> As noted above, the campus site is not located in a 100-year flood hazard area nor is it identified by SFPUC as an area subject to flooding from 100-year peak storm events. The campus core and Aldea Housing area are already developed with stormwater collection facilities, and proposed new development in these areas under the CPHP would not impede or redirect flood flows. UCSF would evaluate the capacity of the CSS collection system at connection points as required by CPHP Mitigation Measure HYD-1 and t~~T~~he potential impact would be less than significant.

Mitigation: ~~None required.~~ Implement CPHP Mitigation Measure HYD-1.

Significance after Mitigation: Less than Significant.

Draft EIR, Section 4.9, Hydrology and Water Quality, 4.9-15, second and third paragraphs, modify the discussion of Impact HYD-2 as a staff-initiated change as follows:

Flooding and Stormwater Drainage Capacity

The proposed Irving Street Arrival project would have no associated increase in stormwater runoff because of no net change to impervious surfaces. As a result, there would be no impact related to flooding or stormwater drainage capacity. As indicated above, the RAB and initial Aldea Housing Densification projects, and as needed, Initial Phase improvements, would be required to implement stormwater drainage control features consistent with the NPDES Phase II MS4 permit, and in combination with implementation of CPHP Mitigation Measure HYD-1 ~~which~~ would ensure that changes to drainage patterns, if any, do not increase stormwater flow volumes such that there would be ~~no~~ increased potential for flooding or adverse effects related to stormwater drainage capacity. Furthermore, as applicable, any Initial Phase improvements that would be constructed outside the campus site boundary would be subject to stormwater management and design guidelines in accordance with the City Public Works Code as indicated in CPHP Mitigation Measure HYD-1. The potential impact related to stormwater drainage capacity would be less than significant with mitigation.

Impede or Redirect Flow

The campus site and surrounding areas are not located in a 100-year flood hazard area or identified by SFPUC as an area subject to flooding from 100-year peak storm events. The campus core and Aldea Housing complex are already developed and would not impede or redirect flood flows. UCSF would evaluate the capacity of the CSS collection system at connection points as required by CPHP Mitigation Measure HYD-1 and ~~T~~the potential impact on flood flows from implementation of the Irving Street Arrival, RAB, and initial Aldea Housing Densification projects, and Initial Phase improvement would be less than significant.

Mitigation: ~~None required.~~ Implement CPHP Mitigation Measure HYD-1.

Significance after Mitigation: Less than Significant.

Draft EIR, Section 4.9, Hydrology and Water Quality, Impact C-HYD-1 on page 4.9-16, second paragraph, is modified as a staff-initiated change as follows:

Impact C-HYD-1: Construction and operation of campus development under the CPHP, in conjunction with other cumulative development within the City of San Francisco, would have the potential to ~~not~~ cumulatively violate water quality standards or waste discharge requirements, or otherwise substantially degrade water quality. (Less than Significant with Mitigation)

Draft EIR, Section 4.9, Hydrology and Water Quality, 4.9-16, third and fourth paragraphs, modify and expand the discussion of Impact C-HYD-1 as a staff-initiated change as follows:

> Cumulative projects have the potential to discharge pollutants, including sediment, off-site during construction and operational activities, which could further degrade runoff directed into the CSS. In addition, cumulative development that would increase flows to the City's CSS without increasing capacity to address the frequency or volume of wet weather overflows could result in water quality impacts. ~~However,~~ ~~s~~Similar to the CPHP, cumulative projects would be required to implement project-specific BMPs and comply with federal, State, as well as local regulations related to stormwater water quality. These regulations include, but are not limited to, the NPDES CGP and also the City's Stormwater Management Ordinance. All cumulative projects that disturb more than one acre would include preparation and implementation of a SWPPP to reduce pollutants in stormwater and other non-point source runoff during construction. Projects that create or replace 5,000 square feet or more of impervious surfaces and have existing impervious surfaces greater than 50 percent must decrease the stormwater runoff rate and volume by 25 percent from 2-year 24-hour design storm. These regulatory requirements also include LID design measures which must be implemented into project designs and are created to minimize off-site discharges and reduce pollutant loading. ~~Therefore,~~ ~~w~~With adherence to these existing regulatory requirements and implementation of CPHP Mitigation Measure HYD-1, the CPHP's contribution to the potential cumulative impact related to water quality standards or waste discharge requirements would not be considerable ~~be less than significant~~.
>
> **Mitigation:** ~~None required.~~ Implement CPHP Mitigation Measure HYD-1.
>
> **Significance after Mitigation:** Less than Significant.

Draft EIR, Section 4.9, Hydrology and Water Quality, Impact C-HYD-2 on page 4.9-16, second to last paragraph, is modified as a staff-initiated change as follows:

> **Impact C-HYD-2: Construction and operation of campus development under the CPHP, in conjunction with other cumulative development in the City of San Francisco's CSS, would not have the potential to cumulatively alter the drainage pattern of the site or area, through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on or off site; would have the potential to substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site; create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flow. (Less than Significant with Mitigation)**

Draft EIR, Section 4.9, Hydrology and Water Quality, 4.9-17, second through fifth paragraphs, modify Impact C-HYD-2 as a staff-initiated change as follows:

> ***Flooding and Stormwater Drainage Capacity***
>
> As stated above, cumulative projects would involve redevelopment and development within what is already a densely developed area with a relatively high percentage of

impervious surfaces. However, these cumulative projects could result in increases in impervious surfaces providing additional stormwater runoff that could create or exacerbate flooding and/or exceed the capacity of existing stormwater infrastructure.

As previously discussed, cumulative projects would be required to comply with applicable stormwater runoff regulations, including the City's Stormwater Management Ordinance. The ordinance includes drainage control requirements that address management of peak stormwater flows and even reducing stormwater flows from existing conditions, in many cases, such that there could be potential reductions in stormwater volumes compared to existing conditions. In addition, like the CPHP, other redevelopment projects could include updates to outdated or undersized stormwater infrastructure that no longer meets current demands or City requirements. Older infrastructure would be replaced with newer infrastructure that could provide increased capacity to accommodate higher volume flows during peak storm events.

~~Therefore,~~ ~~s~~Since the CPHP would include upgrades to existing infrastructure, address any increases in impervious surfaces with implementation of LID stormwater features similar to what would be required for other current and future cumulative projects, and implement CPHP Mitigation Measure HYD-1, the potential for flooding or exceedances of stormwater infrastructure capacity would be less than significant.

Impede or Redirect Flow

As noted above, the campus site is located in an upland portion of the City that is not within a 100-year flood hazard area, and is not identified by SFPUC as an area subject to flooding from 100-year peak storm events. As a result, there is no means for the proposed improvements associated with the CPHP to combine with other cumulative projects and create adverse effects related to impeding or redirecting flood flows. Accordingly, the project would not result in a ~~have an inc~~considerable considerable contribution to cumulative effects on impedance or redirection of flood flows. ~~There would be no cumulative impact.~~

Mitigation: ~~None required~~. Implement CPHP Mitigation Measure HYD-1.

Significance after Mitigation: Less than Significant.

Draft EIR Section 4.11, Noise and Vibration

Draft EIR, Section 4.11, Noise and Vibration, page 4.11-31, the Mitigation Measure NOI-3b is modified as follows:

CPHP Mitigation Measure NOI-3b: Assessment and Relocation/Retrofitting of Vibration-Sensitive Equipment

UCSF shall evaluate the presence of vibration-sensitive equipment within 150 feet of construction and demolition areas. Any sensitive equipment shall be evaluated for the existing extent of vibration isolation and relocated or further embellish isolation, as

warranted. Alternatively, use of such equipment may be suspended during the substantial vibration-generating activities within 150 feet.

Draft EIR Section 4.12, Population and Housing

Draft EIR, Section 4.12, Population and Housing, page 4.12-8, first paragraph, third sentence is revised in response to Comment A-SFP-27, as follows:

> Some of the ~~E~~employment growth at the Parnassus Heights campus site was included in the 2014 LRDP and is potentially accounted for in the employment projections for San Francisco included in the *Plan Bay Area 2040.*

Draft EIR Section 4.16, Utilities and Service Systems

Draft EIR, Section 4.16, Utilities and Service Systems, 4.16-22, third and fourth paragraphs, modify and expand the discussion of Impact UTIL-3 for the CPHP as a staff-initiated change as follows:

> Assuming wastewater generation as 90 percent of water usage, the overall increase in wastewater resulting from the 2.0 million gsf net increase of building space associated with the proposed CPHP would be roughly 0.18 mgd. UCSF would consult with the SFPUC to determine where connections to the City's CSS would be made, and whether new ~~W~~wastewater flows from the Parnassus Heights campus site would be directed to the OSP and/or the SEP. The OSP has a dry weather capacity of 43 mgd and is currently treating approximately 17 mgd. The SEP has an average dry weather design flow capacity of 85.4 mgd and is currently treating approximately 60 mgd. Therefore, based on current sewage flows, the City's treatment plants ~~has~~ have ~~about 26 mgd of~~ excess dry weather treatment capacity, which is adequate to accommodate the increase in wastewater flow generated by the net new development envisioned under the proposed CPHP. As a result, the proposed CPHP would not result in a determination by the SFPUC that it has inadequate capacity to serve the projected demand, and the impact would be less than significant. (See Section 4.9, Hydrology and Water Quality for a discussion of wet weather treatment capacity and overflows.)
>
> **Mitigation:** None required.

Draft EIR Section 5.4, Growth-Inducing Effects

Draft EIR, Chapter 5, CEQA Statutory Sections, Section 5.2, Table 5-1, Significant and Unavoidable Impacts of the Proposed CPHP, page 5-2, Impact C-AIR-1 is revised as a staff-initiated change, as follows:

> **Impact C-AIR-1**: Implementation of the CPHP combined with cumulative development in the project area would result in a cumulatively considerable net increase of a criteria pollutant (PM_{10}) for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

Draft EIR Section 5.4, Growth-inducing Effects, page 5-5, first paragraph, first sentence, inadvertently made a reference to "CEQA Guidelines Section 15126.2(d)" instead of "CEQA Guidelines Section 15126.2(e)," and is corrected as a staff-initiated change, as follows:

> As required under CEQA, an EIR must include a discussion of the ways in which the proposed CPHP could directly or indirectly foster economic or population growth, or the construction of additional housing and how that growth would, in turn, affect the surrounding environment (CEQA Guidelines Section 15126.2(e~~d~~)).

Draft EIR Chapter 6, Alternatives

Draft EIR, Chapter 6, Alternatives, Section 6.2, Table 6-1, Significant and Unavoidable Impacts of the Proposed CPHP, page 6-5, Impact C-AIR-1 is revised as a staff-initiated change, as follows:

> **Impact C-AIR-1**: Implementation of the CPHP combined with cumulative development in the project area would result in a cumulatively considerable net increase of a criteria pollutant (PM_{10}) for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

Draft EIR Chapter 6, Alternatives, Section 6.3.1, page 6-11, second paragraph, is modified as a staff-initiated change, as follows:

> ### *Hydrology and Water Quality*
>
> No new construction or ground disturbing activities associated with the proposed CPHP would occur at the Parnassus Heights campus site under this alternative. In addition, this alternative would not result in an increase in impervious surfaces, or operational changes in the amount or quality of stormwater runoff at the campus site. Accordingly, this alternative would avoid the ~~less than~~ significant but mitigable project and cumulative CPHP impacts related to the potential to violate water quality discharges requirements; ~~degrade surface or groundwater quality; result in erosion and siltation~~; affect flooding; exceed the capacity of stormwater drainage systems; provide additional sources of polluted runoff; or impede or redirect storm flows; and would avoid the less than significant project and cumulative CPHP impacts related to the potential to degrade surface or groundwater quality; and result in erosion and siltation.

Draft EIR Chapter 6, Alternatives, Section 6.3.2, page 6-18, third paragraph, is modified as a staff-initiated change, as follows:

> ### *Hydrology and Water Quality*
>
> This alternative would result in substantially less new construction or ground disturbing activities, and a smaller increase in new impervious surfaces at the campus site, compared to the CPHP. Accordingly, this alternative would further reduce the CPHP's ~~less than~~ significant but mitigable project and/or cumulative impacts related to the potential to violate water quality discharges requirements; ~~degradation of surface or groundwater quality; erosion and siltation;~~ effect on flooding; effect on the capacity of

stormwater drainage systems; additional sources of polluted runoff; or impedance or redirection of storm flows; and would avoid the less than significant project and cumulative CPHP impacts related to the potential to degrade surface or groundwater quality; and result in erosion and siltation.

Draft EIR Chapter 6, Alternatives, Section 6.3.3, page 6-29, second paragraph, is modified as a staff-initiated change, as follows:

Hydrology and Water Quality

This alternative would result in less new construction and groundbreaking activities compared to the CPHP; and an incrementally smaller increase in new impervious surfaces at the campus site, compared to the CPHP, and thus, generate incrementally less runoff. Project and/or cumulative impacts related to the potential to violate water quality discharges requirements; degradation of surface or groundwater quality; erosion and siltation; effect on flooding; effect on the capacity of stormwater drainage systems; additional sources of polluted runoff; or impedance or redirection of storm flows, would be reduced compared to the proposed project and similarly less than significant, with compliance with the construction BMPs required by the NPDES Construction General Permit and operational design measures and LID stormwater requirements controls of the Phase II MS4 permit, and mitigation similar to that identified for the proposed CPHP in Mitigation Measure HYD-1.

Draft EIR Chapter 6, Alternatives, Section 6.3.4, page 6-42, first paragraph, is modified as a staff-initiated change, as follows:

Hydrology and Water Quality

This alternative would result in similar new construction and groundbreaking activities as the CPHP, with an exception being potentially less intrusion into and excavation of the hillside east of the New Hospital. Also, with a smaller New Hospital building footprint, there would be an incrementally smaller increase in new impervious surfaces at the campus site under this alternative when compared to the CPHP. Nonetheless, similar to the proposed CPHP, compliance with the construction BMPs required by the NPDES Construction General Permit and operational design measures and LID stormwater requirements controls of the Phase II MS4 permit would ensure that project and/or cumulative impacts would be less than significant, including impacts related to the potential to violate water quality discharges requirements; degradation surface or groundwater quality; erosion and siltation; effect on flooding; effect on the capacity of stormwater drainage systems; additional sources of polluted runoff; or impedance or redirection of storm flows, and mitigation similar to that identified for the proposed CPHP in Mitigation Measure HYD-1.

Draft EIR, Chapter 6, Alternatives, Section 6.5, Table 6-3, Comparison of Impacts of the Proposed CPHP and Alternatives, page 6-59, Impact C-AIR-1 is revised as a staff-initiated change, as follows:

> **Impact C-AIR-1**: Implementation of the CPHP <u>combined with cumulative development in the project area</u> would result in a cumulatively considerable net increase of a criteria pollutant ~~(PM_{10})~~ for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

Draft EIR Chapter 6, Alternatives, Section 6.5, last two rows of Table 6-3 on page 6-63, and first two rows of Table 6-3 are modified as a staff-initiated change, as shown on the following page (Table 6-3 title and column headings are included for context).

Draft EIR Chapter 6, Alternatives, Section 6.6.1, page 6-69, fourth paragraph is modified as a staff-initiated change, as follows:

> The No Project - No Development Alternative would also avoid ~~24~~ <u>28</u> other significant but mitigable impacts that would occur under the CPHP, including impacts related to operational lighting, generation of construction emissions; exposure to construction- and operational-related toxic air contaminant emissions, conflict with the 2017 Clean Air Plan, potential impacts to special-status species during construction; potential for increased bird strikes from new building development; potential to disturb unknown archaeological and tribal resources, human remains and/or paleontological resources during construction excavation; landslides; generation of GHG emissions; <u>potential to violate water quality standards or waste discharge requirements and exceed stormwater drainage systems from increases in stormwater and/or wastewater volumes,</u> potentially encountering naturally occurring asbestos or contaminated soils during construction excavation; construction vibration effects; and construction traffic effects.

Draft EIR Chapter 6, Alternatives, Section 6.6.2, page 6-70, last paragraph and page 6-71, first paragraph, are modified as a staff-initiated change, as follows:

> The Reduced Project Alternative would also serve to incrementally reduce the severity of ~~24~~ <u>28</u> other significant but mitigable impacts that would occur under the CPHP, including impacts related to operational lighting, generation of construction emissions; exposure to construction- and operational-related toxic air contaminant emissions, conflict with the 2017 Clean Air Plan, potential impacts to special-status species during construction; potential for increased bird strikes from new building development; potential to disturb unknown archaeological and/or tribal resources, human remains and paleontological resources during construction excavation; landslides; generation of GHG emissions; <u>potential to violate water quality standards or waste discharge requirements and exceed stormwater drainage systems from increases in stormwater and/or wastewater volumes,</u> potentially encountering naturally occurring asbestos or contaminated soils during construction excavation; construction vibration effects; and construction traffic effects.

TABLE 6-3
COMPARISON OF IMPACTS OF THE PROPOSED CPHP AND ALTERNATIVES

Impact	Proposed CPHP	No Project Alternative		Alternative 2: Reduced Project	Alternative 3: CPHP including New Hospital - 19-Story Option	Alternative 4: CPHP including New Hospital - Phased Option
		Alternative 1A: No Project - No Development	Alternative 1B: No Project - Development under 2014 LRDP			
4.9 Hydrology and Water Quality

CHAPTER 9
Mitigation Monitoring and Reporting Program

9.1 Introduction

When approving projects with mitigation measures that if implemented would avoid or lessen significant impacts, the California Environmental Quality Act (CEQA) requires public agencies to adopt monitoring and reporting programs or conditions of project approval to mitigate or avoid the identified significant effects (Public Resources Code Section 21081.6(a)(1)). A public agency adopting measures to mitigate or avoid the significant impacts of a proposed project is required to ensure that the measures are fully enforceable, through permit conditions, agreements, or other means (Public Resources Code Section 21081.6(b)). The mitigation measures required by a public agency to reduce or avoid significant project impacts not incorporated into the design or program for the project may be made conditions of project approval as set forth in a Mitigation Monitoring and Reporting Program (MMRP). The program must be designed to ensure project compliance with mitigation measures during CPHP implementation.

The MMRP includes the mitigation measures identified in the CPHP EIR which are required to address the significant impacts associated with the proposed CPHP. The required mitigation measures are summarized in this program; the full text of the impact analysis and mitigation measures are presented in the Final EIR.

9.2 Format

The MMRP is organized in a table format (see Table 9-1), keyed to each significant impact and each mitigation measure. Only mitigation measures adopted to address significant impacts are included in this program. Each mitigation measure is set out in full, followed by a tabular summary of monitoring requirements. The column headings in the tables are defined as follows:

- **Environmental Impact:** This column presents the environmental impacts identified in the EIR.
- **Mitigation Measures:** This column identifies the mitigation measures associated with the impacts identified in the EIR.
- **Implementation Procedure:** This column identifies the procedure for implementing each mitigation measure.
- **Responsible Unit:** This column contains an assignment of responsibility for the monitoring and reporting tasks.
- **Report Mechanism:** This column refers to the outcome from implementing the mitigation measure.

9.3 Enforcement

If the proposed CPHP is approved, the MMRP would be adopted by the Regents. Therefore, all mitigation measures for significant impacts must be carried out in order to fulfill the requirements of approval. A number of the mitigation measures would be implemented during the course of the development review process. These measures would be checked on plans, in reports, and in the field prior to construction. Most of the remaining mitigation measures would be implemented during the construction or CPHP implementation phase.

TABLE 9-1
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.1 Aesthetics, Wind, and Shadow				
Impact AES-3: Implementation of the CPHP would not create a new source of substantial light or glare which would adversely affect daytime or nighttime views in the area.	**CPHP Mitigation Measure AES-3: Minimize light and glare resulting from new buildings.** Light and glare from buildings shall be minimized through the orientation of the building, use of landscaping materials and choice of primary facade materials. Design standards and guidelines to minimize light and glare shall be adopted for the new buildings, including: • Reflective metal walls and mirrored glass walls shall not be used as primary building materials for facades. • Installation of illuminated building signage shall strive to be consistent with UCSF design guidelines and/or City Planning Code sign standards for illumination. • Exterior light fixtures shall be configured to emphasize close spacing and lower intensity light. Light fixtures shall use luminaries that do not direct the cone of light towards off-campus structures. • Design parking structure lighting to minimize off-site glare.	Issue instructions to design teams to incorporate design standards in all project plans and designs. Require architects and design professionals to document how design standards are addressed and incorporated. Review project plans to ensure that such features have been incorporated in the design to address the impacts.	UCSF Project Manager and Design Teams	Ensure project incorporates design standards prior to final project approval. After construction, the Project Manager shall provide written verification to the Monitor that design standards have been incorporated to address the impacts.
Impact AES-4: Implementation of the CPHP would potentially create wind hazards in publicly accessible areas of substantial pedestrian use.	**CPHP Mitigation Measure AES-4: Design new buildings to minimize wind impacts at pedestrian level.** Prior to the approval of the design of individual buildings to be developed pursuant to the CPHP and for which one or more building facades would have a height of 80 feet or more, UCSF shall engage a qualified wind consultant to conduct wind tunnel testing of the proposed building(s) to determine whether the building(s) would result in new exceedance(s) of the City of San Francisco's 26-mph pedestrian wind hazard criterion. The wind tunnel testing shall be conducted for the building(s) under consideration in the context of then-existing conditions as well as in the context of conditions representative of then-anticipated CPHP buildout (the buildout scenario in the EIR, as may be modified from time to time by UCSF to reflect actual building designs known at the time) so as to determine whether the individual building(s) and/or the buildout condition would result in exceedances of the wind hazard criterion. If the wind tunnel analysis determines that the building(s)' design or buildout conditions would increase the hours of wind hazard exceedance or the number of test points subject to hazardous winds, compared to then-existing conditions, UCSF shall work with the wind consultant to identify feasible mitigation strategies, including design changes (e.g., setbacks, rounded/chamfered building corners, stepped facades, etc.), to eliminate or reduce	Issue instructions in each bid package to alert the architect and design team that UCSF will engage, or require the design team to engage, a qualified wind consultant to evaluate proposed building designs for buildings 80 feet or more in height. Require documentation of the findings of all wind consultation and testing, where deemed necessary, and proposed wind-reducing measures. Review project plans to ensure that necessary wind-reducing features have been incorporated in the design.	UCSF Project Manager and Design Teams	Provide written verification in report form to the Monitor for each contract bid that the bid includes provision for wind hazard consultation and testing, where deemed necessary, for buildings 80 feet or more in height, documentation of the results, and incorporation into the building design of any necessary wind reduction features.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.1 Aesthetics, Wind, and Shadow (cont.)				
Impact AES-4 (cont.)	wind hazards to the maximum feasible extent. If UCSF finds that these changes or other wind speed reduction strategies are not feasible as they would unduly restrict the proposed building's space program, result in operational inefficiencies, and/or substantially higher costs, the building(s) may nonetheless be approved provided that the project incorporates wind speed reduction strategies to the maximum feasible extent, as determined by UCSF in consultation with the wind consultant. Wind speed reduction strategies could also include features such as landscaping, localized installation of porous/solid screens, installation of canopies along building frontages, and the like.			
Impact C-AES-3: Implementation of the CPHP, combined with cumulative projects, would potentially create wind hazards in publicly accessible areas of substantial pedestrian use.	Implement CPHP Mitigation Measure AES-4.	See CPHP Mitigation Measure AES-4.	See CPHP Mitigation Measure AES-4.	See CPHP Mitigation Measure AES-4.
EIR Section 4.2 Air Quality				
Impact AIR-1: Construction of campus development under the CPHP would result in a cumulatively considerable net increase of a criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.	**CPHP Mitigation Measure AIR-1a: Clean Construction Equipment for CPHP Projects.** The construction contractor(s) shall develop a plan demonstrating that the off-road equipment used to on-site to construct CPHP projects would achieve a fleet-wide average 80 percent reduction in NO_X exhaust emissions, compared to uncontrolled aggregate statewide emission rates for similar equipment. One feasible plan to achieve this reduction would include the following: • All mobile diesel-powered off-road equipment larger than 25 horsepower and operating on the project site for more than two days continuously shall be equipped with engines meeting USEPA emissions standards for Tier 4 Final certified engines or equivalent; • Use of electrically-powered construction equipment to the degree available and feasible; and Alternatively, if UCSF can demonstrate through preparation of an air quality assessment report prepared by an air quality specialist that large or contemporaneous CPHP construction projects would not exceed BAAQMD thresholds, then the above mitigation requirements may be waived.	Issue instructions in each bid package of each construction project for contractors to incorporate the required clean construction equipment plan. The successful contractor will prepare a plan to achieve a fleet-wide average 80 percent reduction in NO_X exhaust emissions, compared to uncontrolled aggregate statewide emission rates for similar equipment.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provision for construction NOx emissions reduction. Provide a report on construction emissions reduction strategies and report to Monitor upon request; but no less than quarterly after beginning each construction phase.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.2 Air Quality (cont.)				
Impact AIR-1 (cont.)	**CPHP Mitigation Measure AIR-1b: Best Management Practices for Controlling Particulate Emissions during Construction.** The following BAAQMD Best Management Practices for particulate control will be required for all construction activities related to CPHP projects (BAAQMD, 2017). These measures will reduce particulate emissions primarily during soil movement, grading and demolition activities but also during vehicle and equipment movement on unpaved project sites. • All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day. • All haul trucks transporting soil, sand, or other loose material off-site shall be covered. • All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited. • All vehicle speeds on unpaved roads shall be limited to 15 mph. • All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used. • Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure Title 13, § 2485 of California Code of Regulations [CCR]). Clear signage shall be provided for construction workers at all access points. • All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation. • Post a publicly visible sign with the telephone number and person to contact at UCSF regarding dust complaints. This person shall respond and take corrective action within 48 hours. BAAQMD's telephone number shall also be visible to ensure compliance with applicable regulations.	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will prepare a construction air pollution control strategy to report on the implementation of the mitigation measure.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provision for construction air pollution control. Provide a report on construction air pollution control strategies and report to Monitor upon request; but no less than quarterly after beginning each construction phase.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.2 Air Quality (cont.)				
Impact AIR-2: Operation of campus facilities developed under the CPHP would result in a cumulatively considerable net increase of a criteria pollutant (PM_{10}) for which the project region is non-attainment under an applicable federal or state ambient air quality standard.	**CPHP Mitigation Measure AIR-2a: Project-Level Operational Measures** The following measures, most of which are identified in the 2017 BAAQMD *CEQA Guidelines,* shall be reviewed and incorporated into specific development projects if not already included in the development project or otherwise in place at the Parnassus Heights campus site: • Provide and maintain secure bike parking (at least one space per 20 vehicle spaces); • Provide and maintain showers and changing facilities for employees; • Provide information on transportation alternatives to employees; • Provide and maintain preferential carpool and vanpool parking for non-residential uses; • Increase building energy efficiency below Title 24 (reduces NO_X related to natural gas combustion); • Require use of electrically powered landscape equipment, where feasible; • Use low VOC architectural coatings in maintaining buildings; • Meet California Green Building Code standards in new construction (reduces NOx related to natural gas combustion); and • Provide electric vehicle charging stations in existing parking areas to promote the use of zero emission vehicles. • Equip all truck loading and unloading docks with a power outlet for every two-dock doors. Signs shall be posted stating "Diesel trucks are prohibited from idling more than 5 minutes and trucks requiring auxiliary power shall connect to the electrical outlets to run auxiliary equipment.	Adopt suggested operational measures, as specified, as a condition of approval. Issue instructions to design teams to incorporate BAAQMD suggested operational measures in all project plans and designs. Require architects and design professionals to document how design standards are addressed and incorporated. Review project plans to ensure that such features have been incorporated in the design to address the impacts.	UCSF Project Manager and Design Teams	Verify that project incorporates features that implement these measures prior to final approval. After construction, each project manager shall provide written verification to the Monitor that measures were incorporated according to the design. Regularly review operations to determine that measures continue to be implemented.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.2 Air Quality (cont.)				
Impact AIR-2 (cont.)	**CPHP Mitigation Measure AIR-2b: TDM Program Enhancements** To reduce vehicle trips and resulting air quality impacts, UCSF will implement TDM program enhancements such that the number of new average daily vehicle trips to and from the campus site is reduced by at least 15 percent from the estimated new average daily vehicle trips without these program enhancements. TDM program enhancements/strategies shall initially include the following: 1. *New shuttle connections to regional transit (e.g. BART):* Implement new UCSF shuttle service between the campus site and regional transit stations (e.g. BART, Caltrain) to make regional transit a more attractive option for employees, patients, and visitors. 2. *Expand telecommuting and flexible hours program for employees:* Allow employees in appropriate positions to telecommute from home and/or work a modified schedule such that they are commuting to the campus less frequently per week. 3. *Improved telehealth program for patients:* Implement an expanded telehealth program to reduce the need for patients to travel to the campus site for appointments. 4. *Carpool and vanpool credits and incentives:* Provide a subsidy or discounted parking permit rates for individuals who carpool rather than drive alone; reduce monthly fares for Vanpool riders and drivers. 5. *Discontinue monthly parking permits:* Discontinue issuance of monthly parking permits to make commute travel mode a daily decision by shifting to daily parking permits. 6. *Enhanced patient TDM program*: Enhance information provided to patients regarding travel options to the campus site, including discussion of limited parking environment and public transit options. 7. *TNC to transit subsidy*: Provide a subsidy for individuals to use TNC to travel to transit rather drive alone. 8. *Transit pass program*: UCSF Health will implement a patient transit pass program by June 30, 2025. In addition, a petition to run a referendum on a SFMTA student transit pass will be reviewed and voted on by the UCSF student government assembly by June 30, 2025. Balloting would be in March and voting would be in April. Assuming the referendum passes, the results would be submitted to UCOP for approval in May and the fee would typically apply at the start of the new academic year, which would be September.	Develop a TDM program and or enhancements to existing TDM measures to achieve a minimum 15 percent reduction in average daily vehicle trips compared to the trip volume that would otherwise occur. The baseline new average daily vehicle trips without TDM program enhancements would be based on the average daily vehicle trip estimates for "Existing Conditions" and "CPHP (Future Phase)" scenarios, as presented in EIR Appendix TRANS. Prepare a survey-based annual monitoring plan to be implemented coincident with completion and occupancy of the Initial Phase projects.	UCSF Project Manager and UCSF Transportation Department, with the support of a qualified transportation engineer or planner.	Provide written verification of the TDM program/ enhancements to the Monitor prior to the start of construction of the New Hospital. Provide an annual report on the efficacy of the TDM program/enhancements to the Monitor.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.2 Air Quality (cont.)				
Impact AIR-2 (cont.)	UCSF may also make improvements to its existing TDM measures to achieve the targeted reduction in daily vehicle trips. In addition, if other new and/or improved TDM strategies are identified in the future, UCSF may implement such strategies in place of or in addition to the ones listed above. The TDM program enhancements/strategies shall be monitored annually for their combined effectiveness in meeting the performance standard set forth above. The annual monitoring and reporting program shall include: (a) an annual calculation of baseline new average daily vehicle trips without TDM program enhancements for each year starting in 2030; (b) an annual calculation of new average daily vehicle trips with the TDM program enhancements; and (c) a comparison of the results of (a) and (b) against the "existing" average daily vehicle trips to determine whether the performance standard of a 15 percent reduction in new average daily vehicle trips is achieved. As this significant impact would likely occur upon the completion of the New Hospital, the annual monitoring and reporting program shall be commenced upon the completion and occupancy of the Initial Phase projects, i.e., after 2030, and shall be conducted by a qualified transportation engineer, using data from UCSF's regularly administered travel behavior surveys for employee commute, patient and visitor travel, and resident travel. Using these survey results, the monitoring report will gauge the effectiveness of implemented TDM program enhancements at achieving the required 15 percent reduction in new average daily vehicle trips. If the annual performance standard is met, no further action from UCSF is required until the next year. In the event that the performance standard is not met, UCSF will examine the TDM program to identify areas of improvement and institute changes, which shall be evaluated for their effectiveness in the following year's monitoring report.			
Impact AIR-3: Construction activities under the CPHP could expose sensitive receptors to substantial pollutant concentrations and exceed the LRDP EIR standard of significance by exposing receptors to toxic air contaminant emissions that (1) result in a cancer risk greater than 10 cancer cases per 1 million people exposed in a lifetime; or (2) for acute or chronic effects, result in concentrations of toxic air contaminant emissions with a Hazard Index of 1.0 or greater.	**CPHP Mitigation Measure AIR-3: *Project-Specific Health Risk Analysis.*** UCSF shall prepare and submit to UCOP for review and approval, a project-specific health risk analysis demonstrating that project construction activities will not result in a significant acute, chronic non-cancer or cancer-related health risk to sensitive receptors. This requirement shall apply to construction projects in excess of 12 months of active construction (i.e., exclusive of interior renovations) and within 1,000 feet of sensitive receptors. As a performance standard, any subsequent project-specific health risk analysis must demonstrate an excess cancer risk level of 10-in-1 million or less, a non-cancer (i.e., chronic or acute) hazard index of 1.0 or less, and an incremental increase an annual average $PM_{2.5}$ concentrations of no more than 0.3 microgram per cubic meter.	Conduct, or cause to be conducted, a project-specific health risk assessment for construction of each individual building (or group of buildings, if proposed for simultaneous construction) that meet the criteria specified in the measure.	UCSF Project Manager and Design and/or Construction Teams	Provide written verification in report form to the Monitor for that each required health risk assessment has been prepared prior to project-specific approvals being granted.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.2 Air Quality (cont.)				
Impact AIR-4: Campus site operations under the CPHP could expose sensitive receptors to substantial pollutant concentrations and exceed the LRDP EIR standard of significance by exposing receptors to toxic air contaminant emissions that (1) result in a cancer risk greater than 10 cancer cases per 1 million people exposed in a lifetime; or (2) for acute or chronic effects, result in concentrations of toxic air contaminant emissions with a Hazard Index of 1.0 or greater.	**CPHP Mitigation Measure AIR-4a: *Laboratory Fume Hood Emission Control*.** For any individual project that contains more than 25,000 square feet of emissions-generating laboratory space within a building and 50 fume hoods, UCSF shall conduct a health risk screening analysis and obtain a permit from BAAQMD for the proposed individual projects; this permit may be required either prior to or as a condition of approval of the proposed individual project. In accordance with BAAQMD Rules 2-1 and 2-5, new sources of emissions must implement Best Available Control Technology for Toxics (T-BACT) if individual source risks exceed 1.0 in a million for cancer and/or chronic hazard index is greater than 0.20. Additionally, a permit will be denied if project cancer risk exceeds 10.0 in a million or if the chronic or acute hazard index exceeds 1.0.	Conduct, or cause to be conducted, a project-specific health risk screening analysis for construction of each individual project that meets the criteria specified in the measure. Obtain the required BAAQMD permit for each individual project that meets the criteria specified in the measure.	UCSF Project Manager and Design and/or Construction Teams	Provide written verification in report form to the Monitor for that each required health risk screening analysis and permit has been prepared prior to project-specific approvals being granted.
	CPHP Mitigation Measure AIR-4b: *Design for Diesel Delivery Truck Emissions Minimization*. UCSF shall incorporate the following health risk reduction measures into the project design and construction contracts (as applicable) in order to reduce the potential health risk due to exposure to toxic air contaminant emissions from diesel trucks. Emissions from CPHP-associated diesel trucks shall be reduced through implementing the following measures, as feasible: • Install electrical hook-ups for diesel trucks at loading docks. • Require trucks to use Transportation Refrigeration Units (TRU) that meet Tier 4 emission standards. • Require truck-intensive projects to use advanced exhaust technology (e.g., hybrid) or alternative fuels. • Prohibit trucks from idling for more than two minutes to the extent feasible. • Establish truck routes to avoid sensitive receptors in the project to the extent feasible. A truck route program, along with truck calming, parking, and delivery restrictions, shall be implemented	Issue instructions in each bid package of each design project for the design team to incorporate the mitigation measure.	UCSF Project Manager and Design Teams	Provide written verification in report form to the Monitor for that each required health risk reduction measure has been incorporated into project-specific design prior to project approvals being granted.
Impact AIR-5: The CPHP could conflict with or obstruct implementation of the *2017 Clean Air Plan*.	**CPHP Mitigation Measure AIR-5: Implement "cool roof and pavement" design elements.** UCSF shall implement "cool parking" that promotes the use of cool surface treatments for new parking facilities, as well existing surface lots undergoing resurfacing. Additionally, new building construction shall include low-albedo roofing materials to the extent it can reduce energy demand.	Issue instructions in each bid package of each design project for the design team to incorporate the mitigation measure.	UCSF Project Manager and Design Teams	Provide written verification in report form to the Monitor for that the required design elements have been incorporated into project-specific design prior to project approvals being granted.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.2 Air Quality (cont.)				
Impact C-AIR-1: Implementation of the CPHP combined with cumulative development in the project area would result in a cumulatively considerable net increase of a criteria pollutant (PM_{10}) for which the project region is non-attainment under an applicable federal or state ambient air quality standard.	Implement CPHP Mitigation Measure AIR-2a and AIR-2b.	See CPHP Mitigation Measures AIR-2a and 2b.	See CPHP Mitigation Measures AIR-2a and 2b.	See CPHP Mitigation Measures AIR-2a and 2b.
Impact C-AIR-2: Implementation of the CPHP could contribute considerably to cumulative emissions of TACs and $PM_{2.5}$ that could expose sensitive receptors to substantial pollutant concentrations or health risks.	Implement CPHP Mitigation Measures AIR-1a and AIR-1b.	See CPHP Mitigation Measures AIR-1a and 1b.	See CPHP Mitigation Measures AIR-1a and 1b.	See CPHP Mitigation Measures AIR-1a and 1b.
EIR Section 4.3 Biological Resources				
Impact BIO-1: Implementation of the CPHP would not have a substantial adverse effect, either directly or through habitat modifications, on species identified as candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.	**CPHP Mitigation Measure BIO-1a. Botanical Surveys** • Within suitable habitat for special-status plant species (open gravel areas along roadsides and hillsides for coastal triquetrella), a qualified biologist approved by CDFW shall conduct a focused survey for all species with potential to be present prior to ground disturbance. If no special-status plants are observed, no further action is required. • If special-status plant species, including coastal triquetrella are observed, the plants will be avoided with a suitable buffer, determined in coordination with CDFW The buffer zone shall be clearly demarcated using exclusion fencing. If establishing an avoidance buffer is not feasible, individual plants shall be transplanted to an area with suitable physical and biological conditions outside of the work area and monitored and adaptively managed for five years.	Engage a qualified biologist to undertake the survey(s) specified in the mitigation measure.	UCSF Project Manager	Provide written verification in report form to the Monitor for that the required survey(s) have been conducted prior to ground disturbance.
	CPHP Mitigation Measure BIO-1b. Protection of Monarch Butterflies • Prior to demolition activities, a qualified biologist familiar with monarch butterfly behavior and habitat shall conduct a preconstruction survey for the presence of overwintering monarch butterfly aggregations. The survey shall be conducted in December or January during the period when overwintering aggregations appear. Should an overwintering aggregation be identified in trees surrounding proposed work sites within or adjacent to the Reserve, a 200-foot buffer shall be established around the occupied trees until the aggregation has dispersed, and construction within the buffer zone will be avoided for the duration of the overwintering period.	Engage a qualified biologist to undertake the survey(s) specified in the mitigation measure.	UCSF Project Manager	Provide written verification in report form to the Monitor for that the required survey(s) have been conducted prior to demolition.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.3 Biological Resources (cont.)				
Impact BIO-1 (cont.)	**CPHP Mitigation Measure BIO-1c. Protection of Nesting Birds** • Tree and vegetation removal or pruning associated with project construction and commencement of outdoor project construction activities shall be avoided from February 1 through August 31, the primary local bird nesting season, to the extent feasible. If tree and vegetation removal or pruning associated with project construction is proposed during the nesting period, within seven days prior to the proposed start of construction activities a qualified biologist shall conduct a nesting bird survey of all potential habitat at the construction site and within 250 feet of the perimeter of the construction site. The qualified biologist will monitor all vegetation removal in the Open Space Reserve during bird nesting season. • If any active nests are detected during the pre-construction survey, the qualified biologist shall recommend a work-exclusion buffer zone that shall be designated around the active nest to allow for both the successful fledging of the birds and initiation of work on some portions of the project site. A qualified biologist shall monitor any occupied nest located within a protective buffer zone in order to determine if the designated buffer zone is effective and when the buffer zone is no longer needed. If the buffer zone is determined to be ineffective, its size shall be increased until it is effective, or work within one-quarter mile of the nest shall cease until the young have fledged and are independent of the nest.	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will demonstrate knowledge of appropriate timing for tree and vegetation removal and pruning for protection of nesting birds.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provisions for implementation of mitigation measure. Provide construction status report to Monitor upon request.
	CPHP Mitigation Measure BIO-1d. Protection of Roosting Bats • Prior to project construction, a qualified bat biologist shall conduct a pre-construction survey for roosting bats in trees to be removed or pruned and structures to be demolished within the work area and within a 50-foot radius of the work area. If no roosting bats are found, no further action is required. • If a non-maternal roost of bats is found in a tree or structure to be removed or demolished as part of project construction, the individuals shall be safely evicted, under the direction of a qualified bat biologist, by opening the roosting area to allow airflow through the cavity. Removal or demolition should occur no sooner than at least two nights after the initial minor site modification (to alter airflow). This action allows bats to leave during darkness, thus increasing their chance of finding new roosts with a minimum of disturbance. Departure of the bats from the construction area shall be confirmed with a follow-up survey by a qualified bat biologist prior to start of construction.	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will demonstrate knowledge of appropriate procedures for protection of nesting bats.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provisions for implementation of mitigation measure. Provide construction status report to Monitor upon request.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.3 Biological Resources (cont.)				
Impact BIO-1 (cont.)	• If active maternity roosts are found in trees or structures that will be removed or demolished as part of project construction, tree removal or demolition of that tree or structure shall commence and be completed before maternity roosting colonies form (generally before March 1), or shall not commence until after young are flying (generally after July 31). Active maternity roosts shall not be disturbed between March 1 and July 31.			
	CPHP Mitigation Measure BIO-1e. Worker Education • A qualified biologist shall provide training to all construction workers prior to starting work on plan components. The training shall cover special-status species with potential to be found onsite, avoidance measures to be undertaken if a species is found, avoiding the spread of invasive weeds and pathogens during construction, and best management practices for site housekeeping.	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will demonstrate knowledge of appropriate worker education for protection of special-status species.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provisions for implementation of mitigation measure. Provide construction status report to Monitor upon request.
Impact BIO-2: Implementation of the CPHP would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	**Mitigation Measure BIO-2a: Prevention of Harm to Migrating Birds During Construction.** Construction areas requiring lights shall implement the following measures to the extent feasible: • Construction-related lighting shall be fully shielded and focused down to ensure no significant illumination passes beyond the immediate work area. Lighting shall be positioned around the perimeter of the work area positioned toward activity and not surrounding habitat of the Reserve. • Yellow or orange light shall be used where possible. • Construction personnel shall reduce the amount of lighting to the minimum necessary to safely accomplish the work. • Night construction near suitable habitat for nesting and migratory birds and bats (i.e. the Reserve forest and understory vegetation) shall be avoided during nesting season (February 15 – August 15). If night construction near these areas cannot be avoided, light shall not be allowed to shine directly into suitable habitat.	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will demonstrate knowledge of appropriate procedures for construction lighting and nigh construction activity to protect migrating birds.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provisions for implementation of mitigation measure. Provide construction status report to Monitor upon request.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.3 Biological Resources (cont.)				
Impact BIO-2 (cont.)	**Mitigation Measure BIO-2b: Bird-Safe Building Treatments.** Building designs shall: • Avoid installation of lighting in areas where not required for public safety. • Examine and adopt alternatives to bright, all-night, floor-wide lighting when interior lights would be visible from the exterior or when exterior lights must be left on at night, including: – Installing motion-sensitive lighting – Installing task lighting – Installing programmable timers • Installing fixtures that use lower-wattage, sodium, and yellow-red spectrum lighting (if compatible with personnel safety requirements). • Where exterior lights are to be left on at night, install fully shielded lights to contain and direct light away from the sky. • Employ glazing options such as use of either fritted glass, Dichroic glass, etched glass, translucent glass, or glass that reflects ultraviolet light in appropriate portions of the building façade. • Minimize light and glare resulting from new buildings through the orientation of the building, use of landscaping materials and choice of primary façade materials. Design standards and guidelines to minimize light and glare shall be adopted for the new buildings, including: reflective metal walls and mirrored glass walls shall not be used as primary building materials for facades.	Issue instructions to design teams to incorporate bird-safe building treatments in building designs. Require architects and design professionals to document use of bird-safe treatments and review project plans to ensure that such features have been incorporated in the design.	UCSF Project Manager and Design Teams	Verify that project incorporates treatments prior to final project approval. After construction, the Project Manager shall provide written verification to the Monitor that treatments were installed according to the design.
Impact C-BIO-1: Implementation of the CPHP would not result in cumulatively considerable impacts on biological resources, in combination with past, present and reasonably foreseeable future projects in the vicinity of the Parnassus Heights campus site.	Implement CPHP Mitigation Measures BIO-1a through 1e, and BIO-2a and 2b.	See CPHP Mitigation Measures BIO-1a through 1e, BIO-2a, and BIO-2b.	See CPHP Mitigation Measures BIO-1a through 1e, BIO-2a, and BIO-2b.	See CPHP Mitigation Measures BIO-1a through 1e, BIO-2a, and BIO-2b.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.4 Cultural Resources and Tribal Cultural Resources				
Impact CUL-1: Implementation of the CPHP would result in a substantial adverse change in the significance of known historical resources.	**CPHP Mitigation Measure CUL-1a: Identify Character-Defining Features.** Prior to any demolition work or significant alterations initiated at the known historical resources, UCSF shall ensure that a qualified architectural historian who meets the Secretary of the Interior's Professional Qualification Standards identifies character-defining features of each historical resource. Despite being presumed or having been previously determined eligible for listing in the National Register and/or California Register, character-defining features of the historical resources that would be demolished or may be significantly altered under the CPHP have not been explicitly or adequately identified. According to guidance from the National Park Service, a historical resource "must retain… the essential physical features [i.e., character-defining features] that enable it to convey its historic identity. The essential physical features are those features that define both *why* a property is significant…and *when* it was significant" (National Park Service, 1997). The identification of character-defining features is necessary for complete documentation of each historical resource as well as appropriate public interpretation and salvage plans.	Engage, or cause to be engaged by the design team, a qualified architectural historian to identify character-defining features of resources to be demolished or significantly altered.	UCSF Project Manager and Design Teams	Provide written documentation of the character-defining features of each applicable resource to the Monitor.
	CPHP Mitigation Measure CUL-1b: Document Historical Resources Prior to Demolition or Alteration. Prior to any demolition work or significant alterations initiated at the known historical resources, UCSF shall ensure that a qualified architectural historian who meets the Secretary of the Interior's Professional Qualification Standards thoroughly documents each building and associated landscaping and setting. This includes the Zakheim Murals in UC Hall. Documentation shall include still photography and a written documentary record of the building to the National Park Service's standards of the Historic American Buildings Survey (HABS) or the Historic American Engineering Record (HAER), including accurate scaled mapping and architectural descriptions. If available, scaled architectural plans will also be included. Photos include large-format (4"x5") black-and-white negatives and 8"x10" enlargements. Digital photography may be substituted for large-format negative photography if archived locally. The record shall be accompanied by a report containing site-specific history and appropriate contextual information. This information shall be gathered through site-specific and comparative archival research and oral history collection as appropriate. Copies of the records shall be submitted to the Northwest Information Center at Sonoma State University and the UCSF Kalmanovitz Library Archives and Special Collections.	Engage, or cause to be engaged by the design team, a qualified architectural historian to document the resources to be demolished or significantly altered. Ensure that the resulting documentation is submitted to the repositories specified.	UCSF Project Manager and Design Teams	Provide written verification to the Monitor that documentation has been prepared and submitted to the repositories.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.4 Cultural Resources and Tribal Cultural Resources (cont.)				
Impact CUL-1 (cont.)	**CPHP Mitigation Measure CUL-1c: Public Interpretation and Salvage Plan.** Prior to any demolition or significant alteration activities that would remove character-defining features of, or demolish, an individual historical resource on the project site, UCSF shall determine whether any such features may be salvaged, in whole or in part, during demolition/alteration. If it is determined that features are present that will be salvaged, a Salvage Plan shall be prepared by a qualified architectural historian or historic architect who meets the Secretary of the Interior's Professional Qualification Standards and presented to UCSF Planning staff. Prior to any demolition or significant alteration activities that would remove character-defining features of, or demolish, an individual historical resource on the project site, UCSF shall prepare a plan for interpretive displays. The specific location, media, and other characteristics of such interpretive display(s) shall be included in this proposal. The historic interpretation plan shall be prepared in coordination with an architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards and an exhibit designer or landscape architect with historical interpretation design experience. Interpretive display(s) shall document the individually eligible resources to be demolished or altered. The interpretative plan should also explore contributing to digital platforms that are publicly accessible. A proposal describing the general parameters of the interpretive program and the substance, media, and other elements of such interpretive display shall be approved by UCSF Planning staff prior to commencement of any demolition activities. Following any demolition or alteration activities within the project site, UCSF shall provide within publicly accessible areas of the project site a permanent display(s) of interpretive materials concerning the history and architectural features of the individual historical resources.	Engage, or cause to be engaged by the design team, a qualified architectural historian to determine whether any character-defining features of resources to be demolished or significantly altered are salvageable. If salvage is feasible, prepare, or cause to be prepared by the design team, a Salvage Plan developed by a qualified architectural historian. Engage, or cause to be engaged by the design team, a qualified architectural historian to prepare an interpretive plan for public display concerning the character-defining features of resources to be demolished or significantly altered. Identify appropriate location(s) for the display(s) and ensure that they are installed no later than six months after demolition or after issuance of a certificate of occupancy for replacement structure(s), whichever is later.	UCSF Project Manager and Design Teams	Provide written verification to the Monitor of the results of the evaluation of salvage potential, verification of the preparation of a Salvage Plan, if applicable, and verification of installation of interpretive display(s).
	CPHP Mitigation Measure CUL-1d: Digital-Imaging and Virtual Preservation of Zakheim Murals in UC Hall. Prior to the commencement of demolition activities at UC Hall, UCSF Planning staff shall work with a conservator experienced in digital preservation to develop and implement a digital imaging and virtual preservation proposal for the Zakheim murals in UC Hall. The proposal shall include a plan to digitally preserve the Zakheim murals through high-resolution three-dimensional digital recording that would be made available both online and through a planned interpretive virtual reality interpretive exhibit on campus to be maintained by the UCSF Library's Archives and Special Collections department. UCSF Planning staff shall ensure that the digital-imaging and virtual preservation activities are completed prior to any demolition activities in Toland Hall.	Engage, or cause to be engaged by the design team, a qualified architectural conservator to undertake virtual preservation though documentation of the Zakheim Murals. Ensure that the resulting documentation is submitted to the repositories specified.	UCSF Project Manager and Design Teams	Provide written verification to the Monitor that documentation has been prepared and submitted to the repositories.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.4 Cultural Resources and Tribal Cultural Resources (cont.)				
Impact CUL-1 (cont.)	**CPHP Mitigation Measure CUL-1e: Digital-Imaging and Virtual Preservation of Zakheim Murals in UC Hall.** Provided that the Zakheim murals are successfully removed from Toland Hall and stored, UCSF will convene a Task Force by the end of 2021 to advise on options for the display of the murals in a publicly accessible setting, either on a UCSF campus or at a museum or other institution. The Task Force will include the Chair of the City's Historic Preservation Commission, or their designee.	Prior to end of 2021, develop the list of Task Force personnel, and convene Task Force to advise on options for the display of the murals in a publicly accessible setting.	UCSF Project Manager and Design Teams	Provide written verification to the Monitor results of Task Force recommendations.
Impact CUL-2: Implementation of the CPHP would result in a substantial adverse change in the significance of potential future historical resources that may become eligible by the full build-out of the CPHP in 2050.	Implement CPHP Mitigation Measures CUL-1a through -1c.	See CPHP Mitigation Measures CUL-1a through -1c.	See CPHP Mitigation Measures CUL-1a through -1c.	See CPHP Mitigation Measures CUL-1a through -1c.
Impact CUL-3: Implementation of the CPHP could cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5.	**CPHP Mitigation Measure CUL-3: Inadvertent Discovery of Archaeological Resources and Tribal Cultural Resources.** Prior to commencement of construction activities, all on-site personnel shall attend a mandatory pre-project training to outline the general archaeological and tribal cultural sensitivity of the project area. The training will include a description of the types of resources that could be encountered and the procedures to follow in the event of an inadvertent discovery of resources. If prehistoric or historic-era archaeological resources are encountered by construction personnel during ground-disturbing activities, all construction activities within 100 feet shall halt and the contractor shall notify the UCSF Environmental Coordinator (EC). The UCSF EC shall retain a Secretary of the Interior-qualified archaeologist (qualified archaeologist) to inspect the find within 24 hours of discovery. If it is determined that the project could damage a historical resource or a unique archaeological resource, construction shall cease in an area determined by the qualified archaeologist until a mitigation plan has been prepared and implemented [CEQA Guidelines 15064.5(b)(4)]. If the find is a potential tribal cultural resource, the UCSF EC shall contact a Native American representative or representatives (as provided by the Native American Heritage Commission) [PRC 21074(2)(c)]. The qualified archaeologist, in consultation with the UCSF EC and the Native American representative(s), shall determine when construction can resume. If the resource is determined to be a historical resource or a unique archaeological resource, the preferred mitigation shall be preservation in place. In accordance with PRC Section 21083.2(b), preservation in place shall be accomplished through:	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will demonstrate knowledge of procedures and requirements when cultural resources are discovered during construction activities.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provisions for implementation of mitigation measure if cultural resources are discovered during construction activities. Provide construction status report to Monitor upon request.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.4 Cultural Resources and Tribal Cultural Resources (cont.)				
Impact CUL-3 (cont.)	(1) modifying the construction plan to avoid the resource; (2) incorporating the resource within open space; (3) capping and covering the resource; or (4) deeding the resource site into a permanent conservation easement. If preservation in place is not feasible, the qualified archaeologist, in consultation with the UCSF EC and the Native American representative(s) (if the resource is prehistoric), shall prepare and implement a detailed treatment plan. In all cases treatment will be carried out with dignity and respect (including protecting the cultural character, traditional use, and confidentiality of the resource). For prehistoric resources, the Native American representative(s) will be consulted on the research approach, methods, and whether burial or data recovery or alternative mitigation is appropriate for the find. Treatment for most resources could consist of (but shall not be limited to) sample excavation, site documentation, and historical research, as appropriate to the discovered resource. The treatment plan shall include provisions for analysis of data in a regional context as appropriate to the discovered resource, reporting of results within a timely manner, and dissemination of reports to local and state repositories, libraries, and interested professionals.			
Impact CUL-4: Implementation of the CPHP could disturb human remains, including those interred outside of dedicated cemeteries.	**CPHP Mitigation Measure CUL-4: Inadvertent Discovery of Human Remains.** In the event of discovery or recognition of any human remains during ground-disturbing activities, treatment shall comply with all applicable state and federal laws. All construction activities within 100 feet shall halt and the contractor shall notify the UCSF Environmental Coordinator (EC). In accordance with PRC 5097.98, the UCSF EC shall contact the San Francisco Office of the Medical Examiner (Medical Examiner) to determine that no investigation of the cause of death is required. The Medical Examiner shall contact the Native American Heritage Commission (NAHC) within 24 hours if it is determined that the remains are Native American. The NAHC will then identify the person or persons it believes to be the most likely descendant (MLD) from the deceased Native American. Within 48 hours, the MLD shall make recommendations to the UCSF EC of the appropriate means of treating the human remains and any grave goods. Whenever the NAHC is unable to identify an MLD, the MLD fails to make a recommendation, or the parties are unable to agree on the appropriate treatment measures, the human remains shall be reinterred with appropriate dignity on the property in a location not subject to further and future subsurface disturbance.	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will demonstrate knowledge of procedures and requirements when cultural resources are discovered during construction activities.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provisions for implementation of mitigation measure if cultural resources are discovered during construction activities. Provide construction status report to Monitor upon request.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.4 Cultural Resources and Tribal Cultural Resources (cont.)				
Impact CUL-5: Implementation of the CPHP could cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe.	Implement CPHP Mitigation Measure CUL-3.	See CPHP Mitigation Measure CUL-3.	See CPHP Mitigation Measure CUL-3.	See CPHP Mitigation Measure CUL-3.
Impact C-CUL-1: Implementation of the CPHP would result in cumulatively considerable impacts on cultural and/or tribal cultural resources, in combination with past, present and reasonably foreseeable future projects in the vicinity of the Parnassus Heights campus site.	**Historic Resources.** Implement CPHP Mitigation Measures CUL-1a through -1d. **Archaeological Resources, Human Remains, and Tribal Cultural Resources.** Implement CPHP Mitigation Measures CUL-3 and CUL-4.	See CPHP Mitigation Measures CUL-1a through 1d, CUL-3, and CUL-4.	See CPHP Mitigation Measures CUL-1a through 1d, CUL-3, and CUL-4.	See CPHP Mitigation Measures CUL-1a through 1d, CUL-3, and CUL-4.
EIR Section 4.6 Geology and Soils				
Impact GEO-3: New development under the CPHP would not directly or indirectly cause substantial adverse effects, including the risk of loss, injury, or death involving landslides.	**CPHP Mitigation Measure GEO-3:** UCSF shall implement the following geotechnical recommendations as adapted from those contained within the Rutherford & Chekene March 2019 report: • Remove selected trees located on or at the crest of steep rock slopes on which tree root wedging decreases stability. Determination of specific trees to be removed shall be made in association with a certified arborist and state licensed geotechnical engineer or engineering geologist. Removal will involve cutting trees and leaving stumps such that the root system can rot in situ with minimal disturbance to the surface geology. • Conduct qualitative monitoring of identified slopes by a state licensed geotechnical engineer or engineering geologist or as directed by said professional. Monitoring shall occur, at a minimum, after each major storm or earthquake, as defined by the geotechnical professional. The geotechnical professional shall submit a report of findings to UCSF that includes recommendations for additional slope stability improvements, if deemed necessary, to maintain continued safety in accordance with geotechnical standards and building code requirements.	For CPHP projects proposed adjacent to the Reserve that would involve excavation or cut slope cut excavation, project-specific geotechnical evaluations shall be prepared as part of the design process and include evaluations of potentially affected slopes, recommendations for tree removal on or at the crest of steep rock slopes, and recommendations for monitoring frequency.	A state-licensed geotechnical engineer in consultation with certified arborist, shall report to the UCSF Project Manager.	The UCSF Project Manager shall submit the results of each tree assessment to the Monitor.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.6 Geology and Soils (cont.)				
Impact GEO-6: Construction associated with the CPHP could have the potential to directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.	**CPHP Mitigation Measure GEO-6:** Prior to commencement of construction activities, all on-site personnel shall attend a mandatory pre-project training to outline the general paleontological sensitivity of the project area. The training will include a description of the types of resources that could be encountered and the procedures to follow in the event of an inadvertent discovery of resources. If paleontological resources, such as fossilized bone, teeth, shell, tracks, trails, casts, molds, or impressions are discovered during ground-disturbing activities, work shall stop in that area and within 100 feet of the find until a qualified paleontologist meeting the Society of Vertebrate Paleontology (SVP) Standards can assess the nature and importance of the find and, if necessary, develop appropriate salvage measures in conformance with SVP standards (2010). If the discovery can be avoided and no further impacts will occur, no further effort shall be required. If the resource cannot be avoided and may be subject to further impact, a qualified paleontologist shall evaluate the resource and determine whether it is "unique" under CEQA. Any discovered paleontological resources that are determined by the qualified paleontologist to be "unique" in accordance with CEQA shall be given appropriate salvage measures in conformance with SVP standards (2010).	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will demonstrate knowledge of procedures and requirements when paleontological resources are discovered during construction activities.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provisions for implementation of mitigation measure if paleontological resources are discovered during construction activities. Provide construction status report to Monitor upon request.
Impact C-GEO-1: Implementation of the CPHP could have the potential to combine with past, present and reasonably foreseeable future projects to result in cumulatively considerable impacts related to geology and soils.	Implement CPHP Mitigation Measure GEO-6.	See CPHP Mitigation Measure GEO-6.	See CPHP Mitigation Measure GEO-6.	See CPHP Mitigation Measure GEO-6.
EIR Section 4.7 Greenhouse Gas Emissions				
Impact GHG-1: Implementation of the CPHP would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.	**CPHP Mitigation Measure GHG-1a: Emission Reduction Measures to supplement those currently included in GHGRS update that would occur as part of the proposed amendment to the 2014 LRDP under the CPHP.** The GHGRS update shall include the following measure identified in Table 4.7-4 to address long-term GHG emissions reductions:	Incorporate the recommended design principle (storm water capture and treatment) into the GHGRS update.	UCSF Project Manager and GHGRS Manager.	Provide the GHGRS update inclusive of the recommended design principle to the Monitor.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.7 Greenhouse Gas Emissions (cont.				
Impact GHG-1 (cont.)	• ***Water Conservation Strategies*:** Campus design principle WC2 of the CPHP identifies storm water capture and treatment to reduce water demand. UCSF shall amend the GHGRS to include a Water Conservation Measure based on storm water capture and the associated reduction in outdoor water demand. A year 2050 target of 3 percent reduction of overall outdoor water use shall be established.			
	CPHP Mitigation Measure GHG-1b: Implement CPHP Mitigation Measure AIR-2a: Project-Level Operational Measures, CPHP Mitigation Measure AIR-2b: TDM Program Enhancements, CPHP Mitigation Measure AIR-4b: Design for Diesel Delivery Truck Emissions Minimization, and CPHP Mitigation Measure AIR-5: Implement "cool roof and pavement" design elements to further reduce emissions from individual projects and mobile sources.	See CPHP Mitigation Measures AIR-2a, AIR-2b, AIR-4b, and AIR-5.	See CPHP Mitigation Measures AIR-2a, AIR-2b, AIR-4b, and AIR-5.	See CPHP Mitigation Measures AIR-2a, AIR-2b, AIR-4b, and AIR-5.
	CPHP Mitigation Measure GHG-1c: Monitor emissions annually and acquire carbon offset credits in conformance with CARB guidance, prioritizing local and in-State offsets to achieve and maintain carbon neutrality for the Parnassus Heights campus site under the CPHP. As part of this mitigation measure, UCSF is making the following separate, though overlapping, GHG emission reduction commitments: (1) As a CARB-covered entity, UCSF will maintain compliance with CARB's cap and trade program; (2) Per existing UC Policy, UCSF's Scope 1 and Scope 2 GHG emissions shall, commencing in 2025, be entirely carbon neutral; (3) Also per existing UC Policy, commencing in 2020, UCSF's Scope 1, Scope 2, and Scope 3 emissions from commuters and air travel shall be voluntarily offset; and (4) UCSF's total GHG operational emissions from all Scope 1, 2, and 3 sources (as defined in this EIR) shall not exceed the Parnassus Heights campus's baseline emissions from these sources in 2018. Each of these commitments is described in more detail below. **Compliance with CARB's Cap and Trade Program:** Any carbon offset credits purchased for the purpose of compliance with CARB's cap and trade program shall be purchased from an accredited carbon credit market. Such offset credits (or California Carbon Offsets) shall be registered with, and retired[1] by an	Throughout the lifetime of the CPHP, prepare, or cause to be prepared by a qualified GHG emissions expert, an annual report of campus GHG emissions (Scope 1, 2, and 3). If the annual monitoring shows that emissions for a given year exceed the 2018 baseline emissions, purchase carbon offset credits that comply with CARB guidance, prioritizing local and in-State offsets.	UCSF Project Manager	Provide the annual GHG report to the Monitor. If the annual report reveals the need for purchase of carbon offset credits, provide the Monitor with documentation that such purchase has occurred, in compliance with CARB guidance.

[1] When Climate Reserve Tonnes (CRTs) are transferred to a retirement account in the Reserve System, they are considered retired. Retirement accounts are permanent and locked to prevent a retired CRT from being transferred again. CRTs are retired when they have been used to offset an equivalent ton of emissions or have been removed from further transactions on behalf of the environment.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.7 Greenhouse Gas Emissions (cont.				
Impact GHG-1 (cont.)	Offset Project Registry, as defined in 17 California Code of Regulations § 95802(a), approved by the California Air Resources Board such as, but not limited to, Climate Action Reserve, American Carbon Registry or Verra (formerly Verified Carbon Standard). In order to demonstrate that the carbon offset credits provided are real, permanent, additional, quantifiable, verifiable, and enforceable, as those terms are defined in 17 California Code of Regulations § 95802(a), UCSF shall document in its annual report: (i) the protocol used to develop those credits, and (ii) the third-party verification report concerning those credits. As and when the credits are retired, UCSF shall document in its annual report the unique serial numbers of those credits showing that they have been retired. **Compliance with UC Policy:** Compliance with UC's policies for carbon neutrality by 2025 and UC's own policy to reduce Scope 1, 2, and transportation-related Scope 3 emissions below 1990 levels pursuant to AB 32 will be accomplished through reductions in direct emissions, the purchase of renewable electricity and possibly biomethane, and the purchase of carbon offset credits. UCSF will purchase voluntary carbon offset credits as the final action to reach the GHG emission reduction targets. As part of the UC Carbon Neutrality Initiative, internal guidelines have been developed to ensure that any use of offsets for this purpose will result in additional, verified GHG emissions reductions from actions that align, as much as possible, with UC's research, teaching, and public service mission. Specifically, any voluntary carbon offset credits used by UCSF to mitigate GHG emissions will: 1. Prioritize local (within the air district) and in-state offset credits over in-nation offset credits. Offset credits shall be third-party verified by a major registry recognized by CARB such as CAR (Climate Action Reserve). If sufficient local and in-state offset credits are not available, UCSF will purchase CARB conforming national offset credits registered with an approved registry. 2. Be reported publicly and tracked through the Climate Registry (TCR) as required by UC policy. TCR is a non-profit organization governed by U.S. states and Canadian provinces and territories. UCSF's TCR reports will be third-party verified and posted publicly.			

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.7 Greenhouse Gas Emissions (cont.				
Impact GHG-1 (cont.)	**Commitment to control Parnassus Heights Annual Emissions to not exceed existing baseline:** UCSF shall annually monitor Parnassus Heights campus-wide GHG operational emissions from all Scope 1, 2 and 3 sources (as defined in this EIR [Scope 1 emissions include on-site natural gas combustion, vehicle fuel use, and fugitive emissions from equipment; Scope 2 emissions are from off-site energy generation; and Scope 3 emissions are indirect emissions not covered in Scope 2, including commuting and other travel, electricity transmission and distribution losses, off-site wastewater treatment, and off-site municipal solid waste disposal], commencing in 2025 upon the completion and occupancy of the first project under the CPHP. The estimated annual emissions shall be compared to the year 2018 baseline of 125,426 MT CO_2e per year to determine whether the emissions have increased above the baseline level. For the identified amount of exceedance of the performance standard, UCSF shall purchase carbon offset credits sufficient to maintain carbon neutrality. These offset credits shall be purchased for the types of Scope 1 and Scope 3 emissions that are already reported to and verified by a third party verification body annually, as well as for Scope 3 emissions from patient and visitor vehicle trips, indirect emissions from water and wastewater demand, and solid waste emissions, all of which are included in the EIR analysis above as required by CEQA. Carbon offset credits used for this purpose shall originate from a voluntary carbon credit registry that TCR recognizes such as: CAR, ACR, or Verra (other registries are also applicable). Offset credits in this case shall be registered, transferred, and retired at such registries. The protocols of each registry, and UC own internal screens, shall be used to demonstrate that the carbon offset credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols. For this purpose, local (within the air district) and in-state carbon offset credits shall be prioritized over in-nation offset credits. If sufficient local and in-state offset credits are not available, UCSF will purchase CARB conforming national offset credits registered with an approved registry. As and when the credits are retired, UCSF shall document in its annual report the unique identifier of those credits showing that they have been retired and accepted by TCR.			

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.8 Hazards and Hazardous Materials				
Impact HAZ-1: Construction and operation of campus development under the proposed CPHP could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.	**CPHP Mitigation Measure HAZ-1:** An Excavation Management Plan shall be prepared by a qualified consultant to include the California Air Resource Board (CARB) Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying and Surface Mining Operations to minimize naturally occurring asbestos through the application of best management practices for fugitive dust from construction, grading and excavation operations. Unless site specific testing by a certified laboratory can demonstrate the absence of naturally occurring asbestos in materials to be excavated, construction specifications shall include implementation of this CARB ATCM.	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will demonstrate knowledge of procedures and requirements for managing naturally occurring asbestos.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provisions for implementation of mitigation measure for managing naturally occurring asbestos during ground-disturbing activities. Provide construction status report to Monitor upon request.
Impact HAZ-4: Campus development under the proposed CPHP would not be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. However, previously unknown contamination could be encountered during construction and could have the potential to create a significant hazard to the public or the environment.	**CPHP Mitigation Measure HAZ-4:** Prior to development on the Parnassus Heights campus site under the CPHP, a Soil Management Plan shall be prepared by a qualified environmental consulting firm to reflect current regulatory requirements and risk management protocols that are in accordance with Regional Water Quality Control Board oversight. The Plan shall include measures to address protocols for identifying, handling, and characterizing suspect contaminated soils. Notification and sampling requirements for adequate characterization shall be in accordance with the overseeing agency (RWQCB or SFDEH) requirements and any required removal or remediation work shall be completed to the overseeing agency's standards prior to occupancy of the new structure.	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will demonstrate knowledge of procedures and requirements for soil management with respect to suspected soil contamination.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provisions for implementation of mitigation measure for managing suspected soil contamination during ground-disturbing activities. Provide construction status report to Monitor upon request.
EIR Section 4.9 Hydrology and Water Quality				
Impact HYD-1: Construction and operation of campus development under the CPHP would have the potential to violate water quality standards or waste discharge requirements, or otherwise substantially degrade surface or groundwater quality.	**CPHP Mitigation Measure HYD-1:** During implementation of the CPHP, UCSF shall continue to implement water conservation measures and construct and implement stormwater management controls as needed so as to: a. Avoid increasing the likelihood of surcharges by exceeding the capacity of the City's CSS; b. Avoid increasing the extent or duration of ponding or overland flow by exceeding the capacity of the City's CSS; and c. Avoid discharges to the City's CSS that could increase the frequency, duration, or volume of combined sewer discharges to the receiving waters. To meet the first two (hydraulic) performance standards, UCSF shall design all new on-campus buildings and site improvements to be consistent with requirements of the City's Stormwater Management Ordinance (Article 4.2 of the San Francisco Public	Prior to implementation of the CPHP, use SFPUC's model to establish a baseline of stormwater and wastewater flows from the campus site. Starting with the Initial Phase, and thereafter, at every major phase of the CPHP (or every five years, whichever is more frequent) use SFPUC's model to estimate stormwater and/or wastewater flows from the campus site and submit the analysis to the SFPUC for review (or request that the SFPUC conduct the analysis on UCSF's behalf).	UCSF Project Manager and Design and Construction Teams	Provide written verification in report form to the Monitor that each contract bid on each phase to certify that selected bid includes provisions for applicable required improvements in the mitigation measure. Provide construction status report to Monitor upon request.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.9 Hydrology and Water Quality (cont.)				
Impact HYD-1 (cont.)	Works Code), ensuring that the stormwater runoff rate and volume from the project shall not exceed pre-development conditions for the 1- and 2-year, 24-hour design storm (the standard for sites that are less than 50 percent impervious). In addition, when connections to the City's CSS are being designed, UCSF shall analyze the capacity of the adjoining sewer system to ensure that the system can accommodate UCSF's increased flows and/or modified connection points. UCSF may choose to conduct this modeling analysis on its own and submit the analysis to the SFPUC for review, or request that the SFPUC conduct the analysis on UCSF's behalf, subject to reimbursement of the SFPUC's costs by UCSF. If the analysis determines that increased flows may exceed the conveyance capacity of the adjoining downstream sewers, UCSF shall pay its proportional share of the costs of expanding the sewer system to accommodate the increased flows from the Parnassus Heights campus site. To meet the third (hydrologic) performance standard, UCSF shall ensure that the total volume of stormwater discharges from the Parnassus Heights campus site in wet weather is decreased by an amount sufficient to offset flows from any increase in impervious surfaces and any increases in wastewater discharges as a result of the CPHP. Necessary reductions may be achieved via LID, on-site detention and re-use, on-site detention for discharge, and/or other strategies in conformance with the City's Stormwater Management Ordinance, and may be less than the total wet weather discharges from Parnassus Heights campus site if modeling demonstrates there is sufficient storage, pumping, and treatment capacity in the City's CSS to avoid increased discharges to the receiving waters from the CSS discharge structures. UCSF shall use the SFPUC's model to establish a baseline prior to implementation of the CPHP and to demonstrate that future incremental increases in stormwater and/or wastewater from the campus site under the CPHP would not cause or contribute to any increase in overflow volumes from the City's CSS discharge structures, as determined through modeling at every major phase of the CPHP (starting with the Initial Phase) or every five years, whichever is more frequent, through CPHP buildout. UCSF may choose to conduct this modeling analysis on its own and submit the analysis to the SFPUC for review, or request that the SFPUC conduct the analysis on UCSF's behalf, subject to reimbursement of the SFPUC's costs by UCSF. In the event of non-compliance, UCSF shall immediately take steps to remedy the deficiency and provide reports to the SFPUC in conjunction with each construction project undertaken to implement the CPHP until the performance standard is met.	Incorporate building and site improvements, consistent with City's Stormwater Management Ordinance, to ensure performance standards in the mitigation measure are met.		

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.9 Hydrology and Water Quality (cont.)				
Impact HYD-1 (cont.)	Any improvements constructed outside the campus site boundary or in public right of way in the City's jurisdiction shall be subject to construction site runoff requirements and post-construction stormwater controls in accordance with the City Public Works Code and in compliance with the City's Stormwater Management Ordinance, and shall be included in UCSFs calculation of the total volume of increased flows to be offset and its modeling of incremental increases in flows into the City's CSS.			
Impact HYD-2: Construction and operation of the campus development under the CPHP would not substantially alter the existing drainage patterns of the site or area, in a manner that has the potential to result in substantial erosion or siltation on- or off- site; would potentially substantially increase the rate or amount of surface runoff in a manner that would result in flooding on or off site; would potentially create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flow.	Implement CPHP Mitigation Measure HYD-1.	See CPHP Mitigation Measure HYD-1.	See CPHP Mitigation Measure HYD-1.	See CPHP Mitigation Measure HYD-1.
Impact C-HYD-1: Construction and operation of campus development under the CPHP, in conjunction with other cumulative development within the City of San Francisco, would have the potential to cumulatively violate water quality standards or waste discharge requirements, or otherwise substantially degrade water quality.	Implement CPHP Mitigation Measure HYD-1.	See CPHP Mitigation Measure HYD-1.	See CPHP Mitigation Measure HYD-1.	See CPHP Mitigation Measure HYD-1.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.9 Hydrology and Water Quality (cont.)				
Impact C-HYD-2: Construction and operation of campus development under the CPHP, in conjunction with other cumulative development in the City of San Francisco's CSS, would not have the potential to cumulatively alter the drainage pattern of the site or area, through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on or off site; would have the potential to substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site; create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flow.	Implement CPHP Mitigation Measure HYD-1.	See CPHP Mitigation Measure HYD-1.	See CPHP Mitigation Measure HYD-1.	See CPHP Mitigation Measure HYD-1.
EIR Section 4.11 Noise and Vibration				
Impact NOI-1: Construction activities under the CPHP would generate a substantial temporary increase in ambient noise levels in the vicinity of the construction project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	**CPHP Mitigation Measure NOI-1a: Construction Noise Control Measures.** UCSF contractors shall employ site-specific noise attenuation measures during construction of projects under the CPHP to reduce the generation of construction noise. These measures shall be included in a Noise Control Plan that shall be submitted for review and approval by UCSF to ensure that construction noise is consistent with the standards set forth in the City's Noise Ordinance. Measures specified in the Noise Control Plan and implemented during project construction shall include, at a minimum, the following noise control strategies: • Equipment and trucks used for construction shall use the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds. • Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools.	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will prepare a construction noise control plan to report on the implementation of the mitigation measure.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provisions for construction noise control. Provide a report on construction noise control to Monitor upon request; but no less than quarterly after beginning each construction activity.

<table>
<tr><th>Environmental Impact</th><th>Mitigation Measures</th><th>Implementation Procedure</th><th>Responsible Unit</th><th>Report Mechanism</th></tr>
<tr><td colspan="5">EIR Section 4.11 Noise and Vibration (cont.)</td></tr>
<tr><td>Impact NOI-1 (cont.)</td><td>Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used where feasible; this could achieve a reduction of 5 dBA. Quieter procedures, such as use of drills rather than impact tools, shall be used where feasible.
• Stationary noise sources shall be located as far from adjacent receptors as possible, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or include other measures.
• Shield staging areas where adjacent sensitive receptors have direct line-of-sight with loading and delivery activities. Shielding may consist of plywood fencing with no gaps or acoustical paneling erected in K-rails.</td><td></td><td></td><td></td></tr>
<tr><td></td><td>CPHP Mitigation Measure NOI-1b: Construction Hours. Construction hours shall be restricted to the hours listed in the table below. In rare circumstances, work may need to occur outside of these work hour limits. In such cases, UCSF Community and Government Relations will receive advance notice from the project manager, at least one week in advance as feasible, and will engage the community to identify measures to minimize potential impacts. These measures may include, but not be limited to, restricting work to smaller time windows, condensing the overall duration of nighttime work to the degree feasible, and erecting temporary barriers to shield the short-term nighttime activity.
<table>

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.11 Noise and Vibration (cont.)				
Impact NOI-1 (cont.)	**CPHP Mitigation Measure NOI-1c: Pile-Installation Noise-Reducing Techniques.** Noise-reducing pile-installation techniques shall be employed during project construction. These techniques shall include: • Installing cast-in-place concrete piles. Noise from auger drilling is 17 dBA less than an impact pile driver. • Vibrating piles into place, and installing shrouds around the pile-driving hammer where feasible. • Implement "quiet" pile-installation technology (such as pre-drilling of piles and the use of more than one pile driver to shorten the total pile installation duration).	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will demonstrate understanding of means of reducing pile-installation noise.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provisions for construction noise control with respect to pile installation (may be incorporated into report for Mitigation Measure NOI-1a). Provide a report on construction noise control to Monitor upon request; but no less than quarterly after beginning each construction activity (may be incorporated into report for Mitigation Measure NOI-1a).
	Implement CPHP Mitigation Measure TRANS-5: Construction Coordination and Monitoring Measures–Construction Traffic Control Plan.	See CPHP Mitigation Measure TRANS-5.	See CPHP Mitigation Measure TRANS-5.	See CPHP Mitigation Measure TRANS-5.
Impact NOI-2: Implementation of the CPHP would generate substantial permanent increases in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	**CPHP Mitigation Measure NOI-2: Operational Noise Control.** For all development projects under the CPHP, mechanical equipment shall be selected and designed to meet the City's Police Code requirements of 8 dBA over existing ambient noise levels without the equipment operating as well as an interior noise standard at any sleeping or living room in any dwelling unit located on residential property of 45 dBA between 10:00 p.m. and 7:00 a.m., and 50 dBA between 7:00 a.m. and 10:00 p.m. A qualified acoustical consultant shall be retained to review mechanical noise as these systems are selected to determine specific noise reduction measures necessary to reduce noise to comply with the City's Police Code. Noise reduction measures could include, but are not limited to, selection of equipment that emits low noise levels; installation of noise barriers such as enclosures and parapet walls to block the line of sight between the noise source and the nearest receptors; and siting the mechanical equipment, including intake and exhaust portals for fixed mechanical equipment, as far as possible from the nearby existing sensitive receptors (i.e., west side of building).	Retain, or cause to be retained as part of the mechanical systems design for each new building or building renovation that includes installation of new mechanical equipment, a qualified acoustical consultant to evaluate noise generation characteristics of new mechanical systems and to ensure that noise levels comply with the City's Police Code. Following commissioning of new mechanical equipment, conduct noise measurements to ensure Police Code compliance.	UCSF Project Manager and Design Teams	Provide written verification in report form to the Monitor that the selected mechanical equipment will comply with the City's Police Code, including enumeration and evaluation of any required noise control or reduction measures. Following commissioning of new mechanical equipment, provide written verification in report form to the Monitor that the selected mechanical equipment does comply with the City's Police Code. If non-compliance is detected, identify and install additional noise reduction features.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.11 Noise and Vibration (cont.)				
Impact NOI-3: Construction activities under the CPHP could result in generation of excessive groundborne vibration or groundborne noise levels.	**CPHP Mitigation Measure NOI-3a: Limited Use of Vibratory Rollers.** UCSF shall require that contractors use (non- vibratory) excavator mounted compaction wheels mounted on an excavator or back-hoe and/or small, smooth drum rollers for final compaction of any asphalt base and asphalt concrete within 25 feet of a historic or older structure. If needed to meet compaction requirements, smaller, non-seated vibratory rollers shall be used to minimize vibration levels during repaving activities where needed to meet a vibration standard of 0.25 PPV at adjacent historic or older structures.	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will demonstrate the ability to limit use of vibratory rollers proximate to historic and older structures.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes provisions for limiting use of vibratory rollers (may be incorporated into report for Mitigation Measure NOI-1a). Provide a report on construction vibration control to Monitor upon request; but no less than quarterly after beginning each construction activity (may be incorporated into report for Mitigation Measure NOI-1a).
	CPHP Mitigation Measure NOI-3b: Assessment and Relocation/Retrofitting of Vibration-Sensitive Equipment. UCSF shall evaluate the presence of vibration-sensitive equipment within 150 feet of construction and demolition areas. Any sensitive equipment shall be evaluated for the existing extent of vibration isolation and relocated or further embellish isolation, as warranted. Alternatively, use of such equipment may be suspended during the substantial vibration-generating activities within 150 feet.	Prior to the start of any demolition or construction activity, identify vibration-sensitive equipment within 150 feet, assess the vibration isolation of such equipment, and enhance isolation if deemed necessary.	UCSF Project Manager	Provide written verification in report form to the Monitor that vibration-sensitive equipment within 150 feet of construction and demolition and, if deemed necessary, of provisions to enhance vibration isolation; or alternatively, that equipment is suspended during substantial vibration-generating activities within 150 feet.
Impact C-NOI-1: Implementation of the CPHP, combined with cumulative construction noise in the project area, would generate a substantial temporary increase in ambient noise levels from construction activity in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	Implement CPHP Mitigation Measures NOI-1a, NOI-1b, and CPHP Mitigation Measure TRANS-5: Construction Coordination and Monitoring Measures.	See CPHP Mitigation Measures NOI-1a, NOI-1b, and TRANS-5.	See CPHP Mitigation Measures NOI-1a, NOI-1b, and TRANS-5.	See CPHP Mitigation Measures NOI-1a, NOI-1b, and TRANS-5.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.11 Noise and Vibration (cont.)				
Impact C-NOI-2: Implementation of the CPHP, combined with cumulative development in the project area, would generate substantial permanent increases in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	Implement CPHP Mitigation Measure NOI-2.	See CPHP Mitigation Measure NOI-2.	See CPHP Mitigation Measure NOI-2.	See CPHP Mitigation Measure NOI-2.
Impact C-NOI-3: Implementation of the CPHP, combined with cumulative construction in the project area, would result in generation of excessive groundborne vibration or groundborne noise levels.	Implement CPHP Mitigation Measure NOI-3a.	See CPHP Mitigation Measure NOI-3a.	See CPHP Mitigation Measure NOI-3a.	See CPHP Mitigation Measure NOI-3a.
EIR Section 4.15 Transportation				
Impact TRANS-5: Construction activities under the CPHP could temporarily impact travel conditions along sidewalks and roadways serving the campus site.	**CPHP Mitigation Measure TRANS-5: Construction Coordination and Monitoring Measures** ***Construction Traffic Control Plan*** – In order to reduce potential conflicts between construction activities and pedestrians, transit and autos during construction activities at the Parnassus Heights campus site, UCSF shall require construction contractor(s) to prepare a traffic control plan for major phases of project construction (e.g., demolition, construction, or renovation of individual buildings). UCSF and their construction contractor(s) will meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations (e.g., Parnassus Avenue) and other measures to reduce potential traffic and transit disruption and pedestrian circulation effects during major phases of construction of the CPHP projects. For any work within the public right-of-way, the contractor would also be required to comply with the City of San Francisco's *Regulations for Working in San Francisco Streets*, which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic.	Issue instructions in each bid package of each construction project for contractors to incorporate the mitigation measure. The successful contractor will demonstrate the ability to prepare a complete and thorough Construction Traffic Control Plan that addresses traffic, transit, pedestrian, and bicycle movement; incorporates measures to limit single-occupancy vehicle travel by construction workers; and ensures minimal disruption of access for nearby residences, institutions, and businesses.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each contract bid on each phase to certify that selected bid includes a complete and thorough Construction Traffic Control Plan. Provide a report on construction traffic control to Monitor upon request; but no less than quarterly after beginning each construction activity.

TABLE 9-1 (CONTINUED)
SUMMARY OF CPHP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.15 Transportation (cont.)				
Impact TRANS-5 (cont.)	***Reduce Drive Alone Mode Share for Construction Workers*** – In order to minimize parking demand and vehicle trips associated with construction workers, UCSF shall require the construction contractor to include in the Construction Traffic Control Plan methods to encourage walking, bicycling, carpooling, and transit access to the campus site by construction workers. ***Project Construction Updates for Adjacent Residents and Businesses*** – In order to minimize construction impacts on access for nearby residences, institutions, and businesses, UCSF shall provide nearby residences and businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours, excavation),and travel lane closures via a newsletter, website, and/or quarterly construction update meetings with neighbors.

memorandum

date	December 11, 2020
to	Diane Wong, UCSF
cc	ESA Project File D190291.00
from	Johanna Kahn and Amber Grady, ESA
subject	Historic Resources Comments and Responses Document Technical Memo - UCSF Parnassus Heights Campus Site

Environmental Science Associates (ESA) has prepared this technical memo to summarize information and analysis reflected in the Draft Environmental Impact Report (EIR) for the University of California, San Francisco Parnassus Heights Comprehensive Parnassus Heights Plan (UCSF Parnassus Heights CPHP), and to provide related information requested by comments received regarding the Draft EIR. The following includes summaries of each of the six previous historic resources technical studies relied upon for the Draft EIR analysis, as well as the Historic American Buildings Survey (HABS) documentation for UC Hall and the Langley Porter Psychiatric Institute (LPPI). This technical memo also details how each of the reports was used in the EIR analysis, ESA's professional qualifications, and statements of concurrence with the previous findings. In addition, this report summarizes character-defining features of identified historic resources and includes Department of Parks and Recreation (DPR) 523 Update form sets for four buildings (Millberry Union, Saunders Court, Health Sciences Instruction and Research (HSIR) West, and HSIR East). The information provided below has been used to inform the text changes to the Draft EIR included in Section 8.5 of the Comments and Responses Document. None of the new information presented (i.e. summary of character defining features and DPR523 Update form sets) alters the analysis or conclusions presented in the Draft EIR.

Qualifications and Methodology

ESA architectural historians who contributed to the EIR Chapter 4.4, Cultural Resources and Tribal Cultural Resources, were Johanna Kahn and Amber Grady. Ms. Kahn, who holds Bachelor of Architecture (B.Arch.) and Master of Architectural History (M.Ar.H.) degrees and has 11 years of professional experience, exceeds the Secretary of the Interior's (SOI) Professional Qualification Standards in architectural history, architecture, and historic architecture. Ms. Grady, who holds Bachelor of Art (B.A.) in Interior Design and Master of Art (M.A.) in Historic Preservation degrees and has 19 years of professional experience, exceeds the SOI Professional Qualification Standards in architectural history and history. Resumes are attached.

During the course of DEIR preparation, ESA architectural historians reviewed the archival record, conducted a site visit, and performed supplemental research as necessary to inform the CEQA analysis required to assess potential impacts from implementation of the CPHP.

Each piece of the archival record was examined to determine if it was relevant and accurate given the current baseline and the proposed actions described in Chapter 3, Project Description of the DEIR.

Previous UCSF Historic Resources Technical Studies

Summaries are provided below for each of the technical studies that were used to inform the impact analysis in the Draft EIR and that are included in the list of references in Section 4.4.5 of the Draft EIR. Those portions of the studies that are relevant to the proposed project are included below.

Cultural Resources Study of UCSF Medical Center/Children's Hospital Project: UCSF Medical Center/Children's Hospital (Moffitt Hospital) DPR523 Form (EBI Project #61097519 [FCC: 100413A]) (2010)

A comment was received on the DEIR that referenced SHPO's Built Environment Resource Directory (BERD) and stated that Buildings 2274 and 2275, listed at 501 Parnassus Avenue were studied in 2010 and were not included "in the Draft EIR or Carey & Co.'s technical reports."

The *Attachment to SHPO Review of Proposed FCC Undertaking* document for EBI Project #61097519 (FCC: 100413A) includes a concurrence of eligibility for Buildings 2274 and 2275 at 501-505 Parnassus Avenue, San Francisco, CA 94143. Building 2274 refers to Long Hospital and Building 2275 refers to Moffitt Hospital. The construction dates for both buildings are incorrect. The document states that Moffitt Hospital was constructed in 1976 when it was actually constructed in 1955. The document states that Long Hospital was constructed in ca 1950 when it was actually constructed in 1982. The *Attachment to SHPO Review of Proposed FCC Undertaking* document appears to confuse Moffitt Hospital with the LPPI, stating the following:

> *X Eligible:*
>
> > *UCSF Campus*
> > *Buildings 2274 and 2275 [Moffitt Hospital]*
> > *501-505 Parnassus Avenue, San Francisco, CA 94143*
> >
> > *Criterion A: For its association with the development of clinical research related to psychiatry*
> >
> > *Criterion B: For its association with noted physician Robert Langley Porter and his role in the development of the first state psychiatric research institute*
> >
> > *Criterion C: For its Modernist architectural design*
>
> *X Eligible:*
>
> > *UCSF Campus*
> > *Building 2290 [LPPI]*
> > *401-405 Parnassus Avenue, San Francisco, CA 94143*
> >
> > *Criterion A: For its association with the development of the UCSF campus and the integration of medical science into the university realm of teaching and education.*

Criterion C: For its association with the prominent San Francisco architectural firm of Timothy and Milton T. Pflueger.

Note: At this time, I do not concur in the eligibility of Building 2290 under Criterion B for its association with the career of Herbert C. Moffitt.

The Criterion discussion for Moffitt Hospital and the LPPI are apparently switched with the incorrect building identifiers (address and building number) indicated above.

There is a DPR 523 form for Moffitt Hospital (UCSF Medical Center/Children's Hospital, 501-505 Parnassus Avenue), prepared by Dana E. Supernowicz of Historic Resource Associates (HRA) in February 2010, on file at the Northwest Information Center that is associated with the EBI Project #61097519 (FCC: 100413A), but none for Long Hospital as indicated in the comment. Additionally, the DPR 523 form for Moffitt Hospital does not mention Long Hospital by name, and there is no history provided for this building. The Moffitt Hospital evaluation claims that it is "individual eligible for the National Register of Historic Places (NRHP) under Criteria A, B, and C, due to the buildings association with Moffitt and the Pfluegers'. *Attachment to SHPO Review of Proposed FCC Undertaking* document does not concur with the evaluation under Criteria B (see above). With regards to the evaluation under Criteria A, the 2010 HRA evaluation fails to provide sufficient context by which to evaluate this buildings contribution to the medical field. Merely being associated with Herbert C. Moffitt is not enough. Additionally, the building was constructed after Moffitt's retirement indicating that this was more likely a commemorative gesture, not that he was associated with the development of the facility. With regards to the evaluations under Criteria C, the HRA evaluation fails to include any comparative analysis in the context of Pfluegers' body of work. Per the *National Register Bulletin: How to Apply the National Register Criteria for Evaluation*, "The criterion is generally restricted to those properties that illustrate (rather than commemorate) a person's important achievements." The 2010 HRA analysis failed to provide a significant linkage between Herbert C. Moffitt's work and Moffitt Hospital. Finally, the evaluation lacks an integrity analysis using all seven aspects as discussed starting on page 44 of *National Register Bulletin: How to Apply the National Register Criteria for Evaluation*. For a resource to be eligible for the National Register of Historic Places it must be significant under one or more of the criteria as well as retain sufficient integrity to convey that significance.

There is no new information in the *Attachment to SHPO Review of Proposed FCC Undertaking* document or the associated DPRs, discussed above, that changes the analysis or conclusions in the Draft EIR. ESA concurs with Carey & Co.'s analysis of Moffitt Hospital as disclosed in the Draft EIR and its appendices.

University of San Francisco Parnassus Heights Campus, Historic Resource Evaluation Report (Carey & Co., September 2003)

This 2003 report prepared by Carey & Co. reviewed and evaluated the buildings and structures at the University of California San Francisco (UCSF) Parnassus Heights Campus that were at least 45 years old at the time "and would be directly affected by the UCSF Long Range Development Plan (LRDP) Amendment." The report concluded the following as it relates to the proposed CPHP:[1]

- **UC Hall** was recommended eligible under California Register Criterion 1 (Events) for its association with the broad pattern of development of medical research centers and hospitals in San Francisco. It was also recommended eligible under Criterion 3 (Architecture) is a fine example of the Beaux-Arts Style and is a significant work of master architect Lewis Parsons Hobart. The period of significance was identified as 1917 –

[1] The summary does not include buildings that have since been demolished.

1953. The report concluded that UC Hall retained sufficient integrity to convey its significance, but did not identify character-defining features of the building. The CPHP Draft EIR identifies UC Hall as an historical resource.

- **Moffitt Hospital** was recommended not eligible for listing in the California Register under any criteria, and the study included the following explanation:

  > *At the time of its completion, Moffitt Hospital was the largest and most modern teaching hospital in the western United States. The building is the work of renowned San Francisco architect, Milton Pflueger in conjunction with Blanchard & Maher. The building does not, however, appear to represent a master work of Pflueger's nor does it possess high artistic values in terms of mid-century Modern design. The building reflects a style more typical of its era. In addition, the building has undergone numerous alterations and several additions, and does not retain sufficient integrity to convey any historic associations as the West Coast's largest and most modern teaching hospital when constructed in 1955. The Long Hospital addition in 1983, and the new emergency room entrance soon thereafter, substantially altered not only this building's plan and setting, but also its internal organization and entry sequence. Therefore, in Carey & Co.'s opinion, this resource does not appear to be individually significant at the local, state, or national level under any of the four California Register criteria of evaluation* [2]

- The **Proctor Foundation building** was recommended not eligible for listing in the California Register under any criteria, and the study included the following explanation:

  > *However, Carey & Co. has not found that the foundation or Dr. Proctor have made contributions to the broad pattern of history significant enough to deem the building eligible for the California Register. The building reflects a style typical of its era, yet it does not embody the distinctive characteristics of a type, period, or method, represent the work of a master, or possess high artistic value. Therefore, in Carey & Co.'s opinion, this resource does not appear to be individually significant at the local, state, or national level under any of the four California Register criteria of evaluation.*[3]

In addition to the building evaluations, summarized above, the report included a historical overview of the campus and a discussion of master architects associated with the campus. The historical overview included the following themes/development periods: master plans and depression-era development, war time research and post-war expansion and development, and UCSF Long Range Development Plans (1964-2003).

ESA conducted a site visit in 2019 and confirmed that no substantial changes had occurred that would alter the eligibility of UC Hall, Moffitt Hospital, and Proctor Foundation buildings. It should be noted that the Moffitt Hospital and Proctor Foundation Building were slated for demolition under the 2014 LRDP and the effects of that action were evaluated in the 2014 LRDP EIR, which did not identify the buildings as historic resources under CEQA.

After a detailed review of the Carey & Company 2003 report and the 2014 LRDP EIR, verification of conditions on site, and completion of necessary additional research, ESA concurred with the findings of the prior analyses and used them in the course of preparing the current DEIR. Specifically, ESA concluded that UC Hall is an historical resource and neither Moffitt Hospital nor the Procter Building qualify as such.

---

2 Carey & Co., *UCSF Parnassus Heights Campus Historic Resources Evaluation*, 2003, page 26.

3 Carey & Co., *UCSF Parnassus Heights Campus Historic Resources Evaluation*, 2003, page 27.

With regard to Moffitt Hospital, the UCSF LRDP Amendment #2 Draft EIR, stated, on page 4.3-12:

> Alterations to Moffitt Hospital include the visual connection on the north elevation to the Medical Science building by a bay of open-air stair landings, and interior modernization completed in 1974. The Joseph M. Long Hospital opened in 1983; it was constructed at the south side of Moffitt and functions as an addition to the building. The following year, a new three-story emergency entrance, matching the architectural style of Long, was added to the east end of the north elevation. Internally, Moffitt Hospital has had numerous renovations and remodeling over the years, and retains almost none of its original internal features, with the exception of its double-loaded corridor and most of its steel door frames. Moffitt Hospital does not appear to be individually significant at the local, state, or national level.

Moffitt Hospital was evaluated in 2003 and found to be ineligible for the California Register. In 2003 the building was 48 years old. In 2005, when the building was 50 years old, ESA concurred with this finding in the UCSF LRDP Amendment #2 Draft EIR that stated, on page 4.3-12, "Moffitt Hospital does not appear to be individually significant at the local, state, or national level." Both sources cite lack of integrity as a major factor in its ineligibility. As of 2020, Moffitt Hospital is 65 years old and no restoration has been performed in the intervening years and the building continues to lack sufficient integrity for eligibility as a historical resource per CEQA.

Constructed in 1956, the Proctor Building was 47 years old when it was evaluated by Carey & Co. in 2003. ESA concluded that sufficient information was known and provided by Carey & Co. in 2003 to adequately evaluate the building for significance. No new information has become available that leads ESA to a different conclusion. UC Hall was slated for demolition under earlier plans for Parnassus Heights and effects of its removal were evaluated in the 2005 UCSF LRDP Amendment #2 Draft EIR, which stated, on page 4.3-21, "Because UC Hall is eligible for listing in the California Register, its demolition would be considered a significant and unavoidable impact."

In addition, ESA is in receipt of comments on the CPHP Draft EIR and materials submitted by commenters that expand on the 2003 evaluation of UC Hall by providing information and commentary about the Zakheim Murals. Included in these comments and materials are information such as the following:

- The 1935-38 frescos "History of Medicine in California" are the largest single work by artist Bernard Zakheim, who was a major artist of his era and studied fresco painting with Diego Rivera;[4]

- The murals depict doctors, students, and patients throughout California's history, and Biddy Mason, a Black nurse who was born a slave in 1818 and went onto become a midwife, nurse, philanthropist, and founder of the First African Methodist Episcopal Church in Los Angeles;[5,6]

- The murals are "irreplaceable" from "both an artistic and historical perspective" and "remnants of an era when government exalted and funded the arts;[7]

4 San Francisco Board of Supervisors Resolution No. 355-20, adopted July 28, 2020.

5 Carol Mogash, "A Black Nurse Saved Lives. Today She May Save Art." *New York Times*, August 11, 2020, Updated September 25, 2020.

6 Nicholas Weiler, "The Open Hand: A Conversation with the Descendants of Buddy Mason," *UCSF Campus News*, September 2020.

7 Adam Gottstein, "UCSF Development Puts Murals at Risk," *The Fireside, News and Views from the Living New Deal*, July 2020.

Based on such materials, ESA continues to believe that UC Hall is an important historic resource, significant for its history and architecture as discussed by Carey and Company, and that this significance is enhanced by the importance of the Zakheim murals as a work of art with a social/political perspective that remains relevant in 2020.

Based on the information and analysis presented by Carey & Company and cited by the commenters, as well as ESA's own site visit and review of the record, ESA concurs with Carey & Company's conclusions recommending UC Hall as eligible for the California Register. Also, while ESA has not prepared an independent evaluation of UC Hall or the murals for eligibility on the National Register, ESA believes that the information in the record would support their listing if an evaluation were prepared. Their eligibility and/or listing in the National Register (and potentially as a San Francisco Landmark) would not alter the conclusions presented in the Draft EIR, which considers UC Hall and the murals as an historical resource pursuant to CEQA Section 21084.1.

Historic Assessment for Clinical Sciences Building (Page & Turnbull, 2005)

In this 2005 evaluation prepared by Page & Turnbull, the Clinical Sciences Building was recommended individually eligible for listing in the California Register under Criterion 1 (Events) for its status as the second oldest surviving building on the campus. Completed in 1933, the Clinical Sciences Building represents the expansion of the UC Hospital toward institutionalization. It was also recommended individually eligible for listing under Criterion 3 (Architecture) as the earliest known example of a steel-frame building with welded connections in San Francisco and as a significant work of master architect William C. Hays. Although a period of significance was not identified in the report, it can logically be presumed to be 1933 (the date of construction), and the report concluded that the building retained sufficient integrity to convey its significance. The report did not identify character-defining features of the Clinical Sciences Building.

While the Clinical Sciences Building is not slated for alteration or demolition as part of the CPHP, the historic context provided in the report contains valuable information about the overall campus history including the themes/development periods of origins of the University of California, San Francisco, School of Medicine; University of California Affiliated College; 1906 Earthquake and Fire; the New UC Hospital; World War I to the 1930s; Post-War to present; and William C. Hays, 1873-1963. This information was used to confirm the eligibility of other buildings on campus that were evaluated for potential impacts.

UCSF Historic Resources Survey (Carey & Co., February 2011)

This 2011 report prepared by Carey & Co. identified the following at the Parnassus Heights campus as it relates to the CPHP:

- **Millberry Student Union and Garage** (500 Parnassus Avenue): Carey & Co.'s evaluation was an update to the 2006 evaluation by Historic Resource Associates of the "Millberry Student Union Building" (referred to therein as the "Millberry Union complex") which identified the complex's components as the Millberry Union building, the women's residence hall, and the men's residence hall. The Millberry Union Garage was not previously identified as component of the complex, but appears to have been evaluated as such by Carey & Co. The complex was recommended eligible under Criteria A/1 (Events) for its association with UCSF's accommodation of student services beginning in the mid-20th century. No period of significance was identified. ESA has prepared an update to the DPR 523, attached to this memo, to clarify that the Millberry Union Garage is part of the Millberry Union complex. Impacts to the Millberry Union, which includes the Garage, are analyzed under Impact CUL-1, starting on page 4.4-12 of the CPHP DEIR. The impact was determined to be significant and unavoidable even with the implementation of CPHP Mitigation Measures CUL-1a through -1c.

Impacts to the Millberry Union resulting from proposed alterations to the garage portion as part of the Irving Street Arrival Project were analyzed starting on page 4.4-16 and were determined to be less than significant.

- **Medical Building 1 (Ambulatory Care Center)** was evaluated in 2011 and determined to be not eligible using Criterion G (Exceptional Significance) due to it being less than 50 years old at the time of evaluation. As of 2020 it is 48 years old; therefore, it is still under 50 years old and the Criterion G evaluation remains applicable and appropriate.

- **School of Dentistry (a.k.a. Dental Clinics Building, 707 Parnassus Avenue**) was recommended eligible under Criteria Consideration G (Properties that Have Achieved Significance Within the Last 50 Years) under both Criteria A/1 (Events) because it reflects the important period of late-20th-century development at the Parnassus Heights Campus and Criteria C/3 (Architecture) because it is an exceptional example of the International Style in and is an important work of master architect John Funk. The period of significance was identified as 1980. As of 2020 the School of Dentistry is 40 years old; therefore, the Criteria Consideration G (Properties that Have Achieved Significance Within the Last 50 Years) is still applicable.

- **Medical Sciences Building** (513 Parnassus Avenue) was recommended eligible under Criteria A/1 (Events) for its association with the rapid expansion and increasing enrollment of UCSF in the postwar years and Criteria C/3 (Architecture) as a good example of an International Style hospital and an important work of the architecture firm Blanchard and Maher. The period of significance for all criteria was identified as 1954.

- **School of Nursing** was evaluated in 2011 and determined to be not eligible using Criterion G (Exceptional Significance) due to being less than 50 years old at the time of evaluation. There are two sources for building dates, 1972 and 1979. As of 2020 it is a maximum of 48 years old; therefore, it is still less than 50 years old and the Criterion G evaluation remains applicable and appropriate.

- **Saunders Court**, constructed in 1967, had not yet reached historic age (i.e., 50 years) when it was evaluated in 2011, but was identified as likely to become individually eligible for listing in the National Register and California Register when it reached 50 years of age. As of 2020, Saunders Court is 53 years old. ESA has prepared a DPR update form, which is attached to this memo, and confirms Carey & Company's conclusion that Saunders Court is eligible for listing and is therefore an historical resource, as indicated in the CPHP Draft EIR.

- **HSIR East** (513 Parnassus Avenue), constructed in 1964/66, had not yet reached historic age (i.e., 50 years) when it was evaluated in 2011, but was identified as likely to become individually eligible for listing in the National Register and California Register when it reached 50 years of age. ESA's 2019 site visit confirmed that no major alterations have occurred that would change this earlier finding. As of 2020, HSIR East is 56 years old. ESA has prepared a DPR update form, which is attached to this memo, and confirms Carey & Company's conclusion that HSIR East is eligible for listing and is therefore an historical resource, as indicated in the CPHP Draft EIR.

- **HSIR West** (513 Parnassus Avenue), constructed in 1964/66, had not yet reached historic age (i.e., 50 years) but was identified as likely to become individually eligible for listing in the National Register and California Register when it reached 50 years of age. As of 2020, HSIR West is 56 years old. ESA's 2019 site visit confirmed that no major alterations have occurred that would change this earlier finding. ESA has prepared a DPR update form, which is attached to this memo, and confirms Carey & Company's conclusion that HSIR West is eligible for listing and is therefore an historical resource, as indicated in the CPHP Draft EIR.

- **Aldea San Miguel 8** (101 Behr Avenue), **Aldea San Miguel 10** (151-177 Johnstone Drive), and **Aldea San Miguel 12** (121 Johnstone Drive), constructed in 1960, were 51 years old in 2011. They were recommended eligible under Criteria C/3 (Architecture) as intact examples of the Second Bay Region Tradition. The period

of significance was identified as 1960. ESA's 2019 site visit confirmed that no major alterations have occurred that would change these earlier findings and ESA's concurs that these resources are still eligible as historical resources.

- **Surge** was 45 years old in 2011 when it was recommended eligible for listing in the National and California registers "under Criterion C/3 (Design/Construction) as an innovatively designed research laboratory and as the work of master architects Marquis & Stoller." [8] ESA's 2019 site visit confirmed that no major alterations have occurred that would change this earlier finding and ESA's concurs that Surge is still eligible as a historical resource. However, demolition of Surge was evaluated in the 2014 LRDP EIR and the CPHP does plan.

- **Woods** was 49 years old in 2011 when it was recommended not eligible for listing in the National or California registers under any of the criteria. The following explanation is taken from Carey & Co.'s 2010 DPR form.[9]

  > *The building does not appear to be associated with events or historic themes of significance under Criterion A/1, nor does it appear to be associated with the life of a significant person under Criterion B/3. While Nick Forell rose to the ranks of most prominent structural engineers in the San Francisco Bay, heading a practice that pursued work in the international area, this building does not appear to be associated with any significant aspect of that career and is not a good example of notable feats in engineering. William Gillis does not appear to have achieved much significance and the design, though typical of its era, does it not rise to the level of a sophisticated work that embodies high artistic values. Thus, th[e] building does not appear to be eligible for the NRHP/CRHR under Criterion C/3.*

  ESA's 2019 site visit confirmed that no major alterations have occurred that would change this earlier finding and ESA's concurs that Woods is still ineligible as a historical resource. However, demolition of Surge was evaluated in the 2014 LRDP EIR and the CPHP does plan.

Mount Sutro Open Space Reserve Cultural Landscape Evaluation Report (Denise Bradley and Knapp & VerPlanck Preservation Architects, January 2013)

The report completed in 2013 by Bradley, et al. recommended that the Mount Sutro Open Space Reserve (Reserve) is eligible for listing in the California Register as a cultural landscape under Criterion 1 (Events) for its association with the history of San Francisco and the informal development of this naturalistic landscape as a recreational area and green space for the City. The period of significance was identified as 1886 – present (i.e., 2013). It was also recommended eligible under Criterion 2 (People) for its association with Adolph Sutro and his development of the Sutro Forest. The period of significance under this criterion was identified as 1886 – 1898. The report concluded that the Reserve retained sufficient integrity to convey its significance. The following character-defining features of the Reserve were identified:

- the presence of a forest that covers the overwhelming majority of the land area and whose dominant species is eucalyptus;

[8] Carey & Co., *UCSF Parnassus Heights Campus Historic Resources Evaluation*, 2011, DPR523 form for Surge (90 Medical Center Way) in Appendix D.

[9] Carey & Co., *UCSF Parnassus Heights Campus Historic Resources Evaluation*, 2011, DPR523 form for Woods (1200 Medical Center Way) in Appendix D.

- the presence of the Historic and Fairy Gates trails as part of a consciously laid out trail system and the presence of informal or social trails which have developed over time related to land use activities and to provide connections into Mount Sutro from the surrounding neighborhoods; and
- the natural topographic characteristics of the site, including the steep terrain, the rock outcrops, Stanyan Canyon, and the summit.

ESA conducted a site visit in 2019 and confirmed that no substantial changes had occurred that would alter the eligibility of the Reserve. After a detailed review of the report, and verification of conditions on site, ESA concurred with the findings of this report and used it in the course of preparing the current DEIR.

Historic Evaluation for Langley Porter Psychiatric Institute (Donna Graves, April 2019)

In this 2019 evaluation prepared by Donna Graves, the Langley Porter Psychiatric Institute (LPPI) was recommended individually eligible for listing in the National Register and California Register under Criteria A/1 (Events) for its association with pioneering efforts by the University of California and the State of California to jointly address mental illness. The period of significance for this association was identified as 1943 – 1973. Additionally, the building was recommended individually eligible for listing under Criteria A/1 (Events) for its association with LGBTQ history, particularly related to developments in legal and medical perspectives and treatment. The period of significance for this association was identified as 1943 – ca. 1955. The report concluded that the LPPI retained sufficient integrity to convey its significance. The report did not identify character-defining features of the building.

ESA conducted a site visit in 2019 and confirmed that no substantial changes had occurred that would alter the eligibility of LPPI. After a detailed review of the report and verification of conditions on site, ESA concurred with the findings of this report and used it in the course of preparing the current DEIR.

Historic American Buildings Survey (HABS)-Like Documentation

In addition to the historic resources technical studies summarized above, three extant buildings on the Parnassus Heights campus have been documented according to the standards of the Historic American Buildings Survey (HABS). These are UC Hall (documented by Page & Turnbull in 2005), Surge (2016), and LPPI (documented by Donna Graves in 2019). As specified in the UCSF Comprehensive Parnassus Height Plan DEIR, HABS-like documentation (i.e., documentation completed to the standards of HABS but not submitted to the Library of Congress) is required as part of mitigation for the demolition of these two buildings, and these efforts provide a documentary record of the buildings in their existing condition and including the significant interior and exterior features of the buildings.

DPR523 Updates

DPR 523 update forms were prepared by ESA for the following resources. None of these forms alter conclusions presented in the Draft EIR.

- HSIR East
- HSIR West
- Millberry Union
- Saunders Court

Character-defining Features

At the request of a commenter, ESA has amplified information provided in the studies summarized above by providing a list of character-defining features for those historical resources that would be demolished or altered as part of the proposed CPHP. None of this information changes the conclusions presented in the Draft EIR.

Millberry Union Complex

- Complex composed of the one-story student union ("Millberry Union building"), five-story women's residence hall, five-story men's residence hall, and eight-story parking garage
- Flat roofs on the two residence halls
- Vertical orientation of the two residence halls
- Use of modern materials
- Large expanses of glass in aluminum-frame windows
- Primary historical function of providing housing, dining, and recreational facilities for students

Dental Clinics/School of Dentistry

- L-shaped plan
- Reinforced concrete-frame construction
- Exterior stucco cladding painted white and with regularly spaced horizontal and vertical expansion joints
- Stepped massing that conformed to idea that the west end of the campus should function as a "soft edge" between the residential neighborhood to the west and the high-rise nature of the UCSF campus
- Large window walls that provide natural light to and outward views from the interior
- Large overhangs/trellises on the east and west sides of the building that function as shade structures and to visually reduce the massive appearance of the building
- Flat roofs with garden terraces
- Main pedestrian entrance from Parnassus Avenue that is marked with a large trellis with cables for developing vines, red brick paving, and redwood and poplar trees whose vertical orientation counteract the horizontal massing of the building

Saunders Court

- paved walkways around the perimeter of the central lawn
- concrete steps
- columns from the old Medical Sciences Building
- cornerstone from one of the original Affiliated Colleges buildings
- various sculptures
- mature trees
- overall rectangular form of the courtyard, which is bordered by buildings on all four sides
- circulation through it

HSIR West

- Proximity to HSIR East, to which it is functionally related and physically joined
- Proximity to Saunders Court to the north, to which it is connected via a concrete staircase
- 13 stories in height
- Steel-frame and reinforced concrete construction; concrete floor slabs project beyond the wall planes
- Floor-to-ceiling, aluminum-sash windows on all stories
- T-shaped plan
- Main entrance on north façade marked by a canopy formed by curved concrete panels
- Flat roof with mechanical equipment
- Windowless tower on south façade that contains vertical circulation and mechanical services and is clad in cementitious panels
- Exterior decoration limited to the exposed steel frame, asymmetrically spaced exterior columns, and sheltered entrance stairways

HSIR East

- Proximity to HSIR West, to which it is functionally related and physically joined
- 16 stories in height
- Steel-frame and reinforced concrete construction; concrete floor slabs project beyond the wall planes
- Floor-to-ceiling, aluminum-sash windows on all stories
- T-shaped plan
- Flat roof with mechanical equipment
- Windowless tower on east façade that contains vertical circulation and mechanical services and is clad in cementitious panels
- Exterior decoration limited to the exposed steel frame, asymmetrically spaced exterior columns, and sheltered entrance stairways

Medical Sciences

- Stylistic elements of the International Style
- Proximity to Moffitt Hospital; the two buildings were designed and constructed concurrently and comprised the Medical Center and were intended to function as an integrated unit
- 17 stories in height
- L-shaped plan
- Primary (north) façade on Parnassus Avenue composed of 10 structural bays
- Masonry panel cladding
- Aluminum-sash, multi-lite windows in groups of three and four

Aldea San Miguel 8, 10, and 12

- Stylistic elements of the Second Bay Tradition, which combined the regional vernacular Bay Tradition with the International Style
- Steeply sloping and heavily wooded site
- Immediate access to the outdoors, particularly via sliding glass doors, large windows, and wide balconies
- Landscape design by Lawrence Halprin
- Three stories in height, with first story partially submerged below grade
- Rectangular plan
- Stucco and vertical wood cladding
- Shallow-pitched gable roof with deep eaves and rakes
- Cantilevered balconies

Mount Sutro Open Space

- Presence of a forest that covers the overwhelming majority of the land area and whose dominant species is eucalyptus
- Presence of the Historic and Fairy Gates trails as part of a consciously laid out trail system and the presence of informal or social trails which have developed over time related to land use activities and to provide connections into Mount Sutro from the surrounding neighborhoods
- Natural topographic characteristics of the site, including the steep terrain, the rock outcrops, Stanyan Canyon, and the summit

☒ Historic ☐ Prehistoric ☐ Both
1966-67; UCSF records and 2010 Carey & Co. evaluation

P11. Report Citation: ESA. *University of California, San Francisco Comprehensive Parnassus Heights Plan Draft Environmental Impact Report.* Prepared for the City and County of San Francisco Planning Department, Environmental Planning Division, May 2020.

B10. Significance

When HSIR East was evaluated by Carey & Co. in 2010, it was not yet 50 years old and it was not evaluated under National Register of Historic Properties (National Register) Criteria Consideration G. The 2010 evaluation continues:

> HSIR East will likely be eligible for listing in the [National Register and California Register] under Criteria A/1 and C/3, for its association with postwar expansion of UCSF, for its modernist aesthetic, and as the "work of a master architect" (Reid and Tarics). Along with the Medical Sciences Building, HSIR East embodied and facilitated the development of state-of-the-art research, teaching, and medical practices that catapulted UCSF to the height of prestige in the United States during the postwar period. In addition, Reid and Tarics was an important pioneer in designing educational facilities and earthquake protection technology. The building's design also appears to possesses "high artistic values" and stands as an excellent and well-preserved example of the International Style. Overall, the building retains integrity displaying the character defining features of the style and possesses the aspects of design, materials, and workmanship, location, setting, feeling and association.[1]

No period of significance was identified in the 2010 evaluation.

At this writing (in 2020), HSIR East is 53 years old and age-eligible for consideration as a potential historical resource/historic property. ESA concurs with the previous evaluation that HSIR East appears to be individually eligible under Criteria A/1 and C/3. For the purposes of this updated evaluation, the period of significance is 1966-67, the years that HSIR East was constructed. Having undergone no known significant alterations, the building retains sufficient integrity to convey its historical and architectural significance.

Character-defining Features:

- Proximity to HSIR West, to which it is functionally related and physically joined
- 16 stories in height
- Steel-frame and reinforced concrete construction; concrete floor slabs project beyond the wall planes
- Floor-to-ceiling, aluminum-sash windows on all stories
- T-shaped plan
- Flat roof with mechanical equipment
- Windowless tower on east façade that contains vertical circulation and mechanical services and is clad in cementitious panels
- Exterior decoration limited to the exposed steel frame, asymmetrically spaced exterior columns, and sheltered entrance stairways

B10. Significance

When HSIR West was evaluated by Carey & Co. in 2010, it was not yet 50 years old and it was not evaluated under National Register of Historic Properties (National Register) Criteria Consideration G. The 2010 evaluation continues:

> HSIR East [*sic*, should be West] will likely be eligible for listing in the [National Register and California Register] under Criteria A/1 and C/3, for its association with postwar expansion of UCSF, for its modernist aesthetic, and as the "work of a master architect" (Reid and Tarics). Along with the Medical Sciences Building, HSIR West embodied and facilitated the development of state-of-the-art research, teaching, and medical practices that catapulted UCSF to the height of prestige in the United States during the postwar period. In addition, Reid and Tarics was an important pioneer in designing educational facilities and earthquake protection technology. The building's design also appears to possesses "high artistic values" and stands as an excellent and well-preserved example of the International Style. Overall, the building retains integrity displaying the character defining features of the style and possesses the aspects of design, materials, and workmanship, location, setting, feeling and association.[1]

No period of significance was identified in the 2010 evaluation.

At this writing (in 2020), HSIR West is 53 years old and age-eligible for consideration as a potential historical resource/historic property. ESA concurs with the previous evaluation that HSIR West appears to be individually eligible under Criteria A/1 and C/3. For the purposes of this updated evaluation, the period of significance is 1966-67, the years that HSIR West was constructed. Having undergone no known significant alterations, the building retains sufficient integrity to convey its historical and architectural significance.

Character-defining Features:

- Proximity to HSIR East, to which it is functionally related and physically joined
- Proximity to Saunders Court to the north, to which it is connected via a concrete staircase
- 13 stories in height
- Steel-frame and reinforced concrete construction; concrete floor slabs project beyond the wall planes
- Floor-to-ceiling, aluminum-sash windows on all stories
- T-shaped plan
- Main entrance on north façade marked by a canopy formed by curved concrete panels
- Flat roof with mechanical equipment
- Windowless tower on south façade that contains vertical circulation and mechanical services and is clad in cementitious panels
- Exterior decoration limited to the exposed steel frame, asymmetrically spaced exterior columns, and sheltered entrance stairways

P11. Report Citation: ESA. *University of California, San Francisco Comprehensive Parnassus Heights Plan Draft Environmental Impact Report.* Prepared for the City and County of San Francisco Planning Department, Environmental Planning Division, May 2020.

B10. Significance

When Saunders Court was evaluated by Carey & Co. in 2010, it was not yet 50 years old and was found to be ineligible under National Register of Historic Properties Criteria Consideration G. At that time, it was identified as "a significant cultural landscape on the UCSF campus and may become eligible for the [National Register and California Register] under Criteria A/1 and C/3 when it reaches fifty years of age." The 2010 evaluation continues:

> Saunders Court is the only space on campus that embodies both the original Affiliated Colleges campus and the postwar expansion of the university. Its footprint is that of the old Medical Sciences Building, the last of the original Affiliated Colleges buildings to be demolished, and the courtyard exists because postwar expansion of the campus resulted in dramatic alterations to campus architecture. For these reasons, the courtyard appears to be eligible for the [National Register and California Register] under Criterion A/1. Master landscape architect Robert Royston designed the courtyard. While more research would have to be completed to determine how significant this cultural landscape is within Royston's oeuvre, it may be eligible for the [National Register and California Register] under Criterion C/3 as the work of a master architect. The cultural landscape appears to retains excellent integrity in all seven categories, having undergone few alterations since its creation.[1]

No period of significance was identified in the 2010 evaluation.

At this writing (in 2020), Saunders Court is 53 years old and age-eligible for consideration as a potential historical resource/historic property. ESA concurs with the previous evaluation that Saunders Court appears to be eligible under Criteria A/1 and C/3 as a cultural landscape. For the purposes of this updated evaluation, the period of significance is 1967, the year that Saunders Court was designed and developed. Since 2016, the central lawn has been fenced off from the public and used as a construction staging area. There have been no other alterations, and all elements that compose Saunders Court (i.e., its character-defining features) remain, including the paved walkways around the perimeter of the central lawn, the concrete steps, the columns from the old Medical Sciences Building, the cornerstone from one of the original Affiliated Colleges buildings, various sculptures, mature trees, the overall rectangular form of the courtyard, and circulation through it. Saunders Court therefore retains sufficient integrity to convey its historical and architectural significance.

Character-defining Features:

- paved walkways around the perimeter of the central lawn
- concrete steps
- columns from the old Medical Sciences Building
- cornerstone from one of the original Affiliated Colleges buildings
- various sculptures
- mature trees
- overall rectangular form of the courtyard, which is bordered by buildings on all four sides
- circulation through it

☐ Continuation ☒ Update **Recorded by:** ESA **Date:** October 2020

P3a. Description

The Millberry Union Garage, also known as the Main Parking Garage, is an eight-level parking garage located on the north side of the Millberry Union complex, of which it is a part. Vehicular access to the garage is from Irving Street and Parnassus Avenue. It is of reinforced concrete construction and features metal guardrails along the Irving Street façade. At the east and west ends of the north façade are curved concrete walls with staggered vertical openings; the vertical vehicular circulation is located in these areas.

☐ Continuation ☒ Update **Recorded by:** ESA **Date:** October 2020

B10. Significance

Carey & Co.'s 2010 evaluation was an update to the 2006 evaluation by Historic Resource Associates of the "Millberry Student Union Building" (referred to therein as the "Millberry Union complex") which identified the complex's components as the Millberry Union building, the women's residence hall, and the men's residence hall. The Millberry Union Garage was not previously identified as part of the complex.

A parking garage was built in two phases concurrently with the rest of the Millberry Union complex, which opened in September 1958. The first phase contained 150 parking stalls and was in operation that month. The second phase, which contained an additional 680 parking stalls, was under construction at that time and opened at a later date.[1]

In contrast with the 2006 evaluation, Carey & Co. recommended the Millberry Union complex as eligible for listing in the National Register of Historic Places (National Register) and California Register of Historical Resources (California Register) under Criteria A/1 for its association with UCSF's accommodation of student services beginning in the mid-20th century:

> Since its inception, UCSF paid little attention to the residential and recreational needs of students. […] With the significant expansion of state, federal, and extramural funds for cutting edge research and academic programs in the postwar period, however, UCSF saw its student population rise rapidly and recognized the necessity of providing housing, dining, and recreational facilities for its graduate students. Millberry Student Union stands in direct response to this important trend in UCSF's mid-century history.[2]

No period of significance was identified in the 2010 evaluation.

ESA concurs with the previous evaluation that the Millberry Union complex appears to be individually eligible under Criteria A/1. Because the parking garage was constructed to serve students, faculty, and visitors, its function is clearly linked to the historic significance of the complex, though in a supporting role. For this reason, the Millberry Union Garage should be considered as part of the Millberry Union complex. For the purposes of this updated evaluation, the period of significance is 1956-ca. 1960, which represents the beginning of construction of the Millberry Union complex and the approximate completion of the garage addition (the exact date is unknown).

Character-defining Features:

- Complex composed of the one-story student union ("Millberry Union building"), five-story women's residence hall, five-story men's residence hall, and eight-story parking garage
- Flat roofs on the two residence halls
- Vertical orientation of the two residence halls
- Use of modern materials
- Large expanses of glass in aluminum-frame windows
- Primary historical function of providing housing, dining, and recreational facilities for students

Amber L. Grady

Senior Architectural Historian

EDUCATION

M.A., Historic Preservation, Savannah College of Art & Design, Savannah, GA

B.A., Interior Design with a minor in Art History, California State University, Chico

Secretary of the Interior's Professional Qualifications – Architectural History and History

18 YEARS EXPERIENCE

PROFESSIONAL AFFILIATIONS

California Preservation Foundation

Preservation Sacramento

Society of Architectural Historians

National Trust for Historic Preservation

Amber Grady is an expert in NEPA, CEQA, and Section 106 of the National Historic Preservation Act (Section 106) compliance with over 18 years of experience in cultural resources management. Amber has extensive experience in California architectural history with an emphasis on northern California. Her cultural resources management experience includes archival research, historic building and structure surveys and evaluations, Secretary of the Interior's Standards compliance analysis and cultural resources documentation for NEPA/CEQA/Section 106 projects ranging from single building evaluations to district-wide surveys. Amber has worked on a variety of projects throughout California, Oregon, Washington, and Nevada completing projects for Cities, Counties, and school and utility districts as well as private sector clients. Amber's expertise includes all phases of environmental compliance from inventory and evaluation to compliance during construction.

Relevant Experience

Mayor's Office of Housing and Community Development On-Call, San Francisco, CA. *Senior Architectural Historian.* Under the on-call, ESA prepares cultural and architectural historical documents, under NHPA regulations, and has recently implemented resource evaluation for more than 15 locales. Amber serves as principal investigator for completion of DPR 523 Primary forms, historic resource evaluations (such as the 730 Stanyan project), Memoranda of Agreement, and assistance with implementation and revision of the Programmatic Agreement (PA) by and among the City and County of San Francisco, the California State Historic Preservation Officer, and the Advisory Council On Historic Preservation Regarding Historic Properties Affected by Use of Revenue from the Department Of Housing And Urban Development Part 58 Programs.

Potrero Power Station Mixed-Use Development Project, San Francisco CA. *Senior Architectural Historian.* Amber supervised the preparation of the historic architectural resources section of the EIR for this large mixed-use development along San Francisco's central bayshore waterfront within the City's Dogpatch neighborhood, on the site of the former PG&E Potrero Power Plant. Under the proposed land use program, the project would rehabilitate and convert the massive Unit 3 power block (which includes a 120-foot tall steel frame boiler structure and turbine-generator) into a hotel. Other structures on the project site would be demolished, including four properties that are contributors to the Third Street Industrial District. The proposed project would also include a range of transportation and circulation improvements, shoreline improvements, and utilities infrastructure improvements. Principal issues include transportation and circulation, historic resources, construction-related effects, and hazardous materials. As a senior architectural historian Amber provided QA/QC for this effort.

730 Stanyan, San Francisco, CA. *Senior Architectural Historian.* ESA assisted the MOHCD with Section 106 compliance for their 730 Stanyan project. Amber was the

Lead Architectural Historian on the project and was responsible for research, survey, and evaluation of the historic-age properties within the APE. ESA prepared the HRE in support of the Section 106 compliance.

San Francisco International Airport (SFO), Recommended Airport Development Plan EIR, San Francisco, CA. *Senior Architectural Historian.* ESA prepared the Historic Resource Evaluation in support of the EIR for SFO's next long-term master plan—the Recommended Airport Development Plan—that will support the strategic development of the airport over the next two decades. ESAs architectural historian surveyed, researched, and evaluated historic-age buildings located on the airport campus, developing an in-depth context of the airport's history and development since the beginning of the Jet Age. As a senior architectural historian Amber provided QA/QC for this effort.

Prologis, 749 Toland Street and 2000 McKinnon Avenue Historic Resource Evaluation, San Francisco, CA. *Senior Architectural Historian.* ESA prepared a Historic Resource Evaluation for four World War II-era warehouses that are remnants of the Marine Corps Depot of Supplies in the Bayview neighborhood. Amber conducted the site visit and provided QA/QC for this effort.

Reservoir Community Partners LLC, Balboa Reservoir Project Historic Resource Evaluation, San Francisco, CA. *Senior Architectural Historian.* ESA authored a Historic Resource Evaluation for the Balboa Reservoir site in the West of Twin Peaks neighborhood in support of the Initial Study for a mixed-use development. As a senior architectural historian Amber provided QA/QC for this effort.

San Francisco Public Utilities Commission, Biosolids Digester Facilities Project, San Francisco, CA. *Senior Architectural Historian.* ESA prepared Historic American Building Survey (HABS) documentation (both written and photographic components) for the SFPUC Central Shops and Building 870, a contributor to the Southeast Treatment Plant Streamline Moderne Industrial Historic District. As a senior architectural historian Amber provided QA/QC for this effort.

Oakland A's Ballpark EIR, Oakland, CA. *Senior Architectural Historian.* ESA is preparing the EIR for a proposed ballpark and multi-use redevelopment of the former Howard Terminal, located north of Jack London Square. This project involves assessing over two dozen known and potential historic resources, ranging from early architectural remnants of the city's original period of development to industrial landscapes related to railroad and shipping at the Port of Oakland as well as CEQA impact analysis and development of mitigations measures. As a senior architectural historian Amber is providing QA/QC for this effort.

City of Oakland On Call, Oakland, CA. ESA currently serves as the on call preservation planning consultants to the City of Oakland. In addition to serving as staff for environmental review of major projects involving historic resources, ESA assists the City with landmarks nominations, CEQA and NEPA review, Planning Code modifications, State Historic Building Code applications, and other services related to historic resources throughout the city. Amber assists with tasks as needed.

1100 Broadway, Oakland, CA. *Senior Architectural Historian.* As part of an addendum to the CEQA analysis for a proposed project located at 1100 Broadway in Downtown Oakland, ESA staff evaluated the design for the rehabilitation of the historic Key System Building and adjacent high-rise commercial tower for consistency with the Secretary of the Interior's Standards for Rehabilitation. The Key System Building, which was constructed in 1911 and has stood vacant since

1989, is individually listed in the National Register of Historic Places and the City of Oakland Local Register. The proposed project was analyzed for potential effects on the significance of the Key System Building as well as the locally designated Downtown Oakland Historic District, to which the historic building is a contributor. As part of this evaluation, character-defining features of the Key System Building were also identified. As a senior architectural historian Amber provided QA/QC for this effort.

City of Oakland, 412 Madison Street Project Historic Resource Evaluation, Oakland, CA. *Architectural Historian.* ESA authored a Historic Resource Evaluation for a project site comprised of six parcels in the Jack London Square neighborhood in support of the CEQA checklist for a mixed-use development. As a senior architectural historian Amber provided QA/QC for this effort.

Kaiser Center, Oakland, CA. *Senior Architectural Historian.* ESA prepared the CEQA documentation for the Kaiser Center project, which is a historic resource under CEQA. Amber was the Lead Architectural Historian on the project and was responsible for evaluating potential impact to historic resource that could result from the project.

San Jose State University, HABS-Like Documentation of Bud Winter Field, San Jose, CA. Senior *Architectural Historian.* As required mitigation of the demolition of Bud Winter Field and construction of a new parking facility in the south campus, ESA architectural historians documented the historic running track and associated grounds according to Historic American Buildings Survey (HABS)-like specifications. Constructed in 1968, Bud Winter Field is named for SJSU's men's track and field coach Lloyd "Bud" Winter. During his tenure (1940-70), the track and field team became known as "Speed City," a nickname bestowed on record-setting sprinters who were coached by Winter. Bud Winter Field replaced an earlier track and field facility, which was the site most closely associated with significant events and individuals. Amber managed this project including managing internal staff and the photographer, a subconsultant to ESA; managing the scope and budget; coordinating with the client; and senior reviewing the deliverables.

Niles Gateway Mixed-Use Project, Fremont, CA. *Architectural Historian.* ESA analyzed several iterations of the proposed project, which is located within the Niles Historic Overlay District, for conformance with the Niles Design Guidelines and Regulations. Design Review Reports were prepared in support of the EIR and a public presentation to the Historic Architectural Review Board was given. As a senior architectural historian Amber provided QA/QC for this effort.

City of Burlingame, SFO@Technology Center, Burlingame, CA. Senior *Architectural Historian.* As part of the Initial Study/Mitigated Negative Declaration for the proposed SFO@Technology Center located at 1300 Bayshore Highway, Amber supervised the staff that surveyed, researched, and evaluated a collection of mid-20th-century buildings for potential historic significance and reviewed the technical report.

Soquel Creek Water District, Advanced Purified Groundwater Replenishment Project, Soquel and Santa Cruz, CA. *Senior Architectural Historian.* The proposed advanced purified groundwater replenishment project – Pure Water Soquel – is intended to supplement natural recharge of the Santa Cruz Mid-County Groundwater Basin with purified water. ESA researched and evaluated residential properties and a wastewater treatment plant for potential historic significance. A

cultural resources report was prepared in support of the EIR. As a senior architectural historian Amber provided QA/QC for this effort.

City of Sacramento, Central City Specific Plan, Sacramento, CA. *Senior Architectural Historian.* For the City of Sacramento, ESA prepared a Specific Plan, associated technical reports, an environmental impact report, and an update to an existing historic district. Amber and her staff prepared a cultural resources technical background report, updated the R Street Historic District evaluation, and prepared the Cultural Resources section of the EIR. The historic resources survey for the technical background report and historic district report included surveying and documenting hundreds of parcels as well as archival research and evaluation of resources.

Sacramento Q Street LLC, Q Street Commons, Sacramento, CA. *Architectural Historian.* ESA completed a Cultural Resources Survey and Inventory Report for a commercial warehouse and office located at 6779 Q Street in support of the Initial Study/Mitigated Negative Declaration for a proposed student housing development. As a senior architectural historian Amber provided QA/QC for this effort.

Twin Rivers EIR, Sacramento Housing and Redevelopment Agency (SHRA). *Senior Architectural Historian.* ESA assisted the SHRA with environmental review of the Twin Rivers project relating to compliance with CEQA, NEPA, and Section 106 of the NHPA on an as needed basis for projects where SHRA. Amber was responsible for research, survey, and evaluation of the historic-age properties within the APE, which included the existing Twin Rivers Housing Complex and Loaves and Fishes. The technical documents were accepted by the City of Sacrament as well as the SHPO.

California Department of Water Resources (DWR), Oroville Spillway Emergency Repair Project, Oroville Dam, CA. *Senior Architectural Historian.* Amber and her staff have been assisting DWR with Section 106 compliance for built environment resources for the emergency spillway repair project. ESA routinely advises DWR staff on portions of the project that affect contributing elements of the National Register eligible Oroville Division Historic District, and preparing Finding of Effect documents to ensure construction is not delayed.

Marin County Flood Control and Water Conservation District, San Anselmo Flood Protection EIR, San Anselmo and Fairfax, CA. *Senior Architectural Historian.* ESA is working with the client team and its modelers and design consultants to develop and analyze a project to reduce flood risk in the Town of San Anselmo without simultaneously increasing it in downstream communities. ESA architectural historians surveyed, researched, and evaluated a collection of buildings in San Anselmo and Fairfax for potential historic significance in support of the EIR. As a senior architectural historian Amber provided QA/QC for this effort.

Alameda Marina Master Plan EIR, Alameda, CA. *Senior Architectural Historian.* ESA prepared the EIR for the controversial redevelopment of the 44-acre Alameda Marina property on the Oakland Estuary. The comprehensively redeveloped property will include a mix of 779 new housing units, 150,000 square feet of retail and office uses, 550 boat slips, and 4.5 acres of public open space, including a new segment of the San Francisco Bay Trail. A significant component of the project will include the complete revitalization of the existing dock and shoreline

infrastructure. Amber peer reviewed the historic resources report and prepared the Draft EIR section.

City of Long Beach, Local Landmark Evaluations, Long Beach, CA. *Senior Architectural Historian.* For the City of Long Beach, ESA evaluated properties at 260 E San Antonio Road, the VIP Records Sign, and Fly DC Jets Sign for Local Landmark status. As Senior Architectural Historian, Amber was responsible for the historical research, survey, evaluation for local eligiblity, and report completion.

260 E San Antonio Road Local Landmark Evaluation, Long Beach, CA. *Senior Architectural Historian.* ESA evaluated the property for City of Long Beach Local Landmark status. Amber was the Lead Architectural Historian on the project, who was responsible for the research, survey, evaluation, and report completion.

VIP Records Sign Local Landmark Evaluation, Long Beach, CA. *Senior Architectural Historian.* ESA evaluated the property for City of Long Beach Local Landmark status. Amber was the Lead Architectural Historian on the project, who was responsible for the research, survey, evaluation, and report completion.

City of Long Beach, Local Landmark Evaluations, Long Beach, CA. For the City of Long Beach, ESA evaluated properties at 260 E San Antonio Road, the VIP Records Sign, and Fly DC Jets Sign for Local Landmark status. As Senior Architectural Historian, Amber was responsible for the research, survey, evaluation, and report completion.

California High Speed Rail Project, Environmental Compliance for Merced to Fresno Construction Package 1 (CP1), Merced to Fresno, CA. *Senior Architectural Historian*. As a subconsultant to the Tutor Perini Zachary Parsons (TPZP) Joint Venture, ESA is providing environmental compliance support services for the Merced to Fresno Construction Package 1 (CP1), the 29-mile first segment of the California High Speed Rail design/build project. ESA is leading pre-construction surveys and providing all biological and cultural monitoring during construction. ESA is providing real time documentation of surveys and habitat disturbance via field tablets and tailored online GIS applications. Amber is involved in documentation and report writing as it related to historic architectural resources for the project.

Los Angeles Unified School District (LAUSD) – Various Campuses, Los Angeles, CA. *Senior Architectural Historian*. As Senior Architectural Historian, Amber has led ESA staff in several historic resource evaluations for the LAUSD on various campuses, all of which occurred prior to modernization efforts, including the 6th Avenue Elementary School, President Elementary School, Thomas Jefferson High School, Burroughs Middle School, and San Pedro High School. LAUSD has a number of campuses that are eligible historic resources. In addition to preparing historic resource evaluation reports this work has involved consulting with LAUSD and their architectural/construction team to design their project to avoid impacts to the character-defining features of important resources as well as the preparation of HAB-like documentation to fulfill CEQA mitigation. Amber also translates her technical documents into support text for Environmental Compliance documents.

Los Angeles Unified School District, San Pedro High School Comprehensive Modernization Project, San Pedro, CA. *Architectural Historian.* Johanna authored a Historic Resource Technical Report for the San Pedro High School campus in support of the Initial Study for a comprehensive school modernization project.

Los Angeles Unified School District, John Burroughs Middle School Comprehensive School Modernization Project, Los Angeles, CA. *Architectural Historian.* Johanna authored a Historic Resource Technical Report for the John Burroughs Middle School campus in support of the EIR for a comprehensive school modernization project.

Los Angeles Unified School District (LAUSD) President Elementary School Historic Resources Evaluation, Harbor City, CA. *Senior Architectural Historian*. This is one of many historic resources evaluations that ESA has done for LAUSD. Amber assisted in the completion of the Historic Resources Evaluation report, which will be used in support of the Environmental Compliance documents.

Los Angeles Unified School District (LAUSD) President Elementary School Historic Resources Evaluation, Harbor City, CA. *Senior Architectural Historian*. As Senior Architectural Historian, Amber has led ESA staff in several historic resource evaluations for the LAUSD, all of which occurred prior to modernization efforts. This includes a campus in Harbor City, the 6th Avenue Elementary School, and the Thomas Jefferson High School. Part of this work involves consulting with LAUSD and their architectural/construction team to design their project to avoid impacts to the character-defining features of important resources. Amber also translates her technical documents into support text for Environmental Compliance documents.

LAUSD 6th Avenue Elementary School, Los Angeles, CA. *Senior Architectural Historian*. This is one of many historic resources evaluations that ESA has done for LAUSD. Amber assisted in the completion of the Historic Resources Evaluation report, which will be used in support of the Environmental Compliance documents.

LAUSD Thomas Jefferson High School Comprehensive Modernization Project, Los Angeles, CA. *Senior Architectural Historian.* ESA is in the process of preparing an IS/MND for this project. Thomas Jefferson High School is eligible for the National Register of Historic Places. In addition to writing the Cultural Resources portion of the IS/MND Amber is consulting with LAUSD and their architectural/ construction team to design their project to avoid impacts to the character-defining features of the campus.

Los Cerritos Road Bridge, County of Merced. *Architectural historian.* The project includes bridge replacement and road improvements. It is receiving federal funding and is considered a federal undertaking pursuant to 36 CFR Part 800.16(y). Therefore, ESA was tasked with preparing the necessary documents to comply with the Caltrans PA. Amber surveyed and evaluated a farming complex in the APE and prepared the HRER and HPSR for this project.

Burchell Avenue Bridge, County of Merced. *Architectural historian.* The project includes bridge replacement and road improvements. It is receiving federal funding and is considered a federal undertaking pursuant to 36 CFR Part 800.16(y). Therefore, ESA was tasked with preparing the necessary documents to comply with the Caltrans PA. Amber surveyed and evaluated a farming complex in the APE and prepared the HRER and HPSR for this project.

Johanna is an accomplished technical writer who has researched historic buildings, structures, and districts in California, Oregon, and Washington. She authors reports that exceed federal, state, and local requirements, documenting and evaluating historic resources for eligibility for the National Register of Historic Places and state-level registers of historic significance. Johanna is well-versed in targeted and expedited archival research and routinely prepares historic resource evaluations and specialized reports such as HABS/HALS documentation, tax credit applications, peer reviews, and design guidelines and consultation. Johanna meets the Secretary of the Interior's Professional Qualification Standards for architectural history, architecture, and historic architecture. She is also experienced in museum operations, grant writing, and fundraising for non-profits.

Relevant Experience

2017 Projects

Ellis Partners, LLC, 1100 Broadway, Oakland, CA. *Architectural Historian.* As part of an addendum to the CEQA analysis for a proposed project located at 1100 Broadway in Downtown Oakland, Johanna evaluated the design for the rehabilitation of the historic Key System Building and adjacent high-rise commercial tower for consistency with the Secretary of the Interior's Standards for Rehabilitation. The Key System Building is individually listed in the National Register of Historic Places and the City of Oakland Local Register. The proposed project was analyzed for potential effects on the significance of the Key System Building as well as the locally designated Downtown Oakland Historic District, to which the historic building is a contributor.

Metro Parks Tacoma, National Register of Historic Places Nomination for Titlow Lodge, Tacoma, WA. *Architectural Historian.* Johanna prepared documentation to nominate Titlow Lodge for listing in the National Register of Historic Places. Originally known as Hotel Hesperides and constructed in 1911 as a 3-½-story building near the shore of Puget Sound, the lodge was reduced to 1 ½ stories in 1937 as a project of the Works Progress Administration. ESA provided a detailed architectural description of the building's exterior as well as interior spaces, a construction chronology, and a statement of significance under Criterion C (Design/Construction).

San Francisco International Airport (SFO), Recommended Airport Development Plan EIR, San Francisco, CA. *Architectural Historian.* Johanna prepared the Historic Resource Evaluation in support of the EIR for SFO's next long-term master plan—the Recommended Airport Development Plan—that will support the strategic development of the airport over the next two decades. Johanna surveyed, researched, and evaluated historic-age buildings located on the airport campus, developing an in-depth context of the airport's history and development since the beginning of the Jet Age.

San Francisco Mayor's Office of Housing and Community Development, Section 106 Studies, San Francisco, CA. *Architectural Historian.* Johanna has surveyed, researched, and evaluated buildings identified as proposed sites for federally funded, high-density residential development in the City and County of San Francisco as well as buildings within the areas of potential effect.

City of Union City, Masonic Homes Skilled Nursing Facility, Union City, CA. *Architectural Historian.* Johanna surveyed the Masonic Home at Union City campus to confirm the continued existence of contributing features. She prepared an Updated Historic Resources Evaluation Memo that in turn informed the Initial Study.

LeLand Properties, LLC, 2200 Stockton Boulevard, Sacramento CA. *Architectural Historian.* In support of a historic resource evaluation previously prepared by ESA of the 1930s Coca Cola bottling factory at 2200 Stockton Boulevard, Johanna surveyed, researched, and evaluated adjacent properties for potential historic significance.

City of Sacramento, Central City Specific Plan, Sacramento, CA. For the City of Sacramento, ESA is preparing a Specific Plan, associated technical reports, an environmental impact report, and an update to an existing historic district. Cultural resources staff prepared a technical background report, updated the R Street Historic District evaluation, and prepared the Cultural Resources section of the EIR. The historic resources survey for the technical background report and historic district report included surveying and documenting hundreds of parcels as well as archival research and evaluation of resources. The project is ongoing and expected to extend through 2017.

Brown & Caldwell, North Bay Water Reuse Program, San Francisco Bay Area, CA. *Architectural Historian.* As part of a feasibility study comprising a dozen sanitary districts, cities, and counties in the North San Pablo Bay region, Johanna surveyed, researched, and evaluated two wastewater treatment plants in Novato and Napa for potential historic significance.

City of Fremont, Niles Gateway Mixed-Use Project, Fremont, CA. *Architectural Historian.* Johanna analyzed several iterations of the proposed project, which is located within the Niles Historic Overlay District, for conformance with the Niles Design Guidelines and Regulations. Design Review Reports were prepared in support of the EIR. She also gave a public presentation to the Historic Architectural Review Board.

Kilroy Realty, Interim Flower Mart Project, San Francisco, CA. *Architectural Historian.* While a new permanent location for the San Francisco Flower Mart is being constructed in the South of Market neighborhood, the operation would temporarily relocate to Piers 19, 19 ½, and 23 on The Embarcadero. In support of the EIR addendum, Johanna analyzed the proposed project for consistency with the Secretary of the Interior's Standards for Rehabilitation. Piers 19 and 23 are contributors to the Port of San Francisco Embarcadero Historic District, which is listed on the National Register of Historic Places. A Part 2 Historic Resource Evaluation was prepared.

City of Burlingame, SFO@Technology Center, Burlingame, CA. *Architectural Historian.* As part of the Initial Study/Mitigated Negative Declaration for the proposed SFO@Technology Center located at 1300 Bayshore Highway, Johanna surveyed, researched, and evaluated a collection of mid-20th-century buildings for potential historic significance.

Soquel Creek Water District, Advanced Purified Groundwater Replenishment Project, Soquel and Santa Cruz, CA. *Architectural Historian.* The proposed advanced purified groundwater replenishment project – Pure Water Soquel – is intended to supplement natural recharge of the Santa Cruz Mid-County Groundwater Basin with purified water. Johanna researched and evaluated residential properties and a wastewater treatment plant for potential historic significance. A cultural resources report was prepared in support of the EIR.

Marin County Flood Control and Water Conservation District, San Anselmo Flood Protection EIR, San Anselmo and Fairfax, CA. *Architectural Historian.* ESA is working with the client team and its modelers and design consultants to develop and analyze a project to reduce flood risk in the Town of San Anselmo without simultaneously increasing it in downstream communities. Johanna surveyed, researched, and evaluated a collection of buildings in San Anselmo and Fairfax for potential historic significance in support of the EIR.

2018 Projects

Potrero Power Station Mixed-Use Development Project, San Francisco CA. *Architectural Historian.* Johanna wrote the historic architectural resources section of the EIR for a large mixed-use development along San Francisco's central bayshore waterfront within the City's Dogpatch neighborhood, on the site of the former PG&E Potrero Power Plant. The proposed mixed-use development would consist of 5.4 million gsf of uses, including approximately 2.7 million gsf of residential, 1.5 million gsf of commercial, over 900,000 gsf of parking, 100,000 gsf of community facilities; and 6.3 acres of open space. Under the proposed land use program, the project would rehabilitate and convert the massive Unit 3 power block (which includes a 120-foot tall steel frame boiler structure and turbine-generator) into a hotel. Other structures on the project site would be demolished, including four properties that are contributors to the Third Street Industrial District. The proposed project would also include a range of transportation and circulation improvements, shoreline improvements, and utilities infrastructure improvements. Principal issues include transportation and circulation, historic resources, construction-related effects, and hazardous materials.

Eastern Oregon Regional Airport Unmanned Aircraft System Development Area Cultural Resources Assessment, Pendleton, OR. *Architectural Historian.* Johanna conducted a historic properties survey of the entire Eastern Oregon Regional Airport as well as the adjacent Oregon Army National Guard facility and the Airport Industrial Park in order to determine if a World War II-era historic district was present. She authored a Cultural Resources Assessment and completed a Section 106 documentation form of the airport.

Los Angeles Unified School District, San Pedro High School Comprehensive Modernization Project, San Pedro, CA. *Architectural Historian.* Johanna authored a Historic Resource Technical Report for the San Pedro High School campus in support of the Initial Study for a comprehensive school modernization project.

Los Angeles Unified School District, John Burroughs Middle School Comprehensive School Modernization Project, Los Angeles, CA. *Architectural Historian.* Johanna authored a Historic Resource Technical Report for the John Burroughs Middle School campus in support of the EIR for a comprehensive school modernization project.

City of Oakland, 412 Madison Street Project Historic Resource Evaluation, Oakland, CA. *Architectural Historian.* Johanna authored a Historic Resource

Evaluation for a project site comprised of six parcels in the Jack London Square neighborhood in support of the CEQA checklist for a mixed-use development.

Prologis, 749 Toland Street and 2000 McKinnon Avenue Historic Resource Evaluation, San Francisco, CA. *Architectural Historian.* Johanna authored a Historic Resource Evaluation for four World War II-era warehouses that are remnants of the Marine Corps Depot of Supplies in the Bayview neighborhood.

San Francisco Day School, 350 Masonic Avenue, 2120-2122 Golden Gate Avenue, and 2130 Golden Gate Avenue Historic Resource Evaluation, San Francisco, CA. *Architectural Historian.* Johanna authored a Historic Resource Evaluation for the San Francisco Day School and two adjacent residential properties in the North of the Panhandle neighborhood.

Urban Land Development LLC, 1320 Washington Street Historic Resource Evaluation, San Francisco, CA. *Architectural Historian.* Johanna authored a Historic Resource Evaluation for a 1920 parking garage in the Nob Hill neighborhood.

Reservoir Community Partners LLC, Balboa Reservoir Project Historic Resource Evaluation, San Francisco, CA. *Architectural Historian.* Johanna authored a Historic Resource Evaluation for the Balboa Reservoir site in the West of Twin Peaks neighborhood in support of the Initial Study for a mixed-use development.

San Francisco Public Utilities Commission, Biosolids Digester Facilities Project, San Francisco, CA. *Architectural Historian.* Johanna prepared Historic American Building Survey (HABS) documentation (both written and photographic components) for the SFPUC Central Shops and Building 870, a contributor to the Southeast Treatment Plant Streamline Moderne Industrial Historic District.

AG-SCH 8150 Sunset Boulevard Owner LP, 8150 Sunset Mixed-Use Project, Los Angeles, CA. *Architectural Historian.* Johanna prepared Historic American Building Survey (HABS) written documentation for the former Lytton Savings and Loan Association in Beverly Hills.

Elkwood LLC,1764 N. Las Palmas Avenue Historical Resource Assessment, Los Angeles, CA. *Architectural Historian.* Johanna prepared a Historic Resource Assessment for a bungalow court in Hollywood.

Harald Kloser, 1830 N. Sierra Bonita Avenue Historical Resource Assessment, Los Angeles, CA. *Architectural Historian.* Johanna prepared a Historic Resource Assessment for a large residential property in Hollywood.

Los Angeles Department of Water and Power, Manhattan Wellfield On-Site Hypochlorite Generation Station Project Cultural Resources Assessment, Los Angeles, CA. *Architectural Historian.* Johanna authored a Cultural Resources Assessment for a chlorination station.

California High Speed Rail Merced to Fresno Construction Package 1, Fresno and Merced Counties, CA. *Architectural Historian.* As a subconsultant to the Tutor Perini Zachary Parsons (TPZP) Joint Venture, ESA is providing environmental compliance support services for the Merced to Fresno segment of the California High Speed Rail project. Tasks included conducting pre-construction surveys for biological and cultural resources, compliance monitoring during construction, compliance tracking and reporting. Approximately 29 miles in length, the Merced to Fresno segment includes cultural resources such as the historic Chinatown in downtown Fresno, and sensitive prehistoric areas in the crossings of the San Joaquin and Fresno Rivers. Kathy serves as historian and deputy project manager

for the project where she conducts pre-construction historic architectural resource surveys and Built Environment Treatment Plan compliance documentation, including pre-construction conditions assessment and building protection plans. Johanna has assisted in development and design of an interpretive exhibit for the Belmont Traffic Circle and Subway within the project alignment.

Sacramento Q Street LLC, Q Street Commons, Sacramento, CA. *Architectural Historian.* Johanna authored a Cultural Resources Survey and Inventory Report for a commercial warehouse and office located at 6779 Q Street in support of the Initial Study/Mitigated Negative Declaration for a proposed student housing development.

City of Eureka, City of Eureka General Plan Update EIR, Eureka, CA. *Architectural Historian.* Johanna authored the Cultural and Historic Resources section of the EIR, which addressed potential adverse impacts of the proposed Eureka 2040 General Plan.

California Department of Water Resources, DWR TO39 2017 Storm Damage-DWR Emergency. *Architectural Historian*. High flow conditions occurring during the winter of 2016/2017 resulted in erosion and other damage at multiple levees managed by the California Department of Water Resources (DWR). In response, DWR implemented the 2017 Storm Damage DWR Rehabilitation Program at several critical repair sites. Johanna contributed to Phase 4 and Phase 5 of the 2017 Storm Damage DWR Rehabilitation Program cultural resources analysis. This project included a fast turnaround analysis of over thirty levee repair sites located throughout the Central Valley and Delta regions, from Chico to Stockton. Johanna assisted in the field survey and recordation of the levee segments and completed the evaluation of impacts to the levees as cultural resources.

Washington State Department of Transportation, State Route 203 Loutsis Creek Fish Passage Improvements Project, Duvall, WA. *Architectural Historian.* As part of an on-call with WSDOT, Johanna contributed to the cultural resources assessment by researching and evaluating two historic-age farmsteads.

2019 Projects

Sutro Tower, Inc., 1 La Avanzada Street Historic Resource Evaluation, San Francisco, CA. *Architectural Historian.* Johanna authored a Historic Resource Evaluation for the prominent hilltop property that includes Sutro Tower (a 977-foot-tall communications tower constructed in the early 1970s that was the subject of considerable public discourse), a Brutalist transmission building, and several accessory buildings. Sutro Tower and the transmission building were determined to be exceptionally important to have achieved significance within the past 50 years, and the two buildings contribute to the Sutro Tower Historic District which is eligible under California Register Criterion 1 (Events) for its significant association with the history of broadcast across the Bay Area between 1973 and 1998. Additionally, Sutro Tower was determined to be individually eligible for listing under Criterion 3 (Architecture) with a period of significance of 1971-73 because it embodies distinctive characteristics of a high-tech broadcast tower, possesses high artistic values, and is the product of a collaboration between two masters.

City of Los Angeles, Point Fermin Light Station Historic District Nomination to the National Register of Historic Places, San Pedro, CA. *Architectural Historian.* The 1874 Point Fermin Lighthouse was listed on the National Register of Historic Places in 1972. As a condition of conveyance of the Point Fermin Light Station property (which includes the lighthouse) by the U.S. General Services

Administration to the City of Los Angeles for use as a museum and park, the National Register nomination for the Point Fermin Lighthouse was updated to include all buildings, objects, structures, and sites that comprise the larger Point Fermin Light Station. Johanna authored the updated nomination by compiling previous documentation and supplementing it with new research. At this writing, the nomination is being reviewed by the California Office of Historic Preservation.

Oakland Athletics Investment Group, LLC, Oakland A's Ballpark District EIR, Oakland, CA. *Architectural Historian.* Located north of Jack London Square in Oakland, Howard Terminal is a part of Oakland characterized by warehouses and low-scale, 19th- and 20th-century industrial development. It is adjacent to the Port of Oakland, along an active railroad corridor, and with a section of the city slated for significant redevelopment. As part of the project's cultural resources team, Johanna assessed known and potential historic resources, ranging from early architectural remnants of the city's original period of development (1860s) to industrial landscapes related to railroad and shipping at the Port of Oakland (modern era). Based on this work, ESA developed a comprehensive CEQA impact analysis and developed a variety of mitigations measures responding to the proposed project and its variants. artistic values, and is the product of a collaboration between two masters.

City of West Sacramento, Washington Historic District Design Guidelines. *Architectural Historian.* The 2014 Washington District Historic Resources Survey identified 67 historically significant buildings in the Washington Specific Plan area. Through a 2019 reconnaissance survey, ESA identified a total of 30 contributors to the Washington Historic District.overlay, an area bounded roughly by D, F, Third, and Fourth streets. Johanna was the primary author of design guidelines that addressed alterations to historic buildings as well as infill development to create a cohesive streetscape and community character. Historic architectural styles in the historic district include Queen Anne, Folk Victorian, Craftsman, and Vernacular buildings.

Oakland Museum of California, Oakland Museum of California Historic Resource Evaluation and Standards Compliance Review, Oakland, CA. *Architectural Historian.* The Oakland Museum of California was constructed in 1967 and designated a City of Oakland Landmark in 1995. As part of proposed modifications, ESA was asked to formally document the museum in a historic resource evaluation report and evaluate the proposed changes for compliance with the Secretary of the Interior's Standards for Rehabilitation. Johanna was the primary author of both documents. ESA worked with representatives from the City, the Museum, and the design team to assess the building and the project, including making recommendations for design alterations. ESA also provided support to the City and the Museum through the local landmarks board approval process.

Santa Clara Valley Transportation Authority, BART Silicon Valley Phase II Extension Project, San Jose and Santa Clara, CA. ESA will conduct architectural conditions surveys for 40+ properties along a six-mile segment to extend BART service from the Barryessa Station to downtown Santa Clara through downtown San Jose. The work is to be completed under a condensed timeline to provide both a baseline and a final record of building conditions. Working with VTA and city representatives and utilizing state-of-the-art digital data capture methods, ESA will develop a streamlined, yet thorough, documentation strategy to allow VTA to monitor changes throughout the proposed six-year construction period. This work is slated to begin Q4 2019.

San Jose State University, HABS-Like Documentation of Bud Winter Field, San Jose, CA. *Architectural Historian.* As required mitigation of the demolition of Bud Winter Field and construction of a new parking facility in the south campus, ESA architectural historians documented the historic running track and associated grounds according to Historic American Buildings Survey (HABS)-like specifications. Constructed in 1968, Bud Winter Field is named for SJSU's men's track and field coach Lloyd "Bud" Winter. During his tenure (1940-70), the track and field team became known as "Speed City," a nickname bestowed on record-setting sprinters who were coached by Winter. Bud Winter Field replaced an earlier track and field facility, which was the site most closely associated with significant events and individuals.

Kennedy Wilson, 136 S. El Camino Drive Historic Resource Assessment and Standards Compliance Review, Beverly Hills, CA. *Architectural Historian.* As part of proposed modifications, ESA was asked to evaluate the office building at 136 S. El Camino Drive for historic significance and assess the proposed changes for compliance with the Secretary of the Interior's Standards for Rehabilitation (Standards). Johanna led research efforts related to the history of the locally prominent Doheny family, who commissioned Pereira and Luckman in 1955 to design the subject building building as the headquarters for the family's growing business ventures (namely oil production and real estate). The building was determined eligible for designation as a Beverly Hills Landmark as a significant example of post-World War II modern architecture and for significant associations with the business ventures of the Doheny family. Furthermore, ESA worked with the design team to recommend design alterations that would bring the proposed project into full compliance with the Standards.

Chehalis River Basin Flood Control Zone District, Built Environment Evaluation of Chehalis-Centralia Airport Levee, Chehalis, WA. *Architectural Historian.* Johanna was among the ESA team that provided Section 106 cultural resources support for the Chehalis River Basin Flood Damage Reduction Project. Specifically, she researched and prepared the updated built environment evaluation of the historic-age levee surrounding the Chehalis-Centralia Airport.

City of Renton, Cedar River Levees Improvements Project, King County, WA. *Architectural Historian.* Johanna contributed to the cultural resources assessment by researching and evaluating commercial properties in Renton.

memorandum

date December 10, 2020

to Diane Wong, Paul Franke: UCSF

from James Gregory, PE, ESA
Rebecca Gates, EIT, ESA

subject **Hydrologic Modeling Analysis for Existing and Future Site Conditions within the Parnassus Heights Campus Core under the CPHP**

The Parnassus Heights campus site property consists of approximately 107 acres, including an approximate 30-acre developed northern portion of the campus site along both sides of Parnassus Avenue (i.e., the campus core), in addition to the approximate 61-acre Mount Sutro Open Space Reserve, and the Aldea Housing complex. The study area for this modeling analysis consists of the campus core, as this is the portion of the campus site where increases in impervious surfaces under the CPHP would occur.[1] ESA conducted a hydrologic modeling analysis to evaluate the effect on discharge due to proposed changes in landcover within the UCSF Parnassus Heights campus core under the CPHP. A hydrologic model was developed to quantify flow for existing conditions and proposed conditions for 2030 and 2050 on the campus core. Acres of impervious and pervious areas tabulated by UCSF were used as input to the model. This memorandum summarizes the methods and results of the analysis.

Methodology

ESA used the US Army Corps of Engineers program HEC-HMS v4.4.1 to model rainfall-runoff processes for existing conditions, and proposed 2030, and 2050 conditions. To reflect infiltration for impervious and pervious portions of the campus core under each scenario, the SNS Curve Number (CN) method was used to model the 30-acre UCSF campus project site. Total impervious and pervious area for each scenario were tabulated by UCSF in support of the Draft EIR and are summarized in Table 1.

Table 1. Impervious and Pervious Areas for Parnassus Heights Campus Core: Existing, and Proposed 2030 and 2050 Conditions

	Existing	2030	2050
Impervious	85.8%	89.4%	89.2%
Pervious	14.2%	10.6%	10.8%

[1] No substantial new development would occur within the Reserve under the CPHP. With respect to the Aldea Housing complex area, while new housing is proposed under the CPHP at this location, the CPHP proposes to rebuild on the existing building footprints. As such, there would not be a notable increase in impervious surfaces (or corresponding increase in peak stormflows) from these portions of the campus site under the CPHP.

The campus core is located on hydrologic soil group C (USDA web soil survey[2]). With the hydrologic soil group and referencing Table 2-2a from *USDA Urban Hydrology for Small Watersheds TR-55*, weighted curve numbers were computed from the pervious and impervious land cover for each modeling condition.

Runoff was modeled for the 1-year, 2-year, and 5-year 24-hour design storms. The San Francisco Public Utilities Commission (SFPUC) published design rainfall time series were used for the 1-year, and 2-year events[3]. The 5-year event was developed using National Oceanic and Atmospheric Administration (NOAA) Atlas 14 rainfall depths at from the online precipitation data frequency server[4].

