(1)	Reference
µg	Microgram
AERMOD	Atmospheric Dispersion Modeling System
APS	Auxiliary Power System
AQMD	Air Quality Management District
ARB/CARB	California Air Resources Board
CEQA	California Environmental Quality Act
CPF	Cancer Potency Factor
DPM	Diesel Particulate Matter
EMFAC	Emission Factor Model
EPA	Environmental Protection Agency
HHD	Heavy Heavy-Duty
HI	Hazard Index
HRA	Health Risk Assessment
LHD	Light Heavy-Duty
MATES	Multiple Air Toxics Exposure Study
MEIR	Maximally Exposed Individual Receptor
MEISC	Maximally Exposed Individual School Child
MEIW	Maximally Exposed Individual Worker
MHD	Medium Heavy-Duty
NAD	North American Datum
OEHHA	Office of Environmental Health Hazard
PCE	Passenger Car Equivalent
PM10	Particulate Matter 10 microns in diameter or less
Project	Meridian South Campus
REL	Reference Exposure Level
RM	Recommended Measures
SCAQMD	South Coast Air Quality Management District
SRA	Source Receptor Area
TAC	Toxic Air Contaminant
URF	Unit Risk Factor
UTM	Universal Transverse Mercator
VMT	Vehicle Miles Traveled

EXECUTIVE SUMMARY

This report evaluates the potential mobile source health risk impacts to sensitive receptors associated with exposure to diesel particulate matter (DPM) as a result of diesel trucks serving the Meridian South Campus area (Proposed Project and Built/Entitled land uses).

The results of the health risk assessment of lifetime cancer risk from resulting from the Meridian South Campus area are provided in Table ES-1.

Residential Exposure Scenario:

The results of the analysis indicate that, at the maximally exposed individual receptor (MEIR), the maximum incremental cancer risk attributable to trucks is estimated at 4.79 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.002, which would not exceed the applicable threshold of 1.0. The sensitive land use with the greatest potential exposure to Project DPM source emissions is the existing residential community located north of Van Buren Boulevard and west of Orange Terrace Parkway.

Tomas Riviera School Child Exposure Scenario:

The results of the analysis indicate that, at the Tomas Riviera School, the maximum incremental cancer risk attributable to trucks is estimated at 0.50 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0008, which would not exceed the applicable threshold of 1.0.

Amelia Earhart Middle School Child Exposure Scenario:

The results of the analysis indicate that, at the Amelia Earhart Middle School, the maximum incremental cancer risk attributable to trucks is estimated at 0.36 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0006, which would not exceed the applicable threshold of 1.0.

TABLE ES-1: SUMMARY OF RISK ATTRIBUTABLE TO DIESEL TRUCK TRAFFIC

Time Period	Location	Maximum Lifetime Cancer Risk (Risk per Million)	Significance Threshold (Risk per Million)	Exceeds Significance Threshold
30 Year Exposure	Maximum Exposed Resident	4.79	10	NO
9 Year Exposure	Tomas Rivera Elementary School	0.50	10	NO
9 Year Exposure	Amelia Earhart Middle School	0.36	10	NO
Time Period	**Location**	**Maximum Hazard Index**	**Significance Threshold**	**Exceeds Significance Threshold**
30 Year Exposure	Maximum Exposed Resident	0.002	1.0	NO
9 Year Exposure	Tomas Rivera Elementary School	0.0008	1.0	NO
9 Year Exposure	Amelia Earhart Middle School	0.0006	1.0	NO

1 INTRODUCTION

This report presents the results of the Cumulative Health Risk Assessment (HRA) prepared for the proposed Meridian South Campus and Village West Drive Extension ("Project"). Although the proposed Project is defined as the net change in impacts as compared to the 2003 EIR Phase III, for the purposes of analyzing health risks, this HRA evaluates the proposed South Campus Specific Plan in its entirety. As such, this approach conservatively overstates the health risks of the proposed Project.

The South Coast Air Quality Management District (SCAQMD) typically issues a comment letter on the Notice of Preparation of a CEQA Document. Per the SCAQMD's typical comment letter, if a proposed Project is expected to generate/attract diesel trucks, which emit diesel particulate matter (DPM), preparation of a HRA is necessary. This document serves to meet the SCAQMD's request for preparation of an HRA. The mobile source HRA has been prepared in accordance with the document Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis (1). Cancer risk is expressed in terms of expected incremental incidence per million population. The SCAQMD has established an incidence rate of 10 persons per million as the maximum acceptable incremental cancer risk due to DPM exposure. This threshold serves to determine whether or not a given project has a potentially significant development-specific and cumulative impact.

The AQMD has published a report on how to address cumulative impacts from air pollution: *White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution* (2). In this report the AQMD clearly states (Page D-3):

"…the AQMD uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or EIR. The only case where the significance thresholds for project specific and cumulative impacts differ is the Hazard Index (HI) significance threshold for toxic air contaminant (TAC) emissions. The project specific (project increment) significance threshold is HI > 1.0 while the cumulative (facility-wide) is HI > 3.0. It should be noted that the HI is only one of three TAC emission significance thresholds considered (when applicable) in a CEQA analysis. The other two are the maximum individual cancer risk (MICR) and the cancer burden, both of which use the same significance thresholds (MICR of 10 in 1 million and cancer burden of 0.5) for project specific and cumulative impacts.

Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant."

The SCAQMD has also established non-carcinogenic risk parameters for use in HRAs. Non-carcinogenic risks are quantified by calculating a "hazard index," expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). An REL is a concentration at or below which health effects are not likely to occur. A hazard index less of than one (1.0) means that adverse health effects are not expected. Within this analysis, non-carcinogenic exposures of less than 1.0 are considered less-than-significant.

1.1 SITE LOCATION

The proposed Meridian South Campus site is located on the south side of Van Buren Boulevard between Barton Street and Village West Drive, within the jurisdiction of the . The Project site is partially developed and located within the southwestern portion of the March JPA jurisdiction. More specifically, the Project site is located in the southern portion of the Meridian South Campus Specific Plan area, south of Van Buren Boulevard, west of Village West Drive, and east of Barton Street, in unincorporated Riverside County, California. Interstate 215 (I-215) is located approximately 1 mile east of the Project site.

1.2 PROJECT DESCRIPTION

The *March Business Center Specific Plan and Final Focused Environmental Impact Report (SCH#2002071089)*, which guides land use decisions within a 1,290-acre portion of the planning area, was adopted and certified in 2003. Within the March Business Center Specific Plan, two separate "campuses" were identified, along with the potential for a possible third campus. The two identified campuses include the North Campus and South Campus. The South Campus components of the March Business Center Specific Plan have been analyzed under both California Environmental Quality Act (CEQA) and National Environmental Protection Agency (NEPA) in the following documents:

- Final Environmental Impact Statement: Disposal of Portions of March Air Force Base (February 1996)
- Final Environmental Impact Report for the March Air Force Base Redevelopment Project (June 1996)
- Redevelopment Plan for the March Air Force Base Redevelopment Project (June 1996)
- March JPA Development Code (July 1997)
- General Plan of the March JPA (September 1999)
- Master Environmental Impact Report for the General Plan of the March JPA (September 1999)
- March Business Center Specific Plan (February 2003)
- March JPA General Plan Amendment (February 2003)
- March Business Center Focused Environmental Impact Report (February 2003)
- March Business Center Design Guidelines (November 2003)
- Addenda to the certified 2003 EIR, including:
    - Meridian South Campus Specific Plan Amendment – Parcel Delivery Terminal Project (September 2017)
    - Meridian South Campus Specific Plan Amendment – Land Swap Addendum (September 2018)

PROPOSED PROJECT

The square footage calculated based on maximum allowable floor area ratio (FAR) for each land use type is shown below:

- Office – 388.011 thousand square feet (TSF)

- Commercial – 221.394 TSF
- Grocery Store – 61.336 TSF
- Business Park – 1,764.180 TSF
- High Cube Warehouse – 800.000 TSF
- High Cube Cold Storage Warehouse – 700.000 TSF
- Warehousing – 274.437 TSF
- Dog Park – 6.2 Acres

At the time this study was prepared, the Grocery Store component was assumed to consist of 61,336 sf. However, the current site plan for the Grocery Store component reflects a 44,200 sf grocery store with 17,136 sf of shops/general commercial retail space (total of 61,336 sf of commercial retail use). For the purposes of this study, the 61,336 sf of Grocery Store use results in a higher trip generation and consequently higher emissions (therefore more conservative) as opposed to evaluating the 44,200 sf Grocery Store and 17,136 sf of commercial retail space. The higher emissions have been evaluated for the purposes of this study in order to account for any minor changes that may occur to the building area as part of the final design.

VILLAGE WEST DRIVE EXTENSION

The improved portions of Village West Drive currently terminate at Lemay Drive to the south. The proposed Project would include improvements to and the extension of Village West Drive to provide a through connection between Van Buren Boulevard to the north and Nandina Avenue to the south. The improved Village West Drive would require the removal of an abandoned water tank currently owned by Western Municipal Water District that formerly served March Air Force Base, followed by the construction of two through lanes, a center striped median, and a bike lane. Sidewalks would also be provided on either side of the roadway.

