Section 1: Introduction

A. Project Description

The "2020 Walnut Light Industrial Park" Project proposes development of nine 1-story and 1-story-with-mezzanine concrete tilt-up buildings, ranging in height from 30 feet six inches to 34 feet and comprising 151,075 square feet of total building area. The buildings are for occupancy by businesses engaged in a variety of light industrial activities permitted in the City's Light Industrial Zone.

The project requires the following discretionary approvals from the City of Signal Hill:

1) *General Plan Amendment:* To amend the City's General Plan Land Use Element to redesignate Site 2 (eastern parcel) from Commercial Office to Light Industrial.

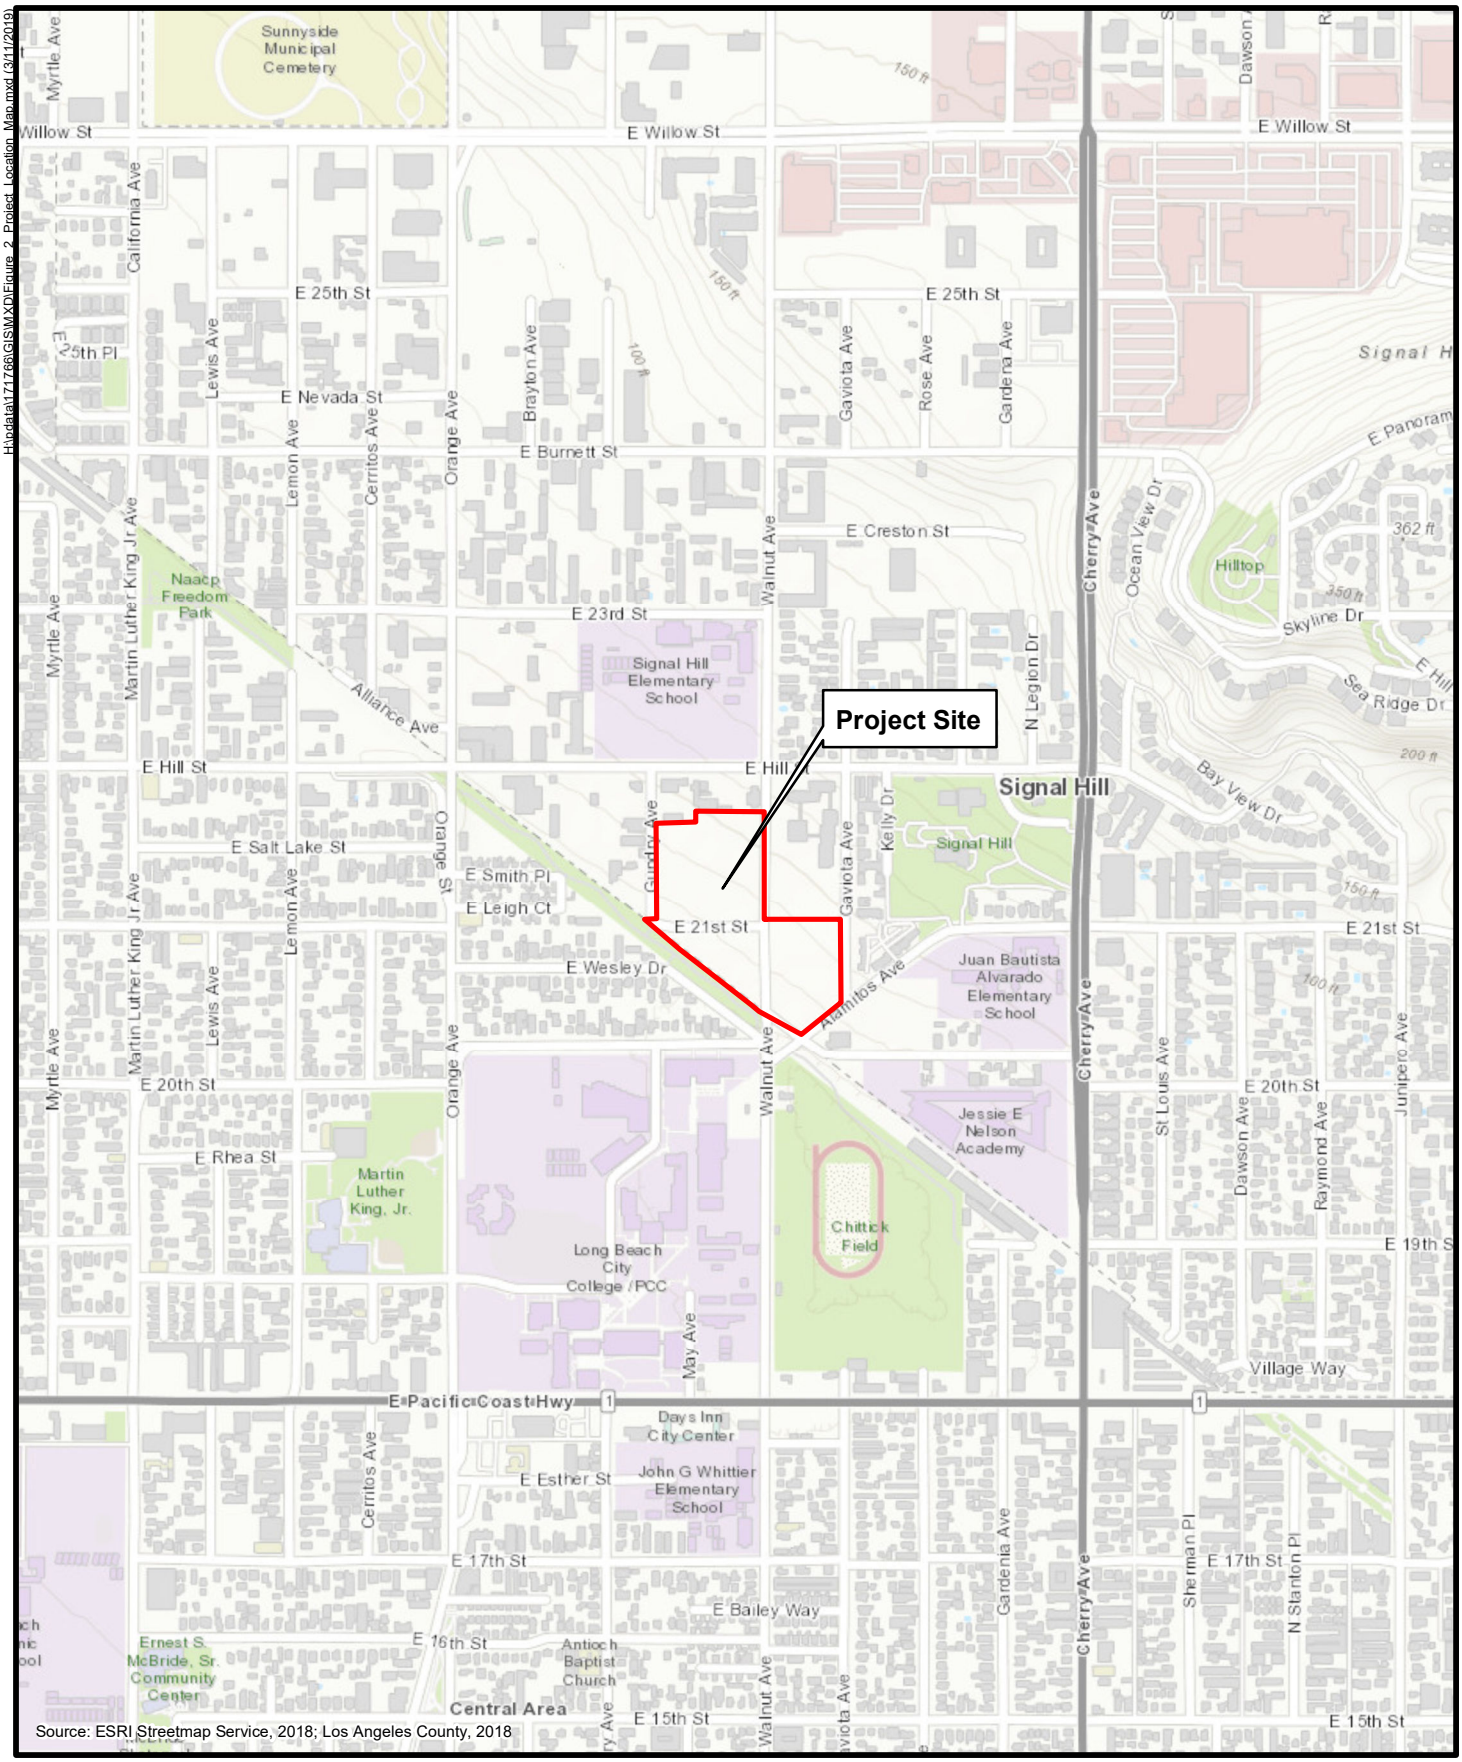
2) *Zone Change:* To amend the City's Zoning Map to classify Site 2 (eastern parcel) from Commercial Office to Light Industrial.

3) *Tentative Tract Map 80302:* To merge and re-subdivide existing parcels to create condominium ownership rights for each of the nine buildings, plus commonly owned parcels for shared site improvements to be maintained by an association of the future property owners. This map will also vacate the existing 21st Street right-of-way and dedicate 5 feet of additional public right-of-way along both Walnut Avenue frontages.

4) *Site Plan and Design Review:* The purpose of site plan and design review process is to ensure the proposed project is in conformance with the provisions of the Municipal Code and to guide City departments in the issuance of permits.

Location: The project is located on the west and east sides of Walnut Avenue, south of Hill Street and north of Jenni Rivera Park, 20th Street, and Alamitos Avenue. Gundry Avenue borders the site on the west and Gaviota Avenue borders the site on the east. For reference purposes, the site address is 2020 Walnut Avenue. The western part is referred to as "Site 1" and the eastern part is referred to as "Site 2." A regional location map and a vicinity map are provided in *Figures 1 and 2*.

B. Draft Mitigated Negative Declaration Previously Circulated for Public Review



A Draft Initial Study/Mitigated Negative Declaration (IS/MND) was prepared for the subject project, pursuant to 14 California Code of Regulations, Section 15063 (Initial Study) and Section 15070 (Mitigated Negative Declaration). The entire Draft IS/MND, including all appendix materials, is on file at the City of Signal Hill, Community Development Department, 2175 Cherry Avenue, Signal Hill, CA 90755. The Draft IS/MND is hereby incorporated, by reference.

The Draft IS/MND was published and circulated for a 30-day public review period beginning February 28, 2020 and ending March 28, 2020. A Notice of Intent to Adopt an MND was posted at the office of the Los Angeles County Clerk on February 28, 2020. The NOI and the IS/MND materials were also posted on the City's website, throughout the public review period and afterward.

Copies of the Draft IS/MND were transmitted to the following:

- Governor's Office of Planning and Research, State Clearinghouse
- City of Long Beach
- South Coast Air Quality Management District
- Los Angeles Regional Water Quality Control Board
- The Law Firm of Louzeau Drury, LLP

Written comments concerning the project and the information in the Draft IS/MND were submitted by the City of Long Beach, South Coast Air Quality Management District, and Supporters Alliance for Environmental Responsibility. Copies of those comments and responses to the comments are presented in Section 2.

C. Recirculated Mitigated Negative Declaration (MND)

The City has prepared and is circulating a Recirculated MND (this document) for public review and comment, pursuant to Section 15073.5 of the State CEQA Guidelines. This is due to a change in the determination of impact significance for two of the air quality impact thresholds, involving regional emissions of nitrogen oxides (NOx) during the grading phase and localized emissions of gaseous pollutants and particulate matter, also during the grading phase. The original determination, in the Draft MND that was previously published and circulated for public review and comment, was that those emissions would be close to, but below, the significance threshold recommended by the South Coast Air Quality Management District (SCAQMD), and a mitigation measure was identified to limit grading activities to four hours a day, to reduce daily emissions and ensure that there would not be exceedances of the regional threshold due to emissions from grading machinery or trucks transporting soil materials off site. It was later determined, in the process of responding to comments on the Draft MND, that the length of truck trips for off-site soil disposal of hazardous soil materials had been underestimated and that total emissions of NOx would now exceed the daily threshold, due to higher truck emissions from those longer trips and from on-site machinery emissions throughout an 8-hour grading day. The original 4-hour per day grading limit has also been changed to allow for normal 8-hour workdays. Updated calculations of grading period emissions have been completed, including the benefits of additional mitigation measures to require later model/cleaner burning diesel-powered grading machinery, and to limit the number of daily truck trips involved in hauling off excess soil materials. With these mitigation measures, the daily NOx emissions would be reduced to well below the regional significance threshold, and the localized emissions would also be reduced to below all threshold levels for the pollutants of concern. Updated construction emissions calculations and related revisions to the text of the original Air Quality section are included in the Recirculated MND.

Further, the temporary emissions from drill rigs needed to install soil vapor probes, air sparge equipment and groundwater monitoring wells was added to the analysis to account for the emissions as a distinct source in the construction program. A new mitigation measure has been added to require that drill rig equipment to consist of cleaner-burning engine models to reduce particulate and gaseous emissions from that source during construction. A discussion of this additional construction emissions source and the added mitigation measures are included in the revised Air Quality section. Finally, a supplemental Health Risk Assessment has been prepared to evaluate the potential concentrations of diesel particulate matter generated from the exhausts of light and medium duty trucks anticipated to occur daily with the fully built industrial park. The HRA determined that such

emissions would occur at levels well below the significance thresholds for cancer and non-cancer health risks, established by the SCAQMD. A copy of the HRA and a summary of the results are included in the Recirculated MND.

Consistent with the CEQA Guidelines, which provide that recirculated revisions to an EIR can be "limited to a few chapters or portions of the EIR" (14 CCR § 15088.5(c)) and absolve the lead agency of any requirement to respond to comments on a MND (id. § 15074(b)), the City has requested that reviewers limit their comments to the revised portion of this recirculated MND.

Section 2: Comments and Responses to Comments on Draft MND

2A: SCAQMD Comments and Responses

Responses to Comments by South Coast Air Quality Management District

Comments concerning information and analysis in the Draft MND prepared for the project were submitted by the South Coast Air Quality Management, in a letter dated March 24, 2020, attached hereto. Responses to those comments are provided below, corresponding to the bracketing and numbering shown in the attached comments.

Comment 1: **Mitigated Negative Declaration (MND) for the Proposed 2020 Walnut Industrial Park Project**

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be included into the Final MND.

South Coast AQMD Staff's Summary of Project Description
The Lead Agency proposes to construct a total of 151,075 square feet of buildings for warehouse and light industrial uses on an 8.2-acre vacant site (Proposed Project). The Proposed Project is located on the southwest corner of Gundry Avenue and E Hill Street. Construction of the Proposed Project will take place approximately 19 months beginning in 2020[1]. During full operation in 2021, the Proposed Project would generate 2,320 one-way trips per day, including 348 truck trips.[2]

Summary of South Coast AQMD Staff's Comments
In the MND, the Lead Agency quantified the Proposed Project's regional and localized emissions and found that the Proposed Project's construction and operational air quality impacts would be less than significant. The Lead Agency includes one construction mitigation measure (MM III-1) to restrict daily grading activities and truck hauling activities to four hours a day[3].

Based on reviews of the MND and supporting technical documents, South Coast AQMD staff has eight comments on the air quality analysis and mitigation measures. A summary of these comments is provided as follows with additional details provided later in the attachment.

1. Air Quality Impacts from Cleanup Activities: According to the MND, hazardous contaminants including total petroleum hydrocarbons (TPH) and volatile organic compounds (VOCs) have been found on-site. In order to facilitate the subsequent use of the Final MND by the Los Angeles Regional Water Quality Control Board (LARWQCB) for final approval of the Soil Reuse Plan and any other remediation plans, the Lead Agency should quantify emissions and fully disclose air quality impacts from cleanup activities in the Final MND.
2. Construction Emissions from Stockpiling, Material Loading and Unloading, and Truck Idling: During construction of the Proposed Project, there will be on-site stockpiles of both contaminated and clean soil and materials. In the MND, the Lead Agency did not quantify fugitive dust emissions from on-site stockpiles and associated material loading and unloading activities. In addition, the localized construction air quality impact analysis in the MND did not quantify haul truck exhaust emissions from on-site travel and idling (e.g., during queuing and/or

[1] MND. Section A. Page 4
[2] MND. Section D. XVII. Page 126
[3] MND. Page 41.

material loading and unloading). Therefore, the Lead Agency likely underestimated the Proposed Project's construction emissions and should revise the air quality analysis in the Final MND.

3. Health Risk Assessment (HRA): The MND indicated that after Proposed Project becomes operational, toxic air contaminants (TACs) will continue to be emitted from ongoing remediation activities such as operation of a soil vapor extraction (SVE) system. Additionally, diesel particulate matter (DPM), which has been identified by the California Air Resources Board (CARB) as a TAC based on its carcinogenic effects, will be emitted from 348 daily truck trips (e.g., 174 trucks) that will occur during operation. The Lead Agency should conduct a quantitative HRA to analyze the Proposed Project's TACs emissions from all concurrent operational sources and activities in the Final MND.
4. Inconsistency Regarding Haul Truck Trip Numbers: The MND used different haul truck trip numbers to analyze the Proposed Project's environmental impacts. South Coast AQMD staff recommends that the Lead Agency use one haul truck trip number consistently throughout the Final MND and technical appendices.
5. Guidance Regarding Warehouses Sited Near Sensitive Receptor: Since the Proposed Project will be developed in close proximity to sensitive receptors, the Lead Agency should consider and discuss state and South Coast AQMD's guidance that recommends a buffer between warehouse uses and sensitive land uses such as residences in the Final MND.
6. Additional Recommended Mitigation Measures for Construction Air Quality Impacts: To further reduce the Proposed Project's construction emissions and their impacts on residents living in close proximity of the Proposed Project, and in addition to MM III-1, South Coast AQMD staff recommends that the Lead Agency require the use of Tier 4 Final construction equipment and limit the daily haul truck trip numbers during the grading phase in the Final MND.
7. Additional Recommended Mitigation Measures for Operational Air Quality Impacts: Because operation of the Proposed Project generates or attracts heavy-duty, diesel-fueled trucks, and residential receptors are living in close proximity, South Coast AQMD staff recommends that the Lead Agency incorporate additional mitigation measures to reduce the Proposed Project's operational air quality impacts and health risks on nearby receptors in the Final MND.
8. South Coast AQMD Rules and Consultation: The Lead Agency discussed South Coast AQMD Rule 1166 in the MND[4]. It is recommended that the Lead Agency initiate consultation with South Coast AQMD in advance to determine permit requirements and any South Coast AQMD rules that the Proposed Project must comply pursuant to CEQA Guidelines Section 15096(b). If a permit from South Coast AQMD is required, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the Final MND.

Conclusion

Pursuant to CEQA Guidelines Section 15074, prior to approving the Proposed Project, the Lead Agency shall consider the MND for adoption together with any comments received during the public review process. Please provide South Coast AQMD with written responses to all comments contained herein prior to the adoption of the Final MND. When responding to issues raised in the comments, responses should provide sufficient details giving reasons why specific comments and suggestions are not accepted. There should be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information do not facilitate the purpose and goal of CEQA on public disclosure and are not meaningful, informative, or useful to decision makers and the public who are interested in the Proposed Project. Further, when the Lead Agency makes the finding that the additional

[4] MND. Page 87.

recommended mitigation measures are not feasible, the Lead Agency should describe the specific reasons supported by substantial evidence for rejecting them in the Final MND (CEQA Guidelines Sections 15070 and 15074.1).

South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this comment letter. Please feel free to contact Tina Su, Air Quality Specialist, at tsu@aqmd.gov or (909) 396-2498 if you have questions or wish to discuss the comments.

Response 1: This comment provides a summary of the project description and an overview of SCAQMD's concerns with respect to the analysis of air quality and health risk impacts presented in the Draft IS/MND, and an overview of additional remarks that are expressed in further detail later in this letter. The project description summary is accurate. Responses to the various overview concerns are addressed in the responses to the specific comments that follow.

Comment 2: Air Quality Impacts from Cleanup Activities

Workers and Equipment for Cleanup Activities

As indicated in the MND's Hazards and Hazardous Materials section, soil cut, light non-aqueous phase liquid (LNAPL) removal, and other remediation activities are required for the implementation of the Proposed Project[5]. Based on the review of the Air Quality Analysis, the MND quantified the Proposed Project's emissions from construction worker vehicle trips and construction equipment for developing the proposed industrial uses, but it did not quantify emissions from vehicle trips by workers that will be required to conduct cleanup activities. Additionally, cleanup activities proposed in the Response Plan and Soil Reuse Plan of the Proposed Project site will likely require the use of additional equipment that may be different from typical equipment for grading and site preparation for construction. The MND did not identify emissions from cleanup equipment. Therefore, South Coast AQMD staff recommends that the Lead Agency quantify emissions from vehicle trips by workers conducting cleanup activities and emissions from the use of cleanup equipment, include those emissions in the Proposed Project's construction emissions profile, and compare the combined emissions to South Coast AQMD's air quality CEQA significance thresholds for construction to determine the level of significance in the Final MND. This recommendation ensures that the air quality impacts from cleanup activities are fully identified and disclosed in the Final MND to facilitate the subsequent use of this Final MND by the Los Angeles Regional Water Quality Control Board (LARWQCB) for final approval of the Soil Reuse Plan and any other remediation plans.

Response 2: Site remediation would occur as part of the construction program, not separately. As such, the emissions associated with workers and equipment involved in remediation work was accounted for in the analysis of construction impacts in the Draft IS/MND. The remediation efforts that will be occurring simultaneously with site grading and horizontal development consist of activities such as trenching for installation of remediation system conveyance piping and soil stockpiling for characterization and reuse determination. These types of activities use the same equipment as "normal" construction activities. The only specialized equipment with a different emissions profile are drill rigs,

[5] MND. Section D. IX. Pages 84-92.

which will be used for installation of soil vapor extraction, air sparge, and groundwater monitoring wells. The use of drill rigs will occur after site grading and not simultaneously.

There are expected to be two drilling rigs on-site during the installation of soil vapor extraction, air sparge, and groundwater monitoring wells. The rigs will be truck mounted with auger type drilling systems. The equipment is powered by a Cummins QSB 6.7L (409 cubic inch) 250 horsepower (186 kilowatt) 6-cylinder turbocharged diesel engine. Emissions will be standard for an off-road diesel engine: Carbon Monoxide = 2.6 grams/bhp-hr and nitrogen oxides (NOx) = 3.0 grams/bhp-hr. The engines are U.S. EPA Tier 3 emissions certified. Typically, the drill rigs operate between 6 to 10 hours per day. 10 hours per day is not typical; however, well installations cannot be left partially complete overnight, consequently work sometimes continues after a normal eight-hour shift to complete full installation Based on the total number of well installations, the rigs are expected to be on-site a total of 18 days.

Emissions associated with operation of the drilling rigs have been added to updated construction emissions calculations and would not result in exceedance of regional or local significance thresholds. Mitigation Measure III-2 has been added to require use of EPA-certified Tier 3 or "better" drill rigs. Updated construction emissions modeling worksheets are provided in Section 3A in the Final MND. Results of the updated modeling are provided in updated Tables III-1 and III-3 of the MND; these tables are included in the response to Comment 8, later herein.

Comment 3: Haul Trip Length and Trip Numbers

In the MND, the Lead Agency estimated 8,551 cubic yards (cy) of contaminated soil and materials would be exported off-site and 41,672 cy of clean fill material would be imported to the Proposed Project site[6]. This will result in approximately 17 percent of the estimated 6,696 one-way haul truck trips be used for exporting contaminated soil and materials. Based on a review of the MND, South Coast AQMD staff found that the Lead Agency used a default one-way haul trip length of 20 miles to quantify the Proposed Project's emissions from exporting contaminated soil and materials[7]. However, the Lead Agency did not identify which landfill facilities will be used for accepting contaminated soil and materials from the Proposed Project in the MND to support the use of the default one-way haul trip length. Additionally, since only limited number of permitted landfills in California accept hazardous materials, and they are generally located more than 20 miles away from the Proposed Project, using a default one-way trip length of 20 miles likely underestimated the Proposed Project's hauling emissions, particularly NOx emissions. Therefore, South Coast AQMD staff recommends additional information be provided in the Final MND to justify the use of the default one-way haul trip length. Alternatively, the Lead Agency should use its best efforts to find out the permitted hazardous disposal facility that the Proposed Project will use to dispose contaminated soil and materials, disclose it in the Final MND, and re-calculate the emissions from haul truck trips based on a revised one-way haul trip length.

Response 3: Soil materials that are contaminated from past oil refinery operations that cannot be reused on site due to excessive contaminant levels would be transported to appropriately licensed facilities for disposal. Based on site characterization investigations to date, the majority of contaminated soils are anticipated to be "non-hazardous." Chemical concentrations within excavated soil will be confirmed by laboratory testing prior to transporting for off-site disposal. Based on previous

[6] MND. Page 36.
[7] MND. Appendix A.

site sample results, soils which are characterized as "hazardous" are expected to be a few hundred cubic yards at most.

The disposal site for contaminated materials will be based on the closest suitable facility in order to minimize miles traveled. The project applicant has indicated that 90 percent of these materials (non-hazardous) would be transported to the Simi Valley Landfill, located 64 miles from the project site, and the remaining 10 percent (hazardous) would be transported to the US Ecology facility in Beatty, Nevada, located 316 miles from the project site. These longer travel distances have been included in updated emissions modeling for 8 hours/day grading activities. Updated modeling worksheets are provided in Section 3A in the Final MND. Results of the updated modeling are presented in revised Table III-1, in comparison to SCAQMD regional thresholds of significance (refer to the Response to Comment 8). As shown therein, grading phase emissions would exceed the NOx thresholds, before mitigation. With CARB Tier 4-certified diesel powered on-site machinery, emissions would be reduced by approximately 40 percent, to well below the 100 pounds/day threshold. This control measure has been added to revised Mitigation Measure III-1, as shown below.

MM III-1: ~~Daily grading activities on-site shall be limited to a maximum of four hours on any work day. This time restriction also applies to all haul trucks bringing in soil material to the project site, or trucks that are transporting excavated materials off-site.~~ During the grading phase of construction, all off-road diesel-powered construction equipment greater than 50 horsepower shall meet the United States Environmental Protection Agency (EPA)-certified Tier 4 emission standards. In addition, all construction equipment shall be outfitted with best available control technologies (BACT) devices certified by the California Air Resources Board (CARB). Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 4 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. Daily truck trips for importing or exporting soil shall be limited to 71.

All trucks hauling soil, sand, or other loose materials excavated from the Site shall be covered. If visible soil material is carried onto adjacent public streets, the streets shall be swept with water sweepers as necessary to maintain them free of materials. Stockpiles will be placed on a plastic liner of 30-mil or greater. During construction, the piles will be lightly sprayed with water and covered with plastic sheeting of 10-mil or greater. Plastic sheeting will be secured with sandbags.

A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment for verification by the City of Signal Hill Building Official or their designee. Daily logs of the volume of grading export truck trips shall be provided to the City's Building Official to verify compliance with the 71 trucks/day limit.

Comment 4: Construction Emissions from Stockpiling, Material Loading and Unloading, and Truck Idling

During construction of the Proposed Project, there will be on-site stockpiles of both contaminated and clean soil and materials[8]. However, the Lead Agency did not quantify fugitive dust emissions from on-site stockpiles and associated material loading and unloading activities in the MND. In addition, the localized construction air quality impact analysis in the MND did not include haul truck exhaust emissions from on-site travel and idling. Therefore, to provide a more comprehensive analysis of the Proposed Project's construction air quality impacts, South Coast AQMD staff recommends that the Lead Agency quantify those emissions and include them in the Proposed Project's construction emissions profile to be compared to South Coast AQMD's regional and localized air quality CEQA significance thresholds for construction to determine the level of significance in the Final MND.

Response 4:

The MND modeled emissions during the grading phase of construction, including emissions associated with loading/unloading construction equipment and materials. Emissions, if any, that may occur with temporary soil stockpiling consist of volatile organic compounds associated with petroleum, including the volatile TPH fractions, benzene, toluene, ethylbenzene, and xylenes. The calculation of construction emissions that are summarized in Tables III-1 and III-2 in the Draft IS/MND include reduction/credits based on the application of dust control techniques as required by SCAQMD Rule 403 and Rule 1166. The dust control techniques include the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces twice daily; cover stockpiles with tarps; water all haul roads three times daily; and limit speeds on unpaved roads to 15 miles per hour. The Applicant has stated it will require contractors to implement the following additional dust control measures:

- All trucks hauling soil, sand, or other loose materials excavated from the Site shall be covered or shall maintain at least two feet of freeboard.
- If visible soil material is carried onto adjacent public streets, the streets shall be swept with water sweepers as necessary to maintain them free of materials.
- Stockpiles will be placed on a plastic liner of 30-mil or greater. During construction, the piles will be lightly sprayed with water and covered with plastic sheeting of 10-mil or greater. Plastic sheeting will be secured with sandbags.

These additional measures have been added to revised Mitigation Measure III-1, as shown in the preceding response to comment 3. In addition, as discussed in Section IX.d of the Draft IS/MND, and as specified in Mitigation Measure IX-1 (page 87), earthwork will be conducted under a SCAQMD Rule 1166 permit, which requires specific handling protocols and monitoring related to volatile organic compound emissions from soil during earthwork activities. Any disturbed soil with a PID reading greater than 1,000 ppmv will not be stockpiled; it will be immediately loaded into sealed containers or trucks for offsite disposal and SCAQMD will be notified within one hour of detection. Mitigation Measure IX-2 (see pages 87-88 of the Draft IS/MND) also requires a number of soil disturbance management measures to address the requirements of the Los Angeles Regional Water Quality Control Board to prevent significant impacts due to disturbance and handling of contaminated soil materials. Given these extensive dust suppression and soil management measures, emissions from stockpiles are anticipated to be minimal and would not result in significant air quality impacts.

[8] MND. Page 82.

On-site hauling truck exhaust emissions would be minimal. As discussed in response to comment 6, the revised weighted average import/export hauling trip distance utilized in CalEEMod is approximately 42 miles. As the project site is approximately 0.15 miles long, on-site hauling emissions would represent approximately 0.36 percent of total hauling emissions. As shown below, localized on-site hauling emissions would be negligible. Accounting for on-site hauling emissions, project-generated localized construction emissions would remain below the applicable SCAQMD thresholds.

Localized Construction-Related Emissions

Source	Pollutant (pounds/day)			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Construction (Grading Phase)				
On-Site Emissions	103.78	50.64	22.20	11.18
On-Site Hauling Emissions	0.1299	0.0316	0.0310	0.0082
Total Emissions	***103.91***	***50.67***	***22.23***	***11.19***
Localized Significance Threshold	99	1,503	14	8

Mitigated Construction (Grading Phase)				
Mitigated On-Site Emissions	25.45	54.71	7.82	3.78
On-Site Hauling Emissions	0.1299	0.0316	0.0236	0.0064
Total Emissions	***25.58***	***54.74***	***7.85***	***3.79***
Localized Significance Threshold	99	1,503	14	8
Thresholds Exceeded?	***No***	***No***	***No***	***No***

Comment 5: Health Risk Assessment (HRA)

Based on the site location information in the MND and a review of aerial photographs, South Coast AQMD staff found that the nearest sensitive receptor location is located within 15 feet of the Proposed Project. The Hazards and Hazardous Material section of the MND indicated that remediation activities that include soil vapor extraction (SVE) system will continue after the Proposed Project becomes operational. Nearby sensitive receptors will likely be exposed to volatile TACs emissions from such ongoing remediation activities through the inhalation pathway[9],[10]. In addition, the Transportation/Traffic section of the MND stated that the Proposed Project is expected to generate approximately 348 truck trips (174 trucks) per day during operation. Diesel particulate matter (DPM) will be emitted from the transportation and idling of trucks visiting the Proposed Project. DPM has been identified by California Aire Resources Board (CARB) as a TAC based on its carcinogenic effects. However, the Lead Agency did not quantify the Proposed Project's operational TAC emissions and did not perform an HRA to analyze the Proposed Project's health risks in the MND.

One of the basic purposes of CEQA is to inform decision-makers and the public about the potential, significant environmental effects of proposed activities (CEQA Guidelines Section 15002(a)(1)). A mitigated negative declaration is appropriate when the Lead Agency finds that the project will not have

[9] MND. Page 81

[10] MND. Page 83.

a significant effect on the environment after incorporating mitigation measures (CEQA Guidelines Sections 15070 to 15075). Reasons to support this finding shall be documented as substantial evidence in the initial study. Therefore, South Coast AQMD staff recommends that the Lead Agency quantify TACs emissions from concurrent operational activities (e.g., those from the ongoing remediation activities, heavy-duty, diesel-fueled truck trips, and other TAC emission sources including the use of equipment potentially generating TACs), perform a quantitative operational HRA of those TAC emissions, and compare the results to South Coast AQMD's CEQA significance threshold of 10 in one million for cancer risk[11] to determine the level of significance for the Proposed Project's health risk impacts in the Final MND.

Response 5: For clarification, no ongoing SVE activity is occurring at this time or will occur during site grading and construction. Previous SVE remediation operated under a temporary "various locations" permit. The one-year period of operation has expired and the equipment has been removed.

The SVE system will be designed to provide a negative vacuum "capture zone" throughout the property, including the footprint above the air sparge groundwater barrier at the southern and western perimeters. Injected air will be recovered by the SVE wells to minimize potential off-site migration of soil vapors from the Project Site. The potential for vapor migration is mitigated through ongoing operation and monitoring to ensure that the SVE system is providing adequate capture of vapors. Standard adjustments that are made during system operation include optimization of the operating vacuum above the air sparge curtain, and adjustments to the air sparge flowrate/pressure. The SVE/AS system as designed, and using standard operating and monitoring practices, will provide capture of the injected air and draw contaminants in the vapor phase into the system for treatment.

Emissions from the SVE extraction system will be treated prior to discharge using a thermal/catalytic oxidizer. Furthermore, the new system will be operated under a South Coast Air Quality Management District (SCAQMD) permit and will be operated in compliance with SCAQMD Rule 1147. Both SCAQMD Rule 1147 and the site-specific permit will impose strict emissions limits on the system. The new system's vapor extraction volume and emission abatement equipment will be specifically designed to comply with the emission limits established by SCAQMD. Those limits will be determined through a quantitative health risk assessment to identify specific types and levels of emissions and potential cancer and non-cancer health risks. System control measures will be imposed, as warranted, to ensure that any atmospheric emissions from the SVE system are below the SCAQMD health risk thresholds. Given the pre-emission treatment and SCAQMD limits the system must comply with, operation of the SVE system would not result in significant health risk impacts. Further details regarding the characteristics of the SVE system and the SCAQMD permitting procedures are provided below.

SCAQMD does allow and permit devices which are anticipated to release TACs, such as those that can be anticipated from an SVE system. The thermal/catalytic oxidizer which will be installed to treat emissions from the SVE system is a best available control technology, designed with a contaminant destruction efficiency of over 99%. An estimated range of anticipated emissions are as follows:

[11] South Coast AQMD has developed the CEQA significance threshold of 10 in one million for cancer risk. When South Coast AQMD acts as the Lead Agency, South Coast AQMD staff conducts a HRA, compares the maximum cancer risk to the threshold of 10 in one million to determine the level of significance for health risk impacts, and identifies mitigation measures if the risk is found to be significant.

Range of Anticipated SVE System TAC Emissions			
TAC	(lbs/day)		
Benzene	0.03	to	0.10
Ethylbenzene	0.04	to	0.18
Toulene	0.03	to	0.22
o-Xylene	0.04	to	0.06
m,p-Xylene	0.07	to	0.34

Source: RMD, April 2020

As part of the permitting process, SCAQMD has developed standards and rules designed to protect human health. During the permit application process, the applicant (Signal Hill XC in this case) will provide SCAQMD with the concentrations of the TACs present at the site. As part of the application process, estimated emission limits will be included for each anticipated TAC subject to SCAQMD Rule 1401. The SCAQMD assigned engineer then evaluates the health risk associated with the proposed exhaust TAC emissions, based on Rule 1401, and may grant the permit with the proposed emission limits, or may require the applicant to further reduce certain limits as needed, based on the health risk results. It is our understanding that the SVE system TAC emissions must meet a risk threshold of $1x10^{-5}$. Additional details regarding SCAQMD's risk evaluation process and procedures during the permitting process can be found on their Risk Assessment page. The project proponent is currently designing the SVE system, which will identify the specific types of TACs and emission levels that would occur, along with the control mechanisms to ensure that emission levels are below the limits specified by SCAQMD. As specified in Mitigation Measure III-3, an approved SCAQMD permit for the SVE system will be required to be submitted to the City, prior to issuance of a building permit for the proposed project.

The SVE system emissions would be regularly monitored by both hand-held field sampling device (photo-ionization detector (PID)) and periodic samples collected for laboratory analysis to ensure that the device is compliant with permit conditions and is protective of public health. Monitoring is conducted pursuant to an SCAQMD permit and is reported quarterly.

To ensure that the project's SVE system is fully approved and permitted in accordance with SCAQMD regulations, Mitigation Measure III-3 has been added, as follows:

> MM III-3: Evidence of issuance of an SCAQMD permit for the SVE system shall be provided to the City of Signal Hill, prior to issuance of a building permit.

An operational Health Risk Assessment (HRA) was conducted to quantify the carcinogenic effects from the diesel exhaust generated by 348 daily truck trips. It was determined by the consulting traffic engineer that these 348 truck trips would be split evenly between 2-axle "light duty trucks" and 3-axle "medium-duty trucks," with no heavy duty trucks, based on the design of the proposed project with relatively small tenant spaces, no truck loading docks, and insufficient area to maneuver large/heavy trucks. The HRA was prepared in accordance with SCAQMD methodological standards. Cancer risks were evaluated for 30-year, 25 -year worker, and 9-year exposure scenarios. The HRA is included as Section 3B in the Final MND. Potential health risk effects were analyzed at a total of 9,788 individual sensitive receptor locations, to capture the maximum individual cancer risk (MICR) within a 2.5

kilometer by 2.5 kilometer radius. In addition, smaller sensitive receptor grids of 10 meters (33 feet) by 10 meters (33 feet) or less were modeled over nearby sensitive receptors of concern:

- Zinnia Apartment complex (1480 East Hill Street, Signal Hill, CA 90755) adjacent to the north of the project site (SR 1);
- Jenni Rivera Memorial Park (2001 Walnut Avenue, Long Beach, CA 90806) adjacent to the south of the project site (part of the Discrete Receptor Grid; labeled as "Jenni");
- American University of Health Sciences (1600 East Hill Street, Signal Hill, CA 90755) to the east of the project site (SR2);
- Signal Hill Elementary School (1600 East Hill Street, Signal Hill, CA 90755) to the north of the project site (SR3);
- Signal Hill Park (2175 Cherry Avenue, Signal Hill, CA 90755) to the east of the project site (SR4);
- Alvarado Elementary School (1900 E 21st Street, Signal Hill, CA 90755) to the east of the project site (SR5);and
- Butler Middle School/ Long Beach City College Pacific Coast Campus (1400 East 20th Street, Long Beach, CA 90806) to the south of the project site (SR6).

The HRA determined that the maximum incremental cancer risk (MICR) at any of the sensitive receptor locations would occur along the northern edge of the project site, with a calculated MICR of 5.29 in one million for a 30-year exposure, which is below the SCAQMD significance threshold of 10 in one million. The maximum 25-year worker exposure would be 0.40 in one million, and the maximum 9-year exposure would be 1.84 in one million, both well below the 10 in one million significance threshold. The calculated MICR at Jenni Rivera Park, for a 6-month exposure period, is 0.59 per one million-- again, far below the threshold of 10 in one million.

