TABLE OF CONTENTS

VOLUME I: FINAL ENVIRONMENTAL IMPACT REPORT

1—INTRODUCTION 1-1

1.1 Overview of the Project and Environmental Review Process 1-1

1.2 Summary of Additional Studies And Revisions to the Draft Eir 1-3

1.2.1 Overview 1-3

1.2.2 New and Revised Technical Studies and Analyses 1-3

1.2.3 Clarifications and Expanded Analysis 1-4

1.2.4 Summary of Impact Conclusions 1-5

1.3 Final EIR Requirements 1-5

1.4 Use of the EIR in the Decision-Making Process 1-6

1.5 Significant and Unavoidable Impacts 1-8

2—CEQA PUBLIC REVIEW PROCESS 2-1

2.1 Purpose of the Public Review 2-1

2.2 Public Review Period and Notifications 2-1

2.3 Summary of Public Input and Approach To Responses 2-2

3—DRAFT EIR ERRATA 3-1

3.1 Overview 3-1

3.2 Errata 3-1

3.2.1 Errata to the Draft EIR Executive Summary 3-1

3.2.2 Errata to the Draft EIR Chapter 1, "Introduction" 3-4

3.2.3 Errata to the Draft EIR Chapter 2, "Project Description" 3-62

3.2.4 Errata to the Draft EIR Chapter 3, "Terminology, Approach and Assumptions" 3-70

3.2.5 Errata to Draft EIR Chapter 4, "Environmental Analysis" 3-70

3.2.5.1 Errata to Draft EIR Section 4.1, "Aesthetics and Visual Resources" 3-70

3.2.5.2 Errata to Draft EIR Section 4.2, "Agricultural and Forestry Resources" 3-77

3.2.5.3 Errata to Draft EIR Section 4.3, "Air Quality" 3-78

3.2.5.4 Errata to Draft EIR Section 4.4, "Biological Resources" 3-81

3.2.5.5 Errata to Draft EIR Section 4.5, "Cultural Resources" 3-104

3.2.5.6 Errata to Draft EIR Section 4.6, "Energy" 3-104

3.2.5.7 Errata to Draft EIR Section 4.7, "Geology and Soils" 3-106
3.2.5.8 Errata to Draft EIR Section 4.8, "Greenhouse Gas Emissions" 3-109
3.2.5.9 Errata to Draft EIR Section 4.9, "Hazards and Hazardous Materials" 3-112
3.2.5.10 Errata to Draft EIR Section 4.10, "Hydrology and Water Quality" 3-112
3.2.5.11 Errata to Draft EIR Section 4.11, "Land Use and Planning" 3-130
3.2.5.12 Errata to Draft EIR Section 4.12, "Mineral Resources" 3-146
3.2.5.13 Errata to Draft EIR Section 4.13, "Noise" 3-146
3.2.5.14 Errata to Draft EIR Section 4.14, "Population and Housing" 3-154
3.2.5.15 Errata to Draft EIR Section 4.15, "Public Services" 3-154
3.2.5.16 Errata to Draft EIR Section 4.16, "Recreation" 3-154
3.2.5.17 Errata to Draft EIR Section 4.17, "Transportation" 3-156
3.2.5.18 Errata to Draft EIR Section 4.18, "Tribal Cultural Resources" 3-177
3.2.5.19 Errata to Draft EIR Section 4.19, "Utilities and Service Systems" 3-178
3.2.5.20 Errata to Draft EIR Section 4.20, "Wildfire" 3-178
3.2.6 Errata to Draft EIR Chapter 5, "Cumulative Impacts" 3-179
3.2.7 Errata to Draft EIR Chapter 6, "Project Alternatives" 3-184
3.2.8 Errata to Draft EIR Chapter 7, "Other CEQA Topics" 3-191
3.2.9 Errata to Draft EIR Chapter 8, "List of Preparers" 3-191
3.2.10 Errata to Draft EIR Chapter 9, "References and Resources" 3-191
3.2.11 Errata to Draft EIR Chapter 10, "Acronyms and Glossary" 3-193

4—RESPONSE TO COMMENTS 4-1

4.1 Collective Responses 4.1-1
4.1.1 Collective Response #1: County CEQA Process 4.1-2
4.1.2 Collective Response #2: Previous Permit Extensions 4.1-5
4.1.3 Collective Response #3: Aggregate Demand and Need for Project 4.1-6
4.1.4 Collective Response #4a: CEMEX Regulatory History 4.1-9
4.1.5 Collective Response #4b: Liability and Fund for Potential Damages 4.1-10
4.1.6 Collective Response #5: Duration of Use Permit 4.1-12
4.1.7 Collective Response #6: Operational Nuisance 4.1-13
4.1.8 Collective Response #7: Economic Effects 4.1-14
4.1.9 Collective Response #8: Visual Impact Mitigation 4.1-15
4.1.10 Collective Response #9: Air Quality Analysis and Project Impacts 4.1-16
4.1.11 Collective Response #10: Air Quality Analysis Baseline 4.1-18

4.1.12 Collective Response #11: Analysis of Population-wide Cancer Burden 4.1-21
4.1.13 Collective Response #12: Effects on San Joaquin River and Chinook Salmon Restoration Efforts 4.1-21
4.1.14 Collective Response #13: Project Operational Effects on Offsite Wildlife 4.1-23
4.1.15 Collective Response #14: Analysis of Impacts on Swainson's Hawk 4.1-23
4.1.16 Collective Response #15: Impacts to Non-Nesting Birds and Birds Outside of Nesting Season 4.1-24
4.1.17 Collective Response #16: Impacts to Salmon Spawning and Analysis Methods 4.1-25
4.1.18 Collective Response #17: Flooding and Bank Stability 4.1-26
4.1.19 Collective Response #18: Consistency with San Joaquin River Parkway Master Plan 4.1-28
4.1.20 Collective Response #19: Public Accessibility of Adjacent Parks 4.1-29
4.1.21 Collective Response #20: Encroachment on an Ecological Preserve 4.1-30
4.1.22 Collective Response #21: Public Access to San Joaquin River, Recreational Sites, and Future Uses of the Existing Project Sites 4.1-31
4.1.23 Collective Response #22: Trail Easements 4.1-32
4.1.24 Collective Response #23: Quality of Water Pumped to Onsite Ponds and Potential Impacts to San Joaquin River and Groundwater Quality if Pumped to Recharge Trenches 4.1-33
4.1.25 Collective Response #24: Groundwater Monitoring Program Changes and Funding 4.1-35
4.1.26 Collective Response #25: Interconnected Surface Water, Groundwater Dependent Ecosystems, and Impacts on Flows in the San Joaquin River 4.1-38
4.1.27 Collective Response #26: Baseline Groundwater Data 4.1-53
4.1.28 Collective Response #27: Operational Effects on Park/Trail Users 4.1-54
4.1.29 Collective Response #28: Land Subsidence 4.1-55
4.1.30 Collective Response #29: Traffic Impacts and Mitigation 4.1-56
4.1.31 Collective Response #30: Road Safety 4.1-58

4.2 Public Agency Comments and Responses 4.2-1

Letter #1 January, 28, 2025, Larry Brown, Fresno County Fire Protection District 4.2-1
Letter #2a February 24, 2025, Keyomi Jones, California Department of Transportation 4.2-1

Letter #2b February 10, 2026, Dave Padilla, California Department of Transportation 4.2-2
Letter #3 February 28, 2025, Jennifer Laird, City of Fresno 4.2-4
Letter #4 February 28, 2025, Jamie Silva, Central Valley Flood Protection Board 4.2-4
Letter #5 March 7, 2025, Bryan Rock, Central Valley Flood Protection Board 4.2-7
Letter #6 March 7, 2025, Karl Stock, Regional Director U.S. Bureau of Reclamation, Department of the Interior 4.2-13
Letter #7 March 10, 2025, Jonathan Ambrose, National Marine Fisheries Service 4.2-99
Letter #8 March 10, 2025, Joaquin Arambula, California Assemblymember, 31st District 4.2-102
Letter #9 March 10, 2025, Ian Buck-MacLeod, Friant Water Authority 4.2-107
Letter #10 March 10, 2025,Kassey Chauhan, North Kings Groundwater Sustainability Agency 4.2-115
Letter #11 March 10, 2025, Kari Kylr Daniska, San Joaquin River Conservancy 4.2-123
Letter #12 March 10, 2025, Douglas Hedenkamp, City of Fresno 4.2-147
Letter #13 March 10, 2025, Tom Jordan, San Joaquin Valley Air Pollution Control District 4.2-267
Letter #14 March 10, 2025, Elsa Mejia, City of Madera District 5 Councilmember 4.2-279
Letter #15 March 11, 2025, Julie Vance, California Department of Fish and Wildlife 4.2-279

4.3 Organizations and Local Businesses Comments and Responses 4.3-1

Letter #16 February 2, 2025, Leo Labbe, Fresno Fly Fishers for Conservation 4.3-1
Letter #17 February 5, 2025, Daniel Frank, Floyd Johnston Construction 4.3-9
Letter #18 February 7, 2025, Kim Nulick, Caliber Contracting 4.3-10
Letter #19 February 11, 2025, Samantha McCarty, Santa Rosa Rancheria Tachi-Yokut Tribe 4.3-11
Letter #20 February 11, 2025, Christopher Robins, Fresno Fly Fishers for Conservation 4.3-11
Letter #21 February 12, 2025, Karry Wendel, Clean Cut Landscape 4.3-17
Letter #22 February 13, 2025, Ronald Hicks, Fresno Fly Fishers For Conservation 4.3-18

Letter #23 February 14, 2025, Michael Branco, American Industrial Equipment 4.3-21
Letter #24 February 14, 2025, Mike Higgins, Pape Machinery 4.3-22
Letter #25 February 17, 2025, Robert Joubert, Jameson Hydro Crane... 4.3-23
Letter #26 February 18, 2025, Steve Sharp, General Teamsters Union Local No. 431 ..... 4.3-24
Letter #27 February 19, 2025, Chase Hager, 559 Pro Landscape, Inc. 4.3-25
Letter #28 February 20, 2025, Chuck Riojas, FMKTC Building and Construction Trades..... 4.3-26
Letter #29 February 21, 2025, Matthew Estipona, Associated Builders and Contractors Northern California..... 4.3-27
Letter #30 February 21, 2025, James Hammond, Laborers' International Union of North America Local 294 .. 4.3-28
Letter #31 February 24, 2025, Emily Braswell, Braswell Construction 4.3-29

1—INTRODUCTION

1.1 OVERVIEW OF THE PROJECT AND ENVIRONMENTAL REVIEW PROCESS

This final environmental impact report (Final EIR) has been prepared by Fresno County (County), the lead agency under the California Environmental Quality Act (CEQA) (Public Resources Code [PRC], Section 21000 et seq.; California Code of Regulations [CCR] Title 14 Section 15000 et seq. [CEQA Guidelines]) in accordance with CEQA and the CEQA Guidelines, to evaluate the potentially significant environmental effects associated with the Rockfield Quarry Modification Project (proposed project). A summary of revisions and additional information is provided in Section 1.2, "Summary of Additional Studies and Revisions to the Draft EIR," of this Final EIR.

CEMEX Construction Materials Pacific, LLC (CEMEX or Operator) proposes to continue and modify its existing rock, sand, and gravel mining and processing operations at the Rockfield Quarry, and to reclaim the project sites upon completion of mining activities. The proposed project would require adoption of an amended Surface Mining and Reclamation Plan (SMRP), as well as approval of two Conditional Use Permits (CUP Application Nos. 3666 and 3667), which would amend the Operator's existing land use entitlements.

The Rockfield Quarry is located in an unincorporated area of Fresno County, north of the City of Fresno, between North Friant Road to the east and the San Joaquin River to the west. The project consists of two primary components: (1) the "Plant Site," which encompasses approximately 138.5 acres and contains aggregate processing and production facilities; and (2) the "Quarry Site," which encompasses approximately 352.4 acres and contains the primary mining operations. Collectively, these properties are referred to as the "project sites."

Mining operations at the Rockfield Quarry have been conducted continuously since at least 1913, with aggregate processing operations established at the Plant Site since 1924. Existing operations at the Plant Site and Quarry Site are governed by multiple Conditional Use Permits and have historically included aggregate extraction, processing, stockpiling, recycling of concrete materials, and associated support activities. In 2026, Fresno County approved a one-year extension of the existing Conditional Use Permits, allowing existing operations to continue through July 2027 while review of the proposed project is completed.

The proposed project would continue existing mining and processing activities within the established project sites and would introduce hard rock (granite) mining at the

Quarry Site in addition to continued extraction of alluvial materials. The project would also include the addition of processing facilities at the Quarry Site, modifications to existing facilities at the Plant Site, and an increase in permitted aggregate production and sales. Combined annual aggregate production would increase from the currently permitted level of 1.4 million tons per year (MT/year) to up to 3.0 MT/year over time.

The proposed project would be implemented in two stages. Stage 1 would involve continued operations at both the Plant Site and Quarry Site for up to approximately 30 years, including mining of remaining alluvial deposits at the Plant Site and continued operations at the Quarry Site. Upon completion of mining at the Plant Site, that site would be reclaimed and operations would shift entirely to the Quarry Site. Stage 2 would consist of continued mining and processing operations at the Quarry Site for an additional period of approximately 70 years. The total project life is estimated to be up to 100 years. At the conclusion of mining, both sites would be reclaimed to open space, riparian habitat, and open water habitat.

The objectives of the proposed project include maintaining a reliable, long-term local source of high-quality aggregate materials for the Fresno region; efficiently utilizing known mineral resources designated as Mineral Resource Zone 2 (MRZ-2); supporting regional construction needs; maintaining employment and economic contributions; and reclaiming the project sites in a manner consistent with surrounding San Joaquin River Parkway lands and the Fresno County General Plan.

Approval of the proposed project is a discretionary action subject to CEQA. This EIR has been prepared to inform decision-makers and the public of the potential environmental effects of the proposed project, to identify feasible mitigation measures to reduce or avoid significant impacts, and to evaluate reasonable alternatives to the project. A complete description of the proposed project is provided in Chapter 2, "Project Description," of the Draft EIR.

The Draft EIR for the proposed project was circulated for public review and comment in accordance with CEQA Guidelines requirements. This Final EIR has been prepared to provide responses to comments received on the Draft EIR, together with revisions and clarifications to the environmental analysis, and is intended to be used in conjunction with the Draft EIR. A summary of revisions, clarifications, and additional technical analyses prepared since publication of the Draft EIR is provided in Section 1.2, "Summary of Revisions to the Draft EIR."

1.2 SUMMARY OF ADDITIONAL STUDIES AND REVISIONS TO THE DRAFT EIR

1.2.1 Overview

This Final EIR includes revisions, clarifications, and additional technical analyses prepared in response to comments received on the Draft EIR, as well as evaluation by the County and its consultants. These updates clarify, refine, and expand upon the analysis presented in the Draft EIR.

The revisions include both (1) new or revised technical studies and (2) clarifications and expanded discussion of topics addressed in the Draft EIR. As described below, these updates do not result in new significant environmental impacts or a substantial increase in the severity of previously identified significant impacts.

1.2.2 New and Revised Technical Studies and Analyses

Since circulation of the Draft EIR, the following technical studies, technical memoranda, and analyses have been prepared or revised in response to comments received on the Draft EIR, as well as evaluation by the County and its consultants. Revisions to the Draft EIR associated with these updates are identified in Chapter 3, "Draft EIR Errata," and are further addressed in Chapter 4, "Responses to Comments."

- **Air Quality, Health Risk, and Climate Impact Assessment (Revised):** A fully revised Air Quality, Health Risk, and Climate Change Impact Assessment (April 2026) has been prepared and replaces Draft EIR Appendix D-1 in its entirety. The revised analysis incorporates updated emissions modeling, refined assumptions, and expanded discussion of health risk and greenhouse gas emissions. The revised study, included as Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," refines the analytical methods and assumptions but does not alter the impact significance conclusions presented in the Draft EIR. Related revisions to the Draft EIR are presented in Chapter 3.
- **Hydrology and Flood Hazard Analysis (200-Year Flood):** A 200-year flood analysis has been prepared to supplement the hydrology and water quality evaluation presented in the Draft EIR in accordance with Fresno County requirements. This analysis provides an additional conservative evaluation of potential flood hazards and informs site design considerations, including localized berm adjustments. The additional analysis does not alter the impact significance conclusions presented in the Draft EIR and is included as Appendix G-7, "200-Year Flood Hazard Analysis—Quarry Site," and Appendix G-8, "200-Year Flood Hazard Analysis—Plant Site," to this Final EIR.

- **Blasting and Human Response Technical Memorandum:** In response to comments received on the Draft EIR, a supplemental technical memorandum was prepared to further evaluate human response to blast-induced ground vibration and air overpressure and to support refinements to the blasting analysis and blasting protocols presented in the Draft EIR. The memorandum is included as Appendix H-8, "Blasting and Human Response Technical Memorandum," to this Final EIR, and the revised blasting protocols are included as Appendix H-9. These revisions do not alter the impact significance conclusions presented in the Draft EIR. Related revisions to the Draft EIR are presented in Chapter 3. The technical discussion is also presented in Response 58C-3 in Chapter 4.
- **Transportation Analysis Updates**. In response to comments received on the Draft EIR, supplemental transportation analyses were prepared to evaluate potential roadway deterioration, including pothole formation associated with project-related truck traffic, and potential project effects at the State Route 41/Friant Road interchange. These analyses are documented in the technical memoranda included as Appendix I-5, "Pavement Hazard Identification and Mitigation Technical Memorandum," and Appendix I-6, "State Route 41/Friant Road Interchange Analysis Technical Memorandum," to this Final EIR and support refinements to the transportation analysis and the addition of a mitigation measure addressing roadway conditions. The supplemental analyses do not alter the impact significance conclusions presented in the Draft EIR. Related revisions to the Draft EIR are presented in Chapter 3 and discussed in Chapter 4

1.2.3 Clarifications and Expanded Analysis

In addition to the new and revised technical studies described above, the Final EIR includes clarifications and expanded discussion in response to comments received on the Draft EIR and evaluation by the County and its consultants. These updates provide additional detail and explanation of the analysis presented in the Draft EIR but do not alter the overall impact conclusions.

- **Biological Resources Expanded Analysis:** Additional biological resources evaluation was completed in response to comments received on the Draft EIR, including expansion of the California Natural Diversity Database (CNDDB) search to a nine-quadrangle area to meet current industry standards, evaluation of additional special-status species, and expanded analysis of bats and other wildlife resources. Based on this expanded analysis, revisions have been made to the biological resources analysis and associated mitigation measures to further avoid or minimize potential impacts. The supplemental biological resources evaluation memorandum documenting this work is included as Appendix E-6, "WRA

Supplemental Biological Resources Evaluation Memorandum," to this Final EIR. These revisions clarify and refine the analysis presented in the Draft EIR but do not alter the impact significance conclusions.

- **Transportation Section Clarifications:** Clarifications and expanded explanation of methodologies, regulatory context (including VMT and LOS considerations), and assumptions have been incorporated throughout the transportation analysis in response to comments. These updates are reflected in Chapter 3 and in applicable responses to comments. This additional information does not alter the impact significance conclusions presented in the Draft EIR.

1.2.4 Summary of Impact Conclusions

Based on review of the revisions and additional information presented in this Final EIR, the County has determined that the updates amplify, clarify, and refine the analysis presented in the Draft EIR and include additional technical information prepared in response to comments and agency requirements as well as evaluation by the County and its consultants. While this Final EIR includes revised analyses and supplemental information, including updated technical studies and additional mitigation measures, these revisions do not constitute significant new information within the meaning of CEQA Guidelines Section 15088.5. Specifically, the revisions do not identify new significant environmental impacts, result in a substantial increase in the severity of previously identified impacts, or otherwise alter the conclusions of the Draft EIR.

The Final EIR includes the addition of mitigation measures addressing roadway conditions and potential impacts to special-status bat species, as well as refinements to the project's blasting protocols, along with clarifications and refinements to existing mitigation measures. These updates reflect additional analysis of previously disclosed impacts and enhanced environmental protection measures but do not alter the significance conclusions of the Draft EIR. Accordingly, recirculation of the Draft EIR is not required.

1.3 FINAL EIR REQUIREMENTS

This Final EIR provides responses to comments received on the Draft EIR. Section 15132 of the CEQA Guidelines requires that the Final EIR consist of:

- The Draft EIR or a revision of the draft;
- Comments and recommendations received on the Draft EIR either verbatim or in summary;
- A list of persons, organizations, and public agencies commenting on the Draft EIR;

- The responses of the Lead Agency to significant environmental points raised in the review and consultation process; and
- Any other information added by the Lead Agency.

This Final EIR for the proposed project has been prepared to provide responses to comments received on the Draft EIR and is to be used in conjunction with, rather than in place of, the Draft EIR. Therefore, the information in this Final EIR, which incorporates the Draft EIR including its appendices, fulfills state and County CEQA requirements for a complete EIR.

Chapter 3 of this Final EIR provides revisions for clarification or amplification of information in the record. As summarized in Section 1.2 above, these revisions do not constitute substantial new information or indicate a new impact or increase in the severity of an impact identified in the Draft EIR.

1.4 USE OF THE EIR IN THE DECISION-MAKING PROCESS

The EIR is an informational document designed to inform the public of the significant environmental effects of a project, identify possible ways to minimize or mitigate the significant effects, and describe reasonable alternatives to the project.

The County will use the EIR, together with economic, social, and technical information, to decide whether to approve the discretionary entitlements being requested. The County has made this Final EIR available prior to hearings on proposed project approval or denial to provide an opportunity for agency and public review of the complete EIR before decisions are made. In addition, the County provided responses to comments to each of the agencies commenting on the Draft EIR 10 days before the first County Planning Commission hearing to consider certification of the Final EIR.

The County reviews proposed mining use permits, reclamation plans, and financial assurance estimates before considering their approval. The proposed project would be regulated by the County in accordance with Section 834.4.220 (Material Extraction Sites) of the Fresno County Zoning Ordinance and the California Surface Mining and Reclamation Act (PRC Section 2710 et seq.).

The EIR (consisting of this Final EIR and the Draft EIR which is incorporated by reference) reviews the environmental consequences of the proposed project, as described in Chapter 4, "Environmental Analysis," of the Draft EIR. The County will use the EIR, along with other information, in its consideration of the Conditional Use Permit and Surface Mining and Reclamation Plan application.

Before rendering decisions on the discretionary actions, the County must certify that:

- the EIR has been completed in compliance with CEQA,
- the EIR was presented to the decision-making body of the Lead Agency,
- the information in the EIR was reviewed and considered by the Lead Agency before approving the project, and
- the EIR reflects the Lead Agency's independent judgment and analysis.

Should the County approve the proposed project, a statement of findings would be adopted for each significant environmental impact of the proposed project, accompanied by a brief explanation of the rationale for each finding. The possible findings are:

- changes or alterations have been required in, or incorporated into, the project to avoid or substantially lessen the significant environmental effects as identified in the Final EIR;
- such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency; and/or
- specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR.

The Lead Agency must adopt, in conjunction with the findings, a program for reporting or monitoring the changes that it has either required in the project or made a condition of approval to avoid or substantially lessen impacts (CEQA Guidelines Section 15091[d]). These measures must be fully enforceable through conditions of approval, agreements, or other measures in a program referred to as the Mitigation Monitoring and Reporting Program (MMRP), which shall be prepared in advance of a public hearing on the proposed project.

In addition, because of the significant and unavoidable impacts identified in the EIR, the County must adopt a statement of overriding considerations for those impacts to approve the proposed project. The statement of overriding considerations would set forth the specific reasons why the benefits of the project outweigh the unavoidable significant environmental impacts. The statement of overriding considerations and the findings must be adopted by the County decision-making body following its decision at a public hearing.

1.5 SIGNIFICANT AND UNAVOIDABLE IMPACTS

The Draft EIR identifies the project's environmental impacts that would remain significant after implementation of all feasible mitigation measures. In accordance with CEQA Guidelines Section 15126.2(c), a detailed discussion of significant and unavoidable impacts is provided in Draft EIR Chapter 7, "Other CEQA Topics." Chapter 3 of this Final EIR, "Draft EIR Errata," presents revisions to the Draft EIR, including revisions to the impact analysis and associated mitigation measure.

If the County determines to approve the project, it would be required to adopt a Statement of Overriding Considerations explaining the specific reasons why the project is being approved despite these impacts.

2—CEQA PUBLIC REVIEW PROCESS

THIS PAGE
INTENTIONALLY
LEFT BLANK

2—CEQA PUBLIC REVIEW PROCESS

2.1 PURPOSE OF THE PUBLIC REVIEW

The California Environmental Quality Act (CEQA) Guidelines Section 15201 states:

> Public participation is an essential part of the CEQA process. Each public agency should include provisions in its CEQA procedures for wide public involvement, formal and informal, consistent with its existing activities and procedures, in order to receive and evaluate public reactions to environmental issues related to the agency's activities. Such procedures should include, whenever possible, making environmental information available in electronic format on the Internet, on a web site maintained or utilized by the public agency.

Fresno County (County) has invited public input during the Environmental Impact Report (EIR) preparation process, including providing opportunities to review and comment during the scoping process and during Draft EIR circulation, as discussed further in Section 2.2, "Public Review Period and Notifications," below.

CEQA (California Public Resources Code [PRC] Section 21082.2(e)) explains that "[s]tatements in an environmental impact report and comments concerning an environmental impact report shall not be determinative of whether the project may have a significant effect on the environment." According to CEQA, it is the responsibility of the lead agency decision makers to "determine whether a project may have a significant effect on the environment based on substantial evidence in the record." (PRC Section 21082.2(a)). Substantial evidence is defined as facts, fact-related reasonable assumptions, and expert opinion. "Substantial evidence" does not include arguments, speculation, unsubstantiated opinion or narrative, clearly erroneous evidence, or socioeconomic impacts not related to the physical environment (PRC Section 21080(e), 21082.2(c), and CEQA Guidelines Section 15384).

2.2 PUBLIC REVIEW PERIOD AND NOTIFICATIONS

In accordance with both the specific requirements and the intent of CEQA, the environmental review process for the proposed project has included substantial opportunities for public and agency review and comment on the environmental evaluations. The public review process for the proposed project EIR has included the following opportunities:

- June 5, 2020, to July 6, 2020: EIR Public Scoping and Notice of Preparation of EIR Review Period

- June 22, 2020: Agency Scoping Meeting
- June 24, 2020: Public Scoping Meeting
- January 2, 2025, to March 10, 2025: Extended Draft EIR public review period
- January 16, 2025: Public Information Meeting

The revised Notice of Availability extending the Draft EIR public review period is included as Final EIR Appendix L, "Draft EIR Revised Notice of Availability."

This Final EIR or notices of its availability have been provided to commenting agencies, organizations, and individuals made available via the County website at: https://www.fresnocountyca.gov/eir7763 or electronic form via USB prior to proposed project hearings before County decision makers. The County provided responses to comments to each of the agencies commenting on the Draft EIR 10 days before the first County Planning Commission hearing to consider certification of the Final EIR.

2.3 SUMMARY OF PUBLIC INPUT AND APPROACH TO RESPONSES

Comments were received from 14 public agencies, 53 organizations and businesses, and 545 individuals. Each comment set (i.e., letter or e-mail) is included in Appendix M, "Draft EIR Comment Letters," of this Final EIR. A list of the agencies, organizations, and individuals who submitted comments is provided in the table of contents of this Final EIR.

Comments addressed a range of issues, including the content and analysis of the Draft EIR. Comments addressing the adequacy of the EIR or issues relevant to the environmental review included all of the CEQA checklist topics:

- Aesthetics and Visual Resources,
- Agricultural Resources,
- Air Quality,
- Biological Resources,
- Cultural Resources,
- Energy,
- Geology and Soils,
- Greenhouse Gas Emissions,
- Hazards and Hazardous Materials,
- Hydrology and Water Quality,
- Land Use and Planning,
- Mineral Resources,
- Noise,
- Population and Housing,
- Public Services,
- Recreation,
- Transportation,
- Tribal Cultural Resources,
- Utilities, and
- Wildfire

These comments were responded to with the level of detail appropriate to the comment and issue. In some cases, the County decided that it was appropriate to revise information in the Draft EIR to correct, clarify, or amplify information. These revisions are presented as errata in Chapter 3, "Draft EIR Errata.".

Some issues raised in comments did not speak to the adequacy of the Draft EIR or did not otherwise address environmental issues. These comments are included in the administrative record by virtue of their submittal to the County and will be considered by County decision makers. However, the Final EIR need not, and does not, respond in detail to non-environmental issues raised in comments. Responses to these issues in this Final EIR are limited to identifying that the comment does not raise an environmental issue and noting that decision makers will consider the issue separate from the environmental review process.

3—DRAFT EIR ERRATA

3.1 OVERVIEW

In reviewing and responding to comments on the Draft EIR, Fresno County (County) determined that revisions to portions of the Draft EIR text were warranted to correct, clarify, or amplify certain information. CEQA Guidelines Section 15088 provides that where the response to comments makes important changes in the information contained in the text of the Draft EIR, the lead agency should either revise the text in the body of the EIR or include marginal notes showing that the information is revised in the response to comments.

Section 3.2, "Errata," below, provides revisions to the Draft EIR as deemed necessary based on consideration of issues raised in comments on the Draft EIR. Revisions to the Draft EIR text are shown as *errata*, consisting of an excerpt of the Draft EIR text with changes represented with added text shown in underline (example) and deleted text show in strikethrough (~~example~~).

None of the changes provided in Section 3.2 constitute significant new information within the meaning of CEQA Guidelines Section 15088.5 because they are limited to clarifications, amplifications, and minor refinements to the analysis presented in the Draft EIR. The inclusion of this information in the Final EIR does not deprive the public of a meaningful opportunity to comment on a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect. The revisions also include clarifications and refinements to existing mitigation measures, as well as the addition of limited new mitigation measures based on supplemental analysis. The Final EIR does not identify any new significant impacts or substantial increases in the severity of any environmental effects identified in the Draft EIR. Therefore, recirculation of the Draft EIR is not required (see CEQA Guidelines Section 15088.5).

3.2 ERRATA

This section contains errata to the Draft EIR; each is preceded by a brief explanation of the purpose of the change to the Draft EIR text.

3.2.1 Errata to the Draft EIR Executive Summary

Explanation

Revisions have been made to the Draft EIR Executive Summary to correct an acreage number and provide additional context regarding the property owned by the California

Department of Fish and Wildlife. Draft EIR Executive Summary page ES-2 was revised as follows.

ERRATA

Plant Site: The Plant Site is located on approximately 138.5 acres adjacent to North Friant Road, approximately 1.5 miles north of the City of Fresno, and approximately 0.5 miles east of the San Joaquin River. The 138.5-acre Plant Site area includes approximately 126.6 acres owned by the ~~applicant~~ Operator (APNs 300-070-56S, 57S, 58S, 59S, and 60S) and ~~12.9~~approximately 11.9 acres owned by the California Department of Fish and Wildlife (CDFW) (portions of APNs 300-070-43ST, 48ST, and 50ST).

CDFW acquired the south half of the Ball Ranch in 2000, which included the approximately ~~12.9~~11.9-acre area that was part of the mining and processing operations associated with the Plant Site. In March 2019, the ~~applicant~~ Operator acquired the 126.6-acres of the Plant Site that was under lease from Ball Ranch, and the ~~applicant~~ Operator wishes to continue operations on those portions of CDFW property that are still utilized by the ~~applicant~~ Operator for its current operations. In the event CDFW does not allow operations to continue on the ~~12.9~~11.9 acres (on August 26, 2026, CEMEX received a letter from the California Department of Fish and Wildlife (CDFW) that, among other things, disputes the total CDFW-owned acreage. According to CDFW, this area consists of approximately 13.8 acres, not 11.9 acres. For purposes of this Errata, and as consistent with the DEIR and the Final EIR, CEMEX will refer to the area as consisting of 11.9 acres, with the understanding that this amount is disputed) currently owned by CDFW, such properties would not be used for mining and stockpiling operations. This Draft EIR conservatively assumes that CDFW property will continue to be used for mining and processing operations under the proposed project. Therefore, this ~~12.9~~11.9-acre area is included in the 138.5-acre Plant Site.

END OF ERRATA

Explanation

Revisions have been made to the Draft EIR Executive Summary to clarify the intent of Project Objective 2 by expanding the definition of aggregate to include all crushed rock and also to expand Project Objective 8 by including project consistency with the Fresno County General Plan. These revisions to the Project Objectives were made in response to requests by the Operator. Draft EIR pages ES-3 and ES-4 are revised as follows.

ERRATA

Project Objectives

The project purpose is to continue and expand existing mining and processing operations at the Plant Site and Quarry Site and reclaim the two sites when mining operations are complete.

The objectives for the proposed project are to:

1) Continue to provide a reliable and sustainable, local source of high-quality aggregate to help meet the current and long-term demand (100 years) for construction materials in the Fresno region;
2) continue to utilize known aggregate reserves from existing partially mined properties, including those mineral resources designated by the state and county as Mineral Resource Zone 2 (MRZ-2) (Mineral Resource Zone areas where adequate information indicates that significant mineral resources are present~~), i.e., sand and gravel)~~ to produce construction aggregates;
3) Continue to utilize high quality aggregate resources that meet the California Department of Transportation's specifications for use in Portland Cement Concrete (PCC) and Asphaltic Concrete (AC), which aggregate is important for quality infrastructure growth and maintenance because of its versatility, value, and relative scarcity;
4) Maintain a local source of construction aggregate with enough annual sales capacity (3.0 MT) to encourage a healthy, competitive market;
5) Continue to provide aggregate resources with access to an efficient local road network;
6) Continue to provide an environmentally sound project that would balance the recovery of the aggregate resource with the protection of other resources including wildlife habitat, groundwater, surface water, and air quality;
7) Continue local quality jobs, while also benefiting local downstream businesses and creating an enhanced tax revenue to the county;
8) Maintain consistency with the Fresno County General Plan and the San Joaquin River Parkway Master Plan;
9) Reclaim both sites to wildlife habitat in a manner similar to the reclaimed mine sites that make up the majority of the San Joaquin River Parkway Properties; and
10) Provide potential Parkway trail easements.

END OF ERRATA

3.2.2 Errata to the Draft EIR Chapter 1, "Introduction"

Explanation

An additional appendix was added to Draft EIR Appendix A, "Notice of Preparation," to provide copies of each comment letter received in response to the Notice of Preparation (NOP) for the project. Appendix A-3, "NOP Comment Letters," is inserted after Appendix A-2, "NOC of the Notice of Preparation."

Revisions are made to Draft EIR Chapter 1 to add a new appendix to Draft EIR Appendix A, "Notice of Preparation," which contains copies of each comment letter received in responses to the NOP for the proposed project.

ERRATA

A virtual scoping meeting for public agencies was held on June 22, 2020, using the Zoom teleconference format, and a virtual public scoping session for the general public was held on June 24, 2020, using the Zoom webinar format. All comments received by the County through these scoping sessions, or otherwise received in writing or via e-mail on the NOP, were accounted for during preparation of the Draft EIR. Appendix A-3, "NOP Comment Letters," provides copies of each written comment on the NOP.

END OF ERRATA

Explanation

The Draft EIR Executive Summary Table has been comprehensively updated to incorporate all errata presented in this chapter that affect impact statements or numbering, significance determinations, mitigation measures, or other information summarized in the table. These revisions reflect changes made in response to comments addressed throughout this Final EIR and ensure consistency between the Executive Summary and the revised text of the Draft EIR. Draft EIR Table ES-1, "Summary of Project Impacts and Mitigation Measures" beginning on Draft EIR page ES-11 is revised as follows.

ERRATA

Table ES-1
Summary of Project Impacts and Mitigation Measures

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
AESTHETICS AND VISUAL RESOURCES			
Impact 4.1-1: Have a substantial adverse effect on a scenic vista	PS	**Mitigation Measure 4.1-1:** Rock Staining to Reduce Visual Contrast Within two years of the ~~Following~~ completion of active mining in each western facing highwall/bench, visual modeling will occur to determine the portions of the completed highwall/bench visible from Locations #12 and #13 and those visible portions ~~each phase, an appropriate earth tone rock staining product shall be utilized on exposed and visible pit walls~~ shall be treated to reduce the color contrast to the extent feasible between the pit walls and the surrounding ~~undisturbed slopes~~ landscape. Methods to achieve this reduction include: (1) application of an appropriate earth tone rock staining product; and/or (2) application of a surface weathering accelerant to hasten formation of a natural patina.	SU
Impact 4.1-2: Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.	NI	None required.	
Impact 4.1-3: In nonurbanized areas, substantially degrade the existing visual character or quality of public views (i.e., views experienced from publicly accessible vantage points) of the project sites and their surroundings.	PS	Implement Mitigation Measure 4.1-1.	SU

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Impact 4.1-4: Creation of a new source of substantial light and glare that would adversely affect day or nighttime views in the vicinity of the project sites.	LTS	None required.	
AGRICULTURAL AND FORESTRY RESOURCES			
Impact 4.2-1: Convert prime farmland, unique farmland, or farmland of statewide importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.	NI	None required.	
Impact 4.2-2: Conflict with existing zoning for agricultural use, or a Williamson Act contract.	NI	None required.	
Impact 4.2-3: Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g)).	NI	None required.	
Impact 4.2-4: Result in the loss of forest land or conversion of forest land to non-forest use.	NI	None required.	
Impact 4.2-5: Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.	LTS	None required.	
AIR QUALITY			
Impact 4.3-1: Conflict with or obstruct implementation of the applicable air quality plan.	LTS	None required.	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Impact 4.3-2: Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standards	PS	**Mitigation Measure 4.3-2a:** Off Road Engines Off-road engines shall be retrofitted or upgraded in order to meet the Tier 4i Particulate Emissions standard of 0.008 grams of PM_{10}/horsepower-hour. **Mitigation Measure 4.3-2b:** Fugitive Dust Control Plan A Fugitive Dust Control Plan ~~shall be~~ has been prepared for the proposed project and shall be submitted to the San Joaquin Valley Air Pollution Control District (SJVAPCD) for review and approval prior to project implementation. The Applicant will also coordinate with the SJVAPCD for monitoring of this Mitigation Measure 4.3-2b and the approved Fugitive Dust Control Plan. The Fugitive Dust Control Plan ~~shall~~ demonstrates how the following will be implemented and enforced throughout project activities: • ~~Off-road engines shall be retrofitted or upgraded in order to meet the Tier 4 Interim Particulate Emissions standard of 0.008 grams of PM_{10}/horsepower-hour.~~ • Unpaved roads shall be controlled at all times by application of chemical dust suppressants or other equivalent methods with a minimum of 90% effectiveness. • Stockpiles shall be controlled at a level of 90% by daily application of water, by covering, or by use of another SJVAPCD approved chemical dust suppressant or other method.	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Impact 4.3-3: Expose sensitive receptors to substantial pollutant concentrations	~~PS~~ LTS	~~Implement Mitigation Measure 4.3-2.~~ None required.	~~LTS~~
Impact 4.3-4: Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people	PS	**Mitigation Measure 4.3-4:** Asphalt Plant Emissions Controls The following design features shall be incorporated into project plans to mitigate VOC, SVOC, and/or SO_2 emissions: 1) The type of asphaltic cement produced by on-site plants affects odorous emissions. Some asphaltic cements have lower VOC/SVOC emissions than others. Therefore, asphaltic cements with lower VOC/SVOC emissions, as approved by the SJVAPCD, shall be used to the extent feasible. 2) In accordance with SJVAPCD Rule 4309, the Project will implement "periodic burner tune-ups" that may reduce VOC emissions from the asphalt plant. ~~To reduce VOC emissions, periodic burner tune-ups shall be implemented.~~ 3) ~~Prior to issuance of a building permit for the proposed Asphalt Plant, project plans shall show that~~ ~~m~~Mixing drum vapors will be routed back to the dryer burner. Implementation of this provision shall be verified by ~~Imperial~~ Fresno County Building Inspectors prior to authorizing operation.	LTS
BIOLOGICAL RESOURCES			
Impact 4.4-1: Have an adverse effect, directly or indirectly, on special-status plant or wildlife species on the Plant Site or Quarry Site during mining operations.	PS	**Mitigation Measure 4.4-1a:** Burrowing Owl ~~A p~~Pre-construction ~~clearance~~ take avoidance surveys for burrowing owl shall be conducted on the Quarry Site prior to disturbing any grasslands in accordance with the CDFW Staff Report on Burrowing Owl Mitigation (dated	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		March 7, 2012). The ~~first~~ surveys shall occur as described in the CDFW Staff Report and shall be conducted ~~at least~~ no more than 14 days prior to the initiation of construction of the aggregate plant and/or of each mining phase ~~and the~~. The second survey shall be conducted within 24 hours of the start of construction of the aggregate plant and/or of each mining phase to ensure burrowing owl remain absent from the Quarry Site. ~~If burrowing owls are found to occupy observed within the Quarry Site grasslands at the time of the clearance survey, a relocation plan shall be developed, approved by CDFW, and implemented prior to development of any Quarry Site grasslands.~~ If no burrowing owls are observed, no further actions are required. If burrowing owls are observed within the Quarry Site or within adjacent lands in close enough proximity to be affected by proposed activities, the burrow will be protected using a combination of buffer zones, visual screens or similar measures as recommended by a qualified biologist congruent with recommendations in the CDFW Staff Report on Burrowing Owl. Buffer distances, visual barriers and other minimization practices will be based on the location of observation, time of year, and status of the burrowing owl burrow. If the active burrowing owl burrow cannot be avoided, the Operator shall consult with CDFW to obtain an Incidental Take Permit prior to excluding and relocating non-nesting owls from the burrow. In coordination with any measures	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		or mitigation required in the ITP, the following measures will at minimum be enacted to reduce effects to burrowing owl to less than significant levels: • Prior to any exclusion, mitigation for any lost habitat will be procured (i.e. credits purchased from an approved mitigation bank or mitigation lands protected through a recognized conservation easement). Suitable habitat shall be mitigated at a ratio of 1:1 (mitigation to impact) unless otherwise approved by CDFW. • Exclusion will not occur during the breeding season (February 1 – August 31). • If exclusion occurs immediately after the breeding season (September 1 – September 30) daily monitoring shall be conducted by a qualified biologist for a minimum of one week prior to relocation to confirm young of the year have fledged. • Exclusion will be performed only by a qualified biologist. • Biological monitoring shall be conducted prior to, during, and after exclusion of burrowing owls sufficient to ensure take is avoided. • Following completion of exclusion, a summary will be provided to the County and CDFW documenting the results. **Mitigation Measure 4.4-1b**: Western Pond Turtle and Western Spadefoot Pre-construction clearance surveys within the boundaries of the Quarry Site shall be conducted no more than 14 days	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		prior to removal of a temporary pond to be removed so that the aggregate or hardrock below the pond can be mined. A combination of visual and trapping surveys by a ~~CDFW~~ qualified biologist ~~may~~ shall be performed. A pond cannot be left elevated above the surrounding excavation, as a result avoidance of occupied habitat is not feasible. Therefore, if the species is determined to be present in work areas, the qualified biologist with approval of a relocation plan from CDFW ~~may~~ shall capture turtles and spadefoot prior to ~~construction~~ mining and reclamation activities and relocate them to nearby suitable habitat near the Quarry Site. Exclusion fencing ~~should~~ shall then be installed, if necessary and feasible, to prevent turtles and spadefoot from reentering the work area. ~~For the duration of work to remove the temporary pond, the biologist shall conduct at least weekly follow up visits to monitor effectiveness and take appropriate corrective action if protection measures are not adequate.~~ A qualified biologist shall be present during the draining and removal of the pond and shall monitor removal of the pond until no areas that could ensconce pond turtle or spadefoot remain. **Mitigation Measure 4.4-1c:** Nesting Birds If the initiation of construction (i.e. ground disturbing activities and/or blasting) at the Plant Site or the Quarry Site ~~initiation of a mining phase as shown on the Plant Site Mining Plan (Figure 2-7)~~ will occur between February 1 and August 31, ~~a~~ pre-construction clearance surveys for nesting birds, including ~~the above noted~~ the following raptor species: ~~(~~Swainson's hawk, bald eagle, osprey, red-	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		tailed hawk and white-tailed kite~~,~~) and the tricolored blackbird (Agelaius tricolor) ~~should~~ shall be conducted by a qualified biologist. A total of three surveys shall be conducted. Surveys will be separated from each other by at least one week, and the final survey will end within three (3) days of the start of any vegetation removal or ground disturbing activities~~ within~~. (Note that in accordance with the ~~immediate area of~~ Swainson's hawk survey protocol, the ~~mining phase where construction is to~~ survey efforts shall not be initiated ~~and as well as~~ during the period of April 21 to June 10, when active nests of this species are difficult to detect.) For general mining activities (not blasting) the survey area shall extend to all areas within 500 feet. For blasting events, the survey area shall extend to all areas within ~~a 50-foot buffer~~500 feet for most birds and 0.25-mile for large raptors including Swainson's hawk or bald eagle. Once ground disturbing activities or blasting have begun, if they are discontinued for a period of 7 or more days, a single survey shall be conducted (in addition to the already completed three surveys described above) to verify that no new active nests are present that could be impacted by the resumption of such ~~areas to ensure that no nesting birds will be disturbed during construction.~~ activities. If cessation of activities lasts longer than three weeks, the three-survey survey requirement described above shall be implemented. ~~As shown on Exhibit 5 in Appendix E 1, "Plant Site Habitat Assessment" there are no trees suitable for nesting at the Plant Site for the above noted raptor species~~	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		~~(Swainson's hawk, bald eagle, osprey, red tailed hawk and white tailed kite) except along Friant Road and outside the perimeter of the survey area. Therefore, the survey for the raptor species shall be limited to the initiation of construction along Friant Road and outside the perimeter of the survey area.~~ ~~If the initiation of construction at the new plant at the Quarry Site or the initiation of a mining phase as shown on the Quarry Site Mining Plan (Figure 2-8) will occur between February 1 and August 31, a pre-construction clearance survey for nesting birds, including the above noted raptor species (Swainson's hawk, bald eagle, red-tailed hawk and white tailed kite) and the tricolored blackbird (Agelaius tricolor) should be conducted by a qualified biologist within three (3) days of the start of any vegetation removal or ground disturbing activities within the immediate area of the mining phase as shown on the Quarry Site Mining Plan (Figure 2-8) where construction is to be initiated and as well as within a 50-foot buffer of such areas to ensure that no nesting birds will be disturbed during construction.~~ ~~As shown on Exhibit 5 in Appendix E-2, "Quarry Site Habitat Assessment," there are no trees suitable for nesting for the above noted raptor species except along the west side of the project next to the river. Therefore, the survey for the raptor species shall be limited to the initiation of construction along the west side of the project next to the river. The biologist who conducted the clearance survey should document a negative survey with a brief letter report indicating that no impacts to active~~	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		~~avian nests will occur.~~ If an active avian nest is discovered during the pre-construction clearance survey, ~~construction~~ mining and/or reclamation activities shall stay outside of a ~~300 foot~~ buffer recommended by the qualified biologist. Buffers may be as small as 100 feet around the active nest~~.~~ of non-status passerine species. For listed and raptor species, this buffer shall be expanded to 500 feet~~.~~ (minimum for raptors) and 0.25 mile for bald eagle or listed species such as Swainson's hawk. A ~~biological monitor~~ qualified biologist shall be present to delineate the boundaries of the buffer area and monitor the active nest as detailed below to ensure that nesting behavior is not adversely affected by ~~construction~~ mining and/or reclamation activities. Once the young have fledged and left the nest, or the nest otherwise becomes inactive under natural conditions, mining and/or reclamation ~~construction~~ activities within the buffer area can occur. Criteria related to the amount and duration of nest monitoring that ~~will~~ shall be required if an active avian nest is found are as follows: • If an active nest is found and construction will ~~remain outside of a 300/500 foot~~need to occur within the recommended buffer~~ from the nest~~, the ~~Biologist~~ qualified biologist shall watch the nest for at least ~~15 minutes during construction~~ 1 hour prior to initiating mining and/or reclamation activities and continuing for at least 1 hour following the start of mining and/or reclamation activities to determine if the nesting birds are disturbed by construction activities. If the birds	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		appear distressed or behave aggressively toward the construction, work will not occur within the buffer, and a greater avoidance buffer shall be implemented and ~~watched~~ observations by the ~~Biologist again~~ biologist will continue. Once a suitable buffer has been determined to be effective, the ~~Biologist~~ biologist may decide whether ongoing nest monitoring is warranted. • If an active nest is found and construction will occur within ~~300/500 feet of~~ the specified buffer for the active nest for multiple weeks, the nest shall be checked on the first day as described above, while establishing a suitable buffer. Subsequently the nest shall be checked at least ~~on a weekly basis~~ twice per week to determine if its status has changed. The ~~Biologist~~ biologist shall ~~check~~ then recheck the nest a week after mining and/or reclamation activities have ~~construction has left~~ ceased in the focal area ~~in order~~ to ~~document that the nesting activity continues to proceed successfully~~ note the status, e.g., if the nest remains active. • If the nest of a listed or fully protected species is found within ~~a~~ the survey buffer, ~~the~~ and work will need to occur within that buffer, CDFW will be notified ~~within 24 hours~~ for coordination of any additional monitoring ~~requirements~~ recommendations.	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		Mitigation Measure 4.4-1d: Bat Roost Assessment and Survey No more than 30 days prior to surface disturbing activities of an undisturbed area (e.g., vegetation removal, initial grading/mining or tree removal), a qualified biologist familiar with bats and bat ecology, and experienced in conducting bat surveys, shall conduct a bat habitat assessment amongst suitable habitat (e.g., large trees with crevices, cavities, exfoliating bark, foliage) within the surface disturbance area as well as within a buffer of 100 feet. The qualified biologist shall inspect the habitat areas for signs of bat use (e.g., whitewash, guano); shall inspect crevices, cavities, and exfoliating bark for bat presence (e.g., using a flashlight); and may use bat detection devices if needed. If no evidence of bat roosts or potential bat roosting substrates are found, the qualified biologist shall submit a report summarizing the results of the survey to the Operator, and further mitigation shall not be required. The Operator shall retain this report for five years and make it available to Fresno County staff upon request or as required for mitigation monitoring. If evidence of bat roosts is found, the qualified biologist shall submit a report summarizing the results of the survey to the Operator. The Operator shall retain this report for five years and make it available to Fresno County staff upon request or as required for mitigation monitoring. If evidence of bat roosts is observed during the maternity roosting season (April 1 – August 31), roost type, species and number of bats using the roost shall be	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		determined by a qualified biologist. Bat detectors may be used if deemed necessary to supplement survey efforts by the qualified biologist. A no-disturbance buffer of 100 feet shall be established around active bat maternity roost, and project activities shall not occur within this buffer until after the maternity season or roosts are unoccupied. If non-maternity roosts are found, or the survey identifies a suitable roost outside of the maternity roosting season (between September 1 and May 30) the qualified bat biologist will develop a bat exclusion plan to humanely evict bats from occupied trees or structures. Upon successful completion of the eviction, project activities may be allowed to resume within the buffer.	
Impact 4.4-2: Have an adverse effect, directly or indirectly, on special-status wildlife species in riparian habitat surrounding the Plant Site and Quarry Site during mining operations.	LTS	None required.	
Impact 4.4-3: Have an adverse effect, directly or indirectly, on special-status plant or wildlife species on the plant site or quarry site after the completion of mining and reclamation.	LTS	None required.	
Impact 4.4-4: Have a substantial adverse effect on any riparian habitat or other sensitive natural community.	PS	Implement Mitigation Measures 4.10-1 and 4.3-2a~~,~~ and -2b~~, and -2c~~.	LTS
Impact 4.4-5: Have an adverse effect on protected wetlands or waters of the state.	LTS	None required.	
Impact 4.4-6: Interfere with native resident or migratory fish or wildlife species movement, corridors, or nursery sites.	LTS	None required.	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Impact 4.4-7: Conflict with local policies or ordinances protecting biological resources.	PS	Implement Mitigation Measures 4.3-2a, 4.3-2b, ~~4.3-2c,~~ 4.4-1a, 4.4-1b, 4.4-1c, and ~~4.13-6~~4.10.	LTS
CULTURAL RESOURCES			
Impact 4.5-1: Substantial adverse change in the significance of a historical resource pursuant to CCR Section 15064.5.	LTS	None required.	
Impact 4.5-2: Substantial adverse change in the significance of an archaeological resource pursuant to CCR Section 15064.5.	PS	**Mitigation Measure 4.5-2:** Inadvertent Discovery of Archaeological Resources If prehistoric or historic-era cultural resources are encountered during project activities, all ground-disturbing activities within 50 feet of the find shall cease. The qualified archaeologist shall evaluate the significance of the resources and recommend appropriate treatment measures. Per CEQA Guidelines Section 15126.4(b)(3)(A), project redesign and preservation in place shall be the preferred means to avoid impacts too significant to archaeological sites. Consistent with CEQA Guidelines Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures in consultation with Fresno County, which may include data recovery or other appropriate measures. Fresno County shall consult with appropriate Native American representatives in determining appropriate treatment for unearthed cultural resources if the resources are prehistoric or Native American in nature. Archaeological materials recovered during any investigation shall be curated at an accredited curational facility. The qualified archaeologist shall prepare a report documenting evaluation and/or additional treatment of the resource. A copy of the report shall be provided to Fresno County and	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		to the Southern San Joaquin Valley Information Center. Construction can recommence based on direction of the qualified archaeologist and with concurrence from the County.	
Impact 4.5-3: Disturb human remains, including those interred outside of formal cemeteries.	PS	**Mitigation Measure 4.5-3:** Inadvertent Discovery of Unmarked Burials If human remains are uncovered during project activities, the project operator shall immediately halt work on the site, contact the Fresno County Coroner to evaluate the remains, and follow the procedures and protocols set forth in CEQA Guidelines Section 15064.4 (e)(1). If the County Coroner determines that the remains are Native American in origin, the Native American Heritage Commission (NAHC) will be notified, in accordance with Health and Safety Code Section 7050.5(c) and Public Resources Code (PRC) 5097.98 (as amended by Assembly Bill 2641). The NAHC shall designate a Most Likely Descendent (MLD) for the remains per PRC Section 5097.98, and the landowner shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located, is not damaged or disturbed by further development activity until the landowner has discussed and conferred, as prescribed in PRC Section 5097.98, with the MLD regarding their recommendations for the disposition of the remains, taking into account the possibility of multiple human remains.	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
ENERGY			
Impact 4.6-1: Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources.	PS	Implement Mitigation Measures 4.3-2a, 4.3-2b, and 4.8-1.	LTS
Impact 4.6-2: Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.	LTS	None required.	
GEOLOGY AND SOILS			
Impact 4.7-1: Exposure or people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, as a result of rupture of a known fault.	NI	None required.	
Impact 4.7-2: Exposure of people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, as a result of strong seismic ground shaking or as a result of seismically induced liquefaction, lateral spreading, or settlement.	LTS	None required.	
Impact 4.7-3: Exposure of people or structures to potential substantial adverse effects as result of landslides.	LTS	None required.	
Impact 4.7-4: Result in substantial soil erosion	LTS	None required.	
Impact 4.7-5: Result in the substantial loss of topsoil.	LTS	None required.	
Impact 4.7-6: Result in slope instability at the Plant Site.	PS	**Mitigation Measure 4.7-6:** Plant Site Slope Stability Monitoring The operator of the Rockfield Quarry (Operator) shall retain a County-approved qualified engineering geologist or geotechnical engineer experienced in evaluating the	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		stability of slopes in alluvial materials. The engineering geologist or geotechnical engineer shall develop an inspection and reporting program that would be implemented at the Plant Site. In general, the interim mining slopes as well as perimeter slopes should be periodically inspected, and recommendations for the reconfiguration of mining slope gradients, dewatering measures, and localized stabilizations should be developed as dictated by the exposed conditions. The engineering geologist or geotechnical engineer shall document the results of the inspection and any recommendations, and the Operator shall submit the inspection report to the County within 30 days following the inspection. The inspection report shall describe the subsurface materials and groundwater conditions observed and shall compare the observed conditions relative to those identified in the Plant Site geotechnical evaluation completed for the revised reclamation plan by Tetra Tech in 2021 ("Stability Assessment Perimeter Mining Slopes"). The Plant Site geotechnical evaluation shall be appended to the Mitigation Monitoring and Reporting Program and shall be incorporated into the conditions of approval for the project. If the conditions vary from the geotechnical evaluation document characterization, the engineering geologist or geotechnical engineer shall evaluate whether the changes would have an adverse impact on slope stability, and, if so, provide feasible recommendations to mitigate the slope stability concerns to achieve a minimum static factor of safety of 1.3 and a pseudo-static (seismic) factor of safety greater than 1.0. Recommendations shall be implemented within 6	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		months by the Operator, if feasible, otherwise no later than one year from the publishing of the recommendations.	
Impact 4.7-7: Result in slope instability at the Quarry Site	PS	**Mitigation Measure 4.7-7a:** Quarry Site Slope Stability Monitoring The operator of the Rockfield Quarry (Operator) shall retain a County-approved qualified engineering geologist or geotechnical engineer experienced in evaluating the stability of slopes in both hard rock and alluvial materials. The engineering geologist or geotechnical engineer shall develop an inspection and reporting program that would be implemented at the Quarry Site, which inspections will be semi-annual until a comprehensive and reliable geologic and groundwater model of the site is developed. In general, the interim mining slopes as well as perimeter slopes should be inspected as per the inspection and reporting program developed by the engineering geologist or geotechnical engineer. Recommendations for the reconfiguration of mining slope gradients, dewatering measures, and localized stabilizations should be developed as dictated by the exposed conditions. It is anticipated that the inspections will be more frequent until a comprehensive and reliable geologic and groundwater model of the Quarry Site is developed. The survey and monitoring program should at least include the following: • Groundwater regime characterization, including effects of dewatering on the aquifers and slope stability; • Rock mass discontinuities and structure characterization; and	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		• Slope stability evaluation, including kinematic failure analyses. The engineering geologist or geotechnical engineer shall document the results of each inspection and any recommendations, and the Operator shall submit the inspection report to the County within 30 days following the inspection. The inspection report shall describe the subsurface materials and groundwater conditions observed and shall compare the observed conditions relative to those identified in the Quarry Site geotechnical valuations completed for the revised reclamation plan by Tetra Tech in 2019 and 2021 ("Geological and Geotechnical Assessment Report" and "Response to Peer Review Comment, Geological and Geotechnical Assessment Report"). The Quarry Site geotechnical evaluations shall be appended to the Mitigation Monitoring and Reporting Program. If the conditions vary from the geotechnical evaluation documents characterization, the engineering geologist or geotechnical engineer shall evaluate whether the changes would have an adverse impact on slope stability or groundwater, and, if so, provide feasible recommendations to mitigate the slope stability concerns to achieve a minimum static factor of safety of 1.5 and a pseudo-static (seismic) factor of safety greater than 1.1. Recommendations shall be implemented within 6 months by the Operator, if feasible, otherwise no later than one year from the publishing of the recommendations.	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		Mitigation Measure 4.7-7b: Quarry Site Kinematic Analyses During the mining excavations, the County-approved qualified engineering geologist or geotechnical engineer identified in Mitigation Measure 4.4-7a shall carry out periodic field surveys of structural geologic data and shall apply this information to kinematic analyses of the quarry pit. Initially, during the first year of the mining in the bedrock, the field survey shall be carried out every 6 months. After that, during the Phase 1 mining, the mapping shall be carried out every time the excavation exposes an area of approximately 50 vertical feet and 1,000 horizontal feet of previously unmapped slope. This mapping frequency shall continue until a robust geologic model is developed and verified. Subsequent mapping intervals may be increased to about 1 to 2 years, depending on the exposed conditions. If/when the geologic conditions are found to be consistent as mining progresses, the County shall be notified, and the field mapping and kinematic analysis program may be entirely phased out. As the mapping proceeds, structural domains (i.e., portions of the rock mass with similar patterns of rock mass discontinuities) shall be identified and appropriate kinematic analysis of various failure modes such as planar, wedge, and toppling type failures should be evaluated for each identified structural domain. The analysis shall take into account the groundwater conditions observations required under Mitigation Measure 4.4-7c. The mapping and the associated	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		quantitative database, interpretations, kinematic analyses, failure potential assessment, and any appropriate recommendations to prevent kinematic-type failure shall be summarized in a written report after the completion of each mapping mobilization and submitted to the County by the Operator within 30 days of the completion of each field survey. The report shall also include a summary of the groundwater conditions observations required under Mitigation Measure 4.4-7c. Recommendations shall be implemented within 6 months by the Operator, if feasible, otherwise no later than one year from the publishing of the recommendations. **Mitigation Measure 4.7-7c:** Quarry Site Groundwater Conditions The County-approved qualified engineering geologist or geotechnical engineer identified in Mitigation Measures 4.7-7a and 4.7-7b shall conduct observations of groundwater conditions relevant to slope stability along with the geologic observation of kinematic conditions carried out in support of Mitigation Measure ~~4.4-7b~~4.7-7b. These observations shall focus on the potential presence of: • Artesian conditions; • Preferential seepage paths; and • Piping conditions. To assist with these observations, a series of piezometers shall be installed within six months of project commencement and within the hard to very hard intact granitic rock. Although there are currently seven	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		monitoring wells in the Quarry Site completed within the intact rock, these wells cover the full interval to be mined. As such, they do not adequately allow for the observation of differences in water pressures at different depths or within different groups of fractures. At least four additional piezometer clusters shall be installed as described below: • Two locations spaced equally between MW-1 and MW-2 along the westerly perimeter of the quarry pit along the San Joaquin River; • One location at the eastern boundary near the entry point from Friant Road; and • One location at the southwest limit of the project area between MW-2 and MW-7. The installations shall be nested to establish at least 3 monitoring intervals within the intact bedrock. Each interval shall be about 100 feet long with the shallowest interval extending from the top of the intact bedrock to a depth of about 200 feet, the second interval extending from a depth of approximately 200 feet to approximately 300 feet, and the third interval extending from approximately 300 feet to approximately 400 feet. In no case shall the screened interval for each piezometer section overlap with the interval above or below. Additional groundwater monitoring intervals and/or locations may be required depending on the actual groundwater conditions encountered during mining. The field observations shall also include assessment of seepage conditions in the mined bedrock slopes, if any are	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		found to occur. Specifically, seepage conditions shall be evaluated that may indicate local or more extensive rock slope instability due to local water pressure conditions. Documentation of groundwater observations shall be submitted to the County as required under Mitigation Measure 4.7-7b.	
Impact 4.7-8: Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.	LTS	None required.	
Impact 4.7-9: Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater.	LTS	None required.	
Impact 4.7-10: Directly or indirectly destroy a unique geological feature.	NI	None required.	
Impact 4.7-11: Directly or indirectly destroy a unique paleontological resource.	PS	**Mitigation Measure 4.7-11:** Paleontological Resources Prior to initiation of ground disturbance, the operator of the Rockfield Quarry (Operator) shall develop and submit to the County Planning Department for review and approval a project-specific paleontological resource impact mitigation program (PRIMP) for the Plant Site and Quarry Site. The PRIMP shall only be implemented at the Quarry Site until mining of any remaining alluvial deposits is complete. The PRIMP shall not be required at the Quarry Site if the alluvial deposits remaining on the site are mined under the existing CUP. The PRIMP should be developed by a professional paleontologist (Project Paleontologist, Principal Investigator) who meets Society of Vertebrate Paleontology (2010) qualification standards. The PRIMP will specify the steps to be taken to mitigate	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		the potential of mining excavation and reclamation-related ground disturbing activities to destroy paleontological resources. At a minimum, these measures shall include development of a Worker's Environmental Awareness Training Program that shall be presented in-person to all field personnel prior to the start of each phase of project-related earth-moving activities, as well as to any new field personnel prior to beginning work on the site. The following directive shall be included in employee and contractor training materials: "The subsurface of the quarry may be sensitive for paleontological resources in the alluvial (non-bedrock) materials. If paleontological resources are encountered during subsurface disturbance, all ground disturbing activities within 100 feet [or another appropriate distance specified in the PRIMP] of the find shall be redirected and a professional paleontologist contacted to assess the situation, consult with agencies as appropriate, and make recommendations for the treatment of the discovery. Employees and contractors shall not collect or move any paleontological materials. Paleontological resources include fossil plants and animals, and such trace fossil evidence of past life as animal tracks. Employee/contractor acknowledges and understands that excavation or removal of paleontological material is prohibited by law and constitutes a misdemeanor under California Public Resources Code, Section 5097.5."	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		A copy of the training materials and documentation of completed training shall be provided to the County for review upon request. The PRIMP shall specify whether field monitoring during earthmoving activities is required, and, if so, the frequency of required monitoring (i.e., full-time, spot-check, etc.). Approximately 96 acres of the Plant Site have already been partially mined to depths of between 5 to 32 feet bgs and backfilled. (See 2.4.2.1.) Any monitoring (i.e., spot-check) should be limited to mining of the remaining undisturbed alluvial material. The PRIMP shall require that if a paleontological resource is encountered during earthmoving activities, the Operator shall notify the County and all activity within 100 feet (or another appropriate distance specified in the PRIMP) of the find shall halt until it can be evaluated by a professional paleontologist. The paleontologist shall evaluate the resource and determine its significance. If significant, the paleontologist shall notify the County and the Operator. The PRIMP shall provide details about fossil collection, analysis, and preparation for permanent curation at an approved repository. Lastly, the PRIMP shall describe the different reporting standards to be used for negative or positive findings during construction activities.	
GREENHOUSE GAS EMISSIONS			
Impact 4.8-1: Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.	~~PS~~ LTS	None required. ~~**Mitigation Measure 4.8-1:** Asphalt Plant Performance Standards~~ ~~The asphalt plant dryer drum and mixing chamber shall be separated so that dryer exhaust gases do not contact~~	~~LTS~~

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		~~liquid asphalt and premium efficiency electric motors with exhaust fan motors shall be equipped with variable frequency speed control. These specifications shall be shown on project plans and submitted to the San Joaquin Air Pollution Control District as part of the application for Authority to Construction the proposed asphalt plant. Air district staff will verify implementation of this measure as part of the permit review process.~~	
Impact 4.8-2: Consistency with applicable GHG plans, policies, or regulations.	LTS	None required.	
HAZARDS AND HAZARDOUS MATERIALS			
Impact 4.9-1: Create a significant hazard to the public or the environment through the routing transport, use, or disposal of hazardous materials or through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment during construction, relocation, and/or demolition activities.	PS	**Mitigation Measure 4.9-1:** Survey for PCB-Containing Building Materials Prior to the County issuing a demolition permit for the aggregate processing plant, the operator of the Rockfield Quarry shall prepare a comprehensive Hazardous Building Materials Survey for the project site signed by a qualified environmental professional. The Hazardous Building Materials Survey shall document the presence, or lack thereof, of PCB-containing equipment and materials. The Hazardous Building Materials Survey shall include abatement specifications for the stabilization and/or removal of the identified hazardous building materials in accordance with all applicable laws and regulations. The demolition contractor(s) shall implement the abatement specifications and submit to the County evidence of completion of abatement activities prior to demolition of the existing structure.	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Impact 4.9-2: Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials transported, used, or disposed of during mining or final reclamation.	PS	Implement Mitigation Measure 4.10-1	LTS
Impact 4.9-3: Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials transported, used, or disposed of post-reclamation.	LTS	None required.	
Impact 4.9-4: Create a significant hazard to the public or the environment through flyrock generated by the use of blasting agents on the Quarry Site.	PS	Implement the Flyrock Mitigation Plan established by the Blasting Protocols as required by Mitigation Measure 4.10-1.	LTS
Impact 4.9-5: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.	LTS	None required.	
Impact 4.9-6: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.	LTS	None required.	
HYDROLOGY AND WATER QUALITY			
Impact 4.10-1: Violate surface water quality standards or waste discharge requirements or otherwise substantially degrade surface water quality at the Plant Site or Quarry Site during mining and reclamation.	PS	**Mitigation Measure 4.10-1:** Blasting Protocols The operator of the Rockfield Quarry shall at all times implement the requirements of the "Blasting Protocols" developed October ~~27~~12, 2020, and updated ~~September 8, 2021~~April 29, 2026, by Vibra-Tech Engineers, Inc. The Blasting Protocols shall be appended to the Mitigation Monitoring and Reporting Program and shall be incorporated into the conditions of approval for the	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		project. County staff shall monitor and verify, on a semi-annual basis, implementation of the Blasting Protocols throughout project operations.	
Impact 4.10-2: Violate surface water quality standards or waste discharge requirements or otherwise substantially degrade surface water quality at the Plant Site after the completion of mining and reclamation.	LTS	None required.	
Impact 4.10-3: Violate surface water quality standards or waste discharge requirements or otherwise substantially degrade surface water quality at the Quarry Site after the completion of mining and reclamation.	LTS	None required.	
Impact 4.10-4: Violate groundwater quality standards or otherwise substantially degrade groundwater quality at the Plant Site due to activities conducted during mining and reclamation.	LTS	None required.	
Impact 4.10-5: Violate groundwater quality standards or otherwise substantially degrade groundwater quality at the Plant Site due to the ponding of water in the excavation.	PS	**Mitigation Measure 4.10-5a:** Plant Site Pond Adaptive Management Program With oversight and enforcement by Fresno County, t~~T~~he Operator of the Rockfield Quarry shall implement an adaptive management program at the Plant Site that includes monitoring, comparison of monitoring results with action levels, and subsequent implementation of mitigation measures if the action levels are exceeded. The impact does not have the potential to occur until after mining on part or all of the Plant Site area is completed, and water is allowed to fill all or a part of the excavated quarry pit. Therefore, monitoring under the adaptive management program shall begin when the quarry	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		Operator allows water to begin to fill all or part of the excavated mine pit. At the latest, monitoring shall begin at the completion of the Phase 1 mining at the Plant Site. A qualified professional shall be responsible for the monitoring and reporting to be conducted under the adaptive management program. The qualified professional's qualifications shall be provided to the County prior to the start of the monitoring under the adaptive management program. Every six months, the qualified professional shall supervise field measurements for the parameters, and associated action levels, listed below. • pH>8.5 • Conductivity >700 micromhos/cm @ 25 degree C • Temperature (no action level) • Dissolved oxygen (DO) <8 mg/L or <70% of saturation • Oxidation-reduction potential (ORP) <0 These parameters are general indicators of water quality and the potential for reducing conditions to form that could mobilize naturally occurring iron and manganese and thereby degrade water quality. An annual report documenting the methodology and results of the sampling shall be submitted to Fresno County. The field measurements shall be conducted at two depths: (1) near the surface of the water and (2) near the bottom of the water column. If any of the action levels shown in the "Field Indicator Parameters" table are exceeded for two	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		successive monitoring events, then water samples shall be collected from the Plant Site pond and submitted to an analytical laboratory for analysis of iron and manganese. If the iron concentration exceeds its secondary MCL and NPDES discharge limit of 300 ug/L, or manganese exceeds its secondary MCL and NPDES discharge limit of 50 ug/L mg/L, then the laboratory testing shall be completed again in six months to assess whether there are potential seasonal influences. If the iron and/or manganese levels do not consistently remain below their respective water quality standards, then the semiannual field monitoring shall continue. If no exceedances of the action levels shown in the "Field Indicator Parameters" table or of the iron and manganese water quality standards occur for a period of five years, then the water quality conditions in the reclaimed Plant Site pond shall be considered to have stabilized and no further monitoring shall be necessary. A final monitoring report shall be submitted to the County documenting the cessation of monitoring. If the iron and/or manganese levels persist for five consecutive years above their respective water quality standards, then the following mitigation actions shall be implemented <u>within six months of the end of the five-year monitoring period</u>: • Aeration or mechanical circulation of the water from the bottom of the pond to the surface of the pond. Reducing conditions that favor high pH values and low dissolved oxygen (DO) values,	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		resulting in higher concentrations of iron and manganese, typically form at the bottom of ponds due to the breakdown of organic matter, such as dead aquatic or riparian vegetation. Aeration or mechanical circulation of the water from the bottom of the pond to the surface of the pond would better distribute DO throughout the water column and would minimize the formation of reducing conditions. • Additional Measures. If substantial amounts of submerged aquatic vegetation form within the pond, or riparian vegetation such as reeds and cattails form around the perimeter of the pond, and aeration or water circulation alone is insufficient to eliminate the reducing conditions, then further measures to minimize the vegetation would be implemented. Such measures may include physical removal by hand or mechanical equipment (e.g. dredging), growth prevention using physical barriers (e.g. tarps or bottom barriers) in areas of heavy growth, or use of approved terrestrial or aquatic herbicides if other methods are not feasible or effective. Any herbicides used in implementing this measure shall comply with applicable Regional Water Quality Control Board Basin Plan specifications and Waste Discharge Requirements. Monitoring results shall be reported to the County in an annual report that ~~would~~ will be submitted at the end of the first quarter of every year. The annual report shall describe any measures that have been or are planned to be	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		taken based on the monitoring results and provide the timing of measure implementation, an analysis of the effectiveness of the measures, and a description of any further recommended measures, as part of subsequent annual reports. **Mitigation Measure 4.10-5b:** Plant Site Pond Adaptive Management Program Funding Mechanism Prior to the completion of mining, the Operator shall establish a funding mechanism to provide a permanent funding source for the monitoring of the final reclaimed pond on the Plant Site. The funding mechanism shall be sufficient to cover costs associated with the annual monitoring and reasonably foreseeable actions that may be required to address oxygen reducing conditions, if necessary. The funding mechanism shall be managed by a third party approved by the Operator and County. The Operator shall submit for County review and approval, a proposed funding mechanism and cost basis. If conditions stabilize and no further monitoring is required, as described above in Mitigation Measure 4.10-5a, then the funding mechanism would be cancelled, and any funds returned to the Operator.	
Impact 4.10-6: Violate groundwater quality standards or otherwise substantially degrade groundwater quality at the Quarry Site during mining and reclamation.	PS	Implement Mitigation Measure 4.10.1	LTS
Impact 4.10-7: Violate groundwater quality standards or otherwise substantially degrade groundwater quality at the Quarry Site due to the ponding of water in the excavation.	LTS	None required.	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Impact 4.10-8: Substantially decrease groundwater supplies during mining operations and after the completion of reclamation at the Plant Site such that the project could interfere with existing groundwater supply wells.	LTS	None required.	
Impact 4.10-9: Substantially decrease groundwater supplies during mining operations and after the completion of reclamation at the Plant Site such that the project may impede sustainable groundwater management of the basin.	LTS	None required.	
Impact 4.10-10: Substantially decrease groundwater supplies during mining operations and after the completion of reclamation at the Quarry Site such that the project could interfere with existing groundwater supply wells.	PS	**Mitigation Measure 4.10-10a:** Quarry Site Groundwater Adaptive Management Program To assess any potential effect on the CSA 44C wells due to the proposed excavation of a hard rock quarry pit at the Quarry Site, monitoring shall be conducted in the nested set of wells between the Northeast Pond and the CSA 44C wells, and in the CSA 44C wells themselves. The existing MW-3 well cluster, with individual wells completed in the alluvium, weathered rock, and hard rock, is appropriately located for this purpose. In addition, the data from the MW-3 well cluster provides a continuous record of water level conditions at this location since August 2017, when dataloggers were installed~~for several years prior to implementation of the project~~. The water levels recorded in the MW-3 well cluster from 2017 until the time that mining and dewatering in the weathered rock begins after approval of the project will be used to define the baseline groundwater level conditions. Baseline water level ranges will be identified for the alluvium, weathered rock, and hard rock, specifically identifying conditions during	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		drought periods, wet periods, and seasonal fluctuations, and these baseline conditions shall be documented in the first annual groundwater monitoring report. Pumping and water level data from the CSA 44C wells has been provided by Fresno County to support the analysis in this EIR. Fresno County will continue to provide these data sets to the Operator for the purposes of implementing this Adaptive Management Program. Monitoring of the water levels in the MW-3 cluster will continue to~~shall~~ be conducted using the downhole pressure transducers with dataloggers, which have been in place since August 2017. ~~Dataloggers are already installed in the MW-3 wells~~ (Installation of dataloggers was previously attempted in the CSA 44C wells. Due to the construction of the well head and the pump system, it was not possible to install dataloggers in a manner that would not potentially interfere with the operation of the pumping equipment.) The dataloggers shall be programmed to record water levels at least once every six hours such that a range of static and pumping water level effects would be captured. The data shall be downloaded every six months for review and subsequent inclusion in annual ~~mitigation~~ groundwater monitoring reports. The annual ~~mitigation~~ groundwater monitoring reports shall be prepared by a Professional Geologist/Certified Hydrogeologist and submitted to Fresno County annually ~~at the end of the first quarter of every~~ no later than March 31st each subsequent year. The annual report shall describe any additional measures that have been or are planned to be taken based on the monitoring results, in accordance with this adaptive management program. The first annual report shall be	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		completed at the end of the first quarter of the year after the use permit becomes active and shall describe the baseline water level ranges at the MW-3 cluster for the alluvium, weathered rock, and hard rock, specifically identifying conditions during drought periods, wet periods, and seasonal fluctuations. If the monitoring data indicate that groundwater levels in any of the monitored wells drop such that the available water column decreases by more than 15 percent (analytical solutions for drawdown in a well in an unconfined aquifer indicate that when the drawdown reaches 30% to 45% of the available water column, the reduction in the transmissivity is large enough to potentially cause the drawdown rate to become unstable and increase rapidly. Therefore a 2 to 3-fold factor of safety was used to identify the 15% criterion for this Adaptive Management Plan) then ~~a significant impact to available groundwater supply will have occurred~~ additional assessment as specified below is required. The data from the MW-3 well cluster shall be evaluated to ~~verify whether the impact is specific to the weathered rock and/or hard rock and is not~~ determine if the effect is related to the project or due to other unrelated factors, such as drought, a reduction in regional groundwater recharge (for example, by changes in operating practices along the Friant Kern Canal), or use of groundwater by future developments located upgradient to the north and northeast of the Quarry Site and CSA 44C wells. If the additional assessment confirms that a decrease in water levels greater than 15 percent is the result of mine	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		dewatering, and is not due to other factors (such as those listed above)~~exclusively attributable to mine dewatering~~, then corrective measures would be implemented. ~~"For this analysis, a factor of safety has been applied, such that a criterion of 15 percent reduction in the water column is used to define the condition where a potentially significant impact may occur to the production capacity of a well. Use of the 15 percent criterion is conservative (i.e., protective of groundwater resources) not only due to the applied factor of safety, but also because it accounts for shallow wells or wells with a small water column that may be at a greater distance from the quarry. Other approaches that are based only on the total amount of drawdown do not take into consideration the effects to shallow wells at greater distances from the dewatering location (i.e., the quarry)" (EMKO, October 3, 2023).~~ The initial corrective measure would be to divert additional water from the mining excavation into the Northeast Pond or to a recharge trench to be constructed along the northeast side of the Quarry Site to enhance recharge in the area of CSA 44C wells. The rate of pumping into the Northeast Pond or recharge trench would be increased until the water level in the MW-3 well cluster and the CSA 44C wells recovers to a point between baseline and 15% below baseline. If, during mining, all available water from dewatering is being pumped to the Northeast Pond or recharge trench and the water level in the MW-3 well cluster remains 15% or more below the	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		baseline elevations, then mining could not progress to greater depths in the quarry, although mining could proceed to the full width allowed at that depth under the reclamation plan. If such a condition occurred, then the Reclamation Plan would be amended to reflect the adjusted depth of the quarry. For wells completed west of the Quarry Site, and for the San Joaquin River, the existing MW-1 monitoring well cluster provides an appropriate monitoring location for the purposes of this adaptive management plan. Water levels have been measured in the three wells at the MW-1 cluster since August 2017 using downhole pressure transducers with dataloggers. The water levels recorded in the MW-1 well cluster from 2017 until the time that mining and dewatering in the weathered rock begins after approval of the project will be used to define the baseline groundwater level conditions. Baseline water level ranges will be identified for the alluvium, weathered rock, and hard rock, specifically identifying conditions during drought periods, wet periods, and seasonal fluctuations, and, similar to the MW-3 well cluster, these baseline conditions shall be documented in the first annual report. If access can reasonably be gained to any of the five private wells in Table 4.10-9 located to the west of the Quarry Site from the private owners, then those wells should also become part of the monitoring program. Groundwater levels would continue to be recorded using downhole pressure transducers with dataloggers, programmed to record water levels at least once every six hours such that a range of static and pumping water level effects would be	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		captured. The data would be downloaded every six months for review and subsequent inclusion in annual groundwater mitigation monitoring reports. The annual report would also describe any additional measures that have been or are planned to be taken based on the monitoring results, in accordance with this adaptive management program. If the monitoring data indicate that groundwater levels in any of the monitored wells drop such that the available water column decreases by more than 15 percent as compared to the baseline level, then ~~a significant impact to available groundwater supply will have occurred.~~ additional assessment as specified below is required. This conclusion would be confirmed by analysis of data from the MW-1 well cluster to ~~verify that~~ determine if the ~~impact~~ effect is ~~specific~~ related to the ~~weathered rock and/~~project or ~~hard rock and is not~~ due to other unrelated factors, such as drought, future developments in the area that rely on groundwater, or a reduction in regional groundwater recharge (for example, by changes in operating practices on the San Joaquin River or the Friant Kern Canal). ~~For the San Joaquin River, the impact must be specific to both the alluvium and weathered rock aquifer zones.~~ If the additional assessment confirms that the decrease in water levels is the result of mine dewatering, and is not due to other factors (such as those listed above)~~is primarily due to mine dewatering~~, then corrective measures would be implemented. The initial corrective measure would be to divert additional water from the mining excavation into the	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		recharge trench adjacent to the San Joaquin River on the west side of the Quarry Site. The rate of pumping into the recharge trench would be increased until the water column in the MW-1 well cluster and any monitored private wells west of the Quarry Site recover to within 85 percent or more of baseline levels. If, during mining, all available water from dewatering is being pumped to the western recharge trench and the water column in the MW-1 well cluster remains below 85 percent of baseline elevations, then mining could not progress to greater depths in the quarry, <u>although mining could proceed to the full width allowed at that depth under the reclamation plan</u>. If such a condition occurred, then the Reclamation Plan would be amended to reflect the adjusted depth of the quarry. If mining progresses to completion without impacting nearby wells ~~or flows in the San Joaquin River~~, then monitoring in the MW-1 and MW-3 well clusters will continue for at least 3 years, to include at least two below-normal rainfall years or one critically dry year, as defined by DWR. Dewatering will cease once mining is completed, so groundwater levels will begin to recover. During the post-mining monitoring period, the rate that water is pumped to the Northeast Pond and the recharge trenches will be reduced proportionally in accordance with the rate that the water level in the pond recovers. If the drawdown in the MW-1 and MW-3 monitoring well clusters is less than 15% at the end of the initially required monitoring period, then no further mitigation is required, monitoring can cease, and the related pumps, piping, and other	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		equipment can be removed from the Quarry Site and monitoring equipment on private wells will be removed. However, if at the end of the monitoring period, the drawdown in the monitoring wells is greater than 15%, then pumping to the Northeast Pond, east recharge trench, and/or west recharge trench, as appropriate based on the post-mining monitoring data, must continue ~~indefinitely to reduce~~until the drawdown in the monitoring well clusters is reduced to below the 15% criterion. ~~**Please see Section 4.10 for a footnote on this measure.*~~ **Mitigation Measure 4.10-10b:** Quarry Site Groundwater Adaptive Management Program Funding Mechanism During the mining period, the Operator will be present to fund and implement the Quarry Site Groundwater Adaptive Management Program described in Mitigation Measure 4.10-10a. Implementation of that Program would be a condition of approval for the Conditional Use Permit. ~~Prior to the completion of mining~~Once mining ceases, and prior to the release of the financial assurance mechanism for reclamation, the Operator shall establish a post-reclamation funding mechanism to provide a ~~permanent~~secured funding source for ~~the initial 3 years of~~ monitoring of groundwater levels in the MW-1 and MW-3 well clusters, ~~and~~ review of CSA 44C well monitoring data from the County, and monitoring of wells west of the San Joaquin River that become part of the monitoring program after mining ceases and dewatering is no longer occurring in the quarry pit. The post-reclamation funding mechanism shall be sufficient to cover costs associated with the annual monitoring, the technical analysis and	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		reporting described in Mitigation Measure 4.10-10a, and reasonably foreseeable actions that may be required to address excessive drawdown, including continuing to pump water to the Northeast Pond and recharge trenches indefinitely, if necessary. Upon completion of mining and prior to release of the financial assurance mechanism to be in place through reclamation, the~~The~~ Operator shall submit for review and approval by the County Department of Public Works and Planning~~Agency Director, or designee, ("Director")~~ a proposed funding mechanism (e.g., a bond) and cost basis to secure costs related to the required Quarry Site groundwater adaptive management activities as described in Mitigation Measure 4.10-10a, above. The funding mechanism shall be held by the County or held and managed by a third party approved by the Operator and County, as determined by the ~~Director~~County. Following the completion of the post-mining monitoring period and if conditions are confirmed to be stabilized~~If conditions stabilize~~ and no further monitoring or management actions are~~is~~ required, as described in Mitigation Measure 4.10-10a, then the funding mechanism would be ~~cancelled~~released, and any remaining funds returned to the Operator.	
Impact 4.10-11: Substantially decrease groundwater supplies during mining operations and after the completion of reclamation at the Quarry Site such that the project may impede sustainable groundwater management of the basin.	LTS	None required.	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Impact 4.10-12: Substantially decrease groundwater levels in a manner that would result in the flow of substantial volumes of water from the San Joaquin River to the Quarry Site.	PS	Implement Mitigation Measures 4.10-10a and 4.10-10b	LTS
Impact 4.10-13: Interfere substantially with groundwater recharge at the Plant Site and Quarry Site such that the project may impede sustainable groundwater management of the basin.	LTS	None required.	
Impact 4.10-14: Alter drainage patterns in a manner which would result in substantial erosion or siltation on or off site.	NI	None required.	
Impact 4.10-15: Alter drainage patterns in a manner which would result in on or off-site flooding or exceed the capacity of the existing storm drainage system.	NI	None required.	
Impact 4.10-16: Alter drainage patterns in a manner which would impede or redirect flood flows.	NI	None required.	
Impact 4.10-17: Release of pollutants in flood hazard, tsunami, or seiche zones due to project inundation.	LTS	None required.	
LAND USE AND PLANNING			
Impact 4.11-1: Physically divide an established community.	NI	None required.	
Impact 4.11-2: Conflict with land use plans, policies, and regulations.	LTS	None required.	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
MINERAL RESOURCES			
Impact 4.12-1: Loss of availability of a known mineral resource or locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.	LTS	None required.	
NOISE			
Impact 4.13-1: Generate a substantial temporary or permanent increase in ambient noise levels from project-generated traffic in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	LTS	None required.	
Impact 4.13-2: Generate a substantial temporary or permanent increase in ambient noise levels from Plant Site stage 1 operations in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	PS	**Mitigation Measure 4.13-2:** Plant Site Noise Reduction The operator of the Rockfield Quarry (Operator) shall implement one or more of the following measures to reduce noise from Plant Site operations: 1. Line aggregate hopper drop-points with heavy urethane sheets. 2. Ensure that all processing area conveyors are properly lubricated at all times. 3. Equip all mobile plant area equipment with acoustic growler-type backup warning systems, rather than conventional beepers. 4. Suspend acoustic curtains around the aggregate processing plant crushers and screen decks (i.e. the loudest components of the processing plant). 5. Install an acoustic silencer on the asphalt plant bag house exhaust fan. 6. Suspend acoustic curtains around the asphalt plant burner.	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		7. Following implementation of the appropriate noise control measures identified above, noise monitoring shall be conducted to confirm the effectiveness of noise control measures and compliance with the applicable noise standards. Noise monitoring shall be conducted by a qualified noise specialist within 1 month of the initiation of excavation and operation of the hot-mix asphalt plant on the Plant Site. Monitoring locations and estimated noise levels at the nearest sensitive receptors to the Plant Site shall be consistent with the noise monitoring locations and methodology included in the "Environmental Noise and Vibration Assessment, July 26, 2021." Changes from the locations and methodology that are determined to be necessary by the qualified noise specialist shall be documented. If noise levels are found to exceed the thresholds, additional noise reduction measures shall be implemented, and monitoring conducted until the thresholds achieve acceptable levels. Quarterly reports of noise monitoring and reduction efforts shall be developed and submitted to the County until noise monitoring shows that Plant Site noise levels have been reduced to below the applicable thresholds. If complaints regarding noise generated by Plant Site operations are received by the County, additional noise monitoring shall be conducted in accordance with the procedures described above.	
Impact 4.13-3: Generate a substantial temporary or permanent increase in ambient noise levels from Quarry Site stage 1 and 2 operations and	PS	**Mitigation Measure 4.13-3:** Quarry Site Noise Reduction	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
final reclamation in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.		The operator of the Rockfield Quarry (Operator) shall implement one or more of the following measures to reduce noise from Quarry Site operations: 1. Limit excavation operations to daytime hours (6 a.m. to 7 p.m.). 2. Limit aggregate processing plant operations to daytime hours. 3. Limit asphalt and ready-mix operations to daytime hours unless construction contracts specifically require the delivery of materials during nighttime hours. 4. Line aggregate hopper drop-points with heavy urethane sheets. 5. Ensure that all processing area conveyors are properly lubricated at all times. 6. Utilize electric power rather than generators to the maximum extent feasible. If generators must be used, ensure that they are located within acoustic enclosures or property shielded from nearby residences through structures or aggregate stockpiles. 7. Equip all mobile plant area equipment with acoustic growler-type backup warning systems, rather than conventional beepers. 8. Suspend acoustic curtains around the aggregate processing plant crushers and screen decks (i.e. the loudest components of the processing plant). 9. Install acoustic silencers on the asphalt plant bag house exhaust fan. 10. Suspend acoustic curtains around the asphalt plant burner.	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		11. Locate aggregate stockpiles to provide screening of processing area noise sources from view of nearby residences. 12. Following implementation of the appropriate noise control measures identified above, noise monitoring shall be conducted to confirm the effectiveness of noise control measures and compliance with the applicable noise standards. Noise monitoring shall be conducted by a qualified noise specialist within 1 month of the initiation of the start of operation of the aggregate processing plant at the Quarry Site. Monitoring locations and estimated noise levels at the nearest sensitive receptors to the Plant Site shall be consistent with the noise monitoring locations and methodology included in the "Environmental Noise and Vibration Assessment, July 26, 2021." Changes from the locations and methodology that are determined to be necessary by the qualified noise specialist shall be documented. If noise levels are found to exceed the thresholds, additional noise reduction measures shall be implemented, and monitoring conducted until the thresholds achieve acceptable levels. Quarterly reports of noise monitoring and reduction efforts shall be developed and submitted to the County until noise monitoring shows that Quarry Site noise levels have been reduced to below the applicable thresholds. Similarly, within 1 month of the start of operation of the hot-mix asphalt plant, ready-mix cement plant, and portable recycle plant during Stage 2 operations at the Quarry Site, noise monitoring shall be	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		conducted in accordance with the procedures described above. If complaints regarding noise generated by Quarry Site operations are received by the County during Stage 1 or Stage 2 operations, additional noise monitoring shall be conducted in accordance with the procedures described above.	
Impact 4.13-4: Generate a substantial temporary or permanent increase in ambient noise levels from Plant Site and Quarry Site final reclamation activities and post-reclamation in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	LTS	None required.	
Impact 4.13-5: Generate substantial groundborne vibration or groundborne noise from mining operations and reclamation activities (excluding blasting).	LTS	None required.	
Impact 4.13-6: Generate substantial groundborne vibration or airborne vibration as a result of blasting.	PS	Implement Mitigation Measure 4.10-1, "Blasting Protocols." ~~**Mitigation Measure 4.13-6:** Blasting Protocols~~ ~~The operator of the Rockfield Quarry shall at all times implement the requirements of the "Blasting Protocols" developed October 27, 2020, and updated September 8, 2021, by Vibra-Tech Engineers, Inc. The Blasting Protocols shall be appended to the Mitigation Monitoring and Reporting Program and shall be incorporated into the conditions of approval for the project.~~	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
POPULATION AND HOUSING			
Impact 4.14-1: Induce substantial unplanned population growth in an area, either directly or indirectly.	LTS	None required.	
Impact 4.14-2: Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.	NI	None required.	
PUBLIC SERVICES			
Impact 4.15-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: fire protection, law enforcement, schools, parks, other public facilities.	LTS	None required.	
RECREATION			
Impact 4.16-1: Increase use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.	LTS	None required.	
Impact 4.16-2: Inclusion of recreational facilities or requiring the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.	LTS	None required.	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
TRANSPORTATION			
Impact 4.17-1: Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.	PS	**Mitigation Measure 4.17-1a:** Equitable Share Contributions—Friant Road and Willow Avenue (Existing Plus Project) The County of Fresno has collected equitable share contributions for future signalization of the intersection of Friant Road and Willow Avenue from other development projects. The project shall pay an equitable share of the cost of future signalization. **Mitigation Measure 4.17-1b:** Equitable Share Contributions—Pavement Conditions The project shall contribute an equitable share of pavement improvements to increase the pavement section to accommodate the traffic index values in Table 4.17-12. **Mitigation Measure 4.17-1c:** Equitable Share Contributions—Friant Road and Willow Avenue (5-Year Cumulative) The project shall pay an equitable share of the cost of future signalization of the Friant Road and Willow Avenue intersection. **Mitigation Measure 4.17-1d:** Equitable Share Contributions—Copper Avenue and Willow Avenue (5-Year Cumulative) The project shall pay an equitable share of the cost of the future widening and signalization of the Copper Avenue and Willow Avenue intersection. **Mitigation Measure 4.17-1e:** Equitable Share Contributions—SR 41 and Road 145 (15-Year Cumulative)	SU

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		The project shall pay an equitable share of the cost of future widening of the SR 41 and Road 145 intersection. **Mitigation Measure 4.17-1f:** Equitable Share Contributions—Road 206 and Road 145 Intersection (15-Year Cumulative) The project shall pay an equitable share of the cost of the future widening and signalization of the Road 206 and Road 145 intersection. **Mitigation Measure 4.17-1g:** Equitable Share Contributions—Friant Road and North Fork Road Intersection (15-Year Cumulative) The project shall pay an equitable share of the cost of future widening the Friant Road and North Fork Road intersection. **Mitigation Measure 4.17-1h:** ~~Equitable Share Contributions—~~Friant Road and Quarry Site Access Intersection (15-Year Cumulative) Once ~~County Annual Mine Inspections~~ the annual mine report reveals that the project has reached 2.65 MT per year (based on interpolation of peak-hour project traffic volumes between 2.0 and 3.0 MT per year as compared to the California Manual on Uniform Traffic Control Devices (CMUTCD) peak-hour warrant), the operator shall conduct annual traffic signal warrants analyses in accordance with the edition of the ~~California Manual on Uniform Traffic Control Devices~~ CMUTCD current at that time, or future equivalent as determined by the agency having jurisdiction over the intersection, to determine whether traffic signals are warranted at the intersection of	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		Friant Road and the Quarry Site. Passenger Car Equivalent (PCE) volumes shall be used, queue lengths and number of vehicles in the queue should be documented, and the warrants studies should consider the exclusion of right turns as described in the CMUTCD. Traffic signals shall be installed if the traffic signal warrants analyses indicates that signals are warranted, and if approved by the agency having jurisdiction over the intersection. The project will be responsible for installing the traffic signals. **Mitigation Measure 4.17-1i:** ~~Equitable Share Contributions—~~Friant Road and Plant Site Access Intersection (15-Year Cumulative) Once ~~County Annual Mine Inspections~~ the annual mine report reveals that the project has reached 2.65 MT per year (based on interpolation of peak-hour project traffic volumes between 2.0 and 3.0 MT per year as compared to the California Manual on Uniform Traffic Control Devices (CMUTCD) peak-hour warrant), the operator shall conduct annual traffic signal warrants analyses in accordance with the edition of the ~~California Manual on Uniform Traffic Control Devices~~ CMUTCD current at that time, or future equivalent as determined by the agency having jurisdiction over the intersection, to determine whether traffic signals are warranted at the intersection of Friant Road and the Plant Site. Traffic signals shall be installed if the traffic signal warrants analyses indicates that signals are warranted, and if approved by the agency having jurisdiction over the intersection. The project will be responsible for installing the traffic signals. The analyses shall take into consideration the future elimination of the Plant Site.	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		Mitigation Measure 4.17-1q: Equitable Share Contributions—Friant Road and Willow Avenue (Year 2040 Cumulative) The project shall pay an equitable share of the cost of future signalization of the Friant Road and Willow Avenue intersection. **Mitigation Measure 4.17-1r:** Equitable Share Contributions—Copper Avenue and Willow Avenue (Year 2040 Cumulative) The project shall pay an equitable share of the cost of future signalization of the Copper Avenue and Willow Avenue intersection.	
Impact 4.17-2: Conflict with or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).	LTS	None required.	
Impact 4.17-3: Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).	~~LTS~~ PS	~~None required.~~ Implement Mitigation Measures 4.17-1a through 4.17-1r. **Mitigation Measure:** 4.17-3: Pothole Repair Until such time as other parties have entered agreements with the County of Fresno regarding sharing of these costs, at which time the project operator's obligations would be reduced by such sharing, the project operator shall repair potholes greater than 6.0 inches in width, length, or diameter, and greater than 2.0 inches in depth, within the travel lanes on Friant Road between North Fork Road and Willow Avenue (inclusive of the area within the intersections) as requested by the County of Fresno in response to substantiated reports from the public or as identified through County pavement condition surveys.	LTS

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		The repair cost, including permits and fees, if any, shall be the responsibility of the operator. The operator shall coordinate any required work with the County of Fresno Public Works Department, including closing lanes and maintaining public safety in accordance with the applicable County permits.	
Impact 4.17-4: Result in inadequate emergency access.	LTS	None required.	
TRIBAL CULTURAL RESOURCES			
Impact 4.18-1: Substantial adverse change in the significance of a tribal cultural resource listed or eligible for listing in the California Register of Historical Resources or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or by the lead agency pursuant to criteria set forth in Public Resources Code Section 5024.1(c).	PS	Implement Mitigation Measures 4.5-2 and 4.5-3.	LTS
UTILITIES AND SERVICE SYSTEMS			
Impact 4.19-1: Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.	NI	None required.	
Impact 4.19-2: Not have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.	LTS	None required.	

Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Impact 4.19-3: Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, otherwise impair the attainment of solid waste reduction goals, or conflict with federal, state, and local management and reduction statutes and regulations related to solid waste.	LTS	None required.	
WILDFIRE			
Impact: 4.20-1: Substantial Impairment of an Adopted Emergency Response Plan or Emergency Evacuation Plan.	LTS	None required.	
Impact: 4.20-2: Exacerbation of Wildfire Risks Due to Slope, Prevailing Winds, and Other Factors, That Could Thereby Expose Project Occupants to Pollutant Concentrations from a Wildfire or the Uncontrolled Spread of a Wildfire.	PS	Implement Mitigation Measure ~~4.13-6~~4.10.	LTS
Impact: 4.20-3: Installation or Maintenance of Associated Infrastructure (Such as Roads, Fuel Breaks, Emergency Water Sources, Power Lines or Other Utilities) That May Exacerbate Fire Risk or That May Result in Temporary or Ongoing Impacts to the Environment.	LTS	None required.	
Impact: 4.20-4: Exposure of People or Structures to Significant Risks, Including Downslope or Downstream Flooding or Landslides, as a Result of Runoff, Post-Fire Slope Instability, or Drainage Changes.	LTS	None required.	

END OF ERRATA

3.2.3 Errata to the Draft EIR Chapter 2, "Project Description"

Explanation

Revisions are made to Draft EIR Chapter 2 to correct an acreage number. Draft EIR pages 2-2 and 2-3 are revised as follows.

ERRATA

- **Plant Site:** The Plant Site is located on approximately 138.5 acres adjacent to North Friant Road, approximately 1.5 miles north of the City of Fresno, and approximately 0.5 miles east of the San Joaquin River. The 138.5-acre Plant Site area includes approximately 126.6 acres owned by the ~~applicant~~ Operator (APNs 300-070-56S, 57S, 58S, 59S, and 60S) and ~~12.9~~11.9 acres owned by the California Department of Fish and Wildlife (CDFW) (portions of APNs 300-070-43ST, 48ST, and 50ST).

  CDFW acquired the south half of the Ball Ranch in 2000, which included the approximately ~~12.9-acre~~11.9-acre area that was part of the mining and processing operations associated with the Plant Site. In March 2019, the ~~applicant~~ Operator acquired the 126.6-acres of the Plant Site that was under lease from Ball Ranch, and the ~~applicant~~ Operator wishes to continue operations on those portions of the CDFW property that are still utilized by the ~~applicant~~ Operator for its current operations. In the event CDFW does not permit the ~~12.9~~11.9 acres currently owned by CDFW to continue to be used by the ~~applicant~~ Operator, such properties would not be used for mining and stockpiling operations. This Draft EIR assumes that CDFW will permit CDFW to continue to be used for mining and processing operations under the proposed project. Therefore, this ~~12.9-acre~~11.9-acre area is included in the 138.5-acre Plant Site.

END OF ERRATA

Explanation

Revisions have been made to Draft EIR Chapter 2 to correct the depth to groundwater at the Plant Site and Quarry Site stated in Table 2-1, "Rockfield Modification Project Characteristics." In addition, the estimated maximum annual processed aggregate volume (including waste/fines) has been revised from 3.3 million tons (MT) to 3.0 MT to align the project description with the production level evaluated in the technical analyses supporting this Final EIR. As documented in Final EIR Appendix B-3, "CEMEX Production Limit Letter," the Operator has agreed to accept a condition of approval limiting the maximum annual processed aggregate volume (including waste/fines) to 3.0

MT, the amount evaluated in the Draft EIR. Draft EIR pages 2-5 and 2-6 are revised as follows.

ERRATA

Table 2-1
Rockfield Modification Project Characteristics

Item/Activity	Description[1]		
Existing Permits, Acres	Plant Site: CUPs 367, 2209, 3063, ~~and~~ 3093, 3755-A, 3755-B, 3852-A, and 3852-B. Approximately 138.5 acres. Quarry Site: CUPs 367, 2032, 3063, ~~and~~ 3093, 3755-A, 3755-B, 3852-A, and 3852-B. Approximately 352.4 acres. Total Both Sites: Approximately 490.9 acres		
Proposed Mining Acres	Plant Site: Approximately 117.6 acres Quarry Site: Approximately 281.9 acres Total Both Sites: Approximately 399.5 acres		
Mining Depth Allowed Under Existing CUPs	Plant Site: no maximum depth specified Quarry Site: no maximum depth specified		
Proposed Mining Depth	Plant Site: Approximately 85 feet bgs Quarry Site: Approximately 600 feet bgs		
Interplant Haul Via North Friant Road	Existing = 1.4 MT/year Stage 1 = 0.7 MT/year Stage 2 = None		
Estimated Aggregate Reserves Volume	Plant Site: 12 MT Quarry Site: 215 MT		
Estimated Total Sales	195 MT		
Estimated Maximum Annual Processed Aggregate Volume (including waste/fines)[5]	~~3.3~~3.0 MT		
Estimated Maximum Annual Aggregate Sales Volume[2] (excluding waste/fines)	Existing = 1.4 MT Stage 1 (first 5 to 10 years) = 2.0 MT Stage 1 and 2 (after 10 years) = 3.0 MT		
Estimated Annual Sales at Total 3.0 MT[3]	**Existing**	**Stage 1—Combined from both Sites**	**Stage 2—Quarry Site Only**
Aggregate[2]	1,400,000 Tons	3,000,000 Tons	3,000,000 Tons
Hot-Mix Asphalt	0 Tons (Historically 230,800 Tons)	500,000 Tons	500,000 Tons
Ready-Mix Concrete	189,500 Cubic Yards	300,000 Cubic Yards	300,000 Cubic Yards
Concrete and Asphalt Recycling	25,000 Tons (concrete only)	200,000 Tons	200,000 Tons
Depth to Groundwater	Plant Site: 10-30 feet bgs (current surface) Quarry Site: 15-40 feet bgs (current surface)		

Item/Activity	Description[1]
Reclamation End Uses: Open Space, Riparian and Open Water Habitat[4]	Plant Site: Approximately 138.5 acres Quarry Site: Approximately 352.4 acres
Project Life	Plant Site: Up to 30 Years Quarry Site: Up to 100 Years

Table Source: CEMEX 2021.

Table Notes:

feet bgs = feet below ground surface (i.e. original ground surface before historical mining); MT = million tons; MT/year = million tons per year

1. All values are approximate.
2. Includes sales to on-site hot-mix asphalt plant and ready-mix concrete plant.
3. Typical mix of products. Actual sales mix will vary based on demand.
4. Actual final reclamation and areal extent at each site will depend on the volume and availability of overburden and process fines suitable for use as fill occurring on site.
5. The Operator has agreed to limit the maximum annual processed aggregate volume (including waste/fines) to 3.0 MT, consistent with the production level evaluated in the environmental technical analyses. See Appendix B-3.

END OF ERRATA

Explanation

Revisions have been made to Draft EIR Chapter 2 to clarify the intent of Project Objective 2 by expanding the definition of aggregate to include all crushed rock and also to expand Project Objective 8 by including project consistency with the Fresno County General Plan. These revisions to the Project Objectives were made in response to requests by the Operator. Draft EIR pages 2-6 and 2-7 have been revised as follows.

ERRATA

2.3 PROJECT PURPOSE AND OBJECTIVES

The project purpose is to continue and expand existing mining and processing operations at the Plant Site and Quarry Site and reclaim the two sites when mining operations are complete.

The objectives for the proposed project are to:

1) continue to provide a reliable and sustainable, local source of high-quality aggregate to help meet the current and long-term demand (100 years) for construction materials in the Fresno region;
2) continue to utilize known aggregate reserves from existing partially mined properties, including those mineral resources designated by the state and county as Mineral Resource Zone 2 (MRZ-2) (Mineral Resource Zone areas where adequate information indicates that significant mineral resources are present)~~, i.e., sand and gravel)~~ to produce construction aggregates;

3) continue to utilize high quality aggregate resources that meet the California Department of Transportation's specifications for use in Portland Cement Concrete (PCC) and Asphaltic Concrete (AC) which aggregate is important for quality infrastructure growth and maintenance because of its versatility, value, and relative scarcity;
4) maintain a local source of construction aggregate with enough annual sales capacity (3.0 MT) to encourage a healthy competitive market;
5) continue to provide aggregate resources with access to an efficient local road network;
6) continue to provide an environmentally sound project that would balance the recovery of the aggregate resource with the protection of other resources including wildlife habitat, groundwater, surface water, and air quality;
7) continue local quality jobs, while also benefiting local downstream businesses and creating an enhanced tax revenue to the county;
8) maintain consistency with the Fresno County General Plan and the San Joaquin River Parkway Master Plan;
9) reclaim both sites to wildlife habitat in a manner similar to the reclaimed mine sites that make up the majority of the San Joaquin River Parkway Properties; and
10) provide potential Parkway trail easements.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Chapter 2 to correct an acreage number. Draft EIR page 2-7 is revised as follows.

ERRATA

The ***Plant Site*** is located on approximately 138.5 acres adjacent to North Friant Road, approximately 1.5 miles north of the City of Fresno, and approximately 0.5 miles east of the San Joaquin River. The 138.5-acre Plant Site area includes approximately 126.6 acres owned by the ~~applicant~~ Operator (APNs 300-070-56S, 57S, 58S, 59S, and 60S) and ~~12.9~~11.9 acres owned by the California Department of Fish and Wildlife (CDFW) (portions of APNs 300-070-43ST, 48ST, and 50ST). A detailed Plant Site aerial map with parcel delineations is shown on Figure 2-1, "Plant Site Aerial." The Plant Site is accessible from one existing driveway entrance on the west side of North Friant Road. The first 100 feet of the access road is paved and has a width of at least 24 feet.

END OF ERRATA

Explanation

New text has been added to Draft EIR Section 2.4.2.2, "Quarry Site Existing Conditions," to clarify the description of existing conditions related to setbacks. Draft EIR page 2-18, third Section, has been revised as follows.

ERRATA

Setbacks

The following setbacks are required under the existing CUPs for the Quarry Site and the Fresno County Zoning Code:

1) 200-foot mining and stockpiling setback from the river edge;
2) continued avoidance of specified native trees;
3) 250-foot radius mining setback from the residence just south of the southwest corner;
4) 75-foot mining setback from south boundary between the 250 feet from the southwest corner and 350-feet from North Friant Road right-of-way;
5) 50-feet mining setback from the North Friant Road right-of-way;
6) 25-feet mining setback from other property lines; and
7) Per Fresno County Zoning Code Section 834.4.220, ~~no~~ stockpiled soil or material ~~will~~shall not be placed closer than 25 feet from any property boundary ~~except visual/sound berms~~; and
8) Stockpiling of material shall not be allowed within 200 feet of Friant Road or that portion of the north property line adjoining Lost Lake Park unless Permittee screens any such closer stockpiling with approved landscaping so that it is not visible from Friant Road and the north property line of Lost Lake Park.

END OF ERRATA

Explanation

Revisions have been made to Draft EIR Chapter 2 Section 2.4.5, "Surrounding Land Uses," to provide acreages for some of the park facilities surrounding the project sites. Draft EIR pages 2-23 and 2-24 have been revised as follows.

ERRATA

The property that borders the Plant Site to the north, west, and south is the 238-acre Willow Unit Ecological Reserve, owned by California Department of Fish and Wildlife (CDFW). There are several 20-acre farming parcels and other farmland south of the

CDFW property. Most of the property north of the Plant Site and generally north of Little Dry Creek is now the 358-acre Ball Ranch Nature Reserve, owned by the San Joaquin River Conservancy (SJRC). The land east of North Friant Road is primarily open grazing land with several 8 to 10-acre rural residential homesites to the southeast.

Quarry Site

The Quarry Site is bounded on the northwest by Fresno County Lost Lake Regional Park (268 acres), and to the northeast by lands that were previously mined for aggregate between Lost Lake Regional Park and North Friant Road. The property north of the center of the Quarry Site that was previously mined for aggregate was reclaimed as open space, ponds, and riparian habitat, and is now the Beck Ranch Natural Reserve owned by the SJRC. The property north of the northeast portion of the Quarry Site that was previously mined for aggregate was reclaimed as farmland, open space, ponds, and riparian habitat, and includes a rural residence.

The San Joaquin River flows along the west side of the Quarry Site. Across the river to the west in Madera County, there is farmland to the northwest and a private, gated residential community to the west. The Ledger Island Natural Reserve, 161 acres, land previously mined for aggregate and now owned by the SJRC, is located across the river to the southwest of the Quarry Site.

A residence and Peck Ranch farmland owned by the Parkway Trust (76 acres) are located to the south of the Quarry Site. There is a residential community to the northeast overlooking the Quarry Site. A private, gated residential community is located at the base of the foothills southeast of the entrance road to the Quarry Site. The remaining area to the east consists of open grazing land.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Chapter 2 to add details of the 2023 use permit extension granted for the Rockfield Quarry to the summary of conditional use permits for the operation. Draft EIR page 2-27, Table 2-4, has been revised as follows.

ERRATA

TABLE 2-1
SUMMARY OF CONDITIONAL USE PERMITS

CUP Number	Approval Date	Properties	Description
367	9/7/1960	Ball Ranch (including the Plant Site and Quarry Site)	Allowed existing sand and gravel excavation and processing operations, including washing, screening, and grading, on 850 acres that included the Plant Site and Quarry Site. Also permitted processing of materials from the Quarry Site at the processing plant located on the Ball Ranch.
2032	6/7/1984	Quarry Site	Allowed rock, sand, and gravel excavation on an additional 147 acres southwest of CUP 367
367 and 2032	1/8/1985	Ball Ranch and Quarry Site	Settlement Agreement with Fresno County confirming validity of CUP 367. Limited the processing plant operations, asphalt and concrete batch plant operations, and excavation activities to 20 years. Also limited processing of material to that which was extracted from properties permitted under CUP 367 and 2032.
2209	6/10/1986	Plant Site	Extended operating hours.
2235	*7/28/1987*	*Beck Ranch*	*Add 251-acre mining site immediately north of Quarry Site. Allowed aggregate to be processed on the Ball Ranch. (Beck Ranch was mined out and reclaimed in 2009)*
2241	*7/28/1987*	*Plant Site*	*Allowed aggregate mined from Beck Ranch to be processed at Plant Site. (Beck Ranch was mined out and reclaimed in 2009)*
3063	9/25/2003	Quarry and Plant Sites	Extended expiration date to 2023 for CUPs 367, 2032 and 2241.
3064	*9/25/2003*	*Beck Ranch*	*Extended expiration date to 2023 for CUP 2235. (Beck Ranch was mined out and reclaimed in 2009)*
3093	10/21/2004	Quarry and Plant Sites	Amended CUPs 367, 2032, 2241 and 3063 to increase daily limit on mining and processing from 180 truckloads per day to 225 truckloads per day.
3094	*10/21/2004*	*Beck Ranch*	*Amended CUPs 2235 and 3064 (Beck Ranch) to increase loads from 180 truckloads per day to 225 truckloads per day. (Beck Ranch was mined out and reclaimed in 2009)*
3755-A and 3755-B	7/18/2023	Quarry and Plant Sites	Extended expiration date by three years to 2026 for CUPs 3093, 367, 2032, 2209, 2241, 2235, and 3063. A Notice of Exemption from CEQA review was filed on July 20, 2023 (SCH No. 2023070433).
3852-A and 3852-B	6/4/2026	Quarry and Plant Sites	Extended expiration date by one year to 2027 for CUPs 3755-A, 3755-B, 3093, 3094, 367, 2032, 2209, 2241, 2235, 3064, and 3063. A Notice of Exemption from CEQA review was filed on June 9, 2026 (SCH No. 2026060496).

Table Source: CEMEX 2021 and 2026.
Table Notes: *Italicized* text indicates that mining and processing activities authorized by the CUP have been completed.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Chapter 2 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 2-28 is revised as follows.

ERRATA

2.4.10 Zoning Classifications

Both the Quarry Site and Plant Site are zoned "AE-20" Exclusive Agriculture, 20-acre minimum parcel size (Fresno County ~~2022~~2024). Surface mining operations and related facilities and activities are permitted in the AE-20 district subject to a CUP under the provisions of Section ~~858~~834.4.220 of the Fresno County Zoning Ordinance.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Chapter 2 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 2-35 is revised as follows.

ERRATA

As described under Section 2.4.2, above, the perimeter of the property along Friant Road is fenced with four-foot-high, barbed wire ranch fencing with a chain link entrance gate. Under the proposed project, the entire perimeter of the property would be fenced with minimum four-foot-high, ranch fencing consisting of metal T-posts and at least three strands of barbed wire in accordance with Section ~~858 H.4~~834.4.220 I.4 of the Fresno County Zoning Ordinance. The fencing would be erected upon project approval.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Chapter 2 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 2-40 is revised as follows.

ERRATA

The aggregate processing plant, ready-mix concrete plant, hot-mix asphalt plant, offices/scale house, QC lab, and maintenance shop would be located within an approximately 42-acre area, shown as the "plant site" on Figure 2-8. These facilities

would all be located in a previously excavated pit approximately 30 feet bgs. This area is centrally located in accordance with standard ~~H.23, Section 858~~I.23, Section 834.4.220 of the Fresno County Zoning Ordinance. The area where these facilities are located would be mined as part of Phase 5. Prior to mining of this area, the facilities would be removed, and an electric-powered, portable aggregate plant would be used to process the remaining aggregate materials.

3.2.4 Errata to the Draft EIR Chapter 3, "Terminology, Approach and Assumptions"

There are no errata for Draft EIR Chapter 3.

3.2.5 Errata to Draft EIR Chapter 4, "Environmental Analysis"

3.2.5.1 Errata to Draft EIR Section 4.1, "Aesthetics and Visual Resources"

Explanation

Revisions are made to Draft EIR Section 4.1, to clarify that the Ball Ranch property was included as a potentially sensitive viewpoint. Draft EIR Section 4.1.1.4 beginning on page 4.1-4 is revised as follows.

ERRATA

Public Parks/Recreational Facilities

Public recreation areas adjacent to the project sites consist of Lost Lake County Park, located adjacent to the northwest boundary of the Quarry Site, Ball Ranch, located adjacent to the northern boundary of the Plant Site, and the San Joaquin River, located west of the Plant Site and Quarry Site.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.1 to update the text to reflect the 2024 Fresno County General Plan. Draft EIR Section 4.1.2.3, "Local," on page 4.1-9 is revised as follows:

ERRATA

Fresno County General Plan

The *Fresno County General Plan* (Fresno County 2000) Agricultural and Land Use Element and Open Space and Conservation Element include policies related to conservation of visual resources as well as sand and gravel (i.e., aggregate) resources within County

lands. *Fresno County General Plan* policies that apply to the proposed project are listed below.

Agriculture and Land Use Element

Section C. River Influence Areas

Goal LU-C: To preserve and enhance the value of the river environment as a multiple use, open space resource; maintain the environmental and aesthetic qualities of the area; protect the quality and quantity of the surface and groundwater resources; provide for long term preservation of productive agricultural land; conserve and enhance natural wildlife habitat; and maintain the flood-carrying capacity of the channel at a level equal to the one (1) percent flood event (100-year flood).

Policy LU-C.2: Within the San Joaquin River Corridor Overlay, the County shall accommodate agricultural activities with incidental homesites, recreational uses, sand and gravel extraction, and wildlife habitat and open space areas.

Policy LU-C.~~6~~5: The County may allow the extraction of rock, sand, and gravel resources along the San Joaquin River consistent with the Minerals Resources section policies of the Open Space and Conservation Element.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.1, to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.1-13 is revised as follows.

ERRATA

Zoning Ordinance of Fresno County—Land Use and Planning

The Zoning Ordinance of Fresno County—Land Use and Planning, last amended ~~June 2018~~February 2026, has policies and ordinances related to visual and aesthetic resources. Specifically, Section ~~858~~834.4.220, "~~Regulations for Surface Mining and Reclamation in All Districts~~ Material Extraction Sites," contains the following countywide development standards that potentially apply to visual resources and impacts associated with mining projects in the County.

~~**Section 858—Regulations for Surface Mining and Reclamation in All Districts**~~

Section 834.4.220—Material Extraction Sites

~~**H. Mining and Reclamation Standards**~~

I. Mining and Reclamation Standards

The standards for surface mining operations and reclamation shall be as follows:

1. ~~No extraction of material or overburden shall be permitted within twenty-five (25) feet of any property boundary nor within fifty (50) feet of a boundary contiguous with a public road right-of-way or recorded residential subdivision.~~ Extraction of material or overburden shall not be allowed within 25 feet of any property boundary nor within 50 feet of a boundary contiguous with a public road right-of-way or recorded residential subdivision.
2. ~~No stockpiled soil or material shall be placed closer than twenty-five (25) feet from a property boundary.~~ Stockpiled soil or material shall not be placed closer than 25 feet from a property boundary.
4. ~~Security fencing four (4) feet in height consisting of not less than three (3) strands of barbed wire, or an approved equivalent, shall be placed along any property line abutting a public right-of-way and around any extraction area where slopes steeper than two (2) feet horizontal to one (1) foot vertical are maintained. Such interior fencing will not be required where exterior fencing surrounds the property.~~ Security fencing four feet in height consisting of not less than three strands of barbed wire, or an approved equivalent, shall be placed along any property line abutting a public right-of-way and around any extraction area where slopes steeper than two feet horizontal to one-foot vertical are maintained. The interior fencing will not be required where exterior fencing surrounds the property.
5. ~~Screening of the site shall be achieved by planting trees of a variety approved by the Director along all property lines adjacent to a public road right-of-way or a recorded residential subdivision. Adequate screening can generally be achieved with evergreen trees planted in two (2) staggered rows, with twenty (20) feet between the rows and between the trees in each row. As an alternative, oleanders or shrubs of a similar size and density may be planted in the same pattern at ten (10) foot intervals. The plant species and planting plan and timetable shall be designated in the Mining and Reclamation Plan. All required plants shall be maintained in a good horticultural manner. In areas where it is found that the planting of trees or shrubs will not achieve the desired screening effect due to soil conditions, the Director may approve an alternate method of screening consisting of meandering dirt berms of sufficient height to screen the~~

~~site. (Amended by Ord. T-252 adopted 12-9-80)~~Screening of the site shall be achieved by planting trees of a variety approved by the Director along all property lines adjacent to a public road right-of-way or a recorded residential subdivision. Adequate screening can generally be achieved with evergreen trees planted in two staggered rows, with 20 feet between the rows and between the trees in each row. As an alternative, oleanders or shrubs of a similar size and density may be planted in the same pattern at 10-foot intervals. The plant species and planting plan and timetable shall be designated in the Mining and Reclamation Plan. All required plants shall be maintained in a good horticultural manner. In areas where it is found that the planting of trees or shrubs will not achieve the desired screening effect due to soil conditions, the Director may approve an alternative method of screening consisting of meandering dirt berms of sufficient height to screen the site.

7. Where an access road intersects a County maintained road, it shall be improved with a driveway approach constructed to ~~Fresno~~ County Standards.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.1 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.1-14 is revised as follows.

ERRATA

20. Good operating practices shall at all times be utilized to minimize noise, vibration, dust and unsightliness. In reviewing a proposal, the ~~Planning~~ Commission shall consider:
    a) The location of the processing plant.
    b) The location where unused equipment will be stored.
    c) Proposals for the removal of all structures, metallic equipment, debris, or objects upon conclusion of the extraction operations.

22. ~~21.~~ Any night lighting established on the property shall be arranged and controlled so as not to illuminate public rights-of-way or adjacent properties.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.1 to further explain the methodology used in selecting representative viewpoints surrounding the project sites. Draft EIR page 4.1-17, Table 4.1-2, is revised as follows.

ERRATA

Map Reference	Location	Approximate Distance from Project Sites	Description
#13	Quarry Site—Private Residence Sumner Hill Community	2,260-feet to thewest	This viewpoint represents the view from the private residential community of Sumner Hill, west of the Quarry Site at the end of Croom Place. This viewpoint also represents potential views of a potential future trail easement proposed along the western boundary of the Quarry Site.

Table Source: Sespe 2022
Table Notes: Figure 4.1-1 displays the location of these viewpoints in relation to the project sites.
Ball Ranch and Ledger Island were not accessible to the public at the time the field photo survey was completed.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.1 to correct the stated acreage of the Plant Site in the footnote of Table 4.1-3, "U.S. Bureau of Land Management Visual Project Impact Ratings at Nearby Viewpoints." Draft EIR page 4.1-54, Table 4.1-3, footnote "c" is revised as follows.

ERRATA

c = Upon completion of mining at the Plant Site at the end of Stage 1, operations at the Plant Site would cease, all equipment and septic systems would be removed, and the site reclaimed as ~~122~~138.5 acres of open space, and riparian and open water wildlife habitat. Upon completion of mining at the Quarry Site at the end of Stage 2, operations would cease, all equipment and septic systems would be removed, and the site reclaimed to open space, and riparian and open water wildlife habitat.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.1 to better define the requirements and specify the party responsible for implementation of Mitigation Measure 4.1-1. Draft EIR page 4.1-61 has been revised as follows.

ERRATA

Mitigation Measure 4.1-1: *Rock Staining to Reduce Visual Contrast*

Within two years of the ~~Following~~ completion of active mining in each western facing highwall/bench, visual modeling will occur to determine the portions of the completed highwall/bench visible from Locations #12 and #13 and those visible portions ~~each phase, an appropriate earth tone rock staining product shall be utilized on~~ exposed and visible pit ~~walls~~ shall be treated to reduce the color contrast to the extent feasible between the pit walls and the surrounding ~~undisturbed slopes~~ landscape. Methods to achieve this reduction include: (1) application of an appropriate earth tone rock staining product; and/or (2) application of a surface weathering accelerant to hasten formation of a natural patina.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.1 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.1-63 is revised as follows.

ERRATA

High pressure sodium and/or cut-off fixtures (or equivalent International Dark-Sky Association-approved fixtures) would be used at the proposed hot-mix asphalt plant, which minimize the occurrence of light pollution (International Dark-Sky Association 2021). Furthermore, the new lighting would be required to comply with Section ~~858~~834.4.220 of the Fresno County Zoning Ordinance, which states "any night lighting established on the property shall be arranged and controlled so as not to illuminate public rights-of-way or adjacent properties (Section ~~858.H.22~~834.4.220.I.22)." Consistent with this requirement, the proposed Surface Mining and Reclamation Plan indicates that the new lighting would be designed to confine illumination to the Plant Site and/or to areas that do not include light-sensitive uses.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.1 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.1-64 is revised as follows.

ERRATA

The majority of nighttime lighting at the Quarry Site would be installed around the plant equipment (north central portion of the facility as shown on Figure 2-9). Because the plant site facilities would be located at a minimum of 30 feet bgs within the Quarry Site, the surrounding excavation pit walls would help shield excess light and keep it confined to the site. The proposed landscaped berm at North Friant Road frontage would further reduce the light and glare visible off-site. High pressure sodium and/or cut-off fixtures (or equivalent International Dark-Sky Association-approved fixtures) would be used and would minimize the occurrence of light pollution (International Dark-Sky Association 2021). All new lighting would be required to comply with Section ~~858~~834.4.220 of the Fresno County Zoning Ordinance, which states "any night lighting established on the property shall be arranged and controlled so as not to illuminate public rights-of-way or adjacent properties (Section ~~858.H.22~~834.4.220.I.22)." Consistent with this requirement, the proposed Surface Mining and Reclamation Plan indicates that the new lighting would be designed to confine illumination to the Quarry Site and/or to areas that do not include light-sensitive uses.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.1 to correct a minor text error. Draft EIR page 4.1-64 has been revised as follows.

ERRATA

For these reasons, the potential of the proposed project to result in a new source of substantial light or glare at the ~~Plant Site~~ Quarry Site would be less than significant.

END OF ERRATA

3.2.5.2 Errata to Draft EIR Section 4.2, "Agricultural and Forestry Resources"

Explanation

Revisions are made to Draft EIR Section 4.2 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.2-1 is revised as follows.

ERRATA

4.2.1.1 General Plan Land Use Designations and Zoning Classifications

Both the Plant Site and Quarry Site are zoned Exclusive Agriculture (AE-20), 20-acre minimum parcel size (see Section 4.2.2.3, "Local," below). Surface mining operations and related facilities and activities are permitted in the AE-20 district subject to a Conditional Use Permit (CUP) under the provisions of Section ~~858~~834.4.220 of the County Zoning Ordinance. The purpose of the AE-20 district, as described in the Agriculture and Land Use Element of the *Fresno County General Plan*, is to protect farming areas by permitting agricultural uses only and preserving agricultural lot sizes. Characteristic uses permitted in the district include farming, livestock, processing of agricultural products, agriculture-related businesses, and labor camps (Fresno County ~~2000~~2024).

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.2 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.2-9 is revised as follows.

ERRATA

U. Off-site rock, sand, and gravel trucking operations which may include a newly created parcel size of not less than five acres (See Section ~~816.5-A.4~~808.2.10) on sites located outside the Sphere of Influence of any City or community and not located on productive agricultural land as defined in Section 204-02:3.02a of the General Plan (Fresno County ~~2018~~2024).

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.2 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.2-10 is revised as follows.

ERRATA

In addition, per ~~Section 858, "Regulations for Surface Mining and Reclamation in All Districts,"~~ Section 834.4.220, "Mineral Extraction Sites," mining is a permitted use within this zone subject to approval of a CUP.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.2 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.2-15 is revised as follows.

ERRATA

The Plant Site and Quarry Site are both zoned AE-20, Exclusive Agriculture, district. In accordance with ~~Section 858~~Section 834.4.220 of the Fresno County Zoning Code, mining is a permitted use within this zone subject to approval of a CUP. The Plant Site and Quarry Site's zoning designations would not change under the proposed project. Therefore, implementation of the proposed project would not conflict with the existing zoning for an agricultural use. No impact relating to an agricultural zoning conflict would occur.

END OF ERRATA

3.2.5.3 Errata to Draft EIR Section 4.3, "Air Quality"

Explanation

Revisions are made to Draft EIR Section 4.3 to clarify and amplify the discussion of the project's potential effects on air quality. The revised section is provided as Appendix D-4, "Revised Section 4.3, Air Quality," to this Final EIR and replaces Draft EIR Section 4.3 in its entirety. Additions to the section are marked with underlined font, while removals are indicated by font that has been struck through. The technical analysis of potential air quality impacts was updated to address comments on the Draft EIR, as described in the Air Quality, Health Risk and Climate Change Impact Assessment, Revised May 13, 2026 ("2026 Air Report")(see Appendix D-3, "Revised Air Quality, Health Risk and Climate

Change Impact Assessment,"). The 2026 Air Report replaces the prior air reports contained in Appendix D-1 and Appendix D-2 of the Draft EIR, in their entirety. The 2026 Air Report Executive Summary provides a detailed explanation of the changes made in the air quality analyses, which is in part re-stated here, as it applies to revisions to Section 4.3.

The discussion of the Voluntary Emissions Reduction Agreement (VERA) Program presented in the Draft EIR has been revised as the project is not subject to the Air District's Rule 9510 (Indirect Source Rule).

The Draft EIR has been updated to evaluate the environmental impact of above ground blasting at the Quarry Site. This includes NO_2 dispersion modeling with nine emission sources where each represents a location where blasting would occur and showed a concentration of NO_2 less than the national and state 1-hour limits.

The Draft EIR previously segmented the cancer risk assessment of the project into two timespans with the first timespan lasting the first 30 years (i.e., phase 1 of the project) of the project and the second phase analyzing years 31 to 60 (i.e., 30 years of phase 2 of the project) for a total of 60 years. Per SJVAPCD guidance, the updated HRA now analyzes two 70-year periods with the first period (years 1 to 70) including all of phase 1 and part of phase 2 and the second period (years 31 to 100) including all of phase 2. These changes resulted in updated figures in Tables 4.3-24 and 4.3-25. Additionally, the updated analysis resulted in Impact 4.3-3 (whether the project would expose sensitive receptors to substantial pollutant concentrations) changing from a potentially significant impact to a less than significant impact.

The Draft EIR previously acknowledged the future preparation of a Fugitive Dust Control Plan to comply with SJVAPCD rules and quantified specific mitigation measures for the project. Now, a Fugitive Dust Control Plan has been prepared and will be submitted to the SJVAPCD for further approval. The proposed Fugitive Dust Control Plan is contained in Appendix K of Appendix D-3. Implementation of the "Fugitive Dust Control Plan," is required by Mitigation Measure 4.3-2b as updated in the Final EIR. Mitigation Measure 4.3-2a "Off Road Engines," which was previously a part of Draft EIR Mitigation Measure 4.3-2, has been separated to clarify the requirement that off-road engines shall be upgraded to meet tier 4i particulate emissions standards. It is separate from the fugitive dust control plan measure. Mitigation Measure 4.3-4 "Asphalt Plant Emission Controls," has been updated to correct a minor typographical error and specify the correct agency responsible for issuing a building permit.

The Ambient Air Quality measurements in the project area were updated to include data from 2020 through 2024, in addition to the 2013 through 2017 data previously included. This change resulted in the updated figures in Tables 4.3-2 and 3. In response to comments received, the criteria pollutant concentrations included in Table 4.3-23 have been expanded to include NO_2, SO_2, PM_{10}, $PM_{2.5}$, and Pb as well as the previously included CO.

Additionally, the updated analysis described in Appendix D-3 includes an update of the dispersion model to align with current SJVAPCD receptor grid density guidance, and includes an update to current software, methods, and meteorological/monitoring data. Off-site on-road emissions from haul trucks were also updated to align with the Final EIR GHG Section analysis, which accounts for the project's proportional share of regional demand growth rather than calculating emissions based on continuous operation at maximum throughput as was used in the Draft EIR. This revised methodology, as expanded upon in Appendix J of Appendix D-3, accounts for the fact that project approval would not result in increased demand for aggregates in the region. This updated analysis resulted in changes to the figures as well as the tables throughout Section 4.3.

Additional minor changes to Section 4.3 include minor corrections, including correction to the acreage of the Quarry Site. In addition, the section was revised to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment and to include summaries of the 2024 Plan for the 2012 Annual $PM_{2.5}$ Standard and the 2022 Plan for the 2015 8-hour Ozone Standard.

Project Impact 4.3-1 and the Regulatory Setting as it applies to federal, State, and local rules and regulations are unchanged from the Draft EIR. In addition, the aforementioned changes and updated analysis do not change the conclusions in the Draft EIR, except as discussed above.

ERRATA

See Final EIR Appendix D-4, "Revised Section 4.3 Air Quality," for a full reproduction of Section 4.3 showing errata in underline/strikethrough text.

END OF ERRATA

3.2.5.4 Errata to Draft EIR Section 4.4, "Biological Resources"

Explanation

Revisions are made to Draft EIR Section 4.4 to update the information presented in Table 4.4-1, "Special-Status Wildlife Species." The revisions incorporate the results of the expanded California Natural Diversity Database (CNDDB) (CDFW 2025a) search conducted as part of preparation of this Final EIR (see Response 65-4) and to incorporate corrections and refinements based on agency and public comments received on the Draft EIR.

As documented in the WRA Supplemental Biological Resources Evaluation Memorandum (WRA 2026; see Appendix E-6), WRA, Inc., the County's biological resources consultant, expanded the original four-quadrangle California Natural Diversity Database (CNDDB) (CDFW 2025a) search to a nine-quadrangle search and evaluated the habitat potential of the additional special-status wildlife species identified through the expanded search. These evaluations were conducted by WRA biologists with at least 10 years of experience evaluating the applicable taxa and were based on the expanded CNDDB search results, existing biological resources information, documented site conditions, and professional judgement. The WRA memorandum further concludes that the revised species evaluations reflected in Table 4.4-1 below, together with the corresponding revisions to the biological impact analysis and mitigation measures in Draft EIR Section 4.4, do not identify any new significant impacts, do not substantially increase the severity of previously identified impacts, and do not constitute significant new information requiring recirculation of the Draft EIR pursuant to CEQA Guidelines Section 15088.5. Table 4.4-1 beginning on Draft EIR page 4.4-25 is revised as follows.

ERRATA

Table 4.4-2
Special-Status Wildlife Species

Scientific Name **Common Name**	**Status**		**Habitat**	**Observed On-site**	**Potential to Occur on the Plant Site**	**Potential to Occur on the Quarry Site**
Accipiter cooperii Cooper's hawk	Fed: CA:	None WL	Generally found in forested areas up to 900 meters (3,000 feet) in elevation, especially near edges and rivers. Prefers hardwood stands and mature forests but can be found in urban and suburban areas where there are tall trees for nesting. Common in open areas during nesting season.	No	**Moderate** The Plant Site provides suitable foraging habitat. Nesting habitat occurs offsite in adjacent areas.	**Moderate** The Quarry Site provides suitable foraging habitat. Nesting habitat occurs offsite in adjacent areas.
Actinemys marmorata western pond turtle	Fed: CA:	None SSC	Requires both aquatic and terrestrial habitats. Uses permanent and seasonal aquatic habitats including rivers, sloughs, lakes, reservoirs, ponds, and irrigation canals. Moves onto land for nesting, overwintering, dispersal, and basking.	No	**Low** The Plant Site provides marginal habitat for this species. The adjacent offsite riparian areas associated with the San Joaquin River and Little Dry Creek provide suitable habitat.	**Low** There is marginal habitat on the Quarry Site. The adjacent offsite riparian areas associated with the San Joaquin River provides suitable habitat.
Agelaius tricolor tricolored blackbird	Fed: CA:	None Candidate END/SSC	Range is limited to the coastal areas of the Pacific coast of North America, from Northern California to upper Baja California. Can be found in a wide variety of habitat including annual grasslands, wet and dry vernal pools and other seasonal wetlands, agricultural fields, cattle feedlots, and dairies. Occasionally forage in riparian scrub habitats along marsh borders. Basic habitat requirements for breeding include open accessible water, protected nesting substrate (freshwater marsh dominated by cattails, willows, and bulrushes [*Schoenoplectus* sp.]), and either flooded or thorny or spiny vegetation and suitable foraging space providing adequate insect prey.	No	**Low** The Plant Site provides suitable foraging and nesting habitat. However, per CNDDB, there are no known occurrences within the immediate vicinity of the Plant Site.	**Low** The Quarry Site does not provide suitable foraging and nesting habitat. CNDDB records show no known occurrences within the immediate vicinity of the Quarry Site.
Ambystoma californiense California tiger salamander	Fed: CA:	THR THR/WL	Nocturnal, and fossorial, spending most of their time underground in animal burrows. Frequents grassland, oak savanna, and edges of mixed woodland and lower elevation coniferous forest.	No	**Presumed Absent** There is no suitable habitat on the Plant Site and no CNDDB observations in the immediate area.	**Presumed Absent** The Quarry Site supports low quality breeding and inaccessible, low quality aestivation habitat for this species.
Anniella pulchra Northern California legless lizard	Fed: CA:	None SSC	Occupies loose, sandy, or loamy soils in coastal dunes, chaparral, oak woodland, and riparian scrub, living underground beneath leaf litter, grass thatch, and surface debris where soil moisture is retained.	No	**Presumed Absent** There is no suitable habitat on the Plant Site. The only CNDDB observation of this species which appeared in the background search is dated from the 1880's and is more than 10 miles from the Plant Site (CDFW 2025a).	**Presumed Absent** There is no suitable habitat on the Quarry Site. The only CNDDB observation of this species which appeared in the background search is dated from the 1880's and is more than 10 miles from the Quarry Site (CDFW 2025a).
Antrozous pallidus *pallid bat*	Fed: CA: WBWG:	None SSC High	Occurs in open, arid habitats and along riparian zones. Roosts in rock crevices, caves, buildings, bridges, and tree cavities. Forages low over the ground in open areas, agricultural fields, and riparian edges.	No	**Moderate** The Plant Site and adjacent riparian area provide suitable foraging and roosting habitat.	**Moderate** There is potential foraging habitat on Quarry Site. The offsite riparian habitat along the San Joaquin River provides suitable roosting habitat.

Scientific Name **Common Name**	**Status**		**Habitat**	**Observed On-site**	**Potential to Occur on the Plant Site**	**Potential to Occur on the Quarry Site**
Aquila chrysaetos Golden eagle	Fed: CA:	None FP; WL	Occupies nearly all terrestrial habitats of the western states except densely forested areas. Favors secluded cliffs with overhanging ledges and large trees for nesting and cover. Hilly or mountainous country where takeoff and soaring are supported by updrafts is generally preferred to flat habitats. Deeply cut canyons rising to open mountain slopes and crags are ideal habitat.	No	**Low** Suitable foraging and nesting habitat are found west of the Plant Site in the valley oak woodland.	**Presumed Absent** There is no suitable habitat within or adjacent to the Quarry Site.
Ardea alba great egret	Fed: CA:	None None	Yearlong resident throughout California, except for the high mountains and deserts. Feeds and rests in fresh, and saline emergent wetlands, along the margins of estuaries, lakes, and slow-moving streams, on mudflats and salt ponds, and in irrigated croplands and pastures.	Yes	**Present** This species was detected during the 2021 habitat assessment.	**Present** This species was detected during the 2017 habitat assessment.
Ardea herodias great blue heron	Fed: CA:	None None	Fairly common all year throughout most of California, in shallow estuaries and fresh and saline emergent wetlands. Less common along riverine and rocky marine shores, in croplands, pastures, and in mountains about foothills.	Yes	**Present** This species was detected during the 2021 habitat assessment.	**Present** This species was detected during the 2017 habitat assessment.
Arizona elegans occidentalis California glossy snake	Fed: CA:	None SSC	Ranges from Contra Costa to San Diego Counties along the western foothills of the Central Valley and from the coast to inland areas in Ventura to San Diego Counties. Found in a variety of habitat types including grasslands, fields, chaparral, and coastal sage scrub within its geographic range.	No	**Presumed Absent** An occurrence of this species is noted in the CNDDB database within the Fresno North USGS quad, the occurrence is dated to the 1880's with no other local occurrences (CDFW 2025a). This species is also not known to occur within this portion of California (CalHerps 2025)	**Presumed Absent** An occurrence of this species is noted in the CNDDB database within the Fresno North USGS quad, the occurrence is dated to the 1880's with no other local occurrences (CDFW 2025a). This species is also not known to occur within this portion of California (CalHerps 2025)
Athene cunicularia burrowing owl	Fed: CA:	None SSC	Primarily a grassland species, but it persists and even thrives in some landscapes highly altered by human activity. Occurs in open, annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. The overriding characteristics of suitable habitat appear to be burrows for roosting and nesting and relatively short vegetation with only sparse shrubs and taller vegetation.	No	**Presumed Absent** The Plant Site provides line-of-sight opportunities favored by this species. A limited number of suitable burrows (>4 inches in diameter) for nesting and roosting are present; however, they occur directly adjacent to heavy machinery and other significant routine disturbances.	**Presumed Absent** The Quarry Site does not provide suitable foraging habitat. Additionally, there are no suitable burrows (>4 inches in diameter) for nesting or roosting.
Bombus crotchii Crotch's bumble bee	Fed: CA:	None END	Primarily occurs in open grasslands, shrublands, and chaparral of central and southern California, often in hot, dry lowland settings with abundant blooming forbs and shrubs for nectar and pollen.	No	**Presumed Absent** The Plant Site has been disturbed by mining operations for many decades. No intact shrubland, grassland or similar native habitats with pollinator forage sources are present to support this species. The species may occur in offsite areas in the near vicinity, but it is not expected to nest within the Plant Site.	**Low** The Quarry Site has been disturbed by mining operations for many decades. Grassland or potentially suitable habitats are limited to a small area, where limited pollinator forage sources are present to support this species. The species may occur in offsite areas in the near vicinity, but it is not expected to nest within the Quarry Site.

Scientific Name Common Name	Status		Habitat	Observed On-site	Potential to Occur on the Plant Site	Potential to Occur on the Quarry Site
Branchinecta lynchi vernal pool fairy shrimp	Fed: CA:	THR None	Distributed from southern Oregon to southern California and associated with vernal pool habitats. Vernal pools are subject to seasonal variations such as duration of inundation and presence or absence of water at specific times of the year. Vernal pool fairy shrimp are dependent on the ecological characteristics of such variations.	No	**Presumed Absent:** There is no suitable habitat within or adjacent to the Plant Site.	**Presumed Absent** There is no suitable habitat within or adjacent to the Quarry Site.
Branchinecta mesovallensis midvalley fairy shrimp	Fed: CA:	None SSI	Endemic to the Central Valley, where it occurs in shallow seasonal vernal pools and other ephemeral depressions in grasslands and low foothills that fill with winter–spring rain and dry completely by summer.	No	**Presumed Absent** The soils within the Plant Site have been disturbed across its entire footprint as a result of mining operations. There are no vernal pools within the project area or adjacent riparian areas.	**Presumed Absent** The soils within the Quarry Site have been disturbed as a result of mining operations and suitable vernal pools are not present.
Buteo swainsoni Swainson's hawk	Fed: CA:	None THR	Typical habitat is open desert, grassland, or cropland containing scattered, large trees or small groves. Breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley. Forages in adjacent grassland or suitable grain or alfalfa fields or livestock pastures.	No	**Moderate** The Plant Site provides suitable foraging habitat. The adjacent, offsite riparian habitat provides suitable foraging and nesting habitat.	**Moderate** There is suitable foraging habitat but no nesting habitat on the Quarry Site. The adjacent, offsite riparian habitat provides suitable foraging and nesting habitat.
Circus hudsonius northern harrier	Fed: CA:	None SSC	Frequents meadows, grasslands, open rangelands, desert sinks, fresh and saltwater emergent wetlands; seldom found in wooded areas. Mostly found in flat, or hummocky, open areas of tall, dense grasses moist or dry shrubs, and edges for nesting, cover, and feeding.	No	**Moderate** The Plant Site provides marginal foraging habitat but no nesting habitat for this species. The adjacent, offsite grassland habitat provides suitable foraging habitat.	**Moderate** The Quarry Site provides marginal foraging habitat but no nesting habitat for this species. The adjacent, offsite grassland habitat provides suitable foraging habitat.
Coccyzus americanus occidentalis western yellow-billed cuckoo	Fed: CA:	THR END	In California, the breeding distribution is now thought to be restricted to isolated sites in Sacramento, Amargosa, Kern, Santa Ana, and Colorado River valleys. Obligate riparian species with a primary habitat association of willow-cottonwood riparian forest.	No	**Low** The Plant Site and adjacent riparian area provide suitable foraging and nesting habitat. However, per CNDDB the last recorded occurrence of this species within the vicinity of the Plant Site was in 1883 (CNDDB)	**Presumed Absent** There is no suitable habitat on the Quarry Site.
Corynorhinus townsendii *Townsend's big-eared bat*	Fed: CA: WBWG:	None SSC High	Occurs in a variety of habitats near suitable roosts, including caves, underground mine features such as shafts and adits, older buildings, and bridges. Prefers open woodland, riparian zones, and edges for foraging. Highly sensitive to disturbance at roost sites.	No	**Presumed Absent** While the Plant Site and adjacent riparian area provide suitable foraging habitat, no suitable abandoned buildings or caves are present to support roosting.	**Presumed Absent** While there is potential foraging habitat on the Quarry Site and within the offsite riparian habitat along the San Joaquin River; none of the required roosting features such as caves, abandoned buildings or similar structures required by this species to support roosting are present.
Desmocerus californicus dimorphus valley elderberry longhorn beetle	Fed: CA:	THR None	Found in riparian habitat only in the vicinity of its host plant, the elderberry species such as the Mexican elderberry (*Sambucus mexicana*)	No	**Presumed Absent** There are no elderberries or riparian habitats on the Plant Site capable of supporting this species.	**Presumed Absent** There are no elderberries or riparian habitats on the Quarry Site capable of supporting this species.

Scientific Name Common Name	Status		Habitat	Observed On-site	Potential to Occur on the Plant Site	Potential to Occur on the Quarry Site
Dipodomys nitratoides exilis Fresno kangaroo rat	Fed: CA:	END END	Restricted to arid valley-floor habitats in the central San Joaquin Valley, primarily in alkali sink and saltbush scrub and adjacent open grasslands with friable, fine-textured soils suitable for burrowing.	No	**Presumed Absent** This species is restricted to western Fresno County which is outside of the vicinity of the project. The only CNDDB occurrence which occurred in the background research is more than 10 miles from the Plant Site and dates to the 1890s (CDFW 2025a). No other occurrences are known in the vicinity of the Plant Site.	**Presumed Absent** This species is restricted to western Fresno County which is outside of the vicinity of the project. The only CNDDB occurrence which occurred in the background research is more than 10 miles from the Plant Site and dates to the 1890s (CDFW 2025a). No other occurrences are known in the vicinity of the Quarry Site.
Efferia antiochi Antioch efferian robberfly	Fed: CA:	None None	Known only from a few localities near the lower San Joaquin River (Antioch, Fresno, and Scout Island); occurs in highly localized, open riverine landscapes, although specific microhabitat requirements have not been well documented.	No	**Presumed Absent** This species is restricted to a small number of locations, none of which are within 5 miles of the project (CDFW 2025a).	**Presumed Absent** This species is restricted to a small number of locations, none of which are within 5 miles of the Quarry Site (CDFW 2025a).
Egretta thula snowy egret	Fed: CA:	None None	Uses shallow fresh and brackish wetlands, marshes, mudflats, and the margins of rivers, ponds, irrigated croplands, and pastures for foraging and roosting.	No	**Moderate** Species such as great blue heron have similar habitat requirements and have been documented during previous site visits. This species may co-occur and therefore there is a moderate potential to occur.	**Moderate** Species such as great blue heron have similar habitat requirements and have been documented onsite. This species may co-occur and therefore there is a moderate potential to occur.
Elanus leucurus White-tailed kite	Fed: CA:	None FP	Found in grasslands, open woodlands, savannas, marshes, and cultivated fields	No	**Moderate** The Plant Site provides foraging habitat but no nesting habitat for this species. There is suitable nesting habitat along the adjacent San Joaquin River and Little Dry Creek.	**Moderate** The Quarry Site provides foraging habitat but no nesting habitat for this species. There is suitable nesting habitat along the adjacent San Joaquin River.
~~***Emys marmorata***~~ ~~western pond turtle~~	~~Fed:~~ ~~CA:~~	~~None~~ ~~SSC~~	~~Requires both aquatic and terrestrial habitats. Uses permanent and seasonal aquatic habitats including rivers, sloughs, lakes, reservoirs, ponds, and irrigation canals. Moves onto land for nesting, overwintering, dispersal, and basking.~~	~~No~~	~~**Low**~~ ~~The Plant Site provides marginal habitat for this species. The adjacent offsite riparian areas associated with the San Joaquin River and Little Dry Creek provide suitable habitat.~~	~~**Low**~~ ~~There is marginal habitat on the Quarry Site. The adjacent offsite riparian areas associated with the San Joaquin River provides suitable habitat.~~
Eremophila alpestris actia California horned lark	Fed: CA:	None WL	Occurs in meadows, grasslands, open fields, prairie, and alkali flats. This subspecies is typically found in coastal regions.	No	**Low** The Plant Site provides marginal foraging and nesting habitat.	**Low** The Quarry Site provides marginal foraging habitat for this species.
Erethizon dorsatum North American porcupine	Fed: CA:	None None	Broad variety of habitats including open tundra, deciduous forests, and desert chaparral. Occupies dens in rock outcroppings and trees. Generalist herbivore, feeding habits change seasonally.	No	**Moderate** The Plant Site and adjacent riparian area provide suitable foraging and denning habitat.	**Moderate** The Quarry Site provides suitable foraging and denning habitat
Euderma maculatum spotted bat	Fed: CA: WBWG:	None None High	Occurs in arid and semi-arid regions including desert scrub, pinyon–juniper woodland, and open conifer forest, typically near cliffs, canyons, or rock faces used for roosting. Forages at night over riparian corridors, open fields, and along cliff faces and is highly sensitive to disturbance at roost sites.	No	**Presumed Absent** This species requires caves or large prominent rock features for roosting. No such features are present within the site.	**Presumed Absent** This species requires caves or large prominent rock features for roosting. No such features are present within the site.

Scientific Name **Common Name**	**Status**		**Habitat**	**Observed On-site**	**Potential to Occur on the Plant Site**	**Potential to Occur on the Quarry Site**
Eumops perotis western mastiff bat	Fed: CA: WBWG:	None None High	Inhabits low- to mid-elevation arid and semi-arid habitats including desert scrub, chaparral, and open woodland, usually in areas with prominent cliffs or rocky outcrops that provide crevices for day roosts. Forages high above the ground over open valleys, canyons, and riparian corridors, often commuting long distances between roosting and foraging areas.	No	**Presumed Absent** This species requires caves or large prominent rock features for roosting. No such features are present within the site.	**Presumed Absent** This species requires caves or large prominent rock features for roosting. No such features are present within the site.
Gonidea angulate ~~Western~~western ridged mussel	Fed: CA:	None None	Occurs on the bottom of streams, rivers, and lakes with substrates that vary from gravel to firm mud, and include at least some sand, silt, or clay.	No	**Low** There is suitable habitat present within the adjacent San Joaquin River, outside the boundaries of the Plant Site.	**Low** There is suitable habitat present within the San Joaquin River, outside the boundaries of the Quarry Site.
Haliaeetus leucocephalus ~~Bald~~bald eagle	Fed: CA:	Delisted END/FP	Often found near large bodies of water such as coastal areas, rivers, swamps, and large lakes	No	**Moderate** There is suitable foraging and nesting habitat along the San Joaquin River.	**Moderate** There is potential foraging habitat onsite. The offsite riparian habitat along the San Joaquin River provides suitable nesting habitat.
Lanius ludovicianus ~~Loggerhead~~loggerhead shrike	Fed: CA:	None SSC	Often found in broken woodlands, shrublands, and other habitats. Prefers open country with scattered perches for hunting and fairly dense brush for nesting.	No	**Moderate** The Plant Site provides suitable foraging and nesting habitat.	**Moderate** The offsite riparian habitat present along the San Joaquin River provides suitable nesting habitat.
Lasiurus blossevillii western red bat	Fed: CA: WBWG:	None SSC High	Roosting sites are found in the foliage of trees and shrubs in forests, most commonly 1.5 to 12 meters above ground. Often relies on riparian trees for roosting and foraging and has been associated with mature stands of cottonwood, sycamore and willows adjacent to streams.	No	**Moderate** The Plant Site and adjacent riparian area provide suitable foraging and roosting habitat.	**Moderate** There is potential foraging habitat on Quarry Site. The offsite riparian habitat along the San Joaquin River provides suitable roosting habitat.
Lasionycteris noctivagans Silver-haired bat	Fed: CA: WBWG:	None None Medium	Occurs primarily in forested habitats including coniferous, mixed conifer–hardwood, and riparian woodlands. Roosts in tree cavities, under exfoliating bark, and in snags, and often selects roosts near water. Forages over ponds, streams, forest openings, and along woodland edges, typically at low to mid heights above the ground.	No	**Low** This species primarily roosts within conifer forests which are not present within the Plant Site. The species may forage over the Plant Site as individuals forage along the San Joaquin River.	**Low** This species primarily roosts within conifer forests which are not present within the Quarry Site. The species may forage over the Quarry Site as individuals forage along the San Joaquin River.
Lasiurus cinereus hoary bat	Fed: CA: WBWG	None None Medium	Thought to prefer trees at the edge of clearings but have also been found in trees in heavy forests, open wooded glades, and shade trees along urban streets and in city parks. They roost 3 to 5 meters above ground during the day, usually in the foliage of trees. They prefer dense leaf coverage above and an open area below. They also prefer trees that border clearings.	No	**Moderate** The Plant Site provides suitable foraging and roosting habitat.	**Moderate** There is potential foraging habitat onsite. The offsite riparian habitat along the San Joaquin River provides suitable roosting habitat.
Lasiurus xanthinus *Western yellow bat*	Fed: CA: WBWG:	None SSC High	Occurs in areas with abundant palm trees used as primary day roosts. Forages along riparian corridors, landscaped areas, and open fields. Often associated with Washingtonia palms in urban and semi-urban environments.	No	**Presumed Absent** The Plant Site is outside of the species known range which only extends north into California up to San Bernardino County.	**Presumed Absent** The Plant Site is outside of the species known range which only extends north into California up to San Bernardino County.

Scientific Name **Common Name**	**Status**		**Habitat**	**Observed On-site**	**Potential to Occur on the Plant Site**	**Potential to Occur on the Quarry Site**
Lavinia exilicauda exilicauda Sacramento hitch	Fed: CA:	None None	Inhabits warm, lowland waters including clear streams, turbid sloughs, lakes, and reservoirs. Prefers shallow stream habitats with small gravel to mud substrates. Spawning takes place over gravel riffles and occasionally on vegetation.	No	**Moderate** There is suitable habitat present within the San Joaquin River.	**Low** There is suitable habitat present within the San Joaquin River but not within the Quarry Site.
Lepidurus packardi vernal pool tadpole shrimp	Fed: CA:	END None	Occupies a variety of seasonal aquatic habitats, including vernal pools, clay flats, alkaline pools, stock ponds, and roadside ditches that hold water for several weeks during the cool season and dry out later in the year.	No	**Presumed Absent** The soils within the Plant Site have been disturbed across its entire footprint as a result of mining operations. There are no vernal pools within the project area or adjacent riparian areas.	**Low** The soils within the Quarry Site have been disturbed as a result of mining operations. Commensurate species have been documented offsite, but this species is unlikely to occur onsite
Linderiella occidentalis California linderiella	Fed: CA:	None None	Currently known from the Central Valley and Coast ranges of California. Has been documented on most land forms, geologic formations, and soil types supporting vernal pools in California.	No	**Presumed Absent** The soils within the Plant Site have been disturbed as a result of the excavation operations. There are no vernal pools within the project area or adjacent riparian areas.	**Low** The soils within the Quarry Site have been disturbed as a result of the excavation operations. However, this species has been documented on adjacent land and the ephemeral pool on-site could provide possible habitat for this species.
Lytta moesta ~~Moestan~~ molestan blister beetle	Fed: CA:	None None	Occurs in central California and is associated with grassland habitats and vernal ~~pools.~~ pool landscapes; adults are typically found on flowering plants such as lupines, clovers, and other forbs, where they feed on blossoms and seed pods. Larvae are parasitic on solitary bees.	No	**Low** There is low quality habitat present within the Plant Site.	**Presumed Absent** There is no suitable habitat within or adjacent to the Quarry Site.
Macrotus californicus California leaf-nosed bat	Fed: CA: WBWG:	None None High	A desert species of the Sonoran and Mojave regions that roosts in warm caves, mines, and rock shelters in low-elevation scrub habitats, foraging at night for insects close to the ground.	No	**Presumed Absent** This species is limited to areas of southern California and is not known to occur near the site.	**Presumed Absent** This species is limited to areas of southern California and is not known to occur near the site.
Mustela frenata xanthogenys San Joaquin long-tailed weasel	Fed: CA:	None None	Occurs in a wide variety of habitats, usually near water. Preferred habitats include brushland, open woodlands, field edges, riparian grasslands, swamps, and marshes. Dens in ground burrows, under stumps, or beneath rock piles. Usually uses abandoned burrows.	No	**High** There is suitable habitat present along the San Joaquin River.	**Low** There is suitable habitat present along the San Joaquin River but not within the Quarry Site.
Mylopharodon conocephalus hardhead	Fed: CA:	None SSC	Occurs mainly in low- to mid-elevation rivers and streams, favoring deep, clear pools with rocky or coarse substrates and relatively undisturbed flow conditions; also persists in some mid-elevation reservoirs. Uses cool, well-oxygenated streams and rivers with riffles and pools over clean gravel and cobble substrates; anadromous steelhead also require accessible migratory corridors between spawning/rearing reaches and estuarine or marine habitats.	No	**Absent** This species may occur offsite within the San Joaquin River, but no suitable habitats are present within the Plant Site to support the species.	**Absent** This species may occur offsite within the San Joaquin River, but no suitable habitats are present within the Plant Site to support the species.

Scientific Name Common Name	Status		Habitat	Observed On-site	Potential to Occur on the Plant Site	Potential to Occur on the Quarry Site
Myotis ciliolabrum Western small-footed bat	Fed: CA: WBWG:	None None Medium	Occupies arid shrublands, open woodlands, and riparian corridors, typically roosting in rock crevices, cliffs, buildings, or tree cavities and foraging low over streams, ponds, and open ground.	No	**Low** No trees, rock outcrops or similar potential roosting features are present within the Plant Site which may be impacted by the project. Any buildings and mining infrastructure are regularly disturbed and are unlikely to support roosting. The species may roost in offsite riparian areas but is only expected to occasionally forage within the Plant Site.	**Low** The Quarry Site has no arid shrublands or woodlands and no cliffs or rock crevices to support roosting by this species. Minimal oak and eucalyptus trees are only located along the riparian corridor. This species may roost in offsite areas along the San Joaquin River but is only likely to forage over the Quarry Site.
Myotis evotis Long-eared myotis	Fed: CA: WBWG:	None None Medium	Found in coniferous forests, shrublands, and riparian zones, where it roosts in tree cavities, under bark, or in rock crevices and forages by gleaning insects from vegetation in cluttered forest and riparian edges.	No	**Low** No trees, rock outcrops or similar potential roosting features are present within the Plant Site which may be impacted by the project. Any buildings and mining infrastructure are regularly disturbed and are unlikely to support roosting. The species may roost in offsite riparian areas, but is only expected to occasionally forage within the Plant Site.	**Low** The Quarry Site has no conifer forest, shrublands or woodlands. No cliff faces or large rock crevices are present to support roosting by this species. Minimal oak and eucalyptus trees are located along the riparian corridor. This species may roost in offsite areas along the San Joaquin River.
Myotis lucifugus Little brown bat	Fed: CA: WBWG:	None None Medium	Widely distributed in forested, riparian, and urban areas; commonly roosts in buildings, bridges, and tree cavities and forages over streams, ponds, wetlands, and forest edges for flying insects.	No	**Low** No trees, rock outcrops or similar potential roosting features are present within the Plant Site which may be impacted by the project. Any buildings and mining infrastructure are regularly disturbed and are unlikely to support roosting. The species may roost in offsite riparian areas, but is only expected to occasionally forage within the Plant Site.	**Moderate** Any buildings and mining infrastructure are regularly disturbed and are unlikely to support roosting. However, the Quarry Site does contain oak and eucalyptus trees which may support roosting by the species. The species may roost in offsite riparian areas as well and may forage within the Quarry Site.
Myotis thysanodes Fringed Myotis	Fed: CA: WBWG:	None None High	Uses arid woodlands, conifer forests, and riparian areas, roosting in caves, mines, rock crevices, and buildings and foraging along forest edges and over open habitats for beetles and other large insects.	No	**Low** No trees, rock outcrops or similar potential roosting features are present within the Plant Site which may be impacted by the project. Any buildings and mining infrastructure are regularly disturbed and are unlikely to support roosting. The species may roost in offsite riparian areas, but is only expected to occasionally forage within the Plant Site.	**Moderate** Any buildings and mining infrastructure are regularly disturbed and are unlikely to support roosting. However, the Quarry Site does contain oak and eucalyptus trees which may support roosting by the species. The species may roost in offsite riparian areas, and may occasionally forage within the Quarry Site.
Myotis volans Long-legged myotis	Fed: CA: WBWG:	None None High	Primarily associated with mid- to high-elevation coniferous forests and woodlands, roosting in tree cavities, under bark, and in rock crevices and foraging above the canopy, along cliffs, and over riparian corridors.	No	**Low** No trees, rock outcrops or similar potential roosting features are present within the Plant Site which may be impacted by the project. Any buildings and mining infrastructure are regularly disturbed and are unlikely to support roosting. The species may roost in offsite riparian areas, but is only expected to occasionally forage within the Plant Site.	**Low** The Quarry Site has no high elevation conifer forest. No cliff faces or large rock crevices are present to support roosting by this species. Some oak and eucalyptus trees are located within the Quarry Site along the riparian corridor but individuals are more likely to roost in offsite areas along the San Joaquin River. The species may occasionally forage within the Quarry Site.

Scientific Name **Common Name**	**Status**		**Habitat**	**Observed On-site**	**Potential to Occur on the Plant Site**	**Potential to Occur on the Quarry Site**
Myotis yumanensis Yuma myotis	Fed: CA:	None None	Strongly associated with rivers, lakes, and other water bodies. Roosts in buildings, bridges, and tree cavities near water. Forages low over open water and along riparian vegetation edges.	No	**Low** No trees, rock outcrops or similar potential roosting features are present within the Plant Site which may be impacted by the project. Any buildings and mining infrastructure are regularly disturbed and are unlikely to support roosting. The species may roost in offsite riparian areas, but is expected to only occasionally forage within the Plant Site.	**Low** The Quarry Site has no cliffs or rock crevices to support roosting by this species. Minimal oak and eucalyptus trees are only located along the riparian corridor. This species may roost in offsite areas along the San Joaquin River, but is likely to only forage over the Quarry Site.
Nyctinomops femorosaccus Pocketed free-tailed bat	Fed: CA: WBWG:	None None Medium	Occurs in arid and semi-arid habitats including desert scrub, chaparral, and open woodland, typically roosting in deep crevices in cliffs, rocky outcrops, and canyon walls. Forages at high altitudes over open desert, canyons, and riparian corridors, often traveling long distances between roosts and feeding areas.	No	**Presumed Absent** This species is limited to areas of southern California and is not known to occur near the site.	**Presumed Absent** This species is limited to areas of southern California and is not known to occur near the site.
Nyctinomops macrotis Big free-tailed bat	Fed: CA: WBWG:	None SSC Medium	Inhabits arid and semi-arid regions, including desert mountains, canyons, and rugged rocky terrain. Roosts primarily in deep crevices of cliffs and steep rock faces. Forages high above ground over open desert, canyons, and riparian areas, often flying long distances in search of insect prey.	No	**Presumed Absent** This species is limited to areas of southern California and is not known to occur near the site.	**Presumed Absent** This species is limited to areas of southern California and is not known to occur near the site.
Oncorhynchus mykiss *steelhead/rainbow trout*	Fed: CA:	THR None	Uses cool, well-oxygenated streams and rivers with riffles and pools over clean gravel and cobble substrates; anadromous steelhead also require accessible migratory corridors between spawning/rearing reaches and estuarine or marine habitats.	No	**Absent** This species may occur offsite within the San Joaquin River, but no suitable habitats are present within the Plant Site to support the species.	**Absent** This species may occur offsite within the San Joaquin River, but no suitable habitats are present within the Plant Site to support the species.
Oncorhynchus tshawytscha *chinook salmon* *Central Valley fall-run chinook salmon*	Fed: CA:	None SSC	Occurs in large river systems with cool, well-oxygenated water. Spawns in shallow riffles with clean, coarse gravel and moderate flows. Juveniles use mainstem channels, side channels, and shallow off-channel areas with low water velocity for rearing. Requires accessible migratory corridors with sufficient flow for downstream movement.	No	**Absent** There is suitable habitat in the San Joaquin River near the project sites, but no suitable habitats are present within the Plant Site to support the species. The fall run is historically and currently the dominant run in the SJR and its tributaries.	**Absent** There is suitable habitat in the San Joaquin River near the project sites, but no suitable habitats are present within the Quarry Site to support the species. The fall run is historically and currently the dominant run in the SJR and its tributaries.
Oncorhynchus tshawytscha *chinook salmon* *Central Valley spring-run chinook salmon*	Fed: CA:	THR THR	Occurs in upstream river reaches with cold, sustained flows and deep pools for summer holding. Spawns in cool, swift-water riffles with clean gravel substrate. Juveniles rely on complex shallow water and floodplain habitats that provide low-velocity refuge and abundant food resources. Requires cool summer temperatures and unobstructed migratory access.	No	**Absent** There is suitable habitat in the San Joaquin River near the project sites. Historically, this species had been extirpated from the mainstem of the river. An experimental population is currently being reintroduced as part of the San Joaquin River Restoration Program (SJRRP). Populations are limited but returning adults have been observed in the adjacent river during annual monitoring.	**Absent** There is suitable habitat in the San Joaquin River near the project sites. Historically, this species had been extirpated from the mainstem of the river. An experimental population is currently being reintroduced as part of the San Joaquin River Restoration Program (SJRRP). Populations are limited but returning adults have been observed in the adjacent river during annual monitoring.

Scientific Name Common Name	Status		Habitat	Observed On-site	Potential to Occur on the Plant Site	Potential to Occur on the Quarry Site
Pandion haliaetus osprey	Fed: CA:	None WL	Occurs in a variety of plant communities in association with riparian habitats including shrublands, grasslands, swamps, and coniferous and deciduous forests. In California, ospreys are primarily associated with ponderosa pine (Pine ponderosa) and mixed-conifer types.	Yes	**Present** This species was detected foraging over the Valley Oak Woodland west of the Plant Site during the 2021 habitat assessment.	**Present** This species was detected foraging over the ~~site~~ Quarry Site during the 2017 habitat assessment.
Phrynosoma blainvillii coast horned lizard	Fed: CA:	None SSC	Occurs in a variety of semi-arid and foothill habitats characterized by loose, sandy or loamy soils and open ground with sparse or low vegetation, conditions that support their primary prey — native harvester ants.	No	**Presumed Absent** The Plant Site has been disturbed over many years and any native habitat features that this species relies on have been removed. This species may occur in offsite areas but is expected to be absent from within the Plant Site.	**Presumed Absent** The Quarry Site has been disturbed over many years of mining and any native habitat features required by this species have been removed. This species may occur in offsite areas but is expected to be absent from within the Quarry Site.
Pogonichthys macrolepidotus *Sacramento splittail*	Fed: CA:	None SSC	Occurs in slow-moving rivers, sloughs, backwaters, and floodplain habitats of the Central Valley. Prefers shallow areas with submerged vegetation, low velocities, and seasonally inundated floodplains used for spawning. Juveniles and adults use slack-water habitats with gentle flows and turbid conditions for feeding and refuge. Requires periodic floodplain inundation to support successful reproduction.	No	**Low** There is suitable habitat in the San Joaquin River near the project sites. Historically, this species was present in the SJR, but current occurrences are rare due to changes in floodplain conditions in the region.	**Low** There is suitable habitat in the San Joaquin River near the project sites. Historically, this species was present in the SJR, but current occurrences are rare due to changes in floodplain conditions in the region.
Rana boylii pop. 5 foothill yellow-legged frog - south Sierra DPS	Fed: CA:	None THR	Closely associated with rocky, sun-exposed streams and rivers in foothill and lower montane forests and chaparral, breeding in shallow riffles and runs with coarse substrates and relatively stable spring and summer flows.	No	**Presumed Absent.** This species requires streams with rocky substrate and stable flows. No such features are present within the Plant Site. While offsite, the San Joaquin River is subjected to regular dam releases, rather than a natural hydrograph, therefore it is also unlikely to support this species.	**Presumed Absent.** This species requires streams with rocky substrate and stable flows. No such features are present within the Quarry Site. While offsite, the San Joaquin River is subjected to regular dam releases, rather than a natural hydrograph, it is also unlikely to support this species.
Spea hammondii western spadefoot	Fed: CA:	None SSC	Prefers open areas with sandy or gravelly soils, in a variety of habitats including mixed woodlands, grasslands, coastal sage scrub, chaparral, sandy washed, lowlands, river floodplains, alluvial fans, playas, alkali flats, foothills, and mountains. Rain pools which do not contain bullfrogs, fish, or crayfish are necessary for breeding.	No	**~~High~~ Low** ~~There is suitable habitat present along the San Joaquin River.~~ While the Plant Site has silt ponds that could provide habitat, the level of disturbance in the vicinity severely limits movement opportunities to access the ponds.	**Low** There is marginal habitat within the Quarry Site. The offsite riparian habitat along the San Joaquin River provides suitable nesting habitat.
Taxidea taxus American badger	Fed: CA:	None SSC	Prefers open grasslands, shrublands, and agricultural areas with loose, well-drained soils that support abundant burrowing prey such as ground squirrels and pocket gophers.	No	**Presumed Absent.** No suitable habitat is present. The Plant Site has been continuously disturbed under current mining activities which has eliminated potential habitats for this species.	**Low.** The only grasslands that are present within the Quarry Site are between the active mining area and North Friant Road. This area is regularly disturbed from ongoing operations and traffic. The Quarry Site has been continuously disturbed under current mining activities which has diminished potential habitats for this species. This species may occur in adjacent undeveloped habitats but is unlikely to be present in the Quarry Site.

Scientific Name **Common Name**	**Status**		**Habitat**	**Observed On-site**	**Potential to Occur on the Plant Site**	**Potential to Occur on the Quarry Site**
Tadarida brasiliensis *Mexican free-tailed bat*	Fed: CA:	None None	Occurs widely in urban, agricultural, and natural habitats. Roosts in large colonies under bridges, in buildings, and in rock crevices. Forages high over rivers, fields, and riparian corridors where insect concentrations are high.	No	**High** There is suitable habitat present along the San Joaquin River.	**Low** There is marginal habitat within the Quarry Site. The off-site riparian habitat along the San Joaquin River provides suitable nesting habitat.
Thamnophis gigas giant garter snake	Fed: CA:	THR THR	Inhabits agricultural wetlands and other waterways such as irrigation and drainage canals, sloughs, ponds, small lakes, low gradient streams, and adjacent uplands in the Central Valley.	No	**Low** There is suitable habitat present along the San Joaquin River. However, per CNDDB this species has not been observed in the general area.	**Low** There is suitable habitat present along the San Joaquin River. However, per CNDDB this species has not been observed in the general area.
Vireo bellii pusillus least Bell's vireo	Fed: CA:	END END	Breeds in dense, low riparian scrub dominated by willow, mulefat, and other shrubs along low-gradient streams, rivers, and floodplains, typically where continuous riparian vegetation occurs near surface water.	No	**Presumed Absent.** The project is outside of the known distribution for this species (USFWS 2025).	**Presumed Absent.** The project is outside of the known distribution for this species (USFWS 2025).
Vulpes macrotis mutica San Joaquin kit fox	Fed: CA:	END THR	Inhabits arid grasslands and scrublands of the San Joaquin Valley and adjacent foothills, typically in areas with sparse, low vegetation and friable soils suitable for denning, including some agricultural and urban edge habitats.	No	**Low** The Plant Site has no intact native habitats such as grassland or scrubland to support denning by this species. In addition, there are no significant attractants such as ground squirrel colonies or industrial food waste to attract and support this species. The species may occur in offsite undeveloped areas.	**Low** The Quarry Site has limited grasslands between the active mine and North Friant Road. Such areas are regularly disturbed from mining activities and traffic. There are no significant attractants such as ground squirrel colonies or industrial food waste to attract and support this species. This species may occur in adjacent non-developed areas.
Xanthocephalus xanthocephalus yellow-headed blackbird	Fed: CA:	None SSC	Nests in fresh emergent wetland with dense vegetation and deep water, often along borders of lakes or ponds. Forages in emergent wetland and moist, open areas, especially cropland and muddy shores of lacustrine habitat. Restricted distribution in Central Valley in winter, occurring mainly in the western portion.	No	**High** There is suitable habitat located along the San Joaquin River.	**Presumed Absent** There is no suitable habitat within the Quarry Site. There is suitable foraging and nesting habitat present along the San Joaquin River.

Table Source: Appendix E-1 and Appendix E-2. Revisions incorporated into this Final EIR, including evaluations of additional special-status wildlife species identified through the expanded California Natural Diversity Database (CNDDB) search, are based on WRA (2026) (See Appendix E-6).

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.4 to correct the stated acreage of the Quarry Site. Draft EIR page 4.4-30 is revised as follows.

ERRATA

Within the ~~349~~352.4-acre Quarry Site, land uses and available vegetation and/or habitat types are in constant flux, generally decreasing, due to the ongoing mining operations which have been continuous for over 30 years. During the 2019 habitat assessment, it was determined that mining has removed soils down to bedrock, 20 to 50 feet deep, on 254.99 acres or 73% of the Quarry Site. These areas do not support native habitats or vegetation. In 2019, there were also 47.21 acres of non-native grasslands, approximately 14%, and 44.70 acres of open ponds, approximately 13%.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.4 to provide setting information regarding chinook salmon. New text was added as paragraph three to Draft EIR page 4.4-37 as follows.

ERRATA

Central Valley Chinook salmon, including fall-run and reintroduced spring-run populations, have the potential to migrate through the San Joaquin River downstream of the project sites. Fall-run Chinook salmon currently represent the predominant run in the basin and use the lower San Joaquin River for migration, spawning, and juvenile rearing under seasonally managed flow conditions. Spring-run Chinook salmon are being reintroduced to the upper San Joaquin River as part of the San Joaquin River Restoration Program (SJRRP), which restores flows to support upstream passage, over-summer holding, and spawning habitat in historically occupied reaches. Although habitat is present in the mainstem San Joaquin River, no suitable habitat occurs within the project sites, and the heavily modified channel in the project area is not expected to support resident or holding adults. Neither fall-run nor spring run Chinook salmon were observed during site-level field surveys.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.4 to provide setting information regarding bats. New text was added as paragraph four to Draft EIR page 4.4-37 as follows.

ERRATA

Bat Species

There is a moderate potential for several bat species, including the western red bat, hoary bat, pallid bat, and fringed myotis. Potential day roosting habitat occurs in riparian woodlands and mature trees associated with the San Joaquin River corridor, as well as in bridges, barns, and other structures in the surrounding area. Some potential roosting structures exist in the form of trees and buildings within the sites, and in the riparian corridor abutting the sites. No bat roosts were observed within the project sites during field surveys; however, because bats have moderate potential to occur, Mitigation Measure 4.4-1d has been included to ensure that any potential roosts are identified and avoided during the maternity season. Incorporating Mitigation Measure 4.4-1d reduces any potential impacts to roosting bats to a less than significant level.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.4 to provide further description of the San Joaquin River Restoration Program. New text was added as the last paragraph of Draft EIR page 4.4-38 as follows.

ERRATA

San Joaquin River Restoration Program

The San Joaquin River Restoration Program (SJRRP) is a long-term, comprehensive effort led by the U.S. Bureau of Reclamation and the California Department of Water Resources (DWR) to restore and manage flows in the San Joaquin River between Friant Dam and the confluence with the Merced River. The SJRRP was established pursuant to the Stipulation of Settlement in *Natural Resources Defense Council et al. v. Kirk Rodgers et al.* (2006), which resolved long-standing litigation over river flow releases from Friant Dam. The primary goals of the SJRRP are to:

- Restore and maintain fish populations, in particular the reintroduction and long-term viability of naturally reproducing, self-sustaining populations of Chinook salmon, including spring-run; and

- Reduce or avoid adverse water supply impacts to Friant Division long-term contractors that could result from restoration flows.

To achieve these goals, the SJRRP includes phased flow releases below Friant Dam; channel and structural improvements to facilitate fish passage and inundation of floodplain habitat; reintroduction of spring-run Chinook salmon; and ongoing monitoring, adaptive management, and cooperative implementation with federal, state, and local agencies. The SJRRP has incrementally restored seasonal connectivity to reaches of the river that had historically been dry, improving aquatic and riparian habitat conditions and supporting the gradual return of anadromous fish to portions of the San Joaquin River.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.4 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.4-41 is revised as follows.

ERRATA

Zoning Ordinance of Fresno County—Land Use and Planning

The Zoning Ordinance of Fresno County—Land Use and Planning, last amended ~~June 2018~~February 2026, has policies and ordinances related to biological resources. Specifically, ~~Section 858, "Regulations for Surface Mining and Reclamation in All Districts,"~~ Section 834.4.220, "Mineral Extraction Sites," contains the following countywide development standards:

~~Section 858—Regulations for Surface Mining and Reclamation in All Districts~~
Section 834.4.220—Mineral Extraction Sites

~~H. Mining and Reclamation Standards~~
I. Mining and Reclamation Standards

11. The species selected for revegetation shall be those with good survival characteristics for the topography, resoiling characteristics, and climate of the mined area. The operator shall provide a schedule and methodology for monitoring vegetation and replacing vegetation should the Department determine that replacement is necessary.

25. The ~~Department~~Director shall consider the potentially adverse environmental effects of surface mining operations and ~~will~~shall generally require that ~~the~~:

a) Disturbances of vegetation and overburden in advance of mining activities be minimized.

c) All reasonable and practical measures be taken to protect the habitat of fish and wildlife.

26. Reclamation of mined lands shall be implemented in ~~conformance~~compliance with applicable performance standards as set forth in the State Regulations Sections 3703 et seq. pertaining to the subjects listed below:

a) Wildlife habitat.

g) Stream protection including surface and groundwater.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.4 to update the discussion to match revisions to Mitigation Measure 4.4-1c required as part of this Final EIR. Draft EIR page 4.4-49 is revised as follows.

ERRATA

The project sites have a low potential to provide suitable habitat for western pond turtle and western spadefoot. However, the removal of silt ponds to allow for the mining of aggregate and/or hardrock underneath would adversely affect western pond turtle and western spadefoot, if any are present in the ponds during removal. Mitigation Measure 4.4-1b would require pre-construction clearance surveys of the ponds on the Plant Site and Quarry Site to be conducted no more than 14 days prior to the removal of a pond. Furthermore, a biologist will be present during pond removal activities to monitor for these species and will perform other duties of the biologist described in Mitigation Measure 4.4-1b. Because excavation for mining would make it physically impossible to maintain the pond while mining hard rock beneath, ~~A pond cannot be left elevated above the surrounding excavation, as a result~~ avoidance of occupied habitat is not feasible. Therefore, any member of the species present would be captured by a qualified biologist and with approval from CDFW relocated to similar habitat near the project sites. With implementation of Mitigation Measure 4.4-1b, the potential of the proposed project to result in adverse impacts to any western pond turtle and western spadefoot present at the Plant Site and Quarry Site ponds would be less than significant.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.4 to further evaluate the project's potential impacts to various bat species (see Draft Table 4.4-1). Draft EIR page 4.4-49 is revised to add new text at the third paragraph as follows.

ERRATA

As discussed in Table 4.4-1, there is moderate potential for western red bat, hoary bat, and other bat species to be present at both the Plant Site and Quarry Site where roosting habitat is provided (i.e., rock crevices, tree cavities, old buildings, etc.). Project activities may remove potential roost sites within the Plant Site and Quarry Site. Additionally, disturbances from project operations could indirectly affect bat roosting and foraging behavior in the riparian areas abutting both sites. Mitigation Measure 4.4-1d has been added to the EIR to address potential impacts to bat species.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.4 to strengthen existing mitigation measures and add new mitigation measures to further avoid and minimize impacts to special status fish and wildlife species. Draft EIR pages 4.4-50 through 4.4-52 have been revised as follows.

ERRATA

Mitigation Measure 4.4-1a: *Burrowing Owl*

~~A p~~Pre-construction ~~clearance~~ take avoidance surveys for burrowing owl shall be conducted on the Quarry Site prior to disturbing any grasslands in accordance with the CDFW Staff Report on Burrowing Owl Mitigation (dated March 7, 2012).

The ~~first~~ surveys shall occur as described in the CDFW Staff Report and shall be conducted ~~at least~~ no more than 14 days prior to the initiation of construction of the aggregate plant and/or of each mining phase ~~and the~~. The second survey shall be conducted within 24 hours of the start of construction of the aggregate plant and/or of each mining phase to ensure burrowing owl remain absent from the Quarry Site. ~~If burrowing owls are found to occupy observed within the Quarry Site grasslands at the time of the clearance survey, a relocation plan shall be developed, approved by CDFW, and implemented prior to development of any Quarry Site grasslands.~~

If no burrowing owls are observed, no further actions are required.

If burrowing owls are observed within the Quarry Site or within adjacent lands in close enough proximity to be affected by proposed activities, the burrow will be protected using a combination of buffer zones, visual screens or similar measures as recommended by a qualified biologist congruent with recommendations in the CDFW Staff Report on Burrowing Owl. Buffer distances, visual barriers and other minimization practices will be based on the location of observation, time of year, and status of the burrowing owl burrow.

If the active burrowing owl burrow cannot be avoided, the Operator shall consult with CDFW to obtain an Incidental Take Permit prior to excluding and relocating non-nesting owls from the burrow. In coordination with any measures or mitigation required in the ITP, the following measures will at minimum be enacted to reduce effects to burrowing owl to less than significant levels:

- *Prior to any exclusion, mitigation for any lost habitat will be procured (i.e. credits purchased from an approved mitigation bank or mitigation lands protected through a recognized conservation easement). Suitable habitat shall be mitigated at a ratio of 1:1 (mitigation to impact) unless otherwise approved by CDFW.*
- *Exclusion will not occur during the breeding season (February 1 – August 31).*
- *If exclusion occurs immediately after the breeding season (September 1 – September 30) daily monitoring shall be conducted by a qualified biologist for a minimum of one week prior to relocation to confirm young of the year have fledged.*
- *Exclusion will be performed only by a qualified biologist.*
- *Biological monitoring shall be conducted prior to, during, and after exclusion of burrowing owls sufficient to ensure take is avoided.*
- *Following completion of exclusion, a summary will be provided to the County and CDFW documenting the results.*

***Mitigation Measure 4.4-1b**: Western Pond Turtle and Western Spadefoot*

Pre-construction clearance surveys within the boundaries of the Quarry Site shall be conducted no more than 14 days prior to removal of a temporary pond to be removed so that the aggregate or hardrock below the pond can be mined. A combination of visual and trapping surveys by a ~~CDFW~~ qualified biologist ~~may~~ shall be performed. A pond cannot be left elevated above the surrounding excavation, as a result avoidance of occupied habitat is not feasible. Therefore, if the species is determined to be present in work areas, the qualified biologist with approval of a relocation plan from CDFW ~~may~~ shall capture turtles and spadefoot prior to ~~construction~~ mining and reclamation activities and relocate them to nearby suitable habitat near the Quarry Site. Exclusion fencing ~~should~~ shall then be installed, if necessary and feasible, to prevent turtles and spadefoot from reentering the work area. ~~For the duration of work to remove the temporary pond, the biologist shall~~

~~*conduct at least weekly follow-up visits to monitor effectiveness and take appropriate corrective action if protection measures are not adequate.*~~ *A qualified biologist shall be present during the draining and removal of the pond and shall monitor removal of the pond until no areas that could ensconce pond turtle or spadefoot remain.*

Mitigation Measure 4.4-1c: *Nesting Birds*

If the initiation of construction (i.e. ground disturbing activities and/or blasting) at the Plant Site or the Quarry Site ~~*initiation of a mining phase as shown on the Plant Site Mining Plan (Figure 2-7)*~~ *will occur between February 1 and August 31,* ~~*a*~~ *pre-construction clearance surveys for nesting birds, including* ~~*the above noted*~~ *the following raptor species:* ~~*(*~~*Swainson's hawk, bald eagle, osprey, red-tailed hawk and white-tailed kite,*~~*)*~~ *and the tricolored blackbird (Agelaius tricolor)* ~~*should*~~ *shall be conducted by a qualified biologist. A total of three surveys shall be conducted. Surveys will be separated from each other by at least one week, and the final survey will end within three (3) days of the start of any vegetation removal or ground disturbing activities* ~~*within*~~*. (Note that in accordance with the* ~~*immediate area of*~~ *Swainson's hawk survey protocol, the* ~~*mining phase where construction is to*~~ *survey efforts shall not be initiated* ~~*and as well as*~~ *during the period of April 21 to June 10, when active nests of this species are difficult to detect.) For general mining activities (not blasting) the survey area shall extend to all areas within 500 feet. For blasting events, the survey area shall extend to all areas within* ~~*a 50-foot buffer*~~*500 feet for most birds and 0.25-mile for large raptors including Swainson's hawk or bald eagle.*

Once ground disturbing activities or blasting have begun, if they are discontinued for a period of 7 or more days, a single survey shall be conducted (in addition to the already completed three surveys described above) to verify that no new active nests are present that could be impacted by the resumption of such ~~*areas to ensure that no nesting birds will be disturbed during construction.*~~ *activities. If cessation of activities lasts longer than three weeks, the three-survey survey requirement described above shall be implemented.*

~~*As shown on Exhibit 5 in Appendix E 1, "Plant Site Habitat Assessment" there are no trees suitable for nesting at the Plant Site for the above noted raptor species (Swainson's hawk, bald eagle, osprey, red-tailed hawk and white-tailed kite) except along Friant Road and outside the perimeter of the survey area. Therefore, the survey for the raptor species shall be limited to the initiation of construction along Friant Road and outside the perimeter of the survey area.*~~

~~*If the initiation of construction at the new plant at the Quarry Site or the initiation of a mining phase as shown on the Quarry Site Mining Plan (Figure 2-8) will occur between February 1 and August 31, a pre-construction clearance survey for nesting birds, including the above noted raptor species (Swainson's hawk, bald eagle, red-tailed hawk and white-*~~

~~*tailed kite) and the tricolored blackbird (Agelaius tricolor) should be conducted by a qualified biologist within three (3) days of the start of any vegetation removal or ground disturbing activities within the immediate area of the mining phase as shown on the Quarry Site Mining Plan (Figure 2-8) where construction is to be initiated and as well as within a 50-foot buffer of such areas to ensure that no nesting birds will be disturbed during construction.*~~

~~*As shown on Exhibit 5 in Appendix E-2, "Quarry Site Habitat Assessment," there are no trees suitable for nesting for the above noted raptor species except along the west side of the project next to the river. Therefore, the survey for the raptor species shall be limited to the initiation of construction along the west side of the project next to the river. The biologist who conducted the clearance survey should document a negative survey with a brief letter report indicating that no impacts to active avian nests will occur.*~~ *If an active avian nest is discovered during the pre-construction clearance survey,* ~~*construction*~~ *mining and/or reclamation activities shall stay outside of a* ~~*300-foot*~~ *buffer recommended by the qualified biologist. Buffers may be as small as 100 feet around the active nest.* ~~.~~ *of non-status passerine species. For listed and raptor species, this buffer shall be expanded to 500 feet.* ~~.~~ *(minimum for raptors) and 0.25 mile for bald eagle or listed species such as Swainson's hawk. A* ~~*biological monitor*~~ *qualified biologist shall be present to delineate the boundaries of the buffer area and monitor the active nest as detailed below to ensure that nesting behavior is not adversely affected by* ~~*construction*~~ *mining and/or reclamation activities. Once the young have fledged and left the nest, or the nest otherwise becomes inactive under natural conditions, mining and/or reclamation* ~~*construction*~~ *activities within the buffer area can occur.*

Criteria related to the amount and duration of nest monitoring that ~~*will*~~ *shall be required if an active avian nest is found are as follows:*

- *If an active nest is found and construction will* ~~*remain outside of a 300/500-foot*~~*need to occur within the recommended buffer* ~~*from the nest*~~*, the* ~~*Biologist*~~ *qualified biologist shall watch the nest for at least* ~~*15 minutes during construction*~~ *1 hour prior to initiating mining and/or reclamation activities and continuing for at least 1 hour following the start of mining and/or reclamation activities to determine if the nesting birds are disturbed by construction activities. If the birds appear distressed or behave aggressively toward the construction, work will not occur within the buffer, and a greater avoidance buffer shall be implemented and* ~~*watched*~~ *observations by the* ~~*Biologist again*~~ *biologist will continue. Once a suitable buffer has been determined to be effective, the* ~~*Biologist*~~ *biologist may decide whether ongoing nest monitoring is warranted.*

- *If an active nest is found and construction will occur within ~~300/500 feet of~~ the specified buffer for the active nest for multiple weeks, the nest shall be checked on the first day as described above, while establishing a suitable buffer. Subsequently the nest shall be checked at least ~~on a weekly basis~~ twice per week to determine if its status has changed. The ~~Biologist~~ biologist shall ~~check~~ then recheck the nest a week after mining and/or reclamation activities have ~~construction has left~~ ceased in the focal area ~~in order~~ to ~~document that the nesting activity continues to proceed successfully~~ note the status, e.g., if the nest remains active.*
- *If the nest of a listed or fully protected species is found within ~~a~~ the survey buffer, ~~the~~ and work will need to occur within that buffer, CDFW will be notified ~~within 24 hours~~ for coordination of any additional monitoring ~~requirements~~ recommendations.*

Mitigation Measure 4.4-1d: *Bat Roost Assessment and Survey*

No more than 30 days prior to surface disturbing activities of an undisturbed area (e.g., vegetation removal, initial grading/mining or tree removal), a qualified biologist familiar with bats and bat ecology, and experienced in conducting bat surveys, shall conduct a bat habitat assessment amongst suitable habitat (e.g., large trees with crevices, cavities, exfoliating bark, foliage) within the surface disturbance area as well as within a buffer of 100 feet. The qualified biologist shall inspect the habitat areas for signs of bat use (e.g., whitewash, guano); shall inspect crevices, cavities, and exfoliating bark for bat presence (e.g., using a flashlight); and may use bat detection devices if needed.

If no evidence of bat roosts or potential bat roosting substrates are found, the qualified biologist shall submit a report summarizing the results of the survey to the Operator, and further mitigation shall not be required. The Operator shall retain this report for five years and make it available to Fresno County staff upon request or as required for mitigation monitoring.

If evidence of bat roosts is found, the qualified biologist shall submit a report summarizing the results of the survey to the Operator. The Operator shall retain this report for five years and make it available to Fresno County staff upon request or as required for mitigation monitoring. If evidence of bat roosts is observed during the maternity roosting season (April 1 – August 31), roost type, species and number of bats using the roost shall be determined by a qualified biologist. Bat detectors may be used if deemed necessary to supplement survey efforts by the qualified biologist. A no-disturbance buffer of 100 feet shall be established around active bat maternity roost, and project activities shall not occur within this buffer until after the maternity season or roosts are unoccupied.