BUILT/ENTITLED LAND USES

The following uses that are built or entitled, but not yet occupied and operational will also be included as part of the proposed Project scenarios:

- Amazon (Building A) – 1,000.000 TSF
- Parcel Delivery (Building B) – 1,000.000 TSF
- Parking Lot – 61.0 Acres
- Building C (Warehousing) – 500.000 TSF
- Commercial (Parcel 72) – 15,485 TSF[1]

Exhibit 1-A shows the Project site plan with the proposed uses. At the time this HRA was prepared, the future tenants of the proposed Project are unknown. Because the operating hours of perspective building tenants is not known at this time, this HRA is intended to describe

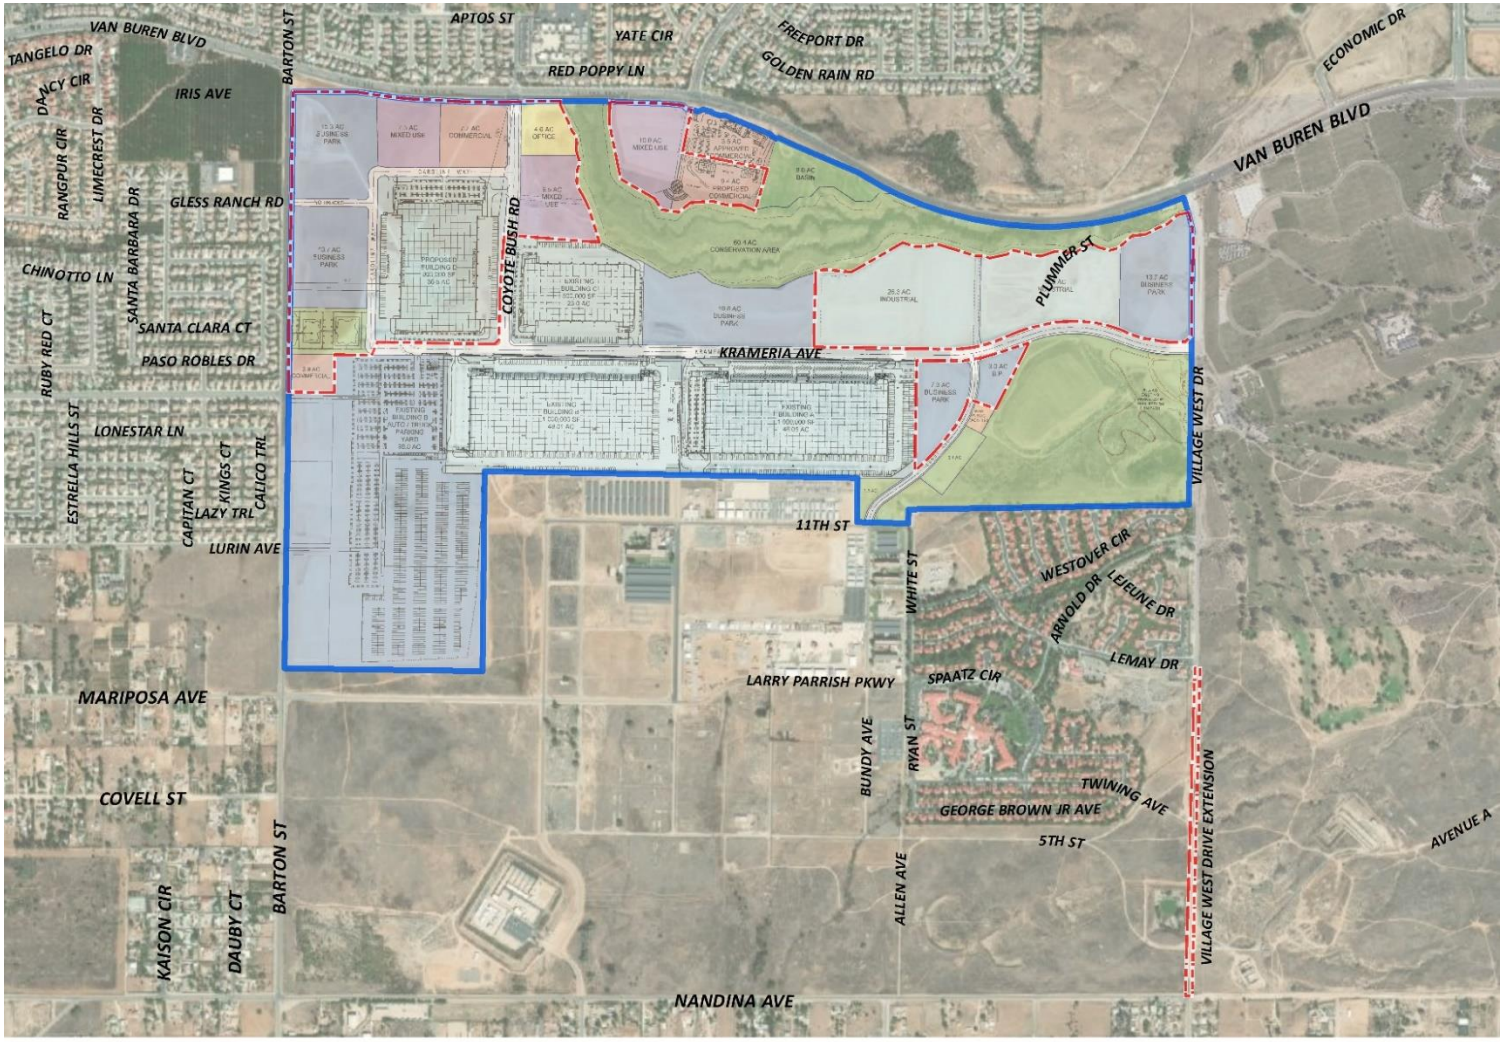
1 At the time this study was prepared, the commercial square footage of Parcel 72 was assumed to consist of 15,485 sf. However, the actual square footage for Parcel 72 is 14,267 sf. For the purposes of this study, the 15,485 sf of commercial use results in a higher trip generation and consequently higher emissions (therefore more conservative) as opposed to evaluating the 14,267 sf of commercial use.

potential toxic emission impacts associated with the expected typical 24-hour, seven day per week operational activities at the Project site.

This HRA study is intended to evaluate the cumulative health risk impacts resulting from the Proposed Project and the Build/Entitled land uses.

Per the *Meridian South Campus Traffic Impact Analysis* (TIA) prepared by Urban Crossroads, Inc., the Proposed Project Land uses are expected to generate a total of approximately 2,308 two-way truck trips per day (1,154 inbound and 1,154 outbound trips). Built/Entitled uses are expected to generate an additional 2,664 two-way truck trips per day (1,332 inbound and 1,332 outbound trips) for a total of 4,972 cumulative two-way truck trips per day (2,486 inbound and 2,486 outbound trips) (3). This HRA evaluates the potential impacts resulting from diesel exhaust associated with the 4,972 cumulative two-way truck trips generated by the Proposed Project and Built/Entitled land uses.

EXHIBIT 1-A: PRELIMINARY SITE PLAN



This page intentionally left blank

2 DPM IMPACT ANALYSIS

2.1 EMISSIONS ESTIMATION

2.1.1 ON-SITE AND OFF-SITE TRUCK ACTIVITY

Vehicle DPM emissions were estimated using emission factors for particulate matter less than 10µm in diameter (PM_{10}) generated with the 2017 version of the Emission FACtor model (EMFAC) developed by the ARB. EMFAC 2017 is a mathematical model that was developed to calculate emission rates from motor vehicles that operate on highways, freeways, and local roads in California and is commonly used by the ARB to project changes in future emissions from on-road mobile sources (4). The most recent version of this model, EMFAC 2017, incorporates regional motor vehicle data, information and estimates regarding the distribution of vehicle miles traveled (VMT) by speed, and number of starts per day.

Several distinct emission processes are included in EMFAC 2017. Emission factors calculated using EMFAC 2017 are expressed in units of grams per vehicle miles traveled (g/VMT) or grams per idle-hour (g/idle-hr), depending on the emission process. The emission processes and corresponding emission factor units associated with diesel particulate exhaust for this Project are presented below.

For this Project, annual average PM_{10} emission factors were generated by running EMFAC 2017 in EMFAC Mode for vehicles in the Riverside County jurisdiction. The EMFAC Mode generates emission factors in terms of grams of pollutant emitted per vehicle activity and can calculate a matrix of emission factors at specific values of temperature, relative humidity, and vehicle speed. The model was run for speeds traveled in the vicinity of the Project. The vehicle travel speeds for each segment modeled are summarized below.

- Idling – on-site loading/unloading and truck gate
- 5 miles per hour – on-site vehicle movement including driving and maneuvering
- 25 miles per hour – off-site vehicle movement including driving and maneuvering.

Calculated emission factors are shown at Table 2-1. As a conservative measure, a 2024 EMFAC 2017 run was conducted and a static 2024 emissions factor data set was used for the entire duration of analysis herein (e.g., 30 years). Use of 2024 emission factors would overstate potential impacts since this approach assumes that emission factors remain “static” and do not change over time due to fleet turnover or cleaner technology with lower emissions that would be incorporated after 2024. Additionally, based on EMFAC 2017, Light-Heavy-Duty Trucks comprised of 50.3% diesel, Medium-Heavy-Duty Trucks comprised of 87.9% diesel, and Heavy-Heavy-Duty Trucks comprised of 98.6% diesel trucks and have been accounted for accordingly in the emissions factor generation.