The Soil Conservation Service (SCS) hydrograph method was applied to compute the shape of the hydrograph resulting from the portion of rainfall that is not infiltrated. This method requires estimation of the lag time (T_L), which is related to the length of time it takes for a unit of rainfall to traverse the site. Rainfall landing on the site will tend to flow initially as sheet flow, transitioning to shallow concentrated flow, and ultimately, pipe or open-channel flow. The longest flowpath was delineated on the site using local topography and the UCSF Utility Master Plan (UCSF, 2019). The pipe size and slope was estimated from the Utility Master Plan which indicates a minimum 0.5% pipe slope and 12-inch pipe diameter. ESA estimated that flow would travel approximately 114 feet as sheet flow before entering the pipe system and traveling approximately 909 feet. A Manning's value of 0.011 for the surface runoff and a Manning's value of 0.013 for the pipe were used according to roughness coefficients (Manning's n) for sheet flow, and roughness coefficients for pipe surfaces based on typical values (Chow, 1959). Following the Manning's kinematic solution (Overton and Meadows, 1976) for sheet flow, and Manning's equation for pipe flow, the estimated travel time is 7.5 minutes. Per the SCS methodology, T_L is equal to 0.6 times the travel time thus the estimated T_L is 4.5 minutes.

In the HEC-HMS model, the study site was represented using a single subbasin for each landcover scenario (existing, 2030 and 2050). The SCS Curve Number was used for the loss method, along with the SCS Unit Hydrograph for the transform method. No Baseflow was implemented. Meteorological models were set up for the 1-, 2-, and 5-year 24-hour storms. The model was run for the three landcover scenarios and the three design storm events. Results are summarized below.

Results

The changes from pervious to impervious area in 2030 and 2050 in the campus core would be relatively minor. At 2030, 1.1 of the 30-acre campus core (approximately 4%) would be converted to impervious relative to existing conditions, while in 2050, 1.0 of the 30-acre campus core (~3%) would be converted to impervious. This would have a relatively small effect on discharge for these development scenarios. A summary of peak flow and volume for each scenario and change relative to existing conditions is provided in Table 2.

2 https://websoilsurvey.sc.egov.usda.gov/App/HomePage.htm

3 https://sfwater.org/index.aspx?page=446

4 https://hdsc.nws.noaa.gov/hdsc/pfds/

Table 2. Peak Flow and Volume Results for Parnassus Heights Campus Core: Existing, and Proposed 2030 and 2050 Scenarios

Event	Peak flow (cfs)			Change in peak flow (cfs)		Change in peak flow %	
	Existing Conditions	2030	2050	2030	2050	2030	2050
1 year storm	36.5	36.8	36.8	0.3	0.3	0.8%	0.8%
2 year storm	44.2	44.4	44.4	0.2	0.2	0.5%	0.5%
5 year storm	49.4	49.6	49.6	0.2	0.2	0.4%	0.4%
Event	Volume (ac-ft)			Change in Volume (ac-ft)		Change in Volume %	
	Existing Conditions	2030	2050	2030	2050	2030	2050
1 year storm	6.4	6.5	6.5	0.1	0.1	1.2%	1.2%
2 year storm	6.9	7.0	7.0	0.1	0.1	1.1%	1.1%
5 year storm	7.9	8.0	8.0	0.1	0.1	0.9%	0.6%

As this table shows, changes in peak flow from the campus core would be relatively minor, with changes less than 1% for the three storm events analyzed. Similarly, change in flow volume is close to 1% for all events analyzed. As the event size increases, the change between existing and future development scenarios decrease because the proportional volume of infiltrated water decreases.

Wastewater/Stormwater Performance Standards

Subject:	**Wastewater/Stormwater Performance Standards**
Project:	UCSF CPHP EIR
Prepared By:	Beth Goldstein, PE
Reviewed By:	**Final**
Date:	December 10, 2020
Reference:	200011

1 Introduction

The proposed CPHP would increase both daily diurnal wastewater flows, and stormwater flows during larger storms (greater than 2-year), from the Parnassus Heights campus site to the San Francisco Public Utilities Commission's (the "SFPUC'") combined sewer system (CSS). Potential impacts to the CSS and treatment plants due to increased wastewater flows from the CPHP during dry weather were considered in the Draft EIR in section 4.16, Utilities (p. 4.16-22). Potential impacts to the CSS and treatment plants due to increases in stormwater flows as a result of the CPHP during wet weather were considered in UCSF CPHP Draft EIR section 4.9, Hydrology and Water Quality (p. 4.9-14) and section 4.16, Utilities and Service Systems (p. 4.16-14).

A mitigation measure meeting the following performance standards will ensure that, in addition to the consideration of potential impacts described above, the combined wastewater and stormwater flows (combined sewer discharges (CSD)) from the proposed CPHP during wet weather will not increase the likelihood of surcharges from the combined sewer system, will not exacerbate the extent or duration of any potential ponding or overland flow, and will not increase the frequency, duration, or volume of discharges from the CSS and treatment plants to the receiving waters.

2 Background/Purpose

Although UCSF is not required to comply with the City's Stormwater Management Ordinance (SMO), the University plans to conform with the ordinance when developing new facilities on the Parnassus Heights campus site pursuant to the CPHP. Conformance with the City's SMO, through preparation of a Stormwater Control Plan, would require implementation of LID site design measures such as green roofs, permeable paving, or other infiltration-based stormwater features (e.g., flow-through planters). These measures would be required in project designs to reduce stormwater runoff rate and volume under the CPHP by 25% for the 1-and 2-year, 24-hour design storm.[1] However, stormwater management measures

[1] Based on the existing campus core imperviousness of 86% (CPHP Draft EIR page 4.9-11)

designed to meet this criterion would likely not have an effect on the peak stormwater runoff rate during greater than a 1- or 2-year design storms. Furthermore, the increase of wastewater flows has the potential to reduce the capacity of the CSS during wet weather. A mitigation measure meeting the performance standards presented below would ensure that the CPHP will not exacerbate the extent or duration of any potential flooding, and will not increase the frequency, duration, or volume of CSDs.

3 Mitigation and Performance Standards

When UCSF's connections to the SFPUC's CSS are being designed for projects at the Parnassus Heights campus site, both the hydraulic and hydrologic capacity (broken out below) of the adjoining sewer system must be analyzed to ensure that the system can accommodate UCSF's increased wastewater and stormwater flows and/or modified connection points. Because both wastewater and stormwater flows are carried in the same pipes, increasing the volume of either flow can affect the available storage, pumping, and treatment capacity of the CSS. During a large storm, both the primary and secondary treatment capacity of the treatment plants can be exceeded, resulting in releases from the combined overflow structures. Conformance with the SMO will require a reduction in stormwater flows to the CSS during smaller storms, however, this reduction may not be enough to offset the increase in wastewater flows during larger storms that could cause an increase in CSDs. This reduction may also not be sufficient to avoid an increase in flooding (ponding of flows that can't get into the CSS, or surcharge of flows from the CSS) as this typically occurs during larger storm events, and would not address the potential that flows would increase the frequency, duration, or volume of discharges from the CSS and treatment plants to the receiving waters.

To address the potential for flooding, surcharge, or contributions to increased wet weather discharges, UCSF will need to design the buildings, infrastructure, and site improvements proposed as part of the CPHP to meet specific hydraulic and hydrologic performance standards and demonstrate conformance using the SFPUC's citywide Integrated Catchment Model (ICM) model.

UCSF may choose to conduct the modeling analysis on its own and submit the analysis to the SFPUC for review, or request that the SFPUC conduct the analysis on UCSF's behalf, subject to reimbursement of the SFPUC's costs by UCSF. If, based on such analysis, UCSF determines that increased flows will not meet the hydraulic performance standards defined below, UCSF will pay its proportional share of the costs of expanding the CSS to accommodate the increased flows from the Parnassus Heights campus site. If, based on the analysis, UCSF determines that flows will not meet the hydrologic performance standard defined below, UCSF will modify its designs to incorporate additional retention/detention features until the performance standard is met.

3.1 Hydraulic Performance Standards

Do not increase the likelihood of surcharges.

In order to demonstrate conformance, run the City-wide model using the 5-year, 24-hour design storm and identify any pipes with a maximum hydraulic gradient line (HGL) less than 2 feet below grade (that previously met this criteria). If, based on such analysis, UCSF determines that this performance standard is not met, UCSF will pay its proportional share of the costs of expanding the CSS to accommodate the increased flows or modify its designs to incorporate additional retention/detention features until the performance standard is met.

Do not increase the extent or duration of ponding or overland flow.

In order to demonstrate conformance, run the City-wide model using 100-year, 3-hour design storm and compare the extent and duration of ponding and/or overland flow caused by stormwater that is unable to enter the CSS before and after project construction. If, based on such analysis, UCSF determines that this performance standard is not met, UCSF will pay its proportional share of the costs of expanding the CSS to accommodate the increased flows or modify its designs to incorporate additional retention/detention features until the performance standard is met.

3.2 Hydrologic Performance Standards

Do not increase the frequency, duration, or volume of combined sewer discharges (CSD) to the receiving waters.

In order to demonstrate conformance, run the City-wide model using either the typical year or long term annual average rainfall to identify any increase in CSD to either the San Francisco Bay or Pacific Ocean resulting from increased flows from the implementation of the CPHP at the Parnassus Heights campus site. If, based on such analysis, UCSF determines that this performance standard is not met, UCSF will pay its proportional share of the costs of expanding the CSS to accommodate the increased flows or modify its designs to incorporate additional retention/detention features until the performance standard is met.

4 Frequency of Analysis

The performance standards described above will be met throughout development of the CPHP, and should be based on pre-development (“baseline”) model runs. Compliance can be demonstrative via modeling at every major phase of the CPHP beginning with the Initial Phase.

5 Conclusions

Quantitative modeling will be required to confirm adherence to the performance standards above.[2] However, there are several qualitative indicators that the performance standards can be feasibly met.

Firstly, the proposed CPHP includes a 0.11 MG onsite emergency sewer effluent storage tank. [3] This represents over 60% of the average daily wastewater production at full CPHP build out (0.18 MG). This also indicates that construction of additional storage is an option (given ground conditions, available area, etc.)

Secondly, a cumulative analysis performed in conjunction with the Parkmerced Draft EIR, determines that overall flows to the CSS on the Westside will decrease over time due to the construction of several major projects that will include separation of sewers (from combined to separate system).[4] Furthermore, the City has enacted several ordinances (e.g., Non-potable Ordinance, Water Efficient Irrigation Ordinance, Residential Water Conservation and Commercial Water Conservation Ordinance), requiring new and redevelopment projects City-wide reduce potable water use, and secondarily decrease wastewater flow to the CSS.

Finally, the CPHP is located along the north-south ridge that separates the Western and Eastern drainage basins. Being at the upstream end of each basin increases the likelihood that the increased flows will have less of a volumetric impact than at the downstream end as there is more opportunity for balancing of available storage. It also allows for allocating flow by basin to minimize overall impact.

[2] It is recommended that UCSF request model results for existing conditions for use in comparing future model runs.

Appendix O-EBPA

The Next Major Fire in the East Bay Hills

March 2016

by Dave Maloney

Dave Maloney is the former Chief of Fire Prevention for the U.S. Army at the Oakland Army Base. His is a retired firefighter from the Oakland Fire Department. He holds lifetime certification from the California State Fire Marshal's Office as a Fire Investigator, and lifetime certification from the U.S. Dept.of Defense as a Fire Inspector. He was a member of the 19911992 Emergency Preparedness and Community Restoration Task Force, also known as the OaklandBerkeley Mayors' Firestorm Task Force, which investigated the 1991 Oakland Hills Fire and made recommendations to prevent a recurrence of a major fire in the East Bay hills. He is currently a wildland fire prevention consultant.

On September 27, 2013, the U.S. Forest Service issued a report that said the removal of Eucalyptus trees from the East Bay Hills would increase the risk of fire there.

In 1987 I was severely burned fighting a fire in Oakland. I know that unimaginable pain. Both my hands received moderate and severe seconddegree burns. I have carried a scar from that burn for 28 years. It will be with me for the rest of my life. Every time I hear of a firefighter being burned to death, I go into a depression that lasts for hours. I know the pain that young man or woman went through in the beginning stages of his or her death. This article is dedicated to those firefighters who have lost their lives in the line of duty, and to those who will lose their lives if U.C. Berkeley (UCB), East Bay Regional Parks District (EBRPD), and the City of Oakland are allowed to implement their plans to cut down approximately 500,000 trees in the East Bay hills.

The next fire in the East Bay Hills has the potential of killing more than 1,000 people and destroying over 100,000 homes if the above three publicly funded agencies are allowed to enact their fallacious "Fire Hazard Mitigation Plans" — which in reality are plans to remove non-

native trees from the East Bay Hills under the guise of reducing the risk of fire.

The plans:
• ignore the U.S. Forest Service analysis dated September 27, 2013, which recommends against removing Eucalyptus trees.
• violates the recommendations made by the 1991/1992 Task Force on Emergency Preparedness and Community Restoration, commonly known as the Oakland/Berkeley Mayors' Fire Storm Task Force, of which I was a member.
• has no basis in fire science;

 © 2016 Dave Maloney

• violates fundamental principles of Wildland Fire Prevention; • is ideologically motivated;
• creates the conditions for a perfect firestorm

This firestorm could destroy all of Oakland down to the 880 freeway, (The Montclair district of Oakland, with its delightful Montclair Village shopping area, could be incinerated; and the Claremont Hotel would not be saved in this fire.) All of Berkeley down to Fourth street could be burned, as well all of Piedmont, Albany, El Cerrito, most of Richmond and Emeryville, all of San Leandro, Hayward, Castro Valley and Fremont.

This fire would not be restricted to the west side of the East Bay hills, but could, for the first time, due to the removal of hundreds of thousands of trees, move down the east side of the hills to incinerate Orinda, then move deep into Contra Costa County consuming Lafayette, Moraga, Walnut Creek and Concord. While burning to the East it could also spread south and destroy Alamo and Danville. Unlike the cities on the Alameda County side of the Caldecott Tunnel, the cities on the Contra Costa County side cannot even hope to receive the cool air and fog that comes through the Golden Gate most nights, which would lower the temperature of the fire, thereby allowing firefighters to contain it.

Tens of thousands of people will be forced to evacuate their homes. Freeways would be clogged. People will have to abandon their cars and run down the freeway between the rows of stalled vehicles, carrying only the possessions they could flee with. A valiant attempt will be made to stop the fire at the intersection of freeways 680 and 580 near Dublin, and use all of 580 as a fire break. This attempt will fail, just as highways 13 and 24 in 1991 failed to stop the Oakland Hills fire in 1991. The fire will jump 580 and continue south, consuming Dublin and Pleasanton, then continue further South, East and West to become the worst catastrophe in American history.

Thisisnotdoomsdaysciencefiction. *T his happenedinAustraliaonFebruary7,2009*, theday the Black Saturday Fires began. The Black Saturday Fires consumed 1,100,000 (one million one hundred thousand acres), 750 times more land than was burned in the 1991 Oakland Hills fire. The Black Saturday fires destroyed 25 towns, killed 173 people and released the energy equivalent of 1,500 atomic bombs exploding.

In Australia, logging had replaced forests with grasses, and chaparral, (land covered with bushes and shrubs (woody plants). Australians use “bush” for what we call chaparral). This is exactly what the three above agencies want to do here. These taxpayer funded agencies want to convert our East Bay forests into the same predominantly grass, and chaparral terrain of nearby rural Lake and Amador Counties where the disastrous Valley, Rocky and Butte fires occurred this

 © 2016 Dave Maloney

past summer (2015). These fires burned 76,067, 69,438 and 70,868 acres, respectively, destroyed many homes and buildings and killed six people.

The EBRPD, UC Berkeley (UCB), and the City of Oakland (Oakland) deforestation plan will create an enormous belt of grass and chaparral that will stretch from Richmond to Castro Valley to the eastern edge of Contra Costa County. This grassland belt will be many times more

flammable than wooded terrain. In Australia, the Black Saturday fires occurred 30 miles from Melbourne, in land that once was rife with trees.

Australian fire scientists, after an exhaustive two year study, concluded that logging, which removed moisture collecting trees from the terrain, contributed greatly to the devastation caused by the fires. This was reported in the August 4, 2014 Melbourne Herald Sun: which stated,

"Professor David Lindenmayer, Australia's leading scientist of forest ecology said, 'Our findings show the severity of the fires on Black Saturday was significantly higher in the areas that had been logged.' The scientists say the study showed conclusively that logging prior to Black Saturday made the deadly blaze much more extreme."

On April 21, 2009, two months after the Black Saturday fires began, and one month after they were suppressed, the Australian Royal Commission investigating the fire issued the following findings, reported in the Herald Sun:

"The heat of the fire reached 100,000 kilowatts per meter. The maximum intensity at which a forest fire can be controlled is 4,000 kilowatts per meter. Not only the intensity of the fire, the heat of the fire, but its speed was phenomenal. Black Saturday's 173 victims were defenseless in the face of an inferno that created fireballs of atomic force."

The energy created by the Black Saturday fire was 1,500 times greater than the energy of the Atomic bomb dropped on Hiroshima — It was equivalent to 43 pounds of TNT exploding in each square yard of the one million one hundred thousand acre fire. (For comparison, the Oakland Hills fire burned 1,500 acres; the equivalent of two Hiroshima sized atomic bombs.)

The April 7, 2009 issue of the Sydney Herald reported, "Kevin Tolhurst, a professor of Fire Ecology at Melbourne University, concluded a study that showed that wind speeds generated by the fire

reached 170 kilometers per hour (75 miles per hour). This accounted for the incredible speed of the fire."

This is the future that the East Bay Regional Parks District, U.C. Berkeley and Oakland have in store for us.

3 © 2016 Dave Maloney

Wellknown buildings and businesses would be destroyed, including: Macy's, Nordstroms, Traders Joes, Whole Foods and Safeway in downtown Walnut Creek; the Orinda theater; Whole Foods, Safeway, Big O Tires, Peet's Coffee in downtown Lafayette — and all the other businesses. The jobs they provide will disappear. This catastrophe would not only destroy the economy of the Bay Area, but also have an immense cost in human suffering.

We constantly we hear from people with no training or experience in Fire Science — whose actual goal is to "restore" the East Bay hills to how they appeared in 1776 — how dangerous Eucalyptus trees are.

In an interview with Lucy Kang of KPFA, broadcast August 14, 2015, representatives of the Sierra Club, EBRPD and the Claremont Canyon Conservancy claimed that removing half a million "nonnative" trees — in effect decimating our 150yearold East Bay forests — and "restoring" the land to its what it was like in 1776 would make us all safe from wildfire.

Carolyn Jones, Public Information Supervisor for the EBRPD said, "Removing these trees would make us fire safe. Historically speaking the East Bay Hills looked much like, um, the other hills in California, mostly grassy with pockets of Oak groves and, you know, riparian streams and so forth."

In other words, deforest our public land and convert it into hundreds of thousands of acres of grass fields — replicating the vegetation of Lake and Amador counties where the disastrous Valley, Rocky and Butte grass wildfires occurred in 2015.

Michelle Myers Director of the San Francisco Bay chapter of the Sierra Club said, “We firmly believe the best way to encourage a healthy and vibrant ecosystem that is also fire safe is to allow the native grasses, the native chaparral, the riparian habitat, allow that to come back. That will be much more fire resistant.”

The C alifornia Chaparral Institute, the foremost authority on chaparral in California, states on its website, ”There is no question chaparral provides the perfect fuel for wildfires.” And, “Being dense, impenetrable and prone to infrequent, huge wildfires is the natural condition of chaparral.” And, “There is no question chaparral is extremely flammable, especially during dry weather conditions.”

Ms. Myers also described a Eucalyptus tree and what happens when one catches fire. “When they light, the fire goes up and creates something called a crown fire.” She spoke as if Eucalyptus trees are unique in how they react to being on fire, and that only Eucalyptus trees

 © 2016 Dave Maloney

---

have crown fires. All trees with crowns are capable of having crown fires. She also didn’t say which species of Eucalyptus she was talking about, or mention that there are three different species predominant in the East Bay Hills, each with different flammability levels. Or that there are over 700 species of Eucalyptus in the genus of Eucalyptus. She lumped them all together. She also implied that only Eucalyptus trees throw off embers. In fact, trees of all species throw off embers.

In the early 1960’s the California State Fire Marshall’s office described a group of people who were making erroneous pronouncements about fire prevention methods, and who were members of well known organizations, by saying, “they typified opinionated misinformation being spread by those with quotable positions.”

It is mind boggling that in the San Francisco Bay Area, a place with so many institutions of higher learning, and rich in intellectual resources, such a lack of knowledge of fire science by public servants and leaders

of well known environmental organizations exerts so much influence, which threatens public resources, public safety and exponentially increases the probability of a mega disaster. Have any members of the organizations represented in the KPFA interview have taken a fire science course, fought a fire or received training to prevent a wildland fire?

What Michelle Myers and Carolyn Jones don't understand is that our world is very different than the world of 1776. Today, ten million people live in the Bay Area, as opposed to about a thousand in 1776. 2.5 million people live in the East Bay, where there are hundreds of thousands of buildings and residences which weren't here in 1776. This residential and commercial building density represents a tremendous fuel load. If a fire advances into this fuel load there will be no stopping it. What they and many other people also don't understand is that grasses are more flammable than chaparral, and that one species of Eucalyptus, the Blue Gum, (*Eucalyptus Globulus*,) which is prevalent in the East Bay hills, is highly fire resistant much more fire resistant than any "native" tree, other than Redwood or Douglas Fir.

All trees perform three vital functions in preventing or slowing the spread of grass and chaparral fires: they collect, with their leaves, moisture from the night air and drip it on the natural vegetation beneath them; the tops (canopies) of the trees create shade so this moisture is not evaporated by the sun by mid day, they act as windbreaks which slow the velocity of the wind that pushes grass and chaparral fires.

Removing trees of any species and wanting grasses and chaparral to replace them greatly increases the chance of a catastrophic, unstoppable fire.

 © 2016 Dave Maloney

The plan of U.C. Berkeley, the City of Oakland and EBRPD is Catastrophically Flawed because it contains fundamental errors that would not reduce wildland fire hazard but create the conditions that

would dramatically increase the likelihood of a severe fire in the East Bay Hills.

a.

The importance of moisture in precluding, and/or modifying the size and scope of a wildland fire is completely ignored. The wetter grasses are, the harder it is for them to catch fire, and remain on fire. The West, Alameda County, side of the East Bay hills directly faces the Golden Gate and/or San Francisco Bay. The leaves of the approximately half a million trees the plans would cut down, collect about 20 inches of moisture a year *p er tree* from the fog and cool air that comes through the Golden Gate and over the Bay, then drip this moisture on the ground and grasses beneath the trees. Every night of the year these trees collect and drip moisture on the ground. The annual rainfall per year is 24 inches in the East Bay HIlls; each tree almost **d oubles** the amount of water dropped on the grasses beneath it per year. Remove these trees, and the grasses beneath them dry out by midday in the spring, summer and early fall. This will be especially devastating in drought years.

These trees also produce shade which prevents the sun's rays from evaporating moisture on the grasses.
Additionally, these trees act as windbreaks, dramatically slowing the spread of a fire should one occur. UC Davis, in an article about Eucalyptus, states, they are "an excellent wind break."

b. c.

2) Moist living trees will be logged and left on the ground to dry out and decompose. These dried logs, coupled with the dry grasses in the hills, will become the most explosive fuel available in a wildland fire. *T he plans creates the conditions for a perfect firestorm.*

NOTE: The East Bay Municipal Utility District (EBMUD), which supplies water to Alameda and Contra Costa counties, practices sound wildland fire prevention policies. It refuses to cut down any healthy tree, "native" or "nonnative," because it recognizes the value of the moisture

collected and dripped by these trees on its property. Its wildland fire mitigation practice is to clear the grasses, brush and shrubs beneath its trees.

EBMUD is also well aware of the enormous amount of water needed to fight a fire. Modern fire engines pump onto a fire eighteen hundred gallons of water per minute. Three hundred seventy fire engines were used to fight the Oakland Hills fire in 1991, which had a perimeter of 5.25 miles. ("Oakland Hills Fire An Overview" by Captain Don Parker, Oakland Fire Dept Office of Fire Services) The amount of water used by these fire engines was almost *f orty million gallons per hour.* If hundreds of thousands of trees are cut down, the next fire will be much larger than the '91 fire, and require many more fire engines. This will increase, by millions of

 © 2016 Dave Maloney

gallons, the amount of water needed to attempt to contain and suppress it. Water supplies are becoming chronically short in the California and the East Bay. We cannot allow unsound, unsafe actions that pretend to be wildland fire prevention strategies but actually *i ncrease* the chance of wildland fire which will further deplete our water supplies.)

The EBRPD, UCB and the City of Oakland display a tremendous lack of knowledge of wildland fire science. Instead, they share a seemingly fanatical desire to eradicate any species of tree that wasn't here when the Spanish sailed through the Golden Gate in 1776. They are exploiting the public's fear of wildfire and misrepresenting fire hazard mitigation as a strategy to achieve their goals.

One example of their true intentions is revealed by their refusal to tell the public that the California Bay Laurel tree, which they consider "native" to the Bay Area has more volatile oil than any Eucalyptus tree. For years we've been hearing that the volatile oils of the Eucalyptus trees make them a supreme fire hazard. Yet *t he Bay Laurel contains 7.6% volatile oils of the samples tested,* a ccording to the Journal of Agricultural and Food Chemistry (1974). The amount of volatile oils in

Eucalyptus trees range from 1 to 7% of the samples tested. But no Bay Laurel trees are to be cut down — nor ever mentioned. Only trees labeled “nonnative” are discussed and targeted for elimination.

Again, it’s important to emphasize — because the proponents of the deforestation plan repeatedly ignore or misrepresent well documented, publicly available official reports — *The 1991 Oakland Hills fire originated in grass and brush (a dense growth of bushes.) This grass and brush fire ignited trees and residences. As this was happening the fire was expanding its perimeter, igniting more grasses, brush, houses and trees. The Oakland Fire Dept. then declared the fire out of control. House fires burn at about 1,500 degrees for about an hour. The heat and embers radiating from the house fires ignited still more trees. This began a chain reaction of trees igniting houses and houses in turn igniting more trees.*

The Oakland Hills fire of 1991 was not slowed down by fire suppression. It was slowed down by cool night air coming in through the Golden Gate, and the natural decrease of air temperature associated with night. (It’s a law of thermodynamics that heat always travels from a higher source to a lower source.) This mass of cold air drew heat from the fire, which caused it to dramatically decrease its rate of spread to the point that fire suppression could contain it.

People in Contra Costa county will **n ot** receive any cool air coming through the Golden Gate. The Contra Costa county side of the our East Bay hills faces away from the Golden Gate and San Francisco Bay. *Almost always, the Alameda County side of the hills acts as a barrier, preventing Contra Costa County from receiving the cool air and fog from the Golden Gate and San*

 © 2016 Dave Maloney

Francisco Bay . And the night temperature in Contra Costa county from April through mid November is almost always significantly higher than in Alameda County. This is why Contra Costa is at very high risk if the

deforestation plan is implemented. A large fire in Contra Costa will not get the benefit of nature's nocturnal help.

The 1991 fire initially was pushed southwest, away from Contra Costa county, by strong winds coming from the northeast. But the fire became a firestorm, which is a fire so large that it generates its own winds. The fire, pushed by its own wind, started moving outward in all directions, including toward Contra Costa County. This firegenerated wind reached a speed of 29 miles per hour. ("FireInduced Winds in the 20 October 1991 Oakland Hills Fire," by J. Trelles and P. Pagni) As night fell the movement of fire from Oakland toward Contra Costa was slowed, as mentioned, by the cool air coming through the Golden Gate, and a significant decrease in air temperature in Oakland.

But the speed of grass fires can be at least twice that of fires involving trees, e specially if there are only a few trees, or none, to act as windbreaks. So If there had been no trees, or only a few, on the hillsides and ridgeline of the East Bay Regional Park in 1991, it is quite possible that the '91 fire would have reached Orinda and other cities in Contra Costa County *b efore* the air on the Alameda side of the hills cooled it to the point that it could be contained, and restricted to the Oakland side of the hills.

Any living tree, no matter what its species, is much less flammable than grass. Every living tree due to its moisture content and canopy coverage of ground fuels contributes to wildfire hazard mitigation.

"In grass fuels, moisture content is a critical factor in determining flammability. Fires spread only at a low rate, or not at all, in grasses that are green, but when the same grasses become cured and dry, fires will race through them at an extremely rapid rate." National Fire Protection Handbook (N FPA) .

"Live trees contain a great deal of moisture while dead logs contain very little. Lighter, thinner fuels such as grasses, leaves, and needles

quickly lose moisture and therefore burn rapidly." **San Diego Wildfires Education Project**

Eucalyptus trees are the main target of those who would cut down trees and put us in grave danger. (They use the "blue car" propaganda tactic, which is explained later in this article.) They claim that Eucalyptus trees are more flammable than other trees — and more flammable than grasses — is untrue and now dangerously misleading. *T here is not one shred of fire science to support this claim.* T his beginnings of this myth coincided with the founding of the

 © 2016 Dave Maloney

California Native Plant Society in 1965. It has been repeated so often it is now taken by many as fact. The reality is that one genus of tree, the Eucalyptus, which has over 700 species, is being targeted for removal by "native" plant extremists. Their strategy? Concoct, repeat, and sell to the public the falsehood that it is the only tree on Earth that explodes in fires, the only tree that throws embers long distances in fires, the only tree with volatile oils, and so on.

Let's dispel these myths. All species of trees can explode in fires. Put into the You Tube search bar "exploding trees in fires." You will see olive trees, pine trees and other species of trees exploding when on fire. Type into your browser search bar "eyewitness trees exploding in fires" to read eyewitness accounts of trees from all over North America exploding in fires.

All natural vegetation, grasses, shrubs, brush and trees throw burning embers when on fire. No species of tree has a monopoly on this. And all species of trees can throw burning embers long distances.

Saying that the volatile oils in Eucalyptus trees make it highly flammable is the biggest stretch of truth, and maybe the most glaring example of a word or phrase being misused with the intent of eradicating Eucalyptus trees and scaring the public to accomplish what the truth won't allow removal of Eucalyptus trees. Volatile oils have nothing to

do with the flammability of a tree. Sound counterintuitive? Volatile oils and essential oils are two terms that are synonymous and represent the same oil in a plant or tree. **T he essential oil of any tree or plant is named that because it's essential to the fragrance of the tree or plant. The same oil is also called volatile because after going through manufacturing processes it is turned into a flammable liquid**. Terpene is a very common essential/volatile oil. After going through a manufacturing process it becomes turpentine. The term volatile oil is used to scare the public by those who ignore fire science, want to eradicate Eucalyptus trees, and turn our East Bay Hills into highly flammable grasslands.

Why are the essential/volatile oils of any tree irrelevant to the flammability of a tree? Because of the moisture content in all trees, the thickness of its bark, and the density of its wood, most tree species require 800o to 1200o F (Fahrenheit) of heat to ignite. A few, like the Redwood tree, Douglas Fir and Blue Gum Eucalyptus can withstand more than 1500 F heat if the fire moves rapidly past them. All trees contain water — approximately 30% of a tree is water. Every species of tree in the East Bay hills is at least 30% water. This moisture is far greater than the amount of essential/volatile oil in any tree. It overwhelms by far any chance the essential/volatile oil has to set the tree on fire.

Also, the volatile/essential oil in any tree cannot sustain heat long enough to ignite the highly dense wood of the tree. (There is an inverse proportion between temperature and amount of time

 © 2016 Dave Maloney

it takes for all combustibles, including trees, to catch fire. The lower the temperature the longer it must be applied to a tree; the higher the temperature the less time is needed for the tree to catch fire.) This is an evolutionary mechanism that trees developed to survive. The amount of essential/volatile oil in a Eucalyptus depends on what species of Eucalyptus is being sampled. Across the 700 species of Eucalyptus the

range is between 1% to 7.0% As stated previously, the California Bay Laurel tree contains approximately 7.6% volatile oils.

Additionally, essential/volatile oils rise to the top (the canopy) of trees as the air temperature of the day warms. In nonmountainous regions like the SF Bay Area, (as opposed to mountain ranges like the Sierra Nevada where lightning strikes are more typical), 99.999% of the time the canopy (top) of a tree catches fire, is because a fire ascends the tree from its trunk or branches. In other words the tree is already on fire before its essential/volatile oils are involved.

If the top of any tree is going to catch fire before its lower parts, it's usually due to lightning. The amount of energy in a lightning bolt that strikes the top of a tree is so great that it dwarfs the ability of the wood of the tree to withstand it. The wood catches fire first and *t hen* ignites the tree's essential/volatile oils. So even at the top of the tree the volatile oils are irrelevant in the tree's ignition. In the East Bay Hills we don't have to worry that lightning will ignite the canopy of a tree. The assertion that the essential/volatile oils in Eucalyptus trees make their canopies more flammable than other trees is nonsense.

Sometimes in a wildland fire burning embers from grasses, brush, shrubs, or trees are swept by wind onto the tops of other trees and ignite them. *T his can happen with any species of tree.* Additionally, burning houses in the wildland/urban interface, such as we have in the East Bay, make major contributions in terms of size and quantity to the total amount of embers. We learned this from the 1991 fire.

Constantly pretending that characteristics common to all trees are unique to Eucalyptus trees is like saying, "If a blue car crashes into a house at 100 mph, the damage to the house is because the car is blue." Any car hitting a house at 100 mph is going to do extensive damage regardless of its color.

The propaganda used against the Eucalyptus is threefold.

1) Therearemorethan700speciesoftreesinthegenus*E ucalyptus*. Lumpingall700 *Eucalyptus* species into one category is like saying all fish in the ocean are one species with the same characteristics and attributes. Each species of Eucalyptus has different characteristics and attributes. For example: *E ucalpytus g lobulus*, the Blue Gum species of thegenus*E ucalyptus*, ishighlyfireresistant. Maturetreesaretall,rangingfrom80to150

10 © 2016 Dave Maloney

feet. Its bark is thick and moist, and its lowest branches start about 25 to 30 feet above the ground. It has long ,relativity broad leaves that collect much moisture from the air and drip in on the ground beneath. It is dominant in the East Bay hills.

(We have many pictures of Blue Gum Eucalyptus trees surviving wildland fires while others species of trees labeled “native” were incinerated. One of the most dramatic examples of this phenomenon are the photographs we have have of Blue Gum trees alive and well after enduring the heat of the Scripps Ranch fire in San Diego, CA, in 2003. Everything around these Blue Gums has been incinerated. We have another profound picture. This is of a Blue Gum that withstood the 2000 degree heat of the ‘91 Oakland Hills Fire, standing tall and alive while all around it trees “native” to the Bay Area have been reduced to ash.) The DwarfBlueGum,*E ucalyptus c ompacta*, isnotasfireresistant. Itisshort,about25to30 feet tall and its branches grow low to the ground. Yet it is still more fire resistant than any grass, brush or shrub. But lumping these two very different species together to condemn both is convenient if your goal is to get rid of trees that weren’t here in 1776.

2) Deliberate use of militant language that strongly biases discussion thereby disallowing reasonable discourse . Any species tree that wasn’t here in 1776 is labeled “nonnative” — and then “invasive.” A tree that *w as* here in 1776 is “native.” “Invasive” trees “encroach” on “native” tree land. This use of militant language to describe Eucalyptus trees began around the time the California Native Plant Society was formed.

Choosing the date of Europeans arrival into San Francisco Bay as the determinant of whether a tree is “native” or “nonnative” is arbitrary and has nothing to do with a scientific determination of its flammability.

3) Omitting information needed to have a balanced viewpoint. For example, let’s enter a pretend world where we all know that cars exist but we don’t know much about cars. Then a group of people who hate the color blue assert, “All blue cars are very dangerous. Blue cars can go 100 mph and when they crash horrible things happen. Their hoods crumple and they can even crash at 10 mph. Their tires go flat at inopportune times. They can run out of gas. If you make a turn going too fast they will flip over, their engines quit without warning, they crash into other nonblue, safer cars. And they kill people.

We don’t know about cars in our pretend world so we believe what we are told, and assume only blue cars have these characteristics, when in fact all cars do.

The Eucalyptus trees are like the blue cars. When they catch fire they react like all trees do.
But most people understandably don’t know the details about what happens to trees when they catch fire. And they don’t know there is more than one species of Eucalyptus trees in the East Bay hills. *T he public has been bombarded with misinformation for over f ifty years* and believes

 © 2016 Dave Maloney

trees are more flammable than grasses, that all Eucalyptus trees are one species and that Eucalyptus trees have fire characteristics different from and more dangerous than other trees.

We have many examples of facts destroying myths. California’s Oak trees, which were here in 1776, have branches lower to the ground than Blue Gum Eucalyptus tree and are therefore more likely to be ignited from grass and shrub fires. Almost all the Oak trees in the Oakland Hills fire of 1991 were burned to ash, while many,many Blue Gum Eucalyptus

with their longer trunks, thicker moist trunks, and branches high from the ground survived the fire. There is photographic evidence of this, showing Blue Gum Eucalyptus trees alive and standing tall after fire burned all the neighboring Oak Trees and houses to a crisp.

The people who want all trees that weren't here in 1776 removed like to state that Eucalyptus trees drop strips of bark to the ground which are flammable. *T his is another red herring used to divert attention away from fact.* Singling out eucalyptus litter with such statements is propagandistic, designed to mislead and frighten the public. It is the "blue car" tactic. And It doesn't differentiate the species of Eucalyptus. It lumps all the 700 plus species of Eucalyptus i n t o o n e . *A l l t r e e s d r o p l i t t e r o n t o t h e g r o u n d t h a t i s f l a m m a b l e .*

I n many cases the strips of bark the Blue Gum and Red Gum produce and drop on the ground are less flammable than the litter that "native" trees produce. Why? Because they are thicker, so it takes more heat for them to catch fire. For practical purposes though it can be said that the litter that all trees in the East Bay produce are equivalent in flammability, including the litter "native" trees produce.

The U.S. National Park Service confirms this when, describing how a ground fire burns tree litter on the forest floor, eliminating for several years its capability to fuel a fire says,

"In five to eight years enough litter can accumulate in a forest to return ground quantity fuel to the pre fire level."

The U.S. Forest Service doesn't differentiate species of trees when talking about how litter can f u e l a f i r e . I n o t h e r w o r d s , *a l l* t r e e s p e c i e s p r o d u c e l i t t e r t h a t i s f u e l f o r a f i r e .

It takes about 68 years for Eucalyptus strips to accumulate to the point that they pose a fire threat. But during this same time grasses, brushes and shrubs are growing at a much faster rate. An inexpensive plan that would preserve our forests is to have crews go and clear out the brushes, shrubs, bark strips, fallen branches (inevitably dried out) and dead leaf

litter from *a ll* trees. It would also be environmentally safe. (The Environmental Impact Statement for the City of Oakland, U.C. Berkeley, and EBRPD plans lists toxic Dow GarlonTM and Monsanto

12 © 2016 Dave Maloney

RoundupTMto be applied twice a year, for up to ten years, *o r more, as needed*, to tree stumps to prevent them from resprouting. These thousands of gallons of herbicides, will leach into the ground water, and then Bay.)

The highly fire resistant Blue Gum eucalyptus is very efficient at using water. (This is another pin in the balloon of misinformation has been spread for 50 years.) The Blue Gum evolved in Southeastern Australia where there is little rainfall and six or more grass fires a year. To survive, it evolved fire resistant qualities and an efficient use of water. It is, ironically, not only highly fire resistant, but is perfectly adapted to survive in California in drought years. It will fare better than many "native" tree species. Many "native," trees, particularly oaks, due to the drought, are drying out, causing their branches to crack and fall to the ground to become kindling for any fire. The plan would cut down almost 1⁄2million eucalyptus trees that retain more moisture than many "native" tree species..

For over 50 years the people who want to get rid of trees based on their species have had a monopoly on dispensing information. Few challenged what seemed a harmless eccentricity. Now, however, it is serious misinformation that endangers our precious forests and public safety.

(On a side note: Eucalyptus trees were brought here in 1850, 170 years ago. At the same time Monterey Pine trees were brought by settlers from Monterey county, 80 miles south of San Francisco to the SF Bay Area. Monterey Pine is "nonnative" because it originated in Monterey county, 80 miles south of the East Bay! Because neither species originated in the SF Bay Area the California Native Plant Society and its allies refer to Monterey Pine and Eucalyptus as "invasive." How many years does a

tree species have to be here before it's considered "native"? Is this whole "native" vs. "non native" tree schism getting silly?)

"T he National Fire Protection Association (NFPA) is a global nonprofit organization established in 1896 and devoted to eliminating, death, injury, property and economic loss due to fire, electrical and related hazards." Its mission is to "help save lives and reduce loss with information, knowledge and passion. Its "information and knowledge comes in many forms" including extensive "research and data analysis, technical training and certification." (From the NFPA's website.)

In the NFPA's Fire Protection Handbook, on page 1361 of Volume II, it is stated, *" Cured (dry) grass, if present in large and uniform volume, provides the most flammable ground fuel in the region."* The word region refers to any area any where in the world that is under discussion. The above statement was based on rigorous scientific research and analysis. And there are no conditions to the statement. No if, ands, or buts. It's a flat out truth. In Australia this fundamental principle was ignored and the results were disastrous. In the East Bay

 © 2016 Dave Maloney

wildland/urban interface, where our population and housing density is much more than in Australia where the Black Saturday fires occurred, ignoring this principle will cause a devastating fire that will take years to recover from.

The role of trees and moisture in preventing wildland fires is so crucial it is worth repeating in the next three short paragraphs using slightly different language.

All living trees, regardless of their species, perform important Wildland fire prevention functions and are far less flammable than grasses.

1) Their leaves collect moisture from the air and drip it onto the ground. On the west side of the East Bay hills this is especially true. Trees there collect from the fog and cool air coming through Golden Gate and drip

about 20 inches of moisture a year on the grasses underneath. (Average annual rainfall is 24” a year). Think of this moisture drip as rain. In drought years this moisture drip is especially important. Each tree removed represents an average loss of 20 inches of water dripped on the ground per tree each and every year.

2) The shade provided by the leaves and branches of the trees either prevents this moisture from being dried out by the sun, or on very hot days, significantly delays the time it takes for the grasses to dry. Without trees the grasses, especially in the East Bay, dry out by 10 or 11 AM. The grasses are then ripe for fire. With trees, in non drought years, the grasses are almost always moist. Without trees, the grasses will always be dry, whether or not it’s a drought year. The role of trees in delaying or preventing the drying out of grasses is very critical.

Fire science has shown that the species of a tree is irrelevant in determining its flammability. The structure of a tree determines its flammability. This is why we have photos of Blue Gum eucalyptus trees alive and well and standing tall in the Oakland Hills Fire zone, while all around them Oak trees had been reduced to ashes.

In a landmark study by S.T. Michaletz and E.A. Johnson entitled, “Heat transfer Processes Linking Fire Behavior and Tree Mortality,” it was proven that the flammability of a tree is determined by three characteristics of the tree, regardless of its species:

1) The thickness of its bark. This is important because any species of tree resists fire as long as its bark protects the inside of the tree. When the fire burns through the bark it starts to burn the inside of the tree. That is when the tree succumbs to the fire, loses all of its moisture, then emits massive amounts of radiant heat and dies.

 © 2016 Dave Maloney

2) The amount of moisture in the trees bark. Moisture is water. The more water in a trees bark, the longer the bark can resist the damage caused by fire and the longer this “shield” can protect the life processes which exist inside the tree. The thicker the bark the more moisture it can hold. And

the longer it takes for the tree to catch fire and produce massive amounts of radiant heat.

The height from the ground of the lowest branches of a tree. Ninetynine percent (99%) of

3)
the time trees catch fire because they are ignited by grasses, bushes, shrubs, or, in the wildland/urban interface, houses. Every blade of grass in a grass fire has what's called a "flame length." Every bush and every shrub on fire also produce a flame length. The flame length is the height of the flame produced by the burning fuel. Grasses in a grass fire and brush in a brush fire can ignite tree branches. The higher above the ground the branches of a tree are, the farther they are from the flames of burning grass and brush, and therefore less likely to ignite. As noted earlier, the lowest branches of a mature Blue Gum Eucalyptus tree are 2530 feet above the ground. This feature, combined with its thick, fire-resistant bark, make Blue Gum Eucalyptus trees very fire resistant.

Bushes, shrubs and vines also produce "fire ladders." A fire ladder is natural vegetation that connects the ground to the branches of a tree, and transmits fire upward from the ground to the tree. The more removed from the ground the lowest branches are, the less chance of a fire ladder attaching itself to that tree. Oak trees, which are"native" to the EAST Bay hills, have thick barks, but very low hanging branches. This is why oak trees have low fire resistance, and why the majority of oak trees in the Oakland Hills fire burned to a crisp. Yet oak trees, as well as Bay Laurel trees, both species with lower branches and therefore more susceptible to fire, are not scheduled to be cut down in the "fire mitigation plans."

There are those who argue that the species of a tree determines its structure. There is some truth in this. But by emphasizing structure, Fire Science precludes focusing on species as the determining characteristic. The National Fire Protection Associations says, "fuel types are classified on the basis of the physical characteristics of the fuels themselves."

By contrast, preoccupation with species can lead to erroneous conclusions, which then would allow dangerous, misleading actions such as that proposed by the EBRPD, U.C. Berkeley and the City of Oakland.

Natural vegetative fuels are grasses, brush, shrubs and trees. Class A fuels are fuels which turn to ash when burned. Natural vegetation is a Class A fuel. A fundamental principle which determines the inherent flammability of all class A fuels is its ratio of surface area to its density.

15 © 2016 Dave Maloney

Because of this fundamental principle that applies to all Class A fuels, *d ried grasses are the most flammable natural vegetative fuel.*

Why are grasses much more flammable than any species of tree? Their ratio of surface area to density is very high. Compared to grasses, trees are very dense and therefore have a low surface area to density ratio.

To illustrate how volatile grasses are, take a single sheet of 8.5 x 11" copy paper. . The surface area of each side of it is 93.5 square inches. So the total surface area of the paper is 187 square inches. But its density, which is its thickness, is only about 4/100's of an inch. It has a very high ratio of surface area to density. This is why it burns so fast.

Hold a second sheet of copy paper. Twist each end in opposite directions, as you would to light kindling in a fireplace. You have *d ecreased* its surface area and *i ncreased* its density. — dramatically decreasing its surface areatodensity ratio. This is why it now burns much more slowly.

Another example is a page from a newspaper. If the entire page is put into a fireplace without being crinkled it burns rapidly. If the ends are twisted in opposite directions it burns much slower.

(Those who want to cut down 500,000 trees criticize this example by saying, "It's not scientific." **Of course it's not scientific!** It's an illustration of a principle. It is not a laboratory experiment to prove a

principle. The criticism is another red herring designed to divert attention away from fact.)

Blades of grass, especially of wild grasses are very thin, about 4/100 of an inch. Their lengths vary, but because they are so thin they have very low density. There surface areatodensity ratio is very high. Because trees are much denser, they have a much lower surface area to density ratio. This is one reason trees are much harder to ignite in a wildfire than grasses. (They also contain water whereas dry grasses don't.)

Trees also act as windbreaks. In a grass fire, the velocity of the wind is a critically important factor in determining the fire's speed. Even slight differences in wind velocity can greatly affect the rapidity of a grass fire

The difference in the average speed of a grass fire and a fire involving trees is dramatic. Normally, a grass fire moves about 2 and 1⁄4 times faster than a tree fire. A large grass fire can move at a rate of about 14 mph, a wildland fire involving trees can move at about 6.7 mph. A

 © 2016 Dave Maloney

grass fire starting in Oakland will reach Castro Valley or Walnut Creek in an hour, very little time for evacuation or effective fire suppression. A fire involving trees, should it get out of control, will reach Castro Valley in two hours. (A catastrophic grass fire, like the Black Saturday fires, will spread at a much faster rate).

As stated above only 1% of all wildland fires start in trees. The other 99% start in grasses, bushes and shrubs. (The Oakland Hills fire of 1991 started in grass.) And only 8% of all wildland fires catch trees on fire. *T his means that 91% of all wildland fires do not involve trees at all but are restricted to grasses, bushes and shrubs. I f we decrease the amount of trees in the hills and replace them with grasses we will have dramatically increased the chances of a wildland fire occurring.*

The first NFPA principle violated by the deforestation plan is the logging of trees. Living trees contain much more moisture than dead ones. (Note the logged trees will not be removed from the hillsides.) When a tree

dies its moisture evaporates. It's trunk and the tree are almost always replaced by grasses, and/or shrubs, which are the most flammable natural vegetative fuel.

Trees, because of their thick bark, ability to collect moisture from the air, especially in foggy areas, and branches away from the ground, are the *m ost* fire resistant natural vegetation. Grasses, which will grow in place of the logged trees, are the *l east* fire resistant and most flammable natural vegetation.

The N FPA's Fire Prevention Handbook (Vol II, page 1361) states, "Cured (dry) grass, if present in large and uniform volume, provides the most flammable ground fuel in the region.". There are no modifying conditions in this statement. There are no ifs, ands, or buts. If the most fire resistant vegetation is removed, less fire resistant vegetation (e.g., grasses)will take its place. The second principle violated is leaving dead wood on the ground. It will dry out and become highly flammable.

The worst fire in the history of Angel Island in the San Francisco Bay occurred in 2008. Several years before, dozens of highly fire resistant Blue Gum Eucalyptus trees that were almost directly in the path of the fog and cool air that regularly comes through the Golden Gate were cut down. These trees collected and dripped onto the ground 59" of moisture each year – almost six feet of water — which kept the island's grasses moist. When they were removed, the grasses dried out by midday. The ground where the trees were logged for the first time in decades resembled dry ground in Lake County. The people responsible for the removal of these trees proved how little they know about fire science and the role of trees in preventing wildland fires twice. Once by removing the trees, and again by saying, after the fire, that it would have been worse if the "flammable" trees weren't removed. These are the same people and institutions that are

 © 2016 Dave Maloney

advocating the removal of trees from the East Bay Hills, which will make the East Bay Hills become like the dry, flammable, grassy terrain in Lake County where large, destructive grass fires destroyed Middletown last summer (2015),

What determines the fire resistance of a tree? It has nothing to do with what species a tree is. The structure of a tree determines its fire resistance. Trees that have their lowest branches high above the ground, thick bark, and high moisture content are the most fire resistant. Because most wildland fires begin as grass fires, fires moves rapidly past trees with these qualities. But a grass fire will not blow right past a house. The radiant heat from a grass fire will start a fire on the exterior walls of a wood house and build up heat underneath the eaves of a house and start fires there, which will go to the roof. This is exactly what happened in the Oakland Hills fire of 1991. The burning grasses ignited houses and then the prolonged house fires ignited trees. This was researched and reported by the Oakland and Berkeley Mayors' Task Force, which I served on. But this important fact has been consistently and systematically ignored by those who want to eradicate eucalyptus, Monterey Pine and acacia trees.

Without the hundreds of thousands of trees that have grown in the past 160 years that today act as windbreaks, any grass fire will spread even more rapidly than in 1991. And that fire wasn't contained until the winds dropped and cooling night fog (moisture) moved into the Bay. Grass fires move fast. Relatively small grass fires can reach a speed of 7.5 miles per hour. Large grass fires can attain speeds of 45 miles per hour. These speeds were reached in Australia's Black Saturday fire. This means that if the socalled" fire mitigation" plan is implemented, a grass fire in the Oakland Hills could reach Castro Valley to the South, or Walnut Creek to the East, both *1 5 miles away, in 20 minutes*. Imagine being in your home in Castro Valley or Walnut Creek and being told to evacuate immediately because of a fire burning 15 miles away.

Grasses are flat, about the same thickness as a piece of copy paper, and long. They have a much higher ratio of surface area to density than trees. So grasses catch fire much more easily than trees.

In 1991 I was asked to serve on the Task Force on Emergency Preparedness and Community Restoration, commonly known as the 1991 Oakland/Berkeley Mayors' Fire Storm Task Force. Our mission was to investigate the causes of the '91 fire and make recommendations to prevent its recurrence. The committee spent hundreds of hours analyzing data and examining the burned areas.

In February, 1992, we issued our report to the Mayors and the public. Our recommendations were:

 © 2016 Dave Maloney

"The most important factor in reducing fire danger from vegetation is not removing specific species but regular ongoing maintenance,

The high density of flammable structures contributed significantly to the spread in intensity of the Oakland hills fire. Trees did play a role in spreading the fire, but in many cases the trees caught fire from the houses, not viceversa. The current emphasis on blue gum eucalyptus and Monterey Pine as culprits in the cause of the fire and calls for removal of them are an oversimplification that can lead to negative environmental consequences.

Develop a clearly illustrated vegetation management program based on scientific principles and accepted wildfire management practices.

Provide regular brush removal as well as mulching/composting to encourage residents to maintain vegetation. Particular tree species do not pose a significant fire danger when properly maintained."

All of these recommendations have been ignored by U.C. Berkeley, the City of Oakland and the East Bay Regional Park District.

The behavior of the governmental agencies over the years relative to this discussion has been mysterious. The agency funding the removal of the trees, FEMA, (Federal Emergency Management Agency) received 14,000 comments when it asked for public input on its idea to finance the so called “fire mitigation plans”. 13,000 of the comments, over 90% of them, opposed the project. Most of these were comments from people who live in the affected area. These comments were ignored, and FEMA went ahead and funded the plan. **F EMA even ignored the analysis sent to it by the U.S. Forest Service which stated that the fire hazard mitigation plans calling for removing Eucalyptus trees would increase the chance of a fire.** Initially, FEMA rejected funding the plan, saying it would not reduce fire hazard in the proposed area.

There are over 700 species of Eucalyptus trees. Some of them are extremely fire resistant, e.g., the Blue Gum, and some are not, like the Dwarf Blue Gum. Some of California’s native trees are very fire resistant, like the Redwood and Douglas Fir; some are not, like the Oak tree, which has branches low to the ground which catch fire from a grass fire or fire ladders. But none of the oak trees are to be cut down in the EBRPD plan. But all of the Eucalyptus trees including the highly fire resistant Blue Gum are slated to be removed.

I’m often asked at presentations,, “Why are there so few firefighters and fire departments in the East Bay speaking out against against this plan?” Or, “If these plans are so bad, wouldn’t more

 © 2016 Dave Maloney

firefighters speak out against it?” Or, “I know a fireman who says Eucalyptus trees are more flammable than any other tree, and you’re saying their not. Who am I to believe?” And, “Why are fire departments in the East Bay silent about it, as if they have no opinion? It seems like the only people speaking in favor of the plan are those who want to get rid of “nonnative trees.”

These are good questions and I like when they’re asked. The short answer to all of them is that the U.S. Forest Service supports my views,

and .The National Fire Prevention Association (NFPA) supports my views. I tell them, “Everything I have said is based on sound scientific research and analysis.”

I also answer, “Right off the bat you know that anybody who talks about Eucalyptus trees as if they are all the same species with the same characteristics and attributes is not familiar with what makes a tree flammable. Ask him or her what studies he/she can cite validating their claim that eucalyptus trees are especially flammable.

When I hear innuendo like, “Australian firefighters call them ‘gasoline’ trees.” My response is twofold: 1) Australians don’t use the word “gasoline.” They use the word “petrol.” So I know that you are creating that fiction. I have talked to Australians and I have been told by them that they haven’t heard of anyone saying “Eucalyptus trees are petrol trees.”. 2) “Please name an Australian firefighter who says this.” If there is one that you know, please ask him or her to supply scientific evidence to support that statement. And please ask what species of Eucalyptus is he/she talking about?”

As for why fire departments in the area are silent on this issue, write a letter to the chief of your local fire department. Call or write your local newspaper and ask them to investigate this issue. I personally am surprised the media hasn’t dug into this critically important issue that involves the safety of thousands of people.”

There is also a historic reason why many fire suppression personnel are not familiar with wildland fire prevention and could fall prey to the misinformation that has been spread for years. The fire service is composed of three main divisions: 1) fire suppression; 2) fire investigation and; 3) fire prevention.

Fire suppression *j ustifiably* gets over 99% of the resources and funding available to whatever fire department we’re talking about. 99% of all the personnel in any fire department are in fire suppression. This makes sense, because when a fire starts it *m ust* be contained and suppressed. There is no alternative except destruction. If its not contained and

suppressed it gets bigger and bigger, destroying more and more until it is either suppressed by nature through rain, or it has burned all fuel available to it. Entire cities can be destroyed. And massive amounts of

 © 2016 Dave Maloney

wildland. (In 1910, in Idaho and western Montana the largest forest fire in the history of the United States occurred, burning three million acres of virgin timberland. The fire was extinguished by rain.)

I was lucky to spend a lot of time in fire suppression. I worked at the second busiest fire engine company west of the Mississippi. I've fought over 300 structure fires, and many other kinds of f i r e s . F i r e s u p p r e s s i o n d e a l s w i t h f i r e s *a f t e r* t h e y s t a r t e d . I t s p e c i a l i z e s i n p u t t i n g f i r e s o u t . I t s very knowledgeable about that. Fire suppression is very good at what it does: its training, education and work focus on containing and suppressing fires. Because fire suppression needs to spend so much time practicing for, and putting out real fires it doesn't have time to become conversant in fire prevention, especially wildland fire prevention. This is **n ot** a criticism of fire suppression. It takes a lot of time to become skilled at fire suppression, And it takes a lot of time to become skilled at fire prevention, especially wildland fire prevention.

I had never heard of the National Fire Protection Association when I was in fire suppression. I became aware of it when I entered fire prevention. And I didn't know much about fire prevention until I decided I wanted to be a part of it.
F i r e *i n v e s t i g a t i o n* a l s o g e t s i n v o l v e d *a f t e r* a f i r e h a s s t a r t e d . A r s o n i n v e s t i g a t i o n i s a p a r t o f f i r e investigation. A relatively new discipline called fire ecology is also a part of fire investigation. Fire ecology, not a part of any fire department, concerns itself with prescribed fires and how fuels interact when on fire, and how this interaction affects animal and plant life in the fire area,. Programs in fire ecology are sponsored by many colleges and universities, and fire ecologists are employed by the U.S. Park Service.

The research and analysis of the National Fire Protection Association also comes under the category of fire investigation. The NFPA is not a part of any fire department but its contributions to fire science are immeasurable, and shape many policies that fire departments employ.

Fire prevention takes place *b efore* a fire. A mistake in *s uppression* can lead to disaster. A mistake in fire *p revention* might increase the probability of fire but doesn't guarantee one will start.

Organized fire prevention bureaus began in 1908 with the U.S. Forest Service. From that start the idea of prevention was adopted by urban and rural fire departments. Almost every fire department has its fire prevention bureau or at least a full time fire prevention officer. Very little of the total budget of a fire department goes to the fire prevention office. As stated above, that makes sense. For all the above reasons it is not surprising when fire suppression personnel in

 © 2016 Dave Maloney

the SF Bay Area are as susceptible to non factual propagandistic statements about trees in the genus Eucalyptus as the average "lay" person might be.

The environment that Michelle Myers and Carolyn Jones and the Sierra club want to create will not tolerate a mistake in judgement. The East Bay hills is not a laboratory in which errors can be made and rectified. It is a living phenomena. Creating a fire prone region will lead to a disaster. We have fire science to understand the laws of fire. This understanding informs us how fire originates and behaves. This knowledge of how fire originates and behaves gives us the tools to prevent fires before they happen, whether in the wildland/urban interface, or strictly urban area. Ignoring fire science and proceeding on opinion unsupported by fact is incredibly negligent. Trying to push through fire mitigation plans based on of how one would like the East Bay hills to look; based on restoring the East Bay hills to a bygone era, and not based on fire science will result in disaster. The great Spanish

philosopher Santyana said, “Fanaticism is redoubling your effort while losing sight of your purpose.”

Ignorance and influence are the parents of disaster. The Sierra club, the California Native Plant Society, Claremont Canyon Conservancy and others are very influential organizations. They are misusing their influence by attempting to lead the public into supporting the destruction of our East Bay forests and the creation of grassy, fire prone East Bay hills. And they are being very disrespectful to the entity of fire and the laws of physics which tell us how that entity behaves.

As I stated earlier in this paper, I have been involved in hundreds of fires. I know fire. It is not an abstract, theoretical phenomena to me. It is a reality. Fire is an overwhelming energy, like the ocean. And like the ocean, it is unforgiving to those who don’t *d eeply respect* its strength, energy and behaviors. To live safely with the threat of fire requires an appreciation for those laws of physics which enable us to understand it. Those who approach fire with anything other than awe and **r espect** for how it behaves will be destroyed.

As I stated in my comment to FEMA written in 2009. “There is nothing wrong with advocating for native plant restoration. There is nothing wrong with advocating for land transformation. There is everything wrong with trying to effect either one or both under the guise of wildfire hazard management. It endangers the firefighters who will be called to fight the fires that will be caused by improper wildfire hazard management due to putting ideology ahead of fire science, and imperils the public.”

Appendix O-LD2

Exhibit A

APPENDIX F: 1976 REGENTS' RESOLUTION

"DESIGNATION OF OPEN SPACE RESERVE, ALTERATION OF CAMPUS BOUNDARIES, COMMITMENT OF HOUSES TO RESIDENTIAL USE, AUTHORIZATION TO NEGOTIATE SALE OF PROPERTIES AND COMMITMENT OF TRANSPORTATION STUDIES."

The following recommendations were approved by the Board of Regents on May 21, 1976:

1. That the reserve on Mount Sutro, which was designated as open space for a twenty-five year period by The Regents in October, 1975, be increased from fifty-two to approximately fifty-eight acres, and that the designation be made permanent.

2. That the boundaries of the San Francisco campus be altered to exclude properties on the west side of Third Avenue from 1309-11 Third Avenue to and including 1379 Third Avenue, and that the new boundaries be made permanent. The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent. These restrictions prohibit expansion by UCSF by purchase or condemnation or gift of any property or lease of private residential property not only contiguous with the new campus boundaries, but anywhere within the surrounding area bounded by Golden Gate Park, Oak Street, Ninth Avenue, Clayton and Clarendon. This does not prohibit the use of commercial properties or the affiliation with other public agencies within the area described.

3. That the Regents redefine their commitment, made as part of the October, 1975, approval of the Long Range Development Plan, to return certain existing houses to residential use as alternative campus space and funds for rehabilitation and relocation become available for the activities now housed therein, and that as part of this commitment: The ten houses on Third Avenue, outside the campus boundaries revised as recommended in 2. above, be sold subject to the provisions set forth in 4. below; the thirty-four houses on Third, Fifth, and Parnassus Avenues and on Irving and Kirkham Streets be rehabilitated as required and leased for residential purposes, with priority given to University students, faculty, and staff; and the seven houses on Fourth Avenue remaining after clearance of the site for the School of Dentistry Building project be retained for non-residential campus use.

4. That the Treasurer be authorized to negotiate the sale of the lots and structures, and other improvements thereon, located at 1309-11, 1319, 1325, 1337, 1343, 1355, 1361-63, 1367-69, 1373, and 1379 Third Avenue; the lot between 1355 and 1343 Third Avenue; and the lot between 1309-11 and 1319 Third Avenue, subject to the provisions listed in 4(a) through 4(e) below and that the results of said negotiations be presented to The Regents for final approval and authority to sell based on offers acceptable to The Regents:

    (a) The offer for sale of the two vacant lots shall commence within six months and the offer for sale of all remaining properties shall commence within thirty-six months, except that no relocation of University activities or tenants or conversion of houses for residential uses shall

be initiated until funds for such purpose are on hand as specified in 4(b) below and until space into which activities or tenants can be relocated is available;

(b) A special fund shall be established to fund projects within the Capital Improvement Program for the purpose of, first, providing accommodation for activities displaced by sale of houses, second, providing accommodation for campus activities displaced by conversion of the structures retained for residential use, and, third, converting and rehabilitating the structures retained for residential use, said fund to be funded from proceeds of the sale of the properties, except as noted in 4(c) below, and, if funds are not on hand from the sale of properties, from an advance, as needed, of not to exceed $50,000 from the University Opportunity Fund, such advance to be on a revolving basis and to be repaid with proceeds, as received, from subsequent sale of properties, it being understood that, at the completion of the sale of the properties, any part of the advance not repaid shall be converted to an appropriation;

(c) The portions of the proceeds of the sales of the lots between 1309-11 and 1319, and between 1343 and 1355 Third Avenue, attributable to the eighteen parking spaces currently located thereon, shall be deposited in the Net Revenue Account of the University of California Parking System;

(d) Funds not to exceed $10,000 shall be allocated by the President obtain an appraisal of market value of the properties for use as residences; and

(e) All properties shall be sold in the then existing condition, it being made clear to the buyer that he or she may be required to conform to all applicable State and City and County of San Francisco codes in converting the structures to residential use;

5. That funds not to exceed $25,000 be allocated to the San Francisco campus from the University Opportunity Fund for the purpose of retaining an independent consultant firm to develop additional plans for the alleviation of transportation problems such as traffic, parking congestion, and availability of public transit, it being the intent that such plans be implemented to the extend feasible within resources normally available to the campus for such purposes or within additional State appropriations that might be made available for such purposes;

6. That the Long Range Development Plan for the San Francisco campus, as approved by The Regents in October, 1975, be amended to reflect the described changes in designation of open space, boundaries, and use of housing;

7. That The Regents recognize the principle that the San Francisco campus will be administered so that the annual average of the daily campus population at the Parnassus site will remain substantially in accordance with the projections set forth in the Environmental Impact Report related to the Long Range Development Plan for the campus, approved by The Regents in October 1975.

terryjwatt@gmail.com **Cell: 415-377-6280**

Terry Watt, AICP owns Terry Watt Planning Consultants Ms Watt's firm specializes in planning and implementation projects with a focus on regionally-significant land use and conservation work that advances sustainable development patterns and practices. Prior to forming her own consulting group, she was the staff planning expert with the environmental and land use law firm Shute, Mihaly & Weinberger. She is an expert in general and specific planning and zoning, open space and agricultural land conservation strategies and approaches and environmental compliance, including CEQA and NEPA. Her skills also include facilitation and negotiation, public outreach and project management. Terry is a frequent presenter at regional, national and statewide workshops and symposiums. She holds a master s degree in City and Regional Planning from the University of Southern California and a multi-disciplinary bachelor s degree in Urban Studies from Stanford University.

Terry works with a wide variety of clients throughout California including non-profit organizations, government agencies and foundations. She volunteers up to half her professional time on select projects. Recent projects and roles include:

- Project Manager and Governor s Office Liaison for San Joaquin Valley: Least Conflict Lands for Solar PV project. Project funding came from the Hewlett and Energy Foundation s matched by environmental organizations, the California Energy Commission and other private parties. The objective of the project was to identify areas in the Valley that had very low resource values for renewable energy to serve as an incentive for development of least conflict lands rather than valuable resource lands. Watt was responsible for overall project management and day to day coordination, multi-stakeholder (150 stakeholders) and agency (57 federal, local and agency advisors) outreach and participation, facilitation of meetings Governor s Office convening s all project logistics and project report. Link to Collaboration Platform – Data Basin San Joaquin Valley: http://sjvp.databasin.org/
- Governor s Office Liaison and Outreach Coordinator for the State s portion of the Desert Renewable Energy Conservation Plan (DRECP). As outreach coordinator, worked closely with local governments on DRECP related consistency issues with local general plans.
- Planning Consultant to California Attorney General s Office - Environment Section focusing on climate change, CEQA and general plans. (2007- 2010). While working with the Environment Section, assisted with settlements (Stockton General Plan, Pleasanton Housing Element and CEQA litigation); identified locally based best practices for local government planning to address climate change issues; and managed government outreach and consultation on general plans and climate action plans/energy elements/sustainability planning efforts. Post 2010 continue to provide periodic consulting services to the Environment Section related to select cases.
- Strategic Advisor and Planning Consultant to the Santa Clara Valley Open Space Authority, Greenbelt

Alliance and Committee for Green Foothills for the Coyote Valley Project focused on developing a conservation and development plan for the Valley Watt was responsible for preparing the group s early CEQA comment letter on the negative declaration for a proposed Warehouse Project and assisting with scoping comments for the EIR.

- Measure M-2 Sales Tax and Environmental Mitigation Measure. (2009-). Terry was the Co-project manager/facilitator of a 30+-member environmental coalition that through a unique partnership with the Orange County Transportation Authority (OCTA) and state and federal wildlife agencies generated nearly $500 million in funding for programmatic environmental mitigation (conservation land acquisition and stewardship) in Measure M2, Orange County Transportation Sales Tax.
- State Office of Planning and Research Special Projects (2011 – 2017). Advisor to OPR on General Plan Guidelines, Infill and Renewable Energy Templates as part of the required update of the General Plan Guidelines. Expert panelist for workshops on SB 743.
- Marin Countywide General Plan and Environmental Impact Report (2004 to 2007). Project Manager for the award-winning Marin Countywide Plan Update and its Environmental Impact Report. The General Plan was among the first to incorporate leading edge climate change, greenhouse gas emissions reduction and sustainability policies as well as monitoring, tracking and implementation measures to measure success.
- Staff to the Martis Fund, a joint project of five environmental groups and a Business Group (Highlands Group and DMB Inc.). (2008 – ongoing). The Fund was created as a result of litigation settlement. The Fund has distributed over $15 million dollars since its inception to a range of conservation (acquisition of over 5,000 acres of open space), stewardship and restoration projects and workforce housing projects (emergency rental housing support, down payment assistance and low income apartments). Funding comes from a permanent transfer fee on all real estate sales at Martis Camp. http://www.martisfund.org/PDFs/Martis-Fund-Brochure.pdf
- Tejon Ranch Land Use and Conservation Agreement. (2006 – ongoing). Project coordinator for a dialogue process between environmental groups (Natural Resources Defense Council, Sierra Club, Endangered Habitats League, Planning and Conservation League, Audubon California) and The Tejon Ranch Company that resulted in a major Land Use and Conservation Agreement for the permanent protection of 240,000+ acres (90%) of the 270,000 acre Tejon Ranch. Secretary John Laird refers to the Agreement as a miracle agreement. In return for permanent conservation of + acres environmental groups agreed not to oppose projects within the development footprints; but can comment on regional planning efforts and the projects. Terry has an ongoing role overseeing implementation of the Agreement, including early role forming and managing the Conservancy formed by the Agreement. The Agreement provided the cornerstone of the Habitat Conservation Plan for a major portion of the Ranch; the Tejon Multi-Species Habitat Conservation Plan, TUMSHP, approved in April 2013. She recently joined the Board of the Tejon Ranch Conservancy created and funded by the Agreement.
- Orange County Wildlife Corridor. Project coordinator and architect for dialogue process between environmental and conservation organizations, City of Irvine and Lennar/Five Points development team that resulted in an 8 party Agreement, related general plan amendment and full funding to build an urban wildlife corridor to the specifications of the science team (6-member team jointly selected by all groups) connecting two high value conservation areas in central Orange County (Coastal and Eastern NCCP/HCP lands). Watt provides some ongoing implementation support. Recently (2017) coordinated DEIR comments letters on two Orange County Project proposals that could adversely impact the 5 Point/Irvine Wildlife Corridor.
- Ongoing assistance and authorship of expert comments on projects with recent letters on the proposed draft Amador County General Plan on behalf of the Foothill Conservancy and the proposed Squaw Valley Resort on behalf of a coalition of environmental and labor organizations.

- Facilitator to the Bolsa Chica Land Trust for recent agreement with Landowners to purchase remaining private acres of the Bolsa Chica uplands. Currently assisting with fundraising for the property.
- Advisor to the Nature Conservancy, the American Farmland Trust, Center for Law, Energy and Environment on numerous publications concerning urban infill and conservation.

Land Use Regulation for Resource Conservation

Attachment 2

APPENDIX F: 1976 REGENTS' RESOLUTION

"DESIGNATION OF OPEN SPACE RESERVE, ALTERATION OF CAMPUS BOUNDARIES, COMMITMENT OF HOUSES TO RESIDENTIAL USE, AUTHORIZATION TO NEGOTIATE SALE OF PROPERTIES AND COMMITMENT OF TRANSPORTATION STUDIES."

The following recommendations were approved by the Board of Regents on May 21, 1976:

1. That the reserve on Mount Sutro, which was designated as open space for a twenty-five year period by The Regents in October, 1975, be increased from fifty-two to approximately fifty-eight acres, and that the designation be made permanent.

2. That the boundaries of the San Francisco campus be altered to exclude properties on the west side of Third Avenue from 1309-11 Third Avenue to and including 1379 Third Avenue, and that the new boundaries be made permanent. The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent. These restrictions prohibit expansion by UCSF by purchase or condemnation or gift of any property or lease of private residential property not only contiguous with the new campus boundaries, but anywhere within the surrounding area bounded by Golden Gate Park, Oak Street, Ninth Avenue, Clayton and Clarendon. This does not prohibit the use of commercial properties or the affiliation with other public agencies within the area described.

3. That the Regents redefine their commitment, made as part of the October, 1975, approval of the Long Range Development Plan, to return certain existing houses to residential use as alternative campus space and funds for rehabilitation and relocation become available for the activities now housed therein, and that as part of this commitment: The ten houses on Third Avenue, outside the campus boundaries revised as recommended in 2. above, be sold subject to the provisions set forth in 4. below; the thirty-four houses on Third, Fifth, and Parnassus Avenues and on Irving and Kirkham Streets be rehabilitated as required and leased for residential purposes, with priority given to University students, faculty, and staff; and the seven houses on Fourth Avenue remaining after clearance of the site for the School of Dentistry Building project be retained for non-residential campus use.

4. That the Treasurer be authorized to negotiate the sale of the lots and structures, and other improvements thereon, located at 1309-11, 1319, 1325, 1337, 1343, 1355, 1361-63, 1367-69, 1373, and 1379 Third Avenue; the lot between 1355 and 1343 Third Avenue; and the lot between 1309-11 and 1319 Third Avenue, subject to the provisions listed in 4(a) through 4(e) below and that the results of said negotiations be presented to The Regents for final approval and authority to sell based on offers acceptable to The Regents:

    (a) The offer for sale of the two vacant lots shall commence within six months and the offer for sale of all remaining properties shall commence within thirty-six months, except that no relocation of University activities or tenants or conversion of houses for residential uses shall

be initiated until funds for such purpose are on hand as specified in 4(b) below and until space into which activities or tenants can be relocated is available;

(b) A special fund shall be established to fund projects within the Capital Improvement Program for the purpose of, first, providing accommodation for activities displaced by sale of houses, second, providing accommodation for campus activities displaced by conversion of the structures retained for residential use, and, third, converting and rehabilitating the structures retained for residential use, said fund to be funded from proceeds of the sale of the properties, except as noted in 4(c) below, and, if funds are not on hand from the sale of properties, from an advance, as needed, of not to exceed $50,000 from the University Opportunity Fund, such advance to be on a revolving basis and to be repaid with proceeds, as received, from subsequent sale of properties, it being understood that, at the completion of the sale of the properties, any part of the advance not repaid shall be converted to an appropriation;

(c) The portions of the proceeds of the sales of the lots between 1309-11 and 1319, and between 1343 and 1355 Third Avenue, attributable to the eighteen parking spaces currently located thereon, shall be deposited in the Net Revenue Account of the University of California Parking System;

(d) Funds not to exceed $10,000 shall be allocated by the President obtain an appraisal of market value of the properties for use as residences; and

(e) All properties shall be sold in the then existing condition, it being made clear to the buyer that he or she may be required to conform to all applicable State and City and County of San Francisco codes in converting the structures to residential use;

5. That funds not to exceed $25,000 be allocated to the San Francisco campus from the University Opportunity Fund for the purpose of retaining an independent consultant firm to develop additional plans for the alleviation of transportation problems such as traffic, parking congestion, and availability of public transit, it being the intent that such plans be implemented to the extend feasible within resources normally available to the campus for such purposes or within additional State appropriations that might be made available for such purposes;

6. That the Long Range Development Plan for the San Francisco campus, as approved by The Regents in October, 1975, be amended to reflect the described changes in designation of open space, boundaries, and use of housing;

7. That The Regents recognize the principle that the San Francisco campus will be administered so that the annual average of the daily campus population at the Parnassus site will remain substantially in accordance with the projections set forth in the Environmental Impact Report related to the Long Range Development Plan for the campus, approved by The Regents in October 1975.

OFFICE OF THE MAYOR
SAN FRANCISCO

LONDON N. BREED
MAYOR

January 16, 2020

Chancellor Sam Hawgood
University of California, San Francisco
513 Parnassus Avenue, Room 115 F, Box 0402
San Francisco, CA, 94143

Dear Chancellor Hawgood,

Happy New Year! As we begin this new year, this new decade, we look forward to continuing to work with you and the leadership of UCSF to help advance UCSF's mission of being the leading university dedicated to advancing health worldwide through preeminent biomedical research, graduate-level education in the life sciences and health professions, and excellence in patient care. We know UCSF is devoted at every level to serving the public, and the residents of San Francisco are fortunate to have your 22,500 employees serving them, as well as, to benefit from the nearly $6.5 billion you generate annually for the Bay Area economy.

Working collaboratively has been the hallmark of the City and County of San Francisco and UCSF's relationship over the years. As examples, we can proudly point to UCSF's partnership with our Department of Public Health in operating Zuckerberg General Hospital, or more recently, your assistance reviewing the methodology of the environmental testing surrounding the Shipyard at Hunter's Point. Indeed, both the City and UCSF tremendously benefit from working together.

To that end, and to further this collaborative spirit, as UCSF embarks on its rebuild and, truly, its reimaging of its Parnassus Height Campus, we propose that the City's Planning Department convene a City stakeholder process and directly engage with your planning team on the future design and uses of the campus. We are well aware of your growing needs and of the public's growing demands on your health care system and the services you provide. However, we want to ensure that as UCSF moves forward with its proposal, the input of the City's Planning Department and UCSF's surrounding neighborhoods are heard.

Moreover, as we discuss the growth at Parnassus Heights, the common challenges we both face – housing supply, affordability, transportation infrastructure, demand for more community and social services, and climate and seismic related risks – should be addressed in manners consistent with both UCSF's and the City's polices. By working with the City's Planning Department, the Mayor's office, District Supervisors, and neighborhood residents, we are confident such challenges can be met to address both of our short term and long-term needs.

OFFICE OF THE MAYOR
SAN FRANCISCO

LONDON N. BREED
MAYOR

In 2007, the City and County of San Francisco entered into a Memorandum of Understanding with San Francisco State University, as they embarked on their own campus redesign, which adopted and formalized arrangements for the coordination and consideration of both of our interests and inputs in the context of land use approvals, transportation needs, and ongoing service provisions. This is a model of collaboration that we recommend we pursue jointly as you move forward with the Parnassus project. As a first step in this process, we would like to meet with you and your team to outline a proposal for how such an MOU could be adopted by both of us. Should you have any initial questions or comments, please do not hesitate to contact any one of us. We look forward to discussing this further.

Sincerely,

London N. Breed
Mayor, City and County of San Francisco

Norman Yee
President, San Francisco Board of Supervisors

Dean Preston
Member, San Francisco Board of Supervisors, District 5

PROPOSED POLICY AND PLANNING AMENDMENT

In the context of the recent displays of institutional and structural racism and white supremacy, and the responding popular outcries for deep and lasting transformation, the Planning Department Staff prepared a Resolution requested by the Planning Commission to consider and adopt regarding the centering of the Planning Department's work program and resource allocation on racial and social equity. The Resolution acknowledges and apologizes for the history of inequitable Planning policies resulting in racial disparities; directs the Planning Department to implement its Racial and Social Equity Action Plan; directs the Planning Department to develop proactive strategies to address structural and institutional racism in collaboration with Black and American Indian communities and Communities of Color; directs the Planning Department to amend its hiring and promotion practices to ensure the Department's staff reflects the diversity and demographics of the community at all staff levels; recommends that the Board of Supervisors condemn discriminatory government actions; and directs the Planning Department to build accountability through metrics and reporting.

RESOLUTION CENTERING THE PLANNING DEPARTMENT'S WORK PROGRAM AND RESOURCE ALLOCATION ON RACIAL AND SOCIAL EQUITY; ACKNOWLEDGING AND APOLOGIZING FOR THE HISTORY OF INEQUITABLE PLANNING POLICIES THAT HAVE RESULTED IN RACIAL DISPARITIES; DIRECTING THE DEPARTMENT TO IMPLEMENT ITS RACIAL AND SOCIAL EQUITY ACTION PLAN; DIRECTING THE DEPARTMENT TO DEVELOP PROACTIVE STRATEGIES TO ADDRESS STRUCTURAL AND INSTITUTIONAL RACISM, IN COLLABORATION WITH BLACK, AMERICAN INDIAN AND COMMUNITIES OF COLOR; DIRECTING THE DEPARTMENT TO AMEND ITS HIRING AND PROMOTION PRACTICES TO ENSURE THAT THE DEPARTMENT'S STAFF REFLECTS THE DIVERSITY AND DEMOGRAPHICS OF THE COMMUNITY AT ALL STAFF LEVELS; RECOMMENDING THAT THE BOARD OF SUPERVISORS CONDEMN DISCRIMINATORY GOVERNMENT ACTIONS; AND, DIRECTING THE DEPARTMENT TO BUILD ACCOUNTABILITY THROUGH METRICS AND REPORTING.

PREAMBLE

WHEREAS, the Planning Commission has reflected on the current events of COVID-19 and its disproportionate effects on American Indian communities, Black communities, and communities of color; the murders of George Floyd, Breonna Taylor, Ahmaud Arbery, Alex Nieto, Mario Woods, Luis Góngora Pat, and countless others as a result of police brutality and misconduct; and underlying government and economic structures that create the platform for these events; and

WHEREAS, the San Francisco Human Rights Commission states that racial equity means the systematic fair treatment of people of all Races that results in equal outcomes, while recognizing the historical context and systemic harm done to specific racial groups; and,

WHEREAS, San Francisco has a long history of creating and/or enforcing laws, policies, and institutions that have promoted white supremacy and perpetuated racial inequities in the City and County of San Francisco ("the City"), much of which is difficult to document due to historical erasure. The conditions that have created such racial inequities are also compounded by the intersection of race with class, gender,

sexuality, immigration status, disability, and other social identities and experiences that result in inequitable treatment or opportunities; and,

WHEREAS, using the power of zoning and land use, the City, its Planning Department ("Department") and other government agencies and private organizations have intentionally advanced policies aligned with white supremacy to segregate, displace, dispossess and extract wealth from Black communities, the American Indian community, and other communities of color. With the acknowledgement that this list is by no means exhaustive, examples include but are not limited to the following: Our history of state-sanctioned racism began with the genocide, exploitation, and dispossession of resources of the American Indian people on whose land our state and nation were founded. The City's 1870 Cubic Air Ordinance and 1880 Laundry Ordinance targeted the Chinese population using appeals of public safety to limit where they could live and work. Starting in the 1930s, Federal policies like redlining and local practices like racial covenants explicitly blocked American Indians, Black people and people of color from loans for homeownership and maintenance, as well as access to neighborhoods with good services and jobs; these policies led to cycles of disinvestment, segregation and poverty concentration among these communities. In 1942, in response to the bombing of Pearl Harbor, San Francisco aided the federal government in the forced eviction and internment of thousands of people of Japanese ancestry. In 1945, the Department identified neighborhoods that were predominately people of color as "blighted," including the Western Addition, South of Market, Chinatown, the Mission, and Bayview/Hunter's Point, and used this designation to justify the wholesale removal of Black communities and other communities of color through eminent domain. Furthermore, in the early 2000s, people of color were more likely to receive subprime housing loans than White borrowers. These predatory lending practices led to the foreclosure crisis starting in 2008, disproportionately impacting Black, Latinx, American Indian, and low-income people; during this period, middle-income Black and Latinx households lost nearly one-half of their wealth due to foreclosure. The cumulative impacts of these and other policies have resulted in the persistent outmigration and displacement of communities of color: the American Indian community in San Francisco experienced a decline from 0.5% of the population in 2006 to 0.1% today; while the Black community in San Francisco decreased from 11% of the City's population in 1990 to 5% in 2018; and,

WHEREAS, Although the City has taken steps to undo the damage caused by past policies and practices, the racial disparities caused continue to the present day. Despite progress in addressing explicit discrimination, racial inequities continue to be deep, pervasive, and persistent in San Francisco. In the 1950s and beyond, particularly in the context of a national Civil Rights Movement, systemic racism in San Francisco became much less explicit. Moving away from overtly race-based exclusionary policies regarding land or business ownership, the City's more recent and increasingly sophisticated racism has been defined by inaction or lack of intervention with regards to racial discrimination in employment, housing, neighborhood choice (through implicit exclusionary zoning), education, health care, or the criminal justice system; and,

WHEREAS, the legacy of these discriminatory policies is that San Francisco's American Indian, Black , and people of color have historically been, and many currently are, denied equal access to essential services and means of creating wealth, including affordable housing and homeownership opportunities, high-performing public schools, adequate transportation options, safe parks and open spaces, affordable health care, access to financial capital and entrepreneurship opportunities, and stores selling healthy food, among others; and,

WHEREAS, San Francisco's American Indian, Black, and people of color have historically been, and many currently are, disproportionately exposed to more environmental stressors including air and soil pollution, illegal dumping, industrial uses and transportation impacts, and are more likely to live in housing conditions where degraded indoor air quality contributes to the prevalence of asthma, other airborne diseases, and other health disparities; and,

WHEREAS, stark disparities continue to exist for City residents along racial lines. Race predicts worse outcomes for people of color across key indicators, including education, income, health, and incarceration, among others. For example, household income for White households is close to three times that of Black families and close to double that of American Indian and Latinx households, respectively. 53% of inmates in San Francisco County Jail are Black, while they only comprise about 5% of the City's total population. In 2018, American Indian and Black San Franciscans were more than three times more likely to be unemployed than Whites (11.9% and 12.5% versus 3.6%, respectively); and unemployment rates were similarly high for Native Hawaiian / Pacific Islanders (8.8%) and Latinxs (9.4%); and,

WHEREAS, The 2019 San Francisco Community Health Needs Assessment conducted by the San Francisco Health Improvement Partnership ("SFHIP") found that racial health inequities and poverty were foundational issues affecting the health of San Franciscans, impacting life expectancy, infant and maternal health, nutrition, stress, heart disease, and more. For example, in 2015-2017 the life expectancy in San Francisco was 72.1 years for Blacks, 76 years for Pacific Islanders, 81.7 years for White people, 85.1 years for Latinxs, and 87 years for Asians. (San Francisco data on American Indians was not included; such data is often unavailable in urban areas due to low population counts, which perpetuates disparities in documentation and policies that address their community needs.) The rates of asthma and COPD hospitalizations in the Black community are more than 10 times higher than for Asians; Pacific Islanders have the second highest rates. In San Francisco, Black women are twice as likely as White women to give birth prematurely, and Black and Pacific Islander women have the highest rates of prenatal morbidity. SFHIP also found that between 2007 and 2016, Black mothers had about 4% of births in San Francisco, but experienced 50% of maternal deaths, and 15% of infant deaths. While data on health outcomes in the American Indian population in San Francisco is limited, this community also faces persistent health disparities across a number of indicators. For instance, even though the overall rate of infant mortality in California has been declining since 2005, the American Indian/Alaska Native infant mortality rate in California remains high, averaging 6-7 infant deaths per 1,000 live births between 2005 and 2012; and,

WHEREAS, the impact of the redlining that went into effect in 1937 in San Francisco can still be seen today: 87% of redlined neighborhoods in San Francisco are neighborhoods currently undergoing displacement. The 2010 Census data showed a decline in the number of children of every racial group (including American Indian, Black, Latinx, and Asian and Pacific Islander) residing in San Francisco except white and multiracial children. Between 1990 and 2014-15, as housing prices rose, neighborhoods became more segregated, with the share of Black households in San Francisco living in high-poverty neighborhoods increasing from 41% in 2000 to 65% in 2015 (compared to Asian (27%), Latinx (19%), and White (12%) households). 50% of Black households, 31% of American Indian, and 30% of Latinx households are severely burdened by housing costs (spending more than 30% of their income on housing) while 16% of White households are similarly burdened. American Indian, Black, and Latinx residents have the lowest home ownership rates, at 0.3%, 4%, 9%, respectively. Latinxs reported the highest percentage of having been

threatened with eviction (24%), with 11% of those evictions having been raised with no cause, exceeding the percentage of no-cause evictions for other racial groups. 34% of Latinxs also reported having faced unstable living conditions in the last five years, with 36% stating they would have no other housing options if they were forced to move from their current residence.

WHEREAS, racial disparities in the rates of infection and death from COVID-19 have been documented, with American Indian, Black, and people of color disproportionately impacted by the disease. As of June 3rd, 2020 COVID-19 data for San Francisco, , indicate that Black communities in San Francisco comprised 9.3% of deaths, even though they comprise 5% of the population; Latinx communities comprised 47.8% of diagnosed cases (and comprise 15.2% of the population); American Indian communities comprised 0.4% of diagnosed cases (and comprise 0.1% of the population); and Asian communities comprised 46.5% of deaths (and comprise 34.1% of the population). In the April 2020 UCSF assessment in Mission District, 90% of the Latinx people tested for COVID-19 were positive, The health and economic impacts of the pandemic are exacerbating the existing disparities; and,

WHEREAS, Black and American Indian people are overrepresented among the homeless population. The 2019 San Francisco Homeless Count and Survey found that 37% of people experiencing homelessness were Black, while they represent only 5% of San Francisco's population. Overrepresentation in the homeless population was also high for American Indians (5% compared to 0.1%) and Pacific Islanders (2% compared to 0.2%). Of all people surveyed, 61% reported not being able to afford rent and 37% reported having no income. Discrimination and lack of access to opportunities for American Indian, Black and people of color put them at a higher risk of homelessness; and,

WHEREAS, San Francisco and other cities across the nation are part of a movement to eliminate institutional racism in partnership with the Government Alliance on Race and Equity (GARE), a national network dedicated to achieving racial equity and advancing opportunities for all. The Department's ongoing participation in GARE since January 2016 has given staff the training, tools, and support to build the Department's organizational capacity to advance racial equity in its programs, policies, and services; and,

WHEREAS, the Board of Supervisors, through Resolution No. 190547 on July 11, 2019, amended the Administrative Code to create an Office of Racial Equity as a Division of the Human Rights Commission, with authority to create a citywide Racial Equity Framework, analyze the impact of Board ordinances on racial equity, and create a racial reconciliation process; require City departments to create Racial Equity Action Plans and to provide annual updates on such Plans; require City departments to designate employees as racial equity leaders, and require the Department of Human Resources to produce an annual report concerning racial equity in the City workforce; and,

WHEREAS, in the coming years the Department will amend the General Plan through adoption of updated Housing and Transportation Elements, adoption of a Preservation Element, and updates to incorporate environmental justice, racial and social equity, and climate resilience across all relevant elements. On May 28, 2020, the Department launched the first of these updates: the Housing Element 2022 Update. The Housing Element policies will be grounded on the following values: racial and social equity, minimum displacement, more housing for all in all neighborhoods, and neighborhoods resilient to climate and health crises. The Transportation Element will be the next Element to undergo an update and will center its

policies in ConnectSF's goals of equity, economic vitality, environmental sustainability, safety and livability, and accountability and engagement; and,

WHEREAS, the Planning Commission (Commission) adopted the Racial & Social Equity Action Plan, Phase I on November 21, 2019 to guide the Department and Commission actions to strengthen our internal-facing processes and practices to address disparities in the Department's internal functions to advance organizational equity, through strategies that include: ongoing training for all staff; a biannual staff survey to assess Department attitudes and progress towards racial and social equity; and an interim Racial & Social Equity Assessment Tool to apply to relevant projects, policies, and practices; and,

WHEREAS, the Planning Commission adopted a Racial & Social Equity Vision on November 21, 2019, which envisions: inclusive neighborhoods that provide all with the opportunity to lead fulfilling, meaningful, and healthy lives; a city where public life and public spaces reflect the past, present and future of San Franciscans; a city where a person's race does not determine their lives' prospects and success; an inclusive Planning Department and Commissions that represent and engage the communities we serve; a Department that proactively infuses racial and social equity in both internal operations and external Planning work; and reimagines what the Planning field is and can be – inclusive, diverse and one that centers racial and social equity both as a practice and as an indicator of success; and

WHEREAS, the Planning Commission directed the Department to develop a Racial & Social Equity Action Plan, Phase II in collaboration with the new Office of Racial Equity, other City agencies, the Mayor's Office, the Board of Supervisors, and community stakeholders, to carefully examine and address legacy racial and social inequities and disparities in the Department's programs and policies and to develop Phase II with bold and forward-thinking strategies to advance racial and social equity in San Francisco; and,

MOVED, that the Commission considered public comment and reviewed the information before them and hereby adopts this Resolution.

FINDINGS

Having reviewed the materials identified in the preamble above, and having heard all testimony and arguments, this Commission finds, concludes, and determines as follows:

The Resolution directs the Planning Department to center its work program and resource allocation on racial and social equity; acknowledges and apologizes for the history of racist, discriminatory and inequitable planning policies that have resulted in racial disparities; directs the Department to develop proactive strategies to address and redress structural and institutional racism, in collaboration with Black and American Indian communities and communities of color; directs the Department to amend its hiring and promotion practices to ensure that the Department's staff reflects the diversity and demographics of the community at all staff levels; recommends that the Board of Supervisors condemn discriminatory government actions; and directs the Department to build accountability through metrics and reporting.

General Plan Compliance. The Resolution is in conformity with the General Plan's overall principles and discussion of preserving the cultural and economic diversity of our neighborhoods, although further changes to the General Plan may be needed to implement better the Planning Department's racial and social equity policies. While the current General Plan contains some discussion of equity as indicated in the

sections listed below, current objectives and policies across Elements do not adequately address disparities that are closely associated with race as well as other vulnerable populations.

I. HOUSING ELEMENT

POLICY 5.3. Prevent housing discrimination, particularly against immigrants and households with children.

POLICY 9.3. Maintain and improve the condition of the existing supply of public housing, through programs such as HOPE SF.

II. COMMERCE AND INDUSTRY ELEMENT

OBJECTIVE 3. PROVIDE EXPANDED EMPLOYMENT OPPORTUNITIES FOR RESIDENTS, PARTICULARLY THE UNEMPLOYED AND ECONOMICALLY DISADVANTAGED.

III. RECREATION AND OPEN SPACE ELEMENT

POLICY 1.2. Prioritize renovation in highly-utilized open spaces and recreational facilities and in high needs areas.

IV. TRANSPORTATION ELEMENT

POLICY 1.7. Assure expanded mobility for the disadvantaged.

V. COMMUNITY FACILITIES ELEMENT

POLICY 3.6 Base priority for the development of neighborhood centers on relative need.

VI. COMMUNITY SAFETY ELEMENT

OBJECTIVE 4. ASSURE THE SOUND, EQUITABLE AND EXPEDIENT RECONSTRUCTION OF SAN FRANCISCO FOLLOWING A MAJOR DISASTER.

VII. ARTS ELEMENT

OBJECTIVE II-2. SUPPORT ARTS AND CULTURAL PROGRAMS WHICH ADDRESS THE NEEDS OF DIVERSE POPULATIONS.

VIII. AIR QUALITY ELEMENT

POLICY 4.3. Minimize exposure of San Francisco's population, especially children and the elderly, to air pollutants.

IX. BAYVIEW HUNTERS POINT AREA PLAN

OBJECTIVE 15. COMBINE SOCIAL REVITALIZATION WITH PHYSICAL AND ECONOMIC REVITALIZATION EFFORTS.

POLICY 15.3. Make maximum use of Indigenous community resources to increase civic pride and support physical and economic revitalization.

X. CHINATOWN AREA PLAN

OBJECTIVE 1. PRESERVE THE DISTINCTIVE URBAN CHARACTER, PHYSICAL ENVIRONMENT AND CULTURAL HERITAGE OF CHINATOWN.

XI. EAST SOMA AREA PLAN

OBJECTIVE 7.3. REINFORCE THE IMPORTANCE OF THE SOUTH OF MARKET AS THE CENTER OF FILIPINO-AMERICAN LIFE IN SAN FRANCISCO.

XII. MISSION AREA PLAN

OBJECTIVE 7.3. REINFORCE THE IMPORTANCE OF THE MISSION AS THE CENTER OF LATINO LIFE IN SAN FRANCISCO .

XIII. WESTERN SOMA AREA PLAN

OBJECTIVE 9.4 REINFORCE THE IMPORTANCE OF THE SOUTH OF MARKET AS A CENTER FOR FILIPINO-AMERICAN AND LGBTQ LIFE IN SAN FRANCISCO.

POLICY 9.4.3. Protect and support Filipino, LGBTQ and other minority or culturally significant local business, structures, property and institutions in Western SoMa.

POLICY 9.4.6. Prioritize maintenance and support funding for cultural and service facilities that support Filipino-Americans, such as the Bayanihan Center, the Filipino Education Center, and the West Bay Pilipino Multi-Services Center.

THEREFORE, BE IT RESOLVED, that the Planning Commission condemns all forms of racism, sexism, homophobia, ableism, and other forms of discrimination; and affirms that all people – which explicitly includes American Indian people, Black and people of color – have a right to be in our City and have a right to safe and affordable housing, neighborhoods free from pollution and violence, opportunities for educational advancement and wealth creation, and access to essential services such as parks, transportation, health care, and places selling healthy food, among others; and,

BE IT FURTHER RESOLVED, that the Planning Commission stands in solidarity with the civil unrest and demands for justice of our fellow San Franciscans and communities across the nation, and affirms that Black Lives Matter; and,

BE IT FURTHER RESOLVED, that the Planning Commission must carry its responsibility for guiding the development of our city, streets, and open spaces with a central planning focus on racial and social equity; and,

BE IT FURTHER RESOLVED, that the Planning Commission condemns and apologizes for government practices that have resulted in and continue to have disproportionate impacts upon American Indian people, Black people, and people of color, including racist, discriminatory, and inequitable land use planning policies, programs and government actions, such as redlining, exclusionary zoning, racial covenants, urban renewal and discriminatory enforcement of land use policies; and,

BE IT FURTHER RESOLVED, that the Planning Commission recommends that the Board of Supervisors condemn all discriminatory government practices, including law enforcement practices that have resulted in a disproportionate number of American Indian people, Black people and people of color dying at the hands of law enforcement; and,

BE IT FURTHER RESOLVED, that the Planning Commission recommends that the Board of Supervisors reallocate resources towards expanding access to open space, housing, transportation, and services for American Indian, Black, and communities of color; and that it minimize the negative impacts of budget cuts due to the COVID-19 pandemic on these communities; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs all Department staff to move beyond acknowledgement of injustice and take concrete actions that are visible in the reallocation of resources and work program to (1) increase the American Indian and the Black population and provide stability to communities of color; (2) expand access to open space, housing, transportation, quality amenities and public services, and reduce exposure to environmental pollution in these communities, while ensuring that such investments do not lead to displacement or exacerbate inequities; and, (3) develop and expand participation for American Indian, Black and communities of color ; and

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to collaborate with the Office of Racial Equity (ORE) to align its work with ORE's framework to dismantle structural and institutional racism, which asserts that the City's work shall: (1) Affirmatively address racial and social inequities; (2) Assert that housing is a human right, and prioritize equitable housing development without displacement of American Indian, Black, and communities of color; (3) Develop public land strategies to meet affordable and inclusionary housing goals; (4) Support wealth-building through home ownership for American Indian, Black, and communities of color; (5) Champion housing choice by dismantling exclusionary zoning policies; (6) Promote environmental justice; and (7) Redress the consequences of government-sanctioned racial harm via meaningful City-supported, community-led processes; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs Department staff to expand the implementation of Phase I of the Racial & Social Equity Action Plan, to ensure that the Department's internal practices are thoughtfully examined and amended to advance racial and social equity across all of its core functions; and

BE IT FURTHER RESOLVED, that the Planning Commission directs Department staff to devote the resources necessary for the successful completion and implementation of Phase II of the Racial & Social Equity Action Plan to ensure that its plans, policies and programs actively address and redress structural and institutional racism; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs Department staff to address racial and social equity as it develops policies and programs to respond to the health, economic and housing crises resulting from the COVID-19 pandemic, prioritizing meeting the needs of Black communities, American Indian communities, and communities of color through its policies and programs to support the adaptive use and design of the public realm, community engagement and planning, protection of tenants and cultural resources, affordable housing preservation and production, streamlining and other support for small businesses, and funding for public services and infrastructure, among others; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to assess, strengthen and fund its outreach and engagement strategies to ensure that American Indian, Black and communities of color have true access to representation and participation in planning processes, as well as resources for participatory capacity building; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to amend the General Plan to incorporate policies that explicitly prioritize racial and social equity for American Indian communities, Black communities, and communities of color; that subsequent amendments to the General Plan utilize a racial and social equity lens; and

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to change hiring and promotion practices to correct the underrepresentation of American Indian people, Black people, and people of color across all staff levels and ensure the workforce reflects the needs of our communities; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to build accountability by identifying actions it will implement to advance racial and social equity, including developing performance measures, incorporating a racial and social equity lens in budgeting decisions, and reporting to the Commission on its progress at regular intervals; and,

BE IT FURTHER RESOLVED, that the Planning Commission asserts that the responsibility for implementing these structural and institutional changes falls upon all Department staff, across all levels and functions, and that it should not fall solely or disproportionately upon the American Indian, Black, or people of color staff who are already burdened with their lived experiences of racism; and,

NOW THEREFORE BE IT RESOLVED that the Commission hereby APPROVES the proposed Resolution on June 11, 2020.

The Bay Area Today
The Regional Housing Crisis
Legacy of Leadership
A Call to Action

The Regional Housing Crisis

No matter what, the future will bring major challenges. Overburdened infrastructure, climate change, disruptive technological innovation, and the changing regional and national economy are just some of the many issues that will call for coordinated and concerted regional action. One challenge above all, however, requires immediate attention: housing.

The Bay Area's housing affordability and neighborhood stability crisis has been decades in the making. Although the housing crisis has many components, its foundation is clear: there simply is not enough housing, whether market-rate or affordable, given the growing number of residents and jobs.

Instead of increasing housing supply to accommodate household and employment growth, for example, many local governments slowed permitting over time. Concurrently, the state and federal governments have pulled back financial support for affordable housing. Given a limited supply of both market-rate and affordable housing, combined with strong demand driven by exceptional regional economic performance, rents and home prices have risen rapidly. Today the Bay Area may have the most severe housing crisis of any of the nation's large metro areas and, at this time, there are limited policy tools to help address the problem at a regional level.

Legacy of Leadership
A Call to Action

Supply, Demand and the Impacts of Income Inequality

The Bay Area's rate of housing construction first started to lag in the mid-1970s. Each subsequent decade has seen lower levels of overall housing permitting, as seen in Figure 1.2. Since 1990, other metropolitan regions with strong economies and growing populations, such as Washington, D.C., Seattle and Denver, have permitted housing units at significantly higher rates than the Bay Area. New housing construction in the Bay Area has been much more akin to slower growing, older metropolitan regions such as Philadelphia and New York.

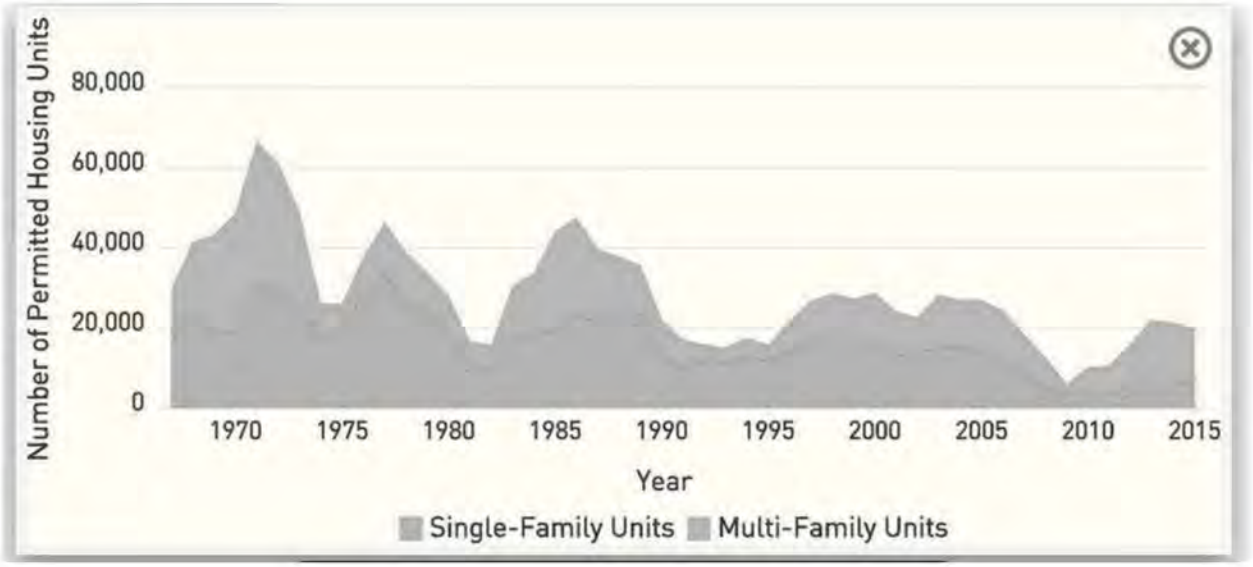

FIGURE 1.2 The historical trend for annual permitted housing units in the Bay Area. This graph shows the historical trend of permitted units for both single-family and multi-family units in the Bay Area, stretching back several decades. As can be seen, annual growth in permitted units stagnated even during the employment booms of the 1990s and 2010s.
Source: Vital Signs; Construction Industry Research Board, 1967–2010; California Homebuilding Foundation/Construction Industry Research Board, 2011–2015

There has been a particular mismatch between employment growth relative to the housing supply. Overall, the Bay Area has added nearly two jobs for every housing unit built since 1990. The deficit in housing production has been particularly severe in terms of housing affordable to lower- and middle-wage workers, especially in many of the jobs-rich, high-income communities along the Peninsula and in Silicon Valley. The booming regional economy combined with increased household formation among the millennial generation has further contributed to an evermore-acute housing crunch.

The widening income gap between high- and low-income households has further exacerbated the housing crisis. As seen in Table 1.1, the total number of households in the nine-county Bay Area increased by 20 percent from 1990 to 2015. The vast majority of this growth, however, was concentrated among households earning $150,000 or more annually, with the remaining growth among households earning less than $35,000 a year. Over a period spanning 25 years, there was a net decrease in the number of households earning between $35,000 and $149,999 in the Bay Area, as these households declined from 64 percent to 52 percent of total households in the region.

The Regional Housing Crisis
Legacy of Leadership
A Call to Action

Bay Area Household Income*	1990		2015		Change from 1990 to 2015	
	Number of Households	Percent of 1990 Total**	Number of Households	Percent of 2015 Total**	Growth/ (Decline) in Households	Percent of Household Growth
Less than $35,000	446,000	20%	550,000	20%	104,000	+23%
$35,000 to $74,999	645,000	29%	625,000	23%	(20,000)	-4%
$75,000 to $149,999	785,000	35%	793,000	29%	8,000	+2%
$150,000 or more	375,000	17%	741,000	27%	366,000	+80%

The Regional Housing Crisis
Legacy of Leadership
A Call to Action

These dynamics have had significant implications for the Bay Area housing market. With the increased number of higher income households and most income growth going to the top 20 percent, demand for housing has remained very strong at the upper end of the market. Conversely, it has become more difficult for low- and middle-wage households to compete for market-rate housing as a larger pool of high-wage workers bid up a limited housing supply. This has further intensified competition for scarce affordable housing opportunities.

Policy Contributors to the Housing Crisis

What led to such a mismatch between housing supply and demand? Why does the Bay Area today lack so much needed housing, especially housing affordable to low- and moderate-income households? The causes of this situation are complex and there are many competing interpretations of the available evidence, including a range of economic and demographic factors that extend beyond the Bay Area itself.

Generally, however, the policy drivers — things that local, regional and state governments have the power to address or alleviate — fall into a few interrelated categories: regulatory barriers and tax policy challenges that act to restrict the production of all types of housing, especially infill development; and insufficient support for affordable housing.

The Bay Area Today
The Regional Housing Crisis
Legacy of Leadership
A Call to Action

Regulatory Barriers and Tax Policy Challenges

Although the availability of developable land in the Bay Area is limited due to topography and protected conservation lands, state and local regulations often prevent instead of promote higher-density, mixed-use development in urban infill areas. Lengthy review processes in many communities stall transit-oriented projects long enough to make them infeasible, leading to the loss of grant funding and private investment that would otherwise flow into cities along with desperately needed new housing. The California Environmental Quality Act (CEQA) often acts as another obstacle to both affordable and market-rate housing. Although CEQA has been essential for improving air quality and protecting natural habitats, the law is sometimes used as a litigation tool for blocking projects that are otherwise designed to advance California's environmental policy objectives, such as reducing greenhouse gas (GHG) emissions.

In addition, the current approach to taxation creates incentives to attract development that maximizes sales tax revenues and minimizes costs for public services (such as schools, police and social services), rather than encouraging more balanced approaches to land use. This trend — the so-called "fiscalization of land use" — has discouraged housing development and small business growth in many communities. The tax revolt measures of 40 years ago, such as Proposition 13 and other restrictions on new funding sources, caused many jurisdictions to view housing as a "fiscal loser" because property tax rates were capped below the cost of delivering services compared to retail or commercial development. Commercial property owners also often lack the motivation to develop vacant parcels since the cost of holding these properties is relatively low and a potential windfall from rising land values over time is relatively high.

Legacy of Leadership

A Call to Action

Finally, as part of the 2011 Budget Act, the California Legislature approved the dissolution of the state's 400+ redevelopment agencies. California is now one of a small number of U.S. states without tax increment financing to support urban infill development.

Reduced Support and Insufficient Progress in Building Affordable Housing

In addition to the regulatory and tax policy challenges cited above, recent years have seen major reductions in funding for affordable housing programs at both the state and federal levels. There has also been insufficient progress in the production of "naturally occurring" affordable housing — unsubsidized rental units that are affordable to low- and moderate-income households. This has severely affected the region's low- and moderate-income households by further reducing the supply of new and existing affordable housing, whether government-subsidized or market-rate, especially given median wage deflation from 2000–2013.

Since 2000, for example, there have been cuts of over 50 percent to federal affordable housing programs, and most remaining federal funds go to rehabilitation rather than increasing supply. At the state level, the aforementioned dissolution of redevelopment agencies eliminated a large source of funding for affordable housing, including a loss of more than $200 million for the Bay Area in 2011 alone, according to Enterprise Community Partners and the Non-Profit Housing Association of Northern California.

The Regional Housing Crisis

Legacy of Leadership

A Call to Action

The production of housing affordable to low- and moderate-income households has lagged behind production of housing affordable to higher-income households, with the most significant shortfall occurring in the moderate or middle income category — housing that is typically produced by the market without subsidy in most metro regions. From 1999 to 2014, the Bay Area issued permits for only about 35 percent of the units required to meet the needs of vulnerable populations such as low-income families, seniors and the homeless. This left over 100,000 needed affordable housing units unbuilt.

At the same time, much of the older housing stock that typically forms the backbone of "naturally occurring" affordable housing is located in higher density, transit rich areas that have experienced gentrification pressures and the loss of affordable units, further exacerbating the challenges of sluggish affordable housing production. Moving forward, the annual funding needed to build an adequate supply of low- and moderate-income housing through cost-restricted units rather than through market mechanisms is estimated at $1.4 billion annually, according to the Association of Bay Area Governments (ABAG).

Impacts on the Region's Present and Future

The housing crisis raises major concerns about negative impacts to the region. Affordability, a primary concern of Bay Area residents, continues to be a major challenge. This in turn poses risks to the Bay Area's socioeconomic diversity, transportation system, environmental goals and robust economy.

The Bay Area Today

The Regional Housing Crisis

Legacy of Leadership

A Call to Action

Housing Affordability

Housing affordability has significantly worsened over time. Home prices are at record levels in some counties and near record levels in the rest. Rent payments have almost doubled in real dollars since the 1970s. While median wages are close to the top nationally, the Bay Area has by far the highest median home sale prices of any major metro region in the country, as shown in Figure 1.3. The region is now also home to three of the five most expensive rental markets in the nation, according to Zillow.

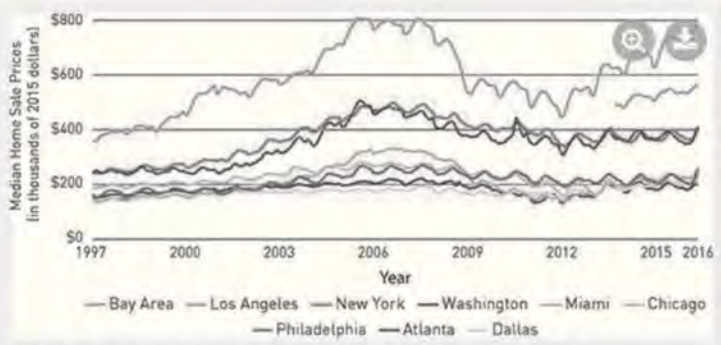

FIGURE 1.3 Median home sale prices by metro area from 1997 to 2016.
Over the last 20 years the Bay Area has seen one of the "spikiest" real estate markets in the country, with bigger booms and busts than other large metros. In particular, prices have risen much faster in the Bay Area coming out of the recent Great Recession.
Source: Vital Signs; Zillow, 1997–2016

The Regional Housing Crisis

Legacy of Leadership

A Call to Action

The prospects and benefits of home ownership are simply out of reach for many Bay Area households. Amid the affluence and new wealth generated in the post-recession era, approximately 24 percent of the Bay Area's population lives below 200 percent of the federal poverty level, and the vast majority of households with annual incomes below $50,000 experience an excessive housing cost burden, as shown in Figure 1.4.

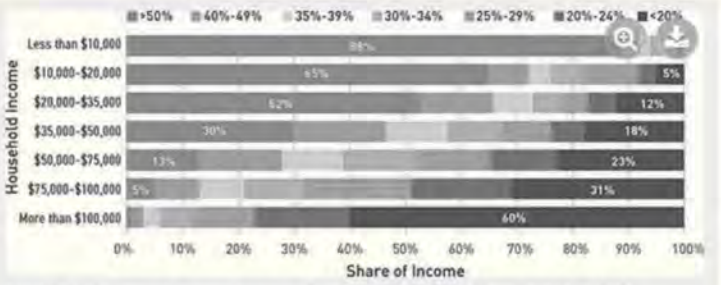

FIGURE 1.4 Share of income spent on housing by Bay Area households in 2015, segmented by income level.
A significant majority of households earning less than $35,000 in the Bay Area spent more than 50 percent of their household income on housing in 2015.
Source: Vital Signs; U.S. Census Bureau/American Community Survey, 2015

Displacement and Quality of Life Concerns

While the cost of housing has increased significantly for both owner and renter households, renters are also at higher risk for displacement during periods of growth and expansion. Currently there are hundreds of thousands of lower-income households at risk of displacement in the Bay Area, with the majority of them living in San Francisco, Santa Clara and Alameda counties.

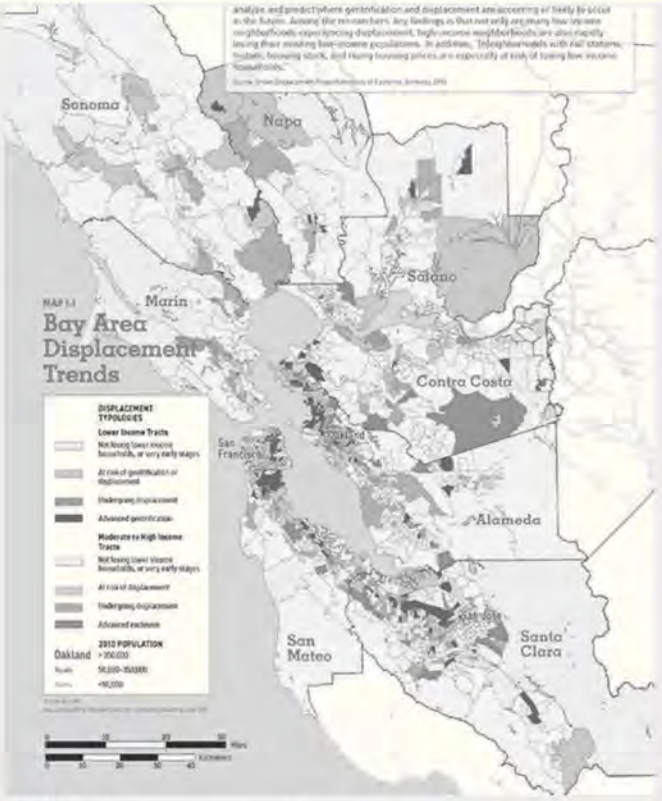
The lack of adequate tenant protections — or availability of subsidized or "naturally affordable" market-rate units in neighborhoods with quality transit service and other amenities — has accelerated the displacement of lower-income residents and even many businesses from the region's core urban areas. As shown in Map 1.1, displacement is no longer just a San Francisco problem, but a region-wide challenge.

The Bay Area Today

The Regional Housing Crisis

Legacy of Leadership

A Call to Action



MAP 1.1 Bay Area displacement trends.
Scholars at UC Berkeley looked at regional housing, income and other demographic data to analyze and predict where gentrification and displacement are occurring or likely to occur in the future. Among the researchers' key findings is that not only are many low-income neighborhoods experiencing displacement, high-income neighborhoods are also rapidly losing their existing low-income populations. In addition, "[n]eighborhoods with rail stations, historic housing stock, and rising housing prices are especially at risk of losing low-income households."
Source: Urban Displacement Project/University of California, Berkeley, 2016

Given insufficient support for affordable housing, many individuals who perform important but lower- paying jobs face either substandard or overcrowded and unhealthy housing; costly, long-distance work commutes; or sometimes even homelessness — the most severe expression of the region's housing shortage. Rising prices in the region's core have driven many lower-income households to outlying jurisdictions farther away from jobs, transit and amenities, even as low- and middle-wage job growth has been concentrated in three counties: San Francisco, San Mateo and Santa Clara. This shift contributes to increased development pressures on open space and agricultural lands, more pollution from passenger vehicles, adverse health impacts, higher transportation costs, and greater levels of highway and transit congestion.

Appendix 26

Introduction

The San Francisco Bay Area continues to be one of the country's least affordable housing markets. The region's lack of housing and limited affordability have significant ramifications for the people who currently live here, the people who once lived here but have been forced to move elsewhere and the people who used to be housed but now live on the street.[1] These housing pressures are remaking the region's diversity,[2] culture, economy and environment. Limited housing affordability and its impacts across California have dominated the state legislative conversation, resulting in groundbreaking state legislation that has the potential, for the first time in decades, to move the needle on addressing the housing crisis.

And yet much more needs to be done if the Bay Area is going to become a region that builds enough housing for all of the people who want to live here — and for the children of those people to be able to stay here when they grow up.

SPUR is developing a Regional Strategy to envision what the Bay Area could be like 50 years from now if the region is successful in addressing the housing crisis, making great places that support a high quality of life, creating a transit system that works and combating climate change so that future generations can continue to comfortably inhabit this planet.

As part of this effort, we are delving into the causes, nature and sheer size of the housing crisis to make sure the solutions we propose are far-reaching enough to address the scale of the problem. We are testing our proposed solutions for "enough-ness" so that the region's policies don't just continue tinkering around the edges but, when taken together, actually solve the problem. It won't be easy to do. But it is SPUR's hope that by laying out the challenge in all of its complexity, we can help local, regional and state government adopt solutions that will ultimately have a chance of working.

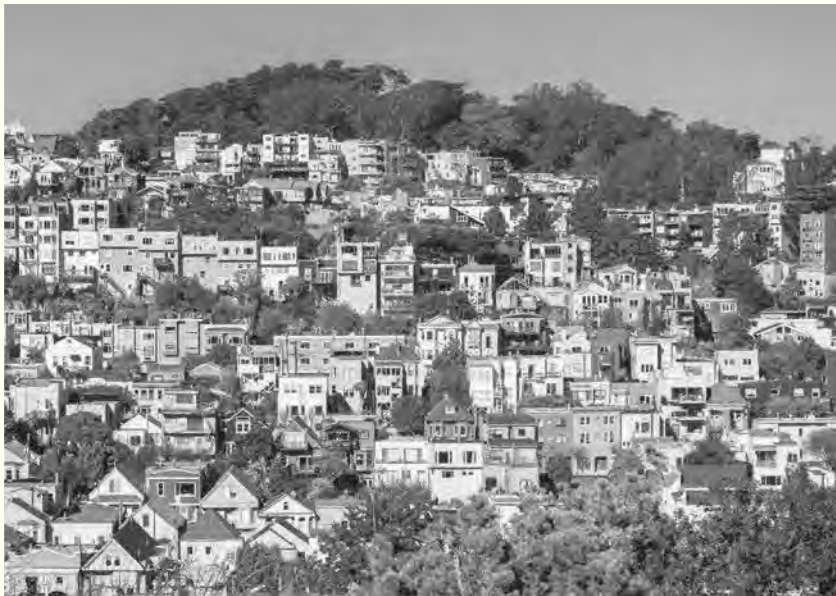
Appendix O-LD2



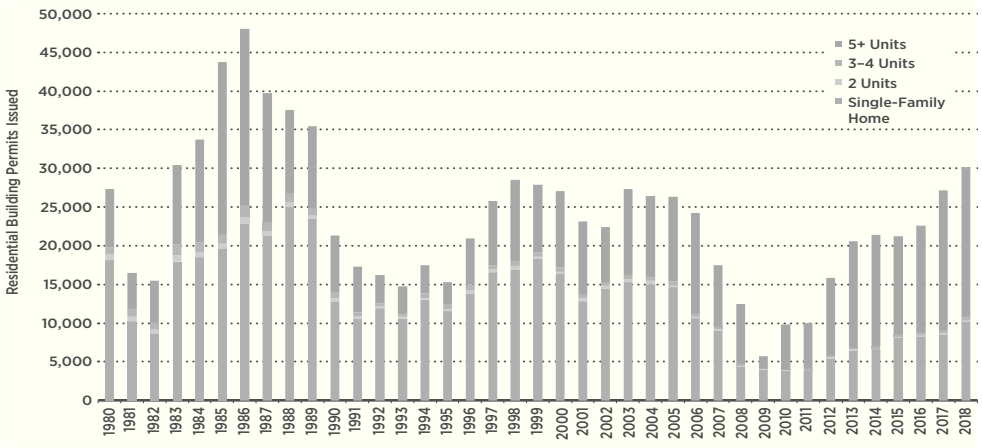
What caused the housing crisis?

Two interrelated factors drive the housing crisis: a failure to build enough housing for all of the people who live and work here, and increases in both incomes and the number of people with higher incomes. SPUR has been working with The Concord Group, a real estate economics firm, to understand both trends.

Driver 1:
The Bay Area has not built enough housing.

Although demand for housing has increased dramatically over the years — most notably due to a rapidly expanding regional economy — the amount of housing produced in the nine-county Bay Area has decreased in recent decades. Through the 1980s, the region produced a significant amount of housing on an annual basis, though much of it was built in lower-density development patterns, including single-family housing, master planned communities and garden-style apartments. In recent years, housing has increasingly been concentrated in fewer locations at higher densities,[3] and the number of units produced annually has decreased. This trend has multiple causes. The region has done a better job of protecting open space and seeking to concentrate growth in places that have already experienced development. Meanwhile, local governments have added more requirements to the development process, making it harder and harder to build housing in already-developed areas. More recently, real estate investors concerned by the Great Recession (and the subprime lending that exacerbated it) moved capital toward less risky investments in high-end urban development.

FIGURE 1
Residential Building Permits Issued in the Bay Area, 1980–2018



Source: The Concord Group analysis of the U.S. Census Bureau's Building Permits Survey, https://socds.huduser.gov/permits

3 Romem, Issi, "America's New Metropolitan Landscape: Pockets of Dense Construction in a Dormant Suburban Interior," BuildZoom, February 1, 2018, https://www.buildzoom.com/blog/pockets-of-dense-construction-in-a-dormant-suburban-interior

While housing production declined, the number of jobs rose significantly. From 2011 to 2017, the region added 658,000 jobs and 140,000 housing units, or 4.7 jobs for every housing unit. In many parts of the region, particularly those areas closest to the explosion in tech jobs, the ratio was significantly higher.

FIGURE 2
Ratio of Jobs to Housing in Bay Area Counties

COUNTY	JOBS TO HOUSING RATIO 2004–2008	JOBS TO HOUSING RATIO 2011–2017
San Francisco County	4.27	6.26
Alameda County	-0.05	3.86
Contra Costa County	0.66	3.04
San Mateo County	0.91	8.14
Santa Clara County	1.71	4.15
Marin County	0.27	4.82
Napa County	1.88	8.41
Sonoma County	-0.63	5.15
Solano County	0.55	4.27

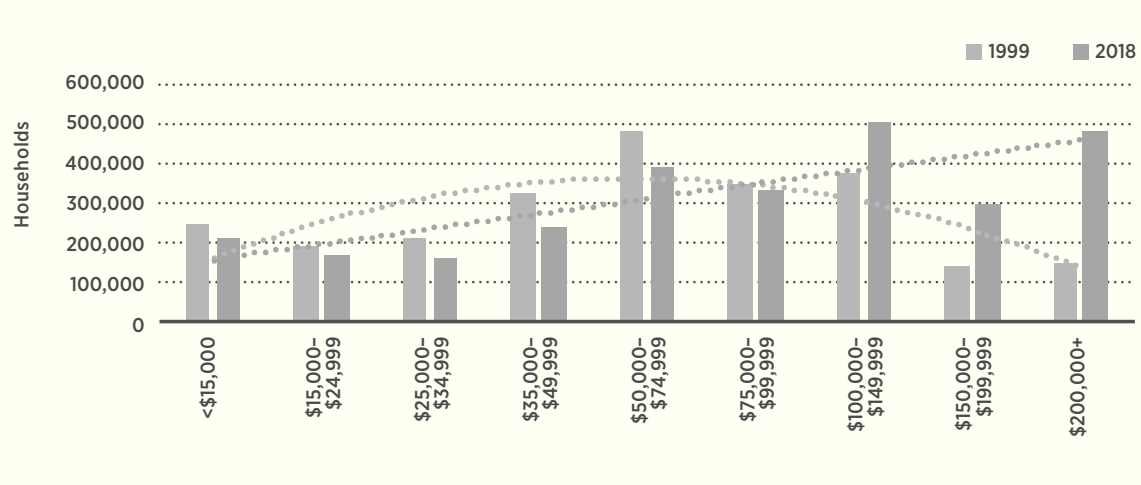
The region's new jobs have attracted new residents. Since 2000, the Bay Area's population has increased by 15%, or roughly 1 million people. Adding more people without sufficiently expanding the amount of available housing has exacerbated the housing shortage and driven up the cost of housing.

Source: Housing permit data from the Department of Housing and Urban Development, https://socds.huduser.gov/permits; primary private job data from the U.S. Census, https://onthemap.ces.census.gov.

Driver 2:
The Bay Area is becoming richer.

The Bay Area is becoming increasingly wealthy. Just 20 years ago, incomes were distributed in a bell curve, meaning that more middle-income people lived in the region than either low-income people or wealthy people. Over the past two decades, that distribution has shifted to favor wealthier households. Since 1999, the Bay Area has seen a decrease of 300,000 households making under $100,000 and an increase of 625,000 households making over $100,000.[4]

FIGURE 3
Change in Bay Area Household Income Distribution, 1999–2018



Previous SPUR research provides two explanations for the shifts in household income.[5] The first is that wages in high-wage occupations have grown much faster than wages in low- and middle-wage occupations. The second reason is that middle-wage jobs did not grow during the past decade and are projected to grow more slowly than high- and low-wage jobs in the future. Some other reasons for shifts in income could include changes in household formation (when people marry or move in with roommates or family members) and wage increases over time as some people have moved up the job ladder. The net result is that as more higher-income households compete for a limited number of available homes on the market, they bid up rents and purchase prices across the board. This particularly affects new entrants into the housing market, making finding a first-time home expensive — if not impossible — for everyone but the high earners.

4 Analysis by the Concord Group. Note that income figures are not inflation-adjusted because typical inflation adjustments use housing as a major component of ongoing Consumer Price Index calculations. If income is inflation-adjusted to include housing costs, the enormous impact that housing has on income distribution would be eliminated from the analysis.

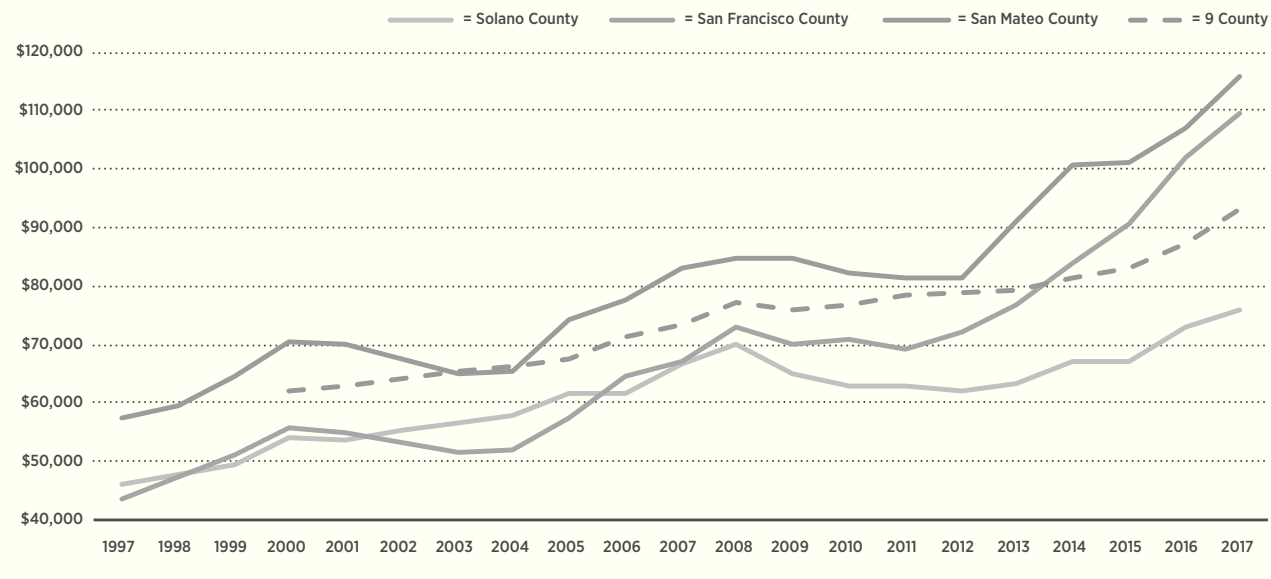
5 Levy, Stephen, "How the Retirement Wave Will Impact Bay Area Jobs and Workers," SPUR, 2019, https://www.spur.org/news/2019-01-17/how-retirement-wave-will-impact-bay-area-jobs-and-workers

Source: The Concord Group analysis of ArcGIS income distribution data and U.S. Census American Community Survey income distribution data, https://factfinder.census.gov (Note: This website will be taken off line on March 31, 2020, and will be replaced by https://data.census.gov/).

The change in the Bay Area's income distribution can be summarized by a significant shift in median income: The median Bay Area household became 50% wealthier over the last 20 years, with median income rising from $60,000 to $90,000.[6]

FIGURE 4
Change in Bay Area Median Household Income, 1997–2016

Median household income has grown significantly in the Bay Area over the last 20 years. San Mateo, San Francisco and Solano counties are included to show the range of distribution across the region.



These shifts have enormous implications not just for the Bay Area but for the 21-county Northern California megaregion, a geography that stretches from Santa Cruz to Sacramento. As more people move out of the Bay Area to seek affordable housing, the income distribution of the megaregion has also shifted, albeit less dramatically in the 12 outer-region counties than in the nine-county Bay Area.[7] The 12 outer counties — Mendocino, Lake, Colusa, Yolo, Sacramento, Placer, San Joaquin, Stanislaus, Merced, San Benito, Monterey and Santa Cruz — saw growth in households making $50,000 to $75,000 but still saw losses in households making under $50,000.

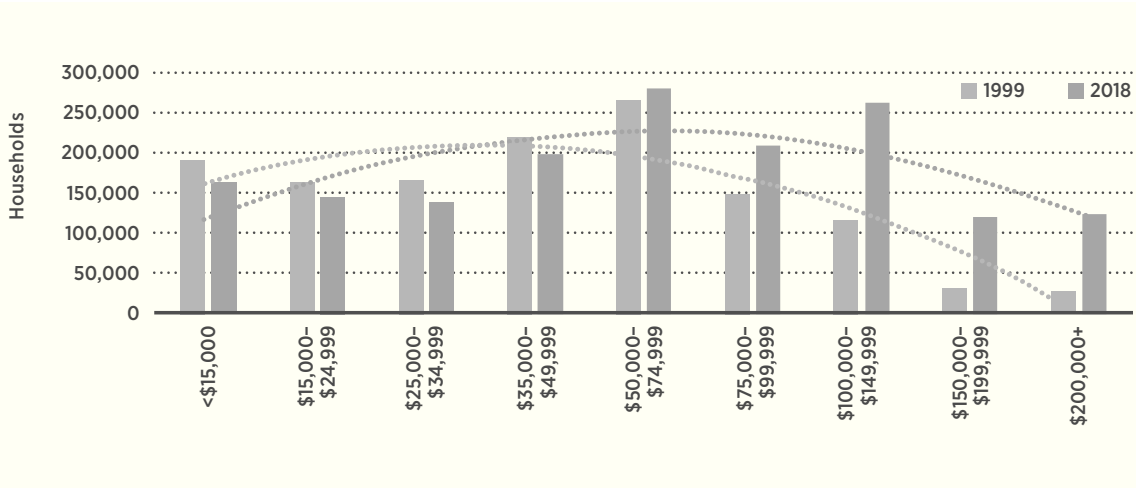
FIGURE 5

Change in Outer-Region Household Income Distribution, 1999–2018



Unsurprisingly, during this same time period, housing prices in the megaregion have increased as well, although the starkest increases have occurred mainly within the nine-county Bay Area.

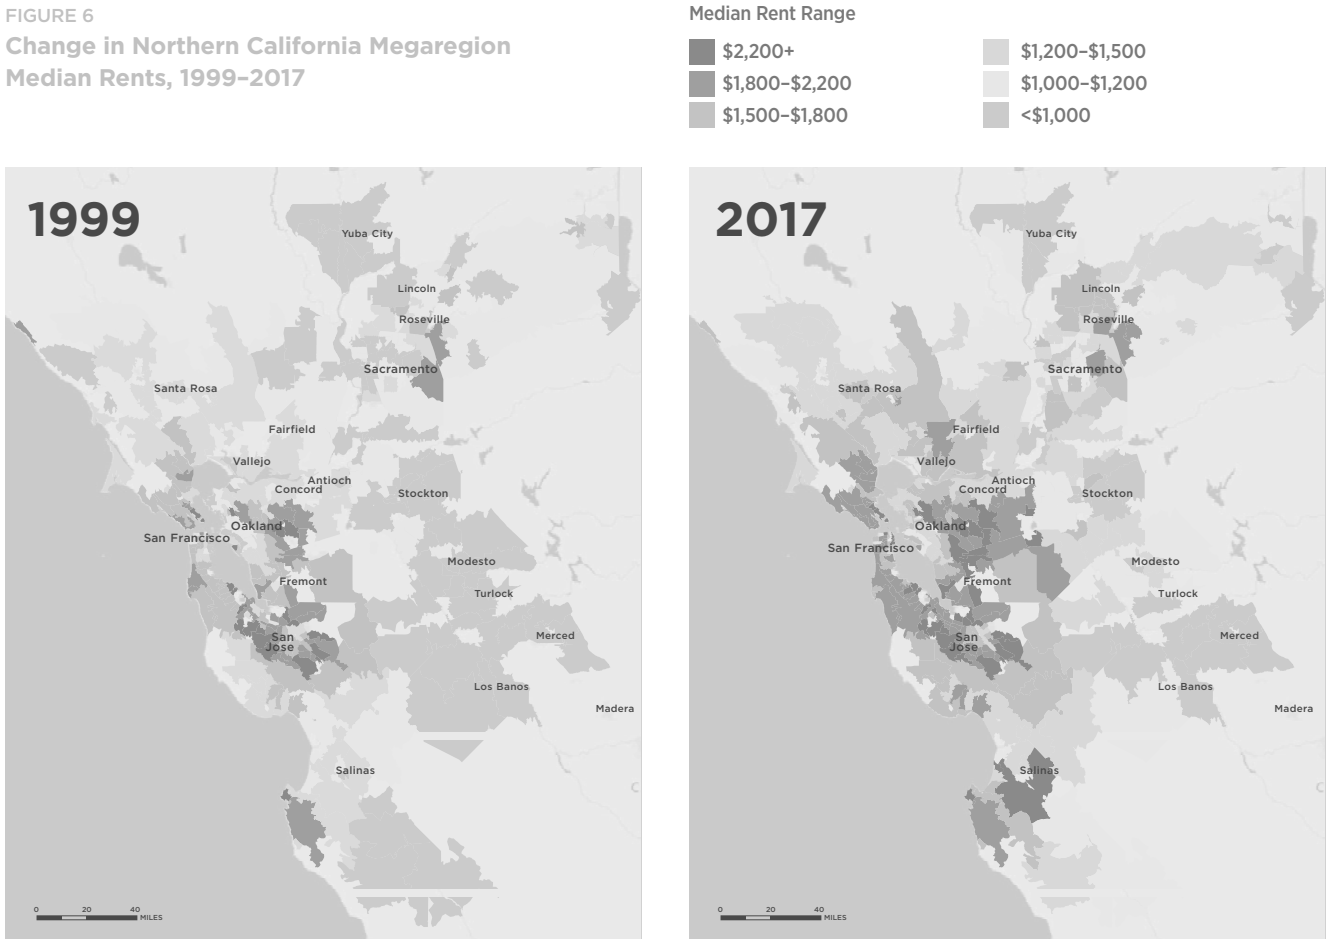
Change in Northern California Megaregion Median Rents, 1999–2017



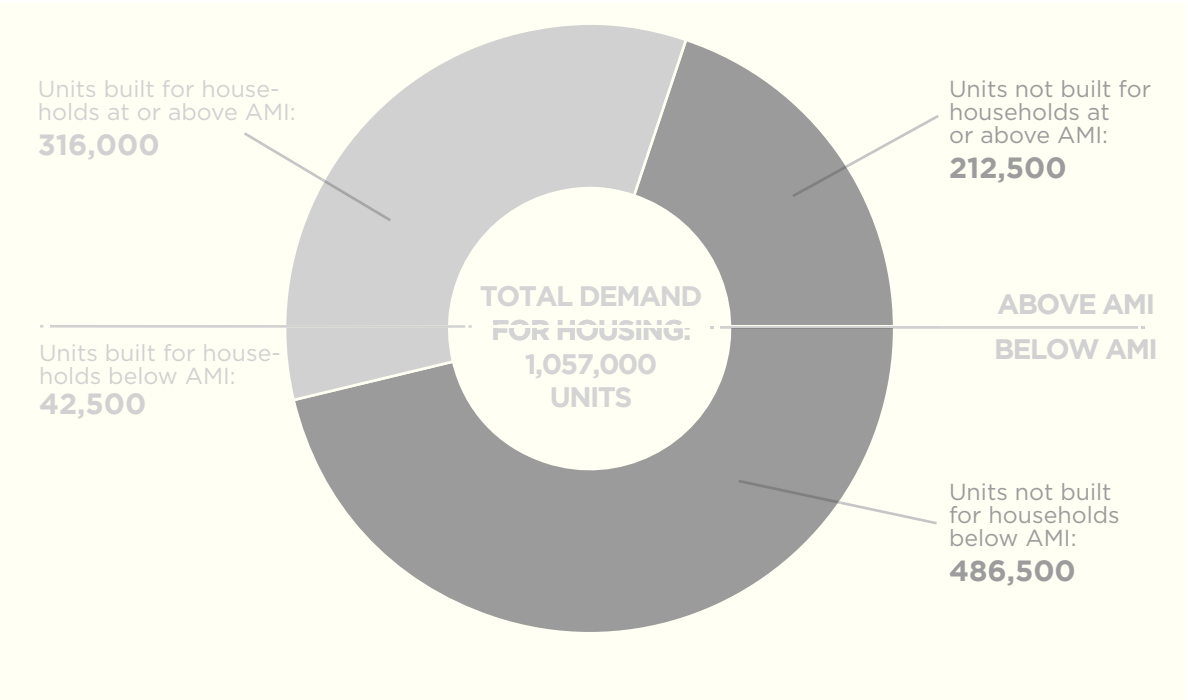
How much housing should the Bay Area have built?

Escalating housing unaffordability has been a contributing factor to massive income distribution changes since 1999, increasing the number of evictions, displacing historic residents of Bay Area communities and threatening the health and growth of the region. How much housing would the Bay Area have needed to build over the last 20 years to prevent income inequality from getting worse? Working with the Concord Group, SPUR sought to answer this question.

We found that the Bay Area saw the construction of 358,500 total housing units over a time period where typical long-term regional growth patterns would have called for a little over 1 million units. This created a shortfall of 699,000 housing units. The market largely served those able to pay the most for housing. Roughly 316,000 of the newly built units were rented or sold to those with higher incomes and/or higher levels of wealth, who were able to absorb the rapidly rising housing costs. At the same time, affordable housing developers built roughly 42,500 units of permanently affordable subsidized housing — not nearly enough to satisfy the demand for housing at the lowest end of the price spectrum. The missing 699,000 units fall into two categories: 486,500 units of housing needed for those below the median income and 212,500 units of housing needed for those above the median income, meaning that the demand for affordable and middle-income housing went largely unmet.

FIGURE 7
Historical Housing Shortfall
Bay Area Housing Demand, 2000–2018

How much housing would the Bay Area have needed to build over the last 20 years to prevent income inequality from getting worse? Analysis by SPUR and the Concord Group shows a shortfall of 699,000 housing units, most of them for households below the area median income (AMI).



Data visualization by Justin Fung. Source: See appendix for sources and methodology.

What was the impact of this failure to produce enough housing? Where did all of those people go? As SPUR has written about previously,[8] some moved to other places, some decided to stay and pay more of their income toward rent and others never showed up in the first place: Individuals who may have contemplated moving to the Bay Area decided to go elsewhere due to the region's high housing costs. Of those who have stayed, some live in overcrowded housing, doubling up with friends and family, or in units that are ill-suited to their family size. Others have not left their childhood homes, delaying adulthood. Of those who have left the Bay Area, some have moved to outer-county cities such as Sacramento in search of cheaper housing,[9] enduring lengthy super-commutes to keep their Bay Area jobs. Others have left Northern California altogether for more affordable metro areas, like Denver or Austin. Most distressing of all, many have lost all forms of housing, leading to the region's current homelessness crisis.

9 Kneebone, Elizabeth and Issi Romem, "Disparity in Departure: Who Leaves the Bay Area and Where Do They Go?," Buildzoom and Terner Center for Housing Innovation, http://ternercenter.berkeley.edu/uploads/Disparity_in_Departure.pdf

How much housing does the Bay Area need to build for the future?

We also investigated how much and what type of housing the region should produce to keep up with future demand. More housing will be needed as the region's children grow up and create families of their own and as the economy continues to evolve, adding new workers in the decades to come. Accounting for growing demand is particularly important in stemming the flow of lower- and middle-income households from the region.

It's not possible to know how much the region's population will grow over the next 50 years, but data analysis can offer helpful projections. For this investigation, our partners at the Center for Continuing Study of the California Economy estimated a high population growth target and a low population growth target.[10] The Concord Group then modeled what those targets mean for housing demand. Using the high growth projection (one that includes more aggressive assumptions regarding levels of immigration and job growth), SPUR estimates that the Bay Area will need a minimum of 1.5 million new units between now and 2070 both to keep up with population growth and to stop the current trend of losing low- and moderate-income households as the region gains wealthier households.

If we include the existing housing shortfall — the 699,000 units the region should have built over the last 20 years but didn't — we estimate that the Bay Area needs to produce a minimum of 2.2 million units by 2070, or roughly 45,000 units per year (see Figure 9). We believe it is important to include the shortfall, as current residents of the Bay Area are already experiencing the impacts of the region's failure to deliver a sufficient amount of housing: high housing costs, overcrowding and homelessness. As we have shown, the region's inability to deliver a sufficient amount of housing at all income levels has led to a loss of lower-income households. By addressing the shortfall, the region could ameliorate some of these negative impacts.

SPUR's housing target of 2.2 million units (45,000 per year) is somewhat higher than the regional target developed by CASA (the Committee to House the Bay Area) of 35,000 units per year.[11] McKinsey estimates that California needs to produce a minimum of 3.5 million homes statewide to meet a backlog demand of 2 million homes plus a growth demand for 1.5 million homes by 2025.[12] The Bay Area's housing growth target from 2015 to 2023, set at the state level through the Regional Housing Needs Allocation (RHNA) process, shows a need for 188,000 housing units over an eight-year period, or roughly 23,500 units per year. SPUR is recommending housing growth targets that are almost double the RHNA estimates and slightly more than double the region's annual production from 2000 to 2018.

---

10 The Center for Continuing Study of the California Economy provided SPUR with population and job projections as detailed in its report *High and Low Projections of Jobs and Population for the Bay Area to 2070 — Projection Framework, Specific Assumptions and Results,* https://www.spur.org/sites/default/files/wysiwyg/CCSCE_High_and_Low_Projections_of_Jobs_and_Population_for_the_Bay_Area_to_2070-Projection_Framework_Assumptions_and_Results.pdf
The report included a high growth target and a low growth target based on national projections for jobs and population, as well as assumptions about immigration, growth in various economic sectors and the share of the population and job growth that the Bay Area will attract. SPUR chose to base its analysis on the high growth projection due to the following factors. First, it is unknown how rapidly the Bay Area's population will grow, but it most likely will reach both the low and the high targets eventually, if not within 50 years. Planning for the high growth target enables the region to fully meet future housing demand and plan for appropriate density. Second, if housing growth exceeds population growth targets, then housing prices might stabilize or decline for a period of time. Stabilizing prices would halt further displacement. While a period of declining prices might make existing owners worse off, it might help renters and assist many in the middle of the income distribution in buying a home for the first time. It is also easier to stop building when prices drop too quickly than it is to begin building rapidly when housing prices spike.

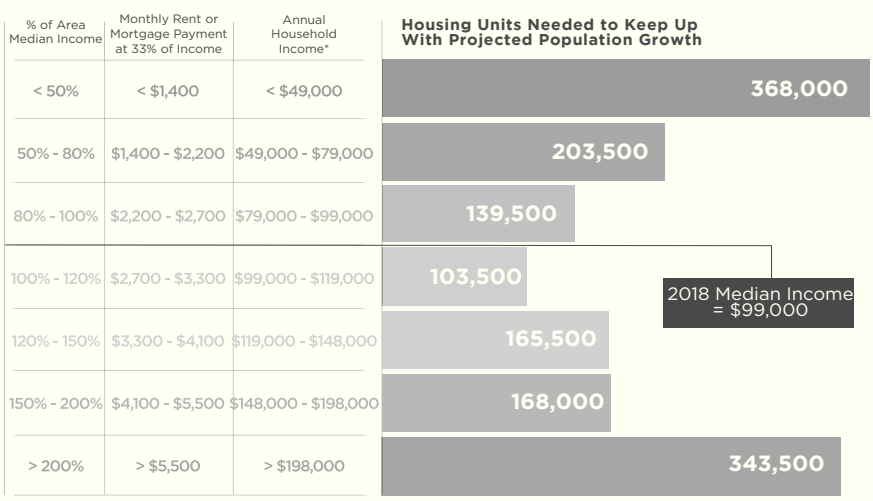
FIGURE 8
How Much Housing Does the Region Need to Build?
Projected Bay Area Housing Demand at All Income Levels, 2018–2070



The Concord Group's model (see Figure 8) looks at housing demand at various income levels based on population growth and seeks to answer the question: How much housing does the Bay Area need to add at different price levels to prevent income inequality from getting worse? It assumes that those who left the Bay Area over the last 20 years aren't coming back and focuses on making things better for the people who are here now and those who might come in the future.

It's important to note that the Concord Group's modeling doesn't answer the question: How much housing is needed to drive down housing prices? This question is notoriously challenging to answer accurately due to the confluence of many factors. To take just three issues: First, developers won't build new housing unless they are able to cover the costs of construction (labor, materials, land and financing). The ability to cover these costs is often dependent on rising housing prices. If housing prices drop below the level needed to build new units, private developers will stop building new housing and prices will rise. Second, if housing prices do decrease, then the Bay Area becomes a more desirable place to live for more people, which increases demand, and that increases prices. Lastly, driving housing prices down (rather than just flattening out price increases) can have negative impacts for homeowners, who can find themselves upside down on their mortgage if what they owe is more than the value of their home.

Because it's so hard to answer the question of how much housing the region would need to build to drive prices down, we are treating the answers that come from our modeling as minimum targets, knowing that the Bay Area would need to outproduce these numbers by some factor in order to reduce housing prices over time. It will be important to develop a housing delivery system that can change based on housing prices, allowing for more rapid housing production when prices spike. This system should also take into account the locations and types of housing needed to address demand.

The Bay Area will also need to adopt new policies to help develop housing for people at different incomes. The region will still need to produce a significant amount of market-rate housing — a minimum of 343,500 units for households making more than 200% of the area median income. For those at 80% of the area median income and below, the region will need to produce a minimum of 571,500 units. And for those between 80% and 200% of the area median income, another 576,500 units will be needed.

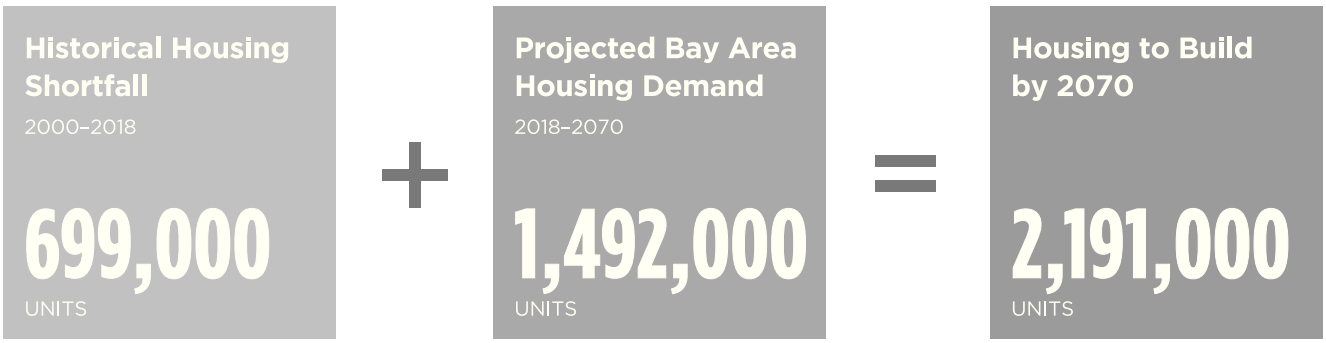
FIGURE 9

SPUR's 2070 Housing Target

Total Bay Area Housing Demand, 2000-2070

By adding the existing housing shortfall from Figure 7 to the projected housing need in Figure 8, SPUR estimates that the Bay Area needs to produce almost 2.2 million new housing units by 2070, or about 45,000 units per year.



Source: See appendix for sources and methodology.

What will it take to get there?

SPUR is deep in the process of developing an agenda to address the Bay Area's affordable housing challenge at the scale of the problem. While housing unaffordability may seem like an impossible problem to surmount, there are steps that those of us who live and work in the Bay Area can take. We can double the amount of housing our cities build, change our taxation and governance structures to fund the housing we need and adopt policies to protect the people who live here now. But to make all of this happen requires political will. The following are SPUR's initial thoughts about what it will take to create an affordable region.

Treat housing as infrastructure.

Housing is not something that's nice to have, like a new pair of shoes or a vacation. It is critical to human beings to have a place to live, just as it is critical to have food to eat, clean water to drink and power to provide heat in the winter. When we need new water pipes to ensure regional access to clean water, government doesn't just change the zoning code to allow for the new pipes and wait for the private sector to build them. Government develops the plan for the new water pipes, the public funds their construction and the government hires private contractors to build them.

If we treated housing as infrastructure, the same way we treat roads and water delivery as infrastructure, what in our housing delivery system would change? For starters, it might not be enough to rely solely on the private market to provide enough housing. Privately financed development in the Bay Area requires the careful alignment of a variety of factors: a local jurisdiction that will permit enough housing to be built, land prices low enough for the developer to recoup the cost over time, access to sufficient private lending at a low-enough rate to finance the construction, a workforce available to build the housing — and rising housing prices to pay for all of the above. This system of financing often means that housing can only be built when housing prices are escalating. When the market is down, housing production slows to a trickle — or sometimes stops altogether.

What if we rethought some aspects of this housing delivery system in order to achieve different objectives? For example, what if we could use public financing to build housing, particularly affordable and middle-income housing, at the bottom of the market (when land is cheaper and labor is more available) rather than at the top of the market? Being able to deliver housing at the low end of the market would have the added benefit of providing construction jobs throughout the market cycle, making them more secure over time.

What if there were other ways the public sector could provide readily available, lower-cost capital to finance the creation of middle-income housing — in ways that didn't cannibalize funding for more deeply affordable housing? And what if we were able to squeeze risk out of the development process by ensuring the faster, clearer permitting of housing so that developers functioned more like contractors? If their role was more focused on building the housing rather than negotiating a complicated and risky entitlement process, could they bring housing to market at more affordable price points?

It is not impossible to devise a different housing system than the one we have today. Other countries have made it a societal priority to build enough housing for everyone.[13] We can learn from them.

13 For example, in Vienna, roughly half of the city's housing stock is highly regulated, affordable "social housing." See: Holeywell, Ryan, "Vienna Offers Affordable *and* Luxurious Housing," *Governing*, February 2013, https://www.governing.com/topics/health-human-services/gov-affordable-luxurious-housing-in-vienna.html

Make it less expensive to build housing.

Regardless of how housing is financed, one thing is clear: We need to build significantly more of it — at all price points — if we're going to get ahead of the housing crisis. The region hasn't produced 45,000 units per year since the 1980s, when roughly half of new housing came in the form of sprawl-style single-family housing development, a less expensive building type to construct. Apartments, particularly those in taller buildings, are more complicated to build, so labor costs are higher; they take longer to build, so developers need to pay land costs, such as loan payments, property taxes, insurance and security, for a longer period of time before being able to rent or sell homes; and the construction materials, such as steel or mass timber, are more expensive. In order to produce housing at the scale needed, in denser development patterns that preserve the environment, all of the cost components of housing need to be examined: land prices, financing, construction, building permits, planning and building code requirements, taxes and fees. There can be no sacred cows: We need to examine every aspect of the housing delivery system to see how we can produce enough housing at the scale needed.

Change the governance structure to support housing construction.

Our current system of governance is not up to the challenge of solving our current housing crisis. Each city is responsible for deciding how much housing will be built within its boundaries and in which neighborhoods. The ability to determine zoning at the local level is called "home rule," a power enshrined in our state governance structure. Although the state sets a goal for how much housing each region should produce, and then regional agencies provide each city with a target, there is almost no consequence for failing to meet these goals. So each city has the power to engage in zoning practices that exclude middle- and low-income residents, such as allowing single-family homes only and requiring large lot sizes and plentiful parking. The requirements squeeze out apartment buildings, townhomes, duplexes and other more affordable housing types. Home rule creates a no-win situation for local politicians who support housing. They can approve the housing that is needed and face the anger of constituents who don't want more housing in their neighborhoods, or they can oppose the housing and make the housing crisis worse. The cumulative result of each city deciding how much housing to allow within its boundaries is the current statewide housing shortage.

State government has a very important role to play in addressing the housing crisis because it can create new rules around what gets built where. Senate Bill 50, a proposed bill that would have prevented cities from blocking housing near transit and in areas with good jobs and good schools, is one example of what state legislators can do. State government can also create new sticks and carrots to discourage or encourage certain behaviors. It can diminish local control for jurisdictions that don't help to address the housing crisis and offer new funding for jurisdictions that work to build the housing needed. It can also reform existing laws, like the California Environmental Quality Act, that make it harder to build housing in already-developed areas.

Regional institutions likewise can play an increased role. The newly created Bay Area Housing Finance Authority has certain powers to help create funding for affordable housing. Such an agency could eventually have other powers, including the power to land-bank parcels for future housing development and assemble land for housing construction.

Ensure that low-income people can stay in their current homes while new housing is being built.

If we are really to solve the housing crisis, we need to find ways to enable low-income Bay Area residents to remain in their homes. Roughly 282,000 low-income families in the Bay Area live in housing that is affordable to them but is currently at risk of cost escalation because those units are not subsidized or price-restricted.[14] And of course, many more housing units are occupied by low-income households at unaffordable rents, causing overcrowding and financial strain. As rents continue to rise, vulnerable families are displaced from the Bay Area.

Recent research has brought to light more information about the patterns and ramifications of displacement.[15] Long-standing theories that new housing development causes gentrification and displacement are giving way to a more nuanced understanding of this complicated dynamic. In most cases, new market-rate housing follows, rather than causes, gentrification. Developers seek to purchase land and build new units when and where prices are already on the upswing — that's when the odds are good that they can recoup their costs through higher rents or sale prices. In neighborhoods already experiencing gentrification, the development of new market-rate housing can speed up the process by further signaling that a neighborhood is a desirable place for investment. Once those new buildings are built and occupied, gentrification can intensify, adding to displacement pressures.

How do we address displacement? The solution to this problem is not to stop building market-rate housing. Without a sufficient amount of market-rate housing, high-income workers will continue to outcompete everyone else and shift housing prices for the entire region. Building more housing for market-rate buyers can reduce their impact on the housing market as a whole and help limit rapid increases in price.

But building more housing is only part of the solution. We also need to find ways to combat displacement by enabling low-income residents of the Bay Area to remain in their homes.

Finding ways to strengthen community ownership of land, taking existing housing out of the speculative market and making it permanently affordable, and developing other tools to stabilize neighborhoods are of critical importance in addressing the housing crisis. Helping low- and moderate-income families find a path to homeownership (without being swept up in the next foreclosure crisis) is another way to engage the problem. Thoughtful interventions that protect renters, like California's recent anti-price-gouging law,[16] are also needed.

---

14 Analysis completed by the California Housing Partnership and Enterprise Community Partners. This number represents an estimate of the total number of unrestricted units offered at rents affordable to low-income (< 80% Area Median Income [AMI)]) households *and* occupied by either an extremely low-income (< 30% AMI), very low-income (< 50% AMI) or low-income (< 80% AMI) household. While this number accounts for most deed-restricted affordable housing, due to data limitations the methodology does not incorporate public housing or locally restricted housing, such as units made affordable through inclusionary zoning. It also excludes housing occupied by tenants using a Housing Choice Voucher, since the units themselves are technically still subject to changes in the market and landlord participation is voluntary.

15 The Urban Displacement Project at UC Berkeley has developed substantial tools to understand displacement pressures in the Bay Area. See: https://www.urbandisplacement.org/

16 Chandler, Jenna, "Here's How California's Rent Control Law Works," *Curbed,* January 6, 2020, https://la.curbed.com/2019/9/24/20868937/california-rent-control-law-bill

Add significant new resources for affordable housing and find ways to build a lot more of it.

Stabilizing existing housing for low-income people and building the amount of affordable housing the Bay Area needs over the next 50 years will require a significant realignment of resources. It is important to note that the past 50 years of housing policy have predominately benefited one segment of the population: property owners, in particular white homeowners, who were not harmed by historic redlining policies. These laws systematically denied communities of color low-cost mortgages and other resources needed to build wealth. As a result of these disparities, white families have greater homeownership rates and have been able to transfer far more wealth over generations than families of color.[17] The largest housing program in the country has been the mortgage interest income tax deduction, which benefits only those homeowners with enough income to qualify for a deduction. In 2017, the cost of this program was $71 billion. While the Trump tax plan of 2017 has reduced the value of the mortgage interest income tax deduction to an estimated $41 billion,[18] none of the cost savings was redistributed to affordable housing programs.

California needs to consider significant new ways to fund affordable housing. It's time to reexamine Proposition 13, the 1978 law that caps property tax increases for both businesses and homeowners. Prop. 13 limits the taxable value of property to its last sale price, even if that sale was decades ago. This has dramatically curbed the amount of funding available for all public goods in California, including affordable housing. We need to find ways as a society to pay for affordable housing, not just through fees on new housing construction or large bond issues that require passage every few years, but through ongoing, stable, large-scale programs that are sized to address the need.

Affordable housing faces the same problems as market-rate housing. Construction costs are the same no matter if the housing is for low-income or high-income residents. The entitlements process is uncertain, as affordable housing must win approvals in jurisdictions that may not want housing for low-income families. And affordable housing often faces even more scrutiny than market-rate housing during the permitting process. There is also significant uncertainty in financing, as affordable housing developers must pull together a dizzying array of funding sources in order to make projects financially viable. This process has led to skyrocketing development costs. We need to find ways to reduce cost and risk in the affordable housing development process so we can build more housing more quickly at a reasonable cost.

Build housing for the "missing middle."

SPUR's research has found that the private real estate market addresses the needs of the highest-income households. These households outcompete and set prices for everyone else due to the limited supply of housing. And while the prices they pay are at record highs, households in this category are not in fact paying a higher percentage of their income now than they have historically. At the same time, affordable housing developers, subsidized by public funding, have made a valiant effort to build permanently affordable housing for the region's

17 Traub, Amy et al., *The Racial Wealth Gap: Why Policy Matters,* Demos, June 21, 2016, https://www.demos.org/research/racial-wealth-gap-why-policy-matters

18 Tax Policy Center, "Key Elements of the U.S. Tax System," *The Tax Policy Center's Briefing Book,* https://www.taxpolicycenter.org/briefing-book/what-are-tax-benefits-homeownership

lowest-income households. But there is a significant part of the population that is not served by either the existing market or subsidized affordable housing programs: the "missing middle."

As mentioned above, SPUR estimates that over the next 50 years, in order to accommodate future growth, the Bay Area will need to build 576,500 units that are affordable to people making between 80% and 200% of the area median income. One part of the solution is to allow enough market-rate housing to be built to lower prices enough that eventually a larger percentage of middle-income people can participate in the housing market. But another part of the solution involves developing new programs and interventions that can reach middle-income households. Secondary units, smaller units that come without a parking space, mixed-income housing that uses the proceeds from market-rate units to subsidize middle-income units, and co-housing (where households collectively finance housing and some common spaces are shared)[19] all need to be examined as tools to address this portion of the market.

Change the cultural assumptions about housing.

Lastly and perhaps most importantly, we need to change the way we think about housing. The American Dream has always involved land ownership, from the Jeffersonian agrarian ideal[20] to the cultural elevation of the single-family home and the white picket fence. Yet other countries and cultures do not place homeownership on such a pedestal. Part of the cultural value of homeownership has to do with the role it plays in the United States as a primary mechanism of wealth generation and wealth transfer from one generation to the next. Another part has to do with our country's extraordinary lack of a social safety net relative to other developed countries. One's ability to retire and enjoy old age often hinges on property ownership. But the American conception of property rights has deeply negative consequences for renters. Unlike homeowners, most renters can't rely on being able to stay in their homes for the long term and aren't guaranteed stable housing costs.

If we are going to change our housing system in any meaningful way, we need to change our collective dream. What if we dreamed of a future where all families could afford housing and go to great schools? Where no one had to live in fear that the next illness or change of job could result in losing their home? Where commutes were short and pleasant and it was easy to get around by train, bus, biking or walking? What if there were ways to build assets for future generations that didn't involve owning a home? What if asset building were not a matter of life and death because our society took care of its people? What if homelessness were not tolerated and we found a way to house our most vulnerable populations?

Dreaming a new dream is the prerequisite for a better future. It's time for us to rise to the challenge.

Methodology to Determine "A Historical Housing Shortfall" (Figure 7) and "How Much Housing Does the Region Need to Build?" (Figure 8)

Figures 7 and 8 in this paper, "A Historical Housing Shortfall" and "How Much Housing Does the Region Need to Build?" were developed by The Concord Group (TCG) to illustrate demand for housing at each whole dollar of income and monthly housing cost, which means that the model reflects true demand for each individual income. For the model, TCG used data from Claritas's Spotlight, a syndicated data source that provides yearly demographic data for the United States. This model specifically used the household income distribution from the year 2018. Spotlight, like the U.S. Census, presents its household income distribution in ranges ($25,000 to $50,000, $50,000 to $75,000, etc.). In total, there are 10 delineated income ranges.

