, should be removed under the CPHP, without adequate mitigation; and suggests UCSF bear the costs of replacement with equivalent new trees elsewhere on the campus or Sutro open space, and tending those new tree into adult growth stages.

The Draft EIR Chapter 3, Project Description, page 3-38 acknowledges certain tree removal would be required under the CPHP including areas within the Reserve, elsewhere within the campus site (including the redwood grove along Parnassus Avenue west of UC Hall), and off-site (e.g., street trees along Parnassus Avenue and/or Irving Street). Impacts to trees under the CPHP was addressed in Impact BIO-3 in Draft EIR Section 4.3, Biological Resources,

page 4.3-22 to 4.3-23. Pursuant to the University of California's constitutional autonomy, on university-controlled property used in furtherance of the University's educational mission, UCSF is not subject to local policies protecting biological resources. However, UCSF will avoid removal of trees that would be considered significant or protected to the maximum extent feasible. Any trees within the public right-of-way that may be removed during the course of off-site construction under the CPHP would conform to the City ordinance governing tree protection. Thus, this impact would be less than significant. Please note UCSF will consider replanting trees in the landscaping plans for each specific project under the CPHP, including the New Hospital, when detailed designs become available.

I-Scatena-10 The commenter asserts that the proposed housing plan is inadequate, and does not provide enough housing for the estimated increase in staff and students at the campus site. Please see Master Response 14: Population and Housing Impacts.

The commenter also makes a general assertion that higher, more dense buildings in the Aldea Housing complex would affect the Reserve. The new Aldea Housing structures would be developed in generally the same building footprints as the existing Aldea Housing buildings, and consequently, this project development would not extend into the Reserve. Regardless, all potential environmental impacts of the Aldea Housing Densification project are adequately addressed in the Draft EIR, and mitigated to the extent feasible.

I-Scatena-11 The comment asks about what mitigation measures are proposed for transportation impacts. The CPHP's transportation impacts are discussed in detail in the Draft EIR, beginning on page 4.15-37 and continuing through page 4.15-52. As discussed in that section, the CPHP would not result in any significant impacts to transportation that require mitigation, with the exception of Impact TRANS-5. Impact TRANS-5, discussed on pages 4.15-49 through 4.15-51, relates to impacts due to construction activities under the CPHP. This impact is potentially significant, and as such the Draft EIR identifies CPHP Mitigation Measure TRANS-5 to reduce the impact to a less-than-significant level. Please see Master Response 16 for a further explanation of the basis of the transportation significance criteria used in this Draft EIR.

I-Scatena-12 The commenter makes a general reference to several environmental topics, including shadows, air quality and noise. These topics are adequately addressed in Draft EIR Sections 4.1, Aesthetics, Wind and Shadow; Section 4.3, Air Quality; and Section 4.11, Noise and Vibration, respectively. The commenter also makes a general reference to "construction pollutants," which are adequately addressed in several Draft EIR Sections, including Section 4.3, Air Quality, Section 4.8, Hazards and Hazardous Materials; and Section 4.9, Hydrology and Water Quality.

The commenter also makes a general reference to wind tunnels. Wind tunnel testing is discussed in the Draft EIR in CPHP Mitigation Measure AES-4, which would be required to assess new development under the CPHP (80 feet or taller) to determine if the proposed building(s) would result in new exceedances of the 26-mph pedestrian wind hazard criterion.

Lastly, the commenter makes reference to potential seismic issues from underground tunnels, and landslide risk. Draft EIR Section 4.6, Geology and Soils adequately addresses all potential seismic issues associated with new CPHP development, including tunnels; and potential landslides risks. Please refer to Impacts GEO-1, GEO-2, GEO-3 and GEO-5.

I-Scatena-13 The commenter opines about the EIR scoping meeting that was held. These comments do not specifically address the adequacy of the Draft EIR; consequently, no response is required. Please also see Response I-Scatena-14, below.

I-Scatena-14 The commenter makes a number of assertions, including that UCSF negotiates within itself and pushes out a plan the UC Board of Regents can approve and that it seems no other government agency can stop it.

Chapter 1, Introduction, in the Draft EIR, includes a detailed discussion of the role of the Lead Agency for the project, the CEQA environmental review process, uses of the EIR, and approvals required. Under CEQA, the lead agency is the California government agency that has the principal responsibility for carrying out or approving the project, and therefore, has the principal responsibility for preparing the CEQA document. As such, the lead agency is responsible for the preparation and adequacy of the CEQA document, and has the ultimate discretion for significance conclusions and appropriateness of mitigation measures identified in the EIR. In the case of the CPHP, the UC Board of Regents (Regents) is the lead agency that will be responsible for approving the CPHP, and UCSF is preparing the CPHP EIR on behalf of the UC Regents. The EIR Introduction, on pages 1-8 to 1-9, also discusses applicable Responsible agencies and other agencies with jurisdiction by law that have certain approval actions, including the Bay Area Air Quality Management District (for stationary source permits for diesel generators), the California Office of Statewide Health Planning and Development (for building permit approval and construction oversight for clinical facilities), and the City of San Francisco (for various approvals of CPHP off-site improvements). As discussed in the Introduction, relevant public agencies are included in the agency/public review process for the EIR, have been solicited for their input on scoping of the Draft EIR, and have given the opportunity to comment on the adequacy of the Draft EIR as well.

I-Scatena-15 The commenter expresses general concern about the effects on the overall environment in the surrounding neighborhood, and preservation of habitat in the

Reserve. Due to lack of specificity in the comment, no direct response is possible; please see Master Response 2: General Comments on EIR and Environmental Topics.

The commenter questions if the suggested mitigation meet the letter of the environmental law. All mitigation measures identified in the Draft EIR have been prepared pursuant to the requirements of CEQA. The Draft EIR mitigation measures are considered feasible; avoid, minimize, rectify, or compensate for the significant environmental effects of the proposed CPHP; and measurable in their effectiveness.

The commenter asserts that the Draft EIR does not capture the true impact. Due to lack of specificity in the comment, no direct response is possible; please see Master Response 2: General Comments on EIR and Environmental Topics.

The commenter suggests staying outside the Reserve boundary, work around existing trees, reduce the height and footprint of the largest buildings save the Zakheim murals. These comments have been noted and will be forwarded to decision-makers. Please also refer to Master Response 11: Toland Hall Murals.

Comment Letter I-Brown1

From: Tish Brown
To: Campus Planning - EIR
Subject: CPHP EIR
Date: Friday, September 11, 2020 9:39:41 PM

The north easternmost building in the new plans is drastically out of scale. It is far too large. It must be reduced in size by 30 - 50 percent. That bulk could be sacrificed or distributed among the rest of the project. 1

Tish Brown

This is addendum to my previous response to the EIR: the Plan to destroy the depression-era murals is shoddy, overly cheap, and overlooks a potential benefit.
The opposite approach is a collaboration of the FAMSF and the Asian Art Museum resulted in the Piazzoni Murals Room at the de Young Museum, a jewel. It's conserved murals moved and saved from the Central Branch of the Library.
Tish Brown

Responses to Comments from Tish Brown

I-Brown2-1 The commenter points to an approach taken by the de Young Museum in San Francisco as an example for proper preservation and relocation of historic murals. Please refer to Master Response 11: Toland Hall Murals.

From:	julie long gallegos
To:	Campus Planning - EIR
Subject:	Tree destruction for the Aldea Student Dorms
Date:	Friday, September 11, 2020 9:55:09 PM

Dear Sir/Madam,

I'm a third generation San Franciscan who is appalled and angered at the wanton destruction of the well-loved Sutro Forest, at the whim of UCSF. I currently reside in Glen Park but spent my teen years on Edgewood Avenue, where the adjacent forest is slated to be destroyed for the Aldea Student Housing. 1

The public was shocked and sickened by the tree felling on Clarendon when photos were posted on social media.

90-foot tall skyscrapers in a 40-foot zone? Is UCSF insane? 2

San Francisco has the lowest green canopy of any major U.S. city and it's shrinking all the time, and you are responsible for the loss. In addition to the eucalyptus tree cutting, you're also curing the redwood grove on Parnassus. Why?

With all the resources UCSF has at its disposal, the continued and relentless tree cutting of Sutro Forest is impossible to understand or justify. We think UCSF can and should come up with something more forest-friendly. 3

Cutting down our trees contributes to the ill health of the citizens of San Francisco. The citizens see UCSF's priorities and they don't include the well-being of the citizens of San Francisco.

Needless to say, UCSF will never see any of my health care dollars.

Julie Long Gallegos

Responses to Comments from Julie Long Gallegos

I-Gallegos-1 The commenter makes a general assertion about UCSF destruction of Sutro Forest, including from the proposed housing in the Aldea Housing complex. The new Aldea Housing structures would be developed in generally the same building footprints as the existing Aldea Housing buildings, and consequently, this project development would not extend into the Reserve. Regardless, all potential environmental impacts of the Aldea Housing Densification project are adequately addressed in the Draft EIR, and mitigated to the extent feasible.

The commenter also references past tree removal activities on Clarendon Avenue. These activities were not associated with the proposed CPHP, but rather, related to implementation of UCSF's Vegetation Management Plan. Consequently, no response is required.

I-Gallegos-2 The commenter expresses concern with building heights exceeding the 40-foot zone. This comment does not address the adequacy of the Draft EIR; consequently, no response is required. However, please see Master Response 7: Aesthetic Impacts and Master Response 13: Land Use Impacts.

I-Gallegos-3 The commenter expresses concern about the removal of eucalyptus and redwood trees in Sutro Forest. To the extent that the CPHP will impact trees, those impacts was addressed in Impact BIO-3 in Draft EIR Section 4.3, Biological Resources, page 4.3-22 to 4.3-23. Pursuant to the University of California's constitutional autonomy, on university-controlled property used in furtherance of the University's educational mission, UCSF is not subject to local policies protecting biological resources. However, UCSF will avoid removal of trees that would be considered significant or protected to the maximum extent feasible. Any trees within the public right-of-way that may be removed during the course of off-site construction under the CPHP would conform to the City ordinance governing tree protection. Thus, this impact would be less than significant. Please note UCSF will consider replanting trees in the landscaping plans for each specific project under the CPHP when detailed designs become available.

Lobby.jpg

To Whom It May Concern,

In 2014 UCSF proposed to rehabilitate UC Hall, the original 1917 UC Hospital, into student housing that is much needed in the increasingly unaffordable San Francisco area. 1

In 2019, UCSF's updated Comprehensive Plan for the Parnassus Heights campus upended this proposal in favor of UC Hall's demolition and construction of a replacement facility that, in its currently anticipated form, would not include any housing. 2

The 210+ signers of the "Save UC Hall" petition listed at https://change.org/SaveUCHall, including myself, object to the updated 2019 proposal, and demand that the historic structure be restored and rehabilitated as outlined in 2014. Delivery of these signatures and accompanying messages of support to the offices of key individuals involved with the CPHP is being arranged at the present time. 3

The historic and architectural significance of UC Hall is summarized on pages 38 and 39 of the 2014 UCSF Long Range Development Plan as follows: 4

> Built in 1917, UC Hall is the oldest building on the Parnassus Heights campus site. It has been determined to be potentially eligible for the CRHR and the NRHP under criteria A/1 and C/3 (Carey & Co., 2003). A review of this building by ESA in 2014 found that it is unchanged since its original evaluation, and as such, its historic status would remain unchanged. This seven-story building is in the west end of the campus site on Parnassus Avenue. It contains approximately 147,000 gsf. UC Hall was slated for demolition in the 1996 LRDP. UCSF now proposes to retain, seismically retrofit, renovate and reuse UC Hall by 2019. The top three floors would be used as housing, with up to 134 beds in 105 units. Initially, the three full floors below the housing would be used as faculty offices; these floors would be converted to housing (up to 78 beds in 64 units) after Moffitt Hospital is decommissioned and renovated and is available for other uses including the offices displaced from these three floors of UC Hall.
>
> In the westernmost courtyard of UC Hall, is the single-story, semicircular Toland Hall auditorium structure. Within Toland Hall are series of Depression-era murals painted by Bernard Zakheim, a student of Diego Rivera, in 1938. These murals depict the history of medicine in California. Original skylights also remain in the auditorium, and the two surviving original interior stairwells feature marble treads and steel balustrades topped by a clear varnished wood handrail. Although UC Hall's interior has been extensively modified, Toland Hall and its corresponding murals remain intact and are considered to be a significant resource (UCSF, 2005). As described in Mitigation Measure 3.3-3 in UCSF's LRDP #2 – Hospital Replacement EIR, UCSF would have been required to remove and conserve these murals at an appropriate facility prior to the demolition of UC Hall (UCSF, 2005). This measure would no longer apply, as the proposed project would retain UC Hall, including the Zakheim Murals in Toland Hall.

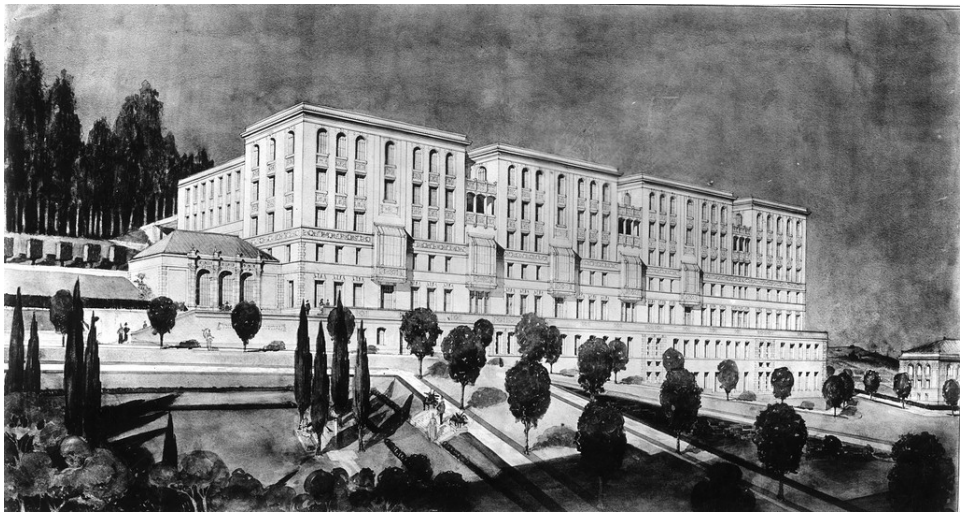
UCSF retained the firm of Page & Turnbull to make preliminary recommendations regarding alterations to the exterior of UC Hall that would be consistent with the Secretary of the Interior's Standards for Rehabilitation (Page & Turnbull, 2011). Recommendations were also made regarding the preservation of the Zakheim Murals within Toland Hall. As indicated in Chapter 3, Project Description, UCSF would follow those recommendations to ensure that, in carrying out the renovation project, the Secretary of the Interior's Standards for Rehabilitation are met. Generally, under CEQA, projects that comply with the Secretary of the Interior's Standards are considered to have a less-than-significant impact on the environment. As UCSF intends to follow the Standards for Rehabilitation when renovating UC Hall, no significant impacts to this historic resource would occur.

UCSF completed HABS photo-documentation of UC Hall in 2005 (Page & Turnbull, 2005). Although not required as part of mitigation for the renovation for this building, this effort provides a documentary record of the building in its existing condition, and documents the significant interior and exterior features of the building.

4 cont.

The generations of memories of UC Hall belonging to the faculty, students, staff, patients and alumni of UCSF are architectural, cultural and historic assets that deserve to be cherished through the restoration and revitalization of UC Hall, rather than its erasure and replacement.

UC Hall is more than an exemplary pre-war Beaux-Arts structure designed by master architect Lewis Hobart: it is an enduring symbol of our state and of the University of California's commitments to the advancement of the medical sciences and the standards of patient care.



This long history of scientific achievements deserves to be memorialized by UCSF and the University of California community at large, and shared with others as part of the current, nationwide movement to recognize and celebrate the uplifting accomplishments of our past.

5

A comprehensive study to examine the preservation, restoration and adaptive re-use of UC Hall, and to determine the present day requirements for doing so, rather than its demolition and replacement, is the appropriate next step in this process.

6

The lobby of UC Hall as it originally appeared, circa 1920s—an exquisite interior space and excellent candidate for reconstruction as part of a restoration and adaptive re-use effort.

Preserving UC Hall's Zakhiem murals, physically or by photogrammetry, without preserving the original architectural context for which they were created, would be a gesture of superficial homage to these unique works, one that is aesthetically insufficient as well as technologically and financially inefficient.

A restored UC Hall could once again become the face of UCSF—akin to the Campanile at UC Berkeley and Royce Hall at UCLA—continuing to grace the Parnassus Heights campus for decades to come.