The vehicle DPM exhaust emissions were calculated for running exhaust emissions. The running exhaust emissions were calculated by applying the running exhaust PM_{10} emission factor (g/VMT)

from EMFAC over the total distance traveled. The following equation was used to estimate off-site emissions for each of the different vehicle classes comprising the mobile sources (5):

$Emissions_{speedA}$ (g/s) = $EF_{RunExhaust}$ (g/VMT) * Distance (VMT/trip) * Number of Trips (trips/day) / seconds per day

Where:

$Emissions_{speedA}$ (g/s): Vehicle emissions at a given speed A;

$EF_{RunExhaust}$ (g/VMT): EMFAC running exhaust PM_{10} emission factor at speed A;

Distance (VMT/trip): Total distance traveled per trip.

Similar to off-site traffic, on-site vehicle running emissions were calculated by applying the running exhaust PM_{10} emission factor (g/VMT) from EMFAC and the total vehicle trip number over the length of the driving path using the same formula presented above for on-site emissions. In addition, on-site vehicle idling exhaust emissions were calculated by applying the idle exhaust PM_{10} emission factor (g/idle-hr) from EMFAC and the total truck trip over the total idle time (15 minutes). The following equation was used to estimate the on-site vehicle idling emissions for each of the different vehicle classes (5):

$Emissions_{idle}$ (g/s) = EF_{idle} (g/hr) * Number of Trips (trips/day) * Idling Time (min/trip) *

60 minutes per hour / seconds per day

Where:

$Emissions_{idle}$ (g/s): Vehicle emissions during idling;

EF_{idle}(g/s): EMFAC idle exhaust PM_{10} emission factor.

TABLE 2-1: 2024 DPM EMISSIONS FACTORS

Speed	LHD	MHD	HHD
0 MPH (idling grams/idle-hour)	0.395247	0.033713	0.01215
5 MPH (grams/second)	0.033284	0.005776	0.01283
25 MPH (grams/second)	0.012343	0.002859	0.00690

Each roadway was modeled as a line source (made up of multiple adjacent volume sources). Due to the large number of volume sources modeled for this analysis, the corresponding coordinates of each volume source have not been included in this report, but are included in Appendix 2.1. The DPM emission rate for each volume source was calculated by multiplying the emission factor (based on the average travel speed along the roadway) by the number of trips and the distance traveled along each roadway segment and dividing the result by the number of volume sources along that roadway. The modeled emission sources are illustrated on Exhibit 2-A. The modeled truck travel routes included in the HRA are based on the truck trip distributions (inbound and outbound) available from the Project's Traffic Assessment (TIA) (3)for heavy trucks. The modeled truck route is consistent with the trip distribution patterns identified in the Project's traffic study,

is supported by substantial evidence, and was modeled to determine the potential impacts to sensitive receptors along the primary truck routes. The modeling domain is limited to the Project's primary truck route and includes off-site sources in the study area for more than 1 mile. This modeling domain is more conservative than using only a ¼ mile modeling domain which is supported by substantial evidence since several studies have shown that the greatest potential risks occur within a ¼ mile of the primary source of emissions (6) (in the case of the Project, this is the on-site idling and on-site travel).

On-site truck idling was estimated to occur as trucks enter and travel through the facility. Although the Project is required to comply with CARB's idling limit of 5 minutes, staff at SCAQMD recommends that the on-site idling emissions be estimated for 15 minutes of truck idling (7), which would take into account on-site idling which occurs while the trucks are waiting to pull up to the truck bays, idling at the bays, idling at check-in and check-out, etc. As such, this analysis estimated truck idling at 15 minutes, consistent with SCAQMD's recommendation.

Per the TIA, the Proposed Project Land uses are expected to generate a total of approximately 2,308 two-way truck trips per day (1,154 inbound and 1,154 outbound trips). Built/Entitled uses are expected to generate an additional 2,664 two-way truck trips per day (1,332 inbound and 1,332 outbound trips) for a total of 4,972 cumulative two-way truck trips per day (2,486 inbound and 2,486 outbound trips) (3). This HRA evaluates the potential impacts resulting from diesel exhaust associated with the 4,972 cumulative two-way truck trips generated by the Proposed Project and Built/Entitled land uses. A breakdown of the truck trip allocation by land use is presented on Table 2-2.

2.1.2 TRANSPORT REFRIGERATION UNITS (TRUS)

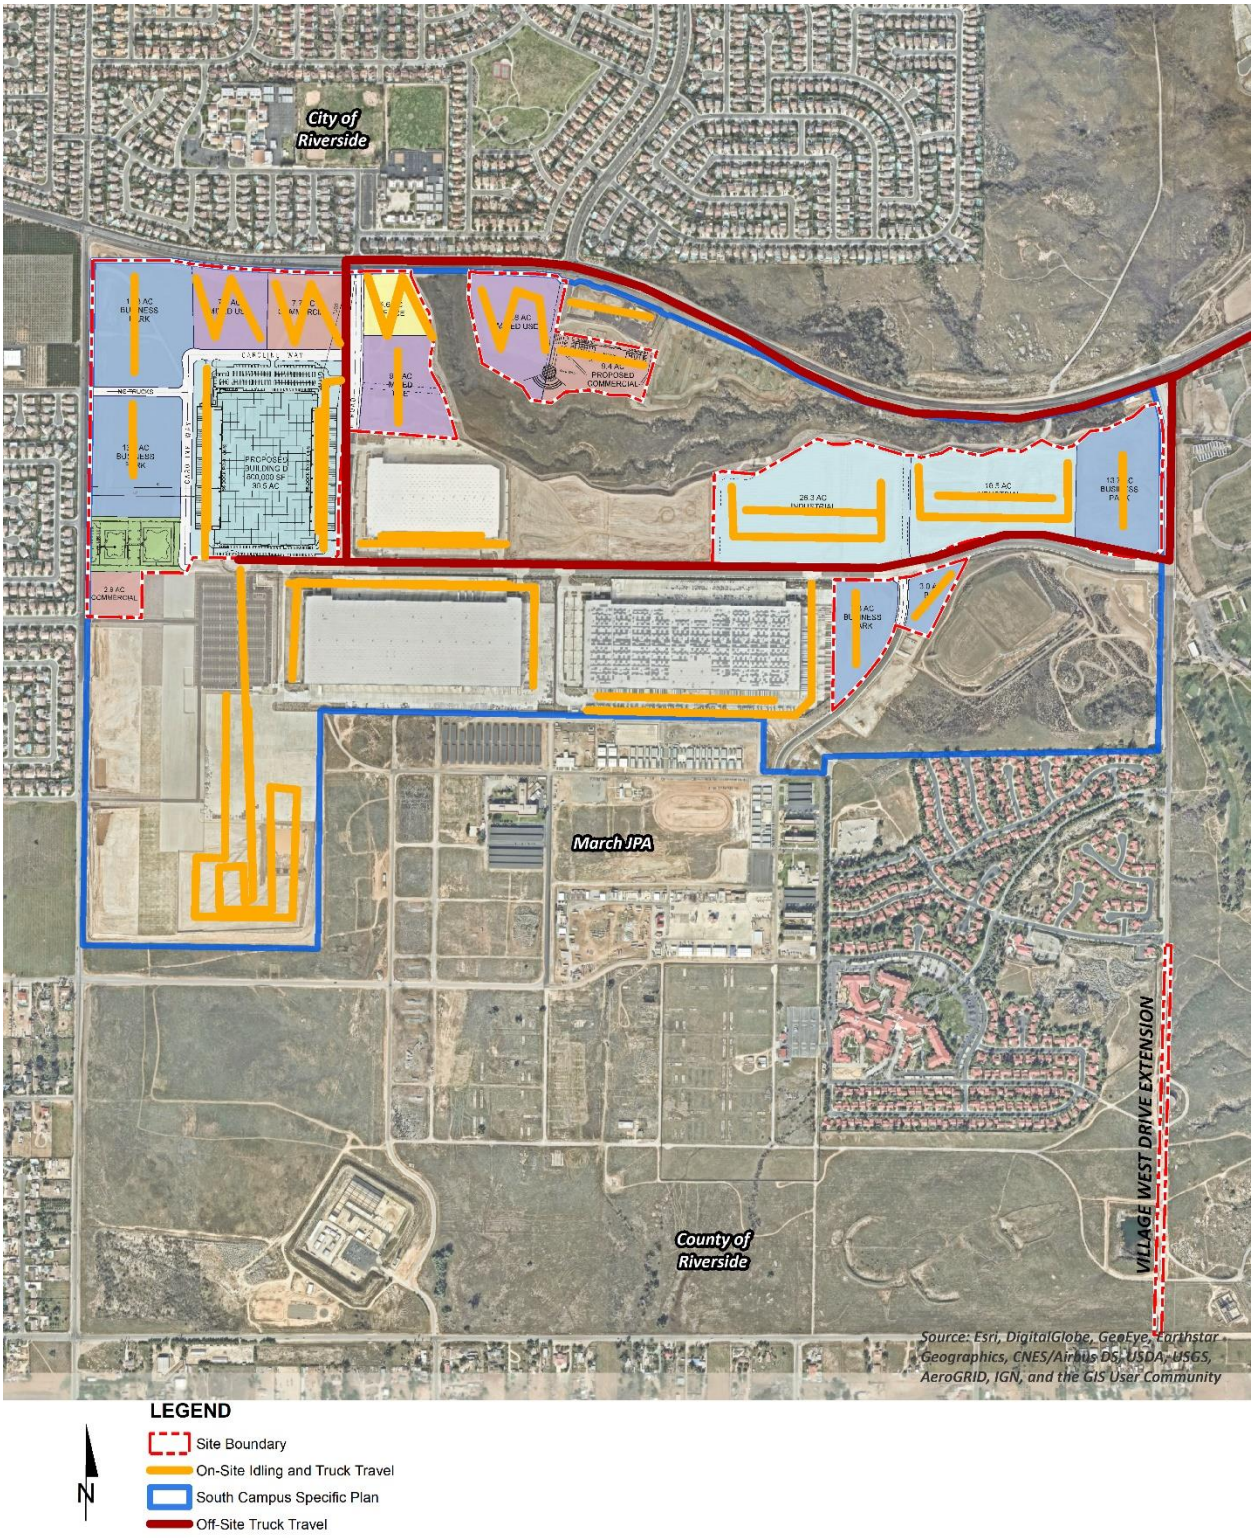
In order to account for the possibility of refrigerated uses (cold storage) that would be accommodated by the up to 700,000 SF of High Cube Cold Storage Warehouse proposed, all trucks accessing this land use are presumed to also have transport refrigeration units (TRUs). Therefore, for modeling purposes 292 total daily trucks (one-way) are assumed to be trucks with TRUs. In addition to on-site truck idling, the analysis assumes that each TRU accessing the site will also idle for 30 minutes, even though the CARB's anti-idling rules mandate a 5-minute idling time. Based on CARB's *Draft Update to Inventory for Transportation Refrigeration Units* (8) 60% of TRUs are anticipated to be 25+ horsepower and 40% of TRUs are anticipated to be 23 horsepower, as such 60% of TRUs are assumed to be 34 horsepower with a load factor of 0.53 (0.01 grams of PM_{10} per brake-horsepower-hour) and 40% of TRUs are assumed to be 23 horsepower with a load factor of 0.46 (0.12 grams of PM_{10} per brake-horsepower-hour). TRUs are also accounted for during on-site and off-site travel. TRU emission rates were calculated based on CARB's 2017 Off-Road Diesel Emission Factors for analysis year 2024.