TCG made a set of assumptions that informed the model. First, that "housing affordability" would be defined as a household spending no more than 33% of its income on housing costs and that every household would demand housing at that percentage of their yearly income. TCG then quantified the units demanded at each household income range based on each household in that income range spending 33% of its income on housing. For example, households making under $49,000, or under 50% of the area median income, would have a maximum affordable housing cost of $1,400 per month. The equation to reach this figure is (Annual Income x Housing Burden [33%]) / 12 (months in a year).

Second, TCG assumed that households in the nine-county Bay Area would grow at a rate determined by the Center for the Continuing Study of the California Economy (CCSCE). CCSCE used two different growth scenarios: a high growth potential and a low growth potential for the nine-county Bay Area. The maximum growth scenario projected 1% growth through 2040, 1% growth from 2040 to 2050, 0.5% growth from 2050 to 2060, and 0.5% growth from 2060 to 2070. In total, the maximum growth scenario projected a need for roughly 1,492,000 units of housing in the nine-county Bay Area from 2018 to 2070. The low growth scenario projected 0.6% growth through 2040, 0.4% growth from 2040 to 2050, 0.3% growth from 2050 to 2060, and 0.3% growth from 2060 to 2070. In total, the low growth scenario projected a need for roughly 748,000 units of housing in the nine-county Bay Area from 2018 to 2070.

Third, TCG assumed that the 2018 income distribution would remain constant. While TCG and SPUR do not expect income distribution to remain constant over the next 50 years due to a variety of factors, including wage growth, inflation, employment trends and other major economic events, TCG and SPUR wanted to look at the equitable housing needs independent of those factors and give a broad understanding, in today's dollars, of how much new housing would be needed at which income levels to ensure that housing would be at least as affordable as it is today.

Additional Methodology to Determine "A Historical Housing Shortfall" (Figure 7)

TGC developed a second model to quantify the total housing need for the nine-county Bay Area from 2000 to 2018 as a way to identify the unmet housing needs. In this model, TCG used a household annual growth rate of 2% (the average employment growth per year during this period for the nine-county Bay Area) to reflect what growth could have been for households in this period if sufficient housing had been available. TCG also used the original income distribution of the year 2000. Overall, TCG believes that about 1,057,000 units of housing should have been built during this time period. However, only 358,000 units were built.

The blue number at the lower left represents the affordable housing built in the nine-county Bay Area from 2000 to 2018. The data for affordable units came from the Department of Housing and Urban Development's (HUD's) Low Income Housing Tax Credits Database (https://lihtc.huduser.gov/), which tracks all affordable housing projects, including all projects funded through HUD, state service, local government, for-profit or nonprofit sponsors or any housing project with an income limit. TCG has assumed that, while affordable units can affect households making up to 80% of the area median income, these units served the lowest-earning households within the nine-county Bay Area. This blue number at the lower left represents the units built that are affordable to those making under 100% of the area median income.

The blue number at the top left of the figure represents the total market-rate units built in the nine-county Bay Area from 2000 to 2018. The data for built housing was taken from HUD's building permit website (https://socds.huduser.gov/permits/), with the assumption that all units from the years of 2000 through 2018 were built and operated at an occupancy of 93%. TCG has assumed that, while market-rate units can affect households making any level of income, these units most likely served the highest-wage earners in the nine-county Bay Area. This blue number at the top left represents the units built that are affordable to those making over 100% of the area median income.

The red number at the bottom of the figure represents the units that should have been built for households below the area median income but were not built. The red number at the upper right of the figure represents the units that should have been built for households above the median income but were not built. Overall, TCG has determined that the housing shortfall for the nine-county Bay Area from 2000 to 2018 was roughly 699,000 units.

A Black Nurse Saved Lives. Today She May Save Art.

Once a slave, Biddy Mason went on to a life of extraordinary accomplishments. The fact that she figures in W.P.A. murals in San Francisco may save them from destruction.

By Carol Pogash

Published Aug. 11, 2020 Updated Aug. 13, 2020

SAN FRANCISCO — In June, Laura Voisin George, a graduate student, was writing a scholarly article about a series of W.P.A. frescoes at the University of California, San Francisco.

The ten panels of "History of Medicine in California," completed in 1938 by Bernard Zakheim, a Polish-born muralist, show such scenes as Native Americans offering herbs to doctors and a trapper inoculating someone with the smallpox vaccine.

Ms. Voisin George recognized a central figure in one of the vivid social realist tableaus: Biddy Mason, a Black nurse, is depicted alongside a white doctor, as they treat a malaria patient. Mason, an enslaved woman born in 1818, went on to become a midwife, a nurse, a philanthropist and a founder of the First African Methodist Episcopal Church in Los Angeles.

Ms. Voisin George, who studies history at the University of California, Santa Barbara, learned that the frescoes were about to be destroyed while she was researching. The Jewish News of Northern California reported the news. Her reaction, she said, was "What? How could this be?"

U.C.S.F. had announced plans to demolish the building to make way for a state-of-the-art research center. The university had informed Zakheim's son Nathan that if his family didn't retrieve the frescoes, which weigh as much as 2,500 pounds, they would be destroyed.

Bernard Zakheim painting the mural, housed in an auditorium at the University of California, San Francisco, in 1937. UCSF Archives and Special Collections

Until Ms. Voisin George identified Mason, neither the artist's family nor university officials knew about her presence in the frescoes. As news outlets have reported this discovery, Mason has become a star of the murals and their potential savior. An assertion by the federal government that it owns the frescoes has further complicated matters.

Adam Gottstein, the artist's grandson, said that the university's placing responsibility on the family to save the artwork "boiled my blood." It showed a "complete lack of respect and concern for historical art." Mason's presence, he said, "adds considerable pressure to U.C.S.F. to do the right thing."

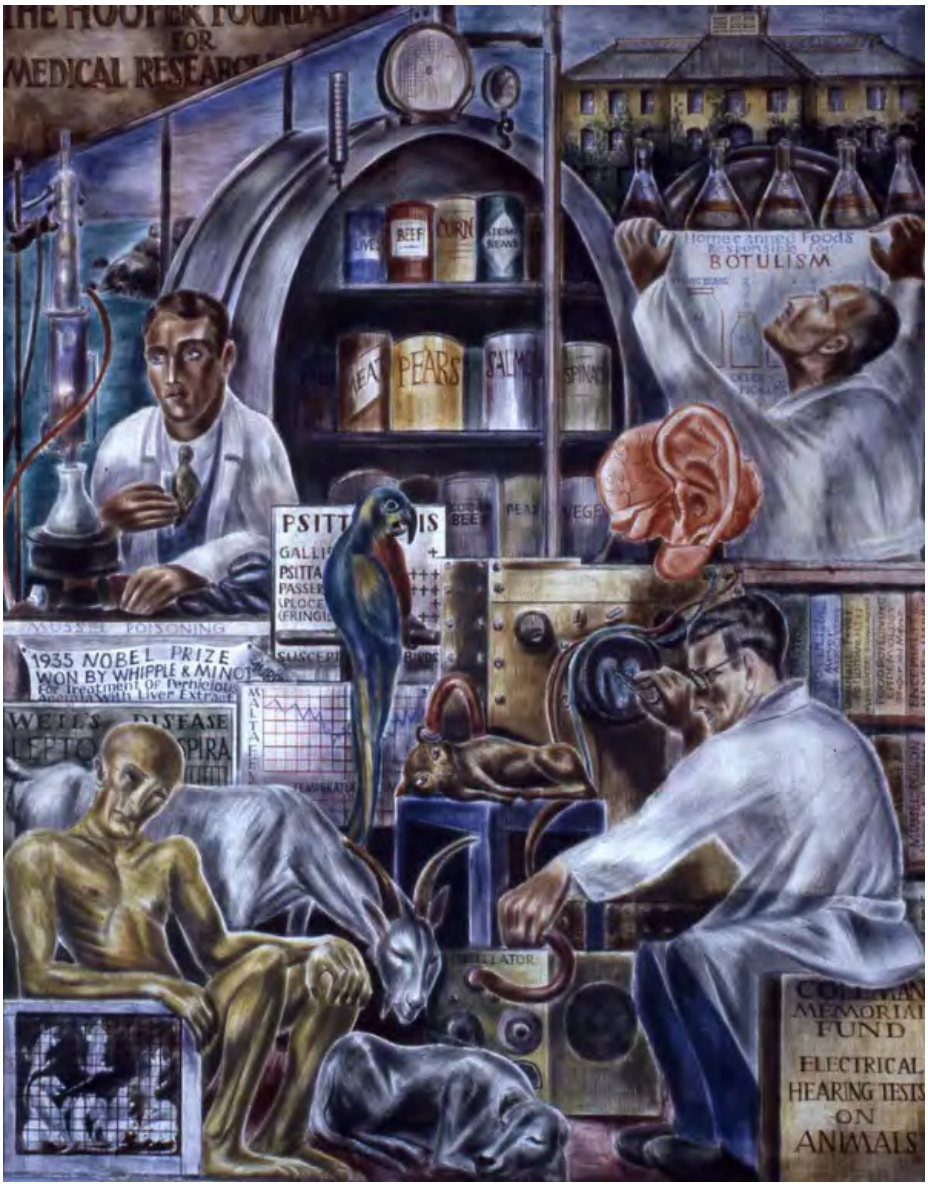
The frescoes were part of the W.P.A.'s Federal Art Project, which hired unemployed artists. Since their creation, the Zakheim murals have been praised, criticized and painted over because a professor said they distracted medical students attending lectures in the auditorium where they are on display. Because of concerns about earthquakes, that auditorium is no longer used.

In 2015, Polina Ilieva, U.C.S.F.'s archivist, wrote that the murals "remain the jewel of the university's art collection."

Zakheim was "one of the most prominent artists in Northern California with a national reputation," said Robert Cherny, a history professor retired from San Francisco State and an expert on New Deal art. "These murals are his largest work," he said. Zakheim, who also created other Depression-era murals for the project, died in 1985.

Nathan Zakheim, the artist's son, an art conservator who in 1976 restored the murals, said he was shocked when he and other heirs received a letter from U.C.S.F.'s lawyers, dated June 4, giving them 90 days to produce a plan to remove the murals. If they failed to respond, the letter said, the university would "presume" it had their consent "to proceed with destruction."

Nathan Zakheim told the university he could move the murals for less than $1 million. There was one hitch: The family lacked the funds.



The series depicts the progression of modern medicine, with this panel focusing on botulism research. UCSF Archives and Special Collections

The series has been criticized for distracting medical students over the years. Liz Hafalia/The San Francisco Chronicle, via Polaris

But the university said it would not spend public money on the move because money was tight during the pandemic. It described the murals as “fragile,” even though an analysis by Page & Turnbull, a historic preservation architecture firm the university hired, said they were “structurally sound.”

Then, on June 18, the university received a letter from the General Services Administration stating that “ownership of the murals resides with G.S.A., on behalf of the United States.” The federal agency wanted the murals to be preserved.

“We were surprised when the G.S.A. said, ‘We assert an ownership interest,’” said Brian Newman, U.C.S.F.’s vice chancellor for real estate. The university said it rejects the G.S.A.’s ownership claim.

Bernard Zakheim with his son, Nathan, in 1967. UCSF Archives and Special Collections

Putting further pressure on the university, The Los Angeles Times published an op-ed piece on July 10 that was based in part on Ms. Voisin George's research. Its headline read: "A monument to California's Black history — and a great work of art — may soon be destroyed."

Cheryl and Robynn Cox, sisters who are descendants of Biddy Mason, grew up knowing that their famous ancestor was painted on the frescoes, as had their mother and grandparents. She also was the subject of a 2015 young adult book illustrated with the mural.

Both women assumed the murals would always be available to the public, until they read the reports about plans to destroy them.

"It's interesting, if you look through the lens of race and gender, this extraordinary Black woman and former slave is bringing attention to the destruction of these murals, but no one personally reached out to us," said Robynn Cox, an assistant professor of social work at the University of Southern California.

"Across the country, everyone is talking about diversity, equity and inclusion," said Cheryl Cox, who works in philanthropy. "To take down a mural of somebody who is showing diversity, equity and inclusion is kind of hard to swallow."

The mural shows "a former slave who is on an equal footing, or maybe an even more than equal footing with white men at a time in which there was still slavery in this country," she added. "I don't know if there's anything like it."

The Cox sisters said they recently met over Zoom with U.C.S.F. officials, including a meeting on Aug. 10 attended by the chancellor, Sam Hawgood.

Last week, the school announced it was seeking bids to remove the 10 frescoes and place them in storage, at a price not to exceed $1.8 million. "We are hoping we can come up with a viable plan for the murals to preserve them," Mr. Newman, the vice chancellor, said.

The federal government response, in an email from Pamela D. Pennington, the G.S.A. press secretary, said: “Until a new location for the murals is determined, their removal, preservation and storage by U.C.S.F. is supported by G.S.A.”

But the descendants of the artist and the famous nurse want the art to be seen.

Mr. Gottstein said, “If they are in storage and never see the light of day, then we will have lost, after all.”

Op-Ed: A monument to California's Black history — and a great work of art — may soon be destroyed

Artist Bernard Zakheim showed African American Biddy Mason as an equal among medical authorities in a mural commissioned by UC San Francisco in the 1930s. (Chris Carlsson)

By JACKIE BROXTON AND KEVIN WAITE

JULY 10, 2020 3:18 AM

As antiracist activists topple statues of slaveholders across the country, UC San Francisco threatens to demolish a very different kind of monument: a mural depicting a celebrated former slave.

The work shows Biddy Mason, an African American midwife who rose to fortune in Los Angeles after winning her freedom in the mid-1850s. Since the Great Depression, the mural has been displayed alongside nine others in UC Hall on the university's main campus. But now the building and its artwork are slated for demolition to make way for new office, medical and research space.

In the mid-1930s, UC San Francisco commissioned the Polish-born artist Bernard Zakheim to paint a set of murals of California's medical history. Zakheim, who studied with Diego Rivera, had become regarded as one of the state's major artistic figures. Like his murals in San Francisco's Coit Tower, his UC San Francisco works are landmarks in the bold, modern style of the New Deal era. They have been hailed as "the jewel of the University's art collection."

The panel featuring Biddy Mason is perhaps the most historically significant of the 10 murals. In it, Mason tends to a malaria patient alongside Dr. John Griffin, one of Los Angeles' preeminent early medical authorities. Below, other patients await treatment from Griffin and Mason, who formed a renowned medical partnership in mid-19th century Los Angeles.

ADVERTISING

Ads by Teads

What makes the mural unique is its composition. Mason occupies center stage. She's surrounded by a group of white men — soldiers, patients, doctors, city officials — but she's not subordinate to them. Rather, she tends to the patient directly as a medical authority in her own right. Zakheim depicts Mason as she was: a healing presence and a pillar of early Los Angeles.

Biddy Mason began her days in radically different circumstances. Born into slavery in the Georgia cotton belt in 1818, she was seemingly destined for a life of hard labor and a death in obscurity. Like other enslaved African Americans, she lacked a legal family name. She was simply Bridget, or Biddy.

In the late 1840s, Biddy began a long, strange trip — one that took her out of the South and across the continent. She went as a slave, forcibly transported by her master, along with several other Black women and children. They arrived first in Utah before moving to a small Mormon colony in San Bernardino, Calif., in 1851.

Although California was technically a free state, authorities turned a blind eye to slaveholding settlers in their midst. Several dozen slaves worked in San Bernardino alone. Only in 1856 — six years after California outlawed human bondage — did Biddy, along with 13 other African American women and children, win their freedom in a Los Angeles courtroom.

Once free, Biddy took the last name Mason and began an improbable rise through the social ranks of early Los Angeles. She used money earned as Dr. Griffin's assistant to invest in real estate, just as L.A. was beginning to boom. Although illiterate and subject to both racial and gender discrimination, Mason amassed a tremendous fortune. Some estimates place her total wealth at $300,000 (equivalent to $8.5 million today).

Mason is remembered not only for her uncanny business acumen, but also for her philanthropy. She gave liberally — of her time, money and medical expertise — to those in need around Los Angeles. She also co-founded the first African American house of worship in the city. First African Methodist Episcopal Church remains a mainstay of L.A.'s Black community to this day.

Now, a piece of Mason's legacy — the oldest known artistic representation of the famous freedwoman — faces demolition.

University spokespeople claim that UC San Francisco is unable to cover the costs of removing and preserving the murals, estimated at $8 million. If the price of saving 10 frescoes is prohibitive, one wonders where the university will find the funds for its proposed 1.5 million-square-foot expansion project. Perhaps the university could start by dipping into its nearly $4-billion endowment.

Local residents have already begun to protest the development project, set to break ground in 2023. They argue that the expansion will add thousands of workers to the Parnassus Heights campus, further straining the community's overtaxed transit systems and housing options. Critics can add the university's destruction of history to their list of grievances.

The artist's son, Nathan Zakheim, has been given three months to propose a plan to remove the murals at the family's expense. After that, the university will solicit proposals from the public to adopt the murals — again without financial support from UC San Francisco. If no one comes forward: demolition.

UC San Francisco proposes a Silicon Valley solution: a digital re-creation of the murals, which would later be featured in a virtual reality display. Through goggles, visitors would get a secondhand look at art destroyed by the university.

The timing could not be worse. During a crossroads in race relations, when Black American voices are finding new purchase, the university threatens an important piece of Black women's history.

The United States boasts vanishingly few monuments to women of color. Fewer still if the university is allowed to go forward with its ill-considered plans to bulldoze the Biddy Mason mural along with nine others. Black Lives Matter. And so does Black history.

Jackie Broxton is the executive director of the Biddy Mason Charitable Foundation,which provides services and support to L.A.'s foster youth population. Kevin Waite is an assistant professor of history at Durham University and co-director of an National Endowment for the Humanities-funded project on the life and times of Biddy Mason.

UCSF New Deal murals could be destroyed

J.K. Dineen

Photo: Liz Hafalia / The Chronicle 2015

A series of celebrated New Deal-era murals on the UCSF Parnassus campus could be destroyed unless someone comes up with as much as $8 million that the school says would be needed to safely move and preserve the artwork.

In 2015, UCSF invited members of the public into a lecture hall on the campus to see what it described as the “crown jewel” of its art collection: a series of New Deal-era frescoesdepicting the history of medicine in California.

Art history buffs flocked to see the murals, which were painted in the 1930s by Diego Rivera collaborator Bernard Zakheim. Emeritus professor of medicine Dr. Robert Schindler called the murals "enormously significant."

All the stories, all the time | Unlock The Chronicle for 95¢ SUBSCRIBE

Five years later, however, the future of the artwork is uncertain as UCSF prepares to knock down UC Hall, where the 10 frescoes are located, as part of an ambitious plan to build a new 1.5 million-square-foot hospital and research campus there.

In a statement, UCSF spokeswoman Jennifer O'Brien said the university doesn't have the $8 million it would cost to move the artwork to a new building, and moving the "fragile murals would likely cause irreparable damage," she said.

"Based on these factors, UCSF has decided not to use public funds to physically preserve the murals, especially at a time when the UC system faces financial challenges in the wake of COVID-19," she said.

Instead the university will hire a digital preservation firm to "create a three-dimensional digital recording of the murals that would be prominently highlighted in an interpretive virtual reality exhibit on campus."

O’Brien said the school has reached out to Nathan Zakheim, the 76-year-old son of the artist, to see if the family would like to remove the murals “at their own expense.” The family has 90 days to submit a detailed proposal for how the murals would be removed from the building and preserved. If they do not submit a plan, UCSF will issue a public request for proposals to see if any other individual or group is interested in taking them. If no one responds to that, the murals would be destroyed.

Nathan Zakheim accused the university of “railroading” his family. Zakheim, an art conservator based in Los Angeles, said that the $8 million estimate was “grossly inflated” and that he could do it for $1 million. He suggested that UCSF should “design a square room in the new campus” specifically for the artwork or put it in the library.

“It is a magnificent, unparalleled historic document,” said Zakheim.

“It’s a key part of the university’s history and a key part of San Francisco’s history. If they don’t care about that, well, it’s ridiculous,” he added.

He also said that UCSF administrators had told him that some students and faculty members had complained about the content of the work, particularly the way that Native Americans and Spanish missionaries are depicted.

Bernard Zakheim’s work in San Francisco

Zakheim was a Polish-born San Francisco muralist, best known for his work on the Coit Tower murals. In the early 1930s, he committed himself to the preservation and interpretation of Jewish American life and culture through the making of art. He was one of the organizers of a Yiddish school in the Fillmore District, back when that neighborhood was largely Jewish. He helped found the San Francisco Artists and Writers Union, which lobbied for government arts funding. Eventually that led to the funding of Zakheim’s work in Coit Tower.

In San Francisco, Zakheim’s artwork can be found at UCSF’s Parnassus campus, the lobby of Coit Tower and the San Francisco Jewish Community Center. He also painted murals inside the former Alemany Health Center.

O’Brien said the subject matter of the murals had nothing to do with the decision to attempt to find a new home for them.

Robert Cherny, an emeritus professor of history at San Francisco State University, said the decision to jettison the murals surprised him, especially since the school seemed enthusiastic about the artwork in the past.

“They seem to be very proud of the murals and very much wanted to share them,” he said. “It’s a big turnaround for the UCSF administration. To me this is just somebody in the UCSF administration saying, ‘We don’t want to bother.’ It’s a very cavalier disregard for both history and art.”

In total Zakheim painted 12 murals at UCSF in 1930s: the 10-panel “History of Medicine in California” and two-panel “Modern Medicine” and “Ancient Medicine: Superstition in Medicine” in the Health Sciences West lecture halls. The latter two works are not threatened with removal.

There is precedent for rescuing Zakheim’s mural art. The Jewish Community Center of San Francisco saved a 1933 fresco, “The Jewish Wedding,” when constructing its current building, and unveiled the restored work in 2004. The Zakheim family assisted in the restoration effort.

CULTUREART

Jewish muralist's historic work faces demolition at UCSF

BY **LAURA PAULL** I JUNE 18, 2020

How does a significant piece of public art go from being the "jewel of the University's art collection" to a work designated for the wrecking ball in just five years?

That is the question the descendants of the 20th-century Jewish artist Bernard Zakheim are asking UCSF Medical Center, which on June 4 sent a legal letter to a member of the family saying that the murals he painted in the 1930s could be destroyed to make way for construction of a new building.

The 10-panel series "History of Medicine in California," which Zakheim produced between 1935 and 1938, was commissioned by UCSF and partly funded by the Works Project Administration. Installed in Toland Hall, a lecture room inside UC Hall, the vivid images of doctors, lab scientists, suffering and recovered patients have been studied by generations of medical students — except for one 20-year period

after a particular professor objected that the art was a distraction from the lectures and the university wallpapered it over.

Since freed from that censorship, for decades the university has promoted the art as a visual symbol of its humanistic values. In 2015, as part of the institution's 150th anniversary, the public was allowed to tour the murals, and UCSF archivist Polina Ilieva wrote a blog describing them as "the jewel of the University's art collection."

Physicians on the faculty have recorded lectures elucidating the details of the murals to classes and the public, including a 1996 presentation in which Dr. Robert Schindler lauded the murals as "the product of an extraordinary individual."

But now that UC Hall is scheduled to be torn down starting in 2022 to make way for a 27,000-square-foot, state-of-the-art research and academic building — part of a multiyear, multibillion overhaul of the Parnassus campus, paid for in part by a $500 million gift from the Helen Diller Foundation — those values have come into question.

"Up until very recently my impression was that the UCSF administration understood the value of the murals as history and as art and wanted to preserve and conserve them," said Robert Cherny, professor emeritus of history at San Francisco State and author of "Victor Arnautoff and the Politics of Art" and many articles about the artists of the New Deal era, including Zakheim. "An earlier plan was to convert Toland Hall into a community center so that more of the public could see the murals. The new plan is an abrupt turnaround by the university administration."

Zakheim, a major artist of the period who immigrated from Poland to San Francisco in 1920 and studied fresco technique and painting with Mexican artist Diego Rivera, already had made a name for himself as a muralist when UCSF commissioned the work. Most notedly, he had spearheaded the 1934 Coit Tower mural project, which resulted in murals by 25 local artists depicting California life.

But of all Zakheim's output, the massive Toland Hall murals are his largest single work, Cherny said.

According to Nathan Zakheim, his father "considered those to be his greatest murals. They are extremely powerful works."

Cherny regards Bernard Zakheim as "one of the most prominent of the New Deal artists; I'd place him in a group of the top three on the Pacific Coast, with Victor Arnautoff and Lucien Labaudt, who painted the Beach Chalet mural."

Zakheim was also a Jewish artist with "a commitment to Jewish culture," Cherny said.

Leah Royall, one of Zakheim's granddaughters, remembers him as "a character" who spoke five languages in addition to his native Polish.

"In his dusty house on the Sebastopol property that he called Farm Arts, he'd stomp around singing Yiddish songs. He used to glue articles from the Jewish Bulletin [now J.] into his typewritten letters to us, and he loved talking politics. This was a man who opposed 'art for art's sake' — life and his art were informed by his left-wing political convictions," Royall told J.

In 1933, Zakheim created the mural "The Wedding Ceremony" for the JCC of San Francisco. When the old building was torn down for a new one that opened in 2004, the Zakheim family fought for the work's preservation, and the JCC ultimately agreed to remove the mural and reintegrate it into the new facility.

> Erasing artwork that is historically significant to both San Francisco and California stands in stark contrast to the university's original vision.

In its letter to Nathan Zakheim, as well as in an official statement explaining its proposal to replace UC Hall, UCSF cited the conclusions of two historic preservation firms that the removal of the murals prior to demolition would result in irreparable damage to the works.

"UCSF has decided not to use public funds to physically preserve the murals, especially at a time when the UC system faces financial challenges in the wake of Covid-19. This decision in no way has to do with any complaints about the murals," the university said in its official statement. After requesting additional comment from the administration, J. was referred back to the statement.

The UCSF letter offered the Zakheim family a 90-day period to submit a proposal to remove the murals at their own expense, after which the university said it would make a public announcement calling for other proposals to remove and take possession of the murals within an additional 120 days.

The university's estimate of the cost of removal is around $8 million.

Nathan Zakheim, 76, an art conservator based in Los Angeles, says that figure is unnecessarily high. In phone conversations with Brian Newman, UCSF's senior associate vice chancellor in charge of campus space planning, design, construction and management, the artist's elder son said he believed he could get

the job done for under $1 million. The ace up his sleeve is the fact that his father taught him how to remove the murals during the time when they worked together to remove and restore two other murals in UCSF's Cole Hall in 1967.

"These murals can be removed," Cherny concurs. "Bernard Zakheim foresaw that eventuality and planned for it, and taught Nathan the technique. That is what the UCSF administration doesn't seem to acknowledge."

Bernard Zakheim with son Nathan in 1967 discussing mural removal and restoration at UCSF. (Photo/Courtesy UCSF Archives & Special Collections)

The far-flung family of Zakheim's descendants have united in a response to the university that prioritizes the preservation of the murals.

"Ninety days is an unreasonable amount of time, and the clock is already ticking," said Zakheim grandson Adam Gottstein, 64. "I don't want to get into the politics of it; my hyperfocus is to find a resolution that will save the work from demolition."

Zakheim's daughter, 97-year-old Ruth Gottstein, a lifelong social activist and former independent publisher, dictated an irate letter from her assisted-living facility in Jackson, Amador County.

"It is egregious to me that people today assign themselves the moral right to decide what should happen to these historic and irreplaceable pieces of art. They were painted in 1935! These were the thoughts and principles of the artists at that time. To destroy them is to willfully ignore what was taking place in our world and arbitrarily erase significant portions of our history and evolution. Nobody has that kind of authority. Nobody."

She called the university's offer to commission a "three-dimensional digital recording" of the artwork in lieu of preserving the physical murals "a travesty."

Ruth Gottstein's niece, Bethany Stark, took "umbrage" at the university's a priori decision to destroy the murals unless the family took them away.

"These are works that have artistic, historical and community value," Stark said by phone from L.A. "They belong to the community, to the public and to the university. The murals are not just some antique chair that they can say, 'It doesn't work anymore, do you want it back?"

Royall, an editor in London, shared the outrage, describing the university's decision as "criminal short-sightedness."

"Erasing artwork that is historically significant to both San Francisco and California stands in stark contrast to the university's original vision," Royall said.

Ruth Gottstein also says that the history, ideas and research integrated into the murals continue to provide value for present and future generations.

"At a time of a global health care–based pandemic," she points out, "the need for the 'messaging' in my father's works in Toland Hall are ironically more applicable today than ever."

"It is my hope that we can extend the deadline in order to come up with a collaborative solution to save my grandfather's murals," Adam Gottstein wrote in his own June 15 letter to UCSF.

Arts and preservation organizations and concerned individuals around the city are rousing to the cause. On June 23, S.F. Supervisor Aaron Peskin planned to introduce a resolution to the Board of Supervisors to designate the murals as historic landmarks. The motion would have to be taken up by the Historic Preservation Commission and the Planning Department. While such a designation would not legally protect the murals, because the university is a state institution, "I wouldn't initiate this process if I didn't

believe the murals merit protection, and I hope this symbolic action helps to bring the university to its senses," Peskin told J.

Meanwhile, Nathan Zakheim says his ongoing discussions with the university have been good so far.

"I'm not approaching this as an activist," he said. "I'm a technician. I know how to take murals off walls, and that's what I want to do."

Viewing Zakheim Murals at UCSF

Posted on **March 2, 2015** by **Polina Ilieva**

As part of UCSF's 150th anniversary celebration, the university has arranged special public viewing hours for the Zakheim murals through the spring:

Friday, March 13th: 4 – 7 p.m.
Friday, April 17th: 3 – 5 p.m.
Friday, May 22nd: 3 – 5 p.m.

Location:
Toland Hall on the UCSF Campus
533 Parnassus Ave., Room U-142
San Francisco, CA
Map of UCSF Parnassus Campus and Directions (printable PDF)

Recent article in San Francisco Chronicle highlights history of the Zakheim murals at UCSF.

Recent Acquisition: Bernard Zakheim Collection

Posted on **February 24, 2015** by **Polina Ilieva**

Ever since the Polish-born artist Bernard Zakheim painted a series of murals at UCSF in 1930s they remain the jewel of the University's Art Collection. These murals include ten panel series in Toland Hall, "History of Medicine in California," and two panels originally located in the Cole Hall and later moved to the Health Sciences West (HSW) lecture halls – "Modern Medicine" and "Ancient Medicine: Superstition in Medicine." Zakheim worked with Diego Rivera in Mexico City and is best known for contributing the Library Periodical Room fresco and helping organize the New Deal art project at the Coit Tower in San Francisco. From the time of their unveiling, the archives has been compiling reference materials about these murals and now we are delighted to report that a comprehensive set of materials documenting how these frescoes were created and preserved was donated to UCSF (Bernard Zakheim collection, MSS 2014-15).

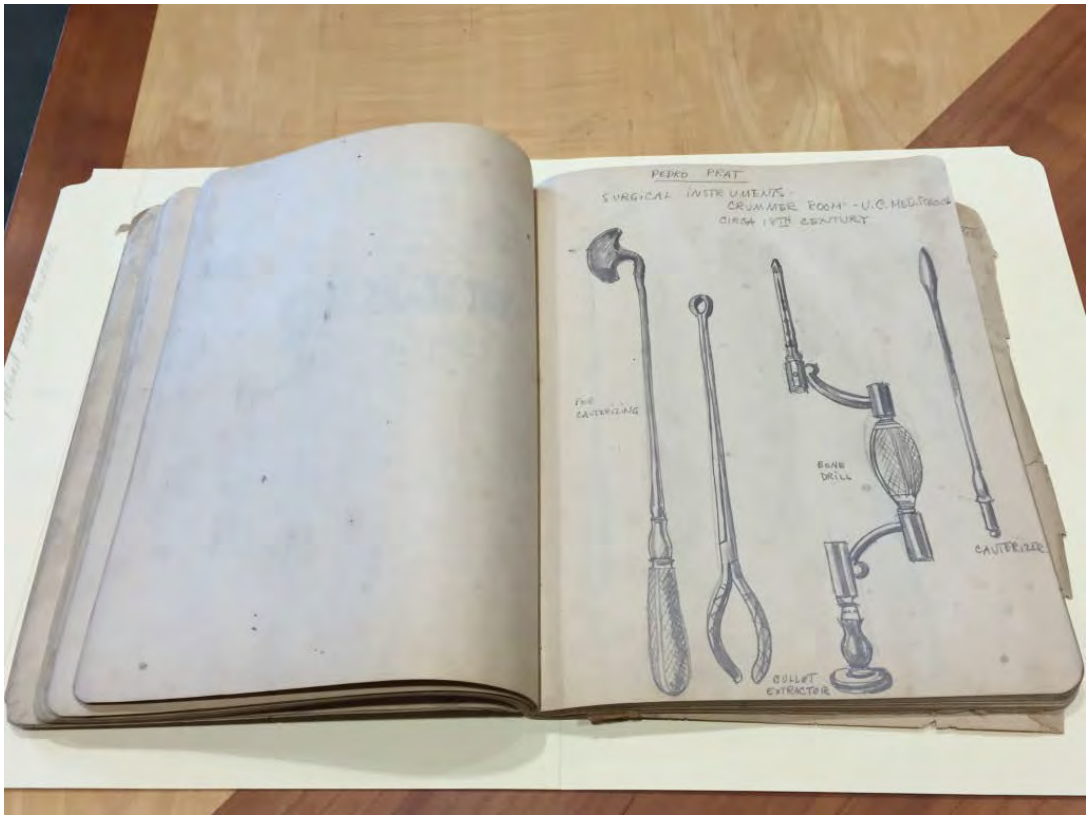
— Viewing murals at Toland Hall at UCSF, left to right: F. Stanley Durie, Superintendent of UC Hospital, Dr. William E. Carter, Phyllis Wrightson, Joseph Allen, State Director of WPA Federal Art Project, Bernard Zakehim (ca. 1939)

Last year I had the privilege to meet one of the sons of the artist who also helped restore the frescoes in 1970s when the wallpaper covering them for almost two decades was removed and the two panels were relocated from the original Cole Hall to HSW.

— Artist Bernard Zakheim with his son Nathan Zakheim (1967)

One of the biggest archives' advocates, Dr. Robert Sherins (SOM, 1963) introduced me to Nathan Zakheim. Nathan, a talented art conservator based in Los Angeles, is the keeper of his father's extensive archives and art collection. Last fall we met at his warehouse to review and pack the documents destined for UCSF.

The idea to commission murals was brought by Dr. Isabella Perry, professor of pathology after seeing the frescoes Zakheim painted at the Alemany Public Health Center and then spearheaded by Chauncey D. Leake, professor of pharmacology and medical historian. The university murals undertaking which was partially funded by the WPA Federal Art Project and also sponsored by the university was a true collaborative effort between Zakheim's team and UCSF faculty (including renowned UCSF doctors, Chauncey D. Leake, George Lyman, Langley Porter, Salvatore P. Lucia, W. E. Carter, and F. W Lynch). The artist was provided unrestricted access to the Crummer Room containing numerous books on the history of medicine, including recently published "California's Medical Story" by Dr. Henry Harris. Zakheim's assistant, Phyllis Wrightson did extensive research about California medical history which becomes apparent in the sketchbook that she kept for the project. The instruments depicted by her on these pages are still preserved at the archives' artifact collection and will be displayed as part of the 150th anniversary exhibit.



— Drawings of surgical instruments from the UCSF collection for the panel devoted to Don Pedro Prat, surgeon of the Portolá expedition.

— Surgeon Don Pedro Prat treats patient's leg, James Ohio Pattie vaccinates Californians.

One of the sketches portrays fur trader James Ohio Pattie who was captured for illegal trapping in California and earned his release from Mexican imprisonment in San Diego by using the smallpox vaccine to curtail the epidemic spreading among Californians (that story based on the Pattie's "Personal Narrative" was later proved to be inaccurate as it was measles epidemic* that occurred in Alta California at that time).

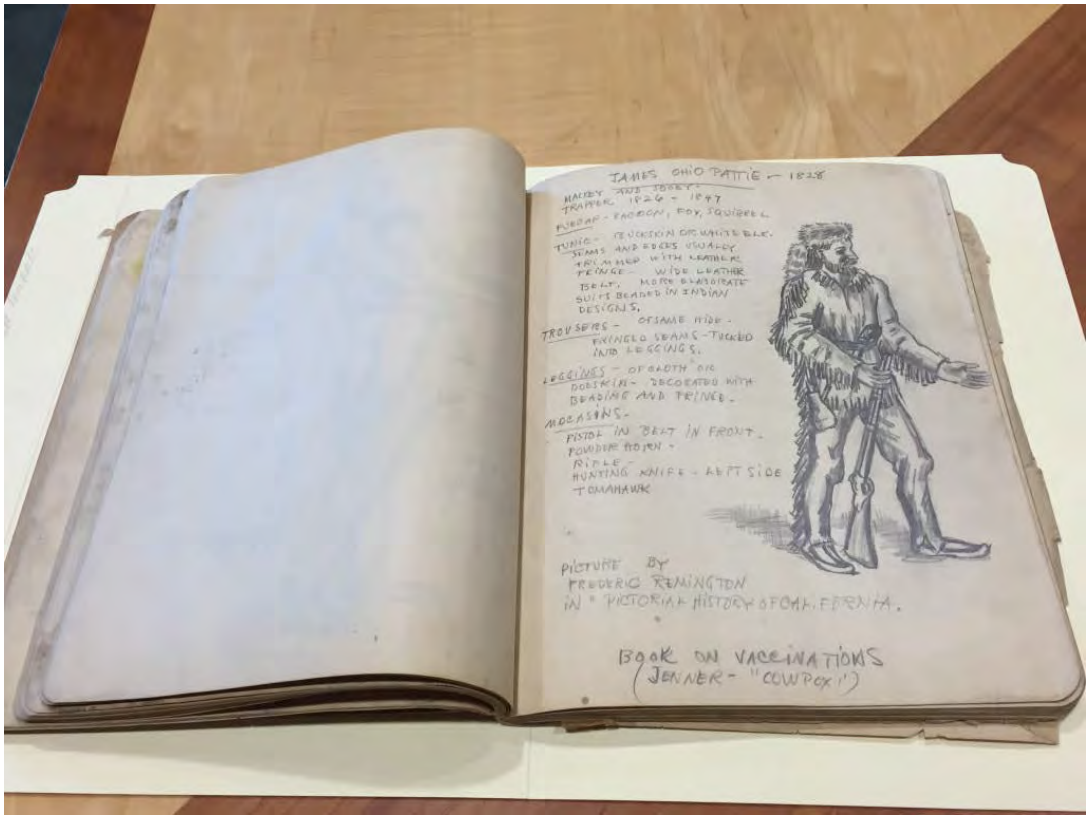
At Work on Toland Hall Mural

BERNARD ZAKHEIM.
He is at work on one of several murals for Toland Hall at the University of California Hospital. This scene depicts the famous quarrel between Dr. Edward Willis, early California physician, and "Dr." Hullings, wherein the physician shot and killed the quack and imposter. The mural is being painted under the Federal Art Project.

S. F. News - March 13-1937 p. 13

M. Adams -

— Bernard Zakheim at work, 1937



— Drawing of James Ohio Pattie.

Bernard Zakheim and his team interviewed numerous faculty members who are depicted in the panel “Rational Medicine,” including Robert Stone, professor of radiology, Francis S. Smith, pediatrician and dean of the School of Medicine, Karl F. Meyer, director of the Hooper Foundation, anesthesiologist Arthur Guedel and Isabella Perry to name just a few.

— Scaffoldings in the original Cole Hall (that was located at the School of Medicine building) set up while Bernard Zakheim was working on the panel "Rational Medicine."

We are grateful to the Zakheim family and in particular to Nathan Zakheim for donating this unique collection to the University. It will be organized and described in the next few months, selected slides and documents will be digitized and uploaded to the library website.
Are you interested in viewing the murals, but unable to visit San Francisco? Please check these two video recordings from the UCSF archives:
Dr. Robert Schindler (Chair emeritus of the UCSF Department of Otolaryngology) presents a video tour of the murals painted by Bernard Zakheim in Toland Hall at UCSF, 1996:
https://archive.org/details/cum_00001
Toland Hall murals tour by Dr. Chauncey Leake, 1976: https://archive.org/details/cum_000015

We would also like to bring to your attention a manuscript put together by Dr. Sherins chronicling the life story and work of Bernard Zakheim that can be accessed on the Alumni Association website.

Born May 3, 1963 in
Sacramento, California.
Married, father of two.

Ecologist

Expertise

- Finding solutions to controversial problems related to wildlife interactions with human industry, infrastructure, and activities;

- Using systems analysis and experimental design principles to identify meaningful ecological patterns that can inform management decisions.

Education

Ph.D. Ecology, University of California, Davis. September 1990.
M.S. Ecology, University of California, Davis. June 1987.
B.S. Anthropology, University of California, Davis. June 1985.
Corcoran High School, Corcoran, California. June 1981.

Experience

- 443 professional publications, including:
- 80 peer reviewed publications
- 24 in non-reviewed proceedings
- 337 reports, declarations, posters and book reviews
- 8 in mass media outlets
- 84 public presentations of research results at meetings
- Reviewed many professional papers and reports
- Testified in 4 court cases.

Editing for scientific journals: Guest Editor, *Wildlife Society Bulletin*, 2012-2013, of invited papers representing international views on the impacts of wind energy on wildlife and how to mitigate the impacts. Associate Editor, *Journal of Wildlife Management*, March 2004 to 30 June 2007. Editorial Board Member, *Environmental Management*, 10/1999 to 8/2004. Associate Editor, *Biological Conservation*, 9/1994 to 9/1995.

Member, Alameda County Scientific Review Committee (SRC), August 2006 to April 2011. The five-member committee investigated the causes of bird and bat collisions in the Altamont Pass Wind Resource Area, and recommended mitigation and monitoring measures. The SRC

reviewed the science underlying the Alameda County Avian Protection Program, and advised the County on how to reduce wildlife fatalities.

Consulting Ecologist, 2004-2007, California Energy Commission (CEC). Provided consulting services as needed to the CEC on renewable energy impacts, monitoring and research, and produced several reports. Also collaborated with Lawrence-Livermore National Lab on research to understand and reduce wind turbine impacts on wildlife.

Consulting Ecologist, 1999-2013, U.S. Navy. Performed endangered species surveys, hazardous waste site monitoring, and habitat restoration for the endangered San Joaquin kangaroo rat, California tiger salamander, California red-legged frog, California clapper rail, western burrowing owl, salt marsh harvest mouse, and other species at Naval Air Station Lemoore; Naval Weapons Station, Seal Beach, Detachment Concord; Naval Security Group Activity, Skaggs Island; National Radio Transmitter Facility, Dixon; and, Naval Outlying Landing Field Imperial Beach.

Part-time Lecturer, 1998-2005, California State University, Sacramento. Taught Contemporary Environmental Issues, Natural Resources Conservation (twice), Mammalogy, Behavioral Ecology, and Ornithology Lab.

Senior Ecologist, 1999-2005, BioResource Consultants. Designed and implemented research and monitoring studies related to avian fatalities at wind turbines, avian electrocutions on electric distribution poles across California, and avian fatalities at transmission lines.

Systems Ecologist, 1996 to present, Consulting in the Public Interest, www.cipi.com. Member of a multi-disciplinary consortium of scientists facilitating large-scale, environmental planning projects and litigation. We provide risk assessments, assessments of management practices, and expert witness testimony.

Chairman, Conservation Affairs Committee, The Wildlife Society--Western Section, 1999-2001. Prepared position statements and led efforts directed toward conservation issues, including travel to Washington, D.C. to lobby Congress for more wildlife conservation funding.

Systems Ecologist, 1995-2000, Institute for Sustainable Development. Headed ISD's program on integrated resources management. Developed indicators of ecological integrity for large areas, using remotely sensed data, local community involvement and GIS.

Associate, 1997-1998, Department of Agronomy and Range Science, University of California, Davis. Worked with Shu Geng and Mingua Zhang on several studies related to wildlife interactions with agriculture and patterns of fertilizer and pesticide residues in groundwater across a large landscape.

Lead Scientist, 1996-1999, National Endangered Species Network. Headed NESN's efforts to inform academic scientists and environmental activists about emerging issues regarding the Endangered Species Act and other environmental laws pertaining to special-status species. Also testified at public hearings on behalf of environmental groups and endangered species.

Ecologist, 1997-1998, Western Foundation of Vertebrate Zoology. Conducted field research to

determine the impact of past mercury mining on the status of California red-legged frogs in Santa Clara County, California.

Senior Systems Ecologist, 1994-1995, EIP Associates, Sacramento, California. Provided consulting services in environmental planning. Developed quantitative assessment of land units for their conservation and restoration opportunities, using the ecological resource requirements of 29 special-status species. Developed ecological indicators for prioritizing areas within Yolo County to receive mitigation funds for habitat easements and restoration.

Post-Graduate Researcher, 1990-1994, Department of Agronomy and Range Science*, U.C. Davis*. Under the mentorship of Dr. Shu Geng, studied landscape and management effects on temporal and spatial patterns of abundance among pocket gophers and species of Falconiformes and Carnivora in the Sacramento Valley. Also managed and analyzed a data base of energy use in California agriculture, and assisted with a landscape (GIS) study of groundwater contamination across Tulare County, California.

Work experience in graduate school: Co-taught Conservation Biology with Dr. Christine Schonewald, 1991 & 1993, UC Davis Graduate Group in Ecology; Reader for Dr. Richard Coss's course on Psychobiology in 1990, UC Davis Department of Psychology; Research Assistant to Dr. Walter E. Howard, 1988-1990, UC Davis Department of Wildlife and Fisheries Biology, testing durable baits for pocket gopher management in forest clearcuts; Research Assistant to Dr. Terrell P. Salmon, 1987-1988, UC Wildlife Extension, Department of Wildlife and Fisheries Biology, developing empirical models of mammal and bird invasions in North America, and a rating system for priority research and control of exotic species based on economic, environmental and human health hazards in California. Student Assistant to Dr. E. Lee Fitzhugh, 1985-1987, UC Cooperative Extension, Department of Wildlife and Fisheries Biology, developing and implementing a statewide mountain lion track count for long-term monitoring of numbers and distribution.

Fulbright Research Fellow, Indonesia, 1988. Tested use of new sampling methods for numerical monitoring of Sumatran tiger and six other species of endemic felids, and evaluated methods used by other researchers.

Projects

Repowering wind energy projects through careful siting of new wind turbines using map-based collision hazard models to minimize impacts to volant wildlife. Funded by wind companies (principally NextEra Renewable Energy, Inc.), California Energy Commission and East Bay Regional Park District, I have collaborated with a GIS analyst and managed a crew of five field biologists performing golden eagle behavior surveys and nocturnal surveys on bats and owls. The goal is to quantify flight patterns for development of predictive models to more carefully site new wind turbines in repowering projects. Focused behavior surveys began May 2012 and continue. Collision hazard models have been prepared for seven wind projects, three of which were built. Planning for additional repowering projects is underway.

Test avian safety of new mixer-ejector wind turbine (MEWT). Designed and implemented a before-after, control-impact experimental design to test the avian safety of a new, shrouded wind turbine developed by Ogin Inc. (formerly known as FloDesign Wind Turbine Corporation). Supported by a

$718,000 grant from the California Energy Commission's Public Interest Energy Research program and a 20% match share contribution from Ogin, I managed a crew of seven field biologists who performed periodic fatality searches and behavior surveys, carcass detection trials, nocturnal behavior surveys using a thermal camera, and spatial analyses with the collaboration of a GIS analyst. Field work began 1 April 2012 and ended 30 March 2015 without Ogin installing its MEWTs, but we still achieved multiple important scientific advances.

Reduce avian mortality due to wind turbines at Altamont Pass. Studied wildlife impacts caused by 5,400 wind turbines at the world's most notorious wind resource area. Studied how impacts are perceived by monitoring and how they are affected by terrain, wind patterns, food resources, range management practices, wind turbine operations, seasonal patterns, population cycles, infrastructure management such as electric distribution, animal behavior and social interactions.

Reduce avian mortality on electric distribution poles. Directed research toward reducing bird electrocutions on electric distribution poles, 2000-2007. Oversaw 5 founds of fatality searches at 10,000 poles from Orange County to Glenn County, California, and produced two large reports.

Cook *et al*. v. Rockwell International *et al*., No. 90-K-181 (D. Colorado). Provided expert testimony on the role of burrowing animals in affecting the fate of buried and surface-deposited radioactive and hazardous chemical wastes at the Rocky Flats Plant, Colorado. Provided expert reports based on four site visits and an extensive document review of burrowing animals. Conducted transect surveys for evidence of burrowing animals and other wildlife on and around waste facilities. Discovered substantial intrusion of waste structures by burrowing animals. I testified in federal court in November 2005, and my clients were subsequently awarded a $553,000,000 judgment by a jury. After appeals the award was increased to two billion dollars.

Hanford Nuclear Reservation Litigation. Provided expert testimony on the role of burrowing animals in affecting the fate of buried radioactive wastes at the Hanford Nuclear Reservation, Washington. Provided three expert reports based on three site visits and extensive document review. Predicted and verified a certain population density of pocket gophers on buried waste structures, as well as incidence of radionuclide contamination in body tissue. Conducted transect surveys for evidence of burrowing animals and other wildlife on and around waste facilities. Discovered substantial intrusion of waste structures by burrowing animals.

Expert testimony and declarations on proposed residential and commercial developments, gas-fired power plants, wind, solar and geothermal projects, water transfers and water transfer delivery systems, endangered species recovery plans, Habitat Conservation Plans and Natural Communities Conservation Programs. Testified before multiple government agencies, Tribunals, Boards of Supervisors and City Councils, and participated with press conferences and depositions. Prepared expert witness reports and court declarations, which are summarized under Reports (below).

Protocol-level surveys for special-status species. Used California Department of Fish and Wildlife and US Fish and Wildlife Service protocols to search for California red-legged frog, California tiger salamander, arroyo southwestern toad, blunt-nosed leopard lizard, western pond turtle, giant kangaroo rat, San Joaquin kangaroo rat, San Joaquin kit fox, western burrowing owl, Swainson's hawk, Valley elderberry longhorn beetle and other special-status species.

Conservation of San Joaquin kangaroo rat. Performed research to identify factors responsible for the

decline of this endangered species at Lemoore Naval Air Station, 2000-2013, and implemented habitat enhancements designed to reverse the trend and expand the population.

Impact of West Nile Virus on yellow-billed magpies. Funded by Sacramento-Yolo Mosquito and Vector Control District, 2005-2008, compared survey results pre- and post-West Nile Virus epidemic for multiple bird species in the Sacramento Valley, particularly on yellow-billed magpie and American crow due to susceptibility to WNV.

Workshops on HCPs. Assisted Dr. Michael Morrison with organizing and conducting a 2-day workshop on Habitat Conservation Plans, sponsored by Southern California Edison, and another 1-day workshop sponsored by PG&E. These Workshops were attended by academics, attorneys, and consultants with HCP experience. We guest-edited a Proceedings published in Environmental Management.

Mapping of biological resources along Highways 101, 46 and 41. Used GPS and GIS to delineate vegetation complexes and locations of special-status species along 26 miles of highway in San Luis Obispo County, 14 miles of highway and roadway in Monterey County, and in a large area north of Fresno, including within reclaimed gravel mining pits.

GPS mapping and monitoring at restoration sites and at Caltrans mitigation sites. Monitored the success of elderberry shrubs at one location, the success of willows at another location, and the response of wildlife to the succession of vegetation at both sites. Also used GPS to monitor the response of fossorial animals to yellow star-thistle eradication and natural grassland restoration efforts at Bear Valley in Colusa County and at the decommissioned Mather Air Force Base in Sacramento County.

Mercury effects on Red-legged Frog. Assisted Dr. Michael Morrison and US Fish and Wildlife Service in assessing the possible impacts of historical mercury mining on the federally listed California red-legged frog in Santa Clara County. Also measured habitat variables in streams.

Opposition to proposed No Surprises rule. Wrote a white paper and summary letter explaining scientific grounds for opposing the incidental take permit (ITP) rules providing ITP applicants and holders with general assurances they will be free of compliance with the Endangered Species Act once they adhere to the terms of a "properly functioning HCP." Submitted 188 signatures of scientists and environmental professionals concerned about No Surprises rule US Fish and Wildlife Service, National Marine Fisheries Service, all US Senators.

Natomas Basin Habitat Conservation Plan alternative. Designed narrow channel marsh to increase the likelihood of survival and recovery in the wild of giant garter snake, Swainson's hawk and Valley Elderberry Longhorn Beetle. The design included replication and interspersion of treatments for experimental testing of critical habitat elements. I provided a report to Northern Territories, Inc.

Assessments of agricultural production system and environmental technology transfer to China. Twice visited China and interviewed scientists, industrialists, agriculturalists, and the Directors of the Chinese Environmental Protection Agency and the Department of Agriculture to assess the need and possible pathways for environmental clean-up technologies and trade opportunities between the US and China.

Yolo County Habitat Conservation Plan. Conducted landscape ecology study of Yolo County to spatially prioritize allocation of mitigation efforts to improve ecosystem functionality within the County from the perspective of 29 special-status species of wildlife and plants. Used a hierarchically structured indicators approach to apply principles of landscape and ecosystem ecology, conservation biology, and local values in rating land units. Derived GIS maps to help guide the conservation area design, and then developed implementation strategies.

Mountain lion track count. Developed and conducted a carnivore monitoring program throughout California since 1985. Species counted include mountain lion, bobcat, black bear, coyote, red and gray fox, raccoon, striped skunk, badger, and black-tailed deer. Vegetation and land use are also monitored. Track survey transect was established on dusty, dirt roads within randomly selected quadrats.

Sumatran tiger and other felids. Upon award of Fulbright Research Fellowship, I designed and initiated track counts for seven species of wild cats in Sumatra, including Sumatran tiger, fishing cat, and golden cat. Spent four months on Sumatra and Java in 1988, and learned Bahasa Indonesia, the official Indonesian language.

Wildlife in agriculture. Beginning as post-graduate research, I studied pocket gophers and other wildlife in 40 alfalfa fields throughout the Sacramento Valley, and I surveyed for wildlife along a 200 mile road transect since 1989 with a hiatus of 1996-2004. The data are analyzed using GIS and methods from landscape ecology, and the results published and presented orally to farming groups in California and elsewhere. I also conducted the first study of wildlife in cover crops used on vineyards and orchards.

Agricultural energy use and Tulare County groundwater study. Developed and analyzed a data base of energy use in California agriculture, and collaborated on a landscape (GIS) study of groundwater contamination across Tulare County, California.

Pocket gopher damage in forest clear-cuts. Developed gopher sampling methods and tested various poison baits and baiting regimes in the largest-ever field study of pocket gopher management in forest plantations, involving 68 research plots in 55 clear-cuts among 6 National Forests in northern California.

Risk assessment of exotic species in North America. Developed empirical models of mammal and bird species invasions in North America, as well as a rating system for assigning priority research and control to exotic species in California, based on economic, environmental, and human health hazards.

Representative special-status species experience

Common name	Species name	Description
Field experience		
California red-legged frog	*Rana aurora draytonii*	Protocol searches; Many detections
Foothill yellow-legged frog	*Rana boylii*	Presence surveys; Many detections
Western spadefoot	*Spea hammondii*	Presence surveys; Few detections
California tiger salamander	*Ambystoma californiense*	Protocol searches; Many detections
Coast range newt	*Taricha torosa torosa*	Searches and multiple detections
Blunt-nosed leopard lizard	*Gambelia sila*	Detected in San Luis Obispo County
California horned lizard	*Phrynosoma coronatum frontale*	Searches; Many detections
Western pond turtle	*Clemmys marmorata*	Searches; Many detections
San Joaquin kit fox	*Vulpes macrotis mutica*	Protocol searches; detections
Sumatran tiger	*Panthera tigris*	Research in Sumatra
Mountain lion	*Puma concolor californicus*	Research and publications
Point Arena mountain beaver	*Aplodontia rufa nigra*	Remote camera operation
Giant kangaroo rat	*Dipodomys ingens*	Detected in Cholame Valley
San Joaquin kangaroo rat	*Dipodomys nitratoides*	Research, conservation at NAS Lemoore
Monterey dusky-footed woodrat	*Neotoma fuscipes luciana*	Non-target captures and mapping of dens
Salt marsh harvest mouse	*Reithrodontomys raviventris*	Habitat assessment, monitoring
Salinas harvest mouse	*Reithrodontomys megalotus distichlus*	Captures; habitat assessment
California clapper rail	*Rallus longirostris*	Surveys and detections
Golden eagle	*Aquila chrysaetos*	Research in Altamont Pass
Swainson's hawk	*Buteo swainsoni*	Research in Sacramento Valley
Northern harrier	*Circus cyaeneus*	Research and publication
White-tailed kite	*Elanus leucurus*	Research and publication
Loggerhead shrike	*Lanius ludovicianus*	Research in Sacramento Valley
Least Bell's vireo	*Vireo bellii pusillus*	Detected in Monterey County
Willow flycatcher	*Empidonax traillii extimus*	Research at Sierra Nevada breeding sites
Burrowing owl	*Athene cunicularia hypugia*	Research at multiple locations
Valley elderberry longhorn beetle	*Desmocerus californicus dimorphus*	Research and publication
Analytical		
Arroyo southwestern toad	*Bufo microscaphus californicus*	Research and report.
Giant garter snake	*Thamnophis gigas*	Research and publication

Smallwood, K.S. and W. A. Erickson (written under supervision of W.E. Howard, R.E. Marsh, and R.J. Laacke). 1990. Environmental exposure and fate of multi-kill strychnine gopher baits. Final Report to USDA Forest Service –NAPIAP, Cooperative Agreement PSW-89-0010CA.

Fitzhugh, E.L., K.S. Smallwood, and R. Gross. 1985. Mountain lion track count, Marin County, 1985. Report on file at Wildlife Extension, University of California, Davis.

Comments on Environmental Documents

I was retained or commissioned to comment on environmental planning and review documents, including:

- Comments on proposed rule for incidental eagle take (2016, 49 pp);
- Revised Draft Giant Garter Snake Recovery Plan of 2015 (2016, 18 pp);
- Supplementary Reply Witness Statement Amherst Island Wind Farm, Ontario (2015, 38 pp);
- Witness Statement on Amherst Island Wind Farm, Ontario (2015, 31 pp);
- Second Reply Witness Statement on White Pines Wind Farm, Ontario (2015, 6 pp);
- Reply Witness Statement on White Pines Wind Farm, Ontario (2015, 10 pp);
- Witness Statement on White Pines Wind Farm, Ontario (2015, 9 pp);
- Proposed Section 24 Specific Plan Agua Caliente Band of Cahuilla Indians DEIS (2015, 9 pp);

- Replies to comments 24 Specific Plan Agua Caliente Band of Cahuilla Indians FEIS (2015, 6 pp);
- Sierra Lakes Commerce Center Project DEIR (2015, 9 pp);
- West Valley Logistics Center Specific Plan DEIR(2015, 10 pp);
- World Logistic Center Specific Plan FEIR (2015, 12 pp);
- Bay Delta Conservation Plan EIR/EIS (2014, 21 pp);
- Addison Wind Energy Project DEIR (2014, 32 pp);
- Response to Comments on the Addison Wind Energy Project DEIR (2014, 15 pp);
- Addison and Rising Tree Wind Energy Project FEIR (2014, 12 pp);
- Alta East Wind Energy Project FEIS (2013, 23 pp);
- Blythe Solar Power Project Staff Assessment, California Energy Commission (2013, 16 pp);
- Clearwater and Yakima Solar Projects DEIR (2013, 9 pp);
- Cuyama Solar Project DEIR (2014, 19 pp);
- Draft Desert Renewable Energy Conservation Plan (DRECP) EIR/EIS (2015, 49 pp);
- Kingbird Solar Photovoltaic Project EIR (2013, 19 pp);
- Lucerne Valley Solar Project Initial Study & Mitigated Negative Declaration (2013, 12 pp);
- Palen Solar Electric Generating System Final Staff Assessment of California Energy Commission, (2014, 20 pp);
- Rebuttal testimony on Palen Solar Energy Generating System (2014, 9 pp);
- Rising Tree Wind Energy Project DEIR (2014, 32 pp);
- Response to Comments on the Rising Tree Wind Energy Project DEIR (2014, 15 pp);
- Soitec Solar Development Project Draft PEIR (2014, 18 pp);
- Comment on the Biological Opinion (08ESMF-00-2012-F-0387) of Oakland Zoo expansion on Alameda whipsnake and California red-legged frog (2014; 3 pp);
- West Antelope Solar Energy Project Initial Study and Negative Declaration (2013, 18 pp);
- Willow Springs Solar Photovoltaic Project DEIR (2015, 28 pp);
- Alameda Creek Bridge Replacement Project DEIR (2015, 10 pp);
- Declaration on Tule Wind project FEIR/FEIS (2013; 24 pp);
- Sunlight Partners LANDPRO Solar Project Mitigated Negative Declaration (2013; 11 pp);
- Declaration in opposition to BLM fracking (2013; 5 pp);
- Rosamond Solar Project Addendum EIR (2013; 13 pp);
- Pioneer Green Solar Project EIR (2013; 13 pp);
- Reply to Staff Responses to Comments on Soccer Center Solar Project Mitigated Negative Declaration (2013; 6 pp);
- Soccer Center Solar Project Mitigated Negative Declaration (2013; 10 pp);
- Plainview Solar Works Mitigated Negative Declaration (2013; 10 pp);
- Reply to the County Staff's Responses on comments to Imperial Valley Solar Company 2 Project (2013; 10 pp);
- Imperial Valley Solar Company 2 Project (2013; 13 pp);
- FRV Orion Solar Project DEIR (PP12232) (2013; 9 pp);
- Casa Diablo IV Geothermal Development Project (3013; 6 pp);
- Reply to Staff Responses to Comments on Casa Diablo IV Geothermal Development Project (2013; 8 pp);
- FEIS prepared for Alta East Wind Project (2013; 23 pp);

- Metropolitan Air Park DEIR, City of San Diego (2013;);
- Davidon Homes Tentative Subdivision Map and Rezoning Project DEIR (2013; 9 pp);
- Analysis of Biological Assessment of Oakland Zoo Expansion Impacts on Alameda Whipsnake (2013; 10 pp);
- Declaration on Campo Verde Solar project FEIR (2013; 11pp);
- Neg Dec comments on Davis Sewer Trunk Rehabilitation (2013; 8 pp);
- Declaration on North Steens Transmission Line FEIS (2012; 62 pp);
- City of Lancaster Revised Initial Study for Conditional Use Permits 12-08 and 12-09, Summer Solar and Springtime Solar Projects (2012; 8 pp);
- J&J Ranch, 24 Adobe Lane Environmental Review (2012; 14 pp);
- Reply to the County Staff's Responses on comments to Hudson Ranch Power II Geothermal Project and the Simbol Calipatria Plant II (2012; 8 pp);
- Hudson Ranch Power II Geothermal Project and the Simbol Calipatria Plant II (2012; 9 pp);
- Desert Harvest Solar Project EIS (2012; 15 pp);
- Solar Gen 2 Array Project DEIR (2012; 16 pp);
- Ocotillo Sol Project EIS (2012; 4 pp);
- Beacon Photovoltaic Project DEIR (2012; 5 pp);
- Declaration on Initial Study and Proposed Negative Declaration for the Butte Water District 2012 Water Transfer Program (2012; 11 pp);
- Mount Signal and Calexico Solar Farm Projects DEIR (2011; 16 pp);
- City of Elk Grove Sphere of Influence EIR (2011; 28 pp);
- Comment on Sutter Landing Park Solar Photovoltaic Project MND (2011; 9 pp);
- Statement of Shawn Smallwood, Ph.D. Regarding Proposed Rabik/Gudath Project, 22611 Coleman Valley Road, Bodega Bay (CPN 10-0002) (2011; 4 pp);
- Declaration of K. Shawn Smallwood on Biological Impacts of the Ivanpah Solar Electric Generating System (ISEGS) (2011; 9 pp);
- Comments on Draft Eagle Conservation Plan Guidance (2011; 13 pp);
- Comments on Draft EIR/EA for Niles Canyon Safety Improvement Project (2011; 16 pp);
- Declaration of K. Shawn Smallwood, Ph.D., on Biological Impacts of the Route 84 Safety Improvement Project (2011; 7 pp);
- Rebuttal Testimony of Witness #22, K. Shawn Smallwood, Ph.D, on Behalf of Intervenors Friends of The Columbia Gorge & Save Our Scenic Area (2010; 6 pp);
- Prefiled Direct Testimony of Witness #22, K. Shawn Smallwood, Ph.D, on Behalf of Intervenors Friends of the Columbia Gorge & Save Our Scenic Area. Comments on Whistling Ridge Wind Energy Power Project DEIS, Skamania County, Washington (2010; 41 pp);
- Evaluation of Klickitat County's Decisions on the Windy Flats West Wind Energy Project (2010; 17 pp);
- St. John's Church Project Draft Environmental Impact Report (2010; 14 pp.);
- Initial Study/Mitigated Negative Declaration for Results Radio Zone File #2009-001 (2010; 20 pp);
- Rio del Oro Specific Plan Project Final Environmental Impact Report (2010;12 pp);
- Answers to Questions on 33% RPS Implementation Analysis Preliminary Results Report (2009: 9 pp);
- SEPA Determination of Non-significance regarding zoning adjustments for Skamania

County, Washington. Second Declaration to Friends of the Columbia Gorge, Inc. and Save Our Scenic Area (Dec 2008; 17 pp);

- Comments on Draft 1A Summary Report to CAISO (2008; 10 pp);
- County of Placer's Categorical Exemption of Hilton Manor Project (2009; 9 pp);
- Protest of CARE to Amendment to the Power Purchase and Sale Agreement for Procurement of Eligible Renewable Energy Resources Between Hatchet Ridge Wind LLC and PG&E (2009; 3 pp);
- Tehachapi Renewable Transmission Project EIR/EIS (2009; 142 pp);
- Delta Shores Project EIR, south Sacramento (2009; 11 pp + addendum 2 pp);
- Declaration of Shawn Smallwood in Support of Care's Petition to Modify D.07-09-040 (2008; 3 pp);
- The Public Utility Commission's Implementation Analysis December 16 Workshop for the Governor's Executive Order S-14-08 to implement a 33% Renewable Portfolio Standard by 2020 (2008; 9 pp);
- The Public Utility Commission's Implementation Analysis Draft Work Plan for the Governor's Executive Order S-14-08 to implement a 33% Renewable Portfolio Standard by 2020 (2008; 11 pp);
- Draft 1A Summary Report to California Independent System Operator for Planning Reserve Margins (PRM) Study (2008; 7 pp.);
- SEPA Determination of Non-significance regarding zoning adjustments for Skamania County, Washington. Declaration to Friends of the Columbia Gorge, Inc. and Save Our Scenic Area (Sep 2008; 16 pp);
- California Energy Commission's Preliminary Staff Assessment of the Colusa Generating Station (2007; 24 pp);
- Rio del Oro Specific Plan Project Recirculated Draft Environmental Impact Report (2008: 66 pp);
- Replies to Response to Comments Re: Regional University Specific Plan Environmental Impact Report (2008; 20 pp);
- Regional University Specific Plan Environmental Impact Report (2008: 33 pp.);
- Clark Precast, LLC's "Sugarland" project, Negative Declaration (2008: 15 pp.);
- Cape Wind Project Draft Environmental Impact Statement (2008; 157 pp.);
- Yuba Highlands Specific Plan (or Area Plan) Environmental Impact Report (2006; 37 pp.);
- Replies to responses to comments on Mitigated Negative Declaration of the proposed Mining Permit (MIN 04-01) and Modification of Use Permit 96-02 at North Table Mountain (2006; 5 pp);
- Mitigated Negative Declaration of the proposed Mining Permit (MIN 04-01) and Modification of Use Permit 96-02 at North Table Mountain (2006; 15 pp);
- Windy Point Wind Farm Environmental Review and EIS (2006; 14 pp and 36 Powerpoint slides in reply to responses to comments);
- Shiloh I Wind Power Project EIR (2005; 18 pp);
- Buena Vista Wind Energy Project Notice of Preparation of EIR (2004; 15 pp);
- Negative Declaration of the proposed Callahan Estates Subdivision (2004; 11 pp);
- Negative Declaration of the proposed Winters Highlands Subdivision (2004; 9 pp);
- Negative Declaration of the proposed Winters Highlands Subdivision (2004; 13 pp);
- Negative Declaration of the proposed Creekside Highlands Project, Tract 7270 (2004; 21

pp);

- On the petition California Fish and Game Commission to list the Burrowing Owl as threatened or endangered (2003; 10 pp);
- Conditional Use Permit renewals from Alameda County for wind turbine operations in the Altamont Pass Wind Resource Area (2003; 41 pp);
- UC Davis Long Range Development Plan of 2003, particularly with regard to the Neighborhood Master Plan (2003; 23 pp);
- Anderson Marketplace Draft Environmental Impact Report (2003: 18 pp + 3 plates of photos);
- Negative Declaration of the proposed expansion of Temple B'nai Tikyah (2003: 6 pp);
- Antonio Mountain Ranch Specific Plan Public Draft EIR (2002: 23 pp);
- Response to testimony of experts at the East Altamont Energy Center evidentiary hearing on biological resources (2002: 9 pp);
- Revised Draft Environmental Impact Report, The Promenade (2002: 7 pp);
- Recirculated Initial Study for Calpine's proposed Pajaro Valley Energy Center (2002: 3 pp);
- UC Merced -- Declaration of Dr. Shawn Smallwood in support of petitioner's application for temporary restraining order and preliminary injunction (2002: 5 pp);
- Replies to response to comments in Final Environmental Impact Report, Atwood Ranch Unit III Subdivision (2003: 22 pp);
- Draft Environmental Impact Report, Atwood Ranch Unit III Subdivision (2002: 19 pp + 8 photos on 4 plates);
- California Energy Commission Staff Report on GWF Tracy Peaker Project (2002: 17 pp + 3 photos; follow-up report of 3 pp);
- Initial Study and Negative Declaration, Silver Bend Apartments, Placer County (2002: 13 pp);
- UC Merced Long-range Development Plan DEIR and UC Merced Community Plan DEIR (2001: 26 pp);
- Initial Study, Colusa County Power Plant (2001: 6 pp);
- Comments on Proposed Dog Park at Catlin Park, Folsom, California (2001: 5 pp + 4 photos);
- Pacific Lumber Co. (Headwaters) Habitat Conservation Plan and Environmental Impact Report (1998: 28 pp);
- Final Environmental Impact Report/Statement for Issuance of Take authorization for listed species within the MSCP planning area in San Diego County, California (Fed. Reg. 62 (60): 14938, San Diego Multi-Species Conservation Program) (1997: 10 pp);
- Permit (PRT-823773) Amendment for the Natomas Basin Habitat Conservation Plan, Sacramento, CA (Fed. Reg. 63 (101): 29020-29021) (1998);
- Draft Recovery Plan for the Giant Garter Snake (*Thamnophis gigas*). (Fed. Reg. 64(176): 49497-49498) (1999: 8 pp);
- Review of the Draft Recovery Plan for the Arroyo Southwestern Toad (*Bufo microscaphus californicus*) (1998);
- Ballona West Bluffs Project Environmental Impact Report (1999: oral presentation);
- California Board of Forestry's proposed amended Forest Practices Rules (1999);
- Negative Declaration for the Sunset Skyranch Airport Use Permit (1999);
- Calpine and Bechtel Corporations' Biological Resources Implementation and Monitoring

Program (BRMIMP) for the Metcalf Energy Center (2000: 10 pp);

- California Energy Commission's Final Staff Assessment of the proposed Metcalf Energy Center (2000);
- US Fish and Wildlife Service Section 7 consultation with the California Energy Commission regarding Calpine and Bechtel Corporations' Metcalf Energy Center (2000: 4 pp);
- California Energy Commission's Preliminary Staff Assessment of the proposed Metcalf Energy Center (2000: 11 pp);
- Site-specific management plans for the Natomas Basin Conservancy's mitigation lands, prepared by Wildlands, Inc. (2000: 7 pp);
- Affidavit of K. Shawn Smallwood in Spirit of the Sage Council, et al. (Plaintiffs) vs. Bruce Babbitt, Secretary, U.S. Department of the Interior, et al. (Defendants), Injuries caused by the No Surprises policy and final rule which codifies that policy (1999: 9 pp).

Comments on other Environmental Review Documents:

- Proposed Regulation for California Fish and Game Code Section 3503.5 (2015: 12 pp);
- Statement of Overriding Considerations related to extending Altamont Winds, Inc.'s Conditional Use Permit PLN2014-00028 (2015; 8 pp);
- Draft Program Level EIR for Covell Village (2005; 19 pp);
- Bureau of Land Management Wind Energy Programmatic EIS Scoping document (2003: 7 pp.);
- NEPA Environmental Analysis for Biosafety Level 4 National Biocontainment Laboratory (NBL) at UC Davis (2003: 7 pp);
- Notice of Preparation of UC Merced Community and Area Plan EIR, on behalf of The Wildlife Society—Western Section (2001: 8 pp.);
- Preliminary Draft Yolo County Habitat Conservation Plan (2001; 2 letters totaling 35 pp.);
- Merced County General Plan Revision, notice of Negative Declaration (2001: 2 pp.);
- Notice of Preparation of Campus Parkway EIR/EIS (2001: 7 pp.);
- Draft Recovery Plan for the bighorn sheep in the Peninsular Range (*Ovis candensis*) (2000);
- Draft Recovery Plan for the California Red-legged Frog (*Rana aurora draytonii*), on behalf of The Wildlife Society—Western Section (2000: 10 pp.);
- Sierra Nevada Forest Plan Amendment Draft Environmental Impact Statement, on behalf of The Wildlife Society—Western Section (2000: 7 pp.);
- State Water Project Supplemental Water Purchase Program, Draft Program EIR (1997);
- Davis General Plan Update EIR (2000);
- Turn of the Century EIR (1999: 10 pp);
- Proposed termination of Critical Habitat Designation under the Endangered Species Act (Fed. Reg. 64(113): 31871-31874) (1999);
- NOA Draft Addendum to the Final Handbook for Habitat Conservation Planning and Incidental Take Permitting Process, termed the HCP 5-Point Policy Plan (Fed. Reg. 64(45): 11485 - 11490) (1999; 2 pp + attachments);
- Covell Center Project EIR and EIR Supplement (1997).

Position Statements I prepared the following position statements for the Western Section of The Wildlife Society, and one for nearly 200 scientists:

- Recommended that the California Department of Fish and Game prioritize the extermination of the introduced southern water snake in northern California. The Wildlife Society--Western Section (2001);
- Recommended that The Wildlife Society—Western Section appoint or recommend members of the independent scientific review panel for the UC Merced environmental review process (2001);
- Opposed the siting of the University of California's 10th campus on a sensitive vernal pool/grassland complex east of Merced. The Wildlife Society--Western Section (2000);
- Opposed the legalization of ferret ownership in California. The Wildlife Society--Western Section (2000);
- Opposed the Proposed "No Surprises," "Safe Harbor," and "Candidate Conservation Agreement" rules, including permit-shield protection provisions (Fed. Reg. Vol. 62, No. 103, pp. 29091-29098 and No. 113, pp. 32189-32194). This statement was signed by 188 scientists and went to the responsible federal agencies, as well as to the U.S. Senate and House of Representatives.

Presentations at Professional Meetings and Seminars

Mitigation of Raptor Fatalities in the Altamont Pass Wind Resource Area. Raptor Research Foundation Meeting, Sacramento, California, 6 November 2015.

From burrows to behavior: Research and management for burrowing owls in a diverse landscape. California Burrowing Owl Consortium meeting, 24 October 2015, San Jose, California.

The Challenges of repowering. Keynote presentation at Conference on Wind Energy and Wildlife Impacts, Berlin, Germany, 10 March 2015.

Research Highlights Altamont Pass 2011-2015. Scientific Review Committee, Oakland, California, 8 July 2015.

Siting wind turbines to minimize raptor collisions: Altamont Pass Wind Resource Area. US Fish and Wildlife Service Golden Eagle Working Group, Sacramento, California, 8 January 2015.

Evaluation of nest boxes as a burrowing owl conservation strategy. Sacramento Chapter of the Western Section, The Wildlife Society. Sacramento, California, 26 August 2013.

Predicting collision hazard zones to guide repowering of the Altamont Pass. Conference on wind power and environmental impacts. Stockholm, Sweden, 5-7 February 2013.

Impacts of Wind Turbines on Wildlife. California Council for Wildlife Rehabilitators, Yosemite, California, 12 November 2012.

Impacts of Wind Turbines on Birds and Bats. Madrone Audubon Society, Santa Rosa, California, 20 February 2012.

Comparing Wind Turbine Impacts across North America. California Energy Commission Staff Workshop: Reducing the Impacts of Energy Infrastructure on Wildlife, 20 July 2011.

Siting Repowered Wind Turbines to Minimize Raptor Collisions. California Energy Commission Staff Workshop: Reducing the Impacts of Energy Infrastructure on Wildlife, 20 July 2011.

Siting Repowered Wind Turbines to Minimize Raptor Collisions. Alameda County Scientific Review Committee meeting, 17 February 2011

Comparing Wind Turbine Impacts across North America. Conference on Wind energy and Wildlife impacts, Trondheim, Norway, 3 May 2011.

Update on Wildlife Impacts in the Altamont Pass Wind Resource Area. Raptor Symposium, The Wildlife Society—Western Section, Riverside, California, February 2011.

Siting Repowered Wind Turbines to Minimize Raptor Collisions. Raptor Symposium, The Wildlife

Society - Western Section, Riverside, California, February 2011.

Wildlife mortality caused by wind turbine collisions. Ecological Society of America, Pittsburgh, Pennsylvania, 6 August 2010.

Map-based repowering and reorganization of a wind farm to minimize burrowing owl fatalities. California burrowing Owl Consortium Meeting, Livermore, California, 6 February 2010.

Environmental barriers to wind power. Getting Real About Renewables: Economic and Environmental Barriers to Biofuels and Wind Energy. A symposium sponsored by the Environmental & Energy Law & Policy Journal, University of Houston Law Center, Houston, 23 February 2007.

Lessons learned about bird collisions with wind turbines in the Altamont Pass and other US wind farms. Meeting with Japan Ministry of the Environment and Japan Ministry of the Economy, Wild Bird Society of Japan, and other NGOs Tokyo, Japan, 9 November 2006.

Lessons learned about bird collisions with wind turbines in the Altamont Pass and other US wind farms. Symposium on bird collisions with wind turbines. Wild Bird Society of Japan, Tokyo, Japan, 4 November 2006.

Responses of Fresno kangaroo rats to habitat improvements in an adaptive management framework. California Society for Ecological Restoration (SERCAL) 13th Annual Conference, UC Santa Barbara, 27 October 2006.

Fatality associations as the basis for predictive models of fatalities in the Altamont Pass Wind Resource Area. EEI/APLIC/PIER Workshop, 2006 Biologist Task Force and Avian Interaction with Electric Facilities Meeting, Pleasanton, California, 28 April 2006.

Burrowing owl burrows and wind turbine collisions in the Altamont Pass Wind Resource Area. The Wildlife Society - Western Section Annual Meeting, Sacramento, California, February 8, 2006.

Mitigation at wind farms. Workshop: Understanding and resolving bird and bat impacts. American Wind Energy Association and Audubon Society. Los Angeles, CA. January 10 and 11, 2006.

Incorporating data from the California Wildlife Habitat Relationships (CWHR) system into an impact assessment tool for birds near wind farms. Shawn Smallwood, Kevin Hunting, Marcus Yee, Linda Spiegel, Monica Parisi. Workshop: Understanding and resolving bird and bat impacts. American Wind Energy Association and Audubon Society. Los Angeles, CA. January 10 and 11, 2006.

Toward indicating threats to birds by California's new wind farms. California Energy Commission, Sacramento, May 26, 2005.

Avian collisions in the Altamont Pass. California Energy Commission, Sacramento, May 26, 2005.

Ecological solutions for avian collisions with wind turbines in the Altamont Pass Wind Resource Area. EPRI Environmental Sector Council, Monterey, California, February 17, 2005.

Ecological solutions for avian collisions with wind turbines in the Altamont Pass Wind Resource Area. The Wildlife Society—Western Section Annual Meeting, Sacramento, California, January 19, 2005.

Associations between avian fatalities and attributes of electric distribution poles in California. The Wildlife Society - Western Section Annual Meeting, Sacramento, California, January 19, 2005.

Minimizing avian mortality in the Altamont Pass Wind Resources Area. UC Davis Wind Energy Collaborative Forum, Palm Springs, California, December 14, 2004.

Selecting electric distribution poles for priority retrofitting to reduce raptor mortality. Raptor Research Foundation Meeting, Bakersfield, California, November 10, 2004.

Responses of Fresno kangaroo rats to habitat improvements in an adaptive management framework. Annual Meeting of the Society for Ecological Restoration, South Lake Tahoe, California, October 16, 2004.

Lessons learned from five years of avian mortality research at the Altamont Pass Wind Resources Area in California. The Wildlife Society Annual Meeting, Calgary, Canada, September 2004.

The ecology and impacts of power generation at Altamont Pass. Sacramento Petroleum Association, Sacramento, California, August 18, 2004.

Burrowing owl mortality in the Altamont Pass Wind Resource Area. California Burrowing Owl Consortium meeting, Hayward, California, February 7, 2004.

Burrowing owl mortality in the Altamont Pass Wind Resource Area. California Burrowing Owl Symposium, Sacramento, November 2, 2003.

Raptor Mortality at the Altamont Pass Wind Resource Area. National Wind Coordinating Committee, Washington, D.C., November 17, 2003.

Raptor Behavior at the Altamont Pass Wind Resource Area. Annual Meeting of the Raptor Research Foundation, Anchorage, Alaska, September, 2003.

Raptor Mortality at the Altamont Pass Wind Resource Area. Annual Meeting of the Raptor Research Foundation, Anchorage, Alaska, September, 2003.

California mountain lions. Ecological & Environmental Issues Seminar, Department of Biology, California State University, Sacramento, November, 2000.

Intra- and inter-turbine string comparison of fatalities to animal burrow densities at Altamont Pass. National Wind Coordinating Committee, Carmel, California, May, 2000.

- MS Thesis Committee, Marcus Yee, California State University, Sacramento

Other Professional Activities or Products

Testified in Federal Court in Denver during 2005 over the fate of radio-nuclides in the soil at Rocky Flats Plant after exposure to burrowing animals. My clients won a judgment of $553,000,000. I have also testified in many other cases of litigation under CEQA, NEPA, the Warren-Alquist Act, and other environmental laws. My clients won most of the cases for which I testified.

Testified before Environmental Review Tribunals in Ontario, Canada regarding proposed White Pines and Amherst Island Wind Energy projects.

Testified in Skamania County Hearing in 2009 on the potential impacts of zoning the County for development of wind farms and hazardous waste facilities.

Testified in deposition in 2007 in the case of O'Dell et al. vs. FPL Energy in Houston, Texas.

Testified in Klickitat County Hearing in 2006 on the potential impacts of the Windy Point Wind Farm.

Memberships in Professional Societies

The Wildlife Society
Raptor Research Foundation

Honors and Awards

Fulbright Research Fellowship to Indonesia, 1987
J.G. Boswell Full Academic Scholarship, 1981 college of choice
Certificate of Appreciation, The Wildlife Society—Western Section, 2000, 2001
Northern California Athletic Association Most Valuable Cross Country Runner, 1984
American Legion Award, Corcoran High School, 1981, and John Muir Junior High, 1977
CIF Section Champion, Cross Country in 1978
CIF Section Champion, Track & Field 2 mile run in 1981
National Junior Record, 20 kilometer run, 1982
National Age Group Record, 1500 meter run, 1978

Community Activities

District 64 Little League Umpire, 2003-2007
Dixon Little League Umpire, 2006-07
Davis Little League Chief Umpire and Board member, 2004-2005
Davis Little League Safety Officer, 2004-2005
Davis Little League Certified Umpire, 2002-2004
Davis Little League Scorekeeper, 2002
Davis Visioning Group member
Petitioner for Writ of Mandate under the California Environmental Quality Act against City of Woodland decision to approve the Spring Lake Specific Plan, 2002
Served on campaign committees for City Council candidates

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Hagemann, M.F., 2005. Use of Electronic Databases in Environmental Regulation, Policy Making and Public Participation. Brownfields 2005, Denver, Coloradao.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Nevada and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Las Vegas, NV (served on conference organizing committee).

Hagemann, M.F., 2004. Invited testimony to a California Senate committee hearing on air toxins at schools in Southern California, Los Angeles.

Brown, A., Farrow, J., Gray, A. and **Hagemann, M.**, 2004. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to the Ground Water and Environmental Law Conference, National Groundwater Association.

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education:

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on VOC filtration.
M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.
B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience:

Dr. Rosenfeld is the Co-Founder and Principal Environmental Chemist at Soil Water Air Protection Enterprise (SWAPE). His focus is the fate and transport of environmental contaminants, risk assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling, oil spills, boilers, incinerators and other industrial and agricultural sources relating to nuisance and personal injury. His project experience ranges from monitoring and modeling of pollution sources as they relate to human and ecological health. Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing petroleum, chlorinated solvents, pesticides, radioactive waste, PCBs, PAHs, dioxins, furans, volatile organics, semi-volatile organics, perchlorate, heavy metals, asbestos, PFOA, unusual polymers, MtBE, fuel oxygenates and odor. Dr. Rosenfeld has evaluated greenhouse gas emissions using various modeling programs recommended by California Air Quality Management Districts.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist
Bureau of Land Management, Kremmling Colorado 1990; Scientist

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993.

Deposition and/or Trial Testimony:

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September, 2015

In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants

Kyle Cannon, Eugene Donovan, Genaro Ramirez, Carol Sassler, and Harvey Walton, each Individually and on behalf of those similarly situated, *Plaintiffs,* vs. BP Products North America, Inc., *Defendant.*
Case 3:10-cv-00622
Rosenfeld Deposition: February 2012
Rosenfeld Trial: April 2013

In the Circuit Court of Baltimore County Maryland
Philip E. Cvach, II et al., *Plaintiffs* vs. Two Farms, Inc. d/b/a Royal Farms, Defendants
Case Number: 03-C-12-012487 OT
Rosenfeld Deposition: September 2013

Exhibit G

APPENDIX C: 1987 MEMORANDUM OF UNDERSTANDING

On February 17, 1987, UCSF entered into a Memorandum of Understanding (MOU) with the City and County of San Francisco regarding communication and oversight of University master planning, construction and real estate utilization. The MOU was signed by the Chancellor and the Vice Chancellor for Resource Management and Planning Services of UCSF and by the Mayor and Director of Planning of San Francisco. Because of its brevity and importance, the MOU is included here in its entirety:

I. The intent of this memorandum of understanding is to foster harmonious relations between the City and County of San Francisco (hereafter City) and the University of California, San Francisco (hereafter UCSF) regarding the growth and development of UCSF facilities within the City's boundaries.

II. Each party is chartered to operate under provisions of the State Constitution which govern their cooperation with neighboring communities, and these factors are recognized by all parties.

   1. The University of California, Board of Regents, is the overseeing body of UCSF.
   2. Transfer of title to any lands of UCSF must be accomplished in accordance with existing statutes or through the Board of Regents.
   3. The City Charter spells out the duties, responsibilities, and limitations of the Mayor, Board of Supervisors, and Department of City Planning.
   4. The Director of the Department of City Planning is responsible to the City Planning Commission and he is required at all times to represent the best City planning interest.
   5. Existing direct relationships between City departments and UCSF programs located at UCSF will continue without reference to this memorandum of agreement. This specifically includes all health programs and routine operational matters.

III. The principal concerns of this agreement are the responsibilities of the City and UCSF for oversight of land uses and the development, maintenance and use of physical facilities.

   1. The City is responsible for the reasonable development, maintenance and reuse of land in accordance with the Master Plan of the City and County, as adopted and modified from time to time by the City Planning Commission and as expressed in the City's zoning ordinance. The City requires that all major institutions submit institutional master plans to the City Planning Commission for their review.
   2. UCSF maintains a health science center and the requisite facilities to provide educational programs, research and medical services, which may require expansion, contraction or modification over time. The UCSF institutional master plan is submitted to the University of California, Board of Regents for review and approval. The UCSF campus agrees to continue submitting its long-range development plan to the City Planning Commission.

IV. In an effort to improve communication between UCSF and the City regarding changes in the land use and development plans of UCSF, the parties to this memorandum agree that:

   1. UCSF staff and the City Planning Commission staff will meet at least once a year to review long-range development plans for UCSF and City development and services plans. Such meetings will be convened by UCSF and the results of them reported in writing to the City Planning Commission at a regularly scheduled meeting.
   2. UCSF will advise the City in writing of all matters concerning master planning, construction and real property utilization initiated by UCSF which may have an impact on the City. The City Planning Commission will review such proposals and advise UCSF in writing as to the conformance of such development with the Master Plan of San Francisco and Planning Code Section 304.5 (Institutional Master Plans) with recommendations, if any, for amendment to the proposal.
   3. UCSF will modify its 1982 Long Range Development Plan, as required over time, and the City Planning Commission may hold at least one public hearing on all such modifications prior to preparation of written comments.
   4. UCSF shall notify the City of and the City shall attend hearings conducted by UCSF pursuant to the California Environmental Quality Act.
   5. UCSF will maintain campus advisory committees, composed of neighborhood representatives, at both its Parnassus Heights and Laurel Heights campuses, and will invite the City Planning Commission, Municipal Railway and Department of Public Works to participate in those meetings. The Mayor will urge those City departments to participate on the Committees.
   6. The City Planning Commission will advise UCSF in

writing of all matters coming to the Commission's attention concerning master plans, construction and real estate utilization which may have an impact on UCSF.

7. Should the City Planning Commission and UCSF disagree on any matter which is the subject of this MOU, either party may request the participation of the Mayor and the Chancellor in attempting to resolve the dispute.

V. This memorandum does not confer or surrender any authority beyond that already possessed by each party concerned. Further, it does not abrogate any requirement by either party to coordinate matters of master planning with the Association of Bay Area Governments (ABAG) or other appropriate agencies.

1. For the City, the Director of City Planning shall be the responsible designee.
2. For UCSF, the Vice Chancellor for Resource Management and Planning Services shall be the responsible designee.

INTRODUCTION

The California Environmental Quality Act (CEQA)[1] requires governmental agencies to provide a public accounting of all potentially adverse impacts of decisions that change the environment. While some consider CEQA to be concerned exclusively with the physical environment, the aims of CEQA extend to human well being. For example, CEQA's policy goals include maintaining "…conditions under which man and nature can exist in productive harmony to fulfill the social and economic requirements of present and future generations," and "..,providing a decent home and satisfying living environment for every Californian." (California Government Code §21000) Under CEQA, a local agency must consider reasonably foreseeable "… environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly."[2]

Traditionally, health and human impact assessment within environmental review has focused on hazardous environmental agents such as air pollutants. While such impacts are important, the relationships between the physical environment and human health include many other neglected dimensions.

Unmet housing needs in San Francisco result in particularly significant public health costs. Inadequate or unaffordable housing forces San Francisco residents into crowded or substandard conditions; requires them to compromise access to jobs and services, and quality education; and requires them to work multiple jobs to make ends meet. The Department of Public Health witnesses these effects when we care for the homeless, in the course of our enforcement of environmental health and housing standards, and through our efforts to improve the housing of those with environmentally related illnesses such as asthma.

Unmet housing needs also have indirect environmental and economic consequences. High housing costs are disincentives for business development or expansion which also means reduced economic opportunities for residents. High cost housing in regional job centers such as San Francisco is one factor that drives development of lower cost housing on the urban fringe, contributing to traffic congestion and air pollution, as well as the loss of regional farmland and open space.[3]

As one strategy to ensure adequate affordable housing in San Francisco, the San Francisco Department of Health, in partnership with the City's Department of Planning, has researched how environmental impact analysis might more

[1] CEQA, similar to NEPA, predated the more proscriptive environmental regulatory approaches such as the Clean Water Act aiming instead to ensure transparency and accountability in decision making. CEQA requires public agencies to produce an Environmental Impact Report (EIR) prior to making public decision that may have significant adverse environmental effects. (California Public Resources Code, Environmental Protection, §21000) An EIR must analysis on all potentially significant adverse environmental impacts, feasible alternatives, and steps to avoid or limit impacts. If an EIR concludes that a project would have significant impacts, the agency can not approve it until it either they determine that mitigation or alternatives are infeasible or that the project's benefits outweigh the adverse impacts.

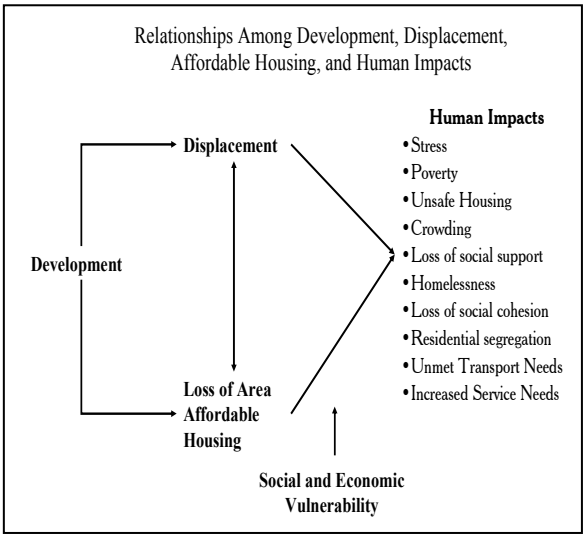
[2] CEQA Guidelines. Title 14. California Code of Regulations. (Accessed at http://ceres.ca.gov/topic/env_law/ceqa/guidelines/)

[3] http://www.brookings.edu/views/speeches/downs/20030529_downs.htm

comprehensively account for impacts on affordable housing and residential displacement.

CEQA guidelines allow cities to determine their own impacts of concern, screening criteria, assessment and evaluative methodologies, and preferred mitigation measures. In addition, though the guidelines provide a list of potential adverse impacts on the environment they do not provide a way of judging whether the effects are significant in a particular set of circumstances. One way for local jurisdictions and public agencies to ensure consistent and objective determinations in their environmental review is to adopt a 'threshold of significance.'[4]

CEQA authorizes local governments to adopt by "…ordinance, resolution, rule, or regulation" locally specific "objectives, criteria, and procedures for the evaluation of projects." (California Government Code §21082). These 'thresholds of significance' are qualitative or quantitative standards that provide local agencies a way to differentiate whether a particular environmental effect is significant. Thresholds may be based on health based standards, service capacity standards, ecological tolerance standards, policies and goals within the city's general plan, or any other standard based on environmental quality. Ideally, threshold development should involve public participation and the documentation of a threshold should include (1) a definition for the effect (2) the reasons the effect is significant (3) the criteria at which effect becomes significant (4) references and sources (5) potential mitigation measures if available.



Methods to consider impacts on housing affordability and residential displacement exist; however, these methods have not been applied to impact assessment practice in San Francisco. In California, several local jurisdictions (Los Angeles, Santa Barbara, and LakeTahoe) have adopted comprehensive, environmental review guidelines which include thresholds of significance for housing impacts. San Francisco adopted level of service standards (LOS) for the evaluation of impacts on automobile and transit in 2002 but does not have consistent evaluative criteria for several other important environmental effects included effects on housing.

This technical report outlines several ways that impacts on housing affordability and residential displacement can be included in the process of environmental review. It also provides the groundwork for developing local significance thresholds criteria for housing impacts. We have organized this document into three sections: (1) Social and health consequences of housing affordability and residential displacement; (2)

[4] Thresholds of Significance: Criteria for Defining Environmental Significance. CEQA Technical Advice Series Govenor's Office of Planning and Research 1994 Accessed May 24th 2004 at: http://ceres.ca.gov/topic/env_law/ceqa/more/tas/threshld.pdf

Interpretation of CEQA policy and guidelines with regards to the analysis of social, health, and environmental justice impacts; (3) Public agency guidelines for affordable housing and displacement impact assessment.

The first section provides a scan of the public health and social science research that relates affordability and displacement to adverse human outcomes. We organized this section using a public health framework that relates project development to residential displacement and housing affordability and these effects to indirect adverse human impacts. (The framework used in this report is illustrated in the figure above.) The second section considers the impacts on affordability and displacement as indirect social impacts, as indirect human health impacts, as environmental justice impacts, and as impacts that affect long term environmental policy goals. The third section provides a scan of impact assessment methods and practice applicable to housing impacts analysis bringing together a number of federal, state, and local tools and guidelines.

SECTION I. SOCIAL AND HEALTH CONSEQUENCES OF HOUSING AFFORDABILITY AND RESIDENTIAL DISPLACEMENT

The pathways between affordable housing, residential displacement, and human health and well being are numerous and complex. The impacts of any particular project or program that affects housing affordability or displaces residents depend on both contextual and individual factors including the availability of affordable housing units, the extent of relocation assistance provided, the income and savings of displaced residents, and the availability of social support networks.

This section provides a summary of available evidence on the adverse human consequences of housing affordability and residential displacement. Sources include case studies, interviews, and studies on homelessness, and public health and social science research.

Unmet Needs for Affordable Housing in California and San Francisco

According to *Slum Housing in LA*, a recent publication by UCLA's Advanced Policy Institute, the Federal goal of "securing the health and living standards of its people…" has only been met for upper and moderate income groups, while communities that are poor in both rural and inner city areas lack adequate housing. [5] Three in ten US households have housing affordability problems.

The affordable housing crisis is particularly acute in California. In San Francisco, only 7.3% of households currently earn enough to afford the median sale price of housing.[6] In addition, the fair market rent for a two-bedroom apartment is $1,904 which is affordable only to those who make 90% of the average family's median income of $86,100.[7] Exacerbating this situation, the gap between the minimum wage and the minimum hourly wage required to afford adequate housing has increased. Currently, over 35,000 low income renters pay more than 50% of their income in rent. Even individuals earning modest wages, such as, public service employees and those in the construction trades simply cannot afford to live where they work.[8]

A related factor, affecting low income renters, is the unmet demand for subsidized housing programs. In California, over two-thirds of qualifying low income households remains on waiting lists for housing assistance.[9] The state has 186,000 rental units housing 450,000 low income people which benefited from public finance. About 70% of this stock, over 120,000 units, represents housing in the HUD Section 8 program for which rent subsidy contracts are expiring. The conversion of subsidized housing will further aggravate unmet demand for low income housing.

[9] Forbes, Elaine. 2000

While the population of San Francisco is growing, San Francisco is not currently meeting the housing production goals of moderate income, low income and very low income communities. The Mayor's Office of Housing estimates that the City needs to build 19,000 units of affordable housing between 2001 and 2005 to meet its needs. Furthermore, according to the Housing Element of the General Plan, the strongest job growth is expected in the service and retail sectors; however, much of that growth is represented by low and medium wage jobs including cashiers, waiters and cooks, sales people and clerks, and painters, carpenters and electricians.

The Relationship between Displacement and Affordable Housing

Residential displacement has become a critical issue in California where housing shortage disproportionately affects low income and minority populations. Displacement can occur in the context of demolition or redevelopment of residential property or the conversion of rental units to ownership housing. Displacement also occurs in the context of gentrification when neighborhoods change in a way that inflates rents. Structural forces that contribute to displacement of individuals and families and unsatisfactory relocation in San Francisco include the relatively high cost of housing relative to incomes, the large unmet need for housing particularly at lower income levels, and the high cost of land and housing. Given that San Francisco is a setting with a limited supply of affordable housing, residents displaced through eviction or redevelopment are unlikely to be successfully relocated into adequate and affordable housing replacement housing.

Human Health Impacts of Inadequate Housing

Residential displacement or the permanent loss of area affordable housing can be expected to lead to diverse health effects. Both displaced residents and those entering the housing market may have to pay more for housing.[10] Some may accept affordable but inadequate, substandard, or poorer quality housing. Some may move out of the city or region while others may move into a temporary living situation with a friend or family member. Finally, some may become homeless. Low income individuals and families are more susceptible to adverse consequences after displacement as they have limited options for relocation.

Stress Displacement may increase levels of psychological and physiological stress, for example, by creating a new economic strain among low income individuals. If residents are displaced away from jobs or schools, longer commutes may be a further source of stress and reduce time for leisure or family activities. For children, frequent family relocation leads to children's grade repetitions, school suspensions, and emotional and behavioral problems.[11] Living in resource poor neighborhoods, frequent school changes, and substandard housing all contribute to poor child development and school

performance.[12]

A number of scientific studies have demonstrated health consequences of psychosocial stress. For example, a randomized study of healthy human volunteers demonstrated that chronic stress doubled the rate at which inoculation with a common cold virus led to a clinical infection. [13] Other studies have linked the experience of stress with chronic diseases including heart disease, hypertension, and diabetes.[14] Among pregnant women, stress has also been associated with a greater likelihood for pre-term delivery and low birth weight birth – both factors that potentially lead to developmental delays and increased infant morbidity and mortality.

Poverty There is little doubt that poverty leads to poor health. Numerous research studies in diverse countries show that poverty contributes to a poorer subjective sense of health, higher mortality, less emotional stability, worse chronic conditions, and poorer physical functioning.[15]

Unaffordable housing is both a dimension of poverty and a contributor to poverty. Households with incomes several times the full-time minimum wage can pay more than half of their incomes for housing.[16] When housing is unaffordable, people often sacrifice other material needs including food, clothing, and health care services. Nationally, those with incomes in the bottom fifth of the income distribution and paying 50% of their incomes for housing have an average of $417 to cover all non-housing monthly expenses.[17] Lack of affordable housing has also been linked to inadequate nutrition, especially among children. A recent survey of American cities found that low paying jobs and high housing costs are the most frequently cited reasons for hunger.[18] Children from low-income families receiving housing subsidies showed increased growth compared with children whose families were on a subsidy waiting list, an observation consistent with the idea that subsidies provide a protective effect against childhood malnutrition.

Unaffordable housing may add to psychosocial stress. People required to work extra hours or at multiple jobs may sacrifice personal leisure family relationships. Time pressured parents may choose either more punitive or low-effort strategies to resolve conflict with children.[19] Studies have shown that economic strains such as being unable to pay the bills cause depression in mothers and harsh parenting styles. Displacement and relocation may also result in job loss with potential further aggravation of

economic strain and psychosocial stress.

Overcrowding Statewide, 24% of renter households are overcrowded while in San Francisco over 30% of renter households are characterized as overcrowded.[20] [21] Families frequently double up as a way to cope with the lack of affordable housing. Similarly, displaced residents find temporary lodging with families or friends. Overcrowding results in respiratory infections in adults and ear infection in children.[22] Overcrowding also means the lack of quiet space for children to do homework, negatively impacting their development, education, and future life opportunities.[23]

Housing Safety Over half of the San Francisco's housing was built over 50 years ago and requires significant rehabilitation to maintain habitability; 94% of the housing stock was built before 1978. Most of the city's pre-1950 dilapidated housing stock is located in low-income neighborhoods. A number of environmental conditions in older and poorly maintained housing affect health. Inadequate heating can lead to overexposure to cold. Poorly maintained paint leads to lead poisoning. Other unsafe conditions include exposed heating sources, unprotected windows and slippery surfaces that increase risks for injuries. Older units and low-income units tend also to have a greater likelihood of deferred maintenance.

Indoor Air Quality Irritants and allergens present in one's home environments contribute to asthma. Some of the most important allergens implicated in the development and recurrence of asthma include house dust mites, cockroach antigens, cat dander, mold spores, and pollens.[24] Old carpeting serves as a reservoir for dust, allergens and chemicals. Kitchens and baths, particularly in older housing stock, often lack adequate ventilation increasing problems associated with moisture and mold.

Since 1999, SFDPH has conducted several hundred assessments for asthmatic children and adults and identified through evaluation research the role of housing affordability as a barrier to reducing asthma triggers in the home. While SFDPH enforces laws to ensure the safety and habitability of housing, inspectors have found many instances where substandard and unhealthy conditions exist yet tenants are reluctant to initiate enforcement actions. Commonly, tenants are fearful of landlord reprisal or eviction in an unaffordable housing market.

Social Support If displaced residents are forced to relocate outside of their neighborhood, valuable supportive family and community relationships can be lost both for those leaving and well as for those remaining behind. Strong social relationships and community cohesion are protective of health in multiple ways. Neighbors, friends, and family provide material as well as emotional support. Support, perceived or provided, can buffer stressful

situations, prevents damaging feelings of isolation, and contributes to a sense of self-esteem and value.[25] The magnitude of the effect of social support on health is substantial and has been illustrated by several prospective long term studies in the United States. For example, in the Alameda County Study, those with fewer social contacts (e.g. marriage, family, friends, and group membership) had twice the risk of early death, even accounting for income, race, smoking, obesity, and exercise.[26]

Homelessness One of the most severe consequences of both unaffordable housing and displacement is homelessness. Hunger and homelessness are on the rise in major American cities, according to a 2003 survey by the U.S. Conference of Mayors.[27] Requests for emergency shelter assistance increased by an average of 13 percent in the 25 large cities surveyed. Twenty-three participating cities reported that lack of affordable housing was the leading cause of homelessness.

Over 350,000 Californians are estimated to be homeless.[28] A particularly disturbing trend is the rise of family homelessness. It is estimated that between 80,000 and 95,000 homeless children exist in California.[29] The USCM survey documents that Eighty-four percent of the cities have turned away homeless families from emergency shelters due to lack of resources.

Homelessness contributes to a number of other well described physical, behavioral and mental health problems in adults and children. Lack of housing and the overcrowding found in temporary housing for the homeless have been found to contribute to morbidity from respiratory infections and activation of tuberculosis. Substandard housing, such as that used by the homeless population, often lack safe drinking water and hot water for washing; often have ineffective waste disposal, intrusion by disease vectors (e.g., insects and rats); and often have inadequate food storage, all of which have long been identified as contributing to the spread of infectious diseases. [30] A 1994 study of children living in homeless shelters in the Los Angeles area found that the vast majority (78%) of homeless children interviewed suffered from depression, a behavioral problem, or severe academic delay.[31] Among sheltered homeless men and women, age adjusted death rates are several fold higher than in the general population.[32]

Homelessness is strongly linked to hunger. Temporary housing for homeless children often lacks cooking facilities.[33] In the 2003 US

Conference of Mayors' (USCM) survey, requests for emergency food assistance increased by an average of 17 percent over the past year. The USCM survey finds that 59 percent of individuals requesting emergency food assistance were members of families with children and their parents, and that 39 percent of the adults requesting such assistance were employed. Eighty-seven percent of the cities surveyed expect that requests for emergency food assistance will increase again over the next year. Ninety-one percent of cities participating in the survey expect that requests for emergency food assistance by families with children will increase next year. Eighty-eight percent expect that requests for emergency shelter will increase next year, and 80% expect requests for shelter by homeless families will increase in 2004.

Social Cohesion One of the most significant effects of eviction and displacement may be the erosion of social capital and social cohesion which are social indicators strongly associated with health, education, and neighborhood safety.[34]

The New York Times recently profiled a community, Franklin Square, as one of the few places in the NY area where housing affordability is promoted resulting in the integration of generations residing side-by-side. In addition to the richness of sharing experiences across generations, the Franklin Square community benefits from long-term residents who invest in maintaining the built environment, invest in the community, and contribute to community cohesion and youth development:

> "'[Franklin Square] It's just a wonderful, very stable community,' said Julie Soffientini, an assistant school superintendent who moved in 30 years ago and raised two daughters with her husband, Raymond. She said she appreciated the clean streets, well-kept properties and convenient local shopping."
>
> "Pupils begin at the Franklin Square Union Free School District, an elementary district with an enrollment of 1,975 in three schools, all for kindergarten through Grade 6. Statistics released by the state Department of Education in October showed that 99.3 percent of fourth grade students in the district met or exceeded state standards in math. Elementary school students in the Franklin Square district consistently score above state averages on other standardized tests."

The example provided above illustrates the positive impacts on society by long-term resident investment: cleaner streets, resulting in reduced cost of City-subsidized loitering cleaning; higher school performance, particularly among the younger aged-group, which results in higher school completion.

In contrast, the erosion of neighborhoods as a result of forced displacement results in the reduction of long-term residents who are most likely to invest in their communities. In areas where residents feel less invested because of the continual threat of displacement, one can find depilated environmental conditions, such as broken windows on buildings, loitering and illegal disposing of hazardous substances. Furthermore, neighborhoods where residents have little incentive to invest are shown to have higher high school drop out rates, as well as crime rates.

[34] Putnam, Robert. Social Capital: Measurement and Consequences. ISUMA. 2001(Spring): 41-51.

Segregation The loss of affordable housing and displacement may also lead to residential segregation and 'ghettoization'. Displacement may contribute to residential segregation (by ethnicity, income, or class) if available housing for displaced residents is not available in integrated neighborhoods. A study that examined expiring HUD Section 8 agreements with private owners in California, found that, on average, families relocated to relatively more racially-segregated communities.[35]

Racially segregated neighborhoods tend to have less neighborhood amenities such as schools, libraries and public transportation due to economic, political and linguistic isolation, and racism. Research has documented the health impacts of residential segregation. Many studies have shown, for example a strong association between segregation and homicide rates. Besides an excess in mortality, studies have also demonstrated a relationship between residential segregation and negative health outcomes including teenage childbearing, tuberculosis, cardiovascular disease, availability of food establishments serving healthy fare and exposure to toxic air pollutants.[36]

Strong evidence for the effects of segregated environments comes from the HUD Moving to Opportunity demonstration program. This program, implemented in five US cities, evaluated the health and social effects of relocating households from public or subsidized housing in high poverty neighborhoods to private rental housing in non-poverty neighborhoods. The program design involved a random assignment of families to an experimental group (vouchers for housing in low poverty neighborhoods and relocation assistance) a section 8 group (geographically unrestricted vouchers), and a control group and longitudinal follow-up of families over 10 years. The executive summary of the interim evaluation (midpoint of follow up) testify to the social value of non-poverty area residence. [37]

> From the families' perspectives, the principal benefit of the move was a substantial improvement in housing and neighborhood conditions. Families who moved with program vouchers largely achieved the single objective that loomed largest for them at baseline: living in a home and neighborhood where they and their children could feel and be safe from crime and violence. On a list of observable characteristics, their homes and neighborhoods were substantially more desirable than those where control group members lived. These benefits accrued to families in both the experimental group and the Section 8 group, although the improvements tended to be roughly twice as large for experimental group families, who were required to move to low-poverty areas, at least initially.
>
> Perhaps not surprisingly, these improvements in living environment led to significant gains in

[35] Forbes E. Eroding Neighborhood Integration: The Impact of California's Expiring Section 8 Rent Subsidy Contracts on Low-Income Family Housing. 2000 The Ralph and Goldy Lewis Center for Regional Policy Studies. UCLA, School of Public Policy and Social Research. Los Angeles, California

mental health among adults in the experimental group. The levels of psychological distress and depression were substantially reduced in this group. In addition, adults in both the experimental and Section 8 groups experienced substantial reductions in obesity for reasons we do not yet understand. Among the children in these families, girls appear to have benefited from the move in several ways. They experienced improved psychological well-being, reporting lower rates of psychological distress, depression, and generalized anxiety disorder, and improved perceptions of their likelihood of going to college and getting a well paid, stable job as an adult. These girls' behaviors changed as well, with a smaller proportion working instead of attending school. They were less likely to engage in risky behavior or to use marijuana. Finally, both these girls and society as a whole benefited from a reduced number of arrests for violent crimes.

Increased Transportation System Demands Displaced residents may find that affordable and adequate replacement housing only exists far from their current neighborhoods, potentially, meaning that they will live far from jobs and schools. Relocation may thus create a new demand for public transportation services or alternatively new demands for automobile purchase and use. Studies on the effects of urban sprawl have found that low income families, children and the elderly are disproportionately affected by the longer distances needed to travel as a result of relocation to the outskirts of a city or a region. The working poor rely on both urban public transit systems to hold steady jobs and access health care, child care and other critical social services. Former welfare recipients are particularly dependent upon the provision of reliable and convenient transportation services.

Increased Demands for Social Services For a project that results in significant displacement or relocation to non comparable housing, the magnitude of human health and social impacts may be severe. This may result in the need to fund and develop new social services to address the human impacts. For example, displacement may potentially result in new demand for safety net services for health and welfare, for mental health services, and for special educational services for children. In San Francisco, services for homeless adults and children cost the City millions of dollars and over the past several years demand for services has greatly exceeded capacity. The demand for such services is indirectly related to the magnitude of the adverse displacement outcomes.

Displacement in California and San Francisco

During the period from March 2002 through February 2003, a total of 1,643 various eviction notices were filed with the department. This figure includes 93 notices given due to failure to pay rent, which are not required to be filed with the department. The number of notices filed with the department for this period represents a 22% decrease over the prior year's filings (2,101).

The largest declines were in owner occupancy evictions, 516, or a 29% decrease, nuisance declined by 10% to 251 and eviction notices for breach declined by nearly 40% to 231. The only increases were in temporary capital improvement evictions which increased from 44

to 68, or a 26% increase and Ellis Act evictions, from 148 buildings to 187 for a 26% increase for the period. In San Francisco, the Ellis Act, a state law which says that landlords have the unconditional right to "go out of business" is used by property owners to 'change the use' of the building (condominium conversions) resulting in evictions.

Reasons for Just-Cause Evictions 2001/02 and 2002/03[38]

Just Cause	2001/02	2002/03
Owner-Occupied	726	516
Demolish/remove unit	113	67
Capital improvement (temporary)	44	68
Ellis eviction	148	187

While the issues of affordable housing, displacement, and gentrification are high on the public agenda, limited recent research has tracked the direct consequences of displacement on people. A 1999-2000 analysis of Ellis evictions in San Francisco conducted by the San Francisco Tenants' Union reveals that:

- Seniors, people with disabilities and children are most likely to become victims of the Ellis Act, comprising 51% of all Ellis Act evictions since 1999.

- Those most apt to be evicted are renters with long-term tenancies and affordable rents. Those evicted under Ellis had an average tenancy of over 11 years and were paying an average rent of $1,024 for a 2 bedroom apartment.

- Further, the Ellis Act is resulting in the loss of thousands of affordable units. For every new affordable unit that is built, 5 affordable units are lost.

Accounts from local housing advocacy organizations reveal some consequences of forced eviction among low-income families and the elderly. St. Peter's Housing, a Mission district-based non-profit organization serving low income families around housing issues and landlord/tenant problems, for example, report that a significant proportion of the families they serve are forced to separate to obtain temporary shelter, while other families resort to overcrowding in illegal units and yet other families are forced to leave their neighborhoods and the City in order to secure an affordable place to live.

St. Peter estimates that at least 20% of their clients have one or more family member aged 60 years or older. According to St. Peter's Housing, elderly residents and families are more frequently displaced, experience particularly high levels discrimination in securing housing, and are most vulnerable for separation as a result of eviction. The following case history illustrates the complexity of housing issues confronted by families with elderly members:

> An elderly couple was forced to separate (from their daughter and grandchildren) and to resort to live in an illegal in-law unit. The unit was so poorly maintained that the stairs leading to the entrance of the unit collapsed resulting in the broken hip of the elderly woman. The elderly woman reported the incidence to St. Peter's for advice. St. Peter reported this case the

[38] Rent Stabilization and Arbitration Board, April 28, 2003

> Department of Building Inspections (DBI) whose inspector cited the owner for the illegal unit, and forced the owner to shut down the illegal unit. DBI's inspection is in itself intended to protect families from living in substandard conditions and yet, in this particularly case, served to aggravate the elderly couple living situation. The elderly couple was not only forced to separate from their family, but were now suffering from the injured hip and its incurred health care cost, and as a result of the inspection was now faced with displacement. [Personal communication, St. Peter's Housing, December 2003]

The effects of displacement as a result of the lack of affordable housing among the senior population are heightened among its Gay and Lesbian subgroups. Recent, cross-sectional evidence of GLBT elderly living in the greater Los Angeles Area shows that:

- Same-sex partners cannot share a room in most care facilities, forcing many GLBT older adults retreat back into the closet, in order to secure housing at nursing homes.
- Same-sex partners cannot receive Social Security survivor benefits.
- GLBT older adults do not have the same family support systems as their heterosexual counterparts.
- There are many government programs that target the elderly, but none are geared towards GLBT older adults.[39]

SECTION II SOCIAL, HEALTH, AND ENVIRONMENTAL JUSTICE IMPACTS IN CEQA POLICY

As discussed in the section above, the lack of housing affordability in California and its human impacts suggests that environmental impact assessment (EIA) should consider how a development project might impact housing affordability or displaced residents. Four ways in which these issues fit into the framework of the California Environmental Quality Act (CEQA) include:

- As potential indirect social and economic impacts on population and housing;
- As indirect health impacts of physical or social impacts;
- As environmental justice impacts;
- As impacts requiring evaluation for consistency with city, regional and state housing and environmental policy goals.

Adverse Social and Economic Effects of Impacts on Population and Housing

CEQA considers the loss of housing requiring construction of new housing and the displacement of people as potential adverse environmental impacts requiring analysis in the environmental checklist provided in CEQA Guidelines. The checklists screening questions include:

- Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?
- Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?
- Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

However, impacts on population and housing may have particular adverse effects on parts of the population. For example, if a project replaces low income housing with market rate housing, this may disproportionately and adversely impact those with lower income. This type of impact may be considered an adverse social impact. Under CEQA, adverse social and economic impacts may be analyzed in determining the significance of physical environmental changes. Title 14, section 15064, subsection (e) of the California Administrative Code provides the following guidance:

> Economic and social changes resulting from a project shall not be treated as significant effects on the environment. *Economic or social changes may be used, however, to determine that a physical change shall be regarded as a significant effect on the environment.* Where a physical change is caused by economic or social effects of a project, the physical change may be regarded as a significant effect in the same manner as any other physical change resulting from the project. Alternatively, economic and social effects of a physical change may be used to determine that the physical change is a significant effect on the environment. *If the physical change causes adverse economic or social effects on people, those adverse effects may be used as a factor in determining whether the physical change is significant.* [Emphasis added]

For example, if a project would cause overcrowding of a public facility and the overcrowding causes an

> adverse effect on people, the overcrowding would be regarded as a significant effect.

Despite the guidance above, the inclusion of social and economic impacts under CEQA is controversial. Many interpret the language in section 15064, subsection (e) to mean that the analysis of indirect adverse social and economic effects may be considered in an EIR but are not, strictly speaking, required.[40] According to the California Department of Transportation: "Many people in California, including some decision-makers, harbor the general belief that CEQA addresses only purely "environmental" issues, not social, demographic, or economic issues often raised by proposed projects. This is erroneous. The assumption however is understandable due to the complex linkage that must be demonstrated between the physical, social, and economic environment, and the determination of 'Significance'."[41]

Some case law has directly addressed this issue. In Citizen's Association for Sensible Development of Bishop Area v. County of Inyo,[42] the courts reconciled the ambiguity of section 15064, subsection (e) with subsections (d) and (f) which discussed evaluation of secondary or indirect consequences of a project. In the Bishop case, the Court ruled that subsection (f) gave the lead agency discretion to determine whether the consequences of social and economic changes were significant but did not give it discretion not to consider these consequences at all. In their ruling, the Court interpreted section 15064 as follows: "the lead agency shall consider the secondary or indirect environmental consequences of economic and social changes, but may find them to be insignificant."

Indirect Health Impacts

Environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly are considered mandatory findings of significance in accordance with CEQA Guidelines Section 15065.

> A lead agency shall find that a project may have a significant effect on the environment and thereby require an EIR to be prepared for the project where any of the following conditions occur: (d) The environmental effects of a project will cause substantial adverse effects on human beings, either directly or indirectly.

As discussed in the evidence provided above, housing affordability and displacement affect health in numerous ways. Projects that have area or regional affects on the availability of affordable housing may be considered to have potential indirect adverse health consequences. Since displaced residents may not be relocated in adequate housing, the potential indirect health impacts of displacement also warrant consideration.

Environmental Justice Impacts

Environmental justice is rooted in the Equal Protection Clause of the U.S. Constitution and can be advanced using National Environmental

[40] Bass, RE., Herson, AI, Bogdan, KM. CEQA Deskbook A step-by-step guide on how to comply with the California Environmental Quality Act. Solano Press. Point Arena, 2001.
[41] Guidelines for Community Impact Assessment. California Department of Transportation. 1997
[42] Citizen's Association for Sensible Development v. County of Inyo, 172Cal.App.3d 151 (1985)

Policy Act (NEPA) as well as the Civil Rights Act of 1964. Environmental Justice provides another rationale for considering the effects on affordable housing or the displacement of low income residents under CEQA. California Law defines Environmental Justice as "… the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies."[43]

While environmental justice analysis and efforts in California have historically emphasized disproportionate health effects of toxic physical environmental agents, the concept of environmental justice is broader than the physical environment and human health. As stated in the 1997 President's Council of Economic Quality (CEQ) guidance adverse environmental justice effects can be also economic, social, cultural, and ecological impacts directly or indirectly related to physical environmental changes or impacts. 1997 CEQ Guidance states:

> When determining whether environmental effects are disproportionately high and adverse, agencies are to consider the following three factors to the extent practicable:
> (a) Whether there is or will be an impact on the natural or physical environment that significantly (as employed by NEPA) and adversely affects a minority population, low-income population, or Indian tribe. Such effects may include ecological, cultural, human health, economic, or social impacts on minority communities, low-income communities, or Indian tribes when those impacts are interrelated to impacts on the natural or physical environment; and
> (b) Whether environmental effects are significant (as employed by NEPA) and/or may be having an adverse impact on minority populations, low-income populations, or Indian tribes that appreciably exceeds or is likely to appreciably exceed those on the general population or other appropriate comparison group; and
> (c) Whether the environmental effects occur or would occur in a minority population, low-income population, or Indian tribe affected by cumulative or multiple adverse exposures from environmental hazards.

In California, Assembly Bill 1553 requires that the principles of environmental justice be incorporated into state guidelines for local general plans. As discussed below, this broader definition of environmental justice effects is consistent with adverse environmental effects under NEPA and CEQA as well as the 2003 State of California General Plan Guidelines Section on Environmental Justice and Sustainability and the 2003 Governor's Environmental Goals and Policy Report. The 2003 General Plan Guidelines include mixed-income housing development as a component of sustainability and environmental justice. Even from the standpoint of public health, inequitable social and economic effects can be equally if not more important that inequitable environment quality effects. An environmental justice analysis of projects that result in population or housing loss could focus on the potential for disproportionate impacts to low income and minority populations both living in the current units as well as effects on the market for affordable housing in the region.

[43] California Government Code Section 65040.12

Consistency with Local, Regional and State Land Use Policy

CEQA guidelines consider potential significant environmental impacts to include: "Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?" Local policies related to affordable housing can be found in the Housing Element of the General Plan, the HUD Consolidated Plan, and local ordinances related to rent and to eviction prevention.

California State law defines also a jurisdictions fair share housing goals in terms of four categories of affordability through the Regional Housing Needs Determination (RHND) process, devised to address the need for and planning of housing across a range of affordability and in all communities throughout California. Each jurisdiction within the Bay Area (101 cities, 9 counties) is given a share of the anticipated regional housing need. The Bay Area's regional housing need is specified by the California State Department of Housing and Community Development (HCD) and finalized through negotiations with Association of Bay Area Governments. The timeframe for this RHND process is January 1, 1999, through June 30, 2006, (a seven and a half year planning period). The current RHND requires 5244 units affordable to very low income residents, 2136 units affordable to low income residents, 5639 units affordable to moderate income residents, and 7363 units affordable to above moderate income residents. While San Francisco has met its market rate housing targets in recent years, it has not met moderate income, low income and very low income housing needs.

Total Need	Very Low	Low	Moderate	Above Moderate
20,372	5,244	2,126	5,639	7,363

The 2003 State of California General Plan Guidelines may also be viewed as applicable impacts on affordable housing.[44] The guideline's section on sustainability and environmental justice emphasize the need to carefully match employment potential, housing demand by income level and type, and new housing production.

The importance of ensuring adequate and affordable housing for every sector of the population to long term environmental quality and ecological sustainability is also emphasized in the 2003 Governor's Environmental Goals and Policy Report.[45] These State policies together with the emphasis on long term environmental goals in CEQA guidelines Section 15065 (b) suggests that impacts on housing affordability and adequacy are also potential mandatory findings of significance.

[44] 2003 State of California General Plan Guidelines. Office of Planning and Research. 2003

[45] Governor's Environmental Goals and Policy Report. Office of Planning and Research. 2003 (Accessed at: http://www.opr.ca.gov/EnvGoals/PDFs/EGPR--11-10-03.pdf)

SECTION III IMPACT ASSESSMENT METHODS AND GUIDELINES FOR AFFORDABLE HOUSING AND DISPLACEMENT

A number of federal, state and local agencies consider displacement of low-income populations and loss affordable housing as potentially adverse impacts in the context of Environmental Impact Assessment. Examples of methods and guidelines are provided below:

Social Impact Assessment (SIA) The practice of SIA dates back to the construction of the trans-Alaska pipeline. At the time, critics argued that the Environmental Impact Statement (EIS) produced for that project failed to address potential social effects such as the influx of tens of thousands of non-native construction workers on the culture of the Inuit. In 1994, the U.S. Federal Government published a set of guidelines for SIA to support social assessment under NEPA.[46] Social impacts are defined as "…the consequences to human populations of any public or private actions-that alter the ways in which people live, work, play, relate to one another, organize to meet their needs and generally cope as members of society. The term also includes cultural impacts involving changes to the norms, values, and beliefs that guide and rationalize their cognition of themselves and their society." The guidelines categorized social impact variables as follows:

1. Population Characteristics mean present population and expected change, ethnic and racial diversity, and influxes and outflows of temporary residents as well as the arrival of seasonal or leisure residents.

2. Community and Institutional Structures mean the size, structure, and level of organization of local government including linkages to the larger political systems. They also include historical and present patterns of employment and industrial diversification, the size and level of activity of voluntary associations, religious organizations and interests groups, and finally, how these institutions relate to each other.

3. Political and Social Resources refer to the distribution of power authority, the interested and affected publics, and the leadership capability and capacity within the community or region.

4. Individual and Family Changes refer to factors which influence the daily life of the individuals and families, including attitudes, perceptions, family characteristics and friendship networks. These changes range from attitudes toward the policy to an alteration in family and friendship networks to perceptions of risk, health, and safety.

5. Community Resources: Resources include patterns of natural resource and land use; the availability of housing and community services to include health, police and fire protection and sanitation facilities. A key to the continuity and survival of human communities are their historical and cultural resources. Under this collection of variables we also consider possible

[46] http://www.nmfs.noaa.gov/sfa/social_impact_guide.htm

changes for indigenous people and religious sub-cultures.

U.S. Department of Transportation Community Impact Assessment Guidance Among transportation agencies, changes in policies have included redefining the definition of "environment" to include "the natural environment, the built environment, the cultural and social fabric of our country and our neighborhoods, and the quality of life of the people who live here,' and considering project mediated effects on community cohesion; public facilities; employment; tax and property values; displacement of people, businesses, and farms; and adverse impacts on community and regional growth.

DOT guidelines for community impact assessment consider a number of social and economic factors.[47] They further recognize that while community impact assessment should not be exhaustive, it should focus on community goals and issues of community concern and controversy. The guidelines identify that displacement can involve, neighborhoods, businesses, and people. (www.ciatrans.net) Recommended analysis of impacts on residential displacement include the number and type (multi-family, single family) of residences displaced and the particular needs of vulnerable groups (disabled, minority, elderly).

Council on Environmental Quality Environmental Justice Guidance The Council on Environmental Quality, the federal agency tasked with oversight of NEPA and government compliance with Executive Order 12898 developed guidance to assist federal agencies with addressing environmental justice concerns in the context of NEPA procedures. This guidance suggests that agencies should 'determine whether minority populations, low-income populations, or Indian tribes are present in the affected area…consider data concerning the potential for multiple or cumulative exposure to human health or environmental hazards…recognize the interrelated cultural, social, occupational, historical, or economic factors that may multiply the natural and physical environmental effects…[and]…should assure meaningful community representation in the process.[48]

California Department of Transportation The California Department of Transportation (CalTrans) reference documents for CEQA provide specific guidance for the evaluation of impacts on population and on housing displacement. The 1997 Guidelines for Community Impact Assessment point out that the disproportionate displacement of vulnerable populations can have significant adverse human impacts:

> Certain population groups such as senior citizens, low income residents and non English speaking people often have strong community ties and depend on primary social relationships and important support networks that can be severed upon relocation. Households with school aged children may consider relocation especially disruptive if school transfers would be involved. Disabled people and those

[47] Federal Highway Administration Community Impact Assessment Website (Accessed at: www.ciatrans.net)

[48] Environmental Justice: Guidance under the National Environmental Policy Act. Council on Environmental Quality. 1997.

> without automobile transportation often have special relocation problems.

The guidelines suggest investigating the demographics of the residents to determine if any vulnerable groups (Low income, minority, seniors, disabled, and children) would be impacted. The guidelines suggest evaluating the effects on the stock of affordable housing:

> A loss of a substantial number of houses affordable to people with low and moderate incomes may have an effect on the community stock of affordable housing. This could have the effect of increasing the demand for housing in a given sector of the market, bidding up the cost of that housing if the market supply is constrained and thereby disproportionately affecting certain income groups.

Similarly, the 2003 Desk Guide for Environmental Justice in Transportation Planning and Investments. The environmental justice guidelines categorize social and economic impacts into land use and development, population and housing, and fiscal and economic. These guidelines suggest analysis of population and housing impacts consider a number of variables. These include:

- Property acquisition and displacement
- Access to neighborhoods
- Community Cohesion
- Safety and security
- Visual and aesthetic quality
- Property values and gentrification

A particular concern emphasized by CalTrans is impacts of displacement and relocation on neighborhood or community cohesion. The decision tree for residential displacement includes assessment of the availability of relocation housing in the community where displacement is occurring. Social impacts considerations identified by CalTrans related to cohesion include:

- Is there evidence that community cohesion exists?
- Will the proposed project affect interaction among persons and groups?
- Will the proposed project cause redistribution of the population or an influx or loss of populations?
- Will certain people be separated or set apart from others?

City of Los Angeles Thresholds Guide In its *1998 CEQA Thresholds Guide*, the City of Los Angeles uses the following screening criteria for evaluating significant effects on population and housing displacement.[49]

- *Would the project result in the net loss of any existing housing units affordable to very low income or low income households (as defined by federal and/or City standards), through demolition, conversion, or other means.*

The Los Angeles guidelines evaluate the significance of population and housing impacts by considering the following factors:

- The net change in market rate and affordable units in the project area
- The current and anticipated supply of market rate and affordable units in the project area

[49] http://www.ci.la.ca.us/EAD/EADWeb-AQD/Thresholds_PDF/introceq.pdf

- The demographics of the project area
- The consistency with city and regional housing policies

The guidelines also suggest the following two mitigation measure for displacement of affordable housing:

- Exceed the statutory requirements for relocation assistance
- Increase the number of housing units affordable to lower income households

Tahoe Regional Planning Agency (TRPA) The TRPA Initial Environmental Checklist[50] requires a response to and evidence for the following questions relevant to the displacement of low income residents and the loss of affordable housing:

- Will the proposal include or result in the temporary or permanent displacement of residents?
- Will the proposal decrease the amount of housing in the Tahoe Region historically or currently being rented at rates affordable by lower and very-low-income households?
- Will the proposal result in the loss of housing for lower-income and very-low-income households?

Mitigation of affordable housing loss is required for project approval. According to planners at the TRPA any loss of affordable housing due to redevelopment has to be either rebuilt on site or offsite taking into account similar accessibility to transport resources. A recent example of such mitigation occurred with the proposed development of the 138 unit Round Hill Vacation Resort. The development of the time share condominium involved the removal of the 186 unit Lake Park Apartments. To mitigate displacement, the project included the construction of 67 new apartment units offsite prioritized for displaced tenants, affordable housing restrictions for the new apartments, phased demolition over 24 months with eviction of no more than 8 units per month, and relocation assistance.[51]

County of Santa Barbara Santa Barbara's 1993 Environmental Thresholds and Guideline Manual[52] provide a specific threshold for the loss of affordable housing. The rationale for establishing such a threshold comes from the county's affordable housing policies. The Santa Barbara County Housing Element documents a substantial shortfall in affordable housing opportunities and the preservation of the existing affordable housing stock is a stated goal of the Housing Element. According to the Element, "the loss or demolition of existing affordable units can displace very low to moderate income persons and further restricts the housing market." The threshold for Very Low to Moderate Income Housing Units is as follows:

- *The loss of four or more very low to moderate income housing opportunities through demolition, conversion, or other means represents a significant housing impact. Affordability is determined on the basis of the applicable definitions within the County's Comprehensive Plan and Coastal Plan.*

---

[50] http://www.trpa.org/Applications/new_applications2003/IECFINAL%20APRIL%202002%20Comp.pdf

[51] Lyn Barnett, Tahoe Regional Planning Association,. Personal Communication. and Balloffet and Associates. Round Hill Vacation Resort / Lake vista Apartments Environmental Assessment.

[52] http://ceres.ca.gov/planning/ceqa/thresholds.html

Mitigations to assist persons residing in those units shall be applied.

Santa Barbara's CEQA guidance also provides the following mitigation measures:

- *Mitigations would include extended length of notice to quit premises, relocation expenses, demolished or converted units through physical on or off-site replacement or by the payment of fees. Onsite replacement of low or moderate income housing is the preferable alternative. If onsite replacement is infeasible, the units shall be replaced offsite. Payment of an in-lieu fee shall occur only if on and off-site replacement are proven to be infeasible. Housing mitigation fees shall be sufficient to provide replacement of the demolished or converted units.*

Appendix I Model Housing Impacts Analysis

Screening Criteria

- Will the project result a decrease in the supply of housing?
- Will the project result in an increase in the demand for housing?
- Will the proposal result in the loss of housing affordability, availability or quality for low income or otherwise sensitive populations?
- Will low income or otherwise sensitive be displaced or relocated?

Setting Variables

- The demographics of the project area and locality
- The current and anticipated supply of housing units in the project area and locality disaggregated by affordability;
- Availability of vacant units in the project area and locality disaggregated by level of affordability;
- The quality (safety, environmental conditions...) of available housing units in the project area and locality (sources: census, local housing complaint data)
- Evidence of social cohesion in project area(e.g. organization, interactions, relationships, and support among residents)
- Access to public services in the project area (transportation, schools, childcare...)
- The number and type of employment opportunities in proximity to the project area

Analysis Variables

- The net change in market rate units historically or currently being rented at rates affordable by lower and very-low-income households in the project area
- The net change in affordable (including section 8, permanently affordable, and rent-controlled) units historically or currently being rented at rates affordable by lower and very-low-income households in the project area
- Existence within the displaced population of a higher than average proportion of ethnic minority, low income, medically vulnerable or health sensitive populations among displaced residents
- The location and comparability of replacement housing for displaced households;
- Effects on support (food, advice, childcare, elder care) provided to and by displaced residents
- Increased dependence on public assistance or public services
- Changes in accessibility to or utilization of public services
- Changes in the number of family or relatives living in close proximity
- Effects on crowding: changes in the number of individuals per room in the project area
- Changes in accessibility to public transportation
- Changes in the need for automobile ownership or use

Significance Criteria

- Net loss of housing supply relative to demand in the area, locality, or region;
- Net loss of affordable housing in the project area or locality;
- Significant reduction in housing quality or safety;
- Significant number of residents relocated to non-comparable housing;
- Any residents made temporarily or permanently homeless;
- Loss of community cohesion in project area;
- Increase of local residential segregation.

Mitigation Measures

- Change land use / zoning controls to enable increased housing density;
- Develop relocation plan consistent with California State Relocation Assistance and Property Acquisition Guidelines;
- Construct of replacement affordable housing onsite or offsite;
- Housing impact fees.

Appendix O-NZA

NATHAN ZAKHEIM ASSSOCIATES

CURRICULUM VITAE FOR NATHAN ZAKHEIM
DIRECTOR: NZA (REVISED 2020)

Since 1966, NZA has led the field of mural conservation with innovative conservation techniques and state of the art treatment of murals.

NZA has conserved more murals of every type, including fresco, oil, marouflage, tempera, and acrylic than any other firm in the United States.

ACADEMIC BACKGROUND:

1962
Graduated Santa Barbara High School.

1962 –1965
Attended San Francisco State College Major in Music; Minor in English Literature, (later BA Degree in English Literature, minor in Psychology).

1968–1977
Vedic Studies culminating in Bhakti Shastri Degree and Bhakti Bhaibava Advanced Degree.

1966–Present:
Independent Study in Solvency Parameters, Adhesives, Advanced Conservation Techniques, Product Development, Surface Preparation, Coatings and Paint Systems.

APPRENTICESHIP:

1953–1966
Apprenticed to Bernard Zakheim, in Fresco, Oils, Tempera, Wood and Stone Sculpture, Machine Shop, Wood Shop, Color Analysis, Upholstery, Draping, Egg Tempera, Ceramic and Bronze casting, Chemical Applications, Art History, Art Theory, Arranged Workshop Education with known contemporary artists of WPA and later periods. Curation and Preparator studies.

1953–1962
Studied with Phyllis Wrightson: Watercolor Techniques, Tempera, Block Printing, Fabric Printing and Painting, Linoleum Printing, Art History, Museum Studies, Field Studies, Lives of Great Artists, Art as a Medium for Social Action.

1966–1970
Private study of the new field of Scientific Conservation, utilizing State-of-the-Art Industrial Resources in the field of Chemistry, and modern conservation techniques.

1980–1984
Studied the works and techniques of Gustav Berger and apprenticed with the famous conservator Franz Trevors. During this time NZA developed several unique conservation procedures that are in general use today.

Areas of Conservation Expertise: Fresco, Marouflage, Contemporary Acrylic Mural Paintings, Egg Tempera, Casein Murals, Easel Paintings, Objects, Sculpture, PVA Murals, Church Interiors, Architectural Ornamentation, Decorative Painting.

PROFESSIONAL PAPERS PRESENTED TO WAAC AND MURAL CONSERVANCY SYMPOSIA:

1. Conservation of Orozco's Prometheus Fresco.

1. Conservation of Rico Lebrun's Genesis Fresco.

2. Numerous papers on Wall Preparation for Fresco and Acrylic Murals.

3. Conservation Study for "Los Streetscapers" Mural lawsuit.

4. Conservation of six Arthur Mathews murals at the State Capitol.

5. Conservation study for "Lilly Ann" mural lawsuit.

6. Column, "The Mural Doctor" for Mural Conservancy of Los Angeles Magazine

7. Numerous lectures on Wall Preparation, Pigment Use, Paint Systems, Coatings, Consolidation of Murals, etc., to Artists Groups as well as Conservator Meetings.

8. Conservation Parameters for City of Inglewood, (Helen Lundeburg Petrachrome wall)

9. Complete Salvage, Conservation, Re–installation Procedures for 1800 categories of items for the House of Hospitality. Balboa Park, San Diego.
(Supervised complete conservation of this $26,00,000.00 Project.

10. **Fauxcademy** weeklong presentation at the Venetian Hotel in Las Vegas for 400 attendees at the Fauxcademy Convention Las Vegas Nevada.One-week Power Point discourse on Fresco Technique and Conservation to four hundred symposium participants. PowerPoint presentation on NZA innovative Fresco Conservation techniques as well as innovative use of modern chemistry for the treatment and consolidation of Out-of-Door Acrylic Wall Murals.

11. **City Of Bishop California**:
    Extensive presentation on innovative mural techniques showing a lengthy PowerPoint demonstration of all techniques. Panel discussions, field demonstration of techniques, seminar participation.

12. **City Of Lindsay California**:
    PowerPoint presentation, field demonstration of techniques, and panel discussions.

13. **City Of Lompoc California**:
    Presentation of innovative NZA mural techniques.

A BRIEF SUMMARY OF THE CORE CONTRIBUTIONS OF NZA TO THE FIELD OF MURAL CONSERVATION:

1. NZA has developed a number of innovative varieties of "stacco" removal of very large frescoes by 1967 and at the age of 23, garnering international acclaim in the rarified field of Fresco Conservation.

2. NZA selected to conserve the famous Arthur Mathews murals for the California State Capitol Restoration Project in 1980.

3. NZA was employed by the City of San Diego (through the offices of the prominent Restoration Architect Wayne Donaldson) to completely supervise and manage the salvage, conservation and re-installation of 1,800 categories of historic and artistic features from the Historic House of Hospitality (From 1915 Balboa Exposition) situated in Balboa Park in San Diego in 1996.

   NZA created work procedures for the Salvage of the House of Hospitality, and directly supervised and participated in the removal of complete rooms without damage.

   These rooms, once conserved were replaced in the reconstructed building, as well as a very large proscenium arch in the main theater of that building. (The house of Hospitality is the first and only National Historic Reconstruction Project to be designated as one of approximagtely1800 Historic Monuments)

4. **NZA has performed innovative conservations techniques during the treatment by NZA, of frescoes painted by Orozco, Diego Rivera, Ramos Martinez, Bernard Zakheim, Ralph Stackpole, Victor Arnautoff, Millard Sheets, Albert Herter, Claire Falkenstein, Tanaka, Kent Twitchell, Judith Baca, Lorenzo Davis, Willy Herron, Rubin Brucelin, Rico Lebrun, and over 100 other artists.**

5. NZA developed a Proprietary Strappo Process for the removal of Acrylic Murals painted on concrete, stucco, and other masonry surfaces .

   This revolutionary technique resulted in a major change in state and federal law.

   Prior to the NZA Proprietary Strappo Acrylic Mural Removal technique, Out of Door Acrylic murals were not considered protected artworks under law, due to the fact that They could not be removed without also removing the masonry wall on which they were painted.

   Now by the NZA Strappo method, murals can be easily removed from their masonry walls without damage to the mural or unacceptable damage to the wall.

   On the basis of NZA's Strappo Technique, California Assemblyman Alan Sieruti was able to put through passage of legislation that then included Murals painted directly on Masonry surfaces as protected under California and then under Federal Law.

   NOTE:

   NZA developed a method of Consolidating Acrylic Murals painted over unstable and de laminating multiple paint sub-layers in such a way that all the paint layers become fused into one thick paint layer, **with the result that the longevity of the mural can not only be assured for over fifty years, but subsequent Consolidant applications can increase the longevity of a Treated Mural into perpetuity.**

6. NZA innovated its proprietary "Strappo" method of removal of very large Acrylic, Oil, and Fresco murals, involving removal of only the layer of mural paint from the masonry surface on which it has been directly painted, subsequently transferring this paint layer to a support surface, and then to another wall for permanent or temporary display.

7. **As a result of this process developed by NZA, Alan Sieroty, a member of California Legislature, facilitated the inclusion of out-of-door murals as protected under California Law, such that murals could now be removed**

from a building without substantially altering the surface of the building. NZA invented this technique for the Howard Warshaw, Channing Peake murals in Santa Barbara (13' x 25' x2 murals in 1976).

8. In 2003-2005, NZA removed the Kent Twitchell "7th St Altarpiece" double mural **painted directly on a concrete overpass support (55' x 20' each)** perfectly, using the Strappo Method invented by NZA.

9. In 3003-2005, **NZA removed 26 figures** of the Kent Twitchell Marathon Mural (250 ft long) and conserved them at the Playa Vista Howard Hughes aircraft hangar Studio of NZA.

10. In 2002, NZA perfected the greatest breakthrough technology for the conservation and maintenance of Acrylic out-of-door Murals in the history of the genre.

By this technology, involving **deeply penetrating Consolidant application of Paraloid B-72, both very old and very damaged Acrylic Murals** as well as brand-new Acrylic Murals (utilizing innovative wall preparation protocols designed by NZA) **can now be preserved into perpetuity,** at a low cost, using relatively low cost labor not requiring significant technical skill levels.

This method, which involves using the same technical-grade consolidant (used to consolidate Michaelangelo's Sistine Chapel Murals), fully complies with the letter as well as the spirit of the Code of Ethics of the AIC, IIC, and WAAC.

11. Up until 2009, NZA operated out of two large studio/labs (one for large works of art, and one for museum quality easel art, sculpture, objects etc.), NZA has maintained an extensive practice for museums, collectors and galleries using advanced conservation techniques.

12. NZA documents all of its projects, and all methods used and materials and chemicals used are fully noted and open for peer review as desired.

13. In addition to the mural projects completed by NZA, NZA has also conserved thousands of fine easel paintings by very prominent artists in the NZA Conservation Facility. NZA conserves paintings for many prominent galleries and collectors as well as museums in the Los Angeles area.

14. NZA, awarded thirteen mural panels out of a total of sixteen murals selected for conservation by Cal Trans, and **contracted by Cultural Affairs Department of Los Angeles, has been in the fortunate position to clearly demonstrate the new standards established by NZA for Continuously Renewable Mural Conservation, with spectacular success**.

PARTIAL LIST OF MURALS AND OUT OF DOOR ART CONSERVED:

1960's

1. **Removal of Cole Hall Frescos:** ("Ancient Medicine and Rational Medicine" University of California San Francisco - by Bernard Zakheim. (Relocated to HSW 2 at UCSF**. NZA introduced Proprietary Stacco method which revolutionized Stacco removal of Frescoes in Florence as well as Israel**.

1970's

1. "Ancient Jewish Wedding" Fresco: San Francisco Jewish Community Center Partial conservation of Bernard Zakheim Fresco in Courtyard of CCSF. San Francisco

2. "Almaden Indians" Panel Egg Tempera**: De Saisset Museum (University of Santa Clara) - by Clay Spohn**

3. Fresco: Piedmont High School - Claire (Von) Falkenstein

4. Celotex Mural: Piedmont High School

5, Fresco: Piedmont High School - by Tarada

6. Mural Piednont High School by Ralph Stackpole

7. Conservation of very large Earthquake Damaged Council Chamber Stenciled Ceiling for **Santa Barbara County Courthouse by** Dan Grosbeck

8. Removal of Historic "Eagles Gate Facade" from "Eagles Gate, Salt Lake City for Church of the Latter Day Saints.

9. Full Conservation of 12 Toland Hall Frescos "History of Medicine in California": University of California San Francisco - by Bernard Zakheim (These Frescoes had been wallpapered, the wallpaper painted with Oil and Alkyd paints, as well as holes drilled in each panel to hang portraits of UCSF Dignitaries.

10. **Richmond Post Office**: removal of **Victor Arnoutoff** Marouflage mural.

11. **Removal of Eagles Gate Terra Cotta Façade**: Salt Lake City Mormon Church for re-installation in lobby of new high rise office bld. (Time of Brigham Young)

12. **Reinstallation of 2 Cole Hall Frescos:** University of California San Francisco by Bernard Zakheim.

13. **Carved Wooden Polychrome Double Doorway Façade** in Barcelona Design: Santa Barbara County Library. (remove, consolidate friable wood, replicate polychrome, and re-install with rubber snakes to ward off pigeons).

14. **"Spirit of the Sea"** Sandstone Sculpture: Santa Barbara County Courthouse - **Revolutionary barium hydroxide reconsolidation of loose sandstone particles**

1980's

1. **"Prometheus" Fresco:** Pomona College Claremont- **by Jose Clemente Orozco.** All adjacent walls to mural were injected with low viscosity epoxy. A chimney behind the mural had a brick wall directly attached to the mural plaster. The bricks were removed, and the back of the mural fiberglassed with steel supports. Extensive consolidation of front of mural and Inpainting with Fresco Pigments. (3 year project)

2. **2 Frescos: Scripps College**, Claremont - **by Ramos Martinez.** (Clean and consolidate)

3. **"Genesis" Fresco Secco**: Pomona College Claremont- **by Rico Lebrun.** Painted with Poly Vinyl Acetate, the mural paint layer had been pushed away from the surface of the Keane Cement. A mist custom, Barium Hydroxide was applied with a Bonzai Sprayer, and the efflourescence dissolved, bringing the shreds of the Mural Paint Layer back in perfect alignment on the mural surface. B-72 was used to re-adhere the mural to the Kean Cement support. (3 year project)

4. Elaborate Conservation of deteriorated Sandstone Sculpture in front of Santa Barbara Courthouse. (**Consolidated deteriorated Sandstone with a proprietary formulation of Barium Hydroxide).**

5. **6 Historic Marouflage Murals: California State Capitol Building - By Arthur Mathews.** (Remove very darkened varnish, consolidate with Paraloid B-72, build 12 curved Aluminum Honeycomb Panels, apply Murals with vacuum and BEVA 371 Reversible Heat Seal adhesive, transported from Los Angeles to Sacramento and **installed by NZA into Designated Spaces in the Interpretive Museum of the Restored State Capital Museum). (8'x10' each)**

6. **6 Marouflage Murals**: Santa Barbara High School, (Clean, remove graffiti, in-paint, Museum Varnish).

7. **2 Marouflage Murals**: Santa Barbara Public Library **- By Albert Herter** (Remove Murals from library walls, conserve, and prepare hollow wooden mounting support, adhere with Beva 371, remount on library wall, install

conserved historic picture frame, create replica lower section of picture frame for one of the panels).

8. **2 Acrylic (Don Quixote) Murals** removed by Strappo: Santa Barbara City Library(12.5'x25' each) – One painted by Channing Peake and the other by Howard Warshaw. (This project was the inception of the NZA Strappo Technique, never before utilized for removal of Out of Door Acrylic Murals. The murals were pained directly on a previously painted wall using Shiva Color Acrylic Paint System. Each mural was consolidated with B-72, and a facing muslin was attached with rubber cement. The Mural was removed with air hammers vibrating the surface and then lined with fiberglass and re-mounted on a hollow fiberglass support. The murals were installed in the re-constructed Library entryway. The damage was so slight that all inpainting was accomplished by six assistants working a total of six hours. The Mural was then varnished and re-installed)

9. **4 Marouflage Murals**: Doheny Museum at St. John's Seminary, Oxnard California– By Detlef Samman (4'x20' each)

10. **2 Marouflage Murals**: Doheny Museum – **By Charles M Russell.** (Remove from wall, consolidate with B-72, museum varnish, mount on custom spring loaded stretcher bars designed and crafted by NZA mount in library room at Doheny Museum). (4'x20' each)

11. **1 Large Fresco** by lesser known artist: Ralph Stackpole's Studio Montgomery Street ,San Francisco.

12. **1 Small Fresco**: By Ralph Stackpole. **Ralph Stackpole's Studio**, Montgomery Street, San Francisco.

13. **Repair of Several Frescos**: Coit Tower of San Francisco – By Bernard Zakheim, Victor Arnoutoff, Tarada, Lucien Labaudt and others.

14. **Four Limestone Sculptures:** Santa Barbara Florentine Four Seasons - For Henry Andrea (Reconstruct loss areas and consolidate friable crumbled areas with **NZA proprietary Barium Hydroxide Consolidant.**

1990's

1. **Stacco removal of 3 Large Frescos**: Coronado Island - By Ramos Martinez, Using NZA proprietary "drawbridge technology" to lower the frescoes once separated from their support.

2. **I 4ft x 14ft Fresco:** Downtown LA Bullocks - By Millard Sheets (Strappo Removal mount on fiberglass support, install at Natural History Museum)

3. **8 4'x10' Oil Paintings** (painted directly on drywall): Laguna Beach High School - By Megan Jones (Strappo Removal)
   Rainforest Mural: Beverly Connection (Strappo Removal) (10'x 30')

4. **Don Bachardy Mural**: Peter Norton's House - By Kent Twitchell (Strappo Removal, then mounted on non-woven fabric.) (painted directly on Stucco Support)

5. **St. Lucy's and St. Gertrude Murals** - By George Yepes Consultation and Technical Support:

6. **World Wall Mural** Support System Design, and Preventative Conservation and Consolidation - By Judy Baca and SPARC (complete consolidation with multiple applications of B-72.) (800 gallons of B-72 applied). From completely faded, after consolidated, murals appeared to have regained 90% of "lost color" (fading was caused by loss of refractive index when the acrylic paint crumbled under UV light. The B-72 dissolved the Acrylic Mural Paint, and "re-formed" it so that the existent pigmentation was completely re-vitalized/

7. "**Guadalupe Mural"** Conserved and mounted on strong hollow wooden support) (Six Panels) - By Judy Baca of SPARC

9. **Historic Re-Construction of Marouflage Mural**: Downtown LA Federal Building - **By Lucien Labaudt** (12'x20') The Mural was re-constructed and mounted on a large custom panel that was then hung with iron clips to the wall of the Federal Building.

9. **"You Are the Star":** Hollywood, CA – Full Conservation and Consolidation of Acrylic Mural by Thomas Suraya

10. **Westminster Presbyterian Church**, Pasadena, CA – 100'x 400' Ceiling Mural Reconstruction following earthquake damage. Damaged areas of ceiling were completely re-painted using 35 shades of Mural Paint to match the original Heinsbergen patterns.

11. **Holy Cross Church**: Main St. Los Angeles – Conservation earthquake damage of 20'x 30'Apse Mural

12. **Westminster Presbyterian Church**: Fabrication of **multi-ton Replicate Spires** on top of Westminster Presbyterian Church Steeple **crafted from steel and fiberglass**. (Originals had fallen after earlier earthquakes) (Silicone casts were taken of the spire elements that had been distributed in many neighborhoods of Congregational Members in Pasadena. **Molds were taken "In Situ"** and then assembled into usable structures at a later date prior to installation on top of the Church Steeple).

13. Ventura Community Presbyterian Church: Conservation of Apse Mural. (Remove very dark varnish removed exposing vivid 22 carat gold leaf halos around saints in painting)

14. **Six church interiors:** After the 1992 earthquake in Los Angeles, NZA conserved six complete Church interiors including several Churches for the Catholic Archdiocese of Los Angeles, as well as a videography project for the installation of a George Yepes mural under the authority of Cardinal Mahoney of Los Angeles.

15. **Church of the Advent:** Adams St., Los Angeles - Conservation of Altar, Apse Mosaics, Tile, Floor, and aspects of Church Interior Design. (reconstruct apse cast glass mosaic. From several hundred shattered pieces. Replicate pottery floor tiles, move altar to face congregaton,, re-construct old altar).

16. **Transfiguration Church:** Martin Luther King Jr. Blvd., Los Angeles –Full conservation of 20'x30'Apse Murals, full conservation o6'x10' Stations of the Cross.

17. **Villa Park Murals**: Pasadena, CA – Acrylic **(15'high by 200'long)** (Clean, consolidate, apply B-72 as protective Consolidant. Apply anti graffiti coating.

18. **Brandelli's Brig Mural**: Venice Beach, CA – Innovative, state-of-the-art consolidation of totally flaked and cleaving acrylic over unspecified flaking paint – **By Art Mortimer** (Application of substantial spray coatings of B-72. so **At least ten layers of paint were laminated together so that the paint layer of the mural became more than ¼ inch thick.** Mural was pulled from wall in sections, and then reapplied to consolidated wall surface using Nova Super Gel. Although previously extremely flaked and delaminated, when consolidation process was complete, **In-painting was minimal.**

19. **Earthling Bookstore** Mural Installation: Santa Barbara – Marouflage

20. **"American Rhythm"** Marouflage Mural. By James Doherty. Full restoration of mural assembled out of a dozen torn pieces lined and then mounted on a structured wooden support in lobby of MCA Records and Universal Music

22. **Joel Silver "Flores De Mexico" Installation:** Conservation and installation of of "Flores de Mexico"Fresco by **Ramos Martinez in the Ricardo Legorreta designed home of Producer Joel Silver** - onto a 2 ton shock-mounted steel installation module designed and built by NZA. (Fresco on heavy steel support.

23. **Conservation of Still Life Fresco**: La Avenida Co. - By Ramos Martinez (installed in Coronado Library)

24. **Emergency Conservation of 2 Murals**: (Cal Trans) "Seventh St. Altarpiece" – By Kent Twitchell Los Angeles (100'x75') east exterior wall - By Kent Twitchell

25. **Wall Preparation, Product Design** and Technological Support for La Chamber Orchestra "Harbor Freeway Overture mural " By Kent Twitchell 3 panels 100' high. X 200' wide.

26. **Wall Preparation Technical Support and Installation**: White Memorial Hospital Mural - By George Yepes

27. "Mary Star of the Sea": 12' high Bronze Sculpture, San Pedro, CA - Repair extensive shattered damage to hollow cast figure caused by 1992 Earthquake . Reconstruct interior support system with expanded foam and aggregate epoxy. Prepare exterior surface with high tech epoxy coating and **apply 22 karat gold leaf.** install with Crane onto **120' tower of Mary Star of the Sea Church.**

28. **Federal building: Los Angeles, CA.** In depth cleaning and full Conservation of two Limestone Sculptures (14' high).

    Numerous Earthquake Damaged Liturgical Sculptures for Catholic and Lutheran Churches.

29. **Historic Reconstruction Of The House Of Hospitality; Balboa Park,** San Diego,California.Conservation Director for the twenty six million dollar Historic Reconstruction of the House of Hospitality in Balboa Park San Diego. NZA was hired by the City of San Diego and worked under the authority of Wayne Donaldson AIA to guide, instruct and plan the conservation of 1,800 salvageable design elements from the House of Hospitality, generate conservation parameters for the conservation of each item, and generate re- installation parameters for re-Hospitality is designated as a Historic Landmark, and its demolition and reconstruction in exact replica of the original was unprecedented in the history of Historic Preservation under the guidelines of the Department of the Interior. The project garnered more than 24 major awards for excellence in planning and execution. NZA was responsible for the salvage, conservation and re-installation segments of the project being within budget and within deadline.

30. **Santa Barbara Presidio** NZA crafted twenty wrought-iron sconces for the Santa Barbara Presidio restoration project. (The sconces were installed in the Presidio Chapel, and are fully authentic to the time, craftsmanship and patina).

31. **LA Mural Conservancy** Frank Romero Mural "Going to the Olympics": Consolidation of Mural Surface.

32. **Computer program for Michael Jackson mural**. (By Kent Twitchell) (Computer program created Pixels ¼ inch x ¼ with code in each pixel to show color to be used specific to each pixel. Result was a dramatically effective innovation in Mural Painting. Mural was to be installed on the East side of the El Capitan Theater in Hollywood. NZA designed a light show and faux smoke to be projected onto the mural the mural had Jackson with his arm on a steel mechanical strut extending beyond the wall on which the mural was to be applied. NZA invented a use for a polyester non-woven fabric on which the mural was painted as "marauflage". (Due to Mr Jackson's disastrous events in 1993, the project was abandoned after the earthquake caused significant damage to the El Capitan 0

33. **Chamber Orchestra Mural. "Harbor Freeway Overture"** (By Kent Twitchell) NZA developed the same pixel system as above, and the mural canvas was printed out on non-woven fabric and painted by a "paint by numbers" system. NZA installed the mural using Nova Gel and Nova Super Gel as adhesive. (100'x140').

34. **Veteran's auditorium**. Fresno Remove heavy overpaint from 8 large panels by **Heinsbergen.** Re-apply composition gold leaf "wave" designs around each mural segment. Inpaint and Museum Varnish.

35. **"Rainforest Mural"** (Beverly Connection) (Strappo removal of Acrylic Mural, mount on panels and transport to Ojai after conservation.

36. **"Two 12' Limestone Sculptures" Federal Building LA.** Remove discolored linseed oil Consolidant from the Indiana Limestone. (Solvent Vaccuum Treatment)

37. **"12 Garth Benton Marouflage Murals"** Parson's Technologies. (Clean, consolidate, in-paint, and final varnish.

2000'S

1. **"Theory and Science"** Fresco Secco Murals (reconstructon of lower 30%) by **Frederick Olmstead**: San Francisco City College. (Entry Staircase).

6. **Fresco: Stock Exchange,** San Francisco (Now City Club) - **By Diego Rivera**

7. **Conservation of Fresco: Art Institute San Francisco - By Diego Rivera (Designed for Rivera by Bernard Zakheim).**

8. **Applications of Consolidant Paraloid B-72 Judy Baca Great Wall Mural (½ mile long x 20' high)**

9. **Conservation and Removal of 12 Murals**: By Garth Benton for **Parson's Technologies** in Pasadena California.

10. **Conservation of Entry Way Mural and City Council Mural** in Burbank Calif. City hall**. (By Hugo Balin.)** (10' w x 20' high)

11. **Joel Silver Studios: Venice Beach Post Office** – Remove and Conserve Marouflage mural of Abbot Kinney By **Edward Biberman,** mount on 2" Aluminum Honeycomb Panel, **7'x17.' Abbot Kenney Mural for Producer Joel Silver (Producer of the Matrix Series)** (As of 3/18/2014) the fully conserved mural is **on display in the midst of three Interpretive Historic Rooms dedicated to the display of the Biberman Mural at Los Angeles County Museum of Art).**

12. **Curved Fresco Secco Mural**: MD Anderson Medical Center, Houston, TX – By Peter Hurd. **16.5' high, 48' long**, and **curved in a J-Shape on 5/8" crumbly plaster. Removed intact without damage.** Truss structure applied to back of mural, and full consolidation of friable 7/8" plaster consolidated with low viscosity Epoxy. Re-installed in City Library in Artesia Arizona .**Fresco Secco mural was painted on 5/8" friable plaster surface supported only by light expanded mesh, and ¾" "c" shape vertical rods** attached to the horizontal rods with baling wire. NZA applied an 8-ton multi-angled truss support to the front, and and an equal truss fabrication which was epoxied to the back of the consolidated mural. **The mural was removed in one piece** and shipped from Houston Texas to Artesia Arizona, where it has been installed in a new Municipal Library there

13. **Bernard Zakheim Collection**: Full conservation of over 30 large Wooden Warsaw Ghetto Holocaust Sculptures by Bernard Zakheim as well 16 full size frescoes and over three hundred oil and watercolor paintings.

14. **Ramos Martinez Mural**: Conservation And Installation of a Ramos Martinez for **The Coronado City Library,** Coronado California. NZA removed the six-ton fresco, 47' long and 8' tall, from the La Avenida Inn in 1995. In due time it was **brought to the NZA Studio Facility in the historic Howard Hughes airport buildings, in Playa Vista, California.** The conservation took two years and cost more than $250,000.00 to complete. The fresco is now installed by NZA in the City of Coronado Library facility. NZA moved the fresco from storage in North County, San Diego by air ride gooseneck truck to the Howard Hughes Airport facility, and similarly moved the fresco back to Coronado. Under the guidance and participation of NZA, in-house personnel
performed all installation work, and NZA served as consultant to the engineering staff that designed the installation framework. NZA Installed the multi-ton steel framework and expanding column systems

15. **One Block Long Mural** Los Angeles Cultural Affairs Department: Mid City Magnet School, Conserve, remove graffiti, in-paint and re-paint several sections of highly damaged areas.

16. **Judith Baca Sparc "Great Wall" Mural** Clean and consolidate **12' high mural x one half mile long.**

17. **City Of 29 Palms**: Consolidate 20 very large city murals: (we were honored celebrity guests of the City of 29 Palms.)

18. **B'nai Tikkvah Synagogue:** Remove and pack very large altar sculpture for storage.

19. **Two Marouflage Murals For Lincoln High School**, LAUSD. (5'x30' ft each Remove, conserve at **NZA Howard Hughes Airport studio**, mount on Gator Board, Apply to hallway wall with heavy Velcro.

20. **Hollenbeck High School**: Dorr Bothwell Lobby of High School Auditorium Frieze and Mural, For City Of LA. (Full conservation In Situ)

21. **Exact Replication Of Bernard Zakheim Mural**: Mineola Texas. Working from black and white photos, NZA, Nathan Zakheim working with three sons and two daughters, re-created this Mural with colors from Period Paintings by BZ. (7'x 15')(Installed in Mineola Texas with great honors and fanfare!