The short-sighted proposal to demolish UC Hall is comparable to recommending the amputation of an atrophied limb when physical therapy and proper medical care could readily return it to healthy function.

As student housing, a refurbished UC Hall could foster a newfound sense of live-work-study community at the Parnassus Heights campus, with plenty of space for amenities, including but not limited to study/maker lounges, dining, exercise and laundry facilities, a store, a cafe, and perhaps most importantly, a small, publicly accessible museum dedicated to the history of medicine at UCSF and throughout the state of California, to capitalize upon UC Hall's iconic status and its unique role in that history.

A refurbished Toland Hall Auditorium, replete with its grandiose skylights, woodwork, and its New Deal-era Zakheim murals, would easily become one of the most iconic event venues at any of the UC campuses, providing an intimate setting for academic and extracurricular speakers and programs.

6 cont.

The stated reasons for rejecting the 2014 proposal—primarily seismic stability issues and difficulties with adaptive re-use—have been exaggerated and by no means present insurmountable financial or operational barriers to the continued existence of UC Hall. They are merely challenges that UCSF and the University of California can and should overcome.

The University of California was founded to serve as a "Great Light of the Pacific." Succumbing to such petty obstacles would doom UC Hall to the wrecking ball and constitute a triumph of the darkness: an unnecessary destruction of irreplaceable art and architecture, an erasure of history and historical context, a rejection of environmental sustainability, and a betrayal of the values of the University of California and the public mission it exists to serve.

The residents of this city, this state, this country and this planet deserve better than that. Please, save UC Hall.

6 cont.

Regards,
Sam Siegel

NOTE: The petition to preserve UC Hall is ongoing, and will continue to solicit support and advocate for the preservation of UC Hall until either the collective goal of rehabilitation is met or the University sadly places itself on the wrong side of history and demolishes UC Hall against the best interests of all Californians.

Responses to Comments from Sam Siegel

I-Siegel1-1 The commenter statement that the 2014 LRDP included the rehabilitation of UC Hall. This comment does not address the analysis of the CPHP Draft EIR. No response is required.

I-Siegel1-2 The commenter notes the change in the proposed action between 2014 and the present with regards to UC Hall from rehabilitation (2014 LRDP) to the proposed demolition (2019 CPHP). The comment does not address the analysis in the Draft EIR. No response is required.

I-Siegel1-3 The commenter notes the existence of a petition that objects to the demolition of UC Hall. The comment does not address the analysis in the Draft EIR. No response is required.

I-Siegel1-4 The commenter includes a block quote from pages 38 and 39 of the 2014 LRDP that summarize the significance of UC Hall including the Zakheim Murals in Toland Hall. The comments do not address the analysis in the CPHP Draft EIR. Please see Master Response 11: Toland Hall Murals for responses to comments regarding the Zakheim Murals.

I-Siegel1-5 The commenter advocates for the "restoration and revitalization of UC Hall." The comment does not address the analysis in the CPHP Draft EIR. No response is required.

I-Siegel1-6 The commenter advocates for preserving the Zakheim murals in place in a restored UC Hall that would be converted to student housing. Additionally, the commenter claims that the seismic stability issues and challenges to adaptive re-use have been exaggerated. The comments do not address the analysis in the CPHP Draft EIR. Please see Master Response 11: Toland Hall Murals for responses to comments regarding the Zakheim Murals.

I-Siegel1-7 The commenter notes the existence of a petition that supports the preservation of UC Hall. The comment does not address the analysis in the CPHP Draft EIR. No response is required.

From:	Sam Siegel
To:	Campus Planning - EIR
Subject:	CPHP EIR - Langley Porter Psychiatric Institute Building
Date:	Friday, September 11, 2020 11:59:46 PM Cornerstone
Attachments:	contents.jpg

To Whom It May Concern,

The Langley Porter Psychiatric Institute building, while not eligible for CRHR or NRHP as stated on Page 36 of Chapter 6 of the 2014 UCSF Long Range Development Plan, has nonetheless played a rather significant role in the history of psychiatric research in California.

Built in 1941 as a collaboration between the UCSF Medical School and the California Department of Institutions, the Langley Porter Clinic (later renamed the Langley Porter Psychiatric Institute) was the original home of the UCSF Psychiatry Department, and the first modern neuropsychiatric institute in the state.

Donna Graves, a Berkeley-based historian and urban planner, while leading a team examining the social history of the LPPI, identified a unique link between the building and California's LGBTQ history amid sexuality and gender research undertaken there in the late 1940s and early 1950s:

> In 1949, LPPI Director Dr. Karl Bowman led a comprehensive statewide investigation into "sex crimes and sex deviants," initiated and funded by the California State Legislature. The resulting reports, coauthored by Bowman and UCSF research associate Bernice Engle, represented a newly liberalized attitude meant to shape future legislation and therapeutic recommendations.
>
> Another of Bowman's key collaborators was Louise Lawrence, who had been living

1

full-time as a transgender woman since 1942. Lawrence lectured on transgender topics at UCSF and created an expansive international network of transgender people. She, along with Virginia Prince and others, published the first incarnation of *Transvestia*, a pioneering transgender publication, in 1952. Lawrence's address book provided the initial subscription list and she was instrumental in connecting transgender people to pioneering sex researchers such as Alfred Kinsey and Harry Benjamin.

Furthermore, the actual cornerstone of the building contains a historically significant 5 April 1941 time capsule dedicated by California Governor Culbert Olson, UC President Robert Sprout, and UC Medical School Dean Emeritus Robert Langley Porter, containing a number of historic artifacts, listed here:

AARON J. ROSANOFF, M. D.
Director Of Institutions

CULBERT L. OLSON
Governor Of California

STATE OF CALIFORNIA
DEPARTMENT OF INSTITUTIONS
SACRAMENTO

April 5, 1941.

CONTENTS OF CORNERSTONE OF THE LANGLEY PORTER CLINIC

Copy of 1939 Legislative Budget Bill making appropriation for the Clinic.

Photostatic Copy of Allocation of additional funds for the Clinic from 1937 appropriations.

Small-scale floor plans and elevations of building.

Copies of San Francisco Call-Bulletin, San Francisco Chronicle, San Francisco Examiner, and San Francisco News of April 5, 1941.

Autographed photographs of:
Hon. Culbert L. Olson, Governor of California.
Dr. Aaron J. Rosanoff, Director of Institutions.
Dr. Robert Gordon Sproul, President, University of California.
Dr. Langley Porter.

American Flag.

Copies of Senate Bills 559 and 560, 1941 Legislative Session, defining purposes of The Langley Porter Clinic.

Imprints of Seals of the Department of Institutions and the University of California.

Program of Ceremonies, Laying of Cornerstone, The Langley Porter Clinic.

Copy of Address of Governor Olson at Cornerstone Laying Ceremonies.

Copy of Address of Dr. Langley Porter at Cornerstone Laying Ceremonies.

1 cont.

While it may not be as practical to preserve the building in its entirety as is the case for UC Hall, it may be worthwhile to **study the incorporation of all or part of the LPPI's extant Parnassus Avenue facade into the new UCSF Hospital facility as a means of paying respect to the original home of the institution and its associated histories.**

2

Such incorporation of existing building materials would allow the updated Parnassus Heights campus to retain a tangible link to the early modernist medical facility design of the original LPPI and the history of UCSF without compromising the size and general massing of the new hospital facility set to be built on the site.

This will help transform the new hospital facility from merely another 21st century medical building into a unique architectural statement and showcase for an expanding and modernizing Parnassus Heights campus that remembers its past while always striving forward to the future.

2 cont.

It could serve as a bold eastern "bookend" to the campus, with the restored UC Hall as its western counterpart; both structures presenting different aspects of preservation to all those who enter the campus grounds. Such a physical presence would cement UCSF as an institution that is both grounded in history, tradition, and longstanding commitments, but forever working towards change and innovation—an ideal that every university strives to achieve.

Responses to Comments from Sam Siegel

I-Siegel2-1 The commenter states that the LPPI Building is not eligible for the CRHR or the NRHP, but then states a number of reasons for its significance. The comment is incorrect in this eligibility statement. As noted in Table 4.4-1 on page 4.4-5 of the Draft EIR, and in Draft EIR Table CUL-1 on page CUL-3 of Appendix CUL, the LPPI Building was determined eligible for both the National and California registers in the 2019 report prepared by Graves. As stated on page 4.4-11 of the Draft EIR:

> As discussed in Section 4.0 [of the CPHP Draft EIR], Introduction to Environmental Analysis, several demolition projects at the Parnassus Heights campus site were previously approved under the 2014 LRDP that have not yet been implemented, including demolition of the LPPI. However, since the LPPI was recently determined to be individually eligible for the National Register and California Register (Graves, 2019a), this EIR addresses the potential effect of demolition of the LPPI on historic resources as part of the CPHP.

The demolition of the LPPI was determined to be a significant and unavoidable impact even after the implementation of CPHP Mitigation Measures CUL-1a, CUL-1b, and CUL-1c (page 4.4-18 to 4.4-19).

I-Siegel2-2 The commenter requests that UCSF study the possibility of incorporating "all or part of the LPPI's extant Parnassus Avenue façade into the new UCSF Hospital facility…" The comment does not address the analysis in the CPHP Draft EIR. No response is required.

From: Letitia Yang
To: Campus Planning - EIR
Subject: Preserve UCSF"s Bernard Zackheim Murals
Date: Monday, September 14, 2020 11:43:46 AM

To whom it may concern,

I'm writing to support the preservation of Bernard Zackheim's "History of Medicine in California" murals. These works of art are an important part of not only UCSF's history, but also have national importance. As such, I strongly urge you to reconsider efforts to preserve these murals, which have been landmarked by the San Francisco Historic Preservation Commission. If UCSF can not take responsibility for the preservation of the murals, at the very least, it should allow for more time so that the artist's family and general public can come up with a feasible plan. 1

To loosely quote a friend who has spent his entire medical career at UCSF starting as a medical student through his long tenure as an attending physician, "I've spent years in lectures in that hall, and there are great stories in those paintings." They are an invaluable treasure and every effort should be made to preserve them.

Kind regards,

Letitia Yang
1769 Green St.
San Francisco, CA 94123

Responses to Comments from Letitia Yang

I-Yang-1 The commenter urges UCSF to preserve the murals, or allow the artists' family and general public to come up with a plan for preservation. Please refer to Master Response 11: Toland Hall Murals.

From: roz arbel
To: Campus Planning - EIR
Subject: Public comment relating to the Parnassus Heights EIR
Date: Monday, September 14, 2020 11:44:11 AM

Hi there,

I hope that I have not missed the deadline for Public Comment.

I understand that you've had this plan in the works for quite some time, but I wanted to add comment in regards to the environmental impact of your plan, specifically the tree removal.

I was quite literally stunned to read section 5.2 of the UCSF Comprehensive Parnassus Heights Plan:
" As discussed in checklist item “d,” above, UCSF proposes to replace any area of the Reserve that is lost, including forest land, due to new development under the CPHP by designating new Reserve acreage elsewhere on the campus site in an amount equal or greater to that area lost. ***Consequently, the impact resulting from conversion of forest land would be less than significant, and this topic will not be evaluated further in the CPHP EIR."***
Yet when you read the EIR, it's talking about removing four acres of trees, in addition to chopping down an entire redwood grove!!! 1

I grew up in San Francisco, in Ashbury Heights, at Masonic and Java. Our back room had a sweeping view from the Marin Headlands to Mount Sutro. My bus to Hoover Jr High and McAteer went past the UCSF campus every day. Even now, my kitchen window looks towards the UCSF Parnassus Heights campus, and I delight in the sight of the lush green of the hill. 2

Reading the EIR, I'm baffled. How is it possible that in this age of climate DISASTER that you can possibly rationalize the removal of more trees from San Francisco's already meager urban canopy? We have the worst urban canopy of any large city in the US, despite the fact we have some green corners. One of these remaining green corners is Parnassus Heights. 3

The EIR barely has any information about tree removal, and literally nothing about environmentally sensitive design. How could you, in good conscience, rubber stamp a plan that intends to destroy so much of our natural environment? 4

Just a few days ago we had temperatures of 90F. The next day we had what can only be described as an seemingly-apocalyptic event of orange skies and darkness. Then an AQI of 209. It's pure insanity to remove more trees when we're already suffering. 5

There's no information in the EIR about what will happen to the space where trees will be felled. Will they be replaced? Will there just be grass, or concrete?
If you're planning on replacing trees, what will they be replaced with? Saplings?
Wouldn't medical staff and patients prefer to walk and relax amongst mature trees, rather than small replacement saplings? A sapling cannot sequester even half of the Co2 that a mature tree can. 6

I'm sure you can find a way to include already existing nature into UCSF's renovation. It's the responsible thing to do. Remember that we are here at nature's behest, not the other way

around.

6 cont.

As John Muir said:
"God has cared for these trees, saved them from drought, disease, avalanches, and a thousand tempests and floods. But he cannot save them from fools."

7

Please devote more time finding a way to incorporate the existing nature into your plans. Future generations of San Franciscans will thank you for that.

Sincerely,
Roz Arbel

Responses to Comments from Rox Arbel

I-Arbel-1 The commenter references the Initial Study's discussion of impacts to forestry resources. The Initial Study acknowledges under Section 5.2, checklist item d), there is the potential for certain new development under the CPHP, including the proposed New Hospital and associated widening of Medical Center Way adjacent to the New Hospital, to result in the need to modify the Reserve boundary, and therefore, may result in a loss and conversion of forest land within the Reserve to a non-forest use. As the commenter notes, UCSF proposes to replace any area of the Reserve that is lost, including forest land, due to new development under the CPHP by designating new Reserve area elsewhere on the campus site in an amount equal or greater to that area lost. On this basis, the Initial Study concluded the impact to loss or conversion of forest land would be less than significant, and therefore, this topic did not require further evaluation in the CPHP EIR.

The commenter then asserts the Draft EIR discusses removing four acres of trees, including the redwood grove. Please note the Draft EIR acknowledges in Chapter 3, Project Description, page 3-38, that certain tree removal tree removal would be required under the CPHP; however, the Draft EIR does not reference a removal of 4 acres of trees. Please also note that Draft EIR indicates that the redwood grove along Parnassus Avenue that would be removed is not located within the Reserve. UCSF will consider replanting trees in the landscaping plans for each specific project under the CPHP when detailed designs become available.

I-Arbel-2 The commenter expresses personal experiences that do not relate to the adequacy of the Draft EIR; consequently, no response is required. Please refer to Master Response 1: Non-CEQA Comments.

I-Arbel-3 The commenter does not address on the adequacy of the Draft EIR; consequently, no response is required. Please refer to Master Response 1: Non-CEQA Comments.

I-Arbel-4 The commenter indicates the Draft EIR barely has any information about tree removal. Please see Impact BIO-3, Section 5.3, Biological Resources, in the Draft EIR, which addresses the impact of tree removal under the CPHP, and determines the impact to be less than significant. Please see also Response I-Arbel-1, above.

I-Arbel-5 The commenter expresses concern about removing trees. The commenter does not address on the adequacy of the Draft EIR; consequently, no response is required. See also Response I-Arbel-4, above.

I-Arbel-6 The commenter indicates there is no information in the Draft EIR about what will happen to the space where trees will be removed. No detailed development or landscaping plans are presently available for CPHP projects. However, UCSF will consider replanting trees in the landscaping plans for each specific project under the CPHP when detailed designs become available.

The commenter also expresses some opinions about the CPHP, which do not address the adequacy of the Draft EIR; consequently, no response is required. Please refer to Master Response 1: Non-CEQA Comments.

I-Arbel-7 The commenter quotes John Muir, and then requests UCSF to devote more time to incorporate the existing nature within its plans. The comment has been noted and will be forwarded to decision-makers.

From: Calvin Welch, member, Advisory Committee for the Future of UCSF Parnassus Heights

RE: Comments on the DEIR , UCSF Comprehensive Parnassus Heights Plan (SCH 2020010175)

September
via Email 15 2020

DEIR Fails to offer complete analysis on housing and transit impacts and possible mitigations of those impacts

While the DEIR on page 4.12-1 posits that the project will increase daily campus population by 5,200 students, faculty and staff, with an estimated additional 3,420 jobs in indirect impacts the report fails to address how the demand for housing created by that increase will be fully met and or mitigated.

Specifically, the DEIR fails to discuss an existing UCSF report, done in 2019, "Advancing Health Equity in San Francisco" which commits UCSF to using "place based economic power...to better the long term health and welfare of San Francisco's most under-resourced communities" (page x) 1

Specifically the report commits UCSF to " the institution strategies of workforce development...and community investment" (pg.2). It adopts recommendations to "increase UCSF capacity to train hire and promote under-resourced populations" (pg. 3).