If non-maternity roosts are found, or the survey identifies a suitable roost outside of the maternity roosting season (between September 1 and May 30) the qualified bat biologist will develop a bat exclusion plan to humanely evict bats from occupied trees or structures. Upon successful completion of the eviction, project activities may be allowed to resume within the buffer.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.4 to clarify implementation of Mitigation 4.10-1, "Blasting Protocols." Draft EIR pages 4.4-57 and 4.4-58 are revised as follows.

ERRATA

Mitigation Measure 4.10-1 would require implementation of the *Blasting Protocols* (Appendix H-6) which specifies that blasting must begin at the center of the Quarry Site so that monitoring of groundborne vibration can occur and be used to verify that predicted maximum ground vibrations are consistent with actual ground vibration measurements and allow for adjustments in blasting design to occur based on the monitoring results. The *Blasting Protocols* detail requirements for the implementation of a blast monitoring program that includes ground vibration measurements, air overpressure measurements, visual inspection of the San Joaquin River embankment whenever blasting occurs within 1,000 feet of the embankment and depths less than 100 feet within the hard rock portion of the quarry pit (measured at the contact between alluvium and rock). Should significance thresholds be exceeded or signs of instability of the embankment (such as slumping or cracking) be noted, the County must be notified within 48 hours. If it is determined that the instability is the direct result of blasting, and not due to natural water erosion, with or without flooding, then a corrective action plan must be developed that identifies changes to the blasting program to prevent future exceedances. If a corrective action plan is required, a suspension of all blasting will immediately occur until the corrective action is approved by the County. The *Blasting Protocols* also detail the requirements for complaint response procedures; record keeping; and annual reporting of monitoring, complaints investigations, and corrective actions.

END OF ERRATA

Explanation

Revisions have been made to the Draft EIR Section 4.4 to correct the lettering regarding Mitigation Measure 4.3-2c, which is a non-existent mitigation measure and is therefore removed. Draft EIR page 4.4-58 is revised as follows.

ERRATA

Lastly, indirect impacts to riparian habitat could occur from fine materials and dust settling on vegetation. The generation of dust by the proposed project is discussed in detail in Section 4.3, "Air Quality," of this Draft EIR. Mitigation Measures 4.3-2a~~,~~ and -2b~~, and -2c~~ would require that all equipment with off-road engines to be retrofitted or upgraded to meet the Tier 4i Particulate Emissions standard and would require dust from unpaved roads and stockpiles to be controlled by the application of dust suppressants or other equivalent methods. With implementation of these measures, the generation of particulate matter would be minimized and the potential for dust to be generated from the project sites in amounts that could damage surrounding vegetation would be less than significant.

Level of Significance Before Mitigation: Potentially significant.

Mitigation Measures: *Implement Mitigation Measures 4.10-1 and 4.3-2a~~,~~ and -2b~~, and -2c.~~*

END OF ERRATA

Explanation

Revisions have been made to the Draft EIR Section 4.4 to correct the lettering regarding Mitigation Measure 4.3-2c, which is a non-existent mitigation measure and is therefore removed. Mitigation Measure 4.13-6 has been removed in the Final EIR as it was duplicative of Mitigation Measure 4.10-1, "Blasting Protocols." Draft EIR page 4.4-58 is revised as follows.

ERRATA

Mitigation Measure: *Implement Mitigation Measures 4.3-2a, 4.3-2b, ~~4.3-2c,~~ 4.4-1a, 4.4-1b, 4.4-1c, and ~~4.13-6~~4.10-1*.

END OF ERRATA

Explanation

Revisions have been made to the Draft EIR Section 4.4 to eliminate references to Mitigation Measure 4.13-6, which is a duplicate mitigation measure of 4.10-1 and is therefore replaced with Mitigation Measure 4.10-1, "Blasting Protocols." Draft EIR page 4.4-64 is revised as follows.

ERRATA

Level of Significance Before Mitigation: Potentially significant.

Mitigation Measure: *Implement Mitigation Measures 4.3-2a, 4.3-2b, 4.3-2c, 4.4-1a, 4.4-1b, 4.4-1c, and ~~4.13-6~~4.10-1.*

Level of Significance After Mitigation: Less than significant.

3.2.5.5 Errata to Draft EIR Section 4.5, "Cultural Resources"

There are no errata for Draft EIR Section 4.5.

3.2.5.6 Errata to Draft EIR Section 4.6, "Energy"

Explanation

Revisions are made to Draft EIR Section 4.6 in order to provide updated information on the most recent version of Fresno Council of Governments Regional Transportation Plan/Sustainable Communities Strategy. Draft EIR page 4.6-13 is revised as follows.

ERRATA

Fresno Council of Governments Regional Transportation Plan/Sustainable Communities Strategy

The Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)(Fresno Council of Governments 2022) develops a regional transportation network that is environmentally sensitive and reduces GHG emissions. New transportation facilities must avoid or fully mitigate all significant impacts on environmentally sensitive areas and natural resources such as minimizing loss of farmland. Increased transportation and facility design is encouraged, along with infill development near existing public transportation, which is intended to reduce vehicle miles traveled (VMT) and the associated GHGs from those mobile emissions. This plan is not applicable to the proposed project because the proposed project does involve changes to existing transportation facilities or development of new transportation facilities.

Fresno COG is currently in the process of preparing an update to the Regional Transportation Plan/Sustainable Communities Strategy to reflect new data, policy priorities, project lists, and federal/state planning requirements. Until the update is adopted, the 2022 RTP/SCS remains the applicable transportation planning document for purposes of this Draft EIR.

Explanation

Revisions are made to Draft EIR Section 4.6 Table 4.6-1, "Existing and Proposed Energy Consumption," as follows. The revisions clarify energy consumption estimates but do not affect the energy use and energy efficiency analysis and conclusions of the Draft EIR. Draft EIR page 4.6-15 is revised as follows.

ERRATA

Table 4.6-2
Existing and Proposed Energy Consumption~~: Plant Site~~

Energy Resource	Unit of Measurement	Existing Average Consumption: Plant Site	Existing Average Consumption: Quarry Site	Existing Average Consumption: Total	Proposed Consumption: Stage 1	Proposed Consumption: Stage 2

3.2.5.7 Errata to Draft EIR Section 4.7, "Geology and Soils"

Explanation

Revisions are made to Draft EIR Section 4.7 to correct a citation for the Fresno County General Plan Background Report. Draft EIR page 4.7-11 is revised as follows.

ERRATA

The *Fresno County General Plan Background Report* (Background Report) indicates that landslide hazard areas in Fresno County consist primarily of foothill and mountain areas where fractured and steep slopes are present (i.e., the Sierra Nevada in eastern Fresno County), areas where less consolidated or weathered soils overlie bedrock (e.g., the Coast Range in western Fresno County), and areas where inadequate ground cover accelerates erosion (e.g., along the San Joaquin River) ~~(Fresno County 2000a)~~. The Background Report concludes that there is no risk of large landslides in the valley area of the County due to its relatively flat topography. However, there is the potential for small slides and slumping along the steep banks of rivers and creeks (Fresno County ~~2000a~~2023). The Hazard Mitigation Plan similarly concludes that localized minor landslides are likely to continue to occur in Fresno County when heavy precipitation occurs, as they have in the past (Fresno County 2018a).

Explanation

Revisions are made to Draft EIR Section 4.7 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.7-19 is revised as follows.

ERRATA

Zoning Ordinance of Fresno County—Land Use and Planning

The Zoning Ordinance of Fresno County—Land Use and Planning, last amended ~~June 2018~~February 2026, has policies and ordinances related to geology and soils. Specifically, ~~Section 858, "Regulations for Surface Mining and Reclamation in All Districts,"~~ Section 834.4.220, "Mineral Extraction Sites," contains the following countywide development standards:

~~Section 858—Regulations for Surface Mining and Reclamation in All Districts~~
Section 834.4.220—Mineral Extraction Sites

~~H. Mining and Reclamation Standards~~
I. Mining and Reclamation Standards

13. Grading and revegetation shall be designed to minimize erosion and to convey surface runoff to natural drainage courses or interior basins designed for water storage. Basins that will store water during periods of surface runoff shall be designed to prevent erosion of spillways when these basins have outlet to lower ground.
14. Stockpiles of overburden and minerals shall be managed to minimize water and wind erosion.
15. Erosion control facilities such as (e.g., settling basins, ditches, stream bank stabilization, and dikes) shall be constructed and maintained where necessary to control erosion.
25. The ~~Department~~Director shall consider the potentially adverse environmental effects of surface mining operations and ~~will~~shall generally require that:
    a. Disturbances of vegetation and overburden in advance of mining activities be minimized.
    b. Sufficient topsoil be saved to perform site reclamation in compliance with the Mining and Reclamation Plan.
    c. All reasonable and practical measures be taken to protect the habitat of fish and wildlife.

END OF ERRATA

Explanation

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.7 to specify the timing of implementation of Mitigation Measure 4.7-7a, "Quarry Site Slope Stability Monitoring." Draft EIR page 4.7-35 is revised as follows.

ERRATA

Mitigation Measure 4.7-7a: *Quarry Site Slope Stability Monitoring*

The operator of the Rockfield Quarry (Operator) shall retain a County-approved qualified engineering geologist or geotechnical engineer experienced in evaluating the stability of slopes in both hard rock and alluvial materials. The engineering geologist or geotechnical engineer shall develop an inspection and reporting program that would be implemented at the Quarry Site, which inspections will be semi-annual until a comprehensive and reliable geologic and groundwater model of the site is developed. In general, the interim mining slopes as well as perimeter slopes should be inspected as per the inspection and reporting program developed by the engineering geologist or geotechnical engineer. Recommendations for the reconfiguration of mining slope gradients, dewatering measures, and localized stabilizations should be developed as dictated by the exposed conditions. It is anticipated that the inspections will be more frequent until a comprehensive and reliable geologic and groundwater model of the Quarry Site is

developed. The survey and monitoring program should at least include the following:

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.7 to specify the timing of implementation of Mitigation Measure 4.7-7c, "Quarry Site Groundwater Conditions." Draft EIR pages 4.7-36 and 4.7-37 is revised as follows.

ERRATA

Mitigation Measure 4.7-7c: *Quarry Site Groundwater Conditions*

The County-approved qualified engineering geologist or geotechnical engineer identified in Mitigation Measures 4.7-7a and 4.7-7b shall conduct observations of groundwater conditions relevant to slope stability along with the geologic observation of kinematic conditions carried out in support of Mitigation Measure ~~4.4-7b~~4.7-7b. These observations shall focus on the potential presence of:

- *Artesian conditions;*
- *Preferential seepage paths; and*
- *Piping conditions.*

To assist with these observations, a series of piezometers shall be installed within six months of project commencement and within the hard to very hard intact granitic rock. Although there are currently seven monitoring wells in the Quarry Site completed within the intact rock, these wells cover the full interval to be mined. As such, they do not adequately allow for the observation of differences in water pressures at different depths or within different groups of fractures. At least four additional piezometer clusters shall be installed as described below:

END OF ERRATA

3.2.5.8 Errata to Draft EIR Section 4.8, "Greenhouse Gas Emissions"

Explanation

Revisions are made to Draft EIR Section 4.8 to clarify and amplify the discussion of the project's potential effects on greenhouse gas emissions (GHG). The revised section is provided as Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions," to this Final EIR and replaces Draft EIR Section 4.8 in its entirety. Additions to the section are marked with underlined font, while removals are indicated by font that has been struck through. The technical analysis of potential air quality impacts was updated to address

comments on the Draft EIR, as described in the Air Quality, Health Risk and Climate Change Impact Assessment, Revised May 13, 2026 ("2026 Air Report")(Appendix D-3). The 2026 Air Report replaces the prior air reports contained in Appendix D-1 and Appendix D-2 in their entirety. The 2026 Air Report Executive Summary provides a detailed explanation of the changes made in the air quality analyses, which is in part re-stated here, as it applies to revisions to Section 4.8 (see Appendix D-5).

Section 4.8 was revised to reflect additional California Climate Change Policies, including California's Greenhouse Gas Reduction Fund, and California Executive Orders N-82-20 and B-55-18. Information regarding the Fresno Council of Governments Priority Climate Action Plan, approved on February 29, 2024, was also added.

The Draft EIR was released on December 20, 2024, and the comment period closed on March 10, 2025. Subsequently, the GHG analysis in the Final EIR was revised, as envisioned by CEQA, to address comments on the Draft EIR by several commenters, including the Center for Biological Diversity. In addition, in the Draft EIR, the GHG analysis relied in part on an analysis used in an EIR certified by Kern County in approving the modification to an oil refinery. That EIR acknowledged that certain GHG emissions related to the consumption of fuel and the use of electricity were offset upstream of those uses pursuant to California's Cap-and-Trade Program. This approach was upheld in a decision by the Fifth District Court of Appeal, which appellate court has jurisdiction over Fresno County, in *Association of Irritated Residents v. Kern County Board of Supervisors*, 17 Cal.App.5th 798 (2017) ("AIR").

However, on June 26, 2025, a new California appellate case out of Los Angeles County reviewing the use of offsets under the Cap-and-Trade Program as part of an EIR used to evaluate a housing development program was filed in the 2nd District Court of Appeal, *Center for Biological Diversity v. County of Los Angeles*, 112 Cal.App.5th 317 (2025) ("LA County Decision"). The LA County Decision distinguished the AIR Decision on the basis that the refinery subject to the Kern County EIR was a "covered entity" for purposes of the Cap-and-Trade Program, whereas the housing development at issue in the LA County Decision was not a "covered entity" for purposes of the Cap-and-Trade Program. The LA County Decision accordingly held that Los Angeles County could not rely on the fact that transportation fuels and electricity that would be used as part of the project were subject to Cap-and-Trade offsets and allowances as a mitigation measure under CEQA. Since the project is also not a "covered entity" under the Cap-and-Trade Program, in an abundance of caution, Fresno County decided to revise the GHG analysis in the Draft EIR to conform to the more recent LA County Decision. Accordingly, all emissions, including those involving the consumption of fuel and the use of electricity, are included in

determining whether total emissions will exceed the GHG significance threshold of 10,000 $MTCO_2e$/yr.

The GHG analysis was also updated to account for the project's proportional share of regional demand growth rather than calculating emissions based on continuous operation at maximum throughput as was used in the Draft EIR. This revised methodology is described further in the Final EIR and in Appendix J of Appendix D-3. In addition, the increased use of renewable diesel fuel has been accounted for in the Final EIR analysis, as is further discussed in Appendix L of Appendix D-3. This updated analysis resulted in changes to the figures in tables 4.8-7 through 4.8-9.

The Draft EIR discusses the project's proposed hot mix asphalt plant and the associated emissions and best performance standards (BPS). This discussion was warranted at the time the analysis of air quality and GHG commenced because SJVAPCD had published a draft BPS for hot mix asphalt plants and the asphalt plant dryer combustion is the only source of GHG emissions that is not transportation fuel or electricity and considered to be subject to the Cap-and-Trade Program as discussed above. However, SJVAPCD did not finalize the draft BPS, has removed it from their website, and the project GHG emissions are less than the 10,000 $MTCO_2e$/yr significance threshold. Therefore, GHG emissions from the Project require no further mitigation, and the previously proposed Mitigation Measure 4.8-1, requiring premium efficiency electric motors with exhaust fan motors equipped with variable frequency speed control has been removed. The requirement that the dryer drum and mixing chamber be separated so that dryer exhaust gases do not contact liquid asphalt is a common requirement and design feature of contemporary asphalt plants that will be required during new source review as a best available control technology (BACT) for that part of the process.

The environmental setting, federal regulatory setting, and the CEQA Statutes and guidelines amendments remain unchanged from the Draft EIR. The aforementioned changes and updated analysis do not change the conclusions in the Draft EIR.

ERRATA

See Final EIR Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions," for a full reproduction of Section 4.8 showing errata in underline/strikethrough text.

END OF ERRATA

3.2.5.9 Errata to Draft EIR Section 4.9, "Hazards and Hazardous Materials"

There are no errata for Draft EIR Section 4.9.

3.2.5.10 Errata to Draft EIR Section 4.10, "Hydrology and Water Quality"

Explanation

The Draft EIR's discussion of Current Flood Maps in Section 4.10 has been revised to incorporate the conclusions of the 200-year floodplain analyses conducted for the project. The 200-year hydraulic analyses are included as Appendix G-7 and G-8 to this Final EIR.

- Chang Consultants, *200-Year Hydraulic Analysis for CEMEX Rockfield Modification Project Quarry Site*, (April 21, 2026) (2026a) (See Appendix G-7, "200-year Flood Hazard Analysis—Quarry Site")
- Chang Consultants, *200-Year Hydraulic Analysis for CEMEX Rockfield Modification Project Plant Site*, (May 12, 2026) (2026b) (See Appendix G-8, "200-year Flood Hazard Analysis—Plant Site")

A 200-year event is a flood that statistically has a 0.5-percent chance of occurring in any given year, as compared to a 100-year flood event which is a flood that statistically has a 1-percent chance of occurring in any given year (Chang 2026a, page 1). The 200-year flood report for the Quarry Site estimated that the 200-year flow rate would be 95,000 cfs based upon FEMA's 2016 flood insurance study (Chang 2026a, page 2). As such, the 200-year hydraulic analysis provides an even more conservative evaluation of the potential for rare flood events to breach the quarry pit. Upon an initial evaluation, the modeled 200-year floodplain entered the quarry pit at stations 16, 19, and 20 by approximately two feet. To proactively prevent the possibility of a 200-year flood event from entering the quarry pit, CEMEX raised the northerly portion of the berms separating the San Joaquin River and Quarry Site up to approximately 4 feet with compacted fill. Topographic mapping was prepared to display the locations where the berms were raised and is included in the 200-year hydraulic analysis for the Quarry Site (see Appendix G-7). These analyses demonstrated that the 200-year flood does not enter the Quarry Site. Chang Consultants also evaluated the 200-year flood at the Plant Site and determined that existing berms and ground elevations would provide protection from the San Joaquin River and Little Dry Creek 200-year flood (Chang 2026b, Appendix G-8). The addition of the 200-year analyses of the project sites does not change the conclusions drawn in the EIR. The following errata updates the Draft EIR's discussion of Current Flood Maps that appears on page 4.10-16 to incorporate the results of the 200-year flood analyses and to clarify that the 100-year hydraulic analysis (Appendix G-1) demonstrated that the San Joaquin 100-year floodplain does not encroach onto the Plant Site.

ERRATA

Localized and Riverine Flooding

Regulatory Flood Maps

The Federal Emergency Management Agency (FEMA) prepares Flood Insurance Rate Maps (Flood Maps) that delineate the areas of known special flood hazards and associated applicable risks to the community. According to FEMA Flood Maps #06019C1030H and #06019C1040H, the San Joaquin River adjacent to the Plant ~~Site~~ and Quarry ~~Site~~sites is mapped as both a 100-year Zone AE floodplain and regulatory floodway (FEMA 2009a and 2009b). A 100-year floodplain is the area that has a 1-in-100 (1%) chance of being flooded in any given year based on historical data and hydraulic modeling. A Zone AE floodplain and associated regulatory floodway are based on detailed engineering analyses. The floodway and floodplain are shown in Figure 4.10-1. As shown in Figure 4.10-1, the San Joaquin River floodway generally does not ~~encroach onto~~ overlie the Plant ~~Site~~ or Quarry ~~Site~~sites, but the FEMA floodplain ~~encroaches on~~ does overlie the west side of both sites. With regards to the Plant Site, the floodplain ~~does encroach onto~~ overlies a small portion of the southwest ~~northwest~~ corner of the Plant Site that contains a stockpile area.

Little Dry Creek is approximately 475 feet or more north of the Plant Site. The creek flows in a westerly direction and joins the San Joaquin River approximately one-half mile west of the Plant Site. According to FEMA Flood Map #06019C1040H, a Zone A floodplain along the creek ~~encroaches onto~~ overlies the northerly portion of the Plant Site; FEMA has not determined a floodway for Little Dry Creek (FEMA 2009b). A Zone A floodplain is determined from approximate methods and is not based on detailed engineering analyses.

According to FEMA Flood Map #06019C1040H, there is also a FEMA Zone A floodplain that ~~encroaches onto~~ overlies the southerly portion of the Plant Site (FEMA 2009b). This Zone A floodplain is isolated with no apparent connectively to the San Joaquin River, Little Dry Creek, or any other watercourse. The Little Dry Creek Zone A floodplain and the southern floodplain are shown in Figure 4.10-1.

Current Flood Maps

The FEMA studies on which the Flood Maps are based were performed over 20 years ago (the initial studies were completed in 1981 with updates from Friant Dam to Highway 99 in 1998). Consequently, an updated hydraulic analysis (Appendix G-1) was completed to estimate floodplain changes that may have occurred as a result of physical changes within and surrounding the project sites,

particularly changes that occurred as a result of the development of berms along the project site's boundaries. The analysis methodology is summarized in Section 4.10.3.2, "Analysis Methodology," and described in detail in Appendix G-1.

The results of the analysis are shown in Figure 4.10-1 as the "Current 100-Year Floodplain." The analysis indicates that the current San Joaquin River 100-year floodplain does not encroach onto the Quarry Site. ~~Similarly, the~~ FEMA's San Joaquin River 100-year floodplain does not ~~encroach onto~~overlie the Plant Site, except where the San Joaquin River water is delivered to the Plant Site via a delivery ditch that terminates just inside the western boundary and except at small portions on the ~~northwest corner~~western side of the Plant Site that contain~~s~~ stockpiled aggregate. FEMA's 100-year floodplain map did not fully account for the Plant Site's topography as existing in November 2018. The 2020 Hydraulic Analysis presented in Appendix G-1 demonstrates that the 100-year flood would not encroach onto the western portion of the Plant Site due to the Plant Site's existing berms and ground elevations.

The results of the analysis of the Little Dry Creek 100-year floodplain indicate that the berms along the northern boundary of the plant site prevent the little Dry Creek floodplain from ~~encroaching onto~~ entering the Plant Site. Similarly, the berm along the south property line of the Plant Site prevents the southern floodplain (not associated with any known water course) from ~~encroaching onto~~ entering the Plant Site.

The Fresno County General Plan previously only required the investigation of the 100-year water surface elevations for the San Joaquin River, but was revised in 2024 to require the investigation of the 200-year water surface elevation of the San Joaquin River in Policy HS-C.12. A 200-year event is a flood that statistically has a 0.5-percent chance of occurring in any given year, as compared to a 100-year flood event which is a flood that statistically has a 1-percent chance of occurring in any given year. (Chang 2026, page 1.) The 200-year flood report estimated that the 200-year flow rate would be 95,000 cfs based upon FEMA's 2016 flood insurance study. (Chang 2026, page 2.) As such, the 200-year hydraulic analysis provides an even more conservative evaluation of the potential for rare flood events to breach the quarry pit. Upon an initial evaluation, the modeled 200-year floodplain entered the Quarry Site at stations 16, 19, and 20 by approximately two feet. To proactively prevent the possibility of a 200-year flood event from entering the quarry pit, CEMEX raised the northerly portion of the berms separating the San Joaquin River and Quarry site up to approximately 4 feet with compacted fill. A topographic mapping was prepared to display the locations where the berms were raised and

is included in the 200-year hydraulic analysis for the Quarry Site. The analysis demonstrated that the 200-year flood does not enter the Quarry Site (Chang 2026a, Appendix G-7). Chang Consultants also evaluated the 200-year flood at the Plant Site and determined that existing berms and ground elevations would provide protection from the San Joaquin River and the Little Dry Creek 200-year flood (Chang 2026b, Appendix G-8).

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.10 to add a discussion of California Code of Regulations (CCR) Title 23 standards related to projects that affect floodways. Text is added to Draft EIR page 4.10-74 as follows.

ERRATA

The Rockfield Quarry Operator has chosen to fund the local PP&O study (CV-SALTS Salinity Control Program 2023).

California Code of Regulations, (Waters)

Under California Code of Regulations, Title 23, Division 1, Section 6, approval from the Central Valley Flood Protection Board (Board) is required for proposed work or uses that encroach upon levees, floodways, or regulated streams within areas subject to an adopted plan of flood control. Board jurisdiction includes levees and associated waterward and landward areas, designated floodways, and areas within specified distances of regulated stream banks, as well as other activities that could adversely affect state or federal flood control facilities. Permits may also be required for existing unpermitted encroachments or where conditions of responsibility or use have changed.

Pursuant to Section 15 of Title 23, the Board may deny an encroachment permit if a project would adversely affect the integrity, operation, or maintenance of flood control facilities; alter flood flows or water velocities; impair inspection, maintenance, or emergency response activities; increase flood hazards; or otherwise interfere with an adopted plan of flood control or the State Plan of Flood Control. As a Responsible Agency under CEQA, the Board reviews the environmental effects of proposed projects based on the Draft EIR and independently determines whether and under what conditions a project may be approved, including consideration of both direct and indirect impacts to flood control facilities.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.10 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR pages 4.10-74 through 4.10-76 are revised as follows.

ERRATA

Fresno County Zoning Ordinance—Land Use and Planning

The Zoning Ordinance of Fresno County—Land Use and Planning, last amended ~~June 2018~~February 2026, has policies and ordinances related to hydrology and water quality as ~~regards~~ it pertains to mine sites. Specifically, ~~Section 858, "Regulations for Surface Mining and Reclamation in All Districts,"~~ Section 834.4.220, "Mineral Extraction Sites," contains the following countywide development standards:

~~Section 858—Regulations for Surface Mining and Reclamation in All Districts~~ Section 834.4.220—Mineral Extraction Sites

~~H. Mining and Reclamation Standards~~
I. Mining and Reclamation Standards

13. Grading and revegetation shall be designed to minimize erosion and to convey surface runoff to natural drainage courses or interior basins designed for water storage. Basins that will store water during periods of surface runoff shall be designed to prevent erosion of spillways when these basins have outlet to lower ground.
14. Stockpiles of overburden and minerals shall be managed to minimize water and wind erosion.
15. ~~Erosion control facilities such as settling basins, ditches, stream bank stabilization, and dikes shall be constructed and maintained where necessary to control erosion.~~ Erosion control facilities (e.g., settling basins, ditches, stream bank stabilization, and dikes) shall be constructed and maintained where necessary to control erosion.
16. Extraction operations adjacent to any flowing stream shall be separated from the stream by closed dikes. No extractions within the stream ~~will be permitted~~ shall be allowed.
17. All water utilized in the plant operation shall be disposed of behind a closed dike so that it will not cause impairment of water in any stream.
18. Operations shall be conducted to substantially prevent siltation of groundwater recharge areas.

19. Settling ponds or basins shall be constructed to prevent potential sedimentation of streams at operations where they will provide a significant benefit to water quality.

25. The ~~Department~~Director shall consider the potentially adverse environmental effects of surface mining operations and ~~will~~shall generally require that:
    a. Disturbances of vegetation and overburden in advance of mining activities be minimized.
    b. Sufficient topsoil be saved to perform site reclamation in ~~accordance~~compliance with the Mining and Reclamation Plan.
    c. All reasonable and practical measures be taken to protect the habitat of fish and wildlife.
    d. Temporary or watershed diversion be restored.
    e. Permanent piles or dumps of mine waste rock and overburden be stabilized and not restrict the natural drainage without suitable provisions for diversion and toxic materials be removed or confined to control leaching.

26. Reclamation of mined lands shall be implemented in ~~conformance~~compliance with applicable performance standards as set forth in the State Regulations Sections 3703 et seq. pertaining to the subjects listed below:
    a. Wildlife habitat.
    b. Backfilling, regrading, slope stability, and recontouring.
    c. Revegetation.
    d. Drainage, diversion structures, waterways, and erosion control.
    g. Stream protection including surface and groundwater.
    h. Topsoil salvage, maintenance, and redistribution.
    i. Tailing and mine waste management

END OF ERRATA

Explanation

The Draft EIR misstates the County Policy HS-C.12 on page 4.10-81. Draft EIR page 4.10-81 is revised as follows.

ERRATA

Policy HS-C.12: The County shall encourage the performance of appropriate investigations to determine the ~~100~~200-year water surface elevations for the San Joaquin River, taking into account recent storm events and existing channel conditions, to identify

the potential extent and risk of flooding. New development, including public infrastructure projects, shall not be allowed along the river until the risk of flooding at the site has been determined and appropriate flood risk reduction measures identified.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.10 to specify monitoring requirements for Mitigation Measure 4.10-1, "Blasting Protocols." Draft EIR page 4.10-94 is revised as follows.

ERRATA

Mitigation Measure 4.10-1: *Blasting Protocols*

The operator of the Rockfield Quarry shall at all times implement the requirements of the "Blasting Protocols" developed October ~~27~~12, 2020, and updated ~~September 8, 2021~~April 29, 2026, by Vibra-Tech Engineers, Inc. The Blasting Protocols shall be appended to the Mitigation Monitoring and Reporting Program and shall be incorporated into the conditions of approval for the project. County staff shall monitor and verify, on a semi-annual basis, implementation of the Blasting Protocols throughout project operations.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.10 to add monitoring and enforcement details to Mitigation Measure 4.10-5a, "Plant Site Pond Adaptive Management Program." Draft EIR pages 4.10-98 through 4.10-100 are revised as follows.

ERRATA

Mitigation Measure 4.10-5a: *Plant Site Pond Adaptive Management Program*

With oversight and enforcement by Fresno County, t~~T~~he Operator of the Rockfield Quarry shall implement an adaptive management program at the Plant Site that includes monitoring, comparison of monitoring results with action levels, and subsequent implementation of mitigation measures if the action levels are exceeded. The impact does not have the potential to occur until after mining on part or all of the Plant Site area is completed, and water is allowed to fill all or a part of the excavated quarry pit. Therefore, monitoring under the adaptive management program shall begin when the quarry Operator allows water to begin to fill all or part of the excavated mine pit. At the latest,

monitoring shall begin at the completion of the Phase 1 mining at the Plant Site.

A qualified professional shall be responsible for the monitoring and reporting to be conducted under the adaptive management program. The qualified professional's qualifications shall be provided to the County prior to the start of the monitoring under the adaptive management program. Every six months, the qualified professional shall supervise field measurements for the parameters, and associated action levels, listed below.

- *pH>8.5*
- *Conductivity >700 micromhos/cm @ 25 degree C*
- *Temperature (no action level)*
- *Dissolved oxygen (DO) <8 mg/L or <70% of saturation*
- *Oxidation-reduction potential (ORP) <0*

These parameters are general indicators of water quality and the potential for reducing conditions to form that could mobilize naturally occurring iron and manganese and thereby degrade water quality. An annual report documenting the methodology and results of the sampling shall be submitted to Fresno County.

The field measurements shall be conducted at two depths: (1) near the surface of the water and (2) near the bottom of the water column. If any of the action levels shown in the "Field Indicator Parameters" table are exceeded for two successive monitoring events, then water samples shall be collected from the Plant Site pond and submitted to an analytical laboratory for analysis of iron and manganese. If the iron concentration exceeds its secondary MCL and NPDES discharge limit of 300 ug/L, or manganese exceeds its secondary MCL and NPDES discharge limit of 50 ug/L mg/L, then the laboratory testing shall be completed again in six months to assess whether there are potential seasonal influences.

If the iron and/or manganese levels do not consistently remain below their respective water quality standards, then the semiannual field monitoring shall continue. If no exceedances of the action levels shown in the "Field Indicator Parameters" table or of the iron and manganese water quality standards occur for a period of five years, then the water quality conditions in the reclaimed Plant Site pond shall be considered to have stabilized and no further monitoring shall be necessary. A final monitoring report shall be submitted to the County documenting the cessation of monitoring.

If the iron and/or manganese levels persist for five consecutive years above their respective water quality standards, then the following mitigation actions shall be implemented

within six months of the end of the five-year monitoring period:

- *Aeration or mechanical circulation of the water from the bottom of the pond to the surface of the pond. Reducing conditions that favor high pH values and low dissolved oxygen (DO) values, resulting in higher concentrations of iron and manganese, typically form at the bottom of ponds due to the breakdown of organic matter, such as dead aquatic or riparian vegetation. Aeration or mechanical circulation of the water from the bottom of the pond to the surface of the pond would better distribute DO throughout the water column and would minimize the formation of reducing conditions.*
- *Additional Measures. If substantial amounts of submerged aquatic vegetation form within the pond, or riparian vegetation such as reeds and cattails form around the perimeter of the pond, and aeration or water circulation alone is insufficient to eliminate the reducing conditions, then further measures to minimize the vegetation would be implemented. Such measures may include physical removal by hand or mechanical equipment (e.g. dredging), growth prevention using physical barriers (e.g. tarps or bottom barriers) in areas of heavy growth, or use of approved terrestrial or aquatic herbicides if other methods are not feasible or effective. Any herbicides used in implementing this measure shall comply with applicable Regional Water Quality Control Board Basin Plan specifications and Waste Discharge Requirements.*

Monitoring results shall be reported to the County in an annual report that ~~would~~ will be submitted at the end of the first quarter of every year. The annual report shall describe any measures that have been or are planned to be taken based on the monitoring results and provide the timing of measure implementation, an analysis of the effectiveness of the measures, and a description of any further recommended measures, as part of subsequent annual reports.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.10 Mitigation Measures 4.10-10a and 4.10-10b to clarify and amplify the requirements of the quarry site groundwater adaptive management program and funding obligations in response to comments on the Draft EIR requesting clarifications to the measures. Additional editorial changes are made to clarify the requirements and to move text that was included as footnotes for these measures in the Draft EIR to parenthetical statements in the text of the measure.

These changes better explain and enhance the groundwater monitoring program requirements and do not affect the analysis or conclusions in the Draft EIR. Draft EIR pages 4.10-107 through 4.10-111 are revised as follows.

ERRATA

After the completion of mining and reclamation, similar potential impacts to the groundwater supply wells shown in Table 4.10-9 could occur due to the local decrease in static groundwater levels as a result of the flow of groundwater to the proposed quarry pit. This is also a potentially significant impact. However, since dewatering would no longer be occurring, the groundwater level around the pit would increase, or rise, over time until reaching equilibrium with the final water level within the reclaimed mining excavation. As discussed in Appendix K of the Draft EIR, EMKO Environmental determined that a criterion of 15% reduction in the water column is an appropriate standard of significance for addressing potential groundwater reduction impacts at wells near the Quarry Site: "Use of the 15 percent criterion is conservative (i.e., protective of groundwater resources) not only due to the applied factor safety, but also because it accounts for shallow wells or wells with a small water column that may be at a greater distance from the quarry. Other approaches that are based only on the total amount of drawdown do not take into consideration the effects to shallow wells at greater distances from the dewatering location (i.e., the quarry)" (EMKO, October 3, 2023). As such, reduction of groundwater levels exceeding 15 percent in specified well clusters would trigger additional assessment under Mitigation Measure 4.10-10a. Furthermore, if such groundwater reduction is determined attributable to the mining operations and not due to unrelated factors, such as a drought, corrective actions would be required, as detailed in Mitigation Measure 4.10-10a. Mitigation Measure 4.10-10a would specifically require the implementation of an adaptive management strategy during mining and after the completion of reclamation that includes monitoring, comparison of monitoring results with action levels, and implementation of corrective measures if the action levels are exceeded. To ensure funding and implementation of the adaptive management program, Mitigation Measure 4.10-10b requires the establishment of an endowment dedicated to the implementation of the adaptive management program and implementation of corrective actions.

Level of Significance Before Mitigation: Potentially significant.

Mitigation Measure 4.10-10a: *Quarry Site Groundwater Adaptive Management Program*

To assess any potential effect on the CSA 44C wells due to the proposed excavation of a hard rock quarry pit at the Quarry Site, monitoring shall be conducted in the nested set

of wells between the Northeast Pond and the CSA 44C wells, and in the CSA 44C wells themselves. The existing MW-3 well cluster, with individual wells completed in the alluvium, weathered rock, and hard rock, is appropriately located for this purpose. In addition, the data from the MW-3 well cluster provides a continuous record of water level conditions at this location since August 2017, when dataloggers were installed~~for several years prior to implementation of the project~~. The water levels recorded in the MW-3 well cluster from 2017 until the time that mining and dewatering in the weathered rock begins after approval of the project will be used to define the baseline groundwater level conditions. Baseline water level ranges will be identified for the alluvium, weathered rock, and hard rock, specifically identifying conditions during drought periods, wet periods, and seasonal fluctuations, and these baseline conditions shall be documented in the first annual groundwater monitoring report. Pumping and water level data from the CSA 44C wells has been provided by Fresno County to support the analysis in this EIR. Fresno County will continue to provide these data sets to the Operator for the purposes of implementing this Adaptive Management Program. Monitoring of the water levels in the MW-3 cluster will continue to~~shall~~ be conducted using the downhole pressure transducers with dataloggers, which have been in place since August 2017.~~ Dataloggers are already installed in the MW-3 wells.~~[1] (Installation of dataloggers was previously attempted in the CSA 44C wells. Due to the construction of the well head and the pump system, it was not possible to install dataloggers in a manner that would not potentially interfere with the operation of the pumping equipment.)–The dataloggers shall be programmed to record water levels at least once every six hours such that a range of static and pumping water level effects would be captured. The data shall be downloaded every six months for review and subsequent inclusion in annual ~~mitigation~~ groundwater monitoring reports. The annual ~~mitigation~~ groundwater monitoring reports shall be prepared by a Professional Geologist/Certified Hydrogeologist and submitted to Fresno County annually ~~at the end of the first quarter of every~~ no later than March 31st each subsequent year. The annual report shall describe any additional measures that have been or are planned to be taken based on the monitoring results, in accordance with this adaptive management program. The first annual report shall be completed at the end of the first quarter of the year after the use permit becomes active and shall describe the baseline water level ranges at the MW-3 cluster for the alluvium, weathered rock, and hard rock, specifically identifying conditions during drought periods, wet periods, and seasonal fluctuations.

If the monitoring data indicate that groundwater levels in any of the monitored wells

~~[1] Installation of dataloggers was previously attempted in the CSA 44C wells. Due to the construction of the well head and the pump system, it was not possible to install dataloggers in a manner that would not potentially interfere with the operation of the pumping equipment.~~

drop such that the available water column decreases by more than 15 percent[2] (analytical solutions for drawdown in a well in an unconfined aquifer indicate that when the drawdown reaches 30% to 45% of the available water column, the reduction in the transmissivity is large enough to potentially cause the drawdown rate to become unstable and increase rapidly. Therefore a 2 to 3-fold factor of safety was used to identify the 15% criterion for this Adaptive Management Plan) then ~~a significant impact to available groundwater supply will have occurred~~ additional assessment as specified below is required. The data from the MW-3 well cluster shall be evaluated to ~~verify whether the impact is specific to the weathered rock and/or hard rock and is not~~ determine if the effect is related to the project or due to other unrelated factors, such as drought, a reduction in regional groundwater recharge (for example, by changes in operating practices along the Friant Kern Canal), or use of groundwater by future developments located upgradient to the north and northeast of the Quarry Site and CSA 44C wells. If the additional assessment confirms that a decrease in water levels greater than 15 percent is the result of mine dewatering, and is not due to other factors (such as those listed above)~~exclusively attributable to mine dewatering~~, then corrective measures would be implemented.

~~"For this analysis, a factor of safety has been applied, such that a criterion of 15 percent reduction in the water column is used to define the condition where a potentially significant impact may occur to the production capacity of a well. Use of the 15 percent criterion is conservative (i.e., protective of groundwater resources) not only due to the applied factor of safety, but also because it accounts for shallow wells or wells with a small water column that may be at a greater distance from the quarry. Other approaches that are based only on the total amount of drawdown do not take into consideration the effects to shallow wells at greater distances from the dewatering location (i.e., the quarry)" (EMKO, October 3, 2023).~~

The initial corrective measure would be to divert additional water from the mining excavation into the Northeast Pond or to a recharge trench to be constructed along the northeast side of the Quarry Site to enhance recharge in the area of CSA 44C wells. The rate of pumping into the Northeast Pond or recharge trench would be increased until the water level in the MW-3 well cluster and the CSA 44C wells recovers to a point between baseline and 15% below baseline. If, during mining, all available water from dewatering is being pumped to the Northeast Pond or recharge trench and the water level in the MW-3 well cluster remains 15% or more below the baseline elevations, then mining could not progress to greater depths in the quarry, although mining could proceed to the full width

~~[2]Analytical solutions for drawdown in a well in an unconfined aquifer indicate that when the drawdown reaches 30% to 45% of the available water column, the reduction in the transmissivity is large enough to potentially cause the drawdown rate to become unstable and increase rapidly. Therefore a 2 to 3 fold factor of safety was used to identify the 15% criterion for this Adaptive Management Plan.~~

allowed at that depth under the reclamation plan. If such a condition occurred, then the Reclamation Plan would be amended to reflect the adjusted depth of the quarry.

For wells completed west of the Quarry Site, and for the San Joaquin River, the existing MW-1 monitoring well cluster provides an appropriate monitoring location for the purposes of this adaptive management plan. Water levels have been measured in the three wells at the MW-1 cluster since August 2017 using downhole pressure transducers with dataloggers. The water levels recorded in the MW-1 well cluster from 2017 until the time that mining and dewatering in the weathered rock begins after approval of the project will be used to define the baseline groundwater level conditions. Baseline water level ranges will be identified for the alluvium, weathered rock, and hard rock, specifically identifying conditions during drought periods, wet periods, and seasonal fluctuations, and, similar to the MW-3 well cluster, these baseline conditions shall be documented in the first annual report. If access can reasonably be gained to any of the five private wells in Table 4.10-9 located to the west of the Quarry Site from the private owners, then those wells should also become part of the monitoring program. Groundwater levels would continue to be recorded using downhole pressure transducers with dataloggers, programmed to record water levels at least once every six hours such that a range of static and pumping water level effects would be captured. The data would be downloaded every six months for review and subsequent inclusion in annual groundwater mitigation monitoring reports. The annual report would also describe any additional measures that have been or are planned to be taken based on the monitoring results, in accordance with this adaptive management program.

If the monitoring data indicate that groundwater levels in any of the monitored wells drop such that the available water column decreases by more than 15 percent as compared to the baseline level, then ~~a significant impact to available groundwater supply will have occurred.~~ additional assessment as specified below is required. This conclusion would be confirmed by analysis of data from the MW-1 well cluster to ~~verify that~~ determine if the ~~impact~~ effect is ~~specific~~ related to the ~~weathered rock and/~~project or ~~hard rock and is not~~ due to other unrelated factors, such as drought, future developments in the area that rely on groundwater, or a reduction in regional groundwater recharge (for example, by changes in operating practices on the San Joaquin River or the Friant Kern Canal). ~~For the San Joaquin River, the impact must be specific to both the alluvium and weathered rock aquifer zones.~~ If the additional assessment confirms that the decrease in water levels is the result of mine dewatering, and is not due to other factors (such as those listed above)~~is primarily due to mine dewatering~~, then corrective measures would be implemented.

The initial corrective measure would be to divert additional water from the mining

excavation into the recharge trench adjacent to the San Joaquin River on the west side of the Quarry Site. The rate of pumping into the recharge trench would be increased until the water column in the MW-1 well cluster and any monitored private wells west of the Quarry Site recover to within 85 percent or more of baseline levels. If, during mining, all available water from dewatering is being pumped to the western recharge trench and the water column in the MW-1 well cluster remains below 85 percent of baseline elevations, then mining could not progress to greater depths in the quarry, although mining could proceed to the full width allowed at that depth under the reclamation plan. If such a condition occurred, then the Reclamation Plan would be amended to reflect the adjusted depth of the quarry.

If mining progresses to completion without impacting nearby wells ~~or flows in the San Joaquin River~~, then monitoring in the MW-1 and MW-3 well clusters will continue for at least 3 years, to include at least two below-normal rainfall years or one critically dry year, as defined by DWR. Dewatering will cease once mining is completed, so groundwater levels will begin to recover. During the post-mining monitoring period, the rate that water is pumped to the Northeast Pond and the recharge trenches will be reduced proportionally in accordance with the rate that the water level in the pond recovers. If the drawdown in the MW-1 and MW-3 monitoring well clusters is less than 15% at the end of the initially required monitoring period, then no further mitigation is required, monitoring can cease, and the related pumps, piping, and other equipment can be removed from the Quarry Site and monitoring equipment on private wells will be removed. However, if at the end of the monitoring period, the drawdown in the monitoring wells is greater than 15%, then pumping to the Northeast Pond, east recharge trench, and/or west recharge trench, as appropriate based on the post-mining monitoring data, must continue ~~indefinitely to reduce~~until the drawdown in the monitoring well clusters is reduced to below the 15% criterion.

***Mitigation Measure 4.10-10b:** Quarry Site Groundwater Adaptive Management Program Funding Mechanism*

During the mining period, the Operator will be present to fund and implement the Quarry Site Groundwater Adaptive Management Program described in Mitigation Measure 4.10-10a. Implementation of that Program would be a condition of approval for the Conditional Use Permit. ~~Prior to the completion of mining~~Once mining ceases, and prior to the release of the financial assurance mechanism for reclamation, the Operator shall establish a post-reclamation funding mechanism to provide a ~~permanent~~secured funding source for ~~the initial 3 years of~~ monitoring of groundwater levels in the MW-1 and MW-3 well clusters, ~~and~~ review of CSA 44C well monitoring data from the County, and monitoring of wells west of the San Joaquin River that become part of the monitoring

program after mining ceases and dewatering is no longer occurring in the quarry pit. The post-reclamation funding mechanism shall be sufficient to cover costs associated with the annual monitoring, the technical analysis and reporting described in Mitigation Measure 4.10-10a, and reasonably foreseeable actions that may be required to address excessive drawdown, including continuing to pump water to the Northeast Pond and recharge trenches indefinitely, if necessary.

Upon completion of mining and prior to release of the financial assurance mechanism to be in place through reclamation, the~~The~~ Operator shall submit for review and approval by the County Department of Public Works and Planning~~Agency Director, or designee, ("Director")~~ a proposed funding mechanism (e.g., a bond) and cost basis to secure costs related to the required Quarry Site groundwater adaptive management activities as described in Mitigation Measure 4.10-10a, above. The funding mechanism shall be held by the County or held and managed by a third party approved by the Operator and County, as determined by the ~~Director~~County. Following the completion of the post-mining monitoring period and if conditions are confirmed to be stabilized~~If conditions stabilize~~ and no further monitoring or management actions are~~is~~ required, as described in Mitigation Measure 4.10-10a, then the funding mechanism would be ~~cancelled~~released, and any remaining funds returned to the Operator.

END OF ERRATA

Explanation

Draft EIR Impact 4.10-16 and Impact 4.10-17 have been revised to incorporate the 2026 200-year San Joaquin River hydraulic analyses conducted for the Quarry Site and Plant Site. The errata to Impact 4.10-16 also clarifies that the San Joaquin River 100-year floodplain does not extend onto the Plant Site. FEMA's San Joaquin River Floodplain partially overlies the westerly portion of the Plant Site; however, the FEMA flood maps do not reflect the existing topography of the Plant Site and therefore do not accurately portray the actual floodplain boundaries. The 2020 Hydraulic Analysis concluded that the San Joaquin River 100-year flood would not extend into the Plant Site given the existing berms and ground elevations. The inclusion of the 200-year hydraulic analysis does not change the conclusions drawn in the Draft EIR. Draft EIR pages 4.10-117 to 4.10-119 are revised as follows.

ERRATA

Impact 4.10-16: Alter Drainage Patterns in a Manner Which Would Impede or Redirect Flood Flows

As described above in Section 4.10.1.45, "Flood Hazards," ~~above,~~ the 2020 Hydraulic Analysis (Appendix G-1) shows that the San Joaquin River 100-year floodplain does not enter into the Quarry Site and therefore the river would not overtop its banks and flow into the quarry. Additionally, as described under Section 4.10.1.5, subsection "Current Flood Maps," CEMEX raised the berms separating the Quarry Site from the San Joaquin River to proactively address potential flooding associated with a 200-year flood. The 2026 Hydraulic Analysis conducted for the Quarry Site reflects the current topography of the Quarry Site and demonstrates that the 200-year floodplain would not enter the Quarry Site (Chang 2026a; see G-7). Consequently, the proposed mining and reclamation of the Quarry Site would not impede or redirect flood flows.

FEMA's San Joaquin River floodplain extends into the westerly portion of the Plant Site, as shown in Figure 4.10-1. However, FEMA's maps do not reflect the existing topography of the Plant Site and therefore do not accurately portray the actual floodplain boundaries. Thus, Chang Consultants conducted an engineering assessment, which demonstrated that ~~The analysis also concludes that~~ the 100-year San Joaquin River floodplain does not enter into the Plant Site, and existing topography and berms along the north edge of the Plant Site prevent the 100-year Little Dry Creek floodplain from entering the Plant Site~~, with the exception of a small portion of the northwest corner of the Plant Site (as shown in Figure 4.10-1)~~. (Appendix G-1). Regardless, ~~This~~ the northwest portion of the Plant Site is currently used as a stockpile area, and this use would continue during Phase 1 mining operations. Upon completion of Phase 1 mining, the stockpiles would be removed, and the area would be graded to drain to the reclaimed pond to the east, as it does under existing conditions, which would improve conditions relative to flood flows. The stockpile area would then be revegetated. Although minor changes to the drainage patterns within the Plant and Quarry Site ~~of the portion of the Plant Site in the Little Dry Creek floodplain~~ would occur due to mining activities and reclamation under the proposed project, ultimately, the on-site storm runoff ~~area~~ would drain towards the ~~reclaimed Plant Site~~ mining excavations, similar to existing conditions, and flood flows would therefore not be impeded or redirected. ~~Removing the stockpiles would improve conditions relative to flood flows.~~ The 2026 Hydraulic Analysis conducted for the Plant Site also demonstrates that the 200-year San Joaquin River floodplain and the 200-year Little Dry Creek floodplain would not enter the Plant Site (Chang 2026b; Appendix G-8) ~~Thus, the proposed project would benefit site conditions and there would be no impact~~.

Because the project would not impede or redirect flood flows, the project's impacts would be less than significant.

Level of Significance: Less than significant.

Mitigation Measure: None required.

Impact 4.10-17: Release of Pollutants in Flood Hazard, Tsunami, or Seiche Zones Due to Project Inundation

As described in Section 4.10.1.45, above, the *Hydraulic Analysis* (Appendix G-1) shows that the San Joaquin River 100-year floodplain does not enter into the Quarry Site. Furthermore, as described in Section 4.10.1.5 above, the 200-year San Joaquin River floodplain also does not enter into the Quarry Site given the increased height of the berms separating the Quarry Site from the San Joaquin River (Chang 2026a, Appendix G-7). As described in the "Erosion and Sedimentation" subsection of Section 4.10.1.5, above, results of the 2020 Hydraulic Analysis indicate that the 100-year flow velocities along the Quarry Site San Joaquin ~~River bank~~ riverbank under existing conditions are generally at or below the 6 fps "permissible velocity" below which the natural channel will resist erosion, at all cross-sections shown in Figure 4.10-1 except at cross-sections 8, 15, and 16. Therefore, the proposed project, which proposes conditions equal to or better than those under existing conditions with respect to the flood hazard zone (i.e., 100-year floodplain) would not have the potential to increase the release of sediment by altering existing river velocities. FEMA's San Joaquin River floodplain extends into the westerly portion of the Plant Site, as shown in Figure 4.10-1. However, FEMA's maps do not reflect the existing topography of the Plant Site. Thus, Chang Consultants conducted an engineering assessment incorporating 2018 topographical information of the Plant Site and ultimately concluded that ~~The analysis also concludes that~~ the San Joaquin River 100-year floodplain does not enter into the Plant Site, and existing topography and berms along the north edge of the Plant Site prevent the Little Dry Creek 100-year floodplain from entering the Plant Site~~, with the exception of a small portion of the northwest corner of the Plant Site (as shown in Figure 4.10-1)~~ (see Appendix G-1). Regardless, this~~This~~ portion of the Plant Site is currently used as a stockpile area, and this use would continue during Phase 1 mining operations. Upon completion of Phase 1 mining, the stockpiles would be removed, and the area would be graded to drain to the reclaimed pond to the east, as it does under existing conditions. The area would then be revegetated. Because the existing land use of this portion of the Plant Site would not change during Phase 1 mining operations and does not involve the use of hazardous materials, and because this area would be graded and revegetated upon the completion of mining, the potential of the proposed project to substantially increase the risk of the release pollutants in the event of

flooding would be less than significant. Further, existing ground elevations and berms also prevent the 200-year San Joaquin River floodplain and Little Dry Creek floodplain from entering into the Plant Site (Chang 2026b, Appendix G-8).

The project sites are located downstream of Friant Dam, a concrete dam that forms the Millerton Lake reservoir. During unforeseen events, the release of water into the San Joaquin River at rates that could exceed the river channel capacity could be required (Fresno County 2018a). This in turn could result in flooding of the Quarry Site and/or Plant Site. During such an event, sediment could be generated due to erosion at both the Quarry Site and Plant Site, but that sediment would be generated with and without the project. However, the resulting inundation due to the unforeseen events would occur far outside the actual flood hazard zones, and thus would not be covered by this impact. In addition, the unforeseen event of the release of water from the Friant Dam or Millerton Lake Reservoir is not required to be addressed under CEQA since the releases are not "reasonably foreseeable." The enlarged mining excavation could help contain and minimize downstream flooding, which would reduce the overall potential for release of pollutants, including sediment. In addition, hazardous materials on both sites would be stored in accordance with the requirements of the Industrial General Permit SWPPP and SPCC Plan. This would minimize the risk of the release of pollutants in the event of site inundation. Upon completion of reclamation, both project sites would contain open space/open water land uses, which would not be sources of pollutants and would not store hazardous materials. Therefore, the potential of inundation of the project sites due to a rapid release of water from Friant Dam to result in the release of pollutants would be less than significant.

During mining operations, the quarry pits on the Plant Site and Quarry Site would generally be dewatered. After the completion of mining operations, quarry pit lakes would form. The lake surfaces would be approximately 20 feet bgs at the Plant Site and 500 feet bgs at the Quarry Site. Any seiches that could occur in these lakes would be unlikely to be sufficient in size to overtop the quarry pit highwalls. Furthermore, the surrounding areas would be reclaimed to open space and therefore water from seiches would not have the potential to come into contact with any substantial potential sources of pollutants. This impact would be less than significant.

Level of Significance: Less than significant.

Mitigation Measure: None required.

END OF ERRATA

3.2.5.11 Errata to Draft EIR Section 4.11, "Land Use and Planning"

Explanation

Revisions are made to Draft EIR Section 4.11 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.11-3 is revised as follows.

ERRATA

4.11.1.4 Zoning Classifications

Both the Quarry Site and Plant Site are zoned "AE-20" Exclusive Agriculture, 20-acre minimum parcel size. Surface mining operations and related facilities and activities are permitted in the AE-20 district subject to a CUP under the provisions of ~~Section 858~~Section 834.4.220 of the Fresno County Zoning Ordinance.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.11 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.11-9 is revised as follows.

ERRATA

4.11.2.3 Zoning Ordinance of Fresno County—Land Use and Planning

The Zoning Ordinance of Fresno County—Land Use and Planning, last amended ~~June 2018~~February 2026, establishes land use districts and regulations within the unincorporated areas of the county, outlines the use permit process, establishes regulations for various special land uses, and describes administrative procedures.

Both the Quarry Site and Plant Site are zoned "AE-20" Exclusive Agriculture, 20-acre minimum parcel size. Surface mining operations and related facilities and activities are permitted in the AE-20 district subject to a CUP under the provisions of ~~Section 858~~Section 834.4.220 of the Fresno County Zoning Ordinance.

~~Section 858—Regulations for Surface Mining and Reclamation in All Districts~~
Section 834.4.220—Mineral Extraction Sites

This section of the Fresno County Zoning Ordinance outlines the County's regulations on surface mining and reclamation operations, consistent with the California Surface Mining and Reclamation Act of 1975 (Public Resources Code Section 2710 et seq.). The section establishes the importance of mineral resources to the County as community

assets while acknowledging the need to protect surrounding uses from potential land use conflicts and adverse environmental effects and to reclaim mining sites to a usable condition. Specifically, this section requires approval of a CUP, Mining and Reclamation Plan, and Financial Assurances for all surface mining operations in the County and outlines the submission requirements and processing procedures for each. This section also establishes standards for surface mining operations and reclamation including requirements for annual inspections and reporting.

Explanation

Revisions are made to Draft EIR Section 4.11 Table 4.11-1 beginning on page 4.11-10 to correct an error regarding the significance level of Impact 4.10-10 and the numbering of the associated mitigation measures. Draft EIR Table 4.11-1, 6th row, is revised as follows.

ERRATA

Table 4.11-4
Project Consistency with Local Planning Documents

Goals/Objectives/Policies	Consistency Analysis
FRESNO COUNTY GENERAL PLAN: AGRICULTURAL & LAND USE ELEMENT	
SECTION A. AGRICULTURE	
Goal LU-A: To promote the long-term conservation of productive and potentially- productive agricultural lands and to accommodate agricultural-support services and agriculturally-related activities that support the viability of agriculture and further the County's economic development goals.	**Consistent:** The proposed project would be consistent with each of the applicable policies under this goal.
Policy LU-A.2: The County shall allow by right in areas designated Agriculture activities related to the production of food and fiber and support uses incidental and secondary to the on-site agricultural operation. Uses listed in Table LU-1 are illustrative of the range of uses allowed in areas designated Agriculture.	**Consistent:** According to Fresno County General Plan Table LU-1, mineral extraction is an allowed use in areas designated Agriculture, pursuant to the policies in the Open Space and Conservation Element.
Policy LU-A.3: The County may allow by discretionary permit in areas designated Agriculture, special agricultural uses and agriculturally related activities, including value added processing facilities, and certain non-agricultural uses listed in Table LU-1. Approval of these and similar uses in areas designated Agriculture shall be subject to the following criteria: a) The use shall provide a needed service to the surrounding agricultural area which cannot be	**Consistent:** Mineral extraction is an allowed use per Fresno County General Plan Table LU-1 and would meet the criteria outlined in this policy. a) The proposed use provides a needed service to the surrounding area by producing cement products for roads and other construction projects. b) As an existing commercial use, the proposed project is excluded from this policy provision per subsection (h) below.

Goals/Objectives/Policies	Consistency Analysis
provided more efficiently within urban areas or which requires location in a non-urban area because of unusual site requirements or operational characteristics; b) The use should not be sited on productive agricultural lands if less productive land is available in the vicinity; c) The operational or physical characteristics of the use shall not have a detrimental impact on water resources or the use or management of surrounding properties within at least one-quarter (1/4) mile radius; d) A probable workforce should be located nearby or be readily available; e) For proposed agricultural commercial center uses the following additional criteria shall apply: 1) Commercial uses should be clustered in centers instead of single uses. 2) To minimize proliferation of commercial centers and overlapping of trade areas, commercial centers shall be located a minimum of two (2) miles from a city sphere of influence and four (4) miles from any existing or approved agricultural or rural residential commercial center or designated commercial area. 3) New commercial uses should be located within or adjacent to existing centers. 4) Sites should be located on a major road serving the surrounding area. 5) Commercial centers should not encompass more than one-quarter (1/4) mile of road frontage, or one-eighth (1/8) mile if both sides of the road are involved, and should not provide potential for developments exceeding ten (10) separate business activities, exclusive of caretakers' residences; f) For proposed value-added agricultural processing facilities, the evaluation under criteria "a" above, shall consider the service requirements of the use and the capability and capacity of cities and unincorporated communities to provide the required services; and g) For proposed churches and schools, the evaluation under criteria LU-A.3a above shall include consideration of the size of the facility.	c) See Section 4.10, "Hydrology and Water Quality." With implementation of mitigation measures, the project would have less-than-significant impacts on water quality, groundwater supplies and recharge, and drainage patterns. ~~However, as it cannot be said with certainty at this time that access would be granted to County and private residential supply wells to allow for the full implementation of Mitigation Measure 4.10-11a, the County has determined that the proposed project's potential impact on groundwater supply wells surrounding the Quarry Site would be significant and unavoidable~~. d) See Impact 4.14-1. The project would require the addition of five new workers which would likely be hired from the surrounding communities. e) The project is not an agricultural commercial center. f) Per Fresno County General Plan Table LU-1, the proposed use is not a value-added agricultural processing facility. g) The proposed use is not a church or school. h) The proposed use is an existing commercial use and is consistent with the applicable criteria outlined in this policy.

Goals/Objectives/Policies	Consistency Analysis
Such facilities should be no larger than needed to serve the surrounding agricultural community. h) When approving a discretionary permit for an existing commercial use, the criteria listed above shall apply except for LU-A.3b, e2, e4, and e5	

END OF ERRATA

Explanation

The Fresno County General Plan was revised in 2024. As a result of the 2024 update, General Plan Policy HS-C.12 was changed to encourage the performance of appropriate investigations to determine the 200-year, rather than 100-year, flood water surface elevations for the San Joaquin River and reduce potential risks associated with the 200-year flood. The Hydraulic Analysis initially prepared for the project, included as Appendix G-1 to the Draft EIR, was completed in 2020, prior to the 2024 General Plan update, and thus previously analyzed the 100-year flood water surface elevations of the San Joaquin River. To address General Plan Policy HS-C.12 and address commenter's concerns pertaining to extreme flood events, Chang Consultants analyzed 200-year flood water surface elevations of the San Joaquin River at both the Quarry Site and the Plant Site. These analyses are included in the following reports:

- Chang Consultants, *200-Year Hydraulic Analysis for CEMEX Rockfield Modification Project Quarry Site*, (April 21, 2026) (2026a) (See Appendix G-7, "200-year Flood Hazard Analysis—Quarry Site")
- Chang Consultants, *200-Year Hydraulic Analysis for CEMEX Rockfield Modification Project Plant Site*, (May 12, 2026) (2026b) (See Appendix G-8, "200-year Flood Hazard Analysis—Plant Site")

A 200-year event is a flood that statistically has a 0.5-percent chance of occurring in any given year, as compared to a 100-year flood event which is a flood that statistically has a 1-percent chance of occurring in any given year (Chang 2026a, page 1). The 200-year flood report estimated that the 200-year flow rate would be 95,000 cfs based upon FEMA's 2016 flood insurance study (Chang 2026a, page 2). As such, the 200-year hydraulic analysis provides an even more conservative evaluation of the potential for rare flood events to breach the quarry pit than could occur with a 100-year flood event. Upon an initial evaluation, the modeled 200-year floodplain entered the quarry pit at stations 16, 19, and 20 by approximately two feet. To proactively and conservatively prevent a 200-year flood event from entering the quarry pit, CEMEX raised the northerly portion of the berms separating the San Joaquin River and Quarry site up to approximately 4 feet with compacted fill. A topographic mapping was prepared to display the locations where the

berms were raised and is included in the 200-year hydraulic analysis for the Quarry Site. These analyses demonstrated that the 200-year flood does not enter the Quarry Site. or the Plant Site. The addition of the 200-year analyses of the project site does not change the conclusions drawn in the EIR. The following errata updates the consistency analysis with policies LU-C.7, HS-C.12, and PF-E.9, to incorporate the results of the 200-year flood analyses and to clarify that the Little Dry Creek floodplain does not extend into the Plant Site. Table 4.11-1, at Draft EIR pages 4.11-13, 4.11-20, and 4.11-36, is revised as follows.

ERRATA

Goals/Objectives/Policies	Consistency Analysis
Policy LU-C.7: Fresno County shall take into consideration the presence of the regulatory floodway or other designated floodway, the FEMA-designated 100-year floodplain, estimated 250-year floodplain, the Standard Project Flood, and the FMFCD Riverine Floodplain Policy in determining the location of future development within the San Joaquin River Parkway area. Any development sited in a designated 100-year floodplain shall comply with regulatory requirements at a minimum and with the FMFCD Riverine Floodplain Policy criteria, or requirements of other agencies having jurisdiction, where applicable.	**Consistent:** Impact 4.10-11 of Section 4.10, "Hydrology and Water Quality," provides an analysis of flood hazards at the project sites. The Quarry Site and ~~majority of~~ the Plant Site are separated from nearby floodplains by existing berms and ground elevations. ~~Only the northwest corner of the Plant Site is within the floodplain for Little Dry Creek.~~ The FEMA maps of the San Joaquin River 100-year flood, which do not accurately reflect existing conditions of the Plant Site, indicate that the floodplain encroaches on the westerly portions of the Plant Site. However, the 2020 Hydraulic Analysis indicates that existing topography and berms and ground elevations prevent the floodplain from entering the site (Appendix G-1). Regardless, the northwestern ~~This~~ area is used solely for stockpile storage and would continue to be used as such after project implementation. Upon reclamation, these stockpiles would be removed, and the area would be graded to drain to an existing pond. Thus, no development is proposed within a designated 100-year floodplain.
Policy PF-E.9: The County shall require new development to provide protection from the 100-year flood as a minimum.	**Consistent:** See discussion of Impact 4.10-11 of Section 4.10, "Hydrology and Water Quality." The project does not constitute a new development; both sites have existed and have been mined for decades. The project sites are located near the San Joaquin River; however, the river's floodplain does not extend into either project site. FEMA's map of the San Joaquin 100-year flood, which do not accurately reflect existing conditions of the Plant Site, indicates that the floodplain encroaches onto the westerly portions of the Plant Site. ~~The floodplain for Little Dry Creek does extend into the northwest corner of the Plant Site; however,~~ However, the 2020 Hydraulic Analysis concludes that existing topography and berms prevent ~~it~~ the floodplain from

Goals/Objectives/Policies	Consistency Analysis
	entering ~~the majority of~~ the site~~.~~ (Appendix G-1). Regardless, the ~~The~~ portion of the Plant Site within the ~~Little Dry Creek~~ FEMA floodplain is used for stockpiles and would be graded to drain into a pond upon reclamation of the site. As further explained in Section 4.10.1.5, the existing, heightened berms at the Quarry Site prevent the 200-year flood from entering the Quarry Site. The existing berms and ground elevations at the Plant Site also prevent the 200-year flood from entering the Plant Site. Thus, the proposed project would be protected from the 100-year and 200-year flood.

Goals/Objectives/Policies	Consistency Analysis
Policy HS-C.12: The County shall encourage the performance of appropriate investigations to determine the 200-year water surface elevations for the San Joaquin River, taking into account recent storm events and existing channel conditions, to identify the potential extent and risk of flooding. New development, including public infrastructure projects, shall not be allowed along the river until the risk of flooding at the site has been determined and appropriate flood risk reduction measures identified.	**Consistent:** See discussion of Impact 4.10-16 of Section 4.10, "Hydrology and Water Quality." The project sites ~~are~~have been located near the San Joaquin River for decades. As discussed in Section 4.10.1.5; ~~however,~~ the San Joaquin River's 200-year~~river's~~ floodplain does not extend into either project site. The existing, heightened berms at the Quarry Site prevent the 200-year flood from entering the Quarry Site. The existing berms and ground elevations at the Plant Site also prevent the 200-year flood from entering the Plant Site. ~~The floodplain for Little Dry Creek does extend into the northwest corner of the Plant Site. This portion of the Plant Site is used for stockpiles and would be graded to drain into a pond upon reclamation of the site.~~ Thus, the proposed project would be protected from potential flood risks, including from the 200-year flood~~the 100-year flood~~.

ERRATA

Goals/Objectives/Policies	Consistency Analysis
FRESNO COUNTY ZONING ORDINANCES	
~~SECTION 858, SURFACE MINING AND RECLAMATION ORDINANCE~~SECTION 834.4.220, MINERAL EXTRACTION SITES	
~~H. Mining and Reclamation Standards~~ I. Mining and Reclamation Standards **The standards for surface mining operations and reclamation shall be as follows:**	
1. ~~No extraction of material or overburden shall be permitted within twenty five (25) feet of any property boundary nor within fifty (50) feet of a boundary contiguous with a public road right-of-way or recorded residential subdivision.~~ Extraction of material or overburden shall not be allowed within 25 feet of any property boundary nor within 50 feet of a boundary contiguous with a public road right-of-way or recorded residential subdivision.	**Consistent:** The approved CUPs for the quarry operation prohibit placement of stockpiled soil or other materials within 25 feet of any property boundary or within 50 feet of any public right-of-way, consistent with these standards. There are two rural residential subdivisions adjacent to the Quarry Site and no residential subdivisions adjacent to the Plant Site. Under the proposed project, the quarry would continue to comply with these standards.
2. ~~No stockpiled soil or material shall be placed closer than twenty five (25) feet from a property boundary.~~ Stockpiled soil or material shall not be placed closer than 25 feet from a property boundary.	**Consistent:** The quarry is restricted by its approved CUPs from placing any stockpiles of soil or other materials within 25 feet of a property boundary. Under the proposed project, the Quarry would continue to comply with these standards.
4. Security fencing four ~~(4)~~ feet in height consisting of not less than three ~~(3)~~ strands of barbed wire, or an approved equivalent, shall be placed along any property line abutting a public right-of-way and around any extraction area where slopes steeper than two ~~(2)~~ feet horizontal to one ~~(1)~~ foot vertical are maintained. ~~Such~~ The interior fencing will not be required where exterior fencing surrounds the property.	**Consistent:** The project sites are currently partially fenced. Upon project approval, fencing meeting these standards would be erected along all project site boundaries.
5. Screening of the site shall be achieved by planting trees of a variety approved by the Director along all property lines adjacent to a public road right-of-way or a recorded residential subdivision. Adequate screening can generally be achieved with evergreen trees planted in two ~~(2)~~ staggered rows, with ~~twenty (20)~~20 feet between the rows and between the trees in each row. As an alternative, oleanders or shrubs of a similar size and density may be planted in the same pattern at ~~ten (10)~~ 10-foot intervals. The plant species and planting plan and timetable shall be designated in the Mining and Reclamation Plan. All required plants shall be maintained in a good horticultural manner. In areas where it is found that the planting of trees or shrubs will not achieve the desired screening effect due to soil conditions, the Director may approve an	**Consistent:** The Plant Site has landscape screening along North Friant Road, the adjacent public right-of-way, consistent with the existing CUP conditions. The Quarry Site would add landscape screening consistent with these standards. Existing and proposed plantings for the project sites are described in Chapter 2, "Project Description."

Goals/Objectives/Policies	Consistency Analysis
alternate method of screening consisting of meandering dirt berms of sufficient height to screen the site. (Amended by Ord. T- 252 adopted 12-9-80)	

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.11 Table 4.11-1 beginning on page 4.11-16. Mitigation Measure 4.13-6 has been removed in the Final EIR as it was duplicative of Mitigation Measure 4.10-1, "Blasting Protocols." Draft EIR Table 4.11-1 is revised as follows.

ERRATA

Goals/Objectives/Policies	Consistency Analysis
Policy PF-C.15: If the cumulative effects of more intensive land use proposals are detrimental to the water supplies of surrounding areas, the County shall require approval of the project to be dependent upon adequate mitigation. The County shall require that costs of mitigating such adverse impacts to water supplies be borne proportionately by all parties to the proposal.	**Consistent:** The project's potential impacts to groundwater quality at the project sites and during both the mining and reclamation phases are addressed in Impacts 4.10-4 through 4.10-7 of Section 4.10, "Hydrology and Water Quality." The analyses determined that the project would have a potentially significant impact to groundwater quality at the Plant Site due to the water quality of the pond that would form in the excavation pit after the completion of mining. To address this impact, Mitigation Measure 4.10-5a requires implementation of a Plant Site Pond Adaptive Management Program while Mitigation Measure 4.10-5b requires establishment of a funding mechanism to ensure implementation of the program. The analyses further determined that the project would have a potentially significant impact to groundwater quality at the Quarry Site during mining operations due to blasting operations. To address this impact, Mitigation Measure ~~4.13-6~~4.10-1 requires implementation of the project's Blasting Protocols to avoid the potential contamination of groundwater by explosives. The project's potential impacts to groundwater supplies are addressed in Impacts 4.10-8 through 4.10-13. According to the impact discussion, dewatering of the Quarry Site excavation pit would have the potential to affect the availability of groundwater at surrounding wells. To address this impact, Mitigation Measure 4.10-11a requires the implementation of a Groundwater Adaptive

Goals/Objectives/Policies	Consistency Analysis
	Management Program during mining and after completion of reclamation that includes monitoring and implementation of corrective measures as necessary to prevent impacts to surrounding wells. ERRATA

Goals/Objectives/Policies	Consistency Analysis
Policy OS-A.24: In areas with increased potential for groundwater degradation (e.g., areas with prime percolation capabilities, coarse soils, and/or shallow groundwater), the County shall only approve land uses with low risk of degrading groundwater.	**Consistent:** The project's potential impacts to groundwater quality at both sites and during both the mining and reclamation phases are addressed in Impacts 4.10-4 through 4.10-7. The analyses determined that the project would have a potentially significant impact to groundwater quality at the Plant Site due to water quality of the pond that would form in the excavation pit after the completion of mining. To address this impact Mitigation Measure 4.10-5a requires implementation of a Plant Site Pond Adaptive Management Program while Mitigation Measure 4.10-5b requires establishment of a funding mechanism to ensure implementation of the program. The analyses further determined that the project would have a potentially significant impact to groundwater quality at the Quarry Site during mining operations due to blasting operations. To address this impact, Mitigation Measure ~~4.13-6~~4.10-1 requires implementation of the project's Blasting Protocols to avoid the potential contamination of groundwater by explosives.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.11 Table 4.11-1 beginning on page 4.11-30 to reflect that Mitigation Measure 4.3-2 has been updated in the Final EIR to include Mitigation Measure 4.3-2a "Off Road Engines," and Mitigation Measure 4.3-2b "Fugitive Dust Control Plan." Additionally, Mitigation Measure 4.13-6 has been removed in the Final EIR as it was duplicative of Mitigation Measure 4.10-1, "Blasting Protocols." Draft EIR Table 4.11-1 is revised as follows.

ERRATA

Goals/Objectives/Policies	Consistency Analysis
Policy OS-E.13: The County should protect to the maximum extent practicable wetlands, riparian habitat, and meadows since they are recognized as essential habitats for birds and wildlife.	**Consistent:** As discussed in Impacts 4.4-4 and 4.4-5, the project sites do not contain any wetlands, riparian habitat, or meadows. There is riparian habitat along the San Joaquin River west of the project sites and along Little Dry Creek north of the Plant Site; however, project activities would not extend into these areas, and potential indirect impacts from dust and

Goals/Objectives/Policies	Consistency Analysis
	noise/vibration are addressed through Mitigation Measures 4.3-2b and ~~4.13-6~~4.10-1, respectively.
Policy OS-E.14: The County shall require a minimum 200-foot-wide wildlife corridor along particular stretches of the San Joaquin River and Kings River, whenever possible. The exact locations for the corridors should be determined based on the results of biological evaluations of these watercourses. Exceptions may be necessary where the minimum width is infeasible due to topography or other physical constraints. In these instances, an offsetting expansion on the opposite side of the river should be considered.	**Consistent:** The Plant Site is located 0.6 miles from the San Joaquin River. The Quarry Site is located adjacent to the San Joaquin River, but Quarry Site operations would not be conducted within 200 feet of the river. As discussed under Impact 4.4-4, project activities would not extend into wildlife corridors, and potential indirect impacts from dust and noise/vibration are addressed through Mitigation Measures 4.3-2b and ~~4.13-6~~4.10-1, respectively.
Policy OS-E.16: The County should preserve in a natural state to the maximum possible extent areas that have unusually high value for fish and wildlife propagation.	**Consistent:** The project sites do not contain areas that have high value for fish and wildlife propagation. The San Joaquin River and associated riparian habitat west of the project sites are considered high value habitat; however, project activities would not extend into these areas, and potential indirect impacts from dust and noise/vibration are addressed through Mitigation Measures 4.3-2b and ~~4.13-6~~4.10-1, respectively.
Policy OS-E.17: The County should preserve, to the maximum possible extent, areas defined as habitats for rare or endangered animal and plant species in a natural state consistent with State and Federal endangered species laws.	**Consistent:** The project sites provide only marginal habitat for any rare or endangered wildlife species and were found during surveys to be absent all special status animals, plants and plant communities.
SECTION F. VEGETATION	
Goal OS-F: To preserve and protect the valuable vegetation resources of Fresno County.	**Consistent:** The proposed project would be consistent with each of the applicable policies under this goal.
Policy OS-F.3: The County shall support the preservation of significant areas of natural vegetation, including, but not limited to, oak woodlands, riparian areas, and vernal pools.	**Consistent:** The project sites are heavily disturbed and do not contain any significant areas of natural vegetation. As discussed in Impacts 4.4-2 and 4.4-4, the riparian habitat associated with the San Joaquin River west of the project sites and with Little Dry Creek north of the Plant Site would not be directly affected by the proposed project, and potential indirect impacts from dust and noise/vibration are addressed through Mitigation Measure 4.3-2b and ~~4.13-6~~4.10-1, respectively.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.11 to provide consistency analysis for additional goals and policies from the San Joaquin River Conservancy's Parkway Master Plan. Draft EIR Table 4.11-1 at page 4.11-46 is revised as follows.

ERRATA

Goals/Objectives/Policies	Consistency Analysis
Mineral Resource Goal: Work with gravel mining companies to acquire high-priority properties after they have been mined. Promote reclamation plans that enhance and complement Parkway goals and are Parkway-ready to the extent practicable.	**Consistent:** As described in greater detail below in the analysis of project consistency with specific Parkway Master Plan policies, the proposed reclamation plan would create approximately 138.5 acres of wildlife habitat that would enhance and complement Parkway goals by restoring open space, riparian, and open-water habitat features consistent with the Parkway Master Plan's long-term vision for post-mining land uses.
Mineral Resource Goal: Design, construct, and manage the Parkway in a manner that will not conflict with sand and gravel mining operations.	**Consistent:** The proposed project has been designed to avoid and minimize conflicts with adjacent parks, trails, and recreational facilities to the extent feasible. As evaluated in Sections 4.13, "Noise," and 4.17, "Transportation," potential operational conflicts related to noise and traffic would be reduced to less-than-significant levels with mitigation. In addition, as described in Section 2.5.8, the project proposes to dedicate easements to allow for future continuation of existing Parkway trails through the project area.
Policy Mineral.1: For new mining permit applications within the Parkway planning area, provide recommendations to local land use control agencies to ensure the appropriate application of Parkway policies.	**Consistent:** The intent of this policy is to ensure coordination between mining projects and Parkway planning objectives. The San Joaquin River Conservancy was provided the project's Notice of Preparation (see Appendix A-2) and given the opportunity to review and provide recommendations during the environmental review process. Comments received from the Conservancy were considered during preparation of this Draft EIR, consistent with the policy's coordination objective.

Goals/Objectives/Policies	Consistency Analysis
Policy Mineral.2: For new mining permit applications in the Parkway planning area, provide recommendations to local land use control agencies to protect existing riparian woodlands, enhance or complement the revegetation of the river wildlife corridor and adjacent areas, improve excavated gravel ponds by providing for specific wildlife habitat needs or replication of natural landscapes, and to reflect public safety needs.	**Consistent:** The entire Plant Site is disturbed by mining and processing operations with the exception of required setbacks from Friant Road. The proposed project would not disturb the existing wildlife corridors along the San Joaquin River to the west or Little Dry Creek to the north. Reclamation of the Plant Site would create approximately 138.5 acres of open space, riparian, and open water wildlife habitat that complement and enhance goals of the Parkway Master Plan. Slopes surrounding the approximate 95-acre reclaimed pond would be seeded with native grasses and forbs and planted with native plants that would provide food and habitat for wildlife. The perimeter of the Plant Site would be fenced with minimum four (4) foot high ranch fencing consisting of metal T-posts and minimum three (3) strands of barbed wire. At the Quarry Site, an approximately 110-acre pond will be located at the bottom of the excavation. Slopes (alluvial and weathered granite) above the hard rock benches would be seeded with native grasses and forbs that will provide food and habitat for wildlife. The perimeter of Plant Site will be fenced with minimum four (4) foot high ranch fencing consisting of metal T-posts and minimum three (3) strands of barbed wire. See also the discussion under Policies Habitat 7.
Policy Mineral.3: In public Parkway areas that have significant sand and gravel reserves that may be needed for the San Joaquin River Restoration Program or other habitat and floodplain restoration needs, site significant permanent structures where they will not preclude or interfere with future extraction of those resources.	**Consistent:** The project proposes to mine aggregate resources within the footprint of the existing Plant Site and Quarry Site. At the Plant Site the project would mine the remaining alluvial deposit. At the Quarry Site, the project would mine the hard rock below the alluvial deposit currently being mined. This would conserve areas that have significant sand and gravel reserves along the San Joaquin River that may be needed for the San Joaquin River Restoration Program or other habitat and floodplain restoration needs. In addition, it will conserve other areas of aggregate resources for future recovery.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.11 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.11-49 is revised as follows.

ERRATA

Fresno County Zoning Ordinance

As described previously, both the Quarry Site and the Plant Site are zoned by the Fresno County Zoning Ordinance as "AE-20" Exclusive Agriculture, 20-acre minimum parcel size. Surface mining operations and related facilities and activities are permitted in this zoning district subject to a CUP under the provisions of ~~Section 858~~Section 834.4.220 of the Fresno County Zoning Ordinance. Surface mining operations at the Quarry Site and Plant Site are permitted through 2023 under multiple existing CUPs approved by Fresno County. The proposed project would allow for continued and expanded mining on the Quarry Site and Plant Site under a new CUP. Therefore, with project approval, the proposed actions would be consistent with the Fresno County Zoning Ordinance.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.11 to add a description of the San Joaquin River Parkway Master Plan. Text is added to Draft EIR page 4.11-50, after the second paragraph, as follows.

ERRATA

San Joaquin River Parkway Master Plan

Overall, the proposed project would be consistent with the San Joaquin River Parkway Master Plan. It maintains the existing 200-foot river setback and, through reclamation, would create substantial new habitat: about 352.4 acres at the Quarry Site and 138.5 acres at the Plant Site. These reclaimed conditions would enhance riparian/open-water resources that support the Parkway Master Plan's habitat goals. Landscaping and revegetation would use native species, and current onsite conservation practices (e.g., nest boxes) would be continued, aligning with habitat policies. The project's cooperative approach with the San Joaquin River Conservancy and neighbors also furthers the Parkway Master Plan's partnership objectives. Mining and reclamation are confined to existing disturbed footprints and sequenced to conserve aggregate resources and minimize the impact to adjacent land uses and the natural environment, consistent with the Plan's mineral policies.

END OF ERRATA

3.2.5.12 Errata to Draft EIR Section 4.12, "Mineral Resources"

Explanation

Revisions are made to Draft EIR Section 4.12 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.12-3 is revised as follows.

ERRATA

Fresno County Zoning Ordinance

The existing zoning designations for the project sites are both AE-20 (Exclusive Agriculture, 20-acre minimum parcel size). As described in Section 816 of the Zoning Ordinance, this zone is intended to be an exclusive district for agriculture and for those uses that are necessary and an integral part of the agricultural operation. Surface mining operations and related facilities and activities are permitted in the AE-20 district subject to a CUP and the provisions of ~~Section 858~~Section 834.4.220 of the Zoning Ordinance.

Mineral resources are specifically identified in ~~Section 858~~Section 834.4.220 as "valuable community assets which must be safeguarded against preemption by competing or conflicting land uses." The County also discusses that mineral deposits are frequently located in areas that are also suited for other types of development or are in areas characterized by significant natural resources. Therefore, care must be taken to ensure that mineral resources are recovered efficiently and safely, with minimal disruption to surrounding land uses and environmental values, and that sites are reclaimed to a usable condition that is readily adaptable for alternative land uses.

END OF ERRATA

3.2.5.13 Errata to Draft EIR Section 4.13, "Noise"

Explanation

Revisions are made to Draft EIR Section 4.13 to reflect the current (February 2024) Fresno County General Plan land use compatibility criteria for community noise environments. Draft EIR Table 4.13-6 on pages 4.13-28 and 4.13-29 has been revised to update text and to incorporate the updated land use compatibility criteria, including revisions to the compatibility shading, updates to the table source and General Plan references, and other minor formatting corrections. Because revisions to the compatibility shading and formatting cannot be shown using underline and strikethrough, the revised shading is presented in the table below without redline notation.

ERRATA

Policies HS-H.4 and HS-H.8 refer to "Figure HS-9" and "Chart HS-1," which provide noise compatibilities for various land use categories. The information in Chart HS-1 of the *Fresno County General Plan* is provided in Table 4.13-6, "Land Use Compatibility for Community Noise Exposure."

Table 4.13-3
Land Use Compatibility for Community Noise Exposure

Land Use Category	Noise Exposure Level, Ldn or CNEL (dBA)							
	50	55	60	65	70	75	80	85
Residential: Low-Density Single-Family, Duplex, ~~and~~ Mobile Homes								
Residential: Multiple Family								
Transient Lodging: Motels, ~~and~~ Hotels								
Schools, Libraries, Churches, Hospitals, ~~and~~ Nursing Homes

ERRATA

Zoning Ordinance of Fresno County—Land Use and Planning

The Zoning Ordinance of Fresno County—Land Use and Planning, last amended ~~June 2018~~February 2026, has policies and ordinances related to noise and vibration. Specifically, ~~Section 858, "Regulations for Surface Mining and Reclamation in All Districts,"~~ Section 834.4.220, "Mineral Extraction Sites," contains the following countywide development standards:

~~Section 858—Regulations for Surface Mining and Reclamation in All Districts~~
Section 834.4.220—Mineral Extraction Sites

~~H. Mining and Reclamation Standards~~
I. Mining and Reclamation Standards

The standards for surface mining operations and reclamation shall be as follows:

20. Good operating practices shall at all times be utilized to minimize noise, vibration, dust and unsightliness. In reviewing a proposal, the ~~Planning~~ Commission shall consider:
    a. The location of the processing plant.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.13 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.13-31 is revised as follows.

ERRATA

    b. The location where unused equipment will be stored.
    c. Proposals for the removal of all structures, metallic equipment, debris, or objects upon conclusion of the extraction operations.

24. All surface mining operations and reclamation activities shall be conducted consistent with all policies of the General Plan's Noise Element.

END OF ERRATA

Explanation

In response to certain comments raising concerns about the potential impacts of blasting upon nearby residents, Vibra-Tech Engineers evaluated the appropriate ground vibration and air overpressure significance threshold for preventing human disturbance. Vibra-Tech Engineers' "Technical Note on Threshold of Significance for Human Response CEMEX Rockfield Quarry Modification Project Fresno County, California, dated April 29, 2026, is presented as Appendix H-8, "Blasting and Human Response Technical Memorandum.".

Revisions are made to Draft EIR Section 4.13 to provide a summary of the analysis of ground vibration and air overpressure thresholds of significance that would account for human sensitivities. Further, the "Blasting Protocols," as required by Mitigation Measure

4.10-1 and presented in Final EIR as Appendix H-9, "Revised Blasting Protocol," have been revised to incorporate the blasting vibration and air overpressure thresholds applicable to humans at occupied residential structures near the Quarry Site.

The following paragraphs have been added to page 4.13-39 of the Draft EIR, after the San Joaquin River Embankment Threshold discussion, as follows.

ERRATA

Human Sensitivity Threshold

Vibra-Tech Engineers evaluated the limited available research regarding blasting impacts to people, including the 2004 CalTrans Study, the 1974 Wiss and Parmelee Study, the American National Standards Institute ("ANSI") standards and the U.S. Bureau of Mines Report RI-8507, and determined that the appropriate significance threshold for minimizing human annoyance resulting from blast-induced ground vibrations and air overpressure is a peak particle velocity of 0.60 inches/second and blast-induced air overpressure threshold of 0.01 psi. (Vibra-Tech Engineers, *Technical Note on Threshold of Significance for Human Response CEMEX Rockfield Quarry Modification Project Fresno County, California* (April 29, 2026) (Appendix H-8, "Blasting and Human Response Technical Memorandum".) The data evaluated in the USBM Report RI-8507 is based on calculated ground vibration levels, and thus is the most valid predictor of homeowner response to blast vibrations. The data is based on human response to perceived vibration in people's homes, the house rattle and other associated sounds produced by vibration in a residential structure, and considers the fear homeowners feel concerning property damage.

The 0.60 inches/second PPV threshold falls between the two ANSI standards and is at the lower end of the "strongly perceptible to mildly unpleasant" average response provided in the 2004 CalTrans Study. This is still encompassing the 95th percentile of responses discussed in the USBM report, meaning that 95% of the population would not be disturbed if the calculated ground vibration levels reached 0.60 inches/second PPV.

Similarly, utilizing data from a USBM study that evaluated air overpressure limits to minimize human annoyance, Vibra-Tech Engineers determined that the appropriate threshold of significance for human response to blast-induced air overpressure is 0.01 psi given that the vast majority of the population would not be disturbed by blasts resulting in 0.01 psi blast-induced air overpressure.

END OF ERRATA

Explanation

Draft EIR Section 4.13 Impact 4.13-6 has been revised to clarify the applicable ground vibration and air overpressure thresholds for residences, structures, wells, the San Joaquin River Embankment, and humans at occupied residential structures near the Quarry Site. The clarification of certain blasting thresholds and the addition of blasting thresholds for humans do not change the significance determinations contained in the Draft EIR. Draft EIR pages 4.13-65 and 4.13-66 are revised as follows.

ERRATA

Impact 4.13-6: Generate Substantial Groundborne Vibration or Airborne Vibration as a Result of Blasting

A substantial ground-borne vibration impact would occur if vibration from blasting resulted in damage to surrounding residential/commercial structures, damage to nearby groundwater wells, disturbance of nearby residents, or destabilization of the San Joaquin River embankment. As described in the "Blasting Significance Thresholds" subsection, of Section 4.13.3.2, above, the following significance thresholds are required to ensure that ground vibration and air overpressure~~airblast~~ from blasting activities do not result in damage or destabilization:

- 0.75 in/sec PPV ground vibration threshold to prevent damage to residential/commercial structures (this threshold can be adjusted based on frequency of vibration as shown on Figure 4.13-5);
- Ground vibrations measured at water wells will not exceed 2.0 in/sec to prevent damage to wells;
- 0.5 in/sec PPV ground vibration threshold to prevent destabilization of the San Joaquin River embankment (this threshold can be adjusted based on frequency of vibration as shown on Figure 4.13-6); and
- 0.012950 psi to prevent damage to residential/commercial structures and minimize human disturbance from airblast ~~(provided that blasting is limited to 1 to 2 blast events per day)~~ (this threshold ~~can be adjusted based on frequency of vibration as summarized in~~ is based on utilizing a 2 Hz microphone for measurements as shown in Table 4.13-12)~~.~~; and
- 0.60 in/sec PPV vibration threshold and 0.01 psi air overpressure threshold to minimize human disturbance at occupied residential structures near the Quarry Site.

Because maintaining the vibration residential/commercial structure threshold of 0.75 in/sec PPV is lower than the 2.0 in/sec PPV threshold to prevent damage to wells,

measures taken to maintain vibration below the residential/commercial structure threshold would also be protective of any wells associated with the structure. The closest wells that are not associated with a residential/commercial structure are located further from the blasting area than the nearest residential/commercial structures. Therefore, measures taken to maintain vibration below the residential/commercial structure threshold would also be protective of the nearby wells that are not associated with a residential/commercial structure. ~~In addition, because blasting would occur once to twice a week between the hours of 10 a.m. and 2 p.m., it would not exceed a frequency of more than two blasts per day, and therefore measures taken to maintain vibration below the 0.01295 psi threshold to prevent damage from airblast would be also prevent human disturbance.~~ To minimize human disturbance that may result from blasting, the *Blasting Protocols* as updated in 2026 and provided in Appendix H-9, "Revised Blasting Protocol," require blasting designs to maintain a vibration threshold of 0.60 in/sec PPV and an air overpressure threshold of 0.01 psi at occupied residential structures near the Quarry Site.

The *Blast Impact Analysis* (Appendix H-3) found that to ensure that vibration and airblast remain below the applicable thresholds, reduced maximum explosive weights would be required as blasting approaches the perimeter of the quarry (at progressively closer distances to residential structures and other receptors). Reduced explosive weights can be achieved using smaller diameter blastholes, shorter diameter blastholes, and/or a reduced number of blastholes per delay. With regards to the San Joaquin River embankment, blasting-generated vibration can also be reduced to meet the ~~0.5 in/sec threshold~~ San Joaquin River embankment threshold curve set forth in Figure 4.13-6 by reducing the bench heights within the quarry pit. The analysis and recommendation of the Blast Impact Analysis (Appendix H-3) indicate that without appropriate vibration and airblast reduction measures, blast-induced groundborne vibration and airblasts could exceed thresholds and result in damage to surrounding residential/commercial structures, to nearby groundwater wells, or destabilization of the San Joaquin River embankment. The Blast Impact Analysis Peer Review (Appendix H-7) recommends adherence to a blasting program that conform to the OSMRE (1987) Blasting Guidance Manual to avoid blast-induced impacts and recommends the implementation of specific mitigation measures that require beginning hard rock blasting towards the center of the Quarry Site, implementing a blast monitoring plan, and preparing and updating a blasting plan annually.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.13 to clarify implementation of Mitigation Measure 4.10-1, "Blasting Protocols." Draft EIR page 4.13-66 is revised as follows.

ERRATA

Mitigation Measure ~~4.13-6~~4.10-1 would require implementation of the Blasting Protocols ~~(Appendix H-6)~~ (Appendix H-9, "Revised Blasting Protocols") which specify that blasting must begin at the center of the Quarry Site so that monitoring of groundborne vibration can occur and be used to verify that predicted maximum ground vibrations are consistent with actual ground vibrations measurements and allow for adjustments in blasting design to occur based on the monitoring results. The Blasting Protocols detail requirements for the implementation of a blast monitoring program that includes ground vibration measurements, air overpressure measurements, visual inspection of the San Joaquin River embankment whenever blasting occurs within 1,000 feet of the embankment and depths less than 100 feet within the hard rock portion of the quarry pit (measured at the contact between alluvium and rock). Should significance thresholds be exceeded or signs of instability of the embankment (such as slumping or cracking) be noted, the County must be notified within 48 hours, and a corrective action plan must be developed that identifies changes to the blasting program to prevent future exceedances. If a corrective action plan is required, a suspension of all blasting will immediately occur until the corrective action is approved by the County. The Blasting Protocols also detail the requirements for complaint response procedures; record-keeping; and annual reporting of monitoring, complaints investigations, and corrective actions. Lastly, the Blasting Protocols would require the operator of the Rockfield Quarry to develop an annual Blasting Plan that includes the proposed blasting designs for areas proposed for blasting each year. The blasting design must be supported by calculations that maintain blast-induced vibrations below the significance thresholds. The plan must be submitted to the County each year for review. With implementation of Mitigation Measure ~~4.13-6~~4.10-1, the potential of the proposed project to generate substantial groundborne vibration or airblast would be less than significant.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.13 to eliminate a duplicate mitigation measure, Mitigation Measure 4.13-6, "Blasting Protocols." Draft EIR page 4.13-67 is revised as follows.

ERRATA

Mitigation Measure ~~4.13-6~~: ~~*Blasting Protocols*~~ *Implement Mitigation Measure 4.10-1, "Blasting Protocols."*

~~*The operator of the Rockfield Quarry shall at all times implement the requirements of the "Blasting Protocols" developed October 27, 2020, and updated September 8, 2021, by Vibra-Tech Engineers, Inc. The Blasting Protocols shall be appended to the Mitigation Monitoring and Reporting Program and shall be incorporated into the conditions of approval for the project.*~~

END OF ERRATA

3.2.5.17 Errata to Draft EIR Section 4.17, "Transportation"

Explanation

Revisions are made through the errata below to the introduction of Draft EIR Section 4.17 to clarify that the level of service (LOS) analysis in the Transportation section of the EIR is included because the Fresno County General Plan requires an LOS analysis. Draft EIR page 4.17-2 is revised as follows.

ERRATA

This EIR discusses anticipated VMT associated with the proposed project based on the analysis of the VMT Addendum (Appendix I-2) and the Additional Response to Comments (Appendix I-4). CEQA changed from requiring a LOS analysis to requiring a VMT analysis in 2018. Thus, this EIR's transportation discussion includes a VMT analysis, see e.g. pages 4.7-20 through 4.7-26. In addition, under the Fresno County General Plan, a LOS analysis is also required under Policy TR-A.3. Thus, the County General Plan requires a LOS analysis that could be properly included in the Draft EIR in either the EIR Land Use and Planning section regarding the project's consistency with the County General Plan, or this Transportation section. For ease of review, Fresno County determined that this Transportation section is a better place for the LOS analysis, which is why it is in this section.

END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 to clarify that CEQA requires VMT analyses to evaluate transportation impacts under Title 14 CCR Section 15064.3. Draft EIR page 4.17-8 is revised as follows.

ERRATA

CEQA Section 21099(b)(1) (Senate Bill 743)

Under SB 743, CEQA Section 21099(b)(1) ~~requires~~ required that the California Governor's Office of Planning and Research (OPR) develop revisions to the CEQA Guidelines establishing criteria for determining the significance of transportation impacts of projects that "promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses." CEQA Section 21099(b)(2) states that upon certification of the revised guidelines for determining transportation impacts pursuant to Section 21099(b)(1), automobile delay, as described solely by LOS or similar measures of vehicular capacity or traffic congestion, shall not be considered a significant impact on the environment under CEQA. Subsequently, the

CEQA Guidelines were amended in 2018 adding Guidelines Section 15064.3 that describes specific considerations for evaluating a project's transportation impacts and advises that vehicle miles traveled (VMT) is generally the most appropriate measure of transportation impacts. In December 2018, OPR published the *Technical Advisory on Evaluating Transportation Impacts in CEQA* (Technical Advisory) recommending that transportation impacts for projects be measured using a VMT metric (OPR 2018).

END OF ERRATA

Explanation

Revisions are made to Draft EIR Section 4.17 to reflect Fresno County's 2024 Comprehensive Zoning Ordinance Update and the March 2026 Zoning Ordinance Amendment. Draft EIR page 4.17-8 is revised as follows.

ERRATA

Zoning Ordinance of Fresno County—Land Use and Planning

The Zoning Ordinance of Fresno County—Land Use and Planning, last amended ~~June 2018~~February 2026, has policies and ordinances related to transportation. Specifically, ~~Section 858, "Regulations for Surface Mining and Reclamation in All Districts,"~~ Section 834.4.220, "Mineral Extraction Sites," contains the following countywide development standards related to transportation that apply to mining projects in the County.

~~Section 858—Regulations for Surface Mining and Reclamation in All Districts~~
Section 834.4.220-Mineral Extraction Sites

~~H. Mining and Reclamation Standards~~
I. Mining and Reclamation Standards

The standards for surface mining operations and reclamation shall be as follows:

6. The first ~~one hundred (~~100~~)~~ feet of access road(s) intersecting with a County maintained road shall be surfaced in a manner approved by the Board and shall not exceed a two ~~(2)~~ percent grade and shall have a width of not less than ~~twenty-four (~~24~~)~~ feet.
7. Where an access road intersects a County-maintained road, it shall be improved with a driveway approach constructed to ~~Fresno~~ County Standards.
9. Traffic control and warning signs shall be installed as required by the Commission at the intersection of all private roads with public roads. The placement, size, and wording of these signs shall be approved by the Director.

END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 to provide information about the Fresno Council of Governments' SB 743 Implementation – Regional Guidelines (June 2025). Fresno County has not adopted the 2025 COG Guidelines; however, the County utilizes the guidelines where VMT analyses are required. This additional guidance does not change the VMT analysis or conclusions presented in the Draft EIR. The following subsection is inserted to Draft EIR page 4.17-12 preceding the subsection "Fresno County General Plan."

ERRATA

Fresno County SB 743 Implementation—Regional Guidelines

The Fresno Council of Governments (COG) prepared the "Fresno County SB 743 Implementation – Regional Guidelines" (Fresno COG VMT Guidelines; updated June 2025) after publication of the Draft EIR in December 2024, as a guide for the COG's 16 member jurisdictions to assist the member agencies in their shift from a delay-based LOS approach to VMT and with the intent that local governments may use the recommendations in the regional guidelines as appropriate based on their individual circumstances (e.g., growth policies and economic development goals). Substantial evidence and explanation on establishing the "Region," VMT screening criteria, and VMT analysis thresholds are also described in the Fresno COG VMT Guidelines. The Regional Guidelines further confirm that heavy-duty trucks are not included in VMT analyses at page 21.

END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 to include additional Fresno County General Plan policies under the list of policies associated with General Plan Goal TR-A. Policy TR-A.2 requires evaluation of transportation impacts be based upon VMT under CEQA, and Policies TR-A.5 and TR-A.25 pertain to road improvements and analysis of transportation impacts. Although these three policies were not specifically listed in the Draft EIR, the transportation analyses are consistent with the applicable aspects of these policies. The addition of these policies through the errata below amplifies the EIR's discussion of General Plan policies related to transportation, but does not affect the analysis or conclusions of the Draft EIR. The policies are added to the list of select Goal TR-A policies beginning on Draft EIR page 4.17-12, as shown below.

ERRATA

Goal TR-A: To plan and provide a unified, multi-modal, coordinated, and cost-efficient countywide street and highway system that ensures the safe, orderly, and efficient movement of people and goods, including travel by walking, bicycle, or transit.

Policy TR-A.2: The County shall require evaluation of County General Plan land use designation changes, zone changes, and discretionary development for their individual (i.e., project-specific) and cumulative transportation impacts based on Vehicle Miles Traveled (VMT) under the California Environmental Quality Act (CEQA) pursuant to the methodology and thresholds of significance criteria established by the County.

Policy TR-A.3: The County shall plan and design its roadway system in a manner that strives to meet Level of Service (LOS) D on urban roadways within the spheres of influence of the cities of Fresno and Clovis and LOS C on all other roadways in the county. Roadway improvements to increase capacity and maintain LOS standards should be planned and programmed based on consideration of the total overall needs of the roadway system, recognizing the priority of maintenance, rehabilitation, and operation of the existing road system.

The County may, in programming capacity-increasing projects, allow exceptions to the level of service standards in this policy where it finds that the improvements or other measures required to achieve the LOS policy are unacceptable based on established criteria. In addition to consideration of the total overall needs of the roadway system, the County shall consider the following factors:

a) The right-of-way needs and the physical impacts on surrounding properties;
b) Construction and right-of-way acquisition costs;
c) The number of hours that the roadway would operate at conditions below the standard;
d) The ability of the required improvement to significantly reduce delay and improve traffic operations; and
e) Environmental impacts upon which the County may base findings to allow an exceedance of the standards.

In no case should the County plan for worse than LOS D on rural County roadways, worse than LOS E on urban roadways within the spheres of influence of the cities of Fresno and Clovis, or in cooperation with Caltrans and the Council of Fresno County Governments, plan for worse than LOS E on State Routes in the county.

Policy TR-A.5: The County shall program road improvements on a countywide priority basis using technical assessment tools such as the Road and Traffic Evaluation (RATE) and Pavement Management System.

Policy TR-A.6: The County shall require dedication of right-of-way or dedication and construction of planned road facilities as a condition of land development, and require an analysis of impacts of traffic from all land development projects including impacts from truck traffic. Each such project shall construct or fund improvements necessary to mitigate the effects of traffic from the project. The County may allow a project to fund a fair share of improvements that provide significant benefit to others through traffic impact fees.

Policy TR-A.7: The County shall assess fees on new development sufficient to cover the fair share portion of that development's impacts on the local and regional transportation system.

Policy TR-A.10: The County shall ensure that land development that affects roadway use or operation or requires roadway access to plan, dedicate, and construct required improvements consistent with the criteria in the Circulation Diagram and Standards section of this element.

Policy TR-A.16: The County working with the cities of Fresno County, Shall establish a system of designated truck routes through areas of urban density.

Policy TR-A.25: Projects that would generate or attract more than 110 daily vehicle trips shall be evaluated for a transportation VMT impact on an individual basis. The threshold of significance shall be 87 percent below the countywide average rate of VMT. Any individual project resulting in VMT that exceeds 87 percent below the countywide average shall be required to implement project-specific mitigation measures aimed at reducing VMT generated by the project.

END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 to discuss the 2025 Fresno Council of Governments (COG) VMT Guidelines. The addition does not affect the analysis or conclusions in the Draft EIR. The second paragraph under the heading "Vehicle Miles Traveled Analysis" beginning on Draft EIR page 4.17-18 is revised as follows.

ERRATA

As of ~~the date of this analysis~~ March 2026, the County has not finalized or adopted any VMT guidelines. In addition, the guidelines that were prepared by COG for the County's consideration have not been approved by the County. As discussed previously, the Fresno Council of Governments adopted the Fresno COG VMT Guidelines in June 2025. The County has not officially adopted the 2025 Fresno COG VMT Guidelines, but the 2025 Fresno COG VMT Guidelines are used as the reference material for reviews that require a VMT analysis. As a result, the VMT analysis presented in this analysis was performed pursuant to the Technical Advisory (OPR 2018) and is supplemented by the 2025 Fresno COG VMT Guidelines.

END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 to provide the additional information pertaining to the 2025 COG VMT Guidelines pertaining to VMT analyses and specifically the difference between the significance thresholds identified in the 2018 OPR Technical Advisory and the 2025 Fresno COG VMT Guidelines. Revisions are made to the "Automobile VMT Significance Thresholds" on Draft EIR page 4.17-19 as shown below.

ERRATA

Automobile VMT Significance Thresholds

The Technical Advisory states that projects that generate or attract fewer than 110 automobile trips per day can be assumed to cause a less-than-significant transportation impact (OPR 2018). Therefore, the 110 automobile trips per day threshold is used to determine whether the increase in automobile trips generated by the proposed project could result in a significant increase in VMT.

The June 2025 Fresno COG *Fresno County SB 743 Implementation Regional Guidelines* ("2025 COG Guidelines") and the December 2018 California Office of Planning and

Research (OPR) *Technical Advisory on Evaluating Transportation Impacts in CEQA* ("2018 Technical Advisory") contain descriptions that the analysis of VMT under CEQA pertains to on-road passenger vehicles (cars and light-duty trucks) and does not apply to heavy-duty trucks typical of those generated by the Project. As such, only employee automobile trips and other non-truck trips are required to be analyzed for VMT. The Fresno County General Plan Policy TR-A.25 requires an analysis for any project generating more than 110 trips per day. This value stems from the 2018 Technical Advisory, which indicates that projects that generate or attract fewer than 110 trips per day generally may be assumed to cause a less-than-significant transportation impact. The 2025 COG Guidelines provide substantial evidence that projects generating up to 500 non-truck trips per day may be screened out (assumed to cause a less-than-significant transportation impact).

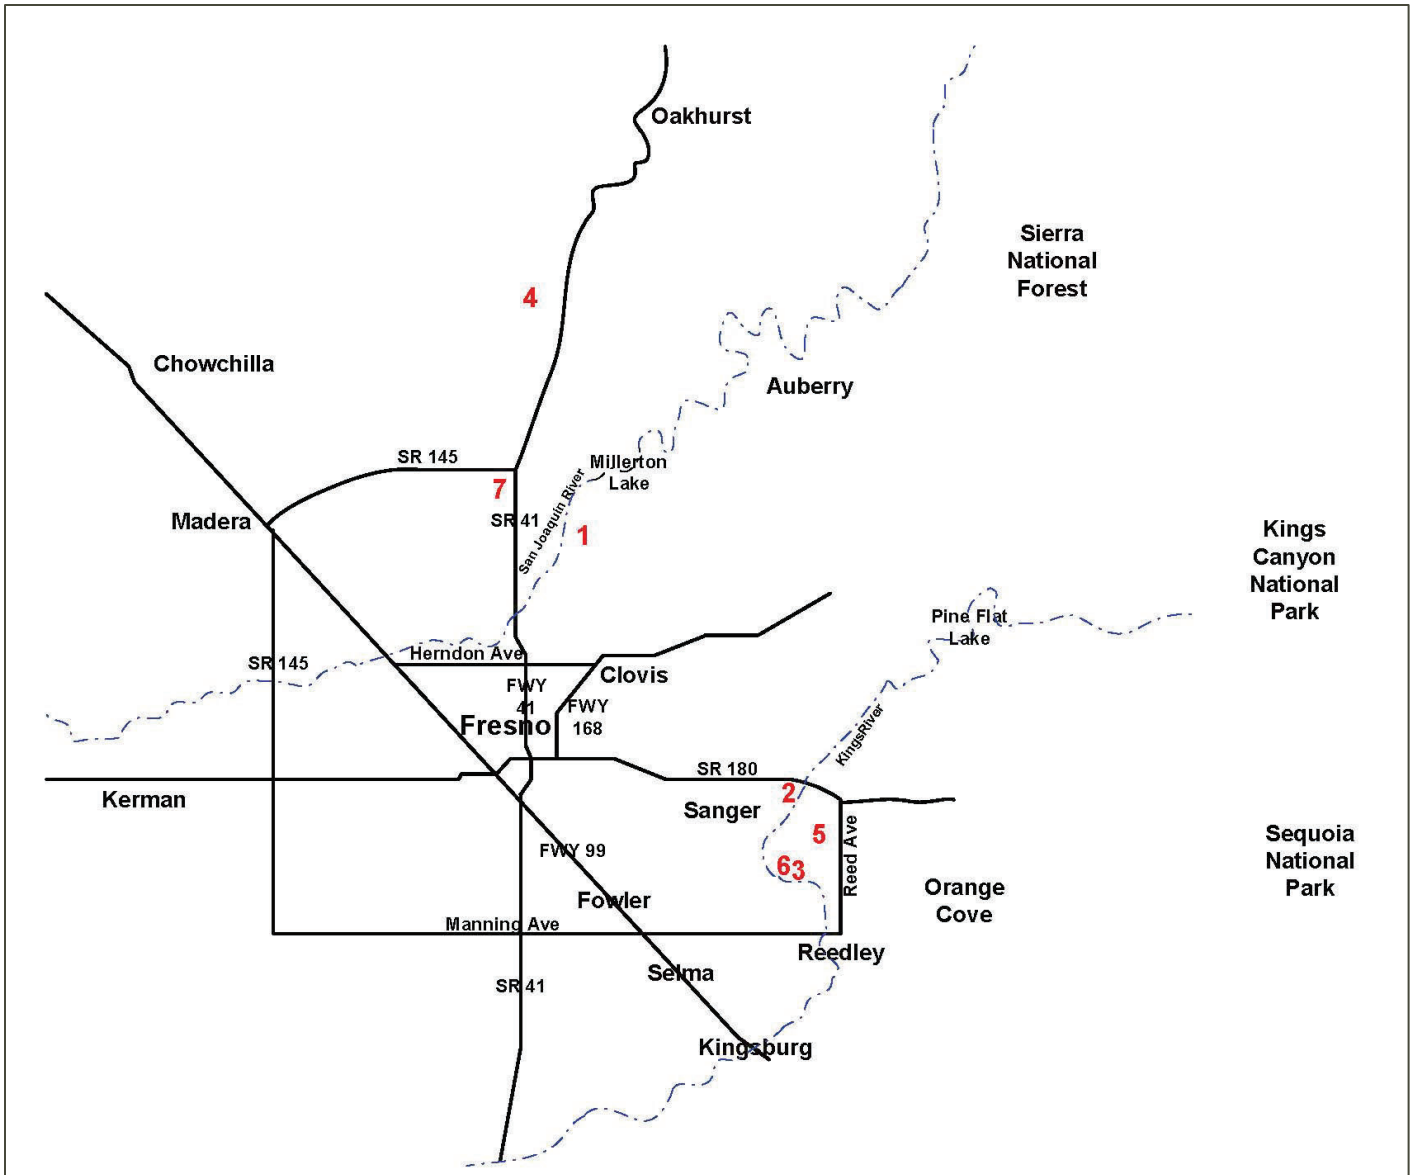
END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 to clarify that the active mines evaluated for the purpose of creating VMT estimates are located in or adjacent to the Fresno Production-Consumption Region. Draft EIR Figure 4.17-2 and Table 4.17-5, and associated references in the paragraph that precedes Table 4.17-5, are updated through the errata below to reflect this clarification. Additionally, the footnote in Table 4.17-5 is revised through the errata below to reference the Traffic Impact Study as Appendix I-1 of the Draft EIR instead of Appendix I-2. These revisions do not affect the analysis or conclusions of the Draft EIR transportation analysis.

ERRATA

There are no well-established methods or sets of empirical data for estimating VMT, particularly for aggregate mining operations that are highly dependent upon the location of the source, the locations of other aggregate mines, regional demand, and the consideration that not all trips are round trips. The trip generation estimates presented in the Traffic Impact Study (Appendix I-1) were utilized as the basis for the VMT estimates developed by the VMT Addendum (Appendix I-2). Calculations were performed to estimate the distribution of trips to the various cities and growth areas in the region considering the relative populations and distances from the source. For purposes of these estimates, truck trips and automobile trips were considered separately, and each trip was considered to be a round trip with an equal trip length in each direction. In addition to the proposed Rockfield Quarry operations, the aggregate mines listed in Table 4.17-5, "Active, Inactive, and Permitted Aggregate Mines in or Adjacent to the Fresno ~~Madera~~ Production Consumption Region," were considered in the VMT analysis. These locations



are shown on Figure 4.17-2, "Active, Inactive, and Permitted Aggregate Mines in or Adjacent to the Fresno ~~Madera~~ Production Consumption Region."

Table 4.17-5
Active, Inactive, and Permitted Aggregate Mines
in or Adjacent to the Fresno ~~Madera~~ Production Consumption Region

Aggregate Mine	Operational Status
Sanger Sand & Gravel—Vulcan	Active
Kings River Sand & Gravel—Calaveras	Active
Madera Quarry	Inactive
Carmelita Resources	Permitted, not operational
Riverbend Sand & Gravel	Permitted, not operational
Austin Quarry	Active

Table Source: Page 2 of Appendix I-2.
Table Notes: Aggregate mine locations are shown on Figure 4.17-2. The operational status is based on conditions that were existing at the time the Traffic Impact Study (Appendix I-~~2~~1) was completed.

END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 to clarify the discussion in the last full paragraph on Draft EIR page 4.17-25 that Mitigation Measures 4.17-1a through 4.17-1r primarily pertain to recommended road improvements. The revisions simply clarify the discussion of road improvement mitigation and do not affect the analysis, mitigation, or conclusions of the Draft EIR.

ERRATA

~~That~~The Traffic Impact Study indicates that all of the study intersections are currently operating at acceptable LOS; therefore, no LOS deficiencies are identified. Queues in some turn lanes exceed the existing storage capacity at some intersections. The analysis in the Traffic Impact Study found that the addition of project-related trips to existing conditions, 5-year cumulative conditions, 15-year, and cumulative (year 2040) conditions would contribute to substantial decreases in LOS and substantial increase in queuing at some intersections. The substantial change in LOS and queuing is based on the thresholds in the *Guidelines for the Preparation of Traffic Impact Studies Within County of Fresno* (Fresno County 2012). ~~Measures to~~ Road improvements that would reduce these traffic congestion effects are recommended in the Traffic Impact Study, are identified under Impact 4.17-1, and are required as Mitigation Measure 4.17-1a through 4.17-1r. These measures primarily consist of the payment of equitable share of costs of future roadway improvements in the County, and, if warranted, the installation of traffic signals at the intersection of North Friant Road with the Quarry Site and Plant Site entrances. The study analysis indicates that LOS and queuing would be effectively reduced to the extent feasible through the implementation of the recommended ~~measures~~ road improvements.

END OF ERRATA

Explanation

Revisions are made through the errata below to the Traffic Index Analysis discussion on page 4.17-26 of Draft EIR Section 4.17 to clarify that a design life of 20 years is the standard used for pavement design life. This revision simply clarifies the discussion of traffic index analysis and does not affect the analysis or conclusions of the Draft EIR.

ERRATA

The traffic index is a measure of the number of 18,000-pound equivalent single axle loads expected over the design period and is used to calculate the required pavement thickness of a roadway. A design life of 20 years is typically utilized for pavement design.

END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 on pages 4.17-26 and 4.17-27 to clarify that the traffic index summary presented in Table 4.17-10 is for Project operations at 3.0 million tons per year. Additionally, the paragraph below Table 4.17-10 is revised to clarify that the equitable share contributions towards pavement improvements are based on the percent increase above the baseline and that such payments are made one time. These revisions more clearly specify the intended requirements for equitable share contributions toward pavement improvements and do not affect the analysis, mitigation efficacy, or conclusions of the Draft EIR.

ERRATA

The results of the existing conditions traffic index analyses are summarized in Table 4.17-10, "Traffic Index Summary—Existing and Existing Plus Project at 3.0 MTY."

Table 4.17-10
Traffic Index Summary—Existing and Existing Plus Project at 3.0 MTY

Road	Segment	Direction	Existing Traffic Index	Traffic Index With Project
Friant Road	Between North Fork Road and Site Access	NB	9.5	**10.0**
		SB	9.5	**10.0**
Friant Road	Between Quarry Site and Existing Plant Access	NB	9.5	**10.0**
		SB	9.5	**10.0**
Friant Road	Between Existing Plant Access and Willow Avenue	NB	9.5	**10.5**
		SB	9.5	**10.5**
Friant Road	Between Willow Avenue and Copper River Drive	NB	9.5	**10.5**
		SB	9.5	**10.5**
Willow Avenue	Between Friant Road and Copper Avenue	NB	8.5	**9.0**
		SB	8.5	**9.0**

The proposed project would cause the traffic index to increase ~~substantially~~ on all of the roadway segments evaluated. Therefore, the Traffic Impact Study (Appendix I-1) recommends that the operator of the Rockfield Quarry must contribute an equitable share of pavement improvements based on the percent increase above baseline to increase the pavement section and accommodate the traffic index values in Table 4.17-10. This is a one-time payment, and for the percentage above baseline.

END OF ERRATA

Explanation

In response to Caltrans's comment made in Letter 2b and in consideration of supplemental evaluation of the State Route 41 (SR 41)/Friant Road interchange memorandum (see Appendix I-6, "State Route 41/Friant Road Interchange Analysis Technical Memorandum") prepared by Peters Engineering Group, revisions are made through the errata below to Draft EIR Section 4.17 to incorporate discussion of the SR 41/Friant Road Interchange. Impact 4.17-1 is revised to incorporate the following discussion of the project's projected net trip volumes at the SR 41/Friant Road Interchange. The additional analysis clarifies and amplifies the transportation analysis and does not identify a new significant impact nor an increase in the severity of a previously identified significant impact.

ERRATA

SR 41 and Friant Road Interchange

The SR 41/Friant Road Interchange is located approximately 6 miles north of the Project sites. The project Transportation Impact Study (Peters Engineering Group 2019) and the Draft EIR Transportation section did not expressly include the SR 41/Friant Road interchange in the analysis, expecting that any project trip-related effects at the interchange would be addressed through the payment of any applicable per-trip fees for use by Caltrans at its discretion in making improvements at this interchange, in accordance with past practices and as presented in Appendix I-3, "Response to Comments on Traffic Impact Study Proposed CEMEX Rockfield Modification Project." To more fully evaluate the potential for project trips to affect traffic operations at the SR 41 / Friant Road Interchange in this Final EIR, Peters Engineering Group prepared a technical memorandum documenting the observed conditions at and near the SR 41 / Friant Road Interchange at peak AM and PM periods, and evaluating potential effects associated with the project's net change in vehicle trips at the interchange in the "Interchange Analysis – State Route 41 and Friant Road" (Peters Engineering Group 2026b), attached as Appendix I-6. The Interchange Analysis demonstrates that the estimated year 2026 volumes at the southbound and northbound SR 41 / Friant ramp intersections under existing conditions are as follows:

- intersection of Friant Road and the SR 41 southbound ramps: 8,996 during the AM peak hour and 11,873 during the PM peak hour.
- intersection of Friant Road and the SR 41 northbound ramps: 8,821 during the AM peak hour and 11,419 during the PM peak hour.

Table 4.17-13, "Percentage of Net Project Trips at State Route 41/Friant Road Intersection," presents the project's net peak-hour trips at the Friant Road / SR 41 interchange, the total trip volumes estimated at the intersection with the addition of net project trips, and the project's percentage of total trips during the AM and PM peak hours.

Table 4.17-13
Percentage of Net Project Trips at State Route 41 / Friant Road Intersection

Location	AM Peak Hour			PM Peak Hour		
	Net Project Trips	Total Volume with Project	Project Percentage	Net Project Trips	Total Volume with Project	Project Percentage
Friant / SR 41 SB Ramps	27	9,023	0.3%	0	11,873	0.00%
Friant / SR 41 NB Ramps	48	8,869	0.5%	0	11,419	0.00%

Table Source: Peters Engineering Group 2026b.

As shown in Table 4.17-13, the net project trips at the Friant Road/SR 41 interchange represent a very small fraction of the total traffic volumes, and are considered operationally negligible with respect to the total volumes and overall traffic operations. During the AM peak hour, the net project trips represent half a percent or less of the total volume, and no net project trips are expected for typical average conditions during the PM peak hour. Project truck trips are expected to be present on any given approach to the intersections at a rate of substantially less than one truck per minute, and would contribute a negligible effect on overall traffic operations. Considering the daily fluctuations in traffic volumes typically expected in urban areas, the trips generated by the project would be within the normal variations that would occur under existing conditions without the project and are not expected to cause a significant change in operations or measurably affect average queue lengths, traffic signal operations, or ramp operations (Peters Engineering Group 2026b).

END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 to amplify and clarify the VMT analysis and the application of the significance thresholds set forth by the 2018 OPR Technical Advisory as well as the 2025 Fresno COG VMT Guidelines. The revisions clarify and amplify the discussion of the project non-truck trips under baseline and with-project conditions and the relationship of these trips to VMT analysis screening

thresholds. The revisions amplify the analysis in consideration of both the 2018 OPR Technical Advisory and the 2025 Fresno COG VMT Guidelines and do not alter the Draft EIR conclusions. The last paragraph on Draft EIR page 4.17-40 is revised and inserted after Table 4.17-12, "Automobile Trip Generation."

ERRATA

~~As shown in Table 4.17-12, the existing Rockfield Quarry generates approximately 78 automobile trips per day, and the proposed project would increase automobile trips between approximately 6 and 10 trips per day during Stage 1 and Stage 2 operations.~~ The baseline number of quarry/plant annual non-truck trips is 14,213 entering and exiting for a total annual volume of 28,426 non-truck trips (combined entering and exiting), as calculated by the Traffic Study in Appendix I-1 and provided in Table 4.17-12. Dividing the total annual volume by 365 days per year, the average number of baseline daily non-truck trips is approximately 78. The number of cumulative annual non-truck Project trips (including baseline quarry/plant trips in Table 4.17-1) is a maximum of 16,126 entering and exiting (specifically presented near the bottom of Table 4.17-3) for a total annual volume of 32,252 non-truck trips (combined entering and exiting). Dividing by 365 days per year, the average number of daily non-truck trips is about 89. Subtracting the baseline quarry/plant trips, the net number of daily new Project non-truck trips is 11. ~~This is less than~~ These values are less than the 110 trips per day screening threshold recommended by the 2018 OPR Technical Advisory and less than the 500-trip threshold recommended by the 2025 COG Guidelines. Therefore, the potential of the proposed project to generate an increase in VMT from automobile trips that would conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b) would be less than significant.

END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 to clarify that the project's increase in vehicle trips would not conflict with the applicable transportation plans because the transportation plans relied on the assumption of a fast-growing population. Draft EIR page 4.17-28 is revised as follows.

ERRATA

Based on Table 4.17-11, Stage 1 and Stage 2 project operations would increase total truck and non-truck vehicle round trips by between 7 and 201 trips per day. The increase in vehicles on existing roadways does not have the potential to conflict with a plan, ordinance, or policy addressing the circulation system because transportation plans,

including the Fresno County General Plan, Fresno County Regional Active Transportation Plan, and Fresno County Regional Transportation Plan, account for anticipated future increases in vehicles travelling along roadways because a fast-growing population is an underlying assumption in these transportation plans.

END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 clarify that the impact referenced in the paragraph pertains to project vehicle trips effects on levels of service (LOS). The revisions clarify the discussion and do not affect the analysis or conclusions of the Draft EIR. Draft EIR page 4.17-29 is revised as follows.

ERRATA

As stated above, Policy TR-A.2 of the Transportation and Circulation Element requires the County to plan and design its roadway system in a manner that strives to meet Level of Service (LOS) D on urban roadways within the spheres of influence of the cities of Fresno and Clovis and LOS C on all other roadways in the county. The Traffic Impact Study (Appendix I-1) identifies that project ~~impacts that~~ vehicle trips would affect such LOS and proposes mitigation measures in accordance with Fresno County General Plan: Transportation and Circulation Element Policies TR-A.5 and TR-A.6 allowing a project to fund a fair share of improvements as identified in Section 4.11, of this Draft EIR. The project impacts and mitigation measures are described below.

END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 clarify mitigation requirements specifying that the Operator would be fully responsible for funding road improvements at the Friant Road and Quarry Site Access Intersection and at the Friant Road and Plant Site Access Intersection. The revisions clarify and amplify the mitigation requirements and obligations, and do not affect the analysis, mitigation efficacy, or conclusions of the Draft EIR. Mitigation Measures 4.17-1h, 4.17-1i, 4.17-1o, and 4.17-1p are revised as follows.

ERRATA

Friant Road and Quarry Site Access Intersection (15-Year Cumulative)

The traffic projections indicate the cumulative effect of regional development within 15 years, including the project (if it reaches sales of 3.0 MT per year), will cause the

intersection of Friant Road and the Quarry Site to operate at LOS F during the a.m. peak hour.

Level of Significance Before Mitigation: Potentially significant.

Mitigation Measure 4.17-1h: ~~*Equitable Share Contributions—*~~*Friant Road and Quarry Site Access Intersection (15-Year Cumulative)*

Once ~~County Annual Mine Inspections~~ the annual mine report reveals that the project has reached 2.65 MT per year (based on interpolation of peak-hour project traffic volumes between 2.0 and 3.0 MT per year as compared to the California Manual on Uniform Traffic Control Devices (CMUTCD) peak-hour warrant), the operator shall conduct annual traffic signal warrants analyses in accordance with the edition of the ~~California Manual on Uniform Traffic Control Devices~~ CMUTCD current at that time, or future equivalent as determined by the agency having jurisdiction over the intersection, to determine whether traffic signals are warranted at the intersection of Friant Road and the Quarry Site. Passenger Car Equivalent (PCE) volumes shall be used, queue lengths and number of vehicles in the queue should be documented, and the warrants studies should consider the exclusion of right turns as described in the CMUTCD. Traffic signals shall be installed if the traffic signal warrants analyses indicates that signals are warranted, and if approved by the agency having jurisdiction over the intersection. The project will be responsible for installing the traffic signals.

Level of Significance After Mitigation: Less than significant.

Friant Road and Plant Site Access Intersection (15-Year Cumulative)

The traffic projections indicate the cumulative effect of regional development within 15 years, including the project (if it reaches sales of 3.0 MT per year), will cause the intersection of Friant Road and the Plant Site to operate at LOS F during the a.m. peak hour and LOS D during the p.m. peak hour.

Level of Significance Before Mitigation: Potentially significant.

Mitigation Measure 4.17-1i: ~~*Equitable Share Contributions—*~~*Friant Road and Plant Site Access Intersection (15-Year Cumulative)*

Once ~~County Annual Mine Inspections~~ the annual mine report reveals that the project has reached 2.65 MT per year (based on interpolation of peak-hour project traffic volumes between 2.0 and 3.0 MT per year as compared to the California Manual on Uniform Traffic Control Devices (CMUTCD) peak-hour warrant), the operator shall conduct annual traffic signal warrants analyses in accordance with the edition of the ~~California Manual on Uniform Traffic Control Devices~~ CMUTCD current at that time, or future equivalent as

determined by the agency having jurisdiction over the intersection, to determine whether traffic signals are warranted at the intersection of Friant Road and the Plant Site. Passenger Car Equivalent (PCE) volumes shall be used, queue lengths and number of vehicles in the queue should be documented, and the warrants studies should consider the exclusion of right turns as described in the CMUTCD. Traffic signals shall be installed if the traffic signal warrants analyses indicates that signals are warranted, and if approved by the agency having jurisdiction over the intersection. The project will be responsible for installing the traffic signals. The analyses shall take into consideration the future elimination of the Plant Site.

Friant Road and Quarry Site (Year 2040 Cumulative)

The traffic projections indicate the cumulative effect of regional development by the year 2040, including the project (if it reaches sales of 3.0 MT per year), will cause the intersection of Friant Road and the Quarry Site to operate at LOS F during the a.m. peak hour.

Level of Significance Before Mitigation: Potentially significant.

Mitigation Measure 4.17-1o: ~~*Equitable Share Contributions—*~~*Friant Road and Quarry Site (Year 2040 Cumulative)*

Once the annual mine report ~~County Annual Mine Inspections~~ reveals that the project has reached 2.65 MT per year (based on interpolation of peak-hour project traffic volumes between 2.0 and 3.0 MT per year as compared to the California Manual on Uniform Traffic Control Devices (CMUTCD) peak-hour warrant), the operator shall conduct annual traffic signal warrants analyses in accordance with the edition of the ~~California Manual on Uniform Traffic Control Devices~~ CMUTCD current at that time, or future equivalent as determined by the agency having jurisdiction over the intersection, to determine whether traffic signals are warranted at the intersection of Friant Road and the Quarry Site. Passenger Car Equivalent (PCE) volumes shall be used, queue lengths and number of vehicles in the queue should be documented, and the warrants studies should consider the exclusion of right turns as described in the CMUTCD. Traffic signals shall be installed if the traffic signal warrants analyses indicates that signals are warranted, and if approved by the agency having jurisdiction over the intersection. The project will be responsible for installing the traffic signals.

Level of Significance After Mitigation: Less than significant.

Friant Road and Plant Site (Year 2040 Cumulative)

The traffic projections indicate the cumulative effect of regional development by the year 2040, including the project (if it reaches sales of 3.0 MT per year), will cause the

intersection of Friant Road and the Plant Site to operate at LOS F during the a.m. peak hour and LOS D during the p.m. peak hour.

Level of Significance Before Mitigation: Potentially significant.

Mitigation Measure 4.17-1p: ~~*Equitable Share Contributions—Friant Road and Plant Site (Year 2040 Cumulative)*~~

Once the annual mine report ~~County Annual Mine Inspections~~ reveals that the project has reached 2.65 MT per year (based on interpolation of peak-hour project traffic volumes between 2.0 and 3.0 MT per year as compared to the California Manual on Uniform Traffic Control Devices (CMUTCD) peak-hour warrant), the operator shall conduct annual traffic signal warrants analyses in accordance with the edition of the ~~California Manual on Uniform Traffic Control Devices~~ CMUTCD current at that time, or future equivalent as determined by the agency having jurisdiction over the intersection, to determine whether traffic signals are warranted at the intersection of Friant Road and the Plant Site. Passenger Car Equivalent (PCE) volumes shall be used, queue lengths and number of vehicles in the queue should be documented, and the warrants studies should consider the exclusion of right turns as described in the CMUTCD. Traffic signals shall be installed if the traffic signal warrants analyses indicates that signals are warranted, and if approved by the agency having jurisdiction over the intersection. The project will be responsible for installing the traffic signals. The analyses shall take into consideration the future elimination of the Plant Site.

Level of Significance After Mitigation: Less than significant.

END OF ERRATA

Explanation

Revisions are made through the errata below to Draft EIR Section 4.17 to amplify and clarify the analysis of the project's potential to substantially increase hazards due to a geometric design feature or incompatible uses in Draft EIR Impact 4.17-3. Because the road improvements that require equitable contributions do not have an established time frame of completion, these future improvements cannot be considered to reduce impacts to less than significant. In consideration of comments on the Draft EIR expressing concerns about conditions on Friant Road, further assessment of measures to address road conditions was performed by Peters Engineering Group and documented in the February 24, 2026, *Pavement Hazard Identification and Mitigation – CEMEX Rockfield Quarry Modification Project* memorandum ("Pavement Memorandum") included as Appendix I-5, "Pavement Hazard Identification and Mitigation Technical Memorandum".

The Pavement Memorandum recommends that the project could mitigate the project's contribution to hazardous pavement conditions and safety concerns by repairing severe potholes on Friant Road between North Fork Road and Willow Avenue (inclusive of the area within the intersections) on request from the County of Fresno in response to substantiated reports from the public or as identified through County pavement condition surveys. The Pavement Memorandum recommends that with the application of such mitigation, the pavement hazard impact would be mitigated to below a level of significance. In consideration of the additional analysis in the Pavement Memorandum, Mitigation Measure 4.17-3 is incorporated to the EIR through the errata below require that the project operator repair severe potholes, thus mitigating the project's contribution to a hazardous pavement condition or pavement safety concerns, with the limitation that such costs would be reduced by future cost-sharing agreements if they ever occur between the County of Fresno and other parties. The errata below incorporate the analysis to the first paragraph of Impact 4.17-3 on Draft EIR page 4.17-41 and incorporates the revised conclusion of potentially significant to the last paragraph of Impact 4.17-3 on Draft EIR page 4.17-42, and the errata then provides the new Mitigation Measure 4.17-3 establishing the pothole repair requirements. The additional analysis and mitigation clarify and amplify the evaluation of the project's potential impact associated with road hazards and establishes a project mitigation obligation that would reduce the impact to less than significant. Although the revisions acknowledge a changed pre-mitigation determination that Impact 4.17-3 would be potentially significant without mitigation, the revisions do not identify a new unmitigable significant impact nor identify an unmitigable increase in the severity of a previously identified significant impact.

ERRATA

Impact 4.17-3: Substantially Increase Hazards Due to a Geometric Design Feature (e.g., Sharp Curves or Dangerous Intersections) or Incompatible Uses (e.g., Farm Equipment)

As described under Impact 4.17-1, the proposed Stage 1 and Stage 2 operations would remain located inside of the existing footprints of the Plant Site and Quarry Site and vehicle trips generated by the proposed project would utilize existing roadways. No changes to existing roadways or bike lanes would occur under the proposed project. Although the proposed project would have the potential to substantially increase the traffic index of the traffic study area roadways, as discussed above under the "Traffic Index Analysis" subsection of Section 4.17.3.2, above, the operator of the Rockfield Quarry would be required to pay an equitable share of pavement improvements to the County of Fresno to improve the pavement section and accommodate the traffic index values, ~~thereby keeping road conditions safe~~ which would contribute to safe road

conditions upon the implementation of such improvements once in the future those improvements occur. However, given the uncertainty of the timing of the fair share improvements, the impact is considered potentially significant. To further ensure safe road conditions, the project operator would repair severe potholes as recommended in the February 24, 2026, *Pavement Hazard Identification and Mitigation – CEMEX Rockfield Quarry Modification Project* memorandum ("Pavement Memorandum") included as Appendix I-5, thus mitigating the project's contribution to a hazardous pavement condition or pavement safety concerns as outlined in Mitigation Measure 4.17-3 below.

…

For these reasons, the potential of the proposed project to substantially increase hazards due to a geometric design feature or incompatible uses is considered potentially significant with the implementation of Mitigation Measures 4.17-1a through 4.17-1r, but would be reduced to less than significant with implementation of Mitigation Measure 4.17-3.

Level of Significance Before Mitigation: ~~Less than significant.~~ Potentially significant.

Mitigation Measures: ~~None required~~ *Implement Mitigation Measures 4.17-1a through 4.17-1r and 4.17-3, "Pothole Repair."*

Mitigation Measure 4.17-3: *Pothole Repair*

Until such time as other parties have entered agreements with the County of Fresno regarding sharing of these costs, at which time the project operator's obligations would be reduced by such sharing, the project operator shall repair potholes greater than 6.0 inches in width, length, or diameter, and greater than 2.0 inches in depth, within the travel lanes on Friant Road between North Fork Road and Willow Avenue (inclusive of the area within the intersections) as requested by the County of Fresno in response to substantiated reports from the public or as identified through County pavement condition surveys. The repair cost, including permits and fees, if any, shall be the responsibility of the operator. The operator shall coordinate any required work with the County of Fresno Public Works Department, including closing lanes and maintaining public safety in accordance with the applicable County permits.

Level of Significance After Mitigation: Less than significant.

3.2.5.18 Errata to Draft EIR Section 4.18, "Tribal Cultural Resources"

There are no errata for Draft EIR Section 4.18.

3.2.5.19 Errata to Draft EIR Section 4.19, "Utilities and Service Systems"

There are no errata for Draft EIR Section 4.19.

3.2.5.20 Errata to Draft EIR Section 4.20, "Wildfire"

Explanation

Revisions are made to Draft EIR Section 4.20, "Wildfire," Impact 4.20-2 on pages 4.20-13 through 4.20-14. Mitigation Measure 4.13-6 has been removed in the Final EIR as it was duplicative of Mitigation Measure 4.10-1, "Blasting Protocols." Draft EIR page 4.20-14 is revised as follows.

ERRATA

The use and handling of these materials would be required to comply with all relevant state and local regulations including the California Fire Code, Cal/OSHA Mine Safety Orders, and all applicable CUPA programs related to hazardous materials storage and handling. With regards to explosives used in blasting, the *Blasting Protocols* (Appendix H-6, and updated in Appendix H-9 of the Final EIR) required to be implemented by Mitigation Measure ~~4.13-6~~4.10-1, prohibit the storage of explosive materials on the Quarry Site. The blasting contractor would deliver adequate quantities of explosives to the site on the days when blasting is planned. All unused explosives and detonators would be returned to the blasting contractor's secure off-site magazines. Compliance with existing regulations and combined with the off-site storage of explosives and the handling of explosives by a licensed blasting contractor would minimize the risk of occurrence of a fire on the Quarry Site due to improper storage and handling of flammable and explosive hazardous materials. The proposed Stage 1 and Stage 2 operations would involve mining, blasting, and aggregate processing activities,

and such activities do not have the potential to alter prevailing winds. For these reasons, the potential for Stage 1 and Stage 2 operations to exacerbate fire risk at the Quarry Site would be less than significant.

Upon completion of mining at the Quarry Site at the end of Stage 1 and Stage 2, operations at the Quarry Site would cease, and all equipment and septic systems would be removed. An approximately 107-acre pond would be formed above the reclaimed bottom of the quarry pit from groundwater and rainfall, as shown on Figure 2-10, "Quarry Site Final Reclaimed Conditions," in Chapter 2 of this Draft EIR. Slopes surrounding the approximately 107-acre reclaimed pond would be seeded with native grasses and forbs and planted with native plants. Because the reclamation of the Quarry Site would create open space land uses with a large central water body and remaining areas revegetated

with native vegetation, there would be limited fuels on the Quarry Site to exacerbate fire risk.

In summary, compliance with existing hazardous materials regulation and implementation of the Blasting Protocols required by Mitigation Measure ~~4.13-6~~4.10-1, would ensure that the potential of Stage 1 and Stage 2 operations and final reclamation activities on the Plant Site and Quarry Site to exacerbate fire risk would be less than significant.

Level of Significance Before Mitigation: Potentially significant.

Mitigation Measures: *Implement Mitigation Measure ~~4.13-6~~4.10-1.*

Level of Significance After Mitigation: Less than significant.

END OF ERRATA

3.2.6 Errata to Draft EIR Chapter 5, "Cumulative Impacts"

Explanation

Revisions are made to Draft EIR Chapter 5 to reflect that Mitigation Measure 4.3-2 has been updated in the Final EIR to include Mitigation Measure 4.3-2a, "Off Road Engines," and 4.3-2b, "Fugitive Dust Control Plan." Draft EIR pages 5-10 and 5-11 are revised as follows.

ERRATA

5.3.3 Air Quality

Section 4.3, "Air Quality," identifies the following project impacts and mitigation measures:

- Impact 4.3-1: Conflict With or Obstruct Implementation of the Applicable Air Quality Plan (**less than significant**)
- Impact 4.3-2: Result in a Cumulatively Considerable Net Increase of Any Criteria Pollutant for Which the Project Region Is Non-Attainment Under an Applicable Federal or State Ambient Air Quality Standard (**less than significant with mitigation incorporated**)
  - Mitigation Measure 4.3-2a, "Off Road Engines"
  - Mitigation Measure 4.3-2b, "Fugitive Dust Control Plan"
- Impact 4.3-3: Expose Sensitive Receptors to Substantial Pollutant Concentrations (**less than significant ~~with mitigation incorporated~~**)

  - Mitigation Measure 4.3-2b, "Fugitive Dust Control Plan"
- Impact 4.3-4: Result in Other Emissions (Such as Those Leading to Odors) Adversely Affecting a Substantial Number of People (**less than significant with mitigation incorporated**)
  - Mitigation Measure 4.3-4, "Asphalt Plant Emissions Controls"

The geographic scope of the cumulative analysis for air quality is the San Joaquin Valley Air Basin, which is currently in non-attainment status for ozone (one-hour and eight-hour), PM_{10}, and $PM_{2.5}$. As described in greater detail in the following discussion, the list method of cumulative impact analysis was used for this resource area.

By its very nature, air pollution is largely a cumulative impact. The nonattainment status of an air basin is a direct result of past and present development. Further, new emissions generating activities in the region could jeopardize the attainment of ambient air quality standards. For these reasons, SJVAPCD considers a project's individual emissions of criteria air pollutants to be both individually significant and cumulatively considerable if they exceed the applicable significance thresholds. Further, according to SJVAPCD guidance (2015), a lead agency should also consider the cumulative impact of multiple simultaneously proposed projects, located in the same area.

The project's estimated criteria air pollutant emissions are shown and compared to applicable significance thresholds in Section 4.3, "Air Quality," under Impact 4.3-2. The impact evaluation concludes that, with implementation of Mitigation Measures 4.3-2a and 4.3-2b, the project's annual emissions and resulting pollutant concentrations would not exceed applicable SJVAPCD significance thresholds. Therefore, the project's individual emissions of criteria air pollutants would not be cumulatively considerable according to SJVAPCD guidance (2015).

END OF ERRATA

Explanation

Revisions are made to Draft EIR Chapter 5 to reflect that Mitigation Measure 4.13-6 has been removed as duplicative of Mitigation Measure 4.10-1, "Blasting Protocols." Draft EIR page 5-20 is revised as follows.

ERRATA

- Impact 4.10-1: Violate Surface Water Quality Standards or Waste Discharge Requirements or Otherwise Substantially Degrade Surface Water Quality at the Plant Site or Quarry Site During Mining and Reclamation (**less than significant with mitigation incorporated**)
  - Mitigation Measure ~~4.13-6~~4.10-1, "Blasting Protocols"

[Text is omitted]

- Impact 4.10-6: Violate Groundwater Quality Standards or Otherwise Substantially Degrade Groundwater Quality at the Quarry Site During Mining and Reclamation (**less than significant with mitigation incorporated**)
  - Mitigation Measure ~~4.13-6~~4.10-1, "Blasting Protocols"

END OF ERRATA

Explanation

Revisions are made to Draft EIR Chapter 5 to correct a typographical error. Draft EIR pages 5-22 and 5-23 are revised as follows.

ERRATA

Over the period from 1997 to 2012, the average overdraft in the Kings Subbasin is estimated to be 122,000 acre-feet per year. The Kings Subbasin has seven Groundwater Sustainability Agencies (GSAs) responsible for meeting the SGMA requirement that medium- and high-priority basins halt groundwater overdraft and bring groundwater basins into balanced levels of pumping and recharge. Therefore, there is an existing significant cumulative impact to the Kings Subbasin where the proposed project is located. The use of groundwater by the proposed project and cumulative projects in a critically over-drafted groundwater basin could also lead to conflict or obstruction of the North Kings GSA Groundwater Sustainability Plan, which is a potentially significant cumulative impact (North Kings GSA 2022) (Impact ~~4.10-18~~4.10-9). The project sites are located within the jurisdiction of the North Kings GSA, which experiences a positive water balance during normal and wet year conditions (Table 3-10 in North Kings GSA 2022). The use of groundwater recharge trenches at the Plant Site and Quarry Site would minimize the consumption of groundwater at the proposed project sites. Furthermore, as described in Impacts 4.10-10 and 4.10-11, during both mining operations and after final reclamation, the estimated increase in groundwater consumption at the Plant Site and Quarry Site are several orders of magnitude smaller than the fluctuations in the water balance of the North Kings GSA area. For these reasons, the project's contribution to the significant cumulative impacts related to the depletion of groundwater and conflict/obstruction with the North Kings GSA Groundwater Sustainability Plan would be less than cumulatively considerable.

END OF ERRATA

Explanation

Section 5.3.10, "Hydrology and Water Quality," addresses cumulative hydrology and water quality impacts. The following paragraph incorrectly states that the Little Dry Creek floodplain extends onto the northwest corner of the Plant Site. The Hydraulic Analyses conducted for the project and included as Appendix G-1 to the Draft EIR conclude that the San Joaquin River and Little Dry Creek floodplains do not enter the Quarry Site or Plant Site. Revisions are also made to correct a typographical error. Draft EIR page 5-24 is revised as follows.

ERRATA

The Quarry Site and the Plant Site are ~~is~~ not located in a flood plain.~~, and only a small portion of the northwest corner of the Plant Site (as shown in Figure 4.10-1, "Current and Regulatory Floodways and Floodplains,") is located within the Little Dry Creek floodplain.~~ None of the cumulative projects listed in Table 5-1 and shown in Figure 5-1 are located in the San Joaquin River or Little Dry Creek floodplains. Consequently, the potential cumulative impact due to the release of pollutants as a result of inundation of the proposed project sites and cumulative projects sites would be less than significant.

As described in Impact ~~4.10-18~~4.10-4, the Basin Plan is the master policy document that establishes the water quality objectives and strategies needed to protect designated beneficial water uses in the Central Valley region. The SWRCB and Central Valley RWQCB enforce compliance with the water quality objectives of the Basin Plan through the issuance of NPDES permits. There are no land uses or activities proposed by the project or cumulative projects that would prevent compliance with the requirements of the NPDES program. Therefore, the cumulative potential of the proposed project and cumulative projects to conflict with or obstruct the Basin Plan would be less than significant.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Chapter 5 to reflect that Mitigation Measure 4.13-6 has been removed as duplicative of Mitigation Measure 4.10-1, "Blasting Protocols." Draft EIR page 5-26 is revised as follows.

ERRATA

- Impact 4.13-6: Generate Substantial Groundborne Vibration or Airborne Vibration As a result of Blasting (**less than significant with mitigation incorporated**).
  − Mitigation Measure ~~4.13-6~~4.10-1, "Blasting Protocols"

END OF ERRATA

Explanation

Revisions are made to Draft EIR Chapter 5 to reflect that Mitigation Measure 4.13-6 has been removed as duplicative of Mitigation Measure 4.10-1, "Blasting Protocols." Draft EIR page 5-32 is revised as follows.

ERRATA

- Impact 4.20-2: Exacerbation of Wildfire Risks Due to Slope, Prevailing Winds, and Other Factors, Which Could Thereby Expose Project Occupants to Pollutant Concentrations from a Wildfire or the Uncontrolled Spread of a Wildfire (**less than significant with mitigation incorporated**).
  − Mitigation Measure ~~4.13-6~~4.10-1, "Blasting Protocols"

END OF ERRATA

Explanation

Revisions are made to Draft EIR Chapter 5 to reflect that Mitigation Measure 4.13-6 has been removed as duplicative of Mitigation Measure 4.10-1, "Blasting Protocols." Draft EIR page 5-33, beginning at the first complete sentence, is revised as follows.

ERRATA

The majority of the slopes above the pond would be solid granite with almost no vegetation. Slopes above the granite would be seeded with native grasses and forbs and planted with native plants. Thus, the newly formed slopes would not exacerbate wildfire risks in the County. As discussed in Impact 4.20-3, all roads, infrastructure, and facilities proposed as part of the project would be constructed in unvegetated, highly disturbed areas and would not exacerbate fire risk. Finally, as discussed in Impact 4.20-4, because the project sites and adjacent properties are relatively flat and because, once reclaimed, the sites would be largely covered by lakes, the project would not expose downstream properties to excessive post-fire runoff or flooding. Implementation of Mitigation Measure ~~4.13-6~~4.10-1 would minimize potential fire risks associated with the use of explosives onsite during blasting events. For these reasons, the project's contribution to

countywide wildlife risk would be less than cumulatively considerable and less than significant.

END OF ERRATA

3.2.7 Errata to Draft EIR Chapter 6, "Project Alternatives"

Explanation

Revisions are made to Draft EIR Chapter 6 to clarify the intent of Project Objective 2. Draft EIR page 6-3 is revised as follows.

ERRATA

6.3 SUMMARY OF PROJECT OBJECTIVES AND IMPACTS

6.3.1 Project Objectives

The CEQA Guidelines provide that "the range of potential alternatives...shall include those that could feasibly accomplish most of the basic objectives of the project..." (CEQA Guidelines Section 15126.6(c)). The overall goal of the project is to continue and expand existing mining and processing operations at the Plant Site and Quarry Site and reclaim the two sites when mining operations are complete. As defined in Section 2.3, "Project Purpose and Objectives," of Chapter 2, "Project Description," of this Draft EIR, specific project objectives as revised since the October 2021 application submittal include:

1) Continue to provide a reliable and sustainable, local source of high-quality aggregate to help meet the current and long-term demand (100 years) for construction materials in the Fresno region;
2) Continue to utilize known aggregate reserves from existing partially mined properties, including those <u>mineral resources</u> designated by the state and county as Mineral Resource Zone 2 (MRZ-2) (Mineral Resource Zone areas where adequate information indicates that significant mineral resources are present~~), i.e., sand and gravel)~~ <u>to produce construction aggregates</u>;

END OF ERRATA

Explanation

Revisions are made to Draft EIR Chapter 6 to expand Project Objective 8 to include project consistency with the Fresno County General Plan. Draft EIR page 6-4 is revised as follows.

ERRATA

8) Maintain consistency with the Fresno County General Plan and the San Joaquin River Parkway Master Plan;

END OF ERRATA

Explanation

The existing operation was extended for one additional year in order to complete the environmental review process. Paragraphs four and five on page 6-12 are revised below.

ERRATA

The Plant Site currently operates under CUPs 367, 2209, 3063, ~~and~~ 3093, 3755-A, 3755-B, 3852-A, and 3852-B. The CUPs allow aggregate mining of the alluvial deposit; plant operations including an aggregate processing plant, a ready-mix concrete plant, a hot-mix asphalt plant (inactive since 2009), and related supportive facilities; and the processing of raw aggregate mined from the Applicant's current Quarry Site.

The Quarry Site currently operates under CUPs 367, 2032, 3063, ~~and~~ 3093, 3755-A, 3755-B, 3852-A, and 3852-B. Since there are no plant operations permitted at the Quarry Site, the CUPs allow the interplant haul of approximately 1.4 MT per year of raw aggregate via North Friant Road approximately 1.1 miles south to the Plant Site for processing. Under the No Project Alternative, mining and processing operations would continue until existing permits expire in ~~2026~~2027.

END OF ERRATA

Explanation

Revisions are made to Draft EIR Chapter 6 to reflect that Mitigation Measure 4.3-2 has been updated in the Final EIR to include Mitigation Measure 4.3-2a, "Off Road Engines," and 4.3-2b, "Fugitive Dust Control Plan." Draft EIR page 6-14 is revised as follows.

ERRATA

Air Quality

Under Alternative 1, no mining equipment would be relocated from the Plant Site and installed at the Quarry Site. Thus, no construction emissions would occur should Alternative 1 be implemented. In addition, mining operations would cease when existing permits expire in 2026, and reclamation would commence. Thus, operational emissions would be significantly lower under Alternative 1 compared to the proposed

project. Mitigation measures 4.3-2a and 4.3-2b would not be required to reduce criteria pollutant emissions or to avoid exposure of sensitive receptors to substantial pollutant concentrations and mitigation measure 4.3-4 would not be required to reduce potential odorous emissions. Alternative 1 would have reduced impacts on air quality compared to the proposed project.

END OF ERRATA

Explanation

The Draft EIR misstated the significance of the project's transportation impacts in the Alternatives Chapter. Page 6-19 is revised below.

ERRATA

Transportation

~~Neither the proposed project nor Alternative 1 would result in any significant transportation impacts. However, under~~Under Alternative 1, transport of raw material from the Quarry Site to the Plant Site would cease when existing permits expire thus significantly reducing traffic volumes on North Friant Road in the vicinity of the project site. Furthermore, Alternative 1 would not require the use of any oversized trucks to relocate mining facilities or equipment as is required under the proposed project. Thus Alternative 1 would have a reduced impact on transportation as the proposed project.

END OF ERRATA

Explanation

The Draft EIR misstated the significance of the transportation impacts in the Alternatives Chapter. Page 6-30 is revised below.

ERRATA

Transportation

~~Neither the proposed project nor Alternative 2 would result in any significant transportation impacts. However, under~~Under Alternative 2, mining operations would cease 14 years earlier than under the proposed project thus reducing traffic volumes on North Friant Road in the vicinity of the project site. Thus Alternative 2 would have a reduced impact on transportation as the proposed project. Impact 4.17-1 would remain significant under Alternative 2 because the project would still result in the operation of specified intersections, identified in the Traffic Impact Study, at LOS D or LOS F during peak hours, which conflicts with the County General Plan Requirement to meet LOS D on urban roadways within the spheres of influence of the

cities of Fresno and Clovis and LOS C on all other roadways in the County. Mitigation Measures 4.17-1a through 4.17-1r would still require equitable contributions towards specified road improvement measures to improve LOS; however, even with the implementation of the mitigation measures, Impact 4.17-1 would remain significant and unavoidable because it is uncertain when the road improvements would be constructed. Neither the proposed project nor Alternative 2 would be inconsistent with CEQA Guidelines Section 15064.3(b) (Impact 4.17-2), substantially increase hazards due to geometric design feature or incompatible uses (Impact 4.17-3), or result in inadequate emergency access (Impact 4.17-4).

END OF ERRATA

Explanation

The Draft EIR misstated the significance of the transportation impacts in the Alternatives Chapter. Page 6-38 is revised below.

ERRATA

Transportation

~~Neither Alternative 3 nor the proposed project would result in any significant transportation impacts. However, under~~Under Alternative 3, mining operations would cease 32 years earlier than under the proposed project thus reducing traffic volumes on North Friant Road in the vicinity of the project site. Thus Alternative 3 would have a reduced impact on transportation as the proposed project. Impact 4.17-1 would remain significant under Alternative 3 because the project would still result in the operation of specified intersections, identified in the Traffic Impact Study, at LOS D or LOS F during peak hours, which conflicts with the County General Plan Requirement to meet LOS D on urban roadways within the spheres of influence of the cities of Fresno and Clovis and LOS C on all other roadways in the County. Mitigation Measures 4.17-1a through 4.17-1r would still require equitable contributions towards specified road improvement measures to improve LOS; however, even with the implementation of the mitigation measures, Impact 4.17-1 would remain significant and unavoidable because it is uncertain when the road improvements would be constructed. Neither the proposed project nor Alternative 3 would be inconsistent with CEQA Guidelines Section 15064.3(b) (Impact 4.17-2), substantially increase hazards due to geometric design feature or incompatible uses (Impact 4.17-3), or result in inadequate emergency access (Impact 4.17-4).

END OF ERRATA

Explanation

The Draft EIR misstated the significance of the transportation impacts in the Alternatives Chapter. Page 6-49 is revised below.

ERRATA

Transportation

~~Neither Alternative 4 nor the proposed project would result in any significant transportation impacts. However, under~~Under Alternative 4, there would be fewer trucks on the road due to mining ceasing 37 years earlier, thus reducing traffic volumes on North Friant Road in the vicinity of the project site. Thus Alternative 4 would have a reduced impact on transportation as the proposed project. Impact 4.17-1 would remain significant under Alternative 4 because the project would still result in the operation of specified intersections, identified in the Traffic Impact Study, at LOS D or LOS F during peak hours, which conflicts with the County General Plan Requirement to meet LOS D on urban roadways within the spheres of influence of the cities of Fresno and Clovis and LOS C on all other roadways in the County. Mitigation Measures 4.17-1a through 4.17-1r would still require equitable contributions towards specified road improvement measures to improve LOS; however, even with the implementation of the mitigation measures, Impact 4.17-1 would remain significant and unavoidable because it is uncertain when the road improvements would be constructed. Neither the proposed project nor Alternative 4 would be inconsistent with CEQA Guidelines Section 15064.3(b) (Impact 4.17-2), substantially increase hazards due to geometric design feature or incompatible uses (Impact 4.17-3), or result in inadequate emergency access (Impact 4.17-4).

END OF ERRATA

Explanation

The Draft EIR misstated the significance of the transportation impacts in the Alternatives Chapter. Page 6-57 is revised below.

ERRATA

Transportation

~~Neither Alternative 5 nor the proposed project would result in any significant transportation impacts. However, under~~Under Alternative 5, there ~~will~~would be fewer truck~~s~~ trips due to less annual tonnage and mining ceasing 14 years earlier, thus reducing traffic volumes on North Friant Road and in the vicinity of the project site~~s~~. Thus Alternative 5 would have a lesser impact on transportation as compared to the

proposed project. Even with reduced tonnage, Impact 4.17-1 would remain significant under Alternative 5 because the project would still result in the operation of specified intersections, identified in the Traffic Impact Study, at LOS D or LOS F during peak hours, which conflicts with the County General Plan requirement to meet LOS D on urban roadways within the spheres of influence of the cities of Fresno and Clovis and LOS C on all other roadways in the County. Mitigation Measures 4.17-1a through 4.17-1r would still require equitable contributions towards specified road improvement measures to improve LOS; however, even with the implementation of the mitigation measures, Impact 4.17-1 would remain significant and unavoidable because it is uncertain when the road improvements would be constructed. Neither the proposed project nor Alternative 5 would be inconsistent with CEQA Guidelines Section 15064.3(b) (Impact 4.17-2), substantially increase hazards due to geometric design feature or incompatible uses (Impact 4.17-3), or result in inadequate emergency access (Impact 4.17-4).

INTRODUCTION

This chapter of the Final Environmental Impact Report (Final EIR) for the Rockfield Quarry Modification Project (proposed project) provides specific responses to each issue raised in comments on the Draft EIR. Comment letters are ordered as received from agencies, organizations, and individuals. Each comment letter has been assigned a number and the individual comments/issues within each letter are assigned sequential subnumbers (e.g., 1-1, 1-2). An index that lists each commenter and the number assigned to the comment letter is provided on the following pages. Section 4.1 presents collective responses that provide a single, central response to multiple similar comments. Responses to specific letters are contained in Sections 4.2 through 4.4 for letters received from public agencies, organizations and businesses, and individuals, respectively.

The text of each comment/issue is reproduced using `courier new font` and is followed by the County's response numbered to correspond with each respective comment. All comment letters are also provided in the EIR original form in Appendix M, "Draft EIR Comment Letters," where the comment letters are numbered in the upper right corner of the first page to correspond to the numbering used in this chapter. Note that the reproduction of comments in this chapter is intended to reflect the text of the comment letters. Formatting; font emphases (e.g., underline, bold, all capital); and graphics, tables, and other attachments are not necessarily reflected in the reproduced text here and are noted in brackets in certain instances in this chapter. The County has reviewed all original comment letters on the EIR with original formatting, font emphasis, graphics, tables, and other attachments. Reviewers interested in the content of a specific comment letter should see Appendix A for a reproduction of the original letter.

The County has provided a response to all comments received during public circulation of the Draft EIR. In every instance, each comment was carefully considered for its contribution of information regarding environmental impacts and other issues relevant to the County's CEQA review of the project. In general, all comments concerning an environmental issue pertaining to analysis in the Draft EIR receive a response that either (1) summarizes the information provided in the EIR and directs the commenter to the chapter/section(s) of the EIR providing that information or (2) provides additional clarifying information concerning the environmental issue raised by the commenter.

In some instances, information in comments was incorporated into the Final EIR to amplify the impact analysis or mitigation measures, or to otherwise clarify the information presented. In none of these instances did the additional information

incorporated to this Final EIR result in identifying a new significant impact or an increase in the severity of a significant impact identified in the Draft EIR. Thus, while these revisions amplify and clarify information based on certain comments, these revisions do not result in requiring the County to recirculate the EIR for public review and comment before certification.

If the comment did not address an environmental issue (e.g., opposition or support of the project), a response is provided noting that this comment does not pertain to an environmental issue. All comments will be considered by County decision-makers for the EIR deliberations in approval or denial of the entitlements requested for the project.

COMMENT LETTERS

Table 4-1, "Comment Letters," lists the comment letters and provides the numbering and order used to organize the comment letters received.

Table 4-1
Comment Letters

Letter Date	Commenter	Comment Letter No.
AGENCY COMMENT LETTERS		
01/28/25	Larry Brown, Fresno County Fire Protection District	1
02/24/25	Keyomi Jones, California Department of Transportation	2a
02/10/25	Dave Padilla, California Department of Transportation	2b
02/28/25	Jennifer Laird, City of Fresno	3
02/28/25	Jamie Silva, Central Valley Flood Protection Board	4
03/07/25	Bryan Rock, Central Valley Regional Water Quality Control Board	5
03/07/25	Karl Stock, United States Bureau of Reclamation	6
03/10/25	Jonathan Ambrose, National Marine Fisheries Service	7
03/10/25	Dr. Joaquin Arambula, California Assemblymember 31st District	8
03/10/25	Ian Buck-Macleod, Friant Water Authority	9
03/10/25	Kassy Chauhan, North Kings Groundwater Sustainability Agency	10
03/10/25	Kari Kyler Daniska, San Joaquin River Conservancy	11
03/10/25	Douglas Hedenkamp, City of Fresno (12-1 through 12-83) Exhibit 1: Brock Buche, City of Fresno Department of Public Utilities (12-84 through 12-111)	12
03/10/25	Tom Jordan, San Joaquin Valley Air Pollution Control District	13
~~03/10/25~~	~~Elsa Mejia, City of Madera District 5 Councilmember~~ (Initially missorted, moved to Letter 613, not an *Agency* commenter. Placeholder kept to preserve numbering.)	14
03/11/25	Julie Vance, California Department of Fish and Wildlife	15

4.1 COLLECTIVE RESPONSES

This subsection provides collective responses to comments that were raised repeatedly. Responses are thus presented in a single location and in a comprehensive manner. The collective responses and the topics addressed are listed below:

- Collective Response #1: County CEQA Process
- Collective Response #2: Previous Permit Extensions
- Collective Response #3: Aggregate Demand and Need for Project
- Collective Response #4a: CEMEX Regulatory History
- Collective Response #4b: Liability and Fund for Potential Damages
- Collective Response #5: Duration of Use Permit
- Collective Response #6: Operational Nuisance
- Collective Response #7: Economic Effects
- Collective Response #8: Visual Impact Mitigation
- Collective Response #9: Air Quality Analysis and Project Impacts
- Collective Response #10: Air Quality Analysis Baseline
- Collective Response #11: Analysis of Population-wide Cancer Burden
- Collective Response #12: Effects on San Joaquin River and Chinook Salmon Restoration Efforts
- Collective Response #13: Project Operational Effects on Offsite Wildlife
- Collective Response #14: Analysis of Impacts on Swainson's Hawk
- Collective Response #15: Impacts to Non-Nesting Birds and Birds Outside of Nesting Season
- Collective Response #16: Impacts to Salmon Spawning and Analysis Methods
- Collective Response #17: Flooding and Bank Stability
- Collective Response #18: Consistency with San Joaquin River Parkway Master Plan
- Collective Response #19: Public Accessibility of Adjacent Parks
- Collective Response #20: Encroachment on an Ecological Preserve
- Collective Response #21: Public Access to San Joaquin River, Recreational Sites, and Future Uses of the Existing Project Sites
- Collective Response #22: Trail Easements

- Collective Response #23: Quality of Water Pumped to Onsite Ponds and Potential Impacts to San Joaquin River and Groundwater Quality if Pumped to Recharge Trenches
- Collective Response #24: Groundwater Monitoring Program Changes and Funding
- Collective Response #25: Interconnected Surface Water, Groundwater Dependent Ecosystems, and Impacts on Flows in the San Joaquin River
- Collective Response #26: Baseline Groundwater Data
- Collective Response #27: Operational Effects on Park/Trail Users
- Collective Response #28: Land Subsidence
- Collective Response #29: Traffic Impacts and Mitigation
- Collective Response #30: Road Safety

4.1.1 Collective Response #1: County CEQA Process

Some comments on the Draft EIR requested additional time to review the Draft EIR and expressed concerns over the County's processing of the project application. Some commenters also expressed concerns that information in the Draft EIR is overly technical and difficult to understand.

Draft EIR Review Period and Public Input Opportunities

California Environmental Quality Act (CEQA) Guidelines Section 15105(a) specifies that "the public review period for a draft EIR shall not be less than 30 days nor should it be longer than 60 days except under unusual circumstances" and requires that a Draft EIR be circulated for a minimum period of 45 days when the Draft EIR is submitted to the State Clearinghouse unless a shorter time period is requested and approved by the State Clearinghouse. The Draft EIR was filed with the State Clearinghouse on January 2, 2025, and a Notice of Availability for the Draft EIR was mailed to neighboring landowners and interested parties and posted on the County's website with project information (https://www.fresnocountyca.gov/eir7763). The Draft EIR was released for a 45-day public review period, ending on February 17, 2025. In response to requests by some commenters for additional time to review the Draft EIR, the County subsequently extended the public review period to end on March 10, 2025, and announced the extended period by filing a revised Notice of Availability with the State Clearinghouse on January 22, 2025, and distributing the revised Notice of Availability to additional interested parties. The revised Notice of Availability is included as Appendix L, "Revised Notice of Availability."

Through the process discussed above, the Draft EIR comment period was a total of 68 days. The Draft EIR review period exceeded CEQA requirements, and the County has determined that the Draft EIR review period was sufficient to ensure that agencies and members of the public were provided with adequate time to review and comment on the Draft EIR.

Prior to and during circulation of the Draft EIR, Fresno County held public meetings to provide information to the public regarding the proposed project. As detailed in Draft EIR Section 1.3, "Environmental Review Process," the County held a virtual public scoping meeting for public agencies on June 22, 2020, and a second virtual public scoping meeting for the general public on June 24, 2020. The public scoping meetings were noticed to the general public in a variety of ways including mailed notifications to neighboring land owners and individuals that had requested to be notified of project activity, on the County website, and in the Fresno Business Journal.

On January 16, 2025, during circulation of the Draft EIR, Fresno County held an additional informational virtual meeting, to ensure interested parties were informed of the availability of the Draft EIR for review and the process for reviewing and submitting comments to the County. The accompanying digital presentation from this meeting was posted on the County website for viewing in both English and Spanish.

The County's public notifications, public informational meetings, and the Draft EIR review period and process have met and exceeded CEQA requirements.

Project Application Review Process and Decision-Making Hearings

Several comments on the Draft EIR expressed concern that the project application is being processed too quickly which is inhibiting the public from fully reviewing and commenting on the Draft EIR. As discussed above, the County's public notifications, public informational meetings, and the Draft EIR review period and process have met and exceeded CEQA requirements. The project application is being processed in accordance with the Fresno County zoning ordinance (e.g., Chapter 842.5, "Conditional Use Permits," and Section 834.4.220, "Material Extraction Sites."). The application was initially submitted to the County in 2020 and has been in process for over five years.

Once the Final EIR is completed, the public will still have additional opportunities to provide input to County decision-makers before final decisions are made with regard to certification of the Final EIR and whether to approve the project. The Final EIR, including responses to comments on the Draft EIR and errata revisions made to the text of the Draft EIR, will be made available to agencies and the public. In accordance with the County Zoning Ordinance, the County Planning Commission will hold a public hearing for

consideration of certification of the EIR and a decision of whether to approve the project. Members of the public will have the opportunity to provide written comments to the Planning Commission prior to the hearing and will be invited to provide oral comments during the hearing. The Planning Commission will consider all comments on the Draft EIR as well as all written and oral comments provided prior to and during the hearing prior to acting on the project.

Draft EIR Content and Readability

Some commenter's expressed concerns regarding the size and content of the Draft EIR. These comments included a combination of commenter's who felt the Draft EIR was too lengthy or too technical for the public to fully comprehend, while other commenter's asserted that the Draft EIR did not contain enough information to fully inform the public and decision-makers.

CEQA Guidelines Section 15140 states:

> EIRs shall be written in plain language and may use appropriate graphics so that decision makers and the public can rapidly understand the documents.

CEQA Guidelines Section 15146 discusses:

> The degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR.

CEQA Guidelines Section 15147 discusses that:

> The information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

In balancing the above directives, the Draft EIR was prepared to provide sufficient information and analysis for consideration by decision-makers and the public to understand the documents and analysis. The Draft EIR is written in plain language and

utilizes graphics (e.g., maps, diagrams, tables) in an effort to clearly present information about the project and environmental effects. Toward this objective, the Draft EIR Executive Summary provides a clear, succinct summary of the proposed project and its impacts, significance determinations, and mitigation measures. The Draft EIR provides a detailed but clearly presented description of the project and uniformly structured resource impact sections, with introductions and explanations regarding content and analytical methods where deemed necessary and appropriate to aid the reader in readily understanding the information presented. Also consistent with the CEQA Guidelines, highly technical and specialized analyses are presented in appendices to the Draft EIR, and their relevant information sufficient to permit full assessment of significant environmental impacts is summarized in the Draft EIR. In preparing the Draft EIR, the County recognizes that a balance must be struck between presenting sufficient information and analysis while maintaining readability and minimizing the length and level of technical information presented. The County has made all reasonable efforts to achieve the appropriate balance of information in the Draft EIR and technical appendices.

Several comments on the Draft EIR asserted that there is a need for revised or additional analyses before the County can certify the EIR or make a project approval decision. Where comments raise specific issues, the County has provided individual responses in Sections 4.2 through 4.4 of the Final EIR. In some instances, the County determined that additional analyses were necessary to respond to comments on the Draft EIR and to more fully present information pertaining to environmental effects of the proposed project and to amplify and clarify the Draft EIR discussion. As discussed in Final EIR Chapter 1, "Introduction," Section 1.2, "Summary of Additional Studies and Revisions to Draft EIR," the additional analyses are summarized in the Final EIR and included as appendices to the Final EIR. As discussed in Section 1.2, these additional analyses and information added to the Final EIR do not result in changes to the Draft EIR that represent substantial new information or significant impacts but aid in amplifying and clarifying information presented in the Draft EIR.

4.1.2 Collective Response #2: Previous Permit Extensions

Comments on the Draft EIR questioned why previous extensions of the operation's conditional use permits (CUPs) were granted by the County and some comments asserted that previous extensions did not receive appropriate CEQA review.

The existing operations at both the Plant Site and Quarry Site were originally evaluated under CEQA in an EIR that was certified by Fresno County on July 28, 1987. In July 2023, the CUPs for the Quarry Site and Plant Site operations were extended by the County Board of Supervisors without the preparation of a new or supplemental EIR because the

extensions did not constitute a new project under CEQA. Specifically, as part of the 2023 extension approval, the County Board of Supervisors determined that CEQA Guidelines Section 15301 (Existing Facilities) applied, which provided a categorical exemption under CEQA for the extensions. In turn, a Notice of Exemption (NOE) was filed on July 20, 2023 (SCH No. 2020060123), covering both the Plant Site and Quarry Site, based in part on the existing physical conditions baseline. (CEQA Guidelines Section 15061(b)(2); *North Coast Rivers Alliance v. Westlands Water Dist.* (2014) 227 Cal.App.4th 832, 872 – 873 ["Where a project involves ongoing operations or a continuation of past activity, the established levels of a particular use and the physical impacts thereof are considered to be part of the existing environmental baseline"].) A second one-year extension was granted in June 2026, and an NOE was subsequently filed on June 10, 2026 (SCH No. 2026060496). The extensions of the CUPs allow operations to continue through July 2027 with the intent to provide sufficient time for the EIR for the proposed project to be completed and for the requested CUP amendments for the proposed project to be processed by the County. With approval of the 2023 and 2026 extensions, no substantial changes to the existing permitted operation, its circumstances, or to the environmental setting occurred that would trigger the need for further CEQA review under CEQA Guidelines Sections 15162 or 15164. Thus, the 2023 approval was in compliance with CEQA and ongoing operations at the project sites are in compliance with the operation's current CUPs as summarized in Draft EIR Table 2-4, "Summary of Conditional Use Permits," on page 2-27. See Chapter 3, "Draft EIR Errata," for a proposed revision to the table to add the 2023 permit extension approval.

4.1.3 Collective Response #3: Aggregate Demand and Need for Project

Several comments on the Draft EIR suggested that the proposed project is not needed as an additional source of aggregate because sufficient aggregate resources are permitted and available to meet regional demand. The majority of these comments directly refer to, or appear to rely on information from, the 2018 "*Map Sheet 52 – Aggregate Sustainability in California Report*" prepared by the California Geological Survey (CGS 2018) and that study's 50-year aggregate demand and supply forecast for the Fresno Production Consumption Region (Fresno PC Region). The CGS study estimates a 50-year aggregate demand for the Fresno PC Region of 305 million tons and documents permitted aggregate reserves within the Fresno PC Region of 556 million tons (CGS 2018, page 5). Comments suggest these data are evidence that the project is not needed as there is sufficient aggregate supply within the Fresno PC Region to meet forecasted demand over the next several decades.

As described in Draft EIR Chapter 2, "Project Description," the Applicant has applied to the County for two CUPs and a reclamation plan that would amend the Applicant's

current land use entitlements to allow the Applicant to expand its existing rock, sand, and gravel mining and processing operation at Rockfield Quarry and to reclaim the quarry when mining operations are complete. The project would occur in two stages with a total project life estimate of up to 100 years. Stage 1 would continue concurrent operations at both the Quarry Site and the Plant Site for up to 30 years and Stage 2 would continue hard rock mining and processing operations only at the Quarry Site for approximately 70 additional years (Draft EIR, pages 2-1 through 2-4). With approval of the project, the combined annual sales of aggregate from both sites are estimated to increase from the 1.4 million tons per year (MT/year) allowed under the current permits to 2.0 MT/year within approximately five years of project approval and *up to* 3.0 MT/year within approximately 10 years of project approval (Draft EIR, page 2-4). Also as discussed in the Draft EIR, one of the Applicant's objectives is to "continue to provide a reliable and sustainable, local source of high-quality aggregate to help meet the current and long-term demand (100 years) for construction materials in the Fresno region" (Draft EIR, pages 2-6 through 2-7).

To comply with CEQA, the County's EIR must evaluate the project as proposed based on the entitlements requested by the Applicant. Thus, the Draft EIR Chapter 2 reflects the requested entitlements, including the proposed 100-year duration of operations and associated CUP, and the proposed maximum annual aggregate production and sales. The Draft EIR properly evaluates environmental effects of the proposed project and identifies mitigation measures that would be implemented to address reasonably foreseeable significant adverse environmental impacts. The Draft EIR also assesses the project's potential to induce growth and through a detailed evaluation concludes that the proposed project is not considered growth-inducing and would therefore not result in potential environmental effects associated with induced growth (Draft EIR, pages 7-4 through 7-6).

Regional aggregate demand and availability are important factors for the regional economy that may be considered by County decision-makers in considering approval of the project. However, the project's contribution to regional construction aggregate supply does not implicate environmental impacts beyond those considered in the EIR associated with the proposed project's operation and reclamation. Demand for construction aggregate is based on several factors associated with development, construction and maintenance of roads and other infrastructure, and other factors not driven by aggregate availability. Thus, the project's contribution to regional construction aggregate availability would not be expected to increase the demand or consumption of aggregate. Instead, the project would provide one of multiple sources of construction aggregate within the region. The Draft EIR evaluates the environmental impacts of the project assuming full production at the proposed maximum annual production and sales rates.

If demand for aggregate materials produced at the project site does not warrant production at the maximum permitted rate, production may be commensurately reduced. However, such a reduction would be a market-driven decision by the operator's potential customers and would not introduce the potential for environmental impacts relevant to the County's CEQA review.

Additionally, it should be noted that the 2018 CGS Map 52 study is a broad, high-level forecast of regional aggregate demand. As stated in the study, "[a]lthough the statewide and regional information presented on the map and in this report may be useful to decision-makers, *it should not be used as a basis for local land-use decisions*. The more detailed information on the location and estimated amounts of permitted and non-permitted resources, and future regional demands contained in each of the aggregate studies employed in the compilation of Map Sheet 52 should be used for local land-use and decision-making purposes" (CGS 2018, page 2). The most recent "aggregate stud[y] employed in the compilation of Map Sheet 52" pertaining to the Fresno PC Region is the 1999 DMG Open File Report 99-02, *Update of Mineral Land Classification: Aggregate Materials in the Fresno Production Consumption Region, California* (Youngs and Miller 1999).

Although both the 1999 Open File Report 99-02 and the more recent CGS 2018 Map 52 study provide information on permitted aggregate reserves and estimates of regional aggregate demand, neither provides sufficiently detailed or current information to accurately inform an understanding of aggregate resources availability and demand within the Fresno PC Region.

For instance, neither report considers maximum annual *permitted* aggregate production capacity from the various permitted mining operations in the region and neither differentiates between permitted *active* mining operations and permitted but *inactive* mining operations. Although total permitted reserves within a region may be useful to decision-makers, more directly relevant to understanding aggregate availability to meet actual demand within a region is the annual production capacity, operational status, and locations of aggregate production facilities within a region. Additionally, the lifetime of several of the permitted mining operations considered in the CGS 2018 Map 52 study are longer than 50 years and even at their maximum permitted annual production rates would not produce their total reserves within the 50-year study period. Yet, CGS presents data for permitted reserves based on the total estimated tonnage of the reserve without accounting for operational constraints that limit the annual production potential. Consequently, including the entire combined permitted reserves for the 50-year supply forecast overstates aggregate availability during the 50-year period.

Additionally, demand projections in the reports are largely based on population estimates and estimated tons of aggregate per capita per year. While this approach may prove useful for certain purposes, such an approach does not account for more recent region-specific factors that may substantially affect actual aggregate demand. For example, the 2018 CGS Map 52 study's use of per capita aggregate consumption estimates appears to omit consideration of aggregate needed for construction and maintenance of the California High-Speed Rail which initiated construction in Fresno and Madera counties in recent years, resulting in a new and substantial demand for aggregate not accounted for in the CGS demand estimates.

Although these and other factors associated with aggregate demand and availability within the region may be relevant for County decision-makers, they do not evaluate potential environmental effects and need not be considered further in the EIR.

4.1.4 Collective Response #4a: CEMEX Regulatory History

Comments on the Draft EIR were received related to the Operator's regulatory compliance history. Comments claim that CEMEX has a record of environmental and labor violations at the existing Rockfield operation and its other operations. Some comments further suggest that this history of violations indicates that CEMEX may not be relied upon to comply with the regulations, conditions of approval, and mitigation measures that are described in the Draft EIR.

As an initial note, the Operator's regulatory history does not constitute a significant environmental issue that needs to be addressed under CEQA. (Title 14 CCR Section 15088.)

Implementation and enforcement of mitigation measures and conditions of approval for surface mining operations are ensured through established local and state regulatory programs. Fresno County, in its role as the SMARA lead agency, regulates surface mining activities through discretionary land use approvals, implementation of Fresno County Zoning Ordinance Section 834.4.220 (Material Extraction Sites), and enforcement of the Surface Mining and Reclamation Act (SMARA) (Public Resources Code [PRC] Section 2710 et seq.).

Surface mining operations in Fresno County may only proceed in accordance with County-approved permits, including approval of a reclamation plan and financial assurances, which are expressly required to be conditions of project approval under SMARA. Conditions of approval and mitigation measures adopted by the County are legally binding and enforceable and are not dependent on the Operator's voluntary compliance.

Fresno County ensures ongoing compliance through mandatory annual reporting and inspection requirements established in Fresno County Zoning Ordinance Sections 834.4.220(M) and (N). Mine operators are required to submit annual reports documenting mining and reclamation activities, which are reviewed by County staff. The County is also required to conduct inspections of surface mining operations at least once each calendar year to evaluate compliance with approved permits, mitigation measures, and reclamation requirements, consistent with SMARA and County implementing regulations.

Where noncompliance is identified, Fresno County has clear enforcement authority under both the County Code and SMARA. The County may issue notices of violation, require corrective actions within specified timeframes, impose administrative penalties, and take additional enforcement action as authorized by law. If violations are not corrected, SMARA authorizes further remedies, including enforcement actions by the State.

In addition to County oversight, the California Department of Conservation, through its Division of Mine Reclamation, provides State-level oversight of SMARA implementation. This includes review of County inspection reports, reclamation plans, financial assurances, and enforcement actions. The State has independent authority to evaluate County compliance with SMARA and to take enforcement action if necessary (PRC Sections 2774.14, 2774.4).

This regulatory framework provides reasonable assurance that mitigation measures and conditions of approval would be implemented and enforced throughout the life of the proposed project and during reclamation. CEQA does not require speculation regarding future noncompliance where adopted mitigation measures are enforceable through existing regulatory mechanisms.

In response to certain comments that incorrectly assume that a settlement reflects an agreed violation, settlements do not mean a violation has occurred. Disputes regarding compliance are typically resolved by settlement agreements that specifically state the allegation of a violation remains disputed. These comments incorrectly assume a settlement reflects an agreed violation.

4.1.5 Collective Response #4b: Liability and Fund for Potential Damages

Comments on the Draft EIR expressed concerns regarding liability for potential damages resulting from the proposed project. In particular, commenters questioned whether CEMEX (the Operator), as a foreign-owned company, could be held liable for potential damages. Some of these comments suggest that the County should require the Applicant

to set aside money to fund any corrective actions that might be needed to address project-related damages.

As an initial matter regarding liability for damages, CEMEX as the Operator is, and would continue to be, subject to compliance with all applicable local, state, and federal laws and regulations pertaining to surface mining operations in California regardless of the nationality of the company. We also note that the Operator would be CEMEX Construction Materials Pacific, LLC, a United States registered company.

Surface mining operations in California are required to comply with the Surface Mining and Reclamation Act (SMARA), codified in PRC Section 2710 et seq. SMARA requires surface mining operations to have a financial assurance to ensure that reclamation is performed in accordance with the approved reclamation plan. Financial assurances are adjusted annually to account for new lands disturbed, inflation, and for reclamation of lands accomplished with the approved reclamation plan. The Reclamation Plan provides the following in Appendix B-1, "Surface Mining and Reclamation Plan," of the Draft EIR:

> "Reclamation of the project site will be covered by financial assurances in accordance with the requirements of SMARA. The financial assurance estimate and the proposed financial assurance mechanism will be submitted to the County no later than 60 days prior to commencement of activities authorized in connection with this Project." (Draft EIR, Appendix B-1, page 62.)

The County's surface mining ordinance (Fresno County Zoning Ordinance Section 834.4.220, "Material Extraction Sites") requires that mining operations establish and maintain financial security as a condition of approval to ensure that reclamation will proceed in compliance with the approved Mining and Reclamation Plan. Pursuant to Section 834.4.220(H), financial assurances are required to ensure compliance with elements of the Mining and Reclamation Plan, including but not limited to, revegetation and landscaping requirements, restoration of aquatic or wildlife habitat, restoration of water bodies and water quality, slope stability, erosion and drainage control, and disposal of hazardous materials.

The County's financial assurance requirements will ensure that sufficient funds are set aside in a financial assurance mechanism (FAM) to ensure that reclamation is performed in accordance with the approved reclamation plan.

4.1.6 Collective Response #5: Duration of Use Permit

Comments on the Draft EIR expressed concerns that the 100-year duration of the project's requested CUP is excessive, and some expressed that additional analysis was needed for the 100-year duration. Some comments also suggested that a more appropriate CUP duration would be between 10 to 25 years.

As described in Draft EIR Chapter 2, "Project Description," the Operator has applied to the County for two CUPs and a reclamation plan that would amend the Operator current land use entitlements to allow the Operator to expand its existing rock, sand, and gravel mining and processing operation at Rockfield Quarry and to reclaim the quarry when mining operations are complete. The proposed project would occur in two stages with a total project life estimate of up to 100 years. Stage 1 would continue concurrent operations at both the Quarry Site and the Plant Site for up to 30 years and Stage 2 would continue hard rock mining and processing operations only at the Quarry Site for approximately 70 additional years. (Draft EIR, pages 2-1 through 2-4.) Also as discussed in the Draft EIR, one of the Applicant's objectives is to "continue to provide a reliable and sustainable, local source of high-quality aggregate to help meet the current and long-term demand (100 years) for construction materials in the Fresno region." (Draft EIR, pages 2-6 through 2-7.)

To comply with CEQA, the County's EIR must evaluate the project as proposed based on the entitlements requested by the Applicant. Thus, the Draft EIR Chapter 2 reflects the requested entitlements, including the proposed 100-year duration of operations and associated CUP. The Draft EIR properly evaluates environmental effects of the proposed project, including the 100-year project operational life and proposed reclamation in accordance with the proposed reclamation plan amendment. The Draft EIR identifies mitigation measures that would be implemented to address reasonably foreseeable significant adverse environmental impacts of the project.

CEQA Guidelines Section 15145 specifies, "[i]f, after thorough investigation, a lead agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact." Although all future conditions within the project region cannot be known or predicted with certainty, and the County must avoid speculation of future circumstances and outcomes, the project is well-defined, and impacts associated with the project over its proposed 100-year duration are thoroughly evaluated and documented in the Draft EIR.

The Draft EIR discusses a "Reduced Operational Life Alternative" as a project alternative that was considered but rejected from further analysis in the Draft EIR. As discussed in

the Draft EIR, after considering this alternative it was eliminated from further analysis as it would reduce utilization of a known MRZ-2 resource in conflict with Fresno County's General Plan and does not fully meet some of the project objectives. (Draft EIR pages 6-7 through 6-8.) The Draft EIR also discusses alternatives (Alternatives 2 through 4) that each describe a scenario in which the overall life of the project is reduced by between 14 and 37 years either due to decreased pit depth or increased setbacks, reducing the total volume of material recovered. Therefore, a potential project with a shorter duration was evaluated in the EIR.

In defining the proposed project based on the entitlements requested by the Operator, the Draft EIR properly characterizes and evaluates the project's environmental effects over the proposed 100-year life of the project in compliance with CEQA.

In project approval deliberations, County decision-makers will consider information in the EIR as well as other factors including public comments and concerns regarding the duration of the project.

4.1.7 Collective Response #6: Operational Nuisance

Comments on the Draft EIR expressed concerns with regard to the existing operation and proposed future operation's potential to result in nuisances associated with aesthetics, air pollutants, odors, noise, and vibration. Some of these comments also expressed concerns that the Draft EIR analysis and mitigation improperly dismissed impacts as temporary or insignificant.

The Draft EIR provides a detailed evaluation of potential project impacts associated with environmental issues that could be associated with nuisance, including but not limited to, visual changes (see Draft EIR Section 4.1, "Aesthetics and Visual Resources," at Impacts 4.1-1, 4.1-2, and 4.1-3), light and glare (see Draft EIR Section 4.1 at Impact 4.1-4), air pollutant emissions (see Appendix D-4, "Revised Section 4.3, Air Quality," at Impacts 4.3-1, 4.3-2, and 4.3-3), odors (see Appendix D-4 at Impact 4.3-4), fly rock hazards (see Draft EIR Section 4.9, "Hazards and Hazardous Materials," at Impact 4.9-4), noise (see Draft EIR Section 4.13, "Noise," at Impacts 4.13-1, 4.13-2, 4.13-3, and 4.13-4), vibration (see Draft EIR Section 4.13 at Impacts 4.13-5 and 4.13-6), and circulation (see Draft EIR Section 4.17, "Transportation," at Impact 4.17-1).

CEQA Guidelines Section 15126.2(a) requires that, "[a]n EIR shall identify and focus on the significant effects of the proposed project on the environment," and CEQA Guidelines Section 15126.4(a)(1) requires that, "[a]n EIR shall describe feasible measures which could minimize significant adverse impacts." In accordance with CEQA, the Draft EIR evaluates potential environmental impacts of the proposed project and provides a

determination of whether each impact is considered significant or less than significant based on the analysis and in consideration of significance criteria and thresholds described in the Draft EIR. Where such impacts are found to be significant or potentially significant, the Draft EIR identifies mitigation measures to avoid the significant impact or to reduce the significant impact to either less than significant or to the extent feasible.

Comments expressing concerns over potential nuisance issues that do not present substantial evidence of a significant environmental impact will be considered by County decision-makers in project approval deliberations but do not require additional evaluation or mitigation in the EIR. In the event that the project results in unanticipated nuisance for adjacent property owners, property owners may notify the County of a suspected violation of County ordinances and property owners may take other legal action deemed appropriate. However, the EIR is not required to evaluate speculative potential future nuisance events outside of the environmental impacts evaluated in the Draft EIR.

4.1.8 Collective Response #7: Economic Effects

Comments on the Draft EIR expressed concern about the project's potential to result in adverse economic impacts (e.g., reduced property values) or otherwise questioned the economic benefit of the project including tax and other revenue to the County, job creation, and other economic and socioeconomic factors.

Under CEQA statute, guidelines, and case law, economic impacts are not cognizable CEQA issues (*Porterville Citizens for Responsible Hillside Development v. City of Porterville* (2007) 157 Cal.App.4th 885, 903 ["CEQA is not an economic protection statute"]; see also *Gray v. County of Madera* (2008) 167 Cal.App.4th 1099, 1120). Evidence of economic impacts, which do not contribute to or are not caused by physical impacts on the environment, are beyond the scope of CEQA (PRC Section 21080). Economic and social effects, by themselves, are not treated as significant effects on the environment (CEQA Guidelines Section 15131(a)). Therefore, comments regarding purported economic impacts of the project (rather than significant physical changes that may be caused by social or economic impacts) are not required to be addressed by the County in the EIR (Kostka & Zischke, *Practice Under the Cal. Environmental Quality Act* (Cont.Ed.Bar 2005) Section 13.24, page 634). It is anticipated that County decision-makers will consider economic and socioeconomic factors in project approval deliberations. However, such factors are outside of the scope of the EIR and do not warrant further consideration or discussion here.

4.1.9 Collective Response #8: Visual Impact Mitigation

Comments on the Draft EIR assert that the proposed visual mitigation (Mitigation Measure 4.1-1) is inadequate to address the project's visual impacts and that the measure is improperly deferred. Comments also ask who will be responsible for maintenance.

The project's potential impacts related to aesthetics and visual resources are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." The comments generally refer to Impact 4.1-1, which begins on Draft EIR page 4.1-51 and evaluates the project's potential impacts to scenic vistas and Impact 4.1-3, which begins on page 4.1-61 and evaluates the project's impacts on the character and quality of public views of the project sites. On page 4.1-60, the Draft EIR determines that the visual quality in the vicinity of Locations #12 and #13 (private residences west of the Quarry Site and west of the river within Madera County; see Figure 4.1-1, "Potentially Sensitive Viewpoint Locations," on Draft EIR page 4.1-19) would be substantially decreased and Impact 4.1-1 would be potentially significant. Similarly, on page 4.1-62 the Draft EIR determines that excavation of the quarry pit would substantially degrade the existing visual quality of the site as viewed from Locations #12 and #13 and Impact 4.1-3 would be potentially significant.

The exposed rock cannot be revegetated and so staining the rock a color that is more harmonious with the surrounding slopes is the only feasible mitigation to reduce visual impacts at these two locations. As stated on Draft EIR page 4.1-60:

> *Implementation of Mitigation Measure 4.1-1 would reduce these impacts to the greatest extent feasible; however, the quarry pit's engineered and linear benches would remain visible and would have an appearance that is discordant and disharmonious with the surrounding open space land uses. For this reason, impacts to views at Locations #12 and #13 would be significant and unavoidable during Stage 2 and after the completion of reclamation.*

Mitigation Measure 4.1-1 is revised in this Final EIR to clarify the specific provisions of the visual contrast reduction measures and provide the frequency of monitoring of the stained surface of the rock, in accordance with CEQA standards. See Chapter 3, "Draft EIR Errata," of this Final EIR, to view this revision to the Draft EIR. This change does not require recirculation under CEQA pursuant to Title 14 CCR Section 15088.5 as it does not change the mitigation approach and does not identify any new significant impacts.