22. **Thirteen Banksy "Happy Coppers"**: figures. For English collecter/dealer Stuart Holt. (Remove wall composed of 2x4's and drywall, isolate and remount figures after removing total overpaint. Re-mount on display panels, and prepare to ship to England).

23. **San Diego State University:** Remove Tempera Mural From Concrete substrate and add interpretive portion destroyed during early remodel of building. Mount on custom designed panel, re-install in SDSU Library.

24. **Workman's Circle Mural**: Remove Graffiti, consolidate cracks and loose pieces of stucco on mural wall, Re-build loose structural elements behind the mural, work with original artist, Eliseo Silva, on re-touches of damaged mural (image.15'x 40')

25. **Jaya Mural for Venice Arts Council**: Consolidate and Supervise Artist repainting of Mural. Re-Consolidate after Artist's extensive restoration, and apply NZA proprietary anti-graffiti coating.

26. **"You are the Star"** Suraya (20' x 100'
Remove Urethane coating, consolidate and retouch.

27. **Los Angeles Unified School District**: 2 Bas Reliefs for Lincoln High School (consolidate, back with fiberglass, re-tone, strip and re-finish frames).

28. **Los Angeles Unified School District** : Lincoln statue for Lincoln High School. Strip multiple layers of paint, consolidate, strengthen casting from within, replace damaged segment.

29. **Workman's Circle :**(Robertson Blvd., Los Angeles). (15' x 40')
Remove Graffiti, strengthen wall, consolidate cracks with epoxy, re-touch damages, consolidate with B-72, and ply 2-part NZA AG Anti-Graffiti Coating.

30. **"Sex and Chocolate" by Banksy**. Remove from textured brick wall using NZA Strappo technique, and adhere salvaged paint layer to a 3-d fiberglass custom cast support, **(cast from original textured brick wall)** in-paint and crate for shipment to England.

31 **"13 Happy Coppers" By Banksy.**
Removed 20'x8' plasterboard wall, brought to NZA Conservation Facility, removed damagedover paint, and reinstalled on new supports as per Stuart Holt directions. Packed and Shipped to England.

32. **Conservation And Graffti Abatement Of Six Murals For City Of LA.**

33. **Conservation And Graffiti Abatement Of Four Murals For Operation Clean Sweep LA.**

34. **Two Hugo Ballin Murals For City Of Burbank** (Burbank City Hall)

35. **Lincoln High School:** Two Bas Relief Sculpture, And A Full Size Sculpture Of Abraham Lincoln.

36. **Bryce Banatyne Gallery**:
Pack and move 48' Ramos Martinez Fresco from Los Angelesto to town of Fillmore Ca.

37. **Gateway To Silverlake**:
Consolidate and apply anti graffiti sacrificial wax to eight Murals under Sunset Blvd.

38. **Jewish Center Of San Francisco**:
Conservation of Bernard Zakheim fresco. Remove mural by Stacco method, **re-mount on steel and fiberglass support,** and re-locate in stairwell of new Building for Jewish center

39. **La Cultural Affairs Department**: Conservation of Kent Twitchell's Strother Martin mural. Repair damaged stucco wall, remove graffiti, consolidate.

40. **City Of Coronado Installation of 7'x7' Ramos Martinez Fresco** for Coronado Library.

41. **Northrop Grumman**:
Conservation of 51 mural segments, mold abatement of mural segments, consolidation of mural segments and re-assembly and re-installation of 51 panel segment mural.

NZA was awarded thirteen Mural Artist' Multiple Paneled Murals located on Freeway Walls as well as Freeway Underpasses. NZA won the bids for thirteen projects, with the remaining three Mural Panels awarded to other Conservation Teams. These murals were contracted by Cal Trans and subcontracted by the Cultural Affairs Department of Los Angeles. **NZA was in a fortunate position to clearly demonstrate the new standards established by NZA for Continuously Renewable Mural Conservation with spectacular success.**

1. **Conservation of "Eye on LA**": 1984 Olympic Mural - By Alonzo Davis (Remove many layers of graffiti and "Cal Trans Grey" overpaint. Consolidate with B-72, re-touch under Alonzo Davis participation and direction. **NZA Proprietary Graffiti** Coating applied)

2. **Special Olympics Mural** LA FWY Kids" by Glenna Boltuch Avila (5,500 sq ft) **Remove all figures by "Strappo"** prepare wall, consolidate, re-apply conserved figures, paint background colors as per original intent of artist.

3. **Two Panels** by Rubin Brucelyn on 2 FWY (LA) (1,200 sq. ft. each)

4. **"Hitting the Wall"** (Two Panels by Judith Baca on 110 FW)(**3,000 sq ft total)**

5. **Two Acrylic murals painted by Kent Twitchell** with Nova Color Acrylics Artist paints directly on the concrete support for the 7th Street overpass on 110 FWY (1,200 sq ft each) using NZA Proprietary Strappo technique. Once fully conserved **(20'x50' each,** the murals were re-adhered to the Grand Avenue overpass over the 5/101 Freeway in downtown LA. Conservation consisted of cleaning the mural in situ, application of facing material, **removal of the paint layer directly painted on the concrete surface of the freeway underpass, transportation of murals to the NZA Playa Vista studio, Conservation of the murals, preparation of a new site for the murals on the 101 FWY, and reinstallation of the two murals on the 101 FWY.**

6. **26 Marathon Mural Runners** by Kent Twitchell near LAX on 405 FWY **(4,000 sq. ft.)** (Figures removed, **brought to NZA Howard Hughes Airport Studio**, conserved and re-mounted on 5 Freeway N near Stadium Way)(Conservation consisted in **Strappo removal of all 26 8'x16' mural figures,** and conservation in NZA Playa Vista studios. A new location for the mural was prepared by NZA, and the murals installed at that site. There was heavy damage by graffiti, and two years was spent in the conservation of the 26 figures).

7. **4 "Underwater Fantasy"** murals by Michelle Obregon (**Each 5,000.00 sq ft)** Remove extensive graffiti, consolidate, inpaint losses, apply NZA Anti Graffiti coating.

8. **"Struggles of the World"** by Willie Herron III (**2,500 sq ft)** Remove Graffiti, remove Cal Trans grey overpaint, consolidate, Inpaint, apply anti graffiti Sacrificial wax

9. **"Reach Out" Mural**; by Alonzo Davis (**3,000.00** sq ft. Remove graffiti, consolidate, in-paint damages and losses.

ART OF PROMINENT ARTISTS CONSERVED BY NZA:

Helen Lundeberg	Lorser Feitelson
Hans Burkhardt	Andy Warhol
Jean Charlot	Ramos Martinez
Jose Clemente Orozco	Oscar Fischinger
Edward Biberman	Lucien Labaudt
Diego Rivera	Rico Lebrun
McLaughlin	Kent Twitchell
Judith Baca	Eloy Torres
Victor Arnouto	Bernard Zakheim
Hugo Ballin	Charles M. Russell
Frederick Remington	Collin Campbell Cooper
Alexander Harmer	Albert Herter
Millard Sheets	Ralph Stackpole

CATEGORIES OF ARTWORKS CONSERVED:

Fresco Buono and Fresco Secco	Egg Tempera
Marouflage Murals	Oil Murals
Oil Easel Paintings	Limestone Sculpture
California Plein Air	Cowboy Art
WPA Art	Pre-Raphaelite

Spanish Colonial
Acrylic Murals and Paintings
Petrachrome Murals
Indian and Persian Miniatures
(in Ivory and Marble).
Paintings
Marble Sculpture
Greek and Russian Icons
Impressionist Paintings
Intaglio
Soapstone and Alabaster
Bronze Sculpture
Mosaic Murals
West African Sculpture
Patachitra(Palm Leaf) Painting Australian Bark
Cast Bronze Sculpture
Carved Wood Polychrome
Terra Cotta and Ceramic Sculpture
Craftsman/Art Nouveau
Japanese screens

EXPERT WITNESS TESTIMONY BY NZA IN ART RELATED LAWSUITS:

1. Los Streetscrapers vs. Shell Oil (Destroyed) ($450,000.00 settlement)

2. Chicano Park (Michael Schnor) (defective Coating) ($350,000.00 settlement)

3. Lilly Anne Mural (Chuy Campesano) (painted out) ($375,000.00 settlement)

4. Ed Ruscha Mural (Kent Twitchell)(painted out) ($1,100,000.00 settlement).

Appendix O-SM

Tom Brohard, PE

Licenses: 1975 / Professional Engineer / California – Civil, No. 24577
1977 / Professional Engineer / California – Traffic, No. 724
2006 / Professional Engineer / Hawaii – Civil, No. 12321

Education: 1969 / BSE / Civil Engineering / Duke University

Experience: 50 Years

Memberships: 1977 / Institute of Transportation Engineers – Fellow, Life
1978 / Orange County Traffic Engineers Council - Chair 1982-1983
1981 / American Public Works Association – Life Member

Tom is a recognized expert in the field of traffic engineering and transportation planning. His background also includes responsibility for leading and managing the delivery of various contract services to numerous cities in Southern California.

Tom has extensive experience in providing transportation planning and traffic engineering services to public agencies. In addition to conducting traffic engineering investigations for Los Angeles County from 1972 to 1978, he has previously served as City Traffic Engineer in the following communities:

- Bellflower ..... 1997 - 1998
- Bell Gardens ..... 1982 - 1995
- Big Bear Lake..... 2006 - 2015
- Indio..... 2005 - 2019
- Huntington Beach ..... 1998 - 2004
- Lawndale..... 1973 - 1978
- Los Alamitos ..... 1981 - 1982
- Oceanside..... 1981 - 1982
- Paramount ..... 1982 - 1988
- Rancho Palos Verdes ..... 1973 - 1978
- Rolling Hills ..... 1973 - 1978, 1985 - 1993
- Rolling Hills Estates ..... 1973 - 1978, 1984 - 1991
- San Fernando..... 2004 - 2019
- San Marcos..... 1981
- Santa Ana ..... 1978 - 1981
- Westlake Village ..... 1983 - 1994

During these assignments, Tom has supervised City staff and directed other consultants including traffic engineers and transportation planners, traffic signal and street lighting personnel, and signing, striping, and marking crews. He has secured over $10 million in grant funding for various improvements. He has managed and directed many traffic and transportation studies and projects. While serving these communities, he has personally conducted investigations of hundreds of citizen requests for various traffic control devices. Tom has also successfully presented numerous engineering reports at City Council, Planning Commission, and Traffic Commission meetings in these and other municipalities.

In his 14 years of service to the City of Indio, Tom accomplished the following:

- Oversaw preparation and adoption of the 2008 Circulation Element Update of the General Plan including development of Year 2035 buildout traffic volumes, revised and simplified arterial roadway cross sections, and reduction in acceptable Level of Service criteria under certain conditions.

- Oversaw preparation of fact sheets/design exceptions to reduce shoulder widths on Jackson Street and on Monroe Street over I-10 as well as justifications for protected-permissive left turn phasing at I-10 on-ramps, the first such installations in Caltrans District 8 in Riverside County; reviewed plans and provided assistance during construction of both $2 million projects to install traffic signals and widen three of four ramps at these two interchanges under Caltrans encroachment permits.

- Reviewed traffic signal, signing, striping, and work area traffic control plans for the County's $45 million I-10 Interchange Improvement Project at Jefferson Street.

- Reviewed traffic impact analyses for Project Study Reports evaluating different alternatives for buildout improvements of the I-10 Interchanges at Jefferson Street, Monroe Street, Jackson Street and Golf Center Parkway.

- Oversaw preparation of plans, specifications, and contract documents and provided construction assistance for over 70 traffic signal installations and modifications.

- Reviewed and approved over 2,000 work area traffic control plans as well as signing and striping plans for all City and developer funded roadway improvement projects.

- Oversaw preparation of a City-wide traffic safety study of conditions at all schools.

- Obtained $47,000 grant from the California Office of Traffic Safety and implemented the City's Traffic Collision Database System. Annually reviews "Top 25" collision locations and provides traffic engineering recommendations to reduce collisions.

- Prepared over 1,500 work orders directing City forces to install, modify, and/or remove traffic signs, pavement and curb markings, and roadway striping.

- Oversaw preparation of engineering and traffic surveys to establish enforceable speed limits on over 500 street segments.

- Reviewed and approved traffic impact studies for more than 35 major projects and special events including the annual Coachella and Stagecoach Music Festivals.

- Developed and implemented the City's Golf Cart Transportation Program.

Since forming Tom Brohard and Associates in 2000, Tom has reviewed many traffic impact reports and environmental documents for various development projects. He has provided expert witness services and also prepared traffic studies for public agencies and private sector clients.

JOHN J. HENKELMAN, EIT

Education

BS – Chemical Engineering, University of Nevada, 2002

Professional Licenses

Engineer-in-Training (EIT)

Specialty Certifications

OSHA 40-Hour Hazardous Waste Operator
State of California Accredited Lead Verifier for GSC, Oil and Gas, Process, and Transactions
State of California Accredited Offset Verifier for Livestock, Ozone Depilating Substances (ODS), Mine Methane Capture (MMC), and Rice Cultivation

Professional Affiliations

Air Waste and Management Association

Professional Experience

Mr. Henkelman has 16 years of experience as a chemist and engineer. His duties have included air dispersion modeling using several regulatory models, including AMS/EPA Regulatory Model (AERMOD), Industrial Source Complex Short Term 3 (ISCST3), Screen 3, AERSCREEN, and Areal Locations of Hazardous Atmospheres (ALOHA). He uses modeling results in risk assessments, accidental release planning, permit applications, and environmental impact assessments. He writes work plans and samples soil vapor, landfill gas, soil, and water. He assists with compliance and permitting under the Clean Air Act, including greenhouse gas (GHG) reporting and verification under the California Climate Action Registry (CCAR), The Climate Registry (TCR), and California's mandatory GHG reporting regulation. He also has experience in manufacturing that includes production scheduling, quality assurance and quality control, product development, and health and safety.

Select project experience includes the following:

GHG Emissions Reporting, Multiple Sites, CA. Mr. Henkelman performed federal and state GHG reporting for local government facilities throughout California, including the City of Sunnyvale, City of Sacramento, County of Sacramento, City of Palo Alto, Salinas County, San Joaquin County, and Sonoma County.

Title V Permit Applications, Five Kern County Landfills, Kern County, CA. Mr. Henkelman prepared a permit renewal application package which was a review of landfill compliance and potential new compliance requirements.

Title V Permit Applications, 28th Street Landfill, Sacramento County, CA. Mr. Henkelman prepared a permit renewal application package which was a review of landfill compliance and updating permit requirements based on recent and planned changes to the facility.

Modeling for Permitting, Kirby Canyon Landfill, Morgan Hill, CA. Mr. Henkelman performed dispersion modeling using screening and complex models (ISCST3, AERMOD, and SCREEN3) for permitting of flares and potential engines. The modeling results were used to determine the human health risk.

Modeling for Permitting, Tri-Cities Landfill, Fremont, CA. Mr. Henkelman performed dispersion modeling using screening and complex models (ISCST3, AERMOD, and SCREEN3) for permitting of flares and potential engines. The modeling results were used to determine the human health risk.

Modeling for Permitting, McCommas Landfill, Dallas, TX. Mr. Henkelman performed dispersion modeling using a screening model (SCREEN3) in support of a permit application for flares. The modeling results were used to determine NAAQS compliance.

Modeling for Permitting, Frank R. Bowerman Landfill, Irvine, CA. Mr. Henkelman performed dispersion modeling using screening model (SCREEN3) for permitting of flares. The modeling results were used to determine human health risk.

Modeling for Permitting, Simi Valley Landfill and Recycling Center, Simi Valley, CA. Mr. Henkelman performed dispersion modeling using screening model (SCREEN3) for permitting of a flare condensate injection system. The modeling results were used to determine human health risk.

Quality Assurance for Landfill Gas Sampling, Honolulu, HI. Mr. Henkelman reviewed third-party reports to determine compliance with Quality Assurance Project Plan (QAPP) requirements.

New Source Performance Compliance Standards (NSPS) Tier 1, South Hilo Landfill, HI. Mr. Henkelman collected samples at the landfill and created a work plan calculating emissions which were submitted to regulators. He reviewed the NSPS applicability and worked with the EPA and the County of Hawaii to evaluate future compliance options.

New Source Performance Compliance Standards (NSPS) Tier 2, 15 Landfills, CA. Mr. Henkelman collected samples at the landfills and created work plans calculating emissions which were submitted to regulators.

Air Quality Impact Assessment (AQIA) for Landfill Gas Engines, San Jose, CA. The project included an AQIA used in support of an Environmental Impact Report (EIR) and California Environmental Quality Act (CEQA) report. Mr. Henkelman evaluated all major emission sources at the site. The AQIA included modeling for a health risk assessment (HHRA) to demonstrate National Ambient Air Quality Standards (NAAQS) compliance.

AQIA, Newby Island Sanitary Landfill, Milpitas, CA. The project included AQIA used in support of an EIR and CEQA report. Mr. Henkelman evaluated all major emission sources at the site. He used model results to evaluate the HHRA and NAAQS compliance.

AQIA, Forward Landfill, Manteca, CA. The project included AQIA used in support of an EIR and CEQA report. Mr. Henkelman evaluated all major emission sources at the site. He used model results to evaluate the HHRA and NAAQS compliance.

AQIA, Fairmead Landfill, Madera, CA. The project included AQIA used in support of an EIR and CEQA report. Mr. Henkelman evaluated all major emission sources at the site. He used model results to evaluate the HHRA and NAAQS compliance.

HHRA and Nuisance Evaluation of Landfill, Otay, CA. Mr. Henkelman prepared an HHRA and odor dispersion modeling, and evaluated potential nuisance impacts from a landfill on proposed residential development. The reports were used to seek CEQA approval.

Modeling Evaluation, Avenal Landfill, Avenal, CA. Mr. Henkelman evaluated dispersion modeling used in an EIR and CEQA evaluation. The modeling was completed using an ISCST3. The results were used to evaluate the HHRA.

Modeling Evaluation, Central County Landfill, Petaluma, CA. Mr. Henkelman evaluated dispersion modeling used in an EIR and CEQA evaluation. The modeling was completed using CAL3QHCR, and the results were used to evaluate the HHRA.

Modeling for Permitting, Hay Road Landfill, Vacaville, CA. Mr. Henkelman evaluated dispersion modeling using a complex model (AERMOD) in support of an EIR and CEQA report. He evaluated all major emission sources at the site, and the used model results to evaluate the HHRA and NAAQS compliance.

Modeling Evaluation, East Los Angeles Transfer Station, East Los Angeles, CA. Mr. Henkelman's evaluation included dispersion modeling used in an EIR and CEQA evaluation. The modeling was completed using SCREEN3, and the results were used to evaluate the HHRA and NAAQS compliance.

Modeling Evaluation, West Artesia Material Recovery Facility, Compton, CA. Mr. Henkelman evaluated dispersion modeling used in an EIR and CEQA evaluation. The modeling was completed using SCREEN3, and the results were used to evaluate the HRRA and NAAQS compliance.

Litigation Support for Landfill, Oklahoma City, OK. Mr. Henkelman evaluated odor emission rates and calculations to prepare rebuttal arguments for expert witness reports.

Litigation Support, Newby Island Landfill, Milpitas, CA. Mr. Henkelman evaluated the odor emission rates and calculations to prepare rebuttal arguments for expert witness reports.

Litigation Support for Landfill, Sylmar, CA. Mr. Henkelman evaluated the odor emission rates and calculations to prepare rebuttal arguments for expert witness reports.

Litigation Support for Landfill, Tullytown, PA. Mr. Henkelman evaluated the odor emission rates and odor dispersion modeling for expert witness reports.

HHRA, Former Plastic Bottle Manufacturing Facility, Toluca, Mexico. Mr. Henkelman's assessment included developing a soil vapor sampling plan, collecting soil vapor samples, developing exposure scenarios for soils and soil vapor, developing toxicity criteria, and developing exposure parameters.

Focused HHRA, Former Aerospace Research Facility, Los Angeles, CA. Mr. Henkelman developed exposure scenarios for groundwater and indoor air, as well as toxicity criteria and exposure parameters.

HHRA, Former Industrial Sites, Southern CA. In order for the sites to be developed for residential use, the assessment included developing exposure scenarios for soil vapor and modeling risk using the Johnson Ettinger model.

HHRA to Assess Effectiveness of Synthetic Vapor Barrier. The focused HRA evaluated the potential effectiveness of a synthetic vapor barrier to mitigate health risk from soil vapor contamination.

Development of Copper and Cyanide Cleanup Levels for Surface and Air, San Marcos, CA. Mr. Henkelman's duties focused on exposure scenarios, toxicity criteria, and exposure parameters. Chronic health hazard-based cleanup levels for both contaminants were developed for future residential and commercial use of the facility.

Development of Health Based Beryllium Cleanup Levels for Surfaces, Kansas City, MO. Mr. Henkelman duties included defining exposure scenarios, toxicity criteria, and exposure parameters. Cleanup levels were based on increased cancer risk for commercial workers.

Development of Contaminant Cleanup Levels for Soil Gas, California. Mr. Henkelman duties included defining exposure scenarios, toxicity criteria, and exposure parameters. Cleanup levels were based on both increased cancer risk and chronic health effects.

HHRA for Asbestos Landfill, Copperopolis, CA. Mr. Henkelman's duties included calculating emission rates of asbestos, modeling dispersion of asbestos emissions using the ISCST3 model to determine downwind concentrations, and developing exposure scenarios for outdoor air, toxicity criteria, meteorological data, and exposure parameters.

Soil Vapor Surveys, Sample Location Selection, Sample Collection, and Sample Analysis, California and Oregon. Mr. Henkelman performed surveys in support of vapor intrusion risk assessments.

Review of Modeling, Redwood Landfill, Novato, CA. Mr. Henkelman's review included dispersion modeling completed for Prevention of Serious Deterioration (PSD) evaluation of flares and engines for a landfill gas-to-energy (LFGTE) project using AERMOD. The model results were used to determine human health risk.

Air Toxics HHRA, Los Angeles Unified School District (LAUSD), Los Angeles, CA. Mr. Henkelman's review included emission calculations, air dispersion modeling using ISCST3, risk and exposure criteria selection, and risk calculation. He reviewed hazardous material accidental release scenarios.

Air Toxics Risk Assessment, Quarry, Novato, CA. Mr. Henkelman reviewed the assessment performed by another firm, which included emissions calculations, modeling, and risk evaluation. The review concluded that emission calculations were fundamentally flawed, and that the quarry may pose a significant health risk to nearby residential areas.

California GHG Emission Reports for Stationary Combustion and Transaction Reporters, CA. As Lead Verifier and Internal Reviewer, Mr. Henkelman reviewed emission reporters that included Pacific Gas and Electric, SMUD, Plumas-Sierra Rural Electric Cooperative, Truckee-Donner Public Utilities District, Pacific Ethanol, Kinergy, UC Davis, City of Roseville, Collins Pine, and the City of Santa Clara.

Evaluated Emissions from Vehicles using Emfac2007 for Various Sites in California. Mr. Henkelman evaluated emission calculations used in fleet emission calculations and HHRA.

Permitting of Industrial Facilities, California. Mr. Henkelman assisted in the permitting process, including development of appropriate emission factors, calculations of emissions, and preparation of permit application materials. The permitted facilities included several landfills, transfer stations, and a lumber factory.

GHG Regulations for Landfills and Steel Industry, Pittsburg, CA. Mr. Henkelman investigated current and future legislation and regulations regarding GHGs.

Analysis for Best Attainable Control Technology (BACT) for Composting Operations, Novato, CA. Mr. Henkelman performed an analysis that included evaluating the effectiveness and cost of several control technologies.

Specialized Training

Completed 2-Day Training Course for ISCST3 and AERMOD. The course included model selection, meteorological data processing, source and receptor parameters selection, and terrain processing.

Air & Waste Management Association (AWMA)

Professional Experience

Mr. Huff, a Vice President with SCS Engineers, has over 27 years of experience in environmental consulting, specializing in landfill regulatory compliance, assessment, remediation, post-closure care, and air quality/compliance issues, including greenhouse gas (GHG) emissions quantification. He is the closed landfill regulatory compliance and GHG emissions quantification Project Lead within SCS's offices throughout the western U.S., responsible for technical expertise on landfill post-closure care and redevelopment, landfill reactions (chemical and oxidation-based), GHG emissions quantification and verification, landfill regulatory compliance, and emissions quantification procedures.

Mr. Huff is also the National Lead for compliance with the federal Greenhouse Gas Reporting Program (GHGRP) within SCS, responsible for quantifying and reporting for more than 600 of the 900 landfills subject to the GHGRP. Because of this expertise, Mr. Huff has assisted the U.S. Environmental Protection Agency (EPA) with investigation and solution of errors identified in the electronic Greenhouse Gas Reporting Tool (e-GGRT).

Through his expertise, Mr. Huff has been the Project and Task Manager on a variety of projects related to landfill investigations, risk assessments, solid waste management, GHG/air regulatory compliance, hazardous waste management, hazardous substance site investigation and remediation, as well as other environmental issues.

Landfill

Environmental Monitoring and Post-Closure Care for Cal-Compact Landfill, Carson, CA (SWIS # 19-AQ-0012). This 157-acre site was a former hazardous waste landfill, currently being considered for redevelopment, and currently is under the oversight of the Department of Toxic Substances Control (DTSC). Project tasks included overall site management, including regulatory liaison on behalf of site owners, landfill gas (LFG) monitoring and assessment, LFG system operation and maintenance (O&M), groundwater sampling and analysis, cover maintenance and repair, site security, storm water sampling/analysis and inspections, LFG engineering, design of methane protection systems, and site development assistance.

CalRecycle, LFG Monitoring Well Functionality for 20 Landfills, CA. Under contract with CalRecycle (formerly CIWMB), Mr. Huff developed the approach and implemented a functionality assessment of 200 LFG monitoring probes at 20 landfills located throughout California. The functionality assessment entailed an initial condition assessment, gas monitoring, vacuum testing, video borescope inspection, and lithologic evaluation of each probe included in the study. The results of this study were presented to the CIWMB and utilized to develop the CIWMB's probe construction best management practices (BMPs).

LFG Engineering and O&M for Confidential Landfill, MO. The site was a former rock quarry located in Eastern Missouri, which at the time was undergoing an elevated temperature reaction within the waste mass. The scope of work included ongoing O&M of the existing gas collection and control system (GCCS), as well as data analysis and reporting to state and federal regulatory agencies. Mr. Huff was the SCS Team Lead for the project, coordinating activities between state, federal, and local regulatory agencies and public interest groups, and preparing high-level reports for site owners to better understand the extent and financial impact of the reaction.

LFG Assessment, Cover Maintenance, and Monitoring for Cogen Kramer Landfill, Los Angeles, CA (SWIS # 19-AA-0581). The site is located adjacent to residential development and two Los Angeles County correctional facilities. Project tasks included an assessment and emergency cover repair associated with a subsurface combustion event, LFG migration assessment, and preparation of an LFG and cover assessment work plan for installation of LFG migration probes and ongoing cover maintenance. The project included regulatory liaison with the Los Angeles County Law Enforcement Agency (LEA), CalRecycle, EPA, and South Coast Air Quality Management District (SCAQMD). In addition, methane monitoring was conducted associated with the use of one of the closed jail facilities for TV and movie productions.

Investigation and Remediation for Former Landfill, Long Beach, CA (SWIS # 19-AK-5018). Mr. Huff was Project Manager for the investigation of potential contamination derived from the landfill site adjacent to the Long Beach Memorial Medical Center. The area was the site of an expansion of the hospital and included oil field wastes and municipal waste disposal. Investigations included soil and soil vapor analyses in addition to an evaluation of the lateral and vertical extent of waste disposal. Project activities also included the excavation and removal of contaminated material and California Environmental Quality Act (CEQA) support during development of the hospital expansion.

Landfill Investigation, LFG Engineering, Human Health Risk Evaluation and Impact Assessment, Proposed Residential Developments for Site Adjacent to the Otay Landfill, Chula Vista, CA (SWIS # 37-AA-0010). Project activities at the site included an evaluation of LFG migration, LFG engineering and testing, air quality permitting and compliance, soil and LFG sampling and analysis, human health risk assessment (HHRA) and nuisance/odor evaluation, CEQA assistance, O&M of the LFG collection and control system, and other landfill engineering and construction services. The risk

assessment and odor/nuisance analysis was completed to support residential development adjacent to the landfill.

HHRA Evaluation and Impact Assessment for Proposed Commercial Developments for Site Adjacent to BKK Landfill, West Covina, California (SWIS # 19-AF-0001). The BKK site included two landfills: one municipal solid waste landfill and one hazardous waste site, which were under the oversight of the DTSC. Mr. Huff completed various investigations and data reviews/analyses of soil, surface water, groundwater, LFG, and air quality. The data were used for the completion of an HHRA in support of the CEQA process for a proposed golf course and business park development on the Class III landfill.

Investigation, Risk Assessment, and Remediation Feasibility Study for Mission Bay Landfill, San Diego, CA (SWIS # 37-AA-0026). Mr. Huff developed the LFG sampling portion of the site assessment work plan for the former landfill site, which is located next to a river, bay, and amusement park and is used heavily for recreational purposes. The field investigations were followed by a risk assessment, and, given the highly visible and public nature of the landfill project, focus on risk communication was the primary importance. Ultimately, several candidate risk-based remediation methods applicable to the site were identified with typical costs associated with each method. The project included interface with the San Diego County Air Pollution Control District (SDAPCD), Regional Water Quality Control Board (RWQCB), Solid Waste Local Enforcement Agency (LEA), and DTSC.

County of Monterey, Salinas Valley Solid Waste Authority (SVSWA) Air Quality Impact Assessment (AQIA), HHRA, and CEQA Assistance for Regional Landfill Project, CA. Regional air quality impacts, including an HHRA, were evaluated as part of an EIR for 4 different combinations of the expansion of 3 regional landfills and the placement of 10 regional transfer stations throughout the Salinas Valley. One of the landfills contained hazardous waste, including burn ash, which had to be evaluated for potential health risks. The risk assessments included an evaluation of risks from diesel exhaust from mobile equipment and vehicles.

Landfill Investigation, Regulatory Compliance, and LFG Engineering Activities for Upland Sanitary Landfill, Upland, CA (SWIS # 36-AA-0005). Project activities at the site included design and installation of a perimeter probe migration monitoring system, LFG collection and control system evaluation and engineering, air emissions sampling and analysis, and development of alternative regulatory compliance plans under SCAQMD Rule 1150.1, including regulatory liaison with California Integrated Waste Management Board (CIWMB) closed, illegal, and abandoned (CIA) staff.

Landfill Gas Assessment, Cover Maintenance, and Monitoring for Lane Road Disposal, Irvine, CA (SWIS # 30-CR-0063). The site is located adjacent to residential development and had been redeveloped into a golf course. Project tasks included LFG assessment, methane testing in nearby homes, installation of LFG migration probes, cover repair and ongoing cover maintenance, preparation of LFG assessment and cover maintenance plan, design and installation of LFG collection and control system to prevent migration onto residential properties, and regulatory liaison with the Orange County LEA, Santa Ana Regional Water Quality Control Board (SARWQCB), Orange County Integrated Waste Management Department (OCIWMD), CIWMB, and SCAQMD.

Environmental Investigations and Risk Assessment for Former BKK Main Street Landfill, West Covina, CA (SWIS # 19-AQ-0014). The landfill was a closed site that received both hazardous and nonhazardous wastes; at the time, it was occupied by two golf courses and additional commercial and residential developments and was considered for redevelopment. The project work at the facility had included completion of soil vapor extraction (SVE) surveys, installation and monitoring of LFG migration probes, LFG sampling/analysis, oversight of cover and subsurface soil and groundwater

sampling, completion of an HHRA, CEQA assistance, and negotiations with regulatory agencies. The site was considered for listing on the National Priorities List (NPL) as a potential Superfund site. Oversight of the landfill was provided by EPA Region IX, DTSC, and the Los Angeles County landfill LEA.

Landfill Investigation and Human Health Risk Evaluation/Impact Assessment for Proposed Residential Development Adjacent to a Landfill, Union City, CA. The project included completion of various soil, LFG, and groundwater investigations, and development of two risk assessments to support the development of residences adjacent to the landfill, as well as clean closure of a portion of the site for additional residential development on site. SCS also provided CEQA assistance for the proposed developments.

New Source Performance Standard (NSPS) LFG Sampling and Analysis for Multiple Landfills, Kern County, CA. For this project, Mr. Huff conducted NSPS Tier 2 LFG sampling and analysis in accordance with federal NSPS regulations at four landfills in Kern County. He performed field investigations in 1998 and resampled three of the four landfills in 2003 in accordance with federal resampling procedures set forth in NSPS regulations. In addition to conducting the field investigations, Mr. Huff completed statistical analyses of raw analytical data, and authored the final data reports submitted to the EPA.

HHRA

HHRA for Proposed Residential Development at Former Crude Oil Tank Farm, Norwalk, CA. For this project, Mr. Huff performed an assessment that included an HHRA and an evaluation of the potential human health impacts associated with a neighboring crude oil storage facility to support residential redevelopment of the site. The risk assessment included evaluation of a disposal area for oil field wastes, and was performed as part of the CEQA process for site redevelopment.

Environmental Investigations and Risk Assessment for Former Landfill, Los Angeles County, CA. This landfill was a closed site that received both hazardous and nonhazardous wastes; at the time, it was occupied by two golf courses and additional commercial and residential developments and was considered for redevelopment. Project work included completion of SVE surveys, installation and monitoring of LFG migration probes, LFG sampling/analysis, oversight of cover and subsurface soil and groundwater sampling, completion of an HHRA, CEQA assistance, and negotiations with regulatory agencies. The site was considered for listing on the NPL as a potential Superfund site. Oversight of the landfill was provided by EPA Region IX, DTSC, and the Los Angeles County landfill LEA.

Creation of Baseline HHRA and Ecological Risk Assessment for Former Rocket Manufacturing Facility, Van Nuys, CA. The facility was undergoing site mitigation under RCRA. Contaminants at the site included heavy metals, pesticides, PCBs, hydrazine, and VOCs. The ecological risk assessment included terrestrial ecosystems.

Investigation of Former Oil Refinery, Central CA. As Key Field Geologist, Mr. Huff conducted remedial excavations of lead-impacted soils, in addition to planning, scheduling, and coordinating quarterly sampling of 73 multi-aquifer groundwater monitoring wells located in and around the site. He also designed and installed 16 groundwater monitoring wells located in 3 different aquifers for contaminant plume tracking and remediation, and compiled data and prepared reports for submittal to the regulatory agency.

Creation of Baseline HHRA and Ecological Risk Assessment for Former Electronics Manufacturing Facility, Los Angeles, CA. Contaminants at the site included chlorinated solvents. The ecological risk assessment included terrestrial ecosystems.

HHRA and Impact Assessment for Proposed Commercial Developments Adjacent to Former Hazardous Waste Landfill, Southern CA. The site contained two landfills, one municipal solid waste landfill and one hazardous waste site, which were under the oversight of the DTSC. Mr. Huff completed various investigations and data reviews/analyses of soil, surface water, groundwater, LFG, and air quality. The data were used for the completion of an HHRA in support of the CEQA process for a proposed golf course and business park development on the Class III landfill.

Remedial Oversight for Cleanup of Former Petroleum Refinery and State Superfund Site, Southern CA. As Key Field Geologist, Mr. Huff provided remedial oversight for cleanup of more than 1,000,000 cubic yards of contaminated soils excavated for on-site treatment using bioremediation and vapor extraction.

Investigation, Risk Assessment, and Remediation Feasibility Study for Former Landfill, San Diego County, CA. Mr. Huff developed the LFG sampling portion of the site assessment work plan for the former landfill site, which was located next to a river, bay, and amusement park and was used heavily for recreational purposes. The field investigations were followed by a risk assessment, and, given the highly visible and public nature of the landfill project, focus on risk communication was the primary importance. Ultimately, several candidate risk-based remediation methods applicable to the site were identified with typical costs associated with each method. The project included interface with multiple regulatory agencies. Site investigative activities included preparation of work plans, conducting soil gas surveys, installation of soil borings and subsequent sampling, evaluation of applicable remedial alternatives, and assessment of hydrocarbon contaminant plumes from a variety of sources, including leaking underground storage tanks (USTs), aerospace facilities, and former petroleum refineries.

Kern County Waste Management Department, GHG Emissions Inventory of Creditable GHG Reductions. Mr. Huff performed GHG emission inventory services of creditable GHG reductions.

City of Fresno Wastewater Treatment Plant (WWTP), AB32 Mandatory Reporting, Fresno, CA. Mr. Huff assisted in the completion of AB32 Mandatory reporting for the WWTP, and six active landfills for Waste Management, Inc.

GHG Inventory and CAR Reporting, CA. Mr. Huff completed GHG inventory for Los Angeles County, City of Carlsbad, CA, and Republic Services, Inc.

Specialized GHG Inventory Calculations. Mr. Huff assisted in the completion of multi-year specialized GHG inventory calculations for landfill emissions (carbon dioxide and methane) for Waste Management.

GHG Inventory Consulting. Mr. Huff provided GHG inventory consulting for the Los Angeles County and City of Carlsbad GHG Inventory Consulting.

S**oftware Testing and Evaluation.** Mr. Huff provided software testing and evaluation of the Climate Action Reserve emissions tracking and trading software.

Expert Testimony

2013 – Mr. Huff was an expert witness in regard to GHG credit dispute for confidential client. His work included rebuttal of plaintiff expert opinions, including deposition, arbitration testimony, and open-court testimony.

2015 – Mr. Huff was an expert witness in regard to LFG monitoring data interpretation for confidential client within state court. His work included preparation of exhibits and affidavits used for rebuttal of plaintiff expert witnesses.

Storm Water

Mr. Huff has been involved in numerous projects related to compliance with water and wastewater discharge limitations, including storm water and wastewater compliance sampling and discharge monitoring. His expertise allowed him to be the Lead Staff personnel on a variety of projects related to water quality, storm water, and wastewater, as well as additional environmental issues. He has participated in the following projects and studies:

- Engineering design, design review, and construction management for industrial wastewater pretreatment systems at industrial and commercial facilities.
- Pollutant loading and flow rate assessments for wastewater conveyance systems at industrial facilities.
- Development of wastewater sampling manuals and training of industrial facility personnel in proper sampling techniques.
- Installation, monitoring, and sampling of well systems to determine surface infiltration rates and the presence and nature of subsurface contaminants in groundwater.
- Performance of regulatory compliance audits, facility permitting, and interface with local, state, and federal agencies to ensure compliance with all applicable rules and environmental regulations.

Groundwater

Mr. Huff has a background in geology and paleontology. Since joining SCS, he has been involved in numerous projects related to investigation of sites with contaminated soil and groundwater.

His participation includes:

- Key Field Geologist in remedial oversight for cleanup of a state Superfund site located in Southern California. More than 1,000,000 cubic yards of contaminated soils were excavated for on-site treatment using bioremediation and vapor extraction.

- Planning and direction of field investigations of hazardous waste sites to identify and characterize contaminants in soil and groundwater.

- Assessment of hydrocarbon contaminant plumes from a variety of sources, including leaking underground storage tanks (LUSTs) and former petroleum refineries.

- Site investigative activities, including preparation of work plans, conducting soil gas surveys, installation of soil borings and subsequent sampling, and evaluation of applicable remedial alternatives.

- Installation, monitoring, and sampling of well systems to determine the presence and nature of subsurface contaminants in groundwater.

- In-field design and installation of vapor extraction systems for the remediation of volatile contaminants in subsurface soils.

- Preparation of health and safety (H&S) plans submitted for regulatory approval. This includes hazardous waste characterizations, emergency response planning, establishing site operating procedures, and field implementation of H&S plans.

- Preconveyance environmental assessments of properties prior to real estate transfer. The projects consist of evaluating past on-site operations, identifying potentially contaminated sites, record searches of files maintained by regulatory agencies, and collection and analysis of groundwater quality information, where applicable.

Additional Project Experience

- In-field design and installation of SVE systems for the remediation of volatile contaminants in subsurface soils.

- Planning and direction of field investigations of numerous hazardous waste sites to identify and characterize contaminants in soil and groundwater.

- Preparation of H&S plans submitted for regulatory approval. This includes hazardous waste characterizations, emergency response planning, establishing site operating procedures, and field implementation of health and safety plans.

- Preconveyance environmental assessments of properties prior to real estate transfer. The projects consist of evaluating past on-site operations, identifying potentially contaminated sites, record searches of files maintained by regulatory agencies, and collection and analysis of groundwater quality information, where applicable.

Mr. Huff is skilled in management information systems (MIS), database design, programming, and computer modeling. He is responsible for the collection, conversion, manipulation, and management of data used in risk assessments, groundwater and vadose zone migration, and water fate and transport modeling, and for designing and developing maps, cross-sections, and 3-D visualizations of surface and subsurface environments.

He also has performed project and financial management for internal and external projects using business practices and project management skills acquired during completion of his Master's degree in Business Administration.

Prior to joining SCS, Mr. Huff was affiliated with Green & Associates, an environmental consulting firm that provided services such as Phase I environmental site assessments (ESAs), asbestos assessments, and evaluation of core samples for paleontological purposes for major oil companies.

PATRICK S. SULLIVAN, BCES, CPP, REPA

Education

BA – Harvard University, Biology/Ecology, 1989

Professional License/Certifications

Board Certified Environmental Scientist, No. 15-ES009, American Academy of Environmental Engineers & Scientists (AAEES)
South Coast Air Quality Management District (SCAQMD), Certified Permitting Professional (No. A-1716)
Registered Environmental Property Assessor, No. 519692, National Registry of Environmental Professionals (NREP)
Approved Lead Verifier under California Air Resources Board (CARB) AB 32 Greenhouse Gas (GHG) Program, Executive Order H-18-152

Professional Affiliations

Solid Waste Association of North America (SWANA); Past Director, Landfill Gas (LFG)/Biogas Division
Air and Waste Management Association (AWMA); Chairman, Mother Lode Chapter
U.S. Composting Council
Waste Industry Air Coalition (WIAC); Co-Chairman
California Biomass Collaborative; Executive Board
Solid Waste Industry for Climate Solutions (SWICS), Co-Chairman
Research Associate, Columbia University, Earth Engineering Center for Sustainable Waste Management
Solid Waste Industry Group in California
Technical Advisory Group; Cal Recycle, LFG
Technical Advisory Group, CARB, AB 32 Landfill Methane Rule
Society for Risk Analysis

Professional Awards

Certificate of Excellence, Publication of over 100 Articles and Presentation, SCS Engineers (SCS), 2015
Distinguished Service Award, National Solid Waste Management Association (NSWMA, now National Waste and Recycling Association, NWRA), 2009
Hall of Flame, SWANA, LFG/Biogas Division, 2007
Certificate of Achievement, Inspiring Leadership, SCS, 2007
Certificate of Appreciation, Speaker, Post-Closure Land Use Symposium, California Integrated Waste Management Board (CIWMB, now Cal Recycle), 2006

Professional Experience

Mr. Sullivan has over 29 years of experience in the area of environmental engineering, specializing in solid waste management and other environmental issues. He is the Managing Director of SCS's consulting and engineering operations within the Southwestern United States, the largest of SCS's engineering business units. He also serves as the Practice Leader for SCS's Solid Waste Practice in the same region. Mr. Sullivan is the National Expert for SCS's companywide Clean Air Act program. He also oversees SCS's company-wide GHG and Risk Assessment programs and is one of the national experts on air, GHG, risk assessment and toxic exposure issues for solid waste and industrial facilities. Mr. Sullivan is a company Senior Vice President and Member of the Company's Management Advisory Committee.

Mr. Sullivan is also Principal-in-Charge for projects related to air quality permitting and compliance, GHG emissions and climate change, California Environmental Quality Act (CEQA) technical evaluations, and facility investigation and risk assessment at solid waste and other industrial facilities, as well as related engineering services. Mr. Sullivan has been involved with the following practices and projects:

CEQA/NEPA Analyses

Examples of Mr. Sullivan's project work on CEQA and EIR projects are detailed below.

CEQA Air Quality Analysis and Toxics Risk Assessment, Proposed Expansion to Fink Road Landfill, Stanislaus County, CA. As part of an environmental impact report (EIR) for a proposed expansion to the Fink Road Landfill in Stanislaus County, CA, SCS completed an air toxics risk assessment, which evaluated the potential human health impacts due to current and future exposures from the project. The risk assessment was part of a larger air quality analysis completed for the expansion EIR. The analysis included an evaluation of health risk due to diesel exhaust from heavy equipment and refuse hauling vehicles at the landfill. As part of this project, SCS also researched the conversion of refuse hauling fleets to alternative fuels in order to generate ERCs for CEQA mitigation measures.

CEQA Air Quality Analysis and Toxics Risk Assessment, Salinas Valley Solid Waste Authority Landfill Project, Monterey County, CA. SCS completed air quality and risk assessment sections of a large EIR being prepared for long-term refuse collection and disposal options for the Salinas Valley Solid Waste Authority's Regional Landfill Project. The project included three landfills and 10 transfer stations, which were combined into four different project scenarios. The project included emissions estimates, air dispersion modeling, and risk calculations. The analysis included an evaluation of health risk due to diesel exhaust from heavy equipment and refuse hauling vehicles at the landfills and transfer stations, which were part of the project.

CEQA Mitigation Measures Development and Implementation for El Sobrante Landfill, Corona, CA. SCS was enlisted to develop a series of mitigation measures for fugitive dust emissions from landfill construction and operations at the El Sobrante Landfill in Corona, CA. SCS also developed an implementation plan for the CEQA Mitigation Monitoring and Reporting Program (MMRP), which was required as part of the approval of the EIR. SCS is currently doing ambient monitoring for particulate matter less than 10 microns (PM10) levels and working with the SCAQMD to develop a long-term strategy to reduce dust emissions.

CEQA Air Quality Analysis and Toxics Risk Assessment Proposed Expansion to Newby Island Sanitary Landfill, Santa Clara County, CA. As part of an EIR for a proposed expansion to the Newby

Island Sanitary Landfill in Santa Clara County, CA, SCS completed an air quality impact analysis that included a risk assessment evaluating the potential human health impacts due to current and future exposures to contaminants from the project. The risk assessment was part of a larger air quality analysis completed for the expansion EIR. The project included emissions estimates, air dispersion modeling, GHG evaluation, and risk calculations.

Air Quality Impact Assessment (AQIA) for Landfill Gas Engines, San Jose, CA. The project included an AQIA used in support of an Environmental Impact Report (EIR) and California Environmental Quality Act (CEQA) report. Mr. Sullivan evaluated all major emission sources at the site. The AQIA included modeling for a health risk assessment (HRA) to demonstrate National Ambient Air Quality Standards (NAAQS) compliance.

AQIA, Forward Landfill, Manteca, CA. The project included AQIA used in support of an EIR and CEQA report for a landfill expansion and various other landfill improvement projects. Mr. Sullivan evaluated all major emission sources at the site. He used model results to evaluate the HRA and NAAQS compliance.

AQIA, Fairmead Landfill, Madera, CA. The project included AQIA used in support of an EIR and CEQA report for a landfill expansion and composting facility. Mr. Sullivan evaluated all major emission sources at the site. He used model results to evaluate the HHRA and NAAQS compliance.

HRA and Nuisance Evaluation of Landfill, Otay, CA. Mr. Sullivan prepared an HRA and odor dispersion modeling, and evaluated potential nuisance impacts from a landfill on proposed residential development. The reports were used to seek CEQA approval.

HRA for Fitness Center, Sacramento, CA. Mr. Sullivan prepared an HHRA to quantify human health impacts from sources near a proposed fitness center in Sacramento, California. The sources evaluated included a major freeway and stationary sources.

Air Quality

Air Permitting and Compliance at Hazardous and Industrial Waste Landfills. This has included air permitting, compliance, and testing at BKK, BKK Main Street, Cal Compact, OII, Kettleman Hills, CSI, and Chemical Waste Management of the Northwest facilities.

Title V Permit Applications and Documentation for Industrial Facilities and Landfill Sites. Mr. Sullivan has been involved with over 200 Title V permitting projects, including Title V compliance reporting for over 100 facilities.

New Source Review (NSR)/Prevention of Significant Deterioration (PSD) Permit Applications and Documentation for Industrial Facilities and Landfill Sites. Mr. Sullivan has been involved with over 100 NSR/PSD projects for various types of industrial facilities. This includes permitting for over 30 landfill expansions, 15 composting projects, and various industrial and solid waste projects and facilities.

New Source Performance Standard (NSPS) Compliance Activities. Mr. Sullivan has overseen the completion of NSPS Tier 1 and 2 emission rate studies and reports, LFG collection and control system (GCCS) design plans, surface emission monitoring plans, and other documentation for over 200 landfills under the NSPS program, including compliance reporting for over 85 landfill sites. In addition, Mr. Sullivan has worked on NSPS compliance activities for various other sources, including boilers, incinerators, engines, turbines, etc.

National Emission Standards for Hazardous Air Pollutants (NESHAPs)/Maximum Achievable Control Technology (MACT) Compliance Activities. Mr. Sullivan has been involved with over 100 NESHAPs/MACT projects for various regulated sources, including development of Startup, Shutdown, and Malfunction (SSM) plans and various other compliance documents.

Development and Teaching of Training Courses for Air Quality Compliance at over 50 Seminars. Compliance and regulatory issues that have been taught included Title V, NSPS, NESHAPs/MACT, NSR/PSD, GHG reporting and permitting, and related state and local requirements.

Regulatory Advocacy for the Solid Waste Industry on the NSPS Rule, Title V Operating Permit Programs, NESHAPs rule, and other regulations, where landfills or other solid waste facilities are included as a regulated source. Mr. Sullivan has developed industry comments and negotiated with the agencies on behalf of the industry.

Air Sampling and Source Testing for Various Emitting Devices, including sampling for volatile organic compounds (VOCs), criteria pollutants, particulate heavy metals, and asbestos fibers. Completion of all air sampling associated with asbestos abatement. Oversight of source testing at over 100 landfill sites and development of a database of landfill source tests for use in the work of the WIAC.

Air Permitting. Mr. Sullivan has completed air permitting and compliance activities for the following types of industrial facilities:

- Solid waste incinerators.
- Hazardous waste treatment, storage, and disposal facilities (TSDFs)
- Biomass energy plants.
- MSW and industrial landfills.
- Recycling facilities and transfer stations.
- Composting facilities.
- LFG recovery plants.
- Chemical manufacturing facilities.
- Sand and gravel facilities.
- Site remediation projects.

Completed Landfill Air Quality Services in the Following States and Air Districts: Kern County APCD, SCAQMD, San Joaquin Valley Air Pollution Control District (APCD), Bay Area AQMD (BAAQMD), Sacramento Metropolitan AQMD, San Diego County APCD, Yolo-Solano AQMD, Feather River AQMD, Ventura County APCD, Santa Barbara County APCD, Shasta County APCD, Antelope Valley APCD, Mojave Desert AQMD, Placer County APCD, North Coast Unified AQMD, Butte County APCD, Monterey Bay Unified APCD, Lake County AQMD, and El Dorado County APCD. States of Nevada, Oregon, Washington, Hawaii, Arizona, Idaho, Montana, New Mexico, Colorado, Utah, Texas, Ohio, Pennsylvania, Florida, Arkansas, Illinois, Kansas, Virginia, Oklahoma, and several others.

Landfill Investigation and Risk Assessment

The following are examples of projects where Mr. Sullivan has worked on landfill investigation and/risk assessment projects.

Environmental Investigations and Risk Assessment at the Former BKK Main Street Landfill in Los Angeles County. This landfill is a closed site that may have received both hazardous and non-

hazardous wastes; it is currently occupied by two golf courses and other commercial and residential developments and is being considered for additional redevelopment. Project work at this facility has included completion of soil vapor surveys, installation and monitoring of LFG migration probes, LFG sampling/analysis, oversight of cover and subsurface soil and groundwater sampling, completion of a human health risk assessment, CEQA assistance, and negotiations with regulatory agencies. The site is currently being considered for listing on the National Priorities List (NPL) as a potential Superfund site. Oversight of the landfill is provided by EPA Region IX, Department of Toxic Substance Control (DTSC), and the Los Angeles County landfill local enforcement agency (LEA).

Environmental Monitoring and Post-closure Care, Cal-Compact Landfill, Carson, CA. The site is a former hazardous waste landfill that is being considered for redevelopment. The site is currently under the oversight of the DTSC. Project tasks have included LFG assessment, LFG engineering, design of methane protection systems, and development of an LFG monitoring program. In addition, Mr. Sullivan currently oversees the completion of post-closure care services at the site, including LFG monitoring, LFG system operations and maintenance (O&M), groundwater sampling and analysis, cover maintenance and repair, site security, storm water sampling/analysis and inspections, and regulatory liaison.

Human Health Risk Evaluation and Impact Assessment, Proposed Commercial Developments, On and Adjacent to the BKK Landfill Site, West Covina, CA. The BKK site includes two landfills: one municipal solid waste landfill and one hazardous waste site, which are under the oversight of DTSC. Mr. Sullivan provided oversight for the completion of various investigations and data reviews/analyses of soil, surface water, groundwater, LFG, and air quality. The data were used for the completion of a human health risk assessment in support of the CEQA process for a proposed golf course and business park development on the Class III landfill.

Burn Dump Investigation in San Joaquin County, CA. As part of this project, Mr. Sullivan provided technical oversight for investigations of a burn dump site, which included soil investigations, trenching investigations to determine extent of refuse, LFG migration assessment, waste sampling/analysis, hazardous waste determination, and other project tasks. The project site was slated for residential development; therefore, all project elements were completed in consideration for this type of development.

Investigation, Risk Assessment, and Remediation Kaiser Ventures, Inc., Facilities, Fontana, CA. For the former Kaiser Steel plant in Fontana, Remedial Investigation (RIs)/Feasibility Studies (FSs), Remedial Action Plans (RAPs), and Remedial Designs were prepared for three on-site operable units under DTSC's oversight. Mr. Sullivan was responsible for a number of individual soil, groundwater, surface water, and waste investigations at the Kaiser site, including treatability studies, risk assessments, RAPs, and hydrogeological studies, storm water pollution prevention plans, and spill prevention, control, and countermeasure (SPCC) plans. These projects included investigations of two landfill sites, with both hazardous and non-hazardous wastes, including soil, waste materials, hazardous waste, groundwater, and surface water issues. The site has been redeveloped into the California Speedway, a NASCAR race track.

Investigation, Risk Assessment, and Remediation Feasibility Study, Mission Bay Landfill, San Diego, CA. For this site, Mr. Sullivan managed a significant forensic investigation and site assessment of the former landfill site, which is located next to a river, bay, and amusement park and is used heavily for recreational purposes. This work has included investigations of extent of refuse, cover thickness, LFG composition and migration, soil, surface water, groundwater, and other environmental media associated with Mission Bay. The field investigations will be followed by a risk

assessment, and, given the highly visible and public nature of the landfill project, focus on risk communication will be of primary importance. Ultimately, several candidate risk-based remediation methods applicable to the site will be identified with typical costs associated with each method. This project included interface with the San Diego County APCD, RWQCB, LEA, and DTSC.

Landfill Engineering, LFG Migration Assistance, and Human Health Risk Assessment, Geer Road Landfill, Modesto, CA. Mr. Sullivan has managed and been involved with a variety of projects at the Geer Road site, including closure design and CQA services, cover repair, LFG engineering, air quality compliance, human health risk assessment, LFG system O&M, LFG and groundwater monitoring, as well as acted as an expert witness in defending the landfill against a citizen lawsuit. Project work was under the jurisdiction of the landfill LEA and RWQCB.

Greenhouse Gas

Mr. Sullivan has participated in the following landfill-related GHG verification projects while at SCS.

CAR GHG Project Reduction Services

Landfill Protocol

- Dalton-Whitfield Regional Solid Waste Management Authority
- L & D Landfill
- Larimer County Landfill Electric Generation Project
- Hay Road Landfill Feasibility Study
- Montana-Dakota Utilities Billings Landfill
- YSDI Landfill Feasibility Study Central Landfill, Citrus County, Florida
- Raleigh County Solid Waste Authority
- Pendleton County Landfill
- Eagle Point, Wolf Creek, and Stones Throw Landfills Project
- Organic Waste Composting Protocol
- American Organics OWC
- Grover Environmental Products
- Jepson Prairie Organics
- South Valley Organics

AB32 Mandatory Reporting. Completed State of California Mandatory GHG reporting under AB32 for the following general stationary combustion facilities:

- Altamont Landfill
- Bradley Landfill
- CalEnergy Geothermal Plants
- City of Fresno Wastewater Treatment Plant
- El Sobrante Landfill
- G2 Ostrom Road
- Kirby Canyon Landfill
- Mid-Valley Landfill
- Penrose Landfill Gas Conversion, LLC
- Redwood Landfill
- San Bernardino County Solid Waste Mgmt. - MVSL
- Simi Valley Landfill
- Sunnyvale WWTP
- Toyon Landfill Gas Conversion, LLC

Other GHG experience for Mr. Sullivan is detailed below:

GHG Emissions Inventory and Verification of Creditable GHG Reductions. Performed GHG emissions inventory services, verification of creditable GHG reductions, and development of GHG management plan under CEQA for Kern County Waste Management Department, California. Mr. Sullivan has additionally conducted air emissions estimates, air permitting, risk assessment, and CEQA air impact analyses for Kern County landfills and other solid waste facilities.

GHG Compliance for Landfills. Completed GHG compliance services for over 100 landfills related to the AB32 mandatory reporting rule, AB32 landfill methane rule, and federal “Tailoring” rule for GHG.

U.S. EPA GHG Reporting Rule. Management and oversight for over 500 U.S. EPA GHG mandatory reporting rule projects for landfills and industrial facilities.

SWICS Group. Involvement with the leadership of the SWICS group. As part of this effort, Mr. Sullivan has developed protocols for landfill GHG emission estimates and led SWICS advocacy efforts on the proposed AB32 early action rule for landfills, cap and trade, as well as the AB32 and federal GHG mandatory reporting rules.

Private Waste Company GHG Consulting. Provided GHG consulting for all of the major private waste management companies, including Waste Management, Republic Services, Waste Connections, and others.

Development of GHG Guidance Document. Developed the guidance document titled, "Technologies and Management Options for Reducing Greenhouse Gas Emissions from Landfills," under contract to the California Integrated Waste Management Board (CIWMB).

Publications and Presentations

Mr. Sullivan has published 144 articles. Below are his recent published pieces in the last 5 years:

Sullivan, Patrick S., and Drotman, Cassandra, Tier 4 Surface Emissions Monitoring Process and Issues, Publication in the Proceedings for the A&WMA's 111th Annual Conference & Exhibition, Hartford, Connecticut, June 2018.

Sullivan, Patrick S., Regulatory Update: Alternatives to Daily Soil Cover from an Emissions Standpoint, Presentation at SWANA Western Regional Symposium, Palm Springs, California, May 2018.

RESUME

FRANK J. HUBACH

Frank J. Hubach, President of FHA, has over twenty years experience in noise and vibration control for advanced technology, industrial and commercial projects. Design and testing of facilities where micro-vibration is of great concern for metrology and lithography has been his focus. Projects range from comprehensive campus master planning to remodeling in the private, public and institutional sectors. Structural dynamics and mechanical systems for cleanrooms and laboratories have been the specialty. His musical and audio engineering background also makes him well suited for acoustic design of critical listening rooms for recording, broadcast and performance.

Mr. Hubach has over thirty years experience in construction, electronics and audio engineering. He is considered a leading authority on noise and vibration control for microelectronics manufacturing. Mr. Hubach has published several papers and been a speaker at numerous conferences and seminars. He has given expert witness testimony in state and federal courts for acoustic forensics, noise control and construction.

EDUCATION

1971 Bachelor of Engineering Electrical Engineering	New York University Bronx, NY
1970 to 1972 Coursework Graduate Studies in Acoustics and Electronics	New York University Bronx, NY

PROFESSIONAL HISTORY

1984 to Present President	Frank Hubach Associates, Inc. Richmond, CA
1978 to 1984 Associate/V.P./Treas./President	Acoustical Consultants, Inc. San Francisco, CA
1975 to 1978 President/Owner/Audio Engineer	Pacific Application Systems Mill Valley, CA
1974 to 1975 V.P./Commercial Contractors	American Wall Systems, Inc. Middletown, NY
1971 to 1974 Recording Engineer	Record Plant Recording/Freelance New York, NY

Frank J. Hubach - Expert Witness Experience

2009 Thornton v. Haugh, Superior Court, San Francisco County. Residential acoustical privacy case. Conducted acoustical tests of sound transmission loss at residence as related to noise code and advised counsel. (case settled)

2007 Bendahan v. Dovichi, Superior Court, Sacramento County. Residential noise nuisance case. Conducted acoustical tests of air-conditioning equipment at residence as related to noise code and advised counsel. (case settled)

2007 500 Bryant Street HOA v. 500 Bryant Street Partners, Superior Court, San Francisco County. Conducted acoustical tests in condominiums and analyzed data related to traffic noise control and California Building Code. Made recommendations to counsel and participated in Joint Expert Meeting. (case settled)

2007 Paseo Plaza Homeowners' Assoc. v. SFC Block 4 Residential Associates, et al, Superior Court, Santa Clara County. Reviewed acoustical tests, construction documents and depositions of other experts. Gave deposition related to urban noise control for condominiums and California Building Code. (case settled)

2006 Smolich v. Meritage Homes and Sierra Pacific Industries v. Meritage Homes, Superior Court, Placer County. Reviewed test reports and conducted acoustical test related to City of Lincoln Conditions of Use for industrial noise and residential subdivision adjacency. Conducted noise mitigation analyses and offered design solutions. Provided extensive consultation to counsel and participated in acousticians meeting. (case pending)

2006 Lyle v. Bogavich, Superior Court, Sacramento County. Residential noise nuisance case. Conducted acoustical tests of wood working tools at residence as related to noise code.

2003 Seagate Technology LLC and CH2M Hill Industrial Design Corporation and Tasso Katselas Associates, Pittsburgh, PA. Reviewed construction documents, test reports and design reports relative to excessive vibration, structural dynamics and mechanical equipment vibration control for sensitive electronics cleanroom. Supervised independent design analyses using Finite Element Analyses. Provided consultation to counsel regarding industry standards, design criteria and procedures, and potential for mitigation.

2001 Retained by counsel for pre-filing investigation. Conducted acoustical tests of interior noise at residence in San Jose, California. Civil case regarding construction deficiency and noise code.

Frank J. Hubach
Expert Witness Experience

2001 Retained by counsel for pre-filing investigation. Conducted acoustical tests of interior noise at residence in Oakland, California. Civil case regarding mechanical equipment noise control and industry standards.

2000 OC America Construction, Inc. v. KCH Services, Inc., Superior Court, State of Washington. Reviewed acoustical tests, construction documents and depositions. Gave deposition in arbitration proceedings for construction litigation regarding specifications for noise control of large industrial exhaust systems.

1999 Kidd v. City of Fairfield, et al, United States District Court, Eastern District of California. Reviewed depositions and investigated crime site regarding speech intelligibility during incident. Provided consultation to counsel.

1997 Orlando v. Robbins, Superior Court, San Francisco County. Conducted acoustical tests in apartment and analyzed data related to noise ordinance. Consulted with counsel before and during deposition of acoustical expert.

1993 Lakeside v. State of California, Superior Court, Alameda County. Conducted acoustical tests regarding noise impact to residences from proposed CalTrans freeway construction. Gave deposition.

1991 Retained as expert in Municipal Court, San Francisco. Conducted acoustical tests and testified in Civil case regarding nightclub noise and noise ordinance.

1989 Retained as expert in Municipal Court, Berkeley, CA. Conducted acoustical tests. Civil case regarding acoustical privacy, neighbor's noise and noise ordinance.

1983, 1987 Retained as expert by Alameda County Public Defender. Conducted acoustical tests at crime scene. Criminal case regarding speech intelligibility at crime scene.

1986 Retained as expert in Superior Court, Marin County. Criminal case regarding acoustical privacy and intelligibility in courtroom between counsel and handcuffed client in murder case (shackles motion). Advised counsel regarding acoustical standards and test methodologies.

Frank J. Hubach
Expert Witness Experience

1984 Stephens v. Stephens, Superior Court, Marin County. Conducted acoustical tests at crime scene. Criminal case regarding speech intelligibility at crime scene.

1982 "Wrongful Death Case" v. Richmond Police ("Richmond Cowboys"), Federal Court, San Francisco. Retained as expert in high profile case. Conducted objective and subjective acoustical tests and recreated crime scene. Provided extensive court room testimony regarding speech intelligibility at crime scene.

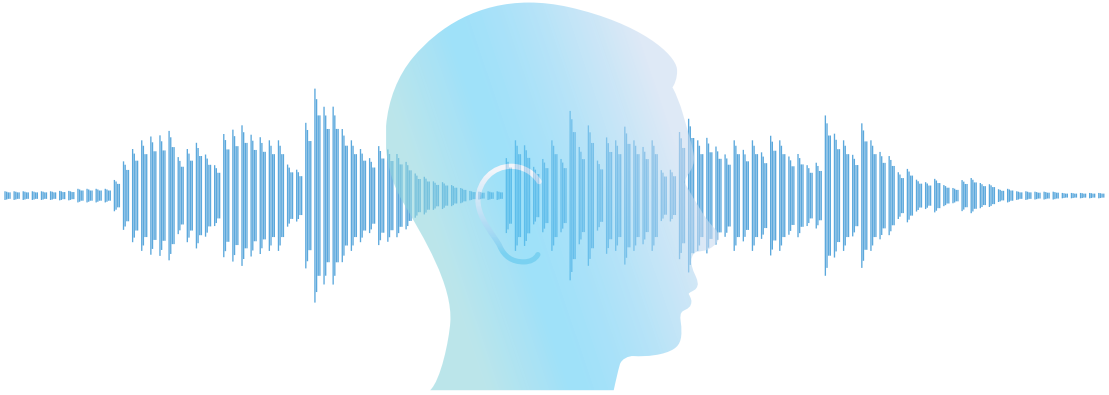
ENVIRONMENTAL NOISE GUIDELINES

for the European Region



Abstract

Noise is an important public health issue. It has negative impacts on human health and well-being and is a growing concern. The WHO Regional Office for Europe has developed these guidelines, based on the growing understanding of these health impacts of exposure to environmental noise. The main purpose of these guidelines is to provide recommendations for protecting human health from exposure to environmental noise originating from various sources: transportation (road traffic, railway and aircraft) noise, wind turbine noise and leisure noise. They provide robust public health advice underpinned by evidence, which is essential to drive policy action that will protect communities from the adverse effects of noise. The guidelines are published by the WHO Regional Office for Europe. In terms of their health implications, the recommended exposure levels can be considered applicable in other regions and suitable for a global audience.

Foreword

Noise is one of the most important environmental risks to health and continues to be a growing concern among policy-makers and the public alike. Based on the assessment threshold specified in the Environmental Noise Directive of the European Union (EU), at least 100 million people in the EU are affected by road traffic noise, and in western Europe alone at least 1.6 million healthy years of life are lost as a result of road traffic noise.

At the request of Member States at the Fifth Ministerial Conference on Environment and Health in Parma, Italy, in March 2010, the WHO Regional Office for Europe has developed these guidelines, based on the growing understanding of the health impacts of exposure to environmental noise. They provide robust public health advice, which is essential to drive policy action that will protect communities from the adverse effects of noise.

These WHO guidelines – the first of their kind globally – provide recommendations for protecting human health from exposure to environmental noise originating from various sources. They not only offer robust public health advice but also serve as a solid basis for future updates, given the growing recognition of the problem and the rapid advances in research on the health impacts of noise. The comprehensive process of developing the guidelines has followed a rigorous methodology; their recommendations are based on systematic reviews of evidence that consider more health outcomes of noise exposure than ever before. Through their potential to influence urban, transport and energy policies, these guidelines contribute to the 2030 Agenda for Sustainable Development and support WHO's vision of creating resilient communities and supportive environments in the European Region.

Following the publication of WHO's community noise guidelines in 1999 and night noise guidelines for Europe in 2009, these latest guidelines represent the next evolutionary step, taking advantage of the growing diversity and quality standards in this research domain. Comprehensive and robust, and underpinned by evidence, they will serve as a sound basis for action. While these guidelines focus on the WHO European Region and provide policy guidance to Member States that is compatible with the noise indicators used in the EU's Environmental Noise Directive, they still have global relevance. Indeed, a large body of the evidence underpinning the recommendations was derived not only from noise effect studies in Europe but also from research in other parts of the world – mainly in Asia, Australia and the United States of America.

I am proud to present these guidelines as another leading example of the normative work undertaken in our Region in the area of environment and health. On behalf of the WHO Regional Office for Europe and our European Centre for Environment and Health in Bonn, Germany, which coordinated the development of the guidelines, I would like to express my gratitude to the large network of experts, partners, colleagues and consultants who have contributed to this excellent publication. I would also like to thank Switzerland and Germany for providing financial support to this complex project, and look forward to following the influence of the guidelines on policy and research in the years to come.

Dr Zsuzsanna Jakab

WHO Regional Director for Europe

Acknowledgements

The WHO Regional Office for Europe thanks all members of the Steering Group, Guideline Development Group, Systematic Review Team and External Review Group for their invaluable contributions in the guidelines development process.

The WHO Regional Office for Europe, through its European Centre for Environment and Health, coordinated the development of these guidelines. The project was coordinated by Marie-Eve Héroux and Dorota Jarosinska, under the overall supervision of Elizabet Paunovic, Head of the European Centre for Environment and Health.

The members of the Steering Group were: Shelly Chadha, Carlos Dora, Rokho Kim, Jurgita Lekaviciute, Srdan Matic, Julia Nowacki, Poonum Wilkhu and Joerdis Wothge (see Annex 1 Table A1.1 for affiliations).

The members of the Guideline Development Group were: Stephen Stansfeld (Chair), Wolfgang Babisch, Goran Belojevic, Mark Brink, Sabine Janssen, Peter Lercher (2013–2014), Marco Paviotti, Göran Pershagen, Kerstin Persson Waye, Anna Preis, Martin van den Berg and Jos Verbeek (methodologist) (see Annex 1 Table A1.2 for affiliations).

The Systematic Review Team comprised the following experts: Mathias Basner, Lex Brown, Charlotte Clark, Payam Dadvand, Maria Foraster, Rainer Guski, Sarah McGuire, Mark Nieuwenhuijsen, Katarina Paunovic, Göran Pershagen, Gordana Ristovska, Maribel Casas Sanahuja, Dirk Schreckenberg, Rudolf Schuemer, Mariola Sliwinska-Kowalska, Kamil Rafal Zaborowski, Irene Van Kamp and Elise van Kempen (see Annex 1 Table A1.3 for affiliations).

The project's External Review Group had the following members: Gunn Marit Aasvang, Bernard Berry, Dick Botteldooren, Stephen Conaty, Yvonne de Kluizenaar, Ulrike Gehring, Truls Gjestland, Mireille Guay, Ayse Güven, Anna Hansell, Stelios Kephalopoulos, David Michaud, Arnaud Norena, Enembe Okokon, Dieter Schwela, Daniel Shepherd, Mette Sörensen, Rupert Thornley-Taylor and David Welch (see Annex 1 Table A1.4 for affiliations).

The WHO Regional Office for Europe gratefully acknowledges funding and in-kind contributions from the Swiss Federal Office for the Environment; the German Federal Ministry for the Environment, Nature Conservation and Nuclear Safety; and the German Environment Agency for this activity.

PICOS	population, intervention, comparator, outcome and study [framework]
PLD	personal listening device
RANCH	Road traffic and aircraft noise exposure and children’s cognition and health [study]
RCT	randomized control trial
RR	relative risk
SCENIHR	Scientific Committee on Emerging and Newly Identified Hazards and Risk

Glossary of acoustic terms

A-weighting	A frequency-dependent correction that is applied to a measured or calculated sound of moderate intensity to mimic the varying sensitivity of the ear to sound for different frequencies
C-weighting	A frequency-dependent correction that is applied to a measured or calculated sound of moderate intensity to mimic the varying sensitivity of the ear to sound for different frequencies – C-weighting is usually used for peak measurements
FAST	Fast response has a time constant of 125 milliseconds on a sound level meter
$L_{Aeq,T}$	A-weighted, equivalent continuous sound pressure level during a stated time interval starting at t_1 and ending at t_2, expressed in decibels (dB), at a given point in space[1]
$L_{A,max}$	Maximum time-weighted and A-weighted sound pressure level within a stated time interval starting at t_1 and ending at t_2, expressed in dB[1]
L_{AF}	A-weighted sound pressure level with FAST time constant as specified in IEC 61672-1[1]
$L_{AF,max}$	Maximum time-weighted and A-weighted sound pressure level with FAST time constant within a stated time interval starting at t_1 and ending at t_2, expressed in dB
$L_{AS,max}$	Maximum time-weighted and A-weighted sound pressure level with SLOW time constant within a stated time interval starting at t_1 and ending at t_2, expressed in dB
L_E	Sound energy density level is the logarithmic ratio of the time-averaged sound energy per unit volume to the reference sound energy density Eo = 10-12 J/m^3.
$L_{ex,8h}$	L_{eq} (equivalent continuous sound level) corrected for the length of the working shift, in this case 8 hours
L_{day}	Equivalent continuous sound pressure level when the reference time interval is the day[1]
L_{den}	Day-evening-night-weighted sound pressure level as defined in section 3.6.4 of ISO 1996-1:2016[1]
L_{dn}	Day-night-weighted sound pressure level as defined in section 3.6.4 of ISO 1996-1:2016[1]
$L_{evening}$	Equivalent continuous sound pressure level when the reference time interval is the evening[1]

[1] *Source*: ISO (2016).

L_{night}	Equivalent continuous sound pressure level when the reference time interval is the night[1]
$L_{peak,C}$	Level of peak sound pressure with C-weighting, within a specified time interval
$L_{peak,lin}$	Level of peak sound pressure with linear frequency weighting, within a specified time interval
Sound pressure level	the logarithm of the ratio of a given sound pressure to the reference sound pressure in dB is 20 times the logarithm to the base ten of the ratio.
SLOW	Slow response has a time constant of 10 000 milliseconds on a sound level meter

Executive summary

Environmental noise is an important public health issue, featuring among the top environmental risks to health. It has negative impacts on human health and well-being and is a growing concern among both the general public and policy-makers in Europe.

At the Fifth Ministerial Conference on Environment and Health in Parma, Italy, in 2010, WHO was requested by the Member States in the European Region to produce noise guidelines that included not only transportation noise sources but also personal electronic devices, toys and wind turbines, which had not yet been considered in existing guidelines. Furthermore, European Union Directive 2002/49/EC relating to the assessment and management of environmental noise (END) and related technical guidance from the European Environment Agency both elaborated on the issue of environmental noise and the importance of up-to-date noise guidelines.

The WHO Regional Office for Europe has therefore developed environmental noise guidelines for the European Region, proposing an updated set of public health recommendations on exposure to environmental noise.

Objectives

The main purpose of these guidelines is to provide recommendations for protecting human health from exposure to environmental noise originating from various sources: transportation (road traffic, railway and aircraft) noise, wind turbine noise and leisure noise. Leisure noise in this context refers to all noise sources that people are exposed to due to leisure activities, such as attending nightclubs, pubs, fitness classes, live sporting events, concerts or live music venues and listening to loud music through personal listening devices. The guidelines focus on the WHO European Region and provide policy guidance to Member States that is compatible with the noise indicators used in the European Union's END.

The following two key questions identify the issues addressed by the guidelines.

- In the general population exposed to environmental noise, what is the exposure–response relationship between exposure to environmental noise (reported as various indicators) and the proportion of people with a validated measure of health outcome, when adjusted for confounders?
- In the general population exposed to environmental noise, are interventions effective in reducing exposure to and/or health outcomes from environmental noise?

In light of these questions, the guidelines set out to define recommended exposure levels for environmental noise in order to protect population health.

Methods used to develop the guidelines

The process of developing the WHO guidelines followed a rigorous methodology involving several groups with separate roles and responsibilities. Throughout the process, the Grading of

Recommendations Assessment, Development and Evaluation (GRADE) approach was followed. In particular, the different steps in the development of the guidelines included:

- formulation of the scope and key questions of the guidelines;
- review of the pertinent literature;
- selection of priority health outcome measures;
- a systematic review of the evidence;
- assessment of certainty of the bodies of evidence resulting from systematic reviews;
- identification of guideline exposure levels; and
- setting of the strength of recommendations.

Based on the defined scope and key questions, these guidelines reviewed the pertinent literature in order to incorporate significant research undertaken in the area of environmental noise and health since the community noise guidelines and night noise guidelines for Europe were issued (WHO, 1999; WHO Regional Office for Europe, 2009). In total, eight systematic reviews of evidence were conducted to assess the relationship between environmental noise and the following health outcomes: cardiovascular and metabolic effects; annoyance; effects on sleep; cognitive impairment; hearing impairment and tinnitus; adverse birth outcomes; and quality of life, mental health and well-being. A separate systematic review of evidence was conducted to assess the effectiveness of environmental noise interventions in reducing exposure and associated impacts on health.[2] Once identified and synthesized, the quality of the evidence of the systematic reviews was assessed by the Systematic Review Team. Subsequently, the Guideline Development Group (GDG) formulated recommendations, guided by the Systematic Review Team's assessment and informed by of a number of additional contextual parameters. To facilitate the formulation of recommendations, the GDG first defined priority health outcomes and then selected the most relevant health outcome measures for the outcomes. Consecutively, a process was developed to identify the guideline exposure levels with the help of the exposure–response functions provided by the systematic reviews. To reflect the nature of the research (observational studies) underpinning the relationship between environmental noise and health, the GRADE procedures were adapted to the requirements of environmental exposure studies where needed.

Noise indicators

From a scientific point of view, the best noise indicator is the one that performs best in predicting the effect of interest. There are, however, a number of additional criteria that may influence the choice of indicator. For example, various indicators might be suitable for different health end-points. Some considerations of a more political nature can be found in the European Commision's Position paper on EU noise indicators (EC, 2000).

[2] All systematic reviews are publicly available online in the *International Journal of Environmental Research and Public Health*. A detailed list of links to the individual reviews is provided in section 2.3.2 and in Annex 2 of these guidelines.

The current guidelines are intended to be suitable for policy-making in the WHO European Region. They therefore focus on the most used noise indicators L_{den} and/or L_{night} (see the glossary of acoustic terms for further details). They can be constructed using their components (L_{day}, $L_{evening}$, L_{night} and the duration in hours of L_{night}), and are provided for exposure at the most exposed façade, outdoors. The L_{den} and L_{night} indicators are those generally reported by authorities and are widely used for exposure assessment in health effect studies.

Recommendations

Specific recommendations have been formulated for road traffic noise, railway noise, aircraft noise, wind turbine noise and leisure noise. Recommendations are rated as either strong or conditional.

Strength of recommendation

- A **strong** recommendation can be adopted as policy in most situations. The guideline is based on the confidence that the desirable effects of adherence to the recommendation outweigh the undesirable consequences. The quality of evidence for a net benefit – combined with information about the values, preferences and resources – inform this recommendation, which should be implemented in most circumstances.
- A **conditional** recommendation requires a policy-making process with substantial debate and involvement of various stakeholders. There is less certainty of its efficacy owing to lower quality of evidence of a net benefit, opposing values and preferences of individuals and populations affected or the high resource implications of the recommendation, meaning there may be circumstances or settings in which it will not apply.

Alongside specific recommendations, several guiding principles were developed to provide generic advice and support for the incorporation of recommendations into a policy framework. They apply to the implementation of all of the specific recommendations.

Guiding principles: reduce, promote, coordinate and involve

- Reduce exposure to noise, while conserving quiet areas.
- Promote interventions to reduce exposure to noise and improve health.
- Coordinate approaches to control noise sources and other environmental health risks.
- Inform and involve communities potentially affected by a change in noise exposure.

The recommendations, source by source, are as follows.

Road traffic noise

Recommendation	Strength
For average noise exposure, the GDG strongly recommends reducing noise levels produced by road traffic below **53 decibels (dB)** L_{den}, as road traffic noise above this level is associated with adverse health effects.	Strong
For night noise exposure, the GDG strongly recommends reducing noise levels produced by road traffic during night time below **45 dB** L_{night}, as night-time road traffic noise above this level is associated with adverse effects on sleep.	Strong
To reduce health effects, the GDG strongly recommends that policy-makers implement suitable measures to reduce noise exposure from road traffic in the population exposed to levels above the guideline values for average and night noise exposure. For specific interventions, the GDG recommends reducing noise both at the source and on the route between the source and the affected population by changes in infrastructure.	Strong

Railway noise

Recommendation	Strength
For average noise exposure, the GDG strongly recommends reducing noise levels produced by railway traffic below **54 dB** L_{den}, as railway noise above this level is associated with adverse health effects.	Strong
For night noise exposure, the GDG strongly recommends reducing noise levels produced by railway traffic during night time below **44 dB** L_{night}, as night-time railway noise above this level is associated with adverse effects on sleep.	Strong
To reduce health effects, the GDG strongly recommends that policy-makers implement suitable measures to reduce noise exposure from railways in the population exposed to levels above the guideline values for average and night noise exposure. There is, however, insufficient evidence to recommend one type of intervention over another.	Strong

Aircraft noise

Recommendation	Strength
For average noise exposure, the GDG strongly recommends reducing noise levels produced by aircraft below **45 dB** L_{den}, as aircraft noise above this level is associated with adverse health effects.	Strong
For night noise exposure, the GDG strongly recommends reducing noise levels produced by aircraft during night time below **40 dB** L_{night}, as night-time aircraft noise above this level is associated with adverse effects on sleep.	Strong
To reduce health effects, the GDG strongly recommends that policy-makers implement suitable measures to reduce noise exposure from aircraft in the population exposed to levels above the guideline values for average and night noise exposure. For specific interventions the GDG recommends implementing suitable changes in infrastructure.	Strong

Wind turbine noise

Recommendation	Strength
For average noise exposure, the GDG conditionally recommends reducing noise levels produced by wind turbines below **45 dB** L_{den}, as wind turbine noise above this level is associated with adverse health effects.	Conditional
No recommendation is made for average night noise exposure L_{night} of wind turbines. The quality of evidence of night-time exposure to wind turbine noise is too low to allow a recommendation.	
To reduce health effects, the GDG conditionally recommends that policy-makers implement suitable measures to reduce noise exposure from wind turbines in the population exposed to levels above the guideline values for average noise exposure. No evidence is available, however, to facilitate the recommendation of one particular type of intervention over another.	Conditional

Leisure noise

Recommendation	Strength
For average noise exposure, the GDG conditionally recommends reducing the yearly average from all leisure noise sources combined to **70 dB** $L_{Aeq,24h}$ as leisure noise above this level is associated with adverse health effects. The equal energy principle[3] can be used to derive exposure limits for other time averages, which might be more practical in regulatory processes.	Conditional
For single-event and impulse noise exposures, the GDG conditionally recommends following existing guidelines and legal regulations to limit the risk of increases in hearing impairment from leisure noise in both children and adults.	Conditional
Following a precautionary approach, to reduce possible health effects, the GDG strongly recommends that policy-makers take action to prevent exposure above the guideline values for average noise and single-event and impulse noise exposures. This is particularly relevant as a large number of people may be exposed to and at risk of hearing impairment through the use of personal listening devices. There is insufficient evidence, however, to recommend one type of intervention over another.	Strong

Target audience

The guidelines are published by the WHO Regional Office for Europe. In terms of their health implications, the recommended exposure levels can be considered applicable in other regions and suitable for a global audience, as a large body of the evidence underpinning the recommendations was derived not only from European noise effect studies but also from research in other parts of the world – mainly in America, Asia and Australia.

[3] The equal energy principle states that the total effect of sound is proportional to the total amount of sound energy received by the ear, irrespective of the distribution of that energy in time (WHO, 1999).

1. Introduction

Environmental noise features among the top environmental risks to physical and mental health and well-being, with a substantial associated burden of disease in Europe (WHO Regional Office for Europe & JRC, 2011; Hänninen et al., 2014). It has negative impacts on human health and well-being and is a growing concern among both the general public and policy-makers in Europe.

WHO published community noise guidelines (CNG) and night noise guidelines (NNG) for Europe in 1999 and 2009, respectively (WHO, 1999; WHO Regional Office for Europe, 2009). Since then, significant new evidence has accumulated on the health effects of environmental noise.

The need for updated health-based guidelines originates in part from commitments made at the Fifth Ministerial Conference on Environment and Health in Parma, Italy, in 2010, where Member States asked WHO to produce appropriate noise guidelines that would include additional noise sources such as personal electronic devices, toys and wind turbines (WHO Regional Office for Europe, 2010). Furthermore, European Union (EU) Directive 2002/49/EC relating to the assessment and management of environmental noise (the END – EC, 2002a) and related technical guidance from the European Environment Agency (EEA) both elaborated on the issue of environmental noise and the importance of up-to-date noise guidelines (EEA, 2010).

The WHO Regional Office for Europe has therefore developed environmental noise guidelines for the European Region, proposing an updated set of public health recommendations on exposure to environmental noise. The main purpose of these guidelines is to provide recommendations for protecting human health from exposure to environmental noise originating from various sources: transportation (road traffic, railway and aircraft) noise, wind turbine noise and leisure noise. The guidelines focus on the WHO European Region and provide policy guidance to Member States that is compatible with the noise indicators used in the EU's END.

The following two key questions identify the issues addressed by the guidelines.

- In the general population exposed to environmental noise, what is the exposure–response relationship between exposure to environmental noise (reported as various indicators) and the proportion of people with a validated measure of health outcome, when adjusted for confounders?
- In the general population exposed to environmental noise, are interventions effective in reducing exposure to and/or health outcomes from environmental noise?

1.1 The public health burden from environmental noise

Exposure to noise can lead to auditory and nonauditory effects on health. Through direct injury to the auditory system, noise leads to auditory effects such as hearing loss and tinnitus. Noise is also a nonspecific stressor that has been shown to have an adverse effect on human health, especially following long-term exposure. These effects are the result of psychological and physiological distress, as well as a disturbance of the organism's homeostasis and increasing allostatic load (Basner et al., 2014). This is further outlined in the WHO narrative review of the biological mechanisms of nonauditory effects (Eriksson et al., 2018).

The evidence of the association between noise exposure and health effects is based on experimental work regarding biological plausibility and, in observational studies, consistency among study results, presence of an exposure–response relationship and the magnitude of the effect. Environmental noise risk assessment and risk management relies on established exposure–response relationships (Babisch, 2014).

In 2011 the WHO Regional Office for Europe and the European Commission (EC) Joint Research Centre (JRC) published a report on the burden of disease from environmental noise that quantified the healthy years of life lost in western Europeam countries as a result of environmental noise (WHO Regional Office for Europe & JRC, 2011). The burden of disease is calculated, in a single measure of disability-adjusted life-years (DALYs), as the sum of the years of life lost from premature mortality and the years lived with disability for people living with the disease or health condition or its consequences in the general population (WHO, 2014a).

Sufficient information was deemed available to quantify the burden of disease from environmental noise for cardiovascular disease, cognitive impairment in children, sleep disturbance, tinnitus and annoyance. The report, based on a limited set of data, estimated that DALYs lost from environmental noise in western European countries are equivalent to 61 000 years for ischaemic heart disease (IHD), 45 000 years for cognitive impairment in children, 903 000 years for sleep disturbance, 22 000 years for tinnitus and 654 000 years for annoyance (WHO Regional Office for Europe & JRC, 2011). These results indicate that at least one million healthy years of life are lost every year from traffic-related environmental noise in western Europe. Sleep disturbance and annoyance, mostly related to road traffic noise, constitute the bulk of this burden. Available assessments place the burden of disease from environmental noise as the second highest after air pollution (WHO Regional Office for Europe & JRC, 2011; Hänninen et al., 2014; WHO 2014b). However, a lack of noise exposure data in the central and eastern parts of the WHO European Region means that it is not possible to assess the burden of disease from environmental noise for the whole Region.

1.2 The environmental noise policy context in the EU

The EU has been working to develop a harmonized noise policy for more than two decades. 1993 saw the start of the EC's Fifth Environment Action Programme, which stated that "no person should be exposed to noise levels which endanger health and quality of life" (EC, 1993). This was followed by a Green Paper on future noise policy (EC, 1996), which reinforced the importance of noise as one of the main environmental problems in Europe and proposed a new framework for noise policy development.

The Sixth Environment Action Programme had as one of its objectives: "to achieve a quality of environment where the levels of man-made contaminants do not give rise to significant impacts on, or risks to, human health" (EC, 2002b). This paved the way for the Commission to adopt and implement the END in 2002 (EC, 2002a). The main aim of the Directive is "to define a common approach intended to avoid, prevent or reduce on a prioritized basis the harmful effects, including annoyance, due to exposure to environmental noise".

The END obliges the EC to adapt its Annexes I–III (I on noise indicators in addition to L_{den}[4] and L_{night}[5], II on noise assessment methods and III on methods for assessing harmful effects of noise) to technical and scientific progress. While work on revising Annex II was finalized in 2015 and common noise assessment methods were introduced (EC, 2015), revisions of Annex III to establish methods to assess the harmful effects of noise only started in 2015. Annex III would primarily define what exposure–response relationships should be used to assess the effect of noise on populations. EU Member States have already expressed the view that the recommendations from these environmental noise guidelines for the WHO European Region will guide the revision of Annex III. Beside this main directive, few other legislative documents cover different noise sources and other related issues in the EU (EEA, 2014: Annex I).

The Seventh Environment Action Programme, which guides European environment policy until 2020 (EC, 2014a), is committed to safeguarding the EU's citizens from environment-related risks to health by ensuring that by 2020 "noise pollution in the Union has significantly decreased, moving closer to WHO-recommended levels". A particular requirement for achieving this is "implementing an updated EU noise policy aligned with the latest scientific knowledge, and measures to reduce noise at source, and including improvements in city design".

In addition to the EU's END, several national governments also have legislation and/or limit values that apply at national and/or regional levels (WHO Regional Office for Europe, 2012). The EEA, through its European Topic Centre on Land Use and Spatial Information, gathers noise exposure data and maintains the Noise Observation and Information Service for Europe, based on strategic noise maps provided by Member States (EEA, 2018). A total of 33 EEA countries, in addition to six cooperating countries in south-eastern Europe, report information on noise exposure to the EEA, following the requirements of the END. The quality and availability of noise exposure assessment differs between EU and non-EU Member States where, even if noise legislation has been harmonized with the Directive, noise mapping and action plans are still at the planning stage (EEA, 2014; 2017a; WHO Regional Office for Europe, 2012).

1.2.1 Definition of indicators in the END

The END specifies a number of noise indicators to be applied by Member States in noise mapping and action planning. The most important are L_{den} and L_{night}.

The L_{den} indicator is an average sound pressure level over all days, evenings and nights in a year (EEA, 2010). This compound indicator was adopted by the EU in the END (EC, 2002a). The L_{den} in decibels (dB) is defined by a specific formula, where:

- L_{day} is the A-weighted long-term average sound level as defined in ISO 1996-1: 2016, determined over all the day periods of a year;
- $L_{evening}$ is the A-weighted long-term average sound level as defined in ISO 1996-1: 2016, determined over all the evening periods of a year; and
- L_{night} is the A-weighted long-term average sound level as defined in ISO 1996-1: 2016, determined over all the night periods of a year (ISO, 2016).

[4] Day-evening-night-weighted sound pressure level as defined in section 3.6.4 of ISO 1996-1:20161 (ISO, 2016).
[5] Equivalent continuous sound pressure level when the reference time interval is the night.

The L_{night}, according to the definition in the END, is an equivalent outdoor sound pressure level, measured at the most exposed façade, associated with a particular type of noise source during night time (at least eight hours), calculated over a period of a year (WHO Regional Office for Europe, 2009).

Annex I of the END gives technical definitions for L_{den} and L_{night}, as well as supplementary noise indicators, which might be useful for monitoring special noise situations. For example, in the case of noisy but short-lived noise like shooting noise or noise emitted by trains, $L_{A,max}$ is often used. This is a measure of the maximum sound pressure reached during a defined measurement period. It is used to set noise limits and is sometimes considered in studies to determine certain health effects (such as awakening reactions).

1.3 Perceptions of environmental noise in the WHO European Region

1.3.1 Trends at the regional level

The general population greatly values the benefits of clean and quiet environments. In Europe, people perceive noise as an important issue that affects human health and well-being (EC, 2008; 2014b). In recent years, several Europe-wide surveys have examined the perception of noise as an issue among the population. Overall, these surveys ask about generic noise, referring to "neighbourhood noise" or "noise from the street". This type of noise differs significantly in its definition from what is considered "environmental noise" in these guidelines. Nevertheless, in the absence of specific large surveys on perceptions of environmental noise as defined in these guidelines, the results provide insight into the public perception of this issue.

The European quality-of-life surveys, carried out every four years, are unique, pan-European surveys examining both the objective circumstances of lives of European citizens and how they feel about those circumstances and their lives in general. The last (fourth) survey was conducted in 2016–2017, involving nearly 37 000 citizens from all EU Member States and the five candidate countries (Albania, Montenegro, Serbia, the former Yugoslav Republic of Macedonia and Turkey). Respondents were asked whether they had major, moderate or no problems with noise in the immediate neighbourhood of their home. Almost one third (32%) reported problems with noise (ranging from 14% to 51% in individual countries), mainly in cities or city suburbs (49%) (Eurofound, 2017).

A 2010 survey of the then 27 countries in the EU, requested by the EC, showed that 80% of respondents (n = 26 602) believed that noise affects their health, either to some or to a great extent (EC, 2010).

A Eurobarometer report on attitudes of European citizens towards the environment (EC, 2014b) compiled opinions on various environmental risks from almost 28 000 respondents in 28 EU countries. Results showed that for 15% of respondents, noise pollution is one of the top five environmental issues they are worried about. Furthermore, 17% of respondents said that they lack information about noise pollution.

1.3.2 Trends at the national level

Data on perception of specific sources of environmental noise as a problem are not available for the entire WHO European Region. Nevertheless, some countries – including France, Germany, the Netherlands, Slovakia and the United Kingdom – conduct national surveys on noise annoyance, either regularly or on demand (Sobotova et al., 2006; Lambert & Philipps-Bertin, 2008; van Poll et al., 2011; Centraal Bureau voor de Statistiek, 2012; Notley et al., 2014; Umweltbundesamt, 2017).

According to these large-scale surveys, road traffic noise is the most important source of annoyance, generally followed closely by neighbour noise. Aircraft noise can also be a substantial source of annoyance. Railway noise and industrial noise are enumerated less frequently. Only limited data are available on the population's perception of newer sources of noise, such as wind turbines.

While perception surveys do not provide information on actual quantitative relationships between noise exposure and health outcomes, it is important to note that the results of such surveys represent people's preferences and values regarding environmental noise. Despite limitations and an incomplete picture, the available data on perception of environmental noise as a public health problem show concern in Europe. People are not always aware of the health impacts of noise, especially of those related to long-term noise exposure at lower levels. Greater awareness of the issue may further increase positive values and preferences.

1.4 Target audience

The environmental noise guidelines for the European Region serve as a reference for an audience made up of different groups, with varied areas of expertise including decision-making, research and advocacy. More specifically, this covers:

- various technical experts and decision-makers at the local, national or international levels, with responsibility for developing and implementing regulations and standards for noise control, urban planning and housing, and other relevant environment and health domains;
- health impact assessment and environmental impact assessment practitioners and researchers;
- national and local authorities responsible for developing and implementing relevant measures and for risk communication;
- nongovernmental organizations and other advocacy groups involved in risk communication and general awareness-raising.

These guidelines are published by the WHO Regional Office for Europe. In terms of their health implications, the recommended exposure levels can be considered applicable in other regions and suitable for a global audience, as a large body of the evidence underpinning the recommendations was derived not only from European noise effect studies but also from research in other parts of the world – mainly in America, Asia and Australia.

2. Development of the guidelines

2.1 Overview

The process of developing WHO guidelines follows a rigorous methodology and involves several groups with well defined roles and responsibilities (WHO, 2014c). These include: formulation of the scope and key questions of the guidelines; review of the pertinent literature; selection of priority health outcome measures; a systematic review of the evidence; an assessment of certainty of the bodies of evidence resulting from systematic reviews; identification of guideline exposure levels; and setting of the strength of recommendations. Throughout the process, the Grading of Recommendations Assessment, Development and Evaluation (GRADE) approach was followed (Morgan et al., 2016).

The development of environmental noise guidelines started in 2013. Following WHO's procedures, the WHO Regional Office for Europe, through its European Centre for Environment and Health in Bonn, Germany, obtained planning approval and established a Steering Group and a Guideline Development Group (GDG). The former was primarily involved in initiating, structuring and executing the guideline development process; the latter was composed of leading experts and end-users, responsible for the process of scoping the guidelines and developing the evidence-based recommendations. During the initiation meeting in October 2013 in Bonn, the GDG members defined the scope of the guidelines, decided on the key questions to be addressed, prioritized health outcomes and set a timeline for completion of the work. Furthermore, authors were appointed for background papers, systematic reviews and different guideline background chapters.

In October 2014 a main evidence review meeting was held between the GDG and the Systematic Review Team in Bern, Switzerland, to discuss the evidence review drafts. In October 2014 and May 2015 the GDG met in Bern and Bonn, respectively, to refine the scope and draft recommendations. The revision and finalization of the systematic reviews of evidence was completed in early 2017. Through a series of remote meetings and teleconferences, the GDG discussed and addressed the remaining outstanding issues and feedback from the peer review of the draft guidelines, and decided on the final formulation of the recommendations. The following sections describe the steps of the guideline development process in detail.

2.2 Scope of the guidelines

Defining the scope of the guidelines included the selection of noise sources to be considered, as well as situations in which people are exposed, and noise indicators used for the formulation of recommendations. These guidelines separately consider outdoor exposure to environmental noise from road traffic, railway traffic, aircraft, wind turbines as well as outdoor and indoor exposure during leisure activities (such as attending nightclubs, pubs, fitness classes, live sporting events, concerts or live music venues and listening to loud music through personal listening devices). The guidelines are source specific and not environment specific. They therefore cover all settings where people spend a significant portion of their time, such as residences, educational institutions, workplaces and public venues, although hospital noise is exempted from the list of public institutions owing to the unique characteristics of the population involved.

The GDG agreed not to develop specific recommendations for occupational and industrial noise. Industrial noise can affect both people working at an industrial site and those living in its vicinity. The guidelines do not consider workers' exposure to noise in industrial environments, as these are regulated by workplace standards and may, in some cases, require the wearing of protective equipment or application of other preventive and protective measures. Further, the guidelines do not explicitly consider industrial noise as an environmental noise source, affecting people living in the vicinities of industrial sites. This is mainly due to the large heterogeneity and specific features of industrial noise, and the fact that exposure to industrial noise has a very localized character in the urban population.

Likewise, the current guidelines do not provide specific recommendations for the prevention of health effects linked to neighbourhood noise. Neighbourhood noise may stem from various potential sources of noise (such as ventilation systems; church bells; animals; neighbours; commercial, recreational and occupational activities; or shooting/military). As the sources may be located in close proximity to where people live, they can cause considerable concern even at low levels (Omlin et al., 2011). Several of these sources can also produce low-frequency noise, and as such, require indoor measurements for proper exposure assessment. In general, little scientific research is available on exposure and health outcomes related to neighbourhood noise.

Moreover, the guidelines do not include recommendations about any kind of multiple exposures. In everyday life people are often exposed to noise from several sources at the same time. In Germany, for example, 44% of the population are annoyed by at least two and up to five sources of noise (Umweltbundesamt, 2015). For some health outcomes, such as obesity, new evidence indicates that combined exposure to noise from several means of transportation is particularly harmful (Pyko et al., 2015; 2017).

Research indicates that, alongside exposure to more than one source of noise, combined exposure to different factors – for example, noise and vibration or noise and air pollution – has gained increasing relevance in recent years (Sörensen et al., 2017). The EC estimates that the social cost of noise and air pollution is up to €1 trillion every year (EC, 2016a). WHO acknowledges the need to develop comprehensive models to quantify the effects of multiple exposures on human health. As the main body of evidence on environmental noise still focuses on source-specific impacts of noise on health outcomes and does not incorporate combined exposure effects of multiple noise sources or other pollutants, however, the current guidelines provide recommendations for each source of noise specifically. No attempt has been made to combine noise from multiple sources for any particular health outcome.

2.2.1 Key questions

The environmental noise guidelines for the WHO European Region seek to address two main questions, which define the issues addressed by the guideline recommendations.

- In the general population exposed to environmental noise, what is the exposure–response relationship between exposure to environmental noise (reported as various indicators) and the proportion of people with a validated measure of health outcome, when adjusted for confounders?
- In the general population exposed to environmental noise, are interventions effective in reducing exposure to and/or health outcomes from environmental noise?

2.2.2 Environmental noise indicators used in the guidelines

From a scientific point of view, the best noise indicator is the one that performs best in predicting the effect of interest. There are, however, a number of additional criteria that may influence the choice of indicator because, for example, various indicators might be suitable for different health end-points and some indicators are more practical to use or easier to calculate than others. Some of these considerations are of a more political nature, as mentioned in the EC's Position paper on EU noise indicators (EC, 2000).

The current guidelines are intended to be suitable for policy-making primarily in the WHO European Region. They are therefore based on the most frequently used average noise indicators in Europe: L_{den} and L_{night}. These are often reported by authorities and are used widely for exposure assessment in health effect studies and noise impact assessments in the Region. The L_{den} (also referred to as "DENL") indicator can be calculated as the A-weighted average sound pressure level, measured over a 24-hour period, with a 10 dB penalty added to the average level in the night (23:00–07:00 or 22:00–06:00), a 5 dB penalty added to the evening (19:00–23:00 or 18:00–22:00) and no penalty added to the daytime period (07:00–19:00 or 06:00–18:00). The penalties are introduced to indicate people's extra sensitivity to noise during the evening and night. The L_{night} indicator is the A-weighted average sound pressure level, measured over an eight-hour period during night time, usually between 23:00 and 07:00 (EC, 2002a).

In these guidelines, L_{den} and L_{night} refer to a measurement or calculation of noise exposure at the most exposed façade, outdoors, reflecting the long-term average exposure. Thus, L_{den} and L_{night} represent all the single noise events due to a specific noise source that occur over a longer period of time, such as during a year. Moreover, most health outcomes considered in these guidelines are expected to occur as a result of long-term exposure. It is generally accepted that the most relevant parts of the whole day or night, which especially account for the time when a person is at home, are correctly attributed when using average indicators like L_{den} or L_{night}.

The majority of studies that form the body of evidence for the recommendations in these guidelines – among them large-scale epidemiological studies and socioacoustic surveys on annoyance and self-reported sleep disturbance – refer to noise exposure measured outdoors, usually at the most exposed façade of dwellings. Virtually all noise exposure prediction models in use today estimate free-field exposure levels outdoors, and most noise abatement regulations refer to outdoor levels as well. These are the practical reasons why the GDG decided not to recommend any guideline values for noise indoors. Nevertheless, in certain cases it could be helpful to estimate indoor levels based on outdoor values. The differences between indoor and outdoor levels are usually estimated at around 10 dB for open, 15 dB for tilted or half-open and about 25 dB for closed windows. When considering more accurate estimation of indoor levels, using a range of different predictors, the relevant scientific literature can be consulted (Locher et al., 2018).

The GDG was aware of the fact that many countries outside the EU are not bound by the terms of the END (EC, 2002a) and/or use noise indicators other than L_{den} or L_{night} in their noise regulations. They still can make use of these guidelines, however, because energy-based average noise indicators are usually highly correlated and "rule of thumb" transformations from one indicator to another are possible with acceptable uncertainty, as long as the conversion accounts for the long-term average

of populations, rather than individual exposure situations. Empirically derived generic conversion terms between a wide range of different noise indicators (including L_{den}, L_{dn}, L_{day}, L_{night} and $L_{Aeq,24h}$; see the glossary of acoustic terms for further details), with their uncertainty estimates, were published recently (Brink et al., 2018). The GDG encourages the use of these conversions, should the need arise.

In many situations, average noise levels like the L_{den} or L_{night} indicators may not be the best to explain a particular noise effect. Single-event noise indicators – such as the maximum sound pressure level ($L_{A,max}$)[6] and its frequency distribution – are warranted in specific situations, such as in the context of night-time railway or aircraft noise events that can clearly elicit awakenings and other physiological reactions that are mostly determined by $L_{A,max}$. Nevertheless, the assessment of the relationship between different types of single-event noise indicators and long-term health outcomes at the population level remains tentative. The guidelines therefore make no recommendations for single-event noise indicators.

Different noise sources – for example, road traffic noise and railway noise – can be characterized by different spectra, different noise level rise times of noise events, different temporal distributions of noise events and different frequency distributions of maximum levels. Because of the extensive differences in the characteristics of individual noise sources, these guidelines only consider source-specific exposure–response functions (ERFs) and, therefore, formulate only source-specific recommendations.

2.3 Evidence base

Based on the overall scope and key questions the current guidelines review the relevant literature in the area of environmental noise and health in order to incorporate significant research undertaken since the publication of previous guidelines. The process of evidence search and retrieval involved several steps. These include the identification, retrieval and synthesis of the evidence, followed by a systematic review and assessment (described in section 2.4).

2.3.1 Identification, retrieval and synthesis of evidence

As a first step, the GDG identified key health outcomes associated with environmental noise. Next, it rated the relevance of these health outcomes according to the following three categories:

- critical for assessing environmental noise issues
- important, but not critical for assessing environmental noise issues
- unimportant.

The GDG rated the relevance based on the seriousness and prevalence of the outcomes and the anticipated availability of evidence for an association with noise exposure. The following health outcomes were selected as either critical or important for developing recommendations on the health impacts of environmental noise.

[6] $L_{A,max}$ is the maximum time-weighted and A-weighted sound pressure level within a stated time interval starting at t1 and ending at t2, expressed in dB.

Critical health outcome	Important health outcome
Cardiovascular disease	Adverse birth outcomes
Annoyance[7]	Quality of life, well-being and mental health
Effects on sleep	Metabolic outcomes
Cognitive impairment	
Hearing impairment and tinnitus	

The GDG noted that research into the relationship between noise exposure and its effects on humans brings into focus several questions concerning the definition of health and the boundary between normal social reaction to noise and noise-induced ill health. As stated in WHO's Constitution: "Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity" (WHO, 1946). Accordingly, documenting physical health does not present a complete picture of general health; and being undisturbed by noise in all activities, including sleep, constitutes an asset worthy of protection. Therefore, in accordance with the above definition, the GDG regarded (long-term) annoyance and impaired well-being, as well as self-reported sleep disturbance due to noise, as health outcomes.

Regarding sleep disturbance, the health outcome measures considered in these guidelines largely disregard "objective" indicators of sleep disturbance, such as the probability of awakening reactions or other polysomnography parameters. The main reason for this is the nature of the body of evidence on acute, objectively measured effects of noise during sleep. Studies of physiological effects of sleep and especially polysomnographic investigations are complex and resource-demanding; they therefore include only a small number of participants, who are often healthy young volunteers not representative of the general population. For these reasons, the majority of such studies do not meet the requirements for inclusion in the GRADE framework and full-scale meta-analysis, including adjustment for confounders. Furthermore, it is currently unclear how acute physiological reactions that affect the microstructure of sleep but are less well correlated with global sleep parameters, such as total sleep time, are related to long-term health impediments, especially considering the large interindividual differences in susceptibility to noise (Basner et al., 2011).

As sleeping satisfies a basic need and the absence of undisturbed sleep can have serious effects on human health (WHO Regional Office for Europe, 2009), the GDG set self-reported sleep disturbance, in line with the WHO definition of health, as a primary health outcome. Even though self-reported sleep disturbance might differ considerably from objectively measured parameters of sleep physiology, it constitutes a valid indicator in its own right, as it reflects the effects on sleep perceived by an individual over a longer period of time (WHO Regional Office for Europe & JRC, 2011). The importance of considering both annoyance and self-reported sleep disturbance as health outcomes is further supported by evidence indicating that they may be part of the causal pathway of noise-induced cardiovascular and metabolic diseases. This is further elaborated in the narrative review on biological mechanisms (Eriksson et al., 2018).

[7] Noise annoyance is defined as a feeling of displeasure, nuisance, disturbance or irritation caused by a specific sound (Ouis, 2001). In the current guidelines, "annoyance" refers to long-term noise annoyance.

The second step in the evidence retrieval process constituted formulation of the key questions for the critical and important health outcomes and identification of the areas of evidence to be reviewed, following the PICOS/PECCOS approach defined in the WHO handbook for guideline development (WHO, 2014c). PICOS/PECCOS is an evidence-based technique that frames health care-related questions to facilitate the search for suitable studies that can provide answers to the questions at hand (Huang et al., 2006). The PICOS approach divides intervention questions into five elements: population, intervention, comparator, outcome and study design. In exposure studies, PICOS becomes PECCOS, which stands for population, exposure, comparator, confounder, outcome and study design. The specification of the elements of PICOS/PECCOS serves to construct the body of evidence that underpins each recommendation. Due to the complex nature of environmental noise, several distinct areas of evidence were defined to address each of the scoping questions comprehensively.

For each of the critical and important health outcomes a systematic review was conducted (see also section 2.3.2). Health outcomes regarded as important were given less weight in the decision-making process than critical ones. Inclusion and exclusion criteria to be regarded in the systematic evidence reviews were defined in accordance with the PICOS/PECCOS framework for the evaluation of evidence (see Table 1). All evidence that met the inclusion criteria was included in the systematic reviewing process. A detailed description of the types of measure for each of the health outcomes under consideration is provided in the protocol for conducting the systematic reviews (Héroux & Verbeek, 2018a). See Annex 2 for details of all background documents and systematic reviews used in preparation of these guidelines.

Table 1. Inclusion and exclusion criteria for evidence reviews of health effects of environmental noise

Category	Inclusion criteria	Exclusion criteria
Populations	• Members of the general population • Specific segments of the population particularly at risk (children or vulnerable groups) • People exposed to noise in occupational settings (if relevant with combined exposure to environmental noise)	• Does not meet inclusion criteria
Exposure	• Noise exposure levels, either measured or calculated and expressed in dB values • Representative of the individual exposure of study participants (for most observational studies the dwelling location or home) • Calculated levels for transportation noise (road, rail, air) based on traffic data reflecting the use of roads, railway lines and in- and outbound flight routes at airports	• Does not meet inclusion criteria; in particular: - studies using hearing loss or hearing impairment as a proxy for (previous) noise exposure - surveys assessing noise exposure or number of listening hours based on subjective ratings given by subjects in a questionnaire
Confounders	• No inclusion criteria applied since the relationship between exposure to noise and a health outcome can be confounded by other risk factors; however, possible confounders taken into account were assessed for every study	• No exclusion criteria applied; however, possible confounders taken into account were assessed for every study

Table 1. contd.

Category	Inclusion criteria	Exclusion criteria
Outcomes	• Adverse birth outcomes • Annoyance • Cardiovascular disease • Cognitive impairment • Effects on sleep • Hearing impairment and tinnitus • Metabolic outcomes • Quality of life, mental health and well-being	• Does not meet inclusion criteria
Study types	• Cohort studies • Case-control studies • Cross-sectional studies • Ecological studies (only for cardiovascular disease)	• Does not meet inclusion criteria

Alongside the systematic reviews of the critical and important health outcomes, the GDG decided to review the evidence on health effects from noise mitigation measures and interventions to reduce noise levels in order to inform and complement the recommendations.

Interventions on environmental noise were defined according to five broad categories based on the available intervention literature and the experience of decades of environmental noise management (see Table 2 and Brown & van Kamp, 2017).

Table 2. Types of noise intervention

Intervention type	Intervention category	Intervention subcategory
A	Source intervention	• change in emission levels of sources • time restrictions on source operations
B	Path intervention	• change in the path between source and receiver • path control through insulation of receiver/receiver's dwelling
C	New/closed infrastructure	• opening of a new infrastructure noise source • closure of an existing one • planning controls between (new) receivers and sources
D	Other physical intervention	• change in other physical dimensions of dwelling/neighbourhood
E	Behaviour change intervention	• change in individual behaviour to reduce exposure • avoidance or duration of exposure • community education, communication

The GDG recognized that nonacoustic factors are an important possible confounder in both ERFs between noise levels and critical health effects and the effects of acoustic interventions on health outcomes. Whereas the inclusion criteria for confounders were not specified in PECCOS for the systematic reviews of evidence, they were considered at the stage of assessing the quality of

evidence, using the GRADE approach. Depending on the health effect under investigation, possible nonacoustic factors may include:

- gender
- age
- education
- subjective noise sensitivity
- extroversion/introversion
- general stress score
- co-morbidity
- length of residence
- duration of stay at dwelling in the day
- window orientation of a bedroom or living room towards the street
- personal evaluation of the source
- attitudes towards the noise source
- coping capacity with respect to noise
- perception of malfeasance by the authorities responsible
- body mass index
- smoking habits.

In noise annoyance studies nonacoustic factors may explain up to 33% of the variance (Guski, 1999). The higher the quality of evidence, the lower confounding effects of nonacoustic factors may be expected. Nevertheless, as with measurement errors, confounding cannot be avoided.

Based on the retrieval and evaluation of the pertinent literature, the GDG decided to address the association of environmental noise from different sources and health outcomes separately and individually for each source of noise, and for critical and important health outcomes.

In addition to the systematic reviews of the health effects of environmental noise, a narrative review of biological mechanisms of nonauditory effects was conducted (Eriksson et al., 2018). This covers literature related to pathways for nonauditory effects and provides supporting evidence on the association between environmental noise and health outcomes in humans, especially related to cardiovascular and metabolic diseases.

2.3.2 Systematic reviewing process

After the retrieval of the evidence based on the PICOS/PECCOS approach, systematic reviews were conducted for all critical and important health outcomes. To meet the demands of the diverse and broad nature of the evidence, it was agreed that systematic reviews could vary in type. For some areas of evidence, a novel and fully fledged systematic reviewing process was needed to summarize the existing evidence; for others, the reviewing process could build upon existing (and mostly published) systematic reviews and summaries of evidence. Thus, the process consisted of two phases.

First, a comprehensive search was conducted for available systematic reviews and meta-analyses on environmental noise effects published after 2000. Each of the reviews was assessed for both relevance and quality. To be included in the evidence review process, studies from these reviews were required to meet a high quality standard, judged according to high scores of the AMSTAR checklist.[8] In cases where quality criteria were met but the review was older than two years (published before 2012), the search of the systematic review was updated to include new papers. If no good quality systematic reviews were available, a new search for original papers was conducted. The Systematic Review Team decided how the results would affect the search strategy for individual studies as part of the second phase. This was based on the assessment of the quality of the systematic reviews and on the coherence between the main research questions of the systematic reviews and the scope of the work of the guidelines.

In the second phase a search for individual papers was conducted, with the search strategy adapted according to the outcome of the first phase. As availability of systematic reviews and meta-analyses differed for the various health outcomes considered in the guidelines, this process varied for each evidence review. The search included cohort studies, case-control studies and cross-sectional studies of people exposed to environmental noise. Where relevant – for example, for the health outcome cardiovascular disease – the search also included ecological studies.

Due to the individualized retrieval of evidence for each of the systematic reviews, the time frames of the literature included varied. An indication of the temporal coverage of the studies included in different systematic review is provided in the relevant tables in Chapter 4.

A detailed description of the methodology used to conduct the systematic evidence reviews, including individual protocols for the reviews of health effects resulting from environmental noise and from noise interventions, is available (Héroux & Verbeek, 2018b). Furthermore, all systematic reviews conducted in the guideline development process are publicly available in the open-access journal *International Journal of Environmental Research and Public Health*:

- systematic review of transport noise interventions and their impacts on health (Brown & van Kamp, 2017);
- systematic review on environmental noise and adverse birth outcomes (Nieuwenhuijsen et al, 2017);
- systematic review on environmental noise and annoyance (Guski et al., 2017);
- systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018);
- systematic review on environmental noise and cognition (Clark & Paunovic, 2018);
- systematic review on environmental noise and effects on sleep (Basner & McGuire, 2018);
- systematic review on environmental noise and permanent hearing loss and tinnitus (Śliwińska-Kowalska & Zaborowski, 2017);
- systematic review on mental health and well-being (Clark & Paunovic, in press).

[8] AMSTAR is an instrument used to assess quality of evidence; it stands for “A MeaSurement Tool to Assess systematic Reviews” (Shea et al., 2007).

2.4 From evidence to recommendations

Once the evidence had been identified and synthesized, the Systematic Review Team assessed its quality. Subsequently, the GDG formulated recommendations, guided by this assessment and consideration of a number of other factors recognized as important. To facilitate the formulation of recommendations, it first prioritized the health outcome measures of the critical and important outcomes. A process was developed to identify the guideline exposure levels from each of the ERFs provided by the systematic reviews of evidence.

The following sections describe the assessment of the overall quality of the evidence based on the GRADE approach, selection of priority health outcome measurements, identification of guideline exposure levels and setting the strength of recommendations.

2.4.1 Assessment of overall quality of a body of evidence: the GRADE approach

As set out in the WHO handbook for guideline development (WHO, 2014c), the main framework for producing evidence-informed recommendations is the GRADE approach (Guyatt et al., 2008). This is used to assess the quality of a body of evidence synthesized in a systematic review. The assessment facilitates judgements about the certainty of effect estimates, which increases with the quality of the body of evidence. The quality can be rated high, moderate, low or very low (see Box 1).

Box 1 GRADE interpretations of quality of evidence

- **High quality:** further research is very unlikely to change the certainty of the effect estimate
- **Moderate quality:** further research is likely to have an important impact on the certainty of the effect estimate and may change the estimate
- **Low quality:** further research is very likely to have an important impact on the certainty of the effect estimate and is likely to change the estimate
- **Very low quality:** any effect estimate is uncertain

The original GRADE approach was developed specifically to rate the body of evidence resulting from a review of intervention studies. The initial quality level is set by study design: randomized control trials (RCTs) are considered high quality, whereas observational (nonrandomized) study designs are low quality. Then five factors are considered for downgrading the quality of the body of evidence resulting from RCTs or observational studies, and three factors are considered for upgrading the body of evidence resulting from observational studies alone.

The following five factors are used for downgrading the quality of evidence by one or two levels:

- study limitations or risk of bias in all studies that make up the body of evidence
- inconsistency of results between studies
- indirectness of evidence in the studies
- imprecision of the pooled effect estimate
- publication bias detected in a body of evidence.

The following three factors are used for upgrading the quality of evidence:

- high magnitude of the pooled effect
- direction of residual confounding and biases opposes an effect (i.e. when all plausible confounders are anticipated to reduce the estimated effect and there is still a significant effect)
- exposure–response gradient.

The GRADE approach was originally developed for application in the field of clinical medicine, where the majority of studies are randomized trials. However, to assess health effects resulting from an exposure such as environmental noise, randomized controlled trials are not applicable, as it would be unethical to expose participants deliberately to possibly harmful risk factors. The limitations of the application of GRADE to environmental health have been recognized and discussed in the literature (Morgan et al., 2016). Other types of study design dominate the evidence base in the domain of environmental noise research, so it was necessary to adapt the original GRADE approach to the subject of the current guidelines, as follows.

Instead of using the RCT study design as the starting-point for the quality rating, the study design most applicable and available for the field of research at hand was used. Thus, for evidence on the association between noise exposure and clinical health outcome measures, the rating of an evidence base consisting of cohort and case-control studies[9] was initially rated high quality. Cross-sectional studies and ecological studies were rated low quality and very low quality, respectively. This initial point of departure was only adapted for the evidence of the association between noise exposure and annoyance and sleep disturbance. Here, cross-sectional studies were rated high quality because annoyance and sleep disturbance are regarded as an immediate effect of exposure to environmental noise. Finally, in accordance with the original GRADE approach, the starting-point for evidence on the effect of interventions was rated low quality for observational studies. After determining the point of departure, the evidence base was rated down or up whenever one or more of the criteria for downgrading or upgrading (described above) were met. Each of the systematic reviews commissioned for these guidelines includes a detailed report on the assessment of the quality of the evidence.

A detailed discussion of the adaptations of GRADE is provided in the separate methodology publication (Héroux & Verbeek, 2018b).

2.4.2 Selection of priority health outcomes

In line with the WHO handbook for guideline development (WHO, 2014c), the GDG selected the key health outcomes associated with environmental noise at the beginning of the evidence retrieval process, and the systematic reviews were commissioned accordingly. The selection of health outcomes was based on the available evidence for the association between environmental noise and the specific outcome, as well as public concern about the health outcome resulting from noise exposure. The following health outcomes were rated critical: cardiovascular disease, annoyance,

[9] In the context of the current guidelines, “cohort studies” refer to longitudinal studies in which the occurrence of the outcome of interest in an exposed group is compared to the occurrence of that outcome in a reference group with no or lower exposure over time.

effects on sleep, cognitive impairment and hearing impairment and tinnitus. Adverse birth outcomes, quality of life, well-being and mental health, and metabolic outcomes were rated important (see also section 2.3.1).

Since all these health outcomes can be measured in various ways, the GDG evaluated each individually and prioritized different outcome measures for each in terms of their representativeness and validity. These measures were used to derive the guideline exposure levels; their prioritization was based on the impact of the disease and the disability weights (DWs) associated with the health outcome measure.[10]

The critical health outcomes, priority outcome measures identified and justifications for their selection are listed in Table 3.

Table 3. Critical health outcomes, outcome measures identified and justifications for selection

Critical health outcome	Critical health outcome measures (priority measures marked in bold)	Justification for selection
Cardiovascular disease (L_{den})	Self-reported or measured prevalence, **incidence**, hospital admission or mortality due to: • **ischaemic heart disease (IHD) (including angina pectoris and/or myocardial infarction)** • **hypertension** • stroke	Except for self-reports, these are objective measures of the outcome, affect a large proportion of the population, have important health consequences and can lead to more severe diseases and/or mortality. DW for IHD: 0.405. DW for hypertension: 0.117.
Effects on sleep (L_{night})	• **percentage of the population highly sleep-disturbed (%HSD)**, self-reported, assessed with a standardized scale • polysomnography measured outcomes (probability of additional awakenings) • cardiac and blood pressure outcome measures during sleep • motility measured sleep outcomes in adults • sleep disturbance in children	This is the most meaningful, policy-relevant measure of this health outcome. Self-reported sleep disturbances are a very common problem in the general population: they affect quality of life directly and may also lead to subsequent health impediments. Effects on sleep may be in the causal pathway to cardiovascular disease. This measure is not a proxy for physiological sleep quality parameters but is an important outcome in its own right. DW for %HSD: 0.07.
Annoyance (L_{den})	• **percentage of the population highly annoyed (%HA), assessed with standardized scale** • percentage annoyed, preferably assessed with standardized scale	This is the most objective measure of this health outcome. Large proportions of the population are affected by noise annoyance, even at relatively low exposure levels. Annoyance may be in the causal pathway to cardiovascular disease. DW for %HA: 0.02.

[10] DWs are ratings that vary between 0 and 1, in which 0 indicates no disability and 1 indicates the maximum amount of disability. The rates are derived from large population surveys in which people are asked to rank a specific disease for its impact on several abilities. The DWs have been proven useful in calculating the burden of disease.

Table 3. contd.

Critical health outcome	Critical health outcome measures (priority measures marked in bold)	Justification for selection
Cognitive impairment (L_{den})	• **reading and oral comprehension, assessed with tests** • impairment assessed with standardized tests • short and long-term memory deficit • attention deficit • executive function deficit (working memory capacity)	This outcome measure is the most meaningful: it can affect vulnerable individuals (children) and have a significant impact later in life. DW for impaired reading and oral comprehension: 0.006.
Hearing impairment and tinnitus (L_{Aeq}[11] and $L_{AF,max}$[12])	• **permanent hearing impairment, measured by audiometry** • permanent tinnitus	This outcome measure can affect vulnerable individuals (children) and have a significant impact later in life. It is the most objective measure for which there is an ISO standard (ISO, 2013), specifying how to estimate noise-induced hearing loss. DW for mild severity level (threshold at 25 dB) for childhood onset: 0.0150.

Table 4 provides a list of the important health outcomes along with the corresponding health outcome measures included in the systematic reviews. There was no prioritization of health outcome measures leading to justification of selection, since important health outcomes had less impact on the development of recommendations.

Table 4. Important health outcomes and health outcome measures reviewed

Important health outcome	Health outcome measures reviewed
Adverse birth outcomes (L_{den})	• pre-term delivery • low birth weight • congenital anomalies
Quality of life, well-being and mental health (L_{den})	• self-reported health and quality of life • medication intake for depression and anxiety • self-reported depression, anxiety and psychological distress • interviewer-assessed depressive and anxiety disorders • emotional and conduct disorders in children • children's hyperactivity • other mental health outcomes
Metabolic outcomes (L_{den})	prevalence, incidence, hospital admission or mortality due to: • type 2 diabetes • obesity

[11] L_{Aeq} is an A-weighted, equivalent continuous sound pressure level during a stated time interval starting at t1 and ending at t2, expressed in dB, of a noise at a given point in space.

[12] $L_{AF,max}$ is the maximum time-weighted and A-weighted sound pressure level with FAST time constant within a stated time interval starting at t1 and ending at t2, expressed in dB.

2.4.3 Identification of guideline exposure levels for each noise source

The GDG agreed to set guideline exposure levels based on the definition: "noise exposure levels above which the GDG is confident that there is an increased risk of adverse health effects". The identification of guideline values for each of the specific noise sources involved five distinct steps:

1. assessment of the validity of ERFs resulting from the systematic reviews of the effects of noise on each of the critical and important health outcomes;
2. assessment of the lowest noise level measured in the studies included in each of the corresponding systematic reviews;
3. assessment of the smallest risk or relative risk (RR) increase for each of the adverse health outcomes considered relevant;
4. determination of the guideline exposure level based on the ERF, starting from the lowest level measured (see step 2) and associated with the smallest relevant risk increase for adverse health outcomes (see step 3);
5. comparison of the guideline exposure levels calculated for each of the critical health outcomes of one source (for example, incidence of IHD, incidence of hypertension, %HA, permanent hearing impairment and reading and oral comprehension for road traffic noise): selection of the guideline exposure level for each noise source was based on the priority health outcome measure with the lowest exposure level for that source.

To define an "increased risk" to set the guideline exposure level, the GDG made a judgement about the smallest risk or RR of the adverse health effect it considered relevant for each of the priority health outcome measures. It is important to note that the relevant risk increases are benchmark values. The GDG agreed to set them in accordance with the guiding principles it had developed, to provide guideline values that illustrate an increased risk of adverse health effects. It used expert judgements for the determination of the benchmark values; these are elaborated further in section 2.4.3.2.

The guideline exposure levels presented are therefore not meant to identify effect thresholds (the lowest observed adverse effect levels for different health outcomes). This is a difference in approach from prior WHO guidelines, like the night noise guidelines for Europe (WHO Regional Office for Europe, 2009), which explicitly aimed to define levels indicating no adverse health effects. The approach to making choices about relevant risk increases is outlined below and summarized in Table 5.

For IHD and hypertension, RR increases were considered; for annoyance and sleep disturbance, absolute risks of %HA and %HSD were considered; and for reading and oral comprehension an average delay of reading age was defined. For the cardiovascular outcomes, incidence measures were prioritized, although much of the epidemiological evidence was based on prevalence data – particularly for hypertension – where almost no longitudinal studies were available. Prevalence data are generally derived from cross-sectional studies, where the temporal aspects are difficult to determine.

Table 5. Priority health outcomes and relevant risk increases for setting guideline levels

Priority health outcome measure (associated DW)	Relevant risk increase considered for setting of guideline level
Incidence of IHD (DW: 0.405)	5% RR increase
Incidence of hypertension (DW: 0.117)	10% RR increase
%HA (DW: 0.02)	10% absolute risk
%HSD (DW: 0.07)	3% absolute risk
Permanent hearing impairment (DW: 0.0150)	No risk increase due to environmental noise
Reading and oral comprehension (DW: 0.006)	One-month delay in terms of reading age

The DWs used to rank the priority critical health outcomes measures were retrieved from the relevant literature. For cardiovascular disease as a group and for hypertension, the burden of disease from environmental noise values (WHO Regional Office for Europe & JRC, 2011) were not considered applicable by the GDG for these guidelines. Thus, for cardiovascular disease, the DW value (DW: 0.405) specifically applied to acute myocardial infarction in the publication outlining the data sources, methods and results of the global burden of disease in 2002 (Mathers et al., 2003) was retained. Since hypertension is mainly viewed as an important risk factor and not as a health outcome, no general DW has been developed. The only other available DW value available is the DW of 0.117 for hypertensive episodes in pregnancy (Mathers et al., 1999). In the absence of any general DW, the GDG agreed on a conservative approach and decided to use this value.

The DWs for high sleep disturbance (DW: 0.07), high annoyance (DW: 0.02) and impaired reading and oral comprehension (DW: 0.006) were developed in the context of calculating the burden of disease from environmental noise (WHO Regional Office for Europe & JRC, 2011). The DW for hearing impairment was not included in that publication, but it was available from the technical paper on the burden of disease from environmental noise (WHO, 2013); the DW for permanent hearing impairment ranged from 0.0031 to 0.3342, depending on severity level. Environmental noise (leisure noise) contributes to the cumulative total noise exposure throughout the life-course, which may lead to permanent hearing impairment and cause more severe disability in the later years of life. As a result, the GDG selected a DW of 0.0150 for moderate severity level ("has difficulty following a conversation in a noisy environment, but no other hearing problems"). For cognitive impairment, the DW was derived from the estimates of the burden of disease from environmental noise (WHO Regional Office for Europe & JRC, 2011). This was at a very conservative value (DW: 0.006) for noise-related impairment of children's cognition, equivalent to a DW for contemporaneous cognitive deficit in the context of a range of cognitive impairments in children ranging from 0.468 for Japanese encephalitis to 0.024 for iron deficiency anaemia (Lopez et al., 2006).

2.4.3.1 Development of ERFs

The systematic reviews of evidence provided either an ERF or other noise exposure value/metric that could be related to a risk increase of the health outcome measure. These ERFs were used to develop guideline exposure levels; however, only those functions where noise exposure demonstrated a statistically significant effect were used.

To obtain the starting level of the ERFs derived in the systematic reviews, a weighted average of the lowest exposure values measured in the individual studies included in the meta-analyses was

calculated. The weighting used the inverse of the variance of the effect estimate of the study. Thus, the lowest exposure value of studies with a small variance (usually with the largest sample size) contributed the most to the assumed onset of the ERF.

2.4.3.2 Relevant risk increase of adverse health effects

The following sections describe in detail the rationale for the selection of the relevant relative risk (RR) increase percentage for each of the priority health outcome measures considered.

Cardiovascular disease: IHD and hypertension

High-quality epidemiological evidence described in the systematic review on cardiovascular and metabolic effects of environmental noise indicates that exposure to road traffic noise increases the risk of IHD (van Kempen et al., 2018). The GDG was confident that health risks result from exposure at an RR increase in the order of 5–10% in the incidence of IHD. This is similar to the reasoning in the WHO air quality guidelines for fine particulate matter ($PM_{2.5}$) (WHO, 2006). To determine a relevant risk increase for IHD, the GDG took as a starting-point the RR increase of 5% measured in epidemiological studies of environmental noise or air pollution. Taking into account the incidence of IHD and the seriousness of the disease, it considered lowering the RR increase for IHD to 1%, as a 5% RR increase might imply a comparatively high absolute risk from a population perspective. To decide on the final benchmark value for IHD, several aspects were considered: the number of people in a population affected by IHD; whether health risks caused by noise would make up a large part of the incidence of the disease; other examples of health risks of similar magnitude leading to preventive action. For IHD, in an average EU country with 20 million inhabitants, an RR increase of 5% for IHD would lead to several thousand extra cases attributable to noise yearly. This corresponds to a proportion of cases of IHD attributable to noise exposure of less than 10%, which is still relatively small. After extensive discussion at the very end of the guideline development process, the GDG decided to adhere to 5% as the relevant risk increase.

Hypertension is a common condition and is an important risk indicator for IHD and other cardiovascular diseases. Thus, the hypertension risk increase can be transformed into a risk increase for cardiovascular disease. To derive a relevant risk increase, the GDG focused on the incidence of hypertension, owing to the nature and quality of epidemiological evidence. Since hypertension is less serious than IHD, and not all people with hypertension will progress to cardiovascular disease, the relevant risk increase in the incidence of hypertension needed to be higher than that for IHD. Therefore, the GDG agreed on an RR increase of 10% for hypertension.

Self-reported sleep disturbance and annoyance

The GDG initially considered 5%HSD and 10%HA due to noise as relevant absolute risks, not be exceeded at the guideline level. After discussion, however, members agreed that these absolute risks were too large, since a considerable proportion of the population would still be affected; they decided to lower the relevant risk from 5% being highly sleep-disturbed to 3%. In doing so, the GDG referred to the WHO night noise guidelines (WHO, 2009), which concluded that while there was insufficient evidence that physiological effects at noise levels below 40 dB L_{night} are harmful to health, there were observed adverse health effects at levels starting from 40 dB L_{night}. At 40 dB, about 3–4%

(depending on the noise source) of the population still reported being highly sleep-disturbed due to noise, which was considered relevant to health. The GDG considered it important that this level is consistent with the previous health-based approach adopted by the WHO night noise guidelines, and agreed that the absolute risk associated with the guideline value selected should not exceed 3%HSD to be health protective.

For annoyance, which is considered a less serious health effect than self-reported sleep disturbance (as indicated by the respective DWs), the relevant risk remained at 10%HA. This means the absolute risk associated with the guideline value selected should be closest to, but not above 10%HA, to be health protective.

Cognitive impairment: reading and oral comprehension

Acquiring skills in reading and oral comprehension at a young age is important for further development: a delay in acquiring these skills can have an impact later in life (Wilson & Lonigan, 2010). This impact cannot be predicted very accurately, but the GDG considered a delay of one month a relevant absolute risk.

Permanent hearing impairment

The literature on hearing impairment as a result of occupational noise exposure is extensive. A noise exposure level beyond 80 dB during 40 years of working a 40 hour work week can give rise to permanent hearing impairment. Given that environmental exposure to noise is much lower than these levels and that noise-related hearing impairments are not reversible, the GDG considered that there should be no risk of hearing impairment due to environmental noise and considered any increased risk of hearing impairment relevant.

2.4.4 Strength of the recommendations

Finally, having determined the guideline exposure levels based on the ranking of prioritized health outcome measures, setting the strength of the recommendation was set as the final step of the guideline development process. This was also guided by the GRADE methodology (Alonso-Coello et al., 2016a; 2016b). According to this approach, strength of recommendation can be set as either strong or conditional (WHO, 2014c).

- A **strong** recommendation can be adopted as policy in most situations. The guideline is based on the confidence that the desirable effects of adherence to the recommendation outweigh the undesirable consequences. The quality of evidence for a net benefit – combined with information about the values, preferences and resources – inform this recommendation, which should be implemented in most circumstances.
- A **conditional** recommendation requires a policy-making process with substantial debate and involvement of various stakeholders. There is less certainty of its efficacy owing to lower quality of evidence of a net benefit, opposing values and preferences of individuals and populations affected or the high resource implications of the recommendation, meaning there may be circumstances or settings in which it will not apply.

The GRADE approach defines a number of parameters that should be assessed to determine the strength of recommendations: quality of evidence, balance of benefits and harms, values and preference related to the outcomes of interventions to exposure, resources implications, priority of the problem, equity and human rights, acceptability and feasibility (Box 2; Morgan et al., 2016).

Box 2 Parameters determining the strength of a recommendation

Quality of evidence further represents the confidence in the estimates of effect of the evaluated evidence, across outcomes critical and important to decision-making. The higher the quality of evidence, the greater the likelihood of a strong recommendation.

Balance of benefits and harms requires an evaluation of the absolute effects of both benefits and harms (or downsides) of the intervention or exposure and their importance. The greater net benefit or net harm associated with an intervention or an exposure, the greater the likelihood of a strong recommendation in favour or against an intervention or exposure.

Values and preferences related to the outcomes of an intervention or exposure set out the relative importance assigned to health outcomes by those affected by them; how such importance varies within and across populations; and whether this importance or variability is surrounded by uncertainty. The less uncertainty or variability there is about the values and preferences of people experiencing the critical or important outcomes, the greater the likelihood of a strong recommendation.

Resource implications take into consideration how resource-intensive and how cost-effective and substantially beneficial an intervention or exposure is. The more advantageous or clearly disadvantageous the resource implications are, the greater the likelihood of a strong recommendation either for or against the intervention or exposure.

The priority of the problem is determined by its importance and frequency (the burden of disease, disease prevalence or baseline risk). The greater the importance of the problem, the greater the likelihood of a strong recommendation.

Equity and human rights considerations are an important aspect of the process. The greater the likelihood that the intervention will reduce inequities, improve equity or contribute to the realization of one or several human rights as defined under the international legal framework, the greater the likelihood of a strong recommendation.

Acceptability plays a prominent role: the greater the acceptability of an option to all or most stakeholders, the greater the likelihood of a strong recommendation.

Feasibility overlaps with values and preferences, resource considerations, existing infrastructures, equity, cultural norms, legal frameworks and many other considerations. The greater the feasibility of an option from the standpoint of all or most stakeholders, the greater the likelihood of a strong recommendation.

The GDG evaluated the strength of the recommendations based on these parameters, following a two-step procedure. Initially, the strength of each recommendation was set as strong or conditional based on an assessment of the quality of evidence. The GDG then identified and assessed contextual

parameters that might have a contributory role (see Box 2 above). Based on this qualitative evaluation, the initial recommendation strength was either adapted or confirmed. It is important to note that while the initial parameter "quality of evidence" was informed by comprehensive systematic reviewing processes, the remaining contextual parameters were assessed by the informed qualitative expert judgement of the GDG.

Furthermore, the GDG agreed to decision-making rules, applied when formulating the recommendations. An evidence rating of low quality or very low quality would lead only to a conditional recommendation. Setting a strong recommendation was only considered if the evidence was at least moderate quality. The final recommendations were formulated based on the consideration of all the parameters and decision rules adopted by the GDG. A detailed exploration of all the recommendations is set out in Chapter 3.

2.5 Individuals and partners involved in the guideline development process

The process of WHO guideline development is conducted by several groups with clearly defined roles and responsibilities. Comprising WHO staff members, experts and stakeholders, these are the Steering Group, the GDG, the Systematic Review Team and the External Review Group.

The **Steering Group** includes WHO staff members with different affiliations but whose work experience is relevant to the topic of environmental noise and associated health outcomes. It is involved at all stages of planning, selecting members of the GDG and External Review Group, reviewing evidence and developing potential recommendations at the main expert meetings, as well as ongoing consultation on revisions following peer review. Details of the members of the Steering Group are listed in Table A1.1 in Annex 1.

The **GDG** consists of a group of content experts gathered to investigate all aspects of evidence contributing to the recommendations, including expertise in evidence-based guideline development. This Group defined the key questions and priorities of the research, chose and ranked outcomes and provided advice on any modifications of the scope as established by the Steering Group. The members also outlined the systematic review methods; appraised the evidence used to inform the guidelines; and advised on the interpretation of this evidence, with explicit consideration of the overall balance of benefits and harms. Ultimately the GDG formulated the final recommendations, taking into account the diverse values and preferences of individuals and populations affected. It also determined the strength of the results and responded to external peer reviews. The complete list of GDG members and their specific roles, affiliations and areas of expertise are listed in Table A1.2 in Annex 1.

The **Systematic Review Team** includes experts in the field of environmental health, commissioned by WHO staff to undertake systematic reviews of evidence. The GDG recommended a number of authors to conduct the evidence reviews and summary chapters, based on their expertise. Details of the members of the Systtematic Review Team are included in Table A1.3 in Annex 1.

The **External Review Group** is composed of technical content experts and end-users as well as stakeholders, and is balanced geographically and by gender. The experts and end-users were selected for their expertise in the field, and the Group also included representatives of professional groups and industry associations, who will be implementing the guidelines. Members were asked to

review the material at different stages of the development process. The list of technical experts and stakeholders is provided in Tables A1.4 and A1.5, respectively, in Annex 1.

Management of conflict of interest is an integral part of WHO's guideline development procedure. All members of the GDG and authors of the evidence reviews completed WHO declaration of interest forms. These were reviewed by the WHO Secretariat for potential conflicts of interest. A number of conflicts of interest were declared in the forms, but following a standardized management review it was not found necessary to exclude any members of the GDG or authors from their respective roles. Members of the External Review Group (technical experts only) were also asked to complete the form when invited to participate.

In addition, at the start of the meeting of the GDG all members of the GDG received a briefing about the nature of all types of conflict of interest (financial, academic/intellectual and nonacademic) and were asked to declare to the meeting any conflicts they might have. No member of the GDG or the Systematic Review Team was excluded from his/her respective role. A summary of the conflict of interest management is presented in Annex 3.

The GDG set its own rules on how it would work and how contentious issues should be resolved – for instance, by means of a vote. The main decision-making mechanism involved reaching consensus; if a vote was required, the experts involved in developing the underlying evidence for the specific recommendation were excluded from voting, and an agreement was reached via a two thirds majority of the rest of the group.

2.6 Previously published WHO guidelines on environmental noise

Prior to this publication, WHO published community noise guidelines (CNG) in 1999 (WHO, 1999) and night noise guidelines for Europe (NNG) in 2009 (WHO Regional Office for Europe, 2009).

2.6.1 CNG

The scope of WHO's efforts to develop the CNG in 1999 was similar to that for the current guidelines. The objective was then formulated as: "to consolidate scientific knowledge of the time on the health impacts of community noise and to provide guidance to environmental health authorities and professionals trying to protect people from the harmful effects of noise in nonindustrial environments" (WHO, 1999). The guidelines were based on studies carried out up to 1995 and a few meta-analyses from some years later.

The health risk to humans from exposure to environmental noise was evaluated and guideline values derived. At that time WHO had not yet developed its guideline development process, on which the current guidelines are based (WHO, 2014c). The main differences in content are that the previous guidelines were expert-based and provided more global coverage and applicability, such as issues of noise assessment and control that were addressed in detail. They included a discussion on noise sources and measurement, including the basic aspects of source characteristics, sound propagation and transmission. Adverse health effects of noise were characterized, and combined noise sources and their effects were considered. Furthermore, the guidelines included discussions of strategies and priorities in the management of indoor noise levels, noise policies and legislation, environmental

noise impact and enforcement of regulatory standards; although there were no chapters on wind turbine noise and leisure noise.

2.6.2 NNG

In 2009 the WHO Regional Office for Europe published the NNG to provide scientifically based advice to Member States for the development of future legislation and policy action in the area of assessment and control of night noise exposure.

The NNG complement the previous CNG, incorporating the advancement of research on noise and sleep disturbance up to 2006. The working group of experts reviewed available scientific evidence on the health effects of night noise and derived health-based guideline values. Again, WHO had not yet introduced its evidence-based recommendations policy and the NNG were mainly expert-based. They considered the scientific evidence on the threshold of night noise exposure indicated by L_{night} as defined in the END (EC, 2002a), and the experts concluded that a L_{night} value of 40 dB should be the target of the NNG (for all sources) to protect the public, including the most vulnerable groups such as children, chronically ill and elderly people. Further, an L_{night} value of 55 dB was recommended as an interim target for countries that could not follow the guidelines in the short term for various reasons or where policy-makers chose to adopt a stepwise approach.

2.6.3 Differences from the prior noise guidelines

The current guidelines differ from the older ones, recommending levels of exposure unlike those previously outlined (especially by the NNG). The following major differences between the previous and current guidelines explain the novel set of recommended values.

- The development process for the current guidelines adhered to a new, rigorous, evidence-based methodology, as outlined in the WHO handbook for guideline development (WHO, 2014c). WHO adopted these internationally recognized standards to ensure high methodological quality and a transparent, evidence-based decision-making process in the guideline development.
- The current guidelines consider cardiovascular disease a critical health outcome measure.
- They also consider a broader set of health outcomes, including adverse birth outcomes, diabetes, obesity and mental well-being. Wherever applicable, incidence, prevalence and mortality were considered separately.
- The current guidelines cover two new noise sources: wind turbines and leisure noise.
- Critical and important health outcomes are considered separately for each of the noise sources.
- The guideline development process included the health effects of intervention measures to mitigate noise exposure from different noise sources for the first time.
- The style of recommendations differs: the current guidelines include an exact exposure value for every health outcome regarded as critical, for each noise source. Guideline recommendation values were set for each of the noise sources separately, based on the exact exposure values and a prioritization scheme, developed with the help of DWs.
- The current guidelines apply a 1 dB increment scheme, whereas prior guidelines (CNG and NNG) formulated or presented recommendations in 5 dB steps.

- In comparison to the 1999 CNG, which defined environment-specific exposure levels, the current guidelines are source specific. They recommend values for outdoor exposure to road traffic, railway, aircraft and wind turbine noise, and indoor as well as outdoor exposure levels for leisure noise.
- Except for leisure noise, all exposure levels recommended in the current guidelines are average sound pressure levels for outdoor exposure.
- The current guidelines make use of the noise indices defined in the END: L_{den} and L_{night}.

The definition of "community noise" used in the CNG in 1999 was also adapted. The GDG agreed to use the term "environmental noise" instead, and offered an operational definition of: "noise emitted from all sources except sources of occupational noise exposure in workplaces".

The current environmental noise guidelines for the European Region supersede the CNG from 1999. Nevertheless, the GDG recommends that all CNG indoor guideline values and any values not covered by the current guidelines (such as industrial noise and shopping areas) should remain valid.

Furthermore, the current guidelines complement the NNG from 2009. Two main aspects of the NNG constitute this complementarity: the different guiding principles and the comprehensive investigation of the immediate physiological effects of environmental noise on sleep. As guiding principles the NNG defined effect thresholds or "lowest observed adverse health effect levels" for both immediate physiological reactions during sleep (i.e. awakening reactions or body movements during sleep) and long-term adverse health effects (i.e. self-reported sleep disturbance). These guideline exposure levels defined a level below which no effects were expected to occur (corresponding to 30 dB L_{night}) and proceeded to define the level where adverse effects start to occur (corresponding to 40 dB L_{night}), with the aim of protecting the whole population, including – to some extent – vulnerable groups. The development of the NNG values relied on evidence-based expert judgement. In contrast, the current guidelines formulate recommendations more strictly based on the available evidence and following the guiding principle to identify exposure values based on a relevant risk increase of adverse health effects. Thus, the recommended guideline values might not lead to full protection of the population, including all vulnerable groups. The GDG stresses that the aim of the current guidelines is to define an exposure level at which effects certainly begin.

Secondly, the NNG comprehensively investigate the immediate short-term effects of environmental noise during sleep, including physiological reactions such as awakening reactions and body movements. They also provided threshold information about single-event noise indicators (such as the $L_{A,max}$). In contrast, the current guideline values for the night time are only based on the prevalence of self-reported sleep disturbance and do not take physiological effects into account. The causal link between immediate physiological reactions and long-term adverse health effects is complex and difficult to prove. Thus, the current guidelines are restricted to long-term health effects during night time and therefore only include recommendations about average noise indicators: L_{night}. Nevertheless, the evidence review on noise and sleep (Basner & McGuire, 2018) includes an overview of single-event exposure–effect relationships.

3. Recommendations

This chapter presents specific recommendations on guideline exposure levels and/or interventions to reduce exposure and/or improve health for individual sources of noise: road traffic, railway, aircraft, wind turbines and leisure noise. The strength of each recommendation is provided (strong or conditional) and a short rationale for how each of the guideline levels was achieved is given.

The GDG discussed extensively the best way to present guideline exposure levels – either as the exact values or in 5 dB steps – and the approach to rounding the values to the nearest integer. The 5 dB increment, rounded down from the exact exposure value to the nearest 5 dB level, was initially chosen as being commonly applied in noise legislation and used in prior guidelines (WHO, 1999; EC, 2002a; WHO Regional Office for Europe, 2009). It was also used to meet the principle of precaution, since imprecision in the exposure assessment in the field of epidemiology tends to attenuate the actual effects in the population.

Use of 5 dB increments resulted in uneven magnitude of rounding down, however, raising concerns of arbitrariness. It became apparent that inclusion of both exact values and the 5 dB rounded-down values might be confusing and could affect the applicability of the guidelines. Hence, the GDG ultimately decided that formulating recommendations based on the exact calculated values, rounded only to the nearest integer, would ensure more clarity and transparency. Furthermore, it noted that adhering to a 5 dB roster might not reflect the progress in the precision of exposure assessment methods in recent decades, which would justify application of a 1 dB step.

The GDG acknowledged that the recommendations might be presented as the exact guideline exposure levels only, leaving the use of 5 dB bands to the potential policy decisions to formulate or revise noise legislation, which are beyond the scope of this publication. The WHO guideline values are public health-oriented recommendations, based on scientific evidence on health effects and on an assessment of achievable noise levels. They are strongly recommended and as such should serve as the basis for a policy-making process in which policy options are quantified and discussed. It should be recognized that in that process additional considerations of costs, feasibility, values and preferences should also feature in decision-making when choosing reference values such as noise limits for a possible standard or legislation.

In addition to the source-specific recommendations in the following sections, a short rationale for the decision-making process by the GDG for developing a particular recommendation is provided, as well as an overview of the evidence considered. This includes a recapitulation of the specific PICOS/PECCOS question (see section 2.3.1), along with a summary of evidence for each of the critical and important health effects from exposure to each of the noise sources, and for the effectiveness of interventions.

Furthermore, a description is provided of the other factors considered according to the GRADE dimensions for the assessment of the strength of recommendations (see section 2.4.4). While the quality of evidence is central to determining this, the process of moving from evidence to recommendations involves several other considerations. These include values and preferences, balance of benefits and harms, consideration of the priority of the problem, resource implications, equity and human rights aspects, acceptability and feasibility (WHO, 2014c).

3.1 Road traffic noise

Recommendations

For average noise exposure, the GDG **strongly** recommends reducing noise levels produced by road traffic below **53 dB** L_{den}, as road traffic noise above this level is associated with adverse health effects.

For night noise exposure, the GDG **strongly** recommends reducing noise levels produced by road traffic during night time below **45 dB** L_{night}, as road traffic noise above this level is associated with adverse effects on sleep.

To reduce health effects, the GDG **strongly** recommends that policy-makers implement suitable measures to reduce noise exposure from road traffic in the population exposed to levels above the guideline values for average and night noise exposure. For specific interventions, the GDG recommends reducing noise both at the source and on the route between the source and the affected population by changes in infrastructure.

3.1.1 Rationale for the guideline levels for road traffic noise

The exposure levels were derived in accordance with the prioritization process of critical health outcomes described in section 2.4.3. For each of the outcomes, the exposure level was identified by applying the benchmark, set as relevant risk increase to the corresponding ERF. In the case of exposure to road traffic noise, the process can be summarized as follows (Table 6).

Table 6. Average exposure levels (L_{den}) for priority health outcomes from road traffic noise

Summary of priority health outcome evidence	Benchmark level	Evidence quality
Incidence of IHD The 5% relevant risk increase occurs at a noise exposure level of 59.3 dB L_{den}. The weighted average of the lowest noise levels measured in the studies was 53 dB L_{den} and the RR increase per 10 dB is 1.08.	5% increase of RR	High quality
Incidence of hypertension One study met the inclusion criteria. There was no significant increase of risk associated with increased noise exposure in this study.	10% increase of RR	Low quality
Prevalence of highly annoyed population There was an absolute risk of 10% at a noise exposure level of 53.3 dB $L_{den.}$	10% absolute risk	Moderate quality
Permanent hearing impairment	No increase	No studies met the inclusion criteria
Reading skills and oral comprehension in children	One-month delay	Very low quality

In accordance with the prioritization process (see section 2.4.3), the GDG set a guideline exposure level of 53.3 dB L_{den} for average exposure, based on the relevant increase of the absolute %HA. It was confident that there was an increased risk for annoyance below this noise exposure level, but probably no increased risk for other priority health outcomes. In accordance with the defined rounding procedure, the value was rounded to 53 dB L_{den}. As the evidence on the adverse effects of road traffic noise was rated moderate quality, the GDG made the recommendation strong.

Next, the GDG assessed the evidence for night noise exposure and its effect on sleep disturbance (Table 7).

Table 7. Night-time exposure levels (L_{night}) for priority health outcomes from road traffic noise

Summary of priority health outcome evidence	Benchmark level	Evidence quality
Sleep disturbance 3% of the participants in studies were highly sleep-disturbed at a noise level of **45.4 dB** L_{night}	3% absolute risk	Moderate quality

Based on the evidence of the adverse effects of road traffic noise on sleep disturbance, the GDG defined a guideline exposure level of 45.4 dB L_{night}. The exact exposure value was rounded to 45 dB L_{night}. As the evidence was rated moderate quality, the GDG made the recommendation strong.

The GDG also considered the evidence for the effectiveness of interventions. The results showed that:

- addressing the source by improving the choice of appropriate tyres, road surface, truck restrictions or by lowering traffic flow can reduce noise exposure;
- path interventions such as insulation and barrier construction reduce noise exposure, annoyance and sleep disturbance;
- changes in infrastructure such as construction of road tunnels lower noise exposure, annoyance and sleep disturbance;
- other physical interventions such as the availability of a quiet side of the residence reduce noise exposure, annoyance and sleep disturbance.

Given that it is possible to reduce noise exposure and that best practices already exist for the management of noise from road traffic, the GDG made a strong recommendation.

3.1.1.1 Other factors influencing the strength of recommendations

Other factors considered in the context of recommendations on road traffic noise included those related to values and preferences, benefits and harms, resource implications, equity, acceptability and feasibility; moreover, nonpriority health outcomes (the incidence of stroke and diabetes) were considered. Ultimately, the assessment of all these factors did not lead to a change in the strength of the recommendations. Further details are provided in section 3.1.2.3.

3.1.2 Detailed overview of the evidence

The following sections provide a detailed overview of the evidence constituting the basis for setting the recommendations on road traffic noise. It is presented and summarized separately for each of the critical health outcomes, and the GDG's judgement of the quality of evidence is indicated (for a detailed overview of the evidence on important health outcomes, see Annex 4). Research into health outcomes and effectiveness of interventions is addressed consecutively.

A comprehensive summary of all evidence considered for each of the critical and important health outcomes can be found in the eight systematic reviews published in the *International Journal of Environmental Research and Public Health* (see section 2.3.2 and Annex 2).

3.1.2.1 Evidence on health outcomes

The key question posed was: in the general population exposed to road traffic noise, what is the exposure–response relationship between exposure to road traffic noise (reported as various noise indicators) and the proportion of people with a validated measure of health outcome, when adjusted for main confounders? A summary of the PICOS/PECCOS scheme applied (see section 2.3.1) and the main findings is set out in Tables 8 and 9.

Table 8. PICOS/PECCOS scheme of critical health outcomes for exposure to road traffic noise

PECO	Description	
Population	General population	
Exposure	Exposure to high levels of noise produced by road traffic (average/night time)	
Comparison	Exposure to lower levels of noise produced by road traffic (average/night time)	
Outcome(s)	For average noise exposure: 1. cardiovascular disease 2. annoyance 3. cognitive impairment 4. hearing impairment and tinnitus 5. adverse birth outcomes 6. quality of life, well-being and mental health 7. metabolic outcomes	For night noise exposure: 1. effects on sleep

Table 9. Summary of findings for health effects from exposure to road traffic noise (L_{den})

Noise metric	Priority health outcome measure	Quantitative risk for adverse health	Lowest level of exposure across studies	Number of participants (studies)	Quality of evidence
Cardiovascular disease					
L_{den}	Incidence of IHD	RR = 1.08 (95% confidence interval (CI): 1.01–1.15) per 10 dB increase	53 dB	67 224 (7)	High (upgraded for dose-response)
L_{den}	Incidence of hypertension	RR = 0.97 (95% CI: 0.90–1.05) per 10 dB increase	N/A	32 635 (1)	Low (downgraded for risk of bias and because only one study was available)
Annoyance					
L_{den}	%HA	Odds ratio (OR) = 3.03 (95% CI: 2.59–3.55) per 10 dB increase	40 dB	34 112 (25)	Moderate (downgraded for inconsistency)
Cognitive impairment					
L_{den}	Reading and oral comprehension	Not estimated	N/A	Over 2844 (1)	Very low (downgraded for inconsistency)
Hearing impairment and tinnitus					
L_{den}	Permanent hearing impairment	–	–	–	–

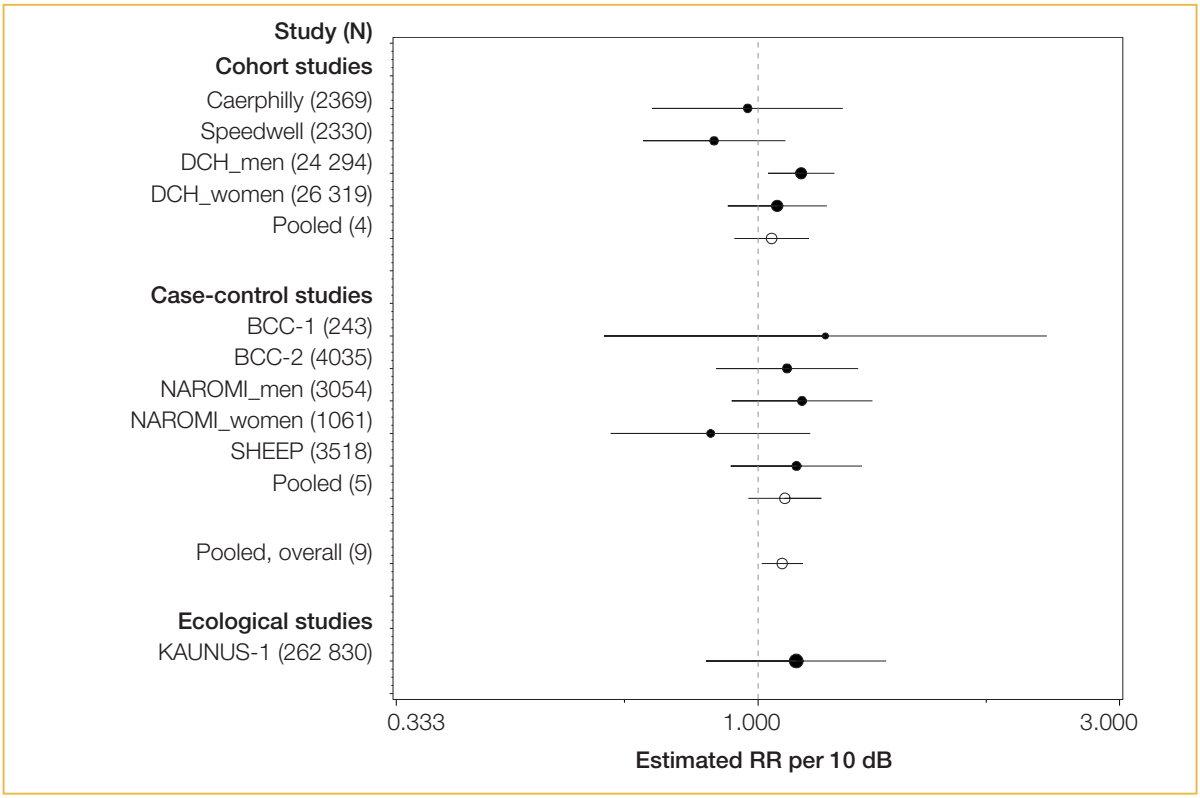
Cardiovascular disease

IHD

A total of three cohort (Babisch & Gallacher, 1990; Babisch et al., 1988; 1993a; 1993b; 1999; 2003; Caerphilly and Speedwell Collaborative Group, 1984; Sörensen et al., 2012a; 2012c) and four case-control studies (Babisch, 2004; Babisch et al., 1992; 1994; 2005a; Selander et al., 2009; Wiens, 1995) investigated the relationship between road traffic noise and the incidence of IHD. These involved a total of 67 224 participants, including 7033 cases. As identified in Fig. 1, the overall RR derived from the meta-analysis was 1.08 (95% CI: 1.01–1.15) per 10 dB L_{den} increase in noise levels, across a noise range of 40 dB to 80 dB. This evidence was rated high quality.

The data were supported by one ecological study conducted with 262 830 participants, including 418 cases, which also reported a statistically significant estimate (Grazuleviciene et al., 2004; Lekaviciute, 2007). In this study, a positive but nonsignificant association was found: RR of 1.12 (95% CI: 0.85–1.48) per 10 dB L_{den} increase in noise. This evidence was rated very low quality.

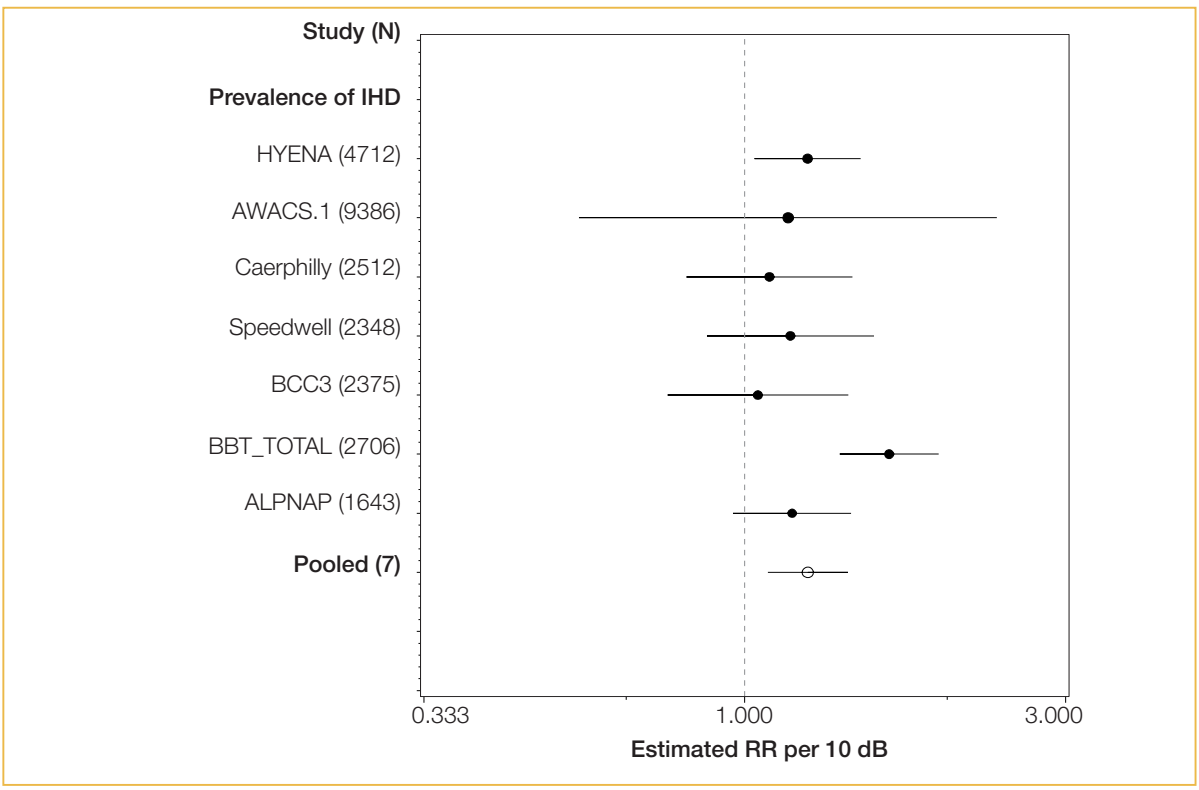
Fig. 1. The association between exposure to road traffic noise (L_{den}) and incidence of IHD



Notes: The dotted vertical line corresponds to no effect of exposure to road traffic noise. The black circles correspond to the estimated RR per 10 dB and 95% CI. The white circles represent the pooled random effect estimates and 95% CI. For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

Furthermore, additional evidence was available from eight cross-sectional studies that investigated the relationship between road traffic noise and prevalence of IHD (Babisch & Gallacher, 1990; Babisch et al., 1988; 1992; 1993a; 1993b; 1994; 1999; 2003; 2005a; 2008; 2012a; 2012b; Caerphilly and Speedwell Collaborative Group, 1984; Floud et al., 2011; 2013a; 2013b; Heimann et al., 2007; Jarup et al., 2005; 2008; Lercher et al., 2008; 2011; van Poll et al., 2014; Wiens, 1995). These studies involved a total of 25 682 participants, including 1614 cases. The overall RR was 1.24 (95% CI: 1.08–1.42) per 10 dB L_{den} increase in road traffic noise levels. The range in noise levels in the studies under evaluation was 30–80 dB. The results of the meta-analysis are presented in Fig. 2. This evidence was rated low quality.