This plan and these commitments need to be discussed and analyzed in reference to the project under review. A local hire program, if aggressively pursued as proposed by the 2019 report, would significantly reduce the housing and transit impacts of the project since for each exiting resident of San Franciscan no new housing unit and no new transit capacity would be required.
The failure of the DEIR to describe, discuss and analyze this current UCSF policy and how it might be applied to the project renders it incomplete and inaccurate.

Responses to Comments from Calvin Welch

I-Welch-1 The commenter asserts that the Draft EIR does not provide a complete analysis of the project's effects on housing. The project would provide more jobs than housing. But the EIR does not explain how the housing need would be met or mitigated. The commenter also references a UCSF report about the University's commitments related to workforce development and a local hire program.

Please refer to Master Response 14: Population and Housing Impacts, regarding the CPHP's impact on population and housing as well as the project's growth inducing effects.

As explained in that master response, the analysis in Section 4.12 of the Draft EIR is focused on the effects of the direct population increase from the implementation of the proposed CPHP. This increase includes the approximately 504 students and 4,680 faculty and staff for a total of 5,184 persons that would be added to the campus site by 2050. This analysis is conservative in that it assumes that all of the 5,184 additional students and employees would be "new" to the 5-county study area and does not deduct from this number the students and employees who would be already living in the study area at the time that they first enroll at UCSF as students or are hired by UCSF to fill the new jobs. The commenter is correct in stating that the population and transit impacts of the CPHP would be lower if some of the new jobs at the Parnassus Heights campus site are filled by local hires.

With respect to the approximately 3,420 indirect and induced jobs that are mentioned by the commenter, please note that indirect employment effects are appropriately addressed in Draft EIR Chapter 5.0, CEQA Statutory Sections, in Section 5.4, Growth Inducing Effects. As stated in that section, the residence locations of people that would work in indirect and induced jobs is unknown, and it would be speculative to state where such workers would reside or be employed in the Bay Area (or beyond), or to determine any associated environmental effects. The Draft EIR therefore describes the potential effect of the indirect and induced jobs in general terms, and acknowledges that growth induced directly and indirectly by the proposed CPHP would likely affect the greater Bay Area region, and would likely increase overall demand in the region for housing, commercial and industrial space, and associated infrastructure.

Re: Draft Environmental Impact Report for the Comprehensive Parnassus Heights Plan

Dear Ms. Wong,
I urge UCSF to abandon plans to encroach upon the Open Space Reserve and to plant San Francisco native plants. 1

As an educational institution, UCSF ought to be educating its students, employees and medical professionals about the need to enhance native habitat, the very environment that supports our lives. Greta Thunberg has it right; we are in the midst of a climate crisis as well as an environmental crisis. Bees, butterflies and birds have been on a steep decline in recent decades, due to human activities, loss/degradation/fragmentation of habitat and climate change. Wildlife provide free ecosystem services, including pollination, which is responsible for 1/3rd of the food on our plates. 2

Audubon reports, “more than 1 in 4 birds...have disappeared from the landscape in a mere half a century.”* This is due to loss of habitat and human activities, exacerbated by climate change. The biology of birds is that they eat insects for protein. And the biology of insects is that they do not have the stomach enzymes to defeat the natural defenses of non-native plants. Non-native plants are like empty bird feeders.

We are in the final year of the United Nations Decade on Biodiversity. Next year begins the UN Decade on Habitat Restoration. Habitat restoration on Mt. Sutro is a good thing, but not construction. The California Biodiversity Initiative also encourages people to recognize the importance of protecting and enhancing native habitat, as does the SF Board of Supervisors’ Biodiversity Resolution. 3

Planting local native plants does help support local fauna. SF State University’s study found that where SF parks are surrounded by gardens with native plants, there are more pollinator species in those parks and a greater abundance of pollinators. Scientists tell us that planting local native plants must occur widely on both public and private property in order to save bees, butterflies and birds. 4

My specific suggestions include the following.
1. Prohibit planting of invasive plants. Nurseries still sell them. Landscapers still design for them. 5

2. Follow CalFire guidelines for tree spacing and choosing fire-safe landscape vegetation. See https://www.readyforwildfire.org/prepare-for-wildfire/get-ready/defensible-space/. 6

3. Require protocols to mitigate the unintentional introduction of weed seeds and pathogens like phytophthora by landscapers and construction equipment. 7

4. Make the most of plants from the Sutro Stewards Nursery. Greg Gaar also gives away SF native plants at the nearby community garden, the former HANC site. LEJ propagates SF native plants for specific projects. 8

5. Educate the entire UCSF community about the bigger biological-ecological picture. Demonstrate the significance and ease of planting local native plants for wildlife that evolved with them. Highlight the fact that California is a biodiversity hotspot; our state is blessed with an abundance of species, many of which occur nowhere else in the world, and many of which we humans have brought to the brink of extinction. Explain that wildlife provide free ecosystem services; without them, we'd be missing 1/3 of the food on our plates. Connect the UCSF community with volunteer opportunities at Sutro Stewards Nursery and in the Open Space Reserve. 9

Thank you. Please let me know whether you'll incorporate my comments into the UCSF Comprehensive Parnassus Heights Plan.

Sincerely,
Denise Louie
Native and resident of San Francisco

Responses to Comments from Denise Louie

I-Louie-1 The commenter urges UCSF to abandon plans to encroach upon the Open Space Reserve. The comment does not address the adequacy of the Draft EIR; consequently, no response is required. The comment has been noted and will be forwarded to decision-makers.

The commenter requests UCSF plant San Francisco native plants. The comment does not address the adequacy of the Draft EIR, but is noted. Please see also responses below regarding native plants.

I-Louie-2 The commenter notes the benefits of wildlife. The comment does not address the adequacy of the Draft EIR, but is noted.

I-Louie-3 The commenter notes the benefits habitat restoration on Mount Sutro. The comment does not address the adequacy of the Draft EIR, but is noted.

I-Louie-4 The commenter notes the benefits of planting local plants. The comment does not address the adequacy of the Draft EIR, but is noted. Please see also responses below regarding native plants.

I-Louie-5 The commenter suggests prohibiting the use of invasive plants on the campus site to improve habitat for native plants and wildlife. This comment does not address the adequacy of the Draft EIR. Nonetheless, UCSF appreciates the input and will consider the suggestion in landscaping decisions. While native plants are used for restoration and replanting in the Open Space Reserve, in landscaped ornamental areas of campus, non-native plants may continue to be used.

I-Louie-6 The commenter recommends that UCSF follow Cal Fire guidelines for tree spacing and choose fire-safe landscape vegetation. As discussed in Section 4.8, Hazards and Hazardous Materials, page 4.8-7, UCSF plans for fire prevention in accordance with guidelines established by the San Francisco Fire Department and Cal Fire to create and maintain defensible space between vegetation and buildings.

I-Louie-7 The commenter recommends that the potential for unintentional introduction of invasive weeds and pathogens like phytophthora during construction and landscaping be mitigated in the Draft EIR. Although these impacts are likely to be minor in an urban setting, it can be instructive for construction workers to be trained to minimize the potential spread of invasive weeds and pathogens. Accordingly, CPHP Mitigation Measure BIO-1e is revised to include avoidance of weed and pathogen spread as part of the worker education measure. Please refer to Section 8.5 of this Comments and Responses document for the proposed revision.

I-Louie-8 and I-Louie-9: The commenter requests that plants for replanting be obtained from the Sutro Stewards Nursery which grows native plants, and that UCSF use the open spaces on campus and pathways on the Reserve to educate the campus community and visitors about the use of local native plants and benefits for wildlife that evolved with them, the ecosystem services provided by plants and wildlife, and the opportunities to volunteer at the Sutro Stewards Nursery and in the Open Space Reserve. The comment does address the adequacy of the Draft EIR; however, UCSF appreciates the suggestions and will consider incorporating them in landscape design.

LILY WONG: As a reminder, tonight is the public hearing for the Draft Environmental Impact Report for the proposed Comprehensive Parnassus Heights Plan. I think we're just going to wait maybe one more minute. Still some people -- looks like they're coming in.

While we're waiting for folks to come in, if you could click the next slide. Next slide. Thank you.

So what you see on the screen right now is the Zoom meeting housekeeping.

So just to emphasize, tonight our court reporter is present to take a transcription of the proceedings. We are going to record it but only in case of blackout or if something else happens. So we just want to make sure that we're encapsulating everybody's comments.

For those who are on the phone, please note that you can hit star-9 to raise your virtual hand. And we are going to be using the virtual hand function. So on the bottom of your screen, you'll see a raised-hand function. If you click that, you'll be in the queue to speak. And we're just going to go in order. So whoever raises their hands first, your hand

is going to be up there. If you lower your hand, you will be bumped back off to the bottom of the queue. It's going to be very hard for us to track where you were.

So if you just -- if you have your hand up, you should just keep raising your hand.

We are recommending that folks join by audio on your computer and put the Zoom in full-screen mode so that it's easier to see the slides and adjust the presentation to fit the window. And I believe that that's pretty much it.

So I will pass it on to my colleague Alicia to go over the next slide.

ALICIA MURASAKI: Thank you, Lily.

Next slide, please. Great. Thank you.

So just a quick reminder. I know many of you have been -- we've been talking to and you've been attending meetings for quite some time. But I wanted to just remind those of you who are newer to the process that tonight we're talking about the Comprehensive Parnassus Heights Plan.

This plan was brought about because the average age of our buildings at Parnassus Heights is 50 years old, and we must meet our seismic compliance requirements by the year 2030.

So we took this opportunity to take a comprehensive look at all of our needs and the campus design, which was the result -- which resulted in the Comprehensive Parnassus Heights Plan. So we want Parnassus to continue to be the home of our professional schools and continue to meet our mission: clinical care, research, and education.

And on top of that, we want it to be a place we can all be proud of.

Next slide, please. Thank you.

So as I said, we've been talking for quite a while. We started in October of 2018 with our first public meetings about the Comprehensive Parnassus Heights Plan. And if you look down to the orange highlighted, that's today, August 2020. And this is our public hearing on the Draft EIR.

So if you want to know what's next, you can see that, whatever your comments are, we're going to be preparing responses. And we anticipate going to the Board of Regents to request the Final EIR certification and the plan to be approved in early 2021.

So next slide, please.

Now, the specific purpose of tonight is to receive your comments on our Draft EIR. So we won't have a dialog or answer questions tonight. We're

really going to focus on receiving your comments, and they will be addressed in writing in the Final EIR.

Next slide, please.

Okay. So here's the nitty-gritty. So as Lily said, we are going to make sure we can have -- give everyone a chance to make a comment by using the virtual raised hand. And because we have -- I think we've hit a hundred people RSVPing for the meeting tonight, we are going to have to limit each speaker's comments to two minutes. So please remember that is to allow everyone who is attending to have time to make a public comment.

But the public comment period does not end tonight. You will be able to give us comments up until 5:00 p.m. on September 11th in writing.

Next slide, please.

And this is the information if you want to send written comments in and also where you can find the Draft EIR in an electronic version. And don't worry; we will put this information up a little bit later as well. But let's give you a -- just a few seconds to jot that down if you'd like.

Okay. I think we can go to the next slide.

I'd like to introduce my colleague Francesca Vega.

Francesca, over to you.

FRANCESCA VEGA: Thank you, Alicia.

And good evening, everyone. Thank you for your participation this evening.

I just want to take a moment to acknowledge and emphasize one of Alicia's points, and that's today -- tonight's legal process does not present an opportunity to engage in dialog with UCSF on this plan.

I also wanted to take a moment to share with you two upcoming opportunities where we're hoping that you will be involved. One is a community meeting with the City and County of San Francisco. And we will be talking through some of the alignment and partnership collaboration opportunities relevant to this project.

I know many of you that are on this call have been involved in various discussions and know that this was something that was part of our ongoing engagement with the City and addressing mutual challenges as well as opportunities.

So we will be confirming a date for that meeting shortly.

Also, I wanted to alert you all, in early 2021, we will begin the formal design process for the new hospital at Parnassus Heights. And, again, there will be an opportunity for your voice to be heard and

for engagement on that part, aspect of the project, to keep informed when these meetings are scheduled and to make sure that you received -- receive the dates of these gatherings.

Please don't hesitate to e-mail community.cgr@ucsf.edu. And that's to sign up for our LISTSERV so you'll be aware of all these engagement opportunities.

Also, if you have general questions or comments that you would like to share, please don't hesitate to contact Lily Wong, our associate director of community relations. And you can see her e-mail and phone number, contact information is listed there.

So, again, on behalf of the Office of Community and Government Relations, thank you for your participation.

ALICIA MURASAKI: Thank you, Francesca.

So now we're going to get to the heart of the public hearing tonight, which is the public comments. We're going to open it up for public comments now.

So you'll see on your screen just a reminder, please raise your hand virtually. And if you're on the phone, it is star-9 to raise your virtual hand. And my colleague Diane Wong will call out groups of names in order of people raising their hands so you can get

ready to speak.

So I will hand it over to Diane and just, in the last second here, remind you to please keep your comments to two minutes to allow everyone a chance to speak tonight.

DIANE WONG: Thank you, Alicia.

So I see two hands raised only. So remember to raise your virtual hand if you want to speak tonight and have your comments become part of the official public record.

When I call out your name, please state your name very clearly for the court reporter.

So the first five people that I see, Whitney Grover, Ariane Eroy, Harvey Smith, Jeanette Quick, and Janice E. Cohen.

LILY WONG: Whitney, you are unmuted, and your two minutes begin now.

WHITNEY GROVER: So my name is Whitney Grover, and I am the chair of the Golden Gate Audubon Conservation Committee in San Francisco as well as a board member for Golden Gate Audubon.

And I just wanted to say that I'm happy to see a lot of our serious concerns were addressed in the EIR, including collisions due to glass structures for birds, permanent lighting as well as the construction

PH-Grover-1

lighting, and then vegetation disturbance during nesting season. So thank you for including those things.

I'd like to point out that several of the birds who nest on the reserve are ground-nesting birds. So any disturbance to vegetation, including in the under-story during nesting season would be a serious disturbance.

So the other -- my other point about the EIR is, in Section 5.3, it says UCSF would replace any reserve area that is lost by designating new reserve area elsewhere on the campus site.

But I just want to say that the benefits when you reserve for wildlife depend on its continuity and connectedness, like the cohesive space. So there's no mention in the EIR of any kind of displaced reserve space. And basically, if the space is added to the campus somewhere that's not continuous to the reserve, it will be less beneficial to wildlife, including birds. Thank you.

LILY WONG: All right. For the next person is Ariane Eroy.

You are unmuted, and your two minutes begins when you start speaking.

ARIANE EROY: I'm in this hearing. We're

PH-Grover-1 cont.

PH-Grover-2

PH-Grover-3

PH-Eroy-4

living in a time of catastrophic climate change, and yet the University plans on reducing the size and density of Mount Sutro Forest, which they call a reserve, by 70 percent of its trees, by increasing the radius around trees between 30 to 60 feet.

This is totally untenable for the viability of this forest. It will decimate the forest. And maybe that's exactly what the University wants so that it can denigrate and thereby develop the forest over time.

The University's already encroaching seriously on its land by increasing the dormitory space threefold when it had plenty of space on Laurel Heights, except it relinquished that with the Board of Regents instead of putting dorm space there.

There's no commitment to preserving this forest. This is our largest urban forest in San Francisco. It belongs to all people. It's part of the Commons. And it's a travesty that the University continues to do clear-cutting at a time of catastrophic climate change.

When will the University be true purveyors and stewards of the forest instead of seeing it as a plot of land on which they can capitalize and expand into? This land can never be replaced. The trees are living beings; they have rights. And we all need them

PH-Eroy-4 cont.

desperately now. Those trees fight for us and fight for the planet every day of our lives. They promote love and generosity. They're our neighbors, and they show us what it means to be a real citizen of the planet, working towards preserving and sharing and promoting goodness. And yet the University clear-cuts.

PH-Eroy-4 cont.

LILY WONG: The next person is Harvey Smith, Harvey, you are unmuted -- or requested to. And your two minutes will begin when you start speaking.

Seems to be a little bit of technical difficulty.

HARVEY SMITH: I asked to unmute.

LILY WONG: So, Harvey, you're going to need to accept unmute in order to begin speaking.

HARVEY SMITH: Okay. My name is Harvey Smith, and my concern is percent for art in this project. My understanding, it's a multi-billion-dollar project, but in communication with staff at UCSF, there's no policy for art in this massive project. This is very much in contrast to the project at Mission Bay.

