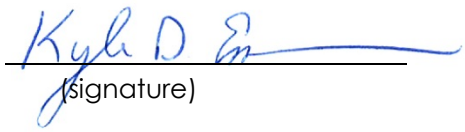
PHASE I ENVIRONMENTAL SITE ASSESSMENT

This document entitled Phase I Environmental Site Assessment was prepared by Stantec Consulting Services Inc. (Stantec) for GNAP Development, LLC and GLC Fullerton LLC, a Delaware Limited Liability Company. The material in it reflects Stantec's best judgment in light of the information available to it at the time of preparation. Any use which a third party makes of this report, or any reliance on or decisions made based on it, are the responsibilities of such third parties. Stantec accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

All information, conclusions, and recommendations provided by Stantec in this document regarding the Phase I ESA have been prepared under the supervision of and reviewed by the professionals whose signatures appear below.



I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in § 312.10 of 40 CFR 312. I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Property. I have developed and performed all the appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

1.0 SUMMARY

Stantec has prepared this Phase I Environmental Site Assessment (ESA) report for the property located at 2001 East Orangethorpe Avenue (the "Property"), on behalf of GNAP Development LLC and GLC Fullerton LLC, a Delaware Limited Liability Company (the "Client"). The work was performed according to Stantec's proposal and terms and conditions dated July 17, 2019 and accepted by Client on the same date. GNAP Development LLC and GLC Fullerton LLC (the "Users") have been designated as the Users of this report.

The Phase I ESA was conducted in general conformance with the requirements of American Society for Testing and Materials (ASTM) Designation E 1527-13 and All Appropriate Inquiries (AAI) Final Rule 40 CFR Part 312, except as may have been modified by the scope of work, and terms and conditions, requested by the Client. Any exceptions to, or deletions from, the ASTM practice are described in the report.

The Property is comprised of two (2) parcels of land totaling approximately 65 acres in the City of Fullerton, Orange County, California. The Property is developed and currently operates as the KCC Fullerton Mill (paper mill) with over 1.2-million square feet of manufacturing, warehouse, office space, and other support buildings used for equipment and chemical storage, fire-suppression and other manufacturing related uses. The Property was developed for industrial purposes by KCC in 1955 and originally included buildings 1 through 6. In the years that followed several buildings were added to the mill to support product demand. At the height of production, historical manufacturing of other KCC product lines at the Fullerton mill included colored paper, diapers, and feminine hygiene products. Current manufacturing processes are reported to include only white paper manufacturing, facial and bath tissue production, on-site equipment/tool repair, and warehousing with support administrative activities. The Property was also formerly used for agricultural purposes and these former uses remain evident today as citrus and avocado groves currently occupy portions of the Property (Figure 2).

Former and current manufacturing operations have been supported with numerous structures, processes and chemicals that could potentially result in environmental impact to the Property (e.g., underground fuel storage tanks, above ground tanks, piping, clarifiers, drains, process areas, drum storage areas, etc.). Chemicals of potential concern include solvents, petroleum hydrocarbons, pH, metals, polychlorinated biphenyls [PCBs], phthalates, polycyclic hydrocarbons, etc.). Bleaching of wood-pulp has also been linked to the formation of dioxins under certain processing conditions; however, KCC does not believe that wood-pulp bleaching was ever conducted at this facility.

Groundwater beneath the Property is reported to be impacted with various VOCs, including chlorinated solvents, at concentrations in excess of allowable maximum contaminant levels (MCLs). The presence of VOC-contaminated groundwater beneath the Property poses a potential vapor intrusion concern to existing and future property users. Multiple potentially responsible parties (PRPs) have been named in a proposed Superfund action (i.e. the Orange

County North Basin) to address groundwater contamination. KCC has not been named as a PRP in the pending Superfund action; however, review of available EPA records indicate that KCC historically used chlorinated solvents including tetrachloroethylene (PCE) and 1,4-Dioxane, the primary regional groundwater contaminants in the proposed Orange County North Basin Superfund Site.

Conclusions

This assessment has revealed the existence of the following potential recognized environmental conditions (RECs) in connection with the Property:

- Off Site Sources (including Regional Groundwater Impacts):
    - The following nearby off-Site facilities have, or may have, contributed VOCs and other contaminants to soil, groundwater, and soil vapor that may potentially impact the Property:
        - Trent Tube Division, 2100 E. Orangethorpe Avenue
        - Orange County Metal Processing, 1711 E. Kimberly Avenue
        - PCE Metal Finishing, 1723 E. Kimberly Avenue
        - Khyber Food, Inc, 1818 E. Rosslynn Avenue
        - Alcoa Global Fasteners, Inc, 800 S. State College Boulevard
        - Winonics, Inc., 1257 S. State College Boulevard
        - Chapman Coast Roofing, Co., 2301 E. Orangethorpe Avenue
        - Vista Paint, 2020 E. Orangethorpe Ave
        - St Hart Container MPP Fullerton, 1901 E. Rosslynn Avenue
        - Golden West Towing Equipment, 1850 E. Orangethorpe Avenue
- General Exterior Areas:
    - Historical Agricultural Use (Orchards) – possible source of organochlorine pesticides and herbicides containing arsenic and lead
    - Railroad spurs – possible source of herbicides, metals, petroleum hydrocarbons, pesticides and polychlorinated biphenyls (PCBs)
    - Industrial wastewater discharge point – potential source of VOCs, metals, petroleum hydrocarbons and other contaminants
    - Forklift wash area and sump – potential releases related to past cleaning operations
    - Tank farm unloading area, diesel UST, and sump – potential source of VOCs, petroleum hydrocarbons and other contaminants
    - Stormwater discharge point – potential source of VOCs, petroleum hydrocarbons and other contaminants

- Four former USTs adjacent to a non-specific "loading dock" as indicated in OCHCA records. The USTs are reported to have contained mineral spirits, dioctyl phthalate and vinyl acetate: potential source of VOCs, petroleum hydrocarbons, phthalates and other contaminants.

- General Interior
  - Sub-slab soil vapor and indoor air – potential vapor intrusion risk associated with potential on-site releases and contaminated groundwater related to regional groundwater impacts beneath most of the property.
  - Building 1
    - Basement – potential source of VOCs, petroleum hydrocarbons, PCBs, and other contaminants
    - Maintenance Shop PCE Parts Washer: potential source of VOCs
    - Maintenance Shop Floor Drain: potential source of VOCs, petroleum hydrocarbons, and other contaminants.
  - Building 3
    - Battery storage area – etching and staining to battery storage and charging processes may be a potential source of acids and metals
  - Building 3/8
    - Maintenance shop PCE part washer: potential source of VOCs
  - Building 4
    - Boiler Building Area, Two Former USTs: Potential source of VOCs and petroleum hydrocarbons
    - Wastewater treatment area: potential source of VOCs, petroleum hydrocarbons, metals and other contaminants
  - Building 8
    - UCON area Sump pit and trench drains: Potential source of VOCs, petroleum hydrocarbons and other contaminants
    - Former ink dye area wash-down/ cleaning area with trench drains: Potential source of VOCs, petroleum hydrocarbons, PCBs, and other contaminants
    - Bath area sump pit: potential source of VOCs, petroleum hydrocarbons and other contaminants
  - Building 10
    - Tractor Shop PCE part washer location: Potential source of VOCs
  - Building 25
    - Chemical Storage Area, three sumps: Potential source of VOCs, metals, petroleum hydrocarbons and other chemicals

The locations of the above RECS are shown on Figure 2.

Recommendations

Based on the conclusions of this Phase I ESA, Stantec recommends that a preliminary Phase 2 assessment be performed at the above referenced locations to evaluate whether releases have occurred that have affected subsurface media at the Property above regulatory cleanup thresholds or human health risk levels. To this end, Stantec has prepared a *Work Plan for Preliminary Phase 2 Investigations* concurrently with this report that details the scope of work for the recommended preliminary assessment.

With regard to the data gap associated with the four (4) USTs for which there is no location information or soil sample data provided in historical records, Stantec recommends that a Soil Management Plan (SMP) be prepared that would discuss actions that would need to be taken in the event that impacted or potentially impacted soil is encountered during Property redevelopment. Such actions taken would include, but are not limited to, field evaluation, soil sampling, and potential excavation/remediation.

In addition, Stantec has identified the following non-ASTM environmental issues associated with the Property:

- **Asbestos Containing Materials.** Given the age of the existing buildings on the Property (some constructed as early as the mid-1950s), the presence of ACM is considered likely. Stantec recommends conducting a comprehensive, pre-demolition survey in accordance with the sampling protocol of the Asbestos Hazard Emergency Response Act (AHERA) prior to any activities with the potential to disturb building materials to determine whether ACM are present. Further, in the event ACM is detected, Stantec recommends proper removal and disposal of the materials identified prior to any activities with the potential to disturb them.

  Portions of the property are paved with asphalt. A stress absorbing fabric marketed as Petromat is sometimes used in asphalt paving operations. The tack coating often associated with this material sometimes contains asbestos. Should development plans include demolition of the asphalt, Stantec recommends inspecting the asphalt for the presence of Petromat and, if observed, sampling the Petromat for the presence of asbestos.

  Additionally, Stantec makes no warranty as to the possible existence or absence of inaccessible materials (buried transite, wrapped, or coated piping) or to their evaluation with respect to asbestos content. Samples of suspect ACM should be collected for laboratory analysis of asbestos prior to any renovation or building demolition, in order to determine the need for compliance with EPA National Emission Standard for Hazardous Air Pollutants (NESHAP) regulations.

- **Lead Based Paint.** Given the age of the existing buildings on-Property (some constructed in the mid-1950's), the presence of lead-based paint (LBP) is considered likely. Stantec recommends conducting a LBP survey, prior to any activities with the potential to disturb building materials to determine whether LBP is present. Further, in the event LBP is

detected, Stantec recommends removing the materials prior to any activities with the potential to disturb them.

- **Universal Wastes -** Fluorescent light ballasts, mercury switches and other common building components were observed in buildings and may contain hazardous materials. These should be properly handled and disposed of in accordance with regulatory guidelines prior to demolition.

2.0 INTRODUCTION

The objective of this Phase I ESA was to perform all appropriate inquiry into the past ownership and uses of the Property consistent with good commercial or customary practice as outlined by the ASTM in "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process", Designation E1527-13. The purpose of this Phase I ESA was to identify adverse environmental conditions including recognized environmental conditions ("RECs") of the Property.

The ASTM E1527-13 standard indicates that the purpose of the Phase I ESA is to identify RECs, including historical recognized environmental conditions ("HRECs"), and controlled recognized environmental conditions ("CRECs") that may exist at a property. The term "recognized environmental conditions" means the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property:

(1) Due to any release to the environment;

(2) Under conditions indicative of a release to the environment; or

(3) Under conditions that pose a material threat of a future release to the environment.

ASTM defines an "HREC" as a REC that has occurred in connection with the property, but has been addressed to the satisfaction of the applicable regulatory authority and meets unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). Before calling the past release a HREC, the environmental professional must determine whether the past release is a REC when the current Phase I ESA is conducted (for example, if there has been a change in the regulations). If the EP considers the past release to be a REC at the time the Phase I ESA is conducted, the condition shall be included in the conclusions section of the report as a REC.

ASTM defines a "CREC" as a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), but with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).

De minimis conditions are not RECs. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. As indicated, the term REC does not include de minimis conditions, which generally do not present a material risk to human health and would not likely be subject to enforcement action if brought to the attention of governmental agencies.

This ESA was conducted in accordance with ASTM E 1527-13. The scope of work conducted during this Phase I ESA consisted of a visual reconnaissance of the Property, interviews with key individuals, and review of reasonably ascertainable documents. The scope of work did not include an assessment for environmental regulatory compliance of any facility ever operated at the Property (past or present), or sampling and analyzing of environmental media. Stantec was not contracted to perform any independent evaluation of the purchase or lease price of the Property and its relationship to current fair market value. The conclusions presented in this ESA Report are professional opinions based on data described herein. The opinions are subject to the limitations described in Section 2.3.

ASTM E1527-13 notes that the availability of record information varies from source to source. The User or Environmental Professional is not obligated to identify, obtain, or review every possible source that might exist with respect to a property. Instead, ASTM identifies record information that is reasonably ascertainable from standard sources. "Reasonably ascertainable" means:

(1) Information that is publicly available;

(2) Information that is obtainable from its source within reasonable time and cost constraints; and

(3) Information that is practicably reviewable.

2.1 PROPERTY DESCRIPTION

The Property consists of two (2) parcels totaling approximately 65 acres of land in the City of Fullerton, Orange County, California, as summarized in the table below.

Operating Business	Assessors Identification Number (AIN)	Associated Addresses	Approximate Area (acres)
Kimberly-Clark Corporation (KCC)	073-120-31	2001 East Orangethorpe Ave	16.35
KCC	073-120-33	2001 East Orangethorpe Ave	48.65

The KCC parcels are developed with over 1.2 million square feet of manufacturing, warehouse, and office space – including several outbuildings and infrastructure that support paper manufacturing and processing activities. Approximately 7.75 acres of the eastern portion of the Property and 2.5 acres of the southwest portion remain as citrus orchards.

A Property location map is illustrated on Figure 1. A Property map illustrating the main features of the Property is provided as Figure 2. Photographs taken during the Property reconnaissance visit are provided in Appendix A.

2.2 SPECIAL TERMS, CONDITIONS, AND SIGNIFICANT ASSUMPTIONS

There were no special terms, conditions, or significant assumptions associated with the Phase I ESA.

2.3 EXCEPTIONS AND LIMITING CONDITIONS

This report documents work that was performed in accordance with generally accepted professional standards at the time and location in which the services were provided. No other representations, warranties or guarantees are made concerning the accuracy or completeness of the data or conclusions contained within this report, including no assurance that this work has uncovered all potential and actual liabilities and conditions associated with the identified property.

This report provides an evaluation of selected environmental conditions associated with the identified portion of the property that was assessed at the time the work was conducted and is based on information obtained by and/or provided to Stantec at that time. (40 CFR 312.20(f)(2) requires that the Environmental Professional evaluate the thoroughness and reliability of provided information.) Stantec assumes no responsibility for any deficiency or inaccuracy in information received from others.

If a service is not expressly indicated, do not assume it has been provided. If a matter is not addressed, do not assume that any determination has been made by Stantec in regard to it.

Conclusions made within this report consist of Stantec's professional opinion as of the time of the writing of this report and are based solely on the scope of work described in the report, the limited data available and the results of the work. They are not a certification of the property's environmental condition.

This report relates solely to the specific project for which Stantec was retained and the stated purpose for which this report was prepared and shall not be used or relied upon by the client identified herein for any variation or extension of this project, any other project or any other purpose.

This report has been prepared for the exclusive use of the client identified herein and any use of or reliance on this report by any third party is prohibited, except as may be consented to in writing by Stantec or as required by law. The provision of any such consent is at Stantec's sole and unfettered discretion and will only be authorized pursuant to the conditions of Stantec's standard form reliance letter. Stantec assumes no responsibility for losses, damages, liabilities or claims, howsoever arising, from third party use of this report.

Project Specific limiting conditions are provided in Section 2.2.

The locations of any utilities, buildings and structures, and property boundaries illustrated in or described within this report, if any, including pole lines, conduits, water mains, sewers and other surface or sub-surface utilities and structures are not guaranteed. Before starting work, the exact

location of all such utilities and structures must be confirmed by the client and Stantec assumes no liability resulting from damage to such utilities and structures.

The conclusions are based on the Property conditions encountered by Stantec at the time the work. Accordingly, additional studies and actions may be required. As the purpose of this report is to identify selected Property conditions which may pose an environmental risk, the identification of non-environmental risks to structures or people on the Property is beyond the scope of this assessment. The findings, observations, and conclusions expressed by Stantec in this report are not an opinion concerning the compliance of any past or present owner or operator of the Property which is the subject of this report with any Federal, state, provincial or local law or regulation.

This report presents professional opinions and findings of a scientific and technical nature. It does not and shall not be construed to offer a legal opinion or representations as to the requirements of, nor compliance with, environmental laws, rules, regulations or policies of Federal, state, provincial or local governmental agencies. Issues raised by the report should be reviewed by client legal counsel.

Stantec specifically disclaims any responsibility to update the conclusions in this report if new or different information later becomes available or if the conditions or activities on the property subsequently change. In the event of any conflict between the terms and conditions of this report and the terms and conditions of the MSA, the MSA shall control.

2.4 PERSONNEL QUALIFICATIONS

This Phase I ESA was conducted by, or under the supervision of, an individual that meets the ASTM definition of an Environmental Professional (EP). The credentials of the EP and other key Stantec personnel involved in conducting this Phase I ESA are provided in Appendix B.

3.0 USER-PROVIDED INFORMATION

ASTM E1527-13 describes responsibilities of the User to complete certain tasks in connection with the performance of "All Appropriate Inquiries" into the Property. The ASTM standard requires that the Environmental Professional request information from the User on the results of those tasks because that information can assist in the identification of RECs, CRECs, HRECs, or *de minimis* conditions in connection with the Property. Towards that end, Stantec requested that the User provide the following documents and information:

Description of Information	Provided (Yes / No)	Description
User Questionnaire	Yes	Mr. Alan Tuntland, Senior Vice President of Goodman provided a user questionnaire; the responses to the questionnaire are provided below. Based on review of the Questionnaire, Mr. Tuntland noted the following: • Environmental Cleanup Lien: None • Activity and Land Use Limitations: None • Mr. Tuntland had no specialized knowledge or experience related to the property or nearby properties. • The purchase price reasonably reflects the fair market value. • Mr. Tuntland indicated the past known uses of the property: as paper/tissue manufacturing • Mr. Tuntland was aware of hydraulic fluids, oils, bleach, and solvents are used at the Property. • Mr. Tuntland indicated that any spills or releases are discussed in the Antea Phase I ESA provided for review. • Mr. Tuntland was aware of an environmental cleanup related to leaking USTs and excavation, as discussed in the Antea Phase I ESA. • Mr. Tuntland provided the following regarding the degree of obvious contamination: Made reference to the leaking UST contamination. • Mr. Tuntland provided a previous Phase I ESA report Stantec for review (Antea, 2018). A copy of the completed user questionnaire is provided in Appendix C.
Environmental Liens or Activity Use Limitations	No	No documents were provided by the seller regarding environmental liens or activity use limitations.

Description of Information	Provided (Yes / No)	Description
Previous Environmental Permits or Reports Provided by User	Yes	Stantec was provided the following environmental report by the User: • *Antea Group, Phase I ESA Report, Kimberly-Clark Corporation, Fullerton Mill, 2001 E. Orangethorpe Ave, Fullerton, California 92831, November 5, 2018.* Stantec's review of the report is discussed in Section 4.4.6.
Additional Documents Provided by User	Yes	Stantec was provided the following environmental report by the User: • Inspection Report excerpt dated February 23, 1989. • Sampling results for wastewater discharge (1993-2008) • Sampling results for F-Kim-2 onsite water well (1985-2006) The 1989 inspection report indicated that ten Safety Kleen degreasing units (parts washers) were located throughout the facility. The cleaning solvent used in the degreasers was reported to be 1,1,1-Trichloroethane (1,1,1-TCA). The limited wastewater discharge sampling results for the sampling events between 1993 and 2008 reported no PCE or TCE. Limited sampling results of water collected from F-KIM-2 between 1985 and 2006 show that PCE ranged from below the laboratory reporting limit to 4.7 ug/L. TCE reached a peak concentration of 1.2 ug/L but was below laboratory reporting limits between January of 1993 and the last listed sampling even in February of 2006.
Purpose of the Phase I ESA	Yes	Due diligence.

4.0 RECORDS REVIEW

The objective of consulting historical sources of information is to develop the history of the Property and surrounding area, in order to evaluate if past uses may have resulted in RECs. Physical setting records are evaluated to determine if the physical setting may have contributed to adverse environmental conditions in connection with the Property. During the review of historical records, Stantec attempted to identify uses of the Property from the present to the Property's first developed use. Stantec's research included the reasonably ascertainable and useful records described in this section.

4.1 PHYSICAL SETTING

A summary of the physical setting of the Property is provided in the table below with additional details in the following subsections.

Topography:	The Property topography slopes to the southwest at elevations ranging from approximately 200 feet above mean sea level (amsl) in the northeast, to approximately 182 feet amsl in the southwest (USGS, 1981).
Soil/Bedrock Data:	The stratigraphy underlying the Property consists primarily of Holocene to Late Pleistocene alluvial fan deposits consisting of unconsolidated to moderately consolidated silt, sand, gravel and cobble/boulder alluvial-fan deposits (USGS, 2006).
Estimated Depth to Groundwater/ Estimated Direction of Gradient:	Information reviewed on Geotracker related to the Orange County North Basin, including data from an adjacent monitoring well along Kimberly Ave, indicates that first groundwater is present at 80 to 120 feet below ground surface (bgs) and flows to the west or southwest.
Note: Property-specific groundwater direction and depth can only be determined by conducting Property-specific testing, which Stantec has not conducted.	

4.1.1 Property Topography and Surface Water Flow

The Property follows the regional gradient to the southwest at elevations ranging from approximately 200 feet above mean sea level (amsl) in the northeast, to approximately 182 feet in the southwest. Surface runoff is expected to travel in that general direction or as redirected by internal Property drainage systems.

4.1.2 Regional and Property Geology

The Property is located in the northern portion of the Peninsular Ranges Geomorphic Province characterized by northwest-southeast trending mountains and faults. The regional surficial geology is described as Holocene to Late Pleistocene age young alluvial-fan deposits consisting of unconsolidated to moderately consolidates silt, sand, cobbles and boulders common to alluvial fan deposits (USGS, 2006). The nearest known active fault is the El Modeno fault which is located approximately 2.25 miles to the southeast (CGS, 2010a). The Property is not located within a designated Alquist-Priolo Special Studies Zone (CGS, 2010b).

4.1.3 Regional and Property Hydrogeology

The Property is located in the Coastal Plain of the Orange County (8-001) groundwater basin. The basin is bounded on the northwest and the north by the Los Angeles-Orange County line; the Whittier fault zone and consolidated rocks of the Puente Hills and Chino Hills to the northeast; consolidated rocks of the Santa Ana Mountains to the east; and consolidated rocks of the Laguna Hills and San Joaquin Hills to the south. The Pacific Ocean bounds the southwest extent of the basin. (Department of Water Resources [DWR], 2004).

The Orange County Water District manages the groundwater basin and has identified three aquifers designated as Shallow, Principal, and Deep. The Shallow aquifer is located at a depth of approximately 80 to 120 feet bgs, the Principal aquifer at approximately 200 to 250 feet, and the Deep aquifer is at depths of more than 850 feet bgs. Based on groundwater sample data, the Shallow and Principal aquifers are impacted with various volatile organic compounds (VOCs), consisting primarily of 1,4-Dioxane, tetrachloroethylene (PCE), and PCE breakdown products. The VOC groundwater plume in the Principal aquifer has been confirmed to be several miles long and over a mile wide and has caused the closure of at least five municipal water supply wells.

In 2014 and 2015, state and local agencies requested that EPA assist in cleanup of groundwater contamination that underlies portions of Fullerton, Anaheim, and Placentia which has now been designated as the "North Basin". The groundwater impacts in the North Basin are the result of spills and leaks from industrial activities over the preceding decades. The EPA is reviewing historical documents and other sources of information to identify Potentially Responsible Parties (PRPs) to assist in funding the cleanup. As part of the remedial investigation/feasibility study (RI/FS) required by the agreement between the EPA and the Orange County Water District (OCWD), OCWD has installed and sampled groundwater monitoring wells and collected other data to help determine the nature and extent of contamination and provide EPA with information needed to develop an initial cleanup plan. According to information available on Geotracker two of these wells are installed immediately north of the Property along Kimberly Avenue.

Information reviewed on Geotracker related to the Orange County North Basin Superfund Site, including data from the two adjacent monitoring wells (MW25 and MW26) along Kimberly Ave, indicates that shallow groundwater in the immediate vicinity of the Property in March of 2015 was located at depths of 68 and 63 feet bgs, respectively, and flows to the west or southwest.

4.2 FEDERAL, STATE AND TRIBAL ENVIRONMENTAL RECORDS

A regulatory agency database search report was obtained from Environmental Data Resources, Inc. (EDR), a third-party environmental database search firm. A complete copy of the database search report, including the date the report was prepared, the date the information was last updated, and the definition of databases searched, is provided in Appendix D.

Stantec evaluated the information listed within the database relative to potential impact to the Property, assessing the potential for impacts based in part on the physical setting. As part of this process, inferences have been made regarding the likely groundwater flow direction at or near the Property. Observations about the Property and surrounding properties made during the Property reconnaissance are provided in more detail in Section 5.

4.2.1 Listings for Property

2001 E. Orangethorpe Ave (Kimberly-Clark Corporation)

The Property (2001 E. Orangethorpe Ave) is listed as under the following environmental databases: RCRA-LQG, ICIS, US AIRS, FINDS, CA EMI, ECHO, CA CHMIRS, CA LUST, CA CERS HAZ WASTE, CA HIST UST, CA CERS TANKS, CA Orange Co. Industrial Site, CA HIST CORTESE, CA NPDES, CA WDS, CA CIWQS, CA CERS, CA AST, CA RGA LUST, CA HAZNET, and ERNS.

The following summarizes pertinent listings:

- The RCRA-LQG database reports that the Property has been operated by KCC since March 1, 1956 and chemical inventories indicate generation of various hazardous wastes, including, but not limited to, unspecified aqueous solutions, off-specification, aged, or surplus inorganics, metals dust, other inorganic solid waste, waste oil and mixed oil, oil/water separation sludge, adhesives, spent non-halogenated solvents, PCE, chromium, lead, 1,4-Dioxane, formaldehyde, and corrosive waste. The facility has received multiple violations related to on-site compliance evaluations and generator usage between 1984 and 2006.

- The US AIRS database reports that the Property has operating and active air permits from 1980 through 2016. No violations are listed.

- The CHMIRS database reports that on February 14, 2002 a release of an estimate 55 gallons fuel oil was encountered during construction excavation work at the former fuel UST locations. A separate release occurred on August 5, 1997 that included a release of an estimated 100 pounds of sodium hypochlorite (bleach) from a 7,150-gallon AST. The spill was contained in the secondary containment berm and cleaned up. A release of sodium hypochlorite also occurred on August 5, 1997 that was contained in an earthen berm and subsequently cleaned up. A release of an unknown volume of diesel fuel occurred onto Kimberly Ave near the north entrance of the Property during a traffic collision on November

3, 2003. The portion of the diesel fuel that was released onto the pavement flowed into the storm drain.

- The LUST database reports that on May 27, 1986, the Property reported a release of diesel fuel from a UST that affected the underlying soil. Excavation and disposal of the diesel impacted soil was performed under the oversight of the Fullerton Fire Department and closure was provided, with concurrence from the Regional Water Quality Control Board (RWQCB), Santa Ana Region (case no. 083001032T) on January 22, 1992. Further discussion regarding the details of this release is provided in Section 4.4.6.

- The CERS HAZ WASTE and CERS AST databases report routine inspections and various violations issued by the Orange County Environmental Health. The violations include, but are not limited to, the lack of secondary containment of an AST, in adequate health and safety equipment, and inadequate emergency response equipment.

- The CA HIST UST database reports the presence of six (6) historical 10,000-gallon USTs – two that were installed in 1956 and three that were installed in 1971. The USTs are listed as containing "product".

- The CA EMI database reports that the Property operates under a South Coast Quality Management District (AQMD) permits for the emission of total organic hydrocarbon gases, reactive organic gases, carbon monoxide, nitrogen oxides, and sulphur oxides between 1987 and 2016 with no reported violations.

- The NPDES database reports that the Property was issued an industrial wastewater discharge permit (WDID no. 8 30I001214) in 1992.

- The HAZNET database reports that the Property has disposed of various hazardous wastes including asbestos containing waste, waste and mixed oil, aqueous solutions with total organic residues of 10 percent or more, other organic solids, PCBs and material containing PCBs, and adhesives.

- The ERNS database reports that separate releases of sodium hypochlorite occurred at the Property in 1990 and 1992. The sodium hypochlorite flowed into a sump and affected soil in the area. In both instances the liquid was pumped from the sump and impacted soil was excavated and disposed.

4.2.2 Adjacent Property Listings

Stantec assessed data presented in the environmental agency database search report to evaluate the potential for conditions to pose a REC, CREC, or HREC for the Property.

Due to the regional westerly groundwater flow direction and documented Orange County North Basin NPL contamination at and downgradient of the subject property, Stantec has evaluated only those sites listed in the EDR Report as located adjacent to or hydraulically upgradient (east)

of the subject property for their potential to impact the subject property. Also, based on the large number of adjacent to or upgradient listings, only those listings with the highest likelihood to be of environmental concern have been summarized below (e.g., PROPOSED NPL, ENVIROSTOR, SEMS, SEMS-ARCHIVE, LUST, SLIC, UST, AST, CA FID UST, SWEEPS UST, HAZNET, HIST CORTESE, and HIST UST).

Based on this evaluation, the following individual facilities were identified as the most likely potential sources of impact to the Property. The basis for why each of the following listed databases does or does not create a REC for the Property is also provided.

Listed Facility Name/Address	Database Listing	Distance/Direction from Property	REC? (YES / NO)
Orange County North Basin 1012 East Elm Ave Fullerton and Anaheim, CA	PROPOSED NPL, SEMS	Regional Groundwater Plume	Yes
The Property is located in an area listed in the Proposed NPL database due to regional groundwater impacts from VOCs. The groundwater impacts in the North Basin are the result of spills and leaks from industrial activities over the preceding decades. The EPA is reviewing historical documents and other sources of information to identify PRPs to assist in funding the cleanup. As discussed in other sections of this report, the documented VOC regional groundwater impacts from off-Property sources constitute a REC to the Property.			
Golden West Towing Equipment 1850 E. Orangethorpe Ave Fullerton, CA	SEMS / RCRA NonGen / NLR / RESPONSE / ENVIROSTOR / CERS HAZ WASTE / Cortese / CERS	100 feet south (cross-gradient)	Yes
This facility is listed in the SEMS and ENVIROSTOR with DTSC (Cal-EPA) listed as the lead agency overseeing environmental cleanup as of August 21, 2017. No specific information is provided. The property is considered a REC as it relates to the OCNB groundwater plume.			
Vista Paint 2020 E. Orangethorpe Ave Fullerton, CA	SEMS / LUST / Hist Cortese / CERS / RCRA-LQG / CPS-SLIC / UST / CERS HAZ WASTE / SWEEPS UST / HIST UST / CA FID UST / US AIRS / EMI / NPDES / WDS / CIWQS / CERS	100 feet south (cross-gradient)	Yes
The facility is listed as LUST site due to a release of substance "107211" (Ethylene Glycol). The release is listed as having affected only soil and was issued case closure from the City of Fullerton Fire Department on March 30, 2009. The facility is also listed in the CERS HAZ WASTE database with multiple violations related to compliance, inspections, and improper labeling or storage of waste. The facility is also listed in several of the databases as having former fuel and waste USTs, and for air emissions between 1987 and 2014. The SLIC database indicates that this facility is a PRP in the OCNB groundwater cleanup. This site is considered a REC as it relates to past chemical releases and potential contribution to the North Basin groundwater plume.			

Listed Facility Name/Address	Database Listing	Distance/Direction from Property	REC? (YES / NO)
Khyber Foods Metalclad Insulation Corporation JC Ford MFG Co 1818 Rosslynn Ave Fullerton, CA	SEMS / LUST / UST/ WDS / CHMIRS / CERS / RCRA-SQG / HAZNET / HISTY UST / CPS-SLIC / REPONSE / ENVIROSTOR / CERS	90 feet north (cross-gradient)	Yes
The facility is listed as LUST and SLIC site due to past releases of gasoline and chlorinated solvents. The release of gasoline is listed as having affected only soil and was issued case closure from the Orange County Local Oversight Program (LOP) on April 9, 1990. The release of chlorinated solvents is listed as having affected soil and groundwater and was issued case closure from the Regional Water Quality Control Board (RWQCB) with no specified date. This facility is considered a REC as it relates to past chemical releases and potential contribution to the OCNB groundwater plume.			
Winonics Inc DBA Bench 2 Bench 1257 S State College Blvd Fullerton, CA	SEMS-ARCHIVE / RCRA-SQG / FINDS / ECHO / ENVIROSTOR / LUST / CPS-SLIC / CA FID UST / CA Orange Co. Industrial Site / TRIS / EMI / CERS / UST /CERS HAS WASTE / SWEEPS UST	Adjacent to the east-southeast	Yes
The various UST databases indicate there may have been one 500-gallon fuel UST and one 2,000-gallon waste UST at this facility in 1992. The LUST database (Case No. 9OUT003) is related to potential contamination of lead, copper, nickel, and chromium to soil. The LUST case was opened in December 1989 during tank closure activities; closure was obtained on February 5, 1990. The SEMS-ARCHIVE database indicates that the facility was investigated by Cal-EPA/DTSC and determined that no further steps will be taken for inclusion of the facility on the NPL. However, the ENVIROSTOR database indicates that an inactive case is open for the site that requires additional evaluation and that the facility is a circuit board manufacturer and reportedly operates a plating line. This facility is considered a REC due to a potential vapor encroachment condition (pVEC).			
PCA Metal Finishing 1723 E. Kimberly Ave Fullerton, CA	SEMS-ARCHIVE / CPS-SLIC / CERS	110 feet north-northwest	Yes
The facility has an open case with DTSC for releases of copper, nickel, and chromium compounds, PCE, and TCE that have affected groundwater, soil, and soil vapor. This site is considered a REC as it relates to past chemical releases and may present a pVEC to the Property.			
Alcoa Global Fasteners, Inc Orange County North Basin – Arconic Global Fasteners 800 S State College Blvd Fullerton, CA	ENVIROSTOR / HIST UST / Orange Co. Industrial Site / EMI / WDS / CPS-SLIC / CERS / CERS HAZ WASTE / CERS TANKS / NPDES / CIWQS	330 feet northeast	Yes
The facility has an open case with the RWQCB and appears to be associated with the OCNB groundwater cleanup for releases of PCE and TCE that have affected groundwater. PCE and TCE have been detected			

Listed Facility Name/Address	Database Listing	Distance/Direction from Property	REC? (YES / NO)
in groundwater as high as 99 and 41 ug/L, respectively. This facility is considered a REC as it relates to past chemical releases and may present a pVEC to the Property.			
St Hart Container MPP Fullerton 1901 E. Rosslynn Ave Fullerton, CA	ENVIROSTOR / VCP / RCRA NonGen / CERS HAZ WASTE / CERS / RCRA-SQG / HAZNET	180 feet north	Yes
The facility has an open case with the DTSC under the voluntary cleanup program (VCP) for releases of PCE that have affected soil and soil vapor. The facility is considered a REC as it relates to past chemical releases and may present a pVEC to the Property.			
Thrifty Oil #303/ARCO 9677 P&M Service Station Target Station 2351 Orangethorpe Ave Fullerton, CA	LUST	300 feet east-southeast	No
This facility has reported two releases that have affect only soil. The first case was issued closure on July 28, 2011and the more recent case is listed with a status of "preliminary site assessment underway". Given that the releases are reported to have only affected soil and that this facility is 300 feet from the east Property boundary, no further investigation is recommended with regard to potential impacts to the Property.			
United Rentals Inc Branch 515 US Rentals 1301 S State College Blvd Fullerton, CA	LUST	300 feet east-southeast	No
This facility reported a release of gasoline that affected soil but was issued closure by the City of Fullerton on January 23, 2001. Given that the release is reported to have only affected soil and that this facility is 300 feet from the southeast Property boundary, no further investigation is recommended with regard to potential impacts to the Property.			
Chevron USA 1803 E. Orangethorpe Ave Fullerton, CA	LUST / HIST UST / CERS	<1 foot	No
Upon further research this facility was located at 1803 W. Orangethorpe Ave, 3.5 miles to the west of the Property.			
Coast Roof Company 2301 E. Orangethorpe Ave Fullerton, CA	UST / AST / CA FID UST / EMI / CERS / SWEEPS UST	<1 foot	No
According to the SWEEPS UST, this facility reportedly had a 10,000-gallon leaded gasoline UST. There are no releases reported in the EDR for this facility. However, given the size of the parcel and that it is adjacent to the Property, the presence or former presence of this UST is considered a REC.			
Myers & Sons, Hi-Way Safety 2304 E. Orangethorpe Ave Fullerton, CA	HIST UST / CA FID UST / UST / SWEEPS UST	100 feet southeast	No
This facility is listed as having had operated a 1,000-gallon gasoline UST. There are no releases associated with this facility. As a result, no further investigation is recommended.			

Listed Facility Name/Address	Database Listing	Distance/Direction from Property	REC? (YES / NO)
Future Foam Covington Development 2451 Cypress Way Fullerton, CA	CERS HAZ WASTE / CERS TANKS / EMI / NPDES / WDS / CIWQS / CERS	130 feet east	No
This facility is listed as operating a fuel AST. There are no releases associated with this facility. As a result, no further investigation is recommended.			

The remaining listings in the database search report provided in Appendix B do not constitute a REC for the Property.

4.3 LOCAL/REGIONAL ENVIRONMENTAL RECORDS

Stantec checked the following sources to obtain information pertaining to Property use and/or indications of RECs in connection with the Property:

4.3.1 Department of Toxic Substance Control (DTSC)

Agency Name Contact Information	Finding
Department of Toxic Substance Control (DTSC) 9211 Oakdale Avenue Chatsworth, California 91311 http://www.envirostor.dtsc.ca.gov/	The Property is not listed on Envirostor - the online public database managed by the DTSC. Several of the surrounding properties are listed in the database that are either associated with the regional Orange County North Basin groundwater plume, a Voluntary Cleanup Program (VCP), or a tiered permit facility. These facilities, and other nearby facilities, are discussed in Section 4.2.2 above.

4.3.2 Regional Water Quality Control Board

Agency Name Contact Information	Finding
Regional Water Quality Control Board (RWQCB) – Santa Ana Region 3737 Main Street, Suite 500 Riverside, CA 92501 http://geotracker.waterboards.ca.gov/	A review of the online Geotracker database, managed by the RWQCB, shows that a leaking underground storage tank (LUST) case is associated with the Property. The database indicates that the case was associated with a release of diesel fuel from USTs that impacted soil at the Property. The Property was issued closure by the City of Fullerton Fire Department on January 22, 1992. No other information is provided on Geotracker regarding case specifics. However, Stantec was provided with a former Phase I ESA report by Antea that discusses the former diesel UST release and includes copies of documents pertaining to the case. Further discussion and details regarding this release, and residual contamination that was left in place, are provided in Section 4.4.6.

4.3.3 Orange County Health Care Agency

Agency Name Contact Information	Finding
Orange County Health Care Agency 1251 E. Dyer Road Santa Ana, California	Stantec contacted the Orange County Health Care Agency on July 19, 2019 and requested photocopies of pertinent hazardous materials records, including files from their industrial cleanup and local oversight programs. Stantec received several hundred pages of files on July 23, 2019. Stantec conducted a cursory review of the files received, which included: • Various regulatory records for review of compliance documents and on-site compliance inspections between 2005 and 2018. Lists of hazardous materials contained in ASTs, drums, or other containers included lube oil, machine oil, used oil, mineral oil, chromium or cadmium grinding sludge, adhesives, and non-halogenated solvents. • Limited documents pertained to the removal of six USTs (2 fuel oil, 1 vinyl acetate, 2 mineral spirits, and 1 dioctyl phthalate) in 1986. The records also suggest that the two fuel oil USTs were removed from the area east of Building 4, while the other four USTs appear to have been removed elsewhere on the Property near an unspecified loading dock. Staining and odors were noted in the fuel oil UST excavation by the OCHCA inspector. No evidence of soil impacts were noted by the inspector in the excavation for the four other USTs. • Several years' worth of forms and correspondence documenting business activities, above-ground petroleum storage tanks, and Spill, Prevention, Control, and Countermeasure Plans (SPCC). • Reports and correspondence pertaining to investigation and regulatory closure of reported subsurface contamination related to storage and dispensing of bleach from an above-ground storage tank. • CERS documentation related to the onsite Southern California Edison (SCE) Substation. Documents indicate the use and storage of 2,843 gallons of mineral oil. • Phase II ESA report by Weeco Environmental and subsequent no further action (NFA) letter dated April 21, 1998 from OCHCA, and with concurrence from the RWQCB, regarding a release of sodium hypochlorite in the area of the tank farm.

4.3.4 Local Building and/or Planning Department Records

Agency Name, Contact Information	Findings
City of Fullerton Building Division 303 W. Commonwealth Ave, Fullerton, California Phone: (714) 738-6300	Archived building records for the City of Fullerton are available online at https://docs.cityoffullerton.com/weblink/Browse.aspx?dbid=1&startid=91553&cr=1. Stantec conducted a cursory search of the available records and found that most of the records consisted of permits for original construction or upgrades for lighting/electrical, building (including roof installation/upgrades), fire suppression system upgrades, grading, mechanical, plumbing, signage, and landscaping. Although a brief review of the files was performed, Stantec did not review every page of every permit due to the length and number of documents available. Based on the findings from the cursory review, we do not expect that this information would materially change the conclusions of this assessment. For example, certain building permits were issued for the installation of chemical storage tanks. However, these permits reported no additional details such as contents or location, that would provide useful information pertaining to the assessment. In the event that a complete review of building permits is deemed necessary by the User of this report, a separate file review can be completed at a later date under a separate task order.

4.4 HISTORICAL RECORDS REVIEW

4.4.1 Land Title Records/Deeds

An environmental Lien Search conducted by EDR did not identify any Environmental Liens or Activity Use Limitations for the Property or the adjoining property at 2301 E. Orangethorpe Ave.

4.4.2 Aerial Photographs

Stantec reviewed historical aerial photographs provided by EDR. The general type of activity on a property and land use changes can often be discerned from the type and layout of structures visible in the photographs. However, specific elements of a facility's operation usually cannot be discerned from aerial photographs alone. The following table summarizes Stantec's observations of the reviewed historical aerial photographs.

Copies of the historical aerial photographs are located in Appendix F.

Year	Scale	Observations, Property and Adjoining Properties
1938, 1947	1:500	The Property is primarily an orchard. A residence is located in the northwest portion and three additional buildings that vary in size are in the north and east portions of the Property. The surrounding properties consist of agricultural and residential properties.

Year	Scale	Observations, Property and Adjoining Properties
1953	1:500	Property development is generally consistent with the previous photograph except that a small residence has been constructed and some of the orchard has been cleared out in the north and northeast areas. The three additional buildings in the north and east portions are no longer visible. The 2301 E Orangethorpe Avenue facility appears to have been developed with the same buildings that presently occupy the Orange Coast Roofing property.
1963	1:500	The central portion of the KCC mill and warehouse areas have been developed. An access road/driveway connects the property to S. Acacia Street and Kimberly Avenue. The rail spurs extend from the east side of the mill and warehouse buildings to the adjacent rail line along Kimberly Avenue. A parking lot is present south of the building. ASTs, smaller outbuildings, and other operations appear to be located to the east of the mill at the current location of the co-gen plant. The water ASTs, used for fire suppression, are visible in the northern portion of the Property. A truck access or similar cleared area is present along the west side of the building. The areas to the west and east-southeast of the mill remain orchards. The building complex located southeast and adjacent to the Property is depicted mostly in its present configuration, with the exception of some small buildings in its southwest section. Industrial/commercial type development is present in all directions around the Property.
1972	1:500	The mill and warehouse areas have been expanded to the west, and the existing pulp storage building (Building 11) was added to the east end of the mill. The water processing tanks, boiler house, and associated equipment are visible to the east of Building 11. The surrounding area has become increasingly developed with commercial/industrial facilities.
1977	1:500	Additional buildings have been constructed in the central portion of the mill/warehouse and now appear as connected buildings. Additional water treatment features are present to the east Building 11, and an additional large tank has been installed to the east of the water treatment area. Expanded outdoor storage/truck parking is present east of the fire suppression tanks in the north-central portion of the Property. A baseball field is present at the far northeastern corner of the Property.
1987	1:500	The warehouse portion of the mill has expanded to the southwest and an additional loading dock are visible along the south exterior wall. Additional truck parking is now present to the east of the car parking lot. The baseball field has been replaced by truck parking. Commercial/industrial development continues in the surrounding area.
1990	1:500	Additional paved area is now present near the southwest loading dock.
1995	1:500	The Property appears similar to the previous photograph.

Year	Scale	Observations, Property and Adjoining Properties
		The building complex that contains the Winonics facility is now visible on the southeast adjacent property and is depicted in its present configuration.
2002, 2005, 2009, 2012, 2016	1:500	The Property and surrounding area appears relatively unchanged from previous photographs.

4.4.3 City Directories

Stantec reviewed the historical city directories provided by EDR. The findings are summarized below:

2001 E. Orangethorpe Avenue

- Kimberly-Clark Corporation (1955 – 2014)
- Solar Turbines Incorporated (2005-2014)
- Skidmore Owings & Merrill Arcts (1955)
- Granades Cafeteria (1966)
- Consumer & Commercial Sales (1975)

City Directories for Adjacent Properties:

1850 E. Orangethorpe Avenue

- McWilliams Truck Simply the Best (1995)

1900 E. Orangethorpe Avenue

- Mid South Pallet Repair, Pyramid Transportation (1995)
- Manufacturing Waterbeds (1986)
- Home Hardware Division of Norris Industries (1975, 1980)
- Hyer Hardware Manufacturing Co (1975)

1950 E. Orangethorpe Avenue

- Monitor Electric Inc (1991)

2000 E. Orangethorpe Avenue

- Auto Truck Electronic Don Chrisman (1980)

2020 E. Orangethorpe Avenue

- Corporate Office (1995)
- Vista Paint and Wall Covering (1995)
- Fullerton, General Offices (1991)

2030 E. Orangethorpe Avenue

- Service Station Supply Co Daper (1980)

2100 E. Orangethorpe Avenue

- Auto Car Leasing (1995)

2125 E. Orangethorpe Avenue

- Gabbianos (1995)

2125 E. Orangethorpe Avenue

- C Technologies (2005-2014)

2150 E. Orangethorpe Avenue

- Guardian Self Storage (1995)

2210 E. Orangethorpe Avenue

- Residential (1966)

2214 E. Orangethorpe Avenue

- Residential (1966)

2230 E. Orangethorpe Avenue

- Computer Service Co, Payne Rudy Mobile Truck Repair, Steiny & Co Inc, Computer Service Consultant (1995)
- Service Manufacturing Company (1986)
- School Pictures Inc (1966-1980)

2238 E. Orangethorpe Avenue

- Warehouse (1966)

2250 E. Orangethorpe Avenue

- Avis Rent A Car (1995)
- Fullerton Medical Center, American Medical Network, various medical (1966-1995)

2137 E. Orangethorpe Avenue

- Karger BB & Associates (1955)

2012 E. Orangethorpe Avenue

- Residential (1960)

2301 E. Orangethorpe Avenue

- Auto Car Leasing (1995)

1200 S. State College Blvd

- Marco Machinery Maintenance & Repair (1995)
- Millard Pacific Metal Service Center (1980 – 1986)
- County Metal Supply Co (1965 – 1980)

4.4.4 Historical Fire Insurance Maps

Fire insurance maps were developed for use by insurance companies to depict facilities, properties, and their uses for many locations throughout the United States. These maps provide information on the history of prior land use and are useful in assessing whether there may be potential environmental contamination on or near the Property. These maps, which have been periodically updated since the late 19th century, often provide valuable insight into historical Property uses.

Stantec requested fire insurance maps from EDR; however, there is no coverage for the Property. The Sanborn® Map Search Report is presented in Appendix F.

4.4.5 Historical Topographic Maps

Stantec reviewed historical USGS 7.5-Minute Topographic Maps of the Property vicinity to help identify past Property usage and areas of potential environmental concern.

Stantec identified no additional RECs based on its review of the topographic maps. Copies of the historical maps are provided in Appendix F. The following table summarizes the maps reviewed and our observations.

Year	Scale	Observations, Property and Adjoining Properties
1896, 1898, 1901 & 1902	1:62,500	The Property is depicted as primarily vacant land, with three small buildings. The surrounding area is lightly developed with small residential/agricultural buildings. A railroad easement identified as "Los Angeles" is present to the west, as well as the town of Fullerton. The town of Placentia is labeled on the 1901 and 1902 maps.
1935	1:24,000	An access road is illustrated on the northwest side of the Property. A small building is present southeast adjacent to the subject property. Carbon Canyon Creek is depicted south of the subject property, followed by a low-relief feature. Fullerton and Placentia have expanded, and La Jolla is now depicted to the east. The Santa Fe railroad is present to the north. More buildings are present along Orangethorpe Avenue.

Year	Scale	Observations, Property and Adjoining Properties
1942	1:24,000	The Property is depicted as orchard, with the same three small buildings as were mapped prior. The region surrounding the subject property is depicted as agricultural orchards and one small building has been constructed on the adjacent property at 2301 E. Orangethorpe Avenue to the south.
1949, 1950	1:24,000	No significant changes are apparent in the subject property as compared to the previous map. A wastewater disposal plant is depicted to the south of the subject property, and a flood control basin is depicted to the southeast. Anaheim appears to the southwest.
1964 & 1965	1:24,000	The central portion of the Property has been developed with several of the interconnecting buildings that make up the existing KCC facility. Water tanks are depicted immediately to the east of these buildings. Access road/driveway connects the property to South Acacia Street and Kimberly Avenue. Three railroad spurs extend from the east sides of the buildings and connect to the adjacent rail line to the north, along Kimberly Avenue. The remainder of the property remains as an orchard. A cluster of two large and three small buildings is now present southeast adjacent to the subject property. A railroad is depicted to the north of Kimberly Avenue. A fire station is present to the north, across the railroad. Much of the surrounding area is now occupied by large industrial-type buildings. One of these buildings is present to the west, across South Acacia Street. A retention basin is now present to the southeast, across the freeway.
1972	1:24,000	Warehouse additions have been constructed on the north and west sides of the facility, and the pulp storage building to the east, near the tanks. General municipal and industrial/commercial expansion is evident in the surrounding area. New buildings are present to the west across South Acacia Street, and to the south across Orangethorpe Avenue.
1981	1:24,000	Additional buildings have been added to the main facility, filling out the northeast portion. One water tank is depicted as replaced, and a new tank is depicted to the east of the driveway. Large commercial/industrial buildings are depicted in all directions.
2012	1:24,000	Other than roads, there are no individual structures or development features depicted on the map.

USGS via EDR, 2019

4.4.6 Other Historical Sources

The following environmental report was provided to Stantec for review and a copy of the report is provided in Appendix F.

Antea Group, 2018, Phase 1 Environmental Site Assessment, Kimberly-Clark Corporation, Fullerton Mill, 2001 E. Orangethorpe Ave, Fullerton, California 92831, November 5.

The Phase I ESA provides an overview of information obtained regard past and present uses of the Property. Antea's review of historical records indicate the Property was first developed circa 1955/1956 and was constructed in phases with multiple building additions and outbuildings used for manufacturing, warehousing, and office space. Records indicate that the existing buildings were constructed and occupied solely by KCC since their development. Prior to commercial development, the Property and the surrounding area was used for agricultural purposes (fruit and/or nut orchards).

The report identified several former USTs, various ASTs (fuel, polymer, bleach, mineral oil), chemical/waste storage areas, clarifiers, floor drains, machine shops. Antea noted an adjacent property 2301 E. Orangethorpe Avenue) along the southern boundary is occupied by a roofing company that formerly operated several USTs and that the USTs were in close proximity to the Property boundary. However, the USTs on that parcel were reportedly removed. Although the report identified the aforementioned industrial support or processing infrastructure that pose a material threat of a future release, none of them were cited in the report as RECs and the report did not recommend further investigation in these areas. However, the Antea Phase I ESA identified the following as RECs, CRECs, or HRECs:

- **Orange County North Basin Superfund site.** Region-wide and private well sampling, mandated by regulatory agencies, has identified VOC commination in the principal and shallow groundwater aquifers at concentrations as high as 5 to 10 times their respective maximum contaminant levels (MCLs). The plume is mapped as extending beneath a large portion of the Property with the highest concentrations migrating onsite from the northwest but reducing in concentrations in a southward direction to roughly one to five times the MCLs. These regional impacts have impacted an on-site water well owned by the City of Fullerton. As a result, the Orange County North Basin Superfund site was identified by Antea as a REC.

- **Petroleum Contaminated Soil.** In May of 1986 a release of petroleum hydrocarbons was discovered following the removal of two diesel/fuel oil USTs. However, the City of Fullerton Fire Department issued a closure letter for the release on January 22, 1992 with the condition that additional assessment or cleanup may be required in the future based on new data or changes in land use. During two separate construction projects at the Property in 1992 and 2002 approximately 2,000 tons of petroleum-impacted soil were excavated from the vicinity of the former USTs. At the conclusion of the excavation activities in 2002, it was found that limited petroleum impacts extended beneath the boiler house and had impacted groundwater which is present at a depth of approximately 30 feet bgs. Antea concluded that due to the release receiving regulatory closure, and because the impacted soils are beneath paved surfaces or buildings, the petroleum impacted soils at this location were a CREC.

- **Sodium hypochlorite (Bleach) spills.** Several bleach spills were documented to have occurred in the KCC tank farm area between 1990 and 1997. Soil testing in the area of the spills reported low levels of sodium hypochlorite in soil to depth of up to 40 feet bgs. Although there is no published regulatory clean up goal established for sodium hypochlorite, the County of Orange Division of Environmental Health calculate that the potential exposure due to sodium hypochlorite in the soil was comparable to that of a swimming pool. The county issued a closure letter for the bleach spills on April 21, 1998.

Antea concluded that the bleach spill was considered an HREC since regulatory closure was issued.

- **Fuel Spill.** A commercial truck was involved in an accident along Kimberly Avenue, near the north entrance of the Property in November of 2003. Diesel fuel was released onto the pavement and into the storm drains. The fuel spill was cleaned up under the oversight of the local regulatory authority on the same day by vacuuming up the fuel/water mixture and using absorbents. No further actions were required by the responsible party. Given that the cleanup occurred with regulatory oversight, Antea considered the fuel spill a HREC.

In addition, the Antea Phase I ESA report did not consider the following issues to meet the definition of a REC, CREC, or HREC but instead identified them as noteworthy items:

- **Past Agricultural Use.** The Property was historically farmed as a fruit and/or nut orchard prior to development of the land by KCC in the mid-1950s. Antea indicated that pesticides can persist in the subsurface long after application.

- **2301 East Orangethorpe Avenue (Adjacent Property).** The adjacent property to the south, which is included as part of Stantec's Phase 1 ESA, was identified as being occupied by Coast Roof Co. (2301 E. Orangethorpe Avenue). Two generations of USTs were formerly located on this property, approximately 30 feet from the KCC property boundary. While removal documentation of the USTs was obtained, Antea found no documentation regarding soil confirmation sampling or that any regulatory driven environmental investigations were performed following UST removal.

5.0 PROPERTY RECONNAISSANCE

A visit to the Property and its vicinity was conducted by Brian Viggiano, Senior Geologist, and Dion Monge, Senior Scientist with Stantec, on July 18, 2019. Access to the Property was coordinated with Mr. Paul Curry, Mechanical Engineer with KCC. Mr. Curry coordinated access to the Property and escorted Stantec through the interior and exterior portions of the facility during the Property visit. Figure 2 provides information about the Property and adjoining properties. Photographs collected during the Property visit are included in Appendix A.

5.1 PROPERTY RECONNAISSANCE METHODOLOGY

The Property reconnaissance focused on observation of current conditions and observable indications of past uses and conditions that may indicate the presence of RECs. The Property reconnaissance was conducted on foot, and travel across portions of the Property were conducted in a vehicle.

Weather conditions during the visit to the Property were clear and sunny. There were no weather-related property access restrictions encountered during the reconnaissance visit.

5.2 GENERAL DESCRIPTION

Property and Area Description:	The Property consists of two (2) parcels totaling approximately 65 acres of land in the City of Fullerton, Orange County, California. The parcels are developed with over 1.2 million square feet of manufacturing, warehouse, and office space – including several outbuildings and infrastructure that support paper manufacturing and processing activities. Approximately 7.75 acres of the eastern portion of the Property and 2.5 acres of the southwest portion remain as citrus orchards. The Property is bounded to the west by Acacia Avenue, then commercial/ industrial properties; to the south by the Orangethorpe Ave, then commercial/ industrial properties; to the east by State College Blvd, then commercial/ industrial properties; and to the north by Kimberly Ave followed by a railroad easement with multiple spurs, then commercial/ industrial properties.
Property Operations.	The KCC Fullerton Mill manufactures paper products, including mostly facial and bath tissue, and paper towels/wipes. Based on discussions with Mr. Paul Curry during the Property reconnaissance, past operations once included manufacturing diapers, tarry towels, tinted/printed bath tissues, and feminine hygiene products. According to Grace Madden, KCC, the paper pulp is not manufactured onsite but is purchased from various distributors based on the source of the pulp necessary for manufacturing certain products according to specification (i.e. strength, softness, smoothness etc). The pulp is stored onsite and initially processed in the eastern portion of the mill with the bulk of these activities occurring in Buildings 11 and 1, respectively.

	Operations at the Property include everything from processing the tissue from a pulp and water mixture, converting the pulp mixture into tissue sheets and rolls, packaging, warehousing, and shipping. The primary raw materials used in the tissue manufacturing process are water, surfactants, mineral oils, adhesives, starch, sodium hypochlorite (bleach), various polymers, and paper/plastic for packaging. Numerous other lubricants, oils, and other materials are used throughout the facility to support the manufacturing processes. In brief, the manufacturing of tissue involves the large-scale and vigorous mixing of raw pulp, water, and other additives (e.g., starch, surfactants). Once adequately mixed, the liquid pulp mixture is sprayed onto large roller belts and dried to a state at which it can be rolled onto industrial "hard rolls" of bulk tissue paper. The hard rolls are then stored in warehouse space until processed by the various tissue machines into smaller rolls, and then eventually packaged and shipped offsite. The above referenced manufacturing process involves the use of large quantities of water, which is derived from a municipal source. Overflow water is captured via a network of floor drains, trenches, and sumps, before being re-routed into the facility's water treatment system where it is re-used in combination with the fresh intake water. All waste raw pulp is typically reused gathered and brought to Building 11 for reuse. As part of the July 2019 site reconnaissance, KCC personnel led Stantec through the facility's manufacturing, warehouse, support buildings, and exterior infrastructure that included various ASTs, water treatment areas, and wastewater and stormwater discharge points. Stantec has collected information from the Property reconnaissance and from KCC-provided documents to complete a basic outline of the building uses and observations. The outline is provided below.
Structures, Roads, Other Improvements:	The Property is developed with multiple connecting buildings and includes offices, manufacturing floor, and warehouse space. With the exception of Building #1 and the adjoining water treatment plant and boiler house, which are underlain by a connecting basement, all of the remaining buildings are slab-on-grade construction. Most warehouse and manufacturing buildings are single-story, high-bay structures, but several of the buildings include second stories or mezzanines. The original buildings were constructed in the mid-1950s, and for the 30 years that followed, additional buildings were constructed through the late-1980s with some later improvements occurring in the area of the water treatment and co-generation areas east of Building 11. Collectively, the buildings occupy approximately 30 acres. Four main loading or rail docks are present – one near the southwestern corner of the site (Building 19), two near the northeastern corner (Buildings 6 and 13), and one in Building 11. The loading docks/areas for Buildings 6 and 11 are also accessible via existing rail spurs. Asphalt paved parking lots are present to the east of the north gate entrance along Kimberly Avenue, and paved lots for employee and visitor parking are present in the south-central portion of the Property, along Orangethorpe Avenue. An approximate 2.5-acre paved parking

	lot in the northeast corner of the Property is leased and currently used for RV parking. Significant observations for each building and exterior infrastructure are discussed in Sections 5.4 and 5.5, respectively.
Property Size (acres):	Approximately 65 acres.
Estimated % of Property Covered by Buildings and/or Pavement:	70%
Observed Current Property Use/Operations:	The Property is operated as the KCC Fullerton Mill. Remnant orchards are present but appear to largely be unmaintained.
Observed Evidence of Past Property Use(s):	KCC Fullerton Mill and formerly an orchard.
Sewage Disposal Method (and age):	The Property is connected to the City sewer since it was constructed in 1955/1956. No evidence of septic systems was observed during the Property Walk. However, the existence or use of on-site historical septic systems cannot be ruled out. Past wastewater discharge sampling results provided to Stantec by KCC for the sampling events between 1993 and 2008 reported no PCE or TCE. Additionally, Ms. Grace Madden of KCC indicate to Stantec that KCC has never had a violation for exceeding allowable VOC concentrations in wastewater.
Potable Water Source:	The Property is connected to the municipal water supply and derives the bulk of its water used for manufacturing from an onsite production well (F-KIM-2) and one offsite production well (F-KIM-1A) to the west of the Property. Limited sampling results of water collected from F-KIM-2 were provided to Stantec by KCC between 1985 and 2006. The results show that PCE ranged from below the laboratory reporting limit to 4.7 ug/L and TCE reached a peak concentration of 1.2 ug/L but was below laboratory reporting limits between January of 1993 and the last listed sampling even in February of 2006.
Electric Utility:	The property is connected to the municipal electric company.

5.3 HAZARDOUS SUBSTANCES AND PETROLEUM PRODUCTS

The following table summarizes Stantec's observations during the Property reconnaissance.

Observations	Description/Location
Hazardous Substances and Petroleum Products as Defined by CERCLA 42 U.S.C. § 9601(14):	Chemical storage areas were observed throughout the Property but were primarily located in pulp processing areas of Building 1, maintenance and machine shops (Buildings 1, 3, 9, 10, and 21), water treatment area east of Building 11, and Building 25 – the chemical storage building.

Observations	Description/Location
	In general, these chemicals were stored in various sizes of drum, totes, or ASTs of mineral oil, gear/lube oils, compressor oils, diesel fuel, hydraulic oil, and used oils. Chemicals were observed within secondary containment or located within the building's interior walls.
Drums (≥ 5 gallons):	Drums were observed in various areas throughout the Property, but the surrounding surfaces appeared clean and well maintained. A high density of 55-gallon drum and totes were observed in Building 25, the chemical storage building. The drums in Building 25 were surrounded by trench drains that led to three separate sumps for containment purposes in the event of a release.
Strong, Pungent, or Noxious Odors:	Odors were observed in Building 1 where pulp processing activities were occurring, and ammonia odors were observed in the water treatment area east of Building 11.
Pools of Liquid:	None observed.
Unidentified Substance Containers:	None observed.
PCB-Containing Equipment:	So-Cal Edison operates a sub-station at the subject property and reported to Kimberly-Clark that the substation does not contain PCBs. Kimberly-Clark escorts did not have access to the interior of the sub-station, so Stantec was only able to observe equipment from outside of the fenced area; no staining was observed. In addition, pole-mounted electrical transformers were observed in the north-central portion of the Property near the north entrance along Kimberly Ave. No surface staining or evidence of a release was observed on the ground below the transformer units.
Other Observed Evidence of Hazardous Substances or Petroleum Products:	A diesel-fueled emergency backup generator was observed in the southwest portion of the ground floor level in Building 1. No staining or evidence of a release was noted on the surrounding concrete slab.

5.4 INTERIOR OBSERVATIONS

Observations	Description
Heating/Cooling Method:	Electric and natural gas heating units; historically the Property used fuel oil for hoods. A Co Gen was installed at the Property in 2001 – 2002 for natural gas.
Surface Stains or Corrosion:	Surface corrosion/etching was evident on the concrete floor throughout the majority of the forklift battery charging area in Building #3.
Floor Drains and Sumps:	Floor drains, trench drains, and evidence of past or filled floor drains or trench drains were observed throughout interior and exterior portions of the Property. Sumps were observed in Buildings 1, 5, 8, and 25, and the bleach dispensing pad adjacent to the west of the tank farm.

Observations	Description
Other Interior Observations:	**Building #1 and Basement – Tissue Manufacturing and Machine Shop** • Ground floor mechanic shop, machine shop and equipment, including milling machines, lathes, drill presses, grinders, metal presses, etc. • Ground floor diesel-fueled emergency backup generator and parts washer in maintenance shop area. • Two large Yankee Dryers (ground floor). • Building underlain by basement – multi-story manufacturing process for two tissue machines. • Pulp mixing tanks extending from ground floor into the basement • Floor drains and sumps in basement, leading to water treatment/recycling system. • Two approximately 1,000-gallon light oil ASTs in basement. **Building #2 – Bundle Packaging and Warehouse** • Chiller #2 (now unused) • Former Online Printer Room (used for printing through 1999); includes floor drains and trench drain; currently receives roof drain discharge. Former use of water-based inks used in tissue coloration processes. • Limited hazardous waste storage containing 55-gallon drums of oil debris, oil filters, and used oil. **Building #3 – Warehouse, Unitizers, and Core Storage** • Several unitizers (for package assembly) and case conveyors • Forklift battery charging area (50+ large lead-acid batteries and associated charging equipment) • Small maintenance area and machine shop with parts washer. **Building #4 – Boiler House** • 2 natural-gas fired boilers, overlying basement leading to Building 1. **Building #5 – Water Plant Filtration and Adjacent Forklift Maintenance** • Equipment and tanks for water filtration and treatment systems • Several totes of water treatment chemicals • Small forklift maintenance building and sump are adjacent to the west of Building 5 **Building #6 - Warehouse** • Several former loading doors (now unused) along north side of the building – once located next to a rail spur • Rail dock and spur (unused since circa 1970s)

Observations	Description
	• Truck loading dock along the east side of the building – 18 loading doors (#6 through #23) **Building #7 – Warehouse** • General warehousing with no specific items of interest **Building #8 – Tissue Converting Lines (B-4 and T-4) and Ultra Converting Room** • Former ink mixing and processing area, including trench drain that discharges to the sanitary sewer. Area unused since approximately 1998. • Warehouse storage • Sump • Ultra Converting (UCON) Room – for application of lotions and waxes to paper rolls. Process includes use of trench drains and sumps for wastewater collection and discharge to sanitary sewer. • Baghouse for dust collection/air filtration systems **Building #9 – Former Bath Tissue Lines (B-1 and B-2)** • Two bath tissue lines • Former diaper manufacturing lines • Small maintenance shop **Building #10 – Tractor (Forklift) Shop and Hard Roll Storage** • Fork lift repair shop and staging area • In-ground pit (walk-in via stairs) for forklift repair • Two parts washers along north wall – one west of the weld shop and one unused to the east of the weld shop) • Weld shop • Used and new oil storage closet, including several 30-gallon drums of oil on secondary containment **Building #11 – Pulp Storage Warehouse and ICON Tank Room** • Various raw pulp storage • Truck loading dock at north side • Rail dock along east side • ICON Tank Room – including two 8,200-gallon polymer ASTs and one 8,000-gallon water AST • Floor drains/grates that drain to basement and ultimately into on-site water treatment system **Building #12 – Warehouse (Hard Roll Storage and Finished Products)** • Warehousing for hard roll storage and finished products • Unused equipment stored along portions of perimeter of this warehouse. **Building #13 –Warehouse (Finished Products) and Pulp Storage** • Distribution Office and restrooms • East loading dock – five truck docks

Observations	Description
	Building #14 – Outbuilding (Storage Only) • Unused Yankee Dryer is stored in this building **Building #15 – West Pump House** • Dedicated fire suppression pump and equipment, just outside northwestern corner of Building #12 **Building #18 – Propane Storage Shed** • Propane storage **Building #19 – Warehouse & Chiller Room** • Chiller unit, including 134A refrigerant, and two stainless steel totes of chiller treatment chemicals • Trench floor drain in chiller room • West Yard loading docks – 11 truck loading doors **Building #20 – Warehouse (Hard Roll Storage)** • Sanitary sewer access manhole • Storm sewer access – west facility outfall and sample point **Building #21 – Multi-folder Lines (MF-1, MF-2)** • Maintenance shop area for multi-folder lines and equipment • Packaging lines • Air Pollution Control Equipment (APCE) room (no access) – large drum-roller dust collection system • 2nd and 3rd-floor offices **Building #22 – Exterior Storage Building** • Storage racks and unused equipment (no access provided as part of this assessment) **Building #23 – West Gate Guard Shack** • No contents – small guard shack near Acacia Street entrance **Building #25 – Chemical and Waste Storage** • Outbuilding designed for chemical and waste storage. Chemicals include various water treatment chemicals such as defoaming agents, flocculants, and felt cleaners. • Includes trench drainage and three sumps for potential spill containment • Staging area for 90-day hazardous waste pails and drums • New oil storage in 55-gallon drums **Building #26 – North Gate Guard Shack** • No contents – small guard shack near Acacia Street entrance and truck scale **Buildings #27 & 29 – City of Fullerton Water Station**

Observations	Description
	• Water well pumping station and equipment, owned/maintained by City of Fullerton • Two large fire suppression water storage tanks **Building #28 – Training Center** • Training room located at south end of building **Building #30 – Café and Patio** Kitchen equipment

5.5 EXTERIOR OBSERVATIONS

Stantec made the following observations during the Property reconnaissance of exterior areas of the Property and/or identified the following information during the interview or records review portions of the assessment:

Observations	Description
On-Property Pits, Ponds, or Lagoons:	No pits, ponds, or lagoons were observed. However, according to Ms. Grace Madden, environmental coordinator for KCC, dry wells are reportedly located around the truck parking lot in the northeast corner of the Property (i.e. southwest of the intersection at Kimberly Ave and State College Blvd).
Stained Soil or Pavement:	Stantec observed minor surface staining at various locations throughout the property. These areas were considered de minimis as not requiring additional assessment.
Stressed Vegetation:	None observed.
Waste Streams and Waste Collection Areas:	Waste collection was observed to be present in Building 25, the chemical storage building.
Solid Waste Disposal:	No areas indicative of solid waste disposal were observed.
Potential Areas of Fill Placement:	No areas of fill placement were observed during the Property reconnaissance.
Wastewater:	Treated wastewater exiting the mill is diverted to the sanitary sewer from a discharge point in the north-central portion of the Property, to southwest of the north gate.
Stormwater:	Stormwater is directed towards drains and swales that divert rainwater to an outfall located in the north-central proportion of the Property, southeast of the north gate. Stormwater discharges from the Property are monitored under an active National Discharge Elimination Permit (NPDES) by the Santa Ana Regional Quality Control Board (SARWQCB) under General Permit No. CAS000001 and Waste Discharge identification (WDID) No. 830I001214 for industrial stormwater. Stormwater at the facility is discharged through two separate networks – to the west and accessed via a manhole beneath Building #12, and the other at a point in the north-central portion

Observations	Description
	of the Property to the southeast of the north gate. Upon leaving the Property, storm water flows to the north and into a narrow concrete-lined channel north of Kimberly Avenue and the BNSF rail yard. An internal KCC specialist reportedly monitors storm water discharge on a quarterly basis, and the sampling results are submitted to the SARWQCB.
Wells:	One water production well (KIM-2) is located in the north-central portion of the Property near the north gate entrance along Kimberly Ave. The water obtained from the well is used by the KCC mill in pulp mixing/processing.
Septic Systems:	No evidence of septic systems was observed during the Property walk. However, given the age of development of the property, historical septic systems associated with early Property operations may be present at the Property.

Other Exterior Observations:	**Exterior – Water Treatment Plant**
	• Three open-top clarifier tanks
	• Totes of water treatment polymers and chemicals
	• Sludge press and conveyors
	• Effluent tanks
	• Subsurface (basement level) piping and equipment
	Exterior – Co-Generation Plan
	• Natural-gas-fired power generation equipment
	• 19% Ammonia AST and containment area
	Exterior – Tank Area
	• Two unused/empty ASTs, and two active ASTs:
	  o Unused – Quaker polymer, empty since circa 1998; Fuel oil AST – emptied and cleaned circa 1990s
	  o Active – Kymene 920A tank; Bleach tank (stainless steel)
	• Tanks overtop concrete containment area and surrounded by earthen berm
	• Includes collection sump from adjoining bleach dispensing pad, just west of tank area
	Exterior – Cooling Towers
	• Four (4) cooling towers east of Building 5 in secondary containment berm
	Exterior – North Gate and East Parking/Storage
	• Wastewater outfall and sampling point
	• Storm water outfall and observation point
	• Truck/trailer parking yard

Observations	Description
	• Large, unused dirt/gravel lots; some gravel piles observed • Leased RV/trailer parking lot • Unmaintained orange and fruit orchard and irrigation lines **Exterior – West Yard** • Empty tote staging area • Recycling dumpsters – cardboard, poly materials, corrugates, wood, and tissue • Orange tree orchard and irrigation lines

5.6 UNDERGROUND STORAGE TANKS/STRUCTURES

Existing USTs:	No visible evidence (fill pipes, vent pipes, dispensers, surface patches), which would indicate the presence of USTs, was discovered during the property reconnaissance.
Former USTs:	Historically, KCC documents indicate that seven USTs were historically at the Property (OCHCA records indicate 6 USTs). The former USTs included four SRM tanks, one sulfuric acid tank, and two former fuel oil USTs. According to facility records, all USTs were removed in 1985 (OCHCA records indicate 1986). All USTs were reportedly located near the Boiler House (Building 4). The SRM tanks contained an adhesive product that was used in multi-ply paper towel manufacturing, and the fuel oil USTs were used to supply fuel to the boilers for steam heating the manufacturing processes. Petroleum contamination was discovered at the time of the UST removals, and was excavated to the extent feasible in multiple excavations that occurred at the time of the UST removal in 1985 or 1986, again in 1992, and during construction of the CoGen Plant in 2002. Facility documents indicate that residual contamination of diesel range TPH remain present adjacent to, and likely below Building 4, at a maximum of 47,000 mg/kg in the 30-foot sample. These concentrations exceed regulatory cleanup thresholds for soil. With the exception of the 55-foot sample (42 mg/kg) the remaining samples from 35 to 70 feet were non-detect for TPH. The lateral extent of the residual TPH impact below Building 4 has not been determined. It is unclear whether additional assessment and remediation would be required by the agency once the overlying structures are removed. A groundwater sample collected in the vicinity of the residual impacts reported diesel range TPH at 0.86 mg/L and xylenes at 7.9 ug/L. These groundwater concentrations are well below the maximum contaminant levels (MCLs) for xylenes in drinking water.
Other Underground Structures:	Property operations include networks of floor drains and sumps as discussed in Section 5.4 and 5.5. Additionally, a basement is present below Building 1 and underground corridor connects the Building 1 basement with Building 4 (Boiler House). The basement contains the lower half of several pulp mixing tanks, two light oil ASTs (~1,000-gallons), and a network of trench drains and sumps used to capture and divert process water to the water treatment plant.

5.7 ABOVEGROUND STORAGE TANKS

Existing ASTs:	A tank farm is present to the east of the water treatment and CoGen plant. The tank farm includes one AST containing Kymene 920A polymer, one bleach AST, and one empty Quaker tank. One large empty AST remains in the tank farm that formerly stored fuel oil. However, the fuel oil AST was reportedly emptied in the 1990s. Piping from the fuel oil AST was reportedly disconnected to the boiler house and piping may remain below ground. The ASTs within the tank farm were located within a concrete secondary containment, followed by an earthen berm containment. Several other ASTs containing various oils, polymer, and fuel were located throughout the mill, as discussed under each building listing in Section 5.4.
Former ASTs:	No visible evidence (fill pipes, vent pipes, dispensers, surface stains), reports, or other evidence of the former presence of ASTs was discovered during this Phase I ESA.

5.8 ADJOINING PROPERTIES

5.8.1 Current Uses of Adjoining Properties

As viewed from the Property and/or from public rights-of-way, Stantec made the following observations about use and activities on adjoining properties:

NORTH	Kimberly Avenue followed by a railroad easement with multiple spurs, then commercial/ industrial properties (PCA Metals Finishing, Inc, Khyber Foods, Inc)
SOUTH	Orangethorpe Avenue followed by commercial/ industrial properties (Goldenwest Towing Equipment, Trent Tube Division, Vista Paint)
EAST	State College Boulevard followed by commercial/ industrial properties (United States Rentals, Winonics, Inc, Alcoa Fastening Systems)
WEST	Acacia Avenue followed by commercial/ industrial properties (Plasticolor, Inc, Jonathon Controls Battery Group)

Refer to Figure 2.

5.8.2 Observed Evidence of Past Uses of Adjoining Properties

Observations of adjoining properties, made from outside the properties, providing indications of past use and activities, if any, are described below.

NORTH	None observed.
SOUTH	None observed.
EAST	None observed.
WEST	None observed.

5.8.3 Pits, Ponds or Lagoons on Adjoining Properties

As viewed from the Property and/or from public rights-of-way, Stantec made the following observations about the presence of pits, ponds and lagoons on adjoining properties:

NORTH	None observed.
SOUTH	None observed.
EAST	None observed.
WEST	None observed.

5.9 OBSERVED PHYSICAL SETTING

Topography of the Property and Surrounding Area:	The Property regional topography is relatively flat, with a slight slope to the southwest. Various Property developments and grading affect the topography locally.

6.0 INTERVIEWS

Mr. Paul Curry, Mechanical Engineer

On July 18, 2019, Stantec was escorted through the Property by Mr. Paul Curry, a retired mechanical engineer with KCC who is presently employed by KCC on an as-needed basis as a consultant. Mr. Curry has been familiar with the KCC Fullerton mill since 1997. During the Property walk, questions were asked about the environmental history of the Property. Mr. Curry was not aware of any ongoing environmental issues at the Property other than the regional groundwater issue being monitored by the USEPA. He was aware of the former petroleum release from the USTs near Building 4, and a release of sodium hypochlorite from the bleach AST in the tank area but indicated that those issues had been addressed to the satisfaction of regulatory agencies.

Mr. Curry directed Stantec to potential areas of concern including sumps, parts washers, wastewater collection areas (including drains), water treatment plant, wastewater and stormwater discharge points, chemical storage areas, cooling towers, compressor and boilers, former USTs and ASTs, existing ASTs, and the repair and maintenance shops located throughout the mill. Mr. Curry also walked Stantec through the manufacturing processes, including Building 1 where pulp mixing, drying, cutting, and rolling occur. Mr. Curry indicated that while that mill formerly manufactured additional paper-related products such as diapers and feminine hygiene products, only tissue and paper towels are currently being manufactured at the Property. He also indicated that all pulp is manufactured offsite and shipped to the mill, stored, and eventually used to make the finished paper products. However, little is known concerning the manufacturing processes conducted during early property development.

Ms. Grace Madden, Environmental Coordinator

Ms. Madden has worked for KCC since 1980 and has been involved with environmental and compliance projects and permitting for the past 20 years. Ms. Madden accompanied Stantec and Mr. Curry during the Property reconnaissance through the manufacturing areas and exterior portions of the mill in the afternoon. Ms. Madden also answered questions regarding current and past chemical uses at the mill. She indicated that, to her knowledge, the facility has been used exclusively as a paper mill since its inception, but that paper product production has been scaled down to facial and bathroom tissue and industrial paper towels/wipes in recent years. Ms. Madden indicated that although the facility has stored and used various types of hazardous chemical such as water-based inks and solvents, the bulk of the manufacturing process uses paper pulp, water, petroleum hydrocarbons, and sodium hypochlorite (bleach). Ms. Madden indicated that the use of chlorinated solvents was limited and primarily used in part cleaning machines. According to Ms. Madden, the cooling towers were cleaned only with water. When asked about dry wells on the Property, Ms. Madden showed Stantec their locations along the perimeter of the leased RV parking lot in the northeast corner of the Property. Ms. Madden mentioned that the City of Fullerton required the dry wells to capture stormwater runoff from the parking lot.

6.1 FINDINGS FROM INTERVIEWS WITH PROPERTY NEIGHBORS

Given the size of the property, Stantec did not conduct interviews with property neighbors. The lack of this information does not represent a significant data gap.

7.0 POTENTIAL FOR VAPOR ENCROACHMENT

Consideration of the migration of hazardous substances and petroleum products in all phases including solid, liquid, or vapor is required by the ASTM E1527-13 standard. As stated in Section 2.1 of ASTM E1527-13:

Vapor migration must be considered no differently than contaminated groundwater migration in the Phase I investigation. While E2600-10 provides an industry consensus methodology to assess vapor migration, use of E2600-10 methodology is not required to achieve compliance with AAI – an EP may use alternative methodology as deemed appropriate, but this must be documented in the Phase I report (i.e., it must be "capable of being reconstructed by an EP other than the EP responsible for the Phase I").

A qualitative vapor encroachment evaluation from both potential on-site or off-site sources was conducted based on evidence of use and documented presence of VOCs in environmental media.

1. Groundwater and Off-Site Sources: The Property is located within the Orange County North Basin groundwater plume which is being evaluated for inclusion on the National Priorities List (NPL). As previously mentioned in Section 4.1.3, groundwater sample data indicates that the Shallow and Principal aquifers are impacted with various VOCs including 1,4-Dioxane, PCE, and PCE breakdown products. The VOC groundwater plume is mapped as being below the Property in the Shallow and Principal aquifers. Soil gas sampling data provided to Stantec on a figure generated by Coffey Environments shows relatively low levels of PCE and TCE at10 and 20 feet below ground surface (bgs) over a majority of the Property with higher concentrations in the northwest portion of the Property along Kimberly Avenue on the opposite side of the street from the PCA Metals Finishing (Coffey, 2010). PCA is listed on DTSC's Envirostor database as being a State Response/NPL site. Other commercial/industrial facilities, located up, cross and down gradient of the Property are also listed as State Response/NPL sites or as tiered permit facilities that use chlorinated solvents. These facilities are shown on Figure 2.

2. As noted previously, operations on the Property used PCE and 1,4-dioxane (referenced EDR Report) which are chemicals of concern in the Orange County North Basin action. While there is currently little evidence that the Property is a significant source to the regional plume, potential releases may affect the potential for vapor encroachment to on-Property structures.

Based on these findings, there is a potential for a vapor encroachment condition (pVEC) to be present for the Property.

8.0 DATA GAPS

The federal AAI rule [40 CFR 312.10(a)] and ASTM E1527-13 identify a "data gap" as the lack or inability to obtain information required by the standards and practices of the rule despite good faith efforts by the Environmental Professional or the User.

Any data gaps resulting from the Phase I ESA described in this report are listed and discussed below.

Gap	Discussion
Deletions or Exceptions from Scope of Work Referenced in Section 1.4:	None
Weather-Related Restrictions to Property Reconnaissance:	None
Facility Access Restrictions to Property Reconnaissance:	The Southern California Edison Substation was locked and KCC does not have access to this area.
Other Property Reconnaissance Restrictions:	None
Data Gaps from Environmental Records Review:	Due to time limitations in the preparation of this report, a full review of regulatory agency files was not reasonable ascertainable. However, a cursory review of files held by the Fullerton Building Division, Fire Department, and Orange County Health Care Agency was performed by Stantec. Based on information provided in the Antea Phase I ESA report, combined with Stantec's research, it is unlikely that this data gap would change the conclusions of this report. With regard to former USTs at the Property, KCC records report that seven USTs were present onsite while OCHCA and RWQCB records only indicate that six USTs were registered for the Property. In addition, two former USTs are known to have been removed from the area to the east of Building 4, as shown in agency records. However, four additional USTs are shown in OCHCA records to have been in an area that appears to be adjacent to a loading dock but does not provide any other reference point to identify the locations of these USTs. The orientation of the loading dock depicted in the OCHCA records does not resemble any of the loading docks currently at the Property. As a result, the discrepancy in the number of former USTs at the Property and lack of clear location information for the four USTs shown in OCHCA records is considered a data gap. In the absence of locational information and soil sample data at the four former USTs, that a Soil Management Plan be prepared that would discuss actions that would need to be taken in the event that soil contamination remains and is encountered during Property redevelopment.
Data Gaps from Historical Records Review:	None

PHASE I ENVIRONMENTAL SITE ASSESSMENT

DATA GAPS
August 19, 2019

Gap	Discussion
Data Gaps from Interviews:	None
Other Data Gaps:	None

9.0 CONCLUSIONS

Stantec has performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E-1527-13 and the requirements of AAI for the "Property". Any exceptions to, or deletions from, this practice are described in the Data Gaps section of this report. This assessment has revealed no evidence of recognized environmental conditions (RECs) in connection with the Property except for the following:

- Off Site Sources (including Regional Groundwater Impacts):
    - The following nearby off-Site facilities have, or may have, contributed VOCs and other contaminants to soil, groundwater, and soil vapor that may potentially impact the Property:
        - Trent Tube Division, 2100 E. Orangethorpe Avenue
        - Orange County Metal Processing, 1711 E. Kimberly Avenue
        - PCE Metal Finishing, 1723 E. Kimberly Avenue
        - Khyber Food, Inc, 1818 E. Rosslynn Avenue
        - Alcoa Global Fasteners, Inc, 800 S. State College Boulevard
        - Winonics, Inc., 1257 S. State College Boulevard
        - Chapman Coast Roofing, Co., 2301 E. Orangethorpe Avenue
        - Vista Paint, 2020 E. Orangethorpe Ave
        - St Hart Container MPP Fullerton, 1901 E. Rosslynn Avenue
        - Golden West Towing Equipment, 1850 E. Orangethorpe Avenue
- General Exterior Areas:
    - Historical Agricultural Use (Orchards) – possible source of organochlorine pesticides and herbicides containing arsenic and lead
    - Railroad spurs – possible source of herbicides, metals, petroleum hydrocarbons, pesticides and polychlorinated biphenyls (PCBs)
    - Industrial wastewater discharge point – potential source of VOCs, metals, petroleum hydrocarbons and other contaminants
    - Forklift wash area and sump – potential releases related to past cleaning operations
    - Tank farm unloading area, diesel UST, and sump – potential source of VOCs, petroleum hydrocarbons and other contaminants
    - Stormwater discharge point – potential source of VOCs, petroleum hydrocarbons and other contaminants
    - Four former USTs adjacent to a non-specific "loading dock" as indicated in OCHCA records. The USTs are reported to have contained mineral spirits, dioctyl

phthalate and vinyl acetate: potential source of VOCs, petroleum hydrocarbons, phthalates and other contaminants.

- General Interior
    - Sub-slab soil vapor and indoor air – potential vapor intrusion risk associated with potential on-site releases and contaminated groundwater related to regional groundwater impacts beneath most of the property.
    - Building 1
        - Basement – potential source of VOCs, petroleum hydrocarbons, PCBs, and other contaminants
        - Maintenance Shop PCE Parts Washer: potential source of VOCs
        - Maintenance Shop Floor Drain: potential source of VOCs, petroleum hydrocarbons, and other contaminants.
    - Building 3
        - Battery storage area – etching and staining to battery storage and charging processes may be a potential source of acids and metals
    - Building 3/8
        - Maintenance shop PCE part washer: potential source of VOCs
    - Building 4
        - Boiler Building Area, Two Former USTs: Potential source of VOCs and petroleum hydrocarbons
        - Wastewater treatment area: potential source of VOCs, petroleum hydrocarbons, metals and other contaminants
    - Building 8
        - UCON area Sump pit and trench drains: Potential source of VOCs, petroleum hydrocarbons and other contaminants
        - Former ink dye area wash-down/ cleaning area with trench drains: Potential source of VOCs, petroleum hydrocarbons, PCBs, and other contaminants
        - Bath area sump pit: potential source of VOCs, petroleum hydrocarbons and other contaminants
    - Building 10
        - Tractor Shop PCE part washer location: Potential source of VOCs
    - Building 25
        - Chemical Storage Area, three sumps: Potential source of VOCs, metals, petroleum hydrocarbons and other chemicals

The locations of the above RECS are shown on Figure 2.

10.0 Recommendations

Based on the conclusions of this Phase I ESA, Stantec recommends that a preliminary Phase 2 assessment be performed at the above reference locations to evaluate whether releases have occurred that have affected subsurface media at the Property above regulatory cleanup thresholds or human health risk levels. To this end, Stantec has prepared a *Work Plan for Preliminary Phase 2 Investigations* concurrently with this report that details the scope of work for the recommended preliminary assessment.

With regard to the data gap associated with the four (4) USTs for which there is no location information or soil sample data provided in historical records, Stantec recommends that a Soil Management Plan (SMP) be prepared that would discuss actions that would need to be taken in the event that impacted or potentially impacted soil is encountered during Property redevelopment. Such actions taken would include, but are not limited to, field evaluation, soil sampling, and potential excavation/remediation.

In addition, Stantec has identified the following non-ASTM environmental issues associated with the Property:

- **Asbestos Containing Materials.** Given the age of the existing buildings on the Property (some constructed as early as the mid-1950s), the presence of ACM is considered likely. Stantec recommends conducting a comprehensive, pre-demolition ACM survey in accordance with the sampling protocol of the Asbestos Hazard Emergency Response Act (AHERA) prior to any activities with the potential to disturb building materials to determine whether ACM are present. Further, in the event ACM is detected, Stantec recommends proper removal and disposal of the materials identified prior to any activities with the potential to disturb them.

  Portions of the property are paved with asphalt. A stress absorbing fabric marketed as Petromat is sometimes used in asphalt paving operations. The tack coating often associated with this material sometimes contains asbestos. Should development plans include demolition of the asphalt, Stantec recommends inspecting the asphalt for the presence of Petromat and, if observed, sampling the Petromat for the presence of asbestos.

  Additionally, Stantec makes no warranty as to the possible existence or absence of inaccessible materials (buried transite, wrapped, or coated piping) or to their evaluation with respect to asbestos content. Samples of suspect ACM should be collected for laboratory analysis of asbestos prior to any renovation or building demolition, in order to determine the need for compliance with EPA National Emission Standard for Hazardous Air Pollutants (NESHAP) regulations.

- **Lead Based Paint.** Given the age of the existing buildings on-Property (some constructed in the mid-1950's), the presence of lead-based paint (LBP) is considered likely. Stantec recommends conducting a LBP survey, prior to any activities with the potential to disturb building materials to determine whether LBP is present. Further, in the event LBP is

detected, Stantec recommends removing the materials prior to any activities with the potential to disturb them.

- **Light Ballasts -** Structures appeared to contain fluorescent light ballasts, which may contain PCBs. Fluorescent light ballasts should be handled and disposed of in accordance with regulatory guidelines.

11.0 NON-SCOPE CONSIDERATIONS

No ASTM E1527-13 non-scope services were performed as part of this Phase I ESA with the following exceptions:

11.1 LEAD-BASED PAINT

Given the age of the existing buildings on-Property (some constructed in the mid-1950's), the presence of lead-based paint (LBP) is considered likely. Stantec recommends conducting a LBP survey, prior to any activities with the potential to disturb building materials to determine whether LBP is present. Further, in the event LBP is detected, Stantec recommends removing the materials prior to any activities with the potential to disturb them.

11.2 ASBESTOS

Asbestos can be found in many applications, including sprayed-on or blanket-type insulation, pipe wraps, mastics, floor and ceiling tiles, wallboard, mortar, roofing materials, and a variety of other materials commonly used in construction. The greatest asbestos-related human health risks are associated with friable asbestos, which is ACM that can be reduced to powder by hand pressure. Friable asbestos can become airborne and be inhaled and has been associated with specific types of respiratory disease. The manufacturing and use of asbestos in most building products was curtailed during the late 1970s.

Given the age of the existing buildings on the Property (some constructed as early as the mid-1950s), the presence of ACM is considered likely. Stantec recommends conducting a comprehensive, pre-demolition ACM survey in accordance with the sampling protocol of the Asbestos Hazard Emergency Response Act (AHERA) prior to any activities with the potential to disturb building materials to determine whether ACM are present. Further, in the event ACM is detected, Stantec recommends proper removal and disposal of the materials identified prior to any activities with the potential to disturb them.

Portions of the property are paved with asphalt. A stress absorbing fabric marketed as Petromat is sometimes used in asphalt paving operations. The tack coating often associated with this material sometimes contains asbestos. Should development plans include demolition of the asphalt, Stantec recommends inspecting the asphalt for the presence of Petromat and, if observed, sampling the Petromat for the presence of asbestos.

Additionally, Stantec makes no warranty as to the possible existence or absence of inaccessible materials (buried transite piping) or to their evaluation with respect to asbestos content. Samples of suspect ACM should be collected for laboratory analysis of asbestos prior to any renovation or building demolition, in order to determine the need for compliance with EPA National Emission Standard for Hazardous Air Pollutants (NESHAP) regulations.

11.3 RADON

Radon is a colorless, tasteless radioactive gas with an EPA-specified action level of 4.0 PicoCuries per liter of air (pCi/L) for residential properties. Radon gas has a very short half-life of 3.8 days. The health risk potential of radon is primarily associated with its rate of accumulation within confined areas near or in the ground, such as basements, where vapors can readily transfer to indoor air from the ground through foundation cracks or other pathways. Large, adequately ventilated rooms generally present limited risk for radon exposure. The radon concentrations in buildings and homes depend on many factors, including soil types, temperature, barometric pressure, and building construction (EPA, 1993).

Stantec reviewed regional data published by the EPA on average indoor radon concentrations in the vicinity of the Property (http://www.epa.gov/radon/zonemap.html).

Zip Code 92831	Orange County
EPA Radon Zones (w/Average Measured Indoor Radon concentrations)	
92% < 4 pCi/L	Zone 3 – low (<2 pCi/L); average first floor concentration 0.763 pCi/L
Normally-occupied sub grade areas (i.e. basement apartments, offices, stores, etc.)?	
No subgrade areas are present at the Property.	

The Property is located in Zone 3 and is considered to have low potential for radon. Stantec concludes that radon is unlikely to represent an environmental concern to the Property and recommends no further investigation regarding this issue.

11.4 FLOOD ZONES

According to the Physical Setting summary portion of the EDR report, the Property is located within a 500-year flood plain.

11.5 POLYCHLORINATED BIPHENYLS (PCBS)

Several large, pole-mounted electrical transformers are located in north-central portion of the Property to the southeast of the north gate entrance. The transformers are reported to be filled with mineral oil. No staining or other signs of release were noted.

Property structures appeared to contain fluorescent light ballasts, which may contain PCBs. Fluorescent light ballasts should be handled and disposed of in accordance with regulatory guidelines.

11.6 ON-PROPERTY PRODUCTION WELLS

Based on information collected during this Phase I ESA, one production well (F-KIM-2) is located in the north-central portion of the property near the north gate entrance. The production well provides water to support the high water demands of the paper manufacturing processes.

Appendix B STANTEC RESUMES

Dion Monge

Project Scientist

Dion has extensive knowledge of underground storage tank investigations, Phase I and II environmental site assessment, groundwater monitoring and reporting, soil, soil vapor, and groundwater quality assessments, and testing for asbestos and lead based paint. His project experience is extensive and wide ranging and includes many types of soil, soil vapor, and groundwater assessment and monitoring for planned, existing, and former sites. Dion also has experience in testing fill soils placed on grading sites.

He has experience on redevelopment of former oil field sites that include submittal of construction site review plans, oil well mitigation (venting and casing alterations), abandonment of oil wells, and remedial investigations and remediation involving soil contamination.

Dion also has experience working with 1166 AQMD air monitoring on projects ranging from limited access dry cleaner excavations, solvent excavations, and petroleum excavations related to underground storage tank releases. Included in this type of monitoring is the assessment of a safe work environment for the contractors involved with this type of work.

He has considerable knowledge in asbestos and lead based paint sampling as a building inspector and lead sampling technician. Asbestos and lead based paint surveys have ranged from large office buildings to sampling highway bridges.

EDUCATION

BS, Soil Science, California Polytechnic University, Pomona, Pomona, California, 2004

Health & Safety Certification (29 CFR 1910.120),, 40-Hour OSHA Health & Safety Certification, Redlands, California, 2005

Health & Safety Annual Update Certification, 8-Hour OSHA, Redlands, California, 2009

First Aid/CPR, American Red Cross, Redlands, California, 2009

Certified Building Inspector, AHERA 8-Hour Refresher, Redlands, California, 2009

PROJECT EXPERIENCE

Asbestos, Lead Based Paint, and Hazardous Material Management

Haller Wash Bridge No. 54-0891R&L, San Bernardino County, California (Asbestos and Lead-Based Paint Sampling Assistant)

Dion conducted asbestos and lead based paint survey on highway bridge. He assisted with planning field operations, measuring bridge dimensions, and collecting samples. Tasks included sample collection, bridge measurements, and documentation.

Project Management Oversight

Magnolia Plaza, Fountain Valley, California

Dion is providing project management of soil, soil vapor, and quarterly groundwater sampling related to a solvent release at a former dry cleaning facility. Tasks include preparation of work plans for approval by the Regional Water Quality Control Board and oversight of field sampling, including lithologic logging, for soil and soil vapor investigations performed within a multi-tenant strip center. Additional tasks include preparation of investigative reports and quarterly groundwater monitoring reports. The site remains an open case and preparation of a work plan to use electrical resistive heating ("ERH") will be prepared in the coming weeks.

Dion Monge

Project Scientist

Former Superb Dry Cleaners, Anaheim, California
Dion performed field oversight, direction, and confirmation soil sampling of a limited access excavation within a former dry cleaner unit. Post excavation field activities included application of a barrier type floor sealant along with post excavation indoor air sampling. Remedial work led to regulatory closure being granted from the local agency.

Site Assessment

I-15/I-215 Interchange Improvements, San Bernardino County, California (Sampling Technician)
Dion helped conduct site investigations and surveys for potentially hazardous materials. His efforts supported Caltrans' plans to improve and widen the existing freeway lanes, entrance and exit ramps, and vehicle and railroad bridges along a 6-mile stretch of the I-15 and I-215 freeways in the Devore area of San Bernardino County. Dion's efforts included Environmental Evaluation of Recognized Environmental Concerns identified in ISAs

Highway 138 Environmental Investigations, San Bernardino County, California (Field Assessment and Reporting)
Dion helped complete hazardous material site investigations on five bridges along State Highway 138 along a 20-mile segment through portions of Los Angeles and San Bernardino Counties, California. The investigation was conducted in accordance with Caltrans protocols and was compliant with EPA's all appropriate inquiries guidance and ASTM Standard Practice E1527. He performed site reconnaissance, conducted regulatory and agency field reviews, and reviewed environmental databases and historical fire insurance, telephone directories, aerial photographs, topographic maps, and other environmental records for properties within one half mile of the proposed 20-mile segment of Highway 138. Dion compiled an report summarizing findings and identifying recognized environmental conditions.

Proposed Friends Christian High School, Yorba Linda, California
Dion prepared preliminary site assessment (PSA) report for future private school site to identify recognized environmental conditions ("RECs") related to past property usage as an oil field with 21 oil wells abandoned prior to 1990. Completion of the PSA led to his management of the project through site closure. Field investigations and reporting by Dion included Phase II investigations, methane survey, oil well leak testing and venting, backfill and compaction (including soils testing), DOGGR Construction Site Review, and excavation and onsite management of more than 5,000 cubic yards of petroleum impacted soils.

SR-58 Widening, San Bernardino County, California
Dion performed Initial Site Assessment (ISA) for Caltran at Kramer Junction for the proposed widening of State Route 58. The ISA was performed in accordance with guidelines promulgated by the American Society for Testing and Materials (ASTM) and included historical research and coordination of permit/file reviews with local building/planning departments and environmental agencies. Dion's role included the field visit, observation documentation, agency reviews, and reporting.

Soil Sampling

Caltrans I-15, Task Order 28, Hesperia, California
Dion conducted a soil investigation for metals analysis alongside I-15 for disposal recommendations during construction of mortar-lined channels at several locations. He assisted with planning field operations and collected soil samples. Tasks included sample collection, preservation, and documentation.