An acute or chronic hazard index of 1.0 is considered individually significant for non-cancer health risks. The highest maximum chronic and acute hazard index associated with the emissions from the project at sensitive receptors would be 0.0013 and 0.0118 respectively, well below the significance threshold. Based on the results of the HRA, the project would not result in significant cancer or non-cancer health risks due to daily trucking emissions.

Comment 6: Inconsistency Regarding Haul Truck Trip Numbers

The Lead Agency used different haul truck numbers in different sections of the MND. Specifically, the Air Quality section assumed a total of 6,278 haul truck trips[12], while 4,140 haul truck trips and 6,696 haul truck trips were used in the Energy section[13] and the Transportation/Traffic section[14], respectively. South Coast AQMD staff recommends that the Lead Agency correct the inconsistency and use one haul truck trip number consistently throughout the Final MND and technical appendices.

[12] MND, Appendix A, CalEEMod output.
[13] MND, Appendix A, page 230.
[14] MND, page 121.

Response 6: The inconsistent numbers are acknowledged and have been updated to reflect revised estimates of haul trip distances to dispose of contaminated soils. The Final MND has resolved these discrepancies, with 6,278 haul trips applied in all affected sections. This results in a higher level of transportation fuel consumption during construction and fewer daily construction related trips on the surrounding street network but does not result in any changes to the project's less than significant impacts for these topics.

During the grading phase of construction, approximately 90 percent of the export haul trips would be routed to the Simi Valley Landfill and the remaining 10 percent would be routed to US Ecology – Nevada Operations Landfill. The Simi Valley Landfill is located approximately 64 miles from the project site and the US Ecology – Nevada Operations Landfill is located approximately 316 miles from the project site. The combined weighted average is approximately 89 miles for both the Simi Valley Landfill and the US Ecology – Nevada Operations Landfill. Additionally, to provide a conservative import hauling distance, the import hauling distance has been increased by ten miles, from the CalEEMod default of 20 miles to 30 miles. The weighted average import/export hauling trip distance utilized in CalEEMod is approximately 42 miles. The weighted average hauling trip distance would result in an increase of approximately 22 miles when compared to the MND hauling trip distance of 20 miles. In addition, construction emissions were re-evaluated to include diesel emissions from installation of the SVE, air sparge, and groundwater monitoring wells, which would require operation of two drill rigs for approximately 18 days and an average of 8 hours per day. It is anticipated that the wells would be installed after the grading phase of construction.

To decrease grading emissions, Mitigation Measure MM III-1 has been revised to require CARB certified Tier 4 engine standards for off-road grading machinery. Additionally, Mitigation Measure MM III-2 would require CARB certified Tier 3 engine standards for operation of the drilling/bore rigs during the monitoring well installation phase of construction. It should be noted that the California Emissions Estimator Model (CalEEMod) has been updated with CARB Emission Factor 2017 (EMFAC 2017) emissions rates and the most recent Southern California Edison 2018 CO_2 Intensity Factor. The air quality emissions associated with the minor project changes, including haul truck trips, have been updated on page 36, 37, 41 and page 42 of the ISMND and are reflected below. Additionally, the greenhouse gas emissions and energy consumption associated with the minor project changes have been updated on page 50, 51, 52, 68, 69, and page 70 of the ISMND and are reflected below. Updated modeling worksheets can be found in Section 3A in the Final MND, *Air Quality/Greenhouse Gas/Energy Modeling Worksheets*. As shown below, air quality and greenhouse gas emissions would remain below the applicable thresholds. Further, the project's energy consumption would remain less than significant. As such, these changes provide a minor update and do not represent "significant new information" as defined in CEQA Guidelines Section 15088.5**.** As noted in the prior response to comment 3, Mitigation Measure III-1 has been revised to impose a limit of 71 truck trips per day during the grading phase, to ensure that regional emissions from these trips do not exceed the levels analyzed in the updated construction emissions calculations and stay well below the SCAQMD regional thresholds.

Page 36, Section III, Air Quality

Short-Term Construction Emissions

The project involves construction activities associated with grading, monitoring well installation, paving, construction, and architectural coating applications. Grading activities would require approximately

35,756 cubic yards of cut and 68,877 cubic yards of fill. Additional earthwork would involve removal and transport of contaminated soils from the prior oil refinery operations. This results in a total of 8,551 cy material to be exported from the project site and a total of 41,672 cy of clean fill material to be transported onto the project site. Exhaust emission factors for typical diesel-powered heavy equipment are based on the California Emissions Estimator Model version 2016.3.2 (CalEEMod) program defaults. Variables factored into estimating the total construction emissions include the level of activity, length of construction period, number of pieces and types of equipment in use, site characteristics, weather conditions, number of construction personnel, and the amount of materials to be transported on- or off-site. The analysis of daily construction emissions has been prepared utilizing CalEEMod. Refer to Appendix B*, Air Quality/Greenhouse Gas and Energy Worksheets*, for the CalEEMod outputs and results. *Table III-1, Construction-Related Emissions*, presents the anticipated daily short-term construction emissions.

Table III-1 Construction-Related Emissions

Emissions Source	Pollutant (pounds/day)[1,2]					
	ROG	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
Emissions Without Mitigation[2]	~~7.45~~ 34.21	~~98.75~~ 140.29	~~44.21~~ 64.97	~~0.15~~ 0.23	~~9.55~~ 30.95	~~5.39~~ 13.28

Threshold Exceeded?	***No***	***~~No~~ Yes***	***No***	***No***	***No***	***No***
Emissions With Mitigation[2,3]	~~5.02~~ 34.14	~~65.87~~ 61.96	~~29.94~~ 60.90	~~0.10~~ 0.23	~~5.37~~ 14.68	~~3.18~~ 5.59
SCAQMD Thresholds	*75*	*100*	*550*	*150*	*150*	*55*
Threshold Exceeded?	***No***	***No***	***No***	***No***	***No***	***No***
Volume Reduced	~~-2.43~~ -0.08	~~-32.88~~ -78.33	~~-14.27~~ -4.07	~~-.05~~ -0.00	~~-4.18~~ -16.27	~~-2.21~~ -7.69

Notes:

1. Emissions were calculated using CalEEMod version 2016.3.2 and EMFAC 2017, as recommended by the SCAQMD.
2. Totals shown are for highest intensity construction activities that generate these pollutants. The grading emissions in this table include reduction/credits based on compliance with SCAQMD Rules that are included in CalEEMod. The emission reduction measures applied in CalEEMod includes the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces three times daily; cover stock piles with tarps; water all haul roads twice daily; and limit speeds on unpaved roads to 15 miles per hour.
3. ~~Totals reflect 4 hour daily limit for grading activities, per Mitigation Measure III-1.~~

3. CARB certified Tier 4 engine standards would be required for all off-road diesel-powered construction equipment greater than 50 horsepower during the grading phase per Mitigation Measure MM III-1. Additionally, CARB certified Tier 3 engine standards would be required for the bore/drill rigs during the monitoring well installation phase of construction per Mitigation Measure MM III-2.

Refer to Appendix A, *Air Pollutant, Greenhouse Gas and Energy Consumption Calculation Worksheets*, for assumptions used in this analysis.

Page 37, Third Paragraph, Section III, Air Quality

Construction Equipment and Worker Vehicle Exhaust

Exhaust emissions from construction activities include emissions associated with the transport of machinery and supplies/materials to and from the project site, transport of soil materials off- and on-site, employee commutes to/from the project site, and emissions produced on-site as the equipment is used. As shown in *Table III-1*, the calculated level of NOx emissions produced by diesel-fueled on-site grading machinery and trucks that haul machinery, supplies and soils off or to the project site would be approximately ~~98.75~~ 140.29 pounds/day, which exceeds the 100 pounds/day threshold.~~ is close to the 100 pounds/day threshold. Because there is uncertainty in any calculation of grading volumes, and because the excavation work may require removal of additional contaminated soils due to the soil testing requirements identified in Section IX and specified in mitigation measure IX-2, it is possible that the estimated quantity of earthwork and truck transport will be higher than this current estimate. As such~~Therefore, the level of NOx emissions associated with the proposed grading plan is considered to be potentially significant.

To reduce daily NOx emissions by a substantial margin, the Project Applicant has agreed to implement Mitigation Measure III-1,which requires CARB certified Tier 4 engine standards for all off-road diesel-powered construction equipment greater than 50 horsepower during the grading phase. ~~to limit daily grading activities, including truck transport of materials on or off-site, to a maximum of four hours per day~~. As shown in *Table III-1*, this would reduce total daily NOx regional emissions by approximately 78 pounds/day, a reduction of 44 percent. This mitigation would also reduce regional emissions for all other criteria pollutants analyzed. As shown in *Table III-3*, this measure would also reduce levels of localized emissions by substantial margins.

Page 41, Mitigation Measures, Section III, Air Quality

Mitigation Measures

MM III-1: ~~Daily grading activities on-site shall be limited to a maximum of four hours on any work day. This time restriction also applies to all haul trucks bringing in soil material to the project site, or trucks that are transporting excavated materials off-site.~~ During the grading phase of construction, all off-road diesel-powered construction equipment greater than 50 horsepower shall meet the California Air Resources Board (CARB)-certified Tier 4 emission standards. In addition, all construction equipment shall be outfitted with best available control technologies (BACT) devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 4 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. Daily truck trips for importing or exporting soil materials shall be limited to 71.

All trucks hauling soil, sand, or other loose materials excavated from the Site shall be covered. If visible soil material is carried onto adjacent public streets, the streets shall be swept with water sweepers as necessary to maintain them free of materials. Stockpiles will be placed on a plastic liner of 30-mil or greater. During construction, the piles will be lightly sprayed with water and covered with plastic sheeting of 10-mil or greater. Plastic sheeting will be secured with sandbags.

A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment for verification by the City of Signal Hill Building Official or their designee.

MM III-2: During the monitoring well installation phase of construction, the bore/drill rigs shall be at least California Air Resources Board (CARB) Tier 3 Certified or better. A copy of the certified bore/drill rigs tier specification shall be provided at the time of mobilization for verification by the City of Signal Hill Building Official or their designee.

Page 41, Fifth Paragraph, Section III, Air Quality

Table III-3, Localized Significance of Construction Emissions, shows the localized unmitigated and mitigated construction-related emissions for NO_X, CO, PM_{10}, and $PM_{2.5}$ compared to the LSTs for SRA 4, South Coastal LA County. It is noted that the localized emissions presented in *Table III-3* are less than those in *Table III-1* because localized emissions include only on-site emissions (i.e., from construction equipment and fugitive dust), and do not include off-site emissions (i.e., from hauling activities). As shown in *Table III-3*, the project's localized construction emissions would ~~not~~ exceed the LSTs for SRA 4, for NOx, PM_{10}, and $PM_{2.5}$. Therefore, Mitigation Measures III-1 and III-2 would be implemented to reduce NOx, PM_{10}, and $PM_{2.5}$ emissions. Mitigation Measure III-1 would require CARB certified Tier 4 engine standards for all off-road diesel-powered construction equipment greater than 50 horsepower during the grading phase. Additionally, Mitigation Measure III-2 would require CARB certified Tier 3 engine standards for the bore/drill rigs during the monitoring well installation phase. Thus, localized significance impacts from construction would be less than significant with implementation of Mitigation Measures III-1 and III-2.

Page 42, Table III-3, Localized Significance of Construction Emissions, Section III, Air Quality

Table III-3 Localized Significance of Construction Emissions

Source	Pollutant (pounds/day)[3]			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Construction (Grading Phase)				
On-Site Emissions [1,2]	~~77.84~~ 103.78	~~37.98~~ 50.64	~~8.18~~ 22.20	~~4.96~~ 11.18
Localized Significance Threshold[3]	99	1,503	14	8
Thresholds Exceeded?	~~***No***~~ ***Yes***	***No***	~~***No***~~ ***Yes***	~~***No***~~ ***Yes***
Mitigated Construction (Grading Phase)[4]				
~~*Reduced Emissions With 4-Hour/Day Grading Limit[4]*~~ Mitigated On-Site Emissions[4]	~~*51.89*~~ *25.45*	~~*25.32*~~ *54.71*	~~*4.35*~~ *7.82*	~~*2.86*~~ *3.78*
Localized Significance Threshold[3]	99	1,503	14	8
Thresholds Exceeded?	***No***	***No***	***No***	***No***

Notes:

1. The grading phase emissions are presented as the worst-case scenario for NOx, CO, PM_{10}, and $PM_{2.5}$.
2. The construction emissions in this table include reduction/credits based on the application of dust control techniques as required by SCAQMD Rule 403. The dust control techniques include the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces twice daily; cover stock piles with tarps; water all haul roads three times daily; and limit speeds on unpaved roads to 15 miles per hour.
3. The Localized Significance Threshold was determined using Appendix C of the SCAQMD Final Localized Significant Threshold Methodology guidance document for pollutants NO_X, CO, PM_{10}, and $PM_{2.5}$. The Localized Significance Threshold was based on the anticipated daily acreage disturbance for construction (approximately 5 acres; therefore the 5-acre threshold was used) and the source receptor area (SRA 4).

~~4. 4-Hour grading day limit per Mitigation Measure III-1.~~

4. CARB certified Tier 4 engine standards would be required for all off-road diesel-powered construction equipment greater than 50 horsepower during the grading phase per Mitigation Measure MM III-1. Additionally, CARB certified Tier 3 engine standards would be required for the bore/drill rigs during the monitoring well installation phase of construction per Mitigation Measure MM III-2.

Refer to Appendix A, *Air Pollutant, Greenhouse Gas and Energy Consumption Calculation Worksheets*, for assumptions used in this analysis.

Page 50, Last Paragraph, Section VI, Energy

Project-Related Sources of Energy Consumption

This analysis focuses on three sources of energy that are relevant to the proposed project: electricity, natural gas, and transportation fuel for vehicle trips associated with new development and project construction. The analysis of operational electricity/natural gas usage is based on the California Emissions Estimator Model version 2016.3.2 (CalEEMod) modeling results for the project, which quantifies energy use for the proposed light industrial occupancy. The project's estimated electricity/natural gas consumption is based primarily on CalEEMod's default settings for Los Angeles County, and consumption factors provided by Southern California Edison (SCE) and the Southern California Gas Company (SoCalGas), who are the electricity and natural gas providers for the City of Signal Hill and the project site. The results of the CalEEMod modeling are included in Appendix A, Air Quality/Greenhouse Gas and Energy Worksheets. The amount of operational fuel consumption for vehicle travel was estimated using CARB's Emissions Factor ~~2014~~ 2017 (EMFAC~~2014~~ 2017) computer program, which provides projections for typical daily fuel (i.e., diesel and gasoline) usage in Los Angeles County, and the project's annual vehicle miles traveled (VMT) outputs from CalEEMod. The estimated construction fuel consumption is based on the project's construction equipment list timing/phasing and hours of duration for construction equipment, as well as vendor, hauling, and construction worker trips.

The project's estimated energy consumption is summarized in *Table VI-1, Project and Countywide Energy Consumption*. As shown, the project's electricity usage would constitute an approximate 0.0026 percent increase over Los Angeles County's typical annual electricity usage and an approximate 0.0009 percent increase over Los Angeles County's typical annual natural gas consumption. The project's construction and operational vehicle fuel consumption would increase Los Angeles County's consumption by ~~0.0128~~ 0.0183 percent and ~~0.0181~~ 0.0158 percent, respectively.

Page 51, Table VI-1, Project and Countywide Energy Consumption, Section VI, Energy

Table VI-1 Project and Countywide Energy Consumption

Energy Type	Project Annual Energy Consumption[1]	Los Angeles County Annual Energy Consumption[2]	Percentage Increase Countywide[2]
Electricity Consumption	1,736 MWh	67,569,000 MWh	0.0026%
Natural Gas Consumption	27,693 therms	2,956,000,000 therms	0.0009%
Fuel Consumption			
• Construction Fuel Consumption[3]	~~73,739~~ 105,378 gallons	575,557,071 gallons	~~0.0128~~ 0.0183%
• Operational Automotive Fuel Consumption[3]	~~700,418~~ 609,251 gallons	3,866,914,629 gallons	~~0.0181~~ 0.0158%

Notes:

1. As modeled in CalEEMod version 2016.3.2.
2. The project increases in electricity and natural gas consumption are compared to the total consumption in Los Angeles County in 2018. The project increases in automotive fuel consumption are compared with the projected countywide fuel consumption in 2018. Los Angeles County electricity consumption and natural gas consumption source from the Energy Consumption Database (CEC n.d.).
3. Project fuel consumption calculated based on CalEEMod results. Countywide fuel consumption is from the CARB EMFAC~~2014~~ 2017 model.

Refer to Appendix A, *Air Quality/Greenhouse Gas and Energy Worksheets*, for assumptions used in this analysis.

Page 52, First Paragraph, Third Sentence, Section VI, Energy

As indicated in *Table VI-1*, the project's annual fuel consumption from construction would be approximately ~~73,739~~ 105,378 gallons, which would increase fuel use in the County by ~~0.0128~~ 0.0183 percent.

Page 52, Transportation Energy Demand, Fifth Sentence, Section VI, Energy

As indicated, project operations are estimated to consume approximately ~~700,418~~ 609,251 gallons of fuel per year, which would increase the Los Angeles County's automotive fuel consumption by ~~0.0181~~ 0.0158 percent.

Total Project-Related Emissions[2]	***~~6,079.40~~ 4,896.82 MTCO₂eq/yr***					

Notes:

1. Emissions were calculated using CalEEMod version 2016.3.2 and EMFAC 2017, as recommended by the SCAQMD.
2. Totals may be slightly off due to rounding.
3. Carbon dioxide equivalent values calculated using the EPA's *Greenhouse Gas Equivalencies Calculator*, http://www.epa.gov/energy/greenhouse-gas-equivalencies-calculator, accessed ~~April 2, 2019~~ May 19, 2020.
4. GHG reductions accounted for in CalEEMod include ~~2016~~ 2019 Title 24 standards and Southern California Edison 2018 CO_2 Intensity Factor.

Refer to Appendix A, *Air Quality/Greenhouse Gas and Energy Worksheets*, for detailed model input/output data.

Page 68, Direct Project-Related Sources of Greenhouse Gases, Section VIII, Greenhouse Gas Emissions

Direct Project-Related Sources of Greenhouse Gases

- Construction Emissions. Construction GHG emissions are typically summed and amortized over the lifetime of the project (assumed to be 30 years), then added to the operational emissions.[1] As seen in *Table VIII-1*, the proposed project would result in ~~1,262.89~~ 1,741.84 $MTCO_2eq/yr$, which represents ~~42.10~~ 92.68 $MTCO_2eq$ when amortized over 30 years.
- Area Source. The project would directly result in 0.01 $MTCO_2eq/yr$ from area source emissions. Area source emissions would be generated due to an increased demand for natural gas associated with the development of the proposed project. The primary use of natural gas-producing area source emissions by the project would be for consumer products, architectural coating, and landscaping.
- Mobile Source. CalEEMod relies upon trip generation rates from the 2018 Traffic Impact Analysis and project-specific land use data to calculate mobile source emissions. Additionally, fuel efficiency data from CARB's 2017 EMission FACtor model (EMFAC 2017) has been incorporated into CalEEMod. The project would directly result in ~~5,090.49~~ 4,135.02 $MTCO_2eq/yr$ of mobile source-generated GHG emissions.

Indirect Project-Related Sources of Greenhouse Gases

- Energy Consumption. Energy consumption emissions were calculated using CalEEMod and project-specific land use data. Southern California Edison (SCE) would provide electricity to the project site. The 2019 Title 24 standards and SCE's 2018 carbon dioxide (CO_2) Intensity Factor has been incorporated into CalEEMod. The primary use of electricity and natural gas by the project would be for space heating and cooling, water heating, ventilation, lighting, appliances, and electronics. The project would indirectly result in ~~703.62~~ 496.70 $MTCO_2eq/year$ due to energy consumption.
- Water Demand. The project operations would result in a demand of approximately 35.4 million gallons of water per year. The project would comply with CALGreen and 2019 Title 24 standards which include water efficient irrigation systems, as well as water reducing features and plumbing fixtures. GHG emissions from indirect energy impacts due to water supply would result in ~~47.71~~ 124.71 MTCO2eq/year.
- Solid Waste. The project would be required to implement a commercial recycling program in accordance with AB 341. Solid waste associated with operations of the proposed project would result in ~~195.47~~ 47.71 MTCO2eq/year.

Total Project-Related Sources of Greenhouse Gases

As shown in *Table VIII-1*, the total amount of proposed project-related GHG emissions from direct and indirect sources combined would total ~~6,079.40~~ 4,896.82 MTCO2eq/yr.

Page 69, Second Paragraph, Section VIII, Greenhouse Gas Emissions

As shown in *Table VIII-1*, the project would result in approximately ~~6,079.40~~ 4,896.82 MTCO2eq/yr. The breakdown of emissions by source category shows approximately less than 1 percent from area sources; 12 percent from energy consumption; 84 percent from mobile sources; less than 1 percent from solid waste generation; 3 percent from water supply, treatment, and distribution; and less than 1 percent from construction activities. *Table VIII-2*, Project Consistency with the Scoping Plan, evaluates applicable reduction actions/strategies by emissions source category to determine how the project would be consistent with or exceed reduction actions/strategies outlined in the First Update to the Scoping Plan.

Page 70, Table VIII-2, Project Consistency with the Scoping Plan, Twelfth Row, Section VIII, Greenhouse Gas Emissions

SB 1368, CCR Title 20, Cap-and-Trade Program	The Cap-and-Trade program places an economy-wide "cap" on major sources of GHG emissions (i.e. refineries, power plants, industrial facilities and transportation fuels) and minimizes the compliance costs of achieving AB 32 goals. Electricity generators and large industrial facilities emitting 25,000 $MTCO_2e$ or more annually are subject to the Cap-and-Trade program. Each year the cap is lowered by approximately 3 percent, ensuring that California is reducing GHG emissions.	**Not Applicable.** As shown in Table VIII-1, the proposed project would generate approximately ~~6,079.40~~ 4,896.82 $MTCO_2eq/yr$, which is below the 25,000 $MTCO_2e/yr$ Cap-and-Trade screening level. As such, the proposed project would not be subject to the requirements of the Cap-and-Trade program.

Comment 7: Guidance Regarding Warehouses Sited Near Sensitive Receptor

South Coast AQMD staff recognizes that there are many factors Lead Agencies must consider when making local planning and land use decisions. To facilitate stronger collaboration between Lead Agencies and South Coast AQMD to reduce community exposure to source-specific and cumulative air pollution impacts, South Coast AQMD adopted the Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning[15] in 2005. Additional guidance is available in the CARB's Air Quality and Land Use Handbook: A Community Health Perspective, available at: https://www.arb.ca.gov/ch/handbook.pdf. For warehouses that accommodate more than 100 trucks per day, or more than 40 trucks with operating transport refrigeration units (TRUs) per day, a 1,000-foot separation between sensitive land uses (e.g., residential uses)[16] and the operating warehouse is recommended. Since operation of the Proposed Project includes approximately 348 daily truck trips (174 trucks), South Coast AQMD staff recommends that the Lead Agency review and consider these guidance documents when making local planning and land use decisions.

Response 7: As noted in the Draft IS/MND, Section IX.a, surrounding land uses include a recently developed apartment complex and the American University of Health Sciences office complex to the north; the Jenni Rivera linear park, single- and multifamily residences, a Los Angeles County Sanitation

[15] South Coast AQMD. May 2005. Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning. Accessed at: http://www.aqmd.gov/home/library/documents-support-material/planning-guidance/guidance-document.

[16] CARB. Air Quality and Land Use Handbook: A Community Health Perspective. Page 4. Accessed at: https://www.arb.ca.gov/ch/handbook.pdf.

District pump house, and school district bus maintenance facility to the south; an office complex and gated townhomes and apartments to the east; and a mix of light industrial land uses to the west. Access to the project site is provided via the existing circulation network, with Hill Street to the north, Alamitos Avenue and 20th Street to the south, Gaviota Avenue to the east, and Gundry Avenue to the west. Walnut Avenue, which runs north/south, bisects the site, creating two distinct development sites on the east and west.

The western side of project site has been designated for light industrial land uses in the Signal Hill General Plan and Zoning Ordinance for a number of years. The proposed light industrial project is consistent with these existing land use policies. A general plan amendment and zone change is required to change the current Commercial Office designation for the smaller portion of the site located on the eastern side of Walnut Avenue.

The two guidance documents referenced in this comment are not regulatory; they provide generalized guidelines to inform local agencies about air quality issues to consider in the local land use planning programs and in site specific land use decisions. The type of warehouse uses that are of concern in these guidances involve large-scale logistics facilities that are designed to be operated with numerous heavy duty trucks to facilitate transport of finished and unfinished materials and merchandise between suppliers and consumers. Heavy duty trucks powered by diesel engines generate diesel particulate matter in their exhausts, which are considered in California to be toxic air contaminants (TACs). In some instances, these logistics businesses may involve cold storage activities (e.g., for food and beverage storage) that attract trucks equipped with transportation refrigeration units (TRUs) that are powered by diesel motors that create additional sources of diesel particulate emissions. Given these sources of TACs, both SCAQMD and CARB published the referenced guidance documents to provide local agencies with recommendations on siting such land uses in a way that reduces exposure of sensitive land uses to the TACs from trucking emissions. Considerable spatial buffers between such trucking dominated logistics businesses and neighboring residential or other sensitive land uses is one of those recommendations.

As noted throughout the Draft IS/MND, the proposed project is not designed as a logistics facility. There are no truck loading docks at any building. The driveways and vehicle maneuvering areas are not configured to enable ingress/egress by large, heavy duty trucks. The buildings are designed for multiple, relatively small, tenants of various types, in spaces of 7,650 to 27,530 square feet. As stated in the project description section of the Draft IS/MND, the project is designed for occupancy by businesses engaged in a variety of light industrial activities permitted in the City's Light Industrial Zone, such as light manufacturing, warehousing and assembly of products for consumers and businesses, limited sales of home furnishings and other products, and research facilities. Each building will be designed to meet the specifications of the occupants, who will lease or own their space. Up to 22 percent of the space may be allocated for office activities directly related to the primary business. The range of permitted and conditionally permitted uses would be limited to those identified in Section 20.20.020 of the Signal Hill Municipal Code, provided that there is sufficient parking in accordance with Section 20.70.030 of the Municipal Code. As such, there would be no large-scale packaging and shipping operations that would be supported by heavy duty trucks, with or without TRUs.

Businesses that would include cold storage are not anticipated within the proposed project, because it would be a difficult and expensive construction process to modify these buildings with the electrical services, freezer equipment, and insulation improvements necessary to provide a cold storage facility. The project applicant, who specializes in development and management of light industrial projects like this one, has found that cold storage users typically don't occupy these types of small business parks.

As noted in the prior response to comment 5, the HRA prepared as part of these responses to comments on the Draft IS/MND determined that the operational project would not result in any significant health risk impacts due to trucking emissions. Tenants would be prohibited from operating with cold storage facilities to prevent TRU emissions from truck deliveries, and this will be specified as a project condition of approval. The assessment of localized operational emissions, summarized in Table III-4 of the Draft IS/MND, determined that localized concentrations of criteria pollutants would be negligible and well below the SCAQMD significance thresholds. Based on the evaluation of the project's long-term air quality impacts, a substantial spatial buffer between the proposed buildings and surrounding residential uses is not warranted.

Comment 8: Additional Recommended Mitigation Measures for Construction Air Quality Impacts

As stated above, the Lead Agency likely underestimated the Proposed Project's construction emissions. (See Comment Nos. 1 and 2). Should the Lead Agency, after revising the Air Quality Analysis, find that the Proposed Project's construction air quality impacts would be significant, mitigation measures are required (CEQA Guidelines Section 15126.4). To further reduce the Proposed Project's construction emissions and their impacts on nearby sensitive receptors (e.g., residents), South Coast AQMD staff recommends that the Lead Agency incorporate the following mitigation measures in addition to MM III-1 in the Final MND.

- Limit the daily number of haul truck trips allowed at the Proposed Project to the level that was analyzed in the Final MND (e.g., 6,696 truck trips / 132 days = 51 daily truck trips during grading phase). If higher daily truck volumes are anticipated during grading phase than the level that was analyzed in the Final MND, the Lead Agency should commit to re-evaluating the Proposed Project's air quality impacts through a CEQA process prior to allowing higher truck activity levels (CEQA Guidelines Section 15162).
- For construction equipment greater than 50 horsepower (>50 HP), the Construction Contractor shall use off-road diesel construction equipment that complies with EPA/CARB Tier 4 Final emission standards or better during all construction phases and shall ensure that all construction equipment is tuned and maintained in accordance with the manufacturer's specifications. Include this requirement in applicable bid documents, purchase orders, and contracts. Successful contractor(s) must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. A copy of each unit's certified tier specification or model year specification shall be available upon request at the time of mobilization of each applicable unit of equipment. Require periodic reporting and provision of written construction documents by construction contractor(s) to ensure compliance and conduct regular inspections to the maximum extent feasible to ensure compliance. In the event that construction equipment cannot meet the Tier 4 Final engine certification, the Project representative or contractor must demonstrate through future study with written findings supported by substantial evidence that is approved by the Lead Agency before using other technologies/strategies. Alternative applicable strategies may include, but would not be limited to, construction equipment with Tier 4 Interim or reduction in the number and/or horsepower rating of construction equipment and/or limiting the number of construction equipment operating at the same time. All reporting and maintenance records for each equipment and their contractor(s) should be made available for inspection and remain on-site for a period of at least two years from completion of construction.

Response 8: As previously noted in the response to comment 3, Mitigation Measure III-1 has been revised to require use of CARB-certified Tier 4 engines for all on-site grading machinery and to limit truck trips required for importing or exporting of soil materials to 71 per day. This would ensure that emissions generated during the grading phase would not exceed the amounts analyzed in the updated emissions calculations, provided in Section 3A in the Final MND. Further, as specified in new Mitigation Measure III-2, drill rigs used to install SVE and air sparge systems, and groundwater monitoring wells, would be required to be EPA-certified Tier 3 or better, to minimize emissions from that period of construction activity.

Comment 9: Additional Recommended Mitigation Measures for Operational Air Quality Impacts

CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize or eliminate any significant adverse air quality impacts. Since operation of the Proposed Project generates or attracts heavy-duty, diesel-fueled trucks that will emit DPM from transportation and idling, and residential receptors are living in close proximity to the Proposed Project, South Coast AQMD staff recommends that the Lead Agency incorporate the following mitigation measures in the Final MND to reduce operational emissions and associated health risk impacts on nearby residents.

Mitigation Measures for Operational Air Quality Impacts from Mobile Sources

a) Require the use of zero-emissions (ZE) or near-zero emissions (NZE) on-road vehicles and offroad equipment during operation, such as trucks with natural gas engines that meet the CARB's adopted optional NOx emission standard of 0.02 grams per brake horsepower-hour (g/bhp-hr). At a minimum, the Lead Agency may require that operators commit to using 2010 model year or newer engines that meet CARB's 2010 engine emission standards of 0.01 g/bhp-hr for particulate matter (PM) and 0.20 g/bhp-hr of NOx emissions or newer, cleaner trucks and equipment. To monitor and ensure ZE, NZE, or 2010 model year or newer trucks are used at the Proposed Project, the Lead Agency should require that operators maintain records of all trucks and equipment associated with the Proposed Project's operation, and make these records available to the Lead Agency upon request. Alternatively, the Lead Agency should require periodic reporting and provision of written records by operators, and conduct regular inspections of the records to the maximum extent feasible and practicable. To facilitate implementation of this mitigation measure, the Lead Agency shall require operators of the proposed facilities to provide the vendor trucks information to incorporate energy efficiency improvement features through the Carl Moyer Program – including truck modernization, retrofits, and/or aerodynamic kits and low rolling resistance tires – to reduce fuel consumption.

   NZE heavy-duty truck engines are commercially available. Examples of commercially available NZE heavy-duty truck engines that meet CARB's optional low NOx standards include, but are not limited to, Cummins Westport 8.9- and 6.7-liter natural gas engines and Roush Cleantech 6.8-liter compressed natural gas and liquefied petroleum gas engines. Therefore, NZE heavy-duty trucks should be required for use during operation in the Final MND.

   If implementing ZE heavy-duty trucks are impractical or infeasible to include in the Final MND, the Lead Agency should develop and include performance standards to achieve the use of ZE

heavy-duty trucks (CEQA Guidelines Section 15126.4(a)). The Lead Agency can and should develop the following performance standards or any other comparable standards in the Final MND.

- Develop a minimum amount of ZE heavy-duty trucks that the Proposed Project must use each year to ensure adequate progress. Include this requirement in the Proposed Project's Business or Management Plan.
- Establish a contractor(s)/truck operator(s) selection policy that prefers contractor(s)/truck operator(s) who can supply ZE heavy-duty trucks at the Proposed Project. Include this policy in the Request for Proposal for selecting contractor(s)/truck operator(s).
- Develop a target-focused and performance-based process and timeline to implement the use of ZE heavy-duty trucks during operation.
- Develop a project-specific process and criteria for periodically assessing progress in implementing the use of ZE heavy-duty trucks during operation.

b) Create a buffer zone of at least 1,000 feet, which can be office space, employee parking, greenbelt, etc. between the Proposed Project and sensitive receptors (e.g., residences in the Zinnia apartment complex, which is to the north of the Proposed Project), where feasible.
c) Design the Proposed Project such that entrances and exits are such that trucks are not traversing past residences, and other sensitive receptors near the Proposed Project.
d) Design the Proposed Project such that any check-in point for trucks is well inside the Proposed Project site to ensure that there are no trucks queuing outside of the facility and that truck traffic within the Proposed Project site is located away from the property line(s) closest to the sensitive receptors (e.g., the apartment complex to the north of the Project site).
e) Limit the daily number of truck trips allowed at the Proposed Project to the level that was analyzed in the Final MND (e.g., 348 daily truck trips). If new information becomes available, after the Proposed Project is approved, suggesting that the Proposed Project will generate more than 348 daily truck trips, the Lead Agency is required to determine if a Subsequent MND is required under CEQA Guidelines Section 15162. This recommended mitigation measure is to ensure that the modeling assumption of 348 daily truck trips used to quantify the Proposed Project's operational air quality impacts and HRA will serve as a condition of project approval.
f) Require trucks to use the truck routes that are used to analyze the air quality impacts and HRA in the Final MND to avoid truck traffic near existing residential uses.
g) Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas that are adjacent to portions of the designated truck routes analyzed in the Final MND.
h) Restrict overnight truck parking in residential areas. Establish parking within the Proposed Project where trucks can rest overnight.
i) Establish area(s) within the Proposed Project site for repair needs and ensure that these designated areas are away from any sensitive land uses.

Mitigation Measures for Operational Air Quality Impacts from Area Sources

j) Maximize the use of solar energy including solar panels.
k) Installing the maximum possible number of solar energy arrays on the building roofs and/or on the Proposed Project site to generate solar energy for the facility and/or EV charging stations.
l) Require the use of electric landscaping equipment, such as lawn mowers and leaf blowers.
m) Require use of electric or alternatively fueled sweepers with HEPA filters.

n) Maximize the planting of trees in landscaping and parking lots.
o) Use light colored paving and roofing materials.
p) Utilize only Energy Star heating, cooling, and lighting devices, and appliances.

Response 9: No significant air quality or health risk impacts have been identified for the fully operational project; therefore, mitigation measures are not proposed. No heavy duty trucks are anticipated due to the relatively small tenant spaces, absence of truck bays and dock high doors and inadequate maneuvering space for such large vehicles. Consequently, measures to mitigate emissions from such sources are not applicable. The suggestions in this comment are noted and will be provided to the City's decision makers for consideration, prior to taking any actions regarding the project approvals.

Comment 10: South Coast AQMD Rules and Consultation
The Proposed Project site is contaminated with total petroleum hydrocarbons (TPH) and volatile organic compounds (VOCs)[17]. The proposed cleanup activities include excavation, transportation, insitu treatment and off-site disposal of contaminated soil and materials. The LARWQCB has prepared a Response Plan and Soil Reuse Plan for cleanup activities. The MND stated that the Proposed Project will comply with South Coast AQMD Rule 403 and Rule 1166. In addition to these rules, South Coast AQMD staff recommends that the Lead Agency consult with the South Coast AQMD in advance to determine permit requirements and any other applicable air quality rules that the Proposed Project must comply. The Lead Agency should initiate consultation with South Coast AQMD as required under CEQA Guidelines Section 15096(b). After consultation, if it is determined that a permit from South Coast AQMD is required, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the Final MND. The Final MND should also include discussions of all applicable South Coast AQMD rules that the Proposed Project must comply. Any assumptions used in the Air Quality Analysis in the Final MND will be used as the basis for permit conditions and limits for the Proposed Project. Should there be any questions on permits, please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385.

Operation of portable engines and portable equipment units of 50 brake horsepower or greater (>50bhp) that emit particulate matter requires a permit from South Coast AQMD or registration under the PERP through the CARB. The Lead Agency should consult with South Coast AQMD's Engineering and Permitting staff to determine if there is any diesel-powered equipment during implementation that will require a South Coast AQMD permit or if the equipment will need to be registered under the PERP through CARB. For more general information on permits, please visit South Coast AQMD's webpage at: http://www.aqmd.gov/home/permits. For more information on the PERP Program, please contact CARB at (916) 324-5869 or visit CARB's webpage at: https://ww2.arb.ca.gov/our-work/programs/portable-equipment-registration-program-perp.

Response 10: Please refer to the prior response to comment 5, regarding required compliance with SCAQMD permitting standards for operation of a soil vapor extraction system. Because of this permitting authority over an essential project component, SCAQMD is recognized as a Responsible Agency for this project. They were notified of the City's Intent to Adopt a Mitigated Negative Declaration for this project and were provided a copy of the Draft IS/MND. Members of City staff and their consultants conversed with SCAQMD staff to discuss SCAQMD concerns, prior to submittal of this comment letter. No other air pollution sources that would require a SCAQMD permit are currently anticipated for the fully operational project. If some future tenant should wish to operate a type of

[17] MND. Section D. IX. Page 78.

equipment such as a portable diesel generator that is subject to SCAQMD permitting regulations, that tenant would be obligated to obtain such a permit and to operate that generator in accordance with the conditions set forth in that permit.

March 24, 2020

Mitigated Negative Declaration (MND) for the Proposed 2020 Walnut Industrial Park Project

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be included into the Final MND.

South Coast AQMD Staff's Summary of Project Description

The Lead Agency proposes to construct a total of 151,075 square feet of buildings for warehouse and light industrial uses on an 8.2-acre vacant site (Proposed Project). The Proposed Project is located on the southwest corner of Gundry Avenue and E Hill Street. Construction of the Proposed Project will take place approximately 19 months beginning in 2020[1]. During full operation in 2021, the Proposed Project would generate 2,320 one-way trips per day, including 348 truck trips.[2]

Summary of South Coast AQMD Staff's Comments

In the MND, the Lead Agency quantified the Proposed Project's regional and localized emissions and found that the Proposed Project's construction and operational air quality impacts would be less than significant. The Lead Agency includes one construction mitigation measure (MM III-1) to restrict daily grading activities and truck hauling activities to four hours a day[3].

1

Based on reviews of the MND and supporting technical documents, South Coast AQMD staff has eight comments on the air quality analysis and mitigation measures. A summary of these comments is provided as follows with additional details provided later in the attachment.

1. Air Quality Impacts from Cleanup Activities: According to the MND, hazardous contaminants including total petroleum hydrocarbons (TPH) and volatile organic compounds (VOCs) have been found on-site. In order to facilitate the subsequent use of the Final MND by the Los Angeles Regional Water Quality Control Board (LARWQCB) for final approval of the Soil Reuse Plan and any other remediation plans, the Lead Agency should quantify emissions and fully disclose air quality impacts from cleanup activities in the Final MND.