I understand the chancellor there put a priority on that, and they have a very robust and vibrant display of contemporary art within that project.

PH-Smith-5

I know that the University is not bound by this. In fact, the State of California does not have a percent for art program, but the City of San Francisco does, like 23 other states and many cities in California and throughout the country.

So I would -- would suggest that this be implemented because it's unthinkable that a major public project like this does not have any provision for artworks. This has become pretty much a standard throughout the country. And as I mentioned, many states and cities make this a matter of policy.

I -- I just can't understand why the University of California can't recognize that and include that within the project.

Mission Bay, as I said, has a program. And many people will say that art, particularly in a medical facility or in a university, adds to the climate for either study or for healing. So, again, this should be policy and part of the project.

PH-Smith-5 cont.

LILY WONG: Thank you for your comments.

The next person is Jeanette Quick. I've requested for you to unmute, and your two minutes will begin when you start speaking.

JEANETTE QUICK: Oh, hi. Did you call on Jeanette Quick?

LILY WONG: Yes, Jeanette. We can hear you.

JEANETTE QUICK: Yeah. Sorry about that.

So I am commenting today to oppose the part of the Draft EIR that has to do with the Zakheim murals. In Sections 4.4.4, there is a -- there is stated an intention to demolish the murals, and there are no adequate alternatives that are provided that would actually keep the murals in sufficient condition to be -- to exist in the world.

I believe that new alternatives need to be developed before the Final EIR to preserve these murals and ensure that they can be displayed for the public. These are very important murals that are important to the history of so much in our country, including Black history, Jewish history, art history, history of medicine. And these are really a national treasure that should not be destroyed without any plan.

PH-Quick-6

You know, I know that separately that UCSF has created an RFP, but I think that RFP also is not a sufficient plan to preserve the murals. And then, you know, the RFP says one thing, and this draft EIR is very explicit about the fact that these murals will be destroyed.

So there's a clear conflict in UCSF's approach between the EIR and RFP. And I believe this needs to

PH-Quick-7

be addressed and that the -- what the EIR has listed as far as their plan for preserving this important historical work is insufficient, and I oppose that part of the EIR. Thank you.

PH-Quick-7 cont.

LILY WONG: Thank you for your comment.

The next person is Janice Cohen.

I have requested for you to unmute, and your two minutes will begin when you start speaking.

Janice?

JANICE COHEN: Hello? Can you hear me?

LILY WONG: Yes. Yes, we can hear you.

JANICE COHEN: I'm concerned and in opposition to the extension of Fourth Avenue. I live on Fourth Avenue near Parnassus. And for many years -- I've been living here since '89, and I'm an alumni of UCSF Medical School. I feel like attention to the impact of UCSF traffic, debris, management of Fourth Avenue has been really significant.

I've dealt with hospital debris in front of my house and with gloves, masks, even medical records, syringes. I've dealt with people blocking my driveway going up to the University. I've dealt with many people coming down here to smoke and leaving cigarette butts all over my -- my little area around my tree and on the streets.

PH-Cohen-8

And every time I've gone to UCSF for help, I've been told we're not part of the campus, so they're not really going to monitor any of these things.

The other thing is that Fourth Avenue is now used as a major route for the shuttle, coming and going. And we've already had a lot of accidents and a lot of problems because we never had a traffic-calming program implemented on our street, for different reasons, when it was done all over the rest of the neighborhood.

And I feel that there has to be an impact study on what the extension of Fourth Avenue is going to be on my street and to be considered -- if it is done, to be part of the UCSF campus so that there's some accountability about issues that you have not addressed to date.

PH-Cohen-8 cont.

LILY WONG: Thank you for your comment.

DIANE WONG: Okay. I see four additional speakers. So I'll call you out: Jeff Cole, Lorri Ungaretti, Richard Rothman, Lope Yap, and Lisa Kessler is the fifth one.

So, Jeff Cole.

LILY WONG: So, Jeff, I've requested that you're unmuted, and your two minutes will begin when you start speaking.

JEFF COLE: Hi, my name's Jeff Cole. I live on Edgewood Avenue, and my property --

LILY WONG: Jeff? We lost you for a second. Unmute yourself, Jeff.

JEFF COLE: Can you hear me now? I've unmuted.

LILY WONG: Yes, you're unmuted now.

JEFF COLE: Okay, good.

LILY WONG: Just restart the timer.

JEFF COLE: Yes. My name is Jeff Cole. I live on Edgewood Avenue, and my property backs up to UCSF's property near the surge parking lot. I have four points I'd like to make about the Draft EIR in no particular order.

The first relates to the representation that any open space that's lost by excavation of the hillside crossing Medical Center Way where the proposed new hospital would go on the north side near Parnassus will be made up by additional open space reserve being added elsewhere.

As far as I can tell, there is no place in the EIR that gives any indication of were this would be. But there is a section of the report that's misleading because it represents that land between the woods and the surge parking lot will be redesignated from support

PH-Cole-9

to open space reserve. But anybody who would walk there would be -- it would be obvious that it's already open space reserve; it's already forest land. So it cannot be counted as any addition to the reserve.

My second point relates to the construction noise components of the Draft EIR. It looks as though existing noise levels were measured from various places including an area near the back of the houses on Edgewood Avenue, at Figure 4.11-1, Figure ST5 or Location ST5. It's important that measurements be done at that location during the construction, and it's also important that construction noise be measured not just at Parnassus and Irving but also up on Edgewood, and that the mitigation hours and things apply there as well.

Is my time up?

LILY WONG: Yes. Thank you so much for your comments, Jeff.

JEFF COHEN: All right.

LILY WONG: And you can submit additional written comments to --

JEFF COHEN: Okay.

LILY WONG: -- to us by e-mail.

The next person is Lorri Ungaretti.

I'm going to request an unmute, and your two

PH-Cole-9 cont.

PH-Cole-10

minutes will start when you begin speaking.

LORRI UNGARETTI: Can you hear me?

LILY WONG: Yes.

LORRI UNGARETTI: My name is Lorri Ungaretti, and I'm a local historian. Mostly I research the western side of the city. I'm also a city guide, and for many years, I would take walkers on my Inner Sunset tour into Toland Hall to look at the Zakheim murals. And fortunately, I had a guy that gave me some information about what Mr. Zakheim was portraying in the murals. And people universally said that was the best part of the entire tour.

It is a -- one of the things that I want to say is one of those panels is all about medicine in San Francisco; it's not just about California. But even if it were just about California, these murals should really be preserved. And I just want to add my voice to the people who are saying that. Thank you.

PH-Ungaretti-11

LILY WONG: Thank you very much for your comment.

The next person is Richard Rothman.

I'm sending a request for you to speak, and your two minutes will begin when you start speaking.

RICHARD ROTHMAN: Hi. My name is Richard Rothman, and I'm interested in saving murals.

PH-Rothman-12

And I just want to -- in strongest possible language that these murals be protected. And Lillian has let me come in and seen the murals a number of times. And I was always told, up until January, that, while construction was going on, that these -- that Toland Hall would remain in place and built around. So I was really shocked to hear that now Toland Hall would not be there.

PH-Rothman-12 cont.

And I don't think these murals need to be moved until UCS [sic] comes up with a plan of where to put the murals. Just look what happened -- what is happening to the Covarrubias murals that have been in storage for a number of years and the City has no place to put them. Before they're moved, there should be a place of where they're going to put them.

Moving murals is very dangerous, even if you get a, you know, well-regarded company to move the murals. And I don't see why they can't build around the building. It doesn't to have meet the hospital seismic standards because this part is only going to be for research here. And I just think that these are too important to be moved and put in storage.

And I think the University needs to come up with a plan, before they move them, of where they're going to put them, or leave them there. And they don't

PH-Rothman-13

even have plans for the new buildings, I understand. They just want to tear these buildings down.

So thank you for letting me speak.

LILY WONG: Thank you for your comment, Richard.

The next person is Lope Yap, Jr.

I sent you a request to unmute. Your two minutes will begin when you start speaking.

LOPE YAP, JR.: Can you hear me?

LILY WONG: Yes.

LOPE YAP, JR.: Good evening. My name is Lope Yap, Jr. I'm vice president of the George Washington High School Alumni Association. And I'm one of the principal persons in protecting New Deal art at our high school from people who want to whitewash or permanently remove or permanently cover the murals.

From this experience, this issue has been brought up to me. And I'm here to mention that I'm understanding there is no master plan yet, not a master architect to design this future plan. And my suggestion is -- first and foremost, is to preserve Toland Hall Zakheim murals ideally in the same environment somewhere, even if it's not seismic -- satisfies the seismic issues for medical buildings.

And I believe there's no studies on the

PH-Rothman-13 cont.

PH-Yap-14

PH-Yap-15

possibilities of doing that, leaving it on the campus. The worst thing would be to remove these murals for safekeeping and not have a permanent place for public access, a predetermined place, if you had to move them for construction purposes.

PH-Yap-15 cont.

I also remind everyone that, through the CEQA process, all options should be considered, must be considered, whether it's doing nothing, preserving them in place, to destruction. That's part of the CEQA process. And I'm not informed or I haven't seen or haven't heard anyone talking about preserving, protecting, curating until that permanent established place has been defined. And that should be done before anything happens to these murals. Thank you very much.

PH-Yap-16

LILY WONG: Thank you for your comment, Lope.

The next person is Lisa Kessler.

And you will be the last in this group of five. I sent you a request to unmute, and your two minutes will begin when you start speaking.

LISA KESSLER: Can you hear me?

LILY WONG: Yes.

LISA KESSLER: I would like to call attention to Part 4 of the Draft EIR, specifically the aesthetics. In the impact analysis, the Draft EIR says that the CPHP would not have adverse effect on a public

PH-Kessler-17

scenic vista. So I'd like to call anyone who's listening and everyone's attention to Figure 4.1-14, which is Viewpoint 6, which is a representation of the view from Lincoln Way and Arguello Boulevard, which is down in the park.

It shows the new hospital so large that it not only blocks Mt. Sutro but actually blocks the full height of the Sutro Tower from view, from the public view. This is an iconic San Francisco structure, and it will be completely obscured for anyone enjoying this view from Golden Gate Park.

The EIR doesn't address the aesthetic effects of this massive building on the public. To be specific, they categorize it as, quote, "criteria not analyzed," because it, quote, "does not substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway."

So that viewpoint includes a section of Lincoln that is actually part of the Scenic 49-Mile Drive and isn't addressed at all in the Draft EIR. And I would say that blocking the entirety of Mt. Sutro including the beloved local landmark red tower certainly qualifies as damaging a scenic resource -- to scenic resource.

PH-Kessler-17 cont.

PH-Kessler-18

So for a plan that keeps talking about its "park to peak," quote, design, the only people who are going to be able to enjoy the view are the people -- is people inside the new giant hospital tower. The public viewpoint from the park will have the peak entirely blocked by the proposed massive new structure.

Thank you.

LILY WONG: Thank you, Lisa.

DIANE WONG: The next group of five: Jonathan Manzo, Cathy Cohn, Adam Gottstein, Michael Semler, and Patrice Scatena.

LILY WONG: So, Jonathan Manzo, I've requested an unmute. Your two minutes will start when you begin speaking.

JONATHAN MANZO: Hi, there. I -- I'm not sure if this is the right forum.

But where in -- can someone let me know where in the EIR the parking impacts to the adjacent neighborhoods is noted? Specifically I'm concerned about Midtown Terrace, as we have a fair amount of [unintelligible] here. And I'd also -- if possible, can you direct me to where the phasing plan for the Aldea Housing is noted? And that's it.

LILY WONG: Thank you for your comment.

The next person is Cathy Cohn.

PH-Kessler-18 cont.

PH-Manzo-19

PH-Manzo-20

I've requested that you are unmuted, and your two minutes will start when you start speaking.

CATHY COHN: Okay. Very good. Thank you.

I appreciate the opportunity for us to make comments. And environmental impact reports seem to be very curious things because I have to say they somehow always really serve the interests who funded it. True environmental impact needs to be evaluated from a real 360 angle. PH-Cohn-21

And from my point of view -- and I really appreciate the first speaker talking about how precious the forest is. We will never get that back. Whereas UCSF could make modifications to this plan where they can get what they need without destroying something that at -- especially at this time in our existence should not -- has to be -- has to be preserved. PH-Cohn-22

But my main point is about the literal environmental toxicity of this process. There are many details missing from the implementation. I'm curious how this is going to be done, what the standards -- you know, whose standards these are about allowable air pollution. Will the air be tested and monitored during this process? How and where? Do we know what the noted particulate that was mentioned in the report, what it's made of, what it's a combination of? It does PH-Cohn-23

mention there will be liberation of asbestos during construction.

Then there's another issue of noise pollution. We don't know how many total trips there will be of the trucks coming back and forth.

And we need real solutions that take into account the whole neighborhood and residents who lived through this decade-long process and not just what's most expedient for UCSF.

I'm hoping we can actually get our questions answered instead of these just being comments. And I have many more questions. I would hope that UCSF is prepared to modify its scope to place less burden on the neighborhood's infrastructure and traffic. Thank you.

LILY WONG: Thank you, Cathy, for your comment.

The next person is Adam Gottstein.

Your two minutes will begin when you start speaking.

ADAM GOTTSTEIN: Thank you very much. My name is Adam Gottstein. Am the grandson of Bernard Zakheim, the artist of the murals in question at Toland Hall. I represent members of our family that would include my mother, Ruth Gottstein, who is 98 years old. She is

PH-Cohn-23 cont.

PH-Cohn-24

PH-Cohn-25

PH-Gottstein-26

the oldest daughter of Bernard Zakheim.

And collectively, I just want to be on record as saying that the family is aggrieved at the initial way UCSF approached us to attempt to save these murals at our expense, the family's expense.

With the amount of money that's being used, huge donations being made for the expansion of UCSF and the new building, it seems to me that the amount of money that would be required to safely conserve, remove, store, and then eventually reinstall these murals is within a budget, if that's what is decided by the Regents.

I encourage the Regents and the decision-makers at UCSF to seriously consider preserving these murals in the manner in which they should be preserved. Thank you very much.

LILY WONG: Thank you, Adam.

The next person is Michael Semler.

I've requested for you to speak, and your two minutes will begin when you start speaking.

MICHAEL SEMLER: Good evening, and thank you much for this opportunity.

First, I would like to thank the University for engaging in work to deal with this pandemic. Its role in public health and public protection for a long

PH-Gottstein-26 cont.

PH-Gottstein-27

PH-Semler-28

time has been of value and especially at the current time.

Consequently, it seems to be somewhat beyond the scope of rational and reasonableness to remove a piece of art from the University which commemorates the activities of a wide variety of Californians, including the first African-American nurse -- or one of the first African-American nurses in California to engage in prevent -- in public health measures in California's history.

The Zakheim murals, as illustrative of the work of this activity, should be preserved. Your environmental document does not -- seems to be contradictory. On one level, you describe in the document a potential to preserve and protect the murals through a digital process; whereas, at the same time you suggest -- that earlier you suggest that there should be a comprehensive review.

Either you have prejudged this activity and decided that this review is superfluous and not necessary -- and, therefore, you have prejudiced the document in a manner that I think is unconscionable. Thank you very much.

LILY WONG: All right. Thank you, Michael, for your comment.

PH-Semler-28 cont.

PH-Semler-29

PH-Semler-30

PH-Semler-31

The next person is Patrice Scatena. I apologize for mispronunciation.

You have two minutes, and it begins when you start speaking.

PATRICE SCATENA: Hi, my name is Patrice Scatena, and I'm very concerned about the intrusion of the new hospital tower into the open space west of Edgewood. I strongly feel that will UCSF should stay within its original footprint wherever it is encroaching on the Sutro open space.

The footprint of the hospital appears to eliminate access to the forest from Parnassus at Medical Center Way. It appears UCSF intends to create a new trail access to the forest on the east side of the campus as part of the parked peak, and with impact on the green space and animal and bird habitat in that area. PH-Scatena-32

Also, the shadow studies in the EIR appear to be inadequate to show the impacts of the new hospital tower on the surrounding neighborhood, including my location in Cole Valley between Stanyon and Clayton.

I would like to request that UCSF separately have its architects provide the community with video animation of the shadow study rather than simply still shots so that we can then -- we the neighbors can PH-Scatena-33

actually see the shadow impacts of putting the Salesforce Tower in Cole Valley and the Inner Sunset.

I am continuing to study the report, and I will be able -- I am hoping to be able to submit more detailed written comments before September 11th.

I did notice the figure that shows the hospital tower blocks the full-height Sutro Tower from Golden Gate Park. And I echo the comments of that speaker.

That is what I have to say today, and thank you very much.