TABLE 2-2: MERIDIAN SOUTH CAMPUS TRUCK TRIP ALLOCATION

	Daily Truck Trips (Actual Vehicles)
Proposed Project Land Uses	
Office	80
Commercial	208
Business Park	844
Warehousing	178
High-Cube Cold Storage	584
High-Cube Warehouse (Building D)	414
Built/Entitled Land Uses	
LGB6 (Building A)	592
Parcel Delivery Site (Building B + Parking Lot)	1,720
Commercial (Parcel 72)	32
Warehousing (Building C)	320
Total Truck Trips	**4,972**

The U.S. Environmental Protection Agency (EPA)-approved dispersion model, American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) was used to model the impacts of DPM emissions from trucks traveling on study area roadways. AERMOD can estimate the air quality impacts of single or multiple sources using actual meteorological conditions. Use of AERMOD is accepted by the SCAQMD for an HRA. The AERMOD model offers additional flexibility by allowing the user to assign an initial release height and vertical dispersion parameters for mobile sources representative of a roadway. On-site idling, on-site travel, and off-site travel were modeled as adjacent volume sources.

EXHIBIT 2-A: MODELED EMISSION SOURCES



2.2 EXPOSURE QUANTIFICATION

The analysis herein has been conducted in accordance with the guidelines in the Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis (1). SCAQMD recommends using the Environmental Protection Agency's (U.S. EPA's) AERMOD model. For purposes of this analysis, the Lakes AERMOD View (Version 9.9.0) was used to calculate annual average particulate concentrations associated with site operations. Lakes AERMOD View was utilized to incorporate the U.S. EPA's latest AERMOD Version 19191 (9).

The model offers additional flexibility by allowing the user to assign an initial release height and vertical dispersion parameters for mobile sources representative of a roadway. For this HRA, the roadways were modeled as adjacent volume sources. Roadways were modeled using the U.S. EPA's haul route methodology for modeling of on-site and off-site truck movement. More specifically, the Haul Road Volume Source Calculator in Lakes AERMOD View has been utilized to determine the release height parameters. Based on the U.S. EPA methodology, the Project's modeled sources would result in a release height of 3.49 meters, and an initial lateral dimension of 4.0 meters, and an initial vertical dimension of 3.25 meters.

SCAQMD required model parameters are presented in Table 2-3 (10). The model requires additional input parameters including emission data and local meteorology. Meteorological data from the SCAQMD's Riverside monitoring station (SRA 23) was used to represent local weather conditions and prevailing winds (11).

TABLE 2-3: AERMOD MODEL PARAMETERS

Dispersion Coefficient (Urban/Rural)	Urban
Population	2,189,641
Terrain (Flat/Elevated)	Elevated (Regulatory Default)
Averaging Time	1 year (5-year Meteorological Data Set)
Receptor Height	0 meters (Regulatory Default)

Universal Transverse Mercator (UTM) coordinates for World Geodetic System (WGS) 84 were used to locate the Project boundaries, each volume source location, and receptor locations in the Project vicinity. The AERMOD dispersion model summary output files for the proposed facility are presented in Appendix 2.1.

Modeled sensitive receptors were placed at residential and school locations where sensitive receptors could remain. Additionally, based on recommendations from SCAQMD staff, a receptor grid with 100-meter spacing was placed at sensitive land use locations in order to ensure that the extent of impacts is properly evaluated.

Discrete variants for daily breathing rates, exposure frequency, and exposure duration were obtained from relevant distribution profiles presented in the 2015 OEHHA Guidelines and the SCAQMD's Rule 1401 risk assessment procedures (12). Tables 2-4 and 2-5 summarize the

Exposure Parameters for Residents and School exposure scenarios based on 2015 OEHHA Guidelines. Appendix 2.2 includes the detailed risk calculation.

TABLE 2-4: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK (30 YEAR RESIDENTIAL)

Age	Daily Breathing Rate (L/kg-day)	Age Specific Factor	Exposure Duration (years)	Fraction of Time at Home	Exposure Frequency (days/year)	Exposure Time (hours/day)
-0.25 to 0	361	10	0.25	1	350	24
0 to 2	1090	10	2	1	350	24
2 to 16	572	3	14	1	350	24
16 to 30	261	1	14	0.73	350	24

TABLE 2-5: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK (9 YEAR SCHOOL CHILD)

Age	Daily Breathing Rate (L/kg-day)	Age Specific Factor	Exposure Duration (years)	Exposure Frequency (days/year) [a]	Exposure Time (hours/day)
4 to 13	631	3	9	180	12

[a] To represent the unique characteristics of the school-based population, the assessment employed the U.S. Environmental Protection Agency's guidance to develop viable dose estimates based on reasonable maximum exposures (RME). RME's are defined as the "highest exposure that is reasonably expected to occur" for a given receptor population. As a result, lifetime risk values for the student population were adjusted to account for an exposure duration of 180 days per year for nine (9) years. The 9 year exposure duration is also consistent with OEHHA Recommendations and consistent with the exposure duration utilized in school-based risk assessments for various schools within the Los Angeles County Unified School District (LAUSD) that have been accepted by the SCAQMD.

Consistent with SCAQMD modeling guidance, all receptors were set to the elevation so that only ground-level concentrations are analyzed (11). United States Geological Survey (USGS) Digital Elevation Model (DEM) terrain data based on a 7.5-minute topographic quadrangle map series using AERMAP was utilized in the HRA modeling to set elevations.

2.3 CARCINOGENIC CHEMICAL RISK

The SCAQMD CEQA Air Quality Handbook (1993) states that emissions of toxic air contaminants (TACs) are considered significant if a HRA shows an increased risk of greater than 10 in one million. Based on guidance from the SCAQMD in the document Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis ((1), for purposes of this analysis, 10 in one million is used as the cancer risk threshold for the proposed Project.

Excess cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens over a specified exposure duration. The estimated risk is expressed as a unitless probability. The cancer

risk attributed to a chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (e.g., lungs) by the chemical-specific cancer potency factor (CPF). A risk level of 1 in a million implies a likelihood that up to one person, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of toxic air contaminants over a specified duration of time. This risk would be an excess cancer risk that is in addition to any cancer risk borne by a person not exposed to these air toxics.