2. Construction Emissions from Stockpiling, Material Loading and Unloading, and Truck Idling: During construction of the Proposed Project, there will be on-site stockpiles of both contaminated and clean soil and materials. In the MND, the Lead Agency did not quantify fugitive dust emissions from on-site stockpiles and associated material loading and unloading activities. In addition, the localized construction air quality impact analysis in the MND did not quantify haul truck exhaust emissions from on-site travel and idling (e.g., during queuing and/or material

[1] MND. Section A. Page 4.
[2] MND. Section D. XVII. Page 126.
[3] MND. Page 41.

loading and unloading). Therefore, the Lead Agency likely underestimated the Proposed Project's construction emissions and should revise the air quality analysis in the Final MND.

3. Health Risk Assessment (HRA): The MND indicated that after Proposed Project becomes operational, toxic air contaminants (TACs) will continue to be emitted from ongoing remediation activities such as operation of a soil vapor extraction (SVE) system. Additionally, diesel particulate matter (DPM), which has been identified by the California Air Resources Board (CARB) as a TAC based on its carcinogenic effects, will be emitted from 348 daily truck trips (e.g., 174 trucks) that will occur during operation. The Lead Agency should conduct a quantitative HRA to analyze the Proposed Project's TACs emissions from all concurrent operational sources and activities in the Final MND.

4. Inconsistency Regarding Haul Truck Trip Numbers: The MND used different haul truck trip numbers to analyze the Proposed Project's environmental impacts. South Coast AQMD staff recommends that the Lead Agency use one haul truck trip number consistently throughout the Final MND and technical appendices.

5. Guidance Regarding Warehouses Sited Near Sensitive Receptor: Since the Proposed Project will be developed in close proximity to sensitive receptors, the Lead Agency should consider and discuss state and South Coast AQMD's guidance that recommends a buffer between warehouse uses and sensitive land uses such as residences in the Final MND.

6. Additional Recommended Mitigation Measures for Construction Air Quality Impacts: To further reduce the Proposed Project's construction emissions and their impacts on residents living in close proximity of the Proposed Project, and in addition to MM III-1, South Coast AQMD staff recommends that the Lead Agency require the use of Tier 4 Final construction equipment and limit the daily haul truck trip numbers during the grading phase in the Final MND. 1

7. Additional Recommended Mitigation Measures for Operational Air Quality Impacts: Because operation of the Proposed Project generates or attracts heavy-duty, diesel-fueled trucks, and residential receptors are living in close proximity, South Coast AQMD staff recommends that the Lead Agency incorporate additional mitigation measures to reduce the Proposed Project's operational air quality impacts and health risks on nearby receptors in the Final MND.

8. South Coast AQMD Rules and Consultation: The Lead Agency discussed South Coast AQMD Rule 1166 in the MND[4]. It is recommended that the Lead Agency initiate consultation with South Coast AQMD in advance to determine permit requirements and any South Coast AQMD rules that the Proposed Project must comply pursuant to CEQA Guidelines Section 15096(b). If a permit from South Coast AQMD is required, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the Final MND.

Conclusion

Pursuant to CEQA Guidelines Section 15074, prior to approving the Proposed Project, the Lead Agency shall consider the MND for adoption together with any comments received during the public review process. Please provide South Coast AQMD with written responses to all comments contained herein prior to the adoption of the Final MND. When responding to issues raised in the comments, responses should provide sufficient details giving reasons why specific comments and suggestions are not accepted. There should be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information do not facilitate the purpose and goal of CEQA on public disclosure and are not meaningful,

[4] MND. Page 87.

informative, or useful to decision makers and the public who are interested in the Proposed Project. Further, when the Lead Agency makes the finding that the additional recommended mitigation measures are not feasible, the Lead Agency should describe the specific reasons supported by substantial evidence for rejecting them in the Final MND (CEQA Guidelines Sections 15070 and 15074.1).

1

South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this comment letter. Please feel free to contact Tina Su, Air Quality Specialist, at tsu@aqmd.gov or (909) 396-2498 if you have questions or wish to discuss the comments.

Sincerely,

Lijin Sun

ATTACHMENT

1. Air Quality Impacts from Cleanup Activities

Workers and Equipment for Cleanup Activities

As indicated in the MND's Hazards and Hazardous Materials section, soil cut, light non-aqueous phase liquid (LNAPL) removal, and other remediation activities are required for the implementation of the Proposed Project[5]. Based on the review of the Air Quality Analysis, the MND quantified the Proposed Project's emissions from construction worker vehicle trips and construction equipment for developing the proposed industrial uses, but it did not quantify emissions from vehicle trips by workers that will be required to conduct cleanup activities. Additionally, cleanup activities proposed in the Response Plan and Soil Reuse Plan of the Proposed Project site will likely require the use of additional equipment that may be different from typical equipment for grading and site preparation for construction. The MND did not identify emissions from cleanup equipment. Therefore, South Coast AQMD staff recommends that the Lead Agency quantify emissions from vehicle trips by workers conducting cleanup activities and emissions from the use of cleanup equipment, include those emissions in the Proposed Project's construction emissions profile, and compare the combined emissions to South Coast AQMD's air quality CEQA significance thresholds for construction to determine the level of significance in the Final MND. This recommendation ensures that the air quality impacts from cleanup activities are fully identified and disclosed in the Final MND to facilitate the subsequent use of this Final MND by the Los Angeles Regional Water Quality Control Board (LARWQCB) for final approval of the Soil Reuse Plan and any other remediation plans.

2

Haul Trip Length and Trip Numbers

In the MND, the Lead Agency estimated 8,551 cubic yards (cy) of contaminated soil and materials would be exported off-site and 41,672 cy of clean fill material would be imported to the Proposed Project site[6]. This will result in approximately 17 percent of the estimated 6,696 one-way haul truck trips be used for exporting contaminated soil and materials. Based on a review of the MND, South Coast AQMD staff found that the Lead Agency used a default one-way haul trip length of 20 miles to quantify the Proposed Project's emissions from exporting contaminated soil and materials[7]. However, the Lead Agency did not identify which landfill facilities will be used for accepting contaminated soil and materials from the Proposed Project in the MND to support the use of the default one-way haul trip length. Additionally, since only limited number of permitted landfills in California accept hazardous materials, and they are generally located more than 20 miles away from the Proposed Project, using a default one-way trip length of 20 miles likely underestimated the Proposed Project's hauling emissions, particularly NOx emissions. Therefore, South Coast AQMD staff recommends additional information be provided in the Final MND to justify the use of the default one-way haul trip length. Alternatively, the Lead Agency should use its best efforts to find out the permitted hazardous disposal facility that the Proposed Project will use to dispose contaminated soil and materials, disclose it in the Final MND, and re-calculate the emissions from haul truck trips based on a revised one-way haul trip length.

3

2. Construction Emissions from Stockpiling, Material Loading and Unloading, and Truck Idling

During construction of the Proposed Project, there will be on-site stockpiles of both contaminated and clean soil and materials[8]. However, the Lead Agency did not quantify fugitive dust emissions from

4

[5] MND. Section D. IX. Pages 84-92.
[6] MND. Page 36.
[7] MND. Appendix A.
[8] MND. Page 82.

on-site stockpiles and associated material loading and unloading activities in the MND. In addition, the localized construction air quality impact analysis in the MND did not include haul truck exhaust emissions from on-site travel and idling. Therefore, to provide a more comprehensive analysis of the Proposed Project's construction air quality impacts, South Coast AQMD staff recommends that the Lead Agency quantify those emissions and include them in the Proposed Project's construction emissions profile to be compared to South Coast AQMD's regional and localized air quality CEQA significance thresholds for construction to determine the level of significance in the Final MND. 4

3. <u>Health Risk Assessment (HRA)</u>

Based on the site location information in the MND and a review of aerial photographs, South Coast AQMD staff found that the nearest sensitive receptor location is located within 15 feet of the Proposed Project. The Hazards and Hazardous Material section of the MND indicated that remediation activities that include soil vapor extraction (SVE) system will continue after the Proposed Project becomes operational. Nearby sensitive receptors will likely be exposed to volatile TACs emissions from such ongoing remediation activities through the inhalation pathway[9,10]. In addition, the Transportation/Traffic section of the MND stated that the Proposed Project is expected to generate approximately 348 truck trips (174 trucks) per day during operation. Diesel particulate matter (DPM) will be emitted from the transportation and idling of trucks visiting the Proposed Project. DPM has been identified by California Aire Resources Board (CARB) as a TAC based on its carcinogenic effects. However, the Lead Agency did not quantify the Proposed Project's operational TAC emissions and did not perform an HRA to analyze the Proposed Project's health risks in the MND. 5

One of the basic purposes of CEQA is to inform decision-makers and the public about the potential, significant environmental effects of proposed activities (CEQA Guidelines Section 15002(a)(1)). A mitigated negative declaration is appropriate when the Lead Agency finds that the project will not have a significant effect on the environment after incorporating mitigation measures (CEQA Guidelines Sections 15070 to 15075). Reasons to support this finding shall be documented as substantial evidence in the initial study. Therefore, South Coast AQMD staff recommends that the Lead Agency quantify TACs emissions from concurrent operational activities (e.g., those from the ongoing remediation activities, heavy-duty, diesel-fueled truck trips, and other TAC emission sources including the use of equipment potentially generating TACs), perform a quantitative operational HRA of those TAC emissions, and compare the results to South Coast AQMD's CEQA significance threshold of 10 in one million for cancer risk[11] to determine the level of significance for the Proposed Project's health risk impacts in the Final MND.

4. <u>Inconsistency Regarding Haul Truck Trip Numbers</u>

The Lead Agency used different haul truck numbers in different sections of the MND. Specifically, the Air Quality section assumed a total of 6,278 haul truck trips[12], while 4,140 haul truck trips and 6,696 haul truck trips were used in the Energy section[13] and the Transportation/Traffic section[14], respectively. South Coast AQMD staff recommends that the Lead Agency correct the inconsistency and use one haul truck trip number consistently throughout the Final MND and technical appendices. 6

[9] MND. Page 81.
[10] MND. Page 83.
[11] South Coast AQMD has developed the CEQA significance threshold of 10 in one million for cancer risk. When South Coast AQMD acts as the Lead Agency, South Coast AQMD staff conducts a HRA, compares the maximum cancer risk to the threshold of 10 in one million to determine the level of significance for health risk impacts, and identifies mitigation measures if the risk is found to be significant.

5. Guidance Regarding Warehouses Sited Near Sensitive Receptor

South Coast AQMD staff recognizes that there are many factors Lead Agencies must consider when making local planning and land use decisions. To facilitate stronger collaboration between Lead Agencies and South Coast AQMD to reduce community exposure to source-specific and cumulative air pollution impacts, South Coast AQMD adopted the *Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning*[15] in 2005. Additional guidance is available in the CARB's *Air Quality and Land Use Handbook: A Community Health Perspective*, available at: https://www.arb.ca.gov/ch/handbook.pdf. For warehouses that accommodate more than 100 trucks per day, or more than 40 trucks with operating transport refrigeration units (TRUs) per day, a 1,000-foot separation between sensitive land uses (e.g., residential uses)[16] and the operating warehouse is recommended. Since operation of the Proposed Project includes approximately 348 daily truck trips (174 trucks), South Coast AQMD staff recommends that the Lead Agency review and consider these guidance documents when making local planning and land use decisions. 7

6. Additional Recommended Mitigation Measures for Construction Air Quality Impacts

As stated above, the Lead Agency likely underestimated the Proposed Project's construction emissions. (See Comment Nos. 1 and 2). Should the Lead Agency, after revising the Air Quality Analysis, find that the Proposed Project's construction air quality impacts would be significant, mitigation measures are required (CEQA Guidelines Section 15126.4). To further reduce the Proposed Project's construction emissions and their impacts on nearby sensitive receptors (e.g., residents), South Coast AQMD staff recommends that the Lead Agency incorporate the following mitigation measures in addition to MM III-1 in the Final MND.

- Limit the daily number of haul truck trips allowed at the Proposed Project to the level that was analyzed in the Final MND (e.g., 6,696 truck trips / 132 days = 51 daily truck trips during grading phase). If higher daily truck volumes are anticipated during grading phase than the level that was analyzed in the Final MND, the Lead Agency should commit to re-evaluating the Proposed Project's air quality impacts through a CEQA process prior to allowing higher truck activity levels (CEQA Guidelines Section 15162).

- For construction equipment greater than 50 horsepower (>50 HP), the Construction Contractor shall use off-road diesel construction equipment that complies with EPA/CARB Tier 4 Final emission standards or better during all construction phases, and shall ensure that all construction equipment is tuned and maintained in accordance with the manufacturer's specifications. Include this requirement in applicable bid documents, purchase orders, and contracts. Successful contractor(s) must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. A copy of each unit's certified tier specification or model year specification shall be available upon request at the time of mobilization of each applicable unit of equipment. Require periodic reporting and provision of written construction documents by construction contractor(s) to ensure compliance, and conduct regular inspections to the maximum extent feasible to ensure compliance. In the event that construction equipment cannot meet the Tier 4 Final engine certification, the Project representative or contractor must demonstrate through future study with written findings supported by substantial evidence that is approved by the Lead Agency before using other technologies/strategies. Alternative applicable strategies may include, but would not be limited to, 8

[16] CARB. *Air Quality and Land Use Handbook: A Community Health Perspective*. Page 4. Accessed at: https://www.arb.ca.gov/ch/handbook.pdf.

construction equipment with Tier 4 Interim or reduction in the number and/or horsepower rating of construction equipment and/or limiting the number of construction equipment operating at the same time. All reporting and maintenance records for each equipment and their contractor(s) should be made available for inspection and remain on-site for a period of at least two years from completion of construction. 8

7. <u>Additional Recommended Mitigation Measures for Operational Air Quality Impacts</u>

CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize or eliminate any significant adverse air quality impacts. Since operation of the Proposed Project generates or attracts heavy-duty, diesel-fueled trucks that will emit DPM from transportation and idling, and residential receptors are living in close proximity to the Proposed Project, South Coast AQMD staff recommends that the Lead Agency incorporate the following mitigation measures in the Final MND to reduce operational emissions and associated health risk impacts on nearby residents.

Mitigation Measures for Operational Air Quality Impacts from Mobile Sources

a) Require the use of zero-emissions (ZE) or near-zero emissions (NZE) on-road vehicles and off-road equipment during operation, such as trucks with natural gas engines that meet the CARB's adopted optional NOx emission standard of 0.02 grams per brake horsepower-hour (g/bhp-hr). At a minimum, the Lead Agency may require that operators commit to using 2010 model year or newer engines that meet CARB's 2010 engine emission standards of 0.01 g/bhp-hr for particulate matter (PM) and 0.20 g/bhp-hr of NOx emissions or newer, cleaner trucks and equipment. To monitor and ensure ZE, NZE, or 2010 model year or newer trucks are used at the Proposed Project, the Lead Agency should require that operators maintain records of all trucks and equipment associated with the Proposed Project's operation, and make these records available to the Lead Agency upon request. Alternatively, the Lead Agency should require periodic reporting and provision of written records by operators, and conduct regular inspections of the records to the maximum extent feasible and practicable. To facilitate implementation of this mitigation measure, the Lead Agency shall require operators of the proposed facilities to provide the vendor trucks information to incorporate energy efficiency improvement features through the Carl Moyer Program – including truck modernization, retrofits, and/or aerodynamic kits and low rolling resistance tires – to reduce fuel consumption. 9

NZE heavy-duty truck engines are commercially available. Examples of commercially available NZE heavy-duty truck engines that meet CARB's optional low NOx standards include, but are not limited to, Cummins Westport 8.9- and 6.7-liter natural gas engines and Roush Cleantech 6.8-liter compressed natural gas and liquefied petroleum gas engines[19]. Therefore, NZE heavy-duty trucks should be required for use during operation in the Final MND.

If implementing ZE heavy-duty trucks are impractical or infeasible to include in the Final MND, the Lead Agency should develop and include performance standards to achieve the use of ZE heavy-duty trucks (CEQA Guidelines Section 15126.4(a)). The Lead Agency can and should develop the following performance standards or any other comparable standards in the Final MND.

- Develop a minimum amount of ZE heavy-duty trucks that the Proposed Project must use each year to ensure adequate progress. Include this requirement in the Proposed Project's Business or Management Plan.

- Establish a contractor(s)/truck operator(s) selection policy that prefers contractor(s)/truck operator(s) who can supply ZE heavy-duty trucks at the Proposed Project. Include this policy in the Request for Proposal for selecting contractor(s)/truck operator(s).
- Develop a target-focused and performance-based process and timeline to implement the use of ZE heavy-duty trucks during operation.
- Develop a project-specific process and criteria for periodically assessing progress in implementing the use of ZE heavy-duty trucks during operation.

b) Create a buffer zone of at least 1,000 feet, which can be office space, employee parking, greenbelt, etc. between the Proposed Project and sensitive receptors (e.g., residences in the Zinnia apartment complex, which is to the north of the Proposed Project), where feasible.

c) Design the Proposed Project such that entrances and exits are such that trucks are not traversing past residences, and other sensitive receptors near the Proposed Project.

d) Design the Proposed Project such that any check-in point for trucks is well inside the Proposed Project site to ensure that there are no trucks queuing outside of the facility and that truck traffic within the Proposed Project site is located away from the property line(s) closest to the sensitive receptors (e.g., the apartment complex to the north of the Project site).

e) Limit the daily number of truck trips allowed at the Proposed Project to the level that was analyzed in the Final MND (e.g., 348 daily truck trips). If new information becomes available, after the Proposed Project is approved, suggesting that the Proposed Project will generate more than 348 daily truck trips, the Lead Agency is required to determine if a Subsequent MND is required under CEQA Guidelines Section 15162. This recommended mitigation measure is to ensure that the modeling assumption of 348 daily truck trips used to quantify the Proposed Project's operational air quality impacts and HRA will serve as a condition of project approval. 9

f) Require trucks to use the truck routes that are used to analyze the air quality impacts and HRA in the Final MND to avoid truck traffic near existing residential uses.

g) Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas that are adjacent to portions of the designated truck routes analyzed in the Final MND.

h) Restrict overnight truck parking in residential areas. Establish parking within the Proposed Project where trucks can rest overnight.

i) Establish area(s) within the Proposed Project site for repair needs and ensure that these designated areas are away from any sensitive land uses.

Mitigation Measures for Operational Air Quality Impacts from Area Sources

j) Maximize the use of solar energy including solar panels.

k) Installing the maximum possible number of solar energy arrays on the building roofs and/or on the Proposed Project site to generate solar energy for the facility and/or EV charging stations.

l) Require the use of electric landscaping equipment, such as lawn mowers and leaf blowers.

m) Require use of electric or alternatively fueled sweepers with HEPA filters.

n) Maximize the planting of trees in landscaping and parking lots.

o) Use light colored paving and roofing materials.

p) Utilize only Energy Star heating, cooling, and lighting devices, and appliances.

9

8. South Coast AQMD Rules and Consultation

The Proposed Project site is contaminated with total petroleum hydrocarbons (TPH) and volatile organic compounds (VOCs)[17]. The proposed cleanup activities include excavation, transportation, in-situ treatment and off-site disposal of contaminated soil and materials. The LARWQCB has prepared a Response Plan and Soil Reuse Plan for cleanup activities. The MND stated that the Proposed Project will comply with South Coast AQMD Rule 403 and Rule 1166. In addition to these rules, South Coast AQMD staff recommends that the Lead Agency consult with the South Coast AQMD in advance to determine permit requirements and any other applicable air quality rules that the Proposed Project must comply. The Lead Agency should initiate consultation with South Coast AQMD as required under CEQA Guidelines Section 15096(b). After consultation, if it is determined that a permit from South Coast AQMD is required, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the Final MND. The Final MND should also include discussions of all applicable South Coast AQMD rules that the Proposed Project must comply. Any assumptions used in the Air Quality Analysis in the Final MND will be used as the basis for permit conditions and limits for the Proposed Project. Should there be any questions on permits, please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385.

Operation of portable engines and portable equipment units of 50 brake horsepower or greater (> 50bhp) that emit particulate matter requires a permit from South Coast AQMD or registration under the PERP through the CARB. The Lead Agency should consult with South Coast AQMD's Engineering and Permitting staff to determine if there is any diesel-powered equipment during implementation that will require a South Coast AQMD permit or if the equipment will need to be registered under the PERP through CARB. For more general information on permits, please visit South Coast AQMD's webpage at: http://www.aqmd.gov/home/permits. For more information on the PERP Program, please contact CARB at (916) 324-5869 or visit CARB's webpage at: https://ww2.arb.ca.gov/our-work/programs/portable-equipment-registration-program-perp.

2B: City of Long Beach Comments and Responses

Responses to Comments by City of Long Beach

Comments concerning information and analysis in the Draft MND prepared for the project were submitted by the City of Long Beach, in a letter dated March 27, 2020, attached hereto. Responses to those comments are provided below, corresponding to the bracketing and numbering shown in the attached copy of the City's letter.

A. Global Comments

1. *The proposed industrial buildings are located only 10-feet from the Jenni Rivera Park*
2. *Jenni Rivera Park serves disadvantaged residents of central Long Beach. The City is concerned about both construction-related and operational impacts on the park. These are understated or ignored in the MND.*
3. *The MND is not appropriate because a fair argument exists that the project will impact Recreation through diminishing access to and quality of recreation at the park. There are also potential health impacts to visitors to the park, who were erroneously not identified as sensitive receptors despite the propensity of children and the elderly to visit parks. The park walkway is adjacent to the project site and grading is proposed to the property line.*
4. *Despite the large site, the access and buildings have been located inappropriately proximate to the park and unnecessary impacts will occur as a result.*
5. *Receipt of the CEQA notice was the first information the Department of Development Services and the Department of Parks, Recreation and Marine had regarding the proposed project.*
6. *The adjacent census tract, 573300 has a CalEnviro Score of 90-95, among the 10% most disadvantaged in California. This census tract's neighborhood park will be impacted by this project and this census tract will bear the brunt of construction emissions from the project. This is inconsistent with California guidance on environmental justice.*
7. *Most surrounding census tracts in Long Beach are also disadvantaged according to CalEnviro Score.*

Response to Global Comments

All of these 'global' comments are focused on concerns about potential impacts to recreational users in Jenni Rivera Park as well as residents of environmentally and economically disadvantaged neighborhoods in nearby parts of Long Beach. Since these concerns are expressed frequently in the more specific comments that follow, a preliminary response is provided below as a frame of reference for the rest of the comments and responses. More specific and more detailed responses are provided for the additional comments, thereafter.

Jenni Rivera Park

Jenni Rivera Park, a linear trail facility designed and used primarily by walkers and bicyclists, is located along the southern edge of the project site. It was built by the City of Long Beach along the route of a former rail line and extends from Walnut Avenue to Hill Street. There are no picnic tables, sport courts,

other athletic facilities or any other features where people could congregate and remain in place for several hours at a time, within the section of the park and abuts the project site. As such, trail users are mobile and are in this part of the park for short periods of time, estimated at less than a minute for bicyclists and some minutes for walkers. Because of the short periods of time that people are found in this park segment, Jenni Rivera Park was not classified in the Draft IS/MND as a "sensitive receptor" for the purpose of air quality or noise impacts. This is based on the definition established by the South Coast Air quality Management District which considers a sensitive receptor to be "…a receptor such as residence, hospital, convalescent facility where it is possible that an individual could remain for 24 hours."[1] There is an existing 5 or 6 feet high block wall located within the park right-of-way, which rests approximately 17 feet from the southern boundary of the proposed project site. The nearest proposed project building, identified as Building 1E on the Site Plan exhibit (Figure X in the Draft IS/MND), would be located 8 feet beyond the boundary between the project site and the park right-of-way, which is 25 feet from that existing block wall.

The proposed project would not affect access to Jenni Rivera Park, nor any activities within the park, as there would be no physical encroachment into any part of that park during project construction or with the fully completed and operational site improvements. Placement of buildings and other site improvements, including driveways and parking areas, was guided primarily by emergency access standards set by the Los Angeles County Fire Department, and by the City's building setback standards and parking requirements.

Construction activities along the southern edge of the project site would involve grading, site improvements and building construction, with the same types of construction machinery and temporary impacts that would occur elsewhere on the project site. Construction work along Jenni Rivera Park would occur intermittently throughout the overall construction phases and would result in temporary impacts for a combined total of four-five months, rather than for the entire 15-to-16-month total construction period. The assessment of construction related impacts provided in the Draft MND and in the supplemental analyses prepared for this Final MND determined that there would be no significant localized air quality impacts and no significant noise impacts that would affect the closest residential land uses (the Zinnia apartments immediately north) or Jenni Rivera Park. The assessment of the project's long-term operational impacts also determined that there would be less than significant air quality impacts and less than significant noise impacts. A supplemental Health Risk Assessment was conducted to evaluate the potential health impacts associated with diesel emissions from the project's daily truck traffic and this found that the emissions would result in incremental cancer and non-cancer health risks that are well below the SCAQMD's significance thresholds. The HRA included specific modeling inputs for Jenni Rivera Park, the closest part of any areas within Long Beach. Based on the HRA results, the original determination in the Draft MND that the project would not result in significant pollutant concentrations affecting sensitive receptors was affirmed.

Aesthetic impacts to the park were determined to be less than significant, given the temporary nature of the trail users' experience in that adjacent park segment, that the southern elevation of the nearest building (Building 1E) will be revised to provide a greater level of articulation that is proposed for other

[1] South Coast Air Quality Management District (SCAQMD), *Final Localized Significance Threshold Methodology*, Revised July 2008, http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf?sfvrsn=2,accessed May 2020,

street-facing building fronts in the project, and that there will be a landscape screen, including tree canopies, that will obscure views into the project site from the park. Night lighting within the southern area of the project site would be similar to lighting provided elsewhere on site and limited to a few fixtures to provide security levels of lighting for on-site employees. Lighting from trucks entering from Walnut would not be aimed directly at the park, and the park would typically have few, if any trail users after dark.

Nearby Long Beach Neighborhoods

The environmentally and economically disadvantaged neighborhoods within Long Beach that are located to the south and west of the project site are located at greater distances from the project site boundaries than any other adjacent land uses analyzed in the Draft MND with respect to air quality, noise, and health risk impacts. The results of those assessments, therefore, are applicable to those neighborhoods and the level of impacts analyzed would be no greater within those neighborhoods, and possibly less, given the greater spatial separation. Since the original and updated air quality assessments determined there would be less than significant localized concentrations of criteria air pollutants during construction, based on a 25 meter distance to the nearest potential sensitive receptor, the level of impact to the nearby Long Beach neighborhoods would also be less than significant, and the pollutant concentrations would likely be lower than what was analyzed. Please also note that revised Mitigation Measure III-1 will require use of cleaner, late model diesel-powered grading machinery, which would reduce daily emissions of gaseous pollutants such as NOx. New Mitigation Measure III-2 will also require the use of cleaner, late model drill rigs to install the soil vapor extraction, air sparge, and groundwater monitoring wells in the early phase of construction.

Noise levels decline with distance, and also due to intervening structures and spaces that provide noise attenuation. This is true for construction noise and other, long-term noise sources. Jenni Rivera Park is located between the project site and the nearest Long Beach homes to the south and west. There are no homes located directly west of the project site, which is bordered by Gundry Avenue, and a row of light industrial properties along the west side of Gundry Avenue. Beyond Gundry are a mixture of industrial and commercial uses and the extension of Jenni Rivera Park. The evaluations of construction noise impacts and long-term noise impacts determined that impacts would be less than significant. Assessment of construction and long-term noise impacts due to daily outdoor activities within the fully operational site were evaluated based on a distance to a nearby sensitive receptor of 40-to-50 feet. No significant noise impacts were identified at those distances and since the nearby Long Beach neighborhoods are farther away, the impacts there would also be less than significant and noise levels would likely be lower than what was analyzed. Proposed construction noise control measures are specified in Mitigation Measure XIII-1 to help reduce noise levels that could affect the nearest sensitive land uses, which includes the Zinnia Apartments immediately north, a townhome community to the east, and the homes located just south/west of Jenni Rivera Park. The project's daily traffic was determined to result in minor impacts to roadway noise levels and would not significantly impact roadway noise levels at the surrounding Long Beach neighborhoods.

B. Section Specific Comments

Project Description

8. *p.4, construction is estimated at 18-19 months representing a major impact on Jenni Rivera park which is not adequately addressed in the MND.*

Response: Construction impacts are addressed in the Air Quality, Energy, Greenhouse Gas Emissions, Hydrology/Water Quality, Noise and Traffic sections of the MND. An 18-19 month construction time frame was estimated, due to the proposed restriction of grading activities to 4 hours per day, as specified in Mitigation Measure III-1. A new restriction is now proposed to require all off-road diesel-powered machinery of 50 horsepower or greater to be CARB-certified Tier 4 engines, which would substantially reduce the exhaust emissions and ensure that levels of criteria pollutants do not exceed SCAQMD thresholds. This will allow for an 8-hour grading day and a shorter time period to complete that phase of construction. The overall construction program is now estimated at approximately 1.3 years. Construction activities along the southern edge, adjacent to Jenni Rivera Park, would occur for shorter time periods, not continuously throughout the 1.3 years, as construction moves across the site.

The construction operations happen in phases, so while the entire project consists of 9 buildings being built, a portion of the phased time spent on any one building will be allocated accordingly. That is, grading operations happen for all of the buildings, then concrete slabs are poured for all of the buildings, then walls are tilted for all of the buildings, etc.; and each building receives its intermittent allotted time and attention accordingly by the respective trades. It is estimated that soil disturbing activities during the grading phase for Building 1E – the building adjacent to Jenni Rivera Park, would occur for approximately 20 working days aggregately, but not consecutively, over the course of grading operations phase. It is estimated that construction of site improvements and Building 1E would require approximately 120-140 total working days overall, but in intermittent stages, rather than continuously throughout that overall time frame.

Analyses of air quality and noise impacts, in particular, accounted for effects at Jenni Rivera Park. For example, in the assessment of localized construction air pollution impacts, the concentrations of criteria pollutants were analyzed at a distance of 25 meters, which would include the adjacent park. This is the closest analysis distance identified in the specifications for modeling such impacts, developed by the South Coast Air Quality Management District (SCAQMD). As shown in updated Table III-3 of the MND and the accompanying discussion, emissions of all modeled pollutants would be below the SCAQMD local significance thresholds, which represent levels that could exceed state and federal air quality standards that were established to protect the health of sensitive receptors. A variety of dust and exhaust control measures would be imposed through compliance with SCAQMD Rules 403 and 1166, and through additional measures specified in Mitigation Measure III-1. No significant air quality impacts were identified due to construction activities.

Table III-3 Localized Significance of Construction Emissions

Source	Pollutant (pounds/day)[3]			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Construction (Grading Phase)				
On-Site Emissions [1,2]	~~77.84~~ 103.78	~~37.98~~ 50.64	~~8.18~~ 22.20	~~4.96~~ 11.18
Localized Significance Threshold[3]	99	1,503	14	8
Thresholds Exceeded?	~~***No***~~ ***Yes***	***No***	~~***No***~~ ***Yes***	~~***No***~~ ***Yes***
Mitigated Construction (Grading Phase)[4]				
~~*Reduced Emissions With 4-Hour/Day Grading Limit*[4]~~ Mitigated On-Site Emissions[4]	~~*51.89*~~ *25.45*	~~*25.32*~~ *54.71*	~~*4.35*~~ *7.82*	~~*2.86*~~ *3.78*
Localized Significance Threshold[3]	99	1,503	14	8
Thresholds Exceeded?	***No***	***No***	***No***	***No***

Notes:

1. The grading phase emissions are presented as the worst-case scenario for NOx, CO, PM_{10}, and $PM_{2.5}$.
2. The construction emissions in this table include reduction/credits based on the application of dust control techniques as required by SCAQMD Rule 403. The dust control techniques include the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces twice daily; cover stock piles with tarps; water all haul roads three times daily; and limit speeds on unpaved roads to 15 miles per hour.
3. The Localized Significance Threshold was determined using Appendix C of the SCAQMD Final Localized Significant Threshold Methodology guidance document for pollutants NO_X, CO, PM_{10}, and $PM_{2.5}$. The Localized Significance Threshold was based on the anticipated daily acreage disturbance for construction (approximately 5 acres; therefore the 5-acre threshold was used) and the source receptor area (SRA 4).
4. ~~4 Hour grading day limit per Mitigation Measure III-1.~~
4. CARB certified Tier 4 engine standards would be required for all off-road diesel-powered construction equipment greater than 50 horsepower during the grading phase per Mitigation Measure MM III-1. Additionally, CARB certified Tier 3 engine standards would be required for the bore/drill rigs during the monitoring well installation phase of construction per Mitigation Measure MM III-2.

Refer toSection 3A, *in the Final MND,* for assumptions used in this analysis.

The assessment of construction noise impacts focused on impacts to the closest neighboring residential land use, the Zinnia Apartments located 40 feet to the north of the project site. As discussed on page 111 of the MND, the construction noise impacts would be temporary and intermittent, depending on which phase of construction is occurring at the time and how close that activity is to the apartments. All construction work would be conducted during the days and hours permitted by the City of Signal Hill Municipal Code, which, like the City of Long Beach Municipal Code, does not establish noise limits for construction work. Mitigation Measure NOI-1 would require implementation of a construction noise control plan that would reduce construction noise impacts at surrounding land uses and the impacts would be less than significant.

While Jenni Rivera Park is located less than 40 feet from the southern boundary of the project site, the analysis of construction impacts presented in the MND is applicable to the park. Construction noise levels would be no higher there than along other edges of the project site, since all construction activities and

equipment would generally be the same in the different parts of the project site. Further, the construction activities along the southern edge would occur in different phases and for different time frames, not for the entire construction period, as noted above. As such, park users would not be exposed to constant construction noise and the levels of noise would vary throughout a given construction day and over the different phases of construction. While the construction activities would generate varying levels of noise that would be audible within the park, and may be experienced as a nuisance, the short-term exposure of park patrons to the varying noise levels that would occur intermittently over the project's construction phases would not be significant.

9. *p.5, the General Plan and Zone Changes from office to industrial are not correctly analyzed in the MND. This change has implications not just to the number of jobs but the wages of jobs and related need for housing. Lower wage jobs will result in housing needs that are not currently being met by Signal Hill nor Long Beach. The VMT and trip length between industrial and officer users is also different as is the vehicle mix, yet the MND seems to simply dismiss this issue as less than significant. The MND also fails to consider if once the General Plan is considered for amendment, what other options might exist. For example, less polluted portions of the site could be further remediated for housing or more intensive development could occur on portions of the site and then a greater buffer could be provided between the park and the proposed development. A full EIR would better provide this type of alternatives analysis that is appropriate in this case.*

Response: This comment alleges that the project would create lower wage jobs that would result in housing needs not currently being met by Signal Hill or Long Beach. No economic analysis to support this claim was provided. As noted on page 86 of the MND, a Land use Covenant will be recorded with the property title to limit future land use to commercial/industrial and requiring notification to the LARWQCB prior to future excavation for renovations, demolitions, remodeling, maintenance, etc. This is a protective measure due to the extensive site contamination by the former oil refinery that operated here for decades. As such, no land use alternative involving some type of housing would be feasible.

This comment offers no data to support the claim that the proposed industrial use would result in higher vehicle miles traveled than a comparably sized office use on the eastern part of the site. No evidence has been offered that would indicate the workers and business owners in the proposed industrial spaces would drive longer distances to/from the site than would office workers and business owners. Based on trip generation factors developed by the Institute of Transportation Engineers (ITE), the traffic study prepared for this project determined that the proposed industrial uses would generate roughly 879 more daily vehicle trips than a comparably sized office project on the eastern site area. This would translate into higher total VMT and related mobile emissions, including both criteria pollutants and greenhouse gases. The MND relied on the trip generation estimates for the proposed industrial uses, and thus accounts for any differences in the VMT profile between an industrial versus an office use on the eastern site area.

10. *Figure 4, we note that the Site Plan intentionally sandwiches building 1E adjacent to Jenni Rivera Park including vehicle parking facing into the park and a setback of only ten-feet from the building to the park. There is unnecessary vehicle circulation between buildings 1C and 1D as well as other opportunities to move the development north and provide a more-appropriate buffer from the park.*

Response: Vehicular circulation areas between buildings are based on compliance with Los Angeles County Fire Department standards for minimum widths and ability to access all buildings during an emergency. Building 1E is sited on the south side of the former 21St Street, which is to be vacated but retained as a private street with access to both Walnut and Gundry Avenues, with double-loaded parking on both sides, to meet the City's on-site parking standards. No significant impacts to Jenni Rivera Park have been identified due to the proposed location of the footprint of Building 1E.

11. *Figure 8, the MND provides one limited view of Jenni Rivera Park but fails to provide any view simulation of the impact of the project from within the park and for pedestrians walking to and from the park. Without this necessary information there is not correct context for the project description, furthermore the aesthetic analysis is not complete or valid.*

Response: No view simulations were prepared for the MND because the project site is not located along a scenic highway or any designated or recognized scenic viewing corridor and the site is not part of any scenic vista. Further, the proposed project is consistent with the City of Signal Hill's development standards concerning building height, setbacks, landscaping and parking. Jenni Rivera Park is a linear park with a paved path for walking and biking, with a grass area on the southern side that provides some usable but passive open space. It is used intermittently and for short time periods by walkers, joggers and bikers and does not support a resident population that would be viewing the proposed project on a permanent basis. There would be no loss of sunlight access to the park because of the project's building envelopes. Thus, there is no need for any view simulations to represent as-built views from Jenni Rivera Park.

Aesthetics

12. *p.25, view impact analysis focuses on the view of Signal Hill peak, however, to surrounding community members, the views into and from Jenni Rivera park are significant and this project will substantially degrade those views.*

Response: The discussion in the MND that is referenced in this comment explains why views of Signal Hill from Jenni Rivera Park would not be significantly impacted, due to limited current visibility and absence of any project-related physical obstruction of the eastern entrance to the park, where views of the hill are most prominent. This comment does not identify any scenic views into the park that would be obstructed by the project. There are no unique or distinguishing visual features of this park that would indicate it represents a significant visual landmark that provides a scenic view for a substantial public viewing audience off-site. The proposed project complies with the City's development standards concerning building height and bulk and any other project that might be built here could result in similar impacts involving placement of buildings along Walnut that could obstruct views of the park.

13. *p.27, the MND discloses that the project will be set back only ten-feet from Jenni Rivera Park however concludes that sufficient buffer exists between the park and the project. This is not supported by substantial evidence. In fact, the buffer between the development and other sensitive receptors is more substantial but the park is ignored. The MND does not contain factual information regarding the shading impacts, or other impacts, from new buildings, but also trees, trucks and other new source of impacts onto Jenni Rivera Park. Information on tree size and growth period, is not provided.*

The southern edge of the project site is approximately 17 feet away from an existing block wall topped by a slatted chain link fence that lies within the boundaries of Jenni Rivera Park, extending the entire distance of the southern edge of the project site, as shown in the plan view provided as Attachment A. Building 1E is proposed to be sited eight feet from the park boundary, which represents 25 feet beyond that wall. The setback area between Building 1E and the southern boundary will be fully landscaped with Brisbane Box trees that will grow to provide a visual screen in that buffer area next to the park. No significant environmental impacts have been identified due to the proposed placement of Building 1E or any of its physical characteristics.