Comments were also received regarding the need for ongoing maintenance of the stained quarry pit wall and responsibility for funding maintenance activities. Products commonly used for rock staining in mining applications are not a pigment or paint but a solution that chemically reacts with minerals in the rock resulting in a permanent,

integral color. Similarly, weathering accelerants hasten the formation of a natural, permanent patina. Therefore, these finishes require minimal upkeep (Natina 2025).

See also Response 6-28 regarding potential water quality impacts associated with the application of a staining product on the quarry pit walls.

None of the comments referenced in this collective response identify any new or substantially more severe environmental impacts or any new project alternatives or mitigation measures that would substantially reduce one or more project impacts. Therefore, recirculation of the Draft EIR is not required.

4.1.10 Collective Response #9: Air Quality Analysis and Project Impacts

Comments on the Draft EIR express concerns about the project's potential impacts upon existing air quality in the region and potential to increase certain health risks. Some commenters raise concerns specifically about the project's air quality impacts associated with blasting and rock debris.

An *Air Quality, Health Risk, and Climate Change Impact Assessment* (Sespe Consulting 2019) was prepared for the proposed project and included as Appendix D-1 of the Draft EIR and the results of the analysis were presented in Section 4.3, "Air Quality," of the Draft EIR (2019 Air Report). In consideration of comments on the Draft EIR, the analysis has been updated for the Final EIR. A revised *Air Quality, Health Risk, and Climate Change Impact Assessment* (Sespe Consulting 2026) is included as Appendix D-3. The 2026 Air Report replaces the 2019 Air Report in its entirety. Revisions to Draft EIR Section 4.3 and Section 4.8, "Greenhouse Gas Emissions," to incorporate the revised analysis are included as Appendix D-4, "Revised Section 4.3, Air Quality," and Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions," respectively. The updated analysis does not identify new or more severe environmental impacts from the analysis presented in the Draft EIR.

As it relates to commenters' general air quality concerns, the 2026 Air Report (Sespe 2026) refined the analysis of the project's particulate matter impacts and reaffirmed that the 2019 Air Report and Draft EIR's determination that impacts associated with particulate matter would be less than significant after mitigation. Specifically, with the implementation of Mitigation Measure 4.3-2b as included in the Final EIR (see Final EIR Appendix D-4), the Fugitive Dust Control Plan (see Appendix K of Appendix D-3), the proposed project's PM_{10} and $PM_{2.5}$ emissions would be effectively reduced compared to existing levels (see Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," of Appendix D-4). Thus, the emissions from the proposed project would not "contribute to non-compliance with state and federal air quality standards." The 2026 Air Report affirms the Draft EIR's conclusion that the Fugitive Dust Control

Plan would sufficiently reduce the project's potential to exceed ambient air quality standards to less than significant (see Appendix D-4, page 4.3-68). Mitigation Measure 4.3-2b as presented in the Final EIR Air Quality section errata (Appendix D-4) requires immediate preparation of the Fugitive Dust Control Plan, rather than requiring its future preparation as specified in the original version of Draft EIR Mitigation Measure 4.3-2. A Fugitive Dust Control Plan consistent with this requirement has been prepared and is included as Appendix K of the 2026 Air Report (Appendix D-3). The Fugitive Dust Control Plan would still be subject to the SJVAPCD's approval, and thus subject to additional modification.

Appendix D-4 presents the unmitigated and mitigated health risk in Tables 4.3-24, "Unmitigated Project Health Risk Impacts," and 4.3-25, "Mitigated Project Health Risk Impacts," respectively, at locations where applicable guidance requires the maximum risk level to be reported. Chronic cancer and non-cancer risks are reported at structures where an individual or worker could reasonably spend a year or more. Acute risk is reported at the fence line because there is the possibility of public access at that location for a period of one hour. Results for each receptor, including those on the fence line, are included in Appendix D-4 and Appendix D-3. Mitigation Measure 4.3-2a and Mitigation Measure 4.3-2b, which are required to reduce the project's potential to result in a cumulatively considerable net increase of any criteria air pollutant for which the project region is in non-attainment under applicable federal or state ambient air quality standards, would also have the effect of reducing health risks to less than significant levels as shown in Appendix D-4 Table 4.3-25. Thus, additional mitigation is unwarranted. Furthermore, the air modeling estimated impacts at the fence line receptors represent the worst-case air impacts from the proposed project. Potential impacts on the adjacent properties located further from the project sites were determined to be less than those potential air impacts reported in the Draft EIR and Final EIR errata for the fence line receptors. Potential impacts at the fence line, at the closest residences and workplaces, and at adjacent properties is included in the newly prepared Air Quality, Health Risk and Climate Change Technical Report, revised March 13, 2026 (see Appendix D-3). Because the proposed project's air impacts were all below applicable significance thresholds for the fence line receptors, the potential impacts at the surrounding communities further from the proposed project's modeled fence line receptors would be less than significant. See Collective Response #11 for additional discussion of cancer burden.

Although blasting emissions were discussed generally in the Draft EIR, blasting emissions are more fully analyzed in the 2026 Air Report and revisions to amplify the discussion of blasting emissions have been made to Draft EIR Section 4.3 as presented in the Final EIR Air Quality errata (Appendix D-4). Blasting emissions are quantified in the

2026 Air Report using representative quarrying drill-and-shoot and detonation emissions factors sources from the San Diego Air Pollution Control District (San Diego APCD). Dust emissions were calculated using the San Diego APCD quarrying drill-and-shoot emissions factor while explosives detonation emissions were calculated using factors from San Diego APCD Drilling-Blasting Ammonium Nitrate and Fuel Oil procedure. The 2026 Air Report concludes that emissions related to blasting would not exceed state or national ambient air quality standards and thus would not result in any new potentially significant impacts. (Appendix D-3). For further discussion of the blasting modeling and associated analysis, see Impact 4.3-2 of the Air Quality section errata included as Appendix D-4.

4.1.11 Collective Response #10: Air Quality Analysis Baseline

Comments on the Draft EIR suggest that the project's air quality analysis inappropriately compares the project's estimated emissions to existing conditions associated with ongoing operation of the Rockfield Quarry. Comments suggest that, instead of using the existing conditions baseline, the analysis should compare project emissions to a baseline that excludes existing emissions associated with ongoing operations.

As described in Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.3.3, "Air Quality," and Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions," Section 4.8.3.3, "Greenhouse Gases," as well as in the revised *Air Quality, Health Risk, and Climate Change Impact Assessment* (Sespe 2026) presented in Appendix D-3, the year 2005 was chosen as the baseline year for determining emissions related to air quality and greenhouse gases.

CEQA Guidelines Section 15125(a), "Environmental Setting," provides that the environmental setting based on the physical environmental conditions in the vicinity of the project will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant. This CEQA Guidelines Section also explains that an EIR should describe physical environmental conditions as they exist at the time the notice of preparation is published or when the environmental analysis is commenced. CEQA Guidelines Section 15125(a) further provides that where existing conditions change or fluctuate over time a lead agency may define existing conditions by referencing historic conditions.

Neither the CEQA statute, regulations or relevant cases supports an approach where the analysis would assume zero emissions, including by assuming that any of the permits pursuant to which the mine operates had expired. The courts have consistently rejected this approach. See e.g., *Citizens for East Shore Parks v. State Lands Commission*, 202 Cal.

App.4th 549, 560 (2011), in which a court rejected an argument that the baseline for a lease renewal project must exclude current conditions because the approving agency could eliminate the emissions by refusing the renewal. "Neither the statute, nor any CEQA case, supports plaintiffs' revisionist approach to the baseline." *Id.* at 561.

Other comments on the Draft EIR suggested that the project chose an arbitrary CEQA baseline for the project's estimated emissions. CEQA Guidelines Section 15125(a) requires that an EIR include a description of the physical environmental conditions in the vicinity of the project. These environmental conditions normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant.

CEQA allows the lead agency discretion in its determination of the baseline by stating that "generally" an EIR should describe physical environmental conditions as they exist at the time the NOP is published. However, CEQA Guidelines Section 15125(a) further provides that where necessary to provide the most accurate picture practically possible, a lead agency may define existing conditions by referencing historic conditions.

The California Supreme Court has additionally stated that, "[n]either CEQA nor the CEQA guidelines mandates a uniform, inflexible rule for determination of the existing conditions baseline. Rather, an agency enjoys the discretion to decide, in the first instance, exactly how the existing physical conditions without the project can most realistically be measured, subject to review, as with all CEQA factual determinations, for support by substantial evidence." *Communities for a Better Environment v. South Coast Air Quality Management Distr.,* 48 Cal. 4th 310, 328 (2010). "It is also appropriate to describe historical levels of operations, including variations in such historical levels, in developing a baseline that represents typical or ordinary operating conditions." 1 Kostka & Zischke, Practice under the Cal. Environmental Quality Act (Cont.Ed.Bar 2d ed. 2026) Section 12.22, page 12-39 (rel. 3/26).

Here, the use of the year 2005 to define the baseline emissions, (as described in Appendix D-4, Section 4.3.3.3, and Appendix D-5, Section 4.8.3.3, as well as in the revised *Air Quality, Health Risk, and Climate Change Impact Assessment* (Sespe 2026) presented in Appendix D-3), is not arbitrary and is supported by substantial evidence.

This project involves aggregate mining. Aggregate mining activity levels can fluctuate substantially depending on market demand and other factors. A California appellate court previously upheld a determination of a baseline for a mining project that was not the year the NOP was published. *See San Francisco Baykeeper, Inc. v. State Lands Com.*, 242 Cal. App. 4th 202 (2015). In *San Francisco Baykeeper*, the defendant sought to use the mining volumes in the years leading up to the publication of the NOP as a baseline for the mine

project's EIR. The Court found that the defendant's choice of baseline was proper as it was supported by substantial evidence. *Id.* at 218.

Like *San Francisco Baykeeper,* substantial evidence exists to show that 2005 is an appropriate baseline for the Rockfield project. The Rockfield mine production was heavily affected by the financial crisis of 2007-2009 (the Great Recession) causing production to slow. John Weinberg, *The Great Recession and Its Aftermath*, https://www.federalreservehistory.org/essays/great-recession-and-its-aftermath (2013) (a primary source of aggregate sales, residential construction, slowed during the Great Recession and "recovery in the years immediately following was by some measures unusually slow.")

Here, the Operator's production of aggregate in the years subsequent to 2005 fell heavily to a low in 2009 and subsequently has grown since that time as indicated in Appendix C, "Documentation Supporting the Baseline Condition," to Appendix D-1, although not fully to the levels produced prior to the Great Recession. Therefore, inclusion of the unusually low mining volumes in the years after 2005 during the Great Recession would distort the baseline by understating the overall levels of mining normally expected at the site.

Even in the period from 2013 to 2019 housing permitting remained 59 percent below the pre-Great Recession period that includes 2005. See *Office of Policy Development and Research, Comprehensive Housing Market Analysis Fresno, California (2023), U.S. Department of Housing and Urban Developmen*t:
https://www.huduser.gov/portal/publications/pdf/FresnoCA-CHMA-23.pdf, pages 13 through 17.

Also, as noted in Appendix D-3, and at Table 4.3-10, "Baseline Maximum Hourly Emissions," Table 4.3-11, "Baseline Maximum Daily Emissions," Table 4.3-12, "Baseline Maximum Annual Emissions," and 4.8-7, "Baseline GHG Emissions," of Appendix D-3 and Appendix D-4, baseline on-road and off-road emission estimates used 2005 production data. However, Year 2018 emission factors from EMFAC were applied for on-road sources, and Year 2012 emission factors from EMFAC were applied for off-road sources. This produces lower baseline values than if Year 2005 emissions from EMFAC were applied.

For these reasons, the County's choice of the year 2005 as a baseline for the project was not arbitrary. Instead, substantial evidence supports the conclusion that the year 2005 provides the most accurate picture practically possible for the physical environmental conditions in the vicinity of the project.

4.1.12 Collective Response #11: Analysis of Population-wide Cancer Burden

Comments on the Draft EIR asserted that the Draft EIR fails to provide an analysis of population-wide cancer burden and that such analysis is required for compliance with CEQA. In general, cancer burden is relevant because it characterizes the effect of low levels of individual cancer risk on a large number of people rather than the maximum cancer risk at an individual receptor (which is also reported). It accomplishes this through factoring in the number of people exposed and risks to all of those individuals. As further described below, and substantiated in the Final EIR, the project would decrease the incremental cancer burden between baseline and project conditions.

The project's potential air quality impacts are evaluated in Appendix D-4, "Revised Section 4.3, Air Quality." Population-wide cancer burden is discussed generally under the "Risk Characterization" subheading in Section 4.3.3.3, "Analysis Methodology," of Appendix D-4 and further discussed under Impact 4.3-3 (as supported by the technical appendices). As discussed under Risk Characterization, estimates of population-wide cancer burden are assessed if maximum incremental cancer risk is greater than zero for individual receptors. The project's incremental cancer risk was less than zero and therefore a cancer burden analysis was not required.

Nevertheless, in response to related comments on the Draft EIR, the technical analysis was reviewed and updated and reported in Section 3.5.3 of the *Air Quality, Health Risk and Climate Change Technical Report*, Revised May 13, 2026 (Appendix D-3). As presented in Appendix D-3, without the implementation of mitigation measures, the total cancer risk sum for the project would be -0.258 and with implementation of Mitigation Measures 4.3-2a and 4.3-2b the total cancer risk sum would be -0.259. Both mitigated and unmitigated cancer risk sums represent a decrease from the baseline condition. Because the updated analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR, the Draft EIR analysis is sufficient.

4.1.13 Collective Response #12: Effects on San Joaquin River and Chinook Salmon Restoration Efforts

Multiple comment letters suggest that the Draft EIR provides inadequate analysis of impacts to Chinook salmon and other native fish species in the San Joaquin River (SJR). Concerns focus primarily on blasting vibrations, habitat degradation, sedimentation, and similar water quality effects. Commenters also frequently reference the San Joaquin River Restoration Project (SJRRP) and ongoing work with salmon restoration. Commenters were generally concerned that project impacts, especially blasting and altered hydrology, could undermine recovery efforts of the SJRRP.

The biological resources setting section has been revised to include further description of Central Valley chinook salmon and the regulatory setting section has been revised to provide further description of the SJRRP. See Chapter 3, "Draft EIR Errata," of this Final EIR, to view these proposed revisions to the Draft EIR. The Draft EIR provides an analysis of blasting as it relates to salmonids and fish under Impact 4.4-6, "Interfere with Native Resident or Migratory fish or Wildlife Species Movement, Corridors, or Nursery Sites," citing the best available standards provided by the Alaska Department of Fish and Game (ADF&G 2013) as well as site specific analysis. See Collective Response #16 regarding the use of the ADF&G best available standards in the Draft EIR. Site-specific analysis of blasting is included in Draft EIR Appendices H-1 through H-5, and the proposed Blasting Protocols for the project are outlined in Appendix H-6, and updated in Appendix H-9. The results of these analyses showed that levels of effect from vibration and noise to the SJR would be below the levels established by the ADF&G, even in the case of eggs or larvae that are the most sensitive to such movement. Additionally, the blasting plan is included in Appendix H-6, which was peer reviewed in Appendix H-7 and found to be appropriate for the project. In the Blasting Protocols (Appendix H-9), a blast monitoring and control plan is included, along with reporting and adaptive management steps. Steps are detailed about how monitoring would occur within the site to ensure real-world measurements are in line with modeled expectations. Further, the plan and any annual monitoring would be submitted to the County, which can enforce corrective actions if identified thresholds in the Blasting Protocols are exceeded.

In addition to disruptions from sound and vibration that are discussed above, elements of habitat degradation that commenters were concerned with centered around sedimentation and subsequent effects to water quality. The project would maintain the existing 200-foot setback from the river's edge at the Quarry Site and would not disturb the easterly channel bank along the Quarry Site (nor any other portions of the channel); thus, ensuring that impacts from mining that could alter the existing conditions is reduced to less than significant levels.

As described in the "Erosion and Sedimentation" subsection of Section 4.10.1.5, "Hydraulic Analysis," the 100-year flow velocities under existing conditions are generally at or below 6 feet per second, which is a "permissible velocity" below which the natural channel will resist erosion. See also the discussion of Draft EIR Impact 4.7-4 and Impact 4.10-14, which addresses the project's potential to result in off-site erosion. While existing conditions would not be changed by adherence to the 200-ft buffer, and existing conditions are already within permissible velocities to allow the natural channel to resist erosion in most locations, the proposed project would also continue its program of BMPs and monitoring the easterly channel bank for evidence of erosion across the duration of Phase 1 and 2. If any erosion occurs following a large storm event, the

Operator would coordinate with the appropriate permitting agencies to determine if repair measures to the bank are necessary for the protection of both the river and the project (Draft EIR page 4.10-116). For these reasons, the proposed project is not expected to degrade habitat quality from sedimentation or erosion or degrade water quality from erosion and sedimentation in a way that could have a significant effect on salmonids.

4.1.14 Collective Response #13: Project Operational Effects on Offsite Wildlife

Commenters note that the San Joaquin River corridor and Little Dry Creek are repeatedly identified as highly important offsite habitat for wildlife. Some commenters are concerned that the 200-foot buffer between the quarry and the river is inadequate and that buffers of several hundred to over a thousand feet are needed for birds, amphibians, and turtles. CDFW specifically calls for focused surveys and expanded buffers for species such as bald eagle, or Swainson's hawk, which may nest or forage offsite but adjacent to quarry boundaries. Other commenters similarly point to burrowing owls, Swainson's hawks, and tricolored blackbirds using lands near the quarry and claim the Draft EIR underestimates risks to nesting and foraging areas offsite.

The project's operational effects on wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources." See Impact 4.4-1 beginning on Draft EIR page 4.4-48 related to wildlife on the project sites and Impact 4.4-2 beginning on page 4.4-52 related to wildlife within riparian habitat surrounding the project sites. After reviewing the comments and potential effects of the project, the Draft EIR was revised to reflect a more rigorous survey requirement for nesting birds and other wildlife in the vicinity of the project sites. Surveys for nesting raptors, specifically Swainson's hawk and bald eagle, or other large raptors required by Mitigation Measure 4.4-1c, were expanded to a buffer of 0.25 mile prior to the initial blasting event once operations begin following approval. Mitigation Measure 4.4-1c was further revised to increase the number of surveys to be conducted before the initial blasting event from one to three once operations begin following approval. Expansion of the survey buffer area, and increased rigor of surveying or monitoring would help ensure that effects are minimized to the extent feasible given site-specific criteria. See Chapter 3, "Draft EIR Errata," of this Final EIR, to view these revisions to the Draft EIR.

4.1.15 Collective Response #14: Analysis of Impacts on Swainson's Hawk

Multiple commenters were concerned about various aspects of potential impacts to Swainson's hawk (SWHA) stemming from a lack of focused surveys, and insufficient assessment for the presence of the species in off-site areas. Concerns follow a similar theme that blasting would be the primary source of disturbance, which could cause acoustic and vibratory disturbance to Swainson's hawks that may nest or forage nearby.

Commenters also note that while much of the area within the project sites is already disturbed, adjacent open fields and fallow areas may provide potential foraging habitat for SWHA. Commenters suggest that project implementation could convert or reduce off-site habitat value, warranting avoidance or mitigation measures to minimize indirect impacts.

The Draft EIR analyzes SWHA potential in the area, concluding that the species may be present, and may be affected by project activities (see Draft EIR page 4.4-49, second paragraph). Mitigation Measure 4.4-1c (Draft EIR page 4.4-50) was included in the Draft EIR to address this potential impact and reduce potential impacts to a less than significant level. In response to public and agency comments, Mitigation Measure 4.4-1c was revised to expand the number of surveys and distance surveyed to reflect current survey ranges and methods outlined in the CDFW SWHA survey protocol. During the nesting season, three surveys would be conducted with at least one week between surveys. The survey area would be expanded to 0.25 mile from the blast site and the on-going mining operations footprint. If a SWHA nest is located, a buffer of 0.25 mile would be enacted around the nest, and blasting and mining and reclamation activities would not occur within the buffer area.

4.1.16 Collective Response #15: Impacts to Non-Nesting Birds and Birds Outside of Nesting Season

Commenters noted that the Draft EIR focused on the analysis of the effects of the proposed project on birds during the nesting season (February-August) but did not evaluate effects on birds outside of that nesting period. Commenters assert that migratory and resident bird species that use the area for foraging or stopovers could be affected by mining activities. Commenters emphasize that the San Joaquin River is part of the Pacific Flyway, supporting migratory movements and overwintering populations, and argue that blasting, dust, and noise during non-nesting months could still disrupt foraging, resting, and migration behaviors even when birds are not nesting.

Noise, dust, and similar mining-related disturbances have existed for decades at the project site due to ongoing mining operations. Similar to ongoing mining practices at the project site, new operations are proposed to occur year-round, during both nesting and non-nesting periods. In addition, because the existing mine has operated in this location for many decades, natural nesting or foraging substrates are largely absent within the Project Area. As such, the Project Area is unlikely to support nesting or non-nesting use by birds.

Prior to initial blasting, Mitigation Measure 4.4-1c would be implemented in its revised form: prior to the initiation of blasting at the Quarry Site, qualified biologists would

conduct at weekly intervals three distinct surveys for nesting birds within 0.25 mile of the blast site. The clarification of the surveys required prior to blasting, as described in revised Mitigation Measure 4.4-1c, would minimize potential effects to nesting or non-nesting birds. Please see Chapter 3, "Draft EIR Errata," for revisions to Section 4.4, "Biological Resources," and Mitigation Measure 4.4-1c.

4.1.17 Collective Response #16: Impacts to Salmon Spawning and Analysis Methods

Multiple commenters suggest that the Draft EIR provides inadequate analysis of project impacts on Chinook salmon in the San Joaquin River (SJR). Commenters note that the SJR supports reintroduced Central Valley spring-run Chinook salmon, a threatened species, and that blasting could disrupt spawning, rearing, and migration or cause behavioral avoidance that undermines the San Joaquin River Restoration Program (SJRRP). Concerns often focus on effects of blasting vibrations, leading to habitat degradation, or impacts to spawning. Several commenters object to reliance on the Alaska Department of Fish and Game (ADF&G) blasting standards, arguing they are not appropriate for California conditions and inadequately account for local species' sensitivity.

The ADF&G blasting standards represent the best available information on effects of blasting on salmonids. Commenters offer no substantial evidence why Chinook salmon in Alaska would be sufficiently different from Chinook salmon in California to warrant an alternative use of data. Nor do they offer alternative data that is more representative of blasting effects to Chinook salmon in rivers. Therefore, use of standards set by the ADF&G continues to be the best available for assessing effects of this project. Additionally, the analysis provided by Vibra-Tech Engineers (see Draft EIR Appendix H-4, "Blasting Effects on San Joaquin River Embankments") showed that blasting effects at the embankment (which is closer to the blast site than the actual river) would not surpass the vibration or movement standards set by the ADF&G for minimizing effects to embryos (i.e., eggs) in spawning gravels. Further, the standards set by the ADF&G are conservative and set acceptable levels well below any observed mortality or physical effects documented in the studies reviewed for their analysis. As noted, blasting standards also considered effects specifically when embryos (i.e., fertilized salmon eggs in redds [salmon nests built in streambed gravels]) are present. Therefore, the standards reflect protection even at this life stage.

The Blasting Protocols, provided in Appendix H-6 and updated in Appendix H-9, require the monitoring of blasting effects, including sites along the SJR embankment, to ensure that specified thresholds of significance for ground vibrations and air overpressures are not exceeded and inform potential Blasting Protocol updates. This approach ensures that (1) the best available data is used when creating standards to avoid impacts, (2) standards

set for blasting effects on salmonids are being adhered to, and (3) adaptive management is being implemented and results reported such that this project and future projects have more data to draw upon to ensure effects to salmonids are appropriately modeled and minimized.

4.1.18 Collective Response #17: Flooding and Bank Stability

As discussed in Draft EIR Section 4.10, "Hydrology and Water Quality," the Draft EIR includes a detailed Hydraulic Analysis prepared by Chang Consultants, which evaluated the potential for the 100-year flood to inundate the project sites. See Appendix G-1, "Hydraulic Analysis," of the Draft EIR. The modeling results demonstrate that the onsite berm elevations are higher than the 100-year flood water surface elevations and would therefore prevent overtopping or breaching during extreme flood events. The 1997 flood, which reached a flow rate of 60,300 cubic feet per second (cfs), was less severe than the 100-year flow rate of 71,000 cfs used in the project's 100-year flood analysis. As such, the analysis and information documented within the Draft EIR provide a conservative flood model and the potential for breaching of the quarry pit is not reasonably foreseeable. Furthermore, the Draft EIR explains that there are no signs of significant bank erosion, and during the historic January 1997 flood event, the easterly bank along the Quarry Site did not experience significant erosion, and the bank has never breached into the Quarry Site. (Draft EIR, page 4.10-7.) The 100-year flood analysis is sufficient to evaluate potential flooding impacts at the project sites, in accordance with CEQA.

Further, in response to certain comments on the Draft EIR raising concerns about the potential for extreme flooding events to inundate the quarry pit and in consideration of Fresno County General Plan Policy HS-C.12, which "encourage[s] the performance of appropriate investigations to determine the 200-year water surface elevations for the San Joaquin River," Chang Consultants evaluated the potential for the 200-year flood to enter the quarry pit (Chang 2026a; Final EIR Appendix G-7, "200-year Flood Hazard Analysis —Quarry Site"). The Fresno County General Plan previously only required the investigation of the 100-year water surface elevations for the San Joaquin River, but was revised in 2024 to require the investigation of the 200-year water surface elevation of the San Joaquin River. A 200-year event is a flood that statistically has a 0.5-percent chance of occurring in any given year, as compared to a 100-year flood event which is a flood that statistically has a 1-percent chance of occurring in any given year (Chang 2026a, page 1). The 200-year flood report estimated that the 200-year flow rate would be 95,000 cfs based upon FEMA's 2016 flood insurance study (Chang 2026a, page 2). As such, the 200-year hydraulic analysis provides an even more conservative evaluation of the potential for rare flood events to breach the quarry pit. Upon an initial evaluation, the modeled 200-year floodplain entered the quarry pit at stations 16, 19, and 20 by approximately two

feet. To proactively prevent the possibility of a 200-year flood event from entering the quarry pit, CEMEX raised the northerly portion of the berms separating the San Joaquin River and the Quarry Site up to approximately 4 feet with compacted fill. Topographic mapping was prepared to display the locations where the berms were raised and is included in the 200-year hydraulic analysis for the Quarry Site.

The 200-year hydraulic analysis for the Quarry Site was conducted based on existing conditions, accounting for the heightened berms. The 200-year hydraulic analysis demonstrates that the 200-year flood would not overtop the bank at the Quarry Site (Chang 2026a, page 3). As such, the project would be consistent with General Plan Policy HS-C.12 as it minimizes potential flood risks associated with a 200-year flood event and the Quarry Site would be further protected from potential severe flood events. Please refer to Appendix G-7 and Appendix G-8, "200-Year Flood Hazard Analysis—Plant Site," for the 200-year flood analyses conducted for the project. See also Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10 and Section 4.11, "Land Use and Planning."

Certain comments also expressed concerns pertaining to the project's blasting impacts upon the stability of the San Joaquin River bank. The project's potential impacts upon bank stability are addressed in Draft EIR Section 4.4, "Biological Resources," and Section 4.13, "Noise." As discussed in Impact 4.4-4 and 4.13-6, adherence to the Blasting Protocols, required by Mitigation Measure 4.10-1, provided in Appendix H-6 of the Draft EIR, and updated in Appendix H-9, would reduce potential impacts to the stability of the riverbank to less than significant. Blasting would be required "to begin at the center of the Quarry Site so that monitoring of groundborne vibration can occur and be used to verify that predicted maximum ground vibrations are consistent with actual ground vibration measurements and allow for adjustments in blasting design to occur based on the monitoring results" (Draft EIR page 4.4-58). The Blasting Protocols also require pre-blast and post-blast visual inspections of the portions of the San Joaquin embankment that are located within 1,000 feet of each blast to determine whether there are any visual signs of instability, such as slumping or cracking of the embankment. These visual inspections would be required to occur until blasts are at depths greater than 100 feet below the contact between alluvium and rock. Vibra-Tech Engineers determined that the appropriate San Joaquin River embankment vibration threshold is a variable particle velocity vs. frequency curve. At low frequencies (1-10 Hz) the vibration threshold is 0.50 in/sec, which is the most restrictive vibration amplitude shown in Draft EIR Figure 4.13-6, "San Joaquin River Embankment Vibration Threshold Curve." From 10 to 30 Hz, a variable particle velocity is allowed with an equivalent displacement of approximately 0.001 inch. From 30 to 40 Hz, a constant particle velocity of 2.0 in/sec should be maintained. From 40 to 60 Hz, a variable particle velocity is allowed with an equivalent

displacement of approximately 0.0095 inch. A ground vibration particle velocity of 4.0 in/sec should be maintained for frequencies above 60 Hz.

The annual blasting plan is required to demonstrate that the blasting design would not exceed the applicable vibration thresholds for the San Joaquin River embankment. Exceedances of this threshold would result in corrective actions, including notification to the County and development of a corrective action plan to avoid future exceedances. With the implementation of the Blasting Protocols, the potential for blasting to impact the San Joaquin River embankment would be less than significant.

4.1.19 Collective Response #18: Consistency with San Joaquin River Parkway Master Plan

Comments on the Draft EIR raise concerns about the project's consistency with the San Joaquin River Parkway Master Plan (Parkway Master Plan).

The Fresno County General Plan, Parkway Master Plan, and other County planning documents as they relate to the proposed project are described in Draft EIR Section 4.11, "Land Use and Planning." Project consistency with these plans is evaluated in Table 4.11-1, "Project Consistency with Local Planning Documents," beginning on Draft EIR page 4.11-10 and summarized under Impact 4.11-2 beginning on Draft EIR page 4.11-49. As shown in Table 4.11-1 of the Draft EIR, the project is consistent with all applicable goals and policies presented in these regional planning documents.

The Parkway Master Plan is a regional planning effort that envisions the expansion and conservation of open space and passive recreational uses within its plan boundaries. It identifies properties for future acquisition and provides policies, design standards, and best management practices to guide the development and management of the Parkway. However, it does not determine allowable land uses or zoning for any parcels. Land use authority remains with the municipalities located within the boundaries of the Parkway Master Plan (i.e., Fresno County, City of Fresno, and Madera County) (Parkway Master Plan page 2-5).

The proposed project would be implemented within the existing boundaries of the project sites and would not conflict with the applicable land use designations or zoning as identified by the Fresno County General Plan and Fresno County Zoning Ordinance. The project would not prohibit the use of adjacent properties envisioned in the Parkway Master Plan. Furthermore, Goal MR2 of the Parkway Master Plan states that the Conservancy will "design, construct, and manage the Parkway in a manner that will not conflict with sand and gravel mining operations." See also Collective Response #20

regarding potential encroachment onto an ecological preserve and Collective Response #27 regarding indirect operational effects on users of adjacent parks and trails.

The Draft EIR evaluates the consistency of the proposed project with the Parkway Master Plan in Table 4.11-1. To amplify and clarify the information contained in Table 4.11-1, a summary discussion of the project's consistency with the Parkway Master Plan has been added to the discussion under Impact 4.11-2. See Chapter 3, "Draft EIR Errata," of this Final EIR, to view this proposed revision to the Draft EIR.

As discussed in greater detail in Collective Response #21, the project would support future development of trail segments consistent with the Parkway Master Plan by proposing to dedicate easements within the project sites.

Comments also express concern over the potential for the project to conflict with growing public access to the San Joaquin River and nearby parks that is expected to occur as implementation of the Parkway Master Plan continues to bring more recreational amenities to the area. These comments indicate that this represents a conflict with the Parkway Master Plan. This potential conflict would not result in a physical impact to the environment. Therefore, this issue was not evaluated in the Draft EIR. However, these comments are noted for the consideration by the decision-makers. See also Collective Response #19 regarding the status of public parks in the vicinity of the project sites as well as Collective Response #21 regarding the project's effects on public access to the river.

4.1.20 Collective Response #19: Public Accessibility of Adjacent Parks

This Collective Response addresses comments on the Draft EIR related to the public accessibility of certain parks located adjacent to the project sites. The comments state that the Draft EIR is outdated and incorrectly describes multiple parks as private lands rather than publicly accessible. Comments specifically refer to Lost Lake Park, Ledger Island, and Sumner Peck Ranch.

In accordance with CEQA Guidelines Section 15125(a), the Draft EIR describes the existing conditions in the vicinity of the project sites as they existed at the time the NOP was published. The NOP for the proposed project was published in 2020. At that time, much of the land surrounding the project sites was under private ownership and did not provide regular public access (see Draft EIR Table 4.16-1, "Recreation Facilities Near the Project Sites," on page 4.16-1).

Since that time, some of the surrounding recreational uses have been opened for regular public access. The comment letters specifically reference changes to public access status

at Lost Lake Park, Ledger Island, and Sumner Peck Ranch. The Draft EIR properly describes and analyzes the existing conditions surrounding the project sites as they existed in 2020. However, to ensure full disclosure of the proposed project, Table 4.16-1 has been revised to reflect the current (2025) status of public accessibility at these facilities. See Chapter 3, "Draft EIR Errata," to view these proposed revisions to the Draft EIR.

While Table 4.16-1 has been updated, no revisions to the impact analyses presented in the Draft EIR are required to address these comments. The *Visual Impact Analysis* prepared for the project (see Draft EIR Appendix C) and summarized in the Draft EIR (see Section 4.1, "Aesthetics and Visual Resources") evaluates the surrounding recreational uses at publicly accessible locations and identifies Potentially Sensitive Viewpoints at these and other surrounding recreational facilities (see Draft EIR Figure 4.1-1, "Potentially Sensitive Viewpoint Locations ," Potentially Sensitive Viewpoints 2, 5, 6, 8, 9).

See also Collective Response #27 regarding the project's potential operational impacts on the users of nearby parks and trails.

4.1.21 Collective Response #20: Encroachment on an Ecological Preserve

Comments on the Draft EIR assert that the existing Plant Site operations encroach on an ecological preserve. The comments refer specifically to the Willow Unit Ecological Reserve that is owned by the California Department of Fish and Wildlife (CDFW), which is located immediately to the southwest of the Plant Site. At least one comment asserts that the Draft EIR fails to require an end to this unpermitted encroachment on state land.

The Draft EIR describes the Plant Site's history and relationship with the Willow Unit Ecological Reserve on page ES-2. The 138.5-acre Plant Site has historically operated on land leased from Ball Ranch. In 2000, the southern half of the Ball Ranch was acquired by CDFW, and approximately 126.6 acres remained under lease by the Operator with the Ball Family. The property acquired in 2010 included 11.9 acres of land used for Plant Site operations. In March 2019, the Operator acquired the remaining 126.6 acres of the Plant Site.

The continuation of operations on CDFW property is an existing condition. Per CEQA Guidelines Section 15125(a), an EIR is not required to evaluate existing conditions. Instead, the EIR need only evaluate how the proposed project would change this existing condition, if approved. Therefore, the Draft EIR appropriately evaluates the proposed continuation of operations on the entire 138.5 acres. The Operator is working with CDFW to continue operations pursuant to a lease agreement or alternatively to acquire those portions of the CDFW-owned parcel that are still utilized for Plant Site operations. See Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan," page 26. However, if

CDFW does not approve the continuation of operations, operations on that portion of the Plant Site would cease and all associated direct and indirect impacts of operating on the 11.9-acre CDFW property would not occur.

The discussion of Plant Site operations on CDFW property on Draft EIR page ES-2 erroneously states that the CDFW-owned portion of the Plant Site totals 12.9 acres; the correct acreage is 11.9 acres (138.5 acres – 126.6 acres = 11.9 acres). Additional pages of the Draft EIR that erroneously state 12.9 acres are ES-3, 2-2, 2-3, and 2-7. Each instance of this incorrect number in the Draft EIR has been corrected accordingly. See Chapter 3, "Draft EIR Errata," of this Final EIR, to view these proposed revisions to the Draft EIR.

4.1.22 Collective Response #21: Public Access to San Joaquin River, Recreational Sites, and Future Uses of the Existing Project Sites

Comments on the Draft EIR expressed concern over the limited public access to the San Joaquin River in the general project area and suggested that the project be required to provide public river access at the project sites. Some comments suggest, without substantive analysis or support under CEQA, that the project should be denied, and the project sites converted to public parks with river access.

The project would continue operations within the existing boundaries of the project sites and thus would not encroach on or otherwise adversely affect existing public access points to the San Joaquin River or neighboring recreational locations. See Collective Response #19 regarding public accessibility at nearby parks. See also Collective Response #27 regarding potential operational effects to users of nearby parks and trails.

With regard to comments concerning the potential future recreational uses of the Plant and Quarry sites, both sites would be reclaimed pursuant to the proposed Reclamation Plan, which is contained in Appendix B-1 of the Draft EIR. The proposed Reclamation Plan is consistent with Fresno County and SMARA requirements, as analyzed in Section 4.11, "Land Use and Planning," of the Draft EIR. As described in Section 5.1.1 of the proposed Reclamation Plan, the project sites are each surrounded by open space parks and nature reserves; thus, the appropriate end-use compatible with the habitat on these adjoining properties was determined to be open space, riparian and open water wildlife habitat. The public may have access to portions of the Plant and Quarry sites if the proposed trail easement and trail construction envisioned by the San Joaquin River Parkway Master Plan Update (2018) takes place. Please refer to Collective Response #22 for further discussion of the proposed trail easement. Due to the formation of the quarry pit ponds that would cover the majority of both the Plant Site and Quarry Site, other future land uses, including recreation, would generally be precluded on the majority of the project sites (Draft EIR page 7-3). To protect public health and safety, the project sites

would be fenced in accordance with the provisions of the approved reclamation plan and gated and appropriate signage posted to specifically restrict public access to the project sites.

Consistent with CEQA Guidelines Section 15126.2(a), the Draft EIR focuses on the project as proposed by the applicant in the complete project application (see Draft EIR Appendices A-K) and defined in the project description (see Draft EIR Chapter 2, "Project Description"). Comments suggesting that the County should require the applicant to provide public river access on the project sites or that the project sites should be converted to public parks are noted for County decision-makers.

4.1.23 Collective Response #22: Trail Easements

Comments on the Draft EIR suggest that, in addition to the proposed trail easement dedications, the associated trails should be designed and constructed as part of the proposed project. Comments further suggest that trail construction should be funded by CEMEX and completed prior to initiation of the proposed mining-related activities.

As described in Draft EIR Section 2.5.8, "Trail Easements," and shown in Draft EIR Figures 2-7 through 2-10, the project includes dedication of a trail easement along the San Joaquin River corridor at the Quarry Site and a trail easement along North Friant Road at the Plant Site. These easements would be dedicated to the San Joaquin River Conservancy to allow for potential future development of one or more trail segments. The County's Regional Bicycle & Recreational Trails Master Plan and the San Joaquin River Parkway Master Plan envision a continuous, connected trail along the San Joaquin River from the San Joaquin Hatchery to the north, along the periphery of the project sites, and southwest to near Highway 99. The proposed trail easement at the Quarry Site generally aligns with the envisioned river corridor trail. The Plant Site is located further east of the river corridor; therefore, the trail easement is proposed for dedication along North Friant Road and does not geographically align with the trail corridor envisioned in the San Joaquin River Parkway Master Plan. While the Plant Site easement does not align with the mapped river corridor trail, dedication of trail easements at both sites is generally consistent with the overall intent and policy direction of the Parkway Master Plan to preserve future opportunities for trail connectivity, where feasible. The proposed easement dedications would ensure that project implementation would not preclude future connection of trails through the project area and would avoid conflict with these regional planning efforts.

Although the project would dedicate easements, the project does not propose the development of trails. Therefore, trail construction is not evaluated as part of the EIR

analysis of the proposed project. Should the San Joaquin River Conservancy seek to develop trails within the easements in the future, funding and construction would be the responsibility of the San Joaquin River Conservancy and a decision to proceed with trail development would be subject to separate CEQA review at that time.

4.1.24 Collective Response #23: Quality of Water Pumped to Onsite Ponds and Potential Impacts to San Joaquin River and Groundwater Quality if Pumped to Recharge Trenches

Comments on the Draft EIR expressed concerns over the quality of water that might be pumped from the mining excavations during dewatering, and the potential effects that might occur to the San Joaquin River and to groundwater if that water is pumped to recharge trenches around the perimeter of the Quarry Site area and the Plant Site.

Water that is currently pumped from the Quarry Site mining excavation is discharged both to onsite ponds, primarily the Northeast Pond, and to recharge trenches along the west side of the site. The pumped water is groundwater that is removed, or dewatered, from the excavation to allow continued mining. As part of the project, groundwater would continue to be pumped from the mining excavation and discharged to the Northeast Pond and the recharge trenches. Thus, pumping of groundwater from the mining excavation to both the Northeast Pond and the recharge trenches is part of the existing, baseline conditions at the Quarry Site.

At the Plant Site, dewatering does not currently occur. However, once mining progresses below the water table as part of the project, groundwater would be pumped from the mining excavation to recharge trenches around the perimeter of the Plant Site.

Quarry Site

Surface water quality is discussed in Section 4.10.1.6, "Surface Water Quality," of the Draft EIR while Table 4.10-4, "Quarry Site Surface Water Quality Data," on Draft EIR page 4.10-26 shows the water quality in the Northeast Pond at the Quarry Site (labeled as "Ponded Water Feature 2" in the table). Groundwater quality data at the Quarry Site is described in Section 4.10.1.8, "Groundwater Quality," and presented in Table 4.10-6, "Quarry Site Groundwater Quality Data," on page 4.10-45 of the Draft EIR. As mining progresses through the weathered rock, the quality of the water pumped to the Northeast Pond and the recharge trenches would be similar to the mid-depth wells completed in that geologic unit (i.e., MW-1M, MW-2M, MW-3M and MW-4M). As mining progresses deeper into the hard rock, the water quality would be comparable to that in the mid-depth and deep wells (i.e., those ending with an M or a D).

Table 11 of Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR presents the water budget for the Quarry Site. Footnote 4 of Table 11 states that the volume of water to be pumped to the recharge trenches would be as high as 380 acre-feet per year, with half that volume assumed to flow to the San Joaquin River through the subsurface (i.e., as groundwater in the alluvium) or to deeper groundwater beyond the Quarry Site. Thus, it is anticipated that up to 190 acre-feet per year of groundwater pumped from the Quarry excavation could potentially seep to the San Joaquin River. That rate of seepage (i.e., 190 acre-feet per year) is equivalent to 0.26 cubic feet per second (cfs). As described in Collective Response #26, the base flow in the San Joaquin River is approximately 400 cfs, while planned San Joaquin River Restoration Project (SJRRP) restoration flows may range from 2,500 cfs to 5,000 cfs. Based on these flow rates, the seepage from the recharge trenches at the Quarry Site to the river would be less than 0.07 percent of the base flow and 0.01 percent of the lowest SJRRP restoration flow rate. At these extremely low percentages, the water seeping from the recharge trenches to the San Joaquin River would have an imperceptible effect on water quality in the river.

The water pumped from the Quarry Site mining excavation into the Northeast Pond would recharge the same groundwater units from which the water was pumped. Therefore, there would be no difference in the quality of the water and no effect on groundwater quality adjacent to the Quarry Site.

Plant Site

Surface water quality is discussed in Section 4.10.1.6 of the Draft EIR while Table 4.10-3, "Plant Site Surface Water Quality Data," of the Draft EIR shows the existing water quality in the silt pond at the Plant Site. As described on page 4.10-25, and discussed further in Response 6-52, the total concentrations shown in Table 4.10-3 include the effects of the suspended silts and clays in the water within the silt pond, while the dissolved concentrations represent the concentrations in the water that may percolate to the subsurface. Groundwater quality data at the Plant Site is discussed in Section 4.10.1.8 and presented in Table 4.10-5, "Plant Site Groundwater Quality Data," of the Draft EIR. As mining progresses below the water table at the Plant Site, the groundwater pumped from the excavation to the recharge trenches would percolate back to the same groundwater aquifer from which it was pumped. Thus, there would be no effect on groundwater quality adjacent to the Plant Site.

Table 7 of Appendix G-3, "Groundwater Conditions at the Plant Site," of the Draft EIR presents the water budget for the Plant Site. Footnote 4 of Table 7 states that it is assumed that half of the groundwater pumped to the recharge trenches would flow to the San Joaquin River or local groundwater beyond the project site. The maximum volume of water to be pumped to the recharge trenches would be as high as 805 acre-feet per year

at the end of the mining period, with half that volume potentially flowing to the San Joaquin River through the subsurface (i.e., as groundwater in the alluvium) or to deeper groundwater beyond the project site. The other half is assumed to reenter the excavation. Thus, it is anticipated that up to 403 acre-feet per year of groundwater pumped from the Plant Site excavation could potentially seep to the San Joaquin River. That rate of seepage (i.e., 403 acre-feet per year) is equivalent to 0.55 cubic feet per second (cfs). As discussed above for the Quarry Site, and in Collective Response #26, the base flow in the San Joaquin River is approximately 400 cfs, while planned SJRRP restoration flows may range from 2,500 cfs to 5,000 cfs. Based on these flow rates, the seepage from the recharge trenches at the Plant Site to the river would be less than 0.14 percent of the base flow and 0.02 percent of the lowest SJRRP restoration flow rate. At these extremely low percentages, the water seeping from the recharge trenches to the San Joaquin River would have an imperceptible effect on water quality in the river.

In addition, the distance from the Plant Site to the San Joaquin River is three times further than the distance from the Quarry Site to the San Joaquin River. Therefore, significantly less flow from the Plant Site, if any, is likely to reach the San Joaquin River, especially because the depth to groundwater at the Plant Site is approximately 20 feet to 30 feet below the elevation of the river channel (see Collective Response #25). Furthermore, mining at the Plant Site is anticipated to occur for a much shorter duration (30 years) than at the Quarry Site. Thus, the period during which water is pumped from the Plant Site mining excavation to the recharge trenches would also be much shorter than that which would occur at the Quarry Site.

4.1.25 Collective Response #24: Groundwater Monitoring Program Changes and Funding

Comments on the Draft EIR suggest that Mitigation Measure 4.10-10a should be revised to expand and clarify the adaptive groundwater monitoring program required by the measure. Some commenters assert that monitoring should be conducted at each residential well near the project sites. Other commenters assert that a third-party should be conducting said monitoring and that all monitoring activities should be funded by CEMEX.

As discussed in Draft EIR Section 4.10, "Hydrology and Water Quality," Mitigation Measure 4.10-10a, provides for monitoring of the MW-3 well cluster to assess groundwater level conditions that might affect wells to the east and northeast of the Quarry Site, and of the MW-1 well cluster to assess groundwater level conditions that might affect the San Joaquin River and wells to the west of the Quarry Site (Draft EIR at pages 4.10-108 through 4.10-111). Each well cluster includes a separate well within the

alluvium, the weathered rock, and the hard rock. Electronic dataloggers have been present in these wells since August 2017 (except for MW-3S, which was installed in 2018, with datalogger recording beginning in September 2018). Therefore, an eight-to-nine-year baseline of groundwater elevation data already exists in each of these well clusters, as provided in Appendix G-6, "Addendum to Hydrology and Water Quality Analysis Report," of the Draft EIR (at the time five to six years). These wells would continue to be monitored throughout the project duration and as further discussed below, for at least 3 years after dewatering of the Quarry Site excavation stops.

Mitigation Measure 4.10-10a, as presented in the Draft EIR (pages 4.10-108 through 111) and as clarified and amplified through errata in Chapter 3, "Draft EIR Errata," of this Final EIR, describes the data analysis to be conducted and the changes in groundwater levels that would require further assessment. If the groundwater changes are confirmed, then specific mitigation actions would be required, including increasing the amount of water provided for groundwater recharge, either at the Northeast Pond or at the western recharge trenches, as appropriate. Mitigation Measure 4.10-10a also requires mining to cease if groundwater levels cannot be maintained above defined thresholds. The cessation of mining would also result in the halting of dewatering to allow groundwater levels to recover if they drop below the target criteria.

As proposed by some commenters, Mitigation Measure 4.10-10a includes monitoring of groundwater levels in up to five offsite private wells west of the Quarry Site if access to the wells can reasonably be gained with permission from the property owners. However, neither CEMEX nor Fresno County can require private well owners to allow monitoring at their individual residential wells. Similar programs have been implemented at other aggregate mining quarries throughout California, the nearest to the project site being at the Vulcan Austin Quarry in Madera County, approximately 5 miles northwest of the Quarry Site. For implementation of this component of Mitigation Measure 4.10-10a, the well owners would be provided with the opportunity to participate and enter into an access agreement to have their wells inspected, monitoring equipment installed, and the water levels in their wells monitored. Participation would be the prerogative of the owners of each of the five wells. For owners that elect not to participate, data would not be available to assess groundwater levels in their wells but would not affect the efficacy of Mitigation Measure 4.10-10a.

The monitoring and reporting work to be performed under Mitigation Measure 4.10-10a would be conducted by a California-licensed Professional Geologist or Certified Hydrogeologist that is approved by Fresno County. In addition, the data, analysis, and conclusions of the Professional Geologist or Certified Hydrogeologist must be reviewed and approved by Fresno County. The program would be funded by CEMEX as described

in Mitigation Measure 4.10-10b. To provide clarification of the funding obligation, Mitigation Measure 4.10-10b is modified in errata in Chapter 3 of this Final EIR specifying that the Operator would be required to fund the Groundwater Adaptive Management Program outlined in Mitigation Measure 4.10-10a and establish a post-reclamation funding mechanism to provide a secured funding source for monitoring the specified well clusters.

Individual well owners or private property owners would not be required or obligated to collect or analyze any data. The monitoring, data collection, data analysis, and development of conclusions and recommendations related to potential corrective actions would all be performed by an independent consultant under oversight from Fresno County and at the expense of the Operator. Thus, there would be no burden of proof placed upon the well or property owners to identify or confirm an impact that would trigger Mitigation Measure 4.10-10a.

Mitigation Measure 4.10-10a specifies that monitoring is to continue for at least 3 years after mining reaches the full approved mining depth and monitoring data demonstrates that any drawdown in the MW-1 and MW-3 monitoring well clusters is less than 15 percent of the previously established water level for the specified well. In other words, monitoring would occur for at least 3 years after dewatering of the Quarry Site excavation stops. During this same 3-year post-dewatering monitoring period, the water level within the Quarry Site excavation, and in the surrounding hard rock aquifer, would be recovering, or increasing, since dewatering would no longer be occurring. Thus, there is no reasonable potential that dewatering of the Quarry Site excavation would have any additional or future effects on nearby groundwater levels following mining since dewatering would have ceased and the groundwater level would be recovering or rising. As an additional protective requirement, the post-dewatering monitoring period would be a minimum of 3 years but must also include at least two below-normal rainfall years or one critically dry year, as defined by the California Department of Water Resources (DWR) (Draft EIR at page 4.10-111). Thus, if mining reaches the permitted depth during a period of wet years, the monitoring period and funding mechanism must remain in place for more than 3 years.

Mitigation Measure 4.10-10a also states that if the water level in any of the monitored wells has decreased by more than the defined criterion of 15 percent at the time mining is complete and dewatering stops, pumping to the Northeast Pond and/or recharge trenches must continue until the 15 percent criterion is met in the MW-1 and MW-3 well clusters (Draft EIR at page 4.10-111). To verify that the 15 percent criterion is met, the monitoring program and any necessary corrective actions would continue until all monitored wells meet that standard. Thus, the funding mechanism would also remain in

place until each of these requirements are met. In other words, the monitoring, data evaluation, and any corrective measures would continue at no expense to the County or to individual well owners.

As summarized above, the Draft EIR analysis is based on substantial evidence and concludes that with implementation of Mitigation Measures 4.10-10a and 4.10-10b, as clarified and amplified through errata in this Final EIR, project groundwater impacts associated with mining and reclaimed conditions at the Quarry Site would be less than significant and no additional mitigation measures are necessary.

(Letter #58), the City of Fresno (Letter #12) and City of Fresno, Department of Public Works (Letter #12, Exhibit 1), among others, for detailed analysis and discussion of water quality issues and appropriate mitigation measures, as analyzed by the County's hydrology and water quality consultants.

4.1.26 Collective Response #25: Interconnected Surface Water, Groundwater Dependent Ecosystems, and Impacts on Flows in the San Joaquin River

Comments on the Draft EIR claim that seepage of surface water from the San Joaquin River into the Quarry Site excavation would reduce overall flows in the river and suggest that potential impacts to downstream water users should be evaluated. Similarly, comments on the Draft EIR also suggest that the inflow of groundwater from the surrounding aquifer would reduce groundwater levels and suggest that potential impacts to nearby wells should be evaluated.

Interconnected surface water (ISW) is defined in California Code of Regulations Title 23 (23 CCR), Section 351(o), which states that "Interconnected surface water refers to surface water that is hydraulically connected at any point by a continuous saturated zone to the underlying aquifer and the overlying surface water is not completely depleted." Groundwater dependent ecosystems (GDEs) are defined in 23 CCR, Section 351(m) as "ecological communities of species that depend on groundwater emerging from aquifers or on groundwater occurring near the ground surface." The definitions within Section 351 of 23 CCR apply specifically to the Sustainable Groundwater Management Act (SGMA) and relate to preparation of Groundwater Sustainability Plans (GSPs) under oversight from the California Department of Water Resources (DWR). These definitions do not relate to water rights and regulations of the Division of Water Rights under the California State Water Resources Control Board.

As explained in detail below, the Draft EIR, including its technical appendices, presents substantial evidence, in the form of data and analysis, to assess the potential occurrence of ISW, along with the presence of GDEs and any related impacts on flows within the San Joaquin River.

Interconnected Surface Water

DWR published a document entitled "Depletions of Interconnected Surface Water – An Introduction – Draft" in February 2024. In that document, DWR identified two conditions that result in, or are indicative of, ISW:

1. Groundwater elevations that are near or above the elevation of the riverbed; and
2. Similar trends in groundwater levels and stream stage.

DWR notes that distance from the river to a groundwater well may diminish the ability to identify changes to groundwater levels. However, if the groundwater level in a well shows the same trend as the stream stage, even if that trend is muted, it could indicate the presence of ISW.

Quarry Site Area

Charts comparing groundwater levels with rainfall and the stage of the San Joaquin River are provided in Section 4.10.1.9, "Groundwater-Surface Water Interaction at the Quarry Site," and within Appendix G-5, "Hydrology and Water Quality Analysis Report," of the Draft EIR. For example, Final EIR Figure 4-1, "Comparison of Pond Elevation at the Beck Ranch with Rainfall and San Joaquin River Stage," which is a reproduction of Figure 16 of Draft EIR Appendix G-5 provided here for easy reference, shows that water levels in ponds at the Beck Ranch property, just north of the Quarry Site, respond very quickly to major rainfall events, but do not have any correlation to changes in the river stage. The ponds on the Beck Ranch property are former mining excavations while the water surface within the ponds is a reflection of the local groundwater surface.

Figure 4.10-11, "Comparison of Groundwater Levels to Daily Rainfall and River Stage," of the Draft EIR (which is a reproduction of Figures 14 and 15 from Appendix G-5 of the Draft EIR) show a similar comparison for rainfall and river stage, respectively, and the groundwater levels measured in Quarry Site wells. These figures, and the related analysis within the Draft EIR, demonstrate that increases in groundwater levels occur primarily in response to significant rainfall events and not to increases in river stage.

Plant Site

For the Plant Site, the hydrographs for wells MW-1 through MW-4 included in Appendix G-6, "Addendum to Hydrology and Water Quality Analysis Report," of the Draft EIR show that the groundwater levels in these wells began to rise in early 2019 in response to rainfall and several months before any appreciable increase in the stage of the San Joaquin River. In fact, the water levels in three of the four Plant Site wells, including the two wells closest to the San Joaquin River (MW-2 and MW-3) were already declining prior to a major increase in river stage from May to July 2019, and continued to decline throughout the period of the elevated river stage.

Conclusion

Based on the discussion above, and the charts cited above from Draft EIR Section 4.10.1.9 and Appendices G-5 and G-6, there are no trends between groundwater levels and river stage at locations evaluated north of the Quarry Site (i.e., Beck Ranch), at the Quarry Site, or at the Plant Site. The absence of similar trends in groundwater levels and river stage show that conditions indicative of ISW are not present at the project sites.

Groundwater Dependent Ecosystems

As described in Section 3.2.8 of the North Kings GSP 2025 Update, potential GDEs along the San Joaquin River have been identified by The Nature Conservancy's (TNC's) Natural Communities Dataset Viewer Vegetative GDE and Wetland GDE map. TNC's dataset is a statewide database that compiles certain publicly available information (data not created by TNC) as then reviewed by the DWR, CDFW and TNC to create a macro analysis of potential GDEs. The data does not represent a determination of a GDE, but rather a starting point for further analysis. "Natural Communities Normally Associated with Groundwater" (CA Natural Resources Agency [2025 website] https://data.cnra.ca.gov/dataset/natural-communities-commonly-associated-with-groundwater). The data set itself conducts no site-specific work, rather it compiles work previously prepared from certain (but not all) sources. In contrast, the work conducted for the Draft EIR was based on site specific field surveys and analysis.

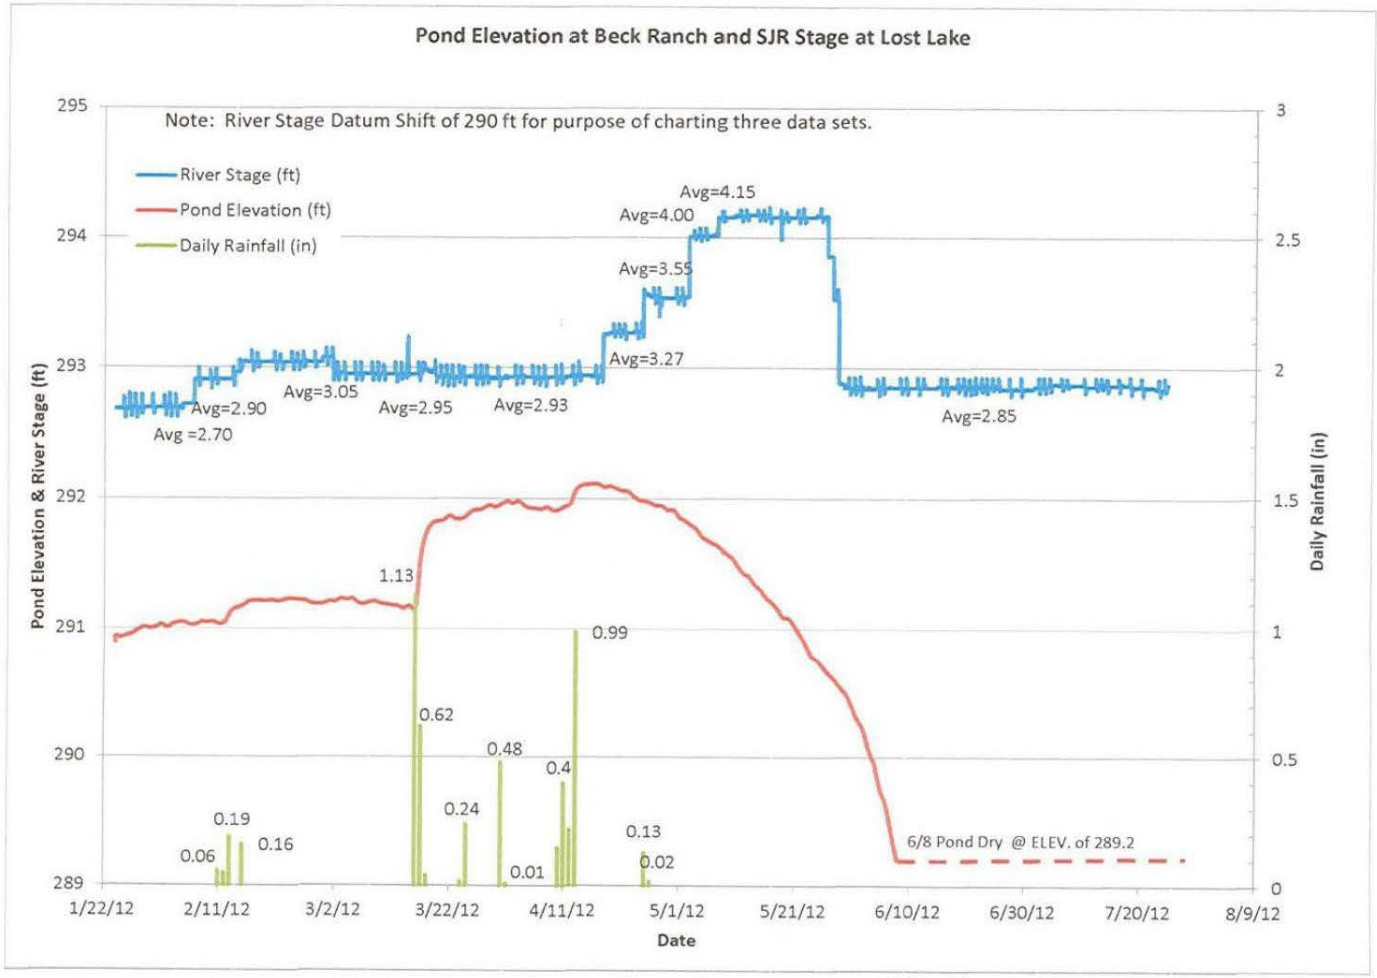

FIGURE 6-RELATION BETWEEN STAGES IN THE SAN JOAQUIN RIVER AND WATER LEVELS IN THE EXCAVATION

FIGURE 16. Comparison of Pond Elevation at the Beck Ranch with Rainfall and San Joaquin River Stage (from KDSA, 2012).

THIS PAGE
INTENTIONALLY
LEFT BLANK

The North Kings GSP recognizes that many areas depicted as GDEs on TNC's Dataset Viewer are in areas where the depth to groundwater is deeper than the deepest vegetative rooting depth for GDEs. As a result, the Groundwater Sustainability Agency has identified "Rejected GDEs" on Figure 3-52 of the North Kings GSP 2025 Update. Figure 3-52 from the GSP 2025 Update, with the Rockfield Modification project boundary overlaid, is reproduced as Final EIR Figure 4-2, "Kings Subbasin Groundwater Dependent Ecosystems."

Quarry Site Area

As shown in Figure 4-2, within the Quarry Site area, "Possible GDEs" are identified along the San Joaquin River and in several discrete areas to the east of the river. As discussed above in the discussion of ISW, the depth to groundwater in the Quarry Site area is deeper than that which would typically support GDEs. As noted in Appendix E-2, "Quarry Site Habitat Assessment," of the Draft EIR, vegetation along the San Joaquin River adjacent to the Quarry Site is riparian but not dependent on groundwater.

Review of aerial images in the areas of the "Possible GDEs" to the east of the river reveals that these features are mining excavations that currently or formerly contained ponded water. The TNC Dataset Viewer is based on information from 1984 to 2016 (ibid). In several cases, these features identified as "Possible GDEs" have been excavated and removed since the time that TNC developed its dataset viewer. These are mining excavations and industrial ponds that are neither waters of the U.S. nor waters of the state, as discussed in more detail in the Quarry Site Habitat Assessment in Appendix E-2 of the Draft EIR.

Plant Site Area

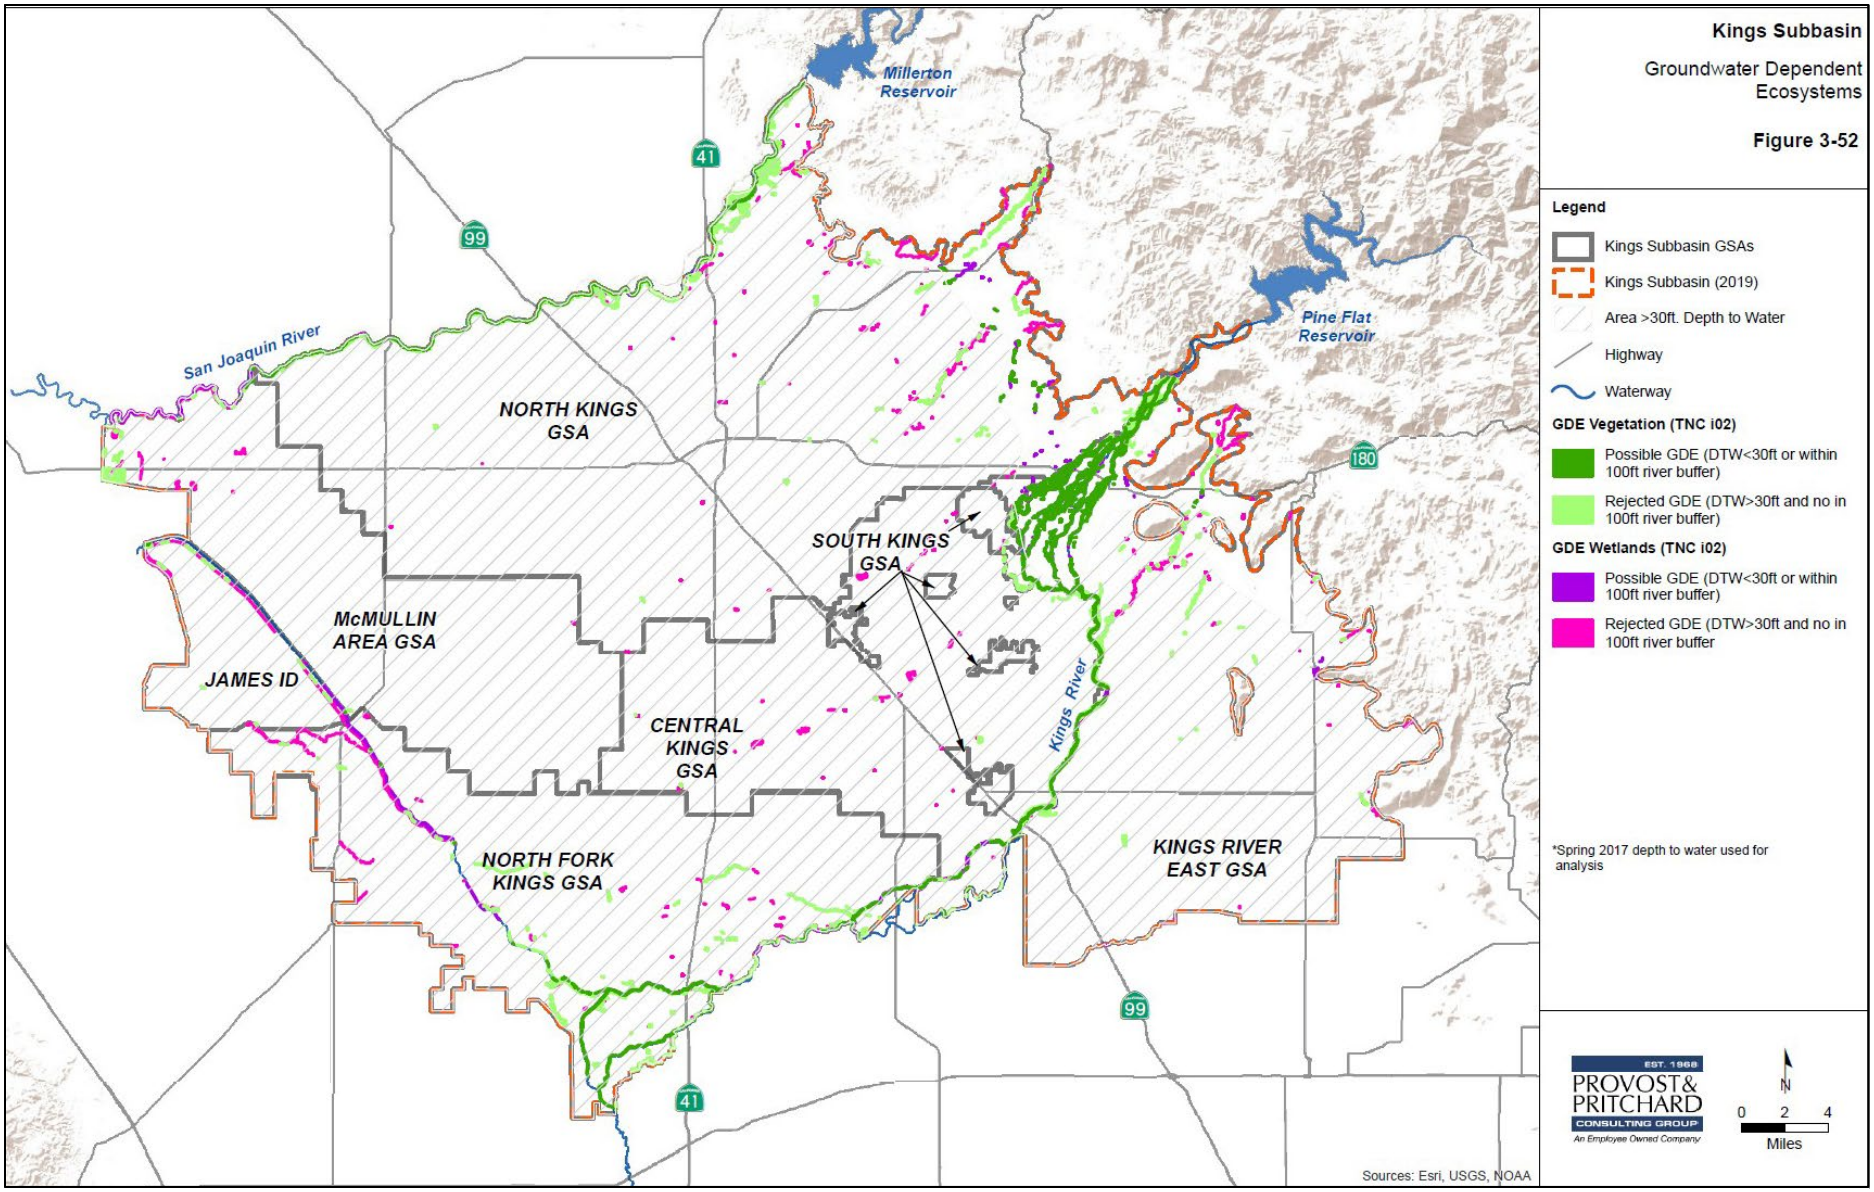
Within the Plant Site area, all of the potential GDEs identified on TNC's Dataset Viewer have been classified as "Rejected GDEs" (see Figure 4-2) due to the depth to groundwater.

Furthermore, ELMT Consulting conducted a survey of potential groundwater dependent vegetation on and within 500 feet of the Plant Site area (see Appendix E-5, "Groundwater Dependent Vegetation Survey," of the Draft EIR). While ELMT Consulting identified a number of potential groundwater dependent plant species in the survey, it concluded that due to the depth to groundwater these species were more likely dependent on rainfall, consistent with the conclusion in the North Kings GSP 2025 Update. ELMT also noted that, while there may be "Possible GDEs" within 100 feet of the San Joaquin River, those GDEs are approximately 2,500 feet from the Plant Site. ELMT concluded that:

At this distance, the decrease in groundwater levels as a result of the proposed project would be 0 to 1 foot. This level of drawdown is generally within normal seasonal fluctuations of groundwater and therefore would be unlikely to have an adverse effect on groundwater dependent ecosystems (Appendix G-3, "Groundwater Conditions at the Plant Site," of the Draft EIR).

Conclusion

Based on the data and analyses presented in and considered by the Draft EIR, as summarized above, there are no GDEs present that would be affected by the project in the Quarry Site area or the Plant Site area.



Impacts on Flows in the San Joaquin River

Section 4.10.1.9 of the Draft EIR acknowledges that the flow of water from the San Joaquin River to groundwater at the Quarry Site does occur but is limited and inconsistent due to several factors. Appendix G-3 of the Draft EIR also acknowledges that groundwater in the alluvium at the Plant Site primarily comes from the San Joaquin River.

Quarry Site

As discussed in the Draft EIR, the hydraulic conductivity (comparable to the permeability) of the alluvium is much higher than that in the underlying weathered rock and hard rock. Thus, appreciable recharge from the San Joaquin River to the Quarry Site is primarily dependent on periods when the stage of the river is above the bottom of the alluvium (equivalent to the top of the weathered rock). The Draft EIR analysis points out that from January 2014 to February 2023; the stage of the river was higher than the bottom elevation of the alluvium only 13 percent of the time.

This is the existing baseline condition. The alluvium at the Quarry Site has already been almost completely removed by mining, especially in the parts of the Quarry Site adjacent to the San Joaquin River. Thus, any future mining to greater depths would not alter the frequency and duration of potential inflow into the quarry from the river through the alluvium. Figure 4.10-13, "Comparison of Weekly Dewatering Rates with Daily Rainfall and River Stage," of the Draft EIR shows that the amount of water that is pumped, or dewatered, from the quarry is primarily related to local rainfall and shows no correlation to river stage. Furthermore, based on the groundwater contour maps and aquifer permeabilities (transmissivities) described in Appendices G-3 through G-5 of the Draft EIR, the rate of groundwater movement is approximately 550 feet per year in the alluvium. The distance from the edge of the Quarry excavation to the San Joaquin River is approximately 350 feet to 400 feet.

ROCKFIELD MODIFICATION PROJECT

FINAL EIR

Figure 4-2

THIS PAGE
INTENTIONALLY
LEFT BLANK

As shown in Final EIR Figure 4-3, "San Joaquin River Stage Below Friant Dam," which is a reproduction of Figure 11 of Appendix G-5 of the Draft EIR, periods of elevated river stage last from a few weeks to six months, depending on the rainfall and runoff for that year. Thus, when the river stage increases, the duration of the period when the stage is above the elevation of the bottom of the alluvium is likely too short for any appreciable quantity of water to move through the alluvium into the quarry excavation.

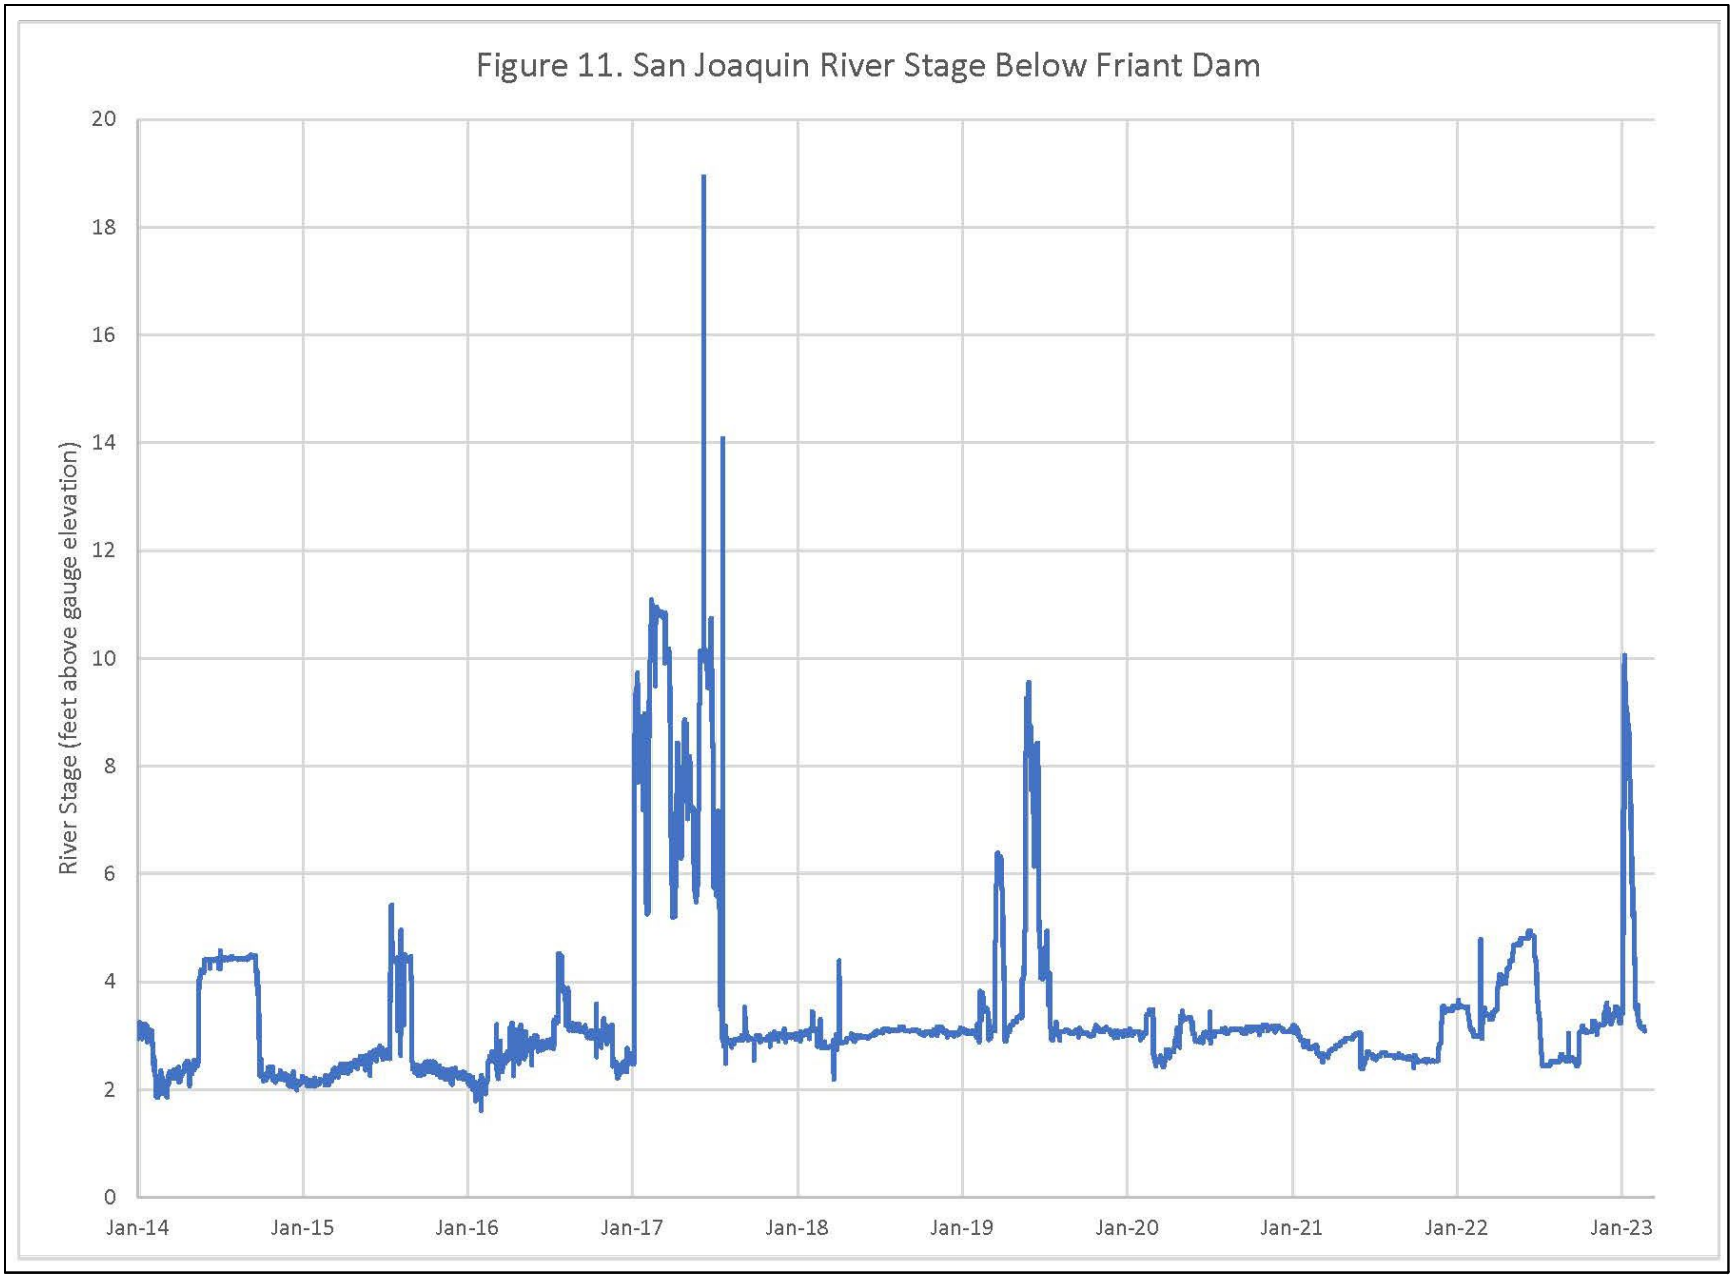
Table 4.10-7, "Comparison of San Joaquin River Water Quality to Quarry Site Groundwater Quality," of the Draft EIR shows little similarity between the water quality in the San Joaquin River and that measured in the weathered rock and hard rock monitoring wells closest to the river. Thus, while there may be some movement of water from the river into the bedrock aquifer units underlying the alluvium, the quantity is small because it is not reflected in the groundwater quality data. Furthermore, the groundwater contour maps presented in the Draft EIR and in Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR for the weathered rock and hard rock units demonstrate that groundwater is primarily flowing from the northeast to the southwest. In other words, groundwater in the deeper bedrock aquifer units is flowing toward the river through the Quarry Site area, not away from the river. Any water from the river that enters the weathered rock, and hard rock does not contribute significantly to the amount of water currently being dewatered from the existing Quarry.

This is demonstrated in the paragraph above in reference to Figure 4.10-13 of the Draft EIR, which shows no correlation between dewatering rates and river stage.

In addition, there is no evidence in the river stage and groundwater elevation data to suggest that there is ISW at the Quarry Site, and there are no GDEs at the Quarry Site.

Plant Site

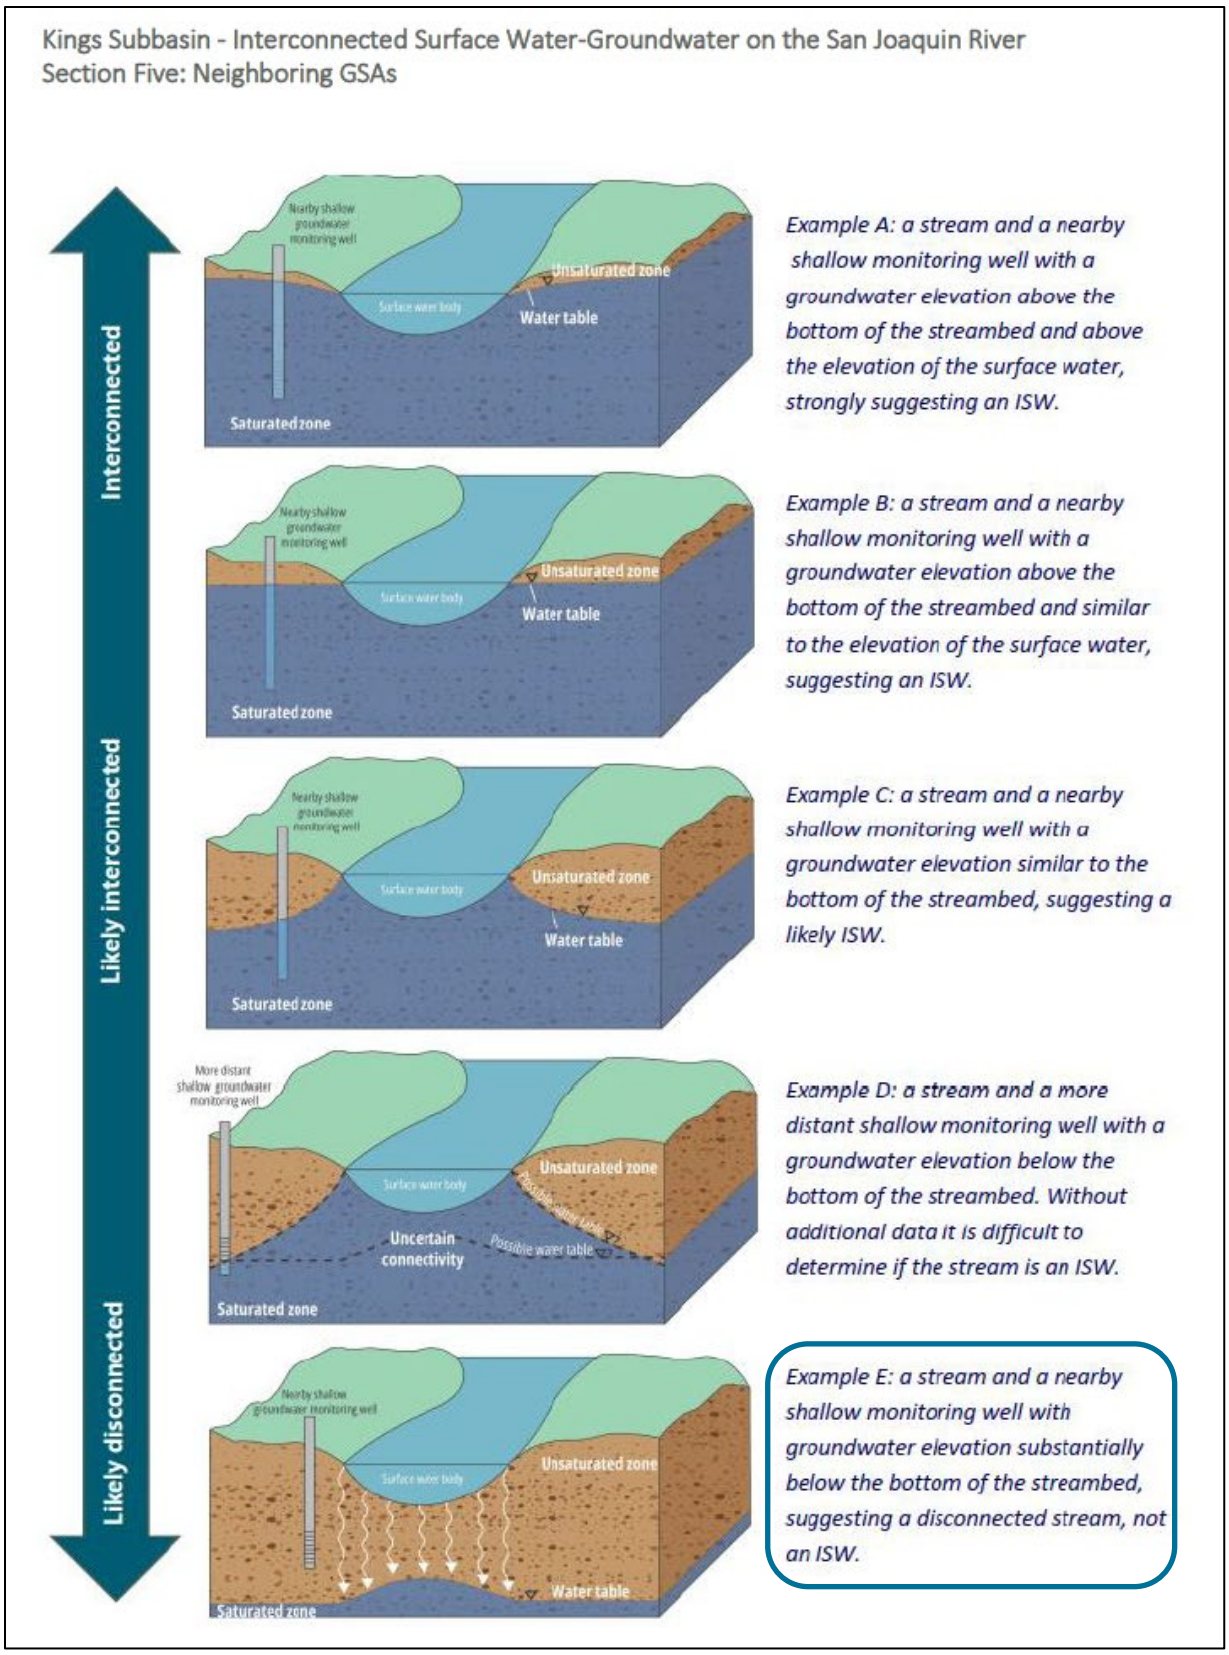
As described above, groundwater within the alluvium at the Plant Site and surface water in the river are not interconnected. However, as acknowledged in Appendix G-3 of the Draft EIR, groundwater within the alluvium in the Plant Site area most likely comes from the river. This relationship is illustrated in Example E from Figure 6 of Appendix 3-C of the North Kings GSP 2025 Update, which is provided here as Figure 4-4. As this figure shows, water percolates through the base of the river channel downward toward the groundwater surface. However, because the groundwater surface and river are not interconnected, the water percolates through the base of channel based on the leakance properties of the sediment in the channel. Thus, the rate of percolation through the base of the river channel is not dependent on the depth



of the groundwater surface beneath the river. This situation is analogous to the rate that water might leak through the roof of a house. If a bucket is used to catch the water leaking into the house, the rate that water comes through the roof does not depend on how close the bucket is to the ceiling. In this analogy, the roof is equivalent to the base of the river channel, while the bucket is equivalent to the underlying, but not interconnected, groundwater surface.

Conclusion

The Draft EIR and its appendices contain substantial evidence, in the form of graphical comparisons, tabular data, and narrative analysis that show that:



- surface water in the San Joaquin River and the groundwater at the project site are not interconnected,
- there are no GDEs at the project site, and
- future mining and dewatering at both the Quarry Site and Plant Site would not significantly alter the amount of water moving from the San Joaquin River into the groundwater.

Within the Quarry Site, the mining excavation already exists and has effectively removed most, or all, of the alluvium. Mining into the underlying weathered rock and hard rock zones would not cause substantial additional movement of water from the river into these geologic deposits, which given their hard rock nature, have very low permeability and limited fracturing.

4.1.27 Collective Response #26: Baseline Groundwater Data

Comments received on the Draft EIR raise concerns about the historical groundwater data utilized in the project's hydrology analyses. The comments suggest that data collected over a longer period of time representing differing hydraulic conditions should be used to determine baseline groundwater conditions.

Draft EIR Appendix G-6, "Addendum to Hydrology and Water Quality Analysis Report," provides groundwater level data that have been collected continually since 2017 at the Plant Site and since 2018 at the Quarry Site (except for Well MW-7D, where monitoring began in 2020, immediately after that well was installed). As shown in Figure 5 of Appendix G-6, this period covers both wet and dry years.

Figure 4.10-11, "Comparison of Groundwater Levels to Daily Rainfall and River Stage," of the Draft EIR provides a comparison of groundwater elevation data from wells at the Quarry Site with the river stage in the San Joaquin River from October 2018 through September 2019. During that period, the river stage exceeded six feet in mid- to late-March 2019 and exceeded eight feet in late May and mid-June 2019. These stage values are equivalent to river flows of approximately 3,200 cubic feet per second (cfs) to over 6,500 cfs, respectively (DWR 2025a). Base flows of approximately 400 cfs occurred before and after these periods. The data presented in Figure 4.10-11 of the Draft EIR demonstrates that groundwater level monitoring has occurred during periods of both low base flows and during periods of elevated river releases.

Appendix B of the "Funding Constrained Framework for Implementation," of the San Joaquin River Restoration Project (SJRRP) describes several flow scenarios to be implemented, with peak flow rates in the range of 2,500 cubic feet per second (cfs) for Stage 1 of the SJRRP. These flow scenarios have durations of 20, 40, or 60 days in the spring months (February to May). Full implementation of the SJRRP after Stage 1 could see flows during these short-duration periods of up to 5,000 cfs. As described in the paragraph above, flows on the San Joaquin River in mid-2019 exceeded both the Stage 1 peak restoration flow rate and the post-Stage 1 flow rate for comparable durations as those to be implemented as part of the SJRRP.

Figure 12 of Appendix G-5, "Hydrology and Water Quality Analysis Report," of the Draft EIR shows that during 2017, river stage levels, and thus the related flows, were substantially greater than those in 2019. Thus, the analysis presented Draft EIR Section 4.10, "Hydrology and Water Quality," and Appendices G-5 and G-6 of the Draft EIR are based on a wide range of river flows, including those that are greater than projected SJRRP flows.

Furthermore, Appendix E within Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR provides groundwater contour maps for multiple depth zones at the Quarry Site for May 2017, October 2018, December 2018, January 2019, March 2019, June 2019, and September 2019. As described above, these periods cover a wide range of river flow conditions. Comparable maps for the Plant Site area are provided in Appendix D within Appendix G-3, "Groundwater Conditions at the Plant Site," of the Draft EIR.

The groundwater monitoring data presented in the Draft EIR span multiple years and include both wet and dry conditions, as well as periods of low base flows and high river releases. These data encompass a reasonable range of hydrologic variability consistent with that described in the subject comments and provide an adequate and representative basis for establishing baseline groundwater conditions.

4.1.28 Collective Response #27: Operational Effects on Park/Trail Users

Comments on the Draft EIR express concerns about various potential effects on users of parks, trails, and other recreational facilities located near the project sites that could result from project operations, in particular blasting events. Comments expressed concerns with potential effects related to noise and vibration, safety hazards, and the inability to enjoy recreational uses.

As described under the subsection "Blasting," in Draft EIR Section 2.5.2.2, "Quarry Site Mine Plans," blasting would occur up to two times per week between 10 a.m. and 2 p.m. on weekdays. A typical blasting event would last approximately one to two seconds. See also Section 4.13, "Noise," of the Draft EIR for further information regarding the project's potential noise and vibration impacts. The project would be required to maintain specified blasting vibration and air overpressure thresholds intended to avoid structural damage, embankment destabilization, and substantial human disturbance. (See discussion of Impact 4.13-6 on page 4.13-64 of Draft EIR.) For further discussion of blasting vibration and air overpressure thresholds applicable to human response, including revised thresholds incorporated into the Blasting Protocols, please see Chapter 3, "Draft EIR Errata," of this Final EIR and Appendix H-9, "Revised Blasting Protocols."

As shown on Draft EIR Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site ," the Lost Lake Recreation Area was identified as sensitive receptor Q-5 for the noise and vibration analysis. Table 4.13-4, "Existing Ambient Noise Environment at Nearest Receptors to Quarry Site," on Draft EIR page 4.13-22 presents existing ambient noise levels at sensitive receptors while Table 4.13-17, "Estimated Quarry Site Noise Levels (dBA) at Nearest Receptors," on Draft EIR page 4.13-60 presents the estimated noise levels from proposed Quarry Site operations at sensitive receptors. As shown, neither

existing ambient nor predicted noise levels at receptor Q-5 exceed the County's significance thresholds. In other words, a significant noise impact would not occur at the Lost Lake Recreation Area due to project operations. Although blasting events may occasionally be perceptible to nearby recreational users during short-duration blasting events, implementation of the revised blasting thresholds and protocols would minimize potential disturbance and avoid significant blasting-related impacts.

Potential safety hazards to recreationists near the Quarry Site are addressed in the Draft EIR under Impact 4.7-7 (slope stability) beginning on page 4.7-32 and Impact 4.9-4 (flyrock) beginning on page 4.9-19.

4.1.29 Collective Response #28: Land Subsidence

The California Department of Water Resources (DWR) defines land subsidence as the sinking of the land surface due to changes in the soil or sediment in the subsurface (https://water.ca.gov/Programs/Groundwater-Management/Subsidence). DWR states that "[s]ubsidence due to groundwater pumping occurs when the water pressure in the subsurface sediments is reduced and the fine-grained sediment (such as silt and clay) compacts. As the water pressure is reduced by pumping, fine-grained soil particles reorganize and compress into a flatter structure." (Ibid.) On a more localized basis, Section 3.2.6 of the 2025 Update to the North Kings Groundwater Sustainability Plan states that "the compression of clay as a result of groundwater extraction from confined aquifers is the cause of the vast majority of subsidence documented in the San Joaquin Valley…Most of the permanent subsidence in the San Joaquin Valley has historically been correlated to overdraft in the confined aquifer below the Corcoran Clay." (https://provostandpritchard-my.sharepoint.com/:b:/g/personal/rquist_ppeng_com/EXPccPEPCtVIoECGOf5QzdYB5035-RctDoMV6elIaM3SEg?e=f6qjBw) Based on these statements from DWR and the North Kings Groundwater Sustainability Agency, the critical factors for land subsidence due to groundwater pumping are:

- The presence of fine-grained sediment, such as silt and clay; and
- Groundwater extraction from confined aquifers.

Section 4.7.1.2, "Soils, Geologic, and Seismic Hazards," of the Draft EIR, in a subsection entitled "Subsidence" (page 4.7-11 of the Draft EIR) describes the causes and potential effects of subsidence. This subsection of the Draft EIR concludes that "[b]elow the groundwater level, the subsurface soils at the Plant Site and Quarry Site generally consist of dense to very dense alluvial sands and gravels underlain by sedimentary and/or granitic rock, which have low potential for subsidence."

At the Plant Site, dewatering and groundwater pumping would occur in an unconfined aquifer zone, not from a confined aquifer. Specifically, there are no clay layers that overlie the alluvial aggregate deposits to be mined at the Plant Site. Thus, a confined aquifer is not present within the depths to be dewatered and mined. As noted on page 3-75 of the 2025 Update to the North Kings Groundwater Sustainability Plan, minimal subsidence has occurred in the North Kings Groundwater Sustainability Area (NKGSA), which includes both the Plant Site area and the Quarry Site area. More specifically, "[t]he greatest subsidence in the plan area has been located along the western edge of the NKGSA boundary…[which] seems to correlate with the presence of the Corcoran Clay" (2025 Update to the North Kings Groundwater Sustainability Plan, page 3-75, last paragraph). The lack of fine-grained confining layers such as the Corcoran Clay throughout the rest of the NKGSA is, therefore, the reason there has been only minimal subsidence within the NKGSA boundary. Thus, the critical factors for land subsidence due to groundwater pumping do not exist at the Plant Site.

Granitic bedrock formations such as the weathered rock and hard rock at the Quarry Site are not subject to subsidence due to the extraction of groundwater because such formations do not consist of or contain fine-grained sediments, such as silt and clays. Therefore, there are no sedimentary confining layers such that the critical factors for land subsidence due to groundwater pumping do not exist at the Quarry Site.

4.1.30 Collective Response #29: Traffic Impacts and Mitigation

Several commenters express concerns about the project's potential traffic impacts and the proposed traffic mitigation measures. Commenters suggest that the applicant/operator should be responsible for fully funding all pavement and transportation impacts.

See Draft EIR Section 4.17, "Transportation," discussing transportation and transportation impacts and for a detailed discussion of the Traffic Index analysis and the LOS and Queuing analysis. See also Draft EIR Section 5.3.17, "Transportation," discussing cumulative transportation impacts. The Traffic Impact Study conducted for the project includes an assessment of project-related truck trip distribution on study area roads. See Draft EIR Appendix I-1, "Traffic Impact Study," conducted for the proposed project. Draft EIR Appendix I-1, Figure 1.3 depicts the selected study areas of the traffic impact study.

The traffic impact analysis study area was determined through coordination with Fresno County and its expert consultant team and is considered appropriate for the purposes of documenting the project's traffic-related impacts.

The Draft EIR analyzes impacts to existing pavement conditions, as well as pavement conditions with the project in place. (Draft EIR page 4.17-29) The results of the Existing-Plus-Project road segment Traffic Index (TI) analyses performed in the Traffic Impact Study are summarized in in the Draft EIR, page 4.17-26, Table 4.17-10, "Traffic Index Summary—Existing-Plus-Project (3.0 MT Per Year)." Because the project would result in a significant increase in the traffic index on all analyzed pavement segments, the Draft EIR proposes equitable share contributions by the Operator to mitigate the impacts of an increased traffic index. Measures to reduce these traffic congestion effects are recommended in the Traffic Impact Study (Draft EIR Appendix I-1), are identified under Impact 4.17-1, and are required as Mitigation Measures 4.17-1a through 4.17-1r. These measures primarily consist of the payment of equitable share of costs of future roadway improvements in the County, and, if warranted, the installation of traffic signals at the intersection of North Friant Road with the Quarry Site and Plant Site entrances. For each intersection requiring equitable contribution for road improvements, these equitable shares are calculated for the increase above the baseline traffic index and are typically paid at one time at the initiation of the project or in installments as provided in a future agreement with the County. The equitable share would apply towards an ultimate future improvement, as specified in Mitigation Measures 4.17-1a through 4.17-1r. The percentage of contribution necessary for the specified intersections is provided in the Traffic Impact Study (see Draft EIR Appendix I-1, Table 12.2 at page 60). The traffic study's analysis indicates that LOS and queuing would be effectively reduced through the implementation of the recommended measures; however, traffic impacts, including impacts to pavement conditions, are considered significant and unavoidable because it is uncertain when the necessary road improvements would be constructed (Draft EIR page 4.17-29).

The County cannot legally require the project to fully fund the necessary road improvements and instead must limit the imposition of mitigation requirements to those that are roughly proportional to the project's impacts (Title 14 CCR Section 15126.4(a)(4); *Dolan v. City of Tigard*, 512 U.S. 374 (1994)). Therefore, the appropriate mitigation requirement for project impacts to traffic operations is for the applicant/operator to contribute the project's proportional share of funding toward the improvements, which is required through Mitigation Measures 4.17-1a through 4.17-1r in the Draft EIR and as revised for clarification through errata in this Final EIR as discussed further below. As discussed in the Draft EIR (see Draft EIR pages 4.17-29 and 4.17-30), even with the applicant/operator's contribution of the project's proportional share of funding for these improvements, the improvements necessary to achieve acceptable LOS and pavement conditions at these intersections may not occur before the project's introduction of additional vehicle trips because of, for example, a lack of funding for the other

proportional shares beyond the control of the applicant/operator. Therefore, the project's impact at 5 intersections (Friant Road and Willow Ave; Copper Ave and Willow Ave; SR 41 and Road 145; Road 206 and Road 145; and Friant Road and North Fork Intersection) under the following conditions is considered significant and unavoidable:

- Existing-Plus-Project Conditions (Stage 1—3.0 MT per year);
- Five-Year Cumulative Conditions with Project (Stage 1—2.0 MT per year);
- 15-Year Cumulative Conditions with Project (Stage 1—3.0 MT per year); and
- Cumulative (Year 2040) Conditions with Project (Stage 1—3.0 MT per year).

As provided in the Traffic Impact Study and clarified in the Chapter 3, "Draft EIR Errata," the Operator would fully fund the road improvements necessary for the Friant Road and Plant Site Access Intersection and the Friant Road and Quarry Site Access Intersection. Revisions to the Draft EIR Transportation section are provided and explained more fully in Chapter 3.

4.1.31 Collective Response #30: Road Safety

Several commenters suggest that the Draft EIR does not sufficiently address road safety impacts, particularly concerning the project's potential to increase loose gravel on public roads. The commenters also raise concerns about loose gravel harming bicyclists and causing windshield damage, as well as the increased potential for traffic accidents involving vehicles from the project sites. The Draft EIR addresses potential road safety impacts associated with the project in Impact 4.17-3.

The project would be subject to San Joaquin Valley Air Pollution Control District (SJVAPCD) rules that would reduce loose gravel on public roads, including SJVAPCD Rule 8041, "Carryout or Trackout." SJVAPCD Rule 8041 requires that affected facilities prevent and/or clean up carryout and trackout at the end of each workday. (Draft EIR page 4.3-28.) In complying with that requirement, the proposed project would reduce fugitive dust emissions by minimizing carryout or trackout (i.e., loose soil, debris and gravel) on paved public roads or paved shoulders of public roads. The project would also be subject to SJVAPCD Rule 8031, "Bulk Materials," which requires certain measures to limit the opacity of visible dust emissions. One of these measures includes maintaining haul trucks to prevent spillage or loss of bulk materials. (Draft EIR page 4.3-28.) Although these rules are aimed at reducing fugitive dust emissions and impacts to air quality, the measures would also reduce the potential for the project to increase the amount of gravel or debris on public roads. Compliance with SJVAPCD Rules 8041 and 8031 would also reduce potential road hazards to pedestrians, bicyclists, and motorists.

As discussed in the Draft EIR at Impact 4.17-3, all trucks and other motor vehicles associated with the proposed project are subject to the California Vehicle Code and local regulations intended to provide an appropriate degree of safety for motorists, bicyclists, and pedestrians. Furthermore, the existing site access/egress at the Plant Site and Quarry Site includes southbound acceleration lanes and northbound left-hand turn pockets for use by vehicles that facilitate safe access to the project sites, and these lanes and turn pockets would continue to be used under the proposed project. (Draft EIR page 4.17-41.)

As further addressed in Final EIR Chapter 3, "Draft EIR Errata," additional assessment of measures to address road conditions was performed by Peters Engineering Group and documented in the February 24, 2026, *Pavement Hazard Identification and Mitigation – CEMEX Rockfield Quarry Modification Project* memorandum (Pavement Memorandum) included as Appendix I-5 of this Final EIR. The Pavement Memorandum recommends that the project could mitigate the project's contribution to hazardous pavement conditions and safety concerns by repairing severe potholes on Friant Road between North Fork Road and Willow Avenue (inclusive of the area within the intersections) on request from the County of Fresno in response to substantiated reports from the public or as identified through County pavement condition surveys. The Pavement Memorandum recommends that with the application of such mitigation, the pavement hazard impact would be mitigated to below a level of significance. In consideration of the additional analysis and recommendations in the Pavement Memorandum, Mitigation Measure 4.17-3 is incorporated to the EIR through errata in Final EIR Chapter 3 and would require the Operator to fund and repair severe potholes in the travel lanes "on Friant Road between North Fork Road and Willow Avenue (inclusive of the area within the intersections) as requested by the County of Fresno in response to substantiated reports from the public or as identified through County pavement condition surveys," with the limitation that such costs would be reduced by future cost-sharing agreements if they ever occur between the County of Fresno and other parties, which would further reduce road safety hazards to motorists and bicyclists. With the addition of Mitigation Measure 4.17-3, the project's potential to increase roadway hazards would be less than significant. For further information, please refer Final EIR Chapter 3 for revisions to Draft EIR Impact 4.17-3 and the full text of Mitigation Measure 4.17-3.

4.2—PUBLIC AGENCIES COMMENTS AND RESPONSES

THIS PAGE
INTENTIONALLY
LEFT BLANK

4.2 PUBLIC AGENCIES COMMENTS AND RESPONSES

Letter #1 January, 28, 2025, Larry Brown, Fresno County Fire Protection District

Comment 1-1

Fresno County Fire Protection District (FCFDP) has received notice of this project, and has not identified any significant concerns. FCFPD has no comment for this project at this time. If future development is sought, your project/development will be subject to the requirements of the current Fire Code and Building Code when a building permit or certificate of occupancy is sought. Your project/development may be required to annex into the Community Facilities District No. 2010-01 of the Fresno County Fire Protection District.

Response 1-1

The comment is noted. The County would require a condition of approval that would ensure that the proposed project would comply with all applicable requirements of the current Fire Code and Building Code.

Letter #2a February 24, 2025, Keyomi Jones, California Department of Transportation

Comment 2a-1

The Rockfield Quarry Modification Project EIR No. 7763 and Unclassified CUP Application Nos. 3666 and 3667 Summary document describes the proposed continuation and modification of the aggregate mining and possessing operations; however, the documents provided are from original proposed operation. The CEMEX Rockfield Modification Project Traffic Impact Study (2019), VMT Letter Addendum to Traffic Impact Study (2020), Scoping Meeting Agenda (2020) are all out of date. The documents concerning this modification should be forwarded for review.

Response 2a-1

The documents referenced in this comment are current documents that pertain to the proposed project. See Appendix I, "Transportation," of the Draft EIR. The project application was submitted in 2019, and the Draft EIR and supporting technical documents were prepared between 2019 and 2025. No substantive comments are provided.

Letter #2b February 10, 2026, Dave Padilla, California Department of Transportation

Comment 2b-1

Dear Mr. Mtunga:

Caltrans has completed the review of the Draft Environmental Impact Report No. 7763 for Conditional Use Permit Nos. 3666 and 3667. CUP Application No. 3666 proposes to amend the approval of the Plant Site, previously approved under CUP Nos. 2235, 3034, and 3094. CUP Application No. 3667 proposes to amend the approval of the Quarry Site, previously approved CUP Nos. 367, 2032, 3063, and 3093.

The project site is located north of State Route (SR) 41/Friant Road interchange.

The mission of Caltrans is to provide a safe and reliable transportation network that serves all people and respects the environment. The Local Development Review (LDR) process reviews land use projects and plans through the lenses of our mission and state planning priorities of infill, conservation, and travel-efficient development. To ensure a safe and efficient transportation system, we encourage early consultation and coordination with local jurisdictions and project proponents on all development projects that utilize the multimodal transportation network.

Caltrans provides the following comments consistent with the State's smart mobility goals that support a vibrant economy and sustainable communities:

Response 2b-1

The comment is introductory in nature and no response is required. The comment is noted for the benefit of the decision-makers.

Comment 2b-2

1. The CEMEX Rockfield Modification Project Traffic Impact Study (2019) is outdated and no longer reflective of current or future conditions. The study neglects the intersections of Friant Road with the State Route 41 interchange ramps despite their proximity to and functional relationship with the project (Comment documented in the Technical Memorandum - Response to Comments on Traffic Impact Study, dated December 17, 2020, with a cost per trip table).

   Vehicle queues are not properly addressed at or near this interchange. Queues from the local road intersections (Fresno

> Street and Nees Avenue) along Friant Road that extend to the ramp intersections are a concern. These conditions, along with potential off-ramp queues spillback, should be analyzed to assess operational and safety impacts.

Response 2b-2

Regarding the commenter's assertion that the Traffic Impact Study (TIS) is outdated, the TIS was prepared near the time of the Notice of Preparation, given that traffic impacts typically inform other areas of the analyses in a Draft EIR. While the traffic volumes may have increased since the time of the TIS, the TIS still provides a sufficient analysis of the project's transportation impacts in accordance with CEQA standards. CEQA does not require lead agencies to perpetually update the analyses forming the basis of impacts analysis.

As explained in the Final EIR Chapter 3, "Draft EIR Errata," the SR 41 / Friant Road Interchange was not previously analyzed in the Draft EIR, expecting that any project trip-related effects at the interchange would be addressed through the payment of any applicable per-trip fees for use by Caltrans at its discretion in making improvements at this interchange, in accordance with past practices. However, in consideration of the comment and to more fully evaluate the potential for project trips to affect traffic operations at the SR 41 / Friant Road Interchange, Peters Engineering Group prepared a technical memorandum documenting the observed conditions at and near the SR 41 / Friant Road Interchange at peak AM and PM periods, and evaluating potential effects associated with the project's net change in vehicle trips at the interchange in the "Interchange Analysis—State Route 41 and Friant Road" (Peters Engineering Group 2026b), provided in Appendix I-6, "State Route 41/Friant Road Interchange Analysis Technical Memorandum."

As presented in the Interchange Analysis memo and added to the Transportation section of the Draft EIR through errata in Chapter 3 of the Final EIR, the net project trips at the Friant Road / SR 41 interchange represent a very small fraction of the total traffic volumes, and are considered operationally negligible with respect to the total volumes and overall traffic operations (Peters Engineering Group 2026b). Considering the daily fluctuations in traffic volumes typically expected in urban areas, the trips generated by the project would be within the normal variations that would occur under existing conditions without the project and are not expected to cause a significant change in operations or measurably affect average queue lengths, traffic signal operations, or ramp operations (Peters Engineering Group 2026b).

Comment 2b-3

2. The Traffic Impact Study recommends improvements to the SR 41 / SR 145 intersection. Given the extent of the modifications recommended, an Intersection Safety and Operational Assessment Process (ISOAP) would be required prior to Caltrans' consideration of intersection modifications within State right-of-way.

   The ISOAP Guide provides a data-driven, performance-based framework incorporating the Safe System Approach to screen intersection strategies and identify optimal solutions for new or improved intersections. ISOAP objectively helps select intersection control and geometric designs for the expected users within the context of an intersection's location.

If you have any other questions, please call or email: Keyomi Jones, Associate Transportation Planner at (559) 981-7284 or keyomi.jones@dot.ca.gov.

Response 2b-3

The comment is noted for the benefit of the decision-makers.

Letter #3 February 28, 2025, Jennifer Laird, City of Fresno

Comment 3-1

Good Afternoon:

The City of Fresno is preparing comments regarding the Draft EIR for the CEMEX Rockfield Quarry. At this time, we are requesting copies of the Unclassified Conditional Use Permit Application Nos. 3666 & 3667.

I am unable to locate them.

Response 3-1

County staff provided the requested documents to commenter on March 4, 2026. See Comment Letter #11 for the City of Fresno's comments on the Draft EIR.

Letter #4 February 28, 2025, Jamie Silva, Central Valley Flood Protection Board

Comment 4-1

The Central Valley Flood Protection Board (Board) appreciates the opportunity to comment on the Draft Environmental Impact Report (DEIR) for the Proposed Modification to the Existing CEMEX

Rockfield Quarry (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667) Project (proposed project).

The proposed project involves the continuation and modification of its current aggregate (rock, sand, and gravel) mining and processing operation in two project stages that are estimated to span 100 years. The proposed project is located along the San Joaquin River, a regulated stream and designated floodway that is within the Board's permitting authority, therefore an encroachment permit may be required. Board permit information is available on the Permitting page at the Central Valley Flood Protection Board website.

Please include the Central Valley Flood Protection Board encroachment permit regulatory setting under heading 4.10.2.2 State.

California Code of Regulations, Title 23 provides standards that govern the design and construction of projects that affect the flood control works and floodways. Board staff recommends that you review Title 23 Standards, including Sections 112 (Streams Regulated and Nonpermissible Work Periods), 116 (Borrow and Excavation Activities – Land and Channel), and 130 (Patrol Roads and Access Ramps). Any deviation or variation from these standards will require approval from the Board.

Responsibility of the Central Valley Flood Protection Board

The Board is the State's regulatory agency responsible for enforcing appropriate standards for the construction, maintenance, and operation of the flood control system that protects life, property, and habitat in California's Central Valley. The Board operates under authorities as described in California Water Code (Water Code), which requires the Board to oversee future modifications or additions to facilities of the State Plan of Flood Control (SPFC).

Encroachment Permit

Per California Code of Regulations, Title 23, Waters, Division 1 (Title 23), Section 6, approval by the Board is required for all proposed work or uses, including the alteration of levees within any area for which there is an Adopted Plan of Flood Control within the Board's jurisdiction. In addition, Board approval is required for all proposed encroachments within a floodway, on adjacent levees, and within any Regulated Stream identified in Title 23, Table 8.1. Specifically, Board jurisdiction includes the levee

section, the waterward area between project levees, a minimum 10-foot-wide strip adjacent to the landward levee toe, the area within 30 feet from the top of bank(s) of Regulated Streams, and inside Board's Designated Floodways. Activities outside of these limits which could adversely affect Federal-State flood control facilities, as determined by Board staff, are also under the Board's jurisdiction. Permits may also be required for existing unpermitted encroachments or where it is necessary to establish the conditions normally imposed by permitting, including where responsibility for the encroachment has not been clearly established or ownership or uses have been changed.

Flood Impacts Analysis

Pursuant to Section 15 of Title 23, the Board may deny an encroachment permit if the proposed project could:

- Jeopardize directly or indirectly the physical integrity of levees or other works • Obstruct, divert, redirect, or raise the surface level of design floods or flows, or the lesser flows for which protection is provided
- Cause significant adverse changes in water velocity or flow regimen
- Impair the inspection of floodways or project works
- Interfere with the maintenance of floodways or project works
- Interfere with the ability to engage in flood fighting, patrolling, or other flood emergency activities
- Increase the damaging effects of flood flows
- Be injurious to, or interfere with, the successful execution, functioning, or operation of any adopted plan of flood control
- Adversely affect the State Plan of Flood Control, as defined in the California Water Code

The Board, as a Responsible Agency under the California Environmental Quality Act (CEQA), will review and consider the environmental effects of the proposed project identified in the DEIR, and will reach its own conclusions on whether and how to approve the project involved (14 CCR 15096, subd. (a)). This includes direct impacts to facilities under construction, as well as indirect impacts from the proposed project to surrounding facilities. Accordingly, the comments herein are intended to

assist in the development of a robust CEQA document capable of supporting the Board's permitting process.

Closing

The potential risks to public safety, including increased flood risks, need to be considered when developing proposed projects that seek to modify flood control works or the hydrology of the water ways. Board staff is available to discuss any questions you have regarding the above comments. Please contact Jordan Robbins at (916) 524-3454, or via email at Jordan.Robbins@CVFlood.ca.gov if you have any questions.

Response 4-1

The project's potential impacts related to flooding hazards are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impact 4.10-16 beginning on page 4.10-117. The Draft EIR has been revised to add a discussion of California Code of Regulations (CCR) Title 23 standards related to projects that affect floodways including the Central Valley Flood Protection Board's encroachment permit and flood impacts analysis process. This discussion was added to Draft EIR Section 4.10.2.2, "State," which begins on page 4.10-66. See Chapter 3, "Draft EIR Errata," of this Final EIR, to view this and other proposed revisions to Draft EIR Section 4.10.

Letter #5 March 7, 2025, Bryan Rock, Central Valley Flood Protection Board

Comment 5-1

Central Valley Regional Water Quality Control Board (Central Valley Water Board) staff has reviewed Draft Environmental Impact Report (DEIR) No. 7763 for the RMC Pacific Materials, LLC (CEMEX) Rockfield Quarry Modification Project. According to the DEIR's description, CEMEX plans to modify and expand its current aggregate mining and processing operations along the San Joaquin River near Friant in Fresno County (Project). The proposed Project will affect operations at two existing locations identified as the Quarry site and the Plant site.

The proposed Project will be implemented in two stages. During Stage One, CEMEX proposes to extend mining operations at the Quarry site to mine the hard rock deposit.

The mining, which will include drilling and blasting, will extend to a final depth of approximately 600 feet. In addition, CEMEX will construct a new aggregate processing plant at the Quarry site to wash, screen, crush, and sort the mined hard rock. At the Plant site, mining operations will be extended to a final depth of

approximately 85 feet before the area is reclaimed as open space and riparian habitat. Aggregate processing operations will continue at the Plant site during this period. In addition, CEMEX will replace the existing asphalt plant at the Plant site with a new hot-mix asphalt plant. Stage One is estimated to span 30 years and increase annual aggregate production from the current 1.4 million tons per year to eventually 3.0 million tons per year.

Stage Two is proposed to span an additional 70 years. During Stage Two, aggregate production will continue only at the Quarry site with a sustained volume of about 3.0 million tons per year. Also, during Stage Two, the ready-mix concrete plant and hot-mix asphalt plant will be relocated to the Quarry site, near the new aggregate processing plant, and all processing operations will take place at the Quarry site.

Response 5-1

The comment accurately describes the proposed project.

Comment 5-2

The Central Valley Water Board is responsible for protecting the quality of surface waters and ground waters of the State; therefore, our comments will address issues related to water quality matters only. The following sections discuss various programs and/or requirements applicable to the proposed Project.

Waste Discharge Requirements (WDRs)

The Central Valley Water Board originally commented on the Notice of Preparation for the proposed Project in a letter dated 3 July 2020 (attached). In our letter we identified that the discharge of process wastewater from the existing aggregate processing plant at the Plant site is subject to regulation under individual waste discharge requirements (WDRs). WDRs Order 90-083 currently regulates the discharge of wastewater from the aggregate processing plant to onsite settling ponds at the Plant site. As discussed in our previous comment letter, WDRs Order 90-083 will need to be updated to reflect the changes outlined in the proposed Project.

In accordance with Water Code section 13260, CEMEX is required to submit a complete Report of Waste Discharge (RWD) to the Central Valley Water Board at least 140 days prior any material change or increase in the discharge as a result of the proposed Project. The RWD must characterize and evaluate all discharges of waste that may occur at the properties, including the discharge of aggregate

wash water, ready-mix concrete wash water, and any wastewater generated at the hot-mix asphalt facility. The DEIR should clearly specify that that applicant will need to submit a RWD to the Central Valley Water Board to address changes in its operation before the proposed Project can proceed.

At a minimum the RWD should include:

1) A Form 200 signed and certified by a duly authorized person at CEMEX

2) A Technical Report that identifies all waste handling and storage areas for both solid and liquid wastes from all processing operations (i.e., aggregate processing plant, ready-mix concrete plant, and hot-mix asphalt plant) at both locations, and describes the treatment process and characterizes the discharge from the new aggregate processing plant at the Quarry site.

3) Discuss how the proposed Project's expanded operations will comply with the Salt and Nitrate Control Programs. Information on the Salt and Nitrate Control Programs can be found on the website at:

https://waterboards.ca.gov/centralvalley/water_issues/salinity/

Note that the Nitrate Control Program is a prioritized program. The proposed Project is within Groundwater Basin 5-22.08 (San Joaquin Valley – Kings), and in a Priority 2 portion of the basin/sub-basin. Dischargers in Priority 2 basins were issued Notices to Comply in December 2023. Some sand and gravel facilities within the Central Valley have been determined to be exempt from the Nitrate Control Program because the typical washing process at aggregate processing plants does not appear to result in increased nitrogen concentrations in the discharge. However, the proposed Project will include hard-rock blasting at the Quarry site, which may introduce materials such as ammonium nitrate fuel oil and other nitrogen containing compounds as blasting agents, which could potentially impact groundwater through the storage and handling of wastewater from aggregate processing operations. Therefore, the RWD should include a Nitrogen Source Evaluation to identify known or potential sources of nitrogen in the proposed discharge from the aggregate processing plants and dewatering water from the Quarry Site mine pits and evaluate the potential impact on underlying groundwater.

The Technical Report and Nitrogen Evaluation accompanying the RWD must be prepared and certified by a person registered to practice in California pursuant to California Business and Professions Code sections 6735, 7835, and 7835.1.

Response 5-2

WDRs Order 90-083 is described in Section 4.10, "Hydrology and Water Quality," on Draft EIR page 4.10-67, second paragraph. The state's Salt and Nitrate Control Program is described on Draft EIR page 4.10-72. The discussion of Impact 4.10-1, beginning on Draft EIR page 4.10-88, acknowledges that the Operator would be required to update the operation's existing Stormwater Pollution Prevention Plan (SWPPP) and WDRs Order 90-083 based on the proposed project and describes the update process consistent with this comment and the Central Valley Board's 2020 NOP comment letter (see Comment Letter #5 enclosure).

The project's NOP comment letters were not included in the Draft EIR appendices. As such, Appendix A-3, "NOP Comment Letters," has been added. See Chapter 3, "Draft EIR Errata," of this Final EIR, to view this proposed revision to the Draft EIR.

Comment 5-3

Construction and Industrial Storm Water General Permits

Dischargers whose project disturbs one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs more than one acre, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction Activities (Construction General Permit Order No. 2022-0057-DWQ). Construction activity subject to this permit includes cleaning, grading, grubbing, and disturbances to ground such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line grade or capacity of the facility. The Construction General Permit requires development and implementation of a Storm Water Pollution Prevention Plan (SWPPP).

Storm water discharges associated with specific industrial activities, including some mining and mineral processing activities, must comply with the regulations contained in the Industrial Storm Water General Permit Order 2014-0057-DWQ.

Information on the Construction Storm Water General Permit and the Industrial Storm Water General Permit can be found on the State Water Resources Control Board website at:

https://waterboards.ca.gov/water_issues/programs/stormwater/construction.html

https://waterboards.ca.gov/water_issues/programs/stormwater/industrial.html

Response 5-3

A summary of the requirements of the National Pollutant Discharge Elimination System (NPDES) Construction General Permit and Industrial General Permit is provided on Draft EIR pages 4.10-67 to 4.10-70. The discussion of Impact 4.10-1, beginning on Draft EIR page 4.10-88, acknowledges that the proposed project activity would require coverage under the NPDES and describes which project activities would be covered under which permit.

Comment 5-4

Dredge and Fill Permitting for Discharges to Waters of the United States and/or Waters of the State

If the Project includes the discharge of dredge and/or fill material to wetlands and/or to non-wetland waters (e.g., creek, river, pond, etc.), CEMEX must submit an application to the Central Valley Water Quality Board for such discharges. The State Water Resources Control Board and Central Valley Water Board (collectively, Water Boards) have the authority to regulate the discharge of dredged or fill material under section 401 of the Clean Water Act and the Porter-Cologne Water Quality Control Act. Dischargers that obtain a federal permit or license that authorizes impacts to waters of the United States (i.e., waters that are within federal jurisdiction), such as section 404 of the Clean Water Act and section 10 of the Safe Rivers and Harbors Act, must obtain certification from the Water Boards to ensure that the discharge does not violate state water quality standards or any other appropriate requirements of State law. When a discharge is proposed to waters outside of federal jurisdiction, the Water Boards regulate the discharge under Porter-Cologne Water Quality Control Act through the issuance of WDRs.

Response 5-4

A description of the existing Wetlands and Waters of the State identified on the project sites is provided at Draft EIR Section 4.4.1.7, "Wetlands and Waters of the State," beginning on page 4.4-19. Discussion of the Porter-Cologne Water Quality Control Act and the 401 Water Quality Certification and Wetlands Program is provided in Section 4.4.2.2, beginning on page 4.4-39 and also in Section 4.10.2.2, "State," beginning on page

4.10-66. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Comment 5-5

The State Water Resources Control Board adopted the *State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* (Procedures), which became effective on 28 May 2020. Applications for dredge/fill activity and the processing of applications must comply with the Procedures. The Procedures require, among other things, a project applicant to conduct a delineation of waters, including wetlands, in an aquatic resource delineation report. The delineation must be performed as specified in the Procedures. The Procedures also require, in some instances, an alternatives analysis to identify the Least Environmentally Damaging Practicable Alternative. Even if a project is determined to be exempt from the Procedures' alternatives analysis requirement, the applicant must, at a minimum, demonstrate a sequence of actions has been taken to first avoid, then to minimize, and lastly compensate for adverse impacts that cannot be practicably avoided or minimized to waters of the state.

Information supporting the Procedures including an implementation guidance document can be found here:

https://www.waterboards.ca.gov/water_issues/programs/cwa401/wrapp.html.

Other resources for applicants, including the application form and fee information can be obtained here:

https://www.waterboards.ca.gov/water_issues/programs/cwa401/

Thank you for the opportunity to comment on this Project. For questions related to waste discharge requirements and submittal of the RWD, please contact Katie

Carpenter at (559) 445-5551 or by email at Katie.Carpenter@waterboards.ca.gov. For questions related to storm water permits or dredge/fill permitting please contact Matt Scroggins at (559) 445-6042 or by email at Matt.Scroggins@waterboards.ca.gov.

(see Appendix M, "Draft EIR Comment Letters," for a copy of the July 3, 2020, letter referenced).

Response 5-5

The comment is a copy of the Central Valley Board's 2020 comment letter submitted during the Notice of Preparation public comment period for the proposed project. This letter was considered during preparation of the Draft EIR and information about each of the referenced regulatory programs is addressed in the Draft EIR as discussed in previous responses.

Letter #6 March 7, 2025, Karl Stock, Regional Director U.S. Bureau of Reclamation, Department of the Interior

Comment 6-1

Dear Mr. Randall,

The U.S. Bureau of Reclamation (Reclamation) is submitting this comment letter regarding the County of Fresno's Draft Environmental Impact Report (DEIR) 7763 for the CEMEX Rockfield Quarry: Rockfield Modification Project (proposed project).

The mission of Reclamation is to manage, develop, and protect water and related resources in an environmentally and economically sound manner in the interest of the American public. Reclamation has extensive infrastructure that is operated in the San Joaquin Basin in support of this mission, including the Friant Division of the Central Valley Project (CVP), which could be impacted by this proposed project. In addition, Reclamation is implementing the San Joaquin River Restoration Program (SJRRP) in accordance with the San Joaquin River Restoration Settlement and the San Joaquin River Restoration Settlement Act (Act), included in Public Law 111-11. The proposed project is located within the SJRRP Restoration Area and has the potential to impact Reclamation's successful implementation of the SJRRP.

With these responsibilities and interests in mind, Reclamation appreciates the County of Fresno's (County's) efforts on the proposed project and consideration of the agency's comments. General comments are provided herein, and specific comments are provided in the attached technical comment spreadsheet.

Response 6-1

This introductory comment describes Reclamation's mission, its role in implementing the San Joaquin River Restoration Program (SJRRP), and its interest in the proposed project due to the project's location within the SJRRP Restoration Area and potential to affect program implementation. This comment does not raise specific issues regarding the adequacy of the Draft EIR. Specific comments are addressed in the responses that follow.

Comment 6-2

Existing Conditions

Reclamation is concerned that the environmental setting does not adequately describe the physical environmental conditions in the vicinity of the proposed project, as required by Section 15125(a) of the California Environmental Quality Act (CEQA), and requests a complete description of the following resources be included in the description of the environmental setting:

a. Terrestrial and aquatic wildlife, including species listed in accordance with the Endangered Species Act, that may be present in the vicinity of the proposed project

Response 6-2

The commenter does not state what is missing from the description to meet the CEQA requirements. Terrestrial species are described under Draft EIR Section 4.4.1.3, "Vegetation," which covers vegetation and onsite habitats, while Section 4.4.1.4, "Wildlife," describes wildlife, fish and other species. Further details are provided in the Draft EIR Appendix E-1, "Plant Site Habitat Assessment," and Appendix E-2, "Quarry Site Habitat Assessment," with habitat assessments for both the Plant Site and Quarry Site. As no specific shortfalls are noted, no updates are recommended.

Comment 6-3

b. The existing impacted hydrology of the San Joaquin River (SJR)

Response 6-3

The environmental setting of the project sites is discussed in Draft EIR Section 4.10, "Hydrology and Water Quality," and provides sufficient contextual information about the project sites to meet the requirements of CEQA Guidelines Section 15125. The general project description provided in Draft EIR Chapter 2, "Project Description," details the proximity of the San Joaquin River several times, sufficiently disclosing the project site's regional setting (see Sections 2.4.1 and 2.4.5 of the Draft EIR).

Draft EIR Section 4.10.1, "Environmental Setting," which discusses the environmental setting for the hydrological resources of the project area, provides the following information: climate and precipitation within the region, topography of the project sites, surface water drainage, an image of current regulatory floodways and floodplains, the current level of erosion and sedimentation along the San Joaquin River adjacent to the project sites, flood hazards, surface water quality, groundwater conditions, and groundwater-surface water interaction. The information provided in Draft EIR Section

4.10 is based upon detailed hydraulic analyses (Draft EIR Appendix G-1, "Hydraulic Analysis"), the *Surface Runoff and Drainage Plan* (Draft EIR Appendix G-2, "Surface Runoff and Drainage Plan"), groundwater conditions reports (Draft EIR Appendix G-3, "Groundwater Conditions at the Plant Site," and Appendix G-4, "Groundwater Conditions at the Quarry Site"), and Appendix G-5, "Hydrology and Water Quality Analysis Report," and the Appendix G-6, "Addendum to: Revised Hydrology and Water Quality Analysis Report," of the Draft EIR. See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10 and associated technical appendices. The discussion of the proximity of the river to the project sites in the Project Description and the detailed environmental setting provided for the hydrological resources section of the Draft EIR include sufficient details for the purposes of CEQA Guidelines Section 15125. It should also be noted that the Draft EIR analyzes potential impacts to water quality, including the San Joaquin River, and concludes that the project would not significantly impact the San Joaquin River (See Section 4.10.4, "Project Impacts and Mitigation Measures," of the Draft EIR).

Comment 6-4

c. Actions being taken to implement the SJRRP, including:
   1) Reintroduction of Central Valley (CV) spring-run Chinook salmon (Oncorhynchus tshawytscha)
   2) SJRRP flows that offset existing impacts to the river and CV spring-run Chinook salmon

Response 6-4

Draft EIR Table 4.4-1, "U.S. Bureau of Land Management Visual Quality Inventory and Evaluation Chart," describes those species that are known to occur in the project area. Central Valley (CV) spring-run Chinook salmon is described in Impact 4.4-6, beginning on Draft EIR page 4.4-62, and a blasting specific analysis is provided to determine if blasting would potentially cause impacts to the various life stages of salmon (see Appendix E-4, "Effects of Blasting on Fish"). However, the species was inadvertently omitted from Table 4.4-1. As shown in Final EIR Chapter 3, "Draft EIR Errata," a detailed description of Central Valley Chinook salmon has been added to the setting description of Section 4.4, "Biological Resources," and both fall-run and spring-run chinook salmon were added to Table 4.4-1.

Comment 6-5

d. The Plant Site river water delivery ditch (delivery ditch) and its connection to Little Dry Creek

Response 6-5

See Response 67-18, which concludes that Little Dry Creek is a tributary of the San Joaquin River (Draft EIR page 2-23) and that the project does not propose expansions or alterations in the existing water system (i.e., there are no changes in the baseline conditions surrounding surface water usage) (see information most relevant to the baseline on pages 4.10-23 through 4.10-49 of the Draft EIR), which includes a description of Little Dry Creek and the water conveyance system.

Comment 6-6

Reclamation also requests that a projected future conditions baseline be included in addition to existing conditions for hydrologic impact analyses, as provided for in CEQA Section 15125(a)(1). The DEIR groundwater section and adaptive management plan assume future groundwater conditions will be similar to existing conditions. However, the ongoing implementation of the SJRRP involves increased flows down the SJR, which will elevate the river stage, increase the river's connectivity with adjacent groundwater, and increase groundwater levels in some locations. Because current conditions are the only baseline used in the analysis of impacts and as a measure of future impact in the adaptive management program, the hydrologic impacts of the proposed project are likely underestimated and would be involuntarily subsidized by SJRRP flows, negatively impacting the implementation of the SJRRP and Reclamation's water rights. The analysis should include impacts based on future SJRRP flows and the adaptive management program should be designed in a way that future SJRRP flows are not impacted by operation of the proposed project.

Response 6-6

See Collective Response #25, which concludes that connectivity conditions with the San Joaquin River indicate that interconnected surface water is not present at the project sites.

Comment 6-7

Holding Contracts and Water Rights

Reclamation is concerned with the applicant's described use of the Holding Contract for this project. Reclamation provides the following comments solely to inform the applicant's environmental review. Reclamation reserves all rights, claims and defenses available to the U.S. under the Holding Contracts.

a. The DEIR improperly points to Holding Contract #15 as a water right; a Holding Contract does not purport to be a water right

nor is it a water supply contract for CVP water. Reclamation could not locate any water right associated with any CEMEX parcel and no water use reports could be located in the State electronic Water Rights Information Management System database. The State of California has required all water right claimants to have claims on file and submittals of annual use since 2006. The applicant should provide evidence that it may lawfully divert water as described in the DEIR.

b. In addition, and assuming the applicant can demonstrate authorization to divert water as described in the DEIR, Holding Contract #15 obligates the water user to return any water used for specified industrial purposes to the river free of pollution and/or contamination. The applicant should provide evidence that they are able to return the water to the river free of pollution and/or contamination. It appears the applicant is proposing to capture river flows in the Quarry Site that contain hazardous materials as a flood reduction strategy. This approach would create unnecessary pollution risk and divert water supplies into the quarry that would otherwise be available for other water users. All flood flows should be routed away from the site. The project proponent should also confirm with the State Water Resources Control Board that this action would conform with the Governor's order regarding the use of flood flows for groundwater recharge.

Response 6-7

The Draft EIR evaluates the potential impacts of the proposed project on the environment, per CEQA requirements. The nature of an almost 80-year-old federal Holding Contract and the status of water rights, including long-existing riparian rights, are not environmental impacts that are addressed under CEQA. EIRs are not intended to adjudicate water rights.

Further, the Draft EIR provides that no polluted or contaminated water is returned to the San Joaquin River, as once the water that is delivered from the river water delivery ditch is utilized, the wash water would continue to be sent to silt ponds, which would be recycled back to the plant as process water (see Draft EIR Section 4.10.3.2, "Analysis Methodology," page 4.10-86).

Finally, the comment incorrectly alleges that all flood flows should be routed away from the project sites. Impact 4.10-16 (Draft EIR pages 4.10-117 through 4.10-118) determined that the project would not alter drainage patterns in a manner which would impede or redirect flood flows. Impact 4.10-17 (Draft EIR pages 4.10-118 through 4.10-119)

determined that the enlarged mining excavation could help contain and minimize downstream flooding, which would reduce the overall potential for release of pollutants, including sediment. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10, "Hydrology and Water Quality." This comment does not provide substantial evidence that the Draft EIR's evaluation of these potential impacts are inadequate.

Comment 6-8

Floodplain Analysis

Reclamation has serious concerns about the use of an alternative floodplain map in the hydrologic impact analysis. The current Federal Emergency Management Agency (FEMA) map shows portions of both the Quarry Site and the Plant Site to be located within the 100-year floodplain. Given the proposed project's 100-year life, that would mean the project sites have a 63% chance of flooding within the project lifetime and a 38% chance of experiencing a 200-year flood during the proposed project's 100-year life (NOAA's National Weather Service, n.d.). The DEIR uses an alternative floodplain map, which does not show the Quarry Site to be located within the floodplain, as the basis for the analysis of impacts of the proposed project. Reclamation has several concerns with this approach:

a. The alternative map does not appear to have been peer reviewed or accepted by FEMA as an official amendment to the currently effective Flood Insurance Rate Map through a Letter of Map Revision (LOMR). Use of an alternate floodplain map that has not been approved through FEMA floodplain mapping is insufficient evidence to demonstrate that the Quarry Site would not be impacted by a 100-year flood event.
b. The 2022 public draft of the Central Valley Flood Prevention Plan Technical Analyses Summary Report (2022 CVFPPT draft technical analyses) (Department of Water Resources, 2022) includes climate change flood frequency analyses for low, medium, and high climate change impact scenarios in 2072. As a part of the analyses, it identifies the change in peak flows for the 1997 flood under the respective climate change conditions. It found that at the Gravelly Ford gage, the projected change in peak flows would increase 132% under the low scenario, 162% under the medium scenario, and 208% under the high scenario (Table 5.6). This data strongly suggests flood forecasts will increase in magnitude over the life of the proposed project.

Response 6-8

As stated in Response 65-22, Figure 4.10-1, "Current and Regulatory Floodways and Floodplains," of the Draft EIR depicts the current and regulatory floodways and floodplains for the project sites. As explained in the Draft EIR, because the FEMA studies underlying the Flood Maps dated from 1981 to 1998, an updated hydraulic analysis was completed (see Draft EIR Appendix G-1). The updated analysis used the 2009 FEMA Flood Insurance Rate Maps and estimated floodplain changes resulting from physical changes within and surrounding the project sites, "particularly changes that occurred as a result of the development of berms along the project sites' boundaries" (Draft EIR pages 4.10-15 through 4.10-16; see also Draft EIR Appendix G-1, page 2). An updated hydraulic analysis (in Appendix G-1) was completed to estimate floodplain changes that have occurred as a result of physical changes within and surrounding the project sites, "particularly changes that occurred as a result of the development of berms along the project site's boundaries" (Draft EIR page 4.10-16). In other words, the FEMA studies had to be updated to reflect the development of berms and other features. The analysis methodology is summarized in the Draft EIR in Section 4.10.3.2 and is set out in detail in Appendix G-1. The comment does not cite to or provide any analysis as to why Draft EIR Appendix G-1 and the summary contained in the Draft EIR in Section 4.10.3.2 are inaccurate. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10 and Appendix G.

According to FEMA's Flood Insurance Study Fresno County and Flood Insurance Study Madera County, the San Joaquin River floodplain between State Highway 99 and Friant Dam was determined from a 1999 California Department of Water Resources study. The cross-section data was from 1989 aerial photography at a 4-foot contour interval. Therefore, the FEMA study is based on 36-year-old topography with moderate resolution.

More up-to-date hydraulic analyses were performed for the project based on 2018 mapping at a 2-foot contour interval. The analyses are included in a Hydraulic Analyses report that was peer reviewed by the County. The project analyses yield more accurate results than the older FEMA data.

As provided in Response 58-25, the impacts of climate change to the floodplain are not required to be analyzed in an EIR. Specifically, the California Supreme Court held that the purpose of an EIR is "to analyze the 'environmental effects' of a project … not … the environment's effects on a project" (*California Building Industry Assn. v. Bay Area Air Quality Management Dist.* (2015) 62 Cal.4th 369, 392; Citing PRC Sections 21002 and 21002.1(c)). In response to comments and in accordance with the Fresno County General Plan (2024), Chang Consultants conducted hydraulic analyses evaluating the 200-year

flood event, a more rare and severe flood event, which demonstrate that the 200-year flood would neither enter the Quarry Site nor the Plant Site (see Appendix G-7, "200-Year Hydraulic Analysis for CEMEX Rockfield Modification Project—Quarry Site," and Appendix G-8, "200-Year Hydraulic Analysis for CEMEX Rockfield Modification Project—Plant Site").

Comment 6-9

The applicant's less conservative approach increases the risk that flood water will enter the proposed project sites without impact assessments or mitigation measures. Until FEMA has accepted the applicant's alternative floodplain map through a LOMR, the official FEMA map should be used for all hydrologic analyses in the DEIR. Should the County move forward with the applicant's HEC-RAS model approach, Reclamation recommends running larger flood events, such as those anticipated in the 2022 CVFPPT draft technical analyses, to understand the risk of large flood events affecting the proposed project by connecting the river to the Quarry Pit and potentially polluting the SJR.

Response 6-9

As explained in Response 6-8, since the FEMA studies on which the Flood Maps were based were from 1981 to 1998, an updated hydraulic analysis was completed (see Draft EIR Appendix G-1; see also Final EIR Chapter 3, "Draft EIR Errata," for revisions to this technical appendix) to determine floodplain changes, which also utilized the 2009 FEMA Flood Insurance Rate Maps that delineated the areas of known special flood hazards and associated applicable risks to the community near the project sites (Draft EIR pages 4.10-15 through 4.10-16; see also Draft EIR, Appendix G-1, page 2). Specifically, more up-to-date hydraulic analyses were performed for the project based on 2018 mapping at a 2-foot contour interval. The analyses were included in a Hydraulic Analyses report that was peer reviewed by the County. The project analyses would yield more accurate results than the older FEMA data.

Finally, with regard to "larger flooding events," which the commenter does not define, "[w]hile a lead agency must use its 'best efforts' to evaluate environmental effects, including the use of reasonable forecasting, 'foreseeing the unforeseeable' is not required, nor is predicting the unpredictable or quantifying the unquantifiable" (see *Citizens for a Sustainable Treasure Island v. City and County of San Francisco* (2014) 227 Cal.App.4th 1036, 1060–1061; citing Guidelines, Section 15064, subd. (d)(3)).

Comment 6-10

In either case, the current analysis based on the alternative map does not include an analysis of direct or indirect impacts from overland flooding into the Quarry Site. Since the proposed project is within the FEMA 100-yr floodplain and is highly likely to experience a large flood during the proposed project life, an analysis of effects of overland flooding to the Quarry Site should be included in the DEIR.

Response 6-10

As explained in Response 6-8, the current hydraulic analysis contains a detailed analysis of the San Joaquin River floodplain based on up-to-date data. The results show that the 100-year floodplain would not enter the quarry, so associated overland flooding would not occur. Accordingly, the Draft EIR addresses the issues raised by the comment, and the comment does not provide any evidence that these conclusions are inaccurate.

Comment 6-11

Impact Analyses

Reclamation is concerned the DEIR provides an incomplete impact analysis for several resource categories as further described below.

Response 6-11

This introductory comment expresses concern that the Draft EIR provides incomplete impact analyses for certain resource areas. This comment does not raise specific issues regarding the adequacy of the Draft EIR. Specific comments are addressed in the responses that follow.

Comment 6-12

Geology and Hydrology

Reclamation is concerned that the analysis presented in the DEIR has an antiquated understanding of SJR hydrology and understates the current and future connectivity between the SJR and the Quarry Pit. The analysis presented provides limited data comparing the river stage and groundwater levels and does not evaluate the river at higher stages as are expected with continued implementation of the SJRRP. In addition, connectivity may be greater than anticipated due to local variation in rock fracturing not characterized in the exploratory borings. Supplemental analysis should be completed to better understand the connectivity between

the river and the Quarry Site so that appropriate mitigation can be developed and implemented.

Response 6-12

In addition to the discussion below, see also Response 62-2 and Collective Response #25.

Appendix B of the "Funding Constrained Framework for Implementation," of the SJRRP (https://www.restoresjr.net/?wpfb_dl=2159) describes several flow scenarios to be implemented with peak flow rates in the range of 2,500 cubic feet per second (cfs) for Stage 1 of the SJRRP. These flow scenarios have durations of 20, 40, or 60 days in the spring months (February to May). Full implementation of the SJRRP after Stage 1 could see flows during these short-duration periods of up to 5,000 cfs. However, it is important to note that appreciable additional work would be required to allow flows of that magnitude to consistently pass through certain reaches of the river.

Figure 12 of Appendix G-5 of the Draft EIR shows that during 2017 and 2019, flows equal to or greater than 2,500 cfs occurred for durations comparable to or longer than the SJRRP Stage 1 flow scenarios described in the above paragraph. The analysis presented in Section 4.10 and Appendices G-5 and G-6 of the Draft EIR demonstrate that flows of those magnitudes and durations did not have any significant effect on groundwater levels at the Quarry Site and Plant Site areas. As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area.

Comment 6-13

It does not appear that an analysis was conducted of impacts of Plant Site pumping on the SJR. The SJR is approximately 800 feet from the Plant Site. Little Dry Creek, which provides tributary flows to the SJR, is within 200 feet of the Plant Site. Please provide an analysis as to how the lowering of the groundwater table around the Plant Site will impact flows in the surface tributaries and include this additional impact determination in the DEIR.

Response 6-13

In addition to the discussion below, see also Collective Response #25.

Comment 6-13 substantially misrepresents the distance from the Plant Site to both the San Joaquin River and Little Dry Creek. At its nearest point, the Plant Site area is more than 2,500 feet from the San Joaquin River, while Little Dry Creek is no closer than 500 feet to the Plant Site (see Google Earth screen capture images below).

As described in Collective Response #25, consistent with the findings in the 2025 Update to the North Kings Groundwater Sustainability Plan, there are no surface water bodies interconnected with groundwater, and no groundwater dependent ecosystems, in the Plant Site vicinity due to the depth to groundwater in the area. Thus, lowering of the groundwater surface during dewatering at the Plant Site would not alter the flows in the San Joaquin River and Little Dry Creek.

Comment 6-14

In the analysis it is stated that the Friant-Kern Canal (FKC) is the primary contributor of groundwater in the area and compares maximum canal flows that only take place in wet years to median river flows in support of this claim. The FKC is lined and over a mile away from this location, while the river is only 200 feet from the site. Comparing maximum canal flows that only take place in wet years to median river flows does not account for temporal, hydrologic, or geographic factors. Please provide a supplemental analysis to verify this assumption or otherwise amend it.

Response 6-14

There are several factors that support the conclusion that most of the groundwater flow in the underlying hard rock may come from leakage from the Friant Kern Canal. As discussed in Appendix G-5 of the Draft EIR, the groundwater contours show that there is a significant component of flow from the northeast (Draft EIR, Appendix G-5, page 32). In addition, groundwater data from offsite wells and Quarry Site wells, and Quarry dewatering data, show that percolation of rainfall on and upgradient of the Quarry Site has a substantially greater effect than flows in the river, indicating that the primary source of recharge is located upgradient away from the river (Draft EIR, Appendix G-5, pages 21 through 26). In addition, the Water Budget presented in Table 11 of Appendix G-4 of the Draft EIR shows that over the life of the project, groundwater inflow into the Quarry Site would range from 170 acre-feet per year to 255 acre-feet per year. These inflow rates are equivalent to 0.23 cubic feet per second (cfs) to 0.35 cfs. These values are miniscule compared to the rate of canal flows and to river flows. Since the groundwater contours indicate that much of the groundwater flowing under the Quarry Site area comes from the northeast, the canal is the most likely source.

Comment 6-15

Water Quality

As currently proposed, water pumped from the sites would either directly, or after other uses, be placed into recharge pits and trenches adjacent to the site. However, there is no water quality

treatment proposed to take place prior to placement in settling and recharge vessels. If water that exceeds water quality standards for surface or groundwater is placed in the trenches, it has the potential to contaminate existing groundwater supplies and percolate into the SJR, impacting aquatic species such as CV spring-run Chinook salmon. An analysis should be conducted on the proposed project's potential to contaminate river water from recharge operations.

To the extent long-term recharge operations at the Quarry Site would be generated from pumping of the pond, pond water quality should be analyzed in greater detail to disclose what constituents would be put into the recharge trenches from the pond. The Quarry Site Pond should be monitored for water quality concerns in a similar fashion to the Plant Site Pond and, if water quality standards are exceeded, mitigation measures should be implemented, including but not limited to, installation of an aeration or oxygenation system in the Quarry Site Pond.

Response 6-15

In addition to the discussion below, see Response 65-28, which explains that the Draft EIR provides adequate analyses and support for its contention that the groundwater pumped into ponds and trenches, and later reclaimed ponds, would not impact water quality in the San Joaquin River. Additionally, Impacts 4.10-1 and 4.10-4 through 4.10-6 provide analyses for both surface water and groundwater conductivity levels/impacts (see Draft EIR pages 4.10-88 and 4.10-93 through 4.10-100). Furthermore, Mitigation Measure 4.10-5a commits to a detailed plan for monitoring groundwater quality (Draft EIR pages ES-34 through ES-35 and 4.10-95 through 4.10-96).

The project's potential effects related to groundwater and surface water quality were evaluated in Draft EIR Section 4.10 as well as in the *Revised Hydrology and Water Quality Analysis Report* and the *Addendum to: Revised Hydrology and Water Quality Analysis Report* prepared by EMKO Environmental, Inc., and included in Draft EIR Appendix G-5 and G-6, respectively. The following excerpts from the Draft EIR and EMKO Environmental, Inc. reports are provided in response to the United States Bureau of Reclamation's comments.

Based on Draft EIR Section 4.7.1.1, "Geologic Conditions," the project is located within the San Joaquin River basin, characterized by alluvial basin fill that overlies older igneous rocks. More specifically, in the project sites, the surficial geology comprises alluvial sediments, which are derived principally from Sierran granite and granodioritic rocks. These rock types are mapped within the immediate vicinity of the project sites and are the primary resource that would be mined and processed to produce aggregate products.

Because the alluvial basin fill is compositionally derived principally from these plutonic rocks, the mineralogic assemblage of the underlying crystalline rock and the alluvium is compositionally similar and thus can be expected to exhibit common geochemical characteristics, though minor differences in mineral assemblages may be present in the weathered plutonic bedrock. When these types of plutonic rocks weather and undergo alteration, the resultant mineral assemblage is typically iron-rich and aluminosilicate clays and quartz, which are generally considered to be geochemically stable in subsurface hydrogeologic environments under typical pH and alkalinity levels.

Moreover, while the San Joaquin River and alluvial aquifer may be hydraulically connected, some interaction between these waters and groundwater in the bedrock fractures is likely, despite differences in conductivities and transmissivities (see Response 65-32; see also Collective Response #25). The variation in flow conditions is attributed to differences in the head elevations of the alluvium aquifer versus the surface water elevations of the San Joaquin River, and the potentiometric surfaces in the underlying bedrock aquifer, which are controlled principally by the spatial distribution, intensity, and apertures of the fractures in the weathered rock and competent crystalline rock (see Draft EIR, page 4.10-112; see also Draft EIR Appendix G-5, Section 3.2.1, pages 45 through 46). Thus, even where flow interaction among the river, alluvial aquifer and the bedrock differ, the connectivity would be expected to result in baseline conditions of similar water quality characteristics. See Collective Response #25.

Given the geochemical similarities between the San Joaquin River, alluvial aquifer, and groundwater within the fractured bedrock, the water quality would therefore be similar in terms of the existing conditions. With project implementation, recharge of pumped groundwater during mining, as well as storage of process water in the designed basins, is therefore unlikely to have any appreciable effect on background water quality with regard to naturally occurring constituent concentrations, given the proposed water management proposed with this project.

Further, as discussed in the EMKO Environmental, Inc. report, both the Quarry Site and the Plant Site are managed and designed as zero-discharge facilities with respect to offsite discharges (see Draft EIR, Impact 4.10-1 beginning on page 4.10-88). Therefore, the proposed project would not significantly impact surface water quality.

However, as precaution, with respect to the Plant Site, the Draft EIR acknowledges the potential impacts to groundwater quality. As such, Mitigation Measure 4.10-5a includes an adaptive management plan for the Plant Site that requires ongoing sampling and monitoring of conditions within any reclaimed pond that forms after mining or once the

Plant Site is completed, and water is allowed to fill all or part of the excavation (Draft EIR, pages 4.10-96 through 4.10-98).

See Final EIR Chapter 3, "Draft EIR Errata," to view proposed revisions to Draft EIR Section 4.10 and associated technical appendices.

Comment 6-16

Biological Resources

Due to incomplete descriptions of existing conditions and incomplete hydrology, water quality, and other resource impact analyses, there is not currently enough information to complete a biological resources impact assessment since impacts to many of these resources, especially aquatic species, are dependent on other resource impacts. The biological resources analysis should be revised based on inclusion of the information requested above.

Response 6-16

The Draft EIR analyzes the project's impacts to hydrology in Section 4.10. See also Response 6-114, which addresses the cumulative hydrology impacts and Collective Response #25, which addresses the Quarry Site groundwater drawdown in the weathered and hard rock, and Collective Responses #23 and #25, both of which address water quality issues. The Draft EIR, together with the errata and Final EIR, contain sufficient descriptions of existing conditions concerning hydrology, water quality, and all other resources affecting aquatic species.

The commenter does not provide substantial evidence indicating that blasting associated with the project would result in impacts to aquatic species. As explained in Impact 4.4-6, the predicted blasting levels would be well below the applicable thresholds established by the Alaska Department of Fish and Game (ADF&G).

The evaluation and analysis in the Draft EIR concluded that ground vibrations at the crest of the embankment, which is closer than the river's edge, are limited to 0.5 in/sec that is consistent with the ADF&G standard for the protection of embryos in spawning gravels. The Vibra-Tech evaluation also determined the resulting overpressures in the waters of the San Joaquin River due to adjacent blasting would be less than 1 psi. This is significantly below the 2.7 psi limit established for the safety of salmon in the current ADF&G blasting standard.

To more clearly describe the analysis performed and parameters under which blasting would have no effect, the discussion under Impact 4.4-6 on Draft EIR page 4.4-6 is revised in this Final EIR through errata presented in Final EIR Chapter 3, "Draft EIR Errata."

Comment 6-17

Blasting Impacts

The river adjacent to the Quarry Site is a rearing site for juvenile CV spring-run Chinook salmon and an over-summer holding and spawning site for adult CV spring-run Chinook salmon. Although the project proponent's analysis concludes the blasting protocols will have significantly less impacts than those that may "cause harm" such as mortality, it is not possible to verify the field accuracy of the analysis. Blasting impacts greater than those stated in the report may impact fish behavior at various life stages (i.e., juveniles displaced from cover in rearing habitat, adults displaced from holding and spawning habitat) and therefore impact the success of SJRRP. Blasting impacts should be monitored to verify the level of impact.

Response 6-17

The commenter does not offer substantial evidence to support why impacts might occur to fish when the project impacts are below the levels of blasting and impact described in Impact 4.4-6 set a threshold for the project well below those permissible levels set by the Alaska Department of Fish and Game (ADF&G).

The analysis in the Draft EIR concluded that ground vibrations at the crest of the embankment, which is closer than the river's edge, are limited to 0.5 in/sec that is consistent with the ADF&G standard for the protection of embryos in spawning gravels. Vibra-Tech Engineer's evaluation of blasting impacts to fish, provided in Draft EIR Appendix E-4, also determined that the resulting overpressures in the waters of the San Joaquin River due to adjacent blasting would be less than 1 psi. This is significantly below the 2.7 psi limit established for the safety of salmon in the current ADF&G blasting standard. The Blasting Protocols, provided in Appendix H-6 of the Draft EIR, and updated in Appendix H-9 of the Final EIR, outline the blasting thresholds and monitoring requirements for the San Joaquin River embankment.

To more clearly describe the analysis performed and parameters under which blasting would have no effect, the discussion under Impact 4.4-6 on Draft EIR page 4.4-6 is revised in this Final EIR through errata presented in Final EIR Chapter 3, "Draft EIR Errata."

See Collective Response #16 for a further response addressing this topic.

Comment 6-18

Invasive Species

Reclamation is concerned with the potential for invasive aquatic fish species entering the river from the Plant Site Pond, especially should the existing delivery ditch remain in place. The applicant should screen the ditch and ensure the ditch is in no way connected to the Plant Site, even in the event of flooding, to prevent invasive species introduction to the SJR.

Response 6-18

As described in Section 4.4, "Biological Resources," of the Draft EIR, fish species known to occur in the San Joaquin River are the same as those within the Plant Site. Therefore, should any fish from the Plant Site enter the river, it would not constitute a "novel" or new species introduction to the system. Further, levees and berms at the site preclude movement of water off-site except in catastrophic floods that are not reasonably foreseeable and speculative in nature. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4.

Comment 6-19

Cumulative Impacts

Reclamation is concerned about the cumulative impacts analysis. The SJR has significant cumulative impacts to its hydrology due to existing diversions, as demonstrated by the need for the SJRRP. Therefore, for the purposes of analyzing cumulative impacts to the hydrology of the SJR, cumulative impacts of this proposed project should be determined based on whether the project is cumulatively considerable, not on whether the impact itself is determined to be significant or if the project substantially draws down groundwater. Please revise this analysis.

Response 6-19

The Draft EIR analyzes the project's impacts to hydrology in Section 4.10. Otherwise, see Response 6-114, which addresses the cumulative hydrology impacts and Collective Response #25, which addresses the Quarry Site groundwater drawdown in the weathered and hard rock. See also Final EIR Chapter 3, "Draft EIR Errata," to view revisions to Draft EIR Section 4.10 and supporting appendices.

Comment 6-20

Mitigation Measures

Floodplain Management

Reclamation requests the proposed project develop additional mitigation measures such as enhanced berms, overland flooding hazardous management plans for the site, and plans to put flood waters back into the river free of pollution or other water quality constituents from the sites to avoid and minimize impacts to the SJR in the event of a flood event.

Response 6-20

As explained in Response 6-21, BMPs would be implemented to minimize impacts to the San Joaquin River. The project would also continue to implement the NPDES Permit and SWPPP applicable to the project sites (Draft EIR, Section 4.10.2.2, "State," pages 4.10-69 through 4.10-70). See also Final EIR Chapter 3, "Draft EIR Errata," to view revisions to Draft EIR Section 4.10.

Comment 6-21

Sediment Management

In reviewing Google Earth (n.d.) aerial photography, sediment deposition from the Plant Site into the delivery ditch is visible at times. The delivery ditch is directly connected to Little Dry Creek and the SJR. Plant Site flood protections should be increased as a part of project mitigation measures to maintain the natural channel and prevent the introduction of sediment into the river from the project site.

Response 6-21

Impact 4.20-4 (Draft EIR, Impact 4.20-4, page 4.20-16) analyzes impacts to existing riparian areas; Impact 4.10-15 (Draft EIR, page 4.10-117) indicates that the project would not alter drainage patterns in a manner that would result in on- or off-site flooding or exceed the capacity of the existing storm drainage system. Impact 4.10-16 (Draft EIR pages 4.10-117 through 4.10-118) determined that the project would not alter drainage patterns in a manner which would impede or redirect flood flows. Impact 4.10-17 (Draft EIR, pages 4.10-118 through 4.10-119) determined that the enlarged mining excavation could help contain and minimize downstream flooding, which would reduce the overall potential for release of pollutants, including sediment. Additionally, sediment would continue to be controlled via the project sites' NPDES Permit, SWPPP, and implementation of BMPs (Draft EIR, Section 4.10.2.2, pages 4.10-68 through 4.10-70). The

comment does not provide evidence or argument that the Draft EIR's evaluation of these potential impacts are inadequate.

Comment 6-22

Blasting

The 2013 State of Alaska Department of Fish and Game Blasting Standard (Alaska Blasting Standard) cited by the applicant identifies mitigation monitoring (hydrophones) that should be conducted in conjunction with blasting (Timothy, 2013). Reclamation requests that the applicant adaptively manage blasting for impacts to aquatic life. Reclamation has provided a recommended mitigation approach for consideration:

Year 1 of blasting: Monitor blasting impacts at the river adjacent to the Quarry Site. Depending on monitoring results, implement the following actions:

(1) Below 0.6 pounds per square inch and 0.5 inches per second: no action.
(2) Between 0.6 pounds per square inch-6 pounds per square inch or 0.6 inches per second-2.0 inches per second: implement avoidance and minimization measures outlined in the Alaska Blasting Standard and continue monitoring.
(3) Above 7.3 pounds per square inch or 2.0 inches per second: implement avoidance, minimization, and mitigation measures outlined in the Alaska Blasting Standard and continue monitoring.

At the end of one year of monitoring, re-evaluate the need for monitoring using the following parameters:

(4) If after 1 year, river impacts stay below 0.6 pounds per square inch and 0.5 inches per second, no additional monitoring is needed so long as future blasting techniques don't create additional pressure or other river impacts.
(5) If after 1 year, river impacts have been between 0.6 pounds per square inch-6 pounds per square inch or 0.5 inches per second-2.0 inches per second, continue monitoring and implementing avoidance and minimization measures until 1 year of 0.6 pounds per square inch and 0.5 inches per second measurements.
(6) If after 1 year, river impacts exceeded above 7.3 pounds per square inch or 2.0 inches per second, continue to implement monitoring and avoidance, minimization, and mitigation measures until 1 year of lesser pounds per square inch

measurements are experienced, at which point follow guidance for the range of pounds per square inch and inches per second measurements experienced.

If at any point blasting technique changes so that blasts have the potential to be more impactful to the surrounding land than they were during a 1-year monitoring period where blasts registered below 0.6 pounds per square inch and 0.5 inches per second at the river, river monitoring should take place for the period of higher impact blasting to verify that the new blasting technique does not create additional impacts to the river. So long as impacts of the new blasting technique remain below 0.6 pounds per square inch and 0.5 inches per second at the river, no additional monitoring is necessary for that blasting technique. If the blasting technique creates impacts, either cease the technique or re-enter monitoring, avoidance, minimization, and mitigation measures described above.

As a part of this adaptive management measure, the applicant is encouraged to work with Reclamation to understand when and where various life stages may be present to efficiently apply avoidance, minimization, and mitigation measures.

Response 6-22

Response 6-17 above addressed the same concerns of this comment.

Comment 6-23

Groundwater Monitoring

Reclamation requests the applicant use the MW-2 monitoring well cluster in addition to MW-1 monitoring well cluster in the adaptive management plan for the Quarry Site. This would likely provide additional benefit to the mitigation measure by providing spatial coverage representing the southern portion of the Quarry Site. Infiltration from the river into the excavated site will be highly influenced by localized fracture characteristics, as demonstrated by the airlift permeability testing in hard rock at MW-2; the well's test results were 10 times greater than at MW-1.

Reclamation also requests that baseline conditions for all groundwater monitoring programs be developed so that they can adapt to expected increased baseflow conditions in the SJR associated with the SJRRP. Reclamation requests the opportunity to review and comment on the baseline proposals and to review the annual reports and any impact evaluations produced.

As currently proposed, the adaptive management plan states that if, upon additional assessment it is confirmed "that a decrease in groundwater levels greater than 15 percent is exclusively attributable to mine dewatering, then corrective measures would be implemented" (4.10-109). The burden of proof is inappropriately placed in this circumstance. The applicant should bear the responsibility to prove that their project does not contribute to impacts above 15 percent and, to the extent impacts may be attributable to them, appropriate corrective measures should be implemented. Reclamation recommends amending this in the adaptive management plan.

Response 6-23

The current approach properly allocates responsibility: corrective measures are triggered where project-related dewatering is demonstrated to exceed the 15 percent threshold. Expanding the plan to include non-representative wells or unbounded obligations would not necessarily improve protection of groundwater resources but would instead undermine the scientific rigor and enforceability of the adaptive management framework.

Comment 6-24

200-foot Setback

Reclamation is concerned about using a 200-foot setback from the river for the Quarry Site. There is no justification provided for the applicability of this setback other than preceding permits. The last time the Conditional Use Permits (CUPs) were updated was in 2004 (from the early 1980s), which was prior to the Settlement and Settlement Act that resulted in the SJRRP. Therefore, the 200-foot setback did not consider the SJRRP restoration activities and reintroduction of CV spring-run Chinook salmon. To avoid adversely impacting the implementation of the SJRRP, this buffer should be revised for any subsequent CUPs, including the proposed project. Reclamation recommends that, based on the sensitive special status resources present near the site, the maximum feasible setback be considered.

Response 6-24

The buffer zone suggested in the comment is not feasible given the location of the long existing Quarry Site and the location of the granite deposit which would be mined. Additionally, the Quarry Site's currently permitted buffer zone of 200-feet from the San Joaquin River is a part of the CEQA baseline. While the depth of the pit would be increased, the perimeter of the disturbed areas would not increase.

Comment 6-25

In conclusion, Reclamation does not have enough information to adequately analyze the impacts of the proposed project to the resources the agency manages. Reclamation requests additional information be provided in the DEIR regarding baseline conditions, impact analyses, and mitigation measures, as described above and in the attached technical comment spreadsheet.

Reclamation appreciates the opportunity to comment on this proposed project and the County's consideration of our comments. Please contact Ms. Becky Victorine at rvictorine@usbr.gov with any questions or if there is a need for discussion of these comments in more detail.

Response 6-25

This comment summarizes Reclamation's concerns regarding baseline conditions, impact analyses, and mitigation measures and requests additional information, as described in prior comments and the attached technical comment spreadsheet. The Draft EIR includes descriptions of environmental baseline conditions, impact analyses, and mitigation measures (see, for example, Draft EIR pages 4.10-23 through 4.10-49, page 4.10-85, Table 4.10-3, "Plant Site Surface Water Quality Data," and Mitigation Measure 4.10-10a). Specific comments regarding these topics are addressed in Responses 6-1 through 6-24 above and Responses 6-26 through 6-117 below.

Comment 6-26

[Table Item #1, DEIR PDF Pg. 29, 98]

Comment: The Draft Environmental Impact Report (DEIR) does not include adequate information to determine the effects of the proposed project on all species listed under the Endangered Species Act (ESA) that have the potential to occur in the action area. The Regulatory Setting Section of Chapter 4.4 mentions the ESA but does not provide information on the applicability to this proposed project (i.e. whether consultation with the United States Fish and Wildlife Service (FWS) is required in accordance with Section 7 or Section 10 and if not, why). Recommend the project proponent request an official species list from the FWS and provide information in the analysis on the potential effects of the proposed project on all listed species potentially occurring in the action area and include project-specific information on the applicability of the ESA to the proposed project. Recommend the project proponent provide further information on what coordination is planned with FWS regarding an incidental take statement.

Response 6-26

Section 4.4 of the Draft EIR, "Biological Resources," and supporting studies (Appendix E-1 and E-2), of the Draft EIR provide a detailed analysis of the potential for species listed under the Federal Endangered Species Act (ESA) to occur on the site and/or be impacted by the project. No listed species were determined to have potential to occur within the project sites or be affected by the proposed project. This analysis considered the documented occurrences on and/or adjacent to the sites, habitat within and adjacent to the sites, and the habitat conditions within the sites. Because no species listed under the ESA were found to have the potential to occur on the sites nor be impacted by the project, no consultation pursuant to the ESA is required.

Comment 6-27

[Table Item #2, DEIR PDF Pg. 29, 98]

Comment: Please provide further analysis regarding the baseline conditions of the San Joaquin River (SJR) in the action area and the effects of the proposed project on the Central Valley (CV) spring-run Chinook salmon (Oncorhynchus tshawytscha) being reintroduced to the SJR by the San Joaquin River Restoration Program (SJRRP), as it is not adequately described in the DEIR. The United States Bureau of Reclamation (Reclamation) recommends the project proponents coordinate with all the SJRRP Implementing Agencies, including National Marine Fisheries Service (NMFS), to ensure that the analysis captures the environmental setting accurately and adequately, and that compliance with all applicable environmental laws and regulations are being documented for the proposed project.

Response 6-27

See Collective Response #16. See also Response 58-31 regarding the Draft EIR's description of the existing biological setting at the project site.

As described in Section 4.4 of the Draft EIR and supporting technical studies (Appendices E-1 and E-2), the baseline conditions of the San Joaquin River corridor and adjacent areas were evaluated in detail. As described in the Draft EIR, the project sites are already highly disturbed by ongoing mining activities. The duration of this ongoing disturbance ranges from 30 to more than 100 years. Given this baseline, the proposed project would not have a significant increase in activity and is therefore unlikely to result in significant effects on biological resources. The analysis considered the documented occurrences on and/or adjacent to the sites, habitat values within and adjacent to the sites, as is standard practice

under CEQA. See also Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4.

Comment 6-28

[Table Item #3, DEIR PDF Pg. 35, Impact Table]

Existing Text: Impact 4.1-1 Rock Staining

Comment: If the walls are stained adjacent to the SJR's edge, there is a potential for the stain to seep or spill into the river. Recommend no staining of pit walls unless the project proponent can prevent impacts to the river through product selection and/or application precautions.

Response 6-28

See Collective Response #8 regarding visual impacts and proposed mitigation. As described there and presented in Final EIR Chapter 3, "Draft EIR Errata," Mitigation Measure 4.1-1 has been revised to provide more specific detail. As discussed in Collective Response #8, products commonly used for rock staining in mining applications are not pigments or paints that could erode off the rock surface and enter drainages. Instead, these products chemically react with minerals in the rock, resulting in a permanent, integral color. According to manufacturer specifications, these products are non-toxic and designed for use in natural settings without causing environmental impacts.

In addition, as described in Responses 6-15, 6-51, 6-55, 65-23, and 459-2, the project does not discharge to the San Joaquin River. Potential impacts associated with staining materials reaching the river would therefore be speculative and are not required to be analyzed or mitigated (CEQA Guidelines Section 15064(d)(3)).

Comment 6-29

[Table Item #4, DEIR PDF Pg. 47, Impact Table]

Existing Text: Impact 4.7-7 Result in slope instability.

Comment: The mitigation measures are good efforts to prevent a potential slope failure from occurring but do not address mitigation in the event a failure occurs. There is particular concern over the potential for failure adjacent to the SJR given the constant seepage and groundwater exchange occurring at the riverbanks. A mitigation plan should be included for the instance there is a slope failure in the quarry or the adjacent riverbank.

Response 6-29

As explained in Response 65-37, Mitigation Measures 4.7-6, 4.7-7a, and 4.10-1 adequately address the potential of pit failure and provides for ongoing slope stability analyses. Additionally, Mitigation Measure 4.10-1 which addresses potential impacts to the San Joaquin River embankment, requires continuous pre-blast and post-blast visual inspections of the portions of the San Joaquin River embankment that are located within 1,000 feet of each blast. In the case of a potential effect, all blasting must cease until the County approves a Corrective Action Plan. See Final EIR Chapter 3, "Draft EIR Errata," to view proposed revisions to the Draft EIR sections, appendices, and mitigation measures referenced in this response. See also Response 53C-3 for further discussion of the proposed Blasting Protocols (see Draft EIR, pages 4.4-57 through 4.4-58; Mitigation Measure 4.10-1; and Appendix H-9, Section E, page 5).

Comment 6-30

[Table Item #5, DEIR PDF Pg. 118, Section 2.4.2.1]

Existing Text: The San Joaquin River is located approximately 0.5 miles to the west of the Plant Site. The project proponent has water rights to use river water for industrial purposes in connection with the processing of rock, sand, and gravel. Water is diverted from the river to the Plant Site via a ditch and the water is then used to wash the aggregate.

Comment: The DEIR improperly points to Holding Contract #15 as a water right; a Holding Contract does not purport to be a water right nor is it a water supply contract for Central Valley Project (CVP) water. Reclamation could not locate any water right associated with any CEMEX parcel and no water use reports could be located in the State electronic Water Rights Information Management System database. The project proponent should provide evidence that it may lawfully divert water as described in the DEIR.

Response 6-30

See Response 6-7 above. The nature of an almost 80-year-old Holding Contract and the status of water rights are not environmental impacts that are addressed under CEQA.

Comment 6-31

[Table Item #6, DEIR PDF Pg. 118, Section 2.4.2.1]

Existing Text: The San Joaquin River is located approximately 0.5 miles to the west of the Plant Site. The project proponent has water rights to use river water for industrial purposes in

connection with the processing of rock, sand, and gravel. Water is diverted from the river to the Plant Site via a ditch and the water is then used to wash the aggregate.

Comment: Holding Contract #15 obligates the water user to return any water used for specified industrial purposes to the river free of pollution and/or contamination. The project proponent should provide evidence that they are able to return the water to the river free of pollution and/or contamination.

Response 6-31

Water that is diverted from the San Joaquin River for industrial uses at the Plant Site is not returned to the river. It flows from the aggregate processing equipment into settling ponds and is subsequently re-used in the onsite material processing (Draft EIR, Section 4.10.3.2, page 4.10-86). Therefore, there is no purpose in providing evidence that it could be returned to the river free of pollution and/or contaminants, since such an action is not a part of the existing conditions nor the proposed project.

Comment 6-32

[Table Item #7, DEIR PDF Pg. 118, Section 2.4.2.1]

Existing Text: [Plant site] Approximately 35 acre feet/year of groundwater from onsite wells is consumed by the ready-mix concrete operations with a small amount of groundwater (approximately 1 acre-feet/year) also used for domestic purposes (e.g., toilets, handwashing, etc.).

Comment: With groundwater levels from 21 to 34 ft below ground surface (bgs), "groundwater" at the Plant Site from shallow wells is more likely interconnected with surface waters, predominantly the SJR. If so, the shallow well use at the Plant Site would then be considered a use of surface waters and would require associated water rights, only deep wells would truly be "groundwater."

Response 6-32

All existing water use at the Plant Site is part of the CEQA baseline and not an impact of this project. California Water Code Section 10752(a) defines “groundwater” as “all water beneath the surface of the earth within the zone below the water table in which the soil is completely saturated with water, but does not include water that flows in known and definite channels,” and thus, groundwater does not consist of only deep wells as Comment 6-32 incorrectly alleges. California Code of Regulations Title 23 (23 CCR), Section 351(o) states that "Interconnected surface water refers to surface water that is hydraulically connected at any point by a continuous saturated zone to the underlying

aquifer and the overlying surface water is not completely depleted." The definitions within Section 351 of 23 CCR are specifically for the Sustainable Groundwater Management Act and relate to preparation of Groundwater Sustainability Plans under the Department of Water Resources. These definitions do not relate to water rights and regulations of the California Division of Water Rights under the California State Water Resources Control Board. Comment 6-32 provides no evidence that groundwater from the two production wells are "interconnected" with the surface waters of the San Joaquin River.

Identification of a potential interconnected surface water does not change the designation of the groundwater to surface water for the purposes of water rights. The potential interconnected surface water only establishes certain requirements under the Sustainable Groundwater Management Act for the Groundwater Sustainability Plan for the respective groundwater basin, as addressed in 23 CCR. The potential for the proposed project to impede sustainable management of the groundwater basin is addressed in the Draft EIR in Impacts 4.10-9, 4.10-11, and 4.10-13.

Furthermore, the comment is speculative and provides no data or other substantial evidence to support the conjecture that the shallow groundwater zone beneath the Plant Site is connected to the San Joaquin River or any other surface water body by a continuous saturated zone. The Groundwater Sustainability Plan 2025 Update prepared for the North Kings Groundwater Sustainability Agency (available at: https://northkingsgsa.org/groundwater-sustainability-plan/) identifies two conditions that may result in interconnected surface water, based on Department of Water Resources guidance. These conditions are: 1) groundwater elevations near or above the riverbed, and/or 2) similar trends in groundwater levels and stream stage. Neither of these conditions exist at the Plant Site, as described in the following two paragraphs.

Regarding the first criterion, aerial images of the San Joaquin River channel to the west of the Plant Site show the presence of many very shallow sections with riffles, small rapids, and exposed gravel bars. These visual features are inconsistent with the river channel extending to the saturated zone 21 to 34 feet below ground surface. In addition, the discussion in Section 3.2.7.1 of the Groundwater Sustainability Plan 2025 Update (as cited above) states that the San Joaquin River appears to meet the first interconnected surface water criterion in areas to the west of Highway 41, not to the east. While groundwater dependent ecosystems are not the same as interconnected surface water, they are closely related. Section 3.2.8 and Figure 3-40 of the Groundwater Sustainability Plan 2025 Update (as cited above) demonstrate that the wetlands in the vicinity of the Plant Site are not dependent on, or connected to, groundwater because of the depth to

groundwater, as noted in this comment (i.e., 21 to 34 feet below ground surface). Thus, there is substantial evidence that the first criterion is not met at the Plant Site.

With respect to the second criterion, Figure 4.10-10, "Comparison of San Joaquin River Stage and Daily Rainfall," of the Draft EIR shows the stream stage for the San Joaquin River from October 2018 through September 2019 (i.e., the 2019 water year, as described in the Draft EIR). The stream stage increases briefly in late March 2019 and again in May through June 2019. Otherwise, the stream stage is at baseflow levels throughout the 2019 water year. Appendix G-6 of the Draft EIR provides water level hydrographs for the four Plant Site groundwater monitoring wells. These hydrographs show that the groundwater levels rise steeply beginning in January 2018 and reach a peak by May 2019. Thus, the groundwater level increases in the 2019 water year began many months prior to any increase in the stage of the San Joaquin River. Thus, the groundwater levels and the stream stage do not have similar trends, and the second criterion is not met at the Plant Site.

Comment 6-33

[Table Item #8, DEIR PDF Pg. 120, Current CUP permits]

Comment: The last time the Conditional Use Permits (CUPs) were updated was in 2004, which is prior to the SJR Settlement that resulted in the SJRRP. Therefore, the 200-foot setback from the river did not consider the SJRRP, the restoration goals and the reintroduction of CV spring-run Chinook salmon. To avoid adversely impacting implementation of the SJRRP and salmon, this buffer should be revisited for any subsequent CUPs, including the bedrock quarry proposal.

Response 6-33

See Response 6-24, which addresses this comment's concern regarding the 200-foot CEQA baseline setback. Furthermore, this comment provides no evidence that the existing 200-foot setback adversely impacts implementation of the SJRRP.

Comment 6-34

[Table Item #9, Appendix 2 of 2, PDF Pg. 131, Well Diagram and Logs]

Existing Text: Well Log MW-2

Comment: Mitigation measures identified in the DEIR propose consistent monitoring of wells to ensure no impact to groundwater during operations, but it does not appear the monitoring wells are sufficiently deep to monitor deep aquifer impacts. Please clarify

how monitoring efforts will be implemented and adapted to reflect conditions of the deep aquifer and ensure adequate mitigation.

Response 6-34

There is no evidence for the existence of a deep alluvial aquifer at the Plant Site. The geologic cross sections in Figure 3, 4 and 5 of Appendix G-3 of the Draft EIR show that the depth to the base of the alluvial deposits ranges from approximately 150 feet to 225 feet below ground surface at the location of the Plant Site mining excavation, with the alluvial units beneath the base of the excavation being predominantly clay. Thus, there is no deeper aquifer zone to monitor beneath the base of the Plant Site excavation.

As for the Quarry Site, the comment incorrectly asserts that the Draft EIR does not have monitoring wells sufficiently deep to monitor deep aquifer impacts associated with the mining operations. As the Draft EIR provides:

> groundwater conditions at the Quarry Site have been investigated by the installation of four alluvial monitoring wells, four weathered rock monitoring wells, and seven hard rock monitoring wells. Pressure transducers with dataloggers were installed in these monitoring wells to monitor fluctuations in groundwater elevation. The locations of these wells are shown in Figure 4.10-4 (Draft EIR, Section 4.10.1.7, "Local Geologic and Groundwater Conditions," page 4.10-37).

Mitigation Measure 4.10-10a requires the monitoring of the groundwater levels within the alluvium, weathered rock, and hard rock, and which requires that if at any point the mining operation causes groundwater levels to decrease by more than 15 percent from the existing CEQA baseline, all dewatering operations must cease (Draft EIR, pages 4.10-108 through 4.10-111). See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10 and associated technical appendices.

Comment 6-35

[Table Item #10, DEIR PDF Pg. 331, Section 4.4.1.3)

Existing Text: River Water Delivery Ditch

Comment: Please describe how the surface water diversion operates in greater detail. For example, is this waterway screened? What species exist in the diversion? How does water move from the diversion to the Plant Site, and how does it interact with the Plant Site at various flow levels? Is the ditch grade maintained by dredging?

Response 6-35

The river water delivery ditch is part of the existing baseline conditions for the project, where water is conveyed to the Plant Site via an existing river conveyance system (Draft EIR, Impact 4.10-4, pages 4.10-93 through 4.10-94). The project does not propose expansions or alterations of this system (i.e., there are no changes in the baseline conditions surrounding surface water usage) (see information most relevant to the baseline on page 4.10-23 through 4.10-49 of the Draft EIR). The nature of an ongoing use that is not increasing beyond the CEQA baseline is not an environmental impact that must be addressed under CEQA.

Comment 6-36

[Table Item #11, DEIR PDF Pg. 335, Section 4.4.1.4)

Existing Text: Plant Site Wildlife

Comment: With the connection of the Plant Site to the SJR through a delivery ditch, are there any potential mitigation measures that could be implemented to prevent non-native species from entering the SJR? Reclamation recommends incorporating some mitigation measure to prevent fish species from using the ditch as a corridor between the Plant Site and the SJR.

Response 6-36

The delivery ditch as shown in Figure 2-3, "Plant Site Existing Conditions," is an existing condition; the project does not involve any change to ditch operations and usage, or water demand, at the Plant Site. Therefore, there is no cognizable impact that would require a mitigation measure, as proposed by the commenter.

Comment 6-37

[Table Item #12, DEIR PDF Pg. 341, Section 4.4.1.4)

Existing Text: Quarry Site Wildlife

Comment: Please clarify the methods used for the Quarry Site assessment of aquatic species. Also, please provide information regarding how native species arrived in the ponded pits and whether those conditions would allow fish from the SJR to get into the pits. Reclamation recommends a more thorough investigation of the aquatic species near the proposed project site, especially in the ponded pits.

Response 6-37

The Quarry Site assessment of aquatic species was conducted through visual inspection of the ponded pits and surrounding water features during site assessments by ELMT Consulting. No native fish species are expected to occur within the pits due to their general isolation from the San Joaquin River (SJR), the absence of suitable habitat, and the presence of physical barriers such as levees and berms that limit connectivity. While extreme flood events could theoretically create temporary connections with the SJR, such occurrences are rare and unlikely to result in the establishment of native fish populations. In the absence of a natural connection to the SJR, management of ponds in a manner to promote use of water features for mining and lack of suitable habitats, native species would have to be introduced to occur in the onsite ponds.

Comment 6-38

[Table Item #13, DEIR PDF Pg. 385, Section 4.4-5)

Existing Text: ...do not fall under the regulatory authority of the Army Corps, SWRCB, or CDFW

Comment: The delivery ditch identified at the Plant Site is directly connected to Little Dry Creek (LDC), which flows into the SJR. However, there is no discussion of this existing condition. In reviewing aerial imagery, there are visible sediment depositions that appear to have originated from the Plant Site and were released into the delivery ditch. This sediment disposition causes turbidity issues and impacts to water quality within LDC and the SJR. Please describe the hydrologic connectivity of the delivery ditch to the Plant Site, how sediment and water quality have been managed to date, and the potential impacts of sediment and water quality concerns to riparian areas along LDC and the SJR.

Response 6-38

Comment 6-38 inaccurately states that the Operator is taking water from Little Dry Creek, which is a tributary of the San Joaquin River (Draft EIR page 2-23). The Applicant has water rights to use water from the San Joaquin River for industrial purposes in connection with processing rock, sand, and gravel (see Draft EIR page 4.10-8). As also noted in the Draft EIR, water is conveyed to the Plant Site via an existing river conveyance system (Draft EIR, Impact 4.10-4, pages 4.10-93 through 4.10-94). Furthermore, the project does not propose expansions or alterations in the existing water system (i.e., there are no changes in the baseline conditions surrounding surface water usage) (see information most relevant to the baseline at pages 4.10-23 through 4.10-49 of the Draft EIR).

Further, see Response 6-21, which concludes that sediment would continue to be controlled via the project sites' NPDES Permit and SWPPP (Draft EIR, Section 4.10.2.2, pages 4.10-69 through 4.10-70). The comment does not provide evidence that the Draft EIR's evaluation of these potential impacts are inadequate.

Comment 6-39

[Table Item #14, DEIR PDF Pg. 385, Section 4.4-5)

Existing Text: result of dewatering would not adversely affect streamflow in either the San Joaquin River or Little Dry Creek because as described above dewatering of these deeper geologic units would not affect the quantity of water in the river.

Comment: This discussion in not consistent with the discussion of Impact 4.10-12, which states there is potential for significant impact; Mitigation Measure 4.10-10a is needed to protect the SJR adjacent to the Quarry Site due to this impact. Impact 4.4-5 describes reduced issues as compared to those described in 4.10-12, by stating that the SJR and LDC are usually losing streams without recognizing connectivity. Please provide a more thorough, consistent analysis and discussion of Impact 4.4-5, particularly LDC during all hydrologic conditions.

Response 6-39

See Collective Response #25, which concludes that evidence shows that groundwater is primarily flowing from the northeast to the southwest, and thus in deeper bedrock aquifer units is flowing toward the river through the Quarry Site area, not away from the river. There is no evidence of the occurrence of interconnected surface water in the Plant Site area.

Moreover, "[w]hile a lead agency must use its 'best efforts' to evaluate environmental effects, including the use of reasonable forecasting, 'foreseeing the unforeseeable' is not required, nor is predicting the unpredictable or quantifying the unquantifiable." (*Citizens for a Sustainable Treasure Island v. City and County of San Francisco* (2014) 227 Cal.App.4th 1036, 1060–1061; citing Guidelines, Section 15064, subd. (d)(3)). Here, the County uses its best efforts in the Draft EIR to evaluate the impacts to groundwater flow utilizing hydrologic experts with doctoral degrees and years of experience in their fields. Further, as discussed in Response 12-77, to ensure that there is a less than significant impact, Mitigation Measures 4.10-10a and 4.10-10b would be implemented, which would mitigate any groundwater depletion caused by the mine greater than 15 percent as compared to the CEQA baseline.

Comment 6-40

[Table Item #15, DEIR PDF Pg. 385, Section 4.4.4)

Existing Text: ...together demonstrate that the San Joaquin River is not in direct hydraulic communication with the weathered rock and hard rock at the Quarry Site.

Comment: While the connection in weathered rock and bedrock is more limited, it is inaccurate to state that there is no hydraulic connection. Please revise this statement and any related analyses and impact determinations accordingly.

Response 6-40

See Collective Response #25, which provides further analyses regarding the connection in weathered rock and bed rock.

Comment 6-41

[Table Item #16, DEIR PDF Pg. 386, Section 4.4.4)

Existing Text: Fish species that occur in the San…

Comment: This is an inadequate description of fish species in the SJR. Reclamation suggests investigating resources on the SJRRP website(restoresjr.net) and from other resource agencies to better describe the aquatic resources in the SJR and consider potential effects and mitigation relevant to the proposed project.

Response 6-41

Those species described in the referenced paragraph include the most common and most notable special-status species such as the spring-run Chinook salmon. In response to this comment, additional, less common fish species were added to Draft EIR Table 4.1-1 to provide a more complete description of the aquatic resources in the San Joaquin River. These species include Sacramento splittail, steelhead/rainbow trout, hardhead, and fall-run chinook salmon. These species were determined to be absent from the project area or to have low potential to occur there. Potential effects to the movement and spawning of these species would be similar to those effects described under Impact 4.4-6 for spring-run Chinook salmon. Thus, the evaluation provided in the Draft EIR is sufficient and no further response is needed.

Comment 6-42

[Table Item #17, DEIR PDF Pg. 387, Section 4.4.4)

Existing Text: In 2013, the Alaska Department of Fish and Game…

Comment: Please clarify if this blasting standard is the common industry standard, or only the standard for Alaska?

Response 6-42

The blasting standard for blasting in areas adjacent to occupied salmonid habitat referenced is an ADF&G recommendation and standard. It is not considered a common industry standard. However, it has a direct correlation to salmon occurring in the SJR. It provides useful guidance, for developing the analysis for this project as no "industry standards" are readily known. Thus, the best available science and guidance is used from areas where salmon and mining cooccur. See also Collective Response #16.

Comment 6-43

[Table Item #18, DEIR PDF Pg. 387, Section 4.4.4)

Existing Text: This level of ground vibration is significantly…

Comment: The SJR adjacent to the Quarry Site is a spawning site for CV spring-run Chinook salmon. Although the project proponent's analysis concludes the blasting protocols will have significantly less impacts than those that may "cause harm" such as mortality, it is not possible to verify the field accuracy of the analysis. Blasting impacts greater than those stated in the DEIR may impact fish behavior at various life stages (i.e., juveniles displaced from cover in rearing habitat, adults displaced from spawning habitat) and therefore impact the success of the SJRRP. Reclamation requests the monitoring and avoidance, minimization, and mitigation measures outlined in the Alaska blasting standards be implemented as necessary for blasting impacts.

Response 6-43

See Response 6-17 for inclusion of monitoring during blasting to document and adaptively minimize effects to fish.

Comment 6-44

[Table Item #19, DEIR PDF Pg. 554, Section 4.9)

Comment: Based on the language in the DEIR, it does not appear that the hazardous materials plan accounts for overland flooding

of the Quarry Site. Please provide a hazardous materials plan that accounts for the possibility of overland flooding.

Response 6-44

Please see the discussion of potential water quality effects associated with site flooding and inundation in the Draft EIR under Impact 4.10-17 (Draft EIR, pages 4.10-118 through 4.10-119). As discussed there, during unforeseen events, the release of water into the San Joaquin River at rates that could exceed channel capacity could result in flooding of the Quarry Site and/or Plant Site. However, such inundation would occur under conditions that are not reasonably foreseeable and therefore are not required to be analyzed under CEQA (CEQA Guidelines Section 15064(d)(3)).

The Draft EIR also describes existing regulatory requirements applicable to hazardous materials management at the site, including Waste Discharge Requirements, the Industrial General Permit Stormwater Pollution Prevention Plan (SWPPP), the Hazardous Materials Business Plan (HMBP), and the Spill Prevention, Control, and Countermeasure (SPCC) Plan (Draft EIR, pages 4.10-68, 4.10-89, and 4.10-90). These plans are required to be updated to reflect the proposed project and include measures to prevent the release of pollutants. In addition, site design features, including berms and levees, separate onsite and offsite drainage.

Upon completion of reclamation, the project sites would consist primarily of open space and open water uses and would not involve the storage of hazardous materials. Based on these regulatory requirements and site conditions, the potential for flooding to result in a release of hazardous materials would be less than significant.

Comment 6-45

[Table Item #20, DEIR PDF Pg. 567, Figure 4.10-1)

Comment: It appears the Quarry Site is within the Federal Emergency Management Agency (FEMA) 100-year Zone AE floodplain, as is a portion of the Plant Site. How will the project proponent prevent flood water from entering the Quarry Site in a 100-year or greater event?

Response 6-45

The FEMA floodplain was prepared based on 36-year-old data. A hydraulic analysis based on recent data shows that the 100-year floodplain would not enter the Quarry. The hydraulic analysis prepared for the Draft EIR is attached as Appendix G-1 to the Draft EIR. The 100-year flow is contained within the easterly San Joaquin River channel bank.

See Figure 4.10-1, "Current 100-Year Floodplain," on page 4.10-3 of the Draft EIR. See also Collective Response #17.

Comment 6-46

[Table Item #21, DEIR PDF Pg. 569)

Existing Text: The easterly bank slope is generally flatter than 2:1 (horizontal: vertical). There are no signs of significant bank erosion. During historic flow events, including the January 1997 flood event of approximately 60,300 cubic feet per second (cfs), the easterly bank along the Quarry Site did not experience significant erosion and the bank has never breached into the Quarry Site.