DIANE WONG: Is there anyone else who like to speak? I see no hands raised.

(No response)

DIANE WONG: Okay. I think there is -- so I saw for a second there was one raised, but it disappeared. Okay.

So we have one more speaker, Nathan Zakheim.

LILY WONG: Nathan, I've just requested for you to unmute, and your two minutes will begin when you start speaking.

NATHAN ZAKHEIM: Let me know when to start. Can I begin?

LILY WONG: Yes, you may begin.

NATHAN ZAKHEIM: Can you hear me?

PH-Scatena-33 cont.

PH-Scatena-34

PH-Scatena-35

LILY WONG: Yes.

NATHAN ZAKHEIM: Okay. Thank you so much.

I would just like to mention that, in 1965 when I was in my 20s, I removed two frescoes from the Cole Hall. They were taken out using a very inventive -- I invented it -- method of consolidating the mural with conservation resins and then putting a steel frame on the back. They are now at HSW-2, and they've been there since 1965 without any damage, any need for further conservation, et cetera.

PH-Zakeim-36

I would like to say that the -- somehow or other, the plan that has been forward, the RFP, is designed to damage or even destroy the murals. And I will say that from the fact that I have removed nine murals and reinstalled nine murals, myself, over my 55 years of working at it and that it can easily be avoided if the consolidation or adding resins to soak into the material of the mural is done. Then you can drop it five feet and it won't break or chip.

I would like that to be reconsidered. I think the RFP should be discontinued until that issue is resolved because, at this present moment, anyone who bids on that, according to the RFP, will guarantee the destruction or the severe damage of the mural.

And I'll explain why in my last breath here.

PH-Zakeim-37

And that is, fresco plaster is thin white plaster, an eighth of an inch thick, mixed with marble dust, lime dust or marble dust. It's not at all compatible with the plaster underneath it. Then again, people don't normally go shaking murals around.

The -- it is -- when I worked on Orozco's Prometheus at Pomona College, I found whole sections that had pushed away from the layer. If that mural had been moved, we would have lost a third of Orozco's Prometheus. I was able to inject it with resins so that now it's as stable as you can get.

So I recommend that that --

LILY WONG: If you can wrap up.

THE WITNESS: -- and no other. Thank you.

LILY WONG: Thank you very much for your comment.

DIANE WONG: So is there anyone who has not spoken yet who would like to speak?

(No respone)

DIANE WONG: Okay. I don't see any more hands from people who have not yet spoken.

So I'll turn it back to Alicia.

ALICIA MURASAKI: Thank you, everyone, for coming and for providing public comment.

I just want to remind you one last time that

PH-Zakeim-37 cont.

the public comment period will end at 5:00 p.m. on September 11th. So you still have an opportunity to submit written comments to -- on the Draft EIR, and any comments will be made a part of the Final EIR.

I really want to thank you for joining us on Zoom and for your patience with us as we work through technology in this new format.

And have a safe and healthy evening. Thank you very much.

(Whereupon, the proceedings concluded at 6:16 p.m.)

STATE OF CALIFORNIA)
) ss.
COUNTY OF MARIN)

I, DEBORAH FUQUA, a Certified Shorthand Reporter of the State of California, do hereby certify that the foregoing proceedings were reported via the Zoom conferencing platform by me, a disinterested person, and thereafter transcribed under my direction into typewriting and which typewriting is a true and correct transcription of said proceedings.

I further certify that I am not of counsel or attorney for either or any of the parties in the foregoing proceeding and caption named, nor in any way interested in the outcome of the cause named in said caption.

Dated the 1st day of September, 2020.

DEBORAH FUQUA

CSR NO. 12948

Responses to Comments from the Public Hearing Transcript

PH-Grover-1 The commenter expresses appreciation that the Golden Gate Audubon's concerns were addressed in the Draft EIR, including bird strikes, lighting, and vegetation disturbance during nesting season. The comment is noted.

PH-Grover-2 The commenter requests consideration of ground-nesting birds within the Reserve who may be particularly vulnerable to vegetation disturbance. The Draft EIR CPHP Mitigation Measure BIO-1c states if construction is required within nesting season, "within seven days prior to the proposed start of construction activities a qualified biologist shall conduct a nesting bird survey of all potential habitat at the construction site and within 250 feet of the perimeter of the construction site." This survey would include herbaceous vegetation. In response to this comment, the discussion of impacts to nesting birds in the Draft EIR Section 4.3, page 4.3-15 is clarified to indicate that herbaceous vegetation may provide nesting habitat for ground-nesting birds in the Reserve. Please refer to Section 8.5 of this Comments and Responses document for the proposed revision.

PH-Grover-3 The commenter indicates that the benefits of space reserved for wildlife depends on its continuity and connectedness, and that that there is no mention of displaced reserve space in the EIR. The Draft EIR Chapter 3, Project Description identifies the location and approximate area of the potential area that may be displaced by the New Hospital under the CPHP, and the area proposed to be redesignated as Open Space Reserve; please see pages 3-26 to 3-27, page 3-39, and Figure 3-21 on page 3-41. The area of forest land to be redesignated as Open Space Reserve is contiguous to the existing Open Space Reserve. UCSF's proposal under the CPHP would provide permanent open space reserve protection that is not currently provided for this area adjacent to the Surge parking lot, and ensure there is no net loss in protected areas at the campus site.

PH-Eroy-4 The commenter discusses vegetative management activities within the Reserve, which were the subject of prior environmental review in the Mount Sutro Open Space Reserve Management Plan Final EIR certified by the Regents in April 2018. These comments are not directly related to either the CPHP or the adequacy of the CPHP Draft EIR. For these comments, no response is required.

The commenter also asserts that that the proposed housing will encroach within the Reserve. The new Aldea Housing structures would be developed in generally the same building footprints as the existing Aldea Housing buildings, and consequently, this project development would not extend into the Reserve. Regardless, all potential environmental impacts of the Aldea Housing Densification project are adequately addressed in the Draft EIR, and mitigated to the extent feasible.

PH-Smith-5 The commenter expresses concern that there is no policy for art to be included in the CPHP. The comment is appreciated, however, it does not address the adequacy of the Draft EIR. The comment will be forwarded to decision-makers.

PH-Quick-6 The commenter states that the alternatives in the Draft EIR are not adequate. The commenter states the murals should be preserved due to their historic relevance. Please refer to Master Response 11: Toland Hall Murals.

PH-Quick-7 The commenter states the treatment of the murals in the Draft EIR and UCSF's proposal for preservation of the murals conflict with one another, and that the Draft EIR's plan for preserving the murals is insufficient. Please refer to Master Response 11: Toland Hall Murals.

PH-Cohen-8 The commenter expresses opposition to the proposed Fourth Street extension. This is not a comment on the adequacy of the EIR. The comment has been noted and will be forwarded to decision makers. To the extent development of the Fourth Avenue extension would result in environmental impacts, they are addressed in the Draft EIR and mitigated to the extent feasible.

The commenter also raises quality of life concerns in the Fourth Avenue vicinity, such as litter. As discussed in Master Response 1: Non-CEQA Comments, quality of life conditions, are not considered environmental impacts under CEQA.

PH-Cole-9 The commenter takes issue with the CPHP's proposal to replace any area of the Reserve that is lost due to new development under the CPHP by designating new Reserve area elsewhere on the campus site. While the commenter is correct that the area of the forest adjacent to the Surge Parking lot illustrated in Figure 3-21 is already forest land, it is currently designated as a "Support" zone in UCSF's existing functional zone map, and under the CPHP would be designated as an "Open Space Reserve" zone. Accordingly, the CPHP would provide permanent open space reserve protection that is not currently provided for this area.

PH-Cole-10 This comment stresses the importance of conducting noise monitoring near residents on Edgewood Avenue, and that the mitigation of limiting construction hours applies to this area.

With respect to construction noise, this topic is addressed on pages 4.11-16 through 4.11-26 of the Draft EIR and the impact was identified as a significant and unavoidable impact. As stated in Section 4.11 Noise and Vibration on page 4.11-24 of the Draft EIR, the Surge parking lot is located as close as 20 feet from the nearest off-site receptors (on Edgewood Avenue), and would likely be used for staging for the Aldea Housing Densification project and the New Hospital. CPHP Mitigation Measure NOI-1b: Construction Hours is

identified on page 4.11-19 of the Draft EIR to restrict the hours of construction to the degree feasible. Material deliveries and equipment start-ups at the staging area would fall within the "not noisy work" category within this mitigation measure and would be restricted to the hours indicated in the associated column.

Additionally, CPHP Mitigation Measure NOI- 1a: Construction Noise Control Measures identified on page 4.11-18 of the Draft EIR would require shielding of the staging area where adjacent sensitive receptors have direct line-of-sight with loading and delivery activities which would reduce off-site noise impacts and also reduce off-site transport of fugitive dust emissions as would the watering requirement of CPHP Mitigation Measure AIR-1b.

PH-Ungaretti-11 The commenter expresses support for preserving the murals. Please refer to Master Response 11: Toland Hall Murals.

PH-Rothman-12 The commenter requests that the murals be protected and notes they were previously informed that Toland Hall would remain in situ and would be surrounded by new development. Please refer to Master Response 11: Toland Hall Murals.

PH-Rothman-13 This comment requests that UCSF identify the location for where the murals will be relocated to prior to their removal, and that a well-regarded company be used to move the murals. Please refer to Master Response 11: Toland Hall Murals.

PH-Yap-14 The commenter suggests that the murals be preserved in the same environment as they are currently in. Please refer to Master Response 11: Toland Hall Murals.

PH-Yap-15 The commenter states that UCSF has no plan for keeping the murals on the campus site. Please refer to Master Response 11: Toland Hall Murals.

PH-Yap-16 The commenter requests that the murals be preserved in situ until a permanent location for the murals is determined. Please refer to Master Response 11: Toland Hall Murals.

PH-Kessler-17 The comment states that the proposed New Hospital would block the view of Sutro Tower from Golden Gate Park and that this would be a significant aesthetic impact. Please refer to Master Response 7: Aesthetic Impacts.

PH-Kessler-18 The comment states that some viewpoints depicted in the Draft EIR represent location on the route of San Francisco's 49-Mile Scenic Drive and that the proposed project would therefore damage scenic resources visible from a scenic route. The comment also states that the proposed New Hospital would

block views from within the Mount Sutro Open Space Reserve. Please refer to Master Response 7: Aesthetic Impacts.

PH-Manzo-19 The comment requests information on the CPHP's parking impacts to the adjacent neighborhoods. As noted on page 4.15-33 of the Draft EIR, parking is not a CEQA topic, and as such the Draft EIR does not include an assessment of parking impacts. Parking demand associated with the project is presented on pages 4.15-33 through 4.15-34 of the Draft EIR for informational purposes. In addition, the Draft EIR accounts for the potential effects of parking demand exceeding supply through its travel demand analysis, as discussed on pages 4.15-30 and 4.15-31 of the Draft EIR, and further discussed in Master Response 18.

PH-Manzo-20 The commenter requests the phasing plan for the proposed Aldea Housing Densification project. The Draft EIR notes the Aldea Housing Densification project would occur in two phases. The initial Aldea Housing Densification project is described in the Draft EIR Project Description on page 3-28, and conceptually illustrated in Figure 3-16 and 3-17 on pages 3-28 and 3-29; the Future Phase of the Aldea Housing Densification project is described on page 3-34 and conceptually illustrated in Figure 3-17 on page 3-29. The initial Aldea Housing Densification project is identified on page 3-37 (from 2028 to end of 2030); the timing of the future phase of the Aldea Housing Densification project is not yet defined, but would be completed prior to 2050.

PH-Cohn-21 The commenter indicates that EIRs always serve the interests that funded it, and true environmental impacts needs to be evaluated from a real 360 angle. Given the lack of specificity in this comment, no direct response is possible. Please see Master Response 2: General Comments on EIR and Environmental Topics.

PH-Cohn-22 The commenter makes a general comment regarding preservation of the forest. Given the lack of specificity in this comment, no direct response is possible. Please see Master Response 2: General Comments on EIR and Environmental Topics.

PH-Cohn-23 This comment questions what the standards and whose standards are in the Draft EIR about allowable air pollution, whether and how the air will be tested and monitored during this process, what the components of the noted particulates mentioned in the Draft EIR are, and that the Draft EIR mentions that there may be a release of asbestos during construction.

The significance criteria applied in the analysis of air quality impacts in the Draft EIR are identified on page 4.2-19 of the Draft EIR. Specifically, numeric thresholds developed by the Bay Area Air Quality Management District (BAAQMD) were applied in the analysis. The numeric thresholds are

presented in Table 4.2-6 of the Draft EIR and are published by BAAQMD. [1] BAAQMD is the regional agency with jurisdiction for regulating air quality within the nine -county San Francisco Bay Area Air Basin. Assessment of localized health risk impact also utilize thresholds published by BAAQMD specific to analysis under CEQA.

BAAQMD regularly monitors air quality in San Francisco at its Arkansas Street station and a summary is provided in Table 4.2-1 on Draft EIR page 4.2-3. Air quality monitoring is not currently conducted nor proposed to be conducted on the UCSF Parnassus campus site or environs.

With respect to diesel particulate matter, a thorough description of this toxic air contaminant is provided on page 4.2-11 of the Draft EIR.

Analysis of potential impacts of the proposed CPHP with respect to release of asbestos containing building materials and naturally occurring asbestos is provided in Section 4.8 Hazards and Hazardous Materials on Draft EIR page 4.8-14 through 4.8-19.

PH-Cohn-24 This comment raises concern regarding noise from truck trips coming back and forth.

Please refer to Draft EIR pages 4.11-27 and 4.11-28 for the assessment of increased noise levels from vehicles on Medical Center Way, including trucks. This analysis calculated noise levels using the DNL calculator developed by the federal Department of Housing and Urban Development. This model takes into account the increases in vehicle trips, including trucks, and the effect of roadway grade on the noise emissions from heavy trucks. Based on the estimated increase in traffic volumes on Medical Center Way as estimated by the transportation consultant, noise levels would increase from 58 DNL to 59 DNL at the nearest residential structures on Edgewood Avenue, approximately 180 feet away from the roadway. These predicted noise levels were identified as a less than significant impact in the Draft EIR.

PH-Cohn-25 The commenter makes a general comment that real solutions are needed that take into account the whole neighborhood and residents, and not what is most expedient for UCSF. The comment is appreciated, however, it does not address the adequacy of the Draft EIR. The comment will be forwarded to decision-makers.

[1] BAAQMD, CEQA Air Quality Guidelines. June 2017

PH-Gottstein-26 The commenter states his familial connection to Bernard Zakheim, and indicates the family is aggrieved at UCSF's suggestion for the family to save the murals at its expense. The comment is noted, and will be forwarded to decision-makers. Please also see Master Response 11: Toland Hall Murals.

PH-Gottstein-27 The commenter suggests the use of donations made for the expansion of UCSF to be used to fund safely conserving, removing, storing and reinstalling the murals. The comment is noted, and will be forwarded to decision-makers. Please also see Master Response 11: Toland Hall Murals.

PH-Semler-28 The commenter expresses appreciation to UCSF for engaging in work to address the COVID-19 pandemic. The comment is noted.

PH-Semler-29 The commenter objects to the removal of the Zakheim murals, including the panel depicting the first African-American nurse. Please see Master Response 11: Toland Hall Murals.

PH-Semler-30 The commenter suggests the Draft EIR is contradictory in how it describes the plan to preserve the murals. Please refer to Master Response 11: Toland Hall Murals.

PH-Semler-31 The commenter asserts that UCSF has prejudged the removal of the murals, and therefore has prejudged the document. Please refer to Master Response 11: Toland Hall Murals.

PH-Scatena-32 The commenter objects to the potential encroachment of the New Hospital into the Reserve. This is not a comment on the adequacy of the EIR. The comment has been noted and will be forwarded to decision makers.

The commenter also questions if the CPHP would result in elimination of access to the Reserve from Parnassus Avenue at Medical Center Way and creation of a new trail access on the east side of the campus. No details of the site plan for New Hospital are available at this time; however, UCSF does not intend to reduce overall pedestrian access to the Reserve.

PH-Scatena-33 The comment states that the shadow analysis is inadequate with respect to shadows in Cole Valley and requests that UCSF provide neighbors with video animation of shadow that would be cast by the proposed project. Please refer to Master Response 9: Shadow Impacts.

PH-Scatena-34 The comment indicates continuing review of the Draft EIR, and that detailed written comments will be submitted before the end of the public review period. The comment is noted; please see responses to comment letter I-Scatena.