14. *p.28, the MND concludes that vehicle and building lights will not be significant. However, this analysis does not consider the fact the site plan shows truck and car parking ten-feet from Jenni Rivera Park. It does not consider the change in ambiance and nighttime or sunset look for park visitors, both human and animal. New sources of nighttime light have a direct impact on birds and other wildlife.*

Response: Nighttime use of this park is likely to be lower than during daylight hours, thus there would be fewer people walking, jogging or biking along the adjacent segment of the park at night. Activities at Building 1E, closest to the park, may include some night operations, depending on the business operations of future tenants. As discussed on p. 28 of the MND, any night lighting on the southern side of that building would be for security purposes and restricted under the City of Signal Hill's Municipal Code standards to place, orient, and shield lighting to prevent off-site glare or excessive illumination levels. If there should be some truck deliveries or pick-ups at night on the south side of Building 1E, this would consist of few trucks for brief periods of time and lighting from truck headlights might spill onto the

adjacent part of the park for a period of seconds while moving in/out of the site. This would not result in any significant glare or intrusive lighting impacts.

Air Quality Impacts

15. *p.32-33, the MND concludes that the proposed project is consistent with the AQMP but that is flawed analysis. The AQMP is based on all the various jurisdictions within the AQMD basin's General Plan, combined into the RTP/SCS and then with air quality conformity determined by AQMD, rolled into the SIP by CARB and ultimately certified by USEPA. The proposed project however is not consistent with the City of Signal Hill General Plan. It involves a General Plan Amendment from Commercial to Industrial. Regardless of whether the density of jobs is similar, the impacts of Industrial is more intensive, from an air quality standpoint, than Commercial uses. Medium duty trucks are more likely than passenger vehicles to run on diesel with associated NOx impacts, important to the fact the region is out of compliance for ozone pre-cursors and the AQMP is the mechanism for bringing the region into conformity. The MND attempts to explain away any impacts from the General Plan Amendment but does not provide relevant data to show that the increased volume of trucks, longer VMT due to deliveries and longer commutes for low-income workers, and associated criteria-pollutant and health impacts, are similar or insignificant. The AQMP was found in conformity without any room for error and even minor deviations may be significant from an air quality standpoint.*

Response: The proposed general plan amendment involves only the eastern part of the project site, where 42,585 square feet of industrial building space is proposed, representing 28% of the overall building area and a corresponding percentage of the project's traffic generation. Again, as noted in the prior response to comment 9, this comment offers no evidence why commuting trips for the proposed industrial uses on the eastern side of the project site would be longer than for a comparably sized office use. The analysis of the project's construction and long-term air quality impacts is based on the characteristics of the proposed industrial use; therefore, it accurately represents the air pollutant emissions profile that would result from the project, including the higher volume of both passenger vehicles and truck trips resulting from the difference between office and light industrial uses. Since the project's construction and operational emissions would be below any SCAQMD significance threshold, the project would be consistent with the AQMP.

As stated on pages 32-33 in the MND, "The project requires a General Plan amendment to change the eastern portion of the site's zoning from Commercial Office to Light Industrial. According to the General Plan, the Light Industrial designation is designed to accommodate a variety of light industrial uses which are non-polluting and which can coexist with surrounding commercial and residential uses. Permitted uses include, but are not limited to, research and development, assembly, general offices, light manufacturing not involving excessive noise, vibrations, odors, dust or hazardous materials, and limited warehouse and distribution uses of finished products but not transportation, storage or shipping uses involving fleets of large size (tractor trailer) trucks. The proposed project does not have any loading docks that could accommodate large trucks. As proposed, the nine light industrial buildings would provide occupancy for businesses engaged in a variety of non-polluting, light industrial activities such as manufacturing, warehousing and assembly of products for consumers and businesses, and research facilities." Therefore, the future use of the site would not include polluting stationary sources.

Additionally, the traffic study determined the project would generate a daily vehicle fleet mix of approximately 85 percent passenger cars and 15 percent trucks. This same fleet mix has been incorporated into CalEEMod for project-generated air quality emissions. Further, it has been determined the project-generated air quality emissions would not exceed regional and Localized Significance Thresholds (LSTs) with implementation of Mitigation Measures III-1 and III-2, requiring use of CARB-certified Tier 4 off road grading machinery and on-road haul trucks, and CARB-certified Tier 3 model drill rigs to install SVE, air sparge and groundwater monitoring wells devices. Mitigation measures III-1 also limits the volume of trucks associated with import or export of soil materials to 71 per day, the amount analyzed for the MND. Please refer to updated Tables III-1 and III-3 in the response to comment 18, later herein.

The South Coast Air Quality Management District (SCAQMD) states, " LSTs represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard, and are developed based on the ambient concentrations of that pollutant for each source receptor area and distance to the nearest sensitive receptor." CARB states, "Ambient air quality standards (AAQS) define clean air and are established to protect the health of the most sensitive groups in our communities. An air quality standard defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without any harmful effects on people or the environment." Therefore, the project would not contribute to an exceedance of the most stringent state ambient air quality standards, including NOx. As the project would not exceed LSTs, the project is not expected to cause health impacts in the local community.

A Health Risk Assessment (HRA)has been prepared to evaluate the potential cancer and non-cancer health risk impacts that could result from the truck-related diesel emissions that would be generated by the fully built and operational project. This accounts for the daily emissions burden from the estimate 174 daily light- and medium-duty trucks that would arrive/depart the site on a daily basis. The HRA determined that both cancer and non-cancer health risks would be less than significant. Please refer to Section 3B in the Final MND, for a copy of the HRA and related modeling worksheets.

16. *p.36, while the MND references Appendix B, the text does not provide sufficient information regarding energy utilization and how that relates to overall City actions to reduce energy use and emissions. The requirement under Ukiah is not just to bury this information into an appendix but to actively consider this information and factor it into the decision-making process, including a complete discussion within the MND or EIR which is missing in this case.*

Response: Modeling worksheets for calculation of the project's energy consumption during construction and for the fully operating conditions are typically placed in an appendix of a CEQA document, while the document itself provides a narrative to explain the methods and findings of the analysis and presentation of key statistics. A full accounting of energy use from fuel consumption and building-related energy demand is provided for the project. The project's energy consumption in relation to citywide actions to reduce energy use is not discussed, because the City has not adopted any specific plans or programs aimed at reducing energy use to be tracked and reported on at the city level. There are no regulations requiring the City to adopt such plans or programs. The City, as do most, if not all local government agencies in California, administers the provisions of the building energy efficiency standards set forth in Title 24, Part 6 of the California Code of Regulations, as well as the applicable provisions of the California Green Building

Code as those pertain to energy efficiency. As noted on p. 53 of the MND, the project would comply with the current versions of these regulations, which are designed to improve building energy efficiency and thereby reduce energy demand from new development projects. The presentation of the Energy impact analysis in the MND, therefore, is typical and sufficient to inform the City's decision makers regarding this aspect of the project's impacts.

17. *p.36-37, the MND conducts a completely inadequate analysis of construction impacts. The construction is immediately adjacent to Jenni Rivera Park and the haul route is along the park boundary and through central Long Beach communities with already elevated rates of air pollution, high poverty and other environmental justice indicators. The MND however does not even discuss the impact of construction on the park or these residents, it does not consider the human health impacts of construction related NOx and particulate emissions on elderly and youth visitors to the park.*

Response: The proposed construction truck route is presented as Figure 12, p. 122 in the MND. As shown therein, that route passes by a small piece of the eastern edge of Jenni Rivera Park, where it intersects Walnut Avenue. The impact of construction vehicle emissions in that small area would be minor, as that would occur intermittently during a construction day and the emissions would quickly dissipate as the trucks move by. This signal also has a dedicated pedestrian cycle to protect crossings by both pedestrians and bicyclists. The proposed haul route follows Pacific Coast Highway and Atlantic Avenue, both designated truck routes and major arterial roadways that already allow a variety of trucks to travel on a daily basis along these same routes. Emissions from project-related construction trucks that pass by homes along these routes would mix with emissions from other vehicles, including trucks and passenger vehicles. Because these construction period trips would be temporary and would occur intermittently during a construction day, the emissions would not persist beyond the construction phase and would not result in permanent air quality impacts affecting those residents. Only residents at home and outdoors in spaces close to the roads would be exposed to traffic emissions along this route. As such, the impact is considered to be less than significant.

18. *p.37, to reduce NOx emissions the MND notes Mitigation Measure III-1 to limit daily grading activities. This mitigation in and of itself has impacts. The lengthening of construction means a longer period that the park will not be enjoyable or fully useable by area residents. It also increases the number of days that residents will hear, see, and be exposed to truck related traffic for project construction. None of these impacts of the mitigation measure itself are addressed in the MND.*

Response: As noted in the prior response to comment 8, the grading period will be reduced by 2-4 months by allowing 8-hour construction days and mandating that off-road grading machinery be CARB-certified Tier 4, which would significantly reduce emissions of NOx and also help reduce emissions of particulates. As shown in revised Table III-1 and III-6, below, both regional and localized emissions during grading and other construction phases would be well below the applicable SCAQMD thresholds, which were developed to avoid significant health impacts and achieve air quality standards.

Page 36, Section III, Air Quality

Short-Term Construction Emissions

The project involves construction activities associated with grading, monitoring well installation, paving,

construction, and architectural coating applications. Grading activities would require approximately 35,756 cubic yards of cut and 68,877 cubic yards of fill. Additional earthwork would involve removal and transport of contaminated soils from the prior oil refinery operations. This results in a total of 8,551 cy material to be exported from the project site and a total of 41,672 cy of clean fill material to be transported onto the project site. Exhaust emission factors for typical diesel-powered heavy equipment are based on the California Emissions Estimator Model version 2016.3.2 (CalEEMod) program defaults. Variables factored into estimating the total construction emissions include the level of activity, length of construction period, number of pieces and types of equipment in use, site characteristics, weather conditions, number of construction personnel, and the amount of materials to be transported on- or off-site. The analysis of daily construction emissions has been prepared utilizing CalEEMod. Refer to updated Appendix A, *Air Quality/Greenhouse Gas and Energy Worksheets*, in Section 4A of this Recirculated MND, for the CalEEMod outputs and results. *Table III-1, Construction-Related Emissions*, presents the anticipated daily short-term construction emissions.

Table III-1 Construction-Related Emissions

Emissions Source	Pollutant (pounds/day)[1,2]					
	ROG	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
Emissions Without Mitigation[2]	~~7.45~~ 34.21	~~98.75~~ 140.29	~~44.21~~ 64.97	~~0.15~~ 0.23	~~9.55~~ 30.95	~~5.39~~ 13.28
SCAQMD Thresholds	*75*	*100*	*550*	*150*	*150*	*55*
Threshold Exceeded?	***No***	***~~No~~ Yes***	***No***	***No***	***No***	***No***
Emissions With Mitigation[2,3]	~~5.02~~ 34.14	~~65.87~~ 61.96	~~29.94~~ 60.90	~~0.10~~ 0.23	~~5.37~~ 14.68	~~3.18~~ 5.59
SCAQMD Thresholds	*75*	*100*	*550*	*150*	*150*	*55*
Threshold Exceeded?	***No***	***No***	***No***	***No***	***No***	***No***
Volume Reduced	~~-2.43~~ -0.08	~~-32.88~~ -78.33	~~-14.27~~ -4.07	~~-.05~~ -0.00	~~-4.18~~ -16.27	~~-2.21~~ -7.69

Notes:

1. Emissions were calculated using CalEEMod version 2016.3.2 and EMFAC 2017, as recommended by the SCAQMD.
2. Totals shown are for highest intensity construction activities that generate these pollutants. The grading emissions in this table include reduction/credits based on compliance with SCAQMD Rules that are included in CalEEMod. The emission reduction measures applied in CalEEMod includes the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces three times daily; cover stock piles with tarps; water all haul roads twice daily; and limit speeds on unpaved roads to 15 miles per hour.
3. ~~Totals reflect 4 hour daily limit for grading activities, per Mitigation Measure III-1.~~

3. CARB certified Tier 4 engine standards would be required for all off-road diesel-powered construction equipment greater than 50

horsepower during the grading phase per Mitigation Measure MM III-1. Additionally, CARB certified Tier 3 engine standards would be required for the bore/drill rigs during the monitoring well installation phase of construction per Mitigation Measure MM III-2.
Refer to Section 4A, in the Recirculated MND, for assumptions used in this analysis.

Page 41, Fifth Paragraph, Section III, Air Quality

Table III-3, Localized Significance of Construction Emissions, shows the localized unmitigated and mitigated construction-related emissions for NO_X, CO, PM_{10}, and $PM_{2.5}$ compared to the LSTs for SRA 4, South Coastal LA County. It is noted that the localized emissions presented in *Table III-3* are less than those in *Table III-1* because localized emissions include only on-site emissions (i.e., from construction equipment and fugitive dust), and do not include off-site emissions (i.e., from hauling activities). As shown in *Table III-3*, the project's localized construction emissions would ~~not~~ exceed the LSTs for SRA 4, for NOx, PM_{10}, and $PM_{2.5}$. Therefore, Mitigation Measures III-1 and III-2 would be implemented to reduce NOx, PM_{10}, and $PM_{2.5}$ emissions. Mitigation Measure III-1 would require CARB certified Tier 4 engine standards for all off-road diesel-powered construction equipment greater than 50 horsepower during the grading phase. Additionally, Mitigation Measure III-2 would require CARB certified Tier 3 engine standards for the bore/drill rigs during the monitoring well installation phase. Thus, localized significance impacts from construction would be less than significant with implementation of Mitigation Measures III-1 and III-2.

Page 42, Table III-3, Localized Significance of Construction Emissions, Section III, Air Quality

Table III-3 Localized Significance of Construction Emissions

Source	Pollutant (pounds/day)[3]			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Construction (Grading Phase)				
On-Site Emissions [1,2]	~~77.84~~ 103.78	~~37.98~~ 50.64	~~8.18~~ 22.20	~~4.96~~ 11.18
Localized Significance Threshold[3]	99	1,503	14	8
Thresholds Exceeded?	~~***No***~~ ***Yes***	***No***	~~***No***~~ ***Yes***	~~***No***~~ ***Yes***
Mitigated Construction (Grading Phase)[4]				
~~*Reduced Emissions With 4-Hour/Day Grading Limit[4]*~~ Mitigated On-Site Emissions[4]	~~*51.89*~~ *25.45*	~~*25.32*~~ *54.71*	~~*4.35*~~ *7.82*	~~*2.86*~~ *3.78*
Localized Significance Threshold[3]	99	1,503	14	8
Thresholds Exceeded?	***No***	***No***	***No***	***No***

Notes:

5. The grading phase emissions are presented as the worst-case scenario for NOx, CO, PM_{10}, and $PM_{2.5}$.
6. The construction emissions in this table include reduction/credits based on the application of dust control techniques as required by SCAQMD Rule 403. The dust control techniques include the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces twice daily; cover stock piles with tarps; water all haul roads three times daily; and limit speeds on unpaved roads to 15 miles per hour.
7. The Localized Significance Threshold was determined using Appendix C of the SCAQMD Final Localized Significant Threshold Methodology guidance document for pollutants NO_X, CO, PM_{10}, and $PM_{2.5}$. The Localized Significance Threshold was based on the anticipated daily acreage disturbance for construction (approximately 5 acres; therefore the 5-acre threshold was used) and the source receptor area (SRA 4).

~~8. 4-Hour grading day limit per Mitigation Measure III-1.~~

5. CARB certified Tier 4 engine standards would be required for all off-road diesel-powered construction equipment greater than 50 horsepower during the grading phase per Mitigation Measure MM III-1. Additionally, CARB certified Tier 3 engine standards would be required for the bore/drill rigs during the monitoring well installation phase of construction per Mitigation Measure MM III-2.

Refer to Section 4A, in the Recirculated MND, for assumptions used in this analysis.

19. *p.39, the thresholds used to evaluate operation impacts are not appropriate due to the proximity of sensitive receptors, only ten-feet away at Jenni Rivera Park. In the context of that close proximity, the fact that park visitors skew either elderly or very young, and the already elevated pollutant levels in the area, the NOx levels are particularly concerning.*

Response: As shown in Table III-2 in the MND, daily levels of NOx for the fully operational project would be 45 percent below the SCAQMD regional significance threshold, and levels of other criteria pollutants would also be significantly below the applicable thresholds. As shown in Table III-4 of the MND, localized concentrations of NOx and all other criteria pollutants would be negligible. It should be noted that the ambient air quality standards are developed and represent levels at which the most susceptible persons (children and the elderly) are protected. In other words, the ambient air quality standards are purposefully set in a stringent manner to protect children, elderly, and those with existing respiratory problems. Given

these minor emissions levels that are well below the significance thresholds, the air quality impacts at the park would be less than significant.

20. *p.40, the lack of consideration of impacts on the park and park visitors is compounded by the fact the MND does not comply with Fryman. While the City of Long Beach agrees that it is not possible to precisely quantify every health impact, the MND fails to even provide a general overview of health impacts. It fails to consider health impacts on visitors to Jenni Rivera Park and residents of Long Beach exposed to construction traffic from the project. The technical studies on which the analysis is based failed to identify Jenni Rivera Park as a sensitive receptor which then results in flawed analysis flowing from those reports.*

Response: A discussion of the issue raised in this comment is provided on page 40 of the MND, under the topic of "Air Quality Health Impacts." As explained therein, currently available models for estimating levels of criteria air pollutants cannot reliably predict health consequences, as there are many meteorological variables involved and many different sensitivities within an affected population. It is simply not feasible to quantify or reliably ascertain the effect of an individual project's air pollutants on specific human health impacts. The MND does include an analysis of localized concentrations of air pollutants during construction and over the operating life of the project and in both cases, the emission levels would be below significance thresholds, which are based on federal and state ambient air quality standards. Please refer to Tables III-3 and III-4 and the associated narratives provided in the MND, and to the updated tables presented in response to comment 18, herein.

As noted in the prior response to comment 15, a Health Risk Assessment has been prepared to evaluate potential cancer and non-cancer health risk impacts associated with the project's diesel-powered truck emissions (see Section 4B in this Recirculated MND). The results determined that the project's diesel emissions from daily trucking activities would not result in a significant health risk impact at any of the surrounding sensitive receptors within a 2.5 kilometer (1.55 mile) radius of the center of the project site, including Jenni Rivera Park.

21. *p.41-43, the MND fails to identify Jenni Rivera Park as a sensitive receptor despite the park meeting the definition in the MND of "groups of individuals as the most likely to be affected by air pollution: the elderly over 65, children under 14, athletes, and persons with cardiovascular and chronic diseases such as asthma, emphysema, and bronchitis." The park is open to all, but the preponderance of visitors are young children with their parents as well as elderly visitors, it includes a walking path (immediately adjacent to the inadequate proposed project "buffer") that may be used by athletes and others exercising, and the CalEnviro Score information shows very high levels of asthma in the adjacent census tract.*

Response: As defined by SCAQMD, "For the purposes of a CEQA analysis, the SCAQMD considers a sensitive receptor to be to be a receptor such as residence, hospital, convalescent facility where it is possible that an individual could remain for 24 hours."[2] Visitors to Jenni Rivera Park would rarely congregate for extended periods of time near the project site, as there are no picnic tables or any recreational facilities, except for the jogging/biking/walking path, which is used almost exclusively for

[2] South Coast Air Quality Management District (SCAQMD), *Final Localized Significance Threshold Methodology*, Revised July 2008, http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf?sfvrsn=2,accessed May 2020,

moving activities. People who are at this park would likely be in the park area next to the project site for limited periods of time, estimated at less than an hour per day. The frequency of such visits is not known, but may not occur every day. Therefore, the Jenni Rivera Park was not identified in the IS/MND as a sensitive receptor as individuals would not remain at the Jenni Rivera Park for 24 hours.

The MND utilizes a distance of 25 meters to the nearest sensitive receptor to analyze localize construction emissions impacts, which is the most conservative threshold for LSTs, which accounts for pollutant concentrations at Jenni Rivera Park. As stated in the SCAQMD's Final Localized Significance Threshold Methodology, "The closest receptor distance on the mass rate LST look-up tables is 25 meters. It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters."[3] As discussed in the prior response to comment 15, the project would not exceed LST thresholds which are indicative of human health impacts.

22. *The LST discussion notes the nearest sensitive receptors are 40-feet away and a 25-meter standard is used. This is incorrect. Construction will occur immediately adjacent, within a foot, of Jenni Rivera Park and its sensitive receptors. The correct standard should be direct exposure, as is used to help determine the safety of construction workers. At 40 meters, the potential exposure of both NOx and PM10 is near the threshold. Considering the impact of PM10 on those with asthma and general health impacts of NOx and PM10 on the population, the MND seems to ignore a critical impact of the proposed project.*

Response: Please refer to the preceding response to comment 21--Jenni Rivera Park is not classified by SCAQMD as a sensitive receptor and therefore, it was not identified as such in the MND. The analysis of localized construction and operational impacts prepared for a sensitive receptor located 25 meters from the project edge is applicable to the adjacent segment of the park, per SCAMQD LST guidance. With the mitigation measures identified in the MND, all levels of construction emissions at 25 meters would be well below the LSTs, not near the thresholds. This is still the case with the revision to MM III-1 for grading control measures to reduce exhaust emissions on-site, and with the added MM III-2 to require later model/cleaner drill rig equipment during installation of the SVE system, air sparge components and the groundwater monitoring wells over an 18-day period. Please refer to updated Table III-3, provided earlier in the response to comment 18. Given the limited and short duration, mostly moving daily activity by park visitors in the adjacent segment of Jenni River Park, and the less than significant levels of localized construction emissions, impacts to park visitors would be less than significant.

23. *The MND also fails to consider the park regarding odors. While vehicle emissions from cars and medium duty trucks may be less than significant at even forty-meters, those emissions will be adjacent during construction and within ten-feet during operations. The project driveway located proximate to the park combined with trucks and cars facing directly into the park in such close proximity, and the limited building setback are all likely to lead to annoyance at best but more likely emissions and impacts to park visitors. This impact is not sufficiently evaluated in the MND.*

Response: The first part of this comment fails to identify what objectionable or hazardous odors could occur during the project's construction activities and the MND does not identify any such significant odor sources. Construction exhaust emissions may have detectable odors within the adjacent part of the park,

[3] Ibid.

but the emissions/odors would have a very short term time of exposure and the common construction exhaust odors associated with the proposed construction machinery are not recognized by SCAQMD as a significant impact. The second part of the comment refers to unspecified odor problems from trucks and car exhausts that occur in the driveway and parking area of Building 1E. Again, these types of exhausts are very common and do not produce significant odor problems. Further, they would occur intermittently and for brief periods of time when vehicles are accessing Building 1E. Odors from such events would not result in significant impacts at the adjacent segment of the park.

24. *The CO hot spot discussion and overall climate impacts to the Air Quality analysis fail to account for an increase in extreme heat event days expected to occur under Global Climate Change. (see State of California Climate Change Assessment http://climateassessment.ca.gov/) This increase is noted in the climate science and recognized by CARB. The proposed project increases impervious surfaces and combined with more heat, elevated pollutant levels in the area, emissions from medium-duty trucks and the close proximity of sensitive receptors, a more detailed CO hot spot and overall air quality analysis, including dispersion modeling, is needed.*

Response: Carbon monoxide is not considered a primary greenhouse gas as it indirectly contributes to climate change and has a weak direct effect on the climate. [4] As discussed on MND page 43, "According to the SCAQMD CEQA Air Quality Handbook, a potential CO hotspot may occur at any location where the background CO concentration already exceeds 9.0 parts per million (ppm), which is the 8-hour California ambient air quality standard. As previously discussed, the project site is located in SRA 4, South Coastal LA County. Communities within SRAs are expected to have similar climatology and ambient air pollutant concentrations. The monitoring station representative of SRA 4 is the Long Beach-Hudson monitoring station, which is located approximately 2.71 miles west of the project site. The highest CO concentration at the Long Beach-Hudson monitoring station was measured at 4.7 ppm in 2018. As such, the background CO concentration does not exceed 9.0 ppm and a CO hotspot impacts would be less than significant in this regard." Therefore, the MND analyzed CO Hotspots in accordance with SCAQMD guidelines and its conclusions are adequate.

Dark colored pavement within the developed project, for internal drives and parking areas, would absorb and reflect heat; however, that would not result in elevated heat levels outside of the project site. Greenhouse gas emissions from all sources of the fully developed site were quantified and analyzed in Section VIII of the MND. As discussed therein, the project would not conflict with applicable state and regional plans and programs aimed at reducing statewide GHGs and the project' impact on climate would be less than significant.

25. *p.44, the MND also dismisses construction related impacts as short term in nature and thus insignificant. Noise and pollution that make your neighborhood park inaccessible or unattractive for more than a year are not insignificant impacts. This acute and specific impact is not evaluated sufficiently anywhere in the MND.*

Response: This comment mischaracterizes the statement on p. 44 of the MND, which only refers to temporary construction odors as less than significant. Full quantitative analysis of construction generated dust and gaseous emissions was conducted and discussed at length, in the preceding portions of the Air

[4] California Air Resources Board, *Carbon Monoxide & Health*, https://ww2.arb.ca.gov/resources/carbon-monoxide-and-health, accessed May 28, 2020.

Quality section of the MND, including impacts that would affect Jenni Rivera Park. As discussed in several prior responses, construction period air quality impacts at the park would be less than significant, with the control measures identified in Mitigation Measures III-1 and III-2.

26. *p.51, the energy analysis within the MND fails to provide actual meaningful impact analysis. The data fails to compare the proposed project's energy consumption to what a project without a General Plan Amendment would yield, it fails to consider other impacts, it provides no information on where the overall City of Signal Hill stands in terms of energy and greenhouse gas reductions required by 2030 and 2050 under AB32 and various executive orders and CARB regulations. Lastly, it relies on the small project proportion analytical trick that has been disallowed in CEQA practice. The MND notes that the increase of this project is 0.0026 percent of County typical electrical usage and a 0.0009 percent increase over Los Angeles County's typical natural gas consumption. This provides no information on whether, for its size and use, the proposed project is efficient or inefficient in terms of energy. That is the entire purpose of the Ukiah and Appendix F analysis that is required. Under the percentage test, all projects would be insignificant so long as they were developed on small to medium sites and a significant and wasteful increase in energy usage would never be fully analyzed. This approach is flawed and should be revised.*

Response: The analysis provided in the MND includes quantification of all energy consumption sources during construction and during the operating life of the project, in accordance with the Court findings in the Ukiah case mentioned in this comment. The significance thresholds established in the State CEQA Guidelines (Appendix G) for energy impacts are identified and addressed in the MND. These thresholds do not include compliance with any statewide GHG reduction targets. There are no locally adopted programs for achieving city-wide reductions in energy usage, although the City does administer the building energy efficiency standards specified in the 2019 version of Title 24, Part 6 of the California Code of regulations, which are among the most stringent in the country and designed to achieve 30% higher efficiencies compared to the 2016 standards (see top of p. 50 in the MND). As discussed in Section VI of the MND, there are no unusual construction methods or materials proposed that would indicate a potential for wasteful or inefficient use of energy during construction. In fact, contractors have a financial incentive to minimize waste of fuels in every part of the construction process. The project's energy consumption was modeled with the California Emissions Estimator Model (CalEEMod) which utilizes the California Commercial End Use Survey (CEUS) database to develop energy intensity values (i.e. electricity and natural gas usage per square foot per year) for non-residential buildings. The CEUS data lists energy use intensity by building type and California Energy Commission (CEC) climate zone. Therefore, a light industrial project of similar size in the vicinity of the project site would consume a similar amount of energy as CalEEMod contains a fixed value for land use energy intensity. There are no proposed design features that would indicate a higher than typical level of energy intensity for this project, compared to other similar land uses. As discussed on page 52 and 53 of the MND, the project would be required to comply with Title 24 and CALGreen standards that were enacted, in part, to ensure efficient energy usage, and would not result in inefficient, wasteful, or unnecessary energy consumption.

The presentation of the project's energy consumption in comparison to countywide statistics was provided as information to put the project's level of energy consumption into a broader perspective that indicates the project's demand would be insignificant as a percentage of the countywide totals. This metric suggests that development of new energy sources would not be required to support this project. This is consistent with CEQA Guidelines Appendix F methodology to examine whether the project's energy

demands would require development of additional energy resources. This comparison was not relied upon to draw any conclusions about the manner in which the project' energy consumption is occurring or whether such consumption could result in significant impacts. The project's demand for electricity and natural gas (if any) can be met through minor local connections to existing energy infrastructure and no new sources of energy would be required to meet the project's demands. The analysis provided in the MND provides sufficient information to inform the City's decision-makers of the project's energy usage and lack of indications of a potential significant impact related to that usage.

27. *p.52, considering the likely impacts on sensitive receptors as discussed in our comments above, the analysis should have considered mitigation requiring all Tier IV construction equipment and trucks with use of a third-party mitigation monitor to assure that all construction equipment is operating in the cleanest possible fashion.*

Response: Mitigation Measure III-1 has been revised to replace the 4 hour/daily limit on grading activities to require all off-road diesel machinery powered by an engine of ≥ 50 horsepower to be a CARB-certified Tier 4 model, to reduce NOx and other exhaust emissions. Further, trucks used for import or export of soil materials will be restricted to no more than 71 per today, consistent with the updated construction emissions modeling and updated MM II-1 which are based on this volume. This will be monitored by the City's building inspectors and identified as a specification in all construction documents.

28. *The fuel consumption analysis again relies on an illusionary declarative statement that is will not be wasteful compared to similar developments in the region. Insufficient data is provided and regardless the analytical link that is required is whether this project, compared to other potential uses of the site, and compared to the City of Signal Hill's overall progress or lack thereof in energy use, is significant in relation to mandates and goals.*

Response: The impact analysis criteria identified in this comment are not consistent with the two thresholds established in the State CEQA Guidelines (Appendix G) and reflected in the MND. The analysis of energy impacts in the MND addresses these two thresholds that consider whether the project's energy consumption would be wasteful or inefficienct, and whether the project's energy profile would conflict with state or local plans for renewable energy or energy efficiency. Accordingly, the MND quantifies the project's energy consumption for construction and operations. This comment does not offer any evidence of how the project's energy consumption could be more wasteful than other similar developments in the region. The project's energy consumption was modeled with the California Emissions Estimator Model (CalEEMod) which utilizes the California Commercial End Use Survey (CEUS) database to develop energy intensity values (i.e. electricity and natural gas usage per square foot per year) for non-residential buildings. The CEUS data lists energy use intensity by building type and California Energy Commission (CEC) climate zone. Therefore, a light industrial project of similar size in the vicinity of the project site would consume a similar amount of energy as CalEEMod contains a fixed value for land use energy intensity. There are no proposed design features that would indicate a higher than typical level of energy intensity for this project, compared to other similar land uses. It is reasonable to conclude, as was done in the MND, that since this project would be built with common construction methods and materials already available in the region, and must be designed to comply with the statewide stringent building energy efficiency standards, the project would not result in wasteful or inefficient energy use and would not somehow operate more inefficiently than similar light industrial developments in the region.

29. *The compliance with Title 24, is a statewide requirement and not a mitigation or distinguishing factor. As described above the percentage analysis compared to county totals does not provide the meaningful analysis required under CEQA.*

Response: Compliance with the Title 24, Part 6 of the California Code of Regulations concerning building energy efficiency is noted in the MND as an indication of energy efficient building practices. It is not presented as a mitigation measure. These standards are among the most stringent energy efficiency regulations in the country and as such, project compliance is a strong indicator of an energy efficient profile. As noted in the prior response to comment 26, the percentage analysis compared to countywide totals is presented as contextual information and was not relied upon to determine impact significance.

30. *The MND concludes that the project would not conflict with energy or energy efficiency plans based on Title 24 and CALGreen with no relation to overall energy consequences of the proposed land uses, or status of VMT and energy reductions in the City of Signal Hill. A fuller analysis should be conducted and measures beyond Title 24 such as required solar installation, use of clean construction and operational trucks should be considered and imposed.*

Response: Energy consumption from mobile sources was modeled in the MND with CalEEMOD, which includes accounting of vehicle miles traveled. As noted in preceding responses, there is no requirement for the City to adopt or administer a local program to achieve city-wide energy reductions and there is no such program in place. Therefore, that consideration cannot be addressed and does not affect the adequacy of the analysis provided in the MND. No significant impacts involving the project's energy consumption profile have been identified; therefore, no mitigation measures related to that are warranted. There are no state or local regulations mandating installation of on-site renewable energy systems for this type of project. Use of clean trucks for construction and operations is more of an air quality measure than an energy measure, though there are certainly co-benefits. Again, imposing such a requirement would not be needed to avoid a significant impact involving excessive fuel consumption for this project.

31. *p.67, the MND provides only project related GHG emissions with no thresholds and no analysis of where the City stands within its obligations to reduce GHG. This analysis is critical to understanding how this project fits into overall progress or lack thereof in meeting GHG targets. The MND provides no inventory, history or projections of GHG levels in the City of Signal Hill.*

Response: The City of Signal Hill is under no obligation by any state or federal regulatory framework to conduct an inventory of citywide greenhouse gas emissions (GHGs) and there is no GHG reduction plan that has been adopted by the City. Addressing project consistency with such a local plan, therefore, is not possible. The MND does assess the project's consistency with applicable statewide GHG reduction programs, including the CARB 2017 Scoping Plan and the 2016 Regional Transportation/Sustainable Communities Plan. As discussed in pages 69-73 of the MND, the project would be consistent with the few pertinent measures in those plans and the project's GHG impact would be less than significant.

32. *P. 68, the total project emissions are approximately 60.8% of the AQMD threshold for industrial facilities. As the project does not include mandatory energy-reduction features such as rooftop solar and there is no inventory or analysis of overall GHG reduction status in the City of Signal Hill, it is likely that this project combined with any other project in Signal Hill, may result in a cumulatively significant new source of GHG emissions over 10,000 MTC02 equivalent.*

Response: This comment begins with an incorrect statement, because the SCAQMD and the City of Signal Hill have not adopted a quantitative significance threshold to assess the GHG impacts of any individual land use project. SCAQMD did elect to apply a threshold of 10,000 $MTCO_2e$ annual GHG emissions for stationary source industrial projects that must obtain an operating permit from SCAQMD, for application in its own CEQA compliance program. SCAQMD's 10,000 $MTCO_2e$ greenhouse gas threshold was not adopted as a cumulative threshold for application in a CEQA document by any local agency within the South Coast Air Basin, nor has this been added to the SCAQMD's CEQA Handbook. The proposed light industrial park, with multiple small tenant spaces, would not require an operating permit from SCAQMD. As such, that threshold does not apply to this project. Even if it did, the project's annual GHG emissions are estimated at 6,079 MTCO2equivalent (see Table VIII-1 in the MND), well below the referenced 10,000 $MTCO_2e$ figure identified in this comment.

33. *p.70, the MND finds conformity with CALGreen and notes the project as less than significant in terms of GHG because it will comply with the minimum 5% tenant bike parking. This is insufficient to support the significance finding. The project does not include bike facilities such as bike repair or "bike kitchen" facilities, employee showers or other measures that are likely to include bicycle usage, the project does not include street improvements to improve bicycle commuting. Rather the project introduces hazards and impacts that are unlikely to result in substantial active transportation use and potential impacts to meeting GHG targets.*

Response: This comment refers to the assessment of project consistency with the CARB 2017 Scoping Plan and the measure involving provision of bicycle parking spaces at a ratio of 5% of all vehicle parking spaces. This is specified in the California Green Building Code. Additional bicycle support facilities are not required. This is not likely to affect potential bicycle commuting by future employees. Furthermore, no assumptions regarding any number of employees who might commute by bicycle was assumed in any air emissions calculations. At any rate, the determination that the project would be consistent with the statewide Scoping Plan is based on compliance with several measures in that plan, not just this provision regarding bicycle parking spaces. This comment also alleges, without any specifics regarding project design features, that the project would "introduce hazards and impacts that are unlikely to result in substantial active transportation use…" This unsupported claim does not warrant a response.

34. *p.71-72, the MND also finds the project consistent with the Mobile Source Strategy despite the fact the project includes no requirement for clean construction or operational trucks, and the 10 EV charging spaces represent a very small portion of the overall parking supply, insufficient to meet CARB goals for EVs in the overall vehicle mix necessary to meet GHG goals.*

Response: The MND determined that the project would generally be consistent with the Mobile Source Strategies identified in the Scoping Plan because it is located on an urban infill site, with a mixture of other land uses in the vicinity where project employees could walk or bicycle to for dining, refreshments, local convenience shopping and housing. In addition, by providing electrical power conduit to support use of low and zero emissions vehicles powered by electrical systems, the project design would facilitate use of such vehicles by future tenants and visitors. It is not necessary to demonstrate direct application of all mobile source strategies to find that the project is generally consistent with this set of strategies.

35. *The MND also finds the project consistent with SB375 despite the fact no context is given for emission in Signal Hill overall and how the GHG profile of this project would compare to other land uses including the land use in the existing Signal Hill General Plan. The RTP/SCS was based on that*

adopted General Plan not the proposed amendments. The MND also provides no VMT information for the project yet states "the project would also reduce VMT as a result of its urban infill location, with access to public transportation within a quarter-mile of the project site and its proximity to other destination including off-site residential, restaurants, and retail." This conclusion is not supported by evidence and is contradicted by other sections of the MND. The traffic analysis section notes that transit use to access the site is unlikely and transit ridership will be minimal and unaffected by the project. The traffic section clearly states that the project is not TOD in nature, contradicting this SB375 conclusion in the GHG section. The project area is a potential TOD in the City of Signal Hill Circulation Element, but this project will leave that site, one of limited TOD sites in Signal Hill unavailable for transit supportive and VMT reducing development. No analysis is provided in the MND to resolve these inconsistencies.

Response: The 2016 RTP/SCS reflects local land use policies of adopted local General Plans, including the City of Signal Hill General Plan, but primarily that is in terms of different intensities of urbanization and mixtures of land uses that translate into patterns of regional travel, rather than some sort of site-specific metrics that represent a desired direction for VMT performance on a broader scale. As such, the proposed general plan amendment to change the designation of the eastern site area from office to industrial is minor with respect to the regional objectives of the RTP/SCS. The MND discussion of the project's urban infill location and mixed use surrounding context is accurate and is not refuted by the comment. There are also several bus stops located with ¼ mile of the project site, which is generally regarded as an acceptable distance for walking to/from a bus stop to a destination. These urban infill, mixed use and transit proximate features are typically regarded as elements that facilitate shorter and fewer vehicle trips and thus reduction in vehicle miles traveled. The MND does not claim that this project is designed as a transit oriented development, in the GHG section or any other section of the analysis of project impacts. As discussed on page 136 of the MND, the adjacent 72-unit Zinnia Apartments projects is considered by the City to be a TOD-oriented development that fulfills the main objectives of the City's General Plan Transit Opportunity policies for this area.

36. *p.73, the MND fails to provide analysis of how the project, which requires a General Plan Amendment and will result in additional truck trips and potentially increased VMT in comparison to the existing General Plan the 2016-2040 RTP/SCS is based on. The MND finds the project consistent with RTP policies on neighborhood mobility and complete communities even though the project is not TOD in nature and actually precludes TOD on a site identified for such in the Signal Hill General Plan Circulation Element (on which the RTP/SCS is based). It is found that TDM does not apply to the project when in fact TDM requirements on the project would reduce emissions and impacts but is not imposed. It also finds mere code compliance as sufficient for promoting zero-emissions vehicles with no requirements to exceed those baseline standards and no incentives for that charging infrastructure to actually be used. Code compliance is not "promotion" within the common dictionary-defined use of that word.*

Response: This comment mischaracterizes the MND discussion on p. 73, where it is stated in that the project would be consistent with strategies to achieve shorter trips. This would occur because of the site location, in a fully urbanized area where proximity to other types of land uses such as housing, dining, retail services and nearby bus stops offer ways to reduce vehicle trip lengths and trip volumes. There is no statement in the MND that this project is consistent with neighborhood mobilities strategies. Please refer to the preceding response to comment 35 regarding the TOD comments. Promotion and

management of certain trip reduction or transportation demand management strategies or development of standards to encourage neighborhood mobility or complete communities is the responsibility of local government agencies and other interest groups, rather than something to be accomplished by an individual land use project. No significant GHG impacts due to the project's transportation characteristics have been identified an no mitigation measures for such impacts are warranted.