Comment: Reclamation recommends conducting a bank stability model that incorporates recharge operations and flooding events to ensure the risks of bank erosion will not increase due to recharge operations.

Response 6-46

See Responses 6-52, 6-71, 6-72, and 65-27, which adequately address the commenter's statement that the Draft EIR needs to analyze water quality impacts associated with the Plant Site's silt pond water and recharge trenches percolating into the groundwater aquifer. Specifically, Response 6-52, 6-71, 6-72, and 65-27 provide that the surface water and groundwater concentrations reported in Draft EIR represent existing baseline conditions at the Plant Site and thus are not indicative of potential project effects. Additionally, Responses 6-52, 6-71, 6-72, and 65-27 provide in pertinent part that the water in the silt pond typically is very turbid and contains a high level of suspended solids due to the aggregate washing process. The suspended solids are clays that consist of natural earth materials and minerals. For the metals, both unfiltered and filtered samples (shown as "total" and "dissolved," respectively in Draft EIR, Table 4.10-3) were analyzed. The unfiltered samples contain the suspended mineral solids and represent the total concentration of the metals in the water and the suspended solids. The filtered samples contain only metals dissolved in the water. The total concentrations of arsenic, iron, lead, and manganese from the unfiltered samples exceed their respective water quality standards, but the dissolved concentrations from the filtered samples do not. Further, as provided in the Draft EIR in Section 4.10.1.8, "Groundwater Quality," page 4.10-42, the occasional elevated levels of iron and manganese identified in Table 4.10-5, "Plant Site Groundwater Quality Data," most likely represent naturally occurring concentrations in the suspended solids within the samples and may be the result of variability in sampling procedures. Additionally, as noted in Response 6-52, Table 4.10-3

of the Draft EIR presents data related to existing baseline conditions at the Plant Site silt pond, and as explained in Impact 4.10-1, the limits established by Table 4.10-3 are intended to regulate water quality standards, in the event that there was ever water that discharges to the San Joaquin River, which would not occur (see Draft EIR, Impact 4.10-1, page 4.10-88). See Final EIR Chapter 3, "Draft EIR Errata," to view revisions to Draft EIR Section 4.10 and supporting appendices.

Comment 6-47

[Table Item #22, DEIR PDF Pg. 569)

Comment: As currently documented and designed, the sites do not contemplate mitigation of overland flow events greater than a 100-year flood. It appears there is notable risk of capturing river flows and contaminating river water and groundwater in an event greater than a 100-year flood. Reclamation recommends that larger events should also be considered in the analysis; County Policy HS-C.14 suggests a 200-year floodplain should be considered. Consider constructing larger levees that can protect the Plant and Quarry Sites from events greater than a 100-year flood.

Response 6-47

See Responses 12-76, 12-97, and 12-100, which discuss the requirements of Mitigation Measure 4.10-5a. There is substantial evidence that Mitigation Measure 4.10-5a would be effective and commits to a detailed plan for monitoring groundwater quality by sampling every six months until manganese levels have fallen to within the water quality parameters for a five-year period and commits the applicant to complying with regulations relating to groundwater quality thresholds which may change (see Draft EIR pages ES-34 through ES-35 and 4.10-95 through 4.10-96). Additionally, as provided in Response 12-100, the County would require additional measures to be added to Mitigation Measure 4.10-5a. The comment does not provide any substantial evidence that Mitigation Measure 4.10-5a would not mitigate impacts to the groundwater quality at the Plant Site and provides no justification for requiring monthly monitoring.

In consideration of commenters' concerns pertaining to severe flooding events and in light of County Policy HS-C.12, Chang Consultants evaluated the potential for the 200-year flood to enter the Quarry Site and Plant Site. Upon an initial evaluation, the modeled 200-year floodplain entered the quarry pit at stations 16, 19, and 20 by approximately two feet. To proactively prevent the possibility of a 200-year flood event from entering the quarry pit, CEMEX raised the northerly portion of the berms separating the San Joaquin River and Quarry Site up to approximately 4 feet with compacted fill. A topographic mapping was prepared to display the locations where the berms were raised and is

included in the 200-year hydraulic analysis for the Quarry Site. Please see Collective Response #17 for further discussion of the 200-year flood analysis conducted for the Quarry Site.

The 2026 hydraulic analysis also demonstrated that the existing berms and topography of the Plant Site would prevent both the San Joaquin River 200-year flood and the Little Dry Creek 200-year flood from entering the Plant Site (Chang 2026b, Appendix G-8). As such, the project sites are sufficiently protected from flood risks, including from the 200-year flood.

Comment 6-48

[Table Item #23, DEIR PDF Pg. 577, Section 4.10.1.5)

Existing Text: San Joaquin River floodway generally does not encroach onto the Plant Site or Quarry Site, but the floodplain encroaches on the west side of both sites

Comment: The description of Figure 4.10-1 (on page 4.10-15) incorrectly characterizes encroachment as potentially occurring by the floodway or floodplain onto the Plant or Quarry Site, instead of the other way around. Please revise the text to characterize the sites' encroachment (or not) into the floodway or floodplain.

Response 6-48

As stated in Comment 12-18, Figure 4.10-1 does depict the current and regulatory floodways and floodplains for the project sites. See also Response 65-22, which provides that the FEMA studies had to be updated to reflect the development of berms and other features. The Draft EIR has been revised to clarify the discussion in the "Localized and Riverine Flooding" subsection of the Draft EIR (Draft EIR pages 4.10-15 through 4.10-16). The clarifications do not alter the conclusions of the Draft EIR. See Final EIR Chapter 3, "Draft EIR Errata," to view this revision to the Draft EIR.

Comment 6-49

[Table Item #24, DEIR PDF Pg. 578, Section 4.10.1.5)

Existing Text: Controlled Release from Dam

Comment: Operations of Friant Dam have changed greatly in the last decade and should be described here.

Response 6-49

Friant Dam and Millerton Lake, including operations at the dam, are described extensively throughout the Draft EIR. See Draft EIR pages 4.10-16, -18, -50, -56, and -119.

Comment 6-50

[Table Item #25, DEIR PDF Pg. 579, Section 4.10-5)

Comment: It appears the Quarry Site equipment will be placed below the groundwater table and the Quarry Site may need to be continuously pumped to not flood the aggregate plant, asphalt plant, ready-mix concrete plant, and office. What happens if a pump goes down and these structures start to flood? Please include appropriate mitigation measrues to address this possibility.

Response 6-50

Impact 4.10-6 of the Draft EIR provides that "[t]he project proposes to use and discharge groundwater to the … recharge trenches within the Quarry Site" which groundwater "is generally within established water quality standards, … [and] there are no known sources of potentially hazardous materials contamination of the groundwater at the Quarry Site or its vicinity; therefore, pumping of dewatered groundwater to the … into proposed groundwater recharge trenches along the western boundary of the [Quarry] [S]ite would not have the potential to substantially degrade groundwater quality relative to existing conditions" (Draft EIR, Impact 4.10-6, page 4.10-99). The comment provides no support that the testing of the groundwater prior to discharging it to the recharge trenches is needed.

Comment 6-51

[Table Item #26, DEIR PDF Pg. 585)

Comment: It appears that some of the ponded water on the sites exceed water quality standards. The project proponent claims water quality exceedances are acceptable because the proposed project does not discharge directly to the SJR, however at the Quarry Site the proposed project discharges within 100 feet of the river and leaves minimal opportunity for filtration. Additional water treatment should be conducted before recharging water collected from the Quarry or plant Sites.

Response 6-51

The project is designed as a zero-discharge facility with respect to offsite discharges, and, therefore, discharge to the San Joaquin River or other surface water bodies would not occur and is not proposed as part of the project. Water at the Quarry Site is stored in

designated recharge trenches and ponds and would not be discharged to surface waters. See Responses 6-52, 6-71, 6-72, and 65-27.

Comment 6-52

[Table Item #27, DEIR PDF Pg. 585, Plant Site Surface Water Quality)

Comment: The water quality analysis of the Plant Site's silt pond shows high exceedances for metals. Please analyze and disclose the potential for those metals to leach into the soils and surrounding groundwater.

Response 6-52

In addition to the response provided below, see Responses 6-52, 6-71, 6-72, and 65-27, which adequately analyze and disclose the potential metals to leach into the soils and surrounding groundwater.

Table 4.10-3 of the Draft EIR presents data related to existing baseline conditions at the Plant Site silt pond. As stated on page 4.10-25 of the Draft EIR:

The water in the silt pond typically is very turbid and contains a high level of suspended solids due to the aggregate washing process. The suspended solids are clays that consist of natural earth materials and minerals. For the metals, both unfiltered and filtered samples (shown as "total" and "dissolved," respectively in Table 4.10-3) were analyzed. The unfiltered samples contain the suspended mineral solids and represent the total concentration of the metals in the water and the suspended solids. The filtered samples contain only metals dissolved in the water. The total concentrations of arsenic, iron, lead, and manganese from the unfiltered samples exceed their respective water quality standards, but the dissolved concentrations from the filtered samples do not.

As stated in the Draft EIR, the elevated metals concentrations are due to the presence of suspended silts and sediment within the silt pond. Since elevated metals concentrations were not present in the filtered sample, which represents the dissolved concentrations within the water, the detected metals levels in the unfiltered sample are simply a reflection of the naturally occurring metals in the natural soils and earth materials in the aggregate being processed at the Plant Site. The lack of elevated metals in the filtered samples demonstrates that the metals are not leaching from the silt into the natural soils beneath the silt pond and to groundwater.

Comment 6-53

[Table Item #28, DEIR PDF Pg. 585, Table 4.10-4)

Comment: It appears the water quality parameters sampled for at the Plant Site were not repeated at the Quarry Site. For instance, arsenic and lead were not sampled; these constituents should be sampled at both sites. Please provide congruent sample information as a part of any analysis.

Response 6-53

Draft EIR Table 4.10-4, "Quarry Site Surface Water Quality Data," presents data from several ponded water features at the Quarry Site. Only Ponded Water Feature 3, the Northeast Pond, is still present at the Quarry Site and is the only ponded water feature that would remain as part of the proposed project. The water within the ponded water features at the time of sampling consisted primarily of groundwater seepage prior to dewatering of those areas for subsequent mining (Ponded Water Features 1 and 2 on Figure 4.10-4, "Quarry Site Surface Water Features and Wells," of the Draft EIR) or groundwater that was pumped to the Northeast Pond during dewatering of other areas of the Quarry Site.

Table 4.10-6, "Quarry Site Groundwater Quality Data," of the Draft EIR presents groundwater quality data from the Quarry Site wells, which includes the same parameters analyzed at the Plant Site. Thus, the potential presence of arsenic, lead, and other parameters in the groundwater pumped to the ponded water features would be indicated in the groundwater quality in Table 4.10-6. Thus, consistent, or congruent, information is available for both the Plant Site and the Quarry Site.

Comment 6-54

[Table Item #29, DEIR PDF Pg. 600, Table 4.10-37)

Comment: Please clarify if trenches and pumps are sized to move and recharge Quarry Site groundwater and rainwater during wet years, or if pump and/or trench capacity will be exceeded in wet years. If capacity will be exceeded, please clarify how site flooding will be mitigated.

Response 6-54

As explained in Response 65-28, Impact 4.10-6, "[t]he project proposes to use and discharge groundwater to the … recharge trenches within the Quarry Site" which groundwater "is generally within established water quality standards, … [and] there are no known sources of potentially hazardous materials contamination of the groundwater

at the Quarry Site or its vicinity; therefore, pumping of dewatered groundwater to the … into proposed groundwater recharge trenches along the western boundary of the [Quarry] [S]ite would not have the potential to substantially degrade groundwater quality relative to existing conditions" (Draft EIR, Impact 4.10-6, page 4.10-99). Further, the groundwater sampling results are summarized in Table 4.10-6 (Draft EIR, page 4.10-43). The MW-3 well cluster has individual wells within the alluvium, weathered rock, and hard rock.

Comment 6-55

[Table Item #30, DEIR PDF Pg. 605, Table 4.10-37)

Comment: To complete a meaningful review of the water quality of the SJR compared to the Quarry Site, the river should be analyzed upstream of any potential groundwater seepage or other impacts from the mining operation. Please include a SJR sample site both upstream and downstream of the proposed project and revise the analysis accordingly.

Response 6-55

The proposed project's potential effects related to water quality were evaluated in Draft EIR Section 4.10 as well as in the *Revised Hydrology and Water Quality Analysis Report* (2023) and the *Addendum to: Revised Hydrology and Water Quality Analysis Report* (2024), prepared by EMKO Environmental, Inc. and included as Draft EIR Appendices G-5 and G-6, respectively. The following excerpts from the Draft EIR and EMKO Environmental, Inc. reports are provided in response to this comment.

A surface water sample was collected from the San Joaquin River, adjacent to the Quarry Site. The water quality constituent concentrations were within typical ranges for natural surface waters. These conditions are considered representative of the project's existing setting, i.e. the CEQA baseline.

As discussed in the Draft EIR, the proposed project is designed as a zero-discharge facility with respect to offsite discharges, and, therefore, the proposed project would continue to not discharge to the San Joaquin River. Therefore, there would be no impacts to surface water quality offsite, and consequently additional analysis of the San Joaquin River water quality is not necessary to evaluate the proposed project's effects to surface water quality.

See Final EIR Chapter 3, "Draft EIR Errata," to view proposed revisions to Draft EIR Section 4.10 and Appendix G.

Comment 6-56

[Table Item #31, DEIR PDF Pg. 610, San Joaquin River Connection to the Quarry Site)

Comment: Please discuss lagged depletions from the SJR to the Quarry Site through weathered rock and bedrock in the DEIR.

Response 6-56

See Collective Response #25, which demonstrates that there is no interconnected surface water at the Quarry Site area. While water may percolate from the river to groundwater, it is not interconnected as defined by DWR. Thus, deeper mining and dewatering would not draw additional water from the river.

Comment 6-57

[Table Item #32, DEIR PDF Pg. 611)

Existing Text: The water level data for well MW-2S, screened only in the alluvium, shows that the well does not contain water except during periods when the San Joaquin River stage is greater than 4 feet. A review of river stage data from January 2014 to February 2023 indicates that the San Joaquin River stage measurements exceeded 4 feet for approximately 13 percent of the January 2014 to February 2023 time period.

Comment: SJRRP flows will increase the river stage in the coming years. How are future conditions with the proposed project analyzed to account for SJRRP flows in the SJR? How will the project proponent ensure SJRRP flows are not taken by proposed project pumping?

Response 6-57

See Response 6-12 and Collective Response #25. The data and analyses presented in the Draft EIR demonstrate that there is no measurable connection between river flows and groundwater conditions. Furthermore, flows equal to or greater than Stage 1 SJRRP restoration flows have occurred during the baseline monitoring period, as discussed in detail in Sections 2.2.1, 2.2.3, and 3.2.2 of Appendix G-5 of the Draft EIR.

Additionally, as noted in Response 58-27, recharge trenches and ponds for groundwater recharge have been used for decades at the Quarry Site, and at numerous other aggregate mining sites in the San Joaquin Valley. Those sites have been reviewed and are within the personal knowledge of two of the hydrology experts who worked on the Draft EIR hydrology reports. Furthermore, Draft EIR Appendix G-6, *Addendum to: Revised*

Hydrology and Water Quality Analysis Report, provides a quantitative assessment of the efficacy of the use of recharge trenches to mitigate effects on groundwater levels, which in turn would alleviate the groundwater recharge from an elevated river stage (see Draft EIR, Appendix G-6, page 3). See also Final EIR Chapter 3, "Draft EIR Errata," to view revisions to Draft EIR Section 4.10 and supporting appendices.

Comment 6-58

[Table Item #33, DEIR PDF Pg. 611)

Existing Text: Thus, for water to flow from the river and into the alluvium any appreciable distance, the San Joaquin River stage needs to be somewhat higher than 2.5 feet to create a sufficient hydraulic gradient, or slope, away from the river and toward the well location.

Comment: This conclusion appears overly broad. It does not address connectivity between weathered rock and bedrock, and it does not address changes to the hydraulic gradient caused by factors such as pumping adjacent to the SJR (as is proposed by the proposed project) or the impacts of recharge trenches. It is unclear if water could be pulled away from the SJR through alluvial material at low stages in these circumstances. Supplemental analysis should be conducted to address these scenarios.

Response 6-58

See Collective Response #25 and Response 6-12. Surface water and groundwater are not interconnected. Additionally, even with increased hydraulic gradients, the rate of groundwater flow is relatively slow compared to the distance between the river and the edge of the Quarry, especially given that increased flows under the SJRRP would only occur from 20 to 60 days per year.

Comment 6-59

[Table Item #34, DEIR PDF Pg. 611, Section 4.10.1.9)

Existing Text: Thus, when the stage of the river is high enough that the water surface is above the base of the alluvium, there is a higher potential for seepage of water from the river into the Quarry Site... As a result, the San Joaquin River flows are always in contact with the alluvium (which overlies the weathered rock) in this segment of the river.

Comment: Will recharge trenches in the NW corner of the Quarry Site provide water that will travel toward the SJR, or will the water move toward the quarry due to location and the hydraulic

grade created by continued pumping? How will the hydraulic grade created by recharge trenches and pumping be impacted by varying hydrologic conditions? The analysis presented suggests there is not a strong correlation between the SJR and Quarry Site groundwater. However, as described, the analysis is insufficient to reach this conclusion. Please expand the discussion on this topic and provide a supplemental analysis.

Response 6-59

The text cited for this comment is simply noting that based on available elevation data, base flows in the San Joaquin River are in contact with the alluvium in the segment of the river near the MW-1 well cluster.

As noted in Response 58-27, recharge trenches and ponds for groundwater recharge have been used for decades at the Quarry Site, and at numerous other aggregate mining sites in the San Joaquin Valley. Those sites have been reviewed and are within the personal knowledge of two of the hydrology experts who worked on the Draft EIR hydrology reports. Furthermore, Draft EIR Appendix G-6, *Addendum to: Revised Hydrology and Water Quality Analysis Report*, provides a quantitative assessment of the efficacy of the use of recharge trenches to mitigate effects on groundwater levels (see Draft EIR, Appendix G-6, page 3). In addition, as noted in Response 12-77, Mitigation Measure 4.10-10a requires mining operations to cease if groundwater recharge cannot be maintained within 85 percent of the CEQA Baseline groundwater levels. Finally, as noted in Appendix G-4 of the Draft EIR, it is assumed that 50 percent of the water released to the trenches flows toward the San Joaquin River and the other half flows back to the Quarry through the alluvium.

Comment 6-60

[Table Item #35, DEIR PDF Pg. 617)

Existing Text: Charts 1 and 2 of Figure 4.10-11 also show relatively minor fluctuations in water levels at the monitoring wells, with the difference between minimum and maximum elevations measured being approximately 10 feet or less... The data from the longer period of record for the offsite wells corroborates the conclusion that, while local rainfall and increased river flows or stages may have short-term effects on the groundwater levels in the weathered rock and hard rock at the Quarry Site and its vicinity, such effects are minor and do not persist.

Comment: Comparing recent data to data from 50 years ago is not an appropriate analysis to verify the validity of the project proponent's claim about consistent groundwater levels in the area

or that local rainfall and river flow has short term, minor effects on groundwater levels in the weathered rock and hard rock at the Quarry Site. Comparison of monitoring well data to offsite wells should have overlapping periods of record and long-term trends should be evaluated based on recent conditions, not conditions from 50 years ago. Please remove this comparison and any conclusions supported by it, or otherwise provide supplemental, local data to provide relevant trend comparisons.

Response 6-60

The comparison is presented to demonstrate that the available historical record reveals conditions that are comparable to current conditions, which provides historical context to the baseline. Otherwise, the comment provides no support for the removal of historical data, which is only utilized to compare existing baseline data with historic data.

Comment 6-61

[Table Item #36, DEIR PDF Pg. 617, Section 4.10-55)

Existing Text: The data from the longer period of record for the offsite wells corroborates the conclusion that, while local rainfall and increased river flows or stages may have short-term effects on the groundwater levels in the weathered rock and hard rock at the Quarry Site and its vicinity, such effects are minor and do not persist.

Comment: These conclusions should be separated to address rainfall and river stage separately, since the two appear to have different levels of correlation with groundwater levels. The charts demonstrate a close correlation between river stage and groundwater levels. This correlation demonstrates a significant risk of future river dewatering through Quarry Site dewatering. This impact should be addressed in the document and adequately avoided, minimized, or otherwise mitigated in the project plans.

Response 6-61

See Collective Response #25, which addresses the river stage effect on groundwater. Further, as noted in Appendix G-5 of the Draft EIR, groundwater levels typically begin to increase before the river stage increases. Thus, while there may appear to be some temporal correlation between groundwater levels and river stage, the change in groundwater levels prior to changes in river stage indicates the correlation is not indicative of causation.

See also Responses 6-14 and 6-56. The volume of groundwater flowing under the Quarry Site and the volume estimated to be dewatered as part of the project are miniscule compared to the flow rates in the river, especially the future SJRRP restoration flows. Thus, even if there was some interconnection between the river and the deeper weathered rock and hard rock units, any effect on the river would be immeasurable.

Comment 6-62

[Table Item #37, DEIR PDF Pg. 617, Section 4.10.1.9)

Existing Text: conclusion that, while local rainfall and increased river flows or stages may have short-term effects on the groundwater levels…such effects are minor and do not persist.

Comment: The bottom of page 4.10-55 makes the conclusion that "increased river flows or stages may have short-term effects on the groundwater levels" at the Quarry Site but "such effects are minor and do not persist." This conclusion ignores the hydraulic connection between groundwater and the SJR that can be observed during periods of higher river stages (Figure 4.10-11) and contributes to stable groundwater elevations in the monitoring wells from generally stable river flows the rest of the year. This hydraulic connection in all three groundwater zones at MW-1 and MW-2 on the west side of the Quarry Site near the river is described in Appendix G-4 (page 35 and 50) but is absent from the text of the DEIR. Please incorporate this data into the DEIR analysis and revise the DEIR impact conclusions to incorporate this information.

Response 6-62

Comment 6-62 incorrectly alleges that the Draft EIR ignores the hydraulic connection between the groundwater and the San Joaquin River. See Responses 6-14, 6-56, and 6-61, and Collective Response #25. The analysis in the Draft EIR (including its supporting appendices) shows that there is no significant hydraulic connection between the river and groundwater, and this comment does not provide any substantial evidence to support an alternative conclusion with respect to such connections. Furthermore, as noted in the responses to the comments cited in the first sentence of this response, even if such a connection did exist, any effect would be miniscule and effectively immeasurable related to the flow in the river.

Comment 6-63

[Table Item #38, DEIR PDF Pg. 618)

Existing Text: Based on pumping records provided by the project proponent, during the 2018-2019 water year, a total of 330 acre-feet were pumped from the existing mining excavation... This indicates that, while there is some hydraulic connectivity between the San Joaquin River and the Quarry Site, water from San Joaquin River is currently not a substantial source of the groundwater inflow into excavations within the Quarry Site.

Comment: The previous section states that connection to the SJR is not significant until the SJR reaches a stage 2.5 ft or higher. This analysis makes conclusions about connectivity to the SJR without verifying the stage was high enough to analyze connectivity when, as claimed by the project proponent, connectivity would be possible. In addition, this analysis was completed without a full year's worth of data; the spring runoff period is when the SJR is most likely to have a higher stage, as discussed in previous sections, and is not included in this analysis. Without this data, there is no way to understand how groundwater and groundwater pumping are related to river flows. The existing analysis should be supplemented with an analysis that includes seasons when the SJR stage is above the start of the alluvial material. In addition, this analysis does not consider impacts of pumping and its effects on hydraulic gradient or lagged impacts of pumping on river flows and vice versa. These influences should be considered in a supplemental analysis.

Response 6-63

The river stage data evaluated as part of the Draft EIR is shown on Figure 11 of Appendix G-5 of the Draft EIR. As can be seen on that figure, the stage of the San Joaquin River was above 2.5 feet for all of the 2018-2019 water year.

See also Responses 6-14, 6-56, and 6-61, and Collective Response #25. Otherwise, the comment does not provide substantial evidence that the Draft EIR fails to adequately analyze the San Joaquin River stage effect on groundwater.

Comment 6-64

[Table Item #39, DEIR PDF Pg. 618)

Existing Text: The Hydrology and Water Quality Analysis Report (Appendix G-5) notes that the median flow in the San Joaquin River is 394 cfs, while diversions to the canal are in the range of 4,200 cfs. Thus, leakage from the canal flows, which flow year-round,

are likely an important source of groundwater recharge to the areas in the vicinity of the Friant-Kern Canal, including the Quarry Site. This is consistent with the Groundwater Sustainability Plan for the North Kings GSA, which identifies both the San Joaquin River and the Friant- Kern Canal as significant sources of groundwater recharge to the North Kings GSA (North Kings GSA 2022).

Comment: The Friant-Kern Canal (FKC) is lined and over a mile away from this location, while the river is only 200 feet from the site. Comparing maximum canal flows that only take place in wet years to median river flows does not account for temporal, hydrologic, or geographic factors that influence groundwater availability. Please provide a supplemental analysis to verify this assumption or otherwise amend this statement.

Response 6-64

See Responses 6-13 and 6-14, which adequately address the commenter's suggestion that the Draft EIR does not account for temporal, hydrologic, or geographic factors that influence groundwater availability.

Comment 6-65

[Table Item #40, DEIR PDF Pg. 621, Figure 4.10-13)

Comment: This figure does not account for any lagged depletion that might exist between the SJR and groundwater due to pumping. A supplemental analysis should be completed that considers lagged impacts to the river.

Response 6-65

See Response 6-56 regarding depletion and impacts to flows in the river. Otherwise, Comment 6-65 does not provide substantial evidence that the Draft EIR fails to provide adequate evidence of depletion that may occur between the San Joaquin River and groundwater due to dewatering operations.

Comment 6-66

[Table Item #41, DEIR PDF Pg. 623, Table 4.10-7)

Existing Text: implies not any significant or consistent flow of water from the river to the GW at the Quarry Site

Comment: Comparing SJR water levels from spring 2017 (wet year) to monitoring levels in fall 2021 (critical-high year) is not an appropriate comparison. Also note that the recharge trenches are right next to the monitoring wells, so they would influence water

levels and quality. Any analysis used to support an impact conclusion should use data from a single analysis time period where there is data available at all monitoring locations. Further, this data should be taken at varying hydrologic regimes to reflect varying conditions, and artificial recharge should either not be taking place or otherwise appropriately addressed in any analysis to ensure the results are not artificially swayed by recharge operations.

Response 6-66

Comment 6-66 improperly alleges that Draft EIR Table 4.10-7, "Comparison of San Joaquin River Water Quality to Quarry Site Groundwater Quality," beginning on page 4.10-61, compares SJR water levels and monitoring levels, whereas Table 4.10-7 shows water quality data, not water levels. See Responses 58-27 and 65-35, with regards to water levels and recharge.

Comment 6-67

[Table Item #42, DEIR PDF Pg. 629)

Comment: It appears that Waste Discharge Requirement Order 90-083 for the Plant Site expired in 2020. Is there a subsequent order permitting discharge? Please provide or reference any subsequent permits with the DEIR materials.

Response 6-67

The basis for the U.S. Bureau of Reclamation to assume that Order 90-083 has expired is unclear. CEMEX has been subject to that Order since 1990 and continues to conduct monitoring and reporting at this time. The most recent Annual Report of Contact Information was submitted to the Regional Water Quality Control Board on January 16, 2025, while the most recent Quarterly Monitoring Report was submitted to the same agency on July 10, 2025.

Comment 6-68

[Table Item #43, DEIR PDF Pg. 633)

Existing Text: The Surface Mining and Reclamation Act of 1975 (SMARA) (Public Resources Code [PRC], Sections 2710–2796) and its implementing regulations (California Code of Regulations [CCR], Title 14, Section 3500 et seq.).....SMARA 14 CCR Section 3706 applies to the discussion of the project's potential for hydrology and water quality impacts:.....f) When stream diversions are required, they shall be constructed in accordance with: (1) the stream and lake alteration agreement between the operator and the

Department of Fish and Game; and (2) the requirements of the Federal CWA, Sections 301 (33 U.S.C. 1311) and Section 404 (33 U.S.C. 1344) and/or Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 403).

Comment: Does the SJR diversion conform to Surface Mining and Reclamation Act standards? This should be reassessed as a part of this permit application to ensure that the proposed project does not contaminate the SJR and impact Reclamation water interests.

Response 6-68

The existing water diversion system is part of the existing baseline. The requirements described above would apply if the project implemented a new diversion system, which it does not. Moreover, the comment does not provide any remarks as to the adequacy of the Draft EIR.

Comment 6-69

[Table Item #44, DEIR PDF Pg. 646)

Existing Text: The analysis assumes that the operator of the Rockfield Quarry (Operator) would comply with the requirements of the California Surface Mining and Reclamation Act, Fresno County Ordinance Code, and NPDES requirements.

Comment: Aerial photos indicate there have likely been previous breaches at the Quarry Site. Given the existing conditions, mitigation measures should be incorporated into the proposed project to reduce the risk of future surface water contamination events.

Response 6-69

Comment 6-44 alleges without providing any support or evidence that there has been a breach at the Quarry Site and fails to define what is meant by breach. The Draft EIR explains that there are no signs of significant bank erosion, and during the historic January 1997 flood event of approximately 60,300 cubic feet per second, the easterly bank along the Quarry Site did not experience significant erosion, and the bank has never breached into the Quarry Site (Draft EIR, page 4.10-7). Regardless, in the event of major flooding or a levee breach, see Response 65-28, which adequately analyzes the unforeseen event of the release of water from the Friant Dam or Millerton Lake Reservoir in an amount that exceeds the River's channel capacity, and concludes that the project sites' enlarged mining excavations would actually help contain and minimize downstream flooding (Draft EIR, page 4.10-119), and the stormwater would be managed in accordance with all applicable requirements of the NPDES program, including site-specific SPPPs

prepared in accordance with Industrial General Permit Requirements and updated Waste Discharge Requirements (Draft EIR, page 4.7-29). Thus, as provided in Appendix G-1 to the Draft EIR, the risk of erosion of the riverbank causing a breach of the easterly bank of the Quarry Site, and the risk of the release of pollutants due to project inundation at the Quarry Site or the Plant Site are less than significant (Draft EIR, Appendix G-1, page 7).

Additionally, relevant aerial photographs were not provided to support the assertions in this comment. It is noted that the August 1998 aerial image available on Google Earth indicates the potential presence of splays to the east of the river channel, potentially from the 1997 floods. It is important to note that mining at that time was only occurring in a relatively small area in the northeast corner of the Quarry Site, more than 1,500 feet east of the San Joaquin River, and well away from the potential splays noted above. Prior to mining closer to the river, CEMEX installed berms that are approximately 15 feet high along the west side of the Quarry Site to prevent a breach or other flooding from the river. CEMEX reports that no breaches have ever occurred between the San Joaquin River and the Quarry Site mining excavation.

Comment 6-70

[Table Item #45, DEIR PDF Pg. 654)

Existing Text: Mitigation Measure 4.10-1: Blasting Protocols - The operator of the Rockfield Quarry shall at all times implement the requirements of the "Blasting Protocols" developed October 27, 2020, and updated September 8, 2021, by Vibra-Tech Engineers, Inc. The Blasting Protocols shall be appended to the Mitigation Monitoring and Reporting Program and shall be incorporated into the conditions of approval for the project.

Comment: Reclamation is concerned that until blasting impact significance can be verified through monitoring, there continues to be the potential for significant blasting impacts. Please see Reclamation's letter for a proposed monitoring and mitigation plan.

Response 6-70

As explained in Response 65-37, Mitigation Measures 4.7-6, 4.7-7a, and 4.10-1 adequately address the potential of pit failure and provides for ongoing slope stability analyses. Additionally, Mitigation Measure 4.10-1, which addresses potential impacts to the San Joaquin River embankment, requires continuous pre-blast and post-blast visual inspections of the portions of the San Joaquin River embankment that are located within 1,000 feet of each blast. In the case of a potential effect, all blasting must cease until the

County approves a Corrective Action Plan (see Draft EIR, pages 4.4-57 through 4.4-58; Mitigation Measure 4.10-1; and Appendix H-9, Section E, page 5).

Comment 6-71

[Table Item #46, DEIR PDF Pg. 655, Impact 4.10-4)

Comment: The impact to the Plant Site is currently being assessed based on groundwater quality, but recharge trenches will put surface water into the groundwater. Therefore, existing groundwater and surface water conditions should be evaluated when determining the proposed project's impact to groundwater quality. According to Table 4.10-3, surface water on the site exceeds water quality standards for manganese, iron, lead, arsenic, and conductivity. All these parameters should be considered in the analysis.

Response 6-71

See Responses 6-15, 6-52, 6-71, 6-72, 12-97, and 65-27, which address groundwater quality in the recharge trenches, which conclude that the elevated metals concentrations are due to the presence of suspended silts and sediment within the silt pond. Since elevated metals concentrations were not present in the filtered sample, which represents the dissolved concentrations within the water, the detected metals levels in the unfiltered sample are simply a reflection of the naturally occurring metals in the natural soils and earth materials in the aggregate being processed at the Plant Site. The lack of elevated metals in the filtered samples demonstrates that the metals are not leaching from the silt into the natural soils beneath the silt pond and to groundwater.

Furthermore, the surface water and groundwater concentrations reported in the 2023 EMKO report represent existing baseline conditions at the Plant Site.

The conductivity exceedance in the Plant Site silt pond would only be applicable if water from the pond were being discharged to the San Joaquin River, which is not the case. The proposed project is designed as a zero-discharge facility and thus, surface water in the pond would not discharge outside of the site's boundaries.

Comment 6-72

[Table Item #47, DEIR PDF Pg. 658, Impact 4.10-4)

Existing Text: The adaptive management program would be responsive to changing water quality conditions in the reclaimed pond over time... If the iron and/or manganese levels persist above their respective water quality standards, then the mitigation measure

recommends feasible actions that can be taken to address reducing conditions in the pond.

Comment: Table 4.10-3 indicates that more than just manganese and iron exceed water quality standards. All parameters that exceed water quality standards should be included in any monitoring and adaptive management plan. Monitoring should be conducted monthly. Iron, manganese, lead, and arsenic monitoring should take place at least every six months or immediately upon determination that there have been two exceedances of one of the action parameters, whichever is more frequent. Once iron, manganese, lead, and arsenic monitoring has begun, it should continue monthly until exceedances have resolved for at least two measurement cycles. Monitoring results should be provided to the County of Fresno and stakeholders yearly unless there is an exceedance event, at which point parties should be notified within 30 days of testing.

Response 6-72

See Response 6-47 above, which adequately addresses the commenter's improper assertion that monitoring should continue monthly. Otherwise, the comment fails to provide any substantial evidence supporting a monthly monitoring requirement.

Comment 6-73

[Table Item #48, DEIR PDF Pg. 658, Impact 4.10-4)

Comment: The 5-year clock on this monitoring should not start until the Plant Site Pond has completely filled and any vegetation present has an opportunity to degrade, creating a hydrologically stable pond elevation and low dissolved oxygen (DO) conditions, at least one year after the pond is filled. Monitoring should also take place as the pond fills.

Response 6-73

As explained in Responses 12-76, 12-97, and 12-100, Mitigation Measure 4.10-5a's monitoring of groundwater quality by sampling every six months as part of a comprehensive adaptive management program – including defined monitoring parameters, action levels, reporting requirements, and County oversight – is supported by substantial evidence (see Draft EIR pages ES-34 through ES-35, 4.10-95 and 4.10-96). As revised in this Final EIR (see Final EIR Chapter 3, "Draft EIR Errata"), Mitigation Measure 4.10-5a further clarifies monitoring implementation, timing, and enforcement. The commenter provides no support or evidence supporting a delay in the monitoring period or adaptive management framework or for monitoring to begin a year after the pond is filled.

Comment 6-74

[Table Item #49, DEIR PDF Pg. 662, Impact 4.10-6)

Existing Text: The Operator would be required to update the existing HMBP and SPCC Plan for both the Plant Site and Quarry Site and in accordance with hazardous material regulations.

Comment: The proposed project poses significant risk of flooding at the Quarry Site. The project proponent should clarify that the updated Hazardous Materials Business Plan and Spill Prevention, Control, and Countermeasure Plan will include a specific plan for Quarry Site flooding, or otherwise this plan should be added as a mitigation measure to prevent significant water quality impacts to the SJR and groundwater in the event of a flood.

Response 6-74

The requirement to update the existing HMBP and SPCC Plan ensures ongoing compliance with applicable federal, state, and local hazardous materials regulations. The project design prevents offsite discharge, and existing regulatory requirements ensure adequate spill prevention and response planning. Accordingly, the potential for significant water quality impacts is less than significant. See also Response 6-44.

Comment 6-75

[Table Item #50, DEIR PDF Pg. 662, Impact 4.10-6)

Existing Text: As described in the "Groundwater Quality at the Quarry Site" subsection of Section 4.10.1.7, above, groundwater sampling of monitoring wells at the Quarry Site indicates that all constituents were generally within water quality standards, except for nitrate, manganese, and gross alpha activity, which exceeded thresholds in some of the wells sampled.

Comment: The impact to the Quarry Site is currently being assessed based on groundwater quality, but recharge trenches will put surface water into the groundwater. Therefore, existing groundwater and surface water conditions should be evaluated when determining the proposed project's impact to groundwater quality. According to Table 4.10-3-4, surface water on the site exceeds water quality standards for manganese, iron, lead, arsenic, and conductivity. All of these parameters should be considered.

Response 6-75

The commenter offers a comment regarding the water quality at the Quarry Site, but references Draft EIR Tables 4.10-3 and 4.10-4, which shows the surface water quality at both the Plant Site and Quarry Site. As such, water quality at both sites is addressed below.

The project's potential effects related to groundwater and surface water quality were evaluated within Draft EIR Section 4.10 as well as within the 2023 *Revised Hydrology and Water Quality Analysis Report* and the 2024 *Addendum to: Revised Hydrology and Water Quality Analysis Report*, prepared by EMKO Environmental, Inc. and included as Draft EIR Appendices G-5 and G-6, respectively. See Final EIR Chapter 3, "Draft EIR Errata," to view proposed revisions to Draft EIR Section 4.10 and Appendix G. The following excerpts from the Draft EIR and EMKO Environmental, Inc. reports are provided in response to the United States Bureau of Reclamation's comments.

With the exception of the Basin Plan limit for conductivity, specifically for discharge to the San Joaquin River, which does not occur in this case, and two pH measurements, likely due to uptake of carbon dioxide and release of oxygen by aquatic plant growth in the pond, the surface water in the ponds at the Quarry Site meets applicable water quality standards. Additionally, the elevated metal concentrations mentioned in the comment are due to the presence of suspended silts and sediment within the silt pond. Since elevated metal concentrations were not present in the filtered sample, which represents the dissolved concentrations within the water, the detected metal levels in the unfiltered sample are simply a reflection of the naturally occurring metals in the natural soils and earth materials in the aggregate being processed at the Plant Site. The lack of elevated metals in the filtered samples demonstrates that the metals are not leaching from the silt into the natural soils beneath the silt pond and to the groundwater.

As noted in Draft EIR on page 4.10-98 through 4.10-99, the elevated nitrates are a regional issue that is being addressed by the RWQCB through the Salt and Nitrate Management Plan. The exceedances of manganese in some wells only exceed the Basin Plan standards, which do not apply here, and secondary MCL standards, which are in place to avoid undesirable tastes, odors, staining, or scaling but do not pose a threat to human health. It is also of note that manganese is a naturally occurring mineral component within the geologic materials at the Quarry Site. These water quality constituents therefore represent existing baseline conditions for the proposed project. The gross alpha activity concentrations found at well MW-2M appear to be an outlier as it differs significantly from the other samples collected at the Quarry Site and may not be representative of the site conditions.

The water quality of the groundwater and surface water described above is representative of conditions that already exist within the project sites. As concluded in Draft EIR Impact 4.10-6, the proposed project would not result in a significant impact to groundwater quality as it would not exceed groundwater quality standards nor substantially degrade groundwater quality at the Quarry Site.

Comment 6-76

[Table Item #51, DEIR PDF Pg. 663, Impact 4.10-6)

Existing Text: However, since the rate of inflow of 455 acre-feet per year exceeds the evaporation rate of 380 acre-feet per year, dissolved solids would not accumulate over time because they would be continually diluted by the inflow of water with an average TDS of 100 mg/L... Therefore, the potential for the quarry pit lake to accumulate concentrations of constituents that would violate water quality standards or waste discharge requirements, or otherwise degrade water quality, would be less than significant.

Comment: Dilution of existing pond water with water that also has dissolved solids will not prevent accumulation of dissolved solids and other water quality constituents such as minerals and metals; accumulation will take place over time because evaporation will not remove dissolved solids from the pond. This analysis should be revised.

Response 6-76

In addition to the response below, see Responses 6-75 and 65-27, which provide that the detected metal levels in the unfiltered sample are simply a reflection of the naturally occurring metals in the natural soils and earth materials in the fines from the aggregate being processed at the Plant Site (*Id.* at page 4.10-25).

The local runoff and direct rainfall into the quarry pit would contain little, if any, dissolved solids, especially metals. As noted in the Quarry Site water budget for reclaimed conditions, the amount of groundwater that flows into the reclaimed Quarry (195 acre-feet per year) is thirteen times greater than any groundwater outflow (15 acre-feet per year). Thus, there could be no impact on groundwater quality from water leaving the Quarry, so revising the analysis would not change the conclusions of this impact analysis.

Comment 6-77

[Table Item #52, DEIR PDF Pg. 663, Impact 4.10-6)

Existing Text: Violate Groundwater Quality Standards or Otherwise Substantially Degrade Groundwater Quality at the Quarry Site Due to the Ponding of Water in the Excavation

Comment: At this point, there is insufficient analysis to determine that this impact is not significant. Additional analysis should be conducted, and this determination should be reconsidered accordingly, including the potential incorporation of mitigation measures and adaptive management actions to address potentially significant impacts.

Response 6-77

As provided in Response 12-74, the Draft EIR explains and analyzes the presence of manganese and iron at Impacts 4.10-5 through 4.10-7 (see Draft EIR pages 4.10-95 through 4.10-101) and provides Mitigation Measure 4.10-5a and 4.10-5b to address potential increased levels caused by the project to reduce the levels to a less than significant level. See also Responses 6-52, 6-71, 6-72, and 65-27, which address water quality impacts associated with the Plant Site's silt pond water percolating into the groundwater aquifer.

Both the groundwater and surface water at the Quarry Site were assessed to establish existing baseline conditions and are represented in Tables 4.10-4 and 4.10-6 of the Draft EIR. It is important to note that the data shown are baseline conditions that are not indicative of past or future effects from the project.

The analysis conducted for assessing the proposed project's potential impacts to groundwater quality at the Quarry Site due to ponding of water in the excavation pit is sufficient to determine the impact to be less than significant (Draft EIR page 4.10-101).

Under CEQA, mitigation is only required for potentially significant impacts caused by the project. No potentially significant impacts were identified with respect to the degradation of water quality standards at the Quarry Site due to the ponding of water in the excavation pit, so no mitigation measures are required.

See Final EIR Chapter 3, "Draft EIR Errata," to view proposed revisions to Draft EIR Section 4.10.

Comment 6-78

[Table Item #53, DEIR PDF Pg. 663, Impact 4.10-6)

Comment: Reclamation requests that the Quarry Site Pond be monitored for water quality concerns in a similar fashion to the Plant Site Pond. If water quality standards are exceeded at the Quarry Site Pond, mitigation of impacts should be implemented, including but not limited to the installation of an aeration or oxygenation system.

Response 6-78

Draft EIR Table 4.10-4 presents data from several ponded water features at the Quarry Site. Only Ponded Water Feature 3, the Northeast Pond, is still present at the site and is the only ponded water feature that would remain as part of the proposed project. Draft EIR Impact 4.10-6 concludes that compliance with existing regulations and implementation of Mitigation Measure 4.10-1 would reduce the potential to violate groundwater quality standards or substantially degrade groundwater quality on the Quarry Site to less than significant. As such, implementation of the same mitigation measures as provided for the Plant Site Pond is not necessary. Additionally, as explained in Response 65-28, the Impact 4.10-6 of the Draft EIR provides that "[t]he project proposes to use and discharge groundwater … recharge trenches within the Quarry Site" which groundwater "is generally within established water quality standards, … [and] there are no known sources of potentially hazardous materials contamination of the groundwater at the Quarry Site or its vicinity; therefore, pumping of dewatered groundwater … into proposed groundwater recharge trenches along the western boundary of the [Quarry] [S]ite would not have the potential to substantially degrade groundwater quality relative to existing conditions" (Draft EIR, Impact 4.10-6, page 4.10-99).

Comment 6-79

[Table Item #54, DEIR PDF Pg. 663, Impact 4.10-6)

Comment: The project proponent has not provided any information on what types of metals or minerals may be naturally present in bedrock and deeper groundwater sources that may impact water quality at the Quarry Site. Without a clear understanding of what parameters may exceed water quality standards, it is not possible to know exactly what constituents should be monitored. Therefore, during mining and reclamation a wide suite of water quality constituents should be monitored to ensure an appropriate long-term monitoring and adaptive management plan is developed and implemented.

Response 6-79

In addition to the response below, see Response 6-78 above, which provides that "[t]he project proposes to use and discharge groundwater to the … recharge trenches within the Quarry Site" which groundwater "is generally within established water quality standards, … [and] there are no known sources of potentially hazardous materials contamination of the groundwater at the Quarry Site or its vicinity. Therefore, pumping of dewatered groundwater … into proposed groundwater recharge trenches along the western boundary of the [Quarry] [S]ite would not have the potential to substantially degrade groundwater quality relative to existing conditions" (Draft EIR, Impact 4.10-6, page 4.10-99).

Further, Table 4.10-6 presents water quality data from the twelve monitoring wells installed to provide groundwater data for the environmental analysis. The seven deep wells (MW-1D, MW-2D, MW-3D, MW-4D, MW-5D, MW-6D, and MW-7D) were drilled to depths ranging from 570 feet below ground surface to 600 feet below ground surface, as shown in Table 1 of the Kenneth D. Schmidt & Associates, *Groundwater Conditions at the Quarry Site of the CEMEX Rockfield Quarry Modification Project*. This report is included in the Draft EIR as Appendix G-4.

The data for the deep wells in Table 4.10-6 of the Draft EIR, therefore, represent the groundwater quality related to naturally occurring metals and minerals that are present in bedrock and deeper groundwater. It should be noted that the water quality conditions shown in Table 4.10-6 for the deep wells represent the existing or baseline conditions in the bedrock and deeper groundwater. They do not represent impacts that may be caused by the proposed project.

Comment 6-80

[Table Item #55, DEIR PDF Pg. 663, Impact 4.10-6)

Comment: At 100 feet deep, the Quarry Site Pond will likely experience low dissolved oxygen (DO) conditions near the bottom. This will make any accumulated metals soluble, increasing the chances of exceeding water quality standards and contaminating adjacent groundwater or alluvial groundwater that is receiving pumped pond water to recharge pits. Should the Quarry Site, during mining, reclamation, or after pond inundation show high levels of metals or trend toward increased metal loads that could contaminate local groundwater supply or the SJR through groundwater recharge, appropriate mitigation measures should be implemented including stopping excavation or installing and maintaining an appropriate system to increase DO in the pond.

Response 6-80

The commenter attributes their comment to the analysis for Impact 4.10-6 in the Draft EIR. However, the cited text in the comment is from Draft EIR Impact 4.10-7.

Assuming that the dissolved oxygen concentration would be low at the bottom of the reclaimed Quarry Site pond is speculative and not consistent with site conditions and the water budget for the reclaimed Quarry. Specifically, the water budget shows that the Quarry Site pond would receive 195 acre-feet per year of groundwater inflow and 260 acre-feet per year of direct rainfall and local runoff. The lack of any appreciable elevated metals concentrations in the deep monitoring wells (see Response 6-79, above, and Table 4.10-6 of the Draft EIR) indicates that the deep groundwater contains adequate dissolved oxygen and the naturally occurring metals in the bedrock are not soluble under the geochemical conditions in the deep groundwater. Local runoff, flowing down the reclaimed Quarry slopes, and direct rainfall into the Quarry, would contain dissolved oxygen at or near saturation levels. Therefore, there is no basis to presume that the water within the Quarry Site pond would have low dissolved oxygen concentrations that would result in increased solubility of metals.

Comment 6-81

[Table Item #56, DEIR PDF Pg. 663, Impact 4.10-6)

Existing Text: Upon the completion of Phase 1 and Phase 2 mining operations at the Quarry Site, the entire quarry pit excavation would have a bottom depth of approximately 290 feet below msl and would fill with groundwater and rainfall to form a 100-foot-deep lake with a surface elevation of about 190 feet below msl, which is about 500 feet below the surrounding grade (shown in Figure 2-10). Once the quarry pit fills to that level, approximately 195 acre feet of groundwater and 260 acre-feet of rainfall and local runoff would enter the Quarry on an annual basis.

Comment: Why does this analysis assume the water level in the Quarry Site Pond will stay 500 ft below ground surface (bgs) when current groundwater elevations are less than 50 feet bgs? One would assume the water level would attempt to rise to reach equilibrium with the level of the existing groundwater table. Please provide evidence to support this assumption.

Response 6-81

The water budget presented in Appendix G-4 of the Draft EIR indicates that at an elevation of -190 ft msl (190 feet below msl), the pond would have a surface area from which the rate of evaporation, plus the rate of other water losses, would match the rate

of water inflows from rainfall, stormwater runoff, and groundwater. Thus, the water level in the pond could not rise to substantially higher elevations because the pond surface would be even larger, which would result in the amount of evaporation exceeding the rate of water inflows. Stated another way, at an elevation of -190 ft msl, a water balance is achieved between the rate of inflow and the rate of outflow.

Comment 6-82

[Table Item #57, DEIR PDF Pg. 664, Impact 4.10-8)

Existing Text: The use of the recharge trenches would limit the amount of drawdown of the water table in the unconfined alluvial aquifer to six to eight feet at a distance of 500 feet from the excavation (KDSA 2021). As shown in Table 4.10-8, there are no supply wells within 500 feet of the excavation. At a distance of 500 feet to 1,000 feet from the excavation, within which there are three wells, the drawdown would be approximately three to five feet (KDSA 2021).

Comment: The SJR is approximately 800 feet from the Plant Site. LDC, which provides tributary flows to the SJR, is within 200 feet of the Plant Site. Please provide a detailed analysis as to how the lowering of the groundwater table around the Plant Site will impact flows in the surface tributaries and describe the outcome of this analysis in a new impact determination within the DEIR. Any impacts to the SJR should be mitigated to avoid impacts to biological resources and other water users.

Response 6-82

Identical to Comment 6-13. Please see response to that comment. See also Collective Response #25.

Comment 6-83

[Table Item #58, DEIR PDF Pg. 670, Mitigation Measure 4.10-10a)

Existing Text: For the San Joaquin River, the impact must be specific to both the alluvium and weathered rock aquifer zones.

Comment: These zones could deplete and replenish at different rates. This is not an appropriate measure of impact and should be revised.

Response 6-83

The intent of the evaluation described in Mitigation Measure 4.10-10a is consistent with the comment. Specifically, the analysis would look at impacts in both the alluvium and in the weathered rock aquifer zones. The impact does not need to occur in both zones and does not need to be identical in both zones. The reason for this statement in the mitigation measure is that the head above the weathered rock and against the alluvium would vary over time, depending on the river stage, so both need to be considered in the analysis.

Comment 6-84

[Table Item #59, DEIR PDF Pg. 670, Mitigation Measure 4.10-10a)

Existing Text: If mining progresses to the full approved depth without causing a potentially significant impact to nearby wells or flows in the San Joaquin River, then monitoring in the MW-1 and MW-3 well clusters will continue for at least 3 years, to include at least two below-normal rainfall years or one critically dry year, as defined by DWR.

Comment: Monitoring at the well clusters should continue for at least 10 years after mining has ceased and include at least one wet year, as defined by the California Department of Water Resources.

Response 6-84

The comment alleges that the groundwater systems should be monitored for at least 10 years after mining has ceased, instead of the three-year period proposed by Mitigation Measure 4.10-10a. The comment fails to acknowledge that the three-year post-mining monitoring period would occur in approximately 100 years, once mining at the Quarry Site has ceased; thus, impacts that would have occurred during the life of the mining operation would have already been analyzed. As a reminder, dewatering of the alluvium at the Quarry Site has been occurring for many decades and mining of the alluvium is effectively completed (see Draft EIR, Impact 4.10-10, page 4.10-105). All future dewatering as part of the proposed project would occur within the weathered rock and hard rock zones (*Ibid*.) These zones have effectively no primary porosity and very limited secondary fracture porosity (see Draft EIR, Impact 4.10-11, page 4.10-112). Thus, dewatering of the deeper bedrock zones would have little or no effect on water levels in the overlying alluvium (Draft EIR, Impact 4.10-11, pages 4.10-112 through 4.10-113). The comment further provides no support for why its recommendation is necessary.

Comment 6-85

[Table Item #60, DEIR PDF Pg. 670, Mitigation Measure 4.10-10a)

Existing Text: If the additional assessment confirms that a decrease in water levels greater than 15% is exclusively attributable to mine dewatering, then corrective measures would be implemented.

Comment: As currently proposed, the adaptive management plan states that if, upon additional assessment it is confirmed that a decrease in groundwater levels greater than 15 percent is exclusively attributable to mine dewatering, then corrective measures would be implemented (4.10-109). The burden of proof is inappropriately placed in this circumstance. The applicant should bear the responsibility to prove that their project does not contribute to impacts above 15 percent and, to the extent impacts may be attributable to them, appropriate corrective measures should be implemented. Reclamation recommends amending this in the adaptive management plan.

Response 6-85

Mitigation Measure 4.10-10a provides sets out a systematic process to determine the groundwater baseline, including:

> The first annual report shall be completed at the end of the first quarter of the year after the use permit becomes active and shall describe the baseline water level ranges at the MW-3 cluster for the alluvium, weathered rock, and hard rock, specifically identifying conditions during drought periods, wet periods, and seasonal fluctuations (Draft EIR, pages 4.10-108 through 4.10-109).

Upon establishing the baseline, groundwater monitoring would continue, whereas if the monitored wells drop by more than 15 percent of the baseline, this data would then be analyzed to evaluate whether the impact is specific to the weathered rock and/or hard rock and is not due to other unrelated factors, such as drought, a reduction in regional groundwater recharge, or use of groundwater by future developments located upgradient to the north and northeast of the Quarry Site and CSA 44C wells. If during this assessment, it is determined that the drop in groundwater was exclusively attributable to mine dewatering, then the corrective measures would be implemented, which may include ceasing all dewatering activities (Draft EIR, pages 4.10-108 through 4.10-111).

Comment 6-86

[Table Item #61, DEIR PDF Pg. 670, Mitigation Measure 4.10-10a)

Existing Text: If the monitoring data indicate that groundwater levels in any of the monitored wells drop such that the available water column decreases by more than 15%, then a significant impact to available groundwater supply will have occurred.

Comment: Any measured change should be based on the change at any given point compared to what groundwater levels would be without the proposed project, not a percentage from current conditions. Groundwater levels will continue to fluctuate in dry and wet years and with the increased SJRRP Restoration Flows down the SJR in the future. Increases in groundwater levels due to other factors such as SJRRP flows could mask impacts of the proposed project. Reclamation requests the applicant use the MW-2 monitoring well cluster in addition to the MW-1 monitoring well cluster in the adaptive management plan for the Quarry Site. This would likely provide additional benefit to the mitigation measure by providing spatial coverage representing the southern portion of the Quarry Site. Infiltration from the river into the excavated site will be highly influenced by localized fracture characteristics, as demonstrated by the airlift permeability testing in hard rock at MW-2; the well's test results were 10 times greater than at MW-1. Reclamation also requests that baseline conditions for all groundwater monitoring programs be developed so that they can adapt to expected increased baseflow conditions in the SJR associated with the SJRRP. Reclamation requests the opportunity to review and comment on the baseline proposals and to review the annual reports and any impact evaluations produced.

Response 6-86

See Collective Response #24 pertaining to groundwater monitoring.

Comment 6-87

[Table Item #62, DEIR PDF Pg. 670, Mitigation Measure 4.10-10a)

Existing Text: If, during mining, all available water from dewatering is being pumped to the recharge trench and the water column in the MW-1 well cluster remains below 85% of baseline elevations, then mining could not progress to greater depths in the quarry.

Comment: If recharge operations cannot recover the water column in the MW-1 well to within 85% of baseline elevations, ceasing mining to greater depths prevents further impact, but it does not mitigate

for the impact that has already occurred. How would the mitigation plan ensure impacts are corrected even after mining ceases?

Response 6-87

Mitigation Measure 4.10-10b requires adequate funding in the case that the Northeast Pond and recharge trenches would be utilized indefinitely post-reclamation (Draft EIR, page 4.10-111). Thus, the Draft EIR provides for mitigation to ensure impacts are corrected even after mining ceases. Moreover, as Mitigation Measure 4.10-10a provides, "[d]ewatering will cease once mining is completed, so groundwater levels will begin to recover" (Draft EIR, page 4.10-111).

Comment 6-88

[Table Item #63, DEIR PDF Pg. 670, Mitigation Measure 4.10-10a)

Existing Text: The dataloggers shall be programmed to record water levels at least once every six hours such that a range of static and pumping water level effects would be captured. The data shall be downloaded every six months for review and subsequent inclusion in annual mitigation monitoring reports.

Comment: Dataloggers should receive more regular downloads to ensure proper function and to be able to provide any impact threshold data more regularly than every 6 months. Sufficient baseline data should be collected from the dataloggers prior to work starting on the Quarry Site to ensure an understanding of existing hydrologic conditions and to validate and calibrate any groundwater models that may be required. This data set should include wet, dry, and average year hydrology.

Response 6-88

The comment's recommended additions to the groundwater well sampling program are noted. See Responses 6-75, 6-85, and 493-3 (for the Quarry Site), which provides information regarding the project's site groundwater well sampling protocols and measures. The Draft EIR analyses are adequate on groundwater well sampling, thus, adoption of the comment's recommended additions to the groundwater well sampling program is unnecessary (see *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 880). The comment does not provide any substantial evidence that Mitigation Measure 4.10-10a would not mitigate impacts to the groundwater quality at the Quarry Site.

Comment 6-89

[Table Item #64, DEIR PDF Pg. 670, Mitigation Measure 4.10-10a)

Existing Text: The rate of pumping into the recharge trench would be increased until the water column in the MW-1 well cluster and any monitored private wells west of the Quarry Site recover to within 85% or more of baseline levels.

Comment: What is considered "baseline level" for these wells? These terms should be dynamic based on hydrologic conditions, including increases in SJRRP flows, and the definitions should be approved by impacted stakeholders. Reclamation requests the opportunity to review the proposed baseline levels and have its comments considered in the development of baseline levels.

Response 6-89

As explained in Mitigation Measure 4.10-10a:

> The water levels recorded in the MW-1 well cluster from 2017 until the time that mining and dewatering in the weathered rock begins after approval of the project will be used to define the baseline groundwater level conditions. Baseline water level ranges will be identified for the alluvium, weathered rock, and hard rock, specifically identifying conditions during drought periods, wet periods, and seasonal fluctuations, and, similar to the MW-3 well cluster, these baseline conditions shall be documented in the first annual report (Draft EIR, page 4.10-110).

The commenter's request to review the proposed baseline levels are noted.

Comment 6-90

[Table Item #65, DEIR PDF Pg. 670, Mitigation Measure 4.10-10a)

Comment: The Quarry Site Groundwater Adaptive Management Program should be designed to assess any potential effect, and avoid, minimize, or otherwise mitigate the effect, to the SJR and alluvial groundwater system surrounding it, not only the CSA 44C wells, as is listed now.

Response 6-90

Comment 6-90 incorrectly asserts that the Quarry Site Groundwater Adaptive Management program only assesses the CSA 44C wells. The Quarry Site Groundwater Adaptive Management Program, as presented in Mitigation Measure 4.10-10a of the Draft EIR addresses the five wells to the west of the San Joaquin River, as listed in Table

4.10-9, Estimated Drawdown of Groundwater Levels in Wells Near the Quarry Site," in addition to effects on the river itself, as stated in the discussion in Draft EIR page 4.10-110, in the three-paragraph discussion of the monitoring and evaluation of data from the MW-1 well cluster.

Comment 6-91

[Table Item #66, DEIR PDF Pg. 670, Mitigation Measure 4.10-10a)

Comment: Any discharged water must be of sufficient quality to keep CV spring-run Chinook salmon in "good" condition to be consistent with the Restoration Goal of the SJR Settlement.

Response 6-91

It is anticipated that the water quality would be equivalent to that already being pumped to the existing recharge trenches along the west side of the Quarry Site. In addition, as noted in Collective Response #25 and Responses 6-14 and 6-56, the rates of groundwater flow and dewatering are miniscule fractions of the baseline and SJRRP restoration flows and would not have any measurable effect on the water quality within the river. Additionally, the project is designed as a zero-discharge facility with respect to offsite discharges, and, therefore, discharge to the San Joaquin River or other surface water bodies would not occur and is not proposed as part of the project. Water at the Quarry Site is stored in designated recharge trenches and ponds and would not be discharged to surface waters. See Responses 6-52, 6-71, 6-72, and 65-27.

Comment 6-92

[Table Item #67, DEIR PDF Pg. 670, Mitigation Measure 4.10-10a)

Comment: Please provide a map of the well sites referenced in Mitigation Measure 4.10-10a.

Response 6-92

See Figure 2 of Appendix G-4 of the Draft EIR.

Comment 6-93

[Table Item #68, DEIR PDF Pg. 675, Impact 4.10-12)

Existing Text: The base flows within the San Joaquin River are typically at or below the elevation of the base of the alluvium on the Quarry Site. Thus, flows from the San Joaquin River toward the Quarry Site within the alluvium can only occur during the infrequent and relatively short-term high flow periods. Due to the recharge trenches along the west side of the Quarry Site,

groundwater levels in the alluvium and the weathered rock would be maintained consistent with existing conditions. As a result, there would be no significant change in the volume of potential inflow from the river into the quarry during high flow events through the alluvium and weathered rock as a result of the project.

Comment: This assumption should be verified through a robust monitoring program that is adapted to consider future baseline conditions and, should impacts to the SJR occur, appropriate mitigation should be implemented.

Response 6-93

As described in the Draft EIR, mining of the alluvium, especially near the San Joaquin River, has already occurred (see Draft EIR, Impact 4.10-10, page 4.10-105). Thus, the conditions referenced in this comment from Impact 4.10-12 related to the alluvium are part of the existing baseline for the project, as noted in the second paragraph of the impact analysis (Draft EIR page 4.10-113). The comment does not provide substantial evidence that conditions referenced from Impact 4.10-12 are an inadequate representation of the existing baseline for the project. See also Collective Response #25.

Comment 6-94

[Table Item #69, DEIR PDF Pg. 675, Impact 4.10-12)

Existing Text: Increases in the San Joaquin River stage of three to six feet may increase the groundwater level in the band of alluvium between the river and the existing quarry by six inches up to three feet for periods of a few weeks to a month.

Comment: How will this be impacted by changes to the hydraulic gradient due to pumping? Please complete a supplemental analysis that includes this information, incorporate mitigation measures, and revise impact determinations, as applicable.

Response 6-94

As noted in Response 6-93, mining of the alluvium has already occurred throughout most of the Quarry Site, especially near the river. In addition, the Quarry Site is currently dewatered to the existing depths of mining, including the full thickness of the alluvium. Subsequent dewatering under the project would occur within the weathered rock and the hard rock and not affect the existing conditions within the alluvium (see Draft EIR, Impact 4.10-10, page 4.10-105). Thus, future dewatering would not alter the existing conditions within the alluvium.

Comment 6-95

[Table Item #70, DEIR PDF Pg. 679, Impact 4.10-14)

Existing Text: As described in the "Erosion and Sedimentation" subsection of Section 4.10.1.5, above, results of the Hydraulic Analysis indicate that the 100-year flow velocities along the Quarry Site river bank under existing conditions are generally at or below the 6 fps "permissible velocity" below which the natural channel will resist erosion, at all cross-sections shown in Figure 4.10-1 except at cross-sections 8, 15, and 16. The proposed SMRP would maintain the existing 200-foot setback from the river edge at the Quarry Site and would not disturb the easterly channel bank along the Quarry Site (nor any other portions of the channel).

Comment: While the excavation will take place more than 200 feet from the bank, recharge trenches will be located between the bank and the Quarry Site. Recharge operations should be considered in the bank stability analysis and appropriate mitigation should be implemented. Further, this impact should be re-assessed using the FEMA flood map and considering a 100-year flood that considers the impacts of climate variability. In addition, as recommended in county code, the 200-year event should also be considered.

Response 6-95

As noted in Responses 6-54, 6-59, and 6-101, recharge trenches have been present along the west and south sides of the Quarry Site for many years and are part of the existing baseline conditions for the CEQA analysis. The presence of the recharge trenches was considered as part of the bank stability analysis, as described in Section 4.7, "Geology and Soils," of the Draft EIR and Appendix F-1, "Stability Assessment Perimeter Mining Slopes," and Appendix F-3, "Response to Peer Review Comment, Geological and Geotechnical Assessment Report Memorandum." See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.7 and supporting appendices.

As discussed in Response 6-45, the FEMA floodplain was prepared based on 36-year-old data. As such, the Hydraulic Analysis based on recent data shows that the 100-year floodplain would not enter the Quarry. Specifically, the 100-year flow would be contained within the easterly San Joaquin River channel bank. Further, as detailed in Response 6-8, more up-to-date hydraulic analyses were performed for the project based on 2018 mapping at a 2-foot contour interval. The analyses are included in a Hydraulic Analyses report that was peer reviewed by a County-retained technical expert. The project analyses would yield more accurate results than the older FEMA data. A Letter of Map Revision (LOMR) would be prepared, if required. Under California CEQA case law, the effect of climate change on the project does not need to be assessed. In response to

comments and in accordance with the Fresno County General Plan (2024), Chang Consultants conducted hydraulic analyses evaluating the 200-year flood event, a more rare and severe flood event, which demonstrate that the 200-year flood would neither enter the Quarry Site nor the Plant Site (see Appendix G-7 and Appendix G-8).

Please see Collective Response #17, which provides a discussion of the 200-year hydraulic analysis conducted for the project.

Comment 6-96

[Table Item #71, DEIR PDF Pg. 679, Impact 4.10-16)

Existing Text: As described in Section 4.10.1.4, above, the Hydraulic Analysis (Appendix G-1) shows that the San Joaquin River floodplain does not enter into the Quarry Site and therefore the river would not overtop its banks and flow into the quarry.

Comment: This impact should be re-assessed using the FEMA floodplain map and climate variability that is expected over the life of the proposed project. In addition, as recommended in county code, the 200-year event should also be considered in this analysis.

Response 6-96

Analyzing the potential future floodplains or flood flows as a result of 200-year event caused by climate change is not reasonably foreseeable, is too speculative, and is not required to be analyzed under CEQA because that would require analyzing the impacts of the environment on the project. Additionally, the commenter incorrectly asserts that the Fresno County Code requires the consideration of the 200-year event, as no such requirement exists. For further discussion of potential flood impacts, please see Collective Response #17, which provides a discussion of the 200-year hydraulic analysis conducted for the Quarry Site.

Regarding the use of the FEMA floodplain map, see Responses 6-8 and 6-9.

As explained in Responses 65-20 and 65-22, potentially significant effects or indirect physical changes, for example, related to extreme flooding, are not required to be analyzed or mitigated if those effects would be speculative (CEQA Guidelines Section 15064(d)(3)). "While a lead agency must use its 'best efforts' to evaluate environmental effects, including the use of reasonable forecasting, 'foreseeing the unforeseeable' is not required, nor is predicting the unpredictable or quantifying the unquantifiable" (see *Citizens for a Sustainable Treasure Island v. City and County of San Francisco* (2014) 227 Cal.App.4th 1036, 1060–1061; citing Guidelines, Section 15064, subd. (d)(3)).

Comment 6-97

[Table Item #72, DEIR PDF Pg. 679, Impact 4.10-15 and 16)

Comment: How would the project proponent handle flood water from the SJR or LDC in the event of a big storm and localized flooding, including potential flooding of site equipment? Water that enters either site that would normally go to the river should be removed from the site promptly and without pollution from on-site hazardous materials.

Response 6-97

The hydraulic analyses indicate that the San Joaquin 100-year floodplain does not enter the Quarry Site nor the Plant Site. Berms have been raised along Little Dry Creek to prevent inundation of the Plant Site. Regardless, in the unforeseen event of an extreme flood event in an amount that exceeds the river's channel capacity, the Draft EIR provides that the project sites' enlarged mining excavations could help contain and minimize downstream flooding (Draft EIR, page 4.10-119), that the on-site storm runoff, wash water, and sediment would be retained within the project sites' pits and ponds (which would include the recharge trenches), and that the stormwater would be managed in accordance with all applicable requirements of the NPDES program, including site-specific SWPPPs prepared in accordance with Industrial General Permit Requirements and updated Waste Discharge Requirements (Draft EIR, page 4.7-29). In addition, The SWPPP provides that both the Plant and Quarry sites are surrounded by berms/levees that separate onsite drainage from offsite drainage (Draft EIR, page 4.10-68).

Comment 6-98

[Table Item #73, DEIR PDF Pg. 680, Impact 4.10-16]

Existing Text: The analysis also concludes that the San Joaquin River floodplain does not enter into the Plant Site, and existing topography and berms along the north edge of the Plant Site prevent the Little Dry Creek floodplain from entering the Plant Site, with the exception of a small portion of the northwest corner of the Plant Site (as shown in Figure 4.10-1). This portion of the Plant Site is currently used as a stockpile area, and this use would continue during Phase 1 mining operations. Upon completion of Phase 1 mining, the stockpiles would be removed, and the area would be graded to drain to the reclaimed pond to the east, as it does under existing conditions, which would improve conditions relative to flood flows... Although minor changes to the drainage patterns of the portion of the Plant Site in the Little Dry Creek floodplain would occur under the proposed project, ultimately, the area would drain towards the reclaimed Plant Site mining excavation, similar

to existing conditions, and flood flows would not be impeded or redirected.

Comment: The text states that flood flows would be directed toward the reclaimed pond to the east and then goes on to state that flood flows would not be impeded or redirected. These two statements contradict each other - please clarify and revise so that the text is consistent. Also, during flooding of LDC, the berm walls could be breached and/or silt leave the Plant Site, travel down to the delivery ditch, and enter the SJR. Aerial photography supports that this could occur and potentially has in the past. Existing conditions that create the risk of sediment entering the river should be remediated prior to any further improvements to the site.

Response 6-98

Upon Phase 1 mining completion, the flood flows would be directed east to the reclamation pond. The project facilities and stockpiles would be removed. As a result, the minor changes to drainage patterns due to the project would be eliminated and the flows would not be impeded or redirected by the mining operations. The berms have been raised to prevent breaching from flood flows. Further, stormwater would be managed in accordance with all applicable requirements of the NPDES program, including site-specific SWPPPs prepared in accordance with Industrial General Permit Requirements and updated Waste Discharge Requirements (Draft EIR, page 4.7-29).

Comment 6-99

[Table Item #74, DEIR PDF Pg. 681, Impact 4.10-17)

Existing Text: The enlarged mining excavation could help contain and minimize downstream flooding, which would reduce the overall potential for release of pollutants, including sediment.

Comment: It appears the project proponent is proposing to capture river flows in the Quarry Site, which contains hazardous materials, as a flood reduction strategy. This approach would create unnecessary pollution risk and divert water supplies into the Quarry Site intended for downstream water users. All flood flows should be routed away from the Quarry Site.

Response 6-99

Comment 6-99 incorrectly asserts that the project proposes to capture river water flows in the Quarry Site, as the capture of flood waters at the Quarry Site is not being proposed as part of the project. The referenced discussion from Impact 4.10-17 is specifically related to unforeseen events that would result in dam releases or flows in the river that exceed

the river channel capacity, resulting in flooding and inundation beyond the defined floodplain and floodway. Examples of such events include flooding greater than that observed in the historical record, uncontrolled dam releases due to some type of mechanical issue with the flood gates, or dam failure. These types of unforeseen releases would not provide water supplies intended for downstream users. This unforeseeable event would result in an impact of the environment or other infrastructure (e.g., dam failure) on the project, not an impact of the project on the environment. Notably, the easterly bank along the Quarry Site did not experience significant erosion, and the bank has never breached into the Quarry Site (Draft EIR, page 4.10-7). Therefore, the effects of such unforeseen circumstances do not require further analysis under CEQA.

Comment 6-100

[Table Item #75, DEIR PDF Pg. 707)

Existing Text:

> *Policy OS-A.14:* The County shall require the protection of floodplain lands and, where appropriate, acquire public easements for purposes of flood protection, public safety, wildlife preservation, groundwater recharge, access, and recreation.
>
> *Consistent:* The project would not result in any development within a floodplain. The northwest corner of the Plant Site is within the floodplain of Little Dry Creek. However, this portion of the site is and would continue to be used for stockpile storage. When the site is reclaimed, the stockpiles would be removed, and the site graded to drain to an existing pond.

Comment: While the proposed project might not create development within the floodplain, it does not protect it, as called for in the policy. There continue to be questions regarding the boundaries of the floodplain relative to the proposed project area that should be addressed before an impact determination is made. In addition, it states here that the Plant Site will divert flood waters into a pond where removal is not possible. This is not how a protected floodplain is intended to function and is not an acceptable long-term plan to address floodwaters on the Plant Site.

Response 6-100

The project's potential effects related to groundwater and surface water quality were evaluated within Draft EIR Section 4.10 as well as within the *Revised Hydrology and Water Quality Analysis Report* and the *Addendum to: Revised Hydrology and Water Quality Analysis Report* prepared by EMKO Environmental, Inc., and included within Draft EIR

Appendices G-5 and G-6, respectively. The commenter asserts that the project would not "protect" the floodplain. Not adding development to the floodplain area is a form of protection.

Further, the floodplain is determined by FEMA studies and updated hydraulic analysis prepared to estimate floodplain changes (see Draft EIR, Appendix G-1). The results of the analysis are shown in Draft EIR Figure 4.10-1, "Current 100-Year Floodplain." The analysis indicates that the current San Joaquin River 100-year floodplain does not encroach onto the Quarry or Plant sites. Chang Consultants conducted additional hydraulic analyses evaluating the San Joaquin River 200-year flood, and concluded that the 200-year flood would neither enter the Quarry Site nor the Plant Site. (Chang 2026a and 2026b, see Appendix G-7 and Appendix G-8). The Plant Site is not within the floodplain of Little Dry Creek. Existing topography and ground elevations protects the Plant Site from the San Joaquin River and Little Dry Creek 200-year flood. Please see Final EIR Chapter 3, "Draft EIR Errata," for revisions to Section 4.10 and Section 4.11, "Land Use and Planning."

Comment 6-101

[Table Item #76, DEIR PDF Pg. 707)

Existing Text:

> *Policy OS-A.5:* The County shall encourage, where economically, environmentally, and technically feasible, efforts aimed at directly or indirectly recharging the county's groundwater.
>
> *Consistent:* Project operations include recharge of the underlying aquifer through direct pumping of water pumped from the excavations into unlined ponds and recharge trenches.

Comment: It is Reclamation's understanding that pumping of water into unlined ponds and recharge trenches is being proposed to mitigate for some of the impacts of the proposed project on the local groundwater table and the SJR and would not creatie [sic] a net gain to groundwater supply. The response to this policy statement is misleading and should be removed; the proposed project would have a negative impact on local groundwater and surface water supply and water users.

Response 6-101

As explained in Response 12-77, recharge of groundwater using perimeter recharge trenches and the Northeast Pond have been occurring at the Quarry Site for decades and are part of the existing baseline conditions to reduce or eliminate the effects of dewatering

outside of the Quarry Site boundary (Draft EIR, Section 2.4.2.2, "Quarry Site Existing Conditions," page 2-21, and Section 2.5.2.2, "Quarry Site Mine Plans," page 2-39). Because the pumped water is recharged back to groundwater, as opposed to being discharged to surface water (e.g., the San Joaquin River), the project is consistent with this Fresno County policy. Otherwise, the commenter does not provide substantial evidence that the proposed project would have a negative impact on local groundwater and surface water supply and water users.

Comment 6-102

[Table Item #77, DEIR PDF Pg. 707, Policy OS-A.14)

Existing Text:

> *Consistent:* The project would not result in any development within a floodplain….

Comment: The applicant appears to be claiming the policy is related only to developing within the floodplain. However, this policy also appears to be related to not constraining floodplains (for wildlife and public safety), promoting groundwater recharge, wildlife preservation, and recreation. The use of a portion of the LDC floodplain for stockpile/storage does not appear to be consistent with this policy. Reclamation recommends that the LDC floodplain be left in or restored to a natural condition and that stockpiling be limited to areas outside of the LDC 100-year floodplain. Reclamation notes that flow contributions from LDC help maintain flows and support water diversions downstream.

Response 6-102

See Response 6-101 above. The project's potential effects related to groundwater and surface water quality were evaluated within Draft EIR Section 4.10 as well as within the *Revised Hydrology and Water Quality Analysis Report* and the *Addendum to: Revised Hydrology and Water Quality Analysis Report* prepared by EMKO Environmental, Inc., and included within Draft EIR Appendices G-5 and G-6. Based on the hydraulic studies prepared by Chang Consultants as provided in Appendix G of the Draft EIR, neither the San Joaquin River 100-year floodplain nor the Little Dry Creek floodplain enter the Plant Site. Further, the project would not result in development within the floodplain. The project would continue to use stockpiling, which is part of the CEQA baseline. See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10 and supporting technical appendices.

Additionally, the hydraulic report indicates that the Little Dry Creek floodplain would not impact the Plant Site. Existing berms and ground elevations prevent both the 100-year and 200-year Little Dry Creek floodplains from entering the Plant Site.

For these reasons, as supported by Draft EIR Section 4.10 and Appendix G, and the revisions presented in Final EIR Chapter 3, the flood plain analysis was complete, and no further analysis is needed.

Comment 6-103

[Table Item #78, DEIR PDF Pg. 709, Policy OS-A.24)

Comment: The project proponent's water quality analysis does not address the water quality of recharge waters, which show water quality exceedances. For instance, DEIR pdf page 656 states "Basin Plan limits for conductivity, iron, and manganese were exceeded, but Basin Plan limits would only apply to groundwater pumped from the Plant Site if the water was to be discharged directly to the San Joaquin River." It appears the project proponent is not intending to mitigate potetnial [sic] water quality impacts from pumped recharge water with known Basin Plan exceedances because it is not being discharged to a live stream. However, recharge water being placed in these shallow recharge structures has a strong potential to introduce pollutants and water quality constituents into the shallow groundwater table, which would degrade groundwater and impact the adjacent water bodies. This impact should be addressed before any determination is made regarding consistency with this policy.

Response 6-103

With regard to the potential for interaction between the surface recharge trenches and the shallow groundwater table it should be noted that while the San Joaquin River and alluvial aquifer are hydraulically connected, and some connectivity between these and groundwater in the bedrock fractures is likely, despite differences in conductivities and transmissivities, the mineralogic continuity of the alluvium and the underlying granitic target resource for the project indicate that the water-rock interactions would be geochemically similar.

Recognizing the geochemical similarities between the San Joaquin River, alluvial aquifer, and groundwater within the fractured bedrock, the water quality characteristics are similar in terms of the existing conditions. With project implementation, recharge of pumped groundwater during mining, as well as storage of process water in the designed basins, is therefore unlikely to have any appreciable effect on background water quality with regard to naturally occurring constituent concentrations, given the proposed water

management for this project. The Draft EIR sufficiently analyzed groundwater quality impacts and correctly concluded that the proposed project would be consistent with Fresno County Policy OS-A.24.

Furthermore, the surface water and groundwater concentrations reported in the 2023 EMKO report represent already existing conditions at the Quarry Site and are not indicative of potential project effects or past practices (see Draft EIR Appendix G-5).

However, Mitigation Measure 4.10-5a is in place and to be implemented as an adaptive management strategy to assess whether the proposed project could cause a water quality impairment, specifically for iron and manganese in the reclaimed Plant Site pond within the former mining excavation, and actions to be undertaken in the event of a verified impact. The monitoring would begin once mining is completed and water starts filling the excavation, since there would be no appreciable water-rock interaction under pumping condition. With this mitigation implemented, water quality would be monitored via direct measurement every six months. If iron or manganese levels exceed regulatory limits during two consecutive monitoring periods, further lab testing and seasonal assessment would follow. Persistent exceedances would trigger mitigation measures, such as aeration, vegetation control, or other methods to reduce iron and manganese concentrations. Monitoring would continue until five years pass without exceedances, at which point it may end. Annual reports would be submitted to the County, detailing monitoring results and any corrective actions taken.

Additionally, Mitigation Measure 4.10-1 and 4.13-6 requires implementation of Blasting Protocols which reduces the potential for the proposed project to contaminate the groundwater by explosives at the Quarry Site (Draft EIR page 4.11-25).

See also Response 65-28 and Collective Response #25.

Comment 6-104

[Table Item #79, DEIR PDF Pg. 711, Goal OS-D, OSD.4)

Existing Text: To conserve the function and value...related riparian areas...

Comment: The DEIR states these goals are "not applicable" and "consistent", respectively. The delivery ditch at the Plant Site is directly connected to Little Dry Creek, which flows into the SJR. In reviewing aerial imagery, there are visible sediment depositions that appear to have originated from the Plant Site and been released into the delivery ditch. There is riparian vegetation along LCD and the SJR that could be impacted by this sediment.

However, there is no discussion of this existing condition or potential impacts. Impact 4.4-4 only discusses dust control and blasting and does not address the other potential impacts. As requested for Impact 4.4-5, baseline conditions should be accurately described, and potential impacts disclosed. The determination for this goal should be reconsidered with this additional information included in the analysis.

Response 6-104

Impact 4.20-4 (Draft EIR, Impact 4.20-4, page 4.20-16) analyzes impacts to existing riparian areas; Impact 4.10-15 (Draft EIR, page 4.10-117) indicates that the project would not alter drainage patterns in a manner that would result in on- or off-site flooding or exceed the capacity of the existing storm drainage system. Impact 4.10-16 (Draft EIR pages 4.10-117 through 4.10-118) determined that the project would not alter drainage patterns in a manner which would impede or redirect flood flows. Impact 4.10-17 (Draft EIR, pages 4.10-118 through 4.10-119) determined that the enlarged mining excavation could help contain and minimize downstream flooding, which would reduce the overall potential for release of pollutants, including sediment. Additionally, sediment would continue to be controlled via the project sites' NPDES Permit, SWPPP, and implementation of BMPs (Draft EIR, Section 4.10.2.2, pages 4.10-68 through 4.10-70). The comment does not provide evidence or argument that the Draft EIR's evaluation of these potential impacts are inadequate.

Comment 6-105

[Table Item #80, DEIR PDF Pg. 728-729, Policy Habitat 7,9, 16)

Comment: The DEIR lacks sufficient detail for addressing long-term ecological restoration of the proposed project sites. No definition of open water habitat and no plan to remove aquatic vegetation is provided. What are the criteria for success and what is the monitoring plan? How will the project proponent ensure the plan does not impact the SJRRP? Please expand here.

Response 6-105

Site-specific restoration details would be further developed in coordination with resource agencies as project design advances. Criteria for success would be based on measurable performance standards such as establishment of desired vegetation communities, water quality targets, hydrologic function, and habitat use by target wildlife species. A monitoring plan would be implemented to evaluate progress toward these standards through periodic field surveys, vegetation mapping, and photo documentation.

To ensure the plan does not adversely affect the SJRRP, project activities would be coordinated with the Division of Mine Reclamation and other responsible agencies. The restoration plan would be designed to complement, rather than conflict with, the goals of the SJRRP, including avoiding adverse alterations to river flows, fish passage, water quality, and other favorable habitat conditions.

Comment 6-106

[Table Item #81, DEIR PDF Pg. 926)

Existing Text:

> *List Method:* A list of past, present, and reasonably foreseeable future projects producing related or cumulative impacts, including those projects outside the control of the agency.

Comment: The DEIR states that a List Method or Regional Growth Projections Method will be used and will be identified at the beginning of each section but does not actually appear to state the method in each section. Please state which approach was used for each resource analyzed.

Response 6-106

The methodology for assessing cumulative impacts for each resource topic is described within the respective sections of Chapter 5, "Cumulative Impacts," of the Draft EIR (e.g., Section 5.3.1, "Aesthetics;" Section 5.3.2, "Agricultural and Forestry Resources"). These sections identify the geographic scope of analysis and the relevant cumulative projects and/or regional growth assumptions, as appropriate to each resource topic. As described in these sections, the cumulative impact analysis uses a combination of the list of related projects (List Method) and regional growth projections, depending on what is most appropriate for the resource topic. In addition, Table 5-1, "List of Nearby Projects" (Draft EIR, pages 5-4 through 5-5) provides a list of nearby cumulative projects, and Figure 5-1, "Cumulative Projects," provides a map of these projects.

Comment 6-107

[Table Item #82, DEIR PDF Pg. 937)

Existing Text: The proposed project would not affect water from Millerton Reservoir, Friant-Kern Canal, and Tule River; therefore, there would not be potential cumulative impacts of the proposed project and the Friant Ranch Specific Plan project on riparian communities, waters of the state, wetlands, or groundwater dependent ecosystems in the vicinity of the project sites.

Comment: Any increase in Reach 1 losses, such as those that would occur from operation of the proposed project, would reduce the amount of available water supply to the Friant Division water users and therefore, negatively impact the Friant-Kern Canal. This conclusion should be revised.

Response 6-107

First, the commenter fails to define what is meant by Reach 1 losses, and the Draft EIR makes no mention to Reach 1 losses. Regardless, the commenter fails to acknowledge the analyses of impacts to the Friant-Kern Canal, which were adequately analyzed in Responses 6-8, 6-14, 6-49, and 58-25. Otherwise, the commenter does not provide substantial evidence that the proposed project would reduce the amount of available water supply or impact the Friant-Kern Canal.

Comment 6-108

[Table Item #83, DEIR PDF Pg. 946)

Existing Text: Regarding cumulative impacts to surface water quality (Impacts 4.10-1, 4.10-2, and 4.10- 3), stormwater runoff is contained within the project sites by the existing berms, and the project would not impact surface water quality outside of the project sites.

Comment: The proposed project does have the potential to impact surface water quality of the SJR if recharge water that is not of a similar quality to SJR water is placed immediately adjacent to the SJR. This statement should be revised to disclose this potential impact and any related analyses should be revisited.

Response 6-108

The commenter asserts without factual basis that the proposed project has the potential to impact the surface water quality of the SJR. The proposed project is designed as a zero-discharge facility with respect to offsite discharges and therefore does not discharge to the San Joaquin River or any other offsite surface water (see Draft EIR, Impact 4.10-1, page 4.10-88). Both the Quarry Site and the Plant Site are managed such that stormwater and groundwater are not discharged from the site boundaries. Therefore, there would be no impacts to surface water quality off-site, including the SJR.

The Draft EIR identified a potentially significant impact related to groundwater quality at the Plant Site pond for iron and manganese (see discussion of Impact 4.10-5 on page 4.10-95 of the Draft EIR). With the implementation of Mitigation Measure 4.10-5a, further

described below, the potential impact to groundwater quality would be reduced to less than significant (Draft EIR page 4.10-98).

Mitigation Measure 4.10-5a provides an adaptive management strategy to assess whether the proposed project would cause a violation of water quality standards for iron and manganese in the reclaimed Plant Site pond within the former mining excavation and indicates actions to take if an impact is verified. The monitoring would begin once mining is completed and water starts filling the excavation, with measurements taken every six months. If iron or manganese levels exceed regulatory limits during two consecutive monitoring periods, further lab testing and seasonal assessment would follow. Persistent exceedances would trigger mitigation measures, such as aeration, vegetation control, or other methods to reduce iron and manganese concentrations. Monitoring would continue until five years pass without exceedances, at which point it may end. Annual reports would be submitted to the County, detailing monitoring results and any corrective actions taken (Draft EIR pages 4.10-96 through 4.10-98).

See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10, including Mitigation Measure 4.10-5a, and supporting appendices.

Comment 6-109

[Table Item #84, DEIR PDF Pg. 947)

Existing Text: Furthermore, as described in Impacts 4.10-10 and 4.10-11, during both mining operations and after final reclamation, the estimated increase in groundwater consumption at the Plant Site and Quarry Site are several orders of magnitude smaller than the fluctuations in the water balance of the North Kings GSA area. For these reasons, the project's contribution to the significant cumulative impacts related to the depletion of groundwater and conflict/obstruction with the North Kings GSA Groundwater Sustainability Plan would be less than cumulatively considerable.

Comment: As stated on Page 5-1, "For purposes of this Draft EIR, the proposed project would be considered to have a significant cumulative effect if... the cumulative effects of other past, present, and reasonably foreseeable future projects without the proposed project are already significant and the project contributes measurably to the effect. The standards used herein to determine measurability are that either the impact must be noticeable or must exceed an established threshold of significance." The measure of significant cumulative effect used for this analysis is a noticeable impact or an impact that exceeds an established threshold of significance. As currently analyzed,

the project proponent has indicated the impact is "less than cumulatively considerable," but has not analyzed the impact against the measures outlined in the document. Please analyze this impact to the standards required and amend the section accordingly.

Response 6-109

As quoted in this comment, the project must contribute measurably to the effect, and the impact must be noticeable. As the impact analysis notes, the estimated increase in groundwater consumption at the Plant Site and Quarry Site are several orders of magnitude smaller than the fluctuations in the water balance of the North Kings GSA area (see Draft EIR, Impact 4.10-11, page 4.10-112 through 4.10-113). In other words, increased groundwater consumption under the project would not contribute measurably to the effect and would not be noticeable in any of the wells identified in the Groundwater Sustainability Plan used to evaluate changes in groundwater levels.

It is also important to note that increased consumption at the Quarry Site area would occur from the crystalline bedrock units, the weathered rock and the hard rock, which are below the bottom of the identified groundwater basin.

See also Response 65-38 and Collective Response #25.

Comment 6-110

[Table Item #85, DEIR PDF Pg. 947)

Existing Text: The proposed project and cumulative projects could have a significant impact on the hydrology of the San Joaquin River should the projects substantially drawdown groundwater and thereby result in a decrease of flows in the river (Impact 4.10-12).

Comment: The SJR already has significant cumulative impacts to its hydrology due to existing diversions, as demonstrated by the need for the SJRRP. Therefore, for the purposes of analyzing cumulative impacts to the hydrology of the SJR, cumulative impacts of this proposed project should be determined based on whether the project is cumulatively considerable, not on whether the impact itself is determined to be significant or if the project substantially draws down groundwater. Please revise this analysis.

Response 6-110

See Responses 6-14 and 6-56 and Collective Response #25. The analysis presented in the Draft EIR and its supporting appendices indicate that groundwater is not interconnected with surface water at the project site. Therefore, groundwater use for the project would have no significant individual or cumulative effect on flows in the San Joaquin River.

Furthermore, the groundwater flow volume under the Quarry Site area and the estimated dewatering rates are miniscule fractions of the baseflow and SJRRP restoration flows in the river, such that even if there was a direct connection between the groundwater under the Quarry Site and the river, any decrease in river flows would be less than that which could be accurately measured or observed.

Comment 6-111

[Table Item #86, DEIR PDF Pg. 947)

Comment: The referenced Groundwater Sustainability Plan (GSP) provided by the North Kings Groundwater Sustainability Agency (GSA) to the State of California Department of Water Resources (DWR) included corrective actions identified by DWR as necessary for GSP approval. The corrective actions include an interconnected surface water (ISW) analysis to better understand the interaction between surface water flows and groundwater. As such, the North Kings GSA entered a Memorandum of Understanding with other GSAs, the SJRRP, Friant Water Authority, and the SJRRP Restoration Administrator to initiate a Technical Committee analyzing ISW. The project proponent should engage the North Kings GSA to ensure consistent understanding of ISW and water budget impacts.

Response 6-111

The Reclamation's suggested engagement of the project proponent with the North Kings GSA is noted. The County agrees that engagement with the North Kings Groundwater Sustainability Agency (North Kings GSA) is necessary for project review. The North Kings GSA reviewed and provided comments on the Draft EIR (North Kings GSA, March 10, 2025). Please see Responses 10-1 through 10-19, below, for comments received by the North Kings GSA and the County's responses to the comments, including consideration of corrective actions and water budget issues. The commenter recommends engagement with North Kings GSA but does not discuss the adequacy of the Draft EIR and no further response here is required.

Comment 6-112

[Table Item #87, DEIR PDF Pg. 948)

Existing Text: The Quarry Site is not located in a flood plain, and only a small portion of the northwest corner of the Plant Site (as shown in Figure 4.10-1, "Current and Regulatory Floodways and Floodplains,") is located within the Little Dry Creek floodplain.

Comment: Please revise this language to reflect the FEMA floodplain map and assess the cumulative impact recognizing that the project

proponent's alternate floodplain map does not represent the complete data set regarding flood risk for this project.

Response 6-112

As explained in Response 6-8, the FEMA floodplain map is out of date. The floodplain mapping prepared for the project is up to date. The analysis methodology is summarized in the Draft EIR in Section 4.10.3.2 and is set out in detail in Appendix G-1. Comment 6-112 does not cite to or provide any analysis as to why Draft EIR Appendix G-1 and the summary contained in the Draft EIR in Section 4.10.3.2 are inaccurate. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10 and supporting appendices.

Comment 6-113

[Table Item #88, DEIR PDF Pg. 956)

Existing Text: The project's contribution to the cumulative increase in groundwater use in Fresno County would be cumulatively considerable.

Comment: Please clarify that there have been significant cumulative impacts to groundwater in the region, as evidenced by the need for the North Kings GSA and GSP. Analyzing water availability during wet hydrology does not provide a complete picture; groundwater availability in times of drought is at a deficit. Over the course of the proposed project's 100-year life, pumping will undoubtedly take place during times of drought. Please provide a proposed mitigation plan to offset this cumulative impact, especially during times of drought.

Response 6-113

The cumulative impacts being assessed in the section of the Draft EIR cited in this comment (Section 5.3.19, "Utilities and Service Systems") are related to Utilities and Service Systems. Cumulative impacts related to groundwater are addressed in Section 5.3.10, "Hydrology and Water Quality," of the Draft EIR, which discusses conditions in the groundwater subbasin managed by the North Kings Groundwater Sustainability Agency (GSA) through the Groundwater Sustainability Plan (GSP). Additionally, the above cited sentence related to ground water is incorrect and has been deleted via an Errata.

Comment 6-114

[Table Item #89, DEIR PDF Pg. 957)

Existing Text: As discussed in the preceding sections, the proposed project would not make cumulatively considerable contributions to any significant cumulative impacts except related to transportation. Impact 4.17-1 would remain a significant and unavoidable impact even with mitigation and would contribute significantly to cumulative transportation impacts in the region. See Section 5.3.17, above, for details.

Comment: This statement does not address the proposed project's impact to groundwater in times of drought or its impact to the SJR when analyzed for cumulative impact. Please revise to reflect these areas of significant cumulative impacts.

Response 6-114

Impacts to groundwater are addressed in Section 4.10 of the Draft EIR, and cumulative impacts to groundwater are addressed in Section 5.3.10 of the Draft EIR. See Response 6-110 with respect to potential cumulative impacts to the San Joaquin River. Additionally, the above cited sentence related to ground water is incorrect and has been deleted from the Draft EIR via an erratum as shown in Final EIR Chapter 3, "Draft EIR Errata."

Comment 6-115

[Table Item #90, DEIR PDF Pg. 1005, Alternative 4)

Comment: Please add a risk analysis of bank stabilization and flood protection with and without an additional 100-foot setback. This appears to be a significant consideration with the 100-foot setback that should be considered in the analysis.

Response 6-115

See Response 65-44, which provides that the Reduced Mining Depth (300 Feet) with Additional Setbacks Alternative would also be inconsistent with Goal OS-C of the Fresno County General Plan Mineral Resources Section of the Open Space and Conservation Element to conserve areas identified as containing significant mineral deposits for potential future use, because it would not promote operation of mining and extraction activities within areas designated for such use (Draft EIR page 6-39). The comment provides no support for why Alternative 4 should be analyzed in the suggested manner.

Comment 6-116

[Table Item #91, Appendix 1 of 2, Appendix 2 of 2, PDF Pg. 1798-3, Hydraulic Analysis]

Existing Text: [Use of 100-year flow velocities] Comment: The use of 100-year flow velocities, equating to a 71,000 cfs flow, is not adequate given the lifetime of the proposed project (i.e. 100 years). There is a 63% chance of a 100-year flood or larger during a 100-year project lifespan. Since the 100-year flow velocity estimates are close to the erosion threshold, higher flows could endanger the integrity of the natural berms and levees around the proposed project sites. Breaching of the proposed project sites by high flows could cause long-term impact to fisheries, the ability for Reclamation to provide water to Holding Contracts below the proposed project site, the ability of Reclamation to meet environmental flow requirements, and potentially the ability of Reclamation to deliver water to Mendota Pool for the Exchange Contract.

Response 6-116

As explained in Response 65-37, which provides the adaptive approaches in Mitigation Measures 4.7-6, 4.7-7a, and 4.10-1 adequately address the potential of pit failure and slope stability analyses. Additionally, Mitigation Measure 4.10-1, which addresses any potential impacts to the San Joaquin River embankment, requires continuous pre-blast and post-blast visual inspections of the portions of the San Joaquin River embankment that are located within 1,000 feet of each blast would be completed, and that in the case of an impact, all blasting must cease until the County approves a Corrective Action Plan (see Draft EIR, pages 4.4-57 through 4.4-58; Mitigation Measure 4.10-1; and Final EIR Appendix H-9, Section E, page 5). Regardless, this unforeseeable event situation would result in an impact of the environment or other infrastructure (e.g., dam failure) on the project, not an impact of the project on the environment. Notably, the easterly bank along the Quarry Site did not experience significant erosion, and the bank has never breached into the Quarry Site (Draft EIR, page 4.10-7). Therefore, the effects of such unforeseen circumstances do not require further analysis under CEQA. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10 and supporting appendices.

Comment 6-117

[Table Item #92, Appendix 1 of 2, PDF Pg. 49, 3.4)

Existing Text: "The San Joaquin River is located approx. 0.6 miles to the west of the Plant Site... In addition, the silt ponds, serve as a source of recharge to the groundwater.

Comment: This section describes in detail how water is being consumed, not returned to the river, which would be inconsistent with Holding Contract #15. Furthermore, this section describes that the project proponent is claiming their Holding Contract as evidence of a water right, which Reclamation does not support. Reclamation recommends revising this language.

Response 6-117

An EIR is not the proper forum to discuss complex water rights issues, as that is not the purpose of CEQA analysis. The comment addresses statements within Appendix B-1 of the Draft EIR, which is the Surface Mining and Reclamation Plan. The Draft EIR evaluates the potential impacts of the proposed project on the environment, per CEQA requirements. The nature of an almost 80-year-old Holding Contract and the status of water rights are not environmental impacts that are addressed under CEQA.

Letter #7 March 10, 2025, Jonathan Ambrose, National Marine Fisheries Service

Comment 7-1

The National Marine Fisheries Service (NMFS) is the federal agency responsible for managing, conserving, and protecting marine resources for inland, coastal, and offshore waters of the United States. We derive mandates from several statues, including the Federal Endangered Species Act (ESA) and the Magnuson-Stevens Fishery Conservation and Management Act1 (MSA). The purpose of ESA is to conserve threatened and endangered species and their ecosystems, while the MSA aims to protect habitat for species important for commercial and recreational fisheries. NMFS's technical assistance in this letter pertains to the Draft Environmental Impact Report (EIR) for the Rockfield Quarry Modification Project (Project), near Fresno, California.

Response 7-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See responses below that address specific issues raised in this comment letter.

Comment 7-2

The Project location is approximately 0.5 miles east of the mainstem San Joaquin River, within an alluvial floodplain deposit. The proximity of the Project location to the San Joaquin River, in addition to the proposed mining depth (i.e., over 300 feet), should take into consideration how surface water and groundwater are hydraulically linked. There is no ESA-designated critical habitat in the San Joaquin River near the Project area, however the hydraulic linkage is critically important in creating and

maintaining habitat for federally threatened California Central Valley (CCV)steelhead (*Oncorhynchus mykiss*), Central Valley (CV) spring-run Chinook salmon (*O. tshawytscha*), and the southern Distinct Population Segment (sDPS) of North American green sturgeon (*Acipenser medirostris*) listed under the ESA. The current analysis is inadequate to understand the full breadth of potential impacts the Project will have on the ESA- listed and MSA-managed species in the San Joaquin River.

Response 7-2

The Draft EIR provides a comprehensive, site-specific analysis of groundwater and surface water interactions and their potential effects on aquatic resources (Draft EIR Section 4.10.1.9, "Groundwater- Surface Water Interaction at the Quarry Site," pages 4.10-48 through 4.10-61). The hydraulic connection between the Quarry Site and the San Joaquin River (SJR) was evaluated using conservative assumptions, modeling, and monitoring data, which demonstrate that the proposed mining depth and operations are not expected to cause significant impacts to federally listed California Central Valley steelhead, Central Valley spring-run Chinook salmon, or southern Distinct Population Segment green sturgeon.

The Draft EIR analyzes the proposed project's potential to interfere with native resident or migratory fish or wildlife species movement, corridors, or nursery sites. In this discussion of Impact 4.4-6, the Draft EIR provides that the San Joaquin River serves as a migratory corridor for certain fish species, including Chinook salmon. The Draft EIR concludes that this impact would be less than significant, with no mitigation required (Draft EIR pages 4.4-62 through 4.4-63).

The hydraulic analysis in the Draft EIR incorporates protective measures and monitoring programs designed to detect and address potential effects, ensuring that the proposed project would not adversely affect ESA-listed species or MSA-managed species. Therefore, the commenter's assertion that the Draft EIR's analysis of impacts to the SJR and additional impacts to the stated fish species is inadequate is not supported.

The surface waters of the San Joaquin River in proximity to the Quarry Site are regulated primarily by releases of water from the Millerton Reservoir, not groundwater or precipitation. As such, habitat for fish, including the species highlighted by the comment, is substantially dependent on factors unrelated to the subject project. Draft EIR Section 4.10, "Hydrology and Water Quality," provides adequate analysis to determine that the project would not have a substantial impact on the fish species highlighted by the commenter. The comment does not provide substantial evidence that a significant

adverse impact to these species would be a reasonably expected outcome from the project.

See Final EIR Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections and supporting appendices referenced in this response.

Comment 7-3

A more robust analysis considering future impacts under a fully implemented San Joaquin River Restoration Program (SJRRP) and expected future hydrologic conditions should be included in your Draft EIR.

Response 7-3

Pursuant to the California Public Resources Code and CEQA Guidelines, the Draft EIR properly analyzes the proposed project's impacts as compared to existing baseline conditions at the time of the Notice of Preparation. The analysis of impacts is not required to assume conditions where the San Joaquin River Restoration Program is fully implemented.

Comment 7-4

In addition, CV fall-run Chinook salmon are an important commercial and recreational sportfish under the MSA. Where groundwater aquifer supplements streamflow, the influx of cold, clean water is important for maintaining surface water temperature and flow volume. The mainstem San Joaquin River, up to Friant Dam, is designated Essential Fish Habitat (EFH) for federally managed Chinook salmon species within the Pacific Coast Salmon Fishery Management Plan2, pursuant to the MSA. For the purposes of the MSA, EFH means "those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity", and includes the associated physical, chemical, and biological properties that are used by fish (50 CFR 600.10).

The Project location is hydraulically linked to habitat in the San Joaquin River where ESA-listed CCV steelhead and sDPS green sturgeon, and MSA-managed CV fall-run Chinook salmon, have the potential to occur over the next 100 years during implementation of the Project. Additionally, CV spring-run Chinook salmon3 currently spawn, rear, and migrate, in the San Joaquin River in the proximity of the Project location. This reintroduced population of CV spring-run Chinook salmon are part of the long-term reintroduction efforts by the San Joaquin River Restoration Program4. The SJRRP also includes volitional fish passage infrastructure projects that are expected to increase the presence

and population of CCV steelhead, sDPS green sturgeon, and Chinook salmon (both fall-run and spring-run) in the hydraulically-linked Project area of the San Joaquin River.

Response 7-4

The commenter provides information regarding Essential Fish Habitat (EFH), the San Joaquin River Restoration Program (SJRRP), and the potential presence of ESA-listed and MSA-managed fish species in the San Joaquin River in the vicinity of the project. This information is noted.

Pursuant to the California Public Resources Code and CEQA Guidelines, the Draft EIR evaluates the proposed project's impacts based on existing baseline conditions at the time of the Notice of Preparation and is not required to assume future conditions associated with full implementation of the SJRRP. The Draft EIR evaluates the hydraulic connection between the project sites and the San Joaquin River and concludes that the project would not adversely affect ESA-listed or MSA-managed species. Protective measures and monitoring are included to detect and address any potential effects, ensuring that river conditions supporting fish populations are maintained. See also Response 7-2 and Collective Response #12 for further discussion of the San Joaquin River Restoration Program and Chinook salmon.

Letter #8 March 10, 2025, Joaquin Arambula, California Assemblymember, 31st District

Comment 8-1

I write in response to the Draft Environmental Impact Report regarding the CEMEX company's proposal to expand its operations on the San Joaquin River, which include plans to blast and drill a 600-foot pit to extract rock for the purpose of making gravel, northeast of the City of Fresno.

Response 8-1

The comment is introductory and does not address the adequacy of the Draft EIR. Please see below for responses to specific comments.

Comment 8-2

The CEMEX proposal is unnecessary, unjustifiable, and unwanted by many concerned area residents, community members, and environmental protection advocates. At its core, the CEMEX plan would permanently disfigure and devastate a prized natural resource in Fresno County – the San Joaquin River and the long-standing goal to restore a 22-mile segment into a scenic parkway.

Response 8-2

With regard to project necessity, please see Collective Response #3 pertaining to regional aggregate demand and supply. With regard to restoration of the San Joaquin River, please see Collective Response #12 pertaining to San Joaquin River restoration efforts and please see Collective Response #18 pertaining to the project's consistency with San Joaquin River Parkway Master Plan. The County received comments during the Draft EIR review period from area residents, community members, and environmental protection advocates, and has considered comments pertaining to the adequacy of the Draft EIR in preparing this Final EIR. County decision-makers will consider all public comments and input in deciding whether to approve the project. The commenter's concern that the project may disfigure and devastate a prized natural resource is noted and will also be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 8-3

There are a number of alarming aspects to CEMEX's plan: the company's request to extend its mining at this location for a stunning 100 years;

Response 8-3

Please see Collective Response #5 pertaining to the requested use permit duration.

Comment 8-4

the pit's size would be deeper than the height of the Washington Monument;

Response 8-4

Draft EIR Chapter 2, "Project Description," provides a detailed description of the project, including the proposed Quarry Site mine pit depth and area and the Draft EIR environmental analyses appropriately consider impacts associated with the full extent of the proposed mine pit. The comment does not address the adequacy of the Draft EIR project description or analyses, and no further response is warranted.

Comment 8-5

the lack of clarity regarding mitigation measures for this project that involves dynamiting;

Response 8-5

Mitigation measures in the Draft EIR, some of which are further amplified and clarified through errata presented in Final EIR Chapter 3, "Draft EIR Errata," of this Final EIR,

provide clearly defined requirements and performance standards as necessary to ensure their efficacy. As discussed in Draft EIR Section 3.3, "Mitigation Measures," on page 3-4, as a condition of project approval, the Operator for the proposed project would be required to implement all of the mitigation measures adopted by the County. In accordance with PRC Section 21081.6(a), the County would adopt a Mitigation Monitoring and Reporting Program (MMRP) at the time it certifies the EIR. The purpose of the MMRP is to ensure that the Applicant would comply with the adopted mitigation measures when the project is implemented. The MMRP would identify each of the mitigation measures and describe the party responsible for monitoring, the time frame for implementation, and the program for monitoring compliance. The comment does not identify or provide evidence of any mitigation measures in the Draft EIR for which the commenter believes there is a lack of clarity, and no further response is warranted.

Comment 8-6

and the probability of increased traffic congestion and its repercussions. And, the list goes on.

Response 8-6

Draft EIR Section 4.17, "Transportation," presents a detailed evaluation of potential transportation-related impacts of the project and includes evaluation of anticipated traffic operations under conditions with the project. For additional discussion, please see Collective Response #29 pertaining to project traffic. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.17.

Comment 8-7

First, the deep pit will be created by using dynamite to blast rock and crush it into gravel. This pit will be in close proximity to the river – so the potential for contamination and harm to the water, fish, and wildlife is extremely high. This risky situation poses a critical threat to efforts to restore the river and its habitat…

Response 8-7

The commenter expresses concern regarding the potential for blasting activities associated with the proposed quarry pit to result in contamination of groundwater and surface water, including the San Joaquin River, and associated effects on fish and wildlife. These concerns are noted.

The Draft EIR evaluates the project's potential effects on water quality and groundwater levels in Section 4.10, "Hydrology and Water Quality," and Section 4.9, "Hazards and Hazardous Materials." As discussed under Impacts 4.10-1 through 4.10-7 and Impact 4.9-

2, the project's potential to affect surface water and groundwater quality, including through blasting activities, is addressed. With implementation of mitigation measures, these impacts would be less than significant.

The Draft EIR describes that impacts to groundwater quality are not expected to occur as a result of blasting activities, based on available research (Bond 1975; Berger 1980; Beaver 1984) (Draft EIR, page 4.10-100). In addition, Blasting Protocols required by Mitigation Measures 4.10-1 and 4.13-6 specify practices to prevent contamination of groundwater and surface water, including the use of appropriate explosive materials, controlled loading and detonation procedures, and management of blasted materials to prevent contact with stormwater. These measures minimize the potential for water quality degradation.

The Draft EIR also includes mitigation measures to address potential groundwater level changes, including Mitigation Measure 4.10-10a, which requires ongoing monitoring, adaptive management, and, if necessary, modification or cessation of mining and dewatering activities to protect groundwater resources (Draft EIR, pages 4.10-108 through 4.10-111).

Potential effects on biological resources, including fish and wildlife, are evaluated in Section 4.4, "Biological Resources," including Impacts 4.4-4 and 4.4-6. Blasting Protocols include measures such as setback distances from the San Joaquin River, timing restrictions, and monitoring to protect riparian habitat and aquatic species. With implementation of these measures, the project would not have a substantial adverse effect on riparian habitat or other sensitive natural communities (Draft EIR, page 4.4-58).

See also Impact 4.10-1 and Impact 4.10-3 for further discussion of water quality, and Collective Responses #12, 13, 14, 15, 16, 23, 24, and 25 regarding groundwater, surface water, and biological resources, including salmon and San Joaquin River restoration efforts.

Comment 8-8

…as well as to residential wells that could go dry because of a shrinking water table.

Response 8-8

See Response 8-7 above. The commenter expresses concern regarding the potential for the proposed project to affect groundwater levels and nearby residential wells.

The Draft EIR includes detailed analysis of potential effects on groundwater levels in Section 4.10, based on the *Revised Hydrology and Water Quality Analysis Report* (Appendix

G-5), which incorporates groundwater studies (Appendix G-3, "Groundwater Conditions at the Plant Site," and Appendix G-4, "Groundwater Conditions at the Quarry Site") and site-specific monitoring data. These analyses evaluate existing groundwater conditions and potential impacts associated with the proposed project.

As discussed in Draft EIR Section 4.10, mitigation measures are identified to protect groundwater resources, including Mitigation Measures 4.10-1, 4.10-5a, 4.10-5b, and 4.10-10a/4.10-10b. In particular, Mitigation Measure 4.10-10a requires ongoing monitoring of groundwater levels, implementation of additional recharge if groundwater levels fall below specified thresholds, and, if necessary, modification or cessation of mining and dewatering activities to ensure protection of groundwater resources and nearby wells (Draft EIR, pages 4.10-108 through 4.10-111). The mitigation includes conservative criteria designed to protect shallow wells and wells with limited water columns (Draft EIR, page 4.10-109).

The Draft EIR also concludes that blasting activities would not result in groundwater quality impacts based on available research (Bond 1975; Berger 1980; Beaver 1984), and Blasting Protocols required by Mitigation Measure 4.10-1 include measures to prevent contamination of groundwater and surface water (Draft EIR, page 4.10-100).

Comment 8-9

Second, the crux of this proposal comes down to the need for it. According to state records cited by a recent report in *Fresnoland*, the "Fresno metro area currently has nearly 200% more gravel than is needed for the next 50 years coming from local mines. The Kings River has roughly 2 billion tons of easily available surface gravel – enough for 500 years at Fresno's current 4 million-ton annual rate."

Response 8-9

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 8-10

In short, there simply is no need for this operation. The *Fresnoland* report described the river this way: "The San Joaquin River, one of California's most beleaguered waterways, has endured over a century of exploitation."

The San Joaquin River deserves protection – not further destruction – to preserve and nurture a river that provides significant health, recreational, and environmental benefits to our community and the Central Valley region.

Response 8-10

The comment does not address the adequacy of the Draft EIR. The commenter's concerns and opinions regarding the San Joaquin River are noted and will be considered by County decision-makers.

Letter #9 March 10, 2025, Ian Buck-MacLeod, Friant Water Authority

Comment 9-1

Background

The Friant Water Authority (FWA) is a public agency formed by its members under California law to operate and maintain the Friant-Kern Canal and to represent our members in federal or state policy, political, and operational decisions that could affect the water supply of the Central Valley Project's Friant Division. FWA also operates and maintains the Friant-Kern Canal on behalf of the U.S. Bureau of Reclamation.

Response 9-1

The Friant Water Authority (FWA) public agency formation and responsibilities are noted. The comment does not address the adequacy of the Draft EIR. Please see below for responses to specific comments.

Comment 9-2

FWA is a party to the litigation entitled *NRDC et al. v. Kirk Rodgers et al*. In 1988, a coalition of environmental groups filed a lawsuit challenging the renewal of long-term water service contracts between the United States and California's Central Valley Project Friant Division contractors. After more than 18 years of litigation, the Settling Parties reached a Stipulation of Settlement Agreement (Settlement). Besides FWA, the Settling Parties include the U.S. Bureau of Reclamation (Reclamation), which operates and maintains Friant Dam, immediately upstream of the CEMEX Rockfield Quarry Modification Project. To implement the Settlement, Reclamation established the San Joaquin River Restoration Program (SJRRP) and invited the U.S. Fish and Wildlife Service, the National Marine Fisheries Service, and the State of California's departments of Water Resources and Fish and Wildlife to join as implementing agencies.

The Settlement provides for, among other things, the release of water from Friant Dam and Millerton Lake into the San Joaquin River to restore and maintain fish populations (including naturally reproducing and self-sustaining populations of salmon and other

fish) in good condition in the mainstem San Joaquin River downstream of Friant Dam to the confluence with the Merced River. The water released, called Restoration Flows, is protected from diversion pursuant to State Water Code Section 1707 and is over and above the water historically released to comply with the so-called Holding Contracts. The Holding Contracts are agreements between Reclamation and certain landowners downstream from Friant Dam under which water is released to maintain a 5 cubic feet per second (cfs) flow requirement past those landowners' property. The most downstream landowner is approximately 40 miles downstream of Friant Dam. Before the Settlement, sufficient water was released from Friant Dam to provide a flow of 5 cfs to that landowner. The San Joaquin River was dry beyond that point, except when flood control releases were required from Friant Dam.

Response 9-2

The commenter's summary of the referenced settlement agreement and input regarding release of water from Friant Dam and Millerton Lake into the San Joaquin River are noted. The comment does not address the adequacy of the Draft EIR. Please see below for responses to specific comments.

Comment 9-3

Comments

FWA has the following specific comments on the subject EIR:

Page 2.16: The text states: "*applicant has water rights to use river water for industrial purposes in connection with the processing of rock, sand, and gravel.*" FWA is unaware of such a water right. The document should be revised to include documentation supporting the claim of water rights, including copies of reports of diversion that the Applicant has made to the State Water Resources Control Board. If the water for the applicant is diverted in accordance with Holding Contract No. 15, it is FWA's understanding that Reclamation does not consider Holding Contracts to confer a water right. Holding Contracts are merely a commitment by Reclamation to provide 5 cfs past the Applicant's property adjacent to the San Joaquin River.

Furthermore, Holding Contract No. 15 states the following:

- Article 12 ("*How the Owner May Divert Water*") states: "*The United Staes does not and willnot…object to any reasonable beneficial use of the water of the River for irrigation and/ordomestic purposes exclusively upon the said land…*"

- Article 28(a) states: "…*the United States agrees, notwithstanding any provision to thecontrary in this contract contained, particularly Article 24 [*"Adverse Interests Conveyed orReconveyed*"], that it will not object to the use by PACIFIC COAST AGGREGATES, INC., [sic]of the water of the San Joaquin River for industrial purposes in connection with theprocessing of rock, sand, and gravel, provided the water used is returned to the River freeof pollution and/or contamination.*"

Therefore, any water diverted under Holding Contract 15 must either be used for "for irrigation and/or domestic purposes" or returned to the San Joaquin River "free of pollution and/or contamination."

Response 9-3

The Draft EIR evaluates the potential impacts of the proposed project on the environment, per CEQA requirements. The nature of an almost 80-year-old federal Holding Contract and the status of water rights are not environmental impacts that are addressed under CEQA. Please see Response 6-7.

Comment 9-4

Page 2.16: The text states: "Water is diverted from the river to the Plant Site via a ditch and the water then is used to wash the aggregate." The document should state if the diversion is screened to prevent fish from entering the ditch.

Response 9-4

As described in Section 2, "Project Description," of the Draft EIR, the Applicant currently has water rights to use river water for industrial purposes in connection with the processing of rock, sand, and gravel. Under existing conditions, water is diverted from the river to the Plant Site via a ditch and the water is then used to wash the aggregate. This diversion process is not being modified as part of the project. Therefore, no change in the physical configuration or operation of the diversion is proposed that would result in a new or increased potential for fish entrainment.

Comment 9-5

Page 4.4-62 to -63: The text states: "*Fish species that occur in the San Joaquin River include largemouth bass, bluegill (Lepomis macrochirus), catfish, and common carp (Cyprinus carpio). Rainbow trout (Oncorhynchus mykiss) that are triploid (fish that is sterile) are planted for recreation. A Central Valley spring-run reintroduction effort for juvenile spring- and fall-run Chinook salmon (Oncorhynchus tshawytscha) is being undertaken on the San*

Joaquin River by the Bureau of Reclamation and others as part of the San Joaquin River Restoration Program. The river contains seasonal habitat for rearing and holding of juvenile spring- and fall-run Chinook salmon and are potential breeding habitat for spring- and fall-run Chinook salmon." The San Joaquin River Restoration Program is undertaking a significant fishery restoration effort. While the description given is accurate, it is insufficient given the magnitude of the effort and the importance of the work. Suggest additional information be provided. The Applicant should review the information available on the San Joaquin River Restoration Program's website (https://www.restoresjr.net/), on the US Fish & Wildlife Service's website (https://www.fws.gov/project/san-joaquin-river-restoration-program), the National Marine Fisheries Service's website (https://www.fisheries.noaa.gov/west-coast/habitat-conservation/san-joaquin-river-restoration), and the California Department of Fish and Wildlife's website (https://wildlife.ca.gov/Regions/4/San-Joaquin-River).

Response 9-5

Please see Collective Response #12 pertaining to San Joaquin River restoration efforts.

Comment 9-6

Page 4.10-7: The text states: "*During historic flow events, including the January 1997 flood event of approximately 60,300 cubic feet per second (cfs), the easterly bank along the Quarry Site did not experience significant erosion and the bank has never breached into the Quarry Site*." The Corps of Engineers estimated the January 1997 flood to have a 60-to-80-year recurrence interval in their "Sacramento and San Joaquin River Basins, California Post Flood Assessment" (https://babel.hathitrust.org/cgi/pt?id=uc1.31210025006170&seq=322 at Table 6-2, page 6-10). The Applicant should analyze the impact from up to a 200-year flood.

Response 9-6

In response to comments and in accordance with the Fresno County General Plan (2024), Chang Consultants conducted hydraulic analyses evaluating the 200-year flood event, a more rare and severe flood event, which demonstrate that the 200-year flood would neither enter the Quarry Site nor the Plant Site (see Appendix G-7 and Appendix G-8). Please also see Collective Response #17 for a discussion of flooding at the Quarry Site, including evaluation of the 200-year flood. CEMEX recently elevated the berm at the Quarry Site to provide additional flood protection.

Comment 9-7

Page 4.10-16: The text states: "*…during unforeseen events, may be required to release water into the San Joaquin River at rates that could exceed the river channel capacity (Fresno County 2018a).*" It should be noted that such releases from Friant Dam may be required during foreseen events as well as unforseen.

Response 9-7

Comment noted. The statement in the Draft EIR that is referenced in this comment is based on the May 2018 Fresno County Multi-Jurisdictional Hazards Mitigation Plan (Draft EIR page 4.10-16). The May 2018 Fresno County Multi-Jurisdictional Hazards Mitigation Plan does not describe a scenario where releases into the San Joaquin River would exceed river capacity during foreseen events.

Comment 9-8

Page 4.10-49: The text states: "*The water level data for well MW-2S, screened only in the alluvium, shows that the well does not contain water except during periods when the San Joaquin River stage is greater than 4 feet. A review of river stage data from January 2014 to February 2023 indicates that the San Joaquin River stage measurements exceeded 4 feet for approximately 13 percent of the January 2014 to February 2023 time period.*" Once full implementation of the SJRRP is completed, there will be times when flows in the San Joaquin River will exceed 2,500 cfs for 2 weeks followed by 4,000 cfs for 2 weeks. The EIR should analyze San Joaquin River stages under these flows. The Restoration Flow hydrographs can be found in Exhibit B of the Settlement (https://www.restoresjr.net/?wpfb_dl=9).

Response 9-8

See Response 6-12.

Figure 12 of Appendix G-5, "Hydrology and Water Quality Analysis Report," of the Draft EIR shows that during 2017 and 2019, flows equal to or greater than 2,500 cfs occurred for durations comparable to or longer than the SJRRP Stage 1 flow scenarios described in the SJRRP Settlement, as summarized in Comment 6-12. The analyses presented in Draft EIR Section 4.10, "Hydrology and Water Quality," and Appendices G-5 and G-6 of the Draft EIR demonstrate that flows of those magnitudes and durations did not have any significant effect on groundwater levels at the Quarry Site and Plant Site. Further, Collective Response #25 explains that the relatively low permeabilities of the underlying weathered rock and hard rock units prevent short-term intermittent flows from resulting in substantial additional movement of surface water to groundwater in the project area.

Comment 9-9

Page 4.10-56: The text states: "…leakage from the canal flows, which flow year-round, are likely an important source of groundwater recharge to the areas in the vicinity of the Friant-Kern Canal, including the Quarry Site." As noted above, FWA operates and maintains the Friant-Kern Canal. We are unaware of the occurrence of significant seepage from the Friant-Kern Canal in the vicinity of the Quarry Modification Project, and the Friant-Kern Canal is about 2 miles from the Quarry Site. The text references the North Kings GSA's 2022 Groundwater Sustainability Plan as a source of the information contained in this section. The specific page number should be provided, using the updated 2025 GSP https://northkingsgsa.org/groundwater-sustainability-plan/

Response 9-9

See Response 6-14.

There are several factors that support the conclusion that most of the groundwater flow in the underlying hard rock may come from leakage from the Friant Kern Canal. As discussed in Appendix G-5 of the Draft EIR, the groundwater contours show that there is a significant component of flow from the northeast. In addition, groundwater data from offsite wells and Quarry Site wells, and Quarry dewatering data, show that percolation of rainfall on and upgradient of the Quarry Site has a substantially greater effect than flows in the river, indicating that the primary source of recharge is located upgradient away from the river. In addition, the Water Budget presented in Table 11 of Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR shows that over the life of the project, groundwater inflow into the Quarry Site would range from 170 acre-feet per year to 255 acre-feet per year. These inflow rates are equivalent to 0.23 cubic feet per second (cfs) to 0.35 cfs. These values are miniscule compared to the rate of canal flows and to river flows. Since the groundwater contours indicate that much of the groundwater flowing under the Quarry Site area comes from the northeast, the canal is the most likely source.

It should also be noted that the technical analyses presented in the Draft EIR were completed prior to 2025 and the issuance of the 2025 Update to the North Kings GSP. Thus, it would not have been possible to cite information from the 2025 Update in the Draft EIR. That timing notwithstanding, page 3-96 of the 2025 Update to the North Kings GSP states: "The Friant-Kern Canal, found on the eastern edge of the NKGSA, is estimated to leak about 4,400 AF/year with all of the water flowing into NKGSA." As noted in the above paragraph, the estimated groundwater flow in the bedrock units into the Quarry Site area are a very small percentage of both the canal flows and the stated

leakage from the canal. Thus, while most of the canal leakage may occur above other areas of the groundwater subbasin, only minor leakage along the canal in the area upgradient of the project sites is sufficient to provide the flow rates and volumes identified in the groundwater.

Comment 9-10

Page 4.10-104: The text states: "*Additionally, diversion of up to 295 acre-feet per year from the San Joaquin River would cease, making that water available for groundwater recharge through the riverbed or for use in lieu of groundwater within the North Kings GSA management area.*" If the diversion of San Joaquin River water is done under a Holding Contract, that water cannot be used outside of the Holding, so the water would NOT be available for use "in lieu of groundwater within the North Kings GSA management area" outside of the boundaries specified in the Holding Contract.

Response 9-10

The commenter misrepresents Impact 4.10-9's statement that the diverted water may be available for use in lieu of groundwater within the North Kings GSA management area. While the Contracting Owner (CEMEX in this case) would not be selling, attempting to sell or convey any of the water rights obtained under *Holding Contract #15* (*Holding Contract #15*, Section 16, page 210), the water currently used under *Holding Contract #15* would no longer be used, thus, additional water would not be available within the River. However, it must be noted that the *Holding Contract #15* would still allow for "any reasonable beneficial use of the water of the River for irrigation and/or domestic purposes exclusively upon the said land…" (*Holding Contract #15*, Section 12, page 210). Otherwise, Comment 9-10 provides no support that the water currently used from the river conveyance channel cannot later remain in the River for groundwater recharge through the riverbed or use by other uses in lieu of groundwater. The statement in the Draft EIR cited in Comment 9-10 is presented in the context of CEQA and the potential impacts of the proposed project on the environment. The Draft EIR does not evaluate the legal conditions of the Holding Contract or any other water rights. If water is no longer being diverted to the Plant Site for industrial use, that water would remain in the river.

Comment 9-11

Page 4.11-36: Policy HS-C.12 discusses determination of the 200-year water surface elevations and states that "*new project development...shall not be allowed along the river until the risk of flooding at the site has been determined and appropriate flood risk reduction measures identified.*" But the consistency analysis only addresses the 100-year flood. The consistency analysis should be redone.

Response 9-11

In response to comments and in accordance with the Fresno County General Plan (2024), Chang Consultants conducted hydraulic analyses evaluating the 200-year flood event, a more rare and severe flood event, which demonstrate that the 200-year flood would neither enter the Quarry Site nor the Plant Site (see Appendix G-7 and Appendix G-8). Please see Collective Response #17 for a discussion of flooding at the Quarry Site, including evaluation of the 200-year flood. CEMEX recently elevated the berm at the Quarry Site to provide additional flood protection. See also Chapter 3, "Draft EIR Errata," for revisions to Section 4.11, "Land Use and Planning," including an updated consistency analysis with Fresno County General Plan Policy HS-C.12.

Comment 9-12

Page 4.11-37: Policy HS-C.14 states the County shall promote flood control measures that maintain natural conditions within the 200-year floodplain, but there is no mention of the 200-year floodplain in the consistency analysis. Again, the consistency analysis should be redone.

Response 9-12

The Draft EIR properly concluded that Policy HS-C.14 would not be applicable because the project would be located outside of the floodplain and no flood control measures are required (see Draft EIR page 4.11-37).

Comment 9-13

Page 5-13: The text states: "*The proposed project would not affect water from Millerton Reservoir, Friant-Kern Canal, and Tule River; therefore, there would not be potential cumulative impacts of the proposed project and the Friant Ranch Specific Plan project on riparian communities, waters of the state, wetlands, or groundwater dependent ecosystems in the vicinity of the project sites.*" The San Joaquin River is declared to be a "fully appropriated stream system" by the California State Water Resources Control Board. Any increase in water seepage from the San Joaquin River directly impacts the water supply of the water users of the Friant Division, which get water from the San Joaquin River, the Friant-Kern Canal, and from Millerton Reservoir. The text and impact analyses should be revised.

Response 9-13

Please see Collective Response #25 pertaining to the proposed project's relationship and potential effects associated with surface water and groundwater interconnectivity.

Comment 9-14

On March 7, 2025, Reclamation also provided comments on the subject EIR, which FWA concurs with and are incorporated here by reference. Thank you for the opportunity to comment.

Response 9-14

The commenter's concurrence and incorporation by reference of the U.S. Bureau of Reclamation (USBR) March 7, 2025, comments is noted. USBR's March 7, 2025, comments are designated as Comment Letter 6 in this Final EIR. Please see responses to Comment Letter #6 for responses to USBR's comments. Those responses are incorporated herein reference.

Letter #10 March 10, 2025, Kassey Chauhan, North Kings Groundwater Sustainability Agency

Comment 10-1

On behalf of the North Kings Groundwater Sustainability Agency (North Kings GSA), the following comments are provided in response to the draft environmental impact report (DEIR) for the CEMEX Rockfield Quarry Modification Project (Project). The Project, both the Plant Site and the Quarry Site, are located within the North Kings GSA as indicated in the DEIR. As such, the scope of the comments provided is limited to potential concerns for water quality, water quantity and ability to reach groundwater sustainability, recharge and potential impacts, and interconnected surface water from the San Joaquin River (SJR) and the groundwater. Specifically, the DEIR should be modified to address the following:

Response 10-1

The scope and concerns raised in the North Kings Groundwater Sustainability Agency (North Kings GSA) comments are noted. Please see below for responses to specific comments.

Comment 10-2

1. The DEIR evaluates several alternatives including one alternative (Alternative 4) that reduces the mining depth and the setbacks from the SJR from current 200-foot setback by another 100-feet creating a 300-foot setback from the SJR. One of the current efforts being undertaken by the North Kings GSA along with Madera County GSA, United States Bureau of Reclamation (USBR), Friant Water Authority (FWA) and the McMullin Area GSA is an investigation related to interconnected surface water in Reaches 1 and 2 of the SJR.

> This evaluation and setting of management criteria is required by the Sustainable Groundwater Management Act of 2014 (SGMA) and is in its infancy. Data is being collected to evaluate the interconnectivity and it is unknown whether 300 feet is adequate to address interconnectivity between the SJR and the groundwater at the Quarry Site. The DEIR must consider an investigation that establishes the adequate setback distance needed to address interconnectivity between the SJR and the groundwater at the Quarry Site.

Response 10-2

See Collective Response #25.

One of the California Department of Water Resources criteria for interconnected surface water is the presence of similar trends in groundwater levels and stream stage. Charts comparing groundwater levels with rainfall and the stage of the San Joaquin River are provided in Section 4.10.1.9, "Groundwater-Surface Water Interaction at the Quarry Site," of the Draft EIR and within Appendix G-5, "Hydrology and Water Quality Analysis Report," of the Draft EIR. For example, Figure 16 within Appendix G-5 shows that water levels in ponds at the Beck Ranch property, just north of the Quarry Site, respond very quickly to major rainfall events, but do not have any correlation to changes in the river stage. The ponds on the Beck Ranch property are former mining excavations while the water surface within the ponds is a reflection of the local groundwater surface.

Figure 4.10-11, "Comparison of Groundwater Levels to Daily Rainfall and River Stage," of the Draft EIR (which is a reproduction of Figures 14 and 15 from Appendix G-5 of the Draft EIR) shows a similar comparison for rainfall and river stage, respectively, and the groundwater levels measured in Quarry Site wells. These figures, and the related analysis within the Draft EIR, demonstrate that increases in groundwater levels occur primarily in response to significant rainfall events and not to increases in river stage.

Thus, the lack of similar trends between groundwater levels and stream stage indicate that the groundwater within the weathered rock and hard rock units (which is below the defined bottom of the North Kings groundwater subbasin) is not interconnected with the surface water in the San Joaquin River.

Comment 10-3

> Additionally, there are several monitoring wells identified at both the Quarry Site and the Plant Site that provide valuable information. CEMEX should ensure the data is shared with Fresno County and the North Kings GSA to be able to monitor potential impacts from the operations and

interconnectivity between the SJR and the groundwater in the Project area.

Response 10-3

See Collective Response #24 regarding groundwater monitoring during project implementation. Draft EIR Section 4.10.1.9 discusses Groundwater-Surface Water Interaction at the Quarry Site. There is some hydraulic connectivity between the San Joaquin River and Quarry Site; however, water from the San Joaquin River is not currently a substantial source of groundwater inflow into excavations within the Quarry Site (Draft EIR page 4.10-56). The potential for the proposed project to impede sustainable management of the groundwater basin is analyzed in the Draft EIR in Impacts 4.10-9, 4.10-11, and 4.10-13 and determined to be less than significant with the implementation of mitigation measures.

In accordance with Mitigation Measures 4.10-5a, 4.10-5b, 4.10-10a and 4.10-10b, the project's potential effects to surrounding groundwater would be monitored throughout the life of the operations through the implementation of a groundwater adaptive management program. This program would require the preparation of mitigation monitoring reports to be submitted to Fresno County annually (Draft EIR page 4.10-108). The groundwater monitoring information contained in the annual reports would be shared with the County and could be made available to the North Kings GSA upon request.

Comment 10-4

2. The DEIR discusses the overdraft conditions in the Kings Subbasin as presented in the original groundwater sustainability plan (GSP) submitted for the North Kings GSA. The California Department of Water Resources approved the GSP with corrective actions needing to be addressed prior to the resubmittal of the revised GSP and periodic evaluation in January 2025. As such, the North Kings GSA GSP has been revised to address the corrective actions. The base period used in the past, present and future water budgets has been updated to capture more recent years including the most recent drought periods of 2012 to 2016 and 2020 to 2022. The revised GSP and periodic evaluation are available on the North Kings GSA websites at www.northkingsgsa.org and the DEIR should be updated to reflect the most current information related to reaching sustainability in the North Kings GSA.

Response 10-4

See Response 65-25 and 65-38 regarding the project's consistency with the North Kings GSP.

Comment 10-5

3. The joint powers authority (JPA) agreement stipulates that each agency in the North Kings GSA is responsible for mitigating for their portion of the total overdraft within the North Kings GSA boundary. As such, Fresno County is responsible for mitigating for the overdraft conditions in the Fresno County white areas (those with no surface water access). The mitigation target for Fresno County across all the white areas is estimated to be between 1000 acre-feet and 3,000 acre-feet average annual. While the Project indicated it has minimal groundwater demand, an analysis of existing and future with project conditions should be completed. These two conditions should be presented side by side to allow for a straight-forward comparison. The analysis should include all sources of water including precipitation, surface water, groundwater, recharge for the current condition and compare that to the future conditions at various phases with the Project. While the total groundwater demand for the Project appears to be minimal according to the numbers cited in Section 4.10, the County and the North Kings GSA need assurances that the project will not result in additional overdraft in the North Kings GSA Any use or loss of water above allowable amounts will need to be mitigated and a plan presented on how that will occur.

Response 10-5

The project's potential impacts to groundwater supply are addressed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. Groundwater conditions at the Plant and Quarry sites are presented in Appendix G-3, "Groundwater Conditions at the Plant Site," and Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR. The Draft EIR provides a summary of the existing groundwater conditions at the Plant Site and Quarry Site on pages 4.10-33 through 4.10-42. See also Draft EIR Appendix G-5, "Hydrology and Water Quality Analysis Report," and Appendix G-6, "Addendum to: Revised Hydrology and Water Quality Analysis Report."

The Draft EIR provides that the North Kings Groundwater Sustainability Agency's groundwater management area is not experiencing critical overdraft conditions and that the Quarry Site and Plant Site would:

(a) Not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project would impede sustainable groundwater management of the basin, and

(b) Not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management

(see Draft EIR, Appendix G-5, Section 2.2.1, pages 10 through 12 and Section 5.0, pages 55 through 57).

Further, Impact 4.10-11 determined that the project would not substantially decrease groundwater supplies during mining operations and after completion of reclamation at the Quarry Site, and thus the project would not impede sustainable groundwater management of the Basin (Draft EIR, page 4.10-112 through 4.10-113). In addition, Impact 4.10-13 analyzed and determined that the Plant Site and Quarry Site would not impede sustainable groundwater management of the Basin, nor substantially interfere with groundwater recharge (Draft EIR, page 4.10-114 through 4.10-115). See also Responses 65-38, 6-109, and Collective Response #25.

Comment 10-6

4. The DEIR indicates that the Project relies on riparian water rights for industrial uses at the Plant Site and no surface water rights at the Quarry Site. The DEIR should better document the riparian rights at the Plant Site and address other sources of water for the Quarry Site to demonstrate there is no net demand on the groundwater aquifer to support the Project activities.

Response 10-6

The Draft EIR includes sufficient discussion of the water rights at the Plant Site, which is briefly discussed here. The Applicant has riparian water rights to use river water for industrial purposes in connection with the processing of rock, sand and gravel at the Plant Site (Draft EIR 4.10-8). Water from the San Joaquin River (SJR) is delivered to the Plant Site through a river water delivery ditch that terminates at the Plant Site. After the aggregate is processed, water from the silt ponds is recycled onsite and used for additional aggregate processing, cleaning, and dust control. The Plant Site also has two groundwater production wells to provide water for the ready-mix concrete plant and water for domestic uses.

With regard to the water sources available at the Quarry Site, the project water sources as summarized below are well documented throughout Section 4.10 of the Draft EIR. There is a permanent pond located in the northeastern portion of the Quarry Site that is

used for groundwater recharge and several additional temporary ponds that have formed over the years during project operations. These temporary ponds mainly contain surface runoff from rainfall and/or groundwater and this water is pumped and used for operational activities (see Figure 4.10-3, "Plant Site Existing and Proposed Water Flow Diagram," and Figure 4.10-5, "Quarry Site Existing and Proposed Water Flow Diagram").

Under current conditions at the Quarry Site, as assessed in the Draft EIR from the Operator's pumping record data, there was a total of 330 acre-feet pumped from the existing Quarry Site from 2018-2019. 95 percent of the water pumped from the mining excavation was sent to recharge trenches along the west side of the quarry and the SJR and the remaining five percent was used for dust control and discharged into the permanent pond to support groundwater recharge.

As noted in the Draft EIR (see Impact 4.10-11), while consumption of groundwater at the Quarry Site is estimated to increase by approximately 145 acre-feet per year, this increase in dewatering is several orders of magnitude smaller than the natural fluctuations in water balance of the North Kings GSA area. Furthermore, the North Kings GSA area GSP defines the vertical extent of the eastern one-quarter of the North Kings GSA aquifer system, where the Plant Site and Quarry Site are located, as the top of the plutonic bedrock. The top of the hard rock unit at the Quarry Site is the top of plutonic bedrock. Therefore, the hard rock unit and the groundwater within it are not a part of the North Kings GSA area groundwater basin and are not addressed by the Groundwater Sustainability Plan. As a result, the use of groundwater at the Quarry Site would not have the potential to substantially impede the sustainable groundwater management of the North Kings subbasin.

Similarly, while the Draft EIR noted that after the completion of mining and reclamation, the net consumption of groundwater at the Plant Site would increase by approximately 110 acre-feet per year relative to existing conditions (i.e., 440 acre-feet after reclamation minus 330 acre-feet existing), the North Kings GSA is not experiencing critical overdraft conditions, and this increase in groundwater consumption is also several orders of magnitude smaller than the fluctuations in the water balance of the North Kings GSA. Therefore, groundwater consumption at the Plant Site would also not have the potential to substantially decrease groundwater supplies such that the reclaimed condition of the Plant Site would impede the sustainable groundwater management of the North Kings subbasin.

Comment 10-7

5. The North Kings GSA has an obligation to address water quality concerns caused by increased pumping and groundwater level declines per SGMA. The DEIR, Section 4.10) addresses existing water quality conditions at the Plant Site and Quarry Sites. There are some constituents of concern as identified on Tables 4.10.5 and 4.10.6 which are in exceedance of existing primary and secondary drinking water standards. With the number of wells located near the Plant Site and Quarry Site, the DEIR must identify how future water contamination issues at these locations will be addressed due to the potential for the water stored in the on-site ponds migrating beyond the project site causing impacts to neighboring wells.

Response 10-7

The existing groundwater conditions at the project sites were within compliance of groundwater standards with the exception of manganese, iron, nitrate, conductivity, and gross alpha activity (Draft EIR page 4.10-93 through 4.10-94). These elevated constituents are representative of baseline conditions, that do not indicate past or future effects from the proposed project. However, these elevated constituents are further addressed below.

With the exception of the Basin Plan limit for conductivity, specifically for discharge to the San Joaquin River, which does not occur in this case, and two pH measurements, likely due to uptake of carbon dioxide and release of oxygen by aquatic plant growth in the pond, the surface water in the ponds at the Quarry Site meets applicable water quality standards.

As mentioned on the Draft EIR pages 4.10-98 to 4.10-99, the elevated nitrates are a regional issue that is being addressed by the RWQCB through the SNMP. The exceedances of manganese in some wells only exceed the Basin Plan standards, which do not apply here, and secondary Maximum Contaminant Level (MCL) standards, which are in place to avoid undesirable tastes, odors, staining, or scaling but do not pose a threat to human health. Manganese is a naturally occurring mineral component within the geologic materials at the Quarry Site. Finally, the gross alpha activity concentrations found at well MW-2M appear to be an outlier as it differs significantly from the other samples collected at the Quarry Site and may not be representative of the site conditions. The concentrations of nitrate, manganese, and gross alpha activity are not associated with the mining operations and are a part of baseline groundwater conditions.

Under CEQA, mitigation is only required for potentially significant impacts caused by the project. No significant impacts were identified with respect to the degradation of

water quality standards at the Quarry Site. Please also see Response 65-28 regarding groundwater quality at the Quarry Site.

The proposed project includes a water quality mitigation measure for the Plant Site (Mitigation Measures 4.10-5a and 4.10-5b), which would reduce the potential impacts of groundwater degradation to less than significant.

Mitigation Measure 4.10-5a is in place and to be implemented as an adaptive management strategy to assess whether the project would cause a violation of water quality standards for iron and manganese in the reclaimed Plant Site pond within the former mining excavation, and actions to take if an impact is verified. The monitoring would begin once mining is completed and water starts filling the excavation, with measurements taken every six months. If iron or manganese levels exceed regulatory limits during two consecutive monitoring periods, further lab testing and seasonal assessment would follow. Persistent exceedances would trigger mitigation measures, such as aeration, vegetation control, or other methods to reduce iron and manganese concentrations. Monitoring would continue for five years without exceedances. Annual reports would be submitted to the County, detailing monitoring results and any corrective actions taken. See also, Collective Response #24.

Comment 10-8

6. Upon Project Completion, the site will be used for habitat and other water recreation activities as there will be a massive hole (up to 600 feet deep) that will be allowed to fill with water. The water budget analysis requested above in Comment No. 4 must address the losses that will occur from evaporation and mitigation measures must be implemented.

Response 10-8

A water budget for the Plant Site is provided in Appendix G-3, "Groundwater Conditions at the Plant Site," of the Draft EIR. Appendix G-3 of the Draft EIR addresses the amount of evaporation that is projected to occur at the Plant Site as a result of the former pit once it becomes a lake. Specifically, page 46 of Appendix G-3 says that "[the lake] would consume 401 acre-feet per year (400 rounded) of groundwater due to evaporation." A water budget for the Quarry Site is presented in Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR. Appendix G-4 of the Draft EIR addresses the amount of evaporation that is projected to occur at the Quarry Site as a result of the lake that would form at the former Quarry Site. Specifically, pages 103 through 104 of Appendix G-4 say that "the evaporation would be 890 acre-feet per year."

Comment 10-9

7. The North Kings GSA requests that monitor well data collected on the site be made available to the North Kings GSA, and a data sharing agreement be entered into to allow that to occur. North Kings GSA will request in the data sharing agreement that any monitor wells remain in place even after decommissioning of the Plant Site or Quarry Site to allow for continued monitoring for water levels and water quality.

Response 10-9

See Collective Response #24 regarding groundwater monitoring during project implementation as well as Response 10-3 above. In accordance with Mitigation Measures 4.10-5a, 4.10-5b, 4.10-10a and 4.10-10b, the project's potential effects to surrounding groundwater would be monitored throughout the life of the operations through the implementation of a groundwater adaptive management program. Mitigation Measures 4.10-5a and 4.10-10a would require annual submission of mitigation monitoring reports to Fresno County, and this information could be shared with the North Kings GSA at the discretion of the County.

Letter #11 March 10, 2025, Kari Kyler Daniska, San Joaquin River Conservancy

Comment 11-1

The San Joaquin River Conservancy (Conservancy) received a Notice of Availability of a Draft Environmental Impact Report (DEIR) from the County of Fresno Department of Public Works and Planning for the Cemex Rockfield Modification Project (Project) pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines[1] (*Footnote 1: CEQA is codified in the California Public Resources Code in section 2100 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.*)

We appreciate the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect the implementation of the Conservancy's mission and updated San Joaquin River Master Plan (Parkway Master Plan).

San Joaquin River Conservancy Background

The San Joaquin River Conservancy is an agency of the State of California created by the Legislature to create the San Joaquin River Parkway by: acquiring 5,900 acres from willing sellers for Parkway purposes; enhancing and restoring riparian, floodplain, and other habitats, and conserving natural and cultural resources on its lands; and developing and managing its lands for public

recreational and educational uses compatible with resource protection. The Conservancy also assists other entities in conserving and improving their lands for the Parkway. The Conservancy works to facilitate the development of the Parkway, cultivate public support, and secure its future.

The Conservancy Governing Board adopted the Parkway Master Plan and certified its programmatic Environmental Impact Report in 1997 and updated the document in 2018. The updated Parkway Master Plan provides goals, objectives, and design standards for appropriate public recreational uses, trail corridors, habitat restoration, fishing and boating access, etc. on public Parkway lands. Goals, objectives, and policies consistent with the Parkway Master Plan have been adopted in the County of Fresno General Plan.

Response 11-1

The comment is introductory. See Responses 11-3 through 11-36 for discussion of the specific comments made by the San Joaquin River Conservancy.

Comment 11-2

Project Description Summary

As presented in the DEIR, the Project will continue and modify its current aggregate (rock, sand and gravel) mining and processing operations located on two properties (Plant Site and Quarry Site) between North Friant Road and the San Joaquin River, in Fresno County. The current mining and processing operations have been continuous at the two sites for 108 years.

The Project would be implemented in two stages:

Stage 1: continue current operations at both the Quarry Site and the Plant Site for up to 30 years. Upon completion of mining at the Plant Site, operations at the Plant Site would cease and the site would be reclaimed as 138.5 acres of open space, riparian, and open water wildlife habitat. At this time, operations at the Quarry Site would then be modified, upon approval of the Modification project permit, to include hard rock (granite) excavation (drilling and blasting).

Upon approval of the project, the combined annual sales of aggregate from both sites are estimated to increase from the 1.4 MT/year allowed under the current permits to 2.0 MT/year within approximately five years of project approval and up to 3.0 MT/year within approximately 10 years of project approval.

Stage 2: continue hard rock mining and processing operations only at the Quarry Site for approximately 70 more years. Upon completion of mining at the Quarry Site, operations at the Quarry Site would cease and the site would be reclaimed as 352.4 acres of open space, riparian, and open water wildlife habitat.

Stage 2 operations are estimated to have annual aggregate sales of 3.0 MT/year.

The total Project life of the combined Stages (1&2) is estimated to be up to 100 years.

Response 11-2

The comment is introductory. See Responses 11-3 through 11-36 for discussion of the specific comments made by the San Joaquin River Conservancy.

Comment 11-3

Comments and Recommendations

As presented in the DEIR, the Project appears to be consistent with several of the goals and policies included within the Parkway Master Plan. For example, the Parkway Master Plan encourages recreational fishing at off-stream excavated ponds (from gravel mining) and specifically supports the development of a multi-use Parkway trail, secondary trails, and a trail system on Parkway properties for a connected recreational system and connect open spaces, provide loop routes and nature trails, provide river access, and secondary trails to link to adjacent bikeways. However, the Project proposes a new activity, hard rock (granite) excavation (drilling and blasting) within the Parkway that was never previously evaluated by the Parkway Master Plan. Therefore, as sand and gravel mining operations were the only mining activity evaluated, hard rock excavation may be an incompatible activity and conflict with existing or planned Parkway land uses near the Project.

Response 11-3

Please see Response 58-5, which explains that hard rock quarries can be surface mined, as would be the case for the proposed project. Drilling and blasting would constitute a small fraction of the overall mineral extraction activities that would occur if the project is approved. Because the proposed project is a surface mining operation that would maintain its existing footprint and setbacks from the San Joaquin River, and is consistent with the applicable policies and objectives presented in the Parkway Master Plan, it

would be a compatible activity and would be consistent with the land uses near the project.

Comment 11-4

In accordance with the goals and policies of the Parkway Master Plan, the Conservancy offers the comments and recommendations below to assist the County of Fresno in the appropriate application of Parkway policies and identification and/or mitigation of the Project's significant, or potentially significant, direct and indirect impacts within the San Joaquin River Parkway. Editorial comments or other suggestions may also be included to improve the accuracy and consistency of the DEIR.

Response 11-4

Comment 11-4 is introductory. See Responses 11-5 through 11-36 for discussion of the specific comments made by the San Joaquin River Conservancy.

Comment 11-5

General Comments

The DEIR does not identify the State Lands Commission as a State Agency with jurisdiction over sovereign lands adjacent to the San Joaquin River or describe any current or potential lease for mining operations.

Response 11-5

As noted in various other comments, the Quarry Site is set back by 200 feet from the San Joaquin River (SJR) at the Quarry Site and 0.6 miles from the Plant Site. The western boundary of the Quarry Site, the closest area to the SJR, is specifically required to maintain a 200-foot setback from the San Joaquin River, and thus does not encroach on areas with potential State Lands Commission (SLC) jurisdiction. Further, as the Operator does not intend to mine in areas of SLC jurisdiction, no lease is required from the SLC.

Comment 11-6

Project Description

During the Conservancy's review of the submitted materials, it was noticed that the project description/operational statement and the project description within the DEIR contain conflicting information. Specifically, it was noted that the project description/operational statement identifies that Stage 1 will reclaim 122 acres of open space, riparian and open water wildlife habitat and Stage 2 would create approximately 349 acres of open

space, riparian and open water wildlife habitat. However, in the project description of the DEIR, Stage 1 is identified as reclaiming 138.5 acres of open space, riparian, and open water wildlife habitat with Stage 2 creating 352.4 acres of open space, riparian, and open water wildlife habitat.

Response 11-6

The Plant Site consists of 138.5 acres, which would be reclaimed upon the completion of mining. To the extent that the Draft EIR and the Project/Operational Statement (attached as Draft EIR Appendix B-2, "Project Description/Operational Statement") differ with regard to the acreage of the Plant Site, the total acreage analyzed for the purposes of the Draft EIR value is 138.5 acres. To the extent that the Draft EIR and the Project Description/Operational Statement differ with regard to the acreage of the Quarry Site, the total acreage analyzed for the purposes of the Draft EIR is 352.4 acres. Draft EIR Appendix B-2, page 1-16, accurately details the total acreage of the Plant and Quarry sites as 138.5 and 352.4, respectively. Draft EIR, Chapter 2, "Project Description," also accurately provides the total acreage of the Plant and Quarry sites as 138.5 and 352.4, respectively. See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR to correct the stated Plant Site acreages in four locations in the document.

Comment 11-7

In Section 2.4.2.2 Quarry Site Existing Conditions, under the Screening, Parking, Lighting and Fencing sub-section, it is mentioned that there is perimeter fencing surrounding the Quarry Site and does not mention fencing at the Conservancy owned property known as Beck Ranch. Presence or absence of fencing should be identified.

Response 11-7

The property line between Lost Lake Park and the Quarry Site is currently fenced with six-foot high chain-link fencing (Draft EIR page 2-21, 4.15-2). There is currently no fencing along the northern border of the Quarry Site along the SJRC/Beck Ranch property boundary.

Comment 11-8

In Section 2.5.2.2 Quarry Site Mine Plans, under the Screening, Parking, Lighting and Fencing sub-section, it is mentioned that the remainder of the north property line would be fenced with minimum four-foot high, ranch fencing consisting of metal T-posts and at least three strands of barbed wire. The Conservancy owns Beck Ranch, which is adjacent to the north property line and is managed as a conservation area. For fencing the boundary between

the north property line and Beck Ranch, 5-strand barbed wire with a wildlife friendly, smooth top and bottom wire is preferred and recommended.

Response 11-8

The SJRC's suggestion to fence the northern boundary of the Quarry Site adjacent to the SJRC-owned Beck Ranch property with 5-strand barbed wire with a wildlife friendly, smooth top and bottom wire is noted.

Comment 11-9

In Section 2.5.8 Trail Easements, it is mentioned that the applicant is in discussions with the Conservancy's Executive Officer towards providing potential easements at the Plant Site and Quarry Site. This statement is misleading. It would be more appropriate to say that discussions are being reinitiated, as there has been no recent communication on proposed easements, until March 6, 2025, after the DEIR was released.

Response 11-9

The SJRC's clarification regarding the discussions pertaining to easement dedications is noted.

Comment 11-10

4.1 Aesthetics and Visual Resources

The DEIR provides a substantial amount of information on impacts to aesthetics and visual resources; however, the DEIR does not adequately address the effects of the Project on adjacent, Conservancy owned properties. Therefore, it appears that the Project is inconsistent with the Parkway Master Plan goals and policies by omitting analysis for Conservancy owned properties and/or negatively impacting quality scenery, aesthetics, and viewsheds.

In Section 4.1.1.4 Identification of Potentially Sensitive Viewpoints, under the Public Parks/Recreation Facilities sub-section, there is no mention of the Conservancy's owned property, known as Ball Ranch, which is adjacent to the Plant Site. Ball Ranch is open to the public 7-days a week for recreation and public access.

Response 11-10

The commenter is incorrect; the Draft EIR identifies a potentially sensitive viewpoint from within the Ball Ranch property. Please refer to Table 4.1-2, "Summary of Potentially Sensitive Viewpoint Locations," on pages 4.1-15 through 4.1-16 of the Draft EIR. Viewpoint #8 is located within the Ball Ranch area 250-ft northwest of the Plant Site. Draft EIR Figure 4.1-9, "Plant Site Public Viewpoint—Location #8," depicts the existing/baseline view, Stage 1 and Stage 2 operation views, and the reclaimed site view from Viewpoint #8 (Draft EIR page 4.1-35). Viewpoint #6 is located directly adjacent to the Ball Ranch area along North Friant Road. Draft EIR Figure 4.1-7, "Plant Site Public Viewpoint—Location #6," depicts the depicts the existing/baseline view, Stage 1 and Stage 2 operation views, and the reclaimed site view from Viewpoint #6. The Draft EIR concluded that the project would not significantly impact the views from these selected locations, and would have a beneficial impact to both viewpoints upon the completion of reclamation of the Plant Site (Draft EIR page 4.1-53).

Draft EIR Section 4.1.1.4, "Identification of Potentially Sensitive Viewpoints," subsection "Public Parks/Recreational Facilities," is revised in this Final EIR through errata presented in Final EIR Chapter 3, "Draft EIR Errata," to clarify that the Ball Ranch property was included as a potentially sensitive viewpoint.

See also Collective Response #19 regarding the updated information pertaining to recreational facilities adjacent to the project sites.

Comment 11-11

Table 4.1-2, Summary of Potentially Sensitive Viewpoint Locations, does not include the Conservancy owned property, known as Beck Ranch, which is a viewpoint located adjacent to Lost Lake Regional Park, north/northwest of the Quarry Site. The table also provides inaccurate information on both Ball Ranch and Ledger Island, stating that they are not currently accessible to the public. Both Conservancy owned properties have been open to the public 7-days a week for recreation and public access.

Response 11-11

The viewpoints analyzed within the EIR were chosen to be representative of the various public viewpoints surrounding the project sites, based on those areas that were publicly accessible at the time the photos were collected circa 2018. During their 2018 field photo survey, Sespe collected photos from locations adjacent to Beck Ranch; however, it was determined that the nearby photos taken from Lost Lake Park (see photo Location #2) and North Friant Road (see photo Locations #4 and #10) were more conservatively representative of potential views of the Quarry Site from the north. Therefore, the

simulations and analysis from these nearby viewpoints (Lake Park and North Friant Road) are conservatively representative of the project's potential visual impacts from Beck Ranch.

Although Ball Ranch and Ledger Island are publicly accessible today, these properties were not yet open to the public in 2018 when the field photo survey was conducted (press releases indicated that these areas opened to the public in 2021). The table notes at the end of Table 4.1-2 have been revised through errata in this Final EIR to note that these areas "were not accessible to the public at the time the field photo survey was completed." See Final EIR Chapter 3, "Draft EIR Errata."

Comment 11-12

Table 4.1-3, U.S. Bureau of Land Management Visual Project Impact Ratings at Nearby Viewpoints, does not include the Conservancy owned property, known as Beck Ranch, which is a viewpoint located adjacent to Lost Lake Regional Park, north/northwest of the Quarry Site. Beck Ranch is also omitted in the following discussion and analysis.

Response 11-12

Please see Response 11-11, above.

Comment 11-13

To minimize impacts to adjacent, Conservancy owned properties, the Conservancy recommends the following avoidance and minimization measures:

- Revegetation, habitat enhancement, and amenity plantings should be implemented in such away to screen views between the Project and surrounding land uses.

The Conservancy requests that the County of Fresno requires the applicant to implement the above recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

Response 11-13

The commenter's request for revegetation, habitat enhancement, and amenity plantings is noted. The Plant Site has landscape screening along North Friant Road, consistent with existing CUP conditions. This screening would remain for the duration of the proposed project (Draft EIR page 2-35). The Quarry Site would add landscape screening consistent with these standards. The Draft EIR provides the following with regard to proposed screening and fencing at the Quarry Site:

> Under the proposed project, the remainder of the north property line would be fenced with minimum four-foot—high, ranch fencing consisting of metal T-posts and at least three strands of barbed wire. Additionally, the existing berm along the north Friant Road would be landscaped with trees that will grow at least 15 feet high in two staggered rows, with one row on top of the berm. Irrigation would be provided. An architecturally designed gate would be added at the site entrance when the landscaping is added to the existing berm along North Friant Road.

Comment 11-14

The Conservancy supports and encourages the conservation of habitat on private lands and recommends planting native vegetation on pond berms and controlling/removing non-native/invasive plant species from the Project as a feasible mitigation measure.

Response 11-14

The comment is noted for the decision-makers.

Comment 11-15

The Conservancy supports and encourages minimizing lighting associated with Parkway development and encourages land use policies that minimize light impacts in the floodplain. Apart from safety, preclude lighting in the vicinity of the wildlife corridor or a natural reserve, to the greatest extent possible.

Response 11-15

The comment is noted for the decision-makers. The new lighting proposed would occur at the Quarry Site would confine illumination to the Quarry Site and/or areas that do not include light-sensitive uses (Draft EIR page 2-41).

Comment 11-16

4.3 Air Quality and 4.8 Greenhouse Gas Emissions

The DEIR provides a substantial amount of information on impacts to air quality; however, the DEIR does not adequately address the effects of the Project on adjacent Conservancy owned properties.

As stated in the DEIR, the Project can provide a potential source of odor due to the hydrocarbons that are emitted from asphaltic concrete at elevated temperatures. The Conservancy owned properties known as Ball Ranch, Ledger Island and Beck Ranch were not considered as potential model receptor locations. Significant

odor impact could occur at the adjacent, Conservancy owned properties and additional analysis should be undertaken to determine the extent of the impacts and appropriate mitigation measures. It appears that the Project is inconsistent with the Parkway Master Plan goals and policies by omitting analysis for Conservancy owned properties and/or negatively impacting regional air quality and greenhouse gas emissions.

Response 11-16

Air modeling included estimating impacts at the fence line of the proposed project facilities; the modeled emissions (including criteria air pollutants, and health risks) at the fence line receptors represent the worst-case air impacts from the proposed project. Potential impacts at the adjacent Conservancy owned properties would be less than those potential air impacts reported in the Draft EIR as updated in the Final EIR for the fence line receptors. Because the proposed project air impacts were each less than the significance thresholds for the fence line receptors, the potential impacts at the Conservancy owned properties known as Ball Ranch, Ledger Island and Beck Ranch, which are further from the proposed project's modeled fence line receptors, would be less than significant.

The odor analysis in the Draft EIR as updated in the Final EIR closely followed SJVAPCD's "Guidance to Conduct Detailed Analysis for Assessing Odor Impacts to Sensitive Receptors" in its Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI) (SJVAPCD, 2016). The significance of odor impact was determined based on empirical evidence that the former asphalt plant, which operated until 2009, did not receive complaints from residences or the Conservancy. Moreover, the prior asphalt plant lacked blue smoke control technology whereas the proposed asphalt plant would have these controls as required by Mitigation Measure 4.3-4 (see Appendix D-4, "Revised Section 4.3, Air Quality"), and therefore emit less odorous compounds.

In response to air comments on the Draft EIR, the technical analysis was reviewed, and the analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient.

The commenter does not provide the basis for the statement that the project is inconsistent with the goals of the Parkway Master Plan, particularly given that the potential impacts were analyzed for all fence line receptors.

Comment 11-17

The Conservancy supports and encourages the applicant to use alternative fueled construction equipment, minimize idling time, and required that equipment is properly maintained and tuned to prevent or minimize impacts to air quality and reduce greenhouse gas emissions.

Response 11-17

The comment is noted. The commenter's suggestions are also compliance goals and policies of the SJVAPCD.

Comment 11-18

4.4 Biological Resources

The Conservancy supports and encourages coordination with federal and State environmental regulatory and permitting agencies, including, but not limited to, the California Department of Fish and Wildlife, the California Department of Water Resources, and the Regional Water Quality Control Board to develop adequate avoidance and minimization measures to impacts on biological resources within the Projects area of impact.

To minimize impacts to adjacent, Conservancy owned properties, the Conservancy recommends implementation of the following buffers:

- Provide native vegetation for screening wildlife from human activity as necessary to accommodate less width for a buffer zone.

- Provide a 700-foot buffer between any Parkway improvement and sensitive habitat. (Sensitive habitat includes areas of special biological significance that provide habitat for locally unique biotic species/communities; that are adjacent to essential habitats of rare, endangered or threatened species; or any natural community vulnerable to environmental effects of projects).

- Avoid more intensive recreational or other uses within 1500 feet of rookeries where feasible.

- From the river wildlife corridor, encourage 100-foot buffers from agriculture/pasture; 150-foot buffers from rural residences (less than .05 unit per acre); 300-foot buffers from medium density rural residences (.05 units per acre to less than 1 unit per acre); 600-foot buffers from business/industry or urban density development (more than 1

unit per acre); and 700-foot buffers for any development from sensitive habitat.

Response 11-18

The buffers recommended in the comment are noted. Please see Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan," for further discussion of the setbacks that are currently required under existing CUPs and which would remain the same for the proposed project (Draft EIR Appendix B-1 pages 27 and 28). A 700-foot buffer or setback from SJRC "[improvements] and sensitive habitat" would not be feasible given the plan to continue mining operations within the existing footprints of the Plant and Quarry sites.

Comment 11-19

To minimize impacts to adjacent, Conservancy owned properties, the Conservancy recommends the following avoidance and minimization measures:

- Avoid, minimize, and ensure pollution prevention and compliance in the use of herbicides.
- Incorporate construction best management practices for stormwater quality management, including erosion and sedimentation controls and spill prevention and control, into all applicable permits and as part of Project implementation.
- Properly maintain stormwater quality management post-construction controls.

The Conservancy requests that the County of Fresno requires the applicant to implement the above buffers and recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

Response 11-19

The Applicant/Operator would be required obtain an Industrial General Permit, which requires the preparation and implementation of a site-specific stormwater pollution prevention plan (SWPPP) (Draft EIR page 4.9-18). One of the purposes of the Industrial SWPPP is to develop best management practices to reduce or prevent storm water pollutants associated with industrial activities (Draft EIR page 4.10-68). Please see the discussion of Impact 4.10-1 of the Draft EIR, which discusses the project's compliance with applicable local, state, and federal water quality and hazardous materials management requirements (Draft EIR page 4.10-89).

Comment 11-20

4.5 Cultural and 4.18 Tribal Resources

The Conservancy supports and encourages the protection of cultural resources within the Project impact area and recommends additional tribal consultation or outreach prior to completion of the Final EIR based on the known and likely cultural and archaeological resources, including human remains.

The Conservancy recommends the following best management practices:

- If any cultural resources, such as structural features, unusual amounts of bone or shell, flaked orground stone artifacts, historic-era artifacts, human remains, or architectural remains areencountered during any project construction activities, work shall be suspended immediately at the location of the find and within an appropriate radius of at least 50 feet. A qualified archaeologist shall conduct a field investigation of the specific site and recommend mitigation necessary for the protection or recovery of any cultural resource concluded by the archaeologist to represent a historical resource or unique archaeological resource.

Response 11-20

The commenter's suggestions are already reflected in the existing mitigation measures. See discussion of Draft EIR Impact 4.5-2. Mitigation Measure 4.5-2, provides, in part, that if "prehistoric or historic-era cultural resources are encountered during project activities, all ground-disturbing activities within 50 feet of the find shall cease. The qualified archaeologist shall evaluate the significance of the resources and recommend appropriate treatment measures." See also discussion of Draft EIR Impact 4.5-3. Mitigation Measure 4.5-3, provides, in part, that "if human remains are uncovered during project activities, the project Operator shall immediately halt work within 50 feet of the find, contact the Fresno County Coroner to evaluate the remains, and follow the procedures and protocols set forth in CEQA Guidelines Section 15064.4 (e)(1)" (Draft EIR page 4.5-32). Mitigation Measures 4.5-2 and 4.5-3 are sufficient to reduce potential impacts to archaeological and cultural resources to less than significant.

Comment 11-21

- If human remains are accidentally discovered during the proposed Project's constructionactivities, the requirements of California Health and Human Safety Code section 7050.5 must befollowed. Potentially damaging excavation must halt in

the area of the remains, with a minimumradius of 50 feet, and the local County Coroner must be notified. The Coroner is required toexamine all discoveries of human remains within 48 hours of receiving notice of a discovery onprivate or state lands (Health and Safety Code section 7050.50(b).) If the Coroner determinesthat the remains are those of a Native American, he or she must contact the Native AmericanHeritage Commission (NAHC) by phone within 24 hours of making that determination (Healthand Safety Code section 7050 (c)). Pursuant to the provisions of the PRC section 5097.98, theNAHC shall identify a Most Likely Descendant (MLD). The MLD designated by the NAHC shallhave at least 48 hours to inspect the site and propose treatment and disposition of the remainsand any associated grave goods.

Response 11-21

Draft EIR Mitigation Measure 4.5-3 incorporates the requirements stated in Comment 11-21.

Comment 11-22

4.9 Hazards and Hazardous Materials and 4.20 Wildfire

To minimize the risk of loss of life, injury, and damage to property and natural resources resulting from fire hazards, the Conservancy recommends the following avoidance and minimization measures:

- Perform fire prevention measures including thinning or mowing, reducing ladder fuels, and weed abatement on property boundaries, access roads, and around parking areas and/or structures.

- Provide 600-foot buffers between business/industry or urban density development (more than 1unit per acre) and Conservancy owned properties.

The Conservancy requests that the County of Fresno requires the applicant to implement the above recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

Response 11-22

See discussion of Draft EIR Impact 4.20-2. The use and handling of flammable materials would be required to comply with all relevant state and local regulations including the California Fire Code, Cal/OSHA Mine Safety Orders, and all applicable CUPA programs related to hazardous materials storage and handling (Draft EIR page 4.20-13). The

Blasting Protocols prohibit the storage of explosive materials on the Quarry Site and outline additional best management practices for blasting. See Appendix H-9, "Revised Blasting Protocols," of the Final EIR. The potential for the project to exacerbate fire risk at both the Plant and Quarry sites is less than significant.

Comment 11-23

4.10 Hydrology and Water Quality

The Conservancy supports and encourages coordination with federal and State environmental regulatory and permitting agencies, including, but not limited to, the California Department of Fish and Wildlife, Department of Water Resources, and the Regional Water Quality Control Board to develop adequate avoidance and minimization measures to impacts on hydrology and water quality resources within the Projects area of impact.

To minimize impacts to adjacent, Conservancy owned properties, the Conservancy recommends the following avoidance and minimization measures:

- Provide erosion control and slope stabilization measures in any area where erosion could lead to sedimentation of a waterbody.
- Perform major vehicle maintenance, repair jobs, and equipment washing at appropriate off-site locations.
- Regularly maintain equipment to prevent fluid leaks. Any leaks shall be captured in containers until the equipment is moved or repaired.
- Prepare a spill prevention and response plan prior to construction.
- Designate one area, well away from streams or storm drain inlets, for auto and equipment parking and routine vehicle and equipment maintenance;
- Clean-up spilled dry materials immediately and dispose appropriately.
- Use the minimum amount of water necessary for dust control.
- Clean-up liquid spills on paved or impermeable surfaces using "dry" cleanup methods (e.g. absorbent materials such as cat litter, and/or rags).

- Clean-up spills on dirt areas by removing and properly disposing of the contaminated soil.

- Store stockpiled materials, wastes, containers and dumpsters under a temporary roof or secured plastic sheeting where they cannot enter into or be washed by rainfall or runoff into waters of the U.S./State or aquatic habitat.

- Properly store containers of paints, chemicals, solvents, and other hazardous materials in garages or sheds with double containment during rainy periods.

- Avoid operating equipment in a live stream channel.

- Apply best management practices for treating, detaining, and percolating stormwater runoff, such as bioswales, bioretention areas and seasonal wetlands.

The Conservancy requests that the County of Fresno requires the applicant to implement the above recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

Response 11-23

The measures listed in the comment are largely incorporated into existing mitigation measures, mine plans, or are required by local regulations. Erosion control measures are incorporated into the mining plans, which are discussed beginning on page 2-29 of the Draft EIR. For example, top soil or overburden stockpiles that are expected to remain for longer than a year would be vegetated with grasses and forbs. The Draft EIR also analyzes the project's potential to result in substantial soil erosion in Impact 4.7-4, and concludes that this impact would be less than significant.

See the Draft EIR's discussion of Impact 4.10-1, which describes the required compliance of the project with the NPDES program and CUPA program, which require implementation of site-specific Stormwater Pollution Prevention Plan, WDRs, HMBP, and SPCC Plan requirements (Draft EIR page 4.10-91). Typical BMPs of a SWPPP includes using contained equipment wash-out and vehicle maintenance areas and covering stockpiled soil at the end of each workday. With the implementation of Blasting Protocols, and the project's compliance with applicable regulations and permitting requirements, impacts to surface water quality standards or waste discharge requirements would be less than significant.

The Draft EIR addresses storage of hazardous materials in Section 4.9, "Hazards and Hazardous Materials." See the Draft EIR discussion of Impacts 4.9-1 and 4.9-2. As

discussed in Impact 4.9-2, all hazardous materials would be managed and stored in accordance with the applicable programs overseen by the Fresno County Environmental Health Division. No hazardous waste would be disposed of on the project site (Draft EIR page 4.9-18).

Comment 11-24

4.11 Land Use and Planning

As previously stated, the Project proposes a new activity, hard rock (granite) excavation (drilling and blasting) within the Parkway that was never previously evaluated by the Parkway Master Plan. Therefore, as sand and gravel mining operations were the only mining activity evaluated, hard rock excavation may be an incompatible activity and conflict with existing or planned Parkway land uses near the Project.

- To minimize land use impacts to adjacent, Conservancy owned properties, the Conservancy recommends implementation of the following buffers:

- To the extent feasible, acquire, enhance, restore and maintain a continuous riparian/wildlife corridor throughout public Parkway lands with a minimum width of 200 feet upland from the ordinary low-water mark and gaps of no greater than 200 feet or the minimum necessary to allow for infrastructure (e.g. roads, bridges, boat launches, etc.).

- Build trails or provide easements for bikeways and other recreation areas at least 300 feet from the boundary of active mining operations and processing plants, separate them by physical barriers, and avoid trail/bikeway crossings of active haul routes.

- Where feasible, provide a minimum width of 100 feet for the Parkway multi-use trail corridor.

- From the river wildlife corridor, encourage 100-foot buffers from agriculture/pasture; 150-footbuffers from rural residences (less than .05 unit per acre); 300-foot buffers from medium density rural residences (.05 units per acre to less than 1 unit per acre); 600-foot buffers from business/industry or urban density development (more than 1 unit per acre); and 700-footbuffers for any development from sensitive habitat.

The Conservancy requests that the County of Fresno requires the applicant to implement the above recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

Response 11-24

See Response 11-26 below regarding the Parkway Master Plan's evaluation of surface mining operations. The Conservancy's recommended buffers are noted. The project would require certain buffers and setbacks from adjacent properties; the existing setbacks required under the Plant Site and Quarry Site CUPs are discussed in Chapter 2, "Project Description," of the Draft EIR. At the Plant Site, a 50-ft setback is required from the public right-of-way and a 25-ft setback is required from other property lines. At the Quarry Site, the project would continue to maintain a 50-ft setback from North Friant Road and a 200-foot setback from the San Joaquin River, among others described on page 2-18 of the Draft EIR. See Section 2.5.8, "Trail Easements," discussing the potential future easements at the Plant Site and Quarry Site (Draft EIR page 2-51). The existing buffers would serve to minimize potential impacts to adjacent Conservancy properties.

Comment 11-25

Additionally, please note that the property referenced in the DEIR that is south of the Quarry Site, known as Sumner Peck Ranch, is not owned by the Conservancy – it is owned by the San Joaquin River Parkway and Conservation Trust. Please see that attached Parkway Public and Non-Profit Property Ownership map for clarification on ownership within the Parkway.

Response 11-25

Comment 11-25 is noted. The Draft EIR accurately denotes that Peck Ranch is owned the San Joaquin River Parkway and Conservation Trust. See Draft EIR Section 2.4.5, "Surrounding Land Uses," and Figure 2-5, "Conditional Use Permits and Surrounding Land Uses" (Draft EIR pages 2-23 through 2-25).

Comment 11-26

4.12 Mineral Resources

The Parkway Master Plan directs the Conservancy to work with gravel mining companies to develop reclamation plans that enhance and compliment Parkway goals, while not conflicting with sand and gravel mining operations. The Project proposes a new activity, hard rock (granite) excavation (drilling and blasting) within the Parkway that was never previously evaluated by the Parkway Master Plan. Therefore, as sand and gravel mining operations were the only mining activity evaluated, hard rock excavation may be an

incompatible activity and conflict with existing or planned Parkway land uses near the Project.

Response 11-26

The Fresno County General Plan mineral policies extend to both hard rock and sand and gravel operations. The Fresno County General Plan defines extracted resources to include aggregate products (sand and gravel), fossil fuels (oil and coal), metals (chromite, copper, gold, mercury, and tungsten), and other minerals used in construction or industrial applications (asbestos, high-grade clay, diatomite, granite, gypsum, and limestone). As such, the 2018 Parkway Master Plan would need to be consistent with the Fresno County General Plan policies pertaining to mineral extraction, even if hard rock operations are not specifically contemplated in the 2018 Parkway Master Plan.

Comment 11-27

4.13 Noise

Project noise generated at the Quarry Site may exceed applicable noise standards. Based on distance to closest receptors, the analysis appears to have excluded the recreating public at adjacent, Conservancy owned properties (Ball Ranch, Ledger Island, Beck Ranch).

To minimize impacts to adjacent, Conservancy owned properties the Conservancy recommends the following avoidance and minimization measures:

- Minimize excessive noise generating activities to reduce disturbance to the nearest sensitive land uses, including the adjacent, Conservancy owned properties, which provide habitat for sensitive wildlife, recreation, and public access.

- Minimize excessive vibration generating activities to reduce disturbance to the nearest sensitive land uses, including the adjacent, Conservancy owned properties, which provide habitat for sensitive wildlife, recreation, and public access.

The Conservancy requests that the County of Fresno requires the applicant to implement the above recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

Response 11-27

The commenter expresses concern regarding potential noise and vibration impacts to nearby San Joaquin River Conservancy-owned properties, including Ball Ranch, Ledger Island, and Beck Ranch, and recommends additional avoidance and minimization measures.

Potential noise impacts are evaluated in Section 4.13, "Noise," of the Draft EIR. The Ball Ranch property is located approximately 600 feet north of the existing Plant Site, and approximately 4,000 feet south of the Quarry Site. Portions of the Beck Ranch and Ledger Island properties are located near the northern and southern boundaries of the Quarry Site. It is recognized that there are numerous public and non-profit-owned properties along the San Joaquin River, including the San Joaquin River Conservancy-owned properties mentioned in this comment. Although these properties were not individually analyzed in the Draft EIR, residential properties with similar proximity to the Plant and Quarry sites were extensively analyzed. For example, Residential Receptor Q-6 is located less than 400 feet from Beck Ranch, and Receptor Q-14 is located on the opposite bank of the San Joaquin River, approximately 200 feet from Ledger Island (see Draft EIR Figure 4.13-1, "Nearest Sensitive Receptors to Plant Site," Table 4.13-3, "Existing Ambient Noise Environment at Nearest Receptors to Plant Site," Table 4.13-4, "Existing Ambient Noise Environment at Nearest Receptors to Quarry Site," and Appendix H-1, "Environmental Noise and Vibration Assessment"). These locations would be expected to have similar project noise exposure.

The Fresno County Land Use Compatibility matrix for community noise exposure (Draft EIR Table 4.13-6, "Land Use Compatibility for Community Noise Exposure") identifies 70 dBA Ldn as being a normally acceptable noise environment for parks and 75 dBA Ldn as being normally acceptable for water recreation areas and riding stables. By contrast, the County identifies 60 dBA Ldn as being normally acceptable for residential land uses. As such, the Conservancy parcels, although not insensitive to noise, are considered by the County to be 10 to 15 dBA less sensitive to noise than the nearby residential properties which were extensively analyzed in the Draft EIR.

Furthermore, the Conservancy properties would be shielded from view of excavation activities by perimeter topography and berms, and noise mitigation required for potentially impacted nearby residences would similarly benefit the Conservancy parcels (see Draft EIR Section 4.13, Mitigation Measure 4.13-3). While noise generated by mining and processing activities at the Quarry and Plant sites may be audible at portions of the Conservancy parcels, audibility is not the threshold of significance under CEQA, and overall noise levels would comply with Fresno County criteria. As a result, no adverse noise impacts are identified for the Conservancy parcels located in the vicinity of either

the Plant or Quarry sites, and adoption of the commenter's recommended additional noise mitigation measures is not required.

Blasting activities would occur up to twice per week, would occur for approximately one to two seconds, and are not expected to result in significant environmental impacts. The Draft EIR discusses the project's potential impacts related to the generation of groundborne vibration as a result of blasting in Impact 4.13-6. The project would take measures to maintain blasting-related vibration below applicable thresholds to prevent human disturbance (Draft EIR page 4.13-65). With implementation of Mitigation Measure 4.13-6, which requires implementation of the Blasting Protocols, potential impacts related to groundborne vibration resulting from blasting would be reduced to less than significant (Draft EIR page 4.13-67).

Comment 11-28

4.16 Recreation and 4.17 Transportation

The Project is consistent with the Parkway Master Plan goals and policies by encouraging low-intensity use and habitat conservation and connections to other regional recreational trails, open spaces, and land uses; trail systems that enhance non-motorized commuting and transportation. However, these sections should be revised to include current information and analysis on both Ball Ranch and Ledger Island, which are currently open 7-days a week for recreation and public access.

Response 11-28

Please see Collective Response #19 regarding the information pertaining to recreational facilities adjacent to the project sites, including Ball Ranch and Ledger Island.

Comment 11-29

To minimize impacts to adjacent, Conservancy owned properties, the Conservancy recommends the following avoidance and minimization measures:

- Improve safety and reduce pedestrian and bicycle traffic between Old Friant Road to Lost Lake campground by assisting the Conservancy in creating the Lewis S. Eaton Trail expansion segment and/or rehabilitation of Ledger Island Bridge.

The Conservancy requests that the County of Fresno requires the applicant to implement the above recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

Response 11-29

The Draft EIR discusses the potential trail easements along the eastern boundary of the Plant Site and along the western boundary of the Quarry Site to facilitate the connection of three miles of planned trails in the San Joaquin River Parkway Master Plan (Draft EIR page 4.16-6). The commenter's request to assist in the creation of the Lewis S. Eaton Trail expansion segment and/or rehabilitate the Ledger Island Bridge is noted for the decision-makers.

Comment 11-30

The Conservancy supports and encourages continued discussions between the applicant and the Conservancy's Executive Officer, towards providing potential easements at the Plant Site and Quarry Site, which will link public Parkway lands and provide a continuous, multi-use trail. For consistency with the Parkway Master Plan, were feasible, a minimum 100ft multi-use Parkway trail corridor is preferred.

Response 11-30

The comment is noted for County decision-makers.

Comment 11-31

Alternatives

The Conservancy supports and encourages an evaluation of a range of reasonable Project Alternatives prior to selecting a preferred Project Alternative. The current mining and processing operations along the San Joaquin River have been limited to sand and gravel mining excavations, and have been continuous at the two sites for 108 years. The Project proposes a new activity, hard rock (granite) excavation (drilling and blasting) within the Parkway that was never previously evaluated by the Parkway Master Plan. Therefore, as sand and gravel mining operations were the only mining activity evaluated, hard rock excavation may be an incompatible activity and conflict with existing or planned Parkway recreation near the Project.

The DEIR considers several Project Alternatives, all of which include hard rock excavation except for the No Project Alternative. The Conservancy recommends that additional alternatives that provide for sand and gravel mining operations, consistent with the Parkway Master Plan, be evaluated and considered.

Response 11-31

The Draft EIR evaluates a reasonable range of alternatives, in accordance with CEQA. One of the main objectives of the project is to expand mining operations at the Quarry Site, which would require excavation of hard rock due to the exhaustion of alluvial reserves at the Quarry Site. Thus, project alternatives 2-5 incorporate this objective.

Comment 11-32

Section 6.3.1 lists ten project objectives. The Conservancy concurs with the project objectives within its purview, specifically:

8.Maintain consistency with the San Joaquin River Parkway Master Plan.

9.Reclaim both sites to wildlife habitat in a manner similar to the reclaimed mine sites that make up the majority of the San Joaquin River Parkway properties.

10.Provide potential Parkway trail easements.

Response 11-32

The comment is noted for County decision-makers. See Response 11-33 below.

Comment 11-33

In addition to the objectives listed in this Section, the Conservancy would also support adding "maintaining consistency with the County of Fresno General Plan" as part of the 8th objective or as a standalone project objective.

Response 11-33

The comment is noted. The project would be required to maintain consistency with the Fresno County General Plan. In response to comments on the Draft EIR and at the request of the Operator, Project Objective 8 is revised in this Final EIR through errata presented in Final EIR Chapter 3, "Draft EIR Errata," to include project consistency with the Fresno County General Plan.

Comment 11-34

Conclusion

The Conservancy appreciates the opportunity to comment on the DEIR for the Project and recommends that the County of Fresno Department of Public Works and Planning address the Conservancy's comments and concerns in the Final EIR.

Due to the issues presented in this letter, the Conservancy concludes that the DEIR does not adequately identify or mitigate the Project's impacts on environmental resources and that the Project may not be consistent with the Parkway Master Plan.

Response 11-34

The Draft EIR adequately analyzes the potential environmental impacts of the proposed project, in accordance with CEQA. The proposed project is consistent with the Parkway Master Plan, as discussed in Section 4.11, "Land Use and Planning," of the Draft EIR.

Comment 11-35

The Conservancy recommends that the Draft Environmental Document discuss additional potential safe, public access opportunities within the San Joaquin River Parkway to accommodate the reasonable and foreseeable impacts to adjacent open space areas, intended for recreation and public access. Increasing safe, public access to the Parkway will also meet policies and objectives that are set forth in the Parkway Master Plan and Open Space and Recreation Element of the City of Fresno General Plan.

Response 11-35

The comment is noted for County decision-makers.

Comment 11-36

The Conservancy also requests to be consulted during the development any reclamation and revegetation plans to ensure that the plans enhance and compliment Parkway goals.

Pursuant to Public Resources Code sections 21092 and 21092.2, the Conservancy requests written notification of proposed actions and pending decisions regarding the Project. Written notifications shall be directed to:

San Joaquin River Conservancy

Kari Kyler Daniska, Executive Officer
PO Box 28338
Fresno, CA 93729

The Conservancy requests an opportunity to review and comment on any response that the County of Fresno has to our comments and to receive notification of any forthcoming hearing date(s) for the Project.

If you have any questions regarding the comments provided in this letter or wish to schedule a meeting, please contact me at (559) 287-2650 or by email at kari.daniska@sjrc.ca.gov.

Response 11-36

The comment is noted. The San Joaquin River Conservancy would be added to the notification list.

Letter #12 March 10, 2025, Douglas Hedenkamp, City of Fresno

Comment 12-1

I represent the City of Fresno, and I write to submit the following comments on the Draft EIR for the CEMEX Rockfield Quarry Project (the "Draft EIR"). As set forth below, the City has identified several procedural and substantive deficiencies that preclude certification of the Draft EIR in its present form.

Chief among the substantive deficiencies is: (1) the Draft EIR's failure to consider the physical impacts of increased hauling by heavy trucks over North Friant Road by shifting truck traffic from the other aggregate mines listed on page 4.17-20 of the EIR to the CEMEX Rockfield Quarry Site and Plant Site (collectively, the "Project"), (2) failure to consider the cumulative impacts of the Project and these other aggregate mines in the cumulative impacts section, despite using these other mines to effectively erase the transportation impacts from the Project, and despite noting that, taken together, these projects will result in an increase of over 3,000,000 annual VMTs by Stage 2 of the Project (3) failure to discuss impacts to water quality, such as the potential alteration to groundwater flow as a result of continuous dewatering during mining operations below the existing groundwater level, mobilization of naturally occurring constiutents, such as arsenic, iron, lead, and manganese into the ground water (these hydrology and water quality impacts and improved mitigation measures to address them are discussed in more detail in the letter dated March 3, 2025 from the City of Fresno Department of Public Utilities to David Randall, Fresno County Public Works and Planning Department, a copy of which is attached as Exhibit 1 hereto).

Chief among the procedural deficiencies is the fact that the Project described in the Draft EIR includes portions of APNs 300-070-43ST, 48ST, and 50ST, which are not included in the applications for Conditional Use Permits 3666 and 3667, and were not listed in the Notice of Preparation ("NOP"), Notice of Completion ("NOC") or Notice of Availability ("NOA").

These and other deficiencies are discussed below in the order in which they appear.

Response 12-1

For discussion of physical impacts and cumulative impacts in reference to truck traffic from other aggregate mines (i.e. points (1) and (2) of this comment), see Response 12-78. See Responses 12-73 – 12-74 for more on "continuous dewatering" and "mobilization of naturally occurring constituents [sic]" (point (3) of this comment). See responses to the letter dated March 3, 2025, from the City of Fresno, Department of Public Utilities to David Randall, Fresno County Public Works and Planning Department in Responses B-84 through B-111 of this Final EIR. The Draft EIR includes and describes the portions of APNs 300-070-43ST, 48ST, and 50ST that are currently within the Plant Site area (Draft EIR page 2-2). The comment's reference to the applications for CUPs 3666 and 3667 does not raise an issue regarding significant environmental impacts. In response to the comment regarding APNs 300-070-43ST, 48ST, and 50ST and the NOP, NOC, and NOA for the project, see Responses 12-3, 12-5, and 12-6 of this Final EIR.

Comment 12-2

1. Project Application

The land use application for Conditional Use Permit 3666, which applies to the Plant Site, is incomplete and does not meet the requirements of the Fresno County Zoning Code 838.5.060, because it contains no reference to the land owned by the California Department of Fish and Wildlife (the "CDFW") referred to on page 2-2 of the EIR's Project Description as portions of APNs 300-070-43ST, 48ST, and 50ST (the "CDFW Property"). If that land is to be included in the Project, it must be listed in the Conditional Use Permit application, and an Authorization of Agent to Act on Behalf of Property Owner must be filed with Fresno County (the "County"). Accordingly, the application is incomplete based on the Draft EIR's Project Description.

Response 12-2

The comment does not raise significant environmental issues and thus does not require a response (PRC Section 21091(d)(2)(B); Title 14 CCR Sections 15088(c), 15132(d), 15204(a)). ee Collective Response #20 pertaining to the California Department of Fish and Wildlife (CDFW) property referenced in this comment. The CDFW property is described on pages ES-2 and 2-2 of the Draft EIR (see also Draft EIR Section 2.4.1, "Project Location and Access"). The Draft EIR explains that the Operator is attempting to acquire the relevant CDFW-owned property. Ultimately, inclusion of this property within the project is predicated on first receiving permission from CDFW. Once the transaction is completed,

or the CDFW otherwise permits the use, the conditional use permit (CUP) would be amended to include these parcels. Regardless, for complete disclosure, the Draft EIR analyzes the environmental impacts of the project boundary, including the CDFW-owned parcels. Further, CDFW received full notice of the application and preparation of the Draft EIR.

The Application complies with the Fresno County Zoning Ordinance (FCZO). The application meets all applicable requirements presented in Chapter 842.5 of FCZO.

Comment 12-3

2. Notice of Preparation

The NOP for the EIR was dated June 3, 2020 and posted on June 5, 2020 as SCH No. 2020060123. That NOP is not valid for the EIR, because the project description included in the NOP lists the Plant Site as "Assessor Parcel Numbers (APNs) 300-070-56S, 57S, 58S, 59S, & 60S," and does not identify the CDFW Property as part of the Plant Site, unlike the Project Description in the EIR. (*Compare* NOP, Attachment A at p. 1, *with* EIR at p. 2-2.)

The Plant Site Aerial included in the NOP also omits the CDFW Property, and is inconsistent with the Aerial depicted in the EIR. (*Compare* NOP, Figure 2 *with* EIR, Figures 2-1 and 2-6.) Project Description/Operational Statement, Appendix B-2, states on page 14 that the CDFW Property is already currently being utilized as part of the Plant Site for mining operations, so this state-owned land should have been identified in the NOP.

This is a significant omission because the NOP was sent to the State Clearinghouse, pursuant to the CEQA Guidelines (California Code of Regulations, Title 14, Section 15000- 15387) for mandatory notice to the following reviewing agencies:

> California Air Resources Board (ARB), California Department of Conservation (DOC), California Department of Parks and Recreation, California Department of Resources Recycling and Recovery, California Department of Transportation, District 6 (DOT), California Department of Water Resources (DWR), California Governor's Office of Emergency Services (OES), California Natural Resources Agency, California Regional Water Quality Control Board, Central Valley Fresno Region 5 (RWQCB), California San Joaquin River Conservancy (SJRC), California State Lands Commission (SLC), Central Valley Flood Protection Board, Delta Stewardship Council, Office of Historic Preservation, State Water Resources Control Board,

> Division of Water Quality, California Native American Heritage Commission (NAHC), California Department of Fish and Wildlife, Central Region 4 (CDFW)

When the NOP was distributed to the reviewing agencies, those agencies, and CDFW in particular, should have been provided notice that CDFW property was being considered as part of the Project in the EIR.