** denotes projects completed with other firms*

Brian Viggiano PG

Senior Geologist

Brian is a California Professional Geologist with approximately ten years of professional experience in environmental and geotechnical fields. He has performed and managed numerous Environmental Site Assessments (ESAs) for real estate transfers, bank loans, and redevelopment projects. Related sites have included former and active retail petroleum stations, former oil fields, dry cleaners, agricultural sites, plating facilities, landfills, chemical plants and other industrial facilities. He has also performed site assessment, investigation, characterization, and remedy of soil and groundwater contamination utilizing established and innovative technologies including single and multi-phase extraction, in-situ chemical oxidation, pump and treat, electrical resistance heating, and chemical fixation. Brian has also performed geotechnical investigations at proposed school developments and for academic purposes. Projects have included evaluation of active and potentially active faults, seismic evaluations, geophysical surveys, and evaluation of remotely sensed data. His versatility and range of environmental and geotechnical skills have been utilized in all stages of investigation including planning, implementation, site reconnaissance, mapping, surveys, and site inspections during construction, assessment or cleanup to final drafting, illustration, and report preparation.

EDUCATION

Member, Geological Society of America

PROJECT EXPERIENCE

Environmental Site Remediation

Chemical Plant Decommissioning and Remediation, Vernon, California (Field Geologist/ Site Superintendent)

Brian worked as the Field Geologist/ Site Superintendent during assessment, below grade demolition and remediation of an historical Chemical plant located in the City of Vernon, California. Assessment activities consisted of evaluating historical process areas, below grade structures and settling ponds impacted by high levels of pesticides, heavy metals and radionuclides (Thorium-232 and Uranium-238). Remediation activities consisted of excavation and off-site disposal of radiological and chemically impacted waste, corrective grading and capping of residual wastes. The Project value was $8,000,000.00.

Former Open Dump Site, Hopi and Navajo Tribal Lands, Arizona (Field Geologist)

Brian worked as the field geologist at a former open dump site located on Hopi and Navajo Tribal lands. The open dump was reported to have been the source of elevated concentrations of uranium and other radionuclides in groundwater at the site and vicinity. Brian conducted a collaborative multi-week field study with the U.S. Geological Survey (USGS) to assess site geological relationships, potential groundwater flow paths and plume limits, and potential for spring and drinking water resources to be impacted by leachate from the site. Field work included rock coring, installation of groundwater monitor wells, field mapping, and stratigraphic analysis. Subsequent data analysis included review of comprehensive legacy data, evaluation of landfill leachate tracers (e.g., tritium) and whole rock and leachability data. The investigation is ongoing and is being conducted collaboratively with the USGS,

** denotes projects completed with other firms*

Department of Interior, and Environmental Protection Agency.

Garden Grove Redevelopment Project, Garden Grove, California (Project Geologist)
Brian implemented remedial investigation of petroleum-impacted soil and groundwater. His investigation consisted of soil sampling, installation, and subsequent development and sampling of groundwater monitoring wells. He worked with others to design and implement a complex dual-phase extraction system that included the installation of 45 extraction wells and two soil vapor extraction systems. He completed work under the oversight of the State of California.

Chlorinated Solvent Remediation, El Centro, California (Project Geologist)
Brian performed site remedial investigation and clean up of chlorinated solvent-impacted soil and groundwater. He designed and implemented feasibility tests which included in-situ chemical oxidation using potassium permanganate and hi-vacuum dual phase extraction. He also designed and implemented final remediation approach using six-phase electrical resistance heating. The project value was $1,000,000.

Mixed-Use
Compton Redevelopment Project, Compton, California (Project Geologist)
Brian performed site remedial investigation and cleanup of soil chemically impacted with petroleum, PCBs, chlorinated solvents, and heavy metals including hazardous waste concentrations of lead and groundwater impacted with chlorinated solvents. Mitigation of impacted soil included appropriate remedial excavations and corrective grading plans. Groundwater remedy included SVE with air sparging and in-situ chemical oxidation using potassium permanganate. All work was completed under State of California oversight. The project value was $2,800,000.

Multi-Unit / Family Residential
Claremont Residential Development, Claremont, California (Project Geologist)
Brian performed a remedial investigation that identified the presence of approximately 9,000 cubic yards of lead impacted fill materials. He designed and implemented corrective grading plan that included the generation a of numerous small stockpiles of soil that were statistically characterized and either reused on site or disposed of off site. Site mitigation was conducted under the oversight of the Los Angeles County Fire Department. The innovative grading approach resulted in client cost savings of $500,000.

Residential Redevelopment Project, Torrance, California (Project Geologist)
Brian oversaw remediation of petroleum and solvent contamination that resulted from historical oil field activities overprinted by contamination from a more recent release from a dry cleaning facility. The site was mitigated to residential standards under State of California oversight. Remedial actions included re-abandonment of an onsite oil well and removal of the historical pipeline infrastructure, excavation and onsite bioremediation of petroleum impacted soil, and soil vapor extraction to reduce solvent impact in the vicinity of the former dry cleaners. In addition, at all locations where solvent-impacted soil was recalcitrant to vapor extraction, due to the presence of heavy petroleum, a large diameter flight auger was used to drill out residual contamination. The project value was $750,000.

Kyle D. Emerson PG, CEG

Managing Principal Geologist

Kyle has more than 28 years of professional experience—17 of those years with Stantec—providing geotechnical and environmental consulting. During the course of his experience, he has been involved with a wide variety of geological and engineering projects. He has been in direct charge of quality control/quality assurance (QA/QC) work for Stantec and previous firms for geological, engineering geological, and environmental services primarily in California. Additionally, Kyle has been a primary contact for Stantec with many different clients (including multi-party actions) and regulatory bodies involving contracting, workplan approvals, site assessments and closures, permitting, remedial action, and litigation support. With regard to litigation services, Kyle has extensive experience providing expert witness testimony, second-party review, and litigation support and analysis.

Kyle's extensive experience includes assessment and remediation of property-specific and regional issues involving soil and groundwater contaminated with petroleum hydrocarbons, chlorinated solvents, heavy metals, pesticides, and PCBs.

He currently serves as the managing principal geologist in Stantec's Redlands, California office.

EDUCATION

Engineering Geology/Hydrogeology, California State University, Los Angeles, California, 1984

AS, General Science, Crafton Hills College, Yucaipa, California, 1975

BS, Geological Sciences, California State University, Long Beach, California, 1982

REGISTRATIONS

Certified Engineering Geologist #1271, State of California

Professional Geologist #4066, State of California

PROJECT EXPERIENCE

Bioremediation

Excavation and Treatment of Petroleum-Contaminated Soil

Kyle designed the excavation and treatment of 45,000 cubic yards of petroleum-contaminated soil. Soil treatment included utilizing vapor extraction, combined with bioremediation.

Chemicals & Polymers

Two Former Chemical Plants, Environmental Site Assessments and Remediation, Vernon, California

Mr. Emerson was part of the team for conducting Phase I and Phase II Environmental Site Assessments (ESA) and developing remedial action plans for two former chemical plant sites with 80-year industrial histories. Phase I ESAs used historical files, maps, aerial photographs, available documents, and data from public agencies and historical directories for identifying recognized environmental concerns. Extensive Phase II ESA survey activities aided in identifying below-grade structures such as vaults/USTs, as well as assessing the extent of influence and nature of the contamination. These investigations confirmed the presence of heavy metals, petroleum hydrocarbons, volatile organic compounds, polychlorinated biphenyls, radioactive materials, semi-volatile organic compounds, and polycyclic aromatic compounds in the soils for these sites. Specific areas of concern included former settling ponds, a bone yard, maintenance areas, transformer and substations, wastewater treatment facilities, and above-ground storage tank farms. A conceptual mode was developedl for use in a health risk assessment and developed risk-based corrective actions to address potential health and environmental concerns. He assisted with the development and implementation of a remedial action plan, combined administrative controls, engineering controls, and active remediation; this resulted in the cost-effective return of one site to active use, and is reducing health risks to occupants and the public at the second site.

Kyle D. Emerson PG, CEG

Managing Principal Geologist

CONFIDENTIAL: Aerospace Adhesives and Coatings Plant, Glendale, California

Mr. Emerson was part of the team that conducted feasibility studies to evaluate remedial alternatives for remediation of chlorinated VOCs, 1,4 dioxane, and hexavalent chromium (CrVI) in soil, soil vapor, and groundwater. Feasibility studies included groundwater pump testing, benchscale column testing to evaluate in situ alternatives for reducing CrVI to the less mobile CrIII valence state, soil vapor extraction, capping, and excavation. Field pilot studies were performed to evaluate the efficiency of various CrVI reductants including the use of ferrous sulfate, calcium polysulfide, emulsified oil, and fructose. Extensive multi-depth soil vapor testing was conducted to evaluate the distribution of VOCs in the subsurface and to support vapor intrusion risk assessment. Feasibility studies were completed in 2008. Remedial actions are expected to be completed in 2011.

Condition Assessments

Assessment and Mitigation of Manufacturing Facility

Kyle managed the assessment and mitigation of an ammunition manufacturing facility covering 1,100 acres in a complex geologic environment. The contaminates involved red and white phosphorous, TNT, chlorinated solvents, solid wastes, and live ordinance.

Soil Contamination Assessment Supervision and Management

Kyle managed and supervised soil contamination assessment and in-situ remediation of heavy metals involving chromium, cadmium, nickel and zinc by chemical fixation to depths in excess of 40 feet below ground surface beneath existing structures within several manufacturing facilities.

Litigation Support and Expert Testimony

Kyle provided litigation support and expert testimony on more than 20 separate projects involving service stations, chlorinated solvent cases, heavy metal, and semi-volatile releases.

Corporate / Office

CT Realty Environmental Remediation of Former Dry Cleaners, El Centro, California

Mr. Emerson was responsible for assessments and remediation at this former dry cleaners which released the dry cleaning chemical tetrachloroethene (PCE) to the ground and underlying groundwater. The work included initial site assessment, agency interaction and negotiations with the California Regional Water Quality Control Board (CRWQCB), and Colorado Basin Region human health risk assessment (HHRA), design and implementation of remedial investigations, feasibility studies, remedial action plans, and implementation of remediation in mitigating chlorinated solvent contamination in vadose and saturated zones at concentrations indicative of DNAPL. The results of the completed remediation, as well as continued confirmation sampling and monitoring, allowed the CRWQCB to issue site closure in 2008. The site has since been redeveloped into a new commercial development.

Environmental Assessments

Siting Studies

Kyle performed initial siting studies for potential Class I, II, and III landfills. The project included detailed geologic mapping, hydrogeological studies, and permeability studies of caps and liners.

Environmental Site Remediation

Assessment and Remedial Design, California (Project Supervisor)

Kyle supervised the assessment and remedial design of a system to eliminate salt brine contamination in shallow perched water horizons in the Yucaipa, San Bernardino, and Riverside areas of southern California.

Design and Installation of Recovery Systems*

Kyle designed and installed numerous free-product recovery systems that successfully recovered product. One of the sites contained product up to 11-feet thick covering more than three city blocks. The dissolved phase had affected a multi-aquifer system and a public drinking water system.

Geophysical Characterizations*

Kyle performed and supervised numerous geophysical characterizations to determine the extent of old landfills. He provided classification studies, landfill gas monitoring, removal verification during grading, methane collection and mitigation plans, permitting, and closure plans.

** denotes projects completed with other firms*

Kyle D. Emerson PG, CEG

Managing Principal Geologist

Domestic Landfill Development*

Kyle designed and supervised the dynamic consolidation of a domestic landfill for development. He used this process to minimize expected settlement to overlying structures. Kyle designed commercial developments on closed landfills that involved complex methane collection and monitoring systems and building settlement controls.

Clay Borrow Site Studies

Kyle performed more than 10 separate clay borrow site studies for determining sources of material to cap landfills; ranged from a 20-acre dry lakebed to a 450-acre parcel in complex folded marine sediments.

Assessment, Clean Up, and Regulatory Support Management, Santa, Monica (Project Manager)

Kyle managed the assessment, clean up, and complex regulatory support of a PRP site in an MTBE case (Charnock subbasin). His work involved more than 20 environmental professionals working full time for two years to complete the assessment and clean up mandated by the regulatory agencies.

Hazardous Waste

San Gabriel Valley Superfund Site, Remediation & Closure of Multiple Source Areas, Industry, California

Mr. Emerson performed feasibility studies to evaluate appropriate and relevant remedial alternatives to mitigate constituents of concern in five AOCs contaminated with chlorinated hydrocarbons, heavy metals, petroleum fuel, and cutting oils. Ultimately, a combination of remedial alternatives was implemented that included large-diameter auger excavation to 45 feet to minimize impacts on facility operations, vapor extraction, vapor intrusion risk assessment, deed restriction, and monitored natural attenuation. At the completion of remedial actions, confirmation soil, soil vapor, and groundwater sampling were conducted and followed with risk assessment to demonstrate that remedial objectives had been achieved. No further action was recently granted by the US EPA and Los Angeles Regional Water Quality Control Board.

Mixed-Use

Port of San Diego Rohr Facility, Chula Vista, California

Mr. Enerson assisted in a detailed subsurface assessment of the Rohr facility. The intent of the assessment was to evaluate the 40-acre former aircraft part manufacturing facility for acquisition by the Port of San Diego for redevelopment into a business park and entertainment complex. The assessment identified the presence of soil, soil vapor, and groundwater impacts by petroleum hydrocarbons, VOCs, heavy metals, PCBs, and semi-volatile organic compounds. He utilized many sampling techniques to assess the limits and concentrations of contaminants in the subsurface. Ultimately, the team was able to develop a cost estimate for potential remedial action cost associated to corrective action to allow redevelopment.

Master Planned Commercial/Residential Redevelopment Project, Whittier, California (Project Manager)

Kyle oversaw the assessment of 26 contiguous properties that are part of a 21-acre master planned commercial/residential redevelopment project. The properties included industrial facilities, platting lines, fuel USTs, and metal processing plants, among others. The estimated cleanup costs are approximately $2 million.

Multi-Unit / Family Residential

Residential Development Assessment, Ventura, California (Project Director)

Kyle directed an assessment of a 40-acre former agricultural property proposed for residential development. Pesticides were identified above hazardous waste levels and preliminary remediation goals established by the U.S. Environmental Protection Agency. Through corrective grading methods and onsite placement of the pesticide impacted soils, all material were re-used on site without offsite disposal. The over all cost savings for the client was more than $1 million. Total cost was less than $250,000 for all necessary activities.

Oil & Gas

Oil Field Site Assessments*

Kyle performed site assessments at oil field leases involving refineries, bulk storage areas, piping systems and wellhead, and drilling mud pit contamination.

** denotes projects completed with other firms*

Kyle D. Emerson PG, CEG

Managing Principal Geologist

Environmental Protection Agency Superfund Action, Culver City, California (Project Manager)
Kyle served as the project manager representing a major oil company in the assessment, remedial action, and litigation support in a multi-party contamination case affecting a City water supply. The assessment involved more than 250 continuous core borings up to 100 feet, as well as extensive remedial actions. The total cost for all related activities was $22 million. The case is settled and the closure of the site is pending.

Project Management
Liability and Property Management Consulting Services
Kyle is providing liability and property management consulting services to more than 10 medium to large property development firms in the US. His work involves property transaction assessments, contract review, acquisition guideline development, liability management evaluation, insurance acquisition, and strategic planning.

Residential Development
Environmental Development Management and Review (Project Manager)
Kyle manages and reviews environmental development issues for a large residential developer specializing in development of contaminated industrial properties by providing innovative solutions in developing contaminated properties for residential use through risk assessment, engineering, and administrative and property development controls.

Site Management and Remediation
Design and Implementation of Biodegradation Programs*, California
Kyle designed and implemented one of the first in-situ biodegradation programs in California; it involved 50,000 cubic yards of diesel-contaminated soils, and groundwater to depths of 70 feet below ground surface.

Soil and Groundwater Remediation Systems
Soil and Groundwater Contamination Assessments and Mitigation*, California (Project Manger)
Kyle managed numerous chlorinated solvent soil and groundwater contamination assessments and mitigation programs in southern California. The projects involved releases that impacted soil and groundwater to depth of groundwater more than 700 feet in multi-aquifer systems. One case involved with plume dimensions more than 1 mile from the source affecting residential properties.

Soil and Groundwater Assessment and Remediation Programs*
Implemented hundreds of soil and groundwater assessment and remediation programs at various service station facilities in Southern and Northern California, and Nevada. Work involved assessment, remedial design, installation, maintenance and monitoring. Closure has been received on a majority of these sites.

Assessment and Remediation Management*
Kyle managed the assessment and remediation of soil and groundwater manufacturing at dry cleaning facilities contaminated with chlorinated solvents.

Warehouse / Light Industrial
Glendale Redevelopment Project, Glendale, California (Project Manager)
Kyle managed the assessment and remedial actions during the redevelopment of and industrial property. The project involved the demolition of a historic manufacturing facility and a commercial dry cleaner. Each of these facilities were associated with releases of solvents and petroleum hydrocarbons. Remedial actions involved excavation by pattern drilling and off site disposal along with removal of former USTs. The total cost of remediation and assessment was $450,000.00.

** denotes projects completed with other firms*

Kyle D. Emerson PG, CEG

Managing Principal Geologist

Compton Redevelopment Project, Compton, California (Project Manager)

Kyle is serving as project manager for the assessment and remedial actions for a large redevelopment project. The project involves the redevelopment of a historic manufacturing facility and a former dry cleaner. Each of these facilities were associated with releases of solvents and petroleum hydrocarbons. The industrial facility was also associated with significant volumes of buried waste that required removal and disposal. These wastes also included the chemical referenced above, as well as PCBs and heavy metals. Remediation has included excavation, vapor extraction, and chemical fixation. The total cost of this project has been $2.8 million to date.

** denotes projects completed with other firms*

Appendix C USER PROVIDED RECORDS

Stantec

PHASE I ESA USER'S QUESTIONNAIRE

In order to qualify for protection from land owner liability under CERCLA as an *innocent landowner, bona fide prospective purchaser,* or *contiguous property owner*, ASTM standard practice E1527-13 and the federal AAI rule (40 CFR 312) require that the User of the Phase I ESA report provide certain information (if available) to the Environmental Professional completing the assessment. Failure to provide this information could result in a determination that "all appropriate inquiry" is not complete. Information that is not or cannot be provided to the Environmental Professional may be identified as a "data gap" in the Phase I ESA report.

Please answer the following questions as completely as possible. Attach additional pages as needed. Return the completed questionnaire to Stantec along with the executed Authorization For services form.

1. Property Information

Property Name: GLC FULLERTON

Property Address(es): 2001 E ORANGETHORPE AVE

City: FULLERTON State CA Zip 92831

Property Owner Name: KIMBERLY-CLARK WORLDWIDE, INC

Property Owner Phone #: _____

2. Contact For Site Access

Name: PAUL KURY

Company/Organization/Title: CONTRACTOR GENERAL SAP / MECHANICAL ENGI

Phone # 714/767-5716 (CELL) E-Mail Address: PAUL.KURY@KCC.COM

3. Environmental Cleanup Liens. Are you aware of any environmental cleanup liens against the property that are filed or recorded under federal, tribal, state or local law?

_____ Yes ___X___ No

If yes, describe or attach details of the lien _____

_____

4. Activity and Land Use Limitations. Are you aware of any activity and use limitations, such as engineering controls, land use restrictions, or institutional controls that are in place at the property and/or have been filed or recorded as applicable to the property as a result of environmental contamination, investigation, cleanup, or related matters?

_____ Yes ___X___ No

If yes, describe or attach details of the limitations _____

_____

5. Specialized Knowledge or Experience. As the User of this ESA, do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property, such that you would have specialized knowledge about chemicals and processes used by this type of business?

_____ Yes _____X_____ No

If yes, describe or attach details of your specialized knowledge or experience _____

_____

6. Relationship of Purchase Price to Fair Market Value of Property. Does the purchase price being paid for the property reasonably reflect the fair market value?

_____X_____Yes _____No

_____Not applicable. User is not involved in a purchase of the property.

If you conclude that there is a difference, do you have any reason to believe that the reduced purchase price may be related to contamination known or believed to be present at the property?

_____Yes, I have reason to believe that the purchase price for the property has been reduced in comparison with the fair market value due to contamination known or believed to be present at the property.

_____No, I have no reason to believe that the purchase price for the property has been reduced in comparison with the fair market value due to contamination known or believed to be present at the property.

7. Commonly Known or Reasonably Ascertainable Information. Are you aware of commonly known or reasonably ascertainable information about the property that would help the Environmental Professional to identify conditions indicative of releases or threatened releases of hazardous substances or petroleum products? For example:

Do you know the past uses of the property?

_____X_____Yes (describe) PAPER / TISSUE MANUFACTURING

_____

_____

_____No

Do you know of chemicals, hazardous substances or petroleum products that are present or once were present at the property?

_____X_____Yes (describe) HYDRAULIC FLUIDS, OILS, BLEACH AND SOLVENTS

_____

_____

_____No

Do you know of spills or other releases of chemicals, hazardous substances or petroleum products that have taken place at the property?

__X__ Yes (describe) AS DISCUSSED IN A SELLER PHASE I ESA PREPARED NOVEMBER 5, 2018 BY ANTEA GROUP.

_____ No

Do you know of any environmental cleanups that have taken place at the property?

__X__ Yes (describe) THE SELLER PHASE I ESA DISCUSSES LUSTs AND SOIL REMOVAL

_____ No

8. The Degree of Obviousness of Contamination. E1527-13 and the federal AAI rule (40 CFR 312.31) require that the Phase I ESA consider the degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation. Based on your knowledge and experience related to the property, are there any *obvious* indictors that point to the presence or likely presence of contamination at the property?

__X__ Yes (describe) AS DISCUSSED ABOVE

_____ No

9. Availability of Previous Environmental Reports. Are you aware of previous environmental site assessment reports, other environmental reports, documents, correspondence, etc. concerning the property and its environmental condition?

__X__ Yes (describe) AS DISCUSSED ABOVE

_____ No

Signature: _____

DATE 11/14/88
CA D009547 37
INSPECTOR I. Muiños

This drum rinsate used to be sent to Omega, but will now be sent to Ensco for incineration (as of Jan. 1989).

5. Spent solvents. This facility has ten Safety-Kleen units that are used for degreasing purposes. The cleaning solvent used is 1,1,1-Trichlorethane. Spent solvents are picked up by Safety-Kleen approximately every 4 weeks and recycled.

The first three waste streams listed above are stored in 55 gallon drums and are disposed of within 90 days.

VII. Violations

No violations found at time of inspection.

VIII. Discussion with Management

After reviewing the facility's records, which were adequate, and walking through the manufacturing and storage areas, which were in good condition, I requested two items from Walter Cordell, III:

1. A copy of the results of the samples taken from the sump on Friday, November 11, 1988.

2. Specifications regarding the sump (i.e. its construction, how often sump is pumped out, etc.).

Since the facility appears to be in compliance with generator requirements, as written in Title 22, and does not treat, store, or dispose hazardous waste on-site, I recommend that this facility's Part A application be withdrawn.

IX. Attachments

1. Site location map - 1 page
2. Facility Map - 2 pages
3. Surveillance and Compliance Report - 1 page
4. Correspondence (Specifications of sump) - 5 pages
5. Letter from Facility - 1 page (exemption request)
6. Generator Checklist - 17 pages
7. Generator Hazardous Waste Report for 1987/Biennial Report - 16 pages
8. Hazardous Waste Spill Prevention Control and Countermeasure Plan/Contingency Plan - 31 pages
9. Part A application - 7 pages

Phase I Environmental Site Assessment
Kimberly-Clark Corporation
Fullerton Mill
2001 E. Orangethorpe Avenue
Fullerton, California 92831

EXECUTIVE SUMMARY

Antea®Group was retained and authorized by Kimberly-Clark Corporation (KCC) to conduct a Phase I Environmental Site Assessment (ESA) of their Fullerton Mill property located at 2001 E. Orangethorpe Avenue, Fullerton, Orange County, California (subject property, or site). The purpose for performing this Phase I ESA was to assist KCC with the divestiture of the subject property, and review of the subject property for the potential presence of any Recognized Environmental Conditions (RECs) in accordance with the requirements of the American Society for Testing and Materials (ASTM) International E1527-13 *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*, a widely accepted standard for conducting Phase I ESAs.

Details of the scope of this assessment, site conditions observed, current uses of the site, site history, and other information gained about the site during the course of this assessment are presented in the body of this report. The following provides a summary of the findings. This Executive Summary should be reviewed within the context of the entire report.

Subject Property and Current Use

The subject property, identified as KCC's Fullerton Mill (paper mill), is an approximate 65-acre property located north of E. Orangethorpe Avenue in Fullerton, California. Information obtained from Orange County indicated that the property includes two tax assessment parcel numbers associated with the 2001 E. Orangethorpe Avenue address listing: 073-120-31 and 073-120-33. The subject property is 65.3 acres in size and is occupied by over 1.2-million square feet of manufacturing, warehouse, and office space, plus several outbuildings. KCC's Fullerton Mill manufacturing operation includes paper manufacturing, facial and bath tissue production, on-site equipment/tool repair, product warehousing, and offices.

Historical Use

Based on a review of the compilation of historical sources presented below dating back to 1896, the subject property was first developed, at least partially, for industrial purposes beginning in 1955 of 1956. The existing site building was constructed in phases beginning at that time, and has been occupied and used exclusively by KCC as a paper mill since its development. The overall operations have included different manufacturing lines

but currently is limited to facial/bath tissue and paper towel manufacturing. The surrounding area has been a mix of commercial/industrial properties in all directions since the mid-1900s. Prior to the industrial development, the entire subject property and surrounding area was used agricultural for fruit tree orchards.

Summary of Findings

Antea Group has performed a Phase I ESA in general conformance with the scope and limitations of ASTM Practice E1527-13 of the property located at 2001 E. Orangethorpe Avenue, Fullerton, Orange County, California (subject property). This is an executive summary of findings and should not be relied upon without consulting the entire following report for a more detailed description of the Phase I ESA performed by Antea Group for Kimberly Clark Corporation. This report is subject to the limitations stated in the body of the report and included in **Section 12.0**.

The ASTM E1527-13 standard defines the term data gap as "a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information." The same standard defines data failure as "a failure to achieve the historical research objectives even after reviewing the standard historical resources that are reasonably ascertainable and likely to be useful."

Antea Group identified the following data gaps or data failures during the completion of this Phase I ESA, none of which would be expected to affect the overall findings of this report, if additional information was to become available:

- The absence of requested city directory listings for off-site properties along S. Acacia Street, Kimberly Avenue, and S. State College Boulevard is a data failure. Further, listings for properties along Orangethorpe Avenue, including the subject site, were available only up to 1995. Although this limits the knowledge of historical use of adjoining properties, Antea Group has obtained information about potential environmental concerns on adjoining properties through other sources, such as the EDR Report and state regulatory databases.

Antea Group identified the following more significant data gaps or data failures during the completion of this Phase I ESA, which would be more likely to affect the overall findings of this report, if additional information was to become available:

- The California Department of Toxic Substances Control reported in their September 26, 2018 letter that files are available in their regional office, but has not responded to Antea Group's requests on the type of information available, and protocol to obtain copies of or review the files. Antea Group left voicemails with the DTSC regional office twice in October 2018.

- Antea Group observed numerous unused floor drains and floor trench drains throughout the facility. Site contacts were unaware of the former purpose of the drains, and could not definitively determine the connections or discharge from these drains.
- Site contacts referred to subsurface environmental testing conducted at the subject property in about the mid-2000s as part of region-wide site evaluations to identify suspected sources of the Orange County North Coast chlorinated solvent plume in groundwater. Copies of reports or testing locations and records from the subject property were not available for review as part of this assessment.
- Regulatory waste records include documentation of the disposal of various oils, metals, and solvents, including PCE wastes. Historical waste handling and generation records are limited, and Antea Group was unable to confirm historical hazardous waste accumulation or satellite locations within the facility.

The ASTM E1527-13 standard defines the term recognized environmental condition as "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment." This assessment has revealed the following evidence of RECs in connection with the subject property:

- Via region-wide municipal and private well sampling, regulatory agencies have documented chlorinated solvent contamination in both the principal and shallow groundwater aquifers, including beneath a large portion of the subject site. According to recent data and figures from investigations completed as part of the proposed Orange County North Basin Superfund site, an on-site City of Fullerton water well is impacted. Beneath the site, contaminants are reported to be at concentrations between one and five times the US EPA Region IX Maximum Contaminant levels (MCLs) in both the shallow and principal aquifers, and as high as 5 to 10-times the MCLs in the portion of the principal aquifer beneath the northernmost extent of the site and beneath Kimberly Avenue.

The ASTM E1527-13 standard defines the term controlled recognized environmental condition as "a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting a risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls)." This assessment has revealed the following evidence of CRECs in connection with the subject property:

- This subject property is associated with a Leaking Underground Storage Tank (LUST) incident (Case No. 083001032T) for a fuel oil release reported in May 1986 following the removal of two diesel/fuel oil USTs. The site received official regulatory closure of this incident in a letter from the City of Fullerton Fire Department in a letter dated January 22, 1992. The letter stated that it did not relieve the responsible party of responsibility to *"clean up additional, existing or previously unidentified conditions at the site which cause or threaten to cause pollution…"* and that present or proposed changes to use of the site may require additional site characterization, with it being "*the property owner's responsibility to notify this Department of any changes in report content, further contamination findings, or site usage*."

  The January 1992 closure letter was followed by KCC's reporting of limited remediation and subsurface testing results from February 1992 where low levels of petroleum contaminants were reported in soil, and approximately three cubic yards of impacted materials were left in place due to their inaccessibility beneath a high-pressure fire-suppression pipe.

  As part of a construction project in 2002, KCC's contractors encountered and excavated an additional 2,000+ tons of petroleum contaminated soils from the vicinity of the former USTs. At this time, it was discovered that limited petroleum impacts must remain in soils beneath the boiler house and in groundwater at depths of approximately 30 feet, due to inaccessibility. The reported concentrations in groundwater were less than the regional MCLs established at that time, but soil contaminant concentrations for total petroleum hydrocarbons exceed the current regulatory criteria for exposure to soils in an industrial setting. Due to the regulatory closure of this LUST release incident with the likelihood that some levels of petroleum contamination remain in soils at locations beneath paved surfaces and/or buildings, this represents an CREC in connection with the subject property.

The ASTM E 1527-13 standard defines the term historical recognized environmental condition as "a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls." This assessment has revealed the following HREC in connection with the subject property:

- Several sodium hypochlorite (bleach) spills were documented to have occurred in the facility's tank farm area between 1990 and 1997. Soil testing data from 1997 and 1998 confirmed low levels of sodium hypochlorite in soils to depths up to 40 feet below grade, the maximum depth explored. There are currently no regulatory comparison standards or cleanup levels for sodium hypochlorite, but the County of Orange Division of Environmental Health calculated potential chlorine exposure due to

sodium hypochlorite in soils to be comparable to that of a swimming pool. In a letter dated April 21, 1998, the agency confirmed completion of remedial investigation related to the bleach spills.

To mitigate the potential for future spills, the bleach tank and dispensing areas are now protected by concrete berms.

- An automobile-semi accident on Kimberly Avenue, near the site's north entrance occurred in November in 2003 and resulted in the semi releasing diesel fuel to the ground surface and storm drains. The release was mitigated by a contractor's same-day response and cleanup of diesel fuel using absorbents and pumping of fuel/water mixture. The cleanup effort was overseen by the local regulatory authority, which did not require any further action be taken by the party responsible for the spill. Based on the reported cleanup with regulatory oversight, Antea Group considers this a Historical Recognized Environmental Condition.

The ASTM E1527-13 standard defines the term de minimis condition as a condition that "generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies." This assessment has revealed the following evidence of de minimis conditions in connection with the subject property:

- Antea Group observed paper dust throughout much of the manufacturing areas within the facility, and paper debris, pulp, and water on flooring in certain warehouse and manufacturing areas.
- Antea Group observed limited areas of oily staining on flooring throughout certain areas of the facility, including in the machine shop and forklift repair shop.

The following noteworthy item did not meet the definition of an REC, HREC, CREC, or de minimis condition in accordance with the ASTM E1527-13 standard; however, the item was deemed a noteworthy historical condition of the subject property and surrounding area:

- The subject property and surrounding area included historical agricultural usage as fruit and/or nut orchards, likely back to the late-1800s. Past standard farming practice included the application of pesticides (including organochlorine pesticides) until they were banned in the 1970s and 1980s. However, many pesticides can persist in the subsurface long after application. Antea Group is unaware of any documentation or knowledge of residual pesticide conditions at this site or in the surrounding area.
- Immediately south of the subject property is a site (Coast Roof Co., 2301 E. Orangethorpe Avenue) that has stored petroleum in two generations of underground storage tanks, the nearest of which were located within approximately 30 feet of the subject property line. Regulatory records indicate all USTs have been removed, and there is no indication that regulators required any formal environmental

investigations following the tank removals. However, regulatory files did not include any environmental testing results from the time of the tank removal project, so it is unknown if there were environmental impacts beneath those former underground storage tanks south of the subject property.

The User did not request, therefore Antea Group did not assess any of the traditional non-scope considerations outlined in Section 13.1.5 of ASTM E1527-13 to be completed as part of this Phase I ESA.

1.0 INTRODUCTION

1.1 Purpose

Antea®Group was retained and authorized by Kimberly-Clark Corporation (KCC) to conduct a Phase I Environmental Site Assessment (ESA) of the property located at 2001 E. Orangethorpe Avenue, Fullerton, Orange County, California (subject property). The subject property location is shown on **Figure 1**. The subject property consists of over one million square feet of interconnected manufacturing and warehouse buildings, several outbuildings, parking, and orchards located on 65 acres of industrial property along a half-mile long stretch of E. Orangethorpe Avenue in Fullerton, CA.

The purpose for performing this Phase I ESA was to assist KCC with the divestiture of the subject property, and review for the potential presence of any Recognized Environmental Conditions (RECs) in connection with the subject property, as defined by American Society for Testing and Materials (ASTM) International E1527-13 *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*. The ASTM E1527-13 standard defines the term REC as "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment." The term is not intended to include de minimis conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis are not RECs.

1.2 Detailed Scope of Service

The Phase I ESA process was conducted in accordance with the ASTM E1527-13 standard in four components: 1) records review; 2) site reconnaissance; 3) interviews; and 4) report. The first three components were conducted in concert to identify RECs associated with the subject property. This Phase I ESA report presents the research findings conducted during this assessment.

The ASTM 1527-13 process recognizes that uncertainty will not be eliminated, that the search will not be exhaustive, and that the level of inquiry will be variable subject to the assessment process and the information developed during the course of the inquiry. The scope of services provided by Antea Group during the completion of this Phase I ESA included the following tasks.

Task 1 – Records Review

The purpose of the records review was to obtain and review records that will help identify RECs in connection with the subject property.

The "User" as defined in this assessment is Kimberly Clark Corporation (KCC). Pursuant to the User's responsibilities specified in Section 6 of ASTM E1527-13, the User has performed or was requested to perform the following activities regarding provision of records:

- The User provided a *User Questionnaire* form on October 4, 2018, and provided several historical documents and other information pertinent to this assessment.
- The User did not provide any title documents or associated documents, as specified in Section 6.2 of ASTM E1527-13. However, Antea Group contracted a search for environmental liens and activity/use restrictions, and the User provided direct, verbal knowledge of the ownership history of the facility itself since its initial development.

Antea Group's records review included records from Standard Sources that are publicly available, obtainable from their source within reasonable time and cost constraints, and were practically reviewable. Records were reviewed for properties within the approximate minimum search distances unless adjusted at the discretion of the Environmental Professional. Record sources included the following:

- Standard Environmental Record Sources obtained from commercially available public federal, state, and tribal environmental record databases as specified in Section 8.2.1 of ASTM E1527-13.
- Pertinent regulatory files and/or records associated with the Standard Environmental Record Sources, if the subject property or any of the adjoining properties is identified on one or more of the databases as specified in Section 8.2.2 of ASTM E1527-13. These files and/or records were reviewed to obtain sufficient information to assist the Environmental Professional in determining if a REC, controlled REC (CREC), historical REC (HREC), or de minimis condition exists at the subject property in connection with the listing. If in the Environmental Professional's opinion, this review is not warranted, then justification is provided
- Select Additional Environmental Records Sources from local sources to enhance or supplement the Standard Sources, when in the Environmental Professional's judgment such records were reasonably ascertainable, sufficiently useful, and generally reviewed in initial ESAs of this type. Examples of local record sources include:
    - Tax assessor records
    - Department of Health/Environmental Division
    - Fire Department
    - Planning/Zoning Department
    - Building Permit Inspection Department
    - Local/Regional Pollution Control Agency
    - Local/Regional Water Quality Agency

- Local Electric Utility Companies (for records relating to PCBs)

- A current United States Geological Survey (USGS) 7.5-Minute Topographic Map as the Standard Physical Setting source.
- Reasonably ascertainable Standard Historical Sources as necessary to develop a history of the previous uses of the property and surrounding area back to the property's first developed use, or back to 1940, whichever is earlier. Past uses were considered in relation to the likelihood that they led to RECs in connection with the subject property. Examples of Standard Historical Sources included:
  - Fire Insurance Maps
  - Aerial Photographs
  - Local Street Directories
  - USGS Topographic Maps
  - Recorded Land Title Records
  - Property Tax Files
  - Building Permit Department Records

Task 2 – Site Reconnaissance

The objective of the site reconnaissance was to obtain information identifying and indicating the likelihood of RECs on the subject property. Prior to conducting a subject property visit, the User arranged permission and access for Antea Group personnel to enter and view the subject property. The site reconnaissance was planned by an Antea Group Environmental Professional and performed by personnel possessing sufficient training and experience necessary to conduct the site reconnaissance and having the ability to identify issues relevant to RECs in connection with the property.

The site reconnaissance included the following activities:

- Visual observation and description of the general site setting of the subject property. The site reconnaissance was performed on areas of the subject property that could be readily accessed safely.
- Identification and documentation of current property uses that use, treat, store, dispose of, or generate hazardous substances or petroleum, along with the quantities and description of storage or use conditions. Past property use, to the extent visually or physically observed, was also identified and documented.
- Visual and/or physical observation and documentation of conditions that suggest a past or potential release of hazardous substances or petroleum products (i.e., stressed vegetation or soil staining).
- Visual identification and documentation of equipment and structures that are commonly known to contain polychlorinated biphenyls (PCBs), including electrical and hydraulic equipment.
- Observation and documentation of building interiors, including identification of the means of heating and cooling of building, and waste disposal.

- Visual observation and documentation of exterior property conditions including exterior waste disposal structures, wells, staining, and stressed vegetation.
- Visual observation and description of current land uses on adjoining properties for evidence of current and/or past uses that may contribute to environmental risks to the adjoining properties or the subject property. Adjoining land use was viewed from the subject property or a publicly accessible vantage point.
- Photographic documentation of current subject property setting and activities (if allowed).
- Preparation of a site diagram or otherwise reference locations of pertinent site features.

Task 3 – Interviews

This component consisted of a series of interviews intended to gather information about current and past uses and conditions of the subject property that may be relevant in identifying potential environmental risks associated with the subject property. The User provided contact information for the present property owner, operator, and occupant of the subject property. Interviews were planned and/or conducted by an Antea Group Environmental Professional and performed by personnel possessing sufficient training and experience to identify issues relevant to RECs in connection with the subject property. Interview activities performed under this component may have included:

- Interviews were conducted with at one key site personnel and regional environment/health/safety personnel to obtain information about the uses and physical characteristics of the subject property and potential environmental risks associated with the subject property.
- Key site personnel and the User were asked to provide helpful documents, including facility operational records, to identify hazardous materials or petroleum products used, documentation of spills and cleanup activities, applicable permits, citations, or procedures, and other pertinent environmental related forms and reports. They were also asked about any pending, threatened, or past litigation, administrative proceedings or notices from any governmental entity regarding violation of environmental laws or possible liability. The User provided these documents or arranged for Antea Group personnel to have access to these documents during the site reconnaissance.
- A reasonable attempt was made to interview past owners, operators, and occupants who were likely to have material information regarding the potential for contamination at the subject property that was not duplicative of information already obtained, when they were identified and contact information was provided by the User.
- A reasonable attempt was made to conduct an interview in person or by telephone with at least one state and/or local government agency. If an initial contact was unsuccessful, a written attempt was used. Content of the questions was formulated at the discretion of the Environmental Professional to obtain information indicating potential environmental risks in connection with the subject property.

Task 4 – Phase I ESA Report

Following the completion of the records review, site reconnaissance, and interviews, Antea Group prepared this Phase I ESA report in general accordance with Section 12 of ASTM E1527-13. An Environmental Professional, as defined in Section 312.10 of 40 Code of Federal Regulations (CFR) 312, completed the review and interpretation of information upon which this report is based. This report contains the following items:

- Summary of services performed and information gathered during the records review process, including past and present subject property owners/operators and activities, interviews, and reasonably ascertainable federal, state, local, and tribal records involving the subject property in sufficient detail to permit another party to reconstruct the work performed.
- Discussion of the site reconnaissance.
- Discussion of significant data gaps that may affect the ability of the Environmental Professional to identify RECs.
- A Findings section that identifies and summarizes known or suspect RECs, CRECs, HRECs, and de minimis conditions identified during the Phase I ESA process. The Environmental Professional's opinions, including their rationale for concluding that a condition is or is not currently a REC, may be included in this section or contained elsewhere throughout the report.
- A Conclusions section that summarizes all RECs and CRECs connected with the subject property.

1.3 Assumptions, Limitations, and Exceptions

Antea Group conducted this Phase I ESA in accordance with ASTM E1527-13 using currently accepted professional standards, under the conditions outlined in Antea Group Proposal No. 2018-06-230592REV, dated June 11, 2018. **Sections 5.1** and **5.2** of this report outline the methodology and limiting conditions associated with the site reconnaissance, and significant scope-of-work additions, deletions, or deviations to ASTM E1527-13 are listed in **Section 7.0** or have been stated in the body of this report. Unless specified in **Section 1.2**, none of the traditional non-scope considerations, listed under Section 13.1.5 of ASTM E1527-13, were requested by the User to be completed as part of this Phase I ESA. **Sections 11.0** and **12.0** discuss the deviations and limitations associated with this Phase I ESA.

When the Environmental Professional made an estimate of the local groundwater flow direction, he or she determined the flow direction using a combination of reasonably ascertainable data. Data sources may include local experience, publicly available reports on groundwater quality and flow direction, topographic maps, well data and regional groundwater gradient maps. When using topographic maps only, shallow groundwater flow direction interpretations generally follow the surface topographic gradients.

Whenever possible, Antea Group has provided copies of supporting documentation in the appendices. **Section 14.0** includes references to the published, Internet, User-provided, and database or other sources relied upon during the preparation of this Phase I ESA report.

1.4 User Reliance

The "User" as defined in this assessment is Kimberly-Clark Corporation (KCC). This report is intended only for the use and benefit of, and may be relied upon by, KCC and any other party specifically identified in writing by Antea Group as a User of this report. Antea Group cannot and will not be liable for unauthorized reliance by any other third party.

KCC understands and agrees that the information contained in this report describes facts and Antea Group's opinions regarding conditions related to the property as of the date of this report and do not purport to describe facts or conditions subsequent to the date of the report. Please also note that the scope of work performed was negotiated by Antea Group and KCC as noted in the contract and this report.

2.0 SUBJECT PROPERTY DESCRIPTION

The subject property is occupied by KCC, and owned by Kimberly-Clark Worldwide, Inc. The subject property is located at 2001 E. Orangethorpe Avenue, Fullerton, Orange County, California. **Figure 1** depicts the subject property location on a recent topographic map, and **Figure 2** depicts the subject property layout and its immediate surroundings. Refer to **Figure 3** for a detailed site plan, and to **Appendix A** for representative photographs of the subject property.

Subject Property Occupant(s)	Kimberly-Clark Corporation – Fullerton Mill (since 1955)
ADDRESS AND LOCATION DESCRIPTION	
Subject Property Address	2001 E. Orangethorpe Avenue, Fullerton, CA 92831
Subject Property Parcel ID	According to information from Orange County and The EDR Property Tax Map Report (**Appendix B**) the land associated with the subject property is an industrial development referenced by the following two parcel index numbers (PINs): • 073-120-31 (17.15 acres) • 073-120-33 (48.19 acres)
Subject Property Location	The subject property is located near the southeastern corner of the City of Fullerton, and is bounded by: • South - Orangethorpe Avenue • West – Acacia Street • North – Kimberly Avenue • East – South State College Boulevard The latitude and longitude coordinates for the approximate center of the subject property are 33°51'42" north and 117°53'35" west, respectively.
SITE AND VICINITY GENERAL CHARACTERISTICS	
Subject Property Size	The subject property is 65.34 acres of land with manufacturing, warehouse, and office buildings totaling over 1,200,000 square feet.
Topographic Relief	The subject property is relatively flat, with no discernable slope. Overall, the regional ground topography slopes downward to the west. The subject property is at an elevation of between 180 and 190 feet above mean sea level.
CURRENT PROPERTY USE AND DESCRIPTIONS	
Subject Property Operations	KCC operates the subject property as a paper goods manufacturing mill. Currently, this includes use of water and pulp to create paper products (e.g., paper towels, facial tissue, and bathroom tissue) distributed for household, commercial, and industrial usage. The 65.3-acre property is occupied primarily by: • Manufacturing/warehouse/office space (~55%) • Exterior paved loading and truck/trailer storage (~20%) • Groves of fruit trees, primarily oranges (~10%) • Paved employee and guest parking lots (~5%) • A leased, paved lot for RV storage (~5%) • Unused lots, driveways, and exterior landscaping (<5%)

Land Area Description	The subject property is located in a primarily industrial area along the north side of E. Orangethorpe Avenue in Fullerton, Orange County, California. The site is located near the center of a large industrial park, zoned "M-P – Manufacturing Park." Nearest residential developments begin approximately 0.25 miles south and 0.4 miles north of the subject property. Located near the southeastern corner of Fullerton, the subject site is west of California State Route 57 and the City of Placentia, and north of State Route 91 and the City of Anaheim. Geographically, the site is about 5 to 10 miles west and southwest of the Santa Ana Mountains, and 14 miles northeast of the Pacific Ocean.
Description of Structures, Roads, or Other Improvements	The subject site is occupied by many interconnected buildings, including a mix of office, manufacturing and warehouse space (Figure 3). With the exception of Building #1 and the adjoining water treatment plant and boiler house (underlain by a basement), all structures are slab-on-grade construction. Most warehouse and manufacturing space are single-story, high-bay structures, but several portions of buildings include second stories or lofted features. The oldest of buildings was constructed in the mid-1950s, and overall the developed portion of the property was completed by the late-1980s, along with some later improvements or outbuildings. Overall, the buildings cover approximately 30 acres. Three main loading docks are present – one near the southwestern corner of the site (Building #19) and accessible by truck from Acacia Street, and two near the northeastern corner (Buildings #6 and #13), each accessible by both truck and rail from Kimberly Avenue. Paved truck parking lots are present south of Kimberly Avenue, and paved lots for employee and visitor parking are present southeast of the buildings, along Orangethorpe Avenue. An approximate 2.5-acre paved parking lot at the far northeastern corner of the subject property is leased and currently used for RV parking.

2.1 Adjacent Property Description

Properties adjacent to the subject property are generally occupied as follows:

Southeast (adjacent): Various light industrial buildings, along with an Arco-branded gasoline station at the northwestern corner of Orangethorpe Avenue and State College Boulevard, and two automotive repair/tire shops along the north side of Orangethorpe Avenue. These adjoining properties are located topographically similar to the subject property.

North: Kimberly Avenue, followed by a BNSF rail yard and several industrial properties, located topographically similar to the subject property.

South: E. Orangethorpe Avenue, followed by several industrial properties, located topographically similar to the subject property.

East: S. State College Boulevard, followed by several industrial properties, located topographically similar to or slightly higher than the subject property

West: Acacia Street, followed by several industrial properties, located topographically similar to or lower than the subject property

2.2 Surrounding Area Description

The subject property is located near the southeastern limits of the City of Fullerton and within a manufacturing park consisting of mostly light industrial and railroad properties, with some scattered commercial properties to the east and west, along Orangethorpe Avenue.

3.0 USER-PROVIDED INFORMATION

Pursuant to the User's responsibilities as described in Section 6 of ASTM E1527-13, the User provided historical and recent facility documentation to support this assessment. The User also completed and returned an ASTM *User Questionnaire* form on October 4, 2018. The User's information is presented below in **Sections 3.1 through 3.5** and included in **Appendix C**.

3.1 Title Records

The User did not provide chain-of-title records for the subject property. During an interview with KCC's on-site Environmental Coordinator, Ms. Grace stated that KCC has occupied the subject property since approximately 1955 or 1956, and likely retained ownership prior to its occupancy and development of the site.

Chain of Title Records were not requested from Environmental Data Resources, Inc. (EDR), however in the *EDR Environmental Lien and AUL Search Report*, records identified Kimberly-Clark Worldwide, Inc. as the owner of the subject property going back to at least 1996, when it was transferred from Kimberly Clark Corporation (**Appendix B**).

3.2 Environmental Liens or Activity and Use Limitation

According to information provided by Ms. Madden during the interview (**Appendix C**), the User is not aware of environmental liens or AULs currently recorded against the subject property. EDR conducted a search of environmental liens and AULs recorded against the subject property. Based on the search, no environmental liens or AULs were identified. Please refer to *EDR Environmental Lien and AUL Search* provided in **Appendix B** for further details.

3.3 Specialized Knowledge

The User provided their specialized knowledge of the subject property via on-site interviews and by providing a number of documents, including the following reports and correspondence, copies of which are included in **Appendix C**:

- *Record of Inspection* and *Hazardous Waste Inspection* – County of Orange Environmental Health department follow-up to a March 28, 1985 inspection, and preliminary inspection of the SRM Tank Farm; inspection completed April 2, 1985.
- *Underground Storage Tank Removal – Project Summary (letter report),* prepared by Kimberly Clark Corporation, dated November 20, 1986.
- *Remediation Closure Report*, prepared by Ledsam Contracting Incorporated, for Kimberly Clark Corporation, dated March 1992.
- *Initial Phase II Site Environmental Assessment – Tank Farm Area*, prepared by Western Environmental Engineers Co., for Kimberly Clark, dated October 27, 1997.
- *Phase II Environmental Site Assessment Report – Tank Farm Area*, prepared by Western Environmental Engineers Co., for Kimberly Clark, dated January 19, 1998.
- *UST Unauthorized Release (Leak) / Contamination Site Report,* submitted by Kimberly Clark, to Fullerton Fire Department – Hazardous Materials Specialist, February 20, 2002.
- Report of Soil Excavation and Sampling for the Kimberly Clark Facility; prepared by Gaston & Associates, LLC, March 8, 2002.
- Letter summarizing fuel oil contamination in Boiler House/CoGen Site, including waste manifests and geologist's report on soil excavation and sampling, submitted by Kimberly Clark, to Fullerton Fire Department – Hazardous Materials Specialist, March 13, 2002.
- *Spill Prevention, Control, and Countermeasure Plan*, prepared for Kimberly-Clark, by ProActive Consulting Group, LLC, September 2015.
- *Aboveground Petroleum Storage Tank Facility Statement – Notification/Change in Status* form, prepared by Kimberly-Clark for Orange County Certified Unified Program Agency (CUPA), dated December 28, 2017.
- Annual submittal to California Environmental Reporting System (CERS), dated February 28, 2018.
- Annual Report for Stormwater Discharges Associated with Industrial Activities, prepared by Kimberly-Clark for State of California Water Resources Board, dated July 11, 2018.
- *Storm Water Pollution Prevention Plan (SWPPP) and Storm Water Monitoring Program (SWMP),* prepared for Kimberly-Clark, by ProActive Consulting Group, LLC, July 2018.

Pertinent information from the referenced reports and documents is summarized below in **Section 4.3.4** of this report.

In addition to the reports listed above, KCC also provided a number of documents pertaining to the current storage and usage of chemicals on the subject property, compliance programs, etc., including the latest CERS submittal, storm water testing data, sump samples, etc. (**Appendix C**). KCC also provided an equipment inventory list and a recent site plan. Information from those documents has been integrated throughout this report and on the figures. Lastly, KCC provided verbal knowledge of a regional groundwater contaminant plume that has been proposed for investigation and cleanup through the U.S. EPA Superfund program.

3.4 Reasonably Ascertainable Records or Other Environmental Conditions

With respect to any commonly known conditions and reasonably ascertainable environmental information, or obviousness of environmental contamination, the User indicated that they have no information outside that provided in interviews and environmental documents included as part of this Phase I ESA assessment. Antea Group has included such records above and in **Section 6.0**, as well as disseminating pertinent information throughout this report.

3.5 Owner, Property Manager, and Occupant Information

The User indicated that the subject property is currently owned and occupied by KCC, and has been since its initial industrial development in the mid-1950s.

3.6 Reasons for Performing Phase I ESA

The User indicated that the purpose for requesting the Phase I ESA was customary due diligence due prior to closure of the manufacturing facility and prior to understand environmental concerns prior to divestiture of the subject property.

4.0 RECORDS REVIEW

The purpose of the records review was to obtain and review records that may contain information indicating RECs associated with the subject property. The records contained in this Phase I ESA were publicly available, obtainable within reasonable time and cost constraints, and practically reviewable.

4.1 Historical Use Information

4.1.1 Historical Use Sources

According to the ASTM E1527-13 standard, all obvious uses of the subject property must be identified from the present back to either the subject property's first developed use or back to 1940, whichever is earlier. In order to fulfill this requirement, historical information provided by and obtained from the sources identified in **Sections 4.1.3** through **4.1.7** was reviewed to develop a history of the previous uses of the subject property and surrounding area in order to help identify the likelihood that past uses have led to RECs in connection with the subject property. The following sections provide a summary of findings from each of the historical sources reviewed.

4.1.2 Historical Use Summary

Based on a review of the compilation of historical sources presented below dating back to 1896, it appears that the subject property was first developed for industrial purposes circa 1955. Prior to industrial development, the subject property and surrounding area were primarily agricultural orchards, with residential/farm buildings scattered throughout. The existing site building was first constructed circa 1955, and has been occupied by KCC since its development. Between initial development and the present, the subject property building, outdoor water storage/treatment operations, and paved lots have expanded several times. The surrounding area has been a mix of commercial/industrial properties since the area's development in the mid-1950's.

A summary of the findings from each of the historical sources is presented in **Sections 4.1.3** through **4.1.7**. Based on a compilation of the historical sources, the following is a summary of historical land uses on adjoining properties (all dates are approximate):

APPROXIMATE DATE RANGE	HISTORICAL USE OF SUBJECT PROPERTY
c. 1955 and prior	Undeveloped, vacant and agricultural orchard, with some small residences/farm buildings.
c. 1955 - Present	The subject property has been occupied industrially by KCC as a paper mill between circa 1955 and the present.

The following table summarizes the historical land uses of adjoining properties:

DIRECTION	HISTORICAL USE OF SURROUNDING PROPERTIES
North	Agricultural orchard prior to c. 1955. Industrial/commercial development began c. 1955, and large warehouses were constructed c. 1985.
South	Agricultural orchard with some residential buildings prior to commercial expansion c. 1955. A flood control detention pond was constructed in the mid-1930s.
East	Agricultural orchard with some residential buildings prior to commercial expansion c. 1955 The building complex located southeast adjacent to the subject property was developed mostly in its current configuration at this time.
West	Agricultural orchard prior to c. 1955. Industrial/commercial development began c. 1955, and has been in its current layout since c. 2000.

4.1.3 Sanborn Fire Insurance Maps

Sanborn Fire Insurance (Sanborn) Maps were historically published to assist the fire insurance industry in assessing the potential for fire and explosion hazards associated with developed properties. As a result, these maps often provide information pertaining to potential environmental concerns including, but not limited to, the number, location, size, and contents of liquid storage tanks, locations of chemical storage areas, and location and number of hydraulic hoists. In addition, fire insurance maps provide cultural information such as building type and construction, addresses, and types and locations of utilities.

Environmental Data Resources, Inc. (EDR) indicated that the subject property is unmapped; therefore, no Sanborn Fire Insurance Maps were provided (**Appendix D**).

4.1.4 Aerial Photographs

EDR provided aerial photographs for several years between 1938 and 2012. The level of detail discernible from the aerial photographs is affected by the scale, resolution, and quality of the photographs. Where those qualities may have affected the review is noted below. Copies of the aerial photographs are included in **Appendix E**. A summary of the historical aerial photography review is provided below.

AERIAL PHOTOGRAPH REVIEW SUMMARY		
YEAR	**SUBJECT PROPERTY**	**SURROUNDING AREA**
1938 & 1947	The subject property is primarily orchard, with two small residential/agricultural buildings.	Primarily orchard. A small building is present southeast adjacent to the subject property. A detention pond is present to the south, across present-day Orangethorpe Ave.

AERIAL PHOTOGRAPH REVIEW SUMMARY		
YEAR	**SUBJECT PROPERTY**	**SURROUNDING AREA**
1953	Similar to prior photos, except that some land along the north and east sides of the subject property has been cleared (no trees present).	Land to the northeast of the subject property has been cleared.
1963	A large warehouse is depicted in the center of the subject property. Access road/driveway connects the property to S. Acacia St and Kimberly Ave. A rail spur leads from the east side of the building to the north adjacent rail line. A car parking lot is present south of the building. Tanks, smaller outbuildings, and other operations appear to be located to the east of the warehouse. A truck access or similar cleared area is present along the west side of the building. The remainder of the property remains orchard.	The building complex located southeast adjacent to the subject property is depicted mostly in its present configuration, with the exception of some small buildings in its southwest section. Industrial/commercial type buildings are now present adjacent to the subject property in all directions.
1972	The warehouse has expanded to the west, and an addition was made to the east 'arm' of the building. Development/activity of some type is present to the east of the tanks.	Continued industrial/commercial expansion in the area.
1977	The warehouse has expanded to fill in its 'core.' Additional water treatment features are present along the east side of the warehouse, and an additional large tank has been installed to the east of the driveway. Expanded outdoor storage/truck parking is present east of the tanks. A baseball field is present at the far northeastern corner of the subject property. A dark discoloration surrounds an outbuilding/square feature near the rail spur and loading docks.	Continued industrial/commercial expansion in the area. A second detention basin is now present to the southeast.
1987	The warehouse has expanded to the southwest with an additional loading dock. Additional truck parking is now present to the east of the car parking lot. The baseball field has been replaced by truck parking.	Continued industrial/commercial expansion in the area.
1990	Additional paved area is now present near the southwest loading dock.	Continued industrial/commercial expansion in the area.
1995	Similar to the 1990 photograph.	Continued industrial/commercial expansion in the area. The building complex located southeast adjacent to the subject property is depicted in its present configuration.

AERIAL PHOTOGRAPH REVIEW SUMMARY		
YEAR	**SUBJECT PROPERTY**	**SURROUNDING AREA**
2005	Similar to prior photographs, but dark-colored features depicted in previous entry no longer present.	Appears similar to previous photograph.
2009 & 2012	Similar to the prior photographs.	Appears similar to previous photograph.
2016	Northeast truck lot appears resurfaced.	Appears similar to previous photograph.

4.1.5 Local Street Directories

Local street (city) directories include business and residential listings arranged by street and address. Listings typically are reviewed to identify names of facilities suggesting past use, generation, storage, treatment, or disposal of potentially hazardous materials or petroleum products. EDR provided city directory reports for addresses located on E Orangethorpe Avenue and searched from various sources between 1955 and 1995.

The subject property and surrounding property addresses were identified in the EDR-City Directory Abstract for the years 1955 through 1995. A summary of the pertinent findings is presented in the table below. Refer to the *EDR-City Directory Abstract* in **Appendix F** for a complete summary of listings surrounding the subject property.

CITY DIRECTORY REVIEW SUMMARY	
ADDRESS	**OCCUPANT (YEARS OF OPERATION)**
2001 E. Orangethorpe Ave. (Subject Property)	Kimberly Clark Corp (1955 – 1970, 1980-1995) Skidmore Owings & Merrill archts (1955) Granades Cafeteria (1966) Consumer & Commercial Sales (1975)
2020 E. Orangethorpe Ave.	Corporate Office (1995) Vista Paint & Wallcovering (1995) General Offices (1991)
2030 E Orangethorpe Ave.	Service Station Supply Co D Daper (1980)
2100 E Orangethorpe Ave.	Autocar Leasing Co (1995)
S Acacia Street (west of subject property)	No listings
Kimberly Avenue (north of subject property)	No listings
S State College Boulevard (east of subject property)	No listings

The available city directories show the subject site was occupied by KCC as far back as 1955. The directories provided little information on the historical occupancy of the area surrounding the subject Antea Group

requested city directory searches for adjoining sites along S Acacia Street, Kimberly Avenue, and S State College Boulevard, but no records were available, which Antea Group considers a data failure.

4.1.6 Historical Topographic Maps

Early topographic maps were constructed by physically observing and surveying the land. In the early 1950s, topographic and land use maps were constructed with the aid of aerial photographs. Topographic maps depicted geologic surface features, roads, buildings, and other aboveground structures. Historical topographic maps for the subject property area for several years between 1896 and 2012 were obtained from EDR. Copies of the topographic maps are included as **Appendix G**. A summary of the historical topographic maps review is provided below.

TOPOGRAPHIC MAP REVIEW SUMMARY		
YEAR	**SUBJECT PROPERTY**	**SURROUNDING AREA**
1896 & 1898	The subject property is depicted as primarily vacant land, with three small buildings.	The surrounding area is lightly developed with small residential/agricultural buildings. A Los Angeles RR line is present to the west, as well as the town of Fullerton.
1901 & 1902	No significant changes are apparent in the subject property as compared to the previous map.	Slight increase in small building development. The town of Placentia is now depicted to the northeast.
1935	An access road is now depicted on the northwest side of the subject property.	A small building is now present southeast adjacent to the subject property. Carbon Canyon Creek is now depicted south of the subject property, followed by a low-relief feature. Fullerton and Placentia have expanded, and La Jolla is now depicted to the east. The Santa Fe RR is now present to the north. More buildings are present along Orangethorpe Ave.
1942	The subject property is depicted as orchard, with the same three small buildings as were mapped prior.	The region surrounding the subject property is depicted as agricultural orchards.
1949	No significant changes are apparent in the subject property as compared to the previous map.	A wastewater disposal plant is depicted to the south of the subject property, and a flood control basin is depicted to the southeast. Continued development of all nearby towns; Anaheim now labeled to the southwest.

TOPOGRAPHIC MAP REVIEW SUMMARY		
YEAR	**SUBJECT PROPERTY**	**SURROUNDING AREA**
1964 & 1965	A large warehouse is depicted in the center of the subject property, with water tanks depicted on the building's east side. Access road/driveway connects the property to S Acacia St and Kimberly Ave. A railroad spur leads from the east side of the building to the north adjacent rail line. The remainder of the property remains orchard.	A cluster of two large and three small buildings is now present southeast adjacent to the subject property. A railroad is depicted to the north of Kimberly Ave. A fire station is present to the north, across the railroad. Much of the surrounding area is now occupied by large industrial-type buildings. One of these buildings is present to the west, across S Acacia St. A retention basin is now present to the southeast, across the freeway.
1972	Warehouse additions have been constructed on the north/west side, and a miller unit to the east, near the tanks.	General municipal and industrial/commercial expansion. New buildings are present to the west across S Acacia St, and to the south across Orangethorpe Ave.
1981	The building has expanded to the east to fill its 'core.' One water tank is depicted as replaced, and a new tank is depicted to the east of the driveway.	New large buildings are depicted in all directions.
2012	Individual structures no longer depicted.	Individual structures no longer depicted.

4.1.7 Other Resources

Orange County Treasurer-Tax Collector/Geographic Information Systems (GIS): Antea Group reviewed the Orange County Treasurer-Tax Collector's website and determined that the subject property encompasses two parcels (073-120-31 and 073-120-33) comprising a total of 65.34 acres. No detailed property records were reasonably ascertainable from the Orange County Treasurer or Tax Collector's offices.

City of Fullerton Building Department: On August 27, 2018, Antea Group contacted the City of Fullerton Building Department to request records pertaining to the subject property. The Building Department responded stating that all available documents are available online. Antea Group conducted a cursory search of the available files which consisted primarily of permits for lighting/electrical, building (including roof installation/upgrades), fire suppression system upgrades, grading, mechanical, plumbing for landscaping. Antea Group completed a cursory review of these files, but did not review every page of every permit due to the length and number of documents available. Based on the findings from the cursory review, we do not expect that this information source would provide information supporting of the findings of this report. For example, there was a building permit (Bldg 06-01979) that Kimberly-Clark received on December 22, 2006 for chemical storage tanks. No additional details (e.g., contents, location) were provided on the available documentation.

City of Fullerton Fire Department: Antea Group contacted the City of Fullerton Fire Department on August 28, 2018. On September 17, 2018, Antea Group received a response indicating they had several files (at least 1,000 pages for the subject property) on review. Antea Group requested copies for review and received well over 1,000 paper copies on October 12, 2018. Antea Group performed a cursory review of the files and deteminted that most of the files were related to recent (since 2002) hazardous material reporting and Business Emergency Plans. Most of these files pre-date very similar information provided to Antea Group by KCC for review.

In addition, the file included a letter dated March 30, 2004 that summarized cleanup of a diesel fuel spill that occurred on November 2, 2003. The letter included a memo summary from contractor Worldwide Waste Management, Inc, summarizing their response and cleanup of diesel fuel from the ground surface and storm drains. Refer below to **Section 4.3.4** for further details on the spill and cleanup.

Antea Group also requested files for the adjoining facility (Coast Roof Co.) located at 2301 E Orangethorpe Avenue (south of the subject site). Returned files included those for past underground storage tanks located at this Coast Roof Co. property. See **Section 4.3.5,** below, for further information.

Orange County Environmental Health Division: Antea Group contacted the Orange County Environmental Health Division on September 17, 2018 and again on September 25, 2018. Antea Group requested photocopies of pertinent records, including from their "industrial cleanup" file. Antea Group received several hundred pages of files on November 1, 2018. Antea Group conducted a cursory review of the files received, which included:

- Various regulatory records for review of compliance documents and on-site compliance inspections between 2005 and 2018.
- Limited information pertaining to removal of six underground storage tanks from the facility in the mid-1980s.
- Several years' worth of forms and correspondence documenting business activities, above-ground petroleum storage tanks, and Spill, Prevention, Control, and Countermeasure Plans (SPCC).
- Reports and correspondence pertaining to investigation and regulatory closure of reported subsurface contamination related to storage and dispensing of bleach from an above-ground storage tank.

Pertinent documents from Orange County Environmental Health are included in **Appendix H** and summarized below in **Section 4.3.4**.

California State Water Resources Control Board – Stormwater Multiple Application and Report Tracking System (SMARTS): On September 21, 2018, Antea Group searched this database for applicable files regarding the subject property. According to this database, the subject property has had an active Permit to Discharge Storm Water Associated with Industrial Activity (WDID 8 30I001214) since March 26, 1992. Documents available for review include annual storm water sampling reports, regulatory correspondence, and notice of violation records. Refer to **Section 4.3.4** for more details.

California Division of Oil, Gas & Geothermal Resources – Well Finder: On September 21, 2018, Antea Group searched this database for historical oil and gas wells on the subject property and found that no oil/gas wells are currently or have been historically present at the subject property.

California SWRCB GeoTracker Database: Antea Group searched this database on September 21, 2018 for listings related to the subject property and discovered a cleanup program was affiliated with the subject property for a diesel leak to soil reported in May 1986. The cleanup status is now listed as completed and the case has been closed as of January 22, 1992. Refer to the Case Summary in **Appendix H** for further detail. The GeoTracker database lists the lead cleanup oversight agency as the City of Fullerton – Antea Group has also requested files from that agency, as discussed prior.

Antea Group also contacted the California Regional Water Quality Control Board's (RWQCB) Santa Ana Region to request records pertaining to the subject property. The RWQCB responded that files related to the subject property have been archived and can be reviewed by contacting the State Archives Facility. These files were not reasonably ascertainable within the timeframe of this assessment. However, the User did provide some files, including a closure letter, related to the referenced incident that was closed in 1992.

California Department of Toxic Substance Control (DTSC): Antea Group searched the DTSC's EnviroStor Database, and no listings were identified for the subject property. Antea Group also contacted DTSC on September 21, 2018 to request records pertaining to the subject property. In a letter dated September 26, 2018, DTSC responded that there are files available in their Cypress, California office. Antea Group followed up by phone twice in October to request information on the type and amount of information available, but has not received response as of the date of this report.

Antea Group also searched DTSC's Hazardous Waste Tracking System database to obtain hazardous waste generator information (**Appendix H**) for: (1) Kimberly Clark; (2) Kimberly Clark Worldwide Inc; and (3) Southern California Edison for their substation located at the subject property. No violations were noted on this

database for either generator. Refer to the hazardous waste generator summary in **Section 4.3.4** of this report for additional information.

U.S. Environmental Protection Agency (EPA) ECHO Database: On September 18, 2018, Antea Group conducted an online search of the subject property address in the US Environmental Protection Agency (US EPA) Enforcement and Compliance History Online (ECHO) database and Envirofacts Multisystem Search database. The subject property address was identified by three separate listings (details of which are provided in the table below):

- Kimberly-Clark Worldwide, Inc. – Fullerton Mill;
- Fullerton Mill CHP; and,
- Southern California Edison Paper Substation.

US EPA Statute	US EPA System	ID	Permit Type/Status	5-Year Compliance History
Clean Air Act	Air	CASCA0000605900404	Major Emissions, Operating	No violations
Clean Air Act	Greenhouse Gas Emissions	1002185	Direct Emitter – General Stationary Fuel Combustion	No violations
Clean Air Act	Air Emissions Inventory	4969911	Operating	No violations
Clean Water Act	National Pollutant Discharge Elimination System (ICP, or NPDES)	CAZ208197	Minor – General Permit coverage; Industrial Storm Water (expires 6/30/2020)	No violations
EP313	Emergency Planning & Comm. Right-to-Know Act - Toxic Release Inventory (TRI)	92634KMBRL2001E		No violations
RCR	Resource Conservation Recovery Act (RCRA)	CAD009547373	Large Quantity Generator, Active; Biennial Reporter	No violations

Additional facility regulatory details are included in US EPA ECHO and Envirofacts summaries provided in **Appendix H**.

U.S. Environmental Protection Agency (EPA) Superfund - National Priorities List (NPL) Sites: As part of this assessment, Antea Group researched publicly available files pertaining to the *proposed* NPL/Superfund site known as the Orange County North Basin (OCNB) in the cities of Fullerton and Anaheim, CA

(https://cumulis.epa.gov/supercpad/cursites/csitinfo.cfm?id=0900251). The OCNB Superfund site consists of an area of commingled groundwater contaminant plumes that have impacted an area several miles long and over a mile wide in the northern portion of the Orange County Groundwater Basin. In 2016, US EPA entered into an administrative settlement with the Orange County Water District, agreeing to completion of a Remedial Investigation and Feasibility Study. Since, contracted consultant AECOM has completed a *Remedial Investigation and Feasibility Study* and addendum. Antea Group has reviewed this and related public records pertaining to the OCNB site. See **Section 4.3.5** of this report for additional information.

4.2 Physical Setting

The physical setting of the subject property can influence the susceptibility to, and relative magnitude of, environmental impacts and liabilities associated with on- and off-site sources of contamination. The following table provides physical setting information for the subject property and surrounding area:

PHYSICAL SETTING INFORMATION	COMMENTS	SOURCE
Site Elevation	Approximately 180 to 190 feet above mean sea level.	Google Earth EDR Historical Topo Map Report, Inquiry No. 5387351.4
Surface Runoff/Topographic Gradient	Site and vicinity are generally flat, regionally gently dipping downward to the west	EDR Historical Topo Map Report, Inquiry No. 5387351.4
Closest Surface Water	Carbon Creek is located approximately 700 feet south of the subject property.	Google Earth EDR Historical Topo Map Report, Inquiry No. 5387351.4
General Geology	Rock Stratigraphic Unit Era: Cenozoic; System: Quaternary; Series: Quaternary Geologic Age Identification Category: Stratified Sequence	EDR Radius Map Report, Inquiry No. 5387351.2s
Primary Soil Type(s)	METZ loamy sand (somewhat excessively drained soil); MOCHO loam (well-drained); SAN EMIDGIO fine sandy loam (well-drained)	EDR Radius Map Report, Inquiry No. 5387351.2s
Flood Zone	Located within a 500-year flood plain.	EDR Radius Map Report, Inquiry No. 5387351.2s
Wetlands	No National Wetland Inventory areas are mapped on the subject property.	EDR Radius Map Report, Inquiry No. 5387351.2s
Inferred Ground Water Flow Direction	The inferred groundwater flow direction is to the west, based on local topography.	EDR Radius Map Report, Inquiry No. 5387351.2s

4.3 Environmental Records Review

4.3.1 Standard Environmental Record Sources

EDR provided a search of federal, state, tribal, and select local governmental agency databases for reasonably ascertainable regulatory records for sites indicating a potential environmental concern in the vicinity of the subject property. At a minimum, the search included the Standard Environmental Record Sources and the specified approximate minimum search distances listed in Section 8.2.1 of the ASTM E1527-13 standard. Descriptions of the databases searched and the regulated and/or contaminated sites identified within the specified approximate minimum search distances are presented in *The EDR Radius™ Map Report with GeoCheck* (referred to herein as the "EDR Report"), which is presented in **Appendix I**.

A summary of the search showing the databases, the minimum search distance applied to each database, and the number of database listings identified is presented in the table below. Additional databases not specified in the table were searched but did not have listings for the subject property or sites located within the approximate minimum search distance of the subject property. A complete listing of the databases searched can be found in the executive summary of the EDR Report.

The evaluation of unmapped orphan sites, discussion of subject property listings, and discussion of sites within the approximate minimum search distances of the subject property identified to be of potential environmental concern in connection with the subject property are presented in **Sections 4.3.3** through **4.3.5**, along with an opinion about their significance to the analysis of RECs in connection with the subject property.

ENVIRONMENTAL RECORD REVIEW			
REGULATORY DATABASE	**SUBJECT PROPERTY LISTED?**	**MINIMUM SEARCH DISTANCE**	**TOTAL LISTED FACILITIES**
Proposed National Priority List (NPL)	No	1 mile	1
Superfund Enterprise Management System (SEMS)	No	½ mile	9
Superfund Enterprise Management System Archive (SEMS-ARCHIVE)	No	½ mile	6
Corrective Action Reports (CORRACTS)	No	1 mile	2
RCRA Treatment, Storage, and Disposal Facility (RCRA-TSDF)	No	½ mile	2
Resource Conservation and Recovery Act Large Quantity Generator of hazardous waste (RCRA-LQG)	YES	¼ mile	10
Resource Conservation and Recovery Act Small Quantity Generator of hazardous waste (RCRA-SQG)	No	¼ mile	29
Federal Emergency Response Notification System (ERNS)	YES	Target property	7
California RESPONSE	No	1 mile	9

ENVIRONMENTAL RECORD REVIEW			
REGULATORY DATABASE	**SUBJECT PROPERTY LISTED?**	**MINIMUM SEARCH DISTANCE**	**TOTAL LISTED FACILITIES**
California ENVIROSTOR	No	1 mile	53
California Landfill and Disposal Facilities (SWF/LF)	No	½ mile	2
California Leaking Underground Storage Tank (LUST)	YES	½ mile	56
California Spills, Leaks, Investigations, and Cleanups (CPS-SLIC)	No	½ mile	20
California Underground Storage Tank (CA UST)	No	¼ mile	21
California Above Ground Storage Tank (CA AST)	YES	¼ mile	13
California Voluntary Cleanup Program (CA VCP)	No	½ mile	1
California Waste Management Unit Database (CA WMUDS/SWAT)	No	½ mile	1
Statewide Environmental Evaluation and Planning System (SWEEPS UST)	No	¼ mile	16
Historical Hazardous Substance Storage Container Database (HIST UST)	YES	¼ mile	25
Facility Inventory Database (CA FID UST)	No	¼ mile	16
Deed Restriction Listing (CA DEED)	No	½ mile	4
California Hazardous Material Incident Report System (CHMIRS)	Yes	Target property	3
Orange County Industrial Site	YES	Target property	1
RCRA Non-Generator / No Longer Registered (NonGen/NLR)	No	Target property	10
2020 Corrective Action Program List	No	¼ mile	1
Integrated Compliance Information System (ICIS)	YES	Target property	1
Aerometric Information Retrieval Facility Subsystem (US AIRS)	YES	Target property	1
Facility Index System (FINDS)	YES	Target property	3
Enforcement & Compliance History Information (ECHO)	YES	Target property	1
“Cortese” Hazardous Waste & Substances Site List (CA Cortese)	No	½ mile	7
Emissions Inventory Data (EMI)	YES	Target property	2
Facility and Manifest Data (HAZNET)	YES	Target property	2
Hazardous Waste and Substance Site List (HIST CORTESE)	YES	½ mile	17
ENVIROSTORE Permitted Facility Listing (CA HWP)	No	1 mile	3
National Pollutant Discharge Elimination System (NPDES)	YES	Target property	1
CA Water Discharge System (WDS)	YES	Target property	1
Well Investigation Program Case List (CA WIP)	No	¼ mile	1

California Integrated Water Quality Control System (CA CIWQS)	YES	Target property	1

4.3.2 Regulatory Agency File and Records Review

The ASTM E1527-13 standard states that if the subject property or any of the adjoining properties is identified on one or more of the Standard Environmental Record Sources, pertinent regulatory files and/or records associated with the listing should be reviewed to obtain sufficient information to assist the Environmental Professional in determining if a REC, CREC, HREC, or de minimis condition exists at the property in connection with the listing. If in the Environmental Professional's opinion this review is not warranted, that justification must be explained.

Given the number types of regulatory listings for the subject property and nearby properties, file reviews of the subject property and nearby properties were conducted. The results of the file reviews are incorporated into the site discussions in **Sections 4.3.4** and **4.3.5**.

4.3.3 Orphan Sites

The EDR Radius Map Report includes a listing of 15 records that the location could not be verified due to inadequate address information but that may be located within the applicable approximate minimum search distances from the subject property.

Antea Group reviewed the information provided by EDR regarding the orphan sites and concluded that none appear to be located within the approximate minimum search distances from the subject property for the categories in which they are listed.

4.3.4 Subject Property

The EDR database search identified multiple environmental listings for the subject property address (2001 E. Orangethorpe Avenue). Please refer to the table below for a discussion of the relevant database findings and whether additional information was reasonably ascertainable for review in addition to the EDR report.

ADDRESS:	**2001 E Orangethorpe Avenue**	
FACILITY NAMES:	**Kimberly Clark Worldwide Inc.; Kimberly-Clark; Kimberly-Clark Corp; Kimberly-Clark Fullerton Mill CHP; Southern California Edison; Southern California Edison Paper Substation**	
Database Listing	**Summary**	**Additional Files Reviewed?**
ERNS (7 listings)	• NRC Report #28819; June 28, 1990 release of 3,500 gallons sodium hypochlorite from AST pump housing failure • NRC Report #127614; July 20, 1992 release of 1,500 gallons sodium hypochlorite from AST valve failure • NRC Report #171566; May 5, 1993 release of 478 pounds of sodium hypochlorite from AST leaking valve • NRC Report #398279; August 5, 1997 release of 165 gallons of sodium hypochlorite from unknown cause; spill affected 20' x 20' land area; planned excavation/disposal of soil • NRC Report #404497; September 21, 1997 release of 31.5 pounds of sodium hypochlorite from leaking hose; spill contained within containment area • NRC Report #594161; February 14, 2002 report of fuel oil staining during excavation at approximately 8 feet below ground surface; case referred to Orange County EHD • NRC Report #704253; November 2, 2003 release of unknown quantity of oil and diesel fuel into storm drain following automobile/truck accident	Yes – see summary following this table
CA CHMIRS (4 listings)	• OES Incident #7-3074; August 6, 1997 report of sodium hypochlorite release (32 lbs) from above-ground tank; spill contained within berm and groundwater was not affected • OES Incident #7-3709; September 21, 1997 release of sodium hypochlorite (32 lbs); initial spill was August 5, 1997 following leak in vacuum hose; spill was contained by earthen berm • OES Incident #2-0887; February 15, 2002 report of fuel oil discovered in excavation area where fuel oil USTs were once present in 1980s. HazMat contractor retained to remove contaminated soil. • OES Incident #3-5674; November 2, 2003 release of diesel fuel (unknown volume) into a storm drain; release resulted from accident between passenger vehicle and semi-truck	Yes – see summary following table
CA LUST (1 listing)	• LUST cleanup of diesel fuel in soil; Leak reported May 27, 1986; Status is "completed-case closed" as of Jan. 22, 1992; Global ID # T0605900814; includes link to GeoTracker database listing • Orange County LUST ID #86UT083, for Diesel fuel oil and additives No. 1-D, 2-D, 204; Dated closed: 04/1/1991; Record ID #RO0002793	Yes – see summary following table
CA RGA LUST (5 listings)	• Several listings between 1992 and 2012 for Kimberly-Clark, 2001 Orangethorpe Ave.; No details specified in EDR Report	No – refer to CA LUST listings above
CA HIST UST (2 listings)	• File #0002EA87; Link to GeoTracker database listing: o Tank M16 – 10,000-gallon tar-coated, carbon steel UST containing diesel fuel and/or #2 fuel oil; Installed 1956; Last used 1986	Yes – see summary following table

ADDRESS:	**2001 E Orangethorpe Avenue**	
FACILITY NAMES:	**Kimberly Clark Worldwide Inc.; Kimberly-Clark; Kimberly-Clark Corp; Kimberly-Clark Fullerton Mill CHP; Southern California Edison; Southern California Edison Paper Substation**	
Database Listing	**Summary**	**Additional Files Reviewed?**
	o Tank M17 – 10,000-gallon tar-coated, carbon steel UST containing #6 fuel oil; Installed 1956 o Tank M8062 – 10,000-gallon carbon steel UST containing motor vehicle fuel or waste oil; Installed 1971; last used 1979 o Tank M8063 – 10,000-gallon carbon steel UST containing motor vehicle fuel or waste oil; Installed 1971; last used 1979 o Tank M8064 – 10,000-gallon stainless steel UST containing motor vehicle fuel or waste oil; Installed 1971 o Tank M8065 – 10,000-gallon stainless steel UST containing motor vehicle fuel or waste oil; Installed 1971; last used 1979	
CA AST (1 listing)	• Reported 104,125 total gallons storage, owned by Kimberly Clark Worldwide Inc. No further details listed. Overseen by Orange County as Certified Unified Program Agency.	Yes – see summary following table
CA HAZNET (2 listings)	• Over 400 records for regulated waste generation of a variety of wastes dating back to 1993, including, but not limited to: o Other organic solids o Corrosive liquids o Alkaline solutions o Off-spec, aged, or surplus organics o Adhesives o Waste oil and mixed oil; unspecified oil-containing waste o Aqueous solutions with total organic residues 10% or more o Metal sludge o Asbestos containing waste o Empty containers o Contaminated soil from site cleanup o Oil/water separation sludge o Liquids with halogenated organic compounds >1,000 mg/L o Hydrocarbon solvents o PCBs, and material containing PCBs o Paint sludge	No
RCRA LQG (1 listing)	• US EPA ID #CAD009547373; Large-Quantity Generator; Numerous listed waste codes; several violations, including: o December 20, 1984 violation (written, informal) of FR-262.10-12A; compliance achieved November 14, 1988 o June 4, 1986 violation of FR-262.10-12.A; compliance achieved April 28, 1992 o May 28, 1992 violation of FR-262.5060 and FR-262.30-34.C; compliance achieved October 31, 1994	No

ADDRESS:	**2001 E Orangethorpe Avenue**	
FACILITY NAMES:	**Kimberly Clark Worldwide Inc.; Kimberly-Clark; Kimberly-Clark Corp; Kimberly-Clark Fullerton Mill CHP; Southern California Edison; Southern California Edison Paper Substation**	
Database Listing	**Summary**	**Additional Files Reviewed?**
	EDR records list numerous waste types generated from the subject site, including wastes exhibiting the following characteristics or contents within US EPA waste codes: • "D" wastes: ignitables, corrosives, methyl ethyl ketone, tetrachloroethylene, barium, cadmium, chromium, lead, mercury • "F" wastes: spent non-halogenated solvents • "U" wastes: acetaldehyde, 1,4-diethyleneoxide, formaldehyde	
ICIS: (1 listing)	• Includes limited details for 10 Air program violations	No
US AIRS/AFS (1 listing)	• Includes information in approximately 180 listings for the site's Operating, Major Emissions air permitting for dates between 1980 and 2016	No
CA EMI (2 listings)	• Includes emissions data reported to the South Coast Air Quality Management District from the years 1987, 1990, 1993, 1995-2016	No
Orange Co. Industrial Site (1 listing)	• Case ID #98IC009; Record ID # RO0000682; closed 4/22/1998 (closure certification issued); resolution for sodium hypochlorite release	Pending response from Orange County Env. Health Department
CA NPDES / CA WDS / CA CIWQS (1 listing each)	• Information pertaining to the site's industrial storm water discharge permitting and activity (NPDES #CAS000001)	Yes – see summary following table

From a variety of sources, including the User (see **Section 3.3**), state regulatory databases, and files publicly available from Freedom of Information Act (FOIA) requests (agencies outlined above in **Section 4.1.7**), Antea Group reviewed and has summarized pertinent information below in addition to EDR Report findings outlined in the table above. Note that information from certain regulatory sources (e.g., Orange County Environmental Health and California DTSC) that may be pertinent to the discussions below remains outstanding at this time.

Sodium hypochlorite spills (ERNS and CA CHMIRS listings in table above)

KCC provided two reports dated November 1997 and January 1998 related to environmental testing conducted in the Tank Farm area of the site, specifically at and surrounding the location of a former sodium hypochlorite (bleach) AST. This tank was located immediately west of the now empty fuel oil AST (**Figure 3**). These reports summarized soil data from over 60 samples collected at 14 locations beneath and surrounding the former bleach AST. Soil samples were analyzed for sodium hypochlorite, and data were compared to US EPA

Preliminary Remediation Goals (PRGs), Region IX, for chlorine. The reports concluded that the detected concentrations were well below the maximum allowable concentrations per the referenced PRGs. Based on this finding, the consultant suggested that groundwater contamination was "extremely unlikely."
Records from the County of Orange Division of Environmental Health include a letter dated April 21, 1998 confirming completion of remedial investigation related to the sodium hypochlorite release. The agency's determination was supplemented by their April 14, 2018 "Closure Rationale" document, which concluded that any exposure to the low levels of sodium hypochlorite detected in soil beneath the tank farm would be comparable to the acceptable exposure of that in a swimming pool. Further, the agency calculated the potential chlorine concentration and demonstrated it being orders of magnitude less than US EPA PRGs. Lastly, the agency deemed no significant threat to groundwater, and obtained concurrence with the Santa Ana Regional Water Quality Control Board prior to issuing the April 21, 1998 closure letter.

Diesel fuel spill (ERNS and CA CHMIRS listings in table above)

Both the City of Fullerton Fire Department and KCC provided information pertaining to a diesel fuel spill that occurred on a portion of the subject site on the evening of November 2, 2003. According to the spill contractor Worldwide Waste Management, Inc.'s report submitted to the Fullerton Fire Department, the contractor responded to find diesel fuel pooled on the street surface, gutters, and KCC's parking lot. A spill resulted from a collision between a JB Hunt semi and another vehicle. The contractor's response covered a 12-hour period where they absorbed fuel from small puddles on paved surfaces and pumped fuel from storm drains. In total, they reported removing 165 gallons of diesel fuel/water mixture from storm drains and generated five drums of diesel fuel/water mixture, plus seven drums of diesel and absorbent materials. The contractor reported that the local Hazmat team deemed the cleanup complete.

KCC corroborated the story in the local environmental coordinator's account of the release incident. According to KCC, they reported the incident to the National Response Center, but JB Hunt claimed responsibility for the incident and ultimately manifested and disposed of the drums of waste. KCC does not have records of the waste generated from the spill incident.

Petroleum USTs (CA HIST UST listings in table above)

KCC provided reports and regulatory correspondence related to soil contamination present from former fuel oil USTs removed from the subject site in May 1986. The first such record is from an April 2, 1985 inspection of the USTs by County of Orange Environmental Health. This inspection resulted in a recommendation to fill or remove the USTs.

EDR records include a State Water Resources Control Board hazardous waste container information (print dated June 1, 1988), which lists up to six USTs on the subject site (outlined in the CA HIST UST section of the table above). To clarify historical UST identifications and locations, Antea Group requested and KCC provided additional information. KCC's information included an internal letter summary report (dated November 20, 1986) summarizing the removal of seven (7) underground storage tanks (USTs) from the subject site in 1986. The removed USTs included four SRM tanks (Scrim Reinforced Material – an adhesive used to bond multi-ply paper towel products), 1 sulfuric acid tank, and two fuel oil tanks. The report outlined that the tanks themselves showed no evidence of leakage, but petroleum impacts to the environment were present due to years of spills during filling of the fuel oil tanks, and from leaking piping at a nearby/former above-ground oil storage tank. Over 1,100 cubic yards of contaminated soils were removed, and Orange County Environmental Health Department agreed to a plan to later treat remaining impacted soils that could not be removed due to proximity to a nearby driveway.

Documents from the mid-1980s received from the agency then known as County of Orange Environmental Health included limited records documenting UST removal, but confirmed oversight of the fuel oil UST removal and observation of petroleum-impacted soils. In addition to the two fuel oil USTs, the agency oversaw the removal of the following four USTs:

- Vinyl acetate;
- Diactyl Pthalate; and,
- mineral spirits (2).

The agency's records do not indicate any evidence of release from USTs, except for the fuel oil and subsequent cleanup ongoing under [release number] "86UT83."

Leaking USTs and contamination cleanup (CA LUST and CA CHMIR listings in table above)

The March 1992 Remediation Closure Report summarized environmental testing and remediation of petroleum contaminated soil that remained following removal of the fuel USTs and contaminated soil several years prior (refer to the November 1986 letter summarized above). An initial excavation phase (February 5, 1992) was followed by a second phase (February 10, 1992), resulting in the excavation and disposal of a total of 97.77 tons of soil. Confirmatory soil sampling indicated only low levels of total petroleum hydrocarbons (TPH) remaining in soil – much less than the City of Fullerton Department of Underground Storage Tank guidelines at that time. The report recognized that a very small pocket (estimated 3 tons) was left in place to preserve the integrity of a high-pressure fire suppression pipe. A January 22, 1992 letter from the City of Fullerton, in concurrence with the California Regional Water Quality Control Board (RWQCB), confirms a "no further action" determination for the fuel oil release incident. Information from California's GeoTracker

database also show this LUST cleanup site (Activity #T0605900814) as "*Completed – Case Closed as of 1/22/1992*."

According to a February 2002 UST *Unauthorized Release (Leak) / Contamination Site Report* filed by KCC, and subsequent reporting to the City of Fullerton Fire Department, site construction activities discovered additional fuel oil contamination during excavation in the vicinity of the former USTs. The March 8, 2002 *Report of Soil Excavation and Sampling* and subsequent reporting outlined the KCC's prompt response and their contractor's excavation of 2,174 tons of petroleum contaminated soil. To better characterize petroleum contamination that could not be excavated from near or beneath the boiler room, contractor's drilled one deep soil boring to a depth of 70 feet below grade, including soil and groundwater sampling. Analytical data showed contaminants in soil at depths of 10, 15, and 30 feet below grade, but at a location that could not be remediated by excavation. Only low levels of TPH and total xylenes were reported in a groundwater sample. The reported volatile organic compound contaminant concentrations, including xylenes, were reportedly less than the MCLs for the drinking water standard at that time (there were no standards for TPH in groundwater). In soil, the 2002 data were not compared to soil MCLs, but the TPH concentrations (highest concentration was 47,000 parts per million for TPH) do exceed the existing regulatory criteria that would likely be used for comparison – the US EPA Region IX Regional Screening Levels.

Petroleum ASTs (CA AST listings in table above)

KCC provided recent documents summarizing materials stored in ASTs. This included their recent *Aboveground Petroleum Storage Tank Facility Statement*, which includes a summary of the location, type, and capacity of containers present on the subject site. Petroleum products reported for 2017 include: mineral oil, gear/compressor/lube oils, machine lube oils, diesel fuel, hydraulic oil, and used oils. In their annual California Environmental Reporting System (CERS) report, KCC reported a thorough inventory of hazardous materials and wastes, including those stored in ASTs. Refer to **Section 5.5.1** below for additional summary of the site's ASTs. KCC has a certified SPCC Plan (last updated September 2015), as required by federal regulations for facilities that store more than 1,320 gallons of petroleum in above-ground containers. A copy of the SPCC Plan is included in **Appendix H**. The SPCC Plan also outlines and shows the locations of petroleum storage containers at the subject site.

Hazardous Waste Generation (CA HAZNET and RCRA LQG listings in table above)

The subject site is listed is registered with US EPA as a large-quantity generator of hazardous waste. KCC provided representative information on hazardous materials and wastes in a historical (1985) hazardous waste inspection and a recent CERS report, and Antea Group obtained additional information for waste generation

via the California DTSC's Hazardous Waste Tracking System. DTSC lists the primary active waste generator at 2001 E. Orangethorpe Avenue as:

- Kimberly-Clark Worldwide, Inc., RCRA ID #CAD009547373, first entered into the system in July 1982 (active).
  The DTSC waste tracking database summarizes waste generation records back to 1993. Between 1993 and 2017, KCC has manifested between 15 and 55 shipments, generating between 12.1 and 112.4 tons of California-regulated waste per year. Antea Group performed a cursory review of the waste code summary matrix provided by DTSC. This summary included federally, or RCRA-regulated wastes, and is included in **Appendix H**.

- Southern California Edison, RCRA ID #CAC002596895, first entered into the system in October 2005, inactive since April 2006. The DTSC waste tracking database summarizes waste generation records for just two years for this entity – presumably as part of a one-time project. Two shipments were logged in both 2005 and 2006, totaling 3.5 tons. Wastes were California-regulated wastes, including asbestos-containing waste, waste oil/mixed oil, PCBs and PCB-containing materials, and other organic solids.

Storm Water Discharge (CA NPDES, CA WDS, and CA CIWQS listings in table above)

KCC provided a copy of their SWPPP and SWMP, both of which were last updated in July 2018. According to these documents and information provided by the EDR Report, the subject site operates under NPDES general permit #CAS000001, and Waste Discharger ID (WDID) #8 30I001214.

Storm water at the facility is discharged through two separate networks – one at the west of the subject site, and one near its center, or just east of the buildings. Discharges are monitored at the west via a manhole beneath Building #12, and near the center at a point near the subject site's north entrance, just south of Kimberly Avenue. Upon leaving the subject site, storm water flows to the north and into a small creek north of Kimberly Avenue and the BNSF rail yard. An internal KCC specialist monitors storm water discharge on a quarterly basis, and sample data are submitted to the state regulatory agency. Regulatory records indicated two violations:

- February 2, 2001 NOV from an inspection, including required improvements to best management practices at exterior storage areas, including pulp storage area and a scrap metal dumpster. KCC responded and outlined their improvements in a letter dated February 15, 2001.
- January 15, 2014 NOV due to missing reporting requirements (quarterly visual authorized discharge observation forms). No follow-up information was available in the regulatory file.

Refer to the SWPPP and SWMP documents in **Appendix H** for additional information.

4.3.5 Adjacent and Surrounding Area Sites

The EDR Report identified numerous environmental listings within the approximate minimum search distances from the subject property. Many sites of potential environmental interest were identified adjacent to and in the immediate area surrounding the subject site. Listings that indicate the mere presence of hazardous materials/wastes or petroleum products at a facility, absent visual evidence or regulatory enforcement actions, do not present a material threat or indicate that a release to the environment has or is likely to occur. Therefore, except as noted below, listed sites or database listings are not expected to be of significant environmental concern to the subject property. Others that may not be specifically called out below, may be of environmental concern, but have been addressed in discussion of the **Orange County North Basin** – a proposed NPL/Superfund site discussed in the paragraphs below.

Groundwater flow direction in the vicinity of the subject property is predominantly west and southwest, following surface topography and surface water flow toward the Pacific Ocean, with the shallow groundwater aquifer averaging a depth of approximately 100 feet below the ground surface. This information was reported as part of the Orange County North Basin assessments.

Orange County North Basin (OCNB) Proposed NPL/Superfund Site

As a result of documented chlorinated solvent contamination, including that by trichloroethylene (TCE) and tetrachloroethylene (PCE), and 1,1-dichloroethylene (1,1-DCE) US EPA, in concurrence with the California Environmental Protection Agency, have proposed placing the approximate 5-square-mile affected area and suspected contaminant source sites on the National Priority List (NPL). Proposed on January 18, 2018, addition to the NPL is nearly complete as of the date of this report, with a public comment period ending on September 12, 2018.

US EPA has summarized the proposed NPL site and made many recent and historical documents publicly available through an online information source:

- https://cumulis.epa.gov/supercpad/SiteProfiles/index.cfm?fuseaction=second.Cleanup&id=0900251#bkground

Antea Group has performed a cursory review of the available documents, the most recent of which is a draft *Remedial Investigation / Feasibility Study – Addendum 1*, dated May 2018. This report details contaminants detected to date in both the principal and shallow groundwater aquifers within the “study area” – an approximate 5.4 x 2.5-mile area stretching westward from the cities of Placentia nearly to Buena Park and covering portions of Anaheim and Fullerton, from north to south.

The subject property is in the northeastern quadrant of the study area and is proximal to the southern boundary of a groundwater contaminant plume identified to have contaminants at concentrations between 1 and 10-times the allowable maximum contaminant levels (MCLs) in the shallow aquifer, and greater than 10-times the MCLs in the principal aquifer. A City of Fullerton water well labeled "F-KIM-2" on the northern boundary of the subject property has been assessed as part of the NPL studies. That well marks the southern boundary of a plume identified as having contaminant concentrations of between 5 and 10-times the MCLs, and almost the entire subject property has been interpolated within a plume in the principal aquifer where contaminants are between 1 and 5-times the MCLs (**Figure 2**).

Multiple sources/sites of contamination have been identified as likely contributors to the OCNB contaminant plume. This includes several sites that have already been or will be under investigation and/or remediation directives by California state or local agencies. Antea Group was unable to find any direct link to the subject property as a contributing party to the OCNB site, or as a potentially responsible party (PRP) that may be required to help fund investigation and cleanup of the OCNB plumes. Antea Group's interviews with site contacts revealed that past environmental testing was believed to have occurred on the subject site by a third-party consultant, for the sole purpose of evaluating whether or not KCC should be considered a PRP.

Based on the subject property's location within the contaminant plume of the OCNB site, Antea Group has considered this a Recognized Environmental Condition as outlined below in **Section 9.1**.

Nearby and Upgradient Sites with Potential Environmental Impacts

Given the westerly groundwater flow direction and documentation of the OCNB NPL contamination at and downgradient of the subject property, Antea Group has evaluated only those sites listed in the EDR Report as located adjacent to or hydraulically upgradient of the subject property for their potential to impact the subject property. Also, based on the large number of adjacent to or upgradient listings, only those listings with the highest likelihood to be of environmental concern have been summarized below (e.g., USTs, LUST, AST, CA FID UST, SWEEPS UST, HAZNET, HIST CORTESE, HIST UST).

Refer to the EDR Report in **Appendix I** for a complete listing of sites and database listings within the ASTM search radii.