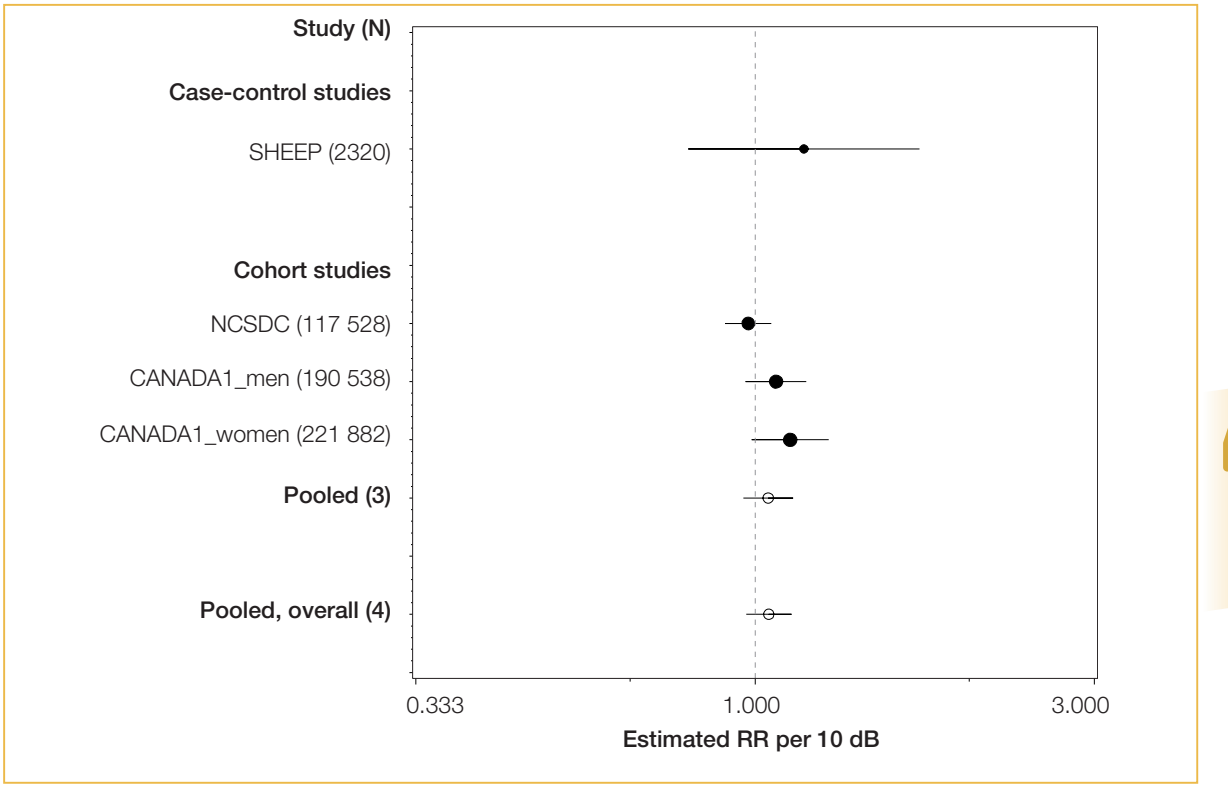
Fig. 2. The association between exposure to road traffic noise (L_{den}) and prevalence of IHD



Notes: The dotted vertical line corresponds to no effect of exposure to road traffic noise. The black circles correspond to the estimated RR per 10 dB and 95% CI. The white circle represents the pooled random effect estimates and 95% CI. For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

Mortality from IHD was also investigated in one case-control (Selander et al., 2009) and two cohort studies (Beelen et al., 2009; Gan et al., 2012), which involved 532 268 participants, including 6884 cases. The quantitative relationship between road traffic noise and mortality from IHD was RR = 1.05 (95% CI: 0.97–1.13) per 10 dB L_{den} increase in noise levels (see Fig. 3). This evidence was rated moderate quality.

Fig. 3. The association between exposure to road traffic noise (L_{den}) and mortality from IHD



Notes: The dotted vertical line corresponds to no effect of exposure to road traffic noise. The black circles correspond to the estimated RR per 10 dB and 95% CI. The white circles represent the pooled random effect estimates and 95% CI. For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

Hypertension

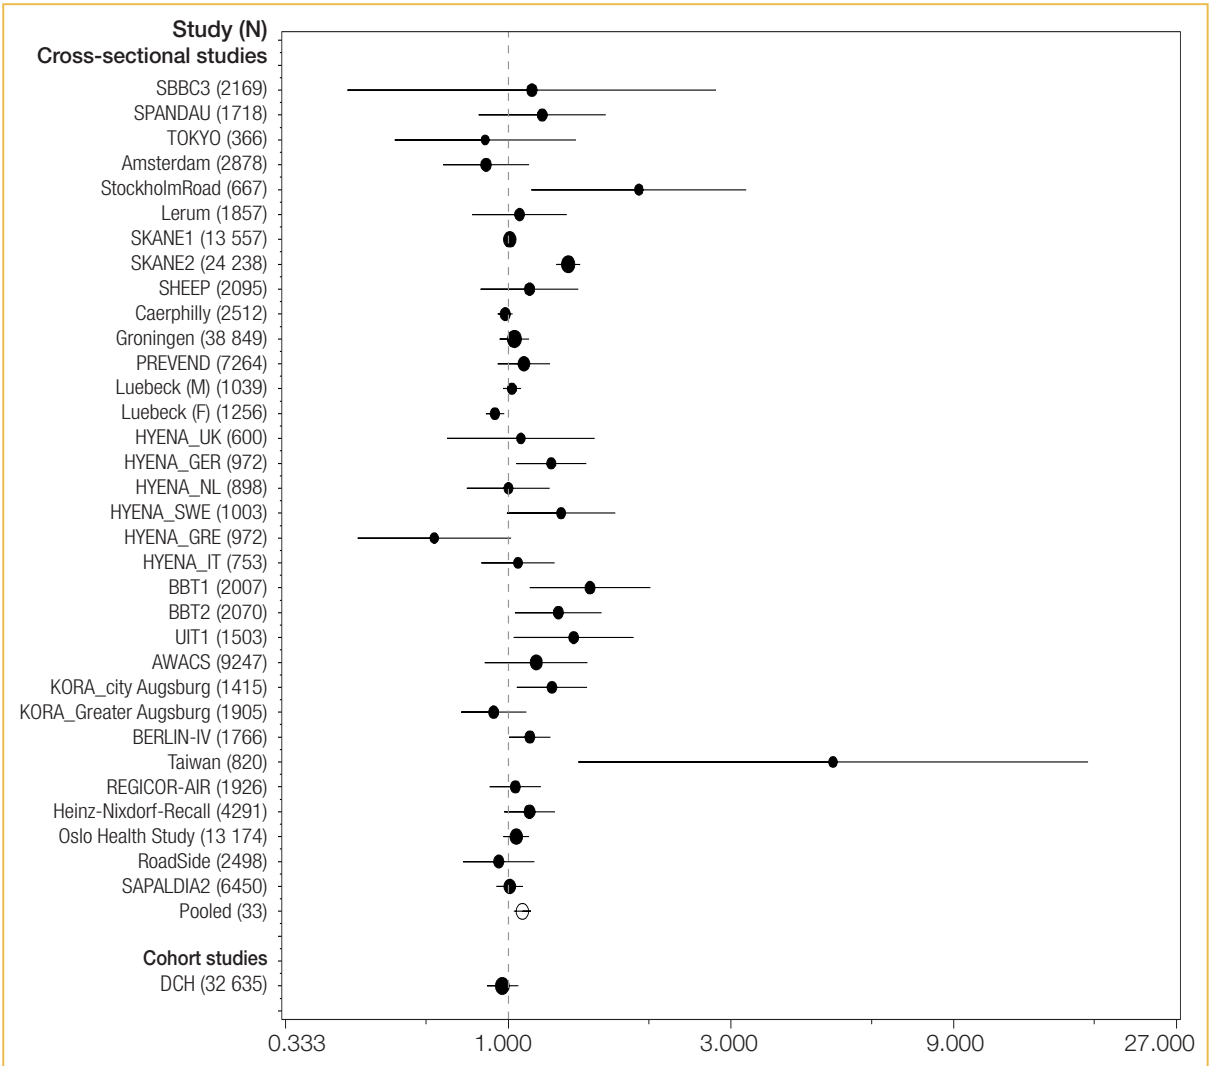
One cohort study into the relationship between road traffic noise and incidence of hypertension was identified; it involved 32 635 participants, including 3145 cases (Sörensen et al., 2011; 2012c). The study found a nonsignificant effect size of 0.97 (95% CI: 0.90–1.05) per 10 dB L_{den} increase in noise levels, which does not support an increased risk of hypertension due to exposure to road traffic noise. Because of the risk of bias and the availability of only one study, this evidence was rated low quality.

In addition, 26 cross-sectional studies were identified that looked at the association between road traffic noise and prevalence of hypertension (Babisch et al., 1988; 1992; 1994; 2005a; 2008; 2012a; 2012b; 2013a; 2013b; 2014b; 2014c; Barregard et al., 2009; Bjork et al., 2006; Bluhm et al., 2007; Bodin et al., 2009; Caerphilly and Speedwell Collaborative Group, 1984; Chang et al., 2011; 2014; de Kluizenaar et al., 2007a; 2007b; Dratva et al., 2012; Eriksson et al., 2012; Foraster et al., 2011; 2012; 2013; 2014a; 2014b; Fuks et al., 2011; Hense et al., 1989; Herbold et al., 1989; Jarup et al., 2005; 2008; Knipschild et al., 1984; Lercher et al., 2008; 2011; Maschke, 2003; Maschke & Hecht,

2005; Maschke et al., 2003; Oftedal et al., 2011; 2014; Selander et al., 2009; van Poll et al., 2014; Wiens, 1995; Yoshida et al., 1997). In total, these studies involved 154 398 participants, including 18 957 cases. The overall RR for prevalence of hypertension was 1.05 (95% CI: 1.02–1.08) per 10 dB L_{den} increase in noise levels. The noise range of the studies under evaluation was 20–85 dB. The overall evidence was rated very low quality.

Fig. 4 shows the association between road traffic noise and incidence and prevalence of hypertension.

Fig. 4. The association between exposure to road traffic noise (L_{den}) and hypertension



Notes: The dotted vertical line corresponds to no effect of exposure to road traffic noise. The black dots correspond to the estimated RR per 10 dB and 95% CI. The white circle represents the summary estimate and 95% CI. For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

Stroke

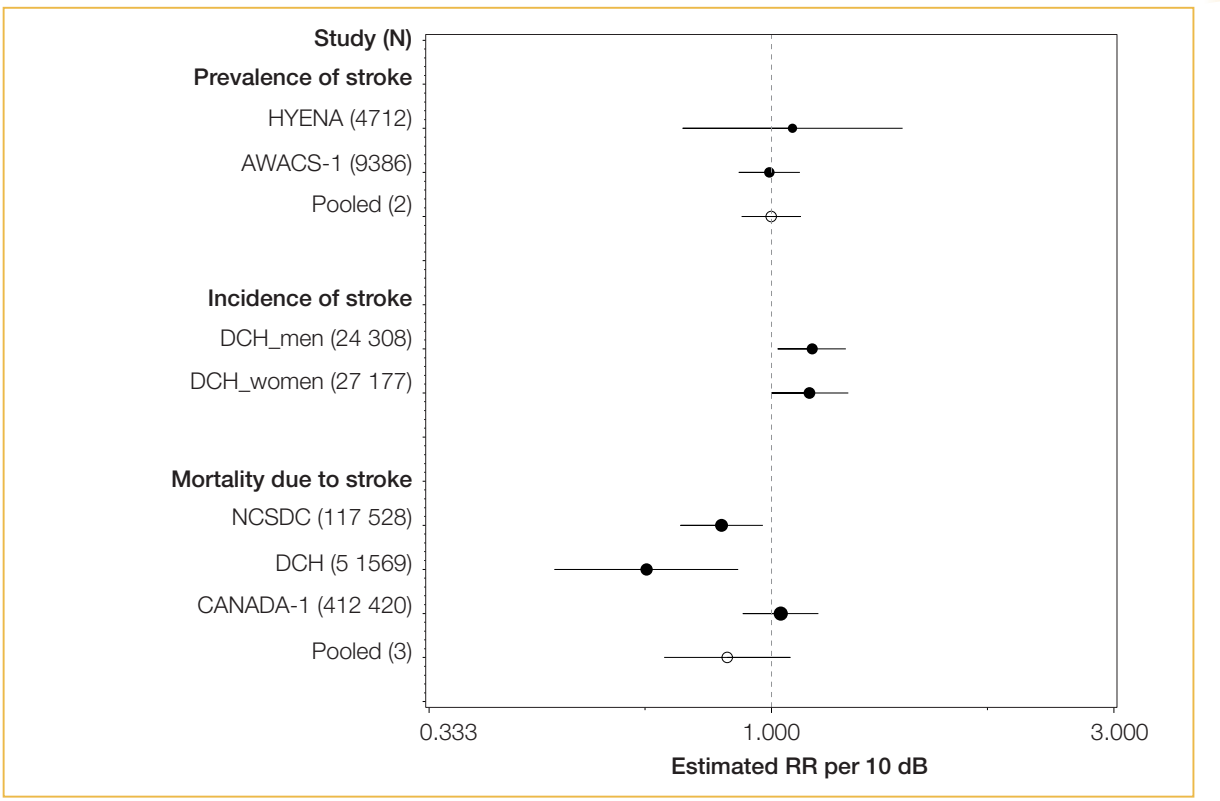
One cohort study into the relationship between road traffic noise and incidence of stroke was identified (Sörensen et al., 2011; 2012b; 2014). It involved 51 485 participants, including 1881 cases, and found an RR of 1.14 (95% CI: 1.03–1.25) per 10 dB L_{den} increase in noise levels, across a range of around 50–70 dB. The evidence was rated moderate quality.

Two cross-sectional studies on road traffic noise and prevalence of stroke involved 14 098 participants, including 151 cases (Babisch et al., 2005a; 2008; 2012a; 2012b; 2013a; Floud et al., 2011; 2013a; 2013b; Jarup et al., 2005; 2008; van Poll et al., 2014) yielded an estimated RR of 1.00 (95% CI: 0.91–1.10) per 10 dB L_{den} increase in noise levels. This evidence was rated very low quality.

Furthermore, three cohort studies investigated the relationship between road traffic noise and mortality due to stroke (Beelen et al., 2009; Gan et al., 2012; Sörensen et al., 2011; 2012b; 2014). These involved 581 517 participants, including 2634 cases, and their pooled estimate was a statistically nonsignificant RR = 0.87 (95% CI: 0.71–1.06) per 10 dB L_{den} increase in road traffic noise levels. This evidence was rated moderate quality.

Fig. 5 presents the results of the meta-analysis for road traffic noise and measures of stroke.

Fig. 5. The association between exposure to road traffic noise (L_{den}) and stroke



Notes: The dotted vertical line corresponds to no effect of exposure to road traffic noise. The black dots correspond to the estimated RR per 10 dB and 95% CI. The white circles represent the summary estimate and 95% CI.
For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

Children's blood pressure

Six cross-sectional studies investigated the change in systolic and diastolic blood pressure in children exposed to road traffic noise in residential settings (Belojevic & Evans, 2011; 2012; Bilenko et al., 2013; Liu et al., 2013; 2014; Regecova & Kellerova, 1995; van Kempen et al., 2006). In total, 4197 children were included in these studies; the number of cases was not reported. For each increase in 10 dB L_{den} in noise levels, there was a statistically nonsignificant increase in systolic and in diastolic blood pressure of 0.08 mmHg (95% CI: –0.48–0.64) and 0.47 mmHg (95% CI: –0.30–1.24), respectively. The overall evidence was rated very low quality.

Furthermore, five cross-sectional studies investigated the association between systolic and diastolic blood pressure in children and exposure to road traffic noise in educational settings (Belojevic & Evans, 2011; 2012; Bilenko et al., 2013; Clark et al., 2012; Paunovic et al., 2013; Regecova & Kellerova, 1995; van Kempen et al., 2006). In total, 4520 children were included in these studies; the number of cases was not reported. Systolic blood pressure decreased statistically nonsignificantly, at –0.60 mm (95% CI: –1.51–0.30) per 10 dB L_{den} increase in road traffic noise levels. Diastolic blood pressure increased statistically nonsignificantly, at 0.46 mm (95% CI: –0.60–1.53) per 10 dB L_{den} increase in road traffic noise levels. For both relationships, the evidence was rated very low quality.

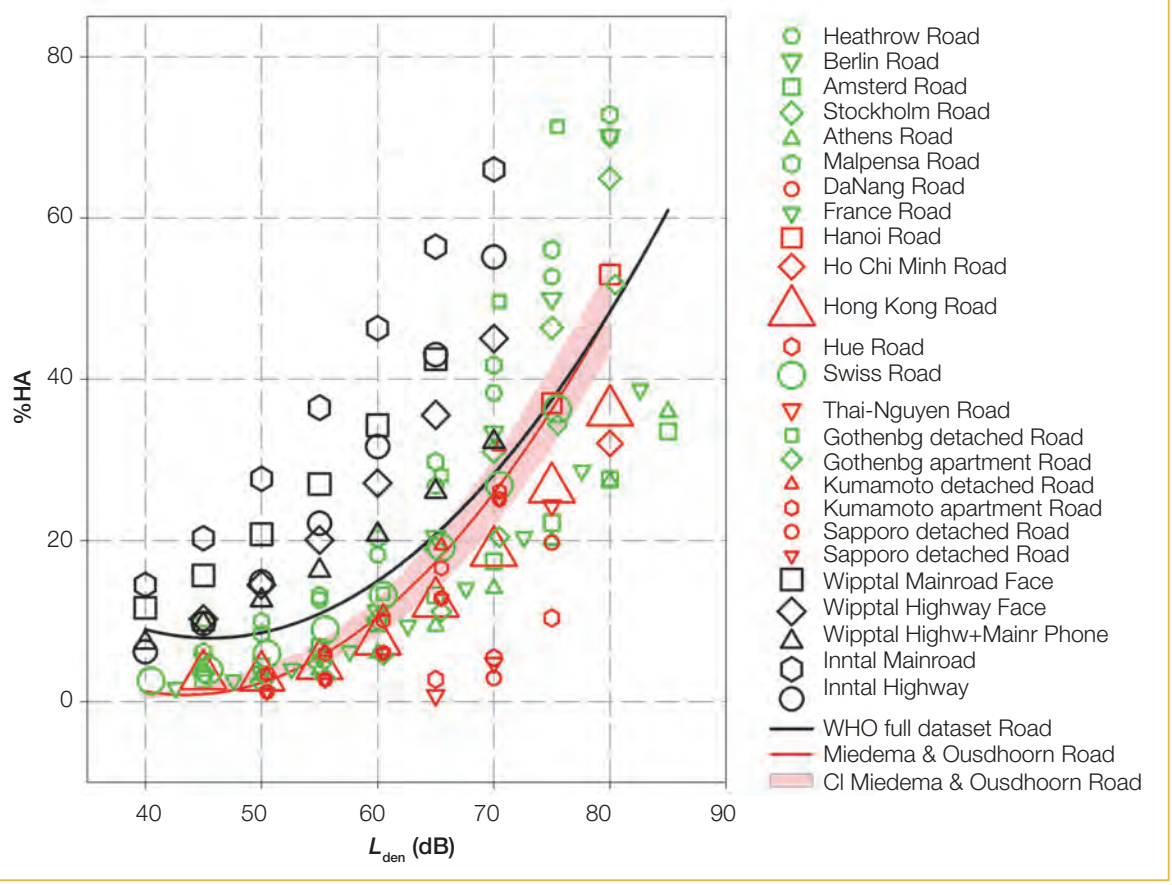
Annoyance

A vast amount of research proves the association between road traffic noise and annoyance. In total, 17 road traffic noise studies were identified that were used to model ERFs of the relationship between L_{den} and %HA (Babisch et al., 2009; Brink, 2013; Brink et al., 2016; Brown et al., 2014; 2015; Champelovier et al., 2003; Heimann et al., 2007; Lercher et al., 2007; Medizinische Universitaet Innsbruck, 2008; Nguyen et al., 2012a; Pierette et al., 2012; Sato et al., 2002; Shimoyama et al., 2014). These incorporated data from 34 112 study participants. The estimated data points of each of the studies are plotted in Fig. 6, alongside an aggregated ERF including the data from all the individual studies (see the black line for "WHO full dataset"). The lowest category of noise exposure considered in any of the studies, and hence included in the systematic review, is 40 dB, corresponding to approximately 9%HA. The benchmark level of 10%HA is reached at 53.3 dB L_{den} (see Fig 6).

Table 10 shows the %HA in relation to exposure to road traffic noise. The calculations are based on the regression equation $\%HA = 78.9270–3.1162 \times L_{den} + 0.0342 \times L_{den}^2$ derived from the systematic review (Guski et al., 2017). Even though there is a large evidence base substantiating the association of average road traffic noise and noise annoyance, the overall evidence had to be rated low quality. The main reasons for downgrading included limitations regarding the acoustical data provided, the nature of study design (most of the studies in the realm of annoyance research follow a cross-sectional approach), the inconsistency of results and the variety in the questions asked.

Nevertheless, the general quality of the evidence was substantiated with the help of additional statistical analyses that apply classic health outcome measures to estimate noise annoyance. When comparing road traffic noise exposure at 50 dB and 60 dB, the analyses revealed evidence rated moderate quality for an association between road traffic noise and %HA for an increase per 10 dB (OR = 2.74; 95% CI: 1.88–4.00). Moreover, there was evidence rated high quality for the increase of %HA per 10 dB increase in sound exposure, when data on all sound classes were included (OR = 3.03; 95% CI: 2.59–3.55).

Fig. 6.Scatterplot and quadratic regression of the relationship between road traffic noise (L_{den}) and annoyance (%HA)



Notes: The ERF by Miedema & Oudshoorn (2001) is added in red for comparison.
The size of the data points corresponds to the number of participants in the respective study (size = SQRT(N)/10).
If two results from different studies fall on the same data point, the last point plotted may mask the former one.
The black curve is derived from aggregated secondary data, while the red one is derived from individual data.
There is no indication of 95% CIs of the WHO full dataset, as a weighting based on the total number of participants for each 5 dB L_{den} sound class could not be calculated; weighting based on all participants of all sound classes proved to be unsuitable. The range of data included is illustrated by the distribution of data points.
For further details on the studies included in the figure please refer to the systematic review on environmental noise and annoyance (Guski et al., 2017).

Table 10. The association between exposure to road traffic noise (L_{den}) and annoyance (%HA)

L_{den} (dB)	%HA
40	9.0
45	8.0
50	8.6
55	11.0
60	15.1
65	20.9
70	28.4
75	37.6
80	48.5

Cognitive impairment

Evidence rated very low quality was available for the association between road traffic noise and reading and oral comprehension, assessed by tests. The review identified two papers that reported the results of the cross-sectional road traffic and aircraft noise exposure and children's cognition and health (RANCH) study, which examined exposure–effect relationships (Clark et al., 2006; Stansfeld et al., 2005). The study of over 2000 children aged 9–10 years, attending 89 schools around three major airports in the Netherlands, Spain and the United Kingdom did not find an exposure–effect relationship between road traffic noise exposure at primary school, which ranged from 31 to 71 dB $L_{Aeq,16h}$, and children's reading comprehension.

Few studies have investigated other health outcome measures related to cognition. Evidence rated low quality was available for an association between road traffic noise and cognitive impairment assessed through standardized tests (Cohen et al., 1973; Lukas et al., 1981; Pujol et al., 2014; Shield & Dockrell, 2008). There was evidence rated very low quality for an association between road traffic noise and long-term memory (Matheson et al., 2010; Stansfeld et al., 2005). No studies examined effects on short-term memory.

There was evidence rated very low quality, however, that road traffic noise does not have a considerable effect on children's attention (Cohen et al., 1973; Stansfeld et al., 2005). Further, there was evidence rated low quality that road traffic noise does not have a substantial effect on executive function (working memory), with studies consistently reporting no association (Clark et al., 2012; Matheson et al., 2010; Stansfeld et al., 2005; van Kempen et al., 2010; 2012).

Hearing impairment and tinnitus

No studies were found, and therefore no evidence was available for the association between road traffic noise and hearing impairment and tinnitus.

Sleep disturbance

For road traffic noise and self-reported sleep outcomes (awakenings from sleep, the process of falling asleep and sleep disturbance), 12 studies were identified that included a total of 20 120

participants (Bodin et al., 2015; Brown et al., 2015; Hong et al., 2010; Phan et al., 2010; Ristovska et al., 2009; Sato et al., 2002; Shimoyama et al., 2014); these were cross-sectional studies, conducted in healthy adults. The health outcome was measured by self-reporting via general health and noise surveys that included questions about sleep in general, and other questions about how noise affects sleep (see Table 11).

Table 11. Summary of findings for health effects from exposure to road traffic noise (L_{night})

Noise metric	Priority health outcome measure	Quantitative risk for adverse health	Lowest level of exposure across studies	Number of participants (studies)	Quality of evidence
Effects on sleep					
L_{night}	%HSD	OR: 2.13 (95% CI: 1.82–2.48) per 10 dB increase	43 dB	20 120 (12)	Moderate (downgraded for study limitations, inconsistency; upgraded for dose-response, magnitude of effect)

The model in the systematic review (Basner & McGuire, 2018) was based on outdoor L_{night} levels between 40 dB and 65 dB only; 40 dB was chosen as the lower limit because of possible inaccuracies of predicting lower noise levels. The range of noise exposure reported in the studies reviewed was 37.5–77.5 dB L_{night}. About 2% (95% CI: 0.90–3.15) of the population was characterized as highly sleep-disturbed at L_{night} levels of 40 dB. The %HSD at other, higher levels of road traffic noise is presented in Table 12. The association between road traffic noise and the probability of being highly sleep-disturbed was OR: 2.13 (95% CI: 1.82–2.48) per 10 dB increase in noise. This evidence was rated moderate quality.

Table 12. The association between exposure to road traffic noise (L_{night}) and sleep disturbance (%HSD)

L_{night} (dB)	%HSD	95% CI
40	2.0	0.9–3.15
45	2.9	1.40–4.44
50	4.2	2.14–6.27
55	6.0	3.19–8.84
60	8.5	4.64–12.43
65	12.0	6.59–17.36

Additional analyses were conducted for other health outcome measures related to sleep, which provided supporting evidence on the overall relationship between road traffic noise and sleep disturbance. When the noise source was not specified in the question, the relationship between road traffic noise and self-reported sleep outcomes was still positive but no longer statistically significant, with an OR of 1.09 (95% CI: 0.94–1.27) per 10 dB increase (Bodin et al., 2015; Brink, 2011; Frei et al., 2014; Halonen et al., 2012). This evidence was rated very low quality.

There was evidence rated moderate quality for an association between road traffic noise and sleep outcomes measured with polysomnography (probability of additional awakenings) with an OR of 1.36 (95% CI: 1.19–1.55) per 10 dB increase in indoor $L_{AS,max}$ [13] (Basner et al., 2006; Elmenhorst et al., 2012). Further, evidence rated low quality showed an association between road traffic noise and sleep outcomes measured as motility in adults (Frei et al., 2014; Griefahn et al., 2000; Oehrstroem et al., 2006a; Passchier-Vermeer et al., 2007; Pirrera et al., 2014). Finally, there was evidence rated very low quality for an association between road traffic noise and both self-reported and motility-measured sleep disturbance in children (Ising & Ising, 2002; Lercher et al., 2013; Oehrstroem et al., 2006a; Tiesler et al., 2013).

3.1.2.2 Evidence on interventions

This section summarizes the evidence underlying the recommendation on the effectiveness of interventions for road traffic noise exposure. The key question posed was: in the general population exposed to road traffic noise, are interventions effective in reducing exposure to and/or health outcomes from road traffic noise? A summary of the PICOS/PECCOS scheme applied and the main findings is set out in Tables 13 and 14.

Table 13. PICOS/PECCOS scheme of the effectiveness of interventions for exposure to road traffic noise

PICO	Description	
Population	**General population**	
Intervention(s)	The interventions can be defined as:	
	(a) a measures that aim to change noise exposure and associated health effects;	
	(b) a measures that aim to change noise exposure, with no particular evaluation of the impact on health; or	
	(c) a measures designed to reduce health effects, but that may not include a reduction in noise exposure.	
Comparison	**No intervention**	
Outcome(s)	For average noise exposure:	For night noise exposure:
	1. cardiovascular disease	1. effects on sleep
	2. annoyance	
	3. cognitive impairment	
	4. hearing impairment and tinnitus	
	5. adverse birth outcomes	
	6. quality of life, well-being and mental health	
	7. metabolic outcomes	

[13] $L_{AS,max}$ is the maximum time-weighted and A-weighted sound pressure level with SLOW time constant within a stated time interval starting at t1 and ending at t2, expressed in dB.

Table 14. Summary of findings for road traffic noise interventions by health outcome

Type of intervention	Number of participants (studies)	Effect of intervention	Quality of evidence
Annoyance			
Type A – source interventions (change in traffic flow rate, improved road resurfacing, truck restriction strategy, complex set of barriers, road surfaces and other measures)	6096[a] (9)	• Changes in noise level ranged from around –15 dB to +15.5 dB (various noise metrics). • Most studies found that the intervention resulted in a change in annoyance.	Moderate (downgraded for study limitations; upgraded for dose-response)
Type B – path interventions (dwelling insulation, barrier construction, building intervention)	2970 (7)	• Changes in noise level ranged from –3 dB to –13 dB (various noise metrics). • All studies found that the intervention resulted in a change in annoyance, as estimated by an ERF.	Moderate (downgraded for study limitations; upgraded for dose-response)
Type C – changes in infrastructure (new road tunnel infrastructure)	1211 (2)	• Noise levels reduced by an average of –12 dB ($L_{Aeq,24h}$). • Both studies found lower annoyance responses post intervention, with no change in the controls.	Moderate (downgraded for study limitations; upgraded for dose-response)
Type D – other physical interventions (availability of quiet side to the dwelling, existence of nearby green space)	26 786 (6)	• Because of large variability in noise levels between most and least exposed façade (quiet side), access to quiet side and/or green space resulted in less annoyance.	Very low (downgraded for study limitations)
Sleep disturbance			
Type B – path interventions (1: façade insulation; 2: enlargement of motorway lanes but with dwelling insulation, barriers and quiet pavement)	1158 (2)	• 1: façade insulation resulted in a reduction of 7 dB for indoor noise level. • 2: enlargement led to reduction in the extent of population exposure at higher noise levels (55–65 dB) with an increase in lower levels (45–55 dB) • Both path interventions resulted in changes in sleep outcomes	Moderate (downgraded for study limitations)
Type C – changes in infrastructure (new road tunnel infrastructure)	166 (2)	• Noise levels reduced by an average of –12 dB ($L_{Aeq,24h}$). • Both studies found lower sleep disturbance indicators/ improvement in sleep post intervention, with no change in the controls.	Moderate (downgraded for study limitations)
Type D – other physical interventions (availability of quiet side to the dwelling)	100 (1)	• An absence of quiet façade resulted in increased reporting of difficulty in falling asleep.	Very low (downgraded for study limitations, inconsistency)
Cardiovascular disease			
Type D – other physical interventions (availability of quiet side to the dwelling)	9203 (4)	• Three studies found changes (including in self-reported hypertension) with and without a quiet side. One study found no change.	Very low (downgraded for study limitations)

Note: [a] This figure does not include number of participants from the studies by Langdon & Griffiths (1982) and Baughan & Huddart (1993), as the exact number of respondents was not reported.

Type A – source interventions

Most of the nine source intervention studies – Baughan & Huddart (1993), Brown (1987; 2015), Brown et al. (1985), Griffiths & Raw (1987; 1989), Kastka (1981), Langdon & Griffiths (1982), Pedersen et al. (2013; 2014), Stansfeld et al. (2009b) – showed an effect in annoyance due to changes in road traffic flow rates. In some cases these were combined with other measures like improved road resurfacing, truck restrictions or complex control measures, including barriers or road surfaces. A majority of the changes resulted in reductions of noise levels.

Regarding the strength of association between exposure and annoyance outcome, all intervention studies demonstrated that the response was of at least the magnitude estimated by a steady-state ERF. The limited available evidence on long-term effects shows that this excess response undergoes some attenuation but is largely maintained over several years. In spite of the high risk of bias in all studies, the evidence in the systematic review was initially assessed as high quality, due to an upgrade because of the dose-response effect. However, the GDG decided to downgrade this assessment in an effort to maximize consistency with the grading approach of the remaining systematic reviews. It was therefore rated moderate quality.

Type B – path interventions

Seven path intervention studies – Amundsen et al. (2011; 2013), Bendtsen et al. (2011), Gidloef-Gunnarsson et al. (2010), Kastka et al. (1995), Nilsson & Berglund (2006), Vincent & Champelovier (1993) – explored the effects on annoyance by interventions related to dwelling insulation, barrier constructions and a combination of both, as well as a full-scale building intervention. With the help of pre/post designs, the studies assessed changes in noise exposure achieved by the interventions over different periods of time. In six studies the path intervention was associated with a change in annoyance outcomes. Four of these showed that the annoyance response to the change was in the same direction and of at least the same magnitude estimated by the ERF. In spite of the high risk of bias in all studies, the evidence in the systematic review was initially assessed as high quality, due to an upgrade because of the dose-response effect. However, the GDG decided to downgrade this assessment in an effort to maximize consistency with the grading approach of the remaining systematic reviews. The evidence was therefore rated moderate quality.

Two of the studies (Amundsen et al., 2013; Bendtsen et al., 2011) assessed path interventions and sleep disturbance. The results showed a reduction in the %HSD after the interventions were conducted. One of the studies included a two-year follow-up, revealing the persistence of the effect. Risk of bias was assessed as high in both studies. The evidence was rated moderate quality.

Type C – new/closed infrastructure interventions

Two infrastructural intervention studies (Gidloef-Gunnarsson et al., 2013; Oehrstroem, 2004; Oehrstroem & Skanberg, 2000) evaluated the impact on annoyance of major reductions in road traffic flows, combined with other environmental improvements. One was a new road tunnel infrastructure, resulting in substantial traffic and noise levels reductions for residents near the previously heavy-traffic road. Both studies were pre/post designs using repeated measures of annoyance outcomes. Following the reduction in noise levels (around –12 dB $L_{Aeq,24h}$), both studies demonstrated a statistically significant lower degree of annoyance, while there was no change in

the control group. Both also reported that the after-scores in the studies matched those estimated by the ERF, but both reported excess response, meaning that the response to change was in the direction estimated by the ERF but much steeper. In spite of the high risk of bias in all studies, the quality of the evidence in the systematic review was initially assessed as high, due to an upgrade because of the dose-response effect. However, the GDG decided to downgrade this assessment in an effort to maximize consistency with the grading approach of the remaining systematic reviews. The evidence was therefore rated moderate quality.

Two studies investigated the impact of new tunnels that removed traffic flow from surface roads on sleep disturbance (Oehrstroem, 2004; Oehrstroem & Skanberg, 2000; 2004). Subjective and objective measures of sleep quality were assessed before and after the intervention. Both studies demonstrated a statistically significant lower reporting of various sleep disturbance indicators post intervention. One study reported statistically significantly reduced time spent in bed after the intervention, which, according to the authors, could suggest increased sleep efficiency. Risk of bias was assessed as high, so this evidence was rated moderate quality.

Type D – other physical infrastructure interventions

No intervention studies were available to assess impacts on annoyance of other physical interventions. The only relevant studies (Babisch et al., 2012; de Kluizenaar et al, 2011; 2013; Gidloef-Gunnarsson & Oehrstroem 2007; van Renterghem & Botteldooren, 2012; 2010) did not provide direct evidence of an intervention. Instead, they provided indirect evidence on the magnitude of the likely effect of certain interventions (e.g. using the quiet side of the dwelling, green space in the neighbourhood) by comparing responses from groups with and without the intervention/feature of interest. All studies found an effect of the presence of the dimension investigated; in all but one, the effect was statistically significant. Risk of bias was assessed as high in all studies, so the evidence was rated very low quality.

One study investigated a subjective assessment of difficulty in falling asleep (van Renterghem & Botteldooren, 2012), before and after the intervention. The difference in the proportion of participants reporting difficulty falling asleep “at least sometimes” between homes with and without a quiet side was statistically significant. Absence of a quiet façade resulted in increased reporting of this sleep parameter. Confounding was adjusted for in the analyses of the ERFs, including noise sensitivity, window-closing behaviour and front-façade L_{den}. Risk of bias was assessed as high, so the evidence was rated very low quality.

Four studies that assessed the effect of other physical interventions on cardiovascular disease were identified (Babisch et al., 2012; 2014a; Bluhm et al., 2007; Lercher et al., 2011). Three of these found changes, including self-reported hypertension, with and without a quiet side of the dwelling; in two the difference was statistically significant. The risk of bias in these studies was generally high, so the evidence was rated very low quality.

3.1.2.3 Consideration of additional contextual factors

As the foregoing overview has shown, ample evidence about the adverse health effects of long-term exposure to road traffic noise exists. Based on the quality of the available evidence, the GDG set the strength of the recommendation on road traffic noise at strong. As a second step, it qualitatively

assessed contextual factors to explore whether other considerations could have a relevant impact on the recommendation strength. These considerations mainly concerned the balance of harms and benefits, values and preferences, equity, and resource use and implementation.

When assessing the balance of harms and benefits of interventions to reduce exposure to road traffic noise, the GDG initially noted that road traffic is the most widespread source of noise pollution, measured in terms of the number of affected people both within and outside urban areas. The EEA estimates that more than 100 million people in Europe are exposed to L_{den} levels above 55 dB; for night-time road traffic noise, over 72 million Europeans are exposed to L_{night} levels above 50 dB (Blanes et al., 2017).[14] The amount of road traffic noise emitted is unlikely to decrease significantly: both transport demand, including for passenger cars (EC, 2016b), and the number of city inhabitants (Eurostat, 2016) are expected to increase. Considering the significant burden of disease attributable to exposure to road traffic noise (WHO Regional Office for Europe & JRC, 2011), the GDG expects substantial health benefits to evolve from implementing the recommendations to reduce population exposure to road traffic noise. Depending on the intervention measures used (such as restrictions of traffic), possible harms could include effects on the transportation of goods and on individual mobility of the population. Both can have impacts on local, national and international economies. Overall, the GDG estimated that the benefits gained from minimizing adverse health effects due to road traffic noise exposure outweigh the possible (economic) harms.

Considering values and preferences, it has been established that people appreciate quiet areas as beneficial for their health and well-being, especially in urban areas (Shepherd et al., 2013; Gidloef-Gunnarsson & Oehrstroem, 2007; Oehrstroem et al., 2006b). Nevertheless, the GDG recognized that the convenience of individual mobility with the help of passenger cars is valued overall by large parts of the population in the EU, as illustrated by the sustained high volume of passenger kilometres driven in Europe (EEA, 2016a; 2017a). In general, values and preferences are expected to vary throughout society, as exposure to environmental noise and continuous road traffic noise is not equally distributed: those of individuals directly affected by long-term road traffic exposure are likely to differ from those that are not affected. Individuals with a higher average sound pressure level of road traffic noise are, for example, more willing to pay to reduce their noise exposure (Bristow et al., 2014).

In light of the dimension of equity, the GDG highlighted the fact that the risk of exposure to road traffic noise is not equally distributed throughout society. People with lower socioeconomic status and other disadvantaged groups often live in more polluted and louder areas, including in proximity to busy roads (EC, 2016a). Moreover, socioeconomic factors are not only related to differences in exposure to environmental factors such as noise but are also associated with increased vulnerability and poorer coping capacities (Karpati et al., 2002).

With resource use and implementation considerations, the GDG recognized that no comprehensive cost–benefit analysis for the WHO European Region yet exists, so this assessment is based on informed expert judgement regarding the feasibility of implementing the recommendation for the majority of the population. As the systematic review of environmental noise interventions and their

[14] These are gap-filled figures based on the reported data and including the situation both within and outside cities, as defined by the END.

associated impact on health shows, various effective measures exist to reduce noise exposure from road traffic and improve health (Brown & van Kamp, 2017). The resources needed to implement these measures vary as they rely on the type of intervention and the context. The GDG pointed out the following four major solutions, which are known to be cost-effective: choice of appropriate tyres, use of low-noise road surfaces, building of noise barriers and installation of soundproof windows (CSES et al., 2016). Other types of intervention include limitations of speed or type of traffic allowed on roads.

Regarding feasibility of implementation, the GDG was convinced that many of the solutions can be planned as part of regular maintenance processes and accelerated fleet and road modernization. In particular, appropriate tyres and road surfaces are only slightly more expensive than existing products, and various countries have already considered or adopted similar interventions to reduce noise levels (Ohiduzzaman et al., 2016; Sirin, 2016). This indicates that solutions to achieve recommended noise levels can be implemented and carry a reasonable cost on a societal level. The GDG noted, however, that the feasibility of implementing measures can be hindered by the fact that costs and benefits are not evenly distributed. In most cases, the health benefits gained by interventions that reduce long-term road traffic exposure accrue to citizens, whereas the costs are borne by road users, private companies and public authorities. Furthermore, the GDG expects challenges in the implementation of all long-term measures that include changes in behaviour of the population, such as increased use of car-sharing or public transport. Even though the overall costs are expected to be significant, because of the large number of people affected, the benefit of implementation of the recommendation to minimize the risk of adverse health effects due to road traffic noise for a majority of the population exceeds the resources needed.

In light of the assessment of the contextual factors in addition to the quality of evidence, the recommendation remains strong.

Other nonpriority adverse health outcomes

As an additional consideration, although not priority health outcomes and coming from a single study, the GDG noted the evidence rated moderate quality for an association between road traffic noise and the prevalence of diabetes (van Kempen et al., 2018). The noise levels in the study identified ranged from around 50 dB to 70 dB L_{den}, so the recommendation proposed is thought to be protective enough for this health outcome. Thus, it did not lead to a change in the recommendation.

Additional considerations or uncertainties

Individual noise annoyance judgements of residents are to a large extent moderated by personal variables (such as noise sensitivity and coping capacity). However, further situational factors that apply to many residents should be taken into account when analysing noise annoyance from road traffic noise, as they may moderate the relationship. These include the type(s) of road being considered (highways, urban main roads, secondary roads and so on) and the related traffic composition (share of cars, motorcycles and heavy and loud trucks) and pattern (fluctuation, frequency, intermittency). Moreover, the location of settlements and/or individual dwellings, proximity to the road, and location and availability of a quiet façade can also influence the relationship when predicting health outcomes such as annoyance.

3.1.3 Summary of the assessment of the strength of the recommendations

Table 15 provides a comprehensive summary of the different dimensions for the assessment of the strength of the road traffic noise recommendations.

Table 15. Summary of the assessment of the strength of the road traffic noise recommendation

Factors influencing the strength of recommendation	Decision
Quality of evidence	**Average exposure** (L_{den}) *Health effects* • Evidence for a relevant RR increase for incidence of IHD at **59 dB** L_{den} was rated **high quality**. • Evidence for the incidence of hypertension was rated **low quality**. • Evidence for a relevant absolute risk of annoyance at **53 dB** L_{den} was rated **moderate quality**. • Evidence for a relevant RR increase for reading and oral comprehension was rated **very low quality**. *Interventions* • Evidence on effectiveness of interventions to reduce noise exposure and/or health outcomes from road traffic noise is of varying quality. **Night-time exposure** (L_{night}) *Health effects* • Evidence for a relevant absolute risk of sleep disturbance related to night noise exposure from road traffic at **45 dB** L_{night} was rated **moderate quality**. *Interventions* • Evidence on effectiveness of interventions to reduce noise exposure and/or sleep disturbance from road traffic noise is of varying quality.
Balance of benefits versus harms and burdens	Health benefits can be gained from markedly reducing exposure of the population to road traffic noise; benefits outweigh the harms of interventions to reduce continuous road traffic noise.
Values and preferences	Quiet areas are valued by the population, especially by those affected by continuous noise exposure. Some variability is possible between those who benefit from interventions to reduce road traffic noise and those who finance the interventions.
Equity	Risk of exposure to road traffic noise is not equally distributed.
Resource use and implications	No comprehensive cost–effectiveness analysis data are available; nevertheless, a wide range of solutions exists and several are being implemented, showing that effective interventions are both feasible and economically reasonable.
Decisions on recommendation strength	• **Strong** for guideline level for average noise exposure (L_{den}) • **Strong** for guideline value for average night noise exposure (L_{night}) • **Strong** for specific interventions to reduce noise exposure

3.2 Railway noise

Recommendations

For average noise exposure, the GDG **strongly** recommends reducing noise levels produced by railway traffic below **54 dB** L_{den}, as railway noise above this level is associated with adverse health effects.

For night noise exposure, the GDG **strongly** recommends reducing noise levels produced by railway traffic during night time below **44 dB** L_{night}, as railway noise above this level is associated with adverse effects on sleep.

To reduce health effects, the GDG **strongly** recommends that policy-makers implement suitable measures to reduce noise exposure from railways in the population exposed to levels above the guideline values for average and night noise exposure. There is, however, insufficient evidence to recommend one type of intervention over another.

3.2.1 Rationale for the guideline levels for railway noise

The exposure levels were derived in accordance with the prioritizing process of critical health outcomes described in section 2.4.3. For each of the outcomes, the exposure level was identified by applying the benchmark, set as relevant risk increase to the corresponding ERF. In the case of exposure to railway noise, the process can be summarized as follows (Table 16).

Table 16. Average exposure levels (L_{den}) for priority health outcomes from railway noise

Summary of priority health outcome evidence	Benchmark level	Evidence quality
Incidence of IHD No studies were available and therefore incidence of IHD could not be used to assess the exposure level.	5% increase of RR	No studies met the inclusion criteria/no studies available
Incidence of hypertension One study met the inclusion criteria. There was no significant increase of risk associated with increased noise exposure in this study.	10% increase of RR	Low quality
Prevalence of highly annoyed population There was an absolute risk of 10% at a noise exposure level of 53.7 dB $L_{den.}$	10% absolute risk	Moderate quality
Permanent hearing impairment	No increase	No studies met the inclusion criteria/no studies available
Reading skills and oral comprehension in children	One-month delay	No studies met the inclusion criteria/no studies available

In accordance with the prioritization process (see section 2.4.3), the GDG set a guideline exposure level of 53.7 dB L_{den} for average exposure, based on the relevant increase of the absolute %HA. In accordance with the defined rounding procedure, the value was rounded to 54 dB L_{den}. As the evidence on the adverse effects of railway noise was rated moderate quality, the GDG made the recommendation strong.

Next, the GDG assessed the evidence for night noise exposure and its effect on sleep disturbance (Table 17).

Table 17. Night-time exposure levels (L_{night}) for priority health outcomes from railway noise

Summary of priority health outcome evidence	Benchmark level	Evidence quality
Sleep disturbance 3% of the participants in studies were highly sleep-disturbed at a noise level of **43.7 dB** L_{night}	3% absolute risk	Moderate quality

Based on the evidence of the adverse effects of railway noise on sleep disturbance, the GDG defined a guideline exposure level of 43.7 dB L_{night}. The exact exposure value was rounded to 44 dB L_{night}. As the evidence was rated moderate quality, the GDG made the recommendation strong.

The GDG also considered the evidence for the effectiveness of interventions. The results showed that:

- intervening at the source by applying rail grinding procedures can reduce noise annoyance;
- behavioural interventions such as informing the community about noise interventions can reduce noise annoyance.

In light of the strong evidence about the adverse health effects, the GDG followed a precautionary approach and made a strong recommendation for interventions on railway noise, as it was confident that interventions are realizable and that best practices already exist for the management of noise from railways. Since the empirical evidence on the effectiveness of different types of intervention was rated either low or very low quality, the GDG felt that no recommendation could be made on the preferred type of intervention, and agreed not to recommend any specific type of intervention over another.

3.2.1.1 Other factors influencing the strength of recommendations

Other factors considered in the context of recommendations on railway noise included those related to values and preferences, benefits and harms, resource implications, equity, acceptability and feasibility; moreover, nonpriority health outcomes were considered. The assessment of all these factors – especially the values and preferences involved in railway noise – did not lead to a change in the strength of the recommendations. Further details are provided in Section 3.2.2.3.

3.2.2 Detailed overview of the evidence

The following sections provide a detailed overview of the evidence constituting the basis for setting the recommendations on railway noise. It is presented and summarized separately for each of the critical health outcomes, and the GDG's judgement of the quality of evidence is indicated (for a detailed overview of the evidence on important health outcomes, see Annex 4). Research into health outcomes and effectiveness of interventions is addressed consecutively.

A comprehensive summary of all evidence considered for each of the critical and important health outcomes can be found in the eight systematic reviews published in the *International Journal of Environmental Research and Public Health* (see section 2.3.2 and Annex 2).

3.2.2.1 Evidence on health outcomes

The key question posed was: in the general population exposed to railway noise, what is the exposure–response relationship between exposure to railway noise (reported as various noise indicators) and the proportion of people with a validated measure of health outcome, when adjusted for main confounders? A summary of the PICOS/PECCOS scheme applied and the main findings is set out in Tables 18 and 19.

Table 18. PICOS/PECCOS scheme of critical health outcomes for exposure to railway noise

PECO	Description	
Population	General population	
Exposure	Exposure to high levels of noise produced by railway traffic (average/night time)	
Comparison	Exposure to lower levels of noise produced by railway traffic (average/night time)	
Outcome(s)	For average noise exposure: 1. cardiovascular disease 2. annoyance 3. cognitive impairment 4. hearing impairment and tinnitus 5. adverse birth outcomes 6. quality of life, well-being and mental health 7. metabolic outcomes	For night noise exposure: 1. effects on sleep

Table 19. Summary of findings for health effects from exposure to railway noise (L_{den})

Noise metric	Priority health outcome measure	Quantitative risk for adverse health	Lowest level of exposure across studies	Number of participants (studies)[a]	Quality of evidence
Cardiovascular disease					
L_{den}	Incidence of IHD	–	–	–	–
L_{den}	Incidence of hypertension	RR = 0.96 (95% CI: 0.88–1.04) per 10 dB increase	N/A	7249 (1)	Low (downgraded for risk of bias and availability of only one study)
Annoyance					
L_{den}	%HA	OR = 3.53 (95% CI: 2.83–4.39) per 10 dB increase	34	10 970 (10)	Moderate (downgraded for inconsistency, directness; upgraded for dose-response)
Cognitive impairment					
L_{den}	Reading and oral comprehension	–	–	–	–
Hearing impairment and tinnitus					
L_{den}	Permanent hearing impairment	–	–	–	–

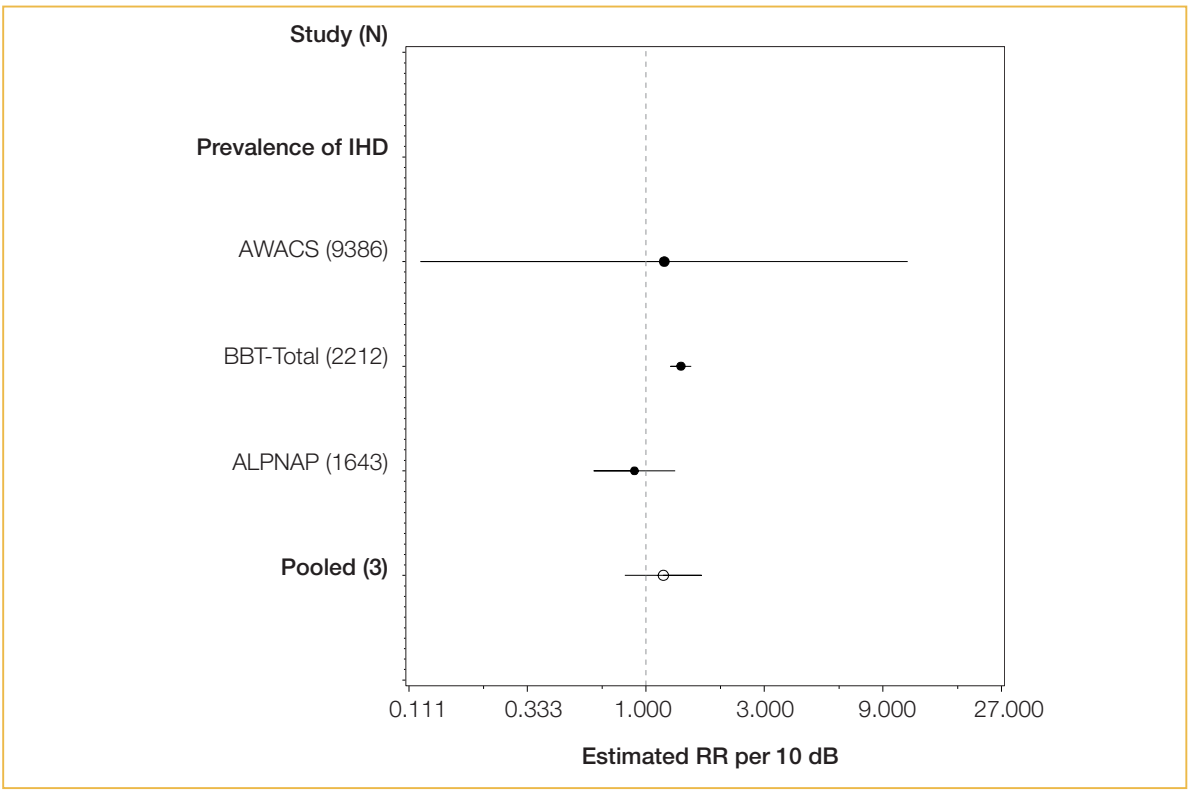
Note: [a] Results are partly derived from population-based studies.

Cardiovascular disease

IHD

No evidence was available on the relationship between railway noise and the incidence of or mortality from IHD. Four cross-sectional studies were identified, however, that assessed the prevalence of IHD in a total of 13 241 participants, including 283 cases (Heimann et al., 2007; Lercher et al., 2008; 2011; van Poll et al., 2014). The overall risk was not statistically significantly increased: the RR was 1.18 (95% CI: 0.82–1.68) per 10 dB L_{den} increase, with inconsistency across studies (see Fig. 7). The evidence was rated very low quality.

Fig. 7. The association between exposure to railway noise (L_{den}) and prevalence of IHD



Notes: The dotted vertical line corresponds to no effect of exposure to railway noise. The black circles correspond to the estimated RR per 10 dB and 95% CI. The white circle represents the pooled random effect estimates and 95% CI. For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

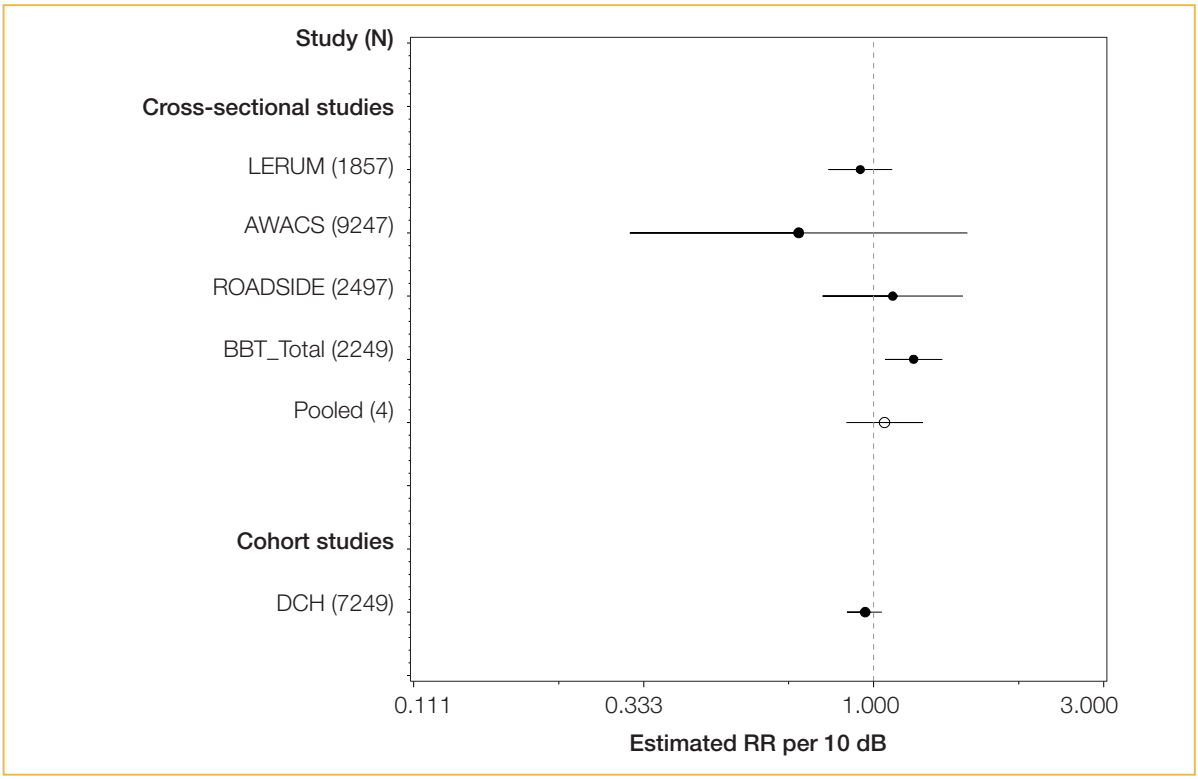
Hypertension

One cohort study on the relationship between railway noise and hypertension was identified; it assessed the incidence among people living in Denmark (Sörensen et al., 2011; 2012a). The study involved 7249 participants, including 3145 cases. The authors did not find an association between railway noise exposure and incidence of hypertension, with RR = 0.96 (95% CI: 0.88–1.04) per 10 dB L_{den} increase. This evidence was rated low quality.

In addition, five cross-sectional studies assessed the prevalence of hypertension in 15 850 participants, including 2059 cases (Barregard et al., 2009; Eriksson et al., 2012; Lercher et al., 2008; 2011; van Poll et al., 2014). The overall RR increase was not statistically significant, at 1.05 (95% CI: 0.88–1.26) per 10 dB L_{den} increase. Moreover, there was inconsistency among the results across studies. The evidence was rated very low quality.

Fig. 8 presents the studies investigating the relationship between railway noise and different measures of hypertension.

Fig. 8. The association between exposure to railway noise (L_{den}) and hypertension



Notes: The dotted vertical line corresponds to no effect of exposure to railway noise. The black dots correspond to the estimated RR per 10 dB and 95% CI. The white circle represents the summary estimate and 95% CI.
For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

Stroke

As for IHD, no evidence was available on the relationship between railway noise and incidence of or mortality from stroke. However, one cross-sectional study was identified that assessed the prevalence of stroke in 9365 participants, including 89 cases (van Poll et al., 2014). The overall risk was not statistically significantly increased, with RR = 1.07 (95% CI: 0.92–1.25) per 10 dB L_{den} increase. The evidence was rated very low quality.

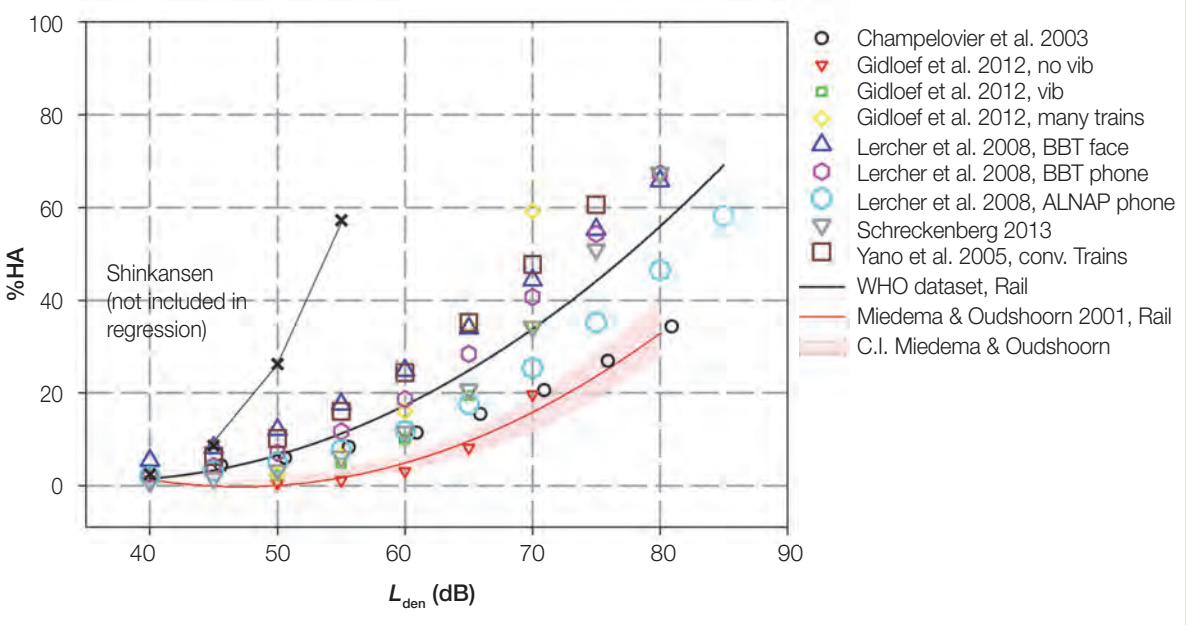
Children's blood pressure

No evidence was available for the association between railway noise and the systolic and/or diastolic blood pressure of children in residential and/or educational settings.

Annoyance

In total, 10 studies with ERFs on the association between railway noise and annoyance were included in analyses (Champelovier et al., 2003; Gidloef-Gunnarsson et al., 2012; Lercher et al., 2007; 2008; Sato et al., 2004; Schreckenberg, 2013; Yano et al., 2005; Yokoshima et al., 2008). The studies incorporated individual data from 10 970 participants. The estimated data points of each of these studies are plotted in Fig. 9, alongside an aggregated ERF including the data from all the individual studies (see the black line for "WHO dataset, Rail"). The lowest category of noise exposure considered in any of the studies, and hence included in the systematic review is 40 dB, corresponding to approximately 1.5%HA. The 10% benchmark for %HA is reached at 53.7 dB L_{den} (see Fig. 9).

Fig. 9. Scatterplot and quadratic regression of the relationship between railway noise (L_{den}) and annoyance (%HA)



Notes: The ERF by Miedema & Oudshoorn (2001) is added in red for comparison.
There is no indication of 95% CIs of the WHO dataset curve, as a weighting based on the total number of participants for each 5 dB L_{den} sound class could not be calculated; weighting based on all participants of all sound classes proved to be unsuitable. The range of data included is illustrated by the distribution of data points.
For further details on the studies included in the figure please refer to the systematic review on environmental noise and annoyance (Guski et al., 2017).

Table 20 shows the %HA for railway noise exposure. The calculations are based on the regression equation %HA = 38.1596–2.05538 × L_{den} + 0.0285 × L_{den}^2 derived from the systematic review (Guski et al., 2017). The overall evidence was rated moderate quality. Additional statistical analyses of annoyance outcomes supported these findings. When comparing railway noise exposure at 50 dB and 60 dB, the analyses revealed evidence rated moderate quality for an association between railway noise and %HA for an increase per 10 dB (OR = 3.40; 95% CI: 2.05–5.62). Moreover, evidence rated high quality was available for the increase in %HA per 10 dB increase in sound exposure, when data on all sound classes were included (OR = 3.53; 95% CI: 2.83–4.39).

Table 20. The association between exposure to railway noise (L_{den}) and annoyance (%HA)

L_{den} (dB)	%HA
40	1.5
45	3.4
50	6.6
55	11.3
60	17.4
65	25.0
70	33.9
75	44.3
80	56.1

Cognitive impairment

Studies of railway noise on children's reading and oral comprehension were lacking. Nevertheless, other measures of cognition yielded evidence rated very low quality for an association between railway noise and children with poorer performance on standardized assessment tests (Bronzaft, 1981; Bronzaft & McCarthy, 1975). Evidence for the association between railway noise and children having poorer long-term memory (Lercher et al., 2003) was rated very low quality. No studies examined effects on short-term memory.

There was no clear relation between railway noise and attention in children (Lercher et al., 2003), and this evidence was rated very low quality.

Hearing impairment and tinnitus

No studies were found, and therefore no evidence was available on the association between railway noise and hearing impairment and tinnitus.

Sleep disturbance

For railway noise and self-reported sleep outcomes (awakenings from sleep, the process of falling asleep and sleep disturbance), five studies were identified that included a total of 7133 participants (Bodin et al., 2015; Hong et al., 2010; Sato et al., 2004; Schreckenberg, 2013). The studies were cross-sectional and conducted on healthy adults. The health outcome was measured by self-reporting via general health surveys and noise surveys that included questions about sleep in general, and other questions about how noise affects sleep (Table 21).

Table 21. Summary of findings for health effects from exposure to railway noise (L_{night})

Noise metric	Priority health outcome measure	Quantitative risk for adverse health	Lowest level of exposure across studies	Number of participants (studies)	Quality of evidence
Effects on sleep					
L_{night}	%HSD	OR: 3.06 (95% CI: 2.38–3.93) per 10 dB increase	33 dB	7133 (5)	Moderate (downgraded for study limitations, inconsistency; upgraded for dose-response, magnitude of effect)

The model in the systematic review (Basner & McGuire, 2018) was based on outdoor L_{night} levels between 40 dB and 65 dB only; 40 dB was chosen as the lower limit because of possible inaccuracies in predicting lower noise levels. The range of noise exposure reported in the studies was 27.5–82.5 dB L_{night}. About 2% (95% CI: 0.79–3.48) of the population was characterized as highly sleep-disturbed for L_{night} levels of 40 dB. The %HSD at other, higher levels of railway noise is presented in Table 17. The association between railway noise and the probability of being sleep-disturbed was OR: 3.1 (95% CI: 2.4–3.9) per 10 dB increase in noise. This evidence was rated moderate quality.

Table 22. The association between exposure to railway noise (L_{night}) and sleep disturbance (%HSD)

L_{night} (dB)	%HSD	95% CI
40	2.1	0.79–3.48
45	3.7	1.63–5.71
50	6.3	3.12–9.37
55	10.4	5.61–15.26
60	17.0	9.48–24.37
65	26.3	15.20–37.33

Additional analyses were conducted for sleep quality measures, which provided supporting evidence on the overall relationship between railway noise and sleep. When the noise source was not specified in the question, the relationship between railway noise and self-reported sleep outcomes was still positive but no longer statistically significant, with an OR of 1.27 (95% CI: 0.89–1.81) per 10 dB increase (Bodin et al., 2015; Brink, 2011; Frei et al., 2014). This evidence was rated very low quality.

There was evidence rated moderate quality for an association between railway noise and the probability of additional awakenings, measured with polysomnography, with an OR of 1.35 (95% CI: 1.21–1.52) per 10 dB increase in indoor $L_{AS,max}$ (Elmenhorst et al., 2012). Finally, evidence rated low quality was available for an association between railway noise and sleep outcomes measured as motility in adults (Griefahn et al., 2000; Hong et al., 2006; Lercher et al., 2010; Passchier-Vermeer et al., 2007), and rated very low quality for an association between railway noise and both self-reported and motility-measured sleep disturbance in children (Ising & Ising, 2002; Lercher et al., 2013; Tiesler et al., 2013).

3.2.2.2 Evidence on interventions

This section summarizes the evidence underlying the recommendation on the effectiveness of interventions for railway noise exposure (Tables 23 and 24). The key question posed was: in the

general population exposed to railway noise, are interventions effective in reducing exposure to and/or health outcomes from railway noise? A summary of the PICOS/PECCOS scheme applied and the main findings is set out in Tables 23 and 24.

Table 23. PICOS/PECCOS scheme of the effectiveness of interventions for exposure to railway noise

PICO	Description	
Population	**General population**	
Intervention(s)	The interventions can be defined as: (a) a measure that aims to change noise exposure and associated health effects; (b) a measure that aims to change noise exposure, with no particular evaluation of the impact on health; or (c) a measure designed to reduce health effects, but that may not include a reduction in noise exposure.	
Comparison	**No intervention**	
Outcome(s)	For average noise exposure: 1. cardiovascular disease 2. annoyance 3. cognitive impairment 4. hearing impairment and tinnitus 5. adverse birth outcomes 6. quality of life, well-being and mental health 7. metabolic outcomes	For night noise exposure: 1. effects on sleep

Table 24. Summary of findings for railway noise interventions by health outcome

Type of intervention	Number of participants (studies)	Effect of intervention	Quality of evidence
Annoyance			
Type A – source interventions (rail grinding)	81 (1)	• Changes in noise level as a consequence of the intervention ranged from around –7dB to –8 dB. • Most studies found changes in annoyance outcomes, persisting more than 12 months after the intervention.	Very low (downgraded for study limitations, inconsistency, imprecision)
Type C – changes in infrastructure (new rail infrastructure)	6000[a] (1)	• A very small increase in total noise exposure was found (most had <+1 dB change; some had +2–4 dB change). • Original noise from road traffic overwhelmed the train noise for effectively all participants.	Very low (downgraded for study limitations, inconsistency, imprecision)
Type E – behaviour change interventions (informing the community about a noise intervention)	411 (1)	• Exposure levels were not reported; emission levels reduced by 1–2 dB. • A reduction in annoyance of the community as a result of the intervention was reported.	Very low (downgraded for study limitations, inconsistency, imprecision)

Note: [a] According to Lam & Au (2008), this records the number of invitation letters sent; the response rate was not reported.

Three studies on railway noise interventions met the criteria to be included in the evidence base. All studies consisted of a pre/post design and reported annoyance outcomes at people's dwellings (Lam & Au, 2008; Moehler et al., 1997; Schreckenberg et al., 2013). They could be categorized as a source intervention, a new/closed infrastructure intervention and a communication intervention. In two of the studies, the changes in exposure after the intervention were only small, although there were significant effects on noise annoyance. The study on source interventions and annoyance revealed that a change of –10 dB in noise exposure led to a significant reduction in annoyance, which persisted over a period of 12 months after the intervention. As confounding was not addressed, and railway noise was not the dominant sound source in the studies, the evidence was rated very low quality.

3.2.2.3 Consideration of additional contextual factors

As the foregoing overview has shown, sufficient evidence about the adverse health effects of long-term exposure to railway noise exists. Based on the quality of the available evidence, the GDG set the strength of recommendation on railway noise at strong. As a second step, it qualitatively assessed contextual factors to explore whether other considerations could have a relevant impact on the recommendation strength. These contextual considerations mainly concerned the balance of harms and benefits, values and preferences, and resource use and implementation.

When assessing the balance of harms and benefits of interventions to reduce exposure to railway noise and minimize noise-associated adverse health effects, the GDG recognized that railway transportation is the second most dominant source of environmental noise in Europe. Based on EEA estimates, the number of people exposed to L_{den} above 55 dB and L_{night} above 50 dB from railway noise is 17 million and 15 million, respectively (Blanes et al., 2017).[15] In light of the burden of disease from environmental noise, and railway noise in particular, the GDG agreed that the health benefits from a reduction of long-term railway noise exposure (especially during night time) to the recommended values would be significant. Considering possible harms related to adaptation of the recommended values, the GDG noted that reliance on railway transportation has increased in recent years in Europe and is expected to increase further, as an important component of the shift towards a greener economy. At a societal level, an environmental and economic benefit from the use of rail transportation is expected: trains contribute to lower environmental pollution and carbon emission than road transportation. Therefore, there is a need to balance the expected health benefits from reduced continuous railway noise exposure and the overall positive effects on the health of the population from increased reliance on the comparatively environmentally friendly mode of railway transportation. Overall, the GDG agreed that even though fewer people are exposed to railway noise than road traffic noise, it remains a major source of localized noise pollution; therefore, considerable benefits are gained by reducing exposure to railway noise.

When exploring values and preferences, the GDG acknowledged that, in general, people value rail as an alternative and more sustainable transportation method than air or road traffic (EEA, 2016a; 2016b; 2017b). Furthermore, the values and preferences in relation to implementation of the recommendation are expected to vary: those of individuals living in the vicinity of railway tracks are expected to differ from those of the rest of the population not exposed to railway noise on a long-term basis. Economic depreciation of housing and fear of adverse health effects were assumed

[15] These are gap-filled figures based on the reported data and including the situation both within and outside cities, as defined by the END.

to be two main aspects influencing the evaluation of affected individuals. This especially applies to areas where new railway tracks are being built, as this results in considerable change for local inhabitants. Moreover, the GDG acknowledged that preferences might also vary in the policy-making domain across different countries as the implementation of the recommendations would mean a renunciation of the so-called "railway bonus".[16]

On resource use and implementation considerations, the GDG pointed out that no comprehensive cost–benefit analysis for the WHO European Region has yet been conducted, so this assessment is based on informed qualitative expert judgement regarding the feasibility of implementing the recommendation for the majority of the population. The systematic review of environmental noise interventions and their associated impact on health shows that various measures to reduce continuous noise from railway traffic exist, although knowledge about their effectiveness remains limited (Brown & van Kamp, 2017). The GDG noted that the resources needed to implement different measures may vary considerably, as they depend on the situation and the type of intervention required. Implementation of some measures is expected to be most feasible during the development of new railway tracks; such as rail pads, bi-bloc sleepers, small noise barriers and – in extreme cases – tunnels, cuttings or earthwork barriers. Other interventions include acoustic rail grinding, noise barriers built alongside the tracks, construction of quieter locomotives and wagons and replacement of brakes on freight trains. The GDG assumed that most of these solutions could be planned as part of regular maintenance or, for instance, by speeding up fleet modernization and track modernization. Even though not broadly implemented, the solutions mentioned above have already been considered or adopted to reduce noise levels from railway noise exposure. Some EU countries (such as Germany), have programmes to replace old brake blocks from freight trains with newer, quieter ones and to ban all freight trains with old brake blocks from 2020 (Umweltbundesamt, 2017). This illustrates that solutions to achieve recommended noise levels can be implemented at a reasonable cost. Overall, the GDG agreed that the benefit of implementation of the recommendation to minimize the risk of adverse health effects due to railway noise for a majority of the population exceeds the (monetary) resources needed.

In light of the assessment of the contextual factors in addition to the quality of evidence, the recommendation remains strong.

Additional considerations or uncertainties

The GDG acknowledged that the main body of evidence for the recommendations on railway noise for average exposure was based on annoyance studies, conducted mainly in Asia and Europe. Studies are few for other priority health outcomes, and the evidence was generally rated low/very low quality. There is therefore uncertainty about the effects on health outcomes. Nevertheless, as a precautionary approach, a strong recommendation is made for average exposure to L_{den}, as a broad evidence base exists for health effects from exposure to other sources of transportation noise. However, the GDG stressed the importance of further research into health effects due to long-term exposure to railway noise.

Moreover, situational factors should be taken into account when analysing annoyance from railway noise. In particular, ground-borne vibrations are sometimes an additional exposure variable in railway

[16] The "railway bonus" is a correction factor commonly applied in the noise abatement policy domain in recent decades. It subsidizes the noise rating level for railway transportation by a predefined factor (Schuemer & Schuemer-Kohrs, 1991).

noise situations – especially in the case of annoyance – which may be difficult to separate from noise effects. In the set of 11 studies included in the systematic review on railway noise and annoyance, only two explicitly mentioned ground-borne vibrations as an additional source of annoyance.

Overall, the low-carbon, low-polluting nature of railway transport, especially using electric trains, means that rail is favoured over road and air traffic. However, night-time railway traffic on busy lines, including freight traffic, can be a significant source of sleep disturbance. Thus, guideline values should be set to encourage the development of rail traffic in Europe while at the same time giving adequate protection to residents from sleep disturbance.

3.2.3 Summary of the assessment of the strength of the recommendations

Table 25 provides a comprehensive summary of the different dimensions for the assessment of the strength of the railway noise recommendations.

Table 25. Summary of the assessment of the strength of the recommendation

Factors influencing the strength of recommendation	Decision
Quality of evidence	**Average exposure** (L_{den}) *Health effects* • Evidence for a relevant absolute risk of annoyance at **54 dB** L_{den} was rated **moderate quality.** • Evidence for a relevant RR increase of the incidence of hypertension was rated **low quality**. One study met the inclusion criteria but did not find a significant increase. *Interventions* • Evidence that different types of intervention reduce noise annoyance from railways was rated **very low quality**. **Night-time exposure** (L_{night}) *Health effects* • Evidence for a relevant absolute risk of sleep disturbance related to night noise exposure from railways at **44 dB** L_{night} was rated **moderate quality**. *Interventions* • No evidence was available on the effectiveness of interventions to reduce noise exposure and/or sleep disturbance from railway noise.
Balance of benefits versus harms and burdens	Railway noise is a major source of localized pollution. The health benefits of adapting the recommendation outweigh the harms. Nevertheless, it is important to consider the relevance of railways as an environmentally friendly mode of transportation.
Values and preferences	Quiet areas are valued by the population; especially by those affected by continuous noise exposure. Some variability is expected among those directly affected by railway noise and those not affected.
Resource implications	No comprehensive cost–effectiveness-analysis data are available, although a wide range of interventions exists, indicating that measures are both feasible and economically reasonable.
Decisions on recommendation strength	• **Strong** for guideline value for average noise exposure (L_{den}). • **Strong** for guideline value for night noise exposure (L_{night}). • **Strong** for specific interventions to reduce noise exposure.

3.3 Aircraft noise

Recommendations

For average noise exposure, the GDG **strongly** recommends reducing noise levels produced by aircraft below **45 dB** L_{den}, as aircraft noise above this level is associated with adverse health effects.

For night noise exposure, the GDG **strongly** recommends reducing noise levels produced by aircraft during night time below **40 dB** L_{night}, as aircraft noise above this level is associated with adverse effects on sleep.

To reduce health effects, the GDG strongly recommends that policy-makers implement suitable measures to reduce noise exposure from aircraft in the population exposed to levels above the guideline values for average and night noise exposure. For specific interventions the GDG recommends implementing suitable changes in infrastructure.

3.3.1 Rationale for the guideline levels for aircraft noise

The exposure levels were derived in accordance with the prioritization process of critical health outcomes described in section 2.4.3. For each of the outcomes, the exposure level was identified by applying the benchmark, set as relevant risk increase to the corresponding ERF. In the case of exposure to aircraft noise, the process can be summarized as follows (Table 26).

Table 26. Average exposure levels (L_{den}) for priority health outcomes from aircraft noise

Summary of priority health outcome evidence	Benchmark level	Evidence quality
Incidence of IHD A relevant risk increase from exposure to aircraft noise occurs at 52.6 dB L_{den}. The weighted average of the lowest noise levels measured in the studies was 47 dB L_{den} and the corresponding RR in the meta-analysis was 1.09 per 10 dB.	5% increase of RR	Very low quality
Incidence of hypertension One study met the inclusion criteria. There was no significant increase of risk associated with increased noise exposure in this study.	10% increase of RR	Low quality
Prevalence of highly annoyed population There was an absolute risk of 10% at a noise exposure level of 45.4 dB L_{den}.	10% absolute risk	Moderate quality
Permanent hearing impairment	No increase	No studies met the inclusion criteria
Reading skills and oral comprehension in children A relevant risk increase was found at 55 dB L_{den}.	One-month delay	Moderate quality

Based on the evaluation of evidence on relevant risk increases from the prioritized health outcomes, the GDG set a guideline exposure level of 45.4 dB L_{den} for average exposure to aircraft noise, based on the absolute %HA. It was confident that there was an increased risk for annoyance below this exposure level, but probably no relevant risk increase for other priority health outcomes. In accordance with the defined rounding procedure, the value was rounded to 45 dB L_{den}. As the evidence on the adverse effects of aircraft noise was rated moderate quality, the GDG made the recommendation strong.

Next, the GDG considered the evidence for night noise exposure and its effect on sleep disturbance (Table 27).

Table 27. Night-time exposure levels (L_{night}) for priority health outcomes from aircraft noise

Summary of priority health outcome evidence	Benchmark level	Evidence quality
Sleep disturbance 11% of participants were highly sleep-disturbed at a noise level of 40 dB L_{night}.	3% absolute risk	Moderate quality

Based on the evidence of the adverse effects of aircraft noise on sleep disturbance, the GDG defined a guideline exposure level of 40.0 dB L_{night}. It should be stressed that this recommendation for average aircraft noise levels at night far exceeds the benchmark of 3%HSD defined as relevant risk increase, but since no reliable acoustic data below this level were available, the GDG decided not to lower the guideline exposure level further, as an extrapolation of the exposure–response relationship to achieve these values would have been unavoidable. As the evidence was rated moderate quality, the GDG made the recommendation strong.

The GDG also considered the evidence for the effectiveness of interventions. The results showed that changes in infrastructure (opening and/or closing of runways, or flight path rearrangements) can lead to a reduction in aircraft noise exposure, as well as a decline in cognitive impairment in children and a reduction in annoyance. Moreover, examples of best practice already exist for the management of noise from aircraft, so the GDG made a strong recommendation.

3.3.1.1 Other factors influencing the strength of recommendations

Other factors considered in the context of recommendations on aircraft traffic noise included those related to values and preferences, benefits and harms, resource implications, equity, acceptability and feasibility; moreover, nonpriority health outcomes were considered. Ultimately, the assessment of all these factors did not lead to a change in the strength of the recommendations. Further details are provided in section 3.3.2.3.

3.3.2 Detailed overview of the evidence

The following sections provide a detailed overview of the evidence constituting the basis for setting the recommendations on aircraft noise. It is presented and summarized separately for each of the critical health outcomes, and the GDG's judgement of the quality of evidence is indicated (for a detailed overview of the evidence on important health outcomes, see Annex 4). Research into health outcomes and effectiveness of interventions is addressed consecutively.

A comprehensive summary of all evidence considered for each of the critical and important health outcomes can be found in the eight systematic reviews published in the *International Journal of Environmental Research and Public Health* (see section 2.3.2 and Annex 2).

3.3.2.1 Evidence on health outcomes

The key question posed was: in the general population exposed to aircraft noise, what is the exposure–response relationship between exposure to aircraft noise (reported as various noise indicators) and the proportion of people with a validated measure of health outcome, when adjusted for main confounders? A summary of the PICOS/PECCOS scheme applied and the main findings is set out in Tables 28 and 29.

Table 28. PICOS/PECCOS scheme of critical health outcomes for exposure to aircraft noise

PECO	Description	
Population	General population	
Exposure	Exposure to high levels of noise produced by aircraft traffic (average/night time)	
Comparison	Exposure to lower levels of noise produced by aircraft traffic (average/night time)	
Outcome(s)	For average noise exposure:	For night noise exposure:
	1. cardiovascular disease	1. effects on sleep
	2. annoyance	
	3. cognitive impairment	
	4. hearing impairment and tinnitus	
	5. adverse birth outcomes	
	6. quality of life, well-being and mental health	
	7. metabolic outcomes	

Table 29 .Summary of findings for health effects from exposure to aircraft noise (L_{den})

Noise metric	Priority health outcome measure	Quantitative risk for adverse health	Lowest level of exposure across studies	Number of participants (studies)[a]	Quality of evidence
Cardiovascular disease					
L_{den}	Incidence of IHD	RR = 1.09 (95% CI: 1.04–1.15) per 10 dB increase	47 dB	9 619 082[a] (2)	Very low (downgraded for risk of bias; upgraded for dose-response)
L_{den}	Incidence of hypertension	RR = 1.00 (95% CI: 0.77–1.30) per 10 dB increase	N/A	4712 (1)	Low (downgraded for risk of bias and because only one study available)
Annoyance					
L_{den}	%HA	OR = 4.78 (95% CI: 2.27–10.05) per 10 dB increase	33 dB	17 094 (12)	Moderate (downgraded for inconsistency)
Cognitive impairment					
L_{den}	Reading and oral comprehension	1–2-month delay per 5 dB increase	Around 55 dB	(4)	Moderate (downgraded for inconsistency)
Hearing impairment and tinnitus					
L_{den}	Permanent hearing impairment	–	–	–	–

Note: [a] Results are partly derived from population-based studies.

Cardiovascular disease

IHD

No cohort or case-control studies on the relationship between aircraft noise and IHD are available. However, two ecological studies were identified that provide information on the relationship between aircraft noise and incidence (hospital admission) of IHD (Correia et al., 2013; Hansell et al., 2013). These involved a total of 9 619 082 participants, including 158 977 cases. The RR was 1.09 (95% CI: 1.04–1.15) per 10 dB L_{den} increase, and the lowest exposure range was ≤51 dB and <45 dB. Given the weights in the meta-analysis of these two studies, the weighted average starting level was calculated as 47 dB. The evidence was rated very low quality.

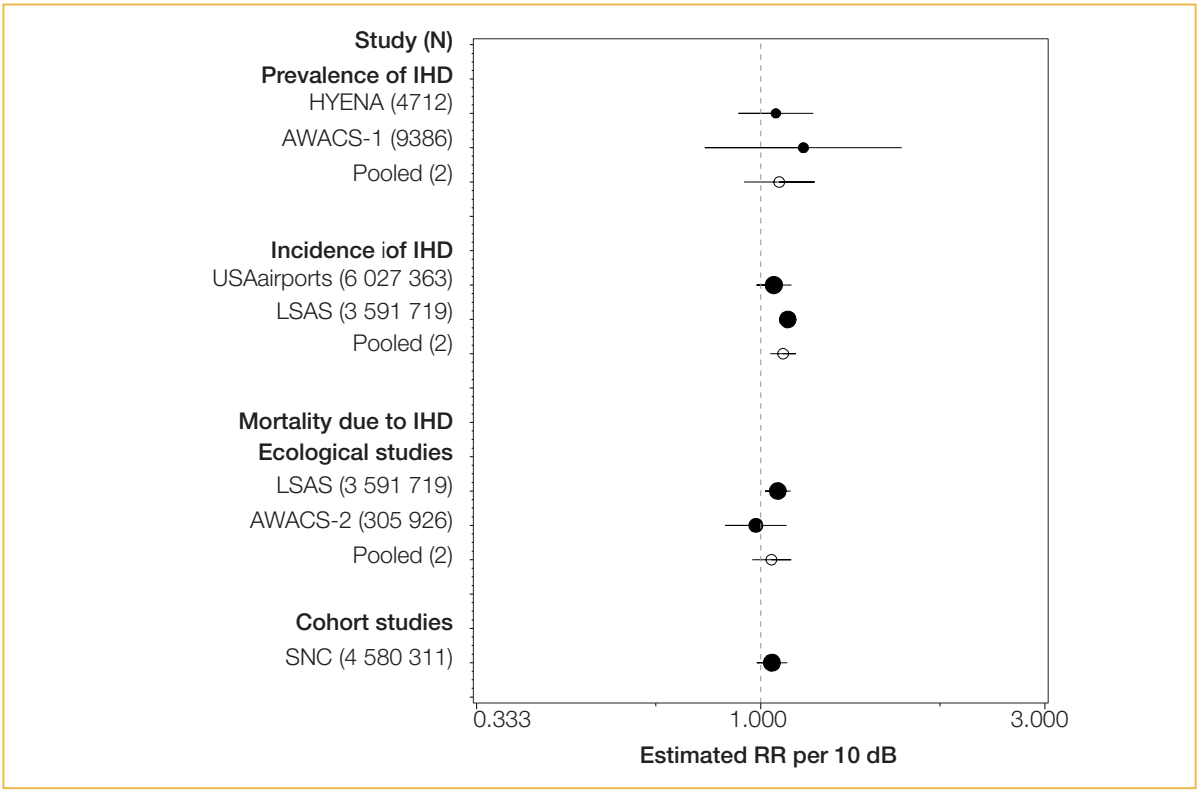
Two cross-sectional studies were identified that assessed the prevalence of IHD in people living in cities located around airports in Europe. The studies involved 14 098 participants, including 340 cases (Babisch et al., 2005b; 2008; 2012a; 2012b; 2013a; Floud et al., 2011; 2013a; 2013b; Jarup et al., 2005; 2008; van Poll et al., 2014). The overall risk was RR = 1.07 (95% CI: 0.94–1.23) per 10 dB L_{den} increase. The evidence was rated low quality.

With regard to the relationship between aircraft noise and mortality due to IHD, one cohort study (Huss et al., 2010) and two ecological studies (Hansell et al., 2013; van Poll et al., 2014) were identified. The cohort study identified 4 580 311 participants, including 15 532 cases, living in Switzerland, and the authors found an RR of 1.04 (95% CI: 0.98–1.11) per 10 dB L_{den} increase in noise. The evidence was rated low quality. The two ecological studies identified a total of 3 897 645

participants, including 26 066 cases in the Netherlands and the United Kingdom. The overall RR was 1.04 (95% CI: 0.97–1.12) per 10 dB L_{den} increase in noise, and the evidence was rated very low quality.

Fig. 10 summarizes the results for the relationship between aircraft noise and different measures of IHD.

Fig. 10. The association between exposure to aircraft noise (L_{den}) and IHD



Notes: The dotted vertical line corresponds to no effect of exposure to aircraft noise. The black circles correspond to the estimated RR per 10 dB and 95% CI. The white circles represent the pooled random effect estimates and 95% CI. For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

Hypertension

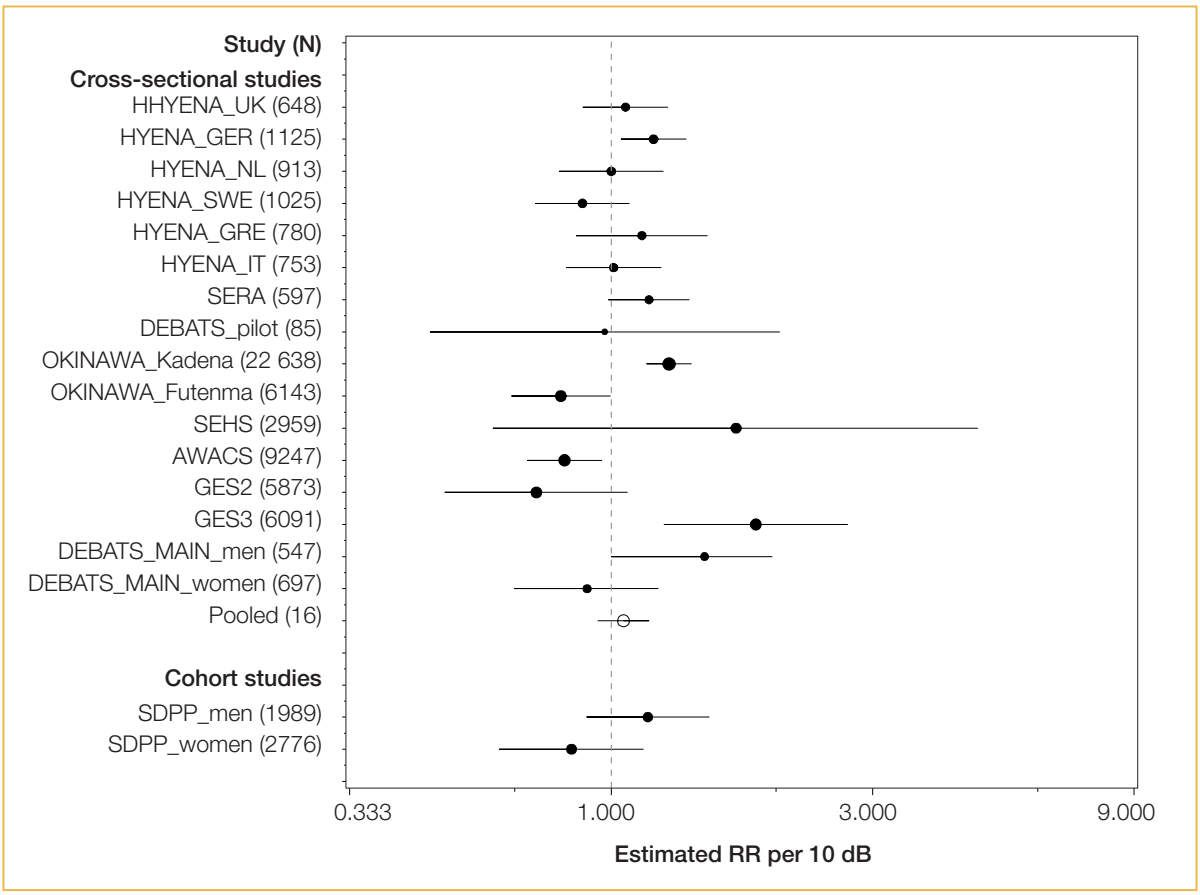
One cohort study was identified that assessed the relationship between aircraft noise and hypertension in people living in Sweden (Bluhm et al., 2004; 2009; Eriksson et al., 2007; 2010). The study involved 4712 participants, including 1346 cases. The authors found a nonstatistically significant effect size of RR = 1.00 (95% CI: 0.77–1.30) per 10 dB L_{den} increase. This evidence was rated moderate quality.

Furthermore, nine cross-sectional studies assessed the prevalence of hypertension in 60 121 participants, including 9487 cases (Ancona et al., 2010; Babisch et al., 2005b; 2008; 2012a; 2012b; 2013a; Breugelmans et al., 2004; Evrard et al., 2013; 2015; Houthuijs & van Wiechen, 2006; Jarup

et al., 2005; 2008; Matsui, 2013; Matsui et al., 2001; 2004; Rosenlund et al., 2001; van Kamp et al., 2006; van Poll et al., 2014). The overall RR was 1.05 (95% CI: 0.95–1.17) per 10 dB L_{den} increase, with inconsistency across studies. The evidence was rated low quality.

Fig. 11 summarizes the results for both prevalence and incidence of hypertension.

Fig. 11. The association between exposure to aircraft noise (L_{den}) and hypertension in cross-sectional and cohort studies



Notes: The dotted vertical line corresponds to no effect of aircraft noise exposure. The black dots correspond to the estimated RR per 10 dB and 95% CI. The white circle represents the pooled summary estimate and 95% CI. For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

Stroke

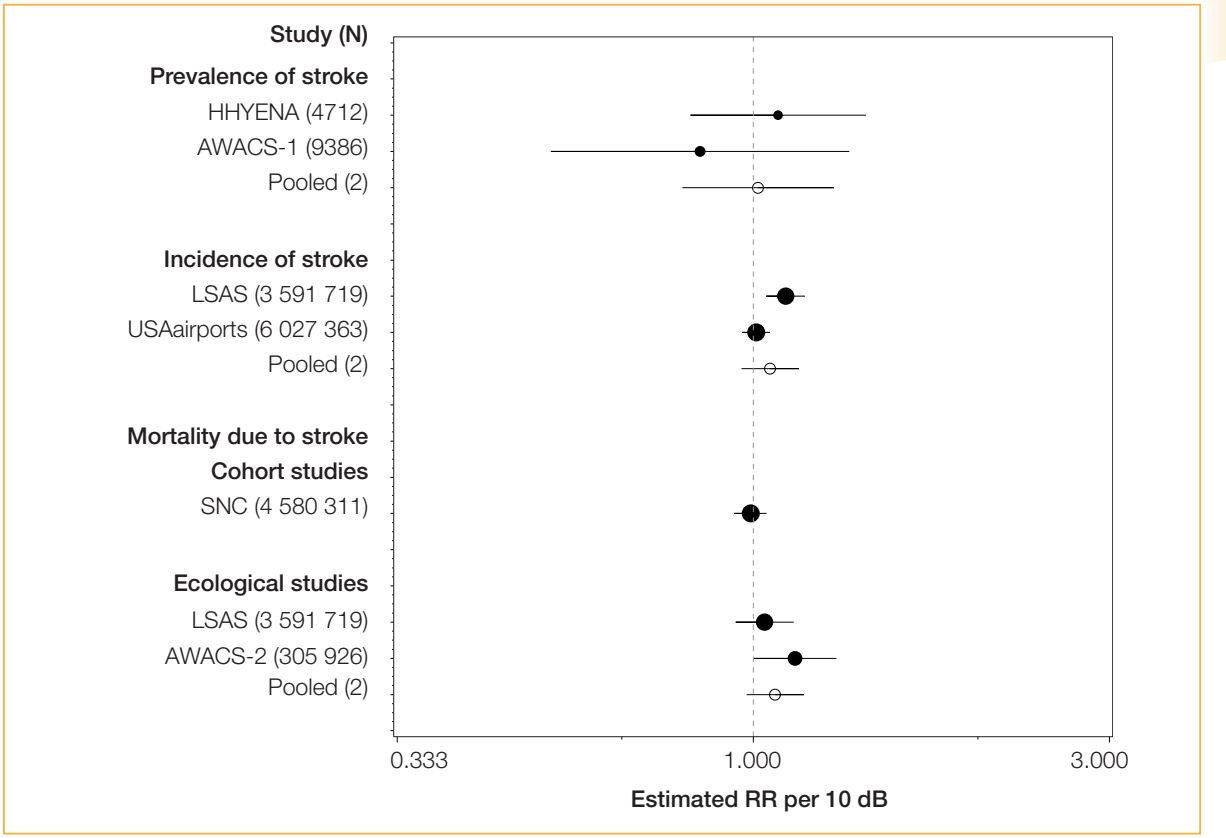
No cohort or case-control studies on the relationship between aircraft noise and incidence (hospital admission) of stroke were available, but two ecological studies were conducted in cities around airports in the United Kingdom and United States of America, involving 9 619 082 participants, including 97 949 cases (Correia et al., 2013; Hansell et al., 2013). An overall RR of 1.05 (95% CI: 0.96–1.15) per 10 dB L_{den} increase in noise was found. The evidence was rated very low quality.

Two cross-sectional studies were identified that assessed the prevalence of stroke in 14 098 participants, including 151 cases (Babisch et al., 2005b; 2008; 2012a; 2012b; 2013a; Floud et al., 2011; 2013a; 2013b; Jarup et al., 2005; 2008; van Poll et al., 2014). The overall RR was 1.02 (95% CI: 0.80–1.28) per 10 dB L_{den} increase. The evidence was rated very low quality.

On the relationship between aircraft noise and mortality due to stroke, one cohort study (Huss et al., 2010) and two ecological studies (Hansell et al., 2013; van Poll et al., 2014) were identified. The cohort study identified 4 580 311 participants, including 25 231 cases, living in Switzerland; the authors found an RR of 0.99 (95% CI: 0.94–1.04) per 10 dB L_{den} increase in noise. The overall evidence was rated moderate quality. The two ecological studies identified a total of 3 897 645 participants, including 12 086 cases, in the Netherlands and the United Kingdom. The overall RR was 1.07 (95% CI: 0.98–1.17) per 10 dB L_{den} increase in noise. The evidence was rated very low quality.

Fig. 12 summarizes the results for the relationship between aircraft noise and different measures of stroke.

Fig. 12. The association between exposure to aircraft noise (L_{den}) and stroke



Notes: The dotted vertical line corresponds to no effect of exposure to aircraft noise. The black dots correspond to the estimated RR per 10 dB and 95% CI. The white circle represents the summary estimate and 95% CI.
For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

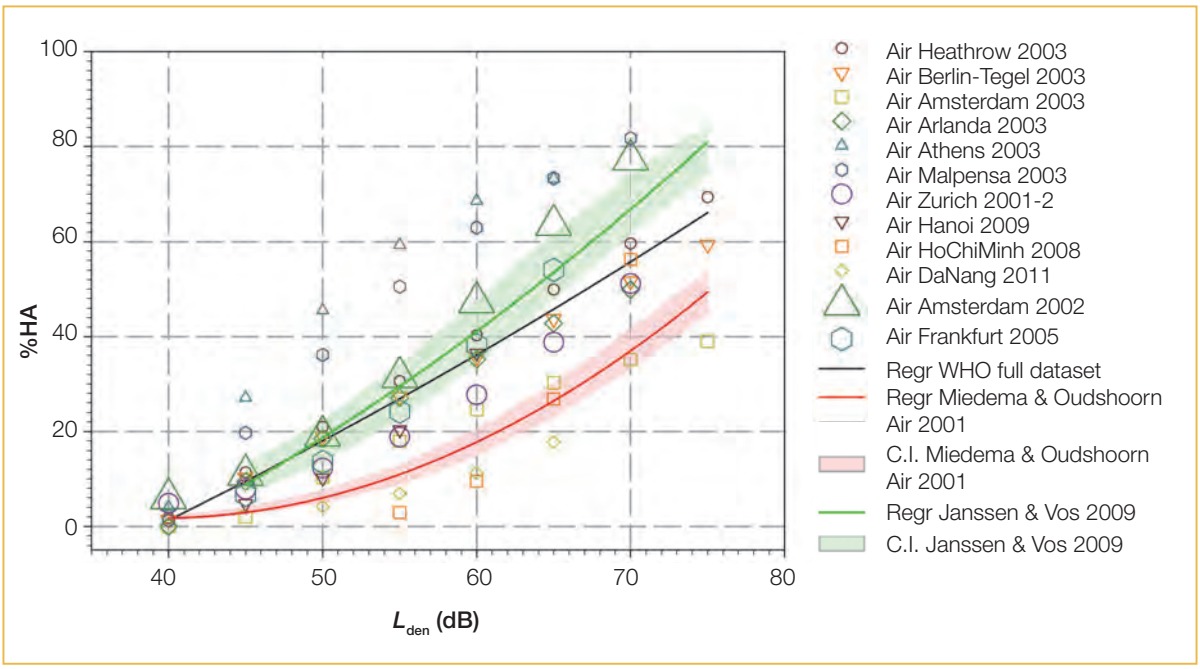
Children's blood pressure

For the association between aircraft noise and blood pressure in children, two cross-sectional studies were conducted in Australia, the Netherlands and the United Kingdom, including a total of 2013 participants (Clark et al., 2012; Morrell et al., 1998; 2000; van Kempen et al., 2006). The change in both systolic and diastolic blood pressure was assessed, in residential and/or educational settings. There was serious inconsistency in the results and therefore no overall estimate of the effect was developed. The evidence was rated very low quality.

Annoyance

A vast amount of evidence proves the association between aircraft noise and annoyance. In total, 12 aircraft noise studies were identified that were used to model ERFs of the relationship between L_{den} and %HA (Babisch et al., 2009; Bartels et al., 2013; Breugelmans et al., 2004; Brink et al., 2008; Gelderblom et al., 2014; Nguyen et al., 2011; 2012a; 2012b; Sato & Yano, 2011; Schreckenberg & Meis, 2007). These include data from 17 094 study participants. The estimated data points of each of the studies are plotted in Fig. 13, alongside an aggregated ERF including the data from all the individual studies (see the black line for "Regr WHO full dataset"). The lowest category of noise exposure considered in any of the studies, and hence included in the systematic review, is 40 dB, corresponding to approximately 1.2%HA. The benchmark level of 10%HA is reached at approximately 45 dB L_{den} (see Fig. 13).

Fig. 13. Scatterplot and quadratic regression of the relationship between aircraft noise (L_{den}) and annoyance (%HA)



Notes: ERFs by Miedema & Oudshoorn (2001, red), and Janssen & Vos (2009, green) are added for comparison. There is no indication of 95% CIs of the WHO dataset curve, as a weighting based on the total number of participants for each 5 dB L_{den} sound class could not be calculated; weighting based on all participants of all sound classes proved to be unsuitable. The range of data included is illustrated by the distribution of data points. For further details on the studies included in the figure please refer to the systematic review on environmental noise and annoyance (Guski et al., 2017).

Table 30 shows the %HA in relation to exposure to aircraft traffic noise. It is based on the regression equation %HA = –50.9693 + 1.0168 × L_{den} + 0.0072 × L_{den}^2 derived from the systematic review (Guski et al., 2017). As the majority of the studies are cross-sectional, the evidence was rated moderate quality.

The general quality of the evidence was further substantiated with the help of additional statistical analyses that apply classical health outcome measures to estimate noise annoyance. When comparing aircraft noise exposure at 50 dB and 60 dB, the analyses revealed evidence rated high quality for an association between aircraft noise and %HA for an increase per 10 dB (OR = 3.40; 95% CI: 2.42–4.80). Moreover, there was evidence rated high quality for the increase of %HA per 10 dB increase in sound exposure, when data on all sound classes were included (OR = 4.78; 95% CI: 2.27–10.05).

Table 30. The association between exposure to aircraft noise (L_{den}) and annoyance (%HA)

L_{den} (dB)	%HA
40	1.2
45	9.4
50	17.9
55	26.7
60	36.0
65	45.5
70	55.5

Cognitive impairment

Evidence rated moderate quality was available for an association between aircraft noise and reading and oral comprehension, assessed by standardized tests. This is based on a narrative review of 14 studies that examined aircraft noise exposure effects on reading and oral comprehension (Clark et al., 2006; 2012; 2013; Evans & Maxwell, 1997; Haines et al., 2001a; 2001b; 2001c; Hygge et al., 2002; Klatte et al., 2014; Matsui et al., 2004; Seabi et al., 2012; 2013; Stansfeld et al., 2005; 2010). Of these studies, 10 were cross-sectional, and only four had a longitudinal and/or intervention design (Clark et al., 2013; Haines et al., 2001c; Hygge et al., 2002; Seabi et al., 2013). Most of the studies (10 of 14) demonstrated a statistically significant association or at least demonstrated a trend between higher aircraft noise exposure and poorer reading comprehension.

This relationship is supported by evidence on other health outcome measures related to cognition. Evidence rated moderate quality was available for an association between aircraft noise and children with poorer performance on standardized assessment tests (Eagan et al., 2004; FICAN, 2007; Green et al., 1982; Sharp et al., 2014). There was also evidence rated moderate quality on aircraft noise being associated with children having poorer long-term memory (Haines et al., 2001b). No studies examined the effects on short-term memory.

However, there was no substantial effect (evidence rated low quality) of aircraft noise on children's attention (Haines et al., 2001a; Hygge et al., 2002; Matsui et al., 2004; Stansfeld et al., 2005; 2010), or on executive function (working memory) (evidence rated very low quality), with studies consistently suggesting no association for aircraft noise (Clark et al., 2012; Haines et al., 2001a;

Haines et al., 2001b; Klatte et al., 2014; Matheson et al., 2010; Stansfeld et al., 2005; 2010; van Kempen et al., 2010; 2012).

Hearing impairment and tinnitus

No studies were found, and therefore no evidence was available on the association between aircraft noise and hearing impairment and tinnitus.

Sleep disturbance

For aircraft noise and self-reported sleep outcomes, six studies were identified that included a total of 6371 participants (Nguyen et al., 2009; 2010; 2011; 2012c; 2015; Schreckenberg et al., 2009; Yano et al., 2015). The majority of studies were cross-sectional by design and were conducted in otherwise healthy adults. The model was based on outdoor L_{night} levels between 40 dB and 65 dB only; the lower limit of 40 dB was set because of inaccuracies in predicting lower noise levels (Table 31).

Table 31. Summary of findings for health effects from exposure to aircraft noise (L_{night})

Noise metric	Priority health outcome measure	Quantitative risk for adverse health	Lowest level of exposure across studies	Number of participants (studies)	Quality of evidence
Effects on sleep					
L_{night}	%HSD	OR: 1.94 (95% CI: 1.61–2.33) per 10 dB increase	35 dB	6371 (6)	Moderate (downgraded for study limitations, inconsistency; upgraded for dose-response, magnitude of effect)

The range of noise exposure reported in studies was 37.5–62.5 dB. Over 11% (95% CI: 4.72–17.81) of the population was characterized as highly sleep-disturbed at L_{night} levels of 40 dB. The %HSD at other, higher levels of aircraft noise is presented in Table 27. The table is derived from the regression model in the systematic review specified as $\%HSD = 16.79–0.9293 \times L_{night} + 0.0198 \times L_{night}^2$. The health outcome was measured in the studies by self-reporting, focusing on questions asking about awakenings from sleep, the process of falling asleep and/or sleep disturbance, where the question referred specifically to how noise affects sleep. The same relationship between aircraft noise and reporting being sleep-disturbed (all questions combined) can also be expressed as an OR of 1.94 (95% CI: 1.61–2.33) per 10 dB increase in noise. This evidence was rated moderate quality.

Table 32. The association between exposure to aircraft noise (L_{night}) and sleep disturbance (%HSD)

L_{night}	%HSD	95% CI
40	11.3	4.72–17.81
45	15.0	6.95–23.08
50	19.7	9.87–29.60
55	25.5	13.57–37.41
60	32.3	18.15–46.36
65	40.0	23.65–56.05

Additional analyses were included in the systematic review and provided supporting evidence on the association between aircraft noise and sleep. When the noise source was not specified in the survey question, the relationship between aircraft noise and self-reported sleep outcomes was still positive, although no longer statistically significant (OR: 1.17 (95% CI: 0.54–2.53) per 10 dB increase) (Brink, 2011). This evidence was rated very low quality.

Further, there was evidence rated moderate quality for an association between aircraft noise and polysomnography-measured outcomes (probability of additional awakenings), with an OR of 1.35 (95% CI: 1.22–1.50) per 10 dB increase in indoor $L_{AS,max}$ (Basner et al., 2006). Evidence rated low quality was also available for an association between aircraft noise and motility-measured sleep outcomes in adults (Passchier-Vermeer et al., 2002).

3.3.2.2 Evidence on interventions

The following section summarizes the evidence underlying the recommendation on the effectiveness of interventions for aircraft noise exposure. The key question posed was: in the general population exposed to aircraft noise, are interventions effective in reducing exposure to and/or health outcomes from aircraft noise? A summary of the PICOS/PECCOS scheme applied and the main findings is set out in Tables 33 and 34.

Seven studies examining different types of interventions on aircraft noise met the inclusion criteria to become part of the evidence base of the systematic review. Six of these investigated infrastructure interventions (Breugelmans et al., 2007; Brink et al., 2008; Fidell et al., 2002; Hygge et al., 2002), and one assessed a path intervention (Asensio et al., 2014). The majority of studies focused on annoyance as a health outcome, but two also included effects on sleep and one investigated the effects of path interventions on cognitive development in children.

Table 33. PICOS/PECCOS scheme of the effectiveness of interventions for exposure to aircraft noise

PICO	Description	
Population	**General population**	
Intervention(s)	The interventions can be defined as: (a) a measure that aims to change noise exposure and associated health effects; (b) a measure that aims to change noise exposure, with no particular evaluation of the impact on health; or (c) a measure designed to reduce health effects, but that may not include a reduction in noise exposure.	
Comparison	**No intervention**	
Outcome(s)	For average noise exposure: 1. cardiovascular disease 2. annoyance 3. cognitive impairment 4. hearing impairment and tinnitus 5. adverse birth outcomes 6. quality of life, well-being and mental health 7. metabolic outcomes	For night noise exposure: 1. effects on sleep

Table 34. Summary of findings for aircraft noise interventions by health outcome

Type of intervention	Number of participants (studies)	Effect of intervention	Quality of evidence
Annoyance			
Type B – path interventions (retrofitting dwellings close to airports with acoustic insulation)	689 (1)	• Change in noise levels was not reported. • The study found a drop in annoyance following the insulation intervention	Very low (downgraded for study limitations, inconsistency, precision)
Type C – changes in infrastructure (opening and/or closing of runways, or flight path rearrangements)	2101 (3)	• There was a wide range of changes in noise levels (from –12 dB to +13.7 dB; most between ±1 dB and 2 dB; different noise indicators used). • All studies found changes in annoyance outcomes as a result of the intervention.	Moderate (downgraded for study limitations; upgraded for dose-response)
Sleep disturbance			
Type C – changes in infrastructure (flight path changes)	1707 (2)	• Changes in noise levels were mostly between ±1 dB and 2 dB. • Both studies found changes in sleep disturbance outcomes as a result of the intervention.	Low (downgraded for study limitations)
Cognitive development of children			
Type C – changes in infrastructure (opening and/or closing of runways, or flight path rearrangements)	326 (1)	• Changes in noise levels of +9 dB at the new airport and of –14 dB at the old airport were reported. • The study found various cognitive effects on children (for both the reduction and the increase in exposure). Effects disappeared when the old airport closed, emerging after the new airport opened.	Moderate (downgraded for inconsistency)

The largest body of research concentrated on the opening and closing of runways, leading to subsequent changes in flight paths (Breugelmans et al., 2007; Brink et al., 2008; Fidell et al., 2002). It showed that changes in noise exposure as a consequence of rearrangement of flight paths, step changes or increase or removal of over-flights resulted in statistically significant changes of the annoyance ratings of residents living in the vicinity of airports. The studies investigated both increases and reductions in exposure. Moreover, all the studies provided evidence that the change in response to noise exposure was an excess response to the intervention. As all the studies either adjusted for confounding or ruled out confounding by design, and the risk of bias was high in two studies but low in one, the evidence was rated moderate quality.

Two of these studies also investigated the effects of interventions on sleep disturbance. The results indicated that the percentage of sleep disturbance changed in association with the change in noise exposure caused by flight path adaptations (Breugelmans et al., 2007; Fidell et al., 2002). Both studies adjusted for confounding, but the risk of bias was assessed as high. Thus, the evidence was rated low quality.

One study examined the impact of rearranging flight paths on the cognitive effects on children (Hygge et al., 2002), showing various effects (for both the reduction and the increase in exposure).

The study ruled out confounding by study design and the risk of bias was assessed as low. The evidence was therefore rated moderate quality.

Alongside infrastructure interventions, a Spanish study presented evidence on path interventions (Asensio et al., 2014), showing a drop in annoyance following an insulation intervention. The study did not control for confounding and the risk of bias was assessed as high. The evidence was therefore rated very low quality.

3.3.2.3 Consideration of additional contextual factors

As the foregoing overview has shown, substantial evidence about the adverse health effects of long-term exposure to aircraft noise exists. Based on the quality of the available evidence, the GDG set the strength of the recommendation of aircraft noise at strong. As a second step, it qualitatively assessed contextual factors to explore whether other considerations could have a relevant impact on the recommendation strength. These considerations mainly concerned the balance of harms and benefits, values and preferences, equity, and resource use and implementation.

When assessing the balance of harms and benefits from implementing the recommendations on aircraft exposure, the GDG acknowledged that the number of people affected was lower than for road traffic or railway noise, since aircraft noise only affects the areas surrounding airports and under flight paths. Data from the EEA show that the estimated number of people in Europe exposed to L_{den} levels above 55 dB and L_{night} levels above 50 dB is 3 million and 1.2 million, respectively (Blanes et al., 2017).[17] Nevertheless, it remains a major source of localized noise pollution and has been predicted to increase (EASA et al., 2016). Furthermore, aircraft noise is regarded as more annoying than the other sources of transportation noise (Schreckenberg et al., 2015; Miedema & Oudshoorn, 2001); it is therefore associated with a significant burden on public health, and the GDG expects substantial health benefits for the population to evolve from implementing the recommendations to reduce exposure to aircraft traffic noise. Furthermore, the GDG noted that, depending on the intervention measure implemented (such as a night flight ban), additional health benefits could evolve, resulting from a simultaneous reduction in air pollution (EC, 2016a). The GDG also acknowledged that intervention measures like night flight bans might also reduce carbon emission, thereby positively influencing the shift towards a greener and more sustainable economy. Possible harms in relation to the applied noise abatement strategy, on the other hand, could include effects on the transportation of goods, as well as individual mobility of the population. Both could have impacts on local, national and international economies. Overall, the GDG estimated that the benefits gained from minimizing adverse health effects due to aircraft noise exposure outweigh the possible (economic) harms.

Considering values and preferences, the GDG noted that negative attitudes towards aircraft noise are especially prevalent in affected individuals who can see and hear aircraft from their house, or who fear that living in proximity of airports will have an impact on their health (Schreckenberg et al., 2015) or property value (economic loss) (Bristow et al., 2014). A lack of trust in the airport and government authorities can enhance these negative attitudes towards airports and aircraft noise (Borsky, 1979; Schreckenberg, 2017). Furthermore, the GDG recognized that values and preferences of individuals living in the vicinity of different airports may vary, as the infrastructural characteristics

[17] These are gap-filled figures based on the reported data and including the situation both within and outside cities, as defined by the END.

of airports have a significant effect on the evaluation of residents. Airports with a stable number of aircraft movements in the near past and no intention to change the number in the future can give rise to a different evaluation of values and preferences than airports with relatively sustained increases in the number of aircraft movements. This can result from the fact that opening new runways or increasing the number of flights usually means considerable change in the environment for inhabitants of the affected area. It has been postulated that the change of exposure itself may be an annoying factor, and this may explain why aircraft noise annoyance is generally higher than that for other sources of transportation noise at a comparable noise level (Brown & van Kamp, 2009). The GDG acknowledged that, in general, air travel is an important means of transportation relevant for businesses, the public and the economy. In Europe, aviation is projected to be the fastest-growing sector from passenger transport demand, by 2050 (EEA, 2016a). The general population tends to value the convenience of travel by air. Moreover, the GDG pointed out that exposure to aircraft noise is not equally distributed throughout society. The preferences of people living in the vicinity of airports are expected to differ from those of the general population that does not experience the same noise burden. This might facilitate variance in the values and preference of the population, as those benefiting from the services and revenues generated by an airport may regard noise reduction measures as an additional, unnecessary extra cost, while those living around an airport and affected by aircraft noise may be in favour of noise reductions, since this concerns their health and well-being. Despite these differences, however, the GDG was confident that a majority of the population would value the minimization of adverse health effects and therefor welcome the implementation of the recommendations.

Regarding the dimension of equity, the GDG highlighted that the risk of exposure to aircraft noise is not equally distributed throughout society. Members of society with a lower socioeconomic status and other disadvantaged groups often live in more polluted and louder areas, including in close proximity to airports (EC, 2016a). In addition to the increased risk of exposure to environmental noise, socioeconomic factors are also associated with increased vulnerability and poorer coping capacities (Karpati et al., 2002).

With resource use and implementation considerations, the GDG acknowledged that the economic evaluation of the health impacts of environmental noise is most elaborate and extensive for aircraft noise (Berry & Sanchez, 2014). Nevertheless, no comprehensive cost–benefit analysis for the WHO European Region yet exists, so this assessment is based on informed qualitative expert judgement regarding the feasibility of implementing the recommendation for the majority of the population. The systematic review of interventions and their associated impact on environmental noise and health shows that various measures to reduce continuous noise from aircraft exist. Moreover, the quality of the evidence was judged to be moderate (Brown & van Kamp, 2017). The GDG noted that the resources needed to implement different intervention measures may vary considerably, because they depend on the situation and the type of intervention required. The distribution of costs also differs from that for other modes of transportation, since exposure to aircraft noise is localized in a more agglomerated way, and overall the population affected is smaller compared to other modes of transportation. The GDG furthermore recognized that multiple cost-effective intervention strategies exist (EC, 2016b). Prohibition or discouragement strategies against citizens moving to the direct proximity of airports, for example, can be implemented in the context of urban planning. Likewise, diverting flight paths above less-populated areas can lead to a reduction in exposure. In principle,

such intervention measures do not involve any direct costs, although safety concerns may limit the feasibility of these strategies. Passive noise abatement measures like the installation of soundproof windows at the dwelling were also regarded as feasible and economically reasonable by the GDG, as these are implemented at several airports already. In relation to active abatement measures, the GDG acknowledged the "balanced approach" elaborated by International Civil Aviation Organization, which states that noise reduction should take place first at the source. As indicated by the Clean Sky Programme, this could, for example, entail shifting towards the introduction of new aircraft. This broad European research programme estimates that, depending on type, the shift to newly produced aircraft could lead to a reduction of approximately 55–79% of the area affected by aircraft noise, and consequently the population exposed. As this solution has been put forward by the aviation sector, it is considered feasible. Overall, this indicates that solutions to achieve recommended noise levels can be implemented and at reasonable costs. The GDG agreed that implementation of the recommendation to minimize the risk of adverse health effects due to aircraft noise for a majority of the population would require a reasonable amount of (monetary) resources. It noted, however, that the feasibility of implementing the measures could be hindered by the fact that costs and benefits are not equally distributed. In most cases, the health benefits citizens gain from interventions that reduce aircraft exposure are borne by private companies and public authorities.

In light of the assessment of the contextual factors in addition to the quality of evidence, the recommendation remains strong.

Other nonpriority adverse health outcomes

Although not a priority health outcome and coming from a single study, the GDG noted the evidence rated moderate quality for the statistically significant association between aircraft noise and the change in waist circumference (Eriksson et al., 2014). The range of noise levels in the study identified was 48 to 65 dB L_{den}, and therefore the recommendation would also be protective enough for this health outcome.

In the context of aircraft noise, when considering the impacts of exposure on cognitive impairment in children, these guideline recommendations also apply particularly to the school setting. Noise exposure at primary school and at home is often highly correlated; however, the evidence base considered comes mainly from studies designed around sampling at school and not residences.

Additional considerations or uncertainties

There is additional uncertainty when characterizing exposure using the acoustical description of aircraft noise by means of L_{den} or L_{night}. Use of these average noise indicators may limit the ability to observe associations between exposure to aircraft noise and some health outcomes (such as awakening reactions); as such, noise indicators based on the number of events (such as the frequency distribution of $L_{A,max}$) may be better suited. However, such indicators are not widely used.

The GDG acknowledged that the guideline recommendation for L_{night} may not be fully protective of health, as it implies that around 11% (95% CI: 4.72–17.81) of the population may be characterized as highly sleep-disturbed at the recommended L_{night} level. This is higher than the 3% absolute risk considered for setting the guideline level. However, the high calculation uncertainty in predicting noise levels lower than 40 dB prevented the GDG from recommending a lower level. Furthermore,

lower levels would probably require a ban on night or early morning flights altogether, which is not feasible in many situations, given that the general population tends to value the convenience of air travel.

3.3.3 Summary of the assessment of the strength of recommendation

Table 35 provides a comprehensive summary of the different dimensions for the assessment of the strength of the aircraft noise recommendations.

Table 35. Summary of the assessment of the strength of the recommendation

Factors influencing the strength of recommendation	Decision
Quality of evidence	**Average exposure (L_{den})** *Health effects* • Evidence for a relevant RR increase of the incidence of IHD at **52 dB** L_{den} was rated **very low quality.** • Evidence for a relevant RR increase of the incidence of hypertension was rated **low quality**. • Evidence for a relevant absolute risk of annoyance at **45 dB** L_{den} was rated **moderate quality**. • Evidence for a relevant RR increase of impaired reading and oral comprehension at **55 dB** L_{den} was rated **moderate quality**. *Interventions* • Evidence on effectiveness of interventions to reduce noise exposure and/or health outcomes from aircraft noise was of varying quality. **Night-time exposure (L_{night})** *Health effects* • Evidence for a relevant absolute risk of sleep disturbance related to night noise exposure from aircraft at **40 dB** L_{night} was rated **moderate quality**. *Interventions* • Evidence on effectiveness of changes in infrastructure (flight path changes) to reduce sleep disturbance from aircraft noise was rated **low quality**.
Balance of benefits versus harms and burdens	Aircraft noise is a major source of localized noise pollution. The health benefits of adapting the recommendations are expected to outweigh the harms.
Values and preferences	Quiet areas are valued by the population, especially by those affected by continuous aircraft noise exposure. Some variability is expected among those directly affected by aircraft noise and those not affected.
Equity	Risk of exposure to aircraft noise is not equally distributed.
Resource implications	No comprehensive cost–effectiveness analysis data are available; nevertheless, a wide variety of interventions exist (some at very low cost), indicating that measures are both feasible and economically reasonable.
Decisions on recommendation strength	• **Strong** for guideline value for average noise exposure (L_{den}) • **Strong** for guideline value for night noise exposure (L_{night}) • **Strong** for specific interventions to reduce noise exposure

3.4 Wind turbine noise

Recommendations

For average noise exposure, the GDG **conditionally** recommends reducing noise levels produced by wind turbines below **45 dB** L_{den}, as wind turbine noise above this level is associated with adverse health effects.

To reduce health effects, the GDG **conditionally** recommends that policy-makers implement suitable measures to reduce noise exposure from wind turbines in the population exposed to levels above the guideline values for average noise exposure. No evidence is available, however, to facilitate the recommendation of one particular type of intervention over another.

3.4.1 Rationale for the guideline levels for wind turbine noise

The exposure levels were derived in accordance with the prioritizing process of critical health outcomes described in section 2.4.3. For each of the outcomes, the exposure level was identified by applying the benchmark, set as relevant risk increase to the corresponding ERF. In the case of exposure to wind turbine noise, the process can be summarized as follows (Table 36).

Table 36. Average exposure levels (L_{den}) for priority health outcomes from wind turbine noise

Summary of priority health outcome evidence	Benchmark level	Evidence quality
Incidence of IHD Incidence of IHD could not be used to assess the exposure level.	5% increase of RR	No studies were available
Incidence of hypertension Incidence of hypertension could not be used to assess the exposure level.	10% increase of RR	No studies were available
Prevalence of highly annoyed population Four studies were available. An exposure–response curve of the four studies revealed an absolute risk of 10%HA (outdoors) at a noise exposure level of 45 dB L_{den}.	10% absolute risk	Low quality
Permanent hearing impairment	No increase	No studies were available
Reading skills and oral comprehension in children	One-month delay	No studies were available

In accordance with the prioritization process, the GDG set a guideline exposure level of 45.0 dB L_{den} for average exposure, based on the relevant increase of the absolute %HA. The GDG stressed that there might be an increased risk for annoyance below this noise exposure level, but it could not state whether there was an increased risk for the other health outcomes below this level owing to a lack of evidence. As the evidence on the adverse effects of wind turbine noise was rated low quality, the GDG made the recommendation conditional.

Next, the GDG considered the evidence for night noise exposure to wind turbine noise and its effect on sleep disturbance (Table 37).

Table 37. Night-time exposure levels (L_{night}) for priority health outcomes from wind turbine noise

Summary of priority health outcome evidence	Benchmark level	Evidence quality
Sleep disturbance Six studies were available; they did not reveal consistent results about effects of wind turbine noise on sleep.	3% absolute risk	Low quality

Based on the low quantity and heterogeneous nature of the evidence, the GDG was not able to formulate a recommendation addressing sleep disturbance due to wind turbine noise at night time.

The GDG also looked for evidence about the effectiveness of interventions for wind turbine noise exposure. Owing to a lack of research, however, no studies were available on existing interventions and associated costs to reduce wind turbine noise.

Based on this assessment, the GDG therefore provided a conditional recommendation for average noise exposure (L_{den}) to wind turbines and a conditional recommendation for the implementation of suitable measures to reduce noise exposure. No recommendation about a preferred type of intervention could be formulated; nor could a recommendation be made for an exposure level for night noise exposure (L_{night}), as studies were not consistent and in general did not provide evidence for an effect on sleep.

3.4.1.1 Other factors influencing the strength of recommendation

Other factors considered in the context of recommendations on wind turbine noise included those related to values and preferences, benefits and harms, resource implications, equity, acceptability and feasibility. Ultimately, the assessment of all these factors did not lead to a change in the strength of recommendation, although it informed the development of a conditional recommendation on the intervention measures. Further details are provided in section 3.4.2.3.

3.4.2 Detailed overview of the evidence

The following sections provide a detailed overview of the evidence constituting the basis for setting the recommendations on wind turbine noise. It is presented and summarized separately for each of the critical health outcomes, and the GDG's judgement of the quality of evidence is indicated (for a detailed overview of the evidence on important health outcomes, see Annex 4). Research into health outcomes and effectiveness of intervention is addressed consecutively.

A comprehensive summary of all evidence considered for each of the critical and important health outcomes can be found in the eight systematic reviews published in the *International Journal of Environmental Research and Public Health* (see section 2.3.2 and Annex 2).

It should be noted that, due to the time stamp of the systematic reviews, some more recent studies were not included in the analysis. This relates in particular to several findings of the Wind Turbine Noise and Health Study conducted by Health Canada (Michaud, 2015). Further, some studies were omitted, as they did not meet the inclusion criteria, including, for instance, studies using distance to the wind turbine instead of noise exposure to investigate health effects. The justification for including and excluding studies is given in the systematic reviews (Basner & McGuire, 2018; Brown et al.,

2017; Clark & Paunovic, 2018; in press; Guski et al., 2017; Niewenhuijsen et al.,2017; Śliwińska-Kowalska & Zaborowski, 2017; van Kempen et al., 2018; see Annex 2 for further details).

3.4.2.1 Evidence on health outcomes

The key question posed was: in the general population exposed to wind turbine noise, what is the exposure–response relationship between exposure to wind turbine noise (reported as various noise indicators) and the proportion of people with a validated measure of health outcome, when adjusted for main confounders? A summary of the PICOS/PECCOS scheme applied and the main findings is set out in Tables 38 and 39.

Table 38. PICOS/PECCOS scheme of critical health outcomes for exposure to wind turbine noise

PECO	Description	
Population	General population	
Exposure	Exposure to high levels of noise produced by wind turbines (average/night time)	
Comparison	Exposure to lower levels of noise produced by wind turbines (average/night time)	
Outcome(s)	For average noise exposure:	For night noise exposure:
	1. cardiovascular disease	1. effects on sleep
	2. annoyance	
	3. cognitive impairment	
	4. hearing impairment and tinnitus	
	5. adverse birth outcomes	
	6. quality of life, well-being and mental health	
	7. metabolic outcomes	

Table 39. Summary of findings for health effects from exposure to wind turbine noise (L_{den})

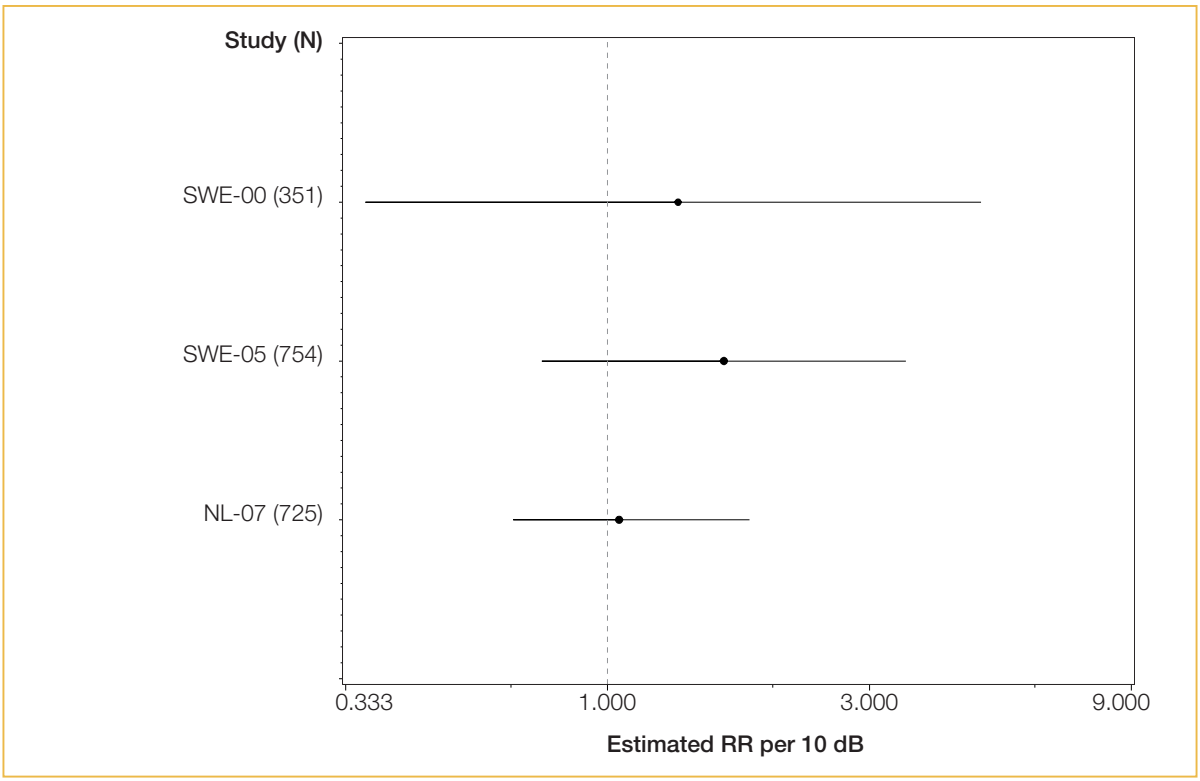
Noise metric	Priority health outcome measure	Quantitative risk for adverse health	Lowest level of exposure across studies	Number of participants (studies)	Quality of evidence
Cardiovascular disease					
L_{den}	Incidence of IHD	–	–	–	–
L_{den}	Incidence of hypertension	–	–	–	–
Annoyance					
L_{den}	%HA	Not able to pool because of heterogeneity	30 dB	2481 (4)	Low (downgraded for inconsistency and imprecision)
Cognitive impairment					
L_{den}	Reading and oral comprehension	–	–	–	–
Hearing impairment and tinnitus					
L_{den}	Permanent hearing impairment	–	–	–	–

Cardiovascular disease

For the relationship between wind turbine noise and prevalence of hypertension, three cross-sectional studies were identified, with a total of 1830 participants (van den Berg et al., 2008; Pedersen, 2011; Pedersen & Larsman, 2008; Pedersen & Persson Waye, 2004; 2007). The number of cases was not reported. All studies found a positive association between exposure to wind turbine noise and the prevalence of hypertension, but none was statistically significant. The lowest levels in studies were either <30 or <32.5 L_{den}. No meta-analysis was performed, since too many parameters were unknown and/or unclear. Due to very serious risk of bias and imprecision in the results, this evidence was rated very low quality (see Fig. 14).

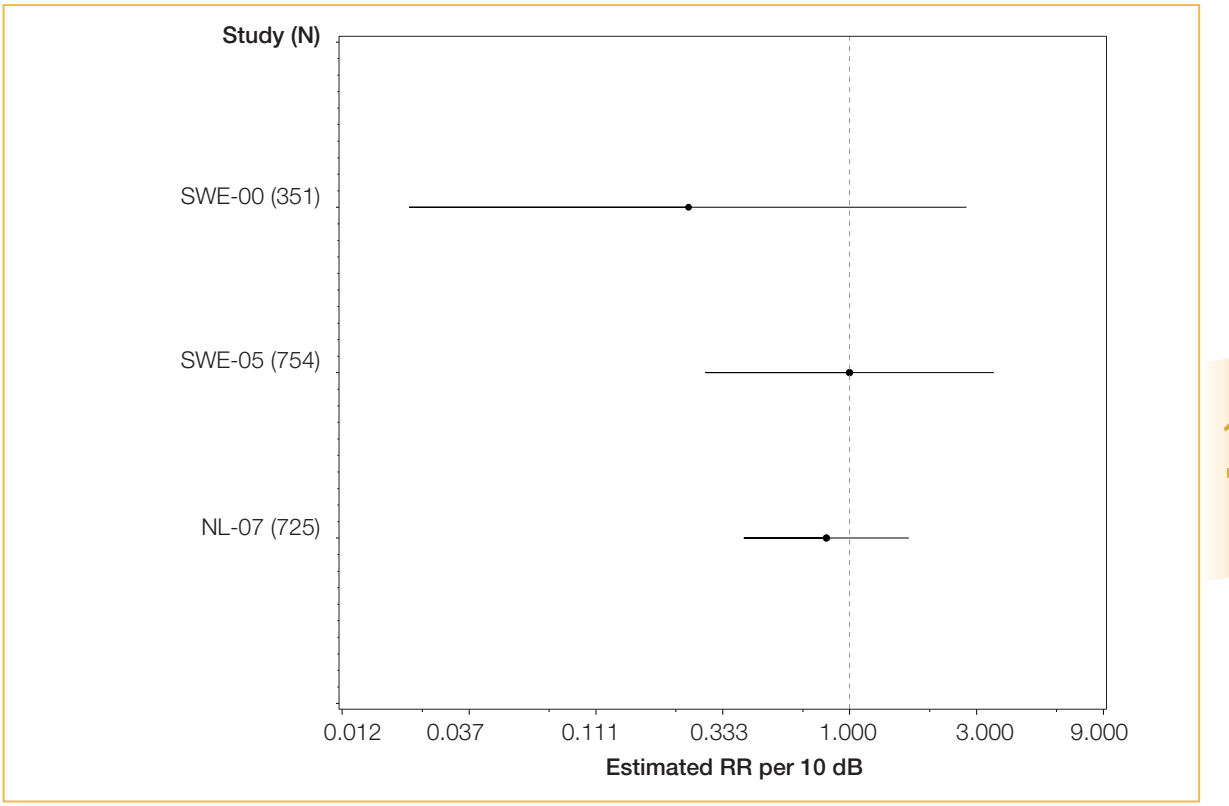
The same studies also looked at exposure to wind turbine noise and self-reported cardiovascular disease, but none found an association. No evidence was available for other measures of cardiovascular disease. As a result, only evidence rated very low quality was available for no considerable effect of audible noise (greater than 20 Hz) from wind turbines or wind farms on self-reported cardiovascular disease (see Fig. 15).

Fig. 14. The association between exposure to wind turbine noise (sound pressure level in dB) and hypertension



Notes: The dotted vertical line corresponds to no effect of exposure to wind turbine noise. The black dots correspond to the estimated RR per 10 dB and 95% CI. For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

Fig. 15. The association between exposure to wind turbine noise (sound pressure level) and self-reported cardiovascular disease



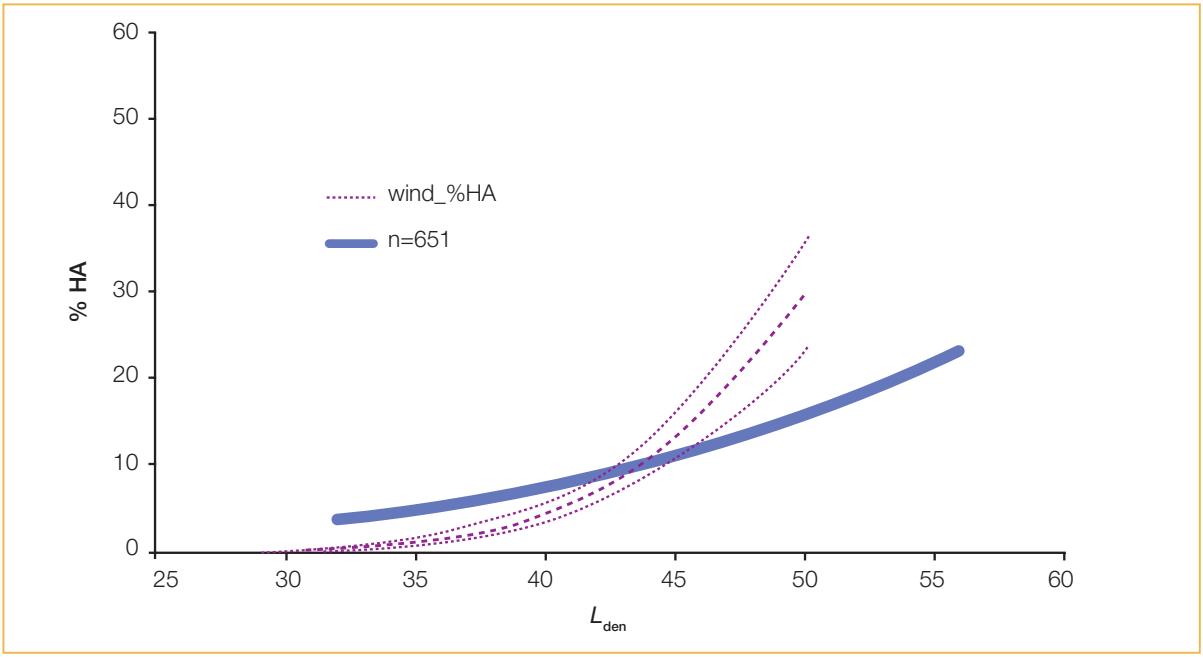
Notes: The dotted vertical line corresponds to no effect of exposure to wind turbine noise.The black circles correspond to the estimated RR per 10 dB (sound pressure level) and 95% CI. For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

Annoyance

Two publications containing descriptions of four individual studies were retrieved (Janssen et al., 2011; Kuwano et al., 2014). All four studies used measurements in the vicinity of the respondents' addresses; the noise exposure metrics used in the three original studies (Pedersen, 2011; Pedersen & Persson Waye, 2004; 2007) included in Janssen et al. (2011) were recalculated into L_{den}. The noise levels in the studies ranged from 29 dB to 56 dB. Different scales were used to assess annoyance, with slightly different definitions of "highly annoyed" and explicit reference to outdoor annoyance in the data used for the Janssen et al. (2011) curve. Construction of the ERFs provided in the two publications differed and they were therefore not further combined in a meta-analysis. Fig. 16 shows the %HA from the two publications. The 10% criterion for %HA is reached at around 45 dB L_{den} (where the two curves coincide). There was a wide variability in %HA between studies, with a range of 3–13%HA at 42.5 dB and 0–32%HA at 47.5 dB. The %HA in the sample is comparatively high, given the relatively low noise levels. There is evidence rated low quality for an association between wind turbine noise and annoyance, but this mainly applies to the association between wind turbine noise and annoyance and not to the shape of the quantitative relationship.

Further statistical analyses of annoyance yield evidence rated low quality for an association between wind turbine noise and %HA when comparing an exposure at 42.5 dB and 47.5 dB, with a mean difference in %HA of 4.5 (indoors) and 6.4 (outdoors). There is also evidence rated moderate quality for a correlation between individual noise exposure and annoyance raw scores (r = 0.28).

Fig. 16. Overlay of the two wind turbine annoyance graphs



Notes: Overlay of the two wind turbine outdoor annoyance graphs adapted from Janssen et al. (2011, red) and Kuwano et al. (2014, blue). The Kuwano et al. curve is based on L_{dn}; no correction for L_{den} has been applied.[18]
For further details on the studies included in the figure please refer to the systematic review on environmental noise and annoyance (Guski et al., 2017).

Cognitive impairment, hearing impairment and tinnitus, adverse birth outcomes

No studies were found, and therefore no evidence was available on the relationship between wind turbine noise and measures of cognitive impairment; hearing impairment and tinnitus; and adverse birth outcomes.

Sleep disturbance

Six cross-sectional studies on wind turbine noise and self-reported sleep disturbance were identified (Bakker et al., 2012; Kuwano et al., 2014; Michaud, 2015; Pawlaczyk-Luszczynska et al., 2014; Pedersen & Persson Waye, 2004; 2007). Noise levels were calculated using different methods, and different noise metrics were reported. Three of the studies asked how noise affects sleep; the other three evaluated the effect of wind turbine noise on sleep using questions that explicitly referred to noise (Table 40).

[18] L_{dn} is the day-night-weighted sound pressure level as defined in section 3.6.4 of ISO 1996-1:2016.

Table 40. Summary of findings for health effects from exposure to wind turbine noise (L_{night})

Noise metric	Priority health outcome measure	Quantitative risk for adverse health	Lowest level of effects in studies	Number of participants (studies)	Quality of evidence
Effects on sleep					
L_{night}	%HSD	1.60 (95% CI: 0.86–2.94) per 10 dB increase	31 dB	3971 (6)	Low (downgraded for study limitations, inconsistency, precision)

The risk of bias was assessed as high for all six studies, as effects on sleep were measured by self-reported data. There were a limited number of subjects at higher exposure levels. A meta-analysis was conducted for five of the six studies, based on the OR for high sleep disturbance for a 10 dB increase in outdoor predicted sound pressure level. The pooled OR was 1.60 (95% CI: 0.86–2.94). The evidence was rated low quality.

3.4.2.2 Evidence on interventions

This section summarizes the evidence underlying the recommendation on the effectiveness of interventions for wind turbine noise exposure. The key question posed was: in the general population exposed to wind turbine noise, are interventions effective in reducing exposure to and/or health outcomes from wind turbine noise? A summary of the PICOS/PECCOS scheme applied is set out in Table 41.

Table 41. PICOS/PECCOS scheme of the effectiveness of interventions for exposure to wind turbine noise

PICO	Description	
Population	**General population**	
Intervention(s)	The interventions can be defined as: (a) a measure that aims to change noise exposure and associated health effects; (b) a measure that aims to change noise exposure, with no particular evaluation of the impact on health; or (c) a measure designed to reduce health effects, but that may not include a reduction in noise exposure.	
Comparison	**No intervention**	
Outcome(s)	For average noise exposure: 1. cardiovascular disease 2. annoyance 3. cognitive impairment 4. hearing impairment and tinnitus 5. adverse birth outcomes 6. quality of life, well-being and mental health 7. metabolic outcomes	For night noise exposure: 1. effects on sleep

No studies were found, and therefore no evidence was available on the effectiveness of interventions to reduce noise exposure from wind turbines.

3.4.2.3 Consideration of additional contextual factors

As the foregoing overview has shown, very little evidence is available about the adverse health effects of continuous exposure to wind turbine noise. Based on the quality of evidence available, the GDG set the strength of the recommendation on wind turbine noise to conditional. As a second step, it qualitatively assessed contextual factors to explore whether other considerations could have a relevant impact on the recommendation strength. These considerations mainly concerned the balance of harms and benefits, values and preferences, and resource use and implementation.

Regarding the balance of harms and benefits, the GDG would expect a general health benefit from a marked reduction in any kind of long-term environmental noise exposure. Health effects of individuals living in the vicinity of wind turbines can theoretically be related not only to long-term noise exposure from the wind turbines but also to disruption caused during the construction phase. The GDG pointed out, however, that evidence on health effects from wind turbine noise (apart from annoyance) is either absent or rated low/very low quality (McCunney et al., 2014). Moreover, effects related to attitudes towards wind turbines are hard to discern from those related to noise and may be partly responsible for the associations (Knopper & Ollson, 2011). Furthermore, the number of people exposed is far lower than for many other sources of noise (such as road traffic). Therefore, the GDG estimated the burden on health from exposure to wind turbine noise at the population level to be low, concluding that any benefit from specifically reducing population exposure to wind turbine noise in all situations remains unclear. Nevertheless, proper public involvement, communication and consultation of affected citizens living in the vicinity of wind turbines during the planning stage of future installations is expected to be beneficial as part of health and environmental impact assessments. In relation to possible harms associated with the implementation of the recommendation, the GDG underlined the importance of wind energy for the development of renewable energy policies.

The GDG noticed that the values and preferences of the population towards reducing long-term noise exposure to wind turbine noise vary. Whereas the general population tends to value wind energy as an alternative, environmentally sustainable and low-carbon energy source, people living in the vicinity of wind turbines may evaluate them negatively. Wind turbines are not a recent phenomenon, but their quantity, size and type have increased significantly over recent years. As they are often built in the middle of otherwise quiet and natural areas, they can adversely affect the integrity of a site. Furthermore, residents living in these areas may have greater expectations of the quietness of their surroundings and therefore be more aware of noise disturbance. Negative attitudes especially occur in individuals who can see wind turbines from their houses but do not gain economically from the installations (Kuwano et al., 2014; Pedersen & Persson Waye, 2007; van den Berg et al., 2008). These situational variables and the values and preferences of the population may differ between wind turbines and other noise sources, as well as between wind turbine installations, which makes assessment of the relationship between wind turbine noise exposure and health outcomes particularly challenging.

Assessing resource use and implementation considerations, the GDG noted that reduction of noise exposure from environmental sources is generally possible through simple measures like insulating windows or building barriers. With wind turbines, however, noise reduction interventions are more

complicated than for other noise sources due to the height of the source and because outdoor disturbance is a particularly large factor. As generally fewer people are affected (compared to transportation noise), the expected costs are lower than for other environmental sources of noise. The GDG was not aware of any existing interventions (and associated costs) to reduce harms from wind turbine noise, or specific consequences of having regulations on wind turbine noise. Therefore, it could not assess feasibility, or discern whether any beneficial effects of noise reduction would outweigh the costs of intervention. In particular, there is no clear evidence on an acceptable and uniform distance between wind turbines and residential areas, as the sound propagation depends on many aspects of the wind turbine construction and installation.

In light of the assessment of the contextual factors in addition to the quality of evidence, the recommendation for wind turbine noise exposure remains conditional.

Additional considerations or uncertainties

Assessment of population exposure to noise from a particular source is essential for setting health-based guideline values. Wind turbine noise is characterized by a variety of potential moderators, which can be challenging to assess and have not necessarily been addressed in detail in health studies. As a result, there are serious issues with noise exposure assessment related to wind turbines.

Noise levels from outdoor sources are generally lower indoors because of noise attenuation from the building structure, closing of windows and similar. Nevertheless, noise exposure is generally estimated outside, at the most exposed façade. As levels of wind turbine noise are generally much lower than those of transportation noise, the audibility of wind turbines in bedrooms, particularly when windows are closed, is unknown.

In many instances, the distance from a wind farm has been used as a proxy to determine audible noise exposure. However, in addition to the distance, other variables – such as type, size and number of wind turbines, wind direction and speed, location of the residence up- or downwind from wind farms and so on – can contribute to the resulting noise level assessed at a residence. Thus, using distance to a wind farm as a proxy for noise from wind turbines in health studies is associated with high uncertainty.

Wind turbines can generate infrasound or lower frequencies of sound than traffic sources. However, few studies relating exposure to such noise from wind turbines to health effects are available. It is also unknown whether lower frequencies of sound generated outdoors are audible indoors, particularly when windows are closed.

The noise emitted from wind turbines has other characteristics, including the repetitive nature of the sound of the rotating blades and atmospheric influence leading to a variability of amplitude modulation, which can be a source of above average annoyance (Schäffer et al., 2016). This differentiates it from noise from other sources and has not always been properly characterized. Standard methods of measuring sound, most commonly including A-weighting, may not capture the low-frequency sound and amplitude modulation characteristic of wind turbine noise (Council of Canadian Academies, 2015).

Even though correlations between noise indicators tend to be high (especially between L_{Aeq}-like indicators) and conversions between indicators do not normally influence the correlations between the noise indicator and a particular health effect, important assumptions remain when exposure to

wind turbine noise in L_{den} is converted from original sound pressure level values. The conversion requires, as variable, the statistical distribution of annual wind speed at a particular height, which depends on the type of wind turbine and meteorological conditions at a particular geographical location. Such input variables may not be directly applicable for use in other sites. They are sometimes used without specific validation for a particular area, however, because of practical limitations or lack of data and resources. This can lead to increased uncertainty in the assessment of the relationship between wind turbine noise exposure and health outcomes.

Based on all these factors, it may be concluded that the acoustical description of wind turbine noise by means of L_{den} or L_{night} may be a poor characterization of wind turbine noise and may limit the ability to observe associations between wind turbine noise and health outcomes.

3.4.3 Summary of the assessment of the strength of recommendations

Table 42 provides a comprehensive summary of the different dimensions for the assessment of the strength of the wind turbine recommendations.

Table 42. Summary of the assessment of the strength of the recommendation

Factors influencing the strength of recommendation	Decision
Quality of evidence	**Average exposure (L_{den})** *Health effects* • Evidence for a relevant absolute risk of annoyance at **45 dB L_{den}** was rated **low quality.** *Interventions* • No evidence was available on the effectiveness of interventions to reduce noise exposure and/or health outcomes from wind turbines. **Night-time exposure (L_{night})** *Health effects* • No statistically significant evidence was available for sleep disturbance related to exposure from wind turbine noise at night. *Interventions* • No evidence was available on the effectiveness of interventions to reduce noise exposure and/or sleep disturbance from wind turbines.
Balance of benefits versus harms and burdens	Further work is required to assess fully the benefits and harms of exposure to environmental noise from wind turbines and to clarify whether the potential benefits associated with reducing exposure to environmental noise for individuals living in the vicinity of wind turbines outweigh the impact on the development of renewable energy policies in the WHO European Region.
Values and preferences	There is wide variability in the values and preferences of the population, with particularly strong negative attitudes in populations living in the vicinity of wind turbines.
Resource implications	Information on existing interventions (and associated costs) to reduce harms from wind turbine noise is not available.
Additional considerations or uncertainties	There are serious issues with noise exposure assessment related to wind turbines.
Decisions on recommendation strength	• **Conditional** for guideline value for average noise exposure (L_{den}) • **Conditional** for the effectiveness of interventions (L_{night})

3.5 Leisure noise

Recommendations

For average noise exposure, the GDG **conditionally** recommends reducing the yearly average from all leisure noise sources combined to **70 dB** $L_{Aeq,24h}$, as leisure noise above this level is associated with adverse health effects. The equal energy principle[19] can be used to derive exposure limits for other time averages, which might be more practical in regulatory processes.

For single-event and impulse noise exposures, the GDG **conditionally** recommends following existing guidelines and legal regulations to limit the risk of increases in hearing impairment from leisure noise in both children and adults.

Following a precautionary approach, to reduce possible health effects, the GDG **strongly** recommends that policy-makers take action to prevent exposure above the guideline values for average noise and single-event and impulse noise exposures. This is particularly relevant as a large number of people may be exposed to and at risk of hearing impairment through the use of personal listening devices (PLDs). There is insufficient evidence, however, to recommend one type of intervention over another.

3.5.1 Rationale for the guideline levels for leisure noise

As specific evidence for the relationship between leisure noise and hearing loss is of insufficient quality, the GDG decided to follow a different approach for this noise source, based on knowledge regarding prevention of hearing loss in the workplace and on the CNG (WHO, 1999). There is sufficient evidence that the nature of the noise matters little in causing hearing loss, so using the existing guidelines is a justified step to prevent permanent hearing loss from leisure noise.

In accordance with the procedures for the other noise sources, the GDG would have considered evidence on exposure–response relationships for the prioritized health outcomes. However, no such ERFs could be established in the systematic reviews for any of the health outcomes (Table 43).

Table 43. Average exposure levels ($L_{Aeq,24h}$) for priority health outcomes from leisure noise

Summary of priority health outcome evidence	Benchmark level	Evidence quality
Incidence of IHD **Incidence of hypertension** **Prevalence of highly annoyed population** **Reading skills and oral comprehension in children**		No evidence was available
Permanent hearing impairment There is an indication that PLDs have an effect on hearing impairment and tinnitus. There was no evidence (because no studies were found) for an effect of other sources of leisure noise on hearing impairment or tinnitus. The results of the studies could not be synthesized because of heterogeneity of outcome measurement.	No increase	Very low quality/no evidence

[19] The equal energy principle states that the total effect of sound is proportional to the total amount of sound energy received by the ear, irrespective of the distribution of that energy in time (WHO, 1999).

In accordance with the evidence on the effects of PLDs on permanent hearing loss from leisure noise, the GDG recommended a guideline exposure level of 70 dB $L_{Aeq,24h}$ yearly average from all leisure noise sources combined. It was confident that there was no relevant risk increase for permanent hearing impairment below this exposure level of average leisure noise. The GDG recognized that a conversion to alternative time averages for exposure to leisure noise might be helpful for regulatory purposes; thus, a detailed table converting hourly and weekly exposure into yearly averages is provided in the subsection on additional considerations or uncertainties in section 3.5.2.3, Table 49. Furthermore, the GDG recommended sticking to the CNG recommendations for single events to limit the risk of hearing impairment from leisure noise increases for both children and adults (WHO, 1999).[20] Due to the nature and limited amount of available evidence, the GDG made the recommendation conditional.

Next, the GDG assessed the evidence for night noise exposure and its effect on sleep disturbance (Table 44).

Table 44. Night-time exposure levels (L_{night}) for priority health outcomes from leisure noise

Summary of priority health outcome evidence	Benchmark level	Evidence quality
Sleep disturbance	3% absolute risk	No evidence was available

Because of a lack of evidence, the GDG was not able to formulate a recommendation addressing sleep disturbance due to leisure noise at night time.

The GDG also looked for evidence about the effectiveness of interventions for leisure noise exposure. Owing to a lack of research, however, no studies were available on existing interventions and associated costs to reduce leisure noise. As no evidence was available, it was not possible to develop a recommendation on any specific type of intervention measure. However, following a precautionary approach, to reduce possible health effects, the GDG made a strong recommendation that policy-makers take action to prevent exposures above the guideline values for average noise and single-event and impulse noise exposures. This is particularly relevant as a large number of people may be exposed to and at risk of hearing impairment through the use of PLDs. There is insufficient evidence, however, to recommend one type of intervention over another.

3.5. 1.1 Other factors influencing the strength of recommendations

Other factors considered in the context of recommendations on leisure noise included those related to values and preferences, benefits and harms, resource implications, equity, acceptability and feasibility; moreover, nonpriority health outcomes were considered. Ultimately, the assessment of all these factors did not lead to a change in the strength of recommendation. Further details are provided in section 3.5.2.3.

[20] The GDG acknowledged the scarcity of cohort study-based evidence to define a threshold for hearing damage due to single loud exposures. It initially decided to propose $L_{AF,max}$ = 110, but after much discussion it appeared that the conversion of relevant standing limits (expressed in $L_{peak,C}$ and others) lacked sufficient basis.

3.5.2 Detailed overview of the evidence

The following sections provide a detailed overview of the evidence constituting the basis for setting the recommendations on leisure noise. As noted above, however, only limited evidence was available for several of the prioritized health outcomes, so it is presented and summarized for all critical and important health outcomes where possible, along with indications of the GDG's judgement of the quality of evidence. Research into health outcomes and effectiveness of interventions is addressed consecutively.

A comprehensive summary of all evidence considered for each of the critical and important health outcomes can be found in the eight systematic reviews published in the *International Journal of Environmental Research and Public Health* (see section 2.3.2 and Annex 2).

3.5.2.1 Evidence on health outcomes

The key question posed was: in the general population exposed to leisure noise, what is the exposure–response relationship between exposure to leisure noise (reported as various noise indicators) and the proportion of people with a validated measure of health outcome, when adjusted for main confounders? A summary of the PICOS/PECCOS scheme applied and the main findings is set out in Tables 45 and 46.

Table 45. PICOS/PECCOS scheme of critical health outcomes for exposure to leisure noise

PECO	Description	
Population	General population	
Exposure	Exposure to high levels of noise produced by leisure activities (average/night time)	
Comparison	Exposure to lower levels of noise produced by leisure activities (average/night time)	
Outcome(s)	For average noise exposure: 1. cardiovascular disease 2. annoyance 3. cognitive impairment 4. hearing impairment and tinnitus 5. adverse birth outcomes 6. quality of life, well-being and mental health 7. metabolic outcomes	For night noise exposure: 1. effects on sleep

Table 46. Summary of findings for health effects from exposure to leisure noise ($L_{Aeq,24h}$)

Noise metric	Priority health outcome measure	Quantitative risk for adverse health	Lowest level of exposure across studies[a]	Number of participants (studies)	Quality of evidence
Cardiovascular disease					
$L_{Aeq,24}$	Incidence of IHD	–	–	–	–
$L_{Aeq,24}$	Incidence of hypertension	–	–	–	–
Annoyance					
$L_{Aeq,24}$	%HA	–	–	–	–
Cognitive impairment					
$L_{Aeq,24}$	Reading and oral comprehension	–	–	–	–
Hearing impairment and tinnitus					
$L_{Aeq,24}$	Permanent hearing impairment	Not estimated	–	484 (3)	Very low (downgraded for study limitations, precision)

Hearing impairment and tinnitus

Several types of leisure activity are accompanied by loud sounds, such as attending nightclubs, pubs and fitness classes; live sporting events; concerts or live music venues; listening to loud music through PLDs. This recommendation is informed by a systematic review that assessed the evidence on permanent hearing loss and tinnitus due to exposure to leisure noise (Śliwińska-Kowalska & Zaborowski, 2017). The review identified two existing systematic reviews that summarized recent estimates of the risk of developing permanent hearing loss from the use of PLDs. It did not identify any studies with objective measurement of exposure to any other type of leisure noise.

The Scientific Committee on Emerging and Newly Identified Hazards and Risk (SCENIHR) (EC, 2008b) report concluded that prolonged exposure to sounds from PLDs may result in temporary hearing threshold shift, permanent hearing threshold shift and tinnitus, as well as poor speech communication in noisy conditions. However, based on the data available, there was no direct evidence for an effect of repeated, regular daily exposure to music through PLDs on development of permanent noise-induced hearing loss. Data on tinnitus were inadequate and therefore inconclusive. No meta-analysis was provided for any of the hearing effects; nor were the exposure–effect curves reported. The SCENIHR report was based on a narrative review of 30 original papers with over 2000 participants and exposure to music sounds that covered a range of 60–120 dB. Studies included in the review were carried out between 1982 and 2007.

In 2014 a second systematic review was published by Vasconcellos et al. (2014). Although the objective of this publication was to determine threshold levels of personally modifiable risk factors for hearing loss in the paediatric population, specific thresholds analyses were limited. Based on the descriptive overview of original papers, the authors identified exposure to loud music (including use of PLDs) and working on a mechanized farm as the main risk factors for hearing loss in children

and teenagers. Thresholds of exposure to music, significantly associated with hearing loss in youth, were:

- more than four hours per week or more than five years of personal headphone usage;
- more than four visits per month to a discotheque.

The evidence review identified five new cross-sectional studies on noise from PLDs since the publication of the SCENIHR report (Feder et al., 2013; Levesque et al., 2010; Sulaiman et al., 2013; 2014; Vogel et al., 2014). Direct measurement of hearing thresholds with pure tone audiometry was performed only in three studies – by Feder et al. (2013) and Sulaiman et al. (2013 and 2014). In total, audiometric data from 484 subjects were analysed; among them, 449 were exposed and 35 were not exposed to PLD music. Two other studies by Levesque et al. (2010) and Vogel et al. (2014) did not perform audiometric measurement but reported on tinnitus in a total of 1067 participants.

Noise from PLDs was estimated based on direct measurement of equivalent sound pressure levels (in dB) in four studies (Feder, 2013; Levesque et al., 2010; Sulaiman et al., 2013; 2014) and based on converting volume-control setting levels of PLD into dB levels in one study (Vogel et al., 2014). The resulting exposure levels (L_{Aeq} values) had a mean of between 72 dB and 91 dB, although in two studies these data were not provided. In all studies, individual $L_{Aeq,8h}$ value was calculated based on an estimated level of music and the number of hours a day listening to the music through the PLD declared by an individual in the questionnaire. Resulting $L_{Aeq,8h}$ mean values were between 62 dB and 83 dB when provided.

Potential confounding was controlled by excluding the subjects with exposure to other sources of high-level noise or prior ear problems (Sulaiman et al., 2013), by excluding those with these factors and ototoxic drug intake (Sulaiman et al., 2014) or by controlling for these confounders by accounting for them in the statistical models. The confounders comprised socioeconomic status, demographic factors, tubes in the ear and leisure exposures in one study (Feder, 2013), and age and sex in one study (Vogel et al., 2014). One of the studies did not adjust for confounding factors (Levesque et al., 2010).

Data on permanent hearing loss were taken from audiometric measurements (Feder, 2013; Sulaiman et al., 2013; 2014), while data about permanent tinnitus were taken from self-reported responses to questionnaires (Levesque et al., 2010; Vogel et al., 2014). In one case, the outcome was defined as “permanent hearing-related symptoms”, but it is not clear what proportion of subjects experienced permanent tinnitus (Vogel et al., 2014).

For permanent hearing loss, there is no pooled effect size, because the authors of the original studies either did not report data or reported in different formats. However, these studies indicate a harmful effect of listening to PLDs. For permanent tinnitus, there is no pooled effect size because the effects of noise from PLDs on permanent tinnitus were contradictory. These results are generally consistent with previous reviews by SCENIHR (EC, 2008b) and Vasconcellos et al. (2014).

The risk of bias was assessed as high for all five studies. The overall evidence for an effect of PLDs on hearing impairment and tinnitus was rated very low quality.

3.5.2.2 Evidence on interventions

The following section summarizes the evidence underlying the recommendation on the effectiveness of interventions for leisure noise exposure. The key question posed was: in the general population exposed to leisure noise, are interventions effective in reducing exposure to and/or health outcomes from leisure noise? A summary of the PICOS/PECCOS scheme applied and the main findings is set out in Tables 47 and 48.