Response 12-3

The comment does not require a response because the time to comment on the Notice of Preparation (NOP) has passed. However, the NOP was valid under CEQA and would not render the Draft EIR insufficient (PRC Section 21080.4). CEQA does not require that APNs specifically be included in the description of the project in the NOP (see CEQA Guidelines Section 15082).

Further, the CDFW received notice as a reviewing agency and thus "the information gathering and presentation mechanisms of CEQA were not subverted or compromised" (see *Schenck v. County of Sonoma* (2011) 198 Cal.App.4th 949). The CDFW provided a response to the NOP and to the Draft EIR, thus indicating CDFW had the opportunity to review and assess the probable environmental impacts of the project.

Comment 12-4

The project description in the NOP also fails to adequately describe the true expansive nature of the Project, which it merely describes as allowing "the Rockfield Quarry a continuation and modification of its current aggregate (rock, sand, and gravel) mining and processing operations." (NOP, Attachment A at p. 1.) The project description does not adequately identify as significant new land uses activities such as significantly increasing the mining depth to 600 feet below grade that requires hard rock blasting adjacent to the San Joaquin River, public parks, camping sites, adding a material recycling of concrete and asphalt concrete, adding on-site sales of materials to the public, resuming aggregate mining at the Plant Site and adding a large hot- mix asphalt plant. The Project results in reduced setbacks and buffers and other project features that were previously required by the Previous CUPs.

Response 12-4

The time to comment on the NOP has passed. However, we note that the NOP's description of the proposed project is adequate under CEQA Guidelines Section 15082. The NOP was submitted on June 3, 2020, and includes the project location, project

description, and a summary of anticipated impacts. The NOP also includes an aerial map and a vicinity map, sufficiently disclosing the location of the project. The project description in the NOP provides that the Operator is requesting both a continuation and *modification* of current aggregate mining and processing operations. The word "modification" suggests a change in the existing operations. Additionally, under the Stage 1 section, the project description provides that the hard rock deposit located at the Quarry Site would be mined to a depth of 600-feet below ground surface (bgs). The NOP also provides that the existing maximum production of 1.4 MT would be increased to 3.0 MT after ten years of production, thus indicating a significant operational expansion of the project. For these reasons, the NOP adequately describes the nature of the project.

Comment 12-5

3. Notice of Completion

The Notice of Completion dated July 6, 2020, (NOC) is not valid for the proposed Draft EIR. As with the NOP, filed one month earlier, the NOC was sent to the same agencies with the same incorrect project location, incorrect project description and including Figure 1 and 2 that do not show the CDFW Property that is included in the Draft EIR.

Only two letters were received by the State Clearinghouse on the NOP, California Department of Fish and Wildlife (CDFW) and Native American Heritage Commission (NAHC). CDFW submitted a letter dated July 6, 2020, that states the CDFW is submitting comments as a Responsible Agency, a permitting agency. However, since the Draft EIR also includes the CDFW Property, it should have been given notice that it is actually an owner of part of the Project, in which case its comments could have addressed more than its interest merely as a permitting agency.

Response 12-5

The comment states that the Notice of Completion (NOC) is invalid for the proposed Draft EIR. The NOP and the NOC included the correct project location and project description, in accordance with CEQA Guidelines (Title 14 CCR Section 15085). CEQA requires that the NOC include a brief description of the project, the project's location, an address at which copies of the Draft EIR are available, and the review period for submission of comments on the Draft EIR (CEQA Guidelines Section 15085(b)). CEQA Guideline Section 15085 provides that the NOC only needs to provide the proposed location of the project by street address and cross street.

CDFW provided comments as a Responsible Agency and was sufficiently noticed of the information concerning the project and its potential environmental effects to enable CDFW to make a meaningful response. This comment provides no meaningful evidence indicating that CDFW would have provided a different response if it had received notice as a property owner versus a Responsible Agency.

Comment 12-6

4. Notice of Availability

The "Reissued Notice of Availability of a Draft Environmental Impact Report (EIR) for the proposed modification to the existing CEMEX Rockfield Quarry (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667)" (the "NOA") for the Draft EIR is posted on the County of Fresno website.

NOA's are typically posted at the Project Site, mailed to adjacent landowners, interested parties and posted at the County of Fresno administrative offices. Public involvement is one of the fundamental objectives of CEQA. Thus, adequate notification to the public of the availability of a Draft EIR is important in achieving this objective (CEQA Guideline §15201, Public Resources Code §21083 and 21087).

As with the NOP and NOC, the NOA merely describes the proposed Project as a "continuation and modification of its current aggregate (rock, sand and gravel) mining and processing operations," and fails to describe the vastly expanded operations that would be allowed under the Project. Like the NOP, the NOA omits the APN numbers for the CDFW Property.

The County of Fresno has failed to comply with the requirements of CEQA and State Law with incorrect and misleading public notices. The proposed Project needs to be correctly noticed and recirculated in order for State and Federal agencies, interested parties and the general public to determine their interest in the proposed Project.

Response 12-6

The County disagrees that it has failed to comply with the requirements of CEQA regarding incorrect and misleading public notices. The Notice of Availability (NOA) complies with CEQA Guidelines Section 15087, which requires a brief description of the proposed project and its location (dee *Maintain Our Desert Env't v Town of Apple Valley* (2004) 124 Cal.App.4th 430, 441 holding that the project description need only be a brief, compact summary without elaboration or detail). Furthermore, PRC Section 21092,

subd. (b)(2) provides that an EIR cannot be invalidated due to "alleged inadequacy of the notice content if there has been substantial compliance with the notice content requirements of this section."

Comment 12-7

5. Draft Environmental Impact Report No. 7763 SCH# 2020060123

Chapter 1, Introduction and **Chapter 2,** Executive Summary need to be revised to reflect the significant revisions to Draft EIR.

a. Chapter 2: Project Description

The Draft EIR project description is insufficient and inaccurate in describing the proposed Project and does not comply with CEQA Guidelines and CEQA regulations. The Draft EIR project description is inconsistent with the Project Description/Operational Statement (Appendix B-2) that is part of the Surface Mining Reclamation Plan (Appendix B-1). The Draft EIR needs to be revised and recirculated.

Response 12-7

The Draft EIR's Introduction and Executive Summary are sufficient under CEQA (Title 14 CCR Section 15123).

This response is also introductory in nature, see Responses 12-8, 12-9, and 12-10 for more detailed responses regarding the Draft EIR's project description.

Comment 12-8

i. Project Location

CEQA §15124, Project Description, lists the required information needed to evaluate and review the environmental impacts of the proposed Project. CEQA §15124(a) states:

The precise location and boundaries of the proposed project shall be shown on a detailed map, preferably topographic. The location of the project shall also appear on a regional map.

The Draft EIR fails to comply with CEQA §15124(a) because the Project Location is both internally inconsistent within the Draft EIR, and inconsistent with the applicable Project CUP applications, which do not include the CDFW Property.

Within the Draft EIR, Figure 1-1 (Regional Location) and Figure 1-2 (Site Location) do not include the whole of the action

which has the potential for resulting in either direct physical change in the environment or the reasonably foreseeable indirect physical change in the environment (CEQA Guidelines §15379(a); Public Resources Code §21065). Figures 1-1 and 1- 2 do not appear to include the CDFW Property (APNs 300-070-43ST, 48ST and 50ST).

Draft EIR section 2.2.1, Project Location, states that the "12.9 acres owned by the [sic] California Department of Fish and Wildlife" is included in the 138.5-acre Plant Site and is currently used by the Applicant for current mining operations. The Draft EIR states:

> This Draft EIR assumes that CDFW will permit CDFW to continue to be used for mining and processing operations under the proposed project. Therefore, this 12.9-acre area is included in the 138.5-acre Plant Site.

However, the Draft EIR depicts the location of the Project, particularly the land owned by the State of California, inconsistently or not at all in the Draft EIR and therefore, does not disclose and analyze the significant environmental impacts of the whole project.

Moreover, Conditional Use Permit 3577-A, to extend operational time limit from July 28, 2023 to July 28, 2027 does not include the land identified as "portions of APNs 300-070-43ST, 48ST and 50ST." Exhibit 2 of CUP 3755, Location Map, depicts the Plant Site as located on APNs 300-070-56S, 57S, 58S, 59S and 60S and consists of approximately 122 acres. APNs 300-070-56S, 57S, 58S, 59S and 60S total to 121.94 acres.

Response 12-8

The CDFW parcel has previously been used by the Operator for some mining operations that existed on that site prior to its acquisition by CDFW when the mining lease property and the CDFW parcel were all owned by the same owner (Draft EIR page 2-7). Currently, the Operator is negotiating an agreement with CDFW to either purchase or continue to use the property. Thus, the Assessor Parcel Numbers are not included on CUP 3666 (Surface Mining and Reclamation Plan, Appendix B-1, "Surface Mining and Reclamation Plan," of Draft EIR, page 7). Because the Operator believes that CDFW would continue to allow the usage of a portion of CDFW-owned property, the Draft EIR analyzes the impacts of the project assuming the continued use of the CDFW land. However, if no agreement is reached, then the Operator would not use the portions of the CDFW land identified in the Draft EIR. For these reasons, the project description complies with CEQA

requirements by including all of the property locations within the proposed project boundaries.

The comment asserts that the CDFW property is not shown on Figure 1-1, "Regional Location," and Figure 1-2, "Site Location." However, the comment fails to explain how these parcels are not included on Figures 1-1 and 1-2 as those maps do not show APNs or individual parcels. Figure 1-1, moreover, is a regional map which serves the purpose of contextualizing the project's location within the County. The scale of the regional map is large enough that it would not properly serve the purpose of detailing the small portions of the CDFW-owned parcels included in the project boundaries. Figure 1-2, likewise, does not show parcels or APNs, but does display the precise location and boundaries on a detailed, topographic map, in accordance with CEQA Guidelines Section 15124(a). Because the scale of the maps make it difficult to see that the CDFW property is included within the project boundary, the Draft EIR provides a sufficiently detailed explanation of the inclusion of the CDFW property within the project boundary for the purposes of analyzing environmental impacts (see Draft EIR Section 2.2.1, "Project Location," on page 2-2).

The Plant Site location is described in Section 2.2.1 of the Draft EIR. The Draft EIR explains the 11.9 acres owned by CDFW within the permitting context. Moreover, Figure 2-6 "Proposed Plant Site Plan" specifically depicts the existing property boundary and the proposed property boundary, including the portions of the CDFW-owned parcels. The Draft EIR consistently reflects that the 138.5 acres encapsulated by the proposed boundary of the Plant Site was analyzed for environmental impacts. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to the total acreage of the CDFW parcel stated in the Draft EIR.

Comment 12-9

ii. Plant Site Aggregate Mining

The Project Description/Operational Statement (Appendix B-2) state on page 2 that "At the Plant Site, mining of the alluvial deposit will resume…." Therefore, aggregate mining that occurred in the past cannot be considered a part of the baseline conditions and needs to be treated as a new and unapproved land use pursuant to Fresno County Zoning Code Section 868.6.020, Expiration. Section 868.6.020A.1.c. states:

If there is a cessation in the occupancy or use of land or structure(s) authorized by the permit or approval for a period in excess of two years, the permit or approval shall expire and be deemed void.

Aggregate mining is a use of land, such as the concrete plant or asphalt plant. If there is cessation of a particular approved land use in a conditional use permit for more than two years, the land use permit expires. The Draft EIR needs to be revised and recirculated to eliminate previous aggregate mining environmental impacts on the Plant Site from the baseline as existing conditions.

Response 12-9

The comment inaccurately states that the temporary pause in aggregate excavation at the Plant Site would cause the current permit to be deemed void under the Fresno County Zoning Code. The Operator has vested rights to operate pursuant to CUPs 367, 3063, 2032, 2209, and 3093. Although excavation of aggregate has temporarily ceased at the Plant Site, mining operations and processing of aggregate have been continuous at the Plant Site from 1913 to present (Draft EIR page 2-1; See also Response 12-12 for a more detailed discussion of the continuous nature of mining operations at the Plant Site). Thus, there has not been a cessation in the occupancy or use of land authorized by CUPs 367, 3063, 2032, 2209, and 3093 that would deem the permit expired and void. A permit may not automatically expire; notice and a hearing are required before expiration or revocation (see *Community Dev. Comm'n v City of Fort Bragg* (1988) 204 Cal.App.3d 1124). See Response 12-12 for additional discussion regarding the Operator's vested rights to operate pursuant to CUPs 367, 3063, 2032, 2209, and 3093.

The comment further suggests that the Draft EIR improperly includes prior aggregate mining environmental impacts within its baseline. CEQA Guidelines provide that the baseline generally should be described as the physical conditions that exist in the area affected by the project at the time the EIR process begins (Title 14 CCR Section 15125(a)(1)). An EIR's assessment of the project's impacts should normally be limited to changes in those existing physical conditions (Title 14 CCR Section 15126.2(a)). An EIR's analysis should, however, employ a realistic baseline (see *Communities for a Better Env't v. S. Coast Air Quality Mgmt. Dist. (*2010*)* 48 Cal.4th at 328). When existing physical conditions change or fluctuate over time, the lead agency may define existing conditions by taking account of historic conditions, or conditions expected when the project becomes operational, or both (Title 14 CCR Section 15125(a)(1)). Inclusion of prior aggregate mining environmental impacts in the baseline is proper here because the property, including the Plant Site, has been continuously disturbed by mining operations and aggregate processing for over a hundred years. Therefore, existing conditions at the time of the NOP includes the history of aggregate mining operations of the Plant Site.

The comment suggests that the Draft EIR needs to be revised and recirculated to eliminate previous aggregate mining environmental impacts as existing conditions. Recirculation

is not necessary here, as the comment has not identified a new significant environmental impact (Title 14 CCR Section 15088.5(a)).

Comment 12-10

iii. Section 2.4.8 Current Operating Entitlements and Vested Rights.

The Project Description fails to adequately describe the current operating entitlements and vested rights, because it fails to describe the approved Site Plans and Rehabilitation Plans that were imposed as conditions on the existing CUPs. This leads to omitted and misleading information regarding the restrictions on the current site operations.

For example, in Table 2-1, Rockfield Modification Project Characteristics, the Draft EIR incorrectly states there is no maximum mining depth under the existing CUPs for the Plant and Quarry Sites. To the contrary, Condition No. 21 to CUP 2032 for the Quarry Site required the submission and approval of a Site Plan Review, which would have established the maximum depth of excavation, most likely at 45'. The parameters of the approved Site Plan Review, which are a condition of approval, should be disclosed. The Staff Report for CUP 2032 states that "The applicant estimates groundwater depth to be 20 feet and is proposing to excavate to a depth of 45 feet." (Staff Report, § C; *see also* City of Fresno Department of Public Utilities, Exhibit 1 hereto, for further commentary on hydrology and the impacts of deeper mining.) The Mining Plan attached to the Staff Report shows the "Maximum Excavation Depth" to be 45'.

Similar Site Plan Review requirements are set forth in CUP 367, though there is no indication of maximum depth in the CUP itself. (CUP 367, Area A Condition No. 24, Area B Condition No. 10.) Nevertheless, since mining stopped at 32 feet bgs (Draft EIR 2-29), it seems likely that a similar limit is present in the current Site Plan. Since these Site Plans are part of the express conditions on the existing CUPs, they should be disclosed in the Draft EIR.

Response 12-10

The Draft EIR accurately reflects the fact that previous CUPs (367, 2032, 2209, 3063, and 3093) did not specify a maximum depth at either the Plant Site or Quarry Site. CEQA sets forth specific requirements for the project description (Title 14 CCR Section 15124). Chapter 2, "Project Description," of the Draft EIR, conforms to CEQA standards, and includes all the required components, including a description of the project's location, a

statement of the project objectives, a description of the project's technical and environmental characteristics, a discussion of the intended uses of the EIR, and a list of the project approvals that would be required (Title 14 CCR Section 15124). Draft EIRs need not include additional information not required by the CEQA statutes and Guidelines (see *Eureka Citizens for Responsible Gov't v City of Eureka* (2007) 147 Cal.App.4th 357, 371).

The Draft EIR discloses the current topography of the project sites, including the current depths of previous mining, and discloses the proposed mining depths, which is sufficient for the purposes of the Project Description. As stated in the Reclamation Plan, the current depth to groundwater at the Plant Site ranges from 10 to 30 feet below ground surface (bgs). The current depth to groundwater at the Quarry Site ranges from 15 to 40 feet bgs (current surface). The previous conditions of approval may be found in Appendix B-1 of the Draft EIR. Furthermore, the Reclamation Plan includes all information required by PRC Section 2772. Prior Conditions of Approval are in Appendix B of the Reclamation Plan (see Appendix B-1 of the Draft EIR).

Table 2-1, "Rockfield Modification Project Characteristics," identifies the current depth to groundwater at the Plant and Quarry sites, as indicated in the reclamation plan. The site plans referenced as prior conditions of approval are also attached to the reclamation plan in Appendix B-1 of the Draft EIR.

Comment 12-11

Similarly, both CUPs required the submission and approval of rehabilitation plans. (CUP 2032, Condition 13; CUP 367, Area A Condition 18, Area B Condition 11.) These plans may include requirements that are inconsistent with the depths proposed for the Project in the Draft EIR. Other requirements in the current rehabilitation plans may be inconsistent with the Project, thereby leading to other potential impacts from the Project. Accordingly, the terms of the existing rehabilitation plans should be disclosed in section 2.4.8.

Response 12-11

We believe that the commenter's reference to rehabilitation plans meant to refer to the applicable SMARA reclamation plans. As discussed in Response 12-10, CEQA outlines specific requirements for the project description and information that must be included (Title 14 CCR Section 15124). Furthermore, CEQA does not require that additional information not listed in the statute or Guidelines be included in the Draft EIR (see *Eureka Citizens for Responsible Gov't v City of Eureka* (2007) 147 Cal.App.4th 357, 371). CEQA does not require a description of prior reclamation plans to be included in the project

description. The project description is meant to provide sufficient information to assess the probable environmental impacts of the proposed project. The objective of the project is to expand the existing aggregate production to include hard rock excavation and increased depths of mining. Therefore, prior reclamation plans are subject to change. It should be noted that CUPs 367, 2032, 2209, 3063, and 3093 did not specify a maximum depth.

Comment 12-12

In addition, section 2.4.8 states that the Operations at the Rockfield Quarry are currently governed by and vested under CUPs 367, 2032, 2209, 3063, and 3093. However, this is only partially true. As disclosed on page 2-8, there are currently no mining operations on the Plant Site. Accordingly, there is no longer any vested right to "continue" mining on the Plant Site.

Moreover, vested rights under SMARA are limited to mining of areas that were "'clearly intended'" to be excavated—as measured by objective manifestations, not subjective intent" when the vested rights were first triggered. (*Calvert v. County of Yuba* (2006) 145 Cal.App.4th 613, 625.) Accordingly, the vested rights do not cover any expansion of the area allowed to be mined. The area intended to be mined at the time of the CUPs is delineated on the Site Plans that were required to be approved before mining commenced. Accordingly, once again, the bounds of mining disclosed in the Site Plans must be disclosed in the Project Description.

Response 12-12

Comment 12-12 does not raise a significant environmental issue for which a response is required.

As indicated in the comment, Section 2.4.8, "Current Operating Entitlements and Vested Rights," of the Draft EIR describes the current operating entitlements and vested rights at the project sites. This section explains that operations at Rockfield Quarry are currently governed and vested under CUPs 367, 2032, 2209, 3063, and 3093. A vested right accrued under common law because mining operations have been ongoing and continuous since 1913 and cannot be abandoned absent a showing of (1) an intention to abandon, and (2) an overt act, which carries the implication that the owner does not claim or retain any interest in the right to the nonconforming use (*Hansen Bros. Enterprises v. Board of Supervisors* (1996) 12 Cal.4th 533, 569).

As described in the Draft EIR, SMARA provides that a person is deemed to have a vested right if, "prior to January 1, 1976, the person has, in good faith and in reliance upon a

permit or other authorization, if the permit or other authorization was required, diligently commenced surface mining operations and incurred substantial liabilities for work and materials necessary for the surface mining operations." (PRC 2776(a)). CEMEX's continuous reliance upon the aforementioned CUPs is sufficient to confer a vested right by operation of law (*Trans-Oceanic Oil Corp. v. City of Santa Barbara* (1948) 85 Cal.App.2d 776; *Community Development Com. v. City of Fort Bragg* (1988) 204 Cal.App.3d 1124; *Morgan v. County of San Diego* (1971) 19 Cal.App.3d 636).

Table 2-4, "Summary of Conditional Use Permits," of the Draft EIR explains that under CUP 367, sand and gravel excavation and processing operations, which had been existing since 1913**,** were permitted on 850 acres that included the Plant Site and the Quarry Site. Additionally, CUP 367 also permitted processing of materials from the Quarry Site at the processing plant located on the Ball Ranch (see Draft EIR Table 2-4). The continuous nature of mining operations at these locations are further evidenced by Draft EIR Section 2.4.7, "Site History," which explains that mining operations at the Rockfield Quarry have been continuous for more than 100 years (1913-present). Aggregate processing has been continuous at the Plant Site throughout this time. Processing aggregate is part of the larger mining operation permitted by the CUPs, and therefore establishes the Operator's vested rights to continue mining at the Plant Site. CUP 3755-A and CUP 3755-B, approved on July 28, 2023, extended CUPs 3093, 367, 2032, 2209, 2241, 2235, and 3063 through July 28, 2026. In June 2026, the County approved a second one-year extension allowing operations to continue through July 2027 while the Final EIR is completed and the requested CUP amendments are processed. See Collective Response #2 for additional information.

Comment 12-13

iv. Stockpiling

Table 2-1, Rockfield Modification Project Characteristics, indicates that the Project will mine and process 3.3 MT of aggregate per year, but sell 3.0 MT per year. It appears the excess0.3 MT per year of waste/fines will be stockpiled until the sites are reclaimed at the end of mining. The Draft EIR needs to identify the amount of sand/fines and mine waste that is existing on site and stockpiled in berms to understand the impact of adding additional sand/fines and mine waste.

In Appendix B-1, page 57, Paragraph 4.4.23 states the Plant Site will use the fines, tailings and other mining waste to reclaim the bottom 20 feet of the excavation. The Quarry Site will deposit the fines, tailing and mining waste in the bottom of the excavation. The Plant Site will not be reclaimed for 30 years, and

the Quarry Site will not be reclaimed for 100. This will amount to 30 MT stockpiled until reclamation or 551 acres of sand and mine waste at 25 feet in height. The Draft EIR needs to detail how the waste/fines will be stockpiled, the amount, maximum height and duration of stockpiling on each site before final reclamation, identify the significant environmental impacts associated with large numerous stockpiles and provide meaningful mitigation. Stockpiling mitigation should include:

- Limiting stockpiles height to 25 feet to prevent visibility from the surrounding properties and public roads
- Covering the sand and mine waste with impermeable material to prevent blowing sand and dust
- Limiting the amount of stockpiled material to 1MT at any one time (1MT at 25 feet in height results in 18.36 acres of stockpiled material) The Project is required to export from the Project Site any material over 1 MT.

Response 12-13

The baseline and project emissions for stockpiles are included in Draft EIR Section 4.3, "Air Quality," Section 4.3.3.3, "Analysis Methodology," as revised through errata in this Final EIR (see Appendix D-4). Additionally, Impact 4.3-2 and Mitigation Measure 4.3-2b, as revised in this Final EIR, analyze and mitigate impacts from potential fugitive dust and particulate matter emissions, specifically from stockpiles.

As discussed on page 4.3-27 of the Draft EIR, the project would comply with fugitive dust prohibitions in SJVAPCD Regulation VIII which includes requirements that reduce fugitive dust from earthmoving activities (Rule 8021), stockpiles (Rule 8031) and open areas (Rule 8051). Specifically, Rule 8031 requires maintenance of stabilized surfaces on stockpiles when they are inactive using one of several effective control methods. Moreover, piling materials in the bottom of pits would not create a visual impact beyond that of the pit itself which already exists. Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment") including preparation of a Fugitive Dust Control Plan (see Appendix D-3, Appendix K). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Stockpiles are depicted as part of the existing physical conditions in Figure 2-3, "Plant Site Existing Conditions," and Figure 2-4, "Quarry Site Existing Conditions," of the Draft

EIR. Plant Site stockpiles with corresponding, approximate acres are also shown in Figure 4 of Appendix A of Appendix D-3, "Air Quality, Health Risk, and Climate Change Impact Assessment."

Comment 12-13 states that a mitigation measure should be included that would require stockpiles to be no more than 25 feet in height to prevent visibility from surrounding areas. CUP 367 Condition of Approval #4 currently requires that the height of all stockpiles be less than 25-ft, except for the main sand pile, and this requirement would be continued (Draft EIR Appendix B of the Draft EIR Appendix B-1 Surface Mining and Reclamation Plan, CUP 367 Conditions of Approval, page 5). Existing CUPs also require stockpile soil or material be place 25 feet from any property boundary, except for visual or sound berms (Draft EIR page 2-15).

Removing waste/fines from the site for any material over 1 MT would unnecessarily increase truck traffic in the region, thus the County declines to require that mitigation.

Comment 12-14

v. Project Life

Table 2-1 indicates the proposed project life of 30 years for the Plant Site and 100 years for the Quarry Site. As stated above, surface mining by its very nature is a finite and temporary land use. State and local regulations require a reclamation plan as part of the permit. The Draft EIR uses models to predict future conditions under which the Project will operate to identify the significant environmental conditions and mitigation of the Project's environmental impacts. No analysis provided in the Draft EIR can model conditions or determine the Project's environmental impact on the area and region 30 years out, let alone 100 years in the future. The Draft EIR will become obsolete in identifying significant environmental impacts and mitigation for those impacts many years before the end of the Project Life. The Project Life should be reduced to the lowest modeling limitations presented in the Draft EIR.

Response 12-14

See Collective Response #5 regarding the duration of the proposed use permit and evaluation of project impacts in the future. CEQA does not have a set time limit on how many years into the future an EIR may evaluate, and examples of previously approved EIRs prove the same. In 2014, the California Fifth District Court of Appeal upheld an EIR for a 100-year mining project (see *Friends of Kings River v. County of Fresno* (2014) 232 Cal.App.4th 105, 111). Additionally, in 2011, an EIR for a mining project in Sacramento

County and in 2016 an EIR for a hard rock mining project in Madera County were approved with CUPs for 100-year terms, and the EIR evaluated potential significant environmental impacts for 100-year timeframes (State Clearing House No. 2007122013 and No. 2010071036).

Comment 12-15

vi. Figures 2-1 And 2-2 Aerials

Figure 2-1 incorrectly shows the "CUP Boundary" as including the CDFW Property. As noted above, the CUP applications do not include the CDFW Property. Figure 2-1 should be corrected to show the actual CUP boundary. Figure 2-2 is not legible to determine the "Existing CUP Boundary." Figure 2-2 needs to be corrected to clearly show the existing and proposed project boundary.

Response 12-15

Figure 2-1, "Plant Site Aerial," of the Draft EIR illustrates the existing CUP boundary, not the boundary for the CUP applications (Draft EIR page 2-9). See pages ES-2 through ES-3 of the Draft EIR for a full description of the CDFW parcels, which include portions of APNs 300-070-43ST, 48ST, and 50ST. These parcels are appropriately included as part of the baseline in this Draft EIR.

Figure 2-2, 'Quarry Site Aerial," of the Draft EIR legibly shows the existing CUP boundary, and the boundaries for proposed CUPs do not need to be included in the figures in this section, because the figures only purport to show existing conditions at the sites (Draft EIR pages 2-8 through 2-11).

No further response is required because the comment does not address significant environmental issues.

Comment 12-16

vii. Existing Setbacks

The existing setbacks stated on Page 2-15 are not consistent with the existing CUPs and approved project features and need to be corrected to provide accurate information to determine the significant environmental impacts of the Project as detailed below. The existing CUPs are described as and have the following conditions of approval concerning what conditions of approval and project design features apply:

Fresno County Resolution No. 11848 (CUP 3093 and 3094) Condition 1 states: "All conditions of Conditional Use

> Permits Nos. 367,2032, 2235, 2241 3063 and 3064 shall remain in full force and effect except as modified by the condition below."
>
> Fresno County Resolution 11776 (CUP 3063 and 3064) Condition 1 states: "All conditions of Conditional Use Permits Nos. 367,2032, 2235, 2241 shall remain in full force and effect except as modified by the condition below."

On Page 2-16 the Draft EIR states: "1) No stockpiled soil or materials placed closer than 25 feet from any property boundary except visual/sound berms." This is an incomplete description of the intent of the previous approved CUPs. Condition 3 of CUP 367 for the Plant Site states:

> Except for the main sand pile, the height of the material stockpiles shall not exceed 25 feet unless the Permittee is able to satisfy County that it will plant landscaping which will, within five (5) years of planting, effectively screen such stockpiles from view from Friant Road.

Response 12-16

The setbacks for the Plant Site listed on page 2-15 of the Draft EIR are consistent with the existing CUPs.

No response is needed because the comment does not address environmental issues; rather recites existing CUP setback language.

Comment 12-17

On page 2-18 of the Draft EIR states: the setback for the Quarry Site is a 200-foot mining setback from the river edge. However, Condition No.15 of CUP 2032 expands that and states:

> All excavation operations, including stockpiling, shall be set back a minimum of 200 feet from the existing San Joaquin River Channel. Riparian vegetation shall not be disturbed.

The setback from San Joaquin River is a project feature of CUP 2032 and is more precisely identified in the Mining Plan cross section attached to the CUP (a copy of which is attached hereto as Exhibit 3), which identifies the approved plan's setback from the San Joaquin River as:

> 200' Setback from existing stream channel or 20' setback from the reclamation board's existing designated floodway, whichever is further from the river bank.

Response 12-17

The comment restates sections of the Draft EIR and CUP 2032, which are consistent, and does not raise any issues related to environmental review nor significant environmental impacts. However, Condition No. 15 of CUP 2032 is misstated in the comment. "All excavation operations" should be "All extraction operations," per CUP 2032.

Comment 12-18

Figure 4.10-1 depicts the current and regulatory floodways and floodplains for the Project Sites. However, the Plant Site does not include the Project's area owned by the State of California. The Draft EIR should include a map showing the setback line as required by the Previous CUPs in order to analyze the impact of the proposed Project to the existing setback requirements.

Response 12-18

As stated in the comment, Figure 4.10-1, "Current and Regulatory Floodways and Floodplains," does depict the current and regulatory floodways and floodplains for the project sites. Setbacks are already included and analyzed as part of the Plant Site. The CDFW-owned parcels, while not specifically shown as within the yellow "Site Boundary" line of Draft EIR Figure 4.10-1 are nonetheless included on the map and shown within the floodplains and floodways depicted, and with a sufficient degree of analysis to provide decision-makers with information to enable them to make a decision that intelligently takes all relevant environmental consequences into account (CEQA Guidelines, Section 15151).

Comment 12-19

On page 2-18 the Draft EIR states: "7) no stockpile soil or material will be placed closer than 25 feet from any property boundary except visual/sound berms." This statement is not accurate and needs to be corrected. Condition No. 3 of CUP 2032 for the Quarry Site states:

> Stockpiling of materials shall not be allowed within 200 feet of the south property line, nor shall an excavation be allowed within a 260-foot radius of the front entry of the residences on the adjoining property to the south.

Also, Condition No. 12 of CUP 367 for the Quarry Site states:

> Stockpiling of material shall not be allowed within 200 feet of Friant Road or that portion of the north property line adjoining Lost Lake Park unless Permittee screens any such

closer stockpiling with approved landscaping so that it is not visible from Friant Road and the north property line of Lost Lake Park.

Response 12-19

Please see the Chapter 3, "Draft EIR Errata," which revises Section 2.4.2.2, "Quarry Site Existing Conditions," to clarify the applicable setback requirements for the Quarry Site. The project sites are subject to Fresno County's development standards for mining operations, which requires a 25-foot setback for the placement of stockpiled soils from any property boundary. As such, the Draft EIR accurately depicts the setback requirements applicable to the Quarry Site. The comment takes the remainder of the list describing the current setbacks at the Quarry Site out of context. The full list on page 2-18 of the Draft EIR is consistent with the current setback requirements of CUPs 367 and 2032, which also includes:

3) 250-foot radius mining setback from the residence just south of the southwest corner;
4) 75-foot mining setback from south boundary between the 250 feet from the southwest corner and 350-feet from North Friant Road right-of-way.

Comment 12-20

viii. General Plan Land Use Designations

On page 2-28 the Draft EIR implies there has been continuous recovery of mineral resources at the "combined" project sites for more than 100 years. This is not a correct description of the recovery of mineral resources at the Plant Site. The Plant Site is subject to a separate conditional use permit (CUP 3666). The Project Description/Operational Statement (Appendix B-2) states that aggregate mining has stopped on the Plant Site and therefore has not been continuous. Pursuant to Fresno County Zoning Code Section 868.6.020, Expiration, the mining of aggregate (land use) that is subject to a conditional use permit at the Plant Site has expired. Therefore, it is considered a new land use at the Plant Site and is not included in the Draft EIR baseline to determine Project's significant environmental impacts.

Response 12-20

The description on page 2-28 of the Draft EIR is correct because between the Plant Site and Quarry Site there has been continuous mining for more than 100 years.

Comment 12-20 also misstates the current permitting for the Plant Site. The Plant Site is

not yet subject to CUP 3666. The Draft EIR includes an application for CUP 3666, which has not yet been approved. The Plant Site is currently permitted under CUPs 367, 2032, 2209, 3063, and 3093 for both excavation and processing operations (Draft EIR Table 2-4, at page 2-27). Nothing in Fresno County Zoning Ordinance Section 868.6.020 shows that CUPs 367, 2032, 2209, 3063, and 3093 for the Plant Site would have expired.

Although alluvial mining has temporarily ceased at the Plant Site, mining operations have been continuous at the Plant Site throughout this time. The Plant Site currently processes aggregate material excavated from the Quarry Site. Thus, there has not been a cessation in the occupancy or use of land authorized by any of the above CUPs that would lead to their expiration under the circumstances stated in Fresno County Zoning Ordinance Section 868.6.020 or any other sections of the Fresno County Zoning Ordinance and is therefore not a "new land use" at the Plant Site. Furthermore, a permit may not automatically expire; notice and a hearing are required before expiration or revocation (see *Community Dev. Comm'n v City of Fort Bragg* (1988) 204 Cal.App.3d 1124).

Comment 12-21

The Draft EIR States the uses allowed in the agriculture designation include special agricultural uses and agriculture-related activities, including value-added processing facilities listed in Table LU-1. General Plan Table LU-1, Agriculture/Resource states:

> This designation provides for the production of crops and livestock, and for location of necessary agriculture commercial centers, agricultural processing facilities, and certain nonagricultural activities.

Although surface mining is allowed in Agricultural designated land, it is not an agricultural use. The Draft EIR implies that any process located on the Project Site is a "Value- Added Agricultural Use (Processing Facility). However, the Fresno County General Plan, Appendix A, Glossary, defines "Value-Added Agricultural Uses as:

> Uses of facilities that increase the value of agricultural produce over the cost of raw produce, such as canning, drying, freezing or packaging agricultural produce for the ultimate sale to consumers.

The use of value added agricultural to justify the inclusion adding concrete and asphalt recycling is not consistent with the Fresno County General Plan.

Response 12-21

Comment 12-21 misconstrues statements from Section 2.4.9, "General Plan Land Use Designations," and Section 4.11.1.3 of the Draft EIR. The "recovery of mineral resources" is allowed in Agricultural areas, as described in Fresno County General Plan Policy LU-A.4. The Draft EIR does not claim or imply that the project sites are a value-added agricultural processing facility or use.

Furthermore, for any use operation that would not typically be allowed under Fresno County General Plan designations and uses, a valid CUP would first be obtained.

Comment 12-22

The proposed Project is inconsistent with the Fresno County General Plan Goal PF-F and Policy PF-F.3, Solid Waste Facility Siting. Policy PF-F.3, e. states:

> Solid waste facilities shall not be located adjacent to rivers, reservoirs, canals, lakes or other waterways.

The proposed Project is located adjacent to the San Joaquin River.

As noted above, Appendix B-1, page 57, Paragraph 4.4.23 states the Plant Site will use the fines, tailings and other mining waste to reclaim the bottom 20 feet of the excavation. The Quarry Site will deposit the fines, tailing and mining waste in the bottom of the excavation. The Plant Site will not be reclaimed for 30 years, and the Quarry Site will not be reclaimed for 100.

This will amount to 30 MT stockpiled until reclamation or 551 acres of sand and mine waste at 25 feet in height. In other words, the Project will include a significant disposal of solid waste onto the Project site. (Fresno County Municipal Code, Section 8.20.010.M ("defining solid waste"); Pub Res. Code 40191 (same), 40192 (defining "disposal" as final deposition of solid waste onto land).)

In addition, the proposed Project includes the acceptance and recycling of used concrete and asphalt concrete. The Project Description indicates the annual tonnage of 200,000 MT. Solid waste processing facilities are considered solid waste facilities under the Public Resources Code and the Fresno County Municipal Code. (Public Resources Code §§ 40172, 40194; Fresno County Municipal Code § 8.20.010(G).)

The proposed uses of the Project as a solid waste facility are not consistent with the Fresno County General Plan. The EIR must be revised to address this land use impact.

Response 12-22

The Fresno County General Plan defines "Solid Waste Facility" as "[a] place, location, tract of land, area, or premises which is in use or intended to be used or which has been used for the disposal or management of municipal solid waste. Solid waste facilities do not include facilities for management of segregated separated waste for salvage or recovery, including segregated agricultural waste" (Fresno County General Plan, page A-6). Pursuant to the Fresno County General Plan, solid waste facilities dispose of and/or manage municipal solid waste.

Even if the fines, tailings, or mining waste would be "municipal solid waste" under the Fresno County General Plan, the materials would be used as part of the reclamation process not for disposal on-site, which re-emphasizes that the Plant Site would not be used as a solid waste facility and thereby the solid waste facility-specific requirements do not apply to the project sites.

Another distinction is that Appendix B-1, Sections 4.4.22 and 4.4.23 of the Draft EIR differentiate between "Solid Waste" and "Mining Waste," which would also be handled separately at the sites. Solid waste at the Plant Site would be deposited in dumpsters for pickup and disposed of by Ponderosa Solid Waste company, and no solid waste would be generated at the Quarry Site. At both the Plant Site and the Quarry Site, fines recovered from the aggregate processing would be deposited in the bottom of the excavation as part of reclamation (Draft EIR, Appendix B-1).

The Fresno County Code of Ordinances defines "solid waste" and "solid waste facility" as defined in PRC 40191 and 40194, respectively. PRC 40191 expressly lists numerous types of solid waste but does not include "mining waste." "'Solid waste facility' includes a solid waste transfer or processing station, a composting facility,…a transformation facility,…and a disposal facility" (PRC Section 40194). Under the laws relevant here, the fines to be deposited in the bottom of the excavation would not be solid waste and would be used for reclamation purposes, and the sites would not be "sold waste facilities." Therefore, Fresno County General Plan Goal PF-F and Policy PF-F.3 would not apply to the fines recovered from the aggregate processing to be used in the reclamation.

Recycling would be increased at the Plant Site through the import of concrete and asphalt debris that would be recycled onsite into crushed miscellaneous base and recycled asphalt product (under existing conditions, only come-back concrete is recycled) (see Draft EIR page 2-35).

The recycling plant's acceptance of concrete and asphalt for recycling does not render it a solid waste processing facility. Pursuant to the Fresno County General Plan, solid waste facilities do not include recycling centers (Fresno County General Plan at page A-6). 'Solid waste facility' under Fresno County Ordinance Code Section 8.20.010 is defined as it is in the PRC Section 40194. While 'processing' includes the "recycling of solid waste," 'recycling' is also distinguished as "reconstituting materials that would otherwise become solid waste" (PRC Sections 40172 – 40180).

Further supporting that the recycling plant would not be a "solid waste facility" is the three-part test used by CalRecycle to determine whether an operation qualifies as a solid waste facility, which would be subject to permitting by CalRecycle, or as a recycling center, which would not be subject to permitting by CalRecycle (PRC Section 40200(b)(2)). The three-part requires that (1) an activity shall only receive material that has been separated for reuse prior to receipt; (2) the monthly average of the residual amount of solid waste left after processing the material received at the facility is less than 10 percent by weight; and (3) the amount of putrescible wastes in the material is less than 1 percent of the amount of separated reuse material received by weight, and the putrescible wastes shall not cause a nuisance.

If the recycling plant were to fail to meet any elements of the three-part test, then it would be considered a solid waste facility as defined in the California Public Resources Code and therefore under the Fresno County Ordinance Code be under CalRecycle's permitting jurisdiction.

As proposed in the Draft EIR, the recycling plant meets the three-part test and therefore would not qualify as a solid waste facility and is consistent with the Fresno County General Plan. Therefore, the EIR does not need to be revised in this regard.

Comment 12-23

ix. Proposed Project Elements

On page 2-40 the Draft EIR states that the Quarry Site is designed to continue avoidance of the riparian corridor along the San Joaquin River and mining setbacks required under the existing CUPs would remain the same. Figure 2-8, Proposed Quarry Site Mining Plan, needs to be revised to depict the setbacks required under the previous CUPs.

Response 12-23

Figure 2-8, "Proposed Quarry Site Mining Plan," of the Draft EIR already provides the setbacks required under the previous CUPs. Specifically, the setbacks are labeled in Figure 2-8 as "Existing … Setback…"

Comment 12-24

Also, on page 2-40 the Draft EIR states that the existing screening berms along North Friant Road frontage and the south property line would remain in place. The Draft EIR needs to provide the height and location of the existing berms and provide information on the north property line screening or setback. The Draft EIR should include a line-of-site analysis that depicts the maximum height of stockpiles on the Project Sites.

Response 12-24

The Draft EIR provides the height and location of the existing berms in the Surface Mining and Reclamation Plan found in Appendix B-1 to the Draft EIR. Specifically, the Surface Mining and Reclamation Plan provides that:

> "there is an existing, minimum five (5) foot high screening berm along the Friant Road frontage (Appendix E) and an existing minimum fifteen (15) foot high screening berm along the south property line extending from the southwest corner of the site to approx. 475 feet from the Friant Road right-of- way." (Draft EIR, Appendix B-1, "Surface Mining and Reclamation Plan," Section 4.1.4(b), page 28).

Further, regarding information on the north property line screening or setback, Draft EIR Figure 2-8 provides that the Quarry would retain the "EXISTING 25' MINING SETBACK FROM PROPERTY LINE."

Comment 12-25

Table 2-6, Existing and Proposed Daily Truck Trip Generation does not include trips from the Material Recovery Facility that is planned to accept used concrete and asphalt concrete which is projected to total 200,000 tons per year. The table and its use within the Draft EIR need to be corrected to accurately depict generated truck trips and identify the significant environmental impact of the Project.

Response 12-25

Comment 12-25 is incorrect. Comment 12-25 refers to daily truck trips from the "Material Recovery Facility" but refers to the Concrete and Asphalt Recycling Facility, and more specifically, the crushed miscellaneous base (CMB) and recycled asphalt product (RAP) sales annual and daily truck trips. The existing CMB and RAP sales annual trips and annual average daily truck trips are provided in Table 4.17-1, "Existing Annual Trip Generation at Plant and Quarry Sites" (Draft EIR, page 4.17-15). The CMB and RAP annual trips and annual average daily truck trips during the life of the project is provided in Tables 4.17-2, 4.17-3, and 4.17-4, which take into account the projections for total used concrete and asphalt (Draft EIR, pages 4.17-16 through 4.17-18). Finally, impacts associated with the annual trips and annual average daily truck trips from the Concrete and Asphalt Recycling Facility were analyzed in Section 4.17, "Transportation," Section 4.17.3.2, "Analysis Methodology," (Draft EIR, pages 4.17-14 through 4.17-27), in Impact 4.17-1 (Draft EIR, page 4.17-27), and resulted in the project's required implementation of Mitigation Measures 4.17-1a through 4.17-1r (Draft EIR, pages 4.17-27 through 4.17-40).

Comment 12-26

x. Trail Easements

On page 2-51, the Draft EIR states that the applicant is in discussions with the San Joaquin Conservancy's (SJRC) Executive Officer towards providing trail easements at the Plant and Quarry Site. The Draft EIR concludes that no further CEQA review is warranted because SJRC has not "currently" proposed development and construction. The trails are part of the San Joaquin River Parkway Master Plan. The Draft EIR further states that should the trails be proposed for development in the future, project-level CEQA review would be required prior to construction. This is not an accurate summary of the Project's impact on the San Joaquin River Parkway Master Plan.

The Draft EIR, states in Section 2.3, Project Purpose and Objectives, 10): Provide potential Parkway trail easement. The Project needs to make provisions for an easement to allow the San Joaquin River Parkway Master Plan to go forward and provide linkage to trails within a certain time limit, instead of 100 years from now. Project Description/Operational Statement, Appendix B-2 states that the Project will "acquire, through purchase, easements, or other mutually satisfactory transactions, land for recreation areas and the expansion of existing parks and recreation areas." Specific mitigation measures should be included in the Draft EIR requiring the Project to provide the necessary trail easements consistent with the San Joaquin River Parkway Master

Plan and Lost Lakes Park Master Plan, acquire, through purchase, easements, or other mutually satisfactory transactions, land for recreation areas and the expansion of existing parks and recreation areas within five years of Project approval.

Response 12-26

The 2018 San Joaquin River Parkway Master Plan Update Final EIR (2018 Parkway Master Plan) provides as its Mineral Resource Goals:

- MINERAL.A Work with gravel mining companies to acquire high-priority properties after they have been mined. Promote reclamation plans that enhance and complement Parkway goals and are Parkway-ready to the extent practicable. (MR1)
- MINERAL.B Design, construct, and manage the Parkway in a manner that would not conflict with sand and gravel mining operations. (MR2) (Parkway Master Plan, page 3-7: https://sjrc.ca.gov/wp-content/uploads/2024/08/Final-EIR-for-Board-certification-4-11-18.pdf).

As provided in the 2018 Parkway Master Plan EIR, the potential trail easements would be implemented once the project sites have been mined. If constructed sooner, the trail easements would be implemented in a manner that would not conflict with the project's mining operations. The timing of the proposed development and construction of trails in the 2018 Parkway Master Plan is unspecified and uncertain. Under CEQA, "where future development is unspecified and uncertain, no purpose can be served by requiring an EIR to engage in sheer speculation as to future environmental consequences" (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 395).

Accordingly, CEQA does not require this EIR to speculate as to the future environmental consequences of a potential trail easement that has not advanced beyond inclusion as a non-mandatory action in a Master Plan. See also Collective Response #22 for further discussion of the proposed trail easements.

Comment 12-27

xi. Other Agencies Whose Approval May Be Required

The proposed Project includes the acceptance and recycling of used concrete and asphalt concrete, and the final disposal of fines, overburden, and other mining waste onto the land. The Project Description indicates the annual tonnage of 200,000 MT in concrete and asphalt waste for recycling. This is considered a large Material Recovery Facility. This land use is subject to regulations as a proposed Material Recovery Facility, and possibly

as a solid waste disposal facility. Recycling of concrete and asphalt concrete is subject to a Solid Waste Facility Permit (SWFP). The Draft EIR needs to provide details in the Project Description how the operation of the Material Recovery Facility and the disposal of fines, overburden, and other mining waste will take place and be consistent with all applicable regulations of CalRecycle.

Response 12-27

The Concrete and Asphalt Recycling Plant does not meet the definition of a "Material Recovery Facility." A "Materials recovery facility" or "MRF" "means a recycling facility that receives recyclable material, including, but not limited to, any covered material, for mechanical or manual sorting into specification-grade commodities for sale to a broker or end market (see PRC Section 42041(p)). "Covered material" is defined as both of the following:

(A) Single-use packaging that is routinely recycled, disposed of, or discarded after its contents have been used or unpackaged, and typically not refilled or otherwise reused by the producer.

(B) Plastic single-use food service ware, including, but not limited to, plastic-coated paper or plastic-coated paperboard, paper or paperboard with plastic intentionally added during the manufacturing process, and multilayer flexible material. For purposes of this subparagraph, "single-use food service ware" includes both of the following:

(i) Trays, plates, bowls, clamshells, lids, cups, utensils, stirrers, hinged or lidded containers, and straws.

(ii) Wraps or wrappers and bags used in the packaging of food offered for sale or provided to customers by food service establishments.

(PRC Section 42041(e)(1)).

Here, the Concrete and Asphalt Recycling Plant does not include the recycling of "covered material" and is therefore not considered a large Material Recovery Facility. The federal, state, and local statutes and regulations governing large Material Recovery facilities do not apply.

The Draft EIR on page 4.19-11 states in detail the procedures to be taken to comply with all applicable federal, state, and local statutes and regulations related to the waste generated at the project site. The Solid wastes currently generated at the Plant Site include parts packaging (e.g., wood, cardboard), paper, and office waste. There are three 4-cubic yard bins that are collected by Ponderosa Solid Waste twice per week. Under the

proposed project, the same amount of solid waste service would be required, but additional waste would be generated at the Quarry Site. It is anticipated that three 4-cubic yard bins would be collected by Ponderosa Solid Waste at the Quarry Site twice per week (Draft EIR page 4.19-11).

The Concrete and Asphalt Recycling Plant would be subject to an Industrial General Permit under the National Pollutant Discharge Elimination System (NPDES) Permit to cover any discharges from the Concrete and Asphalt Recycling Plant. Finally, in compliance with Fresno County General Plan Policy PF-F.1 ("The County shall continue to promote maximum use of solid waste source reduction, reuse, recycling, composting, and environmentally-safe transformation of wastes"), as provided in Impact 4.19-3 of Section 4.19, "Utilities and Service Systems," of the Draft EIR, the project promotes recycling in the County by including the Concrete and Asphalt Recycling Facility (Draft EIR, page 4.11-22). AB 2953, which went into effect in 2024, strongly encourages concrete and asphalt recycling (see PRC Section 42704.6).

Comment 12-28

b. Chapter 4: Environmental Analysis

i. Section 4.1 Aesthetics

The Draft EIR is inadequate in describing the significant impact on a designated scenic roadway. On page 4.1-61 of the Draft EIR states there are no state scenic highways. However, there are local designated scenic highways.

The Draft EIR is not consistent with the Fresno County Rural Bikeways Plan that depicts North Friant Road on Figure OS-1 of the Fresno County General Plan as a designated scenic highway. The Draft EIR is not consistent with the City of Fresno General Plan that depicts North Friant Road as a scenic highway. The Project has the potential to significantly impacting the off- site views from the roadway if not mitigated. The Draft EIR is inadequate because it did not analyze the off-site views from the designated scenic highway and did not include Project features to prevent the Project operations from being visible from the scenic roadway. Mitigation Measure 4.1-1 is inadequate to lessen the visual impact of the Project from the designated scenic roadways. The Project should include the following mitigation:

> No stockpiles or mining facilities including the cement plant, asphalt plant, material recovery or buildings shall be visible from North Friant Road or surrounding properties.

Response 12-28

The visual impact analysis for the Draft EIR addresses impacts to viewpoints along North Friant Road, a locally designated scenic roadway (see Draft EIR page 4.1-14). Table 4.1-2, "Summary of Potentially Sensitive Viewpoint Locations," discusses in detail that four different viewpoints were selected for analysis along North Friant Road, and concludes that the project's impacts to two of these viewpoints would be less than significant from the Quarry Site entrance located along North Friant Road and the bicycle lane, 200 feet east of the Quarry Site (see Draft EIR, Figure 4.1-4, "Quarry Site Public Viewpoint—Location #3," and at page 4.1-56) and the Northeast corner of the Quarry Site Along North Friant Road 375 feet northeast of the Quarry Site (see Draft EIR, Figure 4.1-5, "Quarry Site Public Viewpoint—Location #4," of the Draft EIR and at page 4.1-57). Table 4.1-2 further concludes that the views of the Plant Site along North Friant Road (450 feet northeast of the Plant Site) and the Plant Site along North Friant Road (230 feet east of the Plant Site) would remain largely similar to existing conditions (i.e. the baseline) during Stage 1 operations and would improve after completion of site reclamation due to the removal of processing equipment and revegetation of the site (see Figure 4.1-7, "Plant Site Public Viewpoint—Location #6," and Figure 4.1-8, "Plant Site Public Viewpoint—Location #7," and page 4.1-60 of the Draft EIR).

The comment also asserts that the Draft EIR is inconsistent with the Fresno County General Plan and the City of Fresno General Plan, which both depict North Friant Road as a designated scenic highway. However, the Draft EIR expressly identifies North Friant Road as a Fresno County-designated scenic roadway.

Fresno County Code requires that CUPs be consistent with the General Plan. The Draft EIR provides an analysis of whether the project is consistent with applicable local goals, objectives, and policies in Section 4.11, "Land Use and Planning," (Draft EIR page 4.11-35). The Draft EIR addresses Fresno County Policy OS-K.2 that requires an inventory and map of significant scenic resources within the county and identified that the closest County-designated scenic resource is North Friant Road, which is adjacent to both the Plant Site and Quarry Site. The Draft EIR concluded that the project is consistent with this policy because the project sites have been designed to minimize impacts to public viewpoints from this roadway (Draft EIR page 4.11-35). The Draft EIR also analyzed and concluded that the proposed project would be consistent with Fresno County policies pertaining to scenic roadways as the project (1) would be consistent with the goal to conserve, protect, and maintain the scenic quality of land and landscape adjacent to scenic roads in Fresno County; and (2) would not significantly impact the public views from North Friant Road (Draft EIR page 4.11-35).

Lastly, the comment suggests implementation of a mitigation measure which would prohibit visibility of any mining facilities or stockpiles from North Friant Road. The project sites have been designed to minimize impacts to public viewpoints from this roadway and would not substantially change the existing visual character of the project sites or surrounding areas. In addition, many of the visual impacts of mining visible from Friant Road are already part of the existing CEQA baseline. The Draft EIR concludes that each of the identified viewpoints from North Friant Road would not result in a significant impact to these scenic vistas and thus it is not necessary to implement the comment's suggested mitigation measure (Draft EIR Table 4.1-3, "U.S. Bureau of Land Management Visual Project Impact Ratings at Nearby Viewpoints," on page 4.1-53).

Comment 12-29

The Draft EIR is insufficient in mitigating the Project's impact on Light and Glare. The Project will introduce a new source of night time lighting in the surrounding community. The Draft EIR concludes that design features will result in a less than significant impact. However, there is no requirement that the Project implement any of the features discussed. Therefore, the following mitigation measure should be added to the Draft EIR:

- Night lighting on the property shall be arranged and controlled so as not to luminate public rights-of-way or adjacent properties.
- The Project shall only use high-pressure sodium and cut-off fixtures to minimize light pollution.
- The Applicant shall submit a lighting plan to the County Planning Department for approval prior to construction of the processing facilities that will identify the location of lights, how they will be aimed, and types of shielding that will be utilized such that light bulbs and reflectors are not visible from public viewing areas and illumination of the vicinity and the nighttime sky is minimized.
- Nighttime lighting on the Project Site shall be limited to areas required for the safety of project personnel and the public.
- The Project's fencing shall either be constructed of non-reflective material, treated, or painted to reduce visual impacts.

- Non-reflective surfaces or non-reflective paint shall be used for the processing plant equipment and structures to minimize glare from these facilities.

Response 12-29

The Draft EIR sufficiently analyzes the project's impact on light and glare in Section 4.1, "Aesthetics and Visual Resources," of the Draft EIR. Draft EIR Impact 4.1-4 analyzes this impact and determines that it would be less than significant (Draft EIR page 4.1-62). However, the County agrees that four of the visual mitigation measures proposed in the comment are feasible and would be added as follows bullets 1, 2, 4, and 6 which state: (1) Night lighting on the property shall be arranged and controlled so as not to luminate public rights-of-way or adjacent properties; (2) The project shall only use high-pressure sodium and cut-off fixtures to minimize light pollution; (4) Nighttime lighting on the project sites shall be limited to areas required for the safety of project personnel and the public; (6) Non-reflective surfaces or non-reflective paint shall be used for the processing plant equipment and structures to minimize glare from these facilities.

As to the third bullet, this proposed measure is redundant and unnecessary because the Draft EIR requires compliance with Section 834.4.220, subd. I.22 of the Fresno County Zoning Ordinance and therefore would not illuminate public rights-of-way or adjacent properties (see page 4.1-63 of the Draft EIR).

Regarding the fifth bullet, this measure is not necessary since the previously discussed design elements would be sufficient to reduce impacts of light and glare to less than significant (Draft EIR Impact 4.1-4 on pages 4.1-62 through 64).

Comment 12-30

ii. Section 4.3 Air Quality

The air quality assumptions are inadequate to determine Project's environmental impacts and the conclusions in Section 4.3, Air Quality. The Draft EIR needs to be revised and recirculated.

(1) AQ Modelling

The air quality assessment was peer reviewed by Taylor Environmental in 2020, and was apparently completed in March of 2022. It is now March of 2025, and this analysis would appear to be woefully out of date. Were the latest versions of the air quality modelling tools used? Did they apply the latest regulations, such as the 2022 Advanced Clean Fleets Regulation and

amendments to the 2004 Transport Refrigeration Unit (TRU) Airborne Toxic Control Measures?

Response 12-30

The comment does not specify what conditions have changed that would require a new air quality assessment. The Draft EIR's air quality assessment complies with CEQA and is not outdated or inaccurate. See *W. States Petroleum Assn. v. California Air Res. Bd*. (2025) 108 Cal. App. 5th 938, 984 holding that reliance on 10-year-old data did not violate CEQA because no facts supported that the data was outdated or inaccurate; see also *AquAlliance v. U.S. Bureau of Reclamation*, 287 F. Supp. 3d 969, 1018 (E.D. Cal. 2018) [holding that reliance upon groundwater modeling data collected 10-44 years prior did not violate CEQA]).

The air quality modeling that was prepared remains representative of the project's impacts using a conservative analysis approach. Generally, modeling tools only become more precise and less conservative over time and so using the current version of the modeling tools would result in less impact. Moreover, the stated regulations would have no effect on the modeling results since there are no such electric vehicle available in the weight class of the trucks used to haul aggregates and none of the trucks associated with this project is equipped with refrigeration. Moreover, the Advanced Clean Fleet (ACF) regulation would not affect private fleets, and CARB has withdrawn the request for waiver from EPA that is needed to implement the 2022 ACF regulations. Advanced Clean Fleets | California Air Resources Board has the latest on ACF.

Nevertheless, the technical analysis was reviewed, and the analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (see Appendix D-3). This analysis was used to revise Section 4.3 as seen in Appendix D-4, "Revised Section 4.3, Air Quality." The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 12-31

(2) Baseline Selection

The AQ modelling is fundamentally flawed, because it arbitrarily selects as the baseline year 1998. (Appendix D-1 at p. 88 ("The Baseline was determined based on historical production records for the year 1998").) This flawed baseline was then subtracted from the project impacts, and evaluated against the significance criteria. This is material, because emissions technology has advanced since 1998, and operations at the site have changed. An up-to-date baseline of the current conditions should be used to analyze the Project's impacts.

Response 12-31

Neither CEQA nor the CEQA Guidelines mandates a uniform, inflexible rule for determination of the existing conditions baseline. Rather, an agency has discretion to decide how the existing physical conditions without the project can most realistically be measured (*Communities for a Better Env't v. S. Coast Air Quality Mgmt. Dist*., 48 Cal. 4th 310, 328 (2010)). However, Baseline emissions are based on the 1.4 MT/year production rates that occurred in 2005. One hundred percent of rock mined from the Quarry Site was hauled in on-road trucks to the Plant Site for processing. Accordingly, the baseline year used to calculate air impacts was 2005, not 1998, as described in the errata. Moreover, asphalt emissions were not included in the baseline for purposes of this analysis as reflected in the Draft EIR.

The baseline emissions for Offroad engines were assumed to emit at CalEEMod 2012 default rates. Use of the 2012 rates is conservative because the 2005 rates could have been used and it is appropriate that the project benefit from having paid its fair share to mitigate the cumulative impacts on air quality by upgrading the vehicle engines that it owns.

The baseline emissions for on-road vehicles were assumed to emit at EMFAC default rates for calendar year 2018, which was chosen because it is the year before the environmental analysis supporting the Draft EIR commenced.

The Draft EIR provides that "historical data for production, fuel use, and pollutant emissions were chosen to represent maximum activity levels onsite and utilized to determine the baseline emissions" (see Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.3.3, "Analysis Methodology"). Note that these changes reflected in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (see Appendix D-3) do not change the conclusions of the Draft EIR.

Comment 12-32

(3) Aggregate Processing and Stockpiling

Appendix D-1, Air Quality, Health Risk, and Climate Change Impact Assessment, list the Project features that are used in assessing air emissions. The air emissions were incorrectly modeled on aggregate production of 3 MT per year. Table 2-1 lists 3.3 MT per year of aggregate processing. The remaining .3 tons per year are fines and mine waste that will remain on the Project Sites and stockpiled until they are deposited in the bottom of the mine at the time of reclamation, 30 to 100 years in the future. The Draft EIR air quality assessment needs to be revised to include this significant increase of 30 MT of aggregate processing and

stockpiling to identify the significant environmental effect and provide mitigation.

Response 12-32

The Draft EIR's air quality analysis utilized 3.0 MT per year in order to analyze air quality impacts, which is consistent with the project's proposal to produce 3.0 MT of aggregate per year. CEMEX, moreover, is aware that in Chapter 2, "Project Description," Section 2.2.3, "Summary of Project Characteristics," on page 2-5 of the Draft EIR at Table 2-1, "Rockfield Modification Project Characteristics," the "Estimated Maximum Annual Processed Aggregate Volume (including waste/fines)" was listed as 3.3 million tons, or "3.3 MT" of aggregate. CEMEX understands that this 3.3 MT number is inconsistent with the analysis set forth in the air quality section, which assumed a maximum annual production of 3.0 MT (see Appendix D-1, of the Draft EIR on page i of the Executive Summary).

In a letter to the County dated March 12, 2026, CEMEX communicated that it has agreed to accept a condition of approval that would cap the annual production at 3 MT per year including waste and fines. This letter is provided in Appendix B-3 of the Final EIR. Please see the Final EIR Chapter 3, "Draft EIR Errata" for revisions to Table 2-1 regarding the clarification of the maximum production amount of 3 MT per year.

The air quality analysis was reviewed, and the analysis was updated with new information and is described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3 of the Final EIR). The updated air quality analysis also assumes a maximum annual production of 3.0 MT, consistent with the project's proposal and the proposed condition of approval. The updated air quality analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See Appendix D-4, "Revised Section 4.3, Air Quality."

Comment 12-33

(4) Concrete Recycling

The Draft EIR does not discuss the exposure to asbestos from recycling older concrete or provide protocols to prevent exposure to workers and the public. Mesothelioma Hope website provides information on "The Risk of Asbestos in Concrete." The Draft EIR needs to be revised to include analysis of the risk of airborne asbestos exposure from recycling used concrete.

Response 12-33

The project would only accept material from known customers or sources. Any loads with unsuitable materials would be rejected. Specifically regarding recycle aggregate production, the vast majority of what is consumed is fresh, return concrete typically generated from nearby or onsite ready-mix plants. The project would reject mixed construction debris to be consumed for recycle production because it could affect the finished product quality. Incoming loads would continue to be monitored, and rubble piles would continue to be visually inspected prior to crushing to remove any undesirable debris such as rebar.

Moreover, the concrete recycling facility is not authorized to accept asbestos waste because existing regulations do not permit materials containing asbestos to be sent to this concrete recycling plant.

The project sites are also not located in a region where rock types contain naturally occurring asbestos and therefore naturally occurring asbestos would not be released into the air and the proposed project would not result in health risk impacts from exposure to naturally occurring asbestos (see Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.3.3). This was confirmed by a review of on-site core samples of several borings (see Draft EIR page 4.3-47; See also Appendix F-1, "Plant Site Geotechnical Report").

The State Geological Survey produced Map Sheet 59 showing the locations where asbestos is found. Plotting those locations shows that the project sites are over 20 miles from those sites where such materials could have originated. The transportation cost of disposing of such construction debris is the primary cost. Therefore, it is reasonable to expect the distance traveled to be the minimum possible and likely fewer than 10 miles. The distance to NOA sites and presence of ACTMs that govern the amount of NOA that can be in mined materials sold recently indicates that NOA in recyclables processed on-site is unlikely to be present in quantities that would be a health risk concern for neighbors of the project.

There is no evidence in the record to support the claim that the asbestos in the debris rises to a level that would expose the public to unsafe levels or in any measurable amount. For these reasons, the analysis approach is sufficient and further analysis not required.

Comment 12-34

(5) Project Components for Air Quality Analysis

Table 4.3-8, Rockfield Modification Project Components of Air Quality and Greenhouse Gas Modeling, does not include operation mobile equipment, onsite and offsite delivery trucks, or onsite

and offsite workers vehicles. The air quality and greenhouse gas modeling are insufficient to analyze the significant environmental effect of the proposed Project. Table 4.3-8 needs to be revised to include all Project components.

Response 12-34

Table 4.3-8, "Rockfield Modification Project Components of Air Quality and Greenhouse Gas Modeling," establishes the parameters by which the project would include operation of mobile equipment, onsite and offsite delivery trucks, and onsite and offsite worker's vehicles in the air quality analysis (see Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.3.3). "Emissions Calculations Methodologies" include combustion sources, primarily non-road diesel engines in off-road vehicles and utilize the CalEEMod default method and emissions factors (see Appendix D-4, Section 4.3.3.3).

See mobile sources also listed and analyzed in Tables 4.3-10 through 4.3-12, 4.3-15 through 4.3-17; Impact 4.3-2; and Appendix D-3 (Appendix D-3, "Air Quality, Health Risk, and Climate Change Assessment," Section 3.4, "Methodology," on page 37, "This analysis evaluates and reports historical and potential future emissions from on-site sources including aggregates mining, aggregates processing, ready mix concrete production, asphaltic concrete production, as well as offsite mobile source emissions"). The Draft EIR, as updated in the Final EIR, provides decision-makers with information to enable them to make a decision which takes account of environmental consequences because these sources are included and analyzed in the Final EIR (Title 14 CCR Section 15151).

Table 4.3-8 contains the changes to activities that are proposed. The changes necessitate additional mobile equipment activity and delivery trucks but are an indirect result of the production amounts being proposed. As shown in Tables 4.3-10 through 4.3-12 and 4.3-15 through 4.3-17 and elsewhere throughout the Draft EIR, emissions from these sources are quantified and used in the determination of significance. Additionally, to address comments on the Draft EIR like this one, the technical analysis was reviewed, and the analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3 of the Final EIR).

The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 12-35

(6) Baseline Emissions

Baseline emissions information depicted in Table 4.3-9, Historical Production Data, needs to be revised. Production of aggregate, concrete and asphalt is seasonal with an increase in production during Summer months. The baseline emission data needs to describe how the Maximum Hour and Maximum Day is determined for modeling.

Response 12-35

Though Table 4.3-9, "Historical Production Data," includes the max hour and max day (which would typically be in the summer due to the nature of the materials produced), the baseline is based on the annual production. Additionally, as explained in the executive summary for Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," revised May 13, 2026, the Draft EIR analysis assumed the same baseline rate of excavation and sales, without considering a waste factor. In Appendix D-4, "Revised Section 4.3, Air Quality," a waste factor of 15 percent for alluvial mining and 10 percent for hard rock mining were used to calculate emissions from transport and placement of waste fines. In addition, the baseline daily rates were revised to 6,000 tpd to align with the Draft EIR annual rates.

As explained in the Draft EIR, as updated in the Final EIR (see Appendix D-4) baseline emissions were calculated by analyzing fuel use data, engine information, and production records, and historical data for production, fuel use, and pollutant emissions were chosen to represent maximum activity levels onsite and were taken into account in determining the baseline emissions to provide a clear picture to the public and the decision-makers (Appendix D-4, Section 4.3.3.3). Draft EIR Appendix D-1, which has been incorporated into Appendix D-3, explains how the baseline data was derived:

"Project emissions are quantified by subtracting existing emissions occurring at the Quarry and Plant Sites (Baseline) from emissions with the Project (Future). Baseline emissions are estimated using historical fuel use data from off-road vehicles, aggregates production records, and other specifications (e.g. engine information) provided by CEMEX."

The recycled materials processing plant was brought to the site by contractors at various times in the past. The daily throughput is an estimate based on Operator records. The ready-mix plant daily rate is based on Operator records on large jobs that were fulfilled in the past.

Additionally, Appendix G to Appendix D-3 of the Final EIR includes labels, and further contextualizes the data used to determine the Baseline.

The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 12-36

(7) Emissions

Tables 4.3-10, 4.3-11 and 4.3-12 needs to be revised to include operation mobile equipment, onsite and offsite delivery trucks, or onsite and offsite workers vehicles.

Tables 4.3-16 and 4.3-17 needs to clearly depict the thresholds of significance for each source pollutant.

Response 12-36

Tables 4.3-10 through 4.3-12 in the Draft EIR, as revised in this Final EIR, include operation mobile equipment and onsite and offsite trucks and vehicles, described in the tables as off-road engines, on-road vehicles onsite and offsite, and equipment associated with quarrying, blasting, and material handling (see Appendix D-4, "Revised Section 4.3, Air Quality"). Thus, no revisions to Tables 4.3-10 through 4.3-12 are necessary.

Tables 4.3-16 and 4.3-17 show future emissions and would be inappropriate to compare with the thresholds of significance because the values for that comparison require the subtraction of the Baseline to determine the change in the environment.

Tables 4.3-18 through 4.3-22 of the Draft EIR show the emission levels in comparison to the significance thresholds and criteria, and Table 4.3-19 specifically shows the breakdown of the different pollutant sources during project operations. Thus, tables in Section 4.3 as updated in Appendix D-4, clearly depict thresholds of significance and significance criteria for the different source pollutants.

In addition, the technical analysis was reviewed, and the analysis was updated to address comments on the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (see Appendix D-3). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 12-37

(8) VMT Impacts on GHGs and Air Quality

Table 34 of Appendix D-1 states the Project vehicles are heavy-heavy duty and are not subject to heavy duty GHG Phase 1 regulations. However, there are heavy duty trucks that have a direct and indirect impact that are generated by delivery of Project's products and acceptance of materials for recycling. Although the Vehicle Miles Travel (VMT) is used to determine transportation impacts and has been limited to passenger vehicles and light trucks, VMT for the operational aspects of the Project still applies to determine environmental impacts from air quality and hazards. The Project's air quality modeling needs to include the 6.2 million annual VMT generated by the Project (Appendix I-2, Estimates of Vehicle Miles Traveled). To the extent the VMT analysis indicates that the Project will result in a reduction of regional VMTs from similar aggregate mining operations, the EIR must still analyze the air quality impacts caused by the redistribution of VMTs. For instance, will heavier traffic on Friant Rd. result in higher levels of diesel particulate exposure in closer proximity to sensitive receptors?

Response 12-37

The Draft EIR correctly concludes that GHG Phase 1 Regulations do not apply to the project's off-road heavy-duty vehicles (see Draft EIR 4.8-22, as updated in Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions"). Phase I does not apply to heavy-duty off-road vehicles, but did apply to heavy-duty on-road vehicles (17 CCR Section 95660 et seq). Off-road vehicles are governed by different regulations (13 CCR Sections 2449 et seq). Vehicle emissions are incorporated into the air quality assessment (see Appendix D-3, Section 4.4).

On-road truck emissions were assessed as part of a regional increment analysis, which is based on project activity levels, as well as regional aggregate demand as forecast in the California Department of Conservation Map sheet 52, as revised to account for current conditions (see Appendix J, of Appendix D-3). The GHG emissions are presented in Table 4.8-8, "Maximum Annual Operation Phase GHG Emissions," and further discussed in Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions," Section 4.8.4, "Project Impacts and Mitigation Measures." Regarding possibility of heavier traffic on Friant Road resulting in higher levels of diesel particulate exposure, additional modeling was undertaken and shows that the potential increase in trucks on any road would not expose receptors to significant levels of health risk, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3). The analysis

demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 12-38

(9) Compliance with Air Quality Plans

On page 4.3-57, the Draft EIR, concerning Impact 4.3.1, is insufficient and needs to be revised. The emission data for Project operations exceeds daily and annual San Joaquin Valley Air Pollution Control District (SJVAPCD) thresholds which results in conflict with air quality plans.

In addition, the analysis concludes the Applicant will be able to comply with future rule making by the SJVAPCD concerning implementation of applicable air quality plans. Thus, concluding that the level of significance before mitigation is less than significant. There is no requirement in the Draft EIR for the Project to comply with future air quality attainment plans during the 100-year Project duration. This assumption was used to support a determination of less than significant is not support by proposed Project components. The air quality assessment assumed minor changes in rulemaking in the future will "likely" lessen future Project impacts on air quality. A mitigation measure should be included to the Draft EIR requiring the Project to comply and implement all new technology, air quality plans, goals and regulations in the future.

Response 12-38

The comment is incorrect. Draft EIR Impact 4.3-1, as updated in the Final EIR, provides that the project would not conflict with implementation of applicable air quality plans because the proposed project would not result in any significant and unavoidable air quality impacts related to criteria air pollutant emissions (see Appendix D-4, "Revised Section 4.3, Air Quality"). The project's emissions would not exceed daily or annual SJVAPCD thresholds after implementation of Mitigation Measures 4.3-2a and 4.3-2b (see Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," and Table 4.3-23, "Mitigated and Unmitigated Criteria Pollutant Concentrations," in Appendix D-4). As such, the project is consistent with applicable air quality plans. The comment suggests implementing "all new technology." This is an overbroad suggestion, and not necessary to reduce the project's air emissions to less than significant (see *Covington v. Great Basin Unified Air Pollution Control Dist.* (2019) 43 Cal.App.5th 867, 879). The project would be required to comply with all applicable future air quality plans and regulations.

Comment 12-39

(10) Natural Gas

California Energy Commission has a goal of eliminating natural gas use by 2045. The use of natural gas has a significant impact on greenhouse gases in California. The Project proposes the use of natural gas for the asphalt plant and therefore would not be in compliance with this goal. The Project, to comply should build the new asphalt plant using electricity instead of natural gas or other fossil fuels. This will result in a reduction in air pollutants. The Project should be revised to use electricity instead of natural gas or other fossil fuels for the asphalt plant and other Project components.

The Project should be required to use all-electric mining trucks. Caterpillar has successfully demonstrated the first battery electric 793 large mining truck. The Project should be required to use all-electric mining vehicles to lessen air quality impacts.

Response 12-39

It is assumed that the commenter is referring to Executive Order N-5-24 that was signed by Governor Newsom on October 30, 2024. The order directs the CEC to examine various aspects of energy use in the State. The CEC's commitment to achieving carbon neutrality by 2045, as established by AB 1279, does not require all industries to fully phase out natural gas use by that time. The number of factors that would need to align for natural gas to be eliminated by 2045 is extensive and speculative. Moreover, significant improvements would need to be made to the electrical grid.

Currently, there are no such battery-electric mining trucks that are commercially available and feasible for use. Therefore, achieving this goal is not considered to be reasonably foreseeable or feasible and need not be assessed under CEQA. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

The Draft EIR discusses AB 1279 (also referred to as the Scoping Plan) on pages 4.8-9 and 4.8-20. As demonstrated in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3), all sources of GHG emissions were quantified and the project's emissions were evaluated with respect to consistency with plans and policies adopted to reduce GHG emissions (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions," Section 4.8.4, "Project Impacts and Mitigation Measures"). As demonstrated under Impact 4.8-2, the project would not conflict with an applicable plan, policy or regulation for the purpose of reducing the emissions of GHGs,

and therefore would not conflict with any GHG plans, policies, or regulations. Refer also to Appendix E of Appendix D-3 for the plans, policies and regulations that have been reviewed to ensure that the project would not result in a conflict. In summary, the proposed project would comply with all applicable GHG impact plans, policies, and regulations. This impact would be less than significant.

Comment 12-40

(11) Greenhouse Gases Modeling

The Project used the South Coast Air Quality Management District's guidance on impact analysis for GHG, stating that SJVAPCD modeling was outdated. The advantage to the Project was the exclusion of emissions from sectors that are required to participate in the Cap-and-Trade Program, i.e. gasoline and diesel. This is an impermissible deferral of the obligation to disclose the environmental impacts of this Project. The Project should use the SJVAPCD modeling or another suitable methodology that actually analyzes the impacts from this Project.

Response 12-40

The Draft EIR, as updated by the Final EIR, discloses all GHG emissions that would be emitted by the project, including baseline emissions and emissions related to fuels. These emissions, and their sources, are described at Tables 4.8-7, "Baseline GHG Emissions," 4.8-8, and 4.8-9 of the Final EIR. As discussed in the Draft EIR, GHG emissions are distinct from other types of emissions, and other types of impacts, in that the impacts are not localized but have a worldwide effect. As noted by the California Natural Resources Agency (CNRA) in its Public Notice regarding the amendments to CEQA, and described in Appendix D-5, "Revised Section 4.8 Greenhouse Gas Emissions," Section 4.8.2.2, "State":

> While the Proposed Amendments do not foreclose the possibility that a single project may result in greenhouse gas emissions with a direct impact on the environment, the evidence before [CNRA] indicates that in most cases, the impact will be cumulative. Therefore, the Proposed Amendments emphasize that the analysis of greenhouse gas emissions should center on whether a project's incremental contribution of greenhouse gas emissions is cumulatively considerable.

Accordingly, the discussions of impacts of GHG emissions related to worldwide climate change impacts are disclosed as are the specific emissions associated with this project.

Both baseline emissions and additional emissions related to this specific project, including those related to transportation fuels, are disclosed.

The Draft EIR and Final EIR utilized the South Coast Air Quality Management District's (SCAQMD) methodology to determine whether the project would generate GHG emissions that may have a significant impact on the environment, since the San Joaquin Valley Air Pollution Control District's (SJVAPCD) methodology is outdated. However, as noted in Appendix D-5, Section 4.8.3.2, "Significant Thresholds," in response to a new judicial decision, the County determined to conservatively include emissions subject to the Cap-and-Trade Program, specifically emissions related to electricity generation and transportation fuels, in determining whether the project exceeds the SCAQMD 10,000 MT CO_2e per year threshold.

The County, in the Draft and Final EIR, chose a suitable methodology to analyze the GHG impacts from this project as allowed by CEQA in the lead agency's discretion (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 521). In determining whether the project would generate GHG emissions that may have a significant impact on the environment, the SCAQMD standards provide for a screening threshold of 10,000 metric tons of CO_2e (see Appendix D-5, Section 4.8.3.2). Utilizing this methodology, GHG emissions are considered less than significant when emissions are less than 10,000 MT CO_2e per year (SCAQMD 2008).

South Coast Air Quality Management District (SCAQMD) methodology was used to evaluate whether a project would generate GHG emissions that may have a significant impact on the environment (SCAQMD 2008). It was determined that the San Joaquin Valley Air Pollution Control District methodology is out of date. The GHG analysis in the Final EIR was revised, as envisioned by CEQA, to address comments on the Draft EIR by several commenters, including the Center for Biological Diversity. In addition, the Draft EIR was released on December 20, 2024, and the comment period closed on March 10, 2025. In the Draft EIR, the GHG analysis relied in part on an analysis used in an EIR certified by Kern County in approving the modification to an oil refinery. That EIR acknowledged that certain GHG emissions related to the consumption of fuel and the use of electricity were offset upstream of those uses pursuant to California's Cap-and-Trade Program. This approach was upheld in a decision by the Fifth District Court of Appeal, which appellate court has jurisdiction over Fresno County, in *Association of Irritated Residents v. Kern County Board of Supervisors,* 17 Cal.App.5th 798 (2017) (AIR). However, on June 26, 2025, a new California appellate case out of Los Angeles County reviewing the use of offsets under the Cap-and-Trade Program as part of an EIR used to evaluate a housing development program was filed by the 2nd District Court of Appeal, *Center for Biological Diversity v. County of Los Angeles*, 112 Cal.App.5th 317 (2025) (LA County

Decision). The LA County Decision distinguished the AIR Decision and held that Los Angeles County could not rely on the fact that transportation fuels and electricity that would be used as part of the project were subject to the Cap-and-Trade Program. In an abundance of caution, Fresno County decided to revise the GHG analysis in the Draft EIR to conform to the more recent LA County Decision. Accordingly, all emissions, including those involving the consumption of fuel and the use of electricity, are included in determining whether total emissions would exceed the GHG significance threshold of 10,000 $MTCO_2e$/yr, as demonstrated in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 12-41

(12) CO2 Emissions

SJVAPCD uses the CalEEMOD model to determine project's air quality impacts. The air quality analysis in Appendix D-2 also states the Project uses CalEEMOD. On page 4.3-62, Table 4.3-23, Mitigated and Unmitigated CO Concentration was modeled without including the 6.2 million annual VMT generated as required in the CalEEMOD. Therefore, the conclusion the Project does not exceed CO concentration is not accurate and needs to be revised to analyze the entire Project's environmental impact on CO concentrations and other air pollutants. The Draft EIR needs to be revised to include all sources of air pollutants from the Project for air quality modeling.

Response 12-41

CalEEMod was used exclusively to quantify construction phase emissions and has no bearing on the operational emissions that were calculated using standard methods. The CO modeling reflected in Table 4.3-23 need not assess emissions from off-site travel because the purpose of stationary source modeling is to evaluate the off-site effects from on-site emissions, which is what the Draft EIR correctly assesses.

As provided in Appendix G to the Draft EIR, the Draft EIR analyzed the existing CEQA Baseline CO emissions as compared to the CO emissions generated during years 0-30 (Phase 1), and years 31-100 (Phase 2) (see Draft EIR Appendix D-3, Appendix G "Operation Phase Emissions, Operation Phase Conditions and Project Increment"). Mobile sources of emissions are also incorporated in the air quality analysis (see Draft EIR Table 4.3-17, "Operation Phase Maximum Annual Emissions," on page 4.3-46). See Appendix D-4, "Revised Section 4.3, Air Quality," for revisions to Draft EIR Section 4.3 and the supporting technical appendices referenced in this response.

Further, regarding the comment on the 6.2 million annual VMT, the Draft EIR explains:

> The VMT analysis results presented in Tables 4.17-6, -7, -8 and -9 indicate that, although the proposed project appears to generate a high number of VMT, the actual effect of the project on a regional basis is to reduce VMT as compared to the condition in which the project does not exist. This is because demand for aggregate for construction projects within the region will exist with or without the project. Without the availability of aggregate from the project, aggregate for regional construction projects would need to be transported from other aggregate production operations. Similarly, the project would not create or increase the demand for processing concrete and asphalt for recycling. These needs will exist with or without the project. Thus, with or without the project, construction aggregate, recycled material, and fill material would be hauled throughout the region resulting in increased regional aggregate haul truck VMT, i.e., hauled from further locations for certain projects.

(Draft EIR, page 4.17-24; See also Appendix B-1, "Surface Mining and Reclamation Plan," Section 4.4.4, page 33).

Further, the operation of the project within Fresno County would likely reduce regional VMT and thus GHG emissions according to Peter Berck in his January 2005 Working Paper 994, "A Note on the Environmental Costs of Aggregate" (see Appendix B of Appendix D-3). That is to say that if the project was not approved, the aggregate needed for on-going construction activities in Fresno County as well as the San Joaquin Valley Air Basin would have to come from mines farther away and would thereby increase regional VMT and GHG emissions. In order to accurately address the impact of the project, a regional increment analysis was conducted which characterizes the project contribution to cumulative regional GHG emissions (Appendix J of Appendix D-3 of the Final EIR). The methodology of the regional increment analysis responds to current regulatory guidance and reflects how aggregate demand and associated emissions are projected and managed at the regional level. The regional increment analysis is based on project activity levels, as well as regional aggregate demand as forecast in the California Department of Conservation Map Sheet 52.

State and regional planning forecasts indicate that aggregate demand is driven by population growth and overall regional development, rather than by the maximum production capacity of any single facility. Accordingly, while the project is capable of supplying aggregate to meet regional needs, its operation would not create a net increase in regional aggregate demand beyond that already forecast. Any increase in production

from the project would be offset by corresponding reductions in production from other facilities serving the same regional market, resulting in no substantial change in total regional output. Consistent with this framework, the project's on-road offsite criteria pollutant and GHG analysis evaluates emissions based on the project's proportional share of regional demand growth, rather than calculating emissions based on continuous operation at maximum throughput. This approach, documented in the Final EIR (Appendix D-3 and associated appendices), ensures that the project's on-road offsite criteria pollutant and GHG emissions are attributed in a manner that reflects realistic market conditions and real-world impacts. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient.

Comment 12-42

(13) Fugitive Dust Control

The Draft EIR needs to include an analysis of the Project's dust particulate (PM2.5) impact on the Census Tract 6039001000 located westerly from the Project in unincorporated Madera County and surrounding area in order to determine the cumulative net increase of an criteria pollutant. CalEnviroScreen 4.0 indicates this area has a high pollution burden of 90 percentile for PM2.5 as shown in red. High PM2.5 (94 Percentile) is also the existing condition for adjacent Census Tracts easterly in Fresno County but has a lower overall pollution burden as shown in green due to other socio/environmental factors, such as the ability to deal with pollution load. The increase in aggregate production from 1.3 MT to 3.3 MT annually at both the Plant and Quarry Site will exasperate the existing conditions on this area.

[A graphic was included as part of Comment 12-42 that is not reproduced here. To view this graphic please see Letter 12 in Final EIR Appendix M, "Draft EIR Comments."]

Response 12-42

The Draft EIR demonstrates that with mitigation the dust particulate ($PM_{2.5}$) emissions decrease from the CEQA baseline. Thus, the concentration at Census Tract 6039001000 would go down with the project and further assessment is unwarranted. Nevertheless, PM2.5 was modeled to show that the concentration decreases and remains below thresholds. Further, the highest modeled concentrations are at the fenceline and then concentrations decrease as distance increases from the project.

The project would continue to control fugitive dust emissions through implementation of controls and compliance measures within SJVAPCD Rules 8011, 8021, 8031, 8041, 8051,

8061, and 8071 (see Draft EIR, pages 4.3-27 through 4.3-30, and 4.3-40 as revised in this Final EIR [see Appendix D-4, "Revised Section 4.3, Air Quality"]).

Furthermore, impacts caused by fugitive dust, particularly $PM_{2.5,}$ are analyzed in Impact 4.3-2, which specifically analyzed whether the project would result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under applicable federal or state ambient air quality standards, and was found to be significant before mitigation (Appendix D-4, Section 4.3.4). As shown in Table 4.3-20, "Net Increase in Unmitigated Daily Emissions and Model Screening Level Comparison ,"as updated in the Final EIR, the proposed project mining, processing, and production operations would not generate emissions that would potentially exceed the daily screening level from $PM_{2.5}$ (see Appendix D-4, Section 4.3.4). Nevertheless, the project would implement a Fugitive Dust Control Plan via Mitigation Measure 4.3-2b, which results in Impact 4.3-2's criteria pollutants exceedance being reduced to less than significant after mitigation. This is further shown in Tables 4.3-21 and 4.3-23 (see Appendix D-4, Section 4.3.4).

Finally, Impact 4.3-3 of the Draft EIR analyzed whether the project would expose sensitive receptors to substantial pollutant concentrations (see Draft EIR, page 4.3-63, as updated in Appendix D-4, Section 4.3.4). The sensitive receptors shown on Draft EIR Figure 4.3-2, "Detailed Model Receptor Locations," and Figure 4.3-3, "Plant Site Labeled Receptor Locations," were chosen because they represent the locations of highest exposure. Before mitigation, Impact 4.3-3 is less than significant. Accordingly, implementation of Mitigation Measures 4.3-2a and 4.3-2b would reduce the impact to less than significant after mitigation.

The *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (see Appendix K of Appendix D-3) includes details of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 12-43

Mitigation Measure 4.3-2, Fugitive Dust Control Plan, on page 4.3-62 is not adequate and needs to be revised to include that all trucks hauling materials need to be completely covered both on-site and delivery trucks to reduce fugitive dust generated by the Project.

Table 4.3-20 identifies that CO, PM10 and PM2.5 exceeds significance criteria. Mitigation Measure 4.3-2 is not adequate to

mitigate the significant environmental impacts to less than significant. The Draft EIR needs to identify additional measures that the Project can implement in order to make the finding of less than significance. Therefore, without additional analysis and mitigation the Draft EIR results in Significant and Unavoidable.

Mitigation Measure 4.3-2 Fugitive Dust Control should include the following additional mitigation:

> All truck loading/unloading facilities to be equipped with one 110/208-voltpower outlet for every two-truck loading/unloading facility. A minimum 2-foot-by-3foot sign shall be clearly visible at each loading lock and in a readable letter size that states: "Diesel engine idling limited to a maximum of 2 minutes." The sign shall include instructions for diesel trucks idling for more than 2 minutes to connect to the 110/208-vole poser to run any auxiliary equipment.

Response 12-43

Covering of trucks is regulated by California Vehicle Code Section 23114 which requires covering unless "if the load, where it contacts the sides, front, and back of the cargo container area, remains six inches from the upper edge of the container area, and if the load does not extend, at its peak, above any part of the upper edge of the cargo container area." The project does not own the trucks that would haul aggregates and therefore cannot control whether truck operators cover their load or comply with the freeboard provision. Moreover, while on-site, trucks are subject to a 15 mph speed limit that effectively eliminates the possibility of emissions from hauled aggregates.

Mitigation Measure 4.3-2b, regarding the Fugitive Dust Control Plan, is adequate and does not need to be revised. Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (see Appendix K of Appendix D-3) including details of the Fugitive Dust Control Plan. This analysis resulted in an updated Table 4.3-20 where the unmitigated daily emissions for the project exceed the screening criteria for CO and NO_x, but do not exceed the significance thresholds for PM_{10}, $PM_{2.5}$, or SO_x (see Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4). Tables 4.3-21 and 4.3-23 of the Final EIR demonstrate no new impacts and no changes to any of the findings in the Draft EIR (see Appendix D-4, Section 4.3.4).

The commenter's proposed mitigation measures of covered trucks and plugged in trucks are not necessary, as Mitigation Measure 4.3-2b already sufficiently mitigates environmental impacts. The project's emissions of criteria air pollutants would comply

with the air quality attainment plans maintained by the San Joaquin Valley Air Pollution Control District (see the discussion Impact 4.3-1 on page 4.3-57 of the Draft EIR).

In sum, as discussed above, the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (see Appendix K of Appendix D-3) includes preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 12-44

(14) Air Quality Impact on Sensitive Receptors

On page 4.3-63, Table 4.3-24 indicates the Project exceeds the threshold for environmental significance for Excess Cancer per Million People Exposed and for the Maximum Acute Hazard Index. The Draft EIR reached this conclusion even without including the 6.2 million annual VMT generated by the Project or the added aggregate processing and stockpiling. There is no explanation why "Fence-line Receptors" are not included in the table. However, users and workers at the adjacent recreation parks would have exposure. The Draft EIR needs to include additional mitigation to reduce air quality impact and health risks from the Project.

Thes mitigation measures should include the following:

- All truck loading/unloading facilities to be equipped with one 110/208-voltpower outlet for every two-truck loading/unloading facility. A minimum 2-foot-by-3-foot sign shall be clearly visible at each loading dock that indicates, "Diesel engine idling limited to a maximum of 2 minutes." The sign shall include instructions for diesel trucks idling for more than 2 minutes to connect to the 110/208-volt power to run any auxiliary equipment.

- The use of electric-powered "yard trucks" or forklifts to move truck trailers around a truck yard or truck loading/unloading facility.

- The use of buildings or walls to shield commercial activity from nearby residences or other sensitive land uses.

- The use of EPA-rated Tier 4 Final engines in diesel-fueled construction equipment when construction activities are adjacent to existing sensitive receptors.

- The planting and maintenance of vegetative buffers between truck loading/unloading facilities and nearby residences, schools, daycare facilities, and any other sensitive receptors. As part of detailed site design, a landscape architect licensed by the California Landscape Architects Technical Committee shall identify all locations where trees should be located, accounting for areas where shade is desired such as along pedestrian and bicycle routes, the locations of solar photovoltaic panels, and other infrastructure.
- The use of all electrical-powered Transportation Refrigeration Units (TRUs).
- The use of all electric heavy-duty trucks.
- Designate truck routes that avoid sensitive land uses, including low-income and minority neighborhoods.

Response 12-44

Fence-line receptors are included in Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts." The Draft EIR concludes that Mitigation Measures 4.3-2a and 4.3-2b are sufficient to reduce air quality impacts to less than significant. Thus, the additional proposed mitigation measures are not necessary. The comment does not support the efficacy of the proposed mitigation measures with evidence or technical support, and thus no technical response is required (see *Covington v. Great Basin Unified Air Pollution Control Dist*. (2019) 43 Cal.App.5th 867, 879). Each proposed mitigation measure is discussed individually as follows.

- Response to Proposed First Measure: See Response 12-43, the proposed mitigation measure is infeasible.
- Response to Proposed Second Measure: The yard trucks proposal is inapplicable to the proposed operation. Usage of electric-powered vehicles is not necessary to mitigate impacts of criteria air emissions to less than significant. Mitigation Measure 4.3-2a would require the project to use off-road engines which meet Tier 4 Interim Particulate Emissions, thus contributing to the reduction of emissions of criteria air pollutants.
- Response to Proposed Third Measure: The comment does not explain how a building or wall would be applicable to reduce air quality impacts upon sensitive receptors. Screening berms are located along North Friant Road and along the southwest boundary of the Quarry Site (Draft EIR page 2-17). A landscaped screen exists along the North Friant Road frontage at the Plant Site (Draft EIR page 2-16). Additionally, usage of buildings or walls is not necessary to shield commercial

activity from nearby residences due to the proposed location of new processing facilities. The project would maintain the same aggregate processing plant at the Plant Site, which is part of the current baseline and would remain visible. After Stage 1, all processing facilities would be removed from the Plant Site. The new aggregate processing plant, ready-mix concrete plant, hot-mix asphalt plant, offices/scale house, QC lab, maintenance shop would be in the previously excavated pit on the Quarry Site, at a depth of 30 feet bgs (Draft EIR page 2-40). Therefore, the new processing facilities would already be partially shielded from view.

Thus, additional mitigation is unwarranted. Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the EIR analysis (the Draft EIR, as augmented by the Final EIR) is sufficient, and no further response is required.

Comment 12-45

(15) Odors

The proposed Project includes a hot-mix asphalt plant that will generate 200,000 tons of asphalt per year. Hot-mix asphalt plants generate noxious odors that can impact people even 1.5 miles away. The discussion of Impact 4.3-4, starting on page 4.3-65, states that the hot-mix asphalt is a continuation of the of past activities. However, the asphalt plant stopped operations in 2009 and therefore is not considered a part of the baseline conditions and needs to be treated as a new and unapproved land use pursuant to Fresno County Zoning Code Section 868.6.020, Expiration.

Response 12-45

The Draft EIR, as updated in the Final EIR, addresses the project's potential odor impacts in Impact 4.3-4 and concludes that impacts would be less than significant with the implementation of Mitigation Measure 4.3-4 (see Appendix D-4, "Revised Section 4.3, "Air Quality"). As discussed in Impact 4.3-4 and as provided in Table 4.3-5, "Air Quality Significance Thresholds—Toxic Air Contaminants and Odor," Air District significance thresholds state that a significant impact would occur if the proposed project received "[m]ore than one confirmed complaint per year averaged over a three-year period, or three unconfirmed complaints per year averaged over a three-year period" (Appendix D-4, Section 4.3.4). As explained in the Appendix D-4, as well as in Response 12-46 below,

past Air District records were reviewed in 2023 and revealed no past complaints of the previous asphalt plant operation.

The emissions of the asphalt plant were not used in the calculation of the baseline emissions of criteria air pollutants (see Tables 4.3-10 through 4.3-12 in Section 4.3.3.3 of Appendix D-4; see also subheading "Odor" in Section 4.3.3.3 of Appendix D-4, which states that the asphalt plant is not a contributor to the existing environmental setting, i.e. the baseline, for the project). It should be noted that the Conditional Use Permit for the asphalt plant is not void under Fresno County Zoning Code. The asphalt plant is limited to a single purpose use and is not subject to the surrender of its CUP by nature of being inactive. Furthermore, the Operator holds a vested right to engage in mining operations at the Plant Site under CUPs 367, 2209, 3063, and 3093. Therefore, the asphalt plant is not a new and unapproved land use pursuant to the Fresno County Zoning Code. However, as noted above, the prior asphalt emissions are not included in the project baseline.

Comment 12-46

The Draft EIR states that no odor complaints were received when the previous asphalt plant operated, however there is no information on what type of asphalt plant was in operation. There are no records to search for odor complaints and it is based on a person's memory. Therefore, not a reliable assumption to make a finding of no previous odor complaints. This just as likely indicates there is poor record keeping and lack of concern about the asphalt plant's impact on the community.

Response 12-46

The San Joaquin Valley Air Pollution Control District records were reviewed in 2023 and confirmed that the Operator received no odor complaints in the past (see Draft EIR page 4.3-66, 4.3-50). A hot-mix asphalt plant was in operation at the Plant Site until 2009 (see Draft EIR page 4.3-65; see also Appendix D-4, "Revised Section 4.3, Air Quality").

Comment 12-47

The odor impact analysis assumes facts that are not part of the Draft EIR or its Project description as justification of reduced Project air quality impacts. Section 4.3-4 states that the proposed asphalt plant would generate fewer odor producing emissions than the past due to its fuel source being natural gas instead of diesel and due to the use of new technology to capture 95% of blue smoke emissions and therefore concludes "it is not anticipated that Stage 1 operations on the Plant Site could generate odors that would adversely affect a substantial number of people." This assumption is not supported by facts.

The use of natural gas instead of diesel will not occur until a natural gas line is installed to the asphalt plant for Phase 1 at the Plant Site. There is no discussion of the fuel source for the asphalt plant when it is relocated in Phase 2 at the Quarry Site. The Draft EIR does not identify when natural gas will be used in Phase 2 at the Quarry Site. There is not discussion what happens to the fuel source as the asphalt plant is moved to accommodate surface mining in either Phase 1 or Phase 2. There is no discussion that identifies and details the "new technology" will capture 95% of blue smoke or if the asphalt plant will include this technology. The Draft EIR needs to be revised to provide specific equipment that will capture 95% of blue smoke.

Response 12-47

The Plant Site asphalt plant was in operation until 2009, and did not generate odor complaints. As such, the Draft EIR concludes that it is unlikely for Stage 1 operations at the Plant Site to generate odors that would adversely affect a substantial number of people (Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4).

At the Quarry Site, the asphalt plant would temporarily be fueled by propane until the natural gas connection is established (Draft EIR page 4.6-18). Implementation of Mitigation Measure 4.3-4 reduces any potential odor impacts from the asphalt plants at both the Plant Site and the Quarry Site to less than significant (see Appendix D-4, Section 4.3.4 for further discussion of implementation of Blue Smoke Controls). The efficacy of Blue Smoke Controls system is discussed further in Appendix H-02, "Blue Smoke Control Permitting Parameters," of Appendix D-3, which provides that Blue Smoke Controls are high efficiency cartridge mist collectors. The filter efficiency that would be implemented is 95 percent efficient at 0.3 microns according to the filter manufacturer's data sheet. The implementation of the Blue Smoke Controls system is subject to meeting the regulations and permitting requirements of the SJVAPCD.

Draft EIR Section 4.3.2.3, "Local," as revised in this Final EIR (see Appendix D-4) describes each local rule that applies to project sources including Rule 2201 (New and Modified Stationary Source Review) and Rule 4309 [SC1] (Dryers, Dehydrators, and Ovens). The new source review would result in the application of best available control technology (BACT) which is determined by the air district at the time of the permit application. Because the BACT is constantly subject to change, the process of determining BACT involves review of various sources (commonly called clearinghouses) of new permits approved by air agencies. To the extent that a permit has required a certain control technology and it is achieved in practice, the permit issued by the air district would also include that control technology provided that it is cost-effective.

Comment 12-48

The Draft EIR bases Project Impacts on air quality odors based on a "modern" asphalt plant. The Draft EIR does not provide any details on what a modern asphalt plant consists of or a list of equipment that reduces odor impacts, just that the asphalt plant will receive a permit from the SJVAPCD prior to operation. However, this is not a guarantee that the proposed asphalt plant will not generate offensive odors to the surrounding community during the life of the Project.

The County of Orange, which has a similar air inversion condition as the San Joaquin Valley, approved a hot-mix asphalt plant on a portion of a former gravel quarry in 1993 located in unincorporated Orange County north of the City of Irvine. There are a series of rolling hills and valleys that separate the asphalt plant from the nearest residences, 0.5 miles away. An EIR with a Health-Based Risk Assessment was prepare in 2005 for a residential development that concluded it was unlikely that releases from the asphalt plant would have the potential of adversely affecting the residential development since the asphalt plant received the necessary permits.

However, this was not the result and even with the expert assistance of the South Coast Air Quality Management District (SCAQMD) it was very difficult to stop adversely affecting the surrounding community, even at 1.5 miles away. The asphalt plant emitted odors that resulted in eventually the City of Irvine buying the asphalt plant to eliminate the nuisance from its residents at a cost to tax payers of between $50 and $100 Million Dollars.

In 2020, the City of Irvine filed a "Complaint for Public Nuisance Abatement Injunction, Equitable Relief and Civil Penalties (30-2020-01153015-CU-MC-CJC) (Irvine Lawsuit) against the hot-mix asphalt plant. The Lawsuit stated that since 2019, 468 complaints relating to the asphalt plant were fielded by SCAQMD with the vast majority related to issues with asphalt, oil, tar-like odors and smoke. SCAQMD stated in 2022 that they had received more than 1,400 odor complaints from the asphalt plant source.

SCAQMD issued in 2022 eight odor nuisance NOVs to the asphalt plant. The asphalt plant was expanded in 2016 with active permits for existing equipment. Irvine's asphalt plant is considered "modern" and SCAQMD stated it is working with the operator on a "carbon adsorption unit" under a research permit. The plant in 2022 was to evaluate if there was a decrease in odor or emissions. SCAQMD also required the asphalt plant to instruct drivers to cover any loads of asphalt prior to leaving the facility and instruct

drivers on approved truck routes. None of this worked to mitigate odors and the City of Irvine purchased the asphalt plant in 2023.

Draft EIR, Impact 4.3-4 states that there are residences within 0.25 miles from the proposed asphalt plant and concludes that it is "unlikely" that substantial odors from the asphalt plant would be generated at these distances based on Figure 4.3-4, Wind Rose. However, Figure 4.3-4 depicts a wide area of impact surrounding the Project under typical low wind conditions. Section 4.3.1.1, Environmental Factors Affecting Air Quality, that states: "Low wind speed conditions limit horizontal air dispersion and can result in a buildup of air pollutants." The conclusion that residences 0.25 miles away will not experience substantial odors is not supported by fact and is likely. This would result in a significant environmental impact that needs to be mitigated.

Response 12-48

Comment 12-48 correctly notes that there are sensitive receptors located within one mile of the project sites (Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4). Because of the presence of these sensitive receptors, namely the residences located to the east and southeast of the Quarry Site, the project asphalt plant on the Quarry Site would include blue smoke controls with an efficiency of 95 percent based on manufacturer specifications outlined in Appendix H-02, of Appendix D-3. Implementation of Mitigation Measure 4.3-4 is sufficient to reduce any potential impacts resulting from emissions of the proposed asphalt plant to less than significant (see Draft EIR page 4.3-66).

The comment provides an inapt analogy of the proposed project's asphalt plant to the All-American Asphalt Plant in Irvine. The commenter is from Orange County and Irvine and Fresno are geographically and demographically different. Odor is subjective to a certain extent. The All-American asphalt plant was operating in close proximity to a densely populated urban setting, with less emission controls than the proposed plant here. Here, the project sites are located in a less dense setting, and as discussed in Response 12-46, no odor complaints were made regarding the asphalt plant in the past.

Comment 12-49

Figure 4.3-4, Wind Rose, is insufficient to adequately depict the influence of wind on the Project. Winds are seasonal and vary between winter (December – February) spring (March – May) summer (June – August) and fall (September – November). The Draft EIR should be revised to provide the seasonal analysis of wind direction and speed that is overlaid on aerial maps of the

surrounding 3-mile area that includes all sensitive receptor locations.

Response 12-49

Figure 4.3-4, "Wind Rose," is sufficient to depict wind patterns in the project area because all seasons are incorporated into the analysis. Five years of data spanning all four seasons are incorporated into the Wind Rose analysis, which shows what direction the wind is blowing and how often it occurs (Figure 4.3-4 on Draft EIR page 4.3-67, as updated in Appendix D-4).

Comment 12-50

Mitigation Measure 4.3-4: Asphalt Plant Emissions Controls, is not sufficient to mitigate the significant odors and air pollutants from the asphalt plant. Mitigation Measure 4.3-4 should be revised as follows:

> Prior to the issuance of any permit a sign shall be posted at each entrance to the Project, with letters large enough to be read from the public road, with the San Joaquin Valley Air Pollution Control District most current toll-free phone number (800-870-1037), website address and email address to make odor, vehicle smoke and dust complaints. The sign shall include the name of the facility and address. The sign shall be updated as soon as any of the information changes.
>
> The operator of the facility will annually mail to each property owner within 3 miles of the Project Site, the County of Fresno and any interested parties requesting the notice, a letter with information on how to file an air pollution complaint to the San Joaquin Valley Air Pollution Control District with the following explanation:
>
> > The District receives complaints that may constitute a public nuisance. The state's public nuisance law (CH&SC 41700) prohibits emissions which cause odors or other disturbances in the community that impact a significant number of people, create a threat to public health or cause damage to property.
> >
> > Asphalt loads are required to be covered prior to leaving the facility and operator shall instruct drivers on approved truck routes.

Response 12-50

The proposed project would be subject to permit approval from the San Joaquin Valley Air District (SJVAPCD) and would comply with all applicable local regulations pertaining to noticing and publication requirements (Draft EIR page ES-5). SJVAPCD Rule 2010 requires that the permit be posted on the project site (Draft EIR page 4.3-24). SJVAPCD provides its own notification requirements for new sources of emissions, which the project would comply with if applicable (SJVAPCD Rule 2201, Section 5.4).

Mitigation Measure 4.3-4 is sufficient to mitigate potential odors from the asphalt plant to less than significant. Mitigation Measure 4.3-4 is sufficient because ultimately the asphalt emission control would be regulated by the Air District (SJVAPCD) which would require implementation of the Best Available Control Technology (BACT). The BACT must be achievable in practice and cost effective. See also Response 12-47 discussing the implementation of BACT.

Covering of trucks is regulated by California Vehicle Code Section 23114 which requires covering unless "the load, where it contacts the sides, front, and back of the cargo container area, remains six inches from the upper edge of the container area, and if the load does not extend, at its peak, above any part of the upper edge of the cargo container area." However, trucks carrying asphalt material are exempt from the requirement of having to cover their loads (Cal. Veh. Code Section 23114(e)(2)). The County does not have the authority under state law to require asphalt trucks to be covered because it is expressly preempted by state law (Cal. Veh. Code Section 21; *Rumford v. City of Berkeley*, (1982) 31 Cal.3d 546).

Comment 12-51

Mitigation Measure 4.3-4, 1) states that asphalt cements with lower VOC/SVOC emissions, as approved by the SJVAPCD, shall be used to the "extent feasible" will not result in a measurable reduction in VOC/SVOC. The proposed mitigation does not quantify a limit on the use of processes that generate higher VOC/SVOC. The use of lower VOC/SVOC depends on how the asphalt is being uses, such as the specification requirement of the roadway being paved. The Draft EIR needs to identify the different types of asphalt processes, their use and the amount of VOC/SVOC they emit, and the anticipated percentage of Project's production of the different types of asphalt, especially the production of lower VOC/SVOC asphalt. The mitigation measure needs to quantify and limit on the amount of high VOC/SVOC asphalt that can be produced in order to mitigate the Project's environmental air quality impacts.

Response 12-51

The Draft EIR assesses impacts from the asphalt plant based on standard mix design and asphalt cement materials. The mitigation measure makes no adjustment to emissions because of substituting other asphalt cement that may have lower emissions. Nevertheless, the mitigation measure, which also includes addition of blue smoke control equipment that would decrease emissions, demonstrates that the impacts are less than significant without quantifying potential asphalt cement substitutes.

Moreover, Mitigation Measure 4.3-4 provides that asphaltic cements with lower VOC/SVOC emissions, as approved by the SJVAPCD, shall be used to the extent feasible (Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4). Only feasible mitigation measures are required for significant environmental impacts (PRC Section 21002, 21002.1(b); CEQA Guidelines Section 15002(a)).

Mitigation Measure 4.3-4, as updated in Appendix D-4, does not need to be revised because the mitigation measure is clearly defined, is set up such that the effectiveness can be understood, and provides concrete requirements (*Sierra Watch v. County of Placer* (2021) 69 Cal.App.5th 86, 109 through 110).

Comment 12-52

Mitigation Measure 4.3-4, 2) states: "To reduce VOC emissions, periodic burner tune-ups shall be implemented" is not adequate to mitigate the significant environmental impacts on air quality. The mitigation measure needs to identify the equipment being added that is used to reduce air pollution impacts. The Draft EIR in determining "less than significant impact" relies on the uses of "new technology" that will capture 95% of blue smoke. The mitigation measure should include that the Project will conform to all new laws to prevent generation of air pollutants and update its equipment and procedures to conform with any new rule making, within six months of enactment.

The use of the term "periodic" has no quantifiable meaning and will not result in adequate mitigation. The mitigation needs to include a meaningful time limit, such as daily, weekly or monthly that the burner tune-up shall take place.

Response 12-52

Draft EIR Section 4.3.2.3, as revised in this Final EIR (see Appendix D-4) describes each local rule that applies to project sources including Rule 2201 (New and Modified Stationary Source Review) and Rule 4309 (Dryers, Dehydrators, and Ovens). New source review would result in the application of best available control technology (BACT), which

is determined by the air district at the time of the permit application. Because the best is constantly subject to change, the process of determining BACT involves review of various sources (commonly called clearinghouses) of new permits approved by air agencies. To the extent that a permit has required a certain control technology and it is achieved in practice, the permit issued by the air district would also include that control technology provided that it is cost-effective in this case. Regarding the frequency of burner tune-ups, the frequency would depend on monitoring for the process that is required by Rule 4309. When monitoring indicates a parameter is out-of-range, then a tune-up would be performed. Additionally Draft EIR Section 4.3.4, as updated in the Final EIR, specifies that the project asphalt plant on the Quarry Site would include blue smoke controls with an efficiency of 95 percent, based on manufacturer specifications outlined in Appendix H-02 of Appendix D-3. Implementation of Mitigation Measure 4.3-4 is sufficient to reduce any potential impacts resulting from emissions of the proposed asphalt plant to less than significant (see Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4). Since identification of BACT and the level of monitoring is clearly defined by air district rules, further revisions to Appendix D-4 are unwarranted. For these reasons, the Draft EIR analysis, as updated in the Final EIR, is sufficient, and no further response is required.

Comment 12-53

Mitigation Measure 4.3-4 3) needs to be revised to apply to the features and environmental impacts of the Project instead of a project located in Imperial County.

The mitigation measure should include that the County of Fresno will monthly inspect the operations of the Project to determine that the Plant Site and Quarry Site are implementing all design features, conditions of approval and mitigation measures. The County of Fresno will keep records of all inspections, public complaints and notice of corrections during the life of the Project (100 years). This information shall be available to the public.

Response 12-53

See Appendix D-4, of this Final EIR, where Mitigation Measure 4.3-4 is revised to clarify the public agency that would be responsible for issuing a building permit for the Asphalt Plant.

As provided in the Draft EIR and required by SMARA (PRC Section 2774), the Fresno County Department of Public Works and Planning would conduct annual inspections of the surface mining operation. These annual inspections would include evaluations of whether the surface mining operation is in compliance with the approved conditional use

permit(s), approved mining and reclamation plan, and state regulations pertaining to mining (see Draft EIR page 4.4-41).

Additionally, throughout the life of the project, there would be annual mitigation monitoring reports, as required by the Mitigation Monitoring and Reporting Program (see, for example, Draft EIR pages 4.10-108 and 4.13-67. Furthermore, Fresno County is already required to maintain records and provide records to the public pursuant to the California Public Records Act (Cal. Gov. Code, Title 1, Division 10). The Operator would be responsible for costs associated with conducting inspections and mitigation monitoring and compliance for the project.

Comment 12-54

(16) Odor - Pond Pits

The Reclamation Plan will result in pond pits on each Project Site. The Draft EIR acknowledges stagnant water can lead to odors. The impact analysis assumes that there will be enough groundwater flow through the Plant Site pond and the Quarry Site to eliminate pond stagnation. Appendix G-4, Groundwater Conditions Quarry Site, indicates after reclamation there will be low inflow of groundwater with higher evaporation to prevent a pond deeper than 110 feet. The Draft EIR impact analysis states that the Quarry Site pond will upwell twice a year that will result in no pond odors.

The Quarry Site pond is over 400 feet from the surrounding surface. It is unlikely the pond will experience wind upwelling given the depth of the quarry walls, narrow surface water area and the typical low wind conditions in the area. Ocean upwelling only occurs in 4 places on earth and account for only 1% of the ocean surface.

Upwelling can occur with change in surface water temperature. However, deep quarry ponds typically remain very cold all year so it is unlikely that upwelling will occur due to warm surface water and certainly not twice a year. The Draft EIR does not support the assumption that the pond pits will not become stagnant and create an odor nuisance to the surrounding sensitive receptors. The Draft EIR should include a mitigation measure to prevent stagnant water as is included in Previous CUPs. Conditional Use Permit 2032, included Condition No. 14:

> All water bodies shall be designed to avoid stagnant water or shall be improved with appropriate circulation systems. Corrective measures shall be taken to eliminate the stagnant condition of the pond adjacent to the plant site.

The Draft EIR conclusion of Less than Significant after mitigation for air quality impacts is not supported by the analysis or the proposed mitigation to lessen the identified environmental impacts. The Draft EIR should fine the Project's environmental impact on air quality is Significant and Unavoidable.

Response 12-54

The first portion of the comment does not address the adequacy of the Draft EIR, and no further response to the first portion of this comment is needed. The comment on ocean upwelling is irrelevant to a pond that would be 100 miles from the Pacific Ocean.

As described in the Draft EIR Appendix G-3, "Groundwater Conditions at the Plant Site," an estimated 315 acre-feet per year of groundwater would flow through the reclaimed pond on the Plant Site, which would create a water balance and prevent stagnation and odors (see also Appendix D-4, page "Revised Section 4.3, Air Quality," Section 4.3.4 and Appendix B-1). As the Draft EIR states, at least twice a year, in the spring and fall, the waters at all layers of freshwater bodies turn over and, in the process, equalize the temperatures. This seasonal vertical movement of water, in addition to the lateral movement of the groundwater flow, precludes stagnation and odors (see Section 4.3.4 of Appendix D-4).

At the Quarry Site, groundwater flow through the reclaimed lake from the northeast to the southwest would also minimize stagnation (see Section 4.3.4 of Appendix D-4 and Appendix B-1). Thus, the potential for the proposed land uses to generate odors is less than significant (see Section 4.3.4 of Appendix D-4).

As explained in the Draft EIR, the movement of water in the reclamation pond at the Plant Site and the reclamation lake at the Quarry Site would be caused by both groundwater flows and changes in temperatures with the changing seasons, not caused only by wind, as this comment suggests.

The comment does not provide evidence to support the claim that the water in the reclamation pond and lake would become stagnant, and it does not refute the two reputable reports cited in the Draft EIR that show the likelihood of the opposite. (Draft EIR Appendix B-1 and Appendix B-2, "Project Description/Operational Statement")

Because the potential for the proposed reclamation pond and lake to generate odors would be less than significant, a mitigation measure is not needed (see Section 4.3.4 of Appendix D-4).

The comment provides no other basis for why the conclusion of less than significant after mitigation for air quality impacts would not be supported by the analysis or proposed mitigation measures in the Draft EIR.

Comment 12-55

iii. Section 4.4 Biological Resources

The Draft EIR is insufficient in describing the environmental impact of the Project's Biological Resources and providing mitigation for Project's significant environmental impacts. Mitigation Measures 4.4-1a, 4.4-1b and 4.4-1c only require the biological resources clearance surveys "at the start of construction" or "initiation of a mining phase." The Project only has two phases, Phase 1 of 30 years and Phase 2 of 70 years. The mitigation measures are inadequate to prevent the significant Project impacts on Burrowing Owls, Western Pond Turtle and Western Spadefoot, and nesting birds. The mitigation measure needs to be revised to require annual surveys and when mining operations occur or are relocated within the Project Site to prevent mining operation's impacts on biological resources

Response 12-55

The comment asserts that Mitigation Measures 4.4-1a, 4.4-1b and 4.4-1c are insufficient to mitigate the impacts on Burrowing Owls, Western Pond Turtle, Western Spadefoot, and nesting birds. However, this comment is conclusory in nature and does not substantiate its position with any analysis.

The comment proposes that the Draft EIR include a mitigation measure requiring annual surveys. The request for annual surveys is unusual and the requirement is unnecessary. Because burrowing owls, western pond turtle, and western spadefoot are all unlikely to occur on the project sites, Mitigation Measures 4.4-1a through 4.4-1c sufficiently reduces potential impacts to biological resources to less than significant. Furthermore, the commenter provides no justification or analysis for annual surveys. Annual surveys are not needed because the species are not expected to inhabit the project sites during active mining operations. As such, the comment's proposed mitigation of annual surveys is not required to reduce impacts to these species to less than significant. Mitigation Measures 4.4-1a through 4.4-1c were strengthened and amplified in the Final EIR. Please see Chapter 3, "Draft EIR Errata," to see the full revisions to Mitigation Measures 4.4-1a through 4.4-1c.

See Response 65-11 for further discussion regarding the mitigation measures for burrowing owls, western pond turtles, and western spadefoot.

Comment 12-56

iv. Section 4.8 Greenhouse Gas Emissions

The Project used the South Coast Air Quality Management District's guidance on impact analysis for GHG, stating that SJVAPCD modeling was outdated. The advantage to the Project was the exclusion of emissions from sectors that are required to participate in the Cap-and-Trade Program, i.e. gasoline and diesel. This is an impermissible deferral of the obligation to disclose the environmental impacts of this Project. The Project should use the SJVAPCD modeling or another suitable methodology that actually analyzes the impacts from this Project.

Response 12-56

This comment is a duplicate of Comment 12-40. See Response 12-40 for response to this comment.

Comment 12-57

v. Section 4.9 Hazard and Hazardous Materials

The Draft EIR is insufficient in describing the environmental impact of the Project and needs to be revised. Section 4.9 needs to include the exposure to asbestos from processing 200,000 tons annually of used concrete to make aggregate. The Draft EIR needs to include mitigation to lessen the exposure to workers and the community from asbestos in the aggregate process and stockpiling of broken and crushed concrete that may contain asbestos by requiring testing of used concrete prior to accepting material.

Response 12-57

The Draft EIR analyzes whether asbestos naturally occurs in the rock at the project sites and concludes that this is not the case (see Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.1.3, "Toxic Air Contaminants"). Thus, naturally occurring asbestos would not be released into the air, and the project would not result in health risk impacts due to naturally occurring asbestos related to the recycled come-back concrete (see Response 12-33). Likewise, to the extent that concrete from other processing facilities would be accepted, no mines in the region have asbestos in their rock. The comment thus proposes implementation of a mitigation measure to test all of the concrete for asbestos prior to accepting the material, which is unnecessary.

Comment 12-58

Impact 4.9-3 states that "upon completion of the final reclamation activities, the Plant Site and Quarry Site would be converted to open space land use." The Fresno County General Plan defines Open Space Land as:

> Any parcel or area of land or water that is essentially unimproved and devoted to an open space use for the purpose of: 1) the preservation of natural resources; 2) the managed production of resources; 3) outdoor recreation; or 4) public health and safety.

The Project is not consistent with the Fresno County General Plan definition of Open Space Land. Table 2-2, Allowable Uses and Permit Requirements for Agricultural Zones (attached as Exhibit 2 hereto) lists all the land uses allowed, however none of the land uses listed could be accommodated if the Project's Reclamation Plan is implemented.

Response 12-58

Upon final reclamation, the Plant and Quarry sites would both be converted to open space land use for riparian and open water habitat (Draft EIR pages 2-45 through 2-49).

The lake and pond formed as part of reclamation activities would serve as natural resources by providing additional open water habitat, which is consistent with the Fresno County General Plan. The project's consistency with the Fresno County General Plan is evaluated in Draft EIR Section 4.11.2.5, "Project Consistency with Local Planning Documents," (see Table 4.11-1, "Project Consistency with Local Planning Documents") (see also Draft EIR page 4.11-28). The Rockfield mine sites, as well as other former mine sites near the San Joaquin River, all have been used currently and over the years by numerous wildlife species. Upon reclamation that use would continue.

Comment 12-59

The Fresno County Zoning Code Section 834.4.220, Material Extraction Sites, defines "Reclamation" as:

> Reclamation. The combined process of land treatment that minimizes water degradation, air pollution, damage to aquatic or wildlife habitat, flooding, erosion, and other adverse effects from surface mining operations, including adverse surface effects incidental to underground mines, so that mined lands are reclaimed to a usable condition which is readily adaptable for alternate land uses and create no danger to public health or safety. The process may extend to affected

lands surrounding mined lands, and may require backfilling, grading, resoiling, revegetation, soil compaction, stabilization, or other measures.

The Draft EIR describes that reclamation of the 85-foot-deep pit at the Plant Site is to result in a 65-foot-deep quarry hole with eventually 20 feet of water that is not accessible by the public and has no recreational value or use. The Previous CUP's approved by the County require the Reclamation Plan to show the number of lakes with islands (CUP 2032, Condition of Approval No. 13). All other terms of the previously approved rehabilitation plans required in the CUPs should be disclosed for a fair comparison of the final impacts of this project following reclamation.

The Quarry Site's 600-foot-deep pit is to result in a 400-foot sheer walled quarry with eventually 200 feet of water at the bottom. There is no public accessibility or recreational value to the reclamation plan as presented in the Draft EIR. Surface mining quarries are notoriously hazardous with drowning fatalities. Quarries have steep drop-offs, deep water, sharp rocks, flooded equipment, submerged wire and industrial waste according to an article by Hobart M. King, PhD, RPG, "Abandon Mine and Quarry Accidents Claim Several Lives per Year," (attached as Exhibit 4 hereto).

The Draft EIR needs to be revised to provide analysis of the dangers of closed surface mines on the public. The Project and Reclamation Plan needs to be revised to leave the Project Sites in a useable condition which is readily adaptable for alternative land uses and create no danger to the public health or safety.

Response 12-59

There is no SMARA requirement that the reclaimed land serve a recreational purpose. Upon final reclamation, the Plant and Quarry sites would both be converted to open space for riparian and open water habitat. At the Plant Site, there would be a pond, and at the Quarry Site, there would be a lake formed for use as open water habitat (see Draft EIR pages 2-45 through 2-49). All required and reasonable measures would be taken to ensure that the reclaimed sites would not endanger public health or safety, and the sites would be fenced to prevent trespassing (Draft EIR page 4.11-22). Thus, the Draft EIR and reclamation plan are consistent with the Fresno County General Plan.

The comment misstates the depth of the lake that would be created at the Quarry Site using the mining pit. The Quarry Site would be reclaimed to create a 100-foot-deep lake (see Draft EIR page 2-46). A comparison of the projected environmental impacts

associated with the existing reclamation plan and potential environmental impacts associated with the proposed reclamation activities for the project is not required because the Baseline does not include future conditions (i.e. those associated with future reclamation), but rather the existing physical environment (see CEQA Guidelines Section 15125(a)).

The article cited in the comment was not peer reviewed. The article focuses on the dangers of abandoned mines that have not been reclaimed, while the project includes plans to adequately reclaim both the Quarry Site and the Plant Site. As explained in the Draft EIR, all plant- and mining-related equipment would be removed from the sites and appropriate revegetation would be completed as part of the reclamation process (see Draft EIR pages 2-45 through 2-51).

Comment 12-60

The Draft EIR should analyze the potential for a significant human health impact from mosquito borne pathogens and other vectors that may find habitat in the multiple ponds that will be created within the proposed Project. The Vector-Borne Disease Section of the California Department of Public Health has published Best Management Practices for Mosquito Control in California (the "Vector BMPs"), available at westnile.ca.gov/pdfs/BMPMosquitoControl.pdf.

The document indicates that "Standing water mosquito breeding sites may include artificial containers, treeholes, catch basins, open ditches, retention/detention ponds, natural or constructed ponds and wetlands, stormwater management devices, and the edges of streams." The multiple ponds present in the project therefore present possible breeding grounds for mosquitos, which have been found to be infected with West Nile Virus in Fresno County. (https://westnile.ca.gov/case_counts.php?year=2023&option=print.) This potential impact should be evaluated and the Universally Applicable Mosquito Control BMPs and other appropriate BMPs identified in the Vector BMPs should be included in the Draft EIR. Further analysis and development of appropriate mitigation measures should be performed in consultation with the Fresno Mosquito and Vector Control District.

Response 12-60

The Consolidated Mosquito Abatement District has jurisdiction over the project area, but did not provide a comment on this Draft EIR. The Fresno Mosquito and Vector Control District service area does not cover the project site.

The 2024 Fresno County General Plan provides the following policy: "The County shall prevent and control the spread of vector-borne diseases through best practice vector control techniques on County properties and will encourage use of these practices on other properties" (HS-A.9, emphasis added).

The Draft EIR states that the pond at the Plant Site and the lake at the Quarry Site have a continuous flow of groundwater that would prevent stagnation from occurring. As such, the continuous flow of groundwater would reduce the likelihood of mosquito habitat formation and occurrences of mosquito-borne illnesses. Such mosquito-borne pathogens and illness risks are not a significant impact. Nonetheless, to address any concerns regarding these pathogens and illness risks, the County may require the following as Conditions of Approval for the project:

- Access to the project sites shall be provided for mosquito abatement personnel for surveillance and control of mosquitoes.
- Vegetation shall be removed or thinned as needed (except reclamation vegetation) to facilitate pesticide applications and to enable mosquitofish, if necessary, to reduce the size of the mosquito population through biological means.
- Mosquito breeding habitat shall be dewatered to the extent feasible to minimize the size of potential mosquito-producing areas (except dewatering of active excavations or reclaimed ponds).

Comment 12-61

vi. Section 4.11 Land Use

(1) Zone Change

Table 2-1, Rockfield Modification Project Characteristics, includes "Concrete and Asphalt Recycling" with the "annual sales" of 200,000 MT in both Phase 1 and 2. As noted above, the Project also includes a solid waste disposal component for the fines, overburden, and other mining wastes. Pursuant to Fresno County Zoning Code Section 808.2.- Agricultural Zones, Table 2-2, Allowable Uses and Permit Requirements for Agricultural Zones, a Recycling Facility or Solid Waste Disposal Facility is not an allowed land use in the Agricultural Zone. Therefore, the proposed Project is required to apply for a zone change in order to include concrete and asphalt recycling and processes and large scale solid waste disposal.

Response 12-61

As discussed in Comment 12-22 and Response 12-22 of this Final EIR, the Fresno County Code of Ordinances defines "solid waste" and "solid waste facility" as defined in PRC 40191 and 40194, respectively. PRC 40191 expressly lists numerous types of solid waste but does not include "mining waste." "'Solid waste facility' includes a solid waste transfer or processing station, a composting facility…a transformation facility…and a disposal facility" (PRC Section 40194). Under the laws relevant here, the fines to be deposited in the bottom of the excavation would not be solid waste and would be used for reclamation purposes, and the sites would not be "solid waste facilities."

The acceptance of concrete and asphalt for recycling does not render it a solid waste processing facility. Pursuant to the Fresno County General Plan, solid waste facilities do not include recycling centers (Fresno County General Plan at page A-6).

Additionally, as provided in Fresno County Zoning Ordinance Section 834.4.220(C), concrete batch plants and asphalt batch plants are allowed uses "for the extraction, processing, storage, and transport of materials," with an approved CUP. As seen in Table 2-2, "Plant Site Existing Permitted Hours of Operation," of the Fresno County Zoning Ordinance and explained in Appendix B-2 of the Draft EIR, surface mining operations are allowed in the AE zone with a CUP (Fresno County Zoning Code, Table 2-2, at page 2-14).

Thus, the project is not required to apply for a zone change for the concrete and asphalt plants. If the project is approved, the concrete and asphalt recycling would be allowed subject to a CUP, as part of surface mining operations at the project sites.

Comment 12-62

(2) Lost Lake Park Master Plan

The Draft EIR is not consistent with the Lost Lake Park Master Plan and needs to be revised to include analysis of consistency with the approved plan. Lost Lake Park Master Plan, dated 2011, plans trail connections to and through the Project Sites. The Central Valley Vision Plan to improve livability and the regions need for recreational opportunities.

Response 12-62

The Draft EIR includes and properly analyzes consistency with the Fresno County General Plan (see Draft EIR, Table 4.11-1). The Lost Lake Park Master Plan Policy OS-C.8 provides, in part, that the "County shall, where feasible along the San Joaquin River, site recreational trails, bikeways, and other recreation areas at least three hundred (300) feet

from the edge of active aggregate mining operations and separate them by physical barriers." The Draft EIR is consistent with this policy as it provides a potential easement for a public trail to the SJRC along the Friant Road frontage of the Plant Site providing needed connectivity to planned trails in the area and a potential easement for a public trail to the SJRC along the existing 200-foot setback from the San Joaquin River at the Quarry Site (see Draft EIR page 4.11-46).

The Lost Lake Master Plan is also required to be consistent with the Fresno County General Plan. Furthermore, the Draft EIR analyzes consistency with the San Joaquin River Parkway Master Plan and the potential for trail easements at the project sites (see Draft EIR pages 2-51 and 4.11-44). Thus, the Draft EIR does not need to be revised.

Additionally, all potential recreational impacts to the San Joaquin River are adequately analyzed in Section 4.16, "Recreation," of the Draft EIR.

Comment 12-63

(3) Surface Mining and Reclamation Act

The Draft EIR is not consistent with the California Surface Mining and Reclamation Act (SMRA). The intent of the legislature pursuant to Cal. Pub. Res. Code § 2712:

> It is the intent of the Legislature to create and maintain an effective and comprehensive surface mining and reclamation policy with regulation of surface mining operations so as to assure that:
>
> a. Adverse environmental effects are prevented or minimized and that mined lands are reclaimed to a usable condition which is readily adoptable for alternative land uses.
>
> b. The production and conservation of minerals are encouraged, while giving consideration to values relating to recreation, watershed, wildlife, range and forage, and aesthetic enjoyment.
>
> c. Residual hazards to the public health and safety are eliminated.

The proposed Project results in significant and unavoidable environmental direct, indirect and cumulative impacts for aesthetics, air quality and transportation that cannot be mitigated. Therefore, the adverse environmental effects of the Project are not prevented or minimized. The Project is not consistent with Section 2712(a).

Response 12-63

Comment 12-63 is introductory and conclusory in nature. The Draft EIR is consistent with California Surface Mining and Reclamation Act (SMARA) and Section 834.4.220 of the Fresno County Zoning Ordinance, which implements SMARA. (Draft EIR page 4.11-43) Mining projects have some adverse effects and adverse environmental effects here are minimized, consistent with PRC Section 2712(a). This same section also encourages the production of minerals (PRC Section 2712(b)). Impacts that are minimized are not always avoidable. That is why numerous mines throughout California have been approved even though they have significant and unavoidable impacts, see e.g. Carmelita Resources, which Fresno County EIR was upheld by the 5th District Court of Appeals (see *Friends of the Kings River v. County of Fresno* (2014) 232 Cal.App.4th 105, even though that project had significant and unavoidable traffic and air quality impacts). Operation and reclamation of the proposed project would be consistent with SMARA and all applicable County regulations and policies (Draft EIR page 4.11-26).

Comment 12-64

The Project's reclaimed condition of the Plant Site and Quarry Site has no other adoptable land use than a pit pond surrounded by steep walls. There is no visual benefit to the community because the water is located so far down from the surface. Painting the quarry walls brown is insufficient to mitigate the visual impact of the steep quarry walls that cannot be planted with vegetation and are too steep to maintain vegetation.

The Draft EIR concludes the reclamation plan will be used for open space, riparian and open water wildlife habitat. There is no evidence presented that water wildlife will have a beneficial use of the pit pond. Section 4.4 Biological Resources, states:

> Adverse effects to special-status species could occur if wildlife that encounter the quarry pit pond or quarry lake are exposed to water with elevated concentration of metals or minerals.

The Project does not include measures to prevent the accumulation of metals or minerals. In fact, the Project proposes to abandon mining equipment and other metals in the mine pit that will be broken down over time by water resulting in accumulation of metals. The Project's Reclamation Plan does not provide a recreational value to the community. There is no mitigation measure that requires land dedication for trail easements or purchase of alternative land for recreational use. Although the Project Description/Operational Statement in Appendix B-2 makes many statements of mitigation the operator will do, many are not part

of the Project and have not been included as mitigation measures in the Draft EIR. The Project is not consistent with Section 2712(b).

Response 12-64

The comment asserts an opinion that painting quarry walls brown is an insufficient mitigation measure. The Draft EIR concludes that the impact to potentially sensitive viewpoints #12 and #13 is significant and unavoidable, even after implementation of Mitigation Measure 4.1-1 (Draft EIR pages 4.1-60 through 4.1-61). As stated in the Draft EIR, Mitigation Measure 4.1-1 reduces impacts to the greatest extent feasible (Draft EIR page 4.1-60). The comment does not suggest an additional mitigation measure, and thus no further response is required.

The project sites would be reclaimed to open space land uses, in accordance with SMARA provisions. The Draft EIR concluded that the project is consistent with the Fresno County General Plan regarding the Open Space and Conservation Element, and there is no indication of adverse impacts to the health of wildlife following reclamation of the project site (Draft EIR page 4.4-54).

The comment inaccurately states that the Draft EIR proposes to abandon mining equipment in the mine pit. All equipment would be removed from the project sites following completion of the project (Draft EIR page 4.4-53). However, equipment related to water management, such as pumps, piping, monitoring wells, and related electrical infrastructure, would remain at the Quarry Site because water would be continuously pumped from the quarry pit into the Northeast Pond and groundwater recharge trenches (Draft EIR page 4.10-87). Further, the Draft EIR concludes that the potential for the quarry pit lake to accumulate concentrations of constituents that would violate water quality standards or waste discharge requirements, or otherwise degrade water quality, would be less than significant (Draft EIR page 4.10-101). Therefore, no mitigation measure is required to prevent accumulation of metals or minerals in the pit pond or quarry lake.

The comment asserts that there are no mitigation measures requiring land dedication for trail easements or purchase of alternative land for recreational use. However, the project includes the offer of dedication of a trail easement along North Friant Road adjacent to the Plant Site and offer of dedication of a trail easement along the San Joaquin River at the Quarry Site that would allow for the potential future development of a bicycle and multi-use trail in accordance with existing local transportation planning documents (see Draft EIR Section 2.5.8, "Trail Easements," in Chapter 2, "Project Description). See also, Collective Response #22, which discusses the dedication of trail easements.

Comment 12-65

As discussed above, abandoned quarries are fundamentally dangerous to the community, especially in a high-use recreational area as the San Joaquin River. The abandoned quarry is an attractive nuisance that people will be tempted to go into. The Project will leave behind very dangerous quarry pits. The only protection for the public is a 4-foot-high barb wire fence. The Project is not consistent with Section 2712(c).

Special consideration needs to be applied to the Project in determining consistency with the SMRA and CEQA. The proposed Project is located near to urban development and the area will continue to grow in population with associated housing and commercial development that will result on an increase in people exposed to the dust, odor, noise, air pollutants and safety concerns generated from the Project. A 491 multifamily project has been constructed the northeast corner of Friant Road and Copper Avenue, less than 3 miles from the Project. The Project is located within a highly desirable recreation area of the region. The need for recreational use will continue to grow as the population in the area increases during the life of the Project. The area is already in need of additional recreational opportunities. The Project will result in exposing an increasing number of people using the San Joaquin River recreational facilities to odors, dust, noise, air pollutants and safety concerns during the life of the Project.

Response 12-65

The project is consistent with PRC Section 2712(c) because the project is consistent with all Fresno County's provisions and policies requiring specific safety measures for surface mining operations. The proposed fencing along the perimeter of the project sites complies with SMARA and the Fresno County Zoning Ordinance 834.4.220 I.4, which requires that the entire perimeter of the property would be fenced with a minimum four-foot-high, ranch fencing consisting of metal T-posts and at least three strands of barbed wire (see Draft EIR page 4.1-13). The project, therefore, is consistent with SMARA and CEQA standards (see Draft EIR pages 4.11-43 through 4.11-44). The Draft EIR adequately analyzes the project's impacts upon recreational uses in Section 4.16, "Recreation" (see Draft EIR pages 4.16-1 through 4.16-6). See also Appendix D-4, "Revised Section 4.3, Air Quality," regarding air quality, and Sections 4.9, "Hazards and Hazardous Materials," regarding hazards and hazardous materials, and 4.13, "Noise," regarding noise.

Comment 12-66

vii. Section 4.17 Transportation

(1) Truck Routes

The Draft EIR is insufficient in describing the Project's environmental impacts on transportation and needs to be revised. Section 4.17 needs to include a map of approved truck routes accessing the Project Sites from major transportation facilities in Fresno County and surrounding cites.

The VMT analysis in Appendix I-2 discloses that the Project will result in an increase from the existing 3,153,449 VMTs of the current operation to 6,668,850 VMTs in Phase 2. While the analysis also provides that a no-project alternative will result in 8,060,099 VMTs as a result of demand being "redistributed" to other mines in different locations, Figure 4.17-2 of the Draft EIR shows that these other sites are located away from Friant Road, which will be the most heavily travelled street by trucks from the proposed Project. In light of the sheer volume of VMTs that could be "redistributed" depending on the existence of the Project makes a clear map of truck routes even more crucial to understanding the impacts of this Project.

Response 12-66

The Draft EIR does not need to be revised because Figure 4.17-1, "Traffic Study Intersections and Project Trip Distribution Percentages," regarding traffic study intersections and trip distributions provides the information necessary for proper assessment of potential significant environmental impacts with a sufficient degree of analysis to enable decision-makers to make a decision that intelligently takes relevant environmental consequences into account (CEQA Guidelines Sections 15147 and 15151). The Draft EIR includes maps showing state highways and freeways and explains the potential environmental impacts related to VMT and the redistribution of project trucks, depending on the existence of the project (Draft EIR, Figure 4.17-1, Figure 4.17-2, "Active, Inactive, and Permitted Aggregate Mines in the Fresno-Madera Production Consumption Region"; Appendix I-2).

As described in Appendix I-2, "Estimates of Vehicle Miles Travelled," of the Draft EIR, the increased VMTs for the "Project Trucks Redistributed to Other Sources," is based on the analysis that the number of sources available in a region would not be expected to affect the demand for the material (see Appendix B of Appendix D-1, on, page 7). The more sources that are available, the shorter the average length per trip would be expected to be, meaning that with the no-project alternative, the trucks therefore distributed to

other sources would be expected to travel more miles to transport the material, leading to an increase in VMT (see Draft EIR, Appendix I-2, Table 2).

Figure 4.17-2 of the Draft EIR shows the project area and the other aggregate mines in the area. Figure 4.17-2 of the Draft EIR also depicts all of the state highways and freeways in the region. The comment assumes without basis that trucks from the other aggregate mining sites in Figure 4.17-2 would not use Friant Road to meet aggregate demands in that area of Fresno County, including to access nearby freeways.

Comment 12-67

(2) Pedestrians

The Draft EIR is insufficient in describing the existing pedestrian facilities in the Project vicinity. Section 4.17.1.4 must be updated to include the Eaton Trail on the west side of North Friant Road that serves both pedestrians and cyclists. Intersection trail crossings exist along North Friant Road at the intersections of Copper, Lakewood, Champlain, Fort Washington, Shepherd, Audubon and Fresno. Each of these pedestrian intersections connect residents of the City of Fresno to Woodward Park, trail facilities, residential, office and retail uses.

Response 12-67

The Draft EIR discloses the location of the Eaton Trail in Section 4.17.1.4 (Draft EIR page 4.17-4). The Traffic Impact Study analyzed each of the intersections noted in the comment (see Appendix I-1, "Traffic Impact Study," of the Draft EIR). The project would not construct any roads, walls, or other linear features that could impede vehicle, bicycle, or pedestrian mobility in the area, nor would the project involve the removal of any roads, bridges, trails, or other means of access in the area (Draft EIR page 4.11-48). As discussed in Section 4.17, "Transportation," the project would not interfere with existing or planned transit, bicycle, or pedestrian facilities or plans (see Draft EIR page 4.17-27, Impact 4.17-1) and would add a negligible number of new daily vehicle trips on local roadways (see Draft EIR page 4.17-40, Impact 4.17-2). The project would also contribute a fair share of signal improvements for those intersections mentioned as a mitigation measure.

Comment 12-68

(3) Transportation Policies

The Draft EIR is insufficient in identifying applicable land use and planning policies and ordinance. The proposed Project needs to be consistent with City of Fresno Active Transportation Plan

https://www.fresno.gov/publicworks/active-transportation-plan/
seven (7) goals:

1. Safety Enhancement
2. Connectivity, Accessibility and Comfort
3. Equity and Inclusivity
4. Economic Vitality & Quality of Life
5. Education, Encouragement & Enforcement
6. Data Collection and Performance Monitoring
7. Ongoing Maintenance

The Draft EIR is not consistent with the City of Fresno Active Transportation Plan's safety goals. It is common sense that more than doubling the annual mining activity, adding aggregate mining at the Plant Site (which is a new use, since the prior use was ceased), adding an asphalt plant, increasing concrete production, adding material recovery operations and sales of materials from the plant will increase heavy trucks on the roadways accessing the Project Sites from major transportation corridors. The added truck traffic on roadways, such as North Friant Road will exasperate existing safety issues to motorist, cyclist and pedestrians. There have been multiple pedestrian and bicyclist fatalities along Friant Road. Pursuant to Jill Gromley, Assistant Director, Traffic Engineering Division, City of Fresno:

> There have been 189 collisions reported along Friant Road corridor from Blackstone to Copper River Drive from January 1, 2019 to December 31, 2024. Sixty-two (62) of these collisions resulted in injuries and 8 were fatal. Three of the fatal collisions involved pedestrians and one involved a bicyclist. Park patrons and trail users frequently park east of Friant Road and walk through the Woodward Park entrance on Fort Washington or utilize the parking lot on the southeast corner of the Friant/Copper intersection. The residential uses east of Friant Road generate high volumes of park patrons and trail users crossing Friant Road. Frequent complaints from visitors at the park and trail users is the high speed of traffic along Friant Road and large volumes of truck traffic.

The population of Fresno County will increase over the life of the Project (100 years) which will result in increased

likelihood of conflicts between trucks from the Project and pedestrians and cyclist. Although the City of Fresno monitors roadway speed, intersection operations, and adjusts speed limits accidents and deaths still occur. The Project should implement the measures of the Fresno Area Transportation Plan and include Project features to mitigate truck traffic safety impacts on the surrounding area.

Response 12-68

The comment does not provide a basis for the assertion that the project is not consistent with the City of Fresno Active Transportation Plan. The project is located in unincorporated Fresno County. The comment overlooks that the Draft EIR in Section 4.17 analyzes the project's consistency with the relevant local plans, including, but not limited to, the Fresno County Regional Active Transportation Plan, Fresno County Regional Transportation Plan, and Madera County Active Transportation Plan.

The increase in vehicles on existing roadways does not have the potential to conflict with relevant plans, ordinances, or policies because transportation plans, including the Fresno County General Plan, Fresno County Regional Active Transportation Plan, and Fresno County Regional Transportation Plan, account for anticipated future increases in vehicles travelling along roadways (Draft EIR pages 4.11-7 through 4.11-8, 4.17-28). Additionally, the Operator would be required to pay an equitable share of pavement improvements to the County of Fresno to improve the pavement section and accommodate the traffic index values, which would contribute to maintaining safe road conditions. Because transportation and safety concerns are multifaceted and require input from multiple entities, it is best addressed on the programmatic level (i.e. general plan or transportation plan) (Draft EIR page 4.17-41). See Draft EIR Impact 4.17-1 for further discussion of the project's consistency with applicable transportation plans, ordinances, and/or policies. The Draft EIR adequately addresses safety concerns resulting from the expected increase in number of vehicles as a result of the project.

In addition, the quote from the City of Fresno Traffic Engineering Division does not attribute any of the cited fatalities to aggregate mine truck traffic.

Comment 12-69

(4) Transportation Impacts other Than VMT

The Draft EIR is insufficient in assessing transportation impacts and needs to be revised. Pursuant to OPR's Technical Advisory on Evaluation Transportation Impact in CEQA, dated December 2018, Paragraph G Analyzing Other Impacts Related to Transportation, page 25 a change in the methodology of assessing

transportation impacts does not relieve a public agency of the requirement to analyze a project's potential significant transportation impacts to air quality including mobile sources, noise, safety, or any other impact associated with transportation.

Under Public Resources Code section 21099(b)(3), the deprecation of level of service analysis does not "preclude the application of local general plan policies, zoning codes, conditions of approval, thresholds, or any other planning requirements." Accordingly, the County's traffic index thresholds of significance (along with consideration of other non-delay related impacts) are still applicable.

Using the County's TI thresholds, Chapter 4.17 concludes that the Project results in significant unavoidable impacts after mitigation to pavement conditions on Friant Road between North Fork Road and Copper River Drive, and Willow Avenue between Friant Road and Copper Avenue. (Draft EIR at 4.17-29 through 30.) These impacts are virtually undeniable, given the 6 million VMTs from Project-related vehicles, mostly heavy trucks delivering aggregate and asphalt from the Project and the acceptance of used concrete and asphalt concrete for recycling. While the LOS impacts may be moot in light of SB 743, these pavement impacts are not.

Furthermore, in the discussion of impact 4.17-3, regarding increases to hazards, the Draft EIR concludes that no such impact would occur, in part because "the operator of the Rockfield Quarry would be required to pay an equitable share of pavement improvements to the County of Fresno to improve the pavement section and accommodate the traffic index values, thereby keeping road conditions safe." This is inconsistent with the conclusion in Impact 4.17-1 that the mitigation measure would be insufficient to avoid a significant adverse impact.

Response 12-69

Comment 12-69 takes the OPR's (now the Governor's Office of Land Use and Climate Innovation) Technical Advisory and the Public Resources Code section out of context. The comment's reference to the Technical Advisory and PRC Section 20199(b)(3) apply specifically to infill projects and thus would not apply here.

However, the Technical Advisory states that:

> "Because safety concerns result from many different factors, they are best addressed at a programmatic level (i.e., in a general plan or regional transportation plan) in cooperation with local governments, metropolitan

> planning organizations, and, where the state highway system is involved, the California Department of Transportation. In most cases, such an analysis would not be appropriate on a project by-project basis…Lead agencies should note that automobile congestion or delay does not constitute a significant environmental impact (Pub. Resources Code, Section 21099(b)(2)), and safety should not be used as a proxy for road capacity" ("Technical Advisory on Evaluating Transportation Impacts in CEQA," OPR (April 2018), pages 21 through 22).

The Draft EIR uses the appropriate transportation significant criteria and significance thresholds in evaluating potential significant environmental impacts, including but not limited to VMT analysis and other "non-delay related" potential environmental impacts (see, for example, Draft EIR pages 4.17-4 and 4.17-19).

The comment is correct in noting that the Draft EIR finds that the project would result in potentially significant and unavoidable impacts to pavement conditions on Friant Road between North Fork Road and Copper River Drive and on Willow Avenue between Friant Road and Copper Avenue (Draft EIR pages 4.17-29 through 4.17-30). The Draft EIR also includes Mitigation Measure 4.17-1b, where the project would contribute an equitable share of pavement improvements to increase the pavement section to accommodate the traffic index values shown in Table 4.17-12, "Project Annual Trip Generation—Stage 1 (2.0 MT Per Year)." As explained in the Draft EIR, this potential impact is considered unavoidable mainly due to the uncertainty of when the improvements would be constructed, as that would not be within the control of the project Operator.

For Impact 4.17-3, payment of an equitable share of pavement improvements to improve the pavement section is not the only consideration in the analysis finding a less than significant impact. The analysis for Impact 4.17-3 also notes that construction-related oversize vehicle loads must comply with other California law road and safety requirements and that California Highway Patrol escorts could be used for construction-related oversize vehicle loads, under the authority of Caltrans and the County (Draft EIR page 4.17-42). To further address the commenter's concerns, please see Section 3.2.5, "Errata to Draft EIR Chapter 4, "Environmental Analysis," of Final EIR Chapter 3, "Draft EIR Errata," of this Final EIR, which describes an additional pavement mitigation measure (MM 4.17-3) that would further reduce potential impacts to less than significant. See also Appendix I-5, "Pavement Memorandum."

Comment 12-70

The City of Fresno is concerned about the Project's significant unmitigated environmental impact to its roadway surfaces from truck traffic carrying heavy loads. The Project truck traffic Average Daily Trips is expected to increase 57% over existing conditions in State 1 and an additional 38% in Stage 2. Figure 4.17-1, Traffic Study Intersection and Project Trip Distribution Percentages, indicates that 55% of the Project traffic will utilize North Friant Road to southwest of the Project Site. That traffic will be dispersed throughout the City of Fresno. Public Works Director, Scott Mozier, PE, TE estimates that the cost to repave Friant Road from SR-41 to the northern city limit is $12.8 million dollars. This would occur at 20-year frequencies, there would be a total of five rehabilitation projects for a 100-year repaving cost of$64 million dollars. This is a significant cost to the City of Fresno of Project related to non-LOS transportation impacts.

The Draft EIR needs to provide an up to date analysis of the transportation impact of truck traffic on surrounding roads (not just Friant Road and Willow Avenue) and provide a Project Trip Distribution analysis that indicated the percentage of truck traffic using study area roadways and intersections. The Draft EIR needs to provide an analysis of the existing condition of roadways and the potential of the Project's truck traffic to degenerate the life of the roadway pavement and provide mitigation for the Project's transportation impacts.

Response 12-70

See Draft EIR Section 4.17 discussing transportation and transportation impacts. See also Draft EIR Section 5.3.17 discussing cumulative transportation impacts. The Traffic Impact Study conducted for the project includes an assessment of project-related truck trip distribution on study area roads. See Draft EIR Appendix I-1, Figure 1.3 for a depiction of the selected study areas.

The traffic impact analysis study area was determined through coordination with Fresno County and its expert consultant team and is considered appropriate for the purposes of documenting the project traffic-related impacts. The comment does not reference additional roads that should be included in the traffic impact study area.

The Draft EIR analyzes impacts to existing pavement conditions, as well pavement conditions with the project in place (Draft EIR page 4.17-29). The results of the Existing-Plus-Project road segment Traffic Index (TI) analyses performed in the Traffic Impact Study are summarized in the Draft EIR, page 4.17-26, Table 4.17-10, "Traffic Index

Summary—Existing and Existing Plus Project." Because the project would result in a significant increase in the traffic index on all analyzed pavement segments, the Draft EIR proposes equitable share contributions by the Operator to mitigate the impacts of an increased traffic index.

Measures to reduce these traffic congestion effects are recommended in the Traffic Impact Study (Draft EIR Appendix I-1), are identified under Impact 4.17-1, and are required as Mitigation Measures 4.17-1a through 4.17-1r. These measures primarily consist of the payment of equitable share of costs of future roadway improvements in the County, and, if warranted, the installation of traffic signals at the intersection of North Friant Road with the Quarry Site and Plant Site entrances. The traffic study's analysis indicates that LOS and queuing would be effectively reduced through the implementation of the recommended measures; however, traffic impacts, including impacts to pavement conditions, are considered significant and unavoidable because it is uncertain when the assumed road improvements would be constructed (Draft EIR page 4.17-29; see also Response 12-71 for further discussion of why the traffic impacts are significant and unavoidable).

Comment 12-71

In addition, the Draft EIR should consider additional mitigation measures to address this significant impact. The Project should pay for the repair of all Project-related impacts to wear and tear of roadways. The following mitigation measure should be added to the Project:

> The Applicant/Owner shall enter into an agreement with the City of Fresno to pay for all cost of roadway damage caused by the Project's truck traffic. The Applicant/Owner will pay the cost to prepare a study and monitor roadway conditions every 5 years thorough the life of the Project and until the Reclamation Plan has been fully implemented.

Response 12-71

As recognized by the comment, the County cannot legally require the project to fully fund the necessary road improvements and instead must limit the imposition of mitigation requirements to those that are roughly proportional to the project's impacts (Title 14 CCR Section 15126.4(a)(4); *Dolan v. City of Tigard*, 512 U.S. 374 (1994)). Therefore, the appropriate mitigation requirement for project impacts to traffic operations is for the Operator to contribute its proportional share of funding toward the improvements, which is required here. See Draft EIR Mitigation Measures 4.17-1a through 4.17-1r. As discussed in the Draft EIR (see Draft EIR pages 4.17-29 through 4.17-30), even with the

Operator's contribution of the project's proportional share of funding for these improvements, the improvements necessary to achieve acceptable LOS and pavement conditions at these intersections may not occur before the project's introduction of additional vehicle trips because of, for example, a lack of funding for the other proportional shares beyond the control of the Operator. Therefore, the project's impact at 5 intersections (identified on Draft EIR page 5-28 through 5-29) under the following conditions is considered significant and unavoidable:

- Existing-Plus-Project Conditions (Stage 1—3.0 MT per year);
- Five-Year Cumulative Conditions with Project (Stage 1—2.0 MT per year);
- 15-Year Cumulative Conditions with Project (Stage 1—3.0 MT per year);
- Cumulative (Year 2040) No-Project Conditions; and
- Cumulative (Year 2040) Conditions with Project (Stage 1—3.0 MT per year).

See Draft EIR Section 4.17 for a detailed discussion of the Traffic Index analysis and the LOS and Queuing analysis.

Comment 12-72

viii. Section 4.16 Recreation

The Draft EIR is insufficient in describing the recreational facilities near the Project Sites. A map should be provided to depict the location of the recreation facilities identified in Table 4.16-1.

Table 4.16-1 is not accurate in describing the uses of the recreation facilities. San Joaquin River Ecological Reserve – Willow Unit and Lost Lake Park had access from a bridge and once the bridge is rebuilt, will have public access. Currently, public access can be made via the river by boat. The Draft EIR needs to use descriptions provided by the facility such as day use, hiking trails and camping. The Draft EIR presents information in a manner to lessen the public's value of the recreation facilities around the Project.

Response 12-72

The Draft EIR sufficiently describes the recreational facilities near the project sites, in accordance with CEQA Guidelines, Section 15125. Table 4.16-1, "Recreation Facilities Near the Project Sites," includes sufficient information regarding the nature of the adjacent recreational uses, specifically including Willow Unit and Lost Lake Park (see Draft EIR page 4.16-1). Figure 2-5, "Conditional Use Permits and Surrounding Land Uses," depicts an aerial image of the project's neighboring land uses, including the listed

recreational areas (see Draft EIR page 2-25). Furthermore, the Draft EIR is consistent with applicable goals, objectives, and policies set forth in the San Joaquin River Parkway Master Plan and the Fresno County General Plan applicable to recreational opportunities in the County (Draft EIR page 4.11-44).

Comment 12-73

ix. Section 4.19 Hydrology And Water Quality

The Hydrology and Water Quality analysis fails to consider significant potential impacts and several mitigation measures that should be revised to address those impacts.

For example, the proposed Project stands to greatly increase the depth of mining, which would require continuous dewatering in areas beneath the existing groundwater levels. This may result in the movement of water from deeper confined areas of the aquifer, reducing the availability of water for other wells in the area. Additional analysis of that potential impact is required.

Response 12-73

Comment 12-73 also does not provide specific evidence or argument that the Draft EIR "fails to consider significant potential impacts and several mitigation measures that should be revised to address those impacts."

Dewatering and groundwater levels are analyzed under Impact 4.10-10 and addressed in Mitigation Measures 4.10-10a and 4.10-10b, including but not limited to: "*If the additional assessment confirms that a decrease in water levels greater than 15 percent is exclusively attributable to mine dewatering, then corrective measures would be implemented.*" Additional corrective measures are also included in the mitigation measures provided. Comment 12-73 does not state a specific basis for why "additional analysis" is required. Mitigation Measures 4.10-10a and 4.10-10b are revised and clarified in the Final EIR. See Chapter 3, "Draft EIR Errata," to see the full changes to these mitigation measures.

Comment 12-74

The Draft EIR notes the presence of mobilized natural constituents in recycled silt pond water, but dismisses that impact as the result of "variability in sampling procedures," and discounts the presence of manganese and iron without sufficient analysis. The variability in measurements may be the result of operational factors. The Draft EIR must consider whether mobilized constituents have entered the groundwater at high concentrations, and must fully address the potential health implication of elevated iron and manganese concentrations.

Response 12-74

The Draft EIR explains and analyzes the presence of manganese and iron at Impacts 4.10-5 to 4.10-7 (see Draft EIR on pages 4.10-95 through 4.10-101) and provides Mitigation Measure 4.10-5a and 4.10-5b to address potential increased levels caused by the project to reduce the levels to a less than significant level.

Further, the EIR is only required to analyze impacts from the proposed project, not the existing environmental conditions (baseline). (*California Building Industry Assn. v. Bay Area Air Quality Management Dist.* (2015) 62 Cal.4th 369, 377 ["agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents."]).

Comment 12-75

In addition, the mitigation measures listed in this section require further refinement. The Blasting Protocols (Mitigation Measure 4.10-1) need more detail regarding the frequency of monitoring, and specific actions that would be triggered by any protocol violations, as well as information about verification of compliance and the use of specific monitoring actions using measurable water quality metrics.

Response 12-75

Regarding Blasting Protocols and Mitigation Measure 4.10-1, please see Response 58-46.

The Blasting Protocols (Mitigation Measure 4.10-1) provide sufficient detail regarding the frequency of monitoring and include specific actions that would be triggered by exceedances of specified ground vibration and air overpressure thresholds, and instability as the result of blasting, as well as specific monitoring actions using appropriate metrics (Draft EIR pages 4.4-57 through 4.4-58). Mitigation Measure 4.10-1 is defined and described in detail to show how it would be feasible and effective (see Title 14 CCR Section 15126.4; see also *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 524).

In addition, for further clarification of Mitigation Measure 4.10-1 and the Blasting Protocols, as described in Response 58-46, Mitigation Measure 4.10-1 has been revised to reflect the requirements of the Blasting Protocols (see also Final EIR, Appendix H-9, "Revised Blasting Protocols," on page 6):

> Mitigation Measure 4.10-1 would require implementation of the Blasting Protocols (~~Appendix H-6~~Appendix H-9).... If it is determined that the instability is the direct result of blasting, and not due to natural water erosion, with or without flooding, then a corrective action plan must be

developed that identifies changes to the blasting program to prevent future exceedances. The corrective action plan will require the immediate suspension of all blasting until the corrective action is approved by the County. The Blasting Protocols also detail the requirements for complaint response procedures; record keeping; and annual reporting of monitoring, complaints investigations, and corrective actions (Originally found at Draft EIR pages 4.4-57 through 4.4-58; see also Final EIR Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR).

Comment 12-76

The Plant Site Pond Adaptive Management Program (Mitigation Measure 4.10-5) needs to provide additional information regarding: (1) who will oversee and enforce the plan, (2) the threshold water quality parameters for trigging corrective action, (3) timelines for implementing corrective measures, (4) the risks to human health and safety from herbicide use for vegetation management, (5) guidelines for the selection of such herbicides, and (6) measures to handle high testing variability due to seasonal cycles.

The Plant Site Pond Adaptive Management Program Funding Mechanism (Mitigation Measure 4.10-5) should provide details regarding the amount of funding, and the method of determining whether stabilization has occurred for the purposes of cancelling the funding mechanism.

Response 12-76

Section 4.10, "Hydrology and Water Quality," of the Draft EIR, and specifically the Plant Site Pond Adaptive Management Program (Mitigation Measure 4.10-5a), provide the information requested in the comment, including:

1. Every six months, the qualified professional responsible for the monitoring and reporting would supervise field measurements, and an annual report documenting the methodology and results of the sampling would be submitted to the County;
2. The field measurements are conducted at two depths: (a) near the surface of the water, and (b) near the bottom of the water column, which if iron concentration exceeds its secondary MCL and NPDES discharge limit of 300 ug/L, or if manganese exceeds its secondary MCL and NPDES discharge limit of 50 ug/L mg/L, the laboratory testing shall be completed again in six months to assess whether there is potential testing variability related to seasonal influences;

3. If the iron and/or manganese levels persist for five consecutive years above their respective water quality standards, then the mitigation actions described in Mitigation Measure 4.10-5a would be implemented;
4. The potential use of County approved terrestrial or aquatic herbicides during the reclamation process are also analyzed under Impacts 4.10-2 and 4.10-3 and have been found to have less than significant impacts;
5. Monitoring results shall be reported to the County in an annual report that would be submitted at the end of the first quarter of every year. The annual report shall describe any measures that have been or are planned to be taken based on the monitoring results and provide an analysis of the effectiveness of the measures, and a description of any further recommended measures, as part of subsequent annual reports.

Under the requirements of Mitigation Measure 4.10-5a, the testing and reporting must be done by a qualified professional, whose qualifications are provided to the County. The mitigation measure specifies the frequency of testing, specific testing parameters, required annual reporting to the County, and specific measures that must be taken if measurements exceed certain limits. The Plant Site Pond Adaptive Management Program indicates that monitoring would begin when the Operator allows water to begin to fill all or part of the excavated mine pit. At the latest, monitoring shall begin at the completion of mining at the Plant Site (Draft EIR page ES-33). Timelines for corrective actions are not yet determined, but would occur after the annual report submitted to the County at the end of the first quarter of every year. The annual report would disclose what corrective actions would be taken and when they would be implemented (Draft EIR pages 4.10-97 through 4.10-98).

The Plant Site Pond Adaptive Management Program Funding Mechanism (Mitigation Measure 4.10-5b) provides details regarding the amount of funding and the method of determining whether stabilization has occurred for the purposes of cancelling the funding mechanism, as described in Mitigation Measure 4.10-5a (Draft EIR pages 4.10-97 through 4.10-98). See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10 including revisions to Mitigation Measure 4.10-5a.

Comment 12-77

The Quarry Site Groundwater Adaptive Management Program (Mitigation Measure 4.10-10a) involves monitoring multiple wells across the site, and beyond, which could create logistical challenges. The measure should require the Project Applicant to demonstrate longterm access to offsite wells and further specify contingencies for situations where available data is insufficient.

Also, additional data should be provided regarding how quickly a 15% reduction in the water column could realistically occur given the large-scale nature of the Project.

The Quarry Site Groundwater Adaptive Management Program Funding Mechanism should have a provision for extending the duration beyond three years if the groundwater systems impacted by dewatering take longer than that to stabilize. In addition, this measure should clarify that monitoring and corrective actions will continue indefinitely if groundwater levels do not recover to the baseline levels.

These impacts and mitigation measures, as well as some additional general observations and recommendations are discussed in more detail in the letter dated March 3, 2025 from the Fresno Department of Public Utilities to David Randall, Fresno County Public Works and Planning Department, a copy of which is attached as Exhibit 1 hereto.

Response 12-77

Comment 12-77 restates that the Quarry Site Groundwater Adaptive Management Program (Mitigation Measure 4.10-10a) would involve monitoring multiple wells at the Quarry Site. Regarding how quickly a 15 percent reduction in the water column could occur, there have been both recharge trenches and ponds used for decades at the Quarry Site, and at numerous other aggregate mining sites in the region. Throughout the life of the quarry, water produced during dewatering of the excavation has been pumped to perimeter recharge trenches on the west side of the site and to the Northeast Pond to reduce or eliminate the effects of dewatering outside of the Quarry site boundary (Draft EIR, Section 2.4.2.2, "Quarry Site Existing Conditions," page 2-21, Section 2.5.2.2, "Quarry Site Mine Plans," page 2-39). Furthermore, Draft EIR Appendix G-6, "Addendum to Hydrology and Water Quality Analysis Report," provides a quantitative assessment of the efficacy of the use of recharge trenches to mitigate effects on groundwater levels. That analysis is based on the comparison of water year rainfall over a six-year period with groundwater levels measured over the same period using downhole pressure transducers and dataloggers in 14 Quarry Site monitoring wells. The downhole pressure transducers record water level readings every six hours. Thus, over 1,450 data points are measured in each well every year (see Draft EIR, Appendix G-6, page 3). Additionally, Mitigation Measure 4.10-10a requires mining operations to cease if groundwater recharge cannot be maintained within 85 percent of the CEQA baseline. Mitigation Measures 4.10-10a and 4.10-10b are revised and clarified in the Final EIR. See Chapter 3, "Draft EIR Errata," to see the revisions to these mitigation measures.

The monitoring wells referenced in the Draft EIR are located on-site rather than off-site (see Draft EIR Figure 4.10-4, "Quarry Site Surface Water Features and Wells"; Draft EIR Section 4.10.1.9, "Groundwater-Surface Water Interaction at the Quarry Site," page 4.10-49; and Draft EIR Section 4.10.1.8, on pages 4.10-42and 4.10-43). Accordingly, access is not an issue. Off-site well monitoring would provide supplementary data and the Draft EIR acknowledges that access may or may not be granted (Draft EIR, Appendix G-5, "Hydrology and Water Quality Analysis Report," page 60).

The Quarry Site Groundwater Adaptive Management Program Funding Mechanism explains that the funding mechanism would provide for the monitoring indefinitely if necessary for stabilization (Draft EIR, page 4.10-111).

See responses to the letter dated March 3, 2025, from the City of Fresno, Department of Public Utilities to David Randall, Fresno County Public Works and Planning Department in Responses 12-84 through 12-111 of this Final EIR.

Comment 12-78

c. Chapter 5: Cumulative analysis

The cumulative impact analysis is deficient as it does not include all of the aggregate mining operations that were used to eliminate the VMT impact from off-site hauling trips for the Project. Specifically, it includes only Austin Quarry, and omits Sanger Sand & Gravel, Kings River Sand & Gravel, Madera Quarry, Carmelita Resources, and Riverbend Sand & Gravel.

In section 4.17, the Draft EIR claims that the Project will contribute 6,683,850 VMTs by Phase 2. (Draft EIR at 4.17-20.) In the individual analysis of the Project, those VMTs are ignored based on the argument that in the absence of the Project, these other mines would contribute between 8 and 8.6 million VMTs. (Draft EIR at 4.17-23 through 24.) If this is the case, then these projects, taken together, clearly have a significant cumulative impact, and the proposed Project "contributes measurably" to the effect. This is the very definition of a cumulative impact.

Moreover, the CEQA Guidelines state that when a list is used to evaluate cumulative impacts, consideration should be given to the type of project "when the impact is specialized, such as a particular air pollutant or mode of traffic." (CEQA Guidelines § 15130(b)(2).) Here, the VMT analysis already identified similar projects using a particular mode of traffic and creating related and interdependent impacts. Those projects should all be included

in the cumulative impact analysis, particularly with regards to transportation, GHG, aesthetics, and air quality analysis.

Response 12-78

The mines mentioned in the comment were included in the individual project's VMT analysis in the Environmental Impact Section 4.17 of the Draft EIR (Transportation Impacts). See also, Tables 4.17-5, -6, -7, -8, -9 in the Draft EIR. VMT impacts were analyzed under the following scenarios: (1) all regional aggregate sources operating including permitted (non-operational) and inactive mines, (2) only active aggregate sources and the project operating, (3) no project and all regional aggregate sources operating, and (4) no project and only active aggregate sources operating (see Draft EIR page 4.17-20).

VMT analysis can but is not required to include heavy truck VMT (CEQA Guidelines, Section 15064.3; see also, Technical Advisory, Cal. Governor's Office of Planning and Research (2018) page 4).

The VMT for the project at Stage 2 is estimated at 6,683,850 under the assumption that all regional aggregate sources are operating (Table 4.17-6, Draft EIR page 4.17-20). The no-project alternative would increase VMT due to the demand for aggregate being met by other suppliers that are further from the Fresno urbanized metro area. Thus, the contribution of the other mines' VMT is incorporated in the VMT analysis in the Draft EIR it was just not restated in the cumulative impacts section. See Final EIR Chapter 3, "Draft EIR Errata," to clarify this point. The Draft EIR provides the following in connection to the project's contribution to cumulative VMT in the County: "The project would increase automobile trips between approximately 6 and 10 trips per day during Stage 1 and Stage 2 operations. This is below the 110 trips per day threshold recommended by the California Governor's Office of Planning and Research (OPR) in 2018 (but which has not been adopted by Fresno County), indicating that the project's contribution to cumulative VMT in the county would be less than cumulatively considerable and would not be inconsistent with CEQA Guidelines Section 15064.3 (Impact 4.17-2)" (Draft EIR page 5-30).

See Chapter 5, "Cumulative Impacts," of the Draft EIR, for discussion of the project's cumulative impacts as to transportation, GHG, aesthetics, and air quality. The Draft EIR's analysis of cumulative impacts is sufficient under CEQA (Title 14 CCR Section 15130).

Comment 12-79

On page 5-11, the Draft EIR states that SJVAPCD considers a project's individual emissions of criteria air pollutants to be both individually significant and cumulatively considerable it they exceed the applicable significance thresholds. The proposed

Project exceeds significance thresholds because the Draft EIR did not include a significant quantity of aggregate mining (30 MT) of fines and mine waste, the stockpiling of the excess mine waste on the Project Site for 100 years, or modeling of VMT impact on threshold criteria. These impacts must be reexamined in the cumulative impact section as well, following the addition of the similar aggregate mining projects.

Response 12-79

Please see Response 12-32 above regarding the maximum annual production values and corresponding air quality analysis. The proposed project would not exceed the significance thresholds set forth by the SJVAPCD after implementation of Mitigation Measures 4.3-2a and 4.3-2b (see Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4, "Project Impacts and Mitigation Measures"). As such, the Draft EIR concludes that the project's individual emissions of criteria air pollutants would not be cumulatively considerable according to SJVAPCD guidance (2015) (see Draft EIR page 5-11). See Appendix D-3, "Air Quality, Health Risk, and Climate Change Impact Assessment," and Final EIR Chapter 3, "Draft EIR Errata," regarding an updated air quality analysis for the project, which clarifies and amplifies the discussion in the Draft EIR.

The stockpiles referenced in this comment would be managed in compliance with local regulations and SJVAPCD air permit guidance. SJVAPCD's Rule 8051 limits fugitive dust emissions from open areas and requires certain control measures to stabilize the surface of disturbed areas. With the implementation of Mitigation Measure 4.3-2b, the Fugitive Dust Control Plan, emissions from the surface of the stockpiles would be controlled by application of water, covering, or by use of another SJVAPCD approved chemical dust suppressant (Appendix D-4, Section 4.3.4).

The Draft EIR has evaluated VMT impacts on threshold criteria as thoroughly as the available data would allow, as these impacts depend upon where the fines and mine waste are produced.

Comment 12-80

The Draft EIR is insufficient in analyzing the cumulative impacts of the Project on air quality. The proposed Project will result in a cumulative impact on PM2.5 because the proposed mitigation for fugitive dust is not adequate to lessen the Project impact to less than significant. The Project's impact is Significant and Unavoidable. The Project has a significant impact on exposing sensitive receptors to dust and odor because not all feasible mitigation has been included in the Project. The Asphalt Plant Emission Controls are not adequate to lessen the exposure to

sensitive receptors from dust and odors and results in significant and unavoidable impact. The Project has not included all feasible mitigation to less the adverse impact of the asphalt plant on a substantial number of people.

Response 12-80

Mitigation Measures 4.3-2a and 4.3-2b are sufficient to reduce the project's impact on criteria air pollutant emissions to less than significant. The comment is vague and does not provide any evidence that the impact of $PM_{2.5}$ emissions is significant and unavoidable, nor assert any additional mitigation that the project could apply.

The comment asserts without evidence that the asphalt plant emissions controls are insufficient to reduce dust and odors. The Draft EIR discusses the efficacy of the asphalt plant emissions controls and concludes that Mitigation Measure 4.3-4, the Asphalt Plant Emissions Controls, is sufficient to mitigate VOC, SVOC, and/or SO_2 emissions to less than significant (see Appendix D-4, page Section 4.3.4). The County need not analyze or include every single possible mitigation measure (see *Gilroy Citizens for Responsible Planning v. City of Gilroy* (2006) 140 Cal.App.4th 911, 935).

Comment 12-81

d. Appendix B-2: Project Description/Operational Statement

i. Project Need and Economic Impact

The information provided on Page 6, of Appendix B-2, Project Description/Operational Statement is inaccurate and misleading as to the amount of permitted aggregate mining and processing facilities within the Fresno P-C Region in stating that there is an existing 50-Year permitted capacity of 6.0 MT, but a 50-Year need for 6.1 MT. California Geological Survey, Aggregate Sustainability in California, 2018, Table 1 (attached as Exhibit 5 hereto). Comparison of 50-Year Demand to Permitted Aggregate Reserves for Aggregate Study Area as of January 1, 2017, indicates the Fresno P-C Region has a 305 MT 50-Year Demand, has 556 MT Permitted Aggregate Reserve that results in having 182% of the 50-Year demand. This results in a 6.1 MT 50-Year demand, but the permitted 50-Year aggregate reserve is 11.12 MT. These figures do not include the Fresno County Carmelita Project's permitted aggregate production of 1.25 MT per year.

Response 12-81

CEQA does not require the evaluation of the economic impacts of a proposed project (Title 14 CCR Section 15131).

This comment inaccurately asserts that the Surface Mining and Reclamation Plan's Project Description/Operational statement is misleading as it pertains to the supply and demand of aggregate in the Fresno P-C Region. The last version of Map 52 is based on data over 9 years old and overestimates supply and underestimates demand in the Fresno P-C region and should not be solely relied upon to accurately represent the region's current aggregate needs. Map 52 reflects the total permitted reserves of aggregate in a specified region; furthermore, the data was collected prior to January 1, 2017, and is now outdated. Multiple mines factored into the calculation have either never produced any aggregate (e.g. Carmelita Resources) or have now closed (e.g. Riverrock), causing non-operational mines to overrepresent the permitted aggregate availability in the region. In addition, supply is overstated because the analysis is for a 50-year supply but Map 52 uses production amounts only attainable over 100 years due to annual production limits in the applicable County permits. Finally, Map 52 reflects a temporary decrease in demand for aggregate due to the 2007-2008 Great Recession, therefore skewing downward the actual demand for aggregate in the region, especially when considering the substantial development growth in eastern Madera County since 2016. Therefore, the 556MT Permitted Reserves is a significant overrepresentation of the actual amount of aggregate supply in the region.

It should be noted that there are still currently four active aggregate mining and processing facilities within the Fresno P-C region. Calaveras Materials' Kings River Plant is now owned and operated by Martin Marietta (1.0 MT/yr). As indicated in the Project Description/Operational Statement, the 50-year demand is a measuring tool and not a limit on competition (Draft EIR Appendix B-2, page 6).

See also Collective Response #3 for additional analysis of aggregate supply and demand in the Fresno P-C region.

Comment 12-82

e. Chapter 6: Alternative Analysis

The Alternative Analysis prematurely rejected the Reduced Operational Life Alternative. The County found that it would reduce utilization of a known MRZ-2 resource in conflict with Fresno County's General Plan and does not fully meet some of the project objectives." This ignores the possibility (or given the site's history, the virtual certainty) that the Project Owner would seek

a further extension of the CUPs upon their expiration. At that time, an environmental review could take place to more accurately analyze impacts taking place far in the future from the present day. Armed with that more accurate analysis, the County could then re- evaluate the continuing need for the mine, and weigh that need against the environmental concerns then prevailing. This would have the additional benefit of allowing the County to consider mitigation measures using technological advancements that have not yet taken place.

The same deficiency appears in the discussion of alternatives 2-6. Those alternatives should recognize that a limited CUP approval now does not preclude a further expansion or extension of mining following expiration or exhaustion of current limitations. Accordingly, these alternatives could meet the project objectives, but with the benefit of further environmental review and possibly more effective mitigation to be implemented at a later date.

Response 12-82

Alternatives may be eliminated from detailed consideration in the EIR if they fail to meet most of the project objectives, are infeasible, or do not avoid any significant environmental effects (Title 14 CCR Section 15126.6 (f)). Here, the Reduced Life Alternative was rejected from further analysis because it did not meet three of the basic objectives of the project which seek to continue aggregate mining into the future (Draft EIR page 6-8). Project Alternatives 2 through 5 and associated analysis contained in Draft EIR Chapter 6, "Alternatives," describe a range of reduced pit depths and operational changes that would necessarily result in a reduced project lifetime. Furthermore, this comment speculates that the Operator may wish to request an additional CUP extension in the future following the permitted life of the project, which speculation need not be analyzed under CEQA (Title 14 CCR Section 15145).

Comment 12-83

In addition, the analysis of the project alternatives incorrectly states that neither the proposed project nor Alternatives 1, 2, 3, 4, or 5 would result in any significant transportation impacts." (Draft EIR at 6-19, 6-30, 6-38, 6-49, 6-57.) To the contrary, Chapter 4.17 identified significant unavoidable impacts after mitigation, both in terms of signalization and pavement damage. These impacts must be recognized in the discussion of the alternatives.

6. Conclusion.

For the foregoing reasons, the NOP, NOC, NOA, and Draft EIR all require significant revision, and should be revised and recirculated for public comment.

Response 12-83

Comment 12-83 correctly notes that Impact 4.17-1, "Conflict with a Program, Plan, Ordinance, or Policy Addressing the Circulation System, including Transit, Roadway, Bicycle, and Pedestrian Facilities," was deemed significant and unavoidable, so the impact was properly noted in the Section 4.17, but misstated in the Alternatives Section. See Final EIR Chapter 3, "Draft EIR Errata," Section 6, "Alternatives," addresses and clarifies the issue. As stated in the Draft EIR, this impact is only considered significant and unavoidable because it is uncertain when the improvements mentioned in Mitigation Measure 4.17-1 would be implemented (Draft EIR page 4.17-3).

As discussed in previous responses, the NOP, NOC, and NOA were sufficient under CEQA and need not be revised or recirculated. See Responses 12-2 through 12-12 regarding discussion of CEQA noticing requirements. Additionally, the Draft EIR is sufficient under CEQA and need not be recirculated; minor revisions to the Draft EIR and amplification of certain Draft EIR Sections are noted in responses where applicable.

Development Services and Capitol Projects Division
2220 Tulare St., 6th Floor
Fresno, CA 93721

SUBJECT: RESPONSE TO THE NOTICE OF AVAILABILITY OF A DRAFT ENVIRONMENTAL IMPACT REPORT (EIR) FOR THE PROPOSED MODIFICATION TO THE EXISTING CEMEX ROCKFIELD QUARRY (EIR NO. 7763 AND UNCLASSIFIED CONDITIONAL USE PERMIT APPLICATIONS NO. 3666 AND NO. 3667)

Dear Mr. Randall:

The City of Fresno, Department of Public Utilities, (DPU) is in receipt of the reissued Notice of Availability, received on January 24, 2025, for the Draft Environmental Impact Report (EIR) for the Proposed Modification to the Existing Cemex Rockfield Quarry (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667) (Project). The purpose of this response letter is to convey DPU's concerns following review of the EIR Sections 4.10 - Hydrology and Water Quality and 4.19 - Utilities and Service Systems, particularly as they relate to water supply and water quality impacts.

Response 12-84

The County notes these exhibits for the record. See Responses 12-84 through 12-111 for discussion of issues raised in the Fresno County Department of Public Utilities letter attached as Exhibit 1. See also Collective Response #3 regarding aggregate supply and demand in the Fresno region.

Comment 12-85

BACKGROUND

CEMEX Construction Materials Pacific LLC has submitted applications to Fresno County (County) for two unclassified Conditional Use Permits (CUPs). These applications seek approval to continue and modify existing aggregate mining and processing activities, including the extraction of rock, sand, and gravel, at the Rockfield Quarry. The proposed project encompasses two distinct locations, situated approximately two miles apart:

1. Plant Site (approximately 139 acres): Located on the west side of North Friant Road, between North Willow Avenue and Little Dry Creek, approximately 1.2 miles north of the City of Fresno limits.

2. Quarry Site (approximately 352 acres): Located on the west side of North Friant Road, between Bluff Avenue and Lost Lake Road, approximately 2.7 miles north of the City of Fresno limits.

Response 12-85

This is an introductory comment regarding the proposed project and the locations of the Plant Site and Quarry Site. The comment does not address the adequacy of the Draft EIR and requires no further response.

Comment 12-86

Since 1924, the Plant Site has supported aggregate mining and processing, including an aggregate processing plant, a ready-mix concrete facility, and ancillary operations that also process raw aggregate brought in from the Quarry Site. Mining and processing activities disturb nearly the entire plant site, aside from mandated setbacks along Friant Road.

At the Quarry Site, permitted for aggregate mining since 1960 (with initial operations dating back to 1913 to 1920 and a later resumption in the late 1980s), mining is focused on the alluvial deposit. There are no processing facilities onsite; instead, raw aggregate is transported approximately two miles south via Friant Road to the Plant Site for processing. Most of the Quarry Site has been extensively mined and disturbed, except for required setbacks along the San Joaquin River and Friant Road. Groundwater or surface water encountered during excavation is pumped either to a reclaimed pond in the northeast corner (the "Northeast Pond") or to recharge trenches along the site's western boundary. Historically, when the Northeast Pond was mined about 20 years ago, water from excavations was pumped to a nearby recharge trench, but following the completion of that excavation, water is now directed to the Northeast Pond for recharge.

Response 12-86

This is an introductory comment regarding prior and current mining operations at the Plant Site and Quarry Site. The comment appears to mistakenly state that water from the Quarry Site excavation activities is no longer pumped to nearby recharge trenches. Ongoing activities at the Quarry Site currently include pumping water to existing groundwater recharge trenches (approximately 2,000 feet in length and 5 feet wide) along the western boundary of the Quarry Site (see Draft EIR, Section 2.4.2, "Project Sites Land Uses," page 2-21).

Comment 12-87

The Modification Project is planned in two stages:

- In Stage 1, lasting up to 30 years, operations will continue concurrently at both sites. At the Plant Site, the existing processing plant, ready-mix concrete plant, and related facilities will remain active, with a new modern asphalt plant replacing the outdated unit. Mining will proceed to a depth of about 85 feet below ground surface, with water pumped from excavations to recharge trenches along the site's boundaries. Upon completion, the Plant Site will be reclaimed as 138.5

acres of open space, riparian, and open water wildlife habitat. At the Quarry Site, mining will be modified to extract the underlying hard rock (granite) beneath the alluvial deposit via drilling and blasting to roughly 600 feet bgs while maintaining the Northeast Pond as a groundwater recharge source. A new aggregate processing plant, located in a previously excavated pit about 30 feet bgs, will be added, and wash water will be recycled onsite.

Response 12-87

This is an introductory comment regarding Stage 1 mining operations at the Plant Site and Quarry Site. The comment fails to include that the Quarry Site would also increase the length and amount of recharge trenches as a groundwater recharge source (see Draft EIR, Section 4.10.3.2, page 4.10-85).

Comment 12-88

- In Stage 2, hard rock mining and processing will continue exclusively at the Quarry Site. The ready-mix concrete and hot-mix asphalt plants will be relocated from the Plant Site to the Quarry Site, and once excavation is complete, mining and processing equipment will be removed (except for water management infrastructure). The Quarry Site will then be reclaimed as 352.4 acres of open space, riparian, and open water wildlife habitat.

The City and Project are within the same Kings Subbasin, thus making the Project subject to the objectives of the North Kings Groundwater Sustainability Agency (NKGSA) as imposed by the Sustainable Groundwater Management Act (SGMA).

Response 12-88

This is an introductory comment regarding Stage 2 mining operations at the Quarry Site and regarding the project being subject to the North Kings Groundwater Sustainability Agency (NKGSA) as imposed by the Sustainable Groundwater Management Act (SGMA). As provided in the Draft EIR, the North Kings Groundwater Sustainability Agency's groundwater management area is not experiencing critical overdraft conditions (see Draft EIR, Appendix G-5, Section 5.0, on pages 55 through 57).

Comment 12-89

WATER SUPPLY AND GROUNDWATER USAGE

Plant Site

1. The Applicant holds riparian rights to withdraw water from the San Joaquin River for use in aggregate processing at the Plant Site. River water arrives via a dedicated delivery ditch on the west side of the property. After use in washing rock, sand, and gravel, the process of water now carrying fine sediments, flows to silt ponds, where these fines settle out. The clarified water is then circulated back to the processing plant or used for dust control, with any surplus recharging the underlying aquifer. The water level in the silt ponds fluctuates seasonally based on rainfall and groundwater levels, and new ponds may be formed as mining operations shift across the site. Current usage of river water for processing totals approximately 295 acre-feet per year.

2. Current Groundwater Usage

    - The Plant Site supports aggregate mining and processing, including a ready-mix concrete facility and ancillary operations.

    - Water usage primarily involves low-volume pumping for operational needs such as equipment wash-down, dust control, and limited dewatering if shallow groundwater is encountered during excavation (although much of the site is already heavily disturbed).

    - Existing practices indicate that most onsite water demand is met with minimal groundwater pumping, supplemented by any necessary surface water management.

3. Proposed Groundwater Usage (Stage 1 and Transition to Stage 2)

    - During Stage 1, the existing processing plant and ready-mix facility remain at the Plant Site, with groundwater usage continuing at levels similar to current operations (e.g., equipment washing, dust control).

    - A new asphalt plant will replace the outdated one, but no substantial increase in groundwater extraction is anticipated, as pumping volumes are projected to remain low and used efficiently.

- By Stage 2, once mining ceases at the Plant Site, the ready-mix and asphalt plants relocate to the Quarry Site, substantially reducing or eliminating most groundwater usage at the Plant Site.

- Ultimately, the Plant Site will be reclaimed, thereby further decreasing any groundwater withdrawals. By Stage 2, once mining ceases at the Plant Site, the ready-mix and asphalt plants relocate to the Quarry Site, substantially reducing or eliminating most groundwater usage at the Plant Site.

- Ultimately, the Plant Site will be reclaimed, thereby further decreasing any groundwater withdrawals.

Response 12-89

This is an introductory comment regarding the Plant Site's water supply and groundwater usage. The comment does not address the adequacy of the Draft EIR and requires no further response.

Comment 12-90

Quarry Site

1. No surface water from the San Joaquin River is used at the Quarry Site. Instead, the site relies on the Northeast Pond, a permanent water body located in the northeastern portion of the property that functions as a dedicated groundwater recharge feature. By allowing water to percolate into the underlying aquifer, this pond plays an important role in maintaining local groundwater levels. Beyond the Northeast Pond, several additional ponds have formed over time due to historical and ongoing mining activities. These are typically seasonal or temporary features, receiving water primarily from rainfall runoff and shallow groundwater inflows. Their size and shape may vary seasonally and in response to quarrying operations. If standing water in these ponds impedes active mining, it can be pumped out to facilitate continued excavation. As the quarry expands into new areas, freshly excavated depressions may accumulate water, creating new temporary ponds.

2. Current Groundwater Usage

    - Historically, mining at the Quarry Site has been focused on alluvial deposits. Dewatering activities are limited to pumping water from active excavation areas to a

recharge pond (the "Northeast Pond") or to recharge trenches along the site boundary.

- These small-scale pumping efforts are designed to manage water levels within the excavation while reintroducing excess water to the local aquifer system via recharge features.

- There are no active large-volume production wells at the Quarry Site for processing or potable use.

3. Proposed Groundwater Usage (Stage 1 and Stage 2)

- In Stage 1, mining will expand to underlying hard rock (granite), requiring continued dewatering of excavation areas. However, this water will again be recycled or returned to recharge ponds or trenches, minimizing net groundwater consumption.

- A new aggregate processing plant will be constructed in a previously mined pit (approximately 30 feet below ground surface), using wash water that is largely recycled onsite. Any groundwater usage is expected to remain limited to operational needs such as drilling, dust control, and equipment cleaning.

- In Stage 2, full-scale hard rock mining continues, and the ready-mix and asphalt plants relocate from the Plant Site to the Quarry Site. Groundwater demand may shift onsite but overall remains modest, given the emphasis on water recycling and on pumping water primarily for dewatering and dust control.

- Ultimately, upon mine closure, the Quarry Site is to be reclaimed as open space and habitat, at which point groundwater pumping would cease, apart from possible minimal flows needed to maintain water features for reclamation purposes.

The existing and proposed water use was summarized in Table 4.19-1, which is reproduced below:

Source	Project Phase				Change from Existing Conditions		
	Existing	*Stage 1*	*Stage 2*	*Reclamation*	*Stage 1*	*Stage 2*	*Reclamation*
PLANT SITE							
San Joaquin River	295	125	0	0	-170	-295	-295
Groundwater Supply Wells	35	60	0	0	25	-35	-35
Reclamation Period Evaporation and Evapotranspiration	--	--	440	440	0	440	440
Plant Site Total:	**330**	**185**	**440**	**440**	**-145**	**110**	**110**
QUARRY SITE							
Groundwater Supply Well	0	1	55	0	1	56	0
Water Use from Ponded Pits (includes indirect losses through evaporation/evapotranspiration)	440	465	495	0	24	55	-440
Reclamation Period Evaporation/Evapotranspiration	--	--	--	585	0	0	585
Quarry Site Total:	**440**	**465**	**550**	**585**	**25**	**111**	**145**
PLANT SITE AND QUARRY SITE TOTAL:	**770**	**650**	**990**	**1,025**	**-120**	**220**	**255**

Available of water vs. the proposed water use was summarized in Table 4.19-2, which is reproduced below:

Site	Water Source	Existing	Stage 1	Stage 2	Reclamation
Plant Site	Total for Plant Site[b]	420	865	600	440
Quarry Site	Total for Quarry Site[c]	635	675	715	600
Total for Sources Plant & Quarry Sites		**1,055**	**1,540**	**1,315**	**1,040**
Total Water Use		**770**	**650**	**990**	**1,025**
Total Sources vs Total Use		**+285**	**+890**	**+325**	**+15**

Response 12-90

This is an introductory comment regarding Quarry Site's water supply and groundwater usage during Stages 1 and 2 mining operations and during reclamation. The comment does not address the adequacy of the Draft EIR and requires no further response.

Comment 12-91

HYDROLOGY AND WATER QUALITY

Plant Site Hydrogeologic Setting

Groundwater monitoring at the plant site is currently conducted in four shallow alluvial wells. These wells were installed in 2018 and extend from approximately 96 to 116 feet below ground surface (bgs). The alluvial deposits at this location typically consist of unconsolidated materials such as sand, silt, clay, and gravel, which can provide a relatively shallow groundwater pathway. Based on the data collected to date, groundwater flow in the shallow alluvial aquifer at the plant site generally trends toward the south- southwest.

Quarry Site Hydrogeologic Setting

Groundwater at this site is found in three distinct geologic units: alluvium, weathered rock, and hard rock. Each unit has different physical and hydrogeologic characteristics, which influence both the depth of the wells and the direction of groundwater flow.

1. Alluvium (Shallow Wells)

    - The alluvial deposits consist of unconsolidated materials such as sand, silt, clay, and gravel.
    - Four wells are currently completed in the alluvium, each less than 30 feet deep.
    - These shallow wells are identified by an "S" at the end of their well number (e.g., Well 1S).