Guidance from CARB and the California Environmental Protection Agency, Office of Environmental Health Hazard Assessment (OEHHA) recommends a refinement to the standard point estimate approach when alternate human body weights and breathing rates are utilized to assess risk for susceptible subpopulations such as children. For the inhalation pathway, the procedure requires the incorporation of several discrete variates to effectively quantify dose. Once determined, contaminant dose is multiplied by the cancer potency factor (CPF) in units of inverse dose expressed in milligrams per kilogram per day (mg/kg/day)-1 to derive the cancer risk estimate. Therefore, to assess exposures, the following dose algorithm was utilized.

$$DOSEair = (Cair \times [BR/BW] \times A \times EF) \times (1 \times 10^{-6})$$

Where:

DOSEair = chronic daily intake (mg/kg/day)

Cair = concentration of contaminant in air (ug/m3)

[BR/BW] = daily breathing rate normalized to body weight (L/kg BW-day)

A = inhalation absorption factor

EF = exposure frequency (days/365 days)

BW = body weight (kg)

1×10^{-6} = conversion factors (ug to mg, L to m3)

$$RISKair = DOSEair \times CPF \times ED/AT$$

Where:

DOSEair = chronic daily intake (mg/kg/day)

CPF = cancer potency factor

ED = number of years within particular age group

AT = averaging time

2.4 NON-CARCINOGENIC EXPOSURES

An evaluation of the potential noncarcinogenic effects of chronic exposures was also conducted. Adverse health effects are evaluated by comparing a compound's annual concentration with its

toxicity factor or Reference Exposure Level (REL). The REL for diesel particulates was obtained from OEHHA for this analysis. The chronic reference exposure level (REL) for DPM was established by OEHHA as 5 $\mu g/m^3$ (OEHHA Toxicity Criteria Database, http://www.oehha.org/risk/chemicaldb/index.asp).

The non-cancer hazard index was calculated (consistent with SCAQMD methodology) as follows:

The relationship for the non-cancer health effects of DPM is given by the following equation:

$$HI_{DPM} = C_{DPM}/REL_{DPM}$$

Where:

HI_{DPM} = Hazard Index; an expression of the potential for non-cancer health effects.

C_{DPM} = Annual average DPM concentration ($\mu g/m^3$).

REL_{DPM} = Reference exposure level (REL) for DPM; the DPM concentration at which no adverse health effects are anticipated.

2.5 POTENTIAL PROJECT-RELATED DPM SOURCE CANCER AND NON-CANCER RISKS[2]

Residential Exposure Scenario:

The results of the analysis indicate that, at the maximally exposed individual receptor (MEIR), the maximum incremental cancer risk attributable to trucks is estimated at 4.79 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.002, which would not exceed the applicable threshold of 1.0. The sensitive land use with the greatest potential exposure to Project DPM source emissions is the existing residential community located north of Van Buren Boulevard and west of Orange Terrace Parkway. The nearest modeled sensitive receptors are illustrated on Exhibit 2-B.

Tomas Riviera Elementary School Child Exposure Scenario:

The results of the analysis indicate that, at the Tomas Riviera Elementary School, the maximum incremental cancer risk attributable to trucks is estimated at 0.50 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0008, which would not exceed the applicable threshold of 1.0. The nearest modeled sensitive receptors are illustrated on Exhibit 2-B.

2 SCAQMD guidance does not require assessment of the potential health risk to on-site workers. Excerpts from the document OEHHA Air Toxics Hot Spots Program Risk Assessment Guidelines—The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA 2003), also indicate that it is not necessary to examine the health effects to on-site workers unless required by RCRA (Resource Conservation and Recovery Act) / CERCLA (Comprehensive Environmental Response, Compensation, and Liability Act) or the worker resides on-site.

Amelia Earhart Middle School Child Exposure Scenario:

The results of the analysis indicate that, at the Amelia Earhart Middle School, the maximum incremental cancer risk attributable to trucks is estimated at 0.36 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0006, which would not exceed the applicable threshold of 1.0. The nearest modeled sensitive receptors are illustrated on Exhibit 2-B.

EXHIBIT 2-B: NEAREST MODELED SENSITIVE RECEPTORS

- - - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for  6885 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =   2189641.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  DPM
```

```
 **Model Calculates ANNUAL Averages Only

 **This Run Includes:   6885 Source(s);       1 Source Group(s); and      88
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:   6885 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   245.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                 ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      6.4 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   12760 HRA (07-20).ERR

 **File for Summary of Results:   12760 HRA (07-20).SUM

July 30, 2020

SUBJECT: CONSTRUCTION HEALTH RISK ASSESSMENT MEMORANDUM

Urban Crossroads, Inc. is pleased to submit this construction health risk assessment memorandum for the Meridian South Campus and Village West Drive Extension ("Project"). Although the proposed Project is defined as the net change in impacts as compared to the 2003 EIR Phase III, for the purposes of analyzing health risks, this HRA evaluates the proposed South Campus Specific Plan in its entirety. As such, this approach conservatively overstates the health risks of the proposed Project.

PURPOSE

California Air Resources Board (CARB) has recently been commenting on projects subject to the California Environmental Quality Act (CEQA), requesting that projects that involve construction activity longer than two months should include a construction health risk assessment (HRA). CARB refers to guidance from the Office of Environmental Health Hazard Assessment (OEHHA) to support its claim that construction HRAs should be performed.

BACKGROUND

Urban Crossroads, Inc. has reviewed the referenced OEHHA Guidance Manual[1] to determine applicability of the use of early life exposure adjustments to diesel particulate matter (DPM) emissions resulting from construction activity.

Specifically, the OEHHA Guidance states "Due to the uncertainty in assessing cancer risk from very short-term exposures, we do not recommend assessing cancer risk for projects lasting less than two months at the MEIR. **We recommend that exposure from projects longer than 2 months but less than 6 months be assumed to last 6 months** (e.g., a 2-month project would be evaluated as if it lasted 6 months)." (2015 Guidance Manual p. 8-18 [emphasis added].)

As such, the determination of whether a construction HRA is warranted is dependent on whether or not early life exposure adjustments apply to DPM emissions resulting from construction activity. This memorandum outlines the substantial evidence to support why early life exposure adjustments are *not* applicable to construction DPM and therefore a construction health risk assessment is not required due to the short-term duration of construction activity (long-term exposure e.g. 9 or 30 years of activity are typically used to generate a risk estimates).

For risk assessments conducted under the auspices of The Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588), OEHHA applies specific adjustment factors to all carcinogens regardless of purported mechanism of action. Notwithstanding, applicability of AB 2588 is limited to commercial and industrial operations. There are two broad classes of facilities subject

[1] http://oehha.ca.gov/air/hot_spots/hotspots2015.html

to the AB 2588 Program: 1) Core facilities and 2) facilities identified within discrete industry-wide source categories. Core facilities subject to AB 2588 compliance are sources whose criteria pollutant emissions (particulate matter, oxides of sulfur, oxides of nitrogen and volatile organic compounds) are 25 tons per year or more as well as those facilities whose criteria pollutant emissions are 10 tons per year or more but less than 25 tons per year. Industry-wide source facilities are classified as smaller operations with relatively similar emission profiles (e.g., auto body shops, gas stations and dry cleaners using perchloroethylene). The emissions generated from off-road mobile sources are not classified in AB 2588 as core operations nor subject to industry-wide source evaluation.

In comments presented to the South Coast Air Quality Management District (SCAQMD) Governing Board (Meeting Date: June 5, 2015, Agenda No. 28) relating to toxic air contaminant exposures under Rules 1401, 1401.1, 1402 and 212 revisions, use of the OEHHA Guidelines specifically related to the applicability and use of early-life exposure adjustments for projects subject to CEQA, it was reported that[2]:

> "The Proposed Amended Rules are separate from the CEQA significance thresholds. The SCAQMD staff is currently evaluating how to implement the Revised OEHHA Guidelines under CEQA. The SCAQMD staff will evaluate a variety of options on how to evaluate health risks under the Revised OEHHA Guidelines under CEQA. The SCAQMD staff will conduct public workshops to gather input before bringing recommendations to the Governing Board. In the interim, staff will continue to use the previous guidelines for CEQA determinations."

To date, the SCAQMD, as a commenting agency, has not conducted public workshops nor developed policy relating to the application of early-life exposure adjustments utilizing the OEHHA Guidance Manual for projects prepared by other public/lead agencies subject to CEQA.

As a result, it is recommended that health risk assessments rely upon U.S. EPA documentation when evaluating the use of early life exposure adjustment factors (*Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens*, EPA/630/R-003F) wherein adjustment factors are only considered when carcinogens act "through the mutagenic mode of action." A mutagen is a physical or chemical agent that changes genetic material, such as DNA, increasing the frequency of mutations to produce carcinogenic effects. The use of adjustment factors is recommended to account for the susceptibility of producing adverse health effects during early life stages from exposure to these mutagenic compounds.

In 2006, U.S. EPA published a memorandum which provides guidance regarding the preparation of health risk assessments should carcinogenic compounds elicit a mutagenic mode of action (USEPA, 2006[3]). As presented in the technical memorandum, numerous compounds were identified as having a mutagenic mode of action. For diesel particulates, polycyclic aromatic hydrocarbons (PAHs) and their derivatives, which are known to exhibit a mutagenic mode of

2 See Response to Comment #13, Page A-7 and A-8 of the June 5, 2015 board meeting Agenda No. 28. http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2015/2015-jun1-028

3 United States Environmental Protection Agency, 2006. Memorandum – Implementation of the Cancer Guidelines and Accompanying Supplemental Guidance - Science Policy Council Cancer Guidelines Implementation Workgroup Communication II: Performing Risk Assessments that include Carcinogens Described in the Supplemental Guidance as having a Mutagenic Mode of Action.

action, comprise < 1% of the exhaust particulate mass. To date, the U.S. Environmental Protection Agency reports that whole diesel engine exhaust has not been shown to elicit a mutagenic mode of action (USEPA, 2018[4]).