37. *The MND does not provide an analysis of the inconsistencies between the project, its chosen haul route and impacts to Jenni Rivera Park and the Environmental Justice policies in the RTP/SCS. The MND does not resolve the conflict between the RTP/SCS assumption that each jurisdiction will prepare GHG reduction strategies and the fact that no measures are included in this project and no overview of Signal Hill's emissions are quantified.*

Response: Please refer to prior responses to comments 17, 21, and 31.

38. *p.74, the GHG conclusions are not based on substantial evidence and in fact, based on our comments proceeding, a fair argument exists that impacts to GHG are in fact potentially significant.*

Response: This comment is a statement of opinion and has been refuted by the prior responses to comments alleging inadequacies in the MND analysis of GHG impacts.

Hazards and Hazardous Materials

39. *The MND hazards section relies upon technical reports that fail to identify Jenni Rivera Park as a sensitive receptor. Those reports found that construction workers were potentially impacted from construction, yet the park is adjacent and more likely to have very young or very old visitors and those with asthma that will be under increased risk should hazardous substances be released during construction.*

Response: Since construction workers within the project site would have direct exposure to any potential releases of soil contaminants during soil disturbing activities, they would be the most vulnerable group and thus the focus of the Human Health Risk Assessments that were conducted. Further, the results of the HHRA are sufficient with respect to potential effects to people passing by in the adjacent segment of Jenni Rivera Park, who would be exposed for much shorter periods of time, and less frequently than on-site construction workers. All of the precautions required to be implemented during soil-disturbing activities of construction, described on pages 82-83 of the MND regarding the Soil Reuse Plan approved by the LARWQCB, and as specified in Mitigation Measures IX-1 and IX-2, would be sufficient to protect the health of construction workers and adjacent park users.

40. *p.75, while the 55-gallon threshold may normally be acceptable for further regulation of hazardous materials, it may not be appropriate for this project. This is due to the fact that the project site plan provides on a ten-foot setback form Jeni Rivera Park and trucks delivering hazardous materials are immediately adjacent to the park. We note that the project is designed to consist of multiple small businesses, potentially each containing less 55-gallons of hazardous materials but creating risk on a campus-wide basis.*

Response: Each individual tenant is subject to compliance with hazardous materials regulations, subject to the oversight of the Los Angeles County Fire Department. This existing regulatory framework is considered to be sufficient to reduce potential impacts associated with handling, storage, transport or disposal of hazardous substances associated with normal business activities, to a level of less than significant.

41. *p.76, the MND fails to consider the risk of businesses and delivery trucks dumping hazardous trash within adjacent Jenni Rivera Park. This represents a significant risk to the health of park visitors.*

Response: This comment is speculative in nature, since there is no way to predict whether, how often or of specific circumstances in which a project-related delivery truck might dump hazardous trash within Jenni Rivera Park. No response to such speculation is warranted.

42. *The 2012 Tox Strategies report on which the Hazardous section relies failed to identify Jenni Rivera Park and its visitors as a sensitive receptor. This error is compounded in subsequent reports and flaws the overall MND analysis.*

Response: The noted 2012 Tox Strategies report evaluated potential health risks to a permanent residential population on-site or nearby to the south or southwest of the project site. As such, it evaluated risks for a population that could be present every day, for prolonged periods of time, which would not be the case with the momentary exposure of people passing by through Jenni Rivera Park. To quote from page 80 in the MND: "The results of the human health vapor intrusion risk assessment prepared by ToxStrategies indicated estimated risk values for the residential scenario exceeded thresholds due to exposure to VOCs in soil vapor and shallow groundwater, however, ToxStrategies concluded "potential soil vapor intrusion should not be of concern for current or future residents living south or southwest of the property." (ToxStrategies October 8, 2012). Since a resident population would not be exposed to significant levels of hazardous soil vapor, neither would people present for a much shorter period of time in Jenni Rivera Park.

43. *p.81, the HHRA (Mearns 2018) is not sufficient to understand the human health risk of construction. It again fails to provide analysis of what soil disturbance, temporary piles and active extraction activities will have on Jenni Rivera Park. These risks must be layered atop the criteria pollutants released in construction in order to understand and evaluate the overall human health impacts of the proposed project.*

Response: Please refer to the preceding response to comment 42, which explains why the HHRA is sufficient to address risks to temporary park visitors during soil disturbing activities. The discussion on page 82 in the MND describes various precautions to be taken during soil disturbing activities which would prevent release of hazardous substances that could threaten the health of the temporary park visitors. For example, soil stockpiles must be tested for levels of contamination, sprayed with water and/or vapor suppressant, and covered with plastic sheeting to prevent fugitive dust emissions. As noted on page 85 of the MND, the proposed soil vapor extraction and treatment system will be subject to review and permitting by the SCAQMD to ensure that the treatment process does not release harmful emissions. With the proposed soil management measures described in the MND and SCAQMD permit compliance for the SVE system, risks to human health at Jenni Rivera Park would be less than significant.

44. *p.82, the LARWQCB analysis was based on three to four months of grading but that may be inconsistent with the mitigation-imposed limit on hours of grading per day. The City of Long Beach is concerned that extended grading will expose park visitors and other nearby residents to inhalation of small particles from temporary piles, impacts from construction equipment and impacts from haul trips exporting soil for treatment and disposal.*

Response: As noted in the prior response to comment 8, the grading phase will be shorter than what was estimated in the MND, because the 4-hour daily limit will be removed and replaced by requiring all diesel-powered construction machinery that is ≥ 50 horsepower to be CARB-certified Tier 4 models that will significantly reduce emissions of criteria pollutants, to well below the SCAQMD significance thresholds. The analysis of localized construction emissions, which focuses on concentrations of pollutants within a short distance of the active construction area, also determined that pollutant levels would be well below the applicable thresholds, which are based on federal and state ambient air quality standards intended to be protective of the more sensitive elements of the population. The large majority of trucking emissions associated with hauling export materials will occur away from the park, along the arterial streets and highways leading to the disposal sites. As such, impacts from grading-related emissions would not result in significant impacts for the temporary park visitors.

45. *p.83, the MND fails to provide criteria or contingency plan for what will occur if soils contain larger amounts of pollutants than are anticipated resulting in the need to both export and import additional soils. These potential additional haul trips are not acknowledged in the MND.*

Response: The estimated quantity of contaminated materials to export to a proper facility was based on: 1) laboratory data from over three dozen borings across the Site; 2) field observations, PID readings, and laboratory analytical data from 31 test pits advanced across the Site; and 3) calculated soil volumes based on the grading plan. Based on data collected from these three sources, the estimated volume of contaminated materials requiring export was calculated to be 8,551 cubic yards as follows:

- The estimated cut area required for site grading is 35,756 CY
- Assumed 20% of the soil from the cut areas will not meet reuse criteria and will require offsite disposal. Therefore, the estimated volume required for disposal as a result of site grading equates to 7,151 CY.
- Included an estimate for additional contaminated material that will be required for offsite disposal based on site investigations. This volume includes two areas that were identified during test pit activities with shallow free product and/or debris pits. The estimated disposal volume of additional material is 1,400 CY.
- Based on the above, the total estimated quantity requiring offsite disposal is 7,151 + 1,400 CY = 8,551 CY

Higher volumes than currently estimated could be generated under the following circumstances:

a) If more soils are encountered that measure greater than 50 ppm when scanned with the PID;
b) If a higher volume than expected does not pass the soil reuse criteria based on analytical data; or
c) If site grading reveals unexpected debris pit(s) or additional shallow free product.

Given the substantial characterization that has taken place on the site, additional materials requiring offsite disposal are expected to be limited. Nonetheless, to ensure that emissions from daily export truck

trips do not exceed the levels analyzed in the MND, Mitigation Measure III-1 has been revised to require monitoring of daily trucking volumes to limit the total to no more than 71, as stated below:

Revised Mitigation Measure III-1

~~Daily grading activities on site shall be limited to a maximum of four hours on any work day. This time restriction also applies to all haul trucks bringing in soil material to the project site, or trucks that are transporting excavated materials off site.~~ During the grading phase of construction, all off-road diesel-powered construction equipment greater than 50 horsepower shall meet the United States Environmental Protection Agency (EPA)-certified Tier 4 emission standards. In addition, all construction equipment shall be outfitted with best available control technologies (BACT) devices certified by the California Air Resources Board (CARB). Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 4 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. Daily truck trips for hauling contaminated soil materials to off-site disposal locations shall be limited to 71.

All trucks hauling soil, sand, or other loose materials excavated from the Site shall be covered. If visible soil material is carried onto adjacent public streets, the streets shall be swept with water sweepers as necessary to maintain them free of materials. Stockpiles will be placed on a plastic liner of 30-mil or greater. During construction, the piles will be lightly sprayed with water and covered with plastic sheeting of 10-mil or greater. Plastic sheeting will be secured with sandbags.

A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment for verification by the City of Signal Hill Building Official or their designee. Daily logs of the volume of grading export truck trips shall be provided to the City's Building Official to verify compliance with the 71 trucks/day limit.

46. *p.84, the MND notes that toxic vapors may enter buildings via utility corridors, cracks and seams. In addition to these vapors migrating to Jenni Rivera Park, the City of Long Beach is concerned with how those impacts combined with any active measures, such as SVE, may be directed or carried by air/wind flow toward Jeni Rivera Park. We note that grading, including disturbance of toxic soils will occur immediately adjacent to the park.*

Response: A long term SVE system (including additional extraction wells, SVE extraction equipment, and a thermal/catalytic treatment system) will be installed after site grading occurs and will begin operating after project construction is complete. Emissions from the SVE extraction system will be treated prior to discharge using a thermal/catalytic oxidizer. Furthermore, the new system will be operated under a South Coast Air Quality Management District (SCAQMD) permit and will be operated in compliance with SCAQMD Rule 1147. Both SCAQMD Rule 1147 and the site-specific permit will impose strict emissions limits on the system. The new system's vapor extraction volume and emission abatement equipment will be specifically designed to comply with the emission limits established by SCAQMD. Given the pre-emission treatment and SCAQMD limits the system must comply with, released toxic air contaminants are expected to be minimal.

Impacts at Jenni Rivera Park due to soil vapor migration or other remedial activities are unlikely. SVE systems draw vapors from the soil, capture them and direct them to a treatment unit. An air sparging (AS)

system will be operated in conjunction with the SVE to improve overall remedial performance, which will inject atmospheric air (not oxygen) into the groundwater beneath the Site.

The SVE system will be designed to provide a negative vacuum "capture zone" throughout the property, including the footprint above the air sparge groundwater barrier at the southern and western perimeters. Injected air will be recovered by the SVE wells to minimize potential off-site migration from the Project Site. The potential for vapor migration is mitigated through ongoing operation and monitoring to ensure that the SVE system is providing adequate capture of vapors. Standard adjustments that are made during system operation include optimization of the operating vacuum above the air sparge curtain, and adjustments to the air sparge flowrate/pressure. The SVE/AS system as designed, and using standard operating and monitoring practices, will provide capture of the injected air and draw contaminants in the vapor phase into the system for treatment.

To ensure that the project's SVE system is fully approved and permitted in accordance with SCAQMD regulations, Mitigation Measure III-3 has been added, as follows:

> MM III-3: Evidence of issuance of an SCAQMD permit for the SVE system shall be provided to the City of Signal Hill, prior to issuance of a building permit.

It is also noted that the Jenni Rivera Park is a paved and landscaped walking and bicycling trail without playground equipment, permanent seating or picnic tables. Therefore, it is expected that users of the park are transient in nature, significantly limiting the duration of time users spend in proximity to the Site. The combination of limited emissions from the Site and limited time of potential exposure results in a minimal potential for exposure from the property for users of Jenni Rivera Park.

As stated in several of the prior responses, grading activities would not result in significant impacts within Jenni Rivera Park, based on quantitative assessments prepared for the MND, pursuant to SCAQMD methodology, and implementation of numerous precautionary measures required by SCAQMD and the LARWQCB described in Section IX of the MND, and as specified in Mitigation Measures IX-1 and IX-2 in the MND.

47. *p.85, it is not clear from the MND the location of potential SVE equipment and exhaust nor of the 64 groundwater remediation wells. This information is relevant to analysis of impacts, particularly to the park, the text does note that the southern and western edge (park is the southern edge) will be subject to oxygen injection but impacts on this to adjacent park users is not analyzed.*

Response: Refer to the preceding response to comment 46 regarding SVE and air sparge system design and required SCAQMD permitting that will prevent impacts to park visitors. The proposed SVE treatment equipment would be located within an enclosure, to the west of Building 1E, as shown on Figure 4 – Site Plan, in the MND.

48. *The MND incorrectly states that groundwater is not considered as a source of drinking water in the site vicinity. The City of Long Beach acquires more than half of its drinking water supply from groundwater. The subject parcel is within the larger groundwater basin and any impacts to the groundwater on this piece of real property are not going to respect ownership lines or boundaries. The release of toxic substances into the groundwater is a concern regardless of if groundwater*

wells are present at the site or even nearby. The MND should be expanded as an EIR to provide a fuller analysis of this issue.

Response: The MND refers to the absence of any groundwater production wells in the site vicinity that provide drinking water supplies. The proposed project remediation activities would eliminate current sources of groundwater contamination from the project site and provide methods of ongoing removal of groundwater contaminants, with regular reporting of monitored groundwater conditions to the LARWQCB, thus reducing the level of local groundwater contamination compared to current conditions. The proposed industrial park would not release any toxic substances into the ground or groundwater. Based on these considerations, impacts to groundwater would be less than significant.

49. *p.86, the MND again relies upon a HHRA approach where park visitors, including daily visitors that are very young or very old, are not included in the analysis. This error is critical due to the direct adjacency of construction including disturbance of toxic soils on the southern project boundary.*

Response: This comment repeats a concern expressed in several prior comments. Please refer to previous responses to comments 17, 19, 20, 21, 22, 39, and 43.

50. *P.87, the use of a MND does not allow for speculative deferred future mitigation nor does it allow for impacts that are significant after mitigation. This MND however concludes "[i]t is unknown if capping existing contaminated soil mitigates the environmental hazard posed by inhalation of VOCs from the contaminated soil matrix and/or soil vapor by future construction maintenance workers to less than significant." None of the mitigations, simply adherence to existing rules and regulations and not true impact-reducing mitigations, can reasonably modify this conclusion. The analysis fails to analyze similar impacts to users of Jenni Rivera Park and as a result of these combined factors, the MND lacks the evidence to conclude there will be no significant impacts as to Hazards and more than a fair argument exists that in fact impacts may be significant.*

Response: The referenced statement from the MND in the second sentence was intended to identify the potential for additional post-construction impacts that might possibly occur in the future, during site maintenance activities that require soil disturbance. As such, it provides a disclosure of a potential impact, rather than speculating that it would or would not occur. The MND also includes mitigation measure IX-9, specifically designed to prevent a significant health risk impact from such site maintenance activities through compliance with SCAQMD Rule 1166 procedures. As stated on page 92 in the MND, these procedures would include monitoring of soil every 15 minutes with a handheld instrument such as a photo ionization detector ("PID") or organic vapor analyzer ("OVA") held a minimum of 3-inches above disturbed soil and stockpiling soil that exceeds the threshold of 50 ppmv for offsite disposal. This measure would also prevent significant health risks for temporary park visitors.

51. *The MND fails to analyze the impacts of SVE and other active measures on adjacent sensitive receptors, this despite the conclusion that it is unknown if the proposed onsite remediation of shallow groundwater in conjunction with monitored natural attenuation would sufficiently mitigate the environmental hazards posed by VOCs in groundwater to offsite residents." Again, there is no logical link between this conclusion, the proposed "mitigation" and then the conclusion*

that after mitigation there are not significant impacts. Again, the analysis also fails to consider adjacent park users.

Response: Refer to the prior response to comment 46 regarding the design of the SVE and required SCAQMD permit compliance that will prevent release of hazardous substances that could affect persons on or off-site.

52. *These are not temporary impacts, as the MND notes, therefore, the site will always have contaminated soils which will continue to off gas VOCs due to biodegradation of TPH and this could potentially leach into groundwater. This represents a potential for further significant impacts to the environment and human health.*

Response: Mitigation Measures IX-4 and IX-5 were designed to address this concern and would provide a sufficient safeguard to ensure continued treatment of soil vapors and groundwater, if warranted based on results of ongoing monitoring and reporting efforts to the LARWQCB.

53. *Mitigation Measure MM IX-1 does not reduce impacts. This mitigation merely references regulatory requirements of AQMD that are in the baseline of the technical analysis the led to conclusions of significance reiterated in our comments above. The mitigation measure provides no numerical or other performance standard and it is impossible to draw any specific conclusions on reducing impacts based on the deferred future agencies of AQMD.*

Response: The MND relies on the entire set of mitigation measures to avoid significant impacts during construction and over the operating life of the project. MM IX-1 does provide measures to prevent and contain potential releases of hazardous substances during soil disturbing activities and even though this represents a regulatory compliance measure, it does not reduce its value as a mitigation measure, amongst the other measures. This measure supplements the requirements of the Soil Reuse Plan, approved by the LARWQCB, which includes several numerical performance standards to guide the handling, treatment and disposal of contaminated soils materials.

54. *Mitigation Measure MM IX-2 fails under the same issue. In fact, this mitigation may in fact trigger additional impacts that are not disclosed in the MND. If soils exceed screening levels for VOCs, TPH and PAHs the project construction will be required to increase the number of haul trips, resulting in more truck trips and associated impacts. These impacts are not accounted for in the MND and in fact no performance criteria or procedure is laid out for that possibility. This deferral of mitigation is not permitted when using a MND.*

Response: This measure is considered to provide an effective suite of actions to prevent release of hazardous substances from contaminated soils materials. If compliance with this measure should result in a need to export more than anticipated volumes of contaminated materials from the site, the grading activities would have to be controlled so that the number of daily haul trucks does not exceed the number evaluated in the MND. This is required by updated Mitigation Measure III-1, as provided in the prior response to comment 45.

55. *Table IX-1, the approach in the MND is to use the Commercial/Industrial screening levels. While this is correct to the future land use, we note that the users of the adjacent park are characteristic of the residential screening level and will be exposed during construction due to the complete lack*

of any buffer between the grading area and the park. The MND fails to provide any analysis of these potential impacts.

Response: As discussed on page 80 of the MND, assessments of potential health risks during construction to nearby residential land uses to the south and west were conducted in 2010 (Exponent) and 2012 (ToxStrategies) and both concluded that the risks of soil vapor intrusion affecting those nearby homes would be less than significant. As further discussion on pages 81-82 of the MND, a Human Health Risk Assessment (HHRA) was prepared by Mearns in 2018, which evaluated risks for on-site construction workers that would be exposed more directly and for longer periods of time to soil contaminants than any temporary park visitors. That analysis, therefore, was sufficient to address potential effects to people in the park for shorter periods of time. The various precautions and safeguards to be implemented during soil disturbing construction activities are described in detail on pages 82-83 in the MND, which are reinforced and supplemented with Mitigation Measures IX-1 and IX-2. These measures would be sufficient to protect both on-site construction workers and any park visitors who may be in the nearby segment of Jenni Rivera Park for shorter periods of time.

56. *Mitigation Measure IX-3 does not reduce construction impacts, but rather amounts only to monitoring. The measure does not provide sufficient detail as to what a future reactive SVE system would entail, should future migration of vapors necessitate re-activation of the initial SVE system or construction of a supplemental SVE system. This deferral of mitigation is not permissible.*

Response: This mitigation measure is listed in the MND under "Project Design/Operations" and as such is not intended as a construction mitigation measure. Should an additional SVE system be required as a result of the monitoring activities described in MM IX-3, installation of that system would be subject to all of the SCAQMD rule compliance and oversight and soil disturbance control measures required for construction of the project itself. As such, the impacts from a possible future SVE system installation to remove soil vapors from the clean cap area created during the initial site preparation work would be less than significant.

57. *Mitigation Measure IX-4 does not diminish intermittent impacts to public health. The measure allows for the SVE system to be removed, and then for monitoring to reveal a need to re-activate the system. The impacts of exceedances, for up to six months between monitoring measurements, impacts both to future project employees and to adjacent park users, are not fully mitigated.*

Response: LARWQCB is the lead regulatory agency for the site and has the sole discretion to determine the SVE system has removed VOCs in the vapor phase such that residual concentrations are less than the cleanup goals (Table IX-1). The City reserves the right as the land use authority to require the landowner to treat and/or remove soil, after the SVE system ceases to operate pursuant to the LARWQCB mandate. The data collected from the additional monitoring for VOCs in the vapor phase will be used to determine if the SVE system should be restarted. This is standard operating procedure for remediation with SVE systems. The SVE system is designed to reduce potential impacts to human health, therefore mitigation measure IX-4 does protect public health from potential impacts.

58. *Mitigation Measure IX-5 again simply defers to another agency without sufficient detail or performance criteria. The monitoring of groundwater, in and of itself, does not reduce impacts to groundwater.*

Response: This measure requires both monitoring of groundwater and remediation, if excessive contamination levels are detected. The Los Angeles Regional Water Quality Control Board is the jurisdictional agency with respect to groundwater contamination problems and measures to monitor and remediate groundwater to safe levels. Please refer to the preceding response to comment 57, for further explanation regarding the data collection that will guide the Regional Board monitoring efforts and the performance criteria that must be achieved.

59. *p.92, Mitigation Measure IX-6 fails to state any criteria the LNAPL remediation plan is required to meet. This defers all detail of the mitigation measure and provides no quantifiable evidence that the mitigation will actually reduce impacts. This deferral is not permissible with the use of a MND.*

Response: All LNAPL within the site must be removed during the project construction activities, in accordance with a City-approved remediation plan. This plan will identify the site-specific risk-based human health cleanup goals and/or the clean-up goals in Table IX-1, and/or Regional Screening Levels and/or Environmental Screening Levels protective of human health.

60. *Mitigation Measure IX-7 also relies on an operations and maintenance plan, without any performance criteria. The reporting must be kept on site, there is no assigned review role or criteria by the City of Signal Hill nor any other regulatory body. The only qualification for the designated person is that they are familiar with the site and its history. Without professional qualifications and without an outcome based on the reporting, it is unclear what this mitigation measure accomplishes. This mitigation does not lessen any of the impacts identified in the section and associated technical reports.*

Response: The "designated person" must be a qualified professional, with relevant environmental experience. It is anticipated the "designated person" will be a degreed individual and may be the environmental consultant(s) currently representing the applicant. The dynamic O&M plan must be submitted to the City of Signal Hill for review.

61. *Mitigation Measure IX-8 relates to a land-use covenant. While this is good planning practice, it does not reduce any of the identified construction or operational impacts of the project.*

Response. This comment is acknowledged. The MND does not represent this as a measure to reduce the construction or operational impacts of the project.

62. *Mitigation Measure IX-9 again defers to a future plan, that need only comply with existing baseline regulations (SCAQMD Rule 1166). This does not reduce impacts because existing legal practice should have already been factored into the technical reports and section which found that impacts were in fact likely (see page 87).*

Response: This measure is designed to prevent health impacts to future site maintenance workers in the possible but not predictable circumstances in which some soil disturbing efforts are required that might release soil vapors that have built up over time. It is thus a preventative safeguard for a situation that cannot be defined at this time and which may not occur.

63. *The MND hazards section concludes without explaining how these mitigations reduce impacts to less than significant. In summary the section and its associated studies in fact lead to the conclusion that impacts are significant. Insufficient and deferred mitigation does not reduce those*

impacts. The section should be expanded into an EIR that would provide the quantifiable analysis between pre and post-mitigation impacts and provider greater clarity of any impact on Long Beach residents including park visitors.

Response: This comment is a statement of opinions that are not based on alternative evidence or analysis that indicates serious deficiencies or flaws in the environmental assessments conducted for the project and the MND. All of the concerns stated in prior comments regarding potential impacts on adjacent park visitors and the adequacy of site assessments and mitigation measures have been addressed in those prior responses. The information and analyses provided in the MND regarding the project's potential impacts involving environmental and human health hazards are sufficient to inform the City's decision makers and no additional analysis is necessary to address any information gaps, flawed analysis, or unsubstantiated conclusions regarding the projects impacts and mitigation measures.

Hydrology and Water Quality, Including Flooding Impacts

64. *p. 94, the water quality section of the MND is inconsistent with the hazards section. The hazards section notes the possibility of groundwater contamination and for both construction and operational impacts of toxics in the soil. The hazards section inappropriately dismissed these concerns stating groundwater is not a drinking water source in the area (see previous comment), however, the water quality section simply finds it to be less than significant without any mitigation. There is a lack of evidence to support this conclusion and a fair argument in fact that there is a risk of groundwater contamination that requires further study in an EIR.*

Response: The focus of the analyses in the Hydrology and Water Quality section is on whether the project, as proposed, could result in significant adverse impacts to surface and groundwater quality due to construction activities, site alterations and the developed site conditions, create or worsen flooding conditions, interfere with groundwater recharge and groundwater resources. Compliance with existing federal, state, regional and local regulatory standards to prevent pollution of surface or groundwater during construction or as a result of developed site conditions would be sufficient to prevent significant water quality impacts during construction and in the developed condition. These existing regulatory frameworks and the manner in which the project would comply with those requirements are explained throughout this section of the MND. As explained in prior responses regarding groundwater concerns, the project includes measures to remediate existing groundwater contamination during construction, to provide ongoing monitoring of groundwater quality after the project is built and operational, and obligates the property owner to implement additional groundwater remediation efforts if future monitoring results indicate significant contamination levels that are migrating off site. Further, as previously stated, there are no groundwater production wells near the project site and the nearby portions of the groundwater aquifer are not currently producing drinking water. This comment has not identified any ways in which the project construction or developed conditions could generate contaminants that could result in water quality problems, despite compliance with the existing regulatory requirements.

65. *p.95, the City of Long Beach is concerned not only with operational impacts to groundwater after soil disturbance and oxygen injection, but also about construction-related water quality impacts. The MND does not provide sufficient analysis regarding water flows during construction. The*

possibility exists for water flows from contaminated soil stockpiles down into the Jenni Rivera Park as well as sheet flow into adjacent streets, sidewalks and storm drain systems. There is a particular risk of contamination if grading were to occur during a storm event, grading that will occur with no buffer to the park.

Response: Compliance with the existing provisions of the NPDES Construction General Permit (CGP) program, administered by the LARWQCB, is discussed on pages 95-96 of the MND. Through various construction control measures, potential construction-related water pollutants would be prevented from being contacted by or released into stormwater flows. The details of the project's compliance measures will be provided in a Stormwater Pollution Prevention Plan, prior to issuance of a grading permit. That plan will include various erosion and sediment controls and general housekeeping measures to prevent water contamination from construction activities, including stockpiles, active grading areas, materials and fuel storage areas, trash storage areas, etc. Stockpiles must be covered by plastic sheeting, as required by the proposed Soil Reuse Plan described in the Hazards section, and as specified in revised Mitigation Measure III-1, noted in the prior responses to comment 43 and 45. A standard aspect of a SWPPP is to ensure that construction site runoff does not affect surrounding properties. The SWPPP will clearly identify perimeter control measures to prevent runoff from the construction site to adjacent properties. This will protect the park from runoff potential pollutants in stormwater runoff during project construction activities This will protect the park from runoff during project construction activities.

66. *p. 97, the MND relies upon LID and future biofiltration planters to find that there will be no exceedance of water quality or discharge standards. This does not address the issue of construction. The text references the general construction permit from the LARWQCB but that alone (and the yet to be identified BMPs) is not sufficient due to the unique circumstance of this site containing toxic soils, which are planned to be stockpiled while tested and awaiting transport away for disposal. Due to differences in elevation, the potential exists for construction period water flows to directly discharge into Jenni Rivera Park. This impact however is ignored in the MND.*

Response: Refer to the preceding response.

67. *p. 98, the MND makes the erroneous claim that because the project site, in and of itself, is not a groundwater replenishment site that the change in impervious surfaces is less than significant. That is not how stormwater and groundwater management work on a systems basis. The ability of the aquifer to be recharged is based on the amount of impervious surface throughout the basin and the water quality of the water that does infiltrate back into the groundwater reservoir. Therefore, stormwater permitting focuses on limiting impervious surfaces. The combination of increased impervious surfaces (78% for the project) and the possibility of contaminating what water does infiltrate into the groundwater should be further evaluated. The MND lacks the quantifiable data to draw the conclusion made and a fair argument exists that impacts do in fact exist to water quality and groundwater standards. An arrangement of buildings that allowed for a wider southern buffer and use of impervious paving (the MND claims no large trucks will be using the site) could greatly reduce these impacts.*

Response: The MND determined that the developed site conditions would not have a significant effect on groundwater recharge because a) the site was not historically and is not presently managed for this purpose; b) groundwater resources beneath the project site that flow south and west are not supporting

any nearby groundwater production wells that are part of any drinking water supply, and c) the history of site contamination renders this site unsuitable for direct support of a groundwater recharge program, including infiltration from a stormwater system. Development of this project would thus have a minor and less than significant impact on groundwater supplies.

68. *p. 99, the MND fails to quantify the increase in peak flows into the stormwater system, only noting that it meets the 85th percentile storm event standard. This is incomplete analysis because portions of the stormwater system in this area are already at or near capacity, particularly during peak storm events. The MND notes this is exactly the condition that results in increased flow to the storm drain system. Large storm events are expected by the adopted science to increase both in frequency and severity. The MND concedes that on-site storage may overflow in a 50-year storm event and sheet flow into the storm drain system. It is likely that the storm drain system itself may overflow in this event, resulting in cascading flooding on the project site, adjacent streets and sheet flow into Jenni Rivera Park. This likely scenario is not modeled or analyzed in the MND resulting in incomplete analysis and a lack of factual basis for the water quality and flooding conclusions. These impacts could be reduced through increasing the impervious surfaces of the site and/or through storage and reuse water systems that would also reduce the water demand for on-site irrigation.*

Response: As stated on page 99 of the MND: "An analysis of pre-versus post development runoff conditions was prepared as part of the preliminary hydrology report for the project. That analysis determined that the peak flows would increase from the existing condition to the proposed condition, due to the increase of impervious area when compared to existing conditions. However, the proposed drainage improvements would provide more than enough storage due to water quality requirements to mitigate the increase in volume for the storm events. The proposed storage for water quality is a combined volume of 25,425 CF. This storage volume is greater than the net volume increase of 16,240 CF for the 85th percentile storm event (CA Engineering, 2019a). Runoff from the developed site would not exceed the capacity of the Walnut Avenue storm drain and the project's impact would be less than significant."

The comment speculates that under 50-year storm conditions, the project's drainage system might overflow and contribute to overflow conditions in the adjacent municipal storm drain system, which could then result in various flooding problems on and off the project site, including Jenni Rivera Park. This speculation is not supported by any data or analysis and thus is not considered to be a refutation of the analysis or conclusion presented in the MND. Further analysis of speculative storm event conditions and the interactions of storm flows from upstream properties, the street network and this project and whether any such combination of these sources of runoff could result in flooding within the park is beyond the scope of analysis for a CEQA document because no reliable findings could be made to support any specific conclusions for a range of hypothetical events. Even if there were to be some temporary flooding within Jenni Rivera Park during a severe rainstorm that is somehow related to runoff from the proposed project, that impact would be less than significant, since the park is an open space and recreation area that does not support habitable structures or any critical facilities such as a hospital, major energy or telecommunications facilities, etc. Moreover, during a severe storm, there would likely be no park visitors.

Land Use and Planning

69. *p. 101, the conclusions regarding land use consistency are contradicted by the lack of analysis or any meaningful consideration of alternatives. The proposed project is a change from the existing City of Signal Hill General Plan. It results in industrial employment in lieu of office employment, increased medium-duty truck trips, employment generating a need for lower-income housing, different impacts in VMT, places a non-TOD use in the location where the Circulation Element identifies potential for such uses (and TOD is necessary to meet GHG and RTP/SCS goals). The proposed project results in adverse impacts to Jenni Rivera Park and the disadvantaged residents that park serves. While the City of Signal Hill has not yet updated its General Plan to comply with SB 1000, the consideration of environmental justice is nevertheless required in planning decisions. These are all conflicts that require further analysis rather than a blanket No Impact conclusion supported by no evidence.*

Response: This comment raises several community planning issues that are outside of the scope of the significance threshold regarding consistency with the City's land use plans, policies or regulations that were adopted to avoid or mitigate an environmental effect. As stated on page 101 of the MND, there are no adopted plans, policies or regulations governing the land use of the project site that were established to protect or preserve an important natural resource that occurs within the site, to mitigate an existing environmental problem, or to prevent development in an area subject to environmental hazards. No such conditions or general plan policies exist on or adjacent to the project site. As such, the proposed general plan amendment for the eastern part of the site would not conflict with any such plans, policies or regulations. Consideration of the other issues raised in this comment is beyond the scope of this section of the MND. Please refer to the prior response to comment 35, concerning the development of this industrial park in an area identified in the City's Circulation Element as appropriate for transit oriented development (TOD).

70. *The project appears to be inconsistent with the following City of Signal Hill General Plan Land Use policies (no policy analysis or matrix is present in the MND):*

    - *Policy 3.3 - Ensure a sensitive transition between commercial or industrial uses and residential uses by means of such techniques as buffering, landscaping, and setbacks.*
    - *Policy 3.4 - Promote mixed-use development and ensure compatible integration of adjacent uses to minimize conflicts.*
    - *Policy 3.17 - Promote "smart growth" principles that encourage development that is economically viable, creates a sense of community, and preserves natural resources. Smart growth includes narrower streets, mixed uses, smaller setbacks, open spaces, habitat preserves and parks, infill development and compact commercial centers, and the reuse of brownfields.*
    - *Policy 3.18- Minimize the impacts of storm water runoff to the maximum extent practicable, on the biology, water quality and integrity of natural drainage systems and water bodies.*
    - *Policy 3.19 - Maximize to the extent practicable, the percentage of permeable surfaces to allow more percolation of storm water runoff into the ground.*

- *Policy 3.20- Minimize to the extent practicable, the amount of storm water directed to impermeable areas and to the municipal separate storm water system. Build storm water pollution prevention systems into all development projects including maximizing landscaped areas and providing areas for storm water storage and sedimentation.*
- *Policy 3.21 - Require new projects to include permanent controls to reduce storm water pollutant loads from development sites including parking lots to the maximum extent practicable.*
- *Policy 4.5 - Foster inter-governmental cooperation and coordination to maximize the effectiveness of land use policies.*
- *Policy 4.6 - Develop comprehensive local and regional rather than piecemeal planning solutions and promote long-range solutions to land use issues.*
- *Policy 4.7 - Strengthen the framework for effective regional and local planning efforts.*

Response: This comment offers no evidence that the project would be in conflict with any of the noted policies. Many of the listed policies are aimed at broad-based, community-scale programs that transcend the design and review of a single land use project, including Policies 3.4, 3.17, 3.18, 4.5, 4.6, and 4.7. As such, a discussion of those policies is not warranted. Since the other listed policies pertain to environmental considerations that can be addressed at the level of a single land use project, a discussion of the project's consistency with those policies is provided below.

Policy 3.3 - Ensure a sensitive transition between commercial or industrial uses and residential uses by means of such techniques as buffering, landscaping, and setbacks.

Project Consistency: A residential land use borders the northern edge of the project site, the 72-unit Zinnia Apartments complex, that lies at an elevation of several feet higher than the adjacent portion of the project sit. There are no other adjacent residential land uses. Within the adjacent portion of the apartments site is an approximately 4-feet wide landscape planter along the entire common boundary, with surface parking and driveway area, beyond the landscape planter. There are no habitable spaces or any outdoor recreation areas. This apartment project was planned, designed and developed within the last few years, with consideration that the project site is designated and zoned for Light Industrial uses. Within the adjacent part of the project site, Buildings 1A and 1B would be located near the northern boundary. Building 1A would be set back just under 4 feet from the northern boundary. Building 1B would be set back approximately 56 feet from the northern boundary. Roll-up doors for both buildings would be on the sides of the building, further from the northern boundary line and facing away from the apartments site toward each other. Vehicle parking and internal drives would be located between Building 1B and the northern boundary, with a retaining wall supporting a slope rising up to the level of the apartment site, where there is an existing retaining wall. Since there would be no outdoor activities except for passenger vehicle parking and movements, and no outdoor storage or business activity areas along the northern edge of the project site, the transition to the existing apartment site is considered to be acceptable.

Policy 3.19 - Maximize to the extent practicable, the percentage of permeable surfaces to allow more percolation of storm water runoff into the ground.

Project Consistency: While approximately 78% of the developed site would be covered by impermeable surfaces, the rest would be landscaped, which would allow for percolation of stormwater runoff into the ground in those areas. To meet the City's parking standards and provide for adequate vehicular circulation between buildings for passenger vehicles as well as light and medium duty trucks, fire engines and other emergency vehicles, those areas must be paved. Due to the extensive site contamination from past oil refinery operations, direct infiltration as a primary mechanism to handle storm runoff from the developed portions of the site is not feasible.

Policy 3.20- Minimize to the extent practicable, the amount of storm water directed to impermeable areas and to the municipal separate storm water system. Build storm water pollution prevention systems into all development projects including maximizing landscaped areas and providing areas for storm water storage and sedimentation.

Project Consistency: The project includes a Low Impact Development Plan (LID Plan) for stormwater drainage that is designed to comply with countywide and City standards for removing urban pollutants and providing detention of runoff during design year storms, prior to release of runoff into the municipal storm drain system. Sufficient storage would be provided within the site to handle more than the increase in runoff due to the developed site conditions.

Policy 3.21 - Require new projects to include permanent controls to reduce storm water pollutant loads from development sites including parking lots to the maximum extent practicable.

Project Consistency: The proposed LID Plan includes catch basin inlet filters, detention piping, and biofiltration chambers that would capture and treat runoff to remove urban pollutants flowing from the impermeable surfaces throughout the site, including parking lots, prior to release into the municipal storm drain system.

Noise

71. *p.110, Jenni Rivera Park is immediately adjacent to construction activities however Table Xlll-4 and the noise analysis the follows is based on exposure at 40-feet. The City of Long Beach is concerned that the cumulative impact of truck trips, air emissions, toxic soil exposure, and noise will render the park unusable for community members during construction. This is not a minor inconvenience when it means families not having access to a local park or place to exercise for a period of a year or more.*

Response: The 40 feet distance identified in Table XIII-4 corresponds to the distance to the nearest apartment building within the adjacent Zinnia apartment complex on the north side of the project, which is classified as a sensitive receptor because it is a permanent residential land use where people are on site many hours every day, and usually overnight. Jenni River Park is along the southern edge of the project site; therefore, construction noise levels from the project site might occasionally be higher than at the Zinnia Apartments, but not to a significant degree, since the pathway in the park is approximately 20 feet away from the project's southern boundary. That pathway is separated from the project site by an existing block wall topped by a slatted chain link fence that rests approximately 17 feet from the project site boundary (see Attachment A).