2. Weathered Rock (Intermediate Wells)

    - Beneath the alluvium lies a layer of partially decomposed or weathered bedrock.
    - Four wells are screened within the weathered rock at depths generally between 40 and 70 feet.
    - These are labeled with an "M" after the well number (e.g., Well 2M).

3. Hard Rock (Deep Wells)

    - The deepest geologic unit comprises unweathered (competent) bedrock.

- Seven wells-designated with a "D" (e.g., Well 3D)-are drilled into this hard rock formation, reaching depths of approximately 600 feet.

Based on current hydrogeologic data, groundwater flow in the shallow (alluvial) wells is predominantly toward the south and southeast. In the weathered rock wells, flow is also generally toward the southeast.

Groundwater sampling at the Quarry Site's groundwater monitoring wells occurred in 2018, 2019 and then a more comprehensive groundwater sampling event occurred in September and October 2021.

Response 12-91

This is an introductory comment regarding the Plant Site's and Quarry Site's hydrogeologic setting. However, the comment does not address the adequacy of the Draft EIR and requires no further response.

Comment 12-92

POTENTIAL IMPACTS NOT DISCUSSED IN EIR

1. Potential alteration to natural groundwater flow characteristics

Currently, "the depth of groundwater across the Quarry Site has been measured as varying from about 10 to 45 feet bgs" (page 4.10-37) while, for the Plant Site, "the depth to groundwater varies from about 10 to 40 feet bgs" (page 4.10-34). The Project involves extensive mining below the existing groundwater levels, hundreds of feet in the case of the Quarry Site, which requires continuous dewatering of the mines. The applicant has emphasized that groundwater usage in Phase 1 and Phase 2 will be relatively similar to existing conditions. However, the continuous dewatering of the mines and subsequent recharge of that water into onsite ponding basins may result in the movement of the water from deeper, potentially confined aquifers to the shallower, unconfined aquifer. Many of the City wells in the northern portion of the City draw water from the deeper, confined aquifers, and continuous dewatering of mines in the vicinity of those confined aquifers may reduce water availability for those wells. As such, there needs to be a greater understanding of the volume of water expected to be dewatered from the mines over both Phase 1 and Phase 2, whether the volume changes seasonally or annually, and if the water recharged onsite is able to reach those deeper aquifers.

Response 12-92

The comment incorrectly alleges that the dewatering from the deeper confined aquifers may reduce water availability for those wells. The total proposed water use during Phase 1 and Phase 2 is provided in Table 4.19-1, "Existing and Proposed Water Use Summary (Acre-Feet per Year)," (Draft EIR page 4.19-9), the estimated groundwater flow under the Quarry Site within the alluvium, weathered rock, and the hard rock are found at Draft EIR, Section 4.10.1.7, "Local Geologic and Groundwater Conditions," page 4.10-38, and the estimated drawdown of groundwater levels in wells near the Quarry Site are provided in Table 4.10-9, "Estimated Drawdown of Groundwater Levels in Wells Near the Quarry Site," (Draft EIR page 4.10-106). In addition, Draft EIR Appendix G-5 provides the transmissivity values (i.e., for all of the deep wells) (see Draft EIR, Appendix G-5, Section 2.2.1, page 19).

At the Quarry Site, the alluvial material has already been removed by the historic mining described in Comment 12-86 and it is fully dewatered under current (baseline) conditions. Thus, dewatering would only occur in the weathered rock and hard rock units, which are both part of the bedrock that underlies the bottom of the North Kings Groundwater Basin. These deeper bedrock water bearing units are not directly connected to the aquifers within the groundwater basin, including those from which the City of Fresno pumps water. In any case, Mitigation Measure 4.10-10a provides an adaptive management plan to ensure that dewatering would not significantly reduce groundwater availability in wells in close proximity to the Quarry Site, including the possibility of requiring that mining cease if recharge cannot fully mitigate the effects of dewatering. By protecting the groundwater production in wells near the Quarry Site, the wells located much further from the Quarry Site that the City of Fresno relies on, would also be protected.

Further, Mitigation Measure 4.10-10a requires the monitoring of the deep MW-3 well cluster (which establishes the baseline drought periods, wet periods, and seasonal fluctuations in the water level conditions in the hard rock), and that all dewatering operations cease if due to the mining operations the groundwater levels in the hard rock fall below 15 percent of the CEQA baseline groundwater levels (Draft EIR, on pages 4.10-108 through 4.10-111).

Additionally, the Draft EIR provides the Quarry Site's groundwater conditions have seasonal fluctuations in water levels during the wet and dry seasons, as well as in response to cycles of drought (Draft EIR, page 4.10-37). The Draft EIR explains that:

> regardless of the magnitude of water level decline in response to multiple years of drought from 2020 to 2022, groundwater levels increased rapidly

> due to the elevated rainfall that occurred during the 2023 water year. This increase was observed in all three geologic units (alluvium, weather rock, and hard rock) (Draft EIR, page 4.10-37).

Finally, regarding whether the water recharged onsite is able to reach the deeper aquifers, the Draft EIR provides that:

> Groundwater infiltration from alluvium to weathered rock and hard rock, is limited due to the low hydraulic conductivity of the weathered rock and hard rock as compared to the alluvium; however, some groundwater infiltration does occur and is dependent on the degree and nature of fracturing of the weathered rock and hard rock (Draft EIR, page 4.10-48).

At the Plant Site, all water pumped for dewatering during Phase 1 would come from the shallow alluvial aquifer and be recharged back into that same aquifer using perimeter recharge trenches. Dewatering would not occur after Phase 1. As described in the analysis for Impact 4.10-8 in the Draft EIR, the drawdown in the alluvial aquifer at distances of 1,000 feet or more from the edge of the Plant Site would be two feet or less. Therefore, dewatering at the Plant Site during Phase 1 would not have any measurable effect on City of Fresno wells in the deeper confined aquifers.

Comment 12-93

2. Mobilization of naturally occurring constituents

The EIR seemed to de-emphasize the potential impact of mobilizing naturally occurring constituents, including arsenic, iron, lead, and manganese. Based on the water quality data shown in Table 4.10-3, continuous aggregate processing with recycled silt pond water appears to release and concentrate the naturally occurring constituents in the silt ponds. There was no discussion of whether the silt pond was lined nor of any water treatment associated with the silt ponds, so it was assumed that all the silt pond water freely percolates into the groundwater aquifer. The newly mobilized constituents appear to have impacted multiple monitoring wells throughout the Plant site in the vicinity of the silt pond, as shown in Table 4.10-5. Elevated iron and/or manganese was detected from the monitoring wells on the following dates:

		MW-2	MW-3		MW-4	
Constituent	**Units**	***8/9/18***	***10/17/18***	***8/28/19***	***10/24/18***	**sMCL**
Iron	µg/L	530	<30	2600	<30	300
Manganese	mg/L	790	2,600	1,030	300	50

Response 12-93

See Responses 6-52, 6-71, 6-72, and 65-27, which adequately address the incorrect assertion in the comment that the Draft EIR fails to analyze water quality impacts associated with the Plant Site's silt pond water percolating into the groundwater aquifer. Specifically, Responses 6-52, 6-71, 6-72, and 65-27 provide in pertinent part that the surface water and groundwater concentrations reported in Draft EIR represent existing baseline conditions at the Plant Site and thus are not indicative of potential project effects. Additionally, Responses 6-52, 6-71, 6-72, and 65-27 provide in pertinent part that the water in the silt pond typically is very turbid and contains a high level of suspended solids due to the aggregate washing process. The suspended solids are clays that consist of natural earth materials and mineral. For the metals, both unfiltered and filtered samples (shown as "total" and "dissolved," respectively in Draft EIR, Table 4.10-3, "Plant Site Surface Water Quality Data") were analyzed. The unfiltered samples contain the suspended mineral solids and represent the total concentration of the metals in the water and the suspended solids. The filtered samples contain only metals dissolved in the water. The total concentrations of arsenic, iron, lead, and manganese from the unfiltered samples exceed their respective water quality standards, but the dissolved concentrations from the filtered samples do not. Further, as provided in the Draft EIR in Section 4.10.1.8, "Groundwater Quality," page 4.10-42, the occasional elevated levels of iron and manganese identified in Table 4.10-5, "Plant Site Groundwater Quality Data," are most likely represent naturally occurring concentrations in the suspended solids within the samples and may be the result of variability in sampling procedures. Finally, the Plant Site silt pond is not lined.

Comment 12-94

The explanation provided in the EIR was unsatisfactory. It stated, "However, the iron and manganese concentrations vary substantially between sampling events. Thus, the occasional elevated levels of iron and manganese identified in some of the samples from Plant Site wells MW-2, MW-3, and MW-4 most likely represent naturally occurring concentrations in suspended solids within the samples and may be the result of variability in sampling procedures" (page 4.10-42).

Response 12-94

The comment questions the Draft EIR's explanation that "… samples from Plant Site wells MW-2, MW-3, and MW-4 most likely represent naturally occurring concentrations…" (Draft EIR, page 4.10-42). As noted in Responses 6-52, 6-71, 6-72, and 65-27, the water in the silt pond typically is very turbid and contains a high level of suspended solids due to the aggregate washing process. The suspended solids are clays that consist of natural

earth materials and mineral. For the metals, both unfiltered and filtered samples (shown as "total" and "dissolved," respectively in Table 4.10-3 to the Draft EIR) were analyzed. The unfiltered samples contain the suspended mineral solids and represent the total concentration of the metals in the water and the suspended solids. The filtered samples contain only metals dissolved in the water. The total concentrations of arsenic, iron, lead, and manganese from the unfiltered samples exceed their respective water quality standards, but the dissolved concentrations from the filtered samples do not.

Table 4.10-3 shows that elevated concentrations of arsenic, iron, lead, and manganese are not dissolved within the water at the Plant Site silt pond. The elevated concentrations are only present in water samples that were not filtered and contain suspended naturally occurring silts. Thus, metals are not mobilized in the aggregate washing process and in the silt ponds.

Furthermore, the groundwater contour maps shown in Appendix B of the report within Appendix G-3 of the Draft EIR show that MW-2 is along the upgradient side of the Plant Site, away from the silt pond. Thus, the elevated iron and manganese concentrations at MW-2, as reported in Table 4.10-5 of the Draft EIR, are not from the silt pond. MW-4 is the nearest downgradient well to the silt pond, yet the concentrations of iron and manganese reported in Table 4.10-5 of the Draft EIR in that well are lower than those reported in MW-2, on the upgradient side of the site.

Based on the lack of elevated metals detections in the dissolved samples from Table 4.10-3 of the Draft EIR, the groundwater flow directions shown in Appendix G-3 of the Draft EIR, and the concentrations of iron and manganese in the groundwater samples reported in Table 4.10-5 of the Draft EIR, the occasional elevated iron and manganese concentrations reported in MW-2, MW-3, and MW-4 represent naturally occurring background concentrations from the native geologic materials in which the wells are screened. Also see Response 6-52.

Comment 12-95

The EIR did not consider the possibility that concentrated and mobilized iron and manganese from the silt ponds infiltrated into the groundwater, thus triggering the extremely high concentrations that well exceed background levels. Furthermore, the variability in the concentrations detected are likely a result of operational factors such as when the silt pond is filled or not, whether water is being actively used for aggregate processing and being discharged back to the silt pond, and the groundwater level at the time of the sampling, with higher groundwater levels likely leading to a reduced time of travel from the silt ponds to the monitoring wells.

Response 12-95

See Responses 6-52, 6-71, 6-72, 65-27, and 12B-94 for remarks on the silt pond test results.

Comment 12-96

Furthermore, the EIR appears to be dismissive of the potential health implications of elevated manganese concentrations. During the discussion of Impact 4.10-4, it stated, "Iron and manganese concentrations showed high variability and exceed their respective Basin Plan standards and secondary MCL standards in some of the samples collected. Note that Basin Plan standards for iron and manganese are the same as the secondary MCL standards (300 µg/L for iron and 50 µg/L for manganese) ... The secondary MCL standards are established as a threshold above which constituents may impart undesirable tastes and odors, or can cause staining and scaling, but do not pose a health threat. Therefore, the exceedance of the secondary MCL standards for iron and manganese concentrations in some of the samples collected does not pose a risk to human health" (page 4.10-94).

Response 12-96

See Response 6-75, which addresses the suggestion in this comment that the Draft EIR dismisses the potential threats to human health from elevated manganese concentrations, and concludes that additional consideration or mitigation is outside the scope of environmental review because mitigation under CEQA is only required for potentially significant impacts caused by the project. The water quality of the groundwater and surface water as described in the Draft EIR, page 622, Impact 4.10-6 (and as described in Impact 4.10-4, as stated in this comment) is representative of conditions that already exist within the project sites (i.e. are baseline) and the project would not cause a significant impact on these conditions.

Comment 12-97

It appears the analysis did not take into consideration the recent California legislation introduced to require a maximum contaminant level (MCL) for manganese.

On March 29, 2022, Senate Bill 1124 (SB 1124) was revised to the "Public health goal: primary drinking water standard: manganese" bill with the following requirements:

- On or before July 1, 2023, the Office of Environmental Hazard Assessment (OEHHA) is to prepare a public health goal for manganese.

- The State Water Resources Control Board (SWRCB), after OEHHA publishes a public health goal for manganese, is to adopt a primary drinking water standard for manganese and to establish monitoring requirements for manganese.

- On or before January 31, 2024, the SWRCB is to consider establishing a notification or response level for manganese that would remain in place until the state board adopts a primary drinking water standard for manganese.

In a letter from the Director of the CalEPA Office of Environmental Health Hazard Assessment to the Deputy Director of the SWRCB Division of Drinking Water1, it states, "In response to your request dated April 7, 2022, the Office of Environmental Health

Hazard Assessment (OEHHA) has reviewed the recommendation for a revised notification level (NL) for manganese developed by the Division of Drinking Water (DOW) scientific staff. Based on the potential risk for manganese induced neurotoxicological effects in bottle fed infants, DOW staff recommended a health protective concentration (HPC) of 20 µg/L, equivalent to 20 parts per billion (ppb), to serve as the basis for future recommended revisions to the current manganese notification and response levels of 500 µg/L and 5,000 µg/L, respectively. Based on a review of the information presented, OEHHA agrees with an HPC of 20 µg/L as the basis for the NL. OEHHA also suggests some additional steps, as outlined below, for future work on developing an HPC for manganese".

As such, the EIR should now consider the consequences of how the concentration and mobilization of manganese in the water infiltrating from the silt ponds will impact downstream communities, including the City of Fresno, in light of a notification level and potential MCL for manganese being set at the HPC of 20 µg/L.

Response 12-97

Comment 12-97 references SB 1124 (2022) for the drinking water standards relating to manganese levels; however, the referenced legislation from three years ago was never enacted into law. The comment is speculative of potential future legislation and need not be analyzed in the EIR (Guidelines Section 15145, Section 15162). Furthermore, Mitigation Measure 4.10-5a commits to a detailed plan for monitoring groundwater quality by sampling every six months until manganese levels have fallen to within the following

threshold for a five-year period (Draft EIR on pages ES-34 through ES-35 and 4.10-95 through 4.10-96):

- Manganese exceeds its secondary MCL and NPDES discharge limit of 50 ug/L mg/L

Additionally, Mitigation Measure 4.10-5b requires the establishment of an endowment dedicated to the perpetual implementation of the adaptive management program and implementation of corrective actions established by Mitigation Measure 4.10-5a. These mitigation measures commit the Operator to complying with regulations relating to groundwater quality thresholds which may change. Mitigation Measure 4.10-5a's corrective actions include, as revised in Chapter 3, "Draft EIR Errata," of the Final EIR:

- Aeration or mechanical circulation of the water from the bottom of the pond to the surface of the pond. Reducing conditions that favor high pH values and low dissolved oxygen (DO) values, resulting in higher concentrations of iron and manganese, typically form at the bottom of ponds due to the breakdown of organic matter, such as dead aquatic or riparian vegetation. Aeration or mechanical circulation of the water from the bottom of the pond to the surface of the pond would better distribute DO throughout the water column and would minimize the formation of reducing conditions.
- Additional Measures. If substantial amounts of submerged aquatic vegetation form within the pond, or riparian vegetation such as reeds and cattails form around the perimeter of the pond, and aeration or water circulation alone is insufficient to eliminate the reducing conditions, then further measures to minimize the vegetation would be implemented. Such measures may include physical removal by hand or mechanical equipment (e.g. dredging), growth prevention using physical barriers (e.g. tarps or bottom barriers) in areas of heavy growth, or use of approved terrestrial or aquatic herbicides if other methods are not feasible or effective. <u>Any herbicides used in implementing this measure shall comply with applicable Regional Water Quality Control Board Basin Plan specifications and Waste Discharge Requirements.</u>

Comment 12-98

Furthermore, as the bedrock is fractured over the course of mining operation, it is possible that the infiltration from the manganese laden silt basins will find a preferential path into deeper aquifers. Therefore, the EIR must also consider the potential wider spread mobilization of the manganese with future mining activities.

Response 12-98

See Responses 6-52, 6-71, 6-72, 65-27, and 12-97, which address manganese infiltration from the silt ponds into deeper aquifers, which conclude that the elevated metals concentrations are due to the presence of suspended silts and sediment within the silt pond. Since elevated metals concentrations were not present in the filtered sample, which represents the dissolved concentrations within the water, the detected metals levels in the unfiltered sample are simply a reflection of the naturally occurring metals in the natural soils and earth materials in the aggregate being processed at the Plant Site. The lack of elevated metals in the filtered samples demonstrates that the metals are not leaching from the silt into the natural soils beneath the silt pond and to groundwater.

Comment 12-99

RECOMMENDATIONS FOR EIR MITIGATION MEASURES

With the impacts already detailed in the EIR, along with the additional impacts raised in this letter, the City of Fresno strongly recommends that the mitigation measures consider the following:

Impact 4.10-1: Violate Surface Water Quality Standards or Waste Discharge Requirements or Otherwise Substantially Degrade Surface Water Quality at the Plant Site or Quarry Site During Mining and Reclamation

Mitigation Measure 4.10-1: Blasting Protocols

- **Implementation Details:** While it is great that the protocol will be appended to the Mitigation Monitoring and Reporting Program, more detail on specific measures (e.g., frequency of monitoring or specific actions triggered by protocol violations)could help ensure clarity in enforcement.
- **Enforcement Mechanisms:** How will compliance with the protocols be verified? Including specific monitoring or reporting actions that link back to measurable water quality metrics (e.g., turbidity during blasting) might improve transparency.

Response 12-99

See Response 58-46, which adequately addresses the commenter's recommended additions to Mitigation Measure 4.10-1. The Blasting Protocols set forth instrumentation requirements (Section A), instrumentation setup procedures (Section B), including locations of ground vibration measurement sensors and microphone placements for air

overpressure measurements, discusses receptor locations and frequency of monitoring (Section C), discusses ground vibration and air overpressure control limits for receptors (Section D) and sets out the requirement for the inspection of the San Joaquin River Embankment pre-blast and post-blast as well as other significant requirements, including complaint response procedures, record keeping and annual reporting. Further, the corrective action plan, in addition to outlining the requirements that would need to be taken to prevent future exceedances, also provides for the "immediate suspension of all blasting until the corrective action is implemented" (Section F), which the corrective action plan must be approved by the County (see Response 58-46). Other measures related to the frequency of monitoring (e.g., River embankment inspections before and after blasting) and reporting and County monitoring requirements are set out in the Blasting Protocols. These vary based on the type of potential impact being monitored. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to the Blasting Protocols. Otherwise, Mitigation Measure 4.10-1 is defined and described in detail to show how it would be feasible and effective (Title 14 CCR Section 15126.4; see also *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 524). Since the implementation of Mitigation Measure 4.10-1 would reduce the potential to violate water quality standards or substantially degrade groundwater quality on the Quarry and Plant sites to a less than significant level, adoption of mitigation measures recommended in this comment is unnecessary (see *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 880). However, to further strengthen Mitigation Measure 4.10-1 in response to this comment, the measure is revised in this Final EIR through errata presented in Chapter 3.

Comment 12-100

Impact 4.10-5: Violate Groundwater Quality Standards or Otherwise Substantially Degrade Groundwater Quality at the Plant Site due to the Ponding of Water in the Excavation Mitigation Measure 4.10-Sa: Plant Site Pond Adaptive Management Program

- **Monitoring:** Identify who is overseeing and enforcing the adaptive management plan.
- **Threshold Clarity:** While the thresholds for various water quality parameters (e.g., pH, DO) are provided, it would be helpful to have more specific guidance on the thresholds for corrective action (beyond simply exceeding action levels) and timelines for implementing corrective measures.
- **Possible Risks from Vegetation Removal:** As described in the text of the EIR, "Elevated iron and manganese levels are common in and around reclaimed mining excavations that have

filled with water because decaying vegetation on the bottom of ponds can create oxygen-deficient, or reducing, conditions. The reducing conditions mobilize naturally occurring iron and manganese from within the silts and other sediments present at the bottom of the reclaimed mining excavations" (Page 4.10-95). As such, vegetation removal is needed to reduce the mobilization of iron and manganese. However, the use of herbicides to manage vegetation could be problematic should chemicals used in the treatment of the vegetation pose risk to human health. As such, the mitigation measure should provide proper guidelines for the selection of chemicals used in the vegetation removal, should it be needed.

- **Seasonal Variability:** There is a commitment to testing iron and manganese levels after seasonal cycles, but further clarity on how to handle high variability due to weather or seasonal changes (e.g., during wet or dry seasons) would ensure more accurate interpretation of data.

Response 12-100

See Response 12-76, which adequately addresses the comment's concerns regarding Mitigation Measure 4.10-5a. Further, Mitigation Measure 4.10-5a is defined and described in detail to show how it would be feasible and effective (Title 14 CCR Section 15126.4; see also *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 524). Additionally, Mitigation Measure 4.10-5a contains clear performance criteria and enforceable mechanisms for CEQA compliant mitigation (*California Native Plant Society v. City of Rancho Cordova* (2009) 172 Cal.App.4th 603). The annual report includes a requirement to describe testing conditions during drought, wet, and seasonal fluctuations (Draft EIR on pages 4.10-96 through 4.10-98). However, to further strengthen Mitigation Measure 4.10-5a in response to this comment, the measure has been revised in this Final EIR through errata presented in Chapter 3, "Draft EIR Errata." The measure is revised to more clearly describe timing and oversight of measure implementation.

Comment 12-101

Mitigation Measure 4.10-5b: Plant Site Pond Adaptive Management Program Funding Mechanism

- **Clarity on Funding Amounts:** The measure states that the funding must be "sufficient," but no details are provided on what constitutes a sufficient amount. Providing more specific estimates based on monitoring costs would help ensure that the funding is adequate for long-term mitigation needs.

- **Mechanism Termination Criteria:** The conditions under which the funding mechanism is canceled (after five years of stabilization) are clear. However, it might be helpful to specify how "stabilization" will be definitively determined, especially in the case of ongoing water quality issues that could be challenging to resolve quickly.

Response 12-101

See Response 12-76, which adequately addresses the comment's assertion that the Draft EIR needs to provide more clarity on funding amounts. The costs would be determined in the future, at the conclusion of mining, which costs would vary based on a variety of factors. However, the reclamation financial assurance mechanism would not be released until the County reviewed and approved a proposed funding mechanism for the implementation of the Program. Additionally, as provided in Draft EIR Appendix G-5, "stabilization" is already definitively determined as "[i]f no exceedances of the action levels shown in Table 10 occur for a period of five years…" (Draft EIR Appendix G-5, Section 6, page 58).

Comment 12-102

Impact 4.10-10: Substantially Decrease Groundwater Supplies During Mining Operations and After the Completion of Reclamation at the Quarry Site such that the Project Could Interfere with Existing Groundwater Supply Wells

Mitigation Measure 4.10-10a: Quarry Site Groundwater Adaptive Management Program

- **Complicated Monitoring Locations:** The program involves monitoring multiple wells across the site and beyond (including private wells), which could create logistical challenges. Ensuring access to private wells or finding reliable substitutes for unmonitored areas might be difficult. It may be helpful to demonstrate long-term access to offsite wells and to further specify contingencies for situations when monitoring data is insufficient.

- **Threshold for "Significant Impact":** While the 15% reduction in water column is conservative, additional data might be needed on how quickly such impacts could realistically occur under various environmental conditions, especially given the large-scale nature of the Project.

Response 12-102

See Response 12-77, which adequately addresses the commenter's concern regarding off-site wells. Mitigation Measure 4.10-10a is defined and described in detail to show how it would be feasible and effective (Title 14 CCR Section 15126.4; see also *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 524). Further, Mitigation Measure 4.10-10a requires the monitoring of the MW-3 well cluster to establish the baseline drought periods, wet periods, and seasonal fluctuations in the water level conditions in the alluvial, weathered rock, and hard rock (Draft EIR on pages 4.10-108 through 4.10-111). Additionally, Mitigation Measure 4.10-10a contains clear performance criteria and enforceable mechanisms for CEQA compliant mitigation (*California Native Plant Society v. City of Rancho Cordova* (2009) 172 Cal.App.4th 603). Mitigation Measures 4.10-10a and 4.10-10b are revised and clarified in the Final EIR. See Chapter 3, "Draft EIR Errata," to see the revisions to these mitigation measures.

Comment 12-103

Mitigation Measure 4.10-10b: Quarry Site Groundwater Adaptive Management Program Funding Mechanism

- **Post-Mining Monitoring Duration:** While three years is a reasonable duration, the groundwater systems impacted by dewatering could take longer than three years to fully stabilize. Extending the duration of monitoring or specifying the criteria for extending monitoring if needed would strengthen this mitigation.

- **Monitoring after Mining:** It would be helpful to clarify if monitoring and corrective actions would continue indefinitely if groundwater levels do not recover to baseline levels. The mechanism should account for this possibility without having to revise it at every stage of the process.

Response 12-103

The commenter states that the three-year post-mining monitoring duration is reasonable, but then, without providing any evidence, alleges that the groundwater systems impacted by dewatering could take longer to fully stabilize. The comment fails to acknowledge that the three-year post-mining monitoring period would occur in approximately 100 years, once mining at the Quarry Site has ceased; thus, impacts that would have occurred during the life of the mining operation would have already been analyzed. As a reminder, dewatering of the alluvium at the Quarry Site has been occurring for many decades and mining of the alluvium is effectively completed (see Draft EIR, Impact 4.10-10, page 4.10-105). All future dewatering as part of the proposed

project would occur within the weathered rock and hard rock zones (*Ibid.*) These zones have effectively no primary porosity and very limited secondary fracture porosity (see Draft EIR, Impact 4.10-11, page 4.10-112). Thus, dewatering of the deeper bedrock zones would have little or no effect on water levels in the overlying alluvium (see Draft EIR, Impact 4.10-11, pages 4.10-112 through 4.10-113).

Regarding the indefinite nature of the monitoring and corrective actions, as provided in Mitigation Measure 4.10-10a, as updated in the Final EIR:

> if at the end of the monitoring period, the drawdown in the monitoring wells is caused by mining and is greater than 15 percent of the CEQA baseline levels, then pumping to the Northeast Pond, east recharge trench, and/or west recharge trench, as appropriate based on the post-mining monitoring data, must continue ~~indefinitely to reduce~~until the drawdown in the monitoring well clusters is reduced to below the 15 percent criterion (Draft EIR, page 4.10-111).

In turn, Mitigation Measure 4.10-10b's Quarry Site Groundwater Adaptive Management Program Funding Mechanism would need to secure a funding mechanism sufficient to cover the potential indefinite pumping to the Northeast Pond, east recharge trench, and/or west recharge trench (see Draft EIR, page 4.10-111).

Finally, pursuant to Mitigation Measure 4.10-10b, the funding mechanism would be held by the County or a County-approved third party and the funding mechanism would not be released until the County, or third party determines that the conditions have stabilized within the parameters of the applicable mitigation measures (see Draft EIR, page 4.10-111). Mitigation Measures 4.10-10a and 4.10-10b are revised and clarified in the Final EIR. See Chapter 3, "Draft EIR Errata," to see the revisions to these mitigation measures.

Comment 12-104

General Recommendations:

- **Observance of North Kings Groundwater Sustainability Plan:** As a Project within the NKGSA, the applicant is required to observe all North Kings Groundwater Sustainability Plan guidelines. Should there be a negative impact on neighboring domestics wells, the financial costs for the mitigation shall be entirely borne by the applicant.

Response 12-104

The Draft EIR acknowledges and analyzes the North Kings Groundwater Sustainability Plan in Section 4.10.2.2 of the Draft EIR (Draft EIR on pages 4.10-71 through 4.10-72), Impact 4.10-11 (Draft EIR, pages 4.10-112 through 4.10-113) and Impact 4.10-13 (Draft EIR on pages 4.10-114 through 4.10-115). In order to mitigate potential impacts on neighboring domestic wells, the Draft EIR requires implementation of Mitigation Measure 4.10-10a. Mitigation Measure 4.10-10a requires the utilization of the Northeast Pond and recharge trenches to maintain groundwater levels within 85 percent or more from the CEQA baseline groundwater levels for impacts caused by the mining operation, and if the measures cannot maintain the 85 percent groundwater level, then dewatering operations would cease (Draft EIR, pages 4.10-108 through 4.10-111). In addition, Mitigation Measure 4.10-10b requires adequate funding in the case that the Northeast Pond and recharge trenches would be utilized indefinitely post-reclamation (Draft EIR, page 4.10-111). Finally, see Response 306-4 regarding monitoring of the CSA44C wells and Response 10-7 regarding impacts to neighboring wells.

Comment 12-105

- **Need for Current Groundwater Quality Data:** The most recent groundwater quality data was collected in 2021, which may not accurately reflect current conditions, particularly following recent wet and drought periods that can alter aquifer chemistry and water levels. Collecting and analyzing new data before the planned expansion begins will provide a more reliable baseline for understanding current conditions and monitoring any future changes linked to mining activities. Additionally, it may be beneficial to collect water quality samples during active operation as well as when there is a prolonged pause in operation to better establish a no operation baseline and current impacts from active operation.

Response 12-105

See Response 65-26, which explains that the samples collected and tested for the purposes of this Draft EIR represent baseline conditions and are not indicative of potential project effects or past practices.

Under the CEQA guidelines, to determine the baseline one must analyze "the physical environmental conditions in the vicinity of the project, as they exist at the time . . . [that the] environmental analysis is commenced. . . ." (Title 14 CCR Section 15125, subd. (a); see also *World Business Academy v. California State Lands Commission* (2018) 24 Cal.App.5th 476, 498). The environmental analysis to establish the groundwater quality baseline levels (i.e., the physical environmental conditions in the vicinity of the project) were established

in June 5, 2020, which is when the Notice of Preparation of this Draft EIR was filed; thus, the Draft EIR presents adequate CEQA groundwater quality baseline levels.

The comment fails to provide any evidence that the baseline groundwater quality levels, established shortly after the Notice of Preparation of the Draft EIR was filed, are inadequate. Additionally, the comment recommends the establishment of a no operation baseline (i.e., stop all mining activities for a prolonged period); however, the comment fails to provide any evidence that such an extreme measure would establish accurate physical conditions in the vicinity of the project.

Comment 12-106

- **Groundwater Well Sampling Program:** While discussed, it is recommended to develop and implement a structured, recurring groundwater sampling program focused on monitoring water quality at strategically selected wells located both upgradient and downgradient of the Quarry and Plant Sites. This program should include:

  1. **Key Parameters:** Electrical conductivity, dissolved oxygen, oxidation reduction potential, and manganese levels

  2. **Flexibility for Additional Parameters:** The program should be designed to incorporate other water quality indicators as necessary. These additional parameters might be recommended by regulatory agencies, the City or County, or other stakeholders to address emerging concerns or site-specific conditions.

Response 12-106

The comment's recommended additions to the groundwater well sampling program are noted. See Responses 6-75 and 493-3 (for the Quarry Site) and Response 6-72 (for the Plant Site), which provide for project site groundwater well sampling protocols and measures. The Draft EIR analyses are adequate on groundwater well sampling; thus, adoption of Comment 12-106's recommended additions to the groundwater well sampling program is unnecessary (see *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 880). However, in response to this comment, the County would require that two wells at each site be monitored semi-annually for the four parameters noted in this comment.

Comment 12-107

- **Consistent Sampling Schedule:** To detect trends or anomalies in a timely manner, sampling events should be conducted at regular intervals, such as monthly. Adhering to a predictable schedule will enhance the reliability of trend analyses, enable early identification of potential issues, and support proactive decision-making regarding any necessary mitigation or operational adjustments.

Response 12-107

Mitigation Measure 4.10-5a (established by Impact 4.10-5) requires monitoring of the Plant Site's groundwater quality to occur every six months (see Draft EIR pages 4.10-95 through 4.10-98). Mitigation Measure 4.10-10a (established by Impact 4.10-10) requires monitoring of the Quarry Site's groundwater levels to occur every six months (see Draft EIR, pages 4.10-105 through 4.10-111). As noted above in Response 12-106, the County would require semi-annual water quality monitoring at both project sites.

Comment 12-108

- **Adaptive Management:** If data indicates any significant changes in groundwater quality, implement appropriate mitigation measures (e.g., adjustments to surface water management practices, enhanced water treatment) in consultation with regulatory agencies and other stakeholders. Additionally, as the site conditions evolve, continue to refine the groundwater well sampling program to ensure ongoing protection of downgradient groundwater users.

Response 12-108

The Draft EIR does utilize the comment's Adaptive Management measures, which are addressed in Responses 65-37 and 12-76 regarding Mitigation Measures 4.7-6, 4.7-7a, 4.7-7b, 4.7-7c, 4.10-5a, and 4.10-1. The comment does not address the effectiveness of Mitigation Measures 4.7-6, 4.7-7a, 4.7-7b, 4.7-7c, 4.10-5a, and 4.10-1, and does not explain why existing mitigation measures are inadequate.

Comment 12-109

- **Enhanced Reporting Transparency:** Across the mitigation measures, ensuring clear and accessible reporting (e.g., publicly available monitoring reports) would help build trust with stakeholders.

Response 12-109

Once a semi-annual report is submitted to the County via a reporting requirement of a Mitigation Measure (e.g., Mitigation Measure 4.10-5a), that report would become a "publicly available monitoring report."

Comment 12-110

- **Third-Party Reviews:** While third-party oversight for funding is mentioned, adding independent review of the environmental data and mitigation effectiveness would further strengthen the integrity of these programs.

Response 12-110

Many of the qualified specialists (see, e.g., Mitigation Measures 4.7-6 and 4.7-7a [qualified engineering geologist or geotechnical engineer]) are required to obtain County approval prior to commencing review of environmental data and mitigation effectiveness (Draft EIR, page 4.7-35). The County would also review all submitted reports.

Comment 12-111

- **Contingency Planning:** Developing more explicit contingency plans for situations where the monitoring and mitigation measures fail to resolve issues within the prescribed timeframes would help prevent prolonged environmental impacts.

Should you have any questions, feel free to contact Peter Maraccini by email atPeter.Maraccini@Fresno.gov or by telephone at (559) 621-1603.

Response 12-111

The Draft EIR's mitigation measures contain adequate "Contingency Planning" in order to prevent prolonged environmental impacts. For example:

- Mitigation Measure 4.10-1 (Blasting Protocols) requires that in the case of an exceedance of a specified ground vibration or air overpressure threshold, all blasting must cease until the County approves a Corrective Action Plan.
- Mitigation 4.10-10a requires that all dewatering operations cease in the case where due to the mining operations, the groundwater levels drop below 85 percent of the CEQA baseline groundwater levels.

Letter #13 March 10, 2025, Tom Jordan, San Joaquin Valley Air Pollution Control District

Comment 13-1

Dear Mr. Randall:

The San Joaquin Valley Air Pollution Control District (District) has reviewed the Draft Environmental Impact Report (DEIR) from the County of Fresno (County) for the CEMEX Rockfield Quarry Modification Project. Per the DEIR, the project is for the continuation and modification of its current aggregate (rock, sand, and gravel) mining and processing operation to allow for an increase in their aggregate sales from 1.4 MT/yr to 2.0 MT/yr within 5 years and up to 3.0 MT/yr within 10 years. The Project is located at two sites: 13475 N. Friant Road (Plant Site) and 14765 N. Friant Road (Quarry Site) in Fresno, CA.

Response 13-1

The San Joaquin Valley Air Pollution Control District (SJVAPCD) introductory comment and summary of the proposed project is noted. Please see below for responses to specific comments.

Comment 13-2

The District offers the following comments at this time regarding the Project:

1) Project Operational Emissions

Per the DEIR, the Project will result in increased On-Road Diesel-Fueled Vehicle trips, for example, heavy-heavy duty (HHD) trucks. More specifically, Table 4.3-21 (Mitigated Operational Phase Criteria Air Pollution Annual Emissions), presents the Project mobile source criteria pollutant emissions which are demonstrated to be below the District significance thresholds. Additionally, the DEIR states the emission reductions from mobile sources are attributed to technological advancements and stricter emissions requirements, such as compliance with the "In-Use Off-Road Diesel-Fueled Fleets" and "In-Use On-Road Diesel-Fueled Vehicles" regulations. To ensure air quality emission impacts from Project operations are lessened, the District recommends including an enforceable mitigation measure, that requires the use of cleaner HHD trucks.

The San Joaquin Valley will not be able to attain stringent health-based federal air quality standards without significant reductions in emissions from HHD trucks, the single largest source of NOx emissions in the San Joaquin Valley. Accordingly, to meet federal

air quality attainment standards, the District's ozone and particulate matter attainment plans rely on a significant and rapid transition of HHD fleets to zero or near-zero emissions technologies.

The Project is an aggregate (rock, sand, and gravel) mining and processing operation and will result in HHD truck trips. Therefore, District also recommends that the following measures be considered by the County to reduce Project-related operational emissions:

- *Recommended Measure*: Fleets associated with operational activities utilize the cleanest available HHD trucks, including zero and near-zero technologies.

- *Recommended Measure*: All on-site service equipment (cargo handling, yard hostlers, forklifts, pallet jacks, etc.) utilize zero-emissions technologies.

Response 13-2

CEQA Guidelines Section 15126.4 (a) requires lead agencies to consider feasible mitigation measures to avoid or substantially reduce a project's significant environmental impacts. When the analysis supports that the proposed project's potential environmental impacts would be less than significant, mitigation measures are not required. While mitigation measures are not required for less-than-significant impacts, Fresno County will consider these suggestions as part of its deliberations. Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 13-3

2) Truck Routing

Truck routing involves the assessment of which roads HHD trucks take to and from their destination, and the emissions impact that the HHD trucks may have on residential communities and sensitive receptors. The Project is an aggregate (rock, sand, and gravel) mining and processing operation and will result in HHD truck trips.

The District recommends the County evaluate HHD truck routing patterns for the Project, with the aim of limiting exposure of residential communities and sensitive receptors to emissions. This evaluation would consider the current truck routes, the quantity and type of each truck (e.g., Medium Heavy-Duty, HHD, etc.), the

destination and origin of each trip, traffic volume correlation with the time of day or the day of the week, overall Vehicle Miles Traveled (VMT), and associated exhaust emissions. The truck routing evaluation would also identify alternative truck routes and their impacts on VMT and air quality.

Response 13-3

The health risk assessment modeling includes haul routes within the project boundary and demonstrates that haul truck exhaust impacts outside the project boundary along haul routes are less than significant. Although the Draft EIR modeling was robust and supported a less than significant finding, additional conservative health risk modeling for mobile sources for a larger area was performed and the findings continue to support a less than significant health risk impacts. Thus, mitigation is unwarranted. Please see *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3) for a discussion of these health risk modeling updates.

Comment 13-4

3) Reduce Idling of Heavy-Duty Trucks

The goal of this strategy is to limit the potential for localized PM2.5 and toxic air contaminant impacts associated with the idling of Heavy-Duty trucks. The diesel exhaust from idling has the potential to impose significant adverse health and environmental impacts.

Since the Project will result in HHD truck trips, the District recommends the EIR include measures to ensure compliance of the state anti-idling regulation (13 CCR § 2485 and 13 CCR § 2480) and discuss the importance of limiting the amount of idling, especially near sensitive receptors.

Response 13-4

The regulation cited is part of the existing setting within which the project would be required to operate as discussed on page 4.3-18 of the Draft EIR. Thus, further mitigation is unwarranted. For these reasons, the Draft EIR analysis was sufficient, and no further response is required. See also Appendix D-4, "Revised Section 4.3, Air Quality," regarding proposed revisions to Draft EIR Section 4.3.

Comment 13-5

4) Electric On-Site Off-Road and On-Road Equipment

Since the development Project is an aggregate (rock, sand, and gravel) mining and processing operation, the Project will result

in the increased use of off-road equipment (e.g., tractors, excavators, forklifts, etc.) and on-road equipment (e.g., offhighway trucks to move materials). The District recommends that the County include requirements for project proponents to utilize electric or zero emission offroad and on-road equipment.

Response 13-5

Where on- or off-road equipment is available and feasible, CEMEX can make use of these new mobile source technologies, including electric vehicles and equipment. Given CARBs mobile source rules in California, project implementation would include use of electric equipment and vehicles as required by state regulation.

CEQA Guidelines Section 15126.4(a) requires lead agencies to consider feasible mitigation measures to avoid or substantially reduce a project's significant environmental impacts. When the analysis supports that the proposed project's potential environmental impacts would be less than significant, mitigation measures are not required. When potential impacts are reduced to less than significant levels, additional mitigation measures are additionally not required.

Further, electric heavy duty trucks are in an early development stage and can only operate for about four hours between charges. Given the quarry and plant operations are for eight to 12 hours per day, this would lead to a fleet size that is twice the size than the fleet currently anticipated to ensure the fleet is always charged and in operation. This is not reasonable for an operation of this intensity. As electric trucks are limited for a major operation and there is no significant mobile source impact to mitigate, no further action is required. Fresno County will consider these suggestions as part of its deliberations.

Comment 13-6

5) Health Risk Screening/Assessment and Ambient Air Quality Analysis

The District reviewed the Health Risk Assessment (HRA) and Ambient Air Quality Analysis (AAQA) for the Project and offers the following comments:

- For evaluating the potential health risks to impacted receptors (residences, other businesses, etc.), emissions reductions from one location cannot be used to directly reduce emissions, and therefore potential health impacts (cancer, chronic, and acute), at another location. The potential health risk to surrounding receptors shall be analyzed for all new emissions locations. Any potential decreases/increases in health impacts must be evaluated by

modeling the emissions at their actual release locations and comparing the health impacts on an individual receptor by receptor basis for all receptors. Therefore, in order to ensure that the public's exposure is properly evaluated from this Project, any new potential air toxics emissions resulting from the Project should be evaluated for their potential health risk to the surrounding public.

Response 13-6

CEQA is about the effect on the environment. Comparison between the "existing physical setting" or baseline and the future conditions with the project is required. CEQA Guidelines Section15126.4(a) requires lead agencies to consider feasible mitigation measures to avoid or substantially reduce a project's significant environmental impacts. When the analysis supports that the proposed project's potential environmental impacts would be less than significant, mitigation measures are not required. When potential impacts are reduced to less than significant levels, additional mitigation measures are additionally not required. While mitigation measures are not required for less-than-significant impacts, Fresno County will consider these suggestions as part of its deliberations.

If the project would eliminate a source, then that would be an effect of the project that must be assessed. The commenter seems to suggest that a fictitious setting where the existing facility does not exist should be used instead of the existing physical setting, which would be contrary to CEQA. Similarly, CEQA requires cumulative analysis where emissions from other past, present, and future projects (and locations) are added to, or in this case subtracted from, the project impact. Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the EIR analysis (the Draft EIR, as augmented by the Final EIR) is sufficient, and no further response is required. See also Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to Draft EIR Section 4.3.

Comment 13-7

- Per District Policy APR-2030, the District recommends an AAQA be performed for all criteria pollutant emissions for which an ambient air quality standard exists when a stationary source project would result in an increase of 100 pounds per day for any criteria pollutant. The Project indicates that CO emissions exceed the 100 lb/day threshold, however, it appears that the AAQA only evaluated CO emissions. The

District recommends that the AAQA also include NOx, SOx, PM10, and PM2.5 emissions.

Response 13-7

The GAMAQI states, "When assessing the significance of project-related impacts on air quality, it should be noted that the impacts may be significant when on-site emission increases from construction activities or operational activities exceed the 100 pounds per day screening level of any criteria pollutant after implementation of all enforceable mitigation measures. Under such circumstance, the District recommends that an ambient air quality analysis be performed. An ambient air quality analysis uses air dispersion modeling to determine if emission increases from a project will cause or contribute to a violation of the ambient air quality standards." The air quality analysis follows the guidance that was in place when environmental analysis commenced in January 2018 whereas APR-2030 was not published until June 2018 and then was not listed on the District's CEQA webpage until sometime after that date.

Nevertheless, in response to these comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3) including all of the requested ambient air quality modeling. The concentrations for all criteria pollutants (including NO_2, SO_2, CO, PM_{10}, $PM_{2.5}$, and Pb) are listed in Table 4.3-23, "Mitigated and Unmitigated Criteria Pollutant Concentrations," of Appendix D-4, "Revised Section 4.3, Air Quality." The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the EIR analysis (the Draft EIR, as augmented by the Final EIR) is sufficient, and no further response is required.

Comment 13-8

- Receptor gridding was used for the AAQA and HRA; however, the District recommends using a combination of fence line, cartesian grid, and discrete receptors to ensure that the maximally impacted receptors are reasonably captured. Where maximally impacted receptors are found in areas with coarse gridding, the District recommends placing additional receptors around them such that the spacing does not exceed 25 meters between receptors. For more information, please consult the District's Modeling Guidance.

Response 13-8

The model uses fence line, a cartesian grid, and discrete receptors to ensure that maximally impacts receptors are captured. For small sources emitting near the ground, concentration and risk decrease with increased distance from the source as demonstrated

by the coarse grid results. Thus, the maximally impacted receptors are along the property boundary which is less than significant in each case. Furthermore, discrete receptors which need only be used for purposes of disclosure were placed on the closest part of each structure to the project sources. CEQA does not require an exhaustive analysis but only what is feasible and reasonably foreseeable. Intensifying the grid outside the property boundary would not reveal greater risk and is unwarranted.

Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3) including updating the modeling. The new model uses 26 discrete, and 6857 fence-line/grid receptors in alignment with the comment's recommendation. See Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.3.3, "Analysis Methodology." The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the EIR analysis (the Draft EIR, as augmented by the Final EIR) is sufficient, and no further response is required.

Comment 13-9

- `The District recommends adding receptors along the farmland fence line to the West of the Quarry Site in order properly assess acute health impacts to potential farm workers.`

Response 13-9

Acute risk to farm workers is assessed by the fence line receptors which identify the point of maximum impact (PMI) and show that the risk is less than significant. Other locations are by definition less than the PMI and therefore additional receptors would not reveal greater risks and are unwarranted. Nevertheless, the technical analysis was updated with a new model including receptors along the farmland fence line to the west of the Quarry Site, in the *Air Quality, Health Risk, and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3) (see also Figure 8a of Appendix A of Appendix D-3). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the EIR analysis (the Draft EIR, as augmented by the Final EIR) is sufficient, and no further response is required.

Comment 13-10

- `The emissions from the second phase of the Project are evaluated from thirty-one to sixty years. District policy is to evaluate long term residential risk over a seventy year period.`

Response 13-10

OEHHA recommends residential receptors be modeled for 30 years because that is the 95th percentile of residency duration at a single location. Thus, a 70-year exposure would be speculative and unsupported by current State guidance. Even so, the residential cancer risk that would be affected by using a 70-year exposure duration is shown in Table 4.3-25, "Mitigated Project Health Risk Impacts," to be less than zero. The result of extending the exposure duration to 70 years would result in lower impacts. Therefore, no change to the HRA is necessary to account for this difference in residential cancer risk exposure duration.

Even so, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (Appendix D-3) including updating the HRA modeling. The updated HRA now analyzes two 70-year periods with the first period including all of phase 1 (years 1 to 30) and part of phase 2 (years 31 to 70), and the second period including all of phase 2 (years 31 to 100). See Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.3.3. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the EIR analysis (the Draft EIR, as augmented by the Final EIR) is sufficient, and no further response is required.

Comment 13-11

- The HARP2 output files for the mitigated cancer risk to workers indicate that the risk was evaluated using a 25-year exposure. The District recommends using a 40-year exposure period for evaluating health impacts to worker receptors.

Response 13-11

OEHHA recommends worker receptors be modeled for 25 years because that is the 95th percentile of employment duration at a single work site. Thus, a 40-year exposure would be speculative and unsupported by current State guidance. Even so, the maximum exposed individual worker (MEIW) was determined to have risk of 0.5 excess cancer cases per million workers exposed (Draft EIR Table 4.3-25). Extending the duration from 25 to 40 years would increase the result by a factor of 1.6 to a value of 0.8 per million which is still less than the 20 per million significance threshold and the impact determination would not change from less than significant.

Even so, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (see Appendix D-3) including updating the modeling to use a 40-year exposure period for evaluating health impacts to worker

receptors. This updated analysis resulted in a risk of -2.39 excess cancer cases per million workers exposed (an improvement over the baseline conditions). See also updated Table 4.3-25 of Appendix D-4, "Revised Section 4.3, Air Quality." The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the EIR analysis (the Draft EIR, as augmented by the Final EIR) is sufficient, and no further response is required.

Comment 13-12

- The Project uses variable emission rates in its dispersion modeling which were then imported into HARP2 for the risk assessment. In such cases, at least two modeling runs must be performed. One modeling run for long-term analyses (cancer/chronic) and one run for short term analyses (acute), with each using the appropriate scalars. In addition, the HRA must also apply an appropriate Worker Adjustment Factor (WAF) when evaluating the long-term carcinogenic impacts for workers.

Response 13-12

As presented in Draft EIR Table 2-2, "Plant Site Existing Permitted Hours of Operation," the project would operate 12 hours per day, Monday through Friday, but the model assumed seven days per week which corresponds to a WAF of 2.0. Adjustment of the worker cancer and chronic health risk to account for this issue and for the issue identified in Comment 13-11 would result in MEIW of 2.24 per million and a worker chronic hazard index of 0.82 H.I. Each of these results is less than significant and would not change the significance determination. Not including an acute model is conservative, because acute results would utilize scalars of 1.0 for each hour of activity, while the HRA utilized scalars of 2 for each hour of activity.

Even so, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (see Appendix D-3) including updating the modeling. See also updated Table 4.3-25 of Appendix D-4, "Revised Section 4.3, Air Quality." The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 13-13

- The Fraction of Time at Home was enabled in HARP2 for the residential risk assessments. Due to the prevalence of home schooling and telework the District recommends that this option be disabled unless justification is provided.

Response 13-13

Standard practice is to include schools and daycare centers that are licensed by the State Department of Education. Each APCD guidance document (APR-1906 and AB 2588 Health Risk Assessment Modeling Protocol Guidance) was reviewed in responding to this comment and neither requires home schooling to be assessed. CAPCOA guidance specifically excludes home based schooling and day-cares from the list of sensitive receptors (page 66 of 75, Health Risk Assessments for Proposed Land Use Project, July 2009). Even so, after mitigation Table 4.3-25 shows the residential cancer risk is less than zero. Were this change to be made, the residential cancer risk would be even lower. Thus, because modifying the HRA analysis approach to address this comment would not change the significance finding, such changes to the HRA are unwarranted.

Even so, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (see Appendix D-3) including updating the modeling. This updated modeling did not apply a fraction of time at home for analysis of the residential risk assessment (see Appendix D-3, page 55). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 13-14

- The District could not determine from the documentation provided how the health impacts and ambient air quality impacts from blasting emissions were evaluated.

Response 13-14

Blasting emissions were quantified using two emissions factor sources from San Diego APCD. Dust emissions were calculated using the San Diego APCD quarrying drill-and-shoot emissions factor, while explosives detonation emissions were calculated using factors from San Diego APCD Drilling-Blasting Ammonium Nitrate and Fuel Oil procedure. Drilling and per blast PM10 emissions were not evaluated. However, these additional emissions were accounted for and do not result in any new potentially significant impacts as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Revised May 13, 2026 (see Appendix D-3) which included updating the modeling and preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 13-15

Based on the above, the District recommends the HRA and AAQA be revised to ensure the analysis is representative and adequately reflects the Project's potential air quality health impacts.

Response 13-15

See Responses 13-2 through 13-14 above. The project's Air Quality, Health Risk, and Climate Change Impact Assessment, provided as Draft EIR Appendix D-1, "Air Quality, Health Risk, and Climate Change Impact Assessment," has been updated. The updated *Air Quality, Health Risk, and Climate Change Impact Assessment*, provided as Final EIR Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," adequately addresses the project's air quality health impacts. See also Appendix D-4, "Revised Section 4.3 Air Quality," for proposed revisions to Draft EIR Section 4.3.

Comment 13-16

6) District Rules and Regulations

The District issues permits for many types of air pollution sources, and regulates some activities that do not require permits. A project subject to District rules and regulations would reduce its impacts on air quality through compliance with the District's regulatory framework. In general, a regulation is a collection of individual rules, each of which deals with a specific topic. As an example, Regulation II (Permits) includes District Rule 2010 (Permits Required), Rule 2201 (New and Modified Stationary Source Review), Rule 2520 (Federally Mandated Operating Permits), and several other rules pertaining to District permitting requirements and processes.

The list of rules below is neither exhaustive nor exclusive. Current District rules can be found online at: https://ww2.valleyair.org/rules-and-planning/current-district-rules- and-regulations. To identify other District rules or regulations that apply to future projects, or to obtain information about District permit requirements, the project proponents are strongly encouraged to contact the District's Small Business Assistance (SBA) Office at (559) 230-5888.

6a) District Rules 2010 and 2201 - Air Quality Permitting for Stationary Sources

Stationary Source emissions include any building, structure, facility, or installation which emits or may emit any affected pollutant directly or as a fugitive emission. District Rule 2010 (Permits Required) requires operators of emission sources to obtain an Authority to Construct (ATC) and Permit to Operate (PTO) from the District. District Rule 2201 (New and Modified Stationary Source Review) requires that new and modified stationary sources

of emissions mitigate their emissions using Best Available Control Technology (BACT).

This Project will be subject to District Rule 2010 (Permits Required) and Rule 2201 (New and Modified Stationary Source Review) and will require District permits. Prior to construction, the Project proponent should submit to the District an application for an ATC. For further information or assistance, the project proponent may contact the District's SBA Office at (559) 230-5888.

6b) District Regulation VIII (Fugitive PM10 Prohibitions)

The project proponent may be required to submit a Construction Notification Form or submit and receive approval of a Dust Control Plan prior to commencing any earthmoving activities as described in Regulation VIII, specifically Rule 8021 – *Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities.*

Should the project result in at least 1-acre in size, the project proponent shall provide written notification to the District at least 48 hours prior to the project proponents intent to commence any earthmoving activities pursuant to District Rule 8021 (Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities). Also, should the project result in the disturbance of 5- acres or more, or will include moving, depositing, or relocating more than 2,500 cubic yards per day of bulk materials, the project proponent shall submit to the District a Dust Control Plan pursuant to District Rule 8021 (Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities). For additional information regarding the written notification or Dust Control Plan requirements, please contact District Compliance staff at (559) 230-5950.

The application for both the Construction Notification and Dust Control Plan can be found online at: https://ww2.valleyair.org/media/fm3jrbsq/dcp-form.docx

Information about District Regulation VIII can be found online at: https://ww2.valleyair.org/dustcontrol

6c) Other District Rules and Regulations

The Project may also be subject to the following District rules: Rule 4102 (Nuisance) and Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations).

Response 13-16

SJVAPCD rules and project permit requirements outlined in the comment are noted. The Operator would be required to obtain all applicable air permits and comply with all applicable SJVAPCD rules. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 13-17

7) District Comment Letter

The District recommends that a copy of the District's comments be provided to the Project proponent.

Response 13-17

A copy of the SJVAPCD comment letter has been provided to the project proponent.

Letter #14 March 10, 2025, Elsa Mejia, City of Madera District 5 Councilmember

Comment letter was missorted; comments and responses have been moved to Section 4.4, "Individual Residents' Comments and Responses," as Letter #613 since it is not an *Agency* commenter.

Letter #15 March 11, 2025, Julie Vance, California Department of Fish and Wildlife

Comment 15-1

CDFW ROLE

CDFW is California's **Trustee Agency** for fish and wildlife resources and holds those resources in trust by statue for all the people of the State (Fish & Game Code, Section 711.7, subd. (a) & 1802; Pub. Resources Code, Section 21070; CEQA Guidelines Section 15386, subd. (a)). CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Id., Section 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

CDFW is also submitting comments as a **Responsible Agency** under CEQA (Pub. Resources Code, Section 21069; CEQA Guidelines, Section 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed

alteration regulatory authority (Fish & Game Code, Section 1600 et seq.). Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & Game Code, Section 2050 et seq.), related authorization as provided by the Fish and Game Code may be required.

Response 15-1

The roles of the California Department of Fish and Wildlife (CDFW) as a trustee agency and responsible agency under CEQA and the purpose of CDFW's review and comments on the Draft EIR as summarized in the comment are noted. The comment's input regarding the project's potential to be subject to CDFW's lake and streambed alteration regulatory authority and the project's potential need for authorization(s) from CDFW under the California Endangered Species Act (CESA) are noted.

Comment 15-2

Fully Protected Species: CDFW has jurisdiction over fully protected species of birds, mammals, amphibians and reptiles, and fish, pursuant to Fish and Game Code sections 3511, 4700, 5050, and 5515. Fully protected species may not be taken or possessed at any time and no licenses or permits may be issued for their take except as follows:

- Take is for necessary scientific research,
- Efforts to recover a fully protected, endangered, or threatened species, live capture, and relocation of a bird species for the protection of livestock, or
- They are a covered species whose conservation and management is provided for in a Natural Community Conservation Plan (Fish & G. Code, §§ 3511, 4700, 5050, & 5515).

Additionally, specified types of infrastructure projects may be eligible for an Incidental Take Permit (ITP) for unavoidable impacts to fully protected species if certain conditions are met (see Fish & G. Code §2081.15). Project proponents should consult with CDFW early in the Project planning process if an ITP may be pursued for the Project.

CDFW Ecological Reserve: Fish and Game Code section 1583 states "Except in accordance with the regulations of the commission it is unlawful to enter upon any ecological reserves established under the provisions of the article, or to take therein any bird or the

nest or eggs thereof, or any mammal, fish, mollusks, crustaceans, amphibia, reptiles or any other form of plant or animal life." In addition, California Code of Regulations, Title 14, Section 630 states "All ecological reserves are maintained for the primary purpose of developing a statewide program for protection of rare, threatened, or endangered native plants, wildlife, aquatic organisms, and specialized terrestrial or aquatic habitat types", and therefore, any other activity on these lands is restricted.

Nesting Birds: CDFW has jurisdiction over actions with potential to result in the disturbance or destruction of active nest sites or the unauthorized take of birds. Fish and Game Code sections that protect birds, their eggs and nests include Sections 3503 (regarding unlawful take, possession or needless destruction of the nest or eggs of any bird), 3503.5 (regarding the take, possession or destruction of any birds-of-prey or their nests or eggs), and 3513 (regarding unlawful take of any migratory nongame bird).

Water Rights: The capture of stream flows to is subject to appropriation and approval by the State Water Resources Control Board (SWRCB) pursuant to Water Code section 1200 et seq. CDFW, as Trustee Agency, is consulted by SWRCB during the water rights process to provide terms and conditions designed to protect fish and wildlife prior to appropriation of the State's water resources. Certain fish and wildlife are reliant upon aquatic and riparian ecosystems, which in turn are reliant upon adequate flows of water. CDFW, therefore, has a material interest in assuring that adequate water flows within streams for the protection, maintenance, and proper stewardship of those resources. CDFW provides, as available, biological expertise to review and comment on environmental documents and impacts arising from Project activities.

Response 15-2

The role and jurisdiction of CDFW associated with fully protected species, CDFW ecological reserve, and nesting birds, and the role and material interest of CDFW as a trustee agency associated with water resources as summarized in the comment are noted.

Comment 15-3

PROJECT DESCRIPTION SUMMARY

Proponent: CEMEX

Objective: The proposed Project is a continuation and modification of aggregate (rock, sand, and gravel) mining and processing

operations located on two properties, the Plant Site and the Quarry Site. The Project would occur in two stages as described below:

Stage 1: Stage 1 of the Project would include concurrent operations at both the Quarry Site and the Plant Site for up to 30 years. At the Plant Site, the existing aggregate processing plant will continue to be used to wash, screen, crush, and sort aggregate mined from the Plant Site. The existing ready-mix concrete plant, hot-mix asphalt plant, and related supportive facilities would continue to operate. The remaining alluvial deposit would be mined to a depth of approximately 75 feet below ground surface (bgs). Surface and/or groundwater encountered within the excavation would be pumped to groundwater recharge trenches along boundaries of the Plant Site. Upon completion of alluvial deposit mining at the Plant Site, operations at the Plant Site would cease, all equipment would be removed, and the site reclaimed as 122 acres of open space, riparian, and open water wildlife habitat.

At the Quarry Site, mining would be modified to include the hard rock (granite) that lies beneath the alluvial deposit currently being mined. Surface and/or groundwater encountered within the excavation will continue to be pumped to an existing reclaimed pond in the northeast corner of the Quarry Site for recharge to the groundwater and to existing groundwater recharge trenches along the western boundaries of the Quarry Site. Excavation of the hard rock would require drilling and blasting and would occur to a depth of approximately 600 feet bgs. An aggregate processing plant would be added to the Quarry Site to wash, screen, crush, and sort the aggregate. The plant would be located in a previously excavated pit approximately 30 feet bgs.

Stage 2: Stage 2 of the Project would continue hard rock mining and processing operations at the Quarry Site. The ready-mix concrete plant and the hot-mix asphalt plant will be relocated from the Plant Site to the Quarry Site adjacent to the aggregate processing plant. Upon completion of excavation at the Quarry Site, operations at the Quarry Site would cease and all equipment would be removed. Reclamation of the Quarry Site will create approximately 349 acres of open space, riparian, and open water wildlife habitat. The total Project life of the combined Stages 1 and 2 is estimated to be 100 years.

Location: The Project is located at two sites: 13475 N. Friant Road and 14765 North Friant Road, Fresno. The Project is located between North Friant Road and the San Joaquin River, in an unincorporated portion of Fresno County.

- Plant Site (CUP 3666): CEMEX's current Plant Site is located on approximately122 acres on the west side of North Friant Road, on Assessor's Parcel Number(APNs) 300-070-56S, 57S,58S,59S, and 60S, approximately 1.5 miles north of the City of Fresno and approximately 0.7 mile north of the intersection of North Willow Avenue and North Friant Road.

- Quarry Site (CUP 3667): CEMEX's current Quarry Site is located on approximately 349 acres on the west side of North Friant Road, on APNs 300-040-19 and 20, 300-080-01S, 300-250-12 and portion of 300-310-01, approximately 2.0 miles north of CEMEX's current Plant Site and approximately 2.0 miles south of the unincorporated community of Friant.

Timeframe: Undetermined; however, mining and processing activities are anticipated to take approximately 100 years to complete.

Response 15-3

The comment provides a summary of the project and does not address the adequacy of the Draft EIR. Please see below for responses to CDFW comments and recommendations.

Comment 15-4

COMMENTS AND RECOMMENDATIONS

CDFW offers the following comments and recommendations to assist Fresno County in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources. Editorial comments or other suggestions may also be included to improve the CEQA document prepared for this Project.

Response 15-4

The comment is introductory. Please see below for responses to CDFW comments and recommendations.

Comment 15-5

The DEIR details the Project activities proposed at both the Plant Site and Quarry Site over the next century. CDFW would like to note that the length of the Project coupled with the uncertainty surrounding the extensive blasting and mining activities for the Quarry Site have CDFW concerned that the proposed Project would result in significant long-term impacts to species and habitats within and surrounding the San Joaquin River and its habitats and have the potential to significantly impact restoration and conservation goals in the Project vicinity.

Response 15-5

CDFW concerns regarding the project duration and long-term impacts are noted. Draft EIR Chapter 2, "Project Description," provides a detailed description of the project including the duration of proposed operations and the reclaimed condition of the project sites, and the Draft EIR environmental impact analyses evaluate the project as proposed. For additional discussion regarding the project duration, please see Collective Response #5. Please see below for responses to specific comments and recommendations.

Comment 15-6

For instance, the Willow Unit of CDFW's San Joaquin River Ecological Reserve (SJRER) surrounds the current Plant Site on three sides (the fourth side being Friant Road). The Willow Unit was acquired with State Bond Funds, for the intended purpose of perpetual protection of riparian habitat and associated wildlife. The Willow Unit supports high quality riparian habitat for both nesting and migratory bird species.

Response 15-6

Please see Collective Response #20 pertaining to the relationship between Applicant-owned properties and properties managed by CDFW.

Comment 15-7

Additionally, the San Joaquin River Restoration Program (SJRRP) is currently working to restore and maintain fish populations in "good condition" in the mainstem San Joaquin River downstream of Friant Dam to the confluence with the Merced River (i.e., Restoration Area) and restore and maintain naturally reproducing and self-sustaining populations of salmon and other fish. CDFW would like to note the SJRRP is working on two major passage improvements projects (Sack Dam and Mendota Dam) to allow volitional passage of anadromous fishes upstream to Friant Dam (upstream of the Project). Further, CDFW has invested millions of dollars to construct a state-of-the-art Salmon Conservation and Research Facility (SCARF; i.e., conservation hatchery), also upstream of this site, to help with the reintroduction of spring-run Chinook salmon (*Oncorhynchus tshawytscha pop. 11*). Once fully operational, the SCARF plans to release 1.2 million smolts annually from its volitional release channel upstream of the Project site. Further the Project is directly adjacent to the most important reach of the river for spring-run Chinook salmon to complete various life-cycle stages (egg, juvenile, and adult), with holding, spawning, incubation, and rearing occurring directly adjacent to the Project site.

Response 15-7

See Collective Response #12 pertaining to San Joaquin River restoration efforts. See also Collective Response #16 pertaining to salmon spawning and analysis methods.

Comment 15-8

Finally, the Lost Lake Recreation Area, which borders the Quarry Site to the north, is also State-owned land and is operated under an expired lease with Fresno County. Lost Lake Recreation Area provides important recreational opportunities to the public and also supports high quality riparian habitat for a variety of wildlife species, including many of the special-status species identified in the DEIR.

Response 15-8

See Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 15-9

While CDFW acknowledges that a detailed analysis was included in the Project DEIR to evaluate impacts to the San Joaquin River and associated floodplain from the associated Project blasting and mining activities, CDFW is concerned that the duration of the Project, coupled with the complexity of the Project impacts, which includes blasting and excavation of bedrock down to approximately 600 feet, and uncertainty in climatic conditions due to climate change over the next 100 years, will result in significant unanalyzed direct and indirect impacts to biological resources beyond baseline conditions. CDFW is specifically concerned with potential Project-related impacts to riparian habitat and associated fish and wildlife which inhabit areas adjacent to the Project site, specifically impacts associated with noise (hydroacoustic and acoustic), blasting, water quality, vibration, and direct disturbance.

Response 15-9

Please see Collective Response #5 pertaining to the requested use permit duration. CDFW's concerns regarding uncertainties of future conditions of the 100-year duration of the requested use permit as relates to impacts to riparian habitat are noted. As noted in the comment, the Draft EIR includes a detailed analysis evaluating potential project impacts to the San Joaquin River and associated floodplain associated with project blasting and other project-related activities. With regard to project-related impacts to riparian habitat and associated fish and wildlife which inhabit areas adjacent to the

project sites associated with noise, blasting, water quality, vibration, and direct disturbance, please see Collective Response #13.

Comment 15-10

In addition, deep mining activities could severely impact the underlying hydrology on which the San Joaquin River and the river's associated riparian vegetation depends, particularly if slope failure were to occur at the Quarry Site, the natural berms and levees surrounding the Project site were to fail from high flows or unforeseen climatic conditions, or if unanticipated rock fractures provide more hydrologic connection than assumed in the DEIR. This situation would be of particular concern to the SJRRP restoration activities, as water released from the Friant Dam is fully allocated for downstream riparian water right holders and SJRRP Restoration Flows. Any unintentional diversion, from events such as slope failure or deep pit capture and/or filling, would have significant impacts on downstream water deliveries and the success of SJRRP's goal in restoring a natural self-sustaining population of spring-run Chinook salmon below Friant dam.

Response 15-10

Please see Collective Response #17 pertaining to banks stability and risk.

Comment 15-11

In summary, CDFW is concerned Project activities, which include blasting and mining operations directly adjacent to the San Joaquin River to a depth of approximately 600 feet, and would occur over an approximate 100-year period, would result in significant direct and indirect impacts to sensitive resources within and adjacent to the Project site over the life of the Project. These impacts have the potential to disrupt San Joaquin River hydrology, impact the restoration and conservation goals within the San Joaquin River and associated SJRER, as well as the restoration goals of the SJRRP. Due to these concerns, CDFW strongly recommends that the Project be modified to a more environmentally superior alternative, and that Project activities be adjusted to limit site blasting and excavation (i.e., activities associated with the Quarry Site) further away from the San Joaquin River and the river's associated habitats, reducing the potential for impacts to CDFW-owned lands, and sensitive species and habitats.

Response 15-11

The commenter's concerns regarding blasting and mining operations adjacent to the San Joaquin River during project duration and the commenter's recommendation that the

project be modified to adjust blasting and excavation at the Quarry Site to be further away from the San Joaquin River and habitats are noted and will be considered by County decision-makers. The commenter does not provide evidence of a deficiency in the Draft EIR analysis of potential biological resources impacts of the project or a deficiency in biological resources mitigation measures presented in the Draft EIR and which the Draft EIR analysis determines are sufficient to avoid significant impacts to biological resources.

Comment 15-12

In addition to the general recommendation provided above, CDFW has concerns about the ability of some the proposed mitigation measures to reduce impacts to less than significant and avoid unauthorized take for several special-status animal species, including the State endangered and fully protected bald eagle (*Haliaeetus leucocephalus*), the State threatened Swainson's hawk (*Buteo swainsoni*), the State and federally threatened California tiger salamander – Central California Distinct Population Segment (DPS) (*Ambystoma californiense pop.1*), the State and federally threatened Chinook salmon – Central Valley spring-run Evolutionary Significant Unit (ESU), the State fully protected white-tailed kite (*Elanus leucurus*), the State candidate western burrowing owl (*Athene hypugaea*), tricolored blackbird (*Agelaius tricolor*), and Crotch's bumble bee (*Bombus crotchii*), the State species of special concern and federally proposed threatened western pond turtle (*Actinemys marmorata*) and western spadefoot (*Spea hammondii*), and the State species of special concern Chinook salmon –Central Valley fall/late-run ESU, hardhead (*Mylopharodon conocephalus*), Kern brooklamprey (*Lampetra hubbsi*), Pacific lamprey (*Entosphenus tridentatus*), and Sacramento hitch (*Lavinia exilicauda exilicauda)*, the State species of special concern and federally threatened steelhead – Central Valley DPS (*Oncorhynchus mykiss irideus pop.* 11), and the State species of special concern western river lamprey (*Lampetra ayresii*).

Response 15-12

The commenter expresses a general concern about the ability of some of the proposed mitigation measures to reduce impact to less than significant and avoid unauthorized take of certain species. The commenter does not reference specific mitigation measures, and the comment does not explain or provide substantial evidence of any specific deficiency in the Draft EIR impact analysis and mitigation measures. Please see Responses 15-13 through 15-39 below pertaining to more specific comments.

Comment 15-13

Terrestrial Species

State Fully Protected Raptors

CDFW would like to note that, based on the information provided in the DEIR, habitat assessments and surveys for special-status species were focused mainly within the Project site, and focused surveys were not conducted for bald eagle (BAEA) and white-tailed kite (WTKI). Additionally, the DEIR does not appear to have a substantive analysis of direct and indirect impacts to biological resources adjacent to the Project site. CDFW is particularly concerned with the impacts from Project activities to BAEA and WTKI if these species were to nest within the habitats surrounding the Project site. Certain Project details and their associated potential impacts to biological resources are also lacking, such as a detailed analysis of the potential acoustic and vibratory impacts to BAEA and WTKI from the blasting and mining activities associated with the Quarry Site.

Mitigation Measure 4.4-1c is provided to mitigate for potential impacts to nesting birds, including BAEA and WTKI, and requires a preconstruction survey prior to Project activities and the implementation of inadequate no-disturbance buffers. CDFW does not concur that the surveys and no-disturbance buffers proposed in Mitigation Measure 4.4-1c are sufficient to mitigate for potential impacts to these species. CDFW is also concerned that Project activities such as blasting may result in indirect impacts to BAEA and WTKI, and these Project activities need to be more adequately analyzed in the DEIR. As such, CDFW recommends that the DEIR include a more robust analysis of potential impacts to BAEA and WTKI from ongoing Project activities, particularly for the blasting and mining proposed at the Quarry Site, and that this analysis include a sufficient area around the Project site.

In addition to the recommendation above, CDFW recommends the following:

Recommended Mitigation Measure 1: State Fully Protected Raptor Surveys

CDFW recommends that focused BAEA and WTKI surveys be conducted prior to the initiation of Project blasting activities. CDFW recommends that these surveys occur within the Project site and a ½-mile buffer of the Project site and that BAEA surveys follow the Bald Eagle Breeding Survey Instructions (CDFW 2010) protocol and

be conducted by a qualified biologist prior to the initiation of plant construction or mining phases as outlined in the DEIR.

Recommended Mitigation Measure 2: State Fully Protected Raptor Avoidance Buffer

If a BAEA or WTKI is found prior to or during surveys or Project activities, CDFW recommends implementation of a minimum ½-mile no-disturbance buffer. CDFW advises that this buffer remains in place until the breeding season has ended or until a qualified biologist has determined that nesting has ceased, the birds have fledged and are no longer reliant upon parental care for survival. In the event that a BAEA or WTKI is detected during surveys, and a ½-mile no-disturbance buffer is not feasible, consultation with CDFW is recommended.

Response 15-13

The comment is noted. The analysis and conclusions in the EIR assume a context of mining and associated activities at both project sites that have been ongoing and habitual for decades. The proposed mining and processing activities would continue to be confined to previously disturbed areas at the two project sites, which do not support high-quality riparian, wetland, or riverine habitats. The proposed project activities would avoid direct impacts to sensitive habitats along the SJR where bald eagle may forage, and adjacent non-native grasslands where bald eagle and white-tailed kite (particularly the kite) may forage.

Given ongoing, habitual disturbances associated with mining operations, Mitigation Measure 4.4-1c, as revised in the Final EIR, requires the performance of preconstruction nesting bird surveys in and near areas where the initiation of construction, ground disturbing activities, and blasting is occurring. Measure 4.4-1c has been revised to specify that survey efforts would include areas within 500 feet of the subject limits of disturbance, to ensure that any non-listed raptor nests or those of listed species near construction areas are surveyed for. If blasting is scheduled during the bird nesting season this would also be considered an initial disturbance, and a pre-blasting nesting bird survey would be performed. This survey would include areas within 0.25 mile of the blasting site(s) to cover nesting bald eagle, Swainson's hawk and white-tailed kite, and would conform to survey methods outlined in the CDFW Swainson's hawk survey protocol (deemed sufficient for all three species). If a Swainson's hawk or bald eagle is actively nesting within 0.25 mile of the blasting site(s), blasting would not occur while the nest(s) remain active or unless accompanied by nest monitoring or otherwise approved by CDFW. If blasting ceases for seven or more days, a single additional survey would be conducted to verify that there are no additional active nests.

See Final EIR Chapter 3, "Draft EIR Errata," to view the revisions to Mitigation Measure 4.4-1c.

Comment 15-14

Swainson's Hawk

CDFW would like to note that, based on the information provided in the DEIR, habitat assessments and surveys for special-status species were focused mainly within the Project site, and focused surveys were not conducted for Swainson' hawk (SWHA). Additionally, the DEIR does not appear to have a substantive analysis of direct and indirect impacts to biological resources adjacent to the Project site. CDFW is particularly concerned with the impacts from Project activities to SWHA if individuals were to nest within the habitats surrounding the Project site. Certain Project details and their associated potential impacts to biological resources are also lacking, such as a detailed analysis of the potential acoustic and vibratory impacts to SWHA from the blasting and mining activities associated with the Quarry Site.

Mitigation Measure 4.4-1c is provided to mitigate for potential impacts to nesting birds, including SWHA, and requires a preconstruction survey prior to Project activities and the implementation of inadequate no-disturbance buffers. CDFW does not concur that the surveys and no-disturbance buffers proposed in Mitigation Measure 4.4-1c are sufficient to mitigate for potential impacts to this species. CDFW is also concerned that Project activities such as blasting may result in indirect impacts to SWHA, and these Project activities need to be more adequately analyzed in the DEIR. As such, CDFW recommends that the DEIR includes a more robust analysis of potential impacts to SWHA from ongoing Project activities, particularly for the blasting and mining proposed at the Quarry Site, and that this analysis includes a sufficient area around the Project site.

Response 15-14

See Response 15-13. It is acknowledged that Swainson's hawk occurs in the vicinity of the project sites, including multiple documented nesting occurrences. However, the proposed mining and processing activities would continue to be confined to previously disturbed areas that provide only limited and mostly low-quality foraging opportunities for this species. Open areas near the project sites may be used for foraging. Given a baseline condition of mining-related disturbances at these sites, no potentially significant impacts to Swainson's hawk foraging are anticipated.

Regarding potential impacts to Swainson's hawk nesting, see Response 15-13, which includes revisions to Measure 4.4-1c intended in part to address such potential impacts. See also Final EIR Chapter 3, "Draft EIR Errata," to view the proposed revisions to the Draft EIR.

Comment 15-15

In addition to the recommendation above, CDFW recommends the following: **Western Pond Turtle and Western Spadefoot**

CDFW would like to note that based on the information provided in the DEIR, habitat assessments and surveys for special-status species were focused mainly within the Project site, and focused surveys were not conducted for western pond turtle (WPT) and western spadefoot (WESP). CDFW would also like to note that DEIR did not focus on an evaluation of the habitat adjacent to the Project site, particularly along the San Joaquin River, and the DEIR does not appear to have a substantive analysis of direct and indirect impacts to biological resources adjacent to the Project site. CDFW is particularly concerned with the impacts from Project activities to WPT and WESP if this species were to utilize habitats surrounding the Project site. Certain Project details and their associated potential impacts to biological resources is also lacking, such as a detailed analysis of the potential acoustic and vibratory impacts to WPT and WESP and their associated burrows from the blasting and mining activities associated with the Quarry Site. CDFW is concerned that direct and indirect impacts to WPT and WESP, such as the potential collapse of burrows, inadvertent entrapment, direct mortality of individuals, and displacement due to sound or vibration, are not adequately analyzed in the DEIR. As such, CDFW recommends that the DEIR include a more robust analysis of potential impacts to WPT and WESP from ongoing Project activities, particularly for the blasting and mining proposed at the Quarry Site, and that this analysis include a sufficient area around the Project site. This additional analysis should consider information within several published research studies on various toad species which demonstrate that vibrations outside of typical emergence cues like rainfall can result in the emergence of toads from underground refugia, including during times of hibernation. It is also important to note that thunder, or sounds like thunder, can stimulate toad emergence. The vibrations and sounds associated with blasting could result in the atypical and seasonally inappropriate emergence of spadefoot, resulting in direct mortality, reduced survival, and impacts to reproductive success.

Response 15-15

CDFW's concerns are noted. However, Section 4.4, "Biological Resources," of the Draft EIR, and its supporting studies (Draft EIR Appendix E-1, "Plant Site Habitat Assessment," and E-2, "Quarry Site Habitat Assessment") provide an overview of habitat both within and adjacent to the Plant and Quarry sites and applicable habitat assessments. It was determined that western pond turtle (WPT) and western spadefoot (WESP) have a low potential to occur on the sites. Measures, including preconstruction surveys and relocation measures (see Mitigation Measure 4.4-1b), are adequate to reduce potential impacts to these species to a less than significant level.

In terms of indirect impacts from blasting, the CDFW does not provide substantial evidence that these activities would result in a significant impact to special-status species, including WPT and WESP. Draft EIR Appendix E-4, "Effects of Blasting on Fish," provides an evaluation of the potential for blasting to impact salmonids in the areas of the San Joaquin River adjacent to the sites, as near as 200 feet: *Based upon the blast designs used to maintain safe ground vibration levels for the stability of the slope, the resulting overpressures in the waters of the San Joaquin River due to adjacent blasting at the proposed Cemex Rockfield quarry would be less than 1 psi. This level of overpressure is significantly below the 7.3 psi limit established for the safety of salmon.* Though no species-specific information is available for indirect effects of blasting on WESP and WPT, it is reasonable to assume that the low amount of overpressure that would result from the proposed project would not have a significant impact on these species if they were present and that the mitigation measures proposed to ameliorate effects on these species would further minimize impacts to a less than significant level. As such, no additional analysis or mitigation is required.

Comment 15-16

CDFW would also like to note that Mitigation Measure 4.4-1b of the DEIR states, "Pre-construction clearance surveys within the boundaries of the Quarry Site shall be conducted […] A combination of visual and trapping surveys by a CDFW-qualified biologist may be performed." CDFW is concerned the use of the phrase "may be performed" introduces an element of uncertainty and could lead to inadequate or nonexistent survey efforts, potentially affecting these sensitive species. As such, CDFW recommends revising this measure to explicitly require visual and trapping surveys prior to the initiation of any construction activities.

Response 15-16

Mitigation Measure 4.4-1b has been revised to more explicitly require performance of visual and trapping surveys by a qualified biologist prior to initiation of mining activities. See Final EIR Chapter 3, "Draft EIR Errata," to view this proposed change.

Comment 15-17

Aquatic Species

As noted above, extensive restoration, conservation, and management efforts are occurring within the San Joaquin River and adjacent SJRER, and aquatic species, including Chinook salmon, hardhead, Kern brook lamprey, Pacific lamprey, Sacramento hitch, steelhead, western river lamprey, sacrament sucker (*Catostomus occidentalis*), Sacramento pikeminnow (*Ptycochelis grandis)*, threespine stickleback (*gasterosteus aculeatus*), as well as species of sculpin (*cottus sp.*) have the potential to utilize the habitats directly adjacent to the Project site over the life of the Project. CDFW is concerned that the proximity of Project activities to the San Joaquin River and adjacent riparian habitat, particularly the blasting and mining activities associated with the Quarry Site, are likely to result in potentially significant impacts to aquatic species, particularly if slope failure were to occur at the Quarry Site or the natural berms and levees surrounding the Project site were to fail from high flows or unforeseen climatic conditions. In addition, unanticipated rock fractures could provide more hydrologic connection of the mining pit to the San Joaquin River than assumed in the DEIR, which could deep pit capture by the San Joaquin River and associated modification to San Joaquin River subsurface and subsurface flows. As such, CDFW has the following comments and recommendations:

Response 15-17

Blasting activities would be brief and are not expected to result in significant impacts to wildlife species (see discussion of Impact 4.4-2 on page 4.4-52 of the Draft EIR). A typical blasting event would occur for approximately one to two seconds. As described in the Blasting Protocols in Final EIR Appendix H-9, "Revised Blasting Protocols," blasting would be conducted in such a way that slope stability would be strictly monitored. See Collective Response #17 regarding flooding at the project site. See also Collective Response #12 for further discussion of the San Joaquin River Restoration Program.

Comment 15-18

San Joaquin River Floodplain

While the DEIR notes that the Plant Site and Quarry Site are not located within the modeled 100-year floodplain of the San Joaquin River, the river is not in direct hydraulic communication with the weathered and hard rock at the Quarry Site, and that dewatering of the deeper geologic units associated with the Quarry Site Project activities would not be expected to affect the quantity of the water within the river, CDFW would like to highlight there is extensive amount of uncertainty with these statements, particularly due to the difficulty in attempting to evaluate and analyze potential changes to the surrounding areas over time (e.g., changes in topography, rainfall amounts, etc.), particularly from high flows and/or increasingly extreme weather events associated with climate change. CDFW would also like to note that portions of the Project site are still located within the rivers historic floodplain and is potentially still connected to the San Joaquin River via subsurface flow and at times, potentially overland flow, when large flood flow events occur. CDFW would also like to note that the 20th century levee construction does not cut off the historic plain from local watershed processes.

The San Joaquin River flow/stage is the local control for the shallow groundwater table elevation. This San Joaquin River's influence on the groundwater table extends laterally away from the river into the historic floodplain's subsurface which is predominantly composed of alluvial (sand, gravel, and cobble) deposits. These sediments are found to cap local bedrock in some areas. The extraction or pumping of groundwater within the historic or present-day floodplain adjacent to the San Joquin River, would influence river and hyporheic flow, and shallow groundwater elevations. Excavation or pumping below the groundwater table elevation within the floodplain would cause a local cone of depression that would draw down the groundwater table elevation. This would create a gradient that would pull water from the San Joaquin River and its subsurface, known as a losing stream. This would have the potential to have a significant impact to the San Joaquin River watershed and the success of the SJRRP.

Response 15-18

See Responses 6-12 and 6-13, and Collective Response #25.

Flows within the San Joaquin River that are equivalent to or higher than those that would occur as part of the SJRRP restoration flows occurred during the baseline groundwater

monitoring period for the EIR (Draft EIR at page 4.10-49). Evaluation of the groundwater level data did not indicate similar trends to the river stage, which is one of the DWR criteria for evaluating interconnected surface water (Draft EIR at page 4.10-50). Furthermore, the groundwater flow volumes under the project sites and the estimated dewatering rates are miniscule fractions of the baseline and restoration flows in the San Joaquin River, such that even if the project were to draw water from the river through the weathered rock and hard rock, it would be immeasurable in terms of effect on river flows. The Operator recently elevated the berm at the Quary Site to provide additional flood protection. In response to comments and in accordance with the Fresno County General Plan (2024), Chang Consultants conducted hydraulic analyses evaluating the 200-year flood event, a more rare and severe flood event, which demonstrate that the 200-year flood would neither enter the Quarry Site nor the Plant Site (see Appendix G-7 and Appendix G-8). See Collective Response #17, discussing the 200-year flood plain analysis.

Comment 15-19

Levee Overtopping/Levee Failure

Friant Dam flood releases can occur in winter and spring. These flows have the potential to overtop or laterally incise levees, natural or constructed. Given the proposed Project's 100-year lifespan, it is critical that more dynamic language be incorporated into the DEIR to account for potential changes to the surrounding areas over time and potential for levee overtopping or failure. CDFW is concerned that flood releases, coupled with the potential for increased extreme flow events due to climate change, could jeopardize the integrity of the natural berms and levees surrounding the Project site, and that breaching of these barriers by high flows could result in long-term impacts to San Joaquin River fisheries and nearby restoration projects. As natural systems are inherently dynamic, it is essential to consider all potential scenarios for a Project with such an extended duration. Coordination with CDFW and other relevant agencies is strongly recommended to develop adaptive language that minimizes the potential long-term impacts of the Project.

Response 15-19

The project would not involve the operation or management of Friant Dam. Accordingly operational releases from Friant Dam are outside the scope of the project under CEQA. The project has been designed in consideration of regional hydrology and topography. Specifically, the hydraulic analysis includes a detailed analysis of the 100-year water surface elevations and flow velocities along the San Joaquin River (see Draft EIR, Appendix G-1, "Hydraulic Analysis"). This 100-year flood event represents an extreme

and conservative scenario for evaluating potential flood risks. Even so, the analysis determined that the existing berms are higher than the 100-year surface elevations, which would prevent breaching. As such no significant impacts related to levee/berm overtopping or failure are anticipated. In response to comments and in accordance with the Fresno County General Plan (2024), Chang Consultants conducted hydraulic analyses evaluating the 200-year flood event, a more rare and severe flood event, which demonstrate that the 200-year flood would neither enter the Quarry Site nor the Plant Site (see Appendix G-7 and Appendix G-8). The Operator recently elevated the berm at the Quarry Site to provide additional flood protection from the 200-year flood. See Collective Response #17, discussing the 200-year flood plain at the Quarry Site.

See discussion of Impact 4.10-17 on page 4.10-118 of the Draft EIR which explains that extreme releases of water from the Friant Dam are not required to be evaluated under CEQA because such releases are not reasonably foreseeable (Draft EIR, pages 4.10-118 through 4.10-119; see also CEQA Guidelines Section 15064(d)(3)). Regardless, in the unforeseen event of the release of water from the Friant Dam or Millerton Lake Reservoir in an amount that exceeds the river's channel capacity, the Draft EIR provides that the project sites' enlarged mining excavations would help contain and minimize downstream flooding (Draft EIR, page 4.10-119), that the on-site storm runoff, wash water, and sediment would be retained within the project sites' pits and ponds (which would include the recharge trenches), and that the stormwater would be managed in accordance with all applicable requirements of the NPDES program, including site-specific SPPPs prepared in accordance with Industrial General Permit Requirements and updated Waste Discharge Requirements (Draft EIR, page 4.7-29).

Comment 15-20

Water Temperatures/Water Quality

Suitable San Joaquin River temperatures are essential for the success in restoring the river and for the goals associated with the SJRRP. In general, San Joaquin River temperatures increase as water flows downstream from Friant Dam except for the coldest months in late fall and early winter. The reduction of flow traveling downstream, by a surface or subsurface diversion associated with mining pit capture would increase this dynamic and cause the San Joaquin River to warm sooner and at a faster rate. This can cause lethal/sub-lethal conditions for salmon and other fishes. Water found within the historic San Joaquin River floodplain, surface and subsurface, would have different water quality and temperatures than San Joaquin River surface flow. While the DEIR notes that groundwater and onsite water associated with the mining activities would remain on the Project site for

percolation into the groundwater aquifer, CDFW would like to reiterate that any surface or subsurface flow of water from the Project site would have the potential to warm the San Joaquin River and cause water quality issues that can result in lethal/sub-lethal conditions for fishes and potentially hinder SJRRP's efforts.

Response 15-20

This comment has been noted. Based on Draft EIR Section 4.7.1.1, "Geologic Conditions," the project sites are located within the San Joaquin River basin, characterized by alluvial basin fill that overlies older igneous rocks (Draft EIR pages 4.7-3 through 4.7-4). More specifically, on the project sites, the surficial geology comprises alluvial sediments, which are derived principally from Sierran granite and granodioritic rocks. These rock types are mapped within the immediate vicinity of the site and are the primary resource that would be mined and processed to produce aggregate products. Because the alluvial basin fill is compositionally derived principally from these plutonic rocks, the mineralogic assemblage of the underlying crystalline rock and the alluvium is compositionally similar and thus can be expected to exhibit common geochemical characteristics, though minor differences in mineral assemblages may be present in the weathered plutonic bedrock. When these types of plutonic rocks weather and undergo alteration, the resultant mineral assemblage is typically iron-rich and aluminosilicate clays and quartz, which are generally considered to be geochemically stable in subsurface hydrogeologic environments under typical pH and alkalinity levels.

As discussed in the EMKO Environmental, Inc. report, both the Quarry Site and the Plant Site are managed and designed as zero-discharge facilities with respect to offsite discharges. Therefore, the proposed project would not significantly impact surface water quality.

As discussed in the Draft EIR, a reintroduction effort for Chinook salmon is being orchestrated by the Bureau of Reclamation to restore the San Joaquin River (SJR) (Draft EIR page 4.4-63). Draft EIR Appendix E-4 evaluates the blasting limits of ground vibrations from the project's proposed blasting limits at the crest of the SJR embankment and determined the resulting overpressures in the SJR would be significantly below the threshold level established for the protection of embryos in spawning gravels and the safety of salmon. The ponds and water conveyance channels are artificial wetlands constructed and maintained for active surface mining and dewatering of the deeper geologic units and would not affect the water levels in the river. Due to the very low permeabilities of the weathered rock and hard rock at the Quarry Site, the volume and rate of groundwater flow are very low compared to the volume and rate of flows in the river. Implementation of several Draft EIR Mitigation Measures (such as Mitigation

Measures 4.10-1, 4.10-5a, and 4.10-10a) would reduce impacts on water quality issues, and no further analysis is required. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10, "Hydrology and Water Quality," and the mitigation measures referenced in this response.

Comment 15-21

Rock Blasting and Impacts to Chinook Salmon

The San Joaquin River, from Friant Dam to Little Dry Creek, is the primary spring-run Chinook salmon over-summer holding, spawning, and incubation reach for the SJRRP based on river temperatures, streambed substrate, and flows. The Project is immediately adjacent to this important reach that supports these critical phases of salmon life history. Rock blasting adjacent to the San Joaquin River would likely cause physical vibrations laterally within the floodplain and into the riverine environment, may have significant impacts on the behavior of salmon adults with over-summer holding (April to September), habitat spawning selection (September to mid-November), and the incubation of alevin/fry (September - March). While the DEIR evaluates potential blasting impacts to salmonids and concludes that blasting activities would be below a significant harm threshold identified by the Alaska Department of Fish and Game, CDFW would like to note that in addition to direct mortality and harm, rock blasting may cause an avoidant behavior in salmon. If blasting were to cause avoidant behavior, blasting activities could act as a behavioral barrier blocking salmon from entering and occupying suitable holding and spawning habitat located near and upstream of the Project. In addition, physical vibrations rock blasting could result in premature emergence on alevin/fry from the redd incubation environment. Juveniles emerging too early result in poor survival from their inability to navigate flows, avoid entrainment, and successfully escape predators. Due to the complexity of trying to determine behavioral thresholds to fish salmon from the proposed blasting activities, CDFW reiterates the recommendation that the Project be modified to an environmentally superior alternative, and that Project activities be adjusted to site blasting and excavation (i.e., activities associated with the Quarry Site) further away from the San Joaquin River and the river's associated habitats. In addition to this general recommendation, CDFW recommends the following:

Recommended Mitigation Measure 15: Chinook Salmon Consultation

It is recommended the Project proponent consult with CDFW to determine how to minimize and mitigate impacts to juvenile salmon utilization of the San Joaquin River from rock blasting.

Response 15-21

As explained in the Draft EIR, blasting activities would be brief and would not result in significant impacts to wildlife (see discussion of Impact 4.4-2 on page 4.4-52 of the Draft EIR). A typical blasting event would occur for approximately one to two seconds. See Response 65-13 for further discussion of blasting impacts to Chinook Salmon.

Comment 15-22

Blasting Protocols

Mitigation measure 4.10-1 of the DEIR requires implementation of the *Blasting Protocols* which specifies that blasting must begin at the center of the Quarry site and that monitoring of ground borne vibration can occur and be used to verify that predicted maximum ground vibrations are consistent with actual ground vibration measurements and allow for adjustments in blasting design to occur based on the monitoring results. CDFW is concerned that the blasting protocols may have unforeseen impacts to aquatic species and recommends having a biological monitor visually observe blasting activities adjacent to the San Joaquin River to look for signs of impacts to species (e.g. unusual behavior, mortality).

Response 15-22

Blasting activities would be brief and would not result in significant impacts to wildlife. A typical blasting event would occur for 1-2 seconds. See discussion of Impact 4.4-2 on page 4.4-52 of the Draft EIR for further discussion of blasting impacts to wildlife. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4.

Comment 15-23

Editorial Comments and/or Suggestions

Blasting Impacts: Within the DEIR, noise significance thresholds are discussed. However, these thresholds primarily focus on impacts related to salmon, as detailed in the DEIR section "Effects of Nearby Blasting on Salmon in the San Joaquin River," and do not address potential impacts on other animal species. CDFW strongly recommends a comprehensive evaluation of the potential effects of acoustic and vibration impacts from the proposed blasting, particularly in relation to impacts to special-status species

listed in previous sections of this letter. Furthermore, relevant thresholds or evaluation criteria should be established to minimize these effects and ensure the protection of wildlife in the surrounding areas.

Response 15-23

Blasting activities would be brief and would not result in significant impacts to wildlife (see Draft EIR page 4.4-53). A typical blasting event would occur for 1-2 seconds.

Comment 15-24

Reclamation Plans: The DEIR, on page 148, states that at the Plant Site, "It is estimated that an approximately 100.5-acre, 20-foot-deep pond would form above the reclaimed bottom from groundwater and rainfall." The Project proposes that, upon completion, the Plant Site would be converted into an open water habitat or lake with a relatively uniform bottom elevation and a depth of approximately 20 feet, which offers limited benefit to wildlife. CDFW recommends placing overburden and fines at the bottom of the pit to create topographic complexity, ensuring the formation of dry islands, peninsulas, and variable water depths. This more naturalistic approach would enhance the site's suitability for wildlife use. As an example, CDFW suggests that the reclamation plan reference sites such as Ball Ranch (coordinates: 36.936284°, -119.736811° and 36.857447°, -119.834031°).

Response 15-24

While CDFW's recommendation for additional topographic complexity is noted, the proposed design was developed to ensure stability, water quality protection, and consistency with approved reclamation objectives. The Draft EIR analysis supports the conclusion that the proposed open water habitat would provide beneficial wildlife use, and no additional modification to the reclamation plan is required.

Comment 15-25

Overall, CDFW does not concur with the proposed reclamation plan. CDFW recommends the development of a more comprehensive reclamation plan in collaboration with relevant agencies. Given that the Project is anticipated to be completed over a 100-year timeframe, it is essential to create a detailed reclamation plan that incorporates dynamic language, allowing for flexibility to accommodate potential changes over time.

Response 15-25

The Draft EIR analyzes the proposed project's consistency with Fresno County Zoning Ordinance Section 834.4.220, which enacts the provisions of the Surface Mining and Reclamation Act contained in PRC Section 2710-2796 (SMARA). As discussed in Table 4.11-1, "Project Consistency with Local Planning Documents," of the Draft EIR, the existing quarry and the proposed project were designed and operated in compliance with the Fresno County Surface Mining and Reclamation Ordinance. Specifically, the ordinance requires approval of a CUP, Mining and Reclamation Plan, and Financial Assurances for all surface mining operations in the County and outlines the submission requirements and processing procedures for each. See Table 4.11-1 on pages 4.11-43 through 4.11-44 for further discussion of the project's consistency with Fresno County Zoning Ordinance Section 834.4.220.

Reclamation activities would occur within two years of the completion of each phase of mining on each site and would be conducted in conjunction with mining activities to the extent feasible. Reclamation would occur when mining is completed at the Plant Site, which is estimated to last up to 30 years (Draft EIR page 1-7). The final reclamation would occur on the Quarry Site after 100 years (Draft EIR page 2-29). The Reclamation Plan proposed complies fully with all requirements of SMARA and CEQA. The Reclamation Plan is included in its entirety as Appendix B-1, "Surface Mining and Reclamation Plan," of the Draft EIR, and the CDFW had the opportunity to review and comment on its contents in accordance with CEQA.

Comment 15-26

Quarry Site Groundwater Adaptive Management Program: Mitigation Measure 4.10-10a of the DEIR states, "To assess any potential effect on the CSA 44C wells due to the proposed excavation of a hard rock quarry pit at the Quarry Site, monitoring shall be conducted in the nested set of wells between the Northeast Pond and the CSA 44C wells, and in the CSA 44C wells themselves." CDFW is concerned that monitoring at only one of the two well clusters near the San Joaquin River may not fully represent conditions along the entire boundary.

CDFW recommends the following:

1. Add pressure transducer monitoring to the MW-2 well cluster, located in the alluvium and weathered rock, to establish baseline conditions and evaluate potential impacts (MW-1 is already included and contains applicable thresholds and actions for MW-2).

2. Conduct further investigation into the elevation of the contact between the alluvium and weathered rock in relation to the adjacent channel bed and stream stage along the mine boundary shared with the San Joaquin River. This data should be used to refine the adaptive management program concerning potential streamflow depletion.

Response 15-26

Pressure transducers have been present in each well of the MW-2 cluster since 2017, and CEMEX intends to continue to monitor water levels in that well cluster during the project (Draft EIR Appendix G-6, "Addendum to: Revised Hydrology and Water Quality Analysis Report," page 2). Therefore, monitoring data from the MW-2 wells may be included in the adaptive management program, subject to the same evaluation criteria, thresholds, and corrective measures outlined in Mitigation Measure 4.10-10a that apply to the other wells being monitored for the adaptive management program.

Mining of the Quarry Site adjacent to the San Joaquin River has already removed the alluvium and exposed the top surface of the weathered bedrock. Thus, the current Quarry floor topography near the river defines the elevation of the contact between those two geologic units and further investigation is unnecessary. These conditions are part of the current baseline, and the project would not alter the elevation of the contact in the area between the quarry and the river. Thus, revisions to the adaptive management program due to baseline conditions is not necessary.

Comment 15-27

Sustainable Groundwater Management Act (SGMA), Interconnected Surface Waters, and Groundwater Dependent Ecosystems: Groundwater Sustainability Plans were prepared for the Kings Subbasin. The Kings Subbasin (Subbasin No. 5-022.08 of the San Joaquin Valley Groundwater Basin) is designated as a high priority Subbasin by the Department of Water Resources (DWR). SGMA defines sustainable groundwater management as, "management and use of groundwater in a manner that can be maintained during the planning and implementation horizon without causing undesirable results (Water Code, § 10721 (v))." CDFW recommends that the DEIR include an analysis of Project-related activities in relation to the North Kings Groundwater Sustainability Plan, including analysis of potential undesirable results and adverse impacts to groundwater dependent ecosystems including the biological resources listed above.

CDFW recommends a hydrologic study or other information that identifies and analyzes the impacts to the aquatic ecosystems and

fisheries of the San Joaquin River that may result from Project implementation. CDFW recommends that it include specific triggers for evaluating changes to surface and ground water levels and monitoring wetland and riparian habitats that would be affected by these changes.

Response 15-27

The project's potential impacts to groundwater supply are addressed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. Analyses of groundwater conditions at the Plant and Quarry sites are presented in Appendix G-3, "Groundwater Conditions at the Plant Site," and Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR. The Draft EIR provides a summary of the existing groundwater conditions at the Plant Site and Quarry Site on pages 4.10-33 through 4.10-42. See also the Appendix G-5, "Hydrology and Water Quality Analysis Report," and the Appendix G-6, "Addendum to: Revised Hydrology and Water Quality Analysis Report," of the Draft EIR. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections and appendices referenced in this response.

Please see Response 65-38 for further discussion of the project's consistency with the North Kings GSA. See also Response 6-109 and Collective Response #25.

The Draft EIR provides that the North Kings Groundwater Sustainability Agency's groundwater management area is not experiencing critical overdraft conditions and that the Quarry Site and Plant Site would:

(a) Not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project would impede sustainable groundwater management of the basin, and
(b) Not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management (see Draft EIR, Appendix G-5, Section 2.2.1, pages 10 through 12 and Section 5.0, pages 55 through 57).

Further, Impact 4.10-11 determined that the project would not substantially decrease groundwater supplies during mining operations, and after completion of reclamation at the Quarry Site, the project would not impede sustainable groundwater management of the Basin (Draft EIR, page 4.10-112 through 4.10-113). In addition, Impact 4.10-13 analyzed and determined that the Plant Site and Quarry Site would not impede sustainable groundwater management of the Basin, nor substantially interfere with groundwater recharge (Draft EIR, page 4.10-114 through 4.10-115).

The project's potential impacts on groundwater-dependent ecosystems are analyzed in Section 4.4 of the Draft EIR. See the Draft EIR's discussion of the project's impacts to groundwater dependent ecosystems in Impact 4.4-4 and Impact 4.4-5. The Draft EIR concludes in Impact 4.4-4 that the project would not result in adverse effects to groundwater-dependent ecosystems at the Plant and Quarry sites. Furthermore, the Draft EIR concludes, based upon the hydrologic analyses completed by KDSA (2021) and EMKO (2023) that the project would not significantly impact river-flow dependent ecosystems. As such, impacts to fisheries and other aquatic ecosystems of the San Joaquin River would be less than significant, and no further analysis is required. It should be noted that the project would include groundwater monitoring, see Mitigation Measure 4.10-10a.

Comment 15-28

Water Rights: The Project description allows for the diversion and storage of surface water for Project activities. As stated previously, the capture of stream flows is subject to appropriation and approval by the SWRCB pursuant to Water Code section 1200 et seq. CDFW recommends that the DEIR includes a detailed description of the water rights and water entitlements that would pertain specifically to the Project and address any applications or change petitions that may be filed. CDFW, as Trustee Agency, is consulted by the SWRCB during the water rights process to provide terms and conditions designed to protect fish and wildlife prior to appropriation of the State's water resources. Given the potential for impacts to special-status species and their habitats, it is advised that required consultation with CDFW occur well in advance of the SWRCB water right application process.

Response 15-28

The Draft EIR evaluates the potential impacts of the proposed project on the environment, per CEQA requirements. The status of water rights is not an environmental impact that is addressed under CEQA.

Comment 15-29

Nesting birds: CDFW encourages that Project ground-disturbing and blasting activities occur during the bird non-nesting season; however, if ground or vegetation disturbing or blasting activities must occur during the nesting season (February 1st through September 15th), the Project applicant is responsible for ensuring that implementation of the Project does not result in violation of the Migratory Bird Treaty Act or relevant Fish and Game Code sections as referenced above.

Response 15-29

A pre-construction clearance survey to verify that the site of nesting birds is provided in the Draft EIR, on pages ES-16 through ES-17, and Mitigation Measure 4.4-1c (Draft EIR page 4.4-49). As revised in this Final EIR, pre-construction surveys would be conducted by a qualified biologist within 500 feet of the limits of disturbance and would include multiple survey visits, as appropriate. If an active nest is observed during the survey, appropriate avoidance buffers would be established based on species-specific requirements, including up to 500 feet or greater for listed and raptor species, and construction activities would be modified, delayed, or avoided within the buffer in coordination with the CDFW, as appropriate, until a time when the birds have left the nest, or the nest becomes inactive under natural conditions. With the implementation of Mitigation Measure 4.4-1c, as revised in this Final EIR, the potential for the proposed project to result in adverse impacts to nesting birds at or near the Plant Site and Quarry Site would be less than significant. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4 and Mitigation Measure 4.4-1c.

Comment 15-30

CDFW further recommends that the DEIR include that a qualified biologist conduct a pre-construction survey for active nests no more than three days prior to the start of ground or vegetation disturbance or blasting activities to maximize the probability that nests that could potentially be impacted are detected. CDFW also recommends that surveys cover a sufficient area around the Project site to identify nests and determine their status. A sufficient area means any area potentially affected, either directly or indirectly, by the Project. In addition to direct impacts (i.e., nest destruction), noise, vibration, and movement of workers or equipment could also affect nests. CDFW recommends that a qualified biologist establish a behavioral baseline of all identified nests. Once Project activities begin, CDFW recommends having a qualified biologist continuously monitor nests to detect behavioral changes resulting from the Project. If behavioral changes occur, CDFW recommends halting the work causing that change and consulting with CDFW for additional avoidance and minimization measures.

If continuous monitoring of identified nests by a qualified biologist is not feasible, CDFW recommends a minimum no-disturbance buffer of 300 feet around active nests of non-listed bird species and a 500-foot no-disturbance buffer around active nests of non-listed raptors. These buffers are advised to remain in place until the breeding season has ended or until a qualified biologist has determined the birds have fledged and are no longer

reliant upon the nest or on-site parental care for survival. Variance from these no-disturbance buffers is possible when there is a compelling biological or ecological reason to do so. CDFW recommends that a qualified wildlife biologist advise and support any variance from these buffers and notify CDFW in advance of implementing a variance.

Response 15-30

The commenter recommends additional measures related to pre-construction surveys, monitoring, and buffers to protect nesting birds. These comments are noted.

As stated in Response 15-29, the Draft EIR includes a pre-construction clearance survey requirement to identify and avoid impacts to nesting birds (Draft EIR, on pages ES-16 through ES-17; Mitigation Measure 4.4-1c, page 4.4-49). Mitigation Measure 4.4-1c incorporates measures to avoid and minimize impacts to nesting birds, including surveys conducted by a qualified biologist, establishment of appropriate buffers, and restrictions on construction activities in the vicinity of active nests.

As noted, Mitigation Measure 4.4-1c incorporates most of the methods recommended by the commenter and has been revised to further strengthen protections for nesting birds, including listed species. Implementation of this measure would ensure compliance with the California Endangered Species Act, the federal Endangered Species Act, and CEQA. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Mitigation Measure 4.4-1c. See also Response 15-13.

Comment 15-31

CNDDB Positive Submission of Data: Please note that the California Natural Diversity Database (CNDDB) is populated by and records voluntary submissions of species detections. As a result, species may be present in locations not depicted in the CNDDB but where there are suitable habitats and features capable of supporting species. A lack of an occurrence record in the CNDDB does not mean a species is not present. In order to adequately assess any potential Project-related impacts to biological resources, surveys conducted by a qualified wildlife biologist/botanist during the appropriate survey period(s) and using the appropriate protocol survey methodology are warranted in order to determine whether or not any special-status species are present at or near the Project site.

Response 15-31

The commenter notes that the California Natural Diversity Database (CNDDB) reflects voluntary species occurrence records and recommends protocol-level surveys to determine the presence of special-status species. This information is noted.

Section 4.4 of the Draft EIR, supported by the Plant Site Habitat Assessment (Appendix E-1) and Quarry Site Habitat Assessment (Appendix E-2), provides a detailed analysis of the potential for special-status species to occur on or near the project sites and be affected by the proposed project (Draft EIR, pages 4.4-22 through 4.4-23). This analysis considered not only documented occurrences in the CNDDB, but also habitat conditions within and adjacent to the project sites.

As described in these analyses, a habitat suitability assessment and 2021 field surveys were conducted by qualified biologists. Based on habitat requirements, availability and quality of habitat, known species distributions, and site conditions, ELMT Consulting determined that no listed species are present and that remaining special-status species not observed during surveys are either presumed absent from the project sites or have a low potential to occur and would not be affected by the proposed project.

The analysis also considers site-specific conditions, including the highly disturbed nature of the project sites, the long history of disturbance, the presence of natural barriers to dispersal, and the presence of non-native species such as bullfrogs, which can limit occurrence of certain native species. Based on this information, no special-status species were determined to have a moderate or high potential to occur within the project sites.

Therefore, the level of analysis provided in the Draft EIR, including habitat assessments and field surveys, is adequate to evaluate potential impacts to biological resources and fulfills CEQA requirements.

Comment 15-32

Adjacent State Protected Lands: As mentioned above, the Willow Unit of CDFW's San Joaquin River Ecological Reserve (SJRER) surrounds the Project site on three sides (the fourth side being Friant Road). A portion of the Plant Site acreage has encroached upon property owned by the State of California (both CDFW and the San Joaquin River Conservancy). This encroachment outside of lands now owned by Cemex was a condition present at the time of CDFW's acquisition of the Willow Unit from the Ball Family. However, the condition was to be remedied within a certain timeframe of purchase but the intended retraction and restoration of the State-owned acreage never occurred. Cemex and CDFW have had preliminary discussions about this issue, which could be resolved with a

property exchange and parcel boundary adjustment, but final resolution will be needed prior to ***any*** expanded activities at the Plant Site.

Response 15-32

The Draft EIR recognizes that a resolution pertaining to the CDFW-owned portion of the Plant Site is needed prior to engaging in expanded activities at the Plant Site. The Draft EIR includes the portion of the Plant Site owned by the CDFW for the purpose of evaluating the full extent of potential environmental impacts of the proposed project. It is noted that the project would not include the CDFW-owned portions without prior approval from CDFW (Draft EIR page 2-2 through 2-3).

Comment 15-33

Additionally, the Quarry Site borders Lost Lake Recreation Area. CDFW would like to note that Lost Lake Park not only is State-owned land, but the lands are under an expired lease with Fresno County. Both these CDFW lands provide habitat for several State and federally listed special-status species.

Response 15-33

The comment is noted.

Comment 15-34

In addition to consultation with CDFW regional staff, CDFW recommends consultation with CDFW's Regional Ecological Reserve Management Unit staff well in advance of Project initiation to demonstrate accurate delineation of property boundaries to prevent inadvertent encroachment on CDFW owned lands. Consultation is also recommended to discuss planned ingress and egress to the Project site for the purposes of avoiding impacts on CDFW-owned lands, which is prohibited by Title 14 California Code of Regulations § 630. Please contact John Battistoni, Regional Ecological Reserve Management Unit Supervisor, at the address on the letterhead above or via email at John.Battistoni@wildlife.ca.gov.

Response 15-34

The comment is noted. See Response 15-33 above.

Comment 15-35

Lake and Streambed Alteration: Project activities that substantially change the bed, bank, and channel of any river, stream, or lake are subject to CDFW's regulatory authority pursuant Fish and Game Code section 1600 et seq. Fish and Game Code section

1602 requires an entity to notify CDFW prior to commencing any activity that may (a) substantially divert or obstruct the natural flow of any river, stream, or lake; (b) substantially change or use any material from the bed, bank, or channel of any river, stream, or lake (including the removal of riparian vegetation): (c) deposit debris, waste or other materials that could pass into any river, stream, or lake. "Any river, stream, or lake" includes those that are ephemeral or intermittent as well as those that are perennial and may include those that are highly modified such as canals and retention basins.

CDFW is required to comply with CEQA in the issuance of a Lake or Streambed Alteration Agreement (LSAA); therefore, if the CEQA document approved for the Project does not adequately describe the Project and its impacts to lakes or streams, a subsequent CEQA analysis may be necessary for LSAA issuance. For information on notification requirements, please refer to CDFW's website (https://wildlife.ca.gov/Conservation/LSA) or contact CDFW staff in the Central Region Lake and Streambed Alteration Program at (559) 243-4593.

Response 15-35

The comment is noted. CDFW's jurisdiction over streambed alterations pursuant to Fish and Game Code Section 1602 is discussed in Section 4.4.1.7, "Wetlands and Waters of the State." As discussed in Impact 4.4-5, the ponds and water conveyance channels located on the project sites are artificial wetlands constructed and maintained for active surface mining and do not fall under the regulatory authority of the Army Corps, SWRCB, or CDFW (Draft EIR page 4.4-61).

Comment 15-36

Cumulative Impacts: Currently, the DEIR has a very broad analysis of cumulative impacts to biological resources and does not adequately evaluate impacts to specific resources. As such, the conclusions reached in the cumulative impacts analysis are not supported by substantial evidence and the analysis lacks sufficient rigor and transparency to adequately develop reasonable and feasible measures to reduce harm. To address this lack of evidence, CDFW recommends that a cumulative impact analysis be conducted for all biological resources that will either be significantly or potentially significantly impacted by implementation of the Project, including those whose impacts are determined to be less than significant with mitigation incorporated or for those resources that are rare or in poor or declining health and will be impacted by the Project, even if those impacts are relatively small (i.e., less than significant). CDFW

recommends cumulative impacts be analyzed for the following species using an acceptable methodology to evaluate the impacts of past, present, and reasonably foreseeable future projects on resources and be focused specifically on the resource, not the Project. An appropriate resource study area should be identified and mapped for each resource being analyzed and utilized for this analysis. CDFW staff is available for consultation in support of cumulative impacts analyses as a trustee and responsible agency under CEQA.

Response 15-36

Page 5-12 of the Draft EIR states *"the analysis assumes there are biological resources impacts in the cumulative projects area that could be similar to those on the project sites, and therefore could be subject to cumulative impacts.*" The Draft EIR, on page 5-12, then analyzes cumulative effects to biological resources in the subsequent paragraph of Section 5.3.4, "Biological Resources":

> The project-specific impacts to special-status species (Impacts 4.4-1, 4.4-2, and 4.4-3) in conjunction with those from other past, present, and reasonably foreseeable future cumulative projects have the potential to result in significant cumulative impacts to burrowing owl, western pond turtle, western spadefoot, and nesting birds through the direct and indirect disturbance of the species and their habitats. This is a potentially significant cumulative impact. However, the implementation of Mitigation Measures 4.4-1a, -1b, and -1c would effectively avoid or substantially reduce the proposed project's impacts to these species by requiring preconstruction surveys and avoidance measures. Thus, the proposed project's contribution to cumulative impacts to special-status species, after mitigation, would be less than cumulatively considerable.

Pages 5-13 through 5-14 of the Draft EIR address potential cumulative effects to sensitive resources such as riparian communities, waters of the state, wetlands, and other sensitive communities such as groundwater dependent vegetation communities and wildlife corridors. Ultimately the Draft EIR concluded that through application of mitigation measures, completion of the environmental review process, and similar actions, any cumulative effects are reduced to less than significant levels.

Comment 15-37

Environmental Data

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations. (Pub. Resources Code, Section 21003, subd. (e).) Accordingly, please report any special-status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDB). The CNDDB field survey form can be found at the following link: https://www.wildlife.ca.gov/Data/CNDDB/Submitting-Data. The completed form can be mailed electronically to CNDDB at the following email address: CNDDB@wildlife.ca.gov. The types of information reported to CNDDB can be found at the following link: https://www.wildlife.ca.gov/Data/CNDDB/Plants-and-Animals.

Response 15-37

The database maintained by the State Clearinghouse and the County records satisfies the reporting requirements referenced in this comment. Both County records and the State Clearinghouse allow for information about the EIR to be held centrally to inform subsequent EIRs and revisions. The results of additional wildlife surveys conducted for the project would be maintained by the County, which constitutes a database allowing for public access to subsequent queries of biological results used to inform subsequent EIRs, in accordance with the requirements of PRC Section 21003, subd. (e)

Comment 15-38

Filing Fees

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying Project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, Section 753.5; Fish & G. Code, Section 711.4; Pub. Resources Code, Section 21089.)

Response 15-38

The comment is noted and the County will ensure payment of applicable filing fees.

Comment 15-39

CONCLUSION

CDFW appreciates the opportunity to comment on the DEIR to assist Fresno County in identifying and mitigating Project impacts on biological resources.

More information on survey and monitoring protocols for sensitive species can be found at CDFW's website (https://www.wildlife.ca.gov/Conservation/Survey-Protocols). Please see the enclosed Mitigation Monitoring and Reporting Program (MMRP) table which corresponds with recommended mitigation measures in this comment letter. Questions regarding this letter or further coordination should be directed to Evelyn Barajas-Perez, Environmental Scientist, at (805) 503-5738 or Evelyn.Barajas-Perez@Wildlife.ca.gov.

Response 15-39

The County appreciates the review and input provided by CDFW. Information on survey and monitoring protocols for sensitive species as referenced in the comment are noted. Please see responses above pertaining to CDFW's mitigation recommendations. Mitigation measures adopted by the County would be documented in a Mitigation Monitoring and Reporting Program (MMRP) in compliance with CEQA.

4.3 ORGANIZATIONS AND LOCAL BUSINESSES COMMENTS AND RESPONSES

Letter #16 February 2, 2025, Leo Labbe, Fresno Fly Fishers for Conservation

Comment 16-1

My name is Leo Labbe and I currently serve as the club secretary, I am also a past President of the local Fly Fishers for Conservation here in Fresno County. We have over 200 active members that support and want to conserve our precious environment.

I was totally unaware of the meeting that occurred in January?

However, I did receive the draft of the EIR in the mail and I am very concerned that this proposal even exists and would like to ask how was the meeting made public? I was involved in the original proposal. Also what are the next steps and possibly what can we do as an organization to share our thoughts and concerns?

Response 16-1

Please see Collective Response #1 for discussion of the public review process and opportunities for public input during the County's review of the project.

Comment 16-2

I have attached a list of issues. Can you please respond to the EMAIL to confirm that you have received them.

Response 16-2

The commenter's full comments were received by the County and are responded to in Responses 16-3 through 16-21.

Comment 16-3

I also would appreciate your thoughts on how we should proceed as concerned citizens to this proposal.

Response 16-3

See Collective Response #1 regarding the County's processing of the proposed project. The public will have an additional opportunity to submit comments during the public hearing(s) for the proposed project.

Comment 16-4

CEMEX Proposal issues

This is probably one of the most spectacular parcels of land in the area and the public has virtually no access to it and overall, very limited access to the San Joaquin River. There are a few parks that provide limited access for a fee, but in general most of the land is private or used commercially for mining and pilfering of this precious limited resource. This agreement will insure this limitation is extended for the next 100 years.

Response 16-4

The opinions in the comment are noted. The comment does not address the adequacy of the Draft EIR. Please see Collective Response #5 pertaining to the requested use permit duration and Collective Response #21 pertaining to public access to the San Joaquin River.

Comment 16-5

The process is being expedited in a period where public input and the opportunity to voice concerns are very difficult. I have to ask the obvious question which is, why rush the approval process for an agreement that will last 100 years. What is the hurry? A public meeting was held June 24th and comments accepted through July 6th. Only 8 business days for a commitment that will last for 100 years. Let's slow down and give the people of Fresno County the opportunity to learn about this project and the potential impact that it will have on our Great-Grandchildren who are yet to be born!

Response 16-5

Please see Collective Response #1 for discussion of the public review process and opportunities for public input during the County's review of the project. As described there, the public review and comment period for the Draft EIR was 80 days, which is in excess of the 45-day period required by CEQA. Additional opportunities for public input to the County will also be available during the County decision making hearings process.

Comment 16-6

During the last decade, the CDFW has successfully begun the process of re-introducing Salmon into the San Joaquin River. The impact on this restoration will be significant and could prove to be detrimental to its success!

Response 16-6

Please see Collective Response #12 for discussion of effects on the San Joaquin River and Chinook salmon restoration efforts and please see Collective Response #16 for discussion of blasting impacts to salmon.

Comment 16-7

A 100year agreement is unthinkable and will continue to limit its use for many generations to come.

Response 16-7

Please see Collective Response #5 for discussion of the requested use permit duration.

Comment 16-8

As a society, we have the responsibility to end this tragic use of the land for the profit of a foreign LLC. Return the land to the public and don't add to the pollution of our precious water, air, noise and traffic! There are many other places where gravel can be mined. Why select this pristine piece of land to be permanently destroyed and potentially impact the lives and living conditions of the citizens of Fresno County and add contamination to the already unhealthy environment that already exists in Fresno.

Response 16-8

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The Draft EIR as updated in the Final EIR addresses potential water impacts in Section 4.4, "Biological Resources" (wetlands), Section 4.10, "Hydrology and Water Quality" (water quality, groundwater, flooding hazards), and Section 4.19, "Utilities and Service Systems" (water supply and infrastructure). Air quality impacts are addressed in Appendix D-4, "Revised Section 4.3, Air Quality." The Draft EIR addresses potential noise impacts in Section 4.13, "Noise." The Draft EIR addresses potential traffic and transportation impacts in Section 4.17, "Transportation."

With regard to the project location, the Draft EIR discusses alternatives to the proposed project in Chapter 6, "Alternatives." There, Draft EIR Section 6.4.2.1, "Alternative Site Locations," considers the feasibility of alternative locations explains that "[n]o specific location with the attributes necessary to accomplish the project objectives is known in enough detail to be identified as a specific alternative site to feasibly meet the project objective of developing a known high-quality aggregate deposit." The comment does not provide additional information on available and feasible project location alternatives, and no further response is required.

Comment 16-9

This land could be used for many other purposes that would be much more profitable for the county. Not only by generating more tax revenue, but also potentially adding legitimate business revenue for much more appropriate use on this special property, such as increasing tourist, recreational and business revenue to the County.

Response 16-9

The commenter's suggestions regarding alternative uses of the site are noted. However, the County's CEQA review necessarily evaluates the project as proposed by the Operator and alternative site uses such as those identified in the comment would not achieve the project purpose and objectives described in Draft EIR Section 2.3, "Project Purpose and Objectives." The analysis of the project alternatives includes a no project alternative. See Draft EIR pages 6-10 through 6-20 for further discussion of the no project alternative.

Comment 16-10

Cemex LLC is part of a Mexican corporation and, by design, they have Limited Liability and if something does happens, then no one will be held responsible! The current agreement has provisions that state that the land will be returned to natural conditions after the 100 year period. If the current agreement ends in 2023, Cemex will move out of the area and leave us with the mess that they have already created.

Response 16-10

See Collective Response #4b pertaining to liability and fund for potential damages. The Operator would be responsible to reclaim the project sites in accordance with the approved reclamation plan. Both Fresno County and the Surface Mining and Reclamation Act (SMARA) require that surface mining operators maintain a financial assurance mechanism payable to the SMARA lead agency (here, Fresno County) and to the State of California sufficient to accomplish reclamation as prescribed by the surface mining operation's approved reclamation plan, including conditions of approval and mitigation measures associated with reclamation. The Operator is required to annually prepare and submit for County review and approval a financial assurance cost estimate and evidence of a financial assurance mechanism in an amount at least equal to the cost estimate. Therefore, sufficient funding to ensure reclamation in accordance with the approved reclamation plan would be available in the event of the Operator's failure to reclaim the site in accordance with the approved reclamation plan.

Comment 16-11

They have an existing agreement that is not measured for performance. Input from the ZOOM meeting was that they continually violated the current work time schedule and had many environmental violations that were not addressed.

Response 16-11

Please see Collective Response #4 for discussion of comments regarding CEMEX regulatory compliance history.

Comment 16-12

Truck Traffic increasing to over 1000 per day! A 10 hour day means 100 trucks per hour. Friant Road was not expanded to 4 lanes exclusively for CEMEX truck flow? Who will pay for additional wear and tear of the highways?

Response 16-12

Table 4.17-11 displays the estimated annual average daily trip generation at the Plant and Quarry sites (Draft EIR page 4.17-28). At Stage 2 of project operations, the total trucks entering and exiting the Plant and Quarry sites would be 515. The commenter's calculation incorrectly assumes that the vehicles exiting the project sites are different from the vehicles entering the project sites. The Operator would be required to provide equitable contributions to pavement funding and road mitigation measures at various traffic intersections described in the discussion of Impact 4.17-1 of the Draft EIR. Please see Collective Response #29 for discussion of potential traffic and transportation-related impacts. See also Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.17.

Comment 16-13

What will be the impact on wildlife that habitats in the area?

Response 16-13

The Draft EIR addresses potential biological resources impacts in Section 4.4.

Comment 16-14

Please review the Fresno Bee video that shows the deplorable conditions of their current site.

Here is the link:

https://www.fresnobee.com/article243753187.html

Response 16-14

The Draft EIR adequately describes the existing conditions of the project sites throughout the analysis of project impacts as well as in Section 2.4, "Existing Conditions," of the Draft EIR. The comment does not address the adequacy of the Draft EIR, and thus no further response is required.

Comment 16-15

Now, imagine tripling that area. What kind of mess are we allowing them to create? Wildlife does not and will not exists in these conditions. There is no landscaping or trees of any kind.

Response 16-15

The commenter incorrectly describes the project's expansion, which does not involve an expansion of the surface area or footprint of the existing operations. The project would remain within the existing footprint of the current Plant and Quarry sites, and would not "triple in area," as suggested by the commenter. While the depth of the pit at the Quarry Site would be mined to a depth of 600 feet bgs, the surface area of disturbance would not substantially increase from existing conditions. The Draft EIR addresses potential biological resources impacts in Section 4.4. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4. The comment does not address the adequacy of the Draft EIR, and no further response is required.

Comment 16-16

All we have are dusty roads with lots of equipment adding to our pollution problem.

Response 16-16

See Appendix D-4 for potential air quality impacts, including fugitive dust emissions. See also the prepared Draft Fugitive Dust Control plan in Appendix K of Appendix D-3, "Air Quality, Health Risk, and Climate Change Impact Assessment," which shall be submitted to the SJVAPCD for review and approval prior to project implementation in accordance with Mitigation Measure 4.3-2b.

Comment 16-17

Fracking and blasting a 600ft mine will have a tremendous impact on the San Joaquin River that will be within 200 feet from the area. Water will be used to clean the aggregate and accidental discharge could occur polluting the river.

Response 16-17

The Draft EIR addresses potential impacts to water resources in Section 4.4 (wetlands), Section 4.10 (water quality, groundwater, flooding hazards), and Section 4.19, (water supply and infrastructure).

The proposed project does not include hydraulic fracturing, (i.e. fracking). Potential water quality impacts associated with blasting and use of blasting agents are discussed in the Draft EIR under Impact 4.10-1 beginning on Draft EIR page 4.10-88. As discussed in Impact 4.10-1, implementation of the Blasting Protocols presented in Appendix H-9, "Revised Blasting Protocols," of the Final EIR as required by Mitigation Measure 4.10-1 would minimize the risk of substantial surface water quality degradation by blasting agents. Mitigation Measure 4.10-1, the Blasting Protocols, specifies practices the project would be required to implement to prevent the contamination of groundwater and surface water. The Blasting Protocols would further prevent the accidental release of pollutants by regulating the use of explosives on the project sites, thereby further minimizing the project's potential to impact water quality as it relates to blasting.

The process for containing and reuse of aggregate wash water is described in the Draft EIR on pages 2-41 and 2-42. Waste Discharge Requirements (WDRs) Order No. 90-083 currently regulates the discharge of 1.5 million gallons per day of wash water generated by the washing/processing of sand and gravel at the Plant Site (Draft EIR page 4.10-67). The wash water discharges into the silt ponds, which must not contain chemicals, heavy metals, trace elements, or radionuclides that may adversely affect the beneficial uses of groundwater (Draft EIR page 4.10-67). The proposed project would continue to comply with WDRs issued by the Regional Water Quality Board. Compliance with the WDRs would minimize potential impacts to water quality resulting from the wash water system and ensure that such impacts are less than significant.

Comment 16-18

Seepage from the river and the surrounding aquifer will devastate the river and surrounding wells.

Response 16-18

See Collective Response #24 for discussion of potential impacts associated with groundwater seepage.

Comment 16-19

If we have another emergency release of Lake Millerton like we did in 1996; the pollution and debris from this mining operation will impact all the surroundings on its way to the ocean!

Response 16-19

Please see discussion of potential water quality effects associated with site flooding and inundation in the Draft EIR under Impact 4.10-17 beginning on Draft EIR page 4.10-118. As discussed there, during unforeseen events, the release of water into the San Joaquin River at rates that could exceed the river channel capacity could be required potentially resulting in flooding of the Quarry Site and/or Plant Site. However, such resulting inundation due to the unforeseen events would occur far outside the actual flood hazard zones. The unforeseen event of the release of water from the Friant Dam or Millerton Lake Reservoir is not required to be addressed under CEQA since the releases are not "reasonably foreseeable." In addition, hazardous materials on both sites would be stored in accordance with the requirements of the Industrial General Permit SWPPP and SPCC Plan, minimizing the risk of the release of pollutants in the event of site inundation. Upon completion of reclamation, both project sites would contain open space/open water land uses, which would not be sources of pollutants and would not store hazardous materials. Therefore, the potential of inundation of the project sites due to a rapid release of water from Friant Dam to result in the release of pollutants would be less than significant (Draft EIR, page 4.10-119).

Comment 16-20

All hopes of re-introducing Salmon to the river will be impacted by the blasting near their spawning waters.

Response 16-20

See Collective Response #12 for discussion of effects on the San Joaquin River and chinook salmon restoration efforts. See also Collective Response #16 for discussion of potential impacts to salmon spawning and analysis methods.

Comment 16-21

In closing, this land offers much more potential than an ugly private mine for a foreign LLC for the next 100 years. It could become an amazing public land to be enjoyed by the people of Fresno County. However, if this project is approved, the river will become an eyesore and an environmental hazard for the area that is already plagued by those many issues.

What are the benefits to the county and community? We all have a responsibility to be good Sheppard's of the land. This project does not come close to meeting this responsibility. If this passes, historians will look back and wonder what the county officials were thinking?

I look forward to hearing from you regarding this critical timely issue.

Response 16-21

The commenter's opposition to and concerns regarding the proposed project are noted for the consideration of the decision-makers.

Letter #17 February 5, 2025, Daniel Frank, Floyd Johnston Construction

Comment 17-1

On behalf of Floyd Johnston Construction Co., Inc., I am writing in support of Cemex's Rockfield Quarry Modification Project.

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region.

Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, and would contribute to existing traffic congestion. According to the Department of Conservation, transportation costs alone can increase 22 cents per ton for every additional mile traveled. Consequently, these higher construction costs are passed on to businesses, homeowners and county taxpayers.

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Importantly, Cemex's proposed modification plan also includes considerable resources for wildlife and habitat protection, 470 acres of open space with riparian areas, ponds, lakes, and native vegetation, and an easement for the Parkway Plan to expand the existing pedestrian and bicycle trail along the San Joaquin River that will benefit the local community.

Cemex has developed a constructive and thoughtful plan that serves the region's building, water, environmental and recreational needs, while remaining committed to being a good corporate citizen and responsible neighbor.

Thank you for recognizing the benefits of having a quarry located in your community.

Response 17-1

The commenter's support for the proposed project is noted for the consideration of the decision-makers.

Letter #18 February 7, 2025, Kim Nulick, Caliber Contracting

Comment 18-1

On behalf of Caliber Contracting Services Inc, I am writing in support of Cemex's Rockfield Quarry Modification Project.

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region.

Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, and would contribute to existing traffic congestion. According to the Department of Conservation, transportation costs alone can increase 22 cents per ton for every additional mile traveled. Consequently, these higher construction costs are passed on to businesses, homeowners and county taxpayers.

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Importantly, Cemex's proposed modification plan also includes considerable resources for wildlife and habitat protection, 470 acres of open space with riparian areas, ponds, lakes, and native

vegetation, and an easement for the Parkway Plan to expand the existing pedestrian and bicycle trail along the San Joaquin River that will benefit the local community.

Cemex has developed a constructive and thoughtful plan that serves the region's building, water, environmental and recreational needs, while remaining committed to being a good corporate citizen and responsible neighbor.

Thank you for recognizing the benefits of having a quarry located in your community.

Response 18-1

The commenter's support for the proposed project is noted for the consideration of the decision-makers.

Letter #19 February 11, 2025, Samantha McCarty, Santa Rosa Rancheria Tachi-Yokut Tribe

Comment 19-1

Thank you for contacting the Santa Rosa Rancheria Tachi-Yokut Tribe regarding the proposed changes to the CEMEX Rockfield Quarry EIR. The Tribe will be deferring to Table Mountain Rancheria for this matter. I've included Robert Pennell and Sara Lively on this email who are a part of TMR's Cultural Department staff.

If you have any questions, comments, and or concerns please do not hesitate to contact Nichole or myself. Thank you.

Response 19-1

The comment is noted. The reader is referred to Letter 50 submitted by the Table Mountain Rancheria.

Letter #20 February 11, 2025, Christopher Robbins, Fresno Fly Fishers for Conservation

Comment 20-1

As a member of Fresno Fly Fishers for Conservation and a concerned resident of Fresno County, I am writing to express my deep opposition to the CEMEX proposal that would extend commercial mining operations on the banks of the San Joaquin River for the next 100 years.

Response 20-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 20-2

This area is one of the most spectacular parcels of land in the region, yet public access remains extremely limited. Instead of prioritizing conservation and community use, this agreement would extend private and commercial restrictions, preventing generations of Fresno County residents from enjoying this vital natural resource.

Response 20-2

The opinions in the comment are noted. The comment does not address the adequacy of the Draft EIR. Please see Collective Response #21 pertaining to public access to the San Joaquin River.

Comment 20-3

I am particularly concerned about the expedited approval process for this 100-year commitment. The brief public comment period, which ends on March 10th is far too little time for Fresno County residents to learn about the project's consequences. A project of this magnitude demands thorough consideration, not a rushed decision that will impact future generations.

Response 20-3

See Collective Response #1 for discussion of the public review process and opportunities for public input during the County's review of the project. As described there, the public review and comment period for the Draft EIR was 80 days, which is in excess of the 45-day period required by CEQA. Additional opportunities for public input to the County would also be available during the County decision-making hearings process.

Comment 20-4

The environmental consequences of this project cannot be ignored. The California Department of Fish and Wildlife (CDFW) has made significant strides in reintroducing salmon to the San Joaquin River, yet this mining operation could jeopardize these efforts.

Response 20-4

The comment is noted. Please see Collective Response #12 for discussion of effects on the San Joaquin River and Chinook salmon restoration efforts, and Collective Response #16 for discussion of potential impacts to salmon spawning and applicable analysis methods.

As described in Section 4.4, "Biological Resources," of the Draft EIR, the proposed project is designed to avoid direct impacts to sensitive habitats along the San Joaquin River.

Mining and processing activities would occur within previously disturbed areas at the Quarry and Plant sites, which do not support high-quality riparian, wetland, or riverine habitat. Accordingly, habitat impacts would be limited to areas already affected by existing operations.

Potential effects on salmon habitat were specifically evaluated in the report *Effect of Nearby Blasting on Salmon in San Joaquin River*, prepared by Vibra-Tech Engineers (Draft EIR Appendix E-4, "Effects of Blasting on Fish"), which applies Alaska Department of Fish and Game standards for protection of fish. As discussed in Response 65-13, maintaining ground vibration and air overpressure thresholds associated with the river embankment and slope stability corresponds with ground vibrations and overpressures that would be protective to the fish in the river (see Draft EIR Appendix E-4, "Effects of Blasting on Fish"). Based on this analysis, the Draft EIR concludes that impacts to salmon habitat at both the Quarry Site and Plant Site would be less than significant and would not require mitigation (see Draft EIR, page 4.4-63).

In addition, the project sites are already subject to ongoing mining activities, and the proposed project would not result in a substantial increase in disturbance that would affect aquatic or terrestrial habitat conditions. Accordingly, the Draft EIR adequately evaluates potential impacts to salmon and associated habitats, and no further revision is required.

Comment 20-5

`The increased truck traffic, potential river pollution and habitat destruction would be devastating for local wildlife.`

Response 20-5

The commenter does not provide substantial evidence of impacts to local wildlife associated with truck traffic, river pollution or habitat destruction and the comment does not address the adequacy of the Draft EIR. The Draft EIR addresses potential biological resources impacts in Section 4.4.

Section 4.17, "Transportation," provides an analysis of the project's transportation impacts, including impacts from truck traffic. All truck traffic and other transportation impacts are assessed in detail, with appropriate mitigation measures provided (Draft EIR, Section 4.17, at pages 4.17-1 through 4.17-27; including Appendix I-1, "Traffic Impact Study," and Appendix I-2, "Estimates of Vehicle Miles Traveled").

Section 4.10, "Hydrology and Water Quality," provides an analysis of the project's impacts on water quality and potential effects on the San Joaquin River. All water quality

impacts are assessed in detail, with appropriate mitigation measures provided. (See Draft EIR, Section 4.10, at pages 4.10-1 through 4.10-88; Appendix G, "Hydrology and Water Quality"). See also, responses to letters from the U.S. Bureau of Reclamation (Letter #6), Center for Biological Diversity (Letter #65), San Joaquin River Parkway & Conservation Trust, Inc. (Letter #58), the City of Fresno (Letter #12) and City of Fresno, Department of Public Works, among others, for detailed analysis and discussion of water quality issues and appropriate mitigation measures, as analyzed by hydrology and water quality consultants.

The proposed project is designed to avoid direct impacts to sensitive habitats along the San Joaquin River. Mining and processing activities would be confined to previously disturbed areas at the Quarry and Plant sites, which do not support high-quality riparian, wetland, or riverine habitats. Habitat impacts would be limited to existing project areas. Furthermore, the project sites are already disturbed by ongoing mining activities, and would not experience a significant increase in activity. As a result, there is minimal potential for habitat destruction of native aquatic or terrestrial species.

Comment 20-6

Fracking and blasting a 600-foot mine so close to the river could lead to accidental discharges, seepage, and contamination of the surrounding water table endangering both aquatic ecosystems and local wells.

Response 20-6

The Draft EIR addresses potential water impacts in Section 4.4 (wetlands), Section 4.10, (water quality, groundwater, flooding hazards), and Section 4.19, "Utilities and Service Systems" (water supply and infrastructure).

The proposed project does not include hydraulic fracturing, (i.e. fracking). Potential water quality impacts associated with blasting and use of blasting agents are discussed in the Draft EIR under Impact 4.10-1 beginning on Draft EIR page 4.10-88. With the implementation of the Blasting Protocols (located in Appendix H-9, "Revised Blasting Protocols," of the Final EIR) required by Mitigation Measure 4.10-1, the risk of substantial surface water quality degradation by blasting agents would be minimized. Mitigation Measure 4.10-1, the Blasting Protocols, specifies practices the project would be required to implement to prevent the contamination of groundwater and surface water. The Blasting Protocols would further prevent the accidental release of pollutants by regulating the use of explosives on the project site, thereby further minimizing the project's potential to impact water quality as it relates to blasting.

See also Response 58-49 regarding the project's impacts to groundwater quality. For further discussion of potential impacts pertaining to "accidental discharges," please see Response 65-28. For discussion of the project's potential impacts on groundwater dependent ecosystems, refer to Response 58-28. See Collective Responses #23 and #25 for discussion of potential impacts associated with groundwater seepage.

Comment 20-7

Beyond the environmental harm, this project poses economic concerns. CEMEX, a foreign-owned LLC, is granted limited liability by design, meaning if damages occur, there may be little accountability.

Response 20-7

Please see Collective Response #4b pertaining to liability and funding for potential damages.

Comment 20-8

Moreover, the current agreement lacks measurable performance oversight, and

Response 20-8

The comment is noted. The Operator is subject to ongoing regulatory oversight. The operation is required to report annually and is inspected by Fresno County to ensure compliance with applicable regulations, permits, and conditions of approval pursuant to the County's Surface Mining and Reclamation regulations, as implemented through the Fresno County Zoning Ordinance and consistent with the Surface Mining and Reclamation Act (SMARA). The Operator must also maintain a financial assurance mechanism in accordance with SMARA, sufficient to ensure reclamation of the site in compliance with the approved reclamation plan, including all applicable mitigation measures. These requirements ensure that adequate funding and regulatory oversight are in place to implement monitoring, corrective actions, and site reclamation if necessary.

Comment 20-9

reports indicate repeated violations of work schedules and environmental standards.

Response 20-9

Please see Collective Response #4a pertaining to the Operator's regulatory compliance history.

Comment 20-10

The increased truck traffic alone—up to 1,000 trucks per day will degrade our roads and impact local residents, with little assurance that CEMEX will be held responsible for the consequences.

Response 20-10

The Draft EIR addresses potential traffic and transportation impacts in Section 4.17. The commenter describes a scenario where 1,000 trucks per day are entering/existing the project sites. However, the Draft EIR analyzes truck trips and anticipates 515 trucks entering and 515 trucks exiting the sites each day during Stage 2 of the project. Table 4.17-11, "Estimated Annual Average Daily Trip Generation at Plant Site and Quarry Site," displays the estimated annual average daily trip generation at the Plant and Quarry sites (Draft EIR page 4.17-28). The commenter's statement incorrectly assumes that the vehicles exiting the project sites are different from the vehicles entering the project sites.

As discussed in Draft EIR Impact 4.17-1, the Operator would provide equitable contributions to road and pavement improvements (Draft EIR page 4.17-27 through 4.17-42). Please also see Collective Response #29 for additional discussion of potential traffic impacts, road improvements, and maintenance needs.

Comment 20-11

Fresno County deserves better. Rather than approving a destructive mining operation, this land should be preserved and made accessible to the public. A park or conservation area would not only protect the environment but could also generate long-term revenue through recreation, tourism, and sustainable business opportunities. A private mine will only benefit a foreign corporation, while our community bears the long-term costs.

Response 20-11

The commenter's suggestions regarding alternative uses of the project sites are noted. However, the County's CEQA review necessarily evaluates the project as proposed by the Operator and alternative site uses such as those identified in the comment would not achieve the project purpose and objectives described in Draft EIR Section 2.3, "Project Purpose and Objectives."

Comment 20-12

I urge you to reconsider this agreement and advocate for a better future for Fresno County. Our community has the right to more input and a greater say in how this land is used. Please extend the public comment period and conduct a thorough review of the

environmental and economic impacts before making a decision that will affect our region for the next century.

Response 20-12

The commenter's opposition to and concerns regarding the proposed project are noted for the consideration of the decision-makers. Please see Collective Response #1 pertaining to public review and input opportunities.

Letter #21 February 12, 2025, Karry Wendel, Clean Cut Landscape

Comment 21-1

On behalf of Clean Cut Landscape, Inc., I am writing in support of Cemex's Rockfield Quarry Modification Project.

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region.

Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, and would contribute to existing traffic congestion. According to the Department of Conservation, transportation costs alone can increase 22 cents per ton for every additional mile traveled. Consequently, these higher construction costs are passed on to businesses, homeowners and county taxpayers.

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Importantly, Cemex's proposed modification plan also includes considerable resources for wildlife and habitat protection, 470 acres of open space with riparian areas, ponds, lakes, and native vegetation, and an easement for the Parkway Plan to expand the existing pedestrian and bicycle trail along the San Joaquin River that will benefit the local community.

Cemex has developed a constructive and thoughtful plan that serves the region's building, water, environmental and recreational needs, while remaining committed to being a good corporate citizen and responsible neighbor.

Thank you for recognizing the benefits of having a quarry located in your community.

Response 21-1

The commenter's support for the proposed project is noted for the consideration of the decision-makers.

Letter #22 February 13, 2025, Ronald Hicks, Fresno Fly Fishers For Conservation

Comment 22-1

As a member of Fresno Fly Fishers for Conservation and a concerned resident of Fresno County, I am writing to express my deep opposition to the CEMEX proposal that would extend commercial mining operations on the banks of the San Joaquin River for the next 100 years.

Response 22-1

See Response 20-1.

Comment 22-2

This area is one of the most spectacular parcels of land in the region, yet public access remains extremely limited. Instead of prioritizing conservation and community use, this agreement would extend private and commercial restrictions, preventing generations of Fresno County residents from enjoying this vital natural resource.

Response 22-2

See Response 20-2.

Comment 22-3

I am particularly concerned about the expedited approval process for this 100-year commitment. The brief public comment period, which ends on March 10th is far too little time for Fresno County residents to learn about the project's consequences. A project of this magnitude demands thorough consideration, not a rushed decision that will impact future generations.

Response 22-3

See Response 20-3.

Comment 22-4

The environmental consequences of this project cannot be ignored. The California Department of Fish and Wildlife (CDFW) has made significant strides in reintroducing salmon to the San Joaquin River, yet this mining operation could jeopardize these efforts.

Response 22-4

See Response 20-4.

Comment 22-5

The increased truck traffic, potential river pollution, and habitat destruction would be devastating for local wildlife.

Response 22-5

See Response 20-5.

Comment 22-6

Fracking and blasting a 600-foot mine so close to the river could lead to accidental discharges, seepage, and contamination of the surrounding water table endangering both aquatic ecosystems and local wells.

Response 22-6

See Response 20-6.

Comment 22-7

Beyond the environmental harm, this project poses economic concerns. CEMEX, a foreign-owned LLC, is granted limited liability by design, meaning if damages occur, there may be little accountability.

Response 22-7

See Response 20-7.

Comment 22-8

Moreover, the current agreement lacks measurable performance oversight, and

Response 22-8

See Response 20-8.

Comment 22-9

reports indicate repeated violations of work schedules and environmental standards.

Response 22-9

See Response 20-9.

Comment 22-10

The increased truck traffic alone--up to 1,000 trucks per day will degrade our roads and impact local residents, with little assurance that CEMEX will be held responsible for the consequences.

Response 22-10

See Response 20-10.

Comment 22-11

Fresno County deserves better. Rather than approving a destructive mining operation, this land should be preserved and made accessible to the public. A park or conservation area would not only protect the environment but could also generate long-term revenue through recreation, tourism, and sustainable business opportunities. A private mine will only benefit a foreign corporation, while our community bears the long-term costs.

Response 22-11

See Response 20-11.

Comment 22-12

I urge you to reconsider this agreement and advocate for a better future for Fresno County. Our community has the right to more input and a greater say in how this land is used. Please extend the public comment period and conduct a thorough review of the environmental and economic impacts before making a decision that will affect our region for the next century.

Thank you for your time and consideration. I look forward to your response on this critical issue.

Response 22-12

See Response 20-12.

Letter #23 February 14, 2025, Michael Branco, American Industrial Equipment

Comment 23-1

Dear Mr. Randall,

Please find the attached letter regarding the Cemex - Rockfield Aggregates plant modifications.

I've been fortunate enough to have worked with this facility on many projects over the last 35 years. The information provided in this letter is an honest and fair outline of what companies like Cemex bring to a community.

I would ask that the Fresno County staff delivers an approval for Cemex's plans. This company produces a valuable resource and contributes to the growth of the community as well as solid, well paying jobs for the people in your region.

Kindest Regards,

Mike Branco

American Industrial Equipment

…

On behalf of American Industrial Equipment, I am writing in support of Cemex’s Rockfield Quarry Modification Project.

Cemex’s Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region.

Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, and would contribute to existing traffic congestion. According to the Department of Conservation, transportation costs alone can

increase 22 cents per ton for every additional mile traveled. Consequently, these higher construction costs are passed on to businesses, homeowners and county taxpayers.

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Importantly, Cemex's proposed modification plan also includes considerable resources for wildlife and habitat protection, 470 acres of open space with riparian areas, ponds, lakes, and native vegetation, and an easement for the Parkway Plan to expand the existing pedestrian and bicycle trail along the San Joaquin River that will benefit the local community.

Cemex has developed a constructive and thoughtful plan that serves the region's building, water, environmental and recreational needs, while remaining committed to being a good corporate citizen and responsible neighbor.

Thank you for recognizing the benefits of having a quarry located in your community.

Response 23-1

The commenter's support for the proposed project is noted for the consideration of the decision-makers.

Letter #24 February 14, 2025, Mike Higgins, Pape Machinery

Comment 24-1

On behalf of Pape Machinery, I am writing in support of Cemex's Rockfield Quarry Modification Project.

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. Response 31-1

The commenter's support for the proposed project is noted for the consideration of the decision-makers.

Letter #32 February 24, 2025, David Cruce, Heavy Road Industries

Comment 32-1

On behalf of Heavy Road & Rail Inc., I am writing to express our strong support for Cemex's Rockfield Quarry Modification Project. For the past 100 years, Cemex's Rockfield Quarry has been a reliable and indispensable source of construction aggregate in the Fresno region. Access to a local and affordable aggregate supply is essential for businesses considering expansion or relocation to Fresno County, as well as for public agencies investing taxpayer dollars in infrastructure projects.

The Fresno region is expected to see increased demand for new construction in the coming decades, requiring over 6 million tons of construction aggregate annually for the next 50 years. This demand must be met locally, rather than relying on transportation from outside the region. Transporting aggregates from distant sources not only increases construction costs, fuel consumption, and greenhouse gas emissions but also contributes to worsening traffic congestion. According to the Department of Conservation, transportation costs alone can rise by 22 cents per ton for every additional mile traveled, leading to higher costs that are ultimately passed on to businesses, homeowners, and taxpayers.

Cemex has long been a dependable supplier of the building materials essential for the region's growth and the county's public infrastructure investments. Aggregates from the Rockfield Quarry have been integral to the construction of homes, businesses, roads, and schools throughout our neighborhoods.

Notably, Cemex's proposed modification plan includes extensive resources for wildlife and habitat protection, covering 470 acres of open space with riparian areas, ponds, lakes, and native vegetation. Additionally, the plan includes an easement for the Parkway Plan, which will expand the existing pedestrian and bike trail along the San Joaquin River, benefiting the local community.

Cemex has developed a thoughtful, balanced approach that addresses the region's need for construction materials, water conservation, environmental protection, and recreational spaces, all while remaining a responsible corporate citizen and neighbor.

Thank you for considering the essential benefits of having a quarry in our community. We fully support the

Rockfield Quarry Modification Project and its potential to foster sustainable growth for Fresno County.

Response 32-1

The commenter's support for the proposed project is noted for the consideration of the decision-makers.

Letter #33 February 24, 2025, Sarkis Nersesian, Jim Crawford Construction

Comment 33-1

On behalf of Jim Crawford Const. Inc., I am writing in support of Cemex's Rockfield Quarry Modification Project.

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. Letter #36 February 25, 2025, Joseph Penbera, Penbera Paris

Comment 36-1

Dr. Joseph Penbera is Chairman and founder of the California Energy Investment Center (CEIC) which has assisted in bringing millions of dollars of capital investment and creating thousands of new jobs for environmentally friendly projects in targeted employment areas. He is a member of the National Association of Forensic Economists (NAFE), a former Fulbright Senior Scholar in Economics, and recognized as a top economist by professional and media organizations and as a qualified forensic expert in virtually all court jurisdictions and by many government agencies. Dr. and Mrs. Penbera have deep ties to the Fresno area. Dr. Penbera served as Dean of The Craig Business School and on the San Joaquin River Parkway Board at its inception. He has studied the region for more than three decades and produced the first Statistical Abstract for the Central California counties, and the Population Forecast for Fresno County, among others. Wendy Penbera is a former Regional Director for Special Olympics, served on the State Legislative Committee for Junior League, and is a life-long resident of the Central Valley. All three of the Penbera children graduated from Fresno County schools.

Response 36-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See responses below that address specific issues raised in this comment letter.

Comment 36-2

1. EIR Review Process.

Much respect is accorded to the County staff. CEMEX has proposed a project which is by its very nature complex and challenging as to its scope. However, the EIR review process and an analysis of a 1000-page Draft EIR document is inherently even more overwhelming when considered by people unfamiliar with such matters. Very few people in the general public have experience with the historical and public policy context of the current application made by Cemex. All in all, this can seem daunting as to even where to start and to believing whether spending the time will be worth it. Intended

or not, the review process, handling of public comments, and the meeting and hearing logistics related to the Cemex extension several years ago, muted public participation, disadvantaged interaction and sharing of comments and feedback among individuals and groups, and put major holes in public confidence.

Let's not let that happen again by recognizing that CEMEX has had years to formulate a strategy based on making contact with staff, collateral agencies, and Supervisors. Cemex and its consultants have a head start in terms of influencing the process and the outcomes, so some meaningful steps should be taken to create a more level playing field. We suggest the following:

Response 36-2

Please see Collective Response #1 pertaining to the public review process and public input opportunities. Please see responses below with regard to the commenter's specific suggestions.

Comment 36-3

- The comments made by the public should be posted by the County on its website so that everyone can see them. This information is necessary to coalesce public opinions and interactions and towards properly gauging public sentiment.

Response 36-3

Public comments on the Draft EIR submitted during the Draft EIR review period are included with this Final EIR. The Final EIR, including public comments, will be posted on the County's website at https://www.fresnocountyca.gov/eir7763 prior to public hearings on the project.

Comment 36-4

- The identities of the agencies or entities that have either formally seen the Draft EIR or have worked with CEMEX consultants directly or indirectly through County staff should be made public, and the dates and subject matter and agreements or compromises reached during these contacts should be disclosed. This information is necessary to determine if various organizations are or have been working to meet their respective mandates, and which should be contacted.

Response 36-4

State agencies that received notice and opportunity to review and comment on the Draft EIR include: California Air Resources Board (ARB), California Department of Conservation (DOC), California Department of Fish and Wildlife, Habitat Conservation Planning (CDFW), California Department of Forestry and Fire Protection (CAL FIRE), California Department of Parks and Recreation, California Department of Resources Recycling and Recovery, California Department of Toxic Substances Control (DTSC), California Department of Transportation, District 6 (DOT), California Department of Transportation, Division of Aeronautics (DOT), California Department of Transportation, Division of Transportation Planning (DOT), California Department of Water Resources (DWR), California Energy Commission, California Fish and Game Commission (CDFGC), California Governor's Office of Emergency Services (OES), California Highway Patrol (CHP), California Native American Heritage Commission (NAHC), California Natural Resources Agency, California Public Utilities Commission (CPUC), California Regional Water Quality Control Board, Central Valley Fresno Region 5 (RWQCB), California State Lands Commission (SLC), Delta Protection Commission, Delta Stewardship Council, Department of General Services (DGS), Office of Historic Preservation, San Francisco Bay Conservation and Development Commission (BCDC), State Water Resources Control Board, Division of Drinking Water, State Water Resources Control Board, Division of Water Quality, State Water Resources Control Board, Division of Water Rights, Central Valley Flood Protection Board, California San Joaquin River Conservancy (SJRC), and California Department of Fish and Wildlife, Central Region 4 (CDFW).

Agencies that provided comments on the Draft EIR include: Fresno County Fire Protection District, California Department of Transportation, City of Fresno, Central Valley Flood Protection Board, Central Valley Regional Water Quality Control Board, United States Bureau of Reclamation, National Marine Fisheries Service, Friant Water Authority, North Kings Groundwater Sustainability Agency, San Joaquin River Conservancy, San Joaquin Valley Air Pollution Control District, and California Department of Fish and Wildlife. Written comments from these agencies are included in Appendix M, "Draft EIR Comment Letters," and the County's responses to the comments are included in Section 4.2, "Public Agencies Comments and Responses."

The County is not aware of direct communications or agreements between the Operator and agencies; however, this is not pertinent under CEQA and thus requires no further response.

Comment 36-5

- The names and backgrounds of each of the technical experts used by Cemex in working on the Draft EIR and on any collateral documents or process related to the proposed Quarry, and related current and future Cemex operations, should be disclosed. This information should be provided so that the independence of these persons or organizations can be determined.

Response 36-5

The technical studies submitted by the Operator in support of the application that were utilized for preparation of the Draft EIR are cited within the Draft EIR and included in Chapter 9, "References and Resources," of the Draft EIR.

Comment 36-6

- As reported in The Fresno Bee, CEMEX failed in its attempt to gain approval in Mexico of the blasting methods it wishes to deploy here. If CEMEX has provided information and independent studies associated with deep blast mining to the County, this information should be publicly shared. If it has not provided such information, then this should also be disclosed. Even if such information was forthcoming from Cemex, it would be helpful if the County staff would produce a White Paper about the risks associated with deep blast mining.

Response 36-6

The Draft EIR provides a detailed description of blasting techniques that would be used for mining hard rock associated with the project at Draft EIR pages 2-42 through 2-43 and explains blasting explosives storage and use at page 2-44. The Draft EIR as updated in the Final EIR evaluates potential impacts of blasting as relates to air pollutant emissions (see Appendix D-4, "Revised Section 4.3, Air Quality," as updated by this Final EIR), biological resources including salmon habitat (see Draft EIR Section 4.4, "Biological Resources"), fly rock (see Draft EIR Section 4.9, "Hazards and Hazardous Materials"), water quality (see Draft EIR Section 4.9 and Draft EIR Section 4.10, "Hydrology and Water Quality"), noise and vibration (see Draft EIR Section 4.13, "Noise"), and fire risk (see Draft EIR Section 4.20, "Wildfire").

Draft EIR Mitigation Measure 4.10-1 would require implementation of the Blasting Protocols identified in Final EIR Appendix H-9, "Revised Blasting Protocols," which details requirements for the implementation of a blast monitoring program that includes ground vibration measurements, air overpressure measurements, and visual inspections;

details the requirements for complaint response procedures, record keeping, and annual reporting of monitoring, complaints investigations, and corrective actions; and requires the Operator to develop an annual Blasting Plan that includes the proposed blasting designs for areas proposed for blasting each year. In addition, County staff shall monitor and verify, on a semi-annual basis, implementation of the Blasting Protocols throughout project operations.

The Draft EIR includes substantial evidence pertaining to the proposed project blasting methods and impact evaluations. The commenter does not explain why additional information on blasting or additional studies (e.g., a white paper, as recommended in the comment) are required for evaluation of the potential environmental effects of blasting.

Mexico's mining laws are not relevant and have no jurisdiction over the proposed project.

Comment 36-7

- With a proposal of this magnitude, the proponent and/or the County should provide video and audio simulations relating to deep blast mining methods, and the light, traffic, water, and air pollution and other effects from the Quarry and the proposed plant on the Parkway zone and on residents proximate to plant 2, and at various other distances from the site.

Response 36-7

As discussed in Response 36-6 above, the Draft EIR includes substantial evidence pertaining to the proposed project blasting methods and impact evaluations. The commenter does not explain why additional information or demonstration of anticipated blasting events (e.g., video and audio simulations as recommended in the comment) are required for evaluation of the potential environmental effects of blasting.

Comment 36-8

- The visual perspective of these simulations should not be based solely on current conditions, but also from a forward perspective which includes, among others, important trends like future projected residential growth of the area and the increases in hours and extent of operations.

Response 36-8

As discussed in Responses 36-6 and 36-7, above, the Draft EIR includes substantial evidence pertaining to the proposed project blasting methods and impact evaluations. Additionally, the Draft EIR evaluates potential cumulative effects of the project, including blasting, in Chapter 5, "Cumulative Impacts," in consideration of future

anticipated development within the project area (see Draft EIR Table 5-1, "List of Nearby Projects," and Figure 5-1, "Cumulative Projects") The commenter does not explain why additional information or demonstration of blasting events under future conditions is required for evaluation of the potential environmental effects of blasting.

Comment 36-9

- For decades now, the existing plant has been operating without an EIR. An extension was granted several years ago that ignored the changed conditions of the area even though changes in conditions is supposed to be at the heart of every extension given. The public deserves to know why the continuation of that plant should not be addressed prior to when the Quarry proposal and the Draft EIR are even considered.

Response 36-9

In July 2023, CEMEX received final approval from the Board of Supervisors for the extension of the CUPs. CEQA Guideline Section 15301 applied which provided a CEQA valid existing facilities exemption for the extension. This approval also considered that CEQA Guidelines Section 15162 did not apply as the extension was not subject to the preparation of a supplemental EIR.

As part of the extension approval, a Notice of Exemption was approved on July 20, 2023, covering both the Plant Site and Quarry Site, based in part on the existing physical conditions baseline. The extension of the CUPs allowed operations to continue so that the EIR for the Modification Project could be finalized (CEQA Guidelines Section 15061(b)(3); *North Coast Rivers Alliance v. Westlands Water Dist.* (2014) 227 Cal.App.4th 832, 872 – 873. ["Where a project involves ongoing operations or a continuation of past activity, the established levels of a particular use and the physical impacts thereof are considered to be part of the existing environmental baseline"]).

Thus, the existing site has been operating with a valid CEQA document. Please see Collective Response #2 pertaining to previous permit extensions and the relevance to the proposed project and environmental review process.

Comment 36-10

Again, an overlay of the conditions that exist now at site 1 versus those that existed decades ago would represent an objective approach to assessing if mining operation of ANY kind should be permitted in the river bottom.

Response 36-10

The Draft EIR properly evaluates the proposed project in consideration of the site conditions existing at the time of the Notice of Preparation, i.e. the environmental baseline, for the purpose of environmental review of the proposed project, in accordance with CEQA.

Comment 36-11

- The public hearing meetings need to be held at times that better accommodate public participation. When the Ball Ranch development was proposed, Supervisors like Sharon Levy, seemed to make it easier for multiple voices to be heard. Even prior to the hearings, Supervisors should make themselves available to hear comments and questions at a series of open public meetings.

Response 36-11

The suggestion in the comment regarding public hearing scheduling is noted. The comment does not address the adequacy of the Draft EIR and no further response is warranted.

Comment 36-12

- The governmental process used which resulted in Cemex obtaining its last extension raised the public's awareness of things that impact decision-making in the County. First, CEMEX has many more resources in terms of time and money at its disposal to communicate what it wants.

Response 36-12

The comment does not address the adequacy of the Draft EIR, and no further response is warranted. Please see Collective Response #2 pertaining to previously approved permits and extensions.

The commenter's position is noted and will be considered by County decision-makers during hearings on the project. There will be a public hearing on the project EIR, and all public commenters will have opportunity to be heard and considered by the County decision-makers (CEQA Guidelines Section 15202). Please see Collective Response #2 pertaining to previously approved permits and extensions.

Comment 36-13

Second, CEMEX served up payroll for less than 60 people as the only thing that mattered which had the effect of being

> dismissive the views of not only many other stakeholders, but also contradicted the principle of changed conditions which had implications for how the findings of the staff were treated. If that process and result is repeated in any form or function, then this entire EIR process should be viewed as an accommodation to a foreign company and that the real decisions were made in a dark room.

Response 36-13

The County prepared the Draft EIR and this Final EIR in compliance with CEQA requirements for evaluation and disclosure of potential environmental effects of the proposed project. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 36-14

2. EIR Flaws: In reviewing the EIR itself, there are two things that appear to be missing:

   - Oversight, Sanctions, Financial Reserves: CEMEX is requesting—among other things-- to use risky drilling methods, increase traffic, expand operating times, and for a 100- year period. This is such an overreach that it seems like a corporate strategy which aims very high with the expectation that negotiations could be characterized as give and take, and, seemingly, resulting in a compromise solution, when, in fact, getting the project through in just about any form and over any time frame is really the CEMEX objective.

Response 36-14

Potential environmental impacts of the project associated with mining methods, vehicle trips, hours of operation, and the duration of the requested use permit extensions are described and evaluated in the Draft EIR. The comment does not address the adequacy of the Draft EIR evaluation of these issues, and no further response is warranted.

Comment 36-15

> What is missing in the EIR is any systematic discussion of what happens if the current major assumptions and claims made by CEMEX prove wrong, or even if CEMEX just exhibits bad operational behavior.

Response 36-15

The Draft EIR evaluates potential environmental impacts of the project based on detailed technical evaluations and documentation of reasonably foreseeable physical changes in

the environment, in accordance with CEQA. Additionally, the Draft EIR identifies several mitigation measures that involve monitoring of site conditions and adaptive management actions based on future observed conditions (e.g., see Mitigation Measures 4.7-6, 4.7-7a, 4.7-7b, 4.7-7c, 4.10-1, 4.10-5a, 4.10-5b, 4.10-10a, 4.10-10b, 4.13-2, and 4.13-3,). Such adaptive mitigation measures would serve to address future conditions that may vary from those predicted or anticipated through the environmental analysis in the Draft EIR.

The comment does not explain or provide evidence of any instances in which assumptions or conclusions of the Draft EIR analyses are insufficient, and no further response is warranted.

Comment 36-16

> We view the omission of oversight as a very serious shortcoming. Planners may suggest that the EIR is not required to address this matter, but that has proven to be a very dangerous position to take. It this cannot be addressed directly in the EIR, then there should be a collateral document which does provide for oversight, sanctions, and financial reserves. The Draft EIR invites bad assumptions because there are no consequences for making them. There is no requirement for CEMEX to set aside annually a portion of its revenues. There is no provision for CEMEX to pay for inspectors; we must all rely on CEMEX's good faith that they will self-report and self-correct. There is no provision for sanctioning CEMEX if it violates operating tenets. The Draft EIR lacks common sense based on first, that things go wrong, and second, that the longer the perspective, the less valid are the assumptions underlying that perspective.

Response 36-16

See Response 36-15, above, for discussion of future conditions and adaptive mitigation. Please also see Collective Response #4b pertaining to liability and fund for potential damages. Mitigation measures adopted for the project would be incorporated to a Mitigation Monitoring and Reporting Program (MMRP) that would provide for County oversight to ensure implementation of adopted mitigation measures. Additionally, the Operator is responsible for reclamation of the project sites in accordance with the approved reclamation plan. Both Fresno County and the state Surface Mining and Reclamation Act (SMARA) require that surface mining operators maintain a financial assurance mechanism payable to the SMARA lead agency (here, Fresno County) and to the State of California sufficient to accomplish reclamation as prescribed by the surface mining operation's approved reclamation plan, including conditions of approval and

mitigation measures associated with reclamation. The Operator is required to annually prepare and submit for County review and approval a financial assurance cost estimate and evidence of a financial assurance mechanism in an amount at least equal to the cost estimate to ensure reclamation in accordance with the approved reclamation plan would be available in the event of the Operator's failure to reclaim the site in accordance with the approved reclamation plan.

Comment 36-17

> Ignoring oversight, sanctions, and financial reserves based on negotiations which reduce the timeline of the project would not resolve anything' in fact, that should be considered as somewhat of a red herring. Approval of the project in any form or timeline must still be viewed as generating risks and insecurity for the people of Fresno County.

Response 36-17

Please see Response 36-16, above, regarding oversight of mitigation and reclamation obligations.

Comment 36-18

> The degree of oversight, specifying violations which would generate sanctions (including work stoppages or a total closure), and the amount of reserves that should be very high on the list of the County's responsibilities and should not be ignored or even delayed. Considering the project as it is now proposed, nothing today in the Friant corridor or north Fresno or across the river in Madera or in downturn Fresno is likely to look exactly like it does today 100 years from now, and everyone involved will be gone in 100 years.

Response 36-18

See Response 36-16, above, regarding oversight of mitigation and reclamation obligations.

Comment 36-19

- Taken as a whole, the quarry project is a completely different project than the current project. The proposed project is not simply an extension of current operations and simply moving these to a different site.

  The Draft EIR should, at least, contain a discussion that the current operations have existed for decades without an EIR and have been extended. It should point out that the staff

analysis regarding the changed conditions in the areas--even though changed conditions in the given area are supposed to be the basis for extending or denying operations in the river bottom – was effectively ignored.

Response 36-19

The proposed project is an extension and a modification of existing operations. See Response 36-9 above. See also Collective Response #2 pertaining to previously approved permits and extensions. As discussed in Response 36-10, above, the Draft EIR properly evaluates the proposed project in consideration of the existing site conditions and activities which represent the environmental baseline for the purpose of environmental review of the proposed project. The comment does not address the adequacy of the existing conditions environmental baseline used in the Draft EIR, nor does the comment explain how considering past conditions is required for evaluation of the proposed project.

Comment 36-20

It should also discuss changed conditions around site 2 as well. As will be discussed later, the existence of the River Parkway alone represents a major change in area conditions.

This discussion in the EIR will set the record straight and would resolve a basic question about the legitimacy of the Draft EIR process. Before this Draft EIR is even considered, should a question be put to the Planning Staff and the public which asks whether ANY industrial operation is compatible with respect to the conditions extant in north Fresno, Friant Road, and river corridor, and which, of course, considers the current and future growth prospects and the plans for the River Parkway?

Response 36-20

See Collective Response #2 pertaining to previously approved permits and extensions. As discussed in Response 36-10 above, the Draft EIR properly evaluates the proposed project in consideration of the existing site conditions and activities, i.e. the CEQA baseline, for the purpose of analyzing the project's potential environmental impacts. With regards to the commenter's concerns with the proposed project's compatibility with the San Joaquin River Parkway, Draft EIR Section 4.11, "Land Use and Planning," analyzes the proposed project's compatibility with the goals and policies set forth in the San Joaquin River Parkway Master Plan (Draft EIR page 4.11-44). The Operator is a longtime neighboring landowner to several properties that are a part of the San Joaquin River Parkway and would continue to support and assist with Parkway goals, policies, and

operations (see Draft EIR page 4.11-44). County decision-makers will assess whether to approve the proposed project based on information in the EIR and factors including compatibility between the proposed project and existing and anticipated future conditions within the project area.

Comment 36-21

Part B: Comments Relating to Environmental Issues

Most of our comments are going to relate to untrue statements or implied claims made by Cemex, or the insufficiency of mitigation, or that the assumptions about cause and effect related to a particular issue are too speculative to be relied upon.

1. CEMEX claims that the Quarry and Plant Site 2 is an "extension" of its current aggregate surface mining operations and its current plant at Willow and Friant.

   Comment: This is untrue.

   The project utilizes vastly different methods, is not surface mining, and has much larger environmental impacts.

Response 36-21

Draft EIR Chapter 2, "Project Description," provides a detailed description of the proposed project, including discussion of existing and proposed operations and reclamation within the two project areas – the Quarry Site and Plant Site. Proposed mining methods, processing methods, and reclamation activities and reclaimed conditions at both sites are discussed sufficiently for disclosure and to inform the environmental analysis in the Draft EIR. Please refer to Response 58-5 for further discussion of the definition of surface mining. The comment does not discuss or provide evidence of any incorrect information nor does the comment discuss or provide evidence of "much larger environmental impacts" in comparison to the impact evaluations and conclusions in the Draft EIR.

Comment 36-22

2. The Conditional Use Applications are a continuation and modification of its current mining and processing operations.

   Comment: This statement is somewhat misleading.

   The current method of mining is not the planned method. Also, the current uses are not based on an approved EIR and, thus, the conceptualization of an application for continuing and

modifying current operations that is not supported by an EIR is a false proposition.

Response 36-22

See Response 36-21 pertaining to the Draft EIR project description and evaluations. The Draft EIR provides a clear description of proposed mining methods, processing, and reclamation under the proposed project in Draft EIR Chapter 2.

The Draft EIR addresses the concern regarding the need for an EIR for the project. As described in the Draft EIR, the project proposes to modify the method of mining and processing at the sites (see Draft EIR, pages 2-3 through 2-4 and 2-29 through 2-44). The Draft EIR has been prepared with a sufficient degree of analysis to provide decision-makers with the information needed for evaluation and review of environmental impacts (see CEQA Guidelines Sections 15151 and 15124).

The existing operations for both the Plant Site and Quarry Site are originally covered by an EIR that was certified on July 28, 1987. As also explained in Response 36-9 above, the 2023 extension was approved via a CEQA Notice of Exemption on July 20, 2023, covering both the Plant Site and the Quarry Site, and taking into consideration the existing physical conditions baseline. (CEQA Guidelines Section. 15061(b)(3); *North Coast Rivers Alliance v. Westlands Water Dist.* (2014) 227 Cal.App.4th 832, 872 – 873). Thus, the current operations are appropriately supported by the required CEQA documents.

Moreover, the purpose of the Draft EIR is to evaluate the potential effects of the proposed project compared to the conditions existing at the time of the Notice of Preparation (i.e. the CEQA baseline). Because the comment does not address the adequacy of the analyses of significant environmental impacts in the Draft EIR, no further response to this comment is required.

Comment 36-23

3. Cemex wants to obtain a conditional use permit for 100 years.

   Comment: This time period represents a gross over-reach and calls into question the basic assumptions and claims of mitigation into question. This period represents such a mismatch with respect to business and economic cycles that plans and risk assessment which utilize this time period should be viewed as speculative and, therefore, unreliable.

   It is a commonly accepted principle of planning, and associated attempts to forecast outcomes and consequences of plans, that the longer time period assigned to the forecast,

the less accurate the current assumptions and conclusions become.

The corollary of that principle is that long-term forecasts are inherently riskier than shorter ones.

When rooted in the concept of considering changing conditions which serves as one of the core principles to be applied to a project approval or extension, the Cemex project contradicts this principle. Instead, it serves to improperly instruct the reviewer to abandon consideration of changing conditions to put a private company's benefit in its place.

Response 36-23

Please see Response 36-21 pertaining to the Draft EIR project description and evaluations. See also Response 58-5 regarding the definition of surface mining. The comment does not address the adequacy of the Draft EIR, and no further response is required.

Comment 36-24

4. CEMEX wants approval to blast a 600-foot deep hole in the land in the San Joaquin River bottom for hard rock mining.

   (Note: We do not have direct experience in hard rock mining with blasting; however, Dr. Penbera is drawing on experience with lateral well drilling in hard rock formations).

   Comment: The use of blasting in hard rock mining (sometimes called deep-rock mining), presents significant, unpredictable risks to humans, inanimate objects (like structures, equipment and machinery), and the environment, including other forms of life.

   The following environmental impacts regarding hard rock mining are not sufficiently considered or mitigated in the EIR. Assumptions made in the context of hard rock mining and over a 100-year time frame do not appear to have been empirically tested.

   - Destruction of habitats

Response 36-24

Section 4.4 of the Draft EIR provides an analysis of the potential for the project to adversely affect sensitive biological resources. The commenter does not provide substantial evidence that the project would result in significant impacts to biological resources.

Blasting impacts upon biological resources, including habitats, are analyzed in Section 4.4 of the Draft EIR. With regard to the project's potential impacts to habitats, the proposed blasting activities would be brief and would occur within the existing quarry pit, which is already disturbed by approximately 30 years of continuous mining operations. A typical blasting event would occur for approximately one to two seconds. As such, the proposed blasting would not significantly impact surrounding habitats.

Blasting activities would be conducted in accordance with detailed Blasting Protocols and supporting technical analyses, including the Blast Impact Analysis and Blasting Effects on San Joaquin River Embankments (Draft EIR Appendix H-3, "Blast Impact Analysis," and Appendix H-4, "Blasting Effects on San Joaquin River Embankments"). These analyses evaluate potential groundborne vibration and air overpressure and conclude that blasting would not result in adverse effects on surrounding structures, the San Joaquin River, or adjacent habitats. Mitigation Measure 4.10-1, requires monitoring and control of blasting activities to ensure impacts remain less than significant.

Accordingly, no additional assessment beyond what has already been conducted in the Draft EIR is required.

Comment 36-25

- Preservation of river bottom parkway trail connectivity

Response 36-25

The proposed blasting is not expected to interfere with future trail connectivity. Please see Collective Response #22 pertaining to trail connectivity.

Comment 36-26

- Above ground level energy bursts

Response 36-26

As discussed in Responses 36-6 and 36-24 above, the Draft EIR includes substantial evidence regarding the proposed project's blasting methods and associated impact evaluations. It is unclear what the commenter means by an "above ground level energy burst." However, blasting impacts and thresholds for groundborne vibration and air overpressure are discussed in Section 4.13 of the Draft EIR.

The Surface Mining and Reclamation Plan, Blast Impact Analysis, and Blasting Effects on San Joaquin River Embankments (Draft EIR Appendices B-1, " Surface Mining and Reclamation Plan," Appendix H-3, and Appendix H-4, respectively) describe the

extraction methods, use of explosives, and potential effects on slope stability and nearby resources.

Blast designs would be adjusted based on the distance to the nearest receptors to ensure that applicable vibration and air overpressure criteria are not exceeded. The analyses conclude that the Quarry Site can be developed without adverse effects on surrounding structures or residences from groundborne vibration or air overpressure. Pursuant to Mitigation Measure 4.10-1, the project would implement Blasting Protocols that include monitoring, control, and reporting requirements for blasting-related effects. In addition, best practices would be implemented to control and reduce potential impacts from flyrock. With implementation of these measures, impacts would be less than significant.

Comment 36-27

- Fracturing of ground level rock

Response 36-27

As discussed in Responses 36-6 and 36-24 above, the Draft EIR includes substantial evidence regarding the proposed project's blasting methods and associated impact evaluations. The comment does not provide factual evidence to support the assertion that the Draft EIR's analysis of vibration or geology and soils is insufficient.

Blast designs would be adjusted based on the distance to the nearest receptors to ensure that applicable vibration and air overpressure criteria are not exceeded. The analyses conclude that the Quarry Site can be developed without adverse effects on surrounding structures or residences from groundborne vibration or air overpressure. Pursuant to Mitigation Measure 4.10-1, the project would implement Blasting Protocols, including monitoring, control, and reporting requirements for blasting-related impacts.

Additional analysis of site geology, including foliation and fracture characteristics, is provided in the Geological and Geotechnical Assessment (see Draft EIR Appendix F, "Geology and Soils Report"). See Section 4.7, "Geology and Soils," for further discussion of geology impacts. With implementation of these measures and based on the supporting analyses, impacts would be less than significant, and no further analysis is required.

Comment 36-28

- Fracturing and caving in of blast area walls

Response 36-28

As discussed in Response 36-6 above, the Draft EIR includes substantial evidence pertaining to the proposed project blasting methods and impact evaluations. See also

Response 36-24, which provides an overview of the Draft EIR's evaluation of blasting impacts. The Draft EIR addresses slope stability of the quarry pit walls in Section 4.7. Please refer to Impact 4.7-7 regarding the potential for slope stability to occur at the Quarry Site (see Draft EIR page 4.7-32). The Quarry Site Geotechnical Memorandum (included as Appendix F-3 to the Draft EIR) included a slope stability analysis that determined that the potential of the proposed project to result in overall slope instability is low and that, with Mitigation Measure 4.7-7a, 4.7-7b, and 4.7-7c, potential risks of slope instability at the Quarry Site would be reduced to less than significant (see Draft EIR page 4.7-37). Additionally, Mitigation Measures 4.7-7b and 4.7-7c would require field observations and surveys mapping kinematic conditions, operational activities, water seepage and groundwater conditions, and failure potential assessments to minimize impacts on slope stability in the project vicinity.

The comment provides no factual evidence to support its assertion that the Draft EIR's analysis of slope stability is insufficient. Thus, no further response is required.

Comment 36-29

- Release of blast energy and seismic waves weakening rock stability, based on topography, at distances beyond the plant site

Response 36-29

As discussed in Response 36-6 above, the Draft EIR includes substantial evidence regarding the proposed project's blasting methods and associated impact evaluations. Blasting would occur at the Quarry Site and would not occur at the Plant Site.

Drilling and blasting are methods that would be used for mining hard rock at the project's Quarry Site. The Surface Mining and Reclamation Plan, Blast Impact Analysis, and Blasting Effects on San Joaquin River Embankments (Draft EIR Appendices B-1, H-3, and H-4, respectively) describe the extraction methods, use of explosives, and slope stability impacts associated with blasting activities. Blast designs would be adjusted based on the distance to the nearest receptors to ensure that applicable vibration and air overpressure criteria are not exceeded. The analyses conclude that the Quarry Site can be developed without adverse effects on surrounding structures or residences from groundborne vibration or air overpressure. Pursuant to Mitigation Measure 4.10-1, the project would implement Blasting Protocols, including monitoring, control, and reporting requirements for blasting-related effects.

As discussed in Section 4.13, seismic attenuation is the rate at which ground vibration amplitude decreases as it propagates away from the blast location (Draft EIR page 4.13-

9). This process results in almost all of the ground vibration energy being dissipated within the Quarry Site, with limited remaining energy that may produce perceptible vibrations at some distance. Seismographs are used to measure vibrations and ensure that applicable thresholds are not exceeded. Potential impacts related to groundborne and airborne vibration are further evaluated in Impact 4.13-6 (Draft EIR pages 4.13-65 through 4.13-67).

The comment does not provide factual evidence to support the assertion that blasting would result in significant impacts.

Comment 36-30

- Noise abatement and open noise carry and reverberation

Response 36-30

As discussed in Responses 36-6 and 36-24 above, the Draft EIR includes substantial evidence regarding the proposed project's blasting methods and associated impact evaluations, including evaluation of noise and vibration impacts as discussed in Section 4.13, "Noise."

It is not clear to which specific component of the Draft EIR the comment refers; however, sound propagation and reverberation are addressed in the noise analysis. Sound may travel more freely in open areas without intervening shielding or vegetation, and reverberation may occur where sound is generated within more confined spaces, such as the quarry pit. The noise analysis prepared for the project considered these factors affecting sound propagation between project noise sources and nearby sensitive receptors (see Draft EIR Appendix H-1).

Where the analysis determined that there is potential for exceedance of Fresno County noise standards or a substantial increase in ambient noise levels, potentially significant impacts were identified, and mitigation measures were specified. These include Mitigation Measures 4.13-2 and 4.13-3, which require implementation of noise reduction measures and monitoring to ensure effectiveness.

The comment does not provide factual evidence that the Draft EIR's analysis of noise or vibration is insufficient.

Comment 36-31

- Leaking of chemicals and explosive charge materials into groundwater

Response 36-31

As discussed in Responses 36-6 and 36-24 above, the Draft EIR includes substantial evidence regarding the proposed project's blasting methods and associated impact evaluations, including evaluation of potential water quality impacts in Section 4.9 and Section 4.10.

The potential for chemicals related to blasting agents to affect groundwater quality is addressed in the analysis of Impact 4.10-1 (Draft EIR, pages 4.10-88 through 4.10-92) and Impact 4.10-6 (Draft EIR, pages 4.10-98 through 4.10-100). The discussion for Impact 4.10-6 cites several studies evaluating the effects of blasting on groundwater (Draft EIR, page 4.10-100).

Mitigation Measure 4.10-1, including the Blasting Protocols provided in Appendix H-5 of the Draft EIR, includes measures and monitoring requirements to prevent impacts to groundwater quality associated with blasting activities.

See also Responses 20-8, 22-8, 35-8, 38-8, and 64-8.

Comment 36-32

- Water contamination from rock fracturing and acid leeching into area wells used by humans and livestock

Response 36-32

The water quality analysis presented in Section 4.10 of the Draft EIR, and related Appendices G-3, G-4, and G-5 do not indicate any potential for the presence of acidic conditions in the weathered rock and hard rock as a result of mining activities (Draft EIR pages 4.10-88 through 4.10-89). The potential for chemicals related to blasting agents to contaminate groundwater is addressed in the analysis of Impact 4.10-1 and 4.10-6. The discussion of Impact 4.10-6 in particular cites several studies that evaluate the effects of blasting on groundwater. Mitigation Measure 4.10-1, including the Blasting Protocols provided in Appendix H-5 of the Draft EIR, provides appropriate mitigation measures and related monitoring to prevent impacts to groundwater quality.

Also see Responses 20-8, 22-8, 35-8, 38-8, and 64-8.

Comment 36-33

- Dust and rock and other particulate matter diffusion into the air

Response 36-33

As discussed in Responses 36-6 and 36-24 above, the Draft EIR includes substantial evidence regarding the proposed project's blasting methods and associated impact evaluations, including evaluation of potential air quality impacts. See Appendix D-4, "Revised Section 4.3, Air Quality." See also Collective Responses #6 and #9 pertaining to common nuisance complaints on mining operations and the project's potential impact on air quality, respectively.

The Draft EIR quantifies particulate matter impacts associated with the project, which are determined to be less than significant after mitigation (Appendix D-4, Section 4.3.4).

Comment 36-34

- Loss of asset value of properties proximate to the quarry and plant

Response 36-34

Please see Collective Response #7 for discussion of economic effects and property values.

Comment 36-35

- Long-term health issues and risks associated with air or water contamination

Response 36-35

As discussed in Responses 36-6 and 36-24 above, the Draft EIR as updated by the Final EIR includes substantial evidence regarding the proposed project's blasting methods and associated impact evaluations, including evaluation of potential health risks associated with air and water quality in Section 4.10, as updated by the Final EIR (see Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10 and Appendix D-4, "Revised Section 4.3, Air Quality").

A Health Risk Assessment (HRA) was performed and includes a multi-pathway analysis to ensure that the dose received by receptors from air and other media to which they may be exposed is properly evaluated. The HRA determined that impacts would be less than significant before and after mitigation (see Final EIR, Appendices D-3 and D-4, for additional information).

The comment does not provide additional evidence regarding potential health risks associated with air or water quality impacts.

Comment 36-36

- Fumes emanating from blasting, equipment machinery, trucks and traffic

Response 36-36

As discussed in Responses 36-6 and 36-24 above, the Draft EIR includes substantial evidence regarding the proposed project's blasting methods and associated impact evaluations, including evaluation of potential air quality impacts in Appendix D-4. The air quality analysis also evaluates emissions associated with operational equipment and vehicles, including trucks and other on- and off-site traffic.

The Draft EIR, as updated by this Final EIR, quantifies particulate matter and gaseous pollutant emissions associated with blasting, equipment, and vehicle activity, and concludes that these impacts would be less than significant after mitigation (see Impact 4.3-2).

Comment 36-37

- Light pollution effects on habitat and on residents proximate to the quarry

Response 36-37

The Draft EIR discusses existing and proposed project lighting with both the Plant Site (Draft EIR page 2-35) and Quarry Site (Draft EIR pages 2-40 and 2-41). Potential light and glare impacts of the proposed project are evaluated under Impact 4.1-4 (Draft EIR pages 4.1-62 through 4.1-64) and potential lighting impacts of the project on biological resources (e.g., special-status species and their habitat) are evaluated under Impact 4.4-3 (Draft EIR pages 4.4-52 and 4.4-53) and Impact 4.4-4 (Draft EIR pages 4.4-53 through 4.4-55).

Comment 36-38

5. Cemex wants to move open pit mining operations to what it is calling a quarry site and shut down its current processing site. This implies some mitigation effect by shutting one site and moving to another.

   Comment. The implication is untrue. The EIR does not adequately compare the effects of operations on the current site to the new site. As such, it does not directly address the massive increase in the scale of operations that will occur at the quarry site, and along the Friant Road corridor.

   Viewing project site 2 as merely an extension of current operations is misleading. Cemex wants to more than double

rock production to 3 million metric tons annually, double the amount of direct and collateral truck trips, expand operating hours, and move all of its operations which brings a massive amount of buildings and equipment to site 2.

Response 36-38

The commenter is confused about the nature of existing operations at the Quarry and Plant sites. Quarrying has occurred on both the Plant Site and the Quarry Site for decades. As such, the Draft EIR properly evaluates the potential environmental impacts of the proposed project as compared to the existing conditions of both the Plant and Quarry sites, in accordance with CEQA.

Draft EIR Chapter 2 provides a detailed description of the proposed project, including discussion of existing and proposed operations and reclamation within the two project areas – the Quarry Site and Plant Site. Proposed mining methods, processing methods, and reclamation activities and reclaimed conditions at both sites are discussed sufficiently for disclosure and to inform the environmental analysis in the Draft EIR. To clarify, the Draft EIR includes a detailed analysis of impacts associated with increasing production and introducing blasting at the Quarry Site.

The comment states that future closure of the Plant Site "implies some mitigation effect" and the comment then states that "the implication is untrue." The Draft EIR does not consider closure of the Plant Site to be mitigation; rather, the Draft EIR evaluates the impacts of the proposed continued operations at the Plant Site until such time as Plant Site operations cease and the site is reclaimed. The comment asserts that the project does not adequately address the scale of operations; however, the comment does not discuss or provide evidence of any incorrect information in the Draft EIR nor does the comment discuss or provide evidence that the impact evaluations and conclusions in the Draft EIR are inadequate. Thus, no further response is warranted.

Comment 36-39

6. The effects of the Quarry site with respect to impacts on existing residential areas and planned growth areas, and effects of increased Fraint Road traffic, have been properly assessed, are not material, and can be sufficiently mitigated.

   Comment: This claim is --either by fact or implication --not true.

   Friant Road represents a major residential growth corridor. Major new residential construction includes hundreds of

residences at Copper River. Friant Rd. joins with Willow Ave. and to major residential developments in all directions along Willow. Fraint Road leads to major residential developments occurring around and above Friant Dam and Millerton Dam. There are 13 houses directly across Friant Road facing the site. There are 2 residences on the same side of Friant close to the Quarry site.

Friant Road is the main traffic artery along the River Parkway and leads from Woodward Park entrances and a growing retail area at Audubon to new residential and commercial areas as well as to route 41. The newly opened Table Mountain Casino has materially increased traffic. Friant Rd. leads to the Millerton Lake recreation area which has experienced great demand and to new developments on 145.

The number of accidents and damages caused by debris on Friant Road has increased significantly over the last 10 years.

In terms of changing conditions and growth, the Quarry site would be placed on one of Fresno's highest growth corridors and a main artery for transit of residents and visitors.

Industrial operations should be regarded as among the most unsuitable and incompatible activities for such corridors.

Response 36-39

The Draft EIR evaluates potential impacts of the proposed project on surrounding areas and evaluates potential transportation impacts associated with the project including project-related vehicle trips on Friant Road and other area roads (see Draft EIR Section 4.17). The Draft EIR transportation impact evaluation considers traffic and road conditions under existing conditions with the project and future conditions with the project and anticipated increases in regional trips and evaluates vehicle miles traveled (VMT), road conditions, potential hazards associated with project vehicles, and emergency access to the project sites (see Draft EIR Impacts 4.17-1 through 4.17-4 on Draft EIR pages 4.17-27 through 4.17-42). Additionally, please see Collective Response #29 pertaining to traffic impacts and road improvements and Collective Response #30 pertaining to traffic safety and road damage. The comment does not address the adequacy of the Draft EIR transportation evaluation, and no further response is warranted.

Comment 36-40

C. The River Parkway: A Much Better Choice

The direct and indirect impacts on the River Parkway are not the focus of the EIR. Although this is a seemingly neutral statement, the reality is that there is only an EIR under review because Cemex wants to plunk an industrial operation right down in the middle of the River Parkway.

The EIR process is of little value if one does not appreciate the extent to which Cemex's corporate interests conflict with the River Parkway and good planning. Cemex's proposal clearly conflicts with the peace and serenity of the bordering Ledger Island Nature Reserve and the Beck Ranch Nature Reserve, as well as adjacent and proximate ag land and private homes. While other rock operations have been good citizens in terms of avoiding such conflicts by locating their operations away from the river corridor, river bottom, and the Parkway, CEMEX has proposed a project that is so risky in it approach and so grandiose in its scale that it virtually disregards what the River Parkway is and represents.