Facility/Site Name	Address (proximity to subject site)	Pertinent Database Listing(s)	Comments	Additional File Review?
Coast Roof Co., Inc.	2301 E. Orangethorpe Ave. (Adjacent, to south)	AST, UST, CA FID UST	Limited info available, except listing for one 10,000-gal. leaded fuel UST and a 1,320-gallon AST.	Yes
Thrifty Oil #303 / Arco 9677; Arco 42122; P&M Service Station #947	2351 Orangethorpe Ave. (Adjacent, to southeast)	LUST, HAZNET, SWEEPS UST, CA FID UST, UST	Case No. 083002663T; Gasoline release to soil only. Leak discovered in 1997 and No Further Action granted in April 2012. The LUST Case indicates there are four tanks located at the site (one 10,000-gallon and three 12,000-gallon USTs) consisting of diesel and gasoline.	Yes
Winonics Inc. DBA Bench 2 Bench; Winonics Electro Circuits Inc.	1257 S State College Blvd. (Adjacent, to east-southeast)	UST, SWEEPS UST, LUST, CA FID UST, EMI, ENVIROSTOR, TRIS, ORANGE CO. INDUSTRIAL SITE, CPS-SLIC	SWEEPS UST database indicates there may have been one 500-gallon fuel UST and one 2,000-gallon waste UST at this facility in 1992. Case No. 9OUT003 for potential contamination of lead, copper, nickel, and chromium to soil. The case was opened in December 1989 during tank closure activities; closure was obtained on February 5, 1990.	Yes
Park Master Products Inc.	2418 Cypress Way (East of subject property and S. State College Blvd.)	SWEEPS UST, CA FID UST, HIST UST	Limited info available; this facility has historically had a 1,000-gallon unleaded UST	No – based on proximity and no documentation of environmental release(s)
Chevron USA	1803 E. Orangethorpe Ave. (After review of the No Further Action Letter on GeoTracker, this facility appears to have been located at 1803 W. Orangethorpe Ave, approximately 3.5 miles west of the subject property)	LUST, HIST CORTESE	Case No. 083000098T; Gasoline release, media affected unknown. Case has been closed since October 1, 1986.	No – based on review of address discrepancy discussed herein.
Alcoa Global Fasteners, Inc.	800 S. State College Blvd. (Northeast of subject property)	AST, HIST UST, EMI, ENVIROSTOR, WDS, ORANGE CO. INDUSTRIAL SITE, HAZNET	This facility is listed on the AST database as having 22,000 gallons of an unknown product contained in aboveground storage tanks (CERS ID 10153205).	No – based on sensitivity of files reported by agency, and availability of information for the Orange County North Basin proposed NPL site

Facility/Site Name	Address (proximity to subject site)	Pertinent Database Listing(s)	Comments	Additional File Review?
			This facility is listed on the HIST UST database for having two tanks – one containing diesel that was installed in 1978 and the second tank containing waste oil that was installed in 1962. No other information is available. This facility was listed on the Orange Co. Industrial Site database for PCE (Case #97IC009), however the case is shown as closed as of 6/13/2005.	
Orange County North Basin	1012 E. Elm Avenue	PROPOSED NPL, SEMS	Proposed NPL site including large areas of Fullerton and Anaheim, CA	Yes – see section preceding this table

Antea Group performed a detailed review of information for the selected facilities listed above using the GeoTracker database, pertinent information from which is included in **Appendix H**.

Coast Roof Co., Inc.: This facility does not appear on the GeoTracker or ENVIROSTOR databases. Based on this site's proximity to the subject property, additional information was requested from local regulatory oversight agencies. Files received included UST records from the City of Fullerton File Department. According to those records, there have been two generations of USTs at this site. Those tanks were located immediately south of the subject property's south trailer parking lot (**Figure 3**). Available records confirm that all USTs have been removed from this site, and there is no indication that a petroleum release occurred from the USTs.

Thrifty Oil / Arco 9677; Arco 42122; P&M Service Station #947: According to GeoTracker, subsurface investigations at this facility in May and September 1997 indicated elevated concentrations of total petroleum hydrocarbons as gasoline in soil near the USTs and dispenser islands. Remedial investigative activities are reported to have included additional soil boring/drilling and soil vapor extraction testing. In April 2010, City of Fullerton Fire Department requested a confirmation soil boring be advanced at the site to evaluate the effectiveness of soil vapor extraction activities and determine applicability for case closure. A confirmation soil boring was advanced in September 2010 and samples were submitted for laboratory analysis up to 90 feet below ground surface (bgs). All contaminants of concern were reported at concentrations less than the laboratory's detection limit, with the exception of ethylbenzene at 85 feet bgs (8.9 micrograms per kilogram). No Further Action was granted for this case on April 24, 2012 (**Appendix H**). Based on the current regulatory status and the separation of this site from the subject site by another property, it is unlikely that any contaminant migration has impacted the subject site from this past documented petroleum release incident.

Winonics Inc. DBA Bench 2 Bench; Winonics Electro Circuits Inc.: According to GeoTracker, two case files were associated with this facility: SLT8R2714078 and T0605923655. This facility's environmental case has been closed since February 5, 1990; the No Further Action Letter is included in **Appendix H**. No additional details were available on GeoTracker.
According to the DTSC ENVIROSTOR database, a "Phase I Inspection" was conducted at this facility in February 2008, followed by the regulator's determination that no further action or assessment was warranted. This information falls under the site's listing as having a Tiered-permit on-site hazardous waste treatment system.

Numerous other environmentally regulated, non-adjacent but nearby sites (not described in tables above) were identified by EDR as being located within one mile from the subject property, including several sites documented as having likely had a release of petroleum or hazardous substances. Due to the distance, direction, and/or regulatory status of the other identified properties, the remaining identified sites do not appear to represent a significant threat for environmental soil or soil vapor contamination at or in the immediate vicinity of the subject property, but may be indicative of an overall degraded groundwater condition in this area (as is suggested by the proposed OCNB site discussed above).

5.0 SITE RECONNAISSANCE

5.1 Methodology

The site reconnaissance was planned by an Antea Group Environmental Professional and performed by personnel possessing sufficient training and experience necessary to conduct the site reconnaissance and having the ability to identify issues relevant to RECs in connection with the subject property.

The site reconnaissance consisted of visual and/or physical observations of the subject property and facilities and improvements on the subject property. Field personnel viewed adjoining properties from the subject property or publicly accessible vantage points. The surrounding area was visually observed during mobilization to and from the subject property for the site reconnaissance to the extent that current uses of the properties were visually observable.

Information contained in the following tables is based on a visual reconnaissance performed as set forth below, interviews, and other references presented in the following subsections. **Figure 1** depicts the subject property location on a recent topographic map, and **Figure 2** depicts the subject property layout and its immediate surroundings. **Figure 3** shows details within the subject property building.
Representative photographs of the subject property are provided in **Appendix A**.

5.2 Limiting Conditions

Limiting conditions are generally considered to be physical and/or User or site contact-imposed restraints encountered during the site reconnaissance. Physical limiting conditions may include obstructions such as buildings, pavement, bodies of water, parked vehicles or equipment, snow, overgrown vegetation, or other conditions that prevent field personnel from viewing the entire site. User or site contact-imposed limiting conditions may include incomplete access to all interior portions of a building or incomplete known records or helpful documents for review during completion of the Phase I ESA. Depending on their impact to the results of the reconnaissance or Phase I ESA, the Environmental Professional may or may not determine that limiting conditions are data gaps or data failures (see **Section 8.0**, below).

Antea Group encountered the following limiting conditions during the site reconnaissance:

- The subject property consists of 65+ acres and while Antea Group personnel attempted to walk the entire property and observe site conditions and operations, coverage of the entire property (such as the orchards) was not feasible within the scope of work.
- Much of the building's interior floor surfaces were covered by large equipment, pulp inventory, packaged product, and other stored items or materials on shelving racks, obscuring visibility of flooring and large portions of the buildings.
- Antea Group could not certainly determine the end point or discharge of most floor drains in the building, KCC personnel were generally unaware of their past use.
- Antea Group personnel did not have access to the leased truck parking area at the northeast corner of the subject property.
- Antea Group did not have access to the interior fenced in portion of the Sub-station to observe equipment.
- Antea Group did not have access to the fire pump room in the northwestern corner of the subject property.
- Antea Group did not have access to the many motor control panel and electrical closets throughout the facility.
- KCC escorts did not have access inside Building #22, therefore Antea Group was only able to observe the interior of the warehouse from outside of the fenced area.
- Antea Group was unable to access the Air Pollution Control Equipment room within Building #21, near the western end of the facility.

5.3 General Site Setting

SITE RECONNAISSANCE	
Field Personnel	Antea Group – Dan Keltner, Sara Sichley, and Atir Chak
Reconnaissance Date	Monday, August 27, 2018 through Wednesday, August 29, 2018
Weather	Approximately 80° F, sunny
Escort	Grace Madden, Environmental Coordinator; Flynn Tiffany, Engineering Team Leader
SITE UTILITIES	
Potable Water Supply	Municipal water supply connection via City of Fullerton
Sewage Disposal System	Municipal sewage disposal
Waste Water Disposal System	All wastewater generated from the subject property is discharged to the municipal disposal system
Storm Water Disposal System	Municipal storm drain system
Building Heating/Cooling	Electric and natural gas heating units; historically the subject property used fuel oil for hoods. A Co Gen was installed at the subject property in 2001 – 2002 for natural gas.
Solid Waste	Dumpsters for recyclables, metals, and electronic waste

5.4 Subject Property Observations

Information contained in the following table is based on visual observations during the site reconnaissance, interviews, and other references presented in **Section 5.5**. Where available, representative photographs of the features are referenced in parentheses.

ABOVEGROUND CHEMICAL OR WASTE STORAGE OR DISTRIBUTION SYSTEMS	
Miscellaneous small volumes < 5 gallons	Yes; numerous small containers of paints, sealants, lubricants, gasoline, oils, and other household and industrial materials stored in flammable cabinets throughout the warehouses at the subject property
Evidence of aboveground storage tanks (ASTs)	Yes; please refer to **Section 5.5.1** for more information
Drums, barrels, and/or containers > 5 gallons	Yes; drums and totes of bleach, polymers, lubricant and motor oils, mineral oils, and oily containing debris
Solid waste or scrap dumpster	Yes; dumpsters located in the West Yard and at North Gate
Chemical/petroleum product or waste piping	Yes; piping overhead for manufacturing process (to include polymers and bleach) as well as natural gas piping
UNDERGROUND CHEMICAL OR WASTE STORAGE OR DISTRIBUTION SYSTEMS	
Evidence of USTs or ancillary UST equipment	No
Records of former USTs	Yes; please refer to **Sections 4.3.4 and 5.5.2** for more information

ABOVEGROUND CHEMICAL OR WASTE STORAGE OR DISTRIBUTION SYSTEMS	
Sumps, oil/water separators, cisterns, catch basins, and/or dry wells	Yes; storm drains observed in the truck loading west dock and adjacent to Building 6. Storm drains reportedly flow to one of two discharge points at the subject property; refer to the SWPPP in **Appendix C** for more details. There is one dry well located at the southwestern boundary of the leased parking and orchard. Site contacts indicated there is a sump pump that drains water from the roof to a holding tank. Observed a sump drain in the UCon room.
Septic tanks and/or leach fields	No
Pipeline markers	No
ELECTRICAL TRANSFORMERS/PCBS	
Pad- or pole-mounted transformers	So-Cal Edison operates a sub-station east of Building 1 at the subject property
Records of former hydraulic equipment	Yes; loading docks
Existing hydraulic equipment	Yes; loading docks; hydraulic palletizers and unitizers, hoists to lift batteries
EVIDENCE OF RELEASES OR POTENTIAL RELEASES	
Stressed vegetation	No, except for stressed trees and ground vegetation in the orchard areas, which was reportedly the result of drought conditions.
Stained soil	No
Stained or corroded pavement or similar surfaces	Yes; de minimis staining observed in several areas throughout the subject property, including but not limited to the maintenance shop, battery storage area, West Yard, adjacent to the railroad spur, and surrounding the scale house.
Leachate and/or waste seeps	No
Dumping or disposal areas	No
Construction/demolition debris and/or dumped fill dirt	Yes; Antea Group observed a pile of gravel in the orchard adjacent to the truck parking and Building 22. The gravel was reportedly used for the Co Gen installation
Surface water discoloration, odor, sheen, and/or free-floating product	No
Strong, pungent, or noxious odors	No
OTHER NOTABLE SUBJECT PROPERTY FEATURES	
Surface water control structures	Yes; there is a storm drain culvert running south to north and located east of the Co-Gen Plant and the scale house
Quarries or pits	No
Ponds or lagoons	No
Wells	Yes; two water production wells operated by City of Fullerton are present on the subject property
Floor drains	Yes; several floor drains located within the interior buildings
Roof drains	Yes; roof drains are tied into the floor drains

5.5 Subject Property Operations

The KCC Fullerton Mill is a manufacturer of paper products, including mostly facial and bath tissue, and paper towels/wipes. Past operations once included manufacturing diapers, tarry towels, tinted/printed bath tissues,

and feminine products. Primary operations include manufacturing of tissue (using primarily a pulp and water mixture), converting into tissue sheets and rolls, packaging, warehousing, and shipping. The primary raw materials used in the tissue manufacturing process are water, surfactants, mineral oils, adhesives, starch, sodium hypochlorite (bleach), various polymers, and paper/plastic for packaging. Numerous other lubricants, oils, and other materials are used throughout the facility to keep the entire manufacturing process running smoothly.

The facility currently operates the following manufacturing lines: two tissue manufacturing lines, three bath tissue lines, and two multi-folder lines for facial tissues. The most complex of the manufacturing processes is the tissue manufacturing, which involves the large-scale mixing of raw pulp, water, and other additives (e.g., starch, surfactants), spraying onto large roller belts, and drying until the liquid pulp mixture can be rolled onto industrial "hard rolls" of bulk tissue paper. The hard rolls are then stored in warehouse space until processed by the various tissue machines. The tissue manufacturing process involves the use of large quantities of water, which is derived from a municipal source, but captured via a series of floor drains, trenches, and sumps, before being re-routed into the facility's water treatment system where the pulp is separated for disposal or reuse, and all water is re-used in combination with the fresh intake water.

As part of the August 2018 site reconnaissance, KCC personnel led Antea Group through the entire facility's many manufacturing, warehouse, and other buildings. Antea Group has collected information from that visit and from KCC-provided documents to complete the following building-by-building summary, each of which includes a very basic outline of operations and notable features or environmental items of interest.

Building #1 – Tissue Manufacturing and Machine Shop

- Building underlain by basement – multi-story manufacturing process for two tissue machines.
- Floor drains and sumps in basement, leading to water treatment/recycling system.
- Two large Yankee Dryers.
- Machine shop and equipment, including milling machines, lathes, drill presses, grinders, metal presses, etc.
- Diesel-fueled emergency backup generator.

Building #2 – Bundle Packaging and Warehouse

- Chiller #2 (now unused)

- Former Online Printer Room (used for printing through 1999); includes floor drains and trench drain; currently receives roof drain discharge. Former use of water-based inks used in tissue coloration processes.

Building #3 – Warehouse and Unitizers

- Several unitizers and case conveyors
- Forklift battery charging area (50+ large lead-acid batteries and associated charging equipment)
- Small maintenance area and machine shop

Building #4 – Boiler House

- 2 natural-gas fired boilers, overlying basement

Building #5 – Water Plant Filtration

- Equipment and tanks for water filtration and treatment systems
- Several totes of water treatment chemicals

Building #6 - Warehouse

- Several former loading doors (now unused) along north side of the building – once located next to a rail spur
- Rail dock (unused since c. 1970s)
- Truck loading dock – 18 loading doors (#6 through #23)

Building #7 – Warehouse

- No items of interest

Building #8 – Tissue Converting Lines (B-4 and T-4) and Ultra Converting Room

- Former ink mixing and processing area, including trench drain that discharges to the sanitary sewer. Area unused since c. 1998.
- Warehouse storage
- Ultra Converting Room – for application of lotions and waxes to paper rolls. Process includes use of trench drains and sumps for waste water collection and discharge to sanitary sewer.
- Baghouse for dust collection/air filtration systems

Building #9 – Bath Tissue Lines (B-1 and B-2)

- Former use included diaper manufacturing lines

- Small maintenance shop

Building #10 – Tractor (Forklift) Shop and Hard Roll Storage

- Fork lift repair shop and staging area
- In-ground pit (walk-in via stairs) for forklift repair
- Welding room
- Used and new oil storage closet, including several 30-gallon drums of oil on secondary containment

Building #11 – Pulp Storage Warehouse and ICON Tank Room

- Truck loading dock at north side
- Rail dock along east side
- ICON Tank Room – including two 8,200-gallon polymer ASTs and one 8,000-gallon water AST
- Floor drains/grates that drain to basement and ultimately into on-site water treatment system

Building #12 – Warehouse (Hard Roll Storage and Finished Products)

- Unused/defunct equipment stored along portions of perimeter of this warehouse. Observed de minimis oily staining beneath one piece of equipment.

Building #13 –Warehouse (Finished Products)

- Distribution Office and restrooms
- East loading dock – five truck docks

Building #14 – Outbuilding (Storage Only)

- Unused Yankee Dryer is stored in this building

Building #15 – West Pump House

- Dedicated fire suppression pump and equipment, just outside northwestern corner of Building #12

Building #18 – Propane Storage Shed

- Propane storage

Building #19 – Warehouse & Chiller Room

- Chiller unit, including R410A refrigerant, and two stainless steel totes of chiller treatment chemicals
- Trench floor drain in chiller room
- West Yard loading docks – 11 truck loading doors

Building #20 – Warehouse (Hard Roll Storage)

- Sanitary sewer access manhole
- Storm sewer access – west facility outfall and sample point

Building #21 – Multi-folder Lines (MF-1, MF-2)

- Maintenance shop area for multi-folder lines and equipment
- Packaging lines
- Air Pollution Control Equipment (APCE) room (no access) – large drum-roller dust collection system
- 2nd and 3rd-floor offices

Building #22 – Exterior Storage Building

- Storage racks and unused equipment (no access provided as part of this assessment)

Building #23 – West Gate Guard Shack

- No contents – small guard shack near Acacia Street entrance

Building #25 – Chemical and Waste Storage

- Outbuilding designed for chemical and waste storage
- Includes trench drainage and sump collection as spill containment
- Staging area for 90-day hazardous waste pails and drums

Building #26 – North Gate Guard Shack

- No contents – small guard shack near Acacia Street entrance and truck scale

Buildings #27 & 29 – City of Fullerton Water Station

- Water well pumping station and equipment, owned/maintained by City of Fullerton
- Two large fire suppression water storage tanks

Building #28 – Training Center

- Training room located at south end of building

Building #30 – Café and Patio

- Kitchen equipment

Building #31 – Lift Tank Room (inside Building #8)

- 10,000-gallon AST containing "Formulation 42A" wax/mineral oil mixture
- ~300-gallon tank containing Drakeol® Mineral Oil

Exterior – Water Treatment Plant

- Three open-top clarifier tanks
- Totes of water treatment polymers and chemicals
- Sludge press and conveyors
- Effluent tanks
- Subsurface (basement level) piping and equipment

Exterior – Go-Generation Plan

- Natural-gas-fired power generation equipment
- Ammonia AST and containment area

Exterior – Tank Farm

- Two unused/empty ASTs, and two active ASTs:

  - Unused – Quaker polymer, empty since c. 1998; Fuel oil AST – emptied and cleaned c. 1990s
  - Active – Kymene 920A tank; Bleach tank (stainless steel)
- Tanks overtop concrete containment area and surrounded by earthen berm
- Includes collection sump from adjoining bleach dispensing pad, just west of tank farm

Exterior – North Gate and East Parking/Storage

- Waste water outfall and sampling point
- Storm water outfall and observation point
- Truck/trailer parking yard
- Large, unused dirt/gravel lots; some gravel piles observed
- Leased RV/trailer parking lot – leased to Marie Carriere, a transportation company
- Large orange and fruit orchard and irrigation lines

Exterior – West Yard

- Empty tote staging area
- Recycling dumpsters – cardboard, poly materials, corrugates, wood, and tissue
- Orange tree orchard and irrigation lines

5.5.1 Aboveground Chemical or Waste Storage, Distribution Systems

Refer to the chemical inventory and associated figure in **Appendix C** for a complete list and locations of chemicals stored on the site. This includes several drums and various sizes of totes and aboveground storage tanks of mineral oil, gear/lube oils, compressor oils, diesel fuel, hydraulic oil, and used oils stored throughout the subject property. Chemicals were observed within secondary containment or located within the building's interior walls.

A tank farm containing a tank each of kymene polymer, bleach, and an empty Quaker tank was located east of the CoGen plant (**Figure 3**). Antea Group also observed a large aboveground storage tank in the tank farm that formerly stored fuel oil, but has since been emptied, cleaned, and left in place. Piping from that tank was reportedly cut off between it and the boiler house, so some length of piping may still exist belowground. The tanks within the tank farm were located within a concrete secondary containment, followed by an earthen berm containment.

The Chemical Storage Building (Building #25) contained various totes, drums, and smaller 5 and 30-gallon containers of caustics, acids, oils, and other various products used for their manufacturing process, as well as their 90-day hazardous waste storage. Many of the products within this building were not observed on secondary containment, however the building is designed with a spill containment system that would contain a

release. Totes, drums, and smaller containers were observed in good condition and labels were clear and visible.

There were numerous small containers of paints, sealants, lubricants, oils, aerosol cans, and other household cleaning materials stored in flammable cabinets throughout the facility. Overall, products were labeled clearly and stored within the flammable cabinets appropriately.

Dumpsters are located in the West Yard as well as near the North Gate. No significant staining or evidence of a release or spill of chemicals or petroleum products were observed on or around the dumpsters.

5.5.2 Underground Chemical or Waste Storage & Distribution Systems

KCC has reported seven former USTs at the subject property, including four SRM tanks, one sulfuric acid tank, and two former fuel oil USTs – each installed in 1956 and removed in 1985. All USTs were reportedly located near the Boiler House (Building #4). SRM tanks included an adhesive product that was used in multi-ply paper towel manufacturing, and the fuel oil USTs were used to supply fuel to the boilers for steam heating the manufacturing processes. Petroleum contamination was discovered at the time of the UST removals, and was cleaned up (excavated) to the extent practicable in multiple excavations that occurred at the time of the UST removal in 1985 or 1986, again in 1992, and during construction of the CoGen Plant in 2002.

5.5.3 Electrical Transformers/PCBs

So-Cal Edison operates a sub-station at the subject property and reported to Kimberly-Clark that the sub-station does not contain PCBs. Kimberly-Clark escorts did not have access to the interior of the sub-station, so Antea Group was only able to observe equipment from outside of the fenced area; no staining was observed.

5.5.4 Evidence of Releases or Potential Releases

Although limited, de minimis staining was observed in a several areas of the subject property (to include but not limited to the West Yard, the scale house, the railroad spur, and the battery storage area), no staining that might suggest evidence of a release or potential release to the environment was observed during the site reconnaissance, except at the forklift battery charging station in Building #3, where heavy staining by battery acid residue was observed on concrete flooring throughout much of this area. This condition is mitigated to some extent by the bermed concrete floor surrounding and underlying the charging stations.

5.5.5 Other Notable Features

Antea Group observed many floor drains, a few floor trench drains, and evidence of past or filled floor drains or trench drains throughout several areas of the facility. In most cases, site escorts were unaware of the former purpose or use of the older drains, unless obviously being used to collect discharge from an existing feature, such as a roof drain or shop sink. Otherwise, site contacts reported that most of these former drains were not used as part of current operations, although many appeared to still be usable. Site contacts reported several drains are certainly connected to sanitary sewers, and had no information to suggest that any drains, either used or unused, are or have ever NOT been connected to a sanitary sewer.

At two locations within Building #8, site contacts reported floor trench drains were once associated with former ink mixing or storage operations that ceased in the 1990s. These drains discharge to the sanitary sewer. Inks were once used to tint or print patterns on paper products.

At exterior locations, Antea Group observed a few circular patches in asphalt pavement, indicative of possible former drilling locations. At one of these locations, immediately east of Building #25, site contacts believed that soil test borings may have been conducted in that area as part of a prior environmental investigation conducted to evaluate potential sources of a region-wide groundwater contaminant plume (now known as the Orange County North Basin Superfund site). KCC reported that no substantial evidence was found to identify the subject site as a potential source of groundwater contamination. Antea Group has requested, but KCC does not have record of any prior subsurface investigations that may have been conducted on the subject property.

5.6 Current Uses of Adjoining Properties and Surrounding Area

The following table summarizes the adjoining property occupants/uses as observed from roads or other publicly accessible areas during Antea Group's recent reconnaissance of the subject property. Adjoining property occupants are shown on **Figure 2**.

DIRECTION	USE OF SURROUNDING PROPERTIES
North	Kimberly Avenue, beyond which is a BNSF Railroad, tributary creek that flows into Carbon Creek, and various commercial and industrial businesses to include but not limited to Rayne Water Conditioning and Corru-Kraft Orora
South	To the southeast: Coast Roof Co Inc., Kim's Welding and Iron Works, Eberhardt's Tire Center, Discount Tire Centers, and Arco Service Station. Directly to the South is E. Orangethorpe Avenue, followed by various commercial retailers and industrial facilities to include but not limited to Vista Paint
East	S. State College Boulevard, beyond which are a restaurant called The Grill, Benner Metals, Park Master Products Inc., and Future Foam
West	Acacia Street, beyond which are various commercial and industrial facilities

There was no evidence of past or threatened releases of hazardous materials or petroleum products observed (i.e. monitoring wells, bulk tanks without secondary containment, significant staining, etc.) at any of the adjoining properties during the site reconnaissance. Historical uses and releases of hazardous materials and/or petroleum products at adjoining sites are discussed in **Section 4.3.5**.

6.0 INTERVIEWS

Interviews were planned by an Antea Group Environmental Professional and performed by personnel possessing sufficient training and experience and having the ability to identify issues relevant to RECs in connection with the property.

Antea Group has included a summary of User Provided information and the User's Questionnaire in **Section 3.3** and included affiliated information in **Appendix C**. Antea Group obtained information from site contacts via an interview process prior and throughout the duration of the two-day site reconnaissance. Questions included a detailed list pertaining to the current and historical property use, storage, or release of hazardous materials and petroleum on the subject property and adjacent properties. Responses to the questions and related information are incorporated throughout the report.

Antea Group interviewed the following individuals in connection with this Phase I ESA:

- *Ms. Grace Madden, KCC's Environmental Coordinator* - Ms. Madden accompanied Antea Group personnel during the site reconnaissance between August 27 and 28, 2018 and assisted in completion of the *Interview with Past and Present Owners and Occupants* form. Ms. Madden has worked for KCC at the subject site since 1980, and has been involved with environmental and compliance projects and permitting for at least the past 20 years.

  Ms. Madden reported that KCC first developed and occupied the subject property in the mid-1950s, and was unaware of any prior occupants or usage of the property, except as a fruit orchard (primarily oranges). Ms. Madden also indicated that the facility is has been used exclusively as a paper mill, including the current manufacturing of paper products such as facial and bathroom tissue, and industrial paper towels/wipes. Past but discontinued product lines have included diapers and feminine products.

  The extensive and long-time operation has included the use of many types of petroleum products and hazardous materials, water-based inks, solvents, and long-time generation of state and US EPA-regulated hazardous wastes. Ms. Madden provided several recent and historical documents pertaining to the use and storage of these materials and wastes at the subject site. Aside from water and paper pulp, the largest quantities of products used historically have included fuel oil (no longer used), and

sodium hypochlorite. The site provided copies of historical reports pertaining to past spills/releases of both fuel oil and sodium hypochlorite.

Ms. Madden was aware of, but had limited information pertaining to the following pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in or on the subject property or on the adjoining properties:

- The KCC facility has been issued "minor" violations by regulatory agencies over time, but KCC has been diligent in closing each out in a timely manner. Ms. Madden is not aware of any current or open regulatory violations related to environmental compliance.
- A proposed "Superfund" site in Fullerton, resulting from a region-wide groundwater contaminant plume, primarily by the solvent PCE. It is believed that testing was conducted on the subject property in the past, but data provided no evidence that the KCC facility was a contributor to the region-wide plume.
- KCC has been named as a potential party in litigation in relation to their past disposal waste at off-site facilities. This is related only to off-site disposal facilities in California and does not have bearing on the subject property itself.

Other pertinent information from Ms. Madden has been disseminated throughout this report.

Mr. Flynn Tiffany, KCC's Engineering Team Leader – Mr. Tiffany accompanied Antea Group throughout much of the two-day site reconnaissance, and provided knowledge and manufacturing process explanations to Antea Group throughout the course of this assessment. Mr. Tiffany has been employed at the KCC Fullerton for the past two years. Pertinent information from Mr. Tiffany has been disseminated throughout this report.

7.0 NON-ASTM STANDARD SCOPE CONSIDERATIONS

The User did not request any of the traditional non-scope considerations, listed under Section 13.1.5 of ASTM E1527-13, to be completed as part of this Phase I ESA. Non-scope considerations include, but are not limited to: asbestos-containing building materials, radon, lead-based paint, lead in drinking water, wetlands, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, biological agents and mold, regulatory compliance, and indoor air quality unrelated to releases of hazardous substances or petroleum products into the environment.

8.0 DATA GAPS

The ASTM E1527-13 standard defines the term data gap as "a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information." The same standard defines data failure as "a failure to achieve the historical research objectives even after reviewing the standard historical resources that are reasonably ascertainable and likely to be useful."

Antea Group identified the following data gaps or data failures during the completion of this Phase I ESA, none of which would be expected to affect the overall findings of this report, if additional information was to become available:

- The absence of requested city directory listings for off-site properties along S. Acacia Street, Kimberly Avenue, and S. State College Boulevard is a data failure. Further, listings for properties along Orangethorpe Avenue, including the subject site, were available only up to 1995. Although this limits the knowledge of historical use of adjoining properties, Antea Group has obtained information about potential environmental concerns on adjoining properties through other sources, such as the EDR Report and state regulatory databases.

Antea Group identified the following more significant data gaps or data failures during the completion of this Phase I ESA, which would be more likely to affect the overall findings of this report, if additional information was to become available:

- The California Department of Toxic Substances Control reported in their September 26, 2018 letter that files are available in their regional office, but has not responded to Antea Group's requests on the type of information available, and protocol to obtain copies of or review the files. Antea Group left voicemails with the DTSC regional office twice in October 2018.
- Antea Group observed numerous unused floor drains and floor trench drains throughout the facility. Site contacts were unaware of the former purpose of the drains, and could not definitively determine the connections or discharge from these drains.
- Site contacts referred to subsurface environmental testing conducted at the subject property in about the mid-2000s as part of region-wide site evaluations to identify suspected sources of the Orange County North Coast chlorinated solvent plume in groundwater. Copies of a reports or testing locations and records from the subject property were not available for review as part of this assessment.
- Regulatory waste records include documentation of the disposal of various oils, metals, and solvents, including PCE wastes. Historical waste handling and generation records are limited, and Antea Group was unable to confirm historical hazardous waste accumulation or satellite locations within the facility.

9.0 FINDINGS

Antea Group has performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E1527-13 of the property located at 2001 E. Orangethorpe Avenue in Fullerton, California. Antea Group has considered releases of hazardous substances and petroleum to the soil, groundwater, surface water, and soil vapor in, on, or at the subject property and migration to the subject property in solid or liquid form at the surface or in the subsurface or as vapor in the subsurface. The review and interpretation of information upon which these findings are based was performed by an Environmental Professional. Any exceptions to or deletions from this practice are described in **Sections 8.0** and **11.0** of this report.

9.1 Recognized Environmental Conditions

The ASTM E 1527-13 standard defines the term recognized environmental condition as "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment." This assessment has revealed the following evidence of RECs in connection with the subject property:

- Via region-wide municipal and private well sampling, regulatory agencies have documented chlorinated solvent contamination in both the principal and shallow groundwater aquifers, including beneath a large portion of the subject site. According to recent data/figures from investigations completed as part of the proposed Orange County North Basin Superfund site, an on-site City of Fullerton water well is impacted. Beneath the site, contaminants are reported to be at concentrations between one and five times the US EPA Region IX Maximum Contaminant levels (MCLs) in both the shallow and principal aquifers, and as high as 5 to 10-times the MCLs in the portion of the principal aquifer beneath the northernmost extent of the site and beneath Kimberly Avenue.

9.2 Controlled Recognized Environmental Conditions

The ASTM E1527-13 standard defines the term controlled recognized environmental condition as "a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting a risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls)." This assessment has revealed the following evidence of CRECs in connection with the subject property:

- This subject property is associated with a Leaking Underground Storage Tank (LUST) incident (Case No. 083001032T) for a fuel oil release reported in May 1986 following the removal of two diesel/fuel oil USTs. The site received official regulatory closure of this incident in a letter from the City of Fullerton Fire Department in a letter dated January 22, 1992. The letter stated that it did not relieve the responsible party of responsibility to "*clean up additional, existing or previously unidentified conditions at the site which cause or threaten to cause pollution…"* and that present or proposed changes to use of the site may require additional site characterization, with it being "*the property owner's responsibility to notify this Department of any changes in report content, further contamination findings, or site usage*."

  The January 1992 closure letter was followed by KCC's reporting of limited remediation and subsurface testing results from February 1992 where low levels of petroleum contaminants were reported in soil, and approximately three cubic yards of impacted materials were left in place due to their inaccessibility beneath a high-pressure fire-suppression pipe.

  As part of a construction project in 2002, KCC's contractors encountered and excavated an additional 2,000+ tons of petroleum contaminated soils from the vicinity of the former USTs. At this time, it was discovered that limited petroleum impacts must remain in soils beneath the boiler house and in groundwater at depths of approximately 30 feet, due to inaccessibility. The reported concentrations in groundwater were less than the regional MCLs established at that time, but soil contaminant concentrations for total petroleum hydrocarbons exceed the current regulatory criteria for exposure to soils in an industrial setting.

  Due to the regulatory closure of this LUST release incident with the information that some levels of petroleum contamination remain in soils at locations beneath paved surfaces and/or buildings, this represents an CREC in connection with the subject property.

9.3 Historical Recognized Environmental Conditions

The ASTM E 1527-13 standard defines the term historical recognized environmental condition as "a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls." This assessment has revealed the following evidence of HRECs in connection with the subject property:

- Several sodium hypochlorite (bleach) spills were documented to have occurred in the facility's tank farm area between 1990 and 1997. Soil testing data from 1997 and 1998 confirmed low levels of sodium hypochlorite in soils to depths up to 40 feet below grade, the maximum depth explored. There

are currently no regulatory comparison standards or cleanup levels for sodium hypochlorite, but the County of Orange Division of Environmental Health calculated potential chlorine exposure due to sodium hypochlorite in soils to be comparable to that of a swimming pool. In a letter dated April 21, 1998, the agency confirmed completion of remedial investigation related to the bleach spills.

To mitigate the potential for future spills, the bleach tank and dispensing areas are now protected by concrete berms. An automobile-semi accident on Kimberly Avenue, near the site's north entrance occurred in November in 2003 and resulted in the semi releasing diesel fuel to the ground surface and storm drains. The release was mitigated by a contractor's same-day response and cleanup of diesel fuel using absorbents and pumping of fuel/water mixture. The cleanup effort was overseen by the local regulatory authority, which did not require any further action be taken by the party responsible for the spill. Based on the reported cleanup with regulatory oversight, Antea Group considers this a Historical Recognized Environmental Condition.

9.4 De Minimis Conditions

The ASTM E1527-13 standard defines the term de minimis condition as a condition that "generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies." This assessment has revealed the following evidence of de minimis conditions in connection with the subject property:

- Antea Group observed paper dust throughout much of the manufacturing areas within the facility, and paper debris, pulp, and water on flooring in certain warehouse and manufacturing areas.
- Antea Group observed limited areas of oily staining on flooring throughout certain areas of the facility, including in the machine shop and forklift repair shop.

9.5 Noteworthy Items

The following item did not meet the definition of an REC, HREC, CREC, or de minimis condition in accordance with the ASTM E1527-13 standard; however, the item was deemed a noteworthy historical condition of the subject property and surrounding area:

- The subject property and surrounding area included historical agricultural usage as fruit and/or nut orchards, likely back to the late-1800s. Past standard farming practice included the application of pesticides (including organochlorine pesticides) until they were banned in the 1970s and 1980s. However, many pesticides can persist in the subsurface long after application. Antea Group is unaware of any documentation or knowledge of residual pesticide conditions at this site or in the surrounding area.

- Immediately south of the subject property is a site (Coast Roof Co., 2301 E. Orangethorpe Avenue) that has stored petroleum in two generations of underground storage tanks, the nearest of which were located within approximately 30 feet of the subject property line. Regulatory records indicate all USTs have been removed, and there is no indication that regulators required any formal environmental investigations following the tank removals. However, regulatory files did not include any environmental testing results from the time of the tank removal project, so it is unknown if there were environmental impacts beneath those former underground storage tanks south of the subject property.

10.0 CONCLUSIONS

Antea Group has performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E1527-13 of the subject property located at 2001 E. Orangethorpe Avenue, Fullerton, California (subject property). Any exceptions to, or deletions from, this practice are described in **Sections 8.0** and **11.0** of this report.

This assessment has revealed a REC, a CREC, and two HRECs in connection with the subject property, as well as several Data Gaps, where if additional information was to become available, such information could affect the findings of this report. Refer to **Section 8.0** for a list of Data Gaps and **Sections 9.1, 9.2, and 9.3** for RECs, CRECs, and HRECs, respectively.

11.0 DEVIATIONS

ASTM E1527-13 requires that all additions to or deletions and deviations from this practice (if any) be listed individually and in detail, including client-imposed constraints, and that all additions should be listed. Antea Group adhered to the Principles outlined in Section 4.5 of the ASTM E1527-13 standard practice, and collected and reviewed reasonably ascertainable information that was publicly available, practically reviewable and obtainable from its source within reasonable time and cost constraints. Antea Group's site reconnaissance included observation of areas that were accessible by foot, as well as a drive-by observance of adjacent and surrounding properties. Antea Group attempted to view as much of the subject property as possible in order to make appropriate conclusions regarding RECs.

There were no deviations outside of the variability allowed within the ASTM E1527-13 standard, and no significant conditions were encountered that limited the ability to complete the scope of services during the performance of this Phase I ESA.

12.0 LIMITATIONS OF ENVIRONMENTAL ASSESSMENTS

The findings and conclusions contained in this report represent Antea Group's professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This report is based upon a specific scope of work requested by the User. The contract between Antea Group and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea Group's client and anyone else specifically identified in writing by Antea Group as a User of this report. Antea Group cannot and will not be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea Group makes no express or implied warranty as to the contents of this report.

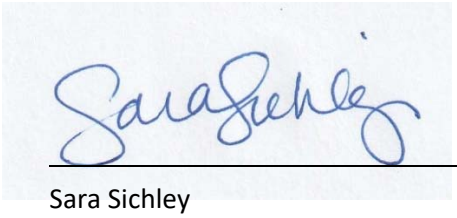
12.1 Subject Property Data Review

Antea Group obtained, reviewed, and evaluated information available from the User(s), property owner, designated representative(s), site contact, and local, state, or federal public entities to the extent practicable within the confines of the project scope and budget. Antea Group's conclusions, opinions, and recommendations are based, in part, on this information. Antea Group's services do not include the verification of the accuracy or authenticity of this information.

12.2 Site Reconnaissance

Antea Group performed a reconnaissance of the subject property to document current conditions. The reconnaissance was performed in accordance with the project scope and within the project time and budget allotted. Antea Group focused on property areas deemed more likely to exhibit RECs while other areas may have received limited attention.

12.3 Interpretation of Results – Final Report



Antea Group's report is based upon the information provided to Antea Group and Antea Group's observations made during the reconnaissance of the subject property. Given the inherent limitations of environmental assessment work, Antea Group does not guarantee that the site is free of hazardous or potentially hazardous materials or conditions, or that latent or undiscovered conditions will not become evident in the future. Antea Group's report is prepared in accordance with the proposal and the standard terms and conditions presented in the Service Agreement between Antea Group and its client, and no other warranties, representations, or certifications are made.

13.0 QUALIFICATION(S) AND SIGNATURE(S) OF ENVIRONMENTAL PROFESSIONAL(S)

Professional profiles of project team members are presented in **Appendix J**.

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in section 312.10 of 40 Code of Federal Regulations (CFR) 312. I have the specific qualifications based on education, training and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquires in conformance with the standards and practices set forth in 40 CFR Part 312.

EDR Property Tax Map Report

Environmental Data Resources, Inc.'s EDR Property Tax Map Report is designed to assist environmental professionals in evaluating potential environmental conditions on a target property by understanding property boundaries and other characteristics. The report includes a search of available property tax maps, which include information on boundaries for the target property and neighboring properties, addresses, parcel identification numbers, as well as other data typically used in property location and identification.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OR DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. EDR Environmental Lien and AUL Search

The EDR Environmental LienSearch Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

PROPERTY INFORMATION

Deed 1:

According to the Orange County Assessor, the current owner of the subject property is Kimberly-Clark Corporation. Records were searched at the Orange County Recorder's Office back to 1980. No conveyance was found of record for the subject property. Based on our research, it appears that Kimberly-Clark Corporation acquired title to the property prior to 1980.

Legal Description: All that certain piece or parcel of land containing 17.15 acres, more or less, being a portion of the Southeast Quarter of Section 35, Township 3 South, Range 10 West, situate and lying in the County of Orange, State of California.

Legal Current Owner: Kimberly-Clark Corporation

Property Identifiers: 073-120-31

Deed 2:

Type of Deed: Corporation Grant Deed

Title is vested in: Kimberly-Clark Worldwide, Inc., a Delaware corporation

Title received from: Kimberly-Clark Corporation, a Delaware corporation

Deed Dated: 11/30/1996

Deed Recorded: 12/18/1996

Instrument: 19960638768

Legal Description: All that certain piece or parcel of land being a portion of the Southeast Quarter of Section 25, Township 3 South, Range 10 West, in the Rancho San Juan Cajon de Santa Ana, as per map recorded in book 51, Page 7 of Miscellaneous Maps, situate and lying in the County of Orange, State of California.

Legal Current Owner: Kimberly-Clark Worldwide, Inc., a Delaware corporation

EXHIBIT A

Description of Real Property

That certain real property in the State of California, County of Orange described as follows:

That portion of the southeast quarter of section 35, Township 3 South, Range 10 West, in the Rancho San Juan Cajon de Santa Ana, county of Orange, state of California, as per map recorded in book 51 page 7 of Miscellaneous Maps, in the office of the county recorder of said county, described as follows:
Beginning at a point on the east line of said section 35, distant thereon 953.10 feet north of the southeast corner of said section 35; thence north 490.37 feet along said east line, to the southeast corner of the land described in deed to Lionel Browning recorded in book 130 page 382 of deeds in the office of the county recorder, of Los Angeles County, California; thence westerly 1799 feet more or less along the southerly line of said Browning land to a line which is parallel with and distant 18 feet east of the east line of the land described in deed to Joseph P. Caldwell recorded in book 93 page 87 of deeds in the office of the county recorder of said Los Angeles County; thence southerly 965 feet more or less, along said parallel line to the northwest corner of the land described in the deed to Peter Jacobson, recorded in book 305 page 188 of deeds in the office of the county recorder of said Orange County; thence easterly 900 feet more or less, parallel with the south line of said section 35, to a line which is parallel with and 899.50 feet west of said east line of said section 35; thence north 474.27 feet parallel with said east line; thence east 899.50 feet to the point of beginning.

RECORD OF INSPECTION

Date 4/2/85

Time 10:00 a.m.

Was visit scheduled? yes

Name and title of inspector Katherine Bish

Agency Address (local) County of Orange Environmental Health
1725 W. 17th Street

Inspector's office phone 834-8184

Name of inspector's immediate supervisor William Diekmann

Supervisor's office phone 834-8183

Names and titles of any accompanying individuals Mark Cousineau, Environmental Health Specialist

1. Purpose and Reasons for visit:
Followup on March 28, 1985 inspection and preliminary assessment of SRM tank.

2. Areas visited (specific list):
Engineering offices
SRM Tank Farm

3. Inspector's questions or comments:
SRM tanks should be either filled (requiring periodic testing) or removed, preferably by 7/1/85. Intent to comply - shown through progress towards removal - will satisfy the inspector

4. Samples taken (list):
None

5. Documents or other information requested:
A. Information on what old SRM tanks have contained and how they were taken out of service (closure), details on associated piping (underground or above).
B. MSDS for Elvace adhesives given to inspector

6. Employees interviewed (name and position):
Laura Dzamka, Mill Process Engineer

7. Comments: A. Need to get sample of water in "dry" sump analyzed.
B. The tanks should be removed from the SRM tank farm
C. Fire Department must be notified prior to removal

8. Length of visit:
1.5 hours

INSTRUCTIONS:

Use additional note paper if the space on this form is not sufficient. After inspection, type clean copy and mail as directed by the Manual

Closure Letter Jan 22, 1992

January 22,1992

Ms. Isabella Alasti
Kimberly Clark Corporation
2001 E. Orangethorpe Avenue
Fullerton, CA 92634

Subject: Clean-up Case Closure for Site at 2001 East Orangethorpe Ave., Fullerton, CA

Dear Ms. Alasti:

This letter confirms the completion of site investigation and remedial action at the above address. With the provision that the information provided to this department was accurate and representative of existing conditions, it is the position of this office that no further action is required at this time.

The contents of these reports have also been discussed with staff of the Regional Water Quality Control Board (RWQCB). Based on the information submitted and current requirements, the RWQCB concurs with the determination of this Department that no further action is required at this time.

Please be advised that this letter does not relieve you of any liability under the California Health and Safety Code or Water Code for past, present or future operations at the site. Nor does it relieve you of the responsibility to clean up existing, additional or previously unidentified conditions at the site which cause or threaten to cause pollution or nuisance or otherwise pose a threat to water quality or public health.

Additionally, be advised that changes in the present or proposed use of the site may require further site characterization and mitigation activity. It is the property owner's responsibility to notify this Department of any changes in report content, further contamination findings or site usage.

If you have any questions regarding this matter, please contact me at (714) 738-6508.

Sincerely,

John White

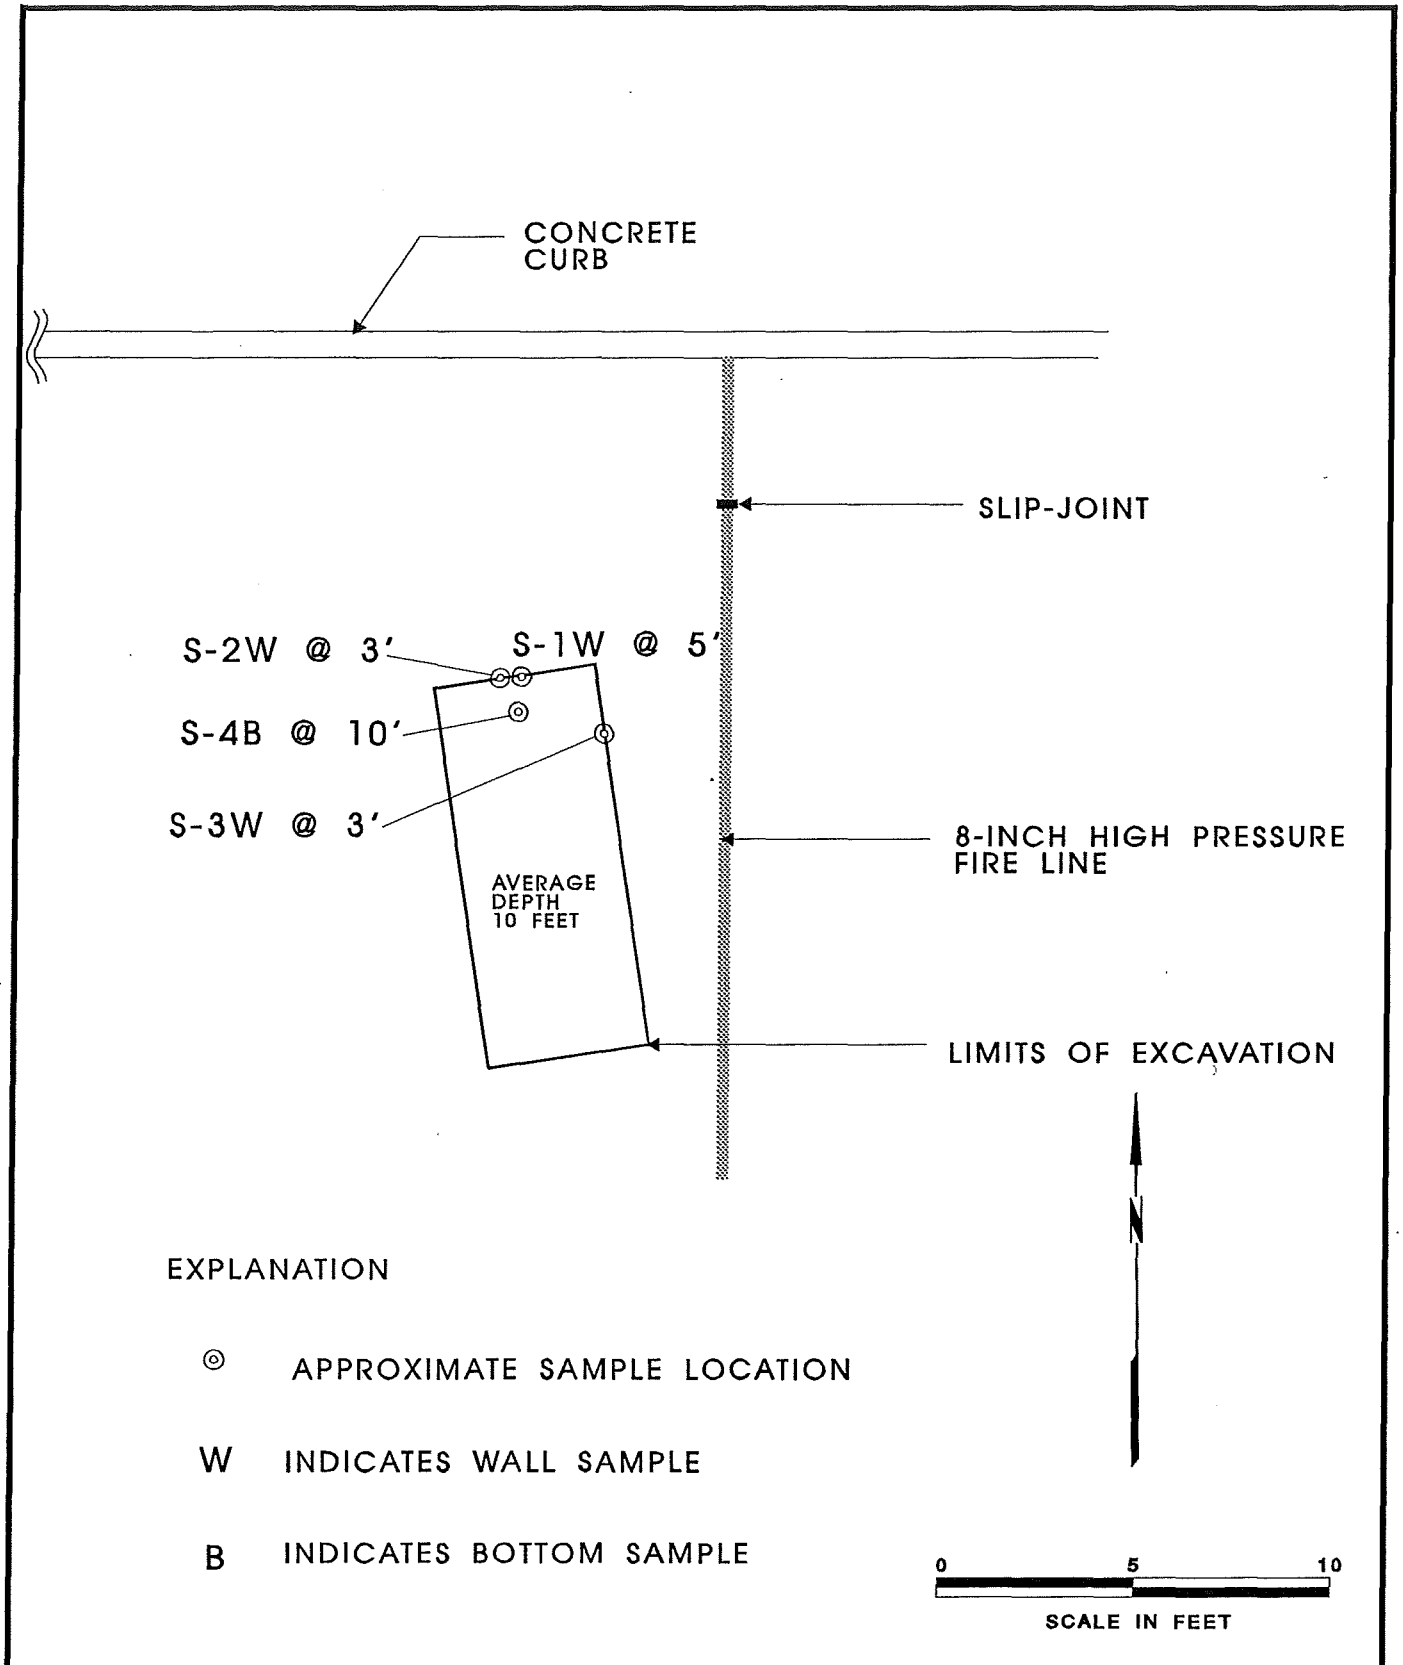
INTRODUCTION

This Closure Report is for the remediation of petreoluem contaminated soil remaining on site from a previous underground storage tank removal project at the Kimberly Clark Corporation facility, 2001 East Orangethorpe Avenue in Fullerton, California. The tanks were removed in May 1986 by Crosby & Overton, under Fullerton Fire Department, Underground Tanks Division, permit #P070-86151. Remediation of the remaining soil was conducted in February 1992, under Fullerton Fire Department permit # 92-T-001.

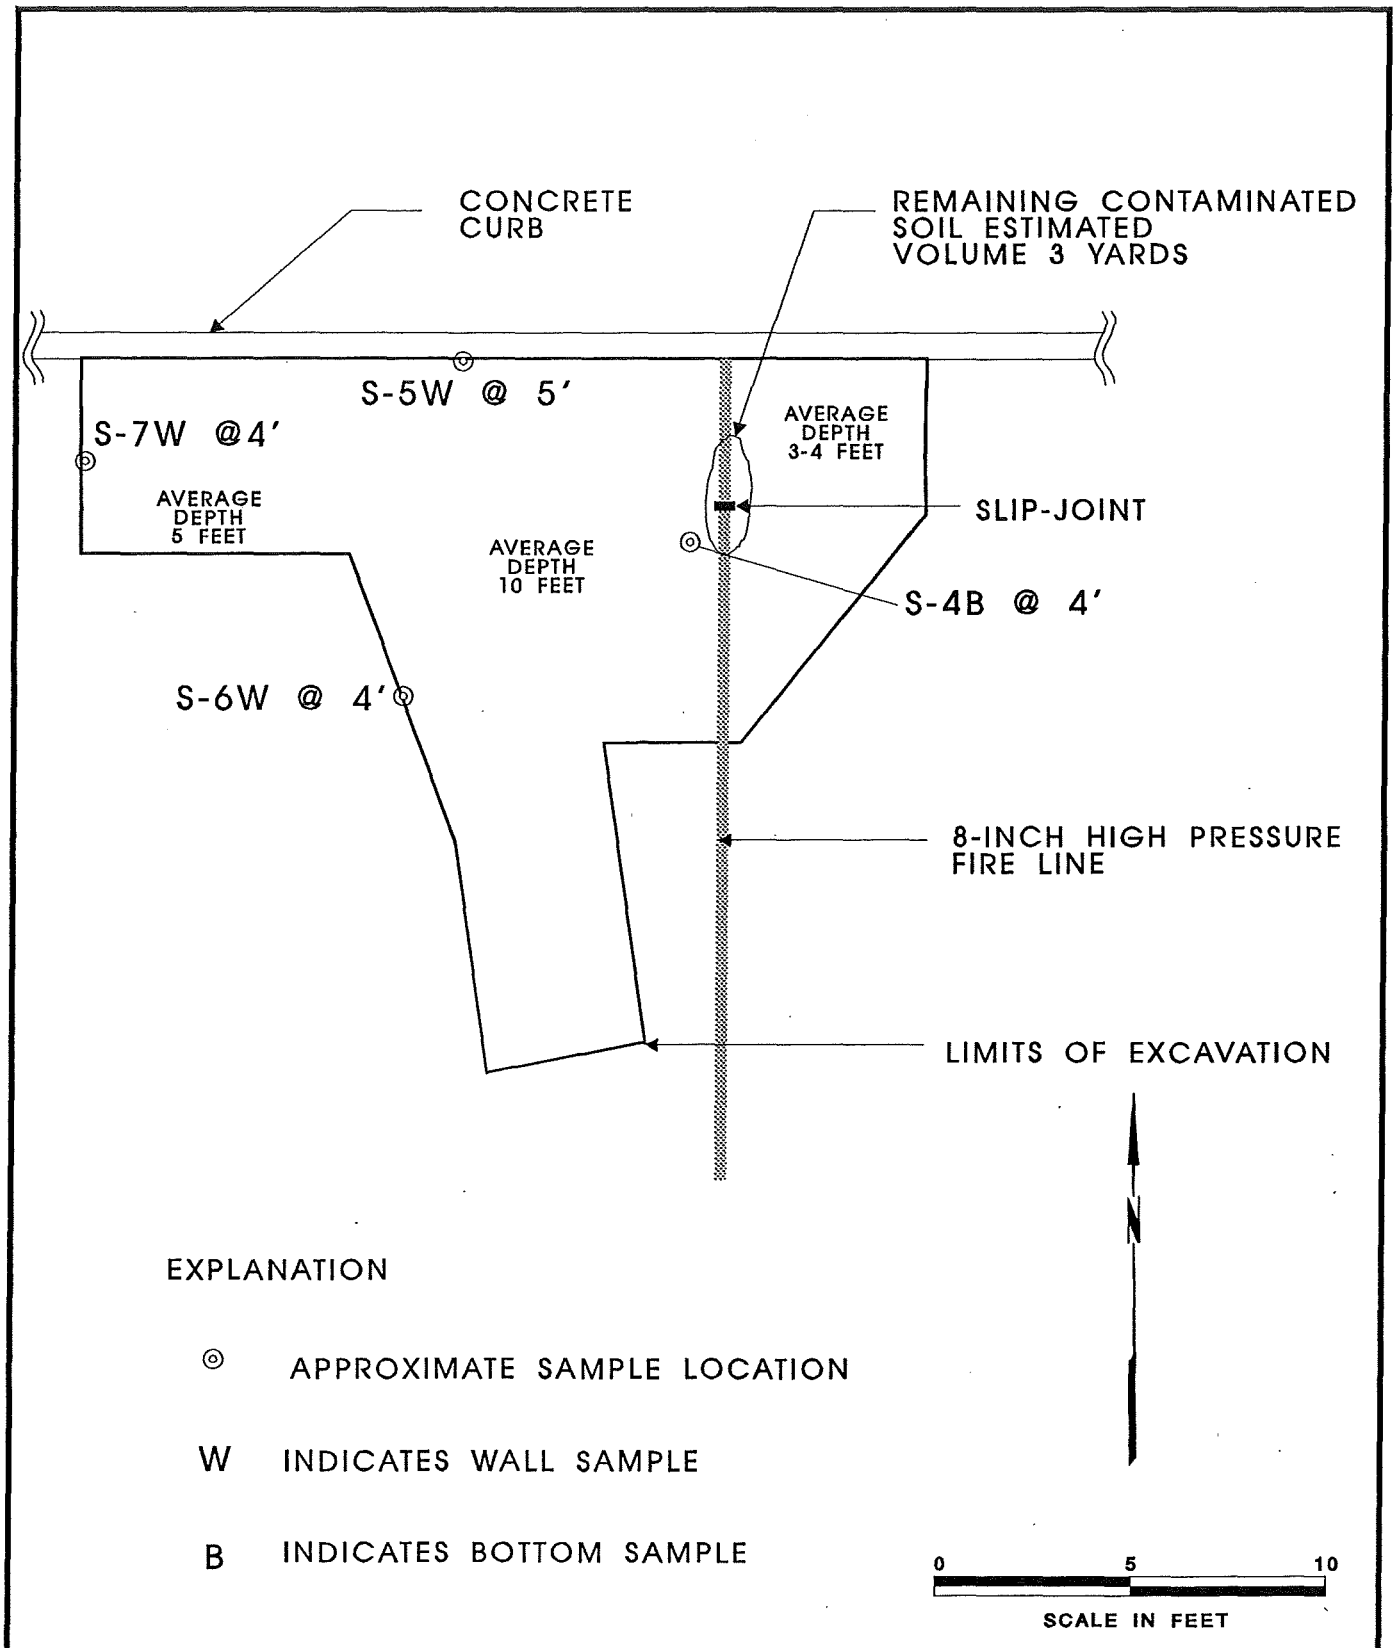


Sample Location Plot Plan (Figure 1) shows initial excavation limits and location of samples for work done on February 5, 1992. Sample Location Plot Plan (Figure 2) shows final excavation limits and location of samples for work done on February 10, 1992 and the arrangement of fire line in relation to excavation. A site vicinity map is provided as Figure 3.

FIELD WORK

INITIAL EXCAVATION

LCI started initial excavation on 2/5/92, see Figure #1. Soils exposed in the excavation consisted of 1.5 feet of moist, dark brown clayey silt, with silty medium to coarse sand, underlain by 8.5 feet of brown/gray coarse sand (sugar sand) followed by a clayey silt/medium sand at the bottom of the excavation. All soils in the northern portion of the excavation had noticeable odor and discoloration. Excavated soils were stockpiled on the northwest side of the excavation.



When sugar sand was encountered, excavation ceased and LCI notified Kimberly-Clark Corporation representative Isabella Alasti that the presence of sugar sand made continued excavation vertually impossible without undermining the sourrounding areas. The areas of concern were the 8" high pressure fire line, east of the excavation, the roadway, north of the excavation and the Kimberly Clark equipment stagging area, west of the excavation. It was agreed by Kimberly Clark and LCI that the excavation would be stopped until Mr. John White of the Fullerton Fire Department could evaulate the situation and suggest the proper procedure for continued excavation. Upon Mr. White's suggestion, four samples were obtained, under his direction (see Figure 1) and analyzed, see Attachment A, Analytical Results. For safety concerns, the excavation was lined with plastic sheeting and temporarly backfilled while evaulating the analytical results.

SOIL SAMPLING

A backhoe was used to remove soil from sampling points in the excavation. Sample #1 was obtained approximately 5 feet below grade from the north wall of the excavation. Sample #2 was obtained approximately 3 feet below grade from the north wall of the excavation. Sample #3 is an east wall sample, obtained approximately 3 feet below grade and 2 foot south of the north wall. Sample #4 was obtained from the bottom of the excavation at approximately 10 feet below grade. Because of obvious gross contamination on the northern half of the west wall, it was agreed by Kimberly Clark, Fullerton Fire Department and LCI representatives that no sampling was necessary at this location. Removal of this material will take place when excavation resumes.

Samples were obtained from the bucket of the excavator and placed into eight (8) ounce glass jars without headspace. The jars were sealed with Teflon-lined lids, marked with sample point identification, date and time sampled and delivered to the Smith-Emery Company (SECO) on-site laboratory. Chain of Custody documentation is included in Attachment A.

DEPTH TO GROUNDWATER

The Orange County Water District, Water Quality Department was contacted for information regarding depth to groundwater in the vicinity of the site. According to Esmeralda Steffen, the nearest well is Kimberly No. 2, state well #3S/10W-35R1. Depth to groundwater in the well was 140 feet on January 9, 1992. Groundwater was not encountered during any of the excavation activities.

ANALYTICAL TESTING

Soil samples obtained were analyzed at SECO's on-site mobile laboratory utilizing EPA method 8015m for diesel constituents and EPA method 8020 for benzene, toluene, ethylbenzene and xylenes (BTEX). The test results of all samples analyzed on 2/5/92 are recorded in Table A. A copy of the analytical laboratory report is included in Attachment A.

TABLE A

Sample #	Method		Results
1	8015M	TPH	290 MG/KG
1	8020	Benzene	ND
		Toluene	ND

		Ethylbenzene	ND
		Xylenes	ND

FIELD WORK FOR SECOND PHASE OF EXCAVATION

LCI began the second phase of excavation on February 10, 1992, by re-excavating the temporary backfill material from the original excavation, then concentrated its efforts in the northern portion of this area with a widening of the excavation limits to the east and west, see Figure #2. Soils exposed in this excavation consisted of like materials as those identified in the initial excavation. LCI stopped excavating once no more visual contamination was present in all but one area; this exception was in the area of the 8" high pressure fire line.

LCI notified Ms. Alasti that the excavation was ready for sampling. Mr. White returned to the site and deturmined that four more samples should be taken. Under his direction, samples were obtained and analyized, see Figure #2 and Attachment A, Analytical Results, dated 2/10/92. It was deturmined that, for safety concerns, the minor amount (estimated to be 3 to 5 cubic yards) of contaminated soil around the high pressure fire line slip joint connector would not be required to be removed because removal of this material could result in the loss of the entire fire protection system, see Figure #2.

SOIL SAMPLING

Samples were obtained utilizing a California hand auger with 2" brass tubes. The ends were plastic capped, taped without headspace, marked with sample point identification, date and time sampled and delivered to SECO's on-site laboratory. Chain of Custody documentation is included in Attachment A, Analytical Report, dated February 20, 1992.

A backhoe was used to remove soil from sampling points in the excavation. Sample #4 was obtained approximately 4 foot below grade, 10 foot south of the north wall and 1 foot west of the high pressure fire line. Sample #5 was obtained approximately 5 foot below grade from the north wall of the excavation. Sample #6 is a west wall sample, obtained approximately 4 foot below grade and 8 foot south of the north wall. Sample #7 was obtained from the west wall cut back, at a depth of 4 foot, approximately 2 foot south of the north wall.

ANALYTICAL TESTING

Soil samples obtained were analyzed at SECO's on-site mobile laboratory utilizing EPA method 8015m for diesel constituents and EPA method 8020 for benzene, toluene, ethylbenzene and xylenes (BTEX). The test results of all samples analyzed on 2/10/92 are recorded in Table B. A copy of the analytical laboratory report is included in Attachment A.

TABLE B

Sample #	Method		Results
4	8015M	TPH	180 MG/KG
4	8020	Benzene	ND
		Toluene	ND
		Ethylbenzene	ND
		Xylenes	ND
5	8015M	TPH	71 MG/KG
5	8020	Benzene	ND
		Toluene	ND
		Ethylbenzene	ND
		Xylenes	ND
6	8015M	TPH	71 MG/KG
6	8020	Benzene	ND
		Toluene	ND
		Ethylbenzene	ND
		Xylenes	ND
7	8015M	TPH	100 MG/KG
7	8020	Benzene	ND
		Toluene	ND
		Ethylbenzene	ND
		Xylenes	ND

BACKFILLING OF EXCAVATION

The excavation was backfilled on Feburary 10 and 18, 1992 by LCI per ASTM D1557-78 standards, see Attachment C, Geobase Report, Dated 2/20/92. When backfill was complete, the excavation was covered with 4" thick asphalt; edges were sealed and surface was fog sealed.

CONCLUSION AND RECOMMENDATIONS

Based on LCI's field observations and the results of analytical testing, there is no evidence of contamination in excess of the 1000 ppm guide lines established by the city of Fullerton, Fire Department, Division of Underground Storage Tanks. Considering the low levels of contamination and the asphalt cover, which extends well beyond the limits of the excavation and acts as a barrier to prohibit the possibility of surface water acting as a hydraulic force in relation to the remaining contamination and ground water, it is LCI's opinion that further environmental assessment of soil or groundwater is not warranted. Closure of the excavation is recommended according to the guidelines established by the city of Fullerton Fire Department, Division of Underground Tanks.

LIMITATIONS

The analyses, conclusions, and recommendations contained in this report are based on site conditions as they existed at the time of LCI's investigation. The factual data and interpretations pertain to the specific project described in this report and are not applicable to any other project or site. LCI's investigation was performed using the standard of care and level of skill ordinarily exercised under similar circumstances by reputable environmental assessors and geologists currently practicing in these or similar locations. No other warranty, expressed or implied, is made as to the conclusions and professional advice included in this report.

Please call if you have any questions reguarding this report.

Sincerely,

LEDSAM CONTRACTING INCORPORATED

Type of Permit ANNUAL PERMIT - trench/EXCAVATION

Pursuant to Labor Code Sections 6500 and 6502, this Permit is issued to the above-named employer for the projects described below.

State Contractor's License Number A-527194-HAZ		Permit Valid through 12/31/92		
Description of Project	Location Address	City and County	Anticipated Dates	
			Starting	Completion
TRENCH/EXCAVATION	Various	Statewide	1/1/92	12/31/92
THIS PERMIT IS ISSUED SUBJECT TO THE CONDITION THAT THE WORK IS PERFORMED BY THE SAME EMPLOYER. THE APPROPRIATE DISTRICT OFFICE SHALL BE NOTIFIED IN WRITING OF LOCATION OF JOB SITE PRIOR TO COMMENCEMENT.				
SEE ATTACHED NOTICE PERTAINING TO THE EXCAVATION STANDARD WITH ITS COMPETENT PERSON REQUIREMENTS.				

This Permit is issued upon the following conditions:

1. That the work is performed by the same employer. If this is an annual permit the appropriate District Office shall be notified, in writing, of dates and location of job site prior to commencement.
2. That employer will comply with all occupational safety and health standards or orders applicable to the above projects, and any other lawful orders of the Division.
3. That if any unforeseen condition causes deviation from the plans or statements contained in the Permit Application Form the employer will notify the Division immediately.
4. Any variation from the specification and assertions of the Permit Application Form or violation of safety orders may be cause to revoke the permit.
5. This permit shall be posted at or near each place of employment as provided in 8 CAC 341.4.

NOTICE

(Attachment)

LATER THIS YEAR (1992), CAL/OSHA EXPECTS TO BEGIN ENFORCING THE NEW FEDERAL TRENCHING AND EXCAVATION STANDARDS THAT WERE RECENTLY ADOPTED BY THE CAL/OSHA STANDARDS BOARD.

THESE STANDARDS, IN PART, CALL FOR DAILY INSPECTION OF ALL EXCAVATIONS AND TRENCHES BY A "COMPETENT PERSON".

TO BE A "COMPETENT PERSON", ONE MUST HAVE:

1. KNOWLEDGE OF SOIL ANALYSIS AS DETAILED IN THE STANDARD
2. AUTHORITY TO TAKE PROMPT CORRECTIVE ACTION ON THE JOB AS CONDITIONS WARRANT
3. KNOWLEDGE OF THIS NEW STANDARD
4. KNOWLEDGE OF THE USE OF PROTECTIVE SYSTEMS

THIS PERMIT IS BEING ISSUED UNDER THE EXISTING AND UNREVISED STANDARDS FOR EXCAVATION WORK. WHEN THE NEW STANDARD TAKES EFFECT, YOUR COMPANY WILL BE EXPECTED TO PROVIDE A "COMPETENT PERSON" ON EACH PERMITTED JOB. ALSO, PERMITS ISSUED AFTER THE EFFECTIVE DATE OF THE NEW STANDARD WILL REQUIRE ON THE PERMIT APPLICATION THE NAME(S) OF THE "COMPETENT PERSON(S)" FOR YOUR COMPANY.

Compaction Report

GEOBASE

SOIL/ROCK MECHANICS AND FOUNDATION ENGINEERING

LEDSAM CONTRACTING INCORPORATED
2702 California Avenue
Signal Hill, California 90806

February 20, 1992

Project No: C.191.16.00

Attention: Mr. S. Ledsam

Dear Mr. Ledsam

SUBJECT: **COMPACTION REPORT ON BACKFILL OF AN EXCAVATION**
2001 East Orangethorpe Avenue
Fullerton, California

This report summarizes observations and compaction testing performed during the backfilling of an excavation at the subject site. The Partial Site Plan is given as Figure 1, attached.

FIELD TESTING

Field density tests were compared to laboratory tests of the same soil type. Maximum dry density/optimum moisture content relationships for the backfill soils used are presented on Table I, attached, Laboratory Test Results. The laboratory standard of compaction used was ASTM D1557-78, Five-Layer Method.

Approximate locations of in-place density tests are shown on the Partial Site Plan, Figure 1, attached. These in-place density tests were performed in accordance with ASTM D2922-81 and D3017-88 (Nuclear Method) and ASTM D1556-82 (Sand Cone Method). The fill soils placed were a minimum of 90 percent of the laboratory standard at the locations tested. The test results are presented on Table II, Results of Compaction Tests, attached. Fill soils were also probed between test locations.

EXCAVATION

The excavation at this site consisted of a irregular shaped pit approximately twenty-two (22) feet long, eleven (11) feet wide, and seven (7) feet deep. A plan view of the excavation is shown on Figure 1, attached.

SOIL TYPES

The backfill soils consisted of light brown to brown, silty, gravelly sands and crushed aggregate base material.

FILL PLACEMENT

Backfill operations were carried out on February 10 and February 18, 1992. Fill material was placed on February 10, 1992 to an approximate depth of three (3) feet below grade. On February 18, 1992, two (2) feet of wet material were removed prior to placement of fill. Approximately six (6) inches of base material was also placed at the surface.

Subsequent to removal, suitable fill soils were placed in approximately 8-inch lifts, brought to near optimum moisture content and compacted to a minimum of 90 percent of the maximum density, where tested, as determined by ASTM D1557-78. Compaction of the backfill soils was achieved by rolling with an excavator equipped with a sheepsfoot wheel.

SUMMARY

The backfill operations, as well as observations and testing services described herein, have been limited to those operations, as noted above, performed on February 10 and February 18, 1992. These testing services allow the testing of only a small percentage of the fill placed at the site. Therefore, testing during grading does not relieve the contractor of his primary responsibility to perform all work in accordance with the specifications.

The conclusions and recommendations contained herein have been based upon our observations and testing as noted. Based on our observations and testing, it is our opinion that

GEOBASE

the grading operations were performed in accordance with the requirements of the regulating agencies.

Services performed by GEOBASE, INC. were prepared in accordance with generally accepted geotechnical engineering principles and practices. No other warranty, expressed or implied, is made as to the conclusions and professional advice included in this report.

This letter report is subject to review by the appropriate regulating agencies.

Respectfully submitted
GEOBASE, INC.

RE: Soil Contamination Analysis for Tank Farm

Dear Ms. Madden:

Attached please find the copy of the report for the soil contamination analysis performed by WEECO regarding the spill of Sodium Hypochlorite(NaOCl) in the tank farm area.

This report concludes that the soil samples taken in the soils underneath the tank farm area revealed sizable contamination.

Further boring/sampling/analysis will be required in order to completely define the horizontal and the vertical extents of the soil contamination with NaOCl.

After the further soil contamination analysis is performed, it will be known how much of the soil should be removed or remediated in order to resolve the problem.

The method of soil remediation shall be discussed in the report that will be made after the further boring/sampling/analysis is finished.

If you have any questions, please feel free to call us.

1.0 INTRODUCTION

This report presents the findings of an initial site assessment investigation conducted at the tank farm of Kimberly Clark factory located at 2001 E Orangethorpe Avenue, Fullerton, California There are five tanks at this tank farm which are used to store fuel oil and chemicals such as Sodium Hypochlorite(NaOCl) Western Environmental Engineers Company(WEECO) was retained by Kimberly-Clark Company to conduct an initial site-environmental assessment in order to find the horizontal and vertical extent of soil contamination due to the potential leak of sodium hypochlorite material around the tank farm area

This report summarizes the drilling, soil sampling, analysis, and evaluation of the analytical results to determine whether it will be necessary to conduct any further site characterization study and site cleanup and remediation for this area

2.0 SITE DESCRIPTION

Kimberly-Clark Company has a factory at 2001 E Orangethorpe Avenue in Fullerton Figure (2) shows the layout of the factory located in Fullerton There is a tank farm on the east site of the factory as indicated in Figure (2) The tank farm has five tanks as described below

(Tank No 1)
(Tank No 2)
(Tank No 3)
(Tank No 4)
(Tank No 5)

These tanks contain chemicals such as sodium hypochlorite(NaOCl), which is used as a breaching solution for pulp processing This sodium hypochlorite is purchased from the manufacturer(Jones Chemical Co) as the brand name of "Sunny Sol-150". Figure (3) shows the layout of the tank farm including the above five tanks As shown in the Figure (3), the five tanks are located in a berm area, whose size is 120-feet by 110-feet It was understood that there was a leak in the Tank No 3 which used to contain Sunny Sol-150 which is a solution of sodium hypochlorite(15 6% solution)

3. Site Background Conditions

(Site Geology)

The project site is located in the Fullerton area of the central basin comprised of alluvium and associated deposit of recent Pleistocene age Jefferson Aquifer, which is the second aquifer in downward succession within the San Pedro Formation, extends over most of the Central Basin, although it is not known to reach the surface Within the boundaries of the aquifer, some irregular areas exist where the aquifer has not been identified The Jefferson Aquifer occurs in sinuous courses extending from both the Los Angeles and Whittier Narrows into Orange County. Lithologically, the sediments comprising this aquifer (based on drilling logs of water wells in the area) are for the most part, fine-grained Gravels are most extensive in the Whittier Narrows area but also occur in scattered patches throughout the rest of the Central Basin The remainder of the aquifer consists primarily of sand with some gravely and clavey lenses

The thickness of the aquifer varies from a few feet to a maximum of 140-feet along the Los Alamitos fault This aquifer is considerably folded and its base varies in elevation from 700-feet below sea level to 50-feet above sea level

Artificial recharge within the Whittier Narrows has some effect on this aquifer Since less 10% of the wells in the Central Basin are perforated in this horizon and then only in the areas where coarse sandy and gravel zones are encountered, it is generally not considered an important water producing aquifer

The movement of groundwater across the Los Angeles and Orange County line is entirely dependent on the hydraulic gradient in the area since no physical barrier to groundwater movement exists Due to the continuity of the hydraulic gradient which slopes in the southerly direction, the general direction of the groundwater in the confined Central Basin is from the north to the south Groundwater conditions in the overlying shallow semi-perched aquifer do not necessarily follow this trend

(Groundwater Level)

The depth-to-groundwater at the subject site area is obtained by contacting the Orange County Water District Water Quality Department As shown in Attachment (D), the OCWD sent us the information regarding the depth-to-groundwater and the ground-surface elevation

As shown in Attachment (D), the depth-to-groundwater in the subject area is around 110-130 feet below the surface as depicted by the neighborhood well technical data It is believed that the direction of the groundwater in the vicinity is from the north to the south

4. Drilling and Soil Sampling

WEECO used manual drilling devices in order to drill and take soil samples from the subject site because there was not enough room for bringing in a large drilling machine mounted on a truck The manual drilling was performed using a 2.5-inch hand-auger and a 1 5-inch sampling device After a hole was drilled with the 2 5-inch drilling auger, a 1.5-inch sampling device was introduced into the hole and the soil samples were taken by pounding in the 1 5-inch sampling rings into the soil at the bottom of the holes The sample rings were retrieved from the bottom of the holes and the ring samples were kept in an ice box until they were delivered to the lab certified by the State of California

From each hole, five soil samples were taken one each from 2, 4, 6, 8, and 10-feet below the surface The chain-of-custody for the soil samples are shown in Attachment (A)

The log sheets for soil boring are shown in Attachment (B) As shown in these log sheets, the nature of the soil in the bored areas can be described as "sandy-silt" and or silty sand

5.Chemical Analysis for The Soil Samples

Since the main concern of soil contamination for this tank farm was the leak of sodium hypochlorite from the Tank No -1, only chemical component that was analyzed for the soil samples taken was "Sodium Hypochlorite, NaOCl" The laboratory where these soil samples were analyzed was Chemtek Environmental Laboratory located in Santa Fe Springs, California This laboratory is approved by the State of California to test these types of chemical contaminants in soil samples

The results of the chemical analysis are shown in Attachment (C) As shown in this Attachment, the sodium hypochlorite concentrations in the soil samples turned out to be less than 13 WPPM(mg/kg NaOCl in soil) The highest concentration of NaOCl was found at B-5-2 sample which was taken from 2-feet below surface at B-1 drilling location

All of the ten soil borings(B-1 through B-10) were made to a maximum depth of 10-ft below surface Most of the ten soil samples taken at the bottom of the hole(10-feet depth) showed some NaOCl contamination This reveals that the soils located further below than 10-feet may be also contaminated Therefore, it will be necessary to drill further down below 10-feet level in order to find out the maximum depth of the soil contamination in the subject area

6. Sodium Hypochlorite as Hazardous Chemical

According to Appendix X (List of Chemical Names and Common Names for Hazardous Wastes and hazardous Materials) of Division 4.5 (Environmental Health Standards for the management of Hazardous Waste) of Title 22 of the California Code of Regulations indicates that sodium hypochlorite is considered a hazardous material The Appendix X is listed in Chapter 11 of Article 5 of the Division 4 5

A portion of the Article 5 of the Division 4 5 of the California Code of Regulations including Chapter 11 and Appendix X is shown in Attachment (F) On Page 687 of the California Code of Regulations(CCR), Sodium Hypochlorite is listed as the hazardous material number (#678) This chemical compound exhibits characteristics of toxicity, ignitability, and reactivity

7. Conclusions

The results of the soil samples analyzed showed that the soil in the tank farm area down to a depth of 10-feet below surface is contaminated with Sodium Hypochlorite material The range of the contamination is from less than 1 0 wppm to 13.0 wppm

A high concentration of sodium hypochlorite in soil was found in the soil sampling area around B-5 The concentrations of sodium hypochlorite were found to be somewhat higher at the shallow ground areas such as 2-4 feet below the surface As the depth of the soil goes deeper, the concentration of sodium hypochlorite becomes lower. This indicates that this hazardous chemical spill is concentrated in the shallow ground areas

However, since the bottom of the bored holes (10-feet below surface) showed still significant contamination, for example, B-3-10 sample showed 4 0 wppm, B-6-10 showed 3 57 wppm, and B-7-10 showed 4 62 wppm

The depth-to-groundwater in the subject area is in excess of 100- feet below surface Since the NaOCl contamination appears to be confined in the shallow area such as within 10-20 feet below surface, the possibility of NaOCl contamination extending into the groundwater at the subject site is considered unlikely at this time

Since the contaminant(NaOCl, Sodium Hypochlorite) is known as a hazardous chemical(toxic, ignitable, and reactive), it should be warned to the plant operation and maintenance people that no direct exposure to human beings to the NaOCl chemical or NaOCl-contaminated soil be allowed at the subject site area until after a thorough contamination assessment is made and the site is remediated, if necessary

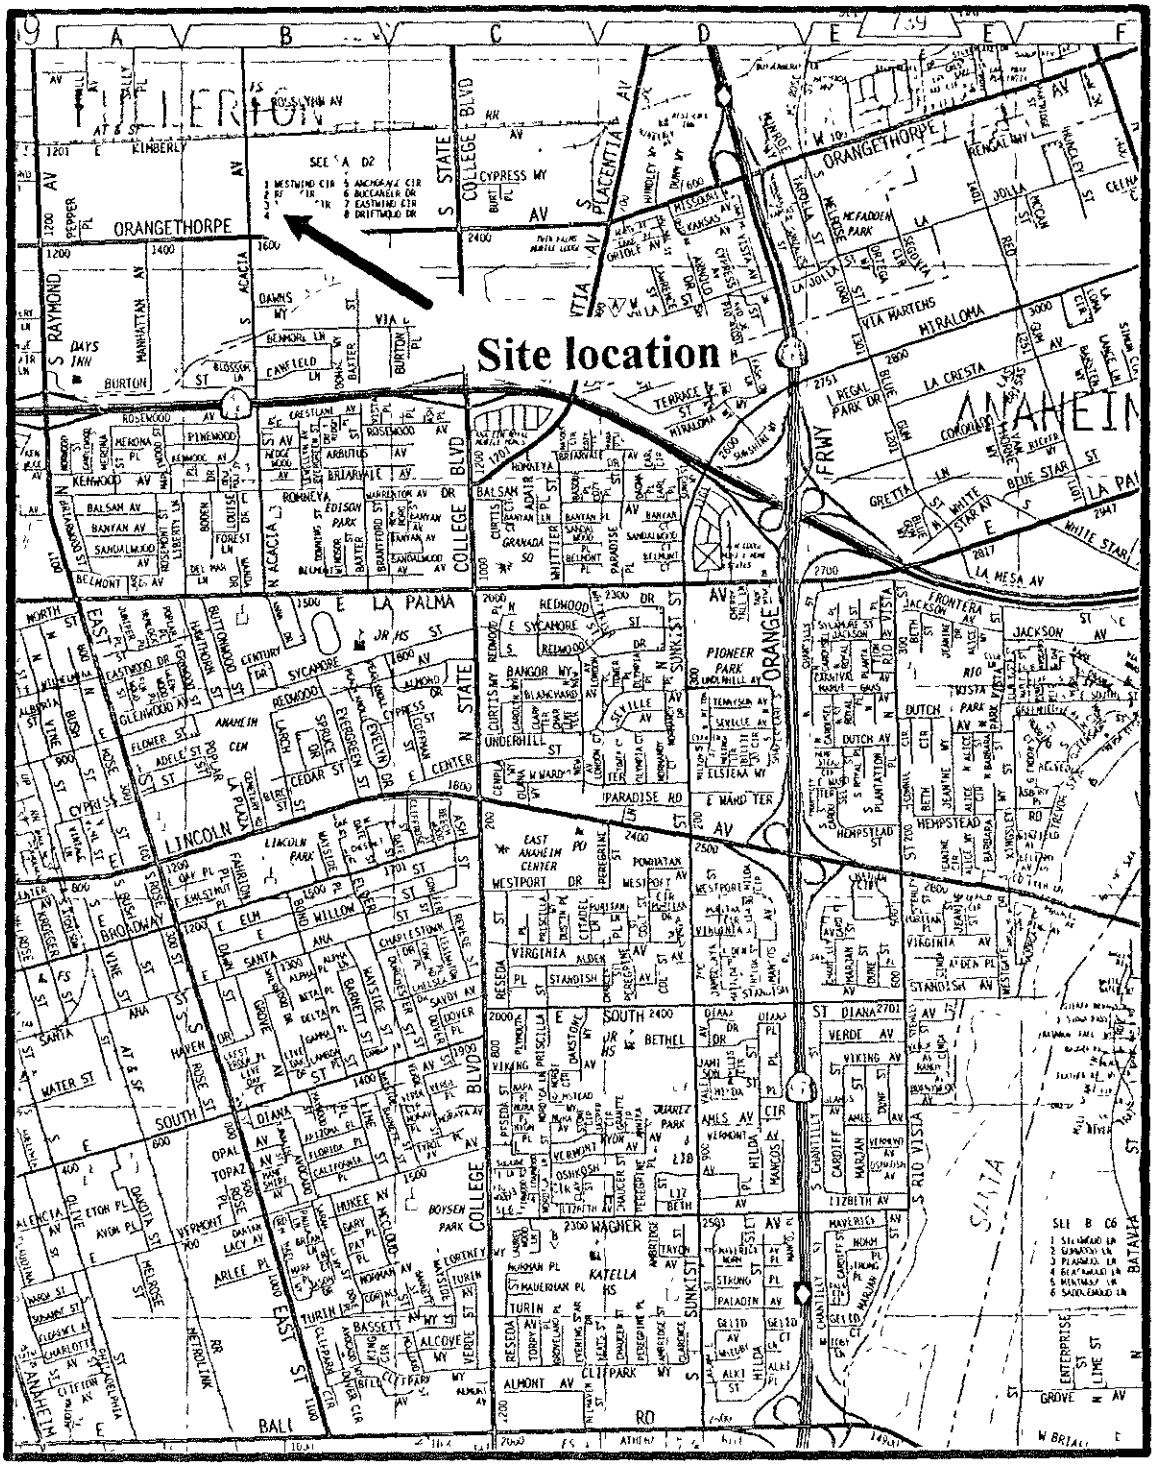
8. Recommendations

Since the chemical spilled onto the ground is a hazardous material(Sodium Hypochlorite) and the bottoms of the bored holes are still shown contaminated, a further boring/sampling/testing is recommended in order to delineate the vertical and the horizontal extent of the plume of the contamination

Further boring below 10-feet depth is recommended especially in the area of B-3, B-6, and B-7 area where the soil samples at the bottom of the 10-feet borings showed more than 1 0 wppm of sodium hypochlorite contamination The future borings at these locations should be drilled and sampled until the soil sample analysis shows less than 1 0 wppm of sodium hypochlorite The maximum level of contaminants to be left at the site was chosen at 1 0 wppm, because the current detection limit of the NaOCl is 1 0 wppm

The technical and economic feasibility for soil remediation will be studied after the second phase of the soil sampling and analysis work is finished By that time, we shall know how deep and how wide the size of the soil contamination is at the site Some of the possible methods of remediation that will be studied are as follows

(l). Excavation and Treatment At An Off-site Location



-Treatment may include passive aeration for NaOCl decomposition

-Or, Treatment may include active aeration with air injection method

-Or, Treatment may include spraying a neutralization chemical in order to convert NaOCl into NaCl salt NaCl salt is a non-hazardous chemical, and thus will be satisfactory to leave in the soil Some of the chemicals that can be used as neutralization-chemical is sodium bisulfite and ferrous salt solutions

(2). On-site Air Injection Method

-If excavation and disposal is not feasible, air injection wells will be drilled and installed so that air may be injected into the underground site for neutralization of NaOCl into NaCl

CERTIFICATE OF ANALYSIS

Job No. 709065 Date: 10-07-97

This is the Certificate of Analysis for the following samples:

Client	: Western Environmental Eng. Co
Contact person	: Jack Liu
Project No.	:
Project	:
Project site	:
Date of sample	: 09-29-97
Date Received	: 09-29-97
Number of Samples	: 33
Sample Type:	: Soil

Samples were labeled as follows:

SAMPLE IDENTIFICATION	LABORATORY NUMBER
B-1-2'	709065-01A
B-1-4'	709065-02A
B-1-6'	709065-03A
B-1-8'	709065-04A

COMMENTS: Per your request, we are transmitting a November 1996 groundwater contour map, and instructions on how to obtain water quality information. To determine if a city or address is within our District boundaries, you may check the attached guide or map.

When you submit the enclosed *Information Request Form,* please complete all the sections and mail it with your payment.

Thank you.

GUIDE TO INFORMATION REQUESTS

The Orange County Water District provides ground water information for the following cities:

Anaheim	Irvine	Santa Ana
Buena Park	La Palma	Seal Beach
Costa Mesa	Los Alamitos	Stanton
Cypress	Midway City	Tustin
Fountain Valley	Newport Beach	Villa Park
Fullerton	Orange	Westminster
Garden Grove	Placentia	Yorba Linda
Huntington Beach		

We suggest that you copy your letterhead onto the Information Request Form to provide us with your address and phone number. Add your name, site address, major cross streets, Thomas guide coordinates, and the reason that you are conducting the site investigation. Please note that Information Requests are processed through a database that requires exact information

All requests require a two to three weeks turnaround time. The processing fee is a minimum of $10.00. Make checks payable to the Orange County Water District.

Please ensure that your request is complete before mailing it Incomplete requests may further delay the inquiry.

NOTE *Driller's logs or well logs are confidential according to the State Water Code, hence the public may not access such information.*

LeRoy, New York 14482
(and Principal Cities)

For information, please contact the Jones Chemicals facility in your area at ( ) - or the Jones Chemicals Corporate Laboratory in Caledonia, New York at (716) 538-2311.

In the event of a transportation emergency,
Call CHEMTREC: (800) 424-9300

SECTION I - IDENTIFICATION

TRADE NAME: Sunny Sol 150®
CHEMICAL NAME: Sodium Hypochlorite
FORMULA: NaOCl
DOT SHIPPING NAME: Hypochlorite Solution
DOT HAZARD CLASS: Corrosive Material
UN/NA NUMBER: UN 1791
DOT LABEL: Corrosive
DOT PLACARD: Corrosive
PACKING GROUP: III
REPORTABLE QUANTITY: Sodium Hypochlorite: 100 Pounds/45.4 Kilograms
CAS NUMBER: 7681-52-9

NFPA DESIGNATION: The NFPA has not rated sodium hypochlorite.

SECTION II - HAZARDOUS INGREDIENTS

MATERIAL	% BY WEIGHT	CAS NO.	OSHA PEL	ACGIH TLV
Sodium Hypochlorite	12.5-15.5	7681-52-9	Not Applicable	Not Applicable
Sodium Hydroxide	0.1-2.0	1310-73-2	2mg/m³ ceiling	STEL/CEIL(c) 2mg/m³ ceiling
Inert Ingredients	Balance	Not Applicable	Not Applicable	Not Applicable

CARCINOGENICITY STATUS: NTP - No, IARC - No, OSHA - No.

SECTION III - PHYSICAL DATA

APPEARANCE: Yellow-green liquid
BOILING POINT: 219°F (104°C) for 12.5% NaOCl by wt.
FREEZING POINT: - 11°F (- 24°C) for 12.5% NaOCl by wt.
ODOR: Chlorine
pH: 12.5 - 13.5 s.u. @ 25°C
VISCOSITY (Cs): 2.15 @ 23°C for 12.5% NaOCl by wt.
PERCENT VOLATILE BY VOLUME: Variable water plus products of decomposition
SOLUBILITY IN WATER: Complete
SPECIFIC GRAVITY (Water=1): 1.218 @ 20°C for 13.79 % NaOCl by wt.
VAPOR DENSITY (AIR=1): Not available
VAPOR PRESSURE (mm Hg): Variable water plus products of decomposition.

SECTION IV - FIRE AND EXPLOSION DATA

FLASH POINT (Test method): Not applicable
AUTO IGNITION TEMPERATURE: Not applicable
FLAMMABLE LIMITS IN AIR (Volume %): Not applicable
EXTINGUISHING MEDIA: Flood with water or carbon dioxide (CO2)
SPECIAL FIRE FIGHTING PROCEDURES: Use National Institute of Occupational Safety & Health (NIOSH) approved respirator with acid type canister or use self-contained breathing apparatus. Unusual fire and explosion hazards: material is a strong oxidizer. Contact with combustibles may initiate or promote combustion. Acid and heat accelerate decomposition. Decomposition products may include chlorine.

SECTION V - HEALTH HAZARD INFORMATION

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE

No medical conditions are known to be aggravated by exposure.

ROUTES OF EXPOSURE

INHALATION: Fumes from spills can cause severe irritation and chemical burns to the nose, throat, and lungs. Very little hazard from properly stored solution.
SKIN CONTACT: Severe irritant, reddening of skin, can cause chemical burns to skin.
SKIN ABSORPTION: Same as skin contact.
EYE CONTACT: Severe irritant, corrosive, can severely burn eyes.
INGESTION: Causes irritation of membranes of the mouth, throat, and stomach pain and possible ulceration. LD50 (oral, rat) for 12.5% NaOCl is approximately 5 g/kg body weight.

EFFECTS OF OVEREXPOSURE

ACUTE OVEREXPOSURE (see Routes of Exposure above)

SWALLOWING: See "ingestion" under routes of exposure.
SKIN CONTACT: severe Irritant, reddening of skin, skin damage, chemical burns.
INHALATION: Fumes from spills are very irritating to mucous membranes.
EYE CONTACT: Extreme irritant, corrosive.

CHRONIC OVEREXPOSURE (see Routes of Exposure above)

EYE: Can cause damage.
SKIN: Can cause damage, chemical burns.

EMERGENCY AND FIRST AID PROCEDURES

IF CONTACT WITH EYES OCCURS: flush with water for at least fifteen (15) minutes. Get medical attention.
IF CONTACT WITH SKIN OCCURS: wash with plenty of soap and water.
INHALATION: Remove to fresh air. Call a physician if exposure is severe.
IF SWALLOWED: drink large amounts of water. Do NOT induce vomiting. Call a physician or poison control center immediately.

SECTION VI - REACTIVITY DATA

CONDITIONS CONTRIBUTING TO INSTABILITY

Solutions are fairly stable in concentrations below 10%. Stability decreases with concentration, heat, light, exposure, decrease in pH, and contamination with heavy metals, such as nickel, cobalt, copper, and iron.

INCOMPATIBILITY

Acids, alcohols, amines, ammonia, chlorinated isocyanurates, combustibles, cyanides, detergents, ethers, hydrocarbons, oxidizable materials, reducing agents. Corrosive to most metals.

DECOMPOSITION PRODUCTS

Hypochlorous Acid (HOCl), chlorine, hydrochloric acid. Composition depends upon temperature and decrease in pH. Additional decomposition products, which depend upon pH, temperature and time, are sodium chloride, sodium chlorate and oxygen.

PROPER STORAGE AND DISPOSAL REQUIREMENTS

Store this product in a cool, dry area away from direct sunlight and heat to avoid deterioration. In case of spill, flood areas with large quantities of water.

Disposal for domestic use: Do not reuse container. Rinse thoroughly before discarding in trash.

Disposal for all other uses: Triple rinse (or equivalent). Then offer for recycling or reconditioning, or puncture and dispose of in a sanitary landfill, or incineration, or, if allowed by state and local authorities, by burning. If burned, stay out of smoke.

Do not contaminate water, food, or feed by storage, disposal or cleaning of equipment.

STORE IN AN UPRIGHT POSITION

OTHER PRECAUTIONS

STRONG OXIDIZING AGENT: Mix only with water according to label directions. Mixing this product with gross filth such as feces, urine, etc.; or with ammonia, acids, detergents or other chemicals may release hazardous gases irritating to eyes, lungs and mucous membranes.

ADDITIONAL REGULATORY CONCERNS

EPA: May not be used for disinfection or sanitization without prior approval by EPA. Repackagers must obtain EPA registration and establishment numbers.
FIFRA: This product is regulated under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) if used as a disinfectant or sanitizer.
TSCA: Included in the Toxic Substances Control Act (TSCA) Inventory Of Chemical Substances.

1.0 INTRODUCTION

This report presents the results of a subsurface investigation for the tank farm of Kimberly Clark Plant located at 2001 E. Orangethrope Ave., Fullerton, CA (see Figure 1), conducted by Western Environmental Engineers Company (WEECO) on December 15 & 16, 1997. This site investigation was completed at the request of Ms. Grace Madden.

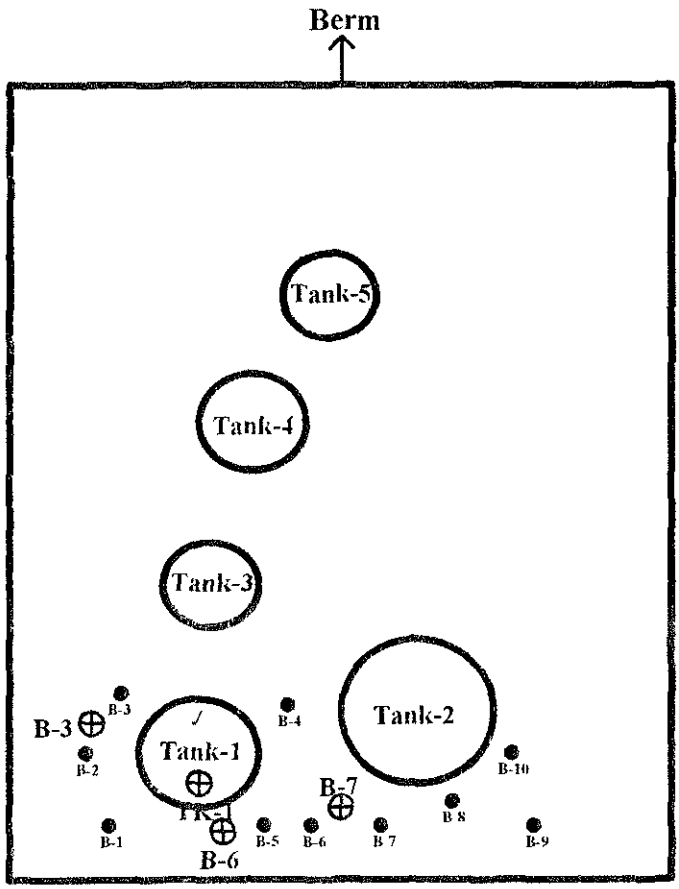
The purpose of this site investigation was to gather detailed information about the contaminants in the existing tank farm area which are used to store Sodium Hypochlorite (NaOCl), and to determine the contaminants existing on site and to approximate the volume of the contaminants plumes. From this information, a preliminary cost estimate to remediate this site, if necessary, could be provided to the owner. This Environmental Site Investigation report contains a brief history of the existing site characteristics, sample collection procedures, analytical results, conclusions and recommendations.