The people who use the pathway in the park for walking, jogging or biking are present for minutes at a time, not overnight, and on an intermittent basis. There are no picnic or other activity areas in the

adjacent park area where people might congregate for extended periods of time. Given these circumstances, park visitors would be exposed to construction noise for brief time periods, at different times of the day, and thus exposed to differing construction noise levels, depending on what type of construction activity is occurring on a given day/time along the southern edge. Peak construction noise levels would occur along the edge that borders the park for temporary periods of the construction program, not for the entire construction program, and likely for days at most, since the work progresses across the site, rather than staying in only one area for the whole construction phase. Given these factors, the temporary and intermittent construction noise impacts within the adjacent segment of Jenni Rivera Park may be regarded as nuisances by park visitors but would not be classified as a significant noise impact. Project construction would not physically interfere with any aspect of the park; therefore, park access would remain available throughout the entire period of construction.

Refer to prior responses to comments regarding impacts to the park during construction, under the topics of Air Quality and Hazards.

72. *p. 111, the MND incorrectly identifies the closest sensitive receptor as the Zinnia apartments at 40-feet to the north. Jenni Rivera Park is adjacent during construction and 10-feet in distance during operations. The failure to identify this sensitive receptor taints the entire noise analysis.*

Response: The meandering pathway within the park that provides the primary recreational opportunity in that adjacent part of the park, is located approximately 17 feet from the southern boundary of the project site and there is an existing block wall topped by a slatted chain link fence (see Attachment A). The analysis of construction noise impacts is mostly generic in nature and does not make conclusions based on any specific distance between a sensitive receptor and active construction work. The MND discussion notes that there could be high noise levels from time to time that would affect neighboring land uses, which includes the park. There are no numeric thresholds in the City's Municipal Code or other regulatory standards to determine what is a significant level of construction noise for any period of time at adjacent land uses. Like many local government agencies throughout California, Signal Hill regulates construction noise by restricting the allowable days and hours of construction to daylight time periods on weekdays and Saturdays. Mandatory compliance with these restrictions is regarded as sufficient to avoid significant construction noise impacts. Nonetheless, Mitigation Measure XIII-1 requires equipping all construction equipment with properly operating and maintained mufflers; locating stationary construction equipment so that emitted noise is directed away from the nearest noise-sensitive receptors; locating equipment staging in areas farthest away from sensitive receptor; and limiting haul truck deliveries to the same hours specified for construction equipment (between the hours of 7:00 a.m. to 6:00 p.m. on weekdays only). Compliance with Mitigation Measure XIII-1 would reduce construction noise impacts at nearby sensitive receptors to ensure normal residential and park activities are not interfered with.

73. *The City is concerned in addition to direct impacts, that because the park is not identified in the MND as a sensitive receptor that instructions to direct noise away from sensitive receptors to the north may actually cause equipment and noise to be aimed at the park and its users.*

Response: Please refer to the response to the Global Comments at the beginning, where it is explained why Jenni Rivera Park was not classified as a sensitive receptor in the MND (does not meet the SCAQMD definition of that term). The City will apply the same construction control measures to minimize noise impacts at nearest residential land uses and at the park.

74. *The MND does acknowledge that traffic will increase on adjacent streets as a result of the project. In fact, traffic on Walnut Street will increase by 45% according to the MND. This is not imperceptible to a pedestrian. It is not imperceptible to users of Jenni Rivera park who will be subject not only to increased traffic levels and noise but the close proximity of one of the project ingress points. The MND relies on the Highway Traffic Noise Analysis and Abatement Policy and Guidance to reach this conclusion. That guidance is not relevant to the unique circumstances of this project. The perception of a pedestrian not only of noise but of their safety during a walk to a park, after such a dramatic increase in traffic including truck traffic, cannot simply be ignored because traffic does not double.*

Response: This comment represents an alternative way in which to assess the significance of the project-related increases in roadway traffic noise. This qualitative method has not been applied to other projects and is not recognized as an 'industry standard' in the assessment of roadway noise impacts under federal, state or local regulatory or planning standards. As noted in the MND on page 111, the threshold of human perception of audible changes in the environment, for people of normal hearing capability, is 3 dBA, and a doubling of traffic volumes is required to produce that level of change. Except for traffic along Walnut, south of Hill Street, the project's added traffic would not result in a doubling of traffic volumes. South of Hill, traffic volumes during the afternoon peak hour would increase from 18 to 50, more than a doubling. These volumes are relatively low and roadway noise levels would remain under 50 dBA, which is well below a residential noise compatibility level of 60 dBA. Pedestrians would experience traffic noise for short durations as they walk, rather than a continuous exposure to such noise by adjacent land uses. The individual pedestrian perceptions of and reactions to changes in traffic noise along the adjacent segment of Walnut Avenue cannot be predicted and to speculate on that for the purpose of the MND would be unreasonable and is not warranted.

75. *p. 112-113, the MND goes on to acknowledge that the project includes slow-moving trucks (despite the MND in other sections downplaying the role of trucks in the proposed development) as well as parking areas as sources of noise. All of these sources are located within 10-feet of Jenni Rivera Park. The impacts however are dismissed based on the fact that they would be intermittent and are compatible with industrial uses to the west of the site. The park, to the south, however, is not industrial in nature and a short or intermittent noise irritant is significant to a family's enjoyment of the park.*

Response: The nearest proposed building to the park is Building 1E, which would have two roll-up doors for occasional truck deliveries/pick-ups and 11 passenger vehicle parking spaces. As such, there would be minor noise from truck and passenger vehicles idling and movements that would occur intermittently and for seconds or perhaps a few minutes at a time. This would not result in a significant noise impact within the park. Traffic from the proposed project, including light and medium-duty trucks would pass by the east edge of Jenni Rivera Park on Walnut Avenue on an intermittent basis on any given day, with concentrations during the morning and afternoon peak periods. People who visit the park would not typically remain at the east edge for an extended period of time, since that is an entrance/exit to the park with no activity areas where people would gather or otherwise remain in place. The impact of roadway traffic noise at the park, therefore, would be less than significant.

76. *The analysis for mechanical equipment, slow-moving trucks and parking areas is all based on a distance of 40-feet, this is wrong for the park (10-feet) as well as the Zinnia apartments (40-feet).*

Response: The analyses of impact of regularly occurring noise sources at the developed, fully functional site were focused on the nearest homes, which would be permanently exposed to these sources for extended periods of time for people who are at home during the business hours. Noise from mechanical equipment, slow moving trucks and parking lots would be irregular, intermittent and of short duration and would not result in exceptionally high noise levels that would result in significant noise impacts at the nearest residential use, the Zinnia apartments to the north. Exposure to these same noise sources from park visitors would occur for much shorter durations and would not significantly affect typical walking, jogging or bicycling activities within the park.

77. *Mitigation Measure XXIII-1 fails to actually reduce noise in a quantifiable fashion. The mitigation measure requires mufflers without any performance criteria for how effective "properly functioning" is, a complaint sign and hotline which only resolves transgressions not noise impact as a result of the project design, a requirement to place equipment aiming noise away from sensitive receptors (if pointed away from residences to the north this results in increased impacts to the park in the south which the study fails to identify as a sensitive receptor), and then a limit on haul hours to 7:00a.m. to 6:00p.m. assuring that hauling will occur during the use hours for the park.*

Response: This mitigation measure would provide ways to reduce the effects of construction noise at surrounding land uses so that potential impacts are reduced. This measure is not required to avoid a significant impact, since all construction must occur within the daily and hourly restrictions imposed by the Signal Hill Municipal Code, which is considered to be sufficient to control construction noise to an acceptable level. As noted in the prior response to comment 73, the City of Signal Hill recognizes the sensitivity of the park and will apply the same control measures to limit impacts to the park as will be applied to protect neighboring residential land uses.

Population and Housing

78. *p. 116, the conclusion of No Impact for unplanned growth is not supported by evidence. The proposal involves a General Plan amendment, it will result in employment growth both different from the existing conditions {the CEQA baseline) and from what would have occurred under the City of Signal Hill General Plan (which the RTP/SCS is modeled from}. The MND offers no analysis of the wages and resulting housing needs of these future workers and their likely commuting distance. It ties the employment to parking spaces, without a study or substantial evidence to support that conclusion. The MND or a future EIR could tie square footage to employment generation numbers as a more analytically sound approach. The document also states that there will be no impact on infrastructure, however the water quality section already noted that flows into the stormwater system will increase but fails to provide full existing conditions information regarding the stormwater main and system. The conclusion that new infrastructure will not be required, especially when it is noted flooding will occur during 5O-year storm events, is not supported by the evidence in the MND.*

Response: It is acknowledged that this project includes unplanned industrial development instead of planned commercial office development, but that is not regarded as “substantial unplanned growth”, since both types of land uses generate an employment population. All long-term impacts related to the growth in employment at the project site were evaluated in the MND, i.e., increased traffic, increased air

pollutant and greenhouse gas emissions, increased energy consumption, increased noise on and off-site, effects on public services and utilities, and contribution to cumulative impacts.

The increased local employment resulting from this project would have no effect on local municipal infrastructure facilities. The proposed site improvements include a comprehensive set of storm drainage and water quality mechanisms that would provide filtration of site runoff and detention in underground chambers, prior to release to the City's storm drain system. With the proposed site improvements, existing ponding problems on-site that occur during rainstorms would be alleviated, and the proposed water quality treatment/detention facilities would be sized to store more than the amount of runoff anticipated in the applicable design-year storm. The proposed storm drainage and water quality treatment facilities are described on pages 98-99 in the MND and further details are presented in the Low Impact Development Plan included as Appendix F of the MND that was provided for review by the City of Long Beach.

No significant environmental impacts associated with the project's growth have been identified. Nonetheless, the conclusion for this threshold has been changed from No Impact to Less Than Significant Impact, since the project would result in some unplanned growth of industrial land uses and related type of jobs. Other issues not involving environmental impacts, such as wages and housing needs, are outside of the scope of the MND.

Public Service Impacts

79. *p. 117-120, egregiously the MND concludes that there will be no impacts to parks as a result of the proposed project. As been demonstrated in these comments the project will result in substantial impacts to Jenni Rivera Park both during construction and operations. The diminution of an existing park is an impact just as adding users to the park system would be. This issue should be more fully analyzed in an EIR.*

Response: This section of the MND addresses impacts to public services, in terms of effects on service standards and whether the project's effects would trigger construction of new facilities. As discussed in the noted pages of the MND, this light industrial development project would not generate a residential population that would increase demand for public parks and would not affect the ratio of parkland to residents, the primary standard for evaluating whether a project could adversely affect the parkland resources in a particular community. The project would not result in a need to expand any public parks, thus there would be no impact relative to this threshold. Impacts to Jenni Rivera park have been mentioned in numerous prior comments. Please refer to the responses to those prior comments. No new information or analysis has been offered in any of these comments to demonstrate there is a serious flaw or inadequacy in the MND assessment of the project's impacts to the park.

Transportation and Traffic

80. *p. 121, the MND fails to fully analyze construction traffic, including the 5-6 months where haul trucks carrying toxic soils will be routed along the Jenni Rivera Park entrance and Long Beach streets. Due to the existing conditions along this haul route, a more detailed analysis should be provided to model the impact on residents including pedestrians during this period. We note that the proposed haul route exits the site, routes along the park entrance and then through the City*

of Long Beach to 1-405. It is not clear why shorter routes, such as use of Hill to Cherry were not considered. The environmental justice impacts of the chosen haul route should be more carefully evaluated.

Response: The proposed haul route was selected to provide access along the closest designated truck routes and arterial roads to I-405 Freeway, since most, if not all, truck trips would need to travel to/from the site via that regional route. The nearest major streets in Signal Hill, i.e., Walnut and Orange Avenues, are not designated truck routes and could not be used for heavy truck trips during the project's construction phases. Hill and Cherry was considered but rejected due to the proximity of the Signal Hill Elementary School and potential safety issues with elementary school aged children and pedestrian conflicts. Additionally, the steep grades on Hill and Cherry Avenue are a potential safety issue with heavy equipment as well as increased emissions due to trucks requiring lower gears to climb the grade.

81. *p. 137, the MND notes that there are no existing or planned bike lanes within the project or its adjacent streets. The MND however takes credit for consistency with RTP/SCS policies on active transportation and find consistency with GHG reduction plans that rely on reducing VMT. It does note that the project may result in increased bicycle travel along Orange Avenue. The City of long Beach is in the process of installing protected bike lanes along Orange Avenue. The City of Signal Hill has raised concerns regarding this active transportation project, does not intend to provide protected bike lanes on their jurisdictional portion of Orange Avenue and is objecting to land-use approvals for an industrial project in Long Beach's jurisdiction that includes the associated bike facilities. A more advisable approach would be to support sufficient bike facilities for this proposed project and throughout the shared region across the two jurisdictions.*

Response: The referenced discussion concerning bike lanes on surrounding streets notes that the proposed project would not impede, obstruct or otherwise alter the configuration of planned bike lanes along Orange Avenue or through Jenni Rivera Park. This comment does not address the adequacy of the MND; therefore, no response is required.

82. *The pedestrian analysis focuses on trails and pathways rather than actual pedestrian movement. Many pedestrians walk or bike to Jenni Rivera Park and their ability to do so will be impacted during the construction of this project. The MND simply defers this analysis to a future traffic control plan that will, according to the text, address elementary school students going to school but not to the park. The conclusion of no impact is not supportable because the analysis is incomplete.*

Response: The project would not physically obstruct pedestrian or bicycle access to Jenni Rivera Park during construction or when the project is fully built and operational. All construction activities would occur within the project site and pedestrian or bicycle access to the park from Walnut Avenue and 20th Street would not be displaced. Construction traffic along Walnut Avenue would pass by the Walnut Avenue entrance to the park and this traffic would be stopped from time to time at the park entrance at Walnut/20th where there is a traffic signal. This signal provides dedicated pedestrian crossing cycles, which would maintain access to the park entrance as it does now. Nonetheless, the construction traffic control plan noted in the MND will address the intersection of Walnut Avenue and 20th Street, to ensure there are no dangerous conditions involving conflicts between construction traffic, pedestrians and bicyclists.

83. *p. 138, it is unfortunate that the analysis does not provide VMT information. This information would be valuable to evaluating the true impacts of the project, understanding the implication of the General Plan Amendment compared to alternative and what the true GHG consequences of the project are. Long Beach and other jurisdictions are providing both VMT and LOS information in environmental documents during the transition period to VMT and VMT guidance from OPR was available to Signal Hill and the MND preparers.*

Response: This comment is noted. As stated in the MND, at the time this document was prepared and circulated for public review and comment, the City of Signal Hill had not adopted local VMT analysis criteria and was not yet obligated to do so under the provisions of SB 743.

Utilities and Service Systems

84. *p. 143, the MND's conclusions on water supply appear to be without any supporting substantial evidence. The City of Signal Hill does not have an adopted UWMP. The MND does not include any quantification of existing water supply, it does not appear to even reference a will-serve letter. The text erroneously relies upon the assertion that office uses are often more employee-intensive than small-scale industrial uses. No study or labor statistics support this conclusion but regardless the analytic question is water demand, use and supply not the number of employees. Industrial processes, particularly in light manufacturing, often involve the heavy use of water either as an input into process (such as for a bakery) or to cool or service equipment. The estimated water demand does not account for any industrial use of water but rather just restrooms and irrigation. The water demand is not compared to supply. Even a small increase in demand would be significant against the environmental baseline (vacant, no use) and a limited supply.*

Response: As explained in the MND, the City is in the process of preparing an Urban Water Management Plan (UWMP), since the total number of local water service connections only recently reached 3,000, which triggers a requirement to prepare an UWMP.

Employment density research conducted for the CalEEMod software program used to calculate emissions from various types of land uses applies a factor of 924 square feet of building space per employee of light manufacturing land uses,[5] which is considered to be applicable to the proposed project. A similar factor for general office uses was not found; however, in a Commercial Nexus Study prepared for the City of Santa Monica in 2013, the research identified a generalized office employment density factor of 471 square feet of building space per employee.[6] While this research is not exhaustive and there are many variances between types of light manufacturing and office uses that affect employment densities, these figures are considered to be adequate for comparison purposes. Given these figures, employment densities for offices are generally twice as high as for light manufacturing uses. This would translate into twice as much daily water demand for "end uses" such as restroom plumbing and possibly other interior fixtures involving sinks and drains. Light industrial projects may also include tenants that have processes

[5] California Emissions Estimate Model (CalEEMod), Appendix E, Technical Source Documentation. July 2016.
[6] Rosenow Spevacek Group, Inc. Commercial (Non-Residential) Nexus Study and Linkage Fee Analysis, for City of Santa Monica. June 2013.

that require water, which would increase the water demand for those spaces. For generalized comparison purposes, water use factors that are included in the CalEEMod program indicate that light industrial uses (encompassing all types of such uses), require roughly 213,250 gallons per 1,000 square feet per year.[7] The average water demand for general office uses identified in the CalEEMod research is 177,734 gallons/1,000 sf/year.[8] Based on these factors, the project's eastern site development would consume a higher amount of water on an annual basis than a comparably sized office use.

There is too much variability in potential tenant types and water needs to estimate potential water demand for the proposed project, since this is being built to attract as yet unknown businesses and the ultimate interior improvements and water demands cannot be quantified. The City of Signal Hill Public Works Department has reviewed this project and determined that the additional water demand it would require can be provided through the City's existing water supply resources, which are stable and sufficient to support modest growth over the next several years. As such, the project would not require acquisition of new water supplies or entitlements thereto and would not have a significant impact on the City's water supply resources.

Conclusions:

- These comments are preliminary in nature and the City may provide additional comments at any time.
- We encourage the City of Signal Hill and applicant to meet with Long Beach Department of Parks, Recreation and Marine as well as Development Services to resolve the concerns outlined in this correspondence.

Response: These final comments are noted. Planning staff of the City of Signal Hill and the City of Long Beach met on April 15, 2020 to discuss City of Long Beach concerns and agreed to maintain communications regarding this project and other issues of joint interest.

Re: 2020 Walnut Industrial Park MND

Ms. Doan,

This letter expresses the City of Long Beach's serious concerns with the 2020 Walnut Industrial Park and the inadequate environmental study prepared to support it. The City of Long Beach's primary concerns involve a lack of adequate buffer or setback from Long Beach's Jenni Rivera Park, construction and operational impacts to that park and the community it serves. The City is also concerned regarding the project's haul route which also runs adjacent to Jenni Rivera Park and then through Long Beach communities.

Jenni Rivera Park is a small linear park that serves the recreation needs of Central Long Beach families. Unlike larger sports fields, it provides a walking a cycling path, places to sit, and a playground for children age 5 to 12. Unlike larger sports fields in the area, Jenni Rivera is a place for family quiet, relaxation and enjoyment. It serves a diverse set of neighborhoods, including some of the most disadvantaged in California according to CalEnviro Score.

Despite the importance of Jenni Rivera Park, the proposed industrial park project includes only a ten-foot setback from the park and grading activities will extend to the property-line of the park. Considering the large development site, we ask that a more considerate design alternative be developed and considered. The project site contains toxic soil contaminates and the new use will introduce trucks immediately proximate to the park. These issues deserve more careful consideration than they are given in the current Mitigated Negative Declaration.

Should you have any questions regarding this matter please reach out to Christopher Koontz, Planning Bureau Manager at (562) 570-6288 or Christopher.Koontz@longbeach.gov.

Thank you,

Linda F. Tatum

Enclosures: MND Technical Analysis

Cc: Department of Toxic Substance Control
South Coast Air Quality Management District Los
Angeles Regional Water Quality Control Board

Mitigated Negative Declaration Technical Analysis

Global comments:

- The proposed industrial buildings are located only 10-feet from the Jenni Rivera Park. 1
- Jenni Rivera Park serves disadvantaged residents of central Long Beach. The City is concerned about both construction-related and operational impacts on the park. These are understated or ignored in the MND. 2
- The MND is not appropriate because a fair argument exists that the project will impact Recreation through diminishing access to and quality of recreation at the park. There are also potential health impacts to visitors to the park, who were erroneously not identified as sensitive receptors despite the propensity of children and the elderly to visit parks. The park walkway is adjacent to the project site and grading is proposed to the property line. 3
- Despite the large site, the access and buildings have been located inappropriately proximate to the park and unnecessary impacts will occur as a result. 4
- Receipt of the CEQA notice was the first information the Department of Development Services and the Department of Parks, Recreation and Marin had regarding the proposed project. 5
- The adjacent census tract, 573300 has a CalEnviro Score of 90-95, among the 10% most disadvantaged in California. This census tract's neighborhood park will be impacted by this project and this census tract will bear the brunt of construction emissions from the project. This is inconsistent with California guidance on environmental justice. 6
- Most surrounding census tracts in Long Beach are also disadvantaged according to CalEnviro Score. 7

Section specific comments:

Project Description

- p.4, construction is estimated at 18-19 months representing a major impact on Jenni Rivera park which is not adequately addressed in the MND. 8
- p.5, the General Plan and Zone Changes from office to industrial are not correctly analyzed in the MND. This change has implications not just to the number of jobs but the wages of jobs and related need for housing. Lower wage jobs will result in housing needs that are not currently being met by Signal Hill nor Long Beach. The VMT and trip length between industrial and officer users is also different as is the vehicle mix, yet the MND seems to simply dismiss this issue as less than significant. The MND also fails to consider if once the General Plan is considered for amendment, what other options might exist. For example, less polluted portions of the site could be further remediated for housing or more intensive development could occur on portions of the site and then a greater buffer could be provided between the park and the proposed development. A full EIR would better provide this type of alternatives analysis that is appropriate in this case. 9
- Figure 4, we note that the Site Plan intentionally sandwiches building 1E adjacent to Jenni Rivera Park including vehicle parking facing into the park and a setback of only ten-feet from the building to the park. There is unnecessary vehicle circulation between buildings 1C and 1D as well as other opportunities to move the development north and provide a more-appropriate buffer from the park. 10
- Figure 8, the MND provides one limited view of Jenni Rivera Park but fails to provide any view simulation of the impact of the project from within the park and for pedestrians walking to and from the park. Without this necessary information there is not correct context for the project description, furthermore the aesthetic analysis is not complete or valid. 11

Aesthetic Impacts

- p.25, view impact analysis focuses on the view of Signal Hill peak, however, to surrounding community members, the views into and from Jenni Rivera park are significant and this project will substantially degrade those views. 12
- p.27, the MND discloses that the project will be setback only ten-feet from Jenni Rivera Park however concludes that sufficient buffer exists between the park and the project. This is not supported by substantial evidence. In fact, the buffer between the development and other sensitive receptors is more substantial but the park is ignored. The MND does not contain factual information regarding the shading impacts, or other impacts, from new buildings, but also trees, trucks and other new source of impacts onto Jenni Rivera Park. Information on tree size and growth period, is not provided. 13
- p.28, the MND concludes that vehicle and building lights will not be significant. However, this analysis does not consider the fact the site plan shows truck and car parking ten-feet from Jenni Rivera Park. It does not consider the change in ambiance and nighttime or sunset look for park visitors, both human and animal. New sources of nighttime light have a direct impact on birds and other wildlife. 14

Air Quality Impacts:

- p.32-33, the MND concludes that the proposed project is consistent with the AQMP but that is flawed analysis. The AQMP is based on all the various jurisdictions within the AQMD basin's General Plan, combined into the RTP/SCS and then with air quality conformity determined by AQMD, rolled into the SIP by CARB and ultimately certified by USEPA. The proposed project however is not consistent with the City of Signal Hall General Plan. It involves a General Plan Amendment from Commercial to Industrial. Regardless of whether the density of jobs is similar, the impacts of Industrial is more intensive, from an air quality standpoint, than Commercial uses. Medium duty trucks are more likely than passenger vehicles to run on diesel with associated NOx impacts, important to the fact the region is out of compliance for ozone pre-cursors and the AQMP is the mechanism for bringing the region into conformity. The MND attempts to explain away any impacts from the General Plan Amendment but does not provide relevant data to show that the increased volume of trucks, longer VMT due to deliveries and longer commutes for low-income workers, and associated criteria-pollutant and health impacts, are similar or insignificant. The AQMP was found in conformity without any room for error and even minor deviations may be significant from an air quality standpoint. 15
- p.36, while the MND references Appendix B, the text does not provide sufficient information regarding energy utilization and how that relates to overall City actions to reduce energy use and emissions. The requirement under Ukiah is not just to burry this information into an appendix but to actively consider this information and factor it into the decision-making process, including a complete discussion within the MND or EIR which is missing in this case. 16
- p.36-37, the MND conducts a completely inadequate analysis of construction impacts. The construction is immediately adjacent to Jenni Rivera Park and the haul route is along the park boundary and through central Long Beach communities with already elevated rates of air pollution, high poverty and other environmental justice indicators. The MND however does not even discuss the impact of construction on the park or these residents, it does not consider the human health impacts of construction related NOx and particulate emissions on elderly and youth visitors to the park. 17
- p.37, to reduce NOx emissions the MND notes Mitigation Measure III-1 to limit daily grading activities. This mitigation in and of itself has impacts. The lengthening of construction means a longer period that the park will not be enjoyable or fully useable by area residents. It also increases the number of days that residents will hear, see, and be exposed to truck related traffic for project construction. None of these impacts of the mitigation measure itself are addressed in the MND. 18
- p.39, the thresholds used to evaluate operation impacts are not appropriate due to the proximity of sensitive receptors, only ten-feet away at Jenni Rivera Park. In the context of that close proximity, the fact that park visitors skew either elderly of very young, and the already elevated pollutant levels in the area, the NOx levels are particularly concerning. 19

- p.40, the lack of consideration of impacts on the park and park visitors is compounded by the fact the MND does not comply with Fryman. While the City of Long Beach agrees that it is not possible to precisely quantify every health impact, the MND fails to even provide a general overview of health impacts. It fails to consider health impacts on visitors to Jenni Rivera Park and residents of Long Beach exposed to construction traffic from the project. The technical studies on which the analysis is based failed to identify Jenni Rivera Park as a sensitive receptor which then results in flawed analysis flowing from those reports. 20
- p.41-43, the MND fails to identify Jenni Rivera Park as a sensitive receptor despite the park meeting the definition in the MND of "groups of individuals as the most likely to be affected by air pollution: the elderly over 65, children under 14, athletes, and persons with cardiovascular and chronic diseases such as asthma, emphysema, and bronchitis." The park is open to all, but the preponderance of visitors are young children with their parents as well as elderly visitors, it includes a walking path (immediately adjacent to the inadequate proposed project "buffer") that may be used by athletes and others exercising, and the CalEnviro Score information shows very high levels of asthma in the adjacent census tract. 21
- The LST discussion notes the nearest sensitive receptors are 40-feet away and a 25-meter standard is used. This is incorrect. Construction will occur immediately adjacent, within a foot, of Jenni Rivera Park and its sensitive receptors. The correct standard should be direct exposure, as is used to help determine the safety of construction workers. At 40-meters the potential exposure of both NOx and PM10 is near the threshold. Considering the impact of PM10 on those with asthma and general health impacts of NOx and PM10 on the population, the MND seems to ignore a critical impact of the proposed project. 22
- The MND also fails to consider the park regarding odors. While vehicle emissions from cars and medium duty trucks may be less than significant at even forty-meters, those emissions will be adjacent during construction and within ten-feet during operations. The project driveway located proximate to the park combined with trucks and cars facing directly into the park in such close proximity, and the limited building setback are all likely to lead to annoyance at best but more likely emissions and impacts to park visitors. This impact is not sufficiently evaluated in the MND. 23
- The CO hotspot discussion and overall climate impacts to the Air Quality analysis fail to account for an increase in extreme heat event days expected to occur under Global Climate Change. (see State of California Climate Change Assessment http://climateassessment.ca.gov/) This increase is noted in the climate science and recognized by CARB. The proposed project increases impervious surfaces and combined with more heat, elevated pollutant levels in the area, emissions from medium-duty trucks and the close proximity of sensitive receptors, a more detailed CO hotspot and overall air quality analysis including dispersion modeling is needed. 24
- p.44, the MND also dismisses construction related impacts as short term in nature and thus insignificant. Noise and pollution that make your neighborhood park inaccessible or unattractive for more than a year are not insignificant impacts. This acute and specific impact is not evaluated sufficiently anywhere in the MND. 25
- p.51, the energy analysis within the MND fails to provide actual meaningful impact analysis. The data fails to compare the proposed project's energy consumption to what a project without a General Plan Amendment would yield, it fails to consider other impacts, it provides no information on where the overall City of Signal Hill stands in terms of energy and greenhouse gas reductions required by 2030 and 2050 under AB32 and various executive orders and CARB regulations. Lastly, it relies on the small project proportion analytical trick that has been disallowed in CEQA practice. The MND notes that the increase of this project is 0.0026 percent of County typical electrical usage and a 0.0009 percent increase over Los Angeles County's typical natural gas consumption. This provide no information on whether, for its size and use, the proposed project is efficient or inefficient in terms of energy. That is the entire purpose of the Ukiah and Appendix F analysis that is required. Under the percentage test, all projects would be insignificant so long as they were developed on small to medium sites and a significant and wasteful increase in energy usage would never be fully analyzed. This approach is flawed and should be revised. 26
- p.52, considering the likely impacts on sensitive receptors as discussed in our comments above, the analysis should have considered mitigation requiring all Tier IV construction equipment and trucks with use of a third-party mitigation monitor to assure that all construction equipment is operating in the cleanest possible fashion. 27

- The fuel consumption analysis again relies on an illusionary declarative statement that is will not be wasteful compared to similar developments in the region. Insufficient data is provided and regardless the analytical link that is required is whether this project, compared to other potential uses of the site, and compared to the City of Signal Hill's overall progress or lack thereof in energy use, is significant in relation to mandates and goals. 28
- The compliance with Title 24, is a statewide requirement and not a mitigation or distinguishing factor. As described above the percentage analysis compared to county totals does not provide the meaningful analysis required under CEQA. 29
- The MND concludes that the project would not conflict with energy or energy efficiency plans based on Title 24 and CALGreen with no relation to overall energy consequences of the proposed land uses, or status of VMT and energy reductions in the City of Signal Hill. A fuller analysis should be conducted and measures beyond Title 24 such as required solar installation, use of clean construction and operational trucks should be considered and imposed. 30
- p.67, the MND provides only project related GHG emissions with no thresholds and no analysis of where the City stands within its obligations to reduce GHG. This analysis is critical to understanding how this project fits into overall progress or lack thereof in meeting GHG targets. The MND provides no inventory, history or projections of GHG levels in the City of Signal Hill. 31
- p.68, the total project emissions are approximately 60.8% of the AQMD threshold for industrial facilities. As the project does not include mandatory energy-reduction features such as rooftop solar and there is no inventory or analysis of overall GHG reduction status in the City of Signal Hill, it is likely that this project combined with any other project in Signal Hill, may result in a cumulatively significant new source of GHG emissions over 10,000 MTCO2 equivalent. 32
- p.70, the MND finds conformity with CALGreen and notes the project as less than significant in terms of GHG because it will comply with the minimum 5% tenant bike parking. This is insufficient to support the significance finding. The project does not include bike facilities such as bike repair or "bike kitchen" facilities, employee showers or other measures that are likely to include bicycle usage, the project does not include street improvements to improve bicycle commuting. Rather the project introduces hazards and impacts that are unlikely to result in substantial active transportation use and potential impacts to meeting GHG targets. 33
- p.71-72, the MND also finds the project consistent with the Mobile Source Strategy despite the fact the project includes no requirement for clean construction or operational trucks, and the 10 EV charging spaces represent a very small portion of the overall parking supply, insufficient to meet CARB goals for EVs in the overall vehicle mix necessary to meet GHG goals. 34
- The MND also finds the project consistent with SB375 despite the fact no context is given for emission in Signal Hill overall and how the GHG profile of this project would compare to other land uses including the land use in the existing Signal Hill General Plan. The RTP/SCS was based on that adopted General Plan not the proposed amendments. The MND also provides no VMT information for the project yet states "the project would also reduce VMT as a result of its urban infill location, with access to public transportation within a quarter-mile of the project site and its proximity to other destination including off-site residential, restaurants, and retail." This conclusion is not supported by evidence and is contradicted by other sections of the MND. The traffic analysis section notes that transit use to access the site is unlikely and transit ridership will be minimal and unaffected by the project. The traffic section clearly states that the project is not TOD in nature, contradicting this SB375 conclusion in the GHG section. The project area is a potential TOD in the City of Signal Hill Circulation Element, but this project will leave that site, one of limited TOD sites in Signal Hill unavailable for transit supportive and VMT reducing development. No analysis is provided in the MND to resolve these inconsistencies. 35
- p.73, the MND fails to provide analysis of how the project, which requires a General Plan Amendment and will result in additional truck trips and potentially increased VMT in comparison to the existing General Plan the 2016-2040 RTP/SCS is based on. The MND finds the project consistent with RTP policies on neighborhood mobility and complete communities even though the project is not TOD in nature and actually precludes TOD on a site identified for such in the Signal Hill General Plan Circulation Element (on which the RTP/SCS is based). It is found that TDM 36

does not apply to the project when in fact TDM requirements on the project would reduce emissions and impacts but is not imposed. It also finds mere code compliance as sufficient for promoting zero-emissions vehicles with no requirements to exceed those baseline standards and no incentives for that charging infrastructure to actually be used. Code compliance is not "promotion" within the common dictionary-defined use of that word. 36

- The MND does not provide an analysis of the inconsistencies between the project, its chosen haul route and impacts to Jenni Rivera Park and the Environmental Justice policies in the RTP/SCS. The MND does not resolve the conflict between the RTP/SCS assumption that each jurisdiction will prepare GHG reduction strategies and the fact that no measures are included in this project and no overview of Signal Hill's emissions are quantified. 37
- p.74, the GHG conclusions are not based on substantial evidence and in fact, based on our comments proceeding, a fair argument exists that impacts to GHG are in fact potentially significant. 38

Hazards and Hazardous Materials:

- The MND hazards section relies upon technical reports that fail to identify Jenni Rivera Park as a sensitive receptor. Those reports found that construction workers were potentially impacted from construction, yet the park is adjacent and more likely to have very young or very old visitors and those with asthma that will be under increased risk should hazardous substances be released during construction. 39
- p.75, while the 55-gallon threshold may normally be acceptable for further regulation of hazardous materials, it may not be appropriate for this project. This is due to the fact that the project site plan provides on a ten-foot setback form Jeni Rivera Park and trucks delivering hazardous materials are immediately adjacent to the park. We note that the project is designed to consist of multiple small businesses, potentially each containing less 55-gallons of hazardous materials but creating risk on a campus-wide basis. 40
- p.76, the MND fails to consider the risk of businesses and delivery trucks dumping hazardous trash within adjacent Jenni Rivera Park. This represents a significant risk to the health of park visitors. 41
- The 2012 ToxStrategies report on which the Hazardous section relies failed to identify Jenni Rivera Park and its visitors as a sensitive receptor. This error is compounded in subsequent reports and flaws the overall MND analysis. 42
- p.81, the HHRA (Mearns 2018) is not sufficient to understand the human health risk of construction. It again fails to provide analysis of what soil disturbance, temporary piles and active extraction activities will have on Jenni Rivera Park. These risks must be layered atop the criteria pollutants released in construction in order to understand and evaluate the overall human health impacts of the proposed project. 43
- p.82, the LARWQCB analysis was based on three to four months of grading but that may be inconsistent with the mitigation-imposed limit on hours of grading per day. The City of Long Beach is concerned that extended grading will expose park visitors and other nearby residents to inhalation of small particles from temporary piles, impacts from construction equipment and impacts from haul trips exporting soil for treatment and disposal. 44
- p.83, the MND fails to provide criteria or contingency plan for what will occur if soils contain larger amounts of pollutants than are anticipated resulting in the need to both export and import additional soils. These potential additional haul trips are not acknowledged in the MND. 45
- p.84, the MND notes that toxic vapors may enter buildings via utility corridors, cracks and seams. In addition to these vapors migrating to Jenni Rivera Park, the City of Long Beach is concerned with how those impacts combined with any active measures, such as SVE, may be directed or carried by air/wind flow toward Jeni Rivera Park. We note that grading, including disturbance of toxic soils will occur immediately adjacent to the park. 46
- p.85, it is not clear from the MND the location of potential SVE equipment and exhaust nor of the 64 groundwater remediation wells. This information is relevant to analysis of impacts, particularly to the park, the text does note that the southern and wester edge (park is the southern edge) will be subject to oxygen injection but impacts on this to adjacent park users is not analyzed. 47
- The MND incorrectly states that groundwater is not considered as a source of drinking water in the site vicinity. The City of Long Beach acquires more than half of its drinking water supply from groundwater. The subject parcel is within the larger groundwater basin and any impacts to the groundwater on this peace of real property are not 48

going to respect ownership lines or boundaries. The release of toxic substances into the groundwater is a concern regardless of if groundwater wells are present at the site or even nearby. The MND should be expanded as an EIR to provide a fuller analysis of this issue. 48

- p.86, the MND again relies upon a HHRA approach where park visitors, including daily visitors that are very young or very old, are not included in the analysis. This error is critical due to the direct adjacency of construction including disturbance of toxic soils on the southern project boundary. 49
- P.87, the use of a MND does not allow for speculative deferred future mitigation nor does it allow for impacts that are significant after mitigation. This MND however concludes "[i]t is unknown if capping existing contaminated soil mitigates the environmental hazard posed by inhalation of VOCs from the contaminated soil matrix and/or soil vapor by future construction maintenance workers to less than significant." None of the mitigations, simply adherence to existing rules and regulations and not true impact-reducing mitigations, can reasonably modify this conclusion. The analysis fails to analyze similar impacts to users of Jenni Rivera Park and as a result of these combined factors, the MND lacks the evidence to conclude there will be no significant impacts as to Hazards and more than a fair argument exists that in fact impacts may be significant. 50
- The MND fails to analyze the impacts of SVE and other active measures on adjacent sensitive receptors, this despite the conclusion that it is unknown if the proposed onsite remediation of shallow groundwater in conjunction with monitored natural attenuation would sufficiently mitigate the environmental hazards posed by VOCs in groundwater to offsite residents." Again, there is no logical link between this conclusion, the proposed "mitigation" and then the conclusion that after mitigation there are not significant impacts. Again, the analysis also fails to consider adjacent park users. 51
- These are not temporary impacts, as the MND notes, therefore, the site will always have contaminated soils which will continue to offgas VOCs due to biodegradation of TPH and this could potentially leach into groundwater. This represents a potential for further significant impacts to the environment and human health. 52
- Mitigation Measure MM IX-1 does not reduce impacts. This mitigation merely references regulatory requirements of AQMD that are in the baseline of the technical analysis the led to conclusions of significance reiterated in our comments above. The mitigation measure provides no numerical or other performance standard and it is impossible to draw any specific conclusions on reducing impacts based on the deferred future agencies of AQMD. 53
- Mitigation Measure MM IX-2 fails under the same issue. In fact, this mitigation may in fact trigger additional impacts that are not disclosed in the MND. If soils exceed screening levels for VOCs, TPH and PAHs the project construction will be required to increase the number of haul trips, resulting in more truck trips and associated impacts. These impacts are not accounted for in the MND and in fact no performance criteria or procedure is laid out for that possibility. This deferral of mitigation is not permitted when using a MND. 54
- Table IX-1, the approach in the MND is to use the Commercial/Industrial screening levels. While this is correct to the future land use, we note that the users of the adjacent park are characteristic of the residential screening level and will be exposed during construction due to the complete lack of any buffer between the grading area and the park. The MND fails to provide any analysis of these potential impacts. 55
- Mitigation Measure IX-3 does not reduce construction impacts, but rather amounts only to monitoring. The measure does not provide sufficient detail as to what a future reactive SVE system would entail, should future migration of vapors necessitate re-activation of the initial SVE system or construction of a supplemental SVE system. This deferral of mitigation is not permissible. 56
- Mitigation Measure IX-4 does not diminish intermittent impacts to public health. The measure allows for the SVE system to be removed, and then for monitoring to reveal a need to re-activate the system. The impacts of exceedances, for up to six months between monitoring measurements, impacts both to future project employees and to adjacent park users, are not fully mitigated. 57
- Mitigation Measure IX-5 again simply defers to another agency without sufficient detail or performance criteria. The monitoring of groundwater, in and of itself, does not reduce impacts to groundwater. 58