PH-Scatena-35 The comment states that the proposed New Hospital would block the view of Sutro Tower from Golden Gate Park and agrees with a prior commenter that

this would be a significant aesthetic impact. Please refer to Master Response 7: Aesthetic Impacts.

PH-Zakheim-36 The comment indicates noticing the visual simulation from Golden Gate Park of the New Hospital blocking Sutro Tower. Please refer to Master Response 7: Aesthetic Impacts.

PH-Zakheim-37 The commenter suggests that UCSF's Request for Proposal with regard to the murals would damage or destroy them, and puts forward an approach the commenter believes will strengthen the murals and allow them to be moved without incurring damage. Please refer to Master Response 11: Toland Hall Murals.

8.5 Revisions to the Draft EIR

8.5.1 Overview

This chapter presents revisions to the text, tables and figures to the Draft EIR. These revisions include both (1) revisions made in response to comments on the Draft EIR, as well as (2) UCSF staff-initiated text changes to correct minor inconsistencies, to add minor updates to information or clarification related to the CPHP, and to provide updated information where applicable. None of the revisions or corrections in this chapter substantially change the analysis and conclusions presented in the Draft EIR.

The chapter includes all revisions to the Draft EIR (see Section 8.5.2) in the sequential order that they appear in those documents. Preceding each revision is a brief explanation for the text change, and the section/page number in the Draft EIR where the revision occurs. Deletions in text and tables are shown in strikethrough (~~strikethrough~~) and new text is shown in underline (underline). The same revisions presented in this chapter are also incorporated in the consolidated Draft EIR in Volume 1 of this Final EIR, which includes the full text of the integrated Draft EIR, as revised.

8.5.2 Revisions to the Draft EIR

Draft EIR Chapter 1, Introduction

Draft EIR Chapter 1, Introduction, Section 1.5, page 1-7, second to last paragraph, first sentence, was incomplete, and is corrected as a staff-initiated change, as follows:

> A program EIR has been prepared for the CPHP that establishes a framework for tiered or project-level environmental documents that would be prepared in the future in accordance with the overall program.

Draft EIR Chapter 2, Summary

Draft EIR, Chapter 2, Summary, Section 2.4, Table 2-1, Significant and Unavoidable Impacts of the Proposed CPHP, page 2-6, Impact C-AIR-1 is revised as a staff-initiated change, as follows:

> **Impact C-AIR-1**: Implementation of the CPHP combined with cumulative development in the project area would result in a cumulatively considerable net increase of a criteria pollutant (PM_{10}) for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, pages 2-13, the first bullet under Mitigation Measure AIR-1a is revised in response to Comments O-LD2-106 and O-LD2-112, as follows:

- All mobile diesel-powered off-road equipment larger than 25 horsepower and operating on the project site for more than two days continuously shall be equipped with engines meeting USEPA emissions standards for Tier 4 Final certified engines or equivalent; and

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, pages 2-15 to 2-16, CPHP Mitigation Measure AIR-2b, first paragraph and Nos. 4 and 7 are revised, and new No. 8 is added, as a staff-initiated change, as follows:

CPHP Mitigation Measure AIR-2b: TDM Program Enhancements

To reduce ~~on- and off-campus~~ vehicle trips and resulting air quality impacts, UCSF will implement TDM program enhancements such that the number of new average daily vehicle trips to and from the campus site is reduced by at least 15 percent from the estimated new average daily vehicle trips without these program enhancements (Fehr & Peers, 2020).

TDM program enhancements/strategies shall initially include the following:

1. *New shuttle connections to regional transit (e.g. BART):* Implement new UCSF shuttle service between the campus site and regional transit stations (e.g. BART, Caltrain) to make regional transit a more attractive option for employees, patients, and visitors.

2. *Expand telecommuting and flexible hours program for employees:* Allow employees in appropriate positions to telecommute from home and/or work a modified schedule such that they are commuting to the campus less frequently per week.

3. *Improved telehealth program for patients:* Implement an expanded telehealth program to reduce the need for patients to travel to the campus site for appointments.

4. *Carpool and vanpool credits and incentives:* Provide ~~cash allowance~~ a subsidy or discounted parking permit rates for individuals who carpool rather than drive alone; reduce monthly fares for Vanpool riders and drivers.

5. *Discontinue monthly parking permits:* Discontinue issuance of monthly parking permits to make commute travel mode a daily decision by shifting to daily parking permits.

6. *Enhanced patient TDM program*: Enhance information provided to patients regarding travel options to the campus site, including discussion of limited parking environment and public transit options.

7. *TNC to transit subsidy*: Provide ~~cash allowance~~ a subsidy for individuals to use TNC to travel to transit rather drive alone.

8. *Transit pass program*: UCSF Health will implement a patient transit pass program by June 30, 2025. In addition, a petition to run a referendum on a SFMTA student transit pass will be reviewed and voted on by the UCSF student government assembly by June 30, 2025. Balloting would be in March and voting would be in April. Assuming the referendum passes, the results would be submitted to UCOP for approval in May and the fee would typically apply at the start of the new academic year, which would be September.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-18, Impact C-AIR-1 is revised as a staff-initiated change, as follows:

Impact C-AIR-1: Implementation of the CPHP combined with cumulative development in the project area would result in a cumulatively considerable net increase of a criteria pollutant (PM_{10}) for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-19, CPHP Mitigation Measure BIO-1c, the following sentence is added add the end of the paragraph in the first bullet:

> The qualified biologist will monitor all vegetation removal in the Open Space Reserve during bird nesting season.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-20, CPHP Mitigation Measure BIO-1e, the bulleted paragraph is revised as follows in response to Comment I-Louie-7:

- A qualified biologist shall provide training to all construction workers prior to starting work on plan components. The training shall cover special-status species with potential to be found onsite, avoidance measures to be undertaken if a species is found, avoiding the spread of invasive weeds and pathogens during construction, and best management practices for site housekeeping.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, pages 2-21 to 2-22, Mitigation Measure CUL-1b is revised as follows:

> **CPHP Mitigation Measure CUL-1b: Document Historical Resources Prior to Demolition or Alteration**
>
> Prior to any demolition work or significant alterations initiated at the known historical resources, UCSF shall ensure that a qualified architectural historian who meets the Secretary of the Interior's Professional Qualification Standards thoroughly documents each building and associated landscaping and setting. This includes the Zakheim Murals in UC Hall. Documentation shall include still photography and a written documentary record of the building to the National Park Service's standards of the Historic American Buildings Survey (HABS) or the Historic American Engineering Record (HAER), including accurate scaled mapping and architectural descriptions. If available, scaled architectural plans will also be included. Photos include large-format (4"x5") black-and-white negatives and 8"x10" enlargements. Digital photography may be substituted for large-format negative photography if archived locally. The record shall be accompanied by a report containing site-specific history and appropriate contextual information. This information shall be gathered through site-specific and comparative archival research and oral history collection as appropriate. Copies of the records shall be submitted to the Northwest Information Center at Sonoma State University and the UCSF Kalmanovitz Library Archives and Special Collections.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-22, new CPHP Mitigation Measure CUL-1e is inserted following Mitigation Measure CUL-1d:

> **CPHP Mitigation Measure CUL-1e: Display of Zakheim Murals**
>
> Provided that the Zakheim murals are successfully removed from Toland Hall and stored, UCSF will convene a Task Force by the end of 2021 to advise on options for the display of the murals in a publicly accessible setting, either on a UCSF campus or at a museum or other institution. The Task Force will include the Chair of the City's Historic Preservation Commission, or their designee.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-23, the last two sentences in Mitigation CUL-3 are revised in response to Comment A-SFP-14, as follows:

> Treatment for most resources could consist of (but shall not be limited to) sample excavation, site documentation, and historical research, as appropriate to the discovered ~~prehistoric~~ resource. The treatment plan shall include provisions for analysis of data in a regional context as appropriate to the discovered ~~prehistoric~~ resource, reporting of results within a timely manner, and dissemination of reports to local and state repositories, libraries, and interested professionals.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-24, the mitigation for historic resources for Impact C-CUL-1 is revised as follows:

> **Historic Resources.** Implement CPHP Mitigation Measures CUL-1a through ~~-1d~~le.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-25, CPHP Mitigation Measure GEO-3 is modified as a staff-initiated change:

> **CPHP Mitigation Measure GEO-3:** UCSF shall implement the following geotechnical recommendations as adapted from those contained within the Rutherford & Chekene March 2019 report:
>
> - Remove selected trees located on or at the crest of steep rock slopes on which tree root wedging decreases stability. Determination of specific trees to be removed shall be made in association with a certified arborist and state licensed geotechnical engineer or engineering geologist. Removal will involve cutting trees and leaving stumps such that the root system can rot in situ with minimal disturbance to the surface geology.
> - Conduct qualitative monitoring of identified slopes by a state licensed geotechnical engineer or engineering geologist or as directed by said professional. Monitoring shall occur, at a minimum, after each ~~moderate to~~ major storm or earthquake, as defined by the geotechnical professional. The geotechnical professional shall submit a report of findings to UCSF that includes recommendations for additional slope stability improvements, if deemed necessary, to maintain continued safety in accordance with geotechnical standards and building code requirements.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, Impact HYD-1 is modified as a staff-initiated change as follows:

> **Impact HYD-1:** Construction and operation of campus development under the CPHP would ~~not~~ have the potential to violate water quality standards or waste discharge requirements, or otherwise substantially degrade surface or groundwater quality.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, the level of significance before mitigation for Impact HYD-1 is modified as a staff-initiated change, and changed from LTS to LTSM, as follows:

> ~~LTS~~ LTSM

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, new Mitigation Measure HYD-1 is included for Impact HYD-1 as a staff-initiated change, as follows:

~~None required.~~

CPHP Mitigation Measure HYD-1: During implementation of the CPHP, UCSF shall continue to implement water conservation measures and construct and implement stormwater management controls as needed so as to:

a. Avoid increasing the likelihood of surcharges by exceeding the capacity of the City's CSS;

b. Avoid increasing the extent or duration of ponding or overland flow by exceeding the capacity of the City's CSS; and

c. Avoid discharges to the City's CSS that could increase the frequency, duration, or volume of combined sewer discharges to the receiving waters.

To meet the first two (hydraulic) performance standards, UCSF shall design all new on-campus buildings and site improvements to be consistent with requirements of the City's Stormwater Management Ordinance (Article 4.2 of the San Francisco Public Works Code), ensuring that the stormwater runoff rate and volume from the project shall not exceed pre-development conditions for the 1- and 2-year, 24-hour design storm (the standard for sites that are less than 50 percent impervious). In addition, when connections to the City's CSS are being designed, UCSF shall analyze the capacity of the adjoining sewer system to ensure that the system can accommodate UCSF's increased flows and/or modified connection points. UCSF may choose to conduct this modeling analysis on its own and submit the analysis to the SFPUC for review, or request that the SFPUC conduct the analysis on UCSF's behalf, subject to reimbursement of the SFPUC's costs by UCSF. If the analysis determines that increased flows may exceed the conveyance capacity of the adjoining downstream sewers, UCSF shall pay its proportional share of the costs of expanding the sewer system to accommodate the increased flows from the Parnassus Heights campus site.

To meet the third (hydrologic) performance standard, UCSF shall ensure that the total volume of stormwater discharges from the Parnassus Heights campus site in wet weather is decreased by an amount sufficient to offset flows from any increase in impervious surfaces and any increases in wastewater discharges as a result of the CPHP. Necessary reductions may be achieved via LID, on-site detention and re-use, on-site detention for discharge, and/or other strategies in conformance with the City's Stormwater Management Ordinance, and may be less than the total wet weather discharges from Parnassus Heights campus site if modeling demonstrates there is sufficient storage, pumping, and treatment capacity in the City's CSS to avoid increased discharges to the receiving waters from the CSS discharge structures.

UCSF shall use the SFPUC's model to establish a baseline prior to implementation of the CPHP and to demonstrate that future incremental increases in stormwater and/or wastewater from the campus site under the CPHP would not cause or contribute to any increase in overflow volumes from the City's CSS discharge structures, as determined through modeling at every major phase of the CPHP (starting with the Initial Phase) or

> every five years, whichever is more frequent, through CPHP buildout. UCSF may choose to conduct this modeling analysis on its own and submit the analysis to the SFPUC for review, or request that the SFPUC conduct the analysis on UCSF's behalf, subject to reimbursement of the SFPUC's costs by UCSF. In the event of non-compliance, UCSF shall immediately take steps to remedy the deficiency and provide reports to the SFPUC in conjunction with each construction project undertaken to implement the CPHP until the performance standard is met.
>
> Any improvements constructed outside the campus site boundary or in public right of way in the City's jurisdiction shall be subject to construction site runoff requirements and post-construction stormwater controls in accordance with the City Public Works Code and in compliance with the City's Stormwater Management Ordinance, and shall be included in UCSFs calculation of the total volume of increased flows to be offset and its modeling of incremental increases in flows into the City's CSS.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, the level of significance after mitigation for Impact HYD-1 is modified as a staff-initiated change, and changed from NA to LTS, as follows:

> ~~NA~~ LTS

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, Impact HYD-2 is modified as a staff-initiated change, as follows:

> **Impact HYD-2:** Construction and operation of the campus development under the CPHP would not substantially alter the existing drainage patterns of the site or area, in a manner that has the potential to result in substantial erosion or siltation on- or off- site; would potentially substantially increase the rate or amount of surface runoff in a manner that would result in flooding on or off site; would potentially create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flow.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, the level of significance before mitigation for Impact HYD-2 is modified as a staff-initiated change, and changed from LTS to LTSM, as follows:

> ~~LTS~~ LTSM

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, new Mitigation Measure HYD-1 is included as mitigation for Impact HYD-2 as a staff-initiated change, as follows:

> ~~None required.~~ Implement CPHP Mitigation Measure HYD-1.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, the level of significance after mitigation for Impact HYD-2 is modified as a staff-initiated change, and changed from NA to LTS, as follows:

> ~~NA~~ LTS

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, Impact C-HYD-1 is modified as a staff-initiated change, as follows:

> **Impact C-HYD-1:** Construction and operation of campus development under the CPHP, in conjunction with other cumulative development within the City of San Francisco, would have the potential to ~~not~~ cumulatively violate water quality standards or waste discharge requirements, or otherwise substantially degrade water quality.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, the level of significance before mitigation for Impact C-HYD-1 is modified as a staff-initiated change, and changed from LTS to LTSM, as follows:

~~LTS~~ LTSM

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, include Mitigation Measure HYD-1 for Impact C-HYD-1 as a staff-initiated change, as follows:

~~None required.~~ Implement CPHP Mitigation Measure HYD-1.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, the level of significance after mitigation for Impact C-HYD-1 is modified as a staff-initiated change, and changed from NA to LTS, as follows:

~~NA~~ LTS

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, Impact C-HYD-2 is modified as a staff-initiated change as follows:

> **Impact C-HYD-2:** Construction and operation of campus development under the CPHP, in conjunction with other cumulative development in the City of San Francisco's CSS, would not have the potential to cumulatively alter the drainage pattern of the site or area, through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on or off site; would have the potential to substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site; create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flow.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, the level of significance before mitigation for Impact C-HYD-2 is modified as a staff-initiated change and changed from LTS to LTSM, as follows:

~~LTS~~ LTSM

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, include Mitigation Measure HYD-1 for Impact C-HYD-2 as a staff-initiated change, as follows:

~~None required.~~ Implement CPHP Mitigation Measure HYD-1.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-30, the level of significance after mitigation for Impact C-HYD-2 is modified as a staff-initiated change, and changed from NA to LTS, as follows:

~~NA~~ LTS

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-3, Summary of CPHP Impacts and Mitigation Measures, page 2-33, Mitigation Measure NOI-3b is modified as follows:

CPHP Mitigation Measure NOI-3b: Assessment and Relocation/Retrofitting of Vibration-Sensitive Equipment: UCSF shall evaluate the presence of vibration-sensitive equipment within 150 feet of construction and demolition areas. Any sensitive equipment shall be evaluated for the existing extent of vibration isolation and relocated or further embellish isolation, as warranted. Alternatively, use of such equipment may be suspended during the substantial vibration-generating activities within 150 feet.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-4, Summary of Irving Street Arrival, RAB and Initial Aldea Densification Projects, and Initial Phase Improvements Impacts and Mitigation Measures, page 2-42, under the applicable mitigation measures for Impact CUL-1 for the RAB, the new CPHP Mitigation Measure CUL-1e is added following CPHP Mitigation Measure CUL-1d:

CPHP Mitigation Measure CUL-1e: Display of Zakheim Murals.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-4, Summary of Irving Street Arrival, RAB and Initial Aldea Densification Projects, and Initial Phase Improvements Impacts and Mitigation Measures, page 2-45, Impact HYD-1 is modified as a staff-initiated change as follows:

Impact HYD-1: Construction and operation of campus development under the CPHP would ~~not~~ have the potential to violate water quality standards or waste discharge requirements, or otherwise substantially degrade surface or groundwater quality.