2.0 BACKGROUND

Kimberly-Clark Company has a factory at 2001 E. Orangethrope Avenue in City of Fullerton, California. Figure (2) show the layout of the factory located in City of Fullerton. There is a tank farm on the east site of the factory as indicated in Figure (2). Tank farm has five tanks as described below:

- Tank No.1 - destroyed
- Tank No.2 - exsiting
- Tank No.3 - existing
- Tank No. 4 - existing
- Tank No.5 - existing

On September 29 and October 6, 1997, ten (10) borings were drilled by *Western Environmental Engineers Company* in order to detect any contamination associated with the Sodium Hypochlorite (NaOCl). At that time, *Western Environmental Engineers Company* found that **Sodium Hypochlorite (NaOCl)** contamination has been detected in the subsurface soils in the vicinity of the tank farm area. They submitted the "Preliminary Phase II Site Assessment Report" to Ms. Grace Madden.



In response to *WEECO's* "Preliminary Site Assessment Report" dated October 20, 1997, Ms. Grace Madden was requested to perform additional work.

Mr. Steve Long
Fullerton Fire Dept.
Hazardous Materials Specialist
Fullerton Fire Department
312 E. Commonwealth Ave.,
Fullerton, CA 92832-2099

Dear Mr Long:

Please find attached on page 2 a draft copy of the UST Unauthorized Release Report for your review and reporting. Per my phone message, the two 10,000 gallons each fuel oil tanks (National tank, single-walled, carbon-steel tanks) were built in 1955 and installed in 1956. The tanks were removed in May 1986 by Crosby & Overton (Permit # P070-86151). The remaining soil was remediated and closure was obtained in January/February 1992 (Permit # 92-T-001).

I am also enclosing a copy of the tank registration and the closure report. We are also scheduled to start borings again on Friday, Feb. 22. A mobile lab will also be onsite. Fleming Environmental (Terry Fleming – tel : 714.228.0935) is the consultant for this activity. We hope to see you then. If you need additional information, please call or email me.

Thanks again for your help.

Sincerely :

Grace Madden

Subject: Clean-up Case Closure for Site at 2001 East Orangethorpe Ave., Fullerton, CA

Dear Ms. Alasti:

This letter confirms the completion of site investigation and remedial action at the above address. With the provision that the information provided to this department was accurate and representative of existing conditions, it is the position of this office that no further action is required at this time.

The contents of these reports have also been discussed with staff of the Regional Water Quality Control Board (RWQCB). Based on the information submitted and current requirements, the RWQCB concurs with the determination of this Department that no further action is required at this time.

Please be advised that this letter does not relieve you of any liability under the California Health and Safety Code or Water Code for past, present or future operations at the site. Nor does it relieve you of the responsibility to clean up existing, additional or previously unidentified conditions at the site which cause or threaten to cause pollution or nuisance or otherwise pose a threat to water quality or public health.

Additionally, be advised that changes in the present or proposed use of the site may require further site characterization and mitigation activity. It is the property owner's responsibility to notify this Department of any changes in report content, further contamination findings or site usage.

If you have any questions regarding this matter, please contact me at (714) 738-6508.

Sincerely,

John White
Underground Tank Specialist

Prop 65 ID# _____

ORANGE COUNTY HCA/ENVIRONMENTAL HEALTH Proposition 65 Notification Report Form

1.172

Any designated government employee who obtains information in the course of his official duties revealing the illegal discharge or threatened illegal discharge of a hazardous waste that is likely to cause substantial injury to the public health and safety, must report such information within 72 hours to the Board of Supervisors and Health Officer or face up to $26,000 in fines and/or up to three years in jail (pursuant to § 25180.7 of the Health and Safety Code). The information submitted in this report is based upon the best available information at the time the report was completed.

Provide the following information to the Health Care Agency at (714) 667-3765 (24 hours)

1. Date Reported: VERBAL REPORT 2-14 & 2-15 Time: NOON & PM Designated Employee Reporting: GRACE MADDEN
2. Report submitted on behalf of all designated employees of what agency: _____
3. Date of Incident: 2-14-02 Time: 8:30AM Source of Information (report #): _____ SEE ADDITIONAL COMMENTS (#23)
4. Incident Location/ Name of Business (DBA): KIMBERLY CLARK WORLDWIDE INC., FULLERTON MILL
   Address: 2001 E. ORANGETHORPE AVE., City: FULLERTON, CA Zip: 92831
5. Site Telephone: 714.773.7500 Company Contact Person: GRACE MADDEN
6. Description/Cause of Incident (What, where, and how did it happen?):
   DURING CONSTRUCTION EXCAVATION, at approx. 8 FT. BGS, SOME WETNESS/ BROWNISH BLACK SOIL STAINS WERE FOUND IN THE AREA THAT USED TO HAVE 2-10,000 gal UST FUEL OIL TANKS THAT WERE REMOVED IN LATE 1980'S. SOIL HAS BEEN CONTAMINATED REMOVED (8FT-13FT BGS).
7. Responsible Party Name: KIMBERLY CLARK WORLDWIDE INC., FULLERTON MILL Telephone: 714.773.7500
   (Business or Company names. Do not identify private citizens)
   ENVIRONMENTAL CONTRACTOR: FLEMING ENVIRONMENTAL 714.228.05
8. Identification of Discharged Waste

Chemical Name/ Common Name	Solid/Liquid/Gas	Quantity	Hazardous Properties
FUEL OIL in SOIL	SOLID	ESTIMATED <55 GAL.	COMBUSTIBLE

9. Field Data or Lab Results (Indicate Soil, Groundwater, etc.): LAB TESTS STILL IN PROGRESS. NO GROUND WATER CONTAMINATION.

10. Environment Affected (check all that apply): ☐ Roadway ☐ Groundwater ☐ Sewer ☐ Storm Drain ☐ Lake ☐ Stream ☐ River ☐ Bay ☐ Ocean ☐ Air ☒ Soil SOIL. ☐ Flood Channel ☐ Paved Ground ☐ Other: _____
11. Locale: ☐ Residential ☐ Commercial ☒ Industrial ☐ Open Area ☐ Rural
12. Property: ☒ Private Property ☐ Public Property

Official Registration Form

California Water Resources Control Board

Hazardous Substance Storage Statement

Who Must File: Each person storing hazardous substances in any underground container must file this form no later than July 1, 1984 (After October 1, 1984 and no later than January 1, 1985 for tanks used on farms).

Definition of Underground Containers: The law applies to "concrete sumps, nonvaulted buried tanks or other underground containers." (Water Code section 13173) All containers, including earthen walled pits, ponds, lagoons and sumps, that are below the normal ground surface level must register. A tank sitting on the ground is not included. Containers partially beneath the surface are included. Lined or unlined pits, ponds and lagoons are covered if earth has been removed from the storage area to construct the facility. Normal grading is not considered construction below ground level.

Definition of Hazardous Substance: Any substance listed in Section 6382 of the Labor Code or in Section 25316 of the Health and Safety Code. This includes gasoline, diesel fuel, all industrial solvents, pesticides, herbicides and fumigants. If the material must be carried by a registered hauler, disposed of at a hazardous waste site, is explosive, generates pressure due to heat or decomposition or would harm humans or wildlife you must register the tank. Wastes are included.

Fee: For each tank registered a $10 fee must be paid, except that retail gasoline stations pay $5 per tank.

Penalties: For failure to file, the penalty is $500-$5,000 per day. If you falsify information, you can be fined up to $20,000 for each day the information is incorrect and has not been corrected.

Confidentiality: If you have information protected by trade secret laws, please attach a list of the information on this form that is confidential and the justification for confidentiality, including specific citations of relevant statutory and case law.

Multiple Containers: Fill I and II on one form and leave it blank on all the remaining forms. Attach all forms together securely. If you own more than 50 tanks you can file information on computer tape. Call 916/324-1262 for information.

This is not a Permit Application. All Underground Tanks will be subject to local regulation. Some jurisdictions have already begun programs. Check with your local county government for further information.

NOTE: ALL UNDERGROUND CONTAINERS MUST REGISTER EVEN IF STATE AND/OR LOCAL PERMITS ARE IN FORCE.

APPENDIX D	SOIL BORING SAMPLE LABORATORY RESULTS AND CHAIN-OF-CUSTODY RECORDS
APPENDIX E	GROUNDWATER SAMPLE LABORATORY RESULTS AND CHAIN-OF-CUSTODY RECORDS

EXECUTIVE SUMMARY

Diesel-affected soil was encountered during construction excavation for a planned new building. The Fullerton Fire Department was notified and Inspector Steve Long was present at the site to witness the soil excavation and associated soil sampling. Samples were obtained to document the complete removal of affected soil from the site. An on-site mobile laboratory was used to test the samples for the presence of diesel- and fuel-range hydrocarbons. All of the soil that was possible to excavate was removed. However, due to the presence of the existing boiler room building adjacent to the west, some residual diesel-range hydrocarbons remain at the site that could not be excavated because of the possibility of undermining the existing building. It is estimated that from 500 to 600 tons of diesel-affected soil was excavated and is temporarily stockpiled at the site pending offsite disposal by Kimberly-Clark at an appropriate disposal facility.

Because all of the affected soil could not be removed, the Fullerton Fire Department required drilling of a soil boring at the west side of the excavated area, as near to the area of residual hydrocarbons as possible. This boring was drilled, soil samples were obtained every five feet, and the samples were analyzed by an onsite mobile laboratory. The analysis of the samples from the boring confirm that residual diesel-range hydrocarbons are present in the soil beneath the existing boiler room building.

During drilling of the boring, groundwater was encountered at a depth of 70 feet. Drilling was halted and a groundwater sample was obtained using a bailer lowered through the drilling augers. The sample was tested for TPH as diesel, BTEX, MTBE, and the common fuel oxygenates. The results of the groundwater testing indicate that low concentrations of TPH-d (0.86 mg/L) and total xylenes (7.9 µg/L) were detected in the sample. These concentrations are every low. Although there is no drinking water standard for TPH as a distinct compound, there is a maximum contaminant level (MCL) for total xylenes which is 1,750 µg/L. The detected xylenes are significantly below the MCL. All of the other tested oxygenates were not detected. Although the sample was obtained through the drilling augers, the results indicate that there has not been a significant impact to the groundwater beneath the site.

REPORT OF SOIL EXCAVATION and SAMPLING
for the
KIMBERLY-CLARK FACILITY
2001 EAST ORANGETHORPE AVENUE
FULLERTON, CALIFORNIA

1.0 SITE HISTORY

The subject site is located at 2001 East Orangethorpe Avenue in the City of Fullerton, California. The site is occupied by a paper product manufacturing and packaging operation. The site is the location of the planned construction of a new building. It is reported that two 10,000-gallon diesel underground storage tanks (USTs) were formerly located in an area just east of the existing boileroom building, which is the area planned for the new construction. On February 14, 2002, during recent excavation and grading activities, hydrocarbon-affected soil was encountered. The Fullerton Fire Department was notified and it was determined that although the former USTs had been removed, there was no information as to whether any soil samples had been collected and tested for the presence of petroleum hydrocarbons. On February 15, 2002, the concrete slabs which had been at the base of the former underground tanks, were broken up and removed. Subsequent to this, excavation and sampling were conducted under the oversight of the Fullerton Fire Department. A site location map and site layout are included as Figures 1 and 2, respectively.

1.1 Previous Investigations

Two 10,000-gallon underground fuel storage tanks were located at the site. However, there were no records provided regarding previous investigations that may have been conducted at the site.

1.2 Site Ownership and Occupancy

The property is currently owned by the Kimberly-Clark WorldWide Inc. The contact for the property owner is Ms. Grace Madden who can be reached by telephone at (714) 773-7500, extension 7677.

2.0 LOCAL GEOLOGY AND HYDROGEOLOGY

2.1 Geology

The site is located within the Peninsular Ranges Geomorphic Province of Southern California at an elevation of approximately 187 feet above sea level. The local topography slopes to the southwest. Based on excavation and soil sampling at the site, the subsurface soils are generally composed of sand or silty sand.

2.2 Hydrogeology

The site is located within the Orange County Coastal Groundwater Basin Forebay Area (Metropolitan Water District (1987). The Forebay portion of the Orange County Groundwater Basin contains relatively little impermeable subsurface materials and is the main recharge area for the groundwater basin. The depth to groundwater beneath the site is approximately 70 feet below grade, based on the depth to groundwater encountered during drilling of an exploratory boring. The estimated groundwater flow direction is towards the southwest, in accordance with the local topography.

3.0 SCOPE OF WORK

3.1 Soil Excavation

Hydrocarbon-affected soil was identified at the site during construction excavation operations. Based on oral approval from Inspector Long of the Fullerton Fire Department, excavation began on February 18, 2002 to remove the affected soil from the site. The excavation and backfilling activities continued through February 21, 2002. During this time, hydrocarbon-affected soil was excavated and stockpiled, soil samples were collected and tested by an onsite mobile laboratory to verify that all of the affected soil had been removed, and the excavated area was backfilled and compacted to local code in accordance with the construction plan. Approximately 500 to 600 tons of affected soil were excavated and stockpiled onsite nearby. The area of excavation is shown on Figure 3.

Soil samples were collected from various areas of the excavation as shown on the attached site plan to verify that the affected soil had been removed. Inspector Long was onsite during much of the excavation and sampling process and provided guidance for the sampling locations. The samples were tested for total petroleum hydrocarbons, as diesel, using modified EPA method 8015 and for volatile organic compounds using EPA method 8260B. A total of twelve samples were obtained from the excavation area and tested. The locations from which the soil samples were obtained are shown on Figure 3. The laboratory results are presented below in Table 1. The laboratory reports and chain-of-custody records from the excavation soil sampling are included in Appendix A.

sec-BB = sec Butylbenzene
p-IPT = p-Isopropyltoluene

The laboratory results indicate that all of the accessible hydrocarbon-affected soil has been excavated and removed. Residual diesel-affected soil, however, remains at the site beneath the existing boileroom building, at the western side of the excavated area. Excavation could not extend to the west or deep enough in this area to remove all of the affected soil due to the threat of soil caving which could undermine the existing building foundation. Because excavation could not be competed in this area and since soil samples could not be obtained from near enough to the building using the excavator to properly characterize the vertical extent of the residual hydrocarbons, the Fire Department requested the drilling and sampling of a soil boring in that area. The proposed scope of work is discussed in the following sections.

3.2 Drill Soil Boring

Drilling and sampling of a soil boring was recommended to evaluate the vertical extent of hydrocarbon-affected soil at the western side of the excavation, adjacent to the existing boiler room. The purpose of the boring was to obtain and test soil samples to document at least 30 feet of clean soil samples beneath the previously identified residual hydrocarbons beneath the boiler room building. Prior to commencing the drilling, Inspector Long requested submittal of a Workplan that would describe the planned sampling activities. A Workplan for Additional Site assessment was prepared and submitted to the Fullerton Fire Department on February 21, 2002.

3.2.1 Health and Safety Plan

A project Health and Safety Plan was prepared prior to beginning field. The purpose of the Plan was to establish personnel/safety protection standards, define responsibilities of personnel involved, establish safe operation procedures relative to physical and chemical conditions encountered on site, and provide for off site safety issues such as traffic control. A tailgate safety meeting was held prior to commencing project tasks. The Health and Safety Plan was available for review at the site during the field investigation. A copy of the Health and Safety Plan is included in Appendix B.

3.2.2 Soil Sampling Procedures

The boring was drilled by A & R Drilling, a licensed California drilling contractor, using a hollow-stem auger drill rig. A California-registered geologist supervised the drilling and sampling, maintained a log of the boring, classified the soils encountered using the Unified Soil Classification System, and obtained soil samples for field examination and laboratory testing. The boring log is included in Appendix C.

The soil samples were collected in brass sample sleeves using an 18-inch sampling tube that held three 6-inch-long sample sleeves. Advancement of the auger was halted at the desired sample depths (every five feet) and the sampler was lowered into the hole and driven into the soil. The

number of blows required to advance the sampler 18 inches was recorded as an indicator of soil density and consistency.

To prevent cross-contamination between samples, the augers were cleaned and the sampler washed using a 3-bucket wash system prior to each use. The wash system involved washing the sampler in a Alconox and water solution, rinsing sampler in tap water, and rinsing sampler in distilled water.

Upon retrieval, the sample sleeves were capped with Teflon™ sheeting, sealed with plastic end caps, and labeled. The samples were then immediately transferred to an onsite California-certified mobile laboratory for testing using standard chain-of-custody documentation.

A lithologic description of the subsurface materials encountered and collected was maintained on boring logs compiled by the field geologist. Soils were classified in accordance with the Unified Soils Classification System (USCS), and descriptions include soil type, particle size and distribution, color (using the Munsell soil color chart), moisture content, and evidence of contamination (discoloration, unusual odors, etc.). These data were compiled on boring logs maintained throughout the project to record observations. The boring log is included in Appendix C.

3.2.3 Head Space Analysis

Head space analysis was performed as a field screening technique using a photo-ionization detector (PID) calibrated using a 50 ppm hexane gas standard. Each soil sample was placed in a zip-lock plastic bag. After being left at ambient temperature approximately 10 minutes, the head space in the bag was evaluated using the field meter. This instrument registers the concentration of organic vapors in the head space, which is an indication of the presence of volatile organic materials in the soil. These readings were included on the boring log in Appendix C.

3.2.4 Groundwater Encountered

Soil samples were collected every five feet and groundwater was encountered during drilling at a depth of approximately 70 feet below grade. A groundwater sample was obtained through the augers in order to obtain and test a groundwater sample. The groundwater sample was collected using a clean bailer and was transferred to the mobile laboratory for analysis. Drilling was halted due to the presence of groundwater and the boring was backfilled with a bentonite cement slurry to grade.

3.3 Laboratory Analysis

3.3.1 Soil Samples

Each of the soil samples collected was tested by the laboratory for total petroleum hydrocarbons as diesel (TPH-d) using modified EPA method 8015 and for volatile organic compounds (VOCs) using EPA methods 8260B and 5035. The principal VOC compounds of concern were benzene, toluene, ethylbenzene, and total xylenes (BTEX), methyl tertiary butyl ether (MTBE) and the common fuel oxygenates.

The results of the exploratory boring soil sample laboratory tests are presented below in Table 2.

TABLE 2
SOIL BORING SAMPLE LABORATORY RESULTS

Depth (in feet)	TPH-d (in mg/kg)	8260B VOCs (mg/kg)								
		B	T	E	X	MTBE	TBA	DIPE	ETBE	TAME
5	**43**	ND	ND	ND	ND	ND	ND	ND	ND	ND
10	**4,100**	ND	ND	ND	ND	ND	ND	ND	ND	ND
15	**20,000**	ND	ND	ND	ND	ND	ND	ND	ND	ND

65	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND
70	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND

Notes:
See official laboratory reports in Appendix D or complete list of analytes. All other compounds were not detected.
ND = Not detected at or above method detection limit. mg/kg = parts per million
BTEX = Benzene, Toluene, Ethylbenzene, Total Xylenes MTBE = Methyl tertiary butyl ether
TBA= Tertiary butyl alcohol DIPE = Di-isopropyl alcohol ETBE = Ethyl tertiary butyl ether
TAME = Tertiary amyl methyl ether

The laboratory results indicate that before 30 feet of not detected samples could be obtained, groundwater was encountered at a depth of 70 feet. The highest concentration of TPH-d was 47,000 mg/kg at a depth of 30 feet. This is 40 feet above groundwater. Low concentrations of toluene, ethylbenzene, and total xylenes were also detected in that sample. Benzene and MTBE were not detected in that 30 foot sample. No hydrocarbons were detected in any of the deeper samples down to groundwater at 70 feet with the exception of 42 mg/kg TPH-d in the 55 foot sample. There were no volatile compounds detected in that 55 foot sample. The official laboratory reports and chain-of-custody records are included in Appendix D.

In addition, the sample with the highest TPH-d concentration (30 feet) was also tested for the full scan of volatile organic compounds using EPA method 8260B. The results indicate that the following compounds were also detected in the 30 foot sample:

chloromethane	1.1 mg/kg
p-isopropyltoluene	1.4 mg/kg
naphthalene	110 mg/kg
n-propylbenzene	1.5 mg/kg
1,2,4-trimethylbenzene	64 mg/kg
1,3,5-trimethylbenzene	26 mg/kg

These compounds are either common constituents of diesel fuel or may be associated with diesel.

3.3.2 Groundwater Sample

The groundwater sample was collected into 40-milliliter VOA vials and an amber liter bottle using a clean, Teflon™ bailer, sealed, labeled, and transferred to the onsite mobile laboratory under proper chain-of-custody procedures. The groundwater sample was identified as sample SB2-02@70AQ. The groundwater sample was tested for TPH as diesel and for VOCs using EPA Method 8260B. The results are shown below in Table 3. The official laboratory reports and chain-of-custody records are included in Appendix E.

The laboratory results indicate that although the groundwater sample was obtained through the drilling augers, the laboratory testing indicates that the only detected compounds were TPH as diesel at 0.86 mg/L and total xylenes at 7.9 µg/L. The TPH-d concentration is low and the xylene concentration is significantly less than the California Maximum Contaminant Level (drinking water standard) for total xylenes of 1,750 µg/L. There is no drinking water standard for TPH-d. All of the other tested compounds, including benzene, toluene, ethylbenzene, MTBE and the other common fuel oxygenates, were all not detected.

TABLE 3
GROUNDWATER SAMPLE LABORATORY RESULTS

See official laboratory reports in Appendix E for complete list of analytes. All other compounds were not detected.
ND = Not detected at or above method detection limit.
µg/L = parts per billion

3.4 Investigative Waste Management

In the process of collecting environmental samples during the sampling program, different types of potentially contaminated investigation-derived wastes (IDW) were generated that included the following:

- Used personal protective equipment (PPE)
- Disposable sampling equipment
- Soil cuttings

The Federal EPA's National Contingency Plan (NCP) requires that management of IDW comply with all applicable or relevant and appropriate requirements (ARARs) to the extent practicable. The sampling plan followed the Office of Emergency and Remedial Response (OERR) Directive

9345.3-02 dated May 1991, which provides the guidance for the management of IDW.

Listed below are the procedures that were followed for handling the IDW:

- Used PPE and disposable equipment were double-bagged and placed in a municipal refuse dumpster. These wastes are not considered hazardous and can be sent to a municipal landfill. Any PPE and disposable equipment to be disposed of which could still be reused was rendered inoperable before disposal in the refuse dumpster.

- There was no decontamination water generated at the site. The drilling augers were cleaned prior to arrival at the site and were cleaned by the drilling contractor at their yard following completion of the work.

- Soil cuttings were added to the existing excavated soil stockpile, pending offsite disposal.

All solid IDW (soil cuttings) will be disposed of at an appropriate disposal/treatment/recycling facility. Kimberly-Clark will be responsible for the handling and disposal of the waste generated during this project.

4.0 REVIEW OF LABORATORY RESULTS

4.1 Soil Samples

Diesel-range hydrocarbons were detected in the soil beneath the site. The highest concentration is 47,000 mg/kg from the boring at a depth of 30 feet. This area that was sampled is just adjacent to the existing boiler room and cannot be removed by excavation due to its proximity to the existing building. There was no benzene or MTBE associated with this sample, although relatively low concentrations of toluene, ethylbenzene, and total xylenes were detected in this sample.
The 30 foot sample was composed of silt, which was an abrupt lithologic change from the overlying sandy material. The fine-grained silt layer extending from a depth of about 30 to 32 feet has apparently served as a relatively impermeable layer which has generally prevented deeper migration of the diesel hydrocarbon release.

Of the eight deeper samples obtained from depths of 35 feet to 70 feet, the only other detected compound was TPH as diesel at 42 mg/kg in the 55 foot sample. All of the other tested compounds were not detected. This suggests that the residual hydrocarbons at the site are of limited vertical extent.

4.2 Groundwater Samples

The laboratory results for the groundwater sample indicate that the only detected compounds were TPH as diesel at 0.86 mg/L and total xylenes at 7.9 µg/L. TPH-d has no established drinking water guidance level and is considered to be low. The xylene concentration is significantly less than the California Maximum Contaminant Level (drinking water standard) for total xylenes of 1,750 µg/L. All of the other tested compounds, including benzene, toluene, ethylbenzene, MTBE and the other common fuel oxygenates, were all not detected in the groundwater sample.

This indicates that the released diesel-range hydrocarbons at the site have not caused a significant impact to the underlying groundwater.

5.0 CONCLUSIONS

Diesel-affected soil was encountered during construction excavation for a planned new building. The Fullerton Fire Department was notified and an inspector was present at the site to witness the soil excavation and associated soil sampling. Samples were obtained to document the complete removal of affected soil from the site. An on-site mobile laboratory was used to test the samples for the presence of diesel- and fuel-range hydrocarbons. All of the soil that was possible to excavate was removed. However, due to the presence of the existing boiler room building adjacent to the west, some residual diesel-range hydrocarbons remain at the site that could not be excavated because of the possibility of undermining the existing building. It is estimated that from 500 to 600 tons of diesel-affected soil was excavated and is temporarily stockpiled at the site pending offsite disposal by Kimberly-Clark at an appropriate disposal facility.

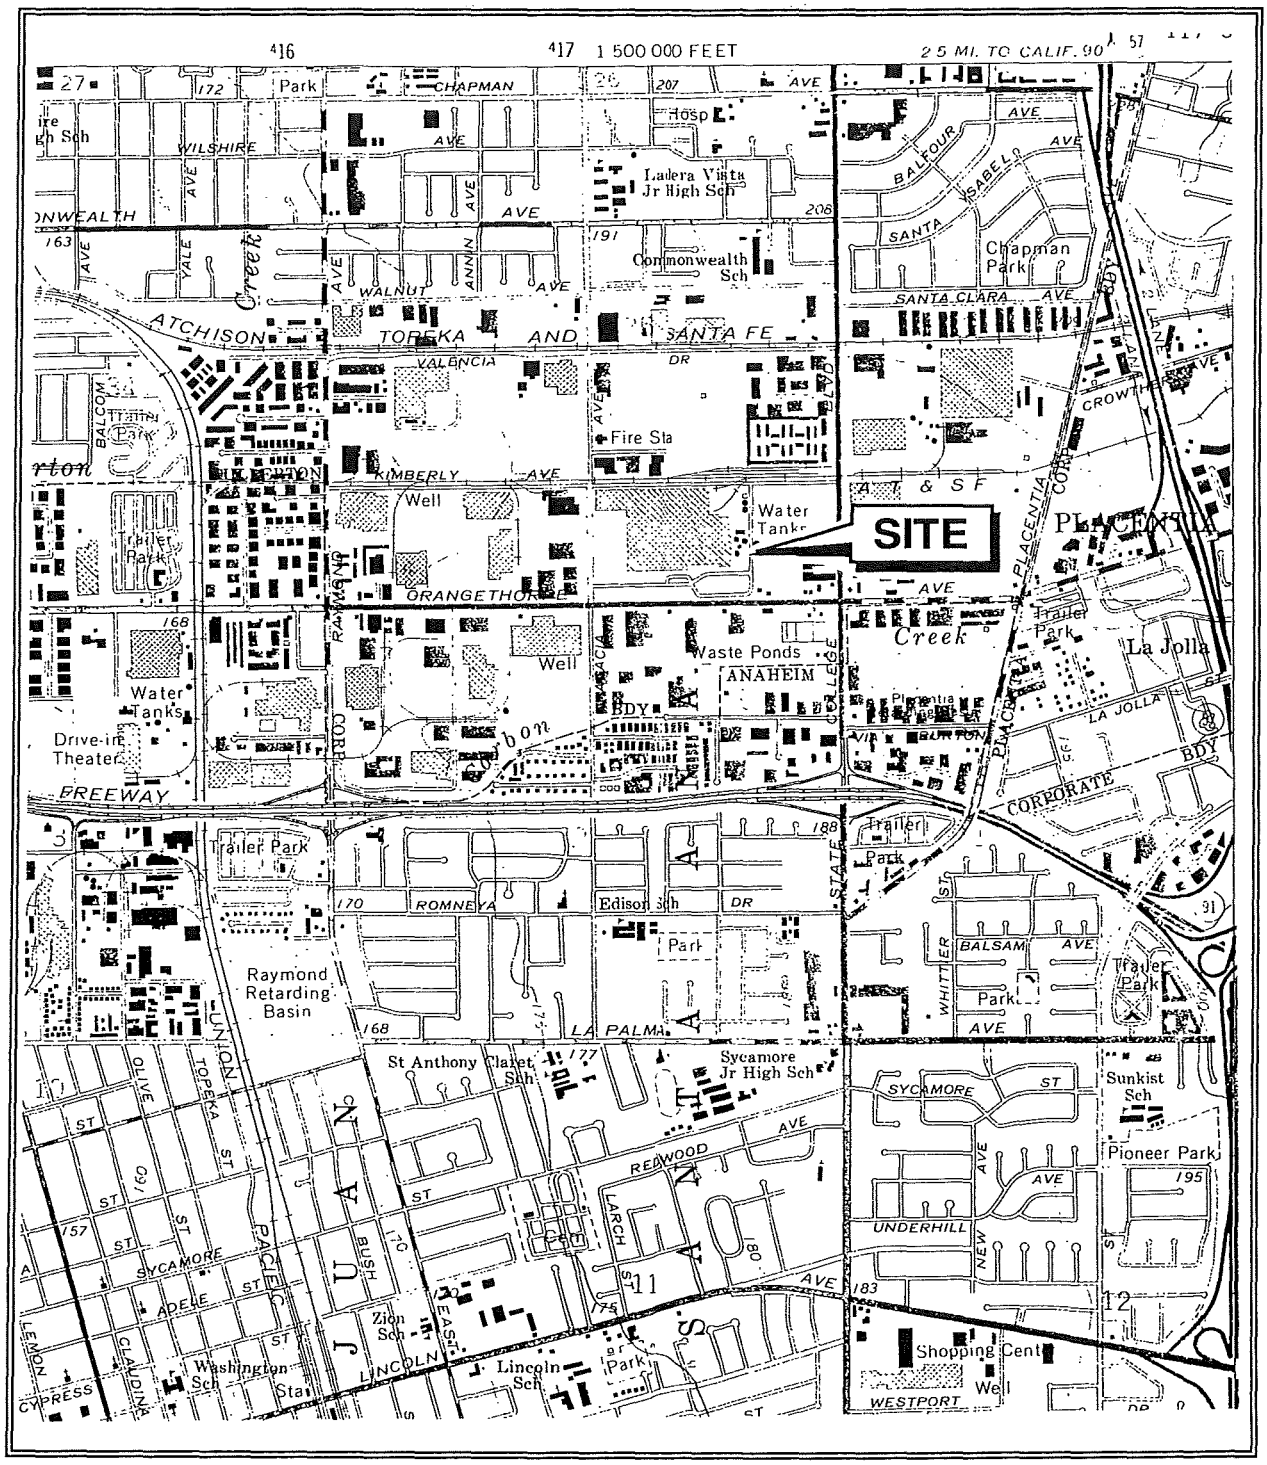
Because all of the affected soil could not be removed, the Fullerton Fire Department required drilling of a soil boring at the west side of the excavated area, as near to the area of residual hydrocarbons as possible. This boring was drilled, soil samples were obtained every five feet, and the samples were analyzed by an onsite mobile laboratory. The analysis of the samples from the boring confirm that residual diesel-range hydrocarbons are present in the soil beneath the existing boiler room building.

During drilling of the boring, groundwater was encountered at a depth of 70 feet. Drilling was halted and a groundwater sample was obtained using a bailer lowered through the drilling augers. The sample was tested for TPH as diesel, BTEX, MTBE, and the common fuel oxygenates. The results of the groundwater testing indicate that low concentrations of TPH-d (0.86 mg/L) and total xylenes (7.9 µg/L) were detected in the sample. These concentrations are every low. Although there is no drinking water standard for TPH as a distinct compound, there is a maximum contaminant level (MCL) for total xylenes which is 1,750 µg/L. The detected xylenes are significantly below the MCL. All of the other tested oxygenates were not detected. Although

the sample was obtained through the drilling augers, the results indicate that there has not been a significant impact to the groundwater beneath the site.

6.0 RECOMMENDATIONS

The findings of this assessment indicate that the diesel-affected soil has been excavated and removed to the practical limits of the site. Residual hydrocarbon-affected soil remains beneath the existing boiler room. Soil sampling from a boring drilled at the site have defined the vertical extent of hydrocarbons in the soil. Groundwater was encountered at 70 feet and a groundwater sample was obtained through the drilling augers for testing. The laboratory results from the groundwater sample indicate that hydrocarbons in the soil at the site have not resulted in a significant impact to the underlying groundwater.



Therefore, since all of the accessible hydrocarbon-affected soil has been excavated from the site, and a groundwater sample does not indicate a significant impact to groundwater, the residual affected soil that cannot be excavated is not considered to pose a threat to the groundwater beneath the site. Therefore, site closure with no further action required is recommended.

APPENDIX B

HEALTH AND SAFETY PLAN

SITE SPECIFIC HEALTH AND SAFETY PLAN

1.0 Site Name and Address

(714)
738-3160

Kimberly Clark Facility
2001 E. Orangethorpe Avenue
Fullerton, California

2.0 Site Personnel

Project Director	Will Gaston
Field Technical Services	Scott Edwards

3.0 Site Description & Background

Kimberly Clark is a manufacturing facility.

4.0 Planned Site Activities

We anticipate a total of one exploratory soil boring will be installed during this investigation. Soil sampling at the site will be performed using A & R Drilling. The boring will be advanced to a total depth of approximately 50 feet beneath ground surface (bgs), and soil samples will be collected every 5 feet, starting at 25 feet. The samples will be collected and submitted to a mobile laboratory (Spectrum Lab) for analysis. After sampling is completed, each sample location is to be backfilled with bentonite chips and native soil, and patched at the surface with a like paving material.

Appropriate first aid and decontamination equipment will be prepared and maintained on-site for all field portions of this project.

5.0 Health and Safety Precautions

Diesel concentrations in these soils are not known; however, these samples are being used as clean-up confirmation samples. Therefore, sampling will be performed in modified Level D. This includes use of personal protection equipment, including safety glasses and Nitrile gloves. Gloves are to be changed between each sample.

6.0 Contingency Procedures

In the event of an emergency, the initial action will be to use a cell phone to call the City of Fullerton Fire Department at 911. If the emergency consists of an injury, the project team must act to stop bleeding, prevent the injured person from going into shock and ready him for transport.

If emergency consist of fire or a potentially explosive situation, the project team must:

- Shut down all equipment (if feasible and if this action does not result in risk to life or property);
- Clear the area; and
- Re-assemble in the parking lot adjacent to the Kimberly Gate.

At that time, the City of Fullerton Fire Department can be contacted by either cellular phone or landline.

A safety kit containing a fire extinguisher and first aid kit will be maintained at the site in the Field Technicians Vehicle. Daily tailgate safety meetings will be held for all site workers to identify hazards not discussed in this HSP and to review and refine these contingency procedures.

7.0 Physical Hazards

Physical hazards associated with site activities include crushing and cutting injuries associated with heavy machinery, slips, trips, falls, contact and eye abrasions, contusions, lacerations, flammability and potential for explosion.

Other physical hazards include the potential for heat exhaustion and heat stroke.

8.0 Minimum required Health and Safety Procedures

All workers engaged in site activities will wear hard hats, safety glasses and safety shoes while on the job site. All workers will be OSHA 40-hour trained and medically approved for respirator use and show written evidence thereof prior to the commencement of site activities.

9.0 Safety Procedures

9.1 Site Entry/Access: The work area will be controlled to prevent entrance of unauthorized persons. The Field Technician will control access to this area. Area access will be limited to those persons required to perform soil-sampling activities.

9.2 Egress: The facility gate will remain open during fieldwork so that workers can vacate the area in the event of an emergency.

9.3 Decontamination: Distilled water and Alconox will be used for the decontamination of both personnel and sampling equipment.

10.0 Special Procedures and Precautions

All on-site work will be coordinated with Fleming Environmental.

11.0 Emergency Contacts

• AMBULANCE:	911
• POLICE:	911
• FIRE:	911
• HOSPITAL:	911
• NATIONAL RESPONSE CENTER:	1-800-424-8802
• POISON CONTROL CENTER:	1-800-682-9211
• TOXLINE:	1-301-496-1131
• CHEMTREX	1-800-424-9300

12.0 Nearest Medical Facility

Anaheim Memorial Hospital
1111 W. La Palma Avenue
Anaheim, CA 92801
(714) 774-1450

DIRECTIONS TO HOSPITAL:

Start our going West on **E. Orangethorpe Avenue** towards **S. Acacia Avenue** by turning RIGHT.
Turn LEFT onto **S. Lemon Street**.
Turn RIGHT onto **W. La Palma Avenue**.
Anaheim Memorial Hospital will be on your RIGHT.

CASE NARRATIVE

The following information applies to samples which were received for analysis by Centrum Analytical Mobile Environmental Laboratory Number Four (MEL #4) on: 02/22/02

The samples were received at the project site intact and were either analyzed immediately or stored at 4°C until analyzed.

Unless otherwise noted below, the Quality Control acceptance criteria were met for all samples for every analysis requested. The date of issue for this report is 02/28/02.

EPA 8260B: Some samples were run at a dilution due to high levels of hydrocarbons in the sample; consequently, reporting limits were raised.

Report approved by:

James M. Reed
Mobile Lab Supervisor

Rodolfo Vergara, Jr.
Quality Assurance Manager

ELAP # 2373

DL : Detection Limit -- The lowest level at which the compound can reliably be detected under normal laboratory conditions.
ND : Not Detected -- The compound was analyzed for but was not found to be present at or above the detection limit.
NA : Not Analyzed -- Per client request, this analyte was not on the list of compounds to be analyzed for.

Job Number: 20086

Project: Kimberly-Clark

CASE NARRATIVE

The following information applies to samples which were received on 02/22/02 :

The sample was received at the laboratory directly from the field and was cooled to 4°C upon arrival. The sample container was intact.

Unless otherwise noted below, the Quality Control acceptance criteria were met for all samples for every analysis requested. The date of issue for this report is 02/28/02.

Report approved by:

Tom Wilson
Laboratory Director

Rodolfo Vergara, Jr.
Quality Assurance Manager

ELAP Lab# 2419

DL : Detection Limit -- The lowest level at which the compound can reliably be detected under normal laboratory conditions
ND : Not Detected -- The compound was analyzed for but was not found to be present at or above the detection limit.
NA : Not Analyzed -- Per client request, this analyte was not on the list of compounds to be analyzed for.

Date Received: 02/22/02
Job Number: M4-351

Project: Kimberly-Clark

CASE NARRATIVE

The following information applies to samples which were received for analysis by Centrum Analytical Mobile Environmental Laboratory Number Four (MEL #4) on: 02/22/02

ELAP Number: 2373

Unless otherwise noted below, the Quality Control acceptance criteria were met for all samples for every analysis requested.

The samples were received at the project site intact and were either analyzed immediately or stored at 4°C until analyzed.

Report approved by:

James M. Reed
Mobile Lab Supervisor

Rodolfo Vergara, Jr.
Quality Assurance Manager

DL: Detection Limit – The lowest level at which the compound can reliably be detected under normal laboratory conditions.
ND: Not Detected – The compound was analyzed for but was not found to be present at or above the detection limit.

Subject: Workplan for Additional Soil Investigation at the Kimberly Clark site located at 2001 East Orangethorpe Avenue, Fullerton, California

Dear Mr. Long:

Enclosed is the Workplan for additional site assessment activities at the subject site as requested by your office.

We appreciate your assistance and look forward to working with you in this matter. If there are any questions, please call at (714) 505-6123.

Respectfully submitted,

Dear Mr. Rains:

The analytical results for the soil samples, received by our laboratory on February 21, 2002, are attached.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call Mr. John Ackerman, our Customer Service Specialist, or myself, if you have any questions.

Sincerely,

Curtis Desilets

LAB I.D.: 020221-14

TOTAL THRESHOLD LIMIT CONCENTRATION ANALYSIS
UNIT: MG/KG = MILLIGRAM PER KILOGRAM = PPM

ELEMENT ANALYZED	SAMPLE RESULT	PQL	TTLC LIMIT	STLC LIMIT	EPA METHOD
Antimony(Sb)	ND	1.0	500	15	6010B
Arsenic(As)	1.57	0.5	500	5.0	6010B
Barium(Ba)	95.7	5.0	10,000	100	6010B
Beryllium(Be)	ND	0.5	75	0.75	6010B
Cadmium(Cd)	ND	0.5	100	1.0	6010B
Chromium(Cr)Total	17.6	0.5	2,500	560/5@	6010B
Chromium VI (Cr6)	--	1.0	500	5.0	7196A
Cobalt(Co)	2.35	1.0	8,000	80	6010B
Copper(Cu)	8.86	1.0	2,500	25	6010B
Lead(Pb)	6.65	0.5	1,000	5.0	6010B
Mercury(Hg)	ND	0.1	20	0.2	7471A
Molybdenum(Mo)	ND	5.0	3,500	350	6010B
Nickel(Ni)	11.3	2.5	2,000	20	6010B
Selenium(Se)	ND	1.0	100	1.0	6010B
Silver(Ag)	ND	1.0	500	5.0	6010B
Thallium(Tl)	ND	1.0	700	7.0	6010B
Vanadium(V)	40.5	5.0	2,400	24	6010B
Zinc(Zn)	58.1	0.5	5,000	250	6010B

COMMENTS:
PQL = Practical Quantitation Limit
ND = The concentration is below the PQL or non-detected
TTLC = Total Threshold Limit Concentration
STLC = Soluble Threshold Limit Concentration
@ = Must meet both the STLC Limit at 560 and EPA-TCLP Limit at 5
* = STLC analysis for the metal is recommended (if marked)
** = TCLP-Chromium analysis is recommended (if marked)
*** = The concentration exceeds the TTLC Limit, and the sample is defined as hazardous waste as per CCR-TITLE 22 (if marked)
-- = Not analyzed/not requested

Fullerton Mill

March 13, 2002

Mr. Steve Long
Fullerton Fire Dept.
Hazardous Materials Specialist
Fullerton Fire Department
312 E. Commonwealth Avenue
Fullerton, CA 92832-2099

Subject : Fuel Oil Contamination in Boiler House/Cogen Site at Kimberly Clark Fullerton Mill

Dear Mr. Long:

Per our phone conversation, please find enclosed the following :

1. Two copies of the Geologist's report on the soil excavation and sampling for the fuel oil contamination encountered during the excavation for the new building site. This area formerly housed two underground storage tanks that was removed in 1986. The soil was remediated and closure was obtained in 1992. We sent you a copy of the paperwork on Feb. 20.

2. A total of 2,174.2 tons of soil (81 truckloads) was sent out for recycling disposal on February 25 & 26. A copy of the lab tests from the waste soil and a copy of the shipping summary of the waste is also attached. Please advise if you need a copy of each waste shipment's manifest.

We look forward to working with you in resolving this issue. If you need additional information, please call or email me. Thank you again for your assistance.

Sincerely,

GMadden

COMMENTS
PQL = Practical Quantitation Limit
ND = The concentration is below the PQL or non-detected
TTLC = Total Threshold Limit Concentration
STLC = Soluble Threshold Limit Concentration
@ = Must meet both the STLC Limit at 560 and EPA-TCLP Limit at 5
* = STLC analysis for the metal is recommended (if marked)
** = TCLP-Chromium analysis is recommended (if marked)
*** = The concentration exceeds the TTLC Limit, and the sample is defined as hazardous waste as per CCR-TITLE 22 (if marked)
-- = Not analyzed/not requested

Dear Mr. Rains:

The analytical results for the soil samples, received by our laboratory on February 21, 2002, are attached.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call Mr. John Ackerman, our Customer Service Specialist, or myself, if you have any questions.

Sincerely,

Curtis Desilets
Vice President/Program Manager

1 PURPOSE

1.1 Introduction

This Spill Prevention, Control, and Countermeasure Plan (Plan) was prepared for Kimberly-Clark Worldwide, Inc. Fullerton Mill (Kimberly-Clark Fullerton Mill). The purpose of the plan is to describe facility operating practices intended to prevent potential oil spill events and to minimize the impact of any spills to human health and the environment. In the unlikely event that an oil spill occurs, this Plan outlines facility response efforts. The oil spill response efforts outlined within this document have been prepared in accordance with the requirements as outlined in Part 112 of the Code of Federal Regulations Title 40 (40 CFR 112) – Oil Pollution Prevention. Many of the procedures and guidance contained in this document are also applicable to preventing and responding to spills of other chemicals that are used and stored at the Facility. However, the primary goal of this plan is oil spill prevention and this Plan provides procedure and strategies for effective oil spill response.

1.2 Policy Statement

The policy of the Facility is to fabricate paper products without endangering the environment or the public through its operation and production. The Facility strives to do this in a manner so as to provide safe and healthy work conditions for its employees. This policy's objectives are in compliance with all city, county, state, federal and international health, safety and environmental (HS&E) laws and regulations. This policy applies to all the Facility's activities.

1.2.1 Guiding Principle

- Provide a safe and healthy work environment. The Facility will operate in a manner intended to protect the health and safety of its employees and the public. Written procedures for safe operations will be established, communicated to its employees, and fully implemented. The Facility will comply with OSHA rules.

- Minimize the environmental impact of the Facility's operations. The Facility will comply with the permits and United States Environmental Protection Agency (EPA) and California Environmental Protection Agency (Cal/EPA) rules regulating emissions to the air, water and land. The Facility will continue to strive for improved environmental performance.

- Provide for the safety of the Facility's products. The Facility will take appropriate steps to provide for the safe transportation of its raw and finished products, to properly dispose of residues, and to prescribe the safe use of its products.

- Cooperate with the public. The Facility will communicate openly with its employees, neighbors, customers, contractors, suppliers, government officials

and other members of the public in regard to its health, safety and environmental (HS&E) performance and impacts. The Facility will seek to resolve any HS&E issues or misunderstandings associated with its operations and products.

1.2.2 Goals of the Plan

In order to comply with this policy as it relates to oil storage and handling, the Facility has developed this Plan. The goals of the Plan are as follows:

- To prevent spills.
- To contain spills should they occur.
- To remove spilled materials.

1.3 General Applicability Requirements (40 CFR §112.1)

1.3.1 Oil Storage

The requirements outlined in 40 CFR Part 112 - Oil Pollution Prevention (SPCC rules) require that facilities prepare a Plan, if the facility could reasonably be expected to discharge oil in quantities that may be harmful into or upon navigable waters of the United States or adjoining shorelines, or into or upon the waters of the contiguous zone, or in connection with activities as detailed in 40 CFR 112.1(a)(1); and the facility contains oil in any above ground container; any completely buried tank; any container used for storage (standby, seasonal, temporary) or not otherwise permanently closed; any bunkered tank or containers in a vault. The various oil storage containers located at Kimberly-Clark Fullerton Mill meet these criteria.

1.3.2 Oil Storage Capacity

In addition, the Facility's aggregate aboveground storage capacity exceeds the threshold value of 1,320 gallons for exemption from the SPCC rules; therefore, the Part 112 requirements are applicable to the Facility.

1.4 Definitions (40 CFR §112.2)

Unless specifically noted, the definitions included in 40 CFR 112.2 have been incorporated into this Plan.

1.5 Requirements to Prepare Plan (40 CFR §112.3)

1.5.1 Facilities Operational on or before August 16, 2002 [40 CFR§112.3(a)]

The Facility has been operational since on or before August 16, 2002 and has prepared this Plan to meet and comply with the requirements of 40 CFR 112.

1.5.2 Facilities Operational after July 1, 2009 [40 CFR§112.3(b)]

The Facility has been operational since on or before August 16, 2002 and has prepared this Plan to meet and comply with the requirements of 40 CFR 112.

1.5.3 Mobile Facilities [40 CFR§112.3(c)]

This section is not applicable to the Facility.

1.6 Professional Engineer's Certification [40 CFR§112.3(d)]

I, Hue C. Liu, a Licensed Professional Engineer, having reviewed this Spill Prevention Control and Countermeasures Plan (Plan) do hereby certify and attest: that I am familiar with the requirements of 40 CFR Part 112 - Oil Pollution Prevention; that I or my agent have visited and examined the Facility; that the Plan has been prepared in accordance with good engineering practice, including consideration of applicable industry standards, and with the requirements of Part 112; that procedures for required inspections and testing have been established; and that the Plan is adequate for the Facility.

Engineer: Hue C. Liu

Registration Number: C66754

Signature:

State: California

Expiration Date: 9/2016

1.7 Plan Availability for Inspection [40 CFR§112.3(e)]

The Facility may be subject to possible inspections by the EPA's Regional Administrator regarding the measures outlined in this Plan. A complete copy of the Plan, including necessary attachments such as completed forms, records of inspections and/or testing, repairs and/or replacement, and any amendments to the Plan will be maintained on-site for review by the EPA during normal working hours.

1.8 Extension of Time for Plan Provisions [40 CFR§112.3(f)]

The EPA has not authorized an extension of time under the provisions of this section of the SPCC rules for the preparation and full implementation of the Plan; therefore, this section is not applicable to the Facility.

1.9 Federal Discharge Reporting Requirements (40 CFR§112.4)

Whenever the Facility has discharged more than 1,000 gallons of oil in a single discharge event as described in 40 CFR§112.1(b) or discharged more than 42 U.S. gallons of oil in each of two discharges within a twelve (12) month period, the Facility must report the events to the EPA within sixty (60) days from the time the Facility becomes subject to this section.

1.9.1 Required Information For EPA [40 CFR§112.4(a)]

The following information must be reported to the EPA [40 CFR§112.4(a)]:

- Name of Facility;
- Name of Reporter;
- Location of Facility;
- Maximum storage or handling capacity of the Facility and the normal daily throughput;
- Corrective Action and Countermeasures taken, including equipment repairs and replacements;
- An adequate description of the Facility;
- The cause for such discharge, including a failure analysis of the system or subsystem in which the failure occurred; and
- Preventive measures taken to minimize the possibility of recurrence.

1.9.2 Applicability of Federal Reporting Requirements [40 CFR§112.4(b)]:

No action is required under this section until it applies to the Facility. This section does not apply until the expiration of the time permitted for the initial preparation and implementation of the Plan under 40 CFR§112.3, not including any amendments to the Plan.

1.9.3 Coordination with State Agency [40 CFR§112.4(c)]

Provide a complete copy of the information provided to the EPA under Section 1.9.1 of this Plan to the California Environmental Protection Agency (Cal/EPA), State Water Resources Control Board (SWRCB), and the local Certified Unified Program Agency (CUPA).

1.10 State Discharge Reporting Requirements

In accordance with Section 13272 of the Water Code for the State of California, whenever the Facility has an occurrence of a discharge, spill or other release of oil, petroleum products, crude oil and/or used oil in a quantity equal to or greater than 42 U.S. gallons (one barrel), the Facility must immediately, upon discovery, notify the Office of Emergency Services, and the local administrative agency using the appropriate 24-hour emergency number or work day number established by the local administrative agency as listed in Section 2.11 of this Plan pursuant to the following requirements of the State of California Water Code.

1.10.1 Notification Requirements

Any person who, without regard to intent or negligence, causes or permits any oil or petroleum product to be discharged in or on any waters of the state, or discharged or deposited where it is, or probably will be, discharged in or on any waters of the state, shall, as soon as (1) that person has knowledge of the discharge, (2) notification is possible, and (3) notification can be provided without substantially impeding cleanup or other emergency measures, immediately notify the Office of Emergency Services of the discharge in accordance with the spill reporting provision of the state oil spill contingency plan adopted pursuant to Article 3.5 (commencing with Section 8574.1) of Chapter 7 of Division 1 of Title 2 of the Government Code for the State of California. This section shall not apply to spills of oil into marine waters as defined in subdivision (f) of Section 8670.3 of the Government Code for the State of California.

1.10.2 Applicability

The notification required by this section shall not apply to a discharge in compliance with waste discharge requirements for the State of California.

1.10.3 Fines

Any person who fails to provide the notice required by this section is guilty of a misdemeanor and shall be punished by a fine of not less than five hundred dollars ($500) or more than twenty-five thousand dollars ($25,000) per day for each day of failure to notify, or imprisonment of not more than one year, or both. Except where a discharge to the waters of this state would have occurred but for cleanup or emergency response by a public agency, this subdivision shall not apply to any discharge to land which does not result in a discharge to the waters of this state. This subdivision shall not apply to any person who is fined by the federal government for a failure to report a discharge of oil.

1.10.4 State Reportable Quantity

The reportable quantity for oil or petroleum products shall be one barrel (42 gallons) or more, by direct discharge to the receiving waters, unless a more restrictive reporting standard for a particular body of water is adopted.

1.10.5 Telephone Report

According to Title 19 of the California Code of Regulations Section 2703, releases or threatened releases of hazardous materials must be immediately reported via telephone to:

- The local emergency response agency (Fire Department) via "911"
- California Office of Emergency Services (OES) via 800-852-7550 or 916-427-4341

Although the regulations state "any release", OES has adopted an exception that when there is reasonable belief that there is no significant present or potential hazard to human health, the environment, or property, no report is required.

For releases equal or greater than the reportable quantity, a telephone report to the National Response Center (800-424-8802) is required by the person responsible as soon as possible after a discharge.

1.10.6 Information for Telephone Report

When making a telephone report of a spill or discharge to the State the following information would be helpful:

- Name, location and telephone number of caller;
- Incident source (truck, train, fixed-site facility, etc.);
- Incident location (township, range, section, if available);
- Type of materials involved; this information may be obtained from placards, bill of lading, and/or driver manifests;
- Name of manufacturer or shipper;
- Amount of materials involved, type, and proximity of other reactive materials;
- Current conditions (leaks, fires, fumes, plumes, etc.);
- Time of incident;
- On-scene contact (name and telephone number, radio communications frequency);
- Type of assistance required;
- Personnel en-route to scene;
- Actions anticipated and/or in progress (evacuations in progress, medical precautions, etc.);
- Known or anticipated acute or chronic health risks;
- Weather condition and forecast;

- Terrain;
- Population in area;
- Adjacent streams, lakes, sewers, etc.

1.10.7 Written Report

A written follow-up report must be filed with OES. The report must be made on the OES form contained in Title 19 of the California Code of Regulations Section 2705. Other agencies may also be involved in an incident depending on the situation. **Table 1-1** summarizes the follow-up written reporting requirements of several agencies.

When making a follow-up written report, the following information must be submitted:

1. Name of the facility.
2. Name and contact information for the facility owner/operator.
3. Location of the facility.
4. Date of the spill/release.
5. Date of initial notification to OES.
6. Information on the specific chemical that was released, including duration of release.
7. Description of actions taken to respond to and contain the release.
8. Description of health effects that occurred or could result from the release.
9. Other pertinent information.

Table 1-1 Agency Follow-up Reporting Requirements

Agency	*Criteria*	*Time Frame*
Orange County Environmental Health Department (CUPA)	Upon request following an incident	72 hours for written follow-up 30 days for final written report
National Response Center (NRC)	None	N/A
Office of Emergency Services (OES)	Following any incident where verbal notification was given to the OES. If a Form 304 is required by EPA (see below), then an "Emergency Release Follow-up Notice Reporting Form" is required to be submitted. [A]	30 days
Regional Water Quality Control Board (RWQCB)	Upon request by RWQCB following an incident	Stipulated in request
California Department of Fish & Game (CDFG)	Upon request by CDFG following an incident	Stipulated in request
U.S. EPA [B]	Emergency incidents of environmental contamination where the NRC was notified Any spill of hazardous waste where the Integrated Contingency Plan was implemented	15 days
California Department of Toxic Substances Control (DTSC)	Following the release of a reportable quantity of hazardous waste.	15 days

[A] According to 19 CCR 2705, if required to submit a written emergency release follow-up pursuant to 42 United States Code Section 11004(c) (1989) (i.e., Form 304), prepare the follow-up form contained in 19 CCR 2705. The notice shall be sent to:

Chemical Emergency Planning and Response Commission
Local Emergency Planning Committee
Attn: Section 304 Reports
2800 Meadowview Road
Sacramento, CA 95832

[B] Send reports to:

U.S. EPA Region 9
75 Hawthorne Street
San Francisco, CA, 94105

1.10.8 Current Regulations

To ensure compliance with the current Cal/EPA rules, the applicable Cal/EPA rules (i.e., Chapter 6.67 Aboveground Storage of Petroleum – Health and Safety Codes §§25270-25270.13) should be reviewed periodically for any changes to these requirements.

1.11 Reportable Spills, as defined by Federal Regulations

Whenever the Facility has a discharge of oil, petroleum products, crude oil and/or used oil in a quantity equal to or greater than the reportable quantity, as defined by federal regulations (40 CFR §302.6), the Facility must immediately report the spill or discharge to the National Response Center (NRC) duty officer in Washington D.C. The toll free number for the NRC is 1-800-424-8802. If it is not possible to immediately report to the NRC, the report may be given to the office of the appropriate federal on-scene coordinator (U.S. Coast Guard or U.S. EPA). However, the Facility is still required to notify the NRC as soon as possible.

EPA has established requirements to report spills to navigable waters or adjoining shorelines. Specifically, EPA requires owners or operators of facilities that discharge oil in quantities that may be harmful to public health or welfare, or to the environment, to report the spill to the federal government. EPA has determined that discharges of oil in quantities that may be harmful include those that:

- Violate applicable water quality standards;
- Cause a film or "sheen" upon, or discoloration of the surface of the water or adjoining shorelines; or
- Cause a sludge or emulsion to be deposited beneath the surface of the water or upon adjoining shorelines.

1.12 EPA Amend Plan [40 CFR§112.4(d)]

After review, the EPA may require the Facility to amend the Plan if the EPA finds that it does not meet the requirements of the 40 CFR§112 or that an amendment is necessary to prevent and contain discharges from the Facility.

1.12.1 Timeframe for EPA Amended Plan [40 CFR§112.4(e)]

If the EPA finds that the Plan does not meet the requirements of Part 112 or the amendment is necessary to prevent and contain discharges from the Facility, the EPA will propose by written notice that the Facility amends the Plan. Within 30 days of this initial notice, the Facility may present views and/or arguments on the proposed changes to the EPA. After considering all relevant material, the EPA will either notify the Facility of any amendment required or rescind the initial notice. If required, the Facility must amend the Plan within 30 days from the date of the notice, or another date as specified by the EPA Regional Administrator. These changes will be implemented as soon as

possible, but no later than six months after the amendment becomes part of the Plan, unless otherwise specified by the Administrator.

1.12.2 Appeal EPA Decision to Amend Plan [40 CFR§112.4(f)]

If the Facility appeals a decision by the EPA requiring an amendment to the Plan, the Facility must send the appeal to the EPA in writing within 30 days of receipt of notice from the EPA requiring the amendment under 40 CFR§112.4(e). This appeal must meet the requirements of 40 CFR§112.4(f).

1.13 Plan Amendments Due to Facility Changes [40 CFR§112.5(a)]

In the event that a change is made to the Facility design, construction, maintenance or operation that will materially affect or alter the Facility's potential for a discharge as described in 40 CFR§112.1(b), the Plan must be amended in accordance with the Spill rules. Types of changes that may require amendments to the Plan include but are not limited to:

- Major changes in types or quantities of chemical or oil storage;
- Commissioning or decommissioning containers;
- Replacement, reconstruction, or relocation of tanks and containers;
- Replacement, reconstruction, or installation of piping systems;
- Changes in the service and operation of containers or piping (i.e. material changes, increased operating pressures);
- Construction or demolition that would potentially alter secondary containment structures; and
- Revisions to the standard operation and/or maintenance procedures.

1.14 Plan Review and Evaluation [40 CFR 112.5(b)]

The Facility must complete a review of this Plan at least **once every five years** from the date of the last Plan certification by a Professional Engineer. If after a review and evaluation of the Plan, new technologies that have been field-proven are discovered that will significantly reduce the possibility of a spill event from the Facility, the Plan must be amended to include the new, more effective prevention and control technologies.

- Any such amendments to the Plan must be completed by the Facility within six months of the review.

- The Facility must implement the amended Plan as soon as possible, but no later than six months following preparation of any amendment.

- The Facility must document the completion of the Plan review and evaluation and must sign a statement as to whether you will amend the Plan. A form for documenting completion of the review and evaluation of the Plan, which includes a

statement in accordance with the requirements of the SPCC rules, is included at the end of the Plan (See **Appendix A**).

1.15 Certification of Technical Amendments to Plan [40 CFR 112.5(c)]

A Licensed Professional Engineer must certify all technical amendments to the Plan in accordance with 40 CFR§112.3(d). Non-technical changes to the Plan do not require certification by a Professional Engineer. This Plan includes footers on the lower right hand corner of each page to signify on each page, which page of the Plan is a technical requirement of the Plan or non-technical requirement of the Plan. **Appendix B** includes a Log for any amendments to the Plan.

1.16 Qualified Facility Plan Requirements (40 CFR§112.6)

This Plan has been reviewed and certified in accordance with 40 CFR§112.3(d) by a Licensed Professional Engineer.

2 GENERAL REQUIREMENTS OF PLAN (40 CFR§112.7)

2.1 Management Approval (40 CFR§112.7)

Kimberly-Clark Worldwide, Inc. Fullerton Mill is committed to the prevention of discharges of oil to navigable waters and the environment, and strives to maintain the highest standards of spill prevention, control and countermeasures through regular review, updating and implementation of this Spill Prevention Control and Countermeasure Plan (Plan) for its Plant located at 2001 E. Orangethorpe Ave., Fullerton, CA 92831. To this end, we are committed to providing the necessary resources to fully implement this Plan in accordance with 40 CFR Part 112.7.

Signature: _____

Date Signed: _____

Name: James M. Roeder

Official Title: Mill Manager

2.2 Cross-Referencing Plan (40 CFR§112.7)

The Plan follows the sequence specified by the SPCC rules and therefore does not require a section cross-referencing the location of the requirements of the Plan with the requirements of the SPCC rules.

2.3 Facility Conformance with SPCC Rules [40 CFR 112.7(a)(1)]

The Plan does not deviate from any of the requirements of 40 §CFR 112, nor does it present equivalent measures for any nonconformance from the provisions of the SPCC rules.

2.4 Equivalent Measures for Non-Conformance [40 CFR 112.7(a)(2)]

The Plan does not present equivalent measures for any nonconformance from the provisions of the SPCC rules. Therefore the provisions of this section are not applicable to the Facility.

2.5 Facility Description [40 CFR 112.7(a)(3)]

2.5.1 Facility Type

Kimberly-Clark Fullerton Mill specializes in the manufacture of and distribution of paper products including facial and bath tissue, towels, and industrial wipers. The Facility manufacturing process includes: (1) temporary storage of raw materials and finished products; (2) processing raw materials in tanks with chemicals and oil derivative liquids; (3) producing paper based products; and (4) shipment to customers and other Kimberly Clark facilities for additional processing.

2.5.2 Facility Location

The Facility covers approximately 65-acres. The manufacturing processes at the Facility are conducted primarily within approximately 1,000,000 square feet of manufacturing buildings (Mill). The Mill occupies approximately 65 percent of the Facility. The remainder of the Facility, with the exception of an area on the eastern boundary, is paved. The paved and concrete surfaces have been sloped to provide drainage of the Facility operations to various storm drain units. The topography of the Facility is predominantly flat and is slightly sloped to the southwest. The main area of the Facility is at an elevation of between 190 and 200 feet above sea level.

The Facility is bounded on the north by Kimberly Avenue, on the west by Acacia Ave., on the south by the Orangethorpe Ave., and on the east by State College Blvd.. The Facility is located at latitude 33°51'37"N and longitude 117°56'46"W. A summary of the facility information is shown below:

- *Facility Name:* Kimberly-Clark Worldwide, Inc. Fullerton Mill
- *Facility/Mailing Address:* 2001 E. Orangethorpe Ave., Fullerton, CA 92831
- *County*: Orange
- *Environmental Contact*: Grace Madden
- *Contact Phone #*: (714) 773-7500

2.5.3 Facility Owner

The Facility is owned and operated by Kimberly-Clark Worldwide, Inc. Fullerton Mill. The owner's mailing address and phone number are the same as those shown for the Facility above.

2.5.4 Facility Diagram

A facility diagram meeting the requirements of 40 CFR§112.7(a) (3) has been prepared for this Plan and is included at the end of the Plan as **Appendix G**.

2.6 Types of Oil [40 CFR§112.7(a)(3)(i)]

2.6.1 Summary of Containers

In addition to the facility plot diagram provided, the Facility is required to indicate the type of oil stored on-site and the corresponding container information and storage capacity for each oil. The following table provides a complete list of all the oil storage containers with the capacity of 55 U.S. gallons or more, unless otherwise exempt from the rule.

Table 2-1 Types of Oils and Containers

TANK NUMBER	LOCATION	CONTAINER CONTENTS	CONTAINER CAPACITY (GAL)	NUMBER OF CONTAINERS	SECONDARY CONTAINMENT	CONTAINER CONSTRUCTION
1	Bldg. #8 Lift Room	Mineral Oil	275 (Plastic Tote)	1	Interior of Building	Plastic
2	Bldg. #8 Lift Room	Mineral Oil	275 (Metal Tank)	1	Interior of Building	Stainless Steel
3	Bldg. #3 - TC Oiler Area	Gear/Lube Oils	275 (55-Gal Drums)	5	Spill Pallets	Steel Drums
4	Building #3 - TC Oiler Area	Gear/Lube Oils	55	1	Spill Pallet	Steel Drum
5A	Building #3 - Compressor Room	Gear/Compressor Oils	165 (55-Gal Drums)	3	Spill Pallets	Steel Drums
5B	Building #10 - Tractor Area	Gear/Compressor Oils	220 (55-Gal Drums)	4	Spill Pallet	Steel Drum
6	Building #1 – Basement	Lube/Mineral Oils	825 (55-Gal Drums)	15	Spill Pallets	Steel Drums
7 (A,B,C, D,E)	Bldg. #1 – Basement Bowsers	Hydraulic Oil / Lube Oil	4,000 (800-Gal Tanks)	5	Basement Interior	Steel Tanks
8A	Building #1 TM Oiler Area	Lube Oil	330 (55-Gal Drums)	6	Spill Pallets; Building Interior	Steel Drums
8B	Building #1 TM Oiler Area	Used Oil	55	1	Spill Pallets; Building Interior	Steel Drum
8C	Building #1 Slitters	Mineral Oil	550 (55-Gal Drums)	10	Spill Pallets; Building Interior	Steel Drum
9A	North Gate Fire Pump	Diesel Fuel	275 (40" x 36" x 65")	1	Bermed Tank Containment; Building Interior	Steel Tank
9B	Acacia Gate Fire Pump	Diesel Fuel	230 (72" x 32" x 24")	1	Bermed Tank Containment; Building Interior	Steel Tank

TANK NUMBER	LOCATION	CONTAINER CONTENTS	CONTAINER CAPACITY (GAL)	NUMBER OF CONTAINERS	SECONDARY CONTAINMENT	CONTAINER CONSTRUCTION
9C	Bldg. #1 – Emergency Genset	Diesel Fuel	175	1	Self-contained Fuel Tank; Building Interior	Steel Tank
10A	Chemical Storage Building (CSB)	Gear, Lube, & Mineral Oils	3,850 (55-Gal Drums)	70	Building Interior	Steel Drums
10B	Chemical Storage Building (CSB)	Used Oils	220 (55-Gal Drums)	4	Building Interior	Steel Drums
10C	Chemical Storage Building (CSB)	Mineral Oil	1650 (275-Gal Totes)	6	Building Interior	Plastic
11A	Caterpillar Cogen. (Turbine Engine)	Lube Oil	1,100	1	Self-contained Tank	Steel
11B	Caterpillar Cogen. (Steam Turbine Engine)	Lube Oil	250	1	Self-contained Fuel Tank; Bermed	Steel
12A #1 MF Saw	Building #21	Hydraulic Oil	85	1	Building Interior	Steel
12B #2 MF Saw	Building #21	Hydraulic Oil	85	1	Building Interior	Steel
12C #1 MF Baler	Building #21	Hydraulic Oil	250	1	Building Interior	Steel
12D #2 MF Baler	Building #21	Hydraulic Oil	230	1	Building Interior	Steel
13 B-1 Bath Baler	Building #8	Hydraulic Oil	300	1	Building Interior	Steel

Based on the list of oil containers and the corresponding storage information, **the total aboveground storage capacity for the Facility is 15,725 gallons. There are no underground storage containers at this facility.**

2.6.2 California Aboveground Storage Tank Program

The following sections detail the requirements of California Aboveground Storage Tank Program.

2.6.2.1 Applicability of Program

Facilities storing "petroleum" in a single tank greater than 1,320 gallons or facilities storing "petroleum" in aboveground tanks or containers with a cumulative storage capacity of greater than 1,320 gallons are subject to the California Aboveground Petroleum Storage Act. The total oil capacity at the

Facility is greater than 1,320 gallons. Hence, the Facility is subject to the aboveground tank program.

2.6.2.2 Definition of Petroleum

"Petroleum" means crude oil or any fraction which is liquid at 60 degrees Fahrenheit temperature at normal atmospheric pressure. This includes petroleum based substances comprised of a complex blend of hydrocarbons, such as gasoline, diesel, jet fuels, residual fuel oils, lubricants, some petroleum solvents, and used oils. Petroleum does not include liquid propane gas (LPG).

2.6.2.3 Program Requirements

The Act requires owners or operators of aboveground petroleum storage tank facilities to:

- file a storage statement,
- pay a facility fee, and
- prepare & implement a federal Spill Prevention Control and Countermeasure (SPCC) plan (this Plan meets this requirement).

2.6.2.4 Storage Statement

A "storage statement" must include the following information about your facility:

1) Name and address of the tank facility. A contact person for the tank facility.
2) The total storage capacity of all petroleum storage tanks on the facility.
3) For each tank that exceeds 10,000 gallons capacity and which holds a substance containing at least five percent petroleum.
    a. Location (on the facility)
    b. Size (in Gallons)
    c. Age (in years)
    d. Contents (type of petroleum product)

2.6.2.5 Fee Requirements

The Facility is required to pay a program fee on a facility basis based on the total storage capacity in gallons for all of the tanks at the Facility. The fee is payable every two years, beginning with the initial payment. This fee is subject to change

and the local Certified Unified Program Agency (CUPA) should be contacted to determine the current fee schedule for subsequent years.

2.6.2.6 Submittal Requirements

The Facility is required to submit the program fee to CUPA. The phrase "aboveground tank" should be written on the Fee check. The local Certified Unified Program Agency should be contact for submittal address.

2.7 Discharge Prevention Measures [40 CFR§112.7(a)(3)(ii)]

2.7.1 Equipment Construction

All tanks, piping and vessels at the Facility are built to American Petroleum Institute (API) standards at a design pressure greater than the operating pressure. Equipment is hydrostatically or pneumatically tested by their manufacturers at pressures higher than their design pressure. There are no underground hydrocarbon tanks or piping at the Facility. The possibility of equipment failure is minimal.

2.7.2 Above Ground Piping

Above ground piping exists to transport oil products from delivery tanks to on-site storage tanks. The piping is provided containment by the curbs/berms around delivery areas, and can be provided with secondary containment from portable berms or storm drain discharge covers.

2.7.3 Movement of Bulk Oil and Oil Products

Personnel responsible with the task of moving bulk oil or oil products on motorized vehicles such as fork lifts, drum dollies, and other mechanized equipment or vehicles within the Facility are trained and certified in the proper and safe use of the applicable equipment or vehicle. For this reason, the possibility of a release from this activity is minimal.

2.7.4 Movement of Non-Bulk Oil and Oil Products

Personnel responsible with the task of moving non-bulk oil or oil products on motorized vehicles such as fork lifts, drum dollies, and other mechanized equipment or vehicles within the Facility are trained and certified in the proper and safe use of the applicable equipment or vehicle. For this reason, the possibility of a release from this activity is minimal.

2.7.5 Tank Fabrication Standards

Storage tanks at Kimberly-Clark Fullerton Mill are built in accordance with accepted industry standards of design. The American National Standards Institute (ANSI), American Society of Mechanical Engineers (ASME), and the American Petroleum Institute (API) Guidelines were followed by the tank manufacturers during the design,

fabrication, erection, inspection, and testing of all storage tanks at Kimberly-Clark Fullerton Mill.

In order to limit the hazards associated with storage of chemical products, all tanks meet or exceed both federal and local standards for design and construction. Tank apertures were specified and safety procedures developed to minimize both mechanical failures of the structure and release to the environment.

2.7.6 Bleeding Pipelines

There are no bleeding pipelines at the Facility; therefore this section is not applicable to the Facility.

2.7.7 Additional Prevention Measures

Any equipment found to be leaking shall be repaired as soon as possible.

2.8 Discharge or Drainage Controls [40 CFR§112.7(a)(3)(iii)]

Constructed secondary containment structures such as spill pallets, berms, and building interiors are utilized throughout the Facility. **Table 2-1** located in Section 2.6 of the Plan provides a listing of all the oil containers at the Facility and the means used for secondary containment. Additional details concerning the discharge and drainage controls used at the Facility are located in Section 2.20 and Section 3.3.3 of this Plan.

2.9 Countermeasures [40 CFR§112.7(a)(3)(iv)]

In the unlikely event of spills or releases of small quantities of oil that migrate outside the storage secondary containment structures, Facility personnel will attempt to isolate the oil by using absorbent materials and other materials intended to stop or absorb the oil. Depending on the size of the contained spill, Facility personnel will either clean up the oil using absorbent materials maintained on-site, or will contact a cleanup contractor. Floor drains inside the manufacturing building are either sealed or protected from oil spills by diversionary devices. In the unlikely event of a spill approaching a storm water catch basin, a spill kit with a plug can be used to block the storm water catch basin. Once clean-up activities have been completed, the surface and/or storm drains will be inspected to ensure that no visible oil residue or sheen is detectable. Records of the clean-up activity will be completed and filed with this Plan. Section 2.13 *Spill Response Procedures* of this Plan provides additional detail descriptions of the Facility's discovery and response procedures.

2.10 Methods of Disposal [40 CFR§112.7(a)(3)(v)]

The disposal of all recovered material, contaminated soil, used absorbent materials, and other spill materials will be coordinated by the SPCC Coordinator according to state and federal regulations. If Facility personnel contained the spill, immediate contact with the

area supervisor must be made so that proper and timely disposal can occur. After spill response is complete, all spill equipment that cannot be reused and which has been contaminated will be managed for proper disposal. Clean-up materials will be removed from temporary staging areas within **180 days** of cleanup completion, to be managed with the Facility's normal waste disposal activities. The Facility will use a licensed waste transporter and disposal facility for all generated wastes. The SPCC Coordinator must ensure that the waste is labeled, transported, and disposed of properly. All waste generated during the clean up of any spill will be removed from the Facility and disposed of as soon as possible. All waste should be disposed off-site at a Facility approved by the appropriate federal or state agency to accept the waste.

2.11 Contact List [40 CFR§112.7(a)(3)(vi)]

In case of a discharge or spill as described in 40 CFR§112.1(b), the contact list and phone numbers of applicable individuals, Facility response coordinator, cleanup contractors, and the appropriate federal, state, and local agencies that may require notification are listed below in **Table 2-2.**

Table 2-2 Contact List

Agency	Phone Number
Emergency	911
Orange County Fire Authority	714-573-6000
Orange County Fire Authority Hazardous Materials Line	714-573-6250
Orange County Environmental Health Department (CUPA)	714-433-6240
Orange County Public Works Water Pollution Response Unit	877-89-SPILL (877-897-7455)
Orange County Health Care Agency	714-834-4722
California Office of Emergency Services (OES)	800-852-7550 or 916-427-4341
National Response Center (NRC)	800-424-8802
Environmental Protection Agency (EPA)	202-272-0167 Headquarters 866-372-9378 Region 9
Department of Fish and Game, Office of Spill Prevention and Response	1-888-DFG-CALTip (1-888-334-2258)
U. S. Coast Guard – National Response Center	1-800-424-8802
West Coast Oil Spill Hotline	1-800-OILS-911
Evergreen Environmental Services (Waste Hauler)	1-800-972-5284

Jason Cho – TC/West Yard (Alternate SPCC Coordinator)	Office: 714-773-7500 24-Hour Phone: 714-773-7500

2.12 Reporting Procedures [40 CFR§112.7(a) (4)]

Sections 1.9, 1.10, and 1.11 of this Plan provide written procedures for reporting a discharge as described in 40 CFR§112.1(b).

2.13 Spill Response Procedures [40 CFR§112.7(a)(5)]

This section provides the steps that must be taken by Facility personnel in the event of a spill. Spill event response procedures can be summarized with the following actions:

Discover/Evaluate/Notify/Contain/Cleanup/Report

By following these procedures, most spills can be prevented from impacting the environment and contained within the Facility property. The following sections contain specific procedures to follow in the event of a spill. These will be useful throughout the spill response process.

2.13.1 Discovery and Evaluation of Spill

A spill can occur at any time and be discovered by anyone in the Facility. Thus, the response procedures must begin with the personnel on-site at the time of discovery. Upon discovery, Facility personnel will evaluate the following:

- Volume and extent of the spill;
- Whether or not there is an immediate threat to human health;
- Whether or not the spill has entered or will enter the storm drain system or impact nearby surface water; and
- Whether or not the source of the spill can be stopped.

If simply closing a valve or switching off a pump can contain the spill, this will be the next step for the person who discovers the spill. This action will only be taken for substances that do not present immediate health hazards. For spills where human health is at risk, all personnel will be evacuated from the spill area and emergency response personnel will manage the area. Employees will be notified if an evacuation is necessary either by verbal notification, telephone calls, and an existing alarm system. The emergency coordinators

will be responsible for spreading the alarm, coordinating the evacuation, and confirming the business has been evacuated.

2.13.2 Immediate Response Actions

Immediate response is required for all situations where petroleum discharge poses a significant risk of contamination of ground cover or storm drains, or could create on-site health risks. Depending on the layout and containment factors for petroleum storage, some tanks may require expedited containment to prevent contamination of outside sources. The following assesses the Facility's petroleum storage tanks and describes the recommended actions associated with the immediate containment of spilled or leaked materials. In most cases, employees will be required to stop the flow of petroleum, contain the spill, and then contact the SPCC Coordinator for further action. For situations that are determined to be of a significantly lower risk of contamination, the SPCC Coordinator may first be contacted before action is taken.

Steel Drums Storage

Steel drums containing oils and other hazardous materials are typically stored atop spill pallets, or otherwise reliant on the building interior for secondary containment. Leaks and spills from drums storing oil that collect in spill pallets should be appropriately collected and disposed of, usually by vacuum processes. For drums that are not stored on pallets, or for spills that exceed or are outside the boundaries of a spill pallet, adsorbent materials should be used for small spills or leaks. The absorbent materials should be properly disposed of as hazardous waste, and the SPCC Coordinator notified of the incident. For substantial spills, whereupon the majority of stored oil escapes a drum, personnel should use portable berms to control the flow of the spill and to limit is discharge outside the building containment. Personnel should take extra care when transporting steel drums throughout the Facility, and should be aware of the nearest available spill control equipment while transporting drums in the event of a sudden spill.

Stationary Storage Tanks

The facility utilizes standalone storage tanks containing petroleum products throughout the facility, ranging in size from 85-gallons up to 300-gallons. These tanks are found within manufacturing or storage buildings, and are provided secondary containment by building interiors. In the event of a large spill, personnel working within the vicinity of a storage tank should utilize portable berms around the perimeter of the tank and around any outlets from the building interior. Given the larger capacity of storage tanks, large spills will require greater attention and mitigating actions in order to control a leak and prohibit harmful discharge. Small leaks or spills can be handled using absorbent materials, but large spills may require extraction utilizing an outside vendor. Once large spills are contained within the building, the SPCC Coordinator will evaluate the most effective and safe means of removing the spilled product.

Petroleum Storage Tanks for Engines and Turbines

The Facility maintains two (2) fire pumps, one (1) emergency generator, and a cogeneration system with two (2) turbine engines. These five pieces of equipment all contain interior petroleum storage within their configuration. Fire pumps and generator sets typically store diesel fuel, and it is anticipated that most minor spills will be contained by the storage tank interior and engine frame. Likewise, it is assumed that the lube oil tanks of the turbine engines will be self-contained in the event of minor spills. Larger spills may exceed the containment allotted by the equipment configurations, at which point portable berms can be used to contain spills, and storm drain covers can be used for any storm drains or catch basins within the immediate vicinity. As with stationary storage tanks, the SPCC Coordinator should evaluate large spills to determine if an outside vendor is required to remove the spill, or if materials stored on-site will be sufficient to contain and remove the spill.

Manufacturing Equipment

Machines operating within the manufacturing or auxiliary buildings that store substantial quantities of oil are subject to spill prevention and containment as well. These pieces of equipment are contained by the building interior. The priority of spill containment for the equipment is to minimize human health risks. While there is a possibility leaked oils may discharge from the building, it will be important to ensure that employees and personnel are not injured by spilled oil. Any leaks that are detected should be immediately contained using portable berms. Leaking equipment should be shut-off, and once the leak is contained, should be repaired. The SPCC coordinator should be contacted immediately in the event of a leak from manufacturing equipment to ensure that access to the spill site is restricted to authorized personnel.

2.13.3 Notification

Upon discovery of a spill, personnel must immediately contact Security at extension x7911 to report the spill. Security will contact the SPCC Coordinator, or the first available Alternative, as well as the department ERT (Emergency Response Team). The SPCC Coordinator should assess the situation and decide if an outside HAZMAT or Fire Department emergency response team should be called in. For additional emergency chemical spill information, personnel may contact CHEMTREC (see **Table 2-2 Contact List**) or the vendor listed on the corresponding MSDS. The SPCC Coordinator should complete a report with the following information:

- Name of the discoverer;
- Exact location of the spill;
- Approximate volume of the spill;
- Direction of migration of the spill; and
- Action(s) being taken to contain the spill.

Security should also notify the following personnel in the affected area:

- For Tissue Manufacturing, contact the machine tender and team / asset leader / weekend duty person;
- For Tissue Converting, contact the pager carrier and team / asset leader / weekend duty person;
- For Distribution, contact the team / asset leader;
- For Stores/Maintenance, contact the facilities or store crew leader or maintenance team leader;
- For Cogen or other contracts, contact the SPCC Coordinator, ERT and/or Cogen manager / lead technician.

The department ERT and the above personnel should supervise safe, immediate, and positive corrective action, including, but not limited to, containing spills with portable berms or sandbags, turning off sump pumps, shutting down leaking machinery, and ensuring that the SPCC Coordinator is notified. **Under all circumstances of a spill, the SPCC Coordinator must ALWAYS be notified.**

When the accidental spill event has been corrected and/or stabilized, the SPCC Coordinator will notify the Mill Manager.

Notification of the spill will be made to one of the following individuals if there is any indication that the spill has left the mill property or caused personnel injury or property damage. The SPCC Coordinator or Mill Manager will notify the corresponding individual:

1. Dell Majure
   Fullerton Regional Manager (Primary Contact)
   Environmental Control Team
   (770) 587-7120

2.13.3.1 Spill Incident Report

The SPCC Coordinator will then begin the notification process as outlined in Sections 1.9, 1.10 and 1.11. The SPCC Coordinator will use and complete the *Discharge Notification Form* provided as **Appendix C** to this Plan or any similar form that records the same information.

2.13.4 Containment

2.13.4.1 Containment Inside Structured Area

Spills that occur within the secondary containment structures, to the extent possible, will be controlled with absorbent materials. These spills will be dealt with on a case-by-case basis by the SPCC Coordinator.

2.13.4.2 Containment Outside Structured Area

Spills which occur outside a secondary containment structure will, to the extent possible, be contained with booms or other barriers, and/or absorbent materials. These spills will be dealt with on a case-by-case basis by the SPCC Coordinator.

2.13.5 Cleanup & Reporting

If the situation involves a small spill or leak, an authorized trained employee will utilize the appropriate Personal Protective Equipment (PPE) and place absorbent materials or other appropriate materials on and around the area of the spill or leak. Spills kits and adsorbent materials can be found throughout the Facility, specifically in Stores 1 & 2, CSB, Team Lab Ch. Room, and around hazardous materials storage areas. PPE can be found in Department PPE lockers, Health Services, and Stores 2. If the situation involves a large leak, attempts should be made by Facility personnel to control the movement of the material and/or block the nearest drain or storm water conveyance system. The SPCC Coordinator may limit access to the area, if safety concerns exist or for other reasons at his discretion. The reporting should be conducted as specified in Sections 1.9, 1.10, and 1.11 of this Plan.

2.14 Prediction Discharge Analysis [40 CFR§112.7(b)]

The topographical relief map of the vicinity shows the ground surface is relatively flat around the regions where hazardous materials are stored. Spill flow directions are therefore expected to follow the concrete and pavement slopes. The facility is not located near any bodies of water.

Loading and unloading of the aforementioned materials occurs near where the containers are stored. Since loading/unloading procedures pose an additional risk of spilling, the area should be adequately sized and constructed to contain the largest possible spill associated with the loading and unloading procedures.

The width of the southwest loading/unloading area is approximately 300 feet by 160 feet. Thus, this drainage area is approximately 48,000 square feet. If the spill layer is assumed to have a thickness of 0.5" once spilled and filled up the entire 48,000 square feet area, the volume of this drainage area should be 2,000 cubic feet. Therefore, the volume of liquid that can be contained in this area is approximately 15,000 gallons ($1 ft^3 = 7.48$ gal).

The width of the northeast loading/unloading area is approximately 300 feet by 215 feet. Thus, this drainage area is approximately 64,500 square feet. If the spill layer is assumed to have a thickness of 0.5" once spilled and filled up the entire 64,500 square feet area, the volume of this drainage area should be 2,700 cubic feet. Therefore, the volume of liquid that can be contained in this area is approximately 20,000 gallons ($1 ft^3 = 7.48$ gal).

Both loading areas will provide adequate containment for the largest possible spill during loading and unloading operations of the various totes and drums located on-site.

The prediction discharge analysis at the facility is summarized in **Table 2-3.**

Table 2-3 Prediction Discharge Analysis

Tank #1 & Tank #2 – Building #8 - Lift Room	
Type of Failure:	Leaks; excess drippings from use
Potential Discharge Volume (gal):	<275 gallon per tank
Direction of Uncontained Discharge:	Discharged fluids will accumulate within the building interior.
Secondary Containment:	Building interior
Secondary Containment Capacity (gal):	~20,000 gallons

Tank #3 & Tank #4 – Building #3 - TC Oiler Area	
Type of Failure:	Leaks; excess drippings from use; tipping
Potential Discharge Volume (gal):	<55 gallon per drum
Direction of Uncontained Discharge:	Discharged fluids will accumulate in the spill pallets that the drums are stored atop. Should leak overcome spill pallet, fluids will disperse around the pallet.
Secondary Containment:	Spill Pallets; Building interior
Secondary Containment Capacity (gal):	>1,000 gallons

Tank #5A & Tank #5B – Buildings #3 & #10 (Compressor Room)	
Type of Failure:	Leaks; excess drippings from use; tipping
Potential Discharge Volume (gal):	<55 gallon per drum
Direction of Uncontained Discharge:	Discharged fluids will accumulate in the spill pallets that the drums are stored atop. Should leak overcome spill pallet, fluids will disperse around the pallet.
Secondary Containment:	Spill Pallets; Building interiors
Secondary Containment Capacity (gal):	>350 gallons

Tank #6, Tank #7(A ,B, C, D, E) – Building #1 - Basement	
Type of Failure:	Leaks; excess drippings from use
Potential Discharge Volume (gal):	<800 gallon per tank
Direction of Uncontained Discharge:	Leaks or spills from the hydraulic oil/lube oil tanks will accumulate in the basement interior.

Secondary Containment:	Basement Sump
Secondary Containment Capacity (gal):	~5,400 gallons

Tank #8A, Tank #8B, Tank #8C– Building #1	
Type of Failure:	Leaks; excess drippings from use; tipping
Potential Discharge Volume (gal):	<55 gallon per drum
Direction of Uncontained Discharge:	Discharged fluids will accumulate in the spill pallets that the drums are stored atop. Should leak overcome spill pallet, fluids will disperse around the pallet.
Secondary Containment:	Spill Pallets; Building interiors
Secondary Containment Capacity (gal):	>14,000 gallons

Tank #9A – North Gate Fire Pump	
Type of Failure:	Leaks; excess drippings from use
Potential Discharge Volume (gal):	<275 gallon
Direction of Uncontained Discharge:	Leaks or spills from the diesel storage tanks located in the fire pump should collect in the engine frame or disperse within the building interior.
Secondary Containment:	Bermed tank containment; building interior
Secondary Containment Capacity (gal):	~ 408 gallons (bermed tank containment) – L (7.08 ft) x W (3.083 ft) x H (2.5 ft) ~19,500 gallons (building interior)

Tank #9B – Acacia Fire Pump	
Type of Failure:	Leaks; excess drippings from use
Potential Discharge Volume (gal):	<250 gallon
Direction of Uncontained Discharge:	Leaks or spills from the diesel storage tanks located in the fire pump should collect under the bermed tank containment. The building interior will provide further containment.
Secondary Containment:	Bermed tank containment; building interior
Secondary Containment Capacity (gal):	~ 408 gallons (bermed tank containment) – L (7.08 ft) x W (3.083 ft) x H (2.5 ft) ~ 478 gallons (building interior) – L (16.9 ft) x W(13.4 ft) x H (0.33 ft)

Tank #9C – Emergency Generator – Building #1	
Type of Failure:	Leaks; excess drippings from use
Potential Discharge Volume (gal):	<175 gallon

Direction of Uncontained Discharge:	Leaks or spills from the diesel storage tanks located in the genset should collect in the engine frame or disperse around the engine.
Secondary Containment:	Engine enclosure; building interior
Secondary Containment Capacity (gal):	~105 gallons

Tank #10A, #10B, and #10C – Chemical Storage Building	
Type of Failure:	Leaks; excess drippings from use
Potential Discharge Volume (gal):	<55 gallon per drum; < 275 gallon per tote
Direction of Uncontained Discharge:	Leaks or spills from the storage totes and steel drums stored in CSB will be contained by the building interior, which includes perimeter drenches.
Secondary Containment:	Building interior
Secondary Containment Capacity (gal):	~4,000 gallons

Tank #11A - Cogeneration Turbine Engine	
Type of Failure:	Leaks; excess drippings from use
Potential Discharge Volume (gal):	<1,100 gallon
Direction of Uncontained Discharge:	Leaks or spills from the lube oil storage tank will collect within the engine frame, which serves as secondary containment.
Secondary Containment:	Engine frame configuration
Secondary Containment Capacity (gal):	~1,500 gallons

Tank #11B - Cogeneration Turbine Engine	
Type of Failure:	Leaks; excess drippings from use
Potential Discharge Volume (gal):	<250 gallon
Direction of Uncontained Discharge:	Leaks or spills from the lube oil storage tank will collect within the engine frame, which serves as secondary containment.
Secondary Containment:	Engine frame configuration; berms
Secondary Containment Capacity (gal):	~1,000 gallon

Tank #12A, #12B, #12C, # 12D - #1 MF Saw, #2 MF Saw, #1 MF Baler, #2 MF Baler - Building #21	
Type of Failure:	Leaks; excess drippings from use

Potential Discharge Volume (gal):	<250 gallon
Direction of Uncontained Discharge:	Hydraulic oil that may leak from any of the equipment will pool within the building interior, which serves as secondary containment.
Secondary Containment:	Building interior
Secondary Containment Capacity (gal):	~27,000 gallon

Tank #13, B-1 Bath Baler – Building #8	
Type of Failure:	Leaks; excess drippings from use
Potential Discharge Volume (gal):	<300 gallon
Direction of Uncontained Discharge:	Hydraulic oil that may leak from the bailer will pool within the building interior, which serves as secondary containment.
Secondary Containment:	Building interior
Secondary Containment Capacity (gal):	~20,000 gallon

In addition to these specific containments, the Facility also ensures that containers of hazardous materials and hazardous wastes are stored with secondary containment in leak-proof containers with tight fitting lids. Quantities of hazardous materials in work areas are kept to a minimum, and incompatible materials are stored separately. Hazardous materials storage areas are routinely inspected to confirm the integrity of the containers.

The greatest total volume of potential petroleum spills is expected not to exceed 1,100 gallons. This is justified by the largest single volume of stored petroleum, which is 1,100 gallons of lube oil stored in one of the cogeneration turbine engines.

2.15 Containment/Diversionary Equipment Measures [40 CFR§112.7(c)]

In accordance with 40 CFR§112.7(c), the Facility has incorporated appropriate containment and/or diversionary structures and equipment to prevent a discharge under the SPCC rules. The measures used at the Facility include the following:

- Dikes, berms, and retaining walls sufficiently impervious to contain oil;
- Curbing; and,
- Sorbent materials.

2.16 Non Practicability Requirements [40 CFR§112.7(d)]

This Plan does not make any non-practicability claims for the Site and therefore this section of the SPCC rules is not applicable.

2.17 Inspections, Tests, and Records [40 CFR§112.7(e)]

Inspection of all storage tanks and material storage areas, piping, valves and appurtenances, and related equipment will be conducted by Facility personnel to detect any leaks, cracks or deterioration of equipment that could cause a spill. The following inspection procedures shall be instituted at the specified frequency.

2.17.1 Day-to-Day Observations

In general, it is the Facility's intention to train all oil handling personnel such that they will be conscious of the conditions that could cause spills. This awareness will allow personnel to identify and rectify those conditions during the course of their day-to-day operations. Any visual leaks identified should be repaired promptly and/or reported to their area supervisor and any oil accumulation removed.

2.17.2 Daily Aboveground Storage Tank Inspections

Daily inspections of aboveground storage tanks (ASTs) subject to the SPCC rules are performed at the Facility. The container inspections involve a visual assessment of the structural and operational integrity of the containers, and related systems. During these inspections, Facility personnel also look for leaks, corrosion cracks, failing seals, loose equipment, safety concerns, and the general cleanliness of the area. If any fluids have accumulated in a secondary containment structure are noted at the time of the inspection, the inspecting person follows the procedures indicated in Section 3.2, Section 3.3.3, and Section 3.3.10 of this Plan. Inspections shall be documented using Kimberly-Clark Fullerton Mill's *Bulk Storage Container Inspection Schedule* which is provided as **Appendix E** to the Plan.

2.17.3 Monthly Drum Inspections

The 55-gallon drums stored on-site are inspected monthly. The container inspections involve a visual assessment of the structural integrity of the drums. If any fluids that have accumulated in a secondary containment structure are noted at the time of the inspection, the inspecting person shall follow the procedures indicated in Section 3.2, Section 3.3.3, and Section 3.3.10 of this Plan. Inspections shall be documented using Kimberly-Clark Fullerton Mill's *Bulk Storage Container Inspection Schedule* which is provided as **Appendix E** to the Plan.

2.17.4 Control Systems Testing

The Facility only stores oil in drums and tanks. Therefore, this section is not applicable to the Facility.

2.17.5 Additional Inspections and Record Keeping Requirements

Additional inspections and/or record keeping requirements are identified in the following Sections of this Plan:

- Section 1.14 *Plan Review and Evaluation;*
- Section 1.15 *Certification of Technical Amendments to Plan;*
- Section 2.18.1 *Training Requirements; and*
- Section 3.3.3 *Drainage of Uncontaminated Rainwater*

Inspection records are maintained for a period of three years and can be reviewed by authorized parties at the office of the SPCC Coordinator. Additional monthly inspection logs can be found in the Chemical Storage Building, while training records will be located in the Human Resources office and the SPCC Coordinator's office.

2.18 Personnel & Training Requirements [40 CFR§112.7(f)]

2.18.1 Training Requirements [40 CFR§112.7(f)(1)]

Personnel responsible with the task of moving non-bulk and bulk oil or oil products on motorized vehicles such as fork lifts, drum dollies, and other mechanized equipment or vehicles within the Facility are trained and certified in the proper and safe use of the applicable equipment or vehicle. For this reason, the possibility of a release from this activity is minimal. Employees responsible for filling operations should be well-trained in their equipment use and practice stringent leak prevention techniques.

The Facility will hold spill prevention training for oil-handling personnel that outlines potential spill events or failures, malfunctioning components, and spill prevention and control measures. The Facility has a long established program of training personnel to operate and maintain oil product-related equipment. Each person that operates or maintains equipment is aware that loss of oil or other hazardous material is unacceptable. Before responsibility for operating equipment is given, personnel are subject to a training program. Training normally includes review of job content with an instructor and a period of working with a person trained on a given job. Special precautions to be taken to prevent spills for each job are stressed in the training of personnel. Annual SPCC Plan education/refresher training is incorporated into oil/chemical handling and employees' training and training records are kept on file.

Briefings for operations personnel are scheduled at least once per year for the purpose of keeping them informed on oil/containment control techniques and equipment/materials. Current SPCC Plan requirements and pollution control laws, rules, and regulations are also included in these briefings. Periodic information training sessions are held for field maintenance, operation, and construction employees who might be involved in containment and clean-up operations. Additionally, the Facility will diligently document all training activities (date of training and attendees). The Human Resources Office maintains all training records. Copies of the training records shall be kept for a minimum of three years.

All oil handling personnel must be trained to prevent spills, to identify conditions that lead to spills, and to respond to spills quickly and effectively. The training is typically tiered so that individuals with lead roles receive more intensive training and can return to their areas of operation and train subordinates. It is the Facility's responsibility to ensure that those in need of training become trained, including new hires. New hires should be trained **within six months** of their start date.

Vendors whose employees unload chemicals (including oils) at the Facility must be trained in the procedures for unloading of liquids or be under the supervision of a Kimberly-Clark Fullerton Mill employee or an approved service maintenance contractor trained in the unloading of liquid products at the Facility.

Oil-handling personnel at the Facility will be trained to prevent discharges of oil products, and will be familiar with the facility-specific discharge procedure protocols, applicable pollution control laws, rules, and regulations. One designated individual will be responsible for reporting to the facility manager and be held accountable for discharge prevention and protocol (see Facility Contact List - Section 2.11).

2.18.2 Designate Accountable Person [40 CFR§112.7(f)(2)]

In accordance with 40 CFR§112.7(f)(2), the Facility has designated SPCC Coordinators for the Facility. This SPCC Coordinators will be responsible for discharge prevention and will report to Facility management. The SPCC Coordinators will take responsibility to notify line management, National Response Center (NRC) and/or other applicable regulatory agencies, as necessary, in the event of a spill. The SPCC Coordinators also have the authority to allocate spill response resources, as necessary. During non-operating hours, the SPCC Coordinators will be on call at all times and be capable of traveling to the Facility in the event of a spill. The SPCC Coordinators shall be the primary individual responsible for responding to a spill and coordinating the clean up activities.

The SPCC Coordinators of the Facility are designated in **Table 2-2**, Section 2.11 of the SPCC Plan. **Table 2-2** provides the necessary contact information for the SPCC Coordinators.

2.18.3 Scheduled Spill Prevention Briefings [40 CFR§112.7(f)(3)]

The Facility will provide spill prevention briefings frequently enough to ensure an adequate understanding by the Facility's oil-handling personnel of the Plan. At a minimum, the Facility must conduct discharge prevention briefings for the Facility's oil-handling personnel **at least once every calendar year**. Such briefings must highlight and describe known discharges as described in 40 CFR 112.1(b) or failures, malfunctioning components, and any recently developed precautionary measures.