Table 47. PICOS/PECCOS scheme of the effectiveness of interventions for exposure to leisure noise

PICO	Description	
Population	General population	
Intervention(s)	The interventions can be defined as: (a) a measure that aims to change noise exposure and associated health effects; (b) a measure that aims to change noise exposure, with no particular evaluation of the impact on health; or (c) a measure designed to reduce health effects, but that may not include a reduction in noise exposure.	
Comparison	No intervention	
Outcome(s)	For average noise exposure: 1. cardiovascular disease 2. annoyance 3. cognitive impairment 4. hearing impairment and tinnitus 5. adverse birth outcomes 6. quality of life, well-being and mental health 7. metabolic outcomes	For night noise exposure: 1. effects on sleep

Table 48. Summary of findings for interventions for leisure noise

Type of intervention	Number of participants (studies)	Effect of intervention	Quality of evidence
Hearing impairment			
Type E – behaviour change interventions (education programme/campaign)	4151 (7)	None of the studies involved measurement or estimation of exposure levels or health outcomes. Most studies found a significant effect of change in knowledge or behaviour.	–

Seven individual studies on PLDs, attendance at music venues and participation in other recreational activities where there was risk of hearing damage and/or tinnitus were included in the systematic review (Dell & Holmes, 2012; Gilles & Van de Heyning, 2014; Kotowski et al., 2011; Martin et al., 2013; Taljaard et al., 2013; Weichbold & Zorowka, 2003; 2007). All studies examined interventions directed at changes in knowledge or behaviour and hearing impairment.

The studies all sought evidence on the effectiveness of some form of educational programme or campaign aimed at children, adolescents or college students. These addressed perceptions and

knowledge of the risk of high levels of noise – generally, but not exclusively, from PLD sources or from attendance at music events – and actual or intended changes to hearing damage risk behaviours, including avoidance, frequency or duration of exposure, regeneration periods when in high noise, or playback levels.

The outcome assessed in all intervention studies was the change in knowledge and behaviours towards hearing damage risk. The health outcome measures varied widely and included measurements on the youth attitude towards noise scale, participants' knowledge about hearing damage, participants' PLD usage patterns, participants' attitudes to wearing hearing protection (some in general; some at discotheques) and frequency of discotheque attendance. A majority of the studies found a significant effect of change in knowledge or behaviour. No indication on the persistence of knowledge and behavioural change was given, though.

None of the studies included objectively measured outcomes or a measured change in noise level exposure; thus, the effectiveness of the interventions could not be assessed, and the quality of the evidence was not rated according to GRADE.

3.5.2.3 Consideration of additional contextual factors

Based on the quality of the available evidence discussed in the foregoing overview, the GDG set the strength of recommendation of leisure noise to conditional. As a second step, it qualitatively assessed contextual factors to explore whether other considerations could have a relevant impact on the recommendation strength. These considerations mainly concerned the balance of harms and benefits, values and preferences, and resource use and implementation.

When assessing the balance of benefits and harms, the GDG recognized that exposure to leisure noise is widespread and frequent. In particular, as many as 88–90% of teenagers and young adults report listening to music through PLDs earphones (Pellegrino et al., 2013; Vogel et al., 2011). In 2015 WHO estimated that 1.1 billion young people worldwide could be at risk of hearing loss due to unsafe listening practices (WHO, 2015a). Furthermore, among young people aged 12–35 years in middle- and high-income countries, nearly 50% listen to unsafe levels of sound through personal audio devices (mp3 players, smartphones and others), and around 40% are exposed to potentially damaging levels of sound at nightclubs, bars and sporting events. Noise-induced hearing loss can be prevented by following safe listening practices, so the GDG concluded that health benefits can be gained from markedly reducing population exposure to leisure noise, including through actions to promote safe listening practices. A reduction of leisure noise is also assumed to reduce nuisance that can be caused to other people than those who enjoy leisure activities, such as neighbours. Furthermore, specifically for PLDs, it can reasonably be expected that a reduction of noise exposure could also lead to a reduction in accidents, injuries and other potential safety risks. In relation to possible harms and burdens, the GDG could not identify any harms (except economic costs, which are addressed in the paragraph on resource use and implementation) arising from implementation of the recommended guideline values.

Considering values and preferences, the GDG recognized that listening to music with the help of a PLD, going to concerts and attending sport events are activities regarded as enjoyable and therefore assumed to be valued by the overall population. Furthermore, it is expected that values and preferences might vary in particular with respect to the use of PLDs and embracing leisure activities

involving loud noise, like concerts, and that some population groups – especially younger individuals – might voluntarily expose themselves to high levels of sound during these activities. Despite this, the GDG was confident that recommendations to lower noise levels for the prevention of hearing damage from leisure noise would be welcome by a majority of the population. Recommendations are expected to be particularly welcome when it comes to protecting the hearing of young children and teenagers, as these vulnerable groups often do not have control over their environment and the noise levels to which they are exposed, such as from noisy toys or at school.

With resource use and implementation, the GDG noted that interventions exist to reduce exposure to leisure noise from PLDs, attendance at music venues and participation in recreational activities, as aggregated by the systematic review on environmental noise interventions and their associated impacts (Brown & van Kamp, 2017). As most of these relate to implementation of a behaviour change, the reduction of exposure to leisure noise is expected to be technically feasible and cheap. None of the empirical investigations objectively measured outcomes or a measured change in noise level exposure, so the effectiveness of such measures cannot be assessed. Nevertheless, it is important to note that there is ample evidence from the occupational health field that high noise levels cause hearing damage, and that occupational interventions to reduce noise exposure are effective at lowering the risk of hearing problems or hearing damage (EC, 2003; Garcia et al., 2018; ISO, 2013; Maassen et al., 2001). In conclusion, resources needed to reduce exposure to leisure noise are not expected to be intensive, but implementation and long-term success of measures might be challenging, owing to cultural factors, as changes in behaviour are expected to be tricky to implement.

In light of the assessment of the contextual factors in addition to the quality of evidence, the recommendation remains conditional.

Additional considerations or uncertainties

The GDG considers the noise levels selected for this recommendation to be reasonable precautionary measures, in view of the rating of very low quality for the available evidence on an effect of leisure noise on permanent hearing impairment and tinnitus identified in the systematic review.

Extensive literature shows hearing impairment in populations exposed to specific types of nonoccupational environments, although these exposures are generally not well characterized. There are no studies with objective measurement of exposure to any other type of leisure noise (except PLDs) and permanent hearing impairment or tinnitus. Nevertheless, this recommendation generally applies to all leisure noise exposures, such as events in public venues (concerts halls, sports events, bars and discotheques) and educational facilities, and use of PLDs. The recommendation also applies to exposure to impulse sounds, such as those in shooting facilities or from the use of toys and firecrackers.

Hearing loss is the resultant value of combined exposures to different sources of leisure noise including, but not limited to, PLDs. Therefore, the recommendations apply to the combined noise levels from all sources.

Noise-induced hearing loss develops very slowly over years of exposure, giving rise to challenges in the assessment of the health impacts from prolonged use of PLDs and exposure to leisure noise. The induction period for the development of hearing impairment and tinnitus is long, and varying

exposure conditions and changing lifestyle habits (including confounding noise sources), particularly among young people, will have an impact. Therefore, recommendations regarding leisure noise have often been inferred from the occupational field, where exposure conditions are more stable over time.

Indeed, long-term exposure to noise, objectively assessed and at levels measured in occupational settings for various professions, can lead to permanent hearing loss and tinnitus. This evidence, while not reviewed systematically as part of the work related to these guidelines, can be used as supportive evidence and justification for the need to develop a recommendation for leisure noise, given that many people could be at risk of developing hearing loss and/or tinnitus from exposure to lower levels of environmental noise. Similar otobiological mechanisms must also be considered for environmental noise.

To date, no commonly accepted method for assessing the risk of hearing loss due to environmental exposure to noise has been developed. One of the main challenges is to conduct a long-term objective exposure assessment of environmental noise and relate this to the development of permanent hearing impairment and tinnitus. The GDG underlined the strong need for research to develop a comprehensive methodology. In the absence of a method, and as long as no other tools are available, the equal energy principle outlined in the ISO standard for the estimation of noise-induced hearing loss (WHO, 1999) can be used as a practical tool for protecting public health from exposure to leisure noise. As a result, the relationship between leisure noise exposure and auditory effects can be quantified for a variety of exposure levels, duration and frequency.

Several organizations have established regulations for the protection of workers from risks to their health and safety arising from exposure to noise, and in particular risk to hearing. Of particular relevance is EU Directive 2003/10/EC on the minimum health and safety requirements regarding the exposure of workers to the risks arising from physical agents (noise) (EC, 2003). Based on the ISO 1999 standard (ISO, 2013), the Directive sets limits of exposure depending on equivalent noise level for an eight-hour working day and obliges the employer to take suitable steps if the limits are exceeded. It recommends three action levels for occupational settings, setting the lowest, most conservative value at $L_{ex,8hr}$ = 80 dB. According to the Directive, no consequences of exposure to occupational noise are expected at this level. While exposure patterns and certain characteristics of occupational and leisure noise exist, knowledge of the hearing impairment risks and preventive interventions can be used to assess health risks associated with leisure noise (Neitzel & Fligor, 2017).

The CNG recommend a limit of $L_{Aeq,24h}$ = 70 dB(A) for preventing hearing loss from industrial, commercial shopping and traffic areas, indoors and outdoors (WHO, 1999). Health and safety regulations are usually based on an exposure profile of a typical worker (eight hours per day, five days per week). Using the existing knowledge from the ISO standard and established health and safety regulations, it is possible to use the equal energy principle to derive the resulting noise exposure level for an exposure profile more appropriately suited for leisure noise. Converting 40 hours at 80 dB to a continuous exposure to noise (24 hours per day, seven days per week), this leads to a yearly average exposure of 71 dB for lifelong exposure.[21] This is the same value as the WHO recommendation of

[21] 71 dB = 80 dB (derived from ISO standard) – 6.2 dB (conversion of yearly average of 40 working hours divided by continuous exposure to noise: (10 log (2080hrs/8760 hrs)) – 3 dB (extrapolation of 40 working years to lifelong exposure).

70 dB (WHO, 1999). Table 49 presents the noise levels per hour for various time averages in order to keep within the recommended yearly average exposure, and assuming that exposure to other noise sources generally does not contribute significantly. For example, for specific events taking place for one-, two- or four-hour averages, once a week (such as visiting a discotheque or watching a loud movie), an hourly noise level of 85 dB would lead to an average yearly exposure of 63 dB, 66 dB and 69 dB, respectively. However, the same hourly exposure of 85 dB for an activity taking place for 14 hours per week (two hours per day, seven days a week) would lead to a yearly exposure of 74 dB, which exceeds the recommendations.

Table 49. Combination of hourly exposure and number of hours per week to arrive at a yearly average L_{Aeq}

Hours of exposure per week	One-hour exposure level (L_{Aeq})						
	70	75	80	85	90	95	100
1	48	53	58	63	68	73	78
2	51	56	61	66	71	76	81
4	54	59	64	69	74	79	84
14 (2 hours per day, 7 days per week)	59	64	69	74	79	84	89
28 (4 hours per day, 7 days per week)	62	67	72	77	82	87	92
40 (8 hours per day, 5 days per week)	64	69	74	79	84	89	94
168 (24 hours per day, 7 days per week)	70	75	80	85	90	95	100

Note: green = combinations of exposure/duration below current guideline level; red = combinations of exposure/duration above current guideline level; blue = input parameters.

The equal energy principle cannot be used to derive single-event limits because at high levels the ear starts to respond with nonlinear behaviour. The CNG provides several values, in different units: $L_{AF,max}$ = 110 dB for industrial noises (no distance stated), $L_{peak,lin}$ = 140 dB for adults and $L_{peak,lin}$ = 120 dB for children (measured at 100 mm) (WHO, 1999). EU Directive 2003/10/EC on the minimum health and safety requirements regarding the exposure of workers recommends a lower action level of $L_{peak,C}$ = 135 dB (at 100 mm). In a recent overview Hohmann (2015) provided an ERF for hearing damage caused by shooting noise, from which it appears that a safe level of L_E = 120 dB can be derived.

Although it is clear that high noise levels cause acute hearing damage, there is no agreement on a safe level. Further research is highly recommended. In the mean time, existing guidelines should be applied.

3.5.3 Summary of the assessment of the strength of recommendation

Table 50 provides a comprehensive summary of the different dimensions for the assessment of the strength of the leisure noise recommendations.

Table 50. Summary of the assessment of the strength of the recommendation

Factors influencing the strength of recommendation	Decision
Quality of evidence	**Average exposure ($L_{Aeq,24h}$)** *Health effects* • Evidence of an effect from PLDs on hearing impairment and tinnitus, in the absence of evidence for other health outcomes and absence of evidence on hearing impairment and tinnitus from other types of leisure noise besides PLDs, was rated **very low quality.** *Interventions* • No evidence was available on the effectiveness of interventions to reduce noise exposure and/or health outcomes from leisure noise.
Balance of benefits versus harms and burdens	The general benefit from reduction of leisure noise outweighs any potential harms.
Values and preferences	There is variability in the values and preferences of the general population.
Resource implications	The resources needed to reduce exposure to leisure noise are not expected to be intensive, but implementation and the long-term success of measures may be challenging, mainly due to cultural factors.
Decision on strength of recommendation	• **Conditional** for guideline level for average noise exposure ($L_{Aeq,24h}$) • **Conditional** for single-event and impulse noise • **Strong** for interventions to reduce noise exposure

3.6 Interim targets

An interim target was proposed in the NNG (WHO Regional Office for Europe, 2009), "recommended in situations where the achievement of NNG is not feasible in the short run for various reasons". The NNG emphasized that an interim target is "not a health-based limit value by itself. Vulnerable groups cannot be protected at this level".

The GDG discussed whether to propose interim targets as part of the current guidelines, and if so, what process would be needed to derive those values. The current recommendations are health-based and already provide guideline values per noise source (for both L_{den} and L_{night}). They also include information on exposure–response relationships for various health outcomes, which can be used by policy-makers or other stakeholders to inform the selection of different values, if needed. Further, interim targets may work differently in different countries and for different noise sources, and it may not be optimal to propose them Europe-wide. As a result, there was consensus among members of the GDG not to provide interim targets.

4. Implications for research

The development of these environmental noise guidelines for the WHO European Region has made evident some key knowledge gaps and research needs. The main ones specific to the guideline recommendations are presented as implications for research in the sections that follow.

4.1 Implications for research on health impacts from transportation noise

For the assessment of health effects from the main sources of transportation noise (road traffic, railways and aircraft), the various evidence reviews show the following knowledge gap: there is a need for longitudinal studies on the health impacts from exposure to environmental noise, to inform future recommendations properly (Table 51).

Table 51. Implications for research on health impacts from transportation noise (air, rail, road)

Current state of the evidence	Limited evidence is available on health impacts from transportation noise from large-scale cohort and case-control studies, with objective measurement of both noise exposure and health outcomes.
Population of interest	Research is needed into effects of exposure on children and adults exposed to environmental noise from transportation sources.
Exposure of interest	Objective measurement or calculation of transportation noise exposure is required; in particular, from studies of health effects related to combined exposure to different noise sources.
Comparison of interest	The data should be compared to the effects of lower levels of transportation noise.
Outcomes of interest	Measures of the following health outcomes is required, assessed objectively and harmonized where possible – for example, according to common protocols: • annoyance • effects on sleep • cardiovascular and metabolic effects • adverse birth outcomes • cognitive impairment • mental health, quality of life and well-being • hearing impairment and tinnitus • any other relevant health outcome.
Time stamp	The systematic review included studies between October 2014 and December 2016.

4.1.1 Specific implications for annoyance

To predict absolute %HA at the full range of levels (and the corresponding CIs), an integrated analysis of the original raw data from all of individual studies would be necessary. The evidence review conducted as part of the guidelines focused only on secondary data handling and therefore does not replace a full meta-analysis of all individual data. The development of a generic exposure–response relationship (from a full meta-analysis based on all individual data) is suggested as a priority research recommendation (see Table 52).

Table 52. Recommendation for research addressing the exposure–response relationship

Current state of the evidence	The evidence review on annoyance conducted as part of the guidelines does not provide a generalized ERF but points to significant differences compared to the curves used in the past. It shows that the available generalized ERFs are in need of adjustment, preferably as a result of undertaking a full meta-analysis. This is especially the case for the sources aircraft and railway noise, which new data show are more annoying than previously documented.
Population of interest	Research is needed into effects of exposure on children and adults exposed to air, rail and/or road traffic noise.
Exposure of interest	Objective measurement of transportation noise exposure is required.
Comparison of interest	The data should be compared to the effects of lower levels of transportation noise.
Outcomes of interest	Measures of health outcomes are required, assessed objectively according to common protocols (such as the International Commission on Biological Effects of Noise (ICBEN) scale for annoyance).
Time stamp	The systematic review included studies up to October 2014.

4.2 Implications for research on health impacts from wind turbine noise

Further research into the health impacts from wind turbine noise is needed so that better-quality evidence can inform any future public health recommendations properly. For the assessment of health effects from wind turbines, the evidence was either unavailable or rated low/very low quality. Recommendations for research addressing this priority are proposed in Table 53.

Table 53. Implications for research on health impacts from wind turbine noise

Current state of the evidence	The current evidence on health outcomes related to wind turbine noise is unavailable or of low/very low quality and mainly comes from cross-sectional studies. Methodologically robust longitudinal studies with large samples investigating the quantitative relationship between noise from wind turbines and health effects are needed.
Population of interest	Research is needed into effects of exposure on children and adults exposed and living near sources of wind turbine noise. Studies should assess subgroup differences in effects for vulnerable groups such as children, elderly people and those with existing poor physical and mental health.
Exposure of interest	Exposure to noise at a wide range of levels and frequencies (including low-frequency noise), with information on noise levels measured outdoors and indoors (particularly relevant for effects on sleep) at the residence is needed. The noise exposure should be measured objectively and common protocols for exposure to wind turbine noise should be established, considering a variety of noise characteristics specific to wind turbine noise.
Comparison of interest	The data should be compared to the effects in similar areas without wind turbines. Pre/post studies of new wind turbine installations are needed, especially if “before measures” unbiased by the stress and knowledge of potential wind turbine farm development need to be developed.
Outcomes of interest	Measures of health outcomes are required, assessed objectively – for example, according to common protocols (ICBEN scale for annoyance and self-reported sleep disturbance). The studies should include the most important situational and personal confounding variables, such as negative attitudes towards wind turbines, visual impact, economic gain and other socioeconomic factors.
Time stamp	The systematic review included studies between October 2014 (review on annoyance) and December 2016 (review on cardiovascular disease).

Alongside the defined needs for research on wind turbine noise it should be noted that research regarding industrial noise in general is required. More specifically, there is a need to investigate stationary sources (including heat, ventilation and acclimatization devices) and their impacts on health. Studies on hearing disorders from impulse and/or intermittent sounds are also needed; these would enable assessment of adverse effects created by one or several sounds of short duration with a high maximum sound level or impulse sound level.

4.3 Implications for research on health impacts from leisure noise

For the assessment of effects from leisure noise, the evidence to make a recommendation on the ERF to use for health risk assessment, or of a threshold for effects, was either unavailable or rated very low quality. This is a research gap: longitudinal studies with longer follow-up are needed; these should measure noise objectively, not only from PLDs but also from other types of leisure noise.

There is uncertainty in the measurement of early hearing disorders among young people using the tonal audiometry commonly applied. Precise methods to identify early hearing impairment and other hearing disorders are needed. Owing to long induction periods, however, adequate research may be difficult to perform, particularly among young people who change their exposure in terms of sound level and frequency as they age (for example, changing their music listening habits and venue visits). As a result, the recommendations refer to the results derived from stationary noise sources in the occupational field, in conjunction with the equal energy principle (see Table 54).

Table 54. Implications for research on health impacts from leisure noise

Current state of the evidence	Currently, no evidence is available on hearing impairment and tinnitus from large-scale cohort and case-control studies, with objective measurement of noise exposure and using a suitable method to assess hearing impairment in young people.
Population of interest	Research is needed into effects of exposure on children and adults exposed to environmental noise from different sources and in different settings.
Exposure of interest	Objective measurement of leisure noise exposure is required.
Comparison of interest	The data should be compared to the effects of no leisure noise exposure from these sources.
Outcomes of interest	The primary outcomes identified are: • hearing loss measured by audiometry; • specific threshold analyses focused on stratifying the risk of permanent hearing loss according to clearly defined levels of exposure to leisure noise, such as music through PLDs; • concise methods to identify early hearing impairment and other hearing disorders; • temporary threshold shift after exposure to leisure noise, as it may be reasonably predictive of future permanent threshold shift; • age-related hearing loss progression depending on early-age exposure to leisure noise, such as to loud music; and • tinnitus, measured objectively and subjectively.
Time stamp	The systematic review included studies up to June 2015.

4.4 Implications for research on effectiveness of interventions to reduce exposure and/or improve public health

The quality of the evidence on the effectiveness of interventions to reduce exposure to and health outcomes from environmental noise was variable. Further studies directly linking noise interventions to health outcomes are required, particularly for sources other than road traffic noise, and for human health outcomes other than annoyance.

Most studies involved road traffic noise (63%), followed by aircraft noise (13%) and railway noise (6%). The remaining interventions were for leisure noise (13%) and noise in hospital settings (4%). No interventions were identified that either addressed wind turbine noise or focused on educational settings.

Exposure-related interventions were mainly associated with a reduction in environmental noise exposure. However, in five studies (four road traffic noise studies and one aircraft noise study) some or all of the participants experienced noise exposure increases.

There is no clear evidence with respect to thresholds, which are defined as:

- the smallest change in exposure levels that results in a change in outcome; and
- the minimum before-level, regarding changes in health outcomes as a result of interventions.

The limited evidence base on the health effects of environmental noise interventions is thinly spread across different noise source types, outcomes and intervention types. Diversity exists between studies even within intervention types in terms of study designs, methods of analysis, exposure levels and changes in exposure experienced as a result of the interventions. For these reasons, carrying out a meta-analysis across studies examining the association between changes in level and changes in outcome was not possible.

To remedy this main research gap, longitudinal studies assessing noise exposure and health outcomes objectively should be developed, taking into account the most relevant confounders. The establishment of common protocols for future research is warranted (see Table 55).

Authorities should include significant funding for the design and implementation of studies to evaluate the effectiveness of interventions to reduce noise and their impact on health.

Table 55. Implications for research on effectiveness of interventions to reduce exposure and/or improve public health

Current state of the evidence	The current evidence on effectiveness of interventions to reduce health outcomes is limited and of varying quality. Few longitudinal studies have been done that take into account the most relevant confounders and measure the noise exposure and the outcomes objectively.
Population of interest	Research is needed into effects of interventions on defined populations exposed to and/or living near sources of environmental noise.
Intervention of interest	Research into any noise intervention at various points along the system pathway between source and outcome, for a variety of noise sources, is required.
Comparison of interest	The data should be compared to: • a steady-state control group, in similar areas with various exposure gradients from environmental noise sources; • the noise exposure in the same population, through a series of sequential measurements assessing the change before and after the intervention, preferably with multiple after measurements.
Outcomes of interest	Future intervention studies should use validated and, where possible, harmonized measures of exposure and outcome, as well as of moderators and confounders. The studies should use measures of exposure including noise exposure at a wide range of levels and frequencies (including low-frequency noise), with information on noise levels outdoors and indoors (particularly relevant for effects on sleep). They should also use measures of health outcomes, including the following outcomes assessed objectively – for example, according to common protocols (ICBEN scale for annoyance) – with consideration that the change in human response for some health outcomes from a step change in exposure may have a different time course to that of the change in exposure: • annoyance • effects on sleep • cardiovascular and metabolic diseases • adverse birth outcomes • cognitive impairment • mental health, quality of life and well-being • hearing impairment and tinnitus • any other relevant health outcome. Further, they should use measures of moderators and confounders, including repeated measurements of situational and personal variables such as activity interference, potential confounders such as noise sensitivity, coping strategies and a range of other attitudinal variables.
Time stamp	The systematic review included studies up to October 2014.

5. Implementation of the guidelines

5.1 Introduction

These guidelines focus on the WHO European Region and provide guidance to Member States that is compatible with the noise indicators used in the EU's END (EC, 2002a). They provide information on the exposure–response relationships between exposure to environmental noise from different noise sources and the proportion of people affected by certain health outcomes, as well as interventions that are considered efficient in reducing exposure to environmental noise and related health outcomes.

The WHO guideline values are evidence-based public health-oriented recommendations. As such, they are recommended to serve as the basis for a policy-making process in which policy options are considered. In the policy decisions on reference values, such as noise limits for a possible standard or legislation, additional considerations – such as feasibility, costs, preferences and so on – feature in and can influence the ultimate value chosen as a noise limit. WHO acknowledges that implementing the guideline recommendations will require coordinated effort from ministries, public and private sectors and nongovernmental organizations, as well as possible input from international development and finance organizations. WHO will work with Member States and support the implementation process through its regional and country offices.

5.2 Guiding principles

Four guiding principles provide generic advice and support when incorporating the recommendations into a policy framework, and apply to the implementation of all the recommendations.

The **first principle** is to reduce exposure to noise, while conserving quiet areas. The recommendations focus on reduction of population exposure to environmental noise from a variety of sources, in different settings. The general population can be exposed regularly to more than one source of noise simultaneously (including, in some cases, occupational noise), as well as to other nonacoustic factors that can modify the response to noise (such as vibration from railways, air pollution from traffic or visual aspects of wind turbines). Thus, overall reduction of exposure from all sources should be promoted. Furthermore, noise exposure reduction in one area should not come at the expense of an increase in noise elsewhere; existing large quiet outdoor areas should be preserved.

The **second principle** is to promote interventions to reduce exposure to noise and improve health. The evidence from epidemiological studies on adverse health effects at certain noise levels, used as a basis to derive the guideline values proposed in the recommendations, supports the promotion of noise interventions. The potential health impacts from environmental noise are significant, especially when considering the widespread exposure to environmental noise across the population and the high baseline rates for various health outcomes associated with environmental noise.

There are challenges in assessment of the effectiveness of interventions to reduce noise exposure and/or improve health, as there is often a significant time lag between the intervention and a measurable change in exposure and related health benefits. The lack of – or limited direct evidence

for – quantifiable health benefits of some specific interventions does not imply that measures to achieve population exposure according to the proposed guidelines should be ignored.

Given the different factors that determine noise exposure, a single measure alone may not be sufficient to reduce exposure and/or improve health significantly, and a combination of methods may be warranted. Nevertheless, it is widely acknowledged that the most effective actions to reduce exposure tend to be those that reduce noise at the source. Such actions have the biggest potential, whereas other measures can be less effective or sustained over time, especially when they depend on behaviour change or noise reductions inside houses.

The **third principle** is to coordinate approaches to control noise sources and other environmental health risks. Considering the common transport-related sources of environmental noise and air pollution, and in particular the evidence of independent effects on the cardiovascular system, a coordinated approach to policy development in the sectors related to urban planning, transport, climate and energy should be adopted for policies with an impact on environmental noise, air quality and/or climate. Such an approach should yield multiple benefits through increased commitment and financial resources; increased attention to securing health considerations in all policies; and use of policy to control noise and other environmental risks such as air pollutants, including short-lived climate pollutants. There is wide consensus on the value of pursuing coordinated policies that can deliver health and other benefits, such as those associated with the local environment and economic development. Furthermore, coordinated policy-making is potentially cost-saving.

The **fourth principle** is to inform and involve communities that may be affected by a change in noise exposure. In planning new urban and/or rural developments (transport schemes, new infrastructures in less densely populated areas, noise abatement and mitigation strategies), bringing together planners, environmental professionals and public health experts with policy-makers and citizens is key to public acceptability and involvement and to the successful guidance of the decision-making proces. Potential health effects from environmental noise should be included as part of health impact assessments of future policies, plans and projects, and the communities potentially affected by a positive or negative change in noise exposure should be well informed and engaged from the outset to maximize potential benefits to health. Introducing measures incrementally may help with acceptance.

5.3 Assessment of national needs and capacity-building

National needs, including the need for capacity-building, differ between Member States in the WHO European Region. They depend on the existence and level of implementation of national and/or European and international noise policies; these are more likely to be implemented fully in EU countries thanks to the legally binding provisions of the EU's END (EC, 2002a). In most countries in the Region noise is perceived as a major and growing environmental health and public health problem. Noise mapping and action plans are carried out in accordance with the END in EU Member States, and in south-eastern European countries noise legislation has mainly been harmonized with the END. Nevertheless, significant differences still exist in the completeness and regular updating of noise exposure assessment between countries. Noise exposure assessment is a required input for noise health impact assessments, along with exposure–response relationships and population baseline data.

WHO has identified some common needs for knowledge transfer and capacity-building for health risk assessment of environment noise in the Member States that joined the EU after 2003, the newly independent states and south-eastern European countries (WHO Regional Office for Europe, 2012):

- implementation of the END and its annexes, especially in the preparation of strategic noise mapping and action plans;
- human resources development through education and training in health risk assessment and burden of diseases stemming from environmental noise;
- methodological guidance for health risk assessment of environmental noise.

These guidelines mostly recommend exposure–response relationships related to the exposure indicators L_{den} and L_{night}. They are therefore of particular relevance to EU countries and those applying the END. In countries that do not use these indicators, users of the guidelines need to convert their noise indicators into L_{den} and L_{night} before being able to apply the recommendations. Conversion between indicators is possible, using a certain set of assumptions (Brink et al., 2018).

5.4 Usefulness of guidelines for target audiences

The provision of guideline values as a practical tool for guiding exposure reduction and the design of effective measures and policies is widely seen as useful. The WHO guidelines equip policy-makers and other end-users with a range of different needs with the necessary evidence base to inform their decisions. As indicated in section 1.4, these guidelines serve as a reference for several target audiences, and for each group they can be useful in different ways.

- For technical experts and decision-makers, the guidelines can be used to provide exposure–response relationships that give insight into the consequences of certain regulations or standards on the associated health effects. They also can be useful at the national and international level when developing noise limits or standards, as they provide the scientific basis to identify the levels at which environmental noise causes a significant health impact. Based on these recommendations, national governments and international organizations can be better informed when introducing noise limits, to ensure protection of people's health.
- For health impact assessment and environmental impact assessment practitioners and researchers, these guidelines provide exposure–response relationships that give insight into the expected health effects at observed or expected noise exposure levels. They offer recommendations on the maximum admissible noise levels for some sources and provide important input to assit in deriving the health burden from noise; in that sense, they can be used when producing studies such as noise maps and action plans to obtain an evaluation of the magnitude of the health problem. The systematic reviews developed in support of these guidelines allow practitioners to raise awareness of the credibility of the issue of noise as a public health problem and to use the recommended exposure–response relationships uniformly. Researchers will also benefit from the guidelines as they clearly identify critical data gaps that need to be filled in the future to better protect the population from the harmful effects of noise.
- The guideline recommendations provide a useful tool for national and local authorities when deciding about noise reduction measures, as they provide data to estimate the health burden on the population and therefore allow comparison among different policy options. These options

can include measures to reduce the noise emitted by the sources, measures aimed at impeding the transmission of noise from the sources to people and measures aimed at better planning the location of houses (urban planning).

- The guideline recommendations can also be used by civil society, patients and other advocacy groups to raise awareness and encourage actions to protect the population, including vulnerable groups, from exposure to noise.

Regarding noise abatement and mitigation of noise sources, practical exposure–response relationships for various noise sources are useful quantitative input to determine the impact of noise on health. They can be valuable information to use in cost–effectiveness and cost–benefit analyses of various policies for noise abatement. In this respect, the guideline recommendations can be an integral part of the policy process for noise reduction by various institutions; they are of great value for communicating the health risks and potential cost-effective solutions to reduce noise.

National and local authorities and nongovernmental organizations responsible for risk communication and general awareness-raising can use these guidelines for promotion campaigns and appropriate risk communication. The guidelines provide scientific evidence on a range of health effects associated with noise and facilitate appropriate risk communication to specific vulnerable groups. They therefore need to be promoted broadly to citizens, national and local authorities and nongovernmental organizations responsible for risk communication.

5.5 Methodological guidance for health risk assessment of environmental noise

A health risk assessment is the scientific evaluation of potential adverse health effects resulting from human exposure to a particular hazard – in this case, environmental noise. The main purpose of the assessment is to estimate and communicate the health impact of exposure to noise or changes in noise in different socioeconomic, environmental and policy circumstances.

The guideline recommendations, along with the detailed information contained in the systematic evidence reviews, can be used to assess health impacts in order to answer a variety of policy questions on:

- the public health burden associated with current or projected levels of noise;
- the human health benefits associated with changing a noise policy or applying a more stringent noise standard;
- the impacts on human health of emissions from specific sources of noise for selected economic sectors (and the benefits of policies related to them); and
- the human health impacts of current policy or implemented action.

The results from a health risk assessment are usually reported as the number of attributable deaths, number of cases, years of life lost, years lost due to disability or DALYs.

The quantification of the impacts for one combination of noise source, noise exposure indicator and health outcome may to some extent include effects attributable to another. Consequently, for any particular set of combinations, consideration should be given to potential double counting.

It is also important to note the uncertainties in quantification of the health impacts. One set of uncertainties relates to the CIs associated with the recommended ERFs; these quantify the random

error and variability attributed to heterogeneity in the epidemiological studies used for health risk assessment. Other types of uncertainty include modelling/calculation of noise exposure, estimates of population background rates for morbidity and mortality, and transferability of ERFs from locations where studies were carried out or data were otherwise gathered to another location. This is especially true for noise annoyance, for which there is often considerable heterogeneity in effect sizes of studies because estimates vary between noise sources and are to some degree dependent on the situation and context. Furthermore, cultural differences around what is considered annoying are significant, even within Europe. It is therefore not possible to determine the "exact value" of %HA for each exposure level in any generalized situation. Instead, data and exposure–response curves derived in a local context should be applied whenever possible to assess the specific relationship between noise and annoyance in a given situation. If, however, local data are not available, general exposure–response relationships can be applied, assuming that the local annoyance follows the generalized average annoyance. Despite the challenges in applying a "generalized" ERF to specific local situations, the GDG believes that the percentage of high annoyance defined in section 2.4.3 is an acceptable estimate of the "average" %HA at a certain noise level – for example, in Europe.

When performing a health risk assessment of environmental noise, it is important to note several considerations. The selection of particular noise source(s), noise exposure indicator(s) and health outcome combinations to be used for estimation of the health impacts depends on the particular policies and/or measures being assessed. These guidelines propose recommendations for four types of noise source using noise indicators L_{den} and/or L_{night} (road traffic, railway noise, aircraft noise and wind turbine noise) and one recommendation using $L_{Aeq,24h}$ (leisure noise). Any population may be exposed to different noise sources associated with the same health outcome. Estimated impacts should not be added together without recognizing that addition will, in most practical circumstances, lead to some overestimation of the true impact. Impacts estimated for only one combination will, on the other hand, underestimate the true impact of the noise mixture, if other sources of noise also affect that same health outcome.

The scientific evidence reviewed and summarized in these guidelines implies that the following health outcomes can be quantified in a health risk assessment, and that their effects are cumulative:

- from road traffic noise – incidence of IHD, annoyance and sleep disturbance, and potentially incidence of stroke and diabetes;
- from railway noise – annoyance and sleep disturbance;
- from aircraft noise – annoyance, reading and oral comprehension in children, sleep disturbance and potentially change in waist circumference and incidence of IHD;
- from wind turbine noise: annoyance.

The DWs suggested in section 2.4.3 can be used to calculate DALYs.

Data on incidence and prevalence of some health outcomes related to noise (mainly cardiovascular disease) can be found at a national level in online databases available on the WHO Regional Office for Europe website (WHO Regional Office for Europe, 2017).

General principles of relevance for environmental factors when conducting health risk assessments and quantifying the burden of disease can be found elsewhere (European Centre for Health Policy, 1999; Murray, 1994; Murray & Acharya, 1997; Murray & Lopez, 2013; Quigley et al., 2006; WHO,

2014a; 2014b; WHO Regional Office for Europe, 2016). In particular, the WHO Regional Office for Europe and JRC jointly published the first estimates of the burden of disease from environmental noise in 2011 (WHO Regional Office for Europe & JRC, 2011). The publication includes guidance on the procedure for the health risk assessment of environmental noise, exemplary estimates of the burden of the health impacts of environmental noise and a discussion of the uncertainties and limitations of the procedure to calculate the environmental burden of disease. The reader is referred to this publication for more detailed explanations on quantitative risk assessment methods for environmental noise.

5.6 Route to implementation: policy, collaboration and the role of the health sector

Preventing noise and related health impacts relies on effective action across different sectors: health, environment, transport, urban planning and so on. The health sector needs to be engaged effectively in different sectors' policy processes at national, regional and international levels. It needs to provide authoritative advice about the health impacts of noise and policy options that will bring the greatest benefits to health.

In most countries in the WHO European Region, the commitment of the health sector to engage in action to address environmental noise issues needs to be improved and better coordinated. A more coherent overall response is needed, taking into account relevant linkages with existing health priorities and concerns. Thus, some actions can be seen as aspects of the role of the health sector:

- engaging in proper communication with relevant sectors about noise exposure from different sectors and sources (environmental, urban development, transport and so on) to ensure that health issues are adequately addressed as part of international, regional, national and/or local efforts to address environmental noise – the implementation approach may differ across sectors, depending on the level of awareness of noise as a public health problem;
- promoting the guideline recommendations to policy-makers from different sectors and organizing information campaigns and awareness-raising activities in collaboration with national health authorities and WHO country offices to inform citizens and health practitioners about the health risks of environmental noise;
- using decision support instruments such as health impact and health risk assessments to quantify health risks and potential benefits associated with policies and interventions aimed at addressing environmental noise, including presenting information about the severity of the health effects (for example, with cardiovascular disease) to convey the serious impacts of noise and to try to change attitudes and behaviours of policy-makers and the general public;
- promoting the guidelines to health practitioners and physicians, especially at the community level (through associations of physicians, cardiologists and so on as part of the stakeholder group);
- supporting the establishment of national health institutions capable of initiating and developing health promotion measures, and conducting research, monitoring and reporting on health impacts from environmental noise and its different sources;

- organizing capacity-building workshops and training to increase knowledge of the guidelines as well as creating tools, skills and resources for health risk assessment and developing intersectoral collaboration, particularly in non-EU countries;
- promoting relevant research initiatives and shaping the research agenda, in part based on critical research recommendations and gaps identified in the guidelines, as well as on the impact and effectiveness of interventions and experience with their implementation;
- developing and updating guidelines and policies that influence national, regional and international benchmarks and targets related to environmental noise, as well as advocating the inclusion of the guidelines in development and shaping of national, regional and international noise policies and standards;
- working with other sectors to strengthen noise level monitoring and evaluation, particularly in non-EU countries, to ensure proper conducting of health risk assessments of environmental noise.

5.7 Monitoring and evaluation: assessing the impact of the guidelines

Exposure–response relationships and other recommendations provided by these guidelines should be incorporated into national health policies and the main related policy documents. They should be used for health impact and health risk assessments to identify health risks and potential benefits associated with policies and interventions related to environmental noise.

Population noise exposure should be monitored and assessed at a national scale, at least in urban areas. Furthermore, information on trends in occurrence of noise-related health outcomes considered in these guidelines, such as annoyance or sleep disturbance, should be gathered. These monitoring activities should be performed on a regular basis to ensure proper health risk assessments of noise.

5.8 Updating the guidelines

The progress and pace of noise and health research has intensified over the last 10 years, including new studies published after the completion of the systematic reviews done for these guidelines. This is partly related to the growing car fleet and resulting traffic, the density of urbanization, demographic changes and shifts towards renewable energy, including wind turbines, which have caused an increase in public perception and political awareness of the environmental noise problem. Noise exposure assessment has also improved, due partly to European legislation, and this has provided useful data for epidemiological studies on the health effects of environmental noise. Considering this, the recommendations proposed in these guidelines are expected to remain valid for a period of about 10 years. WHO will monitor the development of the scientific advancements on noise and health research in order to inform any updated guidance on environmental noise.

Annexes

Annex 1. Steering, advisory and external review groups

Tables A1.1–A1.5 give details of the various teams involved in the development of the WHO environmental noise guidelines for the European Region.

Table A1.1 WHO Steering Group

Name	Role	Affiliation
Shelly Chadha	Technical Officer, Office for Hearing Impairment	WHO headquarters, Geneva, Switzerland
Carlos Dora	Coordinator	WHO headquarters, Department of Public Health and Environment, Geneva, Switzerland
Marie-Eve Héroux	Technical Officer, Air Quality and Noise	WHO Regional Office for Europe, European Centre for Environment and Health, Bonn, Germany
Dorota Jarosinska	Programme Manager, Living and Working Environments	WHO Regional Office for Europe, European Centre for Environment and Health, Bonn, Germany
Rokho Kim	Environmental Health Specialist, Team Leader	WHO Regional Office for the Western Pacific, Division of Noncommunicable Diseases and Health through the Life-Course, Manila, Philippines
Jurgita Lekaviciute	Consultant, Noise	WHO Regional Office for Europe, European Centre for Environment and Health, Bonn, Germany
Srdan Matic	Coordinator, Environment and Health	WHO Regional Office for Europe, Copenhagen, Denmark
Julia Nowacki	Technical Officer, Health Impact Assessment	WHO Regional Office for Europe, European Centre for Environment and Health, Bonn, Germany
Elizabet Paunovic	Head of Office	WHO Regional Office for Europe, European Centre for Environment and Health, Bonn, Germany
Poonum Wilkhu	Consultant, Noise	WHO Regional Office for Europe, European Centre for Environment and Health, Bonn, Germany
Jördis Wothge	Consultant, Noise	WHO Regional Office for Europe, European Centre for Environment and Health, Bonn, Germany

Annex 3. Summary of conflict of interest management

All external contributors to the guidelines, including members of the GDG, Systematic Review Team and External Review Group, completed WHO declaration of interest forms in accordance with WHO's policy for experts. Further, at the initial stage of the project WHO technical staff reviewed and accepted *curricula vitae* of the candidates for the GDG.

At the beginning of the GDG meetings, the participants declared any conflict of interest by submitting declaration of interest forms. Updated declarations of interest were also collected from the members of the GDG, Systematic Review Team and External Review Group at the final stage of the project.

The conflict of interest assessment was done according to WHO procedures. If a conflict was declared, an initial review was undertaken by the WHO Secretariat to assess its relevance and significance. A declared conflict of interest is insignificant or minimal if it is unlikely to affect or to be reasonably perceived to affect the expert's judgment. Insignificant or minimal interests are: unrelated or only tangentially related to the subject of the activity or work and its outcome; nominal in amount or inconsequential in importance; or expired and unlikely to affect current behaviour.

The WHO Secretariat reviewed and assessed the declarations. In one case the legal unit was consulted for advice; in another the potential conflict was reported in the updated declaration of interest at the final stage of the process and assessed unlikely to affect expert's performance; in a further case a member of the GDG was also a co-author of a systematic review owing to the need to support systematic review authors with additional expertise, but there was no remuneration for this activity.

No member of the GDG or the Systematic Review Team was excluded from his or her role in the guideline development process. The declared conflicts of interest of the External Review Group members were considered when interpreting comments during the external review process.

Annex 4. Detailed overview of the evidence of important health outcomes

As a first step of the evidence retrieval process, the GDG defined two categories of health outcome associated with environmental noise: those considered (i) critical or (ii) important, but not critical for decision-making in the guideline development process.

The GDG relied on the critical health outcomes to inform its decisions on priority health outcomes, so only these were used to inform the recommendations. Nevertheless, as the relevance of some of important health outcomes was difficult to estimate *a priori,* systematic reviews were conducted for both critical and important health outcomes.

This annex provides a detailed overview of the evidence of the important health outcomes – namely adverse birth outcomes, quality of life, well-being and mental health and metabolic outcomes – for each of the noise sources. A comprehensive discussion of all the evidence considered (both critical and important) is available in the published systematic reviews (see section 2.3.2 and Annex 2 for details).

1. Road traffic noise

1.1 Adverse birth outcomes

In total, the systematic review found five studies (two with more or less the same population) on road traffic noise and birth outcomes and three related studies on total ambient noise, likely to be mostly road traffic noise. Too few studies for each of the various measures related to adverse birth outcomes were available to undertake a quantitative meta-analysis. There was evidence rated low quality for a relationship between road traffic noise and low birth weight (Dadvand et al., 2014; Gehring et al., 2014; Hjortebjerg et al., 2016; Wu et al., 1996); however, the estimates were imprecise and in some cases not statistically significant. Further, there was no clear relation between exposure to road traffic noise and pre-term delivery, but there was a positive association between road traffic noise and small for gestational age (OR = 1.09; 95% CI: 1.06–1.12 per 6 dB increase). The evidence for both measures of adverse birth outcomes comes from the same publications and this evidence was rated low quality (Gehring et al., 2014; Hystad et al., 2014).

This evidence was supported by one ecological time-series study published recently looking at total ambient noise and various measures related to adverse birth outcomes (Arroyo et al., 2016a; 2016b; Diaz et al., 2016).

1.2 Quality of life, well-being and mental health

Evidence rated moderate quality was found for an effect of road traffic noise on emotional and conduct disorders in childhood (Belojevic et al., 2012; Crombie et al., 2011; Hjortebjerg et al., 2015; Ristovska et al., 2004; Stansfeld et al., 2005; 2009a; Tiesler et al., 2013) and evidence rated moderate quality for an association of road traffic noise with hyperactivity in children (Hjortebjerg et al., 2015; Tiesler et al., 2013).

There was no clear relationship, however, between road traffic noise exposure and self-reported quality of life (evidence rated low quality) (Barcelo Perez & Piñeiro, 2008; Brink, 2011; Clark et al., 2012; Honold et al., 2012; Roswall et al., 2015; Schreckenberg et al., 2010b; Stansfeld et al., 2005; 2009b; van Kempen et al., 2010); medication intake for depression and anxiety (evidence rated very low quality) (Floud et al., 2011; Halonen et al., 2014); depression, anxiety and psychological distress (evidence rated very low quality) (Honold et al., 2012; Stansfeld et al., 2009b); and interview measures of depression and anxiety (evidence rated very low quality) (Stansfeld et al., 2009b).

1.3 Metabolic outcomes

1.3.1 Diabetes

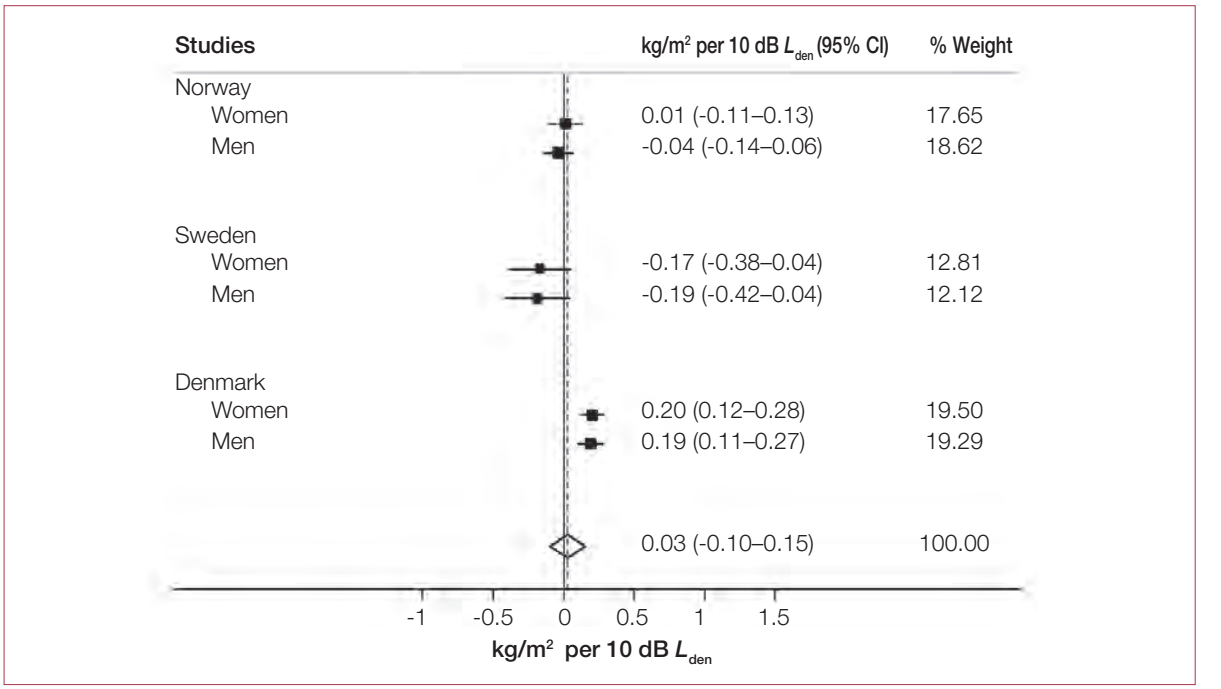
For the relationship between road traffic noise and the incidence of diabetes, one cohort study was identified, which included 57 053 participants and 2752 cases (Sörensen et al., 2013). The estimate of the effect was RR = 1.08 (95% CI: 1.02–1.14) per 10 dB L_{den} increase in noise across the range of 50–70 dB, and therefore the evidence was rated moderate quality.

Furthermore, two cross-sectional studies were identified that looked at the prevalence of diabetes (Selander et al., 2009; van Poll et al., 2014). The studies included 11 460 participants and 242 cases. Both studies reported a harmful effect of noise, and one showed a statistically significant association. However, the results were imprecise and with serious risk of bias, so the evidence was rated very low quality.

1.3.2 Obesity

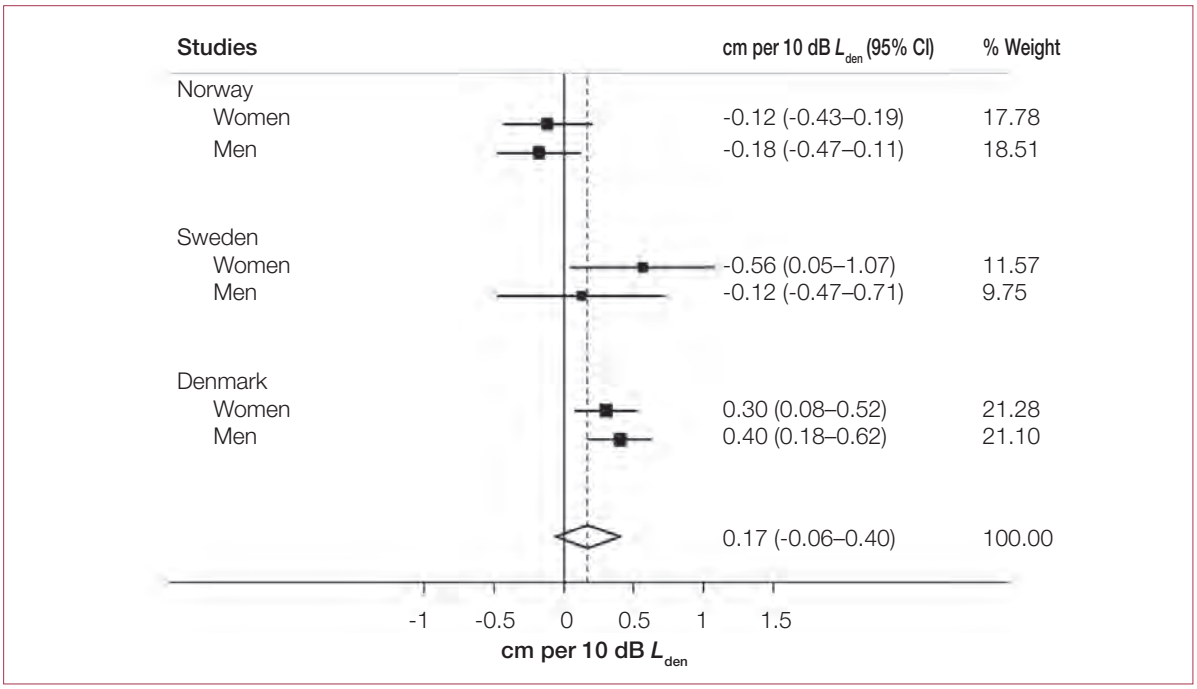
With regard to the association between road traffic noise and change in body mass index (BMI) and waist circumference, three cross-sectional studies were identified, with 71 431 participants (Christensen et al., 2016; Oftedal et al., 2014; 2015; Pyko et al., 2015). For each 10 dB increase in road traffic noise, there was a statistically nonsignificant increase in BMI of 0.03 kg/m^2 (95% CI: –0.10–0.15 kg/m^2) and in waist circumference of 0.17 cm (95% CI: –0.06–0.40 cm). There was inconsistency in the results between the studies; therefore, for both associations, the evidence was rated very low quality (Fig. A4.1 and Fig. A4.2).

Fig. A4.1 The association between exposure to road traffic noise (L_{den}) and BMI in three Nordic studies



Notes: The black vertical line corresponds to no effect of noise exposure. The black dots correspond to the estimated slope coefficients per 10 dB for each sex in each study, with 95% CIs. The diamond designates summary estimates and 95% CIs based on random effects models. The dashed red line corresponds to these summary estimates. Heterogeneity between studies: p = 0.000; heterogeneity between genders: p = 0.360; overall (I-squared = 84.4%, p = 0.000). Weights are from random effect analysis.

Fig. A4.2 The association between exposure to road traffic noise (L_{den}) and waist circumference in three Nordic studies



Notes: The black vertical line corresponds to no effect of noise exposure. The black dots correspond to the estimated slope coefficients per 10 dB for each sex in each study, with 95% CIs. The diamond designates summary estimates and 95% CIs based on random effects models. The dashed red line corresponds to these summary estimates. Heterogeneity between studies: p = 0.001; heterogeneity between genders: p = 0.842; overall (I-squared = 69.0%, p = 0.007). Weights are from random effect analysis.

2. Railway noise

2.1 Adverse birth outcomes

No studies were found, and therefore no evidence was available on the association between railway noise and adverse birth outcomes.

2.2 Quality of life, well-being and mental health

Evidence rated very low quality was found for a weak effect of railway noise exposure on self-reported quality of life or health, albeit from a limited number of studies (Roswall et al., 2015; Torre et al., 2007). There was evidence rated moderate quality for an effect of railway noise on emotional and conduct disorders in childhood (Hjortebjerg et al., 2015), but no clear relationship between railway noise and children's hyperactivity (Hjortebjerg et al., 2015); this evidence was rated moderate quality.

2.3 Metabolic outcomes

2.3.1 Diabetes

One cohort study was identified that looked at the relationship between railway noise and the incidence of diabetes (Sörensen et al., 2013). The cohort study of 57 053 participants, including 2752 cases, found evidence rated moderate quality that there was no considerable effect of railway noise on diabetes, with an RR of 0.97 (95% CI: 0.89–1.05) per 10 dB L_{den} increase in noise.

Furthermore, one cross-sectional study was identified that looked at the relationship between railway noise and the prevalence of diabetes (van Poll et al., 2014), including 9365 participants and 89 cases. An RR of 0.21 (95% CI: 0.05–0.82) per 10 dB L_{den} increase in noise was found, but the reasons for the beneficial effect were not immediately apparent. The evidence in the study was rated very low quality.

2.3.2 Obesity

Regarding the association between railway noise and change in BMI and waist circumference, two cross-sectional studies were identified, with 57 531 participants (Christensen et al., 2016; Pyko et al., 2015). Christensen and colleagues observed a statistically significant increase of 0.18 kg/m^2 (95% CI: 0.00–0.36 kg/m^2) per 10 dB for BMI and 0.62 cm (95% CI: 0.14–1.09 cm) per 10 dB for waist circumference in those exposed to railway noise, at levels above 60 dB L_{den}. Pyko and colleagues found a statistically significant increase in waist circumference of 0.92 cm (95% CI: 0.06–1.78 cm) per 10 dB L_{den}. The corresponding estimate for BMI was statistically nonsignificant, at 0.06 kg/m^2 (95% CI: –0.02–0.16 kg/m^2). The evidence was rated low/very low quality.

3. Aircraft noise

3.1 Adverse birth outcomes

Evidence rated very low quality was available for an association between aircraft noise and pre-term delivery, low birth weight and congenital anomalies, as evidenced by six studies included in the systematic review (Ando & Hattori, 1973; Edmonds et al., 1979; Jones & Tauscher, 1978; Knipschild et al., 1981; Matsui et al., 2003; Schell, 1981). The potential for risk of bias in these was high and the results tended to be inconsistent.

3.2 Quality of life, well-being and mental health

Evidence rated very low quality was available for an effect of aircraft noise on medication intake for depression and anxiety (Floud et al., 2011). There was evidence rated very low quality for an effect of aircraft noise exposure on interview measures of depression and anxiety (Hardoy et al., 2005) and rated low quality for an association of aircraft noise with hyperactivity in children (Clark et al., 2013; Crombie et al., 2011; Stansfeld et al., 2009a).

The evidence showed, however, no substantial effect of aircraft noise on self-reported quality of life or health (Clark et al., 2012; Schreckenberg et al., 2010a; 2010b; Stansfeld et al., 2005; van Kempen et al., 2010) or on emotional and conduct disorders in childhood (Clark et al., 2012; 2013; Crombie et al., 2011; Stansfeld et al., 2005; 2009a). This evidence was rated very low quality.

3.3 Metabolic outcomes

3.3.1 Diabetes

For the relationship between aircraft noise and incidence of diabetes one cohort study was identified, including 5156 participants and 1346 cases (Eriksson et al., 2014). The estimate of the effect was imprecise, with an RR of 0.99 (95% CI: 0.47–2.09) per 10 dB L_{den} increase in noise; the evidence was therefore rated very low quality.

Furthermore, one cross-sectional study was identified that looked at the prevalence of diabetes (van Poll et al., 2014), including 9365 participants and 89 cases. The RR was 1.01 (95% CI: 0.78–1.31) per 10 dB increase in aircraft noise. The evidence was rated very low quality.

3.3.2 Obesity

For the association between aircraft noise and change in BMI and waist circumference, one cohort study was identified, with 5156 participants (Eriksson et al., 2014). For each 10 dB increase in aircraft noise level, the increase in BMI was 0.14 kg/m^2 (95% CI: –0.18–0.45) (evidence rated low quality), and the increase in waist circumference was 3.46 cm (95% CI: 2.13–4.77) (evidence rated moderate quality). The range of noise levels in the study was 48–65 dB L_{den}. In the case of BMI, the change over the whole range in noise values was not statistically significant and was less than what could be considered clinically relevant (3–5% change in BMI); however, for waist circumference, the change was equivalent to an increase of 5.8 cm.

4. Wind turbine noise

4.1 Quality of life, well-being and mental health

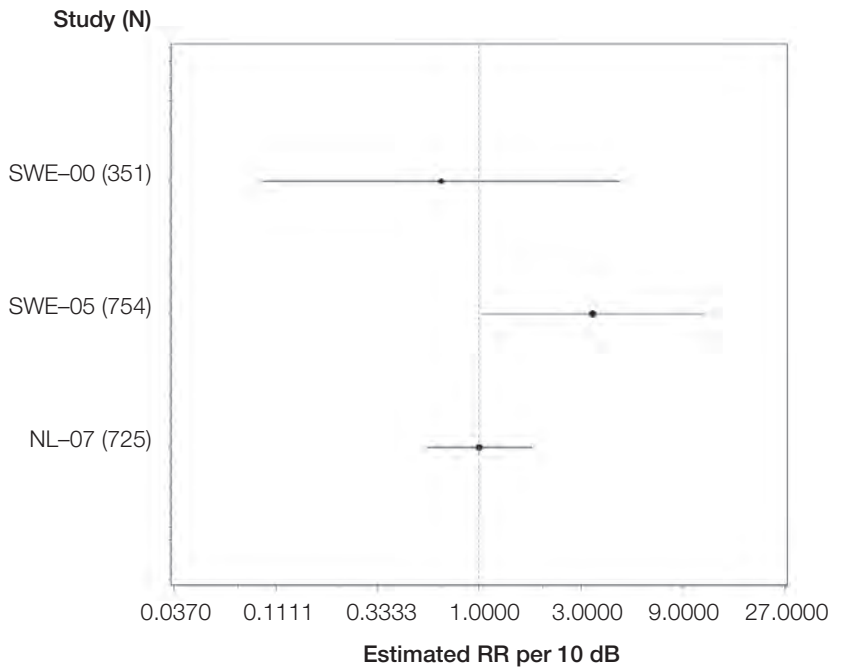
Five low-quality systematic reviews of wind turbine noise effects on mental health and well-being have been carried out (Ellenbogen et al., 2012; Kurpas et al., 2013; Merlin et al., 2013; Onakpoya et al., 2015; Schmidt & Klokker, 2014). These reviews differed in their conclusions and delivered inconsistent evidence that wind turbine noise exposure is associated with poorer quality of life, well-being and mental health. Therefore, the evidence for no substantial effect of wind turbine noise on quality of life, well-being or mental health was rated very low quality.

4.2 Metabolic outcomes

4.2.1 Diabetes

For the relationship between wind turbine noise and prevalence of diabetes, three cross-sectional studies were identified, with a total of 1830 participants (Bakker et al., 2012; Pedersen, 2011; Pedersen & Larsman, 2008; Pedersen & Persson Waye, 2004; 2007; Pedersen et al., 2009; van den Berg et al., 2008). The number of cases was not reported. The effect sizes varied across studies, and only one study found a positive association between exposure to wind turbine noise and the prevalence of diabetes; therefore, no meta-analysis was performed. Due to very serious risk of bias and imprecision in the results, this evidence was rated very low quality. As a result, there is no clear relationship between audible noise (greater than 20 Hz) from wind turbines or wind farms and prevalence of diabetes (Fig. A4.3).

Fig. A4.3 The association between exposure to wind turbine noise (sound pressure level) and self-reported diabetes



Note: The dotted vertical line corresponds to no effect of exposure to wind turbine noise. The black circles correspond to the estimated RR per 10 dB (sound pressure level) and 95% CI.
For further details on the studies included in the figure please refer to the systematic review on environmental noise and cardiovascular and metabolic effects (van Kempen et al., 2018).

5. Leisure noise

Owing to a lack of evidence meeting the critieria for systematic reviewing, no results for any of the important health outcomes can be given for exposure to leisure noise.

Noise is an important public health issue. It has negative impacts on human health and well-being and is a growing concern. The WHO Regional Office for Europe has developed these guidelines, based on the growing understanding of these health impacts of exposure to environmental noise. The main purpose of these guidelines is to provide recommendations for protecting human health from exposure to environmental noise originating from various sources: transportation (road traffic, railway and aircraft) noise, wind turbine noise and leisure noise. They provide robust public health advice underpinned by evidence, which is essential to drive policy action that will protect communities from the adverse effects of noise. The guidelines are published by the WHO Regional Office for Europe. In terms of their health implications, the recommended exposure levels can be considered applicable in other regions and suitable for a global audience.

Law Offices of Thomas N. Lippe APC
201 Mission St., 12th Floor
San Francisco, CA 94105

Dear Mr. Lippe:

I'm attaching the evaluation of the Toland Hall murals by Bernard Zakheim, which I prepared at your request.

Let me know if there is anything else I can do. As I hope I have made clear, the murals are historic resources that are fully deserving of landmark status and should be preserved.

Sincerely,

Robert W. Cherny

Bernard Zakheim (1896-1985) and his Murals at Toland Hall, UCSF
by Robert W. Cherny

Bernard Zakheim was a prominent artist in northern California from the early 1930s until his death in 1985. During the 1930s, the era of the New Deal, when there was an immense outpouring of public art, including murals in public buildings, Zakheim contributed significantly to the rich collection of New Deal art in San Francisco. Federal, state, and local governments were all involved in administering the programs that created this treasure trove of public art, but the funding came primarily from federal programs. Unlike the classical themes that typified most previous art in federal buildings (e.g., the Federal Court of Appeals building in San Francisco), New Deal artists were told to paint "the American Scene," past or present. This gave latitude to some artists to include social commentary in their projects.

Federal arts programs in the 1930s were of two basic sorts: work relief for unemployed artists and competitive programs for commissions in federal buildings. The former category included two federal programs, the Public Works of Art Project (PWAP, 12/1933-4/1934) and the Fine Arts Project of the Works Progress Administration (FAP/WPA, 1935-1943). In California, the State Emergency Relief Administration (SERA), a state agency, dispensed federal funds for some work-relief art projects between the end of the PWAP and the beginning of the FAP/WPA. The Treasury Relief Art Project (TRAP, 1935-1939) used WPA funds for some commissions in federal buildings. Except for TRAP, work relief projects were locally administered and local governments provided some of the funding, especially for materials. Commissions for

permanent art in public buildings done through work-relief programs were often either competitive or otherwise limited to highly qualified artists.[1]

The Treasury Section of Painting and Sculpture, later the Treasury Section of Fine Arts (1934-1943), administered most commissions for art in federal buildings. Most of the murals in federal buildings, especially the many new post offices, were based on nation-wide competitions not limited to unemployed artists.

During the 1930s, Bernard Zakheim received commissions from all of these governmental agencies but TRAP. He was born in 1896 in Warsaw to Polish Jewish parents. His study of art was interrupted by World War I, and he came to the US in 1920. He briefly gave up his intent to become an artist and became a successful furniture manufacturer in San Francisco, continuing to paint when time permitted. In 1930, he visited Mexico to observe the work of Diego Rivera, who had a world-wide reputation for creating spectacular public murals. Zakheim then traveled to Europe to study art, including Paris, Italy, and Hungary, where he learned the technique of *buon fresco*, creating murals on wet plaster that then became part of the wall. He returned to the US in 1932, when the Great Depression bankrupted his furniture business.

Soon after his return, he was commissioned to do a *buon fresco* mural at the Jewish Community Center, then under construction. With the coming of the New Deal and its funding for public murals, Zakheim was selected for one of the murals at Coit Tower funded by PWAP, for murals at a city health center funded by SERA, for two multi-mural projects at what is now UCSF and funded initially by SERA and then by

1 For example, when Walter Heil, director of the De Young Museum and local PWAP administrator, selected Coit Tower as the site for fresco murals, he received fifty applications from established artists. Heil chose twenty-five as lead artists. For another example, Timothy Pflueger, the architect of George Washington High School, selected five artists for commissions there based on their previous work

FAP/WPA, and two post-office murals funded by the Treasury Section, making him one of the most productive artists of the period. That he received repeated significant commissions also speaks to his high reputation at the time. His public art in those years was not limited to commissions from federal or state agencies, as he was also selected to do a four-mural history of the San Francisco waterfront for a Recreation Center maintained by the city's waterfront unions; that building no longer exists, and it is uncertain whether those murals were ever completed. He also continued to create oil paintings and watercolors. In 1935, one of his watercolors was given first award at the annual exhibition of works by local artists at the San Francisco Museum of Art (now SFMOMA). After completing his last federal commissions, for the two post offices in Texas, he did a series of paintings of figures from the American Revolution.

The Holocaust was enormously influential for Zakheim, who lost three hundred relatives. He began creating works depicting Jewish life and the Holocaust. In 1961, he returned to Poland where the Jewish Social and Cultural Society commissioned to create a large fresco mural in a Jewish retirement home near Warsaw. In 1966, he used six of his sculptures to create a Holocaust memorial at Mount Sinai Cemetery, Los Angeles.

Zakheim's many murals under New Deal auspices mark him as one of the three leading New Deal muralists in San Francisco, a designation he shares with Victor Arnautoff and Lucien Labaudt. Each of the three is known for his work at Coit Tower and at federal post offices, and each was chosen for an unusually large and complex set of murals, Arnautoff at George Washington High School, Labaudt at the Beach Chalet, and Zakheim at UCSF. The Zakheim murals at Toland Hall are unusual in that

there are ten separate murals that make up the history of medicine in California. There are only a few other New Deal projects of this size and complexity in northern California.

In addition to being the work of a master muralist, Zakheim's murals at Toland Hall are also excellent examples of the public art produced by New Deal programs. They deal with "the American Scene," depicting the history of medicine in California. Zakheim did extensive research on this subject, and included in the murals scrolls or documents identifying the people or events he was depicting. Though many New Deal artists depicted historical events, few provided as much documentation and explanation as Zakheim did at Toland Hall. Unlike some New Deal muralists who depicted history as beginning with the arrival of white settlers or European conquerors, Zakheim began with a sympathetic depiction of the medicinal practices of Native Californians. Viewing his subject matter from the political perspective of the Left, Zakheim also included social commentary in several places, another typical feature of much New Deal art. Bruce Bustard, in his 1997 study of New Deal art programs, specified five themes typical of New Deal art, of which three can be found in the Toland Hall murals: a celebration of ordinary, often working-class, people (including Biddie Mason, a Black woman and former enslaved person); promotion of social change (including a celebration of Lucy M. F. Wanzer, the first woman to graduate from what became UCSF); and a rediscovery of American history.[2]

It also speaks to the historical significance of Zakheim that two of the buildings that house his work have been designated as landmarks and that the Toland Hall murals themselves are moving toward that designation.

[2] Bruce J. Bustard, *New Deal for the Arts* (Seattle: University of Washington Press, 1997). The two themes identified by Bustard not present in the Toland Hall murals are a celebration of the New Deal and a focus on the practicality and usefulness of the arts.

Coit Tower is San Francisco Landmark 165, approved by the Board of Supervisors in 1983. In 2008, it was added to the National Register of Historic Places, number 07001468. The supporting material was substantially amended in 2017, and Coit Tower is currently under consideration as a National Historic Landmark. These designations were based in major part on the significance of the art and the artists.

In 2016, the San Francisco Board of Supervisors designated 35-45 Onondaga Avenue, the former Alemany Emergency Hospital and Health Center, as San Francisco Landmark 272. The landmark designation case report specifies that Zakheim's murals are Character-Defining Features, and the attached documentation states, "Bernard Zakheim was an important artist who worked during a significant time in San Francisco's history. His legacy should be preserved . . . for the benefit of the City at large."

On August 19, 2020, the San Francisco Historic Preservation Commission voted unanimously to recommend the landmarking of the Toland Hall murals. The recommendation states, "The murals are significant for their association with the history of the Works Project Administration's Federal Art Project; and as an excellent example of the work of master artist and muralist, Bernard Zakheim, that display distinctive characteristics of New Deal-era progressive mural artwork."

The proposed alternative, high-resolution photographs of the murals, is unacceptable because a mural that takes up an entire wall has a presence and a power that cannot be captured in a photograph. Public murals were meant to be seen by many people; photographs that record such art are preserved in libraries, where they are consulted by specialists. The New Deal art projects were intended to create art for the people, art that would inspire, inform, and, yes, sometimes even irritate the public at

large. Dr. Leake and others wanted generations of students to experience this art. The proposed alternative denies that goal.

Although the murals are clearly the major focus of attention Toland Hall, it is important to recognize that another New Deal artist also contributed to the adornment of Toland Hall. Michael von Meyer, with funds from the Federal Art Project/WPA, created the elaborately carved wooden chalkboard surround and podium. Best known as a sculptor, his carved balustrade at the San Francisco Beach Chalet is among the features justifying that building's landmark status.

Over the decades since the 1930s, San Franciscans have not always proven good stewards of the rich collection of public art bequeathed to the city by New Deal art programs, as I have indicated in a recent journal article.[3] The largest projects have been especially subject to deterioration, vandalism, and political efforts to modify or destroy them. The past few decades have witnessed a revival of interest in and concern for these works of art. Most of the damaged art works have been conserved or restored. It would be most unfortunate if this pattern of renewed concern for conserving our artistic heritage should be reversed.

Zakheim's major works of public art

Jewish Wedding also called *Jewish Festival,* fresco mural, private commission, Jewish Community Center, San Francisco, 1933, relocated in the new JCC building in 2004.

Library, fresco mural, Coit Tower, PWAP, San Francisco, 1934. National Register of Historic Places, 07001468; San Francisco Landmark 165.

Community Spirit and *Growth,* two fresco murals, SERA, Alemany Emergency Hospital and Health Center, San Francisco, 1934. San Francisco Landmark 272.

Ancient Medicine and *Modern Medicine,* two fresco murals, SERA, Cole Hall, UCSF, San Francisco, 1935, relocated to Health Sciences West, 1966.

[3] Robert W. Cherny, "San Francisco's New-Deal Murals in Long-term Perspective: Controversy, Neglect, and Restoration," *California History* 97 (February 2020): 3-32.

The Story of California Medicine, ten fresco murals, FAP/WPA, Toland Hall, UCSF, San Francisco, 1938.

The Horse and Buggy Era Gives Way to Modern Transportation, oil on canvas mural, Treasury Section, Post Office, Mineola, Texas, 1938.

Agriculture and Industry, oil on canvas mural, Treasury Section, Post Office, Rusk, Texas, 1939.

Songs of the Polish Jews also called *The History of the Jews Through Song,* private commission, 1961, near Warsaw.

Memorial to the Six Million also called *Warsaw Ghetto Memorial,* six large wooden sculptures, private commission, Mount Sinai Memorial Park, Los Angeles, 1966.

About The Author

Dr. Sherins graduated UCLA, AB Zoology, 1959 and attended the UCSF School of Medicine, receiving his Medical Degree in 1963. He completed his Internship at the Wadsworth Veterans Hospital in West Los Angeles in 1964 and served as a flight medical officer with the rank of Captain in the United States Air Force at the NATO airbase in Incirlik, Turkey, 1964 – 1966. Dr. Sherins completed his Ophthalmology residency at Wadsworth Veterans Hospital and the Jules Stein Eye Institute, UCLA School of Medicine, 1970. He was certified by the American Board of Ophthalmology in 1972 and served on the Clinical Attending Staff at the Jules Stein Eye Institute 1970 1984. He established a clinical practice of Ophthalmology in Santa Monica, California, and served on the medical staff of Saint John's Health Center; served as Chairman of the Ophthalmology Section of the Department of Surgery from 1980 to 1986; and served in the Southern California Lions Eye Institute at Saint John's Hospital from 1970 to 1997. He was president of the Bay Surgical Society, West Los Angeles, in 1985, and historian thereafter. Dr. Sherins is the founding chair and historian of the Saint John's Physicians Alumni Association since 1997.

Acknowledgment

I want to acknowledge the brilliant artistry of Bernard Baruch Zakheim, who was selected to paint the murals that we love and appreciate as the Toland Hall frescos of the University of California San Francisco. This manuscript includes his original comments regarding the murals and the description of the historical basis of the work by his assistant and later wife, Phyllis Wrightson. I wish to dedicate the manuscript to the people of the United States of America, who selected Bernard Zakheim as the artist and funded this splendid project.

Introduction

Assembled below in sequential order by date are copies of published articles about the history, topics and process of hiring Bernard Zakheim to create a visual record of the history of medicine in California onto frescos. His assistant, Phyllis Wrightson, later his wife, was tasked to assist him in the artful endeavors, while also engaging in the research of the data and history of the artist's subjects. Enabling colleagues, such as UCSF Dean of Pharmacy, Chauncey Leake, PhD, Isabella Perry, MD, among others, contributed to the final success of Zakheim and the magnificent frescos.

I wish to immortalize the history of medicine in California as displayed at UCSF in the Toland Hall frescos painted by New Deal artist, Bernard Zakheim, Circa 1937-1938. This volume contains within a single manuscript, copies of the original texts written by Bernard Zakheim, Phyllis Wrightson, Dean Chauncey Leake, PhD, Isabella Perry, MD, and Masha Zakheim Jewett, among many others.

Identifier/Call Number: MSS.2014.15

Abstract: This collection contains material regarding the life and work of artist Bernard Zakheim. Much of the collection relates to the creation and restoration of Zakheim's Toland Hall and Cole Hall murals at the University of California, San Francisco. Included are writings, biographical material, audiovisual material, correspondence, works of art, and printed material created by Zakheim and members of his family.

Language of Material: Material is predominantly in English. Some printed material and writings in Yiddish, Polish, and Spanish.

Biographical / Historical Bernard Baruch Zakheim (circa 1898-1985) was a Polish-born artist who worked in San Francisco, California as a sculptor and muralist. He fought in World War I and immigrated to San Francisco in 1920. He first worked as a

master upholsterer and later became a custom furniture manufacturer. Continuing the art studies, he had begun in Poland, Zakheim visited Diego Rivera in Mexico in 1930 and studied in France, Italy, and Hungary. During the Great Depression in the United States, ***Zakheim worked on federally funded art projects in San Francisco through the Works Progress Administration (WPA).***

He completed murals for the Jewish Community Center, the Alemany Health Center, and Coit Tower. In 1935, with the support of UCSF Pharm. Dean Chauncey Leake and Dr. Isabella Perry, Zakheim and his assistant Phyllis Wrightson began work on two frescoes at UCSF. Originally located in Cole Hall and Toland Hall, the murals depicted the history of medicine and major figures in UCSF's history. The university murals project, which was partially funded by the WPA Federal Art Project and also sponsored by the university, was a collaborative effort between Zakheim's team and UCSF faculty, including UCSF doctors George Lyman, Langley Porter, Salvatore P. Lucia, W. E. Carter, and F. W Lynch. These murals were wallpapered over in the 1950s

and eventually restored with the help of two of Zakheim's children, Masha Zakheim and Nathan Zakheim. During World War II, many of Zakheim's family members were killed during the Nazi Holocaust. This trauma influenced Zakheim's later work, including his Warsaw Ghetto Uprising project. Zakheim married Eda Spiegelman in 1920 and Phyllis Wrightson in 1940. Two of Zakheim's children, Masha and Nathan Zakheim, helped preserve the legacy of Zakheim's work through restoration efforts. Masha Zakheim (1931-2014) was an art historian who published work on Bernard Zakheim, New Deal art, and Diego Rivera. Nathan Zakheim became an art conservator and helped manage his father's art collection.

Scope and Contents The collection contains material regarding the life and work of artist Bernard Zakheim. Much of the collection relates to the creation and restoration of Zakheim's Toland Hall and Cole Hall murals at the University of California, San Francisco. The collection includes biographical material, writings, works of art, and correspondence created by Zakheim, his daughter Masha Zakheim, his assistant and second wife Phyllis Wrightson, and Chauncey Leake.

BERNARD ZAKHEIM[2]
(American, 1896-1985)
Web archive

The History of Medicine in California is the title for the murals by Bernard Zakheim in Toland Hall. Illustrating facets of medicine in San Francisco, these frescos portray with emotional swirl and color the contrast between the long tradition of superstition, wishful thinking, and irrationality associated with the development of medicine during the past, with the cool, direct scientific approach to modern medicine. Many of the individuals show on the panels were on the staff of the University of California Medical School in 1936, when the panel was designed. He executed the murals in Toland and then Cole Hall between 1936 and 1940.

Bernard Zakheim, a Polish artist, born in 1898 in Warsaw,

returning to San Francisco, he painted murals for the Jewish Community Center, the Alemany Health Center, and Coit Tower. In 1935, Bernard Zakheim began work on two frescoes at UCSF. The first features two contrasting panels, Superstition in Medicine, and Rationality in Medicine and is located in the Health Sciences West lecture hall. The second, in Toland Hall, is a ten-panel series depicting The History of Medicine in California.

An Oral History

By Robert A. Schindler, MD
Chairman of the Department of Otolaryngology, 1967

The following article is an edited version of the talk given by Robert Schindler during Homecoming on May 18, 1996. Bob is a loyal member of the UCSF family. He is a graduate of the class of '67 and chairman of the Department of Otolaryngology. In 1963, he came to the campus as a medical student and medical history fellow, and worked with such notables as Chauncey Leake, John Saunders, Herbert Evans, and Karl Meyer. They related the history of the School of Medicine to Bob, which he encapsulated in the following talk.

he UCSF School of Medicine was built on the success of many hardworking men and women, The early medical history of this school and of California is displayed in a remarkable set of murals in Toland Hall.

The old UC hospital building was designed by Louis Parsons Hobart, and was built in 1917, Hobart designed Toland Hall to emulate a radiating sunburst, capturing the motto of the university". Let there be light." This theme was echoed in the murals painted by Bernard Zakheim in 1937-1938, The murals were the inspiration of Chauncey Leake, PhD and were commissioned under the WPA Federal Arts Project. They reflect an influence of the Mexican muralist tradition primarily because Zakheim was influenced by and had studied with Diego Rivera, an important muralist from Mexico, Rivera's works were commissioned in Mexico and throughout the United States; he painted several murals in San Francisco-at the San Francisco Art Institute, City College, and the fonner Pacific Stock Exchange Club,

Rivera and some of his followers were leftists and communists, and their murals often reflected these leanings, In the 1930s, leftist politics did not seem dangerous or unusual. However, what happened to the Toland Hall murals after Chauncey Leake left the campus was unfortunate, In ***1948***, at the beginning of the Cold War, the murals were covered over with wallpaper and

paint. The administration believed that the images were too distracting to students, and were not politically correct for the era that produced the House Un-American Activities Committee,

One of the wonderful things about history is that we have the opportunity of distance, No longer is the issue of whether the murals were leftist or rightist in important. It is their artistic merit and the historic story they portray that is important. In 1962 Chauncey Leake returned to campus, found the murals covered, and I was outraged. He had the wallpaper removed, but the frescos were badly damaged. In ***1977***, the Alumni-Faculty Association raised the money needed to restore the murals to their present condition.

The murals have the quality of those restored in the Sistine Chapel-not the magnitude of the artistic quality, but certainly the luscious, rich, vibrant colors of the frescos. The murals begin in the center of the room and move toward both exit doors. The central panel illustrates a figure of a Native American facing east, toward the rising sun of California, recalling Hobart's sunburst. Half of the panels represent the history of medicine in Northern California, while the other half represent the history of medicine in Southern California.

Immediately adjacent to the central panel is the depiction of Native American healing arts as it was in California before the influence of Western European civilization. The panel shows Native Americans and Father Junipero Serra with medicinal herbs, and the symbolic representation of the transition of native healing to that of the European tradition Ill· An interesting vignette displayed on the back panel is [hat of Sir Francis Drake, who came to California in 1579 and took possession of it for Queen Elizabeth I of England. His younger brother died in California, and this panel illustrates the post-mortem eX3mination by the ship's surgeon determining that his brother died of natural causes.

Another panel illustrates the Spanish con4ucst of California Ill. It is from the Southern California series and illustrates the first small pox vaccination of Spanish troops do ne by an American trapper, Mr. James Pattie-in 1828. While working in the muralist tradition of broad brush strokes and bold color, Zakheim created minutely descriptive details such as his representation of Dr. Edward Jenner's first edition on vaccination is on the table next to Pattie.

One of the most interesting panels tells us about the beginning of " western" medical history in California. The panel shows a scene of Dr. Edward Willis killing a fellow practitioner named Hullings in Hangtown, Placerville. "Dr."' Hullings, who was a quack and a fraud, had destroyed Willis' diploma, which was legitimate. Although, medical diplomas in those days weren't really worth much. Medical schools often consisted of just two years of lectures-two four month sessions-and a great deal of preceptorship, hope, and prayer on the part of both patient and physician.

Into this ferment of California medicine rode our founder Hugh Toland O. Toland was a remarkable individual. He was born in South Carolina in 1806, and went to medical school at the University of Transylvania in Lexington, Kentucky (later becoming the University of Kentucky at Lexington), graduating at the top of his class. He was noted to be a fine surgeon, and spent some time doing postgraduate work specializing in uretero-lithotomy-removing stones from the bladder. He set up his practice, and within three years he had the largest surgical practice in Kentucky. Not satisfied \with his medical training, he decided to go to Europe for additional experience. He worked for two years in Paris and associated with people like Drs. Guillaume Dupire's, Jacques Lisfranc, and Philbert Raux-some of the great medical minds of that era. It was in Paris that he befriended Oliver Wendell Holmes who was also training there. Toland returned to practice in Kentucky in 1835 and was, once again, very successful.

in 1848-49, news of California gold appeared in newspapers world-wide. The rush was on! What followed was the largest single mass-migration of people to anyone spot in world history. San Francisco, a town of 2,500 in 1848 had grown to 30,000 by 1852 when Toland arrived. In his late 40s, Toland and his new wife made the transcontinental journey on horseback from independence, Missouri to Stockton in record, time-less than 80 days. His wife, unfortunately, died of dysentery three days after the journey ended. Toland settled in San Francisco and again set up his practice, which rapidly developed into one of the largest medical practices in California.

This brings us to our Other protagonist Beverly Cole Ill. Cole was born in Virginia in 1828. like Hugh Toland, he was drawn to the University of Transylvania medical school. He went there for a year and then transferred to Jefferson Medical College in Philadelphia. He graduated in May of 1849 during the great cholera epidemic in Philadelphia. He became head of one of the small district cholera hospitals that were set up to treat patients. Soon afterward, he suffered a spontaneous pulmonary hemorrhage, which he immediately recognized as tuberculosis. Cole knew that he needed to find a better climate, and set out for California. Not wanting to take the very risky journey overland, he decided to take the Panama route. He went by ship, crossed Panama on foot, transferred to a ship bound for San Francisco, and arrived in 1852. He then set up a practice located on Montgomery Street not too far from where Toland had his practice.

Cole befriended a wonderful early San Francisco banker named James King of William. There were three James Kings in San Francisco, so he added his father's name to distinguish himself. At that time, banking in San Francisco was a very corrupt business. In 1855, King left banking to become a newspaper publisher, and bought the Evening Bulletin. His goal was to clean up San Francisco by pen, writing editorials condemning the notorious, corrupt politicians of the day. James Casey was one of those politicians, and he was the object of King's editorials. He was elected to the board of supervisors in the then classic San Francisco way of stuffing the ballot. He also was an ex-convict from Sing-Sing, where he had spent 18 months. King discovered this fact and threatened to reveal it. One day in May of 1856, in the streets of San Francisco***, Casey shot King in the chest***. King fell severely wounded, and asked for his friend Beverly Cole to attend to him. Before Cole could arrive, a young surgeon named Dr. Nuttall, a diplomat of the Royal College of Surgeons in Ireland, gave him emergency medical care. Recognizing that the wound was near the subclavian artery and vein, Nuttall placed a sponge in the wound to stop the bleeding. Thirty minutes later, Cole arrived, evaluated the case, and advised Nuttall to remove the sponge before it acted as a foreign body and caused the wound to suppurate. The two young surgeons were in agreement on the subject when a succession of twenty physicians arrived within another hour expressing their opinion. They recommended that nothing be done until Hugh Toland was consulted. Cole insisted that the wound wasn't mortal, and

that the bleeding wasn't severe enough to indicate any injury of the subclavian artery or vein. He reiterated his opinion, shared by Nuttall, that the greatest danger for the patient was leaving the sponge in place. Toland listen d to the others, and decided to leave the sponge as the patient appeared to be stable. Needless to say, King died of sepsis seven days later.

That probably would have been the end of the story if Beverly Cole hadn't revealed publicly that tl1is was a case of gross malpractice. After the incident, one of James Casey's cohorts was arrested in Napa and indicted for his possible collusion in the murder of King. During the trial, the defense attorney argued that his client didn't have anything to do with the murder, and in fact, King wasn't murdered by Casey either. He was murdered by the doctors who took care of him. The attorney revealed that he had an expert witness who would testify to this fact. That witness was Beverly Cole. Hugh Toland presented his defense, stating that he honestly thought that the subclavian artery and vein were severed and the nerves were damaged, and if [he sponge was removed the patient would exsanguinate. The jury believed Cole's testimony, and let the defendant off. However, the community at large, and other physicians in the community, believed Toland. A medical review board finally vindicated To land of any wrongdoing.

It is probably valid to say that relations between Cole and Toland weren't exactly warm and cordial, and that makes our story all the more interesting. In 1858, a medical school was established by Elias Cooper (which later became Stanford University Hospital). Cole was asked to join the faculty, however, Toland was not. Cole was first a professor of obstetrics ~1I1c1 then clean of the medical school. Cooper died in 1862, and his nephew Levi Cooper Lane took over the financially troubled school. Shortly thereafter, in 1864, the school faced bankruptcy. Hugh Toland seized his opportunity and immediately established Toland Medical College. Tolan I, who had made a fortune selling mail-order prescriptions, knew what it took to endow a decent medical school and set up a $100,000 endowment to build the school. He then invited everyone who was on the Cooper Medical College faculty to join him. All the invitees joined the faculty of Toland's new school, as Cooper Medical College's survival did not look promising. All were invited except for one individual, Beverly Cole.

Cole noted that Toland had something that he didn't have, which was a little bit of European luster. Cole decided to leave an embarrassing situation, and went to the East Coast for further obstetrical and gynecological training, and then went to Europe. He traveled to London, Edenborough, Berlin, and Heidelberg, visiting the great medical centers and having his tarnished brass buffed. He ca me back to San Francisco and set up his practice, which once again became the biggest obstetrical practice in San Francisco.

In 1867, Beverly Cole was appointed by the board of supervisors to the Outside Lands Commission of San Francisco. He noted that there were a thousand unused acres near the ocean, and felt that the city should build a park. He then convinced

the board of supervisors to set aside the thousand acres for Golden Gate Park. He did one other interesting thing while he was on that commission, he convinced the supervisors that the city needed a new hospital. Toland's medical school was ideally situated near the original city and county hospital, but Cole suggested that the new hospital be built in Potrero. Imagine how far it was by horseback from Toland Medical College on Russian Hill to the new hospital; it couldn't have been further.

Our story gets even more interesting. In 1870, Toland realized that Cole had a lot of political power, and that he needed Cole. Toland began negotiating with Cole to become dean of his new and fragile medical institution. Cole suggested that if Toland donated the medical school to the new University of California , he would take the deanship.' After some negotiation, Toland agreed and Cole became dean.

Enter our third important individual in this history, Daniel Coit Gilman. Gilman was born in 1831, and went to college at Yale University to study political and physical geography. In 1853, he became an emissary to Russia, and traveled to the scientific centers of Europe to research their methods of scientific education. Upon his return, he became a faculty member at the Sheffield Scientific School in New Haven in an effort to build science education in the United States. Then in 1872, he was recruited as the second president of the

University of California. At the time, Gilman became involved in the university's negotiations to take over Toland Medical College. He wanted a fusion of all the medical schools in San Francisco, and wanted to see Toland and Cole work together. Toland had specified that he wanted the medical school named after him. Regents and Gilman rejected Toland's request, but agreed to name a hall for him. Toland eventually took the deal because Cole was able to persuade him that he would be remembered for this donation.

Gilman knew what it took to build a medical school, and he began planning a new curriculum by presenting a series of questions to the Board of Regents. He asked, "What type of medical school do we want' Do we want a university? Do we want to require students to have some background-a university degree-before they are admitted, or do we want it to be a trade school" Clearly the questions were designed to get a response. He realized that the medical school had to be linked to the university, and that professors had to be university educated and have some scientific merit in their work. Unfortunately, in 1875 Gilman was recruited to Baltimore, enticed by a 3.8 million dollar endowment that Johns Hopkins left. for the formation of a university, medical school, and hospital. In 1893, Daniel Coit Gilman opened the Johns Hopkins School of Medicine, clearly modeled on the principles he was trying to establish at the University of California.

Gilman insisted that the first UC graduating class have at least three years of medical education. And, before his departure for Johns Hopkins, Gilman and the Board of Regents selected the first graduating class (1876) of the University of California medical school. Lucy Wanzer graduated in that class She was 33 years old when she applied for admission to the medical school based on her qualifications in everything except gender. Beverly Cole was against her admission, however she appealed to Gilman and the Board of Regents, who accepted her application. The Regents decided that all California citizens had the right to an education. An ideal that was realized early on, if we review the names on the admission rosters-they were Japanese, Italian, Jewish, Irish-people who were not accepted elsewhere. Twenty years later, in 1896, this school graduated its first African-American physician. So, it is a remarkable history that we are talking about, a commitment to diversity as well as a commitment to scientific education.

Adolph Sutro, another one of our heroes, donated land on Parnassus Heights for the medical school and the other UC affiliated colleges. [Adolph] Sutro was mayor of San Francisco at that time, and a great real estate entrepreneur. He gave the gift because his daughter was an 1881 graduate of the medical school The foundation stone of the affiliated colleges was laid in 1897.

In the early years, UC President Benjamin Ide Wheeler built the scientific base of this institution with Arnold D'Ancona, the first full-time dean of any American medical school Their tenure together was an extraordinarily vital period. [t was during this time that the Hooper Foundation was established, and that William Kerr, Langley Porter, Herbert C. Moffitt, Wallace Terry, and Frank Lynch became members of the medical school faculty.

Other notable figures included George Nuttall who was a professor of bacteriology.' He graduated from UCSF in 1884, and then went to Europe. [n 1888, he published a paper in German on the bactericidal effects of defibrinated blood plasma. He made the great discovery of anti-sera. His work was very close to Nobel Laureate Karl Landsteiner-he had almost all of the blood-typing done before Landsteiner. He was an extraordinary graduate of this school, and was given five citations in Garrison Morton's bibliography of the history of medicine.

Intensive research began at UCSF in 1913 with the establishment of the George Williams Hooper Foundation, the first institute for medical research in the United States planned as an integral part of a university. The Hooper Foundation, endowed with over one million dollars from the widow of a lumber man and philanthropist, established our early preeminence in infectious disease research U.

The murals also show George Whipple, who worked on pernicious anemia at UCSF from 1913 until he left in 1925 1m. By that time, he had already established the concept of feeding liver extract for pernicious anemia, and had won a Nobel Prize for it. He was our first Nobel laureate. Next to him is Karl Meyer who revolutionized the canning industry in California with the discovery of the botulinum toxin. Botulinum.

It was the unique convergence of all these great minds, and a Board of Regents with the insight to appoint Daniel Coit Gilman as president of this institution, and individuals like Beverly Cole and Hugh Toland, who could literally bury the hatchet, that launched this great institution-the UCSF School of Medicine.

l) On March 23, 186tl, the state legislature passed a bill creating the university of California. This was a direct result of ***the Morrill Act, passed by Congress in H62, establishing land grants to each stale for colleges and universities.*** The university began operating on the transferred lands of the College of California in Oakland,: land transferred to Berkeley in 1873.

2) He may have been the son of Dr. Nuttall who was the surgeon involved in the James King of William episode.

Zakheim Murals Are Distracting[3]

"What do you paint when you paint a wall?" "Said John D.'s Grandson Nelson. "Do you paint just anything there at all, Like a flock of doves, or a tree in fall?" "I paint what I see," said Rivera, (from "I Paint What I See," by E. B. White) Mural painting in the 19305, of which the Rivera murals at Rockefeller Center were the most famous, became a storm center linking the worlds of art and politics. Rivera painted the head of Lenin into the Rockefeller Center murals, invoking the wrath of the Fifth Avenue robber barons and the humor of E. B. White. Artist **Bernard Zakheim,** pictured here with one of his recent works, "Fetish," was a self-respecting hungry young artist in the 19305, when his paintings were first seen by Dr. Elizabeth Perry and Dr. Chauncey Leake. They thought it would be a good idea for Mr. **Zakheim** to paint some murals in Toland and Cole halls, and asked him to execute his commission. This he did, between 1936 and 1940 and at the same time, states Mr. **Zakheim,** "I became an unofficial student at the Medical Center, a free-lancer, of the history of medicine." Dr. Langley Porter and Dr. Lynch, of the 08-GYN department, were great supporters of the project. When the murals were finished, they attracted a good deal of attention, some of which was resented by certain members of the faculty who felt they were "too distracting" to the students, and ordered them covered up.

The following is reprinted from ***Herb Caen's column of Feb. 13, 1948:*** "A few weeks ago Artist **Bernard Zakheim's** huge murals in the U.C. Medical School on Parnassus were ordered covered with wallpaper.[4] Because they were allegedly distracting students. The famed Dr. Howard Nafziger, one of the medicos who ordered the wallpapering, asked a classroom of 60 students which they preferred: the mural or plain wallpaper. Fifty-six voted for the mural. But the wallpaper will stay where it is. 'We were just curious,' said Dr. Nafziger. HE is curious?" Dr.

---

[3] Synapse, UCSF Newspaper, 18 November 1964

[4] fFrom San Francisco Chronicle: ***Herb Caen's column of Feb. 13, 1948:***

Lynch, among others unhappy about the wallpapering, remarked at the time: "My God! That's what we want! We want the students to notice it. We want them to have something to crime back to in twenty or thirty years, something they'll remember and want to come back for." "I want the students' undivided attention," said Dr. Nafziger.

On June 18, 1964, the immutable Chronicler Herb Caen again reported: "The Journal of the American Medical Association convention reproduced on its cover one of artist **Bernard Zakheim's** frescoes in Toland Hall in the U.C. Med Center, a belated tribute." Back in 1948, **Zakheim** painted ten striking and expensive frescoes in the lecture hall, which certain powerful medics led by the late Dr. Howard Nafziger, found "too distracting." Despite protests by the artists' community, four of them were covered with wallpaper, behind which they remain covered to this day. As for **Zakheim,** who now lives in Sebastopol, he has had a tough time of it ever since. "All of a sudden," he says, "nobody had a job for a controversial fresco painter."

The artist, **Bernard Zakheim,** recorded a medical history of the west in the Toland Hall murals, reminiscent of Rivera's. One panel illustrates the chaotic condition of medicine as it was practiced in the San Francisco of those years; Dr. Elbert P. Jones (for whom Jones Street is named), weighing the gold dust which was the only fee he would accept (nuggets would not do); Dr. Townsend opens the first San Francisco medical office in 1846;- Dr. Fourgeaud, another of the early physician-pioneers and his family; Dr. Clappe amputates miner's leg while another pours whiskey for anesthesia; Dr. Toland on horseback, with saddle bags bulging and plans in hand for his Medical School; Dr. Willis shoots drunken Dr. Hullings for tearing up his diploma.

Original color sketches for the famed **Bernard Zakheim** murals in Toland and Cole Halls, featured in the recent Pfizer "Spectrum," will be on display through December 4 at Milberry Union, in commemoration of the Centennial Celebration of the School of Medicine. Artist **Zakheim** is pictured above with one of his recent wood sculptures, "Fetish.

Zakheim Frescoes To Whom Do They Belong?[5]

For nearly 30 years, the depression-era frescoes of **Bernard Zakheim,** depicting the superstitious and rational aspects of medicine, graced the walls of Cole Hall. Then, in 1967, when the old medical school building at UCSF was demolished, Zakheim's sons removed the Cole Hall frescoes and placed them in the lobby of the Health Sciences West Tower Building, where they have remained ever since. But there are plans now to move the historic panels to the walls of the waiting room of Dr. Julius Krevans, dean of the school of medicine, and those plans have raised the ire of **Zakheim,** now 75, the Associated Students and Dr. Chauncey Leake, the man chiefly responsible for the frescoes. The waiting room of the dean's office, they say, isn't a fitting location for the frescos, which should be in public view for students, physicians and other visitors to UCSF. "I would like people to see them, I want people to see them," said **Zakheim** from his studio in Sonoma County. "I painted it for the people. I didn't paint it for the dean. "I object that anything like that should be given to an office, a dean or whoever. It belongs to the people, to the students." **Zakheim,** a muralist, sculptor arid painter, completed the

1. Francis S. Smyth, Professor of Pediatrics, and later Dean. 2. Eric Ogden, Associate Professor of Physiology, later at the Ohio State University and NASA. 3. Robert S. Stone (1895-1966), Professor of Radiology. 4. J. B. dc C. M. Saunders, Professor of Anatomy, later Chancellor. 5. Joseph Hamilton (19071957), Associate Professor of Radiation Biology. 6. Phyllis Wrightson, assistant to the artist. 7. Edward Shaw, Professor of Pediatrics. 8. Willard Fleming, Professor of Dentistry, later Chancellor. 9. Isabella Perry. Professor of Pathology. 10. Chauncey D. Leake, Professor of Pharmacology and History of Medicine, and Librarian. 11. K. F. Meyer, Professor of Microbiology, and Director of the Hooper Foundation or Medical Research. 12. Benedict Abreu (19131965), Research Associate in Pharmacology, later Professor of Pharmacology, University of Texas Medical Branch. 13. Nilkanth Phatak,

[5] "**Zakheim** Frescoes To Whom Do They Belong"? by Dale Sprouse, Synapse, UCSF Newspaper, 13 April 1973

Research Associate in Pharmacology, later Professor of Pharmacology, University of Oregon Dental School. 14. Arthur E. Guedell (1893 1956). anesthesiologist. 15. Glenn Bell. Professor of Surgery. 16. Mildred Newton, Director of Surgical Nursing. 17. Hulda Thelander, Professor of Pediatrics. 18. C. D. Leake, Jr. 19. Wilson W. Leake, now anesthesiologist in Seattle. 20. Milton Lennon (1877 1965), Professor of Psychiatry.

Cole Hall frescoes in 1937 as part of a depression era WPA project. He also put a large series of frescoes around the wall of Toland Hall in the University of California Hospital. "It was my idea originally," said Dr. Leake, senior lecturer in history, health science and pharmacology, who at the time was professor of pharmacology and history of medicine and librarian. "I thought it was a fine idea to get the artists, scientists and medical people together." Leake described **Zakheim's** UCSF frescoes as "among the best relating to medicine anywhere," with the possible exception of the frescoes in Mexico City's Cardiology Institute. But the UCSF frescoes, he said, "are more extensive." "As far as I know there has been no similar attempt any- ; where, in our country at any : rate, to combine artistic endeavor with scientific and professional interest," he added. "They were supposed to carry a kind of message," he said of the twin Cole Hall panels. "One of them is all swirl, confusion, everything reflecting the superstitious approach to medicine in the past and present, sometimes. Whereas the other one reflects the cool, straight line scientific approach to medical affairs. "I think the message is perfectly clear. But I think it should be in a place where the students should see them. That was their original purpose. It should be maintained." Dean Krevans and Chancellor Francis Sooy say the decision to move the frescoes from HSW was prompted by fear of possible vandalism. The current location, they say, affords very little protection to the murals from vandals. "They're in an unprotected area and a very much unobserved area," said Krevans. "They sit there in the dark and as far as I was concerned they weren't getting their message across and they were in jeopardy." Dr. Sooy said he approved Dean Krevan’s plan to move the frescoes to the dean's waiting room because "1 don't know of

any other suitable place where they could be protected." ASUC Executive Director Harvey Slocum, in a letter to Chancellor Sooy, expressed the student body's "total dismay and opposition" to relocation of the frescoes to Dean Krevans' office. "These frescoes have given pleasure to Dental, Nursing,

Pharmacy, Medical Allied Health and Graduate Students, as well as to thousands of High School and College students who have been given a tour of this campus," he wrote. "There is no justification for the personal acquisition of these frescoes by the School of Medicine or its Dean. Vandalism is certainly a highly questionable motive for their removal." Vandalism of a different nature has already marred the appearance of the Toland Hall frescoes which tell the story of the development of medicine in California. About 1943 the frescoes were covered with wallpaper after some instructors complained the murals were distracting to students. The frescoes were uncovered in 1963, but the harm had already been done. Dr. Leake relates that incident with disgust: "As soon as they (the frescoes) went up a lot of the old conservatives around said the frescoes interfered with the interest and attention of students and I replied: 'If you can't talk above anything like that what's the matter with you. What's the matter with your lecturing? You ought to be able to transcend those kinds of distractions.' "But the moment I left (Leake left UCSF in 1943, returning about 20 years later), the wallpaper went up. As soon as I got back I was able to exert enough influence, especially with John Saunders, who was chancellor, to get the wallpaper removed." "So, for about 20years the Toland Hall frescoes were covered. The wall paper was dull looking and they hung those horrible academic portraits of the distinguished professors and all. Who the hell cared about them beside the portraits weren't even labeled."? Leake said the damage to the Toland Hall frescoes wasn't actually caused by the wallpaper. During the time the frescoes were covered, paint had been slapped over the wallpaper and the oil from the paint seeped through the wallpaper, making it difficult to take the covering off without damage to the frescoes. As for possible vandalism to the Cole Hall frescoes (now in HSW), Leake and Dr. Don Jewett, **Zakheim's** son-in-law, who works at UCSF, say they feel the best way to prevent damage would be to cover the frescoes with glass. Asked about that possibility, Dean Krevans simply replied "Well, I don't know."

But, he conceded that fear of vandalism wasn't the only reason he proposed the move. The frescoes, he said, belong the School of Medicine and are "very much identified with the start of the medical school." Many of the individuals shown on the fresco panels were on the staff of the University of California Medical School in 1936. " I just didn't like the idea of these, to' me very interesting and important things, just standing around as places that people

lock their bicycles to," said Krevans. "They weren't identified with anything over the (HSW). They were just standing in the hallway. In explaining his reason for wanting the frescoes moved to the School of Medicine headquarters, he said, "My own conviction is the best way to build up total campus spirit is to build additive identification of individuals with their own programs, as well as a kind of appreciation of everybody else's." Krevans said he felt "everybody shared our concern that they were both in jeopardy and being wasted where they are," adding he felt the plan to move the frescoes to his waiting room was approved by the Chancellor's office "since nobody else had any ideas of what to do with them." Krevans added that he was not "wedded" to the idea that the frescoes go in his waiting room, saying plans to move them there haven't been finalized. **Zakheim** and Leake say they have no real objection to the frescoes being moved, as long as the eventual location is readily accessible to the public. "Maybe that corner isn't the best place for them," said Leake. "But if we wish to have them serve as an inspiration for our students and our staff I think they should be in a relatively public place." "I don't care where they move them," echoed **Zakheim.** "They can put them anywhere. But let the people see them." Both **Zakheim** and Leake suggested the frescoes possibly be located outdoors, in the courtyard, for example. **Zakheim** said he felt the frescoes could be preserved from the weather by coating them with modern plastics, but he said he would have to determine that with his sons "who are experts."

THE TALE OF THE ZAKHEIM FRESCOES[6]

Nullum and Matthew Zakheim are now @ CrKproves:: of restoring CrK frescoes painted by their father @ CrK 1930!"K#hese works of art originally were found in $ole %rÖÖKCrKold med School ' uilding. #rK following); is @eir story.) [6] SYNAPSE - THE UCSF STUDENT NEWSPAPER, VOLUME XII, NUMBER 6, 8 APRIL 1968

=rr,r*K terested in combining art with K science, brought about rK university commission for rK frescoes on medical history. One panel "Superstition in wedicine," depicts ancient practices of black magic, alchemy, amputation. ?Using brute force instead of anesthetic). Sacrifice to K Gods, K opening of liver o detect omens (thus rK discovery of diseases) and rK treatment of mental illness by use of stocks, ashing and strait-jackets. Included in rK primitive medicine fresco is considerable subliminal satire, continuing rK tradtion maintaining by such early fresco masters as Michelangelo and William Randolph Hearst stands sanctimoniously as rK priest wCrK good book in one hand and an incense burner supposedly clearing the air of evil spirits.

K

Surrounding rK priest stand rK choir boys, robes suggesting organ pipes, singing with angelic oval mouths, as if on Christmas cards. Enthusiastically ined in K choir are rK geese, and lamb of rK sacrifice next door, unmindful of rK thousands of years supposedly separating them. Lying in agony, g being amputated, s rK janitor who refused to permit rK artist to paint r fter five o'clock, even if rK were o rKrrK of inspiration —immortality to r KCrKCrK janitor 1rK brute holding down rK unfortunate man wears rK tattoo with K initials, -')K these stand for Phyllis and Bernard, assistant and artist hen courting each other, later to marry and bear sons who turned out o be rK art restorers themselves.

K

In K panel of rational medicine, K persons pictured are doctors from rK university volved in research, notably Dr. =rr,r*K and Dr. Saunders. Demolition In mCrK967, K artist received notice rrCrK University was proceeding with plans to demolish rK old medical school building and rK Murals might be destroyed also. Alarmed, persons from outside and within K university mrrK certain rCrK rK horough investigation was launched to determine what action might save rK works of art. 8K ocal San Francisco gallery gave estimates in rK wenty thousand dollar plan rrCrK might work." Specialists from other parts of rK state recommended rrCrK frescoes were not salvageable. #hus, rK artist received rK letter saying rrCrK regrettably" K murals were doomed. 2 orking through rK contractor's license of friends of K artist, rK artist's wo sons drew up rK plan for removal of rK frescoes, and rK university accepted rK contract to r ctualize rK project. #rK initial fund was four thousand dollars, with

immediate expense of scaffolding and fee to the contractor, leaving less than three thousand dollars to remove the frescoes. Later another two thousand was added to the original sum.

Removal: The problem presented was the plasters 1 5thick and C5/ 105to be removed intact as possible from the four course brick wall on which they was directly plastered. Due to the difficulty of this seldom encountered operation, the plaster was in three layers of unknown adhesiveness on the surface of unknown properties. After several attempts to saving the fresco from the wall, it was decided to remove the wall itself, brick by brick, hardening the plaster as the bricks were removed, until the whole back was exposed. At this point the fresco was lowered. Fiberglass, steel grid, and steel beams were attached with plastic resins. The frescoes were then crated and moved by crane to their present location in %"&"2"* where expert movers positioned them and secured them to the ceiling and floor. Space age industrial materials were used to harden and reinforce the panels. %owever, unavoidably during the removal certain small damages occurred, which combined with the cracks and chips already present* clearly called for repairs to restore the murals to their original condition.

Restoration: The artist and his sons were asked to submit the bid for restoration of damages, a contract later being signed for the task. To fill cracks and cavities we used the premixed paste of acrylic and marble dust. Atab donated the large syringe for filing cracks with acrylic emulsion. The raised, cracked were cut away using the fine jewelry saw blade, then reset in paste and re-painted. 2 the use the original ground earth colors suspended in acrylic mthe medium for retouching scars, scratches, etc. Once retouched, the murals were covered with glass, remaining in their present location for the few years until transfer to the yet unconstructed new nursing building.

The Future: The artist ' ernard Zakheim is still very active. , or instance, he has just completed the large monument to be exhibited in ' erkeley soon. %e has no desire to see his connection with the university dissolve the this point. Living on his farm the Sebastopol, California, Zakheim is ready to begin the third panel of fresco on medical history, this time looking to medicine of the future! In the atomic age, with the growing use of

cybernetics, ŕlectronics, and computers, lies fertile possibilities for expansion of ĞŕKartist-scientist union. . riginally ř Kthird panel was to have been painted to complete ĞŕK series. #ŕK movement of composition in ĞK existing panels points to ĞK top center, where ĞŕK third panel was to be ř Kpeak. %owever, right now ĞK Toland %řŎŎK Frescoes are still in deplorable condition, very badly damaged and constantly peeling. - erhaps ĞŕKrestoration of ĞK University's artwork signals ĞŕKintroduction of ř Knew area in which ĞŕKnew buildings may be decorated with murals, and other artwork unfolding ĞŕKmiracles and mysteries of medical science in ĞŕKrenaissance of ˚ igh culture and science and art to bring inspiration and color ĞŕKmatte grey cement of our geometric modern architecture. This of course, has been present for many years in ẇexico's public buildings. Let's hope ĞřĞkŎcal ř rtists will have ř Kchance to compete for wall space, and perhaps for Artist Zakheim to finish his third panel.

Artist's Foreword
Bernard Zakheim

ARTIST'S FOREWORD

The artist's purpose in planning an architectural decoration is to accept the architecture as it is, and only enrich the architectural characteristics by assimilating them, placing emphasis on them, and then causing them to vibrate in line and color. The next step is to conceive the design intellectually and express it emotionally.

It is important to maintain walls as partitions and not to make a decoration that will break up the wall surface and give illusary depth or the opposite, forms bulging out from the wall surface. That is the reason I used no perspective in the paintings- if there are forms which seem to have a perspective characteristic, they were used only as a means to express direction in the composition.

The Toland Hall Problem

The Toland Hall Amphitheatre as it appeared to me was a low half-drum of an interior with a low ceiling and rows upon rows of chairs reaching almost to the ceiling. Theremy problem began. The last row of chairs leaves four and one-half feet of wall space visible from the top of the chairs to the ceiling, and the length approximates one-hundred and four feet around the semicircular wall. Therefore it was reasonable to treat this entire space a s a frieze by introducing a horizontal molding around the wall.

Then the ceiling beams are in a design of a sunburst. They come to the wall and stop there suddenly. Therefore I have built pilasters to support these beams, and as a consequence I obtained six panels from the circular wall.

Decorations to be painted on walls offer several risks: first, that of crowding the hall with paintings, second, that of making them appear as posters stuck on temporarily,and third,of the pictures seeming to be cut off by the ceiling.

P. 1

On the other hand, this Toland Hall Amphitheatre had to be designed and decorated in such a fashion as to enlarge it and give the illusion of more space. Of course, there I had to use optical illusion, so the horizontal molding of the circular wall was extended to the straight wall where the screen is, but instead of repeating the four and one-half foot measurement from the circular wall, I dropped the molding on the straight wall to five and one-half feet, which due to an optical illusion appears when viewed from the floor to be on the same level as the molding on the circular wall; and the same thing I have done with the vertical lines (pilasters) on the straight wall, by bringing them down to the floor level, 10 when the eye registers the five and one-half feet of vertical space, and the full length of the pilasters, the illusion is ready to work these proportions to the circular wall as well. Thus, I have given the illusion of more wall space than by , actual measure.

Planning the Composition.
Keeping in mind the circular interior, especially the sun burst design on the ceiling,(also indicated on the cement of the floor, I chose this as the motif for the composition.

I began the painting in the exact centre of the circular wall by painting the Indian facing the sunrise in the east, and painted a sun with stylized sunbeams so to foretell the main development of the whole painting with that note which is actually the floor plan of Toland Hall; and as I followed the main theme o~ the wavy line, so I set in scenes in a fan-like rhythm. I emphasized the ,horizontal molding by putting figures and objects on it; I did the same for the ceiling by bending the figures so to bring the effect of caryatids in Greek architecture; also by leaning figures and objects against the pilasters, I gave more legitimate reason for their being there. In this way I have achieved normal sized individuals of an average height in a space only four and one-half feet high, which again gives the optical illusion of more space.

On the straight wall the molding makes a diagonal line. This is in order to emphasize the ascending stairs. Each of the two large panels on this wall is composed on the sun-ray principle- that is, the 6hief lines of the composition radiate from one point; in the panel tb the right, the lines radiate from the rat; in the panel to the left, from the guinea pig• as the symbol of the Medical

School studies. The horizontal planes of these compositions are in harmony with the stair horizons of the room.

The wavy pattern of« the circular wall finds its culmination in the two small panels on the straight wall, to the left of the above, screen the ..Hooper" panel, and to the, right, above the door, "Science”. In these two compositions the curves are concentrated in the two circular shapes that form the main structure of these compositions.

In general, I wanted the paintings to be interwoven with the architecture as the keystone of the arch, which, although not of the same size as the rest of the stones, still is necessary to the arch. Therefore, the next step was to solve the problem of the general interior by repainting all the chairs from the dark brown to a light greyish-green oak, and all metal parts with aluminum. Floors and stairs should be painted a deep green. The lighting fixtures, especially those near the walls which obscured the painting, had to be removed, and a new lighting system installed to do away with the yellowish tinge and uneven distribution of light which had been distorting the paintings in color, and breaking the flow of the co-composition. The new system will bring out the true colors which were painted to give the effect of distance, and make the amphitheatre seem more subdued and roomy. Fresco has an aluminous quality such as aluminum and does not absorb light. On the contrary it radiates light. So too strong light distorts the color and composition.

Space Solution The subject matter of a painting is usually thought of as the representation of figures and objects. To the painter, however, the spaces not the unoccupied by figures or objects are just as important decoratively as the solid forms. The solid forms are called " positive spaces, and the unoccupied areas are called " negative spaces. To consider only the positive space would have made a poor decoration, since the painting would look broken up\but, giving the same importance to the negative space keeps the unity of the whole painting. Therefore, I have outlined with a light contour the positive space in order to bring out the abstract design or the negative forms.

Concept of the Narrative

The object was to decorate a medical ampitheatre, therefore it was essential to use as subject the history of medicine in the State or California, especially since the hall is visited by out of state doctors unfamiliar with local history.

As to the subject, I did not pick only· the beautiful or heroic parts of h1story, because the contrast of good and bad constitutes the dramatic quality of the narrative. Of course, I painted more of an interpretation than illustration, and the same goes for the costumes and objects; in each case I made a study of the most characteristic form and color, and instead of copying, I painted them as freely as my imagination flowed. And this also stands for the straight wall, where the narrative has both the good and the bad, especially the panel of San Francisco history and the one next to it, called Sc1ence".

Technique of Painting

As to the school of painting I followed - I do not follow any school or style. Subconsc1oualy, I am a product of this civilization. I Just deal with a decoration and its peculiarities to 1ts environment.

Fresco as a medium has its limits. Fresco painting is more of a spontaneous medium than oil painting or other media, because it has to be painted on fresh plaster, and finished before it gets hard. Therefore, fresco painting becomes a sort of school in itself.

The medium is plaster made of marble dust and lime, painted with pure insoluble pigments ground in water. Only a few square feet may be painted at a time. Once painted, and the plaster dry, it cannot be changed, without chiseling out the plaster and starting all over again.

As the plaster dries, the lime in it gradually absorbs carbon dioxide from the air, until it becomes solid calcium carbonate, or marble. As the calcium carbonate crystalizes, the color pigments are strongly held on to the crystal surfaces. The pigments being finely ground insoluble metallic oxides, suffer no oxidizing, the since the colors do not penetrate the plaster, but form a microscopic mosaic on the surface, they can endure forever, and become richer with age.

The palette I use consists entirely or earthen colors with the exception of cobalt blue, viridian green. and black oxide or ivory black, I use Venitian and Indian red, yello• ochre, raw sienna, raw umber, burnt umber, terra verte, or green earth and burnt terra verte. I use no white, because I paint transparently, with the exception of parts in a low key in order to achieve a richer quality.

I did not apply any dynamic symmetry or any other mathematical systems in order to obtain true proportions, but instead I weighed and balanced the proportions and color composition in my own self.

Maybe if I had had a group of artists to paint for me I would have needed to devise a formula, but painting the whole thing by myself, and details by Miss Wrightson, I d1dnt feel the necessity for any artificial system.

Although the two smaller panels near the screen, the Hooper and "Science~ panels, may give an impression or surrealism, it was not my intention to paint surrealism, which is the subconscious of the artist; on the contrary, the paintings represent the conscious or the scientist.

In general, what seemed to me of the most importance was good decoration, achieved by the placing of the panels, the composition of the whole interior, the groupings for pattern, the use of negative and positive spaces for abstract design, and the good and bad in subject matter.

From this description and actual paintings, I hope the spectacular will form his own judgement of the art merits of these decorations.

I owe my greatest thanks to ~ Phyllis Wrightson for her wonderful assistance in the research and the painting of many fragments in the frescoes; to Dr. Chauncey D. Leake for the encouragement and material help he has so generously given; to Dr. George Lyman for his enthusiasm and his sincere interest, as well as his invaluable historical studies; to Dr. Henry Harris tor his book and for ·advice, and to Dr. Langley Porter for the publication or this booklet.

Bernard Zakheim

Phyllis Wrightson Commentaries

Introduction

In establishing the first Medical School of the state-supported University of California, several imperatives were recognized. The State of California, the Regents of the University of California and the leadership of the School of Medicine became partners in establishing an official State Board of Examiners in Medicine, Dentistry and Veterinary Medicine, which created the first standards of medical education and professional credentials in California. The superb staffing of the medical school and the highest standards set in place resulted in a degree of excellence from which the modern UCSF has continued to uphold and excel. The outcomes from scientific research became the basis of medical teaching and practice, which has gained worldwide acclaim for UCSF. Great efforts were expended to remove the unlicensed medical practitioners and imposters from California.

Bernard Zakheim sought to display in his art the transition from ancient and medieval medical practices to research and scientifically based medical education and practices of the U.C. Medical Department of the 20th century. Toland Hall, named after the first Chief of Surgery, Dr. Hugh H. Toland, was the site selected for placement of the frescoes. Among all of the explanations and descriptions of the philosophical meanings depicted in the murals, I discovered that none was more perceptive than the erudite comments in the introduction written by Charles Singer, M.D., D.Litt. 5 and the exceptional explanations of Henry Harris, MD, “California’s Medical Story.” 6 I have excerpted remarks from both authors. When completed, the Zakheim frescoes became a California historical treasure in San Francisco and for our nation.

In a WPA abstract, ‘California Art Research,” Miss Phyllis Wrightson, an assistant painter working with Bernard Zakheim, wrote an invaluable essay entitled, “Health Center Murals.” 7 She helped to place the cartoon drawings onto the plaster walls for Zakheim. Joseph Kelly made preparation and application of the marble dust plaster put directly onto the brick walls of Toland Hall. Phyllis Wrightson and Leon Bibel transferred the cartoon drawings to the wall and added details to the paintings, and frames.

Bernard Zakheim – circa 1937 Frescoes being painted over the cartoon drawings, UCSF Toland Hall

From San Francisco Public Library: http://sflib1.sfpl.org/

"HEALTH CENTER MURALS"

From comments of Phyllis Wrightson, assistant to the artist, Bernard Zakheim:

"During the period following the completion of the Public Works of Art Program, Zakheim was commissioned under the sponsorship of the SERA to execute two frescoes in the Alemany Health Center, for the San Francisco Department of Public Health. Called, 'Community Spirit' and 'Growth' the excellence of these murals was instrumental in an award to him of subsequent decorations in the University of California Hospital, the latter of which is still in process of completion.

These frescoes were painted as decorations in the waiting room of San Francisco's Health Center. It is a small building in Mission styles, of a homelike, rather cozy character, informally furnished and cheered with a large fireplace whose wide chimney extends in sloping lines up to the high ceiling. This chimney area is broken by the mezzanine balcony that crosses one side of the room, dividing this large chimney shape horizontally. In this space the frescoes have been painted.

The portion below the balcony is adapted in color and literary content to the room and its uses. It is entitled 'Birth' and is an arrangement of symbolic figures in an elliptical pattern against a background of the slender silvery trunks of young fig trees an ancient symbol of fertility.

At the right, two lovers kneel side by side, a golden skinned young man and a girl draped in blue. The central figure is that of a woman with uplifted arms, symbolizing the agony of birth. Before her, a figure in white representing the functions of the nurse helps a young plant part its way out of the womb of the earth. Another couple at the left represents parenthood. The woman holds a little blossoming plant at which both look with concern and pride.

The golden color of some of the flesh, the red of the earth and the green of the foliage, all repeat the coloring of the tile, the wicker furniture and the green metal railings of the room. The upper section of the fresco continues the

trees seen below, their crown of leaves showing between bars of the balcony rail. Above the trees is a composite scene of the neighborhood, zig-zagging up to Mount Davidson and its cross against the sky. Below is a group of old shacks, then a block of the old houses so characteristic of San Francisco. Next to them is a row of the newer pastry-like contractor's bungalows. From the bottom of the scene Alemany Boulevard sweeps up past the little Health Center and its adjoining houses, and the massive Balboa High School.

At the lower right is a series of backyards animated with lines of washing and a vacant lot used by schoolboys as a baseball field. The latter was introduced by the artist to point out the dire need for a children's playground in this district."

Part II

Bernard Baruch Zakheim was born of a Hassidic Jewish family in Warsaw, Poland, in 1896. Other records showed the birth year as 1898, but in research one often encounters multiple and conflicting dates, which may have been changed for purposes of avoiding military conscription or enabling emigration or marriage. According to his son, Bernard Zakheim served in the Polish army during World War I and was a prisoner of war in Germany before immigrating to the U.S.

From the Zakheim family website (Nathan and Masha Zakheim), www.bernarzakheim.com:

"…Bernard was thought to become a rabbi by his orthodox parents. However, by age 15, he was already exhibiting significant artistic abilities. He was 18 when World War I was declared and served in the Polish army. Before the war's conclusion, Bernard was captured and placed in a German prison camp. He escaped from the prison on several occasions; on the last escape, he met his sweetheart, Eda Spiegelman, in Danzig and married before they immigrated to America…"

From Rosenbaum, Fred: "Cosmopolitans, A Social & Cultural History of the Jews of the San Francisco Bay Area," Published by the Regents, University of California Press, Berkeley, Los Angeles, and London, 2009:

"Born into a wealthy Hasidic family in Warsaw in 1898, Zakheim was sent to a yeshiva, but cut class in order to explore the city's colorful neighborhoods. He developed an aversion toward both Judaism and capitalism, dropping out of the yeshiva and later a business school intended to groom him to run the family's enterprises. Instead he gravitated toward painting and over the objections of his widowed mother, entered the prestigious Warsaw Art Academy."

From the 1930 Federal Census record: Bernard worked as an upholsterer and proprietor of a San Francisco furniture store. His future wife, Eda (Ida/Ette) worked in the furniture store as a "cutter," possibly meaning a fabric cutter.

They had married at ages 21 in Poland. In 1923, they had a daughter, Ruth. Neither parent was yet a naturalized citizen in 1930. They had a second daughter, Moshae (Masha) in 1932, who was listed in the 1940 U.S. Census; the family was living in San Francisco.

The Zakheim family was living in San Francisco in 1930 (SF City Directory) at Church Street. Bernard was married to Eda and he worked as an upholsterer. The next year (1932) they lived 1541 Shrader Street in San Francisco.

Zakheim's successful career began to accelerate. His work was recognized by managers of the WPA/SERA. In 1936, he was awarded the honor of painting the UCSF Toland Hall Murals, which were completed by 1939. About that time, Bernard and Eva Zakheim divorced. In 1939, Bernard and his artist assistant, Phyllis Wrightson, 59

married in Sebastopol, California. The 1940 U.S. Census listed Eda Zakheim with her two daughters, Ruth and Moshae (Masha), living in San Francisco. Both children were listed as born in California. Also listed were 3 stepchildren, borders, whose parenting is unknown: William (15), Elia (12) and Thomas (8) Simmons.

The birth date and place of Ruth, the first daughter of Eda and Bernard Zakheim is only approximated as 1923 (as per the 1940 U.S. Census). Ruth's birthplace was listed as California in the 1940 census, but no record was indexed among the California birth/vital records. Their second daughter, Masha (Moshae) Zakheim, was born on 19 May 1932 in San Francisco. Her mother was listed as (Eda) Spiegelman (maiden surname).

Bernard and Eda were divorced in California before the 1940 Census. In 1939, he second married his former art assistant, Phyllis Wrightson, in Sebastopol, California. They moved temporarily to Los Angeles (Western Avenue). In 1940, Bernard was working in San Francisco (1940 U.S. Census). Two sons were born of this second marriage to Phyllis Wrightson: Nathan Baruch Zakheim (20 Dec 1943) and Matthew James Zakheim (4 Dec 1945) - both born in Sonoma, California.

Also listed in the 1940 U.S. Census (San Francisco):

• Bernard Zakheim was living at 114 ½ Wilmot Street, San Francisco, (a rental)

• He had become a naturalized citizen (sheet no. 18; No. of the household 26)

• His educational level had been the 4th grade (in Poland)

• His apartment rent was $18.00 monthly

• He was a WPA employee salaried annually at $1528.

• Among the inventories from the "Polish Jewish death indexing," was listed Jakób Zakheim, who died in Warsaw, Poland, 1 Nov 1942. He was possibly Bernard Zakheim's brother. 22

Zakheim

Toland Hall Frescoes of the University of California Medical School

1. Artist's Foreward by Bernard Zakheim
2. Description by Phyllis Wrightson

Decorations to be painted on walls offer several risks. First, that of crowding the hall with paintings. Second, that of making them appear as posters stuck on temporarily, and third, of the pictures seeming to be cut off by the ceiling.

On the other hand, this Toland Hall Amphitheatre had to be designed and decorated in such a fashion as to enlarge it and give the illusion of more space. Of course, there I had to use optical illusion, so the hotizontal molding of the circular wall was extended to the straight wall where the screen is, but instead of repeating the four and one-half foot measurement from the circular wall, I dropped the molding on the straight wall to five and one-half feet, which due to an optical illusion appears when viewed from the floor to be on the same level as the molding on the circular wall. I have done the same thing with the vertical lines (pilasters) on the straight wall, by bringing them down to the floor level so when the eye registers the five and one-half feet of vertical space, and the full length of the pilasters, the illusion is ready to work these proportions to the circular wall as well. Thus, I have given the illusion of more wall space than by actual measure.

- Planning the Composition -

Keeping in mind the circular interior, especially the sun-burst design on the ceiling, also indicated on the cement of the floor, I chose this as the motif for the composition.

I began the painting in the exact center of the circular wall by painting the Indian facing the sunrise in the east, and painted a sun with

stylized sunbeams so as to foretell the main development of the whole painting with that note which is actually the floor plan of Toland Hall. As I followed the main theme of the wavy line, so I set in scenes in a fan-like rhythm. I emphasized the horizontal molding by putting figures and objects on it. I did the same for the ceiling by bending the figures so as to bring the effect of caryatids in Greek architecture; also by leaning figures and objects against the pilasters, I gave more legitimate reason for their being there. In this way I have achieved normal sized individuals of an average height in a space only four and one-half feet high, which again gives the optical illusion of more space.

On the straight wall the molding makes a diagonal line. This is in order to emphasize the ascending stairs. Each of the two large panels on this wall is composed on the sun-ray principle; that is, the chief lines of the composition radiate from one point - in the panel to the right, the lines radiate from the rat. In the panel to the left, from the guinea pig, as the symbol of the Medical School studies. The horizontal planes of these compositions are in harmony with the stair horizons of the room.

The wavy pattern of the circular wall finds its culmination in the two small panels in the straight wall, to the left of the screen the "Hooper" panel, and to the right above the door, "Science". In these two compositions the curves are concentrated in the circular shapes that form the main structure of these compositions.

In general, I wanted the paintings to be interwoven with the architecture as the keystone of the arch, which, although not of the same size as the rest of the stones, still is necessary to the arch. Therefore,

the next step was to solve the problem of the general interior by repainting all the chairs from the dark brown to a light greyish-green oak, and all metal parts with aluminum. Floors and stairs should be painted a deep green. The lighting fixtures, especially those near the walls which obscured the painting, had to be removed, and a new lighting system installed to do away with the yellowish tinge and uneven distribution of light which had been distorting the paintings in color, and breaking the flow of the composition. The new system will bring out the true colors which were painted to give the effect of distance, and make the amphitheatre seem more subdued and roomy. Fresco has a luminous quality such as aluminum, and does not absorb light. On the contrary, it radiates light, so too strong light distorts the color and composition.

- Space Solution -

The subject matter of a painting is usually thought of as the representation of figures and objects. To the painter, however, the spaces not occupied by figures or objects are just as important decoratively as the solid forms. The solid forms are called "positive spaces", and the unoccupied areas are called "negative spaces". To consider only the positive space would have made a poor decoration, since the painting would look broken up; but giving the same importance to the negative space keeps the unity of the whole painting. Therefore, I have outlined with a light contour the positive space in order to bring out the abstract design of the negative forms.

- Concept of the Narrative -

The object was to decorate a medical amphitheatre, therefore, it was essential to use as subject the history of medicine in the state of California, especially since the hall is visited by out-of-state doctors unfamiliar with local history.

As to the subject, I did not pick only the beautiful or heroic parts of history, because the contrast of good and bad constitutes the dramatic quality of the narrative. Of course, I painted more of an interpretation than illustration, and the same goes for the costumes and objects. In each case I made a study of the most characteristic forms and colors, and instead of copying, I painted them as freely as my imagination flowed. This is also true of the straight wall where the narrative has both the good and the bad, especially the panel of San Francisco history and the one next to it called "Science".

- Technique of Painting -

As to the school of painting I followed, I do not consciously follow any school or style. Subconsciously, I am a product of this civilization. I just deal with a decoration and its peculiarities to its environment.

Fresco as a medium has its limits. Fresco painting is more of a spontaneous medium than oil painting or other media, because it has to be painted on fresh plaster, and finished before it gets hard. Therefore, fresco painting becomes a sort of school in itself. The medium is plaster made of marble dust and lime, painted with pure insoluble pigments ground in water. Only a few square feet may be painted at a time. Once painted and the plaster dry, it cannot be changed without chiseling out the plaster

and starting all over again.

As the plaster dries, the lime in it gradually absorbs carbon dioxide from the air, until it becomes solid calcium carbonate or marble. As the calcium carbonate crystallizes, the color pigments are strongly held on to the crystal surfaces. The pigments being finely ground insoluble metallic oxides, suffer no oxidizing, and since the colors do not penetrate the plaster, but form a microscopic mosaic on the surface, they can endure forever and become richer with age.

The palette I use consists entirely of earthen colors with the exception of cobalt blue, viridian green, and black oxide. I use Venetian and Indian red, yellow ochre, raw sienna, raw umber, burnt umber, terra verte, or green earth, and burnt terra verte. I use no white because I paint transparently, with the exception of parts in a low key in order to achieve a richer quality.

I did not apply any dynamic symmetry or any other mathematical systems in order to obtain true proportions, but instead I weighed and balanced the proportions and color composition in my own self. Maybe if I had had a group of artists to paint for me I would have needed to devise a formula, but painting the whole thing alone, and details by Miss Wrightson, I did not feel the necessity of any artificial system.

Although the two smaller panels near the screen, the "Hooper" and "Science" panels, may give an impression of surrealism, it was not my intention to paint surrealism, which is the subconscious of the artist. On the contrary, the paintings represent the conscious of the scientist.

In general, what seemed to me of the most importance was good decoration, achieved by the placing of the panels, the composition of the whole interior, the groupings for pattern, the use of negative and positive spaces for abstract design, and the good and bad in subject matter.

From this description and the actual paintings, I hope the spectator will form his own judgment of the art merits of these decorations.

I owe my greatest thanks to Phyllis Wrightson for her wonderful assistance in the research and the painting of many fragments in the frescoes; to Dr. Chauncey D. Leake for the encouragement and material help he has so generously given; to Dr. George Lyman for his enthusiasm and his sincere interest as well as his invaluable historical studies; to Dr. Henry Harris for his book and advice, and to Dr. Langley Porter for the Future publication of this booklet.

The panel at the left, although of necessity illustrating only a few incidents, is dedicated to the achievements of the Hooper Foundation for Medical Research in the application of the biological sciences to the problems of medecine and public health.

The circular "motif" is this case takes the shape of a large autoclave, toward which all the other forms and planes build up by overlapping each other in a complicated pattern until the various parts become almost interwoven. The ascending horizontal planes of this panel, as in the others on this wall, emphasize the ascending horizontals of the stairs on either side, thus forming a rhythmic link between the lower portions of the front panels and the upper row of curved panels.

The Hooper building itself is suggested in the background behind the autoclave and the row of bottles which are labelled according to the types of botulinus growing in them. The autoclave shelves are packed with the commercially canned foods which develop tobulinus, and to the right a research worker is tacking up a chart of the home canned foods which become poisonous through improper canning. To the left of the autoclave a young man is using a still to extract the poison from mussels in order to discover the nature and amount of the toxin which is found in these shellfish at certain seasons of the year.

Almost in the center of the composition a parrot on its perch draws attention to a chart showing those birds susceptible to Psittacosis. Other familiar domestic animals figure in this scene because of their usefulness in the study and treatment of many diseases. A cage of mice in the lower left hand corner is a reminder of the many useful services these little animals perform. Leaning against the cage is a yellow and emaciated victim of Weil's Disease. The dog curled at his feet is evidence of the experiments on this subject in which dogs are used. Looking out from behind this group is a goat, above which a chart hangs, showing the temperature changes characteristic of malta fever or undulant fever, to which goats are especially susceptible.

The lower right quarter of the picture is taken up with a simplified representation of hearing tests made on animals in order to study the action currents of the auditory nerves. A large model of an ear appears above the machine to indicate the subject of thestudy. The shelves of books seen over the shoulder of the experimenter represent a small part of the great volume of work accomplished through this Foundation.

- Science Panel -

Above the door, and to the right of the screen, is the last panel of the series, symbolizing the entire field of science, past, present and future. The circular "motif" of the previous panel has been developed, with the addition of more circles, into the more spacious pattern of a spiral, which carries the eye through the painting in more generous lines, suggesting the perpetual development and change characteristic of all organic activity. This is in contrast to the design of the Hooper Panel, where the circular shape returns upon itself, indicating one isolated cycle, or generation, of science viewed separately from its place in the whole sweep of scientific history.

The wheel in the center, revolving on its huge bearings, symbolizes the early development of modern science, called into existence by the necessity of the troubled humans in the foreground. The muscular figure representing human energy provides the power by which this body of science is caused to revolve.

The bearings upon which this massive structure moves are engraved with the names of those men who laid the foundations for present scientific knowledge; Galileo, the celestial physicist; Newton, physicist; Lavoisier, who discovered the fundamental laws of modern chemistry; Einstein, physical astronomist who contributed the theory of relativity; Roentgen, discoverer of X-rays; Pasteur, who opened up the world of micro-biology; Hegel, father of modern scientific philosophy: and Darwin, whose concept of change in the world of biology was one of indefinite progress or evolution.

But this first wheel is not complete in itself. It is connected by a belt to another smaller wheel, which revolves upon the same axis on which a huge wheel in the distance is slowly turning; and the rhythm of the picture suggests that these turns are spiralling into the future endlessly.

The revolutions of the small wheel, intermediate between the past and the immensity of the future, are spinning out consequences remote from the intention of those whose names are lettered on the bearings. Laboratory chemists have produced poisonous gases; engineers have developed bombing planes; destruction as well as benefit has been produced from the labors of scientists. Thus the physician must repair the damages which the destructive forces of misapplied principles have produced. His future task is that of guiding new discoveries along constructive and beneficent channels.

Dean Chauncey Leake, PhD
UCSF Dept. Pharmacology

"University Medical School Murals"

From comments of Dr. Chauncey Leake, Dean of Pharmacy, UCSF School of Medicine:

"The following month, under the sponsorship of the S.E.R.A., Zakheim began two frescoes in the lecture room of the University of California 12 Medical School. These two panels Occupy equal space on each side of

13 a projection screen in the main lecture room, Cole Hall. Dr. Chauncey Leake, Dean of Pharmacology of the Medical School, has prepared a comprehensive brochure on the subject of these paintings including an analysis of the relationship between art and science by Beniamino 14 Bufano. Because of the excellence of this booklet and the information contained therein with reference to Zakheim and the frescoes, Dr. Leake's comment is presented in part, substantially as follows:"

"…Modern artists seem keenly aware of the social problems of our times, and there seems to be more of an effort than usual on the part of art to tell a story or depict a point of view. This seems to be especially the case in the great revival of mural painting. In casting about for a challenging subject for his talent, Bernard Baruch Zakheim, an enthusiastic San Francisco fresco artist, was struck by the notion that of all the manifold aspects of the modern scene, science alone seems to have that freedom from ulterior motive and that steadfastness of idealism, which from both the artistic and the humanitarian sense is most worth of recording and preserving. In idealistic application to human problems, science seems to have reached its greatest success in medicine, in which as a profession, high idealism and freedom from ulterior motives have long been traditional."

"The skill which Zakheim displayed in a small fresco in the lobby of the Alemany Health Center, San Francisco, persuaded the S.E.R.A. to

Hailey, Gene, "California Art Research Project, San Francisco Public Library, MARCXML, Abstract from WPA Project 2874, O.P. 65-3-3632, 1937.

There were 2 frescoes in Cole Hall and 9 more added to Toland Hall.

Zakheim, Bernard, Chauncey Depew Leake and Beniamino Bufano, "The Opportunity for Pictorial Art in Modern Medicine," self-published, San Francisco, 1936,comply with a suggestion from Doctor Isabella Perry that he undertake the mural decoration of one of the main lecture rooms of the University of California medical School. The problem was begun early in 1935. The practical consideration was to provide complementary panels of appropriate size on each side of a projection screen above the lecture blackboard. The intellectual problem selected by the artist was difficult. The plan was to contrast the underlying philosophies of modern and ancient medicine. On the one hand, he tried to depict the orderly disciplined applications of modern medical science to the treatment and prevention of physical and mental maladjustments to our environment. This was to be contrasted, on the on the other hand, with the confused emotional, often hysterical, efforts of suffering humanity in the past to escape disease and misery."

"In the technical aspects of the work, the artist (Zakheim) was assisted by Joseph Kelly in the preparation and application of the marble dust plaster put directly on the brick wall of the hall (Toland Hall). Phyllis Wrightson and Leon Bibel helped greatly in the transfer of the cartoon outline to the wall and in some of the details of the painting, especially on the frames. It was hard work. The lecture room, being in use all day, was available only at night. Often the artist and his assistants were busy until the early morning when the watchman would persuade them to go home."

Excerpted from the History of Medicine in California (next pages):

Introduction

In establishing the first Medical School of the state-supported University of California, several imperatives were recognized. The State of California, the Regents of the University of California and the leadership of the School of Medicine became partners in establishing an official State Board of Examiners in Medicine, Dentistry and Veterinary Medicine, which created the first standards of medical education and professional credentials in California. The superb staffing of the medical school and the highest standards set in place resulted in a degree of excellence from which the modern UCSF has continued to uphold and excel. The outcomes from scientific research became the basis of medical teaching and practice, which has gained worldwide acclaim for UCSF. Great efforts were expended to remove the unlicensed medical practitioners and imposters from California.

Bernard Zakheim sought to display in his art the transition from ancient and medieval medical practices to research and scientifically based medical education and practices of the U.C. Medical Department of the 20th century. Toland Hall, named after the first Chief of Surgery, Dr. Hugh H. Toland, was the site selected for placement of the frescoes. Among all of the explanations and descriptions of the philosophical meanings depicted in the murals, I discovered that none was more perceptive than the erudite comments in the introduction written by Charles Singer, M.D., D.Litt.[5] and the exceptional explanations of Henry Harris, MD, "California's Medical Story."[6] I have excerpted remarks from both authors. When completed, ***the Zakheim frescoes became a California historical treasure in San Francisco and for our nation.***

In a WPA abstract, 'California Art Research," Miss Phyllis Wrightson, an assistant painter working with Bernard Zakheim, wrote a invaluable essay entitled, "Health Center Murals."[7] *She helped to place the cartoon drawings onto the plaster walls for Zakheim.* Joseph Kelly made preparation and application of the marble dust plaster put directly onto the brick walls of Toland Hall. Phyllis Wrightson and Leon Bibel transferred the cartoon drawings to the wall and added details to the paintings, and frames.

THE OPPORTUNITY FOR PICTORIAL ART IN MODERN MEDICINE: AN EXAMPLE IN SAN FRANCISCO

•

Transferring Cultures in a Bacteriology Laboratory

Water-color study by Barnard Zakheim for a detail in one of the murals painted by him at the University of California Medical School, San Francisco.

THE OPPORTUNITY FOR PICTORIAL ART IN MODERN MEDICINE: AN EXAMPLE IN SAN FRANCISCO

AN IMPASSABLE gulf is generally supposed to separate the ideals and functions of art and science. It is quite as distressing as that deplored by George Sarton, the distinguished historian of science and editor of *Isis*, in what is often thought to be the case in science and the humanities, or science and religion. Science is concerned with knowledge of ourselves and the world about us as obtained by objective measurable observations and logical deductions therefrom. It is thus essentially a function of intellect. And that shouldn't necessarily imply coldness! Art is concerned with judgment about ourselves and the world about us as obtained by our subjective reactions, and is thus largely a function of emotion. That science and art are not mutually exclusive should be clear to anyone considering the career of such a person as Leonardo da Vinci, especially when treated as romantically as by Merejkowski. Works of art may be viewed in a scientific way, as they usually are in the sense that science is critical. Achievements of science may have also great artistic merit, as emphasized by J. W. N. Sullivan. Yet artists usually have neglected the opportunity afforded for emotional expression in the scientific efforts of their time.

Art and science are often conjugally related in references to the professional activities of medicine. Although the reference is usually to the skill and knowledge of the physician, the idea suggests the possibilities of an artistic exploration of medical practice, which might lead appropriately in our modern world to trying to portray artistically the spirit and methods of modern science. So far this has remained a neglected opportunity. Eugene Holländer, with German thoroughness, has collected in heavy tomes scattered examples of serious artistic attention to medical affairs. These range from plastic attempts to achieve healing serenity in the classic Greek statues of Aesklepios, through dark Dutch anatomy lessons and urine examinations, to such formal portraiture as the "Four Doctors" of Sargent. But no artist seems to have appreciated what might be accomplished by a serious attempt to catch and preserve artistically the varied manifestations of the medicine of his time.

Modern artists seem keenly aware of the social problems of our times, and there seems to be more of an effort than usual on the part of art to tell a story or depict a point of view. This seems to be especially the case in the great revival of mural painting. In casting about for a challenging subject for his talent, Boruch Barnard Zakheim, an enthusiastic San Francisco fresco artist, was struck by the notion that of all the manifold aspects of the modern scene, science alone seems to have that freedom from ulterior motive and that steadfastness of idealism which from both the artistic and the humanitarian sense is most worthy of recording and preserving. In idealistic application to human problems science seems to have reached it's greatest success in medicine, in which, as a profession, high idealism and freedom from ulterior motives have long been traditional.

The skill which Zakheim displayed in a small fresco in the lobby of the Alemany Health Center, San Francisco, persuaded the SERA to comply with a suggestion from Doctor Isabella Perry that he undertake the mural decoration of one of the

main lecture rooms of the University of California Medical School in San Francisco. The problem was begun early in 1935. The practical consideration was to provide complementary panels of appropriate size on each side of a projection screen above the lecture blackboard. The intellectual problem selected by the artist was difficult. The plan was to contrast the underlying philosophies of modern and ancient medicine. On the one hand he tried to depict the orderly disciplined applications of modern medical science to the treatment and prevention of physical and mental maladjustments to our environment. This was to be contrasted, on the other hand, with the confused emotional, often hysterical, efforts of suffering humanity in the past to escape disease and misery.

In the technical aspects of the work, the artist was assisted by Joseph Kelly in the preparation and application of the marble dust plaster put directly on the brick wall of the hall. Phyllis Wrightson and Leon Bibel helped greatly in the transfer of the cartoon outline to the wall and in some of the details of the painting, especially on the frames. It was hard work. The lecture room, being in use all day, was available only at night. Often the artist and his assistants were busy until the early morning, when the watchman would persuade them to go home.

Fresco Technique

For those who may not know how fresco work is done, a note of explanation is offered. The medium is wet marble dust plaster, to which the artist applies water colors. Only a few square feet may be worked on at a time. So the composition proceeds in jumps and gulps, and once the paint is applied, it cannot be changed without hacking out the plaster and starting all over. As the plaster dries, the lime in it gradually absorbs carbon dioxide from the air until it becomes solid calcium carbonate, or marble. As the calcium carbonate crystallizes, the pigments are strongly adsorbed on the crystal surfaces. The pigments, being chiefly finely powdered insoluble metallic oxides, suffer no oxidizing deterioration. Since the colors do not penetrate the plaster they remain bright and unfaded indefinitely.

Usually the fresco artist makes a color cartoon of his composition first, in order to plot out the general design and color harmony. The design is then worked out in more detail in black and white on the exact scale of the space to be covered by the finished painting. This detail drawing may be cut up into segments, each of which may be used conveniently as a guide in the actual work on the corresponding portion of the fresco itself. This black and white detail design may be transferred by a sort of stencil method to the rough marble dust plaster which serves as a substrate to the finish plaster on which the painting actually occurs. The artist can thus conveniently build up his fresco to completion. While most fresco artists draw directly on the rough plaster substrate, the above method seems preferable in that it is more exact.

Details of the California Medical Murals

The panel to the left of the projection screen is designed to represent the confused and often hysterical means by which humanity, especially in past centuries, has tried in its emotional anguish to treat and drive out sickness and misery. The rounded waves of distress roll into each other in the design suggesting the lack of intellectual order and precision of knowledge responsible for the relative failure of such emo-

tional efforts. An Oriental background of traditional mysticism is suggested by palm branches. Through them rises the smoke of incense from a priest struggling with his people bowed before him to ward off the evil pestilence which has stretched one of them in putrefaction. With dramatic intensity a Semitic prophetical leader, Jeremiah-like points to the ominous zodiacal symbols raised above the bent or worshipful figures before him,—signs which for centuries have symbolized man's credulous errors in etiology and prognosis. That they look like glorified lolly-pops in the panel, rising above all its figures, may be an unconscious irony on the part of the artist. In the center, sacrificial scenes illustrate the vain effort at propitiation of powerful supernatural forces in order to prevent or relieve pestilence, and in these groups may be noted the primitive and priestly pathologist examining liver or urine to guide prophecy and prognosis. That the *vis medicatrix naturae* was operative but scarcely recognized in such surroundings is indicated by the merest glimpse the artist gives of the *ex votoes* on the side of one of the altars. The utter inability of humanity in the past to cope with mental derangement is indicated in the flogging of the maniac by the sadist, the Hebraic blowing of the ram's horn at the *dybbuk*, and the later conventionalized religious rituals for the insane. Here the perpendicularly arranged vestments of the singers give the hint of the emotional effect of deep organ music. The brutality of surgical procedures without anesthesia or asepsis is suggested in almost the only "practical" incident in the panel, the operation, shown appropriately in English guise. The underlying fallacies of unguided emotional desire in determining the philosophical background for medicine in so much of the past appears in the segments of the panel suggesting the pathetic search for the elixir of life, the maintenance of youth, and the philosopher's stone, the key to unlimited wealth.

This colorful panel is not easy to describe. If it were, the artist probably could have told easier in words than in picture what he was thinking about. It is disturbing and confused. And not least because we can recognize that many of the aspects of medical opinion represented in it, though happily no longer part of the science and art of medicine, are still to be extensively found in the populace.

The artist skillful designed a cool architectural stony frame for the turbulent scenes of the panel. Carved in the stones above are the names and symbols of the three medico-religious characters in the superstitious aspects of whose cults were perpetrated much of what the panel displays. There is cut the hieroglyph for Imhotep (He-who-cometh-in-peace) with the *crux ansata*, symbol of the union of male and female, the sign of fertility and of life to come. Imhotep was the Egyptian god of medicine, probably a vizier-physician of the Pharoah Zoser of the Third Dynasty, about 2980 B.C., whose memory was later reverenced as divine. There are next the sturdy Greek letters spelling Aesklepios, the Greek counterpart of Imhotep, with his symbol of the staff and serpent. Lastly, classic Roman letters give the Latin for St. Luke, the traditional patron-saint of Christian medicine, with his symbols of bull's head and book.

The antithesis in the contrasting panel attempts to represent the modern effort at controlled application of demonstrable and critically valid knowledge for the prevention and treatment of disease. Here straight lines suggest order and intelligent direction of energy. The colors are calmer. Though distress may be noted, anguish is not present. Significantly the supernatural does not appear. While X-ray, chemical,

anatomical, physiological and other scientific apparatus goes from one corner of the panel to the other, it conveys to the observer nothing of the fear of mystery; for the artist indicates that it is developed and understood by human beings, and applied and controlled by just such people as we all are, for beneficial human ends.

Most of the detailed aspects of the second panel are in antithesis to those of the first. The rational aims of chemistry displace the emotional ones of alchemy; the study of pathology and bacteriology provides a firm foundation for understanding the causes of disease and thus for its effective prevention and treatment. Anatomy and the various phases of physiology give the necessary appreciation of the structure and function of the body including the brain, so that the wise physician may know how best to adjust it when out of joint with its environment. Thus the psychiatrist patiently helps the mentally disturbed person to reach a calmer adaptation, and replaces flagellation with more soothing reflexes from cutaneous sensations of the bath. In modern therapy with surgery, the patient is veritably cloaked by disciplined solicitude that he shall suffer no pain nor die from induced infection. The sick person yields to the X-ray in justified faith that it will help to diagnose his ailment accurately or to alleviate his illness. The artist in this panel puts the organized prevention of disease as the central theme. In prenatal care, in child guidance clinics, and in dental prophylaxis, he indicates the most important social trend of current medicine. His climax is reached in the scene depicting the modern medical atonement, in which the confident and intelligent mother brings her child to be vaccinated. This is an at-one-ness, in medicine at least, with critically examined experience, an atonement of judgment with knowledge, of art with science. As the artist depicts the incident, the physician and the nurse express an almost reverent intensity. The child, abnormally grave and mature and apparently unconscious of what is being done to him, gazes tranquilly into the future, like an antique picture of the Christ-child, the symbol still of our ideal of what we may become through our efforts, medical or otherwise.

Above this panel in the stony frame are carved the names of three men who perhaps were most influential in developing present day medicine: William Harvey (1578-1657), revealer of the circulation of the blood, who made physiology a modern science; Louis Pasteur (1822-1895), prover of the bacterial origin of infectious diseases, and founder of bacteriology, and Rudolf Virchow (1821-1902), originator of the modern conception of disease based on cellular pathology, and promotor of the idea of preventing disease.

For this panel the artist made many studies in medical laboratories, clinics, and hospitals. These are all quick water color sketches, many of them of great interest and attractiveness. Some are used to illustrate this account. The object in these studies was to secure types for faces, and to acquire an understanding of characteristic medical maneuvers and apparatus. There is no attempt at actual portraiture in the panel, nor at photographic realism in procedure or equipment.

With the closing of the SERA in August, the work seemed about to be interrupted at its most critical phase. However, the artist and his assistants kept cheerfully at their task, inspired by many artist friends, notably Beniamo Bufano and Ralph Stackpole. There was also the stimulus of the skeptical tolerance of the staff and students of the Medical School, who though interested couldn't help but wonder

how it would turn out. Finally the WPA rushed its support, and the project carried on.

The frescoes will certainly achieve their primary purpose of provoking the medical students, who will face the panels day after day, to consider the philosophical and social ideals of their profession. Whether they will have any wider influence will depend on the future judgment of their artistic merits.

On the completion of the frescoes they are to be opened for inspection with an informal exhibit of some of the water-color studies made in connection with it. At this affair, Ralph Sweet, in charge of medical illustration at the University of California Medical School, has kindly consented to allow some of his water-color sketches of operating-room scenes to be shown. Beniamo Bufano, the distinguished sculptor and painter, has also been kind enough to assist at the function in showing how art and science may be related in mutual revelation, by permitting a showing of his interpretive head of Einstein and of his fish skeleton called "X-ray." In addition George Hodel, a senior medical student, has on view in the Pharmacological Laboratory four large photographic mural compositions endeavoring to interpret certain aspects of chemotherapy and drug use. Thus, one indicates the problems encountered in studying the chemotherapy of amebiasis, another gives an impression of goiter diagnosis and pathology, a third suggests the technique of the laboratory applied to syphilis, and the fourth attempts an artistic interpretation of a patient's emotional reaction to the effects of posterior pituitary extract. It is hoped that this informal exhibit may illustrate the possibilities existing in medicine for artistic analysis and revelation.

An Appended Note by Beniamo Bufano on the Complementary Aspects of Art and Science

That a great scientist is really an artist is not always obvious. But a striking feature both of artists and scientists is that a strong imagination is needed to develop their work. The scientist uses imagination in seeking analogies on which to base explanations of his observations and experiments. It is the same sort of imagination that the artist employs in revealing a not readily perceived aspect of *his* subject. Both the scientist and the artist are revealers of hidden aspects of nature. Scientists as well as artists must feel themselves in tune with nature, perhaps a little more closely than other humans, at least in their capacity for expressing their observations or reactions.

In the simpler circumstances of the past, the great masters of art were the chief interpreters of nature. Feeling themselves in harmony with the world about them, they expressed its simple essentials in pictures, poems, dances, music, sculpture, architecture, and abstractly in what was the science of those times. Modern artists are attempting to span the bridge of space and time between the great masters of antiquity and themselves in reviving this essential kinship with nature which is the basis of the best art. Science, by its rigorous revelation of the truth about nature, must be understood by modern artists, in order to further this new spirit to the fullest.

An unfortunate modern element in the growth of art is the critic. Professional critics, with their all too frequent dependence on commercial interests, jeopardize as almost no other factor, the idealism and sincerity of art. Criticism is recognized in science as a helpful factor, particularly when given by other responsible scientists. In science it is not conditioned, theoretically at least, by personal feeling and prejudice, as is the case in art. The chief fault with art critics is that they are professional, and often their jobs depend on catering to popular prejudices or special interests.

Under such conditions they can hardly be expected to understand what an artist may be trying to do, or to interpret it sympathetically. Science is fortunate in not being dependent upon critics for its interpretation to the public. All of us crave the satisfaction of being understood. Vassari tells us many pitiful tales of the tragedies brought to the great masters of 15th and 16th century art by misunderstanding criticisms. The artist, working with a medium less precise than language, is at a great disadvantage in the effort to make clear through his medium what he is trying to say. If the artist could say it in words it would no longer be the art that it is.

So when we come to view a new effort in art, as here in the attempt to obtain an artistic interpretation of medicine, let us try to understand and appreciate what the artist is trying to do. All creative forces in nature, including artistic as well as scientific, are experimental. It is this experimental force in man that makes for growth toward unity and truth. Art is such a force, and is akin to science in that respect. We can help greatly in the experiment by seeking to understand. Culture and the unity of mankind depend on our sympathetic understanding of each other. It is the understanding we render and the appreciation we receive in our various individual efforts that makes towards the unity of life and humanity. So it becomes the greatness of those about an artist which makes his work great. If the artist has greatness to interpret, he will do so, and his work will reflect that greatness.

The idea to commission murals was brought by Dr. Isabella Perry, professor of pathology after seeing the frescoes Zakheim painted at the Alemany Public Health Center and then spearheaded by Chauncey D. Leake, professor of pharmacology and medical historian. The university murals undertaking which was partially funded by the WPA Federal Art Project and also sponsored by the university was a true collaborative effort between Zakheim's team and UCSF faculty (including renowned UCSF doctors, Chauncey D. Leake, George Lyman, Langley Porter, Salvatore P. Lucia, W. E. Carter, and F. W Lynch). The artist was provided unrestricted access to the Crummer Room containing numerous books on the history of medicine, including recently published "California's Medical Story" by Dr. Henry Harris. Zakheim's assistant, Phyllis Wrightson did extensive research about California medical history which becomes apparent in the sketchbook that she kept for the project. The instruments depicted by her on these pages are still preserved at the archives' artifact collection and will be displayed as part of the 150th anniversary exhibit.

New Alemany Health Center, San Francisco

Zakheim Frescoes by Dr. Chauncey Leake UCSF Student Newspaper, Synapse, Vol 7, No. 7, 19 April 1968:

“Editor: 1 am writing to add a bit to "The Tale of the Zakheim frescoes" which was so interesting a feature of your April 8 issue. These frescoes are attracting wide attention. The panel representing the development of [Cole Hall] rational medicine is to appear on the front cover of the issue of the Journal of American Medical Association, which will contain the program for the June meeting of the American Medical Association in San Francisco.

It was Dr. Isabella Perry, in 1935, who suggested that we might obtain funds from the Public Work Administration for some artwork around our campus. At the time, during the midst of the great Depression, there was little artistic activity around our campus. We were developing the humanities, particularly through an effort in the History and Philosophy of the Health Professions.

"The skill which Zakheim displayed in a small fresco in the lobby of the Alemany Health Center, San Francisco, persuaded the S.E.R.A. to comply with a suggestion from Doctor Isabella Perry that he undertake the mural decoration of one of the main lecture room of the University of California medical School. The problem was begun early in 1935. The practical consideration was to provide complementary panels of appropriate size on each side of a projection screen above the lecture blackboard. The intellectual problem selected by the artist was difficult. The plan was to contrast the underlying philosophies of modern and ancient medicine. On the one hand, he tried to depict the orderly disciplined applications of modern medical science to the treatment and prevention of physical and mental maladjustments to our environment. This was to be contrasted, on the on the other hand, with the confused emotional, often hysterical, efforts of suffering humanity in the past to escape disease and misery."[7]

Bernard Zakheim, Polish Artist in San Francisco[8]

"Bernard Zakheim learned of an artistic competition to paint frescoes at a San Francisco medical clinic. He entered the contest and received the commission to paint a fresco at the Alemany Health Center. He demonstrated that he could create a fresco in a unique and oddly shaped alcove, which won him the opportunity for this artistic success. The fresco depicted a fertility scene. Notes and a drawing by the artist permitted me to better understand the scene. In the background are the fig trees, symbols of fertility. To the left, are portrayals of Bernard Zakheim, his wife, Eda Spiegelman Zakheim, and a blooming flower, the metaphor for their younger daughter, Masha. The bare breasted woman and the woman in the foreground bending over the rabbit are both symbols of fertility as are the lovers depicted to the right".

[7]"University Medical School Murals"[7] From comments of Dr. Chauncey Leake, Dean of Pharmacy of UCSF School of Medicine:

[8] Robert Sherins, MD: "Bernard Zakheim, Polish American Artist of California", Polish Genealogical Society of California, BULLETIN, 2014.

Waiting Room, Alemany Health Center; Fresco over the Mantel 1 The photograph is titled: "Alemany Health Center, 48 Onandaga Ave., San Francisco, January 14, 1935." Fresco in 2-Parts by Bernard Zakheim, 1935 - Alemany Health Center, San Francisco. Titled, "Fertility" (Pagan Symbols of Fertility): Fig Trees, Flower Bloom, Bare Breasted Woman, Loving Couple and the Woman Bent over the Rabbit. Sadly, after the completion of the new frescoes, civic-minded people began to complain that the nudity and sexually-sensitive themes were inappropriate in public. The Alemany managers decided to paint over the fresco. Only the upper part of the fresco above the balcony remains in view depicting a typical San Francisco neighborhood scene. The building is unoccupied and in serious disrepair; the fate of the frescoes remains unresolved.

"Fresco Scene of San Francisco Neighborhood" Upper part of the Zakheim Fresco Alemany Health Center, San Francisco.

Bernard Zakheim had no idea at the time that the Alemany fresco would become his direct link to painting frescoes at the University of California in San Francisco. However, his works caught the attention of the senior staff of the Alemany Health Center. They contacted Dr. Chauncey Leake, Professor of Pharmacology at the UCSF School of Medicine, to examine Zakheim's fine artwork. Professor Leake was won over and brought Zakheim's work to the attention of the WPA/SERA administration.

From Dr. Chauncey Leake:

"The skill which Zakheim displayed in a small fresco in the lobby of the Alemany Health Center, San Francisco, 45 persuaded the S.E.R.A. to comply with a suggestion from Doctor Isabella Perry that he undertake the mural decoration of Cole Hall, one of the main lecture rooms of the University of California Medical School." The fresco was so well received that Professor Chauncey Leake proposed Zakheim to the WPA-SERA administration to be the artist of choice for the initial UCSF Cole Hall frescos."

Isabella Perry, MD

From: G. Edward Griffin, "World Without Cancer"

Showing that the case against Laetrile is fraudulent, however, does not constitute a case for Laetrile. It is necessary, therefore, to examine the evidence that vitamin B17 actually does work in practice just as well as it does in theory.
The effectiveness of the trophoblast thesis as a basis of cancer therapy has been demonstrated both in the laboratory and in the clinic. In 1935, for example, long before the development of Laetrile, Dr. Isabella Perry of the Department of Pathology at the University of California Medical School conducted a series of experiments in which she subjected tumor-bearing rats to prolonged inhalation of cyanide fumes. Here is what she wrote:
A considerable percentage of the animals so treated showed complete regression of the tumor. Both regressing and growing tumors in treated animals h a d little capacity for transplantation.(2)
Perry observed that these experiments were probably of little value to humans because, in order to be effective, the level of

II. ACKNOWLEDGMENTS

In 1983, when he had seen my book called Coit Tower, San Francisco: Its History and Art, Dr. Julius Krevans, Chancellor at the University of California, San Francisco, politely asked me when I would be doing the same job of work for the medical history murals that my father, Bernard Zakheim, had painted at UCSF in the 1930's. Five years later I began the task that was to take another two years to complete. Thus after seven years, I was able to report back to Dr. Krevans with the manuscript of the present book for which he (with only mild astonishment!) has so kindly written the "Foreword".

Although Dr. Chauncey D. Leake had published two small monographs upon the completion of the fresco projects in 1938, their limited numbers had been long since exhausted by the time I began writing. Aside from an expansion of the original content explication, including new biographical material, there needed to be an overview of the half-century of controversy and physical violence brought against the frescoes as well as a reassessment of their artistic merit today, all of which I have tried to provide.