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-4, Summary of Irving Street Arrival, RAB and Initial Aldea Densification Projects, and Initial Phase Improvements Impacts and Mitigation Measures, page 2-45, the level of significance before mitigation for Impact HYD-1 is modified as a staff-initiated change, and changed from LTS to LTSM, as follows:

~~LTS~~ LTSM

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-4, Summary of Irving Street Arrival, RAB and Initial Aldea Densification Projects, and Initial Phase Improvements Impacts and Mitigation

Measures, page 2-45, under the applicable mitigation measures for Impact HYD-1, new CPHP Mitigation Measure HYD-1 is included as a staff-initiated change, as follows:

~~None required.~~ **CPHP Mitigation Measure HYD-1.**

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-4, Summary of Irving Street Arrival, RAB and Initial Aldea Densification Projects, and Initial Phase Improvements Impacts and Mitigation Measures, page 2-45, the level of significance after mitigation for Impact HYD-1 is modified as a staff-initiated change and changed from NA to LTS for the Irving Street Arrival, RAB, Initial Aldea Housing Densification and Initial Phase Improvements, as follows:

~~NA~~ LTS

Draft EIR, Chapter 2, Summary, Section 2.7, Table 2-4, Summary of Irving Street Arrival, RAB and Initial Aldea Densification Projects, and Initial Phase Improvements Impacts and Mitigation Measures, page 2-46, Impact HYD-2 is modified as a staff-initiated change, as follows:

Impact HYD-2: Construction and operation of the campus development under the CPHP would not substantially alter the existing drainage patterns of the site or area, in a manner that has the potential to result in substantial erosion or siltation on- or off- site; would potentially substantially increase the rate or amount of surface runoff in a manner that would result in flooding on or off site; would potentially create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flow.

~~NA~~ LTS

Draft EIR Chapter 3, Project Description

Draft EIR Chapter 3, Project Description, Section 3.7, page 3-37, second to last paragraph, third sentence, the estimated volume of demolition associated with UC Hall and School of Nursing was inadvertently overstated, and is corrected as a staff-initiated change, as follows:

> This includes approximately 30,000 gsf of building demolition to accommodate the proposed Irving Street Arrival project, ~~254,000~~ 233,000 gsf for demolition of UC Hall and School of Nursing to make way for the proposed RAB, and an estimated 24,000 gsf of demolition for three of the existing Aldea Housing structures.

Draft EIR Chapter 3, Project Description, Section 3.7.2, page 3-39, first paragraph revised as a staff-initiated change to refer to the proposed LRDP Amendment as Amendment No 7, instead of Amendment No. 6, as follows:

> Proposed LRDP Amendment No. 7~~6~~[7] would revise those portions of the 2014 LRDP pertaining to Parnassus Heights to incorporate concepts and proposals identified in the CPHP. Proposed changes would include the following:
>
> [7] The prior six ~~five~~ amendments to the 2014 LRDP are as follows: Amendment No. 1 revised the functional zone map for the Mission Bay campus site; Amendment No. 2 was for Mission Bay East Campus Phase 1 Building; Amendment No. 3 was for the Child, Teen, and Family Center and Department of Psychiatry Building at 2130 Third Street; Amendment No. 4 was for the Minnesota Street Graduate Student and Trainee Housing; ~~and~~ Amendment No. 5 was for the 2130 Post Street Faculty Housing Retrofit, and Amendment No. 6 was for administrative changes to update the ownership status of the Laurel Heights property, and to include the UCSF-owned 777 Mariposa site.

Draft EIR Chapter 3, Project Description, Section 3.7.2, page 3-44, last paragraph, last sentence is revised as a staff-initiated change to refer to the proposed LRDP Amendment as Amendment No 7, instead of Amendment No. 6, as follows:

> Proposed LRDP Amendment No. 7~~6~~ includes an update to the GHGRS which incorporates emissions generated by CPHP construction and operations.

Draft EIR Section 4.1, Aesthetics, Wind, Shadow

Draft EIR, Section 4.1, Aesthetics, Wind, and Shadow, page 4.1-42, second paragraph is clarified in response to Comment O-PARKIN-13:

> As shown in **Figure 4.1-19**, buildings proposed as part of the initial Aldea Housing Densification project would be up to 96 feet in height in an area of the city currently zoned for 40 feet. As such, this project would not align with 2014 LRDP sub-objective 1B because it would not be consistent with local zoning and height and bulk limitations for the site. However, consistent with the CPHP design principles ~~guidelines~~, the initial Aldea Housing Densification project would be developed in a way that would result in "respectful relationships with neighboring structures and natural features" (Campus Design Principle C3). In addition, the CPHP includes a series of "best practices" with respect to campus design. For redevelopment of the Aldea Housing Community, best

practices would "reinforce its connection with Mount Sutro" Among the means to this end, Aldea redevelopment should, among other things:

- "Thoughtfully incorporate views to maximize connectivity to nature while preserving residents' privacy,
- "~~r~~Respect the existing wooded setting and open space areas, refrain from impacting the extent of the Mount Sutro Open Space Reserve,
- "Consider impact on Clarendon and Behr Avenues if changing the building siting or scale; preserve public view corridors and street scale as feasible,
- "Foster a harmonious integration of housing through landscaping,
- ~~and~~ "~~e~~Establish discrete façade treatments ~~to~~ and a design language that embraces the ~~surrounding~~ context, and
- "Prioritize the use of natural materials for building design."

Draft EIR, Section 4.1, Aesthetics, Wind, and Shadow, page 4.1-45, first paragraph, fourth sentence, the following staff-initiated change is made to correct a typographical error:

> **CPHP Mitigation Measure ~~CPHP~~ AES-3** would be implemented to reduce the impact to a less than significant level.

Draft EIR, Section 4.1, Aesthetics, Wind, and Shadow, page 4.1-67, footnote 11 is corrected in response to Comment O-PARKIN-16:

> [11] Including ~~Excluding~~ potential rooftop observation deck and vestibule that would occupy a small portion of the roof. ~~No rooftop mechanical equipment/enclosures are proposed for the New Hospital.~~ As currently conceived, the majority of mechanical equipment would be contained within various levels of the New Hospital to minimize the amount of equipment located on the roof; components of mechanical equipment located on the roof may slightly exceed the 294 feet in height.

In response to Comment I-Anderson-1, Draft EIR, Section 4.1, Aesthetics, Wind, and Shadow, page 4.1-73, Figure 4.1-38, the street labels for Stanyan Street and Rivoli Street changed to Shrader Street and Alma Street, respectively, and are corrected in a revised Figure 4.1-38 on the following page. (In addition, corresponding shadow figures for Grattan Elementary School included in Appendix SHDW are revised as well; see revisions under the heading, Appendix SHDW, below.)

Draft EIR Section 4.2, Air Quality

Draft EIR, Section 4.2, Air Quality, page 4.2-4, been amended to include the following statement, with associated footnotes:

> At least two recent studies are indicating potential links between pollution exposure and novel COVID-19 mortality. However, these studies are preliminary and qualify that "If COVID-19 spread is indeed impacted by air pollution levels, which is not yet known, some of the effects detected in our study could be mediated by" transmission of infectious disease.[.01, .02]

>
> [.02] Michael Petroni *et al* 2020 *Environ. Res. Lett.* 15 0940a9, Hazardous air pollutant exposure as a contributing factor to COVID-19 mortality in the United States. Available at: https://iopscience.iop.org/article/10.1088/1748-9326/abaf86/pdf.

Draft EIR, Section 4.2, Air Quality, page 4.2-24, fourth paragraph, last sentence is revised in response to Comment O-TL4-2, as follows:

> Therefore, a ~~cumulative~~ cumulatively considerable increase in cancer risk from all sources would occur if the total of all risks exceeds 100 in one million.

Draft EIR, Section 4.2, Air Quality, page 4.2-29, the first bullet under Mitigation Measure AIR-1a is revised in response to Comments O-LD2-106 and O-LD2-112, as follows:

- All mobile diesel-powered off-road equipment larger than 25 horsepower and operating on the project site for more than two days continuously shall be equipped with engines meeting USEPA emissions standards for Tier 4 Final certified engines or equivalent; and

Draft EIR, Section 4.2, Air Quality, page 4.2-36, CPHP Mitigation Measure AIR-2b, first paragraph and Nos. 4 and 7 are revised, and new No. 8 is added, as a staff-initiated change, as follows:

> **CPHP Mitigation Measure AIR-2b: TDM Program Enhancements**
>
> To reduce ~~on- and off-campus~~ vehicle trips and resulting air quality impacts, UCSF will implement TDM program enhancements such that the number of new average daily vehicle trips to and from the campus site is reduced by at least 15 percent from the estimated new average daily vehicle trips without these program enhancements (Fehr & Peers, 2020).
>
> TDM program enhancements/strategies shall initially include the following:
>
> 1. *New shuttle connections to regional transit (e.g. BART):* Implement new UCSF shuttle service between the campus site and regional transit stations (e.g. BART, Caltrain) to make regional transit a more attractive option for employees, patients, and visitors.

2. *Expand telecommuting and flexible hours program for employees:* Allow employees in appropriate positions to telecommute from home and/or work a modified schedule such that they are commuting to the campus less frequently per week.

3. *Improved telehealth program for patients:* Implement an expanded telehealth program to reduce the need for patients to travel to the campus site for appointments.

4. *Carpool and vanpool credits and incentives:* Provide ~~cash allowance~~ a subsidy or discounted parking permit rates for individuals who carpool rather than drive alone; reduce monthly fares for Vanpool riders and drivers.

5. *Discontinue monthly parking permits:* Discontinue issuance of monthly parking permits to make commute travel mode a daily decision by shifting to daily parking permits.

6. *Enhanced patient TDM program*: Enhance information provided to patients regarding travel options to the campus site, including discussion of limited parking environment and public transit options.

7. *TNC to transit subsidy*: Provide ~~cash allowance~~ a subsidy for individuals to use TNC to travel to transit rather drive alone.

8. *Transit pass program*: UCSF Health will implement a patient transit pass program by June 30, 2025. In addition, a petition to run a referendum on a SFMTA student transit pass will be reviewed and voted on by the UCSF student government assembly by June 30, 2025. Balloting would be in March and voting would be in April. Assuming the referendum passes, the results would be submitted to UCOP for approval in May and the fee would typically apply at the start of the new academic year, which would be September.

Draft EIR, Section 4.2, Air Quality, page 4.2-69, Impact C-AIR-1 is revised as a staff-initiated change, as follows:

Impact C-AIR-1: Implementation of the CPHP combined with cumulative development in the project area would result in a cumulatively considerable net increase of a criteria pollutant (PM_{10}) for which the project region is non-attainment under an applicable federal or state ambient air quality standard. (Significant and Unavoidable with Mitigation)

Draft EIR Section 4.3, Biological Resources

Draft EIR, Section 4.3, Biological Resources, page 4.3-3, fourth paragraph, the following sentence is inserted after the second sentence, and associated footnote is added:

The nearby Mount Sutro Open Space Reserve has recorded 99 different migratory bird species.[.01]

[.01] eBird. 2020. Mt. Sutro OSP Sightings. https://ebird.org/hotspot/L1011743?yr=all

Draft EIR, Section 4.3, Biological Resources, page 4.3-15, fourth paragraph, second sentence is clarified in response to Comment PH-Grover-2:

> Smaller birds may nest in trees or shrubs on the campus site or in trees, shrubs, or herbaceous vegetation within the Reserve., ~~though~~ However, they are ~~unlikely~~ less likely to nest in busy areas with frequent human and vehicular traffic.

Draft EIR, Section 4.3, Biological Resources, page 4.3-16, CPHP Mitigation Measure BIO-1c, the following sentence is added add the end of the paragraph in the first bullet:

> The qualified biologist will monitor all vegetation removal in the Open Space Reserve during bird nesting season.

Draft EIR, Section 4.3, Biological Resources, page 4.3-17, CPHP Mitigation Measure BIO-1e, the bulleted paragraph is revised as follows in response to Comment I-Louie-7:

- A qualified biologist shall provide training to all construction workers prior to starting work on plan components. The training shall cover special-status species with potential to be found onsite, avoidance measures to be undertaken if a species is found, avoiding the spread of invasive weeds and pathogens during construction, and best management practices for site housekeeping.

Draft EIR Section 4.4, Cultural Resources and Tribal Cultural Resources

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, edits are made to clarify the scope and findings of earlier reports and to note updates concerning four resources and confirming earlier findings (except where noted otherwise, below):

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, page 4.4-5: Table 4.4-1 is updated on the following pages.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, page 4.4-10, first paragraph under the heading San Francisco City Landmarks, the last sentence is revised acknowledge additional landmark sites, as follows:

> There are currently ~~287~~ 289 landmark sites and 14 historic districts in San Francisco subject to Article 10, and none of these are located within the Parnassus Heights campus site.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, page 4.4-12, first bullet under Impact CUL-1 is revised as follows:

- UC Hall (eligible for listing in the California Register), which includes the Zakheim murals (designated as a City Landmark) in Toland Hall;

NOTES:
[a] National Register of Historic Places
[b] California Register of Historical Resources

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, Impact CUL-1, page 4.4-15, last paragraph, and page 4.4-16, first paragraph are revised as follows:

> In July 2020, ~~P~~pursuant to Article 10 of the City Planning Code, the City of San Francisco ~~has~~ also initiated City Landmark designation procedures with the Board of Supervisors for the Zakheim murals. On November 25, 2020, the Mayor of San Francisco approved Ordinance 241-20 amending the Planning Code to designate the Zakheim murals as a City Landmark consistent with the standards set forth in Article 10 of the Planning Code. However, as UCSF is a constitutionally created state entity, it is not subject to local land use regulation whenever using land under its control in furtherance of its educational mission. While UCSF may consider the requirements of Article 10 of the City Planning Code when demolishing UC Hall and the Zakheim murals therein, it is not bound by the City's plans and policies. Similarly, if it is determined that GSA, on behalf of the United States, has retained federal ownership of the Zakheim murals, GSA also will not be bound by the City's plans and policies. The ~~potential~~ City Landmark designation ~~would~~ makes no practical difference for purposes of the foregoing CEQA analysis because UC Hall and the Zakheim murals therein are already considered to be historical resources for CEQA purposes.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, Impact CUL-1, page 4.4-16, third and fourth paragraphs, are revised as follows:

> Built in 1955, Millberry Union was determined individually eligible for inclusion in the National Register and California Register (Carey & Co., 2011).[2] This evaluation found that the building is historically significant under National Register/California Register criteria A/1 as the first and only location on campus where students and faculty could share in social, cultural, and recreational activities. A reconnaissance-level pedestrian

survey of this building by ESA in 2019 found that it is essentially unchanged since its original evaluation in 2011, and as such, its historic status would remain unchanged. ESA updated the evaluation in 2020 to clarify inclusion of the Millberry Union Garage, which is physically connected to the Millberry Union complex. Because the parking garage was constructed to serve students, faculty, and visitors, its function is linked to the historic significance of the Millberry Union complex, though in a supporting role. ESA concurred with the 2011 evaluation and identified the period of significance as 1956 – ca. 1960, which represents the beginning of construction of the Millberry Union complex and the approximate completion of the garage addition. Millberry Union is considered a historical resource for CEQA purposes.

The proposed Irving Street Arrival project is included below as a project-specific component in the EIR, and the analysis assumes that the Millberry Union would not be demolished in connection with Irving Street Arrival project and that alterations would be limited to the Millberry Union Garage portion of the Millberry Union complex. Under the Future Phase of the proposed CPHP, the Millberry Union's two towers would be partially or completely demolished and replaced with a new building that could contain clinical, instruction, research, and campus community spaces. Partial or complete demolition of the Millberry Union ~~this building~~ under the CPHP would be considered a significant impact.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, Impact CUL-1, page 4.4-17, third paragraph, first sentence is revised as follows:

LPPI (including three small support structures that are either not age-eligible or have been determined not eligible for listing in the National Register or California Register) would be demolished to allow for construction of the New Hospital.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, Impact CUL-1, page 4.4-18, second paragraph is revised as follows:

Saunders Court was evaluated in 2011, at which time it was 43 years old, and was found to be a significant cultural landscape that may become eligible for listing in the National Register and California Register when it reaches 50 years of age (i.e., in 2018). As the only space on campus that embodies both the original Affiliated Colleges campus and the postwar expansion of the university, it appeared to be eligible under criteria A/1, and as the work of master Robert Roysten, it appeared to be eligible under criteria C/3. ESA updated the evaluation in 2020, at which time Saunders Court is 53 years old. ESA concurred with the 2011 evaluation and identified the period of significance as 1967, the year that Saunders Court was designed and developed. ~~It is therefore presumed individually for listing in the National and California Registers as a historical resource.~~ Despite the central lawn having been fenced off for use as a construction staging area since 2016, all other elements that compose Saunders Court (i.e., its character-defining features) remain, including the paved walkways around the perimeter of the central lawn, the concrete steps, the columns from the old Medical Sciences Building, the cornerstone from one of the original Affiliated Colleges buildings, various sculptures, mature trees, the overall rectangular form of the courtyard, and circulation through it. Saunders Court therefore

retains sufficient integrity to convey its historical and architectural significance and is considered a historical resource for CEQA purposes.