2.19 Security [40 CFR§112.7(g)]

The Facility plans to implement security measures to prevent unauthorized access to oil handling, processing, and storage areas. The Facility will utilize the following security measures to control access to oil handling, processing, and storage areas; secure master flow

and drain valves; prevent unauthorized access to starter controls on oil pumps; address appropriate security lighting to prevent acts of vandalism and assist in the discovery of oil discharge:

2.19.1 Site Fence [40 CFR§112.7(g)(1)]

The Facility is fenced and prohibits entry from the general public. The Facility contains fencing with locked gates and/or guards to prevent general public access during normal operating hours (24 hours per day, 365 days per year). In addition, all areas of the facility are under regular surveillance by security personnel. The security guards conduct tours of the facility every hour and all perimeter fences are monitored 24 hours per day with surveillance cameras.

2.19.2 Valve Security Measures [40 CFR§112.7(g)(2)]

The Facility will ensure that the master flow and drain valves and any other valves permitting direct outward flow of the container's contents to the surface have adequate security measures so that they remain in the closed position when in non-operating or non-standby status. The Facility does have a master flow drain valve in standby status which, if opened under specific oil spill circumstances, would allow oil to reach navigable waters. This drain valve, a knife gate valve, is located in a 24-inch diameter storm sewer drainpipe at the north guardhouse. Its function is to contain a possible spill during waste oil transfer from a waste drum to a tanker truck.

The master valve will remain locked and closed at all time. A sign indicated this security measure will be posed on the gate valve. In the event of rain, the SPCC Coordinator will check the rainwater, prior to discharge. The valve will then be opened by the SPCC Coordinator or one of the alternate designated individuals. After discharge, the valve must immediately be closed and secured. In an emergency situation, accountable individuals other than the SPCC Coordinator, including security, may also perform this function. The SPCC Coordinator will be notified of every instance when the valve is opened by another employee. It is the SPCC Coordinator's (or his/her designee's) responsibility to check the valve for leaks or damage on a monthly basis.

2.19.3 Lock Starter Controls [40 CFR§112.7(g)(3)]

The Facility has starter controls on mechanical pumps. Security for the pump controls is protected by employee supervision, inside buildings and/or the fenced facility.

2.19.4 Cap Or Blank-Flange Connections [112.7(g)(4)]

Loading and unloading connections of oil pipelines are securely capped or blind-flanged when out of service for an extended period of time.

2.19.5 Facility Lighting [40 CFR§112.7(g)(5)]

The Facility is equipped with adequate outdoor lighting to allow for the discovery of discharges occurring during hours of darkness, both by operating personnel and by non-operating personnel (general public). The outdoor lighting that illuminates the Facility at

night prevents and deters acts of vandalism. Additionally, security personnel are equipped with additional battery-powered lighting equipment.

2.20 Facility Tank Car and Truck Loading and Unloading [40CFR§112.7(h)]

2.20.1 Containment System [40 CFR§112.7(h)(1)]

Appropriate secondary containment and/or diversionary structures or equipment is essential to all oil handling containers, equipment, and transfer areas to prevent the discharge to navigable waters or adjoining shorelines. The entire secondary containment system, including walls and floors, should be capable of containing oil and is constructed so that any discharge from a primary containment system, such as a tank or pipe, will not escape the containment system. For the items indicated in **Table 2-1** as having secondary containment, the following table describes in detail the type of containment employed and its means of providing spill control.

Table 2-4

Secondary Containment Equipment

TANK NUMBER	LOCATION	CONTAINER CONTENTS	CONTAINER CAPACITY (GAL)	TYPE OF CONTAINMENT	CONTAINMENT VOLUME (GAL)	CONTAINMENT CONSTRUCTION
1	Bldg. #8 Lift Room	Mineral Oil	275 (Plastic Tote)	Interior of Building	20,000	Concrete
2	Bldg. #8 Lift Room	Mineral Oil	275 (Metal Tank)	Interior of Building	20,000	Concrete
3	Bldg. #3 TC Oiler Area	Gear/Lube Oils	275 (55-Gal Drums)	Spill Pallets	1,000	Plastic
4	Bldg. #3 TC Oiler Area	Gear/Lube Oils	55	Spill Pallet	1,000	Plastic
5A	Bldg. #3 Compressor Room	Gear/Compressor Oils	165 (55-Gal Drums)	Spill Pallets; Building Interior	350	Plastic; Concrete
5B	Bldg. #10 Compressor Room	Gear/Compressor Oils	220 (55-Gal Drums)	Spill Pallet; Building Interior	350	Plastic; Concrete
6	Bldg. #1 Basement	Lube/Mineral Oils	825 (55-Gal Drums)	Spill Pallets; Building Interior	5,400	Plastic; Concrete
7(A,B,C, D, E)	Bldg. #1 Basement Bowsers	Hydraulic Oil / Lube Oil	4,000 (800-Gal Tanks)	Basement Interior	5,400	Concrete
8A	Bldg. #1 TM Oiler Area	Lube Oil	330 (55-Gal Drums)	Spill Pallets; Building Interior	14,000	Plastic; Concrete
8B	Bldg. #1 TM Oiler Area	Used Oil	55	Spill Pallet; Building Interior	14,000	Plastic; Concrete
8C	Bldg. #1 Slitters	Mineral Oil	550 (55-Gal Drums)	Spill Pallet; Building Interior	14,000	Plastic; Concrete
9A	North Gate Fire Pump	Diesel Fuel	275 (40" x 36" x 65")	Bermed Containment; Building Interior	19,908	Concrete
9B	Acacia Gate Fire Pump	Diesel Fuel	230 (72" x 32" x 24")	Bermed Containment; Building Interior	886	Concrete
9C	Bldg. #1 Emergency Genset	Diesel Fuel	175	Self-contained Fuel Tank	105	Steel

TANK NUMBER	LOCATION	CONTAINER CONTENTS	CONTAINER CAPACITY (GAL)	TYPE OF CONTAINMENT	CONTAINMENT VOLUME (GAL)	CONTAINMENT CONSTRUCTION
10A	Chemical Storage Building (CSB)	Gear, Lube, & Mineral Oils	3,850 (55-Gal Drums)	Building Interior	4,000	Concrete
10B	Chemical Storage Building (CSB)	Used Oils	220 (55-Gal Drums)	Building Interior	4,000	Concrete
10C	Chemical Storage Building (CSB)	Mineral Oil	1650 (275-Gal Totes)	Building Interior	4,000	Concrete
11A	Caterpillar Cogen. (Turbine Engine)	Lube Oil	1,100	Self-contained Tank	1,500	Steel
11B	Caterpillar Cogen. (Steam Turbine Engine)	Lube Oil	250	Self-contained Fuel Tank; Bermed	1,000	Steel; Concrete
12A #1 MF Saw	Building #21	Hydraulic Oil	85	Building Interior	27,000	Concrete
12B - #2 MF Saw	Building #21	Hydraulic Oil	85	Building Interior	27,000	Concrete
12C - #1 MF Baler	Building #21	Hydraulic Oil	250	Building Interior	27,000	Concrete
12D - #2 MF Baler	Building #21	Hydraulic Oil	230	Building Interior	27,000	Concrete
13 - B-1 Bath Baler	Building #8	Hydraulic Oil	300	Building Interior	20,000	Concrete

Whenever possible, storage drums are stored on-site on top of spill pallets. The spill pallets are made of polyethylene and are designed to contain the entire capacity of the drums stored atop them. The oil storage totes are similarly made of polyethylene and are installed with exterior metal framing to prevent damage from impacts, such as from on-site vehicles like forklifts.

Oils contained in operating machinery within the facility are considered to be contained by the building and by the distance from the machine to the nearest exit point. The outdoor oil storage areas that are bermed contain ramps for entry by fork trucks for the transportation of materials in and out of the storage areas.

Containment in the areas of truck unloading at the Facility is provided by curbed/bermed areas sufficiently large to contain the maximum capacity of a single compartment of a tank truck unloading at the facility. Any petroleum product spilled within such containment will be cleaned up before being disposed off-site.

Containment in the area of the tank car unloading is provided by curbed/bermed areas directing flow to drains for collection and clean-up before being discharged from the Facility. The bermed area for bulk unloading at the Tank Farm will hold approximately 600 gallons of material. A hand valve connects the bermed unloading area to a concrete sump which is inside an earthen dike, which is at a lower elevation. This hand valve is required to be kept open during all unloading.

The combined area within the bermed unloading area and the bulk chemical storage dike has sufficient volume to contain the contents of a tank truck compartment.

In the west gate receiving area, the monthly bulk unloading is only performed after ensuring that the storm drain cover is in place and spill sorbent materials are on-hand.

Valve operations are further discussed in Section 3.2.2 of this Plan.

2.20.2 Area Warning Measures [40 CFR§112.7(h)(2)]

Interlocked warning lights and physical barriers are not provided for the tank truck loading/unloading operations. The truck driver follows a written checklist procedure for hooking and unhooking temporary connections to oil transfer and bulk oil storage equipment. In addition, the truck driver always remains in the immediate area of the truck when loading and unloading operations are in progress, and provides constant attention to prevent the overfilling of a tank. The truck driver will contact the SPCC Coordinators to take immediate action in the event of an equipment failure or other condition resulting in a release of oil.

2.20.3 Inspection Measures [40 CFR§112.7(h)(3)]

The following inspection measures must be performed prior to filling or departure:

- Verification shall be made that the delivering vehicle contains the correct product prior to filling the container.

- During product handling operations, personnel shall continuously monitor both transport vehicles and fixed storage and transfer systems for leakage.

- After ensuring that transport vehicles are properly prepared for product handling operations, fixed facility piping, pumps, valves, loading and unloading stands, and dispensing nozzles, must be inspected to be certain that the system is set up to route the product through the system in the appropriate direction for its intended use or storage purpose.

- After completing product transfer, loading/unloading, dispensing, storage, and other product handling operations, both transport vehicles and fixed systems will be checked and inspected to ensure that pumps are shut off, all valves have been properly closed and locked, and hoses and pipes which could produce spillage have been evacuated. This inspection will include checking the lowest drain and outlet of the containers and vehicles. If necessary, they will be tightened, adjusted, or replaced to prevent liquid discharge while in transit.

Unloading procedures are further defined in the Facility's Procedure Manual 20-01, available for review to authorized personnel upon request at the office of the SPCC Coordinator. The procedures ensure that a Facility employee is on hand to check delivery and proper connection and disconnection of hoses.

2.21 Brittle Fracture Assessments [40 CFR§112.7(i)]

All field constructed above-ground containers subject to the SPCC rules that undergo a physical change (i.e., repairs, alternation, reconstruction, or change in service) must be reviewed for brittle fracture or other potential catastrophic failure.

If any aboveground container were constructed on-site, Kimberly-Clark Fullerton Mill must perform an assessment of the container that includes brittle fracture to ensure that any changes in service or operating conditions (types of liquids stored, increase operating pressures, etc) will not affect the structural integrity of the tank prior to initiating the change. After completion of any changes to the container, a visual inspection of the container by Kimberly-Clark Fullerton Mill must be performed and documented. Kimberly-Clark Fullerton Mill may order additional testing of the container to address any areas of concern identified during his review. Documentation of the failure analysis and container inspection performed by Kimberly-Clark Fullerton Mill as necessitated by changes to the containers will be kept at the Facility for a minimum of three years.

2.22 Conformance with State Requirements [40 CFR§112.7(j)]

In addition to the minimal prevention standards listed under this section, included in this Plan is a complete discussion of conformance with the applicable requirements and other effective discharge prevention and containment procedures listed in this part or any applicable more stringent State rules, regulations, and guidelines.

This Plan conforms to the requirements of the Cal/EPA's Hazardous Material Release Reporting, Inventory, and Response Plans under Title 19 Division 2 Chapter 4 of the California Code of Regulations.

2.23 Qualified Oil-filled Operational Equipment [40 CFR§112.7(k)]

This section of the SPCC rules is not applicable to the Facility.

3 ONSHORE FACILITIES (40 CFR§112.8)

This section provides specific provisions met to fulfill the requirements of the SPCC rules applicable to onshore facilities (excluding oil production facilities). These requirements are applicable to Kimberly-Clark Fullerton Mill.

3.1 General Requirements (non-specific) [40 CFR§112.8(a)]

This section of the SPCC rules provides non-specific requirements that can be found throughout this Plan, specifically in Sections 2 and 3.

3.2 Facility Drainage [40 CFR§112.8(b)]

3.2.1 Drainage From Diked Areas [40 CFR§112.8(b)(1)]

Whenever rainwater is collected in secondary containment and must be drained, the water must be inspected for any oil contamination prior to discharge. The secondary containment structures may be emptied by pumps or drainage; however, the Facility must manually operate these pumps and must visually inspect the accumulated water prior to discharge, to ensure that no oil is discharged. The Facility must maintain records of each event where drainage of uncontaminated rainwater is performed (see **Appendix F**). More detailed requirements for drainage of diked areas are included in Section 3.3.3 of this Plan.

3.2.2 Allowable Drainage Valves [40 CFR§112.8(b)(2)]

Only manually operated valves are allowed for servicing drainage from containment areas. These valves must be manual, open-and-closed design. Flapper-type valves are not permitted for drainage of secondary containment structures. All valves used for drainage must be normally closed and open only during drainage events and must be immediately closed and sealed tight. Valves that cannot produce a liquid tight seal when closed should be replaced.

Drainage valves associated with tote oil storage should be regularly inspected for possible leaks, and repaired or replaced when spill response personnel, or the SPCC Coordinators, deem such actions as necessary.

3.2.3 Facility Drainage System Design [40 CFR§112.8(b)(3)]

The Facility is not equipped with an oily water sewer (OWS) drainage system. Oil containing containers make use of curbing, retaining walls, and absorbent materials in the event of a spill or release.

3.2.4 Drainage Diversion System [40 CFR§112.8(b)(4)]

The Facility storm water discharge system is engineered to prevent discharge from the property except at designed outfalls.

The following drains are vulnerable storm sewer entry points around the Facility.

1. Ditch in the east side of the North-South Mill roadway flows to the storm sewer across Kimberly Avenue.
2. Drains from the truck and trailer parking area adjacent to the north gate flows to the 24 inch diameter storm sewer drainpipe.
3. Drains at the Stores warehouse truck dock.
4. Drains in the pulp track trainwell.
5. Drains in the paved area adjacent to the finished products dock.
6. Drains at the west gate receiving area.

3.2.5 Drainage Water Treatment [40 CFR§112.8(b)(5)]

Drainage waters at the Facility are not treated; therefore, this section of the SPCC rules is not applicable to the Facility.

3.3 Bulk Storage Containers [40 CFR§112.8(c)]

3.3.1 Container Compatibility Requirements [40 CFR§112.8(c)(1)]

All equipment, including but not limited to tanks, vessels, pipes, valves, pumps, containers and compressors must be constructed of materials which are compatible with the chemical that they service. All seals, gaskets and packing materials must be compatible with the material they service. No containers will be placed into service without meeting this requirement.

3.3.2 Secondary Containment Requirements [40 CFR§112.8(c)(2)]

For oil storage containers, a secondary means of containment must be constructed to hold the entire capacity of the largest single container and sufficient freeboard to contain precipitation.

For the steel bulk oil tanks located at the Facility, they are designed and equipped with integral secondary containment to contain any leaks or the potential of tank external corrosion. The drums and totes are usually stored in bermed areas for secondary containment, or atop spill pallets to contain leaks.

3.3.3 Drainage of Uncontaminated Rainwater [40 CFR§112.8(c)(3)]

Secondary containment structures at the Facility are designed to prevent the uncontrolled release of oil into the environment in the event of a container failure, system component failure or human error. At times, accumulated rainwater may have to be drained from the containment structures. These structures must be drained according to the following procedures:

- The decision to discharge uncontaminated rainwater from secondary containment areas must be made by a supervisor or SPCC Coordinator, who will visually inspect the water for sheen, film or other sign that pollutants are present. When the

inspection indicates that the accumulated water has not been visually impacted, the discharge of the rainwater will be allowed to proceed.

- If sheen or another indicator (olfactory) is observed during the initial inspection, the rainwater will be pumped into the wastewater tanks or drums for disposal offsite.

- All discharges from secondary containment structures will be documented using adequate records (**Appendix F**). Copies of these records must be kept for a minimum period of three years.

Accumulated rainwater can be obtained from pooling near concrete containment structures throughout the Facility. The rainwater is visually inspected for oil and sampled for laboratory analysis. If the rainwater is free of visible oil and meets the discharge requirements for the Facility, it is released to the storm sewer system. If it has visible oil and/or does not meet the Facility discharge requirements, it is transported to an appropriate offsite treatment facility.

3.3.4 Cathodic Protection Buried Tanks [40 CFR§112.8(c)(4)]

For completely buried metallic tanks installed on or after January 10, 1974 at this facility, tanks must (1) have corrosion protection with coatings or cathodic protection compatible with local soil conditions and (2) regular leak testing must be conducted.

There are no buried tanks at the Facility and therefore this section of the SPCC rules is not applicable to the Facility.

3.3.5 Cathodic Protection of Partially Buried Tanks [40 CFR§112.8(c)(5)]

For partially buried metallic tanks, the tanks must have corrosion protection with coatings or cathodic protection compatible with local soil conditions.

There are no partially buried or bunkered metallic tanks at the Facility and therefore this section of the SPCC rules is not applicable to the Facility.

3.3.6 Integrity Testing of Aboveground Containers [40 CFR§112.8(c)(6)]

The Facility must perform integrity testing of each aboveground container at the Facility that is subject to the SPCC rules on a regular schedule. **Table 2-1** in Section 2.6 of this Plan provides a listing of applicable containers at the Facility. This integrity testing should be scheduled on a regular basis to ensure testing of each container **within 10 years from the date of the last test for each container**. In the event, a container undergoes material repairs to its shell or containment wall/floor, the container must undergo integrity testing prior to bringing the container back into service. The integrity testing used by the Facility must combine visual inspection with another testing technique such as hydrostatic testing, acoustic emission testing or any other non-destructive shell testing.

At the Facility, 55-gallon drums are typically removed off-site for disposal within six months of becoming empty; therefore, drums will only be visually inspected for integrity while on-site. For all other aboveground containers at the Facility, the Facility must perform

and retain the inspection and integrity testing records for comparison purposes with subsequent future testing records. The integrity testing must include an inspection of the container's supports and foundations.

The following industry standards should be considered as guidelines by Kimberly-Clark Fullerton Mill for the performance of this testing, but are not mandatory requirements and similar or equivalent methods may be used by the Facility. However, the testing method used must be based on "published" written standards or procedures from a nationally recognized body [i.e. American Society of Testing Materials (ASTM), American Petroleum Institute (API), and American Society of Mechanical Engineers (ASME)].

- ASTM – E213-02 – Standard Practice for Ultrasonic Examination of Metal Piping and Tubing
- ASTM – E432-91 (Reapproved 1997) – Standard Guide for the Selection of a Leak Testing Method
- ASTM - E479-91 (Reapproved 2000) - Standard Guide for Preparation of a Leak Testing Specification;
- ASTM – E498-95 (Reapproved 2000) – Standard Test Methods for Leaks Using the Mass Spectrometer Leak Detector or Residual Gas Analyzer in the Trace Probe Mode;
- ASTM - E515-96 (Reapproved 2000) - Standard Test Method for Leaks Using Bubble Emission Techniques;
- ASTM - E1002-96 - Standard Test Method for Leaks Using Ultrasonics;
- ASTM – E1003-95 (Reapproved 2000) – Standard Test Method For Hydrostatic Leak Testing;
- ASTM E1211-02 – Standard Practice for Leak Detection and Location Using Surface-Mounted Acoustic Emission Sensors; and
- ASTM E1930-02 - Standard Test Method for Examination of Liquid-Filled Atmospheric and Low-Pressure Metal Storage Tanks Using Acoustic Emission

3.3.7 Control Leakage from Internal Heating Coils [40 CFR§112.8(c)(7)]

There are no internal heating coils on oil tanks in service at the Facility that discharge into an open watercourse or pass the stream return or exhaust lines through a settling tank, skimmer, or other separation or retention system. Therefore 40 CFR 112.8(c)(7) is not applicable to the Facility.

3.3.8 Overfilling Protection Requirements [40 CFR§112.8(c)(8)]

Direct monitoring of the container gauge will be employed by operating personnel during oil refilling to prevent overfilling of any of containers subject to the SPCC rules. For containers requiring manual filling, the Facility will employ an audible air vent for monitoring and preventing discharges from overfilling.

3.3.9 Effluent Treatment Observations [40 CFR§112.8(c)(9)]

There is no effluent treatment conducted at the Facility; therefore 40 CFR§112.8(c)(9) is not applicable to the Facility.

3.3.10 Correct Visual Leaks and Remove Accumulations [40 CFR§112.8(c)(10)]

Any visual leaks or discharges from containers including but not limited to seams, gaskets, piping, pumps, valves, bolts, or rivets; which result in a loss of oil will be promptly repaired and corrected by the Facility. In addition, any visual observations of oil accumulations in diked areas or secondary containment structures will be promptly removed by the Facility.

3.3.11 Mobile or Portable Containers Requirements [40 CFR§112.8(c)(11)]

The Facility will position or locate all mobile or portable containers subject to the SPCC rules in areas that will prevent a discharge. At the time of preparing this Plan, the Facility does not use any mobile tanks for its manufacturing operations, so this stipulation is not applicable to the Facility.

3.4 Buried Piping Cathodic Protection [40 CFR§112.8(d)(1)]

All oil product underground pipelines at the Facility from ASTs to areas of usage are corrosion wrapped or engineering designed with double wall containment piping. The primary and containment piping is constructed of material that is non-corrosive and is compatible with the materials being transferred.

3.5 Cap or Blank-Flange Connections [40 CFR§112.8(d)(2)]

All oil product pipelines and hose connections that are not in regular service are capped or blind flanged.

3.6 Pipe Supports Design [40 CFR§112.8(d)(3)]

Pipe supports are properly designed to minimize abrasion and corrosion and to allow for piping contraction and expansion as needed.

3.7 Inspection of Valves, Piping, and Appurtenances [40 CFR§112.8(d)(4)]

Regular visual inspections of valves, piping, and appurtenances will be performed by the Facility on an **annual basis (once every 12 months)**. Records of these inspections must be kept with the Plan for a minimum of three years. This inspection should include a review and assessment of the general condition of items, such as flange joints, expansion joints, valve glands and bodies, catch pans, pipeline supports, locking valves, and metal surfaces.

3.8 Vehicles Entering Facility [40 CFR§112.8(d)(5)]

A warning sign post at the Facility gate will warn all vehicles entering the Facility, to maintain proper clearance with all aboveground piping and structures at the Facility, and observe all posted signs and overhead clearance requirements.

3.9 Facility Response Plans [40 CFR 112.20]

A facility response plan (FRP) is needed if the owner or operator of any non-transportation-related onshore facility that, because of its location, could reasonably be expected to cause harm to the environment by discharging oil into or on navigable waters or adjoining shorelines and the facility meets the following criteria:

- The facility transfers oil over water to or from vessels and has a total oil storage capacity greater than or equal to 42,000 gallons; or
- The facility has a total oil storage capacity greater than or equal to 1 million gallons and other factors are applicable under 40 CFR 112.20(f)(ii).

Based on these criteria, the Kimberly-Clark Fullerton Mill Facility does not need a FRP: the total oil storage capacity of the Facility is 10,845 gallons and Facility does not transfer oil over water.

Appendices (Forms and Checklists)

The following appendices (**Appendices A** through **F**) are incorporated into the Plan as non-technical requirements. Therefore, changes to the forms and layout of these appendices do not require certification by a P.E.

However, the requirements for the performance of inspections, testing, and record keeping remain technical requirements of the Plan. Changes to the Facility Diagram (**Appendix G**) also require re-certification by a P.E.

Appendix A – Five Year Review Log (Record Plan Review)

Appendix B – Technical Amendment Log

Appendix C – Discharge Notification Form

Appendix D – Substantial Harm Criteria Certification

Appendix E – Bulk Storage Container Inspection Schedule

Appendix F – Uncontaminated Rainwater Drainage Log

Appendix G – Facility Diagram

APPENDIX A
Five Year Review Log (Record of Plan Review)

FIVE YEAR REVIEW LOG
(RECORD OF PLAN REVIEW)

Notwithstanding compliance with 40 CFR§112.5(b), the Plan must be reviewed and evaluated once every five years from the date the last Plan certification. Any amendments must be implemented as soon as possible but no later than six months.

APPENDIX B
Technical Amendment Log

RECORD OF AMENDMENTS
Log of Revisions to Plan

In accordance with 40 CFR§112.5(a), the Plan must be amended when there is a change in the Facility design, construction, operation, or maintenance that materially affects its potential for a discharge as described in 40 CFR§112.1(b). Any amendments must be implemented as soon as possible but no later than six months.

APPENDIX C
Discharge Notification Form

In the event of a discharge of oil to navigable waters or adjoining shorelines, the following information will be provided to the National Response Center [also see the notification information provided in Section 1.10 of the Plan]:

Information Provided to the National Response Center in the Event of a Discharge			
Discharge/Discovery Date:		Time:	
Facility Name:			
Facility Location (Address / Lat-Long / Section Township Range):			
Name of Reporting Individual:		Telephone #:	
Types of Material Discharged:		Estimated total quantity discharged:	Gallons/Barrels
Source of the Discharge:		Media Affected:	☐ Soil ☐ Water (specify) _____ ☐ Other (specify) _____
Actions Taken:			
Damage or injuries:	☐ No ☐ Yes (specify)	Evacuation needed?	☐ No ☐ Yes (specify)
Organizations and individuals contacted:	☐ National Response Center [800-424-8802] Time _____		
	☐ Cleanup Contractor (specify) Time _____		
	☐ Facility personnel (specify) Time _____		
	☐ State Agency (specify) Time _____		
	☐ Other (specify) Time _____		

APPENDIX D
Substantial Harm Criteria Certification

Substantial Harm Criteria Certification

1. Does the facility transfer oil over water to or from vessels and does the facility have a total oil storage capacity greater than or equal to 42,000?

   ☐ **YES** ☐ **NO**

2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?

   ☐ **YES** ☐ **NO**

3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and is the facility located at a distance such that a discharge from the facility could cause injury to fish and wildlife and sensitive environments?

   ☐ **YES** ☐ **NO**

4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and is the facility located at a distance such that a discharge from the facility would shut down a public drinking water intake?

   ☐ **YES** ☐ **NO**

5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and has the facility experienced a reportable oil discharge in an amount greater than or equal to 10,000 gallons within the last 5 years?

   ☐ **YES** ☐ **NO**

Certification

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe that the submitted information is true, accurate, and complete.

APPENDIX E
Bulk Storage Container Inspection Schedule

SPCC Container Inspection Procedure

Inspection Log and Schedule This log is intended to document compliance with §§112.6(a)(3)(iii), 112.8(c)(6), 112.8(d)(4), 112.9(b)(2), 112.9(c)(3), 112.9(d)(1), 112.9(d)(4), 112.9(c)(6), and 112.12(d)(4), as applicable.					
Date of Inspection	**Container/ Piping/ Equipment**	**Describe Scope (or cite Industry Standards)**	**Observations**	**Name/Signature of Inspector**	**Records Maintained separately**
					☐
					☐
					☐
					☐
					☐

To comply with integrity inspection requirements for bulk storage containers, inspect/test each shop-built aboveground bulk storage container on a regular schedule in accordance with a recognized container inspection standard based on the minimum requirements in the following table:

Bulk Storage Container Inspection Schedule	
Container Size and Design Specifications	**Inspection Requirement**
Portable containers (including drums, totes, and intermodal bulk containers (IBC))	Visually inspect monthly for signs of deterioration, discharges, or accumulation of oil inside diked areas.
55 to 1,100 gallons with sized secondary containment	Visually inspect monthly for signs of deterioration, discharges, or accumulation of oil inside diked areas plus any annual inspection elements per industrial inspection standards.
1,101 to 5,000 gallons with sized secondary containment and a means of leak detection	Visually inspect monthly for signs of deterioration, discharges, or accumulation of oil inside diked areas plus any annual inspection elements per industry inspection standards.
1,101 to 5,000 gallons with sized secondary containment and no method of leak detection	Visually inspect monthly for signs of deterioration, discharges, or accumulation of oil inside diked areas plus any annual inspection elements per industry inspection standards.

Monthly Drum Inspection Log

Any drums containing petroleum products or waste should be inspected monthly to ensure that proper container integrity is maintained and that no leaks are present. The following will serve as an inspection schedule to ensure proper containment and prevent leaks and spills.

Drum Location:	**Month of Inspection:**
	Additional Comments
Are drums in good condition (no holes, rust, dents, leaks, etc.)?	
Are drums clearly labeled as to content?	
Are emergency release valves present and operational?	
Have spills on the drums, near the drums, or in secondary containments been fully cleared?	
Are valves, filling ports, lids, and any other openings sealed/closed when not in use?	
Are secondary containments checked and found free of material?	
If rainwater collects in secondary containments, is it inspected for contamination and properly discharged each week?	
Are secondary containment valves kept closed?	
Are secondary containments sufficiently impervious to contain spills (i.e., no cracks, etc.)?	
Are spill response supplies available in sufficient quantities nearby?	
Additional Comments / Corrective Actions Taken:

Question Information

1. Has the Discharger conducted monthly visual observations (including authorized and unauthorized Non-Storm Water Discharges and Best Management Practices) in accordance with Section XI.A.1?

☒ Yes ☐ No

If No, see Attachment 1, Summary of Explanation.

2. Has the Discharger conducted sampling event visual observations at each discharge location where a sample was obtained in accordance with Section XI.A.2?

☒ Yes ☐ No

If No, see Attachment 1, Summary of Explanation.

3. Did you sample the required number of Qualifying Storm Events during the reporting year for all discharge locations, in accordance with Section XI.B?

☐ Yes ☒ No

If No, see Attachment 1, Summary of Explanation.

4. How many storm water discharge locations are at your facility?

2

5. Has the Discharger chosen to select Alternative Discharge Locations in accordance with Section XI.C.3?

☐ Yes ☒ No

6. Has the Discharger reduced the number of sampling locations within a drainage area in accordance with the Representative Sampling Reduction in Section XI.C.4?

☐ Yes ☒ No

7. Permitted facilities located within an impaired watershed must assess for potential pollutants that may be present in the facility's industrial storm water discharge. Using the table below, populated based on the facility's location, indicate the presence of the potential pollutant at the facility.
See Attachment 2 for the List of Identified Pollutants within the Impaired Watershed.

8. Has the Discharger included the above pollutants in the SWPPP pollutant source assessment and assessed the need for analytical monitoring for the pollutants?

☒ Yes ☐ No

If No, what date will the parameter(s) will be added to the SWPPP and Monitoring Implementation Plan?

9. Were all samples collected in accordance with Section XI.B.5?

☐ Yes ☒ No

If No, see Attachment 1, Summary of Explanation.

10. Has any contained storm water been discharged from the facility this reporting year?

☐ Yes ☒ No

If Yes, see Attachment 1, Summary of Explanation.

11. Has the Discharger conducted one (1) annual evaluation during the reporting year as required in Section XV?

☒ Yes ☐ No

If Yes, what date was the annual evaluation conducted? 06/22/2018

If No, see Attachment 1, Summary of Explanation.

12. Has the Discharger maintained records on-site for the reporting year in accordance with XXI.J.3?

☒ Yes ☐ No

If No, see Attachment 1, Summary of Explanation.

If your facility is subject to Effluent Limitation Guidelines in Attachment F of the Industrial General Permit, include your specific requirements as an attachment to the Annual Report (attach as file type: Supporting Documentation).

ANNUAL REPORT CERTIFICATION

I certify under penalty of law that this document and all attachments were prepared under the direction or supervision in accordance with a system designed to assure that qualified personnel propoerly gether and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

2017-2018

Annual Report for WDID 8 30I001214

Summary of Explanations

Explanation Question	Explanation Text
Question 3	The facility collected four (4) samples during the second half of this reporting year. Due to drought during the first half of the reporting year, from July 2017 through December 2017, there was no rain and therefore no Qualifying Storm Events that produced a runoff in the Fullerton area. Since there were NO qualifying rain events in the first half of the reporting year, July – December 2017, the facility was unable to pull two (2) samples. During the second half of the reporting year, from January to June 2018, there were multiple qualifying rain/storm events, and the facility was able to collect four (4) samples.
Question 9	The facility collected four (4) samples during the second half of this reporting year. Due to drought during the first half of the reporting year, from July 2017 through December 2017, there was no rain and therefore no Qualifying Storm Events that produced a runoff in the Fullerton area. Since there were NO qualifying rain events in the first half of the reporting year, July – December 2017, the facility was unable to pull two (2) samples. During the second half of the reporting year, from January to June 2018, there were multiple qualifying rain/storm events, and the facility was able to collect four (4) samples.

Submittal Status

Submitted on 2/28/2018 by *Patrick Luu* of Kimberly-Clark Worldwide, Inc. (Fullerton, CA)
Submittal was ***Accepted***; Processed on 6/2/2018 by *James Hendron* for Orange County Environmental Health

Hazardous Materials

Does your facility have on site (for any purpose) at any one time, hazardous materials at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids in ASTs and USTs); or is regulated under more restrictive inventory local reporting requirements (shown below if present); or the applicable Federal threshold quantity for an extremely hazardous substance specified in 40 CFR Part 355, Appendix A or B; or handle radiological materials in quantities for which an emergency plan is required pursuant to 10 CFR Parts 30, 40 or 70?	Yes

Underground Storage Tank(s) (UST)

Does your facility own or operate underground storage tanks?	No

Hazardous Waste

Is your facility a Hazardous Waste Generator?	Yes
Does your facility treat hazardous waste on-site?	No
Is your facility's treatment subject to financial assurance requirements (for Permit by Rule and Conditional Authorization)?	No
Does your facility consolidate hazardous waste generated at a remote site?	No
Does your facility need to report the closure/removal of a tank that was classified as hazardous waste and cleaned on-site?	No
Does your facility generate in any single calendar month 1,000 kilograms (kg) (2,200 pounds) or more of federal RCRA hazardous waste, or generate in any single calendar month, or accumulate at any time, 1 kg (2.2 pounds) of RCRA acute hazardous waste; or generate or accumulate at any time more than 100 kg (220 pounds) of spill cleanup materials contaminated with RCRA acute hazardous waste.	No
Is your facility a Household Hazardous Waste (HHW) Collection site?	No

Excluded and/or Exempted Materials

Does your facility recycle more than 100 kg/month of excluded or exempted recyclable materials (per HSC 25143.2)?	No
Does your facility own or operate ASTs above these thresholds? Store greater than 1,320 gallons of petroleum products (new or used) in aboveground tanks or containers.	Yes
Does your facility have Regulated Substances stored onsite in quantities greater than the threshold quantities established by the California Accidental Release prevention Program (CalARP)?	Yes

Additional Information

No additional comments provided.

SECTION 2

INTRODUCTION AND PUBLIC REVIEW

This Storm Water Pollution Prevention Plan (SWPPP) and Storm Water Monitoring Program (SWMP) for Kimberly Clark located at 2001 East Orangethorpe Avenue in Fullerton, California, was prepared as required by the Santa Ana Regional Water Quality Control Board (RWQCB) to meet the requirements of the California State Water Resources Control Board Water Quality Order 2014-0057-DWQ, National Pollutant Discharge Elimination System (NPDES), General Permit No. CAS000001 for *Discharges of Storm Water Associated with Industrial Activities Excluding Construction Activities*

Coverage under this permit requires submittal of a Notice of Intent (NOI) and preparation of a storm water pollution prevention plan (SWPPP), which identifies site-specific Best Management Practices (BMPs) for reducing pollutants in storm water discharges and elimination of unauthorized non-storm water discharges. Records of all monitoring information, copies of all reports required by the General Permit, and report of compliance with the SWPPP will be kept onsite. The Storm Water Permit is administered locally by the Regional Board.

Santa Ana Regional Water Quality Control Board
3737 Main Street, Suite 500
Riverside, CA 92501
Telephone: (951) 782-4130
Fax: (951) 781-6288

The NPDES General Permit is in compliance with Section 402 of the Clean Water Act and has been adopted by the State Water Resources Control Board for regulations associated with industrial activities.

This Plan was prepared under the direction of, and reviewed by:

Name:	Grace Madden
Title:	Environmental Coordinator
Company:	Kimberly-Clark Fullerton Mill

BACKGROUND

On November 16, 1990, the U.S. Environmental Protection Agency (U.S. EPA) promulgated the National Pollutant Discharge Elimination System (NPDES) Permit Applications for Storm Water Discharges as required in the 1987 amendments to the Clean Water Act (CWA) of 1972. The regulations require that storm water associated with industrial activity (storm water) that discharges either directly to surface waters or indirectly through municipal separate storm sewers must be regulated by an NPDES permit. The original NPDES permitting program as legislated in the CWA of 1972, allowed the regulation of the amount of pollutants that a facility could discharge into public, navigable waters. The program mandated specific amounts of industry specific pollutants that would be permitted for discharge. A periodic monitoring and reporting program for every facility insured compliance by industry. The NPDES program is recognized as having significantly reduced the amount of pollution entering the waters of the United States from point sources.

As discharges came under control, it became evident pollution was still occurring. The EPA funded the Nationwide Urban Runoff Program (NURP) from 1978 to 1983 to pinpoint if storm water runoff was a significant contributor to poor water quality. A simple definition of storm water runoff would be "water discharged as a result of rain, snow, or other precipitation." The NURP provided evidence that urban and industrial runoff typically contains significant amounts of the same types of pollutants found in wastewater and industrial discharges. These include heavy metals (e.g. chromium, cadmium, copper, lead, nickel, and zinc), pesticides, herbicides, and organic compounds such as fuels, waste oils, solvents, lubricants, and grease.

In 1987 the Water Quality Act of 1987 revised the CWA to include Section 402(p) to address storm water discharges. The final storm water regulations begin implementing Section 402 (p) of the CWA, which establishes a framework for regulating municipal and industrial storm water discharges under the NPDES program. Section 402 (p) of the CWA lists five types of storm water discharges which are required to obtain a permit prior to October 1, 1992.

- Industries that discharge storm water to waters of the United States.
- A discharge with respect to which a permit has been issued under Section 402 (p) before February 4, 1987.
- Municipalities with population greater than 100,000 but less than 250,000 that discharge storm water in separate storm sewer systems directly to waters of the United States.
- Municipalities with population greater than 250,000 that discharge storm water in separate storm sewer systems directly to waters of the United States.
- Any storm water discharge that the regulatory authority determines as a violation of water quality standards or as a significant contributor of pollutants to the waters of the United States.

The EPA regulations allow states to issue General Storm Water Permits or Individual Permits to regulate industrial storm water discharges. California State Water Board has elected to a standard General Permit that will apply to all industrial storm water discharges requiring a permit. The most recent revision of this General Permit was approved on April 1, 2014, with its taking effect on July 1, 2015. A separate statewide General Permit has been issued for construction activity. This General Permit is intended to cover all new or existing discharges composed of industrial

storm water from facilities required by federal regulations to obtain a permit. The CWA is the interface between state law (e.g. California's Porter-Cologne Water Quality Control Act) and Title 23. The State Regional Water Quality Control Board has been given the responsibility for the permitting, management, and enforcement of the Storm Water Discharge Act. The State Regional Water Quality Control Board (SRWQCB) has been issuing either General or Group Permits.

The General Permit requires Dischargers to:

1. Eliminate unauthorized non-storm water discharges (NSWDs);
2. Develop and implement storm water pollution prevention plans (SWPPPs) that include best management practices (BMP);
3. Implement minimum BMPs, and advanced BMPs as necessary, to achieve compliance with the effluent and receiving water limitations of the General Permit;
4. Conduct monitoring, including visual observations and analytical storm water monitoring for indicator parameters;
5. Compare monitoring results for monitored parameters to applicable numeric action levels (NALs) derived from the U.S. EPA 2008 Multi-Sector General Permit for Storm Water Discharges Associated with Industrial Activity (2008 MSGP) and other industrial storm water discharge monitoring data collected in California;
6. Perform the appropriate Exceedance Response Actions (ERAs) when there are exceedances of the NALs; and
7. Certify and submit all permit-related compliance documents via the Storm Water Multiple Application Reporting and Tracking System (SMARTS). Dischargers shall certify and submit these documents which include, but are not limited to, Permit Registration Documents (PRDs) including Notices of Intent (NOIs), No Exposure Certifications (NECs), and Storm Water Pollution Prevention Plans (SWPPPs), as well as Annual Reports, Notices of Termination (NOTs), Level 1 ERA Reports, and Level 2 ERA Technical Reports.

Facilities that discharge storm water associated with industrial activity requiring a General Permit are listed by category in 40 Code of Federal Regulations (CFR) Section 122.26(b) (14). The facilities can be publicly or privately owned. These facilities are identified in the Federal regulations by a Standard Industrial Classification (SIC).

Facility operators are required to comply with the terms and conditions of the General Permit. This includes the development and implementation of an effective Storm Water Pollution Prevention Plan (SWPPP) to reduce or prevent pollutants associated with industrial activity in storm water discharges and authorized non-storm water discharges. Best Management Practices (BMPs) are included in the SWPPP to prevent or reduce the contact of non-storm water discharges. In addition, a Storm Water Monitoring Program (SWMP) is also required to demonstrate compliance with the General Permit, aid in the implementation of the SWPPP and measure the effectiveness of the BMPs.

STORM WATER POLLUTION PREVENTION PLAN (SWPPP)

The General Permit requires that all Dischargers develop, implement, and retain onsite a site-specific SWPPP. The SWPPP requirements generally follow U.S. EPA's five-phase approach to developing SWPPPs, which has been adapted to reflect the requirements of the General Permit as illustrated in Figure 2 of the General Permit. This approach provides the flexibility necessary to establish appropriate BMPs for different industrial activities and pollutant sources. The General Permit requires a Discharger to include in its SWPPP (Section X of the General Permit) a site map, authorized non-storm water discharges (NSWDs) at the facility, and an identification and assessment of potential pollutants sources resulting from exposure of industrial activities to storm water.

The General Permit requires that Dischargers clearly describe the BMPs that are being implemented in the SWPPP. In addition to providing descriptions, Dischargers must also describe *who is responsible for the BMPs, where the BMPs will be installed, how often and when the BMPs* will be implemented, and identify any pollutants of concern. Table 2 of the General Permit Fact Sheet provides an example of how a Discharger could assess potential pollution sources and provide a corresponding BMPs summary.

The General Permit requires that Dischargers select an appropriate facility inspection frequency beyond the required monthly inspections if necessary, and to determine if SWPPP revisions are necessary to address any physical or operational changes at the facility or make changes to the existing BMPs (Section X.H.4.a.vii and Section XI.A.4 of the General Permit). Facilities that are subject to multi-phased physical expansion or significant seasonal operational changes may require more frequent SWPPP updates and facility inspections. Facilities with very stable operations may require fewer SWPPP updates and facility inspections.

Failure to develop or implement an adequate SWPPP, or update or revise an existing SWPPP as required, is a violation of the General Permit. Failure to maintain the SWPPP on-site and have it available for inspection is also a violation of the General Permit.

Dischargers are also required to submit their SWPPPs and any SWPPP revisions via SMARTS; accordingly, BMP revisions made in response to observed compliance problems will be included in the revised SWPPP electronically submitted via SMARTS.

STORM WATER MONITORING PROGRAM (SWMP)

The General Permit requires Dischargers to develop and implement a facility-specific monitoring program. Monitoring is defined as visual observations, sampling, and analysis. The monitoring data will be used to determine (1) whether BMPs addressing pollutants in industrial storm water discharges and authorized NSWDs are effective for compliance with the effluent and receiving water limitations of the General Permit, (2) the presence of pollutants in industrial storm water discharges and authorized NSWDs (and their sources) that may trigger the implementation of additional BMPs and/or SWPP revisions, and (3) the effectiveness of BMPs in reducing or preventing pollutants in industrial storm water discharges and authorized NSWDs.

All facility operators (with the exception of inactive mining operations) are required to:

1. Perform visual observations of storm water discharges and authorized storm water discharges.
2. Collect and analyze samples of storm water discharges. Analysis must include total suspended solids (TSS), oil and grease (O&G), and pH. Additionally, it is required to evaluate the facility and analyze samples for additional facility specific parameters. Figure 3 of the General Permit provides a summary of all the monitoring-related requirements of the General Permit.

Dischargers are only required to obtain samples required during scheduled facility operating hours and when sampling conditions are safe in accordance with Section XI.C.6.a.ii of the General Permit.

The State Water Board recognizes that it may not be feasible for all facilities to obtain four qualifying storm events (QSEs) in a reporting year because there may not be enough qualifying storm events to do so. Therefore, a Discharger that is unable to collect and analyze storm water samples from two QSEs in each half of a reporting year due to a lack of QSEs is not in violation of Section XI.B.2 of the General Permit. Dischargers that miss four QSEs during a reporting year due to the fact that four QSEs did not occur are not required to make up these sampling events in subsequent reporting years.

RETENTION OF RECORDS

The facility operator is required to retain records of all monitoring information, copies of all reports required by the General Permit, and records of all data used to complete the NOI for a period of five years from the date of measurement, report, or monitoring activity. This period may be extended by the State and/or Regional Water Boards. All records are public documents and must be provided to the Regional Water Boards on request.

FACILITY OPERATOR COMPLIANCE RESPONSIBILITIES

The General Permit has been written to encourage individual facility operators to develop their own SWPPP and monitoring programs. Many facility operators, however, choose to obtain compliance assistance either by hiring a consultant on an individual basis or by participating in a group monitoring plan. Regardless of how a facility operator chooses to pursue compliance, it is the facility operator that is responsible for compliance with the General Permit.

PUBLIC REVIEW

This SWPPP is available for public review, pursuant to Section 308(b) of the Federal Clean Water Act. Public requests to review this document should be made through the California Regional Water Quality Control Boards.

SECTION 3

FACILITY DESCRIPTION

Kimberly-Clark occupies a site that is approximately 67 acres in size. The site is located at 2001 East Orangethorpe Avenue in Fullerton, California. The site is bounded by industrial areas. The land used in the areas surrounding the facility is industrial.

Kimberly Clark manufactures facial tissue, bath, tissue, towels, and wipers for commercial use. The standard industrial code that applies to this facility is 2621 – Paper Mills.

General Descriptions of the Major Processes

The main areas of the facility are the office/manufacturing building, parking areas, storage areas, and loading/unloading areas.

The office/manufacturing building serves as two purposes: office work and the manufacturing of paper. The offices are used solely for administrative duties.

The manufacturing activities are conducted throughout the rest of the building. Raw materials enter the mill via truck and/or railcar. Fiber, water, and chemicals are then mixed in the pulpers. The resulting wet paper slurry is transferred to the process equipment, where it is formed, dried, and wound to produce a hardroll or a big roll of tissue or wipers. The hardroll is then converted, packaged, labeled, and either stored in the warehouse or shipped off-site. The manufacturing activities are conducted indoors.

Regular parking for employees and visitors is located southeast of the office/manufacturing building. Trailer parking may be found at the southeastern and northeastern corners of the site.

The storage areas are immediately east of the office/manufacturing building. These areas are used to store pulp, chemicals, and occasionally products. Tanks that store chemicals are surrounded by impervious secondary containment.

The loading/unloading areas are located on the eastern and western sides of the main building. Materials are immediately transferred inside the building or to the storage areas after unloading.

The facility has implemented a vigorous house-keeping program to keep debris, trash, and particulate generating activities from becoming exposed to storm water. Various employees and contractors provide indoor and outdoor housekeeping and maintenance. Employees and contractors perform housekeeping, sweeping and pick-up debris on a regular basis.

The normal hours of operation at the facility are twenty-four hours a day, seven days a week.

Figure 3-1 presents an aerial photograph of the facility and surrounding area. **Figure 3-2** presents a topographic map of the surrounding area. **Figure 3-3** presents a facility map showing building location and industrial activity areas.

Storm Water Conveyance System

There are two main storm water conveyance systems. The first system is on the west side of the facility and conveys storm water through underground pipes beneath the main building. Storm water enters this system from eaves, spouts, and other means. This stormwater gathers together at a storm drain located in the northwestern corner of the facility, underneath the floor. The second flow of storm water starts from the parking areas and outdoor storage areas, converging at an internal road next to the orange grove. From here it flows north to a storm drain at the north gate on Kimberly Avenue.

A. DESCRIPTION OF SIGNIFICANT MATERIALS

Significant materials stored outside the main office/manufacturing building include pulp and chemicals used in manufacturing. These materials are stored in other enclosed buildings and containers with secondary containment.

B. SUMMARY OF BEST MANAGEMENT PRACTICES

The management practices indicated below have been implemented at this facility to minimize contact of significant materials with storm water discharges:

- Good housekeeping measures are maintained, including observing outdoor areas, maintaining cleanliness, properly covering and storing materials, and minimizing authorized discharges.

- Preventative maintenance is practiced by inspecting outdoor equipment and systems that leak pollutants and by establishing an appropriate maintenance schedule for this equipment.

- Procedures and controls are established to minimize spills and leaks, and response procedures are developed to promptly clean and dispose of materials.

- Proper material handling and waste management are maintained by correct storage, prompt cleaning, and minimizing handling of industrial materials that can come into contact with storm water.

- Erosion and sediment controls are in place to control wind erosion, provide stabilization for inactive areas, and divert run-on and storm water from inside the facility away from erodible materials.

- Appropriate employee training is given to relevant personnel who have responsibilities relevant in maintaining compliance with the General Permit.

- Suitable implementation records are kept for a minimum of five years, and management procedures are implemented that ensure appropriate staff implements all elements of the SWPPP.

C. POTENTIAL POLLUTANTS IN STORM WATER DISCHARGE

Potential pollutants that may be present in storm water discharged from this facility are listed in Section A. Data is not available to support an estimate of annual quantities of these materials that may be discharged in storm water.

D. EXISTING STORM WATER SAMPLING DATA

Storm water sampling data is located in the Environmental Coordinator's office.

E. HISTORY OF SIGNIFICANT SPILLS SINCE NOVEMBER 17, 1994

As per our interview with the facility personnel, there have been no significant spills or leaks of toxic or hazardous pollutants into storm water, including chemicals that have been reported on EPA Form R (40 CFR 372), and oil or substances in excess of reportable quantities (40 CFR 110, 117, or 302).

F. STORM WATER POLLUTION PREVENTION TEAM

Personnel from various departments are selected to be members of the Storm Water Pollution Prevention Team (SWPPT). The SWPPT is responsible for developing the SWPPP, SWPPP implementation and revision, and conducting all monitoring program activities. This team is defined and responsibilities are assigned in Section 9.

SECTION 4

NON-STORM WATER DISCHARGES

The General Permit covers all discharges of storm water and authorized non-storm water from industrial facilities designated by Federal regulations. There are two types of non-storm water discharges (NSWDs): authorized non-storm water and unauthorized non-storm water discharges. Authorized non-storm water discharges originate from specific sources and do not contain pollutants, nor are they exposed to surface contaminants. Examples include potable water sources relating to operation, maintenance, or testing of potable water systems, irrigation drainage, landscape watering, etc. Unauthorized non-storm water discharges can be generated from a wide variety of potential pollutant sources including waters from rinsing or washing vehicles, equipment, buildings, or pavements.

Pursuant to the Clean Water Act (CWA), unauthorized non-storm water discharges are prohibited and shall be eliminated. Best Management Practices (BMPs) are included in this SWPPP to prevent or reduce the contact of non-storm water discharges and minimize, to the extent practicable, the flow or volume of non-storm water discharges.

Potential Authorized Non-Storm Water Sources

- General faucet water
- Sprinkler and fire hydrant flushing
- Irrigation
- Landscaper watering

Potential Unauthorized Non-Storm Water Sources

- Water from rinsing vehicles, equipment, pavement
- Discharges from equipment or vehicles that contain pollutants
- Wash water from cleaning

If the facility does wash vehicles or equipment on site, it prevents the wash fluid from entering the storm water system.

Presented below is a template of the investigating form for non-storm water discharges. This form should be used to investigate non-storm water discharges at the facility.

INVESTIGATING FORM FOR NON-STORM WATER DISCHARGES

Date(s) observed.

Visual description of non-storm discharge:

Source(s) of non-storm discharge:

Quantity of non-storm water discharge (per typical event, annually, etc):

Typical frequency of discharge

Associated drainage area of non-storm water discharge.

Authorized by 2015 General Permit (Yes / No)?

Description of BMPs to prevent or reduce contact of non-storm water discharges with significant materials or equipment.

SECTION 5

POTENTIAL POLLUTANT SOURCES AND ASSOCIATED BEST MANAGEMENT PRACTICES

The sources of pollutants that may enter storm water at this facility are indicated below. The BMPs implemented to minimize pollutants contact with storm water at each source are also indicated.

Source	Pollutant	Best Management Practice
Parking Areas	Petroleum Products (oil, fuel, grease)	The area is paved.
		Vehicles are inspected to ensure there are no leaks.
		Personnel are instructed not to perform maintenance on vehicles in this area.
		Area is swept / cleaned.
		Any leaks are immediately reported to the *Environmental Coordinator*

Source	Pollutant	Best Management Practice
Loading / Unloading Area	Petroleum Products (oil, fuel, grease), Chemicals, Trash	Loading/unloading area is paved.
		Routine maintenance to ensure equipment is operating properly.
		Any leaks are promptly corrected.
		Park vehicles and conduct loading/unloading only in designated loading/unloading areas so that spills or leaks can be contained.
		Clean loading/unloading areas regularly to remove potential sources of pollutants.
		Reduce exposure of materials to rain.
		Incidental spills are contained in a sump.
		Absorbents and appropriate cleanup materials are available in the event of spills.

Source	Pollutant	Best Management Practice

Material Storage Areas	Pulp, Fiber, Chemicals	Materials are primarily stored in enclosed storage buildings or tanks with secondary containment.
		Store materials on paved or impervious surfaces if necessary.
		Protect materials stored outside from storm water run-on.
		Protect materials stored outside from rainfall and wind dispersal.
		Area is swept / cleaned.
		Conduct regular inspections of storage areas.
		Absorbents and appropriate cleanup materials are available in the event of spills.
		Minimize pooling of water.

Source	Pollutant	Best Management Practice
Tank Farm (Aboveground Storage Tanks)	Liquid Chemicals	Use impervious secondary containment berms
		Dike is dug around the tanks.
		In case of large storm discharge, a portable pump will transfer the water to the mill effluent system.
		Concrete sump is connected to the bermed area to contain excess liquid.
		Area is swept / cleaned.
		Conduct regular inspections.
		Absorbents and appropriate cleanup materials are available in the event of spills.

Source	Pollutant	Best Management Practice
Wastewater Treatment Area	Wastewater	The area is paved.
		Routine maintenance to ensure system is operating properly.
		Absorbents and appropriate cleanup materials are available in the event of spills.
		Protect from rainfall and wind dispersal.
		Area is swept / cleaned.
		Conduct regular inspections.

SECTION 6

FACILITY-WIDE BEST MANAGEMENT PRACTICES

To reduce the possibility of hazardous materials and contaminants from entering the storm water discharge, all outdoor areas are inspected weekly and any debris, wastes, or spills are cleaned immediately.

Industrial materials that can be readily mobilized by contact with storm water are stored in covered containment areas or buildings. Any non-solid industrial materials such as liquids and powders are kept in closed containers to prevent dispersion from wind or contact with storm water.

Rinse or wash water that contacts industrial material is prevented from being disposed through the storm drain system. Non-industrial storm water is diverted from industrial areas to prevent contamination.

Weekly inspections are conducted to ensure no equipment is leaking or is in a condition that will lead to leaks. All waste disposal containers are sent off-site for disposal. Runoff from the east blacktop area is captured in a sump and the rainwater is recycled in the waterplant. Any outdoor material or waste handling equipment is inspected and cleaned to prevent contamination with industrial materials or wastes.

The storm water prevention controls used at the facility include the use of the physical building, bermed areas, secondary containment, covered storage areas, and/or an impermeable surface covering the soils in the area of industrial activity. The roofed building prevents the storm water from being contaminated by the full range of materials used within the physical building.

The facility recognizes the importance of the human-factor in preventing pollutants from commingling with the storm water discharges. The management intends to provide training to remind employees with topics such as spill prevention, good house-keeping, hazardous materials handling, and proper machine maintenance. The storm water management team will also be familiarized with the SWPPP and SWMP, as well as enforcing the best management practices.

Suitable implementation records are kept for a minimum of five years, and management procedures are implemented that ensure appropriate staff implements all elements of the SWPPP.

SECTION 7

PREVENTATIVE MAINTENANCE ACTIVITIES AND GOOD HOUSEKEEPING

A. PREVENTATIVE MAINTENANCE

Preventative maintenance at the facility is performed to prevent leaks and other accidental releases from equipment and storage containers, and to maximize the removal of pollutants provided by BMPs that have been implemented. Preventative maintenance performed at this facility is listed below:

- Inspect all equipment and systems to detect leaks or conditions that may result in the development of leaks on a periodic basis.

- Check the integrity of all containers holding petroleum hydrocarbons, chemicals, or other potential pollutants, and replace as necessary.

B. GOOD HOUSEKEEPING PRACTICES

Good housekeeping practices are measures that maintain a clean and orderly working environment. These measures include immediately cleaning up spilled materials, regularly sweeping paved areas, and depositing waste in designated receptacles. At the present time, the facility has assigned employees and contractors to maintain good housekeeping outdoors. All employees are responsible for maintaining their own work areas. Asset/team leaders are responsible for ensuring that work areas are orderly.

At the facility, the following housekeeping activities are scheduled to be performed weekly:

- Inspect all outdoor areas associated with industrial activity, storm water discharge locations, drainage areas, conveyance systems, perimeter areas affected by off-facility materials or storm water run-on, and waste handling or disposal areas weekly to determine housekeeping needs.

- Cover all stored industrial materials that are not in the containment area that can readily be mobilized by contact with storm water.

- Stormdrain area is covered to prevent debris/trash from getting into the storm drain.

- Contain all non-solid industrial materials that can be transported or dispersed by wind dissipation or contact with storm water.

The employee training program is intended to increase employee awareness of how their daily work activities and work areas can contribute pollutants to storm water discharges, and to suggest ways that their work habits could be modified to reduce the amounts of pollutants that are eventually washed away in storm water.

SECTION 8

SPILL PREVENTION AND RESPONSE

Materials stored and used at the facility could cause significant water quality impacts if accidentally released. Spilled materials could enter the storm water drainage system and be discharged to surface water. Spills could also cause soil and ground-water contamination. Measures have been implemented to minimize the possibility of spills. In addition, spill response procedures have been established for this facility. The spill prevention and response measures implemented by this facility are indicated below:

- Employee Training

  Employees who work with or around chemical and petroleum materials are trained in the proper use, handling, storage, and disposal practices[1]. Employees are also trained in proper spill response procedures.

- Spill Containment and Cleanup Equipment

  A supply of spill containment and cleanup equipment is kept on-site for prompt responses. Available equipment includes personal protective equipment and absorbent materials.

- Regular Inspection of Hazardous Materials and Wastes Storage Areas

  Employees who regularly work with or around chemical and petroleum products and wastes are instructed to inspect building storage area regularly and to initiate corrective measures, if needed.

- Locate Hazardous Materials Storage Areas Away From Storm Drain Inlets and Drainage Ways

  Chemical and other manufacturing materials storage areas are located away from storm drain inlets or other storm water drainage ways to minimize the possibility that spills would be discharged into the storm drainage system. The knife gate is opened during a rain event and closed after the rain event.

- Notification Procedures in Case of Spill Emergency

  Employees are instructed to notify the Emergency Response Team (ERT) and/or the Fire Chief and the Environmental Coordinator, as soon as practical, of any spills. The Emergency Response Team (ERT) is also notified in an emergency. The facility will notify agencies listed in the emergency or spill response plan, as required.

---

[1] Hazard Communication 29 CFR 1200, Hazardous Materials Release Response Plans and Inventory CHCS Ch. 6.95, Generator Requirements 22 CCR 12 and 40 CFR 172 (H), HAZWOPER 29 CFR 120

- List of Contractors Compiled to Assist in Spill Response

  A list of names and phone number of the nearest emergency response contractors have been compiled and are available in the Environmental Coordinator's office.

- Safety Data Sheets (SDS)

  SDSs (formerly called MSDS or Material Safety Data Sheets) of the hazardous materials present at the facility are kept on-site and are kept current.

SECTION 9

STORM WATER POLLUTION PREVENTION TEAM

A Storm Water Pollution Prevention Team (SWPPT) has been developed and is responsible for developing the SWPPP, SWPPP implementation and revision, and conducting all monitoring program activities. The SWPPT and their SWPPP responsibilities are described below.

STORM WATER POLLUTION PREVENTION TEAM

1. *Name·* Grace Madden
   Title: Environmental Coordinator
   Work Phone No. (714) 680-7507
   SWPPP Responsibilities, Duties, and Activities·
   Overseeing the Storm Water Pollution Prevention and Monitoring Program; ensuring compliance; sampling of events; coordinating and/or conducting annual inspections; conducting training.
2. *Name* Kelly Hsu / M. Venegas / J. Wratschko (Backup)
   Title· Distribution Manager / Distri.Analyst/ Disti. IC Specialist
   Work Phone No (714) 680-7422 / (714) 680-7475 / (714)680-7513
   SWPPP Responsibilities, Duties, and Activities:
   Overseeing the Storm Water Pollution Prevention and Monitoring Program; ensuring compliance; sampling of events; coordinating and/or conducting annual inspections; conducting training.

3. *Name.* Lynn Bresnahan / John Kennedy
   Title· TM/WP/Cogen Team Leader / TM/Maint. Team Leader
   Work Phone No (714) 680-7410 / (714)680-7452
   SWPPP Responsibilities, Duties, and Activities·
   Overseeing the Storm Water Pollution Prevention and Monitoring Program; ensuring compliance; sampling of events; coordinating and/or conducting annual inspections; conducting training.

4. *Name:* David Grouls II / Derek Tafoya / Dave Surber (Backup)
   Title· TC Asset Leader / TC Asset Coord./ TC Team Leader
   Work Phone No (714) 680-7418 / (714) 680-7482 / (714)680-7436
   SWPPP Responsibilities, Duties, and Activities·
   Overseeing the Storm Water Pollution Prevention and Monitoring Program; ensuring compliance; sampling of events; coordinating and/or conducting annual inspections; conducting training.

SECTION 10

RECORD KEEPING

Records will be kept on-site of all storm water related compliance activities for a minimum of five years. These completed records will be kept in the environmental files located in the Environmental Coordinator's office. The materials that will be retained to document compliance with Section X of the NPDES No. CAS000001 Order 2014-0057-DWQ will consist of the following:

- Copy of NPDES No. CAS000001
- SWPPP and future revisions
- All inspection forms related to storm water
- Records of preventative maintenance activities related to storm water discharges
- Records of storm water monitoring
- Annual reports submitted to the Regional Water Quality Control Board
- Records of spills and cleanup activities
- Employee training records, including course sign-in rosters
- Correspondences with regulatory agencies regarding storm water discharge

SECTION 11

EMPLOYEE TRAINING PROGRAM

Employee awareness of the relationship between their daily activities and storm water pollution is essential in improving the quality of storm water discharged from this facility. This training is updated annually following the annual SWPPP review. The employee training program covers the elements indicated below:

NPDES Storm Water Requirements

Employees are informed of NPDES permit requirements and potential penalties for violations.

Storm Water Drainage and Sanitary Sewers

Employees have been instructed on the differences between storm water conveyances and sanitary sewers including the types of water or wastewater that may be discharged to the systems.

Sources and Effects of Pollutants

Employees have been informed of the sources of pollutants present on the facility that could be discharged with storm water. They have also been instructed on the effects of different types of pollutants on receiving surface waters.

Best Management Practices

Employees have been familiarized with the best management practices that are being implemented at the facility and their individual responsibilities for maintaining the effectiveness of the best management practices.

Proper Chemical and Petroleum Storage, Handling, and Disposal Practices

Employees who work with chemicals and petroleum products and waste, including fuel, lubricating oil, solvents, and batteries have been trained in the proper storage, use, handling, and disposal of these materials.

Spill Response Procedures

Employees who regularly work with chemicals, petroleum products, and waste have been trained to cleanup minor spills (generally, less than one gallon) of these materials, to notify supervisors/managers of all spills, and to recognize conditions that require the assistance of emergency contractors.

Good Housekeeping

Employees have been instructed in good housekeeping practices that should be incorporated into their daily activities to reduce the amounts of pollutants discharged in storm water.

Preventative Maintenance

Designated employees have been instructed on the preventative maintenance activities, and frequencies, that are to be performed on storm water conveyances and other equipment that could contribute pollutants to storm water.

Storm Water Conveyance/Discharge Inspection

Designated employees have been trained to perform inspections of storm water conveyances, discharge points, and sources of pollutants at specified frequencies to identify potential discharges of contaminated run-off.

Inspectors

Inspectors are trained in all inspections required by the SWPPP.

SECTION 12

MONITORING PLAN

STORM WATER MONITORING PROGRAM AND REPORTING PLAN

The Storm Water Pollution Prevention Plan per the General Industrial Activity Storm Water Permit issued by the State of California requires the implementation of a monitoring program and reporting plan. An effective Monitoring Program and Reporting Plan will aid the facility in meeting the following objectives:

1. To monitor the quantity and quality of the storm water discharges during each half of the reporting year (July 1 to December 31 and January 1 to June 30).

2. To verify the elimination of non-storm water discharges.

3. Aid in the implementation of the Storm Water Pollution Prevention Plan.

4. To insure the effectiveness of the best management practices in preventing and removing pollutants in the storm water discharge.

The facility's Storm Water Monitoring Program consists of a sampling plan and an analysis protocol, and is summarized in a procedure in Appendix A of this Plan.

ANNUAL COMPREHENSIVE FACILITY COMPLIANCE EVALUATION

The facility shall conduct one Annual Evaluation for each reporting year (July 1 to June 30). It shall revise the SWPPP, as appropriate, and implement the revisions within 90 days of the Annual Evaluation. At a minimum, Annual Evaluations shall consist of (1) a review of all sampling, visual observation, and inspection records conducted during the previous reporting year; (2) an inspection of all areas of industrial activity and associated potential pollutant sources for evidence of, or the potential for, pollutants entering the storm water conveyance system; (3) an inspection of all drainage areas previously identified as having no exposure to industrial activities and materials in accordance with the definitions in Section XVII of the General Permit; (4) an inspection of equipment needed to implement the BMPs; (5) an inspection of any BMPs; (6) a review and effectiveness assessment of all BMPs for each area of industrial activity and associated potential pollutant sources to determine if the BMPs are properly designed, implemented, and are effective in reducing and preventing pollutants in industrial storm water discharges and authorized NSWDs; and (7) an assessment of any other factors needed to comply with the requirements in Section XVI.B of the General Permit.

MONTHLY VISUAL OBSERVATIONS

At least once per calendar month, the facility shall visually observe each drainage area for the following:

- ✓ The presence or indications of prior, current, or potential unauthorized NSWDs and their sources;
- ✓ Authorized NSWDs, sources, and associated BMPs to ensure compliance with Section IV.B.3 of the General Permit; and,
- ✓ Outdoor industrial equipment and storage areas, outdoor industrial activities areas, BMPs, and all other potential sources of industrial pollutants.

The monthly visual observations shall be conducted during daylight hours of scheduled facility operating hours and on days without precipitation. The facility shall provide an explanation in the Annual Report for uncompleted monthly visual observations.

Please refer to Attachment 3 in Appendix A of the Plan for the monthly visual observation form to be used for this purpose.

SAMPLING EVENT VISUAL OBSERVATIONS

Sampling event visual observations shall be conducted at the same time sampling occurs at a discharge location. At each discharge location where a sample is obtained, the Discharger shall observe the discharge of storm water associated with industrial activity.

The facility shall ensure that visual observations of storm water discharged from containment sources (e.g. secondary containment or storage ponds) are conducted at the time the discharge is sampled. It shall ensure that visual observations and sampling of storm water discharges from volume-based or flow-based treatment BMPs and any bypass that occurs are conducted at the same time. It shall visually observe and record the presence or absence of floating and suspended materials, oil and grease, discolorations, turbidity, odors, trash/debris, and source(s) of any discharged pollutants.

In the event that a discharge location is not visually observed during the sampling event, the facility shall record which discharge locations were not observed during sampling or that there was no discharge from the discharge location.

The facility shall provide an explanation in the Annual Report for uncompleted sampling event visual observations.

Please refer to Attachment 2 in Appendix A of the Plan for the sampling event visual observation form to be used for this purpose.

STORM WATER SAMPLING AND ANALYSIS

At the facility, there are two main storm water conveyance systems. The first system is on the west side of the facility and conveys storm water through underground pipes beneath the main building. Storm water enters this system from eaves, spouts, and other means, which gathers together at a storm drain in the northwestern corner of the facility, underneath the floor. The second flow of storm water starts from the parking areas and outdoor storage areas, converging at an internal road next to the orange grove. From here it flows north to a storm drain at the north

gate on Kimberly Avenue. The facility's designated storm water sampling points will be at the two aforementioned storm drains. By sampling at the above proposed locations, the facility will have a reasonably accurate representation of the storm water runoff from the property.

A Qualifying Storm Event (QSE) is a precipitation event that produces a discharge for at least one drainage area and is preceded by 48 hours with no discharge from any drainage area. The facility shall collect and analyze storm water samples from two QSEs within the first half of each reporting year (July 1 to December 31), and two QSEs within the second half of each reporting year (January 1 to June 30).

Except as provided in Section XI.C.4 (Representative Sampling Reduction) of the General Permit, samples shall be collected from each drainage area at all discharge locations. The samples must be representative of storm water associated with industrial activities and any commingled authorized NSWDs, or Associated with the discharge of contained storm water.

Samples from each discharge location shall be collected within four hours of the start of the discharge or start of facility operations if the QSE occurs within the previous 12-hour period (e.g., for storms with discharges that begin during the night for facilities with day-time operating hours). Sample collection is required during scheduled facility operating hours and when sampling conditions are safe in accordance with Section XI.C.6.a.ii of the General Permit.

A certified California laboratory will provide appropriate sampling equipment and containers to collect samples for the analysis the following parameters.

Facility Location	**Sample Parameter**	**Sample Bottle**	**Sample Preservation**
Storm Water Sampling Point	pH	1L Glass	None
	Total Suspended Solids	1L Plastic	4°C
	Oil & Grease	1L Glass	H_2SO_4, 4°C
	Ammonia	1L Glass	None

The samples will be iced or refrigerated after collection and transported as soon as practical to a certified California laboratory.

Analysis shall be conducted on samples from a total of at least four QSEs.

Analytical results will be submitted to the Environmental Coordinator. The SWPPT will review the results and compare to receiving water limitations. If results indicate elevated levels of pollutants in the storm water the SWPPT will review the BMPs and discuss improvements. The SWPPP will be revised accordingly.

Analysis results will be filed in environmental files located in the Environmental Coordinator's office.

Qualifying storm events shall be sampled until the permit requirements are completed. For those events that are later found not to be significant, the samples shall be discarded. In case that an event occurred and samples were not taken, a narrative description of why the event was not sampled shall be recorded. The description shall include documentation of the event, adverse conditions (drought, extended freeze, or dangerous weather conditions) and other pertinent information. This description shall be included with the annual monitoring report to be submitted to the Regional Water Quality Control Board by July 1st.

EXCEEDENCE RESPONSE ACTION (ERA)

All sample analysis results shall be compared with the parameter numeric action level (NAL) values to determine if the facility's status will change. Facilities will begin with a Baseline status for all parameters. The NAL values are listed below:

PARAMETER	TEST METHOD	REPORTING UNITS	ANNUAL NAL	INSTANTANEOUS MAXIMUM NAL
pH*	See Section XI.C.2	pH units	N/A	Less than 6.0 Greater than 9.0
Suspended Solids (TSS)*, Total	SM 2540-D	mg/L	100	400
Oil & Grease (O&G)*, Total	EPA 1664A	mg/L	15	25
Zinc, Total (H)	*EPA 200.8*	*mg/L*	*0.26***	
Copper, Total (H)	EPA 200.8	mg/L	0.0332**	
Cyanide, Total	SM 4500--CN C, D, or E	mg/L	0.022	
Lead, Total (H)	EPA 200.8	mg/L	0.262**	
Chemical Oxygen Demand (COD)	SM 5220C	mg/L	120	
Aluminum, Total	EPA 200.8	mg/L	0 75	
Iron, Total	*EPA 200.7*	mg/L	*1.0*	
Nitrate + Nitrite Nitrogen	SM 4500-NO3- E	mg/L as N	0.68	
Total Phosphorus	SM 4500-P B+E	mg/L as P	2.0	
Ammonia (as N)	SM 4500-NH3 B+ C or E	mg/L	2.14

Silver, Total (H)	EPA 200.8	mg/L	0.0183**	
Biochemical Oxygen Demand (BOD)	*SM 5210B*	*mg/L*	*30*	

Level 1 Status

In the event the sampling results indicate an NAL exceedance for a specific parameter, the facility will have their status changed from baseline to Level 1 starting July 1 of the following reporting year.

A facility entering a Level 1 status is required to complete an ERA evaluation by October 1 and submit an ERA report by January 1, which must be completed by a Qualified Industrial Storm Water Practitioner (QISP).

The ERA evaluation should identify:

- The industrial pollutant sources at the facility that are or may be related to the NAL exceedance; and

- The corresponding BMPs in the SWPPP and any additional BMPs to prevent future NAL exceedances.

Based upon the above evaluation, the SWPPP should be revised as necessary to incorporate any additional BMPs.

The ERA report must be certified and submitted via SMARTS by the QISP. This report should include the following:

- A summary of the ERA Evaluation; and

- A detailed description of the SWPPP revisions and any additional BMPs for each parameter that exceeded an NAL.

The facility will return to baseline status once the report has been completed, all identified additional BMP's have been implemented and results from four (4) consecutive QSEs that were sampled indicate no additional NAL exceedances for that parameter.

Level 2 Status

If sample results show an NAL exceedance for that same parameter while the facility is in Level 1, the facility's status will change from Level 1 to Level 2. Level 2 status will begin on July 1 of the following reporting year.

The facility must submit via SMARTS an ERA Action Plan prepared by a QISP by January 1. In the Plan, the facility will have to identify which demonstration it has selected to perform. The Plan will also include a detailed description of the tasks required to complete the demonstration, which correlate to the sources of the NAL exceedance at the facility.

The three demonstrations are as follows:

- Industrial Activity BMPs (Pollutant sources from industrial activities on-site);

- Non-Industrial Pollutant Source (Pollutant sources from non-industrial activities on-site);

- Natural Background Pollutant Source (Pollutant sources from nature).

In the ERA Technical Report, the facility will address one or more of the above demonstrations. For each demonstration, the Report should include:

- Industrial Activity BMPs
    - A description of the industrial pollutant source;
    - An evaluation of all pollutant sources associated with the NAL exceedance;
    - The facility's implemented BMPs and any additional BMPs identified in the ERA Action Plan to eliminate future NAL exceedance.

- Non-Industrial Pollutant Source
    - A statement acknowledging the NAL exceedance is attributable only to the presence of non-industrial pollutant;
    - A statement that the facility has identified and evaluated all potential pollutant sources that may have contacted with storm water from industrial activities;
    - An assessment of the relative contributions of the pollutant;
    - A summary of all existing BMPs for that parameter.

- Natural Background Pollutant Source (Pollutant sources from nature)
    - A statement that the facility has determined the NAL exceedance is attributable only to the presence of the pollutant in the natural background and not disturbed by industrial activity;
    - A summary of all data previously collected by the facility that describes the levels of natural background pollutants in the storm water discharge;
    - A summary of any research or literature that relates to the natural background pollutants.

The report should be prepared by a QISP and submitted via SMARTS on January 1.

A facility with a Level 2 status who submits the Technical Report, implements all BMP's to prevent future NAL exceedance for the Level 2 parameter and has four (4) consecutive QSE samples that indicate no exceedance can return to Baseline status. However, if future NAL exceedances occur for the same parameter, the facility will return to Level 2 status in the following year.

Qualified Industrial Storm Water Practitioner (QISP)

A QISP is only required once a discharger reaches Level 1 status. It can be any person designated by the facility. However, this person must complete the QISP training, according to a State Water Board-sponsored or approved training course, and register as a QISP via SMARTS to be qualified. Upon completed registration, the State Water Board will issue a QISP identification number.

The QISP's responsibilities include:

- Implementing the SWPPP;

- *Assisting in the preparation of Annual Reports;*

- Training the appropriate team members assigned to perform activities required by the General Permit;

- Assisting the Discharger in completing Level 1 ERA Evaluation requirements (e.g. evaluating or revising BMPs) as specified in Section XII of the General Permit;

- Preparing and submitting Level 1 ERA reports, Level 2 ERA Action Plans or Level 2 ERA Technical Reports.

The facility shall ensure that the designated QISP is geographically located in an area where they will be able to perform the permit requirements.

Inspection Summary

Type of Inspection	Description	Frequency	Who
Storm Water Analysis (Attachment 5)	Samples will be taken from designated sampling points.	Twice per each half of reporting year (July 1 to December 31 and January 1 to June 30)	SWPPP Team Member/Leader
Monthly Visual Observations (Attachment 3)	The entire facility will be visually inspected to determine the effectiveness of the SWPPP implementation All areas possibly containing the pollutant sources will be inspected. The inspection will include an assessment of whether good housekeeping practices and preventative maintenance activities are being performed. Storm water discharge point will be visually inspected for evidence of dry weather discharge. If found, the source(s) and corrective measures will be identified, as appropriate. Corrective action will be implemented if deficiencies are identified.	Once per calendar month	SWPPP Team Member/Leader
Sampling Event Visual Observations (Attachment 2)	Storm water discharge point will be inspected for visible pollutants. If found, the source(s) will be identified and appropriate corrective measures will be implemented.	Every time Storm Water Analysis samples are taken	SWPPP Team Member/Leader
Annual Comprehensive Facility Compliance Evaluation (Attachment 4)	A review of all visual observation records, inspection records and analysis results. An inspection of all potential pollutant sources for evidence of, or the potential for, pollutants entering the drainage system. A review and evaluation of all BMPs to determine whether the BMPs are adequate, properly implemented and maintained, or whether additional BMPs are needed.	Annually July 1 through June 30 *Within 8 – 16 months of each other*	SWPPP Team Leader
Annual Report	An annual report is required to be submitted electronically to the Regional Water Quality Control Board. The report forms can be found at: http://www.waterboards.ca.gov	**By July 15th each year**	SWPPP Team Leader

APPENDIX A

ATTACHMENTS

Attachment 1: Sampling Event Visual Observation Record
Attachment 2: Sampling Event Visual Observation Form
Attachment 3: *Monthly Visual Observation Record*
Attachment 4: Annual Comprehensive Facility Compliance Evaluation
Attachment 5: Storm Water Sampling and Analysis Procedure

Attachment 1

SAMPLING EVENT VISUAL OBSERVATION RECORD

***Facility Location*:** Kimberly Clark
2001 East Orangethorpe Avenue
Fullerton, CA 92831

***Basic Requirements*:**

(1) Storm water discharge visual observations are required every time Storm Water Analysis samples are taken.
(2) Visual observations must be conducted during the first four hours of the start of the discharge or start of facility operations if the qualifying storm event occurs within the previous 12-hour period.

Visual observations are only required of storm water discharges that occur under a precipitation event that:

- ✓ Produces a discharge for at least one drainage area, and
- ✓ Is preceded by 48 hours with no discharge from any drainage area.

Records of observation dates, locations observed, observations, and the response taken to reduce or prevent pollutants in storm water discharges shall be maintained in the waste water treatment department by the waste treatment operator. The SWPPP shall be revised as necessary to reflect the appropriate corrective action.

Please use the template form in Attachment 2 for this storm water discharge observation purpose.

Attachment 2

SAMPLING EVENT VISUAL OBSERVATION FORM

Facility Location: Kimberly Clark
2001 East Orangethorpe Avenue
Fullerton, CA 92831

Observer's Name: _____

Title: _____

Observation Date & Time: _____

Rain Started at: _____

Discharge Location:

Were pollutants observed? (i.e. presence of floating and suspended material, oil and grease, discolorations, turbidity, foam, or odor). Provide description below:

If pollutants were observed, describe potential source(s) and actions taken to reduce impact of source(s) on the storm water discharge.

Action taken to address the deficiencies:

Attachment 3

MONTHLY VISUAL OBSERVATION RECORD

Facility Location: Kimberly Clark
2001 East Orangethorpe Avenue
Fullerton, CA 92831

Basic Requirements:

(1) Monthly visual observations are required to observe current and detect prior unauthorized non-storm water discharges.
(2) Monthly visual observations are required during daylight hours of scheduled facility operating hours and on days without precipitation.
(3) Each unauthorized non-storm water discharge source, impacted drainage area, and discharge location must be identified and observed.

Observer's Name: _____

Title: _____

Observation Date & Time: _____

_____

Discharge Location:

Was non-authorized non-storm water discharge or abnormal patterns observed? (e.g. leaking containers, presence of discolorations, stains, odors, floating materials)

Action taken to address the deficiencies:

Attachment 4

ANNUAL COMPREHENSIVE FACILITY COMPLIANCE EVALUATION

On or before July 1 of each calendar year, a facility compliance inspection shall be conducted by members of the Storm Water Pollution Prevention team. The purpose of the annual inspection shall be to verify that all elements of the Storm Water Pollution Prevention Plan are accurate. This inspection shall include areas such as the site map, potential pollution sources and structural and non-structural controls. Observations that require a response shall become part of the permanent record of the Storm Water Pollution Prevention Plan.

***Facility Location*:** Kimberly Clark
2001 East Orangethorpe Avenue
Fullerton, CA 92831

***Basic Requirements*:**

(1) Annual evaluation should be conducted once in each reporting period (July 1 – June 30)
(2) A review of all visual observations, inspection records, and sampling and analysis results.
(3) A visual inspection of all potential pollutant sources for evidence of, or the potential for, pollutants entering the drainage system via a site inspection.

Observer's Name: _____

Title: _____

Observation Date & Time: _____

_____

Site Evaluation Results:

Are current best management practices (BMPs) adequate to control contaminant sources that may contribute to storm water pollution? If no, list the deficiencies in existing BMPs, or the new BMPs that are needed to address the issues identified below:

Action taken to address the deficiencies and responsible person(s) to implement corrective actions:

Attachment 5

STORMWATER SAMPLING AND ANALYSIS PROCEDURE

Facility Location: Kimberly Clark
2001 East Orangethorpe Avenue
Fullerton, CA 92831

Basic Requirements:

(1) Sampling should be conducted twice per each half of the reporting year (July 1 to December 31 and January 1 to June 30).
(2) Review and summary of all sampling and analysis results in the Annual Report filed by July 1 of each year.

The sample collection shall be accomplished with a sample grab-sampling device. The storm water response team member shall initiate the sampling plan within thirty minutes of the start of a storm event. The team shall respond to all events until the required analysis is completed. Samples shall be placed in appropriate containers and sent to a state certified laboratory off site for all analysis.

Samples from a minimum of two qualifying storm events per each half of the reporting year (July 1 to December 31 and January 1 to June 30) shall be analyzed. The specific analysis of the storm water samples collected shall be conducted by a State certified laboratory.

Sample Location Selection

At the facility, there are two main storm water conveyance systems. The first system is on the west side of the facility and conveys storm water through underground pipes beneath the main building. Storm water enters this system from eaves, spouts, and other means, which gathers together at a storm drain in the northwestern corner of the facility, underneath the floor. The second flow of storm water starts from the parking areas and outdoor storage areas, converging at an internal road next to the orange grove. From here it flows north to a storm drain at the north gate on Kimberly Avenue. The facility's designated storm water sampling points will be at the two aforementioned storm drains. By sampling at the above proposed locations, the facility will have a reasonably accurate representation of the storm water runoff from the property.

Training

Training shall be provided to the personnel who are responsible for (1) implementing activities identified in this procedure, (2) conducting inspections, sampling, and visual observations, and (3) managing storm water. Training should address topics such as spill response, good housekeeping, and material handling procedures, and actions necessary to implement all the best management practices identified in the document. Records should be maintained of all training sessions held.

APPENDIX B

GLOSSARY

Beneficial Uses

Beneficial Uses of waters of the state that may be protected against quality degradation include, but are not necessarily limited to, domestic, municipal, agricultural, and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves.

Best Management Practices

Best Management Practices are administrative, procedural, and physical measures to prevent or reduce the amounts of pollutants that are discharged in storm water. These measures include scheduling waste pickup promptly, implementing written policies for good housekeeping, providing secondary containment around tanks, and treating storm water to remove pollutants.

BMPs

See "Best Management Practices."

Clean Water Act

The Clean Water Act is also referred to as the Federal Water Pollution Control Act, passed by Congress in Public Law 92-500 as amended. This law authorized the federal Environmental Protection Agency to establish the NPDES program for the purpose of protecting water quality in the United States.

Contamination

Contamination means an impairment of the quality of the waters of the state by a waste to a degree which creates a hazard to the public health through poisoning or through the spread of disease. Contamination shall include any equivalent effect resulting from the disposal of waste, whether or not waters of the state are affected.

CWA

See "Clean Water Act."

General Permit

For all areas of the State except for Santa Clara County, the General Permit in the SWPPP refers to the NPDES Permit for Discharges of Storm Water Associated with Industrial Activities adopted by the State Water Resource Control Board, including future amendments. For discharges within Santa Clara County, the General Permit refers to the NPDES Permit for Discharges of Storm Water Associated with Industrial Activities within Santa Clara County, adopted by the San Francisco Bay Regional Water Quality Control Board, including future amendments.

National Pollutant Discharge Elimination System

The National Pollutant Discharge Elimination System is the permitting program mandated by the federal Clean Water Act to control pollutant discharges into navigable waters in the United States. This program is being implemented by the SWRCB and RWQCBs within California.

Non-Storm Water Discharge

A Non-Storm Water Discharge is any water leaving a facility via a storm water system that is not entirely composed of storm water except for the following: water line flushing and other discharges from potable water sources, landscape irrigation and lawn watering, irrigation water, diverted stream flows, rising ground-water, infiltration to separate storm drains, uncontaminated pumped ground-water, foundation and footing drains, water from crawl space pumps, air conditioning condensation, springs, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and flows from firefighting.

NPDES

See "National Pollutant Discharge Elimination System."

Nuisance

Nuisance means anything which: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of a property, so as to interfere with the comfortable enjoyment of life or property; and (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal; and (3) occurs during or as a result of the treatment or disposal of wastes.

Pollution

Pollution means an alteration of the quality of waters of the state by waste to a degree which unreasonably affects (1) waters for beneficial uses, or (2) facilities which serve such beneficial uses. Pollution may include contamination.

Regional Water Quality Control Board

The Regional Water Quality Control Boards formulate, adopt, and implement policies to protect the beneficial uses of surface and ground-water within their jurisdiction. There are nine regions in California. The regional boards also implement policies adopted by the State Water Resources Control Board, including enforcing the NPDES General Permit for Storm Water Discharges Associated with Industrial Activities.

RWQCB

See "Regional Water Quality Control Board."

Significant Quantities

Significant Quantities is the volume, concentrations, or mass of pollutants in storm water discharge that can cause or threaten to cause pollution, contamination, or nuisance, adversely impact human health or the environment, and cause or contribute to a violation of any applicable water quality standards for the receiving water.

Significant Storm Water Discharge

Significant Storm Water Discharge is a continuous discharge of storm water for a minimum of one hour, or intermittent discharge of storm water for a minimum of three hours in a 12-hour period.

Significant Materials

Significant Materials are all materials that have the potential to release pollutants to storm water, including aggregate, petroleum products, solvent, paint, Portland cement, hazardous waste, and trash.

State Water Resource Control Board

The State Water Resource Control Board is the agency responsible for formulating and adopting state policy for water quality control, including resource management and protection, in California. The state board adopted the NPDES General Permit for Storm Water Associated with Industrial Activities in California.

Storm Water

Storm Water means rain water run-off, snow melt run-off, and surface run-off and drainage. It excludes infiltration and run-off from agricultural land.

Storm Water Associated with Industrial Activities

Storm Water Associated with Industrial Activities is a discharge from any conveyance which is used for collecting and conveying storm water and which is directly related to (passes through or collects storm water from) manufacturing, processing, or raw materials storage areas at an industrial plant. Storm water from areas separate from the plant's industrial activities, such as office building and employee parking lots, are excluded from this definition as long as drainage from the excluded areas is not mixed with storm water drained from the industrial areas.

SWRCB

See "State Water Resource Control Board."

Waste

Waste includes sewage and any and all other waste substances, liquid, solid, gaseous, or radioactive, associated with human habitation, or of human or animal origin, or from any producing, manufacturing, or processing operation of whatever nature, including such waste placed within containers of whatever nature prior to, and for purposes of, disposal.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Antea Group were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

Naperville, IL 60563
Contact: Dan Keltner

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Antea Group were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Search Results:

P.O.# NA
Project: 180630592A

Coordinates:

Latitude:	33.861422 33° 51' 41" North

Dear Ms./ Mr. Sichley:

We have received your Public Records Act Request for records from the Department of Toxic Substances Control.

After a, thorough review of our files we have found that records exist at this office pertaining to the site/facilities referenced below.

- KIMBERLY CLARK CORP

We would also like to inform you about Envirostor, a database that provides information and documents on over 5,000 DTSC cleanup sites. EnviroStor can be accessed at: http://www.envirostor.dtsc.ca.gov/public.

If you have any questions, would like further information regarding your request or would like to set an appointment, please contact our Regional Records Coordinator at (714)484-5337.

Sincerely,

Julie Johnson

No Records Found

Non California Manifest Total Tonnage

No Records Found

The Department of Toxics Substances Control (DTSC) takes every precaution to ensure the accuracy of data in the Hazardous Waste Tracking System (HWTS). However, because of the large number of manifests handled, inaccuracies in the submitted data, limitations of the manifest system and the technical limitations of the database, DTSC cannot guarantee that the data accurately reflect what was actually transported or produced.

February 2, 2001

Ms. Grace Madden
Environmental Coordinator
Kimberly Clark Worldwide, Inc.
2001 E. Orangethorpe Avenue
Fullerton, CA 92831

NOTICE OF VIOLATION: FAILURE TO COMPLY WITH THE GENERAL PERMIT FOR STORM WATER DISCHARGES ASSOCIATED WITH INDUSTRIAL ACTIVITIES, ORDER NO 97-03-DWQ, NPDES NO. CAS000001 (WDID #8 30 S 001214)

Dear Ms. Madden:

As you are aware, NPDES Permit No. CAS000001, General Permit for Storm Water Discharges Associated with Industrial Activities (General Permit), prohibits the discharge of materials other than storm water from industrial sites. The General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP), emphasizing Best Management Practices (BMP), designed to reduce/eliminate migration of sediment and other pollutants to storm drains and/or receiving waters.

Regional Water Board staff inspected your facility located at 2001 E. Orangethorpe Avenue, on January 31, 2001. The facility is covered under the General Permit and is identified by WDID No. 830S001214. During this inspection, the following problems were observed:

- Improved general housekeeping is needed in several areas, including loading/unloading docks and around salt containers, to keep the site free of tissue debris, salt and dirt, which may be transported to the storm drain system;

- BMPs need to be identified and implemented specifically for the outdoor pulp storage area in order to prevent pollutant discharge into the storm drain system;

- A dumpster situated adjacent to a storm channel had contents that were overflowing and spilling onto the channel grating. Although it is labeled "Metal Only," other materials, including sodium sulfite, were disposed of in this dumpster; and no BMPs are in place to prevent exposure of the contents with storm water and consequent pollutant discharge into the storm drain system; and,

- The site map should show more clearly the direction of storm water flow and location of the storm drain system throughout the facility. Analysis of your storm water samples show frequent high values for SC and TSS; if storm water sampling were to be conducted such that each potential pollutant discharge area could be accurately evaluated, area specific BMPs could be developed to reduce pollutant loading.

This site is currently in violation of the General Permit, the California Water Code and the federal Clean Water Act. We request that you immediately address the findings outlined above and submit a letter to this office by February 16, 2001, specifically addressing each problem. Failure to correct the above-mentioned problems and submit the requested information may result in enforcement action, including civil monetary penalties of up to $10,000 for each day of violation.

If you have any questions, please contact Zulakha Khan at (909) 782-4925, or Kathy Rose at (909) 321-4585.

Sincerely,

Mark E. Smythe, Chief
Storm Water Unit

February 15, 2001

Mr. Mark Smythe
Chief, Storm Water Unit
California Regional Water Quality Control Board
3737 Main Street, Suite 500
Riverside, California 92501-3348

SUBJECT: KIMBERLY-CLARK WORLDWIDE INC. – FULLERTON MILL
NOTICE OF VIOLATION

Dear Mr. Smythe:

This letter is submitted in response to the Notice of Violation (NOV) issued to Kimberly-Clark Worldwide Inc.'s Fullerton Mill ("K-C" or "the mill") on February 2, 2001. As you know, K-C currently operates under a General Permit for Storm Water Discharges Associated with Industrial Activities (NPDES Permit No. CAS000001). In accordance with this permit, K-C has developed a comprehensive Storm Water Pollution Prevention Plan (SWPPP) pursuant to which it has designed and implemented a number of Best Management Practices (BMPs) to minimize or avoid the impact of it's operations on storm water. The mill continues to operate in compliance with the General Permit. Though the observations made during your visit indicated a potential for storm water impacts, no such impacts occurred as controls are presently in place.

At the time of your inspection, the mill had just recently experienced five days of energy curtailments. Loss of electrical power to the mill results in process down time and often creates several abnormal operating conditions, including the need to temporarily manage excess materials . These conditions may have contributed to the observations noted in your February 2 letter. As such, these observations should not be considered "typical" of the Fullerton Mill's operation.

To ensure that potentially contaminated storm water not be released from the Fullerton Mill's property, an emergency responder was called in to pump out the storm water. The entire North gate storm drain channel within the facility to the closed knife gate valve and adjacent areas were cleaned, pressure washed and the stormwater and wastewater was disposed off-site to a licensed waste disposal facility. The mill's storm water discharge point must be manually opened to release accumulated storm water. The storm water

release gate was in the "closed" position during the recent inspection by California Regional Water Quality Control Board personnel and allowed no discharge. As such, K-C does not believe that any harm to the environment occurred as a result of the conditions observed during the Board's inspection.

To address the items of concern noted in your February 2, 2001 letter, the following activities are currently under development or implementation at the mill:

- The mill has reviewed its existing housekeeping practices in areas including the loading/unloading docks, around the salt containers and storage areas. To ensure that these areas are kept free of tissue debris, salt, dirt or other materials that may be transported to the storm drain system, the frequency of housekeeping activities (sweeping, general cleaning, area inspections, etc.) has been increased. If mill personnel are not available to conduct the necessary housekeeping activities, a contractor will be hired.

- In addition to expanded housekeeping practices, the mill is currently evaluating installation or implementation of possible structural and/or administrative BMPs for the above areas, such as:
    - Installation of chute extensions to minimize overflow from waste bins.
    - Installation of secondary containment around the salt containers.
    - Placement of tarps over salt and other materials currently stored outdoors to minimize contact with storm water.
    - Reinforcement of the mill's existing program of employee storm water pollution prevention training to ensure that those working in this area understand the mill's storm water pollution prevention policies.
    - Installation of signage regarding spill prevention and control in the vicinity of the storm drains to remind employees working in the area of the mill's procedures regarding waste disposal, spill clean-up and storm water pollution prevention.
    - Efforts to reduce the inventory of materials stored in pulp area will also be implemented to minimize potential exposure to storm water.

- The "Metal Only" dumpsters have been relocated. The area adjacent to the storm drain is clear and "No Parking" signs have been posted. As noted above, the mill's waste disposal, spill prevention and storm water procedures and policies have been re-emphasized to employees working in this area. In addition, signage has been installed at the storm drains to remind employees of the importance of keeping storm drains clear of any materials.

- The mill's site map currently indicates the direction of storm water flow and the location of the storm drain system throughout the facility. This site map will be reviewed and expanded if necessary. Upon implementation of the above BMPs and other controls, the mill will assess storm water discharges to evaluate the effectiveness of these controls.

If you have any questions regarding this issue or require additional information, please feel free to contact Ms. Grace Madden, the Fullerton Mill Environmental Coordinator, at (714)773-7500.

Sincerely,

Edward J. Bowersox
Mill Manager

FAILURE TO COMPLY WITH REPORTING REQUIREMENTS UNDER THE STATEWIDE GENERAL PERMIT FOR STORM WATER DISCHARGES ASSOCIATED WITH INDUSTRIAL ACTIVITIES, ORDER NO. 97-03-DWQ, NPDES NO. CAS000001 (GENERAL PERMIT), WDID # 8 30I001214

Dear Grace Madden:

Your facility located at 2001 E Orangethorpe Ave, in the city of Fullerton, is regulated under the General Industrial Permit (General Permit) and is identified by WDID number 8 30I001214. The General Permit requires all facility operators to submit an Annual Report by July 1 of each year to the Executive Officer of the Regional Water Board. Section B.14 of the General permit requires that the Annual Report include a summary of visual observations and sampling results, an evaluation of the visual observation and sampling and analysis results, laboratory reports, the Annual Comprehensive Site Compliance Evaluation Report, an explanation of why a facility did not implement any activities required by the General Permit (if not already included in the Evaluation Report), and records specified in Section B.13.i. The Annual Report shall be signed and certified in accordance with Standard Provisions 9 and 10 of Section C of the General Permit.

The following issues were identified with the 2013-2014 Annual Report:

- **Missing quarterly visual authorized discharge observations (Form 2)**

To comply with the General Permit, please submit a revised copy of the 2013-2014 Annual Report that incorporates the missing information mentioned above by February 16, 2015.

Please be advised that failure to conduct analyses or failure to submit information requested by Regional Board staff is a violation of the General Permit. Violations of the General Permit may result in the imposition of administrative civil liability in an amount of up to $10,000 for each day of violation under Section 13385 of the California Water Code.

If you have any questions regarding this matter, please contact Barbara Barry at Barbara.Barry@waterboards.ca.gov or at (951) 248-0375, or myself at Michelle.Beckwith@waterboards.ca.gov or at (951) 782-4433.

Sincerely,

Michelle R. Beckwith, Chief
Coastal Storm Water Unit

Worldwide Waste Management, Inc.
Worldwide Recovery Systems, Inc.

February 18, 2004

At 9:30 PM Sunday evening responding to diesel spill cleanup for JB Hunt Trucking at Kimberly Clark located in Fullerton, CA.

Arrived on site at 10:45 PM. Two police officers and 1 tow truck driver were already on site. The JB Hunt truck was located in the middle of the street completely charred. Tow truck driver was attempting to load truck remains onto flatbed. I proceeded to assist tow truck driver in loading the truck. I visualized severe large pools of diesel fuel in the street, gutters and parking lot. Members of my crew poured absorbent to soak up small diesel fuel pools. Large pools of diesel was pumped into drums. Approximately 165 gallons of diesel fuel water mixture was pumped out of the storm drains. (7) 55 gallon drums of diesel and absorbent and (5) 55 gallon drums of diesel and water were generated at the scene of the accident and spill.

Total time for clean up was 12 hours. After close inspection by Health Hazmat and local policy, site was deemed clean and safe.

REQUEST FOR ENVIRONMENTAL HEALTH RECORDS INSTRUCTION SHEET

1. Complete the "Request for Environmental Health Records" form

- ✓ Please **Print** all information on request forms.
- ✓ Describe the reason the records are being requested so that our staff may be able to narrow your search.
- ✓ If you require site-specific information, give the exact address of the site.
- ✓ If you are asking for information on multiple sites (for example, all sites on a street) you must give an address for each location (for example, 1001, 1003, 1009, etc.).
- ✓ Note that we cannot enter a "range" of addresses as search criteria.

2. Complete the appropriate "Information Checklist" form

- ✓ Check only the desired records associated with the site you have submitted.
- ✓ Remember that you will be charged for each page of copied records, so be sure to specify which records you want.
- ✓ Please note that lists of information can be very lengthy and therefore costly. You can ask about the length of the list before completing the request form to ensure a list is what you desire.