Additionally, the California Department of Toxic Substances Control (DTSC) which is charged with protecting individuals and the environment from the effects of toxic substances and responsible for assessing, investigating and evaluating sensitive receptor populations to ensure that properties are free of contamination or that health protective remediation levels are achieved has adopted the U.S. EPA's policy in the application of early-life exposure adjustments which is consistent with the methodology considered herein. As such, incorporation of early-life exposure adjustments for exposures to DPM emissions in the quantification of carcinogenic risk for construction of the proposed project arguably should not be considered.

Given that there is no available guidance that has been adopted by SCAQMD for CEQA purposes and the fact that the Project does not emit any pollutants that elicit a primary mutagenic mode of action, the use of the OEHHA guidelines to determine potential construction health risks may not be appropriate and at this time. Notwithstanding, in the abundance of caution, a focused construction health risk assessment has been prepared for the Project to determine the potential construction health risks that could occur if the OEHHA guidelines were utilized.

SITE LOCATION

The proposed Meridian South Campus and Village West Drive Extension site is located on the south side of Van Buren Boulevard between Barton Street and Village West Drive, within the jurisdiction of the March JPA. The Project site is partially developed and located within the southwestern portion of the March JPA jurisdiction. More specifically, the Project site is located in the southern portion of the Meridian South Campus Specific Plan area, south of Van Buren Boulevard, west of Village West Drive, and east of Barton Street, in unincorporated Riverside County, California. Interstate 215 (I-215) is located approximately 1 mile east of the Project site.

PROJECT DESCRIPTION

The construction HRA focuses on construction activities associated with the following portions of the Project:

PROPOSED PROJECT USES

The square footage calculated based on maximum allowable floor area ratio (FAR) for each land use type is shown below:

- Office – 388.011 thousand square feet (TSF)
- Commercial – 221.394 TSF
- Grocery Store – 61.336 TSF

4 United States Environmental Protection Agency, National Center for Environmental Assessment, 2018. Integrated Risk Information System (IRIS). Diesel Engine Exhaust.

- Business Park – 1,764.180 TSF
- High Cube Warehouse – 800.000 TSF
- High Cube Cold Storage Warehouse – 700.000 TSF
- Warehousing – 274.437 TSF
- Dog Park – 6.2 Acres

At the time this study was prepared, the Grocery Store component was assumed to consist of 61,336 sf. However, the current site plan for the Grocery Store component reflects a 44,200 sf grocery store with 17,136 sf of shops/general commercial retail space (total of 61,336 sf of commercial retail use). For the purposes of this study, the 61,336 sf of Grocery Store use results in a higher trip generation and consequently higher emissions (therefore more conservative) as opposed to evaluating the 44,200 sf Grocery Store and 17,136 sf of commercial retail space. The higher emissions have been evaluated for the purposes of this study in order to account for any minor changes that may occur to the building area as part of the final design.

VILLAGE WEST DRIVE EXTENSION

The improved portions of Village West Drive currently terminate at Lemay Drive to the south. The proposed Project would include improvements to and the extension of Village West Drive to provide a through connection between Van Buren Boulevard to the north and Nandina Avenue to the south. The improved Village West Drive would require the removal of an abandoned water tank currently owned by Western Municipal Water District that formerly served March Air Force Base, followed by the construction of two through lanes, a center striped median, and a bike lane. Sidewalks would also be provided on either side of the roadway.

CONSTRUCTION EMISSIONS

The emissions calculations for the construction HRA component are based on an assumed mix of construction equipment and vendor truck trips as presented in the *Meridian South Campus and Village West Drive Extension Air Quality Impact Analysis* ("AQIA") prepared by Urban Crossroads, Inc (1).

Construction activities associated with the Project have the potential to result in diesel exhaust from the following phases:

MERIDIAN SOUTH CAMPUS DEVELOPMENT

- Site Preparation: involves clearing vegetation (grubbing and tree/stump removal) and removing stones and other unwanted material or debris prior to grading.
- Grading: involves cut and fill of land to ensure that the proper base and slope is created for the foundation.
- Building Construction: involves the construction of the foundation, structures, and buildings.
- Paving: involves the laying of concrete or asphalt such as in parking lots, roads, driveways, or sidewalks.

- Architectural Coating: involves the application of coatings to both the interior and exterior of buildings or structures, the painting of parking lot or parking garage striping, associated signage and cubes, and the painting of the walls or other components such as stair railings inside parking structures.

5.3.1.2 VILLAGE WEST DRIVE EXTENSION

- Grubbing/Land Clearing: involves clearing vegetation and removal of the water tank.
- Grading/Excavation: involves cut and fill of land to ensure that the proper base and slope is created for the foundation.
- Drainage/Utilities/Subgrade: involves the placement of drainage, utilities, or subgrade material prior to paving activities.
- Paving: involves the laying of concrete or asphalt such as in parking lots, roads, driveways, or sidewalks.

CONSTRUCTION DURATION

Construction is expected to commence in January 2021 and will last through July 2024. As a conservative measure, it is assumed that the Village West Drive Extension will be constructed concurrent with the Meridian South Campus. The construction schedule utilized in the analysis, shown in Table 1, represents a "worst-case" analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as time passes and the analysis year increases due to emission regulations becoming more stringent.[5] The duration of construction activity and associated equipment represents a reasonable approximation of the expected construction fleet as required per *CEQA Guidelines* (2). The duration of construction activity was based on the Project's 2024 opening year.

TABLE 1: CONSTRUCTION SCHEDULE

Activity	Start Date	End Date	Days
Village West Drive Extension			
Grubbing/Land Clearing	01/04/2021	01/13/2021	8
Grading/Excavation	01/14/2021	02/17/2021	25
Drainage/Utilities/Subgrade	02/18/2021	03/23/2021	24
Paving	03/24/2021	04/06/2021	10
Meridian South Campus			
Site Preparation	01/04/2021	04/16/2021	75
Grading	04/17/2021	09/03/2021	100
Building Construction	09/04/2021	07/19/2024	750

[5] As shown in the CalEEMod User's Guide Version 2016.3.2, Section 4.3 "OFFROAD Equipment" as the analysis year increases, emission factors for the same equipment pieces decrease due to the natural turnover of older equipment being replaced by newer less polluting equipment and new regulatory requirements.

Paving	02/18/2024	07/19/2024	110
Architectural Coating	09/16/2023	07/19/2024	220

CONSTRUCTION EQUIPMENT

A summary of construction equipment assumptions by phase is provided at Table 2.

Source: In order to account for fugitive dust emissions associated with Site Preparation and Grading activities, Crawler Tractors were used in lieu of Tractors/Loaders/Backhoes.

Vendor truck trips are included in the emissions estimation based on CalEEMod emissions estimates as described in the project's AQIA.