- p.92, Mitigation Measure IX-6 fails to state any criteria the LNAPL remediation plan is required to meet. This defers all detail of the mitigation measure and provides no quantifiable evidence that the mitigation will actually reduce impacts. This deferral is not permissible with the use of a MND. 59
- Mitigation Measure IX-7 also relies on an operations and maintenance plan, without any performance criteria. The reporting must be kept on site, there is no assigned review role or criteria by the City of Signal Hill nor any other regulatory body. The only qualification for the designated person is that they are familiar with the site and its history. Without professional qualifications and without an outcome based on the reporting, it is unclear what this mitigation measure accomplishes. This mitigation does not lessen any of the impacts identified in the section and associated technical reports. 60
- Mitigation Measure IX-8 relates to a land-use covenant. While this is good planning practice, it does not reduce any of the identified construction or operational impacts of the project. 61
- Mitigation Measure IX-9 again defers to a future plan, that need only comply with existing baseline regulations (SCAQMD Rule 1166). This does not reduce impacts because existing legal practice should have already been factored into the technical reports and section which found that impacts were in fact likely (see page 87). 62
- The MND hazards section concludes without explaining how these mitigations reduce impacts to less than significant. In summary the section and its associated studies in fact lead to the conclusion that impacts are significant. Insufficient and deferred mitigation does not reduce those impacts. The section should be expanded into an EIR that would provide the quantifiable analysis between pre and post-mitigation impacts and provider greater clarity of any impact on Long Beach residents including park visitors. 63

Hydrology and Water Quality, Including Flooding Impacts

- p. 94, the water quality section of the MND is inconsistent with the hazards section. The hazards section notes the possibility of groundwater contamination and for both construction and operational impacts of toxics in the soil. The hazards section inappropriately dismissed these concerns stating groundwater is not a drinking water source in the area (see previous comment), however the water quality section simply finds it to be less than significant without any mitigation. There is a lack of evidence to support this conclusion and a fair argument in fact that there is a risk of groundwater contamination that requires further study in an EIR. 64
- p.95, the City of Long Beach is concerned not only with operational impacts to groundwater after soil disturbance and oxygen injection, but also about construction-related water quality impacts. The MND does not provide sufficient analysis regarding water flows during construction. The possibility exists for water flows from contaminated soil stockpiles down into the Jenni Rivera Park as well as sheet flow into adjacent streets, sidewalks and storm drain systems. There is a particular risk of contamination if grading were to occur during a storm event, grading that will occur with no buffer to the park. 65
- p. 97, the MND relies upon LID and future biofiltration planters to find that there will be no exceedance of water quality or discharge standards. This does not address the issue of construction. The text references the general construction permit from the LARWQCB but that alone (and the yet to be identified BMPs) is not sufficient due to the unique circumstance of this site containing toxic soils, which are planned to be stockpiled while tested and awaiting transport away for disposal. Due to differences in elevation, the potential exists for construction period water flows to directly discharge into Jenni Rivera Park. This impact however is ignored in the MND. 66
- p. 98, the MND makes the erroneous claim that because the project site, in and of itself, is not a groundwater replenishment site that the change in impervious surfaces is less than significant. That is not how stormwater and groundwater management work on a systems basis. The ability of the aquifer to be recharged is based on the amount of impervious surface throughout the basin and the water quality of the water that does infiltrate back into the groundwater reservoir. Therefore, stormwater permitting focuses on limiting impervious surfaces. The combination of increased impervious surfaces (78% for the project) and the possibility of contaminating what water does infiltrate into the groundwater should be further evaluated. The MND lacks the quantifiable data to draw the conclusion made and a fair argument exists that impacts do in fact exist to water quality and groundwater standards. 67

An arrangement of buildings that allowed for a wider southern buffer and use of impervious paving (the MND claims no large trucks will be using the site) could greatly reduce these impacts. 67

- p. 99, the MND fails to quantify the increase in peak flows into the stormwater system, only noting that it meets the 85th percentile storm event standard. This is incomplete analysis because portions of the stormwater system in this area are already at or near capacity, particularly during peak storm events. The MND notes this is exactly the condition that results in increased flow to the storm drain system. Large storm events are expected by the adopted science to increase both in frequency and severity. The MND concedes that on-site storage may overflow in a 50-year storm event and sheet flow into the storm drain system. It is likely that the storm drain system itself may overflow in this event, resulting in cascading flooding on the project site, adjacent streets and sheet flow into Jenni Rivera Park. This likely scenario is not modeled or analyzed in the MND resulting in incomplete analysis and a lack of factual basis for the water quality and flooding conclusions. These impacts could be reduced through increasing the impervious surfaces of the site and/or through storage and reuse water systems that would also reduce the water demand for on-site irrigation. 68

Land Use and Planning

- p. 101, the conclusions regarding land use consistency are contradicted by the lack of analysis or any meaningful consideration of alternatives. The proposed project is a change from the existing City of Signal Hill General Plan. It results in industrial employment in lieu of office employment, increased medium-duty truck trips, employment generating a need for lower-income housing, different impacts in VMT, places a non-TOD use in the location where the Circulation Element identifies potential for such uses (and TOD is necessary to meet GHG and RTP/SCS goals). The proposed project results in adverse impacts to Jenni Rivera Park and the disadvantaged residents that park serves. While the City of Signal Hill has not yet updated its General Plan to comply with SB 1000, the consideration of environmental justice is nevertheless required in planning decisions. These are all conflicts that require further analysis rather than a blanket No Impact conclusion supported by no evidence. 69
- The project appears to be inconsistent with the following City of Signal Hill General Plan Land Use policies (no policy analysis or matrix is present in the MND):
    - Policy 3.3 - Ensure a sensitive transition between commercial or industrial uses and residential uses by means of such techniques as buffering, landscaping, and setbacks.
    - Policy 3.4 - Promote mixed-use development and ensure compatible integration of adjacent uses to minimize conflicts.
    - Policy 3.17 - Promote "smart growth" principles that encourage development that is economically viable, creates a sense of community, and preserves natural resources. Smart growth includes narrower streets, mixed uses, smaller setbacks, open spaces, habitat preserves and parks, infill development and compact commercial centers, and the reuse of brownfields.
    - Policy 3.18 - Minimize the impacts of storm water runoff to the maximum extent practicable, on the biology, water quality and integrity of natural drainage systems and water bodies.
    - Policy 3.19 - Maximize to the extent practicable, the percentage of permeable surfaces to allow more percolation of storm water runoff into the ground.
    - Policy 3.20 - Minimize to the extent practicable, the amount of storm water directed to impermeable areas and to the municipal separate storm water system. Build storm water pollution prevention systems into all development projects including maximizing landscaped areas and providing areas for storm water storage and sedimentation.
    - Policy 3.21 - Require new projects to include permanent controls to reduce storm water pollutant loads from development sites including parking lots to the maximum extent practicable.
    - Policy 4.5 - Foster inter-governmental cooperation and coordination to maximize the effectiveness of land use policies. 70

- Policy 4.6 - Develop comprehensive local and regional rather than piecemeal planning solutions and promote long-range solutions to land use issues.
- Policy 4.7 - Strengthen the framework for effective regional and local planning efforts.

70

Noise Impacts:

- p. 110, Jenni Rivera Park is immediately adjacent to construction activities however Table XIII-4 and the noise analysis the follows is based on exposure at 40-feet. The City of Long Beach is concerned that the cumulative impact of truck trips, air emissions, toxic soil exposure, and noise will render the park unusable for community members during construction. This is not a minor inconvenience when it means families not having access to a local park or place to exercise for a period of a year or more. 71
- p. 111, the MND incorrectly identifies the closest sensitive receptor as the Zinnia apartments at 40-feet to the north. Jenni Rivera Park is adjacent during construction and 10-feet in distance during operations. The failure to identify this sensitive receptor taints the entire noise analysis. 72
- The City is concerned in addition to direct impacts, that because the park is not identified in the MND as a sensitive receptor that instructions to direct noise away from sensitive receptors to the north may actually cause equipment and noise to be aimed at the park and its users. 73
- The MND does acknowledge that traffic will increase on adjacent streets as a result of the project. In fact, traffic on Walnut Street will increase by 45% according to the MND. This is not imperceptible to a pedestrian. It is not imperceptible to users of Jenni Rivera park who will be subject not only to increased traffic levels and noise but the close proximity of one of the project ingress points. The MND relies on the Highway Traffic Noise Analysis and Abatement Policy and Guidance to reach this conclusion. That guidance is not relevant to the unique circumstances of this project. The perception of a pedestrian not only of noise but of their safety during a walk to a park, after such a dramatic increase in traffic including truck traffic, cannot simply be ignored because traffic does not double. 74
- p. 112-113, the MND goes on to acknowledge that the project includes slow-moving trucks (despite the MND in other sections downplaying the role of trucks in the proposed development) as well as parking areas as sources of noise. All of these sources are located within 10-feet of Jenni Rivera Park. The impacts however are dismissed based on the fact that they would be intermittent and are compatible with industrial uses to the west of the site. The park, to the south, however, is not industrial in nature and a short or intermittent noise irritant is significant to a family's enjoyment of the park. 75
- The analysis for mechanical equipment, slow-moving trucks and parking areas is all based on a distance of 50-feet, this is wrong for the park (10-feet) as well as the Zinnia apartments (40-feet). 76
- Mitigation Measure XXIII-1 fails to actually reduce noise in a quantifiable fashion. The mitigation measure requires mufflers without any performance criteria for how effective "properly functioning" is, a complaint sign and hotline which only resolves transgressions not noise impact as a result of the project design, a requirement to place equipment aiming noise away from sensitive receptors (if pointed away from residences to the north this results in increased impacts to the park in the south which the study fails to identify as a sensitive receptor), and then a limit on haul hours to 7:00 a.m. to 6:00 p.m. assuring that hauling will occur during the use hours for the park. 77

Population and Housing:

- p. 116, the conclusion of No Impact for unplanned growth is not supported by evidence. The proposal involves a General Plan amendment, it will result in employment growth both different from the existing conditions (the CEQA baseline) and from what would have occurred under the City of Signal Hill General Plan (which the RTP/SCS is modeled from). The MND offers no analysis of the wages and resulting housing needs of these future workers and their likely commuting distance. It ties the employment to parking spaces, without a study or substantial evidence to support that conclusion. The MND or a future EIR could tie square footage to employment generation numbers as a more analytically sound approach. The document also states that there will be no impact on infrastructure, however the water quality section already noted that flows into the stormwater system will increase but fails to 78

provide full existing conditions information regarding the stormwater main and system. The conclusion that new infrastructure will not be required, especially when it is noted flooding will occur during 50-year storm events, is not supported by the evidence in the MND. 78

Public Service Impacts:

- p. 117-120, egregiously the MND concludes that there will be no impacts to parks as a result of the proposed project. As been demonstrated in these comments the project will result in substantial impacts to Jenni Rivera Park both during construction and operations. The diminution of an existing park is an impact just as adding users to the park system would be. This issue should be more fully analyzed in an EIR. 79

Transportation and Traffic:

- p. 121, the MND fails to fully analyze construction traffic, including the 5-6 months where haul trucks carrying toxic soils will be routed along the Jenni Rivera Park entrance and Long Beach streets. Due to the existing conditions along this haul route, a more detailed analysis should be provided to model the impact on residents including pedestrians during this period. We note that the proposed haul route exits the site, routes along the park entrance and then through the City of Long Beach to I-405. It is not clear why shorter routes, such as use of Hill to Cherry were not considered. The environmental justice impacts of the chosen haul route should be more carefully evaluated. 80
- p. 137, the MND notes that there are no existing or planned bike lanes within the project or its adjacent streets. The MND however takes credit for consistency with RTP/SCS policies on active transportation and find consistency with GHG reduction plans that rely on reducing VMT. It does note that the project may result in increased bicycle travel along Orange Avenue. The City of Long Beach is in the process of installing protected bike lanes along Orange Avenue. The City of Signal Hill has raised concerns regarding this active transportation project, does not intend to provide protected bike lanes on their jurisdictional portion of Orange Avenue and is objecting to land-use approvals for an industrial project in Long Beach's jurisdiction that includes the associated bike facilities. A more advisable approach would be to support sufficient bike facilities for this proposed project and throughout the shared region across the two jurisdictions. 81
- The pedestrian analysis focuses on trails and pathways rather than actual pedestrian movement. Many pedestrians walk or bike to Jenni Rivera Park and their ability to do so will be impacted during the construction of this project. The MND simply defers this analysis to a future traffic control plan that will, according to the text, address elementary school students going to school but not to the park. The conclusion of no impact is not supportable because the analysis is incomplete. 82
- p. 138, it is unfortunate that the analysis does not provide VMT information. This information would be valuable to evaluating the true impacts of the project, understanding the implication of the General Plan Amendment compared to alternative and what the true GHG consequences of the project are. Long Beach and other jurisdictions are providing both VMT and LOS information in environmental documents during the transition period to VMT and VMT guidance from OPR was available to Signal Hill and the MND preparers. 83

Utilities and Service Systems:

- p. 143, the MND's conclusions on water supply appear to be without any supporting substantial evidence. The City of Signal Hill does not have an adopted UWMP. The MND does not include any quantification of existing water supply, it does not appear to even reference a will-serve letter. The text erroneously relies upon the assertion that office uses are often more employee-intensive than small-scale industrial uses. No study or labor statistics support this conclusion but regardless the analytic question is water demand, use and supply not the number of employees. Industrial processes, particularly in light manufacturing, often involve the heavy use of water either as an input into process (such as for a bakery) or to cool or service equipment. The estimated water demand does not account for any industrial use of water but rather just restrooms and irrigation. The water demand is not compared to supply. 84

Even a small increase in demand would be significant against the environmental baseline (vacant, no use) and a limited supply. 84

Conclusions:

- These comments are preliminary in nature and the City may provide additional comments at any time.
- We encourage the City of Signal Hill and applicant to meet with Long Beach Department of Parks, Recreation and Marine as well as Development Services to resolve the concerns outlined in this correspondence.

2C: SAFER Comments and Responses

Response to Comments by Supporters Alliance for Environmental Responsibility, March 12, 2020

A letter was submitted by Lozeau Drury LLP, on behalf of SAFER, regarding the Draft IS/MND. The statements in that letter and a response thereto are provided below.

Comments: *I am writing on behalf of the Supporters Alliance For Environmental Responsibility ("SAFER") regarding the Initial Study and Mitigated Negative Declaration ("IS/MND") prepared for the Project known as 2020 Walnut Industrial Park Project, proposed by Xebec Realty, including all actions related or referring to the proposed construction of nine 1-story and 1-story-with-mezzanine concrete tilt up buildings comprising of 151,075 square feet of total building area located at 2020 Walnut Avenue, in the City of Signal Hill ("Project").*

After reviewing the IS/MND, we conclude that the IS/MND fails as an informational document, and that there is a fair argument that the Project may have adverse environmental impacts, including impacts related to extreme soil contamination from the former oil refinery in the site, air pollution during construction and operation phase, greenhouse gases, and health risks to the nearby senior citizen home and other sensitive receptors. Therefore, we request that the City of Signal Hill ("City") prepare an environmental impact report ("EIR") for the Project pursuant to the California Environmental Quality Act ("CEQA"), Public Resources Code section 21000, et seq.

We reserve the right to supplement these comments during public hearings concerning the Project. Galante Vineyards v. Monterey Peninsula Water Management Dist., 60 Cal. App. 4th 1109, 1121 (1997).

Response: These comments summarize the proposed project, state an opinion that the Draft IS/MND is insufficient, and note that supplemental comments may be submitted during the public hearings on the project. Since these comments do not address any specific aspect of the Draft IS/MND, no response is warranted.

Re: Comment on 2020 Walnut Industrial Park Project, Initial Study | Mitigated Negative Declaration

Dear Ms. Doan and Ms. Brooks:

I am writing on behalf of the Supporters Alliance For Environmental Responsibility ("SAFER") regarding the Initial Study and Mitigated Negative Declaration ("IS/MND") prepared for the Project known as 2020 Walnut Industrial Park Project, proposed by Xebec Realty, including all actions related or referring to the proposed construction of nine 1-story and 1-story-with-mezzanine concrete tilt up buildings comprising of 151,075 square feet of total building area located at 2020 Walnut Avenue, in the City of Signal Hill ("Project").

After reviewing the IS/MND, we conclude that the IS/MND fails as an informational document, and that there is a fair argument that the Project may have adverse environmental impacts, including impacts related to extreme soil contamination from the former oil refinery in the site, air pollution during construction and operation phase, greenhouse gases, and health risks to the nearby senior citizen home and other sensitive receptors. Therefore, we request that the City of Signal Hill ("City") prepare an environmental impact report ("EIR") for the Project pursuant to the California Environmental Quality Act ("CEQA"), Public Resources Code section 21000, et seq.

We reserve the right to supplement these comments during public hearings concerning the Project. *Galante Vineyards v. Monterey Peninsula Water Management Dist.*, 60 Cal. App. 4th 1109, 1121 (1997).

Sincerely,

Richard Drury

Section 3: Revised Air Quality Section

This section presents revisions to the responses to the Initial Study Checklist questions for Air Quality that were included in the original Draft MND. As noted in the Introduction, these revisions originated as a result of responses to comments from various parties concerning the Draft MND regarding the analysis of air quality impacts. No other material changes to the Draft MND are proposed.

III. Air Quality

	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
AIR QUALITY: *Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:*				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☒	☐	☐
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	☐	☒	☐	☐
c) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☒	☐
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☐	☐	☒	☐

Discussion

a) Would the project conflict with or obstruct implementation of the applicable air quality plan?

Less than Significant Impact with Mitigation Incorporated. The project is located within the South Coast Air Basin (Basin), which is governed by the South Coast Air Quality Management District (SCAQMD). Consistency with the SCAQMD 2016 Air Quality Management Plan for the South Coast Air Basin (2016 AQMP) means that a project is consistent with the goals, objectives, and assumptions set forth in the 2016 AQMP that are designed to achieve federal and state air quality standards. According to the SCAQMD CEQA Air Quality Handbook (SCAQMD 1993) in order to determine consistency with the 2016 AQMP, two main criteria must be addressed:

Criterion 1:

With respect to the first criterion, SCAQMD methodologies require that an air quality analysis for a project include forecasts of project emissions in relation to contributing to air quality violations and delay of attainment of federal and/or state air quality standards.

a) *Would the project result in an increase in the frequency or severity of existing air quality violations?*

Since the consistency criteria identified under the first criterion pertains to pollutant concentrations, rather than total regional emissions, an analysis of the project's pollutant emissions relative to localized pollutant concentrations is used as the basis for evaluating

project consistency. As discussed in Response III(c) below, localized concentrations of carbon monoxide (CO), nitrogen oxides (NO_X), particulate matter less than 10 microns in diameter (PM_{10}), and particulate matter less than 2.5 microns in diameter ($PM_{2.5}$) would be less than significant during project construction and operations. Therefore, the proposed project would not result in an increase in the frequency or severity of existing air quality violations.[1]

b) *Would the project cause or contribute to new air quality violations?*

As discussed in Response III(b), the proposed project would result in emissions that are below the SCAQMD regional thresholds, with Mitigation Measure III-1 to reduce NOx emissions during grading. Therefore, the project would not have the potential to cause a violation of the ambient air quality standards.

c) *Would the project delay timely attainment of air quality standards or the interim emissions reductions specified in the AQMP?*

As discussed in Response III(b), the proposed project would result in less than significant impacts with regard to short-term construction and long-term operational emissions. As such, the project would not delay the timely attainment of air quality standards or 2016 AQMP emissions reductions.

Criterion 2:

With respect to the second criterion for determining consistency with SCAQMD and Southern California Association of Governments (SCAG) air quality policies, it is important to recognize that air quality planning within the Basin focuses on attainment of ambient air quality standards at the earliest feasible date. Projections for achieving air quality goals are based on assumptions regarding population, housing, and growth trends. Thus, the SCAQMD's second criterion for determining project consistency focuses on whether or not the proposed project exceeds the assumptions utilized in preparing the forecasts presented in the 2016 AQMP. Determining whether or not a project exceeds these assumptions involves the evaluation of the three criteria outlined below. The following discussion analyzes each of these criteria.

a) *Would the project be consistent with the population, housing, and employment growth projections utilized in the preparation of the AQMP?*

In the case of the 2016 AQMP, three sources of data form the basis for the projections of air pollutant emissions: the Signal Hill General Plan (General Plan), SCAG's regional growth forecast, and SCAG's 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The population, housing, and employment forecasts in the 2016 RTP/SCS, developed by SCAG, are based on local general plans as well as input from local governments. The SCAQMD

[1] Because reactive organic gases (ROGs) are not a criteria pollutant, there is no ambient standard or localized threshold for ROGs. Due to the role ROG plays in ozone formation, it is classified as a precursor pollutant and only a regional emissions threshold has been established.

has incorporated these same demographic growth forecasts for various socioeconomic categories (e.g., population, housing, employment) into the 2016 AQMP.

The project proposes development of nine light industrial buildings comprising 151,075 square feet of total building area. The project requires a General Plan amendment to change the eastern portion of the site's zoning from Commercial Office to Light Industrial. According to the General Plan, the Light Industrial designation is designed to accommodate a variety of light industrial uses which are non-polluting and which can coexist with surrounding commercial and residential uses. Permitted uses include, but are not limited to, research and development, assembly, general offices, light manufacturing not involving excessive noise, vibrations, odors, dust or hazardous materials, and limited warehouse and distribution uses of finished products but not transportation, storage or shipping uses involving fleets of large size (tractor trailer) trucks. The proposed project does not have any loading docks that could accommodate large trucks. As proposed, the nine light industrial buildings would provide occupancy for businesses engaged in a variety of nonpolluting, light industrial activities such as manufacturing, warehousing and assembly of products for consumers and businesses, and research facilities.

As discussed in Section XIV, Population and Housing, the General Plan amendment to change the eastern portion of the site's zoning to Light Industrial would not represent a significant change in employment intensity from the current Commercial Office designation. Because offices typically have higher levels of employment intensity than light industrial uses, the General Plan amendment may actually result in a lower overall employment intensity compared to what is possible under the Commercial Office designation. Therefore, because the General Plan amendment would not increase employment intensity from the current Commercial Office designation, the project would not cause the City's General Plan buildout employment levels to be exceeded. As the SCAQMD has incorporated these same projections into the 2016 AQMP, it can be concluded that the project would be consistent with the projections.

It is also noted that, with the proposed construction mitigation measures, the project's construction and operational air emissions would not exceed the SCAQMD regional thresholds. As such, the project would not result in or cause federal or California air quality standard violations. Thus, a less than significant impact would occur with regard to 2016 AQMP consistency.

b) *Would the project implement all feasible air quality mitigation measures?*

Compliance with all applicable SCAQMD rules for construction emission reduction measures would be required as identified in Response III(b) and III(c) and Mitigation Measure III-1 would also be implemented to reduce NOx emissions during grading. Mitigation Measure III-2 would reduce less than significant short-term emissions from drill rig equipment following the grading phase. As such, the proposed project meets this 2016 AQMP consistency criterion.

c) *Would the project be consistent with the land use planning strategies set forth in the AQMP?*

The AQMP contains air pollutant reduction strategies and demonstrates that the applicable ambient air quality standards can be achieved within the time frames required under federal law. Growth projections from local general plans adopted by cities in the SCAQMD are provided to SCAG, which develops regional growth forecasts that are used to develop future air quality forecasts for the AQMP. Development consistent with the growth projections in the General Plan is considered to be consistent with the AQMP. The proposed project is consistent with the land use designation and development density presented in the General Plan. Therefore, the proposed project meets this AQMP consistency criterion.

Mitigation Measures: Please refer to the responses to III(b) and the specifications for Mitigation Measures III-1 and III-2.

b) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Less than Significant Impact with Mitigation Incorporated.

Criteria Pollutants

Criteria pollutants are pollutants regulated through the development of human health based and/or environmentally based criteria for setting permissible levels. The Basin is currently in state nonattainment status for ozone (O_3), $PM_{2.5}$, and PM_{10}, as well as federal nonattainment status for O_3 and $PM_{2.5}$. Criteria pollutants, their typical sources, and effects are identified below.

Carbon Monoxide (CO). CO is an odorless, colorless toxic gas that is emitted by mobile and stationary sources as a result of incomplete combustion of hydrocarbons or other carbon-based fuels. In cities, automobile exhaust can cause as much as 95 percent of all CO emissions. CO replaces oxygen in the body's red blood cells. Individuals with a deficient blood supply to the heart, patients with diseases involving heart and blood vessels, fetuses (unborn babies), and patients with chronic hypoxemia (oxygen deficiency) as seen in high altitudes are most susceptible to the adverse effects of CO exposure. People with heart disease are also more susceptible to developing chest pains when exposed to low levels of carbon monoxide.

Ozone (O_3). O_3 occurs in two layers of the atmosphere. The layer surrounding the earth's surface is the troposphere. The troposphere extends approximately 10 miles above ground level, where it meets the second layer, the stratosphere. The stratospheric (the "good" ozone layer) extends upward from about 10 to 30 miles and protects life on earth from the sun's harmful ultraviolet rays. "Bad" O_3 is a photochemical pollutant, and needs volatile organic compounds (VOCs), NO_X, and sunlight to form; therefore, VOCs and NO_X are O_3 precursors. To reduce O_3 concentrations, it is necessary to control the emissions of these ozone precursors. Significant O_3 formation generally requires an adequate amount of precursors in the atmosphere and a period of several hours in a stable atmosphere with strong sunlight. High O_3 concentrations can form over large regions when emissions from motor vehicles and stationary sources are carried hundreds of miles from their origins.

While O_3 in the upper atmosphere (stratosphere) protects the earth from harmful ultraviolet radiation, high concentrations of ground-level O_3 (in the troposphere) can adversely affect the human respiratory system and other tissues. O_3 is a strong irritant that can constrict the airways, forcing the respiratory system to work hard to deliver oxygen. Individuals exercising outdoors, children, and people with preexisting lung disease such as asthma and chronic pulmonary lung disease are considered to be the most susceptible to the health effects of O_3. Short-term exposure (lasting for a few hours) to O_3 at elevated levels can result in aggravated respiratory diseases such as emphysema, bronchitis and asthma, shortness of breath, increased susceptibility to infections, inflammation of the lung tissue, and increased fatigue, as well as chest pain, dry throat, headache, and nausea.

Nitrogen Dioxide (NO_2). NO_X are a family of highly reactive gases that are a primary precursor to the formation of ground-level ozone and react in the atmosphere to form acid rain. NO_2 (often used interchangeably with NO_X) is a reddish-brown gas that can cause breathing difficulties at elevated levels. Peak readings of NO_2 occur in areas that have a high concentration of combustion sources (e.g., motor vehicle engines, power plants, refineries, and other industrial operations). NO_2 can irritate and damage the lungs and lower resistance to respiratory infections such as influenza. The health effects of short-term exposure are still unclear. However, continued or frequent exposure to NO_2 concentrations that are typically much higher than those normally found in the ambient air may increase acute respiratory illnesses in children and increase the incidence of chronic bronchitis and lung irritation. Chronic exposure to NO_2 may aggravate eyes and mucus membranes and cause pulmonary dysfunction.

Coarse Particulate Matter (PM_{10}). PM_{10} refers to suspended particulate matter, which is smaller than 10 microns or ten one-millionths of a meter. PM_{10} arises from sources such as road dust, diesel soot, combustion products, construction operations, and dust storms. PM_{10} scatters light and significantly reduces visibility. In addition, these particulates penetrate into lungs and can potentially damage the respiratory tract. On June 19, 2003, the California Air Resources Board (CARB) adopted amendments to the statewide 24-hour particulate matter standards based upon requirements set forth in the Children's Environmental Health Protection Act (Senate Bill 25).

Fine Particulate Matter ($PM_{2.5}$). Due to recent increased concerns over health impacts related to fine particulate matter (particulate matter 2.5 microns in diameter or less), both state and federal $PM_{2.5}$ standards have been created. Particulate matter impacts primarily affect infants, children, the elderly, and those with preexisting cardiopulmonary disease. In 1997, the U.S. Environmental Protection Agency (EPA) announced new $PM_{2.5}$ standards. Industry groups challenged the new standard in court and the implementation of the standard was blocked. However, upon appeal by the EPA, the U.S. Supreme Court reversed this decision and upheld the EPA's new standards. On January 5, 2005, the EPA published a Final Rule in the Federal Register that designates the Basin as a nonattainment area for federal $PM_{2.5}$ standards. On June 20, 2002, CARB adopted amendments for statewide annual ambient particulate matter air quality standards. These standards were revised/established due to increasing concerns by CARB that previous standards were inadequate, as almost everyone in California is exposed to levels at or above the current state standards during some parts of the year, and the statewide potential for significant health

impacts associated with particulate matter exposure was determined to be large and wide-ranging.

Sulfur Dioxide (SO_2). SO_2 is a colorless, irritating gas with a rotten egg smell; it is formed primarily by the combustion of sulfur-containing fossil fuels. Sulfur dioxide is often used interchangeably with sulfur oxides (SO_X) and lead. Exposure of a few minutes to low levels of SO_2 can result in airway constriction in some asthmatics.

Volatile Organic Compounds (VOC). VOCs are hydrocarbon compounds (any compound containing various combinations of hydrogen and carbon atoms) that exist in the ambient air. VOCs contribute to the formation of smog through atmospheric photochemical reactions and/or may be toxic. Compounds of carbon (also known as organic compounds) have different levels of reactivity; that is, they do not react at the same speed or do not form ozone to the same extent when exposed to photochemical processes. VOCs often have an odor; some examples include gasoline, alcohol, and the solvents used in paints. Exceptions to the VOC designation include carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate. VOCs are a criteria pollutant since they are a precursor to O_3, which is a criteria pollutant. The SCAQMD uses the terms VOC and ROG (see below) interchangeably.

Reactive Organic Gases (ROG). Similar to VOC, ROG are also precursors in forming ozone and consist of compounds containing methane, ethane, propane, butane, and longer chain hydrocarbons, which are typically the result of some type of combustion/decomposition process. Smog is formed when ROG and nitrogen oxides react in the presence of sunlight. ROGs are a criteria pollutant since they are a precursor to O_3, which is a criteria pollutant. The SCAQMD uses the terms ROG and VOC interchangeably.

Short-Term Construction Emissions

The project involves construction activities associated with grading, installation of an SVE system, air sparge system and groundwater monitoring wells, paving, construction, and architectural coating applications. Grading activities would require approximately 35,756 cubic yards of cut and 68,877 cubic yards of fill. Additional earthwork would involve removal and transport of contaminated soils from the prior oil refinery operations. This results in a total of 8,551 cy material to be exported from the project site and a total of 41,672 cy of clean fill material to be transported onto the project site. Exhaust emission factors for typical diesel-powered heavy equipment are based on the California Emissions Estimator Model version 2016.3.2 (CalEEMod) program defaults, as well as EMFAC2017 emissions factors. Variables factored into estimating the total construction emissions include the level of activity, length of construction period, number of pieces and types of equipment in use, site characteristics, weather conditions, number of construction personnel, and the amount of materials to be transported on- or off-site.

Site remediation would occur as part of the construction program, not separately. As such, the emissions associated with workers and equipment involved in remediation work was accounted for in the analysis of construction impacts in the Draft IS/MND. The remediation efforts that will be occurring simultaneously with site grading and horizontal development consist of activities such as trenching for installation of remediation system conveyance piping and soil stockpiling

for characterization and reuse determination. These types of activities use the same equipment as "normal" construction activities. The only specialized equipment with a different emissions profile are drill rigs, which will be used for installation of soil vapor extraction, air sparge, and groundwater monitoring wells. The use of drill rigs will occur after site grading and not simultaneously.

There are expected to be two drilling rigs on-site during the installation of soil vapor extraction, air sparge, and groundwater monitoring wells. The rigs will be truck mounted with auger type drilling systems. The equipment is powered by a Cummins QSB 6.7L (409 cubic inch) 250 horsepower (186 kilowatt) 6-cylinder turbocharged diesel engine. Emissions will be standard for an off-road diesel engine: Carbon Monoxide = 2.6 grams/bhp-hr and nitrogen oxides (NOx) = 3.0 grams/bhp-hr. The engines are U.S. EPA Tier 3 emissions certified. Typically, the drill rigs operate between 6 to 10 hours per day. 10 hours per day is not typical; however, well installations cannot be left partially complete overnight, consequently work sometimes continues after a normal eight-hour shift to complete full installation Based on the total number of well installations, the rigs are expected to be on-site a total of 18 days.

Emissions associated with operation of the drilling rigs have been added to updated construction emissions calculations and would not result in exceedance of regional or local significance thresholds. Updated construction emissions modeling worksheets are provided in Section 4A herein. Mitigation Measure III-2 has been added to require use of EPA-certified Tier 3 or "better" drill rigs.

The analysis of daily construction emissions has been prepared utilizing CalEEMod. Refer to Section 4A in this Recirculated MND*, Updated CalEEMod Worksheets*, for the updated results of construction period emissions. *Table III-1, Construction-Related Emissions*, presents the updated calculations of the anticipated daily short-term construction emissions for each of the criteria air pollutants addressed by the SCAQMD thresholds.

Table III-1 Construction-Related Emissions

Emissions Source	Pollutant (pounds/day)[1,2]					
	ROG	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
Emissions Without Mitigation[2]	34.21	140.29	64.97	0.23	30.95	13.28
SCAQMD Thresholds	*75*	*100*	*550*	*150*	*150*	*55*
Threshold Exceeded?	***No***	***Yes***	***No***	***No***	***No***	***No***
Emissions With Mitigation[2,3]	34.14	65.87	29.94	0.10	5.37	3.18
SCAQMD Thresholds	*75*	*100*	*550*	*150*	*150*	*55*
Threshold Exceeded?	***No***	***No***	***No***	***No***	***No***	***No***
Volume Reduced	*-.07*	*-78.33*	*-4.07*	*-.00*	*-16.27*	*-7.69*

Notes:
1. Emissions were calculated using CalEEMod version 2016.3.2, and EMFAC 2017, as recommended by the SCAQMD.
2. Totals shown are for highest intensity construction activities that generate these pollutants. The grading emissions in this table include reduction/credits based on compliance with SCAQMD Rules that are included in CalEEMod. The emission reduction measures applied in CalEEMod includes the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas

quickly; water exposed surfaces three times daily; cover stock piles with tarps; water all haul roads twice daily; and limit speeds on unpaved roads to 15 miles per hour. 3. CARB certified Tier 4 engine standards would be required for all off-road diesel-powered construction equipment greater than 50 horsepoer during the grading phase, per Mitigation Measure MM III-1. Additionally, CARB certified Tier 3 engine standards would be required for the bore/drill rigs during the monitoring well installation phase of construction, per Mitigation Measure III-2.
Refer to Appendix A, *Air Pollutant, Greenhouse Gas and Energy Consumption Calculation Worksheets*, for assumptions used in this analysis.

Fugitive Dust Emissions

Construction activities are a source of fugitive dust emissions that may have a substantial, temporary impact on local air quality. In addition, fugitive dust may be a nuisance to those living and working in the project area. Fugitive dust emissions are associated with land clearing, ground excavation, cut and fill, and truck travel on unpaved roadways (including demolition as well as construction activities). Fugitive dust emissions vary substantially from day to day, depending on the level of activity, specific operations, and weather conditions. Fugitive dust from grading, excavation, and construction is expected to be short term and would cease upon project completion. Most of this material is inert silicates, rather than the complex organic particulates released from combustion sources, which are more harmful to health.

Dust (larger than 10 microns) generated by such activities usually becomes more of a local nuisance than a serious health problem. Of particular health concern is the amount of PM_{10} generated as a part of fugitive dust emissions. PM_{10} poses a serious health hazard alone or in combination with other pollutants. $PM_{2.5}$ is mostly produced by mechanical processes. These include automobile tire wear, industrial processes such as cutting and grinding, and resuspension of particles from the ground or road surfaces by wind and human activities such as construction or agriculture. $PM_{2.5}$ is mostly derived from combustion sources, such as automobiles, trucks, and other vehicle exhaust, as well as from stationary sources. These particles are either directly emitted or are formed in the atmosphere from the combustion of gases such as NO_X and SO_X combining with ammonia. $PM_{2.5}$ components from material in the earth's crust, such as dust, are also present, with the amount varying in different locations.

The project would implement all required SCAQMD dust control techniques (i.e., daily watering), and adhere to SCAQMD Rules 402 and 403 (which require watering of inactive and perimeter areas, track out requirements, etc.), to reduce PM_{10} and $PM_{2.5}$ concentrations. As depicted in *Table III-1*, total PM_{10} and $PM_{2.5}$ emissions would not exceed the SCAQMD regional thresholds during construction. Thus, construction air quality impacts would be less than significant.

Construction Equipment and Worker Vehicle Exhaust

Exhaust emissions from construction activities include emissions associated with the transport of machinery and supplies/materials to and from the project site, transport of soil materials off- and on-site, employee commutes to/from the project site, and emissions produced on-site as the equipment is used. Soil materials that are contaminated from past oil refinery operations that cannot be reused on site due to excessive contaminant levels would be transported to appropriately licensed facilities for disposal. Based on site characterization investigations to date, the majority of contaminated soils are anticipated to be "non-hazardous." Chemical

concentrations within excavated soil will be confirmed by laboratory testing prior to transporting for off-site disposal. Based on previous site sample results, soils which are characterized as "hazardous" are expected to be a few hundred cubic yards at most.

The disposal site for contaminated materials will be based on the closest suitable facility in order to minimize miles traveled. The project applicant has indicated that 90 percent of these materials (non-hazardous) would be transported to the Simi Valley Landfill, located 64 miles from the project site, and the remaining 10 percent (hazardous) would be transported to the US Ecology facility in Beatty, Nevada, located 316 miles from the project site. These longer travel distances have been included in updated emissions modeling for 8 hours/day grading activities. Updated modeling worksheets are provided in Section 4A herein. Results of the updated modeling are presented in Table III-1, in comparison to SCAQMD regional thresholds of significance.

As shown in *Table III-1*, the calculated level of NOx emissions produced by diesel-fueled on-site grading machinery and trucks that haul machinery, supplies and soils off or to the project site would be approximately 140.29 pounds/day, which exceeds the 100 pounds/day threshold. As such, the level of NOx emissions associated with the proposed grading plan is considered to be potentially significant.

To reduce daily NOx emissions by a substantial margin, the Project Applicant has agreed to implement Mitigation Measure III-1, to limit daily grading activities, which requires CARB certified Tier 4 engine standards for all off-road diesel-powered construction equipment greater than 50 horsepower during the grading phase. In addition, daily haul truck trips for transporting unusable soil materials to off-site disposal facilities would be limited to 71 trucks a day, in accordance with the proposed grading plan that was modeled for grading period emissions As shown in *Table III-1*, this would reduce total daily NOx regional emissions by approximately 78 pounds/day, a reduction of 44 percent. This mitigation would also reduce regional emissions for all other criteria pollutants analyzed. As shown in *Table III-3*, this measure would also reduce levels of localized emissions by substantial margins.

ROG Emissions

In addition to gaseous and particulate emissions, the application of asphalt and surface coatings creates ROG emissions, which are O_3 precursors. In accordance with the methodology prescribed by the SCAQMD, the ROG emissions associated with paving and architectural coating have been quantified with the CalEEMod model. As required by SCAQMD Regulation XI, Rule 1113 – *Architectural Coating*, all architectural coatings for the proposed structures would comply with specifications on painting practices as well as regulation on the ROG content of paint (SCAQMD 2016b). ROG emissions associated with the proposed project would be less than significant; refer to *Table III-1*.