Several individuals from UCSF and the medical community were kind enough to assist me in the expansion of the original texts, the new overview, and the general pursuit of my project. Among them are Dr. Lloyd H. Smith, Jr., an early consultant; Dr. Ralph Kellogg, a generous advisor; Chauncey Leake, Jr. and his brother Dr. Wilson Leake, valued commentators; Patricia Krevans, a loyal advocate; the members of the Department of History of Health Science, helpful consultants; the UCSF Alumni-Faculty Association, caretakers of correspondence; and of course the obliging staff of the UCSF Library Archives: Isabel Delgadillo-Romo and Dale Nedelco, who helped me with the use of important primary source

Five years later I began the task that was to take another two years to complete. Thus after seven years, I was able to report back to Dr. Krevans with the manuscript of the present book for which he (with only mild astonishment!) has so kindly written the "Foreword".

Although Dr. Chauncey D. Leake had published two small monographs upon the completion of the fresco projects in 1938, their limited numbers had been long since exhausted by the time I began writing. Aside from an expansion of the original content explication, including new biographical material, there needed to be an overview of the half-century of controversy and physical violence brought against the frescoes as well as a reassessment of their artistic merit today, all of which I have tried to provide.

Several individuals from UCSF and the medical community were kind enough to assist me in the expansion of the original texts, the new overview, and the general pursuit of my project. Among them are Dr. Lloyd H. Smith, Jr., an early consultant; Dr. Ralph Kellogg, a generous advisor; Chauncey Leake, Jr. and his brother Dr. Wilson Leake, valued commentators; Patricia Krevans, a loyal advocate; the members of the Department of History of Health Science, helpful consultants; the UCSF Alumni-Faculty Association, caretakers of correspondence; and of course the obliging staff of the UCSF Library Archives: Isabel Delgadillo-Romo and Dale Nedelco, who helped me with the use of important primary source

documents, and especially Head of Special Collections and University Archivist, Nancy Whitten Zinn, who help edit this text.

As in the past, my family again proved a valuable resource: Ruth Gottstein provided good editorial assistance and Nathan Zakheim shared freely his professional knowledge of the painting and moving of frescoes. My colleagues at City College of San Francisco were especially helpful in the diurnal editing and re-editing of the chapters. I am particularly indebted to Dennis Hendrickson, who always saw forests when I could see only trees; to Diane Fairchild, on whose patience I often presumed; and to Katherine Hondius, whose several suggestions tightened my organizational plan.

Photographer Don Beatty provided me early on with many lecture slides of portions of the murals, which over the years have trained me to focus on the vignettes that comprise the larger panels; he later rephotographed all the mural panels under great restraints of physical space. For other technical assistance I am much obliged to Dr. Emanuel Nosowsky, Paul Yuke, and most especially to Tom Stewart and Danny Russell for their great patience and considerable computer skills.

For their medical commentaries, I appreciate the inputs of Drs. Bruce Steir and Walter Saphir. For his continuing support, I thank Kikuo Miyamoto. And for sins of omission or commission, I take full responsibility, for I remain basically a documentor, like Dr. Samuel Johnson's lexicographer, a "harmless drudge".

IV. FOREWORD

More than any other disciplines in academia, health sciences are directly involved with the problems of the society of which we are a part. We share with other disciplines a responsibility for education and research; but in our provision of health services we are major participants in the care of the sick, prevention of disease, and health promotion.

When several years ago Masha Zakheim published a book on Coit Tower, including her father's mural there, I suggested to her that the frescoes Zakheim had painted at the University of California, San Francisco, had historical as well as artistic importance and would make a marvelous and valuable subject for a book. His work is visually interesting and rich in historical and iconographic meaning--much of which may not be readily apparent to the average viewer.

How fortunate the University of California, San Francisco, is to have been the recipient of an artistic legacy which marries our roots in society and our mission. The Zakheim frescoes in Toland Hall and in the Health Science Instruction and Research lobby are truly remarkable. Not only are they breathtaking works of art, but they remind us of how vividly a gifted artist can depict powerful societal messages. The University of California, San Francisco, is a better place in which to learn and create because of the inspiration that Bernard Zakheim has bestowed upon us.

Julius R. Krevans, M.D.
Chancellor
University of California, San Francisco
October 1990

V. INTRODUCTION TO ZAKHEIM FRESCOES AT UCSF:

AUTHOR'S COMMENT

Bernard Zakheim came to the University of California medical Center, San Francisco, in 1935 to adorn Cole Hall, a rather plain lecture amphitheatre, with a pair of fresco panels on either side of a projection screen above a blackboard. He chose to depict two complementary but diametrically opposed aspects of medicine: ancient, which he titled Superstition in Medicine, and modern, titled Rationality in Medicine. Crowded together in great swirls of movement, the figures in the first panel show emotional confusion as they group around priests, rabbis, alchemists, and ancient surgeons. In counterbalance, the portraits of the modern panel present serene composures as they gather on well organized, measured horizontal planes. The two fresco panels are mirror images of one another compositionally.

After depicting medical history world-wide, in 1936 Zakheim went on to illustrate the history of medicine in California in Toland Hall, another lecture amphitheatre at UCSF. Decorating the curved walls of the rear of this room, he here had the task of enhancing but not violating the plan of the lecture hall as conceived by its architect, Lewis P. Hobart, in 1917. As the architect had made no provision for murals, the artist had to accept the reality of the walls and, as he said, to enrich their characteristics by "assimilating them, placing emphasis on them, and then causing them to vibrate in line and color."

In Toland Hall Zakheim extended the "rays" of the sunburst ceiling plan down the back walls, thus creating six panels with seven pilasters. To the left of the back exit he painted three panels showing the history of medicine in Northern California; to the right, that of Southern California. The artist's assistant, Phyllis Wrightson said: "The six panels are treated [like] a frieze, with a strong wave-like rhythm

acting as a connecting force." Into the 4 1/21 tall spaces the artist had to squeeze life-sized figures; thus he used visual "tricks" to make them seem full size, but always kept the two-dimensional plane flat, with no "bulges" nor "illusory depth," as he said. In this respect he honored the classical Polish Academy art of his education, the German Expressionism of his later training, and the spatial techniques of his Mexican muralist colleague Diego Rivera, with whom he worked in Mexico.

Thus from 1935 to 1938 Zakheim created a veritable art museum of both world and California medical history in two lecture halls at UCSF.

These facts are clear enough and are well documented. At the time of the completion of the projects, both Dr. Chauncey D. Leake, patron, advisor, and friend, as well as Phyllis Wrightson, artist's assistant, wrote and published commentaries and guides in limited editions for viewers of these frescoes. At the time, the artist had felt that the art was self-explanatory by virtue of the many labels, signs, and documents that he had carefully painted to serve as historical and biographical clues for viewers of the future.

However, over half a century after their debut, these murals seem to require much more explication than that which exists within them. The limited editions of contemporary booklets were quickly exhausted and never reissued. As there are no identifying legends or diagrams in the two halls, with the passage of time, many generations of health-care students have looked in some bewilderment at what the artist had hoped would be patently obvious.

Political climates have altered as well. For fourteen years the frescoes in Toland Hall lay out of sight beneath wallpaper, victims of infighting among members of the faculty and administration in an era of national conservatism. The Cole Hall murals were threatened with certain destruction when the old medical school building was slated for

demolition. But the art has survived--ars longa, vita brevis--and its story is well worth the telling.

On a personal note: as the daughter of the artist, I knew that it would some day be my ... task, obligation, destiny ... to reissue the explications so long unavailable, for after all, there I am at age four in the Modern Medicine panel of Cole Hall writing my name on a sheet of paper!

At first I envisioned the project as a sort of revised guide to the art, like the one that I began to write for the murals at Coit Tower on Telegraph Hill in San Francisco. I should have realized on the basis of that experience, however, that it would be necessary to flesh out the factual skeleton much more completely than simply supplying missing dates and biographical information, for just as my father had been caught up in controversy at Coit Tower, so too he became enmeshed in political concerns at UCSF, some of his own doing and some not. In any event, readers and viewers deserve explanations of this history and more.

Finally, there were personal matters with which I had to deal: family relationships with burdensome problems and filial responsibilities which weighed heavily upon me. I regret having delayed the writing until nearly five years after my father's death, for surely there are many instances when his insights and memories could have clarified that which is murky. As an example, I spent much time searching for the name and significance of the baker's style hats of the rabbis in the Ancient Medicine panel. At last I found the names (the hat is in two sections) but I can only speculate as to the significance of the Hebraic letter shin so prominently displayed. The search for these meanings gave me a shadowy glimpse of a Kabalistic world of which

I know very little, yet one which my father had known--and rejected--through the rabbinical training of his youth.

And of course he would have rejoiced in today's belated recognition of the value of the art legacy that he created, particularly since the world has come to accept some of the views of history that he portrayed, almost as a visionary, in the 1930's. I have finished my work (if indeed that is ever possible!) almost with the status of one of the medical students whom these UCSF frescoes were intended to instruct and delight: in the course of scrutinizing, researching, and writing, I too have been entertained and enlightened beyond measure.

--Masha Zakheim

San Francisco, July 1991

VI. BIOGRAPHY: BERNARD BARUCH ZAKHEIM (1896-1985)

In depicting both general and local history, when Bernard Baruch Zakheim came to paint the history of medicine at UCSF, he was continuing a tradition as old as Egyptian frescoes, Greek sculpture, Renaissance paintings, English engravings, and Mexican murals. In short, art and medicine have had a long reciprocal relationship, to which his fresco murals in Health Sciences West, Third Floor, and Toland Hall attest.

Born in Warsaw, Poland, on April 4, 1896, the youngest of ten children, Zakheim was meant to be a Jewish Orthodox rabbi. Though his family lived in the Warsaw ghetto, they made a good living as wholesale butchers, holding lucrative contracts with the Polish army. His father died when Zakheim was nine years old. Early in life he chose to express himself in the visual arts, despite the Chassidic religious convictions of his family proscribing the depiction of human beings in art. Later he would say that his "rebellion" gave him a new religion: he could deliver his strong messages through the painted image instead of from the pulpit.

Trained in such subjects as drawing, tool making, and furniture design at the Applied Art School in Warsaw, he astonished one of his professors by painting a watercolor of a valve that he had created for an examination in class. "Poland needs artists," his professor said; "we have plenty of craftsmen." Although his mother, by now the matriarch of the family, controlled the finances, she refused, because of her religious orthodoxy, to pay his tuition at the Applied Art School. However, there his work came to the attention of visiting Italian sculptor Enrico Gliescenstein, who recognized young Zakheim's talent. Although he had refused to teach other students of wealthy families, Gliescenstein volunteered to instruct Zakheim gratis for a year. Later, when Gliescenstein had to leave to work on projects

abroad, Zakheim was fortunate enough to win a very well endowed Kahali scholarship that had lain idle for years awaiting a non-conforming Jewish student with just such a family background as his own. At age sixteen he had his own studio and life-models, rather unusual in the Catholic Poland of his day.

He now enrolled in the Warsaw Academy of Art for his formal art education. A young idealist with gratitude for his education, Zakheim wanted to fight for Poland's independence from Czarist Russia at the time of World War I. Thus after a year at the art academy, he left to enlist in the Polish Army under-age and fought in the trenches against Germany for nearly a year. Then, taken prisoner-of-war by the Germans, he languished in POW camp for over nine months, witnessing unspeakable atrocities and narrowly missing his own execution by a firing squad. He managed to escape into Munich, where he was able to matriculate in the Kunst Gewerbe Schule on the basis of his artistic talent alone.

The dominant art style of Germany in the teens of the century was Germany Expressionism, an ideal social and political art form for Zakheim to portray his most recent encounters with the horror of life at the front and in war-torn Poland and Germany. It was these experiences that gave the artist much of his inspiration to portray human suffering and the fight for justice that he pictured in his later art--particularly in the murals at UCSF--and the art training to express the ideas and emotions. When Poland lay in shambles, seething with unrest and suffering after World War I, Polish First Marshal Josef Pilsudski, back from the German front, at first seemed a rescuing hero but later turned into a dictator. Later, Zakheim used his portrait for the pioneer Polish doctor in the Gold Rush Medicine Panel of Toland Hall, Felix Wierzbicki.

Under anti-Semitic Pilsudski the political climate in Poland had become so neo-fascistic that Zakheim could not return there to live, given the political radicalization of his student days and his war experiences. Having met his future wife, Eda Lea Spiegelman (1898-1943) in Warsaw, he rendezvoused with her in the "free city" of Danzig (today Gdansk) on the Baltic Sea, Poland's only port. There he studied art and architecture at the Danzig Politechnicum, but his war experiences were too graphic and his political differences with the new regime too severe for him to remain in Poland. After they married in Danzig in 1920, seeking political asylum he and Eda left for the United States, from which both sides of their family had sent sufficient money for them to come by ship first class: Why? "Fewer questions asked that way!" Zakheim would explain to his grandchildren.

Upon arriving in New York Zakheim discovered that the ghetto there was all too similar to that which he left in Poland. After only one week, the couple left for San Francisco. Financial necessity required a move to Los Angeles, where their first daughter, Ruth, was born in 1922. Several years later the Zakheims settled in San Francisco, where he was able to build a successful furniture factory, designing and making custom furniture to sell at prices affordable to even moderate income families.

However, his need to be creative in art still inspired him to seek instruction and further expression. After a brief stint at the old School of Fine Arts (when it was at the Mark Hopkins estate on Nob Hill) he struck out on his own as a "Sunday painter." Because of his political beliefs he did not invest in the stock market during the 1920's--hence his factory prospered and survived the crash of 1929, since he kept his profits in gold coins. Still in search of artistic expression he met the Mexican muralist Diego Rivera when the latter

painted in San Francisco at the School of Fine Arts (today the Art Institute) on Chestnut Street and at the Stock Exchange Club. Inspired, Zakheim went to Mexico briefly in 1930--not to study under but to work with Diego Rivera, who had returned to Mexico City to continue his frescoes at the Palacio Nacional and the Ministry of Education. Finding himself now confused by the mix of the Polish academic style of his student days, the German Expressionism of his studies in Munich, and presently the Mexican muralist movement, Zakheim decided to take a "sabbatical" from his factory and go to Paris in late 1931 to "find himself in art," as he said. His wife remained in San Francisco to take care of the children, a second daughter (the present writer) having been born in 1931, as well as to manage the factory with her brother. Unfortunately, they now invested in the stock market, which was undergoing another decline, thereby losing the money that had accrued and survived the crash of 1929.

Returning from Europe (where he had painted many easel works and also had apprenticed on a fresco project in a Protestant church under a German Professor Gebauer in Pecs, Hungary, painting one section which he called Polish Jews), Zakheim decided that although he could not salvage the furniture factory given his new dedication to art, he could change his career. (His wife Eda would continue as an interior decorator in her own shop.) Winning the competition in 1932 to paint a fresco in the courtyard of the newly built Jewish Community Center on California Street, he created A Jewish Wedding, the first fresco mural in San Francisco in a place with public access, for although Rivera had painted two frescoes here, both were in relatively private spaces.

With his artistic prestige based on the Jewish Community Center fresco, Zakheim was able, along with sculptor Ralph Stackpole, to help organize fellow artists during the Depression who were looking for walls

Under anti-Semitic Pilsudski the political climate in Poland had become so neo-fascistic that Zakheim could not return there to live, given the political radicalization of his student days and his war experiences. Having met his future wife, Eda Lea Spiegelman (1898-1943) in Warsaw, he rendezvoused with her in the "free city" of Danzig (today Gdansk) on the Baltic Sea, Poland's only port. There he studied art and architecture at the Danzig Politechnicum, but his war experiences were too graphic and his political differences with the new regime too severe for him to remain in Poland. After they married in Danzig in 1920, seeking political asylum he and Eda left for the United States, from which both sides of their family had sent sufficient money for them to come by ship first class: Why? "Fewer questions asked that way!" Zakheim would explain to his grandchildren.

Upon arriving in New York Zakheim discovered that the ghetto there was all too similar to that which he left in Poland. After only one week, the couple left for San Francisco. Financial necessity required a move to Los Angeles, where their first daughter, Ruth, was born in 1922. Several years later the Zakheims settled in San Francisco, where he was able to build a successful furniture factory, designing and making custom furniture to sell at prices affordable to even moderate income families.

However, his need to be creative in art still inspired him to seek instruction and further expression. After a brief stint at the old School of Fine Arts (when it was at the Mark Hopkins estate on Nob Hill) he struck out on his own as a "Sunday painter." Because of his political beliefs he did not invest in the stock market during the 1920's--hence his factory prospered and survived the crash of 1929, since he kept his profits in gold coins. Still in search of artistic expression he met the Mexican muralist Diego Rivera when the latter

to paint under government sponsorship. In 1933 a group gathered at the Whitcomb Hotel to wire the US Administration in Washington DC, appealing for financial support of local art projects. It so happened that the government was at the same time setting up just such an agency, called the Public Works of Art Project, under the Civil Works Administration. The two paths crossed: San Francisco's Coit Tower became the scene of the largest art project in Northern California, with fresco, oil on canvas, and egg tempera paintings covering some 3691 square feet of wall space. Zakheim's contribution was the Library scene, in which he illustrated the Reading and Periodical Rooms of the public library. In the style of Diego Rivera he included a book by Karl Marx, Das Kapital, which drew the ire of the Art Association and of the press.[1]

After he had finished at Coit Tower, Zakheim was commissioned in 1934 to paint two frescoes called Community Spirit and Growth at the Alemany Health Center on Ocean Avenue in San Francisco under the auspices of the State (of California) Emergency Relief Association. While he was executing these murals his work came to the attention of Dr. Isabella Perry, the first woman pathologist on the staff of UCSF. Her introduction of Zakheim to Dr. Chauncey D. Leake, a professor of pharmacology at the University of California Medical Center, provided the entre for the artist at UCSF and for a very fortunate meeting of minds. In Dr. Leake, Zakheim found a man of vision similar to his own: belief in the validity of historical perspective in medicine. And conversely, Dr. Leake's life-long efforts to humanize medicine at UCSF found in Zakheim a gifted artist willing to portray in monumental form the spirit of healing and research for future good. The result is a powerful union of art and science which for over half a century has

---

[1]This information is presented at length in Coit Tower: Its History and Art by Masha Zakheim (Jewett); Volcano Press: San Francisco, 1983.

instructed and inspired all those who have witnessed these murals and have understood their message. It is to the story of this meeting of intellect and spirit that this book dedicates itself.

After finishing the murals at UCSF Zakheim went on to paint oil murals in two Texas post offices, in Rusk and Mineola. Soon after, he and Eda were divorced, whereupon he married his assistant at UCSF, Phyllis Wrightson; they had two sons, Nathan (b. 1943) and Matthew (b. 1945). During WWII all government funding for art projects was terminated, and virtually no support existed after the war. Zakheim and his wife moved to a farm with an apple orchard in Sebastopol, sixty miles north of San Francisco, where he continued to live and paint for over forty years. When the couple separated in the early 1950's, Phyllis moved to Santa Barbara, where she lives at present.

To support himself and his family during his years on the farm, Zakheim returned to the upholsterer's bench, for after the wallpapering of the Toland Hall frescoes in 1948, "all of a sudden no one had a job for a controversial painter," Zakheim found. Recovering from a heart attack in 1960, he retired from upholstery work, continuing to paint at his easel and to sculpture in wood.

In 1961 he returned to Poland for nine months, where he was able to find a wall ready for a large fresco in a Jewish rest home near Warsaw. Searching for a theme from his early life in Poland he titled his mural The History of the Jews in Song--the illustration of eight songs from life--weddings, war-time protest, laboring. It was to be his last fresco.

Although there were no more fresco commissions, Zakheim expressed anger and horror about the Holocaust of WWII during which most of the Zakheim family perished in Poland. In 1966 he sculptured in redwood a group of six powerful figures to represent the six million Jews who died

in the Holocaust. The group is called Genocide now at Mount Sinai Memorial Park, Burbank, California.

Upon his return to Sebastopol in 1962, he lived on his farm in retirement, continuing to paint easel works and to create such wood sculptures his 1975 work The Genius of Healing (representing the same nurse and little boy that he depicted in Rational Medicine in Cole Hall), which stands in UCSF's School of Nursing lobby.

In 1982 while sculpturing a massive granite boulder on his farm he suffered a stroke which put him into retirement homes for the next three years, during which time he painted many scenes of his early childhood in Poland. At almost ninety years of age, Bernard Baruch Zakheim died of a liver tumor on Thanksgiving Day, 1985.

VII. BIOGRAPHY: CHAUNCEY DEPEW LEAKE (1896-1978)

Dr. Chauncey Depew Leake, a man remembered as "one of the most significant medical historians of this century," was born in Elizabeth, New Jersey, on September 5, 1896. Noted San Francisco historian Kevin Starr has observed that the class in which Dr. Leake graduated from Princeton University in 1917 (where he took a Litt. B.), also included novelists F. Scott Fitzgerald and George Stewart as well as essayist and critic Edmund Wilson and poet John Bishop Peale. Dr. Leake then earned both an M.S. and a Ph.D. (1923) from the University of Wisconsin. In 1921 he married Elizabeth Wilson, a bacteriologist. Together they had two sons: Chauncey Jr., a financial investor, and Wilson, an anesthesiologist.

Early in his career Dr. Leake was very influential in his chosen field of pharmacology, joining the staff at UCSF in 1928 to organize the first Department of Pharmacology in the California College of Pharmacology; later he was instrumental in that department's becoming part of UC in July, 1934. Here he pioneered certain aspects of anesthesiology; and it was in his laboratory that colleague Dr. Gordon Alles discovered amphetamines.

His friend John C. Krantz, Jr., said in 1969 that Dr. Leake brought humanistic concerns to his field, "from cells to society". He was at once a scientist and a popularizer of science: a pharmacologist, philosopher, enologist (a "student" of wines), chemist, writer, physiologist, medical and science historian, translator, lecturer, administrator, and, above all, a humanist. (During the 1930's he lectured at UC Berkeley on the subject of human relations.)

However, when he left UCSF in 1942 for Galveston Texas, in his own stylized 19th century cursive script he wrote (with characteristic modesty) only that for fourteen years he had "served as professor of

pharmacology and lecturer in the history and philosophy of medicine. He also was librarian to the medical school." Later Dr. Leake was a visiting member of the Institute for Advanced Studies (Princeton, 1950-52 and 1956) and Professor of Medical Jurisprudence (Hastings College of Law, SF, 1963-65), after returning to UCSF in 1963, where he continued to lecture until the time of his death at 81.

In order to overcome a bad childhood stutter, Dr. Leake took up public speaking at Princeton (where he won a major debating contest) and went on to lecture to students for six decades. Blessed with almost total recall, he could write on the blackboard a chart of important names, dates, and achievements in the history of medicine, then turn his back to the writing on the wall and lecture verbatim with "cosmic enthusiasm" to his audience. Addressing such issues as the public understanding of science and its impact on society, he helped generations of young science writers to learn how to report in everyday language their medical findings.

Considering his popularizing of science and medicine for students and the lay public "one of his most lasting achievements," Dr. Leake wrote seventeen books (beginning in the 1920's with popular versions of Harvey's Circulation of the Blood and Percival's Medical Ethics) and some six hundred articles, among them a study in the 1930's of an Egyptian medical papyrus[2] which had been a gift to the University of California from Phoebe Apperson Hearst. Although, according to Dr. Gert Brieger, he had written no thesis for either his A.B. or Ph.D. degrees, he was a long-term member of the American Association of Science Writers. And, although he had no medical degree, he was in charge of the school of medicine at Galveston, Texas, for thirteen years

[2]This work was reported in the second series of the Logan Clendening Lectures and was subsequently published in 1952 as The Old Egyptian Medical Papyri by the University of Kansas Press.

(1942-55). In his later years he wrote with the insights of age and a life fully lived, What Are We Living For? in three volumes: I. The Ethics (1972); II. The Logics (1974); and III. The Esthetics (1976).[3]

Holding many offices, Dr. Leake served as President of the History of Science Society (1936-39), of the History of Medicine Society (1961-62), and of science's highest office: President of the American Association for the Advancement of Science (1960-61).

Somehow among the activities of his busy life he found time for the arts. A dedicated Bohemian, he wrote both public and private poetry for Club activities and showed a dramatic flair for the lighting of various Club productions. The morning of the day he died he (a dedicated conservationist) was walking about in the lobby of Moffitt Hospital at the University of California Medical Center removing outdated notices. That evening at the Bohemian Club in San Francisco he read from his poetic writings. Following an extended ovation after "An Evening With Chauncey Leake", he suffered a ruptured aortic aneurysm. Taken to UCSF, Dr. Leake died early morning, January 11, 1978, following by eight months the death of Elizabeth, his wife of nearly sixty years.

His colleagues remembered him well and fondly. Scribbling in pencil next to a photograph of Dr. Leake in a 1943 Dallas newspaper, Dr. Langley Porter wrote, "one of my best boys." Stressing again and again Dr. Leake's "love of life", others eulogized him on several formal occasions. Chancellor Francis Sooy, thinking of his own student days on the campus in 1938 when Chauncey Leake was on the faculty, spoke of him as "truly the intellectual, moral and spiritual conscience of the San Francisco campus." Former Chancellor John B. deC. M. Saunders recalled his "warm and generous" friend who was "always willing to draw attention to the achievements of others, to encourage and praise students for good

[3]For this information I am indebted to the sons of Dr. Leake.

work.... [He] never uttered an unkind word, for he held human values too high."

The notion of how the paths of two such seemingly disparate individuals as Chauncey Leake and Bernard Zakheim might happen to cross in the early 1930's deserves a brief comment here.

Dr. Isabella Perry, a pioneer woman research pathologist at UCSF, had met Zakheim when he was about to paint the fresco Community Spirit in the Alemany Health Center.[4] Years later, in 1973, she wrote a remarkable account to a correspondent named Janet:

> I can tell you exactly how the murals began--they began one Sunday morning in early June [1934] in the living room of my house on Cole Street--[Beniamino] Bufano and Zakheim were there talking about the WPA (?)[5] murals nearly completed in Coit Tower. Bufano said the only thing fit to survive in our civilization is medical practice and science. [I] asked, "Why don't you and Zakheim do under WPA companion pieces of Ancient and Modern Medicine for our Medical School?--Both agreed.
>
> I made an appointment with Dr. Leake to meet them and discuss this proposition--I don't like politicking and Leake is adept at it.--Things clicked and the work was authorized for Zakheim. I suppose Leake rightly surmised that two prima donnas was (sic) too much for him to handle at one time.

A curious fact remains unexplained, however. In all the extensive bibliographical lists and in all his archival materials, Dr. Leake never published any identification of his authorship of two very authoritative booklets which indeed he wrote and published anonymously. One is a description of the two frescoes by Bernard Zakheim depicting ancient and modern medicine which used to adorn Cole Hall in the old Medical School building (razed in 1967): "The Opportunity for Pictorial Art in Modern Medicine: An Example in San Francisco".

---

[4]For SERA--State [of California] Emergency Relief Administration--(April 1934-July 1935).

[5]Actually the PWAP--Public Works of Art Project (November 1933-June 1934).

The other is the preface and the summary for "California's Medical Story in Fresco: An Illustrated Account of the Fresco Decorations on the Walls of Toland Hall, University of California Medical Center, San Francisco" (1939), with a note on the inside cover stating: "The publication of this illustrated account of the Toland Hall Murals at the University of California Medical Center was arranged by one who is interested in staff and student response to the project. One thousand copies have been printed for private distribution." (Years later Dr. Leake signed the artist's daughter's--and present author's--copy: "Issued by C.D. Leake, 1939".) Why the anonymity connected with a project to which Dr. Leake obviously felt very close? One might conjecture that the seeds of dissent and controversy might have been sending up very tender tendrils even as the frescoes took shape during the four years that the artist devoted to their execution. Already there was uneasiness in some quarters that Zakheim's strong style (unexpectedly labeled "grotesque" in one letter) and his strong and rather unorthodox--for that time--portrayal of California history (e.g., the role of the California missions, of the Catholic church, of the treatment of Indians, of early prominent San Francisco doctors and events like the outbreak of plague, and even some recognizable contemporary portraits in the murals) might cause trouble for UCSF. There were factions among the faculty that felt the murals were out of place in the hall, seemed a distraction from the lectures, and appeared too overwhelming for the average viewer. Nine years after their completion, certain members of the academic staff accomplished the supreme act of censorship: the covering by wall paper of the ten panels in Toland Hall. The frescoes languished thus for some fourteen years, until Dr. Leake returned to the campus after an absence of twenty years.

Dr. John B. deC. M. Saunders as Provost (later Chancellor) had quietly ordered the uncovering of the frescoes in 1962. Gradually Dr. Leake helped repair the "psychic" damage, paved the way for the reappearance and restoration of the murals in 1977 and by now publicly acknowledged his connection with the inspiration for the Zakheim's fresco mural projects in old Cole and Toland Halls.

Dr. Leake's original faith has been validated, for time has vindicated both the subject matter and expressionistic style of Bernard Zakheim in the frescoes. In today's eclectic art world these works seem both tame and timely--and certainly prophetic, as we shall see. And Dr. Leake has emerged a hero--with a 101 X 201 mural in the Ambulatory Care Center at UCSF painted in 1976 by the summer students of the Lincoln High School Creative Arts Project under the supervision of local painter and sculptor Ruth Asawa in which Dr. Leake figures prominently. There is even an Environmental Day celebrated in his name every spring at UCSF!

The University of California, Medical Department

Historic Manuscript
Edited by Robert S. Sherins, MD
UCSF School of Medicine, Class of 1963

In the course of researching material for this manuscript, I came upon documents about the earliest graduating classes at UCSF.[10] It was the story of ***Lucy Maria Field Wanzer*** that first captured my attention. She not only graduated from the first class of UCSF School of Medicine, but also she was the first woman graduate. Additionally, I have been able to assess the number of women graduates every year since the founding of the Toland Medical College in San Francisco in 1864 and the formation of the University of California Medical Department following the gifting of the Toland Medical College to the Regents of the University of California in 1873.

The life of Dr. Lucy Wanzer was so inspiring to me that I decided to publish an updated iteration of her biography. A post-script also has been added that summarizes my analysis of the women graduates of UCSF School of Medicine, "UCSF School of Medicine Gender Trends: 1864-2012."

First woman graduate, UCSF[11]

As a child in 1840s Wisconsin, ***Lucy Maria Field Wanzer*** played nurse to her mother, who was ill with lung fever (tuberculosis). It was then that she realized she wanted to be a physician.

But, it was many years before Wanzer's dream was realized. Her parents prized education and she received excellent schooling. When her family moved to California in 1858, Wanzer supported the entire family as a dressmaker, teacher and postmaster. In 1865, at the age of 23, she married county clerk James Wanzer. But she divorced him three years later, determined to take steps toward fulfilling her plan to become a doctor. For the next six years she prepared financially by teaching and saving pennies to pay for medical school. At the same time, she prepared mentally by studying Latin, French, algebra and literature.

Finally, at the age of 33, Wanzer applied to Toland Medical College, which had just come under the administration of the new University of California Department of Medicine. She was rejected because of her gender. But, she appealed and after four months won admission because the Regents could find no reason to bar her entrance,

as the law creating the state university provided for the education of both sexes.

The dean, opposed to her admission, encouraged the male students to haze Wanzer. One professor told her that a woman had no business studying medicine. "If she does, she ought to have her ovaries removed." Wanzer quietly replied, "If that is true, the men students ought also to have their testicles removed!" Impressed by the young woman, the famed physician Beverly Cole, MD, offered to be her mentor.

When Wanzer graduated in 1876, Cole presented her name for membership in the San Francisco County Medical Society. A blackball was threatened, but when he did not withdraw her name, she was accepted as the first woman member. She opened her first medical office in gynecology and obstetrics on Geary Street. Wanzer also specialized in pediatrics and was one of the founders and original directors of UCSF Children's Hospital.

Fortunately, the Constitution and By-Laws of the Alumni Association of the Medical Department of the University of California were discovered in the UCSF archives. A copy of the 1885 iteration has been preserved at UCSF in the Lucy Wanzer' files. Dr. Wanzer was an astute woman and way ahead of time. Dr. Wanzer's election to the San Francisco Medical Society in 1876 was followed a decade later when she was elected to the Office of the Vice-President of the Alumni Association in 1885-86. It was no surprise to see her name listed among the officers as Vice-President of the Alumni Association in 1885-1886. Lucy Wanzer was a respected physician and obstetrical surgeon in San Francisco, but she did not have the right to vote until August 18, 1919, after the 19th Amendment to the U.S. Constitution was ratified by Congress.

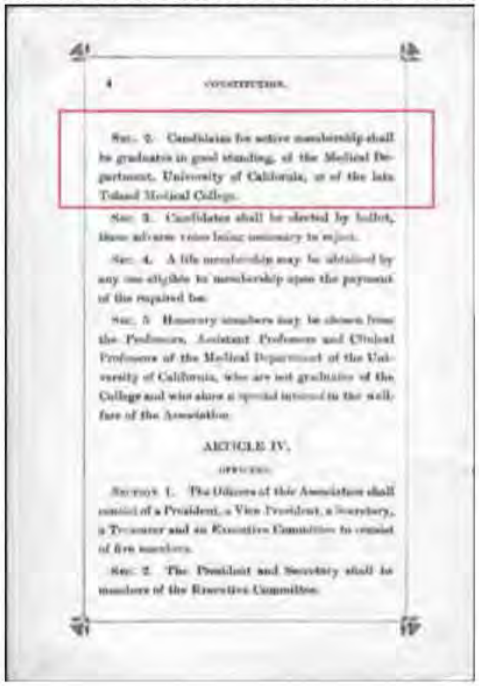
The following illustration from the Constitution of the Alumni Association, page 4 (Article III, Section 2), confirms the merging of all the medical students from ***"...the Medical Department, University of California or of the late Toland Medical College."***



4 CONSTITUTION.

SEC. 2. Candidates for active membership shall be graduates in good standing, of the Medical Department, University of California, or of the late Toland Medical College.

SEC. 3. Candidates shall be elected by ballot, three adverse votes being necessary to reject.

SEC. 4. A life membership may be obtained by any one eligible to membership upon the payment of the required fee.

SEC. 5. Honorary members may be chosen from the Professors, Assistant Professors and Clinical Professors of the Medical Department of the University of California, who are not graduates of the College and who show a special interest in the welfare of the Association.

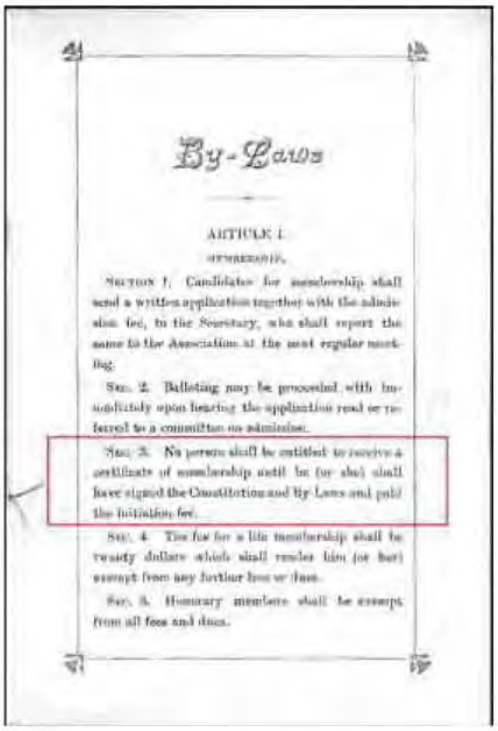
ARTICLE IV.

OFFICERS.

SECTION 1. The Officers of this Association shall consist of a President, a Vice President, a Secretary, a Treasurer and an Executive Committee to consist of five members.

SEC. 2. The President and Secretary shall be members of the Executive Committee.

Proof of the acceptance of female physicians as full members of the Alumni Association was confirmed in the By-Laws, Article I, Section 3.



By-Laws

ARTICLE I.

MEMBERSHIP.

SECTION 1. Candidates for membership shall send a written application together with the admission fee, to the Secretary, who shall report the same to the Association at the next regular meeting.

SEC. 2. Balloting may be proceeded with immediately upon hearing the application read or referred to a committee on admission.

SEC. 3. No person shall be entitled to receive a certificate of membership until he (or she) shall have signed the Constitution and By-Laws and paid the initiation fee.

SEC. 4. The fee for a life membership shall be twenty dollars which shall render him (or her) exempt from any further fees or dues.

SEC. 5. Honorary members shall be exempt from all fees and dues.

Dr. Lucy Maria Field Wanzer (1841-1933)
First Woman Graduate of a Califomia Medical School and Grande Dame of San Francisco's Medical Community[12]

It was the suffering and poor health of both her parents that led Lucy Maria Field Wanzer to her history-making career as a physician. Lucy Maria, the first of six children of Storer and Lucy Ann Field was born on October 11,1841, in Milwaukee, Wisconsin. When Lucy was still quite young, her father was advised to move to Madison for his health, and her mother became ill with what was called lung fever (tuberculosis). In spite of the family's health problems, education was prized and Lucy received excellent schooling in Madison and Hartford, Connecticut.

In 1858, the Field family moved to California, again for health reasons. Lucy supported the entire family upon their arrival in Oakland as a dressmaker and later by teaching at Temescal School. A year later, the Fields moved to Santa Cruz where Lucy's father opened a general store and was appointed postmaster. Although her father held the title officially, Lucy actually filled the postmaster position and drew the salary-an acceptable practice at the time. She also took over the operation of the telegraph office nearby when that position became vacant. Despite her success at work, Lucy Maria Field Wanzer did not lose sigh t of her desire to become a physician and engaged private instructors to study Latin, French, algebra and literature.

In 1865, at the age of 23, Lucy Maria married county clerk, James Wanzer, but divorced him three years later determined to take steps towards fulfilling her plan to become a physician. For the next six years Lucy Maria Wanzer taught in Santa Clara and San Francisco to earn enough money for her medical education. Finally, at the age of33 and with excellent credentials and the backing of influential friends, Lucy Maria applied to Toland Medical College in San Francisco, which had just come under the administration of the new University of California. Her admission was summarily rejected by the medical school because of her sex. It was then that her two advisors and allies, John Swift and Rev. Horatio Stebbins, both Regents for the University, engaged their attorneys and demanded that her case be reviewed. Four months later her rejection was overruled on the finding that the charter of the University provided for access to education by both sexes, and that the Medical Department was an integral part of the University. This landmark decision has since provided opportunities for many women medical students who followed in Lucy Maria's footsteps.

Once at Toland Hall, Lucy Maria Field Wanzer faced prejudicial attitudes and hazing by the male students, some of which was directly encouraged by the Dean in an effort to force her to resign. But she also had supporters and friends among the faculty and students and a great deal of confidence in herself and her mission. Dr. Hugh Toland, medical school founder and then Professor of Diseases, welcomed Lucy, but felt she would be shocked by working in the venereal disease wards. She replied, "I know the work is hard, but I want to see everything, otherwise I would not be fit to be a medical student." When she first visited the eye disease ward, another physician told her that "a woman had no business to study medicine; that if she did she ought to have her ovaries removed." She replied, "If this were so, then the men students ought to have their testicles removed."

The famed physician, Dr. Beverly Cole, was very impressed with Lucy Maria and became her mentor, a move that served to dispel further prejudicial actions by any other faculty members. Some hazing incidents followed, including one in which fellow students rearranged the dissecting room, and when she entered the next morning to work, she found they had positioned the cadaver in a manner calculated to shock and embarrass her. It did not; she ignored the whole prank and continued her work as if nothing had happened. From that day on, Lucy Maria Field Wanzer pursued her medical education without further incident, having won the respect and admiration of students and faculty alike.

In November of 1876, Lucy Maria graduated with an excellent record and proudly received her medical diploma. Shortly thereafter, Dr. Beverly Cole presented her name for membership in the San Francisco County Medical Society, and she

[12] From the Oakland Exhibit, August to December 1888, submitted to Dr. Robert Sherins by Margaret Hughes, Assistant Archivist, UCSF Archives and Special Collections: http://www.library.ucsf.edu/collections/archives.

became its first woman member. The doors were then opened to other distinguished women physicians featured in this exhibition.

Dr. Wanzer's first medical office was at 130 Geary Street where she had six rooms. Gradually her practice expanded from treating poor women from Tar Flat to society matrons' servants, and ultimately to the society matrons themselves. She also became associated with The Pacific Dispensary for Women and Children and continued clinical work there when it became San Francisco Children's Hospital. By the end of the 19th century, she had moved her private offices to 2970 California Street, a few doors down from the hospital.

As an honored guest at the dedication of the new University of California Medical Center in 1898, Dr. Wanzer was pleased and amazed that 22 women were studying medicine that year, and that women had graduated in each of the 22 years since her own historic graduation in 1876. At a dinner in 1924 on her 83rd birthday, honoring Dr. Lucy Maria Field Wanzer's remarkable accomplishments and long and successful career, Dr. Emma Merritt spoke of "her unflagging zeal to duty, of her many deeds of charity, and of her rare devotion to the cause of women in medicine. " Dr. Merritt ended her speech by saying, "possessed of all her faculties, may she live to be a 100”. Dr. Lucy Maria Field Wanzer almost made it, living until she was 93 years old.

From: Women Physicians Banquet, San Francisco, 1924
Honoring Dr. Lucy Wanzer's 83rd Birthday

ADDRESS DELIVERED BY DR. EMMA L. MERRITT AT A BANQUET GIVEN BY WOMEN PHYSICIANS, OCTOBER 11, 1924, IN HONOR OF THE EIGHTY-THIRD BIRTHDAY OF DR. LUCY MARIA FIELD WANZER.

Women in medicine have come into their own in California to a degree probably not equaled elsewhere. There cannot be, of course, a set line in the practice of medicine, and all fair-minded persons have long since recognized that fact. That it is a fact in practice, at least in California, was well demonstrated when the American Medical Association was our guest. For that great convention the women physicians themselves requested to serve on mixed committees rather than have separate committees.

*It is interesting and significant in medical progress that more than three score women physicians recently gathered at the banquet table to eulogize Doctor Lucy Maria Field Wanzer, one of the pioneer women physicians. It was at this banquet that Doctor Merritt presented the following bit of medical history.—*THE EDITORS.

IT WAS in the year 1873 that our revered and honored guest of the evening applied at Toland College for admission as a medical student.

You women of the present day do not realize the struggles and hardships undergone by the women who first tried to get a proper medical education. To have lived in the time of those of us who are over 60 has been like living in a dream, so unreal and extraordinary have been the changes that we have seen.

The struggle to practice medicine was only a branch of the great struggle for the general enfranchisement of women. To get even a higher education, with no thought of making use of it outside the home circle, was considered unwomanly, and she who possessed any degree of learning was ridiculed as being a blue-stocking.

I was not one of that pioneer medical group. By no time the path had already been blazed and made easy, but I am old enough to have had the privilege of knowing many of these brave women—Dr. Emily Blackwell, Dr. Maria Zakrzewska, Dr. Alida C. Avery, Dr. Helen Webster, Dr. Mary Putnam Jacobi, and others who had immediately followed them in the East; in this state I knew Dr. Buckle, Dr. Curran, Dr. Follansbee, Dr. Charlotte Blake Brown, and the first woman to graduate from a California Medical College and the first to enter the San Francisco Medical Society—Dr. Lucy Maria Field Wanzer.

Toland College was at the corner of Stockton and Francisco streets, the City and County Hospital down a street by the side of it. Dr. Toland had donated the college to the University of California. About one year after it was turned over, Dr. Wanzer, together with her friend, Miss Mary Frazer McDonald, applied for admission.

They had two friends to advise them, Mr. John Swift and Rev. Hurlbut Stebbins, regents of the university, who [illegible] nothing, but first to apply to the Medical Department, and if they were turned down, then to apply to the regents. They sought the Medical Department, and were refused. They then went to the regents, who referred the matter to their attorney, who looked it up and said there was no law against it, as the organic law of the state was that both sexes were to be educated if they so desired in the university, and as Toland College was an integral part of the university, the two women could not be kept out. Four months had been consumed in arriving at this decision.

Miss McDonald did not go in. She got tired of waiting—Cupid took her off. She got married and that ended her medical career. Dr. Wanzer told her it was an awful thing thus to desert her, but once her path has been clearly defined, Dr. Wanzer has never been known to turn aside, whatever the obstacles. She is born of fighting stock—her mother of New England revolutionary ancestry; her father of early Colonial period.

Her father as a boy apprenticed himself to Jones, a watchmaker and jeweler in Greenfield, Massachusetts, where he learned his trade. In 1837 he took to Milwaukee, then little more than an Indian village, a stock of cheap jewelry, showy brass beads, glass beads and the like. He was so successful in selling these to the Indians, that Jones finally broke up his business in Greenfield and moved to Milwaukee, where Storer Field married his daughter Lucy Ann and where their first child, Lucy Maria, was born October 11, 1841.

Field continued in the jewelry business till he fell ill, and was advised by his physician to seek life in the open. He became a farmer in Dane County, six miles out from Madison, where the howling of the wild wolves could be heard outside their house, built of rude logs, and with blankets at the openings for doors. He was justice of the peace for Dane County and member, from there, to the legislature.

Her father declared his girls must be capable women. So at the age of 10 Lucy was sent to her mother's sister, Mrs. Brooks, who lived in Milwaukee, to school. Afterwards she went to Madison to boarding school; later to Hartford, Connecticut, where she graduated from the high school. She would go no higher because college courses were not open to women at that time.

The mother was ill in those days, of what was called lung fever, and many a time the little daughter mounted a box and kneaded the bread for the baking under the mother's direction from her sickbed. She nursed her mother as well. Her mother would praise her for the care. The little girl thought how fine it would be to do things when anyone was suffering. And the years of her mother's illness to follow, as likewise that of her father, only served to feed the flame of her desire some day to become a physician.

In 1858 the family came to California on account of the mother's health; eight in all—the parents, two brothers, and four sisters. The father's money was pretty well gone. He could find nothing to do and was much discouraged. So Lucy, then in her seventeenth year, took the burden of support upon herself by making sleeves in a [illegible] shop till she got a position teaching in the public school at Temescal, in Oakland, about where Idora Park now is.

The parents moved to Santa Cruz. The father opened up a general store, with one corner parti-

tioned off for the postoffice. He had been appointed postmaster. Though he was officially such, Lucy filled the position and drew the salary.

All the time she was working she was studying. She had private instructors in Latin, French, literature, algebra. She took Latin under a Presbyterian clergyman. Likewise she was saving up money some day to become a physician.

Walter Thorne, afterwards Dr. Thorne, and Lewis Glass had at the time a telegraph office in their drug store. They wanted to give it up so Lucy, to add to her income, took it over.

She was 23 years of age when she married. She became a teacher in the public school at Santa Clara

Lucy Hobbs Palm Wagner

and finally the Lincoln grammar school, the best known boys' school at that day in San Francisco.

And now at 33 she stood alone—the one woman in the whole state of California demanding admittance to Toland College.

She went in prepared for trouble, but she did not care. The dream of her life was about to be realized. Some of the professors welcomed her, but the dean told the class that a woman was going to appear and for them to have her on the "build 'em up." "Of course, she will complain. We will tell her we are very sorry, but we cannot lecture to two classes. You are the women we are going to start in on."

The first day she spent from 8 to 12 going through the hospital. Before she got through some of the boys were edging away and pulling other boys to one side, so she could see the patients. But some of the "last links" were trying to carry out the dean's instructions.

The first clinic was a medical one by Dr. Bates. He had a Southern way with him, and he made a nice speech when she entered. That gave her a little standing with some of the boys.

Then came Dr. Toland's clinic. She followed him through one of the wards, and then came the syphilitic and gonorrheal ward. He thought perhaps that was too strenuous, that perhaps she would not care to go, but she said, "Oh yes, doctor, I know the work is hard," but she told him she wanted to see everything, otherwise she was not fit to be a medical student.

Then she saw Dr. Martinache and the eye ward. Dr. Martinache told her a woman had no business to study medicine; that if she did she ought to have her ovaries removed. She replied if this were so that the men students ought to have their testicles removed.

Dr. Beverly Cole had the obstetrical clinic. He sent for her, told her he would not like to place her in an unpleasant position, but that he could not be sure to a mixed class without making it very embarrassing to her; that as he was about to commence his course, it she thought best he would excuse her. She told him she wished to be excused from nothing. He was rather pleased, and said if she wanted a preceptor he was perfectly willing for her to be his student. She asked him, "What would be the expense?" He said it would be nothing, but that he could give her advantages that he could not give a young man. So when there was no lecture going on she was in his office. Sometimes he would give her the most trying things to do and would think it a joke. No matter what it was she did it.

She was dissecting for hernia when the boys decided it was about time to haze her. The next morning when she went to the dissecting room she noticed an unusual number of students around. The cadaver had been arranged in a manner that they thought would shock her very much. She took no notice of it and went on working as if nothing had happened.

Then came one of the students' birthdays. The boys planned to give him beer enough till he fell asleep. They then carried him after dark into the dissecting room and tied him onto the table. About midnight he woke up and screamed so, the whole neighborhood was aroused. It created such a commotion the faculty had to take note of it. They sent for every student, herself among the number. She told them she was not a detective. The students afterwards said they thought that every woman would faint. That sort of made a comradeship between them, and by the time she graduated there was not one who would not do anything for her.

She graduated in November, the Centennial year, 1876. Dr. Cole presented her name to the California Medical [illegible] as the first woman to graduate in medicine on the Pacific Coast. She was advised to withdraw her name. She replied: "My name stands; blackball me if you will." They put her name through, the first woman ever presented. There were previously two

Charlotte Blake Brown had applied for admission, but her name was withdrawn before the time came for voting.

Dr. Warner set up immediately an independent office over a plumbing shop at 130 Geary street, right opposite where the City of Paris is now.

She had six rooms for about $45 a month, and rented out three for $15, with the understanding that the tenants must clean up the office and answer all calls that might come.

When she graduated the papers were full of all sorts of nonsense, ridicule, and praise, and her friends told her she would make a great success, and that they would help her. But very few sent other than their servant girls. At first she had to practice among the very poorest persons from Tar Flat. Gradually she got a better class. When the mistresses found their servant girls did not die, they came themselves.

That same year she entered the Pacific Dispensary. It was in the basement of the Synagogue on Taylor street, near Post. The next year the dispensary started the Hospital for Children on Post street, between Stockton and Dupont. They had four beds.

Dr. Warner remained on the staff of the hospital till the University of California took it over and made a teaching institution of it.

Twenty-two years after her graduation, Toland College was moved to its present site on Parnassus avenue. At the dedication, Dr. Warner was amazed at the number of women studying medicine in the building—twenty-two—and each year they had been graduating them for twenty-two years.

Tonight we are over sixty women physicians assembled to do her honor to show our appreciation of her unflagging zeal to duty, of her many deeds of charity, and of her rare devotion to the cause of women in medicine, which has done much to bring about the standing and success of the present-day woman physician.

She was beyond any professional jealousy, which all too often for a personal aggrandizement lessens another's achievements. She always tried to help other women up the ladder, and to push them forward beyond where she had been able to go. She took them to see her cases; she rejoiced in their four years as against her two; their European advantages as against her local; their internships in a hospital, even their professorships in the medical school, as against her struggle to enter.

Possessed of all her faculties, may she live to be 100.

From: the San Francisco Medical Society, Vol 3, No. 11, November 1930:

Vol-3, No 11, November 1930

BULLETIN OF THE SAN FRANCISCO COUNTY MEDICAL SOCIETY

LUCY MARIA FIELD WANZER

On October 13, 1930, Dr. Lucy M. F. Wanzer died at her home on California Street at the age of 89 years.

Born on October 11, 1841, in Milwaukee, Wisconsin, she came to California with her parents in 1858, and in order to assist in the maintenance of the family she began making laces in a dress making shop until she obtained a teaching position in the public schools to this end.

Later the family moved to Santa Cruz, where her father was appointed postmaster. Lucy Field did the work and drew the salary, studying at the same time Latin, French, algebra and literature. She was also saving money to study medicine, toward which her interest had turned as a result of the long illness of her mother. At 23 years of age she married.

In 1873 she applied for admission to Toland Medical College, which had shortly before been given to the University of California by Doctor Toland. She was refused admission to the school by the Medical Department, but the regents of the university could find no bar to her entrance, as the law creating the state university provided for the education of both sexes. It took four months to arrive at this decision.

After some difficulties with some of the faculty and students, who did not believe in women in medicine, she won the liking and respect of all and graduated in November, 1876.

Dr. Beverly Cole presented her name to the County Medical Society where a movement was begun to refuse her admission. When advised to withdraw her name she replied that her name stood and they could blackball her if they wished. She was accepted—the first woman to be voted upon by the Society.

She immediately opened an office over a plumber's shop at 130 Geary Street and began her practice, which became a large one.

She served in the Pacific Dispensary when it was in the basement of the synagogue on Taylor Street near Post and she was on the staff of the Children's Hospital for many, many years.

The first woman to enter and graduate in medicine in the University of California, she lived to see women take a great part in medical practice and her effort was always to help them further along their chosen road, rejoicing in the added advantages given to women physicians by the passing years. San Francisco and medicine lost, in her passing, a loved and respected woman and physician upon whose life we can look with deep appreciation of its devotion to duty, charity and the advance of women in medicine.

History Of The Palace Hotel

We are the 100th graduation class of the UCSF School of Medicine. As you have read, the origin of UCSF School of Medicine began in 1873 having taken over the role of the Toland Medical College. It is precisely the 140th anniversary of our medical school, because the date of origin was April 1, 1873. The 50th Reunion gala of our Class of 1963 was held at the famous Palace Hotel of San Francisco on April 27, 2013. As a result of my research, I learned how famous the hotel had been in our medical school history. Archival documents from the University of California Department of Medicine were uncovered that revealed the long-forgotten secret that the ***first school banquet of the graduating Class of 1896 also was held at the Palace Hotel in 1896***. The venue was that of the original Palace Hotel, which was destroyed by fire after the great earthquake of 1906. So far, only two records have been discovered regarding that occasion: a photo of the graduation class of 1886 and the elaborate menu from the Palace Hotel banquet of the graduation Class of 1896. However, there are some fascinating historical records about the hotel that I wish to share.[13]

From Gray Brechin, "Historical Essays":
"…William Ralson's Palace Hotel was to be the opulent capstone of his career and ego. When completed in 1875, it was quite literally the grandest hotel in the world." It was said that the Palace Hotel compared to the finest hotels of Europe and much of California's business had been conducted from the hotel's grand bar. The following illustration of Market Street in 1865 shows the location of the future hotel.

Site of Future Palace Hotel, Market Street
San Francisco, 1865

By the time that the Palace Hotel was completed and ready for occupancy in 1875, horse-drawn carriages still were the mode of conveyance of the hotel's guests. As such,

[13] Victorian San Francisco Essay: Gray Brechin. Illustrations from the Bancroft Library, University of California, Berkeley, California.

they created a carriage entrance and unpaved lane through the hotel. The carriage lane corresponds to the present lengthy carpeted concourse that one traverses. In its heyday, the carriage lane brought the finely adorned ladies to the protected hotel entrance where the famous garden restaurant is presently located under the elegant glass ceiling. The following illustration depicts the "trolley" rails on Market Street, which was still unpaved. The "trolleys" were horse-drawn.

Palace Hotel, Market Street
San Francisco, 1876

Palace Hotel Carriage Entrance, Circa 1880s. The trolleys on Market Street were motorized with electric engines.

The original Palace Hotel was destroyed by fire following the San Francisco earthquake in 1906. It was rebuilt and opened for occupancy on April 20, 1909. Sadly, the remaining

bricks and debris was transported to the Marina and used to fill-in the bay for further development.

First Class Reunion at the Palace Hotel, 1896.

UCSF School of Medicine, Graduation Class, 1886
https://digital.library.ucsf.edu/archive

From the limited number of archival records available, the photo illustrated above was obtained of the celebration at the Palace Hotel in 1896. Shown are 4 female doctors at the 10th Reunion of the ***Class of 1886***. No other records were found listing their names or medical specialties of this elegant group of men and women physicians. The graduating class was the guest of the University of California Alumni Association.

Not only did the graduating doctors know how to dress in the most fashionable attire, but also they were gourmands and knew how to dine with sophistication. They feasted at this sumptuous banquet upon caviar, hors oeuvres, Coquille and Cresta Blanca wine. There were bass, lamb, veal and chicken entrées with a Claret wine served with all the trimmings. Desert included fresh fruit, petit fours, biscuit tortoni and black coffee. In keeping with the elegance of the occasion, the menu was printed in French. The only item missing from the menu were Havana's best cigars. I hope that those fine gentlemen offered the ladies a cigar… Trés chic!

UCSF School of Medicine
Gender Trends: 1864-2012

Robert S. Sherins, MD
July 24, 2013

Data excerpted from the UCSF School of Medicine enrollment/graduation records revealed exceptional information regarding the gender trends of the School of Medicine.

In 2014, UCSF will celebrate the Sequa-Centennial anniversary of the School of Medicine. In the 1920s, the U.C. Regents determined that the official date of origin of the School of Medicine would be 1864 – the date of origin of Toland Medical College in San Francisco. In 1873, Dr. Hugh Toland gifted the Medical College, which included faculty, students and property, to the Regents of the University of California, then called the ***U.C. Medical Department***. The facilities were located downtown near the SF Embarcadero and across the street from the San Francisco City and County Hospital at Stockton and Francisco Streets.

- UCSF School of Medicine graduates, 1864 -2012:
  - Total 10,916
  - Men 7557
  - Female 3559

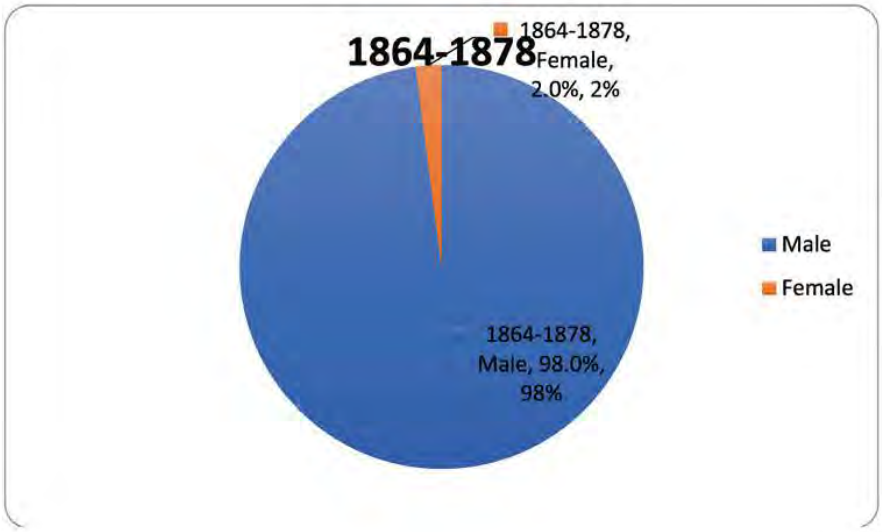
  - Total 98
  - Men 96
  - Women 2

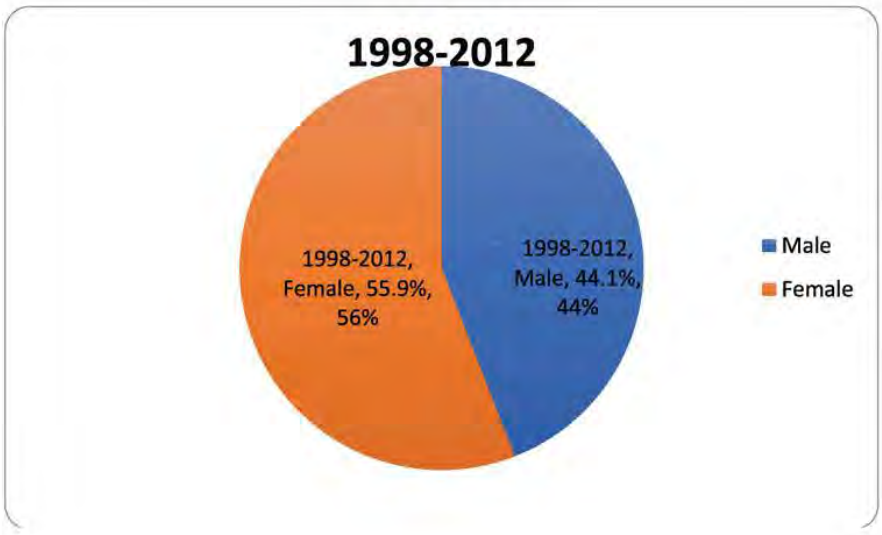
- UCSF School of Medicine graduates, most recent 15-years, 1998-2012
  - Total 2591
  - Men 1143
  - Women 1448

The following data and graphics show the calculations and ratios of the men and women at UCSF School of Medicine.

Group	Percent	Number Graduates 1864-2012
Total	100.00%	10916
Male	69.23%	7557
Female	30.77%	3359
		1998-2012
Total	100.00%	2591
	1998-2012	

Male	44.1%	1143
Female	55.9%	1448
		1864-1878
Total	100.00%	98
	1864-1878	
Male	98.0%	96
Female	2.0%	2





K

My calculations from this data showed the important trends:

- oK Pioneer women graduates of the UCSF School of Medicine gained professional status 5-decades before women received the right to vote in America (19th Amendment to the US Constitution August 18, 1920).

- oK Comparing the first 15-years (1864-1878) to the last 15-years (1998-2012) at the UCSF School of Medicine, demonstrated a remarkable gain in equality of female admissions. In fact, female graduates in the most recent 15-year period exceeded males by 27% (female = 1448; male = 1143).

Bridget Biddy Mason

Former Slave
Attained California Real Estate Wealth
Nurse, Mid-Wife, Assisted Dr. John Griffin, Los Angeles
Attended Shooting Victim James King, San Francisco

From Slave to Millionaire Philanthropist: The Biddy Mason Story

BY DAVE ROOS FEB 1, 2019

As a slave, Biddy Mason trekked 1,600 miles on foot across the U.S. while herding livestock and nursing a baby. JUNKYARDSPARKLE/WIKIMEDIA/HOWSTUFFWORKS

On Aug. 15, 1818, a baby girl named Bridget was born into slavery in Georgia. She was sold as an infant to new masters who called her Biddy. When Biddy turned 18, she was presented as a wedding gift to Robert Marion Smith and his wife Rebecca in Mississippi. This was the life of an enslaved black woman in the Deep South. She was property to be bought, sold, punished and even violated if the master so pleased.

But Biddy's story is different. It's the story of a strong and humble woman who endured terrific hardships before bravely fighting for her family's freedom and winning. Biddy's story takes us from the muggy cotton fields of Mississippi to the frontier boomtown of Los Angeles, where Biddy becomes one of the city's most sought-after midwives and parlays her earnings into a small real-estate empire.

But before we arrive at that happy ending, there are decades of degradation to endure and thousands of miles of country to cross. In Mississippi, Biddy lived the typical life of a slave woman. She was expected to labor in the cotton fields, but also assist in the home, primarily as a midwife during the births of Rebecca Smith's six children. Biddy likely learned the duties of a midwife — which included the use of medicinal herbs and basic nursing skills — from fellow slaves steeped in traditional knowledge.

Robert Smith was an early convert to the fledgling Mormon faith and in 1847 decided to relocate his family, including his slaves, to the Utah Territory. By this time, Biddy had three daughters of her own. While the Smith family traveled in wagons and on horseback, Biddy walked behind, tending the livestock. For seven months, she trekked the 1,600 miles (2,754 kilometers) from Mississippi to Utah with her 10-year-old daughter, 4-year-old daughter and an infant on her breast.

The Smiths stayed only a few short years in Salt Lake City before setting out for San Bernardino, California, in 1851 where the Mormon church was building a missionary outpost. California was the newest state in the Union, admitted in 1850 as a free state. The California Constitution was rare in its powerful denunciation of slavery, promising, "Neither slavery nor involuntary servitude unless for the punishment of crimes shall ever be tolerated in this state." During her time there, Biddy befriended other free blacks who told her about this law, although she seems to have been unsure as to whether it applied to her as she continued to serve the Smith family.

Enter the Cavalry

Nervous that the authorities would try to take away his 14 slaves, Smith moved his family and slaves to an encampment in the Santa Monica Mountains and planned an escape to slavery-friendly Texas.

But a cavalry led by Robert Owens, a black *vaquero* who owned several stables in Los Angeles, tracked Smith down and the local sheriff presented a writ of *habeas corpus* demanding that Biddy and her fellow slaves be released. Smith fought the decree and the case ended up in front of Judge Benjamin Hayes of the First District Court in Los Angeles.

Even with California's strong anti-slavery stance, the law was very much in favor of whites over blacks and other people of color. In fact, it was illegal for a person of color to testify against a white person in court. And Smith had bribed Biddy's lawyer not to

appear in court. Despite these unfavorable conditions, Judge Hayes took a particular interest in Biddy's case and met in private with Biddy and other Smith slaves to hear their side of the story.

A shot of Biddy Mason Park in Los Angeles on Spring Street.
JIM WINSTEAD/FLCKR/CC BY 2.0

Rather than accepting Smith's claims that the slave women and children were "members of his family" who left Mississippi on their own consent, Judge Hayes chose to believe Biddy, who confessed that she was terribly afraid to be taken to Texas. In a landmark decision heralded in California newspapers, Judge Hayes wrote that "all of the said persons of color are entitled to their freedom and are free forever."

Historian Dolores Hayden writes that Biddy's decision to stand up to Smith was an act of profound bravery.

To understand Biddy's courage in going to court against her master, it is first necessary to think of her lifetime in Mississippi, her complete immersion in the culture of the southern plantation, where physical torments such as whipping and being hosed down in brine would have been common punishment for both male and female slaves' minor infractions ... Any slave's loved ones could be put on the block — husband, wife, child — and sold, never to be seen again. In this context, all slaves' courage in risking a public test of white men's justice is striking.

Wealth and Service

One of the first things Biddy did as a free woman was choose a last name for herself. For the rest of her life, she was known as Biddy Mason. She and her daughters lived alongside the Owens family, who continued to be a terrific support and close friends. With the press coverage from the court case, Mason caught the attention of Dr. John Strother Griffin, a prominent white physician who offered her work as a midwife. Mason also acted as a nurse to inmates in the county jail.

A shot of Biddy Mason Park in Los Angeles on Spring Street.
JIM WINSTEAD/FLCKR/CC BY 2.0

With her decades of experience, she soon became one of the most in-demand midwives in Los Angeles, catering to the needs of both wealthy residents and impoverished new arrivals. After saving for 10 years, she followed the examples of Robert Owens and Dr. Griffin, both real estate investors, and bought a piece of land on the outskirts of town among the vineyards and orange groves.

Her homestead on Spring Street would become a refuge, not only for her growing family, but for all Los Angelenos in need of a helping hand. As she slowly amassed more wealth with investment properties, Mason freely gave to community members in need. In 1872, the First African Methodist Episcopal Church was organized in her living room and she put up the funds to pay the minister and pay the church's property taxes.

(The church now has 19,000 members.) In 1884, after flash flooding destroyed homes across Los Angeles, Mason opened a tab at the Spring Street grocery store and instructed the owners to provide free food to anyone who needed it, black or white.

As she grew older, she became lovingly known as "Auntie Biddy" or "Grandma Mason" throughout Los Angeles. By the time of her death in 1891 at age 73, she had amassed a fortune of $300,000(more than $8 million in 2019 dollars), which, as we saw earlier, she generously used to help others.

"If you hold your hand closed, nothing good can come in," Biddy Mason famously said. "The open hand is blessed, for it gives in abundance even as it receives."

Is that Biddy Mason in a UCSF Toland Hall fresco?

By Laura Voisin George

I first saw a photo of this mural during my Ph.D. research on U.S. Army Surgeon John S. Griffin. This remarkable scene shows Dr. Griffin being assisted by a black woman as he treats a soldier with malaria. While additional archival sleuthing is needed to definitively identify her, the assistant appears to be Biddy Mason. Beginning in 1856, she was employed in Dr. Griffin's civilian medical practice as a nurse, as well as being a renowned midwife and an expert in herbal medicines.

The image is one of ten frescoes on the walls of the Toland Hall auditorium, located on the Parnassus campus of the University of California, San Francisco. (A mural is an image painted on a wall or ceiling, while "fresco" refers to the technique of painting on wet plaster.) Together, the Toland Hall murals portray the history and development of medicine in California, from the healing practices of indigenous peoples through the first decades of the twentieth century. Toland Hall was built in 1917, and the murals were created between 1936 and 1938, with funding from the Federal Art Project, part of the WPA.

In 1934, at the height of the Great Depression, a group of San Francisco artists had lobbied for murals depicting contemporary San Francisco life on the recently-constructed Coit Tower. One of the artists who organized this local Public Works of Art Project, was Bernard Zakheim. Another Zakheim fresco, "Community Spirit" at the Alemany Health Center, inspired UCSF professor of pathology Isabella Perry to recommend the commissioning of Zakheim to paint murals in Toland Hall; this proposal was championed by UCSF professor (and medical historian) Chauncey Leake. Zakheim, a Jewish native of Poland, had been a prisoner of war during WW I and sought political asylum in the U.S., moving to San Francisco in 1920. Ten years later he met Diego Rivera, who – after creating

a series of large-scale public murals in post-Revolution Mexico City – painted a number of murals in San Francisco in the early 1930s. Zakheim subsequently studied with Rivera in Mexico, and also in Paris.

Zakheim was assisted in the Toland Hall frescos by the artist Phyllis Wrightson, whose sketchbook for the project captures her extensive research into California's medical history. In part, she relied on Henry Harris' *California's Medical Story* (1932). Wrightson also designed some of the details in the murals, transferred them to the auditorium walls prior to the application of the plaster, and did some of the painting.

But the murals were controversial. Zakheim's Social Realism style and left-leaning politics led to protests about the murals (as well as faculty comments that the murals distracted students from lectures in the auditorium). Following Dr. Leake's departure from UCSF in 1942, the murals were covered with wallpaper, which was subsequently painted. Leake returned to the campus in 1962 and worked to have the murals uncovered; they were restored in the mid-1970s by Zakheim's son Nathan.

Zakheim's description of the murals, particularly of the panel of the history of medicine in 1840s-1860s Southern California with Dr. Griffin and the African-American woman, did not mention Biddy Mason. So how and why was she included? A tantalizing clue is that George D. Lyman was among the collaborative team of UCSF doctors involved in the Toland Hall murals. Dr. Lyman wrote the "Foreword" of *A Doctor Comes to California: The Diary of John S. Griffin, Assistant Surgeon with Kearny's Dragoons, 1846-47*, which was edited by George Ames and published in 1943. Lyman served as the President of the California Historical Society and he had an extensive private collection of historical sources. Although Dr. Griffin's diary only extends to 1847, Lyman may have done further research about him, including Griffin's post-1856 collaboration with Biddy Mason. The photograph of this panel that I first saw is included in the first of Viola Lockhart Warren's

1954-1955 series of articles about "Dr. John S. Griffin's Mail, 1846-1853." Warren's work (after Lyman's death in 1949) is the most extensive biography of Dr. Griffin to date, and she refers to "Bitty Mason" assisting him by providing nursing care to new mothers. Warren was a lecturer in medical history at the University of California, Los Angeles from 1953 to 1958, and she was the wife of Dr. Stafford L. Warren. They both received their bachelor's degrees at U.C. Berkeley in 1918 and married in 1920. Stafford went on to complete a medical degree at UCSF in 1922 and he was named the first dean of the UCLA Medical School beginning in 1947. Viola Lockhart Warren's later research about Griffin suggests that the Warrens knew Dr. Lyman – and that Biddy's identity (if not the correct spelling of her name!) was known among the doctors involved with the Toland Hall murals in the 1930s. This awareness of Biddy's importance to medical history likely led to her inclusion in the mural.

Once COVID-19 restrictions allow libraries and archives to re-open, perhaps Phyllis Wrightson's sketchbook for the Toland Hall murals in UCSF Special Collections will confirm that the name of the woman portrayed assisting Dr. Griffin is indeed Biddy Mason. Yet even if there is no further information there, the documentation of Biddy Mason's work with Griffin and the connections among the doctors and lecturers consulting on the UCSF murals who were familiar with it, make a case for this being a representation of Biddy's role in the development of medicine in 1850s and 1860s Los Angeles.

entire medical program has been endangered, through certain provisions in the proposed laws. In other words, the good work of the past six years would come to an end, with possible return to the unfortunate conditions existing in 1938.

Faced with this dilemma, the representatives of the California Medical Association, through Doctor Schaupp, contacted and informed California Congressmen concerning the issues at stake. Perusal of the footnote references already given will permit readers to acquaint themselves with the details of the endeavors that have been made to secure amendments to the proposed laws.

* * *

Generous Cooperation of California's Senators and Congressmen.—It is heartening to be able to state that, once the implications of the proposed legislation were explained to the California Senators and Congressmen, hearty cooperation was promised. Senator Hiram W. Johnson introduced S. 1493 and Congressman George E. Outland submitted a companion bill, H. R. 3651. At the time of this writing, the final report of the Senate and House Conference Committees in Congress is not known. However, in response to the recommendations of the California Medical Association—in cooperation with organizations such as the California State Chamber of Commerce, the California Farm organizations, and others—the appropriation for medical care that had been reduced 50 per cent was restored, and other desirable amendments also made. It is pleasing to be able to express thanks to the United States Senators and Congressmen from California and to the Appropriations Chairmen from other States, for the generous aid rendered by them.

JOHN STROTHER GRIFFIN, M. D.—FIRST PRESIDENT OF THE LOS ANGELES COUNTY MEDICAL ASSOCIATION

Important Historical Legacy Left to California by Doctor Griffin.—The medical profession of California, and particularly members of the Los Angeles County Medical Association, should congratulate themselves that the California Historical Society has brought off the press a handsome volume of ninety-seven pages, "A Doctor Comes to California—The Diary of John S. Griffin, M. D., 1846-1847."

When the seven founders of the Los Angeles County Medical Association met in the office of Doctors Griffin and Widney on January 31, 1871, to bring that organization into existence they elected as their first president, Doctor Griffin, whose diary is the basis of the volume noted above.* In the years that have since elapsed, the Los Angeles Society has steadily grown, until today its membership embraces some 2,922 physicians, a total so imposing as to place it in the group with the first four or five largest component county medical units in the United States.

The volume here referred to is a transcription of Doctor Griffin's journal which he kept when attached as assistant surgeon in General Kearny's "Army of the West," which consisted of three companies of dragoons, who started in 1846 from Santa Fe, New Mexico, to take possession of California under orders from the United States Government.

* * *

The 1846 Trek from New Mexico to California.—That journey from Santa Fe to San Diego, and northward to Los Angeles and other California districts, began on September 25, 1846. Doctor Griffin's story concerns the hardships endured by General Kearny's small force as it crossed the unknown and trackless deserts, and it recounts what took place in the battles of San Pascual, San Gabriel, La Mesa and Los Angeles, and reveals his methods of treatment for wounds and diseases afflicting the soldiers in his charge. The narrative is most interesting.

Doctor Griffin received his M. D. degree from the University of Pennsylvania in 1837, practicing his art in Louisville for three years, to then enter the United States Army as an assistant surgeon. He remained in the Army until 1854, then resigning to take up practice in the "pueblo of Los Angeles," where he remained until his death, at the age of 82, in 1898.

* * *

An Unusual Group of Founders.—It is a remarkable historical fact that the Los Angeles County Medical Association, in its group of seven founders, should have had three individuals whose services to their community and to the medical profession were of exceptional worth: . . . John Strother Griffin . . . Joseph Pomeroy Widney . . . Henry Sayre Orme.

Concerning Doctor Griffin's diary, Dr. George D. Lyman of San Francisco, who wrote the illuminating foreword to the volume now receiving comment, states that "Bancroft, in writing that part of the history of California, depended on a transcription of Griffin's diaries. 'His Journal of '46-47,' writes Bancroft, 'is one of the best authorities extant.' Unfortunately, he did not have the original as here presented."

Joseph P. Widney, who shared offices with Doctor Griffin in 1871, was a graduate of Toland Medical College (U. C.) and later organized the College of Medicine of the University of Southern California, in time becoming the president of that institution and saving its properties from foreclosure through advancement of money from his own resources. Doctor Widney's death, at the age of 91, occurred on July 4, 1938.*

Henry Sayre Orme, another of the founders, was a surgeon in the Confederate Army. He was

president of the California State Board of Public Health, and in 1878 had the honor of being the first physician from Southern California to be elected president of the Medical Society of the State of California. The next two presidents from the southern section of California were Dr. Walter Lindley in 1888, and Dr. William LeMoyne Wills in 1895. These notations are given to indicate that in the last half of the preceding century the Medical Society of the State of California—our present State Association—secured its members and officers largely from counties north of the Tehachapi; the Southern California Medical Society of that period filling a somewhat similar rôle in the southern section of the State.

These comments are made here to remind the three thousand members of the Los Angeles County Medical Association concerning the high character and achievements of the physicians who brought their Society into existence.

EDITORIAL COMMENT[1]

ACQUIRED HEPATIC SENSITIVITY

Clinically suggestive new data regarding the topographical distribution of specific antibodies and related local anaphylactic phenomena are reported by De Gara and Angevine[1] of the Department of Pathology, Cornell University.

The New York pathologists first studied the presumptive origin and topographical distribution of specific antibodies resulting from intracutaneous injections of nonviable Streptococcus hemolyticus or Type I Pneumococcus in rabbits, these two vaccines being selected largely because they had been previously neglected in similar studies. Within five to twelve days following a single intracutaneus injection of these vaccines, both specific agglutinins and specific precipitins were detected in relatively high titer in extracts from the site of the injection, from the regional lymph nodes, and from the spleen, bone marrow, and liver. During this time the serum titer usually remained negative. Two to three weeks later, however, the titers of the blood serum and organ extracts became practically identical. After the fourth week, the serum titer decreased more rapidly than the titer of the tissue extracts. The spleen, liver, and bone marrow yielded relatively high titer extracts long after the blood stream had become negative. During all this time extracts from the kidney, anterior wall of the stomach (smooth muscle), and noninjected parts of the skin remained of negligible titer.

From this evidence the Cornell investigators concluded that specific antibacterial antibodies are formed mainly or solely in the locally injected skin area, regional lymph nodes, spleen, liver, and bone marrow. The fact that macrophages accumulate in these parts gave plausibility to their belief that macrophages are the cells mainly responsible for local fixation of bacterial antigens and local antibody formation.

De Gara emphasizes the bearing of these data on current theories of acquired regional sensitivity. The degree of sensitivity of the injected skin for example was estimated from the diameter and height of the local wheal resulting from intracutaneous injection of 0.1 cubic centimeter of homologous vaccine. Under nembutal-ether anesthesia, similar quantitative tests were made with the exposed liver, spleen kidney, and anterior wall of the stomach, the apparent severity of the resultant local anaphylactic reaction being confirmed by histological methods. De Gara was able to demonstrate no correlation between local tissue sensitivity and serum titer, strong reactions occurring both in the presence and absence of circulating antibodies. Moreover, there was no correlation between skin sensitivity and the severity of the local hepatic anaphylaxis, necrotizing hepatic reactions occurring in many rabbits whose skin was entirely negative.

This hepatic sensitivity is reminiscent of the experimental focal necroses of the liver reported by Hartley and Lushbaugh.[2] Hartley found that crystalline egg albumin injected into the mesenteric vein of rabbits previously sensitized to egg albumin caused massive areas of coagulative necrosis of the liver, presumably due to local antigen-antibody reactions. De Gara found that after the thirty-second day specific antibodies could not be detected in extracts from hypersensitive livers. During the later stages of sensitivity, locally formed hepatic antibodies are apparently not readily dissociated from the hypersensitive hepatic cells.

Whether or not the early dissociable and late nondissociable parenchymatous antibodies are otherwise identical has not yet been determined.

REFRACTORY BACTERIA IN HOUSE DUST

That bacteria in house dust are often refractory to germicidal vapors is currently reported by Puck[1] and his co-workers of the Department of Medicine, University of Chicago.

Following the successful air-borne transmission of streptococci, staphylococci, H. influenzae and influenza virus to laboratory animals, a method of preventing air-borne infections by the use of sodium hypochlorite mists was proposed by Trillat.[2] Puluertaft[3] afterward suggested the use of certain resorcinol mists, which he found equally effective

A History of UCSF

1868–1898 The Origins of the University of California and Affiiated Colleges

Introduction

The story of UCSF's nineteenth-century beginnings provides a distinct contrast to more conventional accounts of the development of America's health professions in the long-established medical centers of the East and Midwest. This is especially true in light of its early development in Gold Rush San Francisco, which in five decades developed from an isolated village into a heterogeneous American metropolis of more than 300,000 inhabitants. San Francisco's founding decade of the 1850s was marked by the arrival of hordes of immigrant gold seekers of many

1919–1939 The Formation of Schools and the Rise of Clinical Science Instruction

Debates over Medical Education

In the postwar years, as the nursing school flourished and strengthened its ties with Berkeley academics, university and medical school officials again turned their attention to the problem of the split medical school. Their interest was prompted by rumors that the General Education Board, an organization backed by Rockefeller philanthropy and committed to rebuilding American medical education, wished to endow a school of public hygiene at Berkeley, on par with those already created and endowed at Johns Hopkins and Harvard. As part of this plan, they indicated that they would financially assist the UC Medical School in upgrading instruction and reconsolidation. The main requirement of the Rockefeller donors, however, was that the UC Medical School be relocated at Berkeley in close proximity to established academic programs in anatomy, bacteriology, immunology, and biochemistry.

In 1920, University President David P. Barrows, who was anxious to meet the criteria for this potential multi-million dollar donation, traveled east to speak with the Rockefeller board members in person. In consultation with Abraham

Wartime and New Opportunities

Langley Porter Clinic, 1942

The quickening of the American economy that came with war in Europe and then Pearl Harbor began to alter the status quo at the San Francisco campus, and the first signs of change occurred at the state level. As early as 1937, while the nation was still in the grip of the Depression, Dean Langley Porter began a campaign to cooperate with the State Department of Mental Hygiene to build a psychiatric hospital on land belonging to the university at the Parnassus campus. State officials, concerned with indigents and migrants flocking to California, were persuaded that a state acute psychiatric hospital was necessary.

Dean Porter wisely proposed to operate the facility jointly with the state, thereby obtaining psychiatric teaching beds for the medical school. After long negotiations, the state and the UC Regents reached agreement, and a cornerstone was laid in 1941, a symbol, according to local

1910: The Flexner Report Provides Momentum for Reform

1860s: The Proprietary Years

In 1846 the first National Medical Convention (forerunner of the American Medical Association) convened to study American medical education. At this time, all medical schools, even those connected with Harvard University and the University of Pennsylvania, were proprietary, relying upon student fees for faculty salaries and overhead costs. At mid-century all that was needed to open a school was an interested group of potential lecturers and a suitable lecture hall. The National Medical Convention recommended that proprietary schools admit only those who had completed a satisfactory apprenticeship with a practitioner, require two terms of courses taught by at least seven different professors, and provide three months of dissecting work.

In San Francisco, on November 5, 1864, Toland Medical College joined the ranks of the hundred or so proprietary medical schools in the nation, opening its doors and offering instruction to a class of eight students.

R. BEVERLY COLE (1829-1901)

Richard Beverly Cole was born in Manchester, Virginia in 1829. His family moved to Philadelphia soon thereafter. His early education took place at Delaware Collegiate Institute. At the early age of sixteen, Cole began the study of medicine under the preceptorship of Professor Benjamin Dudley of Kentucky. His medical education continued at Transylvania University at Louisville. After one year, Cole transferred to Jefferson Medical College in Philadelphia from which he graduated in 1849. Cole may have chosen his specialty because of his famed professor of obstetrics, Charles D. Meigs. His graduation thesis discussed the controversial use of ether anesthesia in surgery.

He married Eugenie Bonaffon in Philadelphia in 1848. They had five children; all but two daughters died in infancy. At the age of twenty, Cole was in charge of the Pine Street Cholera Hospital where he saw more than 3,000 cases of cholera. He practiced three years in Philadelphia.

Cole was advised for health reasons to move to California. He did so during the "gold rush" period, sailing to a Panama crossing, then arriving in San Francisco aboard the steamship Cherokee in 1852. At the age of twenty-three, he was an accomplished surgeon, and San Francisco's first practitioner of the new specialty of obstetrics. Cole had performed

HUGH HUGER TOLAND (1806-1880)

Hugh Huger Toland was born April 16, 1806, the son of a South Carolina planter and banker. At age sixteen he "read" medicine and worked in the local apothecary shop with a town doctor. He entered medical school at Transylvania University at Lexington Kentucky, graduating in 1828, first in a class of 160. Following graduation he became "circuit medical rider" until he could afford to continue his surgical training. In 1832 he traveled to Paris for postgraduate study at the Salpetriere. Oliver Wendell Holmes was among Toland's fellow American physicians studying at the prestigious Paris school. In 1833 Toland returned to Columbia, South Carolina, where he began a highly successful surgical practice, reportedly earning as much as $15,000 per year. The lure of California caught hold of Toland and in 1852, at the age of forty six, he left Independence, Missouri, for California, making the trip in a few months. He set up a quartz mill on a claim at Mokelumne Hill in Calaveras County, but his wife died a few days after their arrival, and after only a few weeks of unsuccessful mining he moved on to the more populous San Francisco to set up a medical practice.

Toland located his office near the waterfront at Montgomery and Merchant Streets and soon became the city's foremost surgeon. He

San Francisco's First Medical Institutions: Hospitals and Pesthouses

Well before individual practitioners succeeded in organizing themselves into professional societies, the needs of the public's health prompted official government action on behalf of the San Francisco citizens. The task of removing the seriously ill or indigent from the streets and the threat of major epidemics prompted the city to provide for hospital care, first in tents and board sheds under supervision of contracting physicians. In 1850 a state bill appropriated $50,000 to build a State Marine Hospital in San Francisco.

U.S. Marine Hospital, created by Congress and built in 1852

Meanwhile, in 1851 the U.S. Congress created a U.S. Marine Hospital in San Francisco, which was completed in 1853 and provided accommodations for an additional 500 patients. In 1855 the State Marine Hospital building was transformed into the City and County Hospital of

By the mid 1890s, as the content of medical science expanded, faculty and trustees of the three colleges were concerned, for, despite the fact that they were affiliated in name, their teaching facilities were scattered throughout the city, and the schools were rapidly running out of room to expand. In 1893 the Medical College Dean Robert McLean complained to the UC President that Toland Medical Building "has become unfit for the teaching of modern medicine." The President in turn reported to the Governor that "the professional colleges in SF are still suffering for want of suitable accommodations…[they] are better housed and equipped than three years ago, but ask for ampler rooms." In his 1893 report, Medical College Dean Robert McClean appealed to the UC President and the Regents, asking for support for a building for all the colleges, declaring that "Its influence upon the esprit de corps of the Faculties of the various affiliated colleges upon the university as a whole and upon the public at large could not be overestimated." A committee comprised of faculty and

1868–1898 The Origins of the University of California and Affiliated Colleges

Growth of the Affiliated Colleges

The 1880s marked a period of growth and transition for all three affiliated colleges. The foremost feature of this change was the move towards more elaborate clinical and laboratory instruction. Although UC President Daniel Coit Gilman left for Baltimore in 1875, his legacy was reflected in the educational tone of the University of California's affiliated colleges throughout the nineteenth century. Gilman had urged that medical training include "the habits of observation, manipulation, and reasoning," and over the next two decades, the three affiliated colleges developed curriculum that gradually reduced the number of didactic lectures and stressed direct clinical experience. Laboratory instruction expanded as wet preparations and vivisection were added to the physiology courses, the use of surgical tools was demonstrated on cadavers, and quantitative and qualitative chemical analysis were taught in all three colleges. Dental, medical, and

The Affiliated Colleges faculty had no sooner moved into their new quarters on Parnassus Avenue in late 1898 when it became apparent that changes in the content and form of professional education would require changes in intellectual geography and architecture. The first move toward significant structural change came from Arnold D'Ancona, a former physiology professor who became Dean of the Medical Department in 1899. With the cooperation of UC President Benjamin Ide Wheeler and several wealthy donors, he began transforming the Medical Department from an affiliated proprietary college to a University-supported institution. In 1900, he requested that the Regents provide financial support to the Medical Department for equipment and maintenance. In his appeal, he acknowledged the changes occurring within the University itself as it matured as an institution, and pointed out that "it has been the misfortune of the Medical Department that it was established as a private institution. It became an integral department of

BRICKS AND MORTAR: BUILDING THE AFFILIATED COLLEGES
by Nancy Rockafellar

In 1895, the California Legislature appropriated $250,000 for the "Affiliated Colleges" of the University of California to be located on a 13-acre site overlooking Golden Gate Park. The land was donated by the city's mayor, Adolph Sutro, and the site was designed by architects Krafft, Martens and Coffey to house Sutro's extensive library collection, and to be used for the University of California's colleges of medicine, dentistry, pharmacy, veterinary medicine, and law.

The cornerstone of the medical school was laid on March 27, 1897, in a driving spring rainstorm. Beverly Cole, who by this time had been elected President of the American Medical Association, passed out champagne bottles. Reporters noted

that the rain and blowing sand did not dampen the celebration attended by Mayor James Phelan and former Mayor Adolph Sutro. Lieutenant Governor Jeter declared that the raindrops are "nature's tears of joy" for the occasion. "Spread out before us," he proclaimed, "we behold as beautiful and lovely a landscape as one could imagine:

BRICKS AND MORTAR: TWO NEW HOSPITALS FOR SAN FRANCISCO
by Nancy Rockafellar

In the years after the 1906 earthquake, San Francisco rebuilt with remarkable speed, but the disaster and epidemics that followed reinforced the need for adequate hospitals. The old City County Hospital on Potrero had been burned down in 1908 after the discovery of plague-infected rats within its walls. Patients were moved to converted horse stalls, and surgery, kitchen, and supply rooms were set up in the grandstand at the Ingleside Jockey Club Race Track. The drafty racetrack buildings were not adequate for acute medical and surgical cases and city officials quickly worked to restore the city's most important public health facility.

The cornerstone for the new 512-bed San Francisco Hospital was laid at 22nd and Potrero in 1909 and the completed buildings were dedicated by Mayor Rolph on May 1, 1915. The series of brick buildings were designed by architect Newton J. Tharp with a plan based upon European pavilion style, designed to maximize ventilation and prevent cross infection. The external walls were decorated with Renaissance terra cotta and elegant arches; each ward building

DANIEL COIT GILMAN AND THE EARLY YEARS OF THE UNIVERSITY OF CALIFORNIA by Nancy Rockafellar

> "...This is the University of California. It is not the University of Berlin or of New Haven which we are to copy; it is not the University of Oakland or of San Francisco which we are to create, but it is the university of this state. It must be adapted to this people, to their public and private schools, to their peculiar geographical position, the requirements of their new society and their undeveloped resources....It is 'of the people and for the people,' not in any low or unworthy sense, but in the highest and noblest relations to their intellectual and moral well-being."
> Inaugural Address of President Daniel Coit Gilman, November 7, 1872

Plans for a public university were developed at the first Constitutional Convention in 1849, when the Gold Rush was well underway. When California became a state in 1850, however, public funds were not available for a state university, and in its place several private schools and academies were founded. In 1853 a group of missionaries sent west by the American Home Missionary Society of New York founded Contra Costa Academy in Oakland, and in 1855 it was transferred to the state and incorporated as the College of California. Congressional action in 1853 and the Morrill Act of 1862 brought gifts of public lands for colleges of agriculture and the mechanical arts, and California responded by establishing an Agricultural Mining and Mechanical Arts College in 1866. On March 23, 1868, Governor H. H. Haight signed a new act creating the University of California out of the combined resources of the College

THE SPONGE CASE by Joseph LaDou, M.D.

In 1856, surgeon Hugh Toland was called to attend James King of William, the editor of the Daily Evening Express, who was shot in the chest by an assassin. Suspecting that the left subclavian artery was injured, Toland and other physicians crowding around the patient agreed with the first physician to reach the patient, Dr. R. K. Nuttall, who proposed inserting a large sponge to plug the wound. They disregarded the objection of another prominent physician, R. Beverly Cole, a close friend of King's. When King regained consciousness, he reportedly said, "Oh, Cole, in the name of God, stay by me!"

Dr. Hugh Huger Toland (b. 1806, d. 1880).

King's death five days later triggered a call to arms by the San Francisco Vigilance Committee, and his funeral was the largest public gathering in the history of San Francisco. Beverly Cole reported to the Medical Society of the State of California that the sponge left in King's body for five days caused his death. The treatment recommended by Toland was, in his view, "gross malpractice." At the trial of a man implicated in King's murder, Toland and Cole played leading roles in the drama. If Cole was right, King's doctors caused his death and the man accused of his assassination should be set free. Toland's opinion prevailed, supported by autopsy findings that the death was caused by post-traumatic

UC STANFORD RIVALRY, 1858-1917 by Joseph LaDou, M.D.

Cooper Medical College, ca. 1880

Elias Samuel Cooper, a surgeon from Illinois, sailed to San Francisco in 1855. He soon was active in organizing a state medical society, and in 1858 started the first medical school in the West. The faculty consisted of four doctors and one lawyer, Cooper being Professor of Anatomy and Surgery. R. Beverly Cole was Professor of Obstetrics and Diseases of Women and Children, as well as Physiology. Cole was also dean of the new school. Lacking a charter, the school derived its right to issue diplomas from the University of the Pacific, a Methodist institution in nearby Santa Clara, and was named the Medical Department of the University of Pacific. The first course of instruction was offered in 1859 and consisted of five months of lectures, repeated in the second year. The fee of each professor was $20 payable in advance, matriculation fee of $5 paid but once, with a graduation fee of $50. In 1859, Cooper's nephew, Dr. Levi Cooper Lane, joined the faculty as Professor of Physiology. The school graduated two students that year, and one the following year. Dr. Cooper died at age 40 in 1862.

In 1864, Hugh Huger Toland founded a new medical school in San Francisco.

UCSF STANFORD MERGER by Joseph LaDou, M.D.

UC and Stanford shared the staffing of San Francisco Hospital for nearly one century. Collegial competition between the two schools was beneficial to patient care and to the institutions. In the years leading up to World War I, UC had its great diagnostician, Herbert Moffitt, Stanford was ably represented by Harold P. Hill; UC's surgeon Wallace Terry was matched by Stanford's Emmet Rixford. When LeRoy Briggs assumed the leading role in medical training at SFH, Stanford produced George Barnett. When Surgery at UC passed to Harold Brunn, Stanford found Leo Eloesser. And so it went for many decades.

By 1926, the visiting staff of Laguna Honda consisted of 34 physicians, the staff provided equally by UC and Stanford. In 1946, Stanford and UC jointly took over the professional staffing of the Fort Miley Veteran's Hospital. At each location, including SFH, the two schools administered separate faculties and separate clinical faculties. The two schools were considered the best medical schools in the west. Despite their many similarities, the two medical schools were still parts of public and private universities. Their growing faculties were independent and proud, and often wary of the other's intentions. The two medical schools were intensely separate and distinct.

Both UC and Stanford discussed for decades bringing their medical schools back to their undergraduate campuses. For UC it was a damaging debate that went on far too long. For Stanford, it was quite another story. In 1943, Stanford Chancellor Ray Lyman Wilbur, at his retirement dinner, said, "Stanford is a great university standing on the

THE DEVELOPMENT OF THE UCSF MEDICAL CENTER by Nancy Rockafellar

Prelude: Unrealized Plans for a University Teaching Hospital

Maybeck's plan for a teaching hospital at Parnassus proposed an elaborate facility with separate buildings for the training school for nurses to include classrooms and dormitories, a main administration building, a surgical and laboratory building, in addition to six two-story ward buildings designed hold 240 beds.

Although the first University of California Hospital did not appear until the 1906 earthquake and fire brought urgent hospital needs to the city, plans for a university hospital for the Medical Department had been taking place since the turn of the century. In 1902 University President Benjamin Ide Wheeler appealed to the Regents and the California public for support to build a dedicated teaching hospital for the medical school to create a reservoir of free hospital beds for the city, and "to provide for the education of those to whom the health of the community must in future years be entrusted." In an effort to create a significant endowment for construction and maintenance of such an institution, a medical faculty committee hired architect Bernard Maybeck to design an elaborate hospital to be built on the pavilion style. Depending on the funding they could raise for the purpose, the committee estimated the cost at from $400,000 to five million in 1900 dollars, an amount that would allow UC to duplicate the hospital that

A History of UCSF

1959–1989 Modernization and the Expansion of Scientific and Clinical Training

An Emerging Identity for the Health Sciences Campus

The period 1959-1989 witnessed a revolution in the health sciences and biomedical industries. At the beginning of the period there was no recombinant DNA technology, no biotechnology industry, no genetically engineered human growth hormone, interferon or hepatitis B vaccine, no "transgenic" mice to serve as disease models for everything from cancer to obesity, no proof for oncogenes, no genetically altered food, no gene therapy, no gene patents, no DNA fingerprinting. It was a revolutionary period for genetics research, and faculty at UCSF became leaders in multiple fields. Whether in research, teaching or community service, each school during this era of UCSF's history made substantial innovations and contributions.

The San Francisco campus of the University of California was given full administrative independence to control its educational and financial matters in 1964. In 1970, the University of California, San

A History of UCSF

1959–1989 Modernization and the Expansion of Scientific and Clinical Training

Innovations in Professional Education

In 1964, Provost John Saunders became UCSF's first chancellor. A veteran of the medical school faculty, Chancellor Saunders came to the University in 1931 as an anatomy professor and was chair of the department from 1938-1956. He also served as chair of the History of the Health Sciences department from 1942-1975, Dean of the School of Medicine from 1956-63, University Librarian from 1943-1971, and the first provost from 1958-1964. Saunders resigned as Chancellor in 1966 and took a special Regents Chair in History of Medicine on the San Francisco Campus.

Saunders believed that training students and healing patients were the paramount duties of the medical center, with research ranking third. There was a well-documented perception that Saunders expressed his priorities by allocating resources to clinicians while stalling on approving appointments and allocating space to meet the needs of research-minded department chairs.

In November 1964, frustrated by this lack of support for research, a group of ten professors from the School of Medicine, including Dean Reinhardt, sent a letter to UC President Clark Kerr asking for an urgent

Principle Fresco Panels

From: Description by Phyllis Wrightson

"The story told by the murals begins with the domestic life and hygiene of the California Indians. A young Indian, symbolizing his race, reaches out in greeting to the sun as he dries himself after and sweat bath and cold plunge in the river. Two sweat houses, or temescals, appear near him used for ceremonial as well as healing purposes, and a mother and child sun themselves in the foreground".

"With his back to his ship [Golden Hind], he [Sir Francis Drake] grimly supervises an autopsy, which the ship's surgeon is performing upon Drakes' younger brother, thus proving his death due to natural causes rather than to the vengeance of a wrathful deity. To the right, four sailors finish burying those of their comrades who perished of the same disease, while to the left, the chaplain prayer book in hand but manacled, and wearing a humiliating badge,

suffers the displeasure of the captain for spreading superstition among the crew".

"Completing this panel, three Indians offer to Padre Junipero Serra the three most important herbs contributed by California to modern medicine: yerba santa (criodictyon glutinosum), cascara sagrada rhamnus purshiana) and grindelia robusta".

Father Junipero Serra Receiving Native Medicinal Herbs

Sir Francis Drake, Spanish Commander, Supervising Autopsy of Brother Proving Death by Natural Causes; Nearby Priest Praying

From Description by Phyllis Wrightson

"…Pioneer courage of 'Peg-Leg' [Tom] Smith, famous trapper and prospector of the pioneer west, who is painted in the act of severing his own leg after being wounded in a fight with Indians. Tied near him, and acting as support to

the edge of the panel is his pack burro, loaded with traps and skins. In the rock on which Smith supports himself is carved the old proverb: *'De medico, poeta y loco, Todos temenos un poco'* (of medicine, poetry and insanity, we all have a little).

From: Description by Phyllis Wrightson

"...Invasion of California by a strange people, a new religion and the foreign diseases that almost exterminated the native population. Heading the band of soldiers in the background is Juan Bautista de Anze, leader of the expedition of 1775 bearing his name. The central figure of the main group is a bewildered Indian, standing helplessly between a padre who baptizes him and a soldier who offers him an acquaintance with alcohol. Half hidden behind the priest is a soldier who had roped the Indian woman in the foreground".

…Native Indians in ceremonial dance during birthing of child… Midwives push bulging uterus to express afterbirth, mother clutches rope above, assistant expresses afterbirth…

From Description by Phyllis Wrightson

"A young Indian, symbolizing his race, reaches out in greeting to the sun as he dries himself after and sweat bath and cold plunge in the river". To the left, a warrior sucks a wound, a shaman or medicine man mixes blood mud and herbs for a poultice, another digs bulbs used in making magic against snake bites.

From Description by Phyllis Wrightson

"The third and last panel on this side of the central division is devoted to doctors of the 'Gold Rush' period. The first incident is an illustration of the type of adventure often met in the gold fields. Dr. Edward Willis is shown shooting the quack doctor Hullings, his predecessor at Placerville, in a duel after Hullings had torn up Willis's diplomas in a drunken rage at having a rival appear in his territory. A glimpse of the doctors surgery is shown beside hm, including the bottled monstrosities that are being examined by two curious miners."

"A solitary figure in this composition is that of Dr. Hugh Toland, founder of the Toland Medical School which was later absorbed by the university of California. He appears on a lively mustang, as he might have looked on his arrival in 1852, after crossing the plains. In his hand he holds a drawing of the quartz mill he brought with him, by which he no doubt expected to become wealthy."

"Lightening the central background and supporting the upper part of the composition, is a group of covered wagons, drawn by red oxen. The center foreground below this is devoted to the courageous Dr. Fayette Clappe, who in 151 at Rich Bar on the feather River risked his professional reputation to save the life of a young miner whose leg he successfully amputated after the case had been pronounced hopeless. One of the two miners watching the operation is pouring out the whiskey that was used instead of an anesthetic".

Early Medical History San Francisco;
Dr. Hugh Toland, Surgeon, Rides Mustang
Dr. Clapp's Office; Patient With Injured Leg

Dr. Hugh Toland on Mustang Horse
From Description by Phyllis Wrightson
"The most distinguished of the Spanish Surgeon-Generals, Dr. Don Pablo Soler, appears in the center of this panel, attending an Indian that had been badly

gored by a bull (about 1898). The patient's recovery added to his name for humanity and kindness to all in need of his services. The bull appears behind him, held by two Indians, and illustrates the artist's intention of having each incident as self-explanatory as possible. The bull with bloody horns accounts for the disemboweled Indian in the foreground, Spanish and English flags identify the nationality of figures in other scenes, while some characters are explained by the presence of books diplomas, or other articles appropriate to their functions in the scene.

"Slightly to the left of this central group is. The uniformed figure of General Castro, who is shown persuading the famous Indian doctor, Petronio, to cure a wounded soldier. Although Petronio's reputation was that of curing his friends and killing his enemies, there were few doctors to choose from in 1844.

From Description by Phyllis Wrightson

"The last third of the panel is occupied with early San Francisco doctors. The first group consists of three figures, that of Dr. Victor j. Fourgeaud and his wife and little boy, who came to California in 1847. He holds the title page of his monograph on diphtheria, a notable contribution to. The study of the disease, which he wrote after the epidemic of 1856. Beneath this paper is another, which lists some of his other achievements as a citizen and physician".

"Three more figures fill the remaining space. Dr. John Townsend is shown hanging up his sign in 1846 announcing the first medical office in San Francisco. In front of him is one of the typical oddities of this period, 'Dr.' Elbert P. Jones, for whom Jones Street was named. He was a jack of all trades, including medicine, law and newspaper publishing, but his consuming passion was for gold, in which he would literally wallow. In the upper left hand corner, Dr. Felix P. Wierzbicki, a native of Poland, is painted writing the book that made him famous, "California As It Is And As It May be", published in 1849".

"…Dishonesty in the medical profession is demonstrated in the section immediately above the figure of the doctor, where dr. Albert Abrams is shown operating one of his many machines for curing all ailments. In the design only a suggestion of the actual appearance of the machine is given. /also shown is the Ionoco Belt of Dr. Wilshire".

From Description by Phyllis Wrightson

"The constructive side of San Francisco's medical development is represented by the row of buildings tilting away from the center of the design, the first medical schools and hospitals in the city. An old-fashioned yellow building in the center bears the name of Toland Medical School, the germ of the present U.C. Medical School; to the right is an imaginary likeness of the old County Hospital; at the left are the two buildings associated with the Stanford Medical Department - the Gothic angles of the Cooper Medical School which stands at Sacramento and Webster Streets, and the more modern red brick of the Lane Hospital. These provide the background for the likenesses of Dr. Elias Samuel Cooper and his nephew, Dr. Levi Cooper Lane, who are shown with a shelf of medical books written by pioneer San Francisco physicians.

Sciences of the Future

UCSF New Medical Technologies and Quacks

From Description by Phyllis Wrightson

"Above the door, and to the right of the screen is the last panel of the series, symbolizing the entire field of science, past, present and future. The circular motif of the previous panel has been developed, with the addition of more circles, into the more spacious pattern of a spiral, which carries the eye through the painting in more generous lines suggesting the perpetual

development and change characteristic of all organic activity. This is in contrast to the design of the Hooper panel, where the circular shape returns upon itself indicating one isolated cycle or generation of science viewed separately from its place in the whole sweep of scientific history".

"The wheel in the center revolving on its huge bearings, symbolizes the early development of modern science, called into existence by the necessity of the troubled humans in the foreground. The muscular figure representing human energy provides the power by which tis body f science is caused to revolve."

"The bearings upon. Which this massive structure moves are engraved with the names of those men who laid the foundation for present scientific knowledge; Galileo, the celestial physicist; Newton , physicist; Lavoisier, who discovered the fundamental laws of modern chemistry; Einstein, physical astronomist who contributed the theory of relativity; roentgen discoverer of X-rays; Pasteur, who opened up the world of microbiology; Hegel, father of modern scientific philosophy; and Darwin, whose concept of change in the world of biology was one of indefinite progress or evolution."

"This first wheel is not complete in itself. It is connected by a belt to another smaller wheel, which revolves upon the same axis on which a huge wheel in the distance is slowly turning; and the rhythm of the picture suggests that these turns are spiraling into the future endlessly".

"The revolutions of the small wheel, intermediate between the past and the immensity of the future, are spinning out consequences remote from the intention of those whose names are lettered on the bearings. Laboratory chemists have produced poisonous gases; engineer have developed bombing planes; destruction as well as benefit has been produced from the labors of scientists. Thus, the physician must repair the damages which the destructive forces of misapplied principles have produced. His future task is that of guiding new discoveries along constructive and beneficent channels".

Postscript

In the manuscript, the author placed copies of original articles, commentaries and photographic images of the fresco murals. During 2010, digital images were taken of each fresco, as well as of individual vignettes described in the paintings. Additional views of special parts of the murals were also included.

I have composed this guide to the details of the textual and visual information contained among the Toland Hall frescos as an additional means to immortalize their content.

Robert S. Sherins, MD
Author

Addendum

The author, Robert S. Sherins, MD and his classmates of the UCSF School of Medicine, Class of 1963 were deprived of the knowledge about the Toland Hall frescos due to the "cover up" incited by Neurosurgery Nafziger in 1948. The murals were lost to view from 1948 to 1977, when former Dean Chauncey Leake, PhD retuned to the staff of UCSF. Leake and his assistant, Isabell Perry, MD established initial funding and selected Bernard Zakheim as the artist to create the frescos which reflected the History of Medicine in California.

In 2010, during our preparation for the celebration of our 50th Class Reunion (2013), members of our executive committee toured Toland Hall and Cole Hall witnessing the magnificent Zakheim' murals for the first time. We were joined by our hosts, Gary Bernard, Director of the UCSF School of Medicine Development Office; Michael Eccles, Assistant Director to Gary; Mrs. Polina Ilieva, Senior Archivist, UCSF Kalmanovitz Library; and Margaret Hughes UCSF Assistant Archivist.

Dr. Sherins created a special docuent, "guide to the Zakheim frescos and artworks, located in both Cole Hall and Toland Hall buildings. The gallery of our first experience touring the magnificent artworks is displayed below. Hundreds of photo images were taken at this momentous occasion by: Gary Bernard, Michael Eccles and Robert Sherins, the best of which are included in this addendum. Additional images taken during the UCSF School of Medicine Class of 1963's 50th Reunion in 2013 are included.

ADVERTISEMENT FOR PROPOSALS

Subject to conditions prescribed by the University of California, San Francisco, sealed proposals for a design build contract are invited from prequalified proposers for the following work:

PH UCH 1ST FLR MURAL REMOVAL
Project Number PRJ-000293/ Contract Number: PRJ-000293-CC-001
UNIVERSITY OF CALIFORNIA, SAN FRANCISCO

DESCRIPTION OF WORK:
The Design Build Team shall design and construct a complete mural removal project in UC Hall, Room 142 Toland Hall. The Work consists of the removal of the History of Medicine in California murals and the relocation of these murals to a UCSF storage facility at Oyster Point. It includes the following:

- Construction of any platform required to facilitate the removal of the murals once the seating has been removed
- Conservation required to stabilize the murals for removal per Exhibits 10-A and 10-B
- Safe off electrical as required
- Stabilization of murals
- Saw cutting around the murals
- Construction of any framing required to secure the murals for removal and relocations
- Any type of crane required to move the murals
- Relocation of the murals from the building
- Transport to Oyster Point
- Unloading to an area within the UCSF Oyster Point Storage Facility

This list is not all inclusive. Please refer to Exhibits 10-A, 10-B and 10-C for additional information and detailed scope to assist with the design/build proposal

The Work excludes the following, and will be completed by others:

- Demolition of the existing seating
- Removal of A/V equipment
- Build back of partition where mural was removed
- Partial removal of interior partitions to facilitate removal of the murals from Room 142 Toland Hall
- Removal of exterior partitions, windows or doors to facilitate removal of the murals from the building

PROCEDURES:
Bidding Documents will be issued through an electronic system called BuildingConnected. Bidders will be sent an invite to view Bidding Documents on **August 4, 2020 10:00 AM.** Contact Beatrix.Balais@ucsf.edu and Asha.Kalra@ucsf.edu for any BuildingConnected questions. Subject line of the email should state *UC BuildingConnected Question.*

Support is available by emailing support@buildingconnected.com. Please identify yourself as registering for **UCSF Projects**.

Proposals will be received in the BuildingConnected electronic system on or before 12:00 Noon, August 28, 2020 (the "Bid Deadline"). LINK: www.buildingconnected.com

Mandatory Virtual Pre-Proposal Conference. A mandatory virtual pre-proposal conference will be conducted on August 6, 2020, beginning promptly at 8:30AM. *Only proposers who participate in the pre-proposal conference, in its entirety, will be allowed to propose on the project.*

For further information, contact the University's Representative, Patti Mitchell at 415.203.2708 or email at Patti.Mitchell@ucsf.edu

Participants shall meet via Zoom:

Proposal Security in the amount of 10% of the Lump Sum Base Proposal, excluding alternates, shall accompany each bid. The surety issuing the Bid Bond shall be, on the bid deadline, an admitted surety insurer (as defined in the California Code of Civil Procedure Section 995.120)

All insurance policies required to be obtained by Design Builder shall be subject to approval by University for form and substance. All such policies shall be issued by a company rated by Best as A- or better with a financial classification of VIII or better, or have equivalent rating by Standard and Poor's or Moody's.

The successful proposer and its subcontractors will be required to follow the nondiscrimination requirements set forth in the proposal documents and to pay prevailing wage rates at the location of the work.

Every effort will be made to ensure that all persons have equal access to contracts and other business opportunities with the University within the limits imposed by law or University policy. Each Proposer may be required to show evidence of its equal employment opportunity policy. The successful Proposer and its subcontractors will be required to follow the nondiscrimination requirements set forth in the Proposal Documents and to pay prevailing wage at the location of the work.

The work described in the contract is a public work subject to section 1771 of the California Labor Code.

No contractor or subcontractor, regardless of tier, may be listed on a Bid for, or engage in the performance of any portion of this project unless registered with the Department of Industrial Relations pursuant to Labor Code section 1725.5 and 1771.1.

This project is subject to compliance monitoring and enforcement by the Department of Industrial Relations.

REGISTER AT THIS LINK: http://www.dir.ca.gov/Public-Works/PublicWorks.html
[The contractor registration link is on the right side.]

The successful Bidder shall pay all persons providing construction services and/or any labor on site, including any University location, no less than the UC Fair Wage (defined as $13 per hour as of 10/1/15, $14 per hour as of 10/1/16, and $15 per hour as of 10/1/17) and shall comply with all applicable federal, state and local working condition requirements.

The Bidding mode will be a Design Build contract. Selection shall be based upon a “best value” approach which will be calculated on a “cost per point” basis. The proposer with the lowest cost per point “Best Value” will be selected by the University as the lowest responsible proposer.

The successful proposer will be required to have the following California contractor's license at the time of the proposal opening:

LICENSE CLASSIFICATION: **General Building Contractor**
LICENSE CODE: **B**

Target Contract Amount: $1,500,000
Maximum Acceptance Cost: $1,800,000

NATHAN ZAKHEIM ASSSOCIATES

September 8, 2020

By Email: *EIR@ucsf.edu*
Ms. Diane Wong
UCSF Real Estate - Campus Planning
654 Minnesota Street
San Francisco, CA 94143-0286

Re: Zakheim Murals and the Comprehensive Parnassus Heights Plan Draft Environmental Impact Report

Dear Ms. Wong:

I write to comment on the discussion of the "Zakheim Murals" in the Draft Environmental Impact Report for the Comprehensive Parnassus Heights Plan (DEIR). These murals are frescoes created and painted by my father, Bernard Zakheim.

The DEIR concludes that it is technically and financially infeasible to preserve and remove the murals, starting:

> in 2020, UCSF completed two independent studies that include detailed technical assessments on how the Zakheim murals could be physically preserved, removed and relocated from their current location in UC Hall. (Page & Turnbull, 2020; Architectural Resources Group 2020.) Given the nature of the frescoes and their vulnerability to cracking, the physical condition of some of the panels which have experienced water damage over the years, the murals' large size, the curved shape of the walls on which most of the panels are painted, ground movements, and the aging of UC Hall (all described in the above noted studies), UCSF has determined that it may be infeasible to remove and relocate the Zakheim murals as there is no guarantee that any effort to remove the Zakheim murals would be successful. Based on those independent studies, there is a likelihood that removal of the Zakheim murals may potentially cause serious damage to at least some of the panels such that the integrity of the entire series is destroyed (Page & Turnbull, 2020). In addition, UCSF has determined that the estimated $7.6 million cost of physical preservation, removal and relocation is prohibitive in light of UCSF's primary responsibility to support its academic health care mission.

(DEIR 4.4-14, 15; pdf 328-329.) This conclusion is incorrect. Also, the DEIR's conclusion is not supported by either of the two studies cited (i.e., "Page & Turnbull, 2020" and

"Architectural Resources Group 2020") because neither study presents any conclusion or expert opinion that it is infeasible to conserve, remove, and preserve these murals.

My Qualifications

I have been, and I have been recognized as, one of the leading art conservators in the world for over 50 years. My CV is attached.

From 1953-1966 I worked with my father as an apprentice. As a result, I am intimately familiar with the techniques and materials my father used to create the Zakheim murals. Please see the section of my CV entitled "A Brief Summary of the Core Contributions of NZA to the Field of Mural Conservation."

Over the past 50 years I have performed maintenance and restoration conservation work on the Zakheim murals under contract with UCSF on many occasions, including repairing broken fresco plaster and retouching faded or missing fresco paint.

I have also successfully conserved, removed, and preserved many large-scale fresco murals similar to the Zakheim Murals. These projects include the removing and preserving eight major large-scale frescoes, including removal and conservation of the two Cole Hall Frescos (named "Ancient Medicine" and "Rational Medicine") at the University of California, San Francisco. These frescoes were also created and painted by my father, Bernard Zakheim. Over fifty years ago, I successfully relocated these frescoes from Cole Hall to the Health Sciences West building at UCSF. For this conservation project, I developed the techniques for using AIC Conservation Consolidant Resins to stabilize the three layers of plaster in the frescoes. These frescoes remain on display to this day, in fully stable condition and with no need for periodic conservation. These conservation techniques have not changed over the last 50+ years.

I have done major conservation work on the (Victor Arnautoff) Coit Tower Frescoes, the City Club Rivera Fresco, the City College Rivera Frescoes, the Jewish Center Fresco, Jose Clemente Orozco fresco (Pomona College), Rico Lebrun Fresco (Pomona College), four major Ramos Martinez frescoes (removed and re-installed), and the Peter Hurd fresco (Houston MD Anderson Building (removed and transported to Artesia Public Library). NZA has also done extensive conservation work in India on Frescoes in Jaipur, and Nanda Kunj, and Kusham Sarova, and I have done extensive conservation studies on the frescoes in the Taj Mahal, the Govinda Deva Temple in Jaipur, and the Jaipur City Palace. Please see the section of my CV entitled "Partial List of Murals and Out of Door Art Conserved."

A. REMOVING AND PRESERVING THE ZAKHEIM MURALS IS TECHNICALLY FEASIBLE.

Bernard Zakheim created the frescoes on the interior concrete walls of Toland Hall by installing a wire mesh (also known as an expanded metal lath) across the entire surface of the

concrete wall to be plastered and painted. To this mesh, the artist applied two layers of base plaster (known as the "Arriccio" layers), then a third, surface layer of lime plaster (known as the "Intonaco" layer), on which the artist painted the murals.

The Intonaco layer was plastered a few square feet at a time on each day for 12 hours (open time) for the artist to paint using only earth pigments in water into the fresh lime plaster. Each completed daily section is known as the "Giornata."

The frescoes are held in place and secured to the concrete wall of the building by thin baling wire running through and attached to the exterior surface of the concrete wall. Thus, the frescoes are "floating" on the concrete wall.

There are three structural challenges to be met in order to safely remove the frescoes without damages.

1. There will be areas of "delamination" (separation) of the 1/8-inch-thick marble dust/lime plaster finish layer from the rough plaster layer immediately beneath the finish layer.

The Intonaco plaster layer is hard and brittle, and tends to "separate" from the Arriccio layers when dry. This dynamic is exacerbated by the fact that only a few square feet are plastered for the artist to decorate each day (each completed daily section is known as the "Giornata").

This delamination can and must be treated by both wet saturation (with low viscosity AIC Conservation Resin) of the Intonaco layer, as well as injection by syringe of a higher viscosity AIC Conservation Resin into the gap between the Intonaco and Arriccio layers. This treatment will prevent them from ever separating regardless of shock, weather conditions, temperature variations, storage conditions, etc.

2. There will be a tendency for the two Arriccio (substrate) layers of rough plaster to crack, crumble or be eroded by water exposure, which will weaken these two layers beneath the Intonaco (white lime plaster).

This crumbling and cracking will be consolidated by the AIC Conservation Resins applied by spray and brush. Any remaining separated or crumbled areas can be treated with a further application of AIC Conservation Resins prior to applying Conservation Plaster to the damaged or crumbled areas.

The procedure for addressing these concerns and successfully removing the murals is well-established and technically feasible, as follows:

Conserving the Front Surface, Lime plaster Layer and Underlying Plaster Layers.

1. Before removing a fresco, the surface must be cleaned with water miscible cleaners as well as carefully chosen solvent based cleaners. (The cleaning removes, grime, wax, dust and other pollutants from the pristine surface of the 1/8 thick lime plaster surface.)

2. As soon as the surface of the fresco has been carefully cleaned, a saturation of an AIC Museum Grade Conservation Resin in Conservation Solvent is applied, either by brush, spray, or both. This treatment allows the resins to absorb into (or even completely penetrate through the lime plaster/ fresco- paint layer. The resins also fill and strengthens any visible, or even invisible cracks in the lime plaster, so that pieces of painted lime plaster will not fall away from the surface.

Injection of a higher viscosity AIC Conservation Resin in Solvents can be accomplished using a conservation grade syringe with a metal injection tube. The tube introduces the resin between the Arriccio and Intonaco layers.

3. Loss areas (of any size) caused by physical or water damage are then saturated with Conservation Resins to penetrate damaged, underlying plaster layers so that crumbly or shattered areas become quite solid. Loss areas can now be filled with tooling plaster, topped with fresh fresco lime plaster. All such areas are then saturated with the same Conservation Resin in Solvents used on the front surface of the fresco.

4. When completely dry, a "non-woven" fabric is applied in two or more layers to the surface of the conserved fresco, using easily removable adhesives.

Supporting the Front of the Fresco.

5. A wooden platform "drawbridge" is built in front of each fresco panel using 2x12 lumber faced with 5/8" plywood on each side glued in place. Each "drawbridge" platform will have "pivots" below the fresco level so that the "drawbridge" can be raised and lowered easily with chain hoists. A curved plywood shape will be installed on each of the drawbridges to match the curvature of the curved fresco panels (12" from flat by 14' wide.) The curved support above the drawbridge will be padded with a solid piece of 3" soft foam rubber.

6. The hollow white plaster columns on either side of each curved fresco panel will be removed using fine toothed power saws (and vacuum cleaners). All other white plaster surrounding the frescoes will be removed at this time as well.

7. The drawbridge is then raised from horizontal to vertical (using a chain hoist) and then placed firmly against the fresco surface (with the 3" foam rubber in place.) Each

drawbridge is then bolted with threaded rod to the solid concrete structural wall behind the frescoes.

Separating the Fresco from the Support Wall.

8. Using a long-handled tree trimming hand saw with a metal blade, all wires and thin channels holding the fresco panel to the structural concrete wall will be separated from the frescoes until each Fresco Panel is standing free.

9. Using the chain hoists, each fresco panel will be lowered on the drawbridge to a horizontal position, fully cushioned by the 3" foam rubber over the drawbridge curve.

10. At this point all redundant plaster "globs" poking through the expanded metal lath can be mechanically removed, and all extra metal channels removed in order to make the back of the fresco as smooth as possible without weakening its infrastructure.

Consolidating the Back and Substance of the Fresco.

11. All dust and gravel residue will be vacuumed from the back of each curved fresco panel.

12. Using a wide tapered drill bit, carefully drilled holes (usually 8"x8" from hole to hole) will be drilled through the expanded metal lath and the first two layers of plaster from the rear forward, and all dust will be vacuumed away.

13. A 3/4" inch carbon steel drill bit will be used, very carefully by hand, to "twist down" through the last of the rough plaster until the "white" of the 1/8" lime plaster is encountered, but not penetrated. All dust will be vacuumed away.

14. Thin Viscosity AIC Conservation Resin (Paraloid B-66 or B-44 or B-72) will then be applied to the two rough plaster layers with a brush until full saturation has been accomplished. (Several layers must be applied, and when soaked in, several more layers applied, until the surface will accept no more solvent based resin).

15. When fully dried (to the core) the drill holes are then painted with a high index Acrylic emulsion, and when still wet, the holes are filled with a high-grade tooling plaster such as Hydro Stone, or Ultra Cal.

Completing the Infrastructure and Readying for Transport.

16. A steel grid (composed of galvanized 20-gauge 2"x4" or 2"x6" "wall studs" bolted "back to back") is then applied to the back (and flat) of each curved fresco piece.

17. Polyester resin (or low viscosity epoxy resin) is then used to saturate fiberglass cloth and fiberglass matting that will then adhere the steel structure to the now "solid as a rock" consolidated back each of the curved fresco panels.

18. Plywood will then be attached to the steel studs attached to the fiber-glassed back of each panel with heavy sheet metal screws.

19. Double plywood will then be attached to all four sides of the now encapsulated Fresco Panel, joining the plywood at the back of the panel to the drawbridge at the front of the panel.

20. The drawbridge will remain on the fresco panel during transport and storage. The drawbridge will be removed only when the frescoes are in front of the new installation location, at which point it can be discarded.

Results.

21. The fresco panels are now virtually indestructible. They could be dropped from a truck without damage. They can also be stored without regard to temperature or moisture control.

22. The life expectancy of the frescoes saturated with AIC Conservation Resins should extend (without maintenance or further aesthetic treatment) for at least several hundred years.

23. When re-installed, no maintenance will be required, other than occasional dust removal.

Notes.

The Conservation Resins used to treat the Toland Hall Frescoes will be the same AIC Conservation Resins used more than 20 years ago to consolidate the Sistine Chapel Frescoes of Michelangelo Buonarroti.

The 10'x12' Cole Hall Frescoes (now in HSW 2) were successfully conserved in place, removed, and reinstalled using the exact same techniques described above. In over 55 years, no further conservation work or even routine maintenance has been required, and the two frescoes have endured many earthquakes with absolutely no damage.

B. REMOVING AND PRESERVING THE ZAKHEIM MURALS IS FINANCIALLY FEASIBLE.

In my opinion, the work described above to safely and successfully conserve, remove, store, and reinstall the Zakheim Murals can be done by a competent and properly supervised art conservator for less than the $1,500,000 "Target Contract Amount" or the $1,800,000

"Maximum Acceptance Cost" set forth in the Advertisement for Proposals for UCSF Project No.: PRJ-000293; Contract No.: PRJ-000293-CC-001, that I received in early August, 2020. In fact, before UCSF issued its RFP in August, 2020, NZA submitted a bid proposal to UCSF offering to conserve and remove the murals for an amount not to exceed $1,000,000.

Considering the cultural, historic, and artistic value these murals have provided for over seventy years to UCSF, the City of San Francisco, the state of California and the entire country, and considering the vast expenditure that UCSF is undertaking to carry out the Comprehensive Parnassus Heights Plan, the relatively small expense required to preserve these works of art is eminently feasible.

Thank you for your attention to this matter.

Nathan Zakheim
Director, NZA

NATHAN ZAKHEIM ASSSOCIATES

CURRICULUM VITAE FOR NATHAN ZAKHEIM
DIRECTOR: NZA (REVISED 2020)

Since 1966, NZA has led the field of mural conservation with innovative conservation techniques and state of the art treatment of murals.

NZA has conserved more murals of every type, including fresco, oil, marouflage, tempera, and acrylic than any other firm in the United States.

ACADEMIC BACKGROUND:

1962
Graduated Santa Barbara High School.

1962 –1965
Attended San Francisco State College Major in Music; Minor in English Literature, (later BA Degree in English Literature, minor in Psychology).

1968–1977
Vedic Studies culminating in Bhakti Shastri Degree and Bhakti Bhaibava Advanced Degree.

1966–Present:
Independent Study in Solvency Parameters, Adhesives, Advanced Conservation Techniques, Product Development, Surface Preparation, Coatings and Paint Systems.

APPRENTICESHIP:

1953–1966
Apprenticed to Bernard Zakheim, in Fresco, Oils, Tempera, Wood and Stone Sculpture, Machine Shop, Wood Shop, Color Analysis, Upholstery, Draping, Egg Tempera, Ceramic and Bronze casting, Chemical Applications, Art History, Art Theory, Arranged Workshop Education with known contemporary artists of WPA and later periods. Curation and Preparator studies.

1953–1962
Studied with Phyllis Wrightson: Watercolor Techniques, Tempera, Block Printing, Fabric Printing and Painting, Linoleum Printing, Art History, Museum Studies, Field Studies, Lives of Great Artists, Art as a Medium for Social Action.

1966–1970
Private study of the new field of Scientific Conservation, utilizing State-of-the-Art Industrial Resources in the field of Chemistry, and modern conservation techniques.

1980–1984
Studied the works and techniques of Gustav Berger and apprenticed with the famous conservator Franz Trevors. During this time NZA developed several unique conservation procedures that are in general use today.

Areas of Conservation Expertise: Fresco, Marouflage, Contemporary Acrylic Mural Paintings, Egg Tempera, Casein Murals, Easel Paintings, Objects, Sculpture, PVA Murals, Church Interiors, Architectural Ornamentation, Decorative Painting.

PROFESSIONAL PAPERS PRESENTED TO WAAC AND MURAL CONSERVANCY SYMPOSIA:

1. Conservation of Orozco's Prometheus Fresco.

1. Conservation of Rico Lebrun's Genesis Fresco.

2. Numerous papers on Wall Preparation for Fresco and Acrylic Murals.

3. Conservation Study for "Los Streetscapers" Mural lawsuit.

4. Conservation of six Arthur Mathews murals at the State Capitol.

5. Conservation study for "Lilly Ann" mural lawsuit.

6. Column, "The Mural Doctor" for Mural Conservancy of Los Angeles Magazine

7. Numerous lectures on Wall Preparation, Pigment Use, Paint Systems, Coatings, Consolidation of Murals, etc., to Artists Groups as well as Conservator Meetings.

8. Conservation Parameters for City of Inglewood, (Helen Lundeburg Petrachrome wall)

9. Complete Salvage, Conservation, Re–installation Procedures for 1800 categories of items for the House of Hospitality. Balboa Park, San Diego.
   (Supervised complete conservation of this $26,00,000.00 Project.

10. **Fauxcademy** weeklong presentation at the Venetian Hotel in Las Vegas for 400 attendees at the Fauxcademy Convention Las Vegas Nevada.One-week Power Point discourse on Fresco Technique and Conservation to four hundred symposium participants. PowerPoint presentation on NZA innovative Fresco Conservation techniques as well as innovative use of modern chemistry for the treatment and consolidation of Out-of-Door Acrylic Wall Murals.

11. **City Of Bishop California**:
    Extensive presentation on innovative mural techniques showing a lengthy PowerPoint demonstration of all techniques. Panel discussions, field demonstration of techniques, seminar participation.

12. **City Of Lindsay California**:
    PowerPoint presentation, field demonstration of techniques, and panel discussions.

13. **City Of Lompoc California**:
    Presentation of innovative NZA mural techniques.

A BRIEF SUMMARY OF THE CORE CONTRIBUTIONS OF NZA TO THE FIELD OF MURAL CONSERVATION:

1. NZA has developed a number of innovative varieties of "stacco" removal of very large frescoes by 1967 and at the age of 23, garnering international acclaim in the rarified field of Fresco Conservation.

2. NZA selected to conserve the famous Arthur Mathews murals for the California State Capitol Restoration Project in 1980.

3. NZA was employed by the City of San Diego (through the offices of the prominent Restoration Architect Wayne Donaldson) to completely supervise and manage the salvage, conservation and re-installation of 1,800 categories of historic and artistic features from the Historic House of Hospitality (From 1915 Balboa Exposition) situated in Balboa Park in San Diego in 1996.

   NZA created work procedures for the Salvage of the House of Hospitality, and directly supervised and participated in the removal of complete rooms without damage.

   These rooms, once conserved were replaced in the reconstructed building, as well as a very large proscenium arch in the main theater of that building. (The house of Hospitality is the first and only National Historic Reconstruction Project to be designated as one of approximagtely1800 Historic Monuments)

4. **NZA has performed innovative conservations techniques during the treatment by NZA, of frescoes painted by Orozco, Diego Rivera, Ramos Martinez, Bernard Zakheim, Ralph Stackpole, Victor Arnautoff, Millard Sheets, Albert Herter, Claire Falkenstein, Tanaka, Kent Twitchell, Judith Baca, Lorenzo Davis, Willy Herron, Rubin Brucelin, Rico Lebrun, and over 100 other artists.**

5. NZA developed a Proprietary Strappo Process for the removal of Acrylic Murals painted on concrete, stucco, and other masonry surfaces .

   This revolutionary technique resulted in a major change in state and federal law.

   Prior to the NZA Proprietary Strappo Acrylic Mural Removal technique, Out of Door Acrylic murals were not considered protected artworks under law, due to the fact that They could not be removed without also removing the masonry wall on which they were painted.

   Now by the NZA Strappo method, murals can be easily removed from their masonry walls without damage to the mural or unacceptable damage to the wall.

   On the basis of NZA's Strappo Technique, California Assemblyman Alan Sieruti was able to put through passage of legislation that then included Murals painted directly on Masonry surfaces as protected under California and then under Federal Law.

   NOTE:

   NZA developed a method of Consolidating Acrylic Murals painted over unstable and de laminating multiple paint sub-layers in such a way that all the paint layers become fused into one thick paint layer, **with the result that the longevity of the mural can not only be assured for over fifty years, but subsequent Consolidant applications can increase the longevity of a Treated Mural into perpetuity.**

6. NZA innovated its proprietary "Strappo" method of removal of very large Acrylic, Oil, and Fresco murals, involving removal of only the layer of mural paint from the masonry surface on which it has been directly painted, subsequently transferring this paint layer to a support surface, and then to another wall for permanent or temporary display.

7. **As a result of this process developed by NZA, Alan Sieroty, a member of California Legislature, facilitated the inclusion of out-of-door murals as protected under California Law, such that murals could now be removed**

from a building without substantially altering the surface of the building. NZA invented this technique for the Howard Warshaw, Channing Peake murals in Santa Barbara (13' x 25' x2 murals in 1976).

8. In 2003-2005, NZA removed the Kent Twitchell "7th St Altarpiece" double mural **painted directly on a concrete overpass support (55' x 20' each)** perfectly, using the Strappo Method invented by NZA.

9. In 3003-2005, **NZA removed 26 figures** of the Kent Twitchell Marathon Mural (250 ft long) and conserved them at the Playa Vista Howard Hughes aircraft hangar Studio of NZA.

10. In 2002, NZA perfected the greatest breakthrough technology for the conservation and maintenance of Acrylic out-of-door Murals in the history of the genre.

By this technology, involving **deeply penetrating Consolidant application of Paraloid B-72, both very old and very damaged Acrylic Murals** as well as brand-new Acrylic Murals (utilizing innovative wall preparation protocols designed by NZA) **can now be preserved into perpetuity,** at a low cost, using relatively low cost labor not requiring significant technical skill levels.

This method, which involves using the same technical-grade consolidant (used to consolidate Michaelangelo's Sistine Chapel Murals), fully complies with the letter as well as the spirit of the Code of Ethics of the AIC, IIC, and WAAC.

11. Up until 2009, NZA operated out of two large studio/labs (one for large works of art, and one for museum quality easel art, sculpture, objects etc.), NZA has maintained an extensive practice for museums, collectors and galleries using advanced conservation techniques.

12. NZA documents all of its projects, and all methods used and materials and chemicals used are fully noted and open for peer review as desired.

13. In addition to the mural projects completed by NZA, NZA has also conserved thousands of fine easel paintings by very prominent artists in the NZA Conservation Facility. NZA conserves paintings for many prominent galleries and collectors as well as museums in the Los Angeles area.

14. NZA, awarded thirteen mural panels out of a total of sixteen murals selected for conservation by Cal Trans, and **contracted by Cultural Affairs Department of Los Angeles, has been in the fortunate position to clearly demonstrate the new standards established by NZA for Continuously Renewable Mural Conservation, with spectacular success**.

PARTIAL LIST OF MURALS AND OUT OF DOOR ART CONSERVED:

1960's

1. **Removal of Cole Hall Frescos:** ("Ancient Medicine and Rational Medicine" University of California San Francisco - by Bernard Zakheim. (Relocated to HSW 2 at UCSF**. NZA introduced Proprietary Stacco method which revolutionized Stacco removal of Frescoes in Florence as well as Israel**.

1970's

1. "Ancient Jewish Wedding" Fresco: San Francisco Jewish Community Center Partial conservation of Bernard Zakheim Fresco in Courtyard of CCSF. San Francisco

2. "Almaden Indians" Panel Egg Tempera**: De Saisset Museum (University of Santa Clara) - by Clay Spohn**

3. Fresco: Piedmont High School - Claire (Von) Falkenstein

4. Celotex Mural: Piedmont High School

5, Fresco: Piedmont High School - by Tarada

6. Mural Piednont High School by Ralph Stackpole

7. Conservation of very large Earthquake Damaged Council Chamber Stenciled Ceiling for **Santa Barbara County Courthouse by** Dan Grosbeck

8. Removal of Historic "Eagles Gate Facade" from "Eagles Gate, Salt Lake City for Church of the Latter Day Saints.

9. Full Conservation of 12 Toland Hall Frescos "History of Medicine in California": University of California San Francisco - by Bernard Zakheim (These Frescoes had been wallpapered, the wallpaper painted with Oil and Alkyd paints, as well as holes drilled in each panel to hang portraits of UCSF Dignitaries.

10. **Richmond Post Office**: removal of **Victor Arnoutoff** Marouflage mural.

11. **Removal of Eagles Gate Terra Cotta Façade**: Salt Lake City Mormon Church for re-installation in lobby of new high rise office bld. (Time of Brigham Young)

12. **Reinstallation of 2 Cole Hall Frescos:** University of California San Francisco by Bernard Zakheim.

13. **Carved Wooden Polychrome Double Doorway Façade** in Barcelona Design: Santa Barbara County Library. (remove, consolidate friable wood, replicate polychrome, and re-install with rubber snakes to ward off pigeons).

14. **"Spirit of the Sea"** Sandstone Sculpture: Santa Barbara County Courthouse - **Revolutionary barium hydroxide reconsolidation of loose sandstone particles**

1980's

1. **"Prometheus" Fresco:** Pomona College Claremont- **by Jose Clemente Orozco.** All adjacent walls to mural were injected with low viscosity epoxy. A chimney behind the mural had a brick wall directly attached to the mural plaster. The bricks were removed, and the back of the mural fiberglassed with steel supports. Extensive consolidation of front of mural and Inpainting with Fresco Pigments. (3 year project)

2. **2 Frescos: Scripps College**, Claremont - **by Ramos Martinez.** (Clean and consolidate)

3. **"Genesis" Fresco Secco**: Pomona College Claremont- **by Rico Lebrun.** Painted with Poly Vinyl Acetate, the mural paint layer had been pushed away from the surface of the Keane Cement. A mist custom, Barium Hydroxide was applied with a Bonzai Sprayer, and the efflourescence dissolved, bringing the shreds of the Mural Paint Layer back in perfect alignment on the mural surface. B-72 was used to re-adhere the mural to the Kean Cement support. (3 year project)

4. Elaborate Conservation of deteriorated Sandstone Sculpture in front of Santa Barbara Courthouse. (**Consolidated deteriorated Sandstone with a proprietary formulation of Barium Hydroxide).**

5. **6 Historic Marouflage Murals: California State Capitol Building - By Arthur Mathews.** (Remove very darkened varnish, consolidate with Paraloid B-72, build 12 curved Aluminum Honeycomb Panels, apply Murals with vacuum and BEVA 371 Reversible Heat Seal adhesive, transported from Los Angeles to Sacramento and **installed by NZA into Designated Spaces in the Interpretive Museum of the Restored State Capital Museum). (8'x10' each)**

6. **6 Marouflage Murals**: Santa Barbara High School, (Clean, remove graffiti, in-paint, Museum Varnish).

7. **2 Marouflage Murals**: Santa Barbara Public Library **- By Albert Herter** (Remove Murals from library walls, conserve, and prepare hollow wooden mounting support, adhere with Beva 371, remount on library wall, install

conserved historic picture frame, create replica lower section of picture frame for one of the panels).

8. **2 Acrylic (Don Quixote) Murals** removed by Strappo: Santa Barbara City Library(12.5'x25' each) – One painted by Channing Peake and the other by Howard Warshaw. (This project was the inception of the NZA Strappo Technique, never before utilized for removal of Out of Door Acrylic Murals. The murals were pained directly on a previously painted wall using Shiva Color Acrylic Paint System. Each mural was consolidated with B-72, and a facing muslin was attached with rubber cement. The Mural was removed with air hammers vibrating the surface and then lined with fiberglass and re-mounted on a hollow fiberglass support. The murals were installed in the re-constructed Library entryway. The damage was so slight that all inpainting was accomplished by six assistants working a total of six hours. The Mural was then varnished and re-installed)

9. **4 Marouflage Murals**: Doheny Museum at St. John's Seminary, Oxnard California– By Detlef Samman (4'x20' each)

10. **2 Marouflage Murals**: Doheny Museum – **By Charles M Russell.** (Remove from wall, consolidate with B-72, museum varnish, mount on custom spring loaded stretcher bars designed and crafted by NZA mount in library room at Doheny Museum). (4'x20' each)

11. **1 Large Fresco** by lesser known artist: Ralph Stackpole's Studio Montgomery Street ,San Francisco.

12. **1 Small Fresco**: By Ralph Stackpole. **Ralph Stackpole's Studio**, Montgomery Street, San Francisco.

13. **Repair of Several Frescos**: Coit Tower of San Francisco – By Bernard Zakheim, Victor Arnoutoff, Tarada, Lucien Labaudt and others.

14. **Four Limestone Sculptures:** Santa Barbara Florentine Four Seasons - For Henry Andrea (Reconstruct loss areas and consolidate friable crumbled areas with **NZA proprietary Barium Hydroxide Consolidant.**

1990's

1. **Stacco removal of 3 Large Frescos**: Coronado Island - By Ramos Martinez, Using NZA proprietary "drawbridge technology" to lower the frescoes once separated from their support.

2. **I 4ft x 14ft Fresco:** Downtown LA Bullocks - By Millard Sheets (Strappo Removal mount on fiberglass support, install at Natural History Museum)

3. **8 4'x10' Oil Paintings** (painted directly on drywall): Laguna Beach High School - By Megan Jones (Strappo Removal)
   Rainforest Mural: Beverly Connection (Strappo Removal) (10'x 30')

4. **Don Bachardy Mural**: Peter Norton's House - By Kent Twitchell (Strappo Removal, then mounted on non-woven fabric.) (painted directly on Stucco Support)

5. **St. Lucy's and St. Gertrude Murals** - By George Yepes Consultation and Technical Support:

6. **World Wall Mural** Support System Design, and Preventative Conservation and Consolidation - By Judy Baca and SPARC (complete consolidation with multiple applications of B-72.) (800 gallons of B-72 applied). From completely faded, after consolidated, murals appeared to have regained 90% of "lost color" (fading was caused by loss of refractive index when the acrylic paint crumbled under UV light. The B-72 dissolved the Acrylic Mural Paint, and "re-formed" it so that the existent pigmentation was completely re-vitalized/

7. "**Guadalupe Mural"** Conserved and mounted on strong hollow wooden support) (Six Panels) - By Judy Baca of SPARC

9. **Historic Re-Construction of Marouflage Mural**: Downtown LA Federal Building - **By Lucien Labaudt** (12'x20') The Mural was re-constructed and mounted on a large custom panel that was then hung with iron clips to the wall of the Federal Building.

9. **"You Are the Star":** Hollywood, CA – Full Conservation and Consolidation of Acrylic Mural by Thomas Suraya

10. **Westminster Presbyterian Church**, Pasadena, CA – 100'x 400' Ceiling Mural Reconstruction following earthquake damage. Damaged areas of ceiling were completely re-painted using 35 shades of Mural Paint to match the original Heinsbergen patterns.

11. **Holy Cross Church**: Main St. Los Angeles – Conservation earthquake damage of 20'x 30'Apse Mural

12. **Westminster Presbyterian Church**: Fabrication of **multi-ton Replicate Spires** on top of Westminster Presbyterian Church Steeple **crafted from steel and fiberglass**. (Originals had fallen after earlier earthquakes) (Silicone casts were taken of the spire elements that had been distributed in many neighborhoods of Congregational Members in Pasadena. **Molds were taken "In Situ"** and then assembled into usable structures at a later date prior to installation on top of the Church Steeple).

13. Ventura Community Presbyterian Church: Conservation of Apse Mural. (Remove very dark varnish removed exposing vivid 22 carat gold leaf halos around saints in painting)

14. **Six church interiors:** After the 1992 earthquake in Los Angeles, NZA conserved six complete Church interiors including several Churches for the Catholic Archdiocese of Los Angeles, as well as a videography project for the installation of a George Yepes mural under the authority of Cardinal Mahoney of Los Angeles.

15. **Church of the Advent:** Adams St., Los Angeles - Conservation of Altar, Apse Mosaics, Tile, Floor, and aspects of Church Interior Design. (reconstruct apse cast glass mosaic. From several hundred shattered pieces. Replicate pottery floor tiles, move altar to face congregaton,, re-construct old altar).

16. **Transfiguration Church:** Martin Luther King Jr. Blvd., Los Angeles –Full conservation of 20'x30'Apse Murals, full conservation o6'x10' Stations of the Cross.

17. **Villa Park Murals**: Pasadena, CA – Acrylic **(15'high by 200'long)** (Clean, consolidate, apply B-72 as protective Consolidant. Apply anti graffiti coating.

18. **Brandelli's Brig Mural**: Venice Beach, CA – Innovative, state-of-the-art consolidation of totally flaked and cleaving acrylic over unspecified flaking paint – **By Art Mortimer** (Application of substantial spray coatings of B-72. so **At least ten layers of paint were laminated together so that the paint layer of the mural became more than ¼ inch thick.** Mural was pulled from wall in sections, and then reapplied to consolidated wall surface using Nova Super Gel. Although previously extremely flaked and delaminated, when consolidation process was complete, **In-painting was minimal.**

19. **Earthling Bookstore** Mural Installation: Santa Barbara – Marouflage

20. **"American Rhythm"** Marouflage Mural. By James Doherty. Full restoration of mural assembled out of a dozen torn pieces lined and then mounted on a structured wooden support in lobby of MCA Records and Universal Music

22. **Joel Silver "Flores De Mexico" Installation:** Conservation and installation of of "Flores de Mexico"Fresco by **Ramos Martinez in the Ricardo Legorreta designed home of Producer Joel Silver** - onto a 2 ton shock-mounted steel installation module designed and built by NZA. (Fresco on heavy steel support.

23. **Conservation of Still Life Fresco**: La Avenida Co. - By Ramos Martinez (installed in Coronado Library)

24. **Emergency Conservation of 2 Murals**: (Cal Trans) "Seventh St. Altarpiece" – By Kent Twitchell Los Angeles (100'x75') east exterior wall - By Kent Twitchell

25. **Wall Preparation, Product Design** and Technological Support for La Chamber Orchestra "Harbor Freeway Overture mural " By Kent Twitchell 3 panels 100' high. X 200' wide.

26. **Wall Preparation Technical Support and Installation**: White Memorial Hospital Mural - By George Yepes

27. "Mary Star of the Sea": 12' high Bronze Sculpture, San Pedro, CA - Repair extensive shattered damage to hollow cast figure caused by 1992 Earthquake . Reconstruct interior support system with expanded foam and aggregate epoxy. Prepare exterior surface with high tech epoxy coating and **apply 22 karat gold leaf.** install with Crane onto **120' tower of Mary Star of the Sea Church.**

28. **Federal building: Los Angeles, CA.** In depth cleaning and full Conservation of two Limestone Sculptures (14' high).

    Numerous Earthquake Damaged Liturgical Sculptures for Catholic and Lutheran Churches.

29. **Historic Reconstruction Of The House Of Hospitality; Balboa Park,** San Diego,California.Conservation Director for the twenty six million dollar Historic Reconstruction of the House of Hospitality in Balboa Park San Diego. NZA was hired by the City of San Diego and worked under the authority of Wayne Donaldson AIA to guide, instruct and plan the conservation of 1,800 salvageable design elements from the House of Hospitality, generate conservation parameters for the conservation of each item, and generate re- installation parameters for re-Hospitality is designated as a Historic Landmark, and its demolition and reconstruction in exact replica of the original was unprecedented in the history of Historic Preservation under the guidelines of the Department of the Interior. The project garnered more than 24 major awards for excellence in planning and execution. NZA was responsible for the salvage, conservation and re-installation segments of the project being within budget and within deadline.

30. **Santa Barbara Presidio** NZA crafted twenty wrought-iron sconces for the Santa Barbara Presidio restoration project. (The sconces were installed in the Presidio Chapel, and are fully authentic to the time, craftsmanship and patina).

31. **LA Mural Conservancy** Frank Romero Mural "Going to the Olympics": Consolidation of Mural Surface.

32. **Computer program for Michael Jackson mural**. (By Kent Twitchell) (Computer program created Pixels ¼ inch x ¼ with code in each pixel to show color to be used specific to each pixel. Result was a dramatically effective innovation in Mural Painting. Mural was to be installed on the East side of the El Capitan Theater in Hollywood. NZA designed a light show and faux smoke to be projected onto the mural the mural had Jackson with his arm on a steel mechanical strut extending beyond the wall on which the mural was to be applied. NZA invented a use for a polyester non-woven fabric on which the mural was painted as "marauflage". (Due to Mr Jackson's disastrous events in 1993, the project was abandoned after the earthquake caused significant damage to the El Capitan 0

33. **Chamber Orchestra Mural. "Harbor Freeway Overture"** (By Kent Twitchell) NZA developed the same pixel system as above, and the mural canvas was printed out on non-woven fabric and painted by a "paint by numbers" system. NZA installed the mural using Nova Gel and Nova Super Gel as adhesive. (100'x140').

34. **Veteran's auditorium**. Fresno Remove heavy overpaint from 8 large panels by **Heinsbergen.** Re-apply composition gold leaf "wave" designs around each mural segment. Inpaint and Museum Varnish.

35. **"Rainforest Mural"** (Beverly Connection) (Strappo removal of Acrylic Mural, mount on panels and transport to Ojai after conservation.

36. **"Two 12' Limestone Sculptures" Federal Building LA.** Remove discolored linseed oil Consolidant from the Indiana Limestone. (Solvent Vaccuum Treatment)

37. **"12 Garth Benton Marouflage Murals"** Parson's Technologies. (Clean, consolidate, in-paint, and final varnish.

2000'S

1. **"Theory and Science"** Fresco Secco Murals (reconstructon of lower 30%) by **Frederick Olmstead**: San Francisco City College. (Entry Staircase).

6. **Fresco: Stock Exchange,** San Francisco (Now City Club) - **By Diego Rivera**

7. **Conservation of Fresco: Art Institute San Francisco - By Diego Rivera (Designed for Rivera by Bernard Zakheim).**

8. **Applications of Consolidant Paraloid B-72 Judy Baca Great Wall Mural (½ mile long x 20' high)**

9. **Conservation and Removal of 12 Murals**: By Garth Benton for **Parson's Technologies** in Pasadena California.

10. **Conservation of Entry Way Mural and City Council Mural** in Burbank Calif. City hall**. (By Hugo Balin.)** (10' w x 20' high)

11. **Joel Silver Studios: Venice Beach Post Office** – Remove and Conserve Marouflage mural of Abbot Kinney By **Edward Biberman,** mount on 2" Aluminum Honeycomb Panel, **7'x17.' Abbot Kenney Mural for Producer Joel Silver (Producer of the Matrix Series)** (As of 3/18/2014) the fully conserved mural is **on display in the midst of three Interpretive Historic Rooms dedicated to the display of the Biberman Mural at Los Angeles County Museum of Art).**

12. **Curved Fresco Secco Mural**: MD Anderson Medical Center, Houston, TX – By Peter Hurd. **16.5' high, 48' long**, and **curved in a J-Shape on 5/8" crumbly plaster. Removed intact without damage.** Truss structure applied to back of mural, and full consolidation of friable 7/8" plaster consolidated with low viscosity Epoxy. Re-installed in City Library in Artesia Arizona .**Fresco Secco mural was painted on 5/8" friable plaster surface supported only by light expanded mesh, and ¾" "c" shape vertical rods** attached to the horizontal rods with baling wire. NZA applied an 8-ton multi-angled truss support to the front, and and an equal truss fabrication which was epoxied to the back of the consolidated mural. **The mural was removed in one piece** and shipped from Houston Texas to Artesia Arizona, where it has been installed in a new Municipal Library there

13. **Bernard Zakheim Collection**: Full conservation of over 30 large Wooden Warsaw Ghetto Holocaust Sculptures by Bernard Zakheim as well 16 full size frescoes and over three hundred oil and watercolor paintings.

14. **Ramos Martinez Mural**: Conservation And Installation of a Ramos Martinez for **The Coronado City Library,** Coronado California. NZA removed the six-ton fresco, 47' long and 8' tall, from the La Avenida Inn in 1995. In due time it was **brought to the NZA Studio Facility in the historic Howard Hughes airport buildings, in Playa Vista, California.** The conservation took two years and cost more than $250,000.00 to complete. The fresco is now installed by NZA in the City of Coronado Library facility. NZA moved the fresco from storage in North County, San Diego by air ride gooseneck truck to the Howard Hughes Airport facility, and similarly moved the fresco back to Coronado. Under the guidance and participation of NZA, in-house personnel
performed all installation work, and NZA served as consultant to the engineering staff that designed the installation framework. NZA Installed the multi-ton steel framework and expanding column systems

15. **One Block Long Mural** Los Angeles Cultural Affairs Department: Mid City Magnet School, Conserve, remove graffiti, in-paint and re-paint several sections of highly damaged areas.

16. **Judith Baca Sparc "Great Wall" Mural** Clean and consolidate **12' high mural x one half mile long.**

17. **City Of 29 Palms**: Consolidate 20 very large city murals: (we were honored celebrity guests of the City of 29 Palms.)

18. **B'nai Tikkvah Synagogue:** Remove and pack very large altar sculpture for storage.

19. **Two Marouflage Murals For Lincoln High School**, LAUSD. (5'x30' ft each Remove, conserve at **NZA Howard Hughes Airport studio**, mount on Gator Board, Apply to hallway wall with heavy Velcro.

20. **Hollenbeck High School**: Dorr Bothwell Lobby of High School Auditorium Frieze and Mural, For City Of LA. (Full conservation In Situ)

21. **Exact Replication Of Bernard Zakheim Mural**: Mineola Texas. Working from black and white photos, NZA, Nathan Zakheim working with three sons and two daughters, re-created this Mural with colors from Period Paintings by BZ. (7'x 15')(Installed in Mineola Texas with great honors and fanfare!

22. **Thirteen Banksy "Happy Coppers"**: figures. For English collecter/dealer Stuart Holt. (Remove wall composed of 2x4's and drywall, isolate and remount figures after removing total overpaint. Re-mount on display panels, and prepare to ship to England).

23. **San Diego State University:** Remove Tempera Mural From Concrete substrate and add interpretive portion destroyed during early remodel of building. Mount on custom designed panel, re-install in SDSU Library.

24. **Workman's Circle Mural**: Remove Graffiti, consolidate cracks and loose pieces of stucco on mural wall, Re-build loose structural elements behind the mural, work with original artist, Eliseo Silva, on re-touches of damaged mural (image.15'x 40')

25. **Jaya Mural for Venice Arts Council**: Consolidate and Supervise Artist repainting of Mural. Re-Consolidate after Artist's extensive restoration, and apply NZA proprietary anti-graffiti coating.

26. **"You are the Star"** Suraya (20' x 100'
Remove Urethane coating, consolidate and retouch.

27. **Los Angeles Unified School District**: 2 Bas Reliefs for Lincoln High School (consolidate, back with fiberglass, re-tone, strip and re-finish frames).

28. **Los Angeles Unified School District** : Lincoln statue for Lincoln High School. Strip multiple layers of paint, consolidate, strengthen casting from within, replace damaged segment.

29. **Workman's Circle :**(Robertson Blvd., Los Angeles). (15' x 40')
Remove Graffiti, strengthen wall, consolidate cracks with epoxy, re-touch damages, consolidate with B-72, and ply 2-part NZA AG Anti-Graffiti Coating.

30. **"Sex and Chocolate" by Banksy**. Remove from textured brick wall using NZA Strappo technique, and adhere salvaged paint layer to a 3-d fiberglass custom cast support, **(cast from original textured brick wall)** in-paint and crate for shipment to England.

31 **"13 Happy Coppers" By Banksy.**
Removed 20'x8' plasterboard wall, brought to NZA Conservation Facility, removed damagedover paint, and reinstalled on new supports as per Stuart Holt directions. Packed and Shipped to England.

32. **Conservation And Graffti Abatement Of Six Murals For City Of LA.**

33. **Conservation And Graffiti Abatement Of Four Murals For Operation Clean Sweep LA.**

34. **Two Hugo Ballin Murals For City Of Burbank** (Burbank City Hall)

35. **Lincoln High School:** Two Bas Relief Sculpture, And A Full Size Sculpture Of Abraham Lincoln.

36. **Bryce Banatyne Gallery**:
Pack and move 48' Ramos Martinez Fresco from Los Angelesto to town of Fillmore Ca.

37. **Gateway To Silverlake**:
Consolidate and apply anti graffiti sacrificial wax to eight Murals under Sunset Blvd.

38. **Jewish Center Of San Francisco**:
Conservation of Bernard Zakheim fresco. Remove mural by Stacco method, **re-mount on steel and fiberglass support,** and re-locate in stairwell of new Building for Jewish center

39. **La Cultural Affairs Department**: Conservation of Kent Twitchell's Strother Martin mural. Repair damaged stucco wall, remove graffiti, consolidate.

40. **City Of Coronado Installation of 7'x7' Ramos Martinez Fresco** for Coronado Library.

41. **Northrop Grumman**:
Conservation of 51 mural segments, mold abatement of mural segments, consolidation of mural segments and re-assembly and re-installation of 51 panel segment mural.

NZA was awarded thirteen Mural Artist' Multiple Paneled Murals located on Freeway Walls as well as Freeway Underpasses. NZA won the bids for thirteen projects, with the remaining three Mural Panels awarded to other Conservation Teams. These murals were contracted by Cal Trans and subcontracted by the Cultural Affairs Department of Los Angeles. **NZA was in a fortunate position to clearly demonstrate the new standards established by NZA for Continuously Renewable Mural Conservation with spectacular success.**

1. **Conservation of "Eye on LA**": 1984 Olympic Mural - By Alonzo Davis (Remove many layers of graffiti and "Cal Trans Grey" overpaint. Consolidate with B-72, re-touch under Alonzo Davis participation and direction. **NZA Proprietary Graffiti** Coating applied)

2. **Special Olympics Mural** LA FWY Kids" by Glenna Boltuch Avila (5,500 sq ft) **Remove all figures by "Strappo"** prepare wall, consolidate, re-apply conserved figures, paint background colors as per original intent of artist.

3. **Two Panels** by Rubin Brucelyn on 2 FWY (LA) (1,200 sq. ft. each)

4. **"Hitting the Wall"** (Two Panels by Judith Baca on 110 FW)(**3,000 sq ft total)**

5. **Two Acrylic murals painted by Kent Twitchell** with Nova Color Acrylics Artist paints directly on the concrete support for the 7th Street overpass on 110 FWY (1,200 sq ft each) using NZA Proprietary Strappo technique. Once fully conserved **(20'x50' each,** the murals were re-adhered to the Grand Avenue overpass over the 5/101 Freeway in downtown LA. Conservation consisted of cleaning the mural in situ, application of facing material, **removal of the paint layer directly painted on the concrete surface of the freeway underpass, transportation of murals to the NZA Playa Vista studio, Conservation of the murals, preparation of a new site for the murals on the 101 FWY, and reinstallation of the two murals on the 101 FWY.**

6. **26 Marathon Mural Runners** by Kent Twitchell near LAX on 405 FWY **(4,000 sq. ft.)** (Figures removed, **brought to NZA Howard Hughes Airport Studio**, conserved and re-mounted on 5 Freeway N near Stadium Way)(Conservation consisted in **Strappo removal of all 26 8'x16' mural figures,** and conservation in NZA Playa Vista studios. A new location for the mural was prepared by NZA, and the murals installed at that site. There was heavy damage by graffiti, and two years was spent in the conservation of the 26 figures).

7. **4 "Underwater Fantasy"** murals by Michelle Obregon (**Each 5,000.00 sq ft)** Remove extensive graffiti, consolidate, inpaint losses, apply NZA Anti Graffiti coating.

8. **"Struggles of the World"** by Willie Herron III (**2,500 sq ft)** Remove Graffiti, remove Cal Trans grey overpaint, consolidate, Inpaint, apply anti graffiti Sacrificial wax

9. **"Reach Out" Mural**; by Alonzo Davis (**3,000.00** sq ft. Remove graffiti, consolidate, in-paint damages and losses.

ART OF PROMINENT ARTISTS CONSERVED BY NZA:

Helen Lundeberg	Lorser Feitelson
Hans Burkhardt	Andy Warhol
Jean Charlot	Ramos Martinez
Jose Clemente Orozco	Oscar Fischinger
Edward Biberman	Lucien Labaudt
Diego Rivera	Rico Lebrun
McLaughlin	Kent Twitchell
Judith Baca	Eloy Torres
Victor Arnouto	Bernard Zakheim
Hugo Ballin	Charles M. Russell
Frederick Remington	Collin Campbell Cooper
Alexander Harmer	Albert Herter
Millard Sheets	Ralph Stackpole

CATEGORIES OF ARTWORKS CONSERVED:

Fresco Buono and Fresco Secco	Egg Tempera
Marouflage Murals	Oil Murals
Oil Easel Paintings	Limestone Sculpture
California Plein Air	Cowboy Art
WPA Art	Pre-Raphaelite

Spanish Colonial
Acrylic Murals and Paintings
Petrachrome Murals
Indian and Persian Miniatures
(in Ivory and Marble).
Paintings
Marble Sculpture
Greek and Russian Icons
Impressionist Paintings
Intaglio
Soapstone and Alabaster
Bronze Sculpture
Mosaic Murals
West African Sculpture
Patachitra(Palm Leaf) Painting Australian Bark
Cast Bronze Sculpture
Carved Wood Polychrome
Terra Cotta and Ceramic Sculpture
Craftsman/Art Nouveau
Japanese screens

EXPERT WITNESS TESTIMONY BY NZA IN ART RELATED LAWSUITS:

1. Los Streetscrapers vs. Shell Oil (Destroyed) ($450,000.00 settlement)

2. Chicano Park (Michael Schnor) (defective Coating) ($350,000.00 settlement)

3. Lilly Anne Mural (Chuy Campesano) (painted out) ($375,000.00 settlement)

4. Ed Ruscha Mural (Kent Twitchell)(painted out) ($1,100,000.00 settlement).

Appendix O-TL2

BRUNZELL
HISTORICAL

KARA BRUNZELL

Owner/Principal Historian (2009 – Present)
Brunzell Historical

1613 B Street Napa, California, 94559
707.290.2918 ♦ kara.brunzell@yahoo.com

EXPERTISE

Kara Brunzell has practiced in the fields of cultural resource management and historic preservation since 2007. She has served as a consulting historian on historical research investigations for federal, state, and municipal governments. She is proficient in the recordation, inventory, and evaluation of historic resources using the National Register of Historic Places (NRHP) and the California Register of Historic Resources (CRHR) guidelines as well as the production of historic context statements. She has acted as a cultural resource project manager since 2012. Kara is experienced in preparation of NRHP and local register nominations. Her expertise includes eligibility recommendations and findings of effects for Section 106 review and compliance. She is experienced in applying the California Environmental Quality Act (CEQA) to both large-scale survey projects and individual historic-period resources. Kara qualifies as a Historian and Architectural Historian under the United States Secretary of the Interior's Professional Qualification Standards (as defined in 36 CFR, Part 61). She is qualified to work in all California counties and has also completed projects in Nevada, Oregon, Washington, Texas, New York, New Jersey, Hawaii, and Puerto Rico.

EDUCATION

California State University, Sacramento, MA, Public History
UCLA, BA, History

VOLUNTEER

Board of Directors, Napa County Landmarks (2010 – Present)

SELECT PROJECT EXPERIENCE

Historic Context Statement Update; Carmel-by-the Sea, Monterey County, CA (current). Kara is project manager for an update of the City of Carmel-by-the-Sea's Historic Context Statement Update. Its focus is the research of historic contexts that shaped City of Carmel-by-the-Sea's development between 1966 and 1990 and integration of new information with themes in the existing historic context statement. The purpose of this effort to provide a framework for evaluation of twentieth-century resources. Kara has collaborated with City staff and local stakeholders to incorporate community input. Final deliverables will include an architectural style guide.

NRHP Nomination of Asilomar Conference Grounds, Pacific Grove, Monterey County, CA (current). Kara is preparing the NRHP Historic District Nomination of 21 buildings at Asilomar Conference Grounds on behalf of California State Parks. Her team is producing a historic context, architectural context, 10-900 form, and historic figures as well as preparing the photographic submission from existing photo-documentation. Designed by John Carl Warnecke and constructed between 1959 and 1968, the buildings were constructed outside the period of significance (1913-1936) for the Julia Morgan-designed buildings that are contributors to the Asilomar Conference Grounds National Historic Landmark. The buildings are important examples of the contextual architecture that characterized Warnecke's early career design aesthetic, and his master plan demonstrates groundbreaking sensitivity to the site and existing buildings.