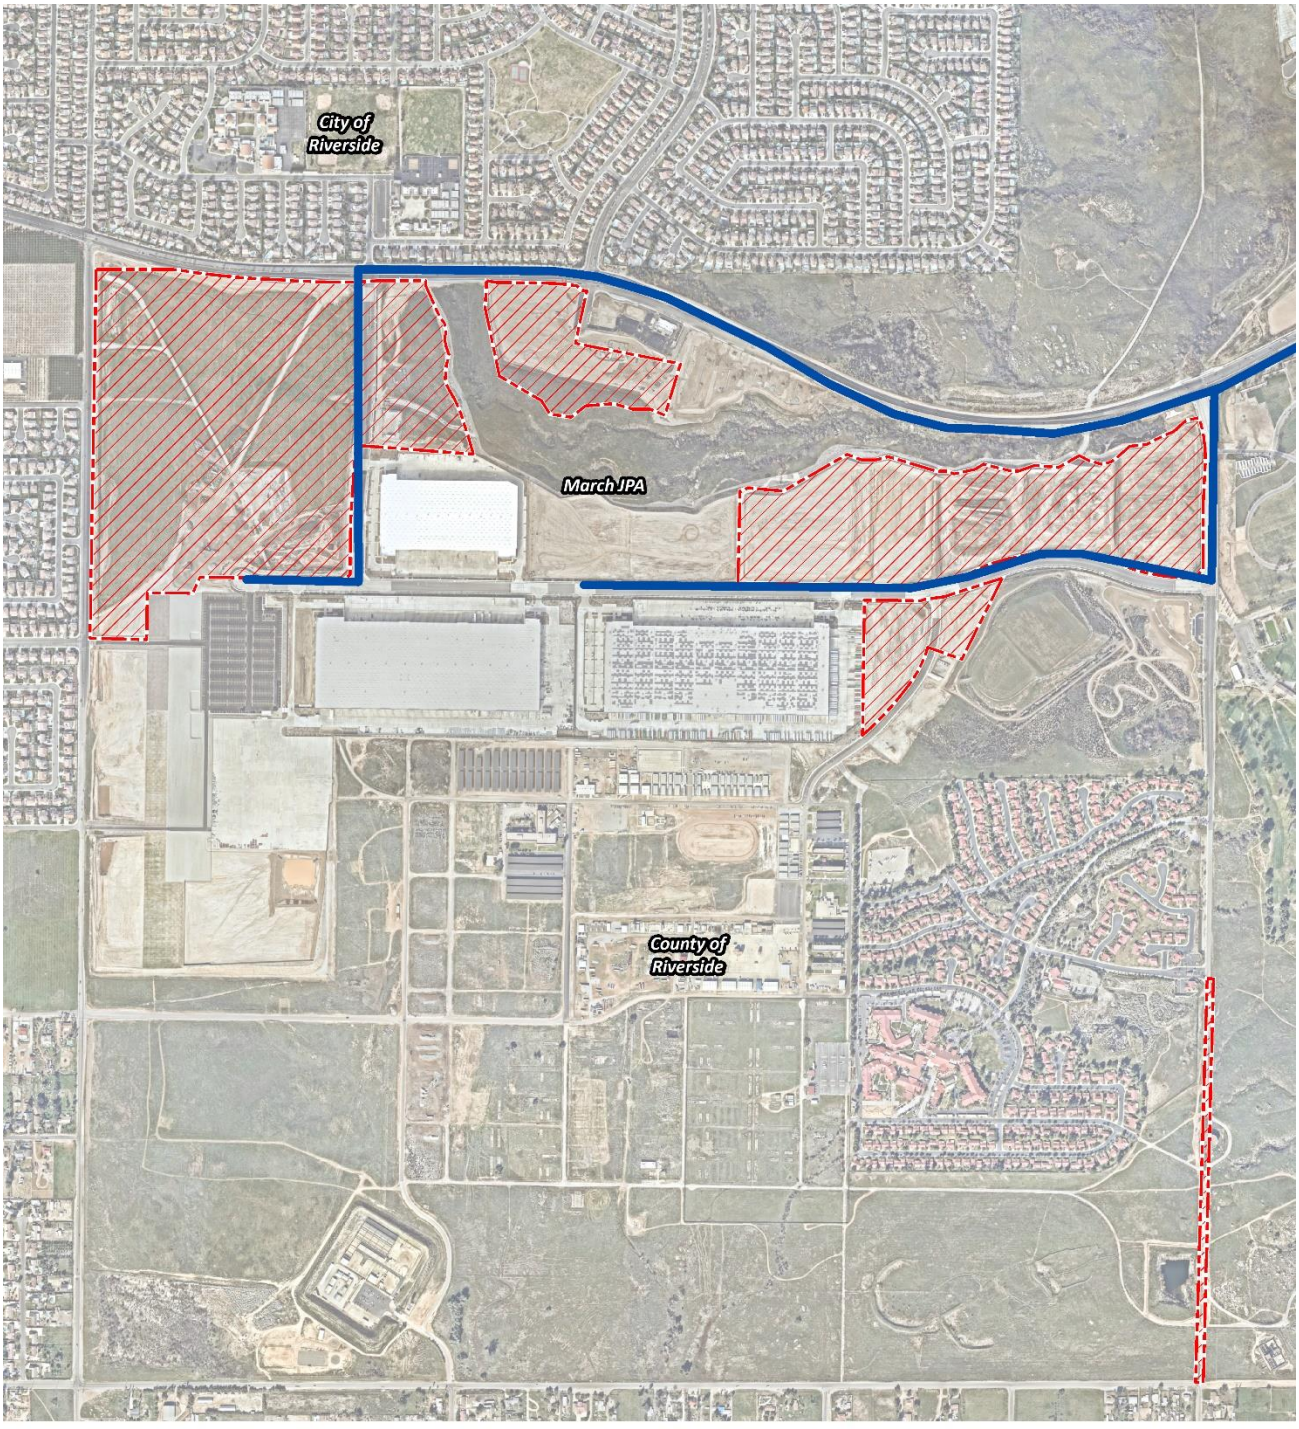
EXPOSURE QUANTIFICATION

The analysis herein has been conducted in accordance with the guidelines in the Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis (3). SCAQMD recommends using the Environmental Protection Agency's (U.S. EPA's) AERMOD model. For purposes of this analysis, the Lakes AERMOD View (Version 9.9.0) was used to calculate annual average particulate concentrations associated with site operations. Lakes AERMOD View was utilized to incorporate the U.S. EPA's latest AERMOD Version 19191 (4).

For this construction HRA, on-site construction activity was modeled as an area source encompassing the construction area and the vendor truck routes were modeled as adjacent volume sources. Vendor truck were modeled using the U.S. EPA's haul route methodology for modeling of off-site truck movement. More specifically, the Haul Road Volume Source Calculator in Lakes AERMOD View has been utilized to determine the release height parameters. Based on the U.S. EPA methodology, the Project's modeled sources would result in a release height of 3.49 meters, and an initial lateral dimension of 7.44 meters, and an initial vertical dimension of 3.25 meters. The modeled emission sources for construction activity are illustrated on Exhibit 1.

The construction activity was modeled to represent typical weekday construction activity (Monday through Friday, 8 hours per day, 7AM to 3PM).

EXHIBIT 1: MODELED CONSTRUCTION SOURCES



SCAQMD required model parameters are presented in Table 3 (5). The model requires additional input parameters including emission data and local meteorology. Meteorological data from the SCAQMD's Riverside monitoring station (SRA 23) was used to represent local weather conditions and prevailing winds (6). A wind rose exhibit of the Riverside monitoring station is provided at Exhibit 2.

TABLE 3: AERMOD MODEL PARAMETERS

Dispersion Coefficient	Urban
Population	2,189,641
Terrain	Elevated (Regulatory Default)
Averaging Time	1 year (5-year Meteorological Data Set)
Receptor Height	0 meters (Regulatory Default)

Universal Transverse Mercator (UTM) coordinates for World Geodetic System (WGS) 84 were used to locate the project boundaries, each source location, and receptor locations in the project vicinity. The AERMOD dispersion model summary output files for the proposed facility are presented in Attachment "A". Modeled sensitive receptors were placed at residential and non-residential locations as illustrated on Exhibit 3.

Consistent with SCAQMD modeling guidance, all receptors were set to the elevation so that only ground-level concentrations are analyzed (5). United States Geological Survey (USGS) Digital Elevation Model (DEM) terrain data based on a 7.5-minute topographic quadrangle map series using AERMAP was utilized in the HRA modeling to set elevations.

Discrete variants for daily breathing rates, exposure frequency, and exposure duration were obtained from relevant distribution profiles presented in the 2015 OEHHA Guidelines as summarized in the *Meridian South Campus and Village West Drive Extension Mobile Source Health Risk Assessment* ("HRA") prepared by Urban Crossroads, Inc (7). Attachment "B" includes the detailed risk calculation.

EXHIBIT 2: WIND ROSE (SRA 23)