The San Joaquin River Parkway is a 23-mile stretch of land along the San Joaquin River which is the 3rd longest river in California. The Parkway came into existence through certain core values that we should encourage in our children: preservation and public stewardship of various natural habits and open space, supporting the work and perseverance of volunteers and the entire community in gathering the land, getting influential and enlightened business and public leaders to share the vision of creating a place for all, and securing the resources to put it all together. This job is not done. The Parkway is developing further through its professional staff, Board and volunteers who work diligently towards educating and involving the public through events held at the Hallowell Center (about 3 miles from the quarry site), and in public buildings and in private homes.

The Parkway embodies all that is good and hopeful about Fresno. It represents one of our area's greatest (if not the greatest) most recognizable and patronized local natural asset. We know this because it is a point of interest that brings people together from all walks of life from dawn to dusk. Families from all cultures hold events there. Bicyclists often comment about how much they enjoy the "nature ride" on Friant Road from Woodward Park to Millerton Lake. During Covid, the Parkway proved to be a haven for children and families. We are hopeful that the Planning Department staff will see that the CEMEX project ---no matter how

one tries to dress it up-- is not only dismissive of responsible planning, but it is also an attack on the public interest.

We are aware that attempts may be made to pigeonhole public comments as being either for or against business and jobs. We are by no means anti-business people and we are not novices in creating jobs. When it comes right down to it, were it not for the Draft EIR, it would be unimaginable that some foreign company would even suggest putting an industrial project of the kind and magnitude that Cemex has proposed in the river bottom. Fresno deserves better. And the best way for us to get better is to preserve and protect the great natural asset that we have. The Parkway enhances the quality of life for virtually all people of our area. And that, in the end, holds the greatest attraction for people to come to live and work here.

Response 36-40

The concerns and preferences explained in the comment are noted and will be considered by the decision-makers. Please see Collective Response #18 pertaining to the project's consistency with the San Joaquin River Parkway Master Plan. To comply with CEQA, the County's EIR must evaluate the project as proposed based on the entitlements requested by the Operator. Thus, the Draft EIR "Project Description" reflects the requested entitlements and the evaluation in the Draft EIR appropriately evaluates potential effects of the proposed project.

Letter #37 February 25, 2025, Juan Serrano, Jim Crawford Construction

Comment 37-1

On behalf of Jim Crawford Construction Co., Inc., I am writing in support of Cemex's Rockfield Quarry Modification Project.

I have been working with Cemex personnel for over 30 years. Cemex has been one of our main suppliers of aggregates in the Fresno Metropolitan area for many projects throughout the years. Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region.

Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, and would contribute to existing traffic congestion. According to the Department of Conservation, transportation costs alone can increase 22 cents per ton for every additional mile traveled. Consequently, these higher construction costs are passed on to businesses, homeowners and county taxpayers.

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Importantly, Cemex's proposed modification plan also includes considerable resources for wildlife and habitat protection, 470 acres of open space with riparian areas, ponds, lakes, and native vegetation, and an easement for the Parkway Plan to expand the existing pedestrian and bicycle trail along the San Joaquin River that will benefit the local community.

Cemex has developed a constructive and thoughtful plan that serves the region's building, water, environmental and recreational needs, while remaining committed to being a good corporate citizen and responsible neighbor.

Thank you for recognizing the benefits of having a quarry located in your community.

Response 37-1

The commenter's support for the proposed project is noted for the consideration of the decision-makers.

Letter #38 February 26, 2025, Marvin Hoogendam, Fresno Fly Fishers for Conservation

Comment 38-1

As a member of Fresno Fly Fishers for Conservation and a concerned resident of Fresno County, I am writing to express my deep opposition to the CEMEX proposal that would extend commercial mining operations on the banks of the San Joaquin River for the next 100 years.

Response 38-1

See Response 20-1.

Comment 38-2

This area is one of the most spectacular parcels of land in the region, yet public access remains extremely limited. Instead of prioritizing conservation and community use, this agreement would extend private and commercial restrictions, preventing generations of Fresno County residents from enjoying this vital natural resource.

Response 38-2

See Response 20-2.

Comment 38-3

I am particularly concerned about the expedited approval process for this 100-year commitment. The brief public comment period, which ends on March 10th is far too little time for Fresno County residents to learn about the project's consequences. A project of this magnitude demands thorough consideration, not a rushed decision that will impact future generations.

Response 38-3

See Response 20-3.

Comment 38-4

The environmental consequences of this project cannot be ignored. The California Department of Fish and Wildlife (CDFW) has made significant strides in reintroducing salmon to the San Joaquin River, yet this mining operation could jeopardize these efforts.

Response 38-4

See Response 20-4.

Comment 38-5

The increased truck traffic, potential river pollution and habitat destruction would be devastating for local wildlife.

Response 38-5

See Response 20-5.

Comment 38-6

Fracking and blasting a 600-foot mine so close to the river could lead to accidental discharges, seepage, and contamination of the

surrounding water table endangering both aquatic ecosystems and local wells.

Response 38-6

See Response 20-6.

Comment 38-7

Beyond the environmental harm, this project poses economic concerns. CEMEX, a foreign-owned LLC, is granted limited liability by design, meaning if damages occur, there may be little accountability.

Response 38-7

See Response 20-7.

Comment 38-8

Moreover, the current agreement lacks measurable performance oversight, and

Response 38-8

See Response 22-8.

Comment 38-9

reports indicate repeated violations of work schedules and environmental standards.

Response 38-9

See Response 20-9.

Comment 38-10

The increased truck traffic alone—up to 1,000 trucks per day will degrade our roads and impact local residents, with little assurance that CEMEX will be held responsible for the consequences.

Response 38-10

See Response 20-10.

Comment 38-11

Fresno County deserves better. Rather than approving a destructive mining operation, this land should be preserved and made accessible to the public. A park or conservation area would not only protect the environment but could also generate long-term revenue through

recreation, tourism, and sustainable business opportunities. A private mine will only benefit a foreign corporation, while our community bears the long-term costs.

Response 38-11

See Response 20-11.

Comment 38-12

I urge you to reconsider this agreement and advocate for a better future for Fresno County. Our community has the right to more input and a greater say in how this land is used. Please extend the public comment period and conduct a thorough review of the environmental and economic impacts before making a decision that will affect our region for the next century.

Response 38-12

See Response 20-12.

Letter #39 February 27, 2025, Rob Chapman, B&B Surplus, Inc.

Comment 39-1

On behalf of B&B SURPLUS, I am writing in support of Cemex's Rockfield Quarry Modification Project.

Cemex has been one of our main suppliers of aggregates in the Fresno Metropolitan area for many projects throughout the years. Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. Response 44-2

See Response 20-2.

Comment 44-3

I am particularly concerned about the expedited approval process for this 100-year commitment. The brief public comment period, which ends on March 10th is far too little time for Fresno County residents to learn about the project's consequences. A project of this magnitude demands thorough consideration, not a rushed decision that will impact future generations.

Response 44-3

See Response 20-3.

Comment 44-4

The environmental consequences of this project cannot be ignored. The California Department of Fish and Wildlife (CDFW) has made significant strides in reintroducing salmon to the San Joaquin River, yet this mining operation could jeopardize these efforts.

Response 44-4

See Response 20-4.

Comment 44-5

The increased truck traffic, potential river pollution and habitat destruction would be devastating for local wildlife.

Response 44-5

See Response 20-5.

Comment 44-6

Fracking and blasting a 600-foot mine so close to the river could lead to accidental discharges, seepage, and contamination of the surrounding water table endangering both aquatic ecosystems and local wells.

Response 44-6

See Response 20-6.

Comment 44-7

Beyond the environmental harm, this project poses economic concerns. CEMEX, a foreign-owned LLC, is granted limited liability by design, meaning if damages occur, there may be little accountability.

Response 44-7

See Response 20-7.

Comment 44-8

Moreover, the current agreement lacks measurable performance oversight, and

Response 44-8

See Response 20-8.

Comment 44-9

reports indicate repeated violations of work schedules and environmental standards.

Response 44-9

See Response 20-9.

Comment 44-10

The increased truck traffic alone—up to 1,000 trucks per day will degrade our roads and impact local residents, with little assurance that CEMEX will be held responsible for the consequences.

Response 44-10

See Response 20-10.

Comment 44-11

Fresno County deserves better. Rather than approving a destructive mining operation, this land should be preserved and made accessible to the public. A park or conservation area would not only protect the environment but could also generate long-term revenue through recreation, tourism, and sustainable business opportunities. A private mine will only benefit a foreign corporation, while our community bears the long-term costs.

Response 44-11

See Response 20-11.

Comment 44-12

I urge you to reconsider this agreement and advocate for a better future for Fresno County. Our community has the right to more input and a greater say in how this land is used. Please extend the public comment period and conduct a thorough review of the environmental and economic impacts before making a decision that will affect our region for the next century.

Response 44-12

See Response 20-12.

Letter #45 March 2, 2025, Donna Mackiewicz, Redbud Audubon Society

Comment 45-1

We are writing to formally express our opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project.

The Environmental Impact Report (EIR) fails to adequately address key concerns including air quality, water impacts, and threats to local bird populations such as the endangered Tricolored Blackbird.

We request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Response 45-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential air quality impacts are addressed in Appendix D-4, "Revised Section 4.3, Air Quality." The Draft EIR addresses potential water impacts in Section 4.4, "Biological Resources" (wetlands), Section 4.10, "Hydrology and Water Quality" (water quality, groundwater, flooding hazards), and Section 4.19, "Utilities and Service Systems" (water supply and infrastructure). The Draft EIR addresses potential impacts to special status and migratory bird species in Section 4.4, Section 4.4.1.5, "Nesting Birds," on page 4.4-18 and addresses potential impacts to tricolored blackbird in Section 4.4.1.8, "Special-Status Biological Resources," on page 4.4-37. As shown in Draft EIR Table 4.4-1, "Special-Status Wildlife Species," on page 4.4-25, it was determined that there is low potential for tricolored blackbird on both project sites. Mitigation Measure 4.4-1c is provided on Draft EIR page 4.4-50 and requires the implementation of pre-construction surveys for nesting birds, including raptors, prior to the initiation of each mining phase. See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See also Collective Response #15 for further discussion of the project's potential impacts to bird species.

Letter #46 March 5, 2025, Bart Jones, JWT Site Management

Comment 46-1

It is my pleasure to write a letter in support of Cemex's Rockfield Quarry Modification Project.

As a contractor, I have worked with Cemex for many years and have found them reliable and efficient to work with. Their leadership in health and safety and attention to environmental needs are exceptional.

As the county and city grow continue to grow and demand for construction aggregate rises, it would benefit Fresno County to supply this demand locally instead of sourcing from outside of the area. By using a local company, we can reduce transportation costs, product prices and greenhouse gas emissions. It also provides more local job opportunities. Cemex will help meet the future demands for our area thoughtfully and responsibly.

In conclusion, I fully support CEMEX's modification plan for the Rockfield Quarry. This venture will be exciting and beneficial for local contractors such as myself, as well as the local community's development.

Response 46-1

The commenter's support for the proposed project is noted for the consideration of the decision-makers.

Letter #47 March 5, 2025, Garrett Jones, Material Movers, Inc.

Comment 47-1

It is my pleasure to write a letter in support of Cemex's Rockfield Quarry Modification Project.

I have worked with Cemex for many years. They work closely with their contractors to make sure everything runs smoothly at their jobsites, their leadership in safety, health and environmental are excellent.

As the county and city grow simultaneously, Cemex's Rockfield Quarry Modification Project will help meet the future demands for our area. It will also reduce traveling long distances to receive product and local companies will save time and money with this facility being located close by.

In conclusion, I fully support CEMEX's modification plan for the Rockfield Quarry. This venture will be exciting and beneficial for local contractors such as myself, as well as the local communities.

Response 47-1

The commenter's support for the proposed project is noted for the consideration of the decision-makers.

Letter #48 March 5, 2025,Janae McCarthy, Xerces Society, Inc.

Comment 48-1

I am writing to strongly oppose Cemex and provide a summary of key environmental impact findings. After reviewing the document, it is clear that the project poses significant risks to water availability, water quality, air quality, recreation, and land use planning that have not been adequately addressed. Below, I have outlined specific areas where the DEIR falls short, and I urge you to reconsider this project in its entirety.

Response 48-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. This is an introductory comment that does not address the adequacy of the Draft EIR. No further response is warranted. See responses below that address specific issues raised in this comment letter.

Comment 48-2

Water Availability and Quality (Section 4.10)

The DEIR fails to sufficiently account for the significant impacts the Rockfield Modification Project will have on **water resources, particularly groundwater levels.** According to **Impact 4.10-12,** the project has the potential to **substantially decrease groundwater levels** in a manner that could result in the **flow of substantial volumes of water from the San Joaquin River** to the Quarry Site. Currently, "no surface water from the San Joaquin River is used at the Quarry Site… Similar to the Plant Site, these ponds are all temporary water features that contain surface runoff from rainfall and/or groundwater (4.10.1.4).

Response 48-2

As discussed in Impact 4.10-12, with the implementation of Mitigation Measures 4.10-10a and 4.10-10b, the project's potential impacts related to decreasing groundwater would be reduced to less than significant (Draft EIR page 4.10-114). Mitigation Measure 4.10-10a requires implementation of the Quarry Site Groundwater Adaptive Management Program. For further discussion of the project's potential impacts to groundwater supplies, please also see Responses 65-34 and 65-36.

Comment 48-3

Questions:

- Where does Cemex think groundwater, approximately 200ft from the San Joaquin River, comes from?
- If Cemex does not currently use "surface water" why shouldn't they be held to the same standard?

Response 48-3

See Responses 6-12, 6-14, and 9-9, in addition to Collective Response #25.

At the Plant Site, "[t]otal consumptive use of river water would be reduced from approximately 295 acre-feet/year to an estimated 125 acre-feet/year . . . groundwater consumptive use [would increase] from approximately 35 acre-feet/year to approximately 60 acre-feet/year (a reduction of 145 acre-feet/year)." (Draft EIR page 2-36.) (total change from this is a reduction of 145). At the Quarry Site, groundwater use through direct and evaporative use "would increase from the existing 440 acre-feet/year to an estimated . . . 510 acre-feet per year during Stage 2 operations. In addition, approximately 56 acre-feet/year of groundwater from the existing well . . . would be consumed (an addition of 126 acre-feet/year)." (Draft EIR page 2-42). Thus, the total change in water use would be a reduction of 19 acre-feet/year.

The groundwater studies provided in Appendices G-4 and G-5 of the Draft EIR show that the groundwater flow direction within the deeper bedrock units is predominantly from the northeast to the southwest, in other words, toward the San Joaquin River, not away from it. The substantial evidence provided in the Draft EIR and its appendices indicates that much of the groundwater within the deeper bedrock units is sourced along the Friant Kern Canal. The volume of groundwater that flows under the site, and the volume that would be pumped from the Quarry during dewatering, are miniscule fractions of the total flow within both the canal and the river.

While direct rainfall and localized surface runoff from the side slopes of the ponds on the Quarry Site enter the temporary ponds, most of the water present in these surface water features is groundwater pumped from the existing mining excavation as part of the current dewatering. It should also be noted that the surface water ponds, or temporary water features, that were present at the time the Draft EIR was prepared no longer exist at the Quarry Site because the alluvial material in those areas has recently been mined under the existing permit, with the exception of the Northeast Pond, which would remain in place permanently.

Comment 48-4

- What is the current water quality of the "temporary water features" which are being used as groundwater recharge?

Response 48-4

Regarding the "temporary water features," located on the project site, surface water samples were collected for the Plant Site and the Quarry Site. The samples were then tested for a series of analytes shown in Table 4.10-3, "Plant Site Surface Water Quality Data," and Table 4.10-4, "Quarry Site Surface Water Quality Data," included in the Draft EIR pages 4.10-24 and 4.10-26.

The sample results were compared against potentially relevant water quality standards, including primary and secondary maximum contaminant levels (MCLs) for drinking water and Regional Water Quality Control Board Basin Plan limits (RWQCB, 2018).

For the Quarry Site, the samples tested were all within the water quality standards identified above, with the exception of the pH being above the secondary MCL range, which is likely due to the uptake of carbon dioxide and release of oxygen by aquatic plant growth in the ponds. The three surface water ponds exceeded the Basin Plan Limits for conductivity; however, those standards do not apply because this water is not discharged into the San Joaquin River.

For the Plant Site, baseline conditions indicate conductivity, and total arsenic, iron, lead, and manganese concentrations are above their respective water quality standards. The dissolved concentrations of arsenic, iron, lead, and manganese were below the respective water quality standards. The total and dissolved phase concentration levels for these constituents are consistent with the range of naturally occurring background levels.

As for the elevated baseline conductivity associated with the silt pond, if the project were to result in an additional impact, it would apply solely to a discharge to the San Joaquin River, since there is an established water quality objective for that receiving water. However, this project is designed as a zero-discharge facility, and would not discharge to the San Joaquin River.

Regarding the metal constituents analyzed as part of the hydrogeologic study prepared for the project, it is important to note that both filtered and unfiltered samples were collected. With respect to establishing baseline conditions, the total concentrations of arsenic, iron, lead, and manganese exceed their respective water quality standards within the unfiltered sample; however, the dissolved concentrations within the filtered sample were within water quality standards. The total metal concentrations represent

interference from suspended sediment, which is comprised of naturally occurring earthen material and minerals.

Comment 48-5

- Is the San Joaquin River labeled "groundwater"?

Response 48-5

The San Joaquin River is a surface water feature. The Draft EIR describes the San Joaquin River in Section 4.10.1.3, "Surface Water Drainage." Current operational water uses and supplies are described in Draft EIR 4.10.1.4. It is unclear which figure is referenced in the comment. Figures 2-4, "Quarry Site Existing Conditions ," 2-5, "Conditional Use Permits and Surrounding Land Uses," and 2-8, "Proposed Quarry Site Mining Plan," which each depict the San Joaquin River, label the feature as "San Joaquin River."

The water quality of the temporary water features at the Quarry Site is provided in Table 4.10-4 of the Draft EIR.

Comment 48-6

This is unacceptable and not what the San Joaquin River should be used for.

Response 48-6

The commenter's opinion regarding use of the San Joaquin River is noted for the consideration of the decision-makers.

Comment 48-7

Mitigation measures are proposed but they are not sufficient to ensure the long-term preservation of water resources in the region.

Response 48-7

The comment does not reference specific mitigation measures and provides no evidence that any of the mitigation measures in the Draft EIR are insufficient.

Comment 48-8

The report does not adequately address the broader implications of this water loss on surrounding communities or agricultural operations that rely on these vital water sources.

Response 48-8

The commenter does not explain or provide evidence of the "broader implications of this water loss" or what such implications might mean for surrounding communities or agricultural operations.

The Draft EIR evaluates potential impacts to groundwater supplies in Section 4.10, "Hydrology and Water Quality," including Impacts 4.10-8, 4.10-9, 4.10-10, and 4.10-11, which address groundwater conditions during project operations and following reclamation. As discussed therein, impacts to groundwater supplies would be less than significant with implementation of Mitigation Measures 4.10-10a and 4.10-10b (see also Draft EIR Appendices G-3 through G-6).

Comment 48-9

The inadequate mitigation and lack of clear, enforceable measures to safeguard water supply and quality are particularly concerning, as this is a **critical resource** for the area.

Response 48-9

The commenter does not reference specific mitigation measures, nor does the comment explain or provide evidence of inadequate mitigation in the Draft EIR.

The Draft EIR evaluates potential impacts to groundwater supply and water quality in Section 4.10. See Collective Response #24 regarding mitigation of impacts to groundwater supply. Impacts 4.10-1 through 4.10-7 address potential impacts to water quality, and identify mitigation measures, including Mitigation Measures 4.10-5a and 4.10-5b, to reduce impacts. With implementation of these measures, impacts to water quality would be less than significant.

Comment 48-10

Groundwater recharge is a long-term, and slow-moving process like so much of conservation efforts. Additionally, if toxic or hazardous materials (4.9-2) enter the groundwater system, this could create expensive and dire consequences for the entire community. To quote, "The transport, transfer, storage, and use of these substances would create a potential for their accidental uncontrolled release. Such releases could result in contamination to soils or surface waters if not properly controlled and cleaned-up. Flammable or other hazardous materials improperly stored or disposed or accidently released to the environment would create fire hazard, risk to human health, and environmental degradation, including surface and groundwater contamination. This is a potentially significant impact."

Response 48-10

The commenter quotes statements from Draft EIR Impact 4.9-2 which pertain to potential effects associated with creating hazards through the transport, transfer, storage, and use of petroleum-based fuels and oils during project operations (Draft EIR page 4.9-17). As discussed in the Draft EIR, Impact 4.9-2 is considered potentially significant and would be reduced to less than significant through compliance with the National Pollutant Discharge Elimination System (NPDES) General Permit No. CAS000001 for Storm Water Discharges Associated with Industrial Activity, Water Quality Order No. 2014-0057-DWQ (Industrial General Permit), compliance with waste discharge requirements (WDRs) established by the Regional Water Quality Control Board (RWQCB) for any discharges of wastewater not authorized under the Industrial General Permit, implementation of applicable programs overseen by the Fresno County Environmental Health Division, including a Hazardous Materials Business Plan and a Spill Prevention, Control, and Countermeasure (SPCC) Plan, and implementation of Mitigation Measure 4.10-1.

Comment 48-11

Air Quality Impact (Section 4.3)

The DEIR states their will be a **cumulatively considerable net increase** of criteria pollutants, particularly in areas where the region is in nonattainment under federal or state ambient air quality standards (Impact 4.3-2). Specifically, **Impact 4.3-2** notes that the project could result in a **cumulatively considerable net increase** of criteria pollutants, exacerbating existing air quality issues in an already nonattainment area for federal and state air quality standards. While a Fugitive Dust Control Plan is proposed, the mitigation measures are **insufficient** and do not fully address the long-term air quality impacts.

The project's reliance on construction-related emissions and dust generation will contribute to elevated levels of particulate matter (PM10 and PM2.5), which are known to have serious health implications for local communities.

- In 2024, Fresno County received failing grades for ozone, short-term particle pollution, and long-term particle pollution, according to the American Lung Association
- In 2024, Fresno County ranked 7th among the most polluted counties in the United States, according to GV Wire

Residents, educational program participants, recreationalists, and community members are suffering. Extending Cemex mining operations

in our community is detrimental to the health and quality of life of residents.

Response 48-11

As shown in Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than currently emitted (see Draft EIR page 4.3-61). The Fugitive Dust Control Plan has been prepared and shall be submitted to the SJVAPCD for review and approval prior to project implementation (see Final EIR, Appendix D-4, Mitigation Measure 4.3-2b). Mitigation Measure 4.3-2b, along with Mitigation Measure 4.3-2a, is sufficient to reduce potential impacts to less than significant. The commenter makes no suggestions regarding other feasible measures that could be implemented to further reduce emissions, and the impact determination does not warrant such additional measures.

Comment 48-12

Recreation and Land Use (Sections 4.11 and 4.16)

The project's potential to increase demand on existing recreational facilities and lead to physical deterioration (Impact 4.16-1) has not been fully evaluated. The DEIR dismisses the potential strain on local parks (Ball Ranch, Sumner Peck, Woodward Park) and other recreational facilities without considering the cumulative impact of ongoing mining operations and associated traffic, noise, and air pollution. The increase in industrial activity and truck traffic is likely to negatively affect the **quality of life** for residents, including their access to safe, clean recreational spaces.

Response 48-12

Draft EIR Section 4.16, "Recreation," discusses recreational facilities near the project sites (see Draft EIR Table 4.16-1, "Recreation Facilities Near the Project Sites") and Draft EIR Impact 4.16-1 (Draft EIR page 4.16-5) discusses that construction, operation, and reclamation of the project sites would not cause a substantial increase in local population, either directly or indirectly, and that the project would not require the removal of any existing parks or recreational facilities and that the project impact associated with recreational facilities would be less than significant. Additionally, the Draft EIR evaluates potential transportation impacts (Section 4.17, "Transportation"), noise impacts (Section 4.13, "Noise"), and air quality impacts (see Appendix D-4, "Revised Section 4.3, Air Quality"). The comment does not provide evidence for the comment's assertion that the project would strain local parks and other recreational facilities.

Comment 48-13

The DEIR mentions the Parkway Master Plan (2018) and discusses trail easements in section 2.5.8. Cemex had 100 years to create a trail easement to connect communities- they did not. I'd like a significant more detail on the proposed plan.

Response 48-13

Please see Collective Response #21 pertaining to public access to the San Joaquin River and Collective Response #22 regarding trail easement along the San Joaquin River.

Comment 48-14

At the time the DEIR was released, Sumner Peck Ranch was open the public and now- Ball Ranch is open 7 days a week, free of charge. This project is not consistent with the Parkway Master Plan.

Questions:

- Is Cemex has not prioritized recreational access, why would they now? Especially if they receive approval?

Response 48-14

Please see Collective Response #18 pertaining to project consistency with the San Joaquin River Parkway Master Plan, Collective Response #21 pertaining to public access to the San Joaquin River, and Collective Response #22 regarding trail easement along the San Joaquin River.

Comment 48-15

- Anyone who has driven on N. Friant Road knows the **dangers of driving** during mining activities, why would recreationalists want to use a trail that endangers their lives and is listed as a significant impact to scenic and natural landscapes?

Response 48-15

See Collective Response #30 regarding traffic safety and vehicle damage resulting from haul trucks. It is unclear to what the commenter refers. The project proposes to dedicate easements at each project site to facilitate the extension of trails through the project area consistent with the Parkway Master Plan. See Draft EIR page 4.11-44 through 4.11-47 for discussion of the project's consistency with applicable goals and policies in the San Joaquin River Parkway Master Plan. The comment does not provide any reasoning or evidence that such trails would be dangerous to users.

The commenter appears to also reference the project's anticipated significant and unavoidable impacts to public views of the Quarry Site as disclosed in Draft EIR Section 4.1, "Aesthetics and Visual Resources," under Impact 4.1-1 (Draft EIR page 4.1-51). These impacts would occur at two locations (Locations #12 and #13) west of the river with clear, long range views of the excavation walls. Views from all other locations would be less than significant with mitigation.

Comment 48-16

- My understanding is Cemex had brief conversations with SJRC in 2021. Have they built relationships with current leadership? Have they shown any active participation in the Parkway effort and Master Plan? Have attend PACE meetings? What is their track record for river protection and participation?

Response 48-16

The comment does not raise environmental issues and thus does not require a response. (PRC Section 21091(d)(2)(B); Title 14 CCR Sections 15088(c), 15132(d), 15204(a).)

The Operator has been in contact with the San Joaquin River Conservancy. The project sites have been in place and operating since before 1995, when the Parkway Master Plan goals and policies were adopted. The proposed project would implement measures to further protect the San Joaquin River (SJR) and the Conservancy properties within the vicinity. The Operator has also been in discussions with the San Joaquin River Conservancy's Executive Officer towards providing trail easements at the Plant Site and Quarry Site (see Section 2.5.8, "Trail Easements," within the Draft EIR). The project was also found to be consistent with County General Plan Policy LU-C.8, which requires that the County preserve and protect identified wildlife corridors along the San Joaquin River (Draft EIR page 4.11-13).

The Operator would continue to coordinate with the San Joaquin River Conservancy to protect valuable resources within the SJR area.

Comment 48-17

- If this project stops the creation of the most used facilities and trails in the County, why does that not qualify as dividing an established community? (Impact 4.11-1)

Response 48-17

As discussed under Draft EIR Impact 4.11-1 on page 4.11-48, the project would not construct any roads, walls, or other linear features that could impede vehicle, bicycle, or

pedestrian mobility in the area and the project would not involve the removal of any roads, bridges, trails, or other means of access in the area. Thus, the project would not physically divide an established community. The Draft EIR properly evaluates the proposed project against the existing condition, in accordance with CEQA.

Comment 48-18

In terms of land use planning (Impact 4.11-2), the project fails to demonstrate that it will not conflict with existing land use plans, policies, and regulations. Despite the claim **of** consistency with local policies, the project introduces substantial risks to surrounding land uses by threatening local communities with increased pollution, noise, and disruption, particularly in areas that are already struggling with recreational infrastructure and air quality issues.

Response 48-18

Draft EIR Table 4.11-1, "Project Consistency with Local Planning Documents," provides a detailed evaluation of the project's consistency with the Fresno County General Plan, Madera County General Plan, Fresno County zoning ordinances, and San Joaquin River Parkway Master Plan. Based on that detailed evaluation, the proposed project would not result in conflicts with any land use plan, policy, or regulations adopted for the purpose of avoiding or mitigating an environmental effect (Draft EIR Impact 4.11-2 at page 4.11-50). The evaluation was performed in consideration of resource impacts of the project including air pollutant emissions and noise. See Collective Response #9 regarding the project's potential impact on the region's existing air quality conditions.

Comment 48-19

The DEIR also does not adequately address the **fragmentation** of natural habitats (4.4.1.6) and recreational spaces that could result from project expansion and land disturbance. While some mitigation measures are proposed, they do not go far enough to **protect vital community assets** and ensure sustainable land use in the area.

Response 48-19

The commenter does not provide explanation or substantial evidence for the comment's assertions that the Draft EIR does not adequately address fragmentation of natural habitats and recreational spaces and that mitigation measures do not go far enough to protect community assets. The proposed project would stay within the existing footprint, and would thus not differ greatly from the baseline conditions. Although the project proposes to increase the depth of the quarry pit, it remains within the existing footprint

of the site, which is already disturbed by 30 years of continuous mining operations. The Draft EIR analyzes impacts to wildlife species movement, corridors, or nursery sites in Impact 4.4-6 and determined this impact to be less than significant due to the fact that mining operations have been continuous at each site for decades (Draft EIR page 4.4-62).

Comment 48-20

Conclusion and Request for Action

The Rockfield Modification Project poses substantial risks to **local water resources**, **air quality**, **recreational spaces**, and **land use planning**, which the DEIR has not properly addressed. The mitigation measures proposed are insufficient and fail to ensure long-term protection of public health, the environment, and local communities. **I strongly urge the lead agency and County Board of Supervisors to: stop this project from moving forward!** Ensure that land use planning concerns are fully incorporated into the project's design, with a focus on maintaining local community integrity and preserving natural habitats. The current DEIR, as written, fails to meet these critical standards and should be reconsidered.

Thank you for your attention to this urgent matter. I look forward to your response and to further discussions on how we can protect the community and the environment from the significant adverse effects of the Rockfield Modification Project.

Response 48-20

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #49 March 6, 2025, Clay Davis, Teter Architects and Engineers

Comment 49-1

I am writing to you today in regard to the proposed CEMEX mining pit expansion that is currently seeking entitlement approvals and for which the county is seeking public comments.

I live at 10672 N. Lanes Rd., Fresno, CA on the San Joaquin River, approximately 7 miles downstream of the proposed mining pit. My wife and I have been at this location for 33 years. While I am generally not opposed to CEMEX continuing their operations and deepening their mining pit, I do have a few concerns that I would like to have the county address in their Conditions of Approval (COA's).

Response 49-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 49-2 through 49-5 below that address specific issues raised in this comment letter.

Comment 49-2

We have 2 wells on our property. Both wells have a fairly high ground water level (20-30 feet) and have historically never varied much over the years we've lived on the river bottom. We've also enjoyed a great water quality in both wells with no issues with contaminants. We suspect that the ground water in our area remains high due to natural ground seepage due to the influence of the river.

My concerns are as follows:

- What mitigation measures will the county impose upon CEMEX to ensure the deepening of their mining pit will not adversely impact surrounding domestic water wells?

Response 49-2

Draft EIR Section 4.10, "Hydrology and Water Quality," provides detailed analyses of potential groundwater and water quality effects of the proposed project. The analyses are based on the *Revised Hydrology and Water Quality Analysis Report* (Draft EIR Appendix G-5) which utilizes information from groundwater conditions reports included as Appendices G-3 and G-4 of the Draft EIR and groundwater and surface water monitoring and sampling data collected for the project sites to draw conclusions on the existing groundwater hydrology conditions on the project sites and to evaluate the potential impacts to groundwater hydrology under the proposed project. Detailed methodology and findings are provided in Appendix G-5.

The Draft EIR concluded, supported by the technical studies contained in Appendix G of the Draft EIR, that the project would not result in significant impacts to groundwater quality or groundwater supply. See discussion of Impacts 4.10-4, 4.10-5, 4.10-6, and 4.10-7 for further discussion of the project's potential impacts to groundwater quality and Impacts 4.10-8, 4.10-9, 4.10-10, 4.10-11, and 4.10-12 for further discussion of potential impacts to groundwater supply. Therefore, the wells described in the comment would not be adversely affected by the proposed project.

As discussed in Draft EIR Section 4.10, mitigation measures are identified in the Draft EIR that require groundwater quality protection measures and groundwater monitoring and adaptive management (see Mitigation Measure 4.10-1 on Draft EIR page 4.10-92,

Mitigation Measures 4.10-5a and 4.10-5b on Draft EIR pages 4.10-96 through 4.10-98, and Mitigation Measures 4.10-10 and 4.10-10b on Draft EIR pages 4.10-108 through 4.10-111). See Response 49-3 below for further discussion of the referenced mitigation measures.

Comment 49-3

I recommend the following measures be a part of the COA's:

- Require a series of monitoring wells around the pit site
- Require CEMEX to regularly test the wells, both from a water level as well as water quality
- Require the testing be performed by an independent third-party testing lab (Krazan, Kleinfelder, etc)
- Require CEMEX to publicly post the results on their website
- Require periodic testing of private domestic wells surrounding the mining pit
- If the ground water drops in the testing wells or the quality is adversely impacted, require CEMEX to immediately cease operations

Response 49-3

The commenter recommends additional groundwater monitoring, testing, reporting, and operational controls. These recommendations are noted.

See Collective Response #24 regarding groundwater monitoring during project implementation, as well as Response 10-3 above. Extensive groundwater monitoring and mitigation measures would be implemented as part of the project. Specifically, Mitigation Measures 4.10-5a, 4.10-5b, 4.10-10a, and 4.10-10b require that the Operator, in consultation with the County, establish the Plant Site Pond Adaptive Management Program and Quarry Site Groundwater Adaptive Management Program, with associated funding mechanisms to cover costs associated with monitoring and reasonably foreseeable actions to address groundwater conditions, including excessive drawdown, if necessary. These programs require monitoring, comparison of results to established action levels, and implementation of corrective measures if those levels are exceeded.

As stated in the Draft EIR, a qualified professional is responsible for monitoring and reporting under the Adaptive Management Programs. The Operator would continue to use qualified third-party firms to conduct water testing and analysis in accordance with Mitigation Measures 4.10-5a and 4.10-5b. These measures also require preparation of

annual monitoring reports documenting methodologies, results, and any corrective actions taken, which are submitted to Fresno County. These reports are prepared by a Professional Geologist or Certified Hydrogeologist, and the County has discretion to make such reports available for public review.

Mitigation Measure 4.10-10a requires implementation of corrective measures if monitoring indicates that groundwater levels in monitored wells decrease beyond specified thresholds. If monitoring demonstrates that such changes are attributable to project-related dewatering, additional measures would be implemented, including restrictions on further mining progression until performance criteria are met.

The commenter also recommends additional monitoring of private domestic wells; however, the comment does not provide evidence that such additional measures are necessary beyond those already included in the Draft EIR. Through implementation of the Adaptive Management Programs described above, impacts to groundwater supply and quality would be reduced to less than significant.

See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10 and the mitigation measures referenced in this response.

Comment 49-4

- Should issues arise with neighboring domestic wells due to CEMEX mining activities, how does the county plan to mitigate those issues in their COA's? Would the only recourse of the impacted property owners be to sue CEMEX? To avoid unreasonable legal costs by owners of impacted wells, I would recommend the following:

    - As part of the COA's, require CEMEX to post a bond to pay for any domestic wells adversely impacted by their activities, including the cost for drilling new wells and/or the installation of water treatment systems to remove any contaminants.

Response 49-4

The recommendations in the comment are noted. Mitigation measures discussed in Responses 49-2 and 49-3, above, provide for groundwater monitoring and adaptive management actions that reduce potential groundwater quality and supply impacts to less than significant. Mitigation Measure 4.10-5b requires the Operator to provide a funding mechanism for the Plant Site Adaptive Management Program. Mitigation Measure 4.10-10b requires the Operator to provide a funding mechanism for the Quarry Site Groundwater Adaptive Management Program.

As described in Chapter 3, "Draft EIR Errata," Mitigation Measures 4.10-5b and 4.10-10b have been revised to clarify and strengthen the funding mechanisms and associated implementation requirements. These revisions further specify that the funding mechanism must be sufficient to support long-term monitoring and reasonably foreseeable adaptive management actions, and ensure that funding remains available for the duration of monitoring and any necessary corrective actions.

Mitigation Measure 4.10-10b provides, as revised in Chapter 3, "Draft EIR Errata," in part, the following:

> The post-reclamation funding mechanism [for the Quarry Site Groundwater Adaptive Management Program] shall be sufficient to cover costs associated with the annual monitoring, the technical analysis and reporting described in Mitigation Measure 4.10-10a, and reasonably foreseeable actions that may be required to address excessive drawdown, including continuing to pump water to the Northeast Pond and recharge trenches indefinitely, if necessary (Final EIR Chapter 3, "Draft EIR Errata").

With these clarifications and strengthened requirements, the mitigation measures ensure that adequate financial resources are available to implement monitoring and adaptive management actions as needed to protect groundwater resources. Accordingly, impacts to groundwater quality and supply remain less than significant with mitigation incorporated.

Comment 49-5

As I'm in a construction related industry, I agree with the need for a steady, sustainable and cost effective supply of sand and gravel for the construction industry. I have no concerns with the proposed drilling and blasting activities due to the distance from our home to the proposed mining pit. In general, I am supportive of CEMEX's plans, and I would encourage the Planning Commission to approve their application, provided that mitigation measures are put in place to address potential impacts to surrounding domestic water wells.

Response 49-5

The comment is noted and will be considered by County decision-makers.

Letter #50 March 6, 2025, Michelle Heredia-Cordova, Table Mountain Rancheria

Comment 50-1

Table Mountain Rancheria, a federally recognized Tribe (Tribe), is in receipt of a letter from the Fresno County Public Works and Planning Department, dated January 2, 2025, regarding the proposed CEMEX Rockfield Quarry Modification Project. As part of the Tribe's initial response, Tribal Cultural Resources staff submitted a request for consultation pursuant to AB-52 in a letter dated January 9, 2025, requesting a site visit, copies of all cultural resources reports, and the results of a record search. Tribal staff was able to secure a site visit on February 24, following outreach by the Tribal Liaison with the California Department of Conservation-Division of Mine Reclamation. Please understand that the Tribe strongly opposes the extension of mining operations at this site and submits formal comments for your consideration. The Tribe feels that this project will continue to pose significant adverse impacts to Fresno County's human population, biological resources, air, water and Native American cultural heritage.

Response 50-1

The Table Mountain Rancheria's opposition to the extension of mining operations at the project sites is noted and will be considered by County decision-makers.

As discussed on page 4.18-8 of the Draft EIR, in accordance with PRC Section 21080.3.1, in 2019 after receiving and deeming complete the application for the proposed project, the Fresno County Planning Department notified by letter the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notification of projects, including the Dumna Wo-Wah Tribal Government, Table Mountain Rancheria, and Picayune Rancheria of the Chukchansi Indians. The notification letters were mailed via certified mail on December 9, 2019, and are included in Appendix J of the Draft EIR. At the time the Draft EIR was completed in December 2024, five years following the initial notification, none of the notified tribes had requested consultation.

The January 2, 2025, letter referenced in the comment was provided to announce the availability of the Draft EIR for review and comment. As described in the comment, the County and Operator invited the Table Mountain Rancheria to the project sites for a visit on February 24, 2025, and the County has provided all project notifications as requested.

Please see Responses 50-2 through 50-12 below for further information.

Comment 50-2

Environmental and Safety Violations

CEMEX, a Mexican multinational building materials company, has a long history of environmental and safety violations. According to GoodJobsFirst.org, a Washington, DC-based nonprofit, CEMEX has amassed over $43 million in environmental penalties and more than $6 million in safety related violations in the US and Puerto Rico, including $2,348,916 in environmental penalties and $1,695,972 in safety penalties incurred in California alone. In 201 7, CEMEX Construction Materials Pacific LLC settled with the California Air Resources Board(ARB), paying $59,063 to the ARB and $59,062 to the San Joaquin Valley Air Pollution Control District for failing to comply with cargo-handling equipment regulations. Additionally, in 2009, CEMEX was forced to pay $2 million in settlement fees after increasing *emissions* at one of its California facilities without obtaining required permits or installing mandated controls. These actions resulted in increased nitrogen oxide pollution, a harmful contaminant that contributes to smog and respiratory problems, in violation of the Clean Air Act. CEMEX's long pattern of environmental neglect and regulatory non-compliance underscores their unfitness for further operations. This history raises deep concerns about their suitability for expanding operations at this location a mere 200 feet from edge of the San Joaquin River, as required by the existing CUP and the CUP currently under consideration. Please be aware that since at least 2014, it appears that heavy equipment mining operations have occurred at the Rockfield Quarry site less than 100 feet from the proximal edge of the San Joaquin River.

Response 50-2

The majority of the comment is not germane to the Draft EIR, or the analysis or impact determinations found therein. The Draft EIR provides a detailed evaluation of potential project impacts associated with environmental issues that could be associated with air quality and air pollutant emissions, in accordance with CEQA standards. Please see Collective Response #4a pertaining to the Operator's regulatory history.

The Plant Site is located approximately 0.6 miles from the San Joaquin River (SJR) (Draft EIR page 4.4-19). The Quarry Site is located adjacent to the SJR; however, quarry operations are not and would not be conducted within 200 feet of the river as the commenter suggests (Draft EIR page 2-17 and 2-18).

The commenter asserts without factual evidence that mining operations have occurred fewer than 100 feet from the proximal edge of the San Joaquin River. Fresno County has

no record of any reports or violations related to encroachment of the required 200-foot setback. Draft EIR Figure 2-2, "Quarry Site Aerial," depicts the aerial view of the existing Quarry Site, and its relative proximity to the San Joaquin River. Current operations are required to maintain a 200-foot setback from the San Joaquin River (Draft EIR page 2-18). The proposed project would also be required to maintain this setback requirement. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 50-3

Adverse Impacts on Biological Resources

The proposed mining activities pose significant threats to Fresno County's biological resources, particularly the threatened spring-run Chinook Salmon that is protected by the Endangered Species Act (ESA) and the San Joaquin River Restoration Settlement Act (PL 111-11, MAR. 30, 2009). Excavating a 600-foot-deep pit adjacent to the San Joaquin River raises serious concerns under the ESA, which prohibits the "take" of threatened species. The term "take" encompasses actions that harm, harass, or kill listed species.

The noise and vibrations from heavy machinery and blasting bedrock can disrupt salmon spawning and migration, as they are highly sensitive to environmental disturbances.

Response 50-3

The project's potential effects on special-status species are evaluated in Impact 4.4-1, beginning on Draft EIR page 4.4-48. The Federal ESA applies only if endangered species are present and could be impacted or critical habitat adversely affected. The proposed project is designed to avoid direct impacts to sensitive habitats along the San Joaquin River. Mining and processing activities are confined to previously disturbed areas at the Quarry and Plant sites, which do not support high-quality riparian, wetland, or riverine habitats. Habitat impacts would be limited to existing project areas. Salmon habitat in particular was carefully analyzed in the report, *Effect of Nearby Blasting on Salmon in San Joaquin River,* prepared by Vibra-Tech Engineers (see Draft EIR Appendix E-4), based on the Alaska Department of Fish and Game standards, as described in detail in Response 65-13. The Draft EIR further confirms that any impacts on salmon habitat at either the Plant Site or Quarry Site would be less than significant, requiring no mitigation (see Draft EIR, page 4.4-63).

As described in Chapter 3, "Draft EIR Errata," the biological resources analysis has been revised to clarify and amplify the evaluation of special-status species and aquatic

resources. These revisions strengthen the analysis and confirm that impacts to salmon and other aquatic species remain less than significant.

The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. As a result, there is minimal potential for habitat destruction of native aquatic or terrestrial species, including Chinook salmon. See also Collective Response #12 regarding the project's potential effects on salmon and river restoration projects in the region and Collective Response #16 regarding potential effects on salmon spawning.

Comment 50-4

The DEIR references a study on fish in Alaska However, landscape, biological diversity and wildlife are very different in Central California from those in Alaska.

Response 50-4

See Response 65-13, which provides further discussion regarding the efficacy and sufficiency of the Alaskan Blasting Standards for analyzing the project's potential impacts to salmon in the San Joaquin River.

Comment 50-5

Additionally excavation of a 600-foot-deep hard rock pit immediately adjacent to the San Joaquin River poses a significant risk of introducing pollutants such as sediment, heavy metals, oil, and fuel spills into the river, threatening water quality and salmon habitats.

Response 50-5

With respect to the potential for increases in concentration levels for constituents associated with mining and aggregates processing, and specifically blasting agents and petroleum products used in the equipment, the proposed project includes spill prevention, controls and countermeasure plans, as well as best management practices, which when implemented would eliminate or reduce water quality impacts to levels that would not have any adverse effect to the San Joaquin River or groundwater (Draft EIR page 4.10-88 through 4.10-93). The proposed project is designed to be a zero-discharge facility with respect to offsite discharges and thus would not discharge into the San Joaquin River or other surface water bodies. With continued compliance with the State Industrial General Permit, there would be no significant impact to the San Joaquin River since this permit is based on water quality criteria deemed to be protective of aquatic species and habitats.

Comment 50-6

The threat increases when the required minimum 200-foot setback is violated, as it appears to have been in the past.

Response 50-6

The commenter expresses concern regarding potential past violations of the 200-foot setback from the San Joaquin River. See Response 50-2 above. See also Collective Response #4a regarding the Operator's regulatory history and alleged violations.

As described in the Draft EIR, the proposed project has been designed to maintain a minimum 200-foot setback between planned disturbance areas within the Quarry Site and the San Joaquin River. The project is consistent with Fresno County General Plan Policy OS-E.2, which requires adequate buffer zones between construction activities and significant wildlife resources, and Policy OS-E.14, which provides for a minimum 200-foot-wide wildlife corridor along portions of the San Joaquin River. As discussed under Impact 4.4-4, project activities would not extend into designated wildlife corridors.

Potential indirect impacts associated with project activities, including blasting-related dust, noise/vibration, and water quality effects, are addressed through mitigation measures, including Mitigation Measures 4.3-2, 4.10-1, and 4.10-5a, 4.10-5b, 4.10-10a, and 4.10-10b.

In addition, the Effect of Nearby Blasting on Salmon in the San Joaquin River technical study (Draft EIR Appendix E-4) concludes that ground vibrations at the crest of the river embankment would be limited to 0.5 in/sec, which is well below the 2.0 in/sec threshold identified for protection of salmon embryos. Accordingly, blasting-related impacts to aquatic habitat would be less than significant.

Comment 50-7

Increased sedimentation from continued mining could smother salmon eggs and reduce oxygen levels,

Response 50-7

Best management practices would be implemented to ensure sediment from the project sites remains onsite. The proposed mining project is designed to avoid direct impacts to sensitive habitats along the San Joaquin River. Mining and processing activities are confined to previously disturbed areas at the Quarry and Plant sites, which do not support high-quality riparian, wetland, or riverine habitats. Habitat impacts would be limited to existing project areas. Salmon habitat in particular was carefully analyzed in the report, *Effect of Nearby Blasting on Salmon in San Joaquin River*, prepared by Vibra-Tech

Engineers (Appendix E-4), based on the Alaska Department of Fish and Game standards, as described in detail in Response 65-13. The Draft EIR further confirms that any impacts on salmon habitat at either the Plant Site or Quarry Site would be less than significant, requiring no mitigation (see Draft EIR, page 4.4-63). The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. As a result, there is minimal potential for habitat destruction of native aquatic or terrestrial species, including Chinook salmon.

Comment 50-8

while changes to groundwater and surface water flow from excavation may deplete vital water sources.

Response 50-8

The commenter does not provide evidence of a significant impact associated with water sources. For additional discussion of the Draft EIR's analysis and conclusions regarding potential water resources impacts associated with the project's proximity to the San Joaquin River, please see Collective Response #25.

Comment 50-9

Habitat destruction near the river could further harm salmon by increasing water temperatures, reducing shade, and disturbing aquatic vegetation. These potential impacts violate both state and federal environmental laws, including the California Environmental Quality Act (CEQA) and the Clean Water Act (CWA), which mandate the protection of water quality and aquatic habitats.

Response 50-9

The project's potential impacts to salmon would be less than significant based on existing studies. The proposed mining project is designed to avoid direct impacts to sensitive habitats along the San Joaquin River. Mining and processing activities are confined to previously disturbed areas at the Quarry and Plant sites, which do not support high-quality riparian, wetland, or riverine habitats. Habitat impacts would be limited to existing project areas. Salmon habitat in particular was carefully analyzed the report, *Effect of Nearby Blasting on Salmon in San Joaquin River,* prepare by Vibra-Tech Engineers (Appendix E-4), based on the Alaska Department of Fish and Game standards, as described in detail in Response 65-13. The Draft EIR further confirms that any impacts on salmon habitat at either the Plant Site or Quarry Site would be less than significant, requiring no mitigation (Draft EIR, page 4.4-63). The measures proposed fully comply with requirements of CEQA and the Clean Water Act. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in

activity. As a result, there is minimal potential for habitat destruction of native aquatic or terrestrial species, including Chinook salmon.

Comment 50-10

Cultural Resource Concerns under CEQA and AB-52

The Rockfield Quarry project fails to adequately address the protection of Tribal Cultural Resources (TCRs) as required by AB-52 and CEQA. This location includes the site of one of the Tribe's ancestral villages and salmon spearing places in use before the construction of Friant Dam in 1941. Fresno County, as the lead agency, must consult with local Tribes to identify, avoid, and mitigate impacts to sacred sites, landscapes, and cultural artifacts. The continued excavation disregards the significance of these resources, violating CEQA Guidelines §21084.3 and the legislative intent of AB-52. Please be aware that the entire stretch of the San Joaquin River in this area of Fresno County is a sacred and Traditional Cultural Landscape pursuant to Public Resources Code§ 21074.

Response 50-10

The Draft EIR's discussion of Impacts 4.18-1 on 4.18-8 under the heading "AB 52 Consultation" discusses the County's outreach to Native American tribal representatives in accordance with PRC 21080.3.1. As discussed there, in 2019 after receiving and deeming complete the application for the proposed project, the Fresno County Planning Department notified by letter the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notification of projects, including the Dumna Wo-Wah Tribal Government, Table Mountain Rancheria, and Picayune Rancheria of the Chukchansi Indians. The notification letters were mailed via certified mail on December 9, 2019 (Draft EIR Appendix J). No tribe requested consultation as a result of the tribal notification letters and no responses were received during the project's scoping period. However, Table Mountain Rancheria representatives subsequently provided comments on the Draft EIR, and those comments and the County's responses are provided here at Comment Letters 50 and at Comment Letter 52 .

The Draft EIR provides a sufficient description of the results of records searches, physical surveys, and tribal outreach conducted for the project. Based on these analyses, the Draft EIR properly concluded that the project's potential to result in adverse effects to cultural resource and tribal cultural resources would be less than significant. Although the commenter asserts that "the entire stretch of the San Joaquin River in this area of Fresno County is a sacred and Traditional Cultural Landscape pursuant to PRC Section 21074,"

the commenter does not provide evidence of this traditional cultural landscape, nor does the commenter provide or reference evidence that such a cultural landscape was identified by tribal representatives through the County's AB 52 efforts summarized above.

See also Responses 50-1 and 52-2.

Comment 50-11

Overproduction and Unsustainability

Local aggregate production levels far exceed Fresno County's needs for the foreseeable future. According to the 2018 report, Aggregate Sustainability in California by the California Geological Survey, the Fresno Production-Consumption (P-C) Region is projected to need 305 million tons of aggregate over the next 50 years. As of January 1 2017, the region possessed 556 million tons of permitted aggregate reserves, representing 182% of the projected demand and ensuring a supply exceeding 90 years. If there is no extension of the Rock: field aggregate mine operation, production levels will still significantly surpass the Fresno PC Region's aggregate needs. If allowed to continue, within 50 years, the region will have extracted over 200% of the region's aggregate requirements. This excessive extraction would be unsustainable and conflicts with CEQA's mandate to prevent unnecessary environmental degradation.

Response 50-11

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 50-12

Request for Action

The Tribe firmly believes that Fresno County has a legal and ethical obligation to reject this project in its current form. As the lead agency under CEQA, the County must uphold its responsibility to protect endangered biological resources, water quality air quality, human safety, and Tribal Cultural Resources. The continuation of CEMEX's mining operations along the San Joaquin River Corridor will result in irreversible harm to our environment, community, and cultural heritage. Additionally, the once beautiful San Joaquin River viewshed has suffered almost irreparable harm from a century of surface aggregate mining. Another century of mining on the river, including blasting bedrock on 493 acres down to 600 feet, is inconceivable. The Tribe urges the County to deny

this permit and prioritize sustainable and legally compliant alternatives.

Response 50-12

Table Mountain Rancheria's concerns and opposition to the project are noted and will be considered by County decision-makers.

Letter #51 March 6, 2025, Carole Laval, Laval and Associates

Comment 51-1

I am writing in opposition to the CEMEX expansion proposals; the extension of the mining contract and the 600' excavation.

Add me to the list of those opposed.

Response 51-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #52 March 6, 2025, Multiple Signers, Table Mountain Rancheria

Comment 52-1

On behalf of the Table Mountain Rancheria, we are writing to express our vehement opposition to the proposed 100-year lease for the Cemex Rockfield Quarry Modification Project. This project poses an unacceptable threat to the ecological integrity of the San Joaquin River, the biological resources it sustains, and the cultural heritage deeply tied to this land. We urge you to consider the profound and irreversible consequences this lease would have on the environment, our community, and our cultural identity.

Response 52-1

Table Mountain Rancheria's concerns and opposition to the project are noted and will be considered by County decision-makers. Please see responses below to specific comments. Please also see the County's response to comments provided submitted by Table Mountain Rancheria Tribal Chairperson Michelle Heredia-Cordova at Responses to Comment Letter #50, above.

Comment 52-2

This land is not just a resource to be exploited - it is a place of profound cultural significance. It is home to culturally identified sites that connect Table Mountain and other Tribes to our ancestors and our heritage. These sites are irreplaceable, and

their destruction would sever our ties to the land and the traditions that define us. The river and the land are intertwined with our identity, providing sustenance, spiritual nourishment, and a sense of belonging. To allow this project to proceed would be to disregard the cultural and historical value of this place.

Response 52-2

The County acknowledges the commenter's statements regarding the cultural, spiritual, and historical importance of the project area to Table Mountain Rancheria and other Tribes. These views are noted for consideration by County decision-makers.

Under CEQA, Tribal Cultural Resources may be identified through the Assembly Bill 52 (AB 52) consultation process or through other information available to the lead agency that meets the definition set forth in PRC Section 21074. As discussed in Response 50-1 and on page 4.18-8 of the Draft EIR, the County complied with the notification requirements of AB 52 by notifying all California Native American tribes that requested notice and that are traditionally and culturally affiliated with the project area, including the Table Mountain Rancheria, Dumna Wo-Wah Tribal Government, and Picayune Rancheria of the Chukchansi Indians. Notification letters were sent by certified mail on December 9, 2019, and are included in Appendix J of the Draft EIR. No tribe requested consultation within the statutory 30-day timeframe; however, Table Mountain Rancheria subsequently provided comments on the Draft EIR, which are addressed in this chapter.

As described in Section 4.18.1.2, "Known Tribal Cultural Resources Within the Project Sites," of the Draft EIR, record searches, archival research, and intensive pedestrian surveys were conducted to identify cultural and tribal resources within the project sites. Two historic-era roads and two isolated artifacts were identified; however, none were determined eligible for listing in the National Register of Historic Places or the California Register of Historical Resources. In addition, a search of the Native American Heritage Commission Sacred Lands File identified one or more sacred sites at the Quarry Site, and the NAHC recommended outreach to potentially affiliated tribes, which the County conducted through the AB 52 notification process.

Based on the information available, no Tribal Cultural Resources, as defined in PRC Section 21074, have been identified within the project area. The Draft EIR provides a sufficient description of records searches, field surveys, and tribal outreach, and concludes that impacts to cultural and tribal cultural resources would be less than significant.

Comment 52-3

The proposed 100-year lease is not only environmentally reckless but also morally indefensible. It prioritizes short-term economic gain over the long-term health of our planet and the well-being of future generations. We have a responsibility to protect this land and the San Joaquin River, not only for ourselves but for those who will come after us.

Response 52-3

Table Mountain Rancheria's request for denial of the project is noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 52-4

There are alternatives that do not require sacrificing our environment and our cultural heritage. I implore you to explore these options and to reject this destructive proposal.

Response 52-4

Table Mountain Rancheria's request for rejection of the project is noted. Draft EIR Chapter 6, "Alternatives," identifies and evaluates a reasonable range of alternatives to the proposed project in compliance with CEQA. The comment does not provide specific alternatives to the project and does not discuss the adequacy of the Draft EIR Alternatives evaluation. Please also see Collective Response #3 pertaining to regional aggregate supply and demand.

Comment 52-5

We stand with countless others in our community who oppose this project. We urge you to listen to our voices, to honor the cultural and ecological significance of this land, and to take immediate action to protect it. Please deny the 100-year lease for the Cemex Rockfield Quarry Modification Project and instead work with us to preserve this invaluable resource for generations to come.

Thank you for your attention to this critical matter. We trust that you will make the right decision and prioritize the health of our environment, the protection of our cultural heritage, and the well-being of our community.

Response 52-5

Table Mountain Rancheria's request for denial of the project is noted and will be considered by County decision-makers.

Letter #53 March 6, 2025, Joe Salazar, Happy Panels

Comment 53-1

I'm not sure if this message will reach you regarding the public comments against the Cemex Rockfield Expansion proposal, but I just learned about this project this morning.

My wife is a former Fresno County employee, we own and operate a small business in Fresno and we currently live Madera County within a 5-mile radius of this mining operation, I strongly oppose the expansion and the method of rock quarrying.

Response 53-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 53-2

My wife and I often hike and bike to the San Joaquin River from the Tesoro Viejo community. From the hills overlooking the river, you can see, hear, and smell the quarry, even in its current state.

Response 53-2

See Collective Response #6 regarding common nuisance complaints on mining operations.

Comment 53-3

With the proposed changes, I am concerned that the noise pollution from the quarry operations will worsen, negatively affecting both humans and wildlife in the area.

Response 53-3

The issue of noise pollution affecting humans is addressed in Draft EIR Section 4.13, "Noise." Mitigation Measures 4.13-2 and 4.13-3 would require the Operator to implement noise reduction measures at the Plant Site and Quarry Site, respectively. Mitigation Measure 4.10-1 requires the Operator to implement the "Blasting Protocols" (see Draft EIR Appendix H-9) which include measures to reduce noise impacts associated with blasting events.

The issue of noise pollution affecting wildlife is addressed in multiple locations within Draft EIR Section 4.4, "Biological Resources." Noise impacts to nesting birds are discussed in Impact 4.4-1, which begins on Draft EIR page 4.4-48. Mitigation Measure 4.4-1c addresses these impacts by requiring pre-construction surveys prior to the initiation

of each mining phase and implementation of avoidance measures, if nesting birds are present. Potential noise impacts to special-status species in the riparian habitat surrounding the project sites are discussed in Impact 4.4-2, which begins on Draft EIR page 4.4-52. Potential vibration impacts on fish species in the San Joaquin River are discussed in Impact 4.4-6, which begins on Draft EIR page 4.4-62.

See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 53-4

This location is one of the few places where people can visit for peace and serenity without needing to travel far out of town.

Additionally, the destruction of the beautiful natural habitats surrounding the river and the plant will lead to other harmful consequences.

Response 53-4

The project's potential impacts to riparian and other sensitive natural habitats are addressed in Draft EIR Section 4.4, in Impact 4.4-4, which begins on page 4.4-55. See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 53-5

I strongly suspect that if this quarry were a completely new operation, rather than a century-old, grandfathered facility, the permit would likely be denied.

Please take my concerns seriously. I do not want this expansion project in my backyard. It is detrimental to the people and wildlife who live and thrive in this area.

Response 53-5

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Impacts to wildlife are addressed in Draft EIR Section 4.4. See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4. See Collective Response #6 regarding common nuisance complaints on mining operations.

Letter #54 March 7, 2025, Don Simmons, Creative Potential Consulting and Training

Comment 54-1

Please register my opposition to the proposed expansion plans for the CEMEX project on the San Joaquin river.

Response 54-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 54-2

The proposed 100 year operation, the new pits and the new mining methods will continue to do irreparable harm to not only the SJ river, but, to miles of it's banks, add more air pollution and allow CEMEX to pollute even more water.

Response 54-2

See Collective Response #5 related to the proposed duration of the use permit. Potential impacts to the San Joaquin River are addressed primarily in Draft EIR Section 4.10, "Hydrology and Water Quality." See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #25 regarding the project's potential impacts to river flows and effects to downstream users and Collective Response #12 regarding potential impacts to recent restoration projects along the San Joaquin River.

The issue of air pollution is addressed in Appendix D-4, "Revised Section 4.3, Air Quality," while the issue of water pollution is addressed in Draft EIR Section 4.10. See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. Each of the impacts identified in these sections was determined to be less than significant with implementation of the mitigation measures provided.

No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 54-3

The Project does not need to proceed, but needs to be halted, and a plan to close the CEMEX facility needs to be in place-especially due to the coming decrease in building and construction projects due to other costs.

Response 54-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 54-4

Fresno County needs to be serious about our air, water and soil environment, and stop the CEMEX destruction.

Response 54-4

The commenter's opposition to the proposed project is noted for the decision-makers.

Letter #55 March 9, 2025, Diane Dimon, Matters of the Mind

Comment 55-1

My name is Diane Dimon. I have been a residence of Fresno County for 37 years. I am very concerned about the possibility of the Country approving the CMEX Drilling Project. Here are my concerns:

1. Blasting and drilling for such a large, deep, and potentially destructive project just don't make sense. Sound, vibration, noise, air, water, and traffic pollution. And as yet unforeseen pollution.

Response 55-1

The project's potential impacts resulting from blasting and other mining operations are evaluated throughout the Draft EIR, as updated by the Final EIR. The issues of sound, vibration, and noise pollution are addressed in Section 4.13, "Noise." The issue of air pollution is addressed in Appendix D-4, "Revised Section 4.3, Air Quality," and the issue of water pollution is addressed in Section 4.10, "Hydrology and Water Quality." Impacts associated with project truck traffic are addressed in Section 4.17, "Transportation." Pollution resulting from unforeseen circumstances is addressed in Section 4.9, "Hazards and Hazardous Materials." See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 55-2

2. Truck Traffic: If approved, CEMEX will not only continue to transport their existing quota (and surplus) of aggregate, but will increase substantially, potentially

damaging Friant Road, as well as increase truck traffic. Note: Friant Road is a residential road.

Response 55-2

See Collective Response #29 regarding project truck trips, traffic congestion, road maintenance, and the funding and timing of necessary traffic improvements. As stated in Draft EIR Section 4.17.1.3, "Local Road Network," on page 4.17-3, Friant Road adjacent to the project sites is designated as an expressway in the *Fresno County General Plan*. North of the project sites, Friant Road is designated as an arterial.

Comment 55-3

3. Air Pollution: Fresno already has horrible air quality. If CEMEX is approved, this project will add significant and unnecessary impact by way of exploding debris particles and other unforeseen events.

Response 55-3

The issue of air quality is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See also Collective Response #9 regarding the project's potential impact on the region's existing air quality and air emissions from blasting events.

Comment 55-4

4. Breach of our precious River Banks: If the water seeps into the wall of CEMEX's pit(s), it could easily breach the wall's structural integrity, pollute ground water, collapse, and who knows what kind of damage that would create downstream to human, wildlife, and agricultural life in the San Juaquin Valley.

5. Contaminating Groundwater: As state above, Fresno residents are dependent upon well waters, and a potential CMEX disaster would destroy ability to live in the area.

Response 55-4

The project's potential impacts to groundwater levels and supplies are addressed in Draft EIR Section 4.10. See Impacts 4.10-8 through 4.10-13 beginning on Draft EIR page 4.10-102. Each of these impacts was determined to be less than significant with implementation of the mitigation measures provided. See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #17 related to riverbank stability and the potential for breach, flooding, and resulting impacts

to groundwater and the San Joaquin River. See also Collective Response #24 regarding groundwater monitoring during project implementation.

Comment 55-5

6. Effect upon neighboring real estate. I have heard arguments lobbying for CEMEX to guarantee reimbursement for real estate value that have been damaged by any kind of mismanagement by CEMEX. This is a real possibility, and therefore should not be entertained.

Response 55-5

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 55-6

All of these very real environmental threats seem to me to require an obvious denial of approval of CEMEX expansion. As our community leaders, please respond to this CEMEX request with farsightedness and wisdom. Please vote NO.

Response 55-6

The commenter's opposition to the proposed project is noted for the decision-makers.

Letter #56 March 9, 2025, Rick Grijalva, Fresno Audubon Society

Comment 56-1

Dear Mr Randall:

Please accept the following comments from the Fresno Audubon Society regarding the draft Environmental Impact Report (EIR 7763).

Background

The Central Valley is one of the major migratory bird routes in the United States. In the spring of 2024 an estimated 44,028,000 migrating birds traversed Fresno County according to Cornell's Lab of Ornithology's BirdCast[1] (*Footnote 1: BirdCast is an avian nocturnal migration monitoring system developed by the Cornell Lab of Ornithology. It utilizes weather radar data and computer analysis to provide real-time bird migration data as well as migration forecasts across the United States. It tracks both spring migration (from March 1 to June 15) and fall migration (August 1-November 15). Its information is available on both a county-*

specific and statewide basis, and is freely accessible by the general public) migration monitoring system. This was followed last fall by an estimated 44,088,000 birds.

The San Joaquin River Corridor is a critical component in California's bird migration framework, providing essential stop-over habitat that enables transitory birds the opportunity to rest, recover, and replenish along their long journeys, many of which extend over several thousand miles. The DEIR itself recognizes its importance:

The San Joaquin River corridor is considered a significant wildlife movement corridor that provides natural areas for wildlife to move through the region in search of food, shelter, or nesting habitat. Additionally, the San Joaquin River can be used as a wildlife movement corridor to facilitate movement further into the Central Valley. (DEIR 4.4.1.6, p. 4.4-19)

Response 56-1

The comment provides background and general discussion and does not address the adequacy of the Draft EIR. Please see responses to specific comments below.

Comment 56-2

The projected 100 year duration of the CEMEX Project and the massive physical scale of the Project, when coupled with its location in the heart of the biologically sensitive San Joaquin River Corridor, require a most thoughtful and thorough consideration of the environment consequences to birds and other wildlife species. The DEIR has not provided an adequate analysis of these impacts as the following will demonstrate.

Response 56-2

The commenter's observations regarding the project location, duration, and the sensitivity of the San Joaquin River corridor are noted.

The Draft EIR evaluates the project's potential impacts to biological resources, including nesting birds, migratory corridors, and sensitive habitat areas, in Section 4.4, "Biological Resources," in compliance with CEQA. Please see the responses to specific comments below for additional discussion of these topics.

Comment 56-3

Inadequacies of Avian Species Surveys

The DEIR undertook only two field surveys of wildlife in the area: April 30, 2019 and June 14, 2021. (DEIR 4.4.1.2, PDF p. 346) These generated counts of 27 bird species for the Plant Site (Appendix E-1 Table B-2, PDF p. 1160) and 31 bird species for the Quarry Site (Appendix E-2 Table B-2, PDF p. 1237).

Fresno Audubon Society (FAS) members and others have been actively birding along the San Joaquin River for many years, particularly at Lost Lake Park, which borders the northern edge of the Quarry Site. Data accumulated from over two thousand such observations along the San Joaquin River Corridor is maintained with eBird, the global database of avian observations developed by the Cornell Lab of Ornithology.[2] (*Footnote 2:* eBird's searchable database of bird observations (checklists) contain the date, time, location, and count for each species reported by the observers. eBird employs statistical analysis as well as expert review of rare or unusual species observations to assure accuracy of its data. eBird data has been utilized for scientific research and environmental policy issues, among other things.)

Several eBird "hotspots"—specific geographic birding locations—abut either the Plant or Quarry Sites. These are: Ball Ranch, Fresno, US-CA (corresponding to Ball Ranch Natural Reserve in DEIR); Sumner Peck Ranch, Fresno, US-CA (Peck Ranch Pkwy Trust in DEIR); Ledger Island, Madera, US-CA (Ledger Island Natural Reserve in DEIR); and Lost Lake Rec Area (FRE Co.), Fresno, US-CA (Lost Lake Park and Beck Ranch in DEIR) (See maps, DEIR Figure 2-5 [PDF p. 127] and Figure 4.1-1 [PDF p. 187].)

- **San Joaquin River Parkway Surveys.** Monthly surveys sponsored by FAS encompass areas along the river both upstream downstream near the CEMEX mining operations. These have been undertaken over a number of years. eBird data for these surveys document the presence of 185 species along the River Corridor.

- **Ball Ranch eBird Hotspot.** Ball Ranch eBird checklists report161 bird species from 160 checklists as of February 2025. Ball Ranch is immediately to the north of the Plant Site. (**https://ebird.org/hotspot/L4131177**)

- **Sumner Peck/Ledger Island Hotspots.** Sumner Peck Ranch is immediately to the south of the Quarry Site. Ledger Island is directly across the river from the Quarry Site. eBird data

documents 120 bird species from 96 checklists at Sumner Peck Ranch and 98 species from 16 checklists from Ledger Island as of February 2025. (**https:// ebird.org/hotspot/L13905811, https://ebird.org/hotspot/L4931237**)

- **Lost Lake Rec. Area Hotspot.** The Lost Lake Hotspot encompasses both Lost Lake Park and adjoining Beck Ranch. Both lie to the immediate north of the Quarry Site. eBird checklist data for this Hotspot records the observation of 228 bird species as the result of 1886 observations as of February 2025. (**https://ebird.org/hotspot/L188972**) It is particularly noteworthy that the the historical monthly species count observed at the Lost Lake Hotspot during April are 158 species and 103 species for June. This contrasts sharply to the 27 species for the Plant Site and 31 species for the Quarry Site from the combined April 2019 and June 2021 field surveys relied upon for the DEIR.

- Additional local avian population data is available from the Audubon **Christmas Bird Count (CBC)** which has been conducted annually for decades within the geographic area encompassing the Project and the adjacent river corridor. Survey results for the CBC from December 2023 reflect a count of 127 bird species within the Lost Lake CBC zone. As with the eBird data, CBC data is publicly accessible. (**https://netapp.audubon.org/CBCObservation/Historical/ResultsByCount.aspx#Countcode:CALL**)

Response 56-3

Based on California Natural Diversity Database (CNDDB) observations, including the expanded 9-quad CNDDB search conducted as part of this Final EIR and incorporated through errata in Chapter 3, "Draft EIR Errata," and several onsite biological surveys, sufficient data was gathered to meet CEQA's analytical requirements. A nesting bird clearance survey would be conducted to ensure impacts to nesting birds would be less than significant. Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds prior to the initiation of a mining phase as shown on the Plant Site Mining Plan (see Figure 2-7, "Proposed Plant Site Mining Plan") and Quarry Site Mining Plan (Figure 2-8, "Proposed Quarry Site Mining Plan"). Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR pages 4.4-50 through 4.4-51). With the mitigation measures, the project's impact upon nesting bird habitat would be less than significant (see Draft EIR page 4.4-52). See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4, and Mitigation Measure 4.4-1c.

Comment 56-4

The treatment of Species of Special Concern in the DEIR is also problematic. The DEIR states that governmental agency databases for Special Status plant and wildlife species were examined for four USGS quadrangle areas to determine the possible presence of such species on Project properties. The searches generated a total of 15 avian species of Special Concern between the two sites. (Table C-1 Appendix E-1 PDF page 1163 for the Plant Site and Table C-1 Appendix E-2 PDF page 1240 for the Quarry Site.)

Fresno Audubon has compared the observation data for the Lost Lake Rec Area eBird Hotspot with the January 3, 2025 California Department of Fish and Wildlife's CNDDB Special Animals List. Twenty-eight CNDDB bird species of interest have been reported at Lost Lake Park, thirteen more than is reflected in the DEIR. (One species in the DEIR inventory has not been reported at Lost Lake.) (See Table 1 attached to this letter.) This discrepancy needs to be examined and explained.

Response 56-4

See Response 56-3. Given existing conditions at the project sites and the history of mining, processing, and associated activities at these sites, the baseline review and assessments performed are sufficient for a CEQA analysis of the proposed project.

Comment 56-5

Moreover, the failure to consider the impact of the Project on non-specially designated bird species needs to be justified given the number of species known to be in the area.

Response 56-5

Based on California Natural Diversity Database (CNDDB) observations and several onsite biological surveys, sufficient data was gathered to meet CEQA analytical requirements for all nesting bird species known to inhabit the project sites. A nesting bird clearance survey would be conducted to ensure impacts to nesting birds would be less than significant. Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds prior to the initiation of a mining phase as shown on the Plant Site Mining Plan (see Figure 2-7) and Quarry Site Mining Plan (Figure 2-8). Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR pages 4.4-50 through 4.4-51). With the mitigation measures, the impact on nesting bird habitat would be less than significant (Draft EIR page 4.4-52). The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. As such, no

additional impacts on non-listed avian species are anticipated. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4 and Mitigation Measure 4.4-1c.

Comment 56-6

The understatement of avian species, both specially designated or general species, is problematic as the DEIR specifically declines to address impacts on any species not identified as having been "known to be present or have a moderate or higher potential for occurrence on the Plant Site and/or Quarry Site…" (DEIR 4.4.1.8, p. 4.4-20). Thus limited, the DEIR does not evaluate the effects of the project on well over one hundred fifty bird species known to have been observed at the adjoining Lost Lake Park, including thirteen bird species recognized by CDFW as deserving special consideration. Therefore, the assessment of the impacts and proposed mitigation measures under the Biological Resources component of the DEIR is deficient. (See Impacts 4.1-1 to 4.4-7 [ES-14 to ES-19; PDF pp. 39-43])

Response 56-6

Based on CNDDB observations and several onsite biological surveys, sufficient data was gathered to meet CEQA analytical requirements for all nesting bird species known to inhabit the project sites. A nesting bird clearance survey would be conducted to ensure impacts to nesting birds would be less than significant. Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds prior to the initiation of a mining phase as shown on the Plant Site Mining Plan (see Figure 2-7) and Quarry Site Mining Plan (Figure 2-8). Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR pages 4.4-50 through 4.4-51). With the mitigation measures, the impact on nesting bird habitat would be less than significant (Draft EIR page 4.4-52). The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. As such, no additional impacts on non-listed avian species are anticipated. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4 and Mitigation Measure 4.4-1c.

Comment 56-7

The DEIR Does Not Adequately Address the Impacts on Birds of Noise, Air Pollution and Other Project-Related Disturbances

An understanding of bird migratory behavior is necessary to fully consider the impact of the CEMEX project on the health of avian species. Migration is a nocturnal activity. Birds travel at night in order to avoid predators and to take advantage of usually more

favorable weather conditions. Consequently, birds must rest and forage during the daylight hours. Foraging is particularly critical to birds during migration, given the tremendous amount of energy prolonged flight requires. This daylight stop-over time, however, will be occurring during the peak operations of the CEMEX Plant and Quarry Sites, when Project-generated disturbances of noise, vibration, dust and air pollution levels will be at their highest.

The DEIR analysis of the effects of these disturbances merely asserts that some bird species have become habituated to activities, providing a list of 19 birds—almost every one of which is commonly found in urban settings. The fact that pigeons frequent parking lots does not establish the the parking lot as suitable bird habitat. Because of the underreporting of bird species known to the area, the DEIR does not address how the mining activities and disturbances may affect over 150 bird species. The examples of other mining projects are presented without any proof of comparability.

There is a significant body of scientific knowledge on the effects of noise for birds.[3] (*Footnote 3: See, for example Francis CD, Ortega CP, Cruz A. Noise pollution changes avian communities and species interactions. Curr Biol. 2009 Aug 25;19(16):1415-9. doi: 10.1016/j.cub.2009.06.052. Epub 2009 Jul 23. PMID: 19631542.*) However, none of the numerous studies were consulted for the DEIR. These studies have documented the following negative consequences for birds of noise and sound disturbances:

Physiological: cardiovascular consequences such as heart rate increase, immune response decline, hearing loss, increase in stress hormone levels.

Behavioral: habitat abandonment, changes in foraging behavior, reduced vigilance, territory shift, navigation difficulties

Acoustic Perception: frequency interference, vocal adjustments, vocalization timing adjustment, impaired song learning, mate attraction.

Response 56-7

See Responses 56-3 and 56-6. It is assumed that a variety of bird species may be present in the vicinity of the project sites, including transient individuals during migration. The baseline for the Draft EIR's analysis is both disturbed existing conditions and a history of routine mining and associated activities at the project sites. The proposed project would not substantially alter this baseline. The commenter has not provided any substantial

evidence that the effective continuance of these project activities (during daylight hours) would result in potentially significant impacts to birds that are migrating or otherwise in the vicinity of the project sites.

Comment 56-8

The DEIR must include a comprehensive and scientifically supported assessment of the impacts of noise and other Project-generated disturbances on the variety of bird species that are actually present in and around the Project sites. This must include adopting acoustic testing measures calculated to take into account the projection of noise into areas where impacted wildlife species are likely to reside in the Corridor areas, such as tree-level monitoring.

Response 56-8

See Responses 56-6 and 56-7. No additional studies or measures to address noise impacts on birds are warranted.

Comment 56-9

Further, the mitigation requirements for noise monitoring program under the DEIR for the Plant Site (DEIR 4.13-2, PDF p. 802) and the Quarry Site (DEIR 4.13-3, PDF p. 804) as well as those relating to the blasting protocols, must be revised to address the consequences of Project-generated disturbances to wildlife in the adjacent habitat. Monitoring stations, equipment and monitoring protocols must take into account the requirements necessary to protect animal species known to the area.

Response 56-9

In terms of indirect impacts from noise, the commenter does not provide substantial evidence that these activities would result in a significant impact to wildlife. The Draft EIR does provide an analysis of potential impacts from the project in Section 4.4 (supported by studies provided as Appendix E-1 and E-2). Appendix E-4 of the Draft EIR provides an evaluation of the potential for blasting to impact salmonids in the San Joaquin River. The proposed project activities would avoid direct impacts to sensitive habitats along the San Joaquin River. Based upon the blast designs used to maintain safe ground vibration levels for the stability of the slope, the resulting overpressures in the waters of the San Joaquin River due to blasting associated with the proposed project would be less than 1 psi. This level of overpressure is significantly below the 7.3 psi limit established for the safety of salmon. Though information is not available for indirect effects of blasting on all wildlife in the area, it is reasonable to assume that the low amount of overpressure that would result from the proposed project would not have a significant

impact on these species, especially given the long duration of mining activities that the project sites have been subjected to over the past 30-100 years. For these reasons, no additional studies or measures to address noise impacts on wildlife are warranted.

Comment 56-10

The Riparian Corridors

The DEIR considers riparian and wildlife corridors at 4.4.1.6 (p. 4.4-18 to -19, PDF pp. 343-344). It recognizes wildlife corridors as "significant features for dispersal, seasonal migration, breeding, and foraging" which "can provide a buffer against both human disturbance and natural fluctuations in resources." It acknowledges the San Joaquin River Corridor as "a significant wildlife movement corridor that provides natural areas for wildlife to move through the region in search of food, shelter, or nesting habitat…." The DEIR discusses three wildlife or riparian corridors in the area:

(1) The area extending approximately 0.6 miles to the west of the Plant site consisting of a portion of the Willow Unit of California DWF (Willow Unit Corridor)

(2) Little Dry Creek, being a portion of the Willow Unit, lying to the north of the Plant Site and between the Plant Site and Ball Ranch

(3) An approximate 1.4 mile section of river frontage along the western boundary of the Quarry Site featuring a 200 foot wide area between the western boundary of the Quarry site and the San Joaquin River.

Response 56-10

The commenter summarizes information presented in the Draft EIR regarding riparian and wildlife corridors. No specific comments regarding the adequacy of the Draft EIR analysis are provided.

Comment 56-11

The Willow Unit Corridor

This corridor lies to the west of the Plant Site. The DEIR assumes the constancy of this area as providing "abundant nesting sites," etc., for birds. However, given the protracted duration of the Project, the long term viability of the Corridor as wildlife habitat is a relevant consideration. Therefore, the impact of climate change and projected increasing significance of drought

conditions should be considered. Although the Report appears to tout the Willow Unit as an ecologically redeeming feature of this area, it's relevance as an ameliorative consideration in the overall scheme of the project will diminish as the focus of operations shift from the Plant Site to the Quarry Site some distance away.

Response 56-11

The commenter raises concerns regarding the long-term viability of the Willow Unit Corridor, including potential effects of climate change and drought conditions.

Under CEQA, the Draft EIR evaluates the potential impacts of the proposed project on the environment, rather than the effects of the environment (e.g., climate change) on the project or surrounding resources (see California Building Industry Assn. v. Bay Area Air Quality Management Dist. (2015) 62 Cal.4th 369, 392; PRC Sections 21002 and 21002.1(c)). Accordingly, an analysis of potential future climate change effects on the Willow Unit Corridor is outside the scope of the CEQA analysis.

As described in Section 4.4, the proposed project avoids direct impacts to the San Joaquin River and associated riparian habitats. The Draft EIR evaluates project-related impacts to wildlife movement and habitat and does not rely on the Willow Unit Corridor to reduce or offset project impacts. Potential future changes to the corridor due to regional factors, such as climate change, would occur independent of the proposed project and are not attributable to project-related activities.

Comment 56-12

The Little Dry Creek Corridor

The DEIR identifies Little Dry Creek as a "riparian corridor with a connection to the San Joaquin River." It consists of a seasonal creek bed with sparse vegetation, featuring a number of dead trees and dead shrubs. The creek bed largely sits at a lower elevation than the adjacent Plant Site and Ball Ranch and provides virtually no acoustic or aesthetic buffer from the Plant Site's activities. It offers little meaningful cover for wildlife so it cannot be considered to be a "wildlife corridor" as defined in the DEIR. If it is intended by CEMEX to suggest that Little Dry Creek is a biological mitigating consideration for its project, then it should be required to implement a program for its revegetation.

As is the case with the Willow Unit Corridor, the DEIR does not address how climate change and drought may further affect this area. The creek appears particularly vulnerable to these factors given the seasonality of the water flow and the notable presence

of dead trees and plant materials. Here again, the relevance of Little Dry Creek as an ameliorative consideration, if it may be considered such, will decline with the shift of activities from the Plant Site to the Quarry Site.

Response 56-12

The intention of the Draft EIR was not to represent Little Dry Creek as a regionally significant wildlife corridor in the same sense that the San Joaquin River (SJR) is a significant wildlife corridor. While Little Dry Creek may provide some connectivity to SJR and provide some habitat for wildlife, it is not a regionally significant wildlife corridor because it does not provide connection between two larger habitat blocks or provide migratory passage between two habitat types.

Additionally, the project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. No significant impacts to the Little Dry Creek Corridor are anticipated.

Please note that the Draft EIR is not required to analyze climate change's impacts upon the project (see *California Building Industry Assn. v. Bay Area Air Quality Management Dist.* (2015) 62 Cal.4th 369, 392; Citing PRC Sections 21002 and 21002.1(c)).

Comment 56-13

The Quarry Site Corridor

The DEIR identifies the area adjacent to the western boundary of the Quarry Site as part of the San Joaquin River Corridor. This riverfront is approximately 1.4 miles in length. The width of the area between the Quarry Site and the River is stated to be 200 feet, however, that will be reduced by the anticipated grant of an an easement for the River Parkway trail which size requirements are undetermined. The DEIR does not disclose the condition of the riverfront on the opposite bank.

Response 56-13

The riverfront on the opposite bank is not part of the project footprint and is not required to be analyzed.

Comment 56-14

The Project proposes a qualitative change in the operations of the Quarry Site which will include a significant increase in mining activity accompanied by extensive excavation and blasting, and in turn, an extraordinary increase in Project-generated disturbances (noise, vibration, dust, air and water pollution) from which the

Corridor must shield wildlife, both resident and migratory, over the course of the projected 100 years. Additionally, the shift in the locus of operations from the Plant Site a half mile from the San Joaquin River to the Quarry Site only 200 feet from the river requires special attention be given to the adequacy of this portion of the Corridor to protect wildlife.

Response 56-14

The project sites have already been exposed to mining activities for several decades at a minimum and as such is highly disturbed. The off-site corridor, which is adjacent to the project functions now and in previous decades within the context of ongoing mining activities within the project sites. It is not reasonably foreseeable that the proposed operational changes would result in significant impacts to natural resources and the comment does not provide substantial evidence that such impacts would result. The Draft EIR does analyze impacts from the proposed project sufficient to establish that the corridor and the wildlife it supports would not be significantly impacted.

Comment 56-15

The following must be considered in the DEIR, especially with reference to the Quarry Site area:

- The width of corridor necessary to buffer wildlife from the Project-related disturbances. The DEIR does not consider the scientific research on features such as corridor width, although a number of studies exist. Much of the research indicates the necessity of corridors well in excess of the 200 foot width proposed. Rather than address the research, the DEIR merely adopts the minimum standard width required under the Fresno County General Plan. This requires further study, including consideration of the science relating to the effects of noise and other disturbances, as discussed above.

Response 56-15

The 200-foot setback is part of the existing baseline conditions of the Quarry Site. The proposed project would maintain this 200-foot setback in accordance with the Fresno County General Plan. The project sites are already disturbed by ongoing mining activities and would not result in a substantial increase in disturbance relative to existing conditions.

The analysis and conclusions in the Draft EIR are based on the existing context of mining and associated activities at the project sites, which have been ongoing for many years. The proposed project would not substantially alter this baseline. The Draft EIR evaluates

potential impacts related to wildlife movement, habitat, noise, and other disturbances, including blasting operations, and concludes that impacts would be less than significant with mitigation.

The Fresno County General Plan, which establishes the 200-foot minimum buffer, was itself subject to CEQA review. The Draft EIR evaluates the project's consistency with these established standards and does not identify a need for a wider buffer based on project-specific impact analysis. See also Response 58-31 for further discussion of potential impacts to wildlife corridors and connectivity.

Comment 56-16

- How will the development of the anticipated multi-use River Parkway trail impact the suitability of the corridor as a wildlife corridor, given the proposed initial width of only 200 feet for the boundary?

Response 56-16

The proposed project would be consistent with applicable County land use policies requiring a minimum 200-foot-wide wildlife corridor (Draft EIR page 4.11-30). Given the narrow footprint of a potential multi-use trail relative to the overall corridor width, the preservation of natural vegetation, and the implementation of design and mitigation measures, the project would not substantially reduce the suitability of the corridor as a wildlife movement pathway.

As discussed in Section 2.5.8, "Trail Easement," of the Draft EIR, the Operator is in discussions with the San Joaquin River Conservancy regarding potential trail easements at the Plant Site and Quarry Site. The Plant Site trail easement would be located along the eastern boundary of the Plant Site within the 50-foot setback from North Friant Road, and the Quarry Site trail easement would be located along the western boundary of the Quarry Site within the 200-foot setback from the San Joaquin River. These easements would set aside areas that could be developed for trails during the mining period.

The Draft EIR evaluates potential impacts to riparian habitats and wildlife movement corridors (see Impacts 4.4-4 and 4.4-6) and concludes that impacts would be less than significant with mitigation. The detailed design and implementation of any future trail would be subject to separate planning and environmental review, as applicable.

Comment 56-17

- What mitigation measures, such as ongoing revegetation programs, soil conservation projects and the like, are necessary to sustain an appropriate buffer to protect

wildlife over the lifespan of the Project? How will these measures be determined and monitored? How will performance of mitigation measures be enforced and how will that performance be secured?

- What mitigation measures should be required in order to restore suitable biological buffer zone in the event of collapse or compromise due to flooding or other geologic or hydraulic event causing the berm to collapse?

Response 56-17

The proposed project includes a comprehensive approach to maintaining appropriate buffers and protecting wildlife over the lifespan of operations. Because the project sites are already disturbed by ongoing mining activities, key measures focus on enhancing and maintaining habitat in areas adjacent to operational zones. These measures include a Revegetation Program and Soil Conservation and Erosion Control. Proposed revegetation is described in Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan," Section 5.1.7, "Reclamation."

Please see Collective Response #17 regarding flooding and Response 65-37 regarding the stability of the San Joaquin riverbank. The Draft EIR is not required to engage in speculation, and as such is not required to provide mitigation measures for an unlikely, extreme flood event.

Comment 56-18

The DEIR is incomplete in its assessment of the impacts likely to result from the CEMEX Project. Substantial data and research are available from which a comprehensive and accurate impact report can be generated. Our community deserves to have a fully developed analysis to consider.

On behalf of Fresno Audubon Society, I thank you for this opportunity to present the foregoing comments.

Response 56-18

The County disagrees with the commenter's general opinion that the Draft EIR is incomplete and should include additional analysis. As discussed in Responses 56-3 through 56-17, the Draft EIR was prepared in accordance with CEQA and contains substantial evidence supporting its analysis and conclusions regarding biological resources, wildlife movement, riparian corridors, noise, and related project impacts. The Draft EIR relies on site-specific surveys, agency database searches, technical studies, and mitigation measures to evaluate the project's potential environmental effects.

The Draft EIR is not required to evaluate every conceivable issue or to address impacts in the manner preferred by the commenter; rather, it must provide sufficient information to permit informed decision-making and public participation. The County finds that the Draft EIR satisfies that standard. To the extent the comment reiterates concerns regarding avian species, wildlife corridors, noise, disturbance, corridor width, trail easements, revegetation, and long-term buffer protection, those concerns are addressed in Responses 56-3 through 56-17, which are incorporated herein by reference.

Accordingly, while the comment is noted, it does not identify any specific deficiency in the Draft EIR that would require recirculation or revision of the impact analysis beyond the clarifications provided in the Final EIR.

Letter #57 March 10, 2025, Kay Bertken and Robin Chiero, League of Women Voters of Fresno

Comment 57-1

The League of Women Voters of Fresno (League) is a nonpartisan political organization that encourages the informed and active participation of citizens in government, works to increase understanding of major public issues and helps shape public policy through education and advocacy.

Response 57-1

This is an introductory comment that does not address the adequacy of the Draft EIR. No further response is warranted. See Responses 57-3 through 57-15 below that address specific issues raised in this comment letter.

Comment 57-2

In preparing these comments, the League reviewed the following documents:

- Surface Mining and Reclamation Act of 1975
- Special Report 158 (Mineral Land Classification: Aggregate Materials in the Fresno Production-Consumption Region, California Department of Conservation – Division of Mines and Geology, 1988)
- Fresno County General Plan Policy Document (February 2024)
- Fresno County Zoning Ordinance, Division 6 of the Fresno Ordinance Code (February 2024)

- San Joaquin River Parkway Master Plan Update (April 2018)
- Draft Environmental Impact Report for the CEMEX Rockfield Quarry Modification Project (December 2024)

CEMEX proposes to modify its Rockfield mining operation to include hard rock mining.

Response 57-2

This is an introductory comment that does not address the adequacy of the Draft EIR. No further response is warranted. See Responses 57-3 through 57-15 below that address specific issues raised in this comment letter.

Comment 57-3

The League asserts that such use is inconsistent with current land use plans and, therefore, that the Draft EIR is incorrect in concluding that the proposed project will not conflict with current land use plans. With respect to the use of river bottom land below Friant Dam, current plans do not entertain, embrace, encourage, envision, or even mention such use.

The only type of mining addressed in local land use plans is the excavation of alluvial deposits — not the blasting and crushing of bedrock.

Response 57-3

Draft EIR Section 4.11, "Land Use and Planning," provides a detailed evaluation of the proposed project's consistency with policies of the Fresno County General Plan, Madera County General Plan, Fresno County Zoning Ordinances, and San Joaquin River Parkway Master Plan (see Draft EIR Table 4.11-1, "Project Consistency with Local Planning Documents," on pages 4.11-10 through 4.11-47). The Draft EIR analysis of Impact 4.11-2, "Conflict with Land Use Plans, Policies, and Regulations," (Draft EIR pages 4.11-49 and 4.11-50) concludes that the proposed project would not result in conflicts with any land use plan, policy, or regulations adopted for the purpose of avoiding or mitigating an environmental effect.

Please see responses below for further discussion of the project's consistency with Fresno County General Plan policies, zoning code, and San Joaquin River Parkway Master Plan.

Fresno County decision-makers will consider the analysis in the EIR, public comments (including those submitted by the commenter), and other information in making a finding of whether the project is consistent with the Fresno County General Plan.

Comment 57-4

Surface Mining and Reclamation Act of 1975 (SMARA)

The principal aim of the Surface Mining and Reclamation Act of 1975 (SMARA) is to protect the environment while allowing responsible mineral extraction. More specifically, the act ensures that the adverse environmental impacts from mining are minimized, that mined lands are reclaimed to a usable condition and that lands bearing mineral resources are protected from encroachment by land uses that could preclude future mining.

With regard to protecting mineral bearing lands from encroachment, SMARA § 2761 requires the Office of Planning and Research to identify areas within the state that are being urbanized or are subject to urban expansion or other irreversible land uses that could preclude mineral extraction. The State Geologist is required to map those areas, and local jurisdictions are required to incorporate that information into their respective general plans and zoning codes.

Areas known to contain PCC-grade aggregate (aggregate suitable for making high-quality portland cement concrete) are classified as Mineral Resource Zone 2 (MRZ-2).

Response 57-4

The comment is noted. Draft EIR Section 4.12, "Mineral Resources," discusses the mineral resource designations of the Plant Site and Quarry Site. Components of the project area are within areas where aggregate resources are classified as MRZ-2 (Draft EIR page 4.12-1).

Comment 57-5

Special Report 158 — Mineral Land Classification: Aggregate Materials in the Fresno Production-Consumption Region

In 1988, the State Geologist published Special Report 158, which described in detail the location of aggregate resources on the valley floor that could be extracted and used in the Fresno area. The State Geologist mapped 31 square miles containing in excess of 2.1 billion tons of aggregate — nearly all which was located within floodplains created by the San Joaquin and Kings Rivers.

In 1988, mining permits in the Fresno area allowed the excavation of 119 million tons of aggregate — only 44% of the projected need for the Fresno area for the next 50 years.[1] (Footnote 1: Special Report 158 - Mineral Land Classification: Aggregate Materials in

the Fresno Production-Consumption Region, prepared by the State Geologist, 1988, page x.) Absent the approval of additional mining permits, the projection was that the Fresno area would run out of mined aggregate by 2010. But that shortfall never occurred. Over the next 30 years, a considerable amount of new acreage was opened to mining, and by 2018, although the 50-year need had grown to 306 million tons, aggregate resources under permit totaled 556 million tons, which was 182% of the Fresno area need through 2068.[2] (*Footnote 2: Map Sheet 52 – Aggregate Sustainability in California (updated 2018), published by the California Department of Conservation, page 5.*)

For this discussion it's important to note that the only aggregate resources evaluated by the State Geologist were those found in alluvium — the particulate rock material (sand and gravel) deposited by streams and rivers.[3] (*Footnote 3: Page ix of the Executive Summary for Special Report 158 reads, " This report presents the results of the classification of aggregate resources by the Division of Mines and Geology (DMG) in the Fresno Production-Consumption (P-C) Region.* ***The primary goals of the study were…to delineate within the P-C region all land containing sand and gravel deposits*** *suitable for production as high-quality, Portland cement concrete (PCC) aggregate. (Highlighting added.*) Special Report 158 did not assess the excavation (blasting) of bedrock.

Response 57-5

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

The comment references the 1988 report, "Mineral Land Classification: Aggregate Materials in the Fresno Production-Consumption Region," (Special Report 158) and quotes one of three primary goals of the study, "[t]o delineate within the P-C region all land containing sand and gravel deposits suitable for production as high-quality, Portland cement concrete (PCC) aggregate.

However, in 1999 the Department of Conservation (DOC) Division of Mines and Geology (DMG) prepared an "Update of Mineral Land Classification: Aggregate Materials in the Fresno Production-Consumption Region" (DMG Open-File Report 99-02, 1999). The updated classification identifies that "[t]he potential resources mentioned in Special Report 158 that lie within the Fresno P-C Region include areas underlain by Quaternary alluvium, Tertiary sediments and volcanic rocks, and pre-Cretaceous intrusive and metamorphic basement rocks" (Open File Report 99-02, page 26).

Comment 57-6

Fresno County General Plan Policy Document (February 2024)

In accordance with SMARA and Special Report 158, the County included in its General Plan update in 2000[4] (*Footnote 4: 2000 General Plan Policy Document, pages 5-9 and 5-10.*)several policies designed to conserve and protect sand and gravel resources.

Policy OS-C.1 The County shall not permit incompatible land uses within the impact area of existing or potential surface mining areas.

Policy OS-C.2 The County shall not permit land uses incompatible with mineral resource recovery within areas designated as Mineral Resource Zone 2 (MRZ-2). (See Figures 7-9, 7-10, and 7-11 in Fresno County General Plan Background Report.)

Policy OS-C.3 The County shall require that the operation and reclamation of surface mines be consistent with the State Surface Mining and Reclamation Act (SMARA) and special zoning ordinance provisions.

Policy OS-C.4 The County shall impose conditions as necessary to minimize or eliminate the potential adverse impact of mining operations on surrounding properties.

Policy OS-C.5 The County shall require reclamation of all surface mines consistent with SMARA and the County's implementing ordinance.

Policy OS-C.6 The County shall accept California Land Conservation (Williamson Act) contracts on land identified by the State as containing significant mineral deposits subject to the use and acreage limitations established by the County.

Policy OS-C.7 The County shall require that new non-mining land uses adjacent to existing mining operations be designed to provide a buffer between the new development and the mining operations. The buffer distance shall be based on an evaluation of noise, aesthetics, drainage, operating conditions, biological resources, topography,

lighting, traffic, operating hours, and air quality.

Policy OS-C.8 The County shall, where feasible along the San Joaquin River, site recreational trails, bikeways, and other recreation areas at least three hundred (300) feet from the edge of active aggregate mining operations and separate them by physical barriers.

Recreational trail/bikeway crossings of active haul routes should be avoided whenever possible; if crossings of haul routes are necessary, separate where feasible.

Policy OS-C.9 The County shall require that any proposed changes in land use within areas designated MRZ-2 along the San Joaquin and Kings Rivers comply with the provisions of the State Surface Mining and Reclamation Act (SMARA).

Policy OS-C.10 The County shall not permit land uses that threaten the future availability of mineral resource or preclude future extraction of those resources.

Policy OS-C.11 The County shall undertake a comprehensive, watershed-based planning effort to assess future extraction of the aggregate resources and recreation uses along the Kings River as a part of an update of the Kings River Regional Plan. Such a planning effort would help to facilitate use of the resource while protecting other Kings River watershed resources and functions, including floodplain areas. (See Policy OS-H.10, Policy LU-C.5, and Program LU-C.A)

These same policies remained unchanged when, in 2024, the County updated its General Plan Policy Document.

Response 57-6

This comment and the referenced policies are noted. As discussed in Response 57-3, above, Draft EIR Section 4.11, provides a detailed evaluation of the proposed project's consistency with policies of the Fresno County General Plan, Madera County General Plan, Fresno County Zoning Ordinances, and San Joaquin River Parkway Master Plan (see Draft EIR Table 4.11-1, on pages 4.11-10 through 4.11-47). Of the policies listed above,

Draft EIR Table 4.11-1 assesses project consistency with Policy OS-C.3, Policy OS-C.4, Policy OS-C.5, Policy OS-C.9, and Policy OS-C.10. Other policies listed in the comment above are not considered applicable to the project for the following reasons:

Policy OS-C.1 pertains to permitting incompatible land uses in proximity to mining areas. The project does not propose land uses that are potentially incompatible with mining and therefore this policy is not applicable to the proposed project.

Policy OS-C.2 pertains to permitting incompatible land uses in proximity to mineral resource recovery areas. The project does not propose land uses that are potentially incompatible with mineral resource recovery areas and therefore this policy is not applicable to the proposed project.

Policy OS-C.6 pertains to allowing California Land Conservation (Williamson Act) contracts within mineral resource recovery areas. The project does not involve California Land Conservation (Williamson Act) contracts and therefore this policy is not applicable to the proposed project.

Policy OS-C.7 pertains to new non-mining land uses adjacent to existing mining operations. The project does not propose new non-mining land uses adjacent to existing mining operations and therefore this policy is not applicable to the proposed project.

Policy OS-C.8 pertains to the siting of recreational trails, bikeways, and other recreation areas in proximity to existing mining operations and pertains to recreational trail/bikeway crossings of active haul routes. While the project proposes a trail easement along the western boundary of the Quarry Site and eastern boundary of the Plan Site, the project does not propose the actual development of recreational trails, bikeways, or other recreation areas and therefore this policy is not applicable to the proposed project. As noted in the Draft EIR, the proposed trail envisioned in the San Joaquin River Parkway Master Plan would undergo a project-level CEQA review process. See discussion of Impact 4.16-2 on Draft EIR page 4.16-6.

Policy OS-C.11 pertains to Kings River aggregate resources and recreational uses. The project does not involve Kings River aggregate resources or recreational uses and therefore this policy is not applicable to the proposed project.

Fresno County decision-makers will consider the analysis in the EIR, public comments (including those submitted by the commenter), and other information in making a finding of whether the project is consistent with the Fresno County General Plan.

Comment 57-7

Fresno County Zoning Ordinance, Division 6 of the Fresno Ordinance Code (February 2024)

On May 18, 1999, the Board of Supervisors added to the County's Zoning Ordinance Section 858 — *Regulations for the Development of Material Extraction Sites in all Districts*.[5] (*Footnote 5: With the update of the Zoning Ordinance in February 2024, Section 858 was renamed 834.4.220 – Material Extraction Sites*)

Section 858 describes the process for permitting new mines, lists standards for mine operation and reclamation and explains obligations related to annual inspections and financial assurances.

The ordinance does not mention hard rock mining, It does, however, directly refer to sand and gravel operations. As shown below, for example, Section 858(D)(3) states that a mining plan must include cross section drawings showing the extent of **sand and gravel** deposits.

3. Mining plan.

a. A site plan which includes all of the following:

(1) Existing and proposed roads, including ingress-egress roads and on-site roads; proposed surface treatment and means to limit dust.

(2) Processing and storage areas including locations of equipment, structures, and facilities.

(3) Proposed setbacks, screening, fencing, gates, parking, and signs.

(4) Proposed phasing for the mining operation and reclamation work.

(5) Cross section (typical) defining planned slopes, extent of overburden, extent of sand and gravel deposits, and water table." (Highlighting added.)

At the time the County was preparing the Draft EIR for the CEMEX Rockfield Quarry Modification Project, it was also reviewing Ordinance Section 858 as part of the County's 2024 update of its Zoning Ordinance. Although the opportunity presented itself, the

County did not revise Section 858 to include a discussion of hard rock mining.

Response 57-7

See Response 58-5 which explains that hard rock quarry operations can be surface mined. See also Responses 58-71.

Comment 57-8

San Joaquin River Parkway Master Plan Update (April 2018)

The San Joaquin River Conservancy last updated its Parkway Master Plan in April of 2018. Just as with the Fresno County Zoning Ordinance, the San Joaquin River Master Plan refers to sand and gravel operations — not to blasting operations.

Printed below are the Parkway Master Plan's two mineral resource goals.[6] (*Footnote 6: Citation from the San Joaquin River Parkway Master Plan, Section 6 (Goals and Policies) as adopted by the San Joaquin River Conservancy by Resolution 18-01 on April 11, 2018.*)

> Goal MR1: Work with gravel mining companies to acquire high priority properties after they have been reclaimed. Promote reclamation plans that enhance and complement Parkway goals and are Parkway-ready to the extent practicable. (Highlighting added.)
>
> Goal MR2: Design, construct, and manage the Parkway in a manner that will not conflict with sand and gravel mining operations. (Highlighting added.)

Response 57-8

This comment and the referenced goals of the San Joaquin River Parkway Master Plan are noted as is the reference in Mineral Resource Goal (MR2) to "sand and gravel mining operations." As discussed in Response 57-3, above, Draft EIR Section 4.11, provides a detailed evaluation of the project's consistency with policies of the Fresno County General Plan, Madera County General Plan, Fresno County Zoning Ordinances, and San Joaquin River Parkway Master Plan (see Draft EIR Table 4.11-1, on pages 4.11-10 through 4.11-47). Draft EIR Table 4.11-1 includes two applicable policies that are related to the goals cited in the comment (Policy Mineral 2 and Policy Mineral 3 on Draft EIR page 4.11-46). As explained there, the Draft EIR concludes that the project would not conflict with the applicable policies. See also Response 11-26.

Comment 57-9

Draft Environmental Impact Report for the CEMEX Rockfield Quarry Modification Project

The Draft EIR for the CEMEX Rockfield Quarry Modification Project does not discuss the fact that there is no accommodation for hard rock mining in the San Joaquin River floodplain in either the Fresno County General Plan, the Fresno County Zoning Ordinance or the San Joaquin River Parkway Master Plan. Nonetheless, the Draft EIR claims that the proposed use is consistent with these plans.

Response 57-9

See Response 58-5 which explains that hard rock quarry operations can be surface mined. The Draft EIR accurately concluded that the proposed project would be consistent with the Fresno County General Plan and Fresno County Zoning Ordinance (Draft EIR page 4.11-50). See also Response 58-71.

Comment 57-10

The Draft EIR claims "the proposed project would be consistent with each of the applicable Fresno County General Plan goals and policies,"[7] (*Footnote 7:* Draft EIR Volume 1, page 4.11-49) but this claim is incorrect. The County promotes mining activities only where aesthetic impacts can be adequately mitigated. General Plan Goal OS-C[8] (*Footnote 8: Draft EIR Volume 1, page 4.11-26*) reads as follows:

> Fresno County General Plan Goal OS-C: To conserve areas identified as containing significant mineral deposits and oil and gas resources for potential future use, while promoting the reasonable, safe, and orderly operation of mining and extraction activities within areas designated for such use, where environmental, aesthetic, and adjacent land use compatibility impacts can be adequately mitigated. (Highlighting added.)

According to the Draft EIR, the project's impact on aesthetic and visual resources cannot be mitigated.[9] (*Footnote 9:* Draft EIR Volume 1, page ES-11) The impact remains significant and unavoidable even with the application of feasible mitigation. Plainly, the Draft EIR erred in finding consistency with the County's General Plan.

In addition, the Fresno County General Plan contains two identical, unequivocal directives that the County support policies of the San Joaquin River Parkway Master Plan that protect the Parkway as an aesthetic resource.[10] (*Footnote 10: Draft EIR Volume 1, Volume 1,*

page 4.11-23; 2024 Fresno County General Plan Policy Document, page 2-137.)

Fresno County General Plan Policy OS-A.15: San Joaquin River Protection. The County shall support the policies of the San Joaquin River Parkway Master Plan to protect the San Joaquin River as an aquatic habitat, recreational amenity, aesthetic resource, and water source. (Highlighting added.)

Fresno County General Plan Policy OS-H.10: San Joaquin River Parkway Master Plan. The County shall support the policies of the San Joaquin River Parkway Master Plan to protect the San Joaquin River as an aquatic habitat, recreational amenity, aesthetic resource, and water source. (RDR/PSP)

Response 57-10

The commenter is referring to Impact 4.1-1, which concludes that the impact to visual resources at two private viewpoints would be significant and unavoidable, even with the implementation of Mitigation Measure 4.1-1, which requires quarry pit staining. However, Mitigation Measure 4.1-1 reduces impacts to the greatest extent feasible. Please refer to Collective Response #8 for further discussion of the project's impacts to visual resources.

The proposed project is consistent with applicable goals, objectives, and policies set forth in the San Joaquin River Parkway Master Plan, the Fresno County General Plan, and the Fresno County Zoning Ordinance (Draft EIR page 4.11-50). The Draft EIR analyzed the project's potential impacts to two different viewpoints on San Joaquin River Conservancy properties, Viewpoint #5 (Ledger Island area) and #8 (Ball Ranch area) (Draft EIR page 4.1-16). The Draft EIR concluded that the project would have a beneficial impact for each of these viewpoints during operations and upon the completion of reclamation (Draft EIR page 4.1-53). As such, the proposed project would be consistent with General Plan Policy OS-A.15 and OS-H.10, as it pertains to aesthetic resources.

Comment 57-11

The Draft EIR also claims that the proposed project "would be consistent with the Fresno County Zoning Ordinance"[11] (*Footnote 11: Draft EIR Volume 1, page 4.11-49*) due to the fact that the company's current permits comply with Zoning Ordinance Section 834.4.220 - Material Extraction Sites (Formerly Section 858). But the these entitlements only permit the excavation of alluvial deposits (sand and gravel). And as previously explained, the County's surface mining ordinance was primarily designed to

accommodate the extraction of the high quality sand and gravel deposits identified in Special Report 185.

Response 57-11

See Response 58-5 which explains that hard rock quarry operations can be surface mined. See also Response 58-71.

Comment 57-12

The Draft EIR also lists reasons why "the project would be consistent with the policies of the San Joaquin River Parkway Master Plan."[12] (*Footnote 12:* Draft EIR Volume 1, page 4.11-23, 4-11-44 through 4-11.47.) They are these:

- The project applicant will offer potential trail easements at the Plant Site and the Quarry Site.
- The project applicant has installed and now maintains nest boxes for cavity-nesting songbirds.
- The proposed project will not disturb wildlife corridors along the river any more than it already has.
- Revegetation would include native plant species that provide food and habitat for wildlife.
- Reclamation will create approximately 500 acres of open water wildlife habitat (fenced with barbed wire).

While it is true that Parkway policies embrace constructing trails and improving wildlife habitat, it's also important to note that the Parkway Master Plan only acknowledges the existence of sand and gravel mining operations within its perimeter, not hard rock mining.

Furthermore, the Draft EIR fails to acknowledge that in an effort to protect wildlife along the river corridor, the San Joaquin River Conservancy, by law,[13] (*Footnote 13: Public Resources Code § 32510. The San Joaquin River Conservancy is hereby established in the Resources Agency to acquire and manage public lands within the San Joaquin River Parkway….The conservancy shall acquire and manage these lands in the parkway to provide a harmonious combination of low-impact recreational and educational uses and wildlife protection through the preservation of the San Joaquin River, existing publicly owned lands, the wildlife corridor, and natural reserves. (Amended by Stats. 1994, Ch. 605, Sec. 1. Effective January 1,1995.*) can only provide low-impact recreation for the

visiting public. It's difficult to imagine how the Parkway's mandate to protect wildlife through low-impact recreation is enhanced by a mining operation that is permitted to blast bedrock underlying the Parkway to the year 3025.

Response 57-12

The Draft EIR is consistent with applicable goals, objectives, and policies set forth in the San Joaquin River Parkway Master Plan and the Fresno County General Plan applicable to recreational opportunities in the County (Draft EIR page 4.11-44). See Response 12-72. The fact that the Parkway Master Plan does not explicitly mention hard rock mining operations does not affect the Draft EIR's analysis of the proposed project's consistency with local planning documents.

Comment 57-13

And finally, the claim in the Draft EIR that the Rockfield Quarry Modification Project is consistent with the Parkway Master plan because it conserves gravel reserves along the San Joaquin River needed for the San Joaquin River Restoration Program[14] (*Footnote 14: Draft EIR page 4.11-46*) is specious in that the mine operation has no control whatsoever over land uses on neighboring properties.

Response 57-13

Comment noted. The fact the proposed project would continue to operate within the existing boundaries, i.e. the footprint would not increase, would help to conserve other areas along the San Joaquin River containing sand and gravel reserves. Thus, the project would be consistent with Policy Mineral 3 of the San Joaquin River Parkway Master Plan (Draft EIR page 4.11-46).

Comment 57-14

Conclusion

The Draft EIR is incorrect in concluding that the project will not conflict with current land use plans. The Fresno County General Plan and Zoning Ordinance only support the mining of alluvium (sand and gravel) in the San Joaquin River floodplain — not hard rock mining. This is made abundantly clear in General Plan Policy LU-C.2,[15] (*Footnote 15:* Fresno County General Plan Policy Document (2024), page 2-36) which reads…

> Fresno County General Plan Policy LU-C.2: San Joaquin River Corridor Overlay Within the San Joaquin River Corridor Overlay, the County shall accommodate agricultural activities with incidental homesites, recreational uses, sand and gravel

extraction, and wildlife habitat and open space areas. (See Figure LU-2) (RDR)

Curing the inconsistency with existing plans necessitates revision of the Fresno County General Plan, the Fresno County Zoning Ordinance and the San Joaquin River Parkway Master Plan.

Environmental information in the accompanying EIRs would need to be updated as well.

Response 57-14

See Response 58-5 which explains that hard rock quarry operations can be surface mined. See also Responses 58-71. The proposed project is consistent with applicable goals, objectives, and policies set forth in the San Joaquin River Parkway Master Plan, the Fresno County General Plan, and the Fresno County Zoning Ordinance (Draft EIR page 4.11-50).

Comment 57-15

Please find attached a copy of Special Report 158 (Mineral Land Classification: Aggregate Materials in the Fresno Production-Consumption Region, California Department of Conservation – Division of Mines and Geology, 1988) and a copy of Map Sheet 52 (Aggregate Sustainability in California (updated 2018), published by the California Department of Conservation).

Response 57-15

The referenced letter attachments are noted and included in the record.

Letter #58 March 10, 2025, Kevin Bundy, San Joaquin River Parkway & Conservation Trust, Inc.

Comment 58-1

This firm represents the San Joaquin River Parkway & Conservation Trust, Inc. ("the Trust") in connection with the proposed Rockfield Quarry Modification Project ("Project"). We submit these comments to inform the County that this draft Environmental Impact Report ("DEIR"), is inadequate under the California Environmental Quality Act ("CEQA"), Public Resources Code § 21000 et seq., and the CEQA Guidelines, California Code of Regulations, title 14, § 15000 et seq. ("CEQA Guidelines").

Response 58-1

The comment is an introductory comment. See Responses 58-14 through 58-72, which further describe or clarify the information presented in the Draft EIR. The Draft EIR is adequate under CEQA (PRC Section 21000 et seq.).

Comment 58-2

The Project as proposed will have significant, adverse impacts on both the natural and the human environment in Fresno County. These impacts include, but are not limited to, potentially devastating effects on: local hydrology and water quality, habitat and movement corridors for both terrestrial and aquatic wildlife, local traffic, air quality, and noise. But none of these impacts or the inconsistencies of the Project can be discerned from reading the DEIR.

Response 58-2

The comment is introductory in nature. To the extent the introductory statements apply to subsequent comments, they will be addressed. See the relevant Draft EIR sections, indicated below, responding to comments regarding local hydrology and water quality, habitat and movement corridors for both terrestrial and aquatic wildlife, local traffic, air quality, and noise. The Draft EIR concluded that the project would not result in significant impacts to water quality or hydrological resources (Hydrology and water quality impacts are discussed on pages 4.10-88 through 4.10-119 of the Draft EIR). See also Responses 58-23 through 58-29 and 58-44 through 58-49 for discussion of the project's impacts to water quality and hydrological resources.

See Section 4.4,"Biological Resources," of the Draft EIR for the analysis of the project's impacts on biological resources, as well as Responses 58-30 through 58-52 for additional discussion. The Draft EIR analyzed the project's impacts to habitat and wildlife corridors, and concluded that these impacts would be less than significant. The Draft EIR's discussion of Impact 4.4-6 (impacts to wildlife corridors) is on page 4.4-62 through 4.4-63 of the Draft EIR, and the discussion of Impact 4.4-2 (impacts to wildlife habitat) is on page 4.4-52 through 4.4-53 of the Draft EIR.

The Draft EIR concluded that the project would result in material, unavoidable impacts to transportation (Impact 4.17-1 discussed on pages 4.17-27 through 4.17-40 of the Draft EIR). See Section 4.17, "Transportation," of the Draft EIR for discussion of traffic and transportation impacts and Collective Responses #29 and #30 regarding traffic increases, funding necessary road improvements, and pedestrian safety.

Regarding the project's impacts to air quality, the Draft EIR, as updated in the Final EIR, concluded that all impacts would be less than significant with implementation of Mitigation Measures 4.3-2a, 4.3-2b, and 4.3-4 (see Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4, "Project Impacts and Mitigation Measures").

The Draft EIR also concluded that the project would not result in significant impacts pertaining to noise (see Section 4.13, "Noise," of the Draft EIR, pages 4.13-49 through 4.13-67).

Comment 58-3

With regard to each of CEQA's substantive requirements--a complete and stable project description, a thorough analysis of significant impacts, identification of feasible and enforceable mitigation measures, an analysis of a reasonable range of alternatives--the DEIR falls woefully short. As a result, the DEIR fails to meet CEQA's fundamental purpose of providing disclosure to the public of the Project's environmental effects. The County and the applicant need to start over--beginning with revised Project objectives that allow for consideration of a reasonable range of alternatives that would be consistent with the General Plan--and prepare and recirculate a new, legally adequate DEIR.

Response 58-3

The comment is introductory in nature. The introductory statements in this comment are addressed in subsequent responses where applicable. The EIR does not require revision and recirculation as it meets CEQA's requirements (Title 14 CCR Section 15088.5). See the relevant sections responding to comments regarding project description, significant impacts, mitigation measures, project alternatives, and whether recirculation is necessary, all of which are addressed. See Responses 58-14, 58-15, 58-16, and 58-17 for a discussion of adjacent land uses and the project description. See Responses 58-67 through 58-70 for a discussion of project alternatives.

Comment 58-4

This letter is submitted along with the reports prepared by Greg Kamman, Hydrogeologist with CBEC Eco Engineering, attached as Exhibit A ("CBEC Report"); Jeff Davis, Biologist with Colibri Environmental, attached as Exhibit B ("Colibri Report"); and Jeremy Decker, Acoustical Engineer with Salter and Associates attached as Exhibit C ("Salter Report"). We respectfully refer the County to the aforementioned attached reports, both here and throughout these comments, for further detail and discussion of the DEIR's inadequacies. We request that the County reply to each of the comments in this letter and to each of the comments in the attached reports.

Response 58-4

The comment is introductory in nature. The responses herein thoroughly and completely address the concerns raised in the reports prepared by CBEC Eco Engineering, Colibri Environmental, and Salter and Associates, the consultants listed. We note that a disagreement among experts does not make an EIR inadequate (Title 14 CCR Section 15151).

Comment 58-5

I. Introduction and Background

The Project site is located within Fresno County's jurisdiction on land designated as 'Agricultural' and falls within the San Joaquin River Corridor Overlay, which allows agricultural activities with incidental homesites, sand and gravel extraction, various recreational activities, wildlife habitat areas, and uses which serve the San Joaquin River Parkway. Fresno County General Plan at 2-25 and DEIR at 2-2. The Project site is zoned AE-20 Exclusive Agriculture, 20-acre minimum parcel size, which allows "surface mining" operations but not hard rock mining. We note that County General Plan Table LU-1 at p. 2-25 similarly allows "Surface Mining Operations" in AE and other agricultural zones, but omits any reference to hard rock mining.

Response 58-5

The comment raises introductory statements and statements regarding the General Plan and Zoning designations. See Responses 58-71 and 58-72 regarding the General Plan and Zoning Designations. The commenter misunderstands mining terminology. Surface mining includes subsets such as alluvial mining and hard rock mining. See, e.g., PRC Section 2735. The dichotomy is surface mining versus underground mining. The dichotomy is <u>not</u> hard rock mining versus surface mining. Hard rock quarry operations can be surface mined.

Comment 58-6

The proposed Project includes: two Conditional Use Permits (one to expand surface mining and processing for another 30 years and one to allow hard rock mining over a period of 100 years; approval of a Surface Mining and Reclamation Plan (SMRP) and the associated Financial Assurance Mechanism (FAM), a Landscape Plan (for revegetation), right-of-way permits; and a host of discretionary permits from resource agencies. DEIR at 2-52 and 2-53. The Project would expand extraction of material by almost double (from the current 1.4 million tons per year to 3 million tons) and would allow a total extraction of approximately 300 million tons of

material from the plant and quarry sites over a period of 100 years. DEIR at ES-4 and 2-5.

Response 58-6

The comment is introductory and does not address the adequacy of the Draft EIR.

Comment 58-7

The project site has been mined by various companies for many decades. The community anticipated that operations would be completed sometime between 2005 and 2008 and the site restored in accordance with the Project Reclamation Plan. Instead, the County granted several extensions and operations continue today.

Response 58-7

The comment is introductory in nature and does not address the adequacy of the Draft EIR.

Comment 58-8

Now, CEMEX proposes to extend and expand operations for *another* 100 years. The proposed Project would result in an enormous increase in the amount of material to be excavated and would include a substantial change from mining alluvial sands and gravel (i.e., surface mining) to hard rock mining (blasting for granite). CEMEX proposes to mine to a depth of 600 feet, which will result in much worse impacts to both human residents and wildlife and to the river and riparian ecosystems as a whole.

Response 58-8

The comment is introductory in nature. See Draft EIR Section 4.4, regarding analysis of impacts to biological resources and Section 4.10, "Hydrology and Water Quality," regarding impacts to hydrological resources. This comment does not raise any deficiencies with the Draft EIR (PRC Section 21091(d)(2)(B); Title 14 CCR Sections 15088(c), 15132(d), 15204(a)).

See Response 58-5, which clarifies what constitutes surface mining.

Comment 58-9

As discussed throughout this letter, the DEIR fails to adequately evaluate the project's impacts, fails to identify feasible mitigation measures, and presents an inadequate alternatives analysis.

Response 58-9

See Responses 58-14 through 58-72 regarding the sufficiency of Draft EIR's evaluation of environmental impacts, mitigation measures, and alternatives analysis, which address in detail all of the concerns raised in this comment.

Comment 58-10

The DEIR for the proposed Project suffers from several major problems. First, the DEIR generally downplays the importance of the Project site as part of the San Joaquin River Restoration Program and the site's location adjacent to conserved lands including Ledger Island to the west, Lost Lake County Park to the north, and Ball Ranch and Sumner Peck Ranch to the south. As discussed in detail below, the Project's expansion of operations, especially the change to allow hard rock mining, has the potential to result in significant, long-term impacts to both people and wildlife, yet the DEIR fails to conduct a thorough analysis of impacts to these areas.

Response 58-10

See Responses 58-14, 58-15, 58-16, and 58-17 for a discussion of adjacent land uses and the project description; see Section 4.4 of the Draft EIR, "Biological Resources," for more information regarding the project's impacts to biological resources. The Draft EIR addresses Ledger Island, Lost Lake County Park, Ball Ranch, and Sumner Peck Ranch on pages 4.11-2 through 4.11-3. Adjacent land uses are depicted on Figure 2-5, "Conditional Use Permits and Surrounding Land Uses," on page 2-25 of the Draft EIR. See also Collective Response #19 for further discussion of Draft EIR descriptions of adjacent parks and public access to these parks.

Comment 58-11

This Project will have serious long-term consequences, not only for area residents, but for the hydrology of the river and the ecology of the region. Those consequences include, but are not limited to: potentially devastating effects related to changes in drainage patterns and river flow; impacts to water quality; impacts to groundwater recharge and groundwater quality; impacts to recreational use in adjacent areas, impacts to multiple sensitive species and their habitats; visual impacts; increased truck traffic; increased noise; and increased air pollution. Moreover, as the DEIR acknowledges, the Project would result in significant, unmitigable impacts to visual resources. DEIR at ES-9.

Response 58-11

The Draft EIR analyzes the impacts described in the comment. It should be noted that the Draft EIR would not result in significant impacts to hydrology, water quality, sensitive species or their habitats, noise, or air quality. The Draft EIR concluded that there would be material, unavoidable impacts to transportation (Draft EIR Impact 4.17-1) and visual resources (Draft EIR Impacts 4.1-1, 4.1-3). For further discussion of the issues raised in this comment, please see below:

- **For more information on drainage patterns and river flow:** See Impact 4.7-4 on page 4.7-29 of the Draft EIR. See Impact 4.10-14, 4.10-15, 4.10-16 on pages 4.10-116 through 4.10-118 of the Draft EIR. See Collective Response #25 for further discussion on river flows.
- **For more information on water quality:** See Impacts 4.10-1, 4.10-2, 4.10-3 on pages 4.10-88 through 4.10-93 in the Draft EIR. See also Responses 58-23 through 58-29, and 58-44 through 58-49 for further discussion of impacts to hydrologic resources.
- **For more information of groundwater recharge:** See Impacts 4.10-9, 4.10-10, 4.10-11, 4.10-12, 4.10-13, on pages 4.10-104 through 4.10-115 in the Draft EIR. See also Collective Response #24 for further discussion of groundwater monitoring. Responses 58-23 through 58-29, and 58-44 through 58-49 address impacts to hydrologic resources.
- **For more information on groundwater quality:** See Impacts 4.10-4, 4.10-5, 4.10-6, 4.10-7 on pages 4.10-93 through 4.10-101 in the Draft EIR. See also Responses 58-23 through 58-29, and 58-44 through 58-49 for further discussion of impacts to hydrologic resources.
- **Regarding impacts to recreational use in adjacent areas:** See Impact 4.16-1 on pages 4.16-5 of the Draft EIR. See Collective Responses #21, #22 and #27 for further discussion of the project's impacts on recreational users.
- **Regarding impacts to species:** See Impacts 4.4-1, 4.4-2, 4.4-3, 4.4-4, 4.4-5, 4.4-6 and 4.4-7 on pages 4.4-48 through 4.4-64 of the Draft EIR. See also Responses 58-30 through 58-52 for further discussion of impacts to biological resources See Collective Responses #12, #13, #14, #15, and #16 for further discussion of the project's analysis of impacts to biological resources.
- **Regarding visual impacts:** See Impacts 4.1-1, 4.1-2, 4.1-3, 4.1-4 on pages 4.1-51 through 4.1-64 in the Draft EIR. See Collective Response #8 for further discussion of the project's mitigation of impacts to visual resources.
- **For more information regarding the project's impacts on truck traffic:** See Impacts 4.17-1, 4.17-2, 4.17-3, 4.17-4 page 4.17-27 through 4.17-42 in the Draft EIR.

See also Collective Responses #29 and #30 for further discussion of traffic and transportation impacts.

- **For more information regarding the project's impact on noise:** See Impacts 4.13-1, 4.13-2, 4.13-3, 4.13-4, 4.13-5, 4.13-6 on pages 4.13-49 through 4.13-67 in the Draft EIR. See Responses 58-61 through 58-66 and Collective Response #27 for further discussion of the project's noise impacts.
- **Regarding the project's impacts on air quality:** See Impacts 4.3-1, 4.3-2, 4.3-3, 4.3-4 in Section 4.3.4 of Appendix D-4, "Revised Section 4.3, Air Quality." See Responses 58-53 through 58-60 and Collective Response #9 for further discussion of the project's impacts to air quality.

Comment 58-12

In addition, as discussed in more detail below, the DEIR presents overly narrow project objectives that preclude uses other than the project being proposed, as well as an incomplete description of the project setting and of the project itself. It also substantially understates the severity and extent of a range of environmental impacts and fails to provide adequate mitigation. These inadequacies require that the DEIR be revised and recirculated so that the public and decision-makers are provided with a proper analysis of the Project's significant environmental impacts and feasible mitigation for those impacts. *See* CEQA Guidelines § 15002(a)(1) (listing as one of the "basic purposes" of CEQA to "[i]nform governmental decision makers and the public about the potential, significant environmental effects of proposed activities").

Response 58-12

See Responses 58-67 and 58-68 for a discussion of the project objectives. See Responses 58-14 through 58-20 for a discussion of the project description and project setting. As discussed in these responses, extensive revision and recirculation is not warranted (CCR Title 14, Section 15088.5).

Comment 58-13

To ensure that the public and the County's decision-makers have adequate information to consider the effects of the proposed Project--as well as to comply with the law--the County must require revisions in the Project to make it compliant with the General Plan and other applicable plans, then prepare and recirculate a revised DEIR that properly describes the Project, analyzes its impacts, and considers meaningful alternatives and mitigation measures that would help ameliorate those impacts.

Response 58-13

As described throughout the Draft EIR, the project is consistent with all applicable state and local regulations and policies, including the Fresno County General Plan. (See Table 4.11-1 on page 4.11-10 of the Draft EIR.) The Draft EIR adequately analyzes the project's impacts, in accordance with CEQA Guidelines Sections 15126, 15126.2, and 15126.4.

Comment 58-14

II. The DEIR's Flawed Description of the Existing Setting and the Project Does Not Permit Meaningful Public Review of the Project.

A. Project Setting

Accurate and complete information pertaining to the setting of the project and surrounding uses is critical to an evaluation of a project's impact on the environment. San Joaquin Raptor/Wildlife Center v. Stanislaus County, 27 Cal.App.4th 713, 728 (1994); see also Friends of the Eel River v. Sonoma County Water Agency, 108 Cal.App.4th 859, 875 (2003) (incomplete description of the Project's environmental setting fails to set the stage for a discussion of significant effects). Here, the DEIR's deficiencies in describing the Project's setting undermine its adequacy as an informational document.

The DEIR fails to present important contextual information related to biological and hydrological resources on the Project site. For instance, as described by American Rivers:

> [T]he health of the San Joaquin River has suffered the impacts of hundreds of dams, levees stretching thousands of miles, and countless water diversions. More than 95 percent of floodplain and freshwater tidal marsh habitat has been converted to development or agriculture. Once-iconic

salmon runs teeter on the brink of extinction. The problems are so acute that American Rivers named the San Joaquin River one of America's Most Endangered Rivers® in 2014. In 2016, it rose to the No. 2 position on the list. [1](*Footnote 1:* American Rivers, San Joaquin River, at https://www.americanrivers.org/river/sacramento-and-san-joaquin-rivers/ (attached as Ex. D).)

Response 58-14

The environmental setting of the project sites is discussed in Draft EIR Section 4.4.1, "Environmental Setting," (biological resources) and 4.10.1 (hydrology), which provide

sufficient contextual information about the project sites to meet CEQA Guidelines Section 15125. The general project description provided in Chapter 2, "Project Description," of the Draft EIR details the proximity of the San Joaquin River several times, sufficiently disclosing the project sites' regional setting (see Sections 2.4.1, "Project Location and Access Road," and 2.4.5, "Surrounding Land Uses," of the Draft EIR).

Section 2.4.5 adequately characterizes the adjacent San Joaquin River and ecological preserves, including Willow Unit Ecological Preserve, Ball Ranch Nature Preserve, Lost Lake Regional Park, and Ledger Island Natural Reserve. Draft EIR Section 2.4.5 is revised in this Final EIR through errata presented in Chapter 3, "Draft EIR Errata," to include the acreage of these preserves. The Draft EIR also provides an aerial photograph indicating the location of the Plant and Quarry sites in proximity to the SJR and ecological preserves (Draft EIR Figure 2-5 on page 2-25).

Draft EIR Section 4.10.1, which discusses the environmental setting for the hydrological resources, provides the following information: climate and precipitation within the region, topography of the project site, surface water drainage, an image of current regulatory floodways and floodplains, the current level of erosion and sedimentation along the San Joaquin River adjacent to the project site, flood hazards, surface water quality, groundwater conditions, and groundwater-surface water interaction. The information provided in this Section is based upon a detailed hydraulic analysis (Draft EIR Appendix G-1), Surface Runoff and Drainage Plan (Draft EIR Appendix G-2), groundwater conditions reports (Draft EIR Appendices G-3 and G-4), Hydrology and Water Quality Analysis Report (Draft EIR Appendix G-5), and the Addendum to the Hydrology and Water Quality Analysis Report (Draft EIR Appendix G-6). The discussion of the proximity of the river to the project sites in the Project Description and the detailed environmental setting provided for the hydrological resources section of the Draft EIR include sufficient details for the purposes of CEQA (see CEQA Guidelines Section 15125: "The description of the environmental setting…shall be no longer than necessary to provide an understanding of the significant effects of the proposed project and its alternatives"). It should also be noted that the Draft EIR analyzes potential impacts to water quality, including the San Joaquin River, and concludes that the project would not significantly impact the San Joaquin River (see Section 4.10.4, "Project Impacts and Mitigation Measure," of the Draft EIR).

Comment 58-15

The majority of the proposed Project site is located in the flood plain for the San Joaquin River. The plant site is located approximately 2,800 feet from the River and encroaches on the San Joaquin River Willow Unit of the San Joaquin River Ecological

Reserve managed by the CA Department of Fish and Wildlife. The Plant site is surrounded by the Willow Unit, which is adjacent to Ball Ranch, conservation lands owned by the State of California San Joaquin River Conservancy (SJR Conservancy) and operated by the Trust. The quarry site is adjacent to Lost Lake Recreation Area, which is land purchased by the Wildlife Conservation Board[2] *(Footnote 2:* The Wildlife Conservation Board is a state grant-making agency dedicated to safeguarding California's spectacular biological diversity and wild spaces for the benefit of present and future generations. Cal. Wildlife Conservation Board, About WCB, at https://wcb.ca.gov/About.)and operated by the County; and Sumner Peck Ranch, which is owned by the SJR Parkway & Conservation Trust, Inc. Ledger Island, which is also owned by the SJR Conservancy, is located immediately to the southwest of the quarry site.

Response 58-15

The project is located adjacent to the San Joaquin River; the river is approximately 0.6 miles west of the Plant Site and 200-ft west of the Quarry Site (see Draft EIR Section 4.10.1.3, "Surface Water Drainage"). However, the comment misstates the project's location in proximity to the FEMA designated flood plain. Only some small portions of the project sites are located in the FEMA San Joaquin River floodplain. See Draft EIR Figure 4.10-1, "Current and Regulatory Floodways and Floodplains," for a depiction of the project site's proximity to the FEMA floodplain.

Comment 58-16

Furthermore, the Project site is located within Reach 1A of the San Joaquin River Restoration Program ("SJR Restoration Program"), which is a comprehensive, long-term effort to "restore flows to the San Joaquin River from Friant Dam to the confluence of the Merced River and restore a self-sustaining Chinook salmon fishery in the river while reducing or avoiding adverse water supply impacts from Restoration Flows."[3] (*Footnote 3:* See San Joaquin River Restoration Program, Annual Report (2007) (attached as Ex. E); see also generally San Joaquin River Restoration Program, at https://www.restoresjr.net/.)The restoration came out of a legal settlement following an 18-year lawsuit and was signed into federal law as the SJR Restoration Act in 2009. Pub. L. 111-11, 123 Stat. 1349 (Mar. 30, 2009). Both the Federal and State Governments have invested substantial effort and funds to establish and maintain the Restoration Program, and the result is a successful fishery for a species widely protected under laws including the federal Endangered Species Act (ESA).[4] *(Footnote 4: See, e.g., 64 Fed. Reg. 50394 (Sept. 16, 1999) (listing Central Valley Spring-Run Chinook*

salmon as threatened under the federal ESA); Cal. Dept. of Fish & Wildlife, Chinook Salmon, at https://wildlife.ca.gov/Conservation/Fishes/Chinook-Salmon (attached as Ex. F).)

Despite the importance of the SJR Restoration Program, the DEIR mentions it only twice. It is mentioned once in an isolated sentence about the reintroduction of Chinook salmon under the program (DEIR at 4.4-63), and in another instance where the DEIR evaluates the Project's consistency with SJR Parkway Master Plan Policies. DEIR 4.11-46. In both cases, the DEIR fails to provide any context about the importance of the habitat areas in and around the River to the success of the Restoration Program. The DEIR also fails to disclose that under the federal ESA, San Joaquin River Spring-Run Chinook are listed as an experimental population. See 78 Fed. Reg. 79622 (Dec. 13, 2013). Finally, the DEIR does not mention steelhead at all, even though San Joaquin River steelhead are listed as threatened in the Project area. 50 C.F.R. § 223.102(a)(16); 71 Fed. Reg. 834 (Jan. 5, 2006).

Response 58-16

A description of the land uses adjacent to the project sites can be found in Section 2.4.5 of the Draft EIR. The Draft EIR discusses the environmental setting pertaining to biological resources in Section 4.4.1, "Environmental Setting" (CEQA Guidelines Section 15125, subd. (a)). The Draft EIR provides an adequate description of the environmental setting of the project's biological resources, which is based upon literature reviews and field surveys and includes a comprehensive list of species observed on the project site.

Central Valley Chinook salmon and Steelhead are both federally listed as endangered but are not expected to be impacted by the project. No Chinook salmon or Steelhead were observed during the field surveys. See Chapter 3, "Draft EIR Errata," for further discussion of Central Valley Chinook salmon. The SJR Restoration Program is a federal and state-funded conservation effort which is aptly discussed in conjunction with the analysis of impacts on native resident or migratory fish or wildlife species' movement, corridors, or nursery (see discussion of Impact 4.4-6 in the Draft EIR). Draft EIR Impact 4.4-6 specifically discusses possible impacts upon species within the SJR, such as Chinook Salmon, and discusses the reintroduction efforts undertaken by the SJR Restoration Program (Draft EIR page 4.4-63). The Draft EIR concludes that impacts to native resident or migratory fish would be less than significant. See Collective Response #12 for further discussion of the SJR Restoration Program. See also Chapter 3, which amplifies and clarifies the information pertaining to the San Joaquin River Restoration Program.

Comment 58-17

Perhaps most egregiously, the DEIR fails to adequately describe the existing hydrologic setting of the site and the vicinity. Specifically, the DEIR fails to accurately describe baseline groundwater conditions especially at the quarry site. Kamman Report at 1. This is important information from which to establish a baseline. As explained in the Kamman report, without a proper description of baseline conditions, the DEIR is unable to provide an adequate analysis of Project-related increases or decreases in groundwater recharge relative to existing conditions. *Id.* A revised analysis must include a Hydrology and Water Quality section that adequately describes the hydrologic and hydraulic setting.

Response 58-17

The comment asserts that the Draft EIR fails to accurately describe baseline groundwater conditions, especially at the Quarry Site, citing the Kamman Report. However, the "Kamman Report" makes no such assertion.

Hydrology and water quality are discussed in Section 4.10 of the Draft EIR. The hydrologic and water quality environmental setting are specifically discussed in Section 4.10.1 of the Draft EIR. See Draft EIR Section 4.10.1.7, "Local Geologic and Groundwater Conditions," for more information about the baseline groundwater conditions at the project sites.

Comment 58-18

B. Project Description

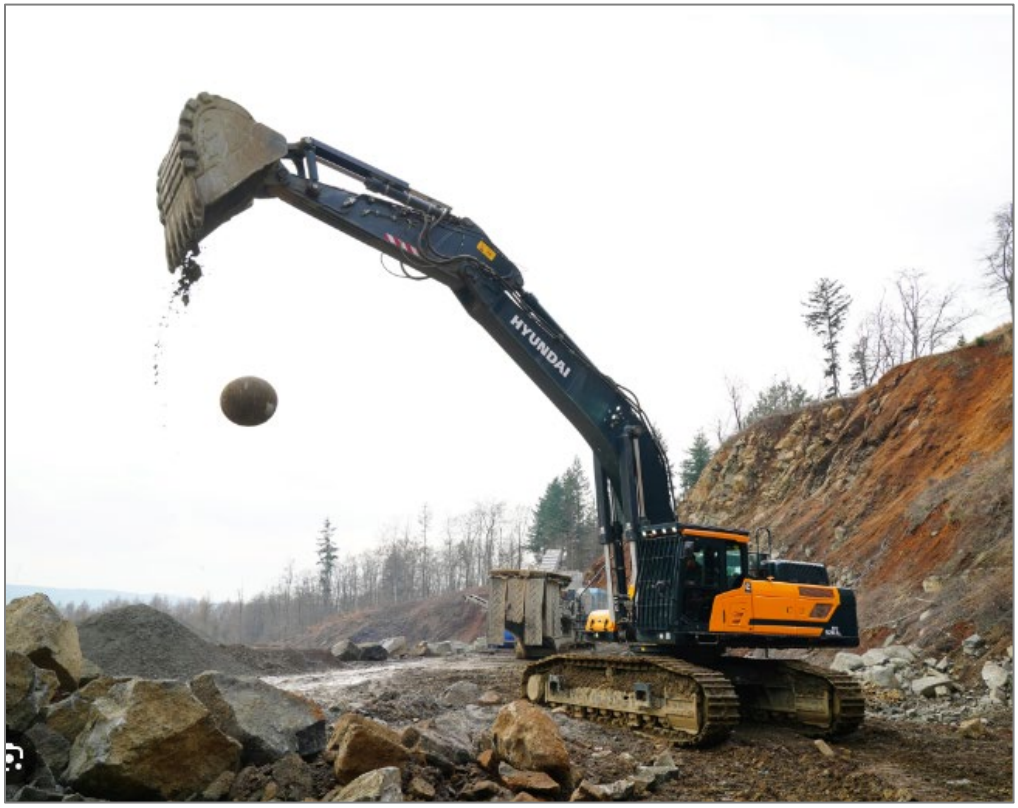
Under CEQA, the inclusion in the EIR of a clear and comprehensive description of the proposed project is critical to meaningful public review. *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 193 ("*Inyo II*"). The court in *Inyo II* explained why a thorough project description is necessary:

> A curtailed or distorted project description may stultify the objectives of the reporting process. Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal (i.e., the "no project" alternative) and weigh other alternatives in the balance.

Id. at 192-93. Thus, "[a]n accurate, stable and finite project description is the sine qua non of an informative and legally

sufficient EIR." *Santiago County Water District v. County of Orange* (1981) 118 Cal.App.3d 818, 830.

Here, the DEIR lacks sufficient detail on specific activities needed to mine and process the aggregate material. The DEIR references these activities at only the most general level. *See e.g.*, DEIR at 2-36 ("The hardrock would then be mined in approximately 50-foot-high benches by drilling and blasting of the hardrock material to a depth of approximately 600 feet bgs using a drill rig and truck with blasting supplies" but provides no information on the amount of area to be disturbed each day); at 2-39 ("If necessary, secondary breakage of oversize material within the quarry pit would be accomplished by conventional methods including, but not limited to, drop ball or hydraulic breaker," but provides no information on either one of these types of equipment or the process involved with each); at 2-42 ("The estimated borehole depth at the Quarry Site quarry would be approximately 50 feet. Boreholes would be drilled using a percussion drill rig" but provides no information on the length of time the drilling process to prepare for each blast day would take).



Response 58-18

The level of detail provided in the EIR is consistent with CEQA Guidelines Section 15124. CEQA requires that the project description disclose "the nature of the project and its main features." (CEQA Guidelines Section 15124, subd. (a)). The degree of specificity required depends on the type of project. (See *Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20; See also *Tiburon Open Space Committee v. County of Marin* (2022) 78 Cal.App.5th 700, 294 Cal.Rptr.3d 56). The main features include "the project's technical, economic, and environmental characteristics" (CEQA Guidelines Section 15124, subd. (c)). The project overview is provided in Draft EIR Section 2.2, "Project Overview," which includes the project location, project stages, and summary of project characteristics. Section 2.5, "Proposed Project Elements," of the Draft EIR contains a description of the proposed project elements.

The project description "should not supply extensive detail beyond that needed for evaluation and review of the environmental impact." Title 14 CCR Section 15124; *Save Round Valley Alliance v County of Inyo* (2007) 157 Cal.App.4th 1437. Furthermore, an EIR need not contain a design level description of the project; a conceptual description of project components is sufficient. (See *The Claremont Canyon Conservancy v. Regents of University of California*, 92 Cal.App.5th 474, 309).

In addition, in response to the three specific comments provided in the comment we note as follows:

- The average area disturbed per average blasting event would be approximately 0.37 acres (16,200 sq. ft.);
- A drop ball is displayed below in Example 1 of this response and is used for splitting boulders; a hydraulic breaker is displayed below in Example 2 and is used to reduce oversized boulders into a more manageable size for entering crusher systems.

Example 1. Drop Ball

Example 2. Hammer/Hydraulic Breaker

- The length of time for the drilling process to prepare for a typical 30,000-cubic-yard blast would take approximately 4 days to complete using a single drill rig operating under normal conditions.

Comment 58-19

These gaps in the project description are important because they implicate other inadequate analysis in the DEIR. For example, the amount of daily ground disturbance implicates the air quality analysis; and the use of drop balls or hydraulic breakers and the amount of time required for drilling boreholes in preparation for each blast implicate the

noise analysis. On the latter point, the DEIR states that blasting would occur up to twice a week, but if drilling boreholes for explosives took a day to complete, receptors would suffer increased noise from drilling and blasting four days a week. Therefore, the DEIR fails to give the reader a clear sense of what these activities entail and how these activities would affect particulate matter emissions and noise impacts to nearby receptors.

Response 58-19

See Response 58-18. CEQA Guidelines Section 15124 requires only a general description of the project's technical, economic, and environmental characteristics. (Title 14 CCR Section 15124.) The description should not "supply extensive detail beyond that needed for evaluation and review of the environmental impact" (Title 14 CCR Section 15124; *Save Round Valley Alliance v. County of Inyo* (2007) 157 Cal.App.4th 1437). Courts have

previously refuted arguments asserting that technical perfection and full completion of the project design are required under CEQA (see *Citizens of Goleta v. Board of Supervisors* 197 Cal.App.3rd 1167, 1176; *Sierra Club v. County of Fresno* 6 Cal.App.5th. 502, 515; *Citizens for a Sustainable Treasure Island v. City and County of San Francisco* 227 Cal.App.4th 1036, 1052). Details such as the exact amount of time required for drilling boreholes and the use of drop balls versus hydraulic breakers are not necessary to analyze the impacts of the project. CEQA allows for some flexibility for changing conditions. For example, the project's blasting designs would change based on the distance between the planned blasting location and the nearest sensitive receptors.

Regardless of the additional details described in the comment, the project would stay within the noise thresholds set forth in the Fresno County General Plan. See Draft EIR Section 4.13, "Noise," for more information regarding noise impacts analysis. Similarly, the project would stay within the San Joaquin Valley Air Pollution Control District's air quality thresholds and comply with applicable County regulations (see Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.2, "Regulatory Setting," and Section 4.3.3, "Significant Thresholds and Analysis Methodology").

Comment 58-20

Moreover, the DEIR indicates that the Project has a lighting design, but fails to provide it. DEIR at 2-40. Instead, it states only that "[H]igh pressure sodium and/or cutoff fixtures (or equivalent International Dark-Sky Association [IDA]-approved fixtures) would be used instead of mercury-vapor fixtures," and that illumination would be confined to the Quarry Site. *Id.* If the Project has a lighting design, it should have been disclosed as part of this DEIR so that the public and decision-makers can understand the planned illumination for the Quarry Site. Lighting on the site would affect light and glare experienced by nearby residents, yet these impacts cannot be properly evaluated because the lighting design has not been included.

Response 58-20

The Draft EIR includes sufficient information about the critical components of the project's lighting design, which allow for sufficient analysis of the project's impacts on lighting and glare on nearby sensitive receptors (see *The Claremont Canyon Conservancy v. Regents of University of California*, 92 Cal.App.5th 474, 309, holding that an EIR need not contain a design level description of the project; a conceptual description of project components is sufficient).

The impact of a new source of substantial light was analyzed in Impact 4.1-4, "Creation of a New Source of Substantial Light and Glare That Would Adversely Affect Day or Nighttime Views in the Vicinity of the Project Sites" (see Draft EIR pages 4.1-62 through 4.1-64). The impact was determined to be less than significant after complying with Fresno County Zoning Ordinance Section 834.4.220.I.22, which provides that "any night lighting established on the property shall be arranged and controlled so as not to illuminate public rights-of-way or adjacent properties." It should also be noted that all sources of lighting would be removed after completion of both stages of the project.

At the Plant Site, existing nighttime lighting would be used, and new lighting would be installed at the proposed hot-mix asphalt plant (Draft EIR page 4.1-62). New light fixtures would also be installed at the Quarry Site to provide a safe working environment (Draft EIR page 4.1-62). At both the Plant and Quarry sites, mining would occur during daylight hours only, and therefore nighttime lighting would not be required throughout the excavation areas, even under expanded hours of operation (see Impact 4.1-4 on pages 4.1-62 through 4.1-64).

Regarding the installation of new light fixtures at both the Plant and Quarry sites, high-pressure sodium and/or cutoff fixtures would be used instead of mercury-vapor fixtures for any nighttime lighting, which minimize the occurrence of light pollution. The lighting design is intended to confine illumination to the Quarry Site and/or to areas that do not include light-sensitive uses. The "lighting design" referenced in the Draft EIR is not a separate document but rather the information provided in the Draft EIR as described in part above. The Draft EIR ultimately concludes that the combined usage of high-pressure sodium and/or cut-off fixtures and the limited placement of new fixtures would result in a less-than-significant impact of light and glare (Draft EIR page 4.1-64).

For more information regarding the project's lighting elements, please see Draft EIR Section 2.5.2.1, "Plant Site Mine Plans," and Section 2.5.2.2, "Quarry Site Mine Plans," of Chapter 2, and Section 4.1, "Aesthetics and Visual Resources."

Comment 58-21

III. The DEIR Fails to Analyze and Mitigate the Project's Significant Environmental Impacts.

CEQA requires that an EIR be detailed, complete, and reflect a good faith effort at full disclosure. CEQA Guidelines § 15151. The document should provide a sufficient degree of analysis to inform the public about the proposed project's adverse environmental impacts and to allow decision-makers to make intelligent judgments. *Id.* Consistent with this requirement, an EIR must contain "extensive, detailed evaluations of the impacts of the

proposed plans on the environment in its current state" in order to serve its function as an "informative document." *Environmental Planning and Information Council of Western El Dorado County v. County of El Dorado*, 131 Cal.App.3d 350, 358 (1982) (finding an EIR for a general plan amendment inadequate where the document did not make clear the effect on the physical environment).

Response 58-21

The comment provides an introductory explanation of CEQA standards regarding analysis contained within an EIR and thus requires no further response (CEQA Guidelines Sections 15088(c), 15132(d), 15204(a); See also *Citizens for E. Shore Parks v. State Lands Comm'n* (2011) 202.Cal.App.4th 549).

Comment 58-22

Meaningful analysis of impacts effectuates one of CEQA's fundamental purposes: to "inform the public and responsible officials of the environmental consequences of their decisions before they are made." *Laurel Heights Improvement Ass'n v. Regents of the University of California*, 6 Cal.4th 1112, 1123 (1993) (*Laurel Heights II*). To accomplish this purpose, an EIR must contain facts and analysis, not just an agency's bare conclusions. *Citizens of Goleta Valley v. Board of Supervisors*, 52 Cal.3d 553, 568 (1990). Nor may an agency defer its assessment of important environmental impacts until after the project is approved. *Sundstrom v. County of Mendocino*, 202 Cal.App.3d 296, 306-07 (1988). An EIR's conclusions must be supported by substantial evidence. *Laurel Heights Improvement Ass'n v. Regents of the University of California*, 47 Cal.3d 376, 409 (1988) (*Laurel Heights I*).

CEQA does not allow a lead agency to defer critical studies regarding environmental impacts until after project approval. *See Sundstrom*, 202 Cal.App.3d 296. Nor may a lead agency satisfy CEQA by approving a project subject to conditions requiring the applicant to prepare future studies and mitigation measures, because in so doing the agency would be improperly delegating its legal responsibility to assess a project's environmental impact. *Id.* at 307. In contrast, CEQA requires the lead agency itself to prepare or contract for the preparation of impact assessments (citing CEQA § 21082.1) that reflect the agency's "independent judgement." *Id.* The fundamental concern underlying *Sundstrom* was that even if the required conditions of project approval had been adequate, the need for post-approval studies demonstrated the inadequacy of the County's environmental review prior to project approval. *Id.*

Finally, the DEIR may not avoid conducting a thorough analysis of the Project's impacts under the assumption that such impacts would be temporary. CEQA requires analysis of temporary or short-term impacts. CEQA Guidelines § 15126.2(a) (agency must analyze both short- and long-term impacts). CEQA defines a "significant effect on the environment" as "a substantial or potentially substantial adverse change in the environment." Pub. Resources Code § 21068. The CEQA Guidelines expand on the statute and define "significant effect on the environment" as:

a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic and aesthetic significance.

CEQA Guidelines § 15382. As a leading CEQA treatise explains,

> An effect on the environment need not be "momentous" or "important" to meet the CEQA test for significance. . The term "significant" covers a spectrum ranging from "not trivial" through "appreciable" to "important" and even "momentous." See *No Oil, Inc. v City of Los Angeles* (1974) 13 Cal.3d 68, 83. An agency has discretion to find a project's impacts insignificant on the basis of the scale of the project, particularly when the project's impacts are indirect and cannot reliably be predicted. *Save the Plastic Bag Coalition v City of Manhattan Beach* (2011) 52 Cal.4th 155. An effect need not be either long term or permanent to be significant, but duration is a factor that may affect the significance of an environmental impact. *Running Fence Corp. v Superior Court* (1975) 51 Cal.App.3d 400, 416.

1 Kostka and Zischke, Practice Under the California Environmental Quality Act (Cont.Ed.Bar 2024) §6.44. As documented below, the Rockfield Modification Project fails to identify, analyze, or support with substantial evidence its conclusions regarding the Project's significant environmental impacts.

Response 58-22

The comment provides an introductory explanation of CEQA standards regarding improper deferral of analysis. This is an introductory comment that does not address the adequacy of the Draft EIR and contains no EIR or project-specific comments. No further response is necessary (CEQA Guidelines Sections 15088(c), 15132(d), 15204(a); See also *Citizens for E. Shore Parks v. State Lands Comm'n* (2011) 202 Cal.App.4th 549). Regarding the reference in the comment to the 37-year-old *Sundstrom* case from 1988, that case

involved a cursory negative declaration and is not in any way comparable to the extensive EIR prepared for this project.

Comment 58-23

A. The DEIR's Evaluation of Hydrology and Water Quality Impacts is Inadequate.

The DEIR's analysis of the Project's impacts to hydrology, water quality, and flooding is inadequate because it: (a) presents an inaccurate hydraulic analysis; (b) presents an inaccurate estimate of impacts on groundwater resources; (c) fails to analyze downstream impacts; (d) fails to support its conclusions with the necessary facts and analysis; and (e) fails to identify mitigation capable of minimizing the Project's significant environmental impacts.

Response 58-23

This is an introductory comment regarding comments that are presented and responded to below in detail.

Comment 58-24

Greg Kamman, Senior Ecohydrologist with CBEC Eco Engineering, reviewed the Rockfield Modification Project DEIR hydrology and water quality analysis and the document's hydrological appendices. His report (CBEC Report), attached as Appendix A, provides a detailed evaluation of the DEIR's Hydrology and Water Quality section. We summarize some of the most critical points of that report below.

Response 58-24

This is an introductory comment regarding the Commenter's provided CBEC Report. The CBEC Report is responded to in Responses 58-25 to 58-29, 58-39, 58-44, 58-45, and 58-49.

Comment 58-25

1. The DEIR Presents an Inaccurate Hydraulic Analysis of the Project's Flood Impacts.

As explained in the CBEC Report, the DEIR fails to accurately analyze the Project's potential impacts related to flooding. CBEC Report at 2. The DEIR's analysis of Project-related flood impacts used the Federal Emergency Management Agency ("FEMA")100 -year flow rate estimate to conclude that that existing floodplain does not encroach into the Quarry site or the western portion of the Plant site. *Id.* However, the DEIR's approach to the analysis failed

to account for the long-term climate change effects on the River flood flow rates at both sites. *Id.* When the analysis is conducted using more recent data models by the California Department of Water Resources ("DWR") that include climate change information, the result indicates drastically higher 100-year flow rates.

The related DWR report discussed in the CBEC Report[5] *(Footnote 5: Nemeth, K., Tjernell, K.A., and Lippner, G. (2021). Revised Draft Central Valley Flood Protection Plan Conservation Strategy 2022 Update. California Department of Water Resources)* states that under climate change, peak flows in the snow-dominated upper San Joaquin River watershed will shift to earlier in the winter and spring. CBEC Report at 2. This change in peak flows will result in high flow events (like the 100-year flow) that cannot be fully contained by Lake Millerton and will be released downstream. *Id.* Specifically, future (year 2072) 100-year flow rates will increase to 126,800 cubic feet per second because of climate change[6] (*Footnote 6:* The related DWR report states that under climate change, peak flows in the snow-dominated upper San Joaquin River watershed will shift to earlier in the winter and spring and high flow events like the 100-year flow cannot be fully contained by Lake Millerton and will be released downstream. CBEC Report at 2). This is a flow rate that is 179% of the FEMA estimate used in the DEIR. *Id*.

According to the CBEC Report, an increase of flow rate of this magnitude would encroach into and inundate both the Quarry and Plant sites. CBEC Report at 2. Importantly, the estimated increase in 100-yr flood flow rates under climate conditions represents a condition only halfway through the life of the Project. *Id.* In fact, 100-year flood flow rates are likely to continue to rise even further through the second 50 years of proposed Project operations. *Id.* Therefore, the DEIR's analysis of flood hazards evaluating the potential impacts from encroachment of the Project site into the floodplain is erroneous.

Response 58-25

Analyzing the potential future floodplains or flood flows from Lake Millerton as a result of 100 years of climate change is not reasonably foreseeable, is too speculative, and is not required to be analyzed under CEQA because that would require analyzing the impacts of the environment on the project.

The Draft EIR Hydraulic Analysis' use of the FEMA 100-year floodplain to analyze the project's flood hazards is compliant with County General Plan Policies LU-C.7 and HS-C.16 (see Draft EIR, pages 4.11-6 and 4.11-37).

Impact 4.10-17 addresses Lake Millerton's potential release during a 100-year flood event. The Draft EIR provides that an unforeseen event of water being released "from the Friant Dam or Millerton Lake Reservoir is not required to be addressed under CEQA since the releases are not "reasonably foreseeable" (see Draft EIR, Impact 4.10-17, page 4.10-119). "While a lead agency must use its 'best efforts' to evaluate environmental effects, including the use of reasonable forecasting, 'foreseeing the unforeseeable' is not required, nor is predicting the unpredictable or quantifying the unquantifiable" (see *Citizens for a Sustainable Treasure Island v. City and County of San Francisco* (2014) 227 Cal.App.4th 1036, 1060–1061; citing Guidelines, Section 15064, subd. (d)(3).)

In response to comments and in accordance with the Fresno County General Plan, Chang Consultants conducted hydraulic analyses evaluating the 200-year flood, a more rare and severe flood event, which demonstrate that the 200-year flood would neither enter the Quarry Site nor the Plant Site (see Appendix G-7, "200-Year Hydraulic Analysis for CEMEX Rockfield Modification Project—Quarry Site," and Appendix G-8, "200-Year Hydraulic Analysis for CEMEX Rockfield Modification Project—Plant Site").

In addition, the California Supreme Court has held that purpose of an EIR is "to analyze the 'environmental effects' of a project … not … the environment's effects on a project." (*California Building Industry Assn. v. Bay Area Air Quality Management Dist.* (2015) 62 Cal.4th 369, 392; Citing Cal. PRC Sections 21002 and 21002.1(c).) The California Supreme Court explained that this holding is consistent with *Ballona Wetlands Land Trust v. City of Los Angeles* (2011) 201 Cal.App.4th 455 (*Id*.) In *Ballona*, the Court held that "an EIR need not identify or analyze effects on the environment resulting from climate change (*Id.* at page 473) CEQA requires an analysis of the "impacts on the environment caused by the development rather than impacts on the project caused by the environment" (*Id*. at page 474, FN 9).

Comment 58-26

2. The DEIR's Analysis of Groundwater-Surface Water

Interaction at the Project Site Is Inaccurate and Unsupported.

As the DEIR explains, understanding the interaction between groundwater on the site and surface water during different river stages[7] (*Footnote 7: The water level in the River, in this case, above the alluvium on the river bed)* is important because when the water level in the river is high enough that the water surface is above the adjacent groundwater table surface, there is seepage of water from the river into groundwater flowing towards the quarry. DEIR Appendix G-5 at 20-21 and CBEC Report at 3. The DEIR's analysis inappropriately uses stream gage data from below Friant

Dam, which is located 4.0 miles and 6.5 miles from the Quarry site and Plant sites respectively, to compare river stages to on-site groundwater levels. CBEC Report at 3. As explained in the CBEC Report, extrapolating data from these distances results is an invalid comparison because of differences in channel geometry and water flow between the sites. *Id.* Instead, to make an accurate comparison between river water levels and groundwater levels at the Quarry and Plant Sites, the DEIR should have included monitoring of channel geometry and flow differences immediately adjacent to the project sites. The DEIR concludes that there is no correlation between river stage and pond water levels at the Quarry site location; however, this conclusion is unsupported. *Id.*

Until the analysis is revised to correct the aforementioned flaws, the DEIR's conclusions regarding the interaction between groundwater and surface water, and the corresponding potential for river water to seep into the Quarry site, are unsupported and the DEIR is inadequate under CEQA.

Response 58-26

The stream gauge data is only presented to extrapolate river levels to conditions at the Quarry Site and not the Plant Site (see Appendix G-5, Section 2.2.3).

The comment states that the Draft EIR improperly extrapolates river level stream gauge from the Department of Water Resources' stream gauge data from below the Friant Dam. Instead, the comment suggests that stream gauge monitoring should have been conducted immediately adjacent to the Quarry Site.

While the magnitude of the San Joaquin River stage may vary from location to location along the river, the nature of the stage over periods longer than a few hours would be comparable over the distances addressed in Section 2.2.3 of Appendix G-5 of the Draft EIR. Put differently, the height of the water within the river may vary from the actual stage reading at the gage location, due to variations in channel depth and width. However, after accounting for travel times downstream from the gage, when the gage is reporting sustained high stage readings, the San Joaquin River level at other locations within a few miles downstream of the gage would also be elevated to a similar stage level. Likewise, when the gauge is consistently reporting base flow stage readings, the San Joaquin River elevation at other locations downstream would also be at base flow elevations.

The CBEC Report also appears to be unaware of the datum of the Friant gage and the location of Beck Ranch. As noted on the California Department of Water Resources California Data Exchange Center (CDEC) website and the U.S. Geological Survey

National Water Information System (NWIS) website, the elevation of the referenced river gage is 294 feet. Figure 16 in Appendix G-5 of the Draft EIR is taken from another report, in which the author determined that there was no shift in the river datum as stated in the CBEC Report, because the approximate gage datum as reported by the California Department of Water Resources and the U.S. Geological Survey was used.

The comment does not describe why the data from the stream gauge station below the Friant Dam cannot be used in the Draft EIR. The comment also fails to describe why monitoring the river immediately adjacent to the Quarry Site would be more accurate given that the existing stream gauge analysis has more comprehensive data (from January 2014 to February 2023).

Comment 58-27

3. The DEIR Fails to Provide Evidence to Support Mitigation Measures Related to Lowering Groundwater Levels.

The DEIR purportedly analyzes the groundwater drawdown that would occur in the areas surrounding the Quarry Site due to dewatering of the quarry pit. DEIR Impact 4.10-10 at 4.10-105. The DEIR indicates that because the alluvium has already been removed from the Quarry site, no further effects related to dewatering (such as seepage of alluvial groundwater into the mining pit) can occur. *Id*. As explained in the CBEC report, this statement is incorrect because alluvial groundwater in off-site areas adjacent to and surrounding the Quarry site would still seep into the mining pit. CBEC Report at 4.

Nonetheless, the DEIR concludes that impacts to groundwater supplies related to the development of a large cone of depression radiating around the site due to pit dewatering and groundwater seepage into the Quarry site mining pit would be potentially significant. DEIR at 4.10-107 and 4.10-108. In addition, the DEIR concludes that potential impacts to the groundwater supply wells will occur "due to the local decrease in static groundwater levels as a result of the flow of groundwater to the proposed quarry pit." *Id*.

To mitigate these impacts of lowered groundwater levels in the cone of depression and increased groundwater seeping into the mining areas, the DEIR proposes Mitigation Measure 4.10-10a, which prescribes preparation of a Groundwater Adaptive Management Program. *Id.* The project includes recharge trenches along portions of the outer edge of the mining pit. As described in the CBEC report, water from mine pit dewatering would be discharged into the recharge trenches and various recharge ponds with the idea

that 50% of the water delivered to the recharge trenches would recharge the underlying groundwater and reduce the amount of drawdown by fifty percent, reducing the amount of groundwater level decline around the pits to less than significant levels. CBEC Report at 4.

The DEIR does not substantiate the benefits and effectiveness of the recharge trenches. *Id*. As explained in the CBEC Report, the DEIR presents no data or analysis to support the claim that 50% of the water delivered to the trenches will recharge the underlying groundwater and the amount of drawdown would be reduced by fifty percent. *Id*. Even if the fifty percent estimate of trench infiltration to recharge the underlying groundwater was accurate, which has not been demonstrated, the drawdown effects would not be fully mitigated. *Id*. The DEIR fails to evaluate how the residual drawdown (after assumed benefits of the recharge trenches) would impact surrounding Groundwater Dependent Ecosystems ("GDE") or increased groundwater flow gradients between the San Joaquin River and mining sites. *Id*.

In sum, the DEIR must revise the necessary analyses as described in the CBEC Report to accurately disclose Project-related impacts to groundwater systems, and substantiate with data and/or analysis the benefits of the recharge trenches. Without this information the DEIR's analysis of the Project's impact related to on-site groundwater impacts is inadequate. As to downstream impacts, the DEIR's analysis is wholly inadequate. A revised DEIR must include an analysis of the aforementioned significant impacts and identify feasible, effective mitigation or alternatives to avoid or minimize the impacts.

Response 58-27

The commenter incorrectly suggests that the Draft EIR fails to substantiate the benefits and effectiveness of the recharge trenches, and that the drawdown effects would not be fully mitigated.

There have been both recharge trenches and ponds used for decades at the Quarry Site, and at numerous other aggregate mining sites in the region. Throughout the life of the quarry, water produced during dewatering of the excavation has been pumped to perimeter recharge trenches on the west side of the site and to the Northeast Pond to reduce or eliminate the effects of dewatering outside of the Quarry Site boundary (see Draft EIR, Section 2.4.2.2, "Quarry Site Existing Conditions," page 2-21, and Section 2.5.2.2, "Quarry Site Mine Plans," page 2-39). Furthermore, Draft EIR Appendix G-6, "Addendum to: Revised Hydrology and Water Quality Analysis Report," provides a

quantitative assessment of the efficacy of the use of recharge trenches to mitigate effects on groundwater levels. That analysis is based on the comparison of water year rainfall over a six-year period with groundwater levels measured over the same period using downhole pressure transducers and dataloggers in 14 Quarry Site monitoring wells. The downhole pressure transducers record water level readings every six hours. Thus, over 1,450 data points are measured in each well every year (see Draft EIR, Appendix G-6, page 3). Additionally, Mitigation Measure 4.10-10a requires mining operations to cease if groundwater recharge cannot be maintained within 85 percent of the CEQA baseline.

Finally, the comment characterizes ongoing seepage from adjacent alluvial groundwater into the Quarry Site as an impact of the proposed project. However, this condition is part of the existing CEQA baseline (see *North Coast Rivers Alliance v. Westlands Water Dist.* (2014) 227 Cal.App.4th 832, 872).

Thus, substantial quantitative analyses support the conclusions in the Draft EIR regarding the mitigation measures to address potential lowering of groundwater levels.

Comment 58-28

4. The DEIR's analysis of potential impacts on Groundwater Dependent Ecosystems Is Inadequate.

As discussed above, in the CBEC report, and further in sections III.B.2(a) and III.B.3 below, the DEIR's incomplete analysis of potential impacts to groundwater dependent ecosystems ("GDEs") is a glaring flaw. CBEC at 5. The DEIR presents contradictory information regarding the effects of dewatering on groundwater supplies and GDEs. In one instance the DEIR erroneously claims that the effects of dewatering would be the same as effects already occurring because alluvium on the Quarry Site has already been removed. *Id.* and DEIR at 4.4-56.

As discussed above and in more detail in the CBEC Report, this statement in the DEIR is incorrect. *Id.* The GDEs located adjacent to the river and north of the Quarry site are rooted in alluvium with rooting depths of less than 30 feet below ground service. *Id.* Far from being identical to current conditions, lowering the alluvium groundwater levels, dewatering remaining alluvium, and ending operation of the infiltration trenches after mining is completed would result in effects that are significantly different. *Id.* The effects would be complete dewatering of the alluvium and associated GDE rooting zone adjacent to the river and north of the quarry. *Id.* This would result in potential adverse impacts on the GDE after, and possibly during, mining operations.

The CBEC Report shows that the DEIR itself presents evidence to support a conclusion that impacts to GDEs would be significant and would threaten the viability and sustainability of existing and future GDEs. A revised DEIR must correct these errors and identify mitigations or alternatives to avoid these significant impacts.

Response 58-28

The comment asserts that the Draft EIR does not adequately analyze the effects of dewatering on groundwater-dependent ecosystems (GDEs).

Dewatering of the alluvium at the Quarry Site has been occurring for many decades and mining of the alluvium is effectively completed (see Draft EIR, Impact 4.10-10, page 4.10-105). All future dewatering as part of the proposed Modification Project would occur within the weathered rock and hard rock zones (*Ibid.*). These zones have effectively no primary porosity and very limited secondary fracture porosity (see Draft EIR, Impact 4.10-11, page 4.10-112). Thus, dewatering of the deeper bedrock zones would have little or no effect on water levels in the overlying alluvium (*Id*. at pages 4.10-112 through 4.10-113). Furthermore, as shown on Figure 1 in the CBEC Report at page 11, the GDEs are all located adjacent to the San Joaquin River. Appendix G-5 of the Draft EIR demonstrates that the project would not have any effect on water levels in the San Joaquin River because the project impacts would be identical to those that are already occurring (e.g., compared to the CEQA baseline), and therefore, would not affect GDEs along the river (Draft EIR, Appendix G-5, Section 5.0(b), page 56).

As noted in the CBEC Report at page 6, the depth to groundwater at the Plant Site is approximately 30 feet below ground surface (ft bgs) and at that depth the groundwater levels at and adjacent to the Plant Site are already deeper than depths that could support riparian vegetation, streamflow, and wetlands (see Draft EIR, Appendix G-5, Section 5.0(b), page 56). Without citing any data or other substantial evidence, the CBEC Report asserts that groundwater levels must be much shallower away from the Plant Site and that dewatering would then lower these hypothetically shallower groundwater levels and affect GDEs. While the cone of depression created during dewatering at the Plant Site would extend offsite, the amount of drawdown within the cone of depression would diminish away from the Plant Site boundary, as demonstrated on Figures 11 and 12 of Appendix G-3 (Draft EIR, Appendix G-3, pages 41 and 45). As a result, if there is no impact to GDEs under the Plant Site, where the drawdown would be greatest, there would be no impact to GDEs away from the Plant Site (see Appendix G-5, Section 3.2.3, page 50).

Finally, as discussed in Response 58-27, the implementation of the recharge trenches and Mitigation Measure 4.10-10a would minimize the offsite effects of dewatering.

Comment 58-29

5. The DEIR Fails to Conduct A Quantitative Analysis of Streamflow Depletions From the San Joaquin River.

The DEIR at 4.10-114 and 4.10-115 presents an incomplete and inadequate analysis of the Project's potential to interfere with groundwater recharge at both mining sites such that the Project would conflict with the requirements of the California Sustainable Groundwater Management Act (SGMA) and sustainable management of the Basin. It claims that related impacts at both sites would be less than significant. However, as explained in detail in the CBEC Report, the DEIR itself presents findings and conclusions that show this conclusion to be inconsistent. CBEC Report at 7 and 8.

The DEIR shows that the San Joaquin River and groundwater in the alluvium, weathered rock and hard rock beneath and adjacent to the river are in hydraulic connection. CBEC Report at 7. For example, as discussed in detail in the CBEC Report and above, the DEIR indicates that mining operations in the Quarry and Plant Sites will increase the water table flow gradients moving from the river towards the mining pits. DEIR at 4.10-114. The result of an increased groundwater hydraulic gradient causing an increased rate of groundwater flow holds true for any saturated aquifer material, whether it is alluvium, weathered rock or fractured hard rock. CBEC Report at 7 and 8. Therefore, when groundwater that is in hydraulic connection to the San Joaquin River experiences an increase in hydraulic gradient toward the Quarry or Plant Sites, there will be an increase in the rate of depletion of water from the river into the groundwater system. *Id.*

Similarly, the DEIR acknowledges that San Joaquin River flows will be depleted due to mining operation. CBEC Report at 8 and DEIR Appendix G-3 at 48 (acknowledging that groundwater and river water are connected so that river water would enter the reclamation pond or mining pit). Therefore, the DEIR fails to demonstrate that it complies with SGMA requirements regarding interconnected surface water depletions because it presents no data or analyses that: a) identify potential unreasonable impacts to beneficial uses of surface water; b) quantify the amount of depletions; or c) develop mitigations for any potential undesirable results due to Project depletions of San Joaquin River flow.

Response 58-29

While the stable isotope data, as referenced in the CBEC Report pages 7 and 8, indicate that the groundwater within the weathered rock and hard rock layers were derived from

high elevations in the Sierra Nevada, like the water in the San Joaquin River, the groundwater flow directions based on the groundwater contours in these units indicate that the flow is from the northeast toward the river, not away from the river (see Draft EIR, Appendix G-5, page 32; see also groundwater contour maps of the Quarry Site area in Appendix G-4 of the Draft EIR). Plausible sources for the groundwater in the deeper bedrock units include Millerton Reservoir and leakage from the Friant-Kern Canal (see Draft EIR, Appendix G-5, page 32). The volume of groundwater flow in the deeper bedrock is very small compared to the volume of water in the reservoir and the flow within the canal (*Id*. at pages 32 through 33). Thus, only incidental, nominal leakage would be sufficient to provide the recharge necessary to sustain the groundwater flow directions within the fractures in the weathered rock and hard rock units (*Id*. at page 33). Furthermore, Section 2.2.3, "Summary of Project Characteristics," of Draft EIR Appendix G-5 provides a quantitative analysis of groundwater and surface water interactions while Section 3.2.2 of Appendix G-5 evaluates the potential effects of the project on flows in the San Joaquin River.

Finally, the comment states that "the Draft EIR acknowledges that San Joaquin River flows would be depleted due to the mining operation." This statement does not accurately characterize the Draft EIR's analysis. Appendix G-3 confirms that the shallow groundwater and the river water are connected, sufficient to offset the total consumptive use during the mining phase and the reclamation phase, in order to make a water balance (Draft EIR, Appendix G-5, page 46). The Draft EIR adequately demonstrates that it complies with SGMA, as the Draft EIR quantifies the amount of depletions (see Draft EIR, Impacts 4.10-12 and 4.10-13 pages 4.10-113 through 4.10-115, and Mitigation Measures 4.10-10a and 4.10-10b); and develops mitigation measures for any potential undesirable results due to project depletions of San Joaquin River flow (see Draft EIR, Impact 4.10-12, pages 4.10-113 through 4.10-114). See also Response 58A-6.

Comment 58-30

B. The DEIR's Evaluation of Biological Resources Is Inadequate.

The DEIR's treatment of biological impacts suffers from substantial deficiencies and fails to meet CEQA's well established standards for impacts analysis. The document's analysis both understates the severity of the potential harm to biological resources within and adjacent to the proposed Project site and neglects to identify sufficient mitigation to minimize these impacts. Given that analysis and mitigation of such impacts are at the heart of CEQA, the DEIR will not comply with these laws until these serious deficiencies are remedied. *See Sundstrom v. County of Mendocino*, 202 Cal.App.3d 296, 311 (1988) ("CEQA places the

burden of environmental investigation on government rather than the public.").

As discussed above, the proposed Project site is surrounded by conserved lands that protect habitat important to biodiversity and long-term sustainability of river and adjacent lands ecosystems. Furthermore, the Project site is located in Reach 1 of the San Joaquin River Restoration Program.[8] (*Footnote 8: See Ex. E (San Joaquin River Restoration Program Annual Report) at 3 (Fig. 1).*) The Project will result in significant direct and indirect impacts to sensitive habitats, especially adjacent to the Quarry site and downstream. *Id*.

Given the importance of the affected biological resources, one would expect the DEIR's analysis to provide careful and thorough evaluation of the Project's potential impacts. Unfortunately, the DEIR's analysis is nowhere close to meeting CEQA's well-established standards for evaluating biological resource impacts. As detailed in the attached Colibri Report, and summarized below, the DEIR presents a cursory and incomplete evaluation and lacks evidence for its conclusions. The DEIR downplays the Project Site's importance to the ecological health of the region; is based on an inadequate search radius for records of special-status species; inadequately analyzes impacts to sensitive species such as burrowing owl, Swainson's hawk, tricolored blackbird, and western red bat; fails to analyze impacts to sensitive species from blasting and fugitive dust emissions; neglects to analyze impacts to riparian areas and downstream habitats; and proposes vaguely defined mitigation measures that do not address all the impacts to species that the Project will cause.

Under CEQA, decision-makers and the public must be given sufficient information about impacts and mitigation to be able to evaluate the impacts of a proposed project for themselves. *See* Pub. Res. Code 21061. Furthermore, analysis of impacts cannot be deferred to a later date but must be performed prior to project approval.

Sundstrom, 202 Cal. App. 3d at 307 ("By deferring environmental assessment to a future date, the conditions run counter to that policy of CEQA which requires environmental review at the earliest feasible stage in the planning process."). Accordingly, a revised DEIR must fully analyze and disclose these impacts and propose and evaluate feasible mitigation measures for each significant impact.

The report prepared by Colibri provides detailed comments on the DEIR's biological resources analysis. *See* Colibri Report attached

as Appendix B. The discussion below highlights the most egregious deficiencies.

Response 58-30

The comment cites a case involving a mitigated negative declaration. That case involved a different type and scope of environmental review than the EIR prepared for the project. See Responses 58-34 and 65-4 regarding the CNDDB search radius for records of special-status species. See Responses 58-37 and 58-38 regarding analysis of impacts to burrowing owl, Swainson's hawk, tricolored blackbird, and western red bat. See Responses 58-40 through 58-43 regarding impacts to sensitive species from blasting and fugitive dust emissions. See Responses 58-44 through 58-49 regarding analysis of impacts to riparian areas and downstream habitats. See Section 4.4.4, "Project Impacts and Mitigation Measures," of the Draft EIR for further discussion of impacts to biological resources.

Comment 58-31

1. The DEIR's Description of the Existing Biological Setting Is Incomplete and Misleading.

An EIR's description of a project's environmental setting crucially provides "the baseline physical conditions by which a Lead Agency determines whether an impact is significant." CEQA Guidelines § 15125(a). Here, the DEIR fails to accurately portray the site's underlying environmental conditions and therefore undercuts the legitimacy of the environmental impact analysis. Specifically, the DEIR lacks sufficient information regarding the biological resources at the Project site. It therefore fails to provide important contextual information and lacks a sufficient baseline for determining impacts.

As discussed in section I above, the DEIR dismisses the site's location adjacent to conserved lands and wildlife corridors. As explained in the attached Colibri Report, the Project site is located near conserved lands that play a key role in promoting biodiversity and the long-term sustainability of ecosystems in the area. Federally designated Critical Habitat for California tiger salamander, succulent owl's clover, and San Joaquin Valley Orcutt grass are located across the San Joaquin River from the Plant Site and Quarry Site, and Critical Habitat for California tiger salamander is located roughly 2.0 miles northeast of the eastern boundary of the project sites. DEIR at 4.4-37. Moreover, the San Joaquin River corridor—a significant wildlife movement corridor that provides critical natural areas—encompasses the western boundary of the Quarry Site and is roughly 0.6 miles west of the Plant Site. Little Dry Creek, which includes a riparian corridor

with a connection to the San Joaquin River, is located approximately 0.1 mile north of the Plant Site. *Id.* at 4.4-18-19. These areas are likely to be impacted by the Project. As explained in the attached CBEC and Colibri Reports, mining to 600 feet below ground surface at the Quarry Site adjacent to the San Joaquin River may impact river flows, leading to adverse impacts to sensitive species like Chinook salmon. Colibri Report at 6. And common sense dictates that fugitive dust emissions from blasting—which results in a significant amount of particulate matter—would be highly likely to carry to off-site areas, including these conserved lands and wildlife corridors, on windy days. The DEIR ignores this latter impact entirely.

Response 58-31

As described in the Draft EIR, the project sites are already highly disturbed by ongoing mining activities. The duration of this ongoing disturbance ranges from 30 to more than 100 years. Given this baseline, the proposed project would not have a significant increase in activity and is therefore unlikely to result in significant effects on biological resources.

Draft EIR Section 4.4 (supported by studies provided as Appendix E-1 and E-2), provides a detailed analysis of the potential for special status species to occur on the sites and/or be impacted by the project. This analysis considered the documented occurrences on and/or adjacent to the sites, habitat values within and adjacent to the sites, as is standard practice under CEQA (CEQA Guidelines Section 15125, see also *San Joaquin Raptor/Wildlife Rescue Ctr. v. Cnty. of Stanislaus*, 27 Cal.App.4th 713, 722, 32 Cal. Rptr. 2d 704 (1994), *as modified* (Sept. 12, 1994).

The Draft EIR provides the location and the extent of the adjacent conservation areas, in accordance with CEQA standards (CEQA Guidelines Section 15125, see also *San Joaquin Raptor/Wildlife Rescue Ctr. v. Cnty. of Stanislaus*, 27 Cal.App.4th 713, 722 (1994), *as modified* (Sept. 12, 1994).

The locations of adjacent conservation lands are discussed Draft EIR Section 2.4.5, "Surrounding Land Uses." The Draft EIR further discusses the proximity of the San Joaquin River and neighboring ecological reserves in Sections 2.2.1, 4.1.1.3, 4.1.1.4, 4.16.1. The acreage of the neighboring ecological reserves is included in other portions of the Draft EIR, namely Table 4.16-1, "Recreation Facilities Near the Project Sites." However, the section detailing the neighboring land uses, Draft EIR Section 2.4.5, has been revised to reflect the acreage of the adjacent ecological reserves. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 2.4.5.

The Draft EIR discusses Critical Habitats in Section 4.4.1.9, "Critical Habitat," of the Draft EIR. All the federally designated critical habitat is either located west of San Joaquin River or east of Friant Road. Neither the Plant Site nor the Quarry Site is located within nor adjacent to any designated Critical Habitat (see Draft EIR page 4.4-37). These sections of the Draft EIR do provide habitat descriptions of the areas onsite, which are in turn discussed in the context of their capacity to support special status wildlife. These include discussions on the presence of bullfrogs, barriers to egress, and the level of and duration of disturbance on the sites. As the commenter points out, and as is described in the above referenced Draft EIR appendices, the San Joaquin River corridor is a significant wildlife movement corridor located near the sites.

The Draft EIR analyzes the impacts to the San Joaquin River corridor in Impact 4.4-6. The Draft EIR concluded that the impact would be less than significant (Draft EIR page 4.4-62). For further discussion of the San Joaquin River corridor, see Section 4.4.1.6, "Migratory Corridors and Linkages."

Though not regionally significant, Little Dry Creek provides connection to the SJR corridor. These corridors have been in place and unaffected by the ongoing operations that are substantively similar to the proposed operations for many decades. There is no substantial evidence to suggest, and none is provided in the comment that the proposed new operations would significantly impact these areas.

See Response 58-29 for further discussion about the project's impact to river flows.

The impacts of fugitive dust emissions on wildlife and vegetation are discussed in Section 4.4 and further analyzed in Appendix D-4, "Revised Section 4.3, Air Quality," of the Draft EIR, as updated in the Final EIR. Mitigation Measures 4.3-2a and 4.3-2b are provided to address the impacts of fugitive dust emissions, which involves the development of a Fugitive Dust Control Plan. Furthermore, implementation of this mitigation measure would minimize the generation of particulate matter and the potential for dust to be generated from the project sites in amounts that could damage surrounding vegetation would be less than significant. This comment does not substantiate its assertion that fugitive dust is likely to carry to off-site areas. For a more detailed discussion regarding fugitive dust emissions, see Responses 58-40 and 58-41.

Comment 58-32

Notwithstanding the acknowledged rich array of biological resources on and adjacent to the Project site, the DEIR fails to sufficiently describe these resources because it relies on insufficient biological surveys. In some cases, surveys are impermissibly deferred until after Project approval. It seems, for

example, that the County did not conduct surveys for western pond turtle or western spadefoot. Rather, the DEIR merely notes that western spadefoot and western pond turtle were not observed on-site during a habitat assessment conducted *six years* ago, and relies on unsubstantiated presumptions to conclude that the species are unlikely to occur on the Project Site. DEIR at 4.4-35. Even though silt ponds are located on the Plant Site and pits that accumulate water are located on the Quarry Site, creating potential habitat for western pond turtle and western spadefoot, the DEIR presumes that western pond turtle and western spadefoot are unlikely to occur on the sites because the level of disturbance throughout the sites "severely limits movement opportunities" for spadefoot and pond turtle. *Id.* at 4.4-35, 3.3-36. This conclusory statement is no substitute for the analysis required under CEQA. Simply presuming the absence of western spadefoot and western pond turtle without conducting surveys constitutes deferred analysis, which is impermissible. *Sundstrom*, 202 Cal. App. 3d at 307. A revised DEIR must properly analyze whether western pond turtle and western spadefoot are present and in what numbers, and determine whether the project will result in permanent loss of habitat for these species.

Response 58-32

The Draft EIR properly analyzes the presence of western pond turtle and western spadefoot. The analysis presented in Draft EIR Section 4.4, demonstrates that blasting and mining activities are not expected to result in significant impacts to these species.

ELMT Consulting conducted a CNDDB query to identify sensitive species that may be present at the project sites and conducted field surveys in 2019 and 2021. Neither western spadefoot nor western pond turtle were observed during these surveys. The western pond turtle has not been observed near the site for over 20 years; the nearest recorded occurrence was approximately 2.75 miles from the Plant Site and 3.25 miles from the Quarry Site in 2004 (Draft EIR page 4.4-35). The nearest recorded occurrence of western spadefoot was approximately 1.80 miles northwest of the Plant Site and 1.20 miles northwest of the Quarry Site in 2008 (Draft EIR page 4.4-36). A subsequent CNDDB search conducted in 2024 revealed no changes in the identification of species potentially present at the project sites.

The comment asserts that the biological surveys are outdated; however, the project sites have not substantially changed in recent years, and no evidence is provided indicating that the survey data are inaccurate. Additional field surveys were conducted in 2021 (see Draft EIR page 4.4-22).

The comment also suggests that protocol-level surveys and population estimates are required. However, CEQA does not require protocol-level surveys or precise population counts where sufficient information exists to evaluate impacts (see *Save North Petaluma River & Wetlands v. City of Petaluma* (2022) 86 Cal.App.5th 207; *Association of Irritated Residents v. County of Madera* (2003) 107 Cal.App.4th 1383).

To ensure protection of the western pond turtle and western spadefoot, Mitigation Measure 4.4-1b requires pre-construction clearance surveys by a qualified biologist within suitable habitat areas. If individuals are observed, they would be relocated to suitable habitat outside the disturbance area. With implementation of this measure, impacts would be less than significant. Please see Chapter 3, "Draft EIR Errata," for revisions to Mitigation Measure 4.4-1b.

Comment 58-33

The DEIR's description of the existing setting also mischaracterizes jurisdictional waters on the Project Site. The DEIR does not characterize the wash water conveyance ditch at the Plant Site at a stream. But as explained in the Colibri Report, the California Department of Fish and Wildlife generally considers a stream to be any feature with a bed, channel, and banks that conveys water and supports stream dependent life, regardless of the origins and use of that feature. The wash water conveyance ditch meets those criteria, and therefore likely qualifies as a stream—meaning that diverting or obstructing its natural flow, altering its bed, channel, or bank, or depositing any materials into the ditch is subject to the provisions of California Fish and Game Code Section 1600 et seq. Colibri Report at 3. By neglecting to characterize the conveyance ditch as a stream—and consequently failing to consider the impacts associated with the removal of the wash water conveyance ditch at the Plant Site—the DEIR fails to adequately portray the existing setting at the Plant Site.

Response 58-33

The commenter asserts that the wash water conveyance ditch at the Plant Site should be characterized as a jurisdictional stream subject to Fish and Game Code Section 1602.

The Draft EIR analyzes and categorizes the wash water conveyance ditch in accordance with applicable laws and regulations, as described in the Habitat Assessment (Appendix E-1, Section 5.0, Impact B-3). The ditch is an artificial feature excavated in uplands and used exclusively to convey process water associated with mining operations. These features are routinely maintained and have been continually used to store and convey process water incidental to mining activities.

Based on these characteristics, the wash water conveyance ditch and associated features were determined not to fall under the regulatory authority of the U.S. Army Corps of Engineers. In addition, under the Draft State Wetlands Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State, these features are not considered "waters of the state" because they are artificial features constructed and maintained for active surface mining.

The commenter's interpretation that such a feature constitutes a jurisdictional stream subject to Fish and Game Code Section 1602 is not supported by applicable statutory or regulatory authority. Accordingly, the Draft EIR appropriately characterizes the existing setting, and no revisions are required.

Comment 58-34

Moreover, the entire DEIR relies on outdated record searches and an inadequate search radius for records of special-status species. *See* Colibri Report at 3. The record searches cited in the DEIR were conducted in 2019—*six years* ago—meaning that any records added since 2019 were not considered. *Id.* Moreover, as the Colibri Report explains, the industry standard for EIR-level record searches is a nine-quadrangle search radius, including the topographic quadrangle containing the project site and the eight surrounding quadrangles. But the County only searched *four* quadrangles when preparing the DEIR. The DEIR's reliance on this insufficient, sub-standard search radius means that special-status species that may occur on or near the project site were almost certainly overlooked, and potential impacts to them were not considered. *Id.*

Response 58-34

The comment is noted. While often performed, a 9-quad CNDDB search is not specifically required for CEQA review. A query of the four relevant USGS quadrangles included all occurrences within five miles of both project sites, which was deemed sufficient for the proposed project, including the temporal and on-site expansion of mining activities at locations that are already thoroughly disturbed and subject to ongoing mining operations. Occurrences of additional species at greater distances would not invalidate the analysis in the Draft EIR or the proposed mitigation measures.

In response to comments on the Draft EIR, an updated CNDDB search was conducted for a nine-quad region. Table 4.4-1, "Special-Status Wildlife Species," was updated in the Final EIR to incorporate the results of the updated CNDDB query and is provided in Chapter 3, "Draft EIR Errata." See also Appendix E-6, "WRA Supplemental Biological Resources Evaluation Memorandum." The updated information does not alter the Draft EIR's analysis or conclusions regarding biological resources.

The comment regarding the age of the database results is also noted. For purposes of this Draft EIR, these results are sufficient to evaluate potential impacts and identify appropriate mitigation measures. The Draft EIR conservatively assumes the potential presence of special-status species (including listed species) in the vicinity of the project sites. Based on existing site conditions, any additional occurrences identified would not be expected to alter the Draft EIR's analysis or conclusions.

Comment 58-35

These errors result in a DEIR that does not accurately reflect the existing setting. Searching the California Natural Diversity Database today and extending the search radius to encompass nine quadrangles, for example, reveals several species not addressed in the DEIR that may occur on or near the Project Site, including California glossy snake, western mastiff bat, pallid bat, spotted bat, and Townsend's big-eared bat. *Id.* A revised DEIR must conduct a new record search using more up-to-date data and, at minimum, a nine-quadrangle search radius.