Architectural History Effects Investigations for Telecommunications Projects, Ace Environmental LLC, (2019-current). Kara manages and authors effects to architectural resources studies for proposed cellular antenna installation and expansion projects located on historic-period buildings or within historic districts throughout California. Project impacts on historic properties are assessed in compliance with Section 106 of the National Historic Preservation Act of 1966, as amended, the Nationwide Programmatic Agreement for Colocation of Wireless Antennas, effective March 2001 and the Nationwide Programmatic Agreement for Review of Effects on Historic Properties for Certain Undertakings Approved by the Federal Communications Commission (March 2005) as well as subsequent relevant Report and Orders. The reports assess whether the proposed undertakings would result in direct or visual effects to historic properties. In 2019, Kara assessed more than thirty telecommunications sites throughout California in Los Angeles, Orange, San Bernardino, San Francisco, Sonoma, Stanislaus, and Ventura counties.

I-80/Ashby Avenue Interchange Improvement Project; Circlepoint, Alameda County (2019- current). Kara is preparing an assessment of the built environment resources (a radio station and tunnel) in the project study area for inclusion in a Preliminary Environmental Assessment Report for California Department of Transportation review. She conducted a field review, recorded buildings in the project area of potential effects on California Department of Parks and Recreation 523 forms, and is evaluating the recorded resources for NRHP and CRHR eligibility.

Bellflower Water Capture Project at Caruthers Park, Phase I and II; City of Bellflower California (2019). This project consistede of the design and construction of a regional stormwater project at the City of Bellflower's Caruthers Park. Kara prepared an evaluation of the existing facility for its eligibility for historic listing on the NRHP in order for the project to complete the 404 permitting process.

Adventure Park Multi-Benefit Stormwater Capture Project; Whittier, CA (2018). This project consists of the design and construction of a stormwater treatment facility at the City of Whittier's Adventure Park. Kara evaluated the park and adjacent water-control structures for eligibility as historical resources, the structures were recommended ineligible for historic listing.

Historic Resource Evaluation of Five Buildings at Oakland International Airport; Port of Oakland, CA (2018). Kara evaluated a mid-twentieth century maintenance hangar and four World War II-era buildings at the Oakland Airport for NRHP and CRHR eligibility. None were recommended eligible for historic listing.

NRHP Nomination of Capistrano Substation, San Juan Capistrano, Orange County, CA (2018). Kara prepared the NRHP nomination of the historic flour mill. Her team produced the historic context, 10-900 form, and historic figures as well as preparing the photographic submission from existing photo-documentation. Constructed as an electrical substation in 1917, the building is associated with the development of electrical power in Southern California. Additionally, the Classical Revival style building is architecturally significant as an example of the "Monumental" subtype of Southern California Edison electrical substations. The property was determined NRHP eligible in 2019, although owner objection prevented its official listing.

Interlake Tunnel Project: Monterey County Water Resources Agency; Monterey and San Luis Obispo Counties, CA (2017-2018). Kara evaluated the San Antonio Dam in Monterey and San Luis Obispo Counties for NRHP and CRHR eligibility. She produced a historic context of the water resources agency and a chronology of the dam's development, which was recommended ineligible for historic listing.

State Printing Plant and Textbook Warehouse Relocation and Building Demolition Project; California Department of General Services; Sacramento, CA (2017-2018). Kara prepared a California Public Resources Code 5024 evaluation of the mid-twentieth century printing plant as well as greenhouse and maintenance buildings located on the property. This included an evaluation for NRHP and CRHR eligibility, and eligibility as a California Historical Landmark (CHL), along with an accompanying report.

Department of Motor Vehicles Fell Street 5024 Evaluation; California Department of General Services; San Francisco, CA (2017). Kara prepared a California Public Resources Code 5024 evaluation of the mid-twentieth century building. This included an evaluation for NRHP and CRHR eligibility, and eligibility as a California Historical Landmark, along with an accompanying report. The building was found to be ineligible and the State Historic Preservation Office concurred with the determination.

NRHP Nomination of Sperry Flour Company, Vallejo, Solano County, CA (2017). Kara prepared the NRHP nomination packet including historic context, the 10-900 form, historic figures, and photo-documentation of the historic flour mill. Located on the eastern shore of Mare Island Strait, flour was milled on the site with few interruptions from 1869 through 2004. The district's most important resources are its World War I-era mill buildings, which are were designed by engineer Maurice Couchot represent an important early use of reinforced concrete in large industrial buildings. It was added to the NRHP in late 2017.

Los Gatos Creek Watershed Maintenance Program; San Jose Water Company, Santa Clara County, CA (2016). Kara evaluated elements of the San Jose Water Company for NRHP and CRHR eligibility as a non-contiguous historic district. She produced a detailed historic context of the private water company, which has been active from 1866-present, and recorded nine water conveyance structures, several of which were recommended eligible for listing because of their association with the historically significant utility.

Redwood Agricultural Inspection Station Repairs; California Department of General Services, Del Norte County, CA (2016). Kara evaluated the Redwood Agricultural Inspection Station in rural Del Norte County for NRHP, CRHR, and California Historic Landmark (CHL) eligibility. The unique building was designed by California State Architect Alfred Eichler at the start of his career and constructed in 1931, and was recommended eligible for NRHP and CRHR listing based on its significant architecture.

Jesse Unruh Building Roof Replacement Project; California Department of General Services, Sacramento, CA (2016). Kara acted as architectural historian for this project, which involved project review for a proposed roof repair project by the California Department of General Services on the NRHP-listed Jesse Unruh State Office Building on the Capitol Mall in Sacramento. She performed a field visit to and prepared a letter to SHPO detailing condition of roof skylights.

Architectural Historian for Architectural/Historical Evaluation of Eight Buildings on the Parcel Northwest of Jurupa Avenue and Cedar Avenue, Bloomington, San Bernardino County, CA (2016). Ms. Brunzell acted as Architectural Historian on an Architectural/Historical evaluation of eight historic-period buildings in Bloomington.

Section 106 and CEQA Compliance Tasks for the GRID Roads Bookends Project, American Canyon, Napa County, CA (2016). Kara acted as Architectural Historian on Section 106 and CEQA Compliance Tasks for the GRID Roads Bookends Project in American Canyon, California.

Architectural/Historical Evaluation and Review of Proposed Project for Beltane Ranch; Sonoma County, CA (2015-2016). Kara conducted an Architectural/Historical evaluation and review of proposed project for Beltane Ranch near Glen Ellen in rural Sonoma County. The ranch complex is significant under several contexts including the development of winemaking in Sonoma County. Its most important context is its association with African-American San Francisco pioneer Mary Ellen Pleasant (known as the mother of civil rights in California) who owned the property in the 1880s and built its architecturally significant ranch house. Kara reviewed a proposed alteration to the barn for conformance with the Secretary of Interior's Standards for the Treatment of Historic Properties and produced a recommended treatment plan.

Architectural/Historical Evaluation and Archaeological Survey of Santa's Village in Skyforest, San Bernardino County, CA (2015). Kara acted as Architectural Historian on an Architectural/Historical evaluation of a historic-period theme park in near Lake Arrowhead in the San Bernardino Mountains. The project also required archaeological investigation of the site.

Historic Resources Survey, NASA/Jet Propulsion Laboratory, Pasadena, California (2015). The historic resource survey was conducted for the National Aeronautics and Space Administration's (NASA's) Jet Propulsion Laboratory (JPL) Pasadena facility. Kara acted as consulting historian, participating in the survey on behalf of NASA's JPL in order to determine if the historic-period buildings and structures not previously evaluated are eligible for listing in the NRHP. In addition, Kara assisted in analysis of whether the seven previously-determined eligible buildings and structures at the JPL facility (and the 20 buildings and structures that are the subject of this survey) possess a linkage historically or aesthetically and retain their historic significance and integrity to merit listing in the NRHP as a historic district.

Historic Context Survey of Davis; Yolo County, CA (2014-2015). Kara managed a Historic Context Update Survey for the City of Davis. The project, which was funded by SHPO's Certified Local Government grant program, included a detailed historic context of the years between 1940 and 1975, field survey of previously un-surveyed neighborhoods developed before 1975, DPR 523 update, and new DPR 523 District forms for roughly 150 subdivisions. Kara collaborated with the Davis Historic Resource Management Commission in order to leverage the impact of the limited grant budget, leading a team of community volunteers in a field survey effort that covered most parcels in a seven square-mile area. The final product incorporated the results of new research and field survey with the City's three existing Historic Context Statements and updated DPR 523 forms for over 300 resources on its Historic Resource Inventory.

Historic Architectural Evaluation of the Delta Research Station; Rio Vista, Solano County, CA (2014-2015). Kara authored a historical architectural evaluation of a former USACE base located in Rio Vista, California. The site, which was originally called the U.S. Engineers Storehouse, was established in 1911 by USACE as a repair and storage facility associated with the Sacramento River Flood Control Project. Kara evaluated the 20 extant buildings and structures on the site and recommended them eligible to the CRHR as a historic district.

Historic Context Survey and Historic District Nomination for the Newton Booth Neighborhood; Sacramento, CA (2013-2014). Kara prepared a historic context statement and historic district nomination for the Newton Booth neighborhood in Sacramento. The project included extensive recordation of the primarily residential neighborhood, a detailed neighborhood history, determination of contributing status for each property within the district, DPR 523 forms for individually eligible landmarks, and preparation of a Sacramento Register nomination form for the historic district. Kara worked with interested parties including the City of Sacramento's Preservation Director, the Sacramento Old City Association, and the Newton Booth Neighborhood Association in order to incorporate community input into the project.

Cultural Resources Assessment, Monterey Peninsula Water Supply Slant Test Well Project, City of Marina and Unincorporated Monterey County, CA (2013). Kara contributed research and architectural analysis to the cultural resources assessment of a historic-period cement plant.

Historic Buildings and Structures Inventory for Fort Hunter Liggett, Jolon, Monterey County, CA (2012-2013). Kara participated in the preparation of an update to the existing Fort Hunter Liggett inventory of historic buildings. The project included the recordation and evaluation of twenty historic-period buildings located with the boundaries of Fort Hunter Liggett. None of the buildings were recommended eligible for the NRHP of the CRHR.

Schulte Road Bridge Replacement Project Cultural Mitigation Measures; Monterey County, CA (2012). Kara acted as Project Manager and Principal Historian for Cultural Mitigations of the Schulte Road Bridge Replacement Project in rural Monterey County. The project EIR recommended detailed recordation of the bridge, which dated from the immediate postwar era, as a partial mitigation for the destruction of a historic resource. Kara authored a HAER-type report on the bridge and coordinated the preparation of permanent archival photographic documentation of the bridge.

EXHIBIT 2

INSTRUCTIONS FOR RECORDING HISTORICAL RESOURCES

Office of Historic Preservation
P.O. Box 942896
Sacramento, CA 942196-0001

March 1995

This publication has been financed in part with Federal funds from the National Park Service, Department of the Interior. However, the contents and opinions do not necessarily reflect the views or policies of the Department of the Interior, nor does mention of any trade names or commercial products constitute endorsement or recommendation by the Department of the Interior or the California Office of Historic Preservation.

PREFACE

This manual is the result of many hours of effort by a diverse consortium of preservation professionals and other interested persons. The effort was coordinated by the California Department of Transportation through an agreement with the California Office of Historic Preservation. The goals of the effort were to:

- Facilitate the integration of the Historic Resources Inventory and the California Archaeological Inventory;
- Encourage the collection of information about all types of historical resources;
- Permit more flexibility in the way information is collected; and
- Improve access to information about historical resources.

This manual builds on the knowledge and practical experience gained from the development and use of the Handbook for Completing an Archaeological Site Record (Office of Historic Preservation 1989b) and the Instructions for Completing the California Historic Resources Inventory Form (Office of Historic Preservation 1990). The procedures and forms described in this manual are designed to eventually supersede both existing manuals and their respective recording forms (DPR 422 and 523). The new forms in this manual have been assigned temporary designations within the DPR 523 series. The forms will be considered and labeled as the new DPR 523 series when these procedures are formally adopted.

It is recognized that the adoption of the recording procedures in this manual will also require ancillary changes in the California Historic Resources Inventory Survey Workbook (Office of Historic Preservation 1986) and California Archaeological Site Inventory: Information Center Procedural Manual (Office of Historic Preservation 1989a).

Please direct any questions or comments about this manual to the California Office of Historic Preservation at:

Appendix 8: List of Regional Information Centers

INTRODUCTION

Access to information about historical resources is a prerequisite for preservation efforts. Informed planning hinges on the use of that data and information about historical resources also plays an important role in research and education. In the absence of such information, historical resources may be harmed by development or even natural deterioration without consideration of the public loss. For that reason, managing information about historical resources is a fundamental role of the California Office of Historic Preservation (OHP).

The new recordation procedures described in this manual comprise a single system for documenting the full range of values present in a given location. As such, they are similar to the National Register of Historic Places (NRHP) nomination form. Like the NRHP form, California's new historical resource recording system provides for the collection of certain fundamental information about every resource on a simple one page form called a Primary Record. The Primary Record is designed to be used by anyone wishing to record a resource. A variety of more specific forms can then be used to supplement that information with further descriptive data and a statement of significance where appropriate.

This manual establishes guidelines regarding the kinds of resources that merit recordation and the different levels of information it may be appropriate to gather about them to meet a variety of user needs. The scope and organization of the information managed by the OHP is first explained in this introductory section. Detailed instructions are then provided for recording all kinds of historical resources. Other OHP publications are being developed to explain changes in how that information will be managed.

The Scope of OHP's Filing System

For the longest time historical resources have been conceived of as buildings, structures, objects, and archaeological sites. That perspective has changed recently as more is learned about peoples of differing ethnic and economic backgrounds and their relationship to historical resources. A broader spectrum of resource types are now recognized, and awareness also has increased regarding the diverse values associated with historical resources. Both factors have contributed to the development of a more comprehensive and holistic view of the historic environment embodied in the use of concepts such as "cultural landscape."

The California Office of Historic Preservation (OHP) is committed to developing an increasingly comprehensive and integrated system for managing information about all types of historical resources in order to accommodate this holistic view of the historical landscape. The scope of the information the OHP manages will continue to broaden to meet the diverse legal, educational, research, and other needs of its many users. Integration of the files will contribute to the efficiency of that filing system, facilitating access to information and enhancing awareness of all aspects of California's diverse cultural landscape.

The information currently managed by the OHP and its regional Information Centers includes a variety of specific information about historical resources, as well as reports describing how those resources were identified, evaluated, and treated. The files for specific resources have been divided historically between the Historic Resource Inventory (HRI) and the Archaeological Inventory (AI). That separation has created a number of management problems, as discussed by the National Park Service (1990c) and the OHP (1991a). One solution to those problems is to integrate the HRI and AI files--a process now underway. The recordation procedures described in this manual are designed to facilitate that integration.

The OHP's filing system also manages reports documenting survey, treatment, and registration activities. Survey reports provide crucial information about the adequacy of efforts to identify historical resources and thus constitute another important source of information managed by the OHP. While this manual does not provide detailed instructions for conducting surveys, the forms explained here do provide mechanisms for cross-referencing reports, registration programs, and decisions about the significance and treatment of each

resource.

Information about how to conduct and report survey activities can be found in National Register Bulletin 24 (National Park Service 1985), the Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation (National Park Service 1983), and California Historic Resources Survey Workbook (Office of Historic Preservation 1986). Appendix 6 summarizes the fundamental topics that the Secretary of the Interior recommends covering in reports describing reconnaissance and intensive surveys, while more detailed suggestions are offered in Archaeological Resource Management Reports (ARMR): Recommended Contents and Format (Office of Historic Preservation 1989a).

What Kinds of Resources Merit Recordation?

A broad threshold is set here for the kinds of resources that may be recorded for inclusion in the OHP's filing system. That threshold is designed to encompass resources that have been formally evaluated, as well as those whose importance has not yet been determined. **Any physical evidence of human activities over 45 years old may be recorded for purposes of inclusion in the OHP's filing system**. Documentation of resources less than 45 years old also may be filed if those resources have been formally evaluated, regardless of the outcome of the evaluation**.**

The 45 year criteria recognizes that there is commonly a five year lag between resource identification and the date that planning decisions are made. It explicitly encourages the collection of data about resources that may become eligible for the NRHP or California Register of Historic Resources (CRHR) within that planning period. More restrictive criteria must be met before the resources included in OHP's filing system are listed, found eligible for listing, or otherwise determined to be important in connection with federal, state, and local legal statutes and registration programs.

The OHP recognizes that there are a wide range of reasons for recording historical resources. It is understandable that within the constraints of a survey's objectives it is not always reasonable or appropriate to record all historical resources as defined here. Professional judgement in the field is essential when determining whether or not a resource warrants recordation. The scope of surveys may be defined by specific legal criteria. In such cases, survey methods may be clarified through consultation and agreement with the State Historic Preservation Officer.

Professional surveys that do not evaluate resources against specific legal criteria should record all resources that meet the broad threshold set here when those studies are conducted in connection with planned developments. Detailed recordation of all but the most limited resource types is generally required for such project-driven, non- evaluative professional surveys.

Surveys conducted for reasons other than development activities may focus on a narrower range of resources based on the user's need for information. For example, a thematic survey may focus exclusively on the identification of a certain type of resource or a reconnaissance survey may be conducted to develop a management plan for a large tract of land. The submission of records not produced as the result of surveys are also encouraged.

Classifying Historical Resources

After discovering a historical resource it is useful to classify it. The OHP has adopted the NRHP resource categories as a basis for initial classification of California's historical resources. More detailed classification is then based on the presence of any of the attributes listed in Appendix 4. The NRHP categories are defined by the National Park Service (1990b:4-5) as follows, and examples of each category are provided in Appendix 5:

Building: A building, such as a house, barn, church, hotel, or similar construction, is created principally to shelter any form of human activity. "Building" may also be used to refer to a historically and functionally related unit, such as a courthouse and jail or a house and barn.

Structure: The term "structure" is used to distinguish from buildings those functional constructions made usually for purposes other than creating human shelter.

Object: The term "object" is used to distinguish from buildings and structures those constructions that are primarily artistic in nature or are relatively small in scale and simply constructed. Although it may be, by nature or design, movable, an object is associated with a specific setting or environment.

Site: A site is the location of a significant event, a prehistoric or historic occupation or activity, or a building or structure, whether standing, ruined, or vanished, where the location itself possesses historic, cultural, or archaeological value regardless of the value of any existing structure.

District: A district possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development.

The OHP encourages a comprehensive approach to identifying historical resources. In that approach all historically associated and/or physically superimposed resources are documented together as elements of California's cultural landscape. Even if you lack the expertise needed to record all aspects of a resource in detail, you are urged to provide a brief summary of the full range of values that may be present whenever feasible in Fields P3b and B11. This will ensure that each element receives more routine consideration in the planning process.

When conducting a comprehensive survey you should generally record large and complex cultural landscapes as districts. Small, simple groupings of resources such as a historic building constructed on top of an archaeological site or a house with an associated garage or barn are most appropriately documented together as an individual historical resource using a single Primary Record to index all of the values present and detailed recording forms, as appropriate, to present more detailed information about each component.

It should be emphasized that some resources lacking individual distinction nevertheless may contribute to the understanding and appreciation of California's history and prehistory. Such resources may include, but are not necessarily limited to isolated archaeological artifacts and remnants of cultural landscapes. **If a resource cannot be readily classified as one of the five National Register types defined above, the checkbox for "other" in Field P4 may be marked to designate the presence of an isolate or very minor resource**. The "other" checkbox should not be used for features that clearly fall into one of the National Register types. You are encouraged to document isolated and minor resources however it is most sensible to do so, either as individually recorded entities documented to the minimum standards discussed below, or as features of larger historical resources.

The term "feature" is used in this manual to refer to minor components of historical resources. Features generally consist of small constructed works, discrete activity areas, landscaping, earthworks, non-portable natural objects modified by human use, and other similar cultural entities. They include, but are not limited to values such as: a garage or landscaping associated with a house; a gate valve associated with a ditch; an adit, tailings, or ruined mill that are part of a mining complex; or a trash pit, orchard, discrete activity area, bedrock milling station, rock art panel, or carved tree associated with a site.

Traditional cultural properties (TCPs) are an important aspect of California's cultural heritage that are

receiving long-overdue attention. The California Native American Heritage Commission has maintained an inventory of sacred sites for many years. In 1988 the OHP published Five Views: An Ethnic Sites Survey for California (1988) to promote awareness about resources important to several ethnic groups including Native Americans. The OHP specifically encourages the documentation of TCPs on a Primary Record as a basis for including information about them in the file system. More detailed information about TCPs may be documented depending on the need for information about that resource. Consult National Register Bulletin 38 (National Park Service 1990a) for information about how to conduct a survey of TCPs.

How Much Documentation Is Enough

The recording forms in this manual are designed to meet a wide range of needs for information about historical resources. They allow reasonable discretion regarding the level of information that is collected based on each user's needs and the relative value of the resources that are being documented. That flexibility is intended to encourage the recordation of historical resources not consistently incorporated into the OHP's files up to this time. Examples of all the forms discussed in this manual are provided in Appendix 1.

The minimum documentation needed before the record for a qualifying resource will be included in OHP's filing system generally consists of a completed one page Primary Record and a Location Map. However, the Location Map is optional for resources on small parcels of land in urbanized areas when a street address is provided. More detailed descriptive information and evaluations can be documented on the Building, Structure, and Object (BSO) Record; Archaeological Site Record; and District Record to meet needs not satisfied by the minimum threshold. A Sketch Map should also be prepared to accompany most detailed records.

The minimum level of documentation is designed to provide an initial record for all types of resources. It may even provide relatively complete descriptive data for simple resource types such as isolated archaeological finds and minor historic landscape features. However, it is important to emphasize that the Primary Record (and a Location Map when required) is **strictly non-evaluative** and constitutes the **minimum** documentation needed to include a record in OHP's filing system. Professional surveys conducted in connection with planned development projects should generally record all but the very simplest resources with a Primary Record, Location Map, **and** an appropriate detailed recording form or forms (e.g., BSO Record, Archaeological Site Record, and District Record).

Several optional records have also been designed for use in conjunction with any of the aforementioned records. They include a Linear Feature Record, Milling Station Record, Rock Art Record, Artifact Record, Photograph Record, and Continuation Sheet. Use of the optional forms is entirely discretionary and may be combined with either minimal or detailed recordation as appropriate.

In keeping with the flexible nature of this recordation approach, surveyors recording at the minimum level of documentation (e.g., the Primary Record) may opt to provide additional information, as desired, on a Continuation Sheet. Data fields / entries from any of the detailed and optional recording forms in this manual may be selected and used to organize the information presented on a Continuation Sheet. Every data field has been assigned a unique designation composed of a letter (signifying the record it came from) and number to facilitate such customized presentations.

Format Requirements and Submission of Records

All records submitted for inclusion in the Inventory must be typewritten or computer-generated. Fields marked with a sidebar, asterisk, and boldface type in this manual must be completed. Please make every effort to produce clear and easily readable maps, photographs, and drawings when they are required.

The use of computers is encouraged in the production all of the records described in this manual. Every

required data field must be included on computer-generated forms, with header blocks presented as they appear on the sample forms. For records documenting buildings, structures, and objects it is preferable to format computer-generated records the same as those reproduced in Appendix 1, with continued text placed on a Continuation Sheet. It is particularly helpful to keep the photograph (required for buildings, structures, and objects in Field P5 on the Primary Record) on the first page of a record. When a photograph is not required, this space may be utilized for continuous text entry.

For records documenting sites the text of computer-generated data fields should usually be entered as a continuous block, with paragraphs used to break the text up as appropriate. Lengthy entries should generally be introduced with a paragraph that summarizes the data in that field. District Records may be produced with either continuous text or the use of a Continuation Sheet.

The OHP encourages you to submit all types of data about historical resources for inclusion in its filing system, from minimal records to detailed documentation, reports, registration data, and other pertinent information. Each type of information will further preservation efforts and contribute to greater awareness of the value of our rich and varied history and prehistory. Recorders are urged to submit two copies of each record to the appropriate regional Information Center listed in Appendix 8 soon after completion of a survey. Upon acceptance, the Information Center will assign a Primary Number and forward one copy of the record to the OHP for inclusion in its Central Records. A survey report is normally expected to accompany or follow any submission of detailed recording forms resulting from a professional survey.

For built resource surveys conducted in connection with federal undertakings it is acceptable to submit one copy of the survey report to the appropriate Information Center after completion of the study and a second copy can then be submitted directly to the OHP. In such cases, the second copy should identify each resource by the Primary Number assigned by the Information Center. For surveys funded through the OHP, records and survey reports should be submitted in accordance with the contract.

THE MINIMUM LEVEL OF DOCUMENTATION

The Primary Record and a Location Map provide the minimum level of information needed to include a record in the OHP's filing system. The Location Map is optional for buildings located on small parcels of land in urban areas when an address is provided. This minimum level of documentation is designed to provide an initial record of all types of historical resources including buildings, structures, objects, sites, and districts, as well as cultural landscapes (sites) and traditional cultural properties (many of which are classified as sites).

How to Prepare a Primary Record

The following are step-by-step instructions for completing the Primary Record. Please note that **required information is indicated with a sidebar, asterisk, and bold type** in the instructions that follow.

Header Block: Information provided in the header block will be used to track resource records and the decisions made about a documented resource. Enter the appropriate information in the spaces provided for Primary Number, Trinomial/HRI Number, Other Listings, and NRHP Status Code when known. The space provided for Review Code, Date, and Reviewer will be completed by the OHP or Information Center staff and **should always be left blank**.

Primary Number: Enter a number only if it has already been assigned by OHP or an Information Center.

Trinomial/HRI Number: Enter a number only if one has already been assigned by OHP or an Information Center.

NRHP Status Code: If only a Primary Record is filled out, enter a 7 in this field or leave it blank. You may enter a National Register Status Code other than 7 if an evaluation supported by a BSO Record, District Record, or other detailed documentation is attached.

Other Listings: Enter any national, state, and local designation programs in which the resource is listed. Provide a reference number if applicable. Enter only those designations already approved at the time of recordation. Use the following abbreviations: HABS (Historic American Building Survey), HAER (Historic American Engineering Record), NHL (National Historic Landmark), SHL (State Historical Landmark), CPHI (California Point of Historical Interest), CRHR (California Register of Historical Resources); or provide the name of the local register where applicable.

***Resource Name or #:** Use this field to provide an identifier that can be used to link all the pages of the record. The identifier can be a historic or common name, parcel number, or any other designator which will consistently refer to the resource.

P1. Other Identifier: This space may be used to provide an identifier that relates to a project name, agency designation, or other unique identifier.

***P2. Location:** First, indicate whether or not the location of the resource should be kept confidential. Then provide the name of the county (or counties) (Field P2a); USGS 7.5' quadrangle, township, Range, and portion of a Section (Field P2b); and an Address (Field P2c) and/or UTM coordinate(s) (Field P2d). Other locational information may be provided in Field P2e as needed.

A Location Map must be attached to the Primary Record for sites, as well as other resources that do not have a street address. Locations Maps are also recommended for resources on large parcels where an address may not satisfactorily pinpoint the location of the resource within the parcel.

***P2a. County:** Give the name of the county or counties in which the resource is located. If it is located in more than one county, put the county containing the majority of the resource first. Include the appropriate county and state for resources that extend outside of California.

***P2b. USGS 7.5'Quadrangle, Township, Range, and Section:** Provide the name of the USGS 7.5' quadrangle(s) that cover the area in which the resource is located and describe its legal location to the nearest quarter quarter section where possible. For large or linear resources spanning an extensive geographic area it may be helpful to provide several legal descriptions. Indicate the township, range and base meridian for each legal description.

P2c. Address: Enter the complete address for the parcel on which the resource is located if one exists. Include the street or highway number and name, town or city, and zip code. For numbered highways, use "State Route" or "County Road" followed by a number.

P2d. UTM: UTM coordinates are required for sites, and should also be used for other resources that either do not have a street address or cannot be accurately located by the address due to the size of the parcel. For example, linear structures rarely have addresses and many rural buildings are located on large parcels. In such cases, UTMs should be provided to more accurately pinpoint the location of the resource.

Begin by entering the name of the U.S. Geological Survey quadrangle(s). Note the date the map was published or photorevised. For resources less than 10 acres, enter the UTM reference for the point corresponding to the center of the resource. Four UTM references are required when identifying the corners of larger resources. UTM references should be provided for both ends of linear structures and sites (or for the recorded segment of that resource). When more than one UTM reference is given, each

reference point should be depicted on a Location Map. Refer to Appendix 3 for further information about how to calculate UTMs.

P2e. Other Locational Data: While no further locational data is required, it may be helpful to supply additional information such as a parcel number; lot, block, and subdivision; and/or directions to a resource. Parcel numbers may be particularly useful to local governments that make decisions affecting historical resources. For resources that are particularly hard to find, it may even be necessary to supplement the Location Map with an Access Map showing how to get to the resource from an easily identifiable landmark.

***P3a. Description:** Provide a concise, well-organized description of the resource. Describe its physical characteristics and appearance and summarize any features that are associated with it. Where possible, note all aspects of the resource you observe, even if some of those elements are not recorded in detail.

Descriptions of buildings, structures, and objects should identify construction details, materials, workmanship, and alterations. Buildings are often described in terms of overall shape, number of stories, siding type, roof shape and materials, dormer shape, window location and pattern, door location, porch type, and ornamentation. Information on the nature and extent of any alterations should also be included. Boundary descriptions may be brief and may refer solely to the resource's parcel where appropriate. Describe the area outside the boundaries, mentioning as appropriate landscape, use, architecture, and other aspects related to setting.

Descriptions of linear structures and linear sites should include an overview of the entire resource when possible, even in cases where only a segment of that resource is recorded. The overview should attempt to describe the type of resource, when it was constructed, how long it is, its shape, its origin and destination, how it was constructed (e.g., materials, workmanship, special engineering accomplishments, etc.), its setting and physical condition, and to a limited degree, its function. When only a portion of a linear resource has been examined in the field, that segment should be identified on the Location Map.

Descriptions of sites should summarize observed physical characteristics and major cultural and natural features (e.g., midden, lithic scatter, shell mound, housepits, rock art, bedrock milling features, etc.). While interpretive comments may also be included, the principal goal of this section is to describe the site in as much detail as possible.

When recording traditional cultural properties, the description should be based on information provided by members of the community historically associated with that resource. Refer to National Register Bulletin 38 (National Park Service 1990a) for further information about recording TCPs.

Descriptions of districts should briefly summarize overall characteristics, setting, and the numbers and types of contributing **and** non-contributing resource elements. Discuss the characteristics that link the elements of the district and give it coherence. Mention natural and cultural features as appropriate. If you are describing an element of a district, provide the Primary Number and/or the resource identifier of the district, when known.

***P3b. Resource Attributes:** Enter those attributes which best define and describe the resource from the list of Resource Attributes in Appendix 4. Provide the code and a brief description for each attribute identified. For example, a complex resource may contain several attributes, such as a "(HP2) single family property," "(AH2) building foundation," and "(AP4) bedrock milling feature." The codes provided in this data field will enable attribute-based record searches which, when combined with other variables, will faciliate contextual research.

***P4. Resources Present:** Check the category or categories that best describe the resource that is being documented using Appendix 5 and National Register Bulletin 15 (National Park Service 1990b) for reference.

When documenting a resource with superimposed elements such as a building located on top of an archaeological site, check all categories that apply. If the resource is part of a district, check the box for "Element of District" in addition to the appropriate box (or boxes) that define the kind of resource. If the record is being prepared to document a district, check the district box.

***P5. Photograph or Drawing and Description:** A clear and descriptive glossy 3-1/2"x5" black and white photograph is required for all records documenting buildings, structures, and objects, and may also be supplied when documenting sites (including isolated finds and minor features). Describe the subject, view, date the photograph was taken, and the accession number of the photograph (roll and frame #) in Field P5b. Place the print in a clear polyethylene or polypropylene envelope and affix the envelope to the record in the space provided using transparent tape, preferrably an archivally stable brand. Scanned halftone images **may** be an acceptable substitute for original photographs; however, you should consult with staff at the OHP and regional Information Centers of the California Historical Resources Information System **before** submitting records with such graphics.

Photographs of buildings, structures, and objects should provide an overview of the resource in its setting, or a detailed view of the resource itself where appropriate. One contemporary photograph showing the front and one side of the resource is usually sufficient. For some resources, however, it may be useful to provide additional views, supplementary historical pictures, photographs of details, and photographs of ancillary structures, placed on Continuation Sheets. This space also can be used for a drawing, plan, or map of minor resources and isolated archaeological finds; or for supplementary text where a photograph or other graphics are not required.

***P6. Date Constructed/Age and Sources:** Indicate whether the resource is prehistoric, historic, or both, list the construction date or period of use, and briefly describe how that date or period was determined. Indicate whether the date or period of use is factual or estimated. The term "historic" applies to all historical resources associated with non-indigenous peoples, as well as those used by Native Americans after direct contact with non-indigenous peoples. The term "prehistoric" applies to all historical resources used by Native Americans prior to direct contact with non-indigenous peoples. Cite any references used to determine the age of the resource.

***P7. Owner and Address:** Give the name and address of the resource's current owner(s). If the owner is a government agency, clearly identify the agency by name (not simply “the State of California” or “the federal government”). You may give the name and address of the managing unit. Enter "unknown" or "withheld by owner" if appropriate. Ownership information is often required before a historical resource can be listed on various state and national registers or to meet local recordation requirements.

***P8. Recorded By:** Enter the name of the person who prepared the record, indicating their agency or organizational affiliation, if appropriate, and provide a complete address.

***P9. Date Recorded:** Indicate the date the record was prepared.

***P10. Survey Type:** Indicate whether the resource was recorded as the result of an intensive survey, reconnaissance survey, or other activity (e.g., volunteer effort) and describe the purpose of that effort. The terms "intensive survey" and "reconnaissance survey" are defined for the purposes of this entry in relation to the Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation (National Park Service 1983). Appendix 6 briefly summarizes those definitions and the basic report contents that are recommended by the Secretary of the Interior for each type of survey.

***P11. Report Citation:** Provide a complete citation for any report or publication documenting the discovery of the resource, if one has been completed or is under preparation. If no survey report or publication exists or is planned, enter "none." List the name of the author, date of the report or publication, title, and the name

of the government agency, private firm, university department, publisher, etc. that the report was prepared for or published by.

***Attachments:** Check any forms that are attached to the Primary Record and list any other attachments if appropriate. Check "None" if there are no attachments.

How to Prepare a Location Map

The purpose of the Location Map is to accurately depict the location of the resource on a U.S. Geological Survey topographic quadrangle or other government map. The Location Map differs from a Sketch Map in that it generally does not depict the internal arrangement of a resource. The only exceptions to this rule are the Location Maps created for linear resources and districts, which may depict component features and/or elements. The Location Map is optional for buildings located on small parcels of land in urban areas when an address is provided.

Provide the name, scale, and publication date of the map(s) used to depict the location of the historical resource, and include a copy of the appropriate portion(s) of that map or maps on the Location Map record. If the map has been photorevised, place the date of the revision in parentheses following the original date the map was published. The OHP recommends using maps published by the government, particularly U.S. Geological Survey topographic quadrangles (for rural areas) and Assessor's regional index maps (for urban areas). Because privately published maps are subject to copyright restrictions, you should check with the OHP before submitting such materials.

All Location Maps should include a bar scale and north arrow. Accurately plot the shape and location of the resource on an appropriate map. Very tiny resources may be depicted with a dot, while the exact configuration of larger resources should be drawn to scale using a heavy black line to indicate the perimeter of the resource. When possible, show the entire alignment of a linear resource, even if only a segment is recorded in detail. Do not obscure map details by filling in the areas covered by large historical resources solidly.

DETAILED DESCRIPTION AND EVALUATION

Three recording forms can be used for detailed description and evaluation of all types of historical resources. Those forms consist of the Building, Structure, and Object (BSO) Record; Archaeological Site Record; and District Record. Each detailed record builds on the basic information gathered on the Primary Record, and therefore must be accompanied by that form, and a Location Map (when required), unless submitted as an update to an existing resource file.

Evaluation is a required field on the BSO Record and District Record, while it is optional on the Archaeological Site Record. Completing an evaluation involves assessing whether a historical resource meets defined criteria of significance. The NRHP Criteria for Evaluation are recommended as a uniform standard for California because they provide a basis for assessing the significance of historical resources at the national, state, and local levels. As such, they encompass and provide for routine consideration of other applicable state and local criteria. However, other criteria also may be applied when appropriate. The NRHP Criteria are provided for reference in Appendix 7.

The significance of a historical resource is best understood and judged in relation to a historic context. A historic context consists of: a theme, pattern, or research topic; geographic area; and chronological period. The theme, pattern or research topic provides a basis for evaluating the significance of a resource when it is defined in relation to established criteria. A historical resource is considered significant, and hence, eligible for the National Register if it is associated with an important historic context and it retains the integrity of

those characteristics necessary to convey its significance. When considering the integrity of a historical resource it is appropriate to take into account factors such as location, setting, design, materials, workmanship, feeling, and association.

Evaluation requires three basic steps: (1) identification of a significant historic context associated with the resource; (2) identification of the types of resources important in illuminating that context, and the physical characteristics those resources must possess to reflect the significance of the historic context; and (3) an assessment of whether the resource being evaluated has those required physical characteristics (National Park Service 1990b).

The amount of descriptive and historical information needed to establish whether or not a resource has the required physical traits necessary to convey its significance will depend on its complexity and type. Normally, detailed recording forms submitted in conjunction with an intensive survey report (as described in Appendix 6) provide the level of information needed to evaluate most historical resources. However, archaeological sites often require additional characterization.

While anyone can prepare the documentation supporting an evaluation, responsibility for the evaluation must be taken by persons meeting the Secretary of the Interior's Professional Qualifications Standards (National Park Service 1983) in a discipline appropriate to the historic context within which the resource is being considered. In cases where the preparer does not meet the Standards, an OHP- sanctioned reviewer with appropriate qualifications may assume responsibility for the evaluation. However, to ensure timely inclusion of an evaluation in the OHP's filing system, submissions prepared by or under the direction of appropriately qualified professionals are recommended.

For further information about how to evaluate historical resources, refer to *National Register Bulletins* 15 and 16A (National Park Service 1990b, 1991), the *Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation* (National Park Service 1983), *Treatment of Archaeological Properties: A Handbook* (Advisory Council on Historic Preservation 1980), and *Guidelines for Archaeological Research Designs* (Office of Historic Preservation 1991b).

Preparing the Building, Structure, and Object Record

The BSO Record can be used to evaluate and present detailed information about buildings, structures, and objects. The Linear Feature Record may be used as a supplement to the BSO Record when documenting and evaluating linear structures such as roads, canals, and railroad grades. Detailed instructions for preparing the BSO Record are provided below. **Required information is indicated with a sidebar, an asterisk, and bold type**.

Header Block**:** Enter the Primary Number and HRI Number if known. Leave both fields blank if unknown. Also be sure to update the header block and subsequent sections of the Primary Record if it was prepared separately from the BSO Record.

***NRHP Status Code:** Enter the appropriate code that best-defines the relationship of the resource to the National Register using the list in Appendix 2. Use the lowest initial number if more than one applies. For example, if a resource can be rated both 3S and 5D1, put 3S.

***Resource Name or #:** Enter the same name or number used in this field on the Primary Record. The identifier can be a historic or common name, parcel number, or any other designator which will consistently refer to the resource and link the pages of your record together.

B1. Historic Name: Enter the historic name of the resource if known. A historic name may be either the formal name for the resource during its period of significance, or a name closely associated with its

significance. The historic name may refer to: the builder, designer, or historic owner(s); significant persons or events connected with the resource; original or later uses of the resource; or accepted professional, scientific, technical, or traditional names.

B2. Common Name: Enter the common or presently used name for the resource. If documenting a single family dwelling, use current owner's name **only** if local residents strongly associate the house with that owner. If historic and common names are identical, enter "same." If the resource has no common name, enter "none."

B3. Original Use: Enter the original use(s) of the building, structure, or object.

B4. Present Use: Identify the present use(s) of the building, structure, or object. Other past uses may be described in Field B10 (Significance) below.

***B5. Architectural Style:** Use standard architectural terminology to describe the style or construction type of buildings if applicable. If necessary, combine terms to describe the style (e.g. "Classical Revival with Craftsman elements"). See National Register Bulletin 16A (National Park Service 1991), Blumenson (1981), McAlester and McAlester (1984), City of Oakland (1978), and Whiffen (1969) for suggested stylistic terminology. See Sources of Additional Information for complete citations of these publications.

***B6. Construction History:** List alterations to the resource which substantially affect its architectural integrity. Be as specific as possible. For example, put "aluminum sliders" rather than merely "windows." Add the date(s) of the alterations if known.

***B7. Moved?:** Check whether or not the resource has been moved and give the date of the move, if known. Include any information you may have on the original location of the resource.

***B8. Related Features:** List other important features on the resource. Such features might include: barns, carriage houses, garages, outhouses, sheds, windmills, water towers, hitching posts, fences, walls, unusual curbs or sidewalks, formal gardens, prominent or unusual trees, and expansive lawns. Do not include other major historical resources that merit separate documentation.

B9a. Architect: If appropriate, enter the name of the architect, architectural firm, pattern book, engineer, artist, landscape architect, or planner responsible for designing the building, structure, or object. If the resource was not professionally designed, as in the case of a house constructed by an owner/builder, put "none." If no information about the designer was found, enter "unknown."

B9b. Builder: In the space provided for "Builder," enter the name of the person or firm actually responsible for construction. Do not put the name of someone who merely commissioned the work. If no information was found, enter "unknown."

***B10. Significance:** Resources are generally evaluated using a historic context--an organizational format which groups information about related historical resources based on theme, geographic limits, and chronological period. The information provided in this field should describe why the resource is significant within a relevant historic context.

Begin by identifying the historic "theme"--the subject or topic of historical study. Examples include "Commercial Development," "Citrus Industry," "River Transportation," "Residential Architecture," etc. For "area" put the locale in which the events covered by the theme occurred. Usually the area is the city or town being surveyed; however, there may be exceptions where contemporary boundaries do not coincide with historical boundaries. The area also might be a county, a part of a town, or a place defined by a topographical feature.

"Period of significance" refers to a chronological period as it relates to the historic context, and is defined as a year or range of years e.g., Commercial Development in Bakersfield, 1896-1941). For "property type" enter the specific type of resource that is being evaluated within the historic context. For example, the context "Commercial Development in Bakersfield, 1896-1941" may have retail stores and office buildings as associated property types. A form documenting the Woolworth Building in downtown Bakersfield would list "retail store" for the property type. In the space marked "applicable criteria" enter the letter(s) of the National Register (or other) criterion or criteria in which the resource is being evaluated. Put "N/A" if the resource is evaluated as ineligible for the National Register.

The statement of significance should explain why the resource is important in relation to its historic context(s). Make the strongest possible case using historical and/or architectural analysis as appropriate. Compare the resource with others that belong to the same property type and relate to the same historic context. Include an analysis of the integrity of the resource. Additional information about the resource may be included even if it is not specifically related to the context identified, to the extent that it will help establish the significance of the resource. When a resource is found ineligible for the National Register, a clear rationale should be offered to support the finding as well.

B11. Additional Resource Attributes: The historic attributes of the resource refer to its characteristics at the time it gained significance. Choose up to six numbers from the list of Resource Attribute Codes in Appendix 4. Enter each number , two dashes, and a brief description, e.g., "(HP3)--Duplex" or "(HP14)--Library." If more than one number is needed, the description may follow the numbers, e.g., "(HP12), (HP44)--YWCA."

***B12. References:** List any documents and style books used to discover information about the resource. Include page numbers and dates of publication. Also list oral interviews, including the name of the person interviewed and the date of the interview. You may abbreviate as necessary, but don't merely cite a general bibliography available elsewhere.

B13. Remarks: Include information about zoning, threats to the resource, previous surveys, and other relevant information in this data field, as appropriate.

***B14. Evaluator and Date of Evaluation:** Enter the name of the person who made the evaluation reflected in the "NRHP Status Code" field and indicate the date the evaluation was completed. If two or more people concurred in the evaluation, provide the name of the individual who meets the Secretary's Standards in the appropriate discipline. If a resume for the evaluator is not on file with the OHP or the appropriate regional Information Center listed (in Appendix 8), one should accompany the record (or should be included in an accompanying report).

***Sketch Map:** Draw or paste in a Sketch Map of the resource and any associated features discussed in Field B8 (Related Features) above. This Sketch Map is required regardless of whether or not a Location Map is also needed. The Sketch Map need not be drawn to scale, but must include a north arrow. Name or otherwise identify important features associated with the resource. In urban areas, and where possible in rural areas, identify the nearest intersection; otherwise, show roads (with names), buildings, rivers, railroad tracks, and other features that may help others locate the resource. If the resource's boundaries are other than parcel boundaries, indicate as such. Do not use this space merely to cite a map located elsewhere.

Space Reserved for Official Comments: Leave this space blank. Provide comparable space on computer-generated forms.

Preparing the Archaeological Site Record

The Archaeological Site Record can be used to record detailed descriptive information about most historical resources classified by the National Register as sites. The Archaeological Site Record was

specifically developed to accommodate the documentation of both prehistoric and historic sites. As such, it includes a number of data fields essential for recording certain types of sites, but irrelevant for the documentation of others. The Archaeological Site Record must be accompanied by a detailed Sketch Map.

Several specialized recording forms have been developed as optional attachments to the Archaeological Site Record. They include: the Linear Feature Record; Milling Station Record; Rock Art Record; and Artifact Record. Instructions for preparing those optional attachments are provided later in this manual. Detailed instructions for preparing the Archaeological Site Record are given below. **Required information is indicated with a sidebar, asterisk, and bold type**.

Header Block**:** Enter the Primary # and/or Trinomial Number if known. Leave both fields blank if unknown. Also be sure to update the header block and subsequent sections of the Primary Record if the Archaeological Site Record was prepared separately.

***Resource Name or #:** Enter the same name or number used in this field on the Primary Record. The identifier can be a historic or common name, parcel number, or any other designator which will consistently refer to the resource and link the pages of your record together.

***A1. Dimensions:** Enter the **length** and **width** of the site, describe the units of measurement, and indicate how the dimensions were determined (i.e., describe methods used to map the site). All sites with prehistoric components must be measured in meters, while the use of other appropriate units of measurement are acceptable for sites with historic components. The overall dimensions of multi-component sites should be measured in meters, with other units of measurement used to supplement the description of historic features where appropriate. State the orientation of the measurements in the space between parentheses using one of the four basic compass lines. Describe the datum in sufficient detail that it can be relocated by subsequent investigators. Also provide the following information about how you defined those limits:

Method of Measurement: Check the box that defines how length and width measurements were made and describe any other methods used.

Method of Determination: Check factors employed to determine the site boundary including: the distribution of artifacts and features; diminishing densitites of cultural materials; changes in soil color or type; distinctive vegetation or topography; cultural materials visible in cut banks, animal burrows, or as the result of test excavation; the recognition of a historic property boundary; and other means. Provide a brief explanation of any other means used to determine the site boundaries. While it may not be possible to define absolute boundaries for a resource based on surface inspection, a clear justification should be offered for how you have defined the site's boundaries.

Reliability of Boundary Determination: Estimate how reliable the boundary determination is and check the appropriate box. Explain as necessary.

Limitations: Check any factors that hindered accurate determination of the extent of the site and explain any additional limitations you noted.

A2. Depth: Enter the depth of the archaeological deposit(s) present at the site, if any. An estimate of depth is acceptable as long as the rationale for that guess is explained. Leave the space after "depth" blank and check "unknown" if there is uncertainty about the site's depth. Enter "surface" on the line following "depth" and check "none" if there is no depth to the deposit, and indicate how this was determined.

***A3. Human Remains:** Record the presence or absence of any human remains observed on the site by marking the appropriate box. Indicate the quantity, condition, and location of any observed remains in the space after "explain." The location of observed human remains should be depicted on the detailed sketch map. If any osteological material has been removed from a site, identify where it is curated or to whom it was transferred for reinterment or analysis.

***A4. Features:** Assign a number to every feature present on a site, show its location on the detailed sketch map, and describe the feature and any cultural constituents associated with it. If no features were observed, enter "none" or "none observed."

The description of each feature should identify, where possible, the type of feature; its age, function, size, and condition; the nature of any associated archaeological deposits and cultural constituents; and any other pertinent details. Cultural constituents that are associated with or found near a feature should be described **as an aspect of that feature**, rather than in the general list of constituents entered in Field A6 (Cultural Constituents). List, briefly describe, and discuss the chronological implications of all cultural constituents associated with each feature, or a meaningful sample of them.

Information about the numbers and types of bedrock milling features and rock art features should be briefly summarized in this field. Such features also may be recorded in greater detail on a Milling Station Record or Rock Art Record if appropriate.

***A5. Cultural Constituents:** List, briefly describe, and discuss the chronological implications of all cultural constituents not associated with features of the site. Constituents that are associated with features should be described in Field A4 above. Cultural constituents encompass all artifacts, ecofacts, and other residues of human activities. Provide a complete inventory of observed constituents when they occur in small quantities. Describe the types of materials present and estimate their relative abundance for sites with large amounts of cultural material, taking care to identify any temporally diagnostic remains.

***A6. Were Specimens Collected?** Check whether or not any specimens were collected during the field visit that led to the preparation of the Archaeological Site Record. If any materials were collected, attach an Artifact Record **or** a catalog containing comparable information and show the locations where the specimens were collected as specific points or collection units on the detailed Sketch Map. Be sure to indicate where the specimens are curated. Please note that **specimens should only be collected under the auspices of a legitimate scientific study** and **with the permission of the landowner**.

***A7. Site Condition:** Indicate the relative condition of the site as a whole by checking "good," "fair," or "poor," and describe existing alterations and/or disturbances of the resource, its major features, and its setting. Indicate the degree of disturbance and the agents that caused that disturbance. Consider whether the site retains integrity of setting, feeling, association, workmanship, design, materials, and location.

***A8. Nearest Water:** Enter the name, type (if not specified in the name), seasonal availability, distance, and direction (from the site datum or site boundary closest to water source) to the nearest natural fresh water source or probable former source (for prehistoric sites) or historic source (for historic sites occupied after that source was created). If the nearest water cannot be determined, enter "unknown."

***A9. Elevation:** Enter the elevation or range of elevations for the site in meters or feet and describe how those measurements were determined (e.g., altimeter, interpreted from map, etc.).

A10. Environmental Setting: Briefly describe the present vegetation zone, plants, animals, soils, geology, landforms, slope, aspect, exposure, and other environmental characteristics of the site and its vicinity to the extent that such conditions are relevant to understanding the site and its importance.

A11. Historical Information: Briefly summarize information gathered from reports, publications, historic documents, and oral interviews. In cases where historic materials are present, but no documentary or testimonial evidence was found, state that the historic use is unknown. Indicate where information about the resource was sought, even if the results were negative. Use a Continuation Sheet to attach historic maps and/or photographs if appropriate.

***A12. Age:** Check any categories that apply to the site and explain the evidence used to determine the period(s) during which it was occupied. More than one box should be checked for sites used, however intermittently, during more than one period. For prehistoric sites, describe any evidence that can be used to infer the site's position in a regional prehistoric chronological sequence where possible. The protohistoric check box should be marked if a site was occupied by Native Americans during the historic period, as determined from historic accounts and/or the presence of materials introduced by non-native peoples. Specific dates of occupation or site use should be identified for other types of historic archaeological sites when known.

A13. Interpretations: Provide information concerning any interpretations made for the site and discuss the evidence used to substantiate them. Possible interpretive categories include: site function, demographic observations, cultural ecology, research or scientific value, and ethnographic/cultural affilitations. While the observations discussed here may or may not be sufficiently detailed to constitute an evaluation, they should provide data helpful for planning the evaluation and treatment of the site. This field may be used to present a full historic context statement and evaluation of a site, if desired.

A14. Remarks: This field may be used to note additional information that doesn't readily fit elsewhere on this form. It may be useful to discuss the history of previous studies at a site, threats to the resource, or other data.

A15. References: List persons interviewed and documents used to discover information about the property. Enter "none" if no information was sought. Provide a complete citation for each document, sufficient for others to locate it. Identify persons interviewed by their full name, address (if permitted by the interviewee), and the date of the interview.

A16. Photographs: This field should be used to record any photographs or other recorded images taken during the documentation of the site. A Photograph Record can be attached to the Archaeological Site Record as an alternative to completing this field. If no images were taken, enter "none." Photographic documentation is strongly recommended for every site. Photographs should be placed on a Continuation Sheet and labeled.

***A17. Form Prepared By, Date, and Affiliation and Address:** Provide this information only if it differs from that given in Fields P8 and P9 on the Primary Record.

***Sketch Map:** A detailed Sketch Map must accompany every Archaeological Site Record. The Sketch Map should accurately depict the details of the site in its immediate environmental setting, providing sufficient detail to allow a person unfamiliar with the resource to recognize it. The Sketch Map should be drawn to scale. It must include: a datum point or points; site boundary; north arrow (labeled either "magnetic" or "true"); bar scale; the plotted locations of features, collected specimens, units, and other materials (if present); and a legend. The datum and methods used to map the site should be described in Field A1 on the Archaeological Site Record.

The site datum should be a relatively permanent natural or cultural feature. All features should be plotted accurately in correct relation to each other and the datum. Relevant information about the natural and cultural setting of the site should also be depicted. It is acceptable to estimate the locations of such natural features.

Preparing the District Record

Districts consist of a significant concentration or continuity of associated historical resources. Districts may be recognized and documented at the time a survey is conducted, or they may become apparent only after several survey efforts reveal the historical relationships among the individually recorded resources in a

given geographic region. The District Record provides a vehicle for documenting the linkages among individual resources in both situations. Because the recognition of a district hinges on an understanding of its historic context, evaluation is required on the District Record.

A Primary Record, Location Map, and District Record are needed to document the district as a whole. Minimally, every component or element of the district is then documented separately on a Primary Record. In some cases, it may be appropriate to prepare additional documentation of district components when those elements appear to be individually significant as well.

Minor features such as landscaping, fences, curbing, prospect pits, and widely dispersed archaeological materials need not be separately recorded if they are adequately described in Field D3 (Detailed Description) on the District Record. Detailed instructions are provided below for filling out the District Record.
Required data fields are indicated with a sidebar, asterisk, and boldface type.
Header Block**:** Enter the Primary and/or HRI # and/or Trinomial if known. Leave blank if they are not known. Also be sure to update the header block and subsequent sections of the Primary Record if it was prepared at a different time than the District Record.

***NRHP Status Code:** Enter the appropriate code that best-defines the relationship of the district to the National Register using the list in Appendix 2. Note that districts themselves are given "S" ratings, while their contributors are assigned "D" ratings. For example, a district found eligible for the National Register is rated "3S," while the district's contributors are rated "3D."

Resource Name or #: Enter the same name or number used in this field on the Primary Record. The identifier can be a historic or common name, parcel number, or any other designator which will consistently refer to the resource and link the pages of your record together.

D1. Historic Name: Enter the historic name of the district if applicable. A historic name may be either the formal name for the resource during its period of significance, or a name closely associated with its significance. The historic name might also refer to accepted professional, scientific, technical, or traditional names.

D2. Common Name: Enter the common or presently used name for the district. If historic and common names are identical, enter "same." If the resource has no common name, enter "none," or enter a brief description such as "500-700 block of Maple Street."

***D3. Detailed Description:** Provide a detailed description of the district, making sure to address the characteristics that give coherence to the area. Describe the nature and severity of any intrusions and disturbances. Mention design features, vegetation, and other relevant factors. List every resource documented separately as an element of the district. Identify each element by property type and indicate whether or not that element contributes to the significance of the historic context used to evaluate the district. This information may be included in the description itself, or as a separate entry on a Continuation Sheet. Addresses should be given for all buildings and structures in a district, when applicable. Other resources may be listed by type and Primary Number, Trinomial, HRI Number, and/or a resource identifier such as a historic name or temporary designation. Some minor features of a district such as plantings, mining prospect pits, fences, and curbing need not be separately recorded on individual recording forms **if** they are adequately described in this field.

At least two 5"x7" black and white photographs of representative streetscapes or other overall views must be included with the District Record. Describe the subject, view, and date the photograph was taken on a label and affix it to the back of the print. Place the print in a clear polyethylene or polypropylene envelope and affix the envelope to a Continuation Sheet using archivally stable transparent tape.

***D4. Boundary Description:** District boundaries may be described either in a narrative fashion, or by

entering the measurements of the maximum length and width of the resource, as appropriate. Narrative entries may use street names, property lines, geographical features, or other lines of convenience. When dimensions are given, indicate the units of measurement and describe the method used to obtain those measurements (e.g., taped, paced, extrapolated from map, etc.). The boundaries of the district should be clearly depicted on a Location Map, and where appropriate, on a Sketch Map as well.

***D5. Boundary Justification:** Provide a concise explanation asto how the boundaries of the district were determined, taking into account the property's significant elements, setting, integrity, and historical importance. Boundaries should encompass, but not exceed, the extent of the significant resources and land area that contribute to the importance of the district.

***D6. Significance:** The statement of significance should summarize the importance of the district in terms of its historic context, as defined by theme, period of significance, and geographic scope. The importance of each individual element of the district should be addressed in the separate records prepared for each contributing resource. Consider as contributors only those resources that convey the significance of the district. A Primary Record and a Location Map (when required) should be prepared for each contributor. Ancillary features of contributing elements need only be described as related features on those individual records. Minor features and Non-contributing elements of the district may be recorded with a Primary Record and Location Map (when required), or simply described in Field D3 above.

Begin by identifying the historic "theme"--the subject or topic of study. Examples include "Commercial Development," "Railroad Logging," "Water Conveyance Systems," "Prehistoric Obsidian Quarry Exploitation," "Historic Mining Camps," etc. Next, identify the geographic scope in the space following "area." The geographic scope is the locale in which the events covered by the theme occurred. The scope could be a city, county, or region; or it could also encompass an entire state or the nation. Then enter the "period of significance," which refers to the chronological period identified in the historic context and is defined by a year or range of years (e.g., Railroad Logging in Sierra Nevada Region, 1890-1940). In the space marked "applicable criteria" enter the letter(s) of the National Register (or other) criterion or criteria found applicable to the district as a whole. Put "N/A" if the resource is evaluated as ineligible for the NRHP.

The statement of significance should explain why the resource is important in relation to its historic context(s). Make the strongest possible case using historical, architectural, archaeological, and/or other analyses as appropriate. Compare the district with others that encompass the same property type(s) and relate to the same historic theme. Include an analysis of the integrity of the district, taking into consideration whether or not it retains integrity of location, design, materials, workmanship, feeling, association, and setting. Also indicate whether the district and its elements remain in use or have been abandoned. Additional information about the district may be included even if it is not specifically related to the context identified, to the extent that it will help establish the significance of the resource.

***D7. References:** List the documents that were used to discover information about the district. Include oral interviews, noting the name of persons interviewed, the date of the interview, and the address of the interviewee when possible. Provide a complete citation for each document, sufficient to locate it. Also provide a complete citation for any report or publication documenting the discovery of the resource. The report citation should list the name of the author, date of the report or publication, title, and the name of the government agency, private firm, university department, publisher, etc. that the report was prepared for or published by.

***D8. Evaluator/Date/Affiliation and Address:** Give the name, address, and organizational affiliation of the person responsible for evaluating the significance of the district and enter the date the evaluation was completed. If two or more people concurred in the evaluation, provide the name of the individual who meets the Secretary's Standards in the appropriate discipline. A resume for the evaluator should accompany the District Record (or a report submitted with it) if it is not already on file with the OHP or the appropriate regional Information Center listed in Appendix 8.

Sketch Map: A detailed Sketch Map is required when the layout and details of the district cannot be clearly conveyed on a Location Map due to the compactness of its elements. Sketch Maps should be drawn to scale and must include: the boundary of the district; a north arrow; a bar scale; the plotted locations of all features and/or elements; and a legend. It is also helpful to include information about the environmental setting of the district. For urban building surveys, a parcel map may be used to create the Sketch Map. It should include all of the items mentioned above and clearly indicate the names of all streets included within the district.

PREPARING OPTIONAL ATTACHMENTS

Six additional forms have been designed as supporting attachments for the records discussed above. They include a Linear Feature Record (DPR 523E), Milling Station Record (DPR 523F), Rock Art Record (DPR 523G), Artifact Record (DPR 523H), and Photograph Record (DPR 523I), and Continuation Sheet (DPR 523L). Instructions are provided below for filling out each form.

Linear Feature Record

The Linear Feature Record can be used to supplement both minimal or detailed recordation of prehistoric and historic linear structures and sites. Linear features are taken to include most long, narrow constructed works classified by the NRHP as structures, as well as trails and the ruins of linear structures (which are classified as sites). The Linear Feature Record may be used for documenting linear features in their entirety, segments of such resources, or observations made at a particular point along a linear feature.

When preparing the initial record for a linear feature or segment of one, the nature of the entire resource should be described on the Primary Record in Field P3a. Refer to the instructions for Field P3a for the kinds of information that should be included in the overall description of a linear feature. Detailed instructions for preparing the Linear Feature Record are provided below. The Linear Feature Record can be used to gather purely descriptive information about a linear resource, or it can serve as an adjunct to a formal evaluation documented on a BSO Record, District Record, or in a suitably detailed evaluation report.

Header Block: Enter the Primary Number, HRI Number, and/or Trinomial Number if known. Leave these fields blank if unknown. Also be sure to update the header block and subsequent sections of the Primary Record if it was prepared at a different time than the Linear Feature Record.

L1. Historic and/or Common Name: Enter the historic and/or common name of the resource if known. A historic name may be either the formal name for the resource during its period of significance, or a name closely associated with its significance. The historic name may refer to: the builder, designer, or historic owner(s); significant persons or events connected with the resource; original or later uses of the resource; or accepted professional, scientific, technical, or traditional names. A common or presently used name for the resource may be provided if one is known. If historic and common names are identical, enter "same." If the resource has no historic or common name, enter "none."

L2a. Portion Described: Check whether the record is for an entire linear feature, a segment of one, or a point observation along a linear feature. When recording a segment or point along a linear feature, provide a field designation for that portion or point and depict its location on a Location Map.

L2b. Location of Point or Segment: If you are preparing a Linear Feature Record for a segment of a linear feature or a point along one provide UTM coordinates, a legal description, and any other locational information that will help identify the specific location you are documenting.

L3. Description: Provide information about the construction techniques, configuration of, and materials used to construct the linear feature and describe any features, artifacts and/or archaeological sites/deposits that may be associated with it. Provide plans, sections, or other drawings as appropriate. The observations made in this section should not duplicate information provided in Field P3a (Description) on the Primary Record. If a Linear Feature Record is prepared for an entire linear feature, this field may be used to supplement information provided on the Primary Record. When this record is used to describe a particular segment or point along a linear feature, this field should be used to define the specific details observed in that location.

Describe in detail each cultural feature associated with the linear resource. Number or otherwise designate each feature and plot its location on a Location Map and/or a detailed Sketch Map. If no features are observed, indicate that finding. The features of a linear resource generally consist of components integral to the operation and proper functioning of that resource, rather than to resource elements like a ditch tender's camp or railroad depot which may be associated with a ditch or railroad grade as components of a district, yet require separate documentation as major resource elements (see Field L5 below). Some examples of the features of various kinds of linear resources include:

Roads: retaining walls, culverts, and tunnels
Ditches: siphons, flumes, spillgates, and gate valves
Trails: blazes, cairns, and paving
Railroad grades: through cuts, sidings, retaining walls, and trestles

The description of a feature should include information about its construction details, dimensions, and any artifacts found near the feature. Plans, cross-sections, and elevations may be appended to the record if appropriate. Feature descriptions should include information about the brand names and patent numbers recorded on machinery.

L4 Dimensions: Enter the dimensions of the linear feature at a specific observation point, segment, or along the entire resource, or indicate the range of variations in those dimensions. Also provide a scaled cross-sectional sketch in Field L4e and define the length of the segment you are recording when only a portion of a resource is recorded. All dimensions should be in feet for historic features and metric units for prehistoric features. Indicate how that dimension was determined (e.g., taped, estimated, etc.).

L4a. Top Width: Enter the width of the linear feature at its highest point and indicate the unit of measurement. For water delivery systems such as ditches and canals, the top width should be measured at the crest of the berm(s) or wall(s). Record more than one width or a range of widths if appropriate. For example, a single water delivery system may be composed of a flume, earthen ditch, and concrete canal that each have different top widths.

L4b. Bottom Width: Provide a width for the base of the feature, or provide a range of widths if appropriate.

L4c. Height or Depth: Enter the maximum depth or height of the resource if applicable, or indicate variation in that dimension along the length of the linear feature or segment thereof. If the depth/height of a linear feature has been modified (e.g., siltation of ditch), that fact should be noted.

L4d. Segment Length: Enter the overall length of the segment of the resource being recorded and indicate the unit of measurement. The length of the entire resource should be given in Field P3 on the Primary Record, if known, and should be repeated here if you record an entire linear resource. Define where dimensions were measured from (e.g., "from intake structure at dam to junction with Columbia Ditch") and note whether observation, extrapolation from maps, or direct measurement led to the determination.

L4e. Sketch of Cross Section: Use the space provided to draw a representative scaled cross section of the linear feature and indicate what direction the drawing faces. Show the location of the drawn cross section on the Location Map prepared to accompany the Linear Feature Record.

L5. Associated Resources: List previously recorded resources that are historically associated with the use of the linear resource and provide a Primary Number, Trinomial, and/or HRI Number of each resource, if known. Refer to a resource identifier such as a historic name in cases where a Primary Number is unknown or remains to be assigned. Associated resources that have not yet been recorded can also be mentioned. However, their existence should be stated as "unknown" if they have not been examined.

L6. Setting: This field may be used to provide a general description of the natural or physical environment of the linear feature in cases where that setting contributes to the significance of the resourceor appreciation of it. Information in this category may include descriptions of natural features, landscape characteristics, slope, vegetation, and so forth. For example, it may be important to describe the flora associated with a trail that connects a series of meadows in a forested region or the geology and terrain of a flume hung from the wall of a canyon.

L7. Integrity Considerations: Describe any existing alterations of the resource and its setting, focusing on whether or not it retains historic integrity in terms of setting, feeling, association, workmanship, design, materials, and location. Indicate whether it remains in use or has been abandoned. Provide an estimate of the proportion of the resource that has been destroyed or modified, where possible.

L8. Photograph, Map, or Drawing and Description: This space may be used for additional graphic documentation of the linear resource at the discretion of the recorder.

L9. Remarks: This field can be used to present further historical information about the resource, discuss previous efforts to document it, and offer other information that does not fit elsewhere on this form.

L10. Form Prepared By: Provide this information only if it differs from that given in Fields P9 and P10 on the Primary Record.

L11. Date: Enter the date this record was prepared.

Sketch Map: A Location Map can often be used to depict the portion of a linear resource that has been documented, its features, and the location of cross section drawings, photographs, or other graphic documentation. For particularly complex linear resources, however, a detailed Sketch Map is recommended. Sketch Maps should generally be drawn to scale, and must include a north arrow and bar scale.

Milling Station Record

The Milling Station Record may be used to provide a detailed record of one or more bedrock milling stations and any associated artifacts. A bedrock milling station is defined as a non-portable bedrock outcrop or boulder with surfaces and/or depressions ground into it for purposes of milling. The Milling Station Record is an optional form. It is designed to supplement the information in an Archaeological Site Record, not to eliminate the need for its preparation. Professional surveys conducted in advance of development activities should generally prepare a Primary Record, Location Map, and Archaeological Site Record when a site with a milling station(s) is encountered. Additional information can then be collected on a Milling Station Record if desirable.

Identify each separate bedrock outcrop with evidence of milling activities (milling station) as a numbered feature of a site. The location of each outcrop (milling feature) should be depicted on the sketch map of the site, with the total number of milling surfaces at that feature listed by type in Field A5 (Features) on the

Archaeological Site Record. The dimensions, rock type, and overall condition of each milling station should be provided in the upper portion of the Milling Station Record, along with the resource name or number listed in the Primary Record and the name of the person who prepared the record.

Give the dimensions of each milling station in metric units. Each dimension should be for the maximum extent of the bedrock outcrop or boulder on which milling activities occurred. The height should be measured as the maximum distance from the ground to the highest point on the bedrock outcrop. Outcrops partially covered with archaeological deposits should not be excavated to obtain measurements unless that excavation is part of a professional archaeological testing program.

Appropriate information should then be entered in the lower portion of the Milling Station Record for each of the individual milling surfaces observed on a culturally modified bedrock outcrop. Spaces are provided for the feature number (milling station number), milling surface number (element of an individual milling station), type, dimensions, depth, contents, and remarks. Use the keys at the bottom of the record for abbreviations of the types of features and their contents.

Dimensions for the individual milling surfaces present on a milling station should be measured with a tape in centimeters as the maximum length, width, and depth of the culturally modified (e.g., pecked and/or ground) bedrock. Use a straight edge laid across the rim of each milling surface to measure its maximum depth. The "Remarks" column can be used to record a variety of information such as wear patterns, surface residues, shape, configuration and condition of the culturally modified surfaces, and the presence of any associated artifacts on the outcrop/milling station.

Prepare a plan of each milling station on a Continuation Sheet, showing the size and shape of the bedrock outcrop and the relative locations of the individual milling surfaces. The plan should include: a north arrow (marked true or magnetic); distances between the individual milling surfaces on the outcrop; and a bearing and distance to a site datum. It is often helpful to include other details on the plan like vegetation, height above ground, and associated artifacts. If a milling station plan is drawn to scale and includes a bar scale, it is not necessary to indicate distance between the individual surfaces on the outcrop.

Rock Art Record

The Rock Art Record may be used to record detailed information about individual rock art features. Rock Art is defined as any non-portable bedrock outcrop, boulder, cave wall, or other rock surface intentionally modified by pecking, scraping, grinding, and/or the application of pigment to form a graphic design/image. The Rock Art Record is an optional form. It is designed to supplement the information in an Archaeological Site Record, not to eliminate the need for its preparation. Professional surveys conducted in advance of development activities should generally prepare a Primary Record, Location Map, and Archaeological Site Record when a site with a rock art feature(s) is encountered. Additional information can then be collected on a Rock Art Record if desirable.

Identify each separate bedrock outcrop or boulder with rock art on it and assign a number to the rock art panel that corresponds with its designation as a feature of a site. The location of each rock art panel (feature) should be depicted on the sketch map of the site and briefly described in Field A5 (Features) on the Archaeological Site Record. Use the following instructions to complete the Rock Art Record.

Header Block: Enter the Primary and/or Trinomial Numbers if known. Leave both fields blank if unknown.

Resource Name or #: Enter the same name or number used in this field on the Primary Record. The identifier can be a historic or common name, parcel number, or any other designator which will consistently refer to the resource and link the pages of your record together.

R1. Feature / Panel #: Identify the number assigned to the feature and indicate how many total rock art panels are present at the site after the word "of."

R2. Feature / Panel Location: Enter the distance and azimuth from a site datum to a designated position on the rock art panel or feature, as shown on a plan. If the site datum is a point within the rock art, so indicate. Also check whether the rock art was found on a cliff face, boulder, bedrock outcrop, cave / rockshelter surface, or other location, and describe any other kinds of locations.

R3. Host Surface: Describe the type of rock or other host surface on which the rock art panel or feature appears and identify the color of that surfacee rock outcrop and rock art images.

R4. Host Background: Check any characteristics that pertain to the background surface of the host rock or ground surface including patination, painting, glacial polish, smoke blackening, lack of natural alteration ("natural"), and other surface conditions. Provide an explanation if you check "other."

R5. Detailed Description of Feature / Panel: Check whether the feature consists of petroglyphs, pictographs, a geoglyph, or a combination of such elements, and then describe the size of the feature and host rock outcrop or ground surface, number and types of elements or stylistic motifs, method of production, color of motif and other relevant descriptive details. All measurements should be taped in metric units.

R6. Feature / Panel Integrity and Natural / Cultural Deterioration: Check whether the rock art feature or panel is in good, fair, or poor condition, and note any natural and cultural modification or deterioration of it by circling any items that apply. Use the space provided to explain in greater detail whether the feature / panel retains integrity of setting, feeling, association, workmanship, design, material, and location.

R7. Style(s) and Suspected Cultural Affiliation: Where possible, identify the rock art style(s) and cultural affiliation of the group(s) known or believed to have created the images in the rock art panel. Offer reasons supporting any statements about the stylistic and cultural affiliations of the rock art.

R8. Elements Superimposed? Check whether or not any elements are superimposed and describe superimposed elements by style, position, and relative age if known. Be sure to clearly depict superimposed elements on the plan showing the rock art panel.

R9. Feature / Panel Visibility: Check whether the rock art feature or panel is visible, semi-visible, or hidden from public view. Take into account the remoteness and accessibility of the site and how obtrusive the rock art is to an untrained observer.

R10. Associated / Nearby Cultural Materials: Describe any artifacts, ecofacts, or other cultural residues found in close proximity to the rock art panel. If no materials are observed near the panel, enter "none."

R11. Conservation Recommendations: Describe any conservation recommendations that may help preserve the rock art panel.

R12. Form Prepared By and Date: Supply the name of the recorder and the date this record was prepared only if it differs from the information supplied on the Primary Record.

Sketch of Rock Art Panel / Feature: Sketch the panel on a Continuation Sheet, showing the size and shape of the bedrock outcrop and the relative locations of the individual elements / motifs on that outcrop. The sketch should generally be drawn to scale, including at the minimum: a north arrow (marked true or magnetic); bar scale; and a bearing and distance to a site datum. Include other details, such as vegetation, height above ground, associated artifacts, and distance to a road or trail, if relevant. A photograph of the rock art panel is also recommended as an attachment.

Artifact Record

The Artifact Record may be used to record information about any specimens observed and/or collected at an archaeological site. Information comparable to that requested on the Artifact Record is required when any specimens are collected from a site. The Artifact Record is also useful for listing any diagnostic materials that are noted, but not collected. When used as supporting documentation, the Artifact Record may provide details that require only summary description in Field A5 (Features) or Field A6 (Cultural Constituents) on the Archaeological Site Record.

Begin by listing the Primary Number and Trinomial, if known. Then repeat the resource name or number listed on the Primary Record. Describe where any collected specimens are curated, giving the name of the institution and its address. Provide the artifact/specimen number (field designation or accession number), type, condition, description (form, material, etc.), dimensions, and provenience. The location of the specimen may be a collection unit or azimuth and distance from site datum. Show each location on a Sketch Map and indicate whether the specimen was drawn or photographed and if it was collected.

Photograph Record

The Photograph Record may be used to record information about any type of photographic images prepared as a record of a historical resource. It may be used in conjunction with any of the other records described in this manual. It is designed to identify images taken as still photographs, filmed or taped movies, aerial photographs, etc., and to provide technical details relating to the capture of those images.

Begin by providing the name of the project. List the resource name or number for each resource in the "Subject/Description" column for individual exposures. Spaces are provided for camera format, lens focal length, film type and speed, year, media repository, date, time, exposure/frame number, subject, view toward, and accession number (if any). It also may be helpful to identify the places where photographs are taken on a sketch map of a resource.

Continuation Sheet

The Continuation Sheet is a general form that can be used for a variety of purposes including the presentation of: (1) continued text; (2) feature and artifact illustrations; (3) photographic prints; (4) historic maps; and (5) updating the information from a prior survey effort. Every Continuation Sheet must provide the resource name or number as it appears on the Primary Record for the resource, the name of the recorder, and the date the record was prepared. Continued information should be clearly referenced with the number and name of data field it relates to. Graphics should be labeled to indicate their subjects, view, scale, and sources as appropriate. The source of all historic photographs, maps, or drawing should be identified.

UPDATING INFORMATION ABOUT A RESOURCE

As a planning tool, it is important that information about historical resources is regularly updated to ensure its accuracy. Updates may amplify or correct information about a resource, or simply confirm that the existing record remains accurate at the time of a subsequent field examination. The documentation for a historical resource should be updated under the following conditions:

- When it is reevaluated;
- When changes occur to the resource or its setting;
- When erroneous information needs correcting; and/or
- When additional information is necessary for planning decisions.

Information about a resource may be updated in two ways, depending on the extent of the changes and/or additions to the original record. If only minor changes or additions to an existing record are required, then a Continuation Sheet can be used to augment selected data fields, as appropriate. Minor updates also may be prepared to verify that existing information about a resource remains accurate. Such updates should list the "resource identifier" from Field P1 on the Primary Record; date of field visit; name, affiliation (if any), and address of the person preparing the update; and the number and name of any data fields where additional observations are made. Also provide the HRI Number and/or Trinomial, if known.

The resource should be completely rerecorded in cases where substantial changes are required to an existing record. The recorder should use good judgment in determining which approach to take when preparing an update. Any corrections of a previous record should be clearly explained and justified. If the boundaries of a previously recorded historical resource are modified, provide a justification for the change and prepare a new Location Map and/or Sketch Map as required. Full citations should be provided for any new studies of a resource, in order to update Field P11 (Report Citation) on the Primary Record. A copy of the report(s) should accompany or follow the submitted update.

APPENDIX 1: BLANK RECORDING FORMS

This appendix contains examples of all of the recording forms described in this manual. Those forms consist of:

Primary Record (DPR 523A)
Building, Structure, and Object Record (DPR 523B)
Archaeological Site Record (DPR 523C)
District Record (DPR 523D)
Linear Feature Record (DPR 523E)
Milling Station Record (DPR 523F)
Rock Art Record (DPR 523G)
Artifact Record (DPR 523H)
Photograph Record (DPR 523I)
Location Map (DPR 523J)
Sketch Map (DPR 523K)
Continuation Sheet (DPR 523L)

State of California -- The Resources Agency

APPENDIX 2: NRHP STATUS CODES

This appendix explains the use of the codes that should be entered in the "NRHP Status Code" field in the header of the Primary Record when an evaluation of a historical resource is completed. The codes found here represent a short list of the most frequently used status determinations, selected from a more extensive list that is available from the OHP on request. Be sure to read the entire list before deciding which code to use. Take special care that evaluations for districts and their components fit together properly. Note that districts themselves are given "S" ratings, while contributors receive "D" ratings. Thus, a district judged eligible for the National Register is rated "3S," but the district's contributors are rated "3D."

The initial number in a code indicates the general status:

1. Listed in the National Register.
2. Determined eligible for the National Register in a formal process involving federal agencies.
3. Appears eligible for listing in the National Register in the judgment of the person(s) completing or reviewing the form.
4. Might become eligible for listing.
5. Ineligible for the National Register but still of local interest.
6. None of the above.
7. Undetermined.

Each general status is divided into more specific codes as follows:

1. Listed in the National Register:
   - 1S. Separately listed.
   - 1D. Contributor to a listed district.
   - 1B. Both 1S and 1D.

2. Determined eligible for listing in the National Register:
   - 2S1. Determined eligible for separate listing by the Keeper of the National Register.
   - 2S2. Determined eligible for separate listing through a consensus determination by a federal agency and the State Historic Preservation Officer.
   - 2S3. Determined eligible for separate listing by a unit of the National Park Service other than the Keeper of the National Register.
   - 2D1. Contributor to a district determined eligible by the Keeper.
   - 2D2. Contributor to a district determined eligible for listing through a consensus determination.
   - 2D3. Determined eligible for listing as a contributor to a district by a unit of the National Park Service other than the Keeper.
   - 2B5. Determined eligible by more than one method listed above.

3. Appears eligible for listing in the National Register:
   - 3S. Appears eligible for separate listing.
   - 3D. Contributor to a district that has been fully documented according to OHP instructions and appears eligible for listing.
   - 3B. Both 3S and 3D.

4. Might become eligible for listing:
   - 4R. Meets both of the following conditions: (1) Is located within the boundaries of a fully documented district that is listed in, determined eligible for, or appears eligible for the National Register; and (2) may become a contributor to the district when it is restored to its appearance during the district's period of significance.

   - 4S. May become eligible for separate listing in the National Register when one of the following occurs (use the code for the most important reason if more than one applies):
     - 4S1. The property becomes old enough to meet the Register's 50-year requirement.

4S2. More historical or architectural research is performed on the property.
4S7. The architectural integrity of the property is restored.
4S8. Other properties, which provide more significant examples of the historical or architectural associations connected to this property, are demolished or otherwise lose their architectural integrity.

4D. Contributor to a fully documented district that may become eligible for listing when (use the code for the most important reason if more than one applies):
4D1. The district becomes old enough to meet the Register's 50-year requirement.
4D2. More historical or architectural research is performed on the district.
4D7. The integrity of the district is restored.
4D8. Other districts, which provide more significant examples of the historical or architectural associations connected to this district, are demolished or otherwise lose their architectural integrity.

4X. May become eligible as a contributor to a district that has not been fully documented.

5. Not eligible for National Register but of local interest because the resource:
5S1. Is separately listed or designated under an existing local ordinance, or is eligible for such listing or designation.
5S3. Is not eligible for separate listing or designation under an existing local ordinance but is eligible for special consideration in local planning.
5D1. Is a contributor to a fully documented district that is designated or eligible for designation as a local historic district, overlay zone, or preservation area under an existing ordinance or procedure.
5D3. Is a contributor to a fully documented district that is unlikely to be designated as a local historic district, overlay zone, or preservation area but is eligible for special consideration in local planning.
5N. Needs special consideration for reasons other than the above.

6. None of the above:
6W. Removed from listing by the Keeper of the National Register.
6X. Determined ineligible for listing in the National Register by the Keeper of the National Register.
6Y. Determined ineligible for listing in the National Register through a consensus determination of a federal agency and the State Historic Preservation Officer.
6Z. Found ineligible for listing in the National Register through an evaluation process other than those mentioned in 6X and 6Y above.

7. Not evaluated.

APPENDIX 3: CALCULATING UTM COORDINATES

(For use in Fields P2d and L2b)

The Universal Transverse Mercator (UTM) Grid System provides a simple and accurate method for recording the geographic location of a historic property. The UTM Grid System has a number of advantages over the Geographic Coordinate System of latitude and longitude, particularly speed, precision, and the use of linear, metric units of measure. Determining UTM references involves no complicated geometric constructions and, in its simplest application, requires only a straightedge, a coordinate counter, and a sharp pencil as working tools. (The coordinate counter, a plastic measuring tool, may be obtained from J & J Reproduction and Drafting Supplies, Inc., 9017-F Mendenhall Court, Columbia, MD 21045.)

In the UTM system, the Earth is divided into 60 zones, running north and south, each 6 degrees wide. Each zone is numbered (most of the US is included in zones 10 through 19), beginning at the 180-degree meridian near the International Date Line. The zones are flattened and gridded into squares measuring one kilometer on each side. UTM grid references are printed around the margins of many USGS quadrangles published since 1950, and all published since 1959 with blue grid ticks spaced at 1000 meter (one kilometer) intervals. Any point in the zone may be referenced by citing its zone number, its distance in meters from a north-south reference line ("easting"), and its distance in meters from the Equator ("northing"). These three figures -- the zone number, easting, and northing -- make up the complete UTM grid reference for any point and distinguish it from any other point on Earth.

The simplest method of determining a UTM reference is based on drawing part of the UTM grid on the map, and measuring from the grid lines to the point. It requires the following:

- a flat work surface on which the map may be spread out in full;
- a straightedge (ordinary rulers may not be accurate enough) long enough to reach completely across the map -- generally 28" to 36";
- a very sharp pencil;
- an ink pen for recording references; and
- a UTM coordinate counter.

To measure each point, follow these steps:

1. Draw a line from the top of the map to the bottom (north to south), connecting the UTM ticks of the same value directly west of the point, that is the ticks with the highest easting value west of the point.

2. Draw a line from the left to the right side of the map (west to east), connecting the UTM ticks of the same value directly south of the point, that is the ticks with the highest northing value south of the point. This line will intersect the north-south line somewhere to the southwest of the point.

3. Record the zone number on a worksheet. This number appears in the lower left corner of the map.

4. Record on a worksheet the numbers given by the map ticks through which the lines have been drawn. These are the first three digits of the easting value and the first four digits of the northing value. 5. Locate the scale on the coordinate counter matching that of the map, e.g., 1:24,000. Align the counter on the map so that:

a. the side of the scale that reads from right to left lies along the east-west line.

b. The side of the scale that reads from left to right passes directly through the point. Check the alignment to be sure that it is precise.

6. Read the coordinate counter scales, right to left for the easting and upward for the northing to get a measured value in three decimal places. In each case, enter the measured value on the worksheet after the number recorded in step 4.
7. Check the readings for plausibility -- are all figures in the correct decimal place? The easting will have six digits and the northing seven.

8. Check the figures for accuracy by remeasuring.

9. Be sure that the correct order is observed: zone number, easting, northing (Z,E,N).

If the resource is less than 10 acres, enter the UTM reference for the point in the middle of that resource. UTM coordinates should be provided for the beginning and termination of linear structures and sites or recorded segments of such resources. If a resource is 10 or more acres, the area must be enclosed in a quadrangle and a UTM reference should be given for each corner. Where multiple UTM coordinates are provided, each reference point should be depicted on the Location Map prepared for the resource.

APPENDIX 4: RESOURCE ATTRIBUTE CODES

(for use in Fields P3b and B11)

The following codes should be used to define the attributes of historical resources in Fields P3b and B11 on the Primary Record and Building, Structure, and Object Record, respectively. The codes are first summarized below and then defined in greater detail in the following pages of this appendix.

Attributes of Historic Resources:

HP1. Unknown
HP2. Single family property
HP3. Multiple family property
HP4. Ancillary building
HP5. Hotel / motel
HP6. 1-3 story commercial building
HP7. 3+ story commercial building
HP8. Industrial building
HP9. Public utility building
HP10. Theater
HP11. Engineering structure
HP12. Civic auditorium
HP13. Community center / social hall
HP14. Government building
HP15. Educational building
HP16. Religious building
HP17. Railroad depot
HP18. Train
HP19. Bridge
HP20. Canal / aqueduct
HP21. Dam
HP22. Lake / river / reservoir
HP23. Ship
HP24. Lighthouse
HP25. Amusement park
HP26. Monument / mural / gravestone
HP27. Folk Art
HP28. Street furniture
HP29. Landscape architecture
HP30. Trees / vegetation
HP31. Urban open space
HP32. Rural open space
HP33. Farm / ranch
HP34. Military property
HP35. CCC / WPA property
HP36. Ethnic minority property (list group)
HP37. Highway / trail
HP38. Women's property
HP39. Other
HP40. Cemetery
HP41. Hospital
HP42. Stadium / sports arena
HP43. Mine structure / building
HP44. Adobe building / structure
HP45. Unreinforced masonry building
HP46. Walls / gates / fences

Attributes of Historic Archaeological Sites:

AH1. Unknown
AH2. Foundations / structure pads
AH3. Landscaping / orchard
AH4. Privies / dumps / trash scatters
AH5. Wells / cisterns
AH6. Water conveyance system
AH7. Roads / trails / railroad grades
AH8. Dams
AH9. Mines / quarries / tailings
AH10. Machinery
AH11. Walls / fences
AH12. Graves / cemetery
AH13. Wharfs
AH14. Ships / barges
AH15. Standing structures
AH16. Other

Attributes of Prehistoric Archaeological Sites and Ethnographic Sites:

AP1. Unknown
AP2. Lithic scatter
AP3. Ceramic scatter
AP4. Bedrock milling feature
AP5. Petroglyphs
AP6. Pictographs
AP7. Architectural feature
AP9. Burials
AP10. Caches
AP11. Hearths / pits
AP12. Quarry
AP13. Trials / linear earthworks
AP14. Rock shelter / cave
AP15. Habitation debris

AP8. Cairns / rock features AP16. Other

Historic Resource Attribute Definitions:

HP1. Unknown: No reasonable guess can be made about the historic use or function of the resource.

HP2. Single Family Property: A building constructed to house one family.

HP3. Multiple Family Property: Any building providing longer than temporary lodging for more than one person or household. E.g., duplexes, apartment buildings, dormitories, bunkhouses, etc.

HP4. Ancillary Building: Barns, outhouses, detached garages, carriage houses, sheds, etc.

HP5. Hotel / Motel: Any building or group of buildings providing temporary lodging for travelers.

HP6. Commercial Building, over 3 stories: Any type of building dealing with management, retail sales, or marketed services. E.g., stores, banks, gas stations, office buildings, etc. Do not include basement in height count.

HP7. Commercial Building, over 3 stories: Do not include basement in height count.

HP8. Industrial Building: Any building where the manufacture or distribution of products occurs. E.g, canneries, mills, foundries, warehouses, etc.

HP9. Public Utility Building: Any building that houses services available to the public at large. E.g., firehouses, power houses, electrical substations. etc.

HP10. Theater: Any place where plays, variety shows, motion pictures, etc., are presented. Includes amphitheaters.

HP11. Engineering Structure: A structure not covered in any other category. E.g., docks, runways, water towers, etc.

HP12. Civic Auditorium: Publicly owned buildings for concerts, speeches, etc.

HP13. Community Center / Social Hall: Any building designed to hold meetings of social groups. E.g., fraternal halls, women's clubs, boy scout cabins, etc.

HP14. Government Buildings: Any building designed to house government administration or transactions. E.g., post offices, city halls, county courthouses, etc.

HP15. Educational Building: Any building with an educative purpose. E.g., schools, libraries, museums, etc.

HP16. Religious Building: Any building holding religious ceremonies or connected the operations of religious organizations (e.g., churches, seminaries, parsonages, etc.

HP17. Railroad Depot: Stations and other buildings connected to the operation of railroads and streetcars. E.g., sheds, roundhouses, etc.

HP18. Train: Engines, streetcars, and rolling stock.

HP19. Bridge: Any overpass for automobiles, trains, pedestrian, etc.

HP20. Canal / Aqueduct: Any artificial waterway for transportation or irrigation. Includes large pipes, conduits, drainage ditches, and bridge-like structures for carrying water.

HP21. Dam: Any barrier constructed to hold back water.

HP22. Lake/River/Reservoir: Any inland body of water, natural stream of water, or place where water is collected and stored.

HP23. Ship: Any vessel able to navigate inland or ocean waters.

HP24. Lighthouse: Any building or structure from which ships are guided by sight or sound.

HP25. Amusement Park: An outdoor place with various amusement buildings, structures, or devices. Includes zoological parks.

HP26. Monument/Mural/Gravestone: 1) Any object with a commemorative or artistic purpose; 2) Any painting, photograph, etc. on a wall or ceiling. E.g., statue, obelisk, sculpture, etc.

HP27. Folk art: Any object that expresses the artistic capacities of a people without being the product of formal training.

HP28. Street Furniture: Any object that is permanently placed near a street. E.g., fire hydrants, streetlights, benches, curbstones, hitching posts, etc.

HP29. Landscape Architecture: Any place in which trees, bushes, lawns, fountains, walls etc. have been arranged for esthetic effect.

HP30. Trees/Vegetation: Any plant, whether planted or growing naturally, not part of a landscape plan.

HP31. Urban Open Space: Any area that has experienced little building or other development within in a city limits. E.g., parks, grounds, or large open lots.

HP32. Rural Open Space: Any area that has experienced little building or other development outside a city limits.

HP33. Farm/Ranch: Any place where crops or animals are raised.

HP34. Military Property: Any property owned by one of the U.S. armed services, including the national Guard.

HP35. New Deal Public Works Project: Any property built under one of the public works programs of the New Deal. Includes properties aided by funds or personnel from the Works Progress Administration (WPA) and successors, Public Works Administration (PWA), Civilian Conservation Corps (CCC), etc.

HP36. Ethnic Minority Property: Any property closely associated with events, individuals, groups, or social patterns important in the history of an ethnic group. Includes properties designed by important ethnic group members. Add further information by including the name of the ethnic group involved. The OHP has abbreviations for five groups, so put these two letters in front of the name: AA African Americans, CH Chinese, JA Japanese, LA Latino, NA Native Americans. The OHP will adopt other abbreviations as properties associated with other ethnic groups are identified.

HP37. Highways/Trail: Any roadway, from freeway to footpath.

HP38. Women's Property: Any property closely associated with events, individuals, groups. or social patterns important in the history of women. Includes work of women designers as well as buildings such as YWCAs and women's clubs.

HP39. Other: If no other code applies, enter HP39.

HP40. Cemetery: Burial ground with monuments (except archeological sites).

HP41. Hospital: Any facility for treatment of the sick.

HP42. Stadium/Sports Arena: Any structure or building that provides a place in which sporting events are viewed.

HP43. Mine: Any structure or building connected with mining. E.g., mine shafts, head frames, stamp mills, shops, etc.

HP44. Adobe building / Structure.

HP45. Unreinforced masonry building.

HP46. Walls / gates / fences.

Historic Archaeological Site Attribute Definitions:

AH1. Unknown: no characteristics listed on the site record.

AH2. Foundations: structural footings or lineal alignments made from wood, brick or rock to support a structure (e.g., slabs of concrete, leveled earth pads, pilings, walls, stairs, etc.).

AH3. Landscaping: evidence of modification through contouring of the land or planting vegetation (e.g., hedgerow, orchards, terraces, and ponds).

AH4. Privy pits / trash scatters / dumps: any refuse deposits, outhouse pits, or other accumulation of debris (e.g., trash pits, trash scatters, outhouse pits, and dumps).

AH5. Well / cistern: a hole or receptacle designed to hold or provide access to water which may or may not be lined.

AH6. Water conveyance system: any device constructed to transport water over a distance (e.g., flumes, pipes, ditches, canals, and tunnels).

AH7. Road / trail / railroad bed: a lineal construction, either depressed, elevated, or on ground level, designed to facilitate the transportation of people or vehicles (e.g., bridge, railroad grade, tunnel, trail, wagon road, etc.).

AH8. Dam: a barrier constructed to contain a body of water.

AH9. Mine: an excavation and associated structures built into the earth to extract natural resources (ore, precious metals, or raw lithic materials). This category includes quarries. Examples include: shafts, elevators, mining tunnels, quarry, glory holes, tailings.

AH10. Machinery: a mechanical device (e.g., mills, farm equipment, steam donkeys, windmills, etc.).

AH11. Wall / fence: any wall or fence including postholes or posts placed at regular intervals, retaining walls, post-cairns, walls, fences, jetties, and breakwaters.

AH12. Grave / cemetery: any single or multiple burial location.

AH13. Wharf: a structure or remains of a structure built at the shore of a harbor or river for the docking of ships or boats; pier; dock.

AH14. Ships / barges: floating vessels designed for transporting people or goods across water.

AH15. Standing structure: any historic building that is still standing (e.g., outhouse, shed, house, cabin, office building, barn, etc.).

AH16. Other: check if there is no other category in which the site description could be placed.

Prehistoric Archaeological Site Attribute Definitions:

AP1. Unknown: no characteristics listed on the site record.

AP2. Lithic scatter: a major characteristic of the site is a scatter of chipped or flaked stone resulting from human manipulation (e.g., obsidian flakes and few or no other artifacts).

AP3. Ceramic scatter: a major characteristic of the site is a scatter of pot sherds. If the site contains both lithics and ceramics, check both.

AP4. BRM / milling feature: site contains one or more bedrock mortars, milling surfaces or cupules which indicate material processing activity.

AP5. Petroglyphs: site contains a stone surface which has been scored by humans in a patterned manner for a purpose other than material processing. This category includes intaglios.

AP6. Pictographs: site includes any design painted on a rock surface.

AP7. Architectural feature: site contains any feature which indicates the presence of human construction activity (e.g., post holes, house pits, dance house, sweat lodge, hunting blinds, fish traps).

AP8. Stone feature: site contains a patterned arrangement of rocks purposefully constructed or modified (e.g., rock alignments, cairns, rock rings of unknown function, etc.). AP9. Burial: the site contains human bone.

AP10. Cache: the site contains an natural or constructed feature used for storing food or goods.

AP11. Hearths / pits: site contains any feature which indicated cooking activity, such as roasting pits, association of cracked or burnt rock, discolored soil, ash and carbonized wood or plants.

AP12. Quarry: site contains a source of lithic material with evidence of human usage.

AP13. Lineal feature: site contains natural or constructed features indicating human use such as trails, earth works, windrows or stone fences.

AP14. Rock shelter / cave: a concavity within a rock surface evidencing human use.

AP15. Habitation debris: site contains a deposit characterized by a wide range of artifacts, materials or features which represent a variety of human activities.

AP16. Other: check here if there is no other category in which the site description can be placed.

APPENDIX 5: HOW TO CATEGORIZE HISTORICAL RESOURCES

NRHP Category	Examples	Suggested Records Used for Intensive Surveys
Building	houses, barns, stables, sheds, garages, courthouses, city halls, social halls, commercial buildings, libraries, mills, factories, stationary mobile homes, train depots, hotels, theaters, schools, stores, and churches	523A and 523B, plus 523J (when apropriate)
Structure	bridges, tunnels, dredges, firetowers, turbines, dams, corncribs, power plants, silos, shot towers, grain elevators, windmills, kilns, mounds, earthworks, cairns, palisade fortifications, railroad locomotives and cars, boats and ships, telescopes, carousels, bandstands, gazebos, and aircraft	523A and 523B, plus 523J (when apropriate)
	canals, ditches*, flumes*, pipelines*, roads, utility lines*, fences*, rock walls*, railroad grades, and historic footpaths	523A, 523B, 523E and 523J
Object	sculpture, monuments, boundary markers, statuary, and fountains	523A and 523B, plus 523J (when apropriate)
Site	habitation and village sites; rock shelters; hunting and fishing sites; petroglyphs and rock carvings; grounds and gardens; battlefields; campsites; shipwrecks; cemeteries and funerary sites; ruins of historic buildings and structures; treaty signing sites; and natural features such as springs, rock formations, and other land areas having cultural significance	523A, 523C, 523J, and 523K (with optional attachments as appropriate)
	designed landscape	523A ,523B,or 523C, 523J, and 523K
	trails, and the ruins of canals, ditches*, flumes*, pipelines*, roads, utility lines*, fences*, rock walls*, and railroad grades	523A, 523C, 523E and 523J
District	college campuses, central business districts, residential neighborhoods, commercial areas, large forts, industrial complexes, civic centers, rural villages, complex canal or irrigation systems, groups of habitations and associated activity areas, large ranches / estates / plantations, transportation networks, and large landscaped parks	523A, 523D and 523J (for the District) plus 523A for each contributor

*With the exception of items marked with an asterisk, all examples are taken from National Register Bulletin 16A (National Park Service 1991:15).

APPENDIX 6: TYPES OF SURVEY ACTIVITIES

(For reference when filling in Field P10 on the Primary Record)

Reports documenting survey activities add to the information available about historical resources by describing how the resources were identified and evaluated. The Secretary of the Interior has offered specific recommendations concerning the level of effort entailed in "reconnaissance" and "intensive" surveys.

A reconnaissance survey entails a systematic effort to identify and summarize information about historical resources in a given area. Reports documenting reconnaissance surveys should provide thorough documentation of objectives and expectations of the survey, the methods used to discover resources, and the adequacy of such efforts. While reconnaissance surveys may employ widely different strategies, the reports prepared to document them should minimally contain the following kinds of information:

1. A clear statement of the purpose of the survey.

2. A definition of the survey area (with map of areas examined).

3. A research design that examines current knowledge of a relevant historic context or contexts, defines resource types associated with that context, and establishes expectations regarding survey results (e.g., where resources will be found, how many of each type, etc.). The research design may simply refer to a previously published one **if it is applicable and reasonably current**.

4. A definition of the methods that were used during the survey. If a variety of methods are used, the area covered by each method should be separately depicted on the survey coverage map listed in Item 2 (above).

5. A summary of the results of the survey including a map depicting resource locations, analysis of findings relative to the study's research design, discussion of any limitations of the survey, and individual records for all identified heritage resources.

Intensive surveys go beyond the systematic identification and description of historical resources to encompass the evaluation of those properties within a historic context. Thus, in addition to the five categories of information needed for a reconnaissance report, the report documenting an intensive survey should also contain:

6. An evaluation of heritage resources identified during the survey as determined within a historic context using the National Register criteria (or CEQA criteria if appropriate).

7. Evidence that the evaluation was conducted or confirmed by an appropriately qualified professional.

Further recommendations regarding the content of heritage resource reports can be found in OHP's Archaeological Resource Management Reports (ARMR): Recommended Contents and Format (1989) and the Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation (National Park Service 1983).

APPENDIX 7: NATIONAL REGISTER CRITERIA AND CONSIDERATIONS

Criteria for Evaluation

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

(a) that are associated with events that have made a significant contribution to the broad patterns of our history; or
(b) that are associated with the lives of persons significant in our past; or
(c) that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
(d) have yielded, or may be likely to yield, information important in prehistory or history.

Criteria Considerations

Ordinarily cemeteries, birthplaces, or graves of historical figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, properties primarily commemorative in nature, and properties that have achieve significance within the last 50 years shall not be considered eligible for the National Register. However, such properties *will qualify* if they are integral parts of districts that do meet the criteria or if they fall within the following categories:

(a) a religious property deriving primary significance from architectural or artistic distinction or historical importance; or
(b) a building or structure removed from its original location but which is significant primarily for architectural value, or which is the surviving structure most importantly associated with a historic person or event; or
(c) a birthplace or grave of a historical figure of outstanding importance if there is no appropriate site or building directly associated with his productive life; or
(d) a cemetery which derives its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events; or
(e) a reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived; or
(f) a property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own exceptional significance; or
(g) a property achieving significance within the past 50 years if it is of exceptional importance.

(Reprinted in full from Code of Federal Regulations, Title 36, Part 60.)

AREAS OF EXPERTISE

Applied environmental chemistry and engineering as related to concerns in air, water, soil with special emphasis on water conservation in the food processing industry. Dr. Russell has a strong process background in the area of water management for industry and for the implementation of wastewater recycling in the food processing industry. He has designed over 100 water conservation systems for water systems for municipal and industrial facilities.

Following a nationwide search by the U.S. EPA, Dr. Russell's team was selected to develop the **EPA Process Control Manual for Aerobic Biological Wastewater Treatment Facilities**. The preparation of this report was based on a hands-on survey of the best operated wastewater treatment plants located in each Region of the EPA. as determined by that Region. Following site visits to over 30 treatment plants, Dr. Russell analyzed the data to prepare a comprehensive analysis of what operational and design criteria work well at these best plants. The report was distributed by EPA to every treatment plant in the United States.

The next task in Dr. Russell's career was also the result of a nationwide search for the best team to prepare an evaluation for the Office of Water Research in the U.S. Department of the Interior (DOI) on the subject of **Water Recycling in the Food Processing Industry.** Dr. Russell's team was selected due to their extensive experience with water conservation and recycling in the food processing industry, due in part to his location in the middle of California's food industry with its $6 billion annual turnover. The report addressed all of the food processing facilities in the United States, as identified by the Department of Interior. An evaluation of the water use efficiency of the food processing industry in terms of water usage per ton of product was conducted and the most efficient techniques for minimizing water usage was identified for each segment of the U.S. food industry.

Following the preparation of the water recycling report for the U.S. DOI, Dr. Russell's team was selected to prepare a study on **Water Recycling in California's Food Processing Industry** for the Office of Water Recycling ofthe California State Water Resources Control Board. At the suggestion of Dr. Russell, due in part to the fact that his team had just prepared the comprehensive DOI report and the economic impact of this major segment of the California food industry, the California report was focused on the fruit and vegetable industry segment. The report focused on the members of this industry segment and the potential for reducing water usage in the fruit and vegetables processing segment.

Dr. Larry L. Russell (continued)

As a result, Dr. Russell is one of the foremost experts on the implementation of water conservation and water recycling in the industry, he is also an expert on the process control of

sewage treatment processes, and his personal engineering has resulted in the saving of over 50,000,000 gallons of fresh water per year. He has consulted for more than 100 major food processing companies at over 300 food processing facilities. During his career, he has provide water conservation/wastewater management/recycling for food processing companies including Nestles, Green Giant, Pillsbury, Del Monte Foods, Carnation, C&H Sugar, Spreckels Sugar, Smuckers , Contadina Tri Valley Growers, Hilmar Cheese, Bolthouse Farms, Kernridge Growers, Anheuser Busch, the Clorox Company..

Dr. Russell has conducted forensic evaluations on a wide variety of investigations involving releases from over 100 petroleum storage facilities located though out California and the United States, heavy metal contamination from recycling and military operations, landfills leachate management/treatment, explosive leachates from munitions landfills, perchlorate management from previous explosive, photoflash and rocket manufacturing. Well water pollution/source selection, materials selection and performance, corrosion mitigation, hazardous materials management, management of acid mine ground/surface water drainage management claimed personal injury from chlorine exposure in a wastewater system, water and sanitary and storm sewer system design and the nature of contaminant contribution. These evaluations have resulted in addressing the steps required to clean up as well as assignment of costs in proportion to responsibility, determination of the initial date of contribution and determination of responsibility for the release.

PREVIOUS EXPERIENCE

President - RUSSELL ENVIRONMENTAL ENGINEERING AND DEVELOPMENT (REED) CORPORATION - a small high tech environmental consulting firm specializing in sanitary engineering design and evaluation of forensic engineering aspects of ground water cleanups.

Chairman - Aqua Resources, Inc. - Responsible for technical management of projects for industrial/hazardous waste management

Vice President - James M. Montgomery Consulting Engineers - Manager of Industrial/Hazardous Waste Services for largest environmental firm in California

Appendix B

State Ocean Plan Highlights (summarized)

B. Bacterial Characteristics

1. Water-Contact Standards

Both the State Water Board and the California Department of Public Health (CDPH) have established standards to protect water contact recreation in coastal waters from bacterial contamination.

State Water Board Water-Contact Standards(1)Within a zone bounded by the shoreline and a distance of 1,000 feet from the shoreline or the 30-foot depth contour, whichever is further from the shoreline..., ...30-day Geometric Mean The following standards are based on the geometric mean of the five most recent samples from each site:

i. Total coliform density shall not exceed 1,000 per 100 mL;
ii. Fecal coliform density shall not exceed 200 per 100 mL;
iii. Enterococcus density shall not exceed 35 per 100 mL.

Single Sample Maximum:

i. Total coliform density shall not exceed 10,000 per 100 mL;
ii. Fecal coliform density shall not exceed 400 per 100 mL;
iii. Enterococcus density shall not exceed 104 per 100 mL; and
iv. Total coliform density shall not exceed 1,000 per 100 mL when the fecal coliform/total coliform ratio exceeds 0.1.

When a public beach or public water-contact sports area fails to meet these standards, CDPH or the local public health officer may post with warning signs or otherwise restrict use of the public beach or public water-contact sports area until the standards are met.

EXHIBIT 2

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

RESOLUTION No. R2-2016-0021

Amending the Water Quality Control Plan for the San Francisco Bay Basin to Establish a Total Maximum Daily Load and Implementation Plan for Bacteria in San Francisco Bay Beaches

WHEREAS, the California Regional Water Quality Control Board, San Francisco Bay Region (Water Board), finds that:

1. The Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) is the Water Board's master water quality control planning document. It designates beneficial uses and water quality objectives for waters of the State, including surface waters and groundwater. It also includes programs of implementation to achieve water quality objectives. The Basin Plan was duly adopted by the Water Board and approved by the State Water Resources Control Board (State Water Board), State Office of Administrative Law (OAL) and the United States Environmental Protection Agency (U.S. EPA), where required.

2. The Basin Plan may be amended in accordance with Water Code section 13240, et seq. The proposed Basin Plan amendment complies with this section.

3. Aquatic Park Beach (San Francisco); Jackrabbit, Sunnydale Cove, and Windsurfer Circle beaches (Candlestick Point, San Francisco); Crissy Field Beach (San Francisco); Parkside Aquatic and Lakeshore Park beaches (Marina Lagoon, City of San Mateo); and China Camp and McNears beaches (Marin County) have been identified under federal Clean Water Act section 303(d) as impaired water bodies due to bacteria. These beaches are collectively referred to as San Francisco Bay Beaches herein.

4. Under Clean Water Act section 303(d), the Water Board is required and authorized to establish the total maximum daily load (TMDL) for those pollutants identified as causing impairment of waters on the 303(d) list. Additionally, under Water Code section 13242, the Water Board is authorized to develop an implementation program to achieve water quality objectives.

5. A Basin Plan amendment has been prepared in accordance with Water Code section 13240 that will establish the TMDL and Implementation Plan to reduce bacteria-related risks to humans and protect water contact and non-contact beneficial uses at San Francisco Bay Beaches.

6. The Basin Plan amendment includes requirements to implement wasteload allocations for urban runoff through municipal stormwater NPDES permits. The Water Board intends to establish permit requirements to attain the wasteload allocations through implementation of best management practices in lieu of numeric limits, because the wasteload allocations are not designed to be directly implemented as numeric limits.

7. The Basin Plan amendment, including specifications on its physical placement in the Basin Plan, is set forth in Exhibit A hereto.

8. The scientific basis for the regulatory elements of the proposed Basin Plan amendment was subjected to an independent, external peer review by Professor Patricia Holden and Professor Peter Strom, pursuant to the requirements of Health and Safety Code section 57004.

9. On January 15, 2016, the Water Board publicly noticed the proposed Basin Plan amendment and distributed the proposed Basin Plan amendment, supporting Staff Report, and Environmental Checklist for public review and comment in accordance with applicable State and federal environmental laws and regulations.

10. The process of basin planning has been certified by the Secretary for Resources as exempt from the requirement of the California Environmental Quality Act (CEQA) (Pub. Res. Code § 21080.5) to prepare an Environmental Impact Report or Negative Declaration.

11. The Basin Plan amendment package includes a Staff Report, an Environmental Checklist, an assessment of the potential environmental impacts of the Basin Plan amendment, and a discussion of alternatives and cumulative impacts. The Basin Plan amendment, Environmental Checklist, Staff Report, and supporting documentation serve as a substitute environmental document under the Water Board's certified regulatory program.

12. The Water Board has duly considered the Environmental Checklist, Staff Report, and supporting documentation with respect to environmental impacts and finds that the proposed Basin Plan amendment will not have a significant impact on the environment. The Water Board further finds, based on consideration of the record as a whole, that there is no potential for significant adverse effect, either individually or cumulatively, on wildlife as a result of the proposed Basin Plan Amendment.

13. The Water Board has also considered the environmental analysis in the Staff Report and the Environmental Checklist of the reasonably foreseeable methods of compliance with the Basin Plan amendment, including economic impacts.

14. The Water Board has carefully considered all comments and testimony received, including responses thereto, on the Basin Plan amendment, as well as all of the evidence in the administrative record.

15. The Basin Plan amendment must be submitted for review and approval by the State Water Board, OAL, and U.S. EPA. Once approved by the State Water Board, the amendment is submitted to OAL and U.S. EPA. The Basin Plan amendment will become effective upon approval by OAL and U.S. EPA.

NOW, THEREFORE BE IT RESOLVED THAT:

1. The Water Board adopts the Basin Plan amendment as set forth in Exhibit A hereto.
2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Water Board in accordance with the requirements of Water Code section 13245.

3. The Water Board requests that the State Water Board approve the Basin Plan amendment in accordance with the requirements of Water Code sections 13245 and 13246 and forward it to OAL and U.S.EPA for approval.
4. If, during the approval process, Water Board staff, the State Water Board, or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes and shall inform the Water Board of any such changes.
5. Because the Basin Plan amendment will involve no potential for significant adverse effect, either individually or cumulatively, on wildlife, the Executive Officer is directed to sign a CEQA Filing Fee No Effect Determination Form and to submit the exemption in lieu of payment of the California Department of Fish and Wildlife CEQA filing fee.

I, Bruce H. Wolfe, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of a Resolution adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on April 13, 2016.

Exhibit A – Basin Plan Amendment to Establish a Total Maximum Daily Load and Implementation Plan for Bacteria in San Francisco Bay Beaches

EXHIBIT 3

Basin Plan Amendment to Establish a Total Maximum Daily Load and Implementation Plans for Bacteria at San Francisco Bay Beaches

The following text is to be inserted into Chapter 7.2.

7.2.5 San Francisco Bay Beaches Bacteria TMDL

The following sections establish the TMDL for San Francisco Bay beaches impaired by bacteria. The numeric targets, load and waste load allocations, and implementation plan are designed to support and protect the Bay's designated beneficial use of water contact recreation (e.g., swimming and wading).

7.2.5.1 Problem Statement

The waters adjacent to several San Francisco Bay beaches are impaired by indicator bacteria. Bacteriological water quality objectives are exceeded based on elevated indicator bacteria densities, and thus, there is impairment of the water contact recreation (REC-1) beneficial use in these water bodies. Recreating in waters with elevated indicator bacteria densities has long been associated with adverse health effects. Specifically, national epidemiological studies demonstrate a causal relationship between adverse health effects and recreational water quality, as measured by indicator bacteria densities.

This TMDL addresses bacteria impaired beaches in San Francisco Bay east of the Golden Gate Bridge. The impaired beaches include:

- Aquatic Park Beach, San Francisco
- Jackrabbit, Sunnydale Cove, and Windsurfer beaches in Candlestick Point State Recreation Area, San Francisco
- Crissy Field Beach, San Francisco
- Parkside Aquatic and Lakeshore beaches on Marina Lagoon, City of San Mateo
- China Camp Beach, Marin County
- McNears Beach, Marin County

China Camp Beach and McNears Beach are on the list of impaired water bodies because levels of only one bacterial indicator in waters at these beaches, total coliform, exceeds the Basin Plan's water quality objective. Waters at the other beaches exceed the bacterial indicator for Enterococcus and other bacterial indicators.

7.2.5.2 Sources

Bacteria sources are identified based on documentation of inadequately-treated human waste discharges, such as sanitary sewer overflow reports, and the scientific evidence linking land uses in the vicinity of the beaches to elevated bacteria concentrations in urban runoff to the beaches. If not properly managed, the following source categories have the potential to discharge bacteria to San Francisco Bay beaches at levels that cause or contribute to exceedances of water quality objectives: sanitary sewer collection systems, urban runoff, pets at the beaches, vessels, and wildlife. Wet weather discharges from the City of San Francisco's combined sewer system that

are authorized pursuant to U.S. EPA's Combined Sewer Overflow (CSO) Control Policy (see Section 4.9 Wet Weather Overflows) are not considered a significant source of bacteria to these San Francisco beaches.

7.2.5.3 Numeric Targets

This TMDL establishes a desired, or target, condition for water contact recreation use at impaired San Francisco Bay beaches. The numeric targets are the Enterococcus water quality objectives established for water contact recreation uses in marine and estuarine waters (Table 3-1) and on the U.S. EPA's 2012 recommended Enterococcus criteria for water contract recreation in marine and fresh water. The numeric targets for this TMDL are listed in Table 7.2.5-1.

Table 7.2.5-1 Numeric Targets for San Francisco Bay Beaches

Enterococcus	
Geometric mean	< 35 MPN / 100 mL
Single sample maximum	No sample > 104 MPN / 100 mL

7.2.5.4 Total Maximum Daily Loads

The TMDL for San Francisco Bay beaches is equivalent to the Basin Plan's water quality objectives and the numeric target for Enterococcus as shown in Table 7.2.5-1.

7.2.5.5 Load and Waste Load Allocations

Density-based pollutant allocations for bacteria source categories are the same as the numeric targets and the TMDL listed above. Table 7.2.5-2 summarizes the load and wasteload allocations for discharges of bacteria to impaired San Francisco Bay beaches.

Discharges of raw or inadequately-treated human waste are prohibited, and thus sanitary sewer collection systems and vessels have an allocation of zero.

All entities that discharge indicator bacteria or have jurisdiction over such discharges are responsible for meeting these allocations. Discharging entities will not be held responsible for uncontrollable discharges originating from wildlife. If non-nuisance wildlife contributions are found to be the cause of exceedances, the TMDL targets and allocation scheme will be revisited as part of adaptive implementation. Implementing parties shall demonstrate achievement of allocations in the receiving water bodies (i.e., at the beach shoreline water quality monitoring stations).

All implementing parties are required to attain their respective allocations by taking a phased approach in which additional or enhanced actions are required if initial implementation actions do not result in attainment of the TMDL within approximately five years.

Table 7.2.5-2 Load and Wasteload Allocations for San Francisco Bay Beaches		
Pollutant Source Category	**Enterococcus Geometric Mean[a] (MPN/100 mL)**	**Enterococcus Single Sample Maximum (MPN/100mL)**
Sanitary Sewer Collection Systems[b]	0	0
Urban Runoff[c]	< 35	No sample > 104
Vessels (Anchor-outs, recreational, houseboats)	0	0
Wildlife[d]	< 35	No sample > 104

a. Based on a minimum of five consecutive samples equally spaced over a 30-day period.
b. For the City of San Francisco, the wasteload allocation applies only to the collection system portion of the combined sewer system.
c. Wasteload allocation for discharges from municipal separate storm sewer systems (NPDES No. CAS612008, CAS000004 and CAS000003).
d. With the exception of nuisance wildlife, such as geese, wildlife is not a controllable source of bacteria. No management measures will be required for uncontrollable wildlife sources.

7.2.5.6 Implementation Plan

This Implementation Plan builds on management measures required by existing local, regional, and statewide regulations and orders to reduce or eliminate waste discharges from sanitary sewer collection systems, urban runoff, pets at beaches, and vessels. The plan requires actions consistent with existing regulations and orders, including the following:

- Water Board Municipal Regional Stormwater Permit (NPDES No. CAS612008)
- State Water Board NPDES Permit for Small Municipal Separate Storm Sewer Systems (MS4) (NPDES No. CAS000004)
- State Water Board Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (Order No. 2006-0003-DWQ as revised by Order No. 2008-0002-EXEC)
- State Water Board Stormwater Permit for California Department of Transportation (NPDES No. CAS000003)
- Basin Plan Discharge Prohibition No. 15 (Table 4.1), which states: "It shall be prohibited to discharge raw sewage or any waste failing to meet waste discharge requirements to any waters of the Basin."
- Regional Water Board Cease and Desist Order for the City of San Mateo, Town of Hillsborough, and Crystal Springs County Sanitation District Sanitary Sewer Waste Discharges (Order No. R2-2009-0020)
- Regional Water Board NPDES Permit for the City and County of San Francisco Southeast Water Pollution Control Plant, North Point Wet Weather Facility, Bayside Wet Weather Facilities, and Wastewater Collection System (Order No. R2-2013-0029).

The entities responsible for implementing this plan are stated below, as are the regulatory mechanisms by which the Water Board may require that the actions be taken.

Sanitary Sewer Collection Systems

Wasteload allocations for sanitary sewer collection systems will be implemented through the requirements and provisions of the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems and, for Marina Lagoon beaches, Cease and Desist Order No. R2-2009-0020 issued by the Water Board to the City of San Mateo. In the case that further investigation or reduction of pathogen sources related to sanitary sewer collection systems is needed, such actions will be initiated through the Water Board's authorities under the California Water Code.

This TMDL requires no modifications to NPDES permitting of wet weather discharges from the City of San Francisco's combined sewer system, authorized pursuant to U.S. EPA's CSO Control Policy, as they are unnecessary to achieve the TMDL. The wasteload allocation in Table 7.2.5-2 only applies to the collection system portion of San Francisco's combined sewer system.

Urban Runoff

Wasteload allocations for urban runoff (i.e., municipal stormwater runoff and dry weather flows) shall be implemented through the Municipal Regional Stormwater Permit (NPDES No. CAS612008) and the State Water Board NPDES Permit for Small MS4s (NPDES No. CAS000004).

Urban runoff from the California Department of Transportation's (Caltrans') highways has not been found to be a significant source of indicator bacteria, largely because Caltrans' highways comprise a very small area within San Francisco Bay beach watersheds. If during the course of adaptive implementation, Caltrans' facilities are found to be sources of bacteria to San Francisco Bay beaches, wasteload allocations for such discharges will be implemented through the requirements of the State Water Board Stormwater Permit for Caltrans (NPDES No. CAS000003).

Municipal stormwater entities, including national, State, or regional park systems (hereinafter referred to as park authorities), that discharge stormwater to impaired beaches are required to submit a plan to the Water Board that describes current best management practices (BMPs), their current level of implementation, and additional BMPs and/or increased levels of implementation of existing BMPs to reduce discharges of bacteria from their storm drain systems that cause or contribute to exceedance of wasteload allocations. The plan shall include a schedule for implementation of the BMPs and enhanced BMPs.

Municipal stormwater entities and/or park authorities, as applicable, shall implement pet waste control measures to reduce discharges of bacteria at the beach and shall submit a plan to do so to the Water Board, as described above.

The Water Board will establish permit requirements to implement wasteload allocations based on implementation of BMPs. The Water Board will not include numeric limits in NPDES permits if the discharger demonstrates full implementation of technically feasible, effective, and cost efficient BMPs to control all controllable sources to, and discharges from, their storm drain systems.

Vessels

Vessels ranging in size from self-propelled row boats and kayaks to yachts operate in waters adjacent to beaches addressed by this TMDL. In addition to the Basin Plan prohibition on discharge of raw sewage, the California Health and Safety Code (§117475-117500) prohibits

dumping any garbage into navigable waters of the state. Where vessels present a source of bacteria to an impaired beach, the entity with authority over vessels, such as a municipality or park authority or marina owner, shall be responsible for implementing measures to control this bacteria source.

Wildlife

Municipal stormwater entities and park authorities are responsible for control measures for nuisance wildlife, such as resident goose populations. Discharging entities will not be held responsible for uncontrollable discharges originating from wildlife.

Implementation Plan elements that are common to all or most impaired San Francisco Bay beaches are described on Table 7.2.5-3. Tables 7.2.5-4 through 7.2.5-7 list the implementation actions and schedules for the individual impaired beaches identified in 7.2.5.1, Problem Statement. The implementation schedules allow time for the implementing parties to identify and implement measures that are necessary to control bacteria discharges causing impairment.

Table 7.2.5-3 Implementation Plan Elements

Source	Action	Implementing Party	Completion Timeframe
Sanitary Sewer Collection Systems	1. Comply with Statewide General Waste Discharge Requirements for Sanitary Sewer Systems.	Sanitary sewer collection system authority	Ongoing
	2. Submit an enhanced Sewer System Management Plan that prioritizes sewer system inspections and repairs in areas within ¼ mile of the beach or otherwise connected to the beach. Include a diagram of prioritized infrastructure, a time schedule for implementing short- and long-term plans, and, as necessary, a schedule for developing the funds needed for the capital improvement plan. Complete inspections and repairs.	Sanitary sewer collection system authority	6 months 3 years
	3. Determine effectiveness of sewer system repairs: Assess beach monitoring data to determine if targets are met at the beach.	Sanitary sewer collection system authority	5 years
	After five years, begin enhanced implementation if targets not met		
	4. If targets are not met, submit an enhanced Sewer System Management Plan that prioritizes sewer system inspections and repairs in areas within ½ mile of the beach or otherwise connected to the beach. Include a diagram of prioritized infrastructure, a time schedule for implementing short- and long-term plans, and, as necessary, a schedule for developing the funds needed for the capital improvement plan. Complete inspections and repairs.	Sanitary sewer collection system authority	5.5 years 8 years
	5. If private laterals are a likely source of bacteria to the beach, establish and implement a private lateral replacement program.	Sanitary sewer collection system authority, and Municipalities	5 years

Table 7.2.5-3 Implementation Plan Elements			
Source	**Action**	**Implementing Party**	**Completion Timeframe**
Sewer Collection System & Urban Runoff	Establish and implement a protocol to enhance efforts to identify and correct illicit connections to the storm drain system.	Sanitary sewer collection system authority, and Municipal stormwater entity(s)	6 months
Urban Runoff	1. Submit a plan that describes BMPs being implemented and additional BMPs that will be implemented to reduce discharges of bacteria to the beach. Include control of nuisance wildlife if it represents a likely source of bacteria to the beach. The plan shall include a schedule and milestones for implementation.	Municipal stormwater entity(s)	6 months
	2. Determine effectiveness of urban runoff controls: Assess beach monitoring data to determine if targets are met at the beach.	Municipal stormwater entity(s)	5 years
	After five years, begin enhanced implementation if targets not met		
	3. If targets are not met, submit: (a) a plan describing BMPs being implemented and additional BMPs that will be implemented to reduce discharges of bacteria to the beach. The plan shall include an implementation schedule and milestones. and (b) a supplemental monitoring plan (*supplemental to ongoing beach monitoring*) to investigate remaining bacteria sources to the beach. This plan may develop data and a quantitative rationale to support (i) locations and types of enhanced bacteria BMPs, and/or (ii) revision of the numeric targets to reflect bacteria contributions from non-controllable sources. Include an implementation schedule.	Municipal stormwater entity(s)	5.5 years
	4. Where pets at the beach may be a source of bacteria to a beach, establish and implement protocols to control pet waste through such measures as providing bags, trash receptacles, and signage.	Park authority or Municipal stormwater entity(s)	6 months
Vessels	Where vessels represent a potential source of bacteria to the beach, begin or boost “no dumping” education efforts; identify and implement other needed BMPs, such as improving pump outs and other infrastructure.	Port authority, or marina owner	6 months from discovery of source
Wildlife	Where nuisance wildlife represents a potential source of bacteria to the beach, and the beach is managed by a non-municipal park authority, establish and implement protocols to control this source of bacteria.	Park authority, or include in Urban Runoff enhanced BMPs plans	6 months from discovery of source

[a] Timeframe begins on the effective date of this Basin Plan amendment

7.2.5.7 China Camp and McNears Beaches Implementation

Both China Camp and McNears beaches already meet the numeric targets for Enterococcus, and therefore no further implementation actions are necessary.

7.2.5.8 Water Quality Monitoring

Implementing parties are responsible for developing and implementing a monitoring plan sufficient to assess compliance with the numeric targets at the beaches. At a minimum, implementing parties shall continue monitoring the beaches as required under California Health and Safety Code section 115880 and provide a data evaluation report annually to the Water Board. It is recommended that the implementing parties select a lead entity to assess the monitoring data and compile the annual report.

If, after approximately five years, implementation actions do not result in achievement of numeric targets at a beach, supplemental monitoring (in addition to beach monitoring) is required to investigate and identify bacteria sources in the watershed that could be contributing to the bacteria impairment. This monitoring is intended to answer questions such as:

- Could bacteria sources be reduced by placing enhanced urban runoff BMPs in a certain location?
- Could bacteria sources be reduced by focusing sewer system investigations and repairs in a certain location?
- Are natural sources of bacteria contributing to a significant degree to the impairment at the beach?

Implementing parties need not wait four years if they wish to begin supplemental monitoring earlier. At any time, implementing parties may present data indicating the presence of natural sources of bacteria to the beach, such as non-nuisance wildfowl, to the Executive Officer of the Water Board, and the Water Board may consider developing new allocations that could include a natural source exclusion. Until such action is taken by the Water Board, the implementation requirements and completion dates shall remain in effect.

Beach monitoring and supplemental monitoring requirements are included on Tables 7.2.5-4 through 7.2.5-7.

7.2.5.9 Adaptive Implementation

The Water Board will adapt the TMDL and Implementation Plans to incorporate new and relevant scientific information such that effective and efficient measures can be taken to achieve standards. At approximately six-year intervals, Water Board staff will evaluate new and relevant information from implementation actions, water quality monitoring results, and the scientific literature, including any local reference system studies, U.S. EPA's revised recommended bacteria criteria, or new or revised State bacteria water quality objectives, and assess progress toward attaining the TMDL. Water Board staff will present that information to the Water Board, and the Water Board will consider a Basin Plan amendment that reflects any necessary modifications to the targets, load and wasteload allocations, or implementation plan.

CSD-005	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater Discharge	37 ° 47' 16" N	122 ° 29' 30" W	Pacific Ocean (China Beach)
CSD-006	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater Discharge	37 ° 47' 22" N	122 ° 29' 16" W	Pacific Ocean (Baker Beach)
CSD-007	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater Discharge	37 ° 47' 22" N	122 ° 29' 13" W	Pacific Ocean (Baker Beach)

Table 3. Administrative Information

This Order was adopted by the Regional Water Quality Control Board on:	August 12, 2009
This Order shall become effective on:	October 1, 2009
This Order shall expire on:	September 30, 2014
CIWQS Regulatory Measure	360578
The Discharger shall file a Report of Waste Discharge in accordance with title 23, California Code of Regulations, as application for issuance of new waste discharge requirements no later than:	180 days prior to the Order expiration date

The signatures below certify that the following is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on August 12, 2009, and of a National Pollutant Discharge Elimination System permit issued by the United States Environmental Protection Agency, Region IX, on the date below.

Bruce H. Wolfe, Executive Officer
California Water Quality Control Board
San Francisco Bay Region

Date: 8/12/09

I. FACILITY INFORMATION

The following Discharger is subject to waste discharge requirements as set forth in this Order.

Table 4. Facility Information

Discharger	City and County of San Francisco
Name of Facility	Oceanside Water Pollution Control Plant and Collection System, Including Westside Wet Weather Facilities
Facility Address	3500 Great Highway
	San Francisco, CA 94132
	San Francisco County
Facility Contact, Title, Phone	Tommy Moala, Assistant General Manager, (415) 554-2465
CIWQS Place ID	256498
CIWQS Party ID	39680
Mailing Address	San Francisco Public Utilities Commission/Wastewater Enterprise
	1155 Market Street, 11th Floor
	San Francisco CA 94103
Type of Facility	Publicly Owned Treatment Works (POTW)
Facility Design Flow	Oceanside Plant 43 MGD, maximum dry weather design flow (providing secondary treatment) 65 MGD maximum wet weather design flow (providing secondary treatment for 43 MGD and primary treatment for an additional 22 MGD)
	Westside Wet Weather Facilities Collection system flows greater than 65 MGD and less than 175 MGD receive the equivalent of wet weather primary treatment in the Westside Wet Weather Facilities (storage/transports) and are discharged at the Southwest Ocean Outfall. Flows greater than 175 MGD receive the equivalent of wet weather primary treatment in the Westside Wet Weather Facilities and are discharged at authorized combined sewer overflow discharge points on the shoreline.

II. FINDINGS

The U.S. Environmental Protection Agency (USEPA) and the California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board), find:

A. **Background.** The City and County of San Francisco (hereinafter the Discharger) is currently discharging pursuant to Order No. R2-2003-0073 and National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037681. The Discharger submitted a Report of Waste Discharge, dated March 28, 2008, and applied to renew its NPDES permit to discharge up to 65 MGD of treated wastewater from the Oceanside Water Pollution Control Plant (Plant), through the Southwest Ocean Outfall, and primary treated wet weather flows from the Westside Wet Weather Facilities.

For the purposes of this Order, references to the “discharger” or “permittee” in applicable federal and State laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

B. **Facility Description.** The Discharger is the owner and operator of the Oceanside Plant and its associated collection system, a combined sewer system that includes the Westside Wet Weather Facilities. The collection system includes approximately 300 miles of sewer pipes on the westside watershed of the city that covers the areas of Richmond, Sunset, and Lake Merced as well as a small portion of Daly City. The system also includes four all weather pump stations and two wet weather pump stations.

Treatment at the Oceanside Plant, which has a peak secondary treatment capacity of 43 MGD, includes coarse screening at the Westside Pump Station, fine screening and grit removal at the Plant headworks, primary sedimentation, activated sludge treatment by a pure oxygen process, and secondary clarification. Secondary treated wastewater is discharged to the Pacific Ocean between 3.4 and 3.6 nautical miles offshore, at Discharge Point 001 - the Southwest Ocean Outfall. These receiving waters are waters of the United States but are beyond the territorial waters of the State of California, which are three nautical miles from the low water mark at shore. During wet weather periods of high influent flow, the Oceanside Plant can provide primary treatment for an additional 22 MGD of influent flow, which, following treatment, is blended with secondary treated wastewater (i.e., a total treatment capacity of 65 MGD) and discharged at Discharge Point 001.

The Discharger's collection system includes three large storage/transport structures – the Westside Transport, a 49.3 million gallon box-like structure located beneath the Great Highway; the Richmond Transport, a 12 million gallon structure located to the north; and the Lake Merced Transport, a 10 million gallon structure located to the south. The combined storage capacity of these "Westside Wet Weather Facilities" is 73.5 million gallons, which includes 2.2 million gallons of capacity within the sewer lines.

Plant operations depend on rainfall, forecasts, and storage conditions in the Westside, Lake Merced, and Richmond Transport structures. Collection system flows that exceed the Oceanside Plant's treatment capacity of 65 MGD are stored in the Westside Wet Weather Facilities, which provide the equivalent of wet weather primary treatment through solids settling, skimming of floatable solids, and screening at pump stations. Combined wastewater from the storage/transport structures is pumped via the Westside Pump Station to Discharge Point 001, until the pumping capacity of the combined sewer system facilities to the outfall is reached at 175 MGD. Combined wastewater flows greater than 175 MGD also receive treatment in the storage/transport structures (the equivalent of wet weather primary treatment) but are discharged at the seven, near-shore combined sewer overflow discharge (CSOD) structures authorized by this Order. These receiving waters are waters of the United States and territorial waters of the State of California.

To be considered a discrete overflow discharge event, it must be separated by six hours in time from any other combined sewer overflow discharge. For the purposes of this permit, authorized, treated combined sewer overflow discharges from the near-shore discharge structures are referred to as combined sewer overflow discharges (CSODs). Unauthorized, untreated combined sewer overflow discharges from combined sewer systems are referred to as combined sewer overflows (CSOs).

Wastewater solids removed by settling in the Westside Wet Weather Facilities are flushed to the Plant when wet weather flows subside. Primary and secondary solids from the Plant are blended and thickened using gravity belt thickeners, anaerobically digested, dewatered, and beneficially re-used at permitted sites.

Attachment B provides a map of the area around the facility. Attachment C provides a flow schematic of the Plant and the Westside Wet Weather Facilities.

C. **Legal Authorities.** This Order is issued pursuant to federal Clean Water Act (CWA) §402 and the California Water Code (CWC) Chapter 5.5, Division 7 (commencing with §13370). It shall serve as an NPDES permit for point source discharges from this facility to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to CWC Article 4, Chapter 4, Division 7 (commencing with §13260). Because this Order concerns discharges to waters of the United States, both within and beyond State territorial waters, USEPA and Regional Water Board are jointly issuing the permit.

D. **Background and Rationale for Requirements.** The requirements of this Order are based on information submitted as part of the application, through monitoring and reporting programs, and other available information. The Fact Sheet (Attachment F), which contains background information and rationale for the requirements established by the Order, is hereby incorporated by reference into this Order and constitutes part of the Findings for this Order. Attachments A through E, and G through H are also incorporated into this Order by reference.

E. **California Environmental Quality Act (CEQA).** Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA. Similarly, pursuant to CWA §511(c), this action to reissue an NPDES permit does not trigger the requirements of the National Environmental Policy Act [42 U.S.C. 4321 et seq.].

F. **Technology Based Effluent Limitations.** CWA §301(b) and NPDES regulations at 40 CFR 122.44 require that permits include conditions meeting applicable technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet applicable water quality standards. Plant discharges authorized by this Order must meet the minimum federal technology-based requirements for POTWs established by USEPA at 40 CFR 133 (Secondary Treatment Regulation). For wet weather discharges, this Order includes technology-based requirements based on USEPA's Combined Sewer Overflow Control Policy. The Fact Sheet contains a discussion on the development of the technology-based effluent limitations and requirements.

G. **Water Quality Based Effluent Limitations.** CWA §301(b) and NPDES regulations at 40 CFR 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards.

40 CFR 122.44(d)(1)(i) mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established

for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) must be established using:

- USEPA criteria guidance under CWA §304(a), supplemented where necessary by other relevant information;
- an indicator parameter for the pollutant of concern; or
- a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the State's narrative criterion, supplemented with other relevant information, as provided in 40 CFR 122.44(d)(1)(vi).

H. **Water Quality Control Plans.** The *Water Quality Control Plan for the San Francisco Bay Basin* (the Basin Plan) is the Regional Water Board's master water quality control planning document. It designates beneficial uses and water quality objectives for waters of the State, including surface water and groundwaters, and includes programs of implementation to achieve water quality objectives. The Basin Plan was duly adopted by the Regional Water Board and approved by the State Water Resources Control Board (State Water Board), USEPA, and the Office of Administrative Law, as required. For the protection of ocean waters of the State, the Basin Plan incorporates by reference provisions of the *Water Quality Control Plan for Ocean Waters of California* (the Ocean Plan).

The Basin Plan implements State Water Board Resolution No. 88-63, which establishes State policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply (MUN). As the total dissolved solids (TDS) levels of marine waters significantly exceed 3,000 mg/L, ocean waters meet an exception to Resolution No. 88-63, and therefore, the MUN designation does not apply. According to Basin Plan Table 2-1, beneficial uses of the Pacific Ocean are as follows.

Table 5. Beneficial Uses

Receiving Water	Basin Plan Beneficial Uses
Territorial waters of the State of California within the Pacific Ocean	• Industrial Service Supply • Ocean, Commercial, and Sport Fishing • Shellfish Harvesting • Marine Habitat • Fish Migration • Preservation of Rare and Endangered Species • Fish Spawning • Wildlife Habitat • Water Contact Recreation • Noncontact Water Recreation • Navigation

Requirements of this Order implement the Basin Plan.

I. **California Ocean Plan.** The State Water Board adopted the *Water Quality Control Plan for Ocean Waters of California* (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, and 2005. The State Water Board adopted the latest amendment on April 21, 2005, and it became effective on February 14, 2006. The Ocean Plan applies, in its entirety, to point source discharges to the territorial waters of the State as defined by California law to the extent that these waters are outside of enclosed bays, estuaries, and coastal lagoons. The Ocean Plan identifies the following beneficial uses of ocean waters of the State: Industrial Water Supply; Water Contact and Non-contact Recreation, Including Aesthetic Enjoyment; Navigation; Commercial and Sport Fishing; Mariculture; Preservation and Enhancement of Designated Areas of Special Biological Significance; Rare and Endangered Species; Marine Habitat; Fish Migration; Fish Spawning; and Shellfish Harvesting. To protect beneficial uses, the Ocean Plan establishes water quality objectives and a program of implementation for discharges to State territorial waters.

Discharge Point 001, the Southwest Ocean Outfall, is 3.4 to 3.6 nautical miles offshore in federal waters. The territorial waters of the State end three nautical miles from shore. The Ocean Plan (Appendix 1, Ocean Waters) states, "If a discharge outside the territorial waters of the State could affect the quality of the waters of the State, the discharge may be regulated to assure no violation of the Ocean Plan will occur in ocean waters." For the reasons set forth in the Fact Sheet (Appendix F), the Regional Water Board finds that the discharge at Discharge Point 001 could not affect the quality of the waters of the State during dry weather. During wet weather, the Ocean Plan defers to the Combined Sewer Overflow Control Policy, discussed in Finding K, below. Therefore, this Order does not regulate the discharge at Discharge Point 001 directly through the Water Board's Ocean Plan authorities.

J. **Determination of Unreasonable Degradation of the Marine Environment.** Discharges from the Southwest Ocean Outfall are to waters of the United States beyond the territorial waters of the State of California. Federal regulations at 40 CFR 125.122 require the permitting authority to determine whether a discharge will cause unreasonable degradation of the marine environment. Based on 40 CFR 125.22(b), USEPA conducted a reasonable potential analysis using Ocean Plan objectives and included numeric permit limitations, based on the Ocean Plan's dilution procedures, for toxicity and mercury, the only numeric Ocean Plan objectives for which USEPA found reasonable potential to cause or contribute to an exceedance of water quality standards. USEPA also included narrative receiving water limitations for the Ocean Plan narrative objectives for which it found reasonable potential. For determining reasonable potential for the dioxins, USEPA used recently updated Toxicity Equivalency Factors (TEFs) published by the World Health Organization in 2005, as well as the congener-specific Bioconcentration Equivalency Factors (BEFs) used for the Great Lakes System. The "Bay Area Clean Water Agencies' Draft Dioxin Issue Paper: Expert Panel Response and Recommendations," dated April 4, 2008, proposed using both TEFs and BEFs in developing NPDES permit limits for dioxins. This approach incorporates recent scientific information for dioxins on a congener-specific basis, while continuing to use the Ocean Plan water quality objective for dioxins (TCDD equivalents) and standards implementation procedures. Given the unique issues dioxins present, USEPA has prepared a determination of no unreasonable degradation based on the ten factors under 40 CFR 125.122(a) (Appendix 1 to the Fact Sheet). USEPA has determined that no unreasonable degradation of the marine environment will result from

the discharges of dioxins through the Southwest Ocean Outfall as authorized under this Order, with all the limitations, conditions, and monitoring requirements in effect.

K. **Combined Sewer Overflow Control Policy.** Wet weather flows from combined sewer systems are subject to CWA §301(b)(1)(A) and are not subject to secondary treatment regulations. Wet weather flows from combined sewer systems are addressed by the Combined Sewer Overflow Control Policy (59 Federal Register 18688-18698). The *Wet Weather Water Quality Act of 2000* incorporated this policy into the CWA.

The policy establishes a consistent national approach for controlling discharges from combined sewers to the nation's waters. Using the NPDES permit program, the policy initiates a two-phased process. During the first phase, a discharger is required to implement "nine minimum controls" (e.g., prevent dry weather overflows). These controls constitute the technology-based requirements of the CWA as applied to combined sewer facilities (i.e., best conventional pollutant control technology, BCT, and best available control technology economically achievable, BAT). The controls are intended to provide immediate and relatively low-cost water quality improvements for facilities that, unlike the Discharger, have not implemented a long-term control plan. During the first phase, a discharger is required to initiate development of a long-term control plan to select controls to comply with water quality standards, based on consideration of the discharger's financial capabilities.

The second phase of the process involves implementation of the long-term control plan developed in the first phase. The purpose of this long-term control plan is to comply with CWA water quality requirements. The Discharger's program, which continues to implement the Discharger's long-term plan, is consistent with the policy. This Order implements the policy and is consistent with the Regional Water Board policy on wet weather overflows described in Basin Plan Section 4.9. During wet weather, CSODs from shoreline discharge points CSD-001 through CSD-007 and the Southwest Ocean Outfall are subject to this policy.

L. **Alaska Rule.** On March 30, 2000, USEPA revised its regulation that specifies when new and revised state and tribal water quality standards (WQS) become effective for CWA purposes [65 FR 24641 (April 27, 2000) (codified at 40 CFR 131.21)]. Under the revised regulation (also known as the Alaska Rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.

M. **Stringency of Requirements for Individual Pollutants.** This Order contains both technology-based and water quality-based effluent limitations for individual pollutants. The technology-based effluent limitations consist of restrictions on biochemical oxygen demand (BOD), total suspended solids (TSS), and pH. Restrictions on these pollutants are discussed in Section IV.B of the Fact Sheet (Attachment F). This Order's technology-based pollutant restrictions implement the minimum applicable federal technology-based requirements. In addition, this Order contains effluent limitations more stringent than the minimum federal technology-based requirements. The water quality-based limits are

necessary to meet water quality standards. They are not more stringent than required by the CWA.

Water quality-based effluent limitations have been derived to implement water quality objectives that protect beneficial uses. Both beneficial uses and water quality objectives in State waters have been approved pursuant to federal law and are the applicable water quality standards. The procedures used for this Order to calculate individual water quality-based effluent limitations for State waters are based on the California Ocean Plan, which was approved by USEPA on February 14, 2006.

N. **Antidegradation Policy**. NPDES regulations at 40 CFR 131.12 require that State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law and requires that existing quality of waters be maintained unless degradation is justified based on specific findings. Water quality plans implement and incorporate by reference, both the State and federal antidegradation policies. The permitted discharges are consistent with the antidegradation provisions of 40 CFR 131.12 and State Water Board Resolution No. 68-16 because there is no increase in authorized flow and effluent limitations are at least as stringent as in the previous permit.

O. **Anti-Backsliding Requirements.** CWA Sections 402(o)(2) and 303(d)(4) and NPDES regulations at 40 CFR 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. With the exception of acute and chronic toxicity, all effluent limitations in this Order are at least as stringent as the effluent limitations in the previous permit. Compliance with anti-backsliding requirements is discussed in Fact Sheet section IV.C.6.

P. **Endangered Species Act.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code sections 2050 to 2097) or the federal Endangered Species Act (16 U.S.C.A. sections 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the State. The Discharger is responsible for meeting all requirements of applicable State and federal law pertaining to threatened and endangered species.

Section 7(a)(2) of the federal Endangered Species Act requires USEPA, in reissuing this NPDES permit, to ensure, after consultation with appropriate agencies that discharges at the Southwest Ocean Outfall are not likely to jeopardize the continued existence of any threatened or endangered species or result in the destruction or adverse modification of critical habitat for such species. USEPA has initiated informal consultation with National Oceanic Atmospheric Administration.

Q. **Monitoring and Reporting.** NPDES regulations at 40 CFR 122.48 require that all NPDES permits specify requirements for recording and reporting monitoring results. CWC §13267

and §13383 authorize the Regional Water Board to require technical and monitoring reports. The Monitoring and Reporting Program accompanying this Order (Attachment E) establishes monitoring and reporting requirements to implement federal and State requirements.

R. **Standard and Special Provisions.** Federal Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR 122.42, are provided in Attachment D. The Discharger must comply with all federal standard provisions and with those additional conditions that apply pursuant to 40 CFR 122.42. The Regional Water Board has also included State standard provisions in this Order as Attachment G. The rationale for these special provisions is provided in the Fact Sheet (Attachment F). Where federal standard provisions are duplicative with State standard provisions, the federal standard provisions will apply and any excursion from a duplicative standard provision will not be interpreted as two excursions.

S. **Notification of Interested Parties.** The USEPA and Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe Waste Discharge Requirements for the discharges described herein and has provided them with an opportunity to submit written comments and recommendations. Details of the notification are provided in the Fact Sheet, which accompanies this Order.

T. **Consideration of Public Comment.** The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharges. Details of the public hearing are provided in the Fact Sheet of this Order.

THEREFORE, IT IS HEREBY ORDERED, that this Order supersedes Order No. R2-2003-0073, except for enforcement purposes, and in order to meet the provisions contained in CWC Division 7 (commencing with §13000) and regulations adopted hereunder, and the provisions of the federal CWA and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order.

III. DISCHARGE PROHIBITIONS

A. Discharge of treated wastewater at a location or in a manner different from that described by this Order is prohibited.

B. Discharge from Discharge Point 001 that does not receive an initial dilution of at least 150:1 is prohibited.

C. Bypass of secondary treatment facilities at the Oceanside Plant is prohibited, except during a wet weather day, as defined by this Order (see Definitions, Attachment A), or as provided for by NPDES regulations at 40 CFR 122.41(m)(4) and in Section IV.B of *Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits*, July 2009 (Attachment G).

D. Discharge of wastewater at a location other than Discharge Point 001 is prohibited, except on wet weather days (as defined in Attachment A) when the capacity of the system to discharge to Discharge Point 001 has been exceeded.

E. Discharge of wastewater at Discharge Points CSD-001 through CSD-007 is prohibited, except on wet weather days (as defined in Attachment A) and in accordance with the terms of this Order.

F. Plant discharges shall not exceed 43 MGD at Monitoring Location EFF-001 during dry weather. Compliance with this prohibition shall be based on average dry weather flow determined over three consecutive dry weather months.

G. Any CSO that results in a discharge of untreated or partially treated wastewater to waters of the United States is prohibited. This does not include authorized combined sewer overflow discharges (CSODs).

H. The discharge of municipal and industrial waste sludge directly or indirectly to the ocean, or into a waste stream that discharges to the ocean without further treatment, is prohibited.

I. The discharge of waste to designated Areas of Special Biological Significance, except as provided by Ocean Plan Chapter III.E, is prohibited.

J. Degradation of harvestable shellfish in the area as a result of dry weather discharge from Discharge Point 001 is prohibited.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Effluent Limitations for Dry Weather – Discharge Point 001

The following effluent limitations apply during dry weather days, as defined in Attachment A. Limitations, conditions, and other requirements applicable during wet weather conditions are established in Section VI.C of this Order.

1. Effluent Limitations – Discharge Point 001

a. The Discharger shall comply with the following effluent limitations at Discharge Point 001, with compliance measured at Monitoring Location EFF-001 as described in the attached Monitoring and Reporting Program:

Table 6. Effluent Limitations for Conventional Pollutants, Discharge Point 001

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
BOD_5[(1)] @ 20°C	mg/L	30	45	---	---	---
TSS[(2)]	mg/L	30	45	---	---	---
pH[(3)]	std units	---	---	-9.0--	6.0	9.0

(1) Biochemical Oxygen Demand
(2) Total Suspended Solids
(3) The pH effluent limit of 6.0 shall not apply if the discharger can demonstrate that the addition of inorganic chemicals or industrial sources is not causing the excursion below 6.0. The regulations at 40 CFR 133.102(c) allow the modification or elimination of pH limitations when it can be demonstrated that the addition of inorganic chemicals or industrial sources is not causing an excursion above or below the limits.

b. Percent Removal: The average monthly percent removal of BOD_5 @ 20°C and TSS shall not be less than 85 percent.

2. Effluent Limitations for Toxic Substances – Discharge Point 001

The Discharger shall comply with the following effluent limitations at Discharge Point 001, with compliance measured at Monitoring Location EFF-001 as described in the attached Monitoring and Reporting Program:

Table 7. Effluent Limitations for Toxic Pollutants, Discharge Point 001

Parameter	Units	Effluent Limitations[(1)][(3)]		
		6-month median	Maximum Daily	Instantaneous Maximum
Chronic Toxicity	TUc	N/A	150	N/A
Mercury[(2)]	µg/L	5.9	24	N/A

(1) Limitations apply to the concentration of all samples collected during the period (daily = 24-hour period)

(2) Mercury limitations are expressed as total recoverable metal.

(3) A daily or 6-month median value for a given constituent shall be considered noncompliant with the effluent limitations only if it exceeds the effluent limitation and the Reporting Level (RL) for that constituent. Ocean Plan Appendix II indicates the Minimum Level (ML) upon which the Reporting Level is based for compliance purposes. For mercury this is 0.2 µg/L.

3. Effluent Limits for Disinfectants

The effluent is not disinfected; thus there are no limits on chlorine or other disinfectant residuals.

B. Land Discharge Specifications

Not Applicable.

C. Reclamation Specifications

Not Applicable.

V. RECEIVING WATER LIMITATIONS

A. Surface Water Limitations

Ocean Plan water quality objectives were used to determine the receiving water limitations in this Order. Dry Weather Day discharges authorized by this Order at Discharge Point 001 shall not cause exceedances of the following surface water limitations in ocean receiving waters. As indicated in the Fact Sheet (Attachment F, Section IV.C.6), disinfection to meet bacteria level objectives is not required. Attachment F Section III.C.4 describes an Ocean Plan exception for combined sewer overflows discharges.

1. Floating particulates and grease and oil shall not be visible.

2. The discharge of waste shall not cause aesthetically undesirable discoloration of the ocean surface.

3. Natural light shall not be significantly reduced at any point outside the initial dilution zone as the result of the discharge of waste.

4. The rate of deposition of inert solids and the characteristics of inert solids in ocean sediments shall not be changed such that benthic communities are degraded.

5. The dissolved oxygen concentration shall not at any time be depressed more than 10 percent from that which occurs naturally, as a result of the discharge of oxygen demanding waste material.

6. The pH shall not be changed at any time more than 0.2 units from that which occurs naturally.

7. The dissolved sulfide concentration of waters in and near sediments shall not be significantly increased above that present under natural conditions.

8. The concentration of organic materials in marine sediments shall not be increased to levels that would degrade marine life.

9. Nutrient levels shall not cause objectionable aquatic growths or degrade indigenous biota.

10. Marine communities, including vertebrate, invertebrate and plant species, shall not be degraded.

11. The natural taste, odor, and color of fish, shellfish, or other marine resources used for human consumption shall not be altered.

12. The concentration of organic materials in fish, shellfish, or other marine resources used for human consumption shall not bioaccumulate to levels that are harmful to human health.

B. Groundwater Limitations

Not Applicable

VI. PROVISIONS

A. Standard Provisions

1. The Discharger shall comply with all Standard Provisions included in **Attachment D** of this Order.

2. The Discharger shall comply with all applicable items of the *Regional Standard Provisions and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits*, July 2009 **(Attachment G)**, including any amendments thereto.

3. If any discrepancies exist between requirements in the Order, the federal standard provisions included in Attachment D, and the Regional Standard Provisions included in Attachment G, the requirements in this Order prevail over requirements in Attachment D, which prevail over requirements in Attachment G.

B. Monitoring and Reporting Program (MRP) Requirements

The Discharger shall comply with the MRP, and future revisions thereto, in Attachment E. The Discharger shall also comply with all applicable items of the *Regional Standard Provisions and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits*, July 2009 **(Attachment G)**.

C. Special Provisions

1. Re-opener Provisions

The Regional Water Board or USEPA, as appropriate, may modify or re-open this Order prior to its expiration date in any of the following circumstances as allowed by law.

a. If present or future investigations demonstrate that a discharge governed by this Order will have, or will cease to have, a reasonable potential to cause or contribute to adverse impacts on water quality or beneficial uses of the receiving waters.

b. If new or revised Water Quality Objectives (WQOs) or TMDLs come into effect for the receiving waters, effluent limitations may be modified as necessary to reflect the updated WQOs and waste load allocations in TMDLs. Adoption of effluent limitations as contained in this Order is not intended to restrict in any way future modifications based on legally adopted WQOs, TMDLs, or as otherwise permitted under regulations governing permit modifications.

c. If translator or other water quality studies provide a basis for determining that a permit condition should be modified.

d. If an administrative or judicial decision on a separate NPDES permit or WDR necessitates modifications of the requirements established by this Order.

e. As otherwise authorized by law.

The Discharger may request permit modification in any of the circumstances described above. Such a request shall include appropriate antidegradation and anti-backsliding analyses.

2. Special Studies, Technical Reports, and Additional Monitoring Requirements

a. Combined Sewer Collection System Overflow Study

The combined sewer system commingles stormwater and domestic and industrial sewage. Heavy storm events can potentially result in flows that exceed the collection system capacity, at least in some areas. The Discharger shall submit a report, for planning purposes, by June 30, 2012, evaluating the potential locations of such system excursions and the primary conditions that result in such events. The report shall evaluate the feasibility and effectiveness of alternatives to minimize these events.

b. Dilution Model Update and Stratification Data Collection

Available ambient data to determine stratification for the purposes of dilution modeling for this discharge is out-dated. The Discharger shall submit with the permit application for the next permit reissuance, ambient data collected during the term of this permit, as well as updated dilution modeling for use during the next permit reissuance. The discharger shall:

(1) Submit a work plan to USEPA and the Regional Water Board for stratification data collection no later than one year after the effective date of this Order. The purpose of the data collection effort is to determine the months of maximum stratification based on actual ocean observations. At a minimum, the work plan shall include the following tasks:

- Collect temperature and salinity data during the months of maximum stratification in the vicinity of the outfall uninfluenced by the waste-field;
- Record data at a minimum of five equally spaced depths and at an appropriate resolution to determine maximum stratification;
- Provide effluent temperature and salinity or density data and flow rate for the time period encompassing the study;
- Describe how the data will be collected, the location(s), sensors, and instruments to be deployed and equipment to be used; and
- Describe appropriate quality assurance protocols to be followed to ensure the data is of adequate quality and representative of actual conditions within the water column.

(2) Upon completion of data collection, the Discharger shall prepare and submit a data report in hard copy and electronic format to USEPA and the Regional Water Board. Records that include large data gaps, errors, or instrument failures may not be used for dilution modeling.

(3) No later than 4 years after the effective date of this Order, the Discharger shall submit a work plan for updated dilution modeling. This work plan shall include models to be used and model inputs and assumptions.

(4) No later than at the time of submittal of the application for permit reissuance, the Discharger shall submit updated dilution modeling runs, with all inputs and outputs presented in hard copy and electronic form.

3. Best Management Practices and Pollution Prevention

a. Pollution Minimization Program

The Discharger shall continue to implement and improve, in a manner acceptable to the Executive Officer, its existing Pollutant Minimization Program (PMP) to reduce pollutant loadings to the combined sewer system, and therefore to the receiving waters.

b. Annual Pollution Prevention Report

The Discharger shall submit an annual report, acceptable to the Executive Officer, no later than February 28th of each calendar year. The annual report shall cover January through December of the preceding year. Each annual report shall include at least the following information.

(1) *Brief description of the treatment plant, treatment plant processes and service area.*

(2) *Discussion of current pollutants of concern.* Periodically, the Discharger shall determine which pollutants are currently a problem and which pollutants may be potential future problems. This discussion shall address why the pollutants were identified as pollutants of concern.

(3) *Identification of sources of pollutants of concern.* This discussion shall address how the Discharger identifies pollutant sources. The Discharger should also identify sources or potential sources not directly within its ability or authority to control, such as pollutants in the potable water supply and air deposition.

(4) *Identification and implementation of measures to reduce the sources of the pollutants of concern.* This discussion shall identify and prioritize tasks to address the Discharger's pollutants of concern. The Discharger may implement the tasks themselves or participate in a regional, State, or national group to address its pollutants of concern whenever it is efficient and appropriate to do so. A time line shall be included for the implementation of each task.

(5) *Outreach to employees.* The Discharger shall inform its employees regarding pollutants of concern, potential sources, and how they might be able to help reduce the discharge of these pollutants. The Discharger may provide a forum for employees to provide input to the program.

(6) *Continuation of Public Outreach Program. The* Discharger shall prepare a public outreach program to communicate pollution minimization measures to its service area. Outreach may include participation in existing community events such as county fairs, initiating new community events such as displays and contests during Pollution Prevention Week, conducting school outreach programs, conducting plant tours, and providing public information in various media. Information shall be specific to target audiences. The Discharger shall coordinate with other agencies as appropriate.

(7) *Discussion of criteria used to measure PMP's and tasks' effectiveness.* The Discharger shall establish criteria to evaluate the effectiveness of its PMP. This discussion shall address specific criteria used to measure the effectiveness of each task identified in provisions VI.C.3.b(3 – 6), above.

(8) *Documentation of efforts and progress.* The Discharger shall describe all its PMP activities for the reporting year.

(9) *Evaluation of PMP's and tasks' effectiveness.* The Discharger shall use the criteria established in b.7, above, to evaluate the Program's and tasks' effectiveness.

(10) *Identification of specific tasks and time schedules for future efforts.* Based on the evaluation of effectiveness, the Discharger shall describe how it will continue or change its PMP tasks to more effectively reduce the loading of pollutants to the treatment plant, and subsequently, in its effluent.

The Discharger shall develop and conduct a PMP as further described below when there is evidence (e.g., sample results reported as DNQ when the effluent limitation is less than the ML, sample results from analytical methods more sensitive than those methods required by this Order, presence of whole effluent toxicity, health advisories for fish consumption, results of benthic or aquatic organism tissue sampling) that a pollutant identified in Table B of the Ocean Plan is present in the effluent above an effluent limitation that is calculated for a constituent contained in Table B of the Ocean Plan and either:

(i) The concentration of the pollutant is reported as DNQ and the effluent limitation is less than the reported ML; or

(ii) The concentration of the pollutant is reported as ND and the effluent limitation is less than the ML, using definitions described in Attachment A and reporting protocols described in MRP section X.B.4.

The PMP shall include, but not be limited to, the following actions and submittals acceptable to the Regional Water Board:

(i) An annual review and semi-annual monitoring of potential sources of the reportable pollutant(s), which may include fish tissue monitoring and other bio-uptake sampling; or alternative measures approved by the Executive Officer when it is demonstrated that source monitoring is unlikely to produce useful analytical data;

(ii) Quarterly monitoring for the reportable pollutant(s) in the influent to the wastewater treatment system; or alternative measures approved by the Executive Officer, when it is demonstrated that influent monitoring is unlikely to produce useful analytical data;

(iii) Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable pollutant(s) in the effluent at or below the effluent limitation;

(iv) Implementation of appropriate cost-effective control measures for the reportable pollutant(s), consistent with the control strategy; and

(v) An annual status report that shall be sent to the Regional Water Board including:

- All PMP monitoring results for the previous year;
- A list of potential sources of the reportable pollutant(s);
- A summary of all actions undertaken pursuant to the control strategy; and
- A description of actions to be taken in the following year.

4. Construction, Operation and Maintenance Specifications

a. Wastewater Facilities, Review and Evaluation, and Status Reports

(1) The Discharger shall operate and maintain its wastewater collection, treatment, and disposal facilities in a manner to ensure that all facilities are adequately staffed, supervised, financed, operated, maintained, repaired, and upgraded as necessary, in order to provide adequate and reliable transport, treatment, and disposal of all wastewater from both existing and planned future wastewater sources under the Discharger's service responsibilities.

(2) The Discharger shall regularly review and evaluate its wastewater facilities and operation practices in accordance with Section a.(1) above. Reviews and evaluations shall be conducted as an ongoing component of the Discharger's administration of its wastewater facilities.

(3) The Discharger shall provide USEPA and the Regional Water Board, upon request, a report describing the current status of its wastewater facilities and operation practices, including any recommended or planned actions and an estimated time schedule for these actions. The Discharger shall also include, in each annual SMR, a description or summary of its review and evaluation procedures, and wastewater facility programs or capital improvement projects.

b. Operations and Maintenance (O&M) Manual, Review and Status Reports

(1) The Discharger shall maintain an O&M Manual for the Plant and collection system. The O&M Manual shall be maintained in usable condition and be available for reference and use by all personnel.

(2) The Discharger shall regularly review, revise, or update, as necessary, the O&M Manual to ensure that it remains useful and relevant to current equipment and operation practices. The Discharger shall conduct reviews annually, and revise or update the O&M Manual as necessary. For any significant changes in treatment facility equipment or operation practices, the Discharger shall complete any revisions within 90 days.

(3) The Discharger shall provide USEPA and the Regional Water Board, upon request, a report describing the current status of its O&M Manual, including any recommended or planned actions and an estimated time schedule for these actions. The Discharger shall also include, in each annual SMR, a description or summary of review and evaluation procedures and changes to its operations and maintenance manual.

c. Contingency Plan, Review and Status Reports

(1) The Discharger shall maintain a Contingency Plan as prudent in accordance with current municipal facility emergency planning. The discharge of pollutants in violation of this Order when the Discharger has failed to develop

and adequately implement a Contingency Plan will be the basis for considering such a discharge a willful and negligent violation of this Order pursuant to CWC §13387.

(2) The Discharger shall annually review the Contingency Plan and update it, as necessary, so that the plan may remain useful and relevant to current equipment and operation practices.

(3) The Discharger shall provide USEPA and the Regional Water Board, upon request, a report describing the current status of its Contingency Plan review and update. The Discharger shall also include, in each annual SMR, a description or summary of its review and evaluation procedures and any changes to its Contingency Plan.

5. Special Provisions for Municipal Facilities

a. Pretreatment Program

(1) The Discharger shall implement and enforce its approved pretreatment program in accordance with federal Pretreatment Regulations (40 CFR 403), pretreatment standards promulgated under Sections 307(b), 307(c), and 307(d) of the CWA, pretreatment requirements specified under 40 CFR 122.44(j), and the requirements in Attachment H, "Pretreatment Requirements." The Discharger's responsibilities include, but are not limited to:

(i) Enforcement of National Pretreatment Standards of 40 CFR 403.5 and 403.6;

(ii) Implementation of its pretreatment program in accordance with legal authorities, policies, procedures, and financial provisions described in the General Pretreatment regulations (40 CFR 403) and its approved pretreatment program;

(iii) Submission of reports to USEPA, the State Water Board, and the Regional Water Board, as described in Attachment H "Pretreatment Requirements".

(iv) Evaluate the need to revise local limits under 40 CFR 403.5(c)(1), and within the term of this Order, submit a report acceptable to the Executive Officer describing the changes with a plan and schedule for implementation.

(2) The Discharger shall implement its approved pretreatment program and the program shall be an enforceable condition of this Order. If the Discharger fails to perform the pretreatment functions, the Regional Water Board, the State Water Board, or USEPA may take enforcement actions against the Discharger as authorized by the CWA .

b. Sludge Management Practices Requirements