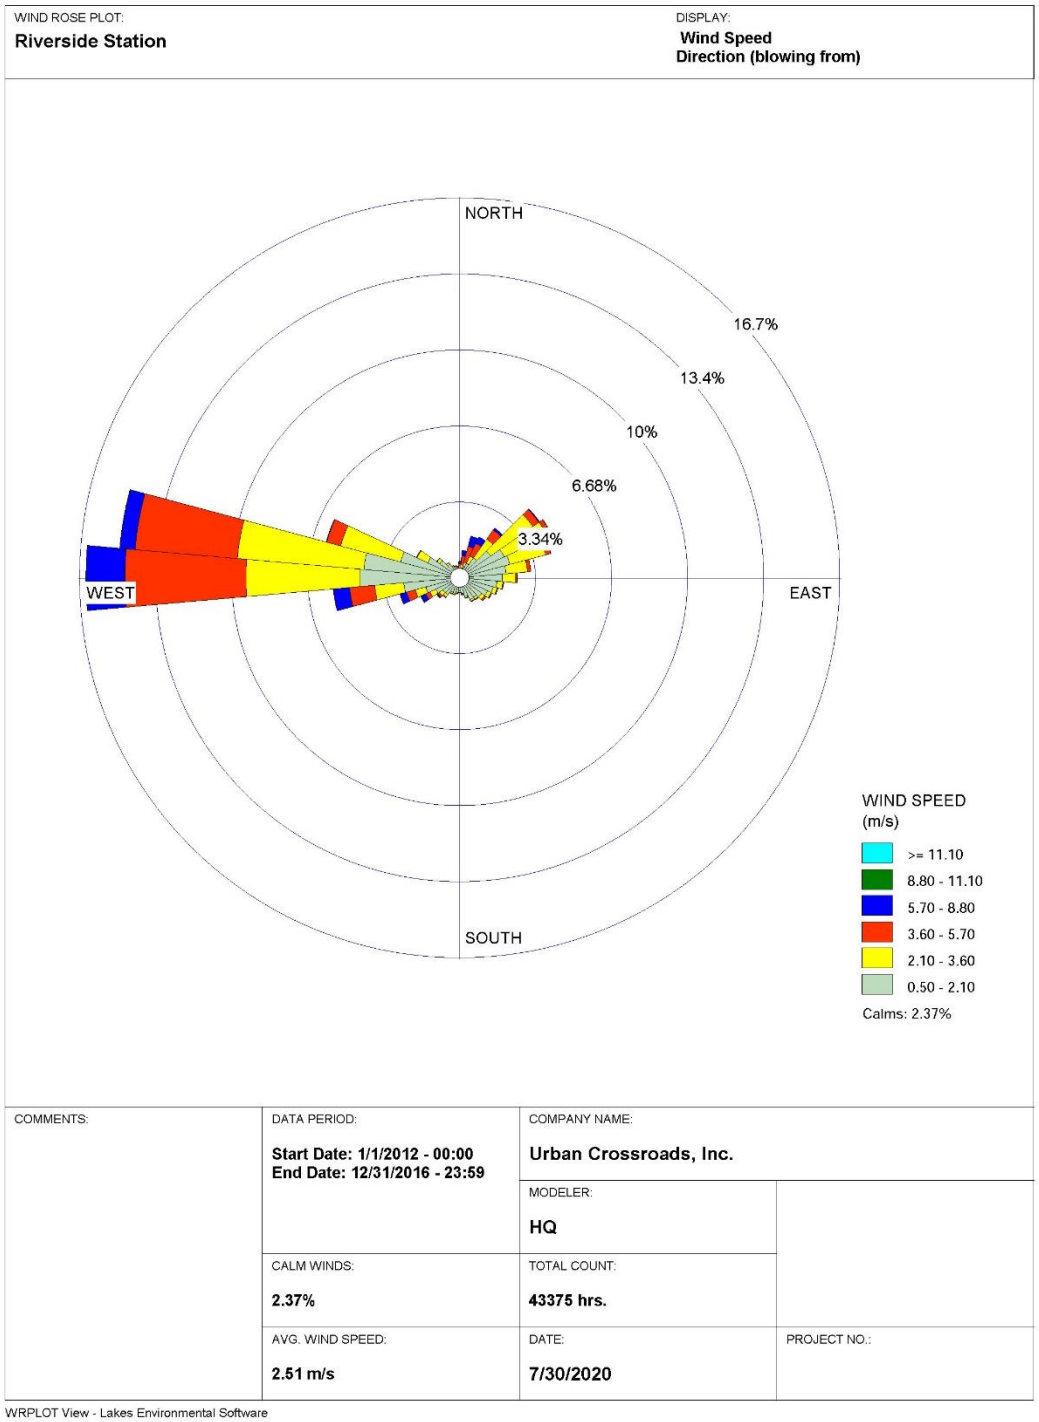


EXHIBIT 3: MODELED RECEPTORS

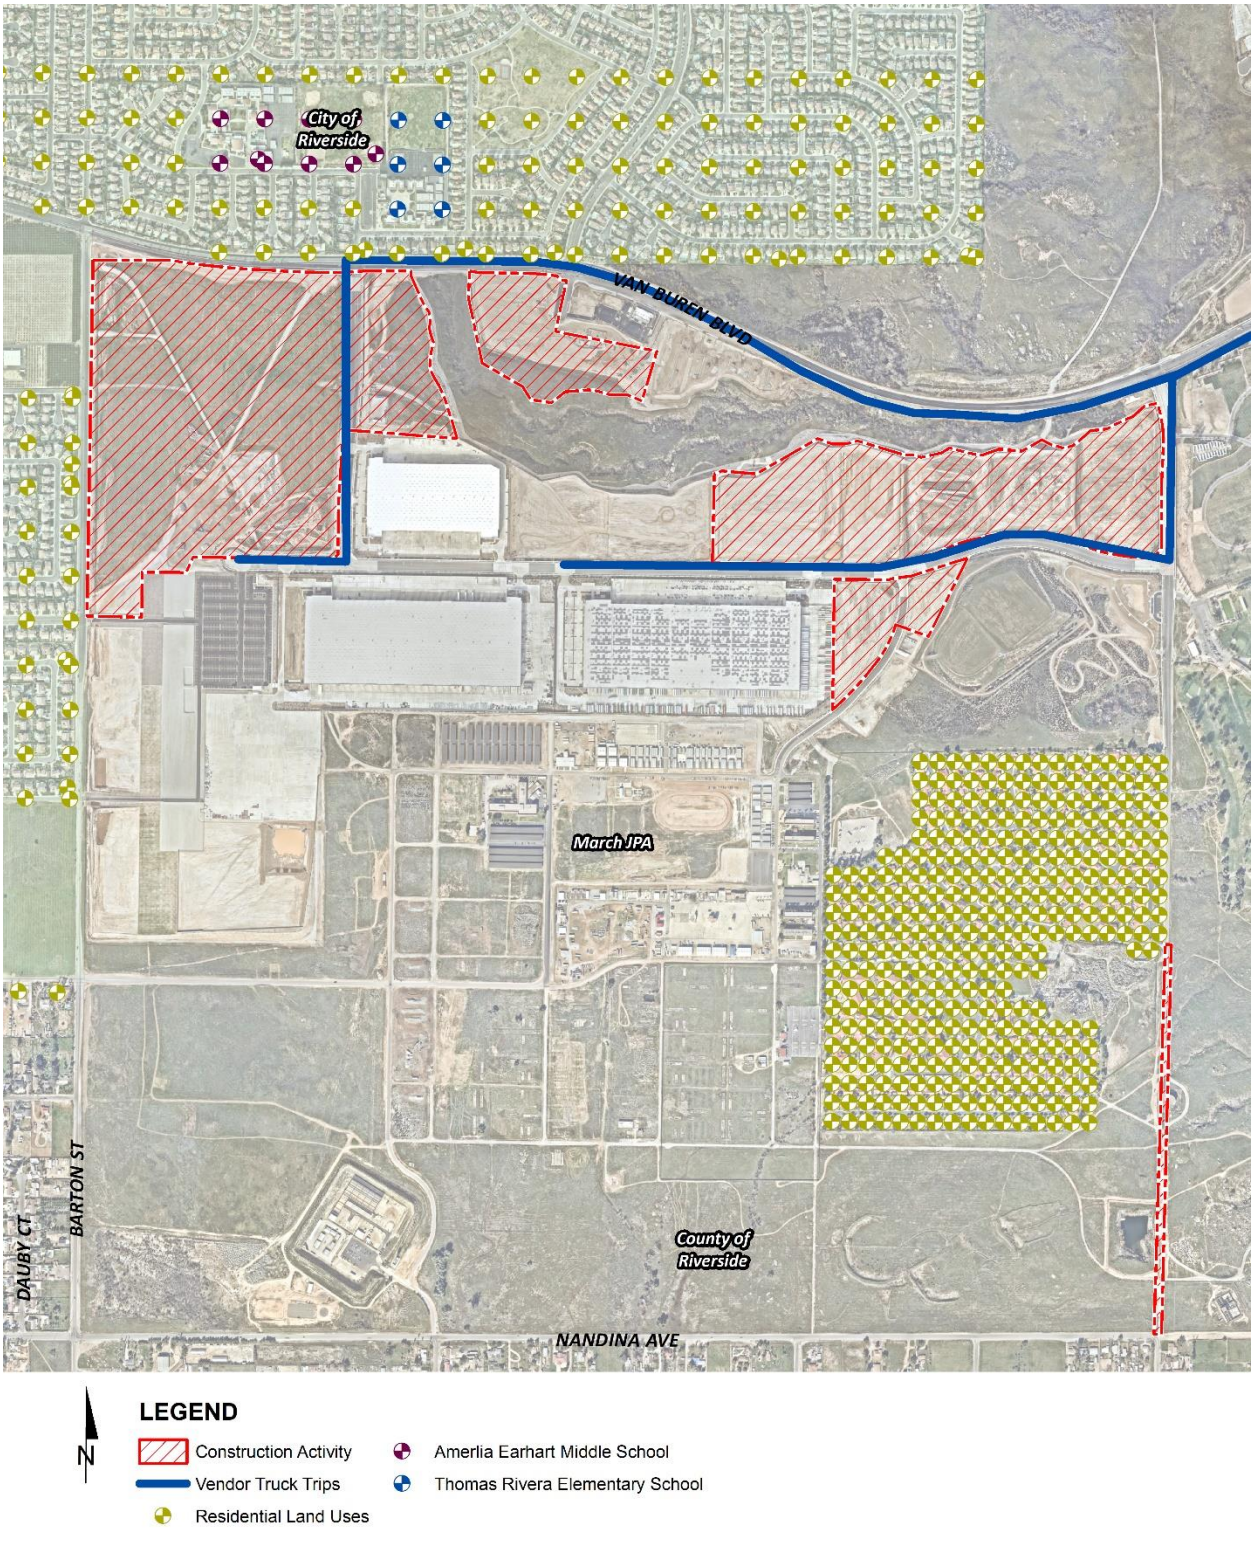

POTENTIAL CONSTRUCTION-RELATED DPM SOURCE CANCER AND NON-CANCER RISKS

Residential Exposure Scenario:

The results of the analysis indicate that, at the maximally exposed individual receptor (MEIR), the maximum incremental cancer risk attributable to construction activity is estimated at 3.29 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.002, which would not exceed the applicable threshold of 1.0. The sensitive land use with the greatest potential exposure to Project DPM source emissions is the existing residential community located north of Van Buren Boulevard and west of Orange Terrace Parkway.

Tomas Riviera Elementary School Child Exposure Scenario:

The results of the analysis indicate that, at the Tomas Riviera Elementary School, the maximum incremental cancer risk attributable to trucks is estimated at 0.03 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0001, which would not exceed the applicable threshold of 1.0.

Amelia Earhart Middle School Child Exposure Scenario:

The results of the analysis indicate that, at the Amelia Earhart Middle School, the maximum incremental cancer risk attributable to trucks is estimated at 0.02 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0001, which would not exceed the applicable threshold of 1.0.

Respectfully submitted,

URBAN CROSSROADS, INC.

Haseeb Qureshi
Associate Principal