Because the DEIR does not provide an accurate description of the existing physical conditions on the Project site, it is incapable of adequately evaluating the Project's impact on sensitive biological resources.

Response 58-35

The comment is noted. While no bat species were documented during the habitat assessments (Appendices E-1 and E-2), the Draft EIR conservatively evaluated the potential for special-status species to occur within and adjacent to the project sites.

In response to comments received on the Draft EIR, additional review of special-status species occurrences was conducted, including an expanded nine-quadrangle California Natural Diversity Database (CNDDB) search. The results of this expanded search have been incorporated into the Final EIR. Revisions to the biological resources analysis, including updates to Table 4.4-1, are provided in Chapter 3, "Draft EIR Errata."

Additionally, the Final EIR has been revised to include further discussion of bat species with moderate potential to occur in the project vicinity. As described in the errata to Section 4.4, several bat species (e.g., western red bat, hoary bat, pallid bat, and fringed myotis) may utilize habitat features in the project area. To address this potential, Mitigation Measure 4.4-1d has been incorporated to ensure that any potential roosting habitat is identified and avoided during sensitive periods. Implementation of this mitigation measure reduces potential impacts to bats to a less than significant level.

With incorporation of the updated database search and additional analysis, the Final EIR provides an adequate and accurate description of existing biological conditions and a sufficient evaluation of potential impacts to special-status species consistent with CEQA. See also Appendix E-6, "WRA Supplemental Biological Resources Evaluation Memorandum."

Comment 58-36

2. Analysis of Significant Impacts on Biological Resources Is Incomplete and Cursory.

In some instances, the DEIR determines that the Project may have significant impacts, but then fails to determine the extent and severity of those impacts. Merely stating that an impact will occur is insufficient; an EIR must also provide "information about how adverse the adverse impact will be." *Santiago County Water District v. County of Orange*, 118 Cal. App. 3d 818, 831 (1981). This information, of course, must be accurate and consist of more than mere conclusions or speculation. *Id.* The DEIR's analysis of impacts to biological resources fails to fulfill this mandate in several instances.

(a) Failure to Disclose The Extent and Severity of Impacts to Sensitive Wildlife

For example, the DEIR concludes that construction of the Project has the potential to result in significant adverse impacts to a host of sensitive animal species, several of which are state-listed as threatened or proposed for federal listing. Nonetheless, the document fails to explain the actual and specific consequences to these species. *See, e.g.*, DEIR at 4.4-48. These sensitive species include burrowing owl, western pond turtle,[9] (Footnote 9: The U.S. Fish & Wildlife Service has proposed to list both the northwestern and southwestern pond turtle as "threatened" under the federal ESA. 88 Fed. Reg. 68370 (Oct. 3, 2023)) western spadefoot,[10] (*Footnote 10: The U.S. Fish & Wildlife Service has proposed to list both the northern and southern distinct population segments of the western spadefoot as "threatened" under the Federal ESA. 88 Fed. Reg. 84252 (Dec. 5, 2023))* Swainson's hawk,[11] (*Footnote 11: Swainson's hawk is listed as "threatened" under the California ESA. Cal. Dept. of Fish & Wildlife, Cal. Natural Diversity Database Special Animals List 18 (Jan. 2025), available at https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=109406&inline (attached as Ex. G)*) bald eagle,[12] (Footnote 12: Bald eagle is a fully protected species under California law and listed as endangered under the California ESA. Id. at 18) and osprey. *Id.* Further, the DEIR notes that "[a]bundant nesting habitat for raptor

species" is found along the San Joaquin River west of the project site and along Little Dry Creek north of the Plant site, and that ground disturbances and noise impacts from mining could thus disturb nesting birds on or near the sites. *Id.*, at 4.4-49. Despite this disclosure, the DEIR fails to discuss the specific consequences to nesting birds. *Id.*, at 4.4-49. The DEIR provides insufficient information regarding the number of individuals of each species that will be affected or the degree to which the populations will be impacted.

Response 58-36

The analysis presented in Draft EIR Section 4.4 demonstrates that blasting and mining activities are not expected to result in significant impacts to these species with the implementation of the identified mitigation measures. While the commenter's concerns are noted, no additional or more robust analysis is warranted beyond that contained in the Final EIR.

The Draft EIR provides sufficient information about the impacts to sensitive species as it relies upon a literature search of the project sites and multiple biological field surveys. See *Save Round Valley All. v. Cnty. of Inyo*, 157 Cal. App. 4th 1437, 70 Cal. Rptr. 3d 59 (2007) holding that an EIR is not required to include a quantitative analysis to determine effect on population of affected species. CEQA requires that studies are sufficiently credible to be considered as part of the total evidence that supports the agency's decision.

The burrowing owl, western pond turtle, western spadefoot, Swainson's hawk, bald eagle, and osprey are discussed in Section 4.4.1.8, "Special-Status Biological Resources," of the Draft EIR. Impacts to burrowing owls and raptor species such as Swainson's hawk, bald eagle, and osprey are further discussed in Impact 4.4-1 of the Draft EIR, which states that implementation of Mitigation Measures 4.4-1a and 4.4-1c prior to the initiation of a mining phase would mitigate the potential adverse impacts to burrowing owls and nesting birds, including nesting raptors, to less than significant. Please see Chapter 3, "Draft EIR Errata." for revisions to Mitigation Measures 4.4-1a and 4.4-1c.

Comment 58-37

Moreover, the DEIR fails to adequately assess impacts to several listed species that have the potential to be harmed by the project. Tricolored blackbirds (a state-listed threatened species)[13] (*Footnote 13: Id.* at 22) have over a dozen breeding season occurrence records within two miles of the project site and potential nesting habitat in the southeastern portion of the Plant Site, but the DEIR ignores possible significant indirect impacts due to activities like blasting, excavating, trenching, or use of heavy equipment. Colibri Report at 5. These activities could cause

tricolored blackbird nests to fail, constituting a significant impact. *Id.* Western red bats, a sensitive species, have a moderate potential to occur on the project site, DEIR at Appendix C, Table C-1, yet the DEIR fails entirely to address the potential effects of the project on this species—including likely significant impacts from blasting given the western red bat's sensitivity to noise and vibration. Because bats are acoustic predators, noise from blasting could compromise their ability to effectively forage.

Response 58-37

Draft EIR Section 4.4 and its supporting studies (Appendices E-1 and E-2) provide an overview of habitat both within and adjacent to the Plant and Quarry sites and applicable habitat assessments. Mitigation Measure 4.4-1c addresses potential impacts to nesting birds resulting from the proposed project. Otherwise, blasting is not expected to result in sustained or long-term impacts.

As discussed in the Draft EIR, the Quarry Site does not provide suitable habitat for nesting sites for tricolored blackbirds (see Draft EIR at page 4.4-25). While some suitable nesting and foraging habitat is present on the Plant Site, the CNDDB records show no known occurrences of tricolored blackbirds within the vicinity of the Plant or Quarry sites, and the bird was not detected during the 2019 or 2021 Habitat Assessment field surveys (see Draft EIR page 4.4-25). Thus, the Draft EIR properly concludes that tricolored blackbirds have low potential to occur on the Quarry Site and Plant Site (see *Save North Petaluma River & Wetlands v. City of Petaluma* (2022) 86 Cal.App.5th 207, 226). Further, the Draft EIR addresses blasting impacts to wildlife, including nesting birds and specifically the tricolored blackbird, and concludes that impacts would be less than significant (Draft EIR page 4.4-51).

Although the western red bat has moderate potential foraging habitat on the project sites, no western red bats were observed on site during the habitat assessment (see Draft EIR, Appendix C, Table C-1). To strengthen the protections for bats, the Final EIR also includes additional discussion of bat species with moderate potential to occur in the project area, and incorporates Mitigation Measure 4.4-1d to ensure that any potential roosting habitat is identified and avoided during sensitive periods. Implementation of this measure reduces potential impacts to bats to a less than significant level. See Chapter 3, "Draft EIR Errata," to view the full description of Mitigation Measure 4.4-1d.

Comment 58-38

Swainson's hawks have more than four dozen breeding season occurrence records within two miles of the Project Site and numerous potential nest trees within half a mile of the Project

Site, yet the DEIR fails to address potential indirect effects of the Project on nesting Swainson's hawks. *Id* at 4. Noise and dust from blasting and other Project activity could cause Swainson's hawks' nests to fail, constituting a significant impact. *Id.* Similarly, the DEIR neglects to address potential indirect impacts to burrowing owls that could result from the Project. Noise and dust from blasting, excavating, scraping, or use of heavy equipment could cause burrowing owl nests to fail and/or substantially modify their habitat, constituting a significant impact. *Id.* The DEIR also presumes Sanford's arrowhead, a California Rare Plant, to be absent—even though this species occurs in aquatic habitats like those in the southeastern portion of the Plant Site, and could be present. *Id.* at 6.

Response 58-38

The comment is noted. See Response 15-13 regarding the sufficiency of Mitigation Measure 4.4-1c, as updated in the Final EIR, for nesting birds, including raptors. The Draft EIR analyzes the project's indirect impacts to Swainson's hawks in Impact 4.4-2, and specifically states that the birds have habituated well to existing mining operations (see Draft EIR pages 4.4-52 through 4.4-53). Within the discussion of the project's potential of noise and vibration impacts on wildlife, the Draft EIR concluded that wildlife has adapted well to active mining conditions, such that the impact of the proposed mining operations, including blasting, would be less than significant (see Draft EIR at pages 4.4-52 and 4.4-53). CEQA does not require mitigation measures where the impact is less than significant. The Draft EIR provides mitigation measures related to blasting that, while not species specific, would result in the reduction of impacts to special-status species and other wildlife and riparian areas. For example, the Draft EIR must comply with certain noise thresholds, which would reduce potential impacts to species. Additionally, the project would implement Mitigation Measure 4.3-2b, which would reduce fugitive dust emissions from blasting and would reduce the potential for fugitive dust emissions settling on vegetation and riparian areas (see Draft EIR page 4.4-58).

Mitigation Measure 4.4-1c has been revised to further mitigate potential impacts to nesting Swainson's hawk. Regarding impacts to burrowing owls, Mitigation Measure 4.4-1a stipulates preconstruction surveys for this species and has been revised in Final EIR Chapter 3, "Draft EIR Errata." Regarding potential indirect impacts, the Draft EIR concludes that blasting-generated dust would be temporary and minimized through enforceable measures in the Fugitive Dust Control Plan, including dust suppressants and stockpile management. See Appendix K of Appendix D-3 for the project's Fugitive Dust Control Plan. These standard measures are effective at reducing impacts to less-than-significant levels. The comment does not provide evidence that the proposed measures

would not be effective in reducing potential impacts to burrowing owls to less than significant levels.

The Draft EIR properly presumes the Sanford's arrowhead to be absent because it was not found on the Plant Site and only grows in swamp or marsh conditions which are not found on the project sites (see Appendix E-1, "Plant Site habitat Assessment"). This comment does not provide evidence to show that the project sites would support Sanford's arrowhead. A plant species' potential presence in the area must be considered in the baseline only if it could occur in the project area, which is not the case here (see *Nassiri v. City of Lafayette* (2024) 103 Cal.App.5th 910, 931 citing Guidelines Section 15332(c)). If the site has no value as a habitat for a listed species, then CEQA does not require analysis on impacts to those species (*Id.* at 926). No special-status plant species were observed in the Plant Site boundaries or within a half-mile buffer during a habitat assessment conducted in April 2019 and a survey conducted in 2021, and none are expected to occur based on habitat assessments, the presence of non-native grasses, the heavily disturbed nature of the majority of the sites, and the known distributions of the special-status plants (see Draft EIR Appendix E-1, ELMT Report at Executive Summary). See also Response 58B-9 for additional discussion of Sanford's arrowhead.

Comment 58-39

As explained in the attached CBEC Report, the DEIR also fails to adequately consider potentially significant impacts to species in groundwater dependent ecosystems that will result from the Project's interference with groundwater levels. CBEC Report at 5. Although groundwater dependent ecosystems are located near the Project Site, the DEIR contains no quantitative analysis of potential impacts to these ecosystems. *Id.* Groundwater dependent ecosystems are rooted in the alluvium extending outside the Project boundary. The Project may result in lowering the alluvium groundwater levels and dewatering remaining alluvium—which would totally dewater the alluvium and associated groundwater dependent ecosystem rooting zone adjacent to the San Joaquin River and north of the Quarry Site. This would result in potentially significant adverse impacts to groundwater dependent ecosystems, and the species that inhabit them, after— and possibly during—mining operations. *Id.* The DEIR fails to analyze these impacts.

A revised DEIR must properly document the biological resources on site and thoroughly evaluate the Project's impacts to both on- and off-site biological resources.

Response 58-39

The Draft EIR provides a comprehensive, site-specific analysis of groundwater and surface water interactions in Section 4.10. The adaptive management and monitoring procedures are also outlined in Mitigation Measure 4.10-10a to adaptively manage conditions in the event that mining is found to decrease groundwater supplies. Please see Final EIR Chapter 3, "Draft EIR Errata," for revisions to Mitigation Measure 4.10-10a.

Comment 58-40

(b) Failure to Analyze and Mitigate Impacts from Blasting and Fugitive Dust Emissions

The DEIR fails to analyze, let alone mitigate, impacts on sensitive wildlife and vegetation from dust emissions generated during blasting, aside from a cursory analysis of potential impacts to riparian habitats. DEIR at 4.4-57. The DEIR concludes that project operations associated with mining, processing, and reclamation activities would emit criteria air pollutants "from construction equipment and from mobile equipment and motor vehicles associated with excavation and blasting, and operation of an aggregate plant, ready-mix concrete plant, asphalt plant, and portable recycle plant on the Plant Site and Quarry Site." *Id.* at 4.3-57. However, the DEIR fails to consider particulate matter impacts of blasting on species—even though it admits in later sections that the generation of dust resulting from blasting would cause fine materials and dust to settle on vegetation, thereby indirectly harming habitats. *Id.* at 4.4-58. To address blasting impacts the DEIR proposes a Fugitive Dust Control Plan (Mitigation Measure 4.3-2), which prescribes upgrades to off-road engines, use of chemical dust suppressants, and daily application of water to stockpiles, but does not include any mitigation measures aimed at protecting sensitive wildlife and vegetation. *Id.*at 4.3-62

As the Colibri Report illustrates, fugitive dust emissions from the Project may adversely impact plants, and animals that depend on those plants, because fugitive dust may make plants unsuitable as habitat for insects and birds. Blasting results in a significant amount of particulate matter and would certainly carry to off-site areas on windy days. Blasting could thus harm or substantially modify the habitat of sensitive species like Swainson's hawks, tricolored blackbirds, burrowing owls, and western red bats, resulting in potentially significant impacts. Colibri Report at 4-6. The DEIR fails to address these impacts entirely (although it does admit, in its discussion of Project alternatives, that the no project alternative would "not create any new impacts to wildlife

or associated habitat" because there would be "no expansion of mining operation and no blasting." DEIR at 6-14).

Response 58-40

The Draft EIR analyzes the impact of fugitive dust emissions upon the surrounding environment in Section 4.3, "Air Quality," and concludes that the impacts of dust emissions from blasting would be temporary and minimized to less than significant levels after implementation of Mitigation Measure 4.3-2a and 4.3-2b (see Final EIR Appendix D-4, "Revised Section 4.3, Air Quality," at page 4.4-58). The Fugitive Dust Control Plan is adequate to reduce impacts of the project's fugitive dust emissions to less than significant, in accordance with CEQA standards. Although the Fugitive Dust Control Plan is not specifically directed towards protection of species, it would still have the effect of reducing impacts to special status species.

The Draft EIR also analyzes impacts to Swainson's hawks, tricolored blackbirds, burrowing owls, and western red bats in Section 4.4 of the Draft EIR. The Draft EIR provides mitigation measures for nesting birds, including Swainson's hawks, tricolored blackbirds, and burrowing owls, which would reduce possible impacts to these species to less than significant. See Mitigation Measure 4.4-1c on page 4.4-50.

The Draft EIR, as updated in the Final EIR, concludes that blasting-generated dust would be temporary and minimized through enforceable measures in the Fugitive Dust Control Plan, including dust suppressants and stockpile management. These standard measures are effective at reducing impacts to less-than-significant levels. The comment does not provide evidence that the proposed measures would not be effective in reducing potential impacts from dust to less than significant levels. No additional assessment or mitigation is required. See also Appendix K of Appendix D-3 for the Fugitive Dust Control Plan prepared for the project that would be submitted to the SJVAPCD for review and approval prior to project implementation.

Comment 58-41

The DEIR does conclude that the generation of dust by blasting could indirectly impact riparian habitats when fine materials and dust settle on vegetation. DEIR at 4.4-58. To address this, the DEIR proposes the Fugitive Dust Control Plan, which would require upgrades to off-road engines and would require that stockpiles be controlled through the application of dust suppressants. But as discussed further below, the Fugitive Dust Control Plan does not ensure that dust control measures will be properly implemented, let alone effective to reduce impacts to less-than-significant levels. A revised DEIR must include the prescribed analysis and

identify feasible mitigation measures that ensure minimization of impacts.

Response 58-41

The Draft EIR concludes that blasting-generated dust would be temporary and minimized through enforceable measures in the Fugitive Dust Control Plan, required by Mitigation Measure 4.3-2b, including dust suppressants and stockpile management. These standard measures are effective at reducing impacts to less-than-significant levels, and no additional mitigation or analysis is required.

Comment 58-42

In addition to inadequately analyzing the impacts of fugitive dust emissions, the DEIR fails to fully analyze the impacts of noise and vibration on wildlife. As described in the attached Salter Report, aside from its analysis of impacts to fish, the DEIR includes virtually no noise or vibration thresholds, analysis, or mitigation for wildlife in areas near the Project Site. Salter Report at 2. Although the DEIR concludes that "[g]round disturbance and noise impacts from mining could disturb nesting birds located on or near the project sites," DEIR at 4.4-49, and that mining could "result in potential adverse impacts to special-status species in the riparian habitat surrounding the project sites" due to substantial disturbances caused by noise and vibration, *Id.* at 4.4-52, it provides insufficient substantive analysis. Salter Report at 10. The County did not measure existing ambient noise levels in the neighboring wildlife areas; nor did it predict Project operational noise levels for these areas. Absent such analysis, the potential noise increase and ensuing impacts to wildlife cannot be evaluated adequately. *Id.* Indeed, the DEIR completely omits any analysis of blasting impacts on wildlife and other nearby riparian habitat. Because the DEIR's analysis of noise and vibration impacts is so deficient, impacts to wildlife remain largely unknown. *Id.* And since there are no noise and vibration mitigation measures that control operational noise or blasting vibration—such as stopping blasting during times when birds are nesting near the Project Site—noise and vibration from the Project will likely disrupt nearby wildlife. *Id.*

Response 58-42

The San Joaquin riverbank was identified as a sensitive receptor in the noise and vibration analysis (see Draft EIR at page 4.13-12). The comment incorrectly claims that ambient noise was not measured in neighboring wildlife areas (see Figure 4.13-4, "Blasting Vibration Receptors," for a map of the locations where ambient noise measurements were

taken). Locations 24F, 24P, and 25A are located on the San Joaquin riverbank and the noise measurements are disclosed in Table 4.13-4, "Existing Ambient Noise Environment at Nearest Receptors to Quarry Site." We also note that the Salter Report does not reference any wildlife noise studies. Furthermore, the Blasting Protocols (see Draft EIR Appendix H-9) specifically state that noise measurements would be continually measured at those receptor locations and if they were to exceed specified thresholds, then blasting activities would cease, the County would be notified, and a corrective action plan would be developed (see Draft EIR Appendix H-9 at page 5). This is sufficient to ensure that wildlife is protected because, as described below, the species have already adapted well to the ambient noise conditions on the sites, therefore it is sufficient to only cease blasting activities if the noise and vibration levels exceed established thresholds.

The Draft EIR discusses and analyzes the project's impacts of vibration in Section 4.13, "Noise," of the Draft EIR. Further discussion of vibration caused by the project is provided in detail in Appendix H-1 of the Draft EIR. The Draft EIR concluded that the impact of ground borne vibration or noise from mining operations would be less than significant, and thus does not require any mitigation (Draft EIR at page 4.13-63 to 64).

The Draft EIR recognizes the possibility that nesting birds and other wildlife may nest at the Quarry Site, and implements mitigation measures to ensure that impacts are lessened. The Draft EIR concludes that blasting impacts to wildlife is less than significant because of the examples that avian species and other wildlife have successfully habituated to land uses that generate substantial noise and vibration (Draft EIR at page 4.4-52). Given the history of mining operations and the continued existence of these species in neighboring areas, the Draft EIR properly concludes that wildlife would continue to habituate to the proposed project. Furthermore, the comment fails to provide any evidence that their proposed mitigation measure to halt blasting while birds are nesting is feasible given that blasting would need to occur twice per week. Blasting would occur up to two times per week, and a typical blasting event would occur for one to two seconds.

Comment 58-43

Project will likely disrupt nearby wildlife. *Id.*

(c) Failure to Disclose Impacts to Special Status Species After Reclamation of the Site.

The DEIR's analysis of impacts to special-status plant and wildlife species after mining and reclamation are complete suffers from similar deficiencies. The DEIR concludes that there would be no significant impacts once reclamation is complete because "all activities would cease, and all equipment would be removed," sources of lighting, noise, and vibration would be removed, and

the area would be reverted to open space. DEIR at 4.4-53. However, the current reclamation plan in place for completion of alluvial mining and the sites does not match the proposed one. The existing reclamation plan would leave a large, but comparatively shallow (approximately 20 feet deep) lake at the Quarry site; the proposed reclamation plan would leave an 108-acre, 600-foot-deep pit with a water surface elevation of approximately 500 feet below the surrounding grade. *Id.* at 4.4-53-54. Compared to the proposed reclamation plan, the existing reclamation plan would offer better opportunities for aquatic plant and animal life, as habitat value is often inversely related to water depth. Colibri Report at 6. But the DEIR ignores likely impacts to wildlife that would result from the creation of the 600-foot-deep pit and fails to analyze the impacts of the proposed reclamation plan compared to the existing plan.

Similarly, the DEIR notes that the formation of quarry pit ponds that would cover the majority of the Plant and Quarry Sites would constitute an "irreversible" environmental change that would preclude future land uses, but fails to analyze whether this change would result in impacts to sensitive species or their habitats. *Id.* at 7-3.

Response 58-43

The Draft EIR appropriately evaluates post-reclamation impacts based on the proposed reclamation plan. Existing physical conditions at the time of the Notice of Preparation "will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant" (Title 14 CCR Section 15125(a); see also *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439, 448; *Communities for a Better Environment v. South Coast Air Quality Management District* (2010) 48 Cal.4th 310, 320). It is appropriate for the Draft EIR to analyze impacts of the proposed Reclamation Plan relative to existing physical conditions, rather than comparing the proposed plan to a previously approved reclamation plan. The prior reclamation plan does not represent existing environmental conditions and would not provide an appropriate baseline for impact analysis.

Furthermore, the proposed Reclamation Plan is consistent with SMARA and is subject to approval by the County and the California Department of Conservation, Division of Mine Reclamation. The plan includes recontouring, slope stabilization, managed water levels, and revegetation in accordance with established performance standards (see Draft EIR Appendix B-1).

As described in the Draft EIR, the majority of both the Plant Site and Quarry Site has been heavily disturbed by decades of mining activity and does not support high-quality native habitat. The Quarry Site, in particular, is largely devoid of habitat value due to ongoing and historical disturbance. Accordingly, the analysis appropriately concludes that the proposed project would not result in a significant loss of habitat value.

In response to comments received on the Draft EIR, the biological resources analysis has been updated in the Final EIR to incorporate an expanded nine-quadrangle California Natural Diversity Database (CNDDB) search and revisions to Table 4.4-1 (see Chapter 3, "Draft EIR Errata").

Additionally, the Final EIR includes expanded discussion of special-status species with potential to occur in the project area, including bat species, and incorporates Mitigation Measure 4.4-1d to ensure that any potential roosting habitat is identified and avoided during sensitive periods. These updates further support the conclusion that impacts to special-status species, including under post-reclamation conditions, would be less than significant.

The comment's suggestion that the EIR must compare the proposed reclamation plan to a prior plan or evaluate speculative differences in habitat outcomes is not required under CEQA. The Draft EIR, as clarified and supplemented in the Final EIR, provides a sufficient and legally adequate analysis of post-reclamation conditions and associated biological impacts.

Comment 58-44

3. The DEIR Fails to Adequately Evaluate the Project's Adverse Impacts on On-Site and Downstream Habitat Areas.

As described in both the CBEC and the Colibri Reports, the Project's effects on site hydrology would result in water stress to existing riparian habitat areas on-site and downstream of the Project site. The Project would result in myriad changes including a substantial loss of groundwater due to increased evapotranspiration from large numbers of wetland and riparian plants proposed as part of the revegetation plan and increased evaporation in ponded areas. In addition, changes in Project site topography, hydraulics, and flow that will redirect flood waters have the potential to impact existing riparian areas on-site and sensitive habitat downstream. CBEC Report at 5 and Colibri Report at 6. The DEIR fails to evaluate these impacts.

Response 58-44

See Response 58-28, which addresses the issues raised in the comment.

The Draft EIR addresses impacts on riparian habitat or other sensitive natural communities under Impact 4.4-4 (Draft EIR, pages 4.4-55 through 4.4-58). With implementation of Mitigation Measures 4.10-1, 4.3-2a, and 4.3-2b, the impact would be less than significant. Further, the comment does not provide evidence or argument indicating that Mitigation Measure 4.10-10a would be inadequate to mitigate impacts to groundwater levels and associated effects on riparian habitat.

The comment states that the Draft EIR fails to evaluate a "substantial loss of groundwater due to increased evapotranspiration from large numbers of wetland and riparian plants proposed as part of the revegetation plan and increased evaporation in ponded areas." The Draft EIR evaluates the project's water use, including that due to evapotranspiration, at Impacts 4.10-9 and 4.10-10, and the overall water use, both existing and following reclamation, is summarized at Table 4.19-1, "Existing and Proposed Water Use Summary (Acre-Feet per Year)." As described at Table 4.19-1, water use following reclamation would be substantially reduced as compared to the existing baseline at both the Quarry Site and the Plant Site. The comment does not provide any evidence that the increased evapotranspiration would result in any impacts not already discussed in the Draft EIR and addressed by Mitigation Measures 4.10-10a and 4.10-10b.

The comment further states that changes in project sites' topography, hydraulics, and flow that would redirect flood waters have the potential to impact existing riparian areas on-site and sensitive habitat downstream. The comment is inconsistent with data and analyses in the Draft EIR. Impact 4.20-4 (Draft EIR, Impact 4.20-4, page 4.20-16) analyzes impacts to existing riparian areas; Impact 4.10-15 (Draft EIR, page 4.10-117) indicates that the project would not alter drainage patterns in a manner that would result in on- or off-site flooding or exceed the capacity of the existing storm drainage system. Impact 4.10-16 (Draft EIR pages 4.10-117 through 4.10-118) determined that the project would not alter drainage patterns in a manner that would impede or redirect flood flows. Impact 4.10-17 (Draft EIR, pages 4.10-118 through 4.10-119) determined that the enlarged mining excavation could help contain and minimize downstream flooding, which would reduce the overall potential for release of pollutants, including sediment. This comment does not identify evidence indicating that the Draft EIR's evaluation of these potential impacts is inadequate.

Comment 58-45

The San Joaquin River to the west of the project site supports a Great Valley Mixed Riparian Forest, and riparian habitat is also

located just north of the Plant Site and south of Little Dry Creek. DEIR at 4.4-55, The DEIR notes that pumping of quarry pits on the project sites and the ensuing formation of a quarry pit pond on the Plant Site and quarry pit lake on the Quarry Site "would result in decreased groundwater levels in the areas surrounding the project sites," which could lead to adverse impacts to riparian habitat should plant species lose access to groundwater or river flow water important to their survival. *Id.* at 4.4-55. Mulefat and sandbar willow, for instance, are groundwater dependent species that have been identified within 500 feet of the Plant Site. *Id.* at 4.4-11. As explained in the attached CBEC Report, the Project will interfere with groundwater dependent ecosystems, resulting in potentially significant impacts on these ecosystems after, and possibly during, mining operations. CBEC Report at 5.

Response 58-45

See Response 58-28 and 58-44. The comment does not provide any evidence that the project would result "in potentially significant impacts on" groundwater dependent ecosystems. While the comment cites to the Draft EIR page 4.4-55, that page indicates that at the Plant Site groundwater levels are more than 30 feet deep, "typically deeper than that which could support riparian vegetation." The level of drawdown related to the project would be "within normal seasonal fluctuations of groundwater and therefore would be unlikely to have an adverse effect on groundwater dependent ecosystems or on river flow dependent ecosystems" (Draft EIR page 4.4-56). Similarly, dewatering of the existing quarry pit currently affects most of the alluvium on and adjacent to the site. As provided in the EMKO Report attached to the Draft EIR as Appendix G-5, no further effects related to dewatering of the alluvium can occur (Draft EIR, Appendix G-5, page 46). Further, the comment does not provide any evidence or argument that Mitigation Measure 4.10-10a and Mitigation Measure 4.10-10b would not mitigate impacts to the groundwater dependent resources.

Comment 58-46

Moreover, blasting at the Quarry Site could impact riparian habitat by destabilizing the San Joaquin River bank, or by generating projectiles that could damage riparian habitat. *Id.* at 4.4-57. To address this, the DEIR proposes Mitigation Measure 4.10-1, which would implement blasting protocols that would require blasting to begin at the center of the Quarry Site so that "monitoring of groundborne vibration can occur and be used to verify that predicted maximum ground vibrations are consistent with actual ground vibration measurements and allow for adjustments in blasting design to occur based on the monitoring results." *Id.* If it is determined that blasting is causing instability (of the river

bank), a "corrective action plan must be developed that identifies changes to the blasting program to prevent future exceedances." *Id.* at 4.4-58. The blasting protocol would also require the development of an annual Blasting Plan submitted to the county each year for review. *Id.* These mitigation measures are both vague and impermissibly deferred. Indeed, these measures would allow significant impacts to occur before any steps are taken to avoid or minimize impacts; corrective action would be taken only after the damage is already done. CEQA prohibits a delay in implementation of mitigation until after a significant impact occurs. *See King and Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 860, 862; *POET, LLC v. State Air Resources Bd.* (2013) 218 Cal.App.4th 681, 738, 740. Compounding the problem, the DEIR fails to articulate exactly *what* corrective action must be taken if significant impacts occur. This is also unlawful. *See, e.g., California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 195-96; *Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260, 280-81.

Response 58-46

Mitigation Measure 4.10-1 requires the implementation and compliance with the Blasting Protocols developed October 27, 2020, and updated April 29, 2026, by Vibra-Tech Engineers, Inc. The Blasting Protocols must be appended to the Mitigation Monitoring and Reporting Program and incorporated as a condition of approval for the project. The Blasting Protocols, which are attached at Appendix H-6 to the Draft EIR, and updated in Appendix H-9 of the Final EIR, are neither vague nor impermissibly deferred. The Blasting Protocols set out instrumentation requirements (Section A), instrumentation setup procedures (Section B), including locations of ground vibration measurement sensors and microphone placements for air overpressure measurements, discusses receptor locations and frequency of monitoring (Section C), discusses ground vibration and air overpressure control limits for receptors (Section D) and sets out the requirement for the inspection of the San Joaquin River Embankment pre-blast and post-blast as well as other significant requirements, including complaint response procedures, record keeping and annual reporting. The procedures are not vague. Moreover, the corrective action plan, in addition to setting out requirements that would need to be taken to prevent future exceedances, also provides for the "immediate suspension of all blasting until the corrective action is implemented" (Section F). These measures are also discussed extensively in the Draft EIR 4.4-57 to 4.4-58.

The adaptive requirements of the Blasting Protocols are not an impermissible deferral of mitigation, which "occurs when an EIR puts off analysis or orders a report without either setting standards or demonstrating how the impact can be mitigated in the manner

described in the EIR." (*Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) Title 17 Cal.App.5th 413, 442–443.) Here, the County clearly has analyzed the potential impacts and described a precise means of mitigating the potential effects of blasting. That a corrective action plan may need to be developed and implemented indicates the mitigation measure is adaptive to changing circumstances and thus more effective than a non-adaptive measure. (See *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) Title 17 Cal.App.5th 413, 442–443.)

The holding in *King and Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 860, 862, is inapplicable. In *King,* the court held that the proposed mitigation measure in the EIR constituted a delay in implementation because the mitigation measure "allowed permits … to be issued (and wells to be drilled) without being subject to the measures contained in the plan." (*Id*. at page 860.) In contrast, Mitigation Measure 4.10-1's requirements would be effective immediately.

See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4.

Comment 58-47

The DEIR also reaches unsupported and unreasonable conclusions about impacts to on-site and downstream wildlife from mining operations and blasting. For instance, it concludes that the project's interference with native resident or migratory fish or wildlife species movement, corridors, or nursery sites would be less than significant, DEIR at 4.4- 63, but justifies this conclusion by discussing post-operating conditions; the DEIR claims that mining operations on the Plant Site will not compromise wildlife movement, in part, because "[u]pon completion of mining and reclamation, the final reclaimed use on the site would be open space." *Id.* But the Project envisions operation for a period of 100 years. *Id.* at ES-4 and 2-5. That reclamation would take place at the end of this period does not mean that there will not be significant impacts in the interim. Disruption of the site over a 100-year period will cause significant impacts, even if the site will one day be reclaimed. The DEIR may not just ignore a century of adverse impacts to wildlife simply because the Project Site will be converted to open space thereafter.[14] (*Footnote 14:* Nor is there any guarantee that the site actually will be reclaimed even after another century of operation. As discussed above, the site would have been reclaimed decades ago had the County not repeatedly extended the expiration of existing permits.)

Response 58-47

See Responses 58-28 and 58-44, which adequately address impacts to on-site and downstream wildlife from mining operations. Impact 4.4-6 adequately analyzes groundborne noise and vibration from blasting that could impact fish in the San Joaquin River (Draft EIR pages 4.4-62 through 4.4-63). Regarding the Quarry Site, the Draft EIR found that the level of significance was less than significant because "level of ground vibration is significantly below the 2.0 in/sec limit for the protection of embryos in spawning gravels" (Draft EIR, page 4.4-63). Regarding the Plant Site, the Draft EIR found that there would be no impacts to wildlife because impacts would not change as compared to the CEQA baseline because the Plant Site is almost entirely disturbed (Draft EIR, page 4.4-62). Time extensions alone are not cognizable CEQA impacts because they do not increase the impacts over the baseline (see, e.g., *World Business Academy v. California State Lands Commission* (2018) 24 Cal.App.5th 476, 493-97 (use of CEQA Class 1 categorical exemption for 7-year extension of lease); *North Coast Rivers Alliance, supra,* 227 Cal.App.4th at 868 (use of CEQA Class 1 categorical exemption for 2-year extension of contract). Further, this comment alleges that the Draft EIR's evaluation of the Plant Site's impacts to wildlife are inadequate because the Plant Site would not be reclaimed for 100 years. However, the Plant Site would continue mining operations for only up to 30 years, not 100 years (see Draft EIR, pages 1-7 and 4.4-62).

Mitigation Measure 4.10-1 provides for Blasting Protocols to address any potential impacts to the San Joaquin River embankment, which require continuous pre-blast and post blast visual inspections of the portions of the San Joquin River embankment that are located within 1,000 feet of each blast and depths less than 100 feet within the hard rock portion of the quarry pit would be completed (see Draft EIR, pages 4.4-57 through 4.4-58; Mitigation Measure 4.10-1; and Appendix H-9, Section E, page 5).

Comment 58-48

Furthermore, the DEIR's discussion of impacts to special-status wildlife species in riparian habitat surrounding the Plant and Quarry sites during mining operations is devoid of any real analysis. Without providing a single citation to back its claims, the DEIR asserts that "wildlife is often observed to habituate well to daily recurring activities and noise associated with the operations," DEIR at 4.4-52. The DEIR provides several examples of species habituating—again, without offering any citations to substantiate these claims. *Id.* at 4.4-52-53. Many of these examples, including the primary example offered, Cajon Creek Conservation Bank, were projects involving alluvial surface mining without blasting, and are therefore not reflective of whether species exposed to blasting on the Quarry Site are likely to

habituate or not. *Id.* The DEIR's conclusion that impacts to special-status wildlife species in riparian habitat surrounding the Plant and Quarry sites during mining operations will be less than significant lacks any basis.

Response 58-48

See Response 58-28, 58-44, and 58-47, which adequately address impacts to special status wildlife species in riparian habitat surrounding the Plant and Quarry sites during mining and blasting operations. In addition, numerous hard rock mining sites in the Southern California desert are examples of where wildlife live in close proximity to blasting (see e.g. Castle Mountain Mine which has operated next to a bighorn sheep population for several decades). A single blasting event is about 1 second in duration (Draft EIR page 2-42).

As explained in Draft EIR Impact 4.4-2, only a few special-status wildlife species have a potential to appear on-site and all remaining special-status species have a low potential to occur on-site (Draft EIR, page 4.4-49). For the few special-status wildlife species that have a potential to appear onsite, although none have been observed on site, Mitigation Measures 4.4-1a, 4.4-1b, and 4.4-1c were established by Impact 4.4-2 to adequately reduce impacts to special status wildlife species in riparian habitats to less than significant (see Draft EIR, Impact 4.4-1; and Draft EIR, pages ES-14 through ES-18 and 4.4-48 through 4.4-52). Given that 1) most special status species are not likely to occur on site, 2) the duration of blasting is mere seconds (one to two seconds at the most) per week, and 3) the noise and vibration levels reached with blasting are not likely to exceed thresholds for humans or salmon, the project is not likely to result in significant adverse impacts to wildlife. See Response 58C-3 for further discussion and analysis of vibration thresholds for humans.

Comment 58-49

In addition, as discussed above, the Project proposes to excavate hard rock to a depth of 600 feet, leaving a large pit even after reclamation has taken place. As described in the attached CBEC report, groundwater in the alluvium beneath off-site areas will likely flow into the Quarry Site pit, resulting in potential groundwater contamination as well as potentially significant impacts to neighboring groundwater dependent ecosystems. CBEC Report at 4. The DEIR ignores these impacts to water quality and to downstream aquatic habitats. *Id.*

Response 58-49

See Response 58-28, 58-44, and 58-47, which discusses the Draft EIR's analyses of water quality and downstream impacts caused by the project.

The comment does not explain why the project would result in groundwater contamination.

The comment alleges that "groundwater in the alluvium beneath off-site areas will likely flow into the Quarry Site pit, resulting in potential groundwater contamination… CBEC Report at 4." First, page 4 of the CBEC report makes no such mention regarding potential groundwater contamination. Second, the project does not have the potential to cause groundwater contamination (see Draft EIR, Section 4.9.1.2, "Soil and Groundwater Contamination Setting," pages 4.9-3 through 4.9-4 [There are no known areas of soil and groundwater contamination within or near the Plant Site or Quarry Site]); Impact 4.9-1, pages 4.9-15 through 4.9-17; Impact 4.9-2, pages 4.9-17 through 4.9-19 [Requires implementation of mitigation measures and protocols to reduce to less than significant with mitigation the release of hazardous materials transported, used, or disposed during mining or final reclamation]; and Impacts 4.10-1, 4.10-4, and 4.10-6 which further analyze potential groundwater contamination.)

Comment 58-50

4. The Project's Approach to Mitigation of Impacts on Biological Resources is Inadequate.

The DEIR not only fails to adequately analyze potentially significant impacts on biological resources on-site and off-site in the adjacent wildlife refuges due to project- related hydrologic changes, fugitive dust emissions, and direct impacts from removal of habitat, but also fails to provide adequate mitigation to address all of the ways that biological resources will be impacted. An EIR is inadequate if it fails to suggest mitigation measures, or if its suggested mitigation measures are so undefined that it is impossible to evaluate their effectiveness. *San Franciscans for Reasonable Growth v. City and County of San Francisco* (1984) 151 Cal.App.3d 61 at 79. The County may not use the inadequacy of its impacts review to avoid mitigation: "The agency should not be allowed to hide behind its own failure to collect data." *Sundstrom*, 202 Cal.App.3d at 306. The formulation of mitigation measures may not properly be deferred until after Project approval; rather, "[m]itigation measures must be fully enforceable through permit conditions, agreements, or legally binding instruments." CEQA Guidelines § 15126.4(a). Here, the DEIR's identification and analysis of mitigation measures, like its analysis of biological impacts, are legally inadequate.

The DEIR concludes that the project could result in significant impacts to special- status species—including burrowing owls, western pond turtles, western spadefoot, Swainson's hawks, bald

eagles, and ospreys—on the Plant Site or Quarry Site during mining operations, DEIR at 4.4-48-49, and that ground disturbance and noise impacts from mining could disturb nesting birds on or near the sites. *Id.* at 4.4-49. But the mitigation measures it proposes, which involve conducting preclearance surveys and relocating any members of these species found on the Project Site, fail to mitigate potential irreversible impacts to these species' habitat. *Id.* at 4.4-50 to 4.4-52, 4.4-57 to 4.4-58. Activities such as mining operations, blasting, and the creation of the 600-foot deep pit could result in the irrevocable destruction of habitat. Even if sensitive species are relocated, loss of their habitat is nevertheless an impact that requires evaluation and mitigation. A revised DEIR should include mitigation measures that adequately address potential irreversible harms to species habitat.

Response 58-50

Preclearance surveys and relocating potentially effected species, which are measures typically used for species mitigation, are adequate for the purposes of mitigating impacts to sensitive species. Additionally, the relocation of species would be done in coordination with the CDFW, following the CDFW's expertise, and with a plan approved by the CDFW (see Draft EIR page 4.4-48). Moreover, the mitigation measures would be fully enforceable as condition of approval to the conditional use permit. Please see Response 65-11 for further discussion of the Mitigation Measures proposed for burrowing owls, western spadefoot, and western pond turtle.

The commenter ignores the current baseline. Both the Quarry and Plant sites are already heavily disturbed and have been for decades. The habitat impacts largely already exist. Although the depth of the pit at the Quarry Site would be increased, the perimeter of the area already disturbed by mining operations would not expand. As such, the project is not likely to result in habitat loss for burrowing owl, western spadefoot, and western pond turtle. Furthermore, as discussed in Response 65-11, and in Section 4.4.1.8 of the Draft EIR, burrowing owl, western spadefoot, and western pond turtle are not likely to occur within the project sites. As such, Mitigation Measures 4.4-1a, 4.4-1b, and 4.4-1c, as revised in the Final EIR, are sufficient to reduce impacts to less than significant (see Draft EIR pages 4.4-50 through 4.4-52).

Furthermore, potentially significant effect/indirect physical change is not required to be analyzed and/or mitigated if the effect would be speculative and therefore not reasonably foreseeable (CEQA Guidelines Section 15064(d)(3)).

To provide clarification and amplify the efficacy of the mitigation measure, Mitigation Measure 4.4-1c is revised in this Final EIR as presented in Chapter 3, "Draft EIR Errata."

The revisions provide additional specifics regarding the requirements of Mitigation Measure 4.4-1c for pre-construction surveys by the qualified biologist and required notification to CDFW in the event that nesting bird species are detected during pre-construction surveys.

Comment 58-51

The DEIR's biological mitigation measures are inadequate for additional reasons. For example, the measures calling for relocation of burrowing owls, western pond turtles, and spadefoot (4.4-1a and 4.4-1b) fail to discuss any potential adverse impacts on these species resulting from capture and relocation. An EIR must evaluate whether mitigation measures may cause significant environmental impacts of their own (CEQA Guidelines § 15126.4(a)(1)(D)), but this EIR fails to do so. Nor do these measures cite any evidence that suitable habitat is available in areas where relocation would be feasible and the relocated species would not be further disturbed.

Response 58-51

The safe relocation of species in coordination with the CDFW is not a mitigation measure with significant effects that would need further analysis under CEQA Guidelines Section 15126.4(a)(1)(D), particularly as the relocation plan would be approved by CDFW. This is a standard mitigation measure, and the comment does not offer any reason why it would be ineffective. Furthermore, a potentially significant effect/indirect physical change is not required to be analyzed and/or mitigated if the effect would be speculative and therefore not reasonably foreseeable (CEQA Guidelines Section 15064(d)).

Any identification of relocation sites at this time would also be premature given that relocation may not occur until decades from now when the suitability of surrounding potential relocation sites may have changed. Thus, identification of suitable habitat can be permissibly deferred. An EIR need not identify the exact location of off-site mitigation property (*Preserve Wild Santee v City of Santee* (2012) 210 Cal.App.4th 260).

Mitigation Measures 4.4-1a and 4.4-1b are appropriate as they prescribe specific actions to be taken should the stated species be located at the time of the pre-construction clearance surveys, and would be subject to CDFW approval. Under CEQA, an agency can commit itself to eventually devising measures that will satisfy specific performance criteria articulated at the time of project approval (*Defend the Bay v. City of Irvine* (2004) 119 Cal.App.4th 1261).

The burrowing owl relocation plan described in Mitigation Measure 4.4-1a would require CDFW approval and includes details about capture, handling, transportation, and the

relocation site(s). Given that the western burrowing owl was listed as a candidate species under CESA in October 2024, if burrowing owls are found onsite during pre-construction surveys, CDFW would be consulted regarding any required Incidental Take Permit and related measures. Mitigation Measure 4.4-1a is revised in this Final EIR through errata presented in Chapter 3, "Draft EIR Errata," to clarify that burrowing owl relocation is not a relevant option during the nesting season and that any burrowing owls found during that period would be assumed to be nesting and subject to a protective buffer of at least 500 feet around the occupied burrow(s), unless otherwise agreed to by CDFW. Similarly, a proposed relocation of western pond turtles or western spadefoot toad would require CDFW approval, and Mitigation Measure 4.4-1b is revised as shown in Chapter 3, to specify that a relocation plan be developed in such a circumstance and submitted to CDFW for review. See Chapter 3, to view this revision to the Draft EIR.

The safe relocation of species in coordination with the CDFW is not a mitigation measure with significant effects that would need further analysis under CEQA Guidelines Section 15126.4(a)(1)(D), particularly as the relocation plan would be approved by CDFW. This is a standard mitigation measure, and the comment does not offer any reason why it would be ineffective. Furthermore, a potentially significant effect/indirect physical change is not required to be analyzed and/or mitigated if the effect would be speculative and therefore not reasonably foreseeable (CEQA Guidelines Section 15064(d)).

Any identification of relocation sites at this time would also be premature given that relocation may not occur until decades from now when the suitability of surrounding potential relocation site may have changed. Thus, identification of suitable habitat can be permissibly deferred (see *Preserve Wild Santee v City of Santee* (2012) 210 Cal.App.4th 260 (an EIR need not identify exact location of off-site mitigation property).

Mitigation Measures 4.4-1a and 4.4-1b are appropriate as they prescribe specific actions to be taken should the stated species be located at the time of the pre-construction clearance surveys, and would be subject to the approval of CDFW (see *Defend the Bay v. City of Irvine* (2004) 119 Cal.App.4th 1261 (holding that an agency can commit itself to eventually devising measures that will satisfy specific performance criteria articulated at the time of project approval).

Comment 58-52

Measure 4.4-1c for nesting birds is also arbitrary, inadequate and inconsistent. Although the measure contemplates that a buffer zone of 300 to 500 feet may be necessary to protect nests from disturbance, it would require surveys only within 50 feet of "the immediate area of the mining phase where construction is to be initiated." DEIR at 4.4-50. Nests outside this 50-foot buffer, but

within the 300- to 500-foot radius where nest protection is necessary, would receive no protection at all. This arbitrary limitation on survey distance is unlawful. *See Sierra Watch v. County of Placer* (2021) 69 Cal.App.5th 86, 106-07.

Response 58-52

The comment is noted. The Draft EIR's reference to a 50-foot survey area in Mitigation Measure 4.4-1c was a typographical error. As clarified and revised in the Final EIR, preconstruction nesting bird surveys would be conducted within 500 feet of the limits of disturbance, consistent with the buffer distances identified for protection of nesting birds. These revisions are provided in Chapter 3, "Draft EIR Errata."

Mitigation Measure 4.4-1c has also been expanded to provide additional specificity regarding survey requirements and protective measures. Surveys would be conducted by a qualified biologist prior to initiation of ground-disturbing activities, including blasting where applicable. If blasting is scheduled during the nesting season, pre-blasting surveys would be conducted within a 0.25-mile radius of blasting locations to address species with larger disturbance sensitivities, such as Swainson's hawk and bald eagle, consistent with applicable California Department of Fish and Wildlife (CDFW) guidance. These surveys would include multiple site visits and, where active nests are identified, appropriate avoidance buffers would be established, or activities would be modified or delayed in coordination with CDFW.

Given these revisions, the Final EIR does not limit surveys to an arbitrary or inadequate distance and instead provides a scientifically supported and species-appropriate survey and buffer framework. Implementation of Mitigation Measure 4.4-1c, as revised in the Final EIR, ensures that potential impacts to nesting birds would be avoided or minimized to a less than significant level.

Comment 58-53

C. The DEIR's Analysis of Project-Related Air Quality Impacts Is Inadequate.

The DEIR's analysis of Project-related air quality impacts contains numerous deficiencies that must be remedied in order for the public and decision-makers to fully understand the Project's impacts. Specifically, the evaluation of the Project's air quality impacts must be revised to address: (1) inadequate analysis of direct and indirect impacts of fugitive dust emissions, (2) an insufficient mitigation plan for particulate matter emissions; and (3) deficient analysis and mitigation of project-related public

health impacts. These issues, and other deficiencies, are discussed in greater detail below.

1. The DEIR Fails to Adequately Evaluate the Project's Direct and Indirect Impacts Resulting from Particulate Matter Emissions.

The DEIR concludes that Project-related particulate matter emissions (specifically fugitive dust emissions) would be significant. DEIR at 4.3-60. However, the DEIR fails to provide adequate details about dust-producing elements of the Project. As a result, readers of the evaluation cannot know whether all direct impacts were evaluated. For example, the DEIR fails to provide information about the area that would be disturbed at both sites each day; the anticipated size, number, and location of stockpiles; and how material would be transported to avoid fugitive dust emissions. This information is important for readers to understand the daily volume of exposed material and how handling of the material may or may not result in additional pollutant emissions.

Response 58-53

The Draft EIR's analysis of project-related air quality impacts is adequate and supported by substantial evidence. See also Response 58-55 for further discussion of the Draft EIR's analysis of direct and indirect impacts from fugitive dust emissions. See Response 58-56 regarding the sufficiency of mitigation measures for reducing particulate matter emissions. See Response 58-59 regarding analysis and mitigation of project-related health impacts.

Mitigation Measure 4.3-2b is sufficient to reduce the project's emissions of particulate matter to a less than significant level along with Mitigation Measure 4.3-2a (see Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4).

The project would comply with all applicable SJVAPCD rules and regulations, which include measures aimed at reducing fugitive dust and particulate matter emissions (Appendix D-4 at Section 4.3.2.3, "Local"). For example, the project would comply with SJVAPCD's Rule 8041, which "prevents or limits fugitive dust emissions from carryout and trackout on paved public roads or the paved shoulders of paved public roads" (Appendix D-4, Section 4.3.2.3). The project must also comply with SJVAPCD's Rule 8051, which limits fugitive dust emissions from open areas and establishes control measures (e.g. applying water or chemical dust suppressants to unvegetated areas, establishing vegetation on previously disturbed areas) to limit visible dust emissions (VDE) to 20 percent opacity (see Appendix D-4, Section 4.3.2.3).

The Draft EIR, as updated in the Final EIR, contains detailed descriptions of each emissions source in Final EIR Appendix D-3. As discussed in Section 3.4.2 of the 2026 "Air Quality, Health Risk, And Climate Change Impact Assessment," "Emissions from dust sources associated with project include windblown dust and other storage pile area emissions (e.g., loading and handling), dozer/quarrying emissions, drop emissions from material transfer, and processing plants" (see Final EIR, Appendix D-3, Section 3.4.2). In Appendix D-3 of the Final EIR, Figure 4, "Stockpile Measurements," Figure 5, "Plant Site Haul Roads," and Figure 6, "Quarry Site Haul Roads," contain evidence for assumptions made regarding on-site stockpiles and haul roads (see Draft EIR Appendix D-3, Appendix A). Emissions are calculated in Draft EIR Appendix D-3, Appendix G using the methods further described in Draft EIR Appendix D-3 Section 3.4.2. The commenter does not identify a dust source that was omitted from the Draft EIR.

Comment 58-54

Similarly, the DEIR states that if topsoil or overburden stockpiles are expected to remain *longer than one year*, the stockpiles would be protected from wind and erosion with planted grasses. DEIR at 2-29, 2-36 (for both the Plant and Quarry sites; emphasis added). This suggests that unused stockpiles could be subject to uncontrolled wind erosion for up to 12 months before being seeded, which could generate substantial dust emissions that were not accounted for in the DEIR analysis.

Response 58-54

The topsoil or overburden stockpiles would not be "uncontrolled" because control is required by SJVAPCD Rule 8031 as discussed on Appendix D-4 Section 4.3.2.3. Thus, these piles would not create substantial dust emissions that were not accounted for in the Draft EIR, as updated by the Final EIR.

The comment also ignores that other mitigation measures would be in place prior to the one-year mark. Consistent with Mitigation Measure 4.3-2b, the Fugitive Dust Control Plan for the project has been prepared (see Appendix K of Appendix D-3), subject to SJVAPCD's approval (see Appendix D-4 Section 4.3-67). The Fugitive Dust Control Plan demonstrates how the project would control stockpile emissions use of a spray system to apply water to stockpiles at transfer point and/or on top of the piles (see Appendix D-4 Section 4.3.4 and Appendix K of Appendix D-3).

The stockpiles would be maintained to prevent the spread of fugitive dust with temporary methods before the more permanent methods would be used to prevent erosion and the spread of fugitive dust.

Comment 58-55

In addition, the DEIR fails to adequately evaluate the indirect impacts related to Project-related fugitive dust. Specifically, as discussed above and in the attached Colibri Report, the DEIR ignores potential impacts of particulate matter on adjacent wildlife and plant habitats. *See* Colibri Report at 3. The DEIR fails to evaluate the effects of fugitive dust drifting into immediately proximate ecological reserves and other open space.

A revised analysis must properly evaluate the Project's particulate emissions, disclose the corrected emissions of particulate matter, and identify feasible, effective mitigation to minimize the impacts.

Response 58-55

See Response 58-54. Neither CEQA nor the SJVAPCD require that fugitive dust emissions be evaluated specifically for plant or animal species either on-site or off-site. See Response 58-40 through 58-41 regarding fugitive dust emissions impacts to adjacent wildlife and plant habitats. NAAQS and CAAQS provide protection against damage to animals, crops, and vegetation, and as noted in the Draft EIR, the project would be required to comply with these standards (see Draft EIR page 4.3-4).

The Draft EIR, as updated in the Final EIR, identifies sensitive receptors in the area. The implementation of Mitigation Measure 4.3-2a and 4.3-2b sufficiently reduce the project's emissions of criteria air pollutants to less than significant (see Appendix D-4, Section 4.3.4). The impacts would be the emission of criteria air pollutants from construction which result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard. The Draft EIR, as updated by this Final EIR, provides an appropriate analysis of these impacts.

Pre-existing requirements would also apply to the project. Specifically, as provided in Draft EIR Appendix D-3, SJVAPCD rules and regulations, which include but are not limited to SJVAPCD Rule 8051, consisting of specific control measures to limit fugitive dust emissions from open areas that have been disturbed. Mitigation Measure 4.3-2a and 4.3-2b would also minimize the potential impacts from fugitive dust and other particulate matter emissions (see Final EIR, Appendix D-4, at Section 4.3.4). With the proposed mitigations, the level of fugitive dust would decrease. Therefore, the potential impacts on wildlife and plants are less than significant as determined in the Draft EIR, as updated in the Final EIR (see Draft EIR Impact 4.4-1 on page 4.4-48).

Comment 58-56

2. The DEIR's Proposed Mitigation for Significant Project-Related Particulate Matter Emissions Is Insufficient.

The DEIR proposes Mitigation Measure 4.3-2 to address the Project's significant impact due to particulate matter emissions. DEIR at 4.3-62. However, as presented, the measure fails to ensure that impacts will be minimized to a less-than-significant level. The measure indicates that a Fugitive Dust Control Plan will be prepared sometime in the future. The deferred plan would include three elements. However, the measure is generic, vague, and fails to provide any mitigation at all for several potential sources of particulate pollution. As discussed above, the DEIR fails to address fugitive dust control in the mining pit area. DEIR at ES-13 and 4.3-62. During dry weather conditions, wind erosion and excavation equipment operation would generate a substantial amount of fugitive dust emissions if not properly controlled. Blasting also produces large amounts of particulate matter, and yet the mitigation measure fails to address these emissions. Finally, although the measure provides for controlling unpaved roads with dust suppressants, it fails to specify how often or under what conditions.

Response 58-56

In accordance with Mitigation Measure 4.3-2b a Fugitive Dust Control Plan has been prepared and would be approved prior to project implementation (see Appendix K of Appendix D-3). This ensures that impacts related to fugitive dust would be minimized to a less than significant level (see Final EIR, Appendix D-4, Section 4.3.4). Accordingly, the Fugitive Dust Control Plan is not deferred because it has been prepared and will be submitted to the SJVAPCD, which would be issuing the air permit as is required by existing rules and would not be approved until the project is approved (see *East Oakland Stadium Alliance v. City of Oakland* (2023) 89 Cal.App.5th 1226, 1267-68).

The comment's claim that the Draft EIR "fails" to address control of fugitive dust in the mining pit area cites only to the Executive Summary and ignores that as provided in Appendix D-1, as updated in the Final EIR at Appendix D-3, the project would comply with all applicable SJVAPCD rules and regulations, which include but are not limited to SJVAPCD Rule 8051, which consists of specific control measures to limit fugitive dust emissions from open areas that have been disturbed, including specifically the mining pit area (see also Draft EIR pages 4.3-24 through 4.3-29, as updated in the Final EIR at Appendix D-4, Section 4.3.2).

As provided in Appendix D-2 of the Draft EIR, as updated in Appendix D-3, blasting emissions were analyzed using the AP-42 methodology and speciation profiles for air toxics from the San Diego Air Pollution Control District (SDAPCD), which is appropriate here because SJVAPCD does not have specific guidance for blasting emissions. Mitigation measures are not required for what would otherwise be less than significant potential impacts (CEQA Guidelines Section 15126.4).

Mitigation Measure 4.3-2b does specify that fugitive dust from unpaved roads would be controlled at a 90 percent effectiveness with dust suppressants or other equivalent methods, and as explained in the Final EIR, a Fugitive Dust Control Plan has been prepared and would be submitted for approval to the SJVAPCD. See Appendix K of Appendix D-3.

With regard to the commenter's assertion that the Draft EIR fails to address fugitive dust emissions in the mining pit area, the mining emissions are based on San Diego Air Pollution Control District's quarrying emissions factor. This emissions factor includes excavation and material handling activities in the quarry. The control efficiency of 90 percent is assumed in the Final EIR (see Final EIR Appendix D-3).

Blasting emissions factors were developed based on activities at western surface coal mines which blasted benches into the side of a hill. The blasted material from western surface coal mines would explode from the side of the mountain creating dust for a long distance. In contrast, the blasting that would occur at the Quarry Site would be in-situ with rock (rather than overburden and coal) being fractured by blasting so that it can be ripped by a dozer and excavated by another machine. Given the material being blasted, the emissions are generally low as compared to the sources from which the emissions factor was derived. Nevertheless, fractured rock can create some dust even if the rock is still sitting in the ground. As such, dust suppressant application would be used to control visible dust and in conformity with manufacturer specifications.

Comment 58-57

In addition, the DEIR fails to evaluate the effectiveness of the control measures proposed in the Fugitive Dust Control Plan. Measures to mitigate the substantial amount of particulate matter that would result from this Project should be specific and substantially more stringent. For example, the measures should include periodic air monitoring by a third party (when triggered by complaints), and should include specific information about how unpaved roads, stockpiles, and disturbed areas would be stabilized to prevent wind erosion.

Response 58-57

The EIR does evaluate the effectiveness of measures that would be included as part of the Fugitive Dust Control Plan (Mitigation Measure 4.3-2b). See, for example, Table 4.3-25, "Mitigated Project Health Risk Impacts," at page 4.3-64 of the Draft EIR. The Draft EIR does also include specific measures for unpaved roads, stockpiles, and off-road engines to prevent the erosion, including wind erosion of particulate matter and fugitive dust that could potentially be created as a part of and an effect of the project (Draft EIR page 4.3-62). Additionally, as provided in Appendix D-1, as updated in Appendix D-3, the project would comply with the applicable SJVAPCD rules and regulations, which include but are not limited to SJVAPCD Rule 8051, which consists of specific control measures to limit fugitive dust emissions from open areas that have been disturbed and would be applied at the project site.

To clarify and amplify the efficacy of the mitigation measure, Mitigation Measure 4.3-2b is revised in this Final EIR as presented in Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4. The revisions amplify and further clarify requirements regarding the monitoring and enforcement of the mitigation measure.

Use of monitoring capable of differentiating project dust from dust generated by other sources in the region (e.g., public roads, agriculture) would require establishment of a monitoring network which is infeasible and unwarranted given the air quality impacts of the mitigated project are determined in the Draft EIR to be less than significant (see discussion or air quality impacts in the Draft EIR page 4.3-57 through 4.3-70).

Comment 58-58

As discussed above, impacts from these fugitive dust emissions are not only harmful to people but can also impact animals and plants on adjacent sites. See Colibri Report at 3. The County must identify effective, enforceable measures that will minimize impacts to the sensitive plant and animal communities on- and off-site as well as sensitive receptors in adjacent residential areas.

Response 58-58

The Draft EIR identifies sensitive receptors in the area, including sensitive receptors in local residential areas. As described in the EIR, with the implementation of Mitigation Measure 4.3-2, which includes measures to mitigate impacts from the main sources of emissions, the project would not result in an increase in cancer, chronic, or acute health risks to residences or workers above the corresponding significance thresholds (Draft EIR pages 4.3-62 through 4.3-64). The model receptors used in the Health Risk Assessment in Appendix D-1 include residential receptors and can also be seen in Figure 4.3-1, "Non-

Residential Sensitive Receptor Locations," Figure 4.3-2, "Detailed Model Receptor Locations," and Figure 4.3-3, "Plant Site Labeled Receptor Locations," of the Draft EIR.

Neither CEQA nor the SJVAPCD require that fugitive dust emissions be evaluated specifically for plant or animal species either on-site or off-site that could potentially be impacted by fugitive dust emissions. As discussed above, the EIR includes specific measures to mitigate the potential impact from project fugitive dust emissions (Draft EIR pages 4.3-62 through 4.3-64).

Comment 58-59

3. The DEIR's Health Risk Assessment Lacks Substantial Evidence to Support Conclusions.

The DEIR presents a Health Risk Assessment evaluating cancer risk from exposure to Project-generated toxic air contaminants (TACs) of concern, including diesel particulate matter, silica dust and trace heavy metals. DEIR at Appendix D-1. However, giving that the Project more than doubles production from the mines, it is unclear how the evaluation concludes there would be a net reduction in cancer risk at the maximum exposed individual sensitive receptor (or MEIR). Specifically, the DEIR identifies an unmitigated cancer risk of 281 in a million. DEIR Table 4.3-24 at p. 4.3-63. However, the DEIR then claims that the cancer risk after implementation of mitigation measures would be reduced to less than zero. DEIR at Table 4.3-25 at p. 4.3-64. This seems to suggest that the mitigation causes a beneficial net reduction relative to baseline conditions, but the DEIR fails to explain how the analysis arrives at this confounding conclusion.

Response 58-59

Appendix D-3 contains calculations that quantify how the mitigation measures reduce project emissions. In essence, the baseline and project were assigned default control efficiencies that would be assigned by the SJVAPCD during emissions inventorying and/or permitting and which are described in Source Specific Policy 1610 (SJVAPCD 2013). Mitigation measures then increased the level of control required from those default values. These include Mitigation Measures 4.3-2a and 4.3-2b (see Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4). Both measures contain enforceable metrics regarding the level of control required. Specifically, Mitigation Measure 4.3-2a would meet the Interim Tier 4 emission standard for particulates of 0.008 grams per horsepower-hour. The unpaved roads would be controlled by a method having 90 percent or greater effectiveness (Mitigation Measure 4.3-2b). In addition, the project includes a design feature that would pave roads at the Plant Site before Year 31 which is when the

throughput increases. As shown in Appendix D-3, the baseline and project were assigned 80 percent control efficiency for watering. The stockpiles areas would be controlled by a method having 90 percent or greater effectiveness (Mitigation Measure 4.3-2b). Mitigation Measure 4.3-4 requires blue smoke control systems on the asphalt plant a control system that would also be required by SJVAPCD as best available control technology (BACT) during stationary source permitting. In summary, Appendix D-3 provides sufficient details in the form of calculations and narrative to allow the reader to understand how emissions were quantified and the level of control assigned to each mitigation measure.

The negative values reported with implementation of the mitigation measures represent emissions reductions compared to baseline emissions, due to newer technology and lower emission equipment requirements, particularly those related to off-road and on-road diesel-fueled vehicles (Appendix D-4, Section 4.3.4). Draft EIR Table 4.3-25 indicates that, the project would not result in significant impacts regarding health risk with the implementation of emissions reductions measures noted above.

Comment 58-60

Furthermore, the health risk analysis assumptions are unclear. For example, it is unclear what baseline health risk scenario is assumed for the existing condition. The DEIR, at Appendix D, indicates that baseline data is based on data in Appendix G to Appendix D1. A review of that data, however, fails to clarify the baseline assumptions.

A revised DEIR must clearly state the baseline health risk scenario and how it was derived, and must include an apples-to-apples comparison between the existing conditions and the proposed net change for to project operations. The assumptions must also be clearly articulated so that the public and decisionmakers can understand the basis for the analysis

Response 58-60

For baseline data, Draft EIR Appendix D-1 explains how the baseline data was derived, which is restated below for emphasis:

> "Project emissions are quantified by subtracting existing emissions occurring at the Quarry and Plant Sites (Baseline) from emissions with the Project (Future). Baseline emissions are estimated using historical fuel use data from off-road vehicles, aggregates production records, and other specifications (e.g. engine information) provided by CEMEX" (Draft EIR

Appendix D-1, Executive Summary page i, as incorporated into Final EIR Appendix D-3).

This is further discussed in Final EIR, Appendix D-3, Executive Summary.

Baseline emissions are based on the approximately 1.6 MT/year excavation rates that occurred in 2005. See Collective Response #10 regarding use of production numbers from 2005. One hundred percent of rock mined from the Quarry Site was hauled in on-road trucks to the Plant Site for processing.

Offroad engines, as described in the Final EIR at Appendix D-3, were assumed to emit at CalEEMod 2012 default rates. Use of the 2012 rates is conservative because the 2005 rates could have been used and it is appropriate that the project benefit from having paid its fair share to mitigate the cumulative impacts on air quality by upgrading the vehicle engines that it owns. On-road vehicles were assumed to emit at EMFAC 2018 default rates. 2018 was chosen because it was the year when the environmental analysis commenced.

Furthermore, the Final EIR at Appendix D-3 also provides a detailed explanation of the sources of the baseline data and breakdown of the baseline data in Final EIR Appendix D-3 Tables 9 through 11. The Draft EIR as updated in the Final EIR clearly states the baseline data and health risk information and compares the baseline to the estimated project impacts. Additionally, Appendix G to Appendix D-3 includes labels, and further contextualizes the data used to determine the baseline.

Dust emissions factors do not change over time and baseline control efficiencies are those assigned by the APCD for compliance with Regulation VIII rules that have existed since 2004. One rule in Regulation VIII (Rule 8051) was amended in 2023, but those amendments include a "contingency provision" that may be triggered if the District fails to meet the $PM_{2.5}$ NAAQS causing smaller disturbed areas to be subject to the rule requirements. The project would not be affected by the 2023 amendments because it is larger than 1.0 acre and so requirements present in the pre-amended version of Rule 8051 adopted in 2004 have not changed.

The project consists of two phases.

- Phase 1 would last 30 years after which operations on the Plant Site would cease. Installation of an aggregates processing plant on the Quarry Site would result in the reduction of interplant haul from 1.4 MT/year in the baseline to 0.7 MT/year. Combined annual production from both sites may reach 2.0 MT/year within five years and up to 3.0 MT/year within ten years after project approval.

- Phase 2 would last an additional 70 years. Processing plants would be installed, on-road truck routes would be paved on the Quarry Site, and interplant hauling of aggregates between the two sites would cease. Production rates would remain unchanged from Phase 1.

The Final EIR contains emissions calculations and assesses associated impacts for both project phases.

- Phase 1 offroad engines emit at the CalEEMod 2018 default rates and on-road engines emit at the EMFAC 2025 default rates. Dust emissions factor and control efficiency assumptions are equal to those assumed in the baseline.
- Phase 2 offroad engines emit at the CalEEMod default 2018 rates and on-road engines emit at the EMFAC default 2025 rates. Dust emissions factor and control efficiency assumptions are equal to those assumed in the baseline.

Mitigation Measures 4.3-2a and 4.3-2b in Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4, reduces emissions from the above descriptions by reducing emissions from the following sources:

- Offroad engines would be retrofit or replaced so that each engine emits less than the Tier 4i emissions standards.
- On-site haul routes would be further controlled to increase efficiency from 80 percent in the Baseline/project to 90 percent. In Phase 2, haul truck routes are paved which further controls road dust emissions.
- Stockpile area sources (wind erosion, loading in/out of stockpile, and movement on unpaved areas around piles) would be further controlled to increase efficiency from 80 percent in the Baseline to 90 percent for the proposed project.

See Final EIR Chapter 3, "Draft EIR Errata," and Appendix D-4 for revisions to Draft EIR Section 4.3. Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, Appendix D-3. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 58-61

D. The DEIR's Noise Analysis Is Inadequate.

1 The DEIR Uses Inappropriate Thresholds of Significance to Evaluate Blasting-Related Impacts on People.

The Project proposes frequent blasting (once or twice a week) for a period of approximately 70 years during the hard rock mining phase. DEIR at 2-42 and 2-43. Blast waves, or pressure waves, are also referred to as airblast. Salter Report at 3 through 7.

The DEIR acknowledges that the nearest sensitive receptors to the Project site are located approximately 250 feet from the noisiest operations at the Quarry site. DEIR at 4.13-59. While the DEIR purports to evaluate the impacts of blasting on nearby residents, it fails to actually do so. DEIR at 4.13-65. As further explained in the Salter Report, the DEIR's thresholds of significance for blasting-related impacts are based on U.S. Bureau of Mines thresholds that focus only on building damage resulting from blast waves, not on the potential for human disturbance. Salter at 3; DEIR at 4.13-65. As the Salter Report shows, human disturbance from vibration and "airblast" can occur at levels far below those that may cause structural damage. Indeed, multiple agencies in the United States and elsewhere have established standards addressing blasting impacts on people that are different from, and far more stringent than, thresholds for assessing the potential for structural damage. Salter at 3. By using a structural damage threshold to assess the potential for human disturbance, the DEIR effectively omits any analysis of potential vibration and airblast impacts on people.

Given that the DEIR's thresholds of significance for the project's ground-borne vibration and airblast impacts only address structural damage, it follows that the analysis of this impact is also limited only to structural damage. This approach does not comport with CEQA. People can perceive levels of motion and sound that are well below (by a factor of 100 to 1000 or more) those levels that could cause damage to the average structure.[15] (*Footnote 15:* See Wesley L. Bender, Understanding Blast Vibration and Airblast, Their Causes, and Their Damage Potential at 9 (2019), available at http://www.iseegoldenwest.org/articles/Blast%20Effects.pdf (attached as Exhibit H))People can detect the effects of airblast from a distance up to 2,000 feet. Salter at 8. The DEIR's analysis is therefore incomplete and inadequate.

Under CEQA, the public has a right to know just how disruptive noise and vibration from the Project's operations will be. California courts are clear on this subject. A DEIR may not "travel the legally impermissible easy road to CEQA compliance . . . [by] simply labeling the effect 'significant' without accompanying analysis . . . ." *Berkeley Keep Jets Over the Bay Com. v. Board of Port Cmrs.*, 91 Cal.App.4th 1344, 1371 (2001). Rather, "a more detailed analysis of how adverse the impact will be is required." *Galante Vineyards v. Monterey Peninsula Water Management Dist.*, 60 Cal.App.4th 1109, 1123 (1997).

The revised DEIR must use thresholds of significance that account for effects on people (not just structures) to evaluate and disclose the full extent and severity of the Project's blasting impacts on adjacent sensitive receptors. Absent identification of applicable thresholds, the DEIR's conclusions regarding the significance of human disturbance impacts fail to inform the public and lack evidentiary support.

Response 58-61

The comment is factually incorrect. The Draft EIR uses an appropriate threshold to analyze the potential vibration and airblast impacts on people. On page 4.13-65, Impact 4.13-6 discusses that the maximum safe airblast threshold for human tolerance as set forth by USBM RI-8485 establishes the 0.01295 psi threshold to prevent human disturbance from airblast (see Draft EIR, Impact 4.13-6, page 4.13-65; see Draft EIR, Table 4.13-12, "Airblast Damage Thresholds," page 4.13-36; see also Appendix H-3, page 10). The Blast Impact Analysis (Appendix H-3) further describes human reaction in substantial detail (see, e.g., Appendix H-3 at page 10, Table 1, discussing the human tolerance to airborne vibration criteria recommended in USBM RI-8485). Moreover, the Draft EIR explains that structural vibration impacts must be considered together with human tolerance to vibration as the two are related in that human reaction to vibration, like structural reaction, is dependent upon duration and amplitude of the vibration event among innumerable other factors beyond the blaster's control (see, e.g., Appendix H-3 at page 11).

To more fully analyze blasting impacts upon people, Vibra-Tech Engineers, Inc. prepared a technical memo, "Technical Note on Threshold of Significance for Human Response," on April 29, 2026. This analysis is also discussed in detail in Response 58C-3 below. The Blasting Protocols were updated in Appendix H-9 to reflect the addition of a blasting threshold that would further reduce the likelihood of human disturbance. Please see Chapter 3, "Draft EIR Errata," for further discussion of revisions to Section 4.13 and the updated Blasting Protocols.

Comment 58-62

2. The DEIR Fails to Adequately Analyze the Project's Impacts Related to Nighttime Noise and Extended Operational Hours.

The DEIR analysis indicates that operational noise at night is projected to exceed thresholds of significance, resulting in significant impacts. DEIR Tables 4.13-16 and 4.13-17, DEIR 4.13-57 through 4.13-60). Making things worse, the Project site would extend operational hours (DEIR at 4.1-62 and 4.1-63) to allow loading/unloading and aggregate trucking to regularly occur between the hours of 4 a.m. and 9 p.m. under the proposed project, compared to existing conditions where the earliest operations begin between 4 a.m. and 6 a.m. seasonally, and end at 6:00 p.m. year-round. As the Salter Report explains, extended operations before 6 a.m. and after 7 p.m. come with increased risk and potential for sleep and speech disturbance for the nearby sensitive receivers. Salter at 10. The DEIR omits analysis of these impacts. A revised DEIR should include an analysis of nighttime noise and the potential for sleep disturbance at nighttime hours (4 a.m. to 7 a.m.). The sleep disturbance study should evaluate both average and single- event maximum noise (i.e., Leq/L50 and Lmax noise levels) from processing, truck loading, and truck pass-by noise. Salter at 10.

Response 58-62

The Draft EIR acknowledges, adequately analyzes, and mitigates the potential increases in nighttime noise at the Plant Site and Quarry Site. Impact 4.13-2, Table 4.13-16, "Estimated Plant Site Noise Levels (dBA) at Nearest Receptors," analyzes estimated Plant Site noise levels (dBA) at the nearest receptors for nighttime noise specifically, including plant noise emissions, noise impact thresholds, and that the impact thresholds are not exceeded (Draft EIR, pages 5.13-57 through 5.13-58.) Impact 4.13-2 determined that the estimated Plant Site noise levels would not exceed the nighttime impact thresholds (see Draft EIR, Impact 4.13-2, pages 4.13-57 through 4.13-59). Regardless, with the implementation of Mitigation Measure 4.13-2, the non-exceeding nighttime noise impacts would further be reduced (Draft EIR, pages 4.13-58 through 4.13-59).

Impact 4.13-3, Table 4.13-17, "Estimated Quarry Site Noise Levels (dBA) at Nearest Receptors," analyzes estimated Quarry Site noise levels (dBA) at the nearest receptors for nighttime noise specifically, including plant noise emissions, noise impact thresholds, and that the impact thresholds are not exceeded (Draft EIR, pages 5.13-60 through 5.13-61). Impact 4.13-3 determined that the estimated Quarry Site noise levels would exceed the nighttime impact thresholds for Receptors Q-8, Q-9, Q-10, Q-11, Q-12, and Q-14, which was determined to be a potentially significant impact (see Draft EIR, Impact 4.13-

3, pages 4.13-59 through 4.13-62). With the implementation of one or more of Mitigation Measure 4.13-3's noise reduction measures, "it would be feasible to reduce operational noise from the Quarry Site to below the significance thresholds" (Draft EIR, pages 5.13-60 through 5.13-61).

See Responses 58C-13, 58C-14, 58C-15, and 58C-16 which further detail the sufficiency of the Draft EIR's noise analysis.

Comment 58-63

3. The DEIR Proposes Inadequate Mitigation and Fails to Provide Evidence That The Proposed Measures Will Reduce Noise to Less Than Significant Levels.

Notwithstanding the DEIR's deficient noise impact analysis, the document recognizes the need to mitigate for the Project's significant noise impacts. DEIR at ES-45 to ES-49; 4.13-58; and 4.13-61 and 4.13-62. Specifically, the DEIR concludes that changes in ambient noise levels at both the Plant Site and at the Quarry site, would be potentially significant during both stages of production. *Id*. The DEIR identifies two mitigation measures that it claims will reduce impacts to less-than-significant levels. *Id*.

Under CEQA, "[m]itigation measures must be fully enforceable through permit conditions, agreements, or legally binding instruments." CEQA Guidelines § 15126.4(a). Here, the DEIR's identification and analysis of mitigation measures are legally inadequate. The identified mitigation measures for the significant noise impacts at both sites include a laundry list of elements. DEIR at ES-45 and ES-46; 4.13-58; and 4.13-61 and 4.13-62. The measures provide that the facility operator "shall implement one or more of the following measures…" so that the operator can choose to implement measures at their discretion. *Id*. The measures include no performance standards to ensure that the combination of elements implemented would control noise to any particular level. *Id.* Without such standards, the measure is not enforceable and the DEIR cannot rely on either measure to conclude that noise would be reduced to less-than-significant levels. *See, e.g., King and Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 872-79.

Response 58-63

The comment asserts that Mitigation Measures 4.13-2 and 4.13-3 lack enforceable performance standards and are therefore inadequate under CEQA. The comment also asserts that the Draft EIR noise evaluation failed to consider the effects of nighttime

operations on sensitive receptors located within the project area. In addition to the response below, see Response 58C-15.

Ambient noise monitoring was conducted for a period of 65 total 24-hour periods at locations representative of baseline noise conditions at sensitive receptors. Those measurement results, which include hour-by-hour ambient conditions at each site, including all nighttime hours, are included in their entirety in Draft EIR, Appendix H-1 (project noise analysis). In addition, Draft EIR Tables 4.13-16 and 4.13-17 specifically include predicted average and maximum noise levels resulting from the project during nighttime hours (Draft EIR, page 4.13-57 and page 4.13-60). Furthermore, Draft EIR Impacts 4.13-2 and 4.13-3 identify nighttime noise thresholds being exceeded at noise-sensitive receptors, and potentially significant noise impacts were identified. Mitigation Measures 4.13-2 and 4.13-3 were developed in response to these impacts and include limitations on nighttime excavation and processing operations at the Quarry Site (Draft EIR, pages 4.13-58 through 4.13-62). Mitigation Measure 4.13-3 also limits asphalt and ready-mix plant operations to daytime hours unless construction contracts specifically require nighttime delivery of materials (Draft EIR, pages 4.13-61 through 4.13-62).

The comment further asserts that Mitigation Measures 4.13-2 and 4.13-3 are inadequate because they allow the implementation of "one or more" measures without enforceable performance standards. However, CEQA Guidelines Section 15126.4(a)(1)(B) provides that the specific details of a mitigation measure may be developed after project approval when it is impractical or infeasible to include those details during environmental review, provided that the agency adopts specific performance standards that the mitigation would achieve and identifies the types of actions that can feasibly achieve those standards.

Consistent with this requirement, both Measure 7 from Mitigation Measure 4.13-2 for the Plant Site and Measure 12 from Mitigation Measure 4.13-3 for the Quarry Site include performance standards to ensure effective noise control. Specifically, monitoring locations and estimated noise levels at the nearest sensitive receptors shall be consistent with the noise monitoring locations and methodology included in the Environmental Noise and Vibration Assessment, July 26, 2021. Changes to monitoring locations or methodology determined to be necessary by a qualified noise specialist shall be documented. If monitoring indicates that noise levels exceed applicable thresholds, additional noise reduction measures shall be implemented, and monitoring shall continue until compliance with the applicable thresholds is achieved. Quarterly reports documenting monitoring results and noise reduction efforts shall be submitted to the County until monitoring demonstrates that noise levels have been reduced to below applicable thresholds (Draft EIR, pages 4.13-59 and 4.13-61 through 4.13-62).

The applicable noise thresholds and performance criteria are provided in detail in the Environmental Noise and Vibration Assessment (Appendix H-1, pages 35 through 48), including Table 8 (FTA criteria for acceptable vibration levels), Table 9 (groundborne vibration impact criteria), Tables 10 through 12 (traffic noise analysis), and Tables 13 and 14 (Plant Site and Quarry Site noise levels at nearest receptors). These thresholds are incorporated by reference and provide the performance standards that the mitigation measures are required to achieve.

Accordingly, Mitigation Measures 4.13-2 and 4.13-3 establish enforceable performance standards and require implementation of additional measures, as necessary, to ensure that noise levels at sensitive receptors are reduced to below applicable thresholds. The measures also include provisions for ongoing monitoring and response to noise complaints, including additional monitoring if complaints are received (Draft EIR, pages 5-25 to 5-26). The Draft EIR also evaluates cumulative traffic noise impacts for the 5-year, 15-year, and 40-year scenarios (see Draft EIR Section 4.13.3.3, "Analysis Methodology," pages 4.13-43 through 4.13-44).

Comment 58-64

In addition, the DEIR fails to provide any analysis of the proposed mitigation measures' efficacy, and fails to provide evidence to support the conclusion that, with the mitigation, impacts would be reduced to less-than-significant levels. Instead, the DEIR defers analysis of the measures' efficacy until after project approval. Specifically, item 7 in Mitigation Measure 4.13-2 and item 12 in Mitigation Measure 4.13-3 call for noise monitoring to determine if the measures adequately lower noise levels. However, under well-established caselaw, when a lead agency relies on mitigation measures to find that project impacts will be reduced to a level of insignificance, there must be substantial evidence in the record demonstrating that the measures are feasible and will be effective. *Sacramento Old City Assn. v. City Council of Sacramento*, 229 Cal.App.3d 1011, 1027 (1991); *Kings County Farm Bureau v. City of Hanford*, 221 Cal.App.3d 692, 726-29 (1990). Because the DEIR defers analysis regarding the effectiveness of the proposed measures, there is no such evidence in the record for this Project.

Response 58-64

The comment asserts that the Draft EIR does not analyze the efficacy of the proposed noise mitigation measures and improperly defers such analysis until after project approval. See also Responses 58C-13 and 58-65.

The comment incorrectly characterizes Mitigation Measures 4.13-2 and 4.13-3 as deferring mitigation. As discussed in Response 58-63, the Draft EIR mitigation measures are tied to performance standards that ensure appropriate noise reduction measures are implemented to reduce project-related noise levels to below applicable thresholds at sensitive receptors. The comment fails to acknowledge these performance standards or explain why they would be ineffective.

Measures 7 and 12 of Mitigation Measures 4.13-2 and 4.13-3 require noise monitoring consistent with the Environmental Noise and Vibration Assessment (Appendix H-1). If noise levels exceed applicable thresholds, additional noise attenuation measures must be implemented, and monitoring must continue until compliance is achieved. These provisions ensure that mitigation effectiveness is verified and that corrective actions are taken as necessary.

The Draft EIR provides substantial evidence that the mitigation measures are feasible and effective, including identification of multiple feasible noise reduction strategies (Draft EIR, pages ES-46 through ES-49). The use of monitoring and adaptive implementation does not constitute improper deferral where, as here, mitigation is tied to performance standards and requires compliance with established thresholds. Accordingly, the Draft EIR does not improperly defer mitigation, and substantial evidence supports the conclusion that impacts would be reduced to less-than-significant levels.

Comment 58-65

Furthermore, as discussed above, the DEIR's mitigation measure for blasting impacts is impermissibly deferred, overly vague, and insufficient to support a conclusion that impacts will be less than significant. In particular, the measure relies on inadequate monitoring of blasting to determine whether thresholds are exceeded and requires preparation of a "Corrective Action Plan" if they are. See DEIR at 4.10-91 (MM 4.10-1); DEIR Appendix H-6 ("Blasting Protocols"). This measure thus impermissibly defers both analysis and mitigation of significant impacts; indeed, the DEIR proposes to allow significant impacts to occur before mitigation is even proposed, much less implemented. Compounding the problem, the mitigation measure does not identify any specific measures that must be included in a "Corrective Action Plan." Mitigation measure 4.10-1 is mentioned several times in the DEIR as the basis for concluding numerous impacts are less than significant. These conclusions are without evidentiary support, and the DEIR's failure to identify and describe adequate mitigation renders the document inadequate as a

Response 58-65

In addition to the response below, see Response 58C-13, which provides that mitigation is not deferred.

The rationale for the development of noise Mitigation Measures 4.13-2 and 4.13-3 is provided in the Response 58-63. Persons familiar with industrial noise control understand that the substantial evidence of the noise control measures identified in these mitigation measures (suspended barriers, acoustic silencers, lining of aggregate hoppers with urethane sheets, replacement of conventional back-up "beeper" type warning devices with broadband devices, etc.) is based on the effective use of these measures at multiple aggregate facilities throughout the state of California. As a result, the argument that, for example, noise barriers do not effectively reduce noise, is not supported by substantial evidence. Sound engineering practice is to apply the type of noise control device required to mitigate the specific noise source in question. Because there are a wide variety of noise sources associated with aggregate excavation and processing facilities, as wide range of noise control options is required. Rather than deferring mitigation, as asserted by the commenter, the Draft EIR mitigation measures are tied to performance standards that would ensure that appropriate noise mitigation measures are implemented for the project. The comment fails to acknowledge these mitigation measures or analyze why they are deficient. Accordingly, the mitigation measures are not deferred.

Comment 58-66

4. The DEIR Fails to Analyze Noise Impacts on Area Recreational Users.

Finally, the DEIR completely ignores Project-related noise impacts to recreational users of the San Joaquin River (e.g., kayaking, canoeing) and of nearby Sumner Peck Ranch, Ball Ranch, and Lost Lake Recreation Area, the southern border of which is adjacent to the Quarry site. Sumner Peck Ranch is open to the public daily from 12-5 pm thanks to Solitary Cellars Winery, which offers an outdoor wine tasting area. Ball Ranch is also open to the public daily and is operated by the Trust under contract to the Conservancy. In addition to recreation, Lost Lake County Park is the location of many elementary school field trips during the school year. According to the County's website, "[T]he primitive nature study area and 38 acre lake make Lost Lake one of the most popular County parks." [16] (*Footnote 16: See Fresno County, Lost Lake Recreation Area, at https://www.fresnocountyca.gov/Departments/Public-Works-and-Planning/divisions-of-public-works-and-planning/resources-and-*

parks-division/parks/lost-lake-recreation-area (attached as Ex. I) Lost Lake Recreation Area provides multiple features and activities, such as group picnic areas, softball field, volleyball courts, hiking trails, nature study area and trail, bird watching, hiking, kayaking, canoeing, fishing, camping and playgrounds, and serves various members of the community, including individuals, groups, students, scouts, and families. *Id.*

It is therefore improper for the DEIR to omit any analysis of impacts to recreational River users and to users of the park. A project that calls for blasting and hard rock mining operations would clearly impact recreational users because it would interfere with their use and enjoyment of the area and may result in safety concerns. One of the purposes of open space and parks is to provide urban users access to spaces away from the noise of urban life. The noise associated with drilling, blasting, excavation, and aggregate processing activities for 100 years would result in the loss of connection to the natural environment. Industrial noise – like second-hand smoke – is indiscriminating; there would be no way to escape the noise except to leave the area altogether. The revised DEIR must address this serious impact.

Response 58-66

The Draft EIR analyzes the Quarry Site's noise impacts to the nearest Receptors, which are located between approximately 250 feet to over 6,000 feet from the Quarry Site, and included: (1) five Receptors (Q-5 through Q-9) that are closer to the Quarry Site than Lost Lake Recreation Area; (2) Receptor Q-15, which is Sumner Peck Ranch, Solitary Cellars Winery; (3) Receptor Q-6, which is Ball Ranch; and (4) the San Joaquin River as Receptor Q-C (see Figure 4.13-2; see Draft EIR, Section 4.13.1.4, "Quarry Site Ambient Noise Environment," pages 4.13-21 through 4.13-23; Section 4.13.3.3, pages 4.13-43, 4.13-44 and 4.13-46 through 4.13-48; Impact 4.13-3, pages 4.13-59 through 4.13-62; Impact 4.13-5, pages 4.13-63 through 4.13-64; and Appendix H-1, Appendices B-19 through B-27). Furthermore, with implementation of Mitigation Measures 4.10-1 and 4.13-3, any potential noise impacts to the nearest Receptors to the Quarry Site are mitigated to less than significant.

Comment 58-67

IV. The DEIR Fails to Comply with CEQA's Mandate Regarding Alternatives Analysis.

Under CEQA, an EIR must consider a "reasonable range" of alternatives "that will foster informed decision making and public participation." CEQA Guidelines § 15126.6(a); *Laurel Heights I*, 47 Cal.3d at 404. ("An EIR's discussion of alternatives must contain analysis sufficient to allow informed decision making."). The

discussion of alternatives must focus on alternatives that are capable of avoiding or substantially lessening any significant effects of the Project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly. CEQA Guidelines § 15126.6(b). In addition, a "lead agency may not give a project's purpose an artificially narrow definition," to shape this determination but rather must "structure its EIR alternative analysis around a reasonable definition of underlying purpose and need." *In re Bay-Delta etc.*, 43 Cal.4th 1143, 1166 (2008). In particular, using overly narrow objectives to dismiss reasonable and feasible alternatives constitutes prejudicial error. See *North Coast Rivers Alliance v. Kawamura*, 243 Cal.App.4th 647, 669-70 (2015) (where the lead agency's overly narrow project purpose caused it to "dismiss[] out of hand" a relevant alternative, this error "infected the entire EIR").

As a preliminary matter, the DEIR's failure to disclose the extent and severity of the Project's broad-ranging impacts necessarily distorts the document's analysis of Project alternatives. As a result, the alternatives are evaluated against an inaccurate representation of the Project's impacts. Proper identification and analysis of alternatives is impossible until Project impacts are fully disclosed.

Moreover, the DEIR's alternatives analysis fails to live up to CEQA standards because: 1) it defines the Project objectives too narrowly and 2) it fails to analyze a reasonable range of alternatives that could significantly reduce the Project's impacts.

Response 58-67

The Draft EIR reviewed four different alternatives, which is a reasonable range of alternatives, and it is in the County's discretion to determine that range. The Draft EIR need not analyze an infinite variety of alternatives (Title 14 CCR Section 15126.6(a), (c)). Please review prior responses discussing the sufficiency of the Draft EIR's analysis and disclosure of the environmental impacts of the project. See Responses 58-68, 58-69, and 58-70 for a discussion of the Draft EIR's analysis of project alternatives.

Comment 58-68

A. The DEIR Presents Overly Narrow Objectives.

An EIR violates CEQA if it defines project objectives so narrowly as to preclude any alternatives at all (*see North Coast Rivers Alliance v. Kawamura (2015) 243 Cal.App.4th 647, 667*), or proposes

purported alternatives that conflict with project objectives only so they can be easily eliminated (*see Watsonville*, 183 Cal.App.4th at 1089).

As discussed above, the DEIR presents overly narrow and self-fulfilling project objectives. The DEIR characterizes the "overall goal" of the Project as "continu[ing] and expand[ing] existing mining and processing operations at the Plant Site and Quarry Site." DEIR at 6-3. Objectives 2 and 4 effectively circumscribe and mandate selection of the Project or an alternative that is substantively similar. In particular, Objective 2 requires the project to continue to use "known aggregate reserves from existing partially mined properties." *Id.* Objective 4 demands the Project "maintain a local source of construction aggregate with enough annual sales capacity (3.0 million tons [MT])." *Id.* These objectives leave no room for consideration of anything other than expansion of the existing operation, at the capacity proposed, at this location.

Indeed, the DEIR rejects the possibility of using alternative site locations because use of a different location would "result in eliminating aggregate production and reclamation impacts that would occur at the project site," "introduce new impacts to a site with no previous aggregate mining activity," and "restrict the full mineral development of the Quarry Site." *Id.* at 6-7. Similarly, the DEIR dismisses the reduced operational life alternative because it would restrict the full mineral development of the Project Site, *id.* at 6-8, and rejects reduced mining depth (200 feet) alternative because this option would require finding "another aggregate source to supply the County's and Fresno regional needs." *Id.* at 6-9.

Because the objectives leave no room to consider—and are used to justify dismissal without analysis of—relevant, feasible alternatives, they preclude consideration of a reasonable range of alternatives and violate CEQA. *North Coast Rivers Alliance v. Kawamura*, 243 Cal.App.4th 647 at 669-70 (2015). The County should withdraw the DEIR and proceed with analysis of a reasonable range of alternatives, and recirculate the EIR for a complete and adequate environmental review.

Response 58-68

Alternate site locations were omitted from consideration because it is not feasible for an existing mining operation seeking continuation and expansion to consider different locations. Section 6.4.1, "Considerations for Mining and Reclamation Project

Alternatives," of the Draft EIR describes the consideration of an alternative location and explains why alternative locations for the project were rejected from further analysis, consistent with CEQA requirements (see Title 14 CCR Section 15126.6). The CEQA Guidelines Section 15126.6(f)(2)(B) explicitly discuss mining projects as the type of project for which there may be no feasible alternative locations due to "proximity to natural resources at a given location."

This comment misconstrues the holding in *North Coast Rivers Alliance v. Kawamura* (2015) 243 Cal.App.4th 647, 667, as it specifically allowed a lead agency to utilize their judgement in rejecting alternatives.

The project objectives are broad enough to offer a reasonable range of alternatives, in accordance with CEQA standards (Title 14 CCR Section 15126.6, subs. (c)). Each alternative meets some or many of the project's objectives while providing for reduction in significant environmental impacts of the proposed project. See Chapter 6, "Alternatives," of the Draft EIR for discussion of project alternatives.

Comment 58-69

B. The DEIR Fails to Consider a Reasonable Range of Alternatives

The DEIR analyzes four alternatives to the Project, aside from the No Project Alternative. The alternatives presented are:

- Alternative 2: Reduced Mining Depth Alternative (400 feet);
- Alternative 3: Reduced Mining Depth Alternative (300 feet);
- Alternative 4: Reduced Mining Depth Alternative (300 feet) with Additional Setback (100 feet); and
- Alternative 5: Reduced Mining Depth Alternative (400 feet) with Reduced Annual Sales (2.5 MT/Y). DEIR at 6-10.

However, these alternatives do little to address the DEIR identified significant impacts to visual resources and safety impacts to pedestrians and bicyclists. Indeed, the DEIR concludes that adverse impacts to the scenic vista and degradation of the existing visual character in nonurbanized areas would be the same in Alternatives 2, 3, and 5 as in the Project. DEIR at 6-60.

Critically, each of these alternatives would still include blasting and hard rock mining and would still result in significant impacts that have not been disclosed. Specifically, Alternatives 2 through 5 would conduct hard rock mining with blasting to a reduced depth of 300 or 400 feet. DEIR at 6-10. Thus, Alternatives

2, 3, 4, and 5 would still continue mining operations for 86, 68, 63, and 86 years respectively. DEIR at 6-20, 6-30, 6-39, 6-52.

Furthermore, the alternatives presented fail to address the undisclosed significant impacts to people and sensitive habitat and species in the area associated with blasting and changes in hydrology. Therefore, the alternatives fail to reduce the Project's significant biological, hydrological, and noise impacts and fail to meet CEQA standards for alternatives analysis. CEQA Guidelines § 15126.6. Similarly, Alternative 4 would allow hard rock mining to a depth of 300 feet and increase the setback from the river by 100 feet. DEIR at 6-39.

Response 58-69

Each alternative includes analysis of potentially significant impacts. The discussion of alternatives adequately assesses the merits of the proposed project and the alternatives. See Table 6-2, "Alternatives Impact Comparison Summary," providing a matrix comparing the impacts of the alternatives and the impacts of the proposed project, including impacts to hydrological resources, biological resources, and noise.

The significant adverse environmental effects of each alternative may be discussed in less detail than is required for the project's effects, and need not be exhaustive (CEQA Guidelines, Section 15126.6(d); *Save San Francisco Bay Ass'n v San Francisco Bay Conserv. & Dev. Comm'n* (1992) 10 Cal.App.4th 908). The Draft EIR need not discuss or include alternatives that are incompatible with the basic purpose of the proposed project, which here is to "continue and expand existing mining and processing operations at the Plant and Quarry sites and reclaim the two sites when mining operations are complete" (Draft EIR page 6-3) (see CEQA Guidelines Section 15126.6(a); *In re Bay-Delta Programmatic Envt'l Impact Report Coordinated Proceedings* (2008) 43 Cal.App.4th 1143).

An EIR need not consider separate alternatives for each impact. Each of the alternatives considered in the Draft EIR offered environmental advantages in comparison with the impacts of the project as a whole, which is sufficient under CEQA. See *Sequoyah Hills Homeowners Ass'n v. City of Oakland* (1993) 23 Cal.App.4th 704.

Comment 58-70

The DEIR should have also considered other feasible alternatives that would actually *substantially lessen* the Project's multiple significant impacts. The document provides no reasonable explanation as to why additional alternatives that reduce the inevitable damage from the proposed Project were not proposed. In this case, where the proposed Project would result in many significant environmental impacts for 100 years, it is especially

important that the DEIR analyze alternatives that could avoid or lessen those impacts. *See* CEQA Guidelines § 15126.6(c).

As discussed above, the Project will result in significant impacts related to hydrology, biological resources, air quality, and noise. Given the site's location in close proximity to residences, immediately adjacent to a river that provides important aquatic and riparian habitat for multiple sensitive wildlife species, the DEIR should have considered additional alternatives that would reduce impacts to a substantive degree. For example, the DEIR should have analyzed a reduced extraction alternative that would allow further shallow mining of aggregate resources at the Plant and Quarry sites, but limit the operation to excavation of shallow sand and gravel resources only. Such an alternative would reduce impacts to groundwater resources, avoid changes to hydraulics and flood flows, avoid on-site and downstream impacts to habitat through changes in flow and water temperature, and avoid impacts to people and wildlife from blasting.

Analysis of such an alternative would also reduce visual impacts and impacts to cyclists and pedestrians, which the current slate of alternatives fail to mitigate. DEIR at 6-60. A revised EIR should analyze these and other alternatives that will avoid or reduce the Project's impacts.

In short, the DEIR's alternatives analysis is riddled with flaws that improperly constrain to the County's consideration of project alternatives. Moreover, the DEIR fails to consider a reasonable range of alternatives that would "avoid or substantially lessen" the significant effects of the project. CEQA Guidelines § 15126.6.

Response 58-70

Alluvium in the Quarry area has been almost entirely exhausted, which is the entire reason for the proposed project, thus the alternative proposed in the comment is infeasible. The proposed project seeks to implement hard rock blasting due to the exhaustion of alluvial reserves at the Plant and Quarry sites. As such, the Draft EIR need not consider an alternative that does not include hard rock blasting (except for the No Project alternative) because it is one of the key components of the project (*In re Bay-Delta Programmatic Envt'l Impact Report Coordinated Proceedings* (2008) 43 Cal.App.4th 1143). The Draft EIR excluded an alternative providing for the reduced mining depth of 200 feet from further analysis because it would cause the premature development of other mine sites in the County and be inconsistent with the General Plan (Draft EIR page 6-9). The overall environmental impact of this alternative would be greater, and thus need not be analyzed.

The Draft EIR included reduced extraction alternatives that are in alignment with the project goals and CEQA standards (Title 14 CCR Section 15126.6). The Draft EIR provides a reasonable range of alternatives which reduce the project's environmental impacts and align with many or most of the project objectives (Title 14 CCR Section 15126.6).

Comment 58-71

V. The Project Is Inconsistent with the County's General Plan and Zoning Ordinance.

Neither the General Plan nor the Zoning Ordinance expressly allow hard rock mining and blasting in agricultural land use designations or the Exclusive Agriculture (AE) zone. The type of mining proposed in this Project is categorically different from the "surface mining" operations contemplated in the County's land use documents. The Project is therefore inconsistent with the General Plan and Zoning Ordinance.

As discussed above, General Plan Table LU-1 (at 2-25) allows "Surface Mining Operations" in AE and other agricultural zones, but does not expressly allow hard rock mining. The Zoning Ordinance similarly lists "Surface Mining Operations" as an allowable use in the AE zone (with a conditional use permit), but does not authorize hard rock mining. Zoning Ord. § 808.2.020, Table 2-2 (at 2-14).

In the AE zone, "[f]or land uses not listed in Table 2-2, the provisions of Section 802.1.020 (Rules of Interpretation) shall apply." *Id.*, § 808.2.020(D). Those "Rules of Interpretation" require specific findings regarding uses of land that are not specifically listed as allowable in particular zones. *See id.*, § 802.1.020(E). Among other things, the Director has to make a determination that "[t]he characteristics of, and activities associated with, the proposed use are equivalent to those of one or more of the uses listed in the zone as allowable, and will not involve a greater level of activity, dust, intensity, noise, parking, population density, or traffic generation than the uses listed in the zone." *Id.*, § 802.1.020(E)(1)(a).

Here, the Project will entail a fundamental shift from surface mining of aggregates to hard rock mining of granite. Hard rock mining involves regular blasting and entails a "greater level" of intensity, activity, dust, and noise than surface mining. These uses are not "equivalent" as required by the Zoning Ordinance.

Response 58-71

The commenter attempts to draw a distinction that does not exist in the Fresno County Zoning Ordinance, General Plan or in SMARA. The Zoning Ordinance explicitly states it should be interpreted consistently with SMARA. The Zoning Ordinance and SMARA both apply to a specific type of mining, surface mining as compared with underground mining. PRC Section 2712 of SMARA clearly indicates that SMARA was enacted for the purpose of ensuring reclamation of "surface mining" sites to ensure that adverse environmental effects are minimized and the site reclaimed. It is the fact that this mining operation would be conducted on the surface, not how the mining is conducted, that results in it being regulated as a surface mining operation under both the Zoning Ordinance and SMARA. Moreover, both SMARA and the Zoning Ordinance provide a list of activities that are not subject to SMARA and the Zoning Ordinance at PRC Section 2714 and Zoning Ordinance Section 834.4.220(D). In neither SMARA nor the Zoning Ordinance is "hard rock mining" exempt from the definition of surface mining. Rather the Fresno County Zoning Ordinance at Section 858 834.4.220(B) defines "surface mining operations" as:

> All, or any part of, the process involved in the mining of minerals on mined lands by removing overburden and mining directly from the mineral deposits, open-pit mining of minerals naturally exposed, mining by the auger method, dredging and quarrying, or surface work incident to an underground mine. Surface mining operations include, but are not limited to, in place distillation or retorting or leaching, the production and disposal of mining waste, prospecting and exploratory activities, borrow pitting, streambed skimming, and segregation and stockpiling of mined materials and recovery of same. A surface mining operation may include the use of equipment, structures, and facilities as are necessary or convenient for the extraction, processing, storage, and transport of materials. (emphasis added)

SMARA Section 2735 contains a similar definition. The fact that hard rock mining is not explicitly listed does not affect the analysis. Moreover, a contrary interpretation would result in a State law and County Zoning Ordinance that did not regulate hard rock mining at all, despite the obvious intent listed in SMARA and in the Zoning Ordinance to ensure that surface mining operations are reclaimed according to the law. Accordingly, there is no legal support for this comment.

Comment 58-72

Nor does hard rock mining fit within the definition of "surface mining" in the Zoning Ordinance: "All, or any part of, the process

involved in the mining of minerals on mined lands by removing overburden and mining directly from the mineral deposits, open-pit mining of minerals naturally exposed, mining by the auger method, dredging and quarrying, or surface work incident to an underground mine." Zoning Ord. § 834.4.220. Nothing in this definition contemplates continuous, regular blasting and removal of materials from areas far deeper than those typically involved in surface mining operations. The proposed Project therefore cannot be found consistent with the General Plan or Zoning Ordinance.

Response 58-72

See Response 58-71.

Comment 58-73

VI. Conclusion

The Project will have a number of potentially significant impacts on the environment, including (but not limited to) impacts on groundwater resources, water quality, special status biological resources, noise, and air quality. Yet these impacts and others were not adequately analyzed and mitigated in the DEIR. As a result, the DEIR fails to serve as an adequate informational document and its conclusions are not supported by substantial evidence. For the foregoing reasons, the Trust urges the County to delay further consideration of the Project unless and until the County prepares and recirculates a revised DEIR that fully complies with CEQA and the CEQA Guidelines.

Response 58-73

As discussed in Responses 58-1 through 58-72, the Draft EIR as updated by this Final EIR, adequately addresses and analyzes the potential environmental impacts of the proposed project. The Draft EIR fully complies with CEQA and CEQA Guidelines, and recirculation is not required.

Letter #58A March 10, 2025, Kevin Bundy, San Joaquin River Parkway & Conservation Trust, Inc.; Exhibit A, CBEC Report, March 6, 2025

Comment 58A-1

I am a hydrologist with thirty-five years of technical and consulting experience in the fields of geology, hydrology, and hydrogeology. I have been providing professional hydrology and geomorphology services in California since 1991 and routinely manage projects in the areas of surface- and groundwater hydrology,

water supply, water quality assessments, water resources management, and geomorphology.

Most of my work has been in the Central Valley and Coast Range watersheds of California. My areas of expertise include: characterizing and modeling watershed-scale hydrologic and geomorphic processes; evaluating surface- and ground-water resources/quality and their interaction; assessing hydrologic, geomorphic, and water quality responses to land-use changes in watersheds and causes of stream channel instability; assisting and leading in the development of CEQA environmental compliance documents and project environmental permits; and designing and implementing field investigations characterizing surface and subsurface hydrologic and water quality conditions. I earned a Master of Science degree in Geology, specializing in sedimentology and hydrogeology as well as an A.B. in Geology from Miami University, Oxford, Ohio. I am a Certified Hydrogeologist (CHG #360) and a registered Professional Geologist (PG #5737) in the state of California. A copy of my resume is attached.

I have been retained by Shute, Mihaly & Weinberger LLP (SMW) to review the Draft Environmental Impact Report (DEIR) for CEMEX Rockfield Quarry Modification Project located in Fresno County, California, and evaluate if the proposed project may impact surrounding properties and the environment. Specifically, I have reviewed the DEIR, supporting technical reports, and reports cited in this letter. Based on my review of these materials, it is my professional opinion that the DEIR is inadequate in evaluating the potential significant impacts of project actions on surface water and groundwater supply and associated biological resources dependent on that water. The rationale for this opinion is presented in the comments below.

Response 58A-1

The comment is introductory in nature. See Responses 58A-2 through 58A-6 for further discussion of the Draft EIR's analysis of impacts to water quality and groundwater supply.

Comment 58A-2

1. No consideration of Climate Change in Flood Hazard Analysis

The hydraulic modeling analysis of existing conditions presented in Appendix G-1 of the DEIR used FEMA's effective 100-year flow rate of 71,000 cubic feet per second (cfs) to determine if the flooding along the San Joaquin River would encroach into the Quarry Site. The results of the flood hazard analysis indicate that the

existing conditions floodplain does not encroach into the Quarry Site. Using FEMA's water surface elevations and a 2018 topographic map, the flood hazard analysis also determined that the 100-yr event floodplain during a flow rate of 71,000 cfs does not encroach into the western portion of the Plant Site.

The flood hazard analysis does not consider or analyze the effects of long-term climate change on San Joaquin River flood flow rates at the Quarry and Plant Sites over the 100-year life of the project. A recent study completed by the California Department of Water Resources (DWR) (Nemeth et al., 2021) completed climate modeling analyses to inform the Central Valley Flood Protection Plan Conservation Strategy 2022 Update. An objective of these analyses is to identify current climate modeling data and results that can be used to assess the spectrum of changes in hydrologic and geomorphic processes that could impact Conservation Strategy's measurable objectives and target species. Appendix H of the Update report contains results of climate and hydrologic model analyses that quantify the changes in peak flood rates using regulated hydrology on the Upper San Joaquin River below Friant Dam for the year 2072. Results of these analyses indicate that future (2072) 100-year flow rates will increase to 126,800 cfs because of climate change[1] (*Footnote 1:* The report states that under climate change, peak flows in the snow-dominated upper San Joaquin River watershed will shift to earlier in the winter and spring and high flow events like the 100-year flow can't be fully contained by Lake Millerton and will be released downstream), a flow rate that is 179% of the FEMA estimate used in the DEIR.

Based on my hydrologic and hydraulic modeling experience and review of the floodplain inundation maps and water surface elevations for the 100-year flow rate of 71,000 cfs presented in Appendix G-1 of the DEIR, it is my professional opinion that an increase in the flow rate to 126,800 cfs would encroach into and inundate both the Quarry and Plant Sites. It is also important to note that this estimated increase in 100-yr flood flow rates under climate conditions represents a condition halfway through the life of the Quarry Modification Project and 100-year flood flow rates would likely continue to increase through the second half of the project lifespan.

Given this new information developed by DWR and the lack of considering and analyzing the effects of climate change, it is my opinion that the DEIR has not completed a flood hazard analysis that evaluates the potential impacts from encroachment of the project into the floodplain.

Response 58A-2

The Draft EIR Hydraulic Analysis' use of the FEMA 100-year floodplain to analyze the project's flood hazards is sufficient for the purposes of analyzing potential flooding impacts under CEQA, nevertheless. Analyses of the 200-year floodplain were also prepared for both the Plant and Quarry sites and showed no flooding impacts. See also Collective Response #17 regarding the 200-year flood analysis conducted for the Quarry Site. Climate change impacts to the floodplain are not required to be analyzed in the EIR.

Comment 58A-3

2. Inappropriate extrapolations of river level data below Friant to the Project sites

With regards to groundwater-surface water interactions, page 20-21 in Appendix G-5 of the DEIR contains the following statement.

> *The stage data can also be used to identify conditions or periods when the water surface in the San Joaquin River is above the geologic contact between the alluvium and underlying weathered rock. This is an important relationship to understand because the alluvium has a much higher transmissivity (i.e., permeability) than the underlying weathered rock and hard rock. Thus, when the stage of the river is high enough that the water surface is above the base of the alluvium, there may be a higher potential for seepage of water from the river into the quarry.*

The stage data referred to in this paragraph was measured on the San Joaquin River at a stream gage located below Friant, which was then applied to the river adjacent to the project site. Extrapolating these data over 4.0- and 6.5-miles to the Quarry and Plant sites, respectively, is not a valid comparison as the stage at the below Friant gage can be totally different than in the river adjacent to the mining site due to differences in channel geometry and potential gains or losses in flow between sites. To make an accurate comparison between river levels and hydrogeologic conditions at the Project site, monitoring these variables needs to be completed at the sites being compared.

Similarly, in Figure 16 of Appendix G-5, a comparison of San Joaquin River water levels (stage) at the below Friant gage are compared to pond water levels in a former mining pond at the Beck Ranch to conclude there isn't any hydraulic connection between the pond and adjacent river. However, to make this comparison, the river stage datum is shifted by 290-feet to transpose these data approximately 4.0 miles downstream to the San Joaquin River adjacent to the pond site. Again, transposing stage data from one

river location to another over this distance is fraught with potential uncertainties and errors.

The bed elevation of the channel adjacent to the pond appears to be derived from a 2-foot contour interval map for the project dated November 6, 2018. The mean daily flow rate on the San Joaquin River measured at the USGS stream gage below Friant (USGS gage No. 11251000) was 386 cfs on this date. This type of topographic mapping is not capable of capturing channel bed elevations submerged under water and thus does not accurately represent the channel bed surface elevation. Depending on local river channel geometry at the location adjacent to the Beck Ranch mining pond, the deepest part of the channel could feasibly be well below the 290-foot datum, and the stage levels could be lower than the bed of the pond. This would explain why there is no correlation between river stage and pond level at this location over the graphed period in Figure 16. It also means that it is quite feasible that Figure 16 does not support the conclusion that the pond and river are not in hydraulic connection, when in fact they could be.

Response 58A-3

The commenter alleges that the discussion on pages 20 through 21 of Appendix G-5 of the Draft EIR relates to both the Quarry Site and the Plant Site. However, as stated in the first sentence of Section 2.2.3, "Groundwater-Surface Water Interaction and Recharge Sources," the evaluation of potential interactions with the San Joaquin River applies only to the Quarry Site. There is no analysis presented related to conditions on the river and the Plant Site.

While the magnitude of the stage may vary from location to location along the river, the nature of the stage over periods longer than a few hours would be comparable over the distances addressed in Section 2.2.3 of Appendix G-5 of the Draft EIR. Stated another way, the height of the water within the river may vary from the actual stage reading at the gage location, due to variations in channel depth and width. For example, a change in gage reading of five feet during a release event from Friant Dam might result in a change in river elevation of four feet or six feet at other locations along the river. However, after accounting for travel times downstream from the gage, when the gage is reporting sustained high stage readings, the river level at other locations within a few miles downstream of the gage would also be elevated. Likewise, when the gage is consistently reporting base flow stage readings, the river elevation at other locations downstream would also be at base flow elevations.

It is important to note that the evaluation presented in this section of Appendix G-5 of the Draft EIR addresses existing, or baseline, conditions. It does not address conditions that

would be altered as part of the proposed modification project. The monitoring data from the shallow alluvial monitoring points at MW-1S and MW-2S provide actual measurements of the changes that occur within the alluvium between the river and the quarry excavation during changes in river stage and at different reported gage readings. Since the surface elevations of the monitoring points have been surveyed, the water elevations in the monitoring wells during high gage readings are known. Thus, the *magnitude* of change in the water levels in the shallow alluvium can be compared directly to the *magnitude* of change in the gage readings, without having to know details regarding channel geometry.

The commenter also appears to be unaware of the datum of the Friant gage and the location of Beck Ranch. As noted on the California Department of Water Resources California Data Exchange Center (CDEC) website and the U.S. Geological Survey National Water Information System (NWIS) website, the elevation of the referenced river gage is 294 feet. Figure 16 in Appendix G-5 is taken from another report, in which the author used a value of 290 feet, as opposed to 294 feet, to convert the gage readings to elevations, so that *changes* in the gage readings could be compared with *changes* in the elevation of the water levels in the Beck Ranch pond. There was no shift in the river datum as stated in the comment. In addition, the Beck Ranch pond is located less than one mile downstream from the river gage, not 4.0 miles downstream as stated in the comment.

Comment 58A-4

3. No quantitative analysis supports mitigation measures for lowering groundwater levels

In the description of Impact 4.10-10 on page 4.10-105[2] (*Footnote 2: The statement that alluvium has been removed from the Quarry Site is contradicted elsewhere in the DEIR. Page 4.4-56 of the DEIR includes the statement, "Since almost all (90%) of the alluvium has already been removed from the Quarry Site". Page 4.10-37 of the DEIR includes the statement, "In most of the Quarry Site, the alluvium has been removed by mining. Where present, alluvium on the Quarry Site is up to 60 feet thick."*), the DEIR states that because most of the upper alluvium has already been removed at the Quarry Site, there will be no groundwater seepage from the alluvium into the mining pit. This is incorrect as groundwater in the alluvium beneath off-site areas surrounding the site will still flow into the Quarry Site pit. Pumping water into the recharge trenches and ponds surrounding the Quarry and Plant Sites are stated to provide protection from this happening but the limited extent of these features may only prevent groundwater inflow in localized areas around the pits, especially the Quarry site. This

is because the stated benefits of the recharge trenches are completely unfounded and based on speculation.

DEIR Appendices G-3 and G-4 present detailed analyses that quantify the amount of excavation dewatering required during mining operations of the Plant and Quarry sites, respectively. Based on the volume and rates of dewatering required, the appendices present calculations that estimate the amount of drawdown in alluvium and hard rock water table elevations radiating away from the mining pits (i.e., quantifying the distance and depth of the cone of depression created by mine dewatering). The dewatering of the mining pits will create a cone of depression in the groundwater surrounding the mining sites. These cones of depression will increase the groundwater flow gradients and flow rates towards and into the mining pits. To mitigate this increase of groundwater inflow into the mining areas, the DEIR proposes the installation of recharge trenches along selected sections of the mining pit perimeters. Water from mining pit dewatering would be discharged into the recharge trenches and various ponds with the idea that these features would recharge the underlying groundwater and reduce the amount of drawdown, reducing the rate and volume of groundwater inflow to the pits.

The DEIR states (page 41-42 of Appendix G-3 to the DEIR), "*Overall, operation of the recharge ditches would decrease the projected off-site drawdowns by fifty percent, as half of the pumped water would recharge the off-site groundwater*." The DEIR continues (page 42 of Appendix G-3), "*Operation of the recharge ditches would decrease the projected drawdowns to insignificant (less than one foot)*." Page 49 of Appendix G-5 states, "*Due to the recharge trenches along the west side of the quarry, groundwater levels in the alluvium and the weathered rock will be maintained consistent with existing conditions*." These statements lack factual basis. First, there are no data or analyses presented in the DEIR that substantiates the claims that the recharge ditches would decrease off-site drawdown by fifty percent or maintain groundwater levels consistent with existing conditions- these claims are based on speculation. The quantification of groundwater recharge through trench infiltration is controlled by many variables including but not limited to: the infiltration rate through the trench bed; hydraulic properties of underlying unsaturated soil; heterogeneities of the underlying medium; and distance between trench bed and underlying groundwater table. Quantifying the amount of trench recharge and how that recharge alters the underlying groundwater table level is complex and highly variable based on localized conditions. Second, even assuming the estimate of fifty percent of trench infiltration would recharge the

underlying groundwater, that does not completely mitigate the drawdown effects on underlying groundwater. The DEIR does not evaluate how the residual drawdown (after assumed benefits of the recharge trenches) would impact surrounding Groundwater Dependent Ecosystems (GDE) or increased groundwater flow gradients between the San Joaquin River and mining sites.

The assumed benefits of the recharge trenches weigh heavily in the DEIR's evaluation of potential

impacts to surrounding water supply wells and mining pit water budgets. Given the benefits of recharge trenches have not been substantiated with data or technical analyses, it is my professional opinion that the DEIR has not provided the evidence necessary to reach valid conclusions pertaining to potential impacts to surrounding water supply wells, GDE, and streamflow depletions from the San Joaquin River.

Response 58A-4

The commenter does not appear to be aware that recharge trenches and ponds have been used for decades at the Quarry Site. Throughout the life of the quarry, water produced during dewatering of the excavation has been pumped to perimeter recharge trenches on the west side of the site and to the Northeast Pond to reduce or eliminate the effects of dewatering outside of the Quarry Site boundary. Thus, effective and successful use of recharge trenches to minimize or mitigate offset effects to groundwater levels is actually part of the existing baseline conditions for the project.

Furthermore, Appendix G-6, "Addendum to: Revised Hydrology and Water Quality Analysis Report," provides a detailed quantitative analysis of the potential efficacy of the use of recharge trenches to mitigate effects on groundwater levels. That analysis is based on the comparison of water year rainfall over a six-year period with groundwater levels measured over the same period using downhole pressure transducers and dataloggers in 14 Quarry Site monitoring wells. The downhole pressure transducers record water level readings every six hours. Thus, over 1,450 data points are measured every year.

The analysis in Appendix G-6 notes that:

> "The most significant observation at the Quarry Site is the rapid increase in groundwater levels in every well due to the very wet 2023 water year. Regardless of the magnitude of the water level decline due to the three-year drought from 2020 to 2022, groundwater levels responded rapidly to the elevated rainfall that occurred during the 2023 water year."

It is also important to note that the magnitude of increase due to the 2023 water year rainfall is comparable in all Quarry Site wells, whether they are completed in the alluvium, weathered rock, or hard rock. The rapid response to elevated rainfall, especially in the weathered rock and hard rock, demonstrates the viability and anticipated efficacy of recharge trenches to mitigate any potential decline in groundwater levels in nearby wells due to dewatering of the quarry. More specifically, since dispersed rainfall resulted in such a rapid increase in groundwater levels across the entire site, recharge trenches focused on areas where effects on groundwater levels in nearby wells may potentially occur due to dewatering would have the same localized effects in areas where mitigation may be called for in accordance with the adaptive management plans presented in the June 2023 *Revised Hydrology and Water Quality Analysis Report* (Appendix G-5) prepared by EMKO Environmental, Inc.

Comment 58A-5

4. No quantitative analysis of potential impacts on Groundwater Dependent Ecosystems

Quarry Site

Section 5.0 b) (Evaluation of Potential Impacts) of the DEIR addresses the question, "*Would the Project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?*" Page 56 of this Section includes the following statement.

> *On a more local basis, dewatering and subsequent reclamation of the Quarry Site would lower groundwater levels outside of the Project boundary. However, this effect would be focused primarily within the weathered rock and the hard rock. As discussed above, the alluvium has already been removed from most areas of the Quarry Site and the remaining alluvium is being dewatered. Thus, any effects on groundwater dependent ecosystems within the alluvium or river-flow dependent ecosystems adjacent to the Quarry Site along the river and north of the quarry due to the Project would be identical to those that are already occurring.*

This statement is contradictory. As demonstrated further below, the riparian vegetation that makes up the GDE adjacent to the river and north of the quarry are rooted in the alluvium that extends outside of the project boundary[3] (*Footnote 3:* These GSP "Potential GDE" were determined to have rooting depths of less than 30 feet below ground surface). Lowering the alluvium groundwater levels,

dewatering remaining alluvium, and terminating operation of the infiltration trenches after mining operations would result in effects that are **not identical** to those that are already occurring, but significantly different. The effects would be to totally dewater the alluvium and associated GDE rooting zone adjacent to the river and north of the quarry. This would result in potential adverse impacts on the GDE after, and possibly during, mining operations.

Figure 1 illustrates the location of potential GDE relative to the Quarry and Plant Sites. The GDEs mapped in **Figure 1** were taken from the North Kings Groundwater Sustainability Agency Groundwater Sustainability Plan (Provost & Pritchard, 2022). **Figure 2** depicts the post-reclamation grades and maps some individual trees that will be retained by the Project on the alluvial terrace between the Quarry Site and San Joaquin River. These trees constitute some of the riparian GDE mapped on **Figure 1** and are rooted in the underlying alluvium. **Figure 2** also indicates the location of the groundwater recharge trenches on the alluvial terrace above the river.

Figure 3 is a location map of groundwater wells completed in and around the Quarry Site and alignments of subsurface cross-sectional profiles A-A' and B-B'. Profile A-A' is provided in **Figure 4** and depicts the stratigraphy beneath the Quarry Site, well depths, and Hard Rock groundwater table elevational profile on October 1, 2018. Based on review of groundwater level measurements collected from wells screened in the alluvium and hard rock at MW-1, the water level in the alluvium generally ranges 3- to 6-feet higher than the hard rock at the Quarry Site, thus a water table profile for the alluvium would be that much higher if plotted on **Figure 4**. Although not called out on **Figure 4**, the GDEs illustrated on **Figure 1** and **Figure 2** are located on the riverbank and upper alluvial terrace adjacent to the Northwest "Project Boundary" of profile A-A'. These GDEs are rooted within the alluvium and are fed by the alluvial groundwater.

As stated in the DEIR, "*dewatering and subsequent reclamation of the Quarry Site would lower groundwater levels outside of the Project boundary.*" **Figure 5** is another subsurface geologic profile along A-A' representative of post-reclamation conditions, which plots the range of hard rock groundwater table profiles. As depicted in this profile, the alluvium is completely dewatered beneath the GDEs and recharge trenches bordering the Northwest project boundary along the San Joaquin River. The DEIR also states (cite page/section), the post-reclamation pond level in the Quarry Site would remain approximately 500-feet below current grade, so

the groundwater table profiles would remain at the levels depicted in **Figure 5**. Comparison of the groundwater table profiles presented in **Figure 4** and **Figure 5** indicates that, post-reclamation, the alluvium would be dewatered, which would likely result in significant adverse impacts to the GDE on the terrace and banks of the San Joaquin River.

Figure 6 presents a geologic cross-section and hard rock water table profile for section B-B', which would intersect the San Joaquin River just southwest of Well MW-2. As indicated in **Figure 1**, GDE are in the immediate vicinity of well MW-2 and southwest end of cross-section B-B'. Review of groundwater level measurements collected from wells screened in the alluvium and hard rock at MW-2, the water level in the alluvium generally ranges 0.25- to 0.50-feet higher than the hard rock, thus a water table profile for the alluvium would be slightly higher if plotted on **Figure 6**. Although there is no post-mining subsurface cross-sectional profile for section B-B' in the DEIR, there will be a similar degree of water table drawdown in this area as depicted in **Figure 5**. This would completely dewater the alluvium and result in potential significant adverse impacts to GDE in and outside the southwest portion of the Quarry Site.

Given these findings presented herein, it is my opinion that the Project will impart significant adverse impacts to the viability and sustainability of existing and future GDE lying between the Quarry Site and San Joaquin River.

Plant Site

Page 56 of the DEIR Appendix G-5 states the following.

> *At the Plant Site, groundwater levels are currently approximately 30 ft bgs. At this depth, groundwater levels at and adjacent to the Plant Site area are already deeper than depths that could support riparian vegetation, streamflow, and wetlands. Thus, any lowering of groundwater levels at the Plant Site due to dewatering during mining or reclaimed conditions would not have an effect on any groundwater dependent ecosystems.*

This statement blurs the area being referenced. Per **Figure 1**, there are no GDE within the Plant Site boundaries. However, the widening, deepening, and dewatering of the Plant Site mine will create a large cone of depression in the groundwater levels at and surrounding the site, similar to that of a pumping well. The cone of depression in the alluvium and weathered rock extends beyond

the project boundaries into surrounding areas that underlie GDEs. The DEIR (Appendix G-3, Figures 11 and 12) demonstrates that the project will increase the depth and extent of the cone of depression beyond the project area during and after mining, thus potentially impacting GDEs outside of the project boundaries.

The project proposes recharge trenches along portions of the project boundaries to lessen the impact of the deepening and expansion of the mining cone of depression. However, nowhere in the DEIR or supporting technical appendices is there any data or quantitative analysis to demonstrate/support the stated benefits - they are based on complete speculation. Regardless, the recharge trenches are not a complete mitigation even if they could achieve the desired effect, as they would only lesson the depth and extent of the cone of depression (Appendix G-3, Figures 11 and 12) and associated impacts – they would not eliminate the potential impacts to surrounding water supply wells, impacts to GDE, and depletions of San Joaquin River flow.

Given these findings presented herein, it is my opinion that the Project will impart significant adverse impacts to the viability and sustainability of existing and future GDE lying between the Plant Site and San Joaquin River.

Response 58A-5

See Collective Response #25. As demonstrated in the 2025 Update to the North Kings Groundwater Sustainability Plan, and additional aerial image review, Groundwater Dependent Ecosystems are not present at or adjacent to the Quarry Site or the Plant Site.

In addition, as discussed in the Response 58A-4, above, recharge trenches have been used successfully for many decades at the Rockfield site, and at numerous other aggregate mining sites in the region, to minimize the offsite effects of dewatering. The effectiveness of recharge trenches is not based on speculation but has been demonstrated to be effective over many years of usage and are part of the existing baseline conditions at the project site.

Comment 58A-6

5. No quantitative analysis of streamflow depletions from the San Joaquin River

The DEIR presents consistent findings and conclusions that the San Joaquin River and groundwater in the alluvium, weathered rock and hard rock beneath and adjacent to the river are interconnected (i.e., in hydraulic or hydrologic connection). In addition, stable isotope analyses of samples collected from surface and groundwater

at the Quarry and Plant Sites indicate that these waters originated from snow or rain that fell high in the Sierra Nevada Range before flowing down the upper San Joaquin River toward the Project site (pg. 32, Appendix G-5). Thus, the isotope signature of the groundwater beneath the site indicates it came come San Joaquin River derived recharge and that the river and adjacent alluvium, weathered rock, and hard rock groundwater are in hydraulic connection.

Figure 7 illustrates the typical ways stream flow interacts with underlying groundwater systems whey the stream and groundwater are interconnected. These diagrams indicate that when flow in the San Joaquin River is in hydraulic connection with the underlying alluvium, the river surface is an aerial expression of the water table surface. Diagram B in **Figure 7** illustrates a losing stream where flow seeps out of the stream into the shallow aquifer. **Figure 8** illustrates how a stream and groundwater system interact when they are disconnected by an unsaturated zone. Diagram A in **Figure 8** illustrates how infiltration of stream water into the unsaturated zone migrates vertically to the underlying groundwater. Even when there is no groundwater within the alluvium beneath the river, the river will continue to recharge the lower weathered and hard rock aquifers. The amount of mounding in the water table surface depends on many variables including, but not limited to, the infiltration rate through the stream bed and unsaturated soil, the hydraulic properties of the aquifer, and distance between stream bed and water table. Diagram A in **Figure 8** is also representative of the processes occurring beneath the proposed recharge trenches proposed within the Quarry and Plant Sites.

As determined in the DEIR and discussed above, mining operations in the Quarry and Plant Sites will increase the water table flow gradients moving from the river towards the pits as discussed above. As stated on page 4.10-114 of the DEIR, "*The increased rate of groundwater inflow through the hard rock into the quarry would be caused by an increase in the hydraulic gradient, or slope of the groundwater surface, toward the quarry.*" *The response of an increased groundwater hydraulic gradient causing an increased rate of groundwater flow holds true for any saturated aquifer material, whether it is alluvium, weathered rock or fractured hard rock. Thus, when groundwater that is in hydraulic connection to the San Joaquin River experiences an increase in hydraulic gradient toward the Quarry or Plant Sites, there will be an increase in the rate of depletion of water from the river into the groundwater system. The DEIR also acknowledges that San Joaquin River flows will be depleted due to mining operations as exemplified in the following statement from page 48 of Appendix G-3.*

> *"However, because the shallow groundwater and river water are connected, an estimated 315 acre-feet per year (rounded) of river water would enter the reclamation pond through the subsurface (groundwater inflow) in order to make a water balance."*

The California Sustainable Groundwater Management Act (SGMA) defines Interconnected Surface Water (ISW) as follows. "Interconnected surface water refers to surface water that is hydrologically connected at any point by a continuous saturated zone to the underlying aquifer and the overlying surface water is not completely depleted (Title 23 California Code of Regulations § 351[o])." The California Department of Water Resources addresses depletions of ISW under SGMA as follows (DWR, 2024).

> *SGMA identifies that an undesirable result occurs if, among other reasons, groundwater use occurring in a basin causes depletions of ISW that significantly and unreasonably impact beneficial uses of the surface water (CWC § 10721(x)(6)). Depletions of ISW under SGMA are only related to impacts caused by groundwater use, although a GSA will likely need to have some understanding of the various causes of reduced surface water flow to accurately determine the component due to groundwater. To comply with SGMA requirements, the GSAs should identify where ISW exists; determine the location, timing, and quantity of depletions; and then develop sustainable management criteria for managing depletions of ISW. Projects and management actions addressing depletions of ISW may also be proposed to support sustainable groundwater management.*

The DEIR has not demonstrated that it complies with SGMA requirements with regards to ISW depletions because there are no data or analyses presented that: identify potential unreasonable impacts to beneficial uses of surface water; quantify the amount of depletions; or develop mitigations for any potential undesirable results due to Project depletions of San Joaquin River flow.

Please feel free to contact me with any questions regarding the material and conclusions contained in this letter.

Response 58A-6

See Collective Response #25 and the additional responses provided below.

The commenter misstates the data and conclusions regarding the stable isotope analysis. While the stable isotope data indicate that the groundwater within the weathered rock

and hard rock layers were derived from high elevations in the Sierra Nevada, like the water in the San Joaquin River, the groundwater flow directions based on the groundwater contours in these units indicate that the flow is from the northeast toward the river, not away from the river. Plausible sources for the groundwater in the deeper bedrock units include Millerton Reservoir and leakage from the Friant-Kern Canal, as discussed in Appendix G-5 of the Draft EIR. Note that the volume of groundwater flow in the deeper bedrock is very small compared to the volume of groundwater in the reservoir and the flow within the canal. Thus, only incidental, nominal leakage would be sufficient to provide the recharge necessary to sustain the groundwater flow directions within the fractures in weathered rock and hard rock units.

Furthermore, Section 2.2.3, of Appendix G-5 of the Draft EIR provides a quantitative analysis of groundwater and surface water interactions while Section 3.2.2 of Appendix G-5 of the Draft EIR evaluates the potential effects of the project on flows in the San Joaquin River.

The commenter also provides a quote attributed to page 48 of Appendix G-3. However, based on the version of Appendix G-3 present on the Fresno County website, page 48 consists of a single reference citation at the end of the report. There is no discussion of a water balance. However, at the bottom of page 46 of Appendix G-3 there is reference to 315 acre-feet of groundwater inflow, but no discussion of water coming from the river.

Finally, with respect to the Sustainable Groundwater Management Act, Figure 3-20 of the 2025 Update of the North Kings Groundwater Sustainability Plan (GSP) (https://provostandpritchard-my.sharepoint.com/:b:/g/personal/rquist_ppeng_com/EXPccPEPCtVIoECGOf5QzdYB5035-RctDoMV6elIaM3SEg?e=f6qjBw) does not indicate the presence of any geologic units conducive to groundwater recharge in the project area. Thus, the project would not conflict with or obstruct implementation of the GSP due to streamflow depletions.

Letter #58B March 10, 2025, Kevin Bundy, San Joaquin River Parkway & Conservation Trust, Inc.; Exhibit B, Colibri Report, March 7, 2025

Comment 58B-1

I am an ecologist with more than 35 years of professional experience who specializes in the identification, ecological requirements, and regulatory protection of the flora and fauna of central California. I oversee, manage, and carry out projects involving biological resource evaluations; environmental impact assessments; special-status species surveys; aquatic resources determinations and delineations; habitat restoration planning and monitoring; species population management and monitoring;

environmental permitting; environmental permit implementation; mitigation monitoring; and environmental compliance. I have contributed to the biological resource sections of hundreds of environmental impact reports, environmental impact statements, and other environmental compliance documents for projects throughout California. I earned a B.S. degree in wildlife and fisheries biology from the University of California, Davis, began working as an ecological consultant in California in 1992, and am a past president of the San Joaquin Valley Chapter and Western Section of The Wildlife Society.

At your request, I reviewed the Draft Environmental Impact Report (Draft EIR) for the CEMEX Rockfield Modification Project (State Clearinghouse Number 2020060123) to identify any biological resource issues. My review focused on Draft EIR Section 4.4 (Biological Resources) and Appendix E (Biological Resources).

Response 58B-1

The comment is introductory in nature. See Responses 58B-3 through 58B-12 for further discussion of the project's potential impacts to biological resources.

Comment 58B-2

The proposed project involves continuing, expanding, and modifying aggregate (rock, sand, and gravel) mining and processing operations on two properties between the San Joaquin River and North Friant Road in Fresno County, California. The two properties include the Plant Site, a 122-acre site approximately 1.5 miles north of the City of Fresno, and the Quarry Site, a 349-acre site approximately 2.0 miles north of the Plant Site.

The project includes two stages:

Stage 1 would involve continuing concurrent operations at both sites for up another 30 years. Operations at the Quarry Site would be modified to include (1) granite mining by drilling and blasting to a depth of 600 feet below the ground surface and (2) aggregate processing, involving washing, screening, crushing, and sorting aggregate.

Stage 2 would involve continuing granite mining and aggregate processing at the Quarry Site for approximately 70 more years.

Pursuant to California Code of Regulations (CCR) Title 14 Section 15002, the purposes of an Environmental Impact Report (EIR) and the California Environmental Quality Act (CEQA) more broadly are to:

(1) inform government decisionmakers and the public about the potential environmental effects of a project;

(2) identify the ways that environmental damage can be avoided or significantly reduced;

(3) prevent significant, avoidable environmental damage by requiring changes to the project, either by adopting alternatives or imposing mitigation measures; and

(4) disclose to the public why a project was approved if that project has significant environmental impacts that cannot be mitigated to a less than significant level.

An EIR must contain sufficient detail and analysis to serve as an adequate informational document, and it must support its conclusions with substantial evidence. That means an EIR must include enough relevant facts, reasonable assumptions based on facts, and expert opinion supported by facts that a fair argument can be made to support its conclusions. With that framework in mind, I identified the following issues in the Draft EIR that affect the soundness of the analysis of the potential environmental effects of the proposed project on biological resources:

Response 58B-2

The comment is introductory in nature. The Draft EIR contains sufficient detail and analysis to serve as an adequate informational document under CEQA.

Comment 58B-3

1. **The Draft EIR mischaracterizes a jurisdictional habitat.** An accurate description of the environmental setting is essential to establish the environmental baseline. The Draft EIR (Section 4.4.1.7) states the wash water conveyance ditch at the Plant Site is not a stream and therefore altering it would not require notifying the California Department of Fish and Wildlife (CDFW) pursuant to Fish and Game Code Section 1602. Fish and Game Code does not include the definition of a stream. However, CDFW generally considers a stream to be any feature with a bed, channel, and banks that conveys water and supports stream dependent life regardless of the origin and use of that feature. As the wash water conveyance ditch appears to meet those criteria, it likely qualifies as a stream, and diverting or obstructing its flow; altering its bed, channel, or bank; or depositing any material into it would be subject to provisions of Fish and Game Code Section 1600 et seq. This is important because the DRAFT EIR states

the ditch is maintained through dredging and vegetation clearing (Section 4.4.1.3) and will be removed with mining (Section 4.10.3.2).

Response 58B-3

The water conveyance ditch is an artificial feature that exists solely to serve quarry operations. It was deliberately constructed in disturbed uplands and does not originate from or connect to (supply water) a natural aquatic feature that would be considered a state-jurisdictional water body and thus is unlikely to qualify as a stream as would be regulated by CDFW. As noted by the commenter, the channel is a component of ongoing quarry operations and is maintained through both dredging and vegetation clearing. These activities occur without CDFW authorization, and the proposed, continued management/maintenance and eventual removal of the artificial channel are not regulated activities. See also Response 58-33.

Comment 58B-4

2. The Draft EIR relies on an outdated and incomplete analysis of potentially occurring special-status species. The cover pages of the Habitat Assessments for the Plant Site and Quarry Site indicate those assessments were updated in December 2024. However, the record searches cited in those assessments were from 2019. As the associated databases are regularly updated, any records added since 2019 would not have been considered. Furthermore, the industry standard for record searches, especially for EIRs, is a nine-quad search radius, which includes the topographic quadrangle containing the project sites and the eight surrounding quadrangles[1] (*Footnote: https://wildlife.ca.gov/Data/CNDDB/FAQ#563522977-what-is-a-9-quad-search*). Only four quadrangles were searched for this EIR (Section 4.4.1.8). Therefore, some special-status species that could occur on or near the project sites may not have been considered. It follows that the potential environmental effects of the proposed project on any such species would not have been disclosed and addressed. For example, searching the California Natural Diversity Database today and extending the search radius to encompass nine quads reveals several species not addressed in the Draft EIR that could occur on or near the project sites2 (Footnote 2: California Department of Fish and Wildlife (CDFW). 2025. California Natural Diversity Database (CNDDB) RareFind 5. https://apps.wildlife.ca.gov. Accessed March 1, 2025). Such species include California glossy snake, western mastiff bat, pallid bat, spotted bat, and Townsend's big-eared bat. Such species should be addressed before project approval.

Response 58B-4

The comment is noted. While often performed, a 9-quad CNDDB search is not specifically required for CEQA review. A query of the four subject USGS quadrangles included all occurrences within 5 miles of both project sites and was deemed sufficient for the proposed project due to the temporal and on-site expansion of mining activities at locations that are already thoroughly disturbed and subject to ongoing mining operations. Occurrences of additional species at greater distances would not invalidate the analysis in the Draft EIR and proposed mitigation measures.

To amplify and clarify the information in the Draft EIR, the CNDDB search was expanded to a 9-quad search and re-run in November 2025. These search results were reviewed by a qualified, County-retained consultant, and it was determined that no additional special-status species were observed within the new search results that would require additional mitigation measures. Thus, the results as reported in Draft EIR Appendices E-1 and E-2 are sufficient to address potential impacts and determine appropriate mitigation measures. Because the Draft EIR assumed the potential presence of special-status species (including listed species) in the vicinity of the project sites based on existing conditions, any additional occurrences identified in interim would not alter or invalidate the Draft EIR's analysis or its conclusions.

Regarding bats, the Draft EIR has been revised to include a discussion of relevant bat species that have been added to Table 4.4-1, "Special-Status Wildlife Species," and a new mitigation measures (Mitigation Measures 4.4-1d) to address potential impacts to sensitive bat species. See Chapter 3, "Draft EIR Errata," to view these proposed revisions to the Draft EIR.

Comment 58B-5

3. The Draft EIR provides an inadequate analysis of environmental impacts on special-status species.

(a) Swainson's hawk. With more than four dozen breeding season (March through August) occurrence records of this species within 2 miles of the project sites (eBird 2025[3] [*Footnote 3:* eBird. 2025. eBird: An online database of bird distribution and abundance [web application]. eBird, Cornell Lab of Ornithology, Ithaca, New York. Available: http://www.ebird.org. (Accessed March 1, 2025)) and numerous potential nest trees within 0.5 mile, the project may adversely affect nesting Swainson's hawks. Although the Draft EIR states there is a moderate potential for this species to forage over the project sites and nest

nearby (Table 4.4-1), it fails to address the potential indirect effects of the project on nesting Swainson's hawks. Noise and dust from blasting, excavating, scraping, or using other heavy equipment such as front-loaders and dozers that causes a Swainson's hawk nest to fail would constitute a significant impact. The unsubstantiated narrative provided in the Draft EIR (e.g., Impact 4.4-2) does not constitute substantial evidence. To sufficiently analyze those potential indirect effects, protocol surveys[4] (*Footnote 4:* Swainson's Hawk Technical Advisory Committee (SWTAC). 2000. Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley. 5 pages) should be conducted within a 0.5-mile radius around the project sites prior to project approval. If an active nest is identified within the 0.5-mile radius, consultation with the CDFW will be required. Depending on the risk for incidental take of Swainson's hawk, that consultation may lead to the need for the project owner to obtain an incidental take permit from the CDFW under Fish and Game Code Section 2081. Regardless, mitigating the potential for incidental take would likely require (1) conducting pre-construction surveys for Swainson's hawk during the nesting season within a 0.5-mile radius of work activities no more than 30 days before the start of those activities; (2) monitoring any Swainson's hawk nest within that area during project activities to determine if the nesting birds are exhibiting distress or abnormal behavior (e.g., swooping, stooping, giving distress calls, or failing to remain on the nest or deliver prey items) that could cause reproductive failure (i.e., though nest abandonment or loss of eggs or young); and (3) ceasing project activities until the behavior of the nesting birds has normalized.

Response 58B-5

CEQA does not require protocol surveys be conducted for the purpose of analyzing potential impacts to wildlife or special status species. See Collective Response #14 addressing avoidance measures for Swainson's hawk.

Comment 58B-6

(b) Tricolored blackbird. With more than one dozen breeding season (March-June) occurrence records of this species within 2 miles of the project sites (eBird 2025[5] [*Footnote 5:* eBird. 2025. eBird: An online database of bird

distribution and abundance [web application]. eBird, Cornell ab of Ornithology, Ithaca, New York. Available: http://www.ebird.org. (Accessed March 1, 2025]) and potential nesting habitat in the southeastern portion of the Plant Site (e.g., Photographs 1 and 2 of the Plant Site Habitat Assessment), the project could adversely impact nesting tricolored blackbirds. Although the Draft EIR (Table 4.4-1) states there is a low potential for this species to occur on the project sites, it fails to address the potential indirect effects of the project on nesting tricolored blackbirds. Noise and dust from blasting, excavating, scraping, or using other heavy equipment such as front-loaders and dozers that causes a tricolored blackbird nest to fail would constitute a significant impact. The unsubstantiated narrative provided in the Draft EIR (e.g., Impact 4.4-2) does not constitute substantial evidence.

Response 58B-6

See Collective Response #13 addressing avoidance measures for nesting birds, including those that may nest off-site. See also Collective Response #15 regarding impacts to bird species beyond those associated with nesting.

Comment 58B-7

(c) Burrowing owl. The Draft EIR fails to address the potential indirect effects of the project on burrowing owl. For the Plant Site, for example, the Draft EIR (Table 4.4-1) states the species is presumed absent but identifies "line-of-sight opportunities favored by this species". Noise and dust from blasting, excavating, scraping, or using other heavy equipment such as front loaders or dozers that causes a burrowing owl nest to fail would constitute a significant impact. To sufficiently analyze such potential indirect effects, protocol surveys[6] (*Footnote 6:* California Department of Fish and Game. 2012. Staff Report on Burrowing Owl Mitigation, State of California Natural Resources Agency, Department of Fish and Game. 36 pages), involving evaluating all suitable burrows within 150 meters of the project sites, should be conducted before the project is approved.

Response 58B-7

Please see Response 58-38, which addresses the concerns raised by the commenter. See Collective Response #13 addressing avoidance measures for nesting birds, including those off-site and expanded measures including further surveys relating to nesting birds, including burrowing owls. See also Collective Response #15.

Comment 58B-8

> **(d) Western red bat.** The Draft EIR (Table 4.4-1) states this species has to roost on the Plant Site. Yet the potential a moderate potential effects of the project on this species were not addressed, and no mitigation was included. Direct impacts or indirect impacts associated with noise from processing and transporting materials that cause a western red bat roost to be abandoned could constitute a significant impact. Because bats are acoustic predators, anthropogenic noise can also compromise their ability to effectively forage. [7] (*Footnote 7:* Theobald, E., D. J. Hosken, P. Foster, and K. Moyes. 2020. Mines and bats: the impacts of open-pit mining on at activity. Acta Chiropterologica 22:157–166.) But such analysis was not included in the Draft EIR.

Response 58B-8

To amplify and clarify the information pertaining to the project's impacts on bats, the Draft EIR has been revised to include a discussion of potential impacts and mitigation measures for bats. See Chapter 3, "Draft EIR Errata," to view this proposed revision to the Draft EIR.

Comment 58B-9

> **(e) Sanford's arrowhead.** The Draft EIR (Appendix E-1, Table C-1) states this species is presumed absent based on the lack of habitat. However, this species occurs in aquatic habitats like that in the southeastern portion of the Plant Site. The special-status plant species surveys conducted at the Plant Site in 2017 (Appendix E-3) focused on state and federally listed species and their habitats, which are different than that of Sanford's arrowhead. Therefore, this species could be present, and the potential effects of the project on this species should be considered before project approval.

Response 58B-9

As noted by the commenter, this species was considered for this assessment and is discussed in Table A-1 of Appendix E-1. Habitats for this species include marshes and swamps up to approximately 2,300 ft in elevation. No marshes or swamps are present within the bounds of the project footprint, and elevations are approximately 3,250 ft to 3,325 ft. Any aquatic features within the sites are managed for mining purposes and are not categorized as either swamps or marshes (See Exhibit 7, Appendix E-1, and Exhibit 7, Appendix E-2). Elevations of the project are also above any known occurrences for this species. In the absence of suitable habitats and being outside the elevation range where the species is known to occur, the species is presumed absent and no further consideration is necessary.

Comment 58B-10

> **(f) Spring-run Chinook salmon.** The Draft EIR does not discuss the potential effects of mining to 600 feet below the ground surface at the Quarry Site on river flows in the adjacent San Joaquin River. River flows are known to impact juvenile Chinook salmon survival[8] (*Footnote 8:* Michel, C. J., J. J. Notch, F. Cordoleani, A. J. Ammann, and E. M. Danner. 2021. Nonlinear survival of imperiled fish informs managed flows in a highly modified river. Ecosphere 12(5):e03498. 10.1002/ecs2.3498). Therefore, such effects could constitute a significant impact and should be addressed before project approval.

Response 58B-10

See Collective Response #25 regarding potential effects on San Joaquin River flows. See also Collective Responses #12 and #16, respectively addressing the project's potential effects on salmon restoration efforts in the region and impacts to spawning.

Comment 58B-11

> **4. The Draft EIR (Section 6.5.2) provides an incomplete analysis of the effects of the proposed project on biological resources compared with the no project alternative at the Quarry Site.** Specifically, the Draft EIR does not address the relative post-reclamation habitat value of comparatively shallow (approximately 20 feet deep) lakes under the no project alternative compared with that of the proposed project that would result in a comparatively deep (approximately 100 feet deep) lake. As habitat value may be inversely related to water depth[9] (*Footnote 9:* Lopez, C. B., J. E. Cloern, T. S. Schraga, et al. 2006. Ecological values of shallow-water habitats:

implications for the restoration of disturbed ecosystems. Ecosystems 9:422–440), such analysis should be included before project approval.

Response 58B-11

The project's post-restoration elements are described in the proposed reclamation plan (Draft EIR Appendix B-1).

Comment 58B-12

The Draft EIR's failure to adequately address these issues and provide substantial evidence in support of its conclusions violates CEQA's fundamental requirements for disclosure and analysis and undermines informed decision-making.

Thank you for the opportunity to review and comment on this Draft EIR.

Sincerely,
Jeff N. Davis
Principal Scientist

Response 58B-12

The Draft EIR adequately analyzes the potential impacts of the proposed project in accordance with CEQA standards, as discussed in the responses to Letter 58 and Attachment 58B. The exhibits are noted for the record.

Letter #58C March 10, 2025, Kevin Bundy, San Joaquin River Parkway & Conservation Trust, Inc.; Exhibit C, Salter Report, March 7, 2025

Comment 58C-1

Dear Carmen:

As requested, we reviewed Subchapter 4.13 Noise of the Draft Environmental Impact Report (DEIR) for the subject Project. We also reviewed information in several sections of Appendix H (Noise Assessment).

SUMMARY

In our opinion, the DEIR does not implement adequate thresholds for blasting and does not sufficiently assess or mitigate potential acoustical impacts to both nearby people and wildlife. The DEIR, therefore, fails to protect the community from future excessive noise and vibration. Our comments focus on the following issues:

- Blasting impact analysis thresholds fail to adequately address human disturbance at nearby sensitive receptors, while focusing solely on damage criteria instead. Therefore, nearby residences and recreational areas could be exposed to excessive vibration that could be startling and disruptive, resulting in complaints, and result in a significant impact under CEQA. The related blasting analysis and mitigation measures should be updated to be stricter and to ensure that noise and vibration impacts are adequately reduced, to the greatest extent feasible. In addition, the required community engagement and communication efforts should be improved. Finally, the blast monitoring, reporting, and review efforts should also be improved.

- Processing operations are projected to exceed noise impact thresholds at night and operating hours are to be extended. The proposed operational noise mitigation is inadequate as it fails to require specific noise reduction measures. The Project should "guarantee" a solution that mitigates the potential noise impacts in the original construction, rather than take a "wait-and-see" approach with a lengthy retrofit process that would follow complaints.

- The DEIR also fails to fully analyze the noise and vibration impact of the Project on wildlife. Beyond the impact analysis for fish, the DEIR includes no noise or vibration thresholds, analysis, or mitigation for other wildlife in nearby areas.

In particular, an analysis of blasting noise, vibration, and "airblast" should be included.

Response 58C-1

The comment is introductory. Please see Responses 58C-3 through 58C-12 for further discussion of the blasting analysis in the Draft EIR. Please see Response 58C-13 through 58C-16 below for further discussion of the project's potential impacts related to nighttime noise and vibration.

Comment 58C-2

BACKGROUND

The Project includes changes to the operation of the Rockfield Quarry sites in Fresno County. The existing aggregate (rock, sand, and gravel) mining and processing operations occur at the Plant Site and the Quarry Site. The proposed Project includes expanded mining operations in two stages as listed in the Project Description section of the DEIR Executive Summary. The Project would include 100 years of additional mining including new hard rock mining at the Quarry Site to a depth of 600 feet requiring the use of rock blasting that is anticipated to occur once or twice per week.

As currently proposed, blasting vibration would be clearly noticeable to nearby residents. At an unknown or unscheduled time of day, people would experience a mixed sensation of feelable vibration at the ground or in their home's structure and an impulsive air pressure wave. This is expected to be accompanied by secondary effects such as a rattle at windows, hung pictures, or other objects in their homes. Depending on the setting, people's activities, and their sensitivity, these weekly unanticipated experiences would likely be disturbing.

Response 58C-2

The comment is introductory. See Response 58C-3 below.

Comment 58C-3

SECTION 1 – COMMENTS ON BLASTING

#1.A – Thresholds for Evaluation of Blasting Vibration Ignore Human Disturbance

Impact 4.13-6 assesses the potential for the Project to generate substantial ground-borne vibration and airblast "vibration" as a

result of blasting. The analysis of ground-borne blasting vibration is based solely on the potential for Project-related blasting to cause damage to nearby structures. For reference, the

DEIR thresholds used to address potential blasting vibration impact vary from 0.75 inch/second to 2.0 inches/second, depending on the frequency of the resulting vibration. Thresholds for human disturbance from blasting vibration are not included. This is a notable oversight as there are several sensitive receptors as close as 250 feet from the Project area as well as recreational users of Lost Lake Park to the north. A revised analysis must employ stricter thresholds to facilitate analysis of impacts to nearby residents. We have the following supporting comments. Relevant excerpts of referenced documents are enclosed in the Appendix.

Response 58C-3

Given the short duration of the blasting events (typically 1-2 seconds per blast), the Draft EIR provided sufficient thresholds of significance to prevent damage and human disturbance. See discussion of Impact 4.13-6 on page 4.13-65 of the Draft EIR. However, to conservatively address potential concerns pertaining to human disturbances resulting from the proposed blasting, the blasting and vibration consultant (Vibra-Tech Engineers) reviewed and analyzed applicable research pertaining to blasting ground vibrations and human responses to provide blasting thresholds applicable to human sensitivities in *Technical Note on Threshold of Significance for Human Response CEMEX Rockfield Quarry Modification Project Fresno County, California* (April 29, 2026), included as Appendix H-8. Vibra-Tech Engineers concluded that significance thresholds of 0.60 in/sec PPV ground vibration and 0.01 psi for human response to blast-induced air overpressure at occupied residential structures adjacent to the Quarry Site would sufficiently minimize potential blasting-related disturbances to humans. These conservative vibration and air overpressure thresholds do not change the conclusions of the Draft EIR. See Final EIR Chapter 3, "Draft EIR Errata," for further discussion of the changes in the vibration significance thresholds.

The following analysis is largely reproduced from the *Technical Note on Threshold of Significance for Human Response CEMEX Rockfield Quarry Modification Project Fresno County, California* (Vibra-Tech Engineers 2026), included as Appendix H-8, and explains the origination and the sufficiency of the 0.60 in/sec PPV and 0.01 psi thresholds of significance.

Researchers for Caltrans developed the following human response table specifically for blast-induced ground vibrations, Table 4.3-1, "Human Response to Blasting Ground Vibration."

Table 4.3-1
Human Response to Blasting Ground Vibration

Average Human Response	PPV (in/sec)
Barely to distinctly perceptible	0.02-0.10
Distinctly to strongly perceptible	0.10-0.50
Strongly perceptible to mildly unpleasant	0.50-1.00
Mildly to distinctly unpleasant	1.00-2.00
Distinctly unpleasant and to intolerable	2.00-10.00

Table Sources: Jones & Stokes, 2004, *Transportation- and construction-induced vibration guidance manual*. June. (J&S 02-039.) Sacramento Prepared for California Department of Transportation, Noise, Vibration, and Hazardous Waste Management Office, Sacramento, CA

Because this table was specifically developed to address human response to blast-induced ground vibrations, it is useful to inform the proper threshold of significance for humans resulting from the project's blast-induced ground vibrations. However, to determine whether the 2004 Caltrans study is the most appropriate significance criteria, it is necessary to compare that table with other available studies.

The majority of the studies done on human tolerance to vibrations have been of steady-state sources, meaning that the amplitude and frequency of the vibration remain constant over the test period. This type of testing is usually performed with vibrations lasting much longer than the vibrations from a typical mine or quarry blast event. The purpose of these studies is usually to determine the vibration levels that people can perform tasks at a reasonable level of comfort, or to set occupational exposure limits for activities such as working in an office, traveling in an airplane, driving an automobile, or operating heavy equipment. Conclusions are drawn about the effects of vibration on the human body.

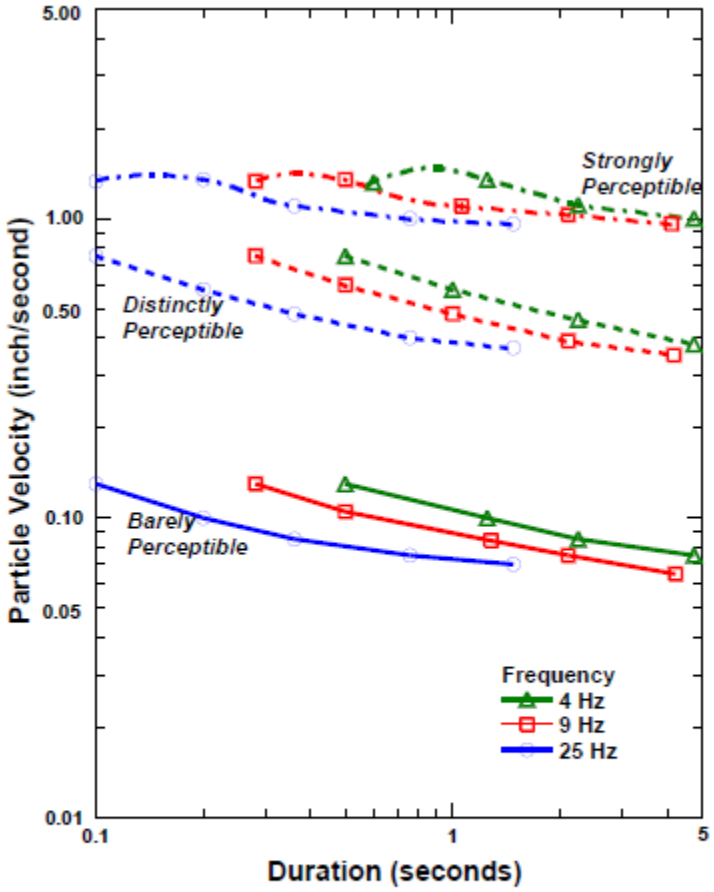

Figure 1. Human Response to Transient Vibrations of Various Frequency and Duration (from Wiss & Parmelee, 1974).

Based on available research, blast vibrations are certainly not detrimental to the human body, and the short period of time over which they occur does not produce physical fatigue. For these reasons, most studies of human response to vibration cannot be related to blast vibrations. However, three important facts become apparent from these studies. First, people can perceive vibrations over an extremely wide range of amplitudes, frequencies, and durations. Second, individual response to a given vibration level is highly subjective and varies not only with each individual but also on a daily basis. Third, an individual response is also dependent upon many factors unrelated to the vibration event.

Blast induced ground vibration is not a steady state vibration, but rather a transient vibration. A transient vibration is a vibration that begins near its maximum level, quickly decreases in amplitude, and usually becomes imperceptible after just a few seconds.

Figure 1 is derived from a study of subjective human response to transient vibrations completed by Wiss and Parmelee in 1974. The Wiss and Parmelee study involved subjecting forty people to transient vertical vibrations while standing on a test platform. Each person was exposed to vibrations of various duration and amplitude, at frequencies between 2.5 and 25 Hz, and asked to characterize their perception of the vibrations. Four levels of subjective human response to vibration were categorized: "Barely Perceptible, Distinctly Perceptible, Strongly Perceptible, and Severe." The mean response to the three lower categories is shown in Figure 2 for three tested frequencies. The mean response to the "Barely Perceptible" category is the level which half of the people tested could not perceive vibrations below. The mean for each of the other categories was found similarly. Human tolerance to vibration decreases as the duration of the vibration increases. The mean response curves for each frequency considered in Figure 1 are asymptotic; that is, they each approach a constant minimum level, or asymptote, as the duration increases, and each category has a common asymptote. These asymptotes provide a convenient method of assigning a subjective criterion to human response to transient vibrations that is independent of frequency or duration. Figure 2 depicts both the asymptotic mean response levels and the threshold response levels from the Wiss and Parmelee study. The threshold response levels are the levels cited by the most sensitive of the test subjects for each vibration category.

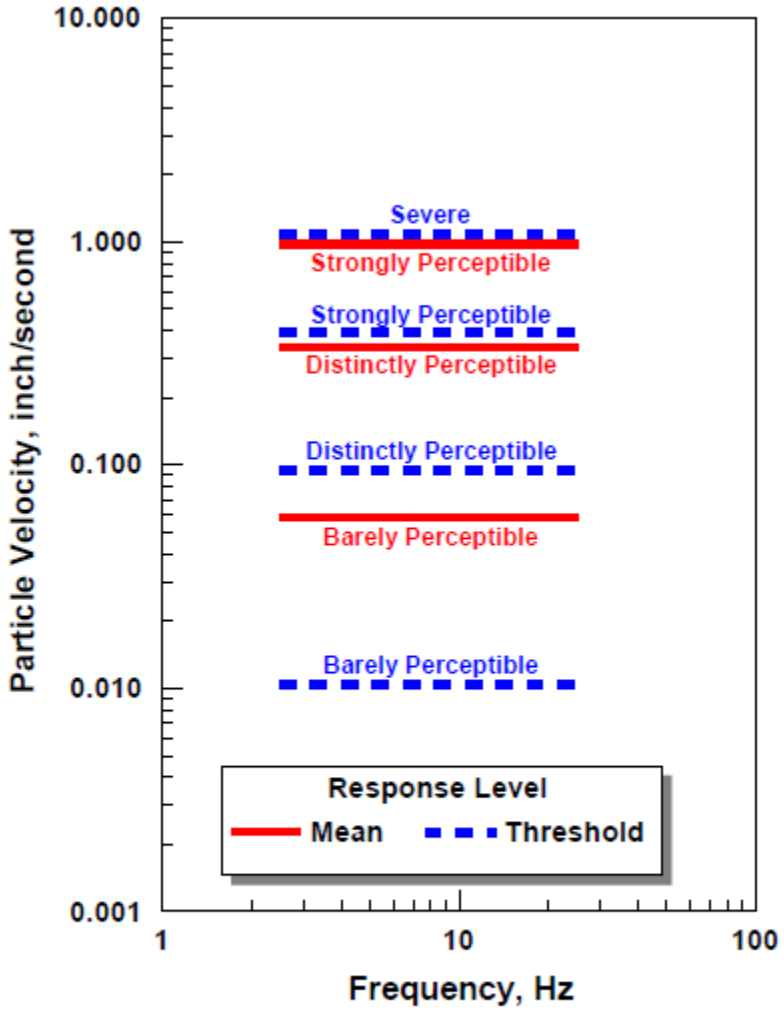

Figure 2. Generalized Human Response to Transient Vibrations (from Wiss & Parmelee, 1974).

The Wiss and Parmelee study was based on people standing and being subjected to vertical vibrations. Studies involving people in various body positions have found good correlation to the data from standing tests, suggesting that body position may not influence a person's sensitivity to vibration. The threshold levels defined by the broken lines in Figure 2 are generally accepted as quite conservative for both transient and steady state vibrations under most conditions.

Most scientific studies regarding human perceptibility to steady state and transient vibrations have been conducted in laboratories and other controlled environments. The levels at which people may perceive vibration would not change when they are in their homes, however, their classification of the vibration levels may. While no studies have

been able to adequately account for all the variables affecting the response of people in their homes to blast vibrations, it is reasonable to conclude that the tolerance to vibrations would occur at levels lower than those found in laboratory environments.

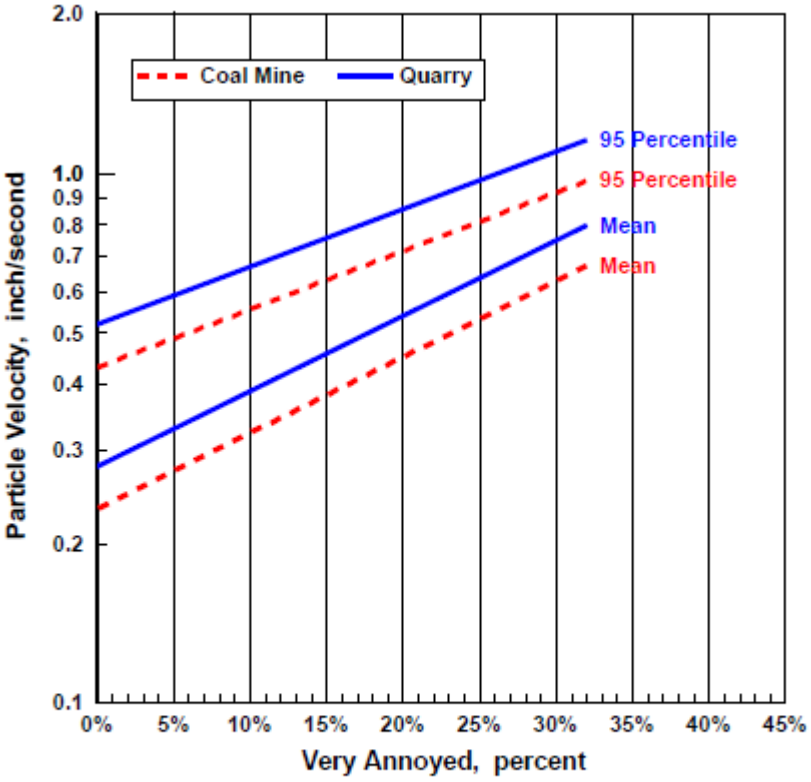

Figure 3. Reactions of Persons Subjected to Blasting Vibration in their Homes (from RI-8507).

To gain a better insight to the levels of vibration which evoke complaints from homeowners, the USBM calculated the ground vibrations necessary to produce structure response similar to that measured during an airblast study (USBM RI-8485). These calculated ground vibrations levels were then correlated to the human annoyance curves generated through the airblast study. The result of this correlation is shown graphically in Figure 3, above. The 95-percentile curve represents the level at which there would be 95 percent confidence in the data that if ground vibration levels reached 0.60 in/sec approximately 5 percent of the population would consider this to be very annoying.

This data, although based on calculated ground vibration levels, may be the most valid predictor of homeowner response to blast vibrations. It is based on human response to not only perceived vibration in their homes, but also the house rattle and other associated

sounds produced by vibration in a residential structure. This data also considered the fear homeowners feel concerning property damage.

Comparing the research described in the preceding section with the 2004 Caltrans study, the appropriate significance threshold for measuring the human response to blast-induced ground vibrations from the proposed Rockfield Quarry is a peak particle velocity of 0.60 inches/second. This threshold falls at the lower end of the "strongly perceptible to mildly unpleasant" average response in the 2004 Caltrans table, while still encompassing the 95th percentile of responses discussed in the USBM report.

Human Response to Air Overpressure

Since noise levels due to blasting are generally very low frequency (approximately 2 to 25 Hz), the human ear does not detect the total energy associated with the overall linear sound energy. Based upon research on blasting, the typical fundamental frequency (the frequency where the majority of sound energy is located) for a blast is at the 20 to 25 Hz range, below the level of human hearing.

Little research has been done on the subjective human reactions to blast noise, although annoyance studies have been made for sonic booms and other impulsive source and applied to blasting. As part of the development of the air overpressure criteria by the USBM, researchers not only had to consider the structural effect of the air overpressure limit but also determine if the limit would be acceptable in terms of annoyance. In studying the limits for air overpressure annoyance, the USBM compared blasting to previous government studies of sonic booms and artillery fire.

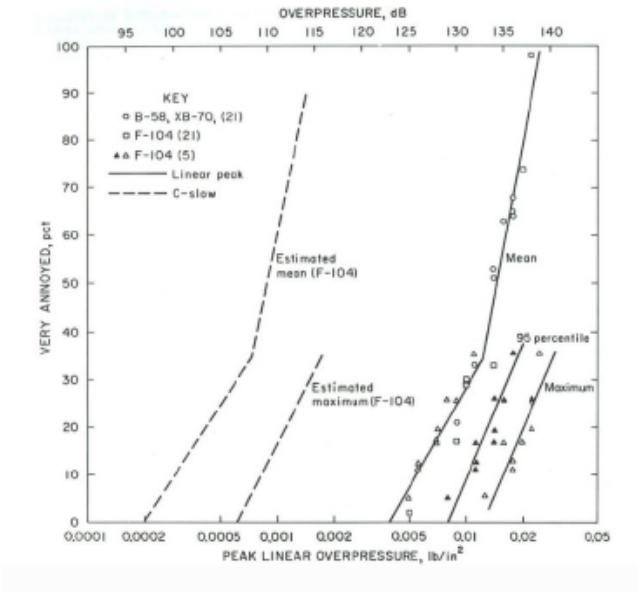

Figure 4. Population very annoyed by sonic boom-produced house rattles (after Siskind).

Figure 4 above shows the results of one study that was utilized for comparison by the USBM. The study was conducted in Oklahoma City and consisted of an average of eight booms per day for six months. Utilizing the 95-percentile line, there would be 95 percent confidence in the data that at 0.01 psi blast-induced air overpressure would be acceptable to all but 5 percent of the population. Therefore, the appropriate threshold of significance for human response to blast-induced air overpressure is 0.01 psi.

The distance to each receptor would change for each blast in the quarry pit as the blast location changes during the pit's development. Figure B1 and B2 in the Vibra-Tech Blast Impact Analysis Report shows 42 different blast designs and the corresponding maximum charge weight for the design that could be used. Table 4.3-2, "Maximum Charge Weight For Closest Distance to Meet Threshold of Significance," shows the closest distance that a blast could occur to the various adjacent structures and the maximum charge weight that would be required to be below the ground vibration and air overpressure threshold of significance of 0.6 in/sec and 0.01 psi. For many blast locations the distance to the receptor would be much greater resulting ground vibration and air overpressure levels significantly lower than 0.6 in/sec and 0.01 psi.

Table 4.3-2
Maximum Charge Weight For Closest Distance To Meet Threshold of Significance

Receptor	Distance (ft)	Max Pounds Per Delay (lbs.)
South Residential Structure	275	*41
East Residential Structures (Mesa View Ave.)	460	116
Lost Lake Park Structures	500	138
North Ranch Structures	1,000	550
Northeast Residential (North Friant Road)	1,430	1,125
Sumner Hill Residences	2,000	2,200

Table Notes: *To accomplish 41 lbs./delay near the closest residential structure a 53' deep hole, 3.5" diameter, 4 explosive decks, and an ANFO product with a density of 0.87 g/cc can be utilized. The maximum pounds per delay interval would be 34 lbs./delay.

Comment 58C-4

1. **Federal Transit Administration (FTA):** It is generally accepted that ground-borne vibration thresholds to address human disturbance are more strict than standards related to building damage. For example, the DEIR presents significance thresholds from the FTA [1] (*Footnote 1:* FTA reference document: Transit Noise and Vibration Impact Assessment Manual, FTA Report No. 0123 (September 2018) for both building damage and human annoyance. These are excerpted below (Tables 4.13-10

and 4.13-11, DIER page 4.13-35). These tables clearly indicate stricter standards for the evaluation of vibration with respect to human disturbance. However, the DEIR blasting vibration impact analysis ignored the thresholds listed in Table 4.13.11.

Table 4.13-10
FTA Thresholds for Assessing Damage to Structures

Building Category	Level RMS VdB[1]
I. Reinforced-concrete, steel or timber (no plaster)	102
II. Engineered concrete and masonry (no plaster)	98
III. Non-engineered timber and masonry buildings	94
IV. Buildings extremely susceptible to vibration damage	90

Table Source: Table 7-5 of FTA 2018.
Table Notes:
1. 1 RMS velocity in decibels (VdB) re 1 micro-inch per second.

Table 4.13-11
FTA Thresholds for Assessing Groundborne Vibration Annoyance Potential

Land Use Category	Impact Levels RMS (VdB)		
	Frequent Event[1]	*Occasional Events[b]*	*Infrequent Events[c]*
Category 1: Buildings where vibration would interfere with interior ops.	65[d]	65[d]	65[d]
Category 2: Residences and buildings where people normally sleep	72	75	80
Category 3: Institutional land uses with primarily daytime uses	75	78	83

Table Source: Table 6-3 of FTA 2018.
Table Notes:
a. "Frequent Events" is defined as more than 70 vibration events of the same source per day.
b. "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day.
c. "Infrequent Events" is defined as fewer than 30 vibration events of the same source per day.
d. This criterion limit is based on levels that are acceptable for most moderately-sensitive equipment such as optical microscopes. Vibration-sensitive manufacturing or research would require detailed evaluation to define the acceptable vibration levels.

Response 58C-4

The Federal Transit Administration Document entitled *Transit Noise and Vibration Impact Assessment Manual* is a document used to assess and guide projects involving rail transit. Ground vibrations resulting from rail transit are considered steady-state vibrations because of their longer duration, cyclic frequency and steady amplitudes. In addition, rail transit events can occur many times during the day or evening.

Gound vibrations from blasting are considered transient events, not steady-state events because their amplitude dissipates quickly over time. The blast events at the CEMEX Rockfield operation would only occur during daytime hours with only one event likely occurring in a day. Time between blast events is dependent on market

needs, but typically is several days. The duration of most blast events is about one to two seconds in duration.

Human response to vibration events is heightened by the duration of the event along with the number of occurrences. This is factored into the lower amplitude thresholds seen in Table 4.13-11, "FTA Thresholds for Assessing Groundborne Vibration Annoyance Potential." These criteria should not be applied to blasting events.

Comment 58C-5

2. **U.S. Bureau of Mines Commentary:** The DEIR references a report published by the U.S. Bureau of Mines (RI 8507[1] (*Footnote 1: U.S. Bureau of Mines Report of Investigations 8507, Structural Response and Damage Produced by Ground Vibration from Surface Mine Blasting (1980)*), DEIR page 4.13-35). Thresholds of significance for potential building damage from blasting vibration are drawn from this report. However, this report includes commentary related to human disturbance as follows:

> *"Human reactions to blasting can be the limiting factor. Vibration levels can be felt that are considerably lower than those required to produce damage. Human reaction to vibration is dependent on event duration as well as level. Particle velocities of 0.5 in/sec from typical blasting (1-sec vibration) should be tolerable to about 95 pct of the people perceiving it as "distinctly perceptible." Relevant to whole-body vibration reaction is the degree that the vibration interferes with activity (sleep, speech, TV viewing, reading), presents a health hazard, and affects task proficiency. For people at home, the most serious blast vibration problems are house rattling, fright (fear of damage or injury), being startled, and for a few, activity interference. Complaints from these causes can be as high as 30 pct at 0.5 in/sec, and this is where good public relations attitudes and an educational program by the blaster are essential."* (RI 8507, page 68)

These statements from the U.S. Bureau of Mines report (RI 8507) indicate that people can feel vibration at considerably lower levels than those required to produce damage. And complaint rates could be as high as 30 percent for blasting vibration at 0.5 inch/second.

Response 58C-5

This quote comes from bullet point 9 in the Conclusions of USBM RI-8507. For insight to this conclusion the reader is referred to Page 67 where it states, "In the absence of a public relations program, it is expected that a mean ground vibration level would produce 15 to 30 percent "very annoyed" neighbors. The 95 percent line gives 5 percent very annoyed at 0.5 in/sec. CEMEX has already started a public relations effort with the community and would continue this effort daily.

Comment 58C-6

3. **U.S. Office of Surface Mining Reclamation and Enforcement (OSMRE):** The DEIR also references the *Blasting Guidance Manual* (March 1987, DEIR Page 4.13-36) published by OSMRE in identifying significance thresholds for blasting vibration. This document also includes the following commentary:

> *"Most authorities agree that the threshold of human perception for blast vibration ground motion is around 0.03 inches per second. Depending on activity, sensitivity, and whether or not the subject knows when the event is to occur, a few humans can sense ground motion as low or lower than most instruments are able to: about 0.01 inch per second! Although complaints can occur at any level perceptible to humans, they are unusual below 0.08 inches per second or so. As peak particle velocities increase and as local and individual sensitivities increase, so will the number of complaints. At, say, 0.25 inches per second, a level that is eminently safe (*) and well within OSMRE limits, except below 2 Hz, complaints can be expected."* [emphasis added] (OSMRE Blasting Guidance Manual, page 37) [* note the author means "safe" with respect to building damage]

Response 58C-6

As the quote states, complaints can occur at any level perceptible to humans. Human reaction is dependent on the duration and amplitude of the vibration event, as well as innumerable other factors beyond CEMEX's control. Because of this great human subjectivity complaints about blast vibrations cannot be completely eliminated. Discernible vibrations cannot be used as a threshold of significance and are by no means a criterion for a significant impact.

Comment 58C-7

4. **Federal Highway Administration:** The U.S. Federal Highway Administration publication No. FHWA-HI-92-001 titled *Rock Blasting and Overbreak Control* (December 1991) also includes commentary on human sensitivity to vibration. The FHWA report states that "vibration is a fact of daily life" but that "other vibration that contrasts sharply, because it is not part of the daily experience but is unusual, has been designated acultural. It surprises a person, is disturbing, and causes an acute awareness." (FHWA, page 275). This FHWA publication also summarizes previous research on the subject, characterizing human response to vibration as listed in the excerpted Table 10.10 (FHWA, page 275). The DEIR selected threshold of significance or 0.75 inch/second would be considered "severe" according to the FHWA guidance. A "severe" human response to blasting vibration should not be considered acceptable for the next 100 years of hard rock mining at the Project site.

FHWA Table 10.10 Human Response

Response	Particle Velocity
Noticeable	0.02 in/s
Troublesome	0.2 in/s
Severe	0.7 in/s

Response 58C-7

Table 10.10 from the FHWA Report HI-92-001 entitled *Rock Blasting and Overbreak Control* (1991) was derived from Figure 61 on page 64 of USBM RI-8507. Figure 61 is a graph composed of three studies, Reiher and Meister (1931), Goldman (1948), and Wiss and Parmalee (1974). The vibration events for the responses in the Reiher and Meister study were 5-minute sinusoids in the frequency range of 4 to 25 Hz. Goldman also used steady state events. The frequency range was 2 to 50 Hz with a shorter duration of 5 seconds. As discussed previously, this is not characteristic of blast vibration events in mining. On page 62, of RI-8507 the USBM states, "Several researchers recognized that duration of the vibration event was critical to its undesirability. Most evident was that a higher level could be tolerated if the event was short. Consequently, steady-state vibration data could not be realistically applied to blasting, except for events that exceed several seconds duration." The USBM further cited Chang that noted Reiher and Meister's responses could be multiplied by a factor of 10 for short events.

The Wiss and Parmelee study is the only study that gets close to a vibration resembling a blast event. This study utilized 5 second, damped sinusoidal pulses. The damping ranged

from 0 to 16 percent and frequencies were 2.5 to 25 Hz. The descriptors and the vibration amplitudes for the mean of the 40 respondents in the Wiss and Parmelee study are given below:

Vibration Descriptor	Particle Velocity (in/sec)
Barely Perceptible	0.033
Distinctly Perceptible	0.28
Strongly Perceptible	0.63
Severe	1.13

It should be noted the only study that used a vibration descriptor of "Severe" was Wiss and Parmelee. This level was noted at 1.13 in/sec. not 0.7 in/sec.

Comment 58C-8

5. **Caltrans:** This comments above are also supported by the Caltrans *Transportation and Construction Vibration Guidance Manual* (April 2020), which states that " Ground vibration and air overpressure can be felt at levels that are well below those required to produce any damage to structures." (Caltrans Manual, page 75). Table 21 below (excerpted from the Caltrans Manual, Page 75), indicates that blasting vibration of 0.75 inch/second (threshold selected in the DEIR) would be considered between "strongly perceptible" and "mildly unpleasant." This characterization demonstrates that it is prudent to select thresholds of significance for blasting vibration that are lower or more strict that the thresholds related to building damage in order to adequately address human disturbance.

Table 21. Human Response to Blasting Ground Vibration and Air Overpressure

Average Human Response	PPV (in/sec)	Airblast (dB)
Barely to distinctly perceptible	0.02–0.10	50–70
Distinctly to strongly perceptible	0.10–0.50	70–90
Strongly perceptible to mildly unpleasant	0.50–1.00	90–120
Mildly to distinctly unpleasant	1.00–2.00	120–140
Distinctly unpleasant to intolerable	2.00–10.00	140–170

Response 58C-8

The threshold of significance that was selected in Response 58C-3 was 0.60 in/sec. As stated previously, if we compare the research conducted by the USBM for justifying their limits in terms of human response with the 2004 Caltrans study, the appropriate significance threshold for measuring the human response to blast-induced ground

vibrations from the proposed Rockfield Quarry is a peak particle velocity of 0.60 inches/second. This threshold falls at the lower end of the "strongly perceptible to mildly unpleasant" average response in the 2004 Caltrans table, while still encompassing the 95th percentile of responses discussed in the USBM report.

Comment 58C-9

6. **Australian Standards:** As further support, consider the Australian Standard AS 2187.2-2006 titled *Explosives – Storage and Use, Part 2: Use of Explosives*. In this standard, the recommended blasting ground vibration limits regarding damage are aligned with the Project DEIR blasting vibration damage thresholds. However, the Australian Standard further adds the following blasting "ground vibration limits for human comfort" (AS 2187.2-2006, Table J4.5(A))

Australian Standard AS 2187.2-2006: Excerpt of Ground Vibration Limits for Human Comfort

Category	Type of Blasting Operations	Peak Component Particle Velocity
Sensitive Site*	Operations lasting more than 12 months or more than 20 blasts	5 mm/s [0.2 inch/s] for 95% blasts per year, 10mm/s [0.4 inch/s] maximum unless agreement is reached with the occupier that a higher limit may apply
Sensitive Site*	Operations lasting for less than 12 months or less than 20 blasts	10 mm/s [0.4 inch/s] maximum unless agreement is reached with the occupier that a higher limit may apply
Occupied non-sensitive sites, such as factories and commercial premises	All blasting	25 mm/s [1 inch/s] maximum unless agreement is reached with the occupier that a higher limit may apply.

** A sensitive site includes houses and low-rise residential buildings, theatres, schools, and similar buildings occupied by people*

Due to the close proximity of sensitive receptors (as close as 250 feet) and the long-term nature of the Project, ground-borne vibration from blasting should be mitigated to a more conservative threshold than the building damage thresholds used in the DEIR. The DEIR has ignored the FTA human sensitivity thresholds offered in the DEIR and ignored commentary from the U.S. Bureau of Mines, the U.S. OSMRE, and the U.S. FHWA. These U.S. publications along with the referenced Australian Standard provide evidence that a stricter standard would be feasible and appropriate to address potential for human disturbance. By failing to incorporate human disturbance thresholds into the blasting analysis, nearby residences and recreational areas could be exposed to excessive vibration that could be startling and

disruptive, resulting in complaints, and should be considered a significant impact under CEQA. Therefore, the DEIR has failed to fully address the impact analysis required by CEQA and the related blasting analysis and mitigation measures should be revised.

Response 58C-9

Although the South Residential structure is 270 feet away from the closest blasting, the vast majority of the blasts would be much greater than this distance. This is true for all of the surrounding receptors at the site. The actual distance to the receptors would vary on a blast-by-blast basis. The Blasting Impact Analysis report has shown feasible blast designs that can control ground vibration and air overpressure at off-site receptors. As the mining operation develops, blast designs would be adjusted based upon distance to receptors and seismograph measurements. In actual practice, blasting operations do not regularly create ground vibrations or air overpressure at damage levels and endeavor to design all blasts to be below damage thresholds, therefore the premise of the Australian Standard is effectively achieved organically without codification.

Comment 58C-10

#1.B – Thresholds for Evaluation of Blasting "Airblast" also Focus on Building Damage

Impact 4.13-6 also assesses the potential for the Project to generate substantial "noise", "airborne vibration," or "airblast" as a result of blasting. "Airblast" refers to the low-frequency pressure wave transmitted through the air from an underground blast. The DEIR's analysis of airblast is based on guidance found in the U.S. Bureau of Mines publication RI 8485 *Structural Response and Damage Produced by Airblast* (1980). This document and the referenced thresholds focus on building damage. For reference, the DEIR threshold used to address potential impact from airblast is 0.01295 psi or 133 dB. This threshold is purported in the DEIR to "prevent damage and human disturbance." However, using the same threshold to address both concerns does not account for the fact that humans are more sensitive than buildings and can be disturbed by lower levels. The US Bureau of Mines Publication RI 8485 also includes this commentary on human disturbance, indicating the human annoyance occurs at lower thresholds than building damage:

> "*[Airblast] Levels exceeding 120 dB will produce some annoyance from rattling and fright, with as much as 5 to 10 pct of homes exhibiting such disturbances at the maximum level of 134 dB (0.1-Hz high-pass). Public reaction depends strongly on the blaster's public relations and the general attitudes of the*

neighbors to the economic and social requirement for the blasting." (RI 8485, page 66)

Focusing on the airblast damage threshold again pays inadequate attention to the potential disturbance of sensitive residential neighbors related to the secondary effects of blasting airblast, such as the rattling of windows.

The Caltrans *Transportation and Construction Vibration Guidance Manual* (April 2020), which states that "Ground vibration and air overpressure can be felt at levels that are well below those required to produce any damage to structures." (Caltrans Manual, page 75). Table 21 below (excerpted from the Caltrans Manual, Page 75) indicates that airblast overpressure of 133 dB (thresholds selected in the DEIR) would be perceived in the range of "mildly to distinctly unpleasant." These characterizations demonstrate that it is prudent to select a threshold of significance for blasting airblast that is lower or more strict that the thresholds related to building damage in order to adequately address human disturbance.

Table 21. Human Response to Blasting Ground Vibration and Air Overpressure

Average Human Response	PPV (in/sec)	Airblast (dB)
Barely to distinctly perceptible	0.02–0.10	50–70
Distinctly to strongly perceptible	0.10–0.50	70–90
Strongly perceptible to mildly unpleasant	0.50–1.00	90–120
Mildly to distinctly unpleasant	1.00–2.00	120–140
Distinctly unpleasant to intolerable	2.00–10.00	140–170

As further support, consider the Australian Standard AS 2187.2-2006 titled Explosives – Storage and Use, Part 2: Use of Explosives. In this standard, the recommended blasting damage airblast limits are aligned with the Project DEIR blasting vibration damage thresholds. However the Australian Standard further adds the following "airblast limits for human comfort" (AS 2187.2-2006, Table J5.4(A))

Australian Standard AS 2187.2-2006: Excerpt of Airblast Limits for Human Comfort

Category	Type of Blasting Operations	Peak Sound Pressure Level
Sensitive Site*	Operations lasting more than 12 months or more than 20 blasts	115 dBL for 95% blasts per year, 120 dBL maximum unless agreement is reached with the occupier that a higher limit may apply
Sensitive Site*	Operations lasting for less than 12 months or less than 20 blasts	120 dBL maximum unless agreement is reached with the occupier that a higher limit may apply
Occupied non-sensitive sites, such as factories and commercial premises	All blasting	125 dBL maximum unless agreement is reached with the occupier that a higher limit may apply.

** A sensitive site includes houses and low-rise residential buildings, theatres, schools, and similar buildings occupied by people*

Response 58C-10

As stated in the commentary provided for Comment 58C-3, the USBM did analyze the air overpressure data for both damage potential and annoyance. The recommended level of 133 dB provided a 95 percent annoyance acceptability. Response 58C-3 proposes reducing the threshold of significance for air overpressure to 0.01 psi of 130 dB. This is the midpoint of Caltrans "Mildly to Distinctly unpleasant" category based upon average human response. Regarding the Australian Standard, our response for air overpressure is the same as above, as the mining operation develops, blast designs would be adjusted based upon distance to receptors and seismograph measurements. In actual practice, blasting operations do not regularly create ground vibrations or air overpressure at damage levels and endeavor to design all blasts to be below damage thresholds, therefore the premise of the Australian Standard is effectively achieved organically without codification.

Comment 58C-11

#1.C – DEIR Should Include Additional Community Engagement and Relations Efforts

In addition to stricter thresholds or limits to be applied to blasting to address human disturbance, additional community relations efforts can and should be incorporated into the Project Blasting Protocols. As stated by the U.S. Bureau of Mines (in publication RI 8507, page 68) "*good public relations attitudes and an educational program by the blaster are essential.*" Clear

communication and notification of blasting events can benefit an adjacent community and reduce the impact of blasting activities. The blasting Mitigation Measure 4.13-6 and related Blasting Protocols (DEIR, Appendix H-6) includes monitoring and "complaint response procedures." However, the Project should not wait until after complaints are received to implement further community engagement. Additional effective community relations efforts should be incorporated into the standard blasting protocol procedures so they are implemented prior to and during blasting and monitoring (not only after complaints are received). The following measures should be included in the DEIR:

- Revise the mitigation measure to require blasting to be scheduled at the same time of day each day that blasting occurs (i.e., on the hour at a certain hour of the day). Based on our experience, awareness of blasting has helped people to more easily tolerate blasting vibration and airblast that is noticeable.

- Revise the mitigation measure to require notification of residents within 2,000 feet at the time of blast. This could be offered as a subscription for notifications via text message or similar means.

Response 58C-11

Please see Response 58C-5 regarding CEMEX's public relations effort. Regarding blasting to be scheduled at the same time of day each day, this is not necessarily achievable due to potential delays in delivery of explosives, loading conditions, and weather issues. CEMEX would endeavor to blast at a set time interval within reason.

Comment 58C-12

#1.D – The DEIR Should Require Peer Review of the Blast Monitoring Results

The blasting Mitigation Measure 4.13-6 and related Blasting Protocols (DEIR, Appendix H-6) includes monitoring requirements and mandatory reporting to the County. However, given the technical nature of the blasting protocols, it would be appropriate for blasting reports and monitoring results to be reviewed by a third party with expertise in assessing the results. This should occur at least at the early stages of blasting and when blasting within 600 feet of a sensitive receptor.

In addition, the current Blasting Protocols include monitoring only "at the closest residential/commercial property, the closest

well, and at three points to the San Joaquin River embankment." This measure does not take into account potential monitoring equipment failure or faulty results. The DEIR should have required blast monitors at the two closest residential properties, not just one. Doing so would improve confidence in the measurement results to ensure that blasting related noise and vibration is minimized.

Response 58C-12

The blasting reports would be produced by the blasting contractor. The monitoring would be conducted by an independent, third-party consultant that would review the blasting reports along with the monitoring results. This information would also be reviewed internally by CEMEX personal. Regarding the monitoring, the Draft EIR proposed a minimum number of monitoring locations, often time operations voluntarily increase the number of monitoring points to facilitate public relation efforts.

Comment 58C-13

SECTION 2 – COMMENTS ON OTHER OPERATIONAL NOISE SOURCES

#2.A – Proposed Operational Noise Mitigation is Inadequate