3. Return the completed forms to the Custodian of Records Representative at 1241 E. Dyer Road, Ste. 120, Santa Ana, CA 92705.

- ✓ Blank Records Request forms can be downloaded from the Records page on the Environmental Health website at *http://ochealthinfo.com/eh/home/records*.
- ✓ Please note that you can ask for an appointment to review multiple records.

4. Most requests take approximately ten (10) days to process. However, if your request requires more processing time, we will notify you of the extension and the estimated date.

5. Upon completion of the search, we will notify you by phone or by mail. You may return to the Environmental Health office to pick up the requested records, or arrange to have them mailed to your address.

6. RECORDS THAT HAVE NOT BEEN PICKED UP WITHIN 60 DAYS OF NOTIFICATION WILL BE DESTROYED.

REQUEST FOR ENVIRONMENTAL HEALTH RECORDS

The undersigned hereby requests a copy of the records prepared and maintained by the Health Care Agency in the ordinary course of business, at or near the time of the act, condition, or event which they depict.

The records requested are maintained under the Public Records Act Government Code § 6250 – 6276.48. Some information held in the documents may be exempt from release pursuant to the Public Records Act.

The undersigned understands that the Health Care Agency will charge $0.15 per page copied. In the case of a request for a large number of copies, the Health Care Agency may provide the requestor an estimate of copy costs prior to making said copies. If any request is to be canceled, this office must be notified at the above number within ten (10) days of receipt of request, otherwise cost incurred will be charged to the undersigned.

In order to assist you, please describe the reason for your request:

Requesting all available environmental records for Kimberly-Clark Corporation as part of an environmental site assessment.

Please list addresses here (no more than 10 addresses per request):

2001 E Orangethorpe Ave, Fullerton, CA 92831 (Kimberly-Clark Corp.)

Check here if you would like a review only or to review before copies are made ☐

THIS IS AN INTERIM PERMIT TO OPERATE

You have selected monitoring alternative #2,

Interm Monitoring (Tank Testing and Inventory Reconciliation or Tank Gauging)

The following must be submitted to this office:

A.) Documentation (ie certified copy) that a Precision test (per NFPA 329) has been performed or the tank indicating a leak rate of less than .05 gallons per hour per tank,

B.) A copy of the inventory reconciliation and excess variation procedures that are to be implemented at this facility. These procedures must conform to the requirements of Section 2644, Subchapter 16, Title 23, California Administrative Code,

C.) A copy of the method to be utilized for gauging the tank(s) and the procedures that are to be followed when an excess variation occurs,

D.) One of the following:

1.) For Small Business (as defined in Subsection 11342(e) of the Government Code) or Non-profit Organizations - A statement provided by the owner that sufficient funds will be available to close the tank or to implement an approved monitoring alternative prior to August 12, 1988; or

2.) All Underground Tank Owners . A written statement indicating that the underground storage tank will be closed or replaced with a new underground storage tanks by September 1, 1989; or

3.) Governmental Agencies. Written documentation that, due to budgetary constraints, the governmental agency needs additional time to close or replace the underground storage tank or implement an approved monitoring alternative.

All of the above material must be submitted to this office prior to September 1, 1986.

THE ITEMS NOTED BELOW WERE OBSERVED DURING COURSE OF THE SITE VISIT. ANY VIOLATIONS OBSERVED MUST BE CORRECTED

OPENING COMMENTS

Onsite this date to conduct a routine hazardous waste inspection. Met with Grace Madden.

Facility was a RCRA LQG, however the facility has significantly decreased the amount of RCRA waste, generating well below the 2,200 pound per month limit that would qualify their RCRA LQG status. This will be verified again after review of the manifests. Facility still uses a Federal EPA ID# (CAD).

Toured facility and inspected waste storage areas. Facility has several satellite accumulation areas and a 90-day storage area. Inspected waste oil, drained used oil filters, paint related waste, waste oily debris, and universal wastes (fluorescent bulbs, batteries, empty aerosol cans). All waste containers appeared to be in good condition, and were properly labeled and stored closed.

Perimeter of facility inspected. No runoff or staining was observed at this time. No hazardous waste was observed in the trash.

A Business Emergency Plan was onsite and available for review.

Employee training records were onsite and reviewed. All employees are trained annually on Haz Com.

Manifests for all waste streams were onsite and reviewed. Site contact also had the most recent SB14 report available and verified exemption from Biennial reporting.

Hazardous waste storage was neat and orderly, and the manifests/bills of lading were organized well.

Signing for the receipt of the above report is not an admission of the facts of the violations set forth herein.

COMMENTS

ZZZ9 - INSPECTOR COMMENTS
On site for the first annual CAL ARP inspection by the Orange County Health Care Agency (OCHCA) since OCHCA was delegated CAL ARP inspection authority in the City of Fullerton, 1-1-11. Covered the following CAL ARP level 1 elements:

Records management: OK.
Executive summary: OK.
5-year accident history: OK, no release of ammonia from this site per Kimberly Clark and was confirmed by the Fullerton fire Department.
Worst Case Off Site Consequence: The submitted RMP OCA listed a "toxic endpoint" of 150 ppm. Discussion was had as to the proper TE to be used for this formula. It was determined that the latest CAL ARP guidance document listed 200 PPm as the TE, therefore the OCA is Ok as it was submitted.
Alternate OCA: An alternate OCA was submitted but not required per level 1 CAL ARP requirements. It was OK as submitted.
Certification letter: OK, used the proper California certification statement.
Coordinate with local emergency responders: Kimberly Clark has trained with the Fullerton Fire Department but not to meet CAL ARP requirements on the ammonia system. Explained the requirement for annual coordination with the fire department and to maintain the documentation. Business card for the Fullerton Fire Department is being mailed with this report.

The RMP was submitted 7-07. It was updated 7-10. The 5 year RMP resubmittal is scheduled for 7-12.

Discussed training and safety programs for the ammonia system. These items will be reviewed on the next annual inspection at length.

Discussed the proper operation of the ammonia cogen system.

Signing for the receipt of the above report is not an admission of the facts of the violations set forth herein.

Reviewed the list of haz mat "disclosure chemicals". Only the aqua ammonia is a regulated substance under CAL ARP. Please complete and return the submitted "regulated substance reporting form" within 30 days for the OCHCA file. Also attached, is a copy of the business card for the Fullerton Fire Department contact for the annual training requirement with the local emergency response agency. Please contact him within the next year and maintain this written verification of "offering to train" with the Fire Department.

On site for the annual CAL ARP inspection with Kimberly Clark EH&S/Madden. Covered the following CAL ARP level 1 elements:

Document Management System: The RMP is on site and reviewed on this inspection. The RMP is due for revalidation by 9-2012. Once completed, please submit this new RMP to my Office for review.

Worst case Off site consequence: Discussed the requirements for the updated OCA. The chemical, concentration and volume have remained the same since the 2007 RMP and may be reused in the RMP update.

Certification letter: The 2012 RMP requires a new certification letter.

Coordinate with the local emergency responders: Madden sent to the Fullerton Fire Department (FFD)/Miner, a letter on this date requesting training with FFD.

Annual training on ammonia responses.

Annual ammonia sensor calibration was completed by Draeger on 10-2011. The paperwork was unavailable for review due to an office change. Please submit this paperwork within 30 days.

Signing for the receipt of the above report is not an admission of the facts of the violations set forth herein.

THE ITEMS NOTED BELOW WERE OBSERVED DURING COURSE OF THE SITE VISIT. ANY VIOLATIONS OBSERVED MUST BE CORRECTED

VIOLATIONS OBSERVED

AT50 - FACILITY Failed to: test each aboveground container for integrity on a regular schedule or when repairs were made; inspect containers and container supports; or keep records of inspections and tests, or provide equivalence as allowed by CFR 112.7(a)(2) (Code of Fed Regulations 112.8(c)(6))
The SPCC states that the metal, fuel tanks (2 fire pump diesel ASTs and 1 diesel emergency generator) are to be integrity tested every 10 years. There were no records of such testing. Either locate the date when these diesel tanks were installed (if less than 10 years ago) or submit tank integrity testing data in order to meet this SPCC requirement. Please submit the information to this Agency by 1-2-13 for review.

COMMENTS

ZZZ9 - INSPECTOR COMMENTS
On site for the triennial Spill Prevention Control and Countermeasure (SPCC) inspection. SPCC was on site and available for review:

SPCC was conducted on 9-2010 and is due for recertification by 9-2015.

PE certified. Discussed the 2015 recertification and need/no need for PE (based on any changes to the SPCC).

The tanks subject to SPCC are in the following groups:

55 gallon drums (~100 drums throughout the facility).
Hydraulic oil tanks associated with machines (Oil Filled Operational Equipment = OFOE). ~5.
Oil totes ~10.
Diesel ASTs ~ 3.

All tanks have secondary containment via berms, true secondary containment or use the "building" as secondary containment (calculations completed).

The emergency contact list was complete but incorrectly listed the Orange County Fire Authority as the local fire agency. This was corrected to the Fullerton Fire Department during the inspection.

Spill kits throughout the facility to meet general secondary containment for loading areas and OFOE.

Facility conducts daily visual inspections of the tanks and monthly inspections of the drums. Records reviewed.

Annual training, reviewed.

The SPCC has a rainwater evaluation/release log. It is not used since no rainwater is released to the storm drain. All on site water (and any oil if released) is plumbed to the water plant for recycling.

The emergency contact list was complete but incorrectly listed the Orange County Fire Authority as the local fire agency. This was corrected to the Fullerton Fire Department during the inspection.

Spill kits throughout the facility to meet general secondary containment for loading areas and OFOE.

Facility conducts daily visual inspections of the tanks and monthly inspections of the drums. Records reviewed.

Annual training, reviewed.

The SPCC has a rainwater evaluation/release log. It is not used since no rainwater is released to the storm drain. All on site water (and any oil if released) is plumbed to the water plant for recycling.

The entire facility has a storm water low point in the NE corner of the site. It has a locked valve.

COMMENTS

ZZZ9 - INSPECTOR COMMENTS
On site for the annual CAL ARP inspection. Covered the following level 1 elements:

Document management system: OK. the 5 year RMP re submittal was received 7-2012. It was reviewed and the 1st/2nd public notice will be performed by HCA.

Executive summary: OK.

Worst case release scenario: OK. 8,100 lbs of 19% aqua ammonia. No off site consequences.

Management certification: OK. singed 7-2012.

Planned changes to improve safety: OK. No planned changes.

No releases of ammonia in the last 5 years: Per FFD.

Train with local emergency responders: OK. Offered to train with FFD 12-2012. No response from FFD.

Train ammonia staff annually on ammonia awareness.

The 2 ammonia leak sensors are tested annually (10-8-2012). Next years CAL ARP inspection will include an on site testing of the ammonia sensors.

COMMENTS

ZZZ9 - INSPECTOR COMMENTS
Onsite this date to conduct a routine hazardous waste inspection. Met with Grace Madden.

Inspected facility and waste storage areas. Facility has satellite accumulation sites throughout the facility and a 90-day storage area.

Satellite storage containers were inspected in the Instrument shop , Maintenance Shop #1, The Oil Room, The Co Generating Plant, The Multipurpose area, The Sorter ARea, and maintenance Area #2
All waste containers were observed to be stored closed and properly labeled.
.Facility EPA ID# CAD009547373. This facility generates is a Large Quantity Generator for NON-RCRA wastes (used oil, ink, grinding sludge, paint, polymer) and Small Quantity Generator for RCRA wastes for bleach, flammable liq, aerosols, lead, & resin).
Perimeter of facility inspected. No runoff or staining was observed at this time. No hazardous waste was observed in the trash.

A Business Emergency Plan was onsite .

Employee training records were onsite and reviewed. All employees are trained annually on Haz Com and HAZWOPER. New employees are trained within 2 weeks to a month of starting.

Manifests for all waste streams were onsite and reviewed.
Hazardous waste manifests from Evergreen Env . Filter Recycling, and Rine Co reviewed at site.

Site contact also had the most recent SB14 report available, and the 2010 Biennial report was postmarked March 1, 2010. All documentation/record keeping were found to be very well organized.
The hazardous waste storage containers and hazardous waste storage areas were observed to be very clean and in excellent condition.

THE ITEMS NOTED BELOW WERE OBSERVED DURING COURSE OF THE SITE VISIT. ANY VIOLATIONS OBSERVED MUST BE CORRECTED

OPENING COMMENTS

On site for the triennial Spill Prevention Control and Countermeasure (SPCC) inspection. Permission to inspect granted by Kimberly Clark/Madden.

The facility has the following regulated petroleum tanks/containers:

~ 275 gallon totes (buildings as secondary containment, visual Overfill Prevention (OFP).
~55 gallon drums (building or pallets as secondary containment).
(5) 850 gallon ASTs (basement as secondary containment).
(1) 175 gallon generator (building as secondary containment, visual OFP).
(1) 1,100 gallon lube oil in the CoGen plant, berm as secondary containment.
(3) fire pump generators, DWT.

Approximate total of 13,006 gallons.

The SPCC was on site and available for review.

The SPCC was written 9-2012 and is due to revalidation by 9-2017.

The SPCC was singed by a PE.

Annual training reports OK. Training program includes SPCC specific items.

Most of the tanks/totes/drums were secondarily contained by pallets or the buildings.

See violations for the "Acacia fire pump" AST. Have this violation abated on/before 9-7-15.

VIOLATIONS OBSERVED

I192 - Adequate secondary containment provided and maintained Failure to provide and maintain adequate secondary containment. 40 CFR 112.8(c)(2); HSC 6.67 25270.4.5(a)
The AST located in the "Acacia fire pump room" (tank 9B) is listed on the SPCC as a single walled tank with the room as the secondary containment. The on site review showed that the fire room does not meet secondary containment and it could not be determined if the AST was single or double walled. A review of the 9-2012 tank integrity testing lists this AST as single walled.

If the AST is in fact single walled and the SPCC claims the building as secondary containment, which it is not, the tank will have to be secondarily contained (tank or building) and have a "technical amendment" to the SPCC by the SPCC PE. If, in fact the AST is double walled, submit verification in order to abate the violation.

Received E-mail from Kimberly/Madden. The AST in question (Acacia fire pump) was reviewed by a tank tester and is single walled. They have put a temporary secondary drip pan and will start true secondary containment (bermed floor) on 8-17-15.

Please notify this Agency once the construction is completed. Be sure to have your SPCC/PE sign off that this new secondary containment is a "technical amendment" and is approved.

I declare that I have examined and received a copy of this inspection report.

THE ITEMS NOTED BELOW WERE OBSERVED DURING COURSE OF THE SITE VISIT. ANY VIOLATIONS OBSERVED MUST BE CORRECTED

OPENING COMMENTS

On site for the triennial California Accidental Release Prevention Program (CAL ARP) inspection. Permission to inspect granted by Kimberly Clark/Madden.

This facility is a CAL ARP level 1.

It has aqueous ammonia in a tank, used for NOX emission treatment.

Ammonia alarms are set @ 20 PPM for ow level alarm. 35 PPM for high level alarm. the sensors are tested annually. Last tested 10-23-14. The next test is set for 10-14-15. OCHCA will attend this testing.

The RMP was written in 2007, re validated 2012 and updated in 2015. The next revalidation is due 7-2017.

The facility has a written ER program. Reviewed. OK

Facility has an HMBEP with FFD.

No spills in the history of the facility (5-year accident review).

The worst case release scenario showed no off site consequence (140' release with a property line @ 580').

No planned changes to improve safety.

Certification was signed by management.

The facility offered to train with the FFD on 8-3-15. No response from FFD.

No violations.

Signing for the receipt of the above report is not an admission of the facts of the violations set forth herein.

THE ITEMS NOTED BELOW WERE OBSERVED DURING COURSE OF THE SITE VISIT. ANY VIOLATIONS OBSERVED MUST BE CORRECTED

OPENING COMMENTS

On site for the Triennial Hazardous Waste (HW) inspection report. Permission to inspect granted by Kimberly Clark/Madden.

This facility is a California only Large Quantity Generator (LQG). They are having all their HW disposed on a 1-2 month schedule.

EPA ID #. OK.

All HW drums were properly labeled with beginning accumulation dates. Satellite accumulation areas are located throughout the facility. All are properly labeled and moved to the HW storage area several times per year. All are stored closed with self sealing lids.

All HW drums/containers were stored closed.

Weekly inspection logs for the HW and satellite accumulation areas were maintained.

Annual HW training. Reviewed the training program. OK.

Reviewed the last 3 years of HW manifests. OK. Matched the California WTMS database.

HW is stored in secondarily contained shed.

Review of the municipal trash and perimeter showed no disposal of HW.

Emergency response notification system has problems. See violations.

Please fix the one violation and submit verification on/before 9-7-15 in order to abate the violation.

VIOLATIONS OBSERVED

I310 - Generator maintains at the facility the required emergency equipment or equivalents Failure of the facility to maintain the following emergency equipment or equivalents:
1) An internal communications or alarm system capable of providing immediate emergency instruction (voice or signal) to facility personnel;
2) A device, such as a telephone (immediately available at the scene of Operations/ Maintenance) or a hand-held two-way radio, capable of summoning emergency assistance from local police departments, fire departments, or State or local emergency response teams;
3) Portable fire extinguishers, fire control equipment (including special extinguishing equipment, such as that using foam, inert gas, or dry chemicals), spill control equipment, and decontamination equipment; and
4) Water at adequate volume and pressure to supply water hose streams, or foam producing equipment, or automatic sprinklers, or water spray systems. 22 CCR 12 66262.34(d)(2); 40 CFR 1 265.32
The emergency response phone located outside the HW storage area worked but communication between the HW area and the operator was barely audible. Have this phone (emergency response notification system) repaired to allow for easy notification. Send verification that this system has been repaired in order to abate the violation.

Spoke to Kimberly Clark/Madden. The violation (I310, no emergency notification equipment) listed on the 8-7-15 inspection has been rectified. When tested, the phone on the outside of the HW storage building did not work. Madden confirmed that the phone did in fact work but that the "volume" button on the phone was in the low volume setting. Once the volume button was increased, both parties could hear via the phone.

Abate violation # I310 listed on the 8-7-15 inspection.

No outstanding violations.

I declare that I have examined and received a copy of this inspection report.

OPENING COMMENTS

Received E-mail from Kimberly/Madden. The AST in question (Acacia fire pump) was reviewed by a tank tester and is single walled. They have put a temporary secondary drip pan and will start true secondary containment (bermed floor) on 8-17-15.

Please notify this Agency once the construction is completed. Be sure to have your SPCC/PE sign off that this new secondary containment is a "technical amendment" and is approved.

Signing for the receipt of the above report is not an admission of the facts of the violations set forth herein.

The "tank 9B" has been secondarily contained. Abate violation # I192 listed on the 8-7-15 inspection report.

See violations for the need of a "technical amendment". Please correct on/before 10-1-15.

VIOLATIONS OBSERVED

I391 - Tech amendments have been certified when there has been a change in facility design/operations Technical amendments to the SPCC have been certified when there has been a change in facility design, construction, operation or maintenance that may affect its potential for a discharge. (40 CFR 112.6(a)(2)) 40 CFR 112.6(a)(2) HSC 6.67 25270.4.5(a)
The "tank 9B" has been secondarily contained. The SPCC now needs a "technical amendment" to address this change. Once the PE has reviewed and approved the amendment, please send a copy of the amendment page to this Agency in order to abate the violation.

Signing for the receipt of the above report is not an admission of the facts of the violations set forth herein.

THE ITEMS NOTED BELOW WERE OBSERVED DURING COURSE OF THE SITE VISIT. ANY VIOLATIONS OBSERVED MUST BE CORRECTED

OPENING COMMENTS

Onsite for a routine CalARP Program Level 1 inspection. I met with Environmental Manager Grace Madden of Kimberly Clark, Inc.

Regulated Substance - 19% Aqua Ammonia - 63,021 pounds (8,100 gallons) total NH3.

The following was observed:

- RMP was revalidated in July 2017 per the 5-year update and updated on 8/3/2018. RMP was complete.

- The off-site consequence analysis (OCA) was conducted using Gaussian Dispersion modeling. The OCA was deemed acceptable.

- The emergency action plan was reviewed. Facility has a personnel that is available 24 hours a day if an emergency occurs. Coordination and notification of outside agencies is in-place. The facility also contracts with Enviro Chem Response for any Emergency Response activities. Facility has (3) personal NH3 sensors (toxirae II).

- Safety:
  - Facility has (2) Ammonia Sensors (Draeger) with alarm set points at 25ppm. Sensors are calibrated on annual basis.
  - Ammonia tank has (1) Pressure Relief Valve set at 45 psi. This is checked on a visual daily inspection.
  - Wind socks are found throughout the facility.
  - (2) eyewash stations were located with 50 feet from the Aqua Ammonia system. Eyewash stations are tested on a daily basis.
  - (2) valves found within the system are checked on an annual basis.

Facility is in compliance

VIOLATIONS OBSERVED

I017 - Revised, updated, and submitted the RMP to the USEPA and CUPA per timelines in Section 2745.10(b) Failure to revise, update, and submit the Risk Management Plan to the CUPA as follows:
1. At least once every five years from the date of its initial submission or most recent update required by section 2745.10(b)(2) through (7);
2. No later than three years after a newly regulated substance is first listed by the California Emergency Management Agency;
3. No later than the date on which on which a new regulated substance is first present in an already covered process above a threshold quantity;
4. No later than the date on which a regulated substance is first present above a threshold quantity in a new process;
5. Within six months of a change that requires a revised process hazard analysis or hazard Review.
6. Within six months of a change that requires a revised offsite consequence analysis as provided in section 2750.7;
7. Within six months of a change that alters the program level that applied to any covered process. 19 CCR 4.5 2745.10(b)

Demographic Profile

Demographic Profile of Surrounding Area (3 Miles)

This section provides demographic information regarding the community surrounding the facility. ECHO compliance data alone are not sufficient to determine whether violations at a particular facility had negative impacts on public health or the environment. Statistics are based upon the 2010 US Census and American Community Survey data, and are accurate to the extent that the facility latitude and longitude listed below are correct. The latitude and longitude are obtained from the EPA Locational Reference Table (LRT) when available.

Radius of Area:	3	Land Area:	99%	Households in Area:	66,814
Center Latitude:	33.86142	Water Area:	1%	Housing Units in Area:	70,801
Center Longitude:	-117.89692	Population Density:	7,996/sq.mi.	Households on Public Assistance:	1,633
Total Persons:	223,103	Percent Minority:	72%	Persons Below Poverty Level:	84,814

Race Breakdown	Persons (%)	Age Breakdown	Persons (%)
White:	122,589 (55%)	Child 5 years and younger:	16,717 (7%)
African-American:	4,987 (2%)	Minors 17 years and younger:	58,929 (26%)
Hispanic-Origin:	126,188 (57%)	Adults 18 years and older:	164,174 (74%)
Asian/Pacific Islander:	25,383 (11%)	Seniors 65 years and older:	20,760 (9%)
American Indian:	1,849 (1%)		
Other/Multiracial:	68,294 (31%)		

Education Level (Persons 25 & older)	Persons (%)	Income Breakdown	Households (%)
Less than 9th Grade:	21,410 (16.35%)	Less than $15,000:	6,373 (9.51%)
9th through 12th Grade:	14,603 (11.15%)	$15,000 - $25,000:	6,512 (9.72%)
High School Diploma:	28,636 (21.87%)	$25,000 - $50,000:	16,379 (24.44%)
Some College/2-yr:	34,425 (26.29%)	$50,000 - $75,000:	13,249 (19.77%)
B.S./B.A. or More:	31,893 (24.35%)	Greater than $75,000:	24,515 (36.57%)

SULFURIC ACID (1994 AND AFTER ACID AEROSOLS ONLY)									

Demographic Profile

Demographic Profile of Surrounding Area (3 Miles)

This section provides demographic information regarding the community surrounding the facility. ECHO compliance data alone are not sufficient to determine whether violations at a particular facility had negative impacts on public health or the environment. Statistics are based upon the 2010 US Census and American Community Survey data, and are accurate to the extent that the facility latitude and longitude listed below are correct. The latitude and longitude are obtained from the EPA Locational Reference Table (LRT) when available.

Radius of Area:	3	Land Area:	99%	Households in Area:	66,814
Center Latitude:	33.86142	Water Area:	1%	Housing Units in Area:	70,801
Center Longitude:	-117.89692	Population Density:	7,996/sq.mi.	Households on Public Assistance:	1,633
Total Persons:	223,103	Percent Minority:	72%	Persons Below Poverty Level:	84,814

Race Breakdown	Persons (%)	Age Breakdown	Persons (%)
White:	122,589 (55%)	Child 5 years and younger:	16,717 (7%)
African-American:	4,987 (2%)	Minors 17 years and younger:	58,929 (26%)
Hispanic-Origin:	126,188 (57%)	Adults 18 years and older:	164,174 (74%)
Asian/Pacific Islander:	25,383 (11%)	Seniors 65 years and older:	20,760 (9%)
American Indian:	1,849 (1%)		
Other/Multiracial:	68,294 (31%)		

Education Level (Persons 25 & older)	Persons (%)	Income Breakdown	Households (%)
Less than 9th Grade:	21,410 (16.35%)	Less than $15,000:	6,373 (9.51%)
9th through 12th Grade:	14,603 (11.15%)	$15,000 - $25,000:	6,512 (9.72%)
High School Diploma:	28,636 (21.87%)	$25,000 - $50,000:	16,379 (24.44%)
Some College/2-yr:	34,425 (26.29%)	$50,000 - $75,000:	13,249 (19.77%)
B.S./B.A. or More:	31,893 (24.35%)	Greater than $75,000:	24,515 (36.57%)

- Selected Facility
- EPA Facility of Interest
- State/Tribe Facility of Interest

The facility locations displayed come from the FRS Spatial Coordinates tables. They are the best representative locations for the displayed facilities based on the accuracy of the collection method and quality assurance checks performed against each location. The North American Datum of 1983 is used to display all coordinates.

STATEMENT OF WORK FOR REMEDIAL INVESTIGATION AND FEASIBILITY STUDY

Orange County North Basin

1. Introduction and General Requirements

1.1. Purpose

This Statement of Work (SOW) describes activities to be performed by Orange County Water District (OCWD) at the Orange County North Basin Study Area (North Basin or Study Area) pursuant to the Settlement Agreement, Docket # 2016-03 (Settlement Agreement). Figure 1 in Attachment 1 shows the location of the Study Area. The Settlement Agreement requires OCWD to conduct a Remedial Investigation and Feasibility Study (RI/FS) to support the development of an interim groundwater remedy to hydraulically contain contaminated groundwater originating from the majority of known or suspected sources in the Study Area, and to further characterize the nature and extent of contamination in the Study Area. EPA may use the results of the RI/FS to identify and propose remedial actions needed to address human health risks, and ecological risks if a pathway for exposure is identified.

OCWD shall furnish all necessary and appropriate personnel, materials, and services needed for, or incidental to, performing and completing the work.

1.2. EPA Oversight and State Review

In accordance with the schedules established in the Settlement Agreement or in this SOW, OCWD shall submit to EPA and the State of California (the State) plans, reports and other deliverables required under the Settlement Agreement, this SOW and the Work Plan required by Section 3.1 of this SOW. All plans, reports and other deliverables will be reviewed and approved or disapproved by EPA pursuant to Section X of the Settlement Agreement ("EPA Approval of Plans and Other Submissions"), except for the Health and Safety Plan (HSP), which will be reviewed by EPA but neither approved nor disapproved.

If EPA disapproves a deliverable and requests modifications, OCWD shall revise the deliverable and resubmit it to EPA and the State, as provided in Section X of the Settlement Agreement. After receipt of comments from EPA, if any, on a draft document, OCWD shall submit for EPA and State review a revised document within 14 days of receipt of such comments or within 21 days of receipt of such comments for the RI/FS Work Plan, Sampling & Analysis and Health and Safety Plans for RI fieldwork, RI Report, Groundwater Flow Modeling Plan, Groundwater Flow Modeling Report, Remedial Alternatives Identification and Screening Technical Memorandum (TM), Detailed Analysis of Remedial Alternatives TM, and FS Report, unless specified

otherwise in the Settlement Agreement, in Attachment 2 to this SOW, or in writing by EPA.

EPA will review deliverables to assess the likelihood that the work will achieve the requirements set forth in the Settlement Agreement and this SOW. Notwithstanding any action by EPA or the State, OCWD remain fully responsible for satisfying the provisions and requirements of the Settlement Agreement and this SOW. Nothing in the Settlement Agreement, this SOW, or any other submission shall be deemed to constitute a warranty or representation of any kind by EPA or the State that full performance of the RI and FS will achieve these requirements. OCWD's compliance with submissions approved by EPA does not foreclose EPA from seeking additional work as provided for in the Settlement Agreement.

1.3 Communication between EPA, OCWD, and State Agencies

The primary EPA contact for activities to be conducted pursuant to this SOW is the EPA Project Manager:

Wayne Praskins
Remedial Project Manager
U.S. EPA, Region IX
75 Hawthorne Street, SFD-7-3
San Francisco, CA 94105
(415) 972-3181
praskins.wayne @epa.gov

The alternate contact for EPA is:

Caleb Shaffer
Section Chief, California Site Cleanup Section 1
U.S. EPA, Region IX
75 Hawthorne Street, SFD-7-1
San Francisco, CA 94105
(415) 972-3336
shaffer.caleb@epa.gov

The legal contact for EPA is:

Bethany Dreyfus
U.S. EPA, Region IX
Office of Regional Counsel, ORC-3
75 Hawthorne Street
San Francisco, CA 94105
(415) 972-3886
dreyfus.bethany@epa.gov

The California Department of Toxic Substances Control (DTSC) contact is:

John Scandura
Branch Chief
Brownfields and Environmental Restoration Program
Department of Toxic Substances Control
5796 Corporate Avenue
Cypress, CA 90630-4732
john.scandura@dtsc.ca.gov
(714) 484-5440

The Santa Ana Regional Water Quality Control Board (RWQCB) contact is:

Ann Sturdivant
Section Chief, Site Cleanup Program
Santa Ana Regional Water Quality Control Board
3737 Main Street, Suite 500
Riverside, CA 92501
ann.sturdivant@waterboards.ca.gov
(951) 782-4904

The OCWD contact is:

Dave Mark
Principal Hydrogeologist
Orange County Water District
18700 Ward Street
Fountain Valley, CA 92708
dmark@ocwd.com
(714) 378-3337

The alternate contact for OCWD is:

William Hunt
Director of Special Projects
Orange County Water District
18700 Ward Street
Fountain Valley, CA 92708
whunt@ocwd.com
(714) 378-8229

1.4 Contractor Personnel and Qualifications

As required by Section VIII of the Settlement Agreement, and in accordance with the schedule included as Attachment 2 to this SOW, OCWD shall notify EPA in writing of the names, titles, and qualifications of the supervising personnel, including contractors to be used in carrying out the Work, and provide a copy of the proposed contractor's Quality Management Plan (QMP). EPA will issue a notice of disapproval or an authorization to proceed regarding hiring of the proposed contractor.

1.5 Reporting to EPA and the State

1.5.1 Monthly Progress Report

OCWD shall prepare and submit written Monthly Progress Reports as required by Section IX of the Settlement Agreement. The progress reports shall, at a minimum: (1) describe the actions that have been taken to comply with the Settlement Agreement during that month, (2) describe Work planned for the next two months with schedules relating such Work to the overall project schedule, (3) describe all problems encountered and any anticipated problems, any actual or anticipated delays, and solutions developed and implemented to address any actual or anticipated problems or delays, (4) describe any modifications that OCWD has proposed to the EPA or that have been approved by the EPA, and (5) describe any community relations activities completed during the previous month or planned for the next two months. Progress reports are due by the fifteenth day of the following month.

1.5.2 Progress Meetings and Documentation of Critical Decisions

Any critical decisions made in meetings or conversations with EPA representatives shall be documented in a written submittal submitted by OCWD to EPA and the State within five (5) days of the decision. The submittal shall document the decision and the rationale for the decision.

1.5.3 Reporting During Field Efforts

OCWD shall communicate more frequently when field work is occurring, in accordance with any requirements in the approved Work Plan or any approved Sampling and Analysis Plans (SAPs) submitted in accordance with this SOW.

1.6 EPA Guidance and Reference Materials

OCWD shall complete the Work in accordance with the provisions of the Settlement Agreement, this SOW, CERCLA, the National Contingency Plan (NCP), and EPA guidance, including, but not limited to, the "Interim Final Guidance for Conducting Remedial Investigations and

Feasibility Studies under CERCLA" (OSWER Directive # 9355.3-01, October 1988 or subsequently issued guidance), "Guidance for Data Usability in Risk Assessment" (OSWER Directive #9285.7-05, October 1990 or subsequently issued guidance), guidance referenced therein, and guidance referenced in Attachment 3 to this SOW.

2. Background

2.1. Orange County North Basin

The Orange County Groundwater Basin is part of the 360-square-mile coastal plain of Orange County. The Santa Ana River, the primary surface water drainage feature in the area, is located east and southeast of the Study Area. The northern portion of the Basin, which includes the cities of Fullerton, Anaheim and Placentia, falls within the region known as the Forebay, the predominant area of basin recharge. In the Study Area, OCWD has identified three aquifers or aquifer systems: Shallow, Principal and Deep. The Principal Aquifer is the primary source of approximately 70 percent of the potable water supply in OCWD's boundary. However, the Shallow Aquifer is also locally used for potable water supply. In portions of the Study Area, the boundary between the Shallow and Principal Aquifers is generally delineated by a fine-grained layer at a depth of approximately 200 to 250 feet; however, this fine-grained layer may be absent or discontinuous, particularly in the eastern part of the Study Area.

OCWD is responsible for managing the Orange County Groundwater Basin, which supplies water to more than 20 cities and other water agencies, serving more than two million customers. OCWD has divided the aquifers into the three aforementioned primary aquifer systems based on the presence of regional aquitards, differences in potentiometric surfaces, and changes in water quality. In the Study Area, the Shallow Aquifer includes sediments extending to an average depth of approximately 200 feet below ground surface (bgs). The Principal Aquifer contains unconsolidated strata extending to an average depth of about 850 feet. The Deep Aquifer contains the unconsolidated aquifers below the Principal Aquifer, extending to an average depth of 1,300 feet bgs. Groundwater in these aquifers generally occurs under unconfined conditions in the North Basin and under semi-confined to confined conditions further west and south. The depth to groundwater in the Shallow Aquifer ranges from approximately 80 to 120 feet bgs. In the Shallow Aquifer, groundwater flow in the area is generally from east to west, but flow may change seasonally and year to year due to changes in groundwater pumping patterns and recharge

Investigations of the North Basin, the area generally under the cities of Anaheim, Fullerton and Placentia, have revealed groundwater contamination from volatile organic compounds (VOCs) and other chemicals. Beginning in the 1950s, VOCs were used for industrial activities in this area. Releases of VOCs into the environment are believed to have resulted in comingled groundwater contamination plumes. To protect public health due to elevated levels of VOCs, four drinking water production wells impacted by contamination have been destroyed: Fullerton well F-FS13 (2002), Fullerton well F-KIM1 (2002), Anaheim well A-23 (2001) and private well BAST-F (2013). High concentrations of perchloroethene (PCE), trichloroethene (TCE), 1,1-

dichloroethene (1,1-DCE) and 1,4-dioxane have been detected in monitoring wells in the Study Area. Other chemicals, including but not limited to 1,2-dichloroethane (1,2-DCA), perchlorate, nitrate, and 1,2,3-trichloropropane, have also been detected.

The North Basin is not on the National Priorities List. DTSC completed a site discovery report in February 2011 and petitioned EPA to conduct an investigation in November 2014 (DTSC 2014). Accordingly, in parallel to the planned RI/FS work, EPA is conducting a Preliminary Assessment and Site Inspection as prescribed by the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) to help evaluate whether the Study Area warrants a proposed listing.

2.2. Source areas

The Study Area was used primarily for agricultural purposes from about 1920 to 1954. Since that time, industrial activity has increased, and multiple industrial facilities in the area are known or suspected to have contributed to the groundwater contamination. The RWQCB and DTSC have identified several sites potentially responsible for groundwater contamination in the North Basin.

The RWQCB is overseeing investigation work and/or cleanup at six sites, namely AC Products (172 East La Jolla St., Placentia); Aerojet (601 South Placentia Ave., Fullerton); Alcoa Plant 1 (800 S. State College Blvd., Fullerton); Monitor Plating (800 East Orangefair Lane, Anaheim); Northrop Kester Solder (1730 North Orangethorpe Park, Anaheim); and Northrop Y-12 (301 E. Orangethorpe Ave., Anaheim). The RWQCB also provided oversight of initial investigative and/or remediation work at the former Fullerton Manufacturing (311 S. Highland Ave, Fullerton) and Northrop ESD/EMD sites (500 E. Orangethorpe Ave, Anaheim).

DTSC is overseeing investigation and/or cleanup work at an additional four sites, namely the former Chicago Musical Instruments (CMI) (350 S. Raymond Ave., Fullerton); Orange County Metal Processing (1711 East Kimberly Ave., Fullerton); PCA Metal Finishing (1726 East Roslyn Ave., Fullerton); and Crucible Materials (2100 Orangethorpe Ave., Fullerton). DTSC considers CMI, Orange County Metal Processing, and PCA Metal Finishing to be "orphan sites," but the status of the CMI site may change. In April 2016, DTSC proposed a settlement with Pitney Bowes Inc. and Novitex Enterprise Solutions, Inc. to perform response actions at the CMI site.

Additionally, the Orange County Health Care Agency (OCHCA) has overseen work at some sites in the Study Area.

As stated in EPA's September 2015 letter to both State agencies, EPA expects that the RWQCB and DTSC will continue investigatory and remedial work at sites they are currently overseeing.

2.3. Regional Plume

Spills, leaks, and other contaminant releases are believed to have resulted in comingled plumes of groundwater contamination in an area several miles long and a mile or more wide. Attachment 1 includes a figure depicting the approximate extent and levels of contamination. The actual extent and levels of contamination may differ from the depiction in the figure, especially in areas with limited data. Data collected as part of the planned RI will be used to improve the understanding of the nature and extent of groundwater contamination in the Study Area.

3. List of Deliverables and Other Tasks

OCWD shall plan and conduct RI and FS work in accordance with this SOW and relevant EPA regulations and guidance, some of which are referenced in Attachment 3. The RI/FS shall, among other things, include field investigation as described in this SOW and, in support of an interim remedy, identify applicable or relevant and appropriate requirements (ARARs); assess potential risks to human health and the environment; and develop, screen, and evaluate remedial action alternatives. Section 3.1.8 describes the preliminary objectives of the interim remedy.

OCWD shall submit plans, reports, and other deliverables for EPA and State review. This SOW requires written submittals describing the results of groundwater modeling, describing the results of the baseline risk assessment, identifying ARARs, describing the development and screening of remedial alternatives, and providing the results of the detailed evaluation of remedial alternatives, as well as a RI Report and a FS Report. Major deliverables are specified in Attachment 2. Pursuant to Section X of the Settlement Agreement, EPA may approve, disapprove, require modifications of, or modify each deliverable.

OCWD shall implement quality control procedures to ensure the quality of all reports and submittals to EPA and the State. These procedures shall include, but are not limited to, internal technical and editorial review; and documentation of all reviews, problems identified, and corrective actions taken.

3.1. Remedial Investigation/Feasibility Study Work Plan

OCWD shall submit a draft RI/FS Work Plan (hereafter "Work Plan") for EPA and State review and approval in accordance with Section IX of the Settlement Agreement and relevant EPA guidance. The Work Plan shall describe the tasks required to complete the RI/FS, the methodologies to be used, information to be produced during and at the conclusion of each task, a description of the work products that will be submitted to EPA, and a schedule for their completion. OCWD may request to meet with EPA and the State prior to submission of the Work Plan to clarify any questions regarding the SOW.

OCWD shall submit a Revised RI/FS Work Plan, if directed by EPA. Upon approval by EPA, OCWD shall implement the Work Plan. Upon its approval by EPA pursuant to Section X of the Settlement Agreement, the Work Plan (and other plans, reports, and deliverables submitted to EPA under the Settlement Agreement) shall be incorporated into and become enforceable under the Settlement Agreement. The Work Plan shall include the elements described in Sections 3.1.1 through 3.1.14 of this SOW.

3.1.1. Study Area Description and Conceptual Site Model (CSM)

The Work Plan shall include a brief description of the Study Area, including the suspected sources, nature, and extent of soil and groundwater contamination; and geographic, hydrogeologic, ecological, cultural, or natural resource features relevant to the RI/FS.

The Work Plan shall also provide an initial conceptual site model (CSM) for the Study Area, along with provisions for updating the CSM when appropriate based on the availability of new information.

3.1.2. Data Management

The Work Plan shall describe how water level, water quality, and other data to be compiled during the RI/FS will be managed. Unless otherwise indicated, data shall be submitted to EPA and the State in electronic format. When necessary due to file size, OCWD shall provide an acceptable file transfer mechanism for the submission of large documents.

3.1.3. RI Activities

The Work Plan shall describe previous findings relevant to the Study Area, and field activities needed to satisfy the requirements of this SOW. The Work Plan shall include provisions for submittal of one or more SAPs that will generate data needed to satisfy the following objectives:

- Refine the CSM and fill data gaps to support the development and evaluation of remedial alternatives for an interim remedy and further characterize the nature and extent of contamination in the Study Area;
- Prepare a baseline risk assessment for human health in support of an interim remedy-
- Evaluate risks to ecological receptors;
- Provide any other data needed to satisfy the requirements of this SOW; and,
- Provide data to address any concerns about the quantity, quality, completeness, or usability of water quality or other data that will be used to satisfy the requirements of this SOW.

The RI investigation shall include, at a minimum:

- Review of existing data developed by EPA, RWQCB, DTSC, OCWD, private companies, and other local entities relevant to the nature and extent of groundwater contamination in the Study Area;
- Creation of a list of potential chemicals of concern (COCs), likely including but not limited to PCE, TCE, 1,1-DCE and 1,4-dioxane;
- Evaluation of the sources of contamination;
- Construction and sampling of new groundwater monitoring wells needed to support development of an interim groundwater remedy and better define groundwater flow directions and the nature and extent of groundwater contamination. A preliminary list of wells is provided in Table 1 in Attachment 1; and,
- Measurements of groundwater elevations and collection and analysis of groundwater samples for possible COCs from new and selected existing groundwater wells throughout the Study Area. The Work Plan shall propose initial sampling frequencies by well and COC, and provide for modifying those frequencies as the investigation progresses. If accessible, sampling existing groundwater monitoring wells associated with the site at 311 South Highland Avenue in Fullerton, California (known as the "Fullerton Manufacturing" site) should be included.

The monitoring well locations shown on Figure 1 in Attachment 1 are subject to change based on constructability and ability to secure access in a timely manner.

As described in more detail in Section 4 of this SOW, the SAP shall describe planning, field, laboratory, data review and interpretation, and reporting efforts needed to satisfy the RI objectives.

3.1.4. Technical Reports

The Work Plan shall include provisions for the preparation and submittal to EPA of one or more technical reports that summarize the results of RI field activities. If appropriate, the reports shall update figures showing water level contours and/or the nature and extent of groundwater contamination in plan view and/or vertical cross section, update the CSM, and make recommendations for any additional RI work needed to satisfy the requirements of this SOW.

3.1.5. Groundwater Flow Modeling

The Work Plan shall include provisions for the use of a numeric groundwater flow model to better understand groundwater movement in the Study Area, support the placement of

groundwater monitoring wells and complete other field activities, and/or evaluate remedial alternatives.

OCWD has developed a groundwater flow model of the Study Area (the "OCWD Model"). The Work Plan shall include provisions for submittal to EPA of a report documenting the development and calibration of the OCWD Model.

The Work Plan shall include provisions for submittal to EPA of a Groundwater Flow Modeling Plan. The Plan shall provide for revisions to the OCWD model if needed to address EPA comments, and provisions for submittal to EPA of preliminary modeling results and a Groundwater Modeling Report at the completion of the modeling effort.

The model shall be calibrated over a wide-range of hydrogeological conditions and have the capability to simulate transient conditions in three dimensions. The model shall be capable of conducting particle tracking simulations to evaluate hydraulic control. The modeling effort shall include a sensitivity analysis. The modeling effort should consider the procedures outlined in EPA's guidance document "A Systematic Approach for Evaluation of Capture Zones at Pump and Treat Systems, EPA/600/R-08/003, January 2008."

3.1.6. Risk Assessment

The Work Plan shall include provisions for the preparation and submittal of a Technical Memorandum (TM) that presents the results of a Baseline Human Health Risk Assessment to support an interim remedy for the Study Area. The risk assessment shall be conducted in accordance with applicable EPA and State guidance, including but not limited to "Interim Final Risk Assessment Guidance for Superfund, Volume I - Human Health Evaluation Manual (Part A)," (RAGS, EPA-540-1-89-002, OSWER Directive 9285.7-01A, December 1989); and "Interim Final Risk Assessment Guidance for Superfund, Volume I - Human Health Evaluation Manual (Part D, Standardized Planning, Reporting, and Review of Superfund Risk Assessments)," (RAGS, EPA 540-R-97-033, OSWER Directive 9285.7-01D, January 1998).

The risk assessment shall address pathways of exposures to contaminated groundwater that pose an actual or potential risk to human health and the environment (e.g., human consumption, dermal contact, inhalation). The risk assessment shall also consider cumulative exposure where multiple contaminants are present.

This task will also evaluate whether there are potentially complete exposure pathways for site contaminants to ecological receptors. If no potentially complete exposure pathways exist, then the ecological risk assessment will be considered complete with documentation of that finding and no further work will be necessary. The Work Plan will include provisions for preparation of an ecological risk assessment in accordance with applicable EPA guidance if EPA determines that there are complete exposure pathways for site contaminants to ecological receptors

3.1.7. Treatability Studies and Pilot Testing

The Work Plan shall include provisions for treatability studies and pilot testing if necessary to support the development of an interim remedy. OCWD shall submit plans for any proposed testing to EPA and the State and obtain EPA approval prior to conducting the corresponding field work. The results of any treatability studies or pilot tests shall be included in the screening of remedial alternatives described below.

3.1.8. Preliminary Remedial Objectives and Remedial Alternatives Development and Screening

The preliminary objectives of an interim remedy would be: i) protect human health and the environment by preventing exposure to contaminated groundwater in the Study Area; and ii) hydraulically contain contaminated groundwater to protect water supply wells and groundwater resources threatened by the spread of the contamination. The area targeted for hydraulic containment (the "Target Area") shall include contaminated groundwater from the majority of known or suspected sources of groundwater contamination in the Study Area. The preliminary Target Area boundary is shown in Figure 1 in Attachment 1.

The Work Plan shall include provisions for the preparation and submittal to EPA of a TM that: i) refines the remedial action objectives; ii) identifies a range of remedial actions including engineering controls and any institutional controls (ICs) needed to address the risks; and iii) provides the results of an initial screening of alternatives to reduce the number of potential remedies for the final detailed evaluation.

3.1.9. Detailed Evaluation of Remedial Alternatives

The Work Plan shall include provisions for the preparation and submittal to EPA of a TM that presents a detailed evaluation of interim remedial alternatives that pass the initial screening based on the nine evaluation criteria specified in 40 CFR 300.430[e][9]. The submittal shall also evaluate any ICs identified as a component of the remedial alternatives. The evaluation shall: (1) state the objectives of the ICs; (2) determine the specific types of ICs to be used to meet the remedial action objectives; (3) determine when the ICs need to be implemented and for what duration; (4) discuss and document

any prior or necessary agreements and with whom (e.g., state and/or local government entities, local landowners, conservation organizations, OCWD) for securing, maintaining and enforcing the ICs.

3.1.10. Applicable or Relevant and Appropriate Requirements

The Work Plan shall include provisions for the preparation and submittal to EPA of a ARARs TM that describes potentially applicable or relevant and appropriate requirements (ARARs) under federal or state law and any proposed ARARs waivers, as required in CERCLA section 121(d). ARARs are environmental regulations, standards, criteria, or limitations, promulgated under federal or more-stringent state laws, for consideration for each remedial alternative being evaluated. Each ARAR evaluated shall be designated as "applicable" or "relevant and appropriate" and linked to the specific remedial activity being evaluated. The ARARs TM shall consider action-specific, chemical-specific, and location-specific ARARs as well as To Be Considered (TBC) criteria, including advisories or guidance that are not promulgated or independently enforceable but which may be used to set protective cleanup levels.

3.1.11. RI and FS Reports

The Work Plan shall include provisions for submittal to EPA and the State a draft RI Report and draft FS Report. The RI and FS Reports collectively shall provide, summarize, and discuss the following:

- Study Area background and setting;
- Sources, nature and extent of groundwater contamination;
- Results of groundwater modeling conducted in support of the RI/FS;
- Baseline human health risk assessment and evaluation of ecological risks;
- Data quality and usability;
- Remedial action objectives;
- ARARs;
- The identification and screening of remedial alternatives, including pilot testing;
- A detailed analysis of interim remedial alternatives, including an evaluation of ICs;
- The roles and responsibilities of the OCWD, water utilities, or other third parties required for implementation of each remedial alternative;
- Existing facilities (e.g., groundwater extraction wells, water treatment systems, pipelines) that may be used as part of a remedy, including their planned use, condition, expected life and the potential for increased maintenance or reduced lifespan compared to new facilities.

Upon review of the draft documents, EPA may require OCWD to revise the RI and FS Reports. When complete, the RI and FS reports, along with an Administrative Record, may provide the basis for a Proposed Plan and Record of Decision to be prepared by EPA in accordance with CERCLA Sections 113(k) and 117(a).

3.1.12. Updated Project Schedule.

The Work Plan shall include a schedule consistent with Attachment 2 of this SOW that provides dates for deliverables and other critical path activities required for the RI/FS. The schedule shall include time for EPA and State review of written deliverables and for meetings with EPA representatives when appropriate.

3.1.13. Roles and Responsibilities of Key Personnel and Organizations.

The Work Plan shall describe the roles and responsibilities of individuals and organizations involved in the RI/FS effort, including contractors and major subcontractors.

3.1.14. Permits, Access, Coordination, and Compliance with Substantive Requirements

The Work Plan shall list all permits, easements, access agreements, and approvals anticipated for implementation of the RI/FS.

3.2. Plans

3.2.1. Sampling and Analysis Plan

In accordance with Section IX of the Settlement Agreement, OCWD shall prepare a Sampling and Analysis Plan (SAP) for field and laboratory activities required to implement the RI/FS. SAPs are required for sample collection and analysis as well as physical measurements such as groundwater levels, borehole geophysics, aquifer parameters, and geodetic survey data.

The SAP submitted pursuant to this SOW shall consist of a Field Sampling Plan (FSP) and a Quality Assurance Project Plan (QAPP), as described in EPA guidance, including, without limitation, "EPA Guidance for Quality Assurance Project Plans (QA/G-5)"(EPA/600/R-02/009, December 2002 or subsequently issued guidance), and "EPA Requirements for Quality Assurance Project Plans (QA/R-5)" (EPA 240/B-01/003, March 2001 or subsequently issued guidance). Key guidance documents are listed in Attachment 3. The plans shall include, or be accompanied by, a schedule for implementation of the planned sampling, analysis, and reporting activities. The FSP and QAPP may be submitted separately or as one document. Upon EPA approval of a SAP, OCWD shall implement the activities described therein.

a. The FSP shall describe sampling and data gathering objectives; proposed monitoring well locations and planned uses of the data; well construction and well development procedures; sampling and data collection methods; sample frequencies; sampling equipment and equipment decontamination procedures; sample preservation, packing, labeling, and shipment

procedures; chain-of-custody procedures; numbers and types of samples (including quality control [QC] samples); use and maintenance of field logs; and management of investigation-derived wastes.

The FSP shall be written so that a field sampling team unfamiliar with the project would be able to gather the samples and field information required. The FSP shall include a schedule that describes activities that must be completed in advance of sampling, including access agreements and arrangements for disposal of investigation-derived waste. The FSP shall include provisions for the collection of split samples by EPA.

b. The QAPP shall describe the project objectives and organization, functional activities, data quality objectives (DQOs), and quality assurance and quality control (QA/QC) protocols that will be used to achieve the DQOs. In addition, the QAPP shall address personnel qualifications, sampling procedures, sample custody, analytical procedures, document control procedures, preservation of records (in accordance with Section XIV of the Settlement Agreement), and procedures that will be used to enter, store, manage, correct, manipulate, review, validate, transfer, and analyze data, and ensure that reported data are accurate and defensible.

OCWD shall be prepared to demonstrate to EPA's satisfaction that each laboratory it may use is qualified to conduct the proposed work. This includes use of methods and analytical protocols for the chemicals of concern, in the media of interest, at detection and quantification limits consistent with DQOs and requirements specified in the approved QAPP for the work. OCWD shall only use laboratories that have documented Quality Assurance Programs that comply with ANSI/ASQ E4-1994, "Specifications and Guidelines for Quality Systems for Environmental Data Collection and Environmental Technology Programs," (American National Standard, January 5, 1995) and "*EPA Requirements for Quality Management Plans (QA/R-2),*" EPA/240/B-01/002, March 2001**,** or equivalent documentation as determined by EPA . EPA may consider laboratories accredited under the National Environmental Laboratory Accreditation Program ("NELAP") as meeting the Quality System requirements. If the laboratory is not in the EPA Contract Laboratory Program ("CLP"), OCWD shall submit for EPA review and approval, if EPA requests, a laboratory QA program plan. EPA may require that OCWD submit detailed information to demonstrate that the laboratory is qualified to conduct the work, including information on personnel qualifications, equipment, and material specifications.

OCWD shall submit analytical data and well construction information to EPA and the State in accordance with the schedule included in Attachment 2.

3.2.2. Health and Safety Plan

OCWD shall prepare a Health and Safety Plan (HSP) in accordance with EPA's Standard Operating Safety Guide (PUB 9285.1-03, PB 92-963414, June 1992 or subsequently issued guidance). The HSP shall comply with all currently applicable Occupational Safety and

Health Administration (OSHA) regulations found at 29 C.F.R. Part 1910, as well as any related requirements specific to California. EPA will review but neither approve nor disapprove the HSP. The OCWD shall consider all changes to the plan recommended by EPA and shall implement the plan while conducting the RI/FS.

3.3. RI Field Work

OCWD shall conduct RI field work in accordance with any approved SAPs and the HSP. OCWD shall notify EPA at least two weeks in advance of any field effort.

3.4. Groundwater Flow Modeling Plan

OCWD shall submit a Groundwater Flow Modeling Plan in accordance with the approved Work Plan.

3.5. Groundwater Flow Modeling

OCWD shall conduct groundwater flow modeling in accordance with the approved Work Plan and approved Groundwater Flow Modeling Plan.

3.6. Groundwater Flow Modeling Reports

OCWD shall submit a report documenting the development and calibration of the OCWD model, preliminary modeling results, and a Groundwater Flow Modeling Report in accordance with the approved Work Plan and Groundwater Flow Modeling Plan.

3.7. Remedial Investigation Report

OCWD shall submit to EPA for review and approval a draft RI Report in accordance with the approved Work Plan, followed by a final RI Report incorporating any revisions required by EPA.

3.8. Remedial Alternatives Screening TM

OCWD shall submit a Remedial Alternatives Screening TM documenting the results of the screening of remedial alternatives in accordance with the approved Work Plan. This effort may include pilot testing as discussed in section 3.1.7.

3.9. Remedial Alternatives Evaluation TM

OCWD shall submit a Remedial Alternatives Evaluation TM documenting the results of the evaluation of remedial alternatives in accordance with the approved Work Plan.

3.10. ARARs TM

OCWD shall submit a TM identifying ARARs in accordance with the approved Work Plan.

3.11. Risk Assessment TM

OCWD shall submit a Risk Assessment TM documenting the results of the baseline human health risk assessment, and an ecological risk assessment if deemed necessary in accordance with the approved Work Plan.

3.12. FS Report

OCWD shall submit a draft FS Report in accordance with the approved Work Plan, and a final FS Report incorporating revisions required by EPA.

3.13. Community Involvement Activities

OCWD shall implement any community involvement activities specified in the approved Work Plan or that EPA directs OCWD to complete. EPA expects to take the lead role in implementing community involvement activities for the Study Area but may request that OCWD assist EPA by participating in public meetings, preparing fact sheets, placing documents in the local information repository, placing announcements in local newspapers, providing translation services, or conducting other community involvement activities. OCWD is a local public agency with independent community involvement responsibilities including conduct of OCWD-led community involvement activities. Where these activities may relate to this Work, OCWD will coordinate with EPA and, where applicable, the affected Cities.

Attachment 1 to the SOW: Study Area, Preliminary Target Area for Interim Remedy, and Monitoring Well Locations and Rationale

EA Engineering, Science, and Technology, Inc.

PATH: J:\2015\15-097_EPA_REGION9_OCNB(ONIELL)\MAP_DOCS\20160519_EPA_SOW\EPA_SOW_FIGURE_1_REV_PDH20160621.MXD - USER: PHILLE - DATE: 6/22/2016

FIGURE 1. ORANGE COUNTY NORTH BASIN: PLANNED GROUNDWATER MONITORING WELL LOCATIONS APPROXIMATE EXTENT OF GROUNDWATER CONTAMINATION

Table 1. Planned Groundwater Monitoring Wells – Orange County North Basin Remedial Investigation

Well No. [(a)]	Target Depth(s) of Screened Interval [(b)]	Justification/Notes
FM-7B	250-270	To evaluate the benefits of hydraulically containing contaminated groundwater at or near the FM-7 location. Adjacent FM-7A and FM-7 have shown decreasing VOC concentrations since they were installed in 2009. Vertical extent and presence of VOCs in the Principal Aquifer in this area is unknown.
FM-29A FM-29B FM-29C	110-130, 175-195, 240-260	To characterize the lateral and vertical extent of groundwater contamination in the vicinity of one-time grab samples MW-GW01, MW-GW02, OW-GW01, and OW-GW02Principal Aquifer well (FM-29C, 250-ft depth) may be eliminated if down-gradient Principal Aquifer well at FM-7B does not exhibit VOCs at concentrations greater than MCL/NL.
FM-30A	140-160	To characterize the extent of shallow groundwater contamination between the FM-7 and FM-23 locations
FM-31A FM-31B	130-150 230-250	To characterize the lateral and vertical extent of groundwater contamination down-gradient of FM-10, between the FM-11 and FM-15 locations.
FM-24B	320-340	To characterize the vertical extent of Principal Aquifer contamination observed in FM-24 (screened 271-291), which exhibits significantly higher VOC concentrations that adjacent Shallow Aquifer monitoring well FM-24A (screened 154-174).
FM-22B	310-330	To characterize the vertical extent of Principal Aquifer contamination observed in FM-22 (screened 242-262), which exhibits significantly higher VOC concentrations than adjacent Shallow Aquifer monitoring well FM-22A (screened 150-170). Provides data to evaluate the possible need to pump from deeper parts of the Principal Aquifer.
FM-33A FM-33B FM-33C	170-190, 270-290, 340-360	To characterize the lateral and vertical extent of groundwater contamination in the Shallow and Principal Aquifers, including helping to define the lateral down-gradient extent of Principal Aquifer contamination observed in FM-19C.
FM-34A FM-34B	140-160, 255-275	To characterize the extent of groundwater contamination downgradient of FM-18A/18. Additional downgradient monitoring may be needed if elevated VOCs are detected at this location.

Notes:

(a) Well locations shown on accompanying map have not been ground-truthed and are subject to change pending suitability for well construction and ability to secure access.

(b) Assume 20-ft-long screened intervals. Actual length and depth of screened intervals will depend on observed lithology.

Attachment 2 to the SOW. Due Dates for Major Deliverables and Other Activities

Ref SOW Section	Ref Settlement Agreement Section	Activity or Deliverable	Due [1, 2, 3, 4, 5]
-	-	Effective Date of Settlement Agreement	
1.4	VIII	Notification of Personnel to be used for the Work, including submittal of QMP	Fourteen (14) days after the Effective Date of the Settlement Agreement
-	VIII	Notification of Project Coordinator	Fourteen (14) days after the Effective Date of the Settlement Agreement
-	XXV	Proof of commercial general liability and automobile liability insurance	Thirty (30) days before commencing any onsite Work
1.5	IX	Monthly Progress Reports	15th day of the following month
1.5	IX	Meeting Notes	5 days after any meeting where critical decisions are made or per EPA/State request.
3.1	IX	RI/FS Work Plan	Ninety (90) days after the Effective Date of the Settlement Agreement
3.3	IX	EPA notification of planned field work	Two weeks before field effort begins
3.2	IX	SAP and HSP for RI fieldwork	Ninety (90) days after the Effective Date of the Settlement Agreement
3.3	IX	RI fieldwork	As specified in approved SAP
3.7	IX	RI Report	As specified in approved Work Plan

PREFACE

This Remedial Investigation/Feasibility Study Work Plan (RI/FS Work Plan) describes activities to be performed by Orange County Water District (OCWD) at the Orange County North Basin Study Area (North Basin or Study Area) pursuant to the Administrative Settlement Agreement, U.S. EPA Docket # 2016-03 (Settlement Agreement). The terms North Basin and Study Area are used interchangeably in this document. The Settlement Agreement requires OCWD to conduct a Remedial Investigation and Feasibility Study (RI/FS) to support the development of an interim remedy to hydraulically contain groundwater with volatile organic compounds (VOCs) originating from the majority of known or suspected sources in the Study Area, and to further characterize the nature and extent of VOCs in groundwater in the Study Area.

Planning documents for this study also include a Sampling and Analysis Plan, which includes a Field Sampling Plan (Part A) and a Quality Assurance Project Plan (Part B), and a Health and Safety Plan.

1. Introduction

This Remedial Investigation/Feasibility Study Work Plan (Work Plan) describes activities to be performed by Orange County Water District (OCWD) at the Orange County North Basin Study Area (North Basin or Study Area) pursuant to the Administrative Settlement Agreement, U.S. Environmental Protection Agency (USEPA) Docket # 2016-03 (Settlement Agreement). The terms North Basin and Study Area are used interchangeably in this document. The Settlement Agreement requires OCWD to conduct a Remedial Investigation and Feasibility Study (RI/FS) to support the development of an interim remedy to hydraulically contain groundwater with volatile organic compounds (VOCs) originating from the majority of known or suspected sources in the Study Area, and to further characterize the nature and extent of VOCs in groundwater in the Study Area. **Figure 1** shows the location of the Study Area.

The primary groundwater constituents in the Study Area are VOCs. It is noted that VOCs are or were present in soil and soil vapor in the Study Area, however the focus of this RI/FS is the regional, commingled VOC groundwater plume in the Study Area. Pursuant to the Settlement Agreement, remedial investigation (RI) activities to be performed include the installation of new groundwater monitoring wells, groundwater sampling and analysis, and the collection of groundwater elevation measurements. Data generated during these activities will be used to refine the conceptual site model (CSM), to evaluate the nature and extent of VOCs in groundwater, and to prepare a baseline human health risk assessment. A sampling and analysis plan (SAP) will be prepared to document rationale, methods, and procedures for the field investigations. The investigation findings will be documented in a RI Report.

Following completion of the RI activities, additional technical studies will be performed to support the preparation of a Feasibility Study (FS) for interim hydraulic containment of regional groundwater contamination in the Study Area. Pursuant to the Settlement Agreement, these studies will include a baseline human health risk assessment and exposure pathway assessment for ecological receptors; an evaluation of applicable or relevant and appropriate requirements (ARARs); treatability/pilot-scale studies (if deemed necessary); development of proposed remedial action objectives (RAOs) for the remedial alternatives; an evaluation and the development and initial screening of remedial alternatives; and finally, a detailed evaluation of remedial alternatives. The findings of each of these studies will be documented in separate technical memoranda.

A numerical groundwater flow model will be used to support the evaluation of remedial alternatives for the FS. OCWD, with assistance from Intera, has developed a groundwater flow model for the Study Area, and will prepare a report that documents the development and calibration of this model. The model may be refined based on the findings of the RI, and

following review by USEPA. A Groundwater Model Refinement Plan will be prepared to document the approach for refining the flow model.

Lastly, relevant findings of the RI, technical studies, and groundwater modeling results will be integrated into an FS Report. The FS report will summarize and evaluate interim hydraulic containment remedies for North Basin, along with no-action and monitored attenuation alternatives.

RI/FS activities will be performed in accordance with the Guidance for Conducting Remedial Investigations and Feasibility Studies under Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) (USEPA 1988), National Oil and Hazardous Substance Pollution Contingency Plan (NCP) (USEPA 1994 and as amended), and the guidance documents specified in the Settlement Agreement.

1.1 Organization of this Plan

This RI/FS Work Plan is organized as follows:

- **Section 1.0: Introduction** – presents the objectives of the RI/FS and organization of this Work Plan.
- **Section 2.0: Background and Physical Setting** – presents an overview of the Study Area, history, source areas, previous investigations, and the currently known nature and extent of contamination.
- **Section 3.0: Preliminary Conceptual Site Model** – presents potential contaminant sources and contaminants of concern, the fate and transport of the potential contaminants, and potential exposure pathways.
- **Section 4.0: Remedial Investigation Technical Approach** – presents a summary and rationale for field activities included in this remedial investigation.
- **Section 5.0: Technical Reports** – presents the technical memoranda and reports to be prepared to support the RI/FS.
- **Section 6.0: Project Schedule and Possible Scope Change** – presents the project schedule and identifies the possible need to modify the scope, with USEPA approval.
- **Section 7.0: Roles and Responsibilities of Key Personnel and Organizations** – presents the roles and responsibilities, qualifications, and organization chart for the RI/FS.

- **Section 8.0: Permits, Access, Coordination, and Compliance with Substantive Requirements** – lists all the permits, easements, access agreements, and approvals anticipated for implementation of the RI/FS.

- **Section 9.0: Community Involvement Activities** – presents the activities to be conducted by the OCWD to inform the community about the goals and activities associated with the RI/FS.

- **Section 10.0: References –** presents the documents used in the preparation of this Work Plan.

2. Background and Physical Setting

This section presents an overview of the Study Area, history, physical setting, source areas, previous investigations, and the currently known nature and extent of contamination

2.1 Study Area History

Previous investigations conducted by OCWD and others have identified VOC-contamination in the northern portion of the Orange County Groundwater Basin, in an area generally west of State Route (SR)-57, north of Lincoln Avenue, east of Brookhurst Street, and south of Commonwealth Avenue (**Figure 2**). Trichloroethene (TCE), tetrachloroethene (PCE), 1,1-dichloroethene (1,1-DCE), 1,4-dioxane and other VOCs have been reported in groundwater in this area at concentrations that exceed Maximum Contaminant Levels (MCLs) or State Notification Levels (NLs) for drinking water (OCWD 2012). In addition, VOCs have been reported in potable supply wells at concentrations that exceed California Public Health Goals for drinking water (OCWD 2012). The Study Area generally encompasses this area of VOC-impacted groundwater with concentrations exceeding MCLs and is located in portions of the cities of Fullerton, Anaheim and Placentia, California (**Figure 3**).

The Study Area was used primarily for agricultural purposes until the early 1950's. Industrial activity has increased since that time, and multiple industrial facilities in the area are known or suspected to have contributed to regional groundwater contamination in the Study Area. To date, four drinking water production wells impacted by VOCs have been taken out of service and destroyed.

Since the early 2000s, OCWD has performed field investigations (extensive monitoring well installations and sampling), groundwater modeling activities, the installation of extraction wells, and preliminary design studies to support interim remedial actions for VOC contamination in the Study Area. Most of a previously planned remediation project has been put on hold while OCWD conducts a re-evaluation of a remedy in a manner consistent with the NCP. Operating the inactive OCWD extraction wells will be considered in the FS.

On October 14, 2016, OCWD entered into the Settlement Agreement with USEPA to conduct an RI/FS to support the development of an interim remedy to hydraulically contain VOC-contaminated groundwater in the Study Area (**Figure 3**). The Settlement Agreement includes the installation of 14 monitoring wells at 8 locations (increased to 20 wells at 12 locations per agreement between the OCWD and USEPA) at the approximate locations shown on Figure 3.

The North Basin is not on the National Priorities List (NPL). The Department of Toxic Substances Control (DTSC) completed a site discovery report in February 2011 and petitioned USEPA to conduct an investigation in November 2014, and to serve as the lead oversight agency. USEPA agreed to do so, and executed the Settlement Agreement with OCWD. In parallel with the RI/FS, USEPA is conducting a Preliminary Assessment and Site Inspection, and Hazard Ranking System Scoring to help evaluate whether the Study Area warrants a proposed NPL listing.

2.2 Physical Setting

The Study Area is located in the Forebay portion of the Coastal Plain of Orange County Groundwater Basin (**Figure 1**). The term Forebay has been accepted in California as a region of the basin where confining layers are thin, absent or less competent, allowing precipitation and surface water to recharge the deeper supply aquifers (United States Geological Survey [USGS] 1976). It is the primary recharge area for the basin, and OCWD recharge facilities are located within and near the study area (**Figure 2**).

The basin comprises an alluvial plain within a synclinal, northwest-trending trough extending north into Los Angeles County. The basin is bounded by the Newport-Inglewood fault zone and Pacific Ocean to the southwest, consolidated rocks exposed in the Puente and Chino Hills to the north, in the Santa Ana Mountains to the east, in the San Joaquin Hills to the south; and by a topographic divide near the Orange County - Los Angeles County line to the northwest (OCWD 2015; California Department of Water Resources [CADWR] 2003). Sediments extend to depths of greater than 20,000 feet, with the upper 2,000 to 4,000 feet containing fresh water (OCWD 2015). **Figure 1** shows the Basin boundaries.

OCWD has categorized the basin into Shallow, Principal, and Deep aquifers systems, which consist of Holocene to upper Pleistocene sand, gravel, and conglomerate with silt and clay beds (CADWR 2003). **Figure 4** shows a generalized cross-section of the basin. The Principal Aquifer is a primary potable supply aquifer in the basin; however the Shallow and Deep Aquifers are also used for potable water supply (OCWD 2012). The Shallow and Principal Aquifers are of primary focus of this RI/FS.

In the Study Area, the depth to groundwater in the Shallow Aquifer ranges from approximately 80 to 120 feet bgs, and the groundwater flow direction is generally from east to west. The Shallow Aquifer is unconfined in the eastern portion of the basin, and consists of inter-fingered alluvial gravel, sand, silt and clay lenses. The vertical hydraulic gradient between the Shallow Aquifer to the Principal Aquifer is downward and is influenced by groundwater extraction from the Principal Aquifer (GeoTrans 2010).

The Shallow Aquifer overlies a fine-grained unit that separates the Shallow and Principal Aquifers. The fine grained unit occurs at a depth of approximately 200 to 250 feet bgs and is locally absent or discontinuous in the eastern portion of the Study Area. Preferential vertical migration of VOCs from the Shallow Aquifer to the Principal Aquifer has occurred where the fine-grained unit is discontinuous or absent (OCWD 2005).

The Principal Aquifer underlies the Shallow Aquifer System at approximate depths of 200 to 1,300 feet bgs. Regionally, groundwater flow in the Principal Aquifer is influenced by the distribution of groundwater production in the basin. Several groundwater production wells are located in the Study Area (**Figure 2**), but most of the groundwater production in the basin occurs farther south in the basin. The predominant groundwater flow direction in the Principal Aquifer is westerly to southwesterly in the Study Area (OCWD 2012).

2.3 Previous Investigations and Sources of Contamination

Since 1990, OCWD has performed investigations and other studies to evaluate the hydrogeology and the nature and extent of regional groundwater contamination in the Study Area. These investigations have included the following:

- Installation of approximately 70 monitoring wells;
- Regular monitoring of OCWD monitoring wells and production wells for contaminants of concern and water quality analysis;
- Collection of 30 groundwater grab samples (one-time samples);
- The installation, testing, and sampling of six extraction wells to contain portions of the VOC plumes (project implementation put on hold, except for one extraction well); and
- The development of locally refined groundwater flow model of the Study area to evaluate containment of the VOC plumes under varying groundwater flow conditions.

The findings of previous investigations have identified widespread VOC contamination exceeding MCLs and NLs in the Shallow Aquifer (OCWD 2012). In addition to VOCs, prior to 2011, OCWD has sampled wells in the North Basin area in the past for a broad suite of contaminants including semi-volatile organic compounds (SVOCs), nitrosamines, pesticides, herbicides, polychlorinated biphenyls, and metals including hexavalent chromium. Reported concentrations of these constituents, summarized in **Table 1**, have not exceeded Maximum Contaminant levels or Notification Levels in the Study Area and therefore, sampling for these constituents is not currently conducted routinely by the OCWD. In addition, three wells in the

North Basin area (two of which are inside the study area but outside the preliminary Target Area) have been sampled for perfluorinated compounds (PFCs) (OCWD 2017).

In addition, these studies have identified areas where there is hydraulic connection between the Shallow and Principal Aquifers, thereby allowing contaminants in the Shallow Aquifer to move into the underlying Principal Aquifer. **Figure 3** shows the approximate areal distribution of VOCs exceeding MCLs in Shallow and Principal Aquifers based on data collected from 2010 to 2014. **Figure 5** shows a generalized cross-section that illustrates the conceptual distribution of VOCs across the Study Area.

Releases of VOCs from multiple sources areas are believed to have combined to form the regional, commingled VOC plumes in the Study Area. The Regional Water Quality Control Board, Santa Ana Region (RWQCB) and the DTSC are overseeing investigation and/or cleanup at multiple sites in the Study Area. **Figure 2** shows their locations. The RWQCB performs, or has performed, oversight for eight of these sites (USEPA, 2016a) as listed below:

- AC Products, Inc. (172 East La Jolla St., Placentia);
- Aerojet (601 South Placentia Ave., Fullerton);
- Alcoa Plant 1 (800 S. State College Blvd., Fullerton);
- Monitor Plating (800 East Orangefair Lane, Anaheim);
- Northrop Kester Solder (1730 North Orangethorpe Park, Anaheim);
- Northrop Y-12 (301 E. Orangethorpe Ave., Anaheim);
- Fullerton Manufacturing (311 S. Highland Ave, Fullerton); and
- Northrop ESD/EMD sites (500 E. Orangethorpe Ave, Anaheim).

The DTSC performs oversight of four sites (USEPA, 2016a):

- Chicago Musical Instruments (CMI)/Pitney Bowes (350 S. Raymond Ave., Fullerton);
- Orange County Metal Processing (1711 East Kimberly Ave., Fullerton);
- PCA Metal Finishing (1726 East Roslyn Ave., Fullerton); and
- Crucible Materials (2100 Orangethorpe Ave., Fullerton).

RWQCB and DTSC are expected to continue regulatory oversight of the sites they are currently overseeing (USEPA, 2016a). Actions at these sites to address the sources contributing to the regional groundwater contamination plumes are anticipated to be addressed individually. Additional sites may be identified in future as investigations proceed.

2.4 Nature and Extent of Contamination

The current understanding of the nature and extent of VOC contamination in the Study Area is summarized in the following figures and tables:

- **Figure 3** shows the approximate extent of composite VOC plume in the Shallow and Principal Aquifers illustrating area where PCE, TCE, or 1,1-DCE concentrations exceed respective MCLs based on water quality data collected from 2010 to 2014 (USEPA, 2016b).
- **Figure 5** is a generalized cross-section that illustrates the conceptual distribution of VOCs across the Study Area.
- **Table 2** presents the maximum detections of analytical results for VOCs and other analytes that have been detected in samples collected in OCWD monitoring wells between 2011 and 2016. Exceedances of applicable MCLs or NLs in the Study Area are shown in bold.

OCWD monitoring wells are not located on the sites where the releases occurred. Many OCWD monitoring wells are miles from the sites of the releases. VOC concentrations in monitoring wells located on the sites where the releases occurred are typically significantly higher than in off-site OCWD monitoring wells.

Based on 2010 to 2014 data, the composite VOC plume is approximately 4.5 miles long and 1.7 miles wide in the Shallow Aquifer (**Figure 3**). In the Principal Aquifer, the composite VOC plume is approximately 3.5 miles long and 1 mile wide (**Figure 3**). Concentrations in the Shallow Aquifer have exceeded up to 200 times the MCLs, while in the Principal Aquifer concentrations are generally lower, with exceedances of up to 10 times the MCLs (**Figure 3**). VOCs exceeding MCLs have been detected at depths exceeding 500 feet (**Figure 5**).

Increasing VOC concentration trends have been observed in several wells completed in the Principal Aquifer, including, but not limited to the following (OCWD, 2016):

Principal Aquifer Wells with Increasing VOC Concentrations	Well Owner	VOCs with Increasing Trend
Production Wells		
A-47	City of Anaheim	TCE, 1,2-DCE
F-7	City of Fullerton	TCE, PCE
F-10	City of Fullerton	PCE
Page-F	Page Mutual Water Company	1,1,-DCE, TCE, 1,4-dioxane
OCWD Principal Aquifer Monitoring Wells		
FM-17	OCWD	PCE
FM-19C	OCWD	PCE
FM-11	OCWD	PCE
FM-1	OCWD	PCE
AM-30	OCWD	TCE, 1,1-DCE
CB-1/MP3	OCWD	TCE, 1,1-DCE, 1,4-dioxane

The locations of these wells are shown on Figure 2. The increasing concentrations observed in these wells indicate further migration of VOCs from the Shallow to the Principal Aquifer and expansion of the VOC plumes into the Principal Aquifer (OCWD, 2012).

Data gaps remain with regard to the lateral and vertical extent of VOCs in the Shallow and Principal Aquifers, and additional monitoring wells are necessary to: 1) refine the size of the target area for interim hydraulic containment of VOC-impacted groundwater (Target Area), 2) provide data needed to develop remedial alternatives, and 3) for performance monitoring of the interim remedy. Section 4 describes proposed investigations to address these data gaps. **Figure 3** shows the preliminary estimate of the Target Area for hydraulic containment.

3. Preliminary Conceptual Site Model (CSM)

The following subsections present a preliminary CSM for groundwater in the North Basin Study Area. The CSM process describes: groundwater contaminants present in the area of concern; the potential sources of contamination; the contaminant distribution and migration; and potential receptors (USEPA 1987). The CSM will be updated as additional data and information are obtained during the RI/FS.

3.1 Contaminants of Potential Concern

Chemical constituents have been detected in groundwater within the Study Area at concentrations exceeding MCLs and NLs and are identified as Contaminants of Potential Concern (COPCs). **Table 2** summarizes the frequency of detection and exceedances of regulatory limits for VOCs and other constituents in groundwater samples collected by OCWD in the Study Area between 2011 and 2016. The VOCs detected most frequently at concentrations exceeding regulatory limits include:

- Tetrachloroethene (PCE);
- Trichloroethene (TCE);
- 1,1-Dichloroethene (1,1-DCE); and
- 1,4-Dioxane.

These constituents are considered the primary COPCs in the Study Area. Other VOCs, including 1,2,3-trichloropropane (1,2,3-TCP), have been detected at concentrations exceeding drinking water regulatory limits, but exceedances occur at fewer locations (**Table 2**). Although TCP contamination is not as pervasive as the primary COPCs, the NL for 1,2,3-TCP is very low (0.005 micrograms per liter [µg/L]). Similarly, ambient nitrate and perchlorate concentrations locally exceed MCLs in the Study Area (**Table 2**).

Note that only a small set of wells in the North Basin area (three) have been sampled for PFCs, and OCWD believes that additional sampling for PFCs would be useful. However, specialized sampling methods and procedures are required for PFCs because of the low detection limits needed and the potential for contamination during sample collection and handling. Of particular concern, dedicated sampling pumps installed by the OCWD may have Teflon-containing materials which could contaminate the samples. Consequently, OCWD will prepare and submit an FSP Addendum that identifies selected wells to be sampled for PFCs and the associated

sampling procedures. The FSP Addendum will be prepared after the new monitoring wells have been installed and sampled for VOCs.

3.2 Sources and Distribution of Contaminants of Potential Concern

Releases of VOCs from multiple sources areas are believed to have combined and resulted in the regional commingled plumes of VOC-contaminated groundwater in the Study Area. Section 2.3 summarized the suspected sources. **Figure 3** shows their locations as well as the extent of the composite VOC plume in the Shallow and Principal Aquifers. These two units are locally merged where the fine-grained unit that separates them is thin or absent, and preferential vertical migration of VOCs from the Shallow to Principal Aquifer has occurred in these areas. Recent concentration trends suggest further expansion of the VOC plume into the Principal Aquifer.

3.3 Contaminant Migration Pathways

Data from the previous investigations demonstrate that VOCs have migrated from the suspected source areas, have combined, and have eventually migrated from the Shallow Aquifer to the Principal Aquifer, impacting production wells. A general overview of suspected migration pathways for VOC contamination in the Study Area is presented below:

- Spills and other releases of VOCs have occurred at multiple industrial facilities in the Study Area. Releases of VOCs at these locations have migrated to groundwater, impacting the Shallow Aquifer in the vicinity of these sites and creating local VOC plumes.

- Over time, lateral migration of VOC plumes from these individual sites have combined into a regional, commingled plume in the Shallow Aquifer.

- The vertical hydraulic gradient is downward between the Shallow and Principal aquifers, and where the fine-grained unit separating these aquifers is discontinuous or absent, preferential vertical migration has occurred, allowing the VOC plume to migrate into the Principal Aquifer.

- VOC plumes in the Principal Aquifer have migrated toward and have impacted drinking water supply wells in the Study Area.

3.4 Potential Receptors

This RI/FS considers only the direct exposure pathways for groundwater (USEPA, 2016a). Potential receptors include residents and commercial/industrial workers in the Cities of Anaheim

and Fullerton. Potential exposure routes include ingestion, dermal contact, and inhalation of vapors in groundwater (while showering) pathways. **Figure 6** shows a preliminary conceptual model for human health exposures.

4. Remedial Investigation Technical Approach

As stated in Section 1, the purpose of the RI is to generate data to further characterize the nature and extent of contamination in the Study Area to support evaluation of alternatives for an interim remedy for North Basin. This section summarizes and provides rationale for the RI activities.

4.1 RI Objectives and Data Needs

As summarized in the Settlement Agreement, the objectives of the RI are as follows:

- Further refine estimates of the lateral and vertical extent of VOC contamination in the Study Area;
- Address data gaps to support the development and evaluation of remedial alternatives for an interim hydraulic containment remedy;
- Further evaluate the fate and transport of VOCs in the study area and revise the CSM;
- Prepare a baseline human health risk assessment (HHRA) and evaluate ecological risk pathways; and
- Provide data to address potential concerns regarding the quantity, quality, completeness, or usability of existing data.

OCWD will perform the following activities to address these objectives:

- Review and compile existing data for the Study Area;
- Install monitoring wells in the Shallow and Principal Aquifers;
- Collect and analyze groundwater samples from the new and existing monitoring wells;
- Compare analytical data to screening levels to identify COPCs; and
- Collect groundwater level data.

OCWD will install 20 new monitoring wells at 12 locations to address data gaps associated with regional VOC contamination. **Table 3** summarizes the rationale for the proposed monitoring wells. **Figures 2** and **3 s**how their locations, and **Table 3** shows their planned depths. The locations shown on **Figures 2** and **3** may be slightly revised based on access and constructability. The planned depths may be modified based on the geology observed during drilling. OCWD is

preparing and circulating a Mitigated Negative Declaration to meet California Environmental Quality Act (CEQA) requirements prior to installing the new wells.

4.2 Data Compilation and Evaluation

The data sources used for RI evaluations include 1) new data generated during RI field work, 2) existing OCWD data, and 3) data generated by potential responsible parties and submitted to regulatory agencies. OCWD maintains an extensive database of analytical, water level, and groundwater production information for production wells and OCWD monitoring wells in the Study Area. In addition, OCWD maintains a dataset of analytical data for the potential responsible sites in the Study Area that has been previously submitted to USEPA. These existing datasets will be updated and integrated with new data generated during RI field work, and the resulting dataset will be used for RI data evaluation tasks.

4.3 RI Field Work

OCWD will perform RI field work using the approach summarized in the SAP (submitted under separate cover). The SAP covers the planned RI field activities including monitoring well installation and groundwater sampling. The SAP consists of the Field Sampling Plan (FSP) and the Quality Assurance Project Plan (QAPP):

- The FSP summarizes methods and procedures for RI field work.
- The QAPP presents the Data Quality Objectives (DQOs), quality program, and information for laboratory activities.

The Health and Safety Plan (HSP) (submitted under separate cover), documents safety hazards and controls for field work.

Key field activities that will be performed are as follows:

- Pre-field Activities: OCWD will acquire access for the proposed monitoring wells, acquire permits, clear the well locations for possible underground utilities, and procure contractors for field work. The locations of select wells may be changed based on physical site constraints and the ability to secure access.
- Monitoring Well Installation: OCWD will install 20 new monitoring wells at 12 locations to address data gaps regarding regional VOC contamination (**Table 3**). The wells will be installed using mud rotary drilling methods and completed as 4-inch diameter polyvinylchloride (PVC) monitoring wells.

- Groundwater Sampling and Water Level Monitoring: OCWD will collect groundwater samples and water level measurements from the new and existing monitoring wells in the Study Area as follows;

    - OCWD continues to routinely sample select North Basin monitoring wells for VOCs and 1,4-dioxane on a trimester (every four month) schedule. Sampling for perchlorate and general minerals (including nitrate) is conducted annually.

    - The newly installed wells will be sampled at the end of well development, at least one or two additional times, and then incorporated into OCWD's routine monitoring program.

    - After all the new monitoring wells have been installed, OCWD will perform a comprehensive sampling event that includes new and existing OCWD monitoring wells in North Basin.

    - **Table 4** summarizes the groundwater sampling schedule and laboratory analyses for the monitoring wells. The monitoring frequencies of the new and existing wells may be modified in the future based on data needs and concentration trends.

    - Other PRP-site monitoring wells, such as those located at the Fullerton Manufacturing Site, may be incorporated into the sampling program if the wells are accessible.

4.4 Data Usability Evaluation

OCWD will evaluate the usability of these data in accordance with the Guidance for Data Quality Assessment (EPA 2000). The following types of data will be generated during the RI field work:

- Groundwater monitoring well construction information;
- Well location information;
- Lithologic logs;
- Geophysical logs;
- Groundwater levels from monitoring wells; and
- Analytical data for groundwater samples.

Analytical data generated during the RI will be reviewed against National Functional Guidelines and the method procedures, as appropriate. The QAPP (SAP Part B) describes the data validation procedures. Well construction information, lithologic logs, geophysical logs, and groundwater levels and will be reviewed by the project geologist to ensure that the data were collected in accordance with the approved planning documents and were reported accurately.

Existing data that have been collected by OCWD, as well as data that have been collected at sites and submitted to State regulatory agencies as part of site investigation and cleanup activities in the Study Area are considered to be of sufficient quality for use in the RI/FS. Groundwater samples collected by OCWD incorporate state-of-the-art Standard Operating Procedures (SOPs) that have been observed and commended by EPA Region 9 staff. OCWD-collected samples are analyzed by OCWD's State-certified laboratory, which has been successfully evaluated by EPA. Groundwater sample analytical results from production wells are reported to the State Water Resources Control Board Division of Drinking Water, and are subject to review and audit. Although OCWD monitoring well data are not currently reported to State regulatory agencies, the same analytical procedures are used for both OCWD monitoring wells and municipal and private drinking water wells. OCWD groundwater monitoring data are routinely reviewed by OCWD staff to assess consistency of results from past monitoring rounds. If an outlier is observed, the well is resampled to confirm results. Furthermore, numerous consistent sampling results provide additional reliability that the data are of sufficient quality for the RI/FS. Groundwater samples collected at sites under regulatory oversight by DTSC or the RWQCB, are collected using State-approved SOPs, and analyzed in State-certified laboratories. Furthermore, those data sets are reviewed by these agencies. For data generated at sites under RWQCB and DTSC oversight, a review will be conducted for data consistency and usability prior to use in mapping and risk assessment.

In addition, to evaluate the reliability of OCWD sampling and analysis, in May 2016 USEPA conducted split sampling with OCWD, with samples analyzed by OCWD's laboratory and a USEPA Contract Laboratory. A total of 44 wells (both monitoring wells and production wells) were sampled as part of the comparison. USEPA was complimentary of the sampling methods and equipment used by OCWD. A comparison of the analytical results for VOCs (**Appendix B**) indicated that OCWD's laboratory performed very well (ICF International, 2016).

4.5 Evaluation of the Nature and Extent of Contamination

OCWD will compile and evaluate existing and new analytical and field data generated during the RI to assess the nature and extent VOCs in the North Basin, evaluate fate and transport of VOCs, evaluate potential contaminant sources, evaluate lateral and vertical hydraulic gradients, and

address data gaps. The comprehensive sampling event will incorporate data from more than 80 monitoring wells. The data evaluation will include preparation of:

- Tabulated summaries of analytical results;
- Comparisons of analytical data to screening levels to refine the list of COPCs;
- Isoconcentration contour maps for the Shallow and Principal Aquifers;
- Cross-sections illustrating the vertical distribution of VOCs;
- Groundwater elevation contour maps; and
- Concentration time series charts.

In general, maps and cross-sections will be prepared using data from the comprehensive sampling event(s) because that dataset will include contemporaneous data for the Study Area.

4.6 Risk Assessment

OCWD will prepare a Baseline HHRA in accordance with applicable USEPA and California State risk assessment guidance, including but not limited to the Interim Final Risk Assessment Guidance for Superfund (RAGS), Volume I - Human Health Evaluation Manual (Part A), (EPA-540-1-89-002), the Interim Final Risk Assessment Guidance for Superfund, Volume II - Human Health Evaluation Manual (EPA 540-R-97-033), Risk Assessment Guidance for Superfund, Volume I – Human Health Evaluation Manual, Part E, Supplemental Guidance for Dermal Risk Assessment (EPA 540-R-99/005), Risk Assessment Guidance for Superfund, Volume I – Human Health Evaluation Manual, Part F, Supplemental Guidance for Inhalation Risk Assessment (EPA 540-R-070-002), and State of California Environmental Protection Agency Department of Toxic Substances Control Preliminary Endangerment Assessment Guidance Manual, October, 2015.

The HHRA will address complete exposure pathways to COPCs in groundwater. This risk assessment will only evaluate risks posed by potable use of groundwater by residents and commercial workers. Potentially complete exposure pathways are the ingestion, dermal contact, and inhalation of vapors (while showering or during other household uses). As a preliminary screening step, following a "sum of the ratios" approach (USEPA, 2016b) where appropriate, ratios of the concentration of a COPC to its risk-based USEPA regional screening level (RSL) or its DTSC-modified screening level (SL) will be calculated, and the ratios summed across all chemicals to estimate a total risk and hazard. The risk assessment will consider cumulative exposure where multiple contaminants are present. There are currently no institutional controls

in place that limit where a property owner can install a production well. Consequently, the risk assessment will evaluate exposure to groundwater in areas within the Study Area to be addressed via interim hydraulic containment, and in existing production wells.

Data generated during the comprehensive area-wide sampling event(s) will be the primary data source use for the HHRA. These data will undergo a data usability evaluation prior to quantifying the risks associated with the Shallow and Principal Aquifer plumes. Data from the most recent year of sampling will be used in the HHRA. The maximum concentration (over the most recent year of sampling) of each chemical in each aquifer will first be used as the exposure point concentration (EPC) to calculate potential cancer risk and noncancer hazard to residents and commercial workers. In addition, the 95% upper confidence limit of the mean, calculated using USEPA's most recent version of ProUCL, will be calculated for each chemical in each aquifer (using the most recent year of sampling) and used as the EPC for calculating potential cancer risk and noncancer hazard for residents and commercial workers.

OCWD will also perform an ecological screening evaluation in accordance with the State of California Environmental Protection Agency Department of Toxic Substances Control Preliminary Endangerment Assessment Guidance Manual (DTSC, 2015). If potentially complete exposure pathways for ecological receptors are identified, an ecological risk assessment will be performed as described in the USEPA Process for Designing and Conducting Ecological Risk Assessments (USEPA, 1997).

4.7 Data Management

OCWD will manage water level, water quality, and other data collected during the RI/FS in an electronic database. Data generated by OCWD during periodic sampling of production wells and OCWD's monitoring well network will be stored in OCWD's Water Resources Management System (WRMS) database. Data outputs from WRMS will be uploaded to a project-specific database that maintains information regarding sampling locations, coordinates, laboratory analytical results, water levels, field measurements, lithology, and well completion information. These data will be managed and maintained through the use of custom front-end database applications. Data outputs from WRMS may be made available to the Regional Water Quality Control Board and DTSC via upload to Geotracker and on request. In addition, OCWD will compile data for monitoring wells located at the investigation/cleanup sites located in the Study Area. This data will be obtained from DTSC and RWQCB files or online databases, input into summary spreadsheets for each investigation/cleanup site, and data entry spot-checked against original submitted reports..

5. Technical Reports

The results of RI/FS activities will be submitted to the USEPA in the form of Technical Reports or Technical Memoranda, including:

- Groundwater Model Development and Calibration Report, Model Refinement Plan, and Model Refinement Report (addendum to the Groundwater Model Report);
- Risk Assessment Technical Memorandum;
- Remedial Investigation Report;
- Treatability Study Work Plan/Treatability Study Report (if needed);
- Applicable or Relevant and Appropriate Requirements Technical Memorandum;
- Remedial Alternatives Identification and Screening Technical Memorandum;
- Detailed Evaluation of Remedial Alternatives Technical Memorandum; and
- Feasibility Study Report.

5.1 Groundwater Model Development and Calibration Report, Model Refinement Plan, and Model Refinement Report

As part of the RI/FS effort, OCWD has developed and calibrated a numeric groundwater flow model to better understand groundwater movement in the Study Area, support the development and refinement of the CSM, and evaluate remedial alternatives. OCWD will prepare and submit a report that documents the model development and calibration to the USEPA, and will then convene a workshop with USEPA and other stakeholders to facilitate a review of the model documentation. In addition, OCWD will prepare a Model Refinement Plan for submittal to USEPA. This plan will describe the process for refining the model, if needed, based on the results obtained during the RI. Refinement to the model will be conducted, if deemed necessary, after installation and sampling of the new monitoring wells. Refinements to the model will be documented in a report that will be an addendum to the Groundwater Model Development and Calibration Report.

5.2 Risk Assessment Technical Memorandum

OCWD will prepare a HHRA as described in Section 4.6. Pursuant to the requirements of the Settlement Agreement, the HHRA will only evaluate risks posed by direct exposure to

groundwater such as ingestion, dermal contact, and inhalation of vapors (while showering). Risks posed by exposure to soil, soil gas, and indoor air will not be evaluated as part of this RI/FS. The risk assessment will also consider cumulative exposure where multiple contaminants are present.

A Technical Memorandum (TM) will document the risk assessment and will summarize exposure pathways associated with the groundwater media, exposure concentrations and chemicals, human health screening values, toxicity values, and a risk characterization. It will also describe the data evaluation process used to identify the list of COPCs.

The TM will also include an exposure pathway evaluation for ecological receptors, and if complete exposure pathways for ecological receptors are identified, an ecological risk assessment will be performed and documented in a separate document. A preliminary evaluation suggests that an ecological risk assessment is not needed for the Study Area because the medium of concern is groundwater and there are no complete pathways to ecological receptors (e.g., the VOC-impacted groundwater does not discharge to surface water features or riparian habitats).

The risk assessment TM will be submitted to USEPA as a stand-alone document and included as an attachment in the RI Report

5.3 Remedial Investigation Report

OCWD will submit an RI report that summarizes the findings of the RI investigation and previous investigation results. The RI report will include sections on the site background, the study area, the physical characterization of the study area, the potential sources of groundwater contamination, and the nature and extent groundwater contamination. The RI report will include updated figures showing the distribution of VOCs in plan view and vertical cross sections, CSM revisions, and if appropriate, recommendations for additional RI work needed to address data gaps. The RI will also include a summary of HHRA and ecological risk screening evaluations. The HHRA TM will be included as an attachment to the RI report.

5.4 Treatability Study Work Plan/Treatability Study Report (If Needed)

Treatability studies and pilot testing may be necessary to support the development of an interim remedy. These studies could include testing to evaluate the effectiveness of treatment technologies or groundwater pumping or injection testing. If these studies are needed, OCWD will submit work plans for the proposed testing to USEPA for review and approval before proceeding with the work. If these studies are performed, OCWD will document the results in

treatability/pilot study reports for USEPA review. The results of any treatability studies or pilot tests will be included in the screening of remedial alternatives.

5.5 Applicable or Relevant and Appropriate Requirements Technical Memorandum

A TM will be prepared and submitted that describes potentially applicable or relevant and appropriate requirements (ARARs) under federal or state law and any proposed ARARs waivers. OCWD will evaluate ARARs consistent with Section 121(d) of CERCLA (42 United States Code [U.S.C.] § 9621[d]).

ARARs identification for the North Basin will involve a two-part analysis: first, a determination whether a given requirement is applicable; then, if it is not applicable, a determination whether it is both relevant and appropriate. The criteria for determining relevance and appropriateness are listed in 40 CFR § 300.400(g)(2).

Pursuant to USEPA ARARs guidance, the following three types of ARARs will be identified in the FS: chemical-specific, location-specific, and action-specific:

- Chemical-specific ARARs are generally drinking water standards, health- or risk-based numerical values, or methodologies applied to site-specific conditions that result in the establishment of a treatment or clean-up level. Chemical-specific ARARs will be identified based on the medium of concern and COCs.

- Location-specific ARARs may include provisions that restrict certain activities at sensitive or hazard-prone locations such as flood plains or wildlife habitat. These ARARs will be identified based on the factors such as location and type of biological resources at the site.

- Action-specific ARARs include provisions pertaining to remedial technologies/alternatives. These ARARs will be identified based on the remedial alternatives evaluated in the FS.

The evaluation of ARARs will be documented in the TM that will initially be submitted for review as a standalone document. The final version will be submitted as an attachment to the FS Report.

5.6 Remedial Alternatives Identification and Screening

A TM will be prepared and submitted that: 1) refines the RAOs; 2) identifies a range of remedial actions including engineering controls and any institutional controls (ICs) needed to address the risks; and 3) provides the results of an initial screening of alternatives to reduce the number of potential remedies for the final detailed evaluation.

As part of identification, screening and evaluation of alternatives, RAOs will be refined for the medium of interest in accordance with USEPA RI/FS Guidance (USEPA 1988). The preliminary RAOs for the interim remedy are expected to include: 1) protect human health and the environment by preventing exposure to contaminated groundwater in the Study Area; and 2) hydraulically contain contaminated groundwater to protect water supply wells and groundwater resources threatened by the spread of the contamination (USEPA, 2016a). The area for hydraulic containment (the Target Area) would include contaminated groundwater from the majority of known or suspected sources of groundwater contamination in the Study Area, including sites identified in the Settlement Agreement (**Figure 2**). The preliminary Target Area for hydraulic containment shown on **Figure 3** may be revised based on the findings of the RI. After identifying preliminary RAOs, OCWD will convene a workshop with USEPA and other stakeholders to reach consensus on the proposed RAOs before proceeding with the initial screening of remedial alternatives.

OCWD will then identify and screen remedial technologies as outlined below in accordance with the USEPA RI/FS Guidance (USEPA 1988):

- Development of general response actions (GRAs) that will satisfy the RAOs.
- Identification of volumes or areas of media to which GRAs might be applied.

The screening of alternatives is expected to consider:

- Identification and screening of remedial technologies and process options;
- Innovative technologies;
- Groundwater extraction well configurations;
- Centralized and decentralized treatment;
- Target treatment levels for groundwater recharge and potable use standards; and
- Other potential discharge options.

After identifying potential remedial alternatives for screening, OCWD will convene a second workshop with USEPA and other stakeholders to discuss the preliminary alternatives and the screening evaluation approach.