Under the proposed CPHP, Saunders Court would be expanded and connected on its west side to the proposed Promenade, a new east-west pedestrian corridor. Because detailed plans are not yet available, proposed alterations are presumed to result in a significant impact to Saunders Court.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, Impact CUL-1, page 4.4-18, last paragraph, first sentence is revised as follows:

As discussed above, the proposed CPHP would result in the partial or total demolition of buildings that are individually eligible for listing in the National Register and/or California Register: UC Hall (including the Zakheim murals), Millberry Union, School of Dentistry, LPPI, and Aldea San Miguel Housing Buildings 8, 10, and 12.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, page 4.4-19, Mitigation Measure CUL-1b is revised as follows:

CPHP Mitigation Measure CUL-1b: Document Historical Resources Prior to Demolition or Alteration

Prior to any demolition work or significant alterations initiated at the known historical resources, UCSF shall ensure that a qualified architectural historian who meets the Secretary of the Interior's Professional Qualification Standards thoroughly documents each building and associated landscaping and setting. This includes the Zakheim Murals in UC Hall. Documentation shall include still photography and a written documentary record of the building to the National Park Service's standards of the Historic American Buildings Survey (HABS) or the Historic American Engineering Record (HAER), including accurate scaled mapping and architectural descriptions. If available, scaled architectural plans will also be included. Photos include large-format (4"x5") black-and-white negatives and 8"x10" enlargements. Digital photography may be substituted for large-format negative photography if archived locally. The record shall be accompanied by a report containing site-specific history and appropriate contextual information. This information shall be gathered through site-specific and comparative archival research and oral history collection as appropriate. Copies of the records shall be submitted to the Northwest Information Center at Sonoma State University and the UCSF Kalmanovitz Library Archives and Special Collections.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, page 4.4-20, new Mitigation Measure CUL-1e is inserted following Mitigation Measure CUL-1d:

CPHP Mitigation Measure CUL-1e: Display of Zakheim Murals

Provided that the Zakheim murals are successfully removed from Toland Hall and stored, UCSF will convene a Task Force by the end of 2021 to advise on options for the display of the murals in a publicly accessible setting, either on a UCSF campus or at a museum or other institution. The Task Force will include the Chair of the City's Historic Preservation Commission, or their designee.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, page 4.4-20, last paragraph, and page 4.4-21, first paragraph are revised as follows:

Irving Street Arrival

The proposed Irving Street Arrival project would modify a portion of Medical Building 1 that functions as a pedestrian entrance extending from Irving Street to Parnassus Avenue. This would entail the modification or demolition of a portion of the Medical Building 1. In addition, the Irving Street Arrival project would replace the façades or reskin two Millberry Union and Medical Building 1 parking garages. ~~None of the affected buildings~~ Medical Building 1 does not qualify as a historical resource~~s~~. The Millberry Union Garage is a component of the Millberry Union complex, which does qualify as a historical resource. The Irving Street Arrival project would make façade changes to the Millberry Union Garage; however, it would still function as a parking garage and access point to the Millberry Union and the campus beyond. The character defining features of the Millberry Union complex are:

- Complex composed of the one-story student union ("Millberry Union building"), five-story women's residence hall, five-story men's residence hall, and eight-story parking garage
- Flat roofs on the two residence halls
- Vertical orientation of the two residence halls
- Use of modern materials
- Large expanses of glass in aluminum-frame windows
- Primary historical function of providing housing, dining, and recreational facilities for students

The Millberry Union complex was determined significant under National Register/ California Register criteria A/1 (events). The character-defining features primarily relate to the Parnassus Avenue side of the complex as well as the presence of the functional components of the resource. The existence of an eight-story parking garage and the use of modern materials are the character-defining features that apply to the Millberry Union Garage portion of the resource. Also, the Parnassus Avenue façade is considered the primary façade and the Millberry Union Garage, fronting Irving Street, constitutes the rear façade. Replacing or reskinning the rear façade of the parking garage portion of the Millberry Union complex would not change the function of the garage or alter the primary façade, the Millberry Union Building portion on Parnassus Avenue leaving the majority of the character-defining features in-tact. As such, the Millberry Union complex would remain an eligible resource after the completion of the Irving Street Arrival project.

For this reason, while ~~T~~the Irving Street Arrival project would ~~have no~~ physically alter a portion of the Millberry Union complex, it would result in a less-than-significant impact on known historical resources.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, page 4.4-21, fourth and fifth paragraphs addressing mitigation and significance after mitigation for Research and Academic Building, are revised as follows:

> **Mitigation:** Implement CPHP Mitigation Measures CUL-1a through ~~-1d~~1e.
>
> **Significance after Mitigation:** Because demolition of UC Hall under the CPHP would result in a substantial adverse change in the significance of a historical resource, no measures would fully mitigate these actions to a less-than-significant level. Therefore, even with implementation of CPHP Mitigation Measures CUL-1a, CUL-1b, CUL-1c, ~~and~~ CUL-1d, and CUL-1e, the impact would be significant and unavoidable.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, page 4.4-22, first paragraph and bullets under Impact CUL-2 is revised as follows:

> ***CPHP***
>
> The following buildings would be altered or demolished under the proposed CPHP. These buildings either already meet or will meet the 45-year age criterion by the full build-out of the CPHP in 2050. They have not been previously evaluated and may become eligible for listing in the National and/or California Registers:
>
> - ~~Millberry Union Garage;~~
> - 75 Behr Avenue;
> - 80 Behr Avenue;
> - 85 Behr Avenue;
> - 90 Behr Avenue;
> - 95 Behr Avenue;
> - 45 Johnstone Drive;
> - 50 Johnstone Drive;
> - 20 Adolph Sutro Court; and
> - 30 Adolph Sutro Court.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, page 4.4-24, fifth paragraph, last two sentences in Mitigation CUL-3, are revised in response to Comment A-SFP-14, as follows:

> Treatment for most resources could consist of (but shall not be limited to) sample excavation, site documentation, and historical research, as appropriate to the discovered ~~prehistoric~~ resource. The treatment plan shall include provisions for analysis of data in a regional context as appropriate to the discovered ~~prehistoric~~ resource, reporting of results within a timely manner, and dissemination of reports to local and state repositories, libraries, and interested professionals.

Draft EIR, Section 4.4, Cultural Resources and Tribal Cultural Resources, page 4.4-30, third paragraph, is revised as follows:

> **Mitigation:** Implement CPHP Mitigation Measures CUL-1a through ~~-1d~~1e.

Draft EIR Section 4.6, Geology and Soils

Draft EIR, Section 4.6, Geology and Soils, page 4.6-21, CPHP Mitigation Measure GEO-3 is modified as a staff-initiated change:

> **CPHP Mitigation Measure GEO-3:** UCSF shall implement the following geotechnical recommendations as adapted from those contained within the Rutherford & Chekene March 2019 report:
>
> - Remove selected trees located on or at the crest of steep rock slopes on which tree root wedging decreases stability. Determination of specific trees to be removed shall be made in association with a certified arborist and state licensed geotechnical engineer or engineering geologist. Removal will involve cutting trees and leaving stumps such that the root system can rot in situ with minimal disturbance to the surface geology.
>
> - Conduct qualitative monitoring of identified slopes by a state licensed geotechnical engineer or engineering geologist or as directed by said professional. Monitoring shall occur, at a minimum, after each ~~moderate to~~ major storm or earthquake, as defined by the geotechnical professional. The geotechnical professional shall submit a report of findings to UCSF that includes recommendations for additional slope stability improvements, if deemed necessary, to maintain continued safety in accordance with geotechnical standards and building code requirements.

Draft EIR Section 4.7, Greenhouse Gas Emissions

Draft EIR, Section 4.7, Greenhouse Gas Emissions, page 4.7-5, the following text is added at the end of the third paragraph as a staff-initiated change:

> Additionally, consistency of the CPHP with the Final 2017 Clean Air Plan of the BAAQMD is addressed in Table 4.2-20 of Draft EIR Section 4.2, Air Quality (pages 4.2-66 and 4.2-67).

Draft EIR Section 4.8, Hazards and Hazardous Materials

Draft EIR, Section 4.8, Hazards and Hazardous Materials, page 4.8-2, the fourth paragraph, first sentence is revised in response to Comment I-Kessler-19 to acknowledge off-campus residences along the east side of the campus site as sensitive receptors:

> Off-campus receptors (residences) abut the western, northern, eastern and southern campus site boundaries.

Draft EIR Section 4.9, Hydrology and Water Quality

Draft EIR, Section 4.9, Hydrology and Water Quality, Impact HYD-1 on page 4.9-10, third paragraph is modified as a staff-initiated change as follows:

> **Impact HYD-1: Construction and operation of campus development under the CPHP would ~~not~~ have the potential to violate water quality standards or waste discharge requirements, or otherwise substantially degrade surface or groundwater quality. (Less than Significant with Mitigation)**

Draft EIR, Section 4.9, Hydrology and Water Quality, Impact HYD-1 on page 4.9-12, third and fourth paragraphs are modified as a staff-initiated change as follows:

~~Therefore,~~ ~~d~~Due to the characteristics of the proposed changes and inclusion of post-development BMPs and NPDES drainage control requirements, the operational impacts of the CPHP related to water quality and waste discharge requirements would be reduced, and well within the dry weather capacity of the City's treatment plants. However, increases in stormwater volumes and wastewater volumes under the CPHP could increase the volume or frequency of overflow events at one or both of the City's plants in wet weather, and result in an impact on water quality. To address this potential impact, UCSF would implement CPHP Mitigation Measure HYD-1 below. ~~less than significant.~~

~~**Mitigation:** Non required.~~

CPHP Mitigation Measure HYD-1: During implementation of the CPHP, UCSF shall continue to implement water conservation measures and construct and implement stormwater management controls as needed so as to:

a. Avoid increasing the likelihood of surcharges by exceeding the capacity of the City's CSS;
b. Avoid increasing the extent or duration of ponding or overland flow by exceeding the capacity of the City's CSS; and

c. Avoid discharges to the City's CSS that could increase the frequency, duration, or volume of combined sewer discharges to the receiving waters.

To meet the first two (hydraulic) performance standards, UCSF shall design all new on-campus buildings and site improvements to be consistent with requirements of the City's Stormwater Management Ordinance (Article 4.2 of the San Francisco Public Works Code), ensuring that the stormwater runoff rate and volume from the project shall not exceed pre-development conditions for the 1- and 2-year, 24-hour design storm (the standard for sites that are less than 50 percent impervious). In addition, when connections to the City's CSS are being designed, UCSF shall analyze the capacity of the adjoining sewer system to ensure that the system can accommodate UCSF's increased flows and/or modified connection points. UCSF may choose to conduct this modeling analysis on its own and submit the analysis to the SFPUC for review, or request that the SFPUC conduct the analysis on UCSF's behalf, subject to reimbursement of the SFPUC's costs by UCSF. If the analysis determines that increased flows may exceed the conveyance capacity of the adjoining downstream sewers, UCSF shall pay its proportional share of the costs of expanding the sewer system to accommodate the increased flows from the Parnassus Heights campus site.

To meet the third (hydrologic) performance standard, UCSF shall ensure that the total volume of stormwater discharges from the Parnassus Heights campus site in wet weather is decreased by an amount sufficient to offset flows from any increase in impervious surfaces and any increases in wastewater discharges as a result of the CPHP. Necessary reductions may be achieved via LID, on-site detention and re-use, on-site detention for discharge, and/or other strategies in conformance with the City's Stormwater Management Ordinance, and may be

less than the total wet weather discharges from Parnassus Heights campus site if modeling demonstrates there is sufficient storage, pumping, and treatment capacity in the City's CSS to avoid increased discharges to the receiving waters from the CSS discharge structures.

UCSF shall use the SFPUC's model to establish a baseline prior to implementation of the CPHP and to demonstrate that future incremental increases in stormwater and/or wastewater from the campus site under the CPHP would not cause or contribute to any increase in overflow volumes from the City's CSS discharge structures, as determined through modeling at every major phase of the CPHP (starting with the Initial Phase) or every five years, whichever is more frequent, through CPHP buildout. UCSF may choose to conduct this modeling analysis on its own and submit the analysis to the SFPUC for review, or request that the SFPUC conduct the analysis on UCSF's behalf, subject to reimbursement of the SFPUC's costs by UCSF. In the event of non-compliance, UCSF shall immediately take steps to remedy the deficiency and provide reports to the SFPUC in conjunction with each construction project undertaken to implement the CPHP until the performance standard is met.

Any improvements constructed outside the campus site boundary or in public right of way in the City's jurisdiction shall be subject to construction site runoff requirements and post-construction stormwater controls in accordance with the City Public Works Code and in compliance with the City's Stormwater Management Ordinance, and shall be included in UCSFs calculation of the total volume of increased flows to be offset and its modeling of incremental increases in flows into the City's CSS.

Significance after Mitigation: Less than Significant.

Draft EIR, Section 4.9, Hydrology and Water Quality, Impact HYD-1 on page 4.9-12, last two paragraphs are modified as a staff-initiated change as follows:

Development associated with the Irving Street Arrival, RAB, and initial Aldea Housing Densification projects, and Initial Phase improvements would be subject to the same or similar regulatory requirements as those described above during construction and operation. Furthermore, as applicable, any Initial Phase improvements that would be constructed outside the campus site boundary would be subject to construction site runoff requirements and post-construction stormwater controls in accordance with the City Public Works Code and in compliance with the City's Stormwater Management Ordinance. As such, the potential to violate water quality standards or waste discharge requirements, or otherwise substantially degrade surface or groundwater quality would be less than significant with implementation of CPHP Mitigation Measure HYD-1.

Mitigation: ~~None required.~~ Implement CPHP Mitigation Measure HYD-1.

Significance after Mitigation: Less than Significant.

Draft EIR, Section 4.9, Hydrology and Water Quality, Impact HYD-2 on page 4.9-13, first paragraph, is modified as a staff-initiated change as follows:

> **Impact HYD-2: Construction and operation of the campus development under the CPHP would not substantially alter the existing drainage patterns of the site or area, in a manner that has the potential to result in substantial erosion or siltation on- or off- site; would potentially substantially increase the rate or amount of surface runoff in a manner that would result in flooding on or off site; would potentially create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flow. (Less than Significant with Mitigation)**

Draft EIR, Section 4.9, Hydrology and Water Quality, 4.9-14, first through third paragraphs, modify the discussion of Impact HYD-2 as a staff-initiated change as follows:

> Flooding and Stormwater Drainage Capacity
>
> As indicated above, the additional development under the CPHP could incrementally increase the amount of impervious surfaces over existing conditions, primarily in the campus core, and could result in localized alteration of existing drainage patterns within the campus site. ~~However,~~ tThe implementation of the LID requirements would minimize any increase in the rate or amount of peak storm runoff making flooding on- or off-site unlikely. As discussed in the Environmental Setting, the campus site is not considered susceptible to flooding from 100-year storm events. As under existing conditions, under buildout of the CPHP, stormwater runoff within developed areas of the campus site would continue to be collected by on-site stormwater collection facilities and routed off-site to the City's CSS. Due to the relatively small change in impervious surfaces and the flow reductions that would be achieved with the implementation of LID stormwater features, storm water flows from the campus site are not expected to ~~would not~~ adversely affect stormwater drainage capacity and ~~. In fact,~~ the CPHP would implement ~~includes~~ upgrades to the existing CSS within the campus core as discussed further in Section 4.16, Utilities. ~~Therefore,~~ ~~c~~Considering the minor change in impervious surfaces, incorporation of LID stormwater features, ~~and~~ proposed improvements to the existing CSS that would occur with the program, and implementation of CPHP Mitigation Measure HYD-1, the potential impacts related to flooding on- or off-site, stormwater drainage capacity, or additional sources of polluted runoff would be less than significant.
>
> Impede or Redirect Flow
>