Naturally Occurring Asbestos

Asbestos is a term used for several types of naturally occurring fibrous minerals that are a human health hazard when airborne. The most common type of asbestos is chrysotile, but other types such as tremolite and actinolite are also found in California. Asbestos is classified as a known

human carcinogen by state, federal, and international agencies and was identified as a toxic air contaminant by CARB in 1986.

Asbestos can be released from serpentinite and ultramafic rocks when the rock is broken or crushed. At the point of release, the asbestos fibers may become airborne, causing air quality and human health hazards. These rocks have been commonly used for unpaved gravel roads, landscaping, fill projects, and other improvement projects in some localities. Asbestos may be released to the atmosphere due to vehicular traffic on unpaved roads, during grading for development projects, and at quarry operations. All of these activities may have the effect of releasing potentially harmful asbestos into the air. Natural weathering and erosion processes can act on asbestos-bearing rock and make it easier for asbestos fibers to become airborne if such rock is disturbed. According to the Department of Conservation (2000), serpentinite and ultramafic rocks are not known to occur within the project area. Thus, there would be no impact in this regard.

Long-Term (Operational) Emissions

Long-term air quality impacts would consist of mobile source emissions generated from project-related traffic and emissions from stationary area and energy sources. Emissions associated with each of these sources were calculated and are discussed below.

Mobile Source

Mobile sources are emissions from motor vehicles, including tailpipe and evaporative emissions. Depending upon the pollutant, the potential air quality impact may be of either regional or local concern. For example, ROG, NO_X, SO_X, PM_{10}, and $PM_{2.5}$ are all pollutants of regional concern (NO_X and ROG react with sunlight to form O_3 [photochemical smog], and wind currents readily transport SO_X, PM_{10}, and $PM_{2.5}$). However, CO tends to be a localized pollutant, dispersing rapidly at the source.

Project-generated vehicle emissions have been estimated using CalEEMod. According to the Signal Hill Business Center Traffic Impact Analysis (Traffic Impact Analysis) prepared by Kunzman Associates, Inc. (revised June 22, 2018), the proposed project would generate approximately 2,668 total daily passenger car equivalent trips.[2]. *Table III-2 Long-Term Air Emissions*, presents the anticipated mobile source emissions.

Table III-2 Long-Term Air Emissions

Emissions Source	Pollutant (pounds/day)[1]					
	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Area	3.47	0.00	0.04	0.00	0.00	0.00
Energy	0.08	0.74	0.62	0.00	0.06	0.06
Mobile	5.71	29.63	83.83	0.30	25.38	6.97
Total Winter Emissions[3]	9.26	30.38	84.49	0.30	25.44	7.02

[2] One car is one "passenger car equivalent." A truck is equal to two or three passenger car equivalents in that a truck requires longer to start, goes slower, and accelerates slower. Loaded trucks have a higher passenger car equivalent than empty trucks.

Emissions Source	Pollutant (pounds/day)[1]					
	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
SCAQMD Threshold	*55*	*55*	*550*	*150*	*150*	*55*
Is Threshold Exceeded? (Significant Impact?)	***No***	***No***	***No***	***No***	***No***	***No***

Notes:
1. Emissions were calculated using CalEEMod version 2016.3.2, as recommended by the SCAQMD.
2. The numbers may be slightly off due to rounding.

Refer to Appendix A, *Air Quality/Greenhouse Gas and Energy Worksheets*, for assumptions used in this analysis.

Area Source Emissions

Area source emissions would be generated from consumer products, architectural coating, and landscaping maintenance. This would result in minor levels of reactive organic gases and minute levels of CO, as shown in *Table III-2.*

Energy Source Emissions

Energy source emissions would be generated as a result of electricity and natural gas usage associated with the proposed project; refer to *Table III-2*. The primary use of electricity and natural gas by the project would be for space heating and cooling, water heating, ventilation, lighting, appliances, and electronics. Note that the proposed project would not include installation of natural gas lines to serve any buildings. Some future building occupants may, however, elect to install their own gas systems and the energy emissions totals shown in *Table III-2* account for that.

Total Operational Emissions

As shown in *Table III-2*, the total operational emissions would not exceed established SCAQMD thresholds. Therefore, impacts in this regard would be less than significant.

Cumulative Construction Impacts

With respect to the proposed project's construction-period air quality emissions and cumulative Basin-wide conditions, the SCAQMD has developed strategies to reduce criteria pollutant emissions, which are outlined in the 2016 AQMP pursuant to Federal Clean Air Act mandates. As such, the proposed project would comply with SCAQMD Rule 403 requirements and implement all feasible SCAQMD rules to reduce construction air emissions to the extent feasible. Rule 403 requires that fugitive dust be controlled and reduced with the best available control measures so that it does not remain visible in the atmosphere beyond the property line of the proposed project. In addition, the proposed project would comply with adopted 2016 AQMP emissions control measures. Pursuant to SCAQMD rules and mandates, as well as the CEQA requirement that significant impacts be mitigated to the extent feasible, these same requirements would also be imposed on construction projects throughout the Basin.

According to the CEQA Air Quality Handbook, project-related emissions that fall below the recommended construction thresholds are considered less than significant on a project level or with respect to cumulative impacts. As discussed above, the project's short-term construction emissions would be below the SCAQMD thresholds and would result in a less than significant

impact, with Mitigation Measure III-1 to reduce NOx emissions during grading. Thus, it can be reasonably inferred that the project's construction emissions would not contribute to a cumulatively considerable air quality impact for nonattainment criteria pollutants in the Basin. Thus, a less than significant impact would occur in this regard.

Air Quality Health Impacts

Adverse health effects induced by criteria pollutant emissions are highly dependent on a multitude of interconnected variables (e.g., cumulative concentrations, local meteorology and atmospheric conditions, and the number and character of exposed individual [e.g., age, gender]). In particular, ozone precursors VOCs and NO_X affect air quality on a regional scale. Health effects related to ozone are therefore the product of emissions generated by numerous sources throughout a region. Existing models have limited sensitivity to small changes in criteria pollutant concentrations, and, as such, translating project-generated criteria pollutants to specific health effects or additional days of nonattainment would produce meaningless results. In other words, the project's less than significant increases in regional air pollution from criteria air pollutants would have nominal or negligible impacts on human health.

As noted in the Brief of Amicus Curiae by the SCAQMD (April 6, 2015), the SCAQMD acknowledged it would be extremely difficult, if not impossible, to quantify health impacts of criteria pollutants for various reasons including modeling limitations as well as where in the atmosphere air pollutants interact and form. Furthermore, as noted in the Brief of Amicus Curiae by the San Joaquin Valley Air Pollution Control District (April 13, 2015), the district acknowledged that currently available modeling tools are not equipped to provide a meaningful analysis of the correlation between an individual development project's air emissions and specific human health impacts.

The SCAQMD acknowledges that health effects quantification from ozone, as an example, is correlated with the increases in the ambient level of ozone in the air (concentration) that an individual person breathes. SCAQMD's Brief of Amicus Curiae states that it would take a large amount of additional emissions to cause a modeled increase in ambient ozone levels over the entire region. The SCAQMD states that based on its own modeling in the 2012 Air Quality Management Plan, a reduction of 432 tons (864,000 pounds) per day of NO_X and a reduction of 187 tons (374,000 pounds) per day of VOCs would reduce ozone levels at the highest monitored site by only nine parts per billion. As such, the SCAQMD concludes that it is not currently possible to accurately quantify ozone-related health impacts caused by NO_X or VOC emissions from relatively small projects (defined as projects with regional scope) due to photochemistry and regional model limitations. Thus, as the project would not exceed SCAQMD thresholds for construction and operational air emissions, the project would have a less than significant impact for air quality health impacts.

Cumulative Long-Term Impacts

As discussed previously, the proposed project would not result in significant long-term air quality impacts, as emissions would not exceed SCAQMD adopted operational thresholds. As a result, the proposed project would not contribute a cumulatively considerable net increase of any

criteria pollutant. Additionally, adherence to SCAQMD rules and regulations would alleviate potential impacts related to cumulative conditions on a project-by-project basis. Emission reduction technology, strategies, and plans are constantly being developed and applied throughout the Basin. Therefore, cumulative operational impacts associated with implementation of the proposed project would be less than significant.

Mitigation Measures

MM III-1: During the grading phase of construction, all off-road diesel-powered construction equipment greater than 50 horsepower shall meet the United States Environmental Protection Agency (EPA)-certified Tier 4 emission standards. In addition, all construction equipment shall be outfitted with best available control technologies (BACT) devices certified by the California Air Resources Board (CARB). Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 4 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. Daily truck trips for importing or exporting soil shall be limited to 71.

All trucks hauling soil, sand, or other loose materials excavated from the Site shall be covered. If visible soil material is carried onto adjacent public streets, the streets shall be swept with water sweepers as necessary to maintain them free of materials. Stockpiles will be placed on a plastic liner of 30-mil or greater. During construction, the piles will be lightly sprayed with water and covered with plastic sheeting of 10-mil or greater. Plastic sheeting will be secured with sandbags.

A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment for verification by the City of Signal Hill Building Official or their designee. Daily logs of the volume of grading export truck trips shall be provided to the City's Building Official to verify compliance with the 71 trucks/day limit.

c) Would the project expose sensitive receptors to substantial pollutant concentrations?

Less Than Significant Impact. Sensitive receptors are defined as facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses. Examples of these sensitive receptors are residences, schools, hospitals, and daycare centers. CARB has identified the following groups of individuals as the most likely to be affected by air pollution: the elderly over 65, children under 14, athletes, and persons with cardiovascular and chronic respiratory diseases such as asthma, emphysema, and bronchitis.

Sensitive receptors near the project site include surrounding residences to the north, east, and south. The nearest sensitive receptors are residents of the Zinnia apartment complex located

approximately 40 feet north of the western parcel (Site 1). There are also apartments and townhomes located on the eastern side of Gaviota Avenue, directly opposite the eastern parcel (Site 2). In order to identify impacts to sensitive receptors, the SCAQMD recommends addressing localized significance thresholds for construction and operations impacts (stationary sources only).

Localized Significance Thresholds

Localized significance thresholds (LSTs) were developed in response to SCAQMD Governing Boards' Environmental Justice Enhancement Initiative (I-4). The SCAQMD provided the *Final Localized Significance Threshold Methodology* (dated June 2003 [revised 2008]) for guidance. The LST methodology assists lead agencies in analyzing localized air quality impacts. The SCAQMD provides the LST lookup tables for 1-, 2-, and 5-acre projects emitting CO, NO_X, $PM_{2.5}$, or PM_{10}. The LST methodology and associated mass rates are not designed to evaluate localized impacts from mobile sources traveling over the roadways. The project is located within Source Receptor Area (SRA) 4, South Coastal LA County.

Construction LST

The SCAQMD guidance on applying CalEEMod to LSTs specifies the number of acres a particular piece of equipment would likely disturb per day. Based on the SCAQMD guidance, the project would disturb approximately 5 acres of land per day during the grading phase. Therefore, the LST thresholds for 5 acres were utilized for the construction LST analysis. The closest sensitive receptors are residential uses approximately 40 feet north of the project site. These sensitive land uses may be potentially affected by air pollutant emissions generated during on-site construction activities. LST thresholds are provided for distances to sensitive receptors of 25, 50, 100, 200, and 500 meters. As the nearest sensitive uses are approximately 40 feet north of the project site, the lowest available LST values for 25 meters were used.

Table III-3, Localized Significance of Construction Emissions, shows the localized unmitigated and mitigated construction-related emissions for NO_X, CO, PM_{10}, and $PM_{2.5}$ compared to the LSTs for SRA 4, South Coastal LA County. It is noted that the localized emissions presented in *Table III-3* are less than those in *Table III-1* because localized emissions include only on-site emissions (i.e., from construction equipment and fugitive dust), and do not include off-site emissions (i.e., from hauling activities).

On-site hauling truck exhaust emissions would be minimal. As the project site is approximately 0.15 miles long, on-site hauling emissions would represent approximately 0.36 percent of total hauling emissions. As shown below, localized on-site hauling emissions would be negligible. Accounting for on-site hauling emissions, project-generated localized construction emissions would remain below the applicable SCAQMD thresholds.

As shown in *Table III-3*, the project's localized construction emissions would exceed the LSTs for SRA 4, for NOx, PM10 and PM2.5. Therefore, localized significance impacts from construction would be significant without mitigation.

The MND modeled emissions during the grading phase of construction, including emissions associated with loading/unloading construction equipment and materials. Emissions, if any, that may occur with temporary soil stockpiling consist of volatile organic compounds associated with petroleum, including the volatile TPH fractions, benzene, toluene, ethylbenzene, and xylenes. The calculation of construction emissions that are summarized in Tables III-1 and III-3 include reduction/credits based on the application of dust control techniques as required by SCAQMD Rule 403 and Rule 1166. The dust control techniques include the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces twice daily; cover stockpiles with tarps; water all haul roads three times daily; and limit speeds on unpaved roads to 15 miles per hour. The Applicant has stated it will require contractors to implement the following additional dust control measures:

- All trucks hauling soil, sand, or other loose materials excavated from the Site shall be covered or shall maintain at least two feet of freeboard.
- If visible soil material is carried onto adjacent public streets, the streets shall be swept with water sweepers as necessary to maintain them free of materials.
- Stockpiles will be placed on a plastic liner of 30-mil or greater. During construction, the piles will be lightly sprayed with water and covered with plastic sheeting of 10-mil or greater. Plastic sheeting will be secured with sandbags.

These additional measures have been added to revised Mitigation Measure III-1, as shown previously. In addition, as discussed in Section IX.d of the Draft IS/MND, and as specified in Mitigation Measure IX-1, earthwork will be conducted under a SCAQMD Rule 1166 permit, which requires specific handling protocols and monitoring related to volatile organic compound emissions from soil during earthwork activities. Any disturbed soil with a PID reading greater than 1,000 ppmv will not be stockpiled; it will be immediately loaded into sealed containers or trucks for offsite disposal and SCAQMD will be notified within one hour of detection. Mitigation Measure IX-2also requires a number of soil disturbance management measures to address the requirements of the Los Angeles Regional Water Quality Control Board to prevent significant impacts due to disturbance and handling of contaminated soil materials. Given these extensive dust suppression and soil management measures, emissions from stockpiles are anticipated to be minimal and would not result in significant air quality impacts. With the revisions to Mitigation Measure III-1 and the other soil disturbance control measures referred to above, localized concentrations of pollutants would be reduced to below the localized significance thresholds, as shown in Table III-3, below.

Table III-3 Localized Significance of Construction Emissions

Source	Pollutant (pounds/day)[3]			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Construction (Grading Phase)				
On-Site Emissions [1,2]	103.78	50.64	22.20	11.18
On-Site Hauling Emissions	0.1299	0.0316	0.0310	0.0082
Total Emissions	***103.91***	***50.67***	***22.23***	***11.19***
Localized Significance Threshold[3]	99	1,503	14	8
Thresholds Exceeded?	***Yes***	***No***	***Yes***	***Yes***
Mitigated Construction (Grading Phase)[4]				
Mitigated On-Site Emissions[4]	*25.45*	*54.71*	*7.82*	*3.78*
On-Site Hauling Emissions	0.1299	0.0316	0.0236	0.0064
Total Emissions	***25.58***	***54.74***	***7.85***	***3.79***
Localized Significance Threshold[3]	99	1,503	14	8
Thresholds Exceeded?	***No***	***No***	***No***	***No***

Notes:

1. The grading phase emissions are presented as the worst-case scenario for NOx, CO, PM_{10}, and $PM_{2.5}$.
2. The construction emissions in this table include reduction/credits based on the application of dust control techniques as required by SCAQMD Rule 403. The dust control techniques include the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces twice daily; cover stockpiles with tarps; water all haul roads three times daily; and limit speeds on unpaved roads to 15 miles per hour.
3. The Localized Significance Threshold was determined using Appendix C of the SCAQMD Final Localized Significant Threshold Methodology guidance document for pollutants NO_X, CO, PM_{10}, and $PM_{2.5}$. The Localized Significance Threshold was based on the anticipated daily acreage disturbance for construction (approximately 5 acres; therefore the 5-acre threshold was used) and the source receptor area (SRA 4).
4. CARB certified Tier 4 engine standards would be required for all off-road diesel-powered construction equipment greater than 50 horsepower during the grading phase per Mitigation Measure MM III-1. Additionally, CARB certified Tier 3 engine standards would be required for the bore/drill rigs during the monitoring well installation phase of construction per Mitigation Measure MM III-2.

Refer to Section 4A herein, *Updated CalEEMod Emissions Worksheets*, for assumptions used in this analysis.

Operational LST

As seen in *Table III-4, Localized Significance of Operational Emissions*, project-related operational area source emissions would be negligible and would be below the LSTs. Therefore, operational LST impacts would be less than significant in this regard.

Table III-4 Localized Significance of Operational Emissions

Source	Pollutant (pounds/day)			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Operational				
Area Source Emissions	0.00	0.04	0.00	0.00
Localized Significance Threshold[1]	99	1,503	4	2
Thresholds Exceeded?	***No***	***No***	***No***	***No***

Notes:

1. The Localized Significance Threshold was determined using Appendix C of the SCAQMD *Final Localized Significant Threshold Methodology* guidance document for pollutants NO_X, CO, PM_{10}, and $PM_{2.5}$. The Localized Significance Threshold was based on the total acreage for operations (the 5-acre threshold was used), the distance to sensitive receptors, and the source receptor area (SRA 4).

Carbon Monoxide Hotspots

CO emissions are a function of vehicle idling time, meteorological conditions, and traffic flow. Under certain extreme meteorological conditions, CO concentrations near a congested roadway or intersection may reach unhealthful levels (adversely affecting residents, school children, hospital patients, the elderly, etc.).

The Basin is designated as an attainment/maintenance area for the federal CO standards and an attainment area for state standards. There has been a decline in CO emissions even though vehicle miles traveled on U.S. urban and rural roads have increased. On-road mobile source CO emissions have declined 24 percent between 1989 and 1998, despite a 23 percent rise in motor vehicle miles traveled over the same 10 years. California trends have been consistent with national trends; CO emissions declined 20 percent in California from 1985 through 1997 while vehicle miles traveled increased 18 percent in the 1990s. Three major control programs have contributed to the reduced per-vehicle CO emissions: exhaust standards, cleaner burning fuels, and motor vehicle inspection/maintenance programs.

According to the SCAQMD CEQA Air Quality Handbook, a potential CO hotspot may occur at any location where the background CO concentration already exceeds 9.0 parts per million (ppm), which is the 8-hour California ambient air quality standard. As previously discussed, the project site is located in SRA 4, South Coastal LA County. Communities within SRAs are expected to have similar climatology and ambient air pollutant concentrations. The monitoring station representative of SRA 4 is the Long Beach-Hudson monitoring station, which is located approximately 2.71 miles west of the project site. The highest CO concentration at the Long Beach-Hudson monitoring station was measured at 4.7 ppm in 2018. As such, the background CO concentration does not exceed 9.0 ppm and a CO hotspot would not occur. Therefore, CO hotspot impacts would be less than significant in this regard.

Air Quality Health Impacts

As evaluated above, the project's air emissions would not exceed the SCAQMD's LST thresholds, and CO hotpots would not occur as a result of the proposed project. Therefore, the project would not exceed the most stringent applicable federal or state ambient air quality standards for emissions of CO, NOX, PM10, or PM2.5. It should be noted that the ambient air quality standards

are developed and represent levels at which the most susceptible persons (children and the elderly) are protected. In other words, the ambient air quality standards are purposefully set in a stringent manner to protect children, elderly, and those with existing respiratory problems. Thus, an air quality health impact would be less than significant in this regard.

Soil Vapor Extraction System

No ongoing SVE activity is occurring at this time or will occur during site grading and construction. Previous SVE remediation operated under a temporary "various locations" permit. The one-year period of operation has expired and the equipment has been removed.

The SVE system will be designed to provide a negative vacuum "capture zone" throughout the property, including the footprint above the air sparge groundwater barrier at the southern and western perimeters. Injected air will be recovered by the SVE wells to minimize potential off-site migration of soil vapors from the Project Site. The potential for vapor migration is mitigated through ongoing operation and monitoring to ensure that the SVE system is providing adequate capture of vapors. Standard adjustments that are made during system operation include optimization of the operating vacuum above the air sparge curtain, and adjustments to the air sparge flowrate/pressure. The SVE/AS system as designed, and using standard operating and monitoring practices, will provide capture of the injected air and draw contaminants in the vapor phase into the system for treatment.

Emissions from the SVE extraction system will be treated prior to discharge using a thermal/catalytic oxidizer. Furthermore, the new system will be operated under a South Coast Air Quality Management District (SCAQMD) permit and will be operated in compliance with SCAQMD Rule 1147. Both SCAQMD Rule 1147 and the site-specific permit will impose strict emissions limits on the system. The new system's vapor extraction volume and emission abatement equipment will be specifically designed to comply with the emission limits established by SCAQMD. Those limits will be determined through a quantitative health risk assessment to identify specific types and levels of emissions and potential cancer and non-cancer health risks. System control measures will be imposed, as warranted, to ensure that any atmospheric emissions from the SVE system are below the SCAQMD health risk thresholds. Given the pre-emission treatment and SCAQMD limits the system must comply with, operation of the SVE system would not result in significant health risk impacts. Further details regarding the characteristics of the SVE system and the SCAQMD permitting procedures are provided below.

SCAQMD does allow and permit devices which are anticipated to release TACs, such as those that can be anticipated from an SVE system. The thermal/catalytic oxidizer which will be installed to treat emissions from the SVE system is a best available control technology, designed with a contaminant destruction efficiency of over 99%. An estimated range of anticipated emissions are as follows:

Range of Anticipated SVE System TAC Emissions			
TAC	(lbs/day)		
Benzene	0.03	to	0.10
Ethylbenzene	0.04	to	0.18
Toulene	0.03	to	0.22
o-Xylene	0.04	to	0.06
m,p-Xylene	0.07	to	0.34

Source: RMD, April 2020

As part of the permitting process, SCAQMD has developed standards and rules designed to protect human health. During the permit application process, the applicant (Signal Hill XC in this case) will provide SCAQMD with the concentrations of the TACs present at the site. As part of the application process, estimated emission limits will be included for each anticipated TAC subject to SCAQMD Rule 1401. The SCAQMD assigned engineer then evaluates the health risk associated with the proposed exhaust TAC emissions, based on Rule 1401, and may grant the permit with the proposed emission limits, or may require the applicant to further reduce certain limits as needed, based on the health risk results. It is our understanding that the SVE system TAC emissions must meet a risk threshold of 1x10-5. Additional details regarding SCAQMD's risk evaluation process and procedures during the permitting process can be found on their Risk Assessment page. The project proponent is currently designing the SVE system, which will identify the specific types of TACs and emission levels that would occur, along with the control mechanisms to ensure that emission levels are below the limits specified by SCAQMD. As specified in Mitigation Measure III-3, below, an approved SCAQMD permit for the SVE system will be required to be submitted to the City, prior to issuance of a building permit for the proposed project.

The SVE system emissions would be regularly monitored by both hand-held field sampling device (photo-ionization detector (PID)) and periodic samples collected for laboratory analysis to ensure that the device is compliant with permit conditions and is protective of public health. Monitoring is conducted pursuant to an SCAQMD permit and is reported quarterly.

To ensure that the project's SVE system is fully approved and permitted in accordance with SCAQMD regulations, Mitigation Measure III-3 has been added, as follows:

> **MM III-3:** Evidence of issuance of an SCAQMD permit for the SVE system shall be provided to the City of Signal Hill, prior to issuance of a building permit.

Health Risk Assessment-Daily Trucks Diesel Emissions

Surrounding land uses include a recently developed apartment complex and the American University of Health Sciences office complex to the north; the Jenni Rivera linear park, single- and multifamily residences, a Los Angeles County Sanitation District pump house, and school district bus maintenance facility to the south; an office complex and gated townhomes and apartments to the east; and a mix of light industrial land uses to the west. Access to the project site is provided via the existing circulation network, with Hill Street to the north, Alamitos Avenue and 20th Street

to the south, Gaviota Avenue to the east, and Gundry Avenue to the west. Walnut Avenue, which runs north/south, bisects the site, creating two distinct development sites on the east and west.

The western side of project site has been designated for light industrial land uses in the Signal Hill General Plan and Zoning Ordinance for a number of years. The proposed light industrial project is consistent with these existing land use policies. A general plan amendment and zone change is required to change the current Commercial Office designation for the smaller portion of the site located on the eastern side of Walnut Avenue.

Heavy duty trucks powered by diesel engines generate diesel particulate matter in their exhausts, which are considered in California to be toxic air contaminants (TACs). In some instances, these logistics businesses may involve cold storage activities (e.g., for food and beverage storage) that attract trucks equipped with transportation refrigeration units (TRUs) that are powered by diesel motors that create additional sources of diesel particulate emissions. Given these sources of TACs, both SCAQMD and the California Air Resources Board have published guidance documents to provide local agencies with recommendations on siting such land uses in a way that reduces exposure of sensitive land uses to the TACs from trucking emissions. Considerable spatial buffers between such trucking dominated logistics businesses and neighboring residential or other sensitive land uses is one of those recommendations. South Coast AQMD adopted the Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning[3] in 2005. Additional guidance is available in the CARB's Air Quality and Land Use Handbook: A Community Health Perspective, available at: https://www.arb.ca.gov/ch/handbook.pdf. For warehouses that accommodate more than 100 trucks per day, or more than 40 trucks with operating transport refrigeration units (TRUs) per day, a 1,000-foot separation between sensitive land uses (e.g., residential uses)[4] and the operating warehouse is recommended.

The two guidance documents referenced above are not regulatory; they provide generalized guidelines to inform local agencies about air quality issues to consider in the local land use planning programs and in site specific land use decisions. The type of warehouse uses that are of concern in these guidances involve large-scale logistics facilities that are designed to be operated with numerous heavy duty trucks to facilitate transport of finished and unfinished materials and merchandise between suppliers and consumers.

As noted throughout the Draft IS/MND, the proposed project is not designed as a logistics facility. There are no truck loading docks at any building. The driveways and vehicle maneuvering areas are not configured to enable ingress/egress by large, heavy duty trucks. The buildings are designed for multiple, relatively small tenants of various types, in spaces of 7,650 to 27,530 square feet. As stated in the project description section of the Draft IS/MND, the project is designed for occupancy by businesses engaged in a variety of light industrial activities permitted in the City's Light Industrial Zone, such as light manufacturing, warehousing and assembly of products for consumers and businesses, limited sales of home furnishings and other products,

[3] South Coast AQMD. May 2005. Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning. Accessed at: http://www.aqmd.gov/home/library/documents-support-material/planning-guidance/guidance-document.

[4] CARB. Air Quality and Land Use Handbook: A Community Health Perspective. Page 4. Accessed at: https://www.arb.ca.gov/ch/handbook.pdf.

and research facilities. Each building will be designed to meet the specifications of the occupants, who will lease or own their space. Up to 22 percent of the space may be allocated for office activities directly related to the primary business. The range of permitted and conditionally permitted uses would be limited to those identified in Section 20.20.020 of the Signal Hill Municipal Code, provided that there is sufficient parking in accordance with Section 20.70.030 of the Municipal Code. As such, there would be no large-scale packaging and shipping operations that would be supported by heavy duty trucks, with or without TRUs.

Businesses that would include cold storage are not anticipated within the proposed project, because it would be a difficult and expensive construction process to modify these buildings with the electrical services, freezer equipment, and insulation improvements necessary to provide a cold storage facility. The project applicant, who specializes in development and management of light industrial projects like this one, has found that cold storage users typically don't occupy these types of small business parks. Tenants would be prohibited from operating with cold storage facilities to prevent TRU emissions from truck deliveries, and this will be specified as a project condition of approval.

An operational Health Risk Assessment (HRA) was conducted to quantify the carcinogenic effects from the diesel exhaust generated by 348 daily truck trips. It was determined by the consulting traffic engineer that these 348 truck trips would be split evenly between 2-axle "light duty trucks" and 3-axle "medium-duty trucks," with no heavy duty trucks, based on the design of the proposed project with relatively small tenant spaces, no truck loading docks, and insufficient area to maneuver large/heavy trucks. The HRA was prepared in accordance with SCAQMD methodological standards and the supporting modeling worksheets are provided in Section 4B herein. Cancer risks were evaluated for 30-year, 25 -year worker, and 9-year exposure scenarios. The HRA is included as Section 3B in the Final MND. Potential health risk effects were analyzed at a total of 9,788 individual sensitive receptor locations, to capture the maximum individual cancer risk (MICR) within a 2.5 kilometer by 2.5 kilometer radius. In addition, smaller sensitive receptor grids of 10 meters (33 feet) by 10 meters (33 feet) or less were modeled over nearby sensitive receptors of concern:

- Zinnia Apartment complex (1480 East Hill Street, Signal Hill, CA 90755) adjacent to the north of the project site (SR 1);
- Jenni Rivera Memorial Park (2001 Walnut Avenue, Long Beach, CA 90806) adjacent to the south of the project site (part of the Discrete Receptor Grid; labeled as "Jenni");
- American University of Health Sciences (1600 East Hill Street, Signal Hill, CA 90755) to the east of the project site (SR2);
- Signal Hill Elementary School (1600 East Hill Street, Signal Hill, CA 90755) to the north of the project site (SR3);
- Signal Hill Park (2175 Cherry Avenue, Signal Hill, CA 90755) to the east of the project site (SR4);

- Alvarado Elementary School (1900 E 21st Street, Signal Hill, CA 90755) to the east of the project site (SR5);and
- Butler Middle School/ Long Beach City College Pacific Coast Campus (1400 East 20th Street, Long Beach, CA 90806) to the south of the project site (SR6).

The HRA determined that the maximum incremental cancer risk (MICR) at any of the sensitive receptor locations would occur along the northern edge of the project site, with a calculated MICR of 5.29 in one million for a 30-year exposure, which is below the SCAQMD significance threshold of 10 in one million. The maximum 25-year worker exposure would be 0.40 in one million, and the maximum 9-year exposure would be 1.84 in one million, both well below the 10 in one million significance threshold. The calculated MICR at Jenni Rivera Park, for a 6-month exposure period, is 0.59 per one million-- again, far below the threshold of 10 in one million.

An acute or chronic hazard index of 1.0 is considered individually significant for non-cancer health risks. The highest maximum chronic and acute hazard index associated with the emissions from the project at sensitive receptors would be 0.0013 and 0.0118 respectively, well below the significance threshold. Based on the results of the HRA, the project would not result in significant cancer or non-cancer health risks due to daily trucking emissions.

d) Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Less Than Significant Impact. According to the SCAQMD CEQA Air Quality Handbook, land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The proposed project does not include any uses identified by the SCAQMD as being associated with odors and would not generate heavy truck trips with high concentrations of diesel exhaust or other emissions leading to odors. In addition, California Health & Safety Code, Division 26, Part 4, Chapter 3, Section 41700 prohibits the emission of any material which causes nuisance to a considerable number of persons or endangers the comfort, health, or safety of the public. Projects required to obtain permits from SCAQMD, typically industrial and some commercial projects, are evaluated by SCAQMD staff for potential odor nuisance and conditions may be applied (or control equipment required) where necessary to prevent occurrence of public nuisance.

Construction activities associated with the project may generate detectable odors from heavy-duty equipment exhaust. Construction-related odors would be short term in nature and cease upon project completion. Additionally, the project site is designated as Light Industrial, which allows for a variety of nonpolluting light industrial uses and can coexist with surrounding commercial and residential uses. Therefore, the project would not emit other types of emissions, including emissions leading to odors, adversely affecting a substantial number of people. Impacts would be less than significant.

Section 4: Supplemental Analyses of Air Emissions

In response to comments submitted by the South Coast Air Quality Management District and the City of Long Beach, supplemental analyses of the project's construction period and operational air emissions were prepared. Part of these supplemental analyses involved adjustments to certain modeling inputs and re-quantification of construction and long-term emissions, along with additional construction emissions reduction measures to be implemented during the grading phase, and prior to building occupancy. The other part involved preparation of a quantitative operational health risk assessment (HRA), to provide a more detailed evaluation of potential cancer and non-cancer health risks associated with diesel exhausts from light and medium-duty trucks that would make deliveries and pick-ups on a daily basis.

Results of the updated construction emissions calculations determined that the gaseous and particulate emissions during grading, and those associated with drilling rigs that will be used to install the proposed Soil Vapor Extraction system and groundwater monitoring wells, would be well below the SCAQMD local and regional thresholds of significance, with the revised mitigation measures identified in the responses to SCAQMD comments. Updated operational emissions calculations, reflecting current building energy efficiency standards and vehicle emissions factors confirmed that emission levels would be well below the SCAQMD significance thresholds, and lower than what was presented in the Draft IS/MND. Section 4A contains the updated CalEEMod worksheets used to re-quantify the construction period emissions and the benefits of the proposed mitigation measures.

Results of the operational HRA determined that emissions of diesel particulate matter from light and medium duty trucks would be well below the SCAQMD thresholds for both cancer and non-cancer health risks. This analysis is based on a restriction that there would be no tenants allowed that incorporate cold storage facilities, which would require trucks that are equipped with diesel-fueled transport refrigeration units. That restriction will be imposed through a condition of approval and enforced through subsequent building permits and certificates of occupancy administered by the City of Signal Hill. The supporting calculations and modeling worksheets for the HRA are provided in Section 4B.

4A: Updated CalEEMod Worksheets

2020 Walnut Industrial Park

Los Angeles-South Coast County, Winter

1.0 Project Characteristics

1.1 Land Usage

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Replace Ground Cover

Water Exposed Area

Water Unpaved Roads

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	513	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

2020 Walnut Industrial Park - Los Angeles-South Coast County, Summer

Project Characteristics - CO2 Intensity Factor Source: Southern California Edison, 2018 Sustainability Report, dated May 2019.

Land Use - Per GAA Architects Sheet No. A1.0, total building area for nine light industrial buildings is 153,000 square feet and parking provided is 266 spaces.

Construction Phase - Per construction questionnaire.

Off-road Equipment -

Off-road Equipment - Per construction questionnaire.

Off-road Equipment - Per construction questionnaire.

Off-road Equipment - Per construction questionnaire.

Trips and VMT - Grading hauling trip length based on weighted average.

Grading - Per construction questionnaire.

Vehicle Trips - Per Traffic Impact Analysis.

Construction Off-road Equipment Mitigation - Per SCAQMD standards and regulations. Tier 4 grading equipment & Tier 3 monitoring well installation equipment.

Area Mitigation - Per SCAQMD Rule 1113

Energy Mitigation - % Improvement based on efficiency of 2019 Title 24 Standards compared to 2016 Title 24 Standards.

Waste Mitigation -

Vehicle Emission Factors - EMFAC 2017

Vehicle Emission Factors - EMFAC 2017

Vehicle Emission Factors - EMFAC 2017

Off-road Equipment - Per applicant.

Architectural Coating - Per SCAQMD Rule 1113

Fleet Mix - Per traffic study

Energy Use -

Water Mitigation -

2020 Walnut Industrial Park - Los Angeles-South Coast County, Annual

Project Characteristics - CO2 Intensity Factor Source: Southern California Edison, 2018 Sustainability Report, dated May 2019.

Land Use - Per GAA Architects Sheet No. A1.0, total building area for nine light industrial buildings is 153,000 square feet and parking provided is 266 spaces.

Construction Phase - Per construction questionnaire.

Off-road Equipment -

Off-road Equipment - Per construction questionnaire.

Off-road Equipment - Per construction questionnaire.

Off-road Equipment - Per construction questionnaire.

Trips and VMT - Grading hauling trip length based on weighted average.

Grading - Per construction questionnaire.

Vehicle Trips - Per Traffic Impact Analysis.

Construction Off-road Equipment Mitigation - Per SCAQMD standards and regulations. Tier 4 grading equipment & Tier 3 monitoring well installation equipment.

Area Mitigation - Per SCAQMD Rule 1113

Energy Mitigation - % Improvement based on efficiency of 2019 Title 24 Standards compared to 2016 Title 24 Standards.

Waste Mitigation -

Vehicle Emission Factors - EMFAC 2017

Vehicle Emission Factors - EMFAC 2017

Vehicle Emission Factors - EMFAC 2017

Off-road Equipment - Per applicant.

Architectural Coating - Per SCAQMD Rule 1113

Fleet Mix - Per traffic study

Energy Use -

Water Mitigation -

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Replace Ground Cover

Water Exposed Area

Water Unpaved Roads

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

3.2 Grading - 2020

Energy Worksheets

Vehicle Type	Percent of Vehicle Trips[1]	Daily Trips[2]	Annual Vehicle Miles Traveled[3]	Average Fuel Economy (miles per gallon)[4]	Total Annual Fuel Consumption (gallons)[5]
Passenger Cars	0.55	--	5622107.57	22	255,550
Light/Medium Trucks	0.37	--	3796926.84	17.3	219,476
Heavy Trucks/Other	0.08	--	859041.59	6.4	134,225
TOTAL [6]	***1.00***	--	***10,278,076***	**--**	***609,251***

Notes:

1. Percent of Vehicle Trip distribution based on trip characteristics within the CalEEMod model.
2. Daily Trips calculated by multiplying the total daily trips by percent vehicle trips (i.e., Daily Trips x percent of Vehicle Trips).
3. Daily Vehicle Miles Traveled (VMT) calculated by multiplying percent vehicle trips by total VMT (i.e., VMT x percent of Vehicle Trips).
4. Average fuel economy derived from the Department of Transportation.
5. Total Daily Fuel Consumption calculated by dividing the daily VMT by the average fuel economy (i.e., VMT/Average Fuel Economy).
6. Values may be slightly off due to rounding.

									945
	Total truck trips[1]		348.00	174					

Notes.

1. Light industrial and industrial park land uses generate more light duty truck trips than medium duty truck trips. Therefore, assuming 50% light duty and 50% medium duty would provide a conservative estimate.

2. Based off the Traffic Impact Analysis Project Trip Distribution, it is assumed that 50% of the trip would occur on the northern portion of the site (TR1-3) and remaining 50% would occur on the southern portion of the site (TR4-6).

HARP2 - HRACalc (dated 19044) 6/14/2020 6:36:52 PM - Output Log

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors set to 0
****
RISK SCENARIO SETTINGS

Receptor Type: Worker
Scenario: Cancer
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER

Start Age: 16
Total Exposure Duration: 25

Exposure Duration Bin Distribution
3rd Trimester Bin: 0
0<2 Years Bin: 0
2<9 Years Bin: 0
2<16 Years Bin: 0
16<30 Years Bin: 0
16 to 70 Years Bin: 25

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: False
Water: False
Fish: False
Homegrown crops: False
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

****
INHALATION

Daily breathing rate: Moderate8HR

Worker Adjustment Factors
Worker adjustment factors enabled: NO

Fraction at time at home
3rd Trimester to 16 years: OFF
16 years to 70 years: OFF

****
SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.05
Soil mixing depth (m): 0.01
Dermal climate: Mixed

****
TIER 2 SETTINGS
Tier2 not used.

****

Calculating cancer risk
Cancer risk breakdown by pollutant and receptor saved to: C:\HARP2 ADMRT\2020 WALNUT INDUSTRIAL\hra\25yr_CancerRisk.csv
Cancer risk total by receptor saved to: C:\HARP2 ADMRT\2020 WALNUT INDUSTRIAL\hra\25yr_CancerRiskSumByRec.csv