The screening of alternatives will then be documented in the TM that will initially be submitted for review as a stand-alone document. The final version will be submitted an attachment to the FS Report.

5.7 Detailed Evaluation of Remedial Alternatives Technical Memorandum

Following the initial screening, selected alternatives will be retained for a detailed evaluation. The remaining alternatives will span a range of treatment and handling of treated groundwater and will also include a No Action and Monitored Natural Attenuation (MNA) alternative. As appropriate, if ICs are identified as a component of a remedial alternative, the IC evaluation will focus on (1) the specific objectives of the ICs; (2) the specific types of ICs to be used to meet the RAOs; (3) when the ICs need to be implemented and for what duration and (4) documenting any prior examples of necessary agreements and with whom (e.g., state and/or local government entities, local landowners, conservation organizations, OCWD) used for securing, maintaining and enforcing the ICs.

The selected alternatives will undergo a detailed evaluation using the first seven of the nine evaluation criteria specified in 40 CFR 300.430[e][9]:

Threshold Criteria

- Overall protection of human health and the environment; and
- Compliance with ARARs.

Balancing Criteria

- Long-term effectiveness and permanence;
- Reduction of toxicity, mobility, or volume through treatment;
- Short-term effectiveness;
- Implementability; and
- Cost

The findings of this evaluation will be documented in a Remedial Alternatives TM.

The modifying criteria, consisting of State and Community Acceptance, will be evaluated following State and public review of the FS and Proposed Remedial Action Plan (Proposed Plan).

5.8 Feasibility Study Report

An FS Report will be prepared and submitted to USEPA and the State. The FS Report will build on the Technical Memoranda described above and will provide a summary and discuss the following:

- Study Area background and setting;
- Sources, nature and extent of groundwater contamination;
- Results of groundwater modeling conducted in support of the RI/FS;
- Baseline HHRA and evaluation of ecological risks;
- Data quality and usability;
- RAOs;
- ARARs;
- The identification and screening of remedial alternatives;
- A detailed analysis of interim remedial alternatives;
- A comparison of remedial alternatives;
- The roles and responsibilities of the required for implementation of each remedial alternative; and
- Existing facilities that may be used as part of a remedy, including their planned use, condition, expected life and the potential for increased maintenance or reduced lifespan compared to new facilities.

6. Project Schedule and Possible Scope Change

This section presents the project schedule, and identifies the possible need to modify the scope.

6.1 Schedule

The baseline schedule included as **Appendix A** provides dates for deliverables and other critical path activities required for the RI/FS. Deliverable dates are also summarized on **Table 5**. Time is included for USEPA and State review of written deliverables and for meetings with USEPA representatives when appropriate.

The schedule will be updated periodically based on actual deliverable dates, agency review times, and if unforeseen delays occur conducting field work, with the approval of USEPA. All revised schedules will be submitted with the appropriate monthly progress reports.

6.2 Possible Scope Changes

Changes to the scope of work outlined in this Work Plan may be necessary for reasons such as changes or unexpected field conditions, new technologies, or approaches that could expedite the project or make it more technically cost effective. The procedures for implementing such changes are contained on the Settlement Agreement, and are subject to USEPA approval.

7. Roles and Responsibilities of Key Personnel and Organizations

This section presents a description of the roles and responsibilities for individuals and organizations involved in the RI/FS effort, including contractors and major subcontractors. The primary project team consists of staff from OCWD, Senior Environmental Strategists Consulting (SES), Intera, and AECOM as shown **on Figure 7**.

7.1 OCWD Team

OCWD will be responsible for performing the scope of work in accordance with the requirements the Settlement Agreement. Mr. Dave Mark, Professional Geologist (PG), Certified Hydrogeologist (CHG) will be the OCWD project manager and will be the primary point of contact with USEPA. Mr. Mark will also coordinate other OCWD resources involved in the project, including OCWD's in-house laboratory, which will analyze most of the samples collected during the RI, and OCWD field sampling staff, who will perform groundwater sampling. In addition, OCWD will procure a drilling contractor to install the new monitoring specified in the Settlement Agreement.

7.2 SES Consulting – Peer Review

SES Consulting will perform a peer review role during the project and, when requested by OCWD, will perform technical review of project deliverables prior to regulatory submittal.

7.3 Intera – Groundwater Flow Modeling

Intera will lead the groundwater modeling-related tasks for the project including the model development and calibration, preparing a model development and calibration report, preparing a model refinement work plan, refining the model following the RI, if deemed necessary, and documenting the model refinement. Intera will also perform modeling activities to support the development, screening, and evaluation of interim remedial alternatives for North Basin.

7.4 AECOM Team – RI/FS Lead

AECOM will lead the RI/FS and will be responsible for preparation of planning documents, technical memoranda, and reports for the project, as well as oversight of field activities. The primary project roles and the AECOM personnel assigned to each of the project roles are summarized below:

- **Project Manager** - Mr. Crispin Wanyoike, Professional Engineer (PE) will serve as the Project Manager and will be the main contact with the OCWD. Mr. Wanyoike will be responsible for coordination of AECOM staff, schedule projections and for ensuring project performance.

- **Deputy Project Manager** - Mr. Richard Sturn will serve as the Deputy Project Manager will assist the project manager to coordinate and manage field activities and staff, and develop field documentation and reports. Mr. Sturn will also serve as project hydrogeologist, with the assistance of Mr. Douglas Roff, PG, Certified Engineering Geologist (CEG), CHG to provide technical support to the RI field activities and the development of the FS.

- **Quality Assurance Manager** - Ms. Joan Siegal will serve as the Quality Assurance (QA) Manager and will responsible for coordination of QA activities such as field sampling audits, lab data quality oversight by the Project Chemist, and peer reviews by subcontractors.

- **Project Geologist** - Mr. James Larwood. PG, CHG will be the Project Geologist and will be responsible for ensuring that field activities follow specified protocols and the supervision of OCWD contractors during drilling and well installation tasks.

- **Project Chemist** - The Project Chemist, Ms. Leta Maclean, will ensure that analytical data are collected in a manner consistent with USEPA QA guidance and QA Project Plan objectives. Ms. Maclean will be responsible for implementing the project analytical QA/Quality Control (QC) program. She is responsible for laboratory coordination, data validation, and data quality assessment.

- **Feasibility Study Lead** – Mr. Eric Lang, PE will lead the FS portion of the project. Mr. Lang will coordinate with Intera and OCWD to develop, screen, and evaluate interim remedial alternatives of the North Basin, and will be a lead author for the remedial alternatives screening and evaluation memoranda.

- **Health and Safety Officer** - The Health and Safety Officer (HSO), Mr. Galen Cooter, Certified Safety Professional (CSP), will be responsible for preparation of North Basin RI/FS Health and Safety Plan (HASP). The HSO will also be responsible for updating the HASP as needed, ensuring that proper health and safety procedures are followed, performing periodic field audits, and assigning site safety coordinators.

- **Database Manager** – Mr. Bret Glidden will be responsible for maintenance of the project database and will be responsible for ensuring that the data are submitted to the OCWD WRMS data base in a compatible format.

- **Risk Assessor** – Ms. Kanan Patel-Coleman will be responsible for providing risk assessment support during RI/FS activities

8. Permits, Access, Coordination, and Compliance with Substantive Requirements

The Orange County Well Ordinance (County Ordinance No. 2607) requires that a permit be obtained prior to the construction or destruction of any well. For monitoring wells proposed in the City of Anaheim, (generally south of SR-91, and west of SR-57), well permits will be obtained from the City of Anaheim. For other proposed monitoring wells, permits will be sought from the Orange County Health Care Agency. It is understood that OCWD and OCWD's drilling subcontractor will obtain relevant permits and access agreements prior to commencement of drilling. Permits, easements, access agreements, and approvals anticipated for implementation of the RI/FS are listed in the table below:

Anticipated Well Permits, Access Agreements, and Approvals

Well ID	Anticipated Well Permits	Anticipated Access Agreements	Anticipated Encroachment Permits
FM-7B	Orange County Well Ordinance	NA	City of Fullerton
AM-54A AM-54B AM-54C	City of Anaheim	NA	City of Anaheim
FM-30A	Orange County Well Ordinance	Yes	NA
FM-31A FM-31B	Orange County Well Ordinance	NA	City of Fullerton
FM-24B	Orange County Well Ordinance	NA	City of Fullerton
FM-22B	Orange County Well Ordinance	NA	City of Fullerton
FM-29A FM-29B FM-29C	Orange County Well Ordinance	NA	City of Fullerton
FM-32A FM-32B	Orange County Well Ordinance	Yes	NA

Notes:
ID identification
NA not applicable

9. Community Involvement Activities

Although the USEPA expects to take the lead role in implementing community involvement activities for the Study Area, it may request that OCWD assist USEPA by participating in public meetings, preparing fact sheets, placing documents in the local information repository, placing announcements in local newspapers, providing translation services, or conducting other community involvement activities. OCWD is a local public agency with independent community involvement responsibilities including conduct of OCWD-led community involvement activities. Where these activities may relate to this Work, OCWD will coordinate with USEPA and, where applicable, the affected Cities. If requested by USEPA, OCWD will help establish and maintain an information repository at the main City of Fullerton public library. This information repository will contain key RI/FS documents selected by USEPA. The information repository will contain a subset of the information available in the USEPA site file for the North Basin RI/FS.

Notes:
Number of samples and wells with concentrations exceeding MCLs or NLs are shown in **bold**.
No detections of pesticides, polychlorinated biphenyls, or ntrosamines in groundwater monitoring wells within the Study Area above reporting limits.

Goal Comparison
[a] Federal (USEPA 05/2009) and Title 22 California Code of Regulations (SWRCB 08/10/2015) - primary MCLs only (Copper and Lead are Regulatory Action Levels).
[b] Drinking Water Notification Levels (SWRCB 02/04/2015)

µg/L micrograms per liter
ID identification
mg/L milligrams per liter
MCL Maximum Contaminant Level
NL Notification Level
No. Number
NP not promulgated
SWRCB State Water Resources Control Board
USEPA United States Environmental Protection Agency

Table 3

Monitoring Well Construction Details - Proposed Wells
Orange County North Basin Study Area
Remedial Investigation and Feasibility Study

Well No.	Target Depth(s) of Screened Interval (ft)	Justification/Notes
AM-54A AM-54B AM-54C	110-130 175-195 240-260	To characterize the lateral and vertical extent of groundwater contamination in the vicinity of one-time grab samples MW-GW01, MW-GW02, OW-GW01, and OW-GW02. Principal Aquifer well (AM-54C, 250-ft depth) may be eliminated if downgradient Principal Aquifer well at FM-7B does not exhibit VOCs at concentrations greater than the MCL/NL.
FM-7B	250-270	To evaluate the benefits of hydraulically containing contaminated groundwater at or near well FM- 7 location. Adjacent wells FM-7A and FM-7 have shown decreasing VOC concentrations since they were installed in 2009. Vertical extent and presence of VOCs in the Principal Aquifer in this area is unknown.
FM-22B	310-330	To characterize the vertical extent of Principal Aquifer contamination observed in FM-22 (screened interval 242-262 ft bgs), which exhibits significantly higher VOC concentrations than adjacent Shallow Aquifer monitoring well FM-22A (screened interval 150-170 ft bgs). Provides data to evaluate the possible need to pump from deeper parts of the Principal Aquifer.
FM-24B	320-340	To characterize the vertical extent of Principal Aquifer contamination observed in well FM-24 (screened interval 271-291 ft bgs), which exhibits significantly higher VOC concentrations than adjacent Shallow Aquifer monitoring well FM-24A (screened interval 154-174 ft bgs).
FM-29A FM-29B FM-29C	170-190 270-290 340-360	To characterize the lateral and vertical extent of groundwater contamination in the Shallow and Principal Aquifers, including helping to define the lateral downgradient extent of Principal Aquifer contamination observed in well FM-19C.
FM-30A	140-160	To characterize the extent of shallow groundwater contamination between wells FM-7 and FM-23 locations.
FM-31A FM-31B	130-150 230-250	To characterize the lateral and vertical extent of groundwater contamination downgradient of wells FM-10, between wells FM-11 and FM-15 locations.
FM-32A FM-32B	140-160 255-275	To characterize the extent of groundwater contamination downgradient of well FM-18A/18. Additional downgradient monitoring may be needed if elevated VOCs are detected at this location.
FM-33A	130-150	To characterize the northern plume boundary and width of containment capture zone for that area (Interim Remedy). Target screened interval similar to OCWD monitoring well FM-18A (located cross-gradient and to the south). VOCs concentrations in nearby Principal Aquifer monitoring well FM-18 are non-detect, or well below MCLs. Consequently, only a Shallow Aquifer monitoring well is proposed.
FM-34A	130-155	To characterize the northern plume boundary and width of containment capture zone for that area (Interim Remedy). Target screened interval similar to OCWD monitoring well FM-20A (located cross-gradient and to the south). VOCs concentrations in nearby Principal Aquifer monitoring well FM-20 are non-detect or well below MCLs. Consequently, only a Shallow Aquifer monitoring well is proposed.
AM-55A AM-55B	310-330 380-400	To characterize groundwater contamination up-gradient and east of the City of Fullerton's main wellfield that has been impacted by VOCs; and, to characterize possible contribution of contamination to that wellfield from known release sites to the east. Target screened intervals of proposed monitoring wells overlap with upper and lower screened intervals of VOC-impacted production wells.
AM-56A AM-56B	310-330 380-400	To characterize groundwater contamination up-gradient and northeast of the City of Fullerton's main wellfield that has been impacted by VOCs; and, to characterize the contribution of contamination to that wellfield from the main body of the North Basin VOC plume. Target screened intervals of proposed monitoring wells overlap with upper and lower screened intervals of VOC-impacted production wells.

Notes:

1. Well locations will be ground-truthed prior to final installation, and are subject to change pending access and suitability for well construction.
2. Assume 20-ft-long screened intervals. Actual length and depth of screened intervals will depend on observed lithology.

Sample Frequency Notes:

1 Routine sampling frequency for existing OCWD wells is every four months; the new wells will be incorporated into the routine sampling program as they are installed

2 Proposed wells to be sampled once after well development and incorporated into the routine sampling program.

3 All OCWD wells within the Study Area, including Proposed Wells, to be sampled once to provide a comprehensive dataset

4 Proposed wells will be sampled at least **three (3)** times during the duration of the remedial investigation: 1) after well development, 2) during routine OCWD sampling, and 3) during comprehensive area-wide sampling

-- Not sampled or analyzed

X Well sampled for laboratory analyses

Analyses Notes:

a VOC suite comprises 81 volatile organic compound analytes by OCWD or EPA Method 524.2

b CLO4 suite comprises perchlorate only, by OCWD or EPA Method 332.0

c 14DIOX suite comprises 6 analytes, including 1,4-dioxane and 1,2,3 trichloropropane in OCWD Method Group #432

d 14DIOX-R suite comprises 1,4-dioxane analysis only.

e GENLVLIN suite comprises 24 anion and general water quality parameters by various methods in OCWD Group #244

f Analysis for 1,4-dioxane by EPA Method 8270-SIM

g Analysis for 1,2,3-trichloropropane by EPA Method 524M-TCP

Table 5
Schedule of Deliverable Dates
Orange County North Basin Study Area
Remedial Investigation and Feasibility Study

Work Element	Activity or Deliverable	Settlement Agreement Section	Due	Start Date	Due Date[1,2]	Actual Completion Date	Status
4	Submittal of analytical data, whether or not validated	IX	Forty-two (42) calendar days of sample shipment to the laboratory or 14 days of receipt of analytical results from the laboratory, whichever occurs first.	Based on sample collection dates			Pending
4	Submittal of validated analytical data	IX	Ninety (90) calendar days of the sample shipment to the laboratory	Based on sample collection dates			Pending
4	Groundwater well construction information	IX	Ninety (90) days after completion of a well.	Based on well completion dates			Pending

Notes:

1. The submittal dates shown for plans, memoranda, and reports are for the initial (draft) submittals of the documents to USEPA.
2. The schedule will be updated based on actual delivery dates, agency review times, and if unforeseen delays occur during field work.

Environmental Services Assistance Team (ESAT) Region 9
ICF International

ESAT Contract No.: EP-W-13-029
Technical Direction Form No.: 10106123

DATE: July 29, 2016

SUBJECT: Split Sample Comparison

As assigned under EPA Contract No. EP-W-13-029 and TDF 10106123, ESAT completed a comparison of 64 split samples collected for the North Basin Project in Orange County, California during May 2016 and analyzed at the two laboratories listed below.

Site:	Orange County North Basin
Site Account No.:	A9 78 QB 00
Case:	46163
Laboratories:	Orange County Water District Laboratory (OCWD) Shealy Environmental Services, Inc. (Shealy)
Analysis:	Trace Volatiles by Purge and Trap GCMS
Samples:	Groundwater Samples Collected May 16 to 26, 2016

The comparison is limited to three target analytes: 1,1-dichloroethene, tetrachloroethene and trichloroethene. Both laboratories use gas chromatography with mass spectrometry (GCMS) to determine volatile concentration using purge and trap sample introduction. Orange County Water District Laboratory (OCWD) references EPA Method 524.2, Revision 4.1, 1995 while Shealy Environmental Services, Inc. (Shealy) performed analysis under the CLP SOW SOM02.3, September 2015. The tabulated results are provided as Attachment A, Orange County North Basin May 2016 Sampling, Summary of Results. Data from both laboratories was validated for the three analytes following the *USEPA National Functional Guidelines for Superfund Organic Methods Data Review*, August 2014 and no significant findings were reported (reports were provided under separate cover and are available from Joe Eidelberg).

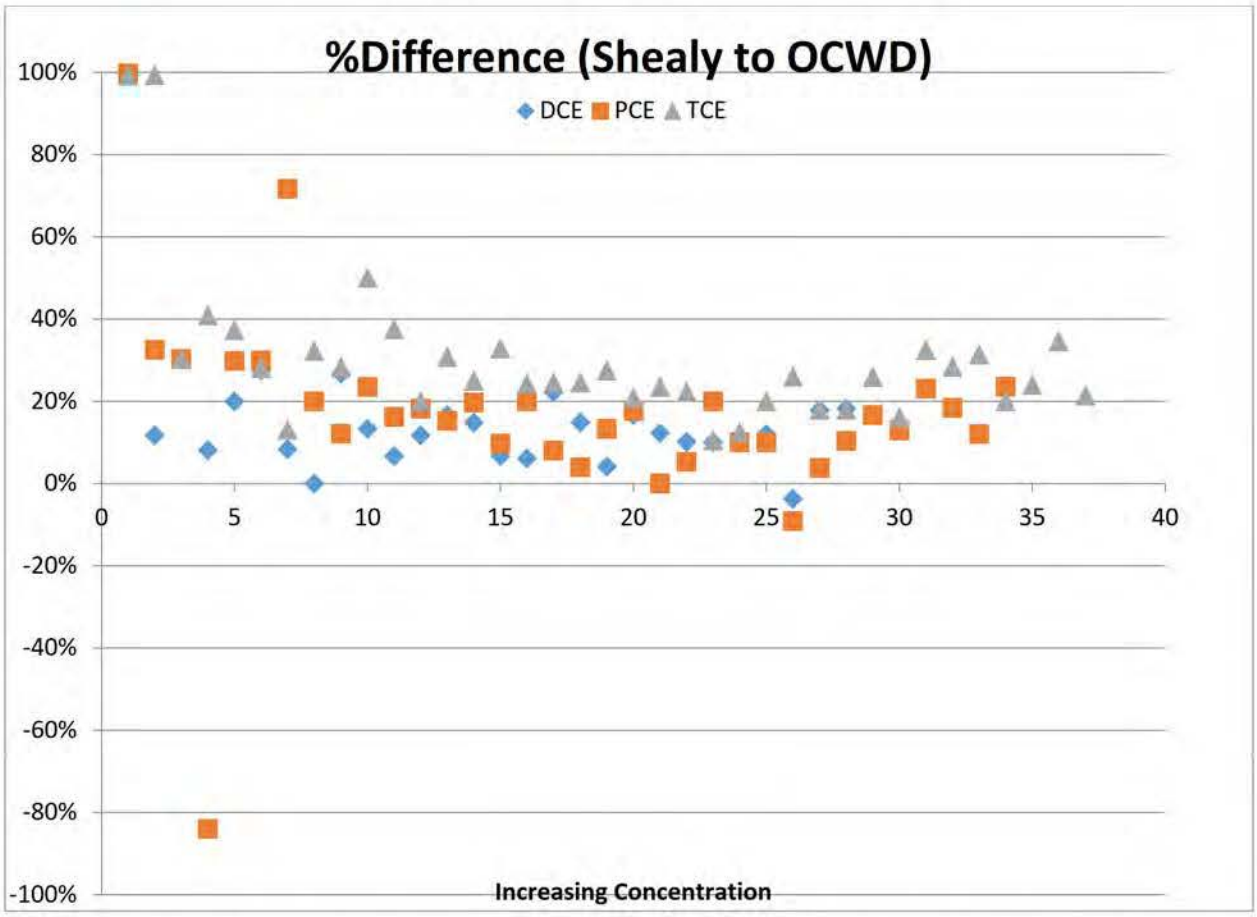
The report was prepared using the following information sources:

1. The *North Basin Project – OCWD _WQ Sample Collection Log from 5/16/16 to 5/26/16* provided by Lily Sanchez of the Orange County Water District Laboratory in an email (thru Joe Eidelberg).
2. Data for the above reference case from the Contract Laboratory Program Support System, Sample Management (SMO) Portal (https://epasmoweb.fedcsc.com).

3. Laboratory reports provided by Lily Sanchez of the Orange County Water District Laboratory.
4. *PES Scoring Evaluation Reports* by the Quality Assurance Technical Support (QATS) Laboratory and provided in an email.

A simple point-by-point comparison of the data for each station location and analyte quickly demonstrates that the results reported by Shealy are higher than those from OCWD. The bias between the two data sets is shown for each analyte in the charts at the end of this report. For each analyte, the first chart presents the paired concentrations for each station location with the x-axis a simple chronological order. A clearer representation of the bias is observed when the data are ordered by increasing concentration and the logarithm of the concentrations are present as seen in the second chart. If only one laboratory reported a non-detected result, the 0 is replaced with 0.001 to allow calculation of the logarithm. Data points where both laboratories reported non-detected results have been removed from the second chart.

Results for station location PAGE-F/1 are the one exception to observed bias. In this instance, as shown below, the 1,1-dichloroethene result from the OCWD Laboratory is significantly greater than that reported by Shealy.



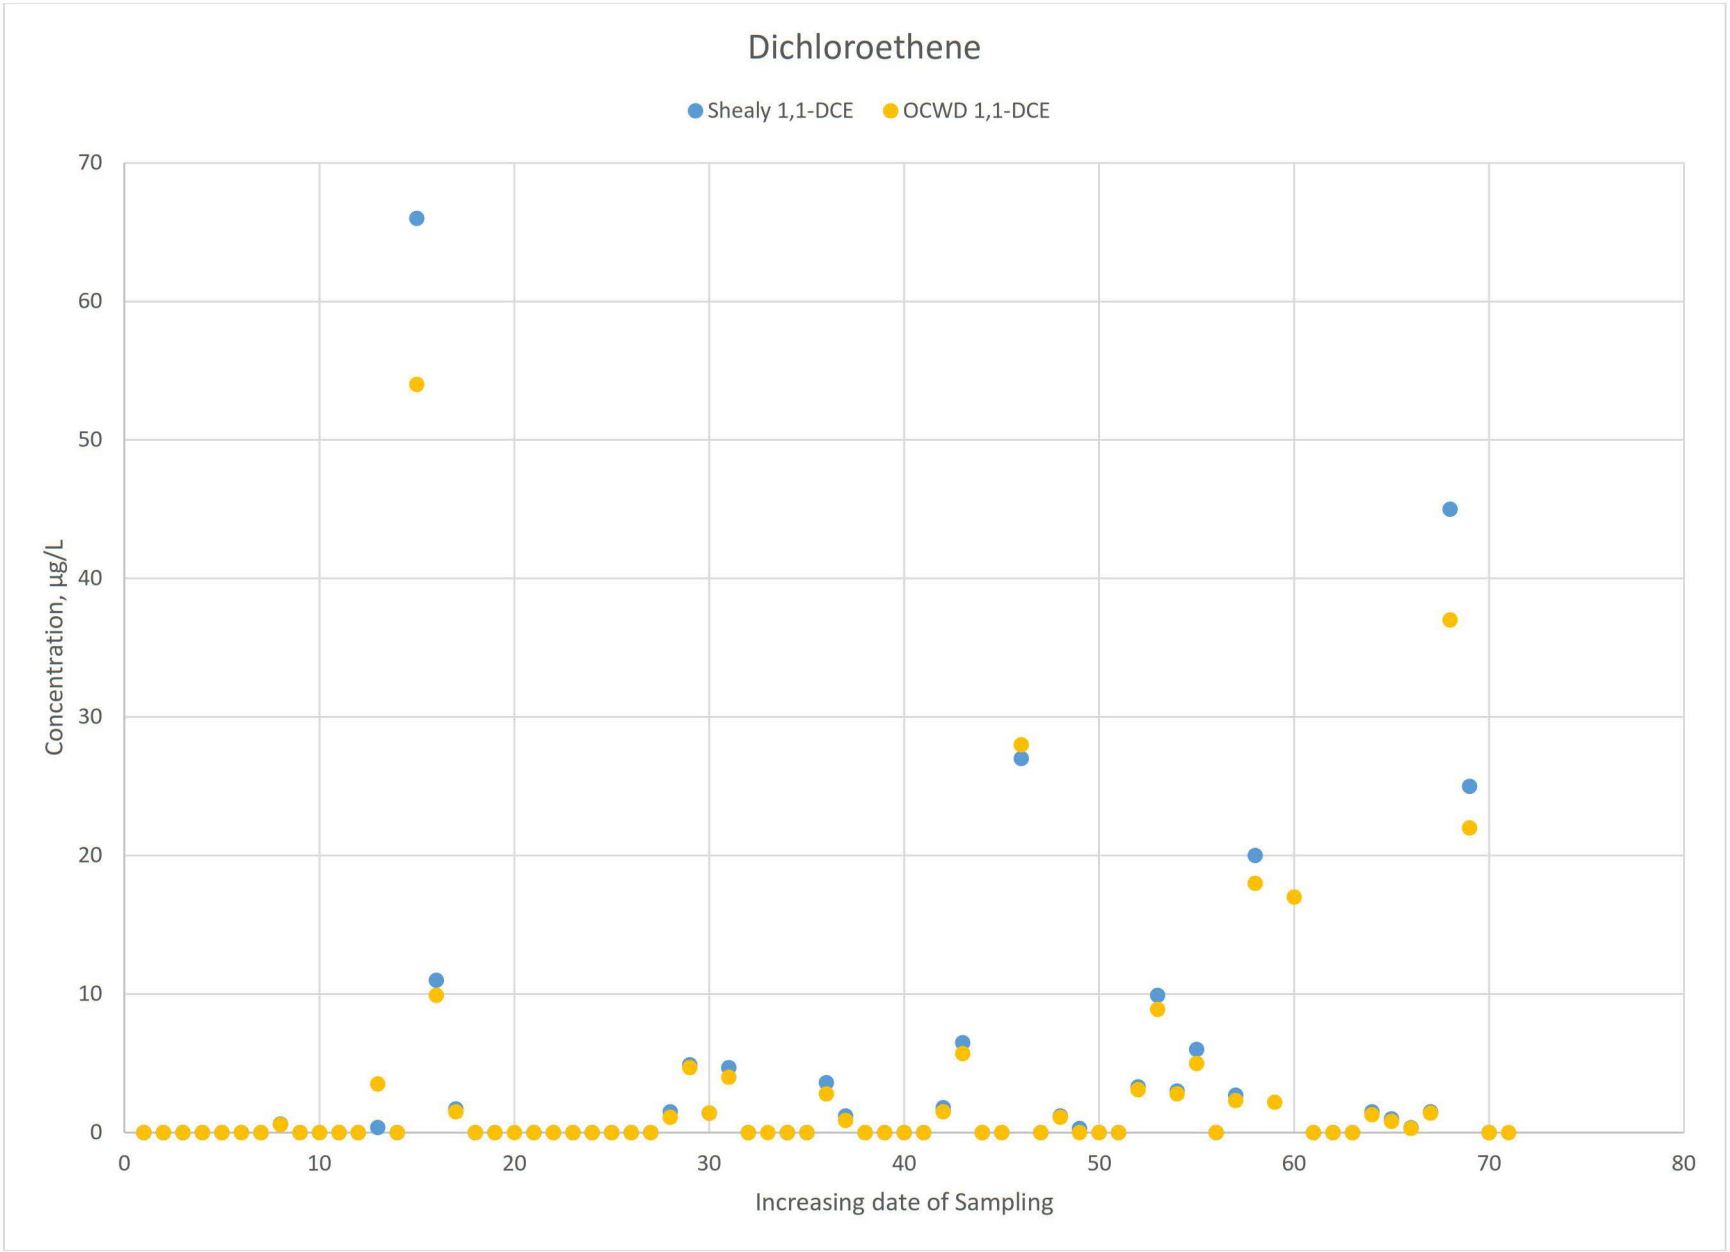
Analyte	OCWD	Shealy	Units
1,1-Dichloroethene	3.5	0.38	µg/L
Trichloroethene	0.59	0.82	µg/L
Tetrachloroethene	ND	ND	µg/L

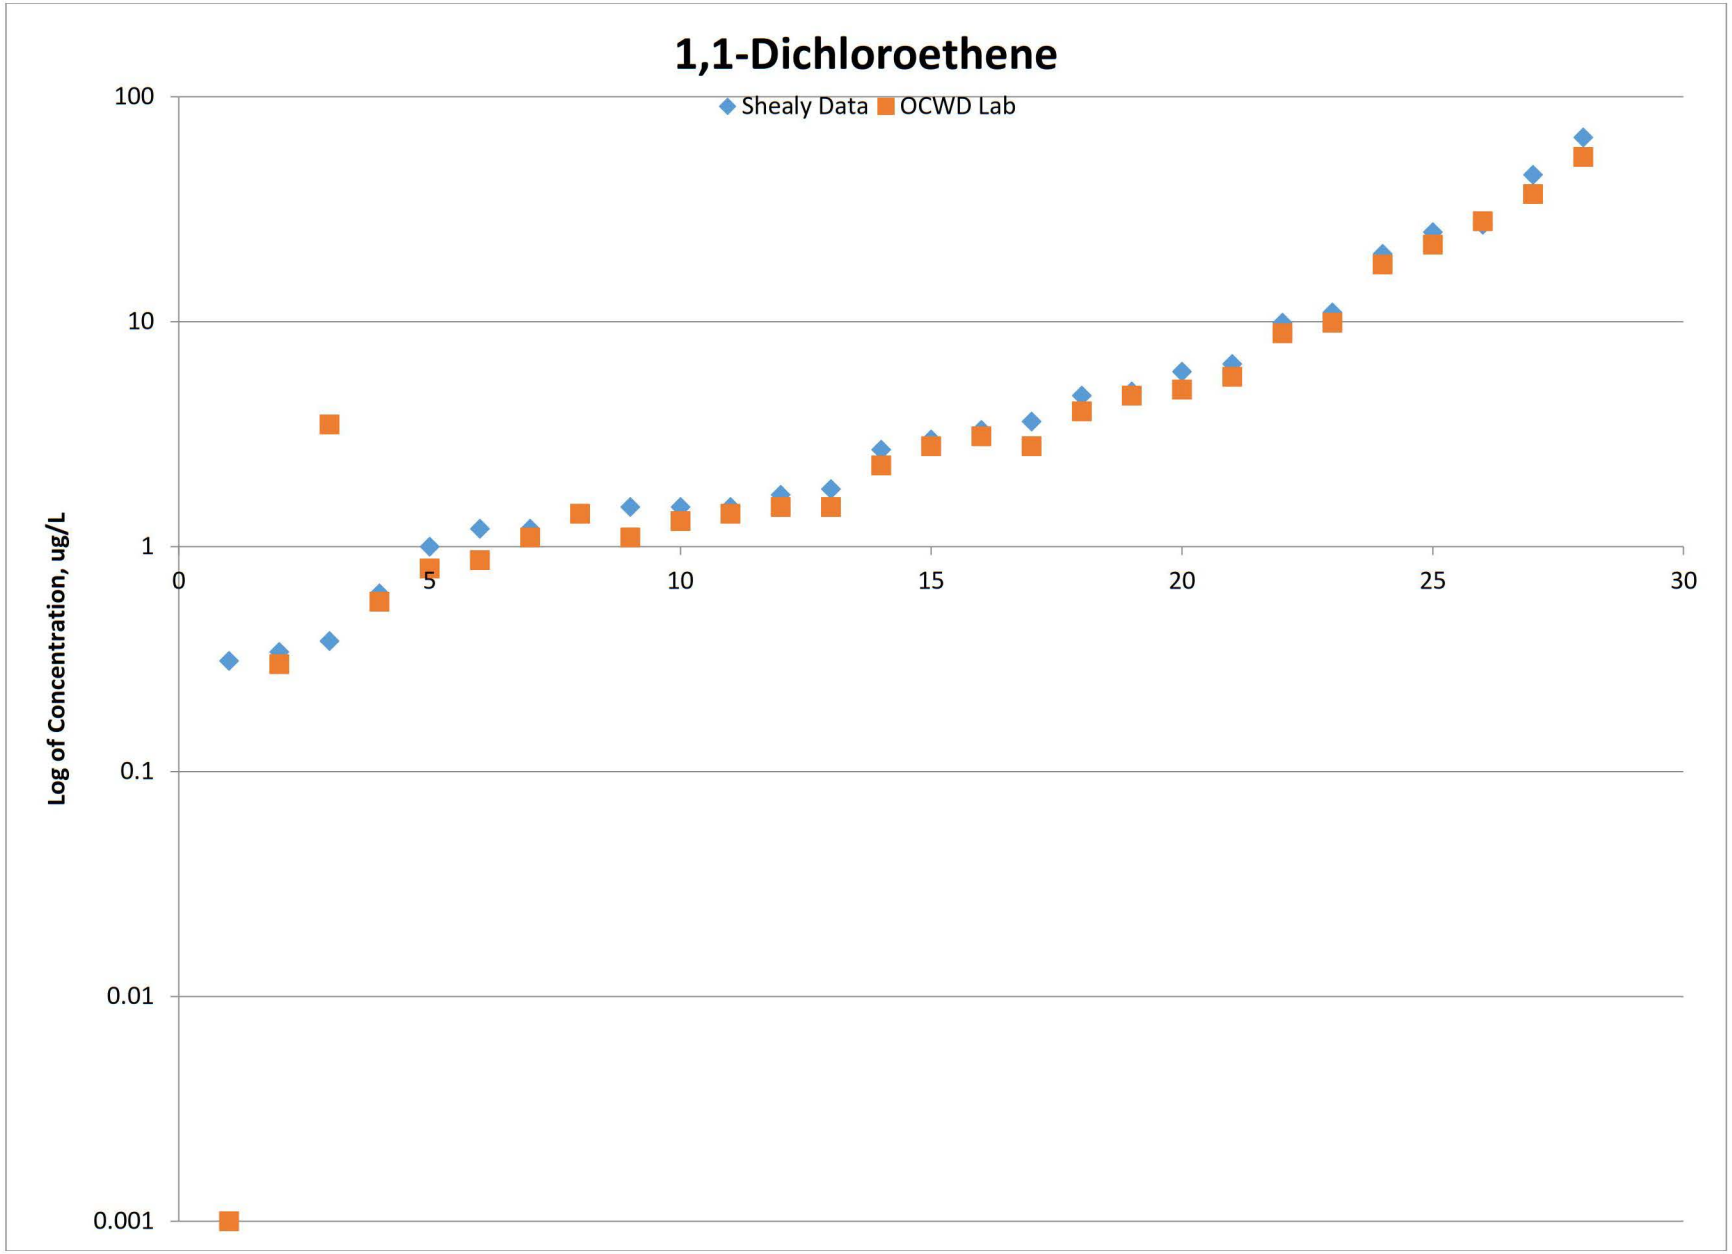
The raw data from both laboratories has been reviewed and no cause of the discrepancy was determined. The most likely source of error is that one sample was mislabeled, either in the field or laboratory. If historical data exists for the station location it would be possible to identify which result is consistent with the previously reported concentrations for the station location.

Although the bias can be easily observed from the attached charts, evaluating the impact requires further investigation. Looking at the data from an absolute magnitude between the reported results provides little information because the concentrations at the various station locations vary by two orders of magnitude. Using percent difference allows direct comparison of pairs of widely different concentrations. The average percent difference for the data set using each laboratory as the reference and the average relative percent difference (RPD) are provided in the table below:

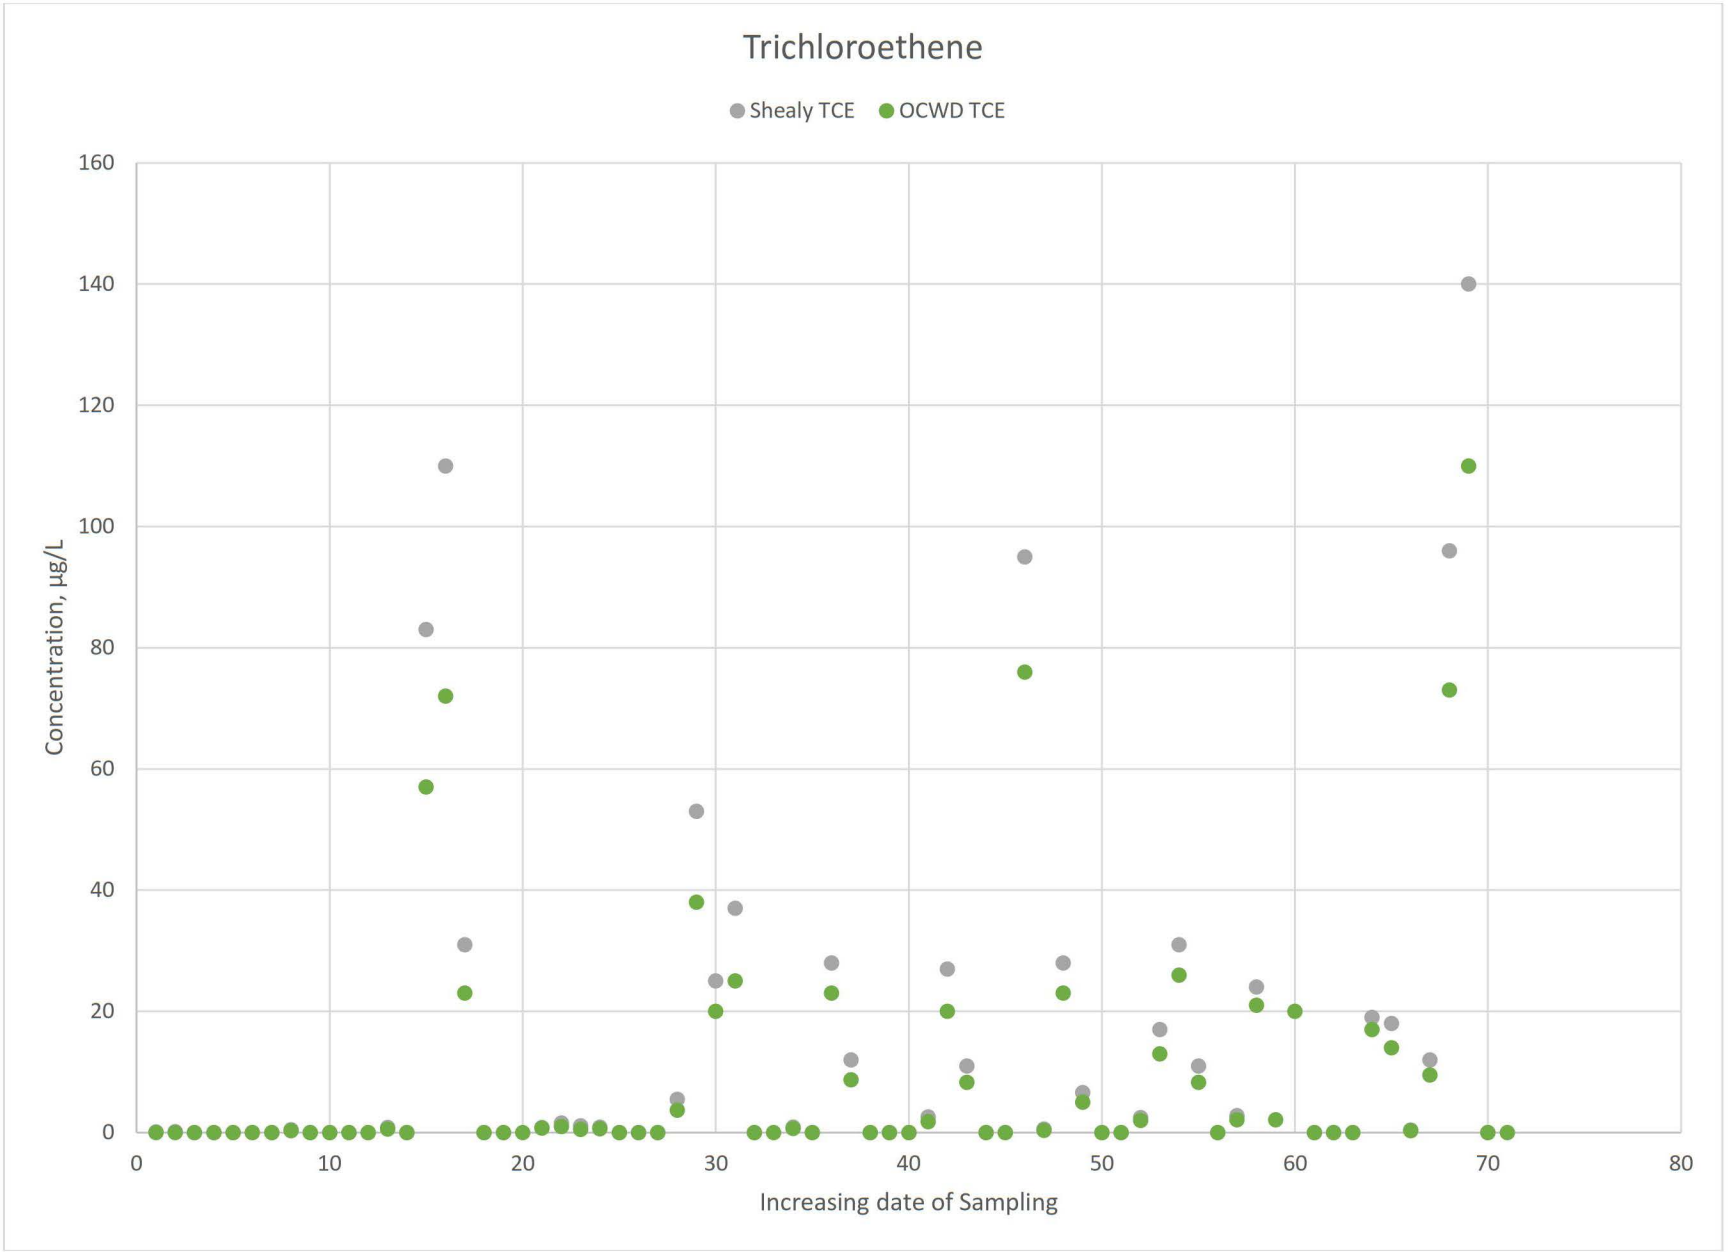
Data set	%Diff, Shealy	%Diff, OCDW	RPD
All non-zero data	18%	- 27%	5%
All data ≥ 0.5 µg/L	16%	- 22%	5%

This table confirms the observation that the Shealy results are consistently higher than the OCWD results. This is clearly presented in a graph of the non-zero data using Shealy as the reference laboratory:



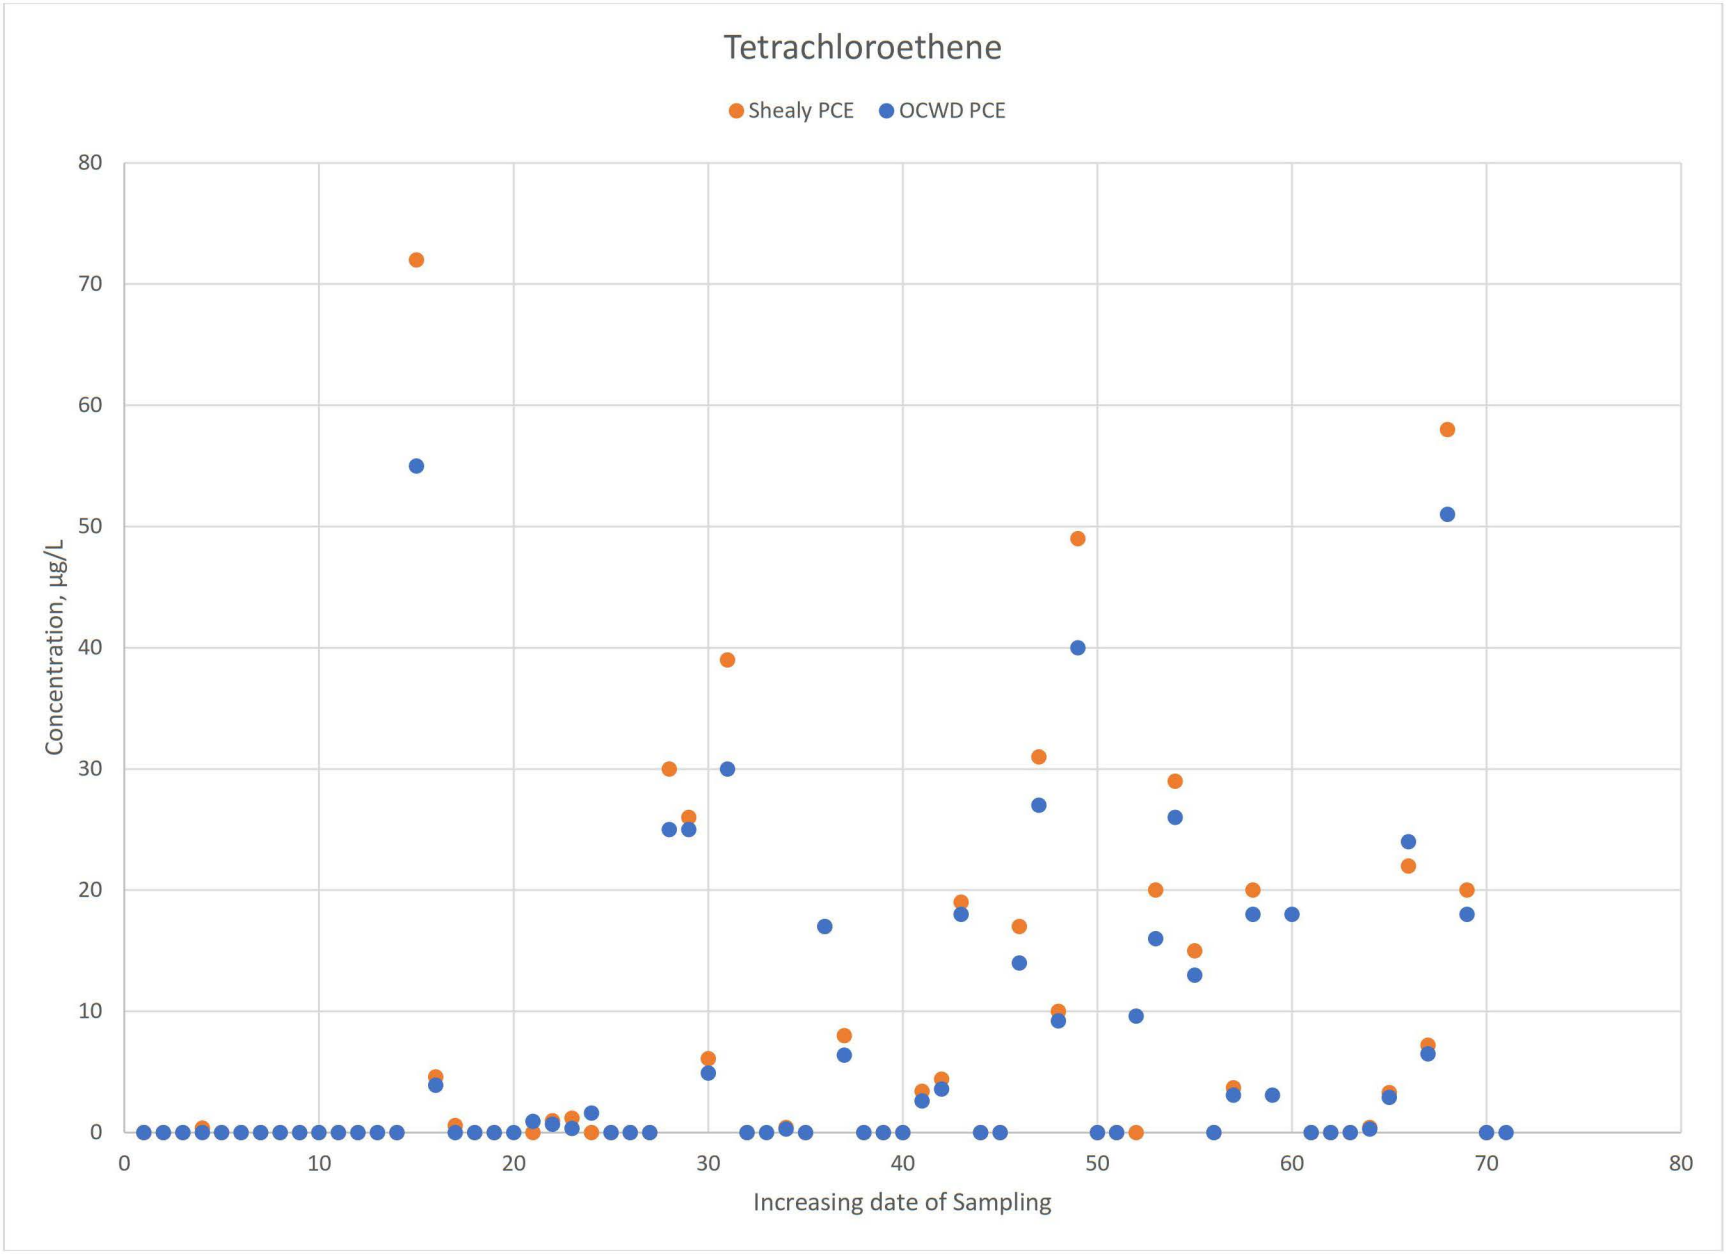


The significance of the above chart is the relative consistency of the bias across the concentration range of the data and between the analytes. To evaluate this bias, the single-blind performance evaluation samples analyzed with project samples are summarized below (units are µg/L). The OCWD analyzed these samples twice with comparable results:



PE Study Acceptance Limits and Statistics

	OCWD (1)		OCWD (2)		Shealy		Ave.	Spike	n
Analyte	Conc.	Flags	Conc.	Flags	Conc.				
1,1-Dichloroethene	2.3		2.2		2.7		2.5	2	20
Trichloroethene	2.1		2.1		2.8	High	2.1	2	19
Tetrachloroethene	3.1		3.1		3.7		3.4	3	20
1,1-Dichloroethene	17		18		20		18	15	22
Trichloroethene	20		21		24		22	20	23
Tetrachloroethene	18		18		20		19	18	22



The Shealy results are consistently above both the study averages and the spike concentration for the PE confirming that the data are biased high. Conversely, both reported results from the OCWD laboratory fall between the study average and spike concentrations. Therefore, the PE results indicate that the OCWD data is more accurate (i.e. reported results are more reflective of actual sample concentration) than the Shealy data.

NATIONAL PRIORITIES LIST (NPL)

Proposed Site

January 2018

ORANGE COUNTY NORTH BASIN | **California**
Orange County

Site Location:

The Orange County North Basin site includes a contaminated groundwater plume and the sources that caused the contamination in Orange County, Southern California. Located in mixed residential, commercial, and industrial areas in the cities of Anaheim, Fullerton, and Placentia, the site includes the Orange County Groundwater Basin, which supplies water to 22 cities serving 2.4 million residents.

Site History:

The site is a comingled groundwater plume of chlorinated solvents and other contaminants covering more than five square miles. Facilities in the area that are known to have used chlorinated solvents include metal manufacturing and plating operations, aerospace manufacturers, and equipment repair and calibration operations.

Site Contamination/Contaminants:

The groundwater plume is contaminated with trichloroethylene (TCE), tetrachloroethylene (PCE), and 1,1 dichloroethylene (1,1-DCE) found at concentrations above the Safe Drinking Water Act Maximum Contaminant Levels (MCLs) and California MCLs. The groundwater is also contaminated with 1,4-dioxane in exceedance of the California Notification Level, and with the chemical perchlorate.

Potential Impacts on Surrounding Community/Environment:

The contamination continues to migrate both vertically and laterally, threatening drinking water supply wells in the principal aquifer including at least 46 active downgradient production wells that serve Orange County. Four drinking water wells in Fullerton and Anaheim were shut down due to this contamination. Recently, one additional well has been taken out of service due to site-related contamination. All drinking water currently served by water purveyors meets federal and state drinking water standards.

Response Activities (to date):

Several known sources are being actively cleaned up by two California EPA state agencies: the Department of Toxic Substances Control (DTSC) and the Santa Ana Regional Water Quality Control Board. Several other possible sources have also been preliminarily assessed by the EPA. Additionally, Orange County Water District is conducting a Remedial Investigation/Feasibility Study under the oversight of EPA Region 9 pursuant to an Administrative Settlement, and operating an extraction well to prevent further vertical and horizontal migration.

Need for NPL Listing:

California EPA referred the site to U.S. EPA to prevent further migration of contaminated groundwater into the area's principal aquifer, the primary drinking water source for Orange County. Other cleanup programs were evaluated, but could not adequately address the plume as a whole due to the number of sources and jurisdictions involved. The EPA received a letter from the state of California on June 28, 2017, in support of placing this site on the NPL.

[The description of the site (release) is based on information available at the time the site was evaluated with the HRS. The description may change as additional information is gathered on the sources and extent of contamination. See 56 FR 5600, February 11, 1991, or subsequent FR notices]

For more information about the hazardous substances identified in this narrative summary, including general information regarding the effects of exposure to these substances on human health, please see the Agency for Toxic Substances and Disease Registry (ATSDR) ToxFAQs. ATSDR ToxFAQs can be found on the Internet at https://www.atsdr.cdc.gov/toxfaqs/index.asp or by telephone at 1-800-CDC-INFO or 1-800-232-4636.

1. Introduction

This Field Sampling Plan (FSP) Addendum No. 1 (FSP Addendum No. 1) describes additional field sampling activities to be performed by the Orange County Water District (OCWD) at the Orange County North Basin Study Area (North Basin or Study Area) pursuant to the Administrative Settlement Agreement, United States Environmental Protection Agency (USEPA) Docket # 2016-03 (Settlement Agreement [USEPA 2016]). The terms North Basin and Study Area are used interchangeably in this document. The Settlement Agreement requires OCWD to conduct a Remedial Investigation/Feasibility Study (RI/FS) to support the development of an interim remedy to contain contaminated groundwater originating from the majority of known or suspected sources in the Study Area, and to characterize the nature and extent of groundwater contamination in the Study Area. **Figure 1** shows the location of the Study Area.

The Final FSP (AECOM 2017) documented the rationale, methods, and procedures for the installation of 20 new monitoring wells at 12 locations, as well as groundwater sampling and analysis for new and existing monitoring wells in the Study Area. Between September 2017 and February 2018, OCWD performed an initial phase of the remedial investigation (RI), installing and sampling 13 new monitoring wells at 7 locations. Subsequent to approval of the Final FSP, USEPA and OCWD revised the locations of several of the remaining monitoring wells, eliminated one well due to access limitations, and added an additional monitoring well to accomplish the study objectives. In total, OCWD will install 21 new monitoring wells at 12 locations as part of the RI.

This FSP Addendum No. 1 documents the rationale, methods, and procedures for the installation of the 8 remaining monitoring wells and sampling for perfluorinated compounds (PFCs), which was not included in the Final FSP (AECOM 2017). The results of this investigation will be documented in the RI report.

1.1 RI Objectives

The objectives of the RI are:

- Refine the conceptual site model (CSM) and fill data gaps to support the development and evaluation of remedial alternatives for an interim remedy;
- Further define the lateral and vertical extent of contamination in the Study Area;
- Prepare a baseline risk assessment for human health and evaluate risks to ecological receptors; and

- Provide data to address any concerns about the quantity, quality, completeness, or usability of existing data.

1.2 RI Field Work

OCWD will perform the following additional sampling and analysis activities to help achieve these objectives:

- Install 8 monitoring wells at 5 locations to address data gaps associated with regional volatile organic compound (VOC) contamination.

- Sample the new and existing monitoring wells for laboratory analysis and collect groundwater level measurements.

- Analyze the groundwater samples for VOCs, 1,4-dioxane, 1,2,3-trichloropropane (1,2,3-TCP), perchlorate, nitrate, metals, major anions and cations, and other general mineral parameters.

- For 19 monitoring wells, analyze groundwater samples for PFCs to augment existing data.

2. Background

A summary of the hydrogeology of the Study Area, previous investigations, and the approximate extent of groundwater contamination is presented in the Final FSP (AECOM 2017).

3. Sampling Rationale, Number of Samples, Laboratory Analyses

This section summarizes the rationale for groundwater sample collection, the number of samples, and laboratory analyses for samples collected during the additional RI activities.

3.1 Installation of Additional Monitoring Wells

The locations of the additional wells were selected to provide further horizontal and vertical delineation of VOCs in the Shallow and Principal Aquifers. **Figure 2** shows their locations. **Table 1** summarizes the rationale for the additional monitoring wells.

The monitoring wells will be installed using mud rotary drilling methods and will be constructed with 4-inch diameter Schedule (Sch) 80 polyvinyl chloride (PVC) casing and screens. Well depths will range from approximately 130 feet below ground surface (bgs) to 445 feet bgs. The final well completion details will be determined based on a review of lithologic and geophysical logs for the new wells.

The locations of selected wells may be slightly modified based on the ability to secure access and constructability limitations.

3.2 Groundwater Sampling

Groundwater samples will be collected from new and existing monitoring wells for laboratory analysis. The new wells will be sampled multiple times to confirm initial results, and a comprehensive, network-wide sampling event will be performed to evaluate overall nature and extent of VOCs in the Study Area. **Table 2** summarizes the sampling schedule for each monitoring well. An overview of the groundwater sampling schedule is as follows:

- The new monitoring wells will be sampled: 1) after well development and 2) during subsequent OCWD routine sampling events;
- The new monitoring wells will be sampled during a comprehensive network-wide sampling event that will be performed after all the new wells have been installed; and
- A subset of the monitoring wells (19) will be sampled for PFC analysis. **Figure 3** shows their locations.

Groundwater level measurements will be collected during each sampling event and the data used to evaluate groundwater flow directions and gradients.

3.3 Laboratory Analyses

All groundwater samples collected from the additional monitoring wells will be analyzed by a fixed-base laboratory. The resulting data will be used to characterize the nature and extent of contamination in the Study Area and to support risk assessment and feasibility study evaluations. The samples will be analyzed for VOCs, 1,4-dioxane, 1,2,3-TCP, nitrate, perchlorate, and other chemical parameters. In addition, samples collected from a subset of the monitoring wells will be analyzed for PFC analysis.

Analytical test methods, analytes, and detection limits, as well as sample containers, preservation requirements, and analytical holding times for all non-PFC samples are provided in the Final FSP (AECOM 2017). **Table 3** summarizes the analytical test methods, analytes, and detection limits for PFC analysis; **Table 4** summarizes the sample containers, preservation requirements, and analytical holding times for PFC analysis.

4. Field Methods and Procedures

This section describes methods and procedures for the following activities to be performed during monitoring well installation and groundwater sampling. These activities include:

- Groundwater monitoring well installation;
- Groundwater sampling and level monitoring;
- Sample handling and custody procedures;
- Decontamination; and
- Investigation-derived waste (IDW) management.

4.1 Groundwater Monitoring Well Installation

RI field work conducted under this addendum will include the installation of new monitoring wells. This work will be performed in accordance with the procedures and technical specifications included in the Final FSP (AECOM 2017). Mud rotary drilling will be used to advance the borings for the proposed monitoring wells. The new wells will be constructed with 4-inch diameter Sch 80 PVC casings and screens, with approximately 10- to 20-foot long screen intervals. **Figure 4** shows a generalized well completion diagram for the proposed monitoring wells. **Table 1** lists the target screen intervals for the new monitoring wells. The final well completion details will be determined based on review of lithologic and geophysical logs for the new wells. As required by the Settlement Agreement, well construction information will be submitted to the USEPA as the wells are completed.

4.2 Groundwater Sampling and Water Level Measurements

RI field work conducted under this addendum will include sampling of new and existing monitoring wells for laboratory analysis. Groundwater sampling will be conducted in accordance with the procedures and technical specifications presented in the Final FSP (AECOM 2017). As required by the Settlement Agreement, laboratory analytical results will be submitted to the USEPA as the data become available and are validated.

Specialized sampling methods and procedures are sometimes needed when for sampling of PFCs because of the low detection limits needed and the potential for contamination during sample collection and handling. Of particular concern, the dedicated sampling pumps used by OCWD may have Teflon-containing materials that could contaminate the samples. To assess this possibility, OCWD performed an evaluation of OCWD's dedicated sample pumps and other groundwater sampling equipment. The testing included running PFC-free water though the sampling equipment and analyzing water samples collected from the discharge for 6 PFCs by

USEPA Method 537. The reporting limit for the analyses was 4 nanograms per liter. PFCs were not detected in any of the test samples. **Appendix A** includes a summary of the testing and the associated analytical results. Based on the findings of this study, the OCWD's sampling procedures that are documented in the Final FSP should not contaminate PFC samples, and therefore the same procedures will be used for PFC sampling during this RI.

4.3 Sample Handling and Custody

Sample handling and custody procedures will be performed in accordance with the procedures described in the Final FSP (AECOM 2017) with the following modification:

- Samples for PFC analysis will be placed in a zip lock bags and then kept in coolers with wet ice. Blue ice is not acceptable for PFC sample storage because it may contain PFC compounds and may contribute to sample contamination.

Table 4 summarizes the sample containers, preservation requirements, and analytical holding times for the PFC samples. **Table 5** summarizes the field (QC) sample requirements for PFC sampling. Trip blanks and matrix spike/matrix spike duplicates are not required for PFC samples; however, field reagent blanks (FRBs) are required to be collected at each well site where field samples are collected for PFC samples. PFC-free water and an empty 250-milliliter high-density polyethylene bottle are shipped to the sampling site along with the sample bottles. At the sampling site, the sampler must open the PFC-free water and pour it into the empty shipped sample bottle; then seal and label this bottle as the FRB. The FRB is shipped back to the laboratory along with the samples and analyzed to ensure that PFC was not introduced into the sample during sample collection/handling.

4.4 Decontamination Procedures

Decontamination activities will be conducted during monitoring well installation and sampling. Decontamination procedures for downhole tooling, sampling pumps and field equipment will be performed in accordance with the procedures described Final FSP (AECOM 2017).

4.5 Investigation-Derived Waste Management

Investigation-derived waste (IDW) includes, but is not limited to drilling fluids, drill cuttings, development fluids, used protective clothing, empty containers, plastic sheeting, and trash. IDW waste will be managed in accordance with the procedures described Final FSP (AECOM 2017).

Monitoring Well Construction Details - Proposed Wells
Orange County North Basin Study Area
Remedial Investigation and Feasibility Study

Well No.	Target Depth(s) of Screened Interval (ft bgs)	Justification/Notes
AM-55A AM-55B	310-330 380-400	To characterize groundwater contamination up-gradient and east of the City of Fullerton's main wellfield that has been impacted by VOCs; and, to characterize possible contribution of contamination to that wellfield from known release sites to the east. Target screened intervals of proposed monitoring wells overlap with upper and lower screened intervals of VOC-impacted production wells.
AM-56A AM-56B	310-330 380-400	To characterize groundwater contamination up-gradient and northeast of the City of Fullerton's main wellfield that has been impacted by VOCs; and, to characterize the contribution of contamination to that wellfield from the main body of the North Basin VOC plume. Target screened intervals of proposed monitoring wells overlap with upper and lower screened intervals of VOC-impacted production wells.
FM-19D	425-445	To characterize the vertical extent of Principal Aquifer contamination observed in well FM-19C (screened interval 365-385 ft bgs), which exhibits increasing PCE concentrations.
FM-33A	130-150	To characterize the northern plume boundary and width of containment capture zone for that area (Interim Remedy). Target screened interval similar to OCWD monitoring well FM-20A (located cross-gradient and to the southeast). VOCs concentrations in nearby Principal Aquifer monitoring well FM-20 are non-detect, or well below MCLs. Consequently, only a Shallow Aquifer monitoring well is proposed.
FM-34A FM-34B	140-160 210-230	To characterize the northern plume boundary and width of containment capture zone for that area (Interim Remedy). Target screened interval similar to OCWD monitoring wells FM-12 and FM-12A (located cross-gradient and to the south).

Notes:

1. Well locations will be ground-truthed prior to final installation, and are subject to change pending access and suitability for well construction.
2. Assume 20-ft-long screened intervals. Actual length and depth of screened intervals will depend on observed lithology.

Notes:

Sample Frequency Notes:

1 Routine sampling frequency for existing OCWD wells is every four months; the new wells will be incorporated into the routine sampling program as they are installed

2 Proposed wells to be sampled once after well development and incorporated into the routine sampling program.

3 All OCWD wells within the Study Area, including Proposed Wells, to be sampled once to provide a comprehensive dataset

4 Proposed wells will be sampled at least **three (3)** times during the duration of the remedial investigation: 1) after well development, 2) during routine OCWD sampling, and 3) during comprehensive area-wide sampling

-- Not sampled or analyzed

X Well sampled for laboratory analyses

Field Quality Control Samples

* Field Duplicates to be collected: one per every 10 wells (10% of normal samples); MS/MSDs to be collected: one per every 20 wells (5% of normal samples); Trip blanks to accompany each cooler shipment of water samples for VOC analysis; and Equipment blanks to be collected only if non-dedicated sampling pumps are used; if required, one equipment blank will be collected at the end of each sampling day.

** Field Reagents Blanks to be collected: one per well cluster (site).

Analyses Notes:

a VOC suite comprises 81 volatile organic compound analytes by OCWD or EPA Method 524.2

b CLO4 suite comprises perchlorate only, by OCWD or EPA Method 332.0

c 14DIOX suite comprises 6 analytes, including 1,4-dioxane and 1,2,3 trichloropropane in OCWD Method Group #432

d 14DIOX-R suite comprises 1,4-dioxane analysis only.

e GENLVLIN suite comprises 24 anion and general water quality parameters by various methods in OCWD Group #244

f Analysis for 1,4-dioxane by EPA Method 8270-SIM

g Analysis for 1,2,3-trichloropropane by EPA Method 524M-TCP

h Analysis for perfluorinated compounds by EPA Method 537 Modifed

Water	Modified 537	17	2	8	27

Notes:

[a]Field Duplicates to be collected: one per every 10 wells (10% of normal samples).

[b]Field Reagents Blanks to be collected: one per well cluster (site).

Appendix A

Equipment Testing for PFCs 2016-2017

Orange County Water District

Water Quality Department

Equipment Testing for

PFAS Compounds

2016-2017

Prepared: January 2018

The OCWD Water Quality Department began testing field equipment for perfluorinated alkyl substances in June 2016. The following is a brief summary of department procedures used to test equipment for PFAS and the final equipment testing results from 2016-17. All results were non-detect for equipment that was tested.

Procedure:

1- Water used to perform equipment testing for PFAS compounds is treated by granular activated carbon (GAC) Filtrasorb 600, and tested by the OCWD laboratory to confirm no detections of PFAS compounds.
2- PFAS-free water is added to stainless steel "decon tubes," which are used by OCWD Water Quality staff to perform various equipment decontamination procedures.
3- Submersible pumps to be tested are placed in the PFAS-Free water inside the decon tube.
4- Submersible pumps are activated and the PFAS-free water is circulated and re-circulated through the pump, hose, and fittings on the portable submersible pump reel. The water is discharged directly back into the decon tube to maintain the circuit.
5- Submersible pump reels in the OCWD Water Quality Department are AMS Port-A-Reel systems built with Tygon or Kuriyama hoses and Grundfos Redi-Flo2 or SQE submersible pumps. They are operated by 110v/220v electricity with variable frequency drives or AC outlets with extension cords.
6- PFAS-free water is re-circulated for 5 minutes throughout the entire pump system, including all components and fittings, to ensure that contact is made between the water and all internal surfaces of the submersible pump system.
7- Nitrile gloves are used in all equipment decontamination and sample collection procedures.
8- Two 250-mL water samples are collected using EPA Method 537 for perfluorinated alkyl substances. This method requires that two 250-mL clear plastic bottles with Trizma© preservative are filled to the neck.*

EPA Method 537 Parameter Details

Abbreviation	Name		Method	RDL
PFBS	Perfluoro butane sulfonic acid	ng/L	537	4.000
PFHpA	Perfluoro heptanoic acid	ng/L	537	4.000
PFHxS	Perfluoro hexane sulfonic acid	ng/L	537	4.000
PFNA	Perfluoro nonanoic acid	ng/L	537	4.000
PFOA	Perfluoro octanic acid	ng/L	537	4.000
PFOS	Perfluoro octane sulfonic acid	ng/L	537	4.000

Total Number Of Parameters: 6

9- Collected samples are kept on wet ice in coolers until delivery to the OCWD laboratory. Samples must have a temperature of 10 °C or lower upon delivery.
10- Method 537 samples are submitted to the OCWD laboratory for analysis along with signed and dated chains of custody.**

*A set of spike, spike/duplicates, a total of six extra 537 samples, must be submitted for every ten samples that are analyzed.

**Note that the holding time for extraction of EPA Method 537 is 14 days and laboratory analysis must be performed within 28 days to comply with the approved method.

PFAS Equipment Tests performed by the Water Quality Department are summarized on the following page.

Equipment Tests Performed in 2016-17:

June 15, 2016

1- Portable Submersible Pump System – Result ND
   - AMS-PR7 (SQ)
2- ½" PVC Riser Sampling Spigot – Result ND
3- Stainless Steel Riser Sampling Spigot – Result ND
4- MP1 Dedicated Pump System – Result ND
5- SQ Dedicated Pump System – Result ND
6- Carbon Treated Decontamination Source-Water from WQ Shop – Result ND

June 30, 2016

1- Teflon-lined Sampling Hose – Result ND
2- 6 Additional Portable Submersible Pump Systems – All Results ND
   - INW-MP1 (MP1)
   - INW2-MP1 (MP1)
   - AMS-PR1 (MP1)
   - AMS-PR2 (MP1)
   - AMS-PR5 (SQ)
   - AMS-PR6 (SQ)
3- 1" PVC Riser Sampling Spigot

July 14, 2016

1- Westbay Bottle and Interconnect Hose – Result ND
2- 1" PVC Riser Sampling Spigot – Result ND
3- 1 ½" PVC Riser Sampling Spigot – Result ND
4- ½" Stainless Steel Riser – Result ND
5- Typhoon Portable Submersible Pump System – All Results ND
   - Typhoon Pump
   - Tygon Tubing
6- Teflon Tape Used on Submersible Pumps – Result ND

July 28, 2016

1- Truck-mounted Submersible Pumps – All Results ND
   a. T-98 P1 (SQ)
   b. T-98 P2 (SQ)

October 21, 2016

1- Westbay O-ring (Green) – Result ND
2- Westbay O-ring (Blue) – ND

June 26, 2017

1- MP1 Dedicated Pump System – Result ND
2- Carbon Treated Decontamination Source-Water from WQ Shop – Result ND
3- 3 Additional Portable Submersible Pump Systems – All Results ND
   a. INW-MP1 (MP1)
   b. AMS-PR1 (MP1)
   c. AMS-PR7 (SQ)

PART B – QUALITY ASSURANCE PROJECT PLAN (QAPP) ADDENDUM NO. 1

This QAPP Addendum No. 1 (Part B of the Sampling and Analysis Plan [SAP]) describes the project organization, data quality objectives, and laboratory procedures to be used in performing work associated with the Remedial Investigation/Feasibility Study (RI/FS) Work Plan. The Field Sampling Plan (FSP) is contained in Part A of the SAP.

1. Introduction

This Quality Assurance Project Plan (QAPP) Addendum No. 1 (QAPP Addendum No. 1) has been developed to ensure that environmental data obtained during additional field sampling activities to be performed by Orange County Water District (OCWD) at the Orange County North Basin Study Area (North Basin or Study Area) comply with all requirements and to ensure data are legally and scientifically defensible and meet all required data quality objectives (DQOs). The QAPP describes the management policies, objectives, principles, and procedures that will be used to produce the required data quality associated with the additional activities.

2. Project Organization and Responsibilities

A description of the roles and responsibilities for individuals and organizations involved in the Remedial Investigation/Feasibility Study (RI/FS) effort, including contractors and major subcontractors is presented in the Final QAPP (AECOM 2017a).

3. Data Quality Objectives and Quality Program

DQOs and the quality program are described in the Final QAPP (AECOM 2017a).

4. Sampling Procedures

Field activities at the Site include monitoring and sampling of groundwater for analytical testing. Sampling procedures including collection, field analysis, containerization, preservation, documentation, and equipment decontamination are contained in the Final QAPP (AECOM 2017a), with the exception of procedures for perfluorinated compounds (PFCs), which are contained in this addendum.

For proposed sampling locations, refer to FSP Figures 2 and 3. Additional sampling locations may also be added as Site activities progress.

4.1 Decontamination, Containerization, and Preservation

Prior to collection of any environmental sample, sampling equipment must be decontaminated according to the procedures outlined in the Final FSP (AECOM 2017b) Section 4.4 and in accordance with Specifications and Guidance for Contaminant-Free Sample Containers (United States Environmental Protection Agency [USEPA] 1992) to avoid cross-contamination of samples. Sample containers will be furnished by the laboratory and provided with preservatives as when applicable.

4.2 Sampling Procedures

The Final FSP (AECOM 2017b) Section 3.0 details the sampling rationale for this investigation and specifies the number of groundwater samples and analytical parameters to be collected at the Site. Procedures and SOPs for the collection of groundwater samples are contained in the Final FSP (AECOM 2017b), Section 4 and Appendix B.

5. Sample Custody

Sample custody procedures are contained in the Final QAPP (AECOM 2017a).

6. Calibration Procedures

Field and laboratory calibration procedures are discussed in the Final QAPP (AECOM 2017a).

7. Analytical Methods and Procedures

This section provides a summary of analytical methods and procedures for the analysis of PFCs. Analytical methods and procedures for all other analytes for this study are contained in the QAPP (AECOM 2017a).

7.1 Analytical Methods Requirements

This section provides information regarding analytical methods and procedures for producing definitive data and contains a brief description of preparation methods. This information was obtained from the latest revisions available from the USEPA website for the following references:

- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods* (USEPA SW-846, Third Edition, Final Updates I (1993), II (1995), IIA (1994), IIB (1995), III (1997), IIIA (1999), IIIB (2005), IV (2008), and V (2015), Washington, D.C., June 1997 (USEPA 1997);
- *USEPA Guidance for Quality Assurance Project Plans,* USEPA QA/G-5,USEPA, Office of Research and Development, Washington, D.C., USEPA/240/R-02/009, December 2002 (USEPA 2002);
- *USEPA Requirements for Quality Assurance Project Plans,* USEPA QA/R-5,USEPA, Office of Environmental Information, Washington, D.C., USEPA/240/B-01/003, Final, March 2001 (USEPA 2001);
- *National Functional Guidelines for Superfund Organic Methods Data Review*, USEPA, Office of Superfund Remediation and Technology Innovation, Washington, D.C., USEPA 540-R-2016-002 (OLEM 9355.0-134), September 2016 (USEPA 2016a); and
- *National Functional Guidelines for Inorganic Superfund Methods Data Review*, USEPA, Office of Superfund Remediation and Technology Innovation, Washington, D.C., USEPA 540-R-2016-001 (OLEM 9355.0-133), September 2016 (USEPA 2016b).

Definitions of terms are given in the Final QAPP (AECOM 2017a), Section 3, and data review guidelines are presented in the Final QAPP (AECOM 2017a), Section 8.

7.2 Analytical Methods

All groundwater samples from monitoring wells collected during field sampling will be analyzed by a fixed-base laboratory. The project samples and associated field and laboratory quality control (QC) samples will be collected, preserved, and analyzed in accordance with USEPA,

American Society for Testing and Materials or American Public Health Association, American Water Works Association & Water Environment Federation standard methods. Laboratory test methods are listed in Section 7.2 of the Final QAPP (AECOM 2017a). In addition, samples from 19 groundwater monitoring wells will be analyzed for PFCs using USEPA Method 537 Modified. **Table 1** presents a comparison of the laboratory detection limits with current regulatory thresholds for PFCs. The extraction/digestion procedures and the associated analytical methods to be used by the analytical laboratory for this analysis are listed in **Appendix A**.

7.3 Specific Data Quality Objectives

In short, the analytical samples are to be collected and processed in a manner to allow for the generation of defensible data, which provides a framework for evaluating remedial alternatives.

This is addressed by first comparing the reporting limits (RLs) for groundwater and their target levels. For groundwater, the Target Levels are based on the lowest of California Maximum Contaminant Levels (MCLs) and Notification Levels (NLs). Ultimately, the DQOs are confirmed as met by conducting the precision and accuracy evaluations.

7.4 Types and Frequency of Quality Control Samples

The following describes the field QC samples to be collected during the Remedial Investigation (RI):

- Equipment blanks will be collected only if non-dedicated sampling pumps are used. If required, one equipment blank will be collected at the end of each day of sampling.

- Trip blanks will accompany each cooler shipment of water samples for volatile organic compound (VOC) analysis (i.e., by Method 524.2) and for PFCs analysis (by Method 537 Modified).

- Ambient condition blanks will not be collected because the site is not in close proximity to known VOC sources.

- Duplicate groundwater samples will be collected at a frequency of 10 percent (%). Duplicates will not be collected for investigation-derived waste (IDW) samples.

- Matrix spike/matrix spike duplicates (MS/MSDs) will be collected at a frequency of 5 % for groundwater samples. MS/MSDs will not be collected for IDW samples.

- Field reagent blanks will be collected at each well site where field samples are collected for PFC samples.

8. Data Management

Data reduction, review, validation, and reporting procedures are provided in the Final QAPP (AECOM 2017a).

9. Performance and Systems Audits

Performance and system audit requirements are discussed in the Final QAPP (AECOM 2017a).

10. Preventative Maintenance

Laboratory-and field equipment preventative maintenance procedures are included in Final QAPP (AECOM 2017a).

11. Corrective Actions

Corrective action procedures are contained in the Final QAPP (AECOM 2017a).

12. Quality Assurance Reports

Field and laboratory quality assurance reporting requirements are contained in the Final QAPP (AECOM 2017a).

13. Reporting Requirements

Reporting requirements are contained in the Final QAPP (AECOM 2017a).

1. SCOPE AND APPLICATION

1.1. This procedure describes the analysis of water, soil, sediment, and tissue samples for the following compounds using liquid chromatography / tandem mass spectrometry (LC/MS/MS).

Compound Name	Abbreviation	CAS #
Perfluoroalkylcarboxylic acids (PFCAs)		
Perfluoro-n-butanoic acid	PFBA	375-22-4
Perfluoro-n-pentanoic acid	PFPeA	2706-90-3
Perfluoro-n-hexanoic acid	PFHxA	307-24-4
Perfluoro-n-heptanoic acid	PFHpA	375-85-9
Perfluoro-n-octanoic acid	PFOA	335-67-1
Perfluoro-n-nonanoic acid	PFNA	375-95-1
Perfluoro-n-decanoic acid	PFDA	335-76-2
Perfluoro-n-undecanoic acid	PFUdA (PFUnA)	2058-94-8
Perfluoro-n-dodecanoic acid	PFDoA	307-55-1
Perfluoro-n-tridecanoic acid	PFTrDA	72629-94-8
Perfluoro-n-tetradecanoic acid	PFTeDA (PFTA)	376-06-7
Perfluoro-n-hexadecanoic acid	PFHxDA	67905-19-5
Perfluoro-n-octadecanoic acid	PFODA	16517-11-6
Perfluorinated sulfonic acids (PFSAs)		
Perfluoro-1-butanesulfonic acid	PFBS	375-73-5
Perfluoro-1-hexanesulfonic acid	PFHxS	355-46-4
Perfluoro-1-heptanesulfonic acid	PFHpS	375-92-8
Perfluoro-1-octanesulfonic acid	PFOS	1763-23-1
Perfluoro-1-decanesulfonic acid	PFDS	335-77-3
Perfluorinated sulfonamides (FOSA)		
Perfluoro-1-octanesulfonamide	FOSA	754-91-6
Perfluorinated sulfonamidoacetic acids (FOSAA)		
N-ethylperfluoro-1-octanesulfonamidoacetic acid	EtFOSAA	2991-50-6
N-methylperfluoro-1-octanesulfonamidoacetic acid	MeFOSAA	2355-31-9
Fluorotelomer sulfonates (FTS)		
1H,1H,2H,2H-perfluorohexane sulfonate *(4:2)*	4:2 FTS	757124-72-4
1H,1H,2H,2H-perfluorooctane sulfonate *(6:2)*	6:2 FTS	27619-97-2
1H,1H,2H,2H-perfluorodecane sulfonate *(8:2)*	8:2 FTS	39108-34-4

Abbreviations in parenthesis are the abbreviations listed in Method 537, where they differ from the abbreviation used by the laboratory's LIMS.

1.2. The working range of the method is listed below. The linear range can be extended by diluting the extracts.

Matrix	Nominal Sample Size	Reporting Limit	Working Range
Water	250 mL	2.0 ng/L – 20 ug/L	2.0 ng/L - 400 ug/L
Soil/Sediment	5 g	0.2 ug/kg – 2.0 ug/kg	0.2 ug/kg - 40 ug/kg
Tissue	1 g	1.0 ug/kg – 10 ug/kg	1.0 ug/kg – 200 ug/kg

1.3. The procedure for the analysis of water samples via in line solid phase extraction (SPE) for a subset of the list in Section 1.1 using liquid chromatography / tandem mass spectrometry (LC/MS/MS) on a SCIEX 5500 is described in Attachment 1 of this SOP.

1.4. This procedure also includes direction for preparing and analyzing samples to determine “Total Oxidizable Precursors”, which may assist in improving understanding of potential PFAS environmental risk.

1.5. When undertaking projects for the Department of Defense (DoD) and/or the Department of Energy (DOE) the relevant criteria in QA Policy WS-PQA-021, “Federal Program Requirements” must be checked and incorporated.

2. SUMMARY OF METHOD

2.1. Water samples are extracted using a solid phase extraction (SPE) cartridge. PFAS are eluted from the cartridge with an ammonium hydroxide/methanol solution.

2.2. Soil/sediment/tissue samples are extracted with a KOH/methanol solution using an orbital shaker for 3 hours followed by sonication for 12 hours. The mixture is centrifuged and the solvent filtered.

2.3. The final 80:20 methanol:water extracts are analyzed by LC/MS/MS. PFAS are separated from other components on a C18 column with a solvent gradient program using 20 mM ammonium acetate/water and methanol. The mass spectrometer detector is operated in the electrospray (ESI) negative ion mode for the analysis of PFAS.

2.4. An isotope dilution technique is employed with this method for the compounds of interest. The isotope dilution analytes (IDA) consist of carbon-13 labeled analogs, oxygen-18 labeled analogs, or deuterated analogs of the compounds of interest, and they are spiked into the samples at the time of extraction. This technique allows for the correction for analytical bias encountered when analyzing more chemically complex environmental samples. The isotopically labeled compounds are chemically similar to the compounds of concern and are therefore affected by sample-related interferences to the same extent as the compounds of concern. Compounds that do not have an identically labeled analog are quantitated by the IDA method using a closely related labeled analog.

2.5. Quantitation by the internal standard method is employed for the IDA analytes/recoveries. Peak response is measured as the area of the peak.

2.6. Samples for the "Total Oxidizable Precursor" assay (TOP) are analyzed in two phases – an aliquot is prepared and analyzed as a normal sample, and a second aliquot is subjected to oxidation with potassium persulfate and sodium hydroxide prior to solid phase extraction and analysis. The total perfluorocarboxylic acid value is determined for each aliquot, and the difference calculated.

3. DEFINITIONS

3.1. PFCAs: Perfluorocarboxylic acids

3.2. PFSAs: Perfluorinated sulfonic acids

3.3. FOSA: Perfluorinated sulfonamide

3.4. PFOA: Perfluorooctanoic acid

3.5. PFOS: Perfluorooctane sulfonic acid

3.6. MPFOA: Perfluoro-n-[1,2,3,4-13C4]octanoic acid. Carbon-13 labeled PFOA

3.7. MPFOS: Perfluoro-1-[1,2,3,4-13C4]octanesulfonic acid. Carbon-13 labeled PFOS

3.8. PTFE: Polytetrafluoroethylene (e.g., Teflon®)

3.9. SPE: Solid phase extraction

3.10. PP: Polypropylene

3.11. PE: Polyethylene

3.12. HDPE: High density polyethylene

3.13. IDA: Isotope dilution analyte

3.14. Further definitions of terms used in this SOP may be found in the glossary of the Laboratory Quality Assurance Manual (QAM).

4. INTERFERENCES

4.1. PFAS have been used in a wide variety of manufacturing processes, and laboratory supplies should be considered potentially contaminated until they have been tested and shown to be otherwise. The materials and supplies used during the method validation

process have been tested and shown to be clean. These items are listed below in Section 6.

4.2. To avoid contamination of samples, standards are prepared in a ventilation hood in an area separate from where samples are extracted.

4.3. PTFE products can be a source of PFOA contamination. The use of PTFE in the procedure should be avoided or at least thoroughly tested before use. Polypropylene (PP) or polyethylene (PE, HDPE) products may be used in place of PTFE products to minimize PFOA contamination.

4.3.1. Standards and samples are injected from polypropylene autosampler vials with polypropylene screw caps once. Multiple injections may be performed on Primers when conditioning the instrument for analysis.

4.3.2. Random evaporation losses have been observed with the polypropylene caps causing high IDA recovery after the vial was punctured and sample re-injected. For this reason, it is best to inject standards and samples once in the analytical sequence.

4.3.3. Teflon-lined screw caps have detected PFAS at low concentrations. Repeated injection from the same teflon-lined screw cap have detected PFNA at increasing concentration as each repeated injection was performed, therefore, it is best to use polypropylene screw caps.

4.4. Volumetric glassware and syringes are difficult to clean after being used for solutions containing high levels of PFOA. These items should be labeled for use only with similarly concentrated solutions or verified clean prior to re-use. To the extent possible, disposable labware is used.

4.5. Both branched and linear PFAS isomers can potentially be found in the environment. Linear and branched isomers are known to exist for PFOS, PFOA, PFHxS, PFBS, EtFOSAA, and MeFOSAA based upon the scientific literature. If multiple isomers are present for one of these PFAS they might be adjacent peaks that completely resolve or not, but usually with a deflection point resolved during peak integration. The later of these peaks matches the retention time of its labeled linear analog. In general, earlier peaks are the branched isomers and are not the result of peak splitting.

As of this writing, only PFOS, PFOA, and PFHxS are commercially available as technical mixtures. These reference standards of the technical mixtures for these specific PFAS are used to ensure that all appropriate peaks are included during peak integration.

4.6. In an attempt to reduce PFOS bias, it is required that *m/z* 499>80 transition be used as the quantitation transition.

4.7. Per the Certificate of Analysis for labeled perfluorohexadecanoic acid ($13C_2$-PFHxDA) produced by Wellington Laboratories, the stock standard contains roughly 0.3% of native perfluorohexadecanoic acid. This equates to roughly 0.30 ng/L or 0.015 ug/kg of perfluorohexadecanoic acid expected in all samples and blanks.

5. SAFETY

Employees must abide by the policies and procedures in the Corporate Safety Manual, Sacramento Supplement to the CSM, and this document. All work must be stopped in the event of a known or potential compromise to the health or safety of an associate. The situation must be reported **immediately** to a supervisor, the EH&S Staff, or a senior manager.

5.1. Specific Safety Concerns

5.1.1. Preliminary toxicity studies indicate that PFAS could have significant toxic effects. In the interest of keeping exposure levels as low as reasonably achievable, PFAS must be handled in the laboratory as hazardous and toxic chemicals.

5.1.2. Exercise caution when using syringes with attached filter disc assemblies. Application of excessive force has, upon occasion, caused a filter disc to burst during the process.

5.1.3. Laboratory procedures such as repetitive use of pipets, repetitive transferring of extracts and manipulation of filled separatory funnels and other glassware represent a significant potential for repetitive motion or other ergonomic injuries. Laboratory associates performing these procedures are in the best position to realize when they are at risk for these types of injuries. Whenever a situation is found in which an employee is performing the same repetitive motion, the employee shall immediately bring this to the attention of their supervisor, manager, or the EH&S staff. The task will be analyzed to determine a better means of accomplishing it.

5.1.4. Eye protection that satisfies ANSI Z87.1 (as per the TestAmerica Corporate Safety Manual), laboratory coat, and nitrile gloves must be worn while handling samples, standards, solvents, and reagents. Disposable gloves that have been contaminated will be removed and discarded; other gloves will be cleaned immediately.

5.1.5. Perfluorocarboxylic acids are acids and are not compatible with strong bases.

5.1.6. The use of vacuum systems presents the risk of imploding glassware. All glassware used during vacuum operations must be thoroughly inspected prior to each use. Glass that is chipped, scratched, cracked, rubbed, or

marred in any manner must not be used under vacuum. It must be removed from service and replaced.

5.1.7. Glass containers are not to be used for "tumbling" soil samples.

5.2. Primary Materials Used

The following is a list of the materials used in this method, which have a serious or significant hazard rating. NOTE: This list does not include all materials used in the method. The table contains a summary of the primary hazards listed in the SDS for each of the materials listed in the table. A complete list of materials used in the method can be found in the reagents and materials section. Employees must review the information in the SDS for each material before using it for the first time or when there are major changes to the SDS.

Material[(1)]	Hazards	Exposure Limit[(2)]	Signs and Symptoms of Exposure
Acetic Acid (3-2-1)	Corrosive Poison Flammable	10 ppm-TWA 15 ppm-STEL	Contact with concentrated solution may cause serious damage to the skin and eyes. Inhalation of concentrated vapors may cause serious damage to the lining of the nose, throat, and lungs. Breathing difficulties may occur.
Ammonium Hydroxide (3-0-0)	Corrosive Poison	50 ppm-TWA	Severe irritant. Effects from inhalation of dust or mist vary from mild irritation to serious damage to the upper respiratory tract. Symptoms may include sneezing, sore throat or runny nose. Contact with skin can cause irritation or severe burns and scarring with greater exposures. Causes irritation of eyes, and with greater exposures it can cause burns that may result in permanent damage, including blindness. Brief exposure to 5000 PPM can be fatal.
Hexane (2-3-0)	Flammable Irritant	500 ppm-TWA	Inhalation of vapors irritates the respiratory tract. Overexposure may cause lightheadedness, nausea, headache, and blurred vision. Vapors may cause irritation to the skin and eyes.
Hydrochloric Acid (3-0-1)	Corrosive Poison	5 ppm (Ceiling)	Can cause pain and severe burns upon inhalation, ingestion, eye or skin contact. Exposure to concentrated solutions may cause deep ulcerations to skin, permanent eye damage, circulatory failure and swallowing may be fatal.
Methanol (2-3-0)	Flammable Poison Irritant	200 ppm (TWA)	A slight irritant to the mucous membranes. Toxic effects exerted upon nervous system, particularly the optic nerve. Symptoms of overexposure may include headache, drowsiness and dizziness. Methyl alcohol is a defatting agent and may cause skin to become dry and cracked. Skin absorption can occur; symptoms may parallel inhalation exposure. Irritant to the eyes.

Material[1]	Hazards	Exposure Limit[2]	Signs and Symptoms of Exposure
Potassium Hydroxide (3-0-1)	Corrosive Poison		Severe irritant. Can cause severe burns upon inhalation, ingestion, eye or skin contact. Exposure to concentrated solutions may cause severe scarring of tissue, blindness, and may be fatal if swallowed.
Potassium Persulfate (2-0-1-OX)	Oxidizer	None	Causes irritation to the respiratory tract. Symptoms may include coughing, shortness of breath. Causes irritation to skin and eyes. Symptoms include redness, itching, and pain. May cause dermatitis, burns, and moderate skin necrosis.
Sodium Hydroxide (3-0-1)	Corrosive Poison	2 mg/cm^3 (Ceiling)	Severe irritant. Can cause severe burns upon inhalation, ingestion, eye or skin contact. Exposure to concentrated solutions may cause severe scarring of tissue, blindness, and may be fatal if swallowed.
(1) Always add acid to water to prevent violent reactions. (2) Exposure limit refers to the OSHA regulatory exposure limit.			

6. EQUIPMENT AND SUPPLIES

6.1. 15 mL polypropylene test tubes with polypropylene screw caps.

6.2. 50 mL graduated plastic centrifuge tubes.

6.3. 125 mL HDPE bottles with HDPE screw caps.

6.4. 250 mL HDPE bottles with HDPE screw caps.

6.5. Analytical balance capable of accurately weighing to the nearest 0.0001g, and checked for accuracy each day it is used in accordance with WS-QA-0041.

6.6. Extract concentrator or nitrogen manifold with water bath heating to 50-55°C.

6.7. Syringe filter, Millipore Millex-HV 0.45 um, or equivalent. Do not use PTFE type filters.

6.8. 300 µL autosampler vials, polypropylene, with polypropylene screw caps, Waters PN 1860004112, or equivalent.

6.9. SPE columns

6.9.1. Phenomenex Strata SPE C18, 6 mL, 500 mg, part number 8B-S002-HCH, Waters SepPak C18, 1 to 10g, or equivalent.

6.9.2. Waters Oasis WAX 150 mg/6 cc (PN 186002493) for the cleanup of solids.

6.9.3. Waters Oasis WAX 500 mg/6 cc (PN 186004647) for extraction of PFAS from aqueous sample.

6.9.4. Phenomonex Gemini 3 µm C18 110Å, 50 X 2 mm, Part No. 00B-4439-B0.

6.9.5. Phenomonex Luna 5 µm C18(2) 100Å, 30 X 3 mm, Part No. 00A-4252-Y0.

6.10. Graphitized carbon (Envi-Carb™ or equivalent).

6.11. Vacuum manifold for Solid Phase Extraction (SPE).

6.12. Miscellaneous laboratory apparatus (beakers, test tubes, volumetric flasks, pipettes, etc.). These should be disposable where possible, or marked and segregated for high-level versus low-level use.

6.13. Water bath: Heated with concentric ring cover capable of temperature control (±5°C) up to 95°C. The bath must be used in a fume hood.

6.14. Plastic tub for an ice bath, AKRO-N.S.T. part No. 35-180 or equivalent.

6.15. pH indicator paper, wide range.

6.16. Bottle rotating apparatus for soil extractions.

6.17. Glass fiber filter, Whatman GF/F, catalog number 1825 090 or equivalent.

6.18. Liquid Chromatography/Tandem Mass Spectrometer (LC/MS/MS) – Either of the instruments described below, or equivalent, may be used for this method. Both HPLC are equipped with a refrigerated autosampler, an injection valve, and a pump capable of variable flow rate. The use of a column heater is required to maintain a stable temperature throughout the analytical run. Data is processed using Chrom Peak Review, version 2.1 or equivalent.

6.18.1. Waters LC/MS/MS

This consists of a Waters Acquity UPLC system interfaced with a Waters Quattro Premier tandem mass spectrometer. The instrument control and data acquisition software is MassLynx version 4.1, or equivalent.

6.18.1.1. Analytical column: Waters Acquity UPLC BEH C18 1.7 um, 3.0 mm x 150 mm, Part No. 186004690,

6.18.1.2. PFAS Isolator column, Waters Acquity UPLC BEH Shield RP-18, 1.7 um, 2.1 mm x 50 mm, PN 186004476, or equivalent. This is plumbed between the UPLC pumps and autosampler valve to minimize PFAS background from the UPLC solvent lines and filters.

6.18.2. SCIEX LC/MS/MS

This system consists of a Shimadzu HPLC interfaced with a SCIEX 5500 Triple Quad MS. The instrument control and data acquisition software is SCIEX Analyst, version 1.6.3 or equivalent.

6.18.2.1. Shimadzu CTO-20AC HPLC equipped with 3 LC-20AD pumps and one DGU-20 degassing unit or equivalent.

6.18.2.2. Phenomenex Gemini C_{18} 3 um, 3.0 mm x 100 mm, Part No. 00D-4439-Y0, or equivalent.

6.18.2.3. PFAS Isolator column, Phenomenex Luna C_{18} 5 um, 50 mm x 4.6 mm, part no. 00B-4252-E0 or equivalent. This is plumbed between the UPLC pumps and autosampler valve to minimize PFAS background from the UPLC solvent lines and filters.

6.19. Preventive and routine maintenance is described in the table below

HPLC/MS/MS Preventative Maintenance	
As Needed: Change pump seals. Change in-line filters in autosampler (HPLC). Check/replace in-line frit if excessive pressure or poor performance. Replace column if no change following in-line frit change. Clean corona needle. Replace sample inlet tube in APCI (10.1 cm). Replace fused silica tube in ESI interface. Clean lenses. Clean skimmer. Ballast rough pump 30 minutes.	**Daily (When in use)** Check solvent reservoirs for sufficient level of solvent. Verify that pump is primed, operating pulse free. Check needle wash reservoir for sufficient solvent. Verify capillary heater temperature functioning. Verify vaporizer heater temperature. Verify rough pump oil levels. Verify turbo-pump functioning. Verify nitrogen pressure for auxiliary and sheath gasses. Verify that corona and multiplier are functioning.
Semi-Annually Replace rough-pump oil (4-6 months). Replace oil mist and odor elements. Replace activated alumina filter if applicable	**Annually** Vacuum system components including fans and fan covers. Clean/replace fan filters, if applicable.

7. REAGENTS AND STANDARDS

7.1. Reagent grade chemicals shall be used in all tests whenever available. Unless otherwise indicated, it is intended that all reagents shall conform to the specifications of the Committee on the Analytical Reagents of the American Chemical Society, where such specifications are available. Other grades may be used, provided it is first

ascertained that the reagent is of sufficiently high purity to permit its use without lessening the accuracy of the determination.

7.1.1. Acetic acid, glacial

7.1.2. Ammonium acetate (20 mM in water)

7.1.3. Ammonium hydroxide (NH4OH), 0.3% in methanol

7.1.4. Hexane

7.1.5. Hydrochloric acid (HCl), 2.0 M solution in water

7.1.6. Hydrochloric acid (HCl), concentrated, reagent grade

7.1.7. Methanol

7.1.8. Potassium hydroxide (KOH), 0.4% in methanol

7.1.9. Potassium persulfate, reagent grade

7.1.10. Ottawa Sand

7.1.11. Sodium hydroxide (NaOH), 0.1N, in water

7.1.12. Sodium hydroxide (NaOH), 10N, reagent grade

7.1.13. Water, Nanopure or Millipore, must be free of interference and target analytes

7.2. Standards

7.2.1. PFAS are purchased as high purity solids (96% or greater) or as certified solutions. Standard materials are verified compared to a second source material at the time of initial calibration. The solid stock material is stored at room temperature or as specified by the manufacturer or vendor.

7.2.1.1. Per the Certificate of Analysis for labeled perfluorohexadecanoic acid ($13C_2$-PFHxDA) produced by Wellington Laboratories, the stock standard contains roughly 0.3% of native perfluorohexadecanoic acid. This equates to roughly 0.30 ng/L or 0.015 ug/kg of perfluorohexadecanoic acid expected in all samples and blanks.

7.2.2. If solid material is used for preparing a standard, stock standard solutions are prepared from the solids and are stored at 4 ± 2°C. Stock standard solutions

should be brought to room temperature before using. Standards are monitored for signs of degradation or evaporation. Standard solutions must be replaced at least annually from the date of preparation.

7.2.3. PFBS, PFHxS, PFHpS, PFOS, PFDS, MPFOS, and many other PFAS are not available in the acid form, but rather as their corresponding salts, such as sodium or potassium. The standards are prepared and corrected for their salt content according to the equation below.

$Mass_{acid}$ = Measured $Mass_{salt}$ × MW_{acid} / MW_{salt}

Where: MW_{acid} is the molecular weight of PFAA

MW_{salt} is the molecular weight of the purchased salt.

7.2.4. For example, the molecular weight of PFOS is 500.1295 and the molecular weight of NaPFOS is 523.1193. Therefore, the amount of NaPFOS used must be adjusted by a factor of 0.956.

7.3. Calibration Standards

The calibration stock solution is prepared by diluting the appropriate amounts of PFCA and PFSA stock solutions in 80% methanol/water. The calibration stock solution is diluted with methanol to produce initial calibration standards. These are the normal calibration levels used. A different range can be used if needed to achieve lower reporting limits or a higher linear range.

7.4. Initial Calibration (ICAL) Levels (ng/mL)

Compound	CS-1	CS-2	CS-3	CS-4	CS-5	CS-6	CS-7
Perfluoroalkylcarboxylic acids (PFCAs)							
PFBA	0.5	1.0	5.0	20	50	200	400

M2-4:2FTS ǂ	50	50	50	50	50	50	50
M2-6:2FTS	50	50	50	50	50	50	50
M2-8:2FTS	50	50	50	50	50	50	50
Internal Standard (IS)							
13C2-PFOA	50	50	50	50	50	50	50

* Both branched and linear isomers are used.

ǂ - This compound is used as a reverse surrogate for the TOP analysis.

Note: Sample extracts are in 80% MeOH/H_2O.

Note- The above calibration limits are provided only as an example. The actual ICAL level used for each analytical batch will depend upon the LOQ requirements of the program. The concentration of the calibration solutions for non-concentrated extracts is 1/20th the levels indicated above.

7.4.1. A technical (qualitative) grade PFOA standard which contains both linear and branched isomers is used as a retention time (RT) marker. This is used to integrate the total response for both linear and branched isomers of PFOA in environmental samples while relying on the initial calibration with the linear isomer quantitative standard This technical (qualitative) grade PFOA standard is analyzed initially, after an initial calibration when a new column is installed or when significant changes are made to the HPLC parameters.

7.5. Initial Calibration Verification Standard (ICV)

A second source solution for PFAS is purchased from the same vendor; the PFC-MXB contains most of the target analytes in this mixture and is used as an ICV. A few compounds are not available in this mixture, may not be available as another lot, and are not available from another vendor. For these analytes only, a second analyst may prepare a second source standard from the same source as the ICAL to produce an ICV. The recommended concentration of the ICV standard should be in the mid-range of the calibration curve. The concentration may be adjusted if the initial calibration levels are changed or altered. The IDA and IS are added at a fixed concentration of 50 ng/mL.

7.6. LCS/Matrix PFC Spike Solution, 20 ng/mL

The PFC spike solution is prepared by diluting all PFAS to produce a solution containing each PFAS at a concentration of 20 ng/mL in methanol.

7.7. PFC Isotope Dilution Analyte Solution, 50 ng/mL

The PFC-IDA solution is prepared by diluting all labeled PFAS to produce a solution containing each compound at a concentration of 50 ng/mL in methanol.

7.8. Reverse Surrogate Solution, 1000 ng/mL

The reverse surrogate solution is prepared by diluting M2-4:2 FTS to produce a solution containing this compound at a concentration of 1000 ng/mL in methanol. This is added to all samples for the TOP assay to monitor the efficiency of the oxidation process.

7.9. Internal Standard Solution, 250 ng/mL

The internal standard solution is prepared by diluting 13C2-PFOA to produce a solution containing this compound at a concentration of 250 ng/mL in methanol. This is added to all extracts prior to analysis. The internal standard solution used for the non-concentrated extracts is at a concentration of 50 ng/mL.

8. SAMPLE COLLECTION, PRESERVATION, AND STORAGE

8.1. Water samples are collected in pre-cleaned 250 mL HDPE containers. Soil samples are collected in pre-cleaned 8 oz. HDPE containers. Other containers may also be suitable. Samples are chilled to 0 - 6°C for shipment to the laboratory.

8.2. Samples are logged in following normal laboratory procedures and are stored under refrigeration at 0 - 6°C. Water samples must be extracted within 14 days of collection. Soil samples must also be extracted within 14 days of collection. Tissue samples must be extracted within 1 year of collection if stored at -20°C. Extracts must be refrigerated at 0 - 6°C, and analyzed within 40 days from extraction.

NOTE: As of this writing, Method 537 provides for a 14 day holding time for water samples preserved with Trizma buffer. The scientific literature indicates that perfluorinated substances are highly persistent in the environment. TestAmerica Sacramento has conducted time stability studies that support a 14 day holding time for aqueous samples with and without Trizma preservation. TestAmerica Denver has conducted stability studies indicating that medium- and low-level solutions of PFOA are stable for at least three months in polystyrene and polypropylene plastics at 0-6°C. The 14/40 day holding times given above are based on the stability study and general EPA convention for the holding time of extractable organic compounds in water and soil.

9. QUALITY CONTROL

9.1. Initial Demonstration of Capability (IDOC)

The initial demonstration and method detection limit (MDL) studies described in Section 13 must be acceptable before analysis of samples may begin.

9.2. Batches are defined at the sample preparation step. Batches should be kept together through the whole analytical process as far as possible, but it is not mandatory to analyze prepared extracts on the same instrument or in the same sequence. Refer to the QC program document (WS-PQA-003) for further details of the batch definition.

9.2.1. The quality control batch is a set of up to 20 samples of the same matrix processed using the same procedure and reagents within the same time period. The quality control batch must contain a matrix spike/matrix spike duplicate (MS/MSD), a laboratory control sample (LCS) and a method blank. Laboratory generated QC samples (Blank, LCS, MS/MSD) do not count toward the maximum 20 samples in a batch. Field QC samples are included in the batch count. In some cases, at client request, the MS/MSD may be replaced with a matrix spike and sample duplicate. If insufficient sample is available for an MS/MSD, an LCSD may be substituted if batch precision is required by the program or client. In the event that multiple MS/MSDs are run with a batch due to client requirements, the additional MS/MSDs do not count toward the maximum 20 samples in a batch.

9.3. One method blank (MB, laboratory reagent blank) must be extracted with every process batch of similar matrix, not to exceed twenty (20) samples. For aqueous samples, the method blank is an aliquot of laboratory reagent water. For solid samples, the method blank is an aliquot of Ottawa sand. The method blank is processed in the same manner and at the same time as the associated samples. Corrective actions must be documented on a Non-Conformance memo, and then implemented when target analytes are detected in the method blank above the reporting limit or when IDA recoveries are outside of the control limits. Re-extraction of the blank, other batch QC, and the affected samples are required when the method blank is deemed unacceptable. See policy WS-PQA-003 for specific acceptance criteria.

9.3.1. If the MB produces a peak within the retention time window of any of the analytes, determine the source of the contamination and eliminate the interference before processing samples.

9.3.2. The method blank must not contain any analyte at or above the reporting limit, or at or above 10% of the measured concentration of that analyte in the associated samples, whichever is higher.

9.3.3. If there is no target analyte greater than the RL in the samples associated with an unacceptable method blank, the data may be reported with qualifiers. Such action should be taken in consultation with the client.

9.3.4. Re-extraction and reanalysis of samples associated with an unacceptable method blank is required when reportable concentrations are determined in the samples.

9.3.5. Refer to WS-PQA-003 for further details of the corrective actions.

9.3.6. Projects performed under the auspices of the DOD/DOE must meet QSM specific criteria for method blanks. Results are acceptable if the blank contamination is less than ½ of the reporting limit/LOQ for each analyte, or less than 1/10 of the regulatory limit, or less than 1/10 of the sample result for the same analyte, whichever is greater. If the method blank does not meet the acceptance criteria, the source of contamination must be investigated and measures taken to correct, minimize or eliminate the problem. Reprepare and reanalyze all field and QC samples associated with the contaminated method blank.

9.4. A laboratory control sample (LCS) must be extracted with every process batch of similar matrix, not to exceed twenty (20) samples. The LCS is an aliquot of laboratory matrix (e.g. water for aqueous samples and Ottawa sand for solids) spiked with analytes of known identity and concentration. The LCS must be processed in the same manner and at the same time as the associated samples. Corrective actions must be

documented on a Non-Conformance memo, then implemented when recoveries of any spiked analyte is outside of the control limits. Re-extraction of the blank, other batch QC, and all associated samples are required if the LCS is deemed unacceptable. See WS-PQA-0003 for specific acceptance criteria. The control limits for the LCS are stored in TALS.

9.5. A matrix spike/matrix spike duplicate (MS/MSD or MS/SD) pair must be extracted with every process batch of similar matrix, not to exceed twenty (20) samples. An MS/MSD pair is aliquots of a selected field sample spiked with analytes of known identity and concentration. The MS/MSD pair must be processed in the same manner and at the same time as the associated samples. Spiked analytes with recoveries or precision outside of the control limits must be within the control limits in the LCS. Corrective actions must be documented on a nonconformance memo, then implemented when recoveries of any spiked analyte are outside of the control limits provided by TALS or by the client.

9.6. A duplicate control sample (LCSD or DCS) may be added when insufficient sample volume is provided to process an MS/MSD pair, or is requested by the client. The LCSD is evaluated in the same manner as the LCS. See WS-PQA-003 for specific acceptance criteria.

9.7. Initial calibration verification (ICV) –A second source standard is analyzed with the initial calibration curve. The concentration should be at the mid range of the curve.

Corrective actions for the ICV include:

- Rerun the ICV.
- Remake or acquire a new ICV.
- Evaluate the instrument conditions.
- Evaluate the initial calibration standards.
- Rerun the initial calibration.

9.8. Isotope Dilution Analytes

9.8.1. The IDA solution is added to each field and QC sample at the time of extraction, as described in Section 11. As described in Section 7, this solution consists of isotopically labeled analogs of the analytes of interest.

9.8.2. IDA recoveries are flagged if they are outside of the acceptance limits (25–150%). Quantitation by isotope dilution generally precludes any adverse effect on data quality due to IDA recoveries being outside of the acceptance limits as long as the signal-to-nose ratio is greater than 10:1.

9.8.2.1. Evaluate data quality for usability, flag and submit a non-conformance memo for any analytes outside of the recovery criteria, and report if data is deemed not adversely effected.

9.8.2.2. Re-extraction of samples should be performed if the signal-to-noise for any IDA is less than 10:1 or if the IDA recoveries fall below 10%.

9.8.2.2.1. Re-extraction may be necessary under other circumstances when data quality has been determined to be adversely affected.

9.8.2.3. Projects performed under the auspices of the DoD/DOE must meet QSM 5.1 specific criteria for IDA recoveries which are 50-150%. If QC or field samples do not meet these criteria then re-extraction is required.

9.9. Internal Standard

9.9.1. The Internal Standard (IS) is added to each field and QC samples prior to analysis. The IS response (peak area) must not deviate by more than 50% from the average response (peak area) of the initial calibration.

9.9.2. Sample IS response (peak area) must be within ±50% of the response (peak area) in the most recent CCV.

10. CALIBRATION

10.1. For details of the calculations used to generate the regression equations, and how to use the factors generated by these equations, refer to SOP CA-Q-P-003 “Calibration Curves and Selection of Calibration Points”.

10.2. Routine instrument operating conditions are listed in the table in Section 11.17.

10.3. Instrument Tuning

Instrument tuning is done initially when the method is first developed and thereafter as needed to maintain the sensitivity and selectivity of the method. Tuning is done by infusing each individual compound (native and IDA) into the mobile phase using a tee fitting at a point just before the entrance to the electrospray probe. The responses for the parent and daughter ions for each compound are observed and optimized for sensitivity and resolution. Mass assignments are reviewed and calibrated if necessary. The mass assignments must be within ± 0.5 amu of the values shown in the table in Section 11.17.

10.3.1. Once the optimal mass assignments (within ±0.5 amu of true) are made

immediately following the initial tune, the lowest level standard from the initial calibration curve is assessed to ensure that a signal to noise ratio greater than 10 to 1 (S/N > 10:1) is achieved for each PFAS analyte. The first level standard from the initial calibration curve is used to evaluate the tune stability on an ongoing basis. The instrument mass windows are set initially at ± 0.5 amu of the true value; therefore, continued detection of the analyte transition with S/N > 10:1 serves as verification that the assigned mass remains within ± 0.5 amu of the true value, which meets the DoD/DOE QSM tune criterion. For QSM work, the instrument sensitivity check (section 10.12.4) is also evaluated to ensure that the signal to noise criteria is met.

10.4. A new calibration curve must be generated after major changes to the system or when the continuing calibration criteria cannot be met. Major changes include, but are not limited to, new columns or pump seals. A new calibration is not required after minor maintenance.

10.5. With the exception of the circumstances delineated in policy CA-Q-P-003, it is not acceptable to remove points from a calibration curve. In any event, at least five points must be included in the calibration curve. Average Response Factor and linear fit calibrations require five points, whereas Quadratic (second order) calibrations require six points.

10.6. A fixed injection volume is used for quantitation purposes and is to be the same for both the sample and standards.

10.7. All units used in the calculations must be consistently uniform, such as concentration in ng/mL.

10.8. Initial Calibration

10.8.1. A number of analytical standards of different analyte concentrations are used to generate the curve. Each standard is injected once to obtain the peak response for each analyte at each concentration. These standards define the working range of the analysis.

10.8.1.1. A minimum of five analytical standards is used when using average response factor and/or linear calibration fits.

10.8.1.2. A minimum of six analytical standards is used when a quadratic fit is used to generate the curve.

10.8.2. Calibration is by average response factor, linear fit, or by quadratic fit. Quadratic fit is used for the analyte if the response is non-linear.

10.8.2.1. For average response factor (RFa), the relative standard deviation (RSD) for all compounds quantitated against an identically labeled analog must be < 35% for the curve to be valid.

10.8.2.2. For average response factor (RFa), the relative standard deviation (RSD) for all compounds quantitated against a closely related labeled analog IDA must be < 50% for the curve to be valid.

10.8.2.3. For linear fit, the intercept of the line must be less than ½ the reporting limit, and the coefficient of determination (r2) must be greater than or equal to 0.990 for the curve to be considered valid (or the correlation coefficient (r) > 0.995).

10.8.2.4. The Internal Standard (IS) response (peak area) must not deviate by more than 50% from the average response (peak area) of the initial calibration.

10.8.2.5. Projects performed under the auspices of the DoD/DOE must meet QSM 5.1 specific criteria for initial calibration: The %RSD of the RFS for all analytes must be <20%. Linear or non-linear calibrations must have r^2>0.99 for each analyte. Analytes must be within 70-130% of their true value for each calibration standard.

10.9. Calibration Curve Fits

10.9.1. Linear regression or quadratic curves may be used to fit the data to a calibration function. Detailed descriptions and formulas for each fitting type can be found in SOP CA-Q-P-003, “Calibration Curves and Selection of Calibration Points”.

10.9.2. The linear curve uses the following function:

Equation 1

$$y = bx + c$$

Where:

$$y = \frac{\text{Area (analyte)}}{\text{Area (IS)}} \times \text{Concentration (IS)}$$

x = concentration
b = slope
c = intercept

10.9.3. The quadratic curve uses the following function:

Equation 2

$$y = ax^2 + bx + c$$

Where y, x, b, and c are the same as above, and a = curvature.

10.9.4. Evaluation of Calibration Curves

The following requirements must be met for any calibration to be used:

- Response must increase with increasing concentration.
- The absolute value of the intercept of a regression line (linear or non-linear) at zero response must be less than the reporting limit.
- There should be no carryover at or above 1/2 MRL after a high CAL standard.

If these criteria are not met, instrument conditions and standards will be checked, and the ICAL successfully repeated before continuing.

10.9.5. Weighting of Calibration Points

In linear and quadratic calibration fits, the points at the lower end of the calibration curve have less absolute variance than points at the high concentration end of the curve. This can cause severe errors in quantitation at the low end of the calibration. Because accuracy at the low end of the curve is very important for this analysis, it is preferable to increase the weighting of the lower concentration points. 1/concentration or 1/x weighting is encouraged. Visual inspection of the line fitted to the data is important in selecting the best fit.

10.10. Initial Calibration Blank (ICB)

10.10.1. Immediately following the ICAL, a calibration blank is analyzed that consists of an injection of 80:20 methanol:water blank containing both IDA and IS.

10.10.2. The result for the calibration blank must be less than the reporting limit.

10.10.3. If the ICB is greater than the reporting limit then the source of contamination must be identified and any necessary cleaning completed, and then the instrument should be recalibrated.

10.10.4. Projects performed under the auspices of the DoD/DOE must meet QSM 5.1 specific criteria for instrument blanks. One is required immediately following the highest standard analyzed and *daily prior to sample analysis*. The instrument blank must be < ½ the LOQ.

10.11. Initial Calibration Verification (ICV)

10.11.1. Following the ICAL and the ICB, an ICV standard obtained from a different source or vendor than the ICAL standards is analyzed. This ICV standard is

a mid-range standard.

10.11.2. The recovery for the ICV must meet the appropriate following criteria:

10.11.2.1. The native analyte must be within or equal to 60-140% for all native analytes quantitated against an identically labeled analog IDA.

10.11.2.2. The native analyte must be within or equal to 50-150% for all native analytes quantitated against a closely related labeled analog IDA.

10.11.2.3. The IDA must be within or equal to 50-150%.

10.11.3. Projects performed under the auspices of the DoD/DOE must meet QSM 5.1 specific criteria for the ICV. Analyte concentrations must be within ±30% of their true values for all analytes, IDA and target.

10.11.4. See Section 9.7 for corrective actions in the event that the ICV does not meet the criteria above.

10.12. Continuing Calibration Verification (CCV)

Analyze a CCV at the beginning of a run, the end of a run, and after every 10 samples to determine if the calibration is still valid. The exception is after an acceptable curve and ICV are run 10 samples can be analyzed before a CCV is required. The CCVs are usually at the mid-level range of the curve and should vary throughout the run from low level (LOQ/RL) to mid level. The curve and ICV do not need to be run every day. To start an analytical run a CCV can be analyzed and if it meets acceptance criteria a run can be started. In addition, the low standard in the curve must be analyzed and must be within ± 50% of the expected value.

10.12.1. The recovery for the CCV standards must be equal to or within 60-140% for all natives quantitated against an identically labeled analog and equal to or within 50% to 150% for all natives quantitated against a closely related labeled analog. The recovery for the IDA must be within or equal to 50-150%.

10.12.2. The Internal Standard (IS) response (peak area) must be within ± 50% from the response (peak area) from the midpoint of the initial calibration.

10.12.2.1. Sample IS response (peak area) must be within ± 50% of the response (peak area) in the most recent CCV.

10.12.3. If this is not achieved, the instrument has drifted outside the calibration limits. The instrument must be recalibrated.

10.12.4. Projects performed under the auspices of the DoD/DOE must meet QSM 5.1 specific criteria for CCV. All analyte concentrations must be within ± 30% of their true value. Additionally, prior to analysis and at least once every 12 hours an instrument sensitivity check (ISC/CCVL) must be analyzed. The analyte concentrations must be at LOQ and the concentrations must be within ± 30% of their true value. This can be used as a CCV.

11. PROCEDURE

11.1. One-time procedural variations are allowed only if deemed necessary in the professional judgment of a supervisor to accommodate variation in sample matrix, chemistry, sample size, or other parameters. Any variation in procedure shall be completely documented using an Non-Conformance Memo (NCM). The NCM process is described in more detail in SOP WS-QA-0023. The NCM shall be filed in the project file and addressed in the case narrative.

Any deviations from this procedure identified after the work has been completed must be documented in an NCM, with a cause and corrective action described.

11.2. Water Sample Preparation

11.2.1. Visually inspect samples for the presence of settled and/or suspended sediment/particulate. Evaluate if the sample can be decanted or centrifuged; if not, contact the client for guidance. Filtering the sample can lead to a low bias.

11.2.2. If authorized by the client to filter the sample, filter the water sample through a glass fiber filter (Whatman GF/F Cat No 1825 090 or equivalent). Gravity or vacuum can be used to pass the sample through the filter. Prepare a filtration blank with any samples requiring filtration. File an NCM noting the need for filtration.

Warning: The use of a vacuum system creates the risk of glassware implosion. Inspect all glassware prior to use. Glassware with chips, scratches, rub marks or cracks must not be used.

11.2.3. Weigh the sample container prior to extraction and then weigh the sample container after extraction to determine the initial volume. Unless otherwise directed by client, use the entire sample volume.

11.2.4. Prepare additional aliquots of a field sample for the MS/MSD, if requested.

11.2.5. Prepare two 250 mL aliquots of HPLC-grade water for the method blank and LCS.

11.2.6. Spike the LCS and MS/MSD (if requested) with 0.5 mL of the LCS/Matrix

PFC Spike solution (Section 7.6). This will result in a sample concentration of 40 ng/L.

11.2.7. Add 0.5 mL of the IDA PFC solution (Section 7.7) into each sample and QC sample, for a fixed concentration of 50 ng/mL in the final sample vial.

11.3. Solid Phase Extraction (SPE) of Aqueous Samples

The automated Zymark Auto-Trace Workstation can be used as long as the program follows these conditions and passes the background check.

11.3.1. Condition the SPE cartridges (Waters WAX, 500 mg/6 cc) by passing the following without drying the column.

NOTE: *The cartridges should not be allowed to go dry until the final elution step with methanol. At all of the other transition steps, the solvent/sample level should be stopped at the top of the column before the next liquid is added.*

WARNING: The use of a vacuum system creates the risk of glassware implosion. Inspect all glassware prior to use. Glassware with chips, scratches, rub marks or cracks must not be used.

11.3.2. Wash with 5.0 mL of 0.3% NH_4OH/methanol.

11.3.3. Wash with 5.0 mL of 0.1N NaOH/water. Close valve when ~ 200 uL remains on top to keep column wet. After this step, the columns cannot go dry until the completion of loading and rinsing samples.

11.3.4. Appropriately label the columns and add the reservoir to the column.

11.3.5. Add samples to the columns and with vacuum, pull the entire 250 mL aliquot of the sample through the cartridge at a rate of approximately 2 to 5 drops per second.

11.3.6. After the final loading of the sample but before completely passed through the column, rinse the SPE column with 1 mL of water.

11.3.7. After the sample and water rinse have completely passed through the cartridge, allow the column to dry well with vacuum for 15 minutes.

11.4. SPE Column Wash of Aqueous Samples with Hexane

11.4.1. Load the first 5 mL of hexane to soak for five minutes and then elute to waste.

11.4.2. Load the second 5 mL of hexane and elute to waste (without a soaking period).

11.4.3. Allow the column to dry with vacuum for 5 to 10 minutes. Columns must be dried before continuing.

11.5. SPE Elution of Aqueous Samples – using 15 mL polypropylene test tubes as receiving tubes in the SPE manifold.

11.5.1. Rinse sample bottles with 5 mL of 0.3% NH_4OH/methanol and transfer to the column reservoir onto the cartridge. Allow the solution to soak for 5 minutes and then elute into the 15 mL collection tube.

11.5.2. Repeat sample bottle to column reservoir rinse and cartridge elution with a second 5 mL aliquot of 0.3% NH_4OH/methanol. The total collection should be approximately 10 mL.

11.5.3. **Note: If the extracts will not be concentrated elute extract with a total of 8 mL of 0.3% NH_4OH/methanol.**

11.5.4. Proceed to Section 11.15.2 (Graphitized Carbon Cleanup) as needed. This required for all DoD/DOE extracts.

11.6. Extract Concentration for Aqueous Extracts (Note, if the extract will not be concentrated, proceed to Section 11.7.)

11.6.1. Prior to concentrating each sample, add 100 uL of water.

11.6.2. Concentrate each sample under a gentle stream of nitrogen until the methanol is evaporated and the 100 uL of water remains.

11.6.2.1. This blow down must take a minimum of 3.5 hours.

11.6.2.2. Extracts can not remain in the water bath longer than 5 minutes once concentrated.

11.6.3. Add 300 uL of methanol and mix the contents well using a vortex mixer.

11.6.4. Add 100 uL of Internal Standard (IS) 250 ng/mL concentration solution to each extract and vortex to mix.

11.6.5. This will create an extract with a final solvent composition of 80:20 methanol:water.

11.6.6. Transfer a portion of the extract to a 300 uL polypropylene autosampler vial (7 drop-wise or approximately ½ filled is sufficient). Archive the rest of the extracts for re-injection and dilution.

11.6.7. Seal the vial with a polypropylene screw cap. Note: Teflon lined caps can

not be used due to detection of low level concentration of PFAS.

11.7. Final volume for non-concentrated extract

11.7.1. If the extract does not undergo concentration add 0.5 mL of IS 50 ng/mL concentration and 2 mL of water to the extract. This will create an extract with a final solvent composition of 80:20 methanol:water.

11.7.1.1. Seal the test tube tightly. Invert container several times and then vortex. Allow extract to settle for 10 minutes prior to moving to the next step.

11.7.2. Transfer a portion of the extract to a 300 uL polypropylene autosampler vial (7 drop-wise or approximately ½ filled is sufficient). Archive the rest of the extracts for re-injection and dilution.

11.7.3. Seal the vial with a polypropylene screw cap. Note: Teflon lined caps cannot be used due to detection of low level concentration of PFAS.

11.8. Soil, Sediment and Tissue Sample Preparation and Extraction

11.8.1. Visually inspect soil samples for homogeneity.

11.8.1.1. Projects performed under the auspices of the DoD/DOE must have the entire sample homogenized prior to subsampling in accordance with QSM 5.1 criteria (see SOP WS-QA-0018).

11.8.2. Weigh a representative 5 g aliquot of soil, sediment or 1 g of tissue sample into a 50 mL HDPE wide-mouth bottle. Weigh additional sample amounts for the matrix spike and matrix spike duplicate analyses if they are requested.

11.8.3. For the method blank and LCS matrix, use 5 g each of Ottawa sand or 0.1 g of oil.

11.8.4. Spike the LCS and MS/MSD (if requested) with 1.0 mL of the LCS/Matrix PFC Spike solution (Section 7.6). This will result in a sample concentration of 4.0 ng/g.

11.8.4.1. Spike non-concentrated samples at 0.5 mL of LCS/Matrix PFC Spike Solution.

11.8.5. Add 1.0 mL of the IDA PFC solution (Section 7.7) into each sample and QC sample, for a fixed concentration of 50 ng/mL in the final sample vial.

11.8.5.1. Spike non-concentrated samples at 0.5 mL of IDA PFC Solution.

11.8.6. Cap the bottles and allow the spike to settle into the sample matrix. Gently shake the bottles to mix the spike into the matrix.

11.8.7. Add 20 mL of 0.4% KOH/methanol to each sample.

11.8.8. Shake each sample on an orbital shaker at room temperature for 3 hours.

11.8.9. Following the shaking, extract the samples in an ultrasonic water bath for an additional 12 hours.

11.8.10. After the completion of extraction, centrifuge each sample at 3500 rpm for 15 minutes.

11.8.11. Collect and decant the KOH/methanol extract to a new 50 mL centrifuge tube.

11.8.12. Add another 2 mL of 0.4% KOH/methanol solution to the residue, briefly shake to mix and centrifuge at 3500 rpm for 15 minutes.

11.8.13. Combine the rinsate to the first corresponding tubes.

11.8.14. To the final KOH/methanol extract, add 2 mL of water to each.

11.8.15. Concentrate the KOH/methanol/water extract under nitrogen to less than 2 mL, and dilute with water to 15 mL final volume.

11.8.16. Acidify with 80 uL of glacial acetic acid, and mix the contents well with vortex mixer. Check the pH to ensure pH is between 6 to 8.

11.8.17. Centrifuge at 3500 rpm for 15 minutes.

11.9. Solid Extract Cleanup by SPE

Set up WAX 150 mg/6 cc SPE columns for sample cleanup using vacuum manifold.

11.9.1. Condition the SPE cartridges by passing the following without drying the column.

NOTE: *The cartridges should not be allowed to go dry until the final elution step with methanol. At all of the other transition steps, the solvent/sample level should be stopped at the top of the column before the next liquid is added.*

WARNING: The use of a vacuum system creates the risk of glassware implosion. Inspect all glassware prior to use. Glassware with chips, scratches, rub marks or cracks must not be used.

11.9.2. Wash with 5.0 mL of 0.3% NH_4OH/methanol.

11.9.3. Wash with 10 mL of 0.1N NaOH/water. Close valve when ~ 500uL remains on top of column to keep column wet. *After this step, the columns cannot go dry until the completion of loading and rinsing samples.*

11.9.4. Add extracts to the columns and with vacuum, pull the entire extracts through the cartridge at rate of approximately 3 to 5 drops per second.

11.9.5. Rinse the sample tube with 5 mL of water and add to the SPE column.

11.9.6. Dry the columns with vacuum for 15 minutes.

11.10. SPE Column Wash of Solid Extracts with Hexane

11.10.1. Load the first 5 mL of hexane to soak for five minutes, and elute to waste.

11.10.2. Load the second 5 mL of hexane and elute to waste (without a soaking period).

11.10.3. Allow the column to dry with vacuum for 10 minutes. Columns must be dried before continuing.

11.11. SPE Elution of Solid Extracts – using 15 mL polypropylene test tube as receiving tube in the SPE manifold.

11.11.1. Rinse extraction bottles with 5 mL of 0.3% NH_4OH/methanol and transfer to the column reservoir onto the cartridge. Allow the solution to soak for 5 minutes and then elute into the 15 mL collection tube.

11.11.2. Repeat extract bottle to column reservoir rinse and cartridge elution with a second 5 mL aliquot of 0.3% NH_4OH/methanol. The total collection should be approximately 10 mL.

11.11.3. **Note: If the extracts will not be concentrated elute extract with a total of 8 mL of 0.3% NH_4OH/methanol.**

11.11.4. Proceed to Section 11.15.2 (Graphitized Carbon Cleanup) as needed. This is required for all DoD/DOE extracts.

11.12. Extract Concentration for Solid Samples (Note, if the extract will not be concentrated, proceed to Section 11.7)

11.12.1. Prior to concentrating each sample, add 200 uL of water.

11.12.2. Concentrate each sample under a gentle stream of nitrogen until the methanol is evaporated and the 200 uL of water remains.

11.12.2.1. This blow down must take a minimum of 3.5 hours.

11.12.2.2. Extracts can not remain in the water bath longer than 5 minutes once concentrated.

11.12.2.3. Add 600 uL of methanol and mix the contents well using a vortex mixer.

11.12.2.4. Add 200 uL of Internal Standard (IS) 250 ng/mL concentration solution to each extract and vortex to mix.

11.12.3. Transfer a portion of the extract to a 300 uL polypropylene autosampler vial (7 drop-wise or approximately ½ filled is sufficient). Archive the rest of the extracts for re-injection and dilution.

11.12.4. Seal the vial with a polypropylene screw cap. *Note: Teflon lined caps can not be used due to detection of low level concentration of PFAS.*

11.13. Product/Dispersion Samples

11.13.1. Check the solubility of the material in both methanol and water

11.13.1.1. If the material is soluble in water, dilute 0.5 mL of sample into 250 mL of DI water and proceed to Section 11.3 (follow water extraction procedures). Fortify sample appropriately with IDA or PFC spike solution, see Section 11.2.

11.13.1.2. If the material is soluble in methanol, dilute 1 g (if solid) or 1 mL (if liquid) of material into 10 mL of methanol (MeOH).

11.13.1.2.1. If the material does not completely dissolve, contact your immediate supervisor.

11.13.2. Take 100 uL of the 10 mL solution and dilute it to 10 mL in MeOH.

11.13.3. Take a 1 mL aliquot of this solution (effective dilution of 1000x (1 mg for solid or 0.001 mL for liquid)) and fortify with 0.5 mL of labeled IDA solution (Section 7.7).

11.13.4. DO NOT PASS EXTRACT THROUGH SPE CARTIRIDGE (omit steps 11.9 – 11.11).

11.13.5. Proceed to Section 11.6 of this SOP for extract concentration.

11.14. TOP (Total Oxidizable Precursor) Assay

11.14.1. Prepare 3-250 mL HDPE containers with HPLC grade water to create the

needed QC Samples (MB, LCS/LCSD).

11.14.2. Prepare enough 125 mL HDPE containers as needed for all “Pre” and “Post” samples, including QC. Label each appropriately.

11.14.3. Spike the “Pre” and “Post” MB 125 mL containers with 25 uL of the reverse surrogate solution of M2-4:2 FTS (Section 7.8).

11.14.4. Spike the “Pre” and “Post” LCS/LCSD 125 mL containers with 0.5 mL of the LCS Spike solution (Section 7.6), both regular and “add-on”, and 25 uL of the reverse surrogate solution (Section 7.8).

11.14.5. Remove the methanol solvent from all Post QC sample 125 mL containers (MB and LCS/LCSD) by using N2 evaporation.

11.14.6. Subsample 100 mL aliquots of water from each field sample and QC from the 250 mL containers into each of the corresponding 125 mL containers for both the “Pre” and “Post” samples. Spike all “Pre” and “Post” samples with 25uL of the reverse surrogate solution (Section 7.8).

11.14.7. Set aside all “Pre” sample containers.

11.14.8. Add 2g of potassium persulfate and 1.9 mL of 10N NaOH to each “Post” sample container.

11.14.9. Heat each “Post” sample container in a water bath (KD) at 85°C for 6 hours.

11.14.10. After digestion for 6 hours, place the “Post” sample containers in an ice bath for 30 minutes.

11.14.11. Adjust the pH of “Post” samples and associated QC aliquots to 7 with concentrated HCl. Use pH paper to determine the pH.

11.14.12. Spike both “Pre” and “Post” samples and their associated QC samples with 0.5 mL of PFC IDA solution (Section 7.7), both regular and add-on.

11.14.13. Use the following SPE procedure for both “Pre” and “Post” samples:

11.14.13.1. Set up WAX 150 mg/6 cc SPE columns for sample extraction using a vacuum manifold.

11.14.13.2. Establish a sample loading flow rate of 1 mL/minute for each port of the vacuum manifold, for as many ports as will be used simultaneously during sample loading.

11.14.13.3. Wash/condition the SPE column with 5 mL of 0.3% NH_4OH/Methanol, then 5 mL water.

11.14.13.4. Load 100 mL of sample onto the SPE cartridge at a flow rate of 1 mL/minute.

11.14.13.5. Add 5 mL rinse water

11.14.13.6. After the sample and water rinse have completely passed through the column, allow it to dry well using vacuum with a flow rate of 1 mL/minute for 15 minutes.

11.14.13.7. Wash the SPE column with 10 mL hexane rinse eluting all to waste.

11.14.13.8. Allow the column to dry well using vacuum with a flow rate of 1 mL/minute for 5 minutes. Columns must be dry before continuing.

11.14.13.9. Elute the samples into 15 mL polypropylene test tubes in the SPE manifold by rinsing each 125 mL sample container with 5 mL of 0.3% NH_4OH/methanol, and add to the SPE cartridge as eluent.

11.14.13.10. Repeat with another 5 mL of 0.3% NH_4OH/methanol.

11.14.13.11. Collect the 10 mL of eluent and concentrate per Section 11.6.

11.15. Other Types of Sample Cleanup

11.15.1. Freezing technique to remove lipids.

If samples contain lipids then freeze the methanolic extract and QC extracts at -20^{o}C for at least 1 hour. Collect the solvent layer.

11.15.2. Cleanup with graphitized carbon will be applied to all samples as needed but is required for all DoD/DOE extracts.

11.15.2.1. Add 100 mg of graphitized carbon to each sample extract and QC extracts.

11.15.2.2. Shake vigorously and then let sit for 10 minutes.

11.15.2.3. Centrifuge each sample for 2 minutes at 1000 rpm.

11.15.2.4. Decant the solvent layer

11.15.2.5. Proceed to Section 11.6, 11.7 or 11.12 as applicable.

11.16. AFFF Sample Preparation

11.16.1. QC for AFFF samples consists of a method blank, a laboratory control sample and a sample or matrix duplicate only. No matrix spike or matrix spike duplicate is needed.

11.16.2. Perform a 1,000,000 X serial dilution of the AFFF sample. Dilute 1 mL of AFFF sample to 1L with laboratory supplied water. Then dilute 1mL of this dilution to 1L with laboratory supplied water.

11.16.2.1. Be sure to retain all dilutions should the initial analysis warrant re-analysis at higher concentration.

11.16.3. Subsample 2.0 mL of this dilution and fortify with 0.5 mL IDA solution and 0.5mL of IS (50 ng/mL) solution: then add 7.0 mL of methanol.

11.16.4. Transfer a portion of the sample to a 300 uL polypropylene autosampler vial (7 drop-wise or approximately ½ filled is sufficient). Archive the rest of the sample for re-injection or dilution.

11.17. Instrument Analysis

Suggested operating conditions are listed below for the Waters LCMS system:

Recommended Instrument Operating Conditions					
HPLC Conditions (Waters Acquity UPLC)					
Column (Column temp = 50°C)	Waters Acquity BEH 1.7µm C18, 3.0 x 150 mm				
Mobile Phase Composition	A = 20 mM Ammonium Acetate in Water B = Methanol				
Gradient Program	**Time**	**%A**	**%B**	**Curve**	**Flow Rate - mL/min.**
	0	98	2	6	0.30
	1	98	2	6	0.30
	2	50	50	6	0.30
	12	10	90	6	0.30
	12.5	0	100	6	0.30
	16	0	100	6	0.30
	16.2	98	2	6	0.30
	Maximum pressure limit = 15,000 psi				
Injection Size	10 µL (fixed amount throughout the sequence)				
Run Time	~20 minutes				
Mass Spectrometer Interface Settings (Quattro Premier XE)					
MS Interface Mode	ESI Negative Ion. Minimum of 10 scans/peak.				
Capillary (kV)	2.8				
Cone (V)	Varies from 8.0 to 65				
Extractor (V)	3				
Source Temp	135ºC				

Desolvation Temp	350ºC
Cone Gas (nitrogen) Flow	25 L/hour
Desolvation Gas (nitrogen) Flow	1100 L/hour

Recommended Instrument Operating Conditions

Mass Spectrometer Scan Settings (Quattro Premier XE)

11.17.1. Post Spike Sample Analysis for AFFF samples

11.17.1.1. This section only applies to aqueous samples prepared by serial dilution instead of SPE that have reported value of <LOQ (RL) for any analyte.

11.17.1.2. Spike aliquots of the sample at the final dilution reported for the sample with all analytes that have reported of <LOQ in the final dilution. The spike must be at the LOQ concentration to be reported with the sample (the < LOQ value).

11.17.1.3. When analyte concentrations are calculated as <LOQ, the spike must recover within 70-130% of its true value.

11.17.1.4. It the recovery does not meet this criteria, the sample, sample duplicate and post spike sample must be reanalyzed at consecutively higher dilutions until the criteria is met.

11.17.2. Tune and calibrate the instrument as described in Section 10.

11.17.3. A typical run sequence is as follows:

- Primer (A number of primers are injected for conditioning of the instrument before analysis, especially when the instrument was idled or changed from a different analysis).
- Blank
- Calibration Curve

- CCV
- Up to 10 samples.
- End sequence with CCV

12. CALCULATIONS

12.1. If the concentration of the analyte ions exceeds the working range as defined by the calibration standards, then the sample must be diluted and reanalyzed. It may be necessary to dilute samples due to matrix.

12.2. Qualitative Identification

12.2.1. The retention times of PFAS with labeled standards must be the same as that of the labeled IDA's to within 0.05 min. For PFAS with no labeled standards, the RT must be within ± 0.3 minutes of the ICV and CCV standards. *Note: The IDA RT and native RT may be offset by 0.02 to 0.04 minutes.*

12.3. The ICAL established in Section 10 is used to calculate concentrations for the extracts.

12.4. Extract concentrations are calculated as below. The first equation applies to the linear fit, the second to the quadratic line fit.

Equation 3 $$\text{Concentration, ng/mL} = \frac{y - c}{b}$$

Equation 4 $$\text{Concentration, ng/mL} = \frac{-b + \sqrt{b^2 - 4a(c - y)}}{2a}$$

Where:

y = $\frac{\text{Area (analyte)}}{\text{Area (IS)}} \times \text{Concentration (IS)}$
x = concentration
a = curvature
b = slope
c = intercept

12.5. Water Sample Result Calculation:

Equation 5 $$\text{Concentration, ng/L} = \frac{C_{ex} V_t}{V_o}$$

Where:

C_{ex} = Concentration measured in sample extract (ng/mL)
V_t = Volume of total extract (mL)
V_o = Volume of water extracted (L)

12.6. Soil Sample Result Calculation:

Equation 6 $$\text{Concentration, } ng/g = \frac{C_{ex} V_t}{W_s D}$$

Where ng/g = µg/kg and:

C_{ex} = Concentration measured in sample extract (ng/mL)
V_t = Volume of total extract (mL)
W_s = Weight of sample extracted (g)
D = Fraction of dry solids, which is calculated as follows:

$\frac{100 - \%\text{ moisture in sample}}{100}$ (for dry weight result)

12.7. IDA Recovery Calculation:

Equation 7 $$\%\,\text{Recovery} = \frac{A_t Q_{is}}{A_{is} Q_t RRF_{IDA}} X 100$$

Where ng/g = µg/kg and:

RF_{IDA}	=	Response Factor for IDA compound
A_t	=	Area response for IDA compound
A_{IS}	=	Area Response for IS compound
Q_{IS}	=	Amount of IS added
Q_t	=	Amount of IDA added

12.8. Raw data, calibration summaries, QC data, and sample results are reviewed by the analyst. These must also be reviewed thoroughly by a second qualified person. See the Data Review Policy (WS-PQA-0012). These reviews are documented on the Data Review Checklist.

13. METHOD PERFORMANCE

13.1. The group/team leader has the responsibility to ensure that this procedure is performed by an associate who has been properly trained in its use and has the required expertise.

13.2. Method Detection Limit

The laboratory must generate a valid method detection limit for each analyte of interest. The MDL must be below the reporting limit for each analyte. The procedure for determination of the method detection limit is given in 40 CFR Part 136, Appendix B, and further defined in SOP WS-QA-0006 and policy WS-PQA-003. MDLs are available in the Quality Assurance Department.

13.3. Initial Demonstration of Capability (IDOC)

Each analyst performing this procedure must successfully analyze four LCS QC samples using current laboratory LCS control limits. IDOCs are approved by the Quality Assurance Manager and the Technical Director. IDOC records are maintained by the QA staff in the central training files.

13.4. The laboratory must generate a valid method detection limit for each analyte of interest. The MDL must be below the reporting limit for each analyte. The procedure for determination of the method detection limit is given in 40 CFR Part 136, Appendix B, and further defined in WS-QA-0006 and policy WS-PQA-003.

14. POLLUTION PREVENTION

14.1. All waste will be disposed of in accordance with Federal, State and Local regulations.

14.2. Solid phase extraction used for water samples greatly reduces the amount of solvent used compared to liquid-liquid extraction.

14.3. Standards and reagents are purchased and prepared in volumes consistent with laboratory use to minimize the volume of expired standards and reagents requiring disposal.

14.4. Where reasonably feasible, technological changes have been implemented to minimize the potential for pollution of the environment. Employees will abide by this method and the policies in Section 13 of the Corporate Safety Manual for "Waste Management and Pollution Prevention."

14.5. Do not allow waste solvent to vent into the hoods. All solvent waste is stored in capped containers unless waste is being transferred.

14.6. Transfer waste solvent from collection cups (tri-pour and similar containers) to jugs and/or carboys as quickly as possible to minimize evaporation.

15. WASTE MANAGEMENT

The following waste streams are produced when this method is carried out:

15.1. Assorted test tubes, autovials, syringes, filter discs and cartridges. Dump the solid waste into a yellow contaminated lab trash bucket. When the bucket is full or after no more than one year, tie the plastic bag liner shut and put the lab trash into the hazardous waste – landfill steel collection drum in the H3 closet. When the drum is full or after no more than 75 days, move it to the waste collection area for shipment.

15.2. Extracted soil samples, used sodium sulfate, paper funnel filters, glass wool, thimbles, and extracted solids contaminated with solvents. Dump these materials into an orange contaminated lab trash bucket. When the bucket is full or after no more than one year, tie the plastic bag liner shut and put the lab trash into the incineration steel collection drum in the H3 closet. When the drum is full or after no more than 75 days, move it to the waste collection area for shipment.

15.3. Waste Methanol. Collect the waste solvents in tripours during use. Empty the tripours into a 1-liter to 4-liter carboy at the fume hood. When the carboy is full, or at the end of your shift, whichever comes first, empty the carboy into the steel flammable solvent drum in the H3 closet. When full to no less than six inches of the top, or after no more than 75 days, move the steel flammable solvent drum to the waste collection area for shipment.

15.4. Mixed water/methanol waste from soil extraction. Collect the waste in the HPLC waste carboy. When full, or after no more than one year, dump into the blue plastic HPLC collection drum in the H3 closet. When the drum is full, to no less than six inches of the top, or after no more than 75 days, move it to the waste collection area for shipment.

15.5. Aqueous acidic waste from the LCMS instrument contaminated with methanol. This is collected in a 1-gallon carboy at the instrument. When the carboy is full, or after no more than one year, it is emptied into the blue plastic HPLC collection drum in the H3

closet. When the drum is full to between two and six inches of the top, or after no more than 75 days, move it to the waste collection area for shipment.

15.6. Autovials contaminated with methanol. As the autovials are removed from the instrument after analysis, they are collected in open containers at the instrument. After all autovials are removed, the open container must be dumped into a closed satellite collection container in a fume hood, as the punctured septa in the autovial can allow methanol and other contaminants to evaporate into the atmosphere. The satellite collection containers are transferred to the waste disposal area when full or after no more than one year, where they are disposed through the vial eater.

17. METHOD MODIFICATIONS

17.1. Modifications from Method 537 are detailed below:

17.1.1. Water sample containers are not preserved with Trizma.

17.1.2. The method has been modified to address soil/solid matrices. The extraction holding time is set at 14 days.

17.1.3. The analyte list has been expanded. The number of labeled analytes has been expanded as well to improve quantitation.

17.1.4. The reporting limits differ as they are all set at one consistent value.

17.1.5. Calibration levels differ from the referenced method.

17.1.6. More labeled analytes are fortified into the samples prior to the extraction process. Most target analytes are quantitated against a labeled analyte.

17.1.7. There is no symmetry requirement.

17.1.8. Calibration, both initial and continuing, has different acceptance criteria due to the longer list of analytes, and the use of isotope dilution quantitation.

17.1.9. The eluents and HPLC configuration differs. As a result the final extract is in 80:20 methanol:water.

17.1.10. The LCS and MS/MSD are spiked at one concentration and do not rotate between a low to high levels.

17.1.11. Samples are not checked for residual chlorine or pH.

17.1.12. A different SPE cartridge (Waters OASIS WAX) is used for the extraction process. As a result solvents and elution procedures are different.

18. ATTACHMENTS

18.1. Attachment 1 - Analysis of Perfluorinated Compounds (PFAS) in Water via In Line Solid Phase Extraction (SPE).

19. REVISION HISTORY

Revisions to Attachment 1 are documented in the attachment.

Revisions prior to 05/01/2017 have been removed and are available in previous versions of this SOP.

19.1. WS-LC-0025, Revision 2.9, Effective 11/22/2017

19.1.1. Section 1.2, table updated to reflect ranges after removing MeFOSA and EtFOSA from the SOP in the previous revision.

19.1.2. Section 9.3.6, last sentence changed to read, “Reprepare and reanalyze all field and QC samples associated with the contaminated method blank.”

19.1.3. Section 9.7, first sentence changed to read, “Initial calibration verification (ICV) – A second source standard is analyzed with the initial calibration curve.

19.1.4. Section 1.3.1 revised to read, “Once the optimal mass assignments (within ±0.5 amu of true) are made immediately following the initial tune, the lowest level standard from the initial calibration curve is assessed to ensure that a signal to noise ratio greater than 10 to 1 (S/N > 10:1) is achieved for each PFAS analyte. The first level standard from the initial calibration curve is used to evaluate the tune stability on an ongoing basis. The instrument mass windows are set initially at ± 0.5 amu of the true value; therefore, continued detection of the analyte transition with S/N > 10:1 serves as verification that the assigned mass remains within ± 0.5 amu of the true value, which meets the DoD/DOE QSM tune criterion. For QSM work, the instrument sensitivity check (section 10.12.4) is also evaluated to ensure that the signal to noise criteria is met.”

19.1.5. Editorial changes.

19.2. WS-LC-0025, Revision 2.8, Effective 11/06/2017

19.2.1. Revised Section 4.5 to “Both branched and linear PFAS isomers can potentially be found in the environment. Linear and branched isomers are known to exist for PFOS, PFOA, PFHxS, PFBS, EtFOSAA, and MeFOSAA based upon the literature. If multiple isomers are present for one of these PFAS they might be adjacent peaks that completely resolved or not, but

usually with a deflection point resolved during peak integration. The later of these peaks match the retention time of its labeled linear analog. In general, earlier peaks are the branched isomers and are not the result of peak splitting.

At this time only PFOS, PFOA and PFHxS are commercially available as technical mixtures. These reference standards of the technical mixtures for these specific PFAS are used to ensure that all appropriate peaks are included during peak integration."

19.2.2. Sections 4.8 and 7.2.1.1, corrected the in-sample contributions to 0.30 ng/L and 0.015 ug/kg.

19.2.3. Removed Section 7.1.14, "Methanol-Water, 78:22 vol./vol., prepared by mixing 780 mL methanol and 220 mL reagent water. Stored in polypropylene bottle and sealed with polypropylene screw cap." Reagent was added incorrectly.

19.2.4. Section 7.2.4, corrected the factor to 0.956 from 1.046.

19.2.5. Added Section 7.4.1, "A technical (qualitative) grade PFOA standard which contains both linear and branched isomers is used as a retention time (RT) marker. This is used to integrate the total response for both linear and branched isomers of PFOA in environmental samples while relying on the initial calibration with the linear isomer quantitative standard This technical (qualitative) grade PFOA standard is analyzed initially, after an initial calibration when a new column is installed or when significant changes are made to the HPLC parameters."

19.2.6. Section 9.7, added "Rerun the initial calibration" as the last bullet item.

19.2.7. Added Section 10.3.1, "The first level standard from the initial calibration curve is used to evaluate the tune criteria. The instrument mass windows are set at ±0.5 amu; therefore, detection of the analyte serves as verification that the assigned mass is within ±0.5 amu of the true value, which meets the DoD/DOE QSM tune criterion.

19.2.8. Section 10.10.1, appended "containing both IDA and IS" to the end of the paragraph.

19.2.9. Sections 11.6.3 and 11.12.2.3, changed "78:22 methanol:water" to "methanol".

19.2.10. Sections 1.1 and 7.4, removed EtFOSA and MeFOSA from tables due to low volume of requests for those analytes.

19.2.11. Removed Section 2.2.1, “Optional cleanups may include sample freezing and/or cleanup by SPE cartridge, unless EtFOSA and MeFOSA are requested.”

19.2.12. Removed EtFOSA/MeFOSA specific comments in various sections throughout the document.

19.2.13. Section 7.4 Note added, “The concentration of the calibration solutions for non-concentrated extracts is 1/20th the levels indicated above.”

19.2.14. Section 7.9, changed 1000 ng/mL to 250 ng/mL and replaced final sentence with “The internal standard solution used for the non-concentrated extracts is at a concentration of 50 ng/mL.”

19.2.15. Removed Section 11.2.8, “If EtFOSA and/or MeFOSA are requested, add 100uL of IS and then adjust the final volume (FV) of these aliquots to 5.0 mL with MeOH. QC samples, LCS, MS, and MSD will require concentration via nitrogen to adjust the FV to 5.0 mL. Vortex each sample. Then, transfer a portion of the extract to a 300 uL polypropylene autosampler vial (7 drop-wise or approximately ½ filled is sufficient). Archive the rest of the extracts for re-injection and dilution.”

19.2.16. Added Section 11.5.4, “Proceed to Section 11.15.2 (Graphitized Carbon Cleanup) as needed. This is required for all DoD/DOE extracts.”

19.2.17. Added Section 11.7.1.1, “Seal the test tube tightly. Invert container several times and then vortex. Allow extract to settle for 10 minutes prior to moving to the next step.”

19.2.18. Inserted Section 11.8.1.1, “Projects performed under the auspices of the DoD/DOE must have the entire sample homogenized prior to subsampling in accordance with QSM 5.1 criteria.”

19.2.19. Section 11.11.4, added “(Graphitized Carbon Cleanup) as needed. This is required for all DoD/DOE extracts.”

19.2.20. Section 11.14.6, added “Spike all “Pre” and “Post” samples with 25uL of the reverse surrogate solution (Section 7.8).”

19.2.21. Section 11.15.2, revised to read, “Cleanup with graphitized carbon will be applied to all samples as needed but is required for all DoD/DOE extracts.”

19.2.22. Added Section 11.15.2.5, “Proceed to Section 11.6, 11.7, or 11.12 as applicable.”

19.2.23. Removed Sections 11.15.3 through 11.15.6.

19.2.24. Added Section 11.16, “AFFF Sample Preparation”.

19.2.25. Section 11.17, removed EtFOSA, MeFOSA, d5-EtFOSA, and d3MeFOSA from all tables.

19.2.26. Section 11.17, changed masses for M2-4:2FTS, M2-6:2FTS, and M2-8:2FTS. Initially assigned daughter masses were bleeding through from the native analog.

19.2.27. Section 11.17, all tables on MS Interface Mode Line, added “Minimum of 10 scans/peak.”

19.2.28. Added Section 11.17.1, “Post Spike Sample Analysis for AFFF Samples”.

19.2.29. Added Section 11.8.4.1 “Spike non-concentrated samples at 0.5 mL of LCS/Matrix Spike Solution.”

19.2.30. Added Section 11.8.5.1, “Spike non-concentrated samples at 0.5 mL of IDA PFC Solution.”

19.2.31. Editorial changes.

19.3. WS-LC-0025, Revision 2.7, Effective 09/20/2017

19.3.1. Section 1.1 table, added 1H,1H,2H,2H-perfluorohexane sulfonate *(4:2)*.

19.3.2. Section 1.1, removed “Sample results for PFOA may also be reported as APFO, at the request of the client. (See Section 12.7).”

19.3.3. Section 1.2 and 11.8.2, updated tissue extracted mass and RL.

19.3.4. Section 2.5, removed “and assumes a proportional relationship between the initial calibration and the analyte in the extract. The ratio of the peak response to mass or concentration injected is used to prepare a calibration curve.”

19.3.5. Added Section 6.6, “Extract concentrator or nitrogen manifold with water bath heating to 50-55°C”.

19.3.6. Added Section 7.1.14, “Methanol-Water, 78:22 vol./vol., prepared by mixing 780 mL methanol and 220 mL reagent water. Stored in polypropylene bottle and sealed with polypropylene screw cap.”

19.3.7. Section 7.2.1.1, revised “roughly 0.15 pg/L” to “roughly 0.15 ng/L”.

19.3.8. Section 7.4 table, added:

4:2 FTS	0.5	1.0	2.0	20	50	200	400

19.3.9. Section 7.4 table, revised Labeled Isotope Dilution Analytes (IDA) Section.

19.3.10. Section 7.4 table, added:

Internal Standard (IS)							
13C2-PFOA	50	50	50	50	50	50	50

19.3.11. Section 7.4, removed “FOSAA may be added to the mix and are added at the same concentration as FOSA.”

19.3.12. Added Section 7.9, “Internal Standard Solution, 1000 ng/mL. The internal standard solution is prepared by diluting 13C2-PFOA to produce a solution containing this compound at a concentration of 1000 ng/mL in methanol. This is added to all extracts prior to analysis. Non-concentrated extracts are fortified with a 5X dilution of this solution.”

19.3.13. Section 8.1, changed “250 mL” to “8 oz.”

19.3.14. Added Sections 9.3.6, 9.8.2.3, 10.10.4, 10.8.2.5, 10.11.3, and 10.12.4 to address DOD QSM 5.1 Table B-15 criteria.

19.3.15. Added Section 9.9, “Internal Standard.”

19.3.16. Updated all tables to indicate target analyte quantitation via isotope dilution. Internal standard quantitation is only used to quantitate the IDA recoveries.

19.3.17. Added Section 10.8.2.4, 10.12.2, and 10.12.2.1 to incorporate IS criteria into calibrations.

19.3.18. Section 11.2.1, “Evaluate if the sample can be decanted or centrifuged; if not, contact the client for guidance. Filtering the sample can lead to a low bias.”

19.3.19. Added Section 11.2.3.1, “Alternatively, weigh the sample container prior to extraction and then weigh the sample container after extraction to determine the initial volume.”

19.3.20. Added Section 11.5.3, “Note: If the extracts will not be concentrated elute extract with a total of 8 mL of 0.3% NH_4OH/methanol.”

19.3.21. Added Section 11.6.2.3, “Add 300 uL of the 78:22 methanol:water solution and mix the contents well using a vortex mixer.”

19.3.22. Added Section 11.6.2.4, “Add 100 uL of Internal Standard (IS) solution to each extract and vortex to mix.”

19.3.23. Added Section 11.7, “Final volume for non-concentrated extract”.

19.3.24. Revised Section 11.11, “SPE Elution of Solid Extracts”.

19.3.25. Revised Section 11.12, “Extract Concentration for Solid Samples”.

19.3.26. Removed Section 12.8, “If results are to be reported as ammonium perfluorooctanoate (APFO), instead of PFOA, apply a multiplier of 1.0406 to the sample results to correct for the molecular weight differences between PFOA and APFO or this adjustment can be made during the preparation of the standards used for calibration. (Use one, not both.)”

19.3.27. Removed Section 13.4 – it was a copy of Section 13.2.

19.3.28. Various revisions to fulfill requirements based on DOD/DOE QSM 5.1.

19.3.29. Editorial changes.

19.4. WS-LC-0025, Revision 2.6, Effective 08/15/2017

19.4.1. Section 7.4, added MPFBS, MPFTeDA, and MPFHxDA to the table.

19.4.2. Section 11.15, added 13C-PFBS to the Recommended Instrument Operating Conditions table for SCIEX 5500.

19.4.3. Section 11.15 Recommended Instrument Operating Conditions table, changed the mass transitions for native PFTeDA from 713 > 669 (quant) and 713 > 169 (qualifier) to 713 > 169 (quant) and 713 > 219 (qualifier).

19.4.4. Editorial changes.

19.5. WS-LC-0025, Revision 2.5, Effective 07/10/2017

19.5.1. Revised Section 11.6.1 to read “Prior to concentrating each sample, add 100 uL of water.”

19.5.2. Revised Section 11.6.2 to read “Concentrate each sample under a gentle stream of nitrogen until the methanol is evaporated and the 100 uL of water remains.

11.6.2.1 This blow down must take a minimum of 3.5 hours.

11.6.2.2 Extracts can not remain in the water bath longer than 5 minutes once concentrated."

19.5.3. Revised Section 11.6.3 to read "Add 400 uL of methanol to each extract, soak, and vortex to mix well. This will create an extract with a final solvent composition of 80:20 methanol:water."

19.5.4. Revised Section 11.11.1 to read "Prior to concentrating each sample, add 200 uL of water."

19.5.5. Revised Section 11.11.2 to read "Concentrate each sample under a gentle stream of nitrogen until the methanol is evaporated and the 200 uL of water remains."

11.11.2.1 This blow down must take a minimum of 3.5 hours.

11.11.2.2 Extracts can not remain in the water bath longer than 5 minutes once concentrated."

19.5.6. Revised Section 11.11.3 to read "Add 800 uL of methanol to each extract, soak, and vortex to mix well. This will create an extract with a final solvent composition of 80:20 methanol:water."

1. SCOPE AND APPLICATION

1.1. This procedure describes the analysis of water samples via in line solid phase extraction (SPE) for the following compounds using liquid chromatography / tandem mass spectrometry (LC/MS/MS) on a SCIEX 5500.

Compound Name	Abbreviation	CAS #
Perfluoroalkylcarboxylic acids (PFCAs)		
Perfluoro-n-heptanoic acid	PFHpA	375-85-9
Perfluoro-n-octanoic acid	PFOA	335-67-1
Perfluoro-n-nonanoic acid	PFNA	375-95-1
Perfluorinated sulfonic acids (PFSAs)		
Perfluoro-1-butanesulfonic acid	PFBS	375-73-5
Perfluoro-1-hexanesulfonic acid	PFHxS	355-46-4
Perfluoro-1-octanesulfonic acid	PFOS	1763-23-1

1.2. The working range of the method is listed below. The linear range can be extended by diluting the extracts.

Matrix	Nominal Sample Size	Reporting Limit	Working Range
Water	1.0 mL	2.0 ng/L	2 to 200 ng/L

2. SUMMARY OF METHOD

2.1. A 1 mL aliquot of sample is diluted to a 40:60 methanol:water extract and analyzed by LC/MS/MS. PFAS are separated from other components on a C18 column with a solvent gradient program using 20mM ammonium acetate/water and methanol.

3. DEFINITIONS

Refer to Section 3 of the main body of this SOP for a summary of definitions.

4. INTERFERENCES

Refer to Section 4 of the main body of this SOP for interferences.

5. SAFETY

Refer to Section 5 of the main body of this SOP for safety information.

6. EQUIPMENT AND SUPPLIES

Refer to Section 6 of the main body of this SOP for supplies, other than those listed below specific to the in line SPE analysis.

6.1. 2 mL auto sampler vials, clear glass, Thermo Scientific Nation surestop vial, part no. C5000-1, or equivalent**.**

6.2. Vial caps, Thermo Scientific National AVCS blue cap, pre slit TEF/STL septa, part no. C5000-55B or equivalent.

6.3. Eppendorf 1000 uL epTIPS, part no. 022491954 or equivalent.

6.4. Eppendorf 200 uL epTIPS, part no. 022491938 or equivalent.

6.5. 50 mL graduated plastic centrifuge tubes, SCP Science DigiTUBES part no. 010-500-263 or equivalent

6.6. 1000 uL Pipette: Eppendorf Research Plus

6.7. 100 uL Pipette: Rainin EDP3-Plus

6.8. 250 mL HDPE bottles with PPE screw caps, ESS part no. 0250-1902-QC or equivalent.

6.9. Analytical columns

6.9.1. Phenomenex Gemini C18 3 um, 3.0 mm x 100 mm, Part No. 00D-4439-Y0, or equivalent.

6.9.2. PFAS Isolator column, Phenomenex Luna C18 5 um, 50 mm x 4.6 mm, part no. 00B-4252-E 0 or equivalent.

6.10. SCIEX 5500 Triple Quad MS. The system utilizes Chrom Peak Review, version 2.1 or equivalent.

6.11. Shimadzu CTO-20AC HPLC equipped with 3 LC-20AD pumps and one DGU-20 degassing unit or equivalent.

7. REAGENTS AND STANDARDS

Refer to Section 7 of the main body of this SOP for reagents and standards, other than those listed below specific to the in line SPE analysis.

7.1. Reagent grade chemicals shall be used in all tests whenever available. Unless otherwise indicated, it is intended that all reagents shall conform to the specifications of the Committee on the Analytical Reagents of the American Chemical Society, where such specifications are available. Other grades may be used, provided it is first ascertained that the reagent is of sufficiently high purity to permit its use without lessening the accuracy of the determination.

7.1.1. Ammonium acetate, Fisher Optima LCMS grade (20 mM in water), part no. A114-50, or equivalent.

7.1.2. Methanol, Baker HPLC grade, part no. 9093-03.

7.1.3. Water, Nanopure or Millipore or Fisher Optima LCMS grade, part no. W6-4, must be free of interference and target analytes.

7.2. Calibration Standards

The calibration stock solution is prepared by diluting the appropriate amounts of the stock solutions (Section 7.2 of the main body of this SOP) in 40:60 methanol:water. The calibration stock solution is diluted with methanol to produce initial calibration standards. These are the normal calibration levels used. A different range can be used if needed to achieve lower reporting limits or a higher linear range.

7.3. Initial Calibration (ICAL) Levels (ng/L)

Compound	CS-1	CS-2	CS-3	CS-4	CS-5	CS-6	CS-7	CS-8
Perfluoroalkylcarboxylic acids (PFCAs)								
PFHpA	1.0	2.0	5.0	10	20	50	100	200
PFOA	1.0	2.0	5.0	10	20	50	100	200
PFNA	1.0	2.0	5.0	10	20	50	100	200
Perfluorinated sulfonic acids (PFSAs)								
PFBS	1.0	2.0	5.0	10	20	50	100	200
PFHxS	1.0	2.0	5.0	10	20	50	100	200
PFOS	1.0	2.0	5.0	10	20	50	100	200
Labeled Isotope Dilution Analytes (IDA)								
13C4-PFHpA	50	50	50	50	50	50	50	50
13C4-PFOA	50	50	50	50	50	50	50	50
13C5-PFNA	50	50	50	50	50	50	50	50
18O2-PFHxS	50	50	50	50	50	50	50	50
13C4-PFOS	50	50	50	50	50	50	50	50

Note- The above calibration levels are provided only as an example. The actual ICAL level used for each analytical batch will depend upon the LOQ requirements of the program.

7.4. LCS/Matrix PFC Spike Solution, 100 ng/mL.

The PFC spike solution is prepared by diluting all PFAS to produce a solution containing each PFAS at 100 ng/mL in methanol.

7.5. PFC Isotope Dilution Analyte (IDA) Spike Solution, 1 ng/mL.

The PFC-IDA solution is prepared by diluting all labeled PFAS to produce a solution containing each at 1 ng/mL in methanol.

8. SAMPLE COLLECTION, PRESERVATION, AND STORAGE

8.1. Water samples are collected in pre-cleaned 250 mL HDPE containers. Other containers may also be suitable. Samples are chilled to 0 - 6 °C for shipment to the laboratory.

8.2. Samples are logged in following normal laboratory procedures and are stored under refrigeration at 0 - 6 °C. Water samples must be analyzed within 28 days of collection.

9. QUALITY CONTROL

Refer to Section 9 of the main body of this SOP for Quality Control information.

9.1. If potable water samples from the state of New York (NY) are analyzed via this method the control limits for LCS and IDA for PFOS and PFOA recoveries are 70-130%. If these limits are not met, refer to Section 9 of the main body of this SOP for corrective action.

9.2. If POST (treatment) samples have positive detections, review the associated PRE and MID (treatment) samples for similar detections. Re-preparation and re-analysis may be needed.

9.3. If PFBS is detected in the method blank greater than the RL, evaluate data for impact. PFBS is a known laboratory artifact. Re-preparation and re-analysis may be needed.

10. CALIBRATION

Refer to Section 10 of the main body of the SOP for calibration information.

11. PROCEDURE

Refer to Section 11 of the main body of this SOP for procedures, other than those listed below specific to the in line SPE analysis.

11.1. Water Sample Preparation

11.1.1. Visually inspect samples for the presence of settled and or suspended sediment/particulate. Evaluate if the sample can be decanted or centrifuged; if not, contact the client for guidance. Filtering the sample can lead to a low bias.

If authorized by the client to filter the sample, filter the water sample through a glass fiber filter (Whatman GF/F Cat No 1825 090 or equivalent). Gravity of vacuum can be used to pass the sample through the filter. Prepare a filtration blank with any samples requiring filtration. File an NCM noting the need for filtration.

Warning: The use of a vacuum system creates the risk of glassware implosion. Inspect all glassware prior to use. Glassware with chips, scratches, rub marks or cracks must not be used.

11.1.2. Prepare an LCS and method blank by adding 250 mL of HPLC grade water into a 250 mL HDPE bottle.

11.1.3. If requested, find the client assigned sample for MS/MSD.

11.1.4. Spike directly into the sample bottles for the LCS and MS/MSD (if requested) with 0.050 mL (50 uL) of the LCS/Matrix PFC Spike solution (Section 7.4). This will result in a sample concentration of 20 ng/L. Shake well to disperse spike.

11.1.5. Measure 1 mL of each sample using an Eppendorf pipette and pour into a labeled 2.0 mL injection vial. This includes the LCS and method blank samples as well.

11.1.6. Be sure to "prepare" the pipette by collecting two 1 mL aliquots and disposing of them, and then collect the aliquot for testing.

11.1.7. Add 83 uL of surrogate solution (PFC IDA Spike Solution, Section 7.5) into each vial for each sample and QC sample. This will result in an extract concentration of 50 ng/L for the surrogate.

11.1.8. Add 577 uL of methanol to each sample for a final solvent composition of 40:60 methanol:water.

11.1.9. Seal the vial with a polypropylene screw cap. Note: Teflon lined caps can not be used due to detection of low level concentration of PFAS.

11.1.10. Vortex to mix the mixture well.

11.2. Instrument Analysis

11.2.1. Suggested operation conditions are listed below:

Routine Instrument Operating Conditions					
HPLC Conditions (Shimadzu HPLC)					
Column (Column temp = 35°C)	Phenomenex Gemini C18 3 um, 3.0 mm x 100 mm				
Mobile Phase Composition	A = 20 mM Ammonium Acetate in Water B = Methanol				
Gradient Program	**Time (min)**	**%A**	**%B**	**Curve**	**Flow Rate (mL/min)**
	0	90	10	6	0.60
	1	90	10	6	0.60

	1.5	35	65	6	0.60
	8	5	95	6	0.60
	8.1	1	99	6	0.60
	12	1	99	6	0.60
	12.5	90	10	6	0.60
	Maximum Pressure limit = 5,000 psi				
Injection Size	950 uL (fixed amount throughout the sequence)				
Run Time	17.1 minutes				

Routine Instrument Operating Conditions	
Mass Spectrometer Interface Settings (SCIEX 5500)	
MS Interface Mode	ESI Negative Ion. Minimum of 10 scans/peak.
Ion Spray Voltage (kV)	4.5
Entrance Potential (V)	5
Declustering Potential (V)	25
Desolvation Temp	550 ºC
Curtain Gas (nitrogen) Flow	35 psi
Collision Gas (nitrogen) Flow	8 psi

Routine Instrument Operating Conditions						
Mass Spectrometer Scan Settings (SCIEX 5500)						
Compound	**Comments**	**Reaction (MRM)**	**Dwell (sec)**	**Ent. Pot. (V)**	**Col. Energy (V)**	**Declu. Pot. (V)**
PFBS	Perfluorobutanesulfonate	299 > 80	0.02	6	58	55
18O2-PFHxS	IDA	403 > 84	0.02	12	74	60
PFHpA	Perfluoroheptanoic acid	363 > 319	0.02	6	12	25
13C4-PFHpA	IDA	367 > 322	0.02	6	12	25
PFHxS	Perfluorohexanesulfonate	399 > 80	0.02	12	74	60
18O2-PFHxS	IDA	403 > 84	0.02	12	74	60
PFOA	Perfluorooctanoic acid	413 > 369	0.02	6	14	25
13C4PFOA	IDA	417 > 372	0.02	6	14	25
PFNA	Perfluorononanoic acid	463 > 419	0.02	6	14	25
13C5-PFNA	IDA	468 > 423	0.02	6	14	25
PFOS	Perfluorooctanesulfonate	499 > 80	0.02	9	108	65
13C4-PFOS	IDA	503 > 80	0.02	9	108	65

Native Compounds	**Typical Native RT (minutes)**	**IS analog**	**Typical IDA RT (minutes)**	**Quantitation Method**
PFBS	6.68	18O2-PFHxS	7.76	Isotope Dilution
PFHpA	7.77	13C4-PFHpA	7.77	Isotope Dilution

PFHxS	7.76	18O2-PFHxS	7.76	Isotope Dilution
PFOA	8.44	13C4-PFOA	8.44	Isotope Dilution
PFNA	9.10	13C5-PFNA	9.10	Isotope Dilution
PFOS	9.06	13C4-PFOS	9.06	Isotope Dilution

11.2.2. Tune and calibrate the instrument as described in Section 10.

12. CALCULATIONS

Refer to Section 12 of the main body of this SOP for calculation information.

13. METHOD PERFORMANCE

Refer to Section 13 of the main body of this SOP for method performance information.

14. POLLUTION PREVENTION

Refer to Section 14 of the main body of this SOP for pollution prevention information.

15. WASTE MANAGEMENT

Refer to Section 15 of the main body of this SOP for waste management information.

16. REFERENCES

Refer to Section 16 of the main body of this SOP for reference information.

17. METHOD MODIFICATIONS

17.1. Refer to Section 17 of the main body of this SOP for modifications from Method 537, except as detailed below:

17.1.1. Water samples are prepared at 1.0 mL, not 250 mL.

17.1.2. Water sample containers are not preserved with Trizma. Holding time has been changed to 28 days for analysis.

17.1.3. The eluents and HPLC configuration differs. As a result the final extract is in 40:60 methanol:water.

18. ATTACHMENTS

There are no attachments to this Appendix.

19. REVISION HISTORY

Revisions prior to 04/10/2017 have been removed and are available in previous versions of this SOP.

19.1. WS-LC-0025, Attachment 1, Revision 2.9, Effective 11/27/2017

19.1.1. No changes to the attachment with this revision.

19.2. WS-LC-0025, Attachment 1, Revision 2.8, Effective 11/06/2017

19.2.1. Section 11.2.1, Routine Instrument Operating Conditions table (SCIEX 5500), added “Minimum of 10 scans/peak”.

19.3. WS-LC-0025, Attachment 1, Revision 2.7, Effective 09/22/2017

19.3.1. Section 6.5, removed “The 5 items above are to be maintained in the drawer labeled “Segregated Supplies for in line SPE Analysis” in the LC/MS instrument room.”

19.3.2. Added Sections 9.1 – 9.3.

19.3.3. Updated Section 11.1.

19.3.4. Editorial changes.

19.4. WS-LC-0025 Attachment 1, Revision 2.6, Effective 08/11/2017

19.4.1. No revisions to this attachment.

19.5. WS-LC-0025 Attachment 1, Revision 2.5, Effective 07/10/2017

19.5.1. No revisions to this attachment.

19.6. WS-LC-0025 Attachment 1, Revision 2.4, Effective 04/25/2017

19.6.1. No revisions to this attachment.

19.7. WS-LC-0025 Attachment 1, Revision 2.3, Effective 04/10/2017

19.7.1. Changed all mentions of “direct aqueous injection (DAI)” to “in line solid phase extraction (SPE).”

19.7.2. Inserted Section 17.1, and changed formatting of the modifications to Method 537 to Section 17.2 and subheadings.

Subject: **Remedial Investigation/Feasibility (RI/FS) Study Work Plan and Sampling and Analysis Plan Addendum No. 1**
Request for Modification
Orange County North Basin (OCNB), EPA# CAN000900251, SSID# A9AN
Orange County, CA

Dear Mr. Mark:

This letter is in reference to RI/FS Study Work Plan Addendum No. 1 (WPA) and Sampling and Analysis Plan (SAP) Addendum No. 1, dated May 2018. Upon review of the aforementioned documents, EPA is providing the following comments:

1) ***WPA.*** The Work Plan should provide context as to why PFCs are being added to the RI, and how locations for sampling PFCs were chosen, as well as adding previous sample results to help support these decisions. The available data should be presented, or at least summarized, to provide rationale for the selection of wells for PFC analysis.

2) ***WPA Section 1.*** It has been proposed to eliminate one of the June 2017 RI/FS Work Plan Shallow zone monitoring well, FM-30A, due to access limitations. As previously discussed between EPA and OCWD, this elimination was acceptable, as the well would provide small-scale mass resolution in the Shallow zone, but is not critical to large-scale plume delineation or characterization.

3) ***WPA Table 2 – item 4.*** The purpose of the installation of proposed Shallow zone monitoring well FM-33A is to characterize the northern plume boundary and the extent of Interim Remedy hydraulic containment in the Shallow zone. EPA agrees with well purpose and placement, as currently the entire northern boundary of the plume is unconstrained and uncharacterized. EPA also agrees with the placement of only a Shallow zone well at this location, as samples from nearby Principal zone monitoring wells show that the deeper groundwater has VOC concentrations below Maximum Contaminant Levels (MCLs) or other actionable levels, such as the State of California Notification Levels. However, EPA requests an option for a second, Principal well be added if the VOC concentrations from proposed well FM-33A are found to be above actionable values.

4) ***WPA Table 2 – item 5a.*** The purpose of the installation of proposed Shallow zone monitoring well FM-34A is to characterize the northern plume boundary and the extent of Interim Remedy hydraulic containment in the Shallow zone. Placement is acceptable but not optimal, see Comment 8 and Figure 1 below. If water chemistry from this well is found to be below the actionable levels for all contaminants of concern, its location will allow for the interpolation (instead of an extrapolation) of a portion of the northern plume boundary in the Shallow zone.

5) ***WPA Table 2 – item 5b.*** The purpose of the installation proposed Principal zone monitoring well FM-34B is to characterize the northern plume boundary and the extent of Interim Remedy hydraulic containment in the Principal zone. As with FM-34A, placement is acceptable but not optimal, see Comment 9 and Figure 2 below. If water chemistry from this well is found to be below the MCL for all contaminants of concern, its location will allow for the interpolation (instead of an extrapolation) of a portion of the northern plume boundary in the Principal zone. Depth of the proposed screen interval is at the same elevation as screen intervals to the south that produce water samples above actionable levels. There is no plume characterization north or east of the proposed location. With no other available plume characterization in this northern region, EPA requests there be an option for the placement of a third, deeper well in the nest (FM-34C) be added, if initial samples from FM-34B are found to be above actionable levels.

6) ***WPA Table 3.*** As previously discussed, please review the list of wells proposed to be sampled for the purposes of the RI/FS and remove wells that no longer are available for sampling, due to access, viability, etc.

7) ***WPA Figure 3.*** The wells FM-22A and FM-24A do not appear to be shown and duplications of FM22-B, FM-24B, FM-29C, FM-31A, FM-31B and FM32-B are on the figure. Please reconcile.

8) ***WPA Shallow Zone Well Placement Comments.*** Figure 1, below, shows the boundary of the Shallow zone VOC plume based on 2017-2018 water chemistry data. Also shown are the results of a data gap analysis identifying where there is less than 50% confidence in the Shallow zone plume delineation. Five data gap regions are identified: A, B, C, D, and E. The VOC plume delineation and the data gap analysis process assumed that the proposed wells have VOC concentrations below detection limits, meaning that with the placement of FM-33A and FM-34A, the shown data gap regions will still exist. Step 2 of the EPA Guidelines for Capture Zone Evaluation is the delineation of the Target Capture Zone, which is the delineation of the VOC plume boundary at and above the actionable concentrations. Therefore, it is anticipated at some point each of these data gap regions may have to be addressed in order to properly place and design the capture remedy.

    a. ***Shallow Zone Data Gap Regions A and C.*** These are the regions of immediate concern for delineation of the plume for the Interim RI/FS. At each of these regions, the plume boundary is unconstrained. EPA requests the Work Plan to be modified with the placement of two additional Shallow zone wells just north of Region A and Region C. If the additional wells are shown to have VOC concentrations below the actionable level, the plume boundary can be interpolated and the data gaps will have been addressed.

b. ***Shallow Zone Data Gap Region B.*** The proposed location of FM-34A is acceptable because if the water chemistry from this well is found to have VOC concentrations below actionable values it will allow for the interpolation of the northern plume boundary in this area. However, its proposed location, determined by accessibility, is too far north to completely close data gap Region B. Delineation of the northern plume boundary is the primary concern in this phase of the project, but an additional well located in Region B may be eventually required.

c. ***Shallow Zone Data Gap Regions D and E.*** These two data gap regions address the delineation of the down gradient VOC plume boundary. It is recognized that this area is outside of the current scope of the Work Plan, but the recommendation is for the eventual placement of Shallow zone wells within these regions for the purpose of closing these data gaps.

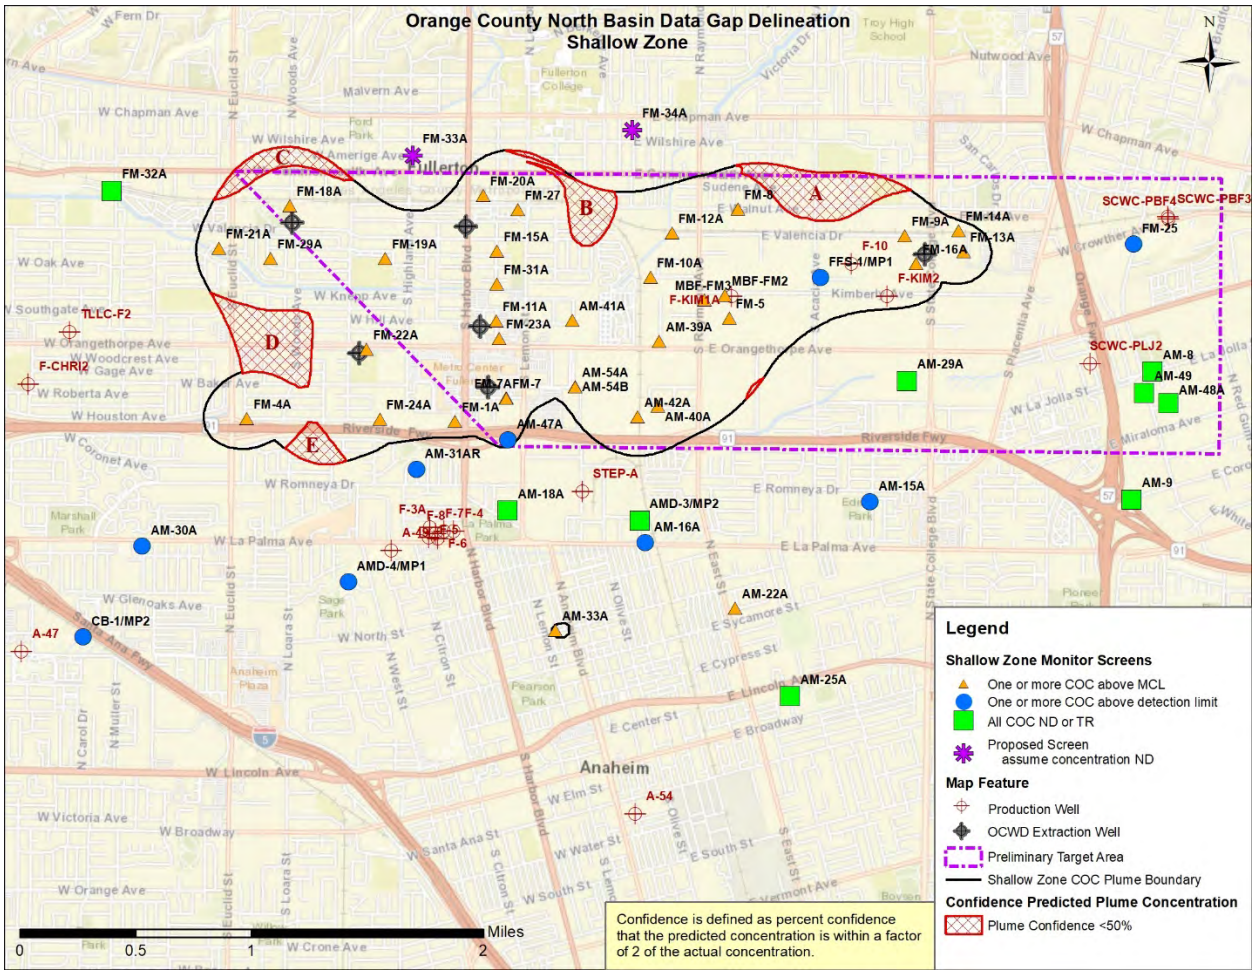

Figure 1. Shallow Zone VOC Plume, Data Gap Regions, and monitor well network.

9) ***WPA Principal Zone Well Placement Comments.*** Figure 2, below, shows the boundary of the Principal Zone VOC plume based on 2017-2018 water chemistry data. Also shown are the results of a data gap analysis identifying where there is less than 50% confidence in the Principal zone plume delineation. Six data gap regions are identified; A', B', C', D', E' and F'. The VOC plume delineation and the data gap analysis process assumed that the proposed wells have VOC concentrations below detection limits, meaning that with the placement of FM-19C, FM-34B, AM-55A, AM-55B, AM-56A, and AM-56B, the shown data gap regions will still exist. It is anticipated at some point each of these data gap regions may have to be addressed in order to properly place and design the capture remedy.

   a. ***Principal Zone Data Gap Region A'.*** This is the region of immediate concern for delineation of the plume for the Interim RI/FS. At this region, the plume boundary is unconstrained. EPA requests the Work Plan to be modified with the placement of a Principal zone well, nested with the recommended Shallow zone A well, just north of Region A. If the additional well is shown to have VOC concentrations below actionable levels, the plume boundary can be interpolated and the northern part the data gap will have been addressed. This is a large data gap region extending into the plume volume. Additional wells may be eventually required to completely close this data gap region. EPA will update the data gap analysis after the proposed and additional wells are completed and sampled in order to identify what, if any, additional well placements will be needed.

   b. ***Principal Zone Data Gap Region B'.*** The proposed location of FM-34B is acceptable because if the water chemistry from this well is found to have VOC concentrations below actionable values it will allow for the interpolation of the northern plume boundary in this area. However, its proposed location, determined by accessibility, is too far north to completely close data gap Region B'. Delineation of the northern plume boundary is the primary concern in this phase of the project, but an additional well located in Region B' may be eventually required.

   c. ***Principal Zone Data Gap Regions C', D' and E'.*** These data gap regions are believed to be related to the overlying Shallow zone data gaps, C, D, and E. Principal zone wells surrounding these data gap regions have VOC concentrations below the actionable values. It is likely that these data gaps will be closed if the recommended additional Shallow zone wells at these regions are placed near the Shallow zone – Principal zone interface and the water chemistry from them is shown to have VOC concentrations below actionable values. There is no recommendation for additional wells at these locations in the Principal zone at this time.

   d. ***Principal Zone Data Gap Region F'.*** This data gap region is completely within the plume volume and identifies an area where the bottom of the VOC plume is poorly delineated. Proposed well FM-19C addressed a similar data gap at that location. The recommendation is to eventually add a deep Principal well, perhaps nested with existing well AM-41, within Region F'.

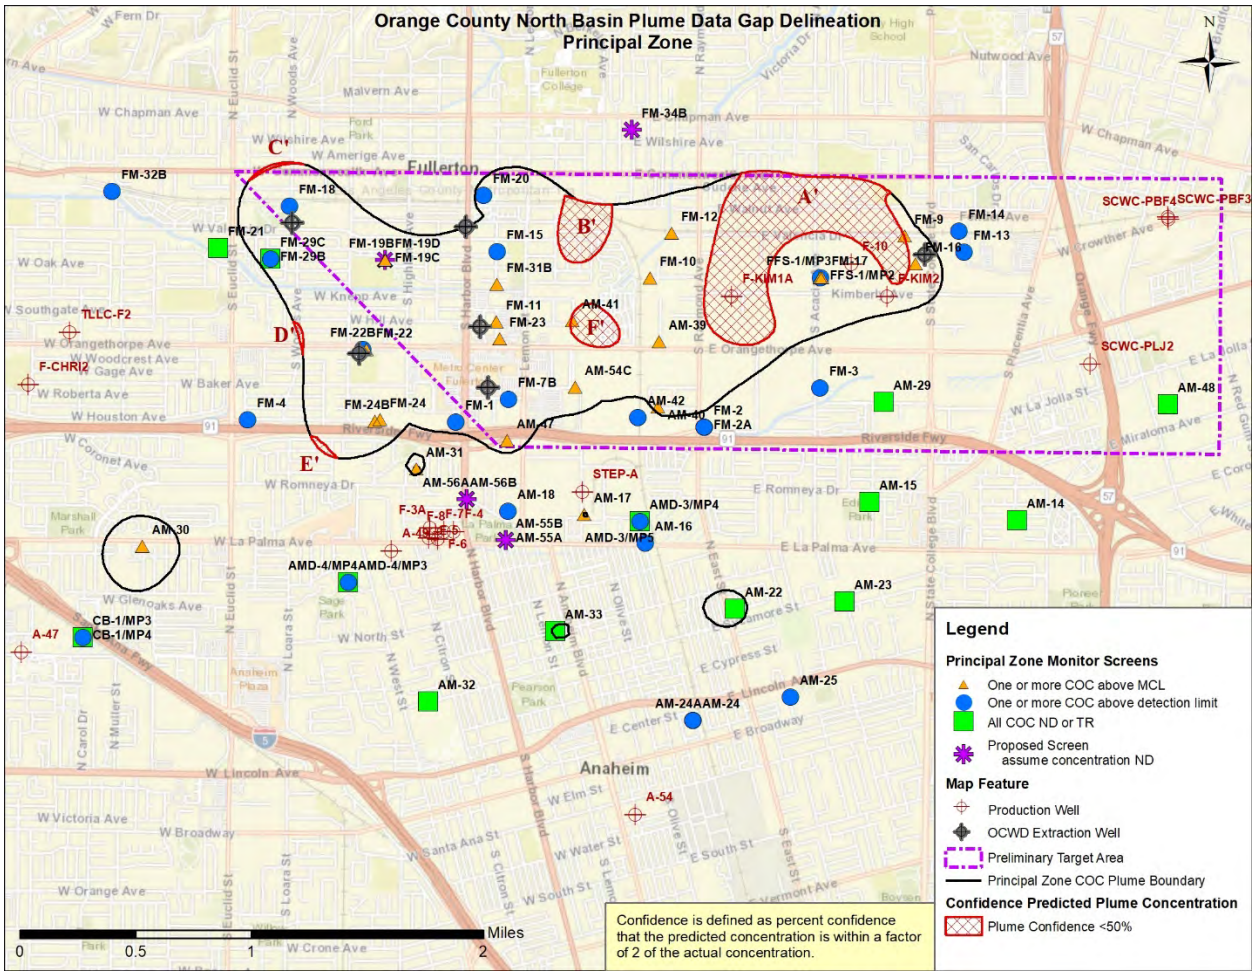

Figure 2. Principal Zone VOC Plume, Data Gap Regions, and monitor well network.

10) ***SAP.*** The SAP should also provide context as to why PFCs are being added to the RI, and how locations for sampling PFCs were chosen (see comment regarding Work Plan).

11) ***SAP Part A Section 4.2.*** The pumps have been tested to confirm that they will not contaminate samples with PFCs. However, the SAP should include additional protocols for preventing cross-contamination with PFCs during field sampling activities, for example associated with other field equipment, food packaging, and personal care products that may be present onsite.

12) ***SAP Part A Section 4.3.*** The text indicates that samples for PFC analysis will be placed in zip lock bags. This should be clarified to indicate that the samples will be placed in HDPE bottles (per Table 4) and then the bottles will be placed in zip lock bags.

13) ***SAP Part A Table 5.*** The table indicates 17 samples for PFC analysis, whereas the text and Table 2 indicate that 19 wells will be sampled for PFCs. This inconsistency should be corrected.

14) ***SAP Part A Section 4.3 & Table 5.*** If any equipment will be reused between wells (including, for example, water level gauging equipment), then equipment blanks should be collected for PFC analysis, to confirm that decontamination between wells is sufficient and that PFC cross-contamination is not occurring.

15) ***SAP Part A Section 4.4 & Part B Section 4.1.*** The SAP should specify that equipment that will contact samples or groundwater in wells that will be sampled for PFCs will be decontaminated with PFC-free water and cleaning agents confirmed PFAS-free.

16) ***SAP Part A Figure 3.*** Wells FM-22A and FM-24A do not appear to be shown on the figure.

17) ***SAP Part B Table 1.*** It is unclear why two different RDLs are provided for each analyte in this table.

18) ***SAP.*** Please provide raw data packages so that EPA may perform independent validation of the data.

19) ***SAP.*** An analytical step in the laboratory method (step 11.1.1) allows for filtration of the water if allowed by the client. Please clarify in the plan that filtration is not allowed or provide a rationale for filtration.

20) ***SAP.*** Please add two matrix spike/matrix spike duplicate (MS/MSD) analyses to the field QC program. The laboratory method allows for optional MS/MSD analyses based on client preference and Table 5 of the SAP indicates no MS/MSD analyses will be performed. EPA believes the proposed method allows for an analytical bias from container adsorption of PFCs as the laboratory subsamples the field samples. Current common practice is to rinse the sample container wall with methanol and combine the methanol extract with the water sample which the proposed method does not do. (EPA understands the isotopic standards are added to the subsample prior to extraction and if this understanding is not correct, please provide clarification.)

21) ***SAP.*** The field QC includes trip blanks and field blanks. EPA is concerned about air to water transfer and recommends that a blank be opened to the ambient air near the corresponding sampling location for the actual time of sampling. This could be accomplished by changing the PFC trip blank to an ambient air blank or leaving open the field blank for the same length of time as the typical sampling time (time from opening the sample container for filling until closing the container.)

22) ***SAP.*** Please clarify how PFOS branched isomers are reported or if they are included in the PFOS results that will be reported.

Please contact me at (415) 972-3831 or Sandoval.Angela@epa.gov if you have questions or comments concerning this letter. We look forward to working with Orange County Water District to address the contamination at the Orange County North Basin site.

Sincerely,

A. H. Sandoval

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

2001 E ORANGETHORPE
FULLERTON, CA 92831

COORDINATES

Latitude (North):	33.8614220 - 33° 51' 41.11''
Longitude (West):	117.8935370 - 117° 53' 36.73''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	417346.9
UTM Y (Meters):	3746956.0
Elevation:	188 ft. above sea level

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

Proposed NPL: Proposed NPL sites . The source of this database is the U.S. EPA.

A review of the Proposed NPL list, as provided by EDR, and dated 05/13/2018 has revealed that there is 1 Proposed NPL site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
ORANGE COUNTY NORTH	***1012 EAST ELM AVENUE***	***W 1/2 - 1 (0.715 mi.)***	***BA255***	***857***

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 05/18/2018 has revealed that there are 9 SEMS sites within approximately 0.5 miles of the target property.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a

given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 05/18/2018 has revealed that there are 6 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/01/2018 has revealed that there are 2 CORRACTS sites within approximately 1 mile of the target property.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 03/01/2018 has revealed that there are 2 RCRA-TSDF sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 9 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 29 RCRA-SQG sites within approximately 0.25 miles of the target property.

CA RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the CA RESPONSE list, as provided by EDR, has revealed that there are 9 CA RESPONSE sites within approximately 1 mile of the target property.

CA ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the CA ENVIROSTOR list, as provided by EDR, and dated 04/30/2018 has revealed that there are 53 CA ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

CA SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the CA SWF/LF list, as provided by EDR, has revealed that there are 2 CA SWF/LF sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

CA UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the CA UST list, as provided by EDR, has revealed that there are 21 CA UST sites within approximately 0.25 miles of the target property.

State and tribal voluntary cleanup sites

CA VCP: Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

A review of the CA VCP list, as provided by EDR, and dated 04/30/2018 has revealed that there is 1 CA VCP site within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/01/2018 has revealed that there are 10 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

2020 COR ACTION: The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

A review of the 2020 COR ACTION list, as provided by EDR, and dated 09/30/2017 has revealed that there is 1 2020 COR ACTION site within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 3 EDR Hist Auto sites within approximately 0.125 miles of the target property.

. Waste name: Other organic solids

. Waste code: 513
. Waste name: Empty containers less than 30 gallons

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE

KIMBERLY-CLARK CORP (Continued) **1000162914**

DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D035
. Waste name: METHYL ETHYL KETONE

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

HAZARDOUS AIR POLLUTANT MAJOR

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D006
. Waste name: CADMIUM

. Waste code: D007
. Waste name: CHROMIUM

. Waste code: F001
. Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F006
. Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

FINDS:

Registry ID: 110000862086

Environmental Interest/Information System

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

ORANGE COUNTY METAL PROCESSING (Continued) **1000315097**

HAZARDOUS AIR POLLUTANT MAJOR

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Description: Orange County Metal Processing (OCMP) is a metal finishing shop which coats metal parts, with finishes for metal, used by automobile and computer manufacturers. The area of the property is approximately 14,000 square feet. OCMP was authorized to operate a Tiered Permitting On-Site Hazardous Waste Treatment System (System) under the Conditional Authorization Tier (DTSC 1772) on April 1, 1993. OCMP submitted a Phase I Environmental Assessment Checklist as required by Health & Safety Code Section 25200.14 on December 23, 1996. The Phase I indicated, No Further Investigation and exempt, because the Regional Water Quality Control Board (RWQCB) had three monitoring wells on or near the property. OCMP sends all of their process waters through PBR units as reported by Orange County Health Care Agency (OCHCA) inspector Nadia Mastella. The process line water (PLW) is used until it exceeds a Total Dissolved Solids (TDS) limit, at which point the water can no longer be used for plating purposes. After the water is spent, it is filtered through the System and produces treated water and filter cake. The treated water is released to the POTW and the filter cake is sent offsite for disposal. Orange County Painting Company (OCPC) is a generator of hazardous waste which shares the building occupied by OCMP. OCPC does not treat waste onsite. Mr. Reynoso also owns OCPC. The company paints and powder coats new unfinished metal products that come from automobile and computer manufacturers. Unfinished metal products to be powder coated are first cleaned with Muriatic Acid to make sure the powder coat adheres to the metal product. After the part is powder coated, the excess powder coating material is collected, and put into an oven at 400 degrees F. The excess powder coating material, placed in the oven, forms a glasslike substance. The glasslike substance reportedly is not hazardous, therefore it is put into the regular trash. OCMP receives steel or aluminum metal parts for electroplating. The surfaces of the steel parts arte cleaned to remove dirt and oils, by being placed into the electro cleaning soap tanks at the Zinc Plating Line (ZPL) and then rinsed with water. After coming out of the rinse tank, the steel parts are placed into 11% Muriatic Acid. After the Muriatic Acid tank, the parts are rinsed with water and then put into the Zinc Cyanide Tank. After rinsing, the parts are placed into a chromate solution tank, then a final rinse tank and finally are dried near the ZPL. The Anodizing Line located in the southern portion of the building is for aluminum parts. In 2001, a Limited Subsurface Soil and Groundwater Investigation was prepared for PCA Industries, LLC, master lessee of the site, by Jorgensen Environmental. A total of 36 borings were installed in the building and outside the building near the property line adjacent to the former PCA Metals site. The areas sampled were: The Anodizing and Cadmium Plating Lines, the Chemical Storage Area, the former Degreasing Area, the former Filter Cake Accumulation Area, the Former Polishing Room, the Masking/Wrapping Room, the Northern ZPL, the Shipping and Receiving Area, the Southern ZPL, the Spray Booths and Waste Water Treatment Area. The sampling has shown that the following areas are contaminated. The spray painting booths at the northwest corner of the building; the former filter cake accumulation area, near the

ORANGE COUNTY METAL PROCESSING (Continued) **S108543046**

southwest corner of the building; the southern ZPL area; the anodizing line and cadmium plating line area; the Northern ZPL; the waste water treatment area; the shipping and receiving area; the chemical storage area. The contaminants detected during sample analysis were cadmium, chromium, copper, zinc and VOC's. Predominant VOC's were perchloroethylene (PCE) and trichloroethylene (TCE). Review of the results showed contamination throughout the site in soil and water.

VISTA PAINT CORP (Continued) **1000395320**

. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D035
. Waste name: METHYL ETHYL KETONE

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Classification: Large Quantity Generator

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT

VISTA PAINT CORP (Continued) **1000395320**

MIXTURES.

. Waste code: F005
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 13294.4

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 1992

Waste code: D035
Waste name: METHYL ETHYL KETONE

VISTA PAINT CORP (Continued) **1000395320**

Amount (Lbs): 10504.4

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Amount (Lbs): 10504.4
